Re: Docket No. FD 36873, *Union Pacific Corp., et al. - Control - Norfolk Southern Corp., et al.*

Dear Chief of Case Administration:

Enclosed for e-filing by Union Pacific Corporation, Union Pacific Railroad Company, Norfolk Southern Corporation, and Norfolk Southern Railway Company (collectively, "Applicants"), in the above-referenced Finance Docket, is an application seeking authority, under 49 U.S.C. §§ 11323–11325, for the acquisition of control by Union Pacific Corporation of Norfolk Southern Corporation and, through it, Norfolk Southern Railway Company (the "Application"). Applicants are also delivering twenty-five hard copies of the Application to the Board today as previously arranged with Board staff.

The Application is being submitted in four volumes. There are two versions of Volume 2 (UP-14/NS-12) and two versions of the Electronic Appendix to the Application: the first version is a public copy from which sensitive financial, commercial, and operating information has been redacted, which is to be filed on the public record and served on all parties of record; the second version, marked "HIGHLY CONFIDENTIAL," is an unredacted version to be filed under seal subject to the Protective Order entered in this proceeding on August 5, 2025 (the "Protective Order"), which will be provided on request to anyone who has executed the appropriate undertaking to the Protective Order. Volumes 1 (UP-13/NS-11), 3 (UP-15/NS-13), and 4 (UP-16/NS-14) do not contain confidential material. They are to be filed on the public record and will be served on all parties of record.

Applicants are also delivering to the Board, via Covington's Kiteworks FTP site, public and "CONFIDENTIAL" or "HIGHLY CONFIDENTIAL" workpapers. The public workpapers will be made available upon request and the "CONFIDENTIAL" or "HIGHLY CONFIDENTIAL" workpapers, which are subject to the Protective Order, will be made available on request to those who have executed the appropriate undertaking to the Protective Order.

Individuals who have executed the appropriate undertaking to the Protective Order may obtain copies of the "CONFIDENTIAL" or "HIGHLY CONFIDENTIAL" materials referenced above by contacting Caroline Harrison at charrison@cov.com.

RAILROAD MERGER APPLICATION

Introduction
[Section 1180.6]

UPC, UP, NSC, and NS,[1] collectively, "Applicants," hereby apply under 49 U.S.C. §§ 11323–25 and the Board's General Acquisition Procedures, 49 C.F.R. pt. 1180,[2] for authorization of (i) the acquisition of control by UPC of NSC, and through NSC of NS and NS's rail carrier subsidiaries, and (ii) the resulting common control by UPC of UP and NS and the consolidation of the rail operations of UP and NS.

This merger is fundamentally about growth. The merger will drive growth by linking two complementary networks—one anchored in the West and the other in the East—into a unified transcontinental railroad capable of providing safe, reliable, single-line rail service. The combination delivers what shippers repeatedly say they want and what the data consistently show they choose when available: seamless, efficient, end-to-end rail service with a single carrier accountable for the full move.

Nowhere will this transformation be more consequential than in the American heartland—the "watershed" markets within roughly 250 miles of Chicago, St. Louis, Memphis, and New Orleans. These are the central interchange gateways between UP and NS, where freight today must change hands, where delays and costs accumulate, and where railroads lose freight to trucking. The merger transforms thousands of

[1] A table of the abbreviations used throughout this Application follows the Master Table of Contents at the beginning of this Volume.

[2] All section references are to Title 49 of the Code of Federal Regulations, unless otherwise noted.

interline lanes in those watershed markets into single-line routes, strengthening rail's ability to reach markets that are not well served today.

The merger will significantly enhance competition. The combined company will provide new, stronger competition to other rail carriers and trucks. This end-to-end combination does not eliminate parallel routes or diminish competitive alternatives. Further, Applicants propose a set of practical, targeted commitments designed to preserve and reinforce competition: protections for the three 2-to-1 shipper facilities; continued access through existing gateways; and a Committed Gateway Pricing program to extend the merger's benefits to more customers. These commitments are backed by a detailed, phased integration plan built around proven systems and careful execution—paired with service benchmarking and an alternative dispute resolution program if service issues arise. Together, these measures ensure that the transformation of thousands of interline lanes into single-line routes produces meaningful public benefits.

American manufacturers and consumers will be the ultimate beneficiaries of this merger. The transaction will create a more accessible, sustainable, and lower-cost supply chain option for the reliable shipping of key goods—ranging from food products to petroleum products to building materials. And the stronger competition resulting from this merger will stimulate more competition—a virtuous cycle of improvements and innovations that will create further efficiencies and benefits.

In sum, the proposed transaction is an unprecedented opportunity for our country. It will create America's first transcontinental railroad, which will transform

the nation's supply chain, unleash the strength of American manufacturing, benefit consumers, and create new sources of economic growth and workforce opportunity from coast to coast.

Summary of Public Interest Considerations
[Section 1180.6]

This Application demonstrates that the proposed transaction thoroughly satisfies the statutory standard of being "consistent with the public interest." 49 U.S.C. § 11324(c). This Application addresses in detail each of the Board's stated criteria for evaluating this element of the proposed transaction, and the following summarizes the key reasons why the proposed transaction will be consistent with the public interest.

The Transaction Is Decidedly in the Public Interest. When assessing the public interest, the Board balances benefits against harms. Here, the benefits are substantial. By eliminating interchange friction and enabling a unified strategy, the combined UP/NS will offer new single-line service that will provide customers with faster, more reliable, and more efficient service. This new service offering will transform tens of thousands of interline lanes into seamless single-line service. The Board has long recognized that customers prefer single-line service and that new opportunities for single-line service are a public benefit.

The Board has similarly recognized that enhanced opportunities for truck-to-rail conversion are a public benefit. Applicants project the combined UP/NS will convert more than 2 million truckloads of traffic from long-haul trucking to rail. These truck-to-rail conversions have cascading benefits for multiple stakeholders: the

freight customers who benefit from more effective competitive options; the commuters who will see reduced highway congestion; the local taxpayers and communities that will see reduced repair costs for highway wear-and-tear; and all Americans who benefit from reduced emissions and improved air quality. As noted above, these benefits will be particularly dramatic in the watershed region, where the transaction will open up significant new rail service options for customers that currently rely on trucking.

On the other side of the balance, the proposed transaction does not risk harm to the public interest. The verified statements of Dr. Elizabeth Bailey and Dr. Mark Israel show that the proposed transaction is decidedly pro-competitive. And the Application details the ways in which the proposed transaction would enhance competition, including through an innovative Committed Gateway Pricing program designed to enhance competition for many rail customers who would not otherwise directly benefit from the merger's new single-line service.

Voluntary Conditions that Protect and Enhance Competition. As detailed in the Application, the balance of benefits and harms decisively favors approval of the proposed transaction. To remove any doubt, however, Applicants are voluntarily committing to standard competition-preserving conditions, such as a gateway commitment and commitments to ensure permanent multi-railroad access for each of the three 2-to-1 shipper facilities. At the same time, the Applicants are not offering commitments or conditions to compensate parties who may be disadvantaged by

increased competition, or which would undermine the benefits of the transaction for customers and the public at large.

Employee Protections. Applicants have committed to preserving employment for all craft employees employed by Applicants at the time of the merger. In addition, Applicants project at least 900 well-paid jobs will be created through the increased growth resulting from the transaction. Applicants are proud of the progress they have already made with their labor union partners.

Environment and Safety Benefits. Applicants are engaged with OEA to fulfill the environmental-review process requirements. Combining the UP and NS networks will result in direct environmental benefits by improving the efficiency of existing rail operations and environmental infrastructure management and will reduce pollution by diverting freight truck traffic from the roads. Applicants are also engaged with the FRA to develop a Safety Integration Plan that protects the public and other stakeholders.

Beneficial Cumulative Impacts and Crossover Effects. As Dr. Mark Israel describes in his verified statement, the transaction will continue to benefit customers and the public in the face of changes (whether operational or transactional) that other railroads may implement in response to the merger. Customers are already benefiting from near-term changes that BNSF and CSX have made in response to the mere announcement of the transaction.

Robust Service Assurance Plans and Operational Monitoring. Applicants have taken to heart the Board's concerns about transitional harm during merger

integration. As the Application reflects, Applicants are conducting a detailed and careful integration planning process that will minimize any risk of disruption. The Service Assurance Plan describes the detailed work thus far on key integration areas.

Strong Public Support. Volume 3 of the Application contains more than 2,000 support statements from customers, communities, elected leaders, and other stakeholders who already recognize the public interest benefits of the proposed transaction. Applicants expect that the information in this Application and their ongoing engagement with stakeholders will lead to additional support in the coming months. No doubt some of Applicants' competitors will not be swayed, but the Board rightly is concerned about preserving competition and not competitors' profits.

A transaction that has multiple public benefits and no meaningful harms meets the Board's standards, is "consistent with the public interest," and should be approved. The proposed transaction is an unprecedented opportunity for our country. The merger will create America's first transcontinental railroad, which will transform the nation's supply chain, unleash the strength of American manufacturing, and create new sources of economic growth and workforce opportunity from coast to coast across the United States.

Summary of Transaction
[Section 1180.6(a)(1)(i)]

The proposed transaction involves UPC's acquisition and exercise of control of NSC and its direct and indirect rail carrier subsidiaries.

Acquisition and Merger. UPC, Merger Sub 1 (a direct, wholly owned subsidiary of UPC), Merger Sub 2 (a direct, wholly owned subsidiary of UPC), and NSC are

parties to the Merger Agreement. A copy of the Merger Agreement is contained in Exhibit 2 in Volume 4 of the Application. Upon satisfaction of certain conditions, including approval by the Board, the Merger Agreement calls for UPC to acquire NSC through the merger of Merger Sub 1 with and into NSC, which transaction is referred to as the "First Merger." NSC will survive the First Merger and become a direct, wholly owned subsidiary of UPC. Immediately following the completion of the First Merger, NSC will merge with and into Merger Sub 2, with Merger Sub 2 surviving as a direct, wholly owned subsidiary of UPC, which transaction is referred to as the "Second Merger."

Upon completion of the First Merger, NSC shareholders will be entitled to receive one share of UPC common stock and $88.82 in cash, without interest, for each share of NSC common stock that they hold immediately prior to the completion of the First Merger.

Consolidation of UP and NS Rail Operations. Upon consummation of the proposed transaction, UP and NS rail operations will be consolidated as set forth in the Operating Plan (Exhibit 13 in Volume 2 of the Application), the Service Assurance Plan (in Volume 2 of the Application), and elsewhere in the Application.

Terminal Railroads. As a consequence of the proposed transaction, Applicants will acquire control over two terminal railroads, (a) PPU, which is owned 12.5 percent by UP and 40.64 percent by NS, and (b) TRRA, which is owned 42.84 percent by UP and 14.29 percent by NS. As discussed in the Verified Statement of Katherine N. Novak in this volume of the Application, Applicants intend to divest some of their

ownership shares of PPU and TRRA so the merged company will not permanently have a controlling stake in those entities. Because Applicants may have temporary control of PPU and TRRA before any divestiture can be effected, Applicants are filing applications for these acquisitions of control in Docket No. FD 36873 (Sub-Nos. 1 and 2). Those applications appear in Volume 2 of this Application.

As an additional consequence of the proposed transaction, Applicants will increase to 50 percent their collective ownership of a third terminal railroad, KCT. This change will not give Applicants control of any rail carrier and thus does not require Board authorization.[3]

Atlanta, Georgia 30308
Telephone: (470) 463-6314

The names of counsel to whom questions regarding the proposed transaction can be addressed are shown on the cover of this Application.

Proposed Time Schedule
[Section 1180.6(a)(1)(ii)]

Applicants will consummate the proposed transaction as quickly as possible after the effectiveness of a final decision of the Board authorizing the proposed transaction so UP/NS can begin delivering on the merger's benefits. Full integration of UP and NS rail operations is expected to be completed within three years. Details regarding Applicants' planned timetable for integration are provided in the Service Assurance Plan in Volume 2 of this Application.

Purpose
[Section 1180.6(a)(1)(iii)]

The purpose of the proposed transaction is to create America's first transcontinental railroad, transform the nation's supply chain, unleash the strength of American manufacturing, and create new sources of economic growth and workforce opportunity from coast to coast across the United States.

As discussed in the Verified Statements of Jim Vena, UP's CEO, and Mark George, NS's CEO, the merger will create a safer, more competitive, more efficient railroad that will promote the growth of American businesses and strengthen the country's economy by eliminating the artificial east-west divide in the national railroad network. The merger will provide customers with a more reliable, resilient

supply chain and lower-cost service so that they can compete more effectively in domestic and international markets.

The faster, seamless, single-line service made possible by the merger will produce significant benefits for rail shippers all across the country, particularly those shipping in the nation's heartland, as explained in the Joint Verified Statement of Kenny Rocker and Claude E. "Ed" Elkins in this volume of the Application. The merger will substantially enhance competition between UP/NS and other railroads, and between UP/NS and trucks, as discussed in the separate Verified Statements of Dr. Elizabeth Bailey and Dr. Mark Israel in Volume 2 of the Application.

The many new services and improvements to existing services made possible by the merger will attract new traffic and produce safety and efficiency benefits. Those benefits, as well as the investments that the merged company plans to make to support the anticipated traffic growth and operational changes, are described in the Operating Plan (Exhibit 13) in Volume 2 of the Application, which is verified by Eric Gehringer, UP's Executive Vice President-Operations, and John F. Orr, NS's Executive Vice President and Chief Operating Officer.

As detailed in the Summary of Benefits Exhibit in Appendix B to this volume, total public benefits will be approximately $3.080 billion in a normal year, including $1.982 billion in net revenues from traffic attracted from trucks and other rail carriers, $965 million in operating efficiencies and cost savings, and $133 million in capital savings.

Nature and Amount of Any New Securities or Other Financial Arrangements [Section 1180.6(a)(1)(iv)]

The proposed acquisition of NSC common stock for a combination of UPC common stock and cash pursuant to the Merger Agreement is described in Section 1180.6(a)(1)(i), "Summary of Transaction," above.

Financing of the Proposed Transaction. Under the Merger Agreement, UPC will acquire all of the outstanding stock of NSC in a stock and cash transaction. NSC shareholders will be entitled to receive one share of UPC common stock and $88.82 in cash, without interest, for each share of NSC common stock they hold immediately prior to the completion of the First Merger. In the aggregate, approximately 72.2 percent of the consideration for the proposed transaction will be in the form of UPC stock and 27.8 percent in cash.

UPC will fund the stock portion of the consideration based on a fixed exchange ratio of one share of UPC common stock for one share of NSC common stock. These shares will be issued out of UPC treasury stock.

The cash portion of the consideration, together with all related fees and expenses, is expected to total $20.1 billion. UPC anticipates it will fund this amount through a combination of cash on hand and new debt. UPC expects to raise the new debt through a combination of (a) issuing senior unsecured notes on substantially similar terms to its outstanding unsecured notes, and (b) establishing one or more new credit or other facilities with various banks or other parties and/or certain existing credit facilities.

The new debt described above will add modestly to UPC's fixed charges. As reflected in the pro forma financial statements (Exhibits 16, 17, and 18 in Appendices B, C, and D to this Volume), UPC will have no difficulty with absorbing these additional fixed charges.

Fairness Determination. The terms under which UPC will acquire all of NSC's common stock are fair to the shareholders of UPC and NSC, and Applicants ask the Board to so find. *See Schwabacher v. Union States*, 334 U.S. 192 (1948); *Zatz v. United States*, 149 F.3d 144 (2d Cir. 1998).

The fairness of these terms to UPC's shareholders was considered by financial advisors to UPC who provided fairness opinions to the UPC Board of Directors in conjunction with the proposed transaction. Those fairness opinions from Wells Fargo Securities, LLC, and Morgan Stanley & Co. LLC, are attached to the Verified Statement of David DeNunzio and the Verified Statement of Kristin Lindia, respectively, in this volume of the Application. The fairness of these terms to NSC's shareholders was considered by NSC's financial advisor BofA Securities, Inc., which provided a fairness opinion to the NSC Board of Directors. That fairness opinion is attached to the Verified Statement of Michael Ruflin in this volume of the Application.

Public Interest Justifications
[Section 1180.6(a)(2)]

The proposed transaction, which is supported by over 2,000 parties, is clearly in the public interest. As described in the Summary of Benefits Exhibit attached as Exhibit B to this volume of the Application, quantified public benefits will be in excess

of $3.080 billion per year in 2023 dollars. The merger will also generate tremendous unquantifiable public benefits.

The merger will greatly intensify competition among railroads and competition between railroads and trucks, expand and improve rail transportation service and customer access to markets, create a more accessible, sustainable, and lower-cost supply chain option for reliable shipping of key goods ranging from food products to petroleum products to building materials, increase transportation safety, strengthen the national defense, and promote job growth and economic expansion across the United States. The merger's quantified and unquantified public benefits are addressed in more detail throughout the Application.

Effects on Competition
[Section 1180.6(a)(2)(i)]

The combination of UP and NS is an end-to-end merger that brings together two complementary rail networks. As a merger of complements, the proposed transaction will generate significant efficiencies and benefits that, without common control, would be otherwise unattainable—including safer, faster, more reliable single-line rail service for shippers between points in the eastern and western United States that today can be served only by interline rail service. The combined company will also compete more effectively with trucks and other Class I railroads, offering customers more and better choices and improved access to domestic and international markets. For example, Applicants expect substantial growth of rail traffic in "watershed" regions in the middle of the country, where the relative time and costs of rail interchange often leave manufacturers and businesses with no current viable

alternative to truck transportation. In this region underserved by rail, the merger is expected to divert truck traffic to new single-line rail service, which will offer customers a new, lower-cost transportation option and new opportunities to compete and grow.

Applicants have also determined that all but three of their shared customer facilities will continue to have access to a Class I railroad other than the merged railroad after the proposed transaction closes. In her Verified Statement in this volume of the Application, Katherine Novak identifies those facilities and confirms Applicants' commitment to ensure that they will have access to a Class I railroad other than UP/NS after the merger.

The Application also addresses the potential competitive impacts of the proposed transaction at a higher level. Dr. Elizabeth Bailey, in her Verified Statement in Volume 2 of the Application, analyzes the horizontal competitive effects of the proposed transaction, with a particular focus on competition at origins and destinations within corridors, as well as geographic cross-corridor competition. She also describes the merger's pro-competitive benefits. Dr. Bailey concludes that the substantial competitive benefits and greater economic efficiency that are expected to result from the transaction outweigh the limited potential horizontal anticompetitive effects. Dr. Mark Israel, in his Verified Statement in Volume 2 of the Application, discusses the pro-competitive benefits of end-to-end mergers, including those specific to this proposed transaction. Dr. Israel explains why the proposed transaction poses

no risk of competitive harm to any customer that might elect to use interline service involving UP/NS rather than single-line service provided by UP/NS.

To remove any doubt that the merger does not pose a risk of competitive harm, Applicants are making specific commitments to address potential concerns relating to build-ins and build-outs, gateway foreclosure, and the creation of new bottlenecks. Those commitments are discussed below in Section 1180.6(b)(10), "Conditions to Mitigate and Offset Merger-Related Harms," and addressed in the Joint Verified Statement of Kenny Rocker and Claude E. "Ed" Elkins.

Additionally, although the proposed transaction would not have "an adverse effect on competition among rail carriers," 49 U.S.C. § 11324(b)(5), but rather would substantially enhance competition with other rail carriers and trucks, to address the Board's policy statement regarding competitive enhancements, which encourages applicants to propose special competitive enhancements "to improve the prospect that their proposal [will] be found to be in the public interest," 49 C.F.R. § 1180.1(d), Applicants are proposing a framework called Committed Gateway Pricing. As described in the Verified Statement of Katherine Novak, Committed Gateway Pricing is a means of sharing the merger's benefits with customers shipping traffic on routes that would otherwise not directly benefit from the merger's new single-line service. Dr. Israel's verified statement addresses the pro-competitive benefits of Competitive Gateway Pricing.

Financial Considerations; Traffic, Revenues, and Earnings Increases; Operating Economies [Section 1180.6(a)(2)(ii)]

Financial Consideration. See Section 1180.6(a)(1)(iv), "Nature and Amount of Any New Securities or Other Financial Arrangements," above.

Increases in Traffic, Revenues, and Earnings. As shown in the Summary of Benefits Exhibit in Appendix B to this volume of the Application, Applicants project annual benefits, in a normal year, of approximately $3.080 billion in 2023 dollars as a result of new traffic ($1.982 billion), efficiencies and cost reductions ($965 million), and capital savings ($133 million).

The figure of $1.982 billion for additional net earnings from new traffic reflects gross revenues from the traffic less the costs of handling it. Additional traffic would be attracted to the merged system by its faster, more reliable service that will enhance competition not only with other railroads but also with trucks. Applicants' projections are based on the Joint Verified Statement of David Hunt and Matthew Schabas of Oliver Wyman, who analyzed the traffic that would be attracted from other railroads and trucks through expanded single-line service and new train services and the associated revenue. The anticipated traffic gains and revenues associated with the traffic are described in their Joint Verified Statement in Volume 2 of the Application. Michael Boyles, an independent transportation industry expert, and Dr. Divya Mathur of Analysis Group calculated the costs associated with handling the added traffic. Their calculations are described in their Joint Verified Statement in this volume of the Application.

Economies to be Effected in Operations. As noted above, Applicants expect that the proposed transaction will result in $965 million in annual gains from efficiencies and cost reductions. Operating changes and related cost savings initiatives are expected to yield annual operating expense savings of $767 million. The steps that will be taken to consolidate and coordinate the operations of UP and NS and produce these costs savings are set forth in the Operating Plan (Exhibit 13) in Volume 2 of the Application and quantified in the Verified Statement of Grant Janke and the Joint Verified Statement of Michael Boyles and Dr. Divya Mathur in this volume of the Application. Applicants also expect to achieve $198 million in economies in the performance of administrative functions. These savings are described in the Verified Statement of Grant Janke included in this volume of the Application.

Applicants expect to incur one-time expenditures to expand the capacity of the UP/NS network and to realize some of the economies described above. These projected expenditures are described in the Operating Plan and in the Verified Statement of Grant Janke. The amount and timing of these one-time expenditures and of the benefits described above are reflected in the Summary of Benefits Exhibit and in the pro forma financial statements, included in this volume of the Application as Exhibits 16, 17, and 18.

Effect of Increase in Total on Fixed Charges
[Section 1180.6(a)(2)(iii)]

With respect to the effect on fixed charges of borrowings in connection with UPC's acquisition of NSC stock, see Section 1180.6(a)(1)(v), "Nature and Amount of Any New Securities or Other Financial Arrangements," above.

The consolidation of UP and NS operations will require capital expenditures for various purposes, including, among other things, increasing capacity of certain lines and yards. Applicants expect to invest approximately $2 billion to implement the proposed transaction, primarily to add and extend sidings and expand intermodal terminals. These investments will allow Applicants to accommodate the traffic attracted to the merged system by their seamless, single-line service offerings. The increase in net traffic revenues and the efficiencies that will be realized by the merged system will offset the costs of these investments, and the merged system will have no difficulty in financing them, as reflected in the pro forma financial statements included as Exhibits 16, 17, and 18 in this volume of the Application.

Effect on Adequacy of Transportation
[Section 1180.6(a)(2)(iv)]

The proposed transaction will unite a western railroad with an eastern railroad to establish America's first transcontinental railroad. As described in Applicants' Operating Plan (Exhibit 13) in Volume 2 of the Application, the end-to-end combination will create a safer, more competitive, more efficient railroad that will promote the growth of American businesses and strengthen the nation's economy. The combined UP/NS network will provide seamless single-line service from coast to coast, connecting major metropolitan areas and approximately 100 ports in the United States. The merger will eliminate interchanges between UP and NS at gateways between Chicago and New Orleans and reduce handlings of rail cars operating across the combined network, allowing the merged company to provide faster, more reliable service. Customers shipping nearly every major commodity will

benefit from these service improvements. Applicants expect to attract additional traffic that UP/NS will serve by optimizing existing train and blocking plans and offering new train services that take advantage of service and efficiency made possible by the merger.

Single-Line Service. Single-line rail service provides significant benefits to rail shippers. When freight moves from origin to destination on one integrated network, customers experience faster transit times, greater reliability, and thus lower total logistics costs. By contrast, interline movements necessarily involve multiple carriers with differing priorities and divided accountability, which can produce delays and frustration for shippers. From a customer perspective, single-line service presents one accountable carrier with one schedule and one standard of service. UP/NS's transcontinental single-line service, by offering the responsiveness of one-stop shopping and unified commercial terms, will foster stronger competition with trucking and other railroads and will result in substantial growth for the combined railroad.

New and Improved Routes. UP/NS will combine UP and NS routes to create new, more efficient through routes and provide faster, more reliable service. For example, UP/NS will combine UP's efficient route from Southern California to Kansas City with NS's efficient route from Kansas City to the Northeast to save approximately 17 hours of transit time on traffic moving from Southern California to the Ohio Valley, Pennsylvania, and New Jersey and approximately 19 hours on trains moving in the opposite direction. UP/NS will save approximately 70 hours of transit

time on traffic moving from Southern and Northern California to the Southeast, including Georgia, Florida, and North Carolina, and approximately 95 hours on traffic moving in the opposite direction by routing traffic via Shreveport and Meridian rather than via Memphis.

UP/NS will also implement new train and blocking plans that allow manifest traffic, including traffic moving to and from customers in watershed markets, to move faster and more reliably with fewer handlings. For example, UP/NS will operate a new train for traffic moving from the legacy UP's network west of North Platte to the Ohio Valley and Northeast that will operate continuously through the Chicago terminal area without interchanging. UP/NS will also introduce new trains to provide truck-competitive service in watershed markets. For example, UP/NS will operate a new train for traffic moving from Texas, Louisiana, and Arkansas to Michigan, Ohio, Pennsylvania, and New Jersey. UP/NS will also introduce new trains for traffic moving between Texas, Louisiana, Arkansas, and western points on the legacy UP system, and Kentucky, Alabama, Tennessee, and northeastern and southeastern points on legacy NS system.

Better Equipment Utilization and Availability. UP/NS will make more efficient use of the combined company's equipment by eliminating handlings and shifting traffic to different routes, which will allow traffic to move faster, to the ultimate benefit of customers and the public. By improving cycle times, the merged system will get more use out of all its rail cars—the equivalent of acquiring a larger fleet. Customers with their own fleets will also benefit because improved cycle times will

allow them to improve equipment utilization and ship the same volume with fewer cars.

Increased Capacity and Other Investments. Applicants plan to make substantial investments in new capacity to accommodate new traffic that they project will be attracted to the combined company through the service improvements described above. The planned investments include spending to add double track to portions of UP's line between Southern California and El Paso, upgrade NS's line between Kansas City and Butler, and add sidings on UP's line between El Paso and Kansas City and NS's line between New Orleans and Atlanta, as well as spending to expand many yards and terminals in which activity is projected to increase as traffic grows. Combining UP and NS will allow the merged company to target its future capital spending more efficiently, ensuring each marginal dollar of capital is used in the way that yields far more in terms of capacity and efficiency than when the separate companies are planning based on their separate priorities.

Improved Safety. UP and NS share a deep-rooted commitment to safety as a core value. Following the merger, UP/NS will continue to prioritize safety at the highest level as it works to develop a new, even higher standard for safety in North American freight rail.

Effect on Employees
[Section 1180.6(a)(2)(v)]

As required by Board rules, Applicants have estimated the effect of the proposed transaction on their employees for three years after consolidation. UP and NS teams collaborated on a comprehensive review of all positions to evaluate the

impact. This integration is being approached thoughtfully and deliberately, with a measured plan designed to maintain safety, stability, operational continuity, and strong customer service. Applicants' estimates are preliminary and will be refined as planning advances and additional information becomes available. While the proposed transaction is pending and throughout the three-year integration period, Applicants will continue to update plans to ensure a smooth transition.

Omaha will serve as the headquarters for the combined company. Atlanta will continue to serve as a regional operating center with a strong commercial presence and remain a vital hub for technology and innovation. Consistent with the Applicants' deliberate integration approach, most adjustments will involve management positions in general and administrative functions at NS's Atlanta headquarters, driven by operational synergies and the elimination of overlapping positions. These changes will be phased over three years to maintain stability, minimize disruption, and leverage natural attrition. Applicants remain committed to supporting employees throughout this process by exploring alternative opportunities wherever possible.

Applicants are committed to preserving job opportunities for all union represented employees working at both UP and NS immediately prior to the control date. Applicants will work collaboratively to facilitate transitions and redeployments where necessary to achieve the benefits of the proposed transaction.

Applicants' specific estimates are addressed in the Employee Impact Exhibit in Electronic Appendices A and B of the Application and the Verified Statements of

Joshua Perkes (for management employees) and Maqui Parkerson (for craft employees), which are contained in this volume of the Application.

As explained in the Perkes and Parkerson Verified Statements, Applicants anticipate that the proposed transaction will be subject to the employee-protective conditions for union represented employees adopted in *New York Dock—Control—Brooklyn Eastern District Terminal*, 360 I.C.C. 60 (1979). In addition, Applicants will honor the obligations established in the so-called "cramdown" agreements reached in 2000 and 2001 with certain labor organizations that represent certain classes of union-represented employees of UP and NS.

Applicants have not yet reached implementing agreements with unions representing UP and NS employees, but they have begun preliminary conversations with unions about the transaction. UP has entered into a preliminary agreement guaranteeing that members of the International Association of Sheet Metal, Air, Rail and Transportation Workers – Transportation Division, the nation's largest railroad union, will have job protection for the length of their careers following the transaction, subject to the usual requirements for continued employment. UP has entered into similar agreements with the Brotherhood of Railroad Carmen, International Brotherhood of Boilermakers, National Conference of Firemen and Oilers, and United Supervisors Council of America. UP looks forward to working with all the labor organizations that represent UP and NS employees to reach implementing agreements necessary to realize the benefits of the transaction.

Effect of Inclusion of Other Railroads
[Section 1180.6(a)(2)(vi)]

Applicants do not contemplate inclusion of other railroads in the proposed transaction. As shown in the Joint Verified Statement of David Hunt and Matthew Schabas and in the Operating Plan (Exhibit 13) in Volume 2 of the Application, (i) the proposed transaction will not cause the loss of any essential rail service, and (ii) inclusion of other rail carriers would interfere with achievement of the benefits of the proposed transaction, contrary to the public interest.

Other Supporting Statements
[Section 1180.6(a)(3)]

This Application is supported by the statements of Jim Vena, UPC's CEO, Mark R. George, NSC's President and CEO, Kenny Rocker, UP's Executive Vice President, Marketing & Sales, Claude E. "Ed" Elkins, NS's Executive Vice President and Chief Commercial Officer, and the statements of several other UPC and NSC employees. These statements are in Volumes 1 and 2 of this Application.

This Application is also supported by expert witnesses addressing (i) the competitive effects of the proposed transaction (Dr. Elizabeth Bailey of Charles River Associates and Dr. Mark Israel of Econic Partners), (ii) the estimated traffic diversions from other railroads and trucks that the proposed transaction will achieve (David Hunt and Matthew Schabas of Oliver Wyman), and (iii) the cost savings flowing from operating efficiencies (Dr. Divya Mathur of Analysis Group and Michael Boyles). In addition, Gaurav Dua, a Principal in the EY Parthenon practice at Ernst

& Young LLP addresses Applicants' planning for the integration of UP and NS. These statements are in Volumes 1 and 2 of this Application.

In addition, more than 2,000 shippers, smaller railroads, ports, public officials, labor unions, and other rail industry stakeholders have submitted statements supporting the UP/NS combination. Volume 3 contains these statements.

Opinions of Counsel
[Section 1180.6(a)(4)]

The opinions of Applicants' counsel that the transactions described in this Application, including the primary docket and related sub-dockets, satisfy the requirements of law and will be legally authorized and valid if approved by the Board appear at the end of the narrative in this volume of the Application, after the Prayer for Relief.

Lists of States
[Section 1180.6(a)(5)]

The following are the states in which any part of the rail property of each Applicant carrier is situated.[4]

[4] Consistent with agency practice and precedent, this list includes the states where applicant carriers operate. The list does not include Washington, DC. The list also does not include states where applicant carriers may own non-rail property or states where non-applicant carriers such as Pan Am Southern operate but NS does not (Connecticut, Massachusetts, and Vermont). NS notes that it has interests relating to the Wylie Intermodal Terminal in Wylie, Texas, but NS does not operate in Texas. NS does operate on approximately three miles of trackage rights in Kansas.

Union Pacific	Norfolk Southern
Arizona	Alabama
Arkansas	Delaware
California	Florida
Colorado	Georgia
Idaho	Illinois
Illinois	Indiana
Iowa	Iowa
Kansas	Kentucky
Louisiana	Louisiana
Minnesota	Maryland
Missouri	Michigan
Montana	Mississippi
Nebraska	Missouri
Nevada	New York
New Mexico	New Jersey
Oklahoma	North Carolina
Oregon	Ohio
Tennessee	Pennsylvania
Texas	South Carolina
Utah	Tennessee
Washington	Virginia
Wisconsin	West Virginia
Wyoming	

Map – Exhibit 1
[Section 1180.6(a)(6)]

Exhibit 1 (set forth in Appendix A in this volume of the Application) contains a map indicating in separate colors the lines of Applicant carriers in their true relations to each other, short line connections, other rail lines in the territory, and the principal geographic points in the region traversed.

Applicants' workpapers also include a Geospatial Information System ("GIS") data set reflecting the same information.

Nature and Terms of Proposed Transaction
[Section 1180.6(a)(7)(i)]

The proposed transaction involves the acquisition by UPC of control of NSC and its rail carrier subsidiaries and integration of those rail carriers into the UP/NS rail network. The significant terms of UPC's acquisition of NSC are described in Section 1180.6(a)(1)(i), "Summary of Transaction," above.

Agreement – Exhibit 2
[Section 1180.6(a)(7)(ii)]

A copy of the Merger Agreement is contained in Exhibit 2 in Volume 4 of this Application.

Description of Resulting Company
[Section 1180.6(a)(7)(iii)]

Under the Merger Agreement, Merger Sub 1, a direct, wholly owned subsidiary of UPC, would legally be merged with and into NSC with NSC continuing as the surviving corporation and a direct, wholly owned subsidiary of UPC. Following the merger of Merger Sub 1 with and into NSC, NSC would legally be merged with and into Merger Sub 2, a direct, wholly owned subsidiary of UPC, with Merger Sub 2 continuing as the surviving corporation as a direct, wholly owned subsidiary of UPC. *See* Section 1180.6(a)(1)(i), "Summary of Transaction," for a more detailed description of the proposed transaction.

Following the proposed transaction, all of UPC's and NSC's U.S. railroad affiliates would be controlled by UPC. UPC was incorporated in 1969 under the Utah

Business Corporation Act, and both Merger Sub 1 and Merger Sub 2 were incorporated and formed, respectively, in 2025 under the Virginia Stock Corporation Act and the Virginia Limited Liability Company Act, respectively. The capitalization proposed for the resulting company and the amount and character of capital stock and other securities to be issued are addressed in Section 1180.6(a)(1)(iv), "Nature and Amount of Any New Securities or Other Financial Arrangements," and Section 1180.6(a)(2)(iii), "Effect of Increase in Total Fixed Charges."

Court Order – Exhibit 3
[Section 1180.6(a)(7)(iv)]

Not applicable. No Applicant is a trustee, receiver, assignee, or personal representative of a real party in interest.

Property Included in Proposed Transaction
[Section 1180.6(a)(7)(v)]

The property involved in the proposed transaction includes all the property of the Applicant carriers. Specifically, the proposed transaction involves the purchase by UPC of the common stock of NSC and consolidation of all of the rail operations of UP and NS.

Description of Principal Routes
[Section 1180.6(a)(7)(vi)]

A brief description of the principal routes of UP and NS follows. The map in Exhibit 1 and the GIS map files provided in Applicants' workpapers show the principal points of interchange on each of the Applicant railroads.

Union Pacific

UP operates approximately 32,880 miles of railroad in the western two-thirds of the United States. Union Pacific has eight principal routes. Three routes are anchored in Chicago and include UP's main line between Chicago and Granger, Wyoming, before branching to the ports and terminals of Seattle and Portland in the Pacific Northwest; Oakland in Northern California; and Los Angeles in Southern California. UP also has three routes anchored in Los Angeles that include UP's main line between Los Angeles and El Paso, Texas, before branching to Chicago via Kansas City and St. Louis; Memphis via Central Texas and Shreveport; and New Orleans via South Texas. UP also has a route between border crossings in Mexico and Chicago via Memphis and St. Louis, and a route between Seattle and Los Angeles.

UP also has secondary routes between Denver and Salt Lake City, Denver and Kansas City, and between Minnesota/Iowa and Texas. UP also has a network of feeder lines in Northern Iowa, Minnesota, and Wisconsin, and feeder lines in Idaho and Montana, including a line to the Canadian border at Eastport, Idaho.

Norfolk Southern

NS operates approximately 19,200 route miles in 22 eastern states and the District of Columbia. Four principal routes are the core of NS's network. The first three routes form a triangle covering the eastern United States. These three routes run between Chicago and Atlanta; Atlanta/Chattanooga and the Northeast; and the Northeast and Chicago. The fourth route runs from Chicago to Norfolk, Virginia. NS also serves several gateways that connect to these core routes, such as Kansas City

and St. Louis; Memphis; Meridian and New Orleans; Jacksonville; and New England. Finally, NS has feeder routes that serve significant origins or destinations such as Birmingham and Mobile and the Southeast to Charleston and Savannah.

Governmental Assistance
[Section 1180.6(a)(7)(vii)]

No governmental financial assistance is contemplated in the proposed transaction.

Environmental Data – Exhibit 4
[Section 1180.6(a)(8)]

Section 1180.6(a)(8) of the Board's regulations addresses the submission of environmental information and data, prepared in consultation with OEA. The Board's National Environmental Policy Act regulations "encourage the use of third-party consultants" to assist in the analysis of environmental impacts and mitigation strategies. 49 C.F.R. § 1105.10(d).

Consistent with these regulations, on August 28, 2025, OEA selected and approved a third-party consultant, Vanasse Hangen Brustlin, Inc., to support OEA's environmental review and drafting of the Environmental Impact Statement. As a result, Applicants need not prepare the "environmental report" referenced in Section 1180.6(a)(8). Applicants have been working with OEA to fulfill the environmental-review process's requirements and will continue to promptly respond to OEA's requests and answer its questions.

With respect to historic preservation requirements, the proposed transaction will not "result in the lease, transfer, or sale of a railroad's line, sites or structures,"

so a Historic Report is not required under the Board's regulations. 49 C.F.R. § 1105.8(a). Moreover, there are no plans to dispose of or alter properties that are 50 years old or older as a result of the proposed transaction. 49 C.F.R. § 1105.8(b)(1). Applicants are committed to working with OEA to address any historic preservation issues and processes and to ensure compliance with the National Historic Preservation Act.

The proposed transaction is also expected to have substantial environmental benefits. These benefits are described and documented in the Verified Statement of Matthew Graham, as well as in the information that Applicants are submitting to OEA as part of the environmental-review process.

Form 10-Ks – Exhibit 6
[Section 1180.6(b)(1)]

Applicants' most recent Form 10-Ks filed with the SEC under 17 C.F.R. § 249.310 made within the year prior to the filing of the Application are submitted as Exhibit 6 in Volume 4 of the Application. Applicants will update the Application with any Form 10-K subsequently filed with the SEC during the pendency of the proceeding.

Form S-4s – Exhibit 7
[Section 1180.6(b)(2)]

Applicants' most recent Form S-4s filed with the SEC under 17 C.F.R. § 239.25 made within the year prior to the filing of the Application are submitted as Exhibit 7 in Volume 4 of the Application. UPC filed one Form S-4 with the SEC within the year prior to the filing of the Application, which was made in connection with the proposed

transaction, and one amendment thereto. NSC did not file a Form S-4 with the SEC within the year prior to the filing of the Application. Applicants will update the Application with any Form S-4 subsequently filed with the SEC during the pendency of the proceeding.

Change in Control – Exhibit 8
[Section 1180.6(b)(3)]

There have been no changes in ownership or control of UP or NS since their most recent form R-1, for 2024. Exhibit 8 (in Appendix C of this Volume) identifies the principal officers of UPC, UP, NSC, NS, and their majority-owned rail carrier subsidiaries.

Annual Reports – Exhibit 9
[Section 1180.6(b)(4)]

Applicants are submitting as Exhibit 9 in Volume 4 of the Application the two most recent annual reports to stockholders for each of the Applicants that has public shareholders. Table 1 below describes the content of Exhibit 9. As reflected in the Table, UPC did not produce annual reports that were separate from its Form 10-K during the relevant period. Applicants will update Exhibit 9 with any annual or quarterly report to stockholders issued over the duration of the proceeding.

Table 1

UP Applicants			
	U.S. Rail Carrier?	*Has Public Shareholders?*	*Annual Reports Submitted with Application*
UPC	No	Yes	Form 10-K (Exhibit 9.1). Filed with the SEC on February 7, 2025. Form 10-K (Exhibit 9.2). Filed with the SEC on February 9, 2024.
UP	Yes	No	N/A

NS Applicants			
	U.S. Rail Carrier?	*Has Public Shareholders?*	*Annual Reports Submitted with Application*
NSC	No	Yes	2024 Annual Report (Exhibit 9.3). Filed with the SEC on March 28, 2025. 2023 Annual Report (Exhibit 9.4). Filed with the SEC on March 20, 2024.
NS	Yes	No	N/A

Relevant Issues – Exhibit 10
[Section 1180.6(b)(5)]

The issues relevant to the proposed transaction, in Applicants' opinion, are:

1. The effect of the proposed transaction on competition among railroads and between railroads and trucks.

2. The effect of the proposed transaction on the adequacy of rail transportation service to the public.

3. The effect of the proposed transaction on the efficiency with which rail services are provided.

4. The effect of the proposed transaction on improving rail service and expanding access to domestic and international markets.

5. The effect of the proposed transaction on promoting economic growth and job opportunities.

6. The effect of the proposed transaction on strengthening America's national defense and infrastructure.

These issues are addressed throughout the Application.

Corporate Charts – Exhibit 11
[Section 1180.6(b)(6)]

Corporate charts for Applicants are set forth in Appendix D of this volume of the Application. The charts reflect the relationships between Applicants and the other affiliates and subsidiaries of UPC and UP and NSC and NS, respectively, including companies controlling Applicant carriers directly, indirectly, or through another entity.

Statement of Common Officers and Directors

Tables 7 and 8 (in Appendix D of this Volume) identify the entities on Applicants' corporate charts that have officers and directors who are officers or directors of any other company that is part of a different corporate family that includes a rail carrier.

Carrier Status List

The carrier or non-carrier status of the entities reflected on Applicants' corporate charts is set forth in Tables 9 and 10 (in Appendix D of this Volume).

Information on Non-Carrier Applicants
[Section 1180.6(b)(7)]

Among the Applicants, two are not U.S. rail carriers: UPC and NSC.

UPC is a holding company formed under the laws of the State of Utah on February 3, 1969 and headquartered in Omaha, Nebraska. UPC provides freight transportation services in the United States through its direct and indirect wholly owned subsidiaries, including UP, and various affiliates.

NSC is a holding company formed under the laws of the Commonwealth of Virginia on July 23, 1980, and headquartered in Atlanta, Georgia. NSC provides freight transportation services in the United States through its direct and indirect wholly owned subsidiaries, including NS, and various affiliates.

Statement of Direct and Indirect Intercorporate or Financial Relationships
[Section 1180.6(b)(8)]

All known direct and indirect intercorporate or financial relationships in which Applicants or their affiliates own or control more than 5 percent of the stock of a non-affiliated carrier are set forth in Exhibit 11 (in Appendix D of this Volume).

Employee Impact Exhibit
[Section 1180.6(b)(9)]

The Employee Impact Exhibit is provided in Electronic Appendices A and B of the Application.

Conditions to Mitigate and Offset Merger-Related Harms
[Section 1180.6(b)(10)]

The Board's major merger rules and precedent provide that the Board "will not impose conditions that undermine or defeat beneficial transactions by creating

unreasonable operating, financial, or other problems for the combined carrier." 49 C.F.R. § 1180.1(d). Moreover, "[c]onditions are generally not appropriate to compensate parties who may be disadvantaged by increased competition." *Id*. Applicants are making a number of commitments that will mitigate and offset potential merger-related harms.

Applicants commit to ensure that shipper facilities served by UP and NS and no other Class I railroad before the proposed transaction closes will have access to a Class I railroad other than UP/NS after the merger. There are only three such facilities. This commitment is addressed in the Verified Statement of Katherine Novak in this volume of the Application.

Applicants also commit to keeping all existing gateways open for eligible traffic on commercially reasonable terms. UP/NS will provide written justification to customers for any interline rate increases that exceed inflation upon request, and will not argue that the open gateway commitment is inapplicable to traffic due to lack of market dominance or low revenue-variable cost percentages. UP/NS will also commit to gateway reporting analogous to that imposed as a condition in Docket No. FD 36500. Further, UP/NS will preserve competitive options involving the use of build-outs or build-ins and will not create new regulatory bottlenecks that could limit customer access to rate relief through the Board. Applicants are also proposing an optional arbitration process for addressing any merger-related service problems. Further details on these commitments are provided in the Joint Verified Statement of Kenny Rocker and Claude E. "Ed" Elkins in this volume of the Application.

In addition, Applicants are proposing a framework called Committed Gateway Pricing to enhance competition by sharing the transaction's benefits with customers shipping traffic on routes that otherwise would not directly benefit from the merger's single-line service. The details of Committed Gateway Pricing addressed in the Verified Statement of Katherine Novak in this volume of the Application and the Verified Statement of Dr. Mark Israel in Volume 2 of this Application.

Calculation of Public Benefits
[Section 1180.6(b)(11)]

Applicants have estimated the quantifiable net public benefits the merger would generate and provide that information in the Summary of Benefits Exhibit, which is Appendix B in this volume of the Application.

The development of the Summary of Benefits Exhibit is discussed in the Verified Statement of Grant Janke in this volume of the Application. Applicants explain why the extensive quantifiable and unquantifiable public benefits of the proposed transaction could not be achieved by actions short of a merger throughout the Application, including in the Joint Verified Statement of Kenny Rocker and Claude E. "Ed" Elkins in this volume of the Application, and in the Joint Verified Statement of Eric Gehringer and John F. Orr and the Verified Statement of Dr. Mark Israel, both of which are in Volume 2 of the Application.

Applicants explain why the proposed transaction is expected to result in substantial competitive benefits and greater economic efficiency throughout the Application, including in the Verified Statement of Dr. Elizabeth Bailey and the Verified Statement of Dr. Mark Israel, as well as the Joint Verified Statement of Eric

Gehringer and John F. Orr and Applicants' detailed Service Assurance Plan, which show the merger will enhance service. The Verified Statement of Katherine Novak addresses measures the Board might take if the anticipated public benefits fail to materialize in a timely manner in this volume of the Application.

Downstream Merger Applications
[Section 1180.6(b)(12)]

The Board's major merger rules now require Applicants to "anticipate whether additional Class I mergers are likely to be proposed in response to their own proposal and explain how, taken together, these mergers, if approved, could affect the eventual structure of the industry and the public interest." 49 C.F.R. § 1180.6(b)(12)(i). However, the Board's rules do not require applicants to present a quantitative analysis of public benefits in light of future transactions or alternative merger benefit calculations based on speculative alternative possible responses that could be filed by various carriers. *See Major Rail Consolidation Procedures*, 5 S.T.B. 539, 582 (2001). Rather, applicants are directed to discuss: (1) how the structure of the industry could change if their transaction and additional Class I mergers that may follow in response to this application were approved; (2) whether such a structure would be consistent with the public interest; and (3) whether any conditions imposed by the Board on the applicants' transaction would have to be altered, or any new conditions imposed, if the Board should approve additional future rail mergers. *See id.*; 49 C.F.R. § 1180.6(b)(12)(i)–(ii). The intent of the rules "is simply to require applicants to initiate a commentary, to which other parties could respond." *Major Rail*

Consolidation Procedures, 5 S.T.B. at 539. Applicants discuss each element in turn below.

First, Applicants cannot predict whether other Class I railroads may choose to pursue mergers in the future. While Applicants recognize there has been some speculation about a BNSF-CSX combination to create a second transcontinental railroad in the United States, Applicants cannot assess whether such a combination is "likely" within the meaning of § 1180.6(b)(12). On the one hand, the substantial public benefits that can be unlocked through creating a U.S. transcontinental railroad that can provide better service without artificial interchange barriers could be a reason for BNSF and CSX to consider creating a rival transcontinental railroad. On the other hand, BNSF's parent company indicated in recent public statements that it is not interested in pursuing a merger. Moreover, Applicants' gateway commitment will ensure that BNSF and CSX, as well as CN and CPKC, could continue competing effectively with UP/NS if they remain as independent companies.

Second, Applicants believe that even if there were a responsive merger, it would not diminish the substantial public benefits of the proposed transaction. Additional Class I mergers are not likely to result in any harm if: (i) they are essentially end-to-end like the combination of UP and NS; (ii) the merging railroads agree to standard competition-protecting conditions like Applicants' gateway commitment; and (iii) the merging railroads plan for integration with the same level of careful planning that Applicants have. The Verified Statement of Dr. Mark Israel, in Volume 2 of this Application, discusses the public benefits of these kinds of vertical

mergers in detail and then describes the public interest implications of a theoretical second Class I merger of complementary networks.

Finally, Applicants do not believe that any of the conditions the Board may impose on their transaction would need to be altered, or that any new conditions would need to be imposed on the proposed transaction, in the event that the Board were to approve additional future rail mergers. The proposed transaction involves end-to-end combination of complementary networks. Its public benefits—expanded single-line service, improved reliability, and more efficient operations—therefore do not depend on the status of other Class I combinations. If subsequent mergers similarly involve end-to-end networks and are subject to standard competition-protecting conditions such as gateway commitments, they would not undermine the benefits of this transaction or necessitate additional safeguards. To the contrary, if other railroads respond to the competitive pressures generated by this merger by forming a second, more efficient transcontinental railroad that also offers broader single-line service, unlocking even more growth in the watershed markets, the result would simply be an American rail network with two stronger, more efficient transcontinental carriers—an outcome fully aligned with the public interest.

Purpose of the Proposed Transaction
[Section 1180.6(b)(13)]

The purpose of the proposed transaction is addressed above in Section 1180.6(a)(1)(iii), "Purpose" in this volume of the Application.

Market Impact Analyses – Exhibit 12
[Section 1180.7]

Analyses of market impacts are provided in the following:

1. The Verified Statements of Jim Vena (UP's CEO) and Mark George (NS's CEO) discuss how the merger will create a more competitive, more efficient railroad that will promote the growth of American businesses and strengthen the country's economy by eliminating an artificial east-west divide in the national railroad network and by increasing the ability of American businesses to export through ports. They describe how the merger will provide customers with a more reliable, resilient supply chain and lower-cost service so they can compete more effectively in domestic and international markets.

2. The Joint Verified Statement of Kenny Rocker (UP's Executive Vice President, Marketing & Sales) and Claude E. "Ed" Elkins (NS's Executive Vice President and Chief Commercial Officer) describes how the merger will provide significant benefits for rail shippers across the country, particularly those shipping in the nation's heartland. They explain how the proposed transaction will increase competition and benefit particular commodity sectors, including the underserved watershed markets.

3. The Joint Verified Statement of David Hunt and Matthew Schabas at Oliver Wyman presents the results of their comprehensive analysis of the potential for the new transcontinental railroad to attract traffic from trucks (truck-to-rail diversions) and from other railroads (rail-to-rail diversions) as a result of the proposed combination. The statement shows that new, more efficient single-line

routes with fewer handlings will attract substantial volumes of rail traffic from trucks and other railroads, including traffic moving to, from, and within watershed markets.

4. The Verified Statement of Dr. Elizabeth Bailey of Charles River Associates analyzes the horizontal competitive effects of the proposed transaction and addresses the anticipated impacts on traffic patterns and available shipping alternatives. She provides estimates of projected shares of revenue and traffic volume by corridor and commodity group, with a particular focus on points that would now be served by one railroad instead of two, or two railroads instead of three. Dr. Bailey's statement highlights the benefits of single-line service, and explains why the substantial procompetitive benefits and greater economic efficiency expected to result from the transaction outweigh the limited potential horizontal anticompetitive effects.

5. The Verified Statement of Katherine N. Novak (UP's General Director of Interline Operations) describes Applicants' Committed Gateway Pricing proposal, which would enhance competition by expanding the merger's benefits to certain customers shipping traffic on routes that otherwise would not directly benefit from the merger's new single-line service.

6. The Verified Statement of Dr. Mark Israel, Founding Partner of Econic Partners, describes the procompetitive benefits of the merger, including how the proposed transaction will enhance competition in the rail industry, create downward pressure on price relative to the statement of the world that would exist absent the merger, and benefit shippers in the form of greater investment, higher quality

service, and a more efficient rail network. Dr. Israel's statement explains why Applicants' Committed Gateway Pricing framework will further enhance competition above and beyond the already significant gains that flow directly from the UP-NS merger itself.

Together, these analyses show how the merged UP/NS will transform the nation's supply chain and create new sources of economic growth and opportunity all while enhancing competition with other railroads and other transportation modes. *See also* Section 1180.6(a)(2)(i) ("Effects on Competition"), Section 1180.6(a)(2)(iv) ("Effect on Adequacy of Transportation"), and the Verified Statement of Grant Janke and Summary of Benefits Exhibit in Appendix B (quantifying net public benefits).

Safety Integration Plan
[Section 1180.8(a)(1)]

The Safety Integration Plan is being separately submitted to the Board and the Federal Railroad Administration. It describes how UP and NS intend to implement the integration safely and in compliance with applicable safety laws and regulations. While integration planning has already begun, the integration process is expected to be implemented deliberately over the three years following Board approval of the proposed transaction to ensure that there will be no disruptions in safe operations or the service provided to customers.

The Safety Integration Plan addresses all the subjects required to be addressed in a combination involving an amalgamation of operations at 49 C.F.R. § 244.13, including corporate culture, training, operating practices (including operating rules, alcohol and drug, qualification and certification of locomotive engineers, and hours of

service laws), motive power and equipment, signal and train control, track safety standards and bridge structures, hazardous materials, dispatching operations, highway-rail grade crossing systems, personnel staffing, capital investment, and information systems compatibility.

Measures to Address Blocked Crossings
[Section 1180.8(a)(2)]

Information regarding measures that Applicants plan to take to address potentially blocked crossings as a result of merger-related changes in operations or increases in rail traffic will be submitted as part of the environmental review process, as required by 49 C.F.R. § 1180.8(a)(2).

Operating Plan – Exhibit 13
[Section 1180.8(b)(1)–(4)]

The Operating Plan (Exhibit 13) is included in Volume 2 of this Application. It describes how a unified UP/NS system will integrate operations to serve its customers and grow the amount of freight moving by rail. The Operating Plan shows how UP and NS will integrate activities, personnel, equipment, and facilities within three years following consummation of the proposed transaction; the operational changes expected to result; and the gains in service, operating efficiencies, and other benefits anticipated from the merger. The Operating Plan also addresses changes in anticipated traffic density and activity levels on the main lines and in the yards of the combined companies, as well as impacts anticipated on commuter and passenger services.

In every respect, the proposed operations and services are practical and feasible.

Density Charts – Exhibit 14
[Section 1180.8(b)(5)]

Gross ton-mile density charts for UP and NS (Exhibit 14) are provided in Volume 2 of the Application and Electronic Appendices C and D.

Operating Plan (Minor Transactions) – Exhibit 15
[Section 1180.8(c)]

Not applicable. Applicants propose a major transaction, not a minor transaction.

Pro Forma Balance Sheets – Exhibit 16
[Section 1180.9(a)]

Pro-forma balance sheets (Exhibit 16) are provided as Appendix E to this volume of the Application.

Pro Forma Income Statements – Exhibit 17
[Section 1180.9(b)]

Pro-forma income statements (Exhibit 17) are provided as Appendix F to this volume of the Application.

Sources and Applications of Funds Statements – Exhibit 18
[Section 1180.9(c)]

Sources and applications of funds statements (Exhibit 18) are provided as Appendix G to this volume of the Application.

Property Encumbrances – Exhibit 19
[Section 1180.9(d)]

Not applicable. Encumbrances that exist on properties affected by the proposed transaction would remain in place.

Current Balance Sheets and Income Statements – Exhibits 20 and 21 [Section 1180.9(e)]

Current balance sheets and income statements for Applicants are set forth in their R1 filings or provided elsewhere in this Application, as indicated in Table 2 below.

Table 2

UP Applicants			
	Applicant?	*Class I Railroad?*	*Balance Sheet / Income Statement*
UPC	Yes	No	See UPC Form S-4 (Exhibit 7.2) and UPC 10-K (Exhibit 6.1)
UP	Yes	Yes	See UP 2024 R1

NS Applicants			
	Applicant?	*Class I Railroad?*	*Balance Sheet / Income Statement*
NSC	Yes	No	See NSC Form 10-K (Exhibit 6.2) and NSC Annual Report (Exhibit 9.2)
NS	Yes	Yes	See NS 2024 R1

Service Assurance Plan [Section 1180.10]

The Service Assurance Plan is included in Volume 2 of this Application and addresses each of the requirements set forth in 49 C.F.R. § 1180.10, including identifying the precise steps to be taken by Applicants to ensure that projected service levels would be attainable and that key elements of the Operating Plan would improve service. The Service Assurance Plan also describes how (i) the integration of UP and NS activities following consummation of the proposed transaction, (ii) the operational changes expected to result from the merger, and (iii) the operating efficiencies and other benefits anticipated from the merger will translate into present

and future benefits for the shipping public. The Service Assurance Plan also describes how Applicants will ensure service will not be adversely impacted due to operational changes.

Transnational and Other Informational Requirements
[Section 1180.11]

The proposed transaction is a merger of two United States railroads. As described below, UP operates almost exclusively in the United States, crossing the Canadian border only to facilitate interchange, and NS also operates almost entirely in the United States, with only de minimis trackage rights in Canada. As a result, the transaction does not implicate any of the concerns that underlie the transnational elements of the major merger rules.

UP indirectly owns a 26 percent minority interest in the Mexican rail carrier Ferromex,[5] but does not control Ferromex. UP's subsidiary SLTM works to connect Mexican customers to intermodal rail service on Mexican railroads, but UP does not provide any rail service in Mexico. UP trains cross the border at Eastport, Idaho, to interchange traffic at CPKC's yard in Kingsport, British Columbia, but UP does not provide any rail service in Canada.

NS's operations are almost entirely within the United States. NS has trackage rights in Canada over approximately 1.9 miles of track between the U.S.-Canada border crossing in Buffalo, New York, and CN's Fort Erie Yard in Fort Erie, Ontario. These trackage rights allow NS to interchange traffic with CN at the Fort Erie Yard.

[5] The remaining 74% is owned by GMéxico Transportes, a company whose main shareholder (with a 70.3% ownership) is Grupo México.

Other than this de minimis operation, NS operates entirely within the United States. NSC has a Mexican subsidiary, NS Mexicana, whose activities are limited to marketing and promoting NS's United States service offerings to Mexican companies. Neither NS Mexicana nor any other NS entity provides rail service in Mexico.

In light of the above, Applicants respond to the informational requirements of 1180.11 as follows:

> *For applicants whose systems include operations in Canada or Mexico, applicants must explain how cooperation with the Federal Railroad Administration would be maintained to address potential impacts on operations within the United States of operations or events elsewhere on their systems.*

As noted above, UP does not provide rail service in Canada or Mexico, and NS has only de minimis trackage rights for 1.9 miles in Canada. It is not likely that any potential event on that segment would impact United States operations. But if there were such an event, UP/NS would cooperate with relevant authorities in both countries, including the Federal Railroad Administration as necessary.

> *All applicants must assess whether any restrictions or preferences under foreign or domestic law or policies could affect their commercial decisions, and discuss any ownership restrictions applicable to them.*

Neither UP nor NS are affected by any restrictions or preferences under the laws of Mexico or Canada that could affect their commercial decisions. And neither UP nor NS has any applicable ownership restrictions.

In addition, Applicants note that the competitive analyses and operating plan in Exhibits 12 and 13 are "full-system" as envisioned by 49 C.F.R. § 1180.1(k). UP does not provide rail service outside the United States, and NS's minimal trackage

rights in Ontario are incorporated in the Operating Plan and the data files used for the comprehensive competitive analysis performed by Dr. Elizabeth Bailey.

Prayer for Relief

Wherefore, Applicants pray that the Board:

1. Enter an order under 49 U.S.C. §§ 11323 and 11324 granting approval and authority for (i) the acquisition of control by UPC of NSC, and through NSC of NS and NS's rail carrier subsidiaries, and (ii) the resulting common control by UPC of UP and NS and the consolidation of the rail operations of UP and NS;

2. Determine that the terms of the acquisition of the stock of NSC are fair and reasonable;

3. Enter an order under 49 U.S.C. §§ 11323 and 11324 granting approval and authority for Applicants to acquire and exercise control over PPU, as requested in Docket No. FD 36873 (Sub-No. 1); and

4. Enter an order under 49 U.S.C. §§ 11323 and 11324 granting approval and authority for Applicants to acquire and exercise control over TRRA, as requested in Docket No. FD 36873 (Sub-No. 2).

Opinions of Counsel for Applicants
[Section 1180.6(a)(4)]

Union Pacific Corporation and Union Pacific Railroad Company

As counsel for Union Pacific Corporation ("UPC") and Union Pacific Railroad Company ("UP"), I am generally familiar with the transactions described in this Application, including the primary docket and related sub-dockets, and have reviewed this Application. It is my opinion that the transactions described in this Application, to the extent they involve UPC or UP, meet the requirements of law, are within the corporate powers of UPC and UP, as applicable, and will be legally authorized and valid, if approved by the Surface Transportation Board and the other requirements set forth in the agreement governing the proposed transaction are satisfied or waived.

Christina B. Conlin

Notes to Pro Forma Balance Sheet

UPC/NSC

Base Year

(1) UPC Base Year: Represents the UPC balance sheet as reported under GAAP in UPC's 2023 Annual Report on Form 10-K filed on February 9, 2024, with goodwill, that was included in other assets, reclassified because this caption would become material after the acquisition.

(2) NSC Base Year: Represents the NSC balance sheet as reported under GAAP in NSC's 2023 Annual Report on Form 10-K filed on February 5, 2024, adjusted for the removal of the Eastern Ohio incident impacts:

Millions, debit/(credit)		*Adjustment Amount*
Accounts payable and other current liabilities	$	325
Deferred income taxes		(249)
Cash and cash equivalents		652
Other long-term liabilities		118
Retained earnings		(846)

(3) Base Year Adjustments: Represents the UPC acquisition of NSC and the related adjustments:

Cash and cash equivalents - Adjustment represents the cash used for the debt issuance costs, interest payments (net of taxes), merger costs, and increased dividend payments.

Properties, net - As of the date of preparation of these pro forma financial statements, Union Pacific does not have sufficient information as to the specific nature, age, condition, or location of NSC's property, software, and equipment. For the purposes of these pro forma financial statements, Union Pacific estimated a fair value addition of $25 billion to properties, net. This estimate is preliminary and subject to change and could vary materially from the actual value at the effective time of the mergers. The properties, net adjustment for the estimated fair value was partially offset by one year of depreciation associated with the additional fair value estimate.

Goodwill - As of the date of preparation of these pro forma financial statements, certain fair value adjustments were made; however, the fair values of NSC's identifiable assets to be acquired and liabilities to be assumed and the impact of applying acquisition accounting have not been fully determined. After reflecting the fair value adjustments made herein, the excess of the total consideration over the recognized amounts was presented in goodwill. Once detailed valuations and related calculations are completed, a material portion of this amount could be attributable to other assets acquired or liabilities assumed. Any increase or decrease in fair values of the net assets as compared with the pro forma financial statements may change the amount of the total consideration allocated to goodwill and other assets and liabilities and may impact the pro forma financial statements due to adjustments in the depreciation and amortization expense of the adjusted assets. Goodwill is not amortized.

Accounts payable and other current liabilities - Adjustments are related to retention costs.

Debt due after one year - For the purposes of these pro forma financial statements, we assume the entire cash consideration will be funded through new debt; however, we expect cash consideration will be funded through a combination of new debt and cash accumulated through cash provided by operating activities. There is also an adjustment to record the NSC debt at its estimated fair value.

Deferred income taxes - Adjusted for the fair value estimates of NSC's property and long-term debt, partially offset by one year of deprecation on the additional fair value estimate.

Total shareholders' equity - Represents UPC's share issuance as part of the acquisition consideration, less NSC's base year total shareholders' equity, as well as income statement and dividend adjustments.

(4) UPC/NSC Base Year: Represents the base year balance sheet for the combined UPC/NSC entity.

Millions	*UPC/NSC BASE YEAR (1)*	*YEAR ONE ADJUSTMENTS (3)*	*UPC/NSC PRO FORMA YEAR ONE (4)*

Notes to Pro Forma Balance Sheet

UPC/NSC

Year One through Normal Year

(1) UPC/NSC Base Year (2023): Represents the pro forma combined UPC/NSC base year balance sheet, included in this section of the Application.

(2) Year One through Normal Year Adjustments: Represents the effects on the combined UPC/NSC pro forma balance sheets of the operating results (earnings and cash flows) for the respective years, inclusive of adjustments to reflect implementation of the operating plan:

Cash and cash equivalents - Represent additional revenue, partially offset by capital spending and additional expense, net of taxes.

Properties, net - Represent capital spending necessary to combine operations of UPC and NSC reduced by additional depreciation.

Deferred income taxes - Represents the net change in deferred taxes payable related to different book and tax treatment of depreciation expense.

Retained earnings - Represents changes in net income.

APPENDIX F

PRO FORMA INCOME STATEMENTS
(EXHIBIT 17)

Pro Forma Income Statements

Millions	*UPC BASE YEAR (1)*	*NSC BASE YEAR (2)*	*BASE YEAR ADJUSTMENTS (3)*	*UPC/NSC BASE YEAR (4)*

Notes to Pro Forma Income Statement

UPC/NSC
Base Year

(1) UPC Base Year: Represents the UPC income statement as reported under GAAP in UPC's 2023 Annual Report on Form 10-K filed on February 9, 2024.

(2) NSC Base Year: Represents the NSC income statement as reported under GAAP in NSC's 2023 Annual Report on Form 10-K filed on February 5, 2024, adjusted for the removal of the Eastern Ohio incident impacts and reclassification of the gains from operating property sales to match UPC's presentation:

Millions, debit/(credit)		*Adjustment Amount*
Operating expenses	Eastern Ohio incident	$ (1,116)
Income tax expense	Eastern Ohio incident	270
Operating expenses	Reclassification	43
Other (income) / expense	Reclassification	(43)

(3) Base Year Adjustments: Represents the UPC acquisition of NSC and the related adjustments:

Depreciation & amortization - Represents increased depreciation expense due to the estimated fair value increase to properties, net.

Interest expense - For the purposes of these pro forma financial statements, we assume the entire cash consideration will be funded through new debt; however, we expect cash consideration will be funded through a combination of new debt and cash accumulated through cash provided by operating activities. The pro forma income statements assume that UPC funded the entire cash consideration through the issuance of new debt, a reasonable interest rate of 5%, and issuance and liability management costs of $190 million that will be amortized over an assumed life of 15 years.

Income tax expense - Adjustment represents the income tax impact related to the increased depreciation and interest expense computed using the statutory federal tax rate for 2023 of 21.0%, plus 3.4% to reflect the estimated net state tax rates.

(4) UPC/NSC Base Year: Represents the base year income statement for the combined UPC/NSC entity.

Millions	*UPC/NSC BASE YEAR (1)*	*YEAR ONE ADJUSTMENTS (2)*	*UPC/NSC PRO FORMA YEAR ONE (3)*

Notes to Pro Forma Income Statement

UPC/NSC

Year One through Normal Year

(1) UPC/NSC Base Year (2023): Represents the pro forma combined UPC/NSC base year income statement, included in this section of the Application.

(2) Year One through Normal Year Adjustments: Represents the effects on the combined UPC/NSC pro forma income statement of the operating results (earnings and cash flows) for the respective years, inclusive of adjustments to reflect implementation of the operating plan:

Revenues - Represents the gross revenue gains from additional traffic.

Operating expenses - Represents the net benefits from efficiencies and synergies, reduced by the additional volume-related costs and one-time costs.

Depreciation & amortization - Represents the increased depreciation expense as a result of capital spending necessary to combine operations of UPC and NSC.

Income tax expense - Adjustment represents the income tax impact related to the increased operating income and depreciation expense computed using the statutory federal tax rate for 2023 of 21.0%, plus 3.4% to reflect the estimated net state tax rates.

Notes to Pro Forma Sources and Application of Funds Statements
(Statement of Cash Flows)

UPC/NSC

Base Year

(1) UPC Base Year: Represents the UPC statement of cash flow as reported under GAAP in UPC's 2023 Annual Report on Form 10-K filed on February 9, 2024.

(2) NSC Base Year: Represents the NSC statement of cash flow as reported under GAAP in NSC's 2023 Annual Report on Form 10-K filed on February 5, 2024, adjusted for the removal of the Eastern Ohio incident impacts:

Millions, debit/(credit)	*Statement of Cash Flow category*	*Adjustment Amount*
Operating expenses	Net income	$ (1,116)
Income tax expense	Net income	270
Accounts payable and other current liabilities	(Increase) decrease in accounts payable and other current liabilities	325
Deferred income taxes	(Net increase) decrease in deferred income taxes	(249)
Other long-term liabilities	(Increase) decrease in other - net	118
Cash and cash equivalents	Net increase (decrease) in cash and cash equivalents	652

(3) Base Year Adjustments: Represents the UPC acquisition of NSC and the related adjustments:

Net income - Adjustment represents increased depreciation as part of the fair value adjustment to properties, net, debt interest and amortization of the issuance and liability management costs, and related income tax impacts.

Depreciation and amortization expense - Adjustment represents increased depreciation as part of the fair value adjustment to properties, net.

Net increase (decrease) in deferred income taxes - Adjustments as the fair value adjustment to properties, net is depreciated.

Increase (decrease) in other - net - Adjustment represents the amortization of the issuance and liability management costs.

Cash dividends paid - Adjustment represents the increase in dividends paid based on UPC's current $1.38 dividend per share.

(4) UPC/NSC Base Year: Represents the base year statement of cash flow for the combined UPC/NSC entity.

Notes to Pro Forma Sources and Application of Funds Statements
(Statement of Cash Flows)

UPC/NSC

Year One through Normal Year

(1) UPC/NSC Base Year (2023): Represents the pro forma combined UPC/NSC base year sources and application of funds statements (statement of cash flows), included in this section of the Application.

(2) Year One through Normal Year Adjustments: Represents the effects on the combined UPC/NSC pro forma balance sheets of the operating results (earnings and cash flows) for the respective years, inclusive of adjustments to reflect implementation of the operating plan:

Net income - The net benefits associated with the acquisition.

Depreciation and amortization expense - Represents the increased depreciation expense as a result of capital spending necessary to combine operations of UPC and NSC.

Net increase (decrease) in deferred income taxes - Represents the net change due to different book and tax treatment of depreciation expense.

Increase (decrease) in other - net - Represents net income impacts from proceeds from the sale of property.

Proceeds from the sale of property - Represents the cash received from the sale of property.

Capital expenditures - Represents capital spending necessary to combine operations of UPC and NSC.

IX. Conclusion 26

VERIFIED STATEMENT

OF

V. JAMES VENA

1. My name is Jim Vena. I am the Chief Executive Officer of Union Pacific Corporation and Union Pacific Railroad Company ("UP"). I have served in this role since August 2023. I previously served as UP's Chief Operating Officer from 2019 to 2020 and was responsible for all operations, technology, and strategy. In 2021, I served as a Senior Advisor to the Chairman. If the Surface Transportation Board approves UP's merger with Norfolk Southern Railway Company ("NS"), I will lead the combined company as the Chief Executive Officer. I am submitting this statement to explain why the merger is good for America, why it serves the public interest, and why it should serve as the next chapter in UP's long, proud history of building America.

2. American businesses, consumers, and communities deserve the safety, service, and competitive benefits of a true transcontinental railroad. The merged company will deliver those benefits to the American public by investing in technology, infrastructure, and our workforce to provide a reliable, resilient, and efficient national network that will promote growth and strengthen the nation's economy. We will begin delivering benefits as soon as the two railroads are allowed to merge.

3. The merger will be the most thoroughly planned, carefully executed railroad merger in history. Safety, Service, and Operational Excellence will remain our top priority. Teams of UP and NS employees have been jointly planning since we announced the merger, and they will continue planning during the approval process,

to ensure full visibility into the merged company's operations, a seamless customer experience on day one, and a clear path to full integration within three years.

4. This isn't just about connecting two rail networks. It's about creating a stronger railroad by bringing together the best of UP and NS practices, systems, and people. Our companies share similar values that include a deep commitment to safety, continuous improvement, operating the best railroad bar none, and empowering decision-making at every level. That's our foundation. Our teams are already finding ways to make the unified railroad safer, more efficient, and more customer-focused by combining proven practices—like UP's Physics Train Builder and NS's industry-leading automated track geometry technology. Through integration we will build on these combined strengths, extend them, and deliver what matters: a world-class transcontinental railroad that serves America from coast to coast.

5. Upon approval, we will immediately improve safety, service, and efficiency by activating a consolidated transportation plan to eliminate approximately 2,400 handlings of cars and containers per day and approximately 60,000 car miles per day for traffic currently interchanged between UP and NS. At the same time, customers will continue interacting with their current sales and support representatives using each railroad's current systems until new platforms are fully tested and the merged railroad's representatives are fully trained. As we make changes, we will communicate clearly, monitor the results, and respond to feedback. We will have procedures in place to promptly address any unexpected

issues and to ensure that we are delivering the services that we promise. We will hold ourselves accountable to our customers.

6. We intend to be determined and intentional in delivering the benefits of the merger. UP's strong performance record reflects our ability to use buffer resources to absorb and respond to the inevitable strains on our network from operating in a changing environment. We will continue to ensure that we have the right resources in the right places as we bring on new business. We plan to invest approximately $2 billion, in addition to the more than $5 billion that UP and NS together reinvest in their networks each year, to increase capacity on main lines and in yards and terminals to accommodate projected growth. And we will continue to invest in our workforce and technology to maintain our status as a leader in innovation.

7. Our merger will significantly enhance competition. We already operate in an intensely competitive industry. We compete directly with trucks and other railroads for most traffic we carry, and we face intense geographic competition, including from foreign producers. The merger will allow us to provide stronger competition to trucks, which have long exploited the service and cost advantage created by the artificial east-west divide in the U.S. railroad network. We will also provide stronger competition to other railroads by offering customers the many benefits of seamless single-line service. And we will help our customers better compete in domestic and international markets.

8. Our merger is fundamentally about unleashing growth—for UP and our employees, our customers, and the nation's economy. We will grow by providing a

safer, more competitive service to take trucks off the highway. Our customers will grow as they take advantage of our more reliable, resilient supply chain and lower-cost service to expand their own markets. The nation's economy will grow as these businesses and manufacturers and their workforces expand.

9. Let me offer a quick overview of my testimony. In **Section I**, I explain how a lifetime working on, running, and leading railroads—from the ballast up—shapes how I judge this iconic opportunity. In **Section II**, I show why the UP/NS transcontinental railroad is good for America today—plain and simple. In **Section III**, I explain how this merger gives our country the chance to complete Abraham Lincoln's original vision of a single, seamless coast-to-coast railroad—and how this Board can finish what he began, connecting 43 states and approximately 100 ports to move America's freight faster, safer, and more reliably, while strengthening our national economy. In **Section IV**, I explain why this deal increases competition by letting rail finally match the speed and reliability of trucks. In **Sections V through VII**, I outline how the merger will grow good-paying jobs, make communities safer, and support our national defense. And in **Section VIII**, I detail how we'll integrate UP and NS without repeating the mistakes of the past—guided by my lifelong obsession with operational excellence, backed by a $2 billion investment and modern technology.

I. My Background and Experience

10. With almost five decades of experience in the railroad industry, I possess extensive knowledge about railroading and know how to properly lead all aspects of the business. My connection to railroading runs even deeper than my experience: my

father, brother, father-in-law, and his father before him all retired from the railroad. I began my own railroad career during high school, working on a maintenance-of-way crew unloading railroad ties from gondola railcars during the summer. I spent another summer maintaining and cleaning passenger cars.

11. After my first year in college, I joined Canadian National Railway Company ("CN") as an entry-level train crew member, then known as a brakeman, pulling pins and tying brakes in rail yards. From there, I advanced to more senior train-crew positions, first as a conductor and later as a locomotive engineer, working in both rail yards switching cars and in over-the-road service handling long-haul movements. I maintained my union seniority by operating trains on weekends throughout college. By working and studying and negotiating work schedules, I graduated without any loans or debts. By my mid-twenties, I had gained on-the-ground experience in the engineering, mechanical, and transportation crafts. I take pride in the fact that I am the only railroad CEO with experience operating trains, which gives me valuable insights into the challenges and possibilities of rail operations from the ground up.

12. My first non-union role was as a trainmaster. As a trainmaster, I was responsible for overseeing all operations in a defined territory, including the safe and efficient makeup of trains, the oversight and support for train crews and adherence to schedules and rules. That role laid the foundation for my ability to lead and inspire employees to deliver a high-level of service in an efficient manner. As I continued to gain more experience, I took on more responsibility for larger territories and more

employees. My own experience as a front-line manager has made me prioritize empowering front-line supervisors—those closest to the work—to make decisions that improve safety, service, and operational performance.

13. While I spent the majority of my career in operations, I also dedicated significant time to the labor relations sphere. Serving as the chief operations negotiator during collective bargaining rounds, I gained valuable experience and developed a deeper understanding of what matters most to employees. This role taught me how to address employee requests while simultaneously driving core operational improvements that benefit all stakeholders, including enhancements in customer service. That experience influenced our successful round of bargaining this year, with agreements reached with all unions in record time, while also improving work rules to move the railroad into the 21st century.

14. Additionally, on two separate occasions, I worked in the marketing and sales department, first as a market manager, tasked with understanding the market dynamics for various commodities, and second as an account manager, responsible for maintaining and building customer relationships. These experiences made me acutely aware of the reliance and trust that our customers place in us and shaped my vision of the importance of delivering the services that we promise.

15. During my more than 45 years of railroading, I have witnessed and experienced countless changes in the industry: removal of the caboose and implementation of end-of-train devices, hump-automation, development of remote-control operations, changes in mainframe and signal system technologies,

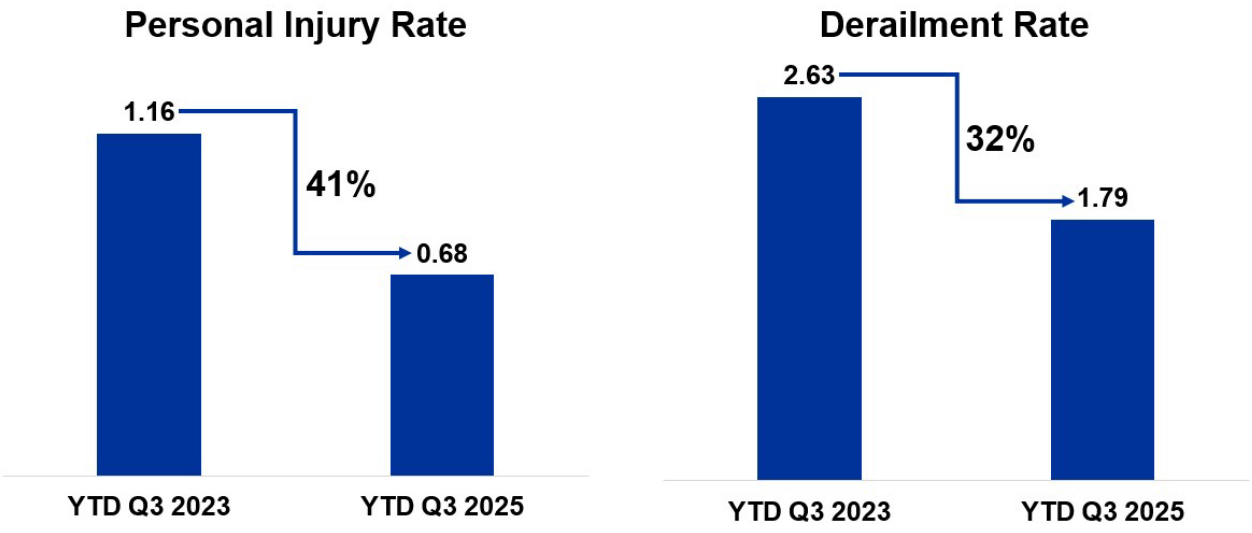
implementation of Positive Train Control, the availability of real-time data, adoption of new operational strategies, regulatory changes, and last but not least, mergers. These experiences prepared me well to learn from the past and to move UP forward as a modern company serving a nation that must compete in a more-connected-than-ever-before global economy.

16. I have demonstrated the ability to successfully navigate and lead through change all while improving safety and service. During my tenure as the Executive Vice President and Chief Operating Officer at CN from 2013 to 2016, CN provided the highest level of service and operated as the most efficient railroad in the industry, with the lowest operating ratio in North America. At UP, from 2019 to 2021, we set new service records, improved daily car mileage, and reduced dwell time.

Table 1[1]
UP Performance from 2018 to 2021

Operating/Performance Statistics	2018	2019	2020	2021
Daily car mileage	198	209	221	203
Dwell (hours)	29.8	24.8	22.7	23.7

17. Since I returned as CEO in 2023, UP has again set new safety and service records (detailed below), with customer approval ratings reaching new highs. I know how to lead people and how to ensure a vision is realized at all levels of a large organization, especially among front-line employees and managers. My approach, dedication, and execution will be the same as we implement the first seamless transcontinental railroad.



[1] *See* Workpaper "UP Performance from 2018 to 2021.pdf."

II. The Union Pacific Transcontinental Railroad Is a Win for America

18. When I returned to UP, my immediate focus was on growing the business through a strategy focused on safety, service, and operational excellence. Our goal is to be the safest railroad in North America. We are investing in a safety culture and cultivating a safety-focused mindset so that every employee goes home safe every day.

19. Since I returned to UP in the third quarter of 2023, UP's personal injury rate fell from 1.16 to 0.68, a 41 percent improvement and UP's derailment rate fell from 2.63 to 1.79, a 32 percent improvement.

Figure 1: Improvements In Safety[2]

20. We also recognize that we cannot succeed as a company unless we are fulfilling our promises to customers consistent with the service that we sell. Our customers rightfully expect us to provide a high-quality and consistent service

[2] *See* Workpaper "Improvements in Safety.pdf."

product. Since I rejoined UP, the team has come together and consistently set new service reliability records for both our carload and intermodal customers.

21. Specifically, since the third quarter of 2023, UP's manifest service performance index increased from 84 percent to 100 percent; UP's intermodal service performance index increased from 85 percent to 98 percent; and UP's first mile/last mile performance increased from 91.4 percent to 96.5 percent.

Table 2[3]
UP Performance Improvement Q3 2023 to Q3 2025

Performance Statistics (%)	Q3 2023	Q4 2023	Q1 2024	Q2 2024	Q3 2024	Q4 2024	Q1 2025	Q2 2025	Q3 2025
Manifest service performance index	84	91	87	84	89	96	93	97	100
Intermodal service performance index	85	96	95	93	86	89	94	99	98
First mile/last mile performance	91.4	92.7	90.6	92.2	93.4	94.9	94.9	95.8	96.5

22. We also cannot grow without achieving operational excellence. This means driving decision-making to those closest to the work and spending resources wisely, with a buffer for the unexpected. In line with this focus on operational excellence, we are investing in growth by allocating nearly $10 million in capital a day to safety, infrastructure, technology, and network expansion. We have a robust pipeline of more than 200 capacity and commercial projects. And we spend millions more to support our daily operations.

23. We also recognized that a transcontinental railroad could serve as an additional path to growth. The U.S. rail network is artificially divided between east and west. There are significant costs to that division that inhibit growth and our

[3] *See* Workpaper "UP Performance Improvement Q3 2023 to Q3 2025.pdf."

ability to best serve our customers. The costs include impacts on service, speed, and reliability, and the financial costs of interchanging traffic between two railroads. They also include the costs that our customers face in having to deal with two separate railroads when they shop, ship, and pay, and when they seek accountability for service. These costs can lead railroads and our customers to miss opportunities to grow. As we successfully advanced our objectives in safety, service, and operational excellence, I began engaging with UP's leadership team in discussions about the future of our railroad and industry and opportunities to erase this artificial divide that places railroads at a disadvantage to trucks.

24. A UP/NS merger is a natural combination from an operational perspective. The two railroads have complementary networks, meeting end-to-end across the middle of the country from Chicago to New Orleans. It became clear to us that combining the railroads would result in efficiencies and growth that we could not achieve independently, as well as investments that we would not make as independent companies. As a result, if the merger is approved, we anticipate achieving significant growth in rail business, driven by truck shipments that move to rail, especially in "watershed" regions located along the historical divide between eastern and western railroads, as well as expanded single-line service to both domestic and international markets for all of our customers. We also anticipate achieving significant efficiencies driven by improved asset utilization for UP and our customers, implementation of best operating practices and technologies, and streamlined administrative costs.

25. A key motivation for this merger is our mission of Building America. Our nation is focused on industrialization, and as railroaders, we play a vital role. Everything we haul directly fuels our economy, driving America's growth. Canada has two transcontinental railroads that not only span their country, but also span the central portion of the U.S. from the north to the south, with one extending into Mexico. I have personally witnessed the benefits to Canada of two transcontinental railroads. American industry deserves an equally efficient supply chain within its own borders. Other countries that compete with American industry, such as Mexico, Russia, China, and India, have unified rail systems that have contributed to their economic growth and security benefits.

26. Our objective is clear: to transport goods more quickly, reliably, and cost-effectively. The combined company will deliver on this objective by eliminating interchange delays, opening new routes, expanding intermodal services, and reducing distance and transit times on key rail corridors. It also will improve the ease of doing business, allowing seamless shopping, tracking, and communication for our customers. These changes will transform the U.S. supply chain, unleash the industrial strength of American manufacturing to better compete in international markets, create new sources of economic growth and workforce opportunity, and put goods in the hands of customers more efficiently.

27. The transaction will also improve safety. The two railroads will apply their shared best practices, improving both railroads and better protecting all employees and the communities we serve. The transaction also will enhance safety

for the traveling public by removing trucks from the road and reducing wear and tear on our national, state, and local roadway systems, reducing burdens on American taxpayers.

28. The transaction will also strengthen America's national defense capabilities. The merged railroad will unite the Atlantic and Pacific coasts, improving military logistics and readiness by efficiently connecting key military facilities, defense manufacturers, and ports.

29. The transaction will also benefit Amtrak. For example, the combined UP/NS will use NS's line between Butler, Indiana, and Kansas City to reroute a westbound intermodal train UP currently operates from St. Louis to Kansas City, creating more capacity on the route of Amtrak's Lincoln, Illinois, and Lincoln/Missouri River Runner services. The combined network will also ease congestion on Amtrak's route through New Orleans by eliminating interchanges between UP and NS on NS's Back Belt Line.

30. The transaction will preserve employment for union employees and grow union jobs for the combined entity's employees. In September, UP signed a landmark agreement with the International Association of Sheet Metal, Air, Rail and Transportation Workers – Transportation Division, the nation's largest railroad union. In that agreement, we formalized the commitment we made to all union employees that they would have job protection for the length of employees' careers following the transaction, subject to the usual requirements for continued employment. UP entered into similar agreements with the Brotherhood of Railway

Carmen, the International Brotherhood of Boilermakers, the National Conference of Firemen and Oilers, and the United Supervisors Council of America. And we stand ready to make similar agreements with our other unions, reaffirming our commitment that every union employee will have a job in the combined company.

31. With our strong safety records, commitment to service excellence, and similar cultures, we are confident that a combined UP/NS will enhance the best freight transportation system in the world. The merger is a win for U.S. manufacturing, consumers, unionized workers, communities, and national defense.

III. The Union Pacific Transcontinental Railroad Is a Transformational Opportunity and in the Public Interest

32. The UP/NS merger marks a historic moment that builds on President Abraham Lincoln's ambitious vision, conceived nearly 165 years ago, of a transcontinental railroad. The merged company will connect the United States from coast to coast. The combined network will span over 50,000 route miles stretching across 43 states, serving 10 international interchanges and approximately 100 ports. This enhanced network will create new and more robust routes for both domestic and international commerce. Customers will benefit from seamless, single-line service across the country that improves transit times, increases reliability, and reduces costs. By eliminating delays associated with multiple handoffs, a process that can add 24 to 48 hours to shipments, customers will benefit from a more efficient supply chain through reduced freight car and inventory carrying costs.

33. America's artificially separated western and eastern-based railroads pose challenges for American businesses' ability to grow and compete domestically

and internationally. For example, in the St. Louis area, UP currently interchanges cars moving to NS via St. Louis with Alton & Southern Railway, which delivers the cars to the Terminal Railroad Association of St. Louis, which switches the cars for NS. This multi-railroad interchange adds two days of transit time and extra handlings. Similar inefficiencies exist in Chicago. Even direct interchanges typically take a day to cross town from one railroad's local yard to another before shipments can continue on a through train out of town.

34. Consider the airline industry by comparison. It would be unthinkable to force passengers to change airports mid-journey when traveling from the West Coast to the East Coast if they have a non-stop option. Worse yet, imagine making them change airports on a shorter trip from Dallas to Detroit. Such inconveniences would understandably cause passengers to take to the highway, rather than endure the hassle. Yet, this is the current reality for U.S. railroads today for traffic crossing the middle of the country. And when you substitute "freight" for "passengers" and "railroads" for "airports," in the example above, that reality is why trucks have maintained their advantage over rail.

35. Interchanges between eastern and western railroads cost businesses time and money, which constrains their use of rail and limits their potential growth. The UP/NS merger will eradicate these barriers, offering businesses faster, more reliable, and more efficient routes. This will allow customers to carry less inventory, reduce railcar ownership costs, and enhance their competitive edge domestically and internationally.

36. Combining the two companies will also create more resilient and stronger supply chains. By eliminating handoffs, we reduce potential points of failure and create a network that simplifies rerouting of traffic in response to natural disasters or other disruptions. We have all witnessed the impact that recent hurricanes, flooding caused by tropical storms, and extreme temperatures have had on rail operations. A unified transcontinental network will mitigate such disruptions.

37. Customers will also benefit from receiving single-line rate quotes with one system to track freight, enabling real-time supply chain optimization. UP has invested in a state-of-the-art customer portal which was developed with a customer centricity mindset. This platform allows customers to view all of their relevant data in one place and to connect with UP on any questions that might arise.

38. Benefits from single-line service mean that every American business that moves goods by rail—whether manufacturers, farmers, or exporters—stands to gain from the merger. Imagine seamlessly hauling steel from Alabama, Ohio, and Pennsylvania to California and Texas, or moving rice from Arkansas to the Ohio Valley and Northeast directly by rail and unlocking access to new markets through direct access to ports.

39. I am confident based on my nearly five decades of railroading that the benefits of this merger to our customers are real and substantial. This belief has been confirmed by customers and stakeholders across the country. Many customers who recognize the benefits of the transaction have provided written comments supporting the merger:

- KC Graner, President and CEO of Central Farm Service: "We believe this will help link our rural communities to more markets. In practical terms, that means our co-op can move Minnesota & Iowa corn and soybeans to customers on the Eastern Seaboard or Gulf Coast seamlessly and bring in fertilizer and feed ingredients from afar with less disruption."

- Monte Froehlich, President of IceCap Cold Storage: "We're especially excited about shipping what is produced in the heart of America (pork, beef and chicken primarily) to the ports and this merger will connect around 100 ports across 43 states! This is much easier and faster for one railroad to handle the entire distance vs a transfer."

- Tim Clay, President and CEO of Cornerstone Systems: "At Cornerstone, we compete directly with over-the-road trucking, and rail is a vital part of how we offer scalable, sustainable solutions. The ability to access a broader geographic footprint, coupled with improved service reliability, would allow us to better serve our existing customers and reach new ones."

- Eugene Seroka, Executive Director, Port of Los Angeles: "I think [the merger] gives us access to the most populous third of the nation that has otherwise been stitched together through handoffs. We'll be more competitive to get cargo to the Eastern seaboard of the U.S."

40. Kenny Rocker and Ed Elkins provide more examples of customer comments in their verified statement. We include a collection of support letters from customers and other stakeholders—more than 2,000 in total, in Volume 3 of the Application.

41. The benefits are not limited to our direct customers. All Americans will gain from the expansion of safe, efficient, reliable rail service, setting a new standard for the industry and revitalizing commerce across the nation.

IV. The Union Pacific Transcontinental Railroad Will Increase Competition

42. The UP/NS merger will increase competition between the combined company and trucks. As UP's CEO, I am keenly aware of the intense competition

railroads face from the trucking sector in capturing customer business. Conversion of traffic from truck to rail presents a tremendous opportunity for growth for the rails. Moving traffic by rail costs our customers less than moving traffic by truck. One freight train can replace several hundred trucks. But in order to capitalize on that opportunity, we must be able to move across the U.S. as seamlessly as trucks.

43. We want to increase rail's share of traffic and remove trucks from our highways. Reliance on trucking has advanced rapidly, and the rise in autonomous and semi-autonomous technology is a further challenge that the rail industry must meet head-on. We must respond to this competitive challenge by creating more efficiencies and continuing to innovate. It is critical that we position ourselves to be successful for the future, and a truly transcontinental railroad would provide the foundation for such innovation and growth.

44. Trucks do not need to spend two days in St. Louis switching a cross-country cargo load between two companies, so to make rail more competitive, railroads need to offer the same seamless customer service and eliminate the delays and challenges to reliability created by interchanges.

45. Transportation companies recognize that the UP/NS merger will drive conversions of long-haul truck traffic to rail intermodal traffic, and on that basis strongly support the transaction:

- Phillip Yeager, President and CEO of Hub Group: "For decades, we have worked collaboratively with both companies to drive growth and scale our operations through excellent service and commercial alignment. The proposed merger presents a new and exciting opportunity for our partnership to grow and be differentiated. There are several catalysts that should create significant incremental intermodal conversion from

over the road, including improved fluidity in the gateways, leading to faster transits and better asset utilization, enhanced fuel efficiency, and access to additional lanes of market. These enhancements should lead to a large opportunity for intermodal conversion due to improved reliability and service quality as well as improved freight economics."

- Adam Miller, CEO of Knight-Swift Transportation: "As a company that operates thousands of trucks and thousands of intermodal containers, we know the power of combining modes. This unified rail system will let us seamlessly integrate our trucking with rail on cross-country shipments like never before. The result will be faster deliveries, and lower fuel usage, which is great news for American businesses."

- David Duncan, CEO of Duncan & Son Lines, Inc.: "As an 83-year-old trucking company, we have seen dramatic changes in the logistics industry over the years and the creation of a seamless coast-to-coast rail carrier would be one more step toward improving the transportation infrastructure. We support the additional movement of goods by rail across the country while still maintaining a strong truck network for the final delivery miles. The potential improvement in transit times, and reduced transportation costs, across the United States via a nationwide rail service is better for supply chains and consumers. We support the proposed Union Pacific–Norfolk Southern merger as the next phase of service improvements in the movement of goods within the United States."

- Zach England, COO of CR England: "As a fourth-generation trucking executive, I've seen our industry evolve from my great-grandfather's Model T to today's Intermodal networks. A seamless coast-to-coast rail carrier is something we've dreamed about for years. This merger lets us combine the best of rail and trucking — moving freight farther with less fuel and fewer emissions, then delivering the last mile by truck. It means faster transit, greater capacity, and lower costs. For our customers, that translates to improved supply chain efficiency and savings we can pass on to consumers. It's better for our business, our customers, and the country."

46. The UP/NS merger will provide increased competition for shippers especially in "watershed" regions, where the relative time and dollar costs of rail interchange often leave manufacturers and businesses with no current viable alternative to truck transportation. The merger will unlock new markets and new

truck-competitive rail routes, creating a more accessible, sustainable, and lower-cost supply chain option for manufacturers and consumers. Agricultural products from the Midwest moving to mills and feed markets in the Southeast, chemicals and petroleum products from Texas and Louisiana moving to Pennsylvania and Ohio, food products from Iowa moving to receivers in Indiana and Ohio, and forest products from Georgia and Alabama moving to large population growth areas in Texas will now have a competitive, lower-cost rail option. UP/NS rail competition with trucks will convert freight from highways to rail, increasing safety, easing road congestion, reducing emissions, and decreasing wear-and-tear on roads, which will save taxpayer dollars.

47. The beneficial effects of this merger on competition are not limited to other forms of surface transportation—this merger will also increase competition between railroads. Customers are already seeing the impact of increased competition that would be created by the UP/NS merger. Other railroads are already trying to improve their offerings and service because they understand the competitive benefits of a combined UP/NS. In fact, since we announced our merger in late July, our competitors have announced several new rail service offerings.

48. We welcome this increased competition because it is good for our customers. Our objective is to grow by increasing customer options, not removing them. Only three of our customer locations have access to UP and NS and no other railroad; we commit to preserving their access to two Class I railroads. We also commit to preserving access to gateways. If customers see benefits in interline

service, UP/NS will quote commercially reasonable interline rates. In addition to enhancing competition with trucks and other rail carriers by offering seamless single-line service, a merged UP/NS will further enhance competition by sharing the merger's benefits with a group of customers shipping to or from facilities that will not benefit directly from our new single-line service though a program called Committed Gateway Pricing. Katherine Novak describes this new program in her Verified Statement.

49. The benefits of the UP/NS merger cannot be achieved through mere partnership arrangements between UP and NS. UP has poured substantial energy into partnerships and is proud of what we have been able to achieve for our customers through these partnerships. At the same time, this experience has confirmed their limitations: partnerships do not and cannot replicate the transformative benefits that will be created through this merger. Unlike partnerships, which are narrow and cannot be scaled, the merger will deliver comprehensive operating and investment benefits. A prime example is the investment the combined company will make on NS's lines from Springfield, Illinois, to Butler, Indiana, so we can substantially improve service by routing traffic around Chicago, as described by Eric Gehringer and John Orr in their Verified Statement. Kenny Rocker and Ed Elkins describe the limits of partnerships, and the incomparable benefits of this merger, in more detail. The UP/NS merger is a truly joint effort to unlock efficiencies and investment. Any recent partnerships with UP/NS will get even better post-merger.

50. I expect additional Class I mergers would further increase competition and improve service to customers. As an obvious recent example, CPKC is touting the benefits of single-line service from their merger, and how their combined network can better serve customers. And while BNSF has said it is not looking to merge with CSX, such a merger would provide the same type of benefits as UP/NS—it would give customers more and stronger options.

V. The Union Pacific Transcontinental Railroad Will Help Grow American Jobs, Including Railroad Jobs

51. As I described above, the UP/NS merger will provide more efficient transportation options for American manufacturers and businesses, allowing them to reduce costs, reach more markets, and grow. The combination of UP and NS will stimulate economic growth by increasing jobs for American workers across various sectors in the United States.

52. The railroad industry is known for providing stable and well-compensated employment opportunities. Railroad employees are among the highest-paid workers across industries in the United States. They receive substantial retirement benefits that surpass those offered to many in the private sector, as well as premium healthcare benefits. As of 2024, the total average pay and benefits package for unionized employees at Class I railroads, which includes healthcare, paid time off, and retirement programs, ranges from approximately $135,000 to almost $190,000, with an average of $160,000.

53. In addition to providing strong employee benefits, UP demonstrates its commitment to workforce development and retention through initiatives like Union

Pacific University. This program offers employees free tuition at a nationally ranked university. To date, over 1,000 employees have enrolled and nearly 170 have obtained degrees at no cost to the employee since joining the program; there are 25 graduates in the most recent spring class alone. Additionally, UP's StockUP program offers all employees the ability to purchase company shares through payroll deduction. Participants receive a 20 percent company match of up to 5 percent of their base compensation per pay period.

54. We are committed to preserving employment for all union employees employed by the Applicants at the time of the merger. We are proud of this commitment, and we are even more proud that this merger has the support of the nation's largest railroad union, SMART-TD, as well as support from the National Conference of Firemen and Oilers, the Brotherhood of Railway Carmen, the International Brotherhood of Boilermakers, the United Supervisors Council of America, and the Iron Workers. This merger will not only protect these employees, but will drive even more railroad jobs as shippers increasingly rely on our streamlined, single-line service offerings.

VI. The Union Pacific Transcontinental Railroad Will Make American Communities Safer and More Secure

55. UP's number one priority is safety. Our goal is simple: zero incidents involving trains, pedestrians, drivers, or employees. In a merged system, there will be 2,400 fewer touches at interchanges and elsewhere across the system by optimizing the separate operations of UP and NS; fewer touches mean fewer

opportunities for injuries. Reduced switching also means fewer opportunities for derailments.

56. We devote substantial resources to achieving our safety goals, both within the railroad and in the communities we serve. We invest in technologies to make transportation safer. Our Automatic Tie Unloader autonomously distributes crossties, enhancing safety by minimizing physical contact and reducing track maintenance time. Physics Train Builder is a simulation tool that manages the train build process prior to departure and continues to monitor the train while en route. It issues alerts if in-train forces exceed standards, initiating communication with the crew to temporarily reduce speed to prevent derailment. Mobile NX allows Train Engine & Yard employees to see the position of and align powered switches in yards without walking to switch or to a single computer in the yard, thus eliminating injuries from slips, trips, and falls.

57. Rail transportation is much safer than truck transportation. Taking freight traffic off highways saves lives. But we recognize that there are risks inherent to the railroad industry, and we trained approximately 6,000 first responders in 2024 in railroad communities across the US to gain insight into rail safety; they work as our partners to enhance community safety.

58. We strive to be the best at safety for our employees, the communities we serve, and the customers we support. UP stands out among other railroads for its safety performance. As I explained above, this has been a top priority for me since I

came back to the railroad in 2023, and the results speak for themselves. In 2025, UP is leading the industry when it comes to personal safety.

VII. The Union Pacific Transcontinental Railroad Will Deliver for Our National Defense

59. UP and NS are proud to support the nation's military needs. UP accesses 37 military installations; NS accesses 29. Railroads are critical in providing logistical support, and facilitating the rapid, efficient movement of critical military hardware. Railroads also help maintain a robust supply chain by ensuring a continuous flow of necessary supplies to military bases and other operational areas.

60. The nation's first true transcontinental railroad will bolster our national defense capabilities by connecting critical military facilities, defense manufacturers, and ports from coast-to-coast with efficient, reliable service. The Department of War relies on rail transportation to provide cost effective and efficient transportation of material, including tanks and ammunition. The current system of interchanges and the bottlenecks that result create inefficiencies that jeopardize our military readiness. A merged UP/NS would eliminate handoffs when moving critical materials across the country. Rail is also a more resilient form of transport compared to other modes of surface transportation, which makes it an ideal candidate for emergency conditions.

61. Our support for the nation's defense extends beyond the infrastructure that railroads provide. It includes a deep respect for the dedicated individuals who serve in the U.S. military. Both UP and NS are proud to employ a significant number of veterans, who bring invaluable skills, discipline, and leadership to our workforce.

Veterans comprise approximately 17 percent of UP's workforce and 11 percent of NS's workforce, reflecting our shared commitment to honoring their service.

VIII. The Union Pacific Transcontinental Railroad Will Deliver Improved Service with No Transitional Service Disruptions

62. UP and NS have consistently upheld high standards of safety, service, and operational excellence. I am committed to not only preserving these standards, but also enhancing them in the integration process.

63. I have firsthand experience with the merger integration process. I witnessed integration problems arising out of railroad mergers in the late 1990s, and I was CN's senior vice-president for the company's southern operations during CN's successful integration of its merger with Elgin, Joliet & Eastern Railway. I am well aware of the challenges involved, and I am confident we have the right team in place to meet them. I have been involved in other large integration projects, including UP's successful cutover to NetControl, which replaced an outdated transportation management system which UP had employed for over 50 years.

64. The combination of UP and NS will be the most thoroughly planned and carefully executed railroad merger in history. Building on a foundation of extensive and strategic planning, as outlined in our comprehensive Service Assurance Plan, both railroads are dedicating significant resources to ensure a seamless transition. Our goal is to expedite the integration process to unlock the numerous benefits this merger offers. However, we are fully committed to maintaining the integrity of our existing operations. Before implementing any significant changes to our systems and process, we will rigorously test and train to safeguard the continuity of our high

standards for safety and reliable service. Constant monitoring will ensure that our transition proceeds smoothly, reflecting our dedication to delivering unparalleled rail service to our customers.

65. Further, we expect to maintain our strong credit rating and to continue to invest.

IX. Conclusion

66. The Union Pacific Transcontinental Railroad will help create a better America. The UP/NS merger is a strategic initiative that will deliver substantial benefits to American industry and the nation at large. By enhancing service quality, expanding access, and optimizing freight transportation, this merger will enable goods to move more efficiently and safely across our country. We are fully prepared to ensure the two railroads come together through careful planning and integration. With nearly 50 years of experience in the railroad sector, I have seen and made my share of mistakes—we will not repeat them. Our current approach is guided by past lessons which we will translate into future successes.

67. I respectfully urge the Board to approve this merger, which is positioned to deliver substantial and lasting benefits to our customers, employees, shareholders, and the broader public. Together, UP and NS can create a more connected and competitive American railway network—one that truly keeps pace with the demands of the modern economy while fortifying our national infrastructure for generations to come.

VERIFICATION

I, V. James Vena, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

VERIFIED STATEMENT

OF

MARK R. GEORGE

1. My name is Mark R. George and I am the President and Chief Executive Officer of Norfolk Southern Corporation and the Chairman, President, and Chief Executive Officer of Norfolk Southern Railway Company (collectively, "Norfolk Southern"). I am pleased to present this verified statement to the Surface Transportation Board ("STB") in support of the application for approval of the combination of Norfolk Southern and UP.

2. Prior to becoming CEO in 2024, I served as Norfolk Southern's Executive Vice President and Chief Financial Officer for five years. Before joining Norfolk Southern, I held successive roles across multiple commercial and business segments of United Technologies Corporation and its subsidiaries, including six years in Asia as the regional CFO for the Otis Elevator Company. I ultimately served as the Global CFO for both the Otis Elevator Company and the Carrier Corporation from 2008 to 2019. Today, I also serve on the Board of Directors for Trane Technologies plc.

Executive Summary

3. The proposed merger of Norfolk Southern and UP is a once-in-a-generation opportunity for our customers, our country, our industry, and our companies. Combined, we will create the first American transcontinental railroad with more than 50,000 route miles connecting communities and industries across 43 states and linking approximately 100 ports. By directly connecting East and West

Coast freight without the need to interchange traffic with another carrier, the merged railroad will strengthen the U.S. supply chain, support American manufacturing, create workforce opportunities (including preserving vital union jobs), improve transcontinental transit times, enhance national security, and deliver broad public benefits. It will also unlock the underserved watershed markets, within a few hundred miles of the Mississippi River, where transport via rail isn't practical because of the onerous interchange burden between two railroads. This freight moves almost exclusively on our congested highways today. There is a mandate to focus on strengthening U.S. manufacturing and national security and improving supply chain resilience. And this merger does just that.

4. In many ways, the combination fulfills President Lincoln's vision of a transcontinental railroad to unify the country. And at a time when a resilient supply chain is more important than ever, this proposal for a transcontinental railroad echoes President Eisenhower's creation of the Interstate Highway System that transformed how people and goods moved across America.

5. The proposed transaction addresses a critical, yet unsolved, competitive problem that has long plagued the U.S. freight rail industry: how to unlock the full potential of rail to meet the needs of more shippers across the country. Our current and prospective customers have made clear that to keep or gain their business, we must offer ease of use and a customer-centric approach akin to that already offered by the trucking industry. In particular, customers today demand seamless, single-line, reliable, coast-to-coast service that reduces transit times, eliminates handoffs,

and provides transparency and responsiveness. Today, trucking companies have fully integrated, nationwide service products offering single contracts, single invoices, real-time visibility, and dynamic pricing. That is the benchmark. To compete effectively and grow, rail must evolve to offer a unified national product. That is precisely what this merger will deliver.

6. Importantly, the proposed transaction will address the very real structural disadvantage the U.S. freight rail industry faces today when it attempts to compete with the highway or other nations' freight rail systems. The highway—rail's primary competitor—already accommodates a fully integrated, seamless national infrastructure paid for by America's taxpayers. As a result, the trucking industry has had greater financial latitude to invest more in technologies that put transparency and ease at customers' fingertips. Canada already enjoys fully integrated transcontinental rail networks extending seamlessly across Canada, through the United States, and into Mexico. Mexico likewise has its own transcontinental railroads. Yet, the United States has limited itself not only at its borders, but also by artificially dividing itself into East and West, creating obstacles that add cost, extend transit times, and disrupt reliability. This structure has prevented American railroads from unlocking their inherent strengths: lower cost per ton-mile, heightened fuel efficiency, unmatched density, fewer trucks stressing the nation's taxpayer-funded roadways, and superior safety.

7. Some might argue that a mere contractual partnership would suffice to deliver such benefits. History shows, however, that, while partnerships can help, the

benefits they can deliver are limited given that physical interchanges still exist, management teams change with time, and incentives don't align as the financial and other interests of one party often prevail over the collective interest that benefits the customer. We must move beyond the outdated belief that fragmented railroad alliances can effectively compete with trucking's unified networks. It is one of the main reasons rail has lost share to the highway, despite the numerous partnerships that have been launched. The question has often been asked: "Why don't railroads just keep offering service alliances like they typically do?" And the answer is: "We will." But marketing agreements, alliances, and cooperative arrangements are not enough to compete against the highway.

8. There are many ways to compete in a market and deliver for customers; the best, most effective companies embrace diversified offerings. We are not jettisoning prior cooperative arrangements. Rather, we are unlocking and adding a new, better option because history has shown that alliances often come up short in the long run. A contractual partnership simply cannot match the power and seamless service consistency of full transcontinental integration. Nor can alliances deliver real-time responsiveness and optimal levels of capital investment. In short, a national, unified railroad is needed to compete head-to-head with the highway.

9. UP CEO Jim Vena and I share a vision first born more than a century ago by President Lincoln, who understood that a transcontinental railroad would unite and strengthen this nation. It is long past time to make that vision a reality. With the approval of the STB, we can complete President Lincoln's work by building

America's first transcontinental railroad. This is good for customers, good for workers, and most importantly, good for the country.

10. My statement will address five topics. **Section I** provides an overview of my background before becoming CEO of Norfolk Southern—three decades in complex manufacturing that shaped my conviction about a quality mindset. **Section II** describes Norfolk Southern's legacy that led us to the proposed transaction from a position of strength, following a transformational period of our own. **Section III** explains why rail must continue to evolve and grow along with the economy and other industries. **Section IV** details the transformative benefits that building America's first transcontinental railroad will deliver for our customers, short line partners, and the country as a whole. Finally, **Section V** explains why the proposed transaction is needed, as alliances alone can no longer deliver the true integrative efficiency needed to fully unlock rail's potential.

I. My Background

11. Three decades in complex manufacturing taught me the discipline of factories, the necessity of quality, and the value of listening. From aerospace to elevators, failure is not an option, and competition requires a relentless drive to improve. This mindset shaped how I have approached the railroad industry in general, and the proposed transaction in particular.

A. An Outsider's Perspective on the Rail Industry

12. Prior to joining Norfolk Southern five years ago, I spent my career in complex manufacturing and dispersed field operations. For thirty years I worked at United Technologies Corporation, a global conglomerate of industry-leading brands

like Otis Elevator, Carrier, and Pratt & Whitney. Roughly twenty-five of those years were spent at Otis, where I ran operations around the globe, including six years leading Otis in the Asia Pacific. Those experiences gave me a front-row seat to geopolitics, the global economy, supply chain dynamics, and the challenges of operating in highly diverse markets.

13. Otis was not a "multinational" in the usual sense. We used to call it a "multi-domestic" because each country's operations functioned as its own enterprise, with its own field operations, workforce, and customer demands. We had regional factories that supplied products throughout the complex global enterprise. That structure taught me how to manufacture and then install on customer job sites high-quality products at scale, how to ensure the requisite redundancy, and to never compromise on safety or quality. Those lessons also applied to many thousands of local field operations where installation took place in varied and far less controlled conditions, requiring consistent processes and high-quality standards. In aerospace and defense, and in vertical transportation like elevators, there is simply no room for error. Jet engines cannot fail. Elevator systems similarly suspend lives in in the sky and demand the same exacting quality standards. I still remember standing in Dubai as our teams installed the elevators for the Burj Khalifa, the tallest building in the world. It was a six-year project by a small subsidiary where we had to recruit and train employees to adhere to safe working conditions, while following standard processes, demanding precision, and working with an uncompromising focus on

quality. While it was a very high-profile project, it was just one project of the million-plus elevators that we either installed or maintained around the globe every year.

14. This background gave me a unique perspective when I arrived at Norfolk Southern. I came in as an outsider with decades of experience building and reliably delivering, day after day, complex, high-precision systems. I was not steeped in traditional rail thinking. This perspective has helped me and my team look at things differently and ultimately integrate into Norfolk Southern successful processes from other industries.

B. Total Quality Railroading

15. Early in my tenure at Norfolk Southern, I learned that the railroad industry produces dedicated employees who rise to the occasion to solve problems. While the industry bred heroes to solve problems, I always felt that we needed more process control and a quality mindset to avoid problems from materializing in the first place. With our employees as our strong foundation, the opportunity was clear: focus that grit, expertise, and dedication on building standard, repeatable processes that prevent problems and deliver excellence. In manufacturing circles, this is called Total Quality Management ("TQM").

16. At Norfolk Southern, we've gone beyond TQM and developed a unique framework called Total Quality Railroading ("TQR"), fusing manufacturing discipline and rail expertise powered by PSR 2.0. Developing standardized processes, real-time, problem-solving war rooms, and a relentless focus on root-cause analysis, we hold ourselves accountable to ever-higher standards of excellence. We are increasing our network's velocity, adding consistency, and elevating customer satisfaction.

17. Railroading is an outdoor sport. It's unpredictable. Weather, terrain, and timing all conspire to challenge our operations in ways faced by very few industries. That's why we need a total quality management system, like most industrial companies figured out twenty-plus years ago. Inconsistent processes lead to inconsistent service. And inconsistent service erodes trust. At Norfolk Southern, we have worked to change that through TQR.

- TQR begins with standardizing our processes to make them repeatable, dependable, and resilient. When something goes wrong, we don't just patch it. We dig deep, identify the root cause, and mistake-proof the process. The result is a culture of continuous improvement.

- We are using war rooms as cross-functional hubs where our teams can come together to solve problems in real time. More than operational triage centers, our war rooms are breeding grounds for customer solutions where we turn setbacks into breakthroughs and repeatable processes. For instance, when we saw too many unscheduled train stops, a mechanical war room was used to drill down on each stop, identify the root cause, analyze potential trends, and fix problems at the source. As a result, train stops decreased 18% in a matter of weeks. Similar war rooms convening cross-functional teams have enabled Norfolk Southern to restore service quickly after major weather events, to optimize train flows during peak shipping seasons, and to formulate and iterate our zero-base operating plan. The result has been higher velocity, reduced dwell time, and smoother processes.

- On the commercial side of the business, we restructured our organization to reflect a more customer-centric model. We are investing in technology that makes it easier for our customers to do business with us. Our customers deserve a railroad that feels as intuitive and responsive to them as when they deal with Amazon or Delta. For many years, that was not the feeling our customers had when dealing with railroads. The results of our efforts are clear: good service and improvements to our commercial interfaces have resulted in our highest ever Net Promoter Scores.

II. Norfolk Southern's Legacy and Merging from Strength

18. Norfolk Southern is one of America's most iconic railroads, with a legacy stretching back nearly 200 years. From the earliest days of the railroads, Norfolk Southern played a vital role in linking communities, powering economic growth, and serving as a trusted backbone of U.S. transportation. Our history is written in the steel we laid across the eastern half of the United States, in the relationships we built with shippers across every industry, and in the generations of railroaders who devoted their careers to moving America forward.

19. At Norfolk Southern, we have always known that progress means rising together, a fitting reflection for a company whose elevators honor our past. Each elevator in our headquarters in Atlanta bears the name of a predecessor railroad, a daily reminder that we ascend on the strength of those who laid the tracks before us. Given that my own journey began at Otis, it's an homage that resonates deeply with me.

20. In that spirit, the proposed transaction represents more than a merger: it elevates our legacies. Just as our "Heritage Fleet" celebrates the colors and character of the railroads that built Norfolk Southern, our combination with UP will honor two centuries of progress and the many lines that have converged to create today's Norfolk Southern by creating a rail network with the scale and seamlessness to meet the demands of a 21st century economy.

21. Let me be clear: this merger is not a "Hail Mary" to save a foundering business. Norfolk Southern is strong financially, operationally, and culturally. While salvage has been the basis of many a rail combination, we are not entering into this

merger because we must. We do so because it is the right next step to unlock even greater potential for our customers, our employees, and for the United States supply chain as it competes in a worldwide economy. We are entering this merger from a position of strength to grow even stronger.

22. Proof of Norfolk Southern's strong performance is in our 2024 results, a year of transformation and momentum-building. We delivered results demonstrating both resilience and progress, and we did so under conditions that tested our ability to adapt and innovate.

23. **Safety Leadership**: We reduced FRA-reportable mainline train accidents by more than 40% year-over-year—the best improvement in the industry. We expanded first responder training to more than 5,500 participants, and we deployed advanced inspection technology to detect potential risks before they become incidents.

24. **Operational Excellence**: In 2024, our system train speed improved by more than 10%, with merchandise service up 11% and unit trains up 17%. We delivered great peak season service while handling 7% more parcel volume per day—proof that our network has the resilience to support customers even under intense demand. And our rebuilt resiliency was on full display following Hurricane Helene, which knocked out Norfolk Southern tracks to and from Asheville. We were able to reopen core routes safely within 72 hours of the hurricane by clearing 15,000 trees, repairing washed out areas and deploying hundreds of generators.

25. **Innovation**: The Great Lakes Reload facility in Chicago increased its volume by 62% compared with 2023, demonstrating the market's demand for new logistics solutions. We supported more than 140 new industrial projects, representing $4.3 billion in customer investment, while deploying technology to give customers real-time visibility into their shipments.

26. **Culture and People**: Our frontline teams have been more engaged than ever, and the results show in safety, service, and customer satisfaction. We have trained more than 2,300 employees through our Safety Camps and reintroduced our SPIRIT Values: Safety, Performance, Integrity, Respect, Innovation, and Teamwork. We made major investments in leadership development and strengthened our "Speak Up" culture, ensuring that employees have the confidence and tools to raise issues and drive improvements.

27. These results prove that Norfolk Southern has the discipline, performance, and innovation necessary to succeed by today's standards and to make this merger successful by the standards of tomorrow.

III. The Need for More: Why Railroads Must Evolve

28. Norfolk Southern is strong on its own. But when two strong railroads combine their complementary networks, their capabilities, and their people, the potential for growth and improvement multiplies. As I have said to our employees:

> It's not that we don't believe in our ability to stay independent and grow. But when you combine the strengths of two successful railroads, one plus one can equal three—meaning the whole is far greater than the sum of the parts.

29. While Norfolk Southern approaches this merger from a position of strength, it is clear that individual strength will not be enough in the future. The world around us is changing, and the transportation marketplace is evolving faster than ever before. Despite efforts otherwise, growth in the rail industry has been stagnant and far outpaced by the growth of our trucking competitors. All of the major U.S. railroads have been treading water for almost twenty years, while the economy, trucking, and our customers' needs have evolved and grown. It has become evident that a structural barrier is impeding rail's potential. So, we ask ourselves: "Does there need to be a catalyst to achieve a breakthrough in growth? Is something interfering with growth?" The U.S. railroad industry has stalled. Something has to change.

A. The Growth Malaise in Railroads

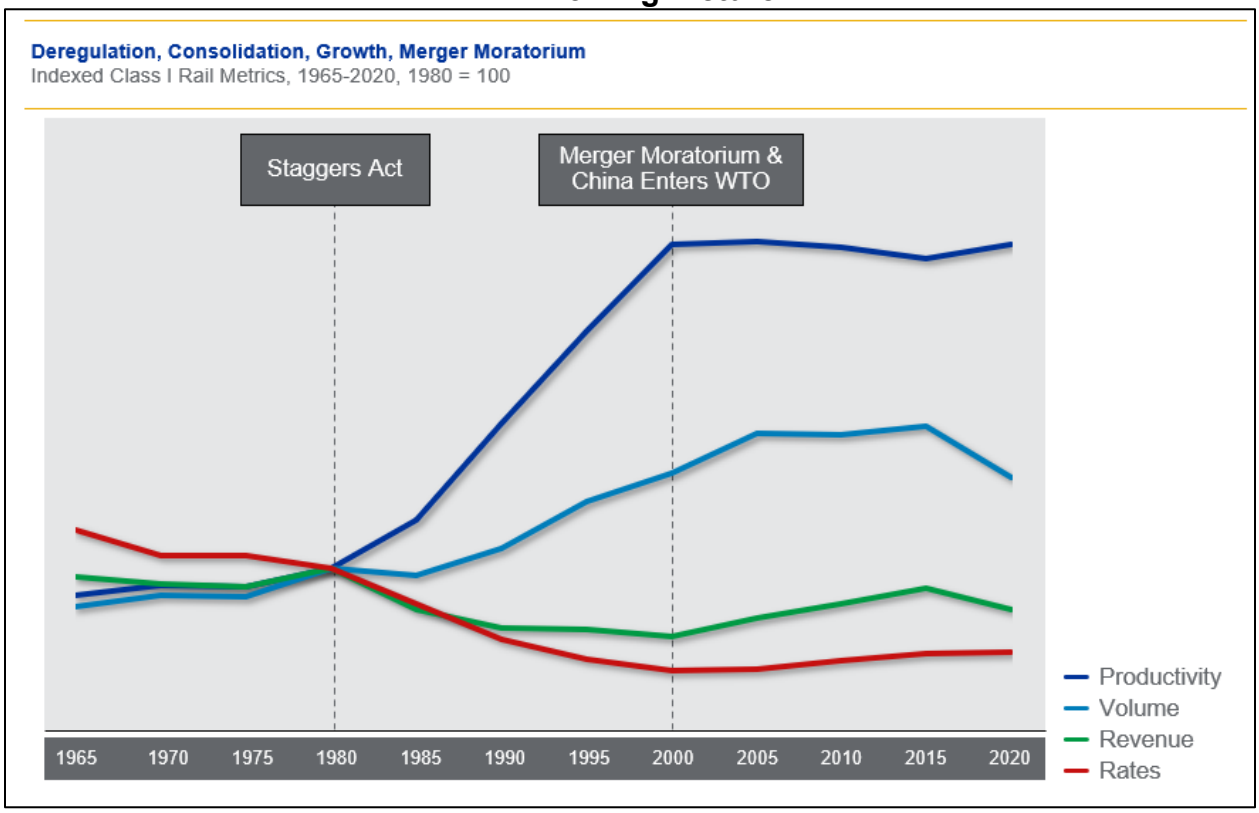
30. For two decades, Norfolk Southern's growth—and indeed the growth of every major U.S. railroad—has lagged far behind the expansion of the trucking sector. Trucks are gaining share because they offer the speed, flexibility, and integration that customers demand. Railroads, meanwhile, struggle to keep up.

31. At the same time, our customers' expectations are rising. Many operate in just-in-time environments where even short delays can shut down production lines. They expect real-time visibility into their shipments, seamless service across regions, and frictionless contracting. They want the same ease of doing business that they get from trucking and logistics providers: single-stop service, speed, transparency, and responsiveness.

32. Broader trends amplify these pressures. The rise of e-commerce, the near-shoring of manufacturing to the United States and the need for more resilient

supply chains are examples. Each requires carriers to be more nimble, flexible, and customer focused. If we cannot adapt, freight will continue to migrate to highways, and railroads will steadily lose relevance.

B. Why U.S. Rail is Falling Behind



33. Why is the U.S. rail industry falling behind? From 1980 through 2000, U.S. freight rail made tremendous progress, driven by the Staggers Act deregulation and a new focus on efficiency. During this period, railroads consolidated, shed excess capacity, and invested heavily in operations. And the short line industry grew by leaps and bounds. Those changes produced decades of productivity growth and financial stability.

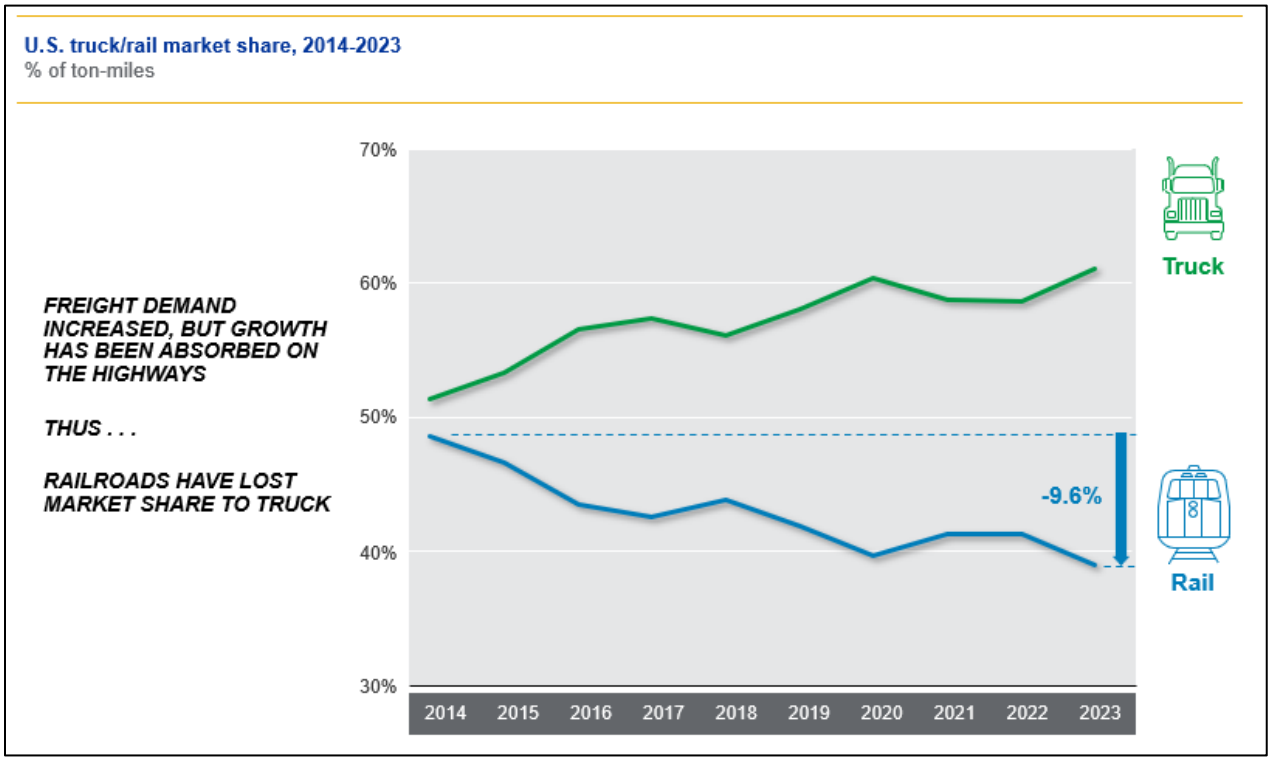
34. After the consolidations of the late 90s, the industry enjoyed several years of growth prompted by significant investment and by unlocking the potential of the new, larger networks we had created. For example, after Norfolk Southern stabilized our Conrail acquisition, we realized intermodal growth of over 1 million units—almost 50%. This would not have happened but for the industry consolidation. But as we entered the Great Recession, growth had already begun to plateau, and most railroads suffered significant reductions in business in 2009 and 2010.

35. While there are many reasons for that—including service volatility), the decline in coal, and the acceleration of logistics demands of our customers—two factors stand out to me as key drivers of malaise. First, U.S. domestic industrial production stagnated as China entered the World Trade Organization ("WTO") and manufacturing left our shores for cheaper overseas locations. Second, while consolidation in the U.S. rail industry might have been the best response to all of

these factors, merger activity among major railroads came to a stop, leaving the industry to operate under a fragmented structure that forces costly interchanges between carriers, adds complexity, and erodes accountability. This lack of integration continues to make rail less competitive than it could be because customers prioritize simplicity and reliability, even when rail is cheaper and greener.

Figure 1[1]
An Evolving Picture

36. The lesson inherent in this history is apparent. Progress was real when railroads continued to evolve. Growth stopped when evolution stopped. Decisions may



[1] *See* American Association of Railroads, Railroad Facts and Analysis of Class I Railroads. "Rates" is inflation-adjusted revenue per ton-mile. "Volume" is ton-miles. "Productivity" is revenue ton-miles per constant dollar operating expense. "Revenue" is operating revenue in 2022 dollars. (1980=100.)

have seemed correct when they were made, but as times and circumstances changed, we have grown, evolved, and enhanced the way we do business. Just think about how much technology alone has changed in 25 years.

C. Lessons from the U.S. Trucking and Canadian and Mexican Rail Industries

37. The U.S. trucking industry offers the clearest proof of the value of an integrated, national transportation network. Today, the top ten U.S. trucking companies all provide integrated, nationwide service. But that was not always the case. Before deregulation in 1980, trucking was fragmented, regional, and more dependent on alliances and handoffs to create long-haul service similar to the rail industry of today. Deregulation unleashed competition, which in turn drove innovation. The industry reinvented itself—moving from a patchwork of carriers to seamless national networks—and never looked back. While freight demand has increased, more and more of that demand is being satisfied not by rail, but by the highways.

Figure 2[2]
Truck Continues to Take Market Share from Rail

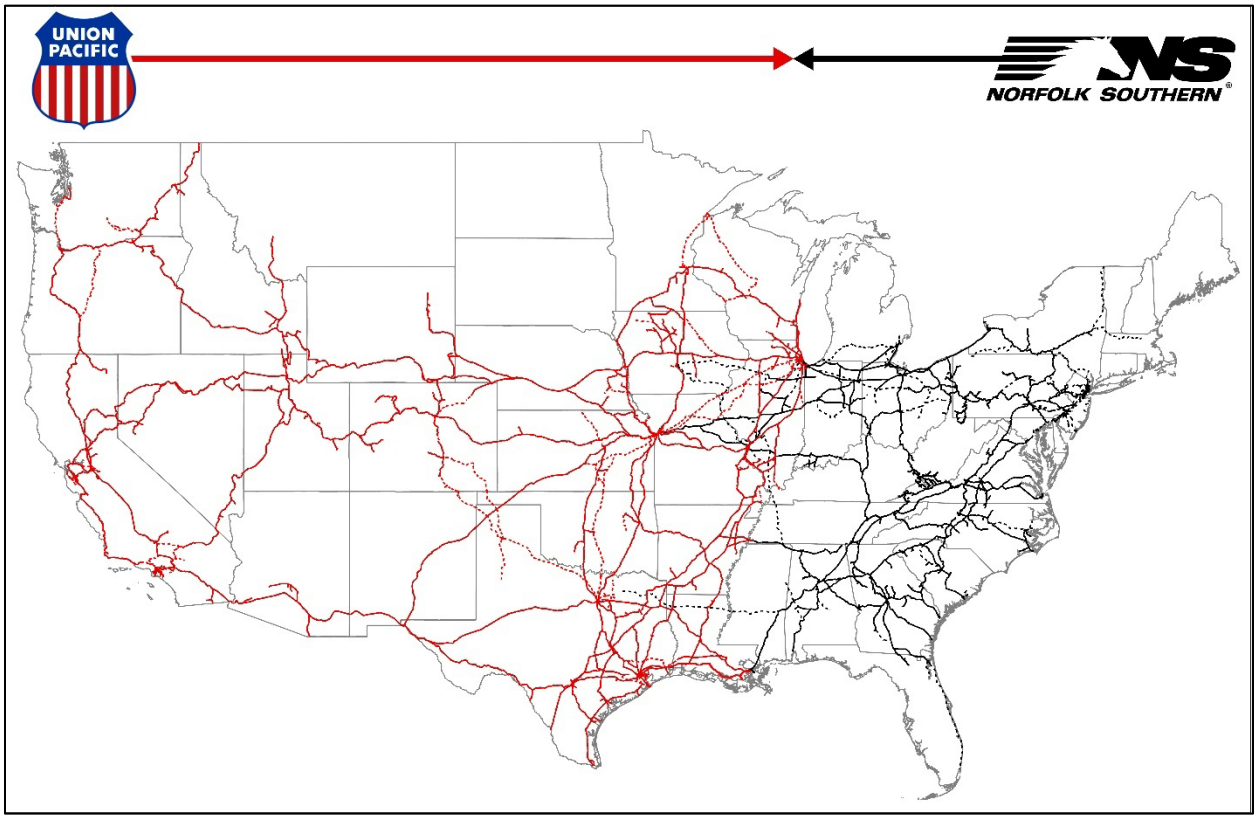
38. Canadian carriers have had the benefit of transcontinental networks for more than a century. Canada's economy and its ports have long enjoyed the advantages of two coast-to-coast railroads, enabling them to capture growth, attract investment, and serve global markets with seamless efficiency. The existence of Canada's transcontinental railroads allows Canadian companies to divert into their ports freight that is ultimately bound for U.S. markets; such freight can move more efficiently across Canada and into the U.S. than it can move across our own country. The results speak for themselves: Canadian rail has grown, while U.S. rail has shrunk.

[2] *See* Workpaper "M. George VS - Truck vs. Rail Market Share.xlsx."

39. Two years ago the STB approved a merger allowing a Canadian railroad to create a north-south transnational railroad connecting the Canadian heartland, through the United States, and into the most important markets and ports in Mexico. In the meantime, U.S. domestic ports and markets continue to be divided into east and west railroads with time consuming interchanges to move cross country.

40. The public interest justifications for a true American transcontinental railroad are compelling. Such a railroad could finally deliver to American shippers, workers, and communities the same benefits that Canada and Mexico enjoy and that our trucking competitors have offered for decades.

D. The Answer Is Clear



41. The message is unmistakable. I am proud of Norfolk Southern's performance in recent years. Despite significant challenges from the COVID pandemic, the Great Resignation and the supply chain collapse, our performance is as good as ever. But we cannot rest on "as good as ever" because, without the return to volume growth that a combination will unlock, the railroads will be stuck in cost reduction mode. Continued evolution requires a relentless drive to innovate and improve.

42. In the face of stagnant long-term growth, our industry cannot stand still while our customers demand more and the highway is delivering. Railroads must further evolve, shifting our mindset to one that embraces urgency, innovation, and customer service at every turn. That is the spirit—and will be the effect—of this merger.

IV. Benefits of the First American Transcontinental Railroad

43. The proposed transaction will create immediate and long-term value for customers, short line partners, and the country. Customers will gain more single-line services across the country, providing faster transit times, greater reliability, and more cost saving options compared to highway solutions. Short line partners benefit from new connections and growth potential through access to new markets. And the nation benefits through reduced highway congestion, stronger manufacturing supply chains, less environmental impact, and greater global competitiveness.

Figure 3
A Transcontinental Railroad

44. A single, coast-to-coast network removes barriers that slow down freight, reduces costs and improves reliability. It will put rail on a more competitive

footing with the highway, generating benefits that will extend from customers to employees, short line partners, and communities across the nation. Importantly, a transcontinental railroad will support the country's goals for growth, manufacturing, and sustainability.

A. For Customers

45. At the heart of this merger is a promise to our customers: seamless, single-line service from coast to coast, including the currently underserved watershed markets. By eliminating interchange handoffs that have functioned as toll gates impeding efficient transport, we will deliver faster transit times, lower costs, reduce delays, and operate with greater reliability. This is the most powerful benefit of integration, and it is why shippers across the country have told me that they support this transaction.[3]

46. UP and Norfolk Southern's Application contains the technical details, the modeling, and the data that demonstrate the vast benefits of this merger. Here are proof points that illustrate the real, tangible benefits of the proposed transaction.

- **Single-line service**. Single-line, coast-to-coast service without today's interchanges will deliver faster transit times, fewer delays, lower costs, and greater reliability. By eliminating interchange handoffs, shipments will move seamlessly across the network with one accountable carrier. In fact, rail's market share against truck is roughly three times higher where single-line service is available which makes sense as freight that moves end-to-end on one integrated network results in faster transit times, fewer handlings, greater reliability, and lower total logistics costs. The benefits of single-line service are undeniable. This merger will transform more than 84,000 county-to-county lanes where shippers

[3] *See* App. Vol. 3, Statements of Shippers, Government Officials and Others in Support of Application.

truck industrial and bulk freight from interline to single-line rail service for the first time.

- **Watershed opportunities.** The integrated system will capture new traffic, expand into markets where rail has traditionally struggled, and make rail viable in lanes long dominated by the highway. The watershed is characterized by shorter-haul routes on both sides of an interchange where rail networks meet. This interchange friction adds disproportionately higher transit time (and cost) to an otherwise short move, that effectively repels traffic to the highway. The merger will create new seamless single-line service to serve freight without interchange and better position rail to compete with the highway. This merger will transform 41,000 lanes within and into the watershed markets from interline to single-line service (of the 84,000 total), and by doing so shift 105,000 carloads of merchandise traffic from the highways annually (of the 183,000 total projected carloads of merchandise growth).

- **National economic benefits.** The merger will advance U.S. manufacturing, reduce highway congestion and impacts to roadways, create a more resilient supply chain, and improve the competitiveness of U.S. ports against ports in Canada and Mexico as routes into North America for international shipments. The Parties anticipate that the merger will take over 2 million trucks off the highways. Fewer trucks mean less congestion, lower emissions, and safer roads for the people who live and work in these regions.[4]

47. The transformation is obvious: what today is a patchwork of interline rail routes becomes a unified national system. What was once thousands of interline service routes will become seamless single-line rail offering more efficient, competitive service.

48. The benefits are not limited to today's rail customers. While existing customers will see immediate improvements and expanded access to markets, the

[4] App. Vol. 2, Verified Statement of David T. Hunt & Matthew Schabas at Exhibit 2-4 (Estimated total truckloads and truck-miles removed from roadways (excludes local drayage mileage for intermodal diversions)); *see also* App. Vol. 2, Op. Plan.

new seamless, interconnected railroad will also create opportunities to capture new traffic and expand into markets where rail has traditionally struggled to compete. And, as the country reindustrializes, manufacturers will entertain sites along the rail network knowing that we can offer single-line service to destinations where single line service previously did not exist.

49. For decades, the highways have had an advantage in speed, reliability, and simplicity. A fully integrated transcontinental railroad will change that equation. By reducing transit times, eliminating inefficient interchanges, simplifying logistics, and improving reliability, we can make rail more competitive with trucking and win back freight.

50. The benefits will extend across the supply chain. Intermodal customers will see faster, more predictable service. Manufacturers and industrial producers will enjoy more reliable connections to their suppliers and markets. Grain shippers will gain more efficient access to ports, while chemical producers will have safer, more dependable options to move their products. And U.S. ports will be able to provide the same transcontinental service that now is offered only by ports in Canada and Mexico. By eliminating speed bumps and duplicative choke points, we will unlock capacity and reliability across every sector.

B. For Short Line Partners

51. Short lines, our trusted partners who are so often the first and last mile of our service, share our entrepreneurial spirit and extend our reach into every community and corner of the economy. They make rail personal, building relationships with farmers, manufacturers, and small businesses. And in doing so,

they ensure that rail remains relevant, competitive, and responsive at the local level. A faster, seamless, coast-to-coast network will give short lines the ability to deliver superior service to their customers and access to more markets unburdened by artificial barriers and delays.

52. Norfolk Southern's and UP's short line partners have recognized the value America's first transcontinental railroad could deliver for them and their customers.[5] The growth that our merger will facilitate will be a tide that rises for all, opening for short lines new opportunities to reach national and global markets. The ripple effect will strengthen local economies, power new industrial growth, and deepen the partnerships that keep America's supply chain strong.

C. For the Country

53. Freight rail already is vital to America's core economic infrastructure. Every day, it moves the goods that power our factories, stock our shelves, and connect our ports, manufacturers, and farmers to world markets. It ensures that American products are shipped by American companies, creating American jobs and building American wealth. This merger will unlock the full potential of American manufacturing by strengthening supply chain resilience and supporting re-shoring.

54. This merger will make today's rail faster, better, and stronger. We will move more freight, more efficiently, and more reliably than ever before and in a way that strengthens our economy and secures America's competitive edge.

[5] *See* App. Vol. 3, Statements of Shippers, Government Officials and Others in Support of Application.

55. Designed for the demands of the modern economy, the combined network will reduce costs, expand opportunity, and build a stronger, more connected America. It also enhances U.S. rail competitiveness against the Canadian and Mexican transcontinental railroads that already exist.

V. Why These Benefits Can Only Come from a Merger

56. Since announcing this merger, I have traveled widely, meeting with customers, employees, investors, and community leaders. In every conversation, I have seen recognition of the power that this merger can bring to the country and to the economy. People understand what is at stake. They see the opportunity to finally create a seamless, modern, coast-to-coast rail network that serves not just shippers, but American workers, families, and communities.

57. Only full integration can deliver the scale, coordination, and customer responsiveness necessary to compete with trucking and modern logistics providers. Partnerships and alliances have been used for decades. They have served—and continue to serve—as a vital option. But they are not enough because rail continues to lose freight market share to the highway. You don't need to look any further than the airline industry, which went through its own consolidation in the 2010s to give passengers more direct seamless options as opposed to relying only on codeshare alliances. That industry is far healthier today.

58. The late Patrick J. Ottensmeyer, legendary CEO of Kansas City Southern, saw risks with relying only on alliances. During the CP-KCS proceedings, he testified:

> Unfortunately, as is often the case when two railroads try to collaborate on arrangements such as joint marketing

> and joint operating agreements, they fail. This is because each railroad works to protect its interests or not expend its capital on a risky commercial opportunity for which there is no guarantee of adequate returns.[6]

Pat was right then, and his words ring even more true today. Railroads cannot contract their way to a seamless network through alliances and marketing agreements. Only integration can remove the structural barriers that prevent full cooperation, seamless operations, and effective investment.

59. Actual integration also fosters a level of strategic agility alliances alone cannot offer. A merged company can work with customers to respond in real time to market changes—shifting gateways, creating new blocks of traffic, adjusting operating plans, extending sidings, moving crew districts, deploying new technology—without endless negotiation and renegotiation with interline partners as often occurs when operating under an alliance. If a customer's needs change because a factory returns production from overseas to the United States, an integrated railroad can quickly reroute traffic to a different port or inland market. If new markets open for American grain exports, an integrated railroad can promptly create new unit train service to capture the opportunity. And if customers face new competitive pressures in regions like the Gulf Coast or the Pacific Northwest, or from Mexican or Canadian origins and destinations, a merged network can reconfigure operations immediately to meet those demands. Alliances, by contrast, require new

[6] Verified Statement of Patrick J. Ottensmeyer, Ex. 2 to Joint Motion for Approval of Voting Trust Agreement, *Canadian Nat'l. Ry. Co. et al.—Control—Kansas City S. et al.*, STB Docket No. 36514 (STB filed May 26, 2021).

agreements for every material change, resulting in missed market opportunities for customers while railroads haggle over how to respond.

60. This merger does not mean that alliances will go away or that they should. Alliances will continue to be an important part of this industry, particularly where geography requires cooperation. One unmovable difference between railroads and trucking is that rail assets are fixed. We cannot easily change our geographic footprint the way that trucks can. That means that when new opportunities arise—opportunities that can only be met by a joint service arrangement with another Class I—we will continue to have the same incentives to work together that we have today. Whether that involves UP and CSX, UP and BNSF, or UP working with the Canadian and Mexican railroads, the merged company will remain committed to collaborating to meet customer needs.

61. From Lincoln's vision of a unified country by rail to Eisenhower's creation of a seamless interstate highway system, America has always chosen integration over fragmentation. The notion that a series of alliances could substitute for a transcontinental railroad is ill-conceived.

VI. Conclusion

62. This merger is more than a business transaction. It is a responsibility to contribute to building the infrastructure that America needs to compete in the 21st century: seamless, national, and responsive. Only full integration can deliver a change on the scale of the Eisenhower Interstate Highway System—a once-in-a-generation modernization that redefines what is possible for freight movement in

America and provide a seamless, competitive, and responsive competitive option to trucks.

63. I therefore urge the STB to approve the proposed transaction as consistent with the public interest. The record is clear. The benefits of the combination are compelling. There is no credible competitive harm. Indeed, the merger began enhancing competition the day it was announced, with competitors announcing new interline partnerships in response to the mere mention of the proposed transaction. This reflects our competitors' concerns that our merger will do exactly what we said it will do: reduce transit times and costs and provide shippers with access to new markets and opportunities. Our competitors believe that they can compete via these new interline partnerships and we strongly believe they do offer compelling alternatives. But one thing interline partnerships cannot do is eliminate the friction and associated transit delays that a single-line service offers to customers, and that will result from this this transaction.

64. Combining two complementary networks into a U.S. transcontinental railroad creates massive competitive benefits: more efficient use of infrastructure, seamless service, fewer handoffs, greater accountability, and stronger competition with trucking. Our application details those benefits in specific, measurable terms, and they align directly with the Board's obligation to protect and promote the public interest.

65. The future of American rail is seamless, coast-to-coast, and customer-driven. Approving this transaction to complete the work that President Lincoln started and creating America's first transcontinental railroad is how we get there.

VERIFICATION

I, Mark R. George, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

JOINT VERIFIED STATEMENT

OF

KENNY ROCKER AND CLAUDE E. "ED" ELKINS

I. Introduction

A. Witness Qualifications

1. My name is Kenny Rocker. I am Executive Vice President, Marketing & Sales at Union Pacific Railroad ("UP"), a position that I have held since August 2018. I joined UP in 1994 and have held various positions in Marketing & Sales, including assignments in Automotive, Chemicals, the Market Development & Sales Center, and Industrial marketing. Prior to my current position, I served as Vice President, Industrial. In my current role, I oversee UP's three major business units—Bulk, Industrial, and Premium—as well as Marketing & Sales Operations, Commercial Strategy, our Mexico business, and our Loup Logistics subsidiary. I have a bachelor's degree in finance from Tuskegee University.

2. My name is Claude E. "Ed" Elkins. I am Executive Vice President and Chief Commercial Officer at Norfolk Southern Corporation ("NS"). I assumed this role in December 2021. I lead NS's Intermodal, Automotive, and Industrial Products business divisions, and oversee the Real Estate, Industrial Development, First and Final Mile Markets, and Customer Logistics business groups. I began my railroad career at NS in 1988 as a road brakeman after completing my service in the U.S. Marine Corps. Over time, I held operational roles, including conductor, locomotive engineer, and relief yardmaster, before moving into marketing and commercial functions with leadership roles in intermodal marketing, chemicals marketing, and

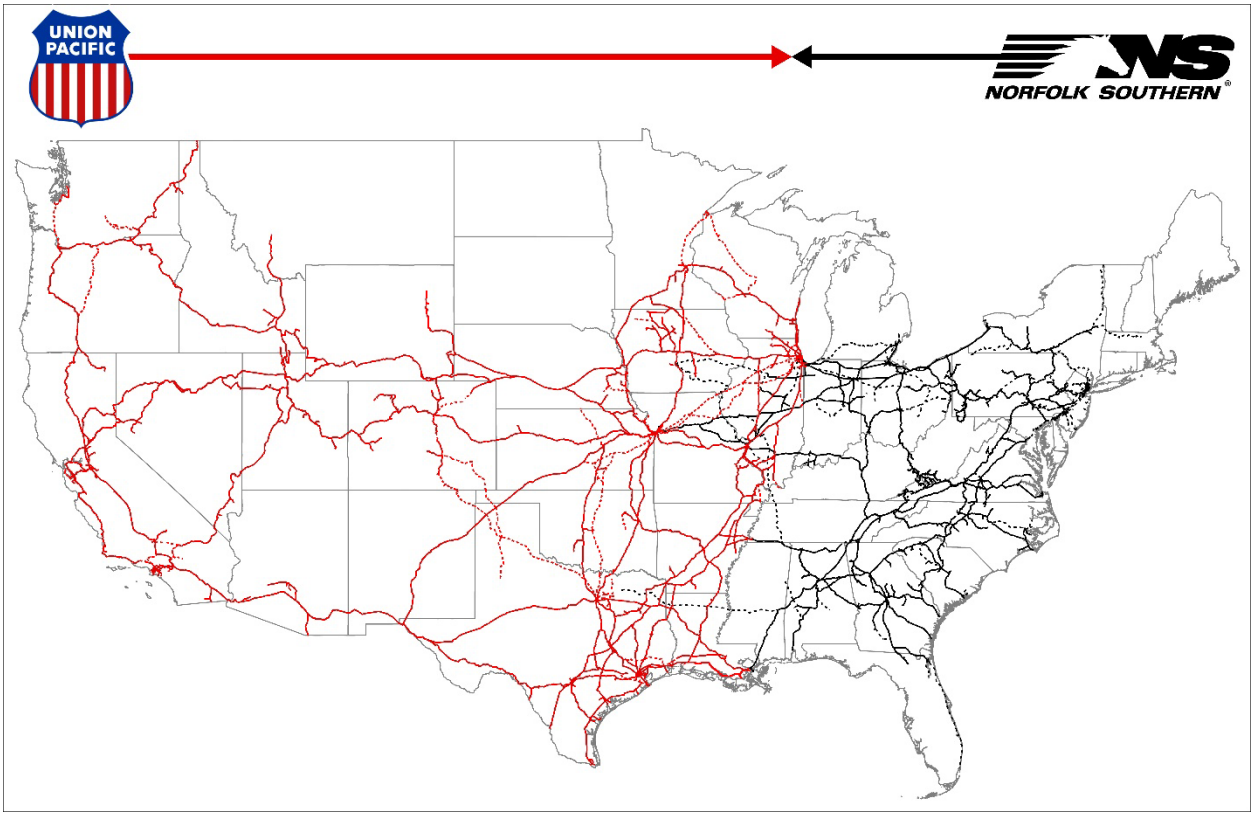
industrial products. I earned a bachelor's degree in English from the University of Virginia's College at Wise and an MBA from Old Dominion University with a concentration in port and maritime economics.

B. Purpose and Scope

3. The purpose of this joint verified statement is to describe the significant market benefits of the proposed combination of UP and NS and to explain how those benefits will be realized. This statement will demonstrate that the transaction will enhance competition, expand service options for customers, and strengthen rail's ability to compete with trucks and other modes of transportation.

4. This statement also explains why the public benefits of the transaction cannot be achieved absent the proposed transaction. While both UP and NS have invested heavily in network improvements, the opportunities that arise from an integrated, end-to-end system cannot be replicated through commercial arrangements or isolated partnerships. Only by combining the two networks into a single, unified operating and marketing structure can these benefits be fully realized.

5. Our testimony further describes how the transaction is unambiguously pro-competitive. In particular, we will explain how the combined entity will preserve and enhance competitive options for customers, maintain open gateways, and provide new opportunities for customers that do not currently have direct access to the benefits of the combined network.



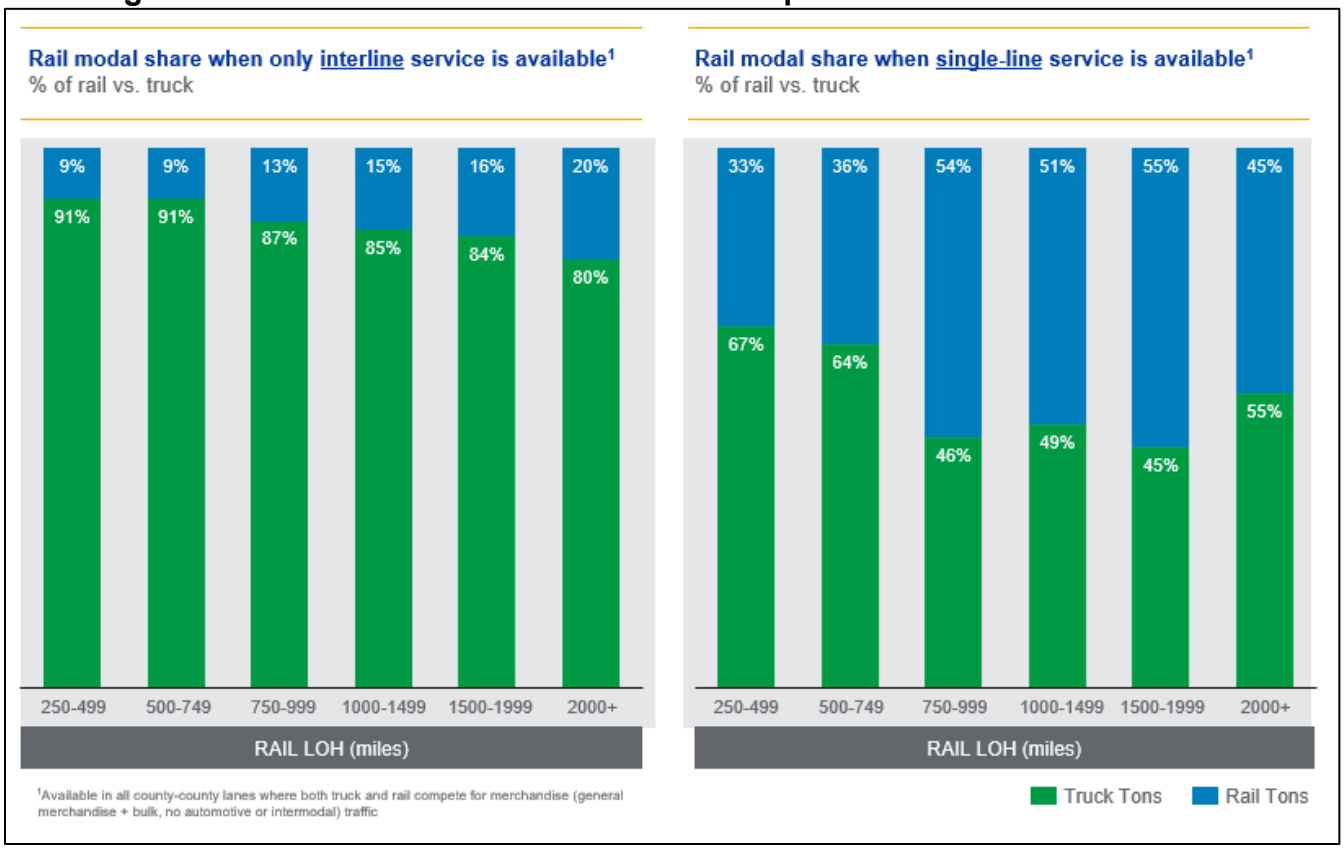
6. We have reviewed the merger-related traffic growth projections prepared by Oliver Wyman and included with this Application. Based on our experience working directly with customers and understanding their transportation

needs, we find these projections to be reasonable. The anticipated growth aligns with what we hear from customers about the demand for more competitive rail service and supports our view that the combined network will deliver a compelling value proposition to the marketplace.

C. Overview—A Unified Rail Network for American Businesses

7. This merger is a landmark opportunity in American transportation history. Railroads have always been part of the backbone of this country, connecting farms, manufacturing industries, and ports for nearly two centuries. By bringing together UP's expansive western rail network and NS's powerful eastern reach, we have the chance to write the next chapter in that story.

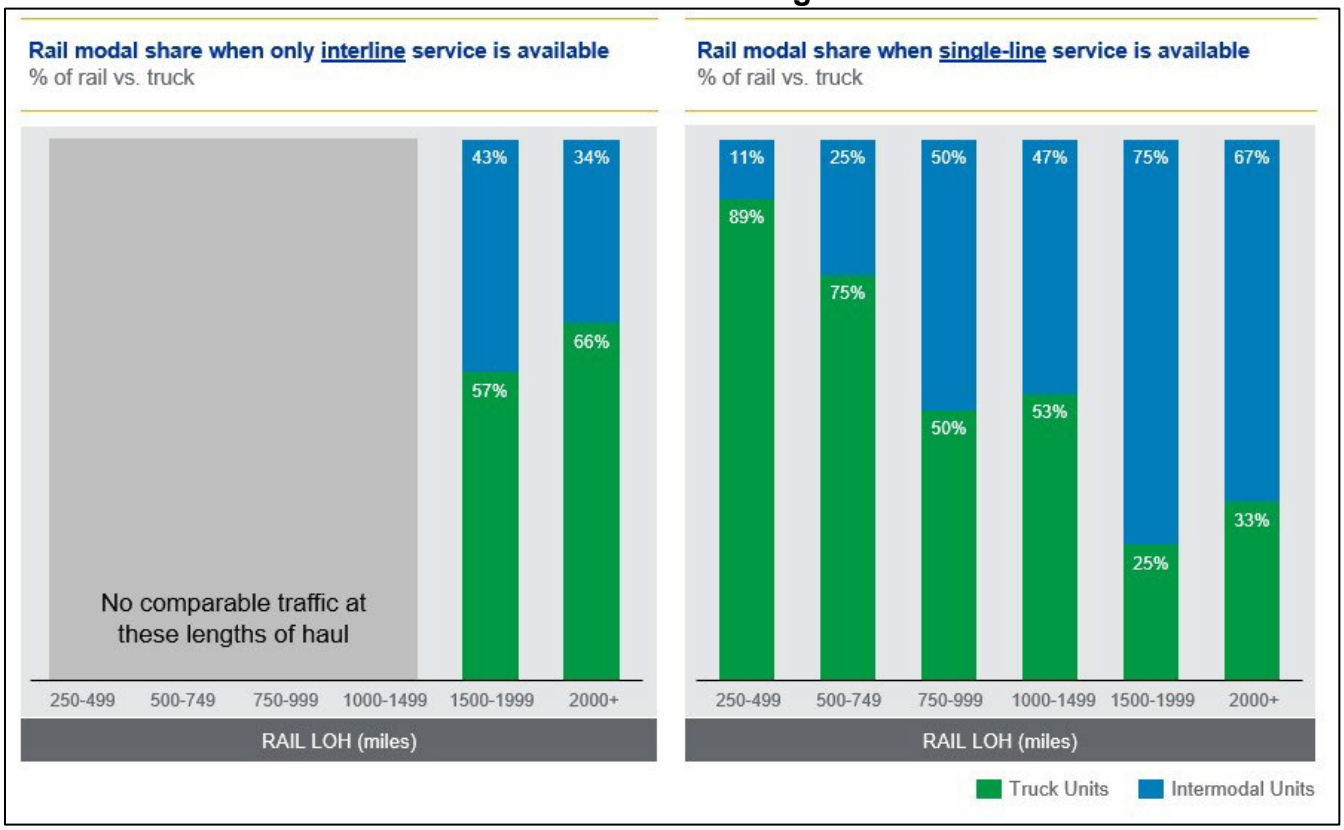
Figure 1
America's First Transcontinental Railroad



8. This merger will grow rail traffic by giving U.S. businesses a faster, more reliable way to move their goods, and it will enhance competition not only with other railroads but with trucks. It will permit the combined company to build a future that outcompetes the present. Put simply, this combination creates a stronger platform for American growth, whether you're shipping across the state, across the country, or across the ocean.

9. Trucks are rail's biggest competitor. While UP and NS work aggressively, with a hustle mindset, to keep and grow rail traffic, the reality is that a fractured rail industry cannot compete effectively against the trucking industry. Trucking offers a seamless, nationwide network, as well as continued technological innovation that promises to lower costs and reduce down time. While individual railroads are investing in technologies to likewise increase their efficiency and reduce their costs, we are hampered by artificial geographic boundaries that result in separate networks, separate priorities, and a lack of integration.

10. As a result, customers often have a hard time simply determining the schedule for interline shipments. It can take customers up to seven days to get a rate for an interline shipment, whereas UP and NS each usually quote direct shipments in one business day. With different carriers, different schedules, different sales personnel responsible for individual pricing, and different rules, no one is accountable for the whole customer experience. This merger is designed to fix that problem by giving customers coast-to-coast, seamless, single-line service.

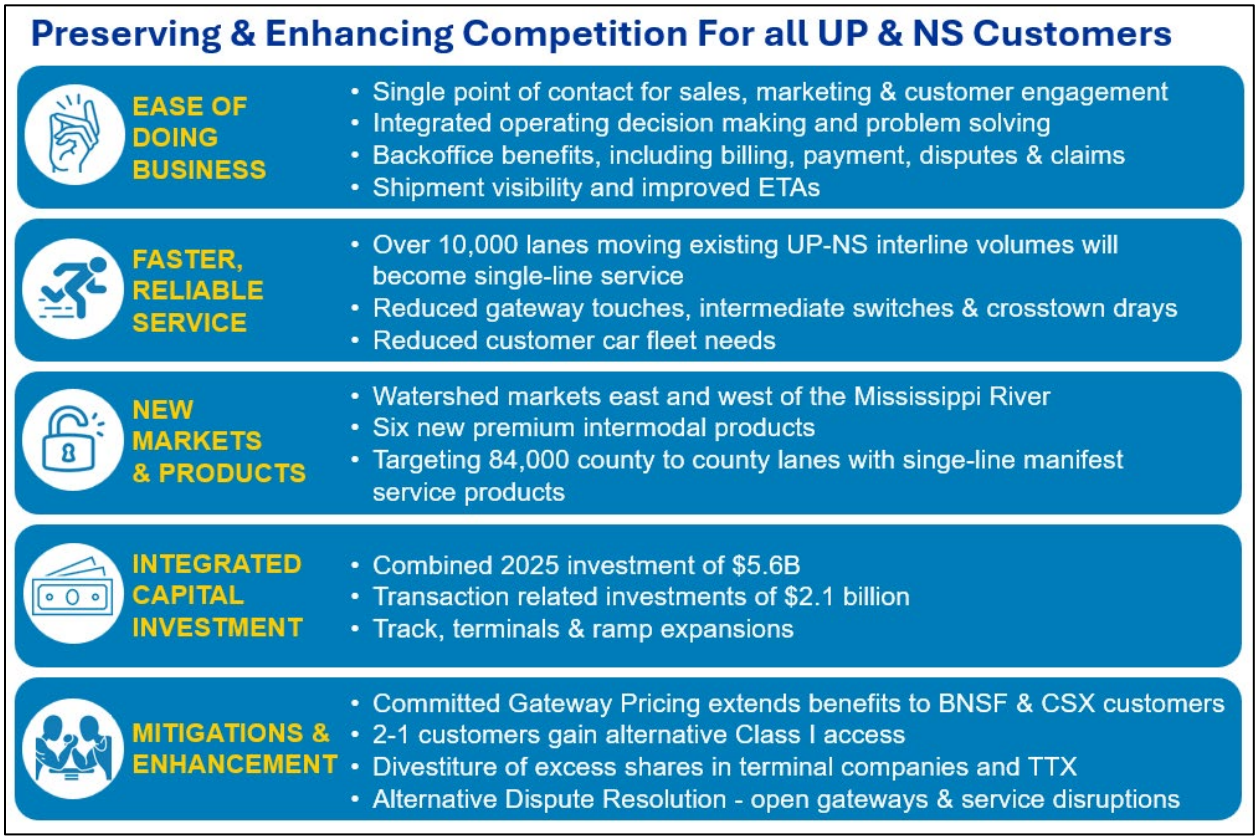


11. The market's preference is crystal clear: customers overwhelmingly and consistently choose single-line options. As shown below in Figure 2 (merchandise service) and Figure 3 (intermodal service), rail's market share against truck is roughly two to three times higher where single-line service is available.

Figure 2[1]
Single-Line Merchandise/Bulk Rail Service Outperforms Interline Service

[1] Verified Statement of David T. Hunt and Matthew Schabas ("Hunt/Schabas VS") at Exhibit 3-1.

Figure 3[2]
Intermodal Customers Also Prefer Single-Line Service



12. The first big win for customers will be more predictable, dependable single-line service. By eliminating the gateway delays that slow down freight today, customers' goods will move more smoothly and quickly across the combined network. No more lengthy delays at interchange points or hand-offs between carriers. Just a single, end-to-end trip that keeps freight on schedule, reduces uncertainty, and for private railcar asset owners, increases productivity.

13. The second big win will be simpler, more customer-friendly commercial relationships. Instead of juggling multiple contracts, multiple carriers, and multiple sets of rules, customers will have true one-stop shopping. That includes unified

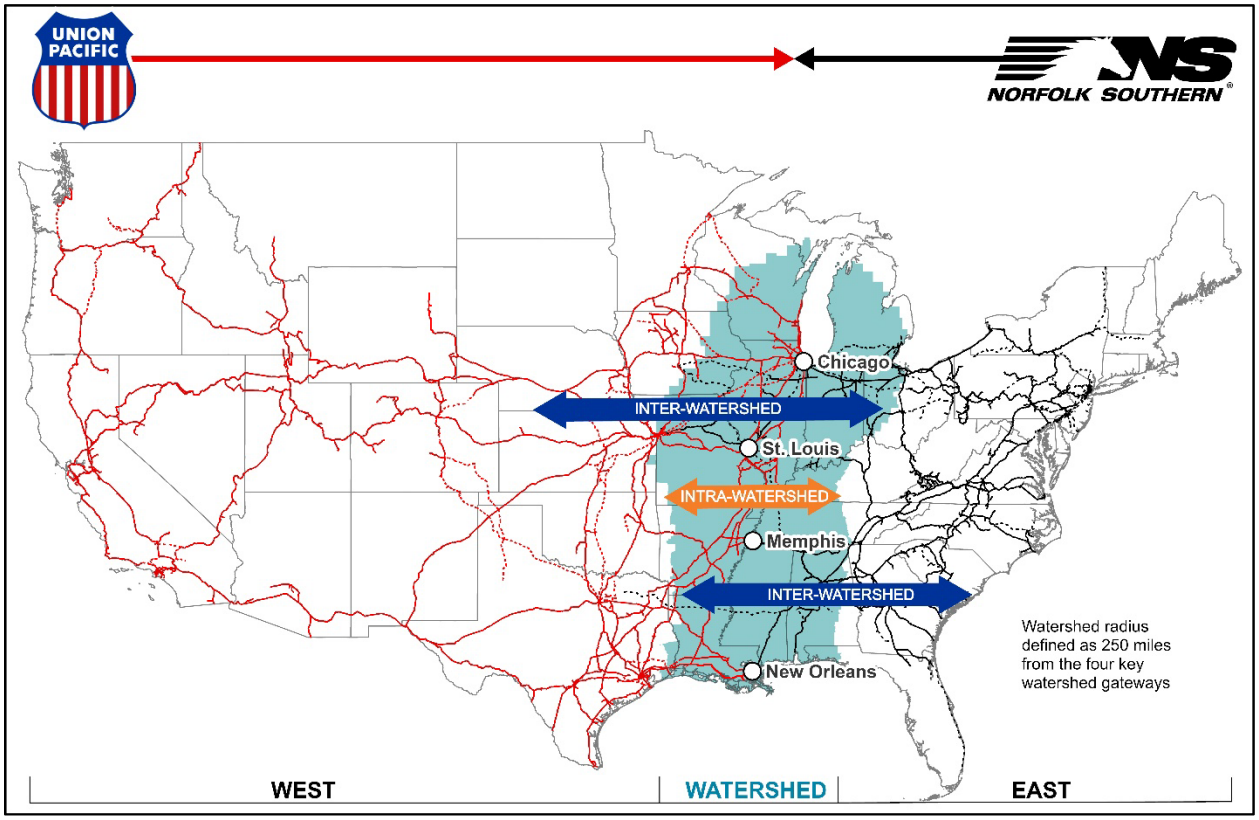
[2] Hunt/Schabas VS at Exhibit 3-2.

commercial terms, a single, integrated logistics solution covering the entire combined system, and a single, comprehensive database of truck-to-rail transload options across the country. For the first time, customers will be able to plan their freight moves with rail as easily as they do with trucking.

Figure 4
Customer Benefits from America's First Transcontinental Railroad

14. A third win will be new visibility and better use of assets. The combined network will provide end-to-end shipment visibility across the vast majority of moves, replacing today's patchwork of systems with a single source of shipment information. Barriers that currently slow down the distribution of railcars will be cleared away, making equipment more available when and where it is needed. And the combined

entity will be committed to expanding telematics capabilities, giving customers richer data and more powerful tools to plan their supply chains with confidence.



15. These customer wins will extend across the spectrum of commodities:

- **Agriculture**: Expansion of new markets and inputs with no gateway barriers, plus new port options east and west of the Mississippi.
- **Automotive**: End-to-end supply chain solutions across the U.S. and elimination of geographic and economic barriers to fluid car supply, which will reduce inventory carrying costs for manufacturers and overall costs for the industry.
- **Chemicals**: Improved access for Gulf Coast customers to East Coast export centers such as Charleston, Norfolk, and Savannah.
- **Coal**: Seamless access for Western coal to Eastern utilities and Eastern coal to Western markets.
- **Food**: Reduced transit times for sensitive products—beverages from Mexico to Eastern markets, produce from the West Coast to the East Coast, poultry from the Southeast to the West.
- **Forest Products**: New single-line services that unlock lower costs, such as lumber moving from the Southeast to Texas.
- **Industrial Development**: A one-stop shop for industrial development support throughout the United States.
- **Intermodal**: The merging of the largest intermodal franchise in the East with UP's extensive network, creating new transcontinental products that eliminate interchange variability.
- **Metals**: Larger geographic reach for scrap inputs and seamless product movement from NS-served mills to high-growth areas in Utah, Arizona, Texas, and Mexico.

16. In terms of geography, this merger will unlock UP's and NS's full potential in the American heartland—the so-called "watershed" markets. These are transportation markets where interchange friction prevents railroads from securing a robust share of freight traffic from our trucking competitors. Where rail networks

meet, short-haul handoff lanes are particularly disadvantaged. There is not a precise demarcation—these watershed markets can fluctuate based on the region, commodity type, and other features. For simplicity, we define watershed markets where UP or NS would haul less than 250 miles before or after interchange. These markets are characterized by short-haul handoff lanes that sit right on the fault lines between the Class I railroad networks. Neither carrier owns the full trip, so no one can offer single-line service.

Figure 5[3]
The Watershed

17. Ultimately, the benefits to the Watershed markets and our customers described in this Application depend on the creation of a fully integrated network

[3] *See* Hunt/Schabas VS at Exhibit 4-8 and Appendix B.5.3.

with single-line service. It is single-line service that makes all the difference to our customers. Indeed, the performance advantages of single-line rail service over interline service are unmistakable. When freight moves end-to-end on one integrated network, customers experience faster transit times, fewer handlings, greater reliability, and lower total logistics costs. By contrast, interline movements—requiring multiple carriers, separate priorities, and disconnected systems—inevitably introduce delay, complexity, and frustration.

18. This merger will transform more than 84,000 county to county lanes to single-line service where shippers currently truck industrial and bulk freight.[4] That is fundamentally what this combination is about: realizing a unified rail network capable of providing single-line service across the entire nation.

II. Primed for Growth, but Constrained by Structure: Why Rail Needs to Do More to Compete

A. The Three Pillars of Railroad Growth: Service, Investment, and Innovation

19. As we both testified before the Surface Transportation Board in 2024, growth in railroading depends on getting the fundamentals right. At both UP and NS, that means three things: safely delivering reliable service that earns our customers' trust, investing in our networks, and innovating through technology and new products to meet customer needs. These fundamentals are the keys to long-term, sustainable growth.

[4] Hunt/Schabas VS at Exhibit 4-13.

20. The following subsections elaborate on how each pillar underpins growth, how UP and NS have built their respective strategies around them, and how the proposed merger will amplify their combined impact on a national level.

1. Safe, Reliable Service is the Foundation of Growth

21. At both UP and NS, we start with a simple principle: growth begins with safe and reliable service. Our customers judge us by one measure—whether we deliver the service we sold. Every carload, every shipment, and every interchange is an opportunity to prove that promise. When we deliver reliable, predictable service, we earn our customers' confidence and open the door to future opportunities and growth.

22. I, Kenny Rocker, can attest that over the past several years, UP has made substantial improvements in service reliability, train speed, and network fluidity. Those improvements are reflected in the metrics and in our customers' feedback. Service consistency has allowed our commercial team to pursue new business aggressively, supported by what we call a "hustle mindset"—a culture that prizes proactivity, responsiveness, performance, and accountability. When we meet a customer, our goal is always the same: to earn repeat business by delivering dependable results.

23. At UP, operational excellence is the foundation of that reliability. We've strengthened crew availability, built buffer capacity into our locomotive and equipment fleet, and streamlined terminal operations to keep freight moving on time. Those steps have translated into improved car velocity and reduced dwell times.

We've also used technology to enhance transparency, allowing customers to see where their shipments are at any time and plan accordingly.

24. At UP, we have demonstrated that when service improves, growth follows. Continuous improvement in reliability, responsiveness, and efficiency has positioned UP to meet and exceed customer expectations. We are proving that high-quality rail service—delivered safely, efficiently, and on time—is the essential foundation for growth. And that is the approach we will continue to use for a combined UP-NS railroad, the benefits of which will only amplify our ability to provide safe, reliable service coast to coast.

25. I, Ed Elkins, can attest that NS shares UP's mindset with regard to safe and reliable service. At NS, safety, reliability, and trust are the foundations for value creation and long-term success. We measure that success not by a single period of good performance but by our ability to deliver consistent, low-variation service month after month, even through changing conditions.

26. Our customers have told us that they most value predictability and consistency. They need a rail partner around which they can build their supply chain. As a result, every part of our operations—from train scheduling to yard performance to car distribution to crew availability—must align to produce consistent results. I am proud that, over the past 18 months, NS has seen measurable progress in train speed, network fluidity, and customer satisfaction. I expect this progress to increase when NS becomes part of an even stronger and more efficient unified UP-NS railroad.

27. One of the reasons this merger is needed is because, even when UP and NS achieve these high levels of service performance, we both continue to experience the headwinds and limitations of the structural barriers that constrain our growth: interchanges, geographic fragmentation, and divided accountability between East and West continue to prevent the rail industry from offering the seamless, single-line service that trucking provides over a free-flowing highway system.

2. Growth-Minded Investment to Increase Capacity, Safety, and Connectivity

28. Both UP's and NS's commitment to growth is backed by investment on a scale few industries can match. Since 2021, both companies have invested billions of dollars to expand terminals, modernize infrastructure, and strengthen both intermodal and carload offerings.

29. I, Kenny Rocker, can attest that, over the past five years alone, UP has spent more than $3.4 billion specifically for long-term growth—about $10 million every day—to keep our network fluid, resilient, and ready for the next generation of freight. These investments have added capacity, improved velocity, and positioned us to serve customers more efficiently and reliably.

30. I, Ed Elkins, can add that investment is likewise central to NS's growth strategy. We are building a network designed for reliability and resiliency—expanding track capacity, upgrading terminals, and modernizing equipment to handle greater volumes with less variability. Our capital program, which has spent well over $9 billion on improvements since 2021, is particularly adept at creating synergies between infrastructure and technology: *e.g.*, digital inspection portals,

autonomous track monitoring, predictive maintenance systems, and new customer-facing platforms. These initiatives increase safety, enhance fluidity, and deliver the experience customers demand.

31. From a broader perspective, UP and NS are investing in the physical and digital backbone of America's supply chain. These commitments demonstrate not only confidence in rail's future, but also our commitment to strengthen national competitiveness and supply-chain resilience. By combining our resources and efficiencies as a unified railroad, we will be able to invest even more—delivering more to our customers and to the American people.

32. Both UP and NS have shown what disciplined investment can achieve within their territories. But despite our respective efforts, the East–West divide in the nation's rail network limits the efficiency and reach of our investments. This merger will ensure the full realization of the benefits that these billions of dollars have created.

3. Innovation to Compete and Win

33. Both UP and NS view innovation as the bridge between performance and growth. We are both investing heavily in technology and data analytics to make rail even safer, easier to use, more transparent, and more reliable for customers.

34. Over the past five years, UP has invested more than $500 million in technology innovation, which includes tools that enhance shipment visibility and streamline communication for customers. These tools—along with new intermodal and cross-border services—allow customers to plan their supply chains with greater

precision, monitor freight in real time, and connect with our network more seamlessly than ever before.

35. Likewise, NS has invested $71.5 million over the past five years in innovations such as digital inspection portals, predictive maintenance, and GPS-based Rail Pulse telematics to improve reliability and responsiveness, as well as enhanced customer-facing platforms, such as AccessNS, that have given our customers better real-time visibility into their shipments and performance metrics. NS has invested an additional $110 million over the past five years to expand existing technologies such as hotbox detectors, automated train inspection, and track inspection tools to reduce the possibility of defects or safety incidents.

36. Today, data systems, digital interfaces, and operating platforms stop at the interchange boundary between East and West. As a result, customers turn to third-party providers to bridge these gaps. A unified network would allow the full integration of scheduling, tracking, and customer-service systems, turning today's separate advancements into a seamless, national rail experience. By integrating these systems end-to-end, the merger will eliminate the need for costly workarounds and deliver further savings to customers.

B. UP and NS: Two Railroads Operating at Best-Ever Performance

1. UP: Operational Excellence Backed by Laser Focus on Growth

37. The Board will hear directly from UP's Chief Executive Officer regarding the company's operating performance and efficiency. I, Kenny Rocker, as Executive Vice President of Marketing and Sales at UP, will explain how that

operational success translates into value for customers and growth for our business. When trains run on time and the network flows smoothly, customers gain the confidence necessary to make investments, plan production, manage inventories, and ultimately commit more freight to rail.

38. UP is operating at best-ever levels, delivering safe, reliable, and efficient service across its western network. Our teams have achieved measurable gains in train speed, network consistency, and trip-plan compliance—evidence of true operational excellence. Since the third quarter of 2023, UP's manifest service performance index increased from 84 percent to 100 percent; UP's intermodal service performance index increased from 85 percent to 98 percent; and UP's first mile/last mile performance increased from 91.4 percent to 96.5 percent.

Table 1[5]
Union Pacific's Operating Performance

Performance Statistics (%)	Q3 2023	Q4 2023	Q1 2024	Q2 2024	Q3 2024	Q4 2024	Q1 2025	Q2 2025	Q3 2025
Manifest service performance index	84	91	87	84	89	96	93	97	100
Intermodal service performance index	85	96	95	93	86	89	94	99	98
First mile/last mile performance	91.4	92.7	90.6	92.2	93.4	94.9	94.9	95.8	96.5

39. This performance matters because it generates confidence that rail can compete head-to-head with trucks on reliability and speed. Consistent execution allows UP to deliver the service it sells—on time, as promised—and to win new business by proving that rail can be as reliable and responsive as trucking.

[5] *See* App. Vol. 1, Verified Statement of V. James Vena at Table 2.

40. Every element of UP's operating model reflects disciplined execution—ensuring dependable, high-quality service day in and day out. From terminal fluidity to locomotive utilization, our operating teams are delivering steady, repeatable results. That reliability is the foundation of customer trust, and it's what allows us to compete successfully for freight that would otherwise move on the highway.

41. This combination of strong operational performance and commercial intensity is what drives UP's success. Operational excellence provides the reliability our customers demand, while the hustle mindset ensures that we remain proactive, innovative, and ready to compete. Together, they form the core of UP's growth strategy and its commitment to strengthening America's freight network.

2. NS: Disciplined Operations Delivering Customer-Focused Results

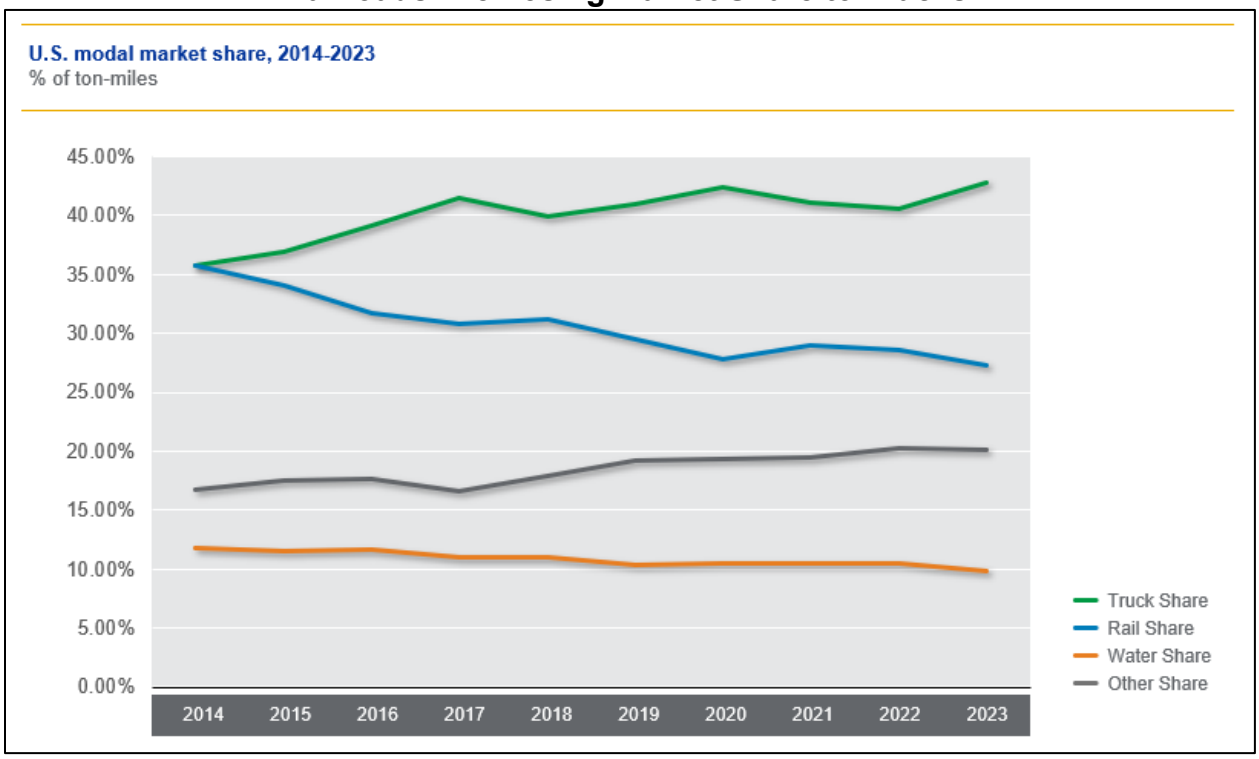
42. NS has also improved its service product and competitive strength as a result of operational discipline. Standardized processes, responsive "war rooms," comprehensive safety training, swift root-cause analyses, and a commitment to continuous improvement have increased our network velocity and improved our service consistency, ultimately better serving our customers.

43. As our service has improved, growth has followed. Our continuous improvement in reliability, responsiveness, and efficiency has positioned NS to meet and exceed customer expectations. Today, we are proving that high-quality rail service—delivered safely, efficiently, and on time—is the essential foundation for growth.

3. UP and NS: Two Railroads in Sync—and Poised for More

44. In our view, UP and NS are executing at a high level across each of the key drivers of growth—service, investment, and innovation. Each is demonstrating operational excellence and an unwavering commitment to customer success. Trains are moving on time, terminals are fluid, and customers are receiving dependable service. Both railroads have invested heavily in capacity and technology to build networks that are safer, more efficient, and more sustainable, proving that when rail focuses on fundamentals, it delivers results. And our methods are compatible, giving us confidence in our ability to smoothly integrate and expand these advantages for customers.

45. The next chapter of growth depends on knocking down the old barriers that divide East from West and building one connected network that works for everyone. Our customers don't care where one railroad ends and another begins—they just want one schedule, one point of contact, and one dependable trip from start to finish. Together, the merged UP/NS can deliver that: single-line, coast-to-coast service that runs faster, smoother, and simpler than ever before.



C. The Structural Divide: Why Trucking Feels Seamless and Rail Does Not

46. Railroads continue to lose freight to trucks, and that gap keeps getting wider. Without structural change, that trend will accelerate. If we want to compete head-to-head, we have to take the next step and create a network that delivers the same seamless, single-line service customers already get on the highway.

1. Diverging Growth as Trucking Dominates

47. Rail has improved its service, safety, and efficiency—but the growth we've captured still lags far behind the growth of the broader economy we serve.

Figure 6[6]
Railroads Are Losing Market Share to Trucks

2. Trucks Offer One Trip, Rail Offers Two—and That's the Problem

48. Rail has tremendous advantages. It moves freight at a lower cost per ton-mile, uses far less fuel per shipment, and produces dramatically lower emissions than trucking. Those are powerful advantages for customers and for the country—helping reduce costs, cut congestion on highways, and lower carbon output. It's the safest, most efficient, and most sustainable way to move freight in America.

[6] *See* Workpaper "Rocker-Elkins VS - Modal Market Share.xlsx."

49. But unlike trucks, which operate on publicly funded highways, railroads pay for their own infrastructure. That self-funded model creates discipline and accountability, but it also adds cost and limits flexibility. Trucks are subsidized through public investment in highways leaving them more opportunities to invest in new, customer-facing technologies, while railroads must earn and reinvest every dollar to keep the system running.

50. The bigger challenge is that the nation's rail system is still fractured. The East–West divide in the middle of the country acts like a toll gate—freight has to stop, switch carriers, and restart its journey. Each handoff adds time, cost, and uncertainty. The result is delay, added expense, and service irregularity—the very inefficiencies that the trucking industry eliminated decades ago by operating as one unified national network.

51. At interchange points, the costs are measurable. Transfers between carriers can add 24 to 48 hours of dwell time and reduce the utilization of locomotives and cars that should be moving freight. Those lost hours make it harder to keep equipment and crews productive and push some customers to choose trucks, even when they would otherwise prefer rail.

52. The problem isn't just time—it's accountability. When two carriers share a shipment, it's harder for customers to get clear pricing, tracking, and service commitments. If a delay occurs, no single railroad owns the full responsibility for addressing the problem. That fragmented accountability undermines the consistency that customers expect and erodes confidence in rail's reliability.

53. The result is lost competitiveness when rail cannot provide seamless single-line service. In those cases, customers don't choose trucks because they're cheaper or greener—they choose them because they're simpler and faster. Trucking offers one quote, one driver, and one schedule from origin to destination. Where rail cannot match that simplicity, even our best service will struggle to win back freight that has shifted to the highway.

54. And the challenge is about to intensify. The trucking industry is moving quickly toward autonomous-vehicle technology, supported by federal research programs and state pilot initiatives. Lower labor costs, longer operating hours, and greater equipment efficiency will make trucks even more competitive.

D. The Opportunity: A Once-in-a-Lifetime Chance to Deliver for Our Customers and the American Economy

55. To compete with a unified highway system, we need a unified rail system. Customers have told us that they want to move more freight by rail. They value rail's cost efficiency, safety, and sustainability—but they need it to be as simple, fast, and predictable as trucking. Today, the handoff between eastern and western carriers adds time, uncertainty, and complexity.

56. As discussed below, the merged UP/NS would answer that demand by creating a single-line, transcontinental network that delivers what customers have asked for—one accountable carrier, one schedule, one standard of excellence. It would create a future with robust single-line service into and through the watershed markets that will outcompete the present. For manufacturers, retailers, and exporters alike, that means faster service, fewer delays, and a level of reliability that

keeps supply chains moving. This is what is required to keep pace with our integrated trucking competitors.

III. America's First Transcontinental Railroad Will Unlock Our Full Growth Potential

57. UP and NS have each pursued a growth strategy, reached independently but aligned in vision: a relentless focus on running a reliably scheduled railroad. As noted above, our respective strategies rest on three pillars of growth: service, investment, and innovation.

58. The merged UP/NS will take this momentum and magnify growth opportunities nationwide for thousands of customers across industries by delivering on these three pillars of rail growth. Through superior service—faster, more reliable, and seamless single-line offerings—customers will gain the confidence to move more freight by rail. Through smart investment, the unified network will deploy capital at scale to expand capacity and open new markets. And through innovation, a tech-enabled customer experience will make rail as simple and transparent as trucking.

59. In other words, this merger is the opportunity to put our shared growth strategy into action on a national scale.

A. Service: Delivering the Service Our Customers Want

1. Current Challenge

60. In our view, the most pressing challenge the railroad industry faces today is not demand or capacity, but how we meet customer demand for rail transportation service across an arbitrarily divided national network. Our U.S. rail network is divided by legacy, not by need. It is artificially split between east and west,

forcing freight to pass through interchange points like Chicago, St. Louis, Memphis, and New Orleans. Our customers know that interchanges add hours of delay, introduce service variability, and raise costs for customers who depend on reliability. What should be one seamless rail experience often feels to our customers like two loosely connected systems.

61. For our customers, that divide translates directly into fragmented responsibility. Many interline shipments require two contracts, two sets of rules, two invoices—and divided accountability when things go wrong. The result is a service that can feel less convenient, less reliable, and less predictable than promised. When cars sit idle in interchange or take inefficient routes, it's not just operational friction; it's a visible gap between expectation and experience that chips away at the trust that underpins every customer relationship.

62. As we discuss above, those gaps have real consequences. Private-fleet owners see their assets underutilized, watching returns erode as equipment waits for interchange. Customers incur higher inventory and logistics costs as they try to buffer against uncertainty. And across competitive markets, these inefficiencies weaken rail's edge against trucks, limiting growth and opportunity for everyone involved.

2. Merger-Related Service Benefits

63. By bringing together our two complementary networks, we move beyond the limits of interchange to a unified national system designed around customer needs rather than carrier boundaries. This integration will expand access, simplify logistics, and strengthen rail's position in the broader freight marketplace. The result

is a service portfolio that is faster and more consistent—delivering on the promise of a truly national rail offering.

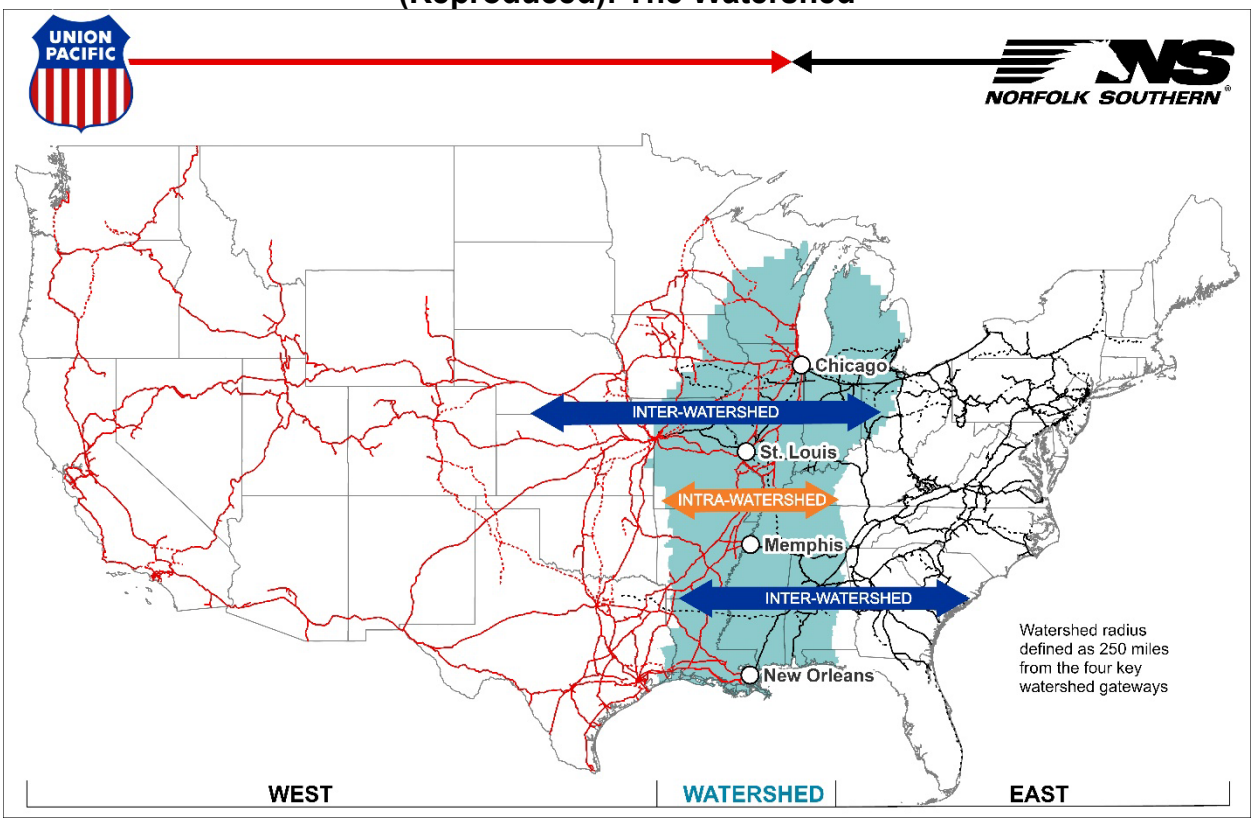
- **Single-Line Service**: The merger will eliminate interchange, creating coast-to-coast coverage and unlocking seamless transcontinental options. Customers will be able to ship across the entire country under one waybill, one set of service commitments, and one accountable team. 84,000 county to county lanes where current shippers truck industrial and bulk freight will have an opportunity to ship single-line manifest service.[7]

- **Faster Transit Times**: Streamlined operations and unified routing will reduce delays, shorten delivery windows, and lower inventory and railcar costs.

- **Increased Reliability**: We hear from customers that they don't "feel" our averages, they "feel" our outliers. In other words, they want reliability. Single-line service eliminates variability introduced by interchanges, improving consistency and accountability. When the same team owns the move from start to finish, the guesswork disappears and the promises mean more. Customers don't have to wonder which railroad is responsible or why a car is sitting still—one network, one playbook, one answer. Reliability is the foundation of trust—and that's what we believe this merger can strengthen most.

- **Improved Customer Asset Utilization**: Faster turns and coordinated pricing/routing decisions maximize the value of customer-supplied railcars. When trains roll smoother, cars earn more—simple as that. For example, more efficient deployment of equipment can reduce idle time and improve productivity across entire fleets. That means customers get more mileage out of the assets they already own.

64. These improvements are grounded in a streamlined Operating Plan, which outlines how this integration will translate directly into better day-to-day execution for customers. The details of our Operating Plan are described in the relevant section of this Application.[8]



[7] *See* Hunt/Schabas VS at Exhibit 4-13.

[8] *See* App. Vol. 2, Op. Plan.

3. Unlocking the American Heartland and the Watershed

65. The Watershed markets sit squarely in the nation's heart—on both sides of the Mississippi—stretching from Chicago and St. Louis down through Memphis, Birmingham, Kansas City, and Louisville. These are the arteries of American manufacturing, agriculture, and energy. When freight flows efficiently here, the entire economy benefits.

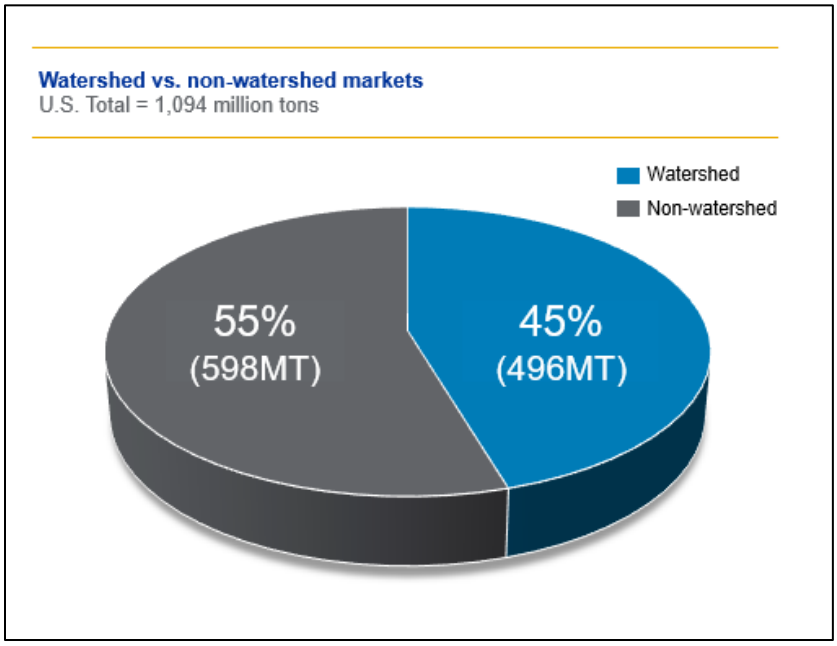
Figure 7[9]
(Reproduced): The Watershed

66. However, customers in these markets operate in a structural gap. Customers located just east of major gateways like Chicago, Memphis, St. Louis, or New Orleans lack access to efficient single-line service to ship to major U.S. western

[9] Hunt/Schabas VS at Exhibit 4-8 and Appendix B.5.3.

markets or access western ports. The same is true for customers located to the west of an interchange who seek to sell goods into the major eastern markets like Atlanta, New York, or Virginia, or seek to transport their goods through eastern ports. These customers are uniquely disadvantaged by short-haul economics and the friction created by the need to interchange. As a result, otherwise competitive rail movements end up moving via truck, or not at all. This is the missing middle of America's rail map.

67. The Interstate Commerce Commission recognized this issue when it approved the Norfolk & Western and Southern rail merger:



> This 'gateway-watershed' problem is explained as follows. Given the loss of responsibility and control associated with interline traffic and assuming current divisions are not easily adjusted, railroads can lack sufficient incentive to undertake marketing initiatives for traffic moving beyond their lines. The most severe constraint on traffic flow is encountered where an origin or destination point of one rail carrier is located relatively close to its interchange point with another railroad. Since the carrier serving the site near the gateway receives only the short-haul of what may be a movement of considerable distance, its share of a competitive rate may be insufficient to warrant its participation even though the total revenue associated with the movement may be remunerative. Factors apart from revenues—such as varying traffic balances on the two systems, so that a given movement balances the traffic flows of one carrier but increases an imbalance for another—can also prevent otherwise competitive movements from taking place.

Norfolk S. Corp. – Control – Norfolk & W. Ry. Co., 366 I.C.C. 173, 195 (1982).

68. These watershed markets could be a powerhouse for rail, as they handle enormous volumes of freight every year. Excluding moves of less than 250 miles, and focusing on the freight market where rail and trucks compete, the data shows that

nearly 500 million tons of steel, grain, lumber, chemicals, and other industrial products that can move in carload service either originate or terminate in this region. This is approximately 45 percent of the total divertible marketplace for the entire United States.

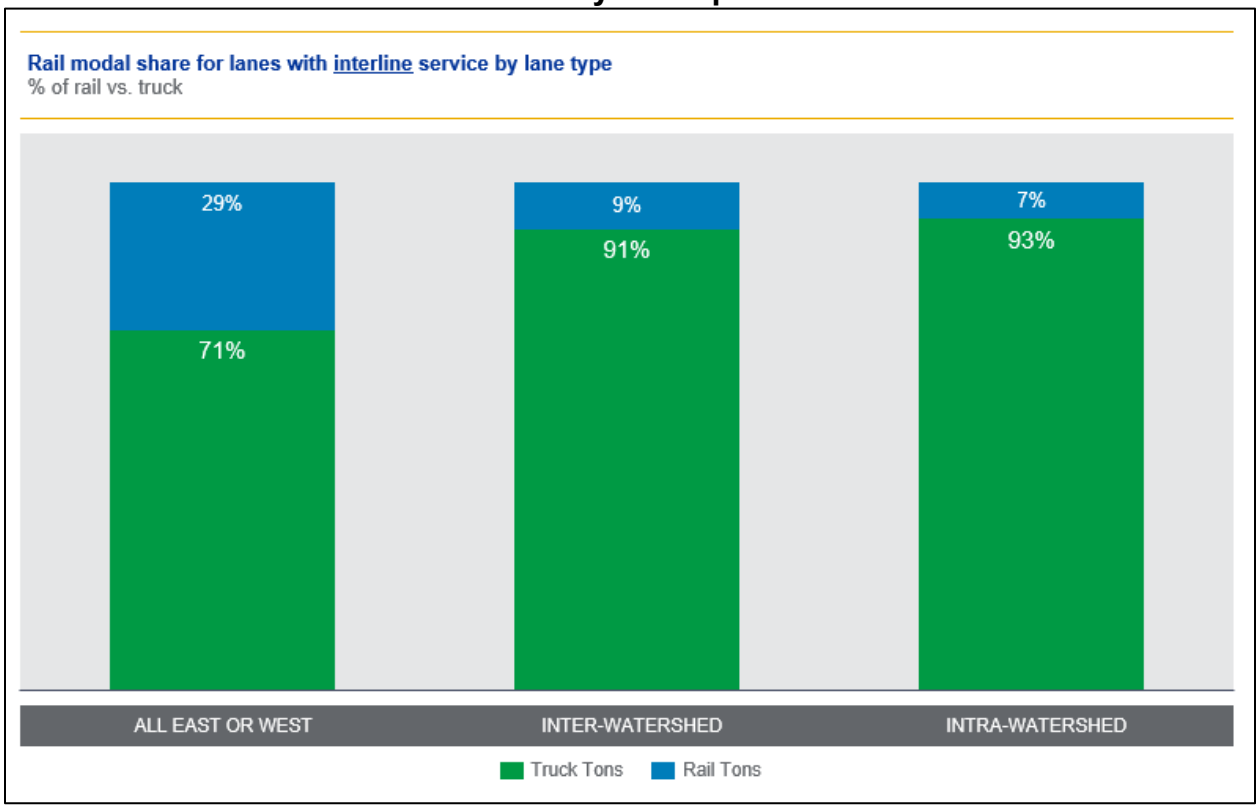


Figure 8[10]
The Watershed Potential

69. Yet rail is underperforming in freight markets to and from the watershed that require interline rail service. Some of that freight moves by rail, but much more moves by truck, because trucks can offer what we cannot—one carrier, one schedule, one promise. The market share data speaks for itself.

[10] Hunt/Schabas VS at Exhibit B-28.

Figure 9[11]
Rail Interline Service Massively Underperforms in the Watershed

70. Not only does trucking dominate the overall market share for inter-watershed and intra-watershed movements, trucking continuously outperforms rail at every length of haul distance.

[11] Hunt/Schabas VS at Exhibit 4-9.

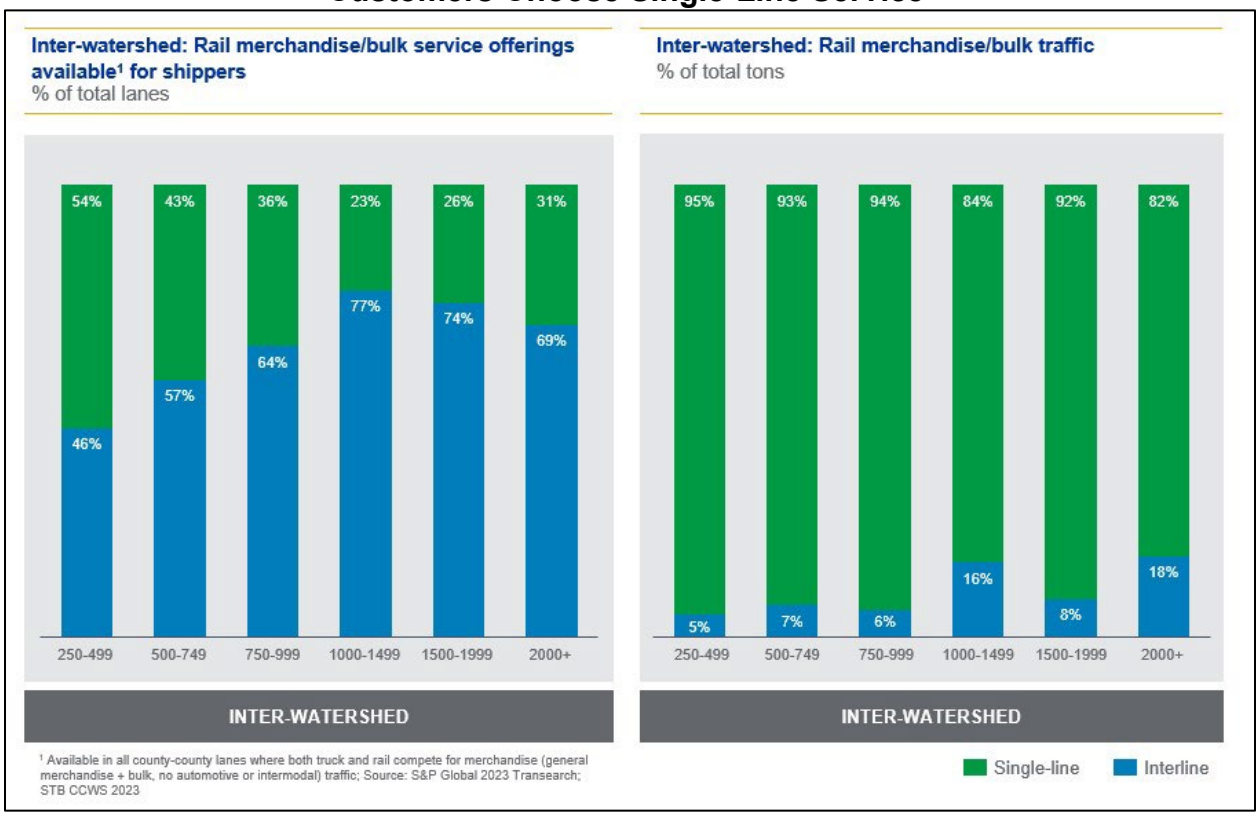

Figure 10[12]
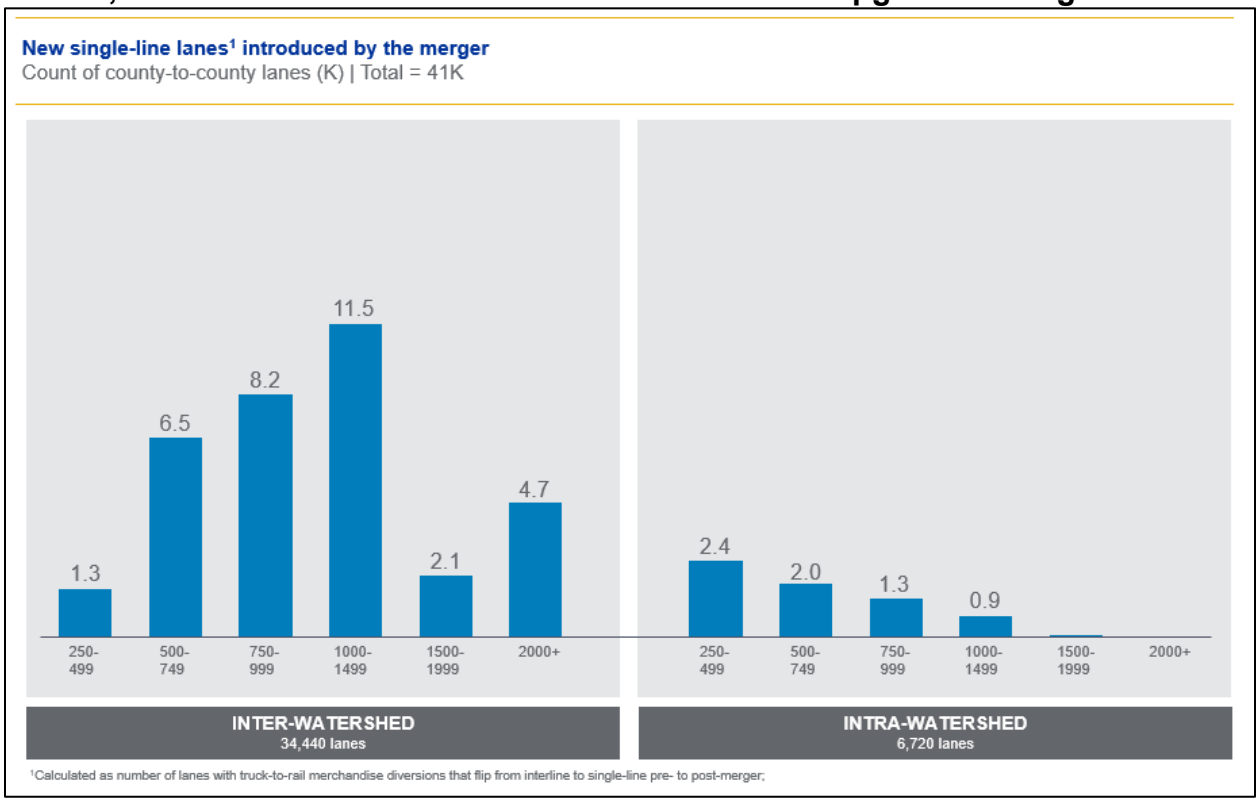
Rail Underperforms in the Watershed Across All Lengths of Haul

71. And Figure 11 below illustrates a striking contrast between potential and actual rail service in the Watershed markets. While most of the lanes that could be served are classified as interline lanes—requiring cooperation between two carriers—the traffic that actually moves is overwhelmingly handled through single-line service. This pattern demonstrates that shippers in the region clearly prefer seamless, single-line rail solutions, valuing reliability, simplicity, and efficiency over multi-carrier coordination.

[12] Hunt/Schabas VS at Exhibit 4-10.

Figure 11[13]
Most Inter-Watershed Lanes Are Interline, but Most Customers Choose Single-Line Service



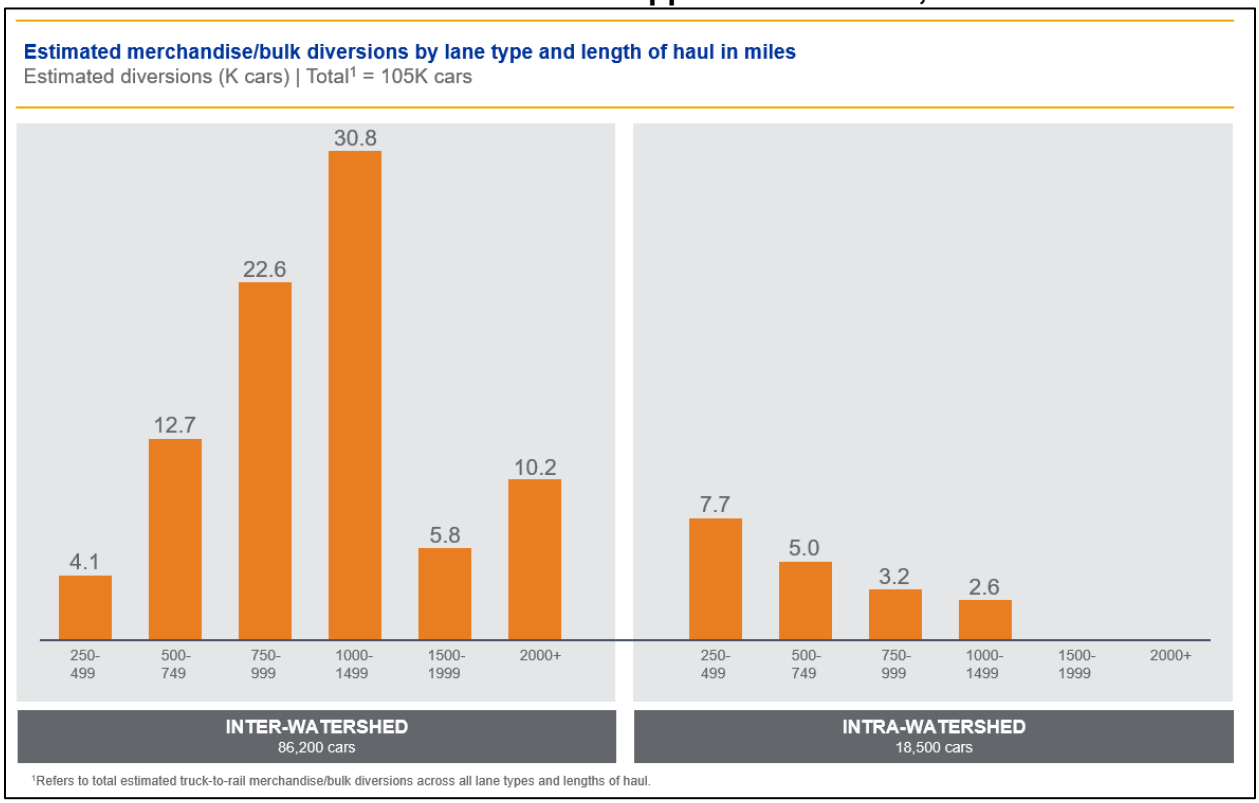
72. These facts reveal the modern "gateway-watershed problem" in a nutshell: staggering opportunities but poor rail market share because the artificial divide between rail networks limits how far we can go.

73. The solution to unlocking the so-called "watershed" markets is integration. By connecting East and West under one unified structure, we will deliver what customers have wanted for decades—one railroad, one standard, and one trusted promise from origin to destination. And in doing so, we will unlock the full potential of the watershed markets.

[13] Hunt/Schabas VS at Exhibit 4-11.

74. The Application puts a spotlight on how much untapped demand lies within these watershed markets: This merger will transform 41,000 lanes (of the 84,000 total) within these watershed markets to single-line rail service where shippers currently truck industrial and bulk freight.[14]

Figure 12[15]
41,000 Merchandise Interline Lanes in Watershed Upgrade to Single-Line



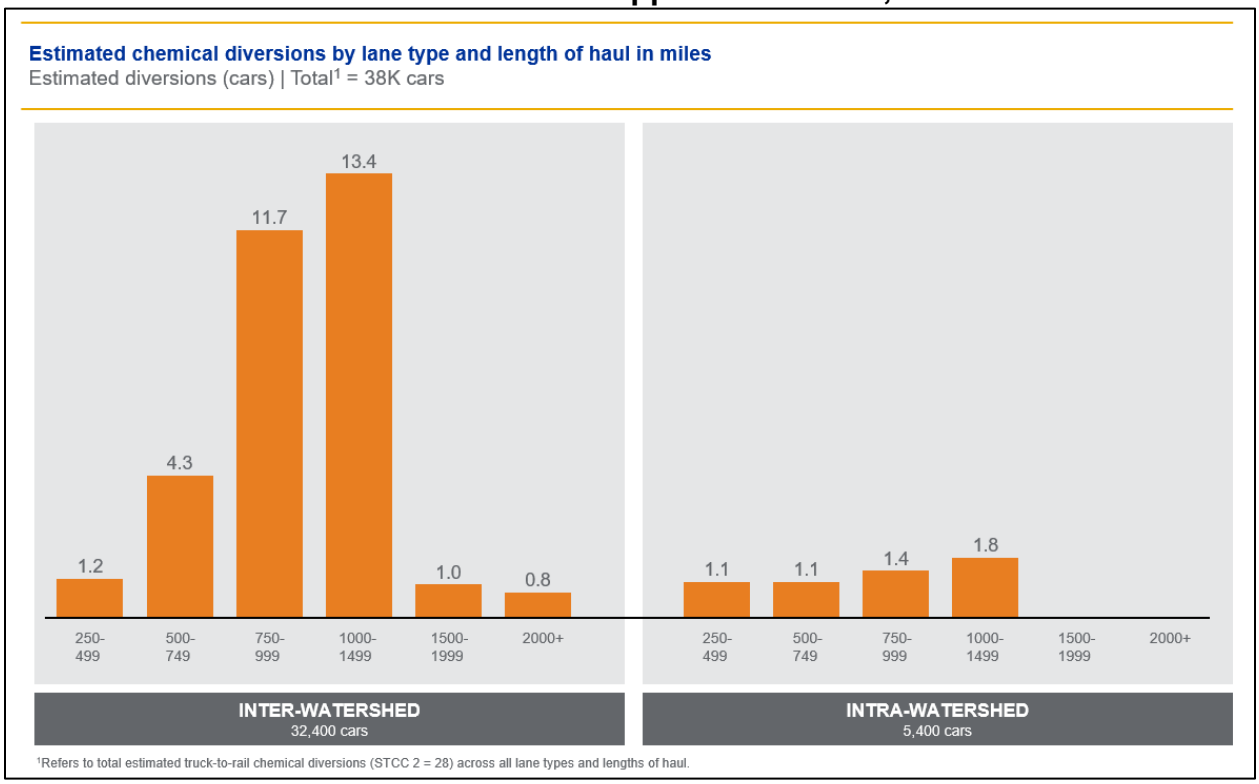
75. These shippers in the watershed markets will get an upgrade from undesirable interline options to new, single-line manifest service for the first time,

[14] Hunt/Schabas VS at Exhibit 4-13.

[15] Hunt/Schabas VS at Exhibit 4-13.

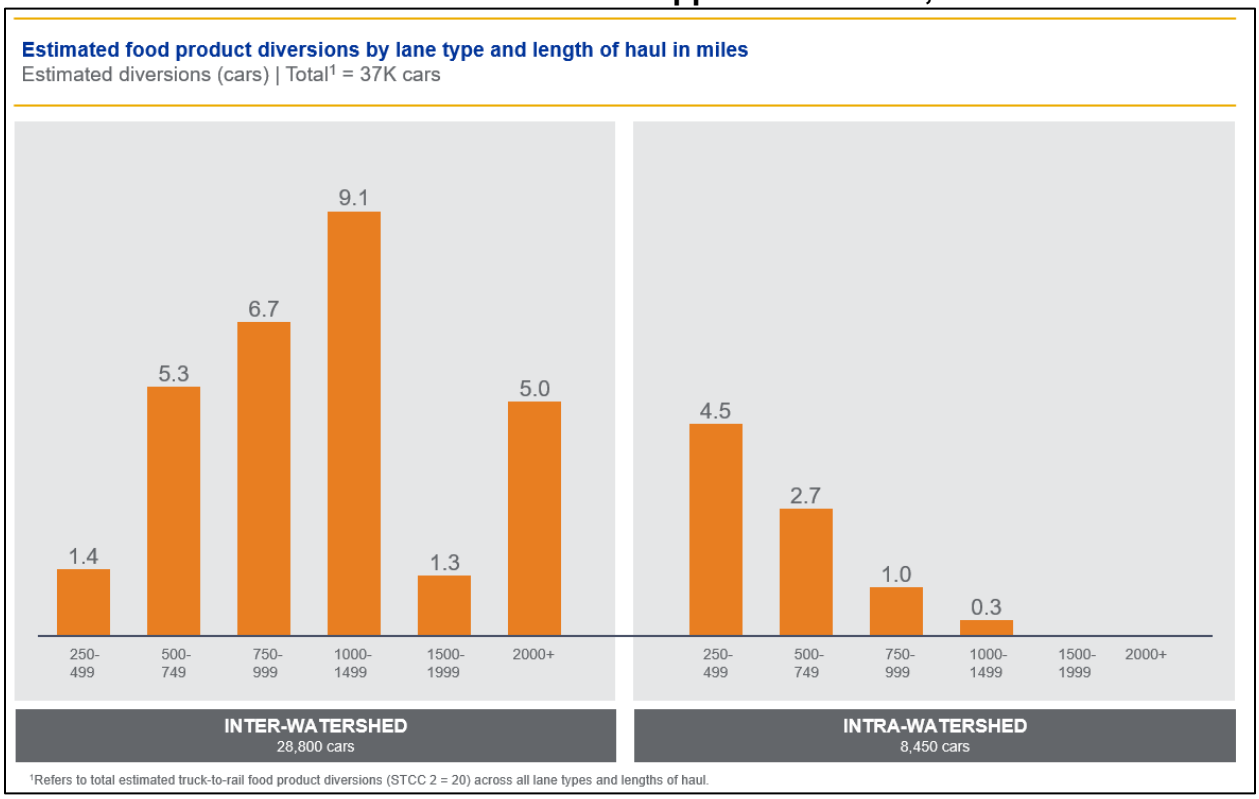
and, by doing so, shift 105 thousand carloads of merchandise traffic from trucks annually (of the 183,000 total projected carloads of merchandise growth).[16]

Figure 13[17]
Watershed Merchandise Growth Opportunities—105,000 Carloads



76. And the opportunities cut a wide swath across commodities, creating openings for customers big and small. The data show just how broad the impact could be—touching everything from chemicals to food products.

[16] Hunt/Schabas VS at Exhibit 4-13; *id.*, at Exhibit 4-12.



[17] Hunt/Schabas VS at Exhibit 4-12.

Figure 14[18]
Chemical Watershed Growth Opportunities—38,000 Carloads

[18] Hunt/Schabas VS at Exhibit B-56.

Figure 15[19]
Food Products Watershed Growth Opportunities—37,000 Carloads

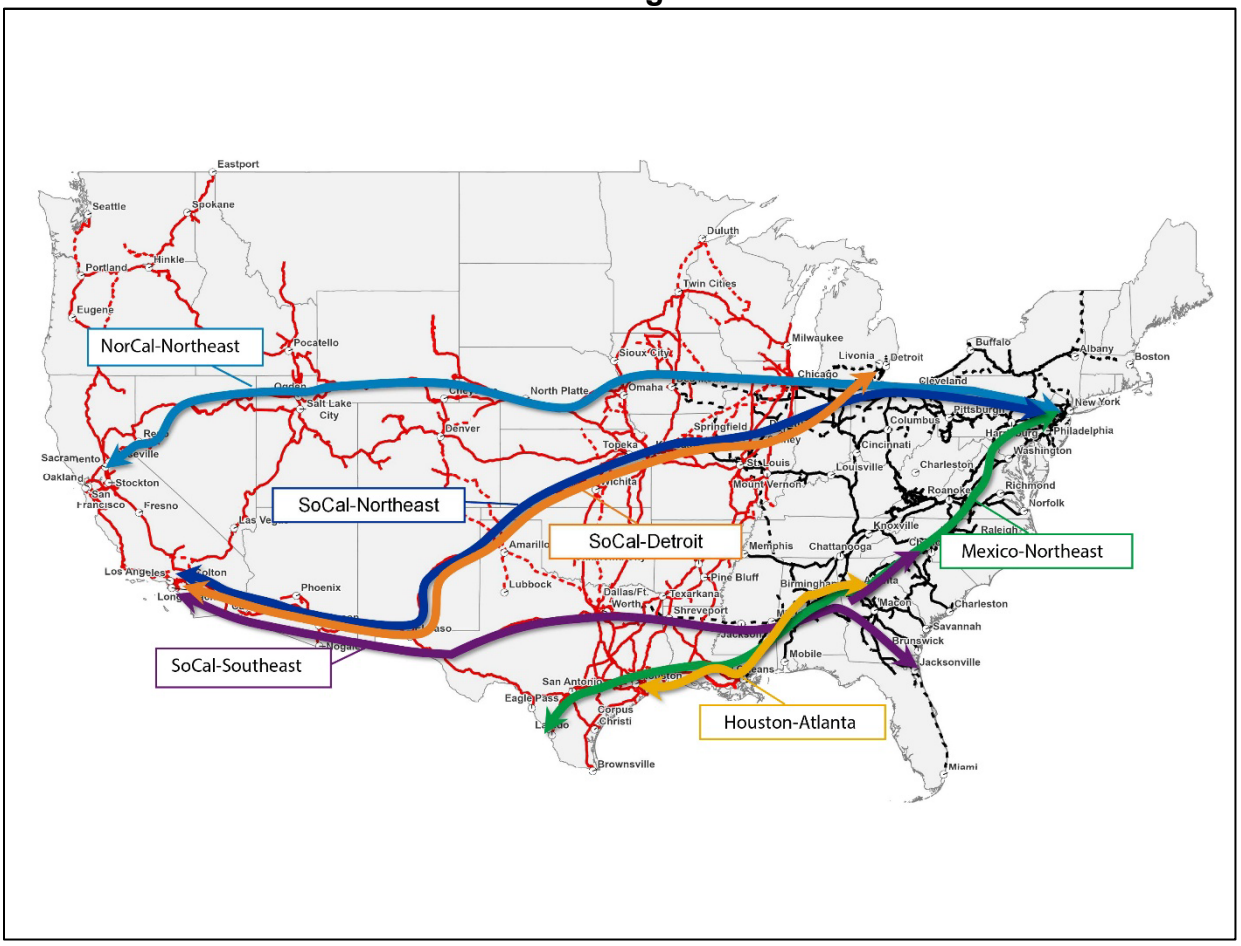
77. Moreover, the benefits of opening the watershed markets don't stop with our network or our customers—they extend to the states themselves. By taking over 2 million truckloads off the highways, this merger delivers real, measurable gains.[20] Fewer trucks mean less congestion, lower emissions, and safer roads for the people who live and work in these regions.

78. We believe that customers in the watershed markets want to move by rail. We believe they value our efficiency, safety, and sustainability. All they need is a rail partner who can provide a commitment for the entirety of their service and live

[19] Hunt/Schabas VS at Exhibit B-55.

[20] Hunt/Schabas VS at Exhibit 2-4.

up to that commitment, from start to finish. And a seamless, transcontinental rail network would do more than improve freight flow—it would strengthen the entire manufacturing base. It would give producers in these watershed markets the dependable, cost-efficient logistics they need to compete globally, while supporting efforts to bring manufacturing back home.



4. Benefits by Commodity & Industry Segment

79. The benefits of this merger are not just to businesses shipping to and from the Watershed markets—the benefits will reshape the playing field for customers across the entire country. The combined UP/NS network will give customers from coast to coast a single, integrated system that touches almost every major population center, every major port, and every major industrial region in America. No matter what customers ship—from cars to chemicals to food and beyond—this merger will create a nationwide footprint that unlocks new opportunities and delivers solutions that customers want.

a. Intermodal

80. Intermodal has historically been rail's fastest-growing segment and a serious competitor to long-haul trucking. Customers of consumer goods, e-commerce products, and high-value freight require consistent schedules, reliable service, and connections to major ports and inland hubs. The merger will combine NS's intermodal franchise with UP's extensive western network, creating unmatched scale and coverage to take trucks off America's highways. For example, as shown in Figure 16 below, this integration will generate new transcontinental products that eliminate interchange variability and provide truck-like reliability.

Figure 16
New Intermodal Single-Line Service

81. According to the World Bank Logistic Performance Index (2023), the U.S.'s infrastructure score lags behind Canada, Germany, Japan, and China.[21] A coast-to-coast integrated railroad is an opportunity to deliver an optimized national intermodal infrastructure that relies more on the efficiency of rail to move large volumes over long distances, leverage the agility of trucking for smaller first-mile connections, and leaves more of our roadways and highways for cars.

[21] World Bank, *2023 Logistics Performance Index (LPI) — Global Ranking* (Aug. 18, 2025), https://lpi.worldbank.org/international/global (see Full LPI Dataset for 2023, "Infrastructure Score" column).

82. The most promising growth opportunities lie in strengthening rail connections between major manufacturing and population centers, particularly along corridors linking Texas to the Southeast and Northeast. In addition, eliminating rubber-tire interchanges in Chicago will provide the speed and consistency needed to compete effectively with trucking on routes from Southern California to the Northeast. And expanding single-line services into the Upper Midwest—with direct rail connections from Southern California and Texas to key destinations such as Cincinnati, Columbus, Toledo, and Detroit—will reduce highway congestion and create more efficient, lower-cost supply chains.

b. Agriculture

83. Efficient rail transportation is critical to our agriculture customers, as rail moves massive volumes of grain, oilseeds, and related products to both domestic and global markets. Across the U.S., 1.88 million farms support 8,000 off-farm facilities (elevators) that manage storage and transportation for today's global farm economy.[22] The majority of these farms and elevators sit in the nation's heartland. Iowa leads with 820 off-farm storage facilities and 2.05 billion bushels of on-farm storage, followed closely by Illinois, Minnesota, Nebraska, and Kansas.[23]

[22] *See* U.S. Dep't of Agric., Econ. Research Serv., *Farming and Farm Income* (updated 2024), https://www.ers.usda.gov/data-products/ag-and-food-statistics-charting-the-essentials/farming-and-farm-income/; U.S. Dep't of Agric., Nat'l Agric. Stat. Serv., *Grain Stocks* (Jan. 2025), https://www.nass.usda.gov/Publications/Todays_Reports/reports/grst0125.pdf.

[23] *See* U.S. Dep't of Agric., Nat'l Agric. Stat. Serv., *Grain Stocks* (Jan. 2025), https://www.nass.usda.gov/Publications/Todays_Reports/reports/grst0125.pdf.

84. These farmers, processors, and exporters need dependable access to inland elevators, feed mills, and export ports on both coasts and the Gulf. Today, gateway barriers and interchange delays limit options and add cost, making U.S. agriculture less competitive internationally. The merger will remove those barriers, creating seamless single-line access to markets and expanding port options east and west of the Mississippi. Examples include soybean meal shipments from western crush plants to East Coast markets, and grain exports from eastern elevators to Gulf Coast ports.

85. Behind those statistics are real people working every day to feed the country and keep their local economies alive. The 1.88 million farms[24] across the United States, along with thousands of off-farm storage facilities, represent families, co-ops, and small businesses that depend on efficient transportation to make a living. When I (Kenny Rocker) visited Landus Cooperative, a farmer-owned co-op based in Des Moines, I saw that reality firsthand. With 5,500 farmer-owners working to serve over 34 states nationally and 16 countries across the globe, Landus shows how much rail service matters.[25]

86. Landus is investing in new technology and smarter operations to compete on the world stage. They rely on strong rail connections to make that possible. They also face the same rural workforce challenges seen across the Midwest.

---

[24] *See* U.S. Dep't of Agric., Econ. Research Serv., *Farming and Farm Income* (updated 2024), https://www.ers.usda.gov/data-products/ag-and-food-statistics-charting-the-essentials/farming-and-farm-income/.

[25] Landus, Home Page (last visited Dec. 10, 2025), https://www.landus.ag/.

Better market access through expanded rail service can help create jobs and keep small towns strong. As Landus noted in its support letter of this merger:

> "Our company depends on efficient, reliable, and cost-effective rail service to meet the needs of our customers and ensure the safe, timely delivery of our products across the country. [At] Landus, we transport grains and feed ingredients to markets nationwide and across North America. The American freight rail network is a critical component of our supply chain, allowing us to move large volumes efficiently and sustainably. We understand the importance of rail to our employees, our products, and our national economy. We also understand firsthand how these rail networks need new investments, and new commitments for growth and innovation, so that Landus Cooperative has a bright future."[26]

87. The biggest win for agriculture is choice. Farming is never static—weather, markets, and world events can change overnight. A transcontinental rail network will give the ag industry more options when those changes come. It would enable grain, wheat, and feed products to move more efficiently from the Midwest to mills and feed markets in the Southeast and East. It would open up new lanes for ethanol to reach the Gulf, West Coast, and East Coast, and for renewable diesel and other clean-fuel projects to grow with confidence. Seamlessly connecting over 50,000 route miles across 43 states and linking approximately 100 ports and nearly every corner of North America will provide farmers and co-ops like Landus greater flexibility to adapt, compete, and win.

[26] *See* App. Vol. 3, Landus Support Letter.

88. Across the country, cooperatives and processors realize the opportunities ahead. Those in support serve nearly eight hundred ninety thousand (890,000) independent farmers who are ready to grow with us.[27]

c. Food

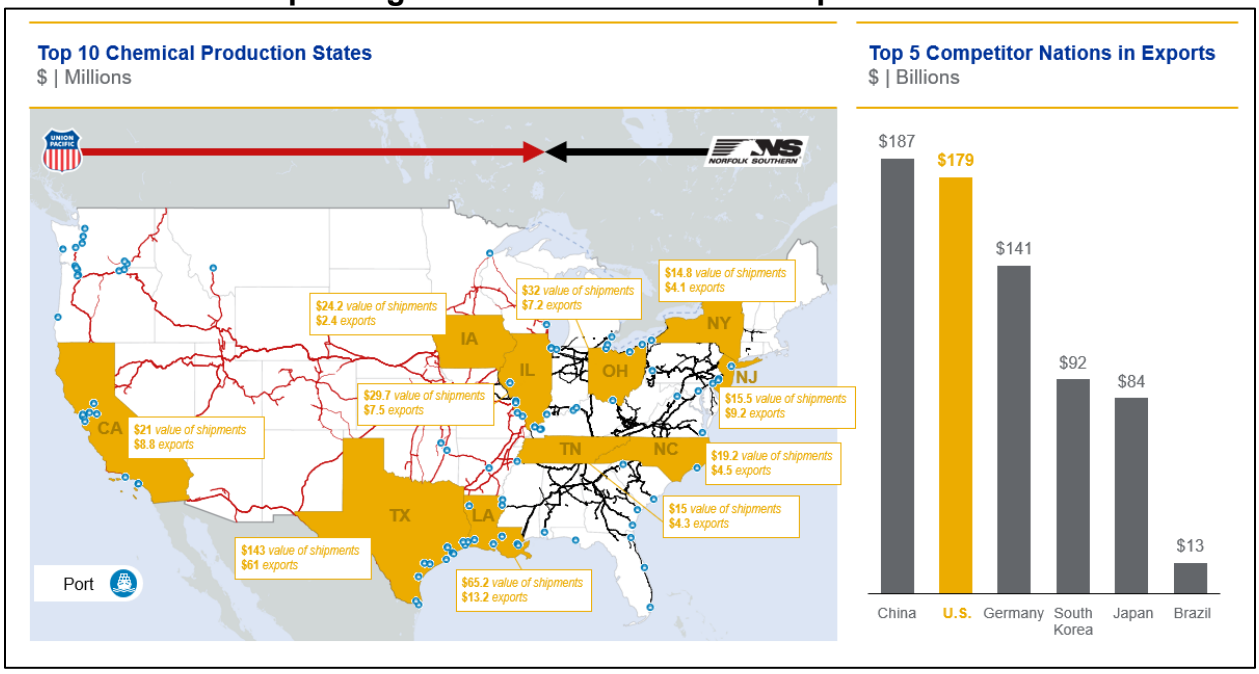
89. The food and beverage sector is highly sensitive to transit times and reliability, as perishable goods such as produce depend on tight supply chains. Customers in this industry need speed, equipment, and consistent delivery windows to prevent spoilage and meet retail demand. Today, interchange delays add time and variability that make many food products noncompetitive on rail for long-haul moves. The merger will reduce transit times and eliminates interchange, creating new opportunities for rail to serve long-distance food shipments.

90. The food industry will also see some exciting new opportunities as a result of the merger. Huge growing regions in the West—from California and Idaho to Oregon and Washington—supply millions of consumers in the East. Every day, rail helps move potatoes, frozen fries, onions, canned goods, and other food products from farms and processors to grocery shelves and restaurant kitchens across the country. A seamless, integrated railroad will make that journey faster, more reliable, and more cost-effective. It will also expand options for moving frozen proteins from the Midwest and Arkansas to major population centers in the East. More direct, efficient rail routes will give producers and distributors the flexibility they need to meet shifting U.S. demand.

[27] *See* Workpaper "Cooperative & Processor Support Letters 11.20.2025.xlsx."

d. Chemicals

91. The American chemical industry is one of the great engines of national strength—a foundation of manufacturing, trade, and innovation that reaches into nearly every part of modern life. The combined network of UP and NS would create single-line service linking the nation's largest chemical production centers with export terminals and manufacturing hubs. This unified network would connect approximately 100 ports across North America, giving chemical producers greater reach with fewer handoffs, faster transit times, and more dependable delivery.



92. The chemical industry along the Gulf Coast—modern U.S. manufacturing success story—will particularly benefit from this merger. It is a region where energy, innovation, and logistics came together to make the United States the world's low-cost producer of key industrial materials. From Houston and Baton Rouge to Lake Charles and Corpus Christi, American chemical companies have invested billions of dollars in new and expanded facilities over the past decade. And Gulf Coast petrochemical production has surged, powered by America's advantage in low-cost natural gas feedstocks. And UP has invested hundreds of millions of dollars in Gulf infrastructure; it now serves more receivers and packaging facilities than any other carrier. Major new projects such as Chevron Phillips Chemical's expansion in Orange, Texas, and Dow's new Poly 7 facility in Freeport, Texas, will add billions of pounds of capacity, all dependent on efficient rail access.

93. But the geography of this industry results in it being uniquely impacted by a fragmented rail network. Many chemical producers or customers in this region are located squarely in, or adjacent to, the "watershed markets"—*i.e.*, the

manufacturing and agricultural heart of the country that lies within roughly 250 miles of major gateways such as Chicago, St. Louis, Memphis, and New Orleans. This is where the artificial East-West divide impedes effective rail service. As a result, these chemical customers face inefficiencies from interchange that result in costly delays or, in some cases, no effective rail service at all. Underserved by rail, many of these facilities have the capacity to expand and compete globally but are limited by the lack of a seamless, direct rail service option.

94. The unified network will change that. Not only will it open new inland markets, it will give producers within and adjacent to the watershed new, more efficient access to coastal ports and export lanes, extending America's chemical reach in both directions and improving American chemical companies' global competitiveness.

Figure 17[28]
Improving U.S. Chemical Global Competitiveness

95. Knocking down these watershed barriers will not only open new markets, but provide new opportunities to convert to lower cost rail where truck has historically been viewed as the only option. As noted above, we are projecting over 55 thousand carloads of chemicals and related products will be converted from truck to single-line rail service to and from (or over) the entire watershed region as a result of this transaction, providing significant cost savings to these customers.[29]

96. But this is more than just unifying two networks and addressing the watershed problem, this combination is about giving chemical customers faster transit times, fewer handoffs, and in some cases, fewer miles travelled. While the

[28] American Chemistry Council, *2023 Guide to the Business of Chemistry*, p. 48, Table 6.3 (global); *id.* at 96, Table 14-1 (states).

[29] Hunt/Schabas VS at Exhibit B-56.

anticipated network fluidity improvements will benefit all of our customers, it will have an outsized benefit for chemical manufacturers who choose to use our services in three key ways.

97. First, improved service performance will enable more efficient railcar utilization. Chemical customers lease and own some of the most expensive railway equipment in the North American fleet. The dependability improvements discussed above will translate into shorter transit times, providing a unique opportunity for customers to adjust their fleet sizes to the new operating environment we will create. Smaller fleets mean less depreciation, lease costs, storage costs, and maintenance costs, all of which will benefit the customers who use these types of fleets.

98. Second, operational improvements will translate into tighter inventories and quicker market access. Chemical customers ship some of the most expensive commodities on the rails. With the reductions in handlings and variability that will result from the merger, chemical customers will have an opportunity to reduce their inventories, which will improve service for the entire supply chain. Time is money, and, in this case, a reduction in cycle time for chemical customers will create a unique opportunity to reduce the production-to-cash-collection cycle time. Getting to markets faster not only saves money, it will create competitive advantage for chemical customers choosing our unified network.

99. Third, and most importantly, the operating improvements of the merger will offer chemical customers a safer journey. The unified network will significantly reduce the number of handlings required to move chemical shipments, eliminating

interchange points and intermediate switching. Fewer transitions and, in some cases, fewer miles, mean less risk, especially for the most hazardous commodities. And competing away chemical traffic from the highways to rail will further strengthen safety.

100. In sum, a faster, stronger rail network does not just mean better service; it means lower costs, higher asset utilization, improved safety, and a more competitive American chemical industry worldwide.

e. Forest Products

101. Forest products—including lumber, paper, and packaging—are vital to construction, housing, and consumer goods supply chains. These are highly cost-sensitive products that depend on efficient long-haul rail service to remain competitive. Currently, routing inefficiencies and interchange add costs that restrict access to distant markets. The merger will create new single-line lanes that will reduce costs and improve market reach for lumber customers.

102. The biggest benefits for shippers of forest products will come from expanded reach into fast-growing regions where trucks currently dominate. An example would be Southern Yellow Pine, which thrives south of the Mason-Dixon line and east of the Great Plains, where its strength, density, and malleability make it one of the chief sources of softwood products in the United States. Shipped by centerbeam railcars—each capable of hauling roughly 205,000 pounds, or enough framing lumber to build seven homes—Southern Yellow Pine moves more economically and sustainably by rail than by truck. The efficient, long-haul rail access that this merger will offer will enable this product to reach growing construction

markets in Texas and the Southwest. And beyond this example, the merger's new single-line routes will expand forest products' market reach, reducing costs and helping these customers compete effectively in fast-growing, truck-dominated regions.

f. Coal

103. Coal continues to play an important role in U.S. energy production and export markets, requiring reliable transportation from coal fields to utilities and ports. Energy producers and utilities need consistent, cost-effective supply chains to keep plants running efficiently. Today, the nation's coal flows are largely regional in nature—what is mined in the West tends to stay in the West, and what is mined in the East typically stays in the East. Western coal primarily serves utilities and export terminals west of the Mississippi River, while eastern coal supplies power plants, industries, and export markets across the eastern half of the country. This is largely market driven, but it is also a reflection of the artificial friction created by the need to navigate two separate rail networks and interchange at major gateways such as Chicago, Memphis, St. Louis, or New Orleans.

104. While powerful market forces will always influence where coal is mined and shipped, this merger is about expanding what is possible. The U.S. is experiencing skyrocketing demand for energy with the AI revolution. A merged UP/NS railroad would create a single, seamless network that can unlock new routing options for coal and improve efficiency across the entire energy supply chain. Imagine Western coal moving directly to eastern utilities without delays at interchange points, or coal from the eastern Appalachian region reaching new export outlets in the West.

The most exciting opportunities for coal customers from this merger lie in these new, unbroken single-line corridors—where western coal can move deeper into eastern markets and vice versa.

g. Metals

105. The metals industry underpins construction, automotive, and manufacturing supply chains. Metals customers require efficient flows of raw materials like scrap into mills, and reliable distribution of finished products into growth regions. Current interchange barriers constrain geographic reach and add unnecessary costs. The largest gains in metals will come from new access to high-growth regions where customers need both raw material inputs and distribution of finished products.

5. Benefits to Our Short Line Partners

106. For both UP and NS, our short line partners play a pivotal role in our success, offering customized solutions and expanding the reach of the national freight network. Customers clearly value their service offerings, as short lines' volumes have grown faster than those of UP or NS. These local and regional railroads—180 connecting to the UP Railroad and 252 connecting to the NS Railway—are the first and last mile for our customers, connecting farms, factories, and distribution centers directly to the Class I main lines. Short lines will remain a critical part of our

[30] *See* Hunt/Schabas VS at Exhibit B-57.

commercial and operating strategy, and we will continue to commit the resources needed to ensure a strong engagement with our short line partners.

107. The greatest benefits for short lines that connect with the new merged network will be access to a single nationwide railroad with one point of accountability. UP and NS both have strong commercial teams working with the short line community, and we expect to adopt the best practices of each to ensure a best-in-class experience and engagement with our short line partners. This will provide streamlined, one-stop shopping for pricing, service, equipment, information services, etc. Further, much of this transaction will open up new watershed markets (discussed above) for the UP and NS; so too will opportunity be afforded to short lines, especially those with service in the heartland, unlocking new markets and truck-to-rail diversion opportunities.

108. As the combined Class I network creates new single-line routes, opens competitive markets, and streamlines service, short lines will see new business flow directly onto their rails. Every new carload represents not just volume for the network, but investment and job creation in the communities short lines serve.

109. In the end, this merger isn't just about two Class I railroads getting stronger, it's about making the whole rail ecosystem stronger. When interchange is easier, service is faster, and reliability improves, short lines can compete more effectively, local industries can grow, and customers across the country gain a more responsive, resilient rail option. That's the rising tide we're working toward: one

network, many partners, all pulling together to deliver the service we sold, from the smallest branch line to the longest main line.

6. Benefits to American Industrial Development

110. Every new plant, terminal, and transload facility represents fresh opportunity: new customers, new markets, and new jobs that keep the railroad strong for the long run. Those of us who work directly with customers know how rewarding that process can be. The first visit to a potential site, the handshake that marks a partnership, the satisfaction of seeing the first carload move. Markets shift, and demand from existing customers rises and falls, but the steady flow of new industry keeps railroads thriving. That's why the marketing team is always out there hustling for the next opportunity, the next customer, the next community ready to grow with rail. This work never stops, and it shouldn't. Because helping a community grow, a plant open, or a customer succeed is what makes this job worth doing.

111. A laser focus on industrial development isn't just important to the railroad, it's vital to American prosperity itself. Today, as national policy turns toward bringing American manufacturing back to American soil, reliable, coast-to-coast rail service is more critical than ever.

112. This merger can power that next wave of industrial growth by giving customers new confidence that an interconnected national rail network can deliver the service, consistency, and reach they need to invest and grow. Companies making new siding and expansion decisions are looking for certainty; they need confidence that their chosen location will have access to efficient, consistent, and long-term rail service. Until now, no American railroad could provide that level of seamless national

coverage. The merger will change that by creating a one-stop shop for industrial development across the continental U.S. that would allow companies to plan with a single transportation partner that can connect both coasts, every major port, and the country's industrial heartland. That certainty is what allows investment to move from plans on paper to jobs on the ground.

113. But real, long-term growth rests on trust. We have to convince the customer before they invest that we can deliver the seamless transportation they need. An existing customer might take a chance on rail, testing how we perform. But for a new investor to commit capital to build a plant, warehouse, or transload facility, that trust must be backed by a network that can deliver exactly what it promises. A fractured rail network, split down the middle of the country, simply can't offer the same credibility or confidence that a true transcontinental railroad could offer.

114. We are therefore very excited about the opportunities for accelerating industry growth this transaction will bring. A unified national network would create the scale and connectivity to support meaningful new industrial investment across America.

B. Investment: The Huge Bet on the American Economy

1. Current Challenge

115. Growth is not just about improving service, it's about making the investments needed to sustain and scale that growth. As we both emphasized in our testimony before the Surface Transportation Board in 2024, better service must be matched by investments that ensure that capacity and infrastructure can keep pace

with rising demand.[31] Delivering the service we sold takes more than operational excellence; it requires the foresight to invest ahead of the market. That's how we earn the confidence of customers who are betting their own capital on long-term transportation solutions.

116. Today, those investments are made separately by eastern and western carriers, limiting scale and duplicating effort. Fragmented investment divides resources, delays innovation, and makes it harder for us to compete with the scale and scope of trucking and highway infrastructure. While highways benefited long ago from unified national planning and funding, railroads have been left to optimize within their own networks, even when customers need solutions that cross both. That divide constrains growth and weakens our ability to compete in national corridors.

117. Others will speak in more detail about the operating plan and the near-term planned capital investments required to support immediate growth. From a marketing perspective, we want to focus on how this merger will align incentives for smarter, more strategic investment—the kind that supports our second pillar of long-term growth.

2. Merger Benefits for Investment

118. Railroads build for the long term, building for decades, sometimes centuries. The merger between UP and NS would represent an $85 billion investment

[31] Sept. 16, 2024, Transcript, Hearing on Growth in the Freight Rail Industry, EP 775, at 97-106, *available at* https://www.stb.gov/wp-content/uploads/Growth-hearing-transcripts_12162024.pdf; Sept. 17, 2024, Transcript, Hearing on Growth in the Freight Rail Industry, EP 775, at 532-41, *available at* https://www.stb.gov/wp-content/uploads/Growth-hearing-transcripts_12172024.pdf.

in the American economy, but, more than that, it would be a show of faith in where this country is headed. The last time we saw this kind of national-scale transportation investment was when President Eisenhower built the Interstate Highway System, a public project that created the modern trucking industry. Just as those highways reshaped commerce in the last century, this merger will reshape it in the next by creating a privately funded rail alternative that can stand toe-to-toe with trucking. It's a big idea. But at its heart, it's a simple idea: keep America connected and keep freight moving.

119. From a marketing perspective, the true potential of this transaction lies in the long-term alignment of incentives to invest. Near-term capital investments will be made, as needed, to capture the immediate growth that improved service creates. But from our perspective, the long-term possibilities are far greater. For the first time, an investment in Pittsburgh could support growth in Portland, and a project at a Gulf Coast plant could unlock markets on the Atlantic seaboard. The combined network would think and invest as one organic system, ensuring that every investment decision serves customers and markets nationwide. When we remove the boundaries that have divided rail for more than a century, we open the door to growth that is national in scale and generational in impact.

120. That potential is limited only by our imagination. Imagine a Gulf Coast chemical processing plant that ships intermediate products to a New York hub for final blending before East Coast distribution. New demand forecasts could trigger rail investments to expand capacity in the Southwest, enabling a single consistent

rate and transit promise all the way into the Northeast. For the first time, these kinds of opportunities could be built, priced, and marketed end-to-end rather than pieced together across disconnected systems. If a customer brings us a plan that requires capital investment in one region to enable growth in another, we are finally in a position to support that growth with a unified transportation and capital plan.

121. Both UP and NS have a long and proven record of private investment in their networks. Over the past decade, the two companies have reinvested billions of dollars to modernize track, expand terminals, upgrade yards, modernize locomotives, add railcars, and deploy new technology to better serve our customers. No other industry in America matches rail's record of private reinvestment in national infrastructure.

122. Our history of massive capital investment shows that this industry can be trusted to align incentives, pursue marketing opportunities, and make smart, integrated investments for our customers across a unified national network.

C. Innovation: Tech-Enabled Customer Experience

1. Current Challenge

123. In our modern transportation networks, innovation is the next great differentiator—the bridge between operational excellence and the customer experience we promise to deliver.

124. Others will speak in detail about the tech integration the combined company will undertake to unite systems and streamline processes. From a marketing perspective, we want to highlight how this merger will advance the third pillar of growth: technology and innovation.

2. Merger Benefits for Innovation

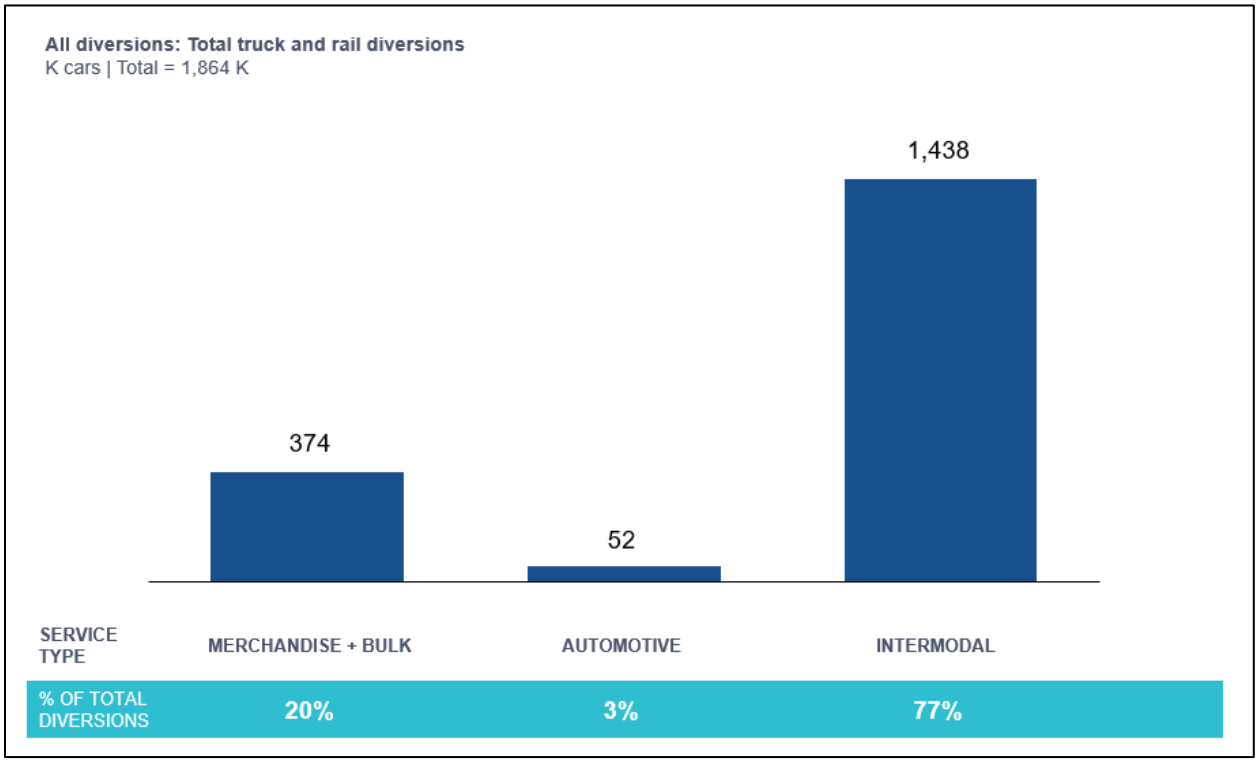
125. A rail customer's experience spans three core actions: Shop, Ship, and Pay. Customers need to find us, complete their transaction, and settle accounts efficiently.

126. **Accelerated Shopping**: The merger would enable an accelerated shopping experience, allowing customers to compare, price, and book rail service faster than ever before—mirroring the simplicity and speed of trucking and logistics platforms. Updated transit time logic and predictive analytics would shorten decision-making cycles and help customers plan smarter. Integrated digital tools would empower customers to identify the most efficient and cost-effective routing options, reducing friction and aligning rail with the pace of modern supply chain management.

127. **Advanced Shipment Management**: The combined network will unlock advanced customer visibility, providing end-to-end transparency and control. We will consolidate critical applications into one intuitive platform, giving customers a single view of their rail shipments. The integrated system will provide management tools alerting customers to potential issues before they become disruptions, which will enable customers to efficiently and confidently manage their supply chains. Customers will further benefit from GPS-enabled devices, such as RailPulse, that unlock even more insights and visibility. This level of clarity and integration will elevate the rail customer experience to a standard that customers expect from leading logistics providers.

128. **Streamlined Ease of Doing Business**: The merger would create a single digital experience that delivers true streamlined ease of doing business across the national network. Customers would enjoy a seamless, truck-like digital journey that extends across the entire combined system—one contract, one set of rules, one invoice, and one customer portal simplifying every transaction. Optimized workflows and proactive issue-resolution tools would minimize administrative effort, reduce downtime, and speed service recovery. What once required multiple touchpoints and manual coordination would instead happen seamlessly, with a single point of accountability.

129. Together, these advancements would redefine what it means to ship by rail. The combined UP and NS network would deliver a modern, tech-enabled shipping experience that simplifies doing business, provides unprecedented visibility, and accelerates the way customers buy and use our rail service. The result would be a digital platform that makes our merged rail services not just cost-competitive, but fully service-competitive with trucking.



D. Growth: Unlocking Our Full Potential

130. A true, integrated transcontinental railroad will create significant opportunities for growth by executing on the three pillars we have discussed throughout this statement: service, investment, and innovation. When all three come together across a unified, transcontinental network, the growth potential will be unlike anything the rail industry has seen in generations.

131. We asked Oliver Wyman to conduct a rigorous, data-driven analysis of traffic flows, diversion potential, and customer demand. Their work combined

detailed network modeling with a rich dataset on market opportunities (TranSearch) to evaluate what a truly unified national rail system could deliver.

Figure 19[32]
Total Quantifiable Growth Potential

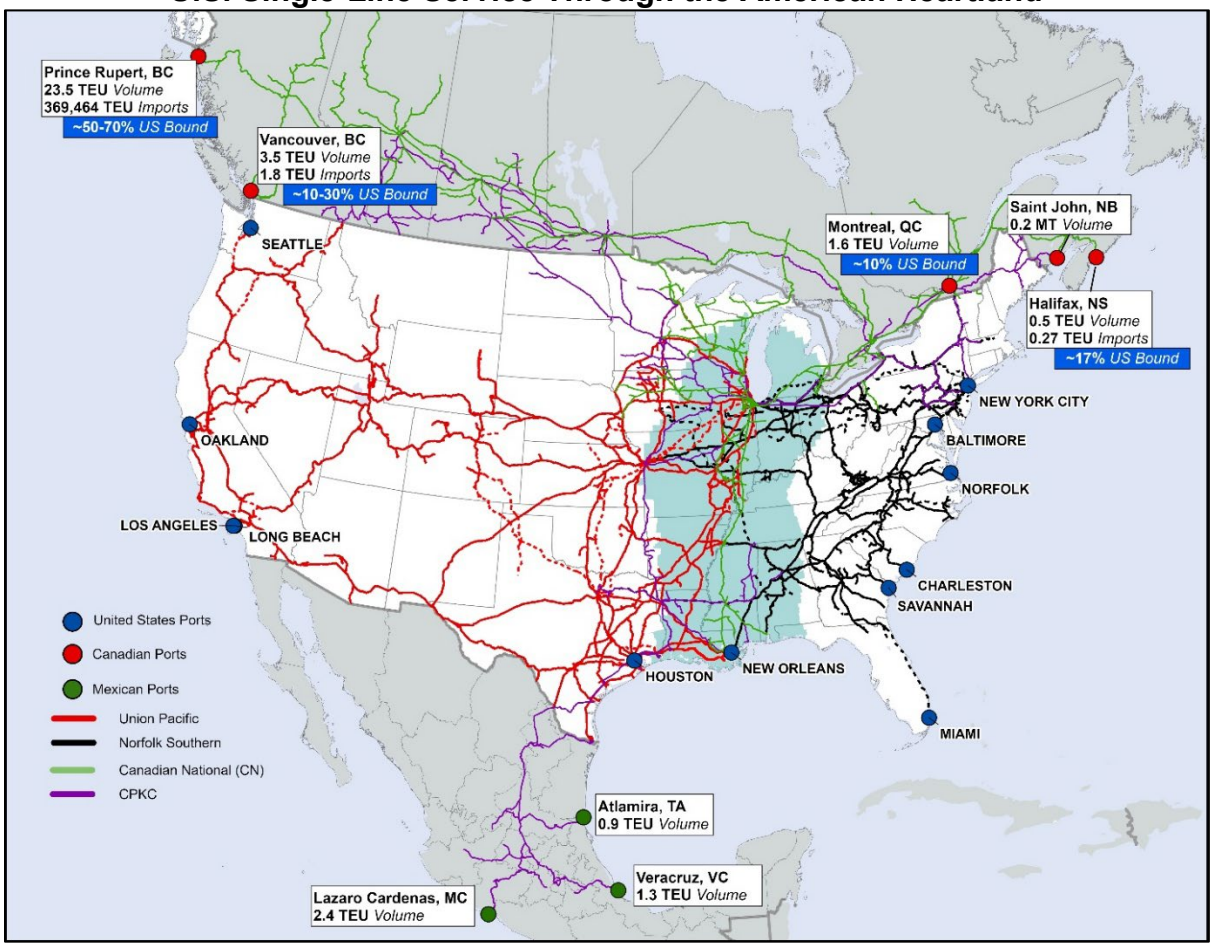
132. These growth models developed by Oliver Wyman are more than just numbers on a page or a technical, table-top data analysis. They reflect months of close work between Oliver Wyman and our marketing teams in intermodal, chemicals, automotive, agriculture, and other key markets. Our people brought their real-world experience to the table to test what the data showed against what they know is actually possible. These teams, who report to us, contributed decades of specialized knowledge about growth opportunities that come from offering single-line service

[32] *See* Hunt/Schabas VS at Exhibit 2-3.

across America's heartland. While it's not practical to check every lane by hand, the work was detailed, thoughtful, and guided by seasoned marketing professionals. The result is a set of growth analyses that we believe are both realistic and well supported.

133. We understand that the STB's rules ask Applicants to forecast not only the growth expected from this transaction but also the timing of those traffic gains over the first three years. We have done our best to provide both, but it is important to keep in mind that modeling is not an exact science. Our models simply reflect what we believe this unified network can achieve when given the chance to perform. And it is always risky to predict both what will happen and when it will happen. With those caveats made clear, the table below outlines our three-year projected modeling, reflecting what we believe are realistic expectations grounded in current demand trends and supported by meaningful operational improvements.

Table 2
Timing of Achieving Anticipated Traffic Gains



Type	Year 1	Year 2	Year 3
Intermodal (growth)	40%	70%	100%
Intermodal (from truck)	40%	70%	100%
General merch (growth)	40%	70%	100%
General merch (from truck)	40%	70%	100%
Autos	40%	70%	100%
Bulk (specific opportunities)	40%	70%	100%

134. We've been around this business a long time and we've seen a lot of forecasts. The consultants do good work, they're careful, and they're thorough. And our marketing teams vetted those analyses thoroughly. But they have to stick to what the numbers can prove. We strongly believe that the true growth potential here goes well beyond what can be modeled on paper. Once customers see a single-line, coast-

to-coast service that's faster and stronger, we believe the growth will come faster than any spreadsheet can predict.

135. As one example, we see big potential around the ports and in global trade. The merged UP/NS railroad would connect seamlessly with approximately 100 U.S. ports, giving customers more options than ever before. Whether it's containers moving inland or exports heading to the coast, we will be able to handle that business faster and more efficiently than anyone else. And as manufacturing comes back to the U.S. and companies adjust supply chains, this unified network will put us in the right place at the right time. Freight that might have moved through Canadian or Mexican ports will now have a stronger reason to stay here at home—moving through U.S. ports served by a truly national rail system. That will be good for our customers, our ports, and American jobs.

Figure 20[33]
Making U.S. Ports More Competitive with Improved U.S. Single-Line Service Through the American Heartland

136. So while the Oliver Wyman models tell you what can be measured over the next few years, this merger isn't about the next two or three years, or the next decade—it's about the next century. It's about building something lasting for future generations. Still, the findings are clear: when we simplify routing, cut dwell, and give customers faster, more dependable single-line choices, the merged UP/NS would become a fiercer competitor to the trucking industry and other Class I carriers who will be forced to elevate their game.

[33] *See* Workpaper "Rocker-Elkins VS - North America Port Data.xlsx".

IV. Creating Opportunities, Ensuring Service, and Enhancing Competition: The Path Forward for American Rail

137. Our customers have good questions. Below, we answer three important questions we've heard our customers raise: (1) "Why do you need a merger to make this happen—why can't you just cooperate more?"; (2) "How will you avoid the integration mistakes of past mergers?"; and (3) "Will this merger really enhance competition?" These three questions matter, and the next few sections will address them head-on.

A. Partnerships Simply Cannot Match the Scope of Benefits That Will Be Unlocked with America's First Transcontinental Railroad

138. We believe in cooperation where it makes sense. But experience has shown that joint alliances have built-in limits. The same issues come up time and again, and they make it difficult for customers to get the seamless, dependable service they expect:

- **Different Goals, Different Bottom Lines**. In any partnership, each partner still answers first to its own shareholders and priorities. As long as both sides see a benefit, things run fine. But when conditions change or one railroad's economics shift, the balance breaks down. What helps one partner's business might hurt the other's, and that tension eventually pulls the partnership apart.

- **Hard to Keep Two Railroads on the Same Schedule**. Coordinating two large, complex rail networks is tough. Different systems, operating cultures, and priorities make it hard to move in lockstep. If one side has congestion, weather problems, or crew shortages, the whole partnership feels it. That lack of synchronization frustrates customers who expect one smooth trip, not two disconnected halves.

- **Priorities Change Over Time**. Leaders change, corporate strategies evolve, and markets shift. What started as a strong partnership can lose momentum when one side changes direction or a new competitor alters

the landscape. These changes are normal in business—but they make long-term cooperation fragile.

- **Difficult to Coordinate Investments**. Partnerships often stumble when one side wants to invest more than the other. A new siding, yard, or terminal only works if both parties are willing to fund and operate it together. When incentives don't line up, investment stalls, and customers miss out on improvements that could have made the service better.

- **Technology Doesn't Always Line Up**. As railroads modernize, their technology platforms and marketing systems evolve differently. Systems that don't talk to each other create gaps in communication, pricing, and shipment visibility. Customers end up with inconsistent information and slower service when those systems don't mesh.

- **Short-Term by Nature**. Most alliances are built to work "as long as it makes sense." That means they're inherently temporary. When market conditions, traffic flows, or technologies change, these relationships often fade out quietly. What once looked like a promising collaboration can end simply because both sides found easier paths forward.

139. What customers want instead is a railroad that can turn on a dime, and that cannot happen when every decision requires a negotiation and a contract. A merged company can create a new block of traffic, adjust operating plans, or launch a new service in days, not months. We can respond when a factory comes back onshore, when fuel prices swing, when new export markets open for agriculture, or when a supply chain disruption demands immediate action. Alliances, by contrast, require new negotiations every time something changes. And while lawyers are drafting the contracts, customers lose opportunities.

140. This merger is like creating thousands of alliances at once, but without the limitations that make alliances fragile. Every origin and every destination across both networks will be connected under one roof, with one plan, one standard of service, and one point of accountability. Instead of stitching together a patchwork of

cooperative deals or temporary arrangements, we will be running one unified system that delivers a single, seamless experience for customers.

141. The scale of service improvements that this transaction can offer is staggering: 84,000 county to county lanes where current shippers truck industrial and bulk freight will have an opportunity to ship single-line manifest service.[34] That's hundreds of thousands of improved service opportunities—each one representing a business that can ship more competitively, a county that can grow its economy, and a supply chain that can operate more efficiently.

142. That doesn't mean that alliances will disappear. Geography will always matter in rail, and there will still be lanes where cooperation is essential—with CSX, with BNSF, with Canadian carriers. UP's Falcon Premium product is a great example of that. Yet the scale of what's possible here is simply not possible through handshake deals. The scale of what's possible here—hundreds of thousands of lanes, every customer touched—is something only a true merger can deliver.

B. Our Commitment to Seamless Integration

143. Other witnesses with direct experience in the Service Assurance Plan will walk the Board through the elaborate plans and operational steps being developed. The Service Assurance Plan is our playbook for how we will bring these two railroads together while protecting customers from the types of service problems the industry has seen in past mergers, and how we will respond if problems still occur. It addresses how we will plan, implement, monitor, and, if needed, reverse changes

[34] Hunt/Schabas VS at Exhibit 4-13.

during the integration. We want to just highlight the key points of that plan, from our perspective, as a reflection of our commitment to a seamless integration.

144. The Service Assurance Plan focuses on four kinds of change that create the most risk: new operating plans, yard and terminal changes, major IT cutovers, and how customer service is organized.[35] On the operating side, we will move in stages. Before any major change goes into effect, it is reviewed by people who run trains, manage crews and locomotives, handle customer orders, and oversee key routes and yards. The change will not launch without their approval. For critical parts of the network that might be affected by integration, such as the Kansas City to Butler line and gateways like Chicago, St. Louis, Memphis, and New Orleans, we have identified backup routes, substitute yards, additional crew bases, at the ready locomotives, and extra car supply so that if a problem flares up in one place, we have preplanned ways to keep freight moving. And if a change does not perform as expected, the plan requires that we be able to roll back to the prior train and blocking pattern or terminal configuration.

145. The Service Assurance Plan also leverages our experience to develop benchmarks to detect emerging issues should they occur. If some of these benchmarks do exceed a carefully determined threshold, UP/NS will activate a special problem resolution team to not only address the issue, but to find the root cause and develop and supervise the execution of plans to ensure problems don't recur. When that team is activated, they will look at what is happening on the ground and use their

[35] *See* App. Vol. 2, Service Assurance Plan.

experience and judgment to deploy buffer resources as appropriate to promptly restore adequate service. During this period, the plan calls for closer internal reporting and direct engagement with the Board's staff until performance is back where it needs to be.

146. With the Service Assurance Plan, our IT integration plan follows the same careful approach. For example, UP's NetControl operating and CADx dispatching systems will be introduced on NS territory in stages, with careful virtual testing and data validation after each step.[36] Here, too, the plan requires that we remain able to roll back any IT change if we detect a problem, so we will keep legacy systems available long enough to support rollback.

147. Customer service integration is also staged and conservative. At first, each railroad will operate as it does today in its own geography, but with shared visibility into the whole network, shared access to critical shipment information, common incident response and escalation paths, and a single entry point for customers that work with both carriers. Over time, we will move to a single platform for shopping, pricing, onboarding, and case handling, with unified call routing and case management. The plan also provides clear protocols for customers who experience merger related service problems. They can raise concerns through existing customer service, marketing, and operations contacts, by calling our customer centers, or by using online portals, where issues are logged, tracked, and escalated

[36] *See* App. Vol. 2, Service Assurance Plan, Information Technology Systems Integration Plan.

for cross network problems. If a customer believes a merger related service problem has caused financial harm and is not satisfied with the response through these channels, the plan offers an optional arbitration process.

148. Taken together, the Service Assurance Plan is a practical, step by step guide for implementing this merger with customers in mind. It relies on staged changes, built in buffers, detailed contingency plans, rigorous monitoring, mandatory rollback features, stands up a dedicated problem solving team, and offers clear customer protocols. It sets the standard by which customers and the Board should hold us accountable throughout the integration process.

C. A Transcontinental Railroad Will Enhance Competition

149. The final question we hear asks how the transaction will enhance competition. The Ph.D. economists will give you the academic models, which confirm this merger will enhance, and not harm, competition.[37] But we know these markets because we live them. And from where we sit, this transaction is, without a doubt, pro-competitive.

1. This Is an End-to-End Merger of Complementary Networks

150. First, this is a classic "end-to-end" merger. UP and NS are not substitutes for each other. They connect. Each serves a distinct geographic region with complementary networks, customers, and markets. There are virtually no customers who would lose a rail option as a result of this transaction. To the contrary,

[37] *See* App. Vol. 2, Verified Statement of Dr. Mark Israel.

by eliminating interchange points and combining complementary routes, the merger will expand competitive options for customers in virtually every major corridor—against competitor railroads and trucks. The result is more competition, not less, and a stronger, more efficient national rail system.

2. A Transcontinental Railroad Will Itself Enhance Competition

151. Second, the most transformational enhancement to competition would come from the creation of America's first coast-to-coast transcontinental railroad. As we have described above, the benefits to customers from combining these two networks are massive. As the merged UP/NS railroad offers faster service, better consistency, and stronger reliability—the very things that enable rail to go toe-to-toe with trucks—our Class I competitors will need to do the same in order to compete.

152. We are already seeing a competitive response from other railroads. Following the announcement of this proposed merger, BNSF and CSX announced new intermodal service alliances aimed at creating coast-to-coast, seamless rail options.[38] That is exactly how competition is supposed to work. Other carriers will not stand still if the STB approves this merger; they will respond with new partnerships, new lanes, and better service offerings of their own. The result will be a more dynamic, customer-focused rail industry—one where everyone has to hustle harder to earn business.

---

[38] *See* BNSF Railway & CSX Corporation, *BNSF, CSX Announce New Intermodal Services, Offering Seamless Coast-to-Coast Rail Solutions* (Aug. 22, 2025), https://www.bnsf.com/news-media/news-releases/newsrelease.page?relId=bnsf-csx-announce-new-intermodal-services-offering-seamless-coast-to-coast-rail-solutions.

153. Just as important, this merger doesn't just make the railroads more competitive—it makes our customers more competitive across the globe. Faster service, shorter routes, better asset utilization, superior customer support, and improved reliability all flow through directly to the businesses we serve. Grain farmers can move harvests to market more efficiently. Metal producers can reach new plants and end users with fewer delays. The American auto industry can connect its supply chains coast-to-coast with less risk and more certainty. And our ports—on the Atlantic, the Pacific, and in the Gulf—will be better supported by a unified rail network that connects them seamlessly to inland markets.

154. Railroads cannot grow unless we offer a service product that helps our customers be more competitive in their markets. Our customers compete in a global marketplace, and approximately 40 percent of UP's business traverses an international border. When our customers grow, our Nation grows stronger in the global economy.

3. 2-to-1 Customers Will Be Protected

155. For those few customers in the Midwest who might see a change in their competitive landscape—the so-called "2-to-1" customers—we have contacted them and committed that they will retain two Class I railroads serving their facility after the merger. Katherine Novak's statement describes the 2-to-1 customers who will be protected from the loss of any rail-to-rail competition.

156. This small group of 2-to-1 customers simply reflects what the data confirm—a tiny overlap between our networks. UP and NS are committed to making sure even that limited group continues to be well served as we move forward.

4. Build-In/Build-Out Options Will Be Preserved

157. To preserve the competitive status quo, we commit to preserve pre-merger build-in/build-out options for existing customer facilities served exclusively by UP or NS that would be eliminated as a result of the merger. Consistent with build-in/build-out condition the Board imposed in authorizing the UP/SP merger, an existing exclusively-served customer of UP or NS will be able to raise a claim that the merger deprived it of a build-out/build-in option at any time. If the relevant connecting line is actually built, UP/NS will negotiate in good faith the terms of an agreement that will implement the build-in/build-out remedy. Any technical disputes with respect to the implementation of this commitment will be resolved either by arbitration or by the Board.[39]

5. Keeping Major Gateways Open on Commercially Reasonable Terms and Not Creating Any New Regulatory Bottlenecks

158. In addition to protecting 2-to-1 customers, we are also making major commitments that apply broadly across the network. Despite the fact that this merger would not harm competition—and would, on its own without any voluntary conditions, enhance competition—we are providing assurances to our customers and

[39] *See Union Pac. Corp.—Control & Merger—S. Pac. Rail Corp.*, 1 S.T.B. 233, 420 (1996).

to the Board that this transaction is going to offer more, not less, competition and customer options.

159. We therefore are voluntarily embracing the same robust and readily enforceable open gateway requirement and bottleneck pricing conditions that the Board imposed in the recent Canadian Pacific-Kansas City Southern ("CP-KCS") merger proceeding.[40] These commitments will thoroughly address any customer fears (even if speculative and groundless) about foreclosure or competitive harm.

160. **Voluntary Gateway Commitment #1**: We commit to keep open on commercially reasonable terms all existing gateways for eligible traffic (that is, traffic that UP or NS interchanged with another carrier for which the transaction will create a longer UP/NS haul than was available on the UP or NS system pre-transaction). This commitment will ensure that the transaction will not result in any foreclosure of customers' opportunities to use existing interline routes that they might prefer to the new UP/NS single-line options.

161. We will apply this commitment to both existing and new traffic flows along the lines that the Board established in the CP-KCS merger approval decision.[41] As in the CP-KCS merger, we will define existing traffic subject to the commitment as traffic that UP or NS has interchanged with another carrier within the five-year

[40] *See* Decision No. 35, *Canadian Pacific Railway Ltd., et al.—Control—Kansas City Southern, et al.*, Docket No. FD 36500, at 67-83 (STB served Mar. 15, 2023) ("CP-KCS").

[41] *See id.* at 70-71.

period before the effective date of STB approval.[42] We will also apply the commitment to "new traffic" as modified by the Board in FD 36500.[43] Regardless of whether the customer has previously chosen an alternative route, shipped a different commodity, or is entirely new, the gateway commitment will apply to preserve pre-transaction interline routing options for traffic moving in origin-destination corridors that have been used by any customer within five years of the date a request for a rate involving new traffic is made. We will commit to keep the gateway used by any such route open on commercially reasonable terms.

162. This gateway commitment means that we will continue to offer commercially reasonable rates and terms capable of supporting the continued movement of traffic via the gateway, and we will not make it impossible to construct viable interline options for customers by refusing to quote commercially reasonable rates. It applies to both the rates we will quote and to the service we will provide.

163. **Voluntary Gateway Commitment #2**: We commit, during the oversight period, to provide a customer upon request a written justification for any rate increase above the rate of inflation for interline movements subject to the open gateway condition.[44]

164. **Voluntary Gateway Commitment #3**: We commit to gateway-related reporting requirements analogous to those imposed in FD 36500.[45] In particular, we

---

[42] *Id.*

[43] *Id.*

[44] *See id.*, at 68, 78–79.

[45] *See id.*, at 80–83.

commit to report monthly during the oversight period with regard to traffic interchanged between the combined entity and connecting carriers at key gateways potentially affected by the transaction. We will comply with the specific reporting requirements imposed by the Board in FD 36500 to the extent they are applicable to the combined entity or analogous data can be provided.

165. **Voluntary Gateway Commitment #4**: Our commitment to keep existing, major gateways open on commercially reasonable terms will apply in perpetuity and to all traffic, including intermodal and other traffic that is exempt.

166. **Voluntary Gateway Commitment #5**: We commit to not take the position that the open gateway commitment does not apply because of a lack of market dominance. Nor will we take the position that the Board lacks jurisdiction because the revenue-variable cost percentage generated by the traffic is less than 180 percent.

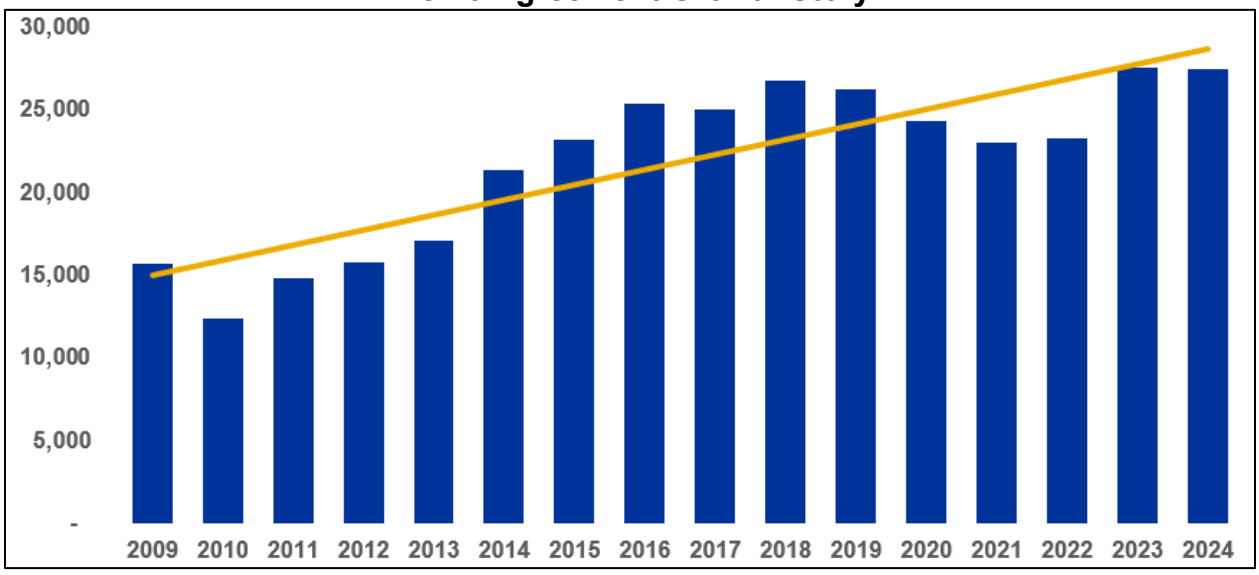
167. **Voluntary Gateway Commitment #6**: We commit to offer connecting carriers commercially reasonable rate divisions and to negotiate in good faith with the connecting carrier to seek to resolve any disagreements about the commercial reasonableness of proposed divisions.

168. **Voluntary Gateway Commitment #7**: Finally, the combined entity will not create any new regulatory "bottlenecks" that, as a result of this transaction, might limit a customer's ability to access relief via the STB's rate review processes.

6. Committed Gateway Pricing Framework Will Further Stoke Competition

169. Beyond these robust protections, we are going even further with a new commitment designed not just to preserve competition, but to expand it.

170. And that's where UP's previous experience in another market comes in. Twenty-five years ago, UP rolled out a similar program in the I-5 corridor, which spans from the Canadian border through Washington and Oregon to California, following Interstate 5, and it worked—spectacularly. Now, I (Kenny Rocker) was not at UP when this program was created, but I saw firsthand as Assistant Vice President of Industrial Marketing how it worked. That program drove tremendous growth by giving customers new competitive choices, and it became one of the most successful examples of railroads expanding competition through innovation.



171. The secret to its success was that it created both parity and transparency. When an opportunity to compete arose, UP could move fast, equipped with a clear, published rate for the BNSF portion of the route. That simple mechanism unlocked agility—if UP had a better relationship with the customer, a stronger service plan, or simply saw an opportunity others had missed, we could step in and win business on merit.

172. From the customer's point of view, it offered the kind of rail experience they had been waiting for. It wasn't just a rate program—it was a window into how rail could feel more like a modern logistics partner. It gave customers the confidence that they could plan, price, and execute through one channel, much like they would with a trucking provider. And that's the lesson we carry forward today: if we want to

compete with trucks, we have to offer a simpler, more responsive, and more connected customer experience. The I-5 program didn't remove all the friction of interchanges—that requires deeper network integration—but it let UP hustle for business as if it were a single-line carrier.

173. And the proof of concept is in the results. In the twenty-five years since that program was introduced, the I-5 corridor has seen sustained growth in rail volumes and market share. What began as an experiment in cooperation became a long-term competitive advantage—for UP, for customers, and for the broader supply chain. The data tells the story: traffic expanded year after year, new customers entered the market, and rail captured freight that previously moved by truck. The lesson is clear—when railroads innovate to make it easier for customers to do business, the market responds decisively.

Figure 21[46]
The I-5 Agreement Growth Story

[46] *See* App. Vol. 1, Verified Statement of Katherine Novak at Figure 1.

174. Building on the success of the I-5 corridor, we now propose to roll out this program on a national scale. While the I-5 initiative was limited to the Pacific Northwest, the vision before us is far broader. Through this merger, we plan to extend the same principles of transparency, parity, and single-point accountability to four major gateways that connect our combined system with the broader North American rail network. The result will be a significant catalyst—creating faster, more flexible options for customers and extending the benefits of seamless coordination well beyond the direct UP/NS footprint.

175. This Committed Gateway Pricing cannot replicate the full service advantages that an integrated UP/NS network will offer in terms of service quality, reliability, and shipment visibility. But it will meaningfully extend the benefits of this merger to a multitude of sole-served customers. For many of these customers, particularly those who cannot move directly on a new UP/NS lane, this proposal will open the door to a new level of access and competitiveness. It will allow CSX or BNSF to act quickly on new opportunities when customers are ready to move freight. That agility will not only improve the customer experience but will also make these lanes more competitive against trucking, offering simpler pricing, faster responses, and a more reliable rail option.

176. The benefits flow both ways. Customers gain speed, clarity, and access to broader markets, while we gain new traffic that flows across the gateways and onto our networks. The entire rail ecosystem grows stronger as more freight moves efficiently by rail rather than by highway. It's a rising-tide opportunity—one that lifts

every participant in the system. The result is not only more competition, but better competition: built around customer needs, grounded in transparency, and driven by shared success.

177. Katherine Novak's statement describes the proposal and its mechanics in greater detail, outlining how the Committed Gateway Pricing framework will function in practice. And Dr. Mark Israel's testimony explains how this initiative will further enhance competition—above and beyond the already significant public benefits that flow directly from the UP/NS merger itself.

V. The Customers, Short Lines, and Communities Supporting This Merger

178. This is the part of the Application that hits home—because this merger isn't about lines on a map. It's about the people we serve, the employees who make it all happen, and the communities who prosper when we succeed. More than 2,000 statements of support have come in from across the country.[47] Our customers touch every part of the U.S. economy, and you see them represented in the many letters from farmers, housing market suppliers, chemical industries, intermodal customers, and soda ash producers. We also received support from employees, short line partners, suppliers, ports, labor unions, and the communities we collectively serve. These letters tell one simple story: that people believe rail can do better and they want more. They see this iconic merger as a chance to build a faster, better, and

[47] Unless otherwise noted, the quotations in this section can be found in the corresponding letters of support in Volume 3 of this Application.

stronger rail network that helps their businesses, their workers, and their hometowns grow.

179. We've not been shy to admit that railroads haven't always been the easiest partners to work with. So when we asked thousands of stakeholders to share their views on this merger, we wanted to make it easy for them to participate, so we offered letters they could use if they wished. Some personalized the letters, some didn't. But everyone took the time to think about what this merger means for them and their community. Whether the words were polished or plain, those letters are theirs. And they represent customers, employees, and communities who care deeply about rail's future and want to see it work better.

A. What Our Customer Are Saying

180. We meet with customers every week and across every industry. And they're telling us the same thing that they're telling the STB in their letters: they want rail to be easier to use, faster across the country, and reliable enough to plan their business around. They understand that this merger isn't just about scale, it's about delivering a better product. And they want the STB to approve it.

181. In agriculture, for example, the message came through loud and clear:

- "Farmers depend on efficient rail service to get their crops to market and their inputs delivered on time. By uniting these rail networks, Union Pacific and Norfolk Southern are taking a logical step to improve agricultural logistics. We expect to see faster grain shipments, fewer delays, and better rail access." – KC Graner, President and CEO of Central Farm Service

- "The proposed merger would . . . position[] us to reach new markets and end-users further east. . . . Farmers don't have time or margin for delays. The sooner this merger is approved, the sooner we can all start seeing the benefits—fewer bottlenecks, better access, and lower costs across the

supply chain. That's good for agriculture and it's good for the communities that depend on it." – James Burgum, CEO of The Arthur Companies

182. The same excitement came from logistics and transportation partners, who voiced their support this way:

- "This is a significant breakthrough in U.S. freight transportation. By knitting together a coast-to-coast rail network, Union Pacific and Norfolk Southern are creating new efficiencies that will benefit everyone – from logistics providers like us, to our customers, to the end consumers."[48] – Adam Miller, CEO of Knight-Swift Transportation

- "By eliminating interchanges where railcars are handed off from one railroad to another, service times from coast to coast will improve by several days. Current interchange points of Chicago, Kansas City, St. Louis and Memphis will be eliminated, which will keep railcars flowing more quickly from coast to coast. Less handling and delays also lessen the chance of product shift, damage and theft. … The watershed areas near current UP and NS interchange points along the Mississippi River will receive particularly enhanced economic competitiveness since the combined railroad will not have to charge minimum rates on short-haul moves that make existing opportunities impractical." – Scott Harris, President of Business Development, CCO of CAD Logistics, LLC

- "Beyond operational improvements, we see this merger as a catalyst for broader industrial growth. Rail is a cornerstone of American infrastructure, and a unified network would be better positioned to invest in the technology, equipment, and capacity needed to support the evolving needs of manufacturers, retailers, and consumers. . . . A transcontinental railroad would allow for more seamless service across regions, reducing transit times and minimizing handoffs. That kind of efficiency isn't just good for business – it's essential for maintaining supply chain reliability in a competitive and fast-moving market." – Tim Clay, President & CEO of Cornerstone Systems

[48] Knight-Swift Transportation Holdings Inc., *Knight-Swift Transportation Holdings Inc. Endorses Union Pacific – Norfolk Southern Merger* (Sept. 2, 2025), https://investor.knight-swift.com/news/news-details/2025/Knight-Swift-Transportation-Holdings-Inc--Endorses-Union-Pacific--Norfolk-Southern-Merger/default.aspx

183. And from the petrochemical industry, Frank Vingerhoets, President of Katoen Natie North America, explained how this merger will improve supply chains that reach across the globe:

- "We wholeheartedly support this merger and the vision of a truly transcontinental railroad. . . . Union Pacific's strong Gulf Coast network has long been the backbone of our petrochemical logistics operations. Linking that network directly with Norfolk Southern's East Coast routes will create unprecedented efficiencies. It means the plastic pellets and other products we handle can reach key markets faster and more seamlessly than ever. In short, it's a win for customers and for the entire supply chain"[49] – Katoen Natie

184. Likewise, from the forest industry, customers see a host of benefits and opportunities from combining the complementary networks of UP and NS:

- "We are in the lumber business . . . . [and the] way the US rail system is laid out and parceled up makes it difficult for us to reach our customers in an efficient and cost-effective manner. . . . It is ridiculous to ship from Lake Charles to the Northeast for example and being basically charged twice for the same railcar, making the entire transaction cost prohibitive." – Thomas Mende, Chief Sales Officer, Binderholz Timber LLC

- "UFP Industries is a $6 billion publicly traded American manufacturer serving the building, construction, and packaging sectors. With hundreds of locations and tens of thousands of customers nationwide, we rely heavily on efficient, reliable, and cost-effective rail service to distribute our products. We believe this merger will help advance these priorities by integrating complementary rail networks and spurring new investment in the freight rail industry, enhance competition and deliver tangible benefits for customers like us, including improved service reliability through more direct routes, fewer disruptions, and greater flexibility. It will also reduce transit times, enabling us to deliver goods

[49] Katoen Natie, *Katoen Natie Supports Union Pacific–Norfolk Southern Merger, Applauds Coast-to-Coast Rail Expansion*, Business Wire (Sept. 3, 2025), https://www.businesswire.com/news/home/20250903921990/en/Katoen-Natie-Supports-Union-PacificNorfolk-Southern-Merger-Applauds-Coast-to-Coast-Rail-Expansion (last visited Nov. 11, 2025) (internal quotations omitted).

more efficiently and expand our reach to new and existing customers." – Will Schwartz, CEO & President of UFP Industries

185. From the food industry, customers are excited about how the merger will get rid of longstanding inefficiencies that get in the way of growth and stability and will offer a more resilient rail network that can meet the needs of modern-day market demands:

- "As a manufacturer deeply reliant on efficient freight transportation, we recognize that the current rail system faces logistical challenges—ranging from inconsistent service schedules and limited network interoperability to congestion at key transfer points. These inefficiencies disrupt supply chains, delay deliveries, and increase operational costs for businesses like mine. The merger between Union Pacific and Norfolk Southern offers a unique opportunity to address these deficiencies by creating a more unified and responsive rail network. A consolidated system would enhance coast-to-coast connectivity, reduce handoffs between carriers, and streamline routing-resulting in faster transit times and improved reliability. It would also allow for better coordination of assets, more flexible scheduling, and increased investment in infrastructure upgrades and digital technologies. For CJ Bio America, these improvements would translate into greater supply chain stability, reduced transportation costs, expanded reach, and improved service to our customers across North America." – Lucas Palmer, Sr. Director of ESG at CJ Bio America, Inc.

- "The strength and competitiveness of our supply chain, and by extension the broader food distribution network, rely on a modern, resilient rail system capable of meeting evolving market demands. We believe this merger represents a forward-looking investment in that future." – Peter Unanue, Executive Vice President, Goya Foods, Inc.

186. The intermodal community anticipates both time and cost savings, as well as value-enhancing innovation that will result in the growth of intermodal traffic and supply-chain reliability:

- "We believe that the formation of America's first transcontinental railroad through the merger of Union Pacific and Norfolk Southern will accelerate the full realization of the benefits of intermodal transportation for our customers and the United States economy. . . . As

manufacturing in the United States further expands it is critical to have the reliable, efficient, and cost-effective freight rail service and offerings that Union Pacific and Norfolk Southern would more effectively provide as a combined company." – Phillip D. Yeager, President, CEO, and Vice Chairman, Hub Group, Inc.

- "Intermodal companies currently tasked with trucking their containers between UP and NS intermodal yards in Chicago, Kansas City, St. Louis and Memphis will finally be able to leave their trailers and containers on railcars for the entirety of the move. This time and cost savings will help U.S. intermodal traffic grow over the next decade." – Scott Harris, President of Business Development, CCO of CAD Logistics, LLC

187. For the metals industry, combining the networks of UP and NS means new efficiencies and opportunities to better serve their customers:

- "By eliminating interchanges where rail cars are handed off, the combination will remove several days from transit times, enabling us to deliver more goods to more customers and to find new producers of steel to supply our facilities faster." – Rafael Andre Martinez, International Planning and Logistics Manager, ViSteel, Inc.

188. In the auto industry, the combined network's single-line service will mean new opportunities and new optionality:

- "My business would benefit from faster, more reliable service, a more efficient and resilient supply chain and access to new markets. The proposed Union Pacific–Norfolk Southern merger has the strong potential to help my business by delivering single-line service and offering more direct routes that increase transportation options, expand[ing] each railroad's geographic reach and encouraging investment in infrastructure and technology." – Cecelia Esparza, Material Logistics Specialist, Siemens Mobility Inc.

189. From the coal industry, the merger is an opportunity to open up new market opportunities for U.S. coal to compete more strongly, including globally:

- "For our coal industry this merger could be especially important. West Virginia leads the nation in coal exports[,] and improved logistics directly reduce cost per ton. International buyers are very sensitive to transportation costs and the ability to move coal efficiently and affordably helps our miners stay competitive. . . Improving the rail

network's efficiency and creating westbound access strengthens the economics of exporting coal to global markets. Reduced rail costs and faster delivery lower the total cost of coal shipped overseas, improving the position of West Virginia producers in world markets." – Gary Howell, West Virginia House of Delegates

190. Customers from a variety of other industries are likewise eager to realize the benefits of America's first transcontinental railroad, which they recognize will not only enhance their ability to compete and succeed in a global marketplace but will strengthen North American trade overall:

- "[E]nhancing connectivity between UP and NS networks is critical for advancing North American trade competitiveness." – Alejandro Rodríguez Villarreal, Founder & CEO of TLTerminals
- "[T]he larger network of a combined NS and UP provides OES with an improved ability to hit markets into which we have historically be[en] unable to enter." – Bryan Hurtado, CEO and Founder of Oleum Energy Solutions, LLC
- "We see firsthand the need for expanded capacity, reduced bottlenecks, and forward-looking investment. This merger is an opportunity to align the freight rail system with 21st-century priorities, from energy security to industrial resilience." – Christopher D. Smith, Founder & CTO, SunTrain, Inc.

191. For companies like these and hundreds more, the merger represents something simple but powerful. It represents railroads delivering on the promise of service that works the way customers have always wanted it to.

B. What Our Short Line Partners Are Saying

192. We've already discussed the many benefits this merger brings to short lines, but they deserve special mention. Short lines are the front door to American industry. They are often the first and last mile connecting farms, factories, and distribution centers to the national rail network. They know their customers and

communities better than anyone, and they've told us what a unified coast-to-coast railroad will mean for them: simpler interchange, faster handoffs, clearer communication, and stronger, more reliable service.

193. But don't take our word for it—listen to theirs. Across the country, short lines have written in support of this merger because they see the benefits firsthand:

- "The proposed merger represents a reasoned and logical step forward for the national rail system. The combined network should unlock efficiencies that benefit all stakeholders from large and small shippers, communities and consumers, and railroads and logistics providers. Rio Grande Pacific looks forward to collaborating with the newly combined railroad to help our shippers capitalize on new routing options, new potential markets and growing service enhancements." – Rio Grande Pacific Corporation

- "One of the biggest barriers today is the complexity and inefficiency created by the need to secure multiple rates and handoffs across various connecting carriers. Reinvigorating the CVLY and attracting sustained investment to this region depends on our ability to connect directly with national markets through seamless, single-line service. . . . With this merger, Clackamas Valley Railway could connect directly into a 53,000-mile unified rail system-one that offers competitive transit times, streamlined pricing, and a service experience that finally rivals that of trucking." – Clackamas Valley Railway

- "Progressive Rail's St. Paul & Pacific Railroad Company, based in Watsonville, California, proudly serves a region that produces cauliflower, broccoli, lettuce, strawberries, raspberries, and the famous Martinelli's Sparkling Fruit Juices. Today, most of these products travel to market by tractor-trailer. However, with a true coast-to-coast rail corridor, frozen strawberries and sparkling apple juice could move with greater purpose and priority—ultimately allowing American consumers to pay less for fresh, healthy, domestically grown food. By linking the Atlantic and Pacific regions of our nation through an efficient, safe, and temperature-controlled rail network, we can advance both economic and environmental goals while supporting America's farmers and families." – St. Paul & Pacific Railroad

- "CPR operates 6 lines, with 5 interchanges with NS, so our daily interaction with NS and the NS management team is tremendous; and our increasing growth could not be possible without them as a partner,

and with the merger, that partnership will only grow to promote UP/NS and CPR's position as an economic driver for the State of Georgia and beyond. We see improved service reliability, reduced transit times and an increase in infrastructure investment. All of which promotes our goal of job growth, domestic and international economic development and ultimately, a safer rail network." – CaterParrott Railnet

- "A combined Union Pacific / Norfolk Southern will unlock more competitive origins for our agricultural shippers located on the Delmarva Peninsula by eliminating several days from transit times, allowing rail to be even more competitive." – Carload Express

- "The UP / NS partnership would open brand new markets with a wildly efficient single line haul and greatly decreased transit times." – Crab Orchard & Egyptian Railroad

- "At the core of the CJR's support [for the merger] is the newfound efficiencies in transit[,] opening brand new markets[] while also dramatically improving overall transit times." – Chicago Junction Railroad

- "We believe this merger will deliver meaningful benefits—not only for Mount Hood Railroad, but for the thousands of local businesses and communities who depend on the broader rail network." – Mount Hood Railroad

- "Industrial development flourishes along the most effective supply chains. The newly proposed 52,215-mile network, spanning forty-three states, is an economic development machine like no other." – Wisconsin Northern Railroad

194. Their message is clear: this merger lifts everyone. A stronger national network, built on better service and closer partnerships, creates a rising tide that lifts all railroads and strengthens the entire transportation ecosystem.

C. What Our Supply Partners Are Saying

195. The people who build our trains and power the technology behind them know what opportunity looks like. They see the proposed merger of UP and NS as a chance to make the whole system stronger. A unified network means more locomotives to build, more components to produce, and more innovation to drive

forward. They understand that when rail runs better, it creates a ripple effect that lifts everyone—suppliers, customers, and workers alike:

- "We believe that the proposed merger can improve the effectiveness of railroad operations to better support customers and enhance competition with trucking. Through integration of Union Pacific and Norfolk Southern's rail footprints, the merged railroad will operate the first coast-to-coast rail network in the U.S., allowing customers to avoid issues in interchange between multiple railroads that have historically made rail shipments more cumbersome and less attractive compared to trucking." – Progress Rail Services Corporation

- "As a family owned and operated company based outside Chicago, we know firsthand the benefits a merger would bring not only to our region, but across the country. Safety, the cornerstone in our company, would be addressed with improved service reliability and increased direct routes and flexibility. Chicago, often called the 'railroad capital of the U.S.' has a long history of growth and opportunity due to the railroads. We value this moniker; our families and local businesses view improved service and reduced transit times as an avenue to ensure our future continues as a transportation hub." – K-Five Construction

- "Our Canadian customers—CPKC and CN—have operated transcontinental and transnational rail networks for decades. It is time for the United States to have the same advantage." – NSH USA Corporation

- "Choctaw Construction Services, LLC is an American Indian and Veteran owned business that strongly supports the proposed merger between Union Pacific and Norfolk Southern. Union Pacific Railroad, which was chartered and partially funded by the U.S. government under Abraham Lincoln's administration, now has the potential to fulfill the vision that Abraham Lincoln had for a transcontinental railroad, but now under a much more efficient single-corporate structure." – Choctaw Construction Services LLC

- "This combination promises to strengthen the national fuel supply network, streamline logistics, and unlock new levels of reliability and responsiveness—benefits that will extend across the entire transportation ecosystem. We are proud to be in full support of this merger and believe it will create a more resilient and forward-looking rail infrastructure." – U.S. Energy, a U.S Venture company

196. As their support statements show, this merger will not only benefit UP and NS suppliers, it will generate American opportunity and growth far and wide.

D. What Our Communities Are Saying

197. Communities along our lines view this merger as an investment in their future too. Local leaders have told us they see new jobs, new industry, and new growth coming from a rail network that moves freight faster and more reliably. To them, railroads are partners in progress, not just carriers of freight. They know that when rail runs better, local businesses can grow, farmers can reach new markets, and communities can attract the kind of development that keeps them thriving:

- "The merger of Union Pacific and Norfolk Southern will only further strengthen the efficiency, reliability, and effectiveness of our freight rail system. . . . These improvements are likely to lower supply chain costs for shippers, which ultimately means lower prices for consumers. And it is projected that all this will increase freight rail demand and thus increase the number of jobs at the newly-formed company, which is one reason why the nation's largest railroad union has announced its support for the merger. Finally, as demand for freight rail increases, more trucks can be taken off our highways and other roadways, reducing congestion and further lowering emissions. In short, the proposed merger, like our freight rail system itself, will promote economic growth and environmental sustainability. It will be good for our individual States and for the Nation as a whole." – Joint Support Letter from State Attorney General: Chris Carr, Georgia Attorney General; Mike Hilgers, Nebraska Attorney General; and J.B. McCuskey, West Virginia Attorney General

- "Norfolk Southern's deep integration into Georgia's manufacturing ecosystem ensures that this merger will amplify—not diminish—economic opportunity across our state[.] . . . The merger will further empower Georgia to compete in the next era of U.S. manufacturing. As someone who helped recruit Norfolk Southern's headquarter operation to the state of Georgia, I'm also pleased to see the companies commit to maintaining Atlanta as a critical hub for innovation, technology, and operations." – Alan Powell, Chairman, House Regulated Industries, Georgia House of Representatives

- "Rail is particularly critical to some of our region's largest employers, including CURRIES, Cargill, Smithfield, and Kraft Heinz. . . . [We] respectfully urge the [STB] to approve this merger so that Mason City and the North Iowa region can fully benefit from the efficiencies, investments, and opportunities it will bring—connecting our community locally, regionally, and across the globe." – Greater Mason City Chamber of Commerce

- "The proposed merger between Union Pacific Railroad and Norfolk Southern Corporation presents a unique and timely opportunity not only for West Virginia but for the entire Appalachian and Mid-Atlantic region." – Gary Howell, West Virginia House of Delegates

- "As the home of the largest port on the eastern seaboard, we rely on dependable and affordable freight service to power our logistics economy. . . . The proposed merger presents a unique opportunity to strengthen [the freight rail] network and deliver direct benefits to New Jersey …." – New Jersey Business and Industry Association

- "I believe this merger will help with providing efficient, reliable, and cost-effective service to businesses large and small. . . . I am also happy to see that this is a true partnership between the company and the working men and women who have helped build and operate the rail system. The announcement of job protections and the endorsement from the union representing the workers, SMART-TD, means they will begin this endeavor stronger together." – Jay Costa, Jr., State Senator, Democratic Leader, 43rd Senate District, State of Pennsylvania

- "In recent years, freight rail expansion has strengthened South Carolina's economy by moving more cargo through our ports, enhancing the competitiveness of local businesses, lowering costs for consumers, and reinforcing supply chains. The proposed merger between Union Pacific (UP) and Norfolk Southern (NS) offers an opportunity to build upon this. . . . For Charleston in particular, the impact will be significant. The Navy Base Intermodal Facility (NBIF), now under construction, will establish a near-dock rail connection linking Port of Charleston cargo directly to inland markets, including those served by NS. Together, this merger and NBIF will unlock transformative opportunities for our region – enabling Southeast businesses compete in global markets and ensuring Palmetto state-made goods can move seamlessly to customers throughout the country. South Carolina is also home to world-class manufacturers like Boeing, Michelin, and Volvo. The merger will enhance these employers' ability to move raw materials and finished products more efficiently, protecting tens of thousands of

well-paying jobs while fueling economic growth." – Charleston Metro Chamber of Commerce

- "For a community like Douglas County, strategically positioned along the I-20 corridor and committed to economic growth, the efficiencies, investments, and opportunities created by this merger will help ensure our competitiveness in the global economy. Ultimately, the Douglas County Chamber supports the proposed merger because it aligns with our legislative priorities to attract diverse businesses and create wage-sustaining jobs, while advancing technology and infrastructure investments that incorporate local input." – Douglas County Chamber of Commerce

- "For Cobb's manufacturers, distributors, and small businesses, this expanded network means faster service, fewer delays, and broader market opportunities. Just as important, it will help improve freight mobility, and support sustainable economic growth across our region. With Atlanta and Cobb County already recognized as global cities, this merger ensures that Cobb County will remain a vital logistics and business hub at the heart of a fully integrated coast-to-coast rail system." – Cobb Chamber of Commerce

- "As State Senator and resident of Greenville County, South Carolina, I've seen firsthand how our region has grown into a thriving hub for manufacturing, small business, and logistics. . . . That success brings challenges on our roads, infrastructure, and freight systems. For this reason, I support the proposed merger between Union Pacific (UP) and Norfolk Southern (NS). This partnership will be an important step forward for the Upstate and for South Carolina as a whole. The merger would strengthen the rail network that serves our region and provide a more efficient, safe, and reliable way of moving freight. Fewer trucks on crowded highways would mean less congestion, reduced wear and tear on local roads, and a more balanced and sustainable transportation system. Anyone who has driven 1-85 through Greenville County knows how congested the highway has become—and how dangerous that congestion can be. . . . The merger would create a more coordinated rail system with greater capacity, connecting businesses in Greer, Spartanburg, and across the Upstate to new markets. In addition, unified operations and upgraded technology would improve safety, maintenance, and scheduling. These enhancements will protect workers, communities, and the environment while keeping goods moving efficiently." – Jason Elliott, State Senator, South Carolina

198. We are deeply grateful for the support from the more than 1,900 customers, employees, and community leaders who see the promise in this merger and took the time to say so. That confidence means a lot to us. But we also know some folks are still on the fence and that's fair. In this business, trust isn't lightly given; it's earned. The only way to earn it is the way we always have: by hustling to deliver what we promised and operating with the consistency and operational excellence our customers demand. That's the mindset we bring to this merger, and it's how we intend to prove, one customer and one train at a time, that the merged UP/NS railroad will live up to its potential.

CONCLUSION

199. We've talked a lot here about what a merged UP/NS railroad could mean for our companies, our customers, and the country. But it really all comes down to those same three pillars that drive growth for any great railroad: service, investment, and innovation.

200. Right now, both railroads are executing on that shared vision. We're operating at best-ever performance, investing billions in our networks, and using innovation to make rail easier to use and more dependable. We both have been relentless in our shared pursuit of operational excellence and innovation. We are two companies with complementary networks in sync, working hard for our customers. But we are poised for so much more. Because as strong as we are individually, together we can finally deliver something this country's never had before: a true coast-to-coast, single-line rail network.

201. The reality is that rail, as an industry, has been steadily losing market share to trucking for decades. Trucks keep getting faster, smarter, and more connected—and with autonomous technology on the horizon, that gap will only grow if we don't act. We can't afford to stand still while the world moves forward. Our customers expect us to compete, and they deserve a rail system that's as seamless, innovative, and reliable as the highway network they use today.

202. This merger is our chance to do that. It's an iconic opportunity to create America's first transcontinental railroad. A network that connects East and West, unites ports and markets, and serves customers from coast to coast with one standard of operational excellence. The near-term growth opportunities are exciting, but the long-term potential is breathtaking.

203. Opportunities like this don't come around often. This merger will shape the next hundred years of American railroading. It's about unlocking growth, strengthening competition, and building something enduring for the generations that will follow us. We respectfully urge the Surface Transportation Board to seize this moment and approve this transaction.

VERIFIED STATEMENT

OF

KATHERINE N. NOVAK

1. My name is Katherine Novak. I am the General Director of Interline Operations for Union Pacific Railroad Company ("UP"). I joined UP in 2006 and have held my current position since 2024.

2. I have served in various roles during my time at UP, including Director of Labor Relations and Senior Director of Passenger Operations. I earned a bachelor's degree in speech communications and political science from Northwest Missouri State, and a Juris Doctor degree from the University of Nebraska College of Law.

3. In my current role with UP, I develop strategies and manage partnerships with public entities, oversee passenger contracts, including UP's contract with Amtrak, and have leadership responsibilities for UP's Joint Facility team.

4. I am submitting this verified statement to describe Applicants' Committed Gateway Pricing framework, which will further enhance the many competitive benefits of the UP/NS merger by sharing the merger's benefits with customers shipping traffic on routes that would not directly benefit from the merger's new single-line service. Under Committed Gateway Pricing, UP/NS's interline partners will have access to rates that reflect the benefits of the merger, and they will be able to offer one-stop shopping to customers shipping from locations on their lines through mid-continent gateways to locations on the UP/NS system. Committed

Gateway Pricing would remain available through the end of the oversight period imposed on this transaction.

5. My statement also describes Applicants' commitments to preserve a second competitive rail service option for the three customer facilities Applicants have identified that are served today by UP, Norfolk Southern Railway Company ("NS"), and no other Class I railroad.

6. My statement also describes Applicants' plans to: (1) divest shares so their ownership stake does not exceed 50 percent of the Peoria & Pekin Union Railway Company ("PPU"); (2) divest NS's ownership stake in the Terminal Railroad Association of St. Louis ("TRRA"); and (3) divest shares so their ownership stake does not exceed 50 percent of TTX Company ("TTX").

I. Applicants' Committed Gateway Pricing Framework Will Further Enhance the Competitive Benefits of the UP/NS Merger.

7. Applicants are proposing that the Board impose Committed Gateway Pricing as a condition to its approval of the UP/NS merger "to improve the prospect that their proposal [will] be found to be in the public interest." 49 C.F.R. § 1180.1(d). In adopting its competitive enhancements rule, the Board recognized that "the quantity and quality of competitive enhancements that would be required" would depend on case-specific factors such as "any merger-related harm for which feasible and effective remedies could not be devised, the amount of post-merger service disruption that would be likely to occur as a result of a particular transaction, and the amount of public benefits that could truly be expected to flow from a particular transaction." *Major Rail Consolidation Procedures*, 5 S.T.B. 539, 547 (2001). As this

Application shows, the UP/NS merger would substantially enhance competition even without any special competitive enhancement, and any potential merger-related harms will be remedied by Applicants' voluntary commitments. The Committed Gateway Pricing program is just one of the ways Applicants will enhance competition as a result of this merger.

A. Committed Gateway Pricing Will Expand the Benefits of the UP/NS Merger to More Shippers.

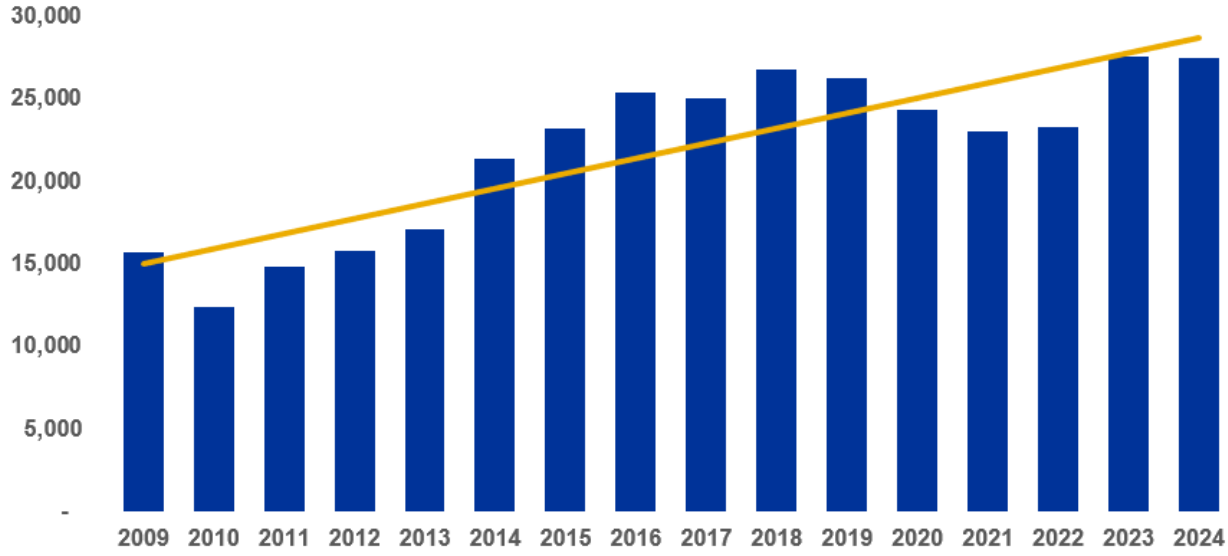
8. The UP/NS merger will produce tremendous benefits for customers shipping traffic between locations served by UP and locations served by NS. As discussed in more detail in other parts of the Application, such as the Joint Verified Statement of Kenny Rocker and Ed Elkins, the UP/NS merger will provide customers with a stronger, more reliable, and more efficient service option via new single-line rates and routes. By making these benefits possible, the merger will substantially enhance competition. Specifically, the merger will enhance competition with trucks, which dominate the freight transportation marketplace, and with other railroads, which have already begun responding with their own new service offerings. The merger will also enhance the ability of customers served by UP/NS to compete for business in existing and new markets, both domestically and overseas, by lowering their supply chain costs.

9. Committed Gateway Pricing will further enhance competition by extending the competitive benefits of this merger to certain customers who would not otherwise benefit from the merger's new single-line route. In particular, under Committed Gateway Pricing, customers shipping to or from facilities served solely by

BNSF Railway Company ("BNSF") or CSX Transportation Company ("CSX") or facilities on a short line interchanging traffic solely with BNSF or CSX will have access to rates that reflect the benefits of the UP/NS merger for traffic shipped through mid-continent gateways to or from facilities served solely by UP/NS or facilities on a short line interchanging traffic solely with UP/NS. Committed Gateway Pricing will allow BNSF and CSX to directly market transcontinental service, offering one-stop shopping to customers shipping traffic between facilities they solely serve and facilities served solely by UP/NS when they interchange traffic with UP/NS in Chicago, St. Louis, Memphis, and New Orleans, regardless of whether they are the originating or terminating carrier.

10. Under Committed Gateway Pricing, UP/NS's revenue requirements for eligible interline movements will be calculated in advance based on rates UP/NS actually used to move similar traffic. BNSF and CSX will be able to use those revenue requirements to rapidly develop independent and confidential origin-to-destination rates in response to requests by customers.

11. Committed Gateway Pricing builds on UP's experience with a similar competition-enhancing approach to pricing implemented in UP's merger with Southern Pacific (the "UP/SP merger"). To further enhance competition, UP negotiated an arrangement called the "I-5 Agreement" that allows it to sell transportation for traffic moving between BNSF-served areas in the Pacific Northwest and Canada, on the one hand, and the Southwest and Mexico, on the other, via the Portland gateway, using rates calculated in advance based on rates BNSF



actually used to move similar traffic (the "I-5 Agreement").[1] The I-5 Agreement was part of a package that also included UP selling BNSF UP's line between Bieber and Keddie, California, which, in conjunction with trackage rights UP granted BNSF between Keddie and Stockton, California, allowed BNSF to handle on a single-line basis traffic that previously had moved on joint BNSF-SP routes.

12. The Board referenced this competitive enhancement in its decision asking applicants to offer competitive enhancements in future mergers. *See Major Rail Consolidation Procedures*, 5 S.T.B. at 569 ("[W]e are also asking applicants to offer competitive enhancements—as applicants did in . . . *UP/SP*. . . ."). In essence, Committed Gateway Pricing will apply, on a wider scale, a concept the Board identified in its Merger Guidelines as enhancing competition.

13. Since the UP/SP merger, UP has used the I-5 Agreement to successfully increase competition with BNSF for traffic moving on the I-5 Corridor. As shown below in Figure 1, shippers have taken advantage of the I-5 Agreement to move increasing volumes of traffic.

[1] *See* Workpaper "I-5 Term Sheet.pdf."

Figure 1[2]
Growth of UP's I-5 Traffic Over Time

14. Committed Gateway Pricing builds on and improves on the I-5 Agreement. One of the most significant improvements involves reducing the number of pricing categories. The I-5 Agreement uses a complex set of five region-based matrices that account for the three-digit Standard Transportation Commodity Code ("STCC") of the freight, direction of movement (*i.e.*, north- or south-bound), car type, car ownership, and train size. This approach produces more than 1,000 pricing "cells." Within the I-5 Agreement, if BNSF has not made any qualifying movements for a given cell, the cell remains empty until such time as a qualifying movement is made; thus UP has no rate to use for the customer. As discussed below, Committed Gateway Pricing uses just 23 freight groupings and four distance ranges. As a result, Committed Gateway Pricing is more likely to have cells populated with rates reflecting current market conditions. Committed Gateway Pricing also includes a

[2] *See* Workpaper "I-5 Annual Volume.xlsx."

mechanism to ensure all cells always have an available rate. Finally, Committed Gateway Pricing bases rates on car-miles, rather than ton-miles, which is more consistent with current ratemaking.

15. Committed Gateway Pricing is purely additive: It will give eligible customers—that is, customers shipping eligible interline movements—an additional rate and service option without eliminating any existing rate or service option available to customers. For customers that are eligible but do not wish to use Committed Gateway Pricing, as well as customers shipping traffic that is not eligible for Committed Gateway Pricing, UP/NS will continue to provide Rule 11 rates to gateways and develop interline rates with BNSF, CSX, and other connecting carriers. Applicants are committed to keeping existing gateways open both operationally and commercially as confirmed in the Joint Verified Statement of Kenny Rocker and Ed Elkins.

16. Committed Gateway Pricing will provide eligible customers both rate and service benefits. With regard to rates, UP/NS's revenue requirements for service on its portion of an interline route initially will be based on pre-merger rates that UP and NS charged for similar traffic moving to and through mid-continent gateways, but ultimately will be based on single-line rates that the merged UP/NS charges for similar traffic. As a result, eligible customers will share in the benefits of competitive single-line pricing.

17. With regard to service, eligible customers will be able to deal exclusively with BNSF and CSX to obtain origin-to-destination rates based on Committed

Gateway Pricing. As a result, eligible customers will experience streamlined, one-stop shopping similar to what will be available to customers using the new single-line lanes that will result from this merger.

18. In the next section of my statement, I provide a more detailed description of the scope of the traffic covered by Committed Gateway Pricing and the methodology that will be used to develop UP/NS's revenue requirements under Committed Gateway Pricing. Additional technical details are provided in the accompanying Appendix A.

B. Committed Gateway Pricing Will Provide a Market-Based, Pricing Option.

19. Committed Gateway Pricing will provide a formulaic and seamless methodology for establishing UP/NS's revenue requirements for traffic shipped between BNSF or CSX sole-served facilities or facilities on short lines interchanging traffic solely with BNSF or CSX, on the one hand, and UP/NS sole-served facilities or facilities on short lines interchanging traffic solely with UP/NS, on the other hand, that is interchanged in Chicago, St. Louis, Memphis, or New Orleans, when customers ask BNSF or CSX to quote origin-to-destination rates for eligible traffic. BNSF and CSX thus will be able to directly market a transcontinental service by quoting origin-to-destination rates without separately obtaining a revenue requirement from UP/NS.

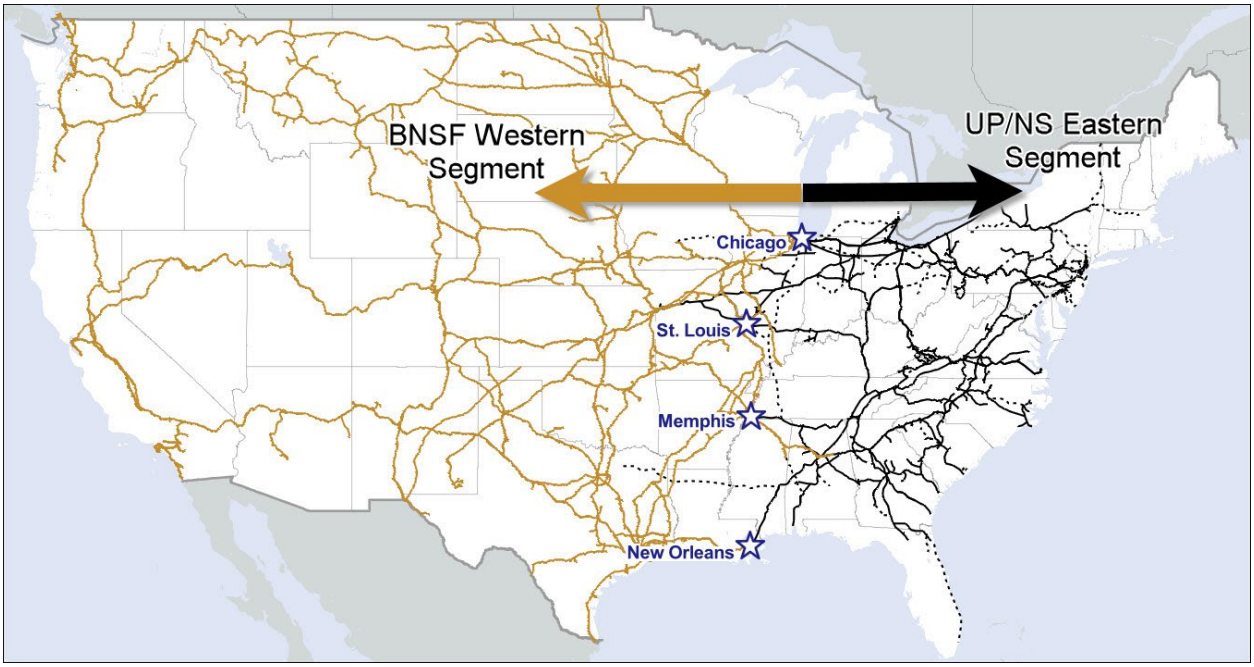
1. Scope

20. Committed Gateway Pricing will apply to manifest carload shipments between UP/NS sole-served facilities and facilities on short lines interchanging traffic

solely with UP/NS, on the one hand, and BNSF and CSX sole-served facilities and facilities on short lines interchanging traffic solely with BNSF or CSX, on the other hand, that are interchanged between UP/NS and CSX or BNSF in Chicago, St. Louis, Memphis, or New Orleans.

21. For a shipment to be eligible for Committed Gateway Pricing, BNSF must provide rail service for the western segment of the move, or CSX must provide service for the eastern segment of the move, as shown below in Figures 2 and 3. BNSF and CSX cannot use a Committed Gateway Pricing rate to price the total movement to a shipper with service entirely provided by UP/NS.

Figure 2
BNSF Network Connections to Eastern UP/NS Network



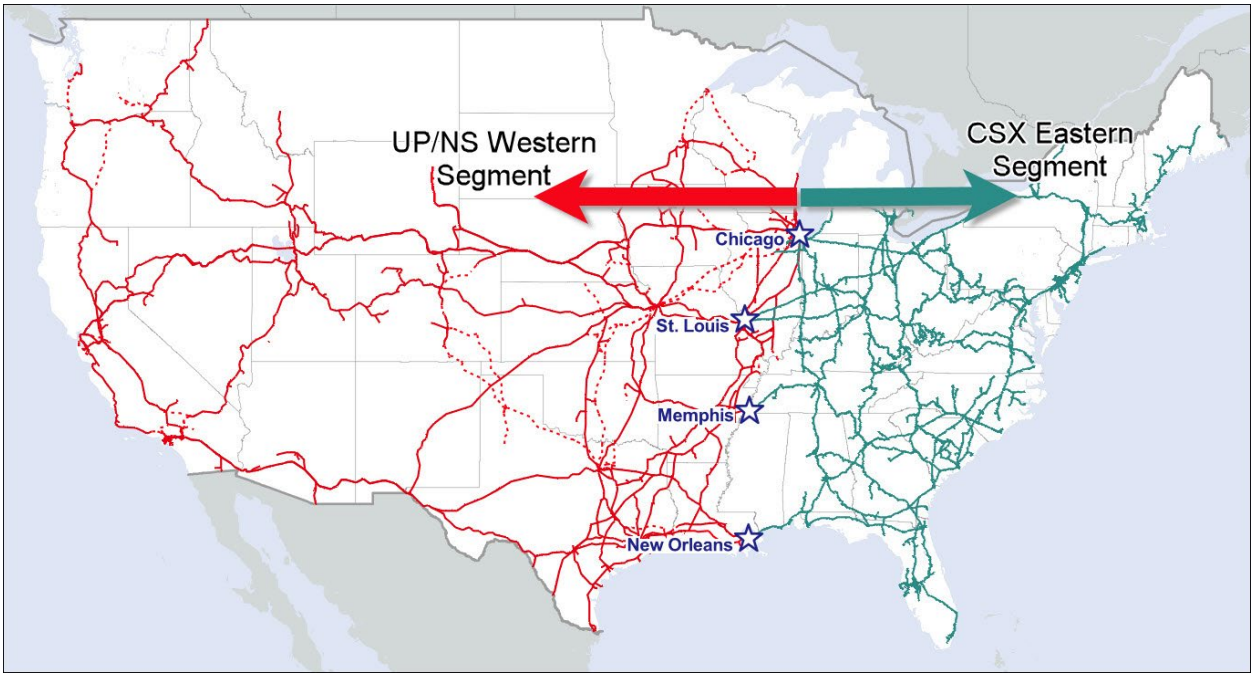


Figure 3
CSX Network Connections to Western UP/NS Network

22. A facility's status as "sole-served" will be determined by the facility's status on the date the merger is consummated—that is, the date on which UPC exercises authority to commonly control UP and NS. A facility will be considered "sole-served" only if it is served directly by a single rail carrier—which to be eligible for Committed Gateway Pricing must be either BNSF, CSX, NS, or UP, or a short line interchanging traffic solely with one of those four carriers—and not open to other means of commercial railroad access.

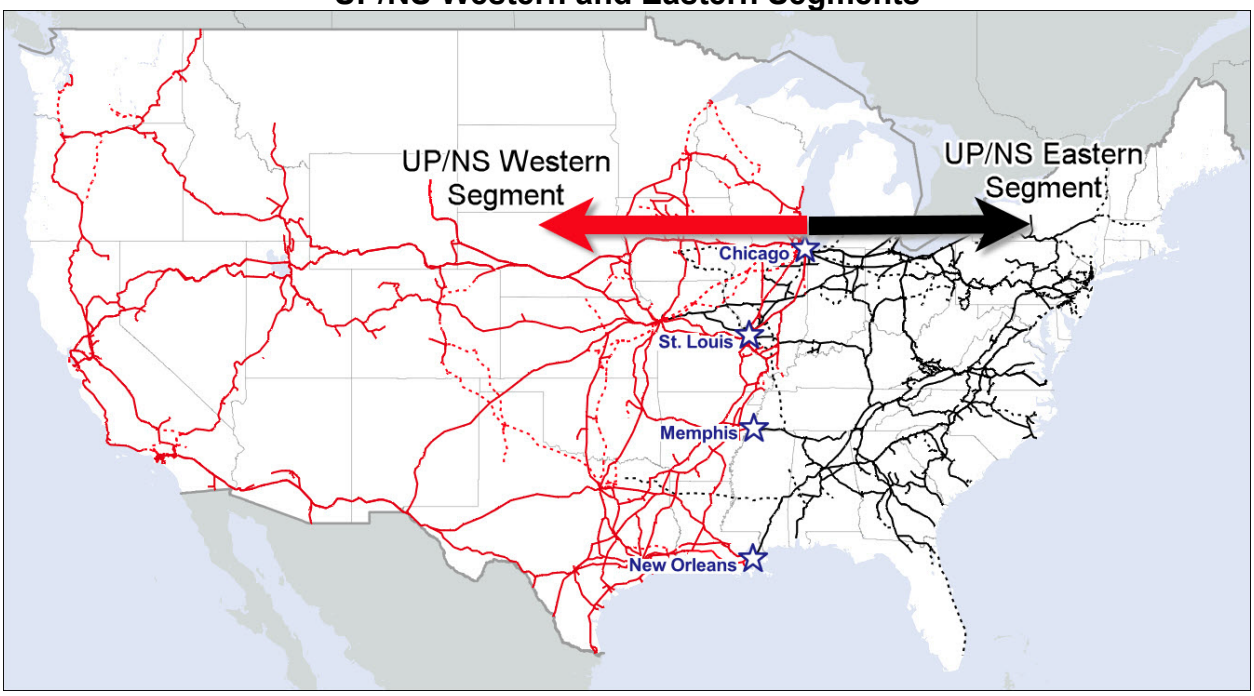
23. Committed Gateway Pricing applies to facilities on BNSF and CSX, because it is intentionally aligned with the UP/NS network. The UP/NS merger links a western carrier (UP) with an eastern carrier (NS). Committed Gateway Pricing complements the merger by incorporating the other major western (BNSF) and eastern (CSX) railroads, thereby enhancing competition in the regions and directional

traffic flows most directly impacted by the merger. For that reason, Committed Gateway Pricing will not apply to facilities on Canadian National Railway or Canadian Pacific Kansas City.

24. In addition, Committed Gateway Pricing is intended to establish prices based on comparable movements. As discussed below, Committed Gateway Pricing uses commodity-based and distance-based segmentation to identify comparable movements. Committed Gateway Pricing will be based largely on east-west movements in somewhat similar markets within the United States. Applying pricing based on east-west movements within the United States to north-south movements, and movements into different countries, would be inconsistent with the comparable-movement approach behind Committed Gateway Pricing.

25. The comparable-movement approach behind Committed Gateway Pricing explains other limitations on Committed Gateway Pricing's scope. Committed Gateway Pricing applies only to manifest carload traffic moving between customer facilities. Committed Gateway Pricing will not apply to intermodal or unit train shipments, shipments of finished vehicles, or shipments to and from storage-in transit facilities, which often have distinct pricing structures and service requirements. Committed Gateway Pricing also will not apply to shipments to or from facilities owned by rail carriers or their affiliates. Finally, Committed Gateway Pricing is designed to apply to manifest traffic that is tailored to pricing under a formula-based approach, so it will not apply to certain specialized shipment types that present heightened operational capacity and risk concerns, including shipments

of Toxic Inhalation Hazard and Poison Inhalation Hazard materials and Dimensional Loads.



2. Price Development

26. Committed Gateway Pricing will use a market-based, data-driven approach to establish UP/NS's revenue requirements when customers ask BNSF and CSX to quote origin-to-destination rates for eligible traffic. Revenue requirements will be stated in terms of a rate per car mile, so they can be applied regardless of whether the traffic is interchanged in Chicago, St. Louis, Memphis, or New Orleans. The applicable rate per car mile will depend on the commodity involved and distance involved, as described in more detail below.

27. Committed Gateway Pricing will calculate UP/NS's revenue requirements for eligible movements based on rates actually used to move similar shipments during the previous waybill year. Initially after the merger, UP/NS's requirements will be based on rates UP and NS charged for similar shipments moving to and from mid-continent gateways—that is, traffic they interchanged with each other, or with BNSF or CSX (for westbound or eastbound moves, respectively)—except for movements that would be eligible for Committed Gateway Pricing. Thereafter, UP/NS's requirements will be based on rates charged by the merged UP/NS during the most recent 12-month period from October 1 to September 30 for similar shipments moving between the western and eastern portions of the United States, as shown below in Figure 4, that both originate and terminate on UP/NS or that are interchanged between UP/NS and BNSF or CSX (for westbound or eastbound

moves, respectively)—except for movements that would be eligible for Committed Gateway Pricing.[3]

Figure 4
UP/NS Western and Eastern Segments

28. Committed Gateway Pricing will use a dual-layered segmentation strategy to identify "similar shipments." To accommodate the diverse nature of rail markets and support differentiated pricing, shipments used to develop rates will be classified based on both commodity and distance traveled. Revenue requirements will then be calculated based on shipments in the same commodity-based segment and the same distance-based segment.

[3] Facilities served by short lines that interchange traffic solely with UP/NS, BNSF, or CSX will be treated as facilities solely served by UP/NS, BNSF, or CSX, respectively for purposes of Committed Gateway Pricing, including in calculating UP/NS's revenue requirements.

29. *Commodity-Based Segmentation*. Shipments will be categorized into 23 commodity-based segments using STCCs. This segmentation will ensure rates reflect the basic economic characteristics and transportation requirements of each commodity class. A listing of the commodity-based segments and associated STCCs is being provided separately as a workpaper.[4]

30. If a shipment's STCC does not align with a predefined commodity-based segment, it will be grouped solely by distance traveled relative to all STCCs within that distance segment. This fallback approach will ensure rates can be developed for all eligible shipments. During the fourth quarter of each calendar year, any STCC that could not be aligned with a predefined commodity-based segment during the preceding four calendar quarters will be assigned to an existing commodity-based segment or placed in a new segment.

31. *Distance-Based Segmentation*. Within each commodity-based segment, shipments used to develop revenue requirements will be categorized into distance-based segments based on the mileage the shipment moved under a UP/NS rate. Shipments will be grouped in four distance-based segments:

- Less than 500 miles
- 500 miles to less than 1,000 miles
- 1,000 miles to less than 1,500 miles
- 1,500 miles or greater

[4] *See* Workpaper "CGP - Commodity-Based Segments and Associated STCCs.xlsx."

32. For example, a shipment that moved 821 miles under a single-line UP/NS rate from Council Bluffs, Iowa, to Cleveland, Ohio, would be grouped in the "500 miles to less than 1,000 miles" segment. A shipment that moved 481 miles under a UP/NS rate from Council Bluffs to Chicago, then 320 miles under a CSX rate from Chicago to Cincinnati, Ohio, would be grouped in the "Less than 500 miles" segment (assuming the shipment was not eligible for Committed Gateway Pricing).

33. The dual-layered segmentation approach will produce 92 unique cells.

34. After shipments are assigned the appropriate cell, UP/NS rates for each shipment will be stated as a rate per car mile. In other words, the UP/NS revenue for the shipment will be divided by the corresponding UP/NS mileage. The rate covers the base cost of transporting goods over specified distances and does not include additional charges such as accessorial fees. Standard UP/NS charges such as fuel surcharges and service fees will apply separately.

35. The UP/NS revenue requirement for each cell—that is, Committed Gateway Pricing applicable to shipments similar to those in each cell—will be calculated using the volume-weighted 70th percentile rate per car mile in each cell. Use of the 70th percentile rate provides meaningful competitive benefits and appropriately reflects the competition-enhancing goals of the program.

36. Once the rate per car mile is established, the UP/NS revenue requirement will be calculated by multiplying the rate per car mile by a shipment's specific mileage on the UP/NS portion of the route to or from the gateway, as determined by PC*Miler software.

37. To improve confidence in the representativeness of the Committed Gateway Pricing data and to reduce the undue influence of outliers, if, during UP/NS's annual fourth quarter review, any cell does not contain a minimum of 100 qualifying shipments within the preceding four quarters, the revenue requirement for shipments within that commodity segment and applicable mileage segment will be determined by pooling rates per car mile of shipments across all commodity groups within the applicable mileage segment. This will be the applicable revenue requirement for the following calendar year.

38. In addition, to account for fixed costs and prevent disproportionately low rates on short-haul movements, UP/NS's minimum revenue requirement for shipments that would move fewer than 250 miles on UP/NS will be 250 miles multiplied by the lower of the rates per mile in the "Less than 500 miles" and "500 miles to less than 1,000 miles" segments.

3. Long-Term Agreements

39. Committed Gateway Pricing will be available for use in multi-year commercial agreements. Customers shipping eligible traffic will be able to use Committed Gateway Pricing rates adjusted annually for agreements with durations of up to three years.

40. Specifically, the rate per car mile value used to determine UP/NS's revenue requirement will be adjusted annually based on the All Inclusive Index Less Fuel with Forecast Error Adjustment as published by the Association of American Railroads, but in no instance would the rate be adjusted below the prior year.

41. Customers shipping eligible traffic will thus be able to obtain rates from connecting carriers that provide a similar level of certainty as the single-line rates available to other customers of UP/NS.

4. Service Standards

42. Applicants recognize that rates and service go hand-in-hand. If customers are paying rates based on similar movements, then they are entitled to service comparable to service for similar movements.

43. Applicants therefore commit to nondiscriminatory treatment of traffic moving under Committed Gateway Pricing. Specifically, traffic UP/NS handles under Committed Gateway Pricing will be handled without any discrimination in promptness, quality of service, or efficiency in favor of comparable traffic moving in UP/NS service.

5. Implementation

44. Appendix A provides additional implementation details for Committed Gateway Pricing, including how customers can determine whether facilities are eligible for Committed Gateway Pricing, the timing of the annual recalculation of rates, and car supply obligations.

6. Duration

45. Committed Gateway Pricing will remain in place until the end of the oversight period in this proceeding, unless extended by the Board. Our reasoning for limiting the duration of this program is as follows.

46. The merger itself will bring massive public benefits and enhance the competitive landscape. We nonetheless understand that Board's regulations

encourage applicants to further "enhance competition" with special competition offerings, unrelated to any detected competitive harms, to assure the agency that the proposed transaction is indeed consistent with the public interest. However, that policy was driven by two core concerns. The principal concern was that a major rail merger would be accompanied by *temporary* service disruptions that could offset some of the public benefits of the transaction. UP and NS have laid out a comprehensive plan to avoid any such disruptions, as set forth in the Service Assurance Plan included in this Application. But in the unlikely event that they do occur, they will be temporary in nature. A special competition-enhancing proposal to offset hypothetical temporary service disruption should be time-limited and not remain in place for centuries.

47. The second concern behind this policy was that a future proposed merger would meaningfully reduce geographic competition for our customers. Here, as explained by Dr. Elizabeth Bailey, the data does not support the concern. Nonetheless, if a party proves that there was some significant loss of indirect competition that became apparent during the oversight period, that could be grounds (depending on the facts and circumstances) to extend the program for particular customers or lanes. Otherwise, there are no grounds for a permanent special program.

48. We recognize that the I-5 Agreement is permanent. But to reiterate, the I-5 Agreement was part of a negotiated package that also included UP selling BNSF UP's line between Bieber and Keddie, California. That sale, plus trackage rights,

allowed BNSF to *permanently* handle on a single-line basis traffic that previously had moved on joint BNSF-SP routes. UP therefore negotiated for similar *permanent* access to sole-served BNSF locations via this I-5 Agreement. Here, Committed Gateway Pricing would be a one-way enhancement provided by Applicants.

49. If Committed Gateway Pricing is as successful as the I-5 Agreement in growing new traffic on these UP-CSX or BNSF-NS sole-served lanes, the parties can negotiate to make it permanent. However, absent a finding by the Board during the oversight process that the program is necessary to address service disruptions from service integration or demonstrated loss of indirect competition, it is appropriate for the program to sunset after a reasonable period.

C. Summary

50. The UP/NS merger will greatly enhance competition for customers shipping traffic between locations currently served by both UP and NS. Committed Gateway Pricing will further enhance competition by sharing the merger's benefits with additional customers and shipments. Customers with shipments eligible for Committed Gateway Pricing will share in the benefits of single-line pricing and experience a similar type of streamlined, one-stop shopping that will be available on lanes with access to the merged UP/NS. For eligible customers that elect not to use Committed Gateway Pricing, as well as customers that are not eligible for Committed Gateway Pricing, UP/NS will continue to quote Rule 11 rates, work with connecting carriers to establish interline rates, and provide the same high level of service for interline shipments that is provided today by UP and NS.

II. No Shipper Facility Will Lose Access to Service by Two Class I Railroads as a Result of the UP/NS Merger.

51. The end-to-end nature of the UP/NS merger means there are very few places in which both UP and NS serve the same customer facilities. Applicants are committed to ensuring that the UP/NS merger does not leave any shipper facility currently served by UP and NS and no other railroad (a "2-to-1 shipper facility") without access to at least two Class I railroads after the merger.

52. Applicants carefully reviewed their records and other available information, and they identified just three 2-to-1 shipper facilities: AgRail LLC, at Bloomington, Illinois; Hillsboro Energy LLC, at Hillsboro, Illinois; and Macoupin Energy LLC, at Carlinville, Illinois. Macoupin Energy and Hillsboro Energy are both operated by Foresight Energy LLC. Operations at Macoupin are idled.

53. Applicants contacted each affected customer and proposed a method of preserving two-carrier competition. Applicants commit to entering into agreements that would allow another existing Class I rail carrier to serve the three shipper facilities using haulage rates under established industry terms and conditions. AgRail submitted a letter in support of the transaction.

III. Applicants Will Divest Portions of Their Shares in PPU, TRRA, and TTX.

A. PPU

54. As a consequence of the UP/NS merger, Applicants will acquire control over PPU. PPU is owned 46.86 percent by CN, 40.64 percent by NS, and 12.50 percent by UP. Applicants have filed an application for this acquisition of control in Volume 2 of this Application.

55. Applicants' acquisition of control of PPU is consistent with the public interest. PPU is currently a non-operating carrier. Since 2004, the lines of PPU have been operated by the Tazewell & Peoria Railroad, Inc. ("TPR"), a Genesee & Wyoming subsidiary. *See Tazewell & Peoria R.R.—Lease & Operation Exemption—Peoria & Pekin Union Ry.*, Docket No. FD 34544 (STB served Sep. 28, 2004). Operation of the PPU rail lines is under the exclusive direction and control of TPR. Moreover, pursuant to a marketing and interchange agreement that accompanies the lease agreement, TPR is required to operate interchanges without discrimination toward any railroad and to provide equal access to PPU's rail lines with any and all other users.[5]

56. However, to eliminate any concern that might arise from Applicants' acquisition of control of PPU, Applicants commit to divesting so much of NS's ownership interest in PPU as is required to reduce Applicants' combined holdings to 50 percent, unless Applicants are unable to find a willing purchaser to acquire the additional shares at fair market value.

B. TRRA

57. As a consequence of the UP/NS merger, Applicants will acquire control over TRRA, one of two terminal railroads operating in St. Louis area. TRRA is owned 42.84 percent by UP and approximately 14.29 percent by each of NS, BNSF, CSX, and Illinois Central Railroad Company. Applicants have filed an application for this acquisition of control in Volume 2 of this Application.

[5] *See* Workpaper "PPU Operating, Marketing and Interchange Agreement.pdf."

58. Applicants' acquisition of control of TRRA is consistent with the public interest. TRRA will continue to operate as a terminal and switching carrier, and no changes to TRRA's basic operations are expected to result as a result of Applicants' control of TRRA. Further, under Article XVI of TRRA's Operating Agreement, TRRA may not discriminate in any manner in favor of any company with respect to the use of its terminal system, nor may it discriminate with respect to the transfer or handling of cars.[6]

59. Applicants will also control Alton & Southern Railway (A&S), the other terminal carrier operating in the St. Louis area. The Board authorized UP's control of A&S in *Union Pacific Corp. et al.—Control—Southern Pacific Rail Corp., et al.*, 1 S.T.B. 233 (1996). A&S facilities are available to all carriers on equal terms. Under a 1972 Interstate Commerce Commission order, A&S is bound to operate on a neutral, non-discriminatory basis. *See St. Louis Southwestern Ry.—Purchase—Alton & Southern R.R.*, 342 I.C.C. 498, 525 (1972) (conditions 2 and 4).

60. As a result of TRRA's Operating Agreement and the Interstate Commerce Commission's 1972 order regarding A&S, Applicants could not use their control of TRRA and A&S to reduce competition. However, to eliminate any concern that might arise from Applicants' acquisition of control of TRRA, Applicants commit to divesting NS's ownership interest in TRRA and redistributing NS's shares equally to UP and TRRA's other current owners unless those owners decline to acquire the

[6] *See* Workpaper "TRRA Operating Agreement.pdf."

additional shares at fair market value. The proposed distribution of NS's shares would reduce UP's post-merger ownership interest in TRRA below 50 percent.

C. TTX

61. As a consequence of the UP/NS merger, Applicants will also acquire majority ownership of TTX, which, among other things, owns and manages a fleet of railroad flatcars on behalf of participating railroads. *See TTX Company, et al.—Application for Approval of Pooling of Car Service With Respect to Flatcars*, FD 27590 (Sub-No. 4) (STB served Oct. 1, 2014). TTX is owned 37.03 percent by UP, 19.78 percent by NS, 19.78 percent by CSX, 17.4 percent by BNSF, 3.2 percent by CN, 2.2 percent by CPKC, and 0.6 percent by Ferromex.

62. TTX is not a rail carrier, so Applicants do not require Board authority to increase their ownership interest above 50 percent. Nevertheless, Applicants recognize TTX's significance in the railroad industry and wish to provide assurance that they will not collectively own a majority of the shares of TTX upon consummation of their merger. Therefore, to eliminate any concern that might arise from Applicants' acquisition of a majority of the shares of TTX, Applicants intend to reduce their ownership interest in TTX so it is not greater than 50 percent, at such time as they are able to do so on commercially reasonable terms.

VERIFICATION

I, Katherine N. Novak, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed this 17th day of December, 2025.

APPENDIX A

Appendix A

This Appendix provides detailed information regarding Committed Gateway Pricing as well as its application and calculation.

Eligibility Criteria

For a shipment to qualify for Committed Gateway Pricing, BNSF must provide rail service for the western segment of the move, or CSX must provide service for the eastern segment of the move, as shown in Figures 2 and 3 of the Novak Verified Statement. Committed Gateway Pricing will apply to a single leg of the shipment route, either from origin to interchange, where UP/NS or a short line interchanging traffic solely with UP/NS is the originating carrier, or from interchange to destination, where UP/NS or a short line interchanging traffic solely with UP/NS is the destination carrier. In other words, BNSF and CSX cannot use a Committed Gateway Pricing rate to price the total movement to a shipper with service entirely provided by UP/NS. Eligible interchange points are Chicago, St. Louis, Memphis, and New Orleans.

Committed Gateway Pricing will apply only to shipments between customer facilities served solely by UP/NS or a short line interchanging traffic solely with UP/NS, on the one hand, and customer facilities served solely by BNSF or CSX or a short line interchanging traffic solely with BNSF or CSX, on the other hand. Solely served facilities are facilities which, as of the date the merger is consummated, are exclusively served by a single Class I railroad or a short line interchanging solely with that single Class I railroad, and have no access to any other Class I or short line carriers. Committed Gateway Pricing will not apply to facilities on Canadian National Railway or Canadian Pacific Kansas City.

Committed Gateway Pricing will apply only to manifest carload traffic moving between customer facilities. Committed Gateway Pricing will not apply to intermodal or unit train shipments, shipments of finished vehicles, or shipments to and from storage-in transit facilities. Committed Gateway Pricing also will not apply to shipments to or from facilities owned by rail carriers or their affiliates, or to shipment types that present heightened operational capacity and risk concerns, including shipments of Toxic Inhalation Hazard and Poison Inhalation Hazard materials and Dimensional Loads.

Only industries that are operational on or before the date of consummation of the UP/NS merger will be eligible for Committed Gateway Pricing.

Market Segmentation

Committed Gateway Pricing will be based on UP/NS's revenue requirements for eligible movements as determined by rates actually used to move similar shipments during the previous waybill year. Initially after the merger, UP/NS's requirements

will be based on rates UP and NS charged for similar shipments moving to and from mid-continent gateways—that is, traffic they interchanged with each other, or with BNSF or CSX (for westbound or eastbound moves, respectively)—except for movements that would be eligible for Committed Gateway Pricing. Thereafter, UP/NS's requirements will be based on rates charged by the merged UP/NS during the most recent 12-month period from October 1 to September 30 for similar shipments moving between the western and eastern portions of the United States, as shown in Figure 4 of the Novak Verified Statement, that both originate and terminate on UP/NS or that are interchanged between UP/NS and BNSF or CSX (for westbound or eastbound moves, respectively)—except for movements that would be eligible for Committed Gateway Pricing. (Facilities served by short lines that interchange traffic solely with UP/NS, BNSF, or CSX will be treated as facilities solely served by UP/NS, BNSF, or CSX, respectively for purposes of Committed Gateway Pricing, including in calculating UP/NS's revenue requirements.)

Committed Gateway Pricing will use a dual-layered segmentation methodology to identify "similar shipments" based on both the commodity type and the distance traveled.

Commodity-Based Segmentation. Commodity segments will be based on Standard Transportation Commodity Codes ("STCCs"). The 23 general market categories within scope for Committed Gateway Pricing are:

• Auto Parts	• Grain	• Petcoke
• Coals & Renewables	• Grain Products I	• Petroleum
• Construction	• Grain Products II	• Plastics
• Fertilizer & Sulfur	• Industrial Products	• Refrigerated
• Food & Beverage I	• LPG	• Sand
• Food & Beverage II	• Metals & Ores I	• Soda Ash
• Forest Products I	• Metals & Ores II	• Specialized Markets
• Forest Products II	• OTE	

If a shipment's STCC does not align with a predefined commodity-based segment, it will be grouped solely by distance traveled relative to all STCCs within that distance segment. During the fourth quarter of each calendar year, any STCC that could not be aligned with a predefined commodity-based segment during the preceding four calendar quarters will be assigned to an existing commodity-based segment or placed in a new segment.

The list of the commodity-based segments and associated STCCs is being submitted separately as Attachment 1 to Appendix A.

Distance-Based Segmentation. Within each commodity-based segment, shipments used to develop revenue requirements will be categorized into distance-based segments based on the mileage the shipment moved under a UP/NS rate. The distance will be based on (1) the distance between the actual origin and destination on UP/NS when it is a through rate, or (2) the distance between the actual origin and gateway or gateway and destination on a Rule 11 or similar type of rate.

Mileage will be segmented into four bands:

- 0 To Less Than 500 Miles
- 500 To Less Than 1,000 Miles
- 1,000 To Less Than 1,500 Miles
- 1,500 Miles Or Greater

For example, a shipment that moved 821 miles under a single-line UP/NS rate from Council Bluffs, Iowa, to Cleveland, Ohio, would be grouped in the "500 miles to less than 1,000 miles" segment. A shipment that moved 481 miles under a UP/NS rate from Council Bluffs to Chicago, then 320 miles under a CSX rate from Chicago to Cincinnati, Ohio, would be grouped in the "Less than 500 miles" segment (assuming the shipment was not eligible for Committed Gateway Pricing).

The 23 commodity categories and four distance categories result in 92 unique cells, which will be used to calculate rates based on a Rate Per Mile, as illustrated in the table below.

Table 1
Illustrative Table of Commodity and Distance Categories

Market Segment	0 To Less Than 500 Miles	500 To Less Than 1,000 Miles	1,000 To Less Than 1,500 Miles	1,500 Miles Or Greater
Auto Parts				
Coals & Renewables				
Construction				
Fertilizer & Sulfur				
Food & Beverage I				
Food & Beverage II				
Forest Products I				
Forest Products II				
Grain				
Grain Products I				
Grain Products II				
Industrial Products				
LPG				
Metals & Ores I				
Metals & Ores II				
OTE				
Petcoke				
Petroleum				
Plastics				
Refrigerated				
Sand				
Soda Ash				
Specialized Markets				

Empty Shipments

Chargeable empty shipments—commonly referred to as revenue empties or "OTE" movements—will be treated as a separate and distinct market segment within the Committed Gateway Pricing framework. These movements will be evaluated based on the STCC associated with the shipment.

Non-revenue empty shipments, which typically involve the movement of equipment without a direct customer charge, will not be governed by the Committed Gateway

Pricing framework. These movements will continue to be subject to the established rules and practices that were in place prior to this framework's implementation.

Establishing the Rate Per Mile

The Rate per Mile will be the foundational charge applied to a shipment that falls within one of the unique cells. The Rate per Mile will cover the base cost of transporting goods over specified distances and will not include additional charges such as accessorial fees. Standard UP/NS charges such as fuel surcharges and service fees will apply separately.

The Rate per Mile within each cell will be determined by:

a. Assigning to a unique cell each UP/NS rate for each shipment used to determine Committed Gateway Rates. (UP/NS rates will not include fuel surcharges or other additional charges or fees.)

b. Normalizing each UP/NS rate to a "per carload" basis, meaning that any rate originally expressed in alternative units (such as per ton) will be converted to a standardized carload metric.

c. Dividing each UP/NS rate for each shipment by the corresponding UP/NS mileage for the shipment.

d. Determining the volume-weighted 70th percentile rate within each cell.

A minimum threshold of 100 qualifying shipments within a preceding waybill year will be required for a cell to generate a published rate within Committed Gateway Pricing. Where a specific cell does not meet this threshold, a rate for the applicable mileage band will be determined by pooling shipments across all commodity groups.

For example, if only 75 shipments of soda ash were recorded in the prior year within the "1,000 To Less Than 1,500 Miles" mileage band, any soda ash shipment occurring in the present year within that mileage range would use the aggregated historical rate data across all commodities for that distance band.

Rate calculations for Committed Gateway Pricing will be made during the fourth quarter of each calendar year. The calculation period spans from October 1 of the prior year through September 30 of the current year. For this timeframe, all applicable interline shipments will be analyzed to determine the Rate per Mile for each market and mileage segment. Once the data are compiled and processed, the calculated rates will be furnished to participating carriers between October 1 and December 31. These rates will become effective on January 1 of the following calendar year and remain in effect through December 31 of that same year.

For example, Committed Gateway Pricing rates applicable for the 2027 calendar year will be based on shipment data collected from October 1, 2025, through September 30, 2026. The finalized rates will be distributed to participating carriers during the fourth quarter of 2026 and will take effect on January 1, 2027. This timetable is structured to provide sufficient time for independent third-party review or audit of the proposed rate structure prior to the commencement of the upcoming contractual term.

The shipment data used to calculate the rates for Committed Gateway Pricing program will include UP and NS data for any relevant periods before the combination of UP and NS is consummated. For periods after the merger, UP/NS will use shipment data from the combined railroad's operations.

Rate Calculation

Once the Rate per Mile is established, the actual shipment rate is calculated by multiplying this value by the shipment's specific mileage from customer origin to destination to the gateway, as determined using the PC*Miler software application. The applicable gateway will be determined pursuant to routing protocols between UP/NS, on the one hand, and CSX or BNSF, on the other hand, which will be subject to change from time to time.

To illustrate the calculation of Committed Gateway Pricing, consider a shipment of plastic pellets that travels a total of 650 miles on the UP/NS network. If the applicable Rate per Mile for the corresponding cell of the rate table is $4.00, then the resulting rate for the shipment is $2,600 (calculated by multiplying the mileage by the rate). Committed Gateway Pricing will be a rate of $2,600.

A minimum mileage threshold of 250 miles will be applied to all shipments for purposes of rate calculation. That is, for shipments that would move less than 250 miles on UP/NS, the Committed Gateway Pricing will be based on a distance of 250 miles and a Rate per Mile value that is the lower of the applicable Rate per Mile for the "0 To Less Than 500 Miles" mileage band and the "500 To Less Than 1,000 Miles" mileage band.

As an example, consider a shipment originating from a UP sole-served location and traveling a total distance of 67 miles on UP. Under Committed Gateway Pricing, a minimum mileage threshold of 250 miles is applied to all shipments for the purpose of rate calculation.

In this scenario, although the actual shipment distance is 67 miles, the model will apply the minimum threshold of 250 miles for rate calculation purposes. The applicable Rate per Mile will then be selected that is the lower of the applicable Rate per Mile for the "0 To Less Than 500 Miles" mileage band and the "500 To Less Than 1,000 Miles" mileage band.

UP/NS will not share Committed Gateway Pricing rates with the customer, enabling carriers to independently manage marketing and pricing strategies.

Multiyear Agreements

Committed Gateway Pricing may be applied to multiyear commercial agreements between participating carriers and customers with durations of up to three years, provided the contract is structured as a multiyear agreement at the outset.

For multiyear Committed Gateway Pricing contracts, the Rate per Mile will be adjusted annually based on the All Inclusive Index Less Fuel with Forecast Error Adjustment ("AIILF"), as published by the Association of American Railroads ("AAR") or its successor organization.

The adjustment is calculated by taking the difference between the AIILF value from the second quarter of the current year and the corresponding value from the second quarter of the prior year, divided by the AIILF value from the second quarter of the prior year. The resulting ratio, rounded to four decimal places, will be applied to the base Rate per Mile values established in the first year of the commercial agreement. Multi-year adjustments will default to a minimum increase of 0.0000% if no increase in growth for AIILF values is calculated.

To illustrate the rate adjustment process, consider an initial rate of $5.00 per mile for the first year. This rate is subject to annual adjustment based on changes in the AIILF. For example, assume an AIILF value for the second quarter of 2025 of 107.4, compared to a value of 106.9 in the second quarter of 2024. This reflects a year-over-year increase of approximately 0.4677%. Applying this percentage increase to the original rate of $5.00 results in a revised rate of $5.02 per mile. The updated rate will take effect on January 1, 2026, and remain in place through December 31, 2026, ensuring alignment with inflationary trends and maintaining consistency in pricing methodology.

Upon the expiration of any applicable multiyear agreement, the process for determining rates will revert to the standard methodology outlined within the Committed Gateway Pricing framework.

If the AAR rebases its AIILF, then UP/NS and participating carriers will use any applicable rebased values in the adjustment calculation. In cases where AAR has rebased without restating the prior period's AIILF value, the parties will apply a linking factor to restate it. If the AAR does not provide a recommended methodology for calculating the linking factor, it will be determined as the ratio of the rebased AIILF to the original base AIILF for the applicable period in which both values are published. This linking factor will then be multiplied by the previous period's AIILF value to complete the adjustment.

Billing & Payment

The freight charges applicable to the shipment will be invoiced to the customer by the railroad holding the transportation contract. UP will receive its allocated share of such charges through the Interline Settlement System ("ISS").

Fuel Surcharge

Fuel surcharges will not be included within the Committed Gateway Pricing rate and will be billed separately. Settlement between railroads will be handled through the ISS. Fuel surcharges will be billed to the customer by the contract holding railroad and then prorated to UP according to respective mileage. Mileage will be based on PC*Miler.

Transfer of Liability ("TOL")

All cars handled under Committed Gateway Pricing will be deemed to be in the possession of UP during the move between the customer's facility and the serving yard, and the customer will be solely liable for all per diem, mileage charges, and other expenses, if any, for such cars, and shall collect for its own account any and all accruing demurrage, storage charges, or other earnings thereon. Any charges owed that are covered by the TOL will be directly payable by, or receivable to, UP.

Freight Claims

Each railroad will be responsible for any loss or damage occurring while the freight is in its possession. The delivering carrier will assume responsibility for claims settlement with the customer and then seek recovery from other carriers if applicable.

Interchange Carrier

Where a short line railroad serves as an interchange carrier for shipments moving under the Committed Gateway Pricing program, and its role is to connect two Class I railroads, the responsibility for all switching charges incurred during this process will rest with the delivering carrier.

Railroad Equipment

UP/NS will be under no obligation to furnish Railroad Equipment for shipments governed by Committed Gateway Pricing.

BNSF and CSX will have the option, at their discretion, to supply railroad equipment to shippers under Committed Gateway Pricing. However, UP/NS will not assume responsibility for any car hire charges associated with this equipment beyond what is addressed in the section regarding Transfer of Liability. All other costs related to

car hire will remain the sole liability of the participating carrier and are explicitly excluded from the scope of Committed Gateway Pricing.

Facility Qualification

To qualify as a sole-served location within this program, a location must meet the following criteria:

a. The location must be served exclusively by a single Class I railroad or a short line interchanging traffic solely with a single Class I railroad.

b. The serving Class I railroad must be one of the following: UP, NS, UP/NS, BNSF, or CSX.

c. No other Class I carrier may have the right to generate a record in the SCRS system for the location in question.

d. No other short line carrier may have the right to generate a record in the SCRS system for the location in question.

e. Evaluation of sole-served status will be conducted at the physical address level and not at the CIF or customer name level.

f. A single customer industry location served by multiple railroads under differing CIF records will not qualify as sole-served.

g. Sole-served status will be determined based on the effective date of operating control of the merged UP/NS entity.

h. Any location that loses sole-served status as a direct result of an action taken by UP/NS, after the effective date, including but not limited to the introduction of a short line carrier, will retain its sole-served status and associated protections.

i. Any sole-served location that obtains access to an additional railroad, after the effective date, except where the preceding provision applies, shall forfeit its sole-served status and will no longer qualify under the applicable criteria.

j. Locations that were not operational at any point prior to the merger's effective date will be excluded from sole-served status.

k. The location must not be owned by a railroad.

l. Locations owned by UP, NS, UP/NS BNSF, or CSX, or any of their affiliates, shall be excluded from sole-served status.

m. Locations that change ownership, whether by sale or other transfer, and were designated sole-served as of the merger's effective date, shall continue to hold that status.

The following procedure shall govern the determination and designation of a location's access status:

a. UP/NS, BNSF, and CSX will be responsible for furnishing a listing of qualifying sole-served locations served by their railroad.

b. A third party will then be responsible for auditing the findings and will work with the railroads to update any locations needed.

c. Lists of eligible facilities will be publicly furnished for customer review.

d. Customers can work with individual railroads on any locations where they disagree with the findings.

e. In the event of a dispute regarding sole-served classification, the customer may seek resolution through arbitration.

f. All review requests and subsequent determinations shall be documented and retained by UP for recordkeeping and audit purposes.

g. Location lists shall be published prior to the commencement of Committed Gateway Pricing.

Attachment 1: Committed Gateway Pricing
Commodity-Based Segments

Market Segment	STCC	STCC Description
AUTO PARTS	2279915	COVERING, AUTOMOBILE FLOOR, SOFT SURFACE (PILE) FABRIC COMBINED WITH CARPET CUSHIONING OR LINING, PREFORMED, SET, CONTOUR-CONFORMING SHAPES, OTHER THAN FLAT
AUTO PARTS	2421480	AUTOMOBILE RACK BOARDS, FILLERS, FILLER BLOCKS AND SILLS, NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED
AUTO PARTS	2441156	AUTOMOBILE BRAKE ASSEMBLY, OR DRIVING GEAR OR STEERING GEAR PARTS OR STEERING GEAR ASSEMBLY CONTROL TUBE SHIPPING CARRIERS, WOOD OR WOOD AND IRON
AUTO PARTS	2499953	BATTERY BOXES, COVERS OR VENTS, WOODEN
AUTO PARTS	2531215	PASSENGER BUS SEATS, SEAT BACKS OR CUSHIONS OR BUS SEAT PARTS, NEC
AUTO PARTS	2531220	SEAT CUSHION BASES, AUTOMOBILE, RUBBER, PNEUMATIC, NOT INFLATED
AUTO PARTS	2531222	SEATS, DRIVERS, MOTOR VEHICLE FREIGHT, DRIVING TRUCK OR TRACTOR, UPHOLSTERED, ON ADJUSTABLE SHOCK ABSORBING MOUNTS OR STANDS
AUTO PARTS	2531223	SEATS OR CHAIRS, TRUCK, VAN OR FREIGHT AUTOMOBILE, OTHER THAN BENCH TYPE, UPHOLSTERED, WITH OR WITHOUT ARMS, WITH OR WITHOUT BASES, MOUNTS OR STANDS, OTHER THAN SHOCK ABSORBING

AUTO PARTS	3714957	AUTOMOBILE GLASS RUN CHANNELS, DIVISION BARS OR WEATHER STRIPS, FABRIC AND METAL, PLASTIC OR RUBBER
AUTO PARTS	3714962	PNEUMATIC TIRE VALVES, OR PARTS
AUTO PARTS	3714963	PARTS, MOTOR TRUCK OR TRACTOR TRAILER COUPLER, IRON OR STEEL, CAST OR FORGED, OR PLATE OR SHEET NOT THINNER THAN 12 GAUGE, IN THE ROUGH
AUTO PARTS	3714975	SHOCK ABSORBERS, OR PARTS THEREOF, RUBBER OR RUBBER AND STEEL, AUTOMOBILE
AUTO PARTS	3714978	SPRING BOLSTERS, VEHICLE
AUTO PARTS	3714987	AUTOMOBILE TRANSMISSIONS
AUTO PARTS	3714990	AUTOMOBILE (MOTOR VEHICLE) PARTS AND ACCESSORIES, IN MIXED LOADS
AUTO PARTS	3714991	AUTOMOBILE PARTS, NEC, ALUMINUM OR BRASS, BRONZE OR COPPER
AUTO PARTS	3714992	AUTOMOBILE PARTS, NEC, BABBITT METAL OR WHITE METAL ALLOY
AUTO PARTS	3714993	AUTOMOBILE PARTS, NEC, IRON OR STEEL
AUTO PARTS	3714995	AUTOMOBILE (MOTOR VEHICLE) PARTS, IN MIXED LOADS
AUTO PARTS	3714997	AUTOMOBILE PARTS, NEC, PLASTIC OR RUBBER, SEPARATE OR COMBINED WITH OTHER MATERIALS
AUTO PARTS	3714998	BUS BODIES, AUTO, MIXED LOAD, WITH AUTO BUS PARTS OR ACCESSORIES
AUTO PARTS	3714999	REVENUE MOVEMENT OF AUTO PARTS, REJECTED, MOVING WITH NONREVENUE EMPTY SHIPPING CONTAINERS OR DEVICES (RACKS, CRATES, BINS, ETC.), RETURNING REVERSE ROUTE
AUTO PARTS	3799990	AUTOMOBILE BODIES OR BODY PARTS AND CHASSIS PARTS, IN MIXED LOADS
AUTO PARTS	4029135	DRY CELL BATTERIES, ELECTRIC, SPENT, HAVING VALUE FOR RECLAMATION OF MATERIALS
AUTO PARTS	4111461	BINS, CRATES, RACKS, TRAYS OR PARTS THEREOF, COLLAPSIBLE, OTHER THAN NEW, EMPTY, USED FOR THE TRANSPORTATION OF AUTOMOBILE PARTS
AUTO PARTS	4111465	BINS, CRATES, RACKS, TRAYS OR PARTS THEREOF, OTHER THAN COLLAPSIBLE, OTHER THAN NEW, EMPTY, USED FOR THE TRANSPORTATION OF AUTOMOBILE PARTS

AUTO PARTS	4111471	AUTOMOBILE BODY SECTIONS, NEC, BODIES, BODY SECTIONS COMBINED WITH HOODS, FENDERS, REAR DECKS, RADIATORS OR OTHER AUTOMOBILE PARTS, OR HOODS, FENDERS, REAR DECKS OR RADIATORS COMBINED, OR COMBINED WITH OTHER AUTOMOBILE PARTS, USED, HAVING VALUE FOR RECONDITIONING OR SURFACE REFINISHING AND REUSE
AUTO PARTS	4111474	PARTS, AUTOMOBILE, OBSOLETE (UNSALABLE), HAVING VALUE ONLY FOR RECLAMATION OF RAW MATERIALS
AUTO PARTS	4111486	BINS, CRATES, RACKS, TRAYS OR PARTS THEREOF, OTHER THAN NEW, EMPTY, OTHER THAN USED FOR THE TRANSPORTATION OF AUTOMOBILE PARTS
AUTO PARTS	4211299	NONREVENUE MOVEMENT OF EMPTY CONTAINERS OR DEVICES, OR PARTS THEREOF, VIZ. RACKS, CRATES, BINS, BRACES, BRACKETS, SPACERS, SPACER BARS OR PROTECTIVE SHIELDS, FOR SHIPPING AUTOMOBILE PARTS, RETURNING IN REVERSE OF ROUTE USED IN LOADED MOVEMENT
AUTO PARTS	4231299	REVENUE MOVEMENT OF EMPTY CONTAINERS OR DEVICES, OR PARTS THEREOF, VIZ. RACKS, CRATES, BINS, BRACES, BRACKETS, SPACERS, SPACER BARS OR PROTECTIVE SHIELDS, FOR SHIPPING AUTOMOBILE PARTS, RETURNING IN REVERSE OF ROUTE USED IN LOADED MOVEMENT
COAL & RENEWABLES	1111215	ANTHRACITE COAL, PEA OR SMALLER
COAL & RENEWABLES	1111220	ANTHRACITE COAL, LARGER THAN PEA
COAL & RENEWABLES	1121110	BITUMINOUS COAL, RAW, FOR FURTHER PREPARATION
COAL & RENEWABLES	1121210	BITUMINOUS COAL FOR METALLURGICAL OR COKING PURPOSES
COAL & RENEWABLES	1121211	COAL, BITUMINOUS FOR PULVERIZED OR GRANULAR INJECTION INTO A BLAST FURNACE
COAL & RENEWABLES	1121212	COAL, BITUMINOUS FOR THE PRODUCTION OF DIRECT REDUCED IRON (DRI) OR HOT BRIQUETTE IRON (HBI)
COAL & RENEWABLES	1121290	BITUMINOUS COAL FOR FUEL OR STEAM PURPOSES
COAL & RENEWABLES	1122190	LIGNITE COAL, PREPARED, INCLUDING CRUSHED, FINES, GROUND FOR FUEL OR STEAM PURPOSES ONLY, RUN OF MINE, SCREENINGS, SLACK OR STEAM, OR OTHER PREPARED COAL, EXCEPT GROUND OR PULVERIZED, OTHER THAN FOR FUEL OR STEAM PURPOSES
COAL & RENEWABLES	3511206	WIND TURBINE TOWER
COAL & RENEWABLES	3511207	WIND TURBINE BLADES
COAL & RENEWABLES	3511208	WIND TURBINE GENERATOR
COAL & RENEWABLES	3511209	WIND TURBINE HUB ASSEMBLY
CONSTRUCTION	1421110	AGRICULTURAL LIMESTONE, UNBURNT, BROKEN OR CRUSHED
CONSTRUCTION	1421120	AGRICULTURAL LIMESTONE AND AGRICULTURAL LIMESTONE SCREENINGS, UNBURNT
CONSTRUCTION	1421310	DOLOMITE (DOLOMITIC LIMESTONE), BROKEN, CRUSHED OR RAW
CONSTRUCTION	1421910	RUBBLE STONE
CONSTRUCTION	1421920	GRANITE OR MARBLE, CRUSHED
CONSTRUCTION	1421926	ARAGONITE LIMESTONE, NATURAL, BROKEN OR CRUSHED
CONSTRUCTION	1421930	BALLAST ROCK OR STONE
CONSTRUCTION	1421950	RIPRAP STONE OR BREAKWATER (JETTY) STONE, OTHER THAN LIME ROCK (LIMESTONE)
CONSTRUCTION	1421965	LIMESTONE, NEC, BROKEN OR CRUSHED, INCLUDING CHIPS, GROUTS OR SPALLS, OTHER THAN AGRICULTURAL, FLUXING OR DOLOMITIC
CONSTRUCTION	1421972	RIPRAP LIME ROCK (LIMESTONE) OR BREAKWATER (JETTY) LIMESTONE (LIME ROCK)
CONSTRUCTION	1421990	NATURAL STONE, NEC, BROKEN OR CRUSHED, INCLUDING CHIPS, GROUTS OR SPALLS, OTHER THAN LIMESTONE
CONSTRUCTION	1421991	NATURAL STONE, CRUSHER RUN, OTHER THAN LIMESTONE
CONSTRUCTION	1441110	STRIPPINGS, SAND PIT
CONSTRUCTION	1441190	SAND, PAVING OR BUILDING, OR LAKE, BEACH, RIVER, BANK, OR FILLING
CONSTRUCTION	1441191	SAND, MIXED WITH CLAY, WITHOUT GRAVEL, PEBBLES OR CRUSHED STONE
CONSTRUCTION	1441210	PEBBLES, NEC

CONSTRUCTION	1441220	STRIPPINGS, GRAVEL PIT
CONSTRUCTION	1441225	SAND, MIXED WITH CLAY, WITH CRUSHED STONE AND GRAVEL OR PEBBLES
CONSTRUCTION	1441230	GRAVEL AND SAND MIXED
CONSTRUCTION	1441290	GRAVEL, NEC, OR CLAY GRAVEL, OR GRAVEL BALLAST, NEC
CONSTRUCTION	1491110	GYPSUM ROCK OR ANHYDRITE ROCK, CRUDE, NOT FURTHER PROCESSED THAN CRUSHED, SCREENED OR DRIED, NOT CALCINED
CONSTRUCTION	1491315	BITUMINOUS ASPHALT ROCK, ASPHALT ROCK, BITUMINOUS LIMESTONE OR BITUMINOUS SANDSTONE
CONSTRUCTION	1491980	POZZOLAN, A SILICEOUS AND ALUMINOUS MATERIAL THAT IN ITSELF POSSESSES NO CE MENTITIOUS VALUE, BUT IT WILL IF IN THE PRESENCE O F MOISTURE AND CHEMICALS.
CONSTRUCTION	2812630	CALCIUM CARBONATE, NEC, OR CARBONATE OF LIME
CONSTRUCTION	2812631	CALCIUM CARBONATE (RECARBONATED WASTE) OR WHITING SUBSTITUTE
CONSTRUCTION	3241110	CEMENT CLINKER
CONSTRUCTION	3241115	CEMENT, HYDRAULIC, PORTLAND
CONSTRUCTION	3241130	CEMENT, HYDRAULIC, MASONRY OR MORTAR
CONSTRUCTION	3241210	PATCHING COMPOUND, CEMENT OR CONCRETE
CONSTRUCTION	3241220	ACID-PROOF (BUILDING) CEMENT
CONSTRUCTION	3241225	CEMENT COMPOUND, BUILDING OR FLOOR, OR PLASTERBOARD TOPPING CEMENT, DRY
CONSTRUCTION	3255117	TILE OR TILING, FACING OR FLOORING, OR FACING MOLDING, BASEBOARD OR COVE, EARTHENWARE, GLAZED OR NOT GLAZED, NEC
CONSTRUCTION	3271115	BLOCKS, BUILDING, CONCRETE WITH LEAD INSULATION OR REINFORCEMENT
CONSTRUCTION	3271135	BRICK, CINDER CEMENT
CONSTRUCTION	3271920	GLASS FACED CONCRETE BLOCKS, NEC
CONSTRUCTION	3271927	RAILROAD CROSSINGS, CONCRETE, WITH OR WITHOUT STEEL RAIL
CONSTRUCTION	3271939	BLOCKS, COUNTERWEIGHT, ANCHOR OR BALLAST, CEMENT OR CONCRETE
CONSTRUCTION	3274110	LIME, COMMON, QUICK
CONSTRUCTION	3274111	LIME, COMMON, HYDRATED
CONSTRUCTION	3274112	LIME, COMMON, HYDRAULIC OR SLAKED
CONSTRUCTION	3274115	LIME, COMMON, HYDRATED, QUICK OR SLAKED, IN MIXED LOADS
CONSTRUCTION	3275220	GYPSUM CONCRETE
CONSTRUCTION	3275235	CALCINED GYPSUM, SUITABLE ONLY FOR FURTHER MANUFACTURE
CONSTRUCTION	3275245	CALCINED PLASTER
CONSTRUCTION	3275248	PLASTER OF PARIS
CONSTRUCTION	3275920	SYNTHETIC GYPSUM
CONSTRUCTION	3275925	GYPSUM ROCK, NOT CRUDE, CONSISTING OF WASTE CALCIUM SULPHATE, HARDENING AGENT, WATER, PELLETIZED, BROKEN, CRUSHED OR GROUND, FOR USE IN THE MANUFACTURING OF CEMENTITIOUS MATERIAL
CONSTRUCTION	3291110	SYNTHETIC ABRASIVES, CRUDE OR LUMP
CONSTRUCTION	3291125	SILICON CARBIDE BRIQUETTES
CONSTRUCTION	3295241	FLY ASH AGGREGATE, SINTERED
CONSTRUCTION	3295253	SLAG, BASIC (CEMENTITIOUS), GROUND OR PULVERIZED
CONSTRUCTION	3295278	SLAG, FURNACE, CRUSHED, EXPANDED, GRANULATED, GROUND OR PULVERIZED, VIZ. ALUMINUM, ANTIMONY (REFUSE FROM ANTIMONY ORE), BRASS, COPPER, DETINNING (REFUSE DERIVED FROM DETINNING PROCESS), FERRO SILICON (FLUE SLAG FROM FERRO-SILICON OR SILICON METAL PRODUCTION FURNACES), IRON, IRON-TITANIUM (IRON TITANIUM BEARING SLAG), LEAD, MAGNESIUM, NICKEL, TIN OR ZINC
CONSTRUCTION	3295291	SLAG, NEC, CRUSHED, GRANULATED, GROUND OR PULVERIZED, WITHOUT COMMERCIAL VALUE FOR THE FURTHER EXTRACTION OF METAL
CONSTRUCTION	3295610	GYPSUM, GROUND, POWDERED OR PULVERIZED, NOT CALCINED, OTHER THAN LAND PLASTER

CONSTRUCTION	3295710	MICA, DRY GROUND
CONSTRUCTION	3295912	BARYTES AGGREGATE, LATEX OR RESIN COATED
CONSTRUCTION	3295920	BRUCITE AND DOLOMITE, CALCINED
CONSTRUCTION	3295926	DOLOMITE (DOLOMITIC LIMESTONE), ROASTED, CONSISTING OF REFRACTORY DOLOMITE, IN GRANULAR FORM, TREATED OR UNTREATED, CLINKERED, OR BURNED TO A DEAD STATE
CONSTRUCTION	3295927	DOLOMITE (DOLOMITIC LIMESTONE), GROUND, PULVERIZED OR HYDRATED
CONSTRUCTION	3295947	LIMESTONE DUST, GROUND, OR AGRICULTURAL LIMESTONE DUST
CONSTRUCTION	3295948	LIMESTONE, GROUND FOR ACID SOIL TREATMENT, GROUND DOLOMITE (DOLOMITE LIMESTONE), OR GROUND AGRICULTURAL LIMESTONE, LIMESTONE SCREENING OR DUST OF WHICH 80% OR LESS WILL PASS THROUGH A U. S. NO. 8 SCREEN
CONSTRUCTION	3295950	LIMESTONE, GROUND OR PULVERIZED, OF WHICH 80 PERCENT OR MORE WILL PASS THROUGH A U. S. NO. 8 SCREEN
CONSTRUCTION	3295953	AGRICULTURAL LIMESTONE, UNBURNT, GROUND OR PULVERIZED
CONSTRUCTION	3295956	LIMESTONE SLURRY, CONSISTING OF GROUND LIMESTONE AND WATER, MIXED
CONSTRUCTION	3295958	WOLLASTONITE, GROUND OR PULVERIZED
CONSTRUCTION	3295960	LIMESTONE, DUST, GRANULAR, GROUND, POWDERED OR PULVERIZED, NEC, OTHER THAN AGRICULTURAL, FLUXING OR DOLOMITIC
CONSTRUCTION	3295964	GRIT, POULTRY OR PIGEON
CONSTRUCTION	3295970	LIMESTONE, NATURAL, GRANULAR, GROUND, POWDERED OR PULVERIZED, CONTAINING AT LEAST 85% AVAILABLE CALCIUM CARBONATE EQUIVALENT, SUITABLE FOR FLUE GAS DESULPHURIZATION
CONSTRUCTION	3295976	NON-CRYSTALLINE SILICA (OR) SILICA, NONCRYSTALLINE
CONSTRUCTION	3311290	SLAG, CRUDE, PRODUCT OF IRON OR STEEL FURNACES
CONSTRUCTION	3311945	MILL CINDER OR MILL SCALE, IRON OR STEEL
CONSTRUCTION	4011206	FLY ASH, PELLETIZED
CONSTRUCTION	4011208	FLY ASH,HAVING FURTHER COMMERCIAL VALUE
CONSTRUCTION	4011213	COAL ASHES OR CINDERS
CONSTRUCTION	4027145	STONE WASTE, NATURAL, NEC, OTHER THAN LIMESTONE (LIME ROCK)
CONSTRUCTION	4029123	GRIT, SAND BLASTING (PRODUCT OF COAL ASHES OR CINDERS, OR SLAG), HAVING NO VALUE FOR FURTHER EXTRACTION OF METAL
FERTILIZER & SULFUR	1471325	POTASSIUM-MAGNESIUM SULPHATE, CRUDE (LANGBEINITE, MAGNESIA (MAGNESIUM) POTASH (POTASSIUM) SULPHATE, POTASH (POTASSIUM) MAGNESIA (MAGNESIUM) SULPHATE, SULPHATE OF POTASH (POTASSIUM) MAGNESIA (MAGNESIUM) (DOUBLE MANURE SALTS) OR POTASH (POTASSIUM) ORE)
FERTILIZER & SULFUR	1471410	PHOSPHATE ROCK, DRY
FERTILIZER & SULFUR	1471620	SULPHUR, LIQUID OR MOLTEN
FERTILIZER & SULFUR	2812534	POTASSIUM CHLORIDE (POTASSIUM MURIATE)
FERTILIZER & SULFUR	2812544	POTASSIUM PHOSPHATE
FERTILIZER & SULFUR	2812552	POTASSIUM SULFATE
FERTILIZER & SULFUR	2812563	POTASSIUM THIOSULFATE SOLUTION
FERTILIZER & SULFUR	2812567	POTASSIUM-MAGNESIUM SULFATE, REFINED (LANGBEINITE, MAGNESIA (MAGNESIUM)) POTASH (POTASSIUM) SULFATE (SULPHATE), POTASH (POTASSIUM)-MAGNESIA (MAGNESIUM) SULFATE (SULPHATE), SULFATE (SULPHATE) OF POTASH (POTASSIUM)-MAGNESIA (MAGNESIUM) OR POTASH (POTASSIUM) ORE
FERTILIZER & SULFUR	2812639	CALCIUM NITRATE (LIME NITRATE)
FERTILIZER & SULFUR	2818142	DIESEL EXHAUST FLUID (DEF)
FERTILIZER & SULFUR	2818146	UREA LIQUOR OR UREA LIQUID OR CONCENTRATE
FERTILIZER & SULFUR	2818170	UREA, OTHER THAN LIQUOR OR LIQUID
FERTILIZER & SULFUR	2819111	AQUA AMMONIA, NEC
FERTILIZER & SULFUR	2819125	AMMONIUM CHLORIDE (AMMONIUM MURIATE, MURIATE OF AMMONIA, OR SAL AMMONIAC)
FERTILIZER & SULFUR	2819148	DIAMMONIUM OR MONO AMMONIUM PHOSPHATE, FEED GRADE

FERTILIZER & SULFUR	2819155	AMMONIUM SULPHATE
FERTILIZER & SULFUR	2819158	AMMONIUM SULPHATE NITRATE (LEUNASALPETER)
FERTILIZER & SULFUR	2819173	AMMONIUM THIOSULPHATE SOLUTION
FERTILIZER & SULFUR	2819315	SULPHURIC ACID OR OIL OF VITRIOL 93-100% CONCENTRATION
FERTILIZER & SULFUR	2819330	ACID, SULPHURIC, SPENT
FERTILIZER & SULFUR	2819345	FUMING SULFURIC ACID, LESS THAN 30% IN STRENGTH
FERTILIZER & SULFUR	2819454	PHOSPHORIC ACID
FERTILIZER & SULFUR	2819548	ZINC SULPHATE, DRY
FERTILIZER & SULFUR	2819815	AMMONIA, ANHYDROUS
FERTILIZER & SULFUR	2819910	DI-CALCIUM OR MONOCALCIUM PHOSPHATE, FEED GRADE
FERTILIZER & SULFUR	2819917	ARSENIC, WHITE (ARSENIC TRIOXIDE)
FERTILIZER & SULFUR	2871235	DIAMMONIUM PHOSPHATE FERTILIZER
FERTILIZER & SULFUR	2871236	MONOAMMONIUM PHOSPHATE FERTILIZER
FERTILIZER & SULFUR	2871238	MONOAMMONIUM PHOSPHATE FERTILIZER, WITH SULPHUR AND/OR ZINC
FERTILIZER & SULFUR	2871240	PHOSPHATE, DEFLUORINATED, OR SUPERPHOSPHATE, DEFLUORINATED
FERTILIZER & SULFUR	2871242	DRY NITROGEN FERTILIZER COMPOUNDS WITH NITROGEN AS THE PRIMARY NUTRIENT
FERTILIZER & SULFUR	2871244	AMMONIUM NITRATE FERTILIZER, DRY
FERTILIZER & SULFUR	2871250	SUPERPHOSPHATE (ACID PHOSPHATE), OTHER THAN AMMONIATED
FERTILIZER & SULFUR	2871251	SUPERPHOSPHATE (ACID PHOSPHATE), AMMONIATED, OR PHOSPHATE ROCK, ACIDULATED OR AMMONIATED
FERTILIZER & SULFUR	2871309	AMMONIUM SULFATE LIQUID SOLUTION CONTAINING NOT MORE THAN 35% AMMONIUM SULFATE
FERTILIZER & SULFUR	2871310	AMMONIUM NITRATE FERTILIZER, LIQUID
FERTILIZER & SULFUR	2871311	LIQUID FERTILIZER NON HAZARDOUS, PHOSGRAD 0 28 25 AND PHOSGRAD 4 25 15
FERTILIZER & SULFUR	2871312	UREA, METHYLENE UREA, TRA IZONE AND DCD ADDUCTS MIX TURE CONSISTING OF, NOT M ORE THAT 35% WATER
FERTILIZER & SULFUR	2871313	NITROGEN FERTILIZER SOLUTION, CONSISTING OF WATER AND AGRICULTURAL NITROGEN SALTS, NOT AMMONIATED
FERTILIZER & SULFUR	2871315	NITROGEN FERTILIZER SOLUTION OR FERTILIZER AMMONIATING SOLUTION, CONSISTING OF WATER AND AGRICULTURAL NITROGEN SALTS, AMMONIATED, TOTAL FREE AMMONIA CONTENT NOT MORE THAN 35 PERCENT BY WEIGHT
FERTILIZER & SULFUR	2871316	NITROGEN FERTILIZER SOLUTION OR FERTILIZER AMMONIATING SOLUTION, CONSISTING OF WATER AND AGRICULTURAL NITROGEN SALTS, AMMONIATED, TOTAL FREE AMMONIA CONTENT MORE THAN 50 PERCENT BY WEIGHT
FERTILIZER & SULFUR	2871317	NITROGEN FERTILIZER SOLUTION, CONTAINING 2% FORMALDEHYDE
FERTILIZER & SULFUR	2871320	NITROGEN FERTILIZER SOLUTION CONSISTING OF 20% NITROGEN FERTILIZER AND 57% AMMONIUM NITRATE SOLUTION (AN-20 SOLUTION)
FERTILIZER & SULFUR	2871321	NITROGEN FERTILIZER SOLUTION WITH CALCIUM CONSISTING OF 36.5% CALCIUM NITRATE AND 30.9% AMMONIUM NITRATE SOLUTION (CALCIUM AMMONIUM NITRATE SOL UTION CAN 17)
FERTILIZER & SULFUR	2871430	FERTILIZING COMPOUNDS (MANUFACTURED FERTILIZERS), NEC, DRY, OR PLANT FOOD, DRY
FERTILIZER & SULFUR	2871431	FERTILIZING COMPOUNDS (MANUFACTURED FERTILIZERS), NEC, LIQUID OR PASTE, OR PLANT FOOD, LIQUID OR PASTE
FERTILIZER & SULFUR	2871432	A LIQUID FERTILZER DESIGNED TO PROVIDE CALCIUM AND SULFUR NUTRIENTS TO VARIOUS CROPS. IT IS PRODUCED USING LIME (CALCIUM OXIDE), SULFUR, OXYGEN AND WATER
FERTILIZER & SULFUR	2871433	FERTILIZER SOLUTION, CONSISTING OF WATER, FREE AMMONIA AND SULPHUR, TOTAL AMMONIA CONTENT NOT TO EXCEED 30 PERCENT BY WEIGHT
FERTILIZER & SULFUR	2871437	SULPHUR FERTILIZER CONTAINING 90 PERCENT SULPHUR, 10 PERCENT NONPLANT FOOD INGREDIENT, BENTONITE CLAY
FERTILIZER & SULFUR	2871445	AMMONIUM PHOSPHATESULPHATE, FERTILIZER

FERTILIZER & SULFUR	2871446	MANGANESE SULPHATE, FERTILIZER GRADE
FERTILIZER & SULFUR	2871450	PHOSPHATIC FERTILIZER SOLUTION, CONTAINING NOT MORE THAN 77 PERCENT OF PHOSPHORIC ANHYDRIDE BY WEIGHT
FERTILIZER & SULFUR	2871451	AMMONIUM POLYPHOSPHATE SOLUTION CONTAINING LESS THAN 40 PERCENT PHOSPHORIC ANHYDRIDE
FERTILIZER & SULFUR	2871453	NITROGEN PHOSPHATE SOLUTION, CONTAINING LESS THAN 10% NITROGEN
FERTILIZER & SULFUR	2871915	FERTILIZERS AND FERTILIZER MATERIALS, PREPARED NOT CONTAINING PROTEINS DERIVED FROM RUMINANTS
FERTILIZER & SULFUR	3295961	PHOSPHATE ROCK, GROUND OR PULVERIZED
FERTILIZER & SULFUR	4830043	SULPHURIC ACID, SPENT
FOOD & BEVERAGE I	113110	BARLEY
FOOD & BEVERAGE I	113115	BARLEY FOR MALTING PURPOSES ONLY
FOOD & BEVERAGE I	113410	RICE, ROUGH
FOOD & BEVERAGE I	114315	PEANUTS, RAW, SHELLED (NUT MEATS), NOT SALTED
FOOD & BEVERAGE I	114940	SEEDS, SUNFLOWER
FOOD & BEVERAGE I	115210	POPCORN, EAR OR SHELLED, NOT POPPED
FOOD & BEVERAGE I	115925	CANARY SEEDS
FOOD & BEVERAGE I	115943	MILLET SEEDS
FOOD & BEVERAGE I	115970	BEANS, VELVET, DRIED, OR IN PODS
FOOD & BEVERAGE I	134190	BEANS, EDIBLE, NEC, DRIED
FOOD & BEVERAGE I	134191	CHICKPEAS
FOOD & BEVERAGE I	134215	PEAS, CANADIAN FIELD, DRIED
FOOD & BEVERAGE I	134290	PEAS, NEC, DRIED, OR SPLIT PEAS, NEC, DRIED
FOOD & BEVERAGE I	134310	LENTILS, NEC, DRIED
FOOD & BEVERAGE I	191566	MUSTARD SEEDS, OTHER THAN WILD
FOOD & BEVERAGE I	2033920	TOMATO REFUSE, FROM CANNERIES
FOOD & BEVERAGE I	2034220	BEANS, PEAS, SPLIT PEAS OR LENTILS, PARTIALLY COOKED AND DEHYDRATED
FOOD & BEVERAGE I	2034232	PULSE/SPECIAL CROPS FRACT IONS: PROTEIN, STARCH OR FIBER PRODUCT. POWDER OR PELLETIZED.
FOOD & BEVERAGE I	2034234	PEA FLOUR OR MEAL, DEHYDRATED, DRIED, EVAPORATED OR PARTIALLY COOKED AND DEHYDRATED
FOOD & BEVERAGE I	2034310	POTATOES, COOKED AND DICED, FLAKED, POWDERED OR SHREDDED, OTHER THAN FROZEN, NEC
FOOD & BEVERAGE I	2034325	POTATOES, DEHYDRATED, DRIED OR EVAPORATED, NOT SUITABLE FOR HUMAN CONSUMPTION
FOOD & BEVERAGE I	2034330	POTATOES, DRIED OR DEHYDRATED, NEC
FOOD & BEVERAGE I	2041922	BAKERS OR BREWERS GRITS, GRANULATED OR REFINED
FOOD & BEVERAGE I	2041993	GRITS, NEC
FOOD & BEVERAGE I	2044110	RICE, CLEANED, WHOLE OR BROKEN
FOOD & BEVERAGE I	2044210	RICE MEAL
FOOD & BEVERAGE I	2044215	RICE FLOUR
FOOD & BEVERAGE I	2044220	RICE BRAN
FOOD & BEVERAGE I	2044310	BREWERS RICE
FOOD & BEVERAGE I	2044915	RICE BRAN AND GROUND RICE HULLS, FEED
FOOD & BEVERAGE I	2044920	HULLS, RICE, GROUND, FEED
FOOD & BEVERAGE I	2044925	RICE HULLS, UNGROUND (RICE CHAFF), FEED
FOOD & BEVERAGE I	2047110	BIRD FOOD OR SEED, PET FOOD
FOOD & BEVERAGE I	2047133	FEED, ANIMAL OR POULTRY, MADE FROM MEAT, POULTRY OR FISH OR A MIXTURE OF MEAT, POULTRY OR FISH AND CEREALS OR VEGETABLES, DEHYDRATED, PET FOOD NOT CONTAINING PROTEINS DERIVED FROM RUMINANTS
FOOD & BEVERAGE I	2061110	SUGAR, BEET OR CANE, RAW
FOOD & BEVERAGE I	2062110	SUGAR, BEET OR CANE, DRY
FOOD & BEVERAGE I	2071310	CHOCOLATE

FOOD & BEVERAGE I	2083110	MALT
FOOD & BEVERAGE I	2099420	YEAST, DRY
FOOD & BEVERAGE II	115110	LAWN GRASS SEEDS, NEC
FOOD & BEVERAGE II	115946	AUSTRIAN WINTER PEA SEEDS
FOOD & BEVERAGE II	115971	SEED BEANS
FOOD & BEVERAGE II	115974	SEED PEAS, NEC
FOOD & BEVERAGE II	115991	GRASS SEEDS, NEC, OR RED TOP SEEDS, OTHER THAN LAWN
FOOD & BEVERAGE II	119710	SUGAR BEETS
FOOD & BEVERAGE II	129845	ALMONDS, BUTTERNUTS OR CHUFAS
FOOD & BEVERAGE II	191990	SEEDS, NEC
FOOD & BEVERAGE II	2023110	MILK POWDER SCRAP, CAKE OR GROUND
FOOD & BEVERAGE II	2023120	MALT AND MILK COMPOUND, NOT MALTED MILK
FOOD & BEVERAGE II	2023125	MILK, CREAM, BUTTERMILK, OR DRY MILK SOLIDS, POWDERED OR FLAKED
FOOD & BEVERAGE II	2023315	MILK, CONDENSED, SKIMMED
FOOD & BEVERAGE II	2023325	MILK OR BUTTERMILK, CONDENSED OR EVAPORATED, LIQUID OR PASTE
FOOD & BEVERAGE II	2025961	WHEY, NEC, POWDERED
FOOD & BEVERAGE II	2032210	SOUPS OR BROTHS, NOT FROZEN
FOOD & BEVERAGE II	2033110	FRUIT, CANNED OR PRESERVED, IN JUICE OR SYRUP, OR IN LIQUID, OTHER THAN BRINE OR ALCOHOLIC LIQUOR
FOOD & BEVERAGE II	2033125	FRUIT OR BERRIES, IN SOLUTION
FOOD & BEVERAGE II	2033220	VEGETABLES, INCLUDING CORN, OTHER THAN CANNED WHOLE KERNEL CORN, VACUUM PACKED, PIMENTOS OR TOMATOES, CANNED, PREPARED OR PRESERVED
FOOD & BEVERAGE II	2033315	HOMINY, CANNED, PREPARED OR PRESERVED
FOOD & BEVERAGE II	2033610	CATSUP OR KETCHUP
FOOD & BEVERAGE II	2033615	TOMATO PASTE, PULP OR PUREE, CANNED, PREPARED OR PRESERVED, NOT REQUIRING PROTECTIVE SERVICE
FOOD & BEVERAGE II	2033617	TOMATOES, DICED OR WHOLE, BULK IN DRUMS OR BINS
FOOD & BEVERAGE II	2033625	TOMATO SAUCE, WITH OR WITHOUT OTHER INGREDIENTS
FOOD & BEVERAGE II	2033990	CANNED OR PRESERVED VEGETABLES AND VEGETABLE JUICES, INCLUDING SAUERKRAUT JUICES, IN MIXED LOADS
FOOD & BEVERAGE II	2033991	FRUITS AND VEGETABLES, CANNED OR PRESERVED, IN MIXED LOADS
FOOD & BEVERAGE II	2034315	POTATOES, COOKED AND SLICED OR POWDERED, OTHER THAN FROZEN, WITH FLOUR AND SEASONING
FOOD & BEVERAGE II	2034326	POTATOES DEHYDRATED DRIED OR EVAPORATED, CUBE OR P ELLET FORM. NOT SUITABLE FOR HUMAN CONSUMPTION
FOOD & BEVERAGE II	2035220	OLIVES, OTHER THAN FRESH, NOT FROZEN
FOOD & BEVERAGE II	2035920	PEPPER SAUCE
FOOD & BEVERAGE II	2035930	BASIC FOOD SAUCES, NEC, INCLUDING MARINARA, PIZZA OR SPANISH, OTHER THAN DRY
FOOD & BEVERAGE II	2035990	TABLE SAUCES, NEC
FOOD & BEVERAGE II	2039111	MIXED LOADS OF CANNED GOODS, WITHOUT SEPARATE WEIGHTS, CONSISTING OF COMMODITIES IN THE 203 GROUP EXCLUSIVELY
FOOD & BEVERAGE II	2041288	WHEAT GRAIN MILL FEED, PELLETIZED, VIZ. BRAN, MIDDLINGS, RED DOG OR SHORTS, OR A PHYSICAL MIXTURE OF ANY TWO OR MORE
FOOD & BEVERAGE II	2047115	FEED SUPPLEMENTS, ANIMAL, FISH OR POULTRY, NOT FROZEN, PET FOOD
FOOD & BEVERAGE II	2047190	FEED, ANIMAL, FISH OR POULTRY, PREPARED, NEC, PET FOOD
FOOD & BEVERAGE II	2047215	FEED, ANIMAL, CARNIVOROUS, CONTAINING ANIMAL, FISH, MEAT, MILK OR POULTRY PRODUCTS, WITH OR WITHOUT CEREAL, GRAIN OR VEGETABLE INGREDIENTS (NOT CONDIMENTAL), INCLUDING BISCUITS (CAKES), WHOLE, BROKEN OR GROUND, OTHER THAN DEHYDRATED OR DRY, PET FOOD
FOOD & BEVERAGE II	2052110	BISCUITS, NOT FROZEN
FOOD & BEVERAGE II	2062215	SUGAR, LIQUID
FOOD & BEVERAGE II	2071319	BUTTER, COCOA

FOOD & BEVERAGE II	2071910	CAKE DECORATIONS, CONSISTING OF CANDLE HOLDERS OR ORNAMENTS MADE OF SUGAR, WITH OR WITHOUT OTHER INGREDIENTS
FOOD & BEVERAGE II	2082110	MALT LIQUORS, VIZ. ALE, BEER, BEER TONIC, NEAR BEER, PORTER OR STOUT
FOOD & BEVERAGE II	2084120	WINES, NEC
FOOD & BEVERAGE II	2084135	BRANDY, ALCOHOLIC
FOOD & BEVERAGE II	2084137	ALCOHOL OR SPIRITS, GRAPE, NEUTRAL, IN BOND
FOOD & BEVERAGE II	2084140	WINE, CHAMPAGNE OR VERMOUTH, SPOILED
FOOD & BEVERAGE II	2084150	ALCOHOL OR SPIRITS, FRUIT, EXCEPT GRAPE, NEUTRAL, IN BOND
FOOD & BEVERAGE II	2085110	BEVERAGES, ALCOHOLIC, CARBONATED, CONTAINING NOT MORE THAN 6 PERCENT ALCOHOL
FOOD & BEVERAGE II	2085115	RUM, DENATURED
FOOD & BEVERAGE II	2085116	ALCOHOL,IN BOND,FOR HUMAN CONSUMPTION
FOOD & BEVERAGE II	2085120	ALCOHOL, IN BOND (FREE OF INTERNAL REVENUE TAX), OTHER THAN DENATURED ALCOHOL OR METHANOL
FOOD & BEVERAGE II	2085125	SPIRITS, ALCOHOLIC, WHISKIES, RUM OTHER THAN DENATURED
FOOD & BEVERAGE II	2085136	SPIRITS, GRAIN, NEUTRAL, IN BOND
FOOD & BEVERAGE II	2085170	LIQUORS, ALCOHOLIC, ALCOHOLIC CONTENT IN EXCESS OF 100 PERCENT PROOF, SUITABLE ONLY FOR FURTHER PROCESSING OR BLENDING
FOOD & BEVERAGE II	2085190	LIQUORS OR LIQUEURS, ALCOHOLIC, NEC
FOOD & BEVERAGE II	2086110	BEVERAGES, FLAVORED OR PHOSPHATED, NEC, BIRCH BEER, GINGER ALE, POP, ROOT BEER, SARSAPARILLA OR SODA WATER, EXCEPT EXTRACTS, SYRUPS, ALCOHOLIC LIQUORS, DEALCOHOLIZED OR NON-ALCOHOLIC CORDIALS AND LIQUEURS (SUCH AS CREME-DE-MENTHE, COCKTAILS, ETC.)
FOOD & BEVERAGE II	2086113	WATER, MINERAL, NEC, OR PLAIN, NOT FLAVORED NOR PHOSPHATED, CARBONATED
FOOD & BEVERAGE II	2086130	FRUIT JUICE DRINKS, NONCARBONATED, CONSISTING OF NATURAL JUICES OR CONCENTRATES WITH WATER ADDED
FOOD & BEVERAGE II	2087130	MALT AND CHOCOLATE OR COCOA COMPOUND OR MILK AND CHOCOLATE OR COCOA COMPOUND, BEVERAGE PREPARATIONS
FOOD & BEVERAGE II	2087175	SYRUP, FLAVORING OR FRUIT, NEC, OR GRAPE SYRUP
FOOD & BEVERAGE II	2099340	COLORING SYRUP, BURNT SUGAR (CARAMEL)
FOOD & BEVERAGE II	2099415	YEAST, COMPRESSED, OTHER THAN DRY
FOOD & BEVERAGE II	2099511	MIXED LOADS OF CANNED GOODS, WITHOUT SEPARATE WEIGHTS, CONSISTING OF COMMODITIES NOT FOUND EXCLUSIVELY IN THE 203 GROUP
FOOD & BEVERAGE II	2099515	MIXED LOADS OF GROCERIES AND GROCERS SUPPLIES
FOOD & BEVERAGE II	2099520	MIXED LOADS OF FOODSTUFFS, CANNED (CANNED GOODS), PREPARED OR PRESERVED, WITHOUT SEPARATE WEIGHTS
FOOD & BEVERAGE II	2099615	VINEGAR
FOOD & BEVERAGE II	2099720	SALT, CELERY, GARLIC OR ONION FLAVORED
FOOD & BEVERAGE II	2099734	CHILI PEPPERS OR CHILI POWDER
FOOD & BEVERAGE II	2099919	CELLULOSE FLOUR, EDIBLE
FOOD & BEVERAGE II	2099972	CAKE OR MEAL, NEC
FOOD & BEVERAGE II	2099988	POPCORN, NOT POPPED, IN POPPING CONTAINERS
FOOD & BEVERAGE II	3461434	CAPS, COVERS OR TOPS, OTHER THAN DISPLAY, FOR BOTTLES, CANS, GLASSES OR JARS, OR CAN BOTTOMS, FOIL, NEC
FOOD & BEVERAGE II	4211142	NONREVENUE MOVEMENT OF CONTAINERS, EMPTY, RETURNED, USED IN THE TRANSPORTATION OF BEVERAGES, FLAVORED OR PHOSPHATED, MALT LIQUORS, VIZ. ALE, BEER, TONIC, STOUT OR NON-INTOXICATING CEREAL BEVERAGES, OR WATER, MINERAL OR PLAIN, CONSISTING OF BEER DISPENSING CONTAINERS, METAL, LESS THAN 5 GALLONS CAPACITY, BOTTLES, BOTTLE CARRIERS OR BOXES WITHOUT BOTTLES, HOGS HEADS, BARRELS, HALF-BARRELS, QUARTERBARRELS, SIXTH-BARRELS, EIGHTH-BARRELS O DRUMS
FOOD & BEVERAGE II	4231115	REVENUE MOVEMENT OF BARRELS, DRUMS OR BULK COMMODITY CONTAINERS, SHIPPING, RUBBER, RETURNED EMPTY

FOOD & BEVERAGE II	4231125	REVENUE MOVEMENT OF BARRELS, DRUMS AND KEGS, NEC, SHIPPING, SHEET STEEL, RETURNED EMPTY
FOOD & BEVERAGE II	4231128	REVENUE MOVEMENT OF BOTTLE SHIPPING CARRIERS (BOTTLE CARRYING BOXES OR CRATES, WITH PERMANENTLY FIXED PARTITIONS), IRON, STEEL, WOODEN OR WOOD AND METAL COMBINED, RETURNED EMPTY
FOOD & BEVERAGE II	4231142	REVENUE MOVEMENT OF CONTAINERS, EMPTY, RETURNED, USED IN THE TRANSPORTATION OF BEVERAGES, FLAVORED OR PHOSPHATED, MALT LIQUORS, VIZ. ALE, BEER, TONIC, STOUT OR NON-INTOXICATING CEREAL BEVERAGES, OR WATER, MINERAL OR PLAIN, CONSISTING OF BEER DISPENSING CONTAINERS, METAL, LESS THAN 5 GALLONS CAPACITY, BOTTLES, BOTTLE CARRIERS OR BOXES WITHOUT BOTTLES, HOGS HEADS, BARRELS, HALF-BARRELS, QUARTERBARRELS, SIXTH-BARRELS, EIGHTH-BARRELS O DRUMS
FOOD & BEVERAGE II	4231145	REVENUE MOVEMENT OF SHIPPING CONTAINERS, OLD (USED), MADE OF FIBREBOARD, PLYWOOD OR WOOD, SEPARATE OR COMBINED WITH STEEL, RETURNED EMPTY
FOOD & BEVERAGE II	4231149	REVENUE MOVEMENT OF WIRE SHIPPING CARRIERS, STEEL OR STEEL AND WOOD, OTHER THAN REELS, RETURNED EMPTY
FOOD & BEVERAGE II	4231180	REVENUE MOVEMENT OF BARRELS, BULK COMMODITY CONTAINERS, DRUMS OR KEGS, NEC, SHEET IRON OR STEEL, SHIPPING, OLD (USED), RETURNED EMPTY
FOOD & BEVERAGE II	4231220	REVENUE MOVEMENT OF PALLETS, PLATFORMS OR SKIDS, SHIPPING OR WAREHOUSE, IRON OR STEEL, USED, RETURNED EMPTY
FOOD & BEVERAGE II	4231245	REVENUE MOVEMENT OF SHIPPING DEVICES, FIBREBOARD, RETURNED
FOREST PRODUCTS I	2411515	PULPWOOD CHIPS, NEC
FOREST PRODUCTS I	2429949	CONSTRUCTION FORMS OR MOLDS, NEC, MADE OF WOOD FLOUR OR WOOD PARTICLES WITH MINERAL COATING AND RESIN AND/OR CEMENT BINDER
FOREST PRODUCTS I	2432120	VENEER, BOXWOOD, BUTTERNUT, DOGWOOD, HOLLY, IRONWOOD, LANCEWOOD OR TULIPWOOD, NATIVE OR FOREIGN, 1/4 INCH OR LESS IN THICKNESS
FOREST PRODUCTS I	2432135	VENEER, NATIVE WOOD, PAPER COVERED, NOT MORE THAN 1/8 INCH IN THICKNESS
FOREST PRODUCTS I	2432158	PLYWOOD, NEC, MADE FROM OR FACED WITH BIRCH, PINE OR SPRUCE, NATIVE OR FOREIGN, OR NATIVE WOOD, NEC, OR CANADIAN WOOD, NEC
FOREST PRODUCTS I	2432159	PLYWOOD, NEC, MADE FROM OR FACED WITH BOXWOOD, BUTTERNUT, DOGWOOD, HOLLY, IRONWOOD, LANCEWOOD OR TULIPWOOD, NATIVE OR FOREIGN, OR FOREIGN WOOD, NEC
FOREST PRODUCTS I	2432162	PLYWOOD OR BUILT-UP WOOD, ROUGH OR DRESSED, CONSISTING OF LAMINATED FLAT PIECES, EDGES GLUED OR NOT GLUED TOGETHER, CUT TO DIMENSIONS OR SHAPED, BORED OR NOT BORED, EDGES PLAIN OR BEVELED, GROOVED OR MOULDED, SLOTTED OR TONGUED, (OTHER THAN CHERRY, MAHOGANY OR WALNUT) UNFIGURED NOT FACED OR FINISHED WITH DECORATIVE OR PERMANENT PROTECTIVE MATERIALS, NEC
FOREST PRODUCTS I	2441113	CRATES, WOODEN OR WOOD AND METAL, NEC
FOREST PRODUCTS I	2499110	ORIENTED STRAND BOARD, NEC
FOREST PRODUCTS I	2499115	WAFERBOARD, WOOD, CONSISTING OF STRUCTURAL-USE PANELS OF COMPRESSED WAFER-LIKE WOOD PARTICLES OR FLAKES BONDED WITH PHENOLIC OR OTHER RESIN
FOREST PRODUCTS I	2499610	PARTICLEBOARD, WOOD, CONSISTING OF FLAT BOARDS OR SHEETS, BONDED WOOD CHIPS, FLAKES, GROUND WOOD, SHAVINGS OR SAWDUST, COMPRESSED
FOREST PRODUCTS I	2499990	PAPER ROLL PLUGS, MOLDED, GROUND WOOD OR SAWDUST, WITH ADDED RESIN BINDER
FOREST PRODUCTS I	2611110	WOODPULP CELLULOSE, NEC
FOREST PRODUCTS I	2611133	HARDWOOD WOOD PULP, BALED, NOT SCREENINGS, NOT SCRAP, AND NOT POWDERED. MADE FROM SPECIES TO INCLUDE, BUT NOT LIMITED TO, OAK, HICKORY, ASH, CHERRY, GUM, POPLAR AND MAPLE.
FOREST PRODUCTS I	2611135	WOODPULP, NOT POWDERED, NEC

FOREST PRODUCTS I	2611137	WOODPULP, CHEMO-THERMOMECHANICAL PULP
FOREST PRODUCTS I	2611140	COTTON LINTERS PULP
FOREST PRODUCTS I	2621110	NEWSPRINT PAPER, BAGASSE OR BAGASSE AND OTHER FIBRES
FOREST PRODUCTS I	2621115	NEWSPRINT PAPER, FIBRE CONTENT CONSISTING OF NOT LESS THAN 60 PERCENT GROUND WOOD (WILL NOT INCLUDE PAPER WHICH HAS BEEN FURTHER PROCESSED AFTER ITS ORIGINAL MANUFACTURE)
FOREST PRODUCTS I	2621216	GROUND WOOD PAPER, UNCOATED, NOT LESS THAN 60 PERCENT GROUND WOOD FIBRE, IN ROLLS OF NOT LESS THAN 16 INCHES IN DIAMETER OR IN SHEETS MEASURING NOT LESS THAN 336 SQUARE INCHES, INCLUDING CATALOG, DIRECTORY, DRAWING, MANILA, NOVEL, POSTER, PRINTING, TABLET OR WRITING PAPERS, OR OTHER PAPERS, OTHER THAN NAPKIN, NEWSPRINT OR TOILET PAPERS, PAPER TOWELING OR UNFINISHED BLANK WALL PAPER
FOREST PRODUCTS I	2621345	PRINTING PAPER, LESS THAN 60 PERCENT GROUND WOOD FIBRE, OTHER THAN NEWSPRINT OR CARBONIZED PRINT
FOREST PRODUCTS I	2621460	WRAPPING PAPER, CORRUGATED
FOREST PRODUCTS I	2621490	WRAPPING PAPER, NEC
FOREST PRODUCTS I	2621745	GYPSUM BOARD PAPER
FOREST PRODUCTS I	2621943	PAPER, PULPBOARD OR FIBREBOARD, OTHER THAN CORRUGATED, LAMINATED, WIRE REINFORCED
FOREST PRODUCTS I	2631117	PULPBOARD OR FIBREBOARD, PAPER OR PULP LINED OR NOT LINED, NOT CORRUGATED NOR INDENTED, EXCLUDING FACED WITH FOIL, EXCLUDING BUILDING, WALL OR INSULATING BOARDS, AND EXCLUDING BOX BLANKS, CREASED, CORNER CUT OR SLOTTED AND CUT TO SHAPE
FOREST PRODUCTS I	2631125	PULPBOARD, CORRUGATED, GLUED INTO ROLLS
FOREST PRODUCTS I	2643142	DUNNAGE, FREIGHT LOADING, PNEUMATIC, PAPER AND PLASTIC, DEFLATED
FOREST PRODUCTS I	2647110	TOILET PAPER OR TISSUES
FOREST PRODUCTS I	2661330	WALLBOARD, FIBERBOARD, STEEL COVERED
FOREST PRODUCTS I	2661935	BUILDING BOARD, FIBREBOARD OR PULPBOARD, SOLID, IN SQUARE OR RECTANGULAR SHAPES, NOT BENT, FACED WITH PLASTIC SHEET OR FILM
FOREST PRODUCTS I	3271941	BOARDS, PANELS OR SHEETS, TILE BACKING OR FLOOR UNDERLAYMENT, PORTLAND CEMENT REINFORCED WITH GLASS FIBRE MESH
FOREST PRODUCTS I	4024110	CLIPPINGS OR SCRAP, SENSITIZED PAPER
FOREST PRODUCTS I	4024115	SCRAP OR WASTE PAPER, NOT SENSITIZED, OR FIBREBOARD OR PULPBOARD SCRAP OR WASTE
FOREST PRODUCTS I	4024117	CORRUGATED CUTTINGS OR CLIPPINGS, NEW, CONSISTING OF BALED CORRUGATED PULPBOARD HAVING LINERS OF EITHER TEST LINER, JUTE OR KRAFT. NOT INCLUDING INSOLUBLE ADHESIVES, BUTT ROLLS, SLABBED OR HOGGED MEDIUM, OR TREATED MEDIUM AND AND LINERS. NEW DOUBLE LINED KRAFT. (NDLK)
FOREST PRODUCTS I	4024181	PAPER STOCK
FOREST PRODUCTS I	4231225	REVENUE MOVEMENT OF PLATFORMS (PALLETS) OR SKIDS, WAREHOUSE OR SHIPPING, WOODEN, USED, REVENUE MOVEMENT, RETURNED EMPTY
FOREST PRODUCTS II	842276	SULFATE TURPENTINE, CRUDE
FOREST PRODUCTS II	2411110	LOGS, FOREIGN WOOD, NEC
FOREST PRODUCTS II	2411115	LOGS, NATIVE WOOD, CANADIAN WOOD OR MEXICAN PINE
FOREST PRODUCTS II	2411210	TIES, RAILROAD, WOODEN, NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED
FOREST PRODUCTS II	2411545	WOOD CHIPS, NOT CHARRED, OTHER THAN PULPWOOD
FOREST PRODUCTS II	2411550	PULPWOOD CHIPS, BROWNWOODS (DOUGLAS FIR/ LARCH)
FOREST PRODUCTS II	2411560	PULPWOOD CHIPS, HARDWOOD
FOREST PRODUCTS II	2411570	PULPWOOD CHIPS, MIXED SPECIES
FOREST PRODUCTS II	2411580	PULPWOOD CHIPS, PINE
FOREST PRODUCTS II	2411615	POLES, WOODEN, NEC, IN THE ROUGH OR ROUGH TURNED, NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED

FOREST PRODUCTS II	2411635	POLES, TELEGRAPH OR TELEPHONE, WOODEN, NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED
FOREST PRODUCTS II	2411701	FUEL, LOGS OR PELLETS, BARK, SAWDUST, SHAVINGS, FIELDSTRAW OR OTHER FIBROUS MILL WASTE MATERIAL, COMPRESSED
FOREST PRODUCTS II	2411810	MINE PROPS OR TIMBERS, WOOD, OR MINE BLOCKS, BOARDS, CAPS, LAGGING, STULLS, WEDGES OR PIT POSTS, WOOD, NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED
FOREST PRODUCTS II	2411923	BARK, SOFTWOOD, GROUND OR POWDERED, OTHER THAN MEDICINAL
FOREST PRODUCTS II	2411970	CORES, LOG
FOREST PRODUCTS II	2421110	FLITCHES, FOREIGN WOOD, NEC
FOREST PRODUCTS II	2421115	FLITCHES, CANADIAN, NATIVE WOOD OR MEXICAN PINE
FOREST PRODUCTS II	2421128	LUMBER, FOREIGN WOOD, NEC, MORE THAN 1/4 INCH IN THICKNESS
FOREST PRODUCTS II	2421131	BIRCH, SPRUCE OR PINE LUMBER, NATIVE, MORE THAN 1/4 INCH IN THICKNESS
FOREST PRODUCTS II	2421150	LUMBER, NEC, NATIVE WOOD, CANADIAN WOOD, BRAZILIAN PINE, EUROPEAN PINE, HONDURAS PINE, MEXICAN PINE, NICARAGUAN PINE, SPRUCE OR BIRCH, EXCEEDING 1/16 INCH IN THICKNESS, NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED
FOREST PRODUCTS II	2421159	LUMBER, CANADIAN WOOD, NEC, OR LUMBER, NATIVE WOOD, NEC, NOT MORE THAN 1/4 INCH IN THICKNESS
FOREST PRODUCTS II	2421160	LUMBER, CANADIAN WOOD, NEC, OR LUMBER, NATIVE WOOD, NEC, MORE THAN 1/4 INCH IN THICKNESS
FOREST PRODUCTS II	2421170	LUMBER, GREEN, NATIVE WOOD, NEC
FOREST PRODUCTS II	2421175	LUMBER,CEDAR,NATIVE WOOD
FOREST PRODUCTS II	2421180	LUMBER, BOARDS, NATIVE OR FOREIGN WOOD, NEC, LESS THAN TWO INCHES IN NOMINAL THICKNESS AND ONE INCH OR MORE IN WIDTH
FOREST PRODUCTS II	2421181	LUMBER, LONG LENGTHS, NATIVE OR FOREIGN WOOD, NEC 18 FEET OR LONGER IN LENGTH
FOREST PRODUCTS II	2421184	LUMBER OR TIMBER, ROUGH OR DRESSED, DRIED
FOREST PRODUCTS II	2421186	TIMBER, HEWED, ROUND OR SAWED
FOREST PRODUCTS II	2421190	KILN DRIED LUMBER IN WIDTHS LESS THAN TEN INCHES
FOREST PRODUCTS II	2421195	KILN DRIED LUMBER MEASURING TWO INCHES BY TEN INCHES OR TWO INCHES BY TWELVE INCHES
FOREST PRODUCTS II	2421215	MINE TIES, WOOD, SAWED
FOREST PRODUCTS II	2421953	BOARDS, PANELS, OR PLANKS, SOLID WOOD, OTHER THAN PLYWOOD OR WOOD PARTICLE BOARD, TONGUED AND GROOVED, FINISHED, 1/2 INCH OR GREATER IN THICKNESS
FOREST PRODUCTS II	2421955	LUMBER, NATIVE WOOD, CANADIAN WOOD, BRAZILIAN PINE, EUROPEAN PINE, HONDURAS PINE, MEXICAN PINE, NICARAGUAN PINE, SPRUCE OR BIRCH, DRESSED OR ROUGH, EDGES GLUED TOGETHER, FORMING A CONTINUOUS FLAT SURFACE, NOT BUILT-UP
FOREST PRODUCTS II	2429110	SHINGLES, WOODEN, NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED
FOREST PRODUCTS II	2429948	BOARDS, PANELS, OR SHEETS, FLAT, CONSISTING OF WOOD FLOUR OR WOOD PARTICLES WITH RESIN BINDER, WITH SURFACE FINISH
FOREST PRODUCTS II	2429970	LANDSCAPE TIMBERS MADE FROM PEELER CORES (REFUSE VENEER MILLS), NOT CREOSOTED NOR OTHERWISE PRESERVATIVELY TREATED
FOREST PRODUCTS II	2431942	BUILDING WOODWORK, OR SHIPS JOINER WORK, WOODEN, FURTHER FINISHED THAN PRIMED, IN MIXED LOAD
FOREST PRODUCTS II	2432113	BUILT-UP WOOD OR PLYWOOD, FACED WITH FIGURED VENEER, ALSO FACED WITH UNFIGURED VENEER MADE FROM CHERRY, MAHOGANY OR WALNUT
FOREST PRODUCTS II	2432122	VENEER, FOREIGN WOOD, NEC, NOT MORE THAN 1/4 INCH IN THICKNESS
FOREST PRODUCTS II	2432141	VENEER, NATIVE WOOD, NEC, OR VENEER, CANADIAN WOOD, NEC, 1/4 INCH OR LESS IN THICKNESS

FOREST PRODUCTS II	2432142	VENEER, NATIVE WOOD, NEC, OR VENEER, CANADIAN WOOD, NEC, EXCEEDING 1/4 INCH IN THICKNESS
FOREST PRODUCTS II	2432143	VENEER, BIRCH, PINE OR SPRUCE, NATIVE OR FOREIGN, 1/4 INCH OR LESS IN THICKNESS
FOREST PRODUCTS II	2432157	WOOD, BUILT-UP OR COM-BINED, MADE FROM OR FACED WITH BOXWOOD, BUTTERNUT, DOGWOOD, HOLLY, IRONWOOD, LANCEWOOD OR TULIPWOOD, NATIVE OR FOREIGN, OR FOREIGN WOOD, NEC, ALSO APPLIES ON COMBINED WOOD, BACKED OR FACED WITH PAPER OR PULPBOARD, OTHER THAN RESIN COATED OR IMPREGNATED
FOREST PRODUCTS II	2432172	WOOD, BUILT-UP OR COMBINED, OR PLYWOOD, BACKED OR FACED WITH CLOTH, PLASTIC, RESIN COATED OR IMPREGNATED PAPER, FIBREBOARD OR PULPBOARD, OR FIBREBOARD WALLBOARD
FOREST PRODUCTS II	2433215	HOUSES OR BUILDINGS, PORTABLE OR FABRICATED, NEC, WITH HEATING, AIR CONDITIONING, PLUMBING EQUIPMENT, ELECTRIC WIRING AND FIXTURES, REFRIGERATORS, STOVES AND CABINETS INSTALLED
FOREST PRODUCTS II	2433310	PANELS, SIDING (WOOD SHINGLES, BACKED WITH FIBERBOARD WALLBOARD, INSULATION BOARD OR PLASTERBOARD)
FOREST PRODUCTS II	2439120	STRUCTURAL BEAMS, GIRDERS, JOISTS, PURLINS OR RAFTERS, LAMINATED OR BUILT-UP WOOD INCLUDING NECESSARY IRON HARDWARE FOR ASSEMBLY, OTHER THAN TREATED
FOREST PRODUCTS II	2439140	ORIENTED STRAND STRUCTURAL LUMBER
FOREST PRODUCTS II	2439150	TREATED STRUCTURAL BEAMS, GIRDERS, JOISTS, PURLINS OR RAFTERS, LAMINATED OR BUILT-UP WOOD INCLUDING NECESSARY IRON HARDWARE FOR ASSEMBLY
FOREST PRODUCTS II	2441193	CRATES, SHIPPING, NEC
FOREST PRODUCTS II	2441969	BOX, CRATE OR SHIPPING DRUM MATERIAL, WOODEN, OR WOODEN, FIBREBOARD OR PAPER COVERED, NEC
FOREST PRODUCTS II	2491125	POLES OR STAKES, PLANT, WOODEN, IN THE ROUGH OR ROUGH TURNED, CREOSOTED OR OTHERWISE PRESERVATIVELY TREATED
FOREST PRODUCTS II	2491127	POLES, WOODEN, NEC, IN THE ROUGH OR ROUGH TURNED, CREOSOTED OR TREATED
FOREST PRODUCTS II	2491128	POLES, TELEGRAPH OR TELEPHONE, WOODEN, CREOSOTED OR TREATED
FOREST PRODUCTS II	2491185	PILING, WOODEN, CREOSOTED OR TREATED
FOREST PRODUCTS II	2491210	RAILROAD TIES, WOODEN, CREOSOTED OR TREATED
FOREST PRODUCTS II	2491215	RAILROAD CROSSING SECTIONS, WOODEN, CREOSOTED, VIZ. 2 OR MORE PIECES OF LUMBER, TIES OR TIMBERS, BOLTED OR DOWELED TOGETHER, FLAT
FOREST PRODUCTS II	2491310	LUMBER, ROUGH OR DRESSED, CREOSOTED OR OTHERWISE CHEMICALLY OR PRESERVATIVELY TREATED
FOREST PRODUCTS II	2498115	POLES, WOODEN, NEC, FURTHER FINISHED THAN IN THE ROUGH OR ROUGH TURNED
FOREST PRODUCTS II	2499210	PALLETS, PLATFORMS OR SKIDS, FOR LIFT TRUCKS, WOOD OR IRON AND WOOD, NEW
FOREST PRODUCTS II	2499215	PALLETS, BRICK, OR CEMENT OR CONCRETE BLOCK OR CONCRETE SEWER PIPE, WOODEN
FOREST PRODUCTS II	2499238	SECTIONS, RAILROAD CROSSING, WOOD, NOT CREOSOTED, CONSISTING OF 2 OR MORE PIECES OF LUMBER, TIES OR TIMBERS, BOLTED OR DOWELED TOGETHER
FOREST PRODUCTS II	2499266	PALLETS, SHIPPING, MOLDED WOOD FIBRE AND ASPHALTIC COMPOUND BINDER
FOREST PRODUCTS II	2499330	BOARD, BUILDING, BUILDING INSULATION OR WALLBOARD, HARDBOARD, SOLID, IN SQUARE OR RECTANGULAR SHAPES, NOT BENT, FACED WITH PLASTIC SHEET OR FILM
FOREST PRODUCTS II	2499615	WOOD PARTICLEBOARD, CONSISTING OF BOARDS OR SHEETS, SAWDUST OR GROUND WOOD, COMPRESSED, BACKED OR FACED WITH CLOTH, PLASTIC, RESIN COATED OR IMPREGNATED PAPER, FIBREBOARD OR PULPBOARD, OR FIBREBOARD WALLBOARD
FOREST PRODUCTS II	2499715	FENCING, WOOD AND WIRE COMBINED
FOREST PRODUCTS II	2499720	FENCING, WOODEN, IN SECTIONS

FOREST PRODUCTS II	2499735	FENCE PICKETS, WOODEN
FOREST PRODUCTS II	2499755	FENCE POSTS AND RAILS, WOOD, NOT TREATED
FOREST PRODUCTS II	2499906	SIDING, EXTERIOR, 3/8 INCH OR MORE IN THICKNESS, MADE FROM WOOD CHIPS AND/OR GROUND WOOD OR WOOD FIBRES WITH OR WITHOUT CEMENT AND/OR SILICA MIXTURE, NOT FURTHER FINISHED THAN PRIMED
FOREST PRODUCTS II	2499912	BEE HIVES, WOOD, OR MIXED LOAD WITH HONEY SECTION FRAMES
FOREST PRODUCTS II	2499933	PANELS, FOLDING DOOR, WALL OR PARTITION, OR INTERIOR PARTITIONS, OTHER THAN PORTABLE (FREE STANDING), OR WALLS, CONSTRUCTED WITH WOOD FRAMES AND RIGID FACINGS OF ANY MATERIAL OR COMBINATION OF MATERIALS, CORES OF CELLULAR OR SOLID CONSTRUCTION OR CONSISTING OF INSULATING MATERIALS, EXCEPT COOLING OR FREEZING ROOM PANELS, WALLS OR DOORS
FOREST PRODUCTS II	2499988	WOOD FLOUR (PULVERIZED WOOD OR WOODPULP)
FOREST PRODUCTS II	2611111	RECYCLED BLEACH KRAFT
FOREST PRODUCTS II	2611134	SOFTWOOD WOOD PULP, BALED, NOT SCREENINGS, NOT SCRAP, AND NOT POWDERED. MADE FROM SPECIES TO INCLUDE PINE, SOUTHERN YELLOW PINE, AND OTHER MISC. SOFTWOOD SPECIES.
FOREST PRODUCTS II	2611136	WOODPULP, NORTHERN BLEACHED SOFTWOOD, KRAFT
FOREST PRODUCTS II	2611190	WOOD PULP DERIVED FROM DEINKING OF PAPER
FOREST PRODUCTS II	2611232	SULPHATE BLACK LIQUOR WASTE, FROM THE PRODUCTION OF WOODPULP BY SULPHATE PROCESS, CONSISTING OF 50 PERCENT WATER, 35 PERCENT DISSOLVED WOOD SUBSTANCE AND 15 PERCENT IMPURE SPENT SODIUM COMPOUNDS
FOREST PRODUCTS II	2621125	NEWSPRINT PAPER, OFF-GRADE, NOT SCRAP OR WASTE PAPER, NOT FOR RECYCLING PURPOSES
FOREST PRODUCTS II	2621415	LINING OR WRAPPER PAPER, CRINKLED, NEC
FOREST PRODUCTS II	2621457	WRAPPING PAPER, COMBINED OR COATED WITH RUBBER OR SYNTHETIC PLASTIC
FOREST PRODUCTS II	2621711	CALENDER ROLL PAPER
FOREST PRODUCTS II	2621730	PACKING PAPER, CHEMICALLY TREATED
FOREST PRODUCTS II	2621912	PAPER OR PAPERBOARD, FLOCK COATED OR PRINTED WITH FLOCK
FOREST PRODUCTS II	2621927	PAPER, CREPE TISSUE, NEC, OR CREPE PAPER WADDING
FOREST PRODUCTS II	2621941	PAPER, IMPREGNATED AND COATED WITH RESIN, NOT LAMINATED, NEC
FOREST PRODUCTS II	2621990	PAPER, NEC, NOT PRINTED
FOREST PRODUCTS II	2631114	PULPBOARD, NEC, PAPER OR PULP LINED, LAMINATED OR COMBINED WITH FOIL, ALUMINUM STEEL, OR TIN, NOT CORRUGATED NOR INDENTED
FOREST PRODUCTS II	2631119	PULPBOARD OR FIBREBOARD, PAPER OR PULP LINED OR NOT LINED, CORRUGATED OR INDENTED, EXCLUDING FACED WITH FOIL, EXCLUDING BUILDING WALL OR INSULATING BOARDS, AND EXCLUDING BOX BLANKS, CREASED, CORNER CUT OR SLOTTED AND CUT TO SHAPE
FOREST PRODUCTS II	2646962	CARRIERS, ICE CREAM CONE, DRINKING CUP OR MILK CARTON, PULPBOARD
FOREST PRODUCTS II	2649748	BRACING, BULKHEADS OR DUNNAGE, FREIGHTLOADING, FIBREBOARD, CONSISTING OF FIBREBOARD FACINGS WITH CORE OF FIBREBOARD OR EXPANDED HONEYCOMB FIBREBOARD, WITH OR WITHOUT WOODEN COMPONENTS, IN PANELS
FOREST PRODUCTS II	2651150	BOXES, FIBREBOARD, PAPER OR PULPBOARD, NEC, WITH TOPS OR BOTTOMS OF SAME OR OTHER MATERIALS, BOXES, FIBREBOARD, WITHOUT WOODEN FRAMES (PAPER BOXES), OTHER THAN CORRUGATED, AND BOX FILLERS, PARTITIONS, PLATFORMS OR INTERIOR PACKING FORMS, FIBREBOARD, PAPER OR WOODPULP, OTHER THAN CORRUGATED, IN MIXED LOADS
FOREST PRODUCTS II	2651511	PALLETS, PLATFORMS OR SKIDS, PAPER OR PULPBOARD, SEPARATE OR COMBINED WITH OTHER THAN EXPANDED PLASTIC OR WOOD
FOREST PRODUCTS II	2651525	PALLETS, WOOD AND PAPER COMBINED, CORRUGATED OR WITH END FLANGES
FOREST PRODUCTS II	2661325	WALLBOARD, CORK, FIBERBOARD AND WOOD COMBINED
FOREST PRODUCTS II	2661345	WALLBOARD, FIBREBOARD, PULPBOARD, WOODPULP BOARD OR STRAWBOARD, NOT PAINTED, ENAMELED OR LACQUERED, OR WITH NOT MORE THAN 2 COATS OF PAINT, ENAMEL OR LACQUER

FOREST PRODUCTS II	3071906	PLASTIC LUMBER
FOREST PRODUCTS II	3071987	RAILROAD TIES,PLASTIC
FOREST PRODUCTS II	3271945	FACINGS OR PANELS, BUILDING OR WALL, CAST STONE, FACED WITH STONE AGGREGATE, INSULATED OR NOT INSULATED, REINFORCED
FOREST PRODUCTS II	3275425	GYPSUM PANELS, STRUCTURAL
FOREST PRODUCTS II	3275440	GYPSUM WALLBOARD
FOREST PRODUCTS II	3275450	FACINGS OR PANELS, BUILDING OR WALL, GYPSUM, FACED WITH STONE AGGREGATE, WITH OR WITHOUT SHEET STEEL BACKING
FOREST PRODUCTS II	4023115	REJECT WOODPULP, SCRAP OR WASTE (WOODPULP WHICH HAS BECOME DAMAGED, SOILED OR OTHERWISE RENDERED UNSUITABLE TO BE CLASSIFIED AND MARKETED AS VIRGIN WOODPULP AND HAVING A VALUE LESS THAN VIRGIN WOODPULP)
FOREST PRODUCTS II	4023130	WOOD FIBRE FELT SCRAPS OR CLIPPINGS
FOREST PRODUCTS II	4024116	CORRUGATED CONTAINERS, USED, CONSISTING OF BALED CORRUGATED PULPBOARD HAVING LINERS OF EITHER TEST LINER, JUTE, OR KRAFT. OLD CORRUGATED CONTAINERS (OCC)
FOREST PRODUCTS II	4024120	WASTE PAPER, GROUND, NEC
FOREST PRODUCTS II	4024125	AGRICULTURAL MULCH, CONSISTING OF SHREDDED OR CHOPPED WASTE AND SCRAP PAPER, OR PLANT OR GARDEN MULCH, CONSISTING OF SHREDDED OR CHOPPED WASTE AND SCRAP PAPER
FOREST PRODUCTS II	4024152	FLYLEAF SHAVINGS
GRAIN	113130	BARLEY , FEED, NEC
GRAIN	113210	CORN (NOT POPCORN) OR MAIZE (NOT POPCORN), IN THE EAR, NOT SHELLED, DRIED NOT ORGANICALLY GROWN FREE OF FERTILIZER AND OR PESTICIDE APPLICATIONS
GRAIN	113211	CORN (NOT POPCORN) OR MAIZE (NOT POPCORN), IN THE EAR, NOT SHELLED, DRIED, ORGANICALLY GROWN FREE OF FERTILIZER AND OR PESTICIDE APPLICATIONS
GRAIN	113215	CORN (NOT POPCORN) OR MAIZE (NOT POPCORN), SHELLED, DRIED NOT ORGANICALLY GROWN FREE OF FERTILIZER AND OR PESTICIDE APPLICATIONS
GRAIN	113216	CORN (NOT POPCORN) OR MAIZE (NOT POPCORN), SHELLED, DRIED, ORGANICALLY GROWN FREE OF FERTILIZER AND OR PESTICIDE APPLICATIONS
GRAIN	113225	CORN, ORGANICALLY GROWN FREE OF FERTILIZER AND OR PESTICIDE APPLICATIONS
GRAIN	113230	CORN, NOT APPROVED FOR FOOD USE NOT ORGANICALLY GROWN FREE OF FERTILIZER AND OR PESTICIDE APPLICATIONS
GRAIN	113231	CORN, NOT APPROVED FOR FOOD USE, ORGANICALLY GROWN FREE OF FERTILIZER AND OR PESTICIDE APPLICATIONS
GRAIN	113240	CORN(NOT POPCORN) OR MAIZE, SHELLED, DRIED, AGRISURE BRAND
GRAIN	113256	WHITE CORN (NOT POPCORN) OR MAIZE BLANCO, GENETICA LLY MODIFIED, FOR HUMAN C ONSUMPTION EX. DOUGH AND TORTILLAS
GRAIN	113310	OATS
GRAIN	113330	OATS, FEED, NEC
GRAIN	113510	RYE
GRAIN	113530	RYE, FEED, NEC

INDUSTRIAL CHEMICALS	2815111	CARBOLIC ACID (PHENOL)
INDUSTRIAL CHEMICALS	2815112	ANILINE (AMINOBENZENE, ANILINE OIL OR PHENYLAMINE)
INDUSTRIAL CHEMICALS	2815119	CHLOROBENZENE (CHLOROBENZOL) OR MONOCHLOROBENZENE (MONOCHLOROBENZOL)
INDUSTRIAL CHEMICALS	2815121	CRESYLIC ACID, INCLUDING META, ORTHO OR PARA (CRESOL)
INDUSTRIAL CHEMICALS	2815122	CUMENE
INDUSTRIAL CHEMICALS	2815124	NONYL PHENOL
INDUSTRIAL CHEMICALS	2815127	METHYLENE DIPHENYL DIISOCYANATE
INDUSTRIAL CHEMICALS	2815130	ISOPHTHALIC ACID (METAPHTHALIC ACID)
INDUSTRIAL CHEMICALS	2815133	BIPHENYL (DIPHENYL)
INDUSTRIAL CHEMICALS	2815134	DIMETHYL TEREPHTHALATE (DMT)
INDUSTRIAL CHEMICALS	2815135	PHTHALIC ANHYDRIDE (ACID PHTHALIC ANHYDRIDE)
INDUSTRIAL CHEMICALS	2815136	DODECYL BENZENE, PENTADECYL BENZENE AND TRIDECYL BENZENE

INDUSTRIAL CHEMICALS	2815139	NAPHTHALENE, OTHER THAN CRUDE (NAPHTHALIN OR TAR CAMPHOR, OTHER THAN CRUDE)
INDUSTRIAL CHEMICALS	2815141	MALEIC ACID OR MALEIC ANHYDRIDE
INDUSTRIAL CHEMICALS	2815142	BENZYL CHLORIDE
INDUSTRIAL CHEMICALS	2815150	XYLIDINE (AMINODIMETHYLBENZENE, AMINOXYLENE OR DIMETHYLANILINE)
INDUSTRIAL CHEMICALS	2815154	PETROLEUM ALKYLATE DETERGENT INTERMEDIATE
INDUSTRIAL CHEMICALS	2815157	PARADICHLOROBENZENE (PARADICHLOROBENZOL)
INDUSTRIAL CHEMICALS	2815158	POLYETHYLBENZENE OR DIETHYLBENZENE OR ETHYLBENZENE
INDUSTRIAL CHEMICALS	2815160	BENZOIC ACID
INDUSTRIAL CHEMICALS	2815161	HEXADECENE
INDUSTRIAL CHEMICALS	2815166	TOLUENE DIISOCYANATE
INDUSTRIAL CHEMICALS	2815170	PICOLINE
INDUSTRIAL CHEMICALS	2815174	TETRAHYDROFURAN
INDUSTRIAL CHEMICALS	2815175	MIXTURE OF BUTYL DIPHENYL METHANE AND BUTYL DIPHENYLETHANE
INDUSTRIAL CHEMICALS	2815177	PARAXYLENE
INDUSTRIAL CHEMICALS	2815179	CYCLOHEXANONE
INDUSTRIAL CHEMICALS	2815180	CYCLOHEXYLAMINE
INDUSTRIAL CHEMICALS	2815182	MELAMINE
INDUSTRIAL CHEMICALS	2815187	DICYCLOPENTADIENE
INDUSTRIAL CHEMICALS	2815190	DYE INTERMEDIATES, NEC
INDUSTRIAL CHEMICALS	2815193	ORTHOXYLENE
INDUSTRIAL CHEMICALS	2815196	STYRENE/ETHYLBENZENE MIXTURE
INDUSTRIAL CHEMICALS	2815197	PARA CUMYLPHENOL
INDUSTRIAL CHEMICALS	2815199	PHENOL, ALKYL
INDUSTRIAL CHEMICALS	2815201	ALPHA METHYL STYRENE
INDUSTRIAL CHEMICALS	2815204	METHYL NAPHTHALENE
INDUSTRIAL CHEMICALS	2815216	DIISOPROPYL BENZENE
INDUSTRIAL CHEMICALS	2815220	METHYLENEDIANILINE OR MDA OR DIAMINODIPHENYLMETHANE
INDUSTRIAL CHEMICALS	2815231	ISOPROPENYLBENZENE
INDUSTRIAL CHEMICALS	2815235	ALKYL BENZENE
INDUSTRIAL CHEMICALS	2815248	POLYOL SURFACTANT OR SURFACE-ACTING AGENT (POLYETHER)
INDUSTRIAL CHEMICALS	2815251	METAXYLENE
INDUSTRIAL CHEMICALS	2815260	TOLUENE DIAMINE
INDUSTRIAL CHEMICALS	2815267	N-METHYL PYRROLIDONE
INDUSTRIAL CHEMICALS	2815285	TOLUENE SOLUTIONS,NEC
INDUSTRIAL CHEMICALS	2815297	XYLENOL
INDUSTRIAL CHEMICALS	2816125	TITANIUM DIOXIDE, NEC
INDUSTRIAL CHEMICALS	2816130	TITANIUM DIOXIDE AND WATER MIXED, CONSISTING OF NOT EXCEEDING 78 PERCENT BY WEIGHT OF TITANIUM DIOXIDE
INDUSTRIAL CHEMICALS	2816340	ZINC OXIDE, DRY
INDUSTRIAL CHEMICALS	2818026	ETHYLENE GLYCOL MONOBUTYL ETHER
INDUSTRIAL CHEMICALS	2818033	DIETHYLENE GLYCOL MONOETHYL ETHER
INDUSTRIAL CHEMICALS	2818034	ETHYLENE GLYCOL MONOPROPYL ETHER
INDUSTRIAL CHEMICALS	2818036	ISOPRENE STILL BOTTOMS
INDUSTRIAL CHEMICALS	2818043	PROPYLENE TETRAMER
INDUSTRIAL CHEMICALS	2818059	ETHYL NITRATE
INDUSTRIAL CHEMICALS	2818065	TRICHLOROSILANE
INDUSTRIAL CHEMICALS	2818066	POLYCAPROLACTAM,DRY
INDUSTRIAL CHEMICALS	2818070	PROPYLENE GLYCOL MONOMETHYL ETHER
INDUSTRIAL CHEMICALS	2818071	PROPYLENE GLYCOL MONOMETHYL ETHER ACETATE
INDUSTRIAL CHEMICALS	2818085	NITROPROPANE
INDUSTRIAL CHEMICALS	2818087	PENTANE-2,4-DIONE
INDUSTRIAL CHEMICALS	2818091	RESIDUAL ACETONE

INDUSTRIAL CHEMICALS	2818092	5-METHYL-2-HEXANONE
INDUSTRIAL CHEMICALS	2818102	ACRYLONITRILE (VINYL CYANIDE) (PROPENENITRILE)
INDUSTRIAL CHEMICALS	2818103	ACETALDEHYDE (ACETIC ALDEHYDE, ALDEHYDE, ETHANAL OR ETHYL ALDEHYDE)
INDUSTRIAL CHEMICALS	2818105	ACETONE, NEC, SYNTHETIC, VIZ. ACETONE (DIMETHYLKETONE, KETOPROPANE, PYROACETIC ETHER, OR 2-PROPANONE)
INDUSTRIAL CHEMICALS	2818106	ETHYLENE AMINES, NEC
INDUSTRIAL CHEMICALS	2818107	ETHYL ACRYLATE
INDUSTRIAL CHEMICALS	2818110	METHYL ACRYLATE
INDUSTRIAL CHEMICALS	2818112	METHYL METHACRYLATE MONOMER
INDUSTRIAL CHEMICALS	2818113	ALLYL CHLORIDE
INDUSTRIAL CHEMICALS	2818115	ACRYLATES, BUTYL, ETHYLHEXYL, HYDROXYETHYL, HYDROXYPROPYL OR ISOBUTYL
INDUSTRIAL CHEMICALS	2818118	BUTYRALDEHYDE
INDUSTRIAL CHEMICALS	2818119	CARBON TETRACHLORIDE
INDUSTRIAL CHEMICALS	2818127	DIETHANOLAMINE, MONOETHANOLAMINE, TRIETHANOLAMINE OR ETHANOLAMINE STILL BOTTOM MIXTURES
INDUSTRIAL CHEMICALS	2818129	DIISOBUTYL KETONE
INDUSTRIAL CHEMICALS	2818130	DIMETHYLAMINE, MONOMETHYLAMINE, TRIMETHYLAMINE OR TRIMETHYLAMINE HYDROCHLORIDE, AQUEOUS
INDUSTRIAL CHEMICALS	2818131	DIMETHYLSULFATE
INDUSTRIAL CHEMICALS	2818132	ADIPONITRILE
INDUSTRIAL CHEMICALS	2818136	ETHYL ACETATE
INDUSTRIAL CHEMICALS	2818137	ETHYL CHLORIDE
INDUSTRIAL CHEMICALS	2818140	ETHYLENE DICHLORIDE
INDUSTRIAL CHEMICALS	2818141	METHYL-N-AMYLKETONE
INDUSTRIAL CHEMICALS	2818144	FORMALDEHYDE, LIQUID OR CONCENTRATE
INDUSTRIAL CHEMICALS	2818148	ETHYLAMINES, VIZ. DIETHYLAMINE, MONOETHYLAMINE OR TRIETHYLAMINE
INDUSTRIAL CHEMICALS	2818149	ISOBUTYL ALDEHYDE (ISOBUTYRALDEHYDE)
INDUSTRIAL CHEMICALS	2818150	METHYL BUTYL KETONE, METHYL ETHYL KETONE, METHYL ISOBUTYL KETONE, METHYLPROPYL KETONE, ETHYL AMYL KETONE OR MESITYL OXIDE
INDUSTRIAL CHEMICALS	2818151	METHYL CHLOROFORM OR TRICHLOROETHANE
INDUSTRIAL CHEMICALS	2818153	METHYLENE CHLORIDE (DICHLOROMETHANE OR METHYLENE BICHLORIDE)
INDUSTRIAL CHEMICALS	2818155	HEXAMETHYLENEDIAMINE, ANHYDROUS
INDUSTRIAL CHEMICALS	2818157	HYDROXYALKYL TRIAZINE
INDUSTRIAL CHEMICALS	2818158	PROPYL ALDEHYDE
INDUSTRIAL CHEMICALS	2818159	PROPYLENE DICHLORIDE
INDUSTRIAL CHEMICALS	2818161	ETHYLENEDIAMINE (1, 2DIAMINOETHANE)
INDUSTRIAL CHEMICALS	2818162	DIETHYL KETONE
INDUSTRIAL CHEMICALS	2818163	ACETONITRILE, CRUDE
INDUSTRIAL CHEMICALS	2818164	GLYCOL ETHERS, NEC
INDUSTRIAL CHEMICALS	2818166	DIMETHYL SULPHIDE
INDUSTRIAL CHEMICALS	2818169	HEXAMETHYLENEDIAMINE (1, 6-DIAMINOHEXANE OR 1, 6-HEXANEDIAMINE) SOLUTION
INDUSTRIAL CHEMICALS	2818172	DIMETHYLETHYLAMINE
INDUSTRIAL CHEMICALS	2818173	ACETONITRILE (METHYL CYANIDE)
INDUSTRIAL CHEMICALS	2818181	PERCHLOROETHYLENE
INDUSTRIAL CHEMICALS	2818190	CHLOROFORM (TRICHLOROMETHANE), NEC, OTHER THAN TECHNICAL GRADE
INDUSTRIAL CHEMICALS	2818191	BUTYLAMINE, SECONDARY (SEC) OR TERTIARY (TERT)
INDUSTRIAL CHEMICALS	2818194	DIISOBUTYLENE
INDUSTRIAL CHEMICALS	2818195	ISOPRENE
INDUSTRIAL CHEMICALS	2818196	ISOPROPYLAMINES, VIZ. DIISOPROPYLAMINE OR MONOISOPROPYLAMINE
INDUSTRIAL CHEMICALS	2818199	CHLOROFORM (TRICHLOROMETHANE), NEC, TECHNICAL GRADE
INDUSTRIAL CHEMICALS	2818201	BUTYLDIETHANOLAMINE
INDUSTRIAL CHEMICALS	2818204	DI-N-BUTYLAMINE

INDUSTRIAL CHEMICALS	2818210	ACRYLAMIDE SOLUTION
INDUSTRIAL CHEMICALS	2818212	AMINOETHYLETHANOLAMINE
INDUSTRIAL CHEMICALS	2818217	CAPROLACTAM (2OXOHEXAMETHYLENIMINE)
INDUSTRIAL CHEMICALS	2818219	DIETHYLAMINOETHANOL
INDUSTRIAL CHEMICALS	2818221	DIMETHYL FORMAMIDE
INDUSTRIAL CHEMICALS	2818222	DIETHYLENETRIAMINE
INDUSTRIAL CHEMICALS	2818223	DIETHYLHYDROXYLAMINE
INDUSTRIAL CHEMICALS	2818226	DIMETHYLAMINOETHANOL OR DIMETHYLETHANOLAMINE
INDUSTRIAL CHEMICALS	2818233	TRIMETHYLPENTANEDIOL
INDUSTRIAL CHEMICALS	2818237	ETHYL HEXALDEHYDE
INDUSTRIAL CHEMICALS	2818239	ETHYLENE OXIDE
INDUSTRIAL CHEMICALS	2818243	HEXANEDIOL
INDUSTRIAL CHEMICALS	2818247	ISOBUTYL ISOBUTYRATE
INDUSTRIAL CHEMICALS	2818248	PROPIONITRILE
INDUSTRIAL CHEMICALS	2818249	ISOPROPYL ETHER (DIISOPROPYL ETHER)
INDUSTRIAL CHEMICALS	2818252	PROPIONIC ANHYDRIDE
INDUSTRIAL CHEMICALS	2818255	POLYOXYPROPYLENE ETHER (GLYCEROL TRI ETHER)
INDUSTRIAL CHEMICALS	2818256	METHYLDIETHANOLAMINE
INDUSTRIAL CHEMICALS	2818257	BUTYLENE OXIDE
INDUSTRIAL CHEMICALS	2818259	HEXAMETHYL DISILAZANE
INDUSTRIAL CHEMICALS	2818265	PROPYLENE OXIDE
INDUSTRIAL CHEMICALS	2818271	METHYL TERTIARY BUTYL ETHER
INDUSTRIAL CHEMICALS	2818273	TETRAETHYLENEPENTAMINE
INDUSTRIAL CHEMICALS	2818275	TRIETHYLENETETRAMINE
INDUSTRIAL CHEMICALS	2818276	VINYLIDENE CHLORIDE, INHIBITED
INDUSTRIAL CHEMICALS	2818280	VINYL METHYL ETHER (METHYL VINYL ETHER OR MVE)
INDUSTRIAL CHEMICALS	2818283	METHYLTRICHLOROSILANE
INDUSTRIAL CHEMICALS	2818289	ISOPROPYLAMINOETHANOL
INDUSTRIAL CHEMICALS	2818292	METHYLMERCAPTOPROPIONALDE HYDE
INDUSTRIAL CHEMICALS	2818294	LAURYL METHACRYLATE
INDUSTRIAL CHEMICALS	2818302	TERTIARY AMINES, NEC
INDUSTRIAL CHEMICALS	2818307	AMINOETHYLPIPERAZINE
INDUSTRIAL CHEMICALS	2818313	ETHYLENE CARBONATE
INDUSTRIAL CHEMICALS	2818322	PHTHALATES, DIBUTYL OR BUTYL, DIETHYL OR DIMETHYL
INDUSTRIAL CHEMICALS	2818323	BIS PHENOL-A (BISPHENOLISOPROPYLIDENE, ISOPROPYLIDENEBISPHENOL OR PARA, PARAISOPROPYLIDENEDIPHENOL)
INDUSTRIAL CHEMICALS	2818340	PENTACHLOROPHENOL
INDUSTRIAL CHEMICALS	2818342	STYRENE, LIQUID
INDUSTRIAL CHEMICALS	2818356	METHOXYDIHYDROPYRAN
INDUSTRIAL CHEMICALS	2818360	PHTHALATES, BUTYL BENZYL, BUTYL OCTYL, DIALLYL, DIBUTOXYETHYL, DICARBITOL, DICYCLOHEXYL, DIDECYL, DIISODECYL, DIISOOCTYL, DIMETHOXYETHYL, DI-N-OCTYL, DIOCTYL OR 2-ETHYL HEXYL, DIOCTYL HEXAHYDRO, ISODECYL OCTYL, OR OCTYL DECYL
INDUSTRIAL CHEMICALS	2818361	A COLORLESS CHEMICAL LIQUID, USED AS AN INTERMEDIATE OR COMONOMER IN THE PRODUCTION OF PAINTS, ADHESIVES AND FILMS, USED AS A REACTIVE PLASTICIZER AND IN COSMETICS, SURFACTANTS AND PHARMACEUTICAL COMPOSITIONS.
INDUSTRIAL CHEMICALS	2818364	PIPERAZINE
INDUSTRIAL CHEMICALS	2818368	FURFURAL (FURFORAL, ARTIFICIAL ANT OIL, PYROMUCIC ALDEHYDE OR FURFURALDEHYDE)
INDUSTRIAL CHEMICALS	2818370	CYCLOHEXANE
INDUSTRIAL CHEMICALS	2818381	METHYLCYCLOHEXANE
INDUSTRIAL CHEMICALS	2818385	MORPHOLINE

INDUSTRIAL CHEMICALS	2818408	ETHANOL SOLUTIONS,NEC NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818409	SPECIALTY DENATURED ALCOHOL
INDUSTRIAL CHEMICALS	2818410	ALLYL ALCOHOL (AA, PROPENYL OR 2-PROPEN1-OL) OR METHALLYL ALCOHOL NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818413	AMYL ALCOHOLS, FLAMMABLE, ACTIVE PRIMARY AMYL ALCOHOL (SEC-BUTYL CARBINOL OR 2 METHYL-1BUTANOL), ACTIVE SEC-AMYL ALCOHOL (METHYL PROPYL CARBINOL OR 2PENTANOL), N-SEC-AMYL ALCOHOL (DIETHYL CARBINOL, 1ETHYL-1-PROPANOL OR 3-PENTANOL), PRIMARY N-AMYL ALCOHOL (N-BUTYL CARBINOL OR 1-PENTANOL), OR TERT-AMYL ALCOHOL (AMYLENE HYDRATE, DIMETHYL ETHYL CARBINOL, TERT-PENTANOL OR 2 METHYL-2-BUTANOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818415	ANTI-FREEZE ALCOHOLS NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818416	BUTYL ALCOHOLS, VIZ. N-BUTYL ALCOHOL (BUTYRIC ALCOHOL OR 1-BUTANOL), SECBUTYL ALCOHOL (METHYLETHYLCARBINOL OR 2BUTANOL) OR TERT-BUTYL ALCOHOL (TRIMETHYLCARBINOL OR 2-METHYL-2 PROPANOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818418	DECYL ALCOHOL, OTHER THAN PERFUMERY GRADE VIZ. N-DECYL ALCOHOL (ALCOHOL C-10 OR 1-DECANOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818422	FURFURYL ALCOHOL (FURYL CARBINOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818424	HEXYL ALCOHOL, OTHER THAN PERFUMERY GRADE (AMYL CARBINOL OR 1-HEXANOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818425	ISOBUTYL ALCOHOL (ISOBUTANOL, ISOPROPYLCARBINOL OR 2-METHYLPROPANOL-1) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818426	METHANOL (METHYL OR WOOD ALCOHOL), LIQUID NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818427	OCTYL ALCOHOL (2-ETHYLHEXANOL, OR 2ETHYLHEXYL ALCOHOL), ISOOCTYL ALCOHOL, PRIMARY NORMAL OCTYL ALCOHOL (ALCOHOL C-8, CAPRYL ALCOHOL, CAPRYLIC ALCOHOL, HEPTYL CARBINOL, OCTOIC ALCOHOL, OCTYLIC ALCOHOL OR 1-OCTANOL) OR SEC-NORMAL OCTYL ALCOHOL (INACTIVE SECONDARY CAPRYL ALCOHOL, METHYLHEXYLCARBINOL OR 2-OCTANOL), OTHER THAN PERFUMERY GRADE NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818428	OCTYL ALCOHOL (2-ETHYLHEXANOL, OR 2ETHYLHEXYL ALCOHOL), ISOOCTYL ALCOHOL, PRIMARY NORMAL OCTYL ALCOHOL (ALCOHOL C-8, CAPRYL ALCOHOL, CAPRYLIC ALCOHOL, HEPTYL CARBINOL, OCTOIC ALCOHOL, OCTYLIC ALCOHOL OR 1-OCTANOL) OR SEC-NORMAL OCTYL ALCOHOL (INACTIVE SECONDARY CAPRYL ALCOHOL, METHYLHEXYLCARBINOL OR 2-OCTANOL), PERFUMERY GRADE NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818429	PROPYL ALCOHOL (N-PROPYL ALCOHOL OR 1PROPANOL) OR ISOPROPYL ALCOHOL (DIMETHYLCARBINOL, IPA, ISOPROPANOL, SECPROPYL ALCOHOL OR 2-PROPANOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818430	TETRAHYDROFURFURYL ALCOHOL (TETRAHYDROFURYL CARBINOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818431	TRIDECYL ALCOHOL (TRIDECANOL), OTHER THAN PERFUMERY GRADE NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818432	2-ETHYLHEXYL METHACRYLATE
INDUSTRIAL CHEMICALS	2818442	DIISOBUTYL CARBINOL NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818443	METHYL ISOBUTYL CARBINOL NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818456	ISOPROPANOL SOLUTIONS, NEC NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818457	HEXANOLS NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818458	METHANOL, CONTAMINATED, HAVING VALUE ONLY FOR REFINING NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818463	MIXTURE OF METHANOL AND ACETONE NOT FIT FOR HUMAN CONSUMPTION

INDUSTRIAL CHEMICALS	2818470	LAURYL ALCOHOL (ALCOHOL C-12, N-DODECANOL OR N-DODECYL ALCOHOL) NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818471	PROPANOL SOLUTIONS,NEC NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818480	ISO NONYL ALCOHOL NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818490	ALCOHOLS, NEC, OTHER THAN ALCOHOLIC LIQUORS NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818491	FATTY ALCOHOLS, ANIMAL FAT OR ANIMAL, FISH, PETROLEUM, SEA-ANIMAL OR VEGETABLE OILS, NEC, INEDIBLE, WHEN BLENDED WITH EACH OTHER, LIQUID OR SOLIDIFIED NOT FIT FOR HUMAN CONSUMPTION
INDUSTRIAL CHEMICALS	2818510	GLYCERINE, CRUDE (SPENT LYE) CONCENTRATED OR CRUDE GLYCERINE, OTHER THAN SPENT LYE
INDUSTRIAL CHEMICALS	2818512	PROPANEDIOL, BIO-PDO (TM) LIQUID MADE FROM CORN SUGAR
INDUSTRIAL CHEMICALS	2818515	GLYCERINE, CRUDE (SPENT LYE), NOT CONCENTRATED
INDUSTRIAL CHEMICALS	2818520	GLYCERINE, OTHER THAN CRUDE
INDUSTRIAL CHEMICALS	2818540	BUTYLENE GLYCOLS, VIZ. 1, 3-BUTYLENE GLYCOL (1, 3-BUTANEDIOL), 1, 4BUTYLENE GLYCOL (1, 4-BUTANEDIOL OR TETRAMETHYLENE GLYCOL) OR 2, 3-BUTYLENE GLYCOL (PSEUDOBUTYLENE GLYCOL, SYM-DIMETHYLETHYLENE GLYCOL, 2, 3-BUTANEDIOL OR 2, 3-DIHYDROXYBUTANE)
INDUSTRIAL CHEMICALS	2818542	DIETHYLENE GLYCOL (DIHYDROXY-DI-ETHYL ETHER)
INDUSTRIAL CHEMICALS	2818543	TRIPROPYLENE GLYCOL
INDUSTRIAL CHEMICALS	2818544	DIPROPYLENE GLYCOL
INDUSTRIAL CHEMICALS	2818545	ETHYLENE GLYCOL, USED OR RECOVERED, SUITABLE ONLY FOR FURTHER REFINING
INDUSTRIAL CHEMICALS	2818546	ETHYLENE GLYCOL (ETHYLENE ALCOHOL OR GLYCOL)
INDUSTRIAL CHEMICALS	2818547	GLYCOL BOTTOMS
INDUSTRIAL CHEMICALS	2818548	HEXYLENE GLYCOL (4-PENTANEDIOL OR 2-METHYL-2)
INDUSTRIAL CHEMICALS	2818549	ETHYLENE GLYCOL, BY-PRODUCT, CONTAINING NOT MORE THAN 10% METHANOL
INDUSTRIAL CHEMICALS	2818550	METHOXYPOLYETHYLENE GLYCOLS
INDUSTRIAL CHEMICALS	2818551	MIXED GLYCOLS AND MONOMER
INDUSTRIAL CHEMICALS	2818552	NEOPENTYL GLYCOL (3-PENTANEDIOL OR 2, 2-DIMETHYL-1)
INDUSTRIAL CHEMICALS	2818554	POLYETHYLENE GLYCOL
INDUSTRIAL CHEMICALS	2818555	POLYPROPYLENE GLYCOL
INDUSTRIAL CHEMICALS	2818556	PROPYLENE GLYCOL (METHYL GLYCOL, METHYLETHYLENE GLYCOL, 1, 2-DIHYDROXYPROPANE, 1, 2-PROPANEDIOL OR TRIMETHYL GLYCOL)
INDUSTRIAL CHEMICALS	2818557	POLYTETRAMETHYLENE GLYCOL
INDUSTRIAL CHEMICALS	2818558	TRIETHYLENE GLYCOL (TEG)
INDUSTRIAL CHEMICALS	2818565	POLYGLYCOLS, NEC
INDUSTRIAL CHEMICALS	2818601	SODIUM ACETATE,CRUDE
INDUSTRIAL CHEMICALS	2818602	SODIUM ACETATE,OTHER THAN CRUDE
INDUSTRIAL CHEMICALS	2818610	ACETIC ACID, GLACIAL OR LIQUID
INDUSTRIAL CHEMICALS	2818613	POTASSIUM ACETATE, LIQUID
INDUSTRIAL CHEMICALS	2818616	FORMIC ACID
INDUSTRIAL CHEMICALS	2818621	ACID, GLACIAL METHACRYLIC
INDUSTRIAL CHEMICALS	2818622	ACID, LACTIC (ALPHAHYDROXYPROPIONIC) (MILK)
INDUSTRIAL CHEMICALS	2818626	ACID, CHLOROACETIC (CHLOR-ACETIC OR MONOCHLOROACETIC)
INDUSTRIAL CHEMICALS	2818632	METHYL ACETOACETATE
INDUSTRIAL CHEMICALS	2818634	ACID, PROPIONIC (METHYLACETIC OR PROPANOIC)
INDUSTRIAL CHEMICALS	2818637	ACID, ETHYL HEXOIC
INDUSTRIAL CHEMICALS	2818641	SODIUM XYLENE SULFONATE SOLUTION
INDUSTRIAL CHEMICALS	2818644	ACETIC ANHYDRIDE (ACETIC OR ACETYL OXIDE)
INDUSTRIAL CHEMICALS	2818645	CITRIC ACID SOLUTION, NOT EXCEEDING 50% CITRIC ACID
INDUSTRIAL CHEMICALS	2818646	AMYL ACETATE
INDUSTRIAL CHEMICALS	2818647	BUTYL ACETATE, SECONDARY
INDUSTRIAL CHEMICALS	2818649	SODIUM NAPHTHALENE SULFONATE SOLUTION

INDUSTRIAL CHEMICALS	2818652	BUTYL ACETATE
INDUSTRIAL CHEMICALS	2818654	ISOPENTANOIC ACID
INDUSTRIAL CHEMICALS	2818655	TRIMETHYL PENTAINEDIOL MONOISOBUTYRATE
INDUSTRIAL CHEMICALS	2818656	ISOBUTYL ACETATE
INDUSTRIAL CHEMICALS	2818658	ISOPROPYL ACETATE
INDUSTRIAL CHEMICALS	2818660	METHYL ACETATE
INDUSTRIAL CHEMICALS	2818662	ADIPIC ACID (HEXANEDIOIC ACID) (1, 4BUTANEDICARBOXYLIC ACID)
INDUSTRIAL CHEMICALS	2818663	PELARGONIC ACID, SYNTHETIC
INDUSTRIAL CHEMICALS	2818664	PROPYL ACETATE
INDUSTRIAL CHEMICALS	2818668	VINYL ACETATE
INDUSTRIAL CHEMICALS	2818671	TEREPHTHALIC ACID (BENZENE-PARA-DICARBOXYLIC OR PARA-PHTHALIC ACID, OR TEREPHTHALIC ANHYDRIDE)
INDUSTRIAL CHEMICALS	2818672	BUTYRIC ACID
INDUSTRIAL CHEMICALS	2818675	ISOBUTYRIC ACID
INDUSTRIAL CHEMICALS	2818686	ACID, NEO-DECANOIC (NEO-CAPRIC, NEODECATOIC, NEO-DECOIC OR NEODECYLIC)
INDUSTRIAL CHEMICALS	2818690	ACID, NEC, DRY, ORGANIC
INDUSTRIAL CHEMICALS	2818691	ACID, NEC, LIQUID, ORGANIC
INDUSTRIAL CHEMICALS	2818692	ACRYLIC ACID
INDUSTRIAL CHEMICALS	2818702	UREA FORMALDEHYDE CONCENTRATE
INDUSTRIAL CHEMICALS	2818711	ALKYLATED DIPHENYLAMINES
INDUSTRIAL CHEMICALS	2818720	ETHOXYLATED POLYAMINES
INDUSTRIAL CHEMICALS	2818830	CHLOROPICRIN
INDUSTRIAL CHEMICALS	2818915	ACETONE CYANOHYDRIN
INDUSTRIAL CHEMICALS	2818926	DETERGENT INTERMEDIATES, OTHER THAN CYCLIC OR PETROLEUM
INDUSTRIAL CHEMICALS	2818930	MERCAPTANS, PETROLEUM
INDUSTRIAL CHEMICALS	2818947	METHYL CHLORIDE
INDUSTRIAL CHEMICALS	2818960	BUTADIENE FROM ALCOHOL
INDUSTRIAL CHEMICALS	2818961	CARBON DISULPHIDE
INDUSTRIAL CHEMICALS	2818965	DIISOPROPANOLAMINE, DI-TRIISOPROPANOLAMINE, MONOISOPROPANOLAMINE OR ISOPROPANOLAMINE STILL BOTTOM MIXTURES
INDUSTRIAL CHEMICALS	2818967	PLASTICIZERS, PAINT, LACQUER, VARNISH, GUM, PLASTIC, RESIN OR ADHESIVE
INDUSTRIAL CHEMICALS	2818990	ORGANIC SODIUM SALTS
INDUSTRIAL CHEMICALS	2818995	METHYLGLUTARONITRILE (MGN), REFINED
INDUSTRIAL CHEMICALS	2819060	SODIUM AND CALCIUM SALTS OF POLY-NAPHTHALENE SULPHONIC ACID, LIQUID AND POWDER
INDUSTRIAL CHEMICALS	2819086	SODIUM METASILICATE
INDUSTRIAL CHEMICALS	2819114	AMMONIUM BISULFITE SOLUTION
INDUSTRIAL CHEMICALS	2819129	AMMONIUM FLUORIDE
INDUSTRIAL CHEMICALS	2819181	AMMONIA COMPOUNDS, ORGANIC
INDUSTRIAL CHEMICALS	2819210	NITRATING ACID (MIXED NITRIC AND SULPHURIC)
INDUSTRIAL CHEMICALS	2819215	NITRIC ACID
INDUSTRIAL CHEMICALS	2819314	SULFURIC ACID, LESS THAN 93% CONCENTRATION
INDUSTRIAL CHEMICALS	2819325	SULPHUR TRIOXIDE, STABILIZED
INDUSTRIAL CHEMICALS	2819415	PHOSPHORUS CHLORIDE OR TRICHLORIDE
INDUSTRIAL CHEMICALS	2819418	BORIC ACID (BORACIC)
INDUSTRIAL CHEMICALS	2819422	CHLOROSULFONIC ACID
INDUSTRIAL CHEMICALS	2819423	PHOSPHORUS PENTASULFIDE
INDUSTRIAL CHEMICALS	2819432	HYDROBROMIC ACID, NOT MORE THAN 49 PERCENT STRENGTH
INDUSTRIAL CHEMICALS	2819434	HYDROCYANIC ACID
INDUSTRIAL CHEMICALS	2819438	HYDROFLUORIC ACID
INDUSTRIAL CHEMICALS	2819446	HYDROFLUOROSILICIC ACID
INDUSTRIAL CHEMICALS	2819450	MURIATIC (HYDROCHLORIC) ACID
INDUSTRIAL CHEMICALS	2819462	PHOSPHORUS, NEC

INDUSTRIAL CHEMICALS	2819484	HYDROGEN FLUORIDE ANHYDROUS
INDUSTRIAL CHEMICALS	2819491	ACIDS, INORGANIC, NEC, LIQUID
INDUSTRIAL CHEMICALS	2819522	IRON CHLORIDE (IRON MURIATE), OTHER THAN CRUDE, LIQUID
INDUSTRIAL CHEMICALS	2819523	IRON CHLORIDE, CRUDE, LIQUID, NOT LESS THAN 50 PERCENT WATER
INDUSTRIAL CHEMICALS	2819529	IRON SULPHATE (FERRIC SULPHATE), OTHER THAN DRY (FERRIC SULPHATE SOLUTION)
INDUSTRIAL CHEMICALS	2819530	IRON SULPHATE (FERROUS SULPHATE) (COPPERAS)
INDUSTRIAL CHEMICALS	2819537	AMMONIUM CHLORIDE, ZINC
INDUSTRIAL CHEMICALS	2819538	ZINC BORATE, DRY
INDUSTRIAL CHEMICALS	2819539	ZINC CARBONATE
INDUSTRIAL CHEMICALS	2819542	ZINC CHLORIDE, LIQUID
INDUSTRIAL CHEMICALS	2819551	ZINC SULPHATE, IN SOLUTION
INDUSTRIAL CHEMICALS	2819602	ALUMINUM ALKYLS,NEC
INDUSTRIAL CHEMICALS	2819620	ALUMINA OXIDE CERIA CATALYST
INDUSTRIAL CHEMICALS	2819626	POLYALUMINUM CHLORIDE SOLUTION
INDUSTRIAL CHEMICALS	2819631	ALUMINUM CHLORIDE, LIQUID
INDUSTRIAL CHEMICALS	2819633	ALUMINUM CHLOROHYDRATE SOLUTION
INDUSTRIAL CHEMICALS	2819655	ALUMINUM SULPHATE (SULPHATE OF ALUMINA), OR PAPER MAKERS ALUM, LIQUID
INDUSTRIAL CHEMICALS	2819667	CRYOLITE
INDUSTRIAL CHEMICALS	2819674	SODIUM ALUMINATE
INDUSTRIAL CHEMICALS	2819901	METALLIC SODIUM
INDUSTRIAL CHEMICALS	2819905	POTASSIUM SILICATE, OTHER THAN DRY
INDUSTRIAL CHEMICALS	2819924	SODIUM CHLORATE
INDUSTRIAL CHEMICALS	2819926	CHROMIUM SULPHATE, BASIC, DRY
INDUSTRIAL CHEMICALS	2819930	LITHIUM CHLORIDE BRINE
INDUSTRIAL CHEMICALS	2819931	HYDROGEN PEROXIDE (HYDROGEN DIOXIDE)
INDUSTRIAL CHEMICALS	2819957	SILICON CHLORIDE OR TETRACHLORIDE, SILICON
INDUSTRIAL CHEMICALS	2819959	STRONTIUM CARBONATE
INDUSTRIAL CHEMICALS	2819971	TITANIUM TETRACHLORIDE
INDUSTRIAL CHEMICALS	2819974	SODIUM SILICATE, DRY
INDUSTRIAL CHEMICALS	2819986	SILICA (SILICON DIOXIDE), COLLOIDAL, IN SOLUTION
INDUSTRIAL CHEMICALS	2819990	SODIUM SALTS, NEC
INDUSTRIAL CHEMICALS	2819992	SODIUM SILICATE, OTHER THAN DRY (SILICATE SOLUTION), INCLUDING MECHANICAL MIXTURES OF SILICATE OF SODA AND CLAY
INDUSTRIAL CHEMICALS	2819993	SODIUM SILICO ALUMINATE OR SODIUMCALCIUM SILICO ALUMINATE
INDUSTRIAL CHEMICALS	2819995	SODIUM BICHROMATE SOLUTION
INDUSTRIAL CHEMICALS	2819996	RARE EARTH CHLORIDE SOLUTION
INDUSTRIAL CHEMICALS	2819997	SULPHUR DIOXIDE (SULPHUROUS ACID ANHYDRIDE)
INDUSTRIAL CHEMICALS	2819998	THIOSULFATE SOLUTION
INDUSTRIAL CHEMICALS	2821245	LATEX (LIQUID RUBBER), SYNTHETIC
INDUSTRIAL CHEMICALS	2841920	COMPOUNDS, CLEANING, SCOURING OR WASHING, NEC, LIQUID
INDUSTRIAL CHEMICALS	2841990	SOAP, NEC, LIQUID
INDUSTRIAL CHEMICALS	2841993	SOAP STOCK, NEC
INDUSTRIAL CHEMICALS	2842280	TYPE CLEANING COMPOUNDS, LIQUID
INDUSTRIAL CHEMICALS	2843102	AMINES,FATTY,ETHOXYLATED
INDUSTRIAL CHEMICALS	2843122	MONO, DI-ALKYLATED, AND M ONO AND DI-SULFONATED DIP HENYL OXIDES
INDUSTRIAL CHEMICALS	2843125	COMPOUNDS, ORGANIC (PRODUCTS OF AMMONIATION OF FATTY ACIDS), VIZ. FATTY AMINE OR DIAMINE ACETATES, OR FATTY AMIDES, AMINES, DIAMINES OR NITRILES, OR FATTY QUATERNARY COMPOUNDS, SUCH AS DIFATTY DIMETHYL OR FATTY TRIMETHYL COMPOUNDS
INDUSTRIAL CHEMICALS	2843126	FATTY ALCOHOLS, ALIPHATIC OR CYCLIC, CYANOETHYLATED OR HYDROGENATED, OR DERIVATIVES THEREOF, SUCH AS SALTS, DIAMINES, OXYALKYLATES OR QUARTERNARY AMMONIUM COMPOUNDS

INDUSTRIAL CHEMICALS	2843127	ALCOHOLS, FATTY OR CYCLIC, ETHOXYLATED AND SULPHATED
INDUSTRIAL CHEMICALS	2843128	ALCOHOLS, FATTY OR CYCLIC, ETHOXYLATED
INDUSTRIAL CHEMICALS	2843129	ETHOXYLATED CYCLIC ALCOHOL AND TRIETHANOLAMINE MIXTURE
INDUSTRIAL CHEMICALS	2843138	FATTY ACID AMIDE OF VEGE-TABLE OILS, INEDIBLE
INDUSTRIAL CHEMICALS	2843152	QUATERNARY AMMONIUM COMPOUNDS
INDUSTRIAL CHEMICALS	2851210	EPICHLOROHYDRIN OR GLYCEROL-DICHLOROHYDRIN
INDUSTRIAL CHEMICALS	2851220	SOLVENTS, ADHESIVE, GUM, LACQUER, PAINT, OTHER THAN SPRAY PAINT, PLASTIC, RESIN OR VARNISH
INDUSTRIAL CHEMICALS	2851250	PAINT RELATED MATERIALS, NEC
INDUSTRIAL CHEMICALS	2851260	PAINT PRESERVING ADDITIVES (BARIUMBORATE COMPOUNDS)
INDUSTRIAL CHEMICALS	2861230	OIL, TALL(LIQUID ROSIN OR TALLOL), OTHER THAN CRUDE, NOT ESTERIFIED, LIQUID OR SOLIDIFIED
INDUSTRIAL CHEMICALS	2861231	PINE OIL
INDUSTRIAL CHEMICALS	2861235	TALL OIL (PRODUCT OF ACIDIFICATION OF SKIMMINGS OF SODA, OR SULPHATE BLACK LIQUOR), CRUDE
INDUSTRIAL CHEMICALS	2861239	ROSIN
INDUSTRIAL CHEMICALS	2861243	ROSIN RESIDUE
INDUSTRIAL CHEMICALS	2861246	PINENE
INDUSTRIAL CHEMICALS	2861248	PINE TAR
INDUSTRIAL CHEMICALS	2861249	BIO-OIL (PYROLYSIS OIL)
INDUSTRIAL CHEMICALS	2861250	ROSIN SOLUTION
INDUSTRIAL CHEMICALS	2861259	ROSIN SIZING, LIQUID
INDUSTRIAL CHEMICALS	2861264	DIPENTENE
INDUSTRIAL CHEMICALS	2861276	PITCH, TALL OIL
INDUSTRIAL CHEMICALS	2861277	TALL OIL HEADS
INDUSTRIAL CHEMICALS	2861278	RESIDUE, TURPENTINE, LIQUID, VIZ. HYDROCARBON RESIDUE OBTAINED AS A BY-PRODUCT IN THE PRODUCTION OF TERPENE HYDROCARBONS FROM TURPENTINE, WITHOUT FURTHER CHEMICAL PROCESSING
INDUSTRIAL CHEMICALS	2861280	ASPHALT ADDITIVE, ANTISTRIPPING
INDUSTRIAL CHEMICALS	2879911	WASTE TREATING BACTERIA, INDUSTRIAL OR SEWAGE
INDUSTRIAL CHEMICALS	2879914	CHLORDANE
INDUSTRIAL CHEMICALS	2879926	DEFOLIANT, FERTILIZER, FUNGICIDE, HERBICIDE, INSECTICIDE OR MITICIDE ADHESIVES, ADJUVANTS, SPREADERS OR STICKERS, DRY OR LIQUID
INDUSTRIAL CHEMICALS	2879934	INSECTICIDES, AGRICULTURAL, NEC, LIQUID
INDUSTRIAL CHEMICALS	2879937	FUNGICIDES, AGRICULTURAL, NEC, LIQUID
INDUSTRIAL CHEMICALS	2879948	SODA ASH AND SULPHUR, FUSED
INDUSTRIAL CHEMICALS	2879956	PYRETHRUM (INSECT FLOWERS OR STEMS)
INDUSTRIAL CHEMICALS	2879958	TREE OR WEED KILLING COMPOUNDS, NEC
INDUSTRIAL CHEMICALS	2879963	HERBICIDES OR PLANT HORMONES, VIZ. 2, 4DICHLOROPHENOXYACETIC ACID (2, 4-D), 2, 4-DICHLOROPHENOXYACETIC ACID (2, 4-D) ESTERS OR AMINE OR SODIUM SALTS, OR 2, 4, 5-TRICHLOROPHENOXYACETIC ACID (2, 4, 5-T) OR 2, 4, 5-TRICHLOROPHENOXYACETIC ACID (2, 4, 5-T) ESTERS OR AMINE OR SODIUM SALTS
INDUSTRIAL CHEMICALS	2879964	NEMATOCIDE, LIQUID, VIZ. DICHLOROPROPENEDICHLOROPR OPANE MIXTURE
INDUSTRIAL CHEMICALS	2879971	SOIL COMPOUNDS, CONTAINING 2 OR MORE OF THE FOLLOWING INGREDIENTS, CARBONATES, IRON OXIDES, CHLORIDES, LIMES, MAGNESIA, MANGANESE, PHOSPHATES, POTASH, SILICATES, SULPHATES, COPPER OXIDE (FERTILIZER GRADE) OR ZINC SOIL COMPOUNDS (FERTILIZER GRADE)
INDUSTRIAL CHEMICALS	2879979	METAM SODIUM
INDUSTRIAL CHEMICALS	2879984	WEED KILLING COMPOUND AND CHLORDANE MIXTURE
INDUSTRIAL CHEMICALS	2879990	DEFOLIANTS, PLANT, NEC
INDUSTRIAL CHEMICALS	2891112	CEMENT MIXING COMPOUNDS
INDUSTRIAL CHEMICALS	2891124	ADHESIVES, NEC, ADHESIVE CEMENTS, NEC, ADHESIVE GLUES, NEC, OR ADHESIVE PASTES, NEC, OR RUBBER CEMENT

INDUSTRIAL CHEMICALS	2891132	COMPOUNDS, CEMENT CLINKER GRINDING, LIQUID
INDUSTRIAL CHEMICALS	2891170	SIZING, NEC
INDUSTRIAL CHEMICALS	2899420	MONOGLYCERIDES, DIGLYCERIDES OR TRIGLYCERIDES OF FAT-FORMING FATTY ACIDS, OR MIXTURES THEREOF, EDIBLE, OTHER THAN SHORTENING
INDUSTRIAL CHEMICALS	2899426	FATTY ACIDS OF TALL OIL
INDUSTRIAL CHEMICALS	2899427	FATTY ACIDS, TALL OIL (LIQUID ROSIN OR TALLOL), NOT ESTERIFIED, LIQUID OR SOLIDIFIED
INDUSTRIAL CHEMICALS	2899463	PETROLEUM FATTY ACIDS
INDUSTRIAL CHEMICALS	2899470	STEARIC ACID
INDUSTRIAL CHEMICALS	2899535	COMPOUNDS, WATER CLARIFYING, HARDENING, PURIFYING, OR SOFTENING, NEC, NOT MEDICATED NOR PERFUMED, LIQUID OR PASTE
INDUSTRIAL CHEMICALS	2899550	COMPOUNDS, WATER TREATING, INDUSTRIAL, LIQUID, CONTAINING FUNGICIDES, BACTERIACIDES, CORROSION INHIBITORS, OR DISPERSANTS
INDUSTRIAL CHEMICALS	2899556	LAUNDRY BLUING, LIQUID
INDUSTRIAL CHEMICALS	2899717	MC 6100134 COMBUSTIBLE LI QUID, N.O.S. (CONTAINS HE AVY AROMATIC PETROLEUM NA PHTHA, NAPHTHALENE), COMB USTIBLE LIQUID, III
INDUSTRIAL CHEMICALS	2899790	CHEMICALS, NEC HAZARD CLASS 3 (FLAMMABLE AND COMBUSTIBLE LIQUIDS
INDUSTRIAL CHEMICALS	2899791	CHEMICALS, NEC HAZARD CLASS 4.1 FLAMMABLE SOLIDS
INDUSTRIAL CHEMICALS	2899792	CHEMICALS, NEC HAZARD CLASS 4.2 DANGEROUS WHEN WET MATERIALS
INDUSTRIAL CHEMICALS	2899793	CHEMICALS, NEC HAZARD CLASS 4.3 SPONTANEOUSLY COMBUSTIBLE MATERIALS
INDUSTRIAL CHEMICALS	2899794	CHEMICALS, NEC HAZARD CLASS 5.1 OXIDIZING MATERIALS
INDUSTRIAL CHEMICALS	2899796	CHEMICALS, NEC HAZARD CLASS 6.1 POISONOUS MATERIALS
INDUSTRIAL CHEMICALS	2899797	CHEMICALS, NEC HAZARD CLASS 8 CORROSIVE MATERIALS
INDUSTRIAL CHEMICALS	2899798	CHEMICALS, NEC HAZARD CLASS 9 MISCELLANEOUS HAZARDOUS MATERIALS
INDUSTRIAL CHEMICALS	2899806	COMPOUNDS, WATERPROOFING, CEMENT, CONCRETE OR MASONRY, DRY
INDUSTRIAL CHEMICALS	2899810	ANTI-FREEZING COMPOUNDS, NEC, DRY OR LIQUID
INDUSTRIAL CHEMICALS	2899828	DEFOAMING COMPOUND, NEC, LIQUID
INDUSTRIAL CHEMICALS	2899832	COMPOUNDS, FIREPROOFING, OR RETARDANTS, FLAME, LIQUID, NEC
INDUSTRIAL CHEMICALS	2899833	POLYACRYLAMIDE, ANIONIC, DRY
INDUSTRIAL CHEMICALS	2899834	POLYACRYLAMIDE-WATER SOLUTION
INDUSTRIAL CHEMICALS	2899837	FOUNDRY CORE COMPOUNDS, NEC, LIQUID
INDUSTRIAL CHEMICALS	2899842	COMPOUNDS, GAS PURIFYING, NEC
INDUSTRIAL CHEMICALS	2899847	COMPOUNDS, ICE ANTISLIPPING AND MELTING
INDUSTRIAL CHEMICALS	2899855	MUD TREATING COMPOUNDS, NEC, GAS OR OIL WELL DRILLING
INDUSTRIAL CHEMICALS	2899868	ELECTRODE BINDER
INDUSTRIAL CHEMICALS	2899869	NICKEL PLATING SOLUTION
INDUSTRIAL CHEMICALS	2899871	COMPOUNDS, RESIN, NOT COMMERCIALLY SUITABLE FOR EXTRUDING OR MOLDING PURPOSES, IN FLAKE, LIQUID, LUMP, POWDER OR SOLID MASS FORM, RESIN CONTENT NOT EXCEEDING 50 PERCENT BY WEIGHT
INDUSTRIAL CHEMICALS	2899877	CARBON, GUM OR SLUDGE REMOVING COMPOUNDS, NEC, DESIGNED TO REMOVE, LOOSEN, SOFTEN OR RETARD THE FORMATION OF CARBON, GUM OR SLUDGE IN INTERNAL COMBUSTION ENGINES
INDUSTRIAL CHEMICALS	2899880	COMPOUNDS, DEFOAMING, EMULSIFIED OIL AND NOT LESS THAN 50% BY WEIGHT OF WATER
INDUSTRIAL CHEMICALS	2899892	NEMATICIDE AND FUNGICIDE, SOLID/LIQUID, TOXIC BY I NHALATION
INDUSTRIAL CHEMICALS	2899895	CHELATING COMPOUND, LIQUID
INDUSTRIAL CHEMICALS	2899896	SODIUM NITRILOTRIACETATE
INDUSTRIAL CHEMICALS	2899898	TECHNICAL OR INTERMEDIATE CHEMICALS USED IN THE PRODUCTION OF HERBICIDES, INSECTICIDES, FUNGICIDES OR NEMATOCIDES
INDUSTRIAL CHEMICALS	2899903	ETHYLHEXYL NITRATE

INDUSTRIAL CHEMICALS	2899915	PROPRIETARY ANTI-FREEZE OR ENGINE COOLANT PREPARATIONS, MADE FROM DENATURED ETHYL ALCOHOL, DIETHYLENE GLYCOL, DIPROPYLENE GLYCOL, ETHYLENE GLYCOL, GLYCOL ETHER, HEXYLENE GLYCOL, METHANOL, OR PROPYLENE GLYCOL
INDUSTRIAL CHEMICALS	2899916	PROPRIETARY DE-ICING PREPARATIONS, CONTAINING ALCOHOLS OR GLYCOLS
INDUSTRIAL CHEMICALS	2899917	HEAT TRANSFER AGENTS OR MEDIA, NEC, CONSISTING OF DIPHENYL AND DIPHENYL OXIDE MIXTURES, ETHYLENE GLYCOL, GLYCOL ETHER, O-DICHLOROBENZENE, PROPYLENE GLYCOL OR SILICATE ESTER
INDUSTRIAL CHEMICALS	2899945	NITROGEN STABILIZER OR INHIBITING AGENT, LIQUID
INDUSTRIAL CHEMICALS	2899951	SODIUM CHLORATE AND SODIUM CHLORIDE, IN WATER SOLUTION, CONSISTING OF NOT EXCEEDING 50 PERCENT BY WEIGHT SODIUM CHLORATE AND SODIUM CHLORIDE
INDUSTRIAL CHEMICALS	2899952	GASOLINE PRESERVATIVE, NEC, LIQUID
INDUSTRIAL CHEMICALS	2899953	TALL OIL PRODUCTS BLENDED, CONSISTING OF 2 OR MORE TALL OIL PRODUCTS, VIZ. CRUDE TALL OIL, TALL OIL ESTERIFIED, NOT FATTY ACID ESTERS, TALL OIL FATTY ACID, NOT ESTERIFIED, TALL OIL FATTY ACID, LIQUID OR SOLIDIFIED, REPLACEMENT OR MODIFIED, TALL OIL, OTHER THAN CRUDE, ACID REFINED OR DISTILLED TALL OIL, TALL OIL HEADS, OR TALL OIL PITCH
INDUSTRIAL CHEMICALS	2899959	PIPERYLENE CONCENTRATE
INDUSTRIAL CHEMICALS	2899973	LUBRICANTS, METAL CUTTING, DRAWING OR DRILLING, OTHER THAN PETROLEUM, NEC
INDUSTRIAL CHEMICALS	2899975	SOLVENT, CONSISTING ONLY OF A MIXTURE OF BENZENE, ETHYLBENZENE, DIETHYLBENZENE, POLYETHYLBENZENE, STYRENE, TOLUENE, ETHYLTOLUENE, VINYLTOLUENE OR XYLENE, SUITABLE ONLY FOR FURTHER REFINING
INDUSTRIAL CHEMICALS	2899980	SALT, BY-PRODUCT FROM MANUFACTURE OF CAUSTIC SODA
INDUSTRIAL CHEMICALS	2899982	STABILIZERS OR EMULSIFIERS, WATER SOLUBLE, NEC
INDUSTRIAL CHEMICALS	2899985	VEGETABLE OILS, NEC, SULPHURIZED OR VULCANIZED, LIQUID OR SOLIDIFIED
INDUSTRIAL CHEMICALS	2899988	FURFURAL RESIDUE (FURFORAL RESIDUE) (ARTI-FICIAL ANT OIL, FURFURAL-DEHYDE OR PYROMUCIC ALDEHYDE RESIDUE)
INDUSTRIAL CHEMICALS	2899990	ACIDS, CHEMICALS AND OTHER ARTICLES, IN MIXED LOADS
INDUSTRIAL CHEMICALS	2899991	CHEMICALS, NEC
INDUSTRIAL CHEMICALS	2899992	POTASSIUM FORMATE NON REGULATED, NON-HAZARDOUS, LIQUID SOLUTION IN WATER.
INDUSTRIAL CHEMICALS	2899997	ZIRCONIUM SULFATE, BASIC
INDUSTRIAL CHEMICALS	3842174	BALLS, ABSORBENT COTTON OR ABSORBENT SYNTHETIC FIBRE, DENTAL, SURGICAL, MEDICAL, HOSPITAL OR COSMETIC
LPG	1321110	GASOLINE, NATURAL (CASINGHEAD), SUITABLE ONLY FOR BLENDING, MIXING OR REFINING
LPG	2911976	PETROLEUM CONDENSATE
LPG	2911985	BUTADIENE FROM PETROLEUM, INHIBITED
LPG	2912110	BUTANE GAS, LIQUEFIED
LPG	2912111	PROPANE GAS, LIQUEFIED
LPG	2912112	ISOBUTANE GAS, LIQUEFIED
LPG	2912115	NATURAL GAS LIQUIDS Y GRA DE
LPG	2912120	ETHYLENE, CRYOGENIC LIQUID
LPG	2912122	BUTENE (BUTYLENE) GAS, LIQUEFIED, OR ISOBUTENE (ISOBUTYLENE), LIQUEFIED
LPG	2912123	POLYISOBUTYLENE
LPG	2912125	PETROLEUM ISOPENTANE OR PENTANE
LPG	2912128	PROPYLENE
LPG	2912181	PETROLEUM BY-PRODUCT, NEC CONSISTING OF IMPURE BUTANE, BUTYLENE OR BUTADIENES FOR FURTHER PROCESSING
LPG	2912190	LIQUEFIED PETROLEUM GAS, NEC, COMPRESSED
METALS & ORES I	3312120	BILLETS, IRON OR STEEL, OTHER THAN COPPER CLAD

METALS & ORES I	3312121	BLOOMS, IRON OR STEEL, OTHER THAN COPPER CLAD
METALS & ORES I	3312122	INGOTS, IRON OR STEEL, OTHER THAN COPPER CLAD
METALS & ORES I	3312130	RAIL ENDS, IRON OR STEEL, FOR FURTHER MANUFACTURE
METALS & ORES I	3312265	PLATE, IRON OR STEEL IN COILS
METALS & ORES I	3312318	SHEET STEEL (STEEL SHEET), BLACK, PLAIN
METALS & ORES I	3312331	SHEET, IRON OR STEEL (SHEET IRON OR STEEL), NEC, PLAIN, GALVANIZED, LEADED, PRIMED OR TARRED, OR PAINTED OR LACQUERED WITH ONE COAT OR BOTH, ONE COLOR ONLY
METALS & ORES I	3312332	SHEET, STEEL, (SHEET STEEL), IN COILS, PLAIN OR GALVANIZED
METALS & ORES I	3312346	STEEL, STRIP, IN COILS
METALS & ORES I	3312350	SHEETS, HOT ROLLED, IRON OR STEEL, 13 GAUGE OR THICKER IN COILS
METALS & ORES I	3312420	BARS, SHEET, IRON OR STEEL
METALS & ORES I	3312432	SQUARES, BAR, IRON OR STEEL, NOT INCLUDING SQUARES ON WHICH ANY WORK HAS BEEN DONE, EXCEPT THAT OF GALVANIZING, DRAWING, GRINDING, HAMMERING OR ROLLING
METALS & ORES I	3312433	BARS, IRON OR STEEL, NEC
METALS & ORES I	3312455	RODS, IRON OR STEEL, COILED, ROUGH HOT ROLLED
METALS & ORES I	3312468	BARS OR RODS, CONCRETE OR PLASTER REINFORCEMENT, IRON OR STEEL
METALS & ORES I	3312523	ANGLES, IRON OR STEEL, NEC
METALS & ORES I	3312528	BEAMS, IRON OR STEEL, NEC
METALS & ORES I	3312534	CHANNELS, IRON OR STEEL, NEC
METALS & ORES I	3312653	PIPE OR TUBING, OR DRILL PIPE WITH OR WITHOUT DRILL PIPE COUPLINGS OR JOINTS AFFIXED, OR INTEGRAL JOINTS, IRON OR STEEL, WROUGHT, NEC, NOT IN COILS, MADE FROM SKELP IRON OR STEEL OR SEAMLESS PIPE OR TUBING MADE FROM INGOTS, BILLETS OR DISCS
METALS & ORES I	3312668	TUBING, IRON OR STEEL, SEAMLESS OR WELDED
METALS & ORES I	3312676	OIL COUNTRY CASING OR TUBING, WROUGHT IRON OR STEEL
METALS & ORES I	3312868	RAILWAY TRACK TIE PLATES OR RODS, STEEL
METALS & ORES I	3352115	ALUMINUM PLATE OR SHEET, NEC
METALS & ORES I	3499864	PLANT POLES OR STAKES, IRON OR STEEL
METALS & ORES I	4021122	SCRAP, IRON OR STEEL, NEC, COPPER CLAD, HAVING VALUE FOR REMELTING PURPOSES
METALS & ORES I	4021125	SCRAP, IRON OR STEEL, NEC, NOT COPPER CLAD, HAVING VALUE FOR REMELTING PURPOSES
METALS & ORES I	4021127	SCRAP IRON OR STEEL, CAST IRON, HAVING VALUE FOR REMELTING PURPOSES
METALS & ORES I	4021129	SCRAP, IRON OR STEEL, STAINLESS, NEC, HAVING VALUE FOR REMELTING PURPOSES
METALS & ORES II	1011190	IRON ORE, NEC, OR MAGNETITE (LOADSTONE) OR HEMATITE ORES, CRUDE, NOT GROUND, WHEN TO BLAST FURNACES
METALS & ORES II	1011290	IRON ORE, NEC, OR MAGNETITE (LOADSTONE) OR TACONITE ORES, CRUDE, NOT GROUND, WHEN TO PROCESSING OR BENEFICIATING PLANTS
METALS & ORES II	1011310	IRON CONCENTRATES, WASHED, GRAVITY OR SIZED
METALS & ORES II	1011320	IRON AGGLOMERATES OR IRON ORE BRIQUETTES, PELLETS OR SINTER
METALS & ORES II	1021210	COPPER CONCENTRATES
METALS & ORES II	1031210	LEAD CONCENTRATES
METALS & ORES II	1032210	CONCENTRATES, ZINC
METALS & ORES II	1033210	LEAD AND ZINC CONCENTRATES
METALS & ORES II	1041210	GOLD ORE CONCENTRATES OR PRECIPITATES
METALS & ORES II	1051110	BAUXITE (BEAUXITE) ORE
METALS & ORES II	1051310	ALUMINA, CALCINED
METALS & ORES II	1051311	ALUMINA, HYDRATED
METALS & ORES II	1061110	MANGANESE ORE, OTHER THAN GROUND
METALS & ORES II	1061310	MANGANESE ORE, GROUND (BLACK OXIDE OF MANGANESE)
METALS & ORES II	1092948	RUTILE ORE OR RUTILE SAND

METALS & ORES II	1092959	STAUROLITE RESIDUE (RESIDUE MATERIAL IN THE MINING OF ILMENITE ORE)
METALS & ORES II	1092977	NICKEL-COPPER CONCENTRATE
METALS & ORES II	2816934	IRON OXIDE, HYDRATED
METALS & ORES II	2816991	IRON OXIDE, NEC
METALS & ORES II	2819634	ALUMINUM FLUORIDE
METALS & ORES II	3291150	FINES, ALUMINUM OXIDE (ALUMINA)
METALS & ORES II	3311115	PIG IRON
METALS & ORES II	3311515	IRON, METALLIC, CRUDE, NOT COMPLETELY REDUCED, HAVING VALUE ONLY FOR MELTING PURPOSES
METALS & ORES II	3312115	BILLETS, IRON OR STEEL, COPPER CLAD, FOR MANUFACTURE OF BARS, RODS OR WIRE
METALS & ORES II	3312124	BILLETS, SQUARE, NON-ALLOY STEEL
METALS & ORES II	3312125	BILLETS, SQUARE, OTHER ALLOY STEEL
METALS & ORES II	3312135	SKELP, IRON OR STEEL
METALS & ORES II	3312140	SLABS, IRON OR STEEL, IN THE ROUGH
METALS & ORES II	3312142	SLABS, STAINLESS STEEL
METALS & ORES II	3312145	STEEL, SEMI-FINISHED, IN LENGTHS (COLD REDUCTION BREAKDOWNS), IN ROLLS
METALS & ORES II	3312210	PLATE OR SHAPES, ARMOR OR DECK, IRON OR STEEL, NOT ASSEMBLED
METALS & ORES II	3312219	PLATE, IRON OR STEEL, BRASS, BRONZE, COPPER, CHROMIUM OR NICKEL COATED BY ELECTROLYTIC OR HOT-DIPPED PROCESS, NEC, OR COPPER CLAD
METALS & ORES II	3312240	BOILER PLATES, IRON OR STEEL
METALS & ORES II	3312241	TANK OR BOILER BOTTOMS, ENDS, HEADS OR TOPS, IRON OR STEEL, UNFINISHED, WITH OR WITHOUT BRACES OR LUGS ATTACHED
METALS & ORES II	3312253	PLATE, IRON OR STEEL, NEC, PLAIN, GALVANIZED, LEADED, PRIMED OR TARRED, OR PAINTED OR LACQUERED WITH ONE COAT OR BOTH, ONE COLOR ONLY
METALS & ORES II	3312260	PLATES, STRUCTURAL, NEC, IRON OR STEEL
METALS & ORES II	3312310	BAND OR HOOP, IRON OR STEEL
METALS & ORES II	3312330	SHEET, IRON OR STEEL, NICKEL-CLAD OR NICKEL PLATED
METALS & ORES II	3312333	SHEET, IRON OR STEEL, CORRUGATED
METALS & ORES II	3312340	SHEET, IRON OR STEEL, FLAT OR IN COILS, GALVANIZED AND LAMINATED WITH THERMOPLASTIC COAL TAR BASED RESIN ON ONE SIDE AND A POLYMER COATING ON THE REVERSE SIDE
METALS & ORES II	3312354	SHEET OR STRIP, IRON OR STEEL, ALUMINUM COATED
METALS & ORES II	3312355	SHEETS, COLD ROLLED, IRON OR STEEL, IN COILS, FOR GALVANIZING, IN STRAIGHT OR MULTIPLE LOADS
METALS & ORES II	3312360	SHEET, IRON OR STEEL, 26 GAUGE OR THINNER, COPPER COATED
METALS & ORES II	3312415	BARS, MUCK OR PUDDLE, IRON OR STEEL
METALS & ORES II	3312441	GUY ANCHOR RODS, IRON OR STEEL
METALS & ORES II	3312445	WIRE RODS, IRON OR STEEL, ROLLED
METALS & ORES II	3312447	WIRE RODS, HOT-ROLLED, COILED, NON-ALLOY STEEL
METALS & ORES II	3312448	WIRE RODS, HOT-ROLLED, COILED, OTHER ALLOY STEEL
METALS & ORES II	3312487	BARS, CRUSHING OR GRINDING, BAR MILL, IRON OR STEEL
METALS & ORES II	3312521	TEES OR ZEES, IRON OR STEEL, NEC
METALS & ORES II	3312576	SHEET PILING, IRON OR STEEL
METALS & ORES II	3312613	CONDUIT PIPE, WROUGHT IRON OR STEEL
METALS & ORES II	3312627	PIPE OR TUBING, IRON OR STEEL, PLATE OR SHEET, NEC, 7 GAUGE OR THICKER, 3 INCHES OR LESS INSIDE DIAMETER
METALS & ORES II	3312628	PIPE OR TUBING, IRON OR STEEL, PLATE OR SHEET, NEC, 7 GAUGE OR THICKER, OVER 3 INCHES INSIDE DIAMETER
METALS & ORES II	3312630	PIPE OR TUBING, IRON OR STEEL, PLATE OR SHEET, NEC, 16 GAUGE OR THICKER, BUT NOT THICKER THAN 8 GAUGE, OVER 3 INCHES INSIDE DIAMETER
METALS & ORES II	3312634	PIPE OR TUBING, IRON OR STEEL, PLATE OR SHEET, NEC, 23 GAUGE OR THINNER, OVER 8 INCHES INSIDE DIAMETER

METALS & ORES II	3312635	PIPE OR TUBING, IRON OR STEEL, PLATE OR SHEET, NEC, 23 GAUGE OR THINNER, OVER 1 1/2 INCHES, BUT NOT OVER 8 INCHES INSIDE DIAMETER
METALS & ORES II	3312636	PIPE OR TUBING, IRON OR STEEL, PLATE OR SHEET, NEC, 23 GAUGE OR THINNER, 1 1/2 INCHES OR LESS INSIDE DIAMETER, SIDE SEAMS CLOSED
METALS & ORES II	3312638	PIPE OR TUBING, IRON OR STEEL, NEC, IN MIXED LOADS OF 8 TO 16 GAUGE INCLUSIVE, OVER 24 INCHES INSIDE DIAMETER, OR 17 TO 22 GAUGE INCLUSIVE, OVER 3 INCHES INSIDE DIAMETER, OR 23 GAUGE OR THINNER, OVER 1 1/2 INCHES INSIDE DIAMETER
METALS & ORES II	3312639	PIPE OR TUBING, IRON OR STEEL, WROUGHT, OUTSIDE DIAMETER NOT EXCEEDING 12 INCHES, NOT THINNER THAN 10 GAUGE, MADE FROM SKELP IRON OR STEEL OR MADE FROM INGOTS, BILLETS OR DISKS
METALS & ORES II	3312640	PIPE, IRON OR STEEL, PLATE OR SHEET, NEC, CORRUGATED, IN LONGITUDINAL HALVES
METALS & ORES II	3312646	PIPE OR TUBING, IRON OR STEEL, WITH OUTSIDE DIAMETER NOT EXCEEDING 14 INCHES
METALS & ORES II	3312648	PIPE OR TUBING, IRON OR STEEL, WITH OUTSIDE DIAMETER EXCEEDING 14 INCHES
METALS & ORES II	3312661	TUBING, STEEL, OPEN SEAM, WITH ROLLED THREADS
METALS & ORES II	3312663	PIPE, IRON OR STEEL, NEC
METALS & ORES II	3312681	PIPE OR TUBING, WELDED STEEL, OUTSIDE DIMENSIONS NOT MORE THAN 4 INCHES, NOT THINNER THAN 20 GAUGE
METALS & ORES II	3312711	TERNE OR TIN PLATE, PLAIN, LACQUERED OR PAINTED
METALS & ORES II	3312725	TERNE PLATE OR TIN PLATE, NEC
METALS & ORES II	3312735	TIN MILL BLACK PLATE, IRON OR STEEL, 29 GAUGE OR THINNER, PLAIN, LACQUERED, PAINTED OR LITHOGRAPHED
METALS & ORES II	3312745	BARS, TIN PLATE, IRON OR STEEL
METALS & ORES II	3312812	RAILWAY TRACK ANGLE BARS OR PLATES, IRON OR STEEL
METALS & ORES II	3312814	RAILWAY TRACK BASE PLATES, IRON OR STEEL
METALS & ORES II	3312819	RAILWAY CAR RETARDERS
METALS & ORES II	3312828	RAILWAY TRACK CROSS TIES, IRON OR STEEL
METALS & ORES II	3312837	RAILWAY TRACK RAIL OR TEE RAIL GUARD, IRON OR STEEL
METALS & ORES II	3312838	RAILWAY TRACK FOOT GUARDS, IRON OR STEEL
METALS & ORES II	3312839	RAILWAY TRACK RAILS, IRON OR STEEL, NEC
METALS & ORES II	3312846	RAILWAY TRACK RAIL ANCHORS, RAIL STAYS, RAIL ANTI-CREEPERS, OR ANTIRAIL CREEPER FASTENINGS
METALS & ORES II	3312849	PORTABLE RAILWAY TRACKS, PANELS, IN SECTIONS, IRON OR STEEL
METALS & ORES II	3312851	PORTABLE RAILWAY SWITCH PANELS, IN SECTIONS, IRON OR STEEL
METALS & ORES II	3312872	RAILWAY TRACK SPIKES, IRON OR STEEL
METALS & ORES II	3312874	RAILWAY TRACK TURNOUTS OR WEDGES, STEEL
METALS & ORES II	3312890	RAILWAY TRACK MATERIAL, IRON OR STEEL, IN MIXED LOADS
METALS & ORES II	3312916	ROLLED STEEL RINGS, NEC
METALS & ORES II	3312981	RAILS, NEW, OTHER THAN RAILS, RAILWAY TRACK, IRON OR STEEL
METALS & ORES II	3312990	IRON OR STEEL PRODUCTS, NEC, FOR FABRICATION OR OTHER PROCESSING PURPOSES
METALS & ORES II	3313110	ALLOYS, FERRO-MANGANESE
METALS & ORES II	3313115	ALLOYS, FERRO-MANGANESESILICON

METALS & ORES II	3339978	TYPE METAL, NEC
METALS & ORES II	3351115	BARS, BRASS, BRONZE OR COPPER, DRAWN, EXTRUDED OR ROLLED
METALS & ORES II	3351130	RODS, COPPER, UNFINISHED, IN COILS, ROUGH ROLLED (NOT DRAWN THROUGH A DIE), 1/4 INCH OR GREATER IN DIAMETER
METALS & ORES II	3351216	BRASS, BRONZE OR COPPER PLATE, SHEET OR STRIP, NEC, OTHER THAN PERFORATED OR SILVER PLATED
METALS & ORES II	3351220	COPPER SHEET, ELECTROLYTICALLY DEPOSITED
METALS & ORES II	3351250	BRASS, BRONZE OR COPPER PLATES, SHEET OR STRIP, NEC, IN COILS
METALS & ORES II	3352112	ALUMINUM SHEET, HOT ROLLED, IN COILS
METALS & ORES II	3352320	ALUMINUM OR ALUMINUM ALLOY BARS
METALS & ORES II	3352335	RODS, ALUMINUM OR ALUMINUM ALLOY
METALS & ORES II	3352910	ALUMINUM OR ALUMINUM ALLOY EXTRUSIONS, NEC
METALS & ORES II	3357110	ALUMINUM OR ALUMINUM ALLOY WIRE, SOLID OR WITH STEEL CORE, PLAIN
METALS & ORES II	3391126	FORGINGS, NEC, IRON OR STEEL, IN THE ROUGH
METALS & ORES II	3391130	FORGINGS, NEC, IRON OR STEEL, COATED, JOINED TOGETHER OR TOOLED
METALS & ORES II	3391132	TIRES, RAILWAY CAR OR LOCOMOTIVE WHEEL, STEEL
METALS & ORES II	3399110	ALUMINUM OR ALUMINUM ALLOY FLAKES
METALS & ORES II	3399120	ALUMINUM POWDER, ATOMIZED GRANULAR
METALS & ORES II	3399134	COPPER POWDER
METALS & ORES II	3399137	IRON, POWDERED, NEC

METALS & ORES II	3399955	BALLS, CRUSHING OR GRINDING, IRON
METALS & ORES II	3399970	BALLS, METAL, NEC
METALS & ORES II	3423565	PAVING RAMMERS, SMOOTHERS OR TAMPERS, OR ASPHALT CUTTERS
METALS & ORES II	3429145	CAR DECKING RACKS, AUTO, IRON, KNOCKED DOWN, OR WOODEN, KNOCKED DOWN OR FLAT
METALS & ORES II	3429947	SHIPPING BLOCKS, BRACES, BRACKETS, DEVICES OR STRAPS, NEC, STEEL
METALS & ORES II	3432158	WATER CLOSET FLOATS, METAL
METALS & ORES II	3433330	BOILERS, TANKS, HEATERS, RADIATORS, IN MIXED LOADS
METALS & ORES II	3433510	BOILERS, HEATING, STEEL, OR SHEET STEEL AND CAST IRON COMBINED
METALS & ORES II	3433640	GAS MANIFOLDS, FURNACE, HEATER OR STOVE, WITHOUT VALVES, NOT ENAMELED NOR PLATED
METALS & ORES II	3441101	STRUCTURAL FORMS, NOIBN, FABRICATED FROM BARS, PLATES OR SHAPES, 3/16 INCH OR THICKER, LOOSE OR PACKAGED
METALS & ORES II	3441110	ANGLES OR CHANNELS, ENAMELED, IRON OR STEEL, OR WOOD COVERED WITH IRON OR STEEL OR TIN PLATE
METALS & ORES II	3441129	JOISTS, IRON OR STEEL
METALS & ORES II	3441131	BUMPERS, IRON OR STEEL, STRUCTURAL
METALS & ORES II	3441133	FORMS, NEC, STRUCTURAL, IRON OR STEEL
METALS & ORES II	3441144	GIRDERS, NEC, OTHER THAN LATTICE, IRON OR STEEL
METALS & ORES II	3441155	HIGHWAY GUARD RAILS, STEEL
METALS & ORES II	3441172	POSTS, STRUCTURAL, IRON OR STEEL
METALS & ORES II	3441215	BEAMS, ALUMINUM OR ALUMINUM ALLOY
METALS & ORES II	3441244	PIPE, BRASS, BRONZE OR COPPER AND IRON OR STEEL PIPE OR TUBING, INSULATED AND IRON JACKETED
METALS & ORES II	3442262	SASH, STEEL BAR, OR SASH, STEEL BAR, AND WINDOW FRAMES COMBINED
METALS & ORES II	3443175	STEAM GENERATORS OR HEAT EXCHANGERS,NAVAL REACTOR SYSTEM,NOT IRRADIATED
METALS & ORES II	3443320	BOILER DOMES OR DRUMS, IRON OR STEEL
METALS & ORES II	3443325	BOILERS, POWER, STEEL OR STEEL AND CAST IRON
METALS & ORES II	3443360	BOILER PARTS, NEC, CAST IRON
METALS & ORES II	3443424	TANKS, AIR PRESSURE OR HYDRO-PNEUMATIC, CYLINDRICAL, ENDS CLOSED, STEEL
METALS & ORES II	3443444	TANKS, MULTIPLE UNIT, FOR SHIPPING AIR, GASES OR LIQUIDS UNDER PRESSURE, MOTOR TRUCK OR TRAILER, OR RAILWAY CAR, STEEL, NEW
METALS & ORES II	3443470	STORAGE TANKS, LIQUEFIED GAS, NEC, STEEL, INSULATED
METALS & ORES II	3443510	REACTOR VESSEL TANKS OR PRESSURIZERS, HEATING OR POWER SYSTEM, OR REACTOR VESSEL TANK HEADS, STEEL, NOT IRRADIATED, WITHOUT MECHANISM
METALS & ORES II	3443517	CREOSOTING CYLINDERS, STEEL PLATE
METALS & ORES II	3443533	TANKS, IRON OR STEEL, LINED WITH ALUMINUM, BLOCK TIN, COPPER, NICKEL OR NICKELCOPPER
METALS & ORES II	3443941	MACHINE BED PLATES, MADE FROM ROLLED OR FORGED STEEL PLATES, WELDED, UNFINISHED, IN THE ROUGH, EXCEPT THAT THEY MAY BE ROUGH TURNED OR PLANED, BUT NOT TO FINISHED SIZE, PROVIDED THEY REQUIRE FURTHER TURNING OR PLANING BEFORE BECOMING FINISHED ARTICLES
METALS & ORES II	3444646	BINS, FRUIT OR VEGETABLE, HOUSEHOLD, SHEET STEEL
METALS & ORES II	3444652	BINS, NEC, STEEL OR STEEL AND WOOD
METALS & ORES II	3449947	MESH, BAR AND WIRE COMBINED, CONCRETE OR PLASTER REINFORCEMENT, IRON OR STEEL
METALS & ORES II	3461983	TAGS, STEEL OR TINPLATE
METALS & ORES II	3481328	FENCE POSTS, IRON OR STEE
METALS & ORES II	3481332	FENCING, IRON OR STEEL, IN PANELS
METALS & ORES II	3481610	BARBED OR TWISTED WIRE, IRON OR STEEL, ACID COPPERED, GALVANIZED, PAINTED, PLAIN OR TINNED, OR ALUMINUM, BRASS, BRONZE, CADMIUM OR COPPER COATED, NEC

METALS & ORES II	3494325	PIPE COILS, NEC, IRON OR STEEL
METALS & ORES II	3499405	BARS OR RODS, NEC, IRON OR STEEL, BRASS, BRONZE, CADMIUM OR COPPER COATED
METALS & ORES II	3499435	PIPE, IRON OR STEEL, NICKEL PLATED
METALS & ORES II	3499745	COMMODITY SHIPPING CONTAINERS, SHEET IRON OR STEEL
METALS & ORES II	3499746	RACKS, TEXTILE MILL ROLL BEAM (WARP BEAM), EMPTY, STEEL
METALS & ORES II	3499759	SHIPPING CONTAINERS, STEEL, 16 GAUGE OR THICKER, CYLINDRICAL, EMPTY
METALS & ORES II	3499772	RACKS, CRACKER CAN SHIPPING
METALS & ORES II	3499870	SPOOLS, IRON OR STEEL OR WOOD, OR IRON OR STEEL AND WOOD
METALS & ORES II	3499982	HARNESS, MISSILE OR ROCKET ENGINE OR PARTS HANDLING, METAL
METALS & ORES II	3511287	TURBINE CONDENSERS, OR PARTS, NEC
METALS & ORES II	3511288	TURBINES, STEAM, GAS OR WATER, OR PARTS, NEC, OTHER THAN AIRCRAFT OR AUTOMOBILE
METALS & ORES II	3519923	DIESEL ENGINES
METALS & ORES II	3522270	TRACTORS, NEC, INTERNAL COMBUSTION OR STEAM, WHEEL-TYPE, NOT INCLUDING THOSE WITH VEHICLE BEDS, BED FRAMES OR FIFTH WHEELS
METALS & ORES II	3522590	HARVESTERS-THRESHERS (COMBINES), NEC, OTHER THAN HAND
METALS & ORES II	3522923	FARM CARTS, TRUCKS, TRAILERS OR WAGONS, NEC
METALS & ORES II	3522930	GRAIN STORAGE BINS OR CRIBS, STEEL OR WIRE AND STEEL
METALS & ORES II	3531110	TRACTORS, NEC, INTERNAL COMBUSTION OR STEAM, TRACK-LAYING TYPE, NOT INCLUDING THOSE WITH VEHICLE BEDS, BED FRAMES OR FIFTH WHEELS
METALS & ORES II	3531211	TRACK LAYING MACHINES, MOVED ON OWN WHEEL
METALS & ORES II	3531216	MAINTENANCE CARS FOR RAIL FLAW DETECTOR CAR OUTFITS, MOVED ON OWN WHEELS
METALS & ORES II	3531226	BALLAST CLEANING OUTFITS, MOVED ON OWN WHEELS, BUT NOT UNDER OWN POWER, CONSISTING OF ONE MACHINE CAR AND ONE CONVEYOR CAR
METALS & ORES II	3531314	ATTACHMENTS, NEC, EXCAVATING, GRADING OR LOADING, TRACTOR OR TRUCK
METALS & ORES II	3531315	COUNTERWEIGHTS, IRON OR STEEL, FOR INSTALLATION ON GRADING, EXCAVATING, LOADING, OR SCRAPING TRACTORS OR TRUCKS
METALS & ORES II	3531451	CRANES OR DERRICKS, NEC, MOVED ON OWN WHEELS
METALS & ORES II	3531472	SHOVELS, POWER, NOT MOVED ON OWN WHEELS
METALS & ORES II	3531834	MOTOR GRADERS
METALS & ORES II	3531878	DRAG SCRAPERS, NEC, HORSE OR TRACTOR DRAWN
METALS & ORES II	3531934	ATTACHMENTS, LOG LOADING, FRONT END LOADER TRACTOR, IRON OR STEEL, FORK TYPE
METALS & ORES II	3531948	TRACTORS AND TRACTOR EXCAVATING, GRADING, OR LOADING ATTACHMENTS, NEC
METALS & ORES II	3532253	MINING MACHINERY, IN MIXED LOADS WITH MISCELLANEOUS EQUIPMENT
METALS & ORES II	3533126	PIPE CAPS, OIL, WATER OR GAS WELL, RUBBER AND STEEL
METALS & ORES II	3537115	HOPPERS, SELF-DUMPING, STEEL, MOUNTED ON LIFT TRUCK BASES, FOR BULK MATERIALS HANDLING
METALS & ORES II	3542140	PRESSES, METAL DRAWING, EXTRUDING, FORGING, PIERCING, PUNCHING, SHEARING OR STAMPING, OR PARTS, NEC
METALS & ORES II	3542191	PRESSES, NEC, OTHER THAN FILTER
METALS & ORES II	3548110	METAL ROLLING MILL MACHINERY, INCLUDING PARTS, IN MIXED LOADS WITH BEARINGS, NEC, BED PLATES, IRON, NEC, CHAINS, IRON OR STEEL, OR ROLLING MILL HOUSINGS, ROLL PINIONS, ROLLS OR TABLES, STEEL
METALS & ORES II	3554134	ROLLER BARS, PAPER MILL, IRON OR STEEL
METALS & ORES II	3559248	FORGES, PORTABLE OR STATIONARY
METALS & ORES II	3559520	GAS, PETROLEUM, AMMONIA OR COAL TAR CRACKING, DISTILLING, REFINING OR SEPARATING CYLINDERS, CHAMBERS, TOWERS OR VESSELS
METALS & ORES II	3559965	BALING PRESSES, SCRAP METAL, HYDRAULIC, NOT LESS THAN 15 TON

METALS & ORES II	3564269	FILTER AIDS, DIATOMACEOUS (DIATOMITE) OR INFUSORIAL (FOSSIL FLOUR, FOSSIL MEAL OR KIESELGUHR) EARTH, MIXED WITH NOT MORE THAN 25 PERCENT ASBESTOS, DRY
METALS & ORES II	3566940	POWER TRANSMISSION SHAFT-ING OR SHAFTS, STEEL, OTHER THAN CRANKSHAFTS, WITHOUT FITTINGS
METALS & ORES II	3569144	BALING PRESSES, NEC
METALS & ORES II	3576110	SCALE TESTING WEIGHTS, IRON
METALS & ORES II	3585390	REFRIGERATORS, NEC
METALS & ORES II	3599990	MACHINERY OR MACHINES, NEC, NEW
METALS & ORES II	3599991	PARTS, MACHINE OR MACHINERY, NEC, BRASS, BRONZE, COPPER OR MAGNESIUM ALLOY
METALS & ORES II	3599993	PARTS, MACHINE OR MACHINERY, NEC, IRON OR STEEL
METALS & ORES II	3612911	TRANSFORMERS, ELECTRIC, NEC, WEIGHING NOT LESS THAN 25 LBS EACH
METALS & ORES II	3613140	ENGINES, GENERATORS AND SWITCHBOARDS COMBINED, ELECTRIC
METALS & ORES II	3621110	ELECTRIC MOTORS
METALS & ORES II	3621210	ELECTRIC GENERATORS
METALS & ORES II	3621920	ENGINES AND GENERATORS COMBINED, ELECTRIC
METALS & ORES II	3621930	GENERATOR, DIESEL/ELECTRIC, SELF CONTAINED IN CONTAINER HOUSING, RUNNING OR NOT, WITH OR WITH OUT REMOVABLE CHASSIS OR BOGIES
METALS & ORES II	3624130	CARBON ELECTRODES, FURNACE OR ELECTROLYTIC BATH (CARBON PLUGS), NEC
METALS & ORES II	3699970	ANTENNA ROTATING DEVICES, TV, OR PARTS
METALS & ORES II	3711220	VEHICLES, MOTOR, COAL, CONCRETE, EARTH, ORE OR STONE DUMPING OR HAULING, WHEELED OR CRAWLER TYPE
METALS & ORES II	3711620	COAL, CONCRETE, EARTH, ORE OR STONE HAULING OR DUMPING VEHICLE CHASSIS, WHEELED OR CRAWLER TYPE
METALS & ORES II	3711917	MULTI-TERRAIN VEHICLES, GASOLINE POWERED, NOT DESIGNED FOR GENERAL HIGHWAY USE
METALS & ORES II	3715131	COMMODITY CONTAINER, SHIPPING, CAPACITY 135 CUBIC FEET OR GREATER, SEE RULE 33, LOOSE OR PACKAGED
METALS & ORES II	3729990	AIRCRAFT PARTS, NEC, CLOTH AND WOOD OR METAL
METALS & ORES II	3729991	AIRCRAFT PARTS, NEC, OTHER THAN CLOTH AND WOOD OR METAL
METALS & ORES II	3742131	RAILWAY BAGGAGE, EXPRESS OR MAIL CARS, NEC, MOVED ON OWN WHEELS
METALS & ORES II	3742839	RAILWAY CAR COUPLERS
METALS & ORES II	3742930	RAILWAY CAR BRAKE BEAMS, WITH CYLINDERS ATTACHED
METALS & ORES II	4021110	BATTERY CYLINDERS, FRAMES OR PLATES, STEEL, BURNT OUT
METALS & ORES II	4021116	ANNEALING BOXES OR POTS, OR ANNEALING BOX OR POT BOTTOMS, IRON OR STEEL, BURNT OUT
METALS & ORES II	4021118	BORINGS, FILINGS, GRINDINGS OR TURNINGS, IRON OR STEEL, NOT GRANULATED, GROUND NOR POWDERED, VALUE FOR OTHER THAN REMELTING PURPOSES
METALS & ORES II	4021119	BORINGS, FILINGS, GRINDINGS OR TURNINGS, IRON OR STEEL, NOT GRANULATED, GROUND NOR POWDERED, HAVING VALUE FOR REMELTING PURPOSES ONLY
METALS & ORES II	4021120	MILL ROLLERS OR ROLLS, IRON OR STEEL,OLD,WORN OUT, OTHER THAN ROLLING MACHINES, HAVING VALUE FOR RE-MELTING PURPOSES, REQUIRING SPECIAL HANDLING
METALS & ORES II	4021126	SCRAP IRON OR STEEL, CUT, HAVING VALUE FOR REMELTING PURPOSES
METALS & ORES II	4021128	SCRAP, TIN PLATE OR TERNE PLATE (SCRAP TIN PLATE OR SCRAP TERNE PLATE OR OLD WORN OUT ARTICLES MADE OF TIN PLATE OR TERNE PLATE HAVING VALUE FOR DETINNING, DELEADING, REMELTING OR SHREDDING PURPOSES ONLY)
METALS & ORES II	4021137	BRIQUETTES, IRON OR STEEL SCRAP, NEC, VALUE FOR REMELTING PURPOSES
METALS & ORES II	4021145	AXLES, RAILWAY CAR OR LOCOMOTIVE, OLD, WITHOUT BEARINGS, GEARS OR OTHER ATTACHMENTS, VALUE FOR REMELTING OR REROLLING PURPOSES ONLY
METALS & ORES II	4021148	RAILWAY TRACK MATERIALS, IRON OR STEEL, VALUE FOR REMELTING OR REROLLING PURPOSES ONLY

METALS & ORES II	4021149	RAILWAY TRACK RAILS, OLD, IRON OR STEEL, HAVING VALUE FOR REMELTING OR REROLLING PURPOSES
METALS & ORES II	4021152	WHEELS, RAILWAY CAR OR LOCOMOTIVE TENDER OR TRUCK, OLD, IRON OR STEEL, HAVING VALUE ONLY FOR REMELTING PURPOSES
METALS & ORES II	4021170	IRON ORE TAILINGS, HAVING NO VALUE FOR FURTHER EXTRACTION OF METAL
METALS & ORES II	4021225	CLIPPINGS, BRASS, BRONZE OR COPPER
METALS & ORES II	4021240	SCRAP, NEC, SCRAPS OR WASTE PIECES OR BENT, BROKEN, CRUSHED OR WORN OUT ARTICLES OR USED WIRE, HAVING VALUE FOR REMELTING PURPOSES ONLY, BRASS, BRONZE OR COPPER
METALS & ORES II	4021355	ZINC OR ZINC ALLOY SHAVINGS
METALS & ORES II	4021412	SCRAP ALUMINUM, DRY, BALED
METALS & ORES II	4021430	ALUMINUM OR ALUMINUM ALLOY SCRAP, NEC
METALS & ORES II	4021440	ALUMINUM DROSS WASTE
METALS & ORES II	4021928	TYPE METAL SCRAP
METALS & ORES II	4021948	SCRAP, NICKEL, NICKELCOPPER OR NICKELIRONCHROMIUM ALLOY, NEC
METALS & ORES II	4021991	METAL SCRAPS, NONFERROUS, MIXED LOADS
METALS & ORES II	4029176	AUTOMOBILE SHREDDER RESIDUE
METALS & ORES II	4111110	AIR COOLERS, HEATERS, HUMIDIFIERS, DEHUMIDIFIERS OR WASHERS AND BLOWERS OR FANS COMBINED, MOUNTED ON FREIGHT AUTOMOBILES
METALS & ORES II	4111139	RAIL GRINDING OUTFITS, MOVED ON OWN WHEELS, CONSISTING OF CREW CAR, GRINDER CARS, POWER GENERATING CAR OR TANK CARS
METALS & ORES II	4111141	RAIL WELDING OUTFITS, NEC, MOVED ON OWN WHEELS, BUT NOT UNDER OWN POWER, CONSISTING OF WELDER CAR, GENERATOR CAR OR RACK CAR (RAIL FEEDER OR HANDLING CAR)
METALS & ORES II	4111159	RAILWAY EQUIPMENT, MINIATURE, OTHER THAN TOYS
METALS & ORES II	4111220	PLANT EQUIPMENT, USED
METALS & ORES II	4111413	CORES OR TUBES, PAPER OR PAPERBOARD OR COMPRESSED PULP, NEC, OLD, USED
METALS & ORES II	4111452	PALLET OR SKID TOPS, WOODEN, USED
METALS & ORES II	4111522	GENERATORS, ELECTRIC, OTHER THAN AUTOMOBILE, OLD, USED, VALUE FOR RECONDITIONING OR RECLAMATION OF PARTS
METALS & ORES II	4111524	GENERATOR FIELD COILS OR GENERATOR OR TURBINE ROTORS, ELECTRIC, OLD, USED, HAVING VALUE ONLY FOR RECONDITIONING OR RECLAMATION OF PARTS
METALS & ORES II	4111535	PALLETS OR PLATFORMS, LIFT TRUCK, WOOD, SCRAP, HAVING VALUE FOR RECONDITIONING
OTE	3741110	LOCOMOTIVES, LOCOMOTIVE TENDERS OR LOCOMOTIVES AND TENDERS COMBINED, COMPRESSED AIR, ELECTRIC, GAS, GASOLINE, OIL-ELECTRIC OR OIL-HYDRAULIC, MOVED ON OWN WHEELS, BUT NOT UNDER OWN POWER
OTE	3741115	LOCOMOTIVES, LOCOMOTIVE TENDERS OR LOCOMOTIVES AND TENDERS COMBINED, COMPRESSED AIR, ELECTRIC, GAS, GASOLINE, OIL-ELECTRIC, OIL-HYDRAULIC OR STEAM, NOT MOVED ON OWN WHEELS

SPECIALIZED MARKETS	1491625	GARNET ROCK OR GARNET SAND, CRUDE, BROKEN, CRUSHED, GROUND OR PULVERIZED
SPECIALIZED MARKETS	1491810	ANHYDRITE AND DIATOMACEOUS EARTH COMBINED
SPECIALIZED MARKETS	1491815	DIATOMACEOUS EARTH (DIATOMITE), WITH NOT MORE THAN 50 PERCENT HYDRATED LIME OR MAGNESIUM OXIDE
SPECIALIZED MARKETS	1491825	DIATOMACEOUS EARTH (DIATOMITE) OR INFUSORIAL EARTH (FOSSIL FLOUR, FOSSIL MEAL OR KIESELGUHR)
SPECIALIZED MARKETS	1491925	EARTH OR SOIL, NEC, OR LOAM, NEC
SPECIALIZED MARKETS	1491930	GRAPHITE ORE
SPECIALIZED MARKETS	1491950	VERMICULITE, CRUDE, BROKEN, CRUSHED OR GROUND, DRIED OR NOT DRIED, NOT EXPANDED
SPECIALIZED MARKETS	1491970	PERLITE ROCK, CRUDE, NOT FURTHER PROCESSED THAN CRUSHED, BROKEN OR GROUND
SPECIALIZED MARKETS	1491988	ZEOLITES, NATURAL
SPECIALIZED MARKETS	1492101	WATER, RAW, UNPROCESSED F ROM OPEN SOURCE FOR IRRIG ATION OR CONSTRUCTION, NO T FOR HUMAN CONSUMPTION
SPECIALIZED MARKETS	1911170	GUNS, NEC, CANNONS, HOWITZERS OR MORTARS, BORE 6 INCHES OR OVER
SPECIALIZED MARKETS	1925110	GUIDED MISSILES, WITH OR WITHOUT FUEL, WARHEADS OR OTHER INCOMPATIBLE COMPONENTS
SPECIALIZED MARKETS	1929110	AMMUNITION, FIXED, CANNON, WITH EMPTY, INERT-LOADED OR SOLID PROJECTILE
SPECIALIZED MARKETS	1929135	PROJECTILES FOR CANNON, EXPLOSIVE
SPECIALIZED MARKETS	1929145	FUZES, COMBINATION PERCUSSION, TRACER OR TIME
SPECIALIZED MARKETS	1929191	AMMUNITION, FIXED, NEC, FOR CANNON
SPECIALIZED MARKETS	1929192	PROJECTILES, NEC, EMPTY, SOLID OR FILLED WITH INERT MATERIAL
SPECIALIZED MARKETS	1929310	BOMBS, MINES OR DEPTH CHARGES, EXPLOSIVE, EXPLOSIVE TORPEDOES, NEC, GAS, INCENDIARY, SMOKE OR TEAR PRODUCING BOMBS
SPECIALIZED MARKETS	1929320	BOMBS, AERIAL, EMPTY, IRON OR STEEL, BOMB BODIES, NEC, OR PARTS, NEC, OR FRAGMENTATION BOMB BODY COILS
SPECIALIZED MARKETS	1929325	BOMBS OR MINES, DUMMY, SOLID OR FILLED WITH INERT MATERIAL

SPECIALIZED MARKETS	1929350	BOMB FIN ASSEMBLIES
SPECIALIZED MARKETS	1929915	ROCKETS, NEC, OTHER THAN GUIDED
SPECIALIZED MARKETS	1929921	HAND OR RIFLE GRENADES, DUMMY OR EMPTY
SPECIALIZED MARKETS	1929923	EXPLOSIVE HAND OR RIFLE GRENADES, NEC
SPECIALIZED MARKETS	1931145	ARMY TRACTOR TANKS, WITH GUNS MOUNTED
SPECIALIZED MARKETS	1931150	ARMY TRACTOR TANKS, WITHOUT GUNS
SPECIALIZED MARKETS	1931190	TANK PARTS, ARMY TRACTOR, NEC, IRON OR STEEL
SPECIALIZED MARKETS	1931193	TANK PARTS, NEC, ARMY TRACTOR, BABBITT METAL OR WHITE METAL ALLOY
SPECIALIZED MARKETS	1931195	ARMY TRACKED VEHICLE GROUP, WITH OR WITHOUT GUNS
SPECIALIZED MARKETS	1931196	ARMY TRACKED VEHICLE GROUP: WITH OR WITHOUT GUNS, VEHICLE WEIGHT LESS THAN 40,00O POUNDS, RVNE $2.50 PER POUND PER VEHICLE
SPECIALIZED MARKETS	1931197	ARMY TRACKED VEHICLE GROUP: WITH OR WITHOUT GUNS, VEHICLE WEIGHT 40,000 TO 59,999 POUNDS, RVNE $2.50 PER POUNDS PER VEHICLE.
SPECIALIZED MARKETS	1931198	ARMY TRACKED VEHICLE GROUP: WITH OR WITHOUT GUNS, VEHICLE WEIGHT 60,000 POUNDS OR MORE, RVNE $2.50 PER POUNDS PER VEHICLE
SPECIALIZED MARKETS	1931215	HALF TRACKS, ARMY, GUNS MOUNTED
SPECIALIZED MARKETS	1951236	FIREARMS OR PARTS, NOIBN, IN PACKAGES
SPECIALIZED MARKETS	1961110	CARTRIDGES, SMALL ARMS, BLANK OR LOADED, NEC, OR SMALL ARMS AMMUNITION
SPECIALIZED MARKETS	1991151	AMMO/EXPL/FRWRKS/CHEM MUN, NOIBN/NOI, CLASS 1 DIVS 1.1 OR 1.2, RV NE $2.50 PER LB
SPECIALIZED MARKETS	1991170	DUMMY CHARGES OR DUMMY CARTRIDGES
SPECIALIZED MARKETS	2091510	COTTON LINTERS, OTHER THAN BLEACHED OR DYED, OR COTTON REGINS
SPECIALIZED MARKETS	2279925	CARPETS, CARPETING, MATS, MATTING OR RUGS, FIBRE, NEC, OTHER THAN COTTON, RAYON, SYNTHETIC FIBRE, SILK OR WOOL
SPECIALIZED MARKETS	2393171	BAGS, CEMENT, OSNABURG
SPECIALIZED MARKETS	2399929	PIPE LINE CONSTRUCTION FORMS OR MOLDS, BURLAP OR COTTON, WITH STEEL OR WIRE STRAPPING TIES
SPECIALIZED MARKETS	2542172	RACKS, NEC, METAL
SPECIALIZED MARKETS	2551535	PALLETS, PLATFORMS OR SKIDS, PAPER OR PULPWOOD, SEPARATE OR COMBINED WITH OTHER THAN CELLULAR, EXPANDED OR FOAMED PLASTIC OR WOOD
SPECIALIZED MARKETS	2599916	FURNITURE, IN MIXED LOADS OR IN MIXED LOADS WITH FURNITURE PARTS
SPECIALIZED MARKETS	2611215	LIGNIN LIQUOR (CONCENTRATED LIQUID OR SEMILIQUID RESIDUE OR BYPRODUCT FROM THE MANUFACTURE OF SULPHATE OR SULPHITE WOOD PULP) OR LIGNIN LIQUOR, EMULSIFIED WITH NOT TO EXCEED 50 PERCENT BY WEIGHT OF CRUDE PETROLEUM OIL
SPECIALIZED MARKETS	2611220	PULP MILL LIQUID
SPECIALIZED MARKETS	2611230	SULPHATE BLACK LIQUOR SKIMMINGS, NOT PROCESSED, LIQUID
SPECIALIZED MARKETS	2812632	CALCIUM CHLORIDE, LIQUID
SPECIALIZED MARKETS	2812633	CALCIUM CHLORIDE, OTHER THAN LIQUID
SPECIALIZED MARKETS	2812649	MAGNESIUM CHLORIDE
SPECIALIZED MARKETS	2812659	MAGNESIUM CHLORIDE BRINE
SPECIALIZED MARKETS	2819711	RADIOACTIVE MATERIALS, ARTICLES OR ISOTOPES, NEC
SPECIALIZED MARKETS	2819720	URANIUM FLUORIDES, OXIDES, SALTS OR URANATES, NOT IRRADIATED NOR REQUIRING PROTECTIVE SHIELDING
SPECIALIZED MARKETS	2821220	RUBBER, ARTIFICIAL, NEOPRENE OR SYNTHETIC, CRUDE, OTHER THAN IN PELLET OR POWDER FORM
SPECIALIZED MARKETS	2821221	CRUDE SYNTHETIC RUBBER, IN PELLET OR POWDER FORM
SPECIALIZED MARKETS	2821230	VULCANIZING RUBBER COMPOUNDS
SPECIALIZED MARKETS	2831176	PETROLATUM, MEDICINAL (PETROLEUM JELLY) (VASELINE)
SPECIALIZED MARKETS	2892111	CARTRIDGES, JET ENGINE STARTER, OR IGNITERS, ROCKET MOTOR, ROCKET ENGINE OR JET THRUST (JATO) UNIT, CLASS B OR C EXPLOSIVE
SPECIALIZED MARKETS	2892113	EXPLOSIVE IGNITERS, NEC, CLASS B OR C
SPECIALIZED MARKETS	2892119	CAPS, BLASTING OR ELECTRIC BLASTING, EXPLOSIVE

SPECIALIZED MARKETS	2892122	EXPLOSIVE DETONATING OR SAFETY CORD OR FUSE
SPECIALIZED MARKETS	2892123	BOOSTERS, EXPLOSIVE
SPECIALIZED MARKETS	2892125	HIGH EXPLOSIVES, NEC, OR DYNAMITE, GUNCOTTON OR TETRYL
SPECIALIZED MARKETS	2892134	NITRO STARCH, DRY
SPECIALIZED MARKETS	2892152	SAFETY SQUIBS, EXPLOSIVE, OR ELECTRIC SQUIBS, EXPLOSIVE
SPECIALIZED MARKETS	2892164	NITROCELLULOSE (COLLOIDED), NON FIBROUS, GRANULAR OR FLAKED, WET WITH ALCOHOL OR SOLVENT, OR NOT LESS THAN 20 PERCENT OF WATER
SPECIALIZED MARKETS	2892190	GUN POWDER, NEC
SPECIALIZED MARKETS	2899110	SODIUM CHLORIDE (SALT, COMMON), IN BLOCKS
SPECIALIZED MARKETS	2899111	SODIUM CHLORIDE (COMMON SALT), IN PACKAGES
SPECIALIZED MARKETS	2899112	SODIUM CHLORIDE (SALT, COMMON), IN BULK
SPECIALIZED MARKETS	2899113	SODIUM CHLORIDE (COMMON SALT), IN MIXED LOADS OF BULK AND PACKAGES
SPECIALIZED MARKETS	2899117	SODIUM CHLORIDE (COMMON SALT), CONSISTING OF BORAX, DISODIUM PHOSPHATE AND SODIUM SULPHATE, NOT TO EXCEED 8 PERCENT, SUITABLE ONLY FOR CURING OR DRYING LUMBER, NOT AS A WOOD PRESERVATIVE, IN BULK
SPECIALIZED MARKETS	2899125	LIVE STOCK SALT, MEDICATED, NOT MORE THAN 3 PERCENT MEDICINAL ELEMENTS
SPECIALIZED MARKETS	2899145	SALT, COMMON (SODIUM CHLORIDE), IODIZED OR SULPHURIZED
SPECIALIZED MARKETS	2899610	BLACKS, CARBON (GAS OR OIL), DRY, COMPRESSED, ELECTROSTATICALLY SEPARATED, FILTERED OR GRANULATED, NOT ACTIVATED, NOT DYES NOR DYESTUFFS
SPECIALIZED MARKETS	2899613	BLACKS (CARBON GAS OR OIL BLACKS), LAMP BLACK OR VEGETABLE BLACK, DRY, NEC, NOT ACTIVATED, NOT DYES NOR DYESTUFFS
SPECIALIZED MARKETS	2899640	BONE, CHARRED FILTERING, SYNTHETIC
SPECIALIZED MARKETS	2899643	CARBON, ACTIVATED, ABSORBENT, CLARIFYING, DECOLORIZING, DEODORIZING OR PURIFYING
SPECIALIZED MARKETS	2952315	ASPHALT COMPOSITION SHINGLES
SPECIALIZED MARKETS	2952350	ROOFING OR SHINGLES, ASPHALT SATURATED PAPER OR FELT AND ALUMINUM FOIL
SPECIALIZED MARKETS	2952990	ASPHALT BUILDING OR ROOFING MATERIALS, IN MIXED LOADS
SPECIALIZED MARKETS	3011110	PNEUMATIC TIRES, RUBBER, OR PNEUMATIC TIRES WITH INSERTED STEEL BEAD LOCKS, OR PNEUMATIC TIRES CONTAINING INNER TUBES, FLAPS OR RELINERS, OR TUBELESS TIRE LINERS (BLOWOUT SHIELDS)
SPECIALIZED MARKETS	3061330	LATEX FOAM RUBBER PADS OR PADDING, MATTRESS OR UPHOLSTERING, NOT COVERED
SPECIALIZED MARKETS	3061415	CARPETS, CARPETING, MATS, MATTING OR RUGS, RUBBER OR RUBBER COMPOSITION
SPECIALIZED MARKETS	3071225	PIPE OR TUBING, PLASTIC
SPECIALIZED MARKETS	3071358	TOTE BOXES, SYNTHETIC PLASTIC AND MINERAL WOOL, TAPER SIDED
SPECIALIZED MARKETS	3071650	POLYSTYRENE, FOAMED, IN SOLID FLAT BOARDS, BLOCKS, LOGS, PLANKS OR SHEETS
SPECIALIZED MARKETS	3071683	LIFT TRUCK PALLETS OR PLATFORMS, FIBREBOARD AND EXPANDED PLASTIC COMBINED
SPECIALIZED MARKETS	3071990	PLASTIC ARTICLES, NEC, NOT CELLULAR, EXPANDED, NOR FOAMED
SPECIALIZED MARKETS	3072990	PALLETS, PLATFORMS OR SKIDS, FOR LIFT TRUCKS, PLASTIC, OTHER THAN CELLULAR, EXPANDED OR FOAM PLASTIC, WITHOUT BODIES, ENCLOSURES, ENDS, SIDES, STANDARDS OR STACKING POSTS
SPECIALIZED MARKETS	3211965	GLASS, FLAT, UNCUT, UNFINISHED, NOT GROUND NOR POLISHED
SPECIALIZED MARKETS	3211980	GLASS, FLAT, NEC, NOT BENT, EXCEEDING 15 FEET IN LENGTH OR 9 FEET IN BREADTH
SPECIALIZED MARKETS	3229520	SKYLIGHT, ROOFING OR SIDEWALL CONSTRUCTION MATERIAL, CONSISTING OF ROLLED GLASS, WIRED OR NOT WIRED, AND INSTALLATION ACCESSORIES
SPECIALIZED MARKETS	3229922	GLASS, CRUSHED, GROUND OR POWDERED
SPECIALIZED MARKETS	3229924	CULLET (BROKEN GLASS)
SPECIALIZED MARKETS	3251115	BUILDING BRICK, COMMON, OTHER THAN HOLLOW, CLAY OR SHALE
SPECIALIZED MARKETS	3251135	BUILDING BRICK, COMMON OR FACE, HOLLOW, CLAY OR SHALE, NOT ENAMELED NOR GLAZED
SPECIALIZED MARKETS	3255110	FIRE BRICK, NEC, OR FIRE BRICK SHAPES OR FIRE CLAY PAVING BRICK

SPECIALIZED MARKETS	3255248	FURNACE OR KILN LINING OR HIGH TEMPERATURE BONDING MORTAR OR CEMENT, NEC
SPECIALIZED MARKETS	3271151	BRICK OR BLOCKS, NOT HOLLOW NOR PERFORATED, CRUSHED MARBLE, SAND AND CEMENT, MARBLE DUST AND CEMENT, OR CRUSHED GRANITE OR CEMENT
SPECIALIZED MARKETS	3271510	STRUCTURAL BEAMS, CHANNELS, DOUBLE TEES, GIRDERS OR JOISTS, METAL REINFORCED CONCRETE
SPECIALIZED MARKETS	3271926	RAILROAD TIES, CEMENT OR CONCRETE, METAL REINFORCED
SPECIALIZED MARKETS	3292910	ASBESTOS ARTICLES, NEC
SPECIALIZED MARKETS	3295215	CINDERS, CLAY, SHALE (EXPANDED SHALE), SLATE OR VOLCANIC (NOT PUMICE STONE), OR HAYDITE
SPECIALIZED MARKETS	3295229	CLAY AND WATER MIXED, OTHER THAN KAOLIN, NOT MORE THAN 70 PERCENT CLAY, IF MIXTURE SHOULD EXCEED 70 PERCENT BY A FRACTION LESS THAN 1 PERCENT, SUCH MIXTURE WILL BE CONSIDERED WITHIN THE 70 PERCENT LIMITATION
SPECIALIZED MARKETS	3295230	KAOLIN AND WATER MIXED, NOT MORE THAN 70 PERCENT KAOLIN, IF MIXTURE SHOULD EXCEED 70 PERCENT BY A FRACTION LESS THAN 1 PERCENT, SUCH MIXTURE WILL BE CONSIDERED WITHIN THE 70 PERCENT LIMITATION
SPECIALIZED MARKETS	3295231	KAOLIN, NOT PROCESSED BEYOND WASHING, AIR FLOATING, GRINDING, DRYING, CALCINING AND/OR TREATMENT WITH CHEMICALS ONLY TO EXTENT NECESSARY TO DISPERSE OR REMOVE IMPURITIES
SPECIALIZED MARKETS	3295232	CLAY, NEC, CRUSHED, GROUND OR PULVERIZED, OR BALL CLAY OR BENTONITE
SPECIALIZED MARKETS	3295234	CLAY, PROCESSED FOR CATALYZING PURPOSES
SPECIALIZED MARKETS	3295236	CLAY OR SAND, NEC, GRANULATED OR PULVERIZED, CONTAINING OTHER INGREDIENTS ADMIXED NOT TO EXCEED 3 1/2 PERCENT BUT NOT PROCESSED FOR DECOLORIZING, FILTERING OR WATER SOFTENING
SPECIALIZED MARKETS	3295238	CLAY, PROCESSED FOR CLARIFYING, DECOLORIZING, NEUTRALIZATION, PURIFYING OR REFINING OF FATS, GREASES, OILS OR WAXES
SPECIALIZED MARKETS	3295275	PERLITE, OTHER THAN CRUDE
SPECIALIZED MARKETS	3295280	SHALE, GROUND, BURNT OR RETORTED
SPECIALIZED MARKETS	3295286	CLAY, CALCINED
SPECIALIZED MARKETS	3295310	MAGNESITE, CALCINED
SPECIALIZED MARKETS	3295312	MAGNESITE, DEAD BURNT
SPECIALIZED MARKETS	3295410	PYROPHYLLITE, CRUDE, GROUND
SPECIALIZED MARKETS	3295420	TALC, GROUND OR PULVERIZED
SPECIALIZED MARKETS	3295510	FELDSPAR, GROUND
SPECIALIZED MARKETS	3295959	NATURAL STONE DUST, GRANULAR, GROUND, POWDERED OR PULVERIZED, NEC, OTHER THAN LIMESTONE
SPECIALIZED MARKETS	3295973	SILICA, NEC, SILEX, NEC, OR DRY COLLOIDAL SILICA, WEIGHING LESS THAN 20 POUNDS PER CUBIC FOOT
SPECIALIZED MARKETS	3295974	SILICA, NEC, SILEX, NEC, OR DRY COLLOIDAL SILICA, WEIGHING 20 POUNDS PER CUBIC FOOT OR OVER
SPECIALIZED MARKETS	3295980	ROOFING GRANULES
SPECIALIZED MARKETS	3295982	HEADLAP ROOFING GRANULES
SPECIALIZED MARKETS	3356936	URANIUM METAL BARS, RODS OR SHAPES, NOT IRRADIATED NOR REQUIRING PROTECTIVE SHIELDING
SPECIALIZED MARKETS	3441118	MILITARY BRIDGES, OTHER THAN PONTOON, STEEL OR STEEL AND WOOD
SPECIALIZED MARKETS	3491940	RADIOACTIVE MATERIAL SHIPPING CONTAINERS, STEEL AND LEAD OR STEEL AND URANIUM METAL COMBINED, EMPTY
SPECIALIZED MARKETS	3499755	CONTAINERS, BOMB, MISSILE OR MISSILE SECTION SHIPPING, ALUMINUM OR ALUMINUM AND OTHER METAL
SPECIALIZED MARKETS	3631171	STOVES OR RANGES, HOUSEHOLD, IRON OR STEEL, GAS, GASOLINE OR OIL, NEC, OR CHARCOAL, COAL OR WOOD AND GAS
SPECIALIZED MARKETS	3632112	COOLING BOXES (FREEZERS), OR REFRIGERATORS AND COOLING OR FREEZING APPARATUS COMBINED, HOUSEHOLD TYPE

SPECIALIZED MARKETS	3633120	LAUNDRY DRYING MACHINES (DRYERS), HOUSEHOLD-TYPE
SPECIALIZED MARKETS	3633130	LAUNDRY WASHING MACHINES (WASHERS), HOUSEHOLD-TYPE
SPECIALIZED MARKETS	3639310	DISH WASHING MACHINES (DISHWASHERS), OR DISH WASHING MACHINES (DISHWASHERS) AND CABINET SINKS, HOUSEHOLD
SPECIALIZED MARKETS	3639910	MIXED LOADS OF COOLING BOXES OR REFRIGERATORS AND COOLING OR FREEZING APPARATUS COMBINED, WATER COOLERS AND COOLING OR FREEZING APPARATUS COMBINED, OR ELECTRIC OR GAS COOKING STOVES, OR WATER HEATERS, NEC, OR IN MIXED LOADS WITH AIR CLEANERS, COOLERS, HEATERS, HUMIDIFIERS, DEHUMIDIFIERS OR WASHERS AND BLOWERS OR FANS COMBINED, BAKE OVENS, ELECTRIC, STATIONARY OR PORTABLE, BROILERS, COOKERS OR ROASTERS, ELECTRIC, WITH OR WITHOUT BROILER GRIDS, OVENWARE DISHES, INSERT PANS OR RACKS, CABINETS, STORAGE OR KITCHEN, NEC, STEEL WITHOUT GLASS, COOLERS, BEER, WITH EQUIPMENT OF COOLING OR FREEZING APPARATUS, COOLING BOXES, NEC, EVAPORATORS, REFRIGERATION (COOLING COILS OR COOLING UNITS), FANS, ELECTRIC, NEC, EACH WEIGHING LESS THAN 400 POUNDS, FRYERS, DEEP-WELL, ELECTRIC, FURNACES, HOUSE HEATING AND AIR CONDITIONING APPARATUS COMBINED, GARBAGE DISPOSAL UNITS (FOOD WASTE DISPOSERS), GRINDER TYPE, ELECTRIC, GENERATORS AND ENGINES COMBINED, HOTPLATES, ELECTRIC, HOUSINGS OR SLEEVES, AIR CONDITIONER, MACHINES, COOLING OR FREEZING, MACHINES, DISHWASHING, MACHINES, DISHWASHING, AND CABINET SINKS COMBINED, MACHINES, DRYING, HOUSEHOLD LAUNDRY, MACHINES, IRONING, HOUSEHOLD LAUNDRY, MACHINES, WASHING, HOUSEHOLD LAUNDRY, WITH OR WITHOUT DISHWASHING ATTACHMENTS, MACHINES, WASHING AND DRYING COMBINED, HOUSEHOLD LAUNDRY, PANELS, DISHWASHER, RANGE CANOPIES OR HOODS WITH BLOWERS OR FANS, REFRIGERATORS, NEC, SAD IRONS, ELECTRIC, WITH OR WITHOUT STANDS, SINKS, KITCHEN CABINET, STOVES, COAL AND ELECTRIC COMBINED, OR TANKS, BEER COOLER, OR WASTE COMPACTORS
SPECIALIZED MARKETS	3692118	LITHIUM-ION ENERGY STORAG E UNITS
SPECIALIZED MARKETS	3711420	TRUCKS, TRACTOR (DRIVING TRUCKS FOR FREIGHT TRAILERS), ARMY TRACTOR TANK RECOVERY, ARMORED
SPECIALIZED MARKETS	3711425	CARRIERS, PERSONNEL, ARMORED, MILITARY
SPECIALIZED MARKETS	3711972	VEHICLES, MOTOR FREIGHT, INCLUDING TRACTORS (DRIVING TRUCKS FOR FREIGHT VEHICLES OR FIRE APPARATUS) LOOSE OR PACKAGED
SPECIALIZED MARKETS	3715130	CONTAINERS, DEMOUNTABLE TRAILER BODY OR FLEXI-VAN, WITH OR WITHOUT REMOVABLE BOGIES OR CHASSIS
SPECIALIZED MARKETS	3722113	AIRCRAFT ENGINE WIRING HARNESS, ELECTRICAL
SPECIALIZED MARKETS	3722118	ENGINES, INTERNAL COMBUSTION, RADIAL CYLINDER OR JET PROPULSION TYPE, OTHER THAN MOUNTED ON TRAILERS OR WHEELED SHIPPING CONTAINERS
SPECIALIZED MARKETS	3722210	ROCKET OR MISSILEPROPELLING UNITS (ROCKET MOTORS), OR JET THRUST (JATO) UNITS, OTHER THAN JET TYPE ENGINES, CLASS A EXPLOSIVES
SPECIALIZED MARKETS	3722211	ROCKET OR MISSILEPROPELLING UNITS (ROCKET MOTORS), OR JET THRUST (JATO) UNITS, OTHER THAN JET TYPE ENGINES, CLASS B EXPLOSIVES
SPECIALIZED MARKETS	3722215	CYLINDERS, EMPTY, OR PARTS THEREOF, NEC, JET THRUST UNIT (JATO), STEEL
SPECIALIZED MARKETS	3722221	MISSILES OR ROCKETS, GUIDED, W/O WARHEADS, GUIDANCE SYSTEMS, OR ELECTRONIC GUIDANCE CONTROL APPARATUS FOR INSTALLATION IN MISSILES OR MISSILE SECTIONS, MISSILE OR ROCKET FRAME ASSEMBLIES CONTAINING ELECTRONIC APPARATUS OR MOBILE MISSILE GUIDANCE CONTROL SYSTEM, LOOSE OR PACKAGED, RV NE $5.00 PER LB.
SPECIALIZED MARKETS	3729940	FUSELAGE WITHOUT POWER, AIRCRAFT, OR FUSELAGE SECTIONS
SPECIALIZED MARKETS	3769125	ROCKET HEADS, EXPLOSIVE, OR WAR HEADS
SPECIALIZED MARKETS	3769130	ROCKET HEADS, EMPTY, SOLID OR FILLED WITH INERT MATERIAL
SPECIALIZED MARKETS	3791210	TRAILER CARS, CARTS, OR COACHES, PASSENGER, HOUSE OR SLEEPER
SPECIALIZED MARKETS	3799933	SYSTEMS, SUSPENSION, NEC, FREIGHT TRUCK OR TRAILER

SPECIALIZED MARKETS	3841110	ADMINISTERING APPARATUS, GAS OR OXYGEN, HOSPITAL OR SURGICAL, WITH CYLINDERS OF GAS OR OXYGEN
SPECIALIZED MARKETS	3999877	DEVICES OR SYSTEMS, ACID SPILL CONTROL, CONSISTING OF A PRESSURIZED CONTAINER, EXPELLANT GAS CARTRIDGE, DISCHARGE HOSE AND SHUT-OFF NOZZLE, WITH INTEGRAL EQUIPMENT NECESSARY FOR DEPLOYMENT, WHEELED, NOT FILLED WITH CHEMICAL AGENT
SPECIALIZED MARKETS	3999913	CANDLES, NEC
SPECIALIZED MARKETS	4011209	FLY ASH,FOR DISPOSAL WITH NO FURTHER COMMERCIAL VALUE
SPECIALIZED MARKETS	4021146	AXLES, RAILWAY CAR OR LOCOMOTIVE, OLD, WITHOUT BEARINGS, GEARS OR OTHER ATTACHMENTS, HAVING VALUE ONLY FOR CUTTING OR HEATING PURPOSES
SPECIALIZED MARKETS	4022138	CARPETS OR RUGS, OLD, WORN OUT
SPECIALIZED MARKETS	4025105	CHEMICAL WASTE, NEC, LIQUID
SPECIALIZED MARKETS	4026113	LATEX, COAGULATED (SCRAP OR WASTE LATEX FROM WHICH THE LIQUID HAS EVAPORATED)
SPECIALIZED MARKETS	4026135	SYNTHETIC PLASTIC SCRAP, NEC, NOT CELLULAR, EXPANDED NOR FOAMED
SPECIALIZED MARKETS	4026171	TIRES, RUBBER, WASTE OR SCRAP, CRUSHED, GROUND, PULVERIZED, CHIPPED OR SHREDDED, WITH VALUE AS FUEL ONLY
SPECIALIZED MARKETS	4027116	BRICK, CRUSHED, GROUND, OR BROKEN (BRICK BATS)
SPECIALIZED MARKETS	4029101	SOIL, CHEMICAL WASTE CONTAMINATED, NEC, DRY
SPECIALIZED MARKETS	4029102	SOIL, HEAVY METAL CONTAMINATED, NEC, DRY
SPECIALIZED MARKETS	4029103	AUTOMOBILE SHREDDER
SPECIALIZED MARKETS	4029104	SOIL, INSECTICIDE OR PESTICIDE CONTAMINATED, NEC, DRY
SPECIALIZED MARKETS	4029105	SOLIDS OR DEBRIS,OTHER THAN SOIL LOW-LEVEL RADIOACTIVE CONTAMINATED,NEC,DRY
SPECIALIZED MARKETS	4029106	SOIL, LOW-LEVEL RADIOACTIVE CONTAMINATED, NEC, DRY
SPECIALIZED MARKETS	4029107	WATER, WASTE, NON-HAZARDOUS, NEC
SPECIALIZED MARKETS	4029108	ASH SLUDGE, METAL BEARING
SPECIALIZED MARKETS	4029110	REFUSE, CORUNDUM, EMERY OR OTHER NATURAL OR SYNTHETIC ABRASIVE MATERIAL, NEC, INCLUDING BROKEN WHEELS, WHEEL STUBS OR WHEEL GRINDINGS
SPECIALIZED MARKETS	4029112	RECYCLABLE MIXED PLASTICS WITH RECLAMATION VALUE U SED FOR CREATING A NEW EN D PRODUCT (SPECIFICALLY B IO-FUELS)
SPECIALIZED MARKETS	4029114	MUNICIPAL GARBAGE WASTE, SOLID, DIGESTED AND GROUND, OTHER THAN SEWAGE WASTE OR FERTILIZER
SPECIALIZED MARKETS	4029120	WASTE WATER
SPECIALIZED MARKETS	4029127	SLUDGE, SEWAGE, DRY, FERTILIZER MATERIAL
SPECIALIZED MARKETS	4029130	CAKE, FILTER, CONTAINING BEESWAX REFUSE
SPECIALIZED MARKETS	4029133	AUTOMOBILE FLUFF OR SHREDDER RESIDUE, OTHER THAN METALS
SPECIALIZED MARKETS	4029145	GRAPHITE SCRAP
SPECIALIZED MARKETS	4029154	CONSTRUCTION AND DEMOLITION DEBRIS,NONHAZARDOUS,HAVING NO COMMERCIAL OR RECYCLABLE VALUE
SPECIALIZED MARKETS	4029168	INCINERATOR ASH,NONHAZARDOUS,HAVING NO COMMERCIAL OR RECYCLABLE VALUE
SPECIALIZED MARKETS	4029170	SLUDGE, ACID OR ALKALI, CONTAINING NOT LESS THAN 75 PERCENT WATER (AN UNREFINED LIQUID WASTE OBTAINED AS A RESIDUE OF THE METAL FINISHING INDUSTRY)
SPECIALIZED MARKETS	4029173	MUNICIPAL OR COMMERCIAL NON-HAZARDOUS SOLID WASTE,HAVING NO COMMERCIAL OR RECYCLABLE VALUE
SPECIALIZED MARKETS	4029179	PLANT REFUSE, REFUSE WASTE MATERIAL OR EXCAVATED MATERIAL, HAVING NO COMMERCIAL VALUE TO SHIPPER
SPECIALIZED MARKETS	4029189	SLUDGE, SEWAGE, NO COMMERCIAL VALUE
SPECIALIZED MARKETS	4029191	DRUMS OR BARRELS, CHEMICAL WASTE CONTAMINATED, NEC (EMPTY)
SPECIALIZED MARKETS	4029192	RAILROAD TIES, WOOD, WHOLE OR PROCESSED, SCRAP
SPECIALIZED MARKETS	4029193	RAILROAD TIES, CONCRETE, WHOLE OR PROCESSED, SCRAP

SPECIALIZED MARKETS	4029195	RECYCLED RUBBER, WOOD, ST EEL RIG MATS
SPECIALIZED MARKETS	4029197	SCRAP BATTERIES, OLD, SPENT, WITH CHEMICALS, HAVING VALUE FOR RECLAMATION OF MATERIALS
SPECIALIZED MARKETS	4029198	SOLID WASTE,NON-HAZARDOUS,NEC,HAVING NO COMMERCIAL OR RECYCLABLE VALUE
SPECIALIZED MARKETS	4029199	CONCRETE BLOCKS OR FORMS, LOW LEVEL RADIOACTIVE CONTAMINATED, NEC
SPECIALIZED MARKETS	4111710	MILITARY IMPEDIMENTA (CAMP EQUIPAGE, SUBSISTENCE STORES, MEDICAL STORES, EMERGENCY AMMUNITION OR OTHER PROPERTY OF THE UNITED STATES, CANADA, OR MEXICO (INCLUDING THEIR STATE MILITIAS) ARMIES, NAVIES, AIR FORCES, COAST GUARDS OR MARINE CORPS, GENERALLY KNOWN AS IMPEDIMENTA (BUT NOT INCLUDING LIVESTOCK OR PERSONAL BAGGAGE))
SPECIALIZED MARKETS	4211131	NONREVENUE MOVEMENT OF CONTAINERS, BULK COMMODITY, SHIPPING, ALUMINUM, OLD, USED, RETURNED EMPTY
SPECIALIZED MARKETS	4211150	NONREVENUE MOVEMENT OF CONTAINERS, RETURNING IN REVERSE OF ROUTE USED IN LOADED MOVEMENT OF NON-HAZARDOUS WASTE
SPECIALIZED MARKETS	4211220	NONREVENUE MOVEMENT OF PALLETS, PLATFORMS OR SKIDS, SHIPPING OR WAREHOUSE, IRON OR STEEL, USED, RETURNED EMPTY
SPECIALIZED MARKETS	4211225	NONREVENUE MOVEMENT OF PLATFORMS (PALLETS) OR SKIDS, WAREHOUSE OR SHIPPING, WOODEN, USED, RETURNED EMPTY
SPECIALIZED MARKETS	4611110	FREIGHT ALL KINDS, (FAK) OR ALL FREIGHT RATE SHIPMENTS, NEC, OR TRAILER-ON FLATCAR SHIPMENTS, COMMERCIAL (EXCEPT IDENTIFIED BY COMMODITIES, THEN CODE BY COMMODITY)
SPECIALIZED MARKETS	4611115	ALL FREIGHT RATE SHIPMENTS, NEC, OR TRAILER-ON-FLAT-CAR SHIPMENTS, GOVERNMENT (EXCEPT WHERE IDENTIFIED BY COMMODITIES, THEN CODE BY COMMODITY)
SPECIALIZED MARKETS	4611121	FAK, EXCEPT CLASS 1, DIVS 1.1, 1.2 AND 1.3 AMMO/EXPL/FRWRKS/CHEM MUN AND OTHER HAZARDOUS MATERIALS, BUT INCLUDING DPM SHIPMENTS OF CRATED HHG AND UB
SPECIALIZED MARKETS	4611123	FAK, EXCEPT CLASS 1, DIV. 1.1, 1.2 AND 1.3 EXPL/FRWRKS/CHEM MUN BUT INCLUDING HAZMAT AND NON-SENSITIVE CLASS 1, DIV. 1.4 COMMODITIES NE 1,000 LBS.
SPECIALIZED MARKETS	4621115	POST OFFICE SUPPLIES, IN MIXTURES CONSISTING OF BOXES CONTAINING MIXTURES OF CUSTODIAL, OFFICE OR CLERICAL SUPPLIES, NOT FURNITURE, CABINETS, VEHICLES OR MACHINERY OR MACHINES

VERIFIED STATEMENT

OF

GRANT JANKE

1. My name is Grant Janke. I am Assistant Vice President, Capital Planning & Finance for Union Pacific Railroad Company ("UP"). I have served in this position since 2024 and have been employed at UP since 1994.

2. I have served in many roles during my time at UP, including Assistant Vice President, Network & Capital Planning and Assistant Vice President Strategic Planning. I earned a bachelor's degree in finance from Kansas State University.

3. In my current role with UP, I have responsibility for management and oversight of the planning initiatives of UP's capital budget. Additionally, my team has responsibility for the analysis, controls, and reporting of the company's operating expenses.

4. I am submitting this verified statement to describe the preparation and contents of the Summary of Benefits Exhibit, which is Appendix B in this volume of the Application.

5. The Board's rules require Applicants to enumerate and, where possible, quantify the net public benefits their merger would generate. Applicants in railroad merger proceedings routinely portray the quantifiable economic costs and benefits of their proposals in a Summary of Benefits Exhibit.

6. The Summary of Benefits Exhibit in this case is intended to capture identified quantifiable benefits arising from the combination of UP and Norfolk

Southern Railway Company ("NS"). Applicants did not attempt to capture all of the potentially quantifiable benefits of the merger. Instead, Applicants focused on some of the largest examples of quantifiable benefits. This includes optimizing processes, elimination of duplication, and implementing improved technology.

7. The Summary of Benefits Exhibit also does not attempt to estimate non-quantifiable benefits of the merger. These are addressed throughout the Application, including:

- Benefits to existing customers of UP and NS from faster, more reliable, more efficient single-line service. For many existing customers, the merger will reduce inventory carrying costs, reduce the costs of rail car ownership, and expand opportunities to grow business by serving new markets. These benefits are addressed in the Joint Verified Statement of Kenny Rocker and Claude E. "Ed" Elkins, the Verified Statement of Elizabeth M. Bailey, PhD, and the Verified Statement of Mark A. Israel.

- Benefits to current customers of rail transportation services in lanes served by UP/NS in terms of increased rail-to-rail competition. These customers will benefit from more intense competition and improved transportation options. These benefits are addressed in the Joint Verified Statement of Kenny Rocker and Ed Elkins, the Verified Statement of Elizabeth Bailey, and the Verified Statement of Mark Israel.

- Benefits to potential customers of rail transportation services in lanes served by UP/NS in terms of unlocking new and increased competition with trucks. These consumers will benefit from the ability to use a lower-cost service to move their products to market. The Joint Verified Statement of Kenny Rocker and Ed Elkins, the Verified Statement of Elizabeth Bailey, and the Verified Statement of Mark Israel address these benefits as well.

- Benefits to the American economy as a whole from an American transcontinental railroad that will deliver growth by supporting domestic manufacturing, increasing the ability of American businesses to export their goods through ports, and strengthening our national defense. The Verified Statement of Jim Vena and the Verified Statement of Mark George address these benefits, as does the Joint Verified Statement of Kenny Rocker and Ed Elkins.

- Benefits to American workers, in the form of expanded job opportunities created by this growth-driven merger. The merger protects union employees, and Applicants project employee growth to handle additional traffic attracted to the merged system's more competitive service offerings. The Verified Statement of Jim Vena and the Verified Statement of Mark George also address these benefits, as does the Verified Statement of Maqui Parkerson.

- Benefits to American taxpayers of shifting freight traffic from taxpayer-funded roadways to privately funded railroads. The Verified Statement of Jim Vena and the Verified Statement of Mark George address these benefits, as does the Verified Statement of Matthew Graham.

- Benefits to all Americans from diverting more than two million trucks to safer and more environmentally friendly rail transportation, as discussed in the Verified Statement of Matthew Graham. In addition, Chicago-area residents will benefit from the reduction of rubber-tire interchanges between UP and NS intermodal facilities in the Chicago area, as described in the Operating Plan.

8. The Summary of Benefits Exhibit summarizes two principal categories of benefits: (a) increases in net operating revenues realized by UP/NS as a result of traffic attracted to new, more competitive offerings of UP/NS, and (b) the net reductions in costs that will flow from the merger, including administrative costs, operating costs, and personnel costs.

9. The Summary of Benefits Exhibit shows the projected benefits and costs during each of the three implementation years leading to full integration of UP/NS. For each year, Applicants identified "annual" costs and benefits, "one-time" costs and benefits, and planned investments. The Summary of Benefits Exhibit shows projected benefits in 2023 dollars, as are dollar figures in this Verified Statement.

10. Applicants also show projected costs and benefits in a "normal year." The normal year is a projected typical year after UP and NS are fully integrated. By

the normal year, the costs and benefits are annual and recurring. All the one-time costs and benefits have been spent or received by then.

11. In the UP/NS merger, certain traffic gains will depend in part on capital expenditures, including projects that will increase the capacity of the main line and yards. UP and NS will also invest capital on Mechanical projects, Engineering equipment, freight car modifications, and technology investments. UP/NS will complete this capital work and use it to enhance operations as soon as practically possible.

12. Applicants estimate that UP/NS will spend $2.1 billion in the first three years in capital investment in support of the merger. UP/NS will invest $1.1 billion to enable Growth Plan traffic volumes described in the Operating Plan.[1] Another $1.0 billion will enable technology improvements and other synergies.[2] This amount includes a $798 million investment to integrate UP and NS information technology systems, and ensure that UP/NS operates on best-in-class, reliable, and efficient systems, as described in the Information Technology part of the Service Assurance Plan.[3] Applicants anticipate 34 percent of the total capital expenditures required to support operations will occur during the first year of UP/NS combined operations, 39 percent in the second year, and 27 percent in the third year.[4] The timing of benefits

[2] *See* Workpaper "Synergies Transportation - Operating.xlsx," Tab "Capital Investment," Cell H96.

[3] *See id.*, Cell H104.

[4] *See id.*, Cells E114, F114, and G114.

is based on predictions by affected departments about when those benefits would be realized and is shown in the work papers accompanying this verified statement.

13. Some of the synergies discussed in this statement will affect UP's and NS's agreement and management workforces. For example, efforts to insource tasks currently performed by third party contractors will add jobs for craft employees. Detailed information regarding the effect of the proposed transaction on Applicants' employees is provided in the Employee Impact Exhibit in Volume 2 of the Application and discussed in the Verified Statements of Joshua Perkes and Maqui Parkerson.

I. Increases in Net Operating Revenues

14. The Summary of Benefits Exhibit shows projected net revenue gains to UP/NS as a result of new and more competitive service offerings. Net revenue gains represent revenues from additional rail traffic less the costs of handling such traffic. These revenue gains reflect public benefits because they flow directly from strengthened competition provided by a merged UP/NS: they result because shippers will view UP/NS service offerings as more attractive than their pre-merger options.

15. The net revenue gains are based on analyses presented by several witnesses. The Joint Verified Statement of David Hunt and Matthew Schabas of Oliver Wyman concludes that some shippers, responding to new and more competitive service offerings, will elect to use UP/NS rather than truck, and other

shippers will choose to route their shipments for a longer distance on UP/NS or decide to use UP/NS service instead of shipping on another railroad.[5]

16. For all this traffic, Mr. Hunt and Mr. Schabas estimated UP/NS's revenues based on 2023 revenue per-ton-mile data.[6] In their Joint Verified Statement, Michael Boyles and Divya Mathur estimate the additional costs of handling the traffic by applying Uniform Rail Costing System ("URCS") unit costs associated with moving the traffic over the merged UP/NS system.[7]

17. In the normal year, Applicants expect gross revenue gains from additional traffic of approximately $4.2 billion.[8] Applicants expect the additional costs of handling that traffic will be approximately $2.2 billion.[9]

18. Applicants expect UP/NS will spend $1.1 billion to add capacity to the combined network in support of additional traffic.[10] Capacity spending includes investment along UP/NS main lines to construct second main track, extend sidings, and improve signal systems. It also includes investments across the UP/NS network to increase capacity at a number of manifest yards, intermodal terminals, and

---

[6] *See id.* § 8 (Revenue).

[7] *See* App. Vol. 1, Verified Statement of Michael Boyles and Dr. Divya Mathur ("Boyles/Mathur VS") ¶¶ 9–11.

[8] *See* Hunt/Schabas VS, Exhibit 8-1 (Total diversion revenue estimate).

[9] *See* Boyles/Mathur VS, Figure 2 (Incremental Costs of Diverted Traffic).

[10] *See* Workpaper "Synergies Transportation - Operating.xlsx," Tab "Capital Investment," Cell H90.

automotive terminals. Finally, capacity spending includes investments to upgrade UP/NS's refrigerated box car fleet to move traffic identified in the Growth Plan.

II. Savings from Cost Reductions

19. The Summary of Benefits Exhibit also shows projected cost savings that will be achieved by a merged UP/NS. These cost savings represent efficiencies UP/NS will achieve by combining their operations. These cost savings are public benefits because they will allow UP/NS to compete more aggressively and increase the resources available for reinvestment in innovating and improving service quality for customers.

20. The projected cost savings shown in the Summary of Benefits Exhibit flow from savings in three categories of costs: (1) administrative; (2) operating, including procurement; and (3) personnel.

21. For these categories, Applicants reviewed UP's spending history and practices against NS's spending history and practices, seeking to eliminate duplication or apply the efficiency of the best practice or technology to the combined railroad. Where Applicants concluded UP has the better practice, they determined the estimated percentage savings from NS's spending history that could be achieved in the future through application of UP's practice to a combined UP/NS. Where Applicants concluded NS has the better practice, they determined the estimated percentage savings from UP's spending history that could be achieved in the future through application of NS's practice to a combined UP/NS.

A. Savings from Reductions in General & Administrative Costs

22. The Summary of Benefits Exhibit includes savings attributable to reduced General and Administrative ("G&A") costs. The G&A savings include (1) non-personnel, non-operating savings; (2) overhead savings associated with rationalized terminals; (3) overhead savings associated with personnel efficiencies; and (4) savings associated with technology spending that result from combining the management and administrative functions of UP and NS.

23. Some savings stem from eliminating duplicative expenses or activities. For example, the combined organization would now only need to pay one set of fees to the New York Stock Exchange, and will be able to combine fees related to mailing of proxy statements. In addition, personnel efficiencies will reduce overhead expenses, including from computer, cell phone, travel, vehicle, and office supplies.

24. Significant technology savings will also be realized. Applicants expect over $60 million of annual savings will come from rationalizing managed service provider and contractor software development expenses.[11] Another roughly $90 million in annual savings will come from consolidating and rationalizing software license agreements between the companies across a range of functions.[12]

25. Overall, Applicants expect the UP/NS merger will produce $198 million annually in G&A savings, as shown in Table 1.[13] Applicants also expect the merger

[11] *See* Workpaper "Synergies G&A - Admin.xlsx," Tab "Tech," Cell E65.

[12] *See id.*, Cell E66.

[13] *See id.*, Tab "Summary Tracking Sheet," Cell H23.

will result in an estimated $40 million in annual capital savings through avoided duplicative investment in developing information technology systems.[14]

26. Table 1 below summarizes total estimated G&A expense savings by year following approval of the merger.

Table 1
Annual Savings for General & Administrative Expense
($ Millions, 2023 dollars)

G&A Expenses	Year 1	Year 2	Year 3	Normal Year
G&A Non-Labor[15]	$21	$32	$36	$36
Technology[16]	-	-	161	161
Total G&A Savings	$21	$32	$198	$198

(Numbers may not add due to rounding)

B. Savings from Reductions in Operating Costs

27. The Summary of Benefits Exhibit also shows projected reductions in operating costs that will flow from the merger. This category includes the savings Applicants expect will result from merger-related changes to (1) rail operations, (2) rolling stock and engineering, (3) operating practices and operating application technologies, and (4) procurement practices. Categories (2), (3), and (4) do not include labor related savings, which are discussed in Section II.C.

[14] *See* Workpaper "Synergies Transportation - Operating.xlsx," Tab "Tech Capital Synergies," Cell D55.

[15] *See* Workpaper "Synergies G&A - Admin.xlsx," Tab "Summary Tracking Sheet," Cells E19:H19.

[16] *See id.*, Cells E22:H22.

1. Savings from Changes to Rail Operations

28. The changes in rail operations resulting from the merger are described in the Operating Plan in Volume 2 of the Application. The Summary of Benefits includes savings from three main sources.

29. First, the merger will create operational efficiencies by allowing the combined company to optimize existing traffic flows. The Operating Plan calculates changes in operating statistics attributable to optimizing existing traffic flows, including reductions to handling, train miles, locomotive unit miles, gross ton miles, car miles, and car days. The Joint Verified Statement of Michael Boyles and Divya Mathur quantifies the dollar savings attributable to those operating metric reductions. Those savings amount to approximately $76 million annually.[17]

30. Second, the merger will reduce the number of intermodal boxes that are currently trucked / drayed at interchange locations from one ramp in a city to a second ramp and are placed on an outbound train. By merging, these expenses associated with trucking boxes between ramps will be eliminated. Applicants estimate these savings will be $26.4 million annually.[18]

31. Finally, the merger will allow the combined company to reduce fees paid to third parties associated with terminal usage. An example of these cost savings would be savings in terminal switch fees paid as a result of no longer routing cars

[17] *See* Boyles/Mathur VS, Figure 1 (Summary of Merger-Related Reductions in Operating Expenses).

[18] *See* Workpaper "Synergy Transportation - Operating.xlsx," Tab "Operating Plan Impact," Cell K24.

through an intermediate switch carrier. Applicants expect these savings will amount to approximately $6.7 million annually.[19]

2. Savings from Changes to Rolling Stock and Engineering Departments

32. As discussed in the Operating Plan, UP/NS will generate significant savings in operating costs by implementing best practices and technologies across the Mechanical (a.k.a. "rolling stock") and Engineering Departments.[20]

33. Mechanical non-labor savings will be generated in a variety of ways. For example, UP/NS will be able to (1) rationalize locomotive and car facilities at interchange locations to reduce associated fixed costs; (2) consolidate freight car fleets to enable the utilization of otherwise underutilized assets; (3) reduced repair and material costs resulting from a smaller combined locomotive fleet; (4) normalize the number of vehicles utilized by the NS Mechanical Department to levels more consistent with UP's rates; and (5) utilize UP shop capacity to insource wheelset production and eliminate contractor spend.

34. Applicants expect UP/NS will invest $17.3 million in capital expenditure in the first three years to achieve these Mechanical savings.[21] This investment will go towards increasing the capacity of the assembly facility at UP's North Little Rock,

---

[19] *See id.*, Tab "Third Party Fees," Cell L38.

[20] *See* App. Vol. 2, Operating Plan §§ 10.2, 10.3.

[21] *See* Workpaper "Synergies Transportation - Operating.xlsx," Tab "Capital Investment," Cell H8.

Arkansas facility. That expanded capacity will allow UP/NS to reduce costs by insourcing wheelset assembly.

35. In total, Applicants project that Mechanical non-labor savings will amount to $32.4 million annually.[22]

36. Engineering non-labor savings will come from a variety of sources, including but not limited to: (1) normalization of the number of vehicles utilized by the NS Engineering Department to levels consistent with UP's fleet size; (2) utilization of UP's specialty machines for track renewal work on NS in place of the contractors currently used by NS for this work; and (3) utilization of best practices existing at the time of the merger for certain aspects of the business—*e.g.*, spray equipment, data warehouse—in order to avoid paying contractor fees.

37. Applicants expect UP/NS will invest $66.8 million in capital expenditure in the first three years after the merger to realize these Engineering savings.[23] This will go towards purchasing additional specialty machines for track renewal work, which will enable insourcing of rail tie removal and transportation to disposal facilities.

38. In total, Applicants project engineering non-labor savings will amount to $55.7 million annually.[24]

---

[22] *See* Workpaper "Mech_Eng Synergies.xlsx," Tab "MECH Op Plan Impact," Cell I1.

[23] *See* Workpaper "Synergies Transportation - Operating.xlsx," Tab "Capital Investment," Cell H9.

[24] *See* Workpaper "Mech_Eng Synergies.xlsx," Tab "EN Op Plan Impact," Cell I1.

3. Savings from Changes to Operating Practices and Operating Technologies Applications

39. As described in the Operating Plan, UP/NS will generate significant savings in operating costs by implementing best practices and operating application technologies across the combined company.

40. UP/NS will apply best practices to enhance the safety of the combined network. Applicants will use their combined expertise to improve NS's injury rate to match UP's, and improve UP's derailment rate to match NS's.[25]

41. UP/NS will also realize additional synergies by applying UP operating best practices and intermodal gate technology to the NS network. Examples of these non-labor synergies include applying UP crew transportation and lodging processes to the NS system.

42. Applicants expect UP/NS will invest $56 million in capital expenditure in the first three years to realize non labor savings.[26] For example, UP/NS will install proprietary gate inspection technology at select NS ramps. By utilizing this in-house technology, gate management can be consolidated, and contractor expense can be eliminated.

---

[25] For additional detail, see the Safety Integration Plan. For the Summary of Benefits, Applicants quantify a partial reduction for the safety and derailment improvements. Specifically, Applicants averaged the injury rate between the UP and NS which reflects a partial reduction in the NS injury rate. The same logic was used for the derailment synergy calculation. *See* Workpaper "Synergies Transportation - Operating.xlsx," Tab "Personal Injury Derailment," Cells C12:G12 and L12:P12.

[26] *See id.*, Tabs "Capital Investment," Cell H6 and "PGT," Cell G38 (base source).

43. Applicants project this combined group of non-labor synergies will save $30.4 million annually.[27]

44. Applicants also expect UP/NS will install and utilize Operating applications (*e.g.*, SwitchPro NX and remote control locomotive operations) at certain NS manifest terminal facilities.

45. The NX System is a proprietary application that is not available to NS today. This application integrates field equipment, back-office systems, handheld devices, and digital displays to automate remote switching operations and car inventory updates. This enables a single operator to safely and efficiently classify cars. This application enhances safety by reducing time spent walking the yard and manually operating switches. Applicants expect UP/NS will install this technology at a number of legacy NS terminals. These benefits are quantified within the Personnel section of this Verified Statement.

46. Applicants also expect UP/NS will expand the use of remote control locomotive operations to additional terminals across the legacy NS network. This technology allows an employee to use a wireless handheld device instead of operating the locomotive inside the cab. This system improves efficiency and safety within our rail yards and industrial sites that we serve by reducing crew requirements and giving operators better visibility during switching operations. This application reduces agreement headcount needs, and the benefits are quantified within the Personnel section of this Verified Statement.

[27] *See id.*, Tab, "Operating Plan Impact," Cell K21.

47. To realize savings, Applicants expect UP/NS will invest $108.2 million in capital expenditure in the first three years to install the NX and remote control operations systems.[28]

48. Applicants also expect UP/NS will implement NetControl as the operating system on UP/NS as discussed in the Information Technology section of the Service Assurance Plan. With the implementation of NetControl, UP/NS will be able to utilize UP's proprietary Terminal Command Center application across legacy NS manifest terminals. Terminal Command Center is a digital platform that gives real-time visibility into terminal operations, including crew productivity and car movement information. By consolidating this information, the management team is able to quickly address challenges, keep operations fluid, and make faster and smarter decisions, the benefits of which are quantified within the Personnel section of this Verified Statement.

49. Applicants also identified an opportunity to reduce the consumption of fuel on the legacy NS network by applying UP policies and efficiencies. Applicants expect to realize this improvement through a number of initiatives: (1) reduced usage of high and low horsepower locomotives as a result of the optimized rail network; (2) increased length of NS trains; and (3) reduced duration of engine component load tests on legacy NS trains, reflecting current UP policy. These changes will save $46.5 million annually.[29]

---

[28] *See id.*, Tab "Capital Investment," Cell H4.

[29] *See id.*, Tabs "Operating Plan Impact," Cell K33 and "Fuel Use Merger Initiatives," Cell C67 (base source).

4. Savings from Changes to Procurement

50. UP has applied a proprietary set of principles and processes for almost 20 years to strategically and routinely evaluate its third-party contract spend. These efforts have resulted in considerable savings, including savings to capital expenditures. UP has tracked these by category—for example, materials or contract services.

51. Applicants intend to apply these same principles and processes to NS's procurement. Applicants have already evaluated NS procurement spend based on the R1 Schedule 410 (operating expenses) and Schedule 330 (capital improvements) filings. My team, in conjunction with the stakeholder departments, jointly reviewed the spend categories on these filings, and excluded categories where Applicants did not expect any synergies or where synergies were otherwise quantified in separate analyses. For the remainder, Applicants applied the historical savings rate that they have realized to the NS spend. The potential synergy amount identified was then discounted by 15 percent.[30] The savings amount to approximately $100.5 million in expenses annually, and $89.8 million in annual capital savings in infrastructure replacement investment.[31]

[30] *See* Workpaper "Mech_Eng Synergies.xlsx," Tab "WAVE OE Summary," Cell G22; Workpaper "Synergies Transportation - Operating.xlsx," Tab "WAVE Capital Summary," Cell G10.

[31] *See* Workpaper "Mech_Eng_Synergies.xlsx," Tab "WAVE OE Summary," Cell G23; Workpaper "Synergies Transportation - Operating.xlsx," Tab "WAVE Capital Summary," Cell G17.

5. Operating Savings Summary

52. I show the sum of savings from merger-related changes to (1) rail operations, (2) Rolling Stock & Engineering, (3) operating practices and technology applications, and (4) procurement practices below in Table 2.

Table 2
Annual Non-Labor Savings for Operating Expense
($ Millions, 2023 dollars)

Operating Expenses	Year 1	Year 2	Year 3	Normal Year
Rail Operations[32]	$55	$109	$109	$109
Rolling Stock & Engineering[33]	21	80	88	88
Operating Practices & Operating Technology applications[34]	23	53	77	77
Changes in Procurement[35]	25	50	100	100
Total Operating Savings	$124	$292	$374	$375

(Numbers may not add due to rounding)

C. Savings from Reductions in Personnel Costs

53. The Employee Impact Exhibit, described in the Verified Statement of Joshua Perkes and the Verified Statement of Maqui Parkerson, identifies the impact

[32] *See* Boyles/Mathur VS, Figure 1 (Applicants estimated year one Optimized Plan savings to be half of the year two and year three savings estimated by Boyles and Mathur, to account for implementation timeline.); Workpaper "Synergies Transportation - Operating.xlsx," Tab "Operating Plan Impact," Cells H26:K26 and H24:K24.

[33] *See* Workpaper "Mech_Eng Synergies.xlsx," Tabs "MECH Op Plan Impact," Cells F1:I1 and "EN Op Plan Impact," Cells F1:I1.

[34] *See* Workpaper "Synergies Transportation - Operating.xlsx," Tab "Operating Plan Impact," Cells H21:K21 and H33:K33.

[35] *See* Workpaper "Mech_Eng Synergies.xlsx," Tab "WAVE OE Summary," Cells D29:G29.

of the proposed transaction on all categories of personnel for both UP and NS. The Summary of Benefits quantifies the savings of those impacts.

54. The UP and NS Human Resources departments carefully assessed the impact of the proposed transaction on management positions. The process included reviewing all jobs, by department, to gain insights into position leveling, workload distribution, span of control, overlap, and potential areas for improved efficiency between the two organizations. A cost estimate was then generated for each job determined to be affected based on its respective grade, including fringe benefits. Efficiencies created by the merger will allow UP/NS to realize approximately $260 million annually in management personnel savings.[36]

55. Synergies also exist for the agreement work force, particularly in the train, engine, and yard ("TE&Y"), mechanical, dispatching, and engineering departments. Applicants expect efficiencies will stem from yard rationalizations and implementation of new processes and technology. Upon identifying affected functions, the associated headcount was approximated and savings estimated.

56. Applicants project that efficiencies created by the merger will allow UP/NS to realize approximately $132.4 million of net annual agreement personnel savings.[37]

---

[36] *See* Workpaper "Labor Synergy Summary.xlsx," Tab "Labor Savings Summary," Cell M176.

[37] *See id.*, Tab "AgrmtLabor_Summary," Cell E18. As discussed above in section I, Boyles and Mathur used URCS to estimate operating savings, including certain TE&Y savings which contain a labor component. *See* Boyles/Mathur VS ¶¶ 20, 39; *id.*, Figure 3 (Train Mile Operating Reductions, URCS Unit Costs, and Estimated

Table 3
Annual Agreement Labor Savings
($ Millions, 2023 dollars)

Category	Year 1	Year 2	Year 3	Normal Year
Management[38]	$100	$195	$260	$260
Agreement[39]	41	88	132	132
Total	$141	$283	$392	$392

57. Savings from reductions in personnel consist of avoided salaries and benefits, and they are expected to be offset by approximately $173.2 million in one-time employee relocation costs, separation payments, and labor protection costs.[40] These one-time costs are primarily due to relocation of certain NS headquarters positions to Omaha, and separation costs associated with reductions in duplicative positions. For the majority of non-executive positions, the savings will be achieved through retirements and normal attrition, especially in the second and third year after the two companies merge.

III. Summary

58. The Summary of Benefits Exhibit shows $3,080 million of projected annual benefits in 2023 dollars in a normal year following the merger. The $3,080 includes $1,982 million in net revenues from traffic attracted from trucks and other

Cost Savings). To avoid double counting, these savings are not included in this estimate.

CARRIE POWERS

Table of Contents

I. Building Base Year Data for Pro Forma Financial Statements 2

II. Combined Base Year Pro Forma Financial Statements..... 2

III. Forward-Looking Pro Forma Financial Statements 3

VERIFIED STATEMENT

OF

CARRIE POWERS

1. My name is Carrie Powers. I am Vice President, Controller and Chief Accounting Officer for Union Pacific Railroad Company ("UP"). I have served in this position since May 2025, and I have been employed at UP since 2000.

2. I have served in multiple roles during my time at UP, including Assistant Vice President Financial Reporting, General Director Payroll, General Director Financial Reporting and Analysis, and various other roles in Tax, Financial Analysis and Financial Reporting at UP. I earned a Bachelor of Science in Business Administration with a major in Accounting from Appalachian State University. I hold an inactive Certified Public Accountant License from the State of Nebraska.

3. In my current role with UP, I am responsible for safeguarding the financial results of the organization by managing accounting operations, ensuring compliance, and providing strategic financial guidance to drive organizational success.

4. I am submitting this verified statement to describe my preparation of the pro forma financial statements for the new UP/NS on a consolidated basis following the acquisition of control by Union Pacific Corporation ("UPC") of Norfolk Southern Corporation ("NSC"), specifically the Pro Forma Balance Sheets (Exhibit 16, Appendix E to this volume of the Application), Pro Forma Income Statements (Exhibit 17, Appendix F to this volume of the Application), and Pro Forma Sources

and Applications of Funds Statement (Exhibit 18, Appendix G to this volume of the Application).

5. Consistent with Board regulations, these statements are designed to show the financial impact of the proposed transaction on a forward-looking basis over the three-year period during which the merger will be implemented and in a normal post-implementation year. All impacts are shown relative to the base year pro forma statements I developed for the combined company for 2023.

6. The notes accompanying Exhibits 16, 17, and 18 explain in detail the assumptions underlying the statements. In the sections below, I explain the process I used to prepare the statements.

I. Building Base Year Data for Pro Forma Financial Statements

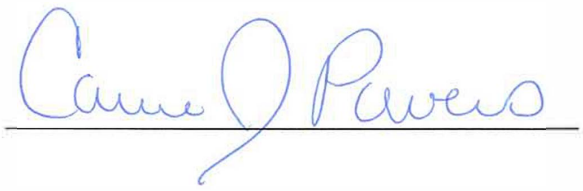
7. I used UPC's 2023 Annual Report on Form 10-K and NSC's 2023 Annual Report on Form 10-K as the starting point for my preparation of the pro forma financial statements. I used 2023 as the base year to be consistent with other analyses presented in the Application. I made minor adjustments to the UPC and NSC 2023 financial statements to create representative base year financial statements, as described in the notes to the Exhibits.

II. Combined Base Year Pro Forma Financial Statements

8. To develop the combined Base Year pro forma financial statements, I started with the separate base-year financials for UPC and NSC and combined them on a pro forma basis, reflecting the financial terms of the proposed transaction. The results are shown in the Base Year columns of the pro forma financial statements presented in Exhibits 16, 17, and 18.

9. The combined Base Year statements reflect the purchase price of the proposed transaction and apply purchase accounting to create pro forma Base Year financial statements for the post-transaction UP/NS. The consideration of purchase price is consistent with the Form S-4 Registration Statement UPC filed with the SEC on September 30, 2025 (set forth as Exhibit 7.2 in Volume 4 of the Application).

III. Forward-Looking Pro Forma Financial Statements



10. I developed the portions of the pro forma financial statements covering the period after the control date using information regarding the proposed transaction's impact on revenues, costs, and capital expenditures over the period of the proposed transaction's full implementation developed for the Summary of Benefits Exhibit.

11. The pro forma financial statements also depict the effects of interest payments and principal repayments on UPC's acquisition debt and UPC and NSC historical debt, as described in the notes to the Exhibits.

VERIFICATION

I, Carrie J. Powers, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

VERIFIED STATEMENT

OF

JOSHUA PERKES

Table of Contents

I. Overview of Anticipated Changes in UP's and NS's Management Workforce 2

II. Norfolk Southern Management Positions 4

III. UP Management Positions 7

IV. Workforce Stability Throughout Integration 8

VERIFIED STATEMENT

OF

JOSHUA PERKES

1. My name is Joshua Perkes. I am Senior Vice President and Chief Human Resources Officer for Union Pacific Railroad Company ("UP"). I have been employed at UP since 2002 and leading Human Resources since August 2024. Previously, I held leadership positions within UP's Marketing and Sales Premium, Industrial, Bulk, and Operations teams. Additionally, I have worked across various Human Resources functions, including talent management, talent acquisition, employee engagement, training, labor relations, and compensation and benefits. I earned a bachelor's degree in English from Brigham Young University and an M.B.A. from the University of Chicago Booth School of Business.

2. In my current role, I lead UP's human resources and labor relations functions, ensuring our workforce strategy aligns with the company's overall strategic objectives. This includes driving effective talent acquisition processes, delivering competitive compensation and benefits, developing comprehensive training programs, and strengthening organizational effectiveness. We handle these responsibilities while staying compliant with labor laws and honoring our union agreements. At the same time, Human Resources is also focused on strengthening our culture by expanding professional growth opportunities for both craft and management employees, promoting safety, and well-being, and ensuring our communications are clear, consistent and aligned with UP's values and mission.

3. This statement addresses the Employee Impact Exhibit in Electronic Appendix B of the Application concerning unrepresented employees, referred to as "management." It also outlines the steps Applicants anticipate taking to manage changes within the management workforce resulting from the proposed combination of UP and Norfolk Southern Railway Company ("NS").

I. Overview of Anticipated Changes in UP's and NS's Management Workforce

4. Applicants are bringing together two talented workforces to create a stronger, more efficient company that is positioned to grow and succeed well into the future. This integration is being approached thoughtfully and deliberately, with a measured plan designed to maintain safety, stability, operational continuity, and strong customer service. By combining the best talent from both organizations, UP/NS will build on shared expertise while capitalizing on synergies to build a foundation for long-term success. Every step of this process will be thoroughly planned and carefully executed to minimize disruption and ensure a smooth transition.

5. UP and NS teams have worked collaboratively to evaluate the estimated impact of the proposed transaction on management positions. This comprehensive review examined responsibilities, workload distribution, span of control, and opportunities to adopt best practices and improve efficiency. The resulting plan reflects Applicants' commitment to a thoughtful, measured approach that maintains stability while positioning the combined organization for greater operational effectiveness.

6. Applicants plan to implement a merit-based approach to determine the post-integration workforce for the combined entity. This approach is designed to build the strongest possible team by integrating expertise, diverse perspectives, and top talent from both organizations. The process will align competencies, qualifications, and demonstrated performance with the functional requirements of each position, rather than defaulting to incumbency or predetermined succession plans. This reflects Applicants' commitment to objectivity, ensuring that every placement supports the strategic and growth objectives of the combined enterprise.

7. Consistent with this approach, the data shown in the following tables relate solely to impacts on the position within the future organization and do not reflect decisions about individual employees. In fact, Applicants fully expect there will be movement of individuals from both companies amongst various positions to ensure optimal placement of top talent in the future organization's integrated structure, leveraging the process outlined above. Current estimates are preliminary and subject to revision.

8. Omaha, Nebraska, will serve as the headquarters for the combined company. Atlanta, Georgia, will continue to serve as a regional operating center with a strong commercial presence and remain a vital hub for technology and innovation. While the proposed transaction is pending and throughout the three-year integration period, Applicants will continue refining plans and the allocation of functions between Omaha and Atlanta to meet the needs of the future organization.

II. Norfolk Southern Management Positions

9. NS employs approximately 4,174 employees who are not represented by labor unions. Of that population approximately 49 percent work at NS's headquarters in Atlanta and 51 percent work in field locations.[1]

10. Table 1 below provides Applicants' best estimate of the impact of the merger on management positions at the Atlanta headquarters and in field locations. Positions are classified as either "operating" or "non-operating." The "operating" classification refers to managerial positions in the operating department, while the "non-operating" classification refers to positions in other departments. As part of Applicants' evaluation process and to ensure consistency, NS positions and departments were mapped to UP's position and department structures.

Table 1[2]
Norfolk Southern's Management Employment by Classification

Locations	NS Mgmt Positions	NS Positions Reduced by Year				NS Positions Retained	NS Positions Relocated to Omaha HQ	NS Positions Remaining at Current Location
		1	2	3	Total			
Atlanta HQ – Operating	781	111	48	31	190	591	200	391
Atlanta HQ – Non-Operating	1,282	244	39	64	347	935	346	589
Atlanta HQ Totals	2,063	355	87	95	537	1,526	546	980
NS Field – Operating	1,853	137	106	19	262	1,591	-	1,591
NS Field – Non-Operating	258	35	14	10	59	199	-	199
Field Totals	2,111	172	120	29	321	1,790	-	1,790
Norfolk Southern Total	4,174	527	207	124	858	3,316	546	2,770

[1] *See* Workpaper "Management_Workpapers_Employee Impact.xlsx," Tab "Table_Impact & Relo."

[2] *See* Workpaper "Management_Workpapers_Employee Impact.xlsx," Tab "Table_Impact & Relo."

11. Following the control date, workforce adjustments will be implemented gradually to ensure stability and continuity. Reductions will be phased over three years to minimize disruption and leverage natural attrition, which averages 8 percent[3] annually for both companies. In total, NS management positions are expected to decline by approximately 21 percent over the three-year period after the control date, with about 13 percent of reductions occurring in the first year, 5 percent in the second year, and 3 percent in the third year.[4] While Applicants have not yet detailed the specific additional management positions that may be needed to support anticipated traffic growth, their projections thoughtfully account for the expectation that new roles will be created as traffic increases. This proactive approach is expected to reduce the overall impact of planned workforce adjustments and help offset severance costs, reflecting a commitment to supporting both operational needs and employees as the business grows.

12. As noted above, NS's Atlanta headquarters will continue to serve as a regional operating center with a strong commercial presence and will remain a vital hub for technology and innovation. Most adjustments will occur in general and administrative functions, driven by operational synergies and the elimination of overlapping positions, particularly at the executive level. Reductions will be phased

[3] *See* Workpaper "Management Attrition Rate.xlsx," Tab "Workpaper_Mgmt Attrition," Cell G16.

[4] *See* Workpaper "Management_Workpapers_Employee Impact.xlsx," Tab "Table_Impact & Relo," Cells D13:F13.

over three years and are expected to affect about 26 percent of the Atlanta headquarters positions.[5] Applicants are committed to supporting employees throughout this process by exploring alternative opportunities wherever possible.

13. To help ensure a seamless integration process, there will be no significant impact on positions critical for the successful integration of new technology or positions responsible for maintaining current systems support and connectivity. In addition, to help ensure continued high levels of customer service, there will be no significant impacts on customer-facing positions in the customer support function. To sustain safety, operational effectiveness, and reliable service delivery, reductions in field operations management positions will be minimized and phased in gradually, relying primarily on natural attrition. This approach underscores Applicants' priority to preserve strong service and operational reliability while integrating functions efficiently.

14. Applicants will carefully determine which positions will remain in Atlanta and which will relocate to Omaha to support the future structure of the combined company. Approximately 26 percent of the positions currently in NS's Atlanta headquarters, primarily in general and administrative functions, are expected to move to Omaha to capture operational efficiencies and synergies achieved by merging teams.[6]

---

[5] *See* Workpaper "Management_Workpapers_Employee Impact.xlsx," Tab "Table_Impact & Relo," Cells D9:F9.

[6] *See* Workpaper "Management_Workpapers_Employee Impact.xlsx," Tab "Table_Impact & Relo," Cells I9:K9.

III. UP Management Positions

15. UP employs approximately 4,912 employees who are not represented by labor unions. Of that population, approximately 55 percent work at UP's headquarters in Omaha, and 45 percent work in field locations.[7]

16. Table 2 below provides Applicants' best estimate of the impact of the merger on management positions at the Omaha headquarters and field locations. Positions are classified as either "operating" or "non-operating." The "operating" classification refers to managerial positions in the operating department, while the "non-operating" classification refers to positions in other departments.

Table 2[8]
Union Pacific's Management Employment by Classification

Locations	UP Mgmt Positions	UP Positions Reduced by Year 1	2	3	Total	UP Positions Retained	UP Positions Relocated to Atlanta HQ	UP Positions Remaining at Current Location
Omaha HQ – Operating	1,047	50	20	9	79	968	-	968
Omaha HQ – Non-Operating	1,674	40	25	10	75	1,599	-	1,599
Omaha HQ Totals	2,721	90	45	19	154	2,567	-	2,567
UP Field – Operating	1,771	60	35	15	110	1,661	-	1,661
UP Field – Non-Operating	420	15	-	1	16	404	-	404
Field Totals	2,191	75	35	16	126	2,065	-	2,065
Union Pacific Total	4,912	165	80	35	280	4,632	-	4,632

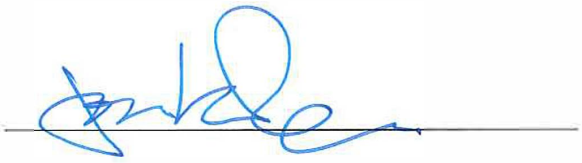
[7] *See* Workpaper "Management_Workpapers_Employee Impact.xlsx," Tab "Table_Impact & Relo."

[8] *See* Workpaper "Management_Workpapers_Employee Impact.xlsx," Tab "Table_Impact & Relo."

17. Following the control date, workforce adjustments will be implemented gradually to ensure stability and continuity. Leveraging a portion of attrition that will naturally occur, UP management positions are expected to decline by approximately 6 percent.

18. For the Omaha headquarters, the number of management positions will increase over the three-year period after the control date from 2,721 to 3,113 as a result of NS positions moving from Atlanta to Omaha.[9] The number of field positions is not expected to increase.

IV. Workforce Stability Throughout Integration



19. As outlined above, integration of the UP and NS workforces is being approached thoughtfully and deliberately to maintain stability and minimize disruption. Immediate impacts on the workforce will be minimal, and staffing levels will remain sufficient to support operational continuity and strong customer service. Adjustments will occur gradually over three years, primarily through natural attrition and phased implementation, with critical roles preserved until integration is complete. This measured approach safeguards essential functions, captures operational efficiencies, and creates opportunities for professional growth, ensuring that the combined company will be well-positioned to deliver reliable service, support employees, and grow.

VERIFIED STATEMENT

OF

MAQUI B. PARKERSON

Table of Contents

I. Current Operations and Union Representation 3

II. The Effects of the Proposed Transaction and Applicants' Commitment to Provide Employment Opportunities for All Current Employees 4

III. Employee Protective Conditions 8

VERIFIED STATEMENT

OF

MAQUI B. PARKERSON

1. My name is Maqui B. Parkerson. I am Vice President Labor Relations for Union Pacific Railroad Company ("UP"). I have held my current position since April 20, 2022. I joined UP as Vice President Labor Relations and Sustainability in April 2021. Before joining UP, I was Vice President Labor Relations for The Kansas City Southern Railway Company ("KCS"). Prior to that, I held positions in the Law Departments of KCS and Norfolk Southern Corporation. I began my railroad career in the Law Department of Norfolk Southern Corporation in May 1998. I earned a bachelor's degree in Economics and Mathematical Methods in the Social Sciences from Northwestern University, a Juris Doctor degree from the William and Mary Law School, and a Master of Science degree in Transportation Management from the University of Denver.

2. In my role as Vice President Labor Relations at UP, I am responsible for negotiating collective bargaining agreements with all of the labor organizations that represent UP's employees. I also have overall responsibility for the administration of UP's collective bargaining agreements and lead UP's Labor Relations Department. UP Labor Relations works closely with other departments to collaborate with labor union leaders on various change initiatives to support the company's Safety, Service, and Operational Excellence strategy while ensuring compliance with all applicable agreements, policies, laws, and regulations.

3. I submit this Verified Statement in support of the proposed transaction involving UP and Norfolk Southern Railway Company ("NS"). As I explain in more detail below, this transaction is expected to protect and enhance employment opportunities for railroad craft employees. The public benefits of the transaction are based on service improvement and traffic growth, which will promote employment security for railroad craft employees. Although the Applicants expect to realize significant operating efficiencies as a result of the transaction as described in the Operating Plan, they also expect that the improved service offerings made possible by the transaction will result in traffic growth following approval, and thus provide employment and job security for Applicants' employees. Accordingly, Applicants have made an unprecedented commitment, discussed below, to provide job opportunities for current craft employees who wish to continue and finish their careers as employees of the combined railroad system. This commitment is further detailed in groundbreaking agreements with the International Association of Sheet Metal, Air, Rail and Transportation Workers - Transportation Division ("SMART-TD"), which is the nation's largest rail labor organization, as well as with the National Conference of Firemen & Oilers ("NCFO"), the Brotherhood of Railroad Carmen ("BRC"), the International Brotherhood of Boilermakers ("IBB"), and the United Supervisors Council of America ("USCA").

4. Further, UP and NS are parties to the so-called "Cramdown Agreements." Pursuant to those agreements, UP and NS will seek implementing agreements that modify collective bargaining agreements only to the extent

necessary to achieve the benefits of the transaction, thus reducing the risk of labor disputes in connection with implementation of the transaction.

I. Current Operations and Union Representation

5. As described in the Application, UP is a Class I freight railroad system operating in 23 states in the western two-thirds of the United States. NS is a Class I freight railroad system operating in 22 states in the eastern United States and the District of Columbia. The chart below shows craft employee populations by craft for the Applicants.

Table 1[1]
UP and NS Agreement Employees (as of September 15, 2025)

Craft	Norfolk Southern Railway	Union Pacific Railroad	Total
Car Mechanical	920	1,205	2,125
Clerical	370	573	943
Communications	138	211	349
Equipment Mechanical	154	242	396
Locomotive Mechanical	1,352	2,242	3,594
Signal Maintainers	965	1,472	2,437
Track Maintainers	3,010	5,844	8,854
Engineers	3,415	5,688	9,103
Trainpersons	4,583	8,230	12,813
Train Dispatchers	285	0	285
Union Supervisors	0	495	495
Yard Controllers	292	153	445
Total	**15,484**	**26,355**	**41,839**

[1] *See* Workpaper "Craft Employee Impact Report.xlsx," Tab "Craft Employee Summary."

6. The craft employees of both UP and NS are covered by collective bargaining agreements negotiated between UP and NS, respectively, and more than a dozen national unions and general committees. Generally, the same labor organizations represent the employees of both carriers with the exception that NS's train dispatchers are represented while UP's are not. Some of the craft employees on each carrier are covered by multiple collective bargaining agreements, corresponding generally to the territories of formerly separate railroads that have since been merged into the Applicants. The only subsidiary or affiliate with separate collective bargaining agreements is the Alton & Southern Railway, which is owned by UP; all other collective bargaining agreements are between UP or NS and the labor organizations that represent their employees.

7. Under Subchapter I of the Railway Labor Act, 45 U.S.C. §§ 151-165, railroad collective bargaining agreements remain in effect until amended by the parties. The collective bargaining process typically occurs in "rounds" of bargaining, which begin when the existing agreements permit the parties to serve notices seeking to amend the contracts. The current round of collective bargaining began on November 1, 2024. At the time of the filing, UP and NS had reached agreements with almost all the labor organizations representing their employees. The agreements are effective through the end of December 31, 2029, and thereafter until amended.

II. The Effects of the Proposed Transaction and Applicants' Commitment to Provide Employment Opportunities for All Current Employees

8. The UP/NS combination protects employment opportunities for craft employees of the combined system. The proposed transaction is an end-to-end

combination. There are no abandonments, discontinuances, or line divestitures contemplated. Applicants project the proposed transaction will add 2,009 craft jobs once UP and NS operations are fully integrated, which is expected to be three years after the transaction is consummated ("the end of Year 3").[2]

9. Initially, while there will be a few opportunities to add craft jobs by insourcing work that is currently being contracted out, Applicants project that the efficiencies described in the Operating Plan will reduce the number of positions required to perform certain functions by 1,108 jobs by the end of Year 3, approximately 2.6 percent of all craft employees of the combined entity.[3] However, in line with Applicants' commitment to provide employment opportunities for all current craft employees, reductions will be realized through attrition or relocating employees to other employment opportunities, which will also help protect Applicants' ability to handle anticipated traffic increases during the three-year period following the merger. In planning for continued and increased operations, Applicants have taken into account their combined annual attrition rate for craft employees, which is approximately 8.0 percent.[4]

10. Ultimately, Applicants project that growth resulting from proposed transaction will increase job opportunities for craft employees. Applicants anticipate

---

[2] *See* Workpaper "Craft Employee Impact Report.xlsx," Tab "Craft Impact Summary," Cell M15.

[3] *See id.*, Cell L15.

[4] *See* Workpaper "Craft Attrition Rates by Union.xlsx," Tab "Attrition Chart," Cell E22.

they will add a net 901 craft jobs by the end of Year 3.[5] The Employee Impact Exhibit in Electronic Appendix A of the Application shows the expected impacts of the transaction to craft jobs in the three-year period following Board approval of the proposed transaction.

11. The Operating Plan and Employee Impact Exhibit set forth in detail the proposed transaction's anticipated impact on craft employees.[6] To achieve the planned efficiencies described in the Operating Plan and other efficiencies that may become evident as implementation proceeds, Applicants will follow the customary *New York Dock* procedures to obtain any necessary implementing agreements. However, Applicants intend to follow existing collective bargaining agreements and will seek implementing agreements only as necessary to achieve the efficiencies made possible by the transaction and to ensure that sufficient forces are available at the proper locations to support the transaction. Without addressing all of the specific operational changes described in the Operating Plan, or the implementing agreements necessary to achieve them, I note the following with respect to the labor impact of some of the efficiencies therein described:

- Applicants will negotiate implementing agreements to permit train, engine, and yard service crews greater flexibility to protect assignments without regard to the historical boundaries of the formerly separate UP and NS or other artificial limitations. Similarly, Applicants will negotiate implementing agreements to facilitate consolidation of

[5] *See* Workpaper "Craft Employee Impact Report.xlsx," Tab "Craft Impact Summary," Cell O15.

[6] In the Employee Impact Exhibit, the category "Train Crews" includes craft employees who could be working in train or engine service in accordance with applicable collective bargaining agreements depending on how assignments are ultimately bulletined.

mechanical shop facilities and changes to crew districts, as needed, primarily near locations where Applicants' systems meet and when necessary to support the optimization of the combined network's mechanical services capacity.

- To support uninterrupted service and provide seamless customer service, clerical functions in Finance, Customer Service, and Crew Calling will eventually be consolidated in Omaha, Nebraska. As uniform technology is implemented across the combined company, most of the functions currently performed by craft employees in NS's headquarters in Atlanta, Georgia, will be relocated to UP's headquarters in Omaha. For example, clerical employees performing crew calling work in Atlanta will be relocated to Omaha once a standardized crew calling process and supporting technology are implemented.

- To maintain continuity in train dispatching, Applicants will maintain separate dispatching centers following approval, and until such time as Applicants can transition safely and seamlessly to a unified dispatching system. When the merged company elects to combine dispatching functions, it will serve the appropriate notice under Section 4 of the New York Dock conditions and obtain any necessary implementing agreements.

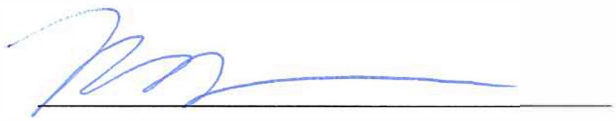
- With regard to Maintenance of Way and Communications & Signals, Applicants will implement best practices and shared technology across the combined system. Applicants will likely seek implementing agreements to permit consolidation of maintenance forces within limited geographic boundaries at or around the interchange locations. Otherwise, Maintenance of Way and Communications & Signals functions will remain largely unchanged during the first three years following the approval of the transaction.

12. Because Applicants expect to realize efficiencies through attrition and anticipate growth will result from the combined entity's more competitive service offerings, Applicants have committed that craft employees employed by either UP or NS at the time of the merger who wish to continue their careers as railroad employees with the combined entity will have the opportunity to do so in some capacity. This unprecedented commitment is conditioned upon the usual requirements for continued employment including remaining fit for duty, maintaining necessary

qualifications, meeting performance and conduct standards applicable to all employees, and accepting available work opportunities. Applicants have entered into agreements with SMART-TD, NCFO, BRC, IBB, and USCA that provide further details regarding Applicants' enhanced career job commitments for those crafts.

III. Employee Protective Conditions

13. Applicants anticipate that the Board will impose the *New York Dock* labor protective conditions on its approval of the transaction. *See New York Dock Ry.—Control—Brooklyn Eastern Dist. Terminal*, 360 I.C.C. 60 (1979), *aff'd sub nom. New York Dock Ry. v. United States*, 609 F.2d 83 (2d Cir. 1979). However, as described above, Applicants also have committed to providing career-long railroad employment for current craft employees. Applicants have formalized that commitment in agreements with SMART-TD, NCFO, BRC, IBB, and USCA. Further, because Applicants are parties to the so-called "Cramdown Agreements," Applicants anticipate that they will be able to reach voluntary implementing agreements with SMART-TD and other labor organizations.



14. Applicants have initiated discussions with SMART-TD and other labor organizations for the purpose of negotiating or, at a minimum, laying the groundwork for voluntary implementing agreements. Following Board acceptance of the Application, Applicants will work with impacted labor organizations to reach implementing agreements to be contingent upon the Board's approval of the proposed transaction. It is the Applicants' objective to achieve voluntary implementing agreements during or shortly after the Board's consideration of this application, and

to immediately begin the *New York Dock* implementing agreement process upon approval.

VERIFICATION

I, Maquiling B. Parkerson, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

I. INTRODUCTION

A. Qualifications

1. We are Michael Boyles and Dr. Divya Mathur.

2. Michael Boyles is a transportation industry expert with more than 35 years of experience conducting economic, financial, cost, and operational analyses in both regulatory and consulting settings. Until his recent retirement, he served as a Supervisory Transportation Industry Analyst and Chief of the Section of Regulatory Economics in the Office of Economics at the Surface Transportation Board ("STB" or "Board"). In that role, he managed major initiatives to modernize and improve the STB's Uniform Rail Costing System, oversaw and modernized the costing of the STB's Confidential Carload Waybill Sample ("CCWS"), oversaw analyses supporting rate reasonableness cases, and contributed to key rulemakings involving railroad costing, rate regulation, and policy development. His work also included the development and defense of cost-of-capital models and the evaluation of environmental impacts for new railroad construction projects. Prior to joining the STB in 2004, he was a consultant at FTI Consulting, where he provided analytical support and expert testimony in transportation and telecommunications matters before the STB, the Federal Communications Commission, and state Public Utility Commissions. He began his career at ALK Associates, where he developed quantitative models to support railroad mergers and designed operational systems to improve asset management and logistics for transportation clients. He holds a Bachelor of Science in Engineering from Princeton University, with a concentration in Engineering and Management Systems. His qualifications and work experience are summarized in his curriculum vitae, attached hereto as **Appendix A**.

3. Dr. Divya Mathur is an economist and a Managing Principal at Analysis Group, Inc., an economic, financial, and strategy consulting firm. She specializes in the application of microeconomics, statistics, and econometrics to complex litigation matters, government and regulatory investigations, and consulting engagements in the areas of antitrust and competition and complex commercial disputes. She has provided expert economic testimony on antitrust, class certification, and damages issues at numerous depositions and trials in federal court and has been qualified by courts as an expert economist. Her economic and financial expertise includes the analysis of market structure and competitive dynamics; economic and financial modeling in merger review and regulatory proceedings; assessment of competitive effects pertaining to mergers and antitrust conduct such as price-fixing, information sharing monopolization, and alleged exclusionary practices; modeling of damages and lost profits; valuation of businesses and assets; and evaluation of financial performance and pricing strategies in regulated industries such as transportation, telecommunications, pharmaceuticals, and financial services. Her engagements have included work on behalf of the United States Department of Justice and the Federal Trade Commission, as well as companies in numerous industries including transportation, technology, telecommunications, manufacturing, and financial services. Dr. Mathur has also submitted expert statements before the STB in connection with compensation for trackage rights and has conducted economic analysis in other regulatory contexts involving the Federal Communications Commission and the International Trade Commission. Dr. Mathur has published and presented extensively on topics including merger analysis, antitrust issues, and the intersection of economics and financial analysis in regulatory enforcement. She holds an M.A. and Ph.D. in economics from The University of Chicago and an A.B. in economics and mathematics from Mount Holyoke College. She has lectured on competitive strategy and microeconomics at The

University of Chicago and has served as a guest lecturer on topics in competitive strategy and industrial structure at the Kellogg School of Management at Northwestern University. Her qualifications, experience, and the matters in which she has provided expert testimony are summarized in her curriculum vitae, attached hereto as **Appendix B**.

B. Assignment

4. We have been asked by Applicants in this proceeding to provide two analyses related to the proposed merger of Union Pacific Railroad Company ("UP") and Norfolk Southern Railway Company ("NS") for the purposes of calculating certain economic and financial impacts of the transaction for use in the Application, including for incorporation into the *pro forma* financial statements. First, we were asked to develop the total dollar value of certain operating savings expected from optimizing the two railroads' operations, as described in the Operating Plan (Exhibit 13 to the Application) without accounting for any additional traffic the combined network would attract. Second, we were asked to estimate the additional operating costs associated with the additional traffic the combined network is projected to attract through extended hauls, rail-to-rail diversions, and truck-to-rail diversions.

C. Materials considered

5. Our opinions, and the bases for these opinions, are set forth in this statement and the attached exhibits and appendices. In reaching these opinions, we have considered various data, documents, and other information, including:

a. The Operating Plan for the combined UP/NS network, described in the Joint Verified Statement of Eric Gehringer and John F. Orr, including the Base Plan, which represents the combined railroads' existing traffic prior to any merger-

related efficiencies, the Optimized Plan, which represents the projected operational efficiencies from serving the two railroads' existing traffic as part of an integrated system, and the Growth Plan, which includes the incremental traffic the merged railroads anticipate serving;

b. Data on traffic expected to be diverted to the combined network through extended hauls, rail-to-rail diversions, and truck-to-rail diversions, as described in the Joint Verified Statement of David T. Hunt and Matthew Schabas;

c. Data, information, and Excel programs provided by the Board related to its Uniform Rail Costing System ("URCS"); and

d. R-1 annual reports of UP and NS.

6. In addition, we have relied on our skills, knowledge, training, education, and experience. We reserve the right to update our opinions, should additional relevant documents or information be made available to us.

II. SUMMARY OF OPINIONS

7. Based on our review and analysis of the data and information identified herein, and our skills, knowledge, experience, expertise, and training, we have reached the opinions summarized below.

8. URCS is a three-phase model developed and maintained by the Board that converts railroads' accounting and operating data into railroad-specific unit costs and shipment-specific variable cost estimates. Our analyses use the Board's 2023 Phase II and Phase III URCS models to estimate: (i) certain cost savings associated with the operating efficiencies that are expected to be realized as a result of the integration of the UP and NS networks and operations;

and (2) the costs associated with extended hauls, rail-to-rail diversions, and truck-to-rail diversions the combined network is expected to attract. *See* **Section III**.

9. Based on our calculations, the operating cost savings resulting from system-wide operating efficiencies that are expected to be achieved from the integration of UP and NS's network and operations in the Optimized Plan (which does not account for any additional traffic the combined network would attract) are approximately $76.02 million (in 2023 USD). These savings are calculated by applying 2023 URCS Phase II unit costs to changes in each operating metric between the Base Plan and the Optimized Plan, using pre-merger UP and NS unit costs—applied respectively to savings on the legacy UP and legacy NS networks—to represent the costs the combined network would avoid as a result of the merger. To avoid potential double counting of operating savings calculated by other witnesses and only retain relevant cost categories, we exclude certain URCS cost components from our calculation. **Figure 1** below shows how each operating metric is reduced between the Base Plan and the Optimized Plan for the combined network, and the corresponding cost savings associated with those reductions. *See* **Section IV**.

Figure 1. Summary of Merger-Related Reductions in Operating Expenses[1]

Operating Metric	Reduction	Savings (in 2023 USD)
Train Miles	1,710,965	$22,385,384
Locomotive Unit Miles	4,623,411	$27,513,974
Gross Ton Miles	2,179,705,070	$5,352,414
Car Miles	5,402,057	$174,914
Car Days	9,410	$32,927
Industry Switches	55,366	$1,028,195
Interchange Switches	347,009	$7,088,722
Intratrain and Intertrain Switches	74,332	$385,918
Intermodal Lifts	258,761	$12,057,473
Total	-	**$76,019,921**

10. We calculate approximately $2,232 million (in 2023 USD) of net increases in operating costs from the additional traffic the combined UP/NS network is expected to attract in the Growth Plan from extended hauls, rail-to-rail diversions, and truck-to-rail diversions. The diverted traffic includes shipments previously handled entirely by other railroads or trucks as well as "extended haul" diversions previously handled by UP and/or NS, for which we also received data on the corresponding "offsetting" traffic reflecting the original pre-merger UP or NS routings. The operating costs were calculated using a post-merger combined UP/NS URCS model. Specifically, we develop a post-merger URCS Phase II model by combining 2023 UP and NS inputs to reflect the integrated cost structure of the merged entity and apply the resulting system-average unit costs in URCS Phase III to the diverted traffic data. To avoid potential double counting and only retain relevant cost categories, we adjust the model to exclude certain URCS cost categories such as depreciation and ROI. **Figure 2** below summarizes our results. *See* **Section V**.

[1] *See* Workpaper "Boyles-Mathur Workpaper 01 - Backup to Figures - Operating Cost Savings from Base to Optimized Plan.xlsx."

Figure 2. Incremental Costs of Diverted Traffic[2]

	Costs (2023 USD)
Incremental Costs Including Full Extended Haul Shipments	$2,563,352,621
Incremental Costs for Offsetting Traffic	-$330,901,541
Incremental Costs of Diverted Traffic	**$2,232,451,081**

III. OVERVIEW OF URCS

11. We have been asked to estimate: (1) certain cost savings associated with the operating efficiencies that are expected to be realized as a result of the integration of the UP and NS networks and operations in the Optimized Plan (which does not account for additional traffic the combined network is expected to attract); and (2) the costs associated with extended hauls, rail-to-rail diversions, and truck-to-rail diversions the combined network is expected to attract in the Growth Plan. For both components of our analysis, we rely on URCS to estimate the relevant costs (or cost savings).[3]

12. URCS is a model developed by the Board that is commonly used in matters governed by the Board to estimate the variable costs associated with railroad shipments.[4] URCS has three phases.[5]

a. **Phase I**, which was only run during the initial development of URCS by the Board's predecessor (the Interstate Commerce Commission) in the 1980s,

---

2 *See* **Figure 12**.

3 *See* "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/, accessed November 9, 2025.

4 *See* Major Issues in Rail Rate Cases, Ex Parte No. 657 (Sub-No. 1), October 30, 2006, p. 47 ("The Board uses the Uniform Rail Costing System (URCS) to determine a carrier's variable costs. URCS is a 'general purpose costing system for all regulatory costing purposes,' designed to measure system-wide average variable costs.").

5 *See* "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/, accessed November 9, 2025 ("URCS is divided into three phases, or steps.").

used regression analysis to determine the extent to which various railroad expenses vary with respect to various operating metrics (*e.g.*, gross ton miles, train miles, etc.).[6]

b. **Phase II**, which is run annually by the Board for each Class I railroad, uses annual data reported by the railroads in their respective R-1 annual reports and other railroad-specific and industry-wide inputs to calculate system-average variable "unit costs."[7] A variable unit cost represents the cost, in dollars, per unit of an operating metric, such as cost per gross ton mile or cost per train mile. Specifically, the Board annually produces Phase II worktables for each Class I railroad.[8] In these worktables, the Board determines the portion of each expense item reported in the R-1 annual reports that is variable (based in part on the regression analysis developed in Phase I) and allocates those variable expenses across a set of system-wide operating metrics. The system-

---

6 *See* "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/, accessed November 9, 2025 ("Phase I: During this phase, the Board's predecessor, the Interstate Commerce Commission, developed regression coefficients needed to calculate cost variabilities. This phase was only run during URCS's original development in the 1980s.").

7 *See* "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/, accessed November 9, 2025 ("Phase II: During this phase, the Board calculates system average variable unit costs from R-1 and other data filed by the railroads. It is run annually using railroad information specific to that year."). The Board also creates regional system-average variable unit costs.

8 *See, e.g.,* "UP2023.xlsx," downloaded from: "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/ (at link "URCS 2023 Worktables"), accessed November 20, 2025 ("UP 2023 URCS Phase II Worktable"); "NS2023.xlsx," downloaded from: "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/ (at link "URCS 2023 Worktables"), accessed November 20, 2025 ("NS 2023 URCS Phase II Worktable"). Throughout this report, we refer to the Board's annually published URCS Phase II worktables more generally as the "URCS Phase II Worktables." To refer to specific cells within the URCS Phase II Worktables, we use the URCS Phase II named cell references. For example, Cell E8 of the "A1P1" tab of the URCS Phase II Worktables corresponds to Line 101 and Column "C1" of Tab "A1P1," which has an URCS named cell reference of A1L101C1.

average variable unit cost for each operating metric equals the sum of all variable expenses allocated to that operating metric, divided by the total system-wide amount of the operating metric.[9] In developing these unit costs, the Phase II model analyzes one to five years of historical data, depending on the expense item.[10] The final Phase II unit costs are grouped into three broad cost categories for each operating metric: (1) operating expenses ("OPR"); (2) depreciation, rents, and leases expenses ("DRL"); and (3) return on investment expenses ("ROI").[11]

c. **Phase III**, which is also updated annually by the Board, is used to calculate the variable costs associated with specific railroad shipments.[12] Specifically, the Phase III model applies the system-average variable unit costs developed in Phase II to the specific properties of an individual shipment—such as the distance of the haul, the net weight of the shipment, and whether the shipment originated and terminated on the railroad or interchanged to or from another railroad—to estimate the variable costs attributable to the shipment.[13]

It is run annually to cost the STB's Waybill Sample. URCS is also used by parties to submit cost evidence before the Board.").

13 *See* "STBRailroadCostProgram_2006-2023.xlsm," downloaded from: "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/ (at link "URCS Phase III Railroad Cost Program"), accessed November 20, 2025 ("URCS Phase III Model"), Tabs "RailroadCostProgram" and "RailroadUnitCostXML."

13. In our analyses, we have relied on both Phase II and Phase III of URCS to develop our cost estimates.

IV. OPERATING COST SAVINGS FROM SYSTEM-WIDE OPERATING EFFICIENCIES

14. In this section, we calculate the operating cost savings resulting from system-wide operating efficiencies that are expected to be achieved from the integration of UP and NS's network and operations, before accounting for any additional traffic the combined network would attract. Specifically, we estimate the cost savings associated with system-wide reductions in train miles ("TMs"), locomotive unit miles ("LUMs"), gross ton miles ("GTMs"), car miles ("CMs"), car days ("CDs"), and switches. The savings are calculated by applying 2023 URCS unit costs to changes in each operating metric between the Base Plan and the Optimized Plan. We estimate operating cost savings using pre-merger 2023 unit costs for UP and NS, as these savings represent the costs the combined network would avoid due to the merger.[14,15] Specifically, we use UP unit costs to calculate savings in operating metrics that occur on the UP portion of the combined network ("legacy UP"), which best reflect the costs of western operations, and NS unit costs to calculate savings in operating metrics that occur on the NS portion ("legacy NS"), which best reflect the costs of eastern operations. Our estimate of operating cost savings are included among other cost savings resulting from merger synergies in the Verified Statement of Grant Janke.[16]

---

[14] We hold unit costs fixed at pre-merger levels. Therefore, any reduction in unit costs the combined network achieves is not accounted for in our estimate.

[15] Because we rely on 2023 URCS unit costs, all cost estimates in our verified statement are in 2023 dollars.

[16] Verified Statement of Grant Janke, ¶ 29.

A. Inputs

15. The Operating Plan uses MultiRail to model the combined UP and NS rail operations under various scenarios.[17] The Base Plan scenario follows UP's and NS's 2023 pre-merger blocking and train service plans, while the Optimized Plan scenario represents the integrated operating plan for the combined network, holding total traffic constant at pre-merger levels (*i.e.*, excluding any incremental traffic the combined network would attract). For each scenario, MultiRail generates system-wide operating metrics—including train miles, GTMs, car miles, and switches—for the combined network, as well as the allocation of those metrics across the legacy UP and legacy NS portions of the combined network. Differences in these operating metrics between the Base Plan and the Optimized Plan represent efficiency-driven reductions in operating activity. We estimate the cost savings from these reductions in operating activity below.

B. System-wide operating metrics and associated URCS costs

16. To estimate savings from system-wide operating efficiencies, we map each operating metric to its relevant URCS Phase II unit costs. MultiRail directly outputs train miles, GTMs, car miles, and switches. For these metrics, we calculate the change between the Base Plan and the Optimized Plan and apply the relevant URCS unit costs to estimate cost savings. Because MultiRail does not directly output LUMs or car days, we first estimate these metrics under the Base Plan and the Optimized Plan using system-average factors from URCS, and then apply the relevant URCS unit costs to estimate cost savings.

[17] Joint Verified Statement of Eric Gehringer and John F. Orr ("Operating Plan" or "Op. Plan"), ¶¶ 19–21.

17. As detailed below, we apply all OPR unit costs that URCS associates with each operating metric, except for road switching costs and "below-the-wheel" switching costs, which consist of "SEM Road Operations" costs and "Switching Track Ownership and Maintenance" costs in URCS. We exclude road switching costs, which are costs that URCS allocates to switching that occurs outside of yards, because we understand that MultiRail's Yard Output—our source for switch reduction estimates—reports only switches occurring in yards, and does not capture road switching. We exclude below-the-wheel switching costs to avoid potential double counting, as Grant Janke separately quantifies savings associated with yard rationalization synergies in his verified statement.[18]

18. Across all operating metrics in our assessment of the cost savings from the Optimized Plan, we also exclude URCS unit costs associated with DRL, General Overhead Expenses ("GOH"), and ROI. We exclude DRL and GOH costs from our calculation to avoid double counting, as depreciation is separately accounted for by Carrie Powers, and GOH and other administrative cost savings in the Optimized Plan, as compared to the Base Plan, are separately accounted for by Grant Janke.[19] ROI is an URCS-imputed cost-of-capital charge that

[18] Verified Statement of Grant Janke, ¶ 55.

[19] App. Vol 1, App'x F; Notes to Pro Forma Income Statement, Base Year, Note 3 ("Depreciation & amortization – Represents increased depreciation expense due to the estimated fair value increase to properties, net."); Verified Statement of Grant Janke, ¶¶ 22–26. We exclude all portions of DRL costs in our operating cost savings estimates, *i.e.*, we exclude both depreciation costs and rents and lease costs. Excluding rents and leases in our estimates of operating costs savings avoids potential double counting rents and lease savings quantified by other witness statements and/or is conservative. Grant Janke states that "[m]echanical non-labor savings" may for example include "consolidat[ing] freight car fleets to enable the utilization of otherwise underutilized assets[.]" Verified Statement of Grant Janke, ¶ 33. However, rents and lease expenses are included in our calculations of estimated operating costs from diverted traffic in **Section V**. We include rents and leases in our estimated operating costs from diverted traffic because, insofar such costs are incurred to accommodate the diverted traffic, they are not separately accounted for by other witnesses.

represents a reasonable return on capital investments—not an operating expense reported in railroad financial statements.[20]

1. Train miles

19. A train mile is the movement of a train over a distance of one mile.[21] On the combined network, improved operating efficiency—as reflected in the Optimized Plan relative to the Base Plan—would enable UP and NS to move the same total traffic volume with fewer total train miles. **Figure 3** (Panel I) shows that the Operating Plan (and the associated workpapers) projects reductions of 609,106 train miles for legacy UP and 1,101,859 train miles for legacy NS, resulting in a combined reduction of 1,710,965 train miles.[22]

20. Our calculation of operating cost savings from reduced train miles includes all variable OPR costs that URCS associates with train miles, classified as "Train Mile – Crew" and "Train Mile – Other Than Crew" (*see* **Figure 3**, Panel II). The "Train Mile – Crew" category primarily reflects costs for "Engine Crews" and "Train Crews."[23] The "Train Mile – Other Than Crew" category primarily reflects costs associated with "Train Inspection" and "Clearing Wrecks."[24]

---

[20] "Economic Data," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/economic-data/, accessed November 20, 2025 ("Within the R-1 reports is a section titled Schedule 250. This schedule is used to develop rate of return on net investment (ROI) for use in revenue adequacy determinations.").

[21] R-1 Annual Report, *Surface Transportation Board*, available at https://www.stb.gov/wp-content/uploads/R1-7-31-2026.pdf, accessed November 23, 2025 ("R-1 Annual Report"), Schedule 755 and p. 75.

[22] We were provided train miles under the Base Plan and Optimized Plan by subregion (UP, NS, Detroit CSAO, N Jersey CSAO, and S Jersey CSAO). Our calculation of the UP/NS split assigns the Detroit CSAO, N Jersey CSAO, and S Jersey CSAO subregions to NS.

[23] *See* URCS Phase II Worktables, Tab "D3P1," Column "C30," Cells D3L191C30 and D8L711C1; Tab "E1P1," Line 104.

[24] *See* URCS Phase II Worktables, Tab "D3P1," Column "C25," Cells D3L191C25 and D8L709C1; Tab "E1P1," Line 103.

21. Based on these URCS unit costs, **Figure 3** (Panel III) reports total train mile cost savings of $8,025,471 for legacy UP and $14,359,913 for legacy NS, for a combined savings of $22,385,384.

Figure 3. Train Mile Operating Reductions, URCS Unit Costs, and Estimated Cost Savings[25]

		UP	NS
Panel I: TM Operating Reductions			
[A]	Train Miles in the Base Plan	112,396,507	61,763,462
[B]	Train Miles in the Optimized Plan	111,787,401	60,661,604
[C] = [A] - [B]	Train Miles Saved	609,106	1,101,859
Panel II: URCS Unit Costs			
[D]	Train Mile - Crew	$12.34	$12.31
[E]	Train Mile - Other Than Crew	$0.84	$0.72
Panel III: Estimated Cost Savings			
[F] = [C] * [D]	Train Mile - Crew	$7,514,978	$13,566,898
[G] = [C] * [E]	Train Mile - Other Than Crew	$510,493	$793,015
[H] = [F] + [G]	Total Train Mile Cost Savings	$8,025,471	$14,359,913
[I] = Sum of [H]	**Combined Train Mile Cost Savings**	**$22,385,384**	

2. Locomotive unit miles

22. A LUM is the movement of a locomotive unit under its own power over a distance of one mile.[26] On the combined network, improved operating efficiency—as reflected in the Optimized Plan relative to the Base Plan—would enable UP and NS to move the same total traffic volume with fewer LUMs.

[25] *See* Workpaper "Boyles-Mathur Workpaper 01 - Backup to Figures - Operating Cost Savings from Base to Optimized Plan.xlsx."

[26] R-1 Annual Report, Schedule 755 and p. 75.

23. Because MultiRail does not directly output LUMs, we use information from URCS to calculate LUMs from train miles. Specifically, we calculate LUMs from train miles reported in MultiRail for each train type—bulk, local, auto, intermodal, and manifest—by applying the corresponding average number of locomotive units per train from URCS.[27] Accordingly, total LUMs are calculated as the sum of: (i) total unit train miles multiplied by the average number of locomotives per unit train; (ii) total way train miles multiplied by the average number of locomotives per way train; and (iii) total through train miles multiplied by the average number of locomotives per through train.[28] **Figure 4** (Panel I) shows reductions of 2,143,591 LUMs for legacy UP and 2,479,819 LUMs for legacy NS, resulting in a combined reduction of 4,623,411 LUMs.[29]

24. We note that **Figure 4** shows no reduction in unit train miles on the combined network, and therefore we do not quantify any associated LUM cost savings. We also note that **Figure 4** shows a negative reduction (*i.e.*, an increase) in way train miles on legacy UP, which we understand reflects a shift in way train miles from the legacy NS network to the legacy UP network under the Optimized Plan. Our cost savings estimates account for this shift by reducing the LUM cost associated with way trains that are costed using the legacy NS cost structure, and instead applying the legacy UP unit costs to the corresponding increase in way train miles on legacy UP.

---

[27] URCS User Manual, p. 4.

[28] The URCS Phase II Worktables report the average locomotives per train in Cells E2L208C1 (unit train), E2L209C1 (way train), and E2L210C1 (through train). For our LUM calculations, we treat both bulk and auto trains as unit trains, local trains as way trains, and we treat both intermodal and manifest trains as through trains.

[29] For each train type, we were provided train miles under the Base Plan and Optimized Plan by subregion (UP, NS, Detroit CSAO, N Jersey CSAO, and S Jersey CSAO). Our calculation of the UP/NS split for LUMs, which is based on train miles by train type, assigns the Detroit CSAO, N Jersey CSAO, and S Jersey CSAO subregions to NS.

25. Our calculation of operating cost savings from reduced LUMs includes all variable OPR unit costs that URCS associates with LUMs (*see* **Figure 4**, Panel II). These unit costs primarily reflect "Locomotive Fuel" used in train operations and "Diesel Road Locomotive Repairs."[30]

26. Based on these URCS unit costs, **Figure 4** (Panel III) reports total LUM cost savings of $12,271,618 for legacy UP and $15,242,356 for legacy NS, for a combined savings of $27,513,974.

3. Gross ton miles

27. A GTM is the movement of one ton (2,000 lb) over one mile, inclusive of tons associated with cars and their contents.[32] On the combined network, improved operating efficiency—as reflected in the Optimized Plan relative to the Base Plan—would enable UP and NS to move the same total traffic volume with fewer total GTMs. **Figure 5** (Panel I) shows that the Operating Plan projects a reduction of 4,548,369,833 GTMs for legacy UP and an increase of 2,368,664,763 GTMs for legacy NS, resulting in a combined net reduction of 2,179,705,070 GTMs.[33]

28. Our calculation of operating cost savings from reduced GTMs includes all variable OPR unit costs that URCS associates with GTMs, classified as "Road Operations" and "Running Track Ownership and Maintenance" (*see* **Figure 5**, Panel II). "Road Operations" primarily reflect costs associated with "Locomotive Fuel" used in train operations and "Diesel Road Locomotive Repairs."[34] "Running Track Ownership and Maintenance" primarily reflects costs associated with "Rail and Other Track Material," as well as "Signals and Interlockers."[35,36]

---

[32] R-1 Annual Report, Schedule 755 and p. 75. While R-1 annual report includes locomotive weight in total GTMs, URCS excludes it from its GTM calculations, and we understand that MultiRail does as well. *See* URCS User Manual, p. 4.

[33] We were provided the GTM split between legacy UP and legacy NS in the "Subregion" tabs of the Op. Plan Workpaper, "T1_T2_T3_Traffic_Cat_Splits_20251124.xlsx." We understand that the estimates in those tabs contain a small discrepancy relative to the Operating Plan totals for the Base Plan and the Optimized Plan, due to accumulated rounding errors. To be consistent with the Operating Plan, we apply the UP/NS split from the "Subregion" tabs (excluding stranded and unmoved blocks) to the Operating Plan's total GTMs. Our calculation of the UP/NS split assigns the Detroit CSAO, N Jersey CSAO, and S Jersey CSAO subregions to NS.

[34] *See* URCS Phase II Worktables, Tab "D3P1," Column "C10," Cells D3L191C10 and D8L702C1.

[35] *See* URCS Phase II Worktables, Tab "D1P1," Column "C10," Cells D1L157C10 and D8L701C1.

[36] URCS derives OPR unit costs for both "Road Operations" and "Running Track Ownership and Maintenance" from R-1 Annual Report, Schedule 410 - Railway Operating Expenses. Accordingly, it is appropriate to include both categories in our cost savings calculation.

29. Based on these URCS unit costs, **Figure 5** (Panel III) reports total GTM cost savings of $12,253,930 for legacy UP and *negative* $6,901,516 for legacy NS, for a combined net savings of $5,352,414, which we understand reflects a shift in GTMs from the legacy UP network to the legacy NS network under the Optimized Plan. Our cost savings estimates appropriately account for this shift by reducing the cost associated with GTMs using the legacy UP cost structure, and instead applying the legacy NS unit costs to the corresponding increase in GTMs on legacy NS. On net, this reduces our cost savings estimates, because legacy NS has higher GTM unit costs than legacy UP.

Figure 5. GTM Reductions, URCS Unit Costs, and Estimated Cost Savings[37]

		UP	NS
Panel I: GTM Operating Reductions			
[A]	GTM in the Base Plan	833,336,849,642	345,809,579,478

[H] = [F] + [G]	Total GTM Cost Savings	$12,253,930	-$6,901,516
[I] = Sum of [H]	**Combined GTM Cost Savings**	**$5,352,414**	

[37] *See* Workpaper "Boyles-Mathur Workpaper 01 - Backup to Figures - Operating Cost Savings from Base to Optimized Plan.xlsx."

4. Car miles and car days

30. URCS calculates freight car costs for cars using costs associated with two metrics: car miles and car days.[38] A car mile is the movement of one freight car over a distance of one mile.[39] A car day is the use of one freight car for one day. Car days are computed as total car miles divided by the average miles a car travels per day.[40,41] On the combined network, improved operating efficiency—as reflected in the Optimized Plan relative to the Base Plan—would enable UP and NS to move the same total traffic volume with lower freight car costs.

31. Because URCS applies different unit costs by car type (*e.g.,* covered hopper, intermodal flatcar, tank, plain gondola, etc.), the magnitude of savings depends on the specific car type in which car mile reductions are achieved. In addition, URCS calculates car mile and car day costs differently for railroad-owned and private-line cars. Specifically, because URCS assigns no OPR costs to private-line cars,[42] we quantify savings only for railroad-owned cars.

32. MultiRail reports car miles by car type but does not distinguish whether those miles are attributable to railroad-owned or private-line cars. Accordingly, for each car type and railroad, we apportion car miles between these two categories based on the shares of railroad-

---

38 URCS User Manual, p. 6.

39 R-1 Annual Report, Schedule 755 and p. 75.

40 URCS applies car-miles-per-car-day averages of 585.32 (UP) and 512.37 (NS). *See* URCS Phase II Worktables, Tab "E2P1," Column "C22." *See also* URCS Phase III Model, Tab "RailroadCostProgram," Rows 173 and 203:204.

41 URCS distinguishes between car miles running and car miles in the yard (*i.e.*, in switching services), and between car days running and car days in the yard. Our cost savings estimates conservatively only include car miles running and car days running, because we understand that the car mile reductions calculated by MultiRail correspond to reductions in car miles running. For simplicity, we refer to these as "car miles" and "car days." *See* URCS Phase II Worktables, Tabs "D6P1A" to "D6P15," Columns "C13" and "C21" (which are the included car mile/car day "running" unit costs), and Columns "C16" and "C24" (which are the excluded car mile/car day "yard" unit costs).

42 *See* URCS Phase II Worktables, Tab "E1P2," where only DRL expenses are quantified for private line cars.

owned car miles reported in the 2023 R-1 annual reports.[43] **Figure 6** (Panel I) shows reductions of 4,658,333 railroad-owned car miles for legacy UP and 743,724 railroad-owned car miles for legacy NS, resulting in a combined reduction of 5,402,057 railroad-owned car miles.[44] Similarly, **Figure 6** shows reductions of 7,959 railroad-owned car days for legacy UP and 1,452 railroad-owned car days for legacy NS, resulting in a combined reduction of 9,410 railroad-owned car days. **Exhibit 1** reports reductions in car miles by car type, and **Exhibit 2** reports reductions in car days by car type.

33. Our calculation of operating cost savings from reduced railroad-owned car miles and car days each includes all variable OPR unit costs that URCS associates with car miles running and car days running, respectively. These unit costs primarily reflect freight car repairs.[45] **Exhibits 1** and **2** list these unit costs by car type.

34. Based on these URCS unit costs, **Figure 6** (Panel II) reports total car miles and car days cost savings of *negative* $138,127 for legacy UP and $345,967 for legacy NS, for a combined net savings of $207,840. Under the Optimized Plan, UP's car mile and car day costs

---

[43] R-1 Annual Report, Union Pacific, 2023, available at https://www.up.com/cs/groups/public/@uprr/@investor/documents/investordocuments/pdf_up_r1_2023.pdf, accessed November 23, 2025 ("UP 2023 R-1 Annual Report"), Schedule 755; R-1 Annual Report, Norfolk Southern, 2023, available at https://filecache.investorroom.com/mr5ir_nscorp/948/2023%20NS%20Consolidated%20R1%20Schedules%20and%20Footnotes.pdf, accessed November 23, 2025 ("NS 2023 R-1 Annual Report"), Schedule 755.

[44] We were provided the car miles split between legacy UP and legacy NS for each car type in the "Subregion" tabs of the Op. Plan Workpaper, "T1_T2_T3_Car_Type_Splits_20251124.xlsx." We understand that the estimates in those tabs contain a small discrepancy relative to the Operating Plan totals for the Base Plan and the Optimized Plan, due to accumulated rounding errors. To be consistent with the Operating Plan, we apply the UP/NS split from the "Subregion" tabs (excluding stranded and unmoved blocks) to the Operating Plan's total car miles. Our calculation of the UP/NS split assigns the Detroit CSAO, N Jersey CSAO, and S Jersey CSAO subregions to NS.

[45] *See* URCS Phase II Worktables, Tabs "D6P1A" to "D6P15," Row "TOTAL OPERATING EXP" or "TOTAL OPERATING EXPENSE," Columns "C13" and "C21"; Tab "D8P7B," Columns "C1" and "C5."

rise even as total car miles and car days fall, reflecting a compositional shift toward car types with higher unit costs (*see* **Exhibits 1** and **2**).

5. Switches and intermodal lifts

35. Switching is the process of using locomotives and switch engines to move and assemble railcars, typically within a terminal or yard. URCS classifies switches into three categories: (1) industry switches that occur at origin or termination points; (2) interchange switches that occur at intermediate yards between different carriers; and (3) intratrain and intertrain ("I&I") switches that occur at intermediate points on a rail carrier's own lines.[47]

36. *First*, improved efficiency of the combined network will lead to a reduction in industry switches, reflected in fewer originations and terminations in the Optimized Plan relative

[46] *See* Workpaper "Boyles-Mathur Workpaper 01 - Backup to Figures - Operating Cost Savings from Base to Optimized Plan.xlsx."

[47] URCS User Manual, pp. 5, 36.

to the Base Plan.[48] This reduction in originations and terminations is due to a reduction in "rubber tire" interchanges of intermodal shipments (*i.e.*, truck transfers between yards or terminals) between UP and NS.[49] Because eliminating a rubber tire interchange between UP and NS removes industry switches for both the delivering railroad (which unloads intermodal shipments to drayage trucks) and the receiving railroad (which loads those shipments from the drayage trucks), we apply the industry switch reduction to both UP and NS when estimating operating cost savings.[50] Because URCS measures industry switches at the car level—*i.e.*, one industry switch corresponds to one car switched at an origin or termination point—**Figure 7** (Panel I) shows reductions of 27,683 industry switches for legacy UP and 27,683 industry switches for legacy NS, resulting in a combined reduction of 55,366 industry switches, measured by the number of cars switched.

37. *Second*, many interchange switches between UP and NS (separate from the "rubber tire" interchanges that we classify as industry switches above) will be either eliminated or converted to more efficient I&I switches in the Optimized Plan relative to the Base Plan.[51] When URCS costs an interchange switch, it only includes the switching cost incurred by the delivering railroad *or* the receiving railroad, depending on which leg of the shipment is being costed. Because eliminating an interchange between UP and NS reduces interchange switching

---

[48] *See* Op. Plan Workpapers, "Yard_Details_Report_T1_20251202_vF.xlsx," Tab "Yard_Output_T1," Columns E:H; "Yard_Details_Report_T2_20251202_vF.xlsx," Tab "Yard_Output_T2_Addback," Columns E:H.

[49] *See* Op. Plan Workpaper, "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "RIC Conv Summary," Column S. Our savings do not include the cost to dray a container from the first ramp to the second ramp, which is not included within URCS. Union Pacific separately quantifies savings from such costs in the Verified Statement of Grant Janke. *See* Verified Statement of Grant Janke, ¶ 30.

[50] Because rubber tire interchanges require loading and off-loading to trucks and generate originations and terminations, they are appropriately classified as industry switches.

[51] *See* Op. Plan Workpaper, "Yard_Details_Report_T1_20251202_vF.xlsx," Tab "Yard_Output_T1," Columns J:K.

costs for *both* the delivering railroad and the receiving railroad, we apply the interchange reduction to *both* UP and NS when estimating operating cost savings. **Figure 8** (Panel I) shows reductions of 347,009 interchange switches for both legacy UP and legacy NS.

38. *Third*, improved efficiency of the combined network will reduce I&I switches in the Optimized Plan relative to the Base Plan.[52] I&I switches occur within a single railroad's network, so unlike interchanges, I&I switch reductions are allocated based on whether they occur on the legacy UP network or legacy NS network. **Figure 9** (Panel I) shows an increase of 38,740 I&I switches for legacy UP and a reduction of 113,072 I&I switches for legacy NS, resulting in a combined net reduction of 74,332 I&I switches. We understand the increase of I&I switches for legacy UP reflects a shift in I&I switches from the legacy NS network to the legacy UP network under the Optimized Plan.

39. URCS estimates costs associated with switches by converting switching events (measured by the number of cars that are switched) into switch engine minutes ("SEMs") and applying unit costs to the SEMs.[53] Our calculation of operating cost savings from reduced industry, interchange, and I&I switches includes all variable OPR unit costs that URCS associates with SEMs, except those related to road operations and below-the-wheel costs. Specifically, we include URCS unit costs for "SEM Yard Operations" (*e.g.*, switch crews and locomotive fuel used in yard operations),[54] and exclude URCS unit costs for "SEM Road

---

[52] *See* Op. Plan Workpapers, "Yard_Details_Report_T1_20251202_vF.xlsx," Tab "Yard_Output_T1," Columns I and O; "Yard_Details_Report_T2_20251202_vF.xlsx," Tab "Auto_Handling_Addback," Cells F14:F15; "Yard_Details_Report_T2_20251202_vF.xlsx," Tab "Yard_Output_T2," Column J.

[53] *See* URCS Phase II Worktables, Tab "E2P1," Columns "C25," "C26," and "C29." *See also*, URCS Phase III Model, Tab "RailroadCostProgram," Rows 130:150.

[54] *See* URCS Phase II Worktables, Tab "D4P1," Column "C10," Cells D4L159C10 and D8L722C1.

Operations" (*e.g.*, train crews, diesel road locomotive repairs)[55] and "Switching Track Ownership and Maintenance" (*e.g.*, rails and other track material, signals and interlockers, and roadway).[56] We exclude "SEM Road Operations" costs because we understand that MultiRail's Yard Output—our source for switch reduction estimates—reports only switches occurring in yards and does not capture road switching. We exclude "Switching Track Ownership and Maintenance" costs to remain conservative and to avoid any double counting, as Grant Janke separately quantifies savings associated with yard rationalization synergies in his verified statement.[57]

40. For originations and terminations (*i.e.*, industry switches) of intermodal traffic, URCS also estimates costs associated with intermodal lifts (*i.e.*, loading and unloading trailers/containers) in addition to costs associated with SEMs.[58] Therefore, our calculation of operating cost savings also accounts for savings in intermodal lifts associated with the reduction in rubber tire interchanges. We include only the "Loading & Unloading" component of the intermodal lift cost per trailer/container in URCS.[59] We exclude the other components of the URCS intermodal lift costs, which include trailer-on-flatcar/container-on-flatcar terminal repair expenses and various other "Ways and Structures" expenses, as to remain conservative and to avoid any double counting, as Grant Janke separately quantifies savings associated with yard rationalization synergies in his verified statement.[60] Because URCS allocates the costs of

---

55 *See* URCS Phase II Worktables, Tab "D3P1," Column "C40," Cells D3L191C40 and D8L721C1.

56 *See* URCS Phase II Worktables, Tab "D2P1," Column "C10," Cells D2L159C10 and D8L720C1.

60 *See* Verified Statement of Grant Janke, ¶ 55; URCS Phase II Worktables, Tabs "A2P1" and "D7P7A."

intermodal lifts on a per-container basis, we calculate total loading and unloading savings by multiplying the URCS unit cost per container by the number of intermodal containers that no longer require rubber tire interchanges between UP and NS under the Optimized Plan, relative to the Base Plan.[61] Consistent with our treatment of rubber tire interchanges, we apply the intermodal lift reduction to both UP and NS when estimating operating cost savings. **Figure 10** (Panel I) shows reductions of 129,381 intermodal lifts for legacy UP and 129,381 intermodal lifts for legacy NS, resulting in a combined reduction of 258,761 intermodal lifts.[62]

41. **Figure 7** (Panel III) reports industry switch cost savings of $484,327 for legacy UP and $543,868 for legacy NS, for a combined savings of $1,028,195. **Figure 8** (Panel III) reports interchange switch cost savings of $3,339,115 for legacy UP and $3,749,607 for legacy NS, for a combined savings of $7,088,722. **Figure 9** (Panel III) reports I&I switch cost savings of *negative* $169,447 for legacy UP and $555,364 for legacy NS, for a combined savings of $385,918. **Figure 10** (Panel III) reports intermodal lift savings of $5,968,812 for legacy UP and $6,088,661 for legacy NS, for a combined savings of $12,057,473.

---

[61] Since each container that is interchanged via rubber tire between the two railroads requires a loading by UP and an unloading by NS (or vice versa), we apply each of the UP and NS loading and unloading intermodal lift unit costs to the number of containers that no longer need to be interchanged via rubber tire in the Optimized Plan. *See* Workpaper "Boyles-Mathur Workpaper 01 - Backup to Figures - Operating Cost Savings from Base to Optimized Plan.xlsx."

[62] *See* Op. Plan Workpaper, "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "RIC Conv Summary," Column T.

[J]	**Total**	**$42.04**	**$33.98**	**$76.02**

V. INCREASES IN OPERATING COSTS FROM DIVERTED TRAFFIC

43. We have been asked to quantify increase in operating costs due to the additional traffic the combined network would attract in the Growth Plan from extended hauls, rail-to-rail diversions, and truck-to-rail diversions, which we estimate using URCS Phase III.

44. Because the diverted traffic will operate on the combined network, it is reasonable and appropriate from an economic perspective to model the post-merger operating cost structure of the combined entity when estimating the associated operating costs.[68] To do so, we first

[67] *See* Workpaper "Boyles-Mathur Workpaper 01 - Backup to Figures - Operating Cost Savings from Base to Optimized Plan.xlsx."

[68] In contrast, when estimating operating cost savings in **Section IV**, we apply the pre-merger UP unit costs to reductions in operating metrics that occur on legacy UP, and pre-merger NS unit costs to reductions in operating metrics that occur on legacy NS. This is because our operating cost savings estimates in **Section IV** represent savings that would be expected to be realized relative to the scenario in which the entities do not merge and retain their individual cost structures. In this section, we estimate the costs of additional traffic that would be incurred if the merger were to occur, and as such, it is appropriate to model the combined operating cost structure of the post-merger entity.

develop a combined URCS Phase II model to estimate system-average variable unit costs for the post-merger entity (*see* **Section V.A**). We then adjust the URCS model to remove certain cost categories that are either separately analyzed by other witnesses (to avoid double counting) or that do not reflect operating expenses typically reported in railroads' financial statements (*see* **Section V.B**). Finally, we apply the adjusted model in URCS Phase III to the incremental traffic identified in the Growth Plan to estimate the variable costs associated with the diverted traffic (*see* **Section V.C**).

A. Development of URCS model for combined entity

45. Because the diverted traffic will operate on the post-merger network, it is first necessary to model an appropriate operating cost structure for the combined entity. To do so, we develop a combined 2023 UP/NS URCS Phase II model by analyzing and combining the inputs to the individual UP and NS 2023 URCS Phase II Worktables.

46. The inputs to the Phase II model are summarized in the "A" tables of the worktables published by the Board.[69] The most common source for the inputs to the URCS Phase II model is data reported in each railroad's R-1 annual report, which report system-wide total operating metrics and expense items.[70] For example, URCS Phase II uses R-1 annual report data on system-wide total operating metrics such as total GTMs and total train miles, and system-

[69] The "A" tables refer to the tabs in the URCS Phase II Worktables starting with the letter "A." In Workpaper "Boyles-Mathur Workpaper 02 - Collect UP and NS 2023 Phase II A Table Inputs.py," we populate all of the UP and NS input values from all the "A" tables of each railroad's 2023 Phase II Worktable into a single table. In Workpaper "Boyles-Mathur Workpaper 03 - Combined UP-NS Phase II A Table Input Values.xlsx," we record our treatment for combining each of these inputs for the purposes of creating a combined UP/NS Phase II URCS model (*e.g.*, summation, weighted average, etc.).

[70] Specifically, the URCS Phase II model relies on railroad-specific data from the past five R-1 annual reports (*i.e.*, 2019-2023 for the 2023 URCS Phase II Worktables). *See*, *e.g.*, UP 2023 URCS Phase II Worktable, Tab "A1P1"; NS 2023 URCS Phase II Worktable, Tab "A1P1."

wide expense items such as total salaries and wages associated with engine and train crews, and total locomotive fuel expenses.[71] To calculate these inputs for the combined UP/NS entity, we sum the corresponding values from the individual UP and NS R-1 annual reports. We sum these inputs when modeling the combined entity's cost structure because the combined entity will integrate the total traffic and expenses of both legacy networks.[72]

47. However, for other inputs to the combined Phase II model—particularly those that are not railroad-specific or do not reflect system-wide aggregate statistics—it is inappropriate to sum the UP and NS values. For example, certain inputs to the Phase II model, such as the Association of American Railroads ("AAR") cost indexes, reflect indexes that are specific to where the railroad operates (*i.e.*, regional values) and are not additive.[73] Therefore, to estimate the corresponding input for the combined entity, we take a weighted average of the UP and NS individual inputs, weighting by legacy UP and legacy NS 2023 total system GTMs.[74,75] Additionally, there are certain inputs to the Phase II model, such as the STB's 2023 cost of

---

71 *See* URCS Phase II Worktables, Tabs "A1P1" and "A2P3."

72 Similarly, we sum other inputs that are railroad-specific, total system-wide metrics. For example, we sum the total system-wide originations and terminations by car type of UP and NS that the Phase II model uses from the Quarterly Commodity Statistics. *See* URCS Phase II Worktables, Tab "A1P6"; Workpaper "Boyles-Mathur Workpaper 03 - Combined UP-NS Phase II A Table Input Values.xlsx."

73 *See, e.g.,* URCS Phase II Worktables, Tab "A2P1."

74 There were approximately 905 billion and 361 billion system-wide GTMs on UP's and NS's networks in 2023, respectively, which correspond to weights of approximately 72 percent for UP and 28 percent for NS. *See* UP 2023 URCS Phase II Worktable, Cell A1L123C1; NS 2023 URCS Phase II Worktable, Cell A1L123C1; Workpaper "Boyles-Mathur Workpaper 03 - Combined UP-NS Phase II A Table Input Values.xlsx."

75 In the URCS Phase II Worktables, the AAR cost index value for a given railroad may be recorded as zero if the corresponding expense item that the index is applied to in the "A" tables is zero for that railroad. *See, e.g.,* UP 2023 URCS Phase II Worktables, Cells A2L130C2 and A2L130C3. In cases where one of the UP or NS AAR cost index values were zero for this reason while the other was non-zero, we set the corresponding AAR cost index input for the combined UP/NS to be equal to the non-zero input value. *See* Workpaper "Boyles-Mathur Workpaper 03 - Combined UP-NS Phase II A Table Input Values.xlsx."

capital and the "Loss & Damage" values, that are industry-wide values.[76] In those cases, we apply the same, industry-wide value when modeling the combined entity.

48. After determining the appropriate method for combining each input to the Phase II model for the combined UP/NS entity, we enter the resulting values into the "A" tables of the URCS Phase II model.[77] The Phase II model then automatically calculates the unit costs of the combined entity. The resulting variable unit costs calculated in the "D" and "E" tables of the Phase II model reflect our estimates of the variable unit costs of the combined UP/NS entity. We then apply those unit costs in the URCS Phase III model to estimate the operating costs associated with the diverted traffic.[78,79]

49. The variable unit costs produced by our model for the combined entity are approximately equivalent to a weighted average of the legacy UP and legacy NS variable unit

---

[76] *See* URCS Phase II Worktables, Tab "A1P4" and Cell A4L205C1.

[77] *See* Workpaper "Boyles-Mathur Workpaper 04 - Combined UP-NS Phase II Worktable.xlsm."

[78] For certain unit costs that are outputted in the "E" tables of the railroads' Phase II Worktables, the Board applies "substitutions," specifying alternative values to be used in the Phase III model when the initial values from the Phase II model are outside a reasonable range. In cases where the Board substituted a given unit cost for UP and NS with a different unit cost from the same railroad's Phase II model, we applied the same substitution for the combined UP/NS Phase II unit cost prior to costing the diverted traffic using the Phase III model. In cases where the Board substituted a given unit cost with a value from a different railroad's Phase II unit cost for both UP and NS (*e.g.*, cases where UP's unit cost was substituted with a "WEST" value and NS's unit cost was substituted with an "EAST" value), we took a weighted average of the substituted values for both UP and NS (based on legacy UP and legacy NS system-wide GTMs) to calculate the substituted value for the combined UP/NS Phase II unit cost. *See* Workpaper "Boyles-Mathur Workpaper 05 - Combined UP-NS E Summary with Substitutions.xlsx"; "URCS2023_U_SUBSTITUTIONS.xlsx," downloaded from: "Uniform Rail Costing System (URCS)," *Surface Transportation Board*, available at https://www.stb.gov/reports-data/uniform-rail-costing-system/ (at link "URCS 2023 Substitutions"), accessed November 20, 2025.

[79] There are certain "residual factors" used in the Phase III model that are not directly calculated in the Phase II model's unit costs (these factors have "E" codes starting with "E2L3" in URCS). These residual factors are calculated annually when the Board costs the waybill sample. To calculate these residual factors for the combined UP/NS, we calculated a weighted average of the legacy UP and legacy NS 2023 factors found in the Board's Phase III model, weighting by system-wide GTMs. *See* Workpaper "Boyles-Mathur Workpaper 05 - Combined UP-NS E Summary with Substitutions.xlsx"; URCS Phase III Model, Tabs "RailroadUnitCostXML" and "ECodeTable."

costs.[80] The legacy UP and NS cost structures reflect differences in geography, operating conditions, and traffic mix. Therefore, using a weighted-average UP/NS cost structure to estimate the costs of the diverted traffic assumes that the geographical and operational characteristics of the diverted traffic are generally consistent with those of the combined network (*i.e.*, a weighted average of the legacy UP and NS networks). This assumption is reasonable because it is consistent with the methodology that URCS typically uses for calculating railroad costs on a regional basis.[81]

B. Adjustments to URCS to account for cost categories estimated by other witnesses, and removal of ROI expense

50. Next, we make adjustments to the combined UP/NS URCS model to account for cost categories that are separately quantified by other witnesses, and to remove ROI expenses.

51. First, we make targeted adjustments to the combined UP/NS URCS Phase II model to avoid double counting costs that are already accounted for in the *pro forma* financial statement by another witness's cost estimates. In particular, Grant Janke estimates the capital and capacity investments that the combined UP/NS entity would incur to accommodate the diverted traffic.[82] These estimates are separately incorporated into the *pro forma* income statement

---

80 This methodology is conservative and does not account for cost efficiencies that would be expected to be achieved as a result of the merger, which would lower certain URCS unit costs relative the combined pre-merger UP and NS cost structure.

81 *See* URCS User Manual, p. 1 ("URCS uses an accounting based approach to costing, relying on annual operating expenses and traffic data reported by the railroads. This approach provides cost estimates on the average cost structure of individual railroads or regionalized groups of railroads. Average data on average railroad moves may not, in all cases, be appropriate for estimating a cost for a given railroad movement.").

82 Verified Statement of Grant Janke, ¶ 18 ("Applicants expect UP/NS will spend $1.1 billion to add capacity to the combined network in support of additional traffic. Capacity spending includes investment along UP/NS main lines to construct second main track, extend sidings, and improve signal systems. It also includes investments across the UP/NS network to increase capacity at a number of manifest yards, intermodal terminals, and automotive terminals. Finally, capacity spending includes investments to upgrade UP/NS's refrigerated box car fleet to move traffic identified in the Growth Plan.").

through the associated depreciation and amortization of the investments.[83] Therefore, we exclude costs associated with depreciation from our URCS costing analysis to avoid "double counting" the impacts of depreciation costs estimated by other witnesses. We do not exclude costs associated with rents and leases—which, together with depreciation, make up URCS cost category DRL—because, insofar such costs are incurred to accommodate the diverted traffic, they are not separately accounted for by other witnesses.[84]

52. Second, we remove URCS cost categories related to ROI. As we explain in **Section IV.B**, ROI costs do not reflect actual operating expenses reported by railroads in their financial statements. They are an imputed category within URCS that represents a reasonable return on capital investments. Specifically, URCS calculates ROI by applying the Board's annual determined cost-of-capital percentage to a railroad's investment expenses.[85] These imputed costs are layered on top of the OPR and DRL unit costs, which already reflect the operating expenses reported in railroad financials. Because our estimates reflect the impact of the incremental traffic on UP/NS's financial statements from an operating cost perspective, it is appropriate to exclude these URCS-imputed ROI costs.[86]

---

[83] App. Vol 1, App'x F; Notes to Pro Forma Income Statement, Year One through Normal Year, Note 2 ("Depreciation & amortization - Represents the increased depreciation expense as a result of capital spending necessary to combine operations of UPC and NSC.").

[84] For example, we understand that some diverted traffic, including intermodal traffic, may move on cars rented or leased from TTX. TTX is a railcar pooling company that owns and provides railcars to railroads for shipment. *See* "About TTX," *TTX*, available at https://www.ttx.com/about/who-we-are/, accessed November 11, 2023. To only remove the depreciation component from the total DRL expense reported in URCS, we excluded all line items in the "D" tabs of the combined UP/NS URCS Phase II Worktable corresponding to depreciation. *See* Workpaper "Boyles-Mathur Workpaper 04 - Combined UP-NS Phase II Worktable.xlsm."

[85] The cost-of-capital percentage is applied in the "B" tables of the URCS Phase II Worktables. *See* URCS Phase II Worktables, Tabs "B5P6" and "B5P7."

[86] We exclude these ROI costs after we run the URCS Phase III Model to estimate the variable costs associated with the diverted traffic. *See* **Section V.C**.

53. Finally, we note that we include the general overhead and administrative cost allocation that URCS applies when estimating the cost of individual shipments. We understand that Grant Janke quantifies savings from reductions in general overhead and administrative costs from combining operations of UP and NS without accounting for growth.[87] However, when accounting for the additional traffic the combined network would attract, it is reasonable (and conservative) to assume that the combined UP/NS entity's general overhead and administrative costs increase to support the diverted traffic.

C. Application of combined adjusted URCS model to diverted traffic

54. We received data on diverted traffic from extended hauls, rail-to-rail diversions, and truck-to-rail diversions that are projected to occur on the combined UP/NS network from the Verified Statement of David T. Hunt and Matthew Schabas. The data include the following fields:

a. The origin and destination of the diverted traffic.

b. The distance between the origin and destination that the diverted traffic will travel on the combined UP/NS network, as calculated by MultiRail.

c. The service type of the diverted traffic (*i.e.*, whether it is intermodal, bulk, auto, or general merchandise traffic).

[87] *See* Verified Statement of Grant Janke, ¶¶ 8, 19, and 22.

d. The commodity of the diverted shipments, represented by the two-digit Standard Transportation Commodity Code ("STCC").[88]

e. The freight car type that the diverted traffic travels on, represented by the first letter of the AAR equipment type.[89]

f. The "junction frequency," which can have a value of 0, 1, or 2, and indicates the number of interchanges with other railroads at both ends of the diverted traffic's journey on the UP/NS network. Specifically, a value of 0 indicates that the traffic originates and terminates on the UP/NS network, a value of 1 indicates that it originates or terminates on the UP/NS network at one end and interchanges with another railroad at the other, and a value of 2 indicates that it interchanges with other railroads at both ends.

g. The total number of cars (or intermodal units, for intermodal service type) expected to be diverted in a year for the given origin-destination-service type-commodity-car type combination.

h. The total net weight of the shipments that are diverted for each origin-destination-service type-commodity-car type combination.[90]

---

88 *See* "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf ("2023 Waybill Sample Reference Guide"), p. 107.

89 *See* 2023 Waybill Sample Reference Guide, pp. 62, 162–163.

90 "Net weight" refers to only the weight of the commodity being transported itself and excludes the tare weight of the cars and equipment used to move the commodity. *See* URCS Phase III Model, Tab "RailroadCostProgram," Rows 11, 48:55. For intermodal diverted traffic, the "net weight" field includes both the true net weight of the shipment and the container tare weight, whereas the "pure weight" or "lading weight" field reflects only the net weight of the contents of the shipment. The latter is the appropriate net weight used in our URCS Phase III model. *See* Hunt/Schabas Workpaper, "Revenue_Calculation_vF.xlsx," Tab "Data dictionary."

55. The diverted traffic includes both traffic that previously traveled exclusively on other railroads or via trucks for its entire journey, and "extended haul" diversions—*i.e.*, traffic that traveled over a portion of the UP or NS network pre-merger. For extended haul diversions, we received the same data fields for "offsetting" traffic, *i.e.*, the original routing as it would occur on either legacy UP or legacy NS prior to the merger.

56. We applied certain transformations to these data fields to convert them into the inputs necessary to run the diverted traffic through our URCS Phase III model. Specifically, the URCS Phase III model requires nine inputs for estimating operating costs,[91] which we calculate as follows:

a. Distance: We obtain this field directly from the diverted traffic data based on the distance between the origin and the destination.

b. Segment Type: This input to the URCS Phase III model determines whether URCS assumes the shipment has two industry switches (*i.e.*, an origination and a termination), two interchange switches (*i.e.*, interchanges to another railroad at both ends of its journey), or one of each type of switch. We map the "junction frequency" field in the diverted traffic data into this URCS input.[92]

---

91 *See* URCS Phase III Model, Tab "RailroadCostProgram," Rows 5:13.

92 Specifically, if junction frequency equals zero, we set segment type to "OT," signifying an origination and termination on both ends of the movement. If junction frequency equals one, we set segment type to "OD," signifying an origination on one end and an interchange (*i.e.*, delivery) on the other end. If junction frequency equals two, we set segment type to "RD," signifying received and delivered (*i.e.*, an interchange on both ends). For cases where junction frequency equals one, we could have also set the segment type to be "RT," which reflects "received" (*i.e.*, an interchange) at the beginning and a termination at the end. Because URCS treats shipments with segment type of "OD" and segment type of "RT" as having an interchange on one end and an origination or termination on the other, both segment types have the same cost estimates. *See* URCS Phase III Model, Tab "RailroadCostProgram."

c. Freight Car Type: The diverted traffic data identify freight car type by the first letter of the AAR equipment code. However, the URCS model classifies car types differently from the AAR classification—URCS car type classifications are consistent with those used in Schedule 710 of the R-1 annual reports. In most cases, the first letter of the AAR equipment code corresponds directly to one URCS car type, allowing for a straightforward mapping.[93] However, in cases where the first letter of an AAR equipment code corresponds to multiple URCS car types, we assign the URCS car type associated with the greatest combined UP/NS car miles among the possible options.[94]

d. Shipment Size: In URCS, the shipment size field can take on values of single-car, multi-car, unit train, or intermodal. The URCS Phase III model estimates proportionally lower costs per car for larger shipment sizes (*i.e.*, multi-car and unit train shipment sizes relative to single-car shipment size) and for intermodal shipments.[95] We determine the shipment size based on the service

---

93 *See* R-1 Annual Report, Schedule 710, pp. 68, 70. For instance, there is a one-to-one mapping between AAR equipment code letter "C" and URCS car type covered hopper cars. Therefore, we assign URCS car type covered hopper cars to all observations with AAR equipment code letter "C."

94 For instance, letter "T" of the AAR equipment code corresponds to two URCS car types, namely tank cars under 22,000 gallons and tank cars 22,000 gallons and over. The Board's URCS Phase II Worktables show that in 2023, the UP/NS combined total car miles for tank cars 22,000 gallons and over was 1.8 million, higher than the UP/NS combined total car miles for tank cars under 22,000 gallons at 0.5 million. Therefore, we assign the URCS car type tank cars 22,000 gallons and over to all observations with AAR equipment code letter "T." *See* Workpaper "Boyles-Mathur Workpaper 06 - AAR to URCS Car Type Crosswalk for Diverted Traffic Analysis.xlsx."

95 The efficiency adjustments and jurisdictional add-ons in the URCS Phase III model reflect economies of scale present in railroad operations. Specifically, the efficiency adjustments apply relatively lower unit costs within certain cost categories for larger shipment sizes and intermodal shipments, while conversely, the jurisdictional add-ons increase the costs that are calculated by URCS for smaller shipment sizes. *See* URCS Phase III Model, Tab "DetailedParameters," Rows 88 and 90, Tab "URCSInputs," Columns AU:AZ; Tab "RailroadCostProgram," Rows 131:150 and 352:368. We apply the URCS efficiency adjustments and jurisdictional add-ons when calculating the costs associated with the diverted traffic, as is recommended by the Board. *See* URCS User Manual, p. 23.

type field of the diversion traffic data. To be conservative, we assume "merchandise" and "auto" service types correspond to single-car shipment sizes. We assign "bulk" service type to "unit train" shipment size, and "intermodal" service type to "intermodal" shipment size.[96]

e. Number of Cars: The URCS input for number of cars is meant to correspond to the number of cars in the specific shipment. The diverted traffic data, however, report the total number of cars diverted over the entire year, and does not contain data on the number of cars in a shipment. Therefore, to be conservative and consistent with our treatment of the "shipment size" variable described above, we assume that the diverted traffic with service types of auto and merchandise are single car shipments and we assume that the diverted traffic with intermodal service type are single intermodal container/trailer shipments. Thus, for these three service types, we set the number of cars or intermodal units equal to one. For the bulk service type, we set the number of cars to be the weighted average number of cars per unit train for UP and NS based on their 2023 R-1 annual reports, which is approximately 122 cars.[97] To estimate the variable costs associated with the total cars or intermodal units diverted over an entire year, we multiply the URCS output for a single-car (or

[96] *See* Workpaper "Boyles-Mathur Workpaper 07 - Diverted Traffic Data Processing - URCS Phase III Input.R."

[97] Specifically, the system-wide unit train miles reported in UP and NS's 2023 R-1 annual reports were 21,465,276 and 7,191,823, respectively, totaling 28,657,099 unit train miles across both networks. The system-wide car miles on unit trains reported in UP and NS's 2023 R-1 annual reports were 2,735,550,000 and 772,092,000, respectively, totaling 3,507,642,000 car miles on unit trains across both networks. Therefore, the weighted average cars per unit train across both networks is 3,507,642,000 car miles divided by 28,657,099 train miles, which is approximately 122 cars per unit train. *See* UP 2023 R-1 Annual Report, Schedule 755; NS 2023 R-1 Annual Report, Schedule 755.

for bulk traffic, 122-car) shipment by the total number of cars or intermodal units diverted in the diverted traffic data (or the total number of cars divided by 122 for bulk traffic).

f. Commodity: Because the URCS commodity input translates to two-digit STCC codes, we directly use the STCC field available in the diverted traffic data.[98]

g. Car Ownership: The diverted traffic data do not include information on car ownership (*i.e.*, railroad-owned versus privately-owned). However, we were separately provided a file that shows the distribution of car ownership by two-digit STCC and AAR car type.[99] Therefore, for each observation in the

[98] There are three STCC code values that appear in the diverted traffic data that the URCS Phase III model does not accept as an input for the commodity field. For codes 0 and 99, which only occur for intermodal offsetting traffic, we use STCC code 46, which represents miscellaneous mixed shipments and is the most common STCC code assigned to intermodal traffic in the non-offsetting diverted traffic data. For STCC code 49, corresponding to hazardous materials, we rely on a lookup table provided by David T. Hunt and Matthew Schabas based on the CCWS that shows the distribution of standard STCC codes by AAR car type for waybills with STCC code 49. Specifically, we use the most common standard STCC code from the lookup table for each AAR car type. *See* 2023 Waybill Sample Reference Guide, p. 158; "Association of American Railroads Hazardous Materials Shipping Descriptions Data Base Reference File Layout," *Association of American Railroads*, 2021, p. 8, available at https://public.railinc.com/sites/default/files/documents/STCC_HazMatFileLayout.pdf, accessed November 24, 2025; Hunt/Schabas Workpaper, "Revenue_Calculation_vF.xlsx," Tab "Lkup_haz_stcc2_car_type"; Workpaper "Boyles-Mathur Workpaper 07 - Diverted Traffic Data Processing - URCS Phase III Input.R"; URCS Phase III Model, Tab "URCSInputs," Columns O:R.

[99] The distribution was provided to us by David T. Hunt and Matthew Schabas and is based on the CCWS. Hunt/Schabas Workpaper, "Revenue_Calculation_vF.xlsx," Tab "Lkup_car_ownership_by_stcc2." This distribution shows a breakdown of car ownership by railroad-owned, private-owned, and TTX cars. URCS costs TTX cars the same as it costs privately-owned cars, so the TTX and private car percentages were combined when comparing the private car ownership to railroad car ownership and determining which was more common for the given STCC-car type combination. *See* Workpaper "Boyles-Mathur Workpaper 07 - Diverted Traffic Data Processing - URCS Phase III Input.R"; URCS Phase III Model, Tab "URCSInputs," Columns T:V; Tab "RailroadCostProgram."

diverted traffic data, we assign the ownership type that is most common for the STCC-car type combination of the observation.[100]

h. Net Weight per Car: To determine net weight per car (or per intermodal unit) for each observation in the diverted traffic data, we divide the total net weight of the diverted shipments by the total number of diverted cars (or intermodal units).

i. Railroad: The railroad input to the URCS Phase III model determines which railroad's Phase II variable unit costs are applied to estimate the variable costs of the given shipment.[101] We adjust the URCS Phase III model to add a new "UPNS" railroad and incorporate the Phase II unit costs we developed for the combined UP/NS network (as described in **Section V.A)** into the Phase III model.[102]

57. After converting the diverted traffic data into the necessary URCS Phase III inputs, we run the URCS Phase III model using those inputs to estimate the variable costs associated with the diverted traffic. We also run the "offsetting" traffic data (for extended haul diversions) through the model to estimate the variable costs associated with the offsetting traffic to deduct from the variable costs of the diverted traffic. For both the diverted traffic and

[100] The car ownership distribution provided to us did not include all the STCC-car type combinations in the diverted traffic data for AAR equipment code letters "U" and "Z," which represent intermodal containers and trailers. These containers and trailers are loaded on intermodal flatcars, which have AAR equipment codes "P," "Q," or "S." Because the distribution we were provided shows that the ownership type most common for intermodal flatcars is always private (or TTX) ownership regardless of STCC, we assign private car ownership to AAR equipment code letters "U" and "Z." *See* Hunt/Schabas Workpaper, "Revenue_Calculation_vF.xlsx," Tab "Lkup_car_ownership_by_stcc2"; Workpaper "Boyles-Mathur Workpaper 07 - Diverted Traffic Data Processing - URCS Phase III Input.R"; R-1 Annual Report, pp. 68, 70.

[101] *See* URCS Phase III Model, Tabs "RailroadCostProgram" and "RailroadUnitCostXML."

[102] *See* Workpaper "Boyles-Mathur Workpaper 08 - Combined UP-NS Phase III Model - Diverted Traffic Costing.xlsm."

"offsetting" traffic, we adjust the outputted URCS costs to exclude depreciation costs (which are already separately accounted for in the *pro forma* financials) and exclude ROI expenses, as explained in **Section V.B**.[103] The resulting incremental costs of the diverted traffic are summarized in **Figure 12** below.

Figure 12. Incremental Costs of Diverted Traffic[104]

	Costs (2023 USD)
Incremental Costs Including Full Extended Haul Shipments	$2,563,352,621
Incremental Costs for Offsetting Traffic	-$330,901,541
Incremental Costs of Diverted Traffic	**$2,232,451,081**

[103] The "jurisdictional add on" and "loss & damage claim" expenses are the two components of the total variable costs that are not explicitly categorized as OPR, DRL, or ROI expenses in the URCS Phase III Model. We include both of these expenses in our estimates of the incremental costs of the diverted traffic. *See* URCS Phase III Model, Tab "RailroadCostProgram," Rows 368, 465, and 468:469; Workpapers "Boyles-Mathur Workpaper 09 - Phase III Model - Cost Categorization.xlsx"; "Boyles-Mathur Workpaper 10 - Calculate Diverted Traffic Costs from Phase III Output.R."

[104] Workpaper "Boyles-Mathur Workpaper 11 - Backup to Figures - Incremental Costs of Diverted Traffic.xlsx."

VERIFICATION

I, Michael Boyles, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on December 16, 2025.

Exhibit 1: Railroad-Owned Car Mile Reductions and Cost Savings from the Base Plan to the Optimized Plan

Notes:

[1] Reductions in car miles represent the difference in railroad-owned car miles between the Base Plan and the Optimized Plan. For each car type and railroad, we estimate railroad-owned car miles by apportioning total car miles reported by MultiRail using the shares of railroad-owned car miles in the 2023 R-1 annual reports.

[2] Unit costs are based on the operating expenses per car mile running for railroad-owned cars, as reported in UP and NS 2023 URCS Phase II Worktables.

[3] For both the Base Plan and Optimized Plan, we were provided the car miles split between the legacy UP and legacy NS networks (by AAR car type first letter) in Operating Plan Workpaper, "T1_T2_T3_Car_Type_Splits_20251124.xlsx," Tabs "Subregion Output_T1" and "Subregion Output_Addback_T2." We calculate the legacy UP/NS split by assigning Detroit CSAO, N Jersey CSAO, and S Jersey CSAO subregions to NS and excluding stranded and unmoved blocks. We then use this legacy UP/NS split to allocate the total car miles for each car type reported in Tabs "Output_T1"and "Output_T2_Addback" to UP and NS.

[4] For both the Base Plan and Optimized Plan, MultiRail reports car miles by the first letter of the AAR equipment code. Using Schedule 710 of the R-1 Annual Report, we map each AAR equipment code letter to the corresponding URCS car type. We assign car miles with "Null" AAR equipment code letters to URCS car type "All Other Freight Cars." For the four AAR equipment code letters (B, F, R and T) that correspond to two URCS car types (excluding "All Other Freight Cars"), we apportion car miles between the two URCS car types in proportion to each railroad's 2023 R-1 car miles for those types.

Total	**7,959**	**1,452**	**N/A**	**N/A**	**-$24,251.81**	**$57,178.39**

Exhibit 2: Railroad-Owned Car Day Reductions and Cost Savings from the Base Plan to the Optimized Plan

Notes:

[1] Reductions in car days represent the difference in railroad-owned car days between the Base Plan and the Optimized Plan. For each railroad and URCS car type, we calculate railroad-owned car days as railroad-owned car miles divided by the system-wide average number of miles a car travels per day reported in URCS, following the URCS Phase III methodology. *See* Exhibit 1 for our estimates of reductions in railroad-owned car miles by URCS car type. URCS reports the system-wide average miles a car travels per day as 585.32 for UP and 512.37 for NS.

[2] Unit costs are based on the operating expenses per car day running for railroad-owned cars, as reported in UP and NS 2023 URCS Phase II Worktables.

APPENDIX A
CURRICULUM VITAE OF MICHAEL BOYLES

Michael J. Boyles

Independent Consultant

+1 (703) 625-2097
m_boyles@hotmail.com

Education

Bachelor of Science and Engineering (B.S.E.) from Princeton University, with a concentration in Engineering and Management Systems.

Summary

Mr. Boyles is a transportation industry expert with more than 35 years of experience conducting economic, financial, cost, and operational analyses in both regulatory and consulting settings – blending qualitative and quantitative approaches.

Work Experience

Mr. Boyles was a Supervisory Transportation Industry Analyst (TIA) in the Office of Economics (OE) at the Surface Transportation Board (STB or Board) with over 20 years of experience before his retirement in September 2025.

Projects related to cost modeling include the following:

- In 2009, he was assigned as Chief of the Section of Regulatory Economics – a new section in OE created to overhaul the STB's Uniform Rail Costing System (URCS).
- Mr. Boyles was a major contributor to the 2010 Report to Congress Regarding URCS (2010 Report). This included identifying the topics to be included in the Basic, Moderate, and Comprehensive options requested by Congress. The two primary topics were (1) updating the URCS legacy systems and (2) revisiting the Make-Whole Adjustment, which accounts for economies of scale as shipment size increases in the cost of providing railroad service.

- He oversaw an outside IT contractor to update and improve the URCS legacy system available to the public. The new Windows-based version of the URCS Phase III cost program was released to the public in 2012.
- Mr. Boyles was the recipient of the U.S. Department of Transportation Secretary's Team Award, Uniform Railroad Costing System Team, awarded November 2012.
- Mr. Boyles oversaw the development of a new URCS Phase II cost program, which calculates system-average unit costs of certain railroad metrics. The new MS Excel-based version of the URCS Phase II cost program was released to the public in 2015, replacing the previous output from the URCS legacy system. This program for the first time allowed users to change inputs and instantaneously observe the impact of such changes on resulting unit costs (*i.e.*, it added a What-If functionality).
- From 2013 to 2016, he conceptualized and proposed changes to how URCS incorporates cost causation and economies of scale in its development of certain unit costs (*i.e.*, the Make-Whole Adjustment) in Ex Parte No. 431 (Sub-No. 4), Review of the General Purpose Costing System. These proposed changes also eliminated negative step functions in the cost calculations as shipment size increased, which created opportunities for parties to use URCS to manipulate regulatory outcomes. This was the first major proposal to change URCS in over 20 years and addressed issues that stakeholders had complained about for years.
- Mr. Boyles personally developed a new URCS Phase III cost program, which calculates the variable costs of individual rail shipments. The new MS Excel-based version of the URCS Phase III cost program was released to the public in 2021, replacing the URCS legacy program. This new program also made certain technical corrections related to the costing of intermodal shipments, as well as other corrections present in the legacy program.
- He designed and oversaw the development of new programs to calculate the variable cost of shipments in the STB's Confidential Carload Waybill Sample (CCWS) using the new MS Excel-based URCS Phase III cost model. This included corrections to the statistics accumulated from the CCWS used to create the Make-Whole Adjustment factors.

Projects related to economic and regulatory policy/rulemakings include the following:

- In Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases, he was team leader assigned to evaluate evidence regarding the Board's proposal to eliminate movement-specific adjustments to the Uniform Rail Costing System (URCS). He also evaluated the impacts of modifications to how revenues are allocated within a Stand-Alone Cost (SAC) case (*i.e.*, Average Total Cost or ATC) and how reparations are calculated (*i.e.*, Maximum

Markup Methodology or MMM) and recommended how to implement those new methodologies.

- In Ex Parte No. 646 (Sub-No. 1), Simplified Standards for Rail Rate Cases, he was team leader assigned to developing the Board's proposal for estimating railroad operating expenses using URCS in the Simplified SAC methodology for the Notice of Proposed Rulemaking (NPRM). He provided comments on the draft NPRM, including its appendices.

- Mr. Boyles was the recipient of the U.S. Department of Transportation Secretary's Team Award, Small Rate Case Team, awarded November 2005.

- In response to Congressional inquiries, Mr. Boyles provided sensitivity analyses on impacts to the railroad industry from changes to eligibility thresholds applied to each of the three methodologies used by the STB for adjudicating railroad rate complaints.

- As part of the Board's Small Rate Case Team, he participated in meetings hosted by the STB with various railroad executives and railroad unions. He provided the STB Chairman with a summary of the Simplified Stand-Alone Cost (SSAC) model previously sponsored by the AAR in Ex Parte No. 347 (Sub-No. 2), Rate Guidelines - Non-Coal Proceedings. He quantified the rail industry's exposure to the small rate case methodology based on certain proposals contemplated by the Board using the carload waybill sample.

Projects related to railroad rate complaints include the following:

- In Docket No. 41191 (Sub-No. 1), AEP Texas v. BNSF, Mr. Boyles analyzed the traffic volumes and revenues associated with the stand-alone railroad (SARR) traffic group. He summarized the parties' respective positions and shared that economic analysis with the Office of Proceedings for use in a draft decision. He helped evaluate the Rail Traffic Control (RTC) model, particularly with how non-SARR train conflicts at the mines are handled and whether random outages are reasonable, and analyzed the parties' respective positions regarding the Discounted Cash Flow (DCF) model. He proposed, researched and developed an analysis of various railroad cost-of-equity models in defense of the Board's use of a Single-Stage DCF model. This analysis was embraced by the Court of Appeals and ultimately led to the settlement of the case.

- In Docket No. 42088, Western Fuels/Basin Electric v. BNSF, Mr. Boyles compared the parties' respective positions regarding the variable cost analysis. He compared and contrasted how non-SARR train conflicts at the mines were modeled within the WF/BE case versus the AEP Texas case. He reviewed BNSF's Petition for Reconsideration of the

compliance order and compared the use of the EIA's AEO 2006 versus AEO 2005 forecasts with the rate case team.

Projects related to environmental analysis include the following:

- In Finance Docket No. 33407, DM&E Construction into the Powder River Basin (PRB), Mr. Boyles developed the environmental analysis included in the Supplemental Environmental Impact Statement (SEIS) and Final SEIS in response to the remand by the Court of Appeals. He developed new inputs given to the Department of Energy's Energy Information Administration (EIA) for use in its National Energy Modeling System (NEMS) model in order to simulate the air quality impacts of the new construction. He incorporated the results of that simulation into the Supplement SEIS and Final SEIS.
- In Finance Docket No. 30186 (Sub-No. 3), Tongue River Construction and Operation – Western Alignment, Mr. Boyles developed the environmental analysis included in the Final EIS. He worked closely with the applicants, the Office of Environmental Analysis (OEA), and the General Counsel's office.

Prior to joining the STB, Mr. Boyles was a consultant with FTI Consulting in its Network Industries Strategies practice.

Projects related to the railroad industry include the following:

- Mr. Boyles performed a number of railroad special studies used as inputs into the Uniform Railroad Costing System (URCS) and Stand-Alone Cost (SAC) analyses in order to develop costs for rate reasonableness cases before the STB.
- He headed a project team of seven in a contract dispute between Amtrak and a U.S. Class I railroad involving a False Claims Act violation. He evaluated Amtrak's claim and provided analyses and an independent audit of contract provisions and its execution. He supported outside counsel's presentation of findings to the Department of Justice (DOJ) including restated damage claims for settlement discussions.
- Mr. Boyles sponsored a series of expert witness reports for a U.S. Class I railroad in a proceeding in front of the STB evaluating rail rates into and out of Buffalo, NY after the division of Conrail (*i.e.*, Finance Docket 33388, Buffalo Rate Study).
- He headed a project team of six in a breach of contract litigation between a coal-fired utility and a U.S. Class I railroad. He critically reviewed opposition's expert witness report, identified errors, and restated opposition's position resulting in diminished damage claims. He drafted an expert witness report and supported outside counsel in depositions.

Projects related to the telecommunications industry include the following:

- Mr. Boyles reviewed numerous Regional Bell Operating Companies (RBOCs) cost models and their inputs, as well as associated cost studies of unbundled network elements (UNEs) for clients attempting to enter the local telecommunications market as a result of the Telecommunications Act of 1996. He identified the major cost drivers of these models and identified where these models and/or their inputs deviated from the economic guidelines established by Federal Communications Commission (FCC), referred to as Total Element Long Run Incremental Costs (TELRIC). He reran the models producing restated cost studies, which were submitted to state Public Utility Commissions (PUCs) in order to establish interconnection rates. Mr. Boyles sponsored expert written testimony and testified in hearings before PUCs. He also supported the client's business units to identify cost-based rates for use in interconnection agreement negotiations and supported counsel in depositions and hearings preparation.

- Mr. Boyles reviewed the telecommunications cost model sponsored by the FCC for any inconsistencies between the model's stated intention and its actual application. He proposed and implemented dramatic improvements to the model's feeder and distribution structure sharing and quantified its impacts. He presented his results to FCC staff who admitted they would have included those improvements, but they were unable to figure out how to implement them.

- He coordinated production of a six-volume report on the direction and competitive environment of Internet broadband access. The report evaluated market share forecasts of DSL, cable modem, wireless and satellite technologies. It included competitor analysis supported by extensive Internet research. He also researched potential for unfair competitive advantage in providing broadband content, including evaluating portal companies and content providers.

Prior to joining FTI Consulting, Mr. Boyles was a consultant with ALK Associates.

- Mr. Boyles evaluated the divestiture of rail lines for a major North American railroad. He quantified the traffic losses to the divesting railroad and the traffic gains to the acquiring railroad, which he presented to marketing and strategic planning personnel from both railroads.

- He evaluated and quantified the incremental rail traffic that the combination of two U.S. Class I railroads could capture from other railroads as part of the merger application before the Interstate Commerce Commission (ICC). He provided traffic data preparation and support for other consultants in their studies for the merger application.

- He jointly managed a multi-firm project to develop an integrated computer-based costing algorithm and railroad network model applying a Simplified Stand-Alone Cost (SSAC) standard for transportation services by railroad. He presented the model methodology before the ICC as part of a proceeding to determine an economical procedure for handling small shipper claims of unreasonable rail rates. He worked with prominent economists to ensure the model correctly applied the underlying economic theory.
- Mr. Boyles designed and implemented a computer system to optimally reposition empty intermodal containers within North America for the daily operations of a worldwide steamship line. He worked closely with the client's IT staff to develop the user interface.

APPENDIX B
CURRICULUM VITAE OF DIVYA MATHUR, PH.D.

DIVYA MATHUR, PH.D.

Managing Principal, Analysis Group, Inc.

+1 (312) 291-5640 | divya.mathur@analysisgroup.com

Dr. Mathur specializes in the application of microeconomics, statistics, and econometrics to complex litigation matters, government and regulatory investigations, and consulting engagements in the areas of antitrust and competition and complex commercial disputes. She has provided expert economic testimony on antitrust, class certification, and damages issues at depositions and trials in federal court and has been qualified by courts as an expert economist. Her economic and financial expertise includes the analysis of market structure and competitive dynamics; economic and financial modeling in merger review and regulatory proceedings; assessment of competitive effects pertaining to mergers and antitrust conduct such as price-fixing, information sharing monopolization, and alleged exclusionary practices; modeling of damages and lost profits; valuation of businesses and assets; and evaluation of financial performance and pricing strategies in regulated industries such as transportation, telecommunications, pharmaceuticals, and financial services. Her engagements have included work on behalf of the United States Department of Justice and the Federal Trade Commission, as well as companies in numerous industries including transportation, technology, telecommunications, manufacturing, and financial services. Dr. Mathur has also submitted expert statements before the Surface Transportation Board in connection with compensation for trackage rights and has conducted economic analysis in other regulatory contexts involving the Federal Communications Commission and the International Trade Commission. Dr. Mathur has published and presented extensively on topics including merger analysis, antitrust issues, and the intersection of economics and financial analysis in regulatory enforcement. She has lectured on competitive strategy and microeconomics at The University of Chicago and has served as a guest lecturer on topics in competitive strategy and industrial structure at the Kellogg School of Management at Northwestern University.

PROFESSIONAL EXPERIENCE

2008–Present, Analysis Group, Inc.

EDUCATION

Ph.D. Economics, The University of Chicago
Areas of Specialization: Industrial Organization, Labor Economics

M.A. Economics, The University of Chicago

A.B. Economics and Mathematics, *summa cum laude*, Mount Holyoke College

EXPERT WITNESS ENGAGEMENTS

- ***Regeneron Pharmaceuticals, Inc. v. Amgen Inc.***
  United States District Court, District of Delaware
  Testified at deposition and trial on antitrust damages pertaining to allegations of exclusionary conduct in pharmaceutical drugs pricing on behalf of Regeneron (2025)

- ***G.I. Industries dba Waste Management v. Arakelian Enterprises dba Athens Services***
  Superior Court of the State of California, County of Ventura
  Testified at deposition on antitrust issues pertaining to allegations of below-cost pricing on behalf of Athens (2025)

- ***In re: LIBOR-Based Financial Instruments Antirust Litigation***
  United States District Court, Southern District of New York
  Testified at deposition on antitrust merits issues in an alleged price-fixing conspiracy on behalf of Credit Suisse (2024)

- ***Atchison, Topeka & Santa Fe Railway Company – Operating Rights – Southern Pacific Transportation Co.***
  Surface Transportation Board
  Submitted expert statements on compensation for trackage rights on behalf of Union Pacific Railroad Company (2024)

- ***Carlisle Construction Materials, LLC, et al. v. Graco Inc., et al.***
  United States District Court, District of Delaware
  Testified at deposition and trial on antitrust issues and damages in the spray foam insulation industry on behalf of Carlisle (2024)

- ***Misty Snow, et al. v. Align Technology***
  United States District Court, Northern District of California
  Testified at deposition on class certification and damages pertaining to antirust claims on behalf of Align (2024)

- ***In re: EpiPen Direct Purchaser Litigation***
  United States District Court, District of Minnesota
  Testified at deposition on class certification on behalf of CVS Caremark, Express Scripts, and OptumRx pertaining to rebating practices (2023)

- ***Erica Frasco, et al. v. Flo Health, Inc., Google, LLC, Meta Platforms, Inc., and Flurry, LLC***
  United States District Court, Northern District of California
  Testified at deposition on class certification on behalf of Google on privacy and data collection practices on a mobile app (2023)

- ***Brainchild Surgical Devices, et al. v. CPA Global Limited***
  United States District Court, Eastern District of Virginia
  Testified at deposition on class certification and damages on behalf of Defendant regarding disclosure of fees (2023)

- ***In re: Foreign Exchange Benchmark Rates Antitrust Litigation***
  United States District Court, Southern District of New York
  Testified at deposition and trial on antitrust issues in an alleged price-fixing conspiracy on behalf of Credit Suisse (2022)

- ***Global Tubing, LLC v. Tenaris Coiled Tubes, LLC***
  United States District Court, Southern District of Texas
  Testified at deposition on antitrust merits and damages pertaining to monopolization allegations in the oil and gas industry on behalf of Tenaris (2022)

- ***Marriott International Customer Data Security Breach Litigation***
  United States District Court, District of Maryland
  Testified at deposition on damages related to a data security incident on behalf of Marriott (2021)

- ***Ingevity Corporation, et al. v. BASF Corporation***
  United States District Court, District of Delaware
  Testified at deposition and trial on antitrust merits and damages from alleged exclusive dealing and tying arrangements in the automotive parts industry on behalf of BASF (2020–2021)

- ***Tillage, et al. v. Comcast Corporation, et al.***
  United States District Court, Northern District of California
  Testified at deposition on class certification and damages from alleged false advertising in the cable television industry on behalf of Comcast (2021)

- ***Payment Logistics Limited v. Lighthouse Network, LLC, et al.***
  United States District Court, Southern District of California
  Submitted an expert report on the economic impact of a vertical merger on competition in the payment card processing industry on behalf of Lighthouse Network (2019)

SELECTED CONSULTING ENGAGEMENTS

Antitrust, Competition, and Regulation

- Analysis of services provided and fees charged by online e-commerce marketplaces
- Analysis of competition issues related to a mobile app store on behalf of a major technology firm
- Analysis of competition issues related to a proposed merger in the book publishing industry
- Analysis of competition issues pertaining to an early-stage acquisition in the pharmaceutical industry
- Analysis of antitrust liability and damages pertaining to the ticket sale practices of a major league sports team
- Analysis of competition issues related to a proposed merger in the telecommunications industry on behalf of the DOJ
- Analysis of competition issues related to a proposed merger in the sewage and waste management industry

- Analysis of the impact of alleged price fixing and bid rigging on behalf of a major automotive parts manufacturer
- Analysis of economic issues related to interchange rates and network rules and fees in the credit card industry
- Analysis of antitrust liability and damages related to allegations of price-fixing in the issuance of government-sponsored enterprise (GSE) bonds on behalf of a major financial institution
- Assessment of the economic impact of an import ban on certain smartphones and tablets on behalf of a major mobile device manufacturer in a US International Trade Commission (ITC) proceeding
- Assessment of the economic impact of an import ban on certain microprocessors, servers, and personal computers on behalf of a major microprocessor manufacturer and original equipment manufacturers in an ITC proceeding
- Assessment of competition in the marketplace for business data services including enterprise-level broadband internet services on behalf of a service provider in a US Federal Communications Commission proceeding
- Analysis of competition issues related to steering and tiering contractual provisions between health care providers and payers in a major health care system on behalf of the DOJ
- Analysis of antitrust liability and damages from refusal to deal and tying claims in the sale of demand deposit account debt portfolios
- Analysis of antitrust liability and damages from monopolization and tying claims involving applications on e-book viewers
- Analysis of antitrust liability and damages issues related to a consummated merger pertaining to drugs prescribed for pediatric heart defects on behalf of the FTC

Class Certification

- Assessment of class certification and damages claims by direct purchasers and end-payors of a brand name immunosuppressant drug
- Assessment of class certification and damages claims by direct purchasers and end-payers of a brand-name beta-blocker drug
- Assessment of class certification and damages claims by direct purchasers of a pharmaceutical therapy for Alzheimer's disease
- Assessment of class certification claims related to payment cards involved in an electronic data security breach
- Analysis of class certification claims related to alleged Real Estate Settlement Procedures Act (RESPA) violations associated with mortgage reinsurance
- Design and analysis of a survey on washing machines in connection with class action damages analyses

Intellectual Property

- Assessment of damages from alleged breach of contract and trademark misuse in the medical device industry

- Assessment of damages from the alleged infringement of a design patent in a retail merchandising and store display system
- Assessment of damages arising from the misappropriation of trade secrets related to product classification and data management systems.
- Analysis of appropriate licensing fees for performing rights for musical compositions in a major performing right organization's repertory
- Analysis of the economic value of patents donated to academic institutions using bibliometric and citation analyses using US Patent and Trademark Office (USPTO) patent data
- Analysis of economic issues related to the scanning and digitizing of books undertaken by a major technology company

Complex Commercial Litigation

- Estimation of damages and valuation of assets in a breach of contract dispute in the chemicals industry
- Valuation of insurance claims and related statistical analyses arising from wildfires
- Estimation of damages pertaining to a manufacturing and supply agreement in the pharmaceutical industry on behalf of a drug manufacturer
- Estimation of damages pertaining to pricing and rebates of pharmaceuticals in a breach of contract dispute on behalf of a major drug wholesaler
- Analysis of liability and damages from allegations of misrepresentation and defamation in the information technology research industry
- Assessment of damages from alleged false advertising and Lanham Act claims in the ride-sharing industry
- Statistical analysis of traffic stops on behalf of a major city police department
- Analysis of statistical sampling issues related to the purchase and securitization of residential mortgage loans
- Estimation of damages in a breach of contract dispute in the sub-prime credit card industry, including claims relating to contractual changes in credit card accounts and credit debt waiver products.
- Estimation of damages arising from an alleged breach of contract to provide logistics and distribution services for the US Army in overseas military engagements
- Estimation of damages resulting from an alleged breach of a market development agreement in the activated carbon industry
- Estimation of economic damages arising from a contract dispute related to military equipment

SELECTED PRESENTATIONS

- "Recent Developments in Cartels," Global Antitrust/Competition Law Conference, Center for Transnational Law and Business, USC Gould School of Law, May 2023
- Spring Meeting Mock Trial, American Bar Association Antitrust Law Section Spring Meeting, April 2023

- "The Ongoing Tale of Two-Sided Markets," American Bar Association Antitrust Law Section Spring Meeting, April 2022

Appendix A 6

VERIFIED STATEMENT

OF

GAURAV DUA

I. Introduction and Summary of Qualifications

1. My name is Gaurav Dua. I am a Principal in the EY Parthenon practice at Ernst & Young LLP ("EY"). I have over 22 years of work experience including 18 years of M&A transaction experience and have advised on over 50 integration and carve-out transactions. My CV is attached as Appendix A to this statement.

2. The EY Parthenon practice includes professionals like myself who specialize in advising companies on leading practices for successfully planning and executing integrations.

3. As a core member of EY Parthenon's Buy & Integrate (B&I) leadership team, I have advised companies on integration related transactions in all phases of the transaction lifecycle, including from early due diligence to transaction sign to close planning, and post-close execution.

4. The areas I have advised companies with integration include developing integration hypothesis, strategies, integration playbooks, integrated operating model designs, integration roadmaps, integration plans, synergy plans, one-time costs, synergy tracking and reporting processes, Day 1 (transaction close) readiness, and integration risk monitoring.

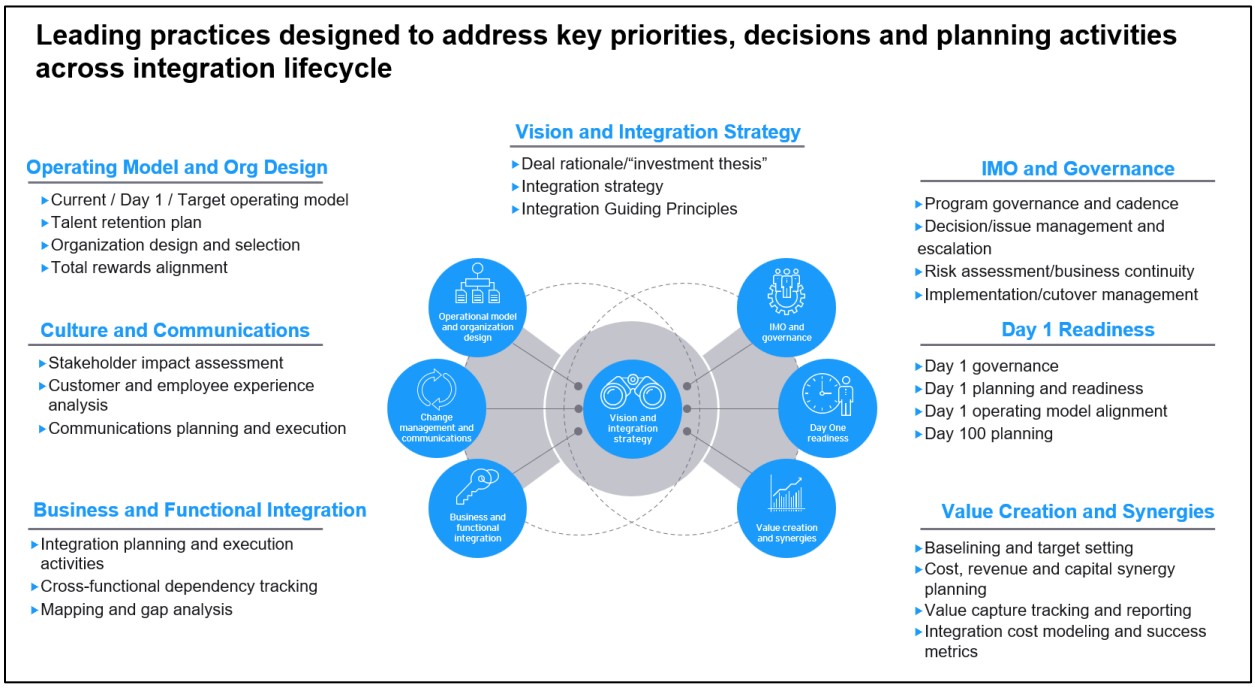
5. EY Parthenon has a track record in advising large-scale mergers in regulated industries to deliver integration efforts that meet regulatory requirements as well as business objectives. The B&I solution supports companies in increasingly

complex transactions process across the entire transaction cycle, from strategy and due diligence to transaction planning and integration across various industries.

6. Union Pacific has retained EY Parthenon to provide advice on industry leading practices to guide the integration of the Union Pacific Railroad Company ("UP") and Norfolk Southern Railway Company ("NS") railroads in a way that delivers transaction benefits without service disruptions.

7. The breadth of EY's experience, my experience, and our structured approach enables me to provide clear perspective and guidance on the UP–NS merger integration planning, aligning the integration planning with industry-leading practices.

8. I submit this Verified Statement to confirm the careful planning work that has been done, and to my understanding, will be done in conjunction with the UP and NS teams to prepare for integration in the event that the STB approves the proposed transaction. The UP-NS integration planning activities are consistent with leading practices I have observed in other large, complex mergers.



9. More detailed explanations of integration planning for certain key functions, developed by UP are set forth in other sections of this Application, such as the Operating Plan and Service Assurance Plan. My statement provides an overview of the overarching planning process that has been utilized to govern integration planning to date.

II. Applicants are Planning for Integration Carefully and Consistent with Leading Practices.

10. The proposed UP–NS merger is a transformative transaction that will create the first transcontinental freight rail network in the United States. To enable a disciplined, risk-based, and value-driven integration, I have advised on integration planning using EY Parthenon's B&I methodology—a framework that has guided large-scale integrations, across industries, geographies, and functions including Technology.

11. This methodology (detailed in Figure 1: EY Parthenon B&I Methodology – Integration Framework) is structured around seven core pillars, each of which is being applied to guide the UP–NS integration planning process. The framework enables the applicants to approach the integration with discipline, transparency, and strategic clarity. These pillars will guide integration planning throughout the pre-approval integration planning process and post-approval execution.

Figure 1: EY Parthenon B&I Methodology – Integration Framework

12. UP-NS integration planning is anchored in the Applicants' goals to grow traffic, improve service reliability, and unlock operational efficiencies across a unified national railroad. EY is supporting the UP Strategy Team in developing integration guiding principles that reflect these strategic priorities—(i) safety, service excellence, and operational continuity, (ii) operating as a unified company, (iii) delivering value and managing risk, and (iv) maintaining compliance. These principles form the basis of preliminary integration planning.

13. In accordance with EY Parthenon's B&I methodology, the UP–NS integration planning process will be scheduled to follow a phased approach to planning and readiness, and build on insights from the UP and NS teams to identify an achievable integration plan.

14. The Service Assurance Plan, developed by UP, in this Application is a product of this thoughtful integration planning effort. It reflects work done to consider how best to integrate key functions like technology, training, and customer service without adverse impacts on service.

15. In my experience, UP and NS are following an integration process that is informed by industry leading practices, and their integration planning to date has the level of detail that I would expect to see given the months long regulatory approval process. It is my understanding that UP and NS will be continuing integration discussions and planning over the course of 2026 as they await a regulatory decision on approval.

16. Based on my experience advising on large-scale integrations in regulated industries, in my opinion, the approach towards integration planning for the UP–NS combination is both disciplined and robust, with an emphasis on anticipating and mitigating any potential impacts on service. The integration planning process is grounded in leading practices, which have been proven across hundreds of complex transactions to deliver structured, cross-functional execution and measurable results.

VERIFICATION

I, Gaurav Dua, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed this 17th day of December, 2025.

Appendix A

CV of Gaurav Dua

Professional Background:

- Gaurav has over 22 years of work experience including 18 years of M&A transaction experience.
- He has advised on 50+ integration and carve-out transactions across different industries on varying deal sizes ranging from $50 million to $100+ billion.
- Gaurav has advised clients in all phases of the transaction lifecycle from early diligence, transaction sign to transaction close to post-close execution.
- He has led multiple transformational integration and separation efforts, and he has extensive experience in translating an investment thesis into an actionable integration or carve-out plan across the entire organization.

Educational background:

- Masters in Business Administration in finance and corporate accounting from Michigan State University
- Bachelor of Arts in Economics from University of Michigan, Ann Arbor

Presentations:

- Guest lecturer at Ross School of Business at University of Michigan, Ann Arbor presenting on the topic of Mergers, Acquisitions, Divestitures, and Corporate Development

Select transaction experience:

Relevant integration specific experience

- Led a team to help two of the world's largest chemical companies plan for achieving >$3B in cost synergies as a result of a merger integration (>$100B deal value) and ultimate 3-way tax-free spin. Engagement included developing an overall approach and enabling tools for synergy identification and management, operating model design, and organization design of ~100K employees.

- Assisted on a $26B merger and integration for a specialty chemicals company transaction including operating model design, organization design, integration synergy planning, Integration Management Office, and execution.

- Led a team to help a grocery retailer/distributor integrate their $1.3B transformational acquisition and realize $50M in annual cost synergies within three years of close date.

- Led a team to help a specialty pharma company integrate their $5.8B acquisition including planning for Day 1, long term integration, and assisting with execution in order to capture the stated deal value.

- Advised a financial services client during diligence to identify $30M in annual cost synergies as part of their $1.2B proposed acquisition. Engagement included conducting a 3rd party point of view on cost synergies and validating with management across all areas of the company.

- Led a team to help a business process outsourcer / shared services client integrate their $500M acquisition and develop an integration playbook to create a repeatable process.

- Led the finance and accounting integration for a $25B consumer products company on their $1.2B acquisition.

Relevant sell-and separate specific experience

- Led a client pursuing three simultaneous divestitures totaling ~$2B of transaction value including early diligence preparing for the sale, supporting through buyer diligence, preparing for Day 1 separation/closing, and post-close Transition Service Agreement (TSA) support.

- Led a team to carve-out a $640MM rail operation from manufacturing parent and selling to an experienced railroad operator.

- Led a project team to carve out a $1B+ revenue business in Europe, Middle East and Asia from a Chemical company including operating model design, standalone cost modeling, TSA scoping and costing, separation planning, and legal entity operationalization.

- Led a project team to assist a technology client plan for their $5B captive leasing carve-out in 20+ countries including operating model design, standalone cost modeling, value creation opportunities, TSA

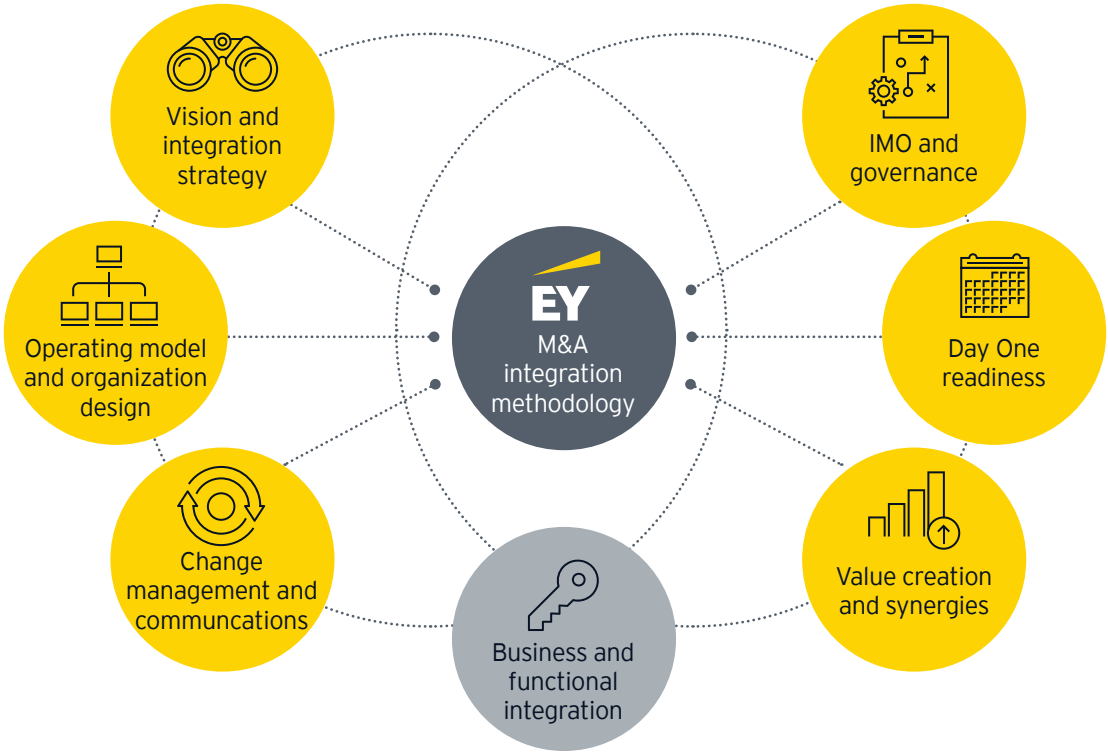
costing/negotiations/governance, separation planning, and managing the Separation Management Office.

- Led a project team for an Automotive carve-out of a $1.3B revenue division from $8B revenue parent including operating model design, day 1 readiness, legal entity changes, TSAs, and contract manufacturing relationships.

- Led a team to support a $6.1B life-sciences carve-out and sale process including complex Day 1 operating model design and planning and post-close TSA exit planning and execution.

- Led a team to carve out and divest a North America bus operator from parent as part of a $4B+ sale.

Nine key steps to setting up an M&A integration program



Building a better working world

Mergers and acquisitions (M&A) are fast-paced, high-stakes, time-intensive events. Integrations can often be extremely complicated due to the level of interdependencies throughout the entire organization, and successful ones require a unique set of resources and skills that may not be built into the core operating model of an organization.

Appointing a leader with the right skills to manage complex and fast-paced integrations can help organizations realize the full value of a transaction.

Once the Executive Steering Committee (SteerCo) is assembled, and the integration leader and team are chosen, a clear and structured timeline can be established for starting work streams and building the necessary governance structure for deal success.

The structured timeline should include the following M&A integration phases:

Vision and integration strategy

1. Determine the value drivers, guiding principles and integration strategy

Program and governance

2. Assess legal considerations and guidelines for interactions between the two companies
3. Set up the program, stand up the Integration Management Office (IMO) and kick off the functional work streams

Functional charters and Day One vision

4. Develop functional charters and Day One must-haves

Operating model and organization design

5. Develop the operating model and organizational structures

Business and functional integration

6. Develop business and functional integration plans
7. Drive execution and maintain momentum

Value creation and synergies

8. Confirm that the value of the transaction is captured

Change management and communications

9. Manage a diverse set of stakeholders while keeping the program on track

Vision and integration strategy

1

Determine the value drivers, guiding principles and integration strategy

The initial responsibility in an integration is to define and determine the value drivers and guiding principles of the deal that support the vision and integration strategy. A strong grasp of executive leadership's priorities from the beginning promotes program alignment throughout the integration.

Integration leaders and their teams will often need to work with the CEO or business unit president (deal executive) to determine the value drivers of the deal. They will also need to work with the deal team to understand the deal context, model and assumptions, as well as get a clear picture of how to quantify and measure the commitments made to the board and street. The integration leader will then need to take this information and work with the deal executive and the SteerCo to document and communicate the value drivers and how the broader integration team will work to enable the deal's value. These guiding principles will drive the integration strategy along with the degree and speed of the integration.

A strong grasp of executive leadership's priorities from the beginning promotes program alignment throughout the integration.

Program and governance

2

Assess legal considerations and guidelines for interactions between the two companies

Integration leaders will need to work with their general counsel, and, if necessary, outside counsel, to understand the legal guidelines of the deal as well as regulatory considerations. While some legal risks and issues may have been raised in the diligence phase, the integration will have its own set of legal guidelines. Approvals from regulators across a number of jurisdictions might be required before a deal can close. Integration leaders should work closely with the legal team to understand these risks and requirements and to establish action plans for various situations.

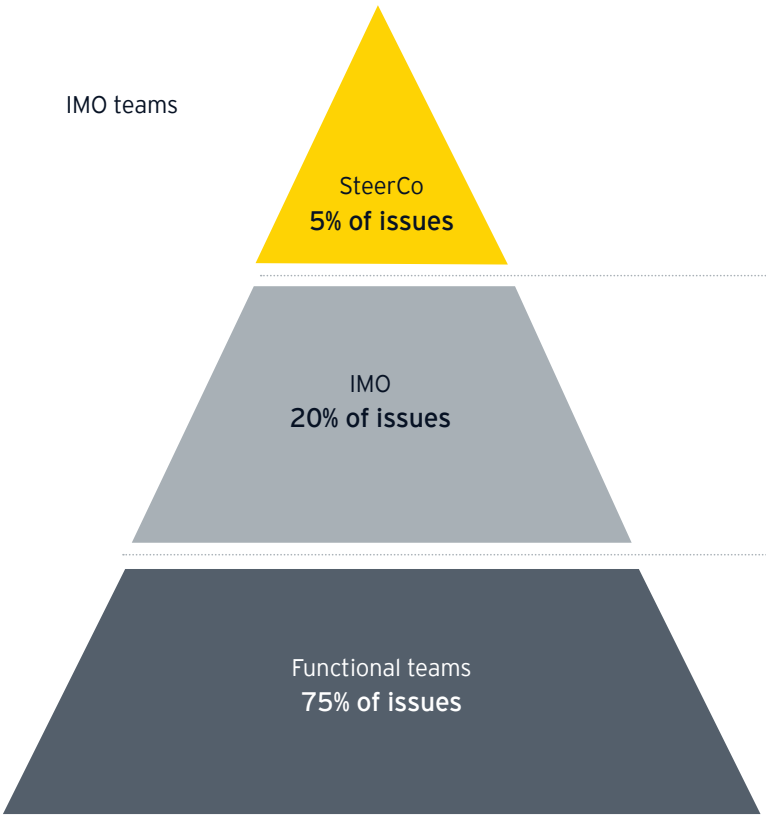
It is also important to first establish confidentiality expectations with the entire integration team as well as establish data-sharing and communication guidelines. A significant amount of data needs to be shared between the organizations, so a Clean Room or other mechanism will likely be needed for sensitive information, while another mechanism can be established for nonsensitive information. If an organization does not have an effective and secure data-sharing platform, they should procure one.

Confidentiality and data sharing are two key concerns in an integration. Prior to the transaction close, careful consideration should be given to prevent the sharing of competitive information and asserting influence on the target, also known as "gun-jumping," to avoid violating antitrust laws. The integration leader will be responsible for confirming that confidentiality is not violated between companies prior to transaction close.

3

Set up the program, stand up the IMO and kick off the functional work streams

Integration leaders and the SteerCo are responsible for standing up a program with a structure to allow the work-stream leads to enable integration planning and execution within their functions while having enough flexibility to enable the leader to adjust to the ever-changing obstacles and business imperatives of an integration. Integration leaders enable this by establishing an IMO.



An IMO is the managing body of the integration and is responsible for simultaneously defining the integration strategy with the executives, establishing the program road map, communicating and upholding the guiding principles of the integration, and managing and resolving functional or cross-functional issues while diligently working toward achieving the deal's value drivers.

The integration leader must establish a strong governance structure that enables effective decision-making and creates a clear mechanism to escalate risks and issues. Based on our experience, for material transactions, a three-tiered governance structure with an executive SteerCo, IMO and functional work streams creates the appropriate level of oversight and operational efficiency.

To properly execute an integration, it is crucial that the integration leader, together with the SteerCo, defines the functional work streams and recruits strong work stream leaders.

Defining the IMO and key responsibilities

- Provide guiding principles for the integration
- Resolve issues or disputes of highest significance

- Lead integration program, coordinate work streams
- Facilitate issues resolution and escalation (as needed)
- Focus on prioritized, deal-specific needs
- Constantly monitor integration risk and dependencies
- Resolve cross-functional issues and risks

- Resolve internal day-to-day project team issues, dependencies and risks
- Keep functional leadership apprised of issues and decisions
- Drive to complete tasks by due date to realize value and enable the new operating model

While standing up an IMO and functional work streams, it is important to establish a weekly cadence between IMO teams to promote daily progress, escalate risks and quickly resolve problems. A reliable and consistent touch point with the functional work streams, as well as the SteerCo, allows the IMO to drive transparency, consistency and accountability throughout the integration.

To properly execute an integration, it is crucial that the integration leader, together with the SteerCo, defines the functional work streams and recruits strong work stream leaders. To do this, it is important to set the operating norms and clearly communicate how decisions will be made throughout the integration. An integration leader should look to work stream leads to provide deep functional knowledge and turn to the IMO to provide program management support and deep integration experience.

When identifying and working with the functional work stream leaders, the integration leader should consider the following:

- Work stream leads should have the functional knowledge and authority to make decisions that may have a significant impact on the business, while also taking into consideration dependencies on other functions and parts of the business.
- Integration leaders must create a strong working relationship with each of the work stream leads as they will be responsible for executing the milestones and tasks related to the integration.

To confirm that work stream leads are adequately prepared, the integration leader and IMO should be in constant communication to discuss progress against the integration plan (e.g., status of the milestones, key risks and issues, cross-functional interdependencies)

Functional charters and day one vision

4

Develop functional charters and Day One must-haves

Once the integration program is defined, the IMO should turn its focus to designing the newly combined company (NewCo) and determining what it will take to get there. While still upholding the guiding principles of the integration, the integration leader will guide the functional teams to determine:

- The work streams' charters
- The critical requirements that need to be met on or shortly after Day One

The work streams' charters clarify the roles and responsibilities of each functional work stream, what is in scope or out of scope as part of the integration, anticipated resource requirements, key interdependencies with other functions, and an initial set of Day One milestones to close the transaction. While the work stream leads will develop the charters, the IMO will support the work streams and challenge their charters to validate that they align to the guiding principles of the deal. The IMO will also verify that each charter includes the critical requirements that need to be met on Day One to close the deal.

Operating model and organization design

5

Develop the operating model and organizational structures

Another key focus of the integration leader is determining how the new organization will operate by designing the operating model of the combined company. The operating model on Day One will likely look very different from the end-state model. While the functional work stream leads will develop the operating model for their function, the integration leader will be responsible for reviewing and validating alignment to the goals of the organization, including synergy targets, value drivers and guiding principles, as well as confirming cross-functional dependencies between each of the functions. The operating model should encompass the people, processes and technology dimensions of the acquirer and the target, individually as well as how they work within the combined organization.

During this phase, it's also important to perform an operation-focused gap analysis to determine if one company has certain capabilities or processes that the other does not have or that the combined organization could benefit from long term. If this is the case, the transaction is an ideal time for business changes or transformational activities to add value to the combined organization. While this phase will take time and has a cost to execute, it will highlight the differences and raise questions on what the best long-term approach will be.

Business and functional integration

6

Develop business and functional integration plans

Once the work stream integration charters are defined and the target operating model is designed, the integration leader will coordinate the creation of a holistic integration work plan, a planning document created by each function with integration milestones, tasks, due dates, owners and interdependencies with other functions. The integration work plans articulate the who, what, when, where and how of the integration.

To determine the major milestones and tasks needed to complete the integration, it is the IMO's responsibility to bring together functional leaders from both organizations to create a similar understanding of interdependencies, align expectations of each function and resolve competing program priorities. The starting point for this is the integration charters.

At the early phase of the integration (pre-close), the focus is entirely on closing the transaction and getting to Day One:

- Each work stream develops detailed Day One integration plans that define tasks that are required to enable a successful Day One.
- Day One readiness sessions and simulations are performed in the weeks leading up to the close of the transaction.
- Shortly before Day One, the IMO will typically start working with the work stream leads to define post-close integration plans. The focus of these plans is on achieving the vision, capturing synergies and factoring in everything that was not accomplished by Day One.

7

Drive execution and maintain momentum

58%

of executives whose deal met or exceeded expectations said they started the integration earlier, according to the *EY Buy & integrate global pulse survey*, 2019.

To operationalize and execute upon the strategy set forth for the combined company, integration leaders will leverage the integration work plans and the other previously discussed documents, e.g., work stream charters, operating model and organization structure. The integration work plans will establish the major milestones of the program and allow the functional leads, IMO and executives to track against the status of the program.

Dashboards and executive summaries are among the tools that can help achieve these tasks and modulate the pace of the integration while obtaining a view of how the program is progressing. Depending on the size and speed of the transaction, these tools can vary from being simply graphs and charts managed manually, to automated, integrated solutions such as EY Capital Edge, a real-time data analytics platform that provides a full suite of capabilities required to help manage a transaction and capture deal value.

It is critical that the IMO constantly coordinates work streams and drives momentum throughout the integration. Paralysis during an integration can rapidly deplete value. Financial markets often expect early signs of value capture from the deal and employees who are already facing heightened levels of change and uncertainty can interpret integration holdups as a sign of instability. It's imperative for the IMO to move the organization as quickly as possible through the integration milestones to meet deadlines and capture value while guiding the team through uncertainty, facilitating decisions and breaking down roadblocks.

Value creation and synergies

8

Confirm that the value of the transaction is captured

A major requirement for deal success is delivering upon the value drivers of the transaction and hitting synergy targets, which typically takes many months to years to achieve. This can best be accomplished by building the synergy capture targets into the performance goals of the executives and by validating that the goals are embedded into the annual budgeting process vs. an offline tracking mechanism. In addition, the executives should validate that the integration goals and targets can be turned into actionable responsibilities for the relevant work stream leads. For instance, during the target setting and planning stages of the transaction, the leader should consider setting "top down" targets that can be broken down into functional goals and developing a prioritized set of initiatives to drive tactical execution toward those targets. Then, during the tracking and reporting stages of the integration, the leader can continue to confirm that value is being captured by aligning and linking value capture reporting with overall integration management reporting. EY Capital Edge can facilitate synergy tracking and realization with target setting, action plans, transparency and team accountability across the entire transaction life cycle.

Driving financial rigor on an enterprise basis will enable accountability within the organization and help articulate value creation to the board and street.

Change management and communications

9

Manage a diverse set of stakeholders while keeping the program on track

An integration will encompass a diverse set of stakeholders. The integration leader is the SteerCo's eyes and ears, acting as both the executives' window into the integration and the functional leads' primary source of access to upper management. It is essential for the IMO to confidently and tactically manage upward, knowing when to escalate issues and potential risks to the executive level, when to delegate authority down and when to make decisions as an executive proxy.

Further, the IMO will need to focus on change management and communication to motivate the core integration team and to confirm that the broader organization is supportive and ready for the pace of change. A significant number of changes could occur throughout the integration that may affect people, processes or technology. The IMO should reduce uncertainty, provide clear leadership and effectively communicate the rationale for the decisions to all stakeholders as applicable.

Conclusion

A thoughtful and rigorous M&A integration approach can increase the speed and realization of deal success. Appointing and supporting the right leaders, team, governance structure and activities are critical elements to capture transaction value.

EY | Assurance | Tax | Strategy and Transactions | Consulting

About EY
EY is a global leader in assurance, tax, transaction and advisory services. The insights and quality services we deliver help build trust and confidence in the capital markets and in economies the world over. We develop outstanding leaders who team to deliver on our promises to all of our stakeholders. In so doing, we play a critical role in building a better working world for our people, for our clients and for our communities.

EY refers to the global organization, and may refer to one or more, of the member firms of Ernst & Young Global Limited, each of which is a separate legal entity. Ernst & Young Global Limited, a UK company limited by guarantee, does not provide services to clients. Information about how EY collects and uses personal data and a description of the rights individuals have under data protection legislation are available via ey.com/privacy. III. Environmental Benefits of the UP/NS Transaction 7

A. Reduced Emissions of Criteria Air Pollutants and CO_{2e} 7

B. Reduced Highway Use 12

C. Reduced Vibration and Noise Pollution 12

D. Fewer Accidents 12

IV. UP and NS Are Participating in the Board's Environmental Review Process 14

VERIFIED STATEMENT

OF

MATTHEW GRAHAM

1. My name is Matthew Graham. I am the General Director of Environmental Management at Union Pacific Railroad Company ("UP"). I have held this position since January 2022.

2. I have worked at UP since 2022, and I have been in the railroad industry for my entire career of more than 28 years. I started out as a locomotive engineer before joining BNSF Railway's environmental team in 2000. I hold a Bachelor of Science degree from the University of Nebraska, as well as an MBA from Bellevue University.

3. In my role at UP, I am chiefly responsible for the railroad's environmental compliance efforts, site remediation, and environmental program development.

4. Since this docket's opening, I have overseen UP's environmental review and analysis and worked with the Surface Transportation Board's Office of Environmental Analysis ("OEA") regarding this merger's potential environmental implications.

5. I am submitting this statement to describe UP's and Norfolk Southern's ("NS's") environmental commitments, the proposed transaction's environmental benefits, and Applicants' process for assessing the transaction's potential environmental impacts.

I. UP's Commitment to the Environment

6. Environmental protection is an important part of what we do at UP. That means we continuously evaluate and improve our environmental management system, our environmental infrastructure, and the way we use technology to reduce risk. These efforts help us to shrink our environmental footprint and improve our efficiency. Today, we use a programmatic management system, informed by ISO 14001 elements, to standardize work, to support and improve day-to-day operations, and to ensure compliance with environmental laws and regulations. In addition, the lessons we learn by operating in some of the country's most challenging environments drive continual improvement.

7. The nature of our business supports sustainability. Railroads are among the least environmentally intensive ways to transport goods. Just one UP double-stacked, high-priority intermodal train can replace more than 500 trucks[1]—and, according to the Association of American Railroads, "railroads are three to four times more fuel efficient than trucks."[2] This means that if just 25 percent of the freight that currently moves via truck for at least 750 miles were diverted to railroads, it would

[1] A 17,000-foot intermodal train, the longest train UP currently operates, contains approximately 550 intermodal boxes. Each box is equivalent to one truckload.

[2] Ass'n Am. R.Rs., *The Positive Environmental Effects of Increased Freight by Rail Movements in America* 3 (2020), https://www.aar.org/wp-content/uploads/2020/06/AAR-Positive-Environmental-Effects-of-Freight-Rail-White-Paper-62020.pdf.

save about 1.2 billion gallons of fuel annually.[3] That fuel efficiency means less air pollution.

8. Well over 90 percent of UP's fuel use and air emissions are attributable to UP's locomotives. To protect the environment and reduce costs for our customers, UP has long sought to improve fuel efficiency. To accomplish this, we have made significant technology investments. For example, we are close to installing an advanced Energy Management System ("EMS") on our entire fleet of AC road locomotives. EMS helps to adjust locomotive throttling and braking to optimize fuel usage. In 2023, when EMS was installed on about 83 percent of active locomotives, the system saved UP more than 18 million gallons of fuel. That much fuel would have produced approximately 2,700 tons of NOx, 82 tons of particulate matter, and 246,000 metric tons of CO_{2e} emissions.[4] We also use automatic shutdown technology on almost 100 percent of our locomotives, which saves money and reduces pollution by preventing unneeded idling. These investments and others are paying off: Our fuel consumption rate has fallen from 1.388 gallons per thousand gross ton-miles in 2000 to 1.082 in 2024, which adds up to 4.6 billion gallons in fuel savings.[5] We estimate that this 30 percent fuel efficiency improvement is associated with emissions

[3] *Id.*

[4] *See* Workpaper "Railroad Emission Data Inventory.xlsx," Tab "2023 EMS Emission Savings," Cells B13:B17. "CO_{2e}" means carbon dioxide equivalent.

[5] *See id.*, Tab "UP Emission Savings Since 2000," Cells B8, B32, and B34.

reductions of about 58 thousand tons of NOx, 1,700 tons of particulate matter, and 3.9 million metric tons of CO_{2e}.[6]

9. Improving our efficiency and reducing our environmental impact is an ongoing project. That is why our Mechanical Department, in partnership with railway technology company ZTR, built a hybrid switching locomotive. Hybrid locomotives use both a diesel engine and battery power. Just like a hybrid car, this dual motive-power system saves money on diesel fuel and reduces emissions—by up to 80 percent compared to traditional switching locomotives. This pilot project will expand to six hybrid locomotives, which we will test in a working rail yard.

10. UP is also a steward for the land and natural resources in our care. We follow habitat conservation plans designed to protect ecosystems and endangered species on our property and along our right of way. We work with government agencies, nonprofit organizations, and community members to mitigate environmental harms and protect resources. We review projects to assess and minimize environmental impacts, and may change site selection and make design modifications to help protect wetlands and other sensitive habitats. During our planning and review, we apply the following mitigation hierarchy for operations near critical biodiversity: (1) avoid impact; (2) minimize impact; (3) rehabilitate or restore; or (4) when necessary, offset impacts elsewhere.

11. We have taken many practical steps to protect environmental resources. For example, when we replaced three bridges near the Pacific Ocean, we funded a

[6] *See id.*, Cells B54:B57, and G53.

program to help eradicate Cape Ivy—an invasive species that harms native vegetation and disrupts ecosystems. Between 2019 and 2023, we produced environmental and biodiversity impact assessments for more than a thousand bridges and other facilities to help guide our future activities. In 2021, we rescheduled work at a particular site to avoid disturbing roosting northern long-eared bats. We also implemented work restrictions to protect pallid sturgeon.

12. UP also supports conservation efforts through its Community Ties Giving Program. Under the Program's Environmental Sustainability pillar, UP helps to fund projects led by nonprofits and community-based organizations. For example, UP has worked with The Nature Conservancy to restore prairies in North Texas, to rewild unused farmland in the California Central Valley, and to conserve grassland in Nebraska.

13. There is always room for innovation at UP, which is why we encourage our employees to identify ways the business can get better at environmental protection. "Planet Tracks," a sustainability-focused business resource group, helps our employees follow through on the railroad's environmental commitments. The group brings together colleagues with an interest in sustainability, helping them to collaborate on environmental stewardship initiatives.

II. NS's Commitment to the Environment

14. From its LEED-certified headquarters to its award-winning sustainability program, NS has long considered environmental stewardship to be a core business principle. It promotes this culture through its "Our World Our Choice" environmental reference manual. The manual provides employees with guidance and

protocols on how to conduct NS's business functions while operating safely and protecting the environment.

15. NS utilizes an environmental management system that incorporates the major elements of ISO 14001. The system helps NS manage its environmental responsibilities and ensure compliance with environmental laws and regulations. NS has also established an "Environmental Policy Council." This body of senior executives from across the corporation reports directly to the CEO, and oversees and monitors corporate environmental policy.

16. Like UP, NS has worked to reduce air emissions by improving its fuel efficiency. For example, between 2023 and 2024, NS improved its gallons-per-gross ton mile ("GTM") rate from 1.11 to 1.08.[7] NS continues to modernize its locomotive fleet by installing more fuel-efficient diesel engines and more powerful AC traction motors. As of September 2025, NS had converted one thousand road locomotives from DC to AC traction. Also, in partnership with Alstom, NS is developing battery-diesel hybrid technology. That technology will be used to convert two locomotives, delivering quieter, lower-emission operations—with an estimated 90% fewer emissions and 30% more pulling capacity than traditional diesel engines.[8]

[7] *See id.*, Tab "NS C-Rate Data," Cells E5:E6.

[8] *See* Norfolk Southern, *Norfolk Southern to launch cutting-edge hybrid locomotive project through Alstom partnership, federal support* (Nov. 12, 2024), https://www.norfolksouthern.com/en/newsroom/news-releases/norfolk-southern-to-launch-cutting-edge-hybrid-locomotive-projec.

17. NS has also modernized its intermodal facilities to make the facilities cleaner and more sustainable. Through 2024, NS has invested in 27 diesel-electric hybrid cranes and 7 fully electric wide-span cranes.

18. Protecting the natural beauty and health of NS's surroundings is also a core mission. For example, NS owns and operates the 14,400-acre Brosnan Forest. The Forest contains over 13,000 acres protected by a conservation easement, over 800 acres of wetlands, and 6 miles of streams. NS also recently won the Best Sustainability Program award from the U.S. Chamber of Commerce for its work restoring a shoreline at its Lamberts Point Terminal in Norfolk, Virginia. The project involved building a "living shoreline" that uses native plants, oysters, and sustainable grading techniques to stabilize the shoreline. This design protects the Chesapeake Bay by preventing nutrients like nitrogen, phosphorus, and sediment from entering the watershed. The project earned a substantial tradable nutrient-credit grant from the Commonwealth of Virginia.

III. Environmental Benefits of the UP/NS Transaction

19. Combining the UP and NS networks will result in direct environmental benefits by improving the efficiency of existing rail operations. And, because the combination improves the competitiveness and reach of rail transportation, the transaction will reduce pollution by diverting freight truck traffic from public roads.

A. Reduced Emissions of Criteria Air Pollutants and CO_{2e}

20. Combining the UP and NS networks and optimizing the new railroad's operating plan will improve efficiency and drive direct environmental benefits. An optimized, combined network means more direct routes that reduce train miles,

locomotive unit miles, GTMs, car miles, and intermediate rail-to-truck handlings—all of which contribute to lower emissions. All together, we expect reductions of over 2 billion GTMs every year, which we estimate will reduce emissions by approximately 360 tons of NOx, 11 tons of particulate matter, and 32 thousand metric tons of CO_{2e}.[9] Although NS's rate of fuel consumption per GTM is already lower than UP's, further improvement is possible. By implementing our fuel efficiency initiatives on the NS network and leveraging our best operating practices for locomotive idling, we will deliver additional emission reductions by cutting annual consumption of fuel by as much as 16 million gallons.[10] That adds up to reductions of approximately 2,450 tons of NOx, 73 tons of particulate matter, and 165 thousand metric tons of CO_{2e}.[11]

Table 1
Approximate Criteria Pollutant & CO_{2e} Benefits

	CO_{2e} Metric Tons	NOx Tons	PM Tons
Optimized Operating Plan	32,000	360	11
Operating Practices	165,000	2,450	73
Total	197,000	2,810	84

21. Trains operate more efficiently—and therefore emit less air pollution—when they keep moving. When trains must stop, idle, or slow, they consume more fuel

[9] *See* Operating Plan Workpaper "C-251124 Operating Plan Metrics vF.xlsx." Tab "Growth Plan," Cell D4; Workpaper "Railroad Emission Data Inventory.xlsx," Tab "Optimized Plan Emissions," Cells B24:B27.

[10] *See* Janke VS Workpaper "Synergies Transportation - Operating.xlsx," Tab "Fuel Use Merger Initiatives," Cell C66.

[11] *See* Workpaper "Railroad Emission Data Inventory.xlsx," Tab "Operating Practice Change," Cells B27:B30.

and release more pollution. The UP/NS merger offers major opportunities to improve service and efficiency by eliminating interchanges between the two railroads. Reduced interchanges allow traffic to move faster, and more reliably, while reducing the need for hand-offs and intermediate railcar handling. These are significant energy drains in the rail network today. This merger will reduce all three of these energy drains at interchange points like Chicago, St. Louis, Memphis, and New Orleans.

22. The merged network will be optimized, enabling larger, more contiguous territory for the new UP operations. Unified planning will consolidate traffic on more direct and fuel-efficient corridors, allow longer and heavier trains that no longer must stop in yards to change carriers, and deploy the best available locomotives over longer, uninterrupted routes. For example, as explained in the Operating Plan, we expect to route a new California-to-Northeast intermodal train through Kansas City, Missouri, Springfield, Illinois, and Sidney, Illinois—instead of exchanging cars in the congested Chicago hub. The route will be up to 252 miles shorter and hours faster than the existing route—and will keep trains out of Chicago. These types of routing efficiencies deliver improved service as well as meaningful emissions reductions. We estimate that approximately 60,000 daily car miles will be eliminated because of this transaction, helping to save on fuel consumption and therefore to reduce air pollution across the country.[12]

[12] *See* App. Vol. 2, Operating Plan § 1.3.

23. The combined railroad will have more resources, such as staff and locomotives, with which to work. That will allow for improved railcar utilization through more single-line service. And improved rail car utilization means a reduction in empty railcar miles—changes that will improve cycle times, allowing the railroad to schedule crews and locomotives more efficiently. Also, because the combined network will have more efficient sidings, trains can be longer and stops for passing can be shorter. By unlocking these efficiencies, the combined railroad will further reduce miles of travel and related emissions and fuel usage.

24. Technology investment and standardization will also unleash new economies of scale. This includes advanced fuel management technologies, modernized locomotive fleets, data analytics for optimal routing, speed control, energy management, and deployment of best practices learned from coast-to-coast operations. We will drive continuous improvement by implementing best practices as we build on our institutional knowledge. These improvements are shown in the GTM efficiencies noted above.

25. The combined network will also drive environmental benefits by reducing truck traffic. A transcontinental railway will be more competitive with long-haul trucking: It is cheaper and faster to ship goods on one unified railroad than on two separate railroads. Transporting freight via rail is three to four times more fuel efficient than by truck[13] and also reduces road traffic in communities. Long-haul

[13] Ass'n Am. R.Rs., *The Positive Environmental Effects of Increased Freight by Rail Movements in America* 3 (2020), https://www.aar.org/wp-

trucks are loud and adversely affect health, quality of life, and the environment of the communities they operate in. Reducing the number of trucks on American roads means less vibration and noise pollution in rural and urban communities. Reduction of these environmental factors will benefit communities with quieter highways and streets and make them more livable.

26. The optimized UP/NS network will be well positioned to grow and support the economy by diverting long haul truck shipments to rail. By diverting more than 2 million long-haul shipments from America's highways, the combined railroad is estimated to save over 2.7 million metric tons of CO_{2e} annually by the end of year three.[14] In addition, as explained in the Operating Plan, the combined network will allow UP to eliminate approximately 350 daily "rubber tire interchanges" in the Chicago area—transfers by truck of containers between intermodal terminals.[15] This decrease in Chicago-area truck traffic is expected to achieve reductions of approximately 4,600 metric tons of CO_{2e} and 12 tons of NOx emissions annually.[16]

---

content/uploads/2020/06/AAR-Positive-Environmental-Effects-of-Freight-Rail-White-Paper-62020.pdf.

[14] *See* App. Vol. 2, Verified Statement of David T. Hunt and Matthew Schabas at Exhibit 2–4 (Estimated total truckloads and truck-miles removed from roadways (excludes local drayage mileage for intermodal diversions)); Workpaper "Railroad Emissions Data Inventory.xlsx," Tab "Diversions from Long-haul Truck," Cell B32.

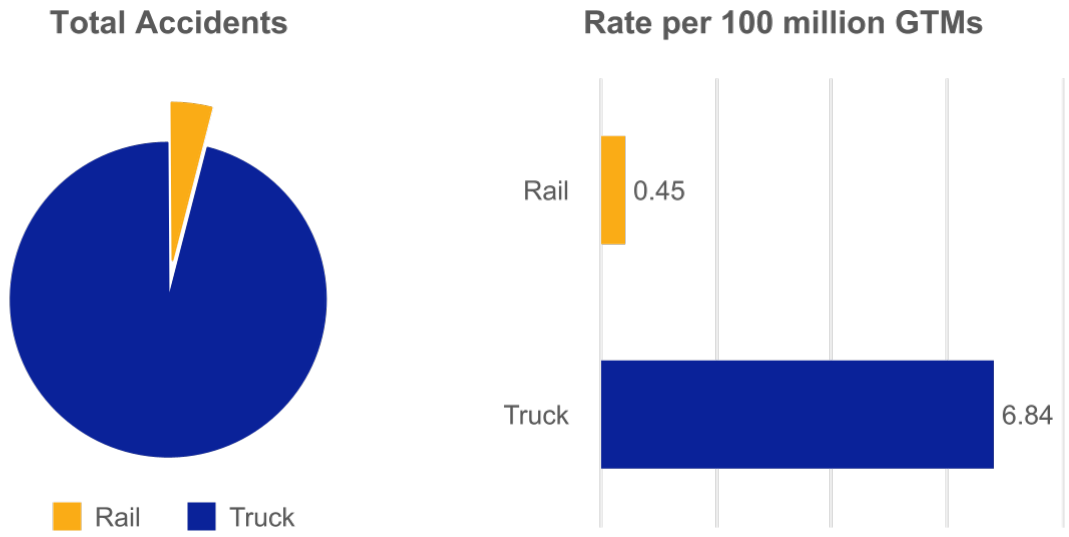
[15] *See* App. Vol. 2, Operating Plan § 4.2.

[16] *See* Workpaper, "Railroad Emission Data Inventory.xlsx," Tab "Rubber Tire Interchange Close," Cells B20:B21.

B. Reduced Highway Use

27. The movement from road to rail will result in less congestion and less wear and tear on the nation's roads. Rail networks handle heavy loads efficiently, reducing the need for highway repairs—which improves long-term infrastructure resilience. This will save taxpayer dollars slated for road maintenance, improve safety across the nation, and reduce emissions from idling.

C. Reduced Vibration and Noise Pollution



28. Long-haul trucks are loud and affect the quality of life of the communities in which they operate. Reducing the number of trucks on American roads means less vibration and noise pollution. Every community where the UP/NS transcontinental railroad takes trucks off roads will benefit from quieter streets and highways, and the health benefits of reduced noise-related stress and sleep disruption.

D. Fewer Accidents

29. Moving from road to rail will also have significant safety benefits. Specifically, it will avoid a significant number of collisions because, when standardized for freight volume, trains are involved in significantly fewer collisions than trucks. Based on statistics from the Department of Transportation, when compared to shipping by train, trucking has 15.3 times as many accidents, 15 times as many injuries, and 4.8 times as many fatalities.[17]

[17] *See* Workpaper "Freight Safety and Volume Trucking vs. Rail (2023).xlsx," Tab "Safety Statistics," Cells F7:F9.

Figure 1[18]
2023 Freight Safety

30. In addition, hazardous-material releases are less likely when those materials are transported by rail instead of by truck. According to the Association of American Railroads, 99.99 percent of hazardous-material shipments by rail arrive without a train-accident-caused release.[19] Also, as the Federal Railroad Administration has recognized, rail transportation of hazardous materials is "the safest land-based method of moving large quantities of chemicals over long distances."[20] Applicants describe their specific plans for rigorous, post-merger hazardous material safety in the Safety Integration Plan.

[18] *See id.,* Cells B7:E7.

IV. UP and NS Are Participating in the Board's Environmental Review Process

31. UP and NS have engaged with the Board's OEA.

32. UP engaged an independent third-party consultant selected by OEA, Vanasse Hangen Brustlin, Inc., to assist the Board in the preparation of environmental documents.

33. UP received an information request from OEA on September 16, 2025. The request asked for information regarding transaction-related rail traffic on the post-transaction, combined network. UP provided detailed responses to OEA's request based on the planned operation changes and forecasted traffic shifts presented in this Application.

34. UP and NS will continue to respond to any questions or requests from OEA. As OEA and the third-party consultant conduct the environmental review process, UP and NS will remain engaged with OEA to ensure that the office is able to complete its review accurately and promptly.

35. Applicants recognize that new and rerouted freight traffic on the combined network may have localized impacts. Applicants will work with OEA to mitigate impacts as appropriate. The combined network will attract shippers with improved freight transportation options. Much of this increased rail traffic on the new UP/NS network will be offset by less traffic on nearby public roads or other rail networks. Applicants believe that the transaction-related traffic changes will have relatively minor negative localized environmental impacts that will be largely offset by the transaction's substantial environmental benefits.

VERIFICATION

I, Matthew P. Graham, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

FAIRNESS OPINION

OF

MORGAN STANLEY & CO. LLC

Docusign Envelope ID: D21C8436-BA09-4779-ADC6-59CA5BBBEAF9

July 28, 2025

Board of Directors
Union Pacific Corporation
1400 Douglas Street, Stop 1580
Omaha, NE 68179

Members of the Board:

We understand that Union Pacific Corporation (the "Buyer"), Ruby Merger Sub 1 Corporation, a direct wholly owned subsidiary of the Buyer ("Merger Sub 1"), Ruby Merger Sub 2 LLC, a direct wholly owned subsidiary of the Buyer ("Merger Sub 2"), and Norfolk Southern Corporation (the "Company") propose to enter into an Agreement and Plan of Merger, dated as of July 28, 2025 (the "Merger Agreement"), which provides, among other things, for (i) the merger (the "First Merger") of Merger Sub 1 with and into the Company, with the Company surviving the First Merger as a direct wholly owned subsidiary of the Buyer, and (ii) immediately following the First Merger, the merger of the Company with and into Merger Sub 2 (the "Second Merger" and, together with the First Merger, the "Mergers"), with Merger Sub 2 surviving the Second Merger as a direct wholly owned subsidiary of the Buyer. Pursuant to the First Merger and the Merger Agreement, each outstanding share of common stock, par value $1.00 per share, of the Company (the "Company Common Stock"), other than Canceled Shares and Converted Shares (each as defined in the Merger Agreement), will be converted into the right to receive (i) $88.82 per share in cash, without interest, and (ii) 1.0 share of common stock, par value $2.50 per share, of the Buyer (the "Buyer Common Stock") (the consideration set forth in (i) and (ii), together, the "Consideration"), as set forth in the Merger Agreement, and, if applicable, subject to the payment of cash in lieu of fractional shares. The terms and conditions of the Mergers are more fully set forth in the Merger Agreement.

You have asked for our opinion as to whether the Consideration to be paid by the Buyer pursuant to the Merger Agreement is fair from a financial point of view to the Buyer.

For purposes of the opinion set forth herein, we have:

1) Reviewed certain publicly available financial statements and other business and financial information of the Company and the Buyer, respectively;

2) Reviewed certain internal financial statements and other financial and operating data concerning the Company and the Buyer, respectively;

3) Reviewed certain financial projections with respect to the Company and the Buyer prepared by the management of the Buyer and approved for our use by you (the "Buyer Management Projections");

4) Reviewed certain financial projections with respect to the Company prepared by the management of the Company;

5) Reviewed information relating to certain strategic, financial and operational benefits anticipated from the Mergers, prepared by the management of the Buyer and approved for our use by you (the "Buyer Management Synergies");

Docusign Envelope ID: D21C8436-BA09-4779-ADC6-59CA5BBBEAF9

6) Discussed the past and current operations and financial condition and the prospects of the Company, including information relating to certain strategic, financial and operational benefits anticipated from the Mergers, with senior executives of the Company and the Buyer;

7) Discussed the past and current operations and financial condition and the prospects of the Buyer, including information relating to certain strategic, financial and operational benefits anticipated from the Mergers, with senior executives of the Buyer;

8) Reviewed the pro forma impact of the Mergers on the Buyer's earnings per share, cash flow, consolidated capitalization and certain financial ratios;

9) Reviewed the reported prices and trading activity for the Company Common Stock and the Buyer Common Stock;

10) Compared the financial performance of the Company and the Buyer and the prices and trading activity of the Company Common Stock and the Buyer Common Stock with that of certain other publicly-traded companies comparable with the Company and the Buyer, respectively, and their securities;

11) Reviewed the financial terms, to the extent publicly available, of certain comparable acquisition transactions;

12) Participated in certain discussions and negotiations among representatives of the Company and the Buyer and their financial and legal advisors;

13) Reviewed the Merger Agreement and certain related documents; and

14) Performed such other analyses, reviewed such other information and considered such other factors as we have deemed appropriate.

We have assumed and relied upon, without independent verification, the accuracy and completeness of the information that was publicly available or supplied or otherwise made available to us by the Company and the Buyer and formed a substantial basis for this opinion. With respect to the financial projections, including information relating to certain strategic, financial and operational benefits anticipated from the Mergers, at your direction, we have utilized the Buyer Management Projections and the Buyer Management Synergies for purposes of our opinion, and we have assumed that they have been reasonably prepared on bases reflecting the best currently available estimates and judgments of the management of the Buyer of the future financial performance of the Company and the Buyer. We express no views as to the reasonableness of the Buyer Management Projections, the Buyer Management Synergies or any other financial projections or the assumptions on which they are based. We have relied upon, without independent verification, the assessment by the management of the Buyer of (i) the strategic, financial and operational benefits expected to result from the Mergers, (ii) the timing and risks associated with the integration of the Company and the Buyer, (iii) the ability to retain key employees of the Company and the Buyer, and (iv) the validity of, and risks associated with, the Company and the Buyer's existing and future technologies, intellectual property, products, services and business models. In addition, we have assumed that the Mergers will be consummated in accordance with the terms set forth in the Merger Agreement without any waiver or amendment of any terms or conditions material to our analysis, including, among other things, that the Mergers will be treated as a tax-free reorganization pursuant to the Internal Revenue Code of 1986, as amended. Morgan Stanley has assumed that in connection with the receipt of all the necessary governmental, regulatory or other approvals and consents required for the proposed Mergers, no delays, limitations, conditions or restrictions will be imposed that would have a material adverse effect on the contemplated benefits expected to be derived in the proposed Mergers. We are not legal, tax or regulatory advisors. We are financial advisors only and have relied upon, without independent verification, the assessment of the Buyer and the Company and their legal, tax or regulatory advisors with respect to legal, tax, or regulatory matters. We express no opinion with respect to the fairness of the amount or nature of the compensation to any of the Company's officers, directors or employees, or any class of such persons, relative to the Consideration to be paid to the holders of shares of the Company Common Stock pursuant to the Merger Agreement. This opinion does not address the relative merits of the transactions contemplated by the Merger Agreement as compared to other business or financial strategies that

Docusign Envelope ID: D21C8436-BA09-4779-ADC6-59CA5BBBEAF9

might be available to the Buyer, nor does it address the underlying business decision of the Buyer to enter into the Merger Agreement or proceed with any other transaction contemplated by the Merger Agreement. Our opinion is limited solely to the fairness of the Consideration to be paid by the Buyer pursuant to the Merger Agreement from a financial point of view to the Buyer, and we do not express any view on, and this opinion does not address, any other term or aspect of the Merger Agreement or the transactions contemplated thereby or any term or aspect of any other agreement or instrument contemplated by the Merger Agreement or entered into or amended in connection therewith. We have not made any independent valuation or appraisal of the assets or liabilities of the Company or the Buyer, nor have we been furnished with any such valuations or appraisals. Our opinion is necessarily based on financial, economic, market and other conditions as in effect on, and the information made available to us as of, the date hereof. Events occurring after the date hereof may affect this opinion and the assumptions used in preparing it, and we do not assume any obligation to update, revise or reaffirm this opinion.

We have acted as financial advisor to the Board of Directors of the Buyer in connection with the Mergers and will receive a fee for our services, a portion of which is payable upon the execution of the Merger Agreement, a portion of which is payable upon the rendering of this opinion and a significant portion of which is contingent upon the closing of the Mergers. In the two years prior to the date hereof, we have provided financial advisory and financing services for the Buyer and the Company and have received fees in connection with such services. Morgan Stanley may also seek to provide financial advisory and financing services to the Buyer and the Company and their respective affiliates in the future and would expect to receive fees for the rendering of these services.

Please note that Morgan Stanley is a global financial services firm engaged in the securities, investment management and individual wealth management businesses. Our securities business is engaged in securities underwriting, trading and brokerage activities, foreign exchange, commodities and derivatives trading, prime brokerage, as well as providing investment banking, financing and financial advisory services. Morgan Stanley, its affiliates, directors and officers may at any time invest on a principal basis or manage funds that invest, hold long or short positions, finance positions, and may trade or otherwise structure and effect transactions, for their own account or the accounts of its customers, in debt or equity securities or loans of the Buyer, the Company or any other company, or any currency or commodity, that may be involved in the Mergers, or any related derivative instrument.

This opinion has been approved by a committee of Morgan Stanley investment banking and other professionals in accordance with our customary practice. This opinion is for the information of the Board of Directors of the Buyer only and may not be used for any other purpose or disclosed without our prior written consent, except that a copy of this opinion may be included in its entirety in any filing the Buyer is required to make with the Securities and Exchange Commission in connection with the Mergers if such inclusion is required by applicable law. In addition, this opinion does not in any manner address the prices at which the Buyer Common Stock will trade following consummation of the Mergers or at any time and Morgan Stanley expresses no opinion or recommendation as to how the shareholders of the Buyer and the Company should vote at the shareholders' meetings to be held in connection with the Mergers.

Based on and subject to the foregoing, we are of the opinion on the date hereof that the Consideration to be paid by the Buyer pursuant to the Merger Agreement is fair from a financial point of view to the Buyer.

Docusign Envelope ID: D21C8436-BA09-4779-ADC6-59CA5BBBEAF9

Very truly yours,

MORGAN STANLEY & CO. LLC

Kristin Lindia
Managing Director

VERIFIED STATEMENT

OF

MORGAN STANLEY & CO. LLC

On behalf of Morgan Stanley & Co. LLC ("Morgan Stanley"), this is to verify that the Fairness Opinion of Morgan Stanley, dated July 28, 2025 (the "Morgan Stanley Fairness Opinion") in the attached Appendix A, is a true and correct copy of the Morgan Stanley Fairness Opinion provided by Morgan Stanley to the Board of Directors of Union Pacific Corporation ("UPC") in connection with UPC's proposed acquisition of Norfolk Southern Corporation ("NSC") pursuant to the Agreement and Plan of Merger, dated as of July 28, 2025 (the "Merger Agreement").

In providing this verification, Morgan Stanley does not intend that any person other than the Board of Directors of UPC be entitled to rely on the Morgan Stanley Fairness Opinion.

I, Kristin Lindia, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on this 10th day of November, 2025.

Wells Fargo Securities, LLC
30 Hudson Yards
New York, NY 10001

July 28, 2025

The Board of Directors of Union Pacific Corporation
1400 Douglas Street, Stop 1580
Omaha, NE 68179

Attention: Board of Directors

Members of the Board of Directors:

You have requested, in your capacity as the Board of Directors (the "Board") of Union Pacific Corporation (the "Company"), our opinion with respect to the fairness, from a financial point of view, to the Company of the Consideration (as defined below) to be paid by the Company in the First Merger (as defined below). We understand that pursuant to an Agreement and Plan of Merger, dated as of July 28, 2025 (the "Agreement") between the Company, Ruby Merger Sub 1 Corporation, a direct wholly owned subsidiary of the Company ("Merger Sub 1"), Ruby Merger Sub 2 LLC, a direct wholly owned subsidiary of the Company ("Merger Sub 2"), and Norfolk Southern Corporation (the "Merger Partner"), Merger Sub 1 will merge with and into the Merger Partner (the "First Merger"), with the Merger Partner surviving the First Merger as a direct wholly owned subsidiary of the Company, and immediately following the First Merger, the Merger Partner will merge with and into Merger Sub 2 (the "Second Merger" and, together with the First Merger, the "Mergers"), with Merger Sub 2 surviving the Second Merger as a direct wholly owned subsidiary of the Company. Pursuant to the First Merger and the Agreement, each outstanding share of common stock, par value $1.00 per share, of the Merger Partner (the "Merger Partner Common Stock"), other than Canceled Shares and Converted Shares (each as defined in the Agreement), will be converted into the right to receive $88.82 in cash, without interest (the "Cash Consideration") and 1.0 share of the common stock, par value $2.50 per share ("Company Common Stock"), of the Company (the "Stock Consideration" and, together with the Cash Consideration, the "Consideration"), as set forth in the Agreement and, if applicable, subject to the payment of cash in lieu of fractional shares. The terms and conditions of the Mergers are more fully set forth in the Agreement.

In preparing our opinion, we have:

- reviewed the Agreement;
- reviewed certain publicly available business and financial information relating to the Company and the Merger Partner and the industries in which they operate;
- compared the financial and operating performance of the Company and the Merger Partner with publicly available information concerning certain other companies we deemed relevant, and compared current and historic market prices of the Company Common Stock and the Merger Partner Common Stock with similar data for such other companies;

© 2025 Wells Fargo & Company. All rights reserved.

- compared the proposed financial terms of the Mergers with the publicly available financial terms of certain other business combinations that we deemed relevant;

- reviewed certain internal financial analyses and forecasts for the Company and the Merger Partner prepared by the management of the Company and approved for our use by you (the "Company Management Projections");

- reviewed certain internal financial analyses and forecasts for the Merger Partner prepared by the management of the Merger Partner;

- reviewed certain estimates prepared by the management of the Company as to the potential cost savings and synergies expected by such management to be achieved as a result of the Mergers (the "Company Management Synergies");

- discussed with the managements of the Company and the Merger Partner regarding certain aspects of the Mergers, the business, financial condition and prospects of the Company and the Merger Partner, respectively, the effect of the Mergers on the business, financial condition and prospects of the Company and the Merger Partner, respectively, and certain other matters that we deemed relevant; and

- considered such other financial analyses and investigations and such other information that we deemed relevant.

In giving our opinion, we have assumed and relied upon the accuracy and completeness of all information that was publicly available or was furnished to or discussed with us by the Company or the Merger Partner or otherwise reviewed by us. We have not independently verified any such information, and pursuant to the terms of our engagement by the Company, we did not assume any obligation to undertake any such independent verification. At your direction, we have utilized the Company Management Projections and the Company Management Synergies for purposes of our opinion and in relying on the Company Management Projections and the Company Management Synergies, we have assumed that they have been reasonably prepared on bases reflecting the best currently available estimates and judgments of the management of the Company as to the future performance and financial condition of the Company and the Merger Partner. We express no view or opinion with respect to the Company Management Projections and the Company Management Synergies or any other financial analysis or forecasts or the assumptions upon which they are based. We have assumed that any representations and warranties made by the Company and the Merger Partner in the Agreement or in other agreements relating to the Mergers will be true and accurate in all respects that are material to our analysis. In addition, we have assumed that the Mergers will be consummated in accordance with the terms set forth in the Agreement without any waiver or amendment of any terms or conditions material to our analysis, including, among other things, that the Mergers will be treated as a tax-free reorganization pursuant to the Internal Revenue Code of 1986, as amended. We have also assumed that in connection with the receipt of all the necessary governmental, regulatory or other approvals and consents required for the proposed Mergers, no delays, limitations, conditions or restrictions will be imposed that would have a material adverse effect on the contemplated benefits expected to be derived in the proposed Mergers.

Our opinion only addresses the fairness, from a financial point of view, of the Consideration to be paid by the Company in the First Merger pursuant to the Agreement and we express no opinion as to the fairness of any consideration paid in connection with the Mergers to the holders of any other class of securities, creditors or other constituencies of the Merger Partner. Furthermore, we express no opinion as to any other aspect or implication (financial or otherwise) of the Mergers, or any other agreement, arrangement or understanding entered into in connection with the Mergers or otherwise, including, without

limitation, the fairness of the amount or nature of, or any other aspect relating to, any compensation or consideration to be received by or otherwise payable to any officers, directors or employees of any party to the Mergers, or class of such persons, relative to the Consideration or otherwise. Furthermore, we are not expressing any advice or opinion regarding matters that require legal, regulatory, accounting, insurance, tax, environmental, executive compensation or other similar professional advice and have relied upon the assessments of the Company and its advisors with respect to such advice.

Our opinion is necessarily based upon information made available to us as of the date hereof and financial, economic, market and other conditions as they exist and can be evaluated on the date hereof. We have not undertaken, and are under no obligation, to update, revise, reaffirm or withdraw this opinion, or otherwise comment on or consider events occurring or coming to our attention after the date hereof, notwithstanding that any such subsequent developments may affect this opinion. Our opinion does not address the relative merits of the Mergers as compared to any alternative transactions or strategies that might be available to the Company, nor does it address the underlying business decision of the Board or the Company to proceed with or effect the Mergers. We are not expressing any opinion as to the price at which Company Common Stock or Merger Partner Common Stock may be traded at any time.

We have acted as financial advisor to the Company in connection with the Mergers and will receive a fee from the Company for such services, a substantial portion of which is contingent upon the consummation of the Mergers. We also became entitled to receive a fee upon the rendering of our opinion and a fee upon the execution of the Agreement. In addition, the Company has agreed to reimburse us for certain expenses and to indemnify us and certain related parties for certain liabilities and other items arising out of our engagement.

During the two years preceding the date of this opinion, we and our affiliates have had investment or commercial banking relationships with the Company and the Merger Partner, for which we and such affiliates have received customary compensation. Such relationships have included acting as joint bookrunner on an offering of debt securities by the Company in February 2025; as joint bookrunner on an offering of debt securities by the Merger Partner in July 2023, joint lead arranger, agent and joint bookrunner on offerings of debt securities by the Merger Partner in January 2024, and as joint bookrunner on an offering or debt securities by the Merger Partner in April 2025. We or our affiliates are also an agent and a lender to one or more of the credit facilities of the Merger Partner. We anticipate that we and our affiliates will arrange and/or provide financing to the Company in connection with the Mergers for customary compensation. We and our affiliates hold, on a proprietary basis, less than 1% of the outstanding common stock of each of the Company and the Merger Partner. In the ordinary course of business, we and our affiliates will trade or otherwise effect transactions in the securities or other financial instruments (including bank loans or other obligations) of the Company, the Merger Partner and certain of their affiliates for our own account and for the accounts of our customers and, accordingly, will at any time hold a long or short position in such securities or financial instruments.

This letter is for the information and use of the Board (in its capacity as such) in connection with its evaluation of the Mergers. This opinion does not constitute advice or a recommendation to any stockholder of the Company, the Merger Partner or any other person as to how to vote or act on any matter relating to the proposed Mergers or any other matter. This opinion may not be used or relied upon for any other purpose without our prior written consent, nor shall this opinion be disclosed to any person or quoted or referred to, in whole or in part, without our prior written consent. This opinion may be reproduced in full in any proxy or information statement mailed to stockholders of the Company but may not otherwise be disclosed publicly in any manner without our prior written consent. The issuance of this opinion has been approved by a fairness committee of Wells Fargo Securities.

Based upon and subject to the foregoing, it is our opinion that, as of the date hereof, the Consideration to be paid by the Company in the First Merger pursuant to the Agreement is fair, from a financial point of view, to the Company.

Very truly yours,

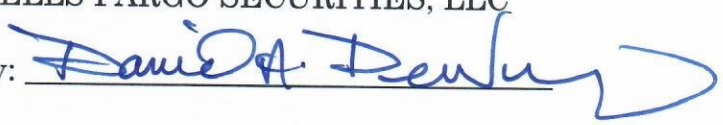
Wells Fargo Securities, LLC

WELLS FARGO SECURITIES, LLC

VERIFIED STATEMENT

OF

WELLS FARGO SECURITIES LLC



On behalf of Wells Fargo Securities LLC ("Wells Fargo"), this is to verify that the Fairness Opinion of Wells Fargo, dated July 28, 2025 (the "Wells Fargo Fairness Opinion") in the attached Appendix A, is a true and correct copy of the Wells Fargo Fairness Opinion provided by Wells Fargo to the Board of Directors of Union Pacific Corporation ("UPC") in connection with UPC's proposed acquisition of Norfolk Southern Corporation ("NSC") pursuant to the Agreement and Plan of Merger, dated as of July 28, 2025 (the "Merger Agreement").

In providing this verification, Wells Fargo does not intend that any person other than the Board of Directors of UPC be entitled to rely on the Wells Fargo Fairness Opinion.

I, David A. DeNunzio, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

FAIRNESS OPINION

OF

BOFA SECURITIES, INC.

Global Corporate & Investment Banking
BofA Securities, Inc.
One Bryant Park, New York, NY 10036

July 28, 2025

The Board of Directors
Norfolk Southern Corporation
650 West Peachtree Street NW
Atlanta, Georgia 30308

Members of the Board of Directors:

We understand that Norfolk Southern Corporation ("Norfolk Southern") proposes to enter into an Agreement and Plan of Merger (the "Agreement"), among Norfolk Southern, Union Pacific Corporation ("Union Pacific"), Ruby Merger Sub 1 Corporation, a wholly owned subsidiary of Union Pacific ("Merger Sub 1") and Ruby Merger Sub 2 LLC, a wholly owned subsidiary of Union Pacific ("Merger Sub 2"), pursuant to which, among other things, Merger Sub 1 will merge with and into Norfolk Southern (the "First Merger"), with Norfolk Southern surviving the First Merger as a wholly owned subsidiary of Union Pacific, and immediately thereafter Norfolk Southern will merge with and into Merger Sub 2 (the "Second Merger", and together with the First Merger, the "Transaction"), with Merger Sub 2 surviving the Second Merger as a wholly owned subsidiary of Union Pacific. Pursuant to the First Merger, each outstanding share of common stock, par value $1.00 per share, of Norfolk Southern (the "Norfolk Southern Common Stock"), other than Canceled Shares and Converted Shares (each as defined in the Agreement, and collectively, "Excluded Shares"), will be converted into the right to receive (i) $88.82 in cash (the "Cash Consideration") and (ii) 1.0 share (the "Stock Consideration" and, together with the Cash Consideration, the "Consideration") of the common stock, par value $2.50 per share, of Union Pacific (the "Union Pacific Common Stock"). The terms and conditions of the Transaction are more fully set forth in the Agreement.

You have requested our opinion as to the fairness, from a financial point of view, to the holders of Norfolk Southern Common Stock (other than Excluded Shares) of the Consideration to be received by such holders in the Transaction.

In connection with this opinion, we have, among other things:

(1) reviewed certain publicly available business and financial information relating to Norfolk Southern and Union Pacific;

(2) reviewed certain internal financial and operating information with respect to the business, operations and prospects of Norfolk Southern furnished to or discussed with us by the management of Norfolk Southern, including certain financial forecasts

relating to Norfolk Southern prepared by the management of Norfolk Southern (such forecasts, the "Norfolk Southern Forecasts");

(3) reviewed certain internal financial and operating information with respect to the business, operations and prospects of Union Pacific furnished to or discussed with us by the management of Union Pacific, including certain financial forecasts relating to Union Pacific prepared by the management of Union Pacific (such forecasts, the "Union Pacific Forecasts");

(4) reviewed certain estimates as to the amount and timing of cost savings and revenue enhancements (collectively, the "Synergies") anticipated by the managements of Norfolk Southern and Union Pacific to result from the Transaction;

(5) discussed the past and current business, operations, financial condition and prospects of Norfolk Southern with members of senior managements of Norfolk Southern and Union Pacific, and discussed the past and current business, operations, financial condition and prospects of Union Pacific with members of senior managements of Norfolk Southern and Union Pacific;

(6) reviewed the potential pro forma financial impact of the Transaction on the future financial performance of Union Pacific, including the potential effect on Union Pacific's estimated earnings per share;

(7) reviewed the trading histories for Norfolk Southern Common Stock and Union Pacific Common Stock and a comparison of such trading histories with each other and with the trading histories of other companies we deemed relevant;

(8) compared certain financial and stock market information of Norfolk Southern and Union Pacific with similar information of other companies we deemed relevant;

(9) compared certain financial terms of the Transaction to financial terms, to the extent publicly available, of other transactions we deemed relevant;

(10) reviewed the relative financial contributions of Norfolk Southern and Union Pacific to the future financial performance of the combined company on a pro forma basis;

(11) reviewed a draft dated July 28, 2025 of the Agreement (the "Draft Agreement"); and

(12) performed such other analyses and studies and considered such other information and factors as we deemed appropriate.

In arriving at our opinion, we have assumed and relied upon, without independent verification, the accuracy and completeness of the financial and other information and data publicly available or provided to or otherwise reviewed by or discussed with us and have relied upon the assurances of the managements of Norfolk Southern and Union Pacific that they are not aware of any facts or circumstances that would make such information or data inaccurate or misleading in any material

respect. With respect to the Norfolk Southern Forecasts, we have been advised by Norfolk Southern, and have assumed, that they have been reasonably prepared on bases reflecting the best currently available estimates and good faith judgments of the management of Norfolk Southern as to the future financial performance of Norfolk Southern. With respect to the Union Pacific Forecasts and Synergies, we have been advised by Norfolk Southern, and have assumed, with the consent of Norfolk Southern, that they have been reasonably prepared on bases reflecting the best currently available estimates and good faith judgments of the management of Union Pacific as to the future financial performance of Union Pacific and other matters covered thereby. We have relied, at the direction of Norfolk Southern, on the assessments of the managements of Norfolk Southern and Union Pacific, respectively, as to Union Pacific's ability to achieve the Synergies and have been advised by Norfolk Southern and Union Pacific, and have assumed, with the consent of Norfolk Southern, that the Synergies will be realized in the amounts and at the times projected.

We have not made or been provided with any independent evaluation or appraisal of the assets or liabilities (contingent or otherwise) of Norfolk Southern or Union Pacific, nor have we made any physical inspection of the properties or assets of Norfolk Southern or Union Pacific. We have not evaluated the solvency or fair value of Norfolk Southern or Union Pacific under any state, federal or other laws relating to bankruptcy, insolvency or similar matters. We have assumed, at the direction of Norfolk Southern, that the Transaction will be consummated in accordance with the terms set forth in the Agreement, without waiver, modification or amendment of any material term, condition or other agreement contemplated therein or thereby and that, in the course of obtaining the necessary governmental, regulatory and other approvals, consents, releases and waivers for the Transaction, no delay, limitation, restriction or condition, including any divestiture requirements or amendments or modifications, will be imposed that would have an adverse effect on Norfolk Southern, Union Pacific or the contemplated benefits of the Transaction, in each case, in any respect material to our analyses or opinion. We have also assumed, at the direction of Norfolk Southern, that (i) the Transaction will qualify for federal income tax purposes as a reorganization under the provisions of Section 368(a) of the Internal Revenue Code of 1986, as amended and (ii) the final executed Agreement will not differ in any material respect from the Draft Agreement reviewed by us.

We express no view or opinion as to any terms or other aspects of the Transaction (other than the Consideration to the extent expressly specified herein), including, without limitation, the form or structure of the Transaction. Our opinion is limited to the fairness, from a financial point of view, of the Consideration to be received by the holders of shares of Norfolk Southern Common Stock (other than Excluded Shares) in the Transaction and no opinion or view is expressed with respect to any consideration received in connection with the Transaction by the holders of any other class of securities, creditors or other constituencies of any party. In addition, no opinion or view is expressed with respect to the fairness (financial or otherwise) of the amount, nature or any other aspect of any compensation to any of the officers, directors or employees of any party to the Transaction, or class of such persons, relative to the Consideration. Furthermore, no opinion or view is expressed as to the relative merits of the Transaction in comparison to other strategies or transactions that might be available to Norfolk Southern or in which Norfolk Southern might engage or as to the underlying business decision of Norfolk Southern to proceed with or effect the Transaction. We are not expressing any opinion as to what the value of Union Pacific Common Stock actually will be when issued or the prices at which Norfolk Southern Common Stock or Union Pacific Common Stock will

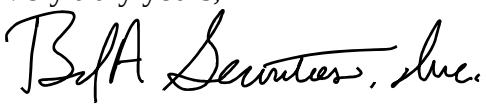
trade at any time, including following announcement or consummation of the Transaction. In addition, we express no opinion or recommendation as to how any stockholder should vote or act in connection with the Transaction or any related matter.

We have acted as financial advisor to Norfolk Southern in connection with the Transaction and will receive a fee for our services, a portion of which is payable upon the rendering of this opinion and a significant portion of which is contingent upon consummation of the Transaction. In addition, Norfolk Southern has agreed to reimburse our expenses and indemnify us against certain liabilities arising out of our engagement.

We and our affiliates comprise a full service securities firm and commercial bank engaged in securities, commodities and derivatives trading, foreign exchange and other brokerage activities, and principal investing as well as providing investment, corporate and private banking, asset and investment management, financing and financial advisory services and other commercial services and products to a wide range of companies, governments and individuals. In the ordinary course of our businesses, we and our affiliates may invest on a principal basis or on behalf of customers or manage funds that invest, make or hold long or short positions, finance positions or trade or otherwise effect transactions in equity, debt or other securities or financial instruments (including derivatives, bank loans or other obligations) of Norfolk Southern, Union Pacific and certain of their respective affiliates.

We and our affiliates in the past have provided, currently are providing, and in the future may provide, investment banking, commercial banking and other financial services to Norfolk Southern and have received, or in the future may receive, compensation for the rendering of these services, including (i) having acted or acting as financial advisor to Norfolk Southern in connection with shareholder activism, (ii) having acted as manager or underwriter for certain debt offerings of Norfolk Southern, (iii) having acted or acting as co-lead arranger, joint bookrunner for, and/or lender under, certain letters of credit, leasing and other credit facilities of Norfolk Southern and (iv) having provided or providing certain treasury management services and products to Norfolk Southern.

In addition, we and our affiliates in the past have provided, currently are providing, and in the future may provide, investment banking, commercial banking and other financial services to Union Pacific and have received or in the future may receive compensation for the rendering of these services, including (i) having acted as manager or underwriter for certain debt offerings of Union Pacific, (ii) having acted or acting as co-lead arranger, joint bookrunner for, and/or lender under, certain leasing and other credit facilities of Union Pacific and (iii) having provided or providing certain treasury management services and products to Union Pacific.



It is understood that this letter is for the benefit and use of the Board of Directors of Norfolk Southern (in its capacity as such) in connection with and for purposes of its evaluation of the Transaction.

Our opinion is necessarily based on financial, economic, monetary, market and other conditions and circumstances as in effect on, and the information made available to us as of, the date hereof. As you are aware, the credit, financial and stock markets have been experiencing unusual volatility and we express no opinion or view as to any potential effects of such volatility on Norfolk Southern, Union Pacific or the Transaction. It should be understood that subsequent developments may affect this

opinion, and we do not have any obligation to update, revise, or reaffirm this opinion. The issuance of this opinion was approved by a fairness opinion review committee of BofA Securities, Inc.

Based upon and subject to the foregoing, including the various assumptions and limitations set forth herein, we are of the opinion on the date hereof that the Consideration to be received in the Transaction by the holders of Norfolk Southern Common Stock (other than Excluded Shares) is fair, from a financial point of view, to such holders.

Very truly yours,

BOFA SECURITIES, INC.

VERIFICATION OF BOFA SECURITIES, INC.

On behalf of BofA Securities, Inc. ("BofA"), this is to verify that the Fairness Opinion of BofA, dated July 28, 2025 (the "BofA Fairness Opinion") in the attached Appendix A, is a true and correct copy of the BofA Fairness Opinion provided by BofA to the Board of Directors of Norfolk Southern Corporation ("NSC") in connection with Union Pacific Corporation's ("UPC's") proposed acquisition of NSC pursuant to the Agreement and Plan of Merger, dated as of July 28, 2025 (the "Merger Agreement").

In providing this verification, BofA does not intend that any person other than the Board of Directors of NSC be entitled to rely on the BofA Fairness Opinion.

I, Michael Ruflin, declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on this 11th day of November, 2025.

1 QUALIFICATIONS, ASSIGNMENT AND SUMMARY OF CONCLUSIONS

1.1 Qualifications

1. My name is Elizabeth M. Bailey. I am a Vice President at Charles River Associates ("CRA"), a global consulting firm that offers economic, financial, and strategic expertise to law firms, corporations, accounting firms, and governments. I have over 20 years of experience in antitrust and competition matters across a wide variety of industries.

2. I have advised clients on mergers and acquisitions proceedings before antitrust regulators in the United States and Canada. My expertise includes a wide variety of industries including trucking, rail, barge, ocean-going cargo tankers and vessels, intermodal containers, coal, oil and natural gas, electricity, consumer retail goods, among many others.

3. I have taught advanced corporate finance to executives at The Wharton School at the University of Pennsylvania and have been a lecturer in the Finance Group at the Haas School of Business at the University of California, Berkeley, and a clinical associate professor at the W.P. Carey School of Business at Arizona State University.

4. I have published articles in the American Economic Review, The Journal of Industrial Organization, Managing IP, and The Electricity Journal, among others. I was a senior editor of the ABA Antitrust Law Section's Antitrust Law Journal. I have been appointed an editor of other ABA antitrust publications, including the Antitrust Magazine and The Antitrust Source.

5. I hold a BA in Economics and Mathematics from Colgate University and a PhD in Economics from the Massachusetts Institute of Technology. My curriculum vitae is attached as Appendix A. A list of the materials that I relied upon is attached as Appendix B. I include

a description of how I construct my data sets in Appendix C. I reserve the right to update my opinions as I receive additional information.

1.2 Background and Assignment

6. I have been asked by counsel for Union Pacific Corporation and Union Pacific Railroad Company (collectively referred to as "UP") to analyze the competitive effects of the proposed merger between UP and Norfolk Southern Corporation and Norfolk Southern Railway Company (collectively referred to as "NS"). The proposed merger between UP and NS (collectively, the "Applicants") would create a post-transaction integrated railroad (referred to as the "combined railroad") that connects the western United States to the eastern United States.

7. My assignment in this matter is to evaluate the potential benefits from the proposed merger, and to analyze whether there are any potential horizontal competitive impacts. Train routes can be single line where one railroad moves traffic on all segments of the route from origin to destination. Train routes can also be interlined, where different railroads operate along different segments to move traffic from origin to destination. In this matter, I have analyzed whether there is any competitive impact in situations where UP and NS each operate the same segment of competing routes.

8. I also was asked to undertake analyses addressing parts of the Surface Transportation Board ("STB") regulations describing the information that applicants proposing mergers of Class I

railroads must provide to the STB.[1] Specifically, I was asked to provide certain data and analyses specified in 49 CFR § 1180.7 (b) (2), (3), and (4). These are discussed further in Section 6.

9. At my direction, CRA staff assisted me in performing these analyses and preparing this statement. Neither CRA's compensation nor my compensation depends on my opinions or the outcome of this matter.

1.3 Summary of Conclusions

10. I find that the substantial competitive benefits and greater economic efficiency that are expected to result from the transaction outweigh the limited potential horizontal anticompetitive effects. The reasons for my conclusion are, in summary, as follows:

11. First, the proposed merger of the Applicants' railroad networks is a predominantly vertical merger with little horizontal overlap. I explain this further in Section 2.

12. Second, combining these complementary networks would likely generate benefits affecting over 2.777 million loaded cars and intermodal container units ("carloads") every year, benefiting shippers and potentially reducing prices for consumers for a broad range of goods.[2] I explain this further in Section 3.

    a. In 2023, UP and NS interchanged approximately 913,000 carloads on interline services connecting shippers in the Eastern United States with shippers in the

[1] *See* 49 CFR § 1180.7 ("Market analyses").

[2] 913,000 carloads on UP/NS interline routes + 1.864 million carloads diverted to the combined railroad = 2.777 million.

Western United States. In a post-merger world, shippers using these services would likely benefit from faster, more reliable single line services. I find that the proposed combined railroad will have incentives to make operating improvements, offer more competitive terms, and prioritize reliability for the single line services that UP and NS acting independently do not for the interline services today. Moreover, it is unlikely that UP and NS could replicate these incentives in the absence of the proposed merger by remaining separate railroads and attempting to coordinate their activities through contracts. My conclusion draws on standard, well-accepted industrial organizational concepts from the economic analysis of the limitations of coordination by contract. I explain this further in Section 3.1.

b. The Applicants estimate that additional benefits would accrue to shippers of approximately 1.864 million carloads that would be diverted to the improved single line services. Achieving these benefits requires investments in expanded and upgraded infrastructure. I find that UP and NS would have limited incentives to make these investments without the proposed merger due to hold-up problems that have been extensively studied in economics. I explain this further in Section 3.2.

13. Third, compared to the expected pro-competitive benefits of the proposed merger, there is limited scope for harm from the loss of horizontal competition between UP and NS.

a. The Applicants report limited scope for harm in the short term to shippers that have direct access to railroad networks at the shippers' own facilities. The Applicants identified only three customer facilities for which the number of railroads serving the facility would fall from two to one following the proposed merger. The Applicants have offered commitments that would preserve competition for these customer

facilities. Even without effective commitments, the proposed merger would impact only {{ }} carloads at these customer facilities. I describe this further in Section 4.1.

b. The limited horizontal geographic overlap between the Applicants' networks means there is limited scope for an impact on horizontal competition to serve the same areas (origins and destinations) more broadly. Across the entire United States, there are no business economic areas ("BEAs")[3] for which the number of railroads declines from two to one as a result of the proposed merger. There is only one BEA for which the number of railroads that serve the geographic area would decline from three to two as a result of the proposed merger. In 2023, the total rail traffic was only 6,000 carloads to or from this area. I explain this further in Section 4.3.

c. The limited horizontal geographic overlap between UP's and NS's networks also means there is little scope for a negative impact on horizontal competition to transport freight across overlapping parts of the same corridor. Approximately {{ }} carloads of freight were carried on corridors where UP and NS were either the only two options at the start or end of the corridor or were two of only three options and which were flagged as potentially vulnerable to a loss of horizontal competition post-merger. I explain this further in Section 4.4.

d. The scope for a negative impact on horizontal origin and destination geographic competition between UP and NS is also limited and is likely outweighed by the benefits to shippers of the proposed merger. In theory, it is possible for railroads to

[3] See Section 2.3 and Section 4.2 for more information on BEAs.

be horizontal geographic competitors even if their networks do not overlap. This can happen, for example, if the railroads originate traffic from shippers in different geographic areas that are bound for customers at the same destination. Applying an initial screen to flag potential horizontal geographic competition concerns at origins and destinations for specific commodities identifies approximately 140,000 carloads where UP and NS each had more than a 10 percent share and combined more than a 50 percent share of either originating or terminating flows (excluding intermodal and automotive traffic, which the STB has acknowledged face substantial competition from trucks). This small number of initial flags is substantially smaller than the scope of projected benefits, and further analysis of them would be likely to reduce the extent of potential horizontal competition concerns even more. I explain this further in Section 4.5.

14. In addition to conducting an assessment of the benefits and the scope for potential harm from a loss of horizontal competition, I provide certain data and analyses responsive to STB regulation 49 CFR § 1180.7(b)(2), (3) and (4) as follows:

    a. First in relation to STB regulation 49 CFR § 1180.7(b)(2), I provide tables of actual and projected market shares of originated and terminated traffic volume by railroad for each major point on the proposed combined railroad and list points where the number of serving railroads would drop from 2-to-1 or from 3-to-2, respectively, as a result of the proposed merger. These tables are based on the same data, and many of the same analytical steps, as the analysis of potential loss of horizontal competition to serve points (origins and destinations) discussed in Section 4.3. I discuss this further in Section 6 and Appendix D.

b. Second in relation to STB regulation 49 CFR § 1180.7(b)(3), I provide tables of actual and projected market shares based on revenues and traffic volumes for major corridor-commodity group pairs. These tables also provide information on the gateways used, single line vs. interline rail, and rail vs. non-rail modes. These tables are based on the same data, and many of the same analytical steps, as the analysis of the scope for potential harm from the loss of horizontal competition to transport freight over overlapping segments of the same corridor discussed in Section 4.4. I discuss this further in Section 6 and Appendix E.

c. Third in relation to STB regulation 49 CFR § 1180.7(b)(4), I provide tables showing, for each major origin-commodity pair, the actual and projected revenues and traffic volumes to each destination from that origin by railroad. I provide analogous tables for each major destination-commodity pair. These tables are based on the same data, and many of the same analytical steps, as the analysis of the scope for harm from the potential loss of geographic horizontal competition discussed in Section 4.5. I discuss this further in Section 6 and Appendix F.

* * *

15. The remainder of my statement explains these conclusions in greater detail and provides the facts and details that support them.

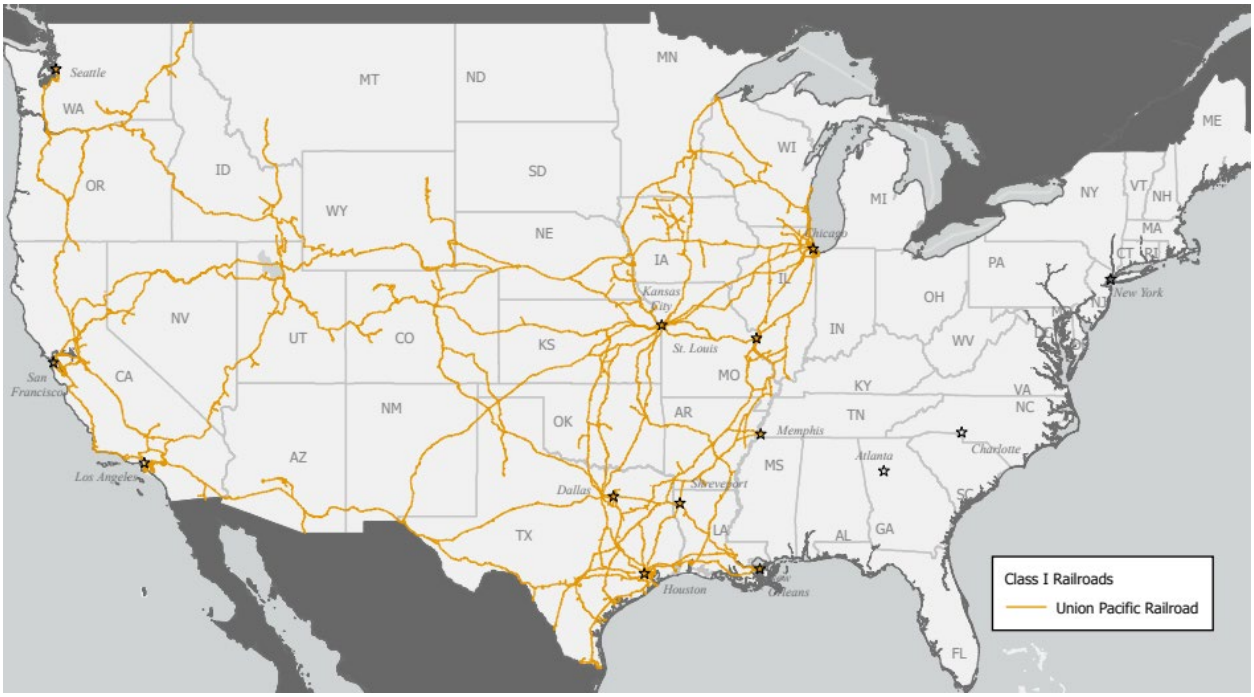
2 OVERVIEW OF THE INDIVIDUAL AND COMBINED RAILROADS

16. In this section of my statement, I briefly describe the current operations of UP and NS railroads, the limited amount of horizontal overlap between the two railroads, and the expanded transcontinental reach of the proposed combined railroad. I also discuss the

competition that these railroads currently face and will continue to face after the proposed merger.

2.1 Individual UP and NS Railroads

17. UP's rail network spans approximately 33,000 route miles and serves 23 states in the western and central United States.[4] UP "serves many of the fastest-growing U.S. population centers, operates from all major West Coast and Gulf Coast ports to Eastern gateways, connects with Canada's rail systems, and is the only railroad serving all six major Mexico gateways."[5] UP is headquartered in Omaha, Nebraska.[6] Exhibit 1 shows the UP railroad map.[7]



[4] *See* Union Pacific, "Company Overview," available at https://www.up.com/aboutup/corporate_info/uprrover/index.htm (accessed October 28, 2025); UP owns over 26,000 route miles and operates the approximately 6,500 remaining route miles via trackage rights or leases. *See* Union Pacific Corporation, 10-K, Fiscal Year Ended December 31, 2024, at pp. 17-18.

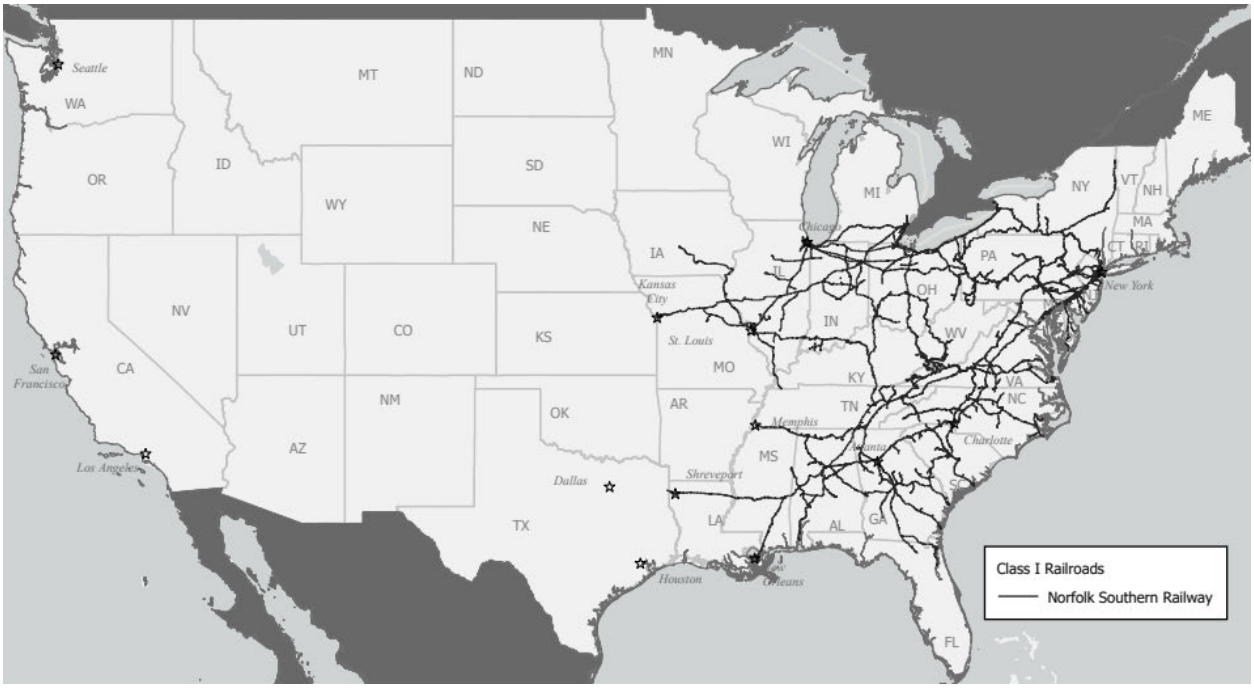
[5] *See* Union Pacific Corporation, 10-K, Fiscal Year Ended December 31, 2024, at p. 5.

[6] *See* Union Pacific Corporation, 10-K, Fiscal Year Ended December 31, 2024, at p. 18.

[7] The map identifies selected cities with a star marker.

Exhibit 1: UP Railroad Map

Source: Surface Transportation Board, "Railroad Map Depot," available at https://www.stb.gov/resources/railroad-map-depot/ (accessed November 20, 2025).



18. NS's rail network spans approximately 19,000 route miles and serves 22 states in the eastern portion of the country.[8] It connects the Southeast, East, and Midwest of the United States and includes rail lines to and from several Atlantic and Gulf Coast ports.[9] NS is headquartered in Atlanta, Georgia.[10] Exhibit 2 shows the NS railroad map.

[8] NS also serves the District of Columbia. NS owns approximately 14,500 route miles and operates under lease, contract, or trackage rights another 4,500 route miles. *See* Norfolk Southern Corporation, 10-K, Fiscal Year Ended December 31, 2024, at K4 and K5.

[9] *See* Norfolk Southern Corporation, 10-K, Fiscal Year Ended December 31, 2024, at K3.

[10] *See* Norfolk Southern Corporation, 10-K, Fiscal Year Ended December 31, 2024, at K3.

Exhibit 2: NS Railroad Map

Source: Surface Transportation Board, "Railroad Map Depot," available at https://www.stb.gov/resources/railroad-map-depot/ (accessed November 20, 2025).

19. Both UP and NS are Class I freight railroads.[11] They provide rail freight service along with four other Class I freight railroads operating in the United States: BNSF Railway ("BNSF"), CSX Transportation ("CSX"), Canadian National Railway ("CN"), and Canadian Pacific

[11] Class I railroads are the largest railroads in the United States. In 2024, Class I railroads are those with annual operating revenues of at least $1,074,600,816. *See* Surface Transportation Board, "Economic Data," available at https://www.stb.gov/reports-data/economic-data/ (accessed October 28, 2025). In 2024, UP's and NS's gross freight revenues were $24.1 and $12.1 billion, respectively. *See,* Surface Transportation Board, "Freight Commodity Statistics," 2024, available at https://www.stb.gov/reports-data/economic-data/freight-commodity-statistics/ (accessed November 19, 2025) (QCS-UP-2024.xlsx, sheet "QCS_Annual," cell AB481; QCS-NS-2024.xlsx, sheet "QCS Page 12," cell L18).

Kansas City ("CPKC").[12] Like UP, NS, and other Class I railroads, Class II and Class III short line railroads also provide rail freight services.[13]

20. Exhibit 3 shows 2024 volume (by carloads[14] and tons) and gross freight revenue for each Class I railroad in the United States. In 2024, UP transported 8.3 million carloads, earning $24.1 billion in freight revenues[15] and NS transported 7.1 million carloads, earning $12.1 billion in freight revenues.[16] According to annual reports published by UP and NS, in 2023 UP transported approximately 8.1 million carloads and NS transported approximately 6.7 million carloads.[17]

[12] *See* U.S. Department of Transportation Federal Railroad Administration, "Freight Rail Overview," available at https://railroads.dot.gov/rail-network-development/freight-rail-overview (accessed October 28, 2025). Kansas City Southern Railway and Canadian Pacific completed their merger in 2023 and are now known as Canadian Pacific Kansas City. *See* Canadian Pacific Kansas City, "About CPKC," available at https://www.cpkcr.com/en/about-cpkc (accessed October 28, 2025).

[13] The other types of railroads are Class II and Class III, which are also classified based on the annual operating revenues of the railroad. *See* Surface Transportation Board, "Economic Data," available at https://www.stb.gov/reports-data/economic-data/ (accessed October 28, 2025). As of 2025, there are 22 regional railroads and 584 local/short line railroads in the United States. *See* U.S. Department of Transportation Federal Railroad Administration, "Freight Rail Overview," available at https://railroads.dot.gov/rail-network-development/freight-rail-overview (accessed October 28, 2025).

[14] Most of the analysis concerns loaded movements. Some commodities are transported in intermodal containers and a freight railcar may carry more than one intermodal container unit at once. For the purposes of my analyses, I count loaded cars and individual intermodal container units as one and throughout this statement use "carloads" to represent loaded cars plus loaded individual intermodal container units.

[15] Surface Transportation Board, "Freight Commodity Statistics," 2024, available at https://www.stb.gov/reports-data/economic-data/freight-commodity-statistics/ (accessed November 19, 2025) (QCS-UP-2024.xlsx, sheet "QCS_Annual," cells T481 and AB481).

[16] Surface Transportation Board, "Freight Commodity Statistics," 2024, available at https://www.stb.gov/reports-data/economic-data/freight-commodity-statistics/ (accessed November 19, 2025) (QCS-NS-2024.xlsx, sheet "QCS Page 12," cells J18 and L18).

Exhibit 3: Class I Railroads' Gross Revenues, Carloads, Tons, and Mileage in 2024

Company	Carloads (000)	Tons (000)	Mileage Operated (000)	Gross Freight Revenue (000)
BNSF	9,589	486,590	33	$24,126,994
UP	8,334	451,217	33	$24,135,427
NS	7,094	320,045	19	$12,143,528
CSX	6,190	342,916	20	$13,147,519
GTC (CN)	2,254	171,136	5	$3,457,229
SOO/KCSR (CPKC)	1,910	135,810	8	$3,561,929
Total	***35,371***	***1,907,714***	***118***	***$80,572,625***

*Note*s:
Gross freight revenue, carloads, and tons figures include less-than-container loads. Carloads and tons figures are for total revenue freight carried. Data for CN and CPKC were published by Grand Trunk Corporation ("GTC") (for CN) and Soo Line Railroad Company ("SOO")/Kansas City Southern Railway Company ("KCSR") (for CPKC). CN and CPKC data are limited to U.S. operations. Mileage operated is limited to U.S. mileage.

2.2 Combined Railroad

21. The proposed merger of UP's and NS's railroad networks would create a unified transcontinental network, the only one of its kind in the United States.[18] Because of the limited horizontal overlap between UP's and NS's railroad networks, this is a largely end-to-end, vertical merger of railroads that meet at several interchanges near the center of the

continental United States. The combined network would stretch from Seattle, San Francisco, and Los Angeles to the Northeast and Mid-Atlantic regions, as well as southeast to cities such as Atlanta and Jacksonville.[19] It would also encompass rail lines in the center of the country from Minneapolis, Chicago, and Detroit in the north to Dallas, Houston, and the United States-Mexico border in the south.[20] The proposed combined railroad would connect over 50,000 route miles across 43 states, linking the West Coast to the East Coast of the United States.[21] As a result, the combined railroad network would connect major ports, border crossings, and railroad hubs providing shippers and consignees a new single line railroad service between points in the eastern and western U.S. that today can be served only by interline service. New single line service will benefit customers by creating efficiencies that cannot otherwise be achieved without the proposed merger.[22]

[18] *See* Union Pacific, "Union Pacific and Norfolk Southern to Create America's First Transcontinental Railroad," available at https://www.up.com/press-releases/growth/norfolk-southern-transcontinental-nr-250729 (accessed October 28, 2025).

[22] *See* Section 3 for further discussion.

Exhibit 4: Combined Railroad (UP + NS) Map

Source: Surface Transportation Board, "Railroad Map Depot," available at https://www.stb.gov/resources/railroad-map-depot/ (accessed November 20, 2025).

2.3 Geographic Overlaps Between the UP and NS Railroads Are Limited

22. As discussed earlier in Section 2.1, UP and NS mostly serve distinct geographic areas, with little horizontal overlap between the UP and the NS railroad networks.

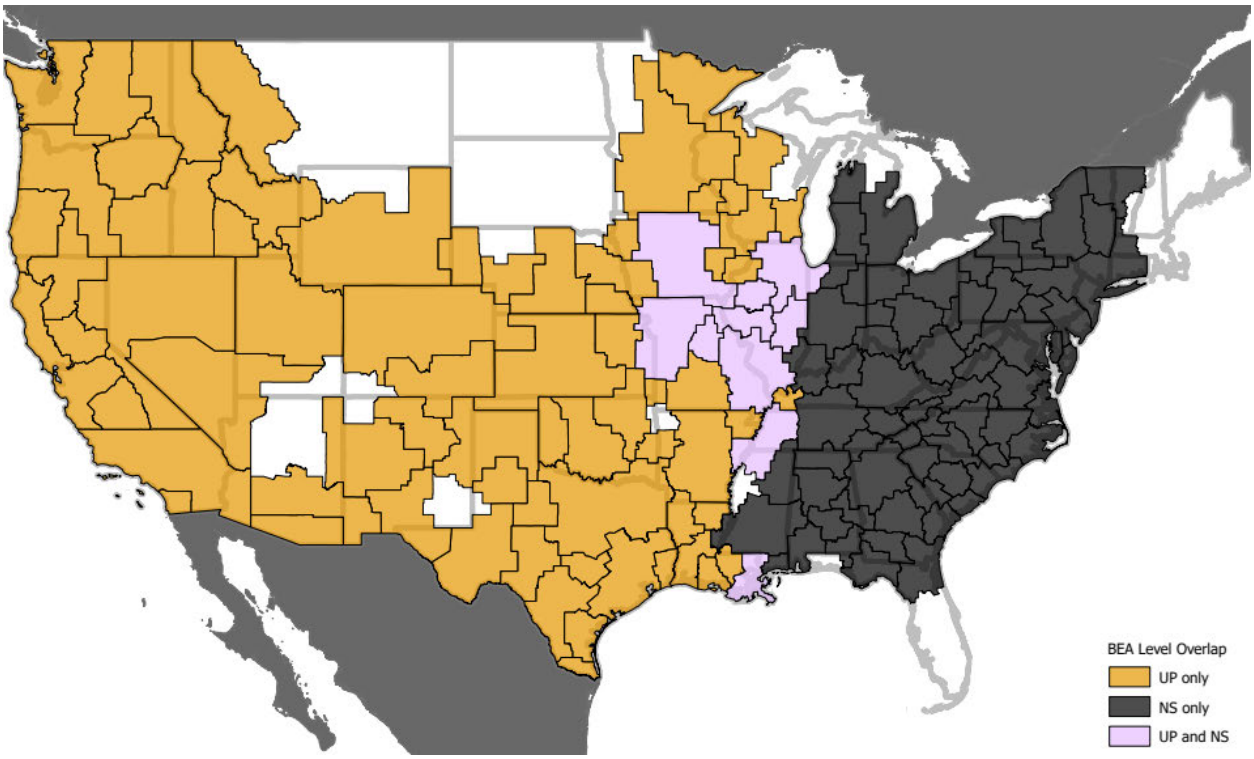
23. The primary horizontal geographical overlap between UP's and NS's railroad networks is in just four states—Illinois, Iowa, Missouri, and Louisiana—with a small additional horizontal overlap in Memphis, TN. Exhibit 4 shows the states that UP and NS railroads run through and which of these states are common to both.

24. When assessing competitive horizontal overlaps, I first review the geographic areas where the networks of UP and NS are both present. I consider the STB's BEA areas, which represent areas that are considered economically integrated by the U.S. Department of

Commerce, Bureau of Economic Analysis.[23] BEAs do not follow the same geographic boundaries as states and some BEAs are part of two or more states.[24] There are 172 BEAs in the United States,[25] and 168 of them where at least one Class I railroad operates.[26] UP operates in 80 BEAs and NS operates in 74 BEAs, but they both operate in only 10 BEAs.[27]

[23] Each BEA represents one or more metropolitan area and their surrounding counties that are considered economically integrated – typically identified based on commuting patterns. See Bureau of Economic Analysis, "Survey of Current Business," February 1995, available at https://fraser.stlouisfed.org/files/docs/publications/SCB/1990-99/SCB_021995.pdf?utm_source=direct_download (accessed December 8, 2025) at p. 75; Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf at p. 42. Prior railroad transactions also conducted economic analyses at the BEA level. See, Verified Statement of W. Robert Majure, "Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.," Finance Docket No. 36500, October 29, 2021, ("Majure VS"). See also, Verified Statement of Christopher A. Vellturo, "An Analysis of the Competitive Effects of the Proposed Combination of the Canadian National and Wisconsin Central Railroads," April 6, 2001 ("Vellturo 2001 VS") and Verified Statement of Christopher A. Vellturo, "Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company," Finance Docket No. 35087, October 29, 2007 ("Vellturo 2007 VS").

[24] *See*, for example, the Chicago-Gary-Kenosha, IL-IN-WI; New Orleans, LA-MS; and Reno, NV-CA BEAs. See, Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf at pp. 83-84.



[25] The 2023 Surface Transportation Board's Carload Waybill Sample Reference Guide defines 172 BEAs in the United States. See Table 4-4 "STB BEA Codes" in Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf at pp. 83-85.

[26] A BEA is reported as being served by a Class I railroad if a Class I railroad has a freight station in the BEA. See workpaper "In-Text Calculations.xlsx." There are two BEAs listed in Surface Transportation Board's Carload Waybill Sample Reference Guide that do not map to a SPLC in the file "1-A-Raw_UPRR_AAR_Station_Master.txt": Honolulu, HI and Farmington, NM-CO. The horizontal geographic overlap analysis based on where freight stations are located may differ from that based on the waybill data discussed in Section 4. These differences are likely attributable to at least two reasons: first, the waybill data provides routes that are used and second, some waybill data used in the analysis is based on a sample as opposed to the full set of waybill data.

[27] *See* workpaper "In-Text Calculations.xlsx."

Exhibit 5 is a map of the BEAs in the United States identifying which BEAs are served by UP, which are served by NS, and which are served by both UP and NS.[28]

Exhibit 5: Map of BEAs Served by UP or NS

Sources: See workpaper "Exhibit 05.do."

2.4 UP and NS Overlaps Are Limited to the Central Region of the United States

25. As discussed above, UP and NS both operate in the Midwest and south-central regions of the United States where the two railroads connect. The horizontal overlap between UP and

[28] Even though UP and NS both interchange in Shreveport, LA, NS neither serves Shreveport nor operates there. NS has haulage in Shreveport for interchange only. For this reason, the Shreveport-Bossier City, LA-AR BEA is not considered a BEA where UP and NS both operate. NS has a "longstanding agreement" with CPKC in which "NS has rights to use the Meridian Speedway, which connects UP in Shreveport and NS in Meridian. Under the agreement, UP and NS can commercially interchange intermodal traffic at Shreveport, with CPKC providing the transportation between Shreveport and Meridian." *See* the Joint Verified Statement of Eric Gehringer and John F. Orr, ("Gehringer-Orr VS"), at ¶ 175.

NS is limited to the central region of the US, regardless of whether one considers the UP and NS railway networks or the common BEAs. There will continue to be competition in the geographic areas served by both UP and NS post-merger because at least two other Class I railroads operate in all of these areas.[29]

26. Exhibit 5 shows the 10 BEAs where UP and NS both operate. In each of the 10 BEAs where UP and NS both operate, there are at least two additional Class I railroads that serve the BEA. Indeed, five of these 10 BEAs are served by all six Class I railroads, and another three are served by five Class I railroads.[30]

27. In addition, within the BEAs where both UP and NS operate, UP and NS currently have five main points of traffic interchange where freight is transferred between the two railroads. After the proposed merger, these interchange points will become points of vertical integration and will create single routes from pre-merger interline routes. These interchange points are Chicago, IL; St. Louis, MO; Kansas City, MO; Memphis, TN; and New Orleans, LA.[31] All six Class I railroads serve three of these five interchange points – Chicago, St. Louis, and New Orleans. Five Class I railroads serve Memphis, and four serve Kansas City. Exhibit 6 summarizes this information.

[29] *See* workpaper "In-Text Calculations.xlsx."

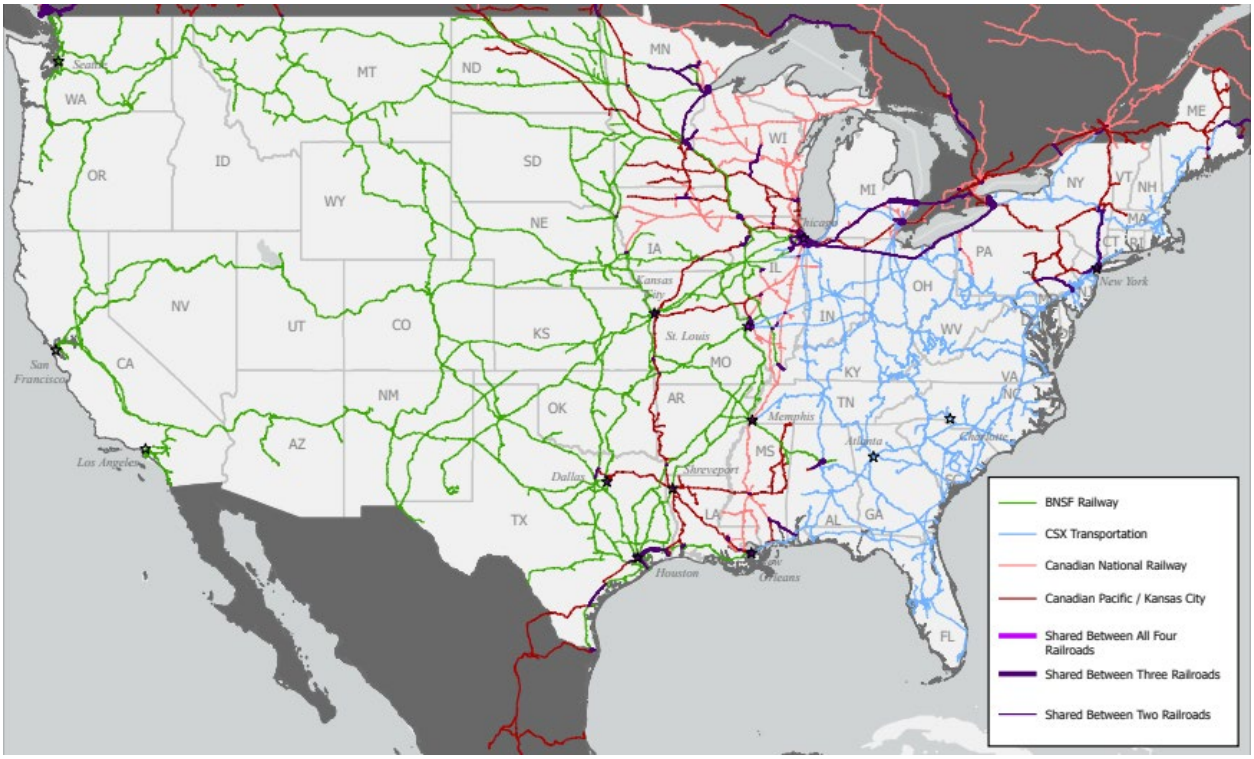
[30] *See* workpaper "In-Text Calculations.xlsx."

[31] *See* Gehringer-Orr VS at ¶ 152.

Exhibit 6: Class I Railroads Serving Main UP/NS Interchange Locations

Location	Number of Class I Railroads	UP	NS	BNSF	CN	CPKC	CSX
Chicago, IL	6	Y	Y	Y	Y	Y	Y
New Orleans, LA	6	Y	Y	Y	Y	Y	Y
St. Louis, MO	6	Y	Y	Y	Y	Y	Y
Memphis, TN	5	Y	Y	Y	Y		Y
Kansas City, MO	4	Y	Y	Y		Y	

Notes:
Whether a Class I railroad has a presence in each city is identified by SPLC (Standard Point Location Code). Chicago, IL is identified by SPLC 380000. St. Louis, MO is identified by SPLC 567500. Kansas City, MO is identified by SPLC 566900. Memphis, TN is identified by SPLC 439900. New Orleans, LA is identified by SPLC 647000. Railroad providers are identified by unique SCACs (Standard Carrier Alpha Code).



Sources: See workpaper "Exhibit 6.xlsx." Main interchange locations are identified in Gehringer-Orr VS at ¶152.

28. To summarize, although UP and NS are large railroad networks that cover significant portions of the United States, their points of horizontal overlap are limited, confined to the central region of the United States. The Applicants are never the only two Class I railroads in the BEAs in which they both operate, and at least two other Class I railroads will continue to serve each of these BEAs post-merger.

2.5 Horizontal Competition

29. As discussed earlier, in addition to UP and NS, BNSF, CSX, CN and CPKC are the four other Class I railroads in the United States. The map in Exhibit 7 shows that these four Class I railroads have a combined network that spans the United States. Exhibit 7 shows BNSF routes in green, CSX routes in blue, CN routes in pink, and CPKC routes in dark red. BNSF's railroads span the western United States. CSX's railroads cover the eastern United States. CN's and CPKC's railroads each connect the northern and southern portions of the central United States and extend through Canada. CPKC connects Canada to Mexico. CPKC also has some routes in the northern portion of the eastern United States.

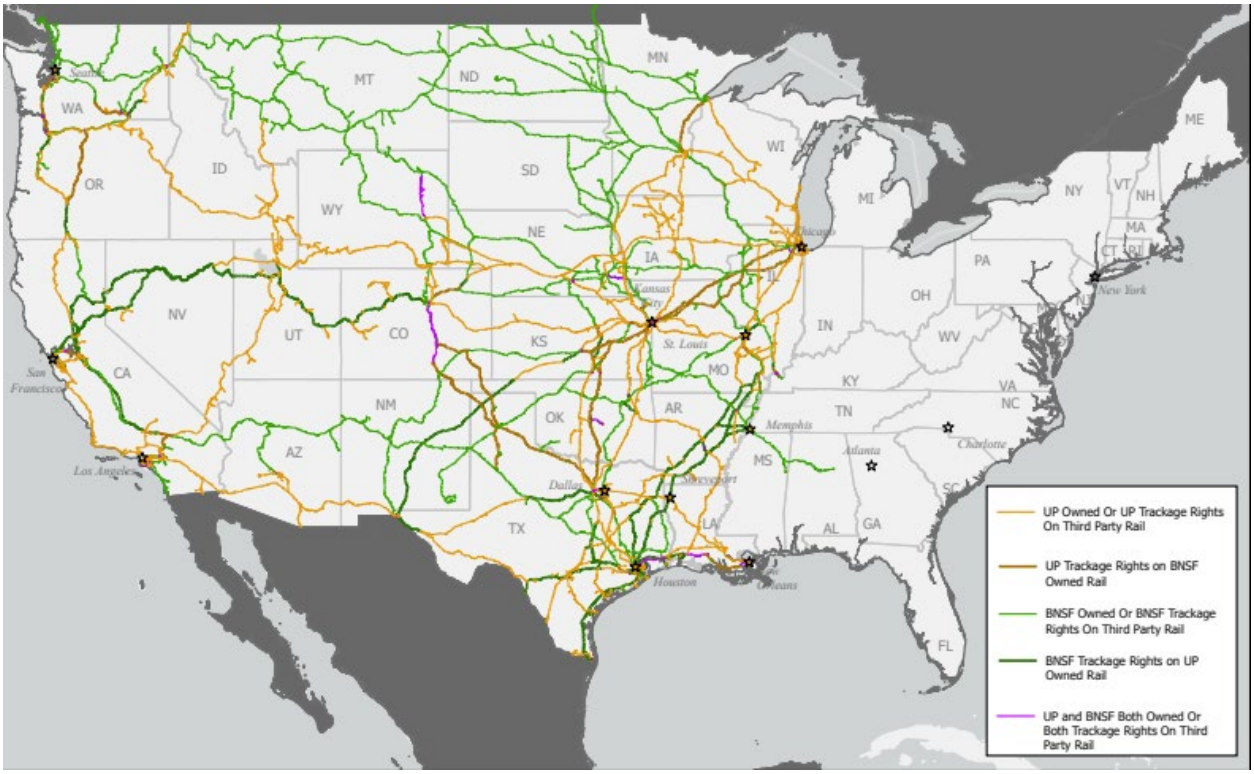


Exhibit 7: BNSF, CSX, CN, and CPKC Railroad Routes Map

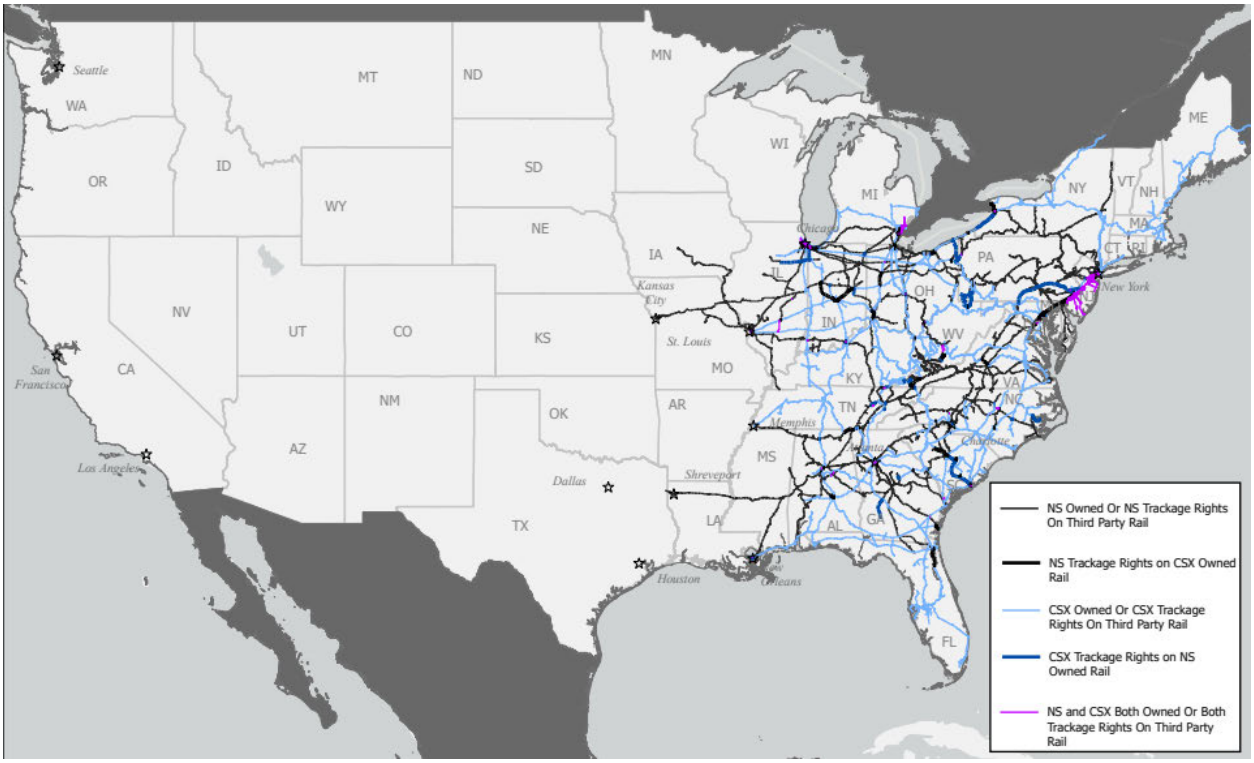
Source: Surface Transportation Board, "Railroad Map Depot," available at https://www.stb.gov/resources/railroad-map-depot/ (accessed November 20, 2025).

30. BNSF operates largely in the same geographic area as UP. The map in Exhibit 8 shows that both BNSF and UP operate on rail lines spanning the western portion of the country. The lighter shades of green and yellow represent rail lines that BNSF and UP respectively own or have a right to operate on per agreements with third-party railroads (i.e., all other railroads other than BNSF and UP). The darker shades of green and yellow represent rail lines that UP and BNSF respectively own but on which the other party can operate. Routes in purple represent rail lines owned or operated on by both BNSF and UP.

Exhibit 8: BNSF and UP Railroad Route Map



Source: Surface Transportation Board, "Railroad Map Depot," available at https://www.stb.gov/resources/railroad-map-depot/ (accessed November 20, 2025).

31. CSX operates largely in the same geographic area as NS. The map in Exhibit 9 shows that both CSX and NS operate on rail lines spanning the eastern portion of the country. The light blue and thin black lines represent rail lines that CSX and NS respectively own or have a right to operate on per agreements with third-party railroads (i.e., all other railroads other than CSX and NS). The dark blue and thick black lines represent rail lines that NS and CSX respectively own but on which the other party can operate. Routes in purple represent rail lines owned or operated on by both CSX and NS.

32. As shown in Exhibit 7, Exhibit 8, and Exhibit 9, BNSF, CPKC, CN, and CSX all operate in the central region of the country, where UP and NS also operate.

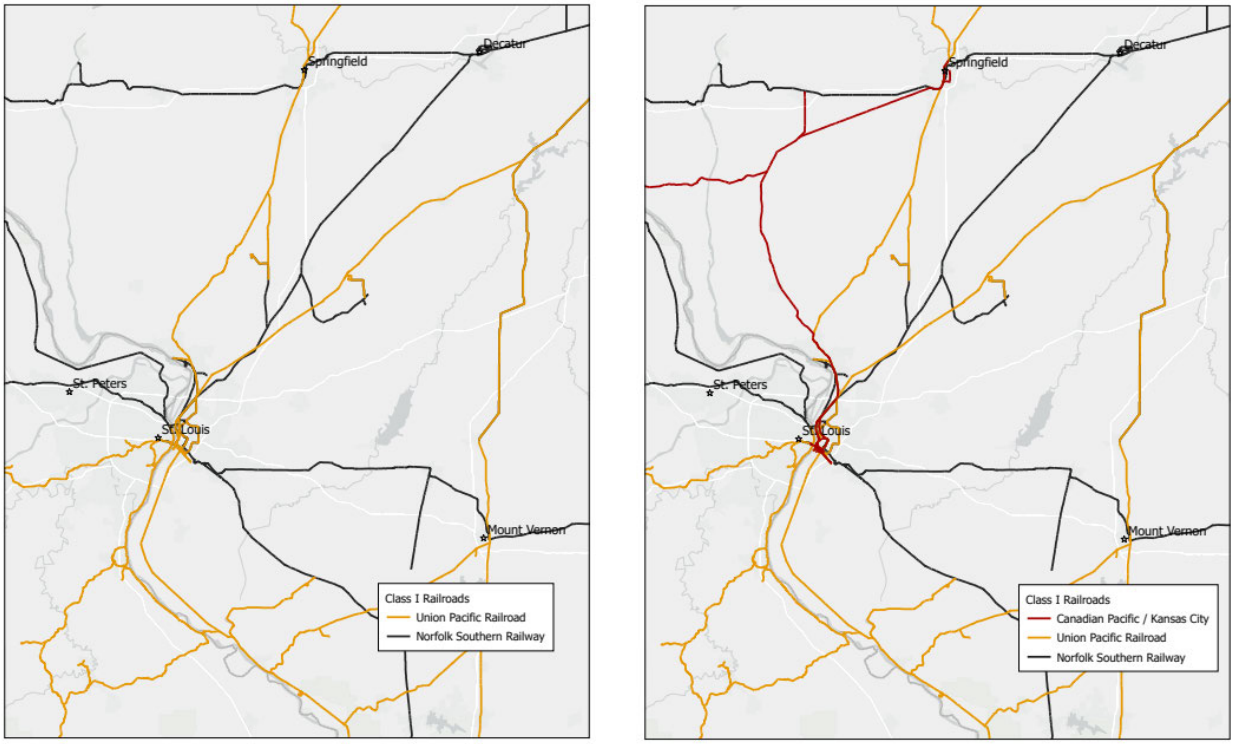


Exhibit 9: CSX and NS Railroad Route Map

Source: Surface Transportation Board, "Railroad Map Depot," available at https://www.stb.gov/resources/railroad-map-depot/ (accessed November 20, 2025).

33. As a result, shippers will continue to have a choice of competing Class I rail service providers post-merger. For example, while both UP (orange) and NS (black) currently offer service between Springfield, IL and St. Louis, MO (left panel of Exhibit 10), another Class I railroad (CPKC; dark red), also connects those two cities (right panel of Exhibit 10). As a result, the shippers located in Springfield, IL and St. Louis, MO will continue to have competing Class I rail service options after the proposed merger.

Exhibit 10: Springfield, IL - St. Louis, MO Route Served by UP, NS, and CPKC

Source: Surface Transportation Board, "Railroad Map Depot," available at https://www.stb.gov/resources/railroad-map-depot/ (accessed November 20, 2025).

34. After the proposed merger, both BNSF and CSX will continue to compete with the combined railroad to carry freight across the United States. In addition, CN and CPKC will continue to compete with the combined railroad in the central region of the United States, since they both often operate in the geographies where UP and NS operate. [32] And, as discussed above, for each of the 10 BEAs where UP and NS both operate, at least two other Class I railroads also compete in each of these 10 BEAs.

[32] BNSF and CPKC each operate in 9 of the 10 BEAs where UP and NS both operate. CN operates in 8 of the 10 BEAs where UP and NS both operate. CSX operates in 7 of the 10 BEAs where UP and NS both operate. *See* workpaper "In-Text Calculations.xlsx."

3 BENEFITS FROM THE PROPOSED MERGER

35. Section 2 relied on station location data to show that the railroad networks of UP and NS are largely complementary and not horizontally overlapping. This section assesses the extent to which combining these complementary assets under common ownership could strengthen competition to transport freight to the benefit of customers. The scope for benefits from better service (such as increased availability of single line options) or heightened competition resulting from the proposed combined railroad is measured by the number of carloads transported by UP and NS in 2023.

36. My assessment of the benefits from combining the networks under common ownership starts with the fact that the combined railroad will replace interline services where UP and NS currently must interact independently to transport freight between points on their respective networks, with single line services operated by one railroad. Viewed through the lens of economics, and based on my review of the evidence provided in the Verified Statements from other experts in this matter, I find that:

    a. In 2023, UP and NS interchanged approximately 1,240,000 cars and intermodal units[33] on interline services, of which approximately 913,000[34] were loaded. The combined railroad will have stronger incentives to seek and implement operating efficiencies for the single line services that would carry these cars than UP and NS acting independently do. The combined railroad will also have stronger incentives to

[33] "In 2023, the two railroads interchanged approximately 1,637 cars of manifest traffic, 1,648 containers of intermodal traffic, and 122 cars of bulk shipments per day." *See* Gehringer-Orr VS at ¶ 152. (364 × (1,637 + 1,648 + 122) = 1,240,148).

[34] *See* workpaper "In-Text Calculations.xlsx."

market and price single line services aggressively and to ensure reliability, compared to the Applicants' independent incentives when marketing and delivering interline services today. The benefits from the improved incentives are unlikely to be achieved in full without the proposed merger. I discuss this further in Section 3.1.

b. Many shippers that currently use other railroads or trucks to transport their freight would benefit from having a single line option from the proposed combined railroad. The Application includes one measure of the potential scope of this benefit: an estimate that roughly 1.864 million carloads would divert from truck or other railroads to take advantage of better services.[35] Those diversions are far less likely to happen absent the proposed merger, nor is the full range of investments needed to support this additional traffic likely to be forthcoming if the proposed merger does not proceed. I discuss this further in Section 3.2.

37. In developing my opinions, I rely on (1) the Joint Verified Statement of Eric Gehringer and John F. Orr ("Gehringer-Orr VS"), which describes the Operating Plan of the combined railroad; (2) the Joint Verified Statement of Kenny Rocker and Claude E. Elkins ("Rocker-Elkins VS"), which describes the benefits from a marketing perspective; (3) the Joint Verified Statement of David T. Hunt and Matthew Schabas ("Hunt-Schabas VS") which estimates the diversion of traffic from truck and from other railroads to take advantage of improved services; and (4) the Verified Statement of John W. Turner ("Turner VS") which describes the investments that the combined railroad intends to make to support the growth in traffic which UP and NS expect to attract as a result of the proposed merger.

[35] *See* the Hunt-Schabas VS at Exhibit 2-3.

3.1 Scope for Benefits on Existing Traffic

38. The combined railroad is likely to have stronger incentives to make single line services faster and more reliable, and more competitive, compared to the incentives of UP and NS in relation to the interline services they replace. This is because the proposed merger would internalize externalities that currently exist between UP and NS when they operate interline services. An externality occurs when the decision one party makes imposes a benefit or cost on a third party. Independent firms producing complementary goods or complementary services do not account for how their actions affect other parties. Acting independently (i.e., choosing decisions based only on the firm's own interest), the first firm ignores the effects of its actions on the second firm. A merger between these two firms aligns incentives: a common owner internalizes externalities as the combined entity will, post-transaction, take into account the effect of each firm's actions on the overall combined firm.[36] The next sections describe these changes to the combined railroads' incentives in more detail.

3.1.1 Incentives to implement operating improvements

39. The combined railroad would have stronger incentives to seek and implement ways to make its single line services faster and more reliable. The Gehringer-Orr VS describes the changes that the proposed combined railroad plans to make to the planning and operation of its services. The statement describes two versions of the Operating Plan for the combined railroad: the Optimized Plan, which identifies operating changes that the combined railroad could implement immediately following the merger, assuming current volumes and patterns

[36] For a discussion of externalities, *see, among others,* Dennis Carlton and Jeffrey Perloff, *Modern Industrial Organization*, HarperCollins (1994) ("Carlton and Perloff"), at pp. 115-123.

of traffic; and a Growth Plan, which identifies additional changes to accommodate the extra traffic that the Applicants expect to be diverted from truck and other rail operators, based on the Hunt-Schabas VS.[37] In this section I focus on the operational changes described in the Optimized Plan.

40. One reason why single line services operated by the proposed combined railroad likely will be faster and more reliable is that cars will be handled fewer times during their journey under the Optimized Plan.[38] Trains are typically comprised of blocks of cars bound for different destinations.[39] Individual railcars may be switched into yards to be sorted and classified or reclassified into blocks and blocks may be removed and attached to different trains multiple times over the course of their journey. These "handlings" introduce delay and variability.[40] Interchanges on interline routes can be particularly time consuming as they often involve two (or more) handlings, one on each of the interchanging networks.[41] The Rocker-Elkins VS reports that interchange points between carriers can add between 24 and 48 hours of

[37] *See* Gehringer-Orr VS at ¶¶ 15, 27, 31.

[38] *See* Gehringer-Orr VS at ¶¶ 8 and 27.

[39] For a description of how freight trains are built, *see* Association of American Railroads, "Freight Rail FAQs," available at https://www.aar.org/faqs/ (accessed November 21, 2025).

[40] *See* Gehringer-Orr VS at ¶ 27. "Reducing intermediate handlings improves service reliability for customers by eliminating events that introduce variability into the system."

[41] *See* Hunt-Schabas VS at Section 3.4. "Even at large gateways, most railcars must be handled twice (at the originating and terminating railroads' terminals) before continuing."

dwell time.[42] Interchanges also make services less reliable as the hand-off between two independent railroads creates operational risk.[43]

41. Under the Optimized Plan, the proposed combined railroad is expected to eliminate over 873,000 handlings per year by converting current interline services into single line services.[44] The Optimized Plan also describes changes to the way that some formerly interline services between UP and NS will be routed, which, together results in reductions in handling.

42. These improvements derive from multiple operational changes. For example, under the Optimized Plan, the combined railroad is anticipated to introduce new, more efficient routes that will have trains pass through the current interchange points without the need for any handling there at all.[45] One example is the combined railroad will introduce a new direct train from North Platte, NE to Conway, PA, that will run through Chicago without any handling.[46] To implement these plans, the combined railroad will assemble blocks at yards

[42] *See* Rocker-Elkins VS at ¶ 51. "Transfers between carriers can add 24 to 48 hours of dwell time and reduce the utilization of locomotives and cars that should be moving freight."

[43] "[The] more interchanges, the greater the risk that a railroad will not be able to meet its service hand-off plan for a railcar." Hunt-Schabas VS at Section 3.3. The Hunt-Schabas VS Section 3.3 reports empirical analysis that uses the number of interchanges as a proxy for service reliability.

[44] *See* Gehringer-Orr VS at ¶ 6. "Applicants project implementation of their optimized plan will remove approximately 2,400 handlings of cars and containers per day."

[45] *See* Gehringer-Orr VS at ¶¶ 27, 182-184.

[46] *See* Gehringer-Orr VS at ¶ 190.

within UP's legacy network that are destined for points within NS's legacy network, and vice versa.[47]

43. Another change is that some interchanges between UP and NS involve the same railcar or intermodal unit being handled multiple times. The combined railroad will reduce some of these. For example, the proposed combined railroad anticipates consolidating some of the UP and NS yards in Chicago, which would allow the Applicants to reduce the number of handlings for traffic passing through the gateway.[48]

44. An example illustrates how the proposed merger would likely create stronger incentives to improve services by internalizing externalities between UP and NS. One type of improvement in the Optimized Plan is to operate existing trains on more efficient routes that run through the points of interchange between UP's and NS's legacy network without needing any handling. Before the proposed merger, this routing would involve one of the Applicants (e.g., UP) using its yards to assemble blocks destined for points within the other Applicant's (e.g., NS's) network.[49] When creating blocks at its yards, UP's economic incentive is to consider the commercial implications only for its own business. Its incentives will differ from those of the combined railroad for at least two reasons. First, UP receives only a part of the profit for interline services with NS as independent entities, but the

[47] *See* Gehringer-Orr VS at ¶¶ 183-184, 230. "In addition, Applicants will change the way traffic currently flows through current interchanges to implement more efficient train and blocking concepts they have developed in the planning process…The planned changes to current traffic flows centrally involve creating new trains with deeper network blocking while optimizing movements through mid-continent gateways."

[48] Gehringer-Orr VS at ¶¶ 203-204, 207. "UP/NS also will reduce complexity and consolidate automotive shipment distribution by shifting operations from UP's Chicago Heights automotive facility into NS's Hegewisch automotive facility, eliminating intermediate handlings between the two facilities."

[49] *See* Gehringer-Orr VS at ¶ 183.

combined railroad would receive all of the profit from single line services. Second, UP has little incentive to incur costs itself in order to reduce NS's costs of delivering interline services. As a result, as an independent entity pre-transaction, UP has weak economic incentives to divert activities from its own direct services in order to sort and reclassify cars to better serve NS's interests. However, a combined railroad would have the full incentive to optimize UP's and NS's combined network.

3.1.2 Incentives to offer improved service terms

45. The combined railroad would also have stronger incentives to compete for business. Shippers typically contract with railroads for interline services in one of two ways. They may contract with one railroad, which arranges for carriage for part of the journey using interline agreements with other railroads on the route. Alternatively, shippers may contract separately with each railroad using Rule 11, an accounting rule set by the Association of American Railroads that allows each railroad on an interline service route to issue its own invoice to the shipper for the services it provides. With interline pricing, shippers negotiate a single rate with one of the carriers and receives a single invoice for the full route. With Rule 11 pricing, on the other hand, shippers negotiate separately with each of the railroads that serve portions of the overall route and receive a separate segment-specific invoice from each carrier.[50]

[50] *See*, for example, Rick LaGore, "Rule 11 vs. Railroad Interline Agreements - A shipping comparison," InTek Logistics, June 18, 2025, available at https://www.inteklogistics.com/blog/rule-11-railroad-interline-agreement-comparison (accessed November 24, 2025). *See also*, Association of American Railroads, "Railway Accounting Rules," December 2, 2025, available at https://public.railinc.com/sites/default/files/documents/RAR.pdf.

46. From an economic perspective, both of these options are inefficient because they involve at least two separate negotiations. Single line services are anticipated to result in customers being able to obtain quotes for shipments more quickly. UP and NS typically provide quotes for single line shipments within one business day, but it can take up to seven days to get quotes for interline shipments.[51]

47. Moreover, there is an externality between the two (or more) railroads that could slow down negotiations and lead to worse terms for shippers. There are at least two ways in which the rate offered by one railroad for its part of a route could affect the profits of railroads operating other parts of the route:

    a. The prices offered by one railroad can affect whether a shipper decides to use a particular route, rather than a competing rail option or truck, and thereby affecting the profits of other railroads that would participate on that route.

    b. Once a shipper has accepted the terms for a route, those prices affect the volume shipped, because prices affect the marginal price the shipper pays for transporting additional units; as a result, the profits of other railroads that would participate on that route are affected.

48. Each railroad would prefer the other railroad to offer price concessions on its part of the service in order to reach an agreement with the shipper, or to offer terms with a lower marginal rate to encourage the customer to ship more freight. A railroad that offers better terms bears the full cost of making the concession, but the benefits – the additional contract

[51] *See* Rocker-Elkins VS at ¶ 10.

or extra volume that results – are shared with the other railroad. There is an externality between the railroads because more attractive terms offered by one of them benefit the other, leading to an incentive misalignment.

49. The proposed merger is likely to address both problems – separate negotiations and the relatively weaker incentives to offer price concessions. The shipper will negotiate with a single sales team from the combined railroad that will be able to offer terms for the full route, avoiding a second negotiation with a different team at another railroad. Moreover, post-merger the combined railroad will internalize the externality between UP and NS because the combined railroad would get the full benefit of any additional business or volume won through offering better terms. All else equal, internalization of the externality increases the economic incentive to offer better terms compared to independent railroads in negotiations over interline services. Consistent with economic theory, higher quality services (such as faster service) coupled with enhanced incentives to compete can result in lower quality-adjusted prices.

50. My conclusion that the proposed combined railroad is likely to have enhanced incentives to compete is based on well-accepted principles in the economics literature on price effects when complements come under common ownership. These ideas appear in several forms, including the elimination of double marginalization. Double marginalization arises when two firms with market power in the same supply chain successively set their own price. The upstream firm will often charge the downstream firm a price that includes a profit margin above its costs. The downstream firm will treat this margin as part of its own costs (since that is the price it pays the upstream firm), and may charge a margin on top of that, resulting in customers paying a price that includes two margins (this is the "double marginalization").

If the firms merge, however, the combined firm bases its pricing decision on the costs of the upstream input, rather than a price that includes a markup on those costs, thereby eliminating the double marginalization, which is then expected to result in lower prices.[52]

3.1.3 Incentives to ensure reliable services

51. Post-transaction, the combined railroad will also have enhanced incentives to ensure reliable single line services in the face of operating difficulties. Compared to a combined entity, standard economic reasoning shows that a standalone UP will generally put less weight on ensuring that interline services arrive on time for two reasons. First, UP shares the benefits (i.e., gets partial benefits) of meeting the expectations of interline customers with NS, whereas the proposed combined railroad would gain the full benefit. Second, shippers pre-merger may be unsure which railroad is responsible for late deliveries, so NS might bear some of the consequences when UP prioritizes its own direct services (and vice versa). The combined railroad, on the other hand, cannot blame-shift responsibilities. According to the Rocker-Elkins VS this is a material consideration.[53]

3.1.4 These benefits are unlikely without the proposed merger

52. Independent firms can attempt to coordinate activities using a contract that specifies the obligations of each and allocates the benefits from better coordination. However, evidence

[52] On the double marginalization and a double markup, *see*, for example, Carlton and Perloff at pp. 523-527.

[53] Rocker-Elkins VS at ¶ 52. "The problem isn't just time—it's accountability. When two carriers share a shipment, it's harder for customers to get clear pricing, tracking, and service commitments. If a delay occurs, no single railroad owns the full responsibility for addressing the problem. That fragmented accountability undermines the consistency that customers expect and erodes confidence in rail's reliability."

and economic theory show that UP and NS could not achieve all the potential benefits of the combined railroad.

53. Evidence that contracts cannot achieve all the benefits of the merger includes the simple point that, while the operating changes in the Optimized Plan would be jointly profitable today, UP and NS have been unable to achieve them though contractual or other means. The frustration of shippers with split accountability for interline services mentioned in the Rocker-Elkins VS,[54] and the evidence in the Rocker-Elkins VS that rail has a smaller share compared to truck on corridors where rail services are interline rather than single line[55], are also consistent with it being difficult to achieve fully aligned services when independent railroads cooperate to provide services under interline agreements.

54. Economic literature describes the limitations of organizing economic activity through arms-length negotiations between independent firms in an environment of changing circumstances.[56] One important concept is the transaction costs associated with negotiating the obligations and allocation of benefits in the contract. These costs can be high when the setting is complex and changeable. Contracts may be unable to specify the actions that would be efficient in all contingencies because there are too many, or they are hard to contemplate. Taking the example of UP using its yard to assemble blocks for points within NS's network,

[54] Rocker-Elkins VS at ¶ 52.

[55] *See* Rocker-Elkins VS at Figure 2.

[56] *See* Ronald H. Coase, "The Nature of the Firm," *Economica,* vol. 4 (1937), pp. 386-405; Oliver E. Williamson, "The Vertical Integration of Production: Market Failure Considerations," *Papers and Proceedings of the Eighty-Third Annual Meeting of the American Economic Association*, vol. 61, no. 2 (1971), pp. 112-123; On the limitations of contracts as commitment devices, *see*, for example, Benjamin Hermalin, Avery Katz, and Richard Craswell, "The Law and Economics of Contracts," in *Handbook of Law and Economics,* editors A. Mitchell Polinsky and Steven Shavell (New York: Elsevier, 2007), at pp. 5-7.

UP may experience increased demand for services on its own network that use the same yard for handling. That could make it more costly for UP to divert capacity at the yard to assemble blocks for NS and UP may no longer be willing to abide by the original agreement. Subsequent renegotiations are costly and time-consuming and can trigger legal disputes as parties strategically bargain over which entity bears the changed costs or receives changed benefits. In contrast, a merger allows for flexible internal coordination without repeated negotiation, thereby preserving efficiencies that are lost when using contracts.

3.2 Scope for Benefits to Other Shippers

55. Improved single line services offered by the combined railroad are also likely to benefit many shippers that currently use other railroads or other transport options (e.g., truck) as well as existing UP and NS customers. Competing railroads may improve their own terms or service quality to remain competitive. Likewise, shippers can switch from their current options to take advantage of the better services and quality-adjusted pricing from the combined railroad.

56. The Hunt-Schabas VS includes an estimate of the additional traffic that the Applicants expect to attract to the single line services of the combined railroad. It estimates an additional 1.864 million carloads and intermodal units per year.[57]

57. These benefits are unlikely to be achieved in full without the proposed merger. As discussed earlier, many of the improvements to services that result in these benefits are unlikely without the proposed merger. In addition, UP and NS would not be able to accommodate the

[57] *See* Hunt-Schabas VS at Exhibit 2-3.

additional traffic that the Hunt-Schabas VS anticipates without additional investments in infrastructure.[58] The Turner VS provides a summary table of expected infrastructure projects needed to support the anticipated increase in traffic on the single line services operated by the combined railroad: These investments total over $1 billion, and include investments in yard and terminal expansion, siding extensions, and signal updates.[59]

58. Based on well-understood principles from the economic literature, it is unlikely that UP and NS would make these investments without the proposed merger. The economic concept of a hold-up problem is key to understanding why a firm may not make investments that would benefit both it and its vertical trading partners when the two firms are coordinating by contract.[60] Hold-up arises when one firm must invest in relationship-specific assets; for example adding a mile of track to a yard to facilitate interchange with a second railroad.[61] Once invested, the first railroad risks opportunism: if the second railroad is contacted by a shipper seeking an interline service, it may threaten to interline with a rival of the first

[58] Turner VS at ¶ 6. "Part IV identifies the infrastructure improvements Applicants currently anticipate they will need to produce the projected service improvements and accommodate projected merger-related traffic growth, and their plan for timely completion of those improvements." *See also*, Turner VS at ¶ 82. "Applicants have planned extensive capital improvements to main lines and yard and terminal facilities on the combined UP/NS network that are projected to experience merger-related traffic growth. These investments will allow the combined railroad to accommodate anticipated traffic growth while also improving safety and service quality."

[59] Turner VS at Table 14.

[60] *See* Oliver E. Williamson, "Transaction-Cost Economics: The Governance of Contractual Relations," *The Journal of Law and Economics*, vol. 22, no. 2 (1979), pp. 233-261. *See also*, the property rights theory of Sanford J. Grossman and Oliver D. Hart, "The Costs and Benefits of Ownership: A Theory of Vertical and Lateral Integration," *Journal of Political Economy,* vol. 94, no. 4 (1986), pp. 691-719 and Oliver D. Hart and John Moore, "Property Rights and the Nature of the Firm," *Journal of Political Economy*, vol. 98, no. 6 (1990), pp. 1119-1158.

[61] Yards are typically surrounded by residential and/or commercial construction and rarely have land available for expansion. Even when land is available, the process of obtaining the right to add capacity to a yard is convoluted. *See, for example,* United States Government Accountability Office, "Freight Transportation: National Policy and Strategies Can Help Improve Freight Mobility," January 2008, available at https://www.gao.gov/assets/gao-08-287.pdf, at p. 14. "Freight movement in population centers and along major corridors is also constrained by the physical barriers created by urban land-use development patterns and the built-up urban environment, such as buildings and other facilities that are adjacent to ports, rail yards, and highways."

railroad unless the first railroad agrees to unfavorable conditions for its part of the through-billed interline shipment, thereby removing some of the first railroad's benefits from its investments.

59. Anticipating the possibility of hold-up, the economic literature shows firms under-invest, or even avoid investing altogether, leading to inefficient outcomes for all parties. Contracts cannot eliminate hold-up risk because contracts are incomplete, and enforcement is imperfect. Vertical integration aligns ownership rights and residual profits, thereby internalizing the hold-up risk which thereby enables efficient levels of relationship-specific investments.

60. In the context of the proposed merger of UP and NS, the hold-up problem provides an informative context as to why UP and NS acting independently may fail to invest in the infrastructure needed to accommodate additional traffic. In particular, with each of UP and NS acting independently, investments made by UP (for example) would only be profitable to UP if NS cooperated to channel additional traffic on interline services with UP rather than one of UP's rivals: needing NS's cooperation enhances NS's bargaining position when negotiating with UP over how to allocate the benefits of the additional traffic volume and could result in UP choosing unilaterally not to make the infrastructure investment.

4 HORIZONTAL COMPETITIVE EFFECTS ANALYSES

61. This section analyses the scope for adverse horizontal competitive effects. I find that, compared to the scope for benefits of the proposed merger, there is limited scope for potential harm from the loss of horizontal competition between UP and NS.

62. Horizontal competition between railroads can take different forms. Some shippers are served by railroads that have lines that connect the shippers' facilities directly to the railroad's network. These shippers might find it costly to switch in the short run to a railroad that does not already serve its facilities. Assessing the effect of the proposed merger on these shippers involves a local analysis of which railroads serve individual customer facilities. Section 4.1 reports the results of an investigation by the Applicants of this issue and describes the commitments the Applicants are offering to shippers whose short run options may be changed by the proposed merger.

63. Other forms of horizontal competition involve freight transport options at a broader geographic level. Shippers that need direct access may be able to choose between different railroads with track or facilities within a broad area when choosing a site for a new facility or when they are considering expanding or replacing existing facilities. In addition, some shippers deliver their freight to railroads by truck and have access to alternatives within ready driving distance. To assess these types of horizontal competition, I conduct analyses using waybill data on actual movements of loaded railcars. These analyses identify routes that are not merely theoretical paths through the rail networks but instead reflect actual routes and existing traffic volumes that flow between areas. Section 4.2 describes the data used for the analysis.

64. Using waybill data, I conduct three analyses of the scope for adverse competitive effects at this broader level. These analyses are:

    a. The scope for potential harm from a loss of horizontal competition between UP and NS where they currently serve the same origins or same destinations (identified by BEAs). I discuss this further in Section 4.3.

b. The scope for potential harm from a loss of horizontal competition between UP and NS to transport freight within the same corridor between any two origins and destinations. I discuss this further in Section 4.4.

c. The scope for potential harm from a loss of horizontal geographic competition between UP and NS. Railroads can be geographic competitors even if their railroad networks overlap at only an origin or destination if, for example, the railroads originate traffic from shippers in different areas that is bound for customers at the same destination. I discuss this further in Section 4.5.

65. These analyses show that there is limited scope for potential harm from adverse competitive effects. The following sections discuss these different analyses and describe the data on which they are based.

4.1 UP and NS Commitments to 2-to-1 Customers

66. The Verified Statement of Katherine N. Novak ("Novak VS") describes the analysis the Applicants undertook to identify instances in which UP and NS are the only railroads serving individual customers. The Applicants identified three customer facilities for which the number of serving railroads would decline from 2-to-1 following the proposed merger. The three customer facilities described in the Novak VS are: AgRail LLC, at Bloomington, Illinois; Hillsboro Energy LLC, at Hillsboro, Illinois; and Macoupin Energy LLC, at Carlinville, Illinois. Macoupin Energy and Hillsboro Energy are both operated by Foresight Energy LLC.[62]

[62] *See* Novak VS at ¶¶ 51-52.

67. To preserve horizontal competition for these three shipper facilities, the Applicants have committed to entering into agreements that would allow another existing Class I railroad to serve the facilities using haulage rates under established industry terms and conditions.[63] The number of carloads affected across these three customer facilities is small: {{ }}[64] in 2023. If these commitments are effective at preserving horizontal competition for these customers, the affected shippers will not be harmed by the proposed merger.

4.2 Data

68. Short run competition between railroads with direct connections to customer facilities is not the only way in which railroads compete. This section discusses the data that is used to assess horizontal competition with a broader lens for three separate analyses, described in sections 4.3, 4.4 and 4.5.

4.2.1 Data sources

69. For the horizontal competition analyses, data on loaded railcar movements is used.[65] These analyses rely on three sources of data.

70. First, I use the STB's Confidential Carload Waybill Sample ("CWS").[66] The CWS is a stratified sample of U.S. rail traffic waybills, containing detailed information on an

[63] *See* Novak VS at ¶ 53.

[64] *See* workpaper "In-Text Calculations.xlsx."

[65] Railroads also transport empty railcars back to shippers; the vast majority of revenues are earned on movement of loaded railcars not empty cars. I analyze waybills for revenue movement of loaded cars only. I focus on linehaul movements and linehaul revenues (e.g., reciprocal switching moves are excluded). *See* Appendix C.

[66] A waybill is a shipping document that accompanies freight during transport and includes detailed information about the shipment.

individual shipment for the reporting railroad including origin, destination, commodity, carloads, tons, and revenue, among others.[67] Each record in the CWS represents a separate waybill and the sample is designed to be representative of the universe of rail freight waybills terminated by the reporting railroads.[68] While CWS records cover only a sample of all freight rail movements, the CWS also includes expansion factors provided by the STB to scale up the CWS so that the data are representative of the U.S. population of waybills.[69] I have access to CWS data for 2019-2023.[70] The STB modified sampling methodology for year 2021, so overall fewer records are sampled in years 2019 and 2020.[71]

71. Second, I have traffic tape data provided by UP, NS, and BNSF for 2019-2024. I also have traffic tape data provided by CN for 2023.[72] Each record in the traffic tape data includes information on the origin, destination, commodity codes, carloads, and revenue, among others, for each respective railroad.

---

[67] *See* Surface Transportation Board, "Carload Waybill Sample," available at https://www.stb.gov/reports-data/waybill/ (accessed November 24, 2025).

[68] CWS "is a stratified sample of carload waybills for all U.S. rail traffic submitted by those rail carriers terminating 4,500 or more revenue carloads annually." *See,* Surface Transportation Board, "Carload Waybill Sample," available at https://www.stb.gov/reports-data/waybill/ (accessed November 24, 2025). Surface Transportation Board, "Procedure for Sampling Waybill Records," January 1, 2021, available at https://www.stb.gov/wp-content/uploads/STB-Statement-81-1-Procedures-for-Sampling-Waybill-Records-2021-Edition.pdf.

[69] The STB provides two types of expansion factors – a theoretical expansion factor and an exact expansion factor. I use the theoretical expansion factor because it is available for all observations. *See,* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at pp. 61 and 77. CWS records also include freight moves that originate in Mexico or Canada if they terminate in the U.S.

[70] As of the date of my report, the most recent CWS data available is for the year 2023.

[71] *See,* Surface Transportation Board, "Carload Waybill Sample," available at https://www.stb.gov/reports-data/waybill/ (accessed November 24, 2025).

[72] Traffic tape data from CSX were not available. CPKC traffic tape data only became available on November 19, 2025, and November 21, 2025 and were therefore not incorporated into these analyses.

72. Third, I use S&P Global Market Intelligence—Transearch data for freight movements shipped by non-rail modes (e.g., trucks, pipeline, water) in 2023. These data contain information on the tons of freight transported by different modes between origins and destinations where either the origin or destination is in the United States. Each record reports the tons of 4-digit standard transportation commodity codes ("STCC") shipped between a pair of BEAs by each transportation mode such as truck, water, or pipeline.[73]

4.2.2 The combined waybill data

73. The combined waybill data consolidates the following waybill data: (1) 2019-2024 traffic tapes for UP, NS, and BNSF, (2) 2023 CN traffic tapes, and (3) 2019-2023 CWS data ("combined waybill data").

74. My analyses rely on data for 2023, the year for which the most complete data are available, namely, traffic tapes from UP, NS, BNSF, and CN and the 2023 CWS which provides information for all other railroads. Although 2024 U.S. traffic tape data provided by UP, NS, and BNSF are available, information on other railroads for 2024 are not available since the most recent CWS data available is for 2023 and CN data are only available for 2023. The Transearch data on freight traffic by non-rail modes of transport, such as trucks and water, used to supplement the waybill data is also only available for 2023.

[73] The Transearch data identifies whether movements are transported by truck, air, pipeline, water, and "other" non-rail freight modes. For a detailed description of these data, *see* S&P Global Market Intelligence, "Transearch Tutorial Documentation," December 19, 2024, at p. 7; S&P Global Market Intelligence, "Transearch Reference Guide 2023"; *see also*, S&P Global Market Intelligence, "Transearch 2023 Modelling Methodology Documentation," April 16, 2025.

75. Combined waybill data for 2019-2022 and 2024 are also used to supplement findings for 2023, for example to determine whether or not other railroads transported freight along a route where they are not observed doing so in the 2023 data, as will be discussed in more detail later in this section.

76. Appendix C describes how the combined waybill data set is constructed. The primary analyses discussed in Sections 4.3, 4.4, and 4.5 use data for 2023. In addition, traffic tape data for UP, NS, and BNSF, as well as the CWS for other available years, are used to supplement these analyses.

77. Using the combined waybill data for a competitive analysis is conservative. Horizontal competitive concerns are likely to be over-identified because while there is complete 2023 information for UP, NS, BNSF, and CN movements, there is only information from the CWS for all other railroads, including the two other Class I railroads (CPKC and CSX), as well as Class II and Class III railroads. Records in CWS are sampled with different frequencies (e.g., some are at a rate of 1 out of 40) so information on movements in the CWS is particularly limited.[74] For example, if waybills for movements from some origins and destinations were not among waybills sampled for the CWS or not included in the traffic tape data from UP, NS, BNSF, and CN, then there is no further information available to identify those movements. Importantly, movements by CPKC or CSX as well as Class II and Class III railroads are underrepresented in these data and therefore the analyses described below would understate competition from CPKC and CSX or Class II or Class III railroads.

[74] *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at p. 53.

4.2.3 Quantity measurement

78. My analyses use information on traffic volumes to identify potential horizontal competitive concerns. Depending on the specific analysis, traffic is measured either in counts of carloads or tons shipped. Whenever possible, carloads are used because there are some discrepancies in how tons are recorded among different sources.[75] Because data for non-rail movement from Transearch reports freight flows in tons, in the analyses where I incorporate non-rail movements, I also rely on tons as units of measurement of both rail and non-rail traffic. Measures of carloads include both railcars and individual intermodal container units.[76]

79. Although revenues are not used for these analyses, revenue information is included in Appendices E and F to respond to 49 CFR § 1180.7(b)(3) and (4).[77] Due to unique data limitations in the waybill data, revenues for other railroads for interlined movements are often unobserved. For example, for interline route moves (e.g., a route involving UP-CPKC-CSX), CSX revenues are not observed unless Rule 11 pricing is used and CSX's segment is sampled in the CWS. Given the sparsity of data in the CWS and the prevalence of non-Rule 11 interlined movements, more often than not, railroad revenues for interlined movements are not observed for either CSX and/or CPKC.[78] As a result, while there are revenues for UP, NS, BNSF, and CN, revenue measures for other railroads are far less complete, resulting in revenue-based analyses that are likely to be less reliable. See Appendix C for further details.

[75] *See* Appendix C.

[76] *See supra* n. 14 for a discussion about railcars and individual intermodal container units.

[77] *See* Appendix E and F for additional details.

[78] *See* Appendix C for details.

4.2.4 Level of geographic aggregation

80. The CWS data provides various geographic classifications for the origins and destinations of each waybill record. The analysis of horizontal competition in sections 4.3, 4.4 and 4.5 considers the freight transportation options available to shippers and consignees within BEAs, which is an economic-based geography area in the CWS.[79]

81. The Bureau of Economic Analysis describes these BEAs as consisting "of one or more economic nodes—metropolitan areas or similar areas that serve as centers of economic activity—and the surrounding counties that are economically related to the nodes."[80] Since "[t]he main factor used in determining the economic relationships among counties is commuting patterns…each economic area includes, as far as possible, the place of work and the place of residence of its labor force."[81]

82. BEAs are an appropriate basis for evaluating important dimensions of competition between alternatives for freight rail movements:

    a. BEAs capture competition when freight is delivered to or from rail by truck. Points within BEAs are linked by roads, such that shippers are able to choose between

[79] BEAs are also discussed in Section 2, *see* Section 2.3 for more information on BEAs. Traffic tape data do not include BEAs, but instead provide SPLC information for each origin and destination which are aggregated to the BEA level, as discussed in Appendix C.

[80] Bureau of Economic Analysis, "Survey of Current Business," February 1995, available at https://fraser.stlouisfed.org/files/docs/publications/SCB/1990-99/SCB_021995.pdf?utm_source=direct_download (accessed December 8, 2025) at p. 75.

[81] Bureau of Economic Analysis, "Survey of Current Business," February 1995, available at https://fraser.stlouisfed.org/files/docs/publications/SCB/1990-99/SCB_021995.pdf?utm_source=direct_download (accessed December 8, 2025) at p. 75.

nearby freight rail stations within a BEA, recognizing that the geographic scope of competitive rail alternatives include more than just the station closest to the shipper.

b. BEAs also capture longer term competition for customers that benefit from direct access between railroads active in the same general area, but not necessarily close to each other or currently serving the same customers, i.e., competitors for the same business. This is because shippers with a presence in that area can decide to develop new facilities near one railroad or the other.

83. Analyzing BEA-level data is consistent with the analysis of competition in prior mergers.[82] Routes or corridors are analyzed by BEA to BEA movements, not movements within each BEA.

4.2.5 Commodities

84. The analysis in Section 4.5 focuses on geographic competition. The geographic pattern of supply and demand will vary by commodity, so the traffic flows are analyzed separately by commodity. Commodities are classified by railroads using STCCs and these analyses use 4-digit STCCs.

85. The 4-digit codes represent a group of commodities (e.g., "Cotton, Raw," "Bituminous coal," "Wool or mohair," "Lead ores") each of which aggregates together 7-digit commodities. For example, the 4-digit code "Cotton, Raw" (0112) aggregates 5 commodities

[82] BEAs were used as the relevant geographic area in prior railroad mergers. *See,* Vellturo 2001 VS, Vellturo 2007 VS, and Majure VS.

defined at the 7-digit level, including "Cotton Bolls" (0112915), "Cotton Fiber, Bleached" (0112911), and "Cotton, Unginned" (0112930).

86. An example of the STCC structure is provided below, demonstrating how the digits in the 7-digit codes move from aggregated (2-digit) to disaggregated (7-digit) product levels.

Example of STCC Structure[83]

STCC Digits	Description
01	Farm Products
01 1	Field Crops
01 12	Cotton, Raw
01 129	Raw Cotton, NEC
01 129 15	Cotton Bolls

87. Two practical reasons merit the use of 4-digit STCC level commodities.

88. The analyses in this statement include an evaluation of competition by commodity between corridors. Traffic data are split between the separate analyses for each origin-commodity or destination-commodity pair. Using 4-digit STCCs allows for more observations in each analysis. For example, there are over 15,000 7-digit STCCs as compared to around 485 at the 4-digit STCC level.[84] Using 7-digit STCCs results in too few data points to support

[83] Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf; Canadian National, "List of Bulk STCCs – Applicable Under CN 7403 and CN 7402," available at https://www.cn.ca/-/media/files/customer-centre/shipping/bulk-stcc-en.pdf.

[84] *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf at pp. 118-161 and "93-A-stcc_comm.xlsx". *See* workpaper "In-Text Calculations.xlsx."

statistically reliable conclusions for many of the analyses. In addition, the data may not show an overlap between UP and NS at the 7-digit STCC level even though both UP and NS may be revealed to be commercially viable options for that commodity when using the 4-digit STCC level. Even using 4-digit commodities, there are many instances for which the traffic flows at the 4-digit level are likely too few to support reliable statistical conclusions about competition.[85] The problem would be even more pervasive using 7-digit STCC data.

89. An assessment of competition includes consideration of whether non-rail freight transport (truck or other non-rail modes) is a competitive alternative for shippers and consignees. The Transearch data for non-rail traffic flows used for my analyses includes 4-digit STCC commodities but does not provide information at the more granular 7-digit STCC level.

4.2.6 Data quality screens

90. Traffic tapes provided by UP, NS, BNSF, and CN contain records from business operations which include certain inconsistencies and discrepancies described in Appendix C. Data from STB is a sample, so is incomplete. To ensure that the analyses described below include sufficient data to draw meaningful conclusions the following screens are applied.

91. **Other years' data**. As described above, analyses are conducted using 2023 data and actual traffic patterns. If a particular origin or destination or corridor is served by two railroads, it is possible that in the single year 2023 a third railroad is not observed moving any traffic. Therefore, I also examine traffic flows in other years to determine if another railroad has moved such traffic during 2019-2022 or in 2024. Despite augmenting with available traffic

[85] *See* Appendix C.

data from additional years, this screen will not fully identify all competitors on any given route or at any given origin or destination because information for other railroads for other years is less complete relative to 2023 as described above.

92. **Small sample.** Three distinct filters are applied to account for small sample size. To draw meaningful conclusions about competition, a sufficient traffic volume needs to be observed at a point or along a corridor. First, a minimum carload volume of 365 carloads per year is applied. This minimum volume requirement of 365 carloads per year is similar to one carload per day in prior rail mergers.[86]

93. Second, a "minimum 10 waybills in year" requirement is applied for similar reasons. This minimum size restriction has been used in previous railroad transactions to account for the CWS sampling and its limitations, resulting in a dataset that can be used for analyzing the impact of a railroad merger.[87] With the lowest waybill sample rate being 1 out of 40 (for

[86] An alternative minimum carload shipment of 100 do not meaningfully change results.

[87] *See* Majure VS at ¶ 90. "[M]easurement of shares as a reliable description of choices, has been recognized in the Board's recent decision to adjust the Waybill sampling methodology to better capture smaller shipments. With the thin observation of these shipments that was still used in the 2019 Waybill Sample, the initial screen can be triggered by shares based on as few as 2 observed shipments which mathematically has to give one carrier at least 50 percent even if that is not an accurate representation of competition. This issue was indirectly addressed in past implementations of this test by imposing a minimum of one carload per day on candidate BEA area-commodity pairs. I will use an equivalent threshold for reliability of the screen." *See also*, Vellturo 2001 VS at pp. 11-12. "For example, there are only 21 product/DBEA pairs where the combined volumes of the two railroads amount to more than a carload a day… I understand that the Board has stated that it must approve a transaction of this type 'unless there will be adverse competitive impacts that are both 'likely' and 'substantial.'' The small CN/WC volumes within the 50/10 product/DBEA pairs indicate that this Transaction will not entail any such anticompetitive effects." *See also*, Vellturo 2007 VS at p. 88.

single car records), limiting the analysis to corridors with at least 10 waybills in a year is similar to 365 carload shipments in a year for reliability.[88]

94. Third, routings with fewer than 10 carloads in a year are excluded from analyses that use observed carloads to identify which operators are present. Routings with fewer than 10 carloads often appear to be idiosyncratic and most likely involve a record, movement, or billing error.[89]

4.3 Analysis of Railroads Serving Origins and Destinations

4.3.1 Overview

95. The first analysis using the waybill data seeks to identify the BEAs that are most at risk because the proposed merger will reduce the number of railroads that serve the BEA from 2-to-1 or from 3-to-2.[90] This analysis looks at the options available to customers who wish to ship from a particular origin, regardless of the destination, or to receive shipments in a particular destination, regardless of origin.

96. The limited horizontal geographic overlap between UP and NS rail networks means that there is little scope for potential horizontal harm. Looking across the whole of the United States, there is only one BEA where the number of railroads that serve the area declines from

[88] The lowest sample rate of waybills in the CWS Reference Guide is 1 out of 40. Using the 1 out of 40 sample rate, the minimum whole number of waybills that would be functionally equivalent to requiring 365 carloads per year would be 10 waybills. *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf at p. 53.

[89] Sensitivity analysis was conducted, as described in Section 4.4.2. Omitting routings with fewer than 10 carloads in a year does not affect the substance of my conclusions.

[90] *See* Section 2.3 and Section 4.2 for more on BEAs.

3-to-2 as a result of the proposed merger. In 2023, railroads carried nearly 6,000 carloads to or from this area in total. There are no BEA origins or destinations for which the number of railroads declines from 2-to-1.

4.3.2 Analysis and results

97. For each BEA, the analysis uses the combined waybill data to identify the railroads that originate traffic of any commodity in that BEA and separately also the railroads that terminate traffic of any commodity in that BEA. The BEAs for which the proposed merger may result in the number of railroads changing from 2-to-1 or 3-to-2, either when considering traffic originating at the BEA, or terminating at the BEA, are reported in Exhibit 11.[91] The table also reports the total 2023 railroad carloads of traffic associated with each record.

Exhibit 11: Combined Railroad's 2-to-1 or 3-to-2 Points
(All Commodities, Origins and Destinations)

BEA Name	BEA Number	Origin or Destination	2-to-1 or 3-to- 2	Carloads
Columbia, MO	98	Origin	3-to-2	{{ }}
Columbia, MO	98	Destination	3-to-2	{{ }}
Total				***5,956***

Notes: All 2023 traffic. Data for 2019-2022, 2024 are used for prior year comparisons.
Sources: Combined Waybill Data; *See* workpaper "Exhibit 11.xlsx."

98. Exhibit 11 shows that there are no BEAs for which the number of serving railroads changes from 2-to-1.

99. There is one BEA, Columbia, MO, that is identified by the 3-to-2 screen, and it is flagged as both an origin and destination. {{ }} is the other Class I railroad serving this BEA

[91] Columbia, MO is the only BEA identified in 2023. An examination of waybill data from years other than 2023 had no impact on the results of this analysis.

accounting for over {{ }} of total originating traffic and approximately {{ }} of terminating traffic.[92] Significant competitive harm is unlikely in this BEA for the following reasons:

a. Concerns about competitive harm are less acute when shippers and consignees have a Class I alternative to the combined UP and NS, as they do here. In the STB's decision in a prior merger, with regard to 3-to-2 points, the STB stated that "Competition at 3-to-2 Points Not Diminished" and that there was "little potential for significant, merger-related competitive harm" at these points.[93]

b. While the focus of this analysis is on railroads, UP and NS also compete with non-rail options like truck and water.

100. In any case, the total volume of shipments to and from this BEA is small, just under 6,000 carloads of combined originating and terminating traffic.[94] For all these reasons, horizontal competition at origins and destinations is unlikely to be substantially harmed after the proposed merger.

[92] *See* workpaper "In-Text Calculations.xlsx."

[93] *See* Surface Transportation Board, "Union Pacific Corporation, Union Pacific Railroad Company, and Missouri Pacific Railroad Company—Control and Merger—Southern Pacific Rail Corporation, Southern Pacific Transportation Company, St. Louis Southwestern Railway Company, SPCSL Corp., and The Denver and Rio Grande Western Railroad Company," Finance Docket No. 32760, Decision No. 44, STB Decided August 6, 1996, at p. 72.

[94] *See* Exhibit 11.

4.4 Analysis of Competition Within Corridors

4.4.1 Overview

101. The second analysis using the waybill data considers the options available to shippers to transport freight along a specific origin-destination corridor. There is horizontal competition between UP and NS within the corridor if each operates the originating segment (the segment that starts at the origin) of different routes within the corridor or if each operates the terminating segment (the segment that ends at the destination point) of different routes within the corridor. Horizontal competition may also occur if each operates as a bridge between originating and terminating segments.[95]

102. The analysis shows that there is little scope for potential horizontal harm. Around {{ }} carloads of freight were carried on corridors where UP and NS were either the only two options at the start or end of the corridor or were two of only three options.[96]

4.4.2 Analysis and results

103. A corridor is identified as an origin BEA and destination BEA pair. Within each corridor the analysis considers the options to shippers for moving freight from one BEA to another BEA for all commodities in aggregate. If a route is a viable option for one commodity, then it is a

[95] The evaluation of prior railroad mergers has included analyses of the effect on the number of options that shippers have within corridors. *See* Majure VS at ¶¶ 49-53. My approach differs in that it focuses on horizontal overlaps.

[96] *See* Exhibits 12 and 13.

viable option for others when the focus is long run competition or competition for shipments that start or end their journey by truck.[97]

104. This analysis considers the number of railroad options that shippers have at the start of the corridor, the number of railroad options that shippers have to terminate traffic at the end of the corridor, and the number of railroad options that shippers have as a bridge between originating and terminating segments. The corridor pair is flagged if UP and NS are either the only railroad options (2-to-1) or are two of only three options (3-to-2) at either the start or end of the corridor. The corridor is also flagged if (1) both UP and NS operated as a bridge between the originating segment and the terminating segment and (2) either no other railroads operated as a bridge on the corridor (2-to-1) or only one other did so (3-to-2).

105. Shippers of some traffic within a flagged corridor are protected from horizontal anticompetitive harm because they have other transport options or because rail competition is particularly effective. The reported carloads in the flagged corridors excludes this protected traffic in two ways.

106. Transearch data are used to assess whether shippers have a viable non-rail option to move freight within a given corridor. The most common non-rail option in the data is trucking, although water movements are important for some origins and destinations and pipelines are important for certain commodities.[98] This analysis looks only at trucking and water transport as competing non-rail modes, meaning pipeline, air and "other" are excluded.[99] Trucking is

[97] Using all commodities to assess competition within a corridor is consistent with prior transactions. *See, for example,* Majure VS ¶¶ 42 and 61.

[98] *See* workpaper "In-Text Calculations.xlsx."

[99] Including these other modes does not alter the conclusions. *See also* Appendix E where all modes are reported.

fragmented, which means shippers in corridors where trucks are a viable alternative have numerous competing truck options in addition to rail.[100] Shippers in corridors where barges are a viable alternative also have waterway options in addition to rail.[101] These options may vary across commodities. To capture this competition, traffic on a flagged corridor for a particular commodity is excluded from the carloads reported in Exhibits 12 and 13 if truck and water non-rail volume (measured in tons) accounts for 50 percent or more of the combined freight tonnage by rail and non-rail for that commodity on that corridor.[102]

107. The reported carloads also exclude traffic that is carried in intermodal containers and motor vehicle and motor vehicle parts traffic. Previous STB and Interstate Commerce Commission ("ICC") (predecessor to the STB) decisions have stated that there is "effective competition"

[100] According to the U.S. Department of Transportation, as of June 2025, nearly 580,000 active U.S. motor carriers were registered with the Federal Motor Carrier Safety Administration ("FMCSA") that owned or leased at least one tractor. Among those carriers, 91.5 percent operate 10 or fewer trucks and 99.3 percent operate no more than 100 trucks. *See* American Trucking Associations, "Economics and Industry Data," available at https://www.trucking.org/economics-and-industry-data (accessed December 8, 2025). *See also*, USDA Agricultural Marketing Service, "Study of Rural Transportational Issues, Chapter 13: Truck Transportation," available at https://www.ams.usda.gov/sites/default/files/media/RTIReportChapter13.pdf, at p. 404. "[T]he average ratio of operating cost to operating revenue is a tight 95 percent in over-the-road long-haul truckloads, demonstrating that the sector is highly competitive."

[101] *See* USDA Agricultural Marketing Service, "Study of Rural Transportational Issues, Chapter 12: Barge Transportation," available at https://www.ams.usda.gov/sites/default/files/media/RTIReportChapter12.pdf, at p. 377. "[The] barge industry is generally considered to be highly competitive—perhaps not as competitive as the truck industry, but more competitive than rail. Rates are determined by market conditions and no one company dominates the market."

[102] The Interstate Commerce Commission ("ICC") stated that effective competition can be created from alternative modes with shares as low as 28 percent. In addition, in one decision, the STB expanded an ICC decision that exempted the transportation of hydraulic cement from regulation in part because there is "effective competition" to railroads if alternative modes to railroad transport (including trucks) have a 57 percent share of freight. *See* Surface Transportation Board, "Rail General Exemption Authority—Exemption of Hydraulic Cement," Ex Parte No. 346 (Sub-No. 34), STB Decided December 4, 1996, at pp. 3-4.

in the transport of intermodal shipments, motor vehicles (STCC 3711), and motor vehicle parts or accessories (STCC 3714).[103, 104]

108. The 2023 corridors that are flagged as 2-to-1 or 3-to-2 are reported below. The tables include the origins and destinations for each corridor and total carloads shipped, adjusted as described above. As discussed earlier, these results use waybill data from years other than 2023 to determine if there are other additional railroads that served the corridor in other years. Since these additional railroads can serve and have served those corridors, such corridors are removed from the 2-to-1 or 3-to-2 lists.[105]

---

[103] The ICC exempted "from its regulation the rail transportation of motor vehicles (STCC 37-11) and motor vehicle parts or accessories (STCC 37-14)" since "such regulation is not needed to protect shippers from an abuse of market power." The ICC stated that "[o]n account of motor carrier competition, geographic competition generally, and various shipper options and powers, there is, overall, effective competition for the rail transportation of motor vehicles and motor vehicle parts and accessories." *See* Surface Transportation Board, "Rail General Exemption Authority—Transportation Equipment," Ex Parte No. 346 (Sub-No. 27), ICC Decided December 30, 1992 (9 I.C.C. 2d) at pp. 1-2.

Trailer-on-flatcar ("TOFC") and container-on-flatcar ("COFC") transportation had "long been exempted from economic regulation" by the ICC. "The basis for the ICC's exemption of TOFC/COFC traffic from economic regulation was the agency's finding that transportation of these intermodal shipments is market-driven and subject to widespread and effective competition from both motor carriers and other railroads. Shippers can truck their freight to any railroad intermodal ramp, or move it entirely over the highways, enabling them to choose the most effective and commercially responsive service and price offerings." *See* Surface Transportation Board, "WTL Rail Corporation Petition for Partial Revocation of Exemption," Ex Parte No. 230 (Sub-No. 9), STB Decided February 15, 2006, at p. 1.

The ICC considers trucks to "compete effectively" over a distance of 200-250 miles and that other non-rail options can also compete effectively for longer hauls. *See* Surface Transportation Board, "Rail General Exemption Authority—Exemption of Hydraulic Cement," Ex Parte No. 346 (Sub-No. 34), STB Decided December 4, 1996, at pp. 2-3.

[104] A sensitivity test was run which reported all traffic for corridors flagged as 2-to-1, including traffic from intermodal commodities, motor vehicles, motor vehicle parts or accessories, and commodities where non-rail volume accounts for at least half of all tonnage. This added {{ }} carloads to the count of 2-to-1 carloads. This finding does not affect the substance of my conclusions. *See* workpaper "In-Text Calculations.xlsx."

[105] Note that there are {{ }} carloads associated with corridors that were initially flagged as 2-to-1 but which featured at least one railroad other than UP or NS in another year (and accordingly do not appear in Exhibit 12). This finding does not alter the substance of my conclusions. *See* workpaper "In-Text Calculations.xlsx."

109. The 2-to-1 results are reported in Exhibit 12. The records are ordered from highest to lowest total carloads involved.

Exhibit 12: Combined Railroad's 2-to-1 Corridors

Corridors				Carloads
Origin		Destination

Total				**{{ }}**

Notes: All 2023 traffic. Data for 2019-2022, 2024 are used for prior year comparisons.
Sources: Combined Waybill Data; Transearch Data; *See* workpaper "Exhibit 12, 13.xlsx."

110. There are thousands of corridors in the data where either UP or NS provide service, but there are only five 2-to-1 corridors shown in Exhibit 12 which carry {{ }} carloads in total.[106] For these carloads, UP and NS are the only railroad options (2-to-1) at either the start or end of the corridor. In addition, there are {{ }} 2-to-1 carloads not shown in Exhibit 12 for which both UP and NS operated as a bridge between the originating segment and the terminating segment.[107] Further detailed analyses were not undertaken given the small volume of traffic involved.

[106] Some of the corridors in Exhibit 12 may be flagged because competitive options were underrepresented in the combined waybill data rather than because they reflect real horizontal competitive concerns. Four of the flagged corridors originate at Kansas City, and a fifth one terminates at St Louis. Both are served by CPKC (in addition to BNSF, UP, NS), and St Louis is also served by CSX and CN. Movements by CPKC, CSX, and CN are underrepresented in the data (see Section 4.2).

[107] *See* workpaper "In-Text Calculations.xlsx."

111. Concerns are less acute when shippers continue to have at least one railroad alternative to the Applicants after the proposed merger (as discussed in section 4.3 above). Nevertheless, I report results for the 3-to-2 analysis in Exhibit 13.

112. In Exhibit 13, there are 41 corridors and only {{ }} carloads identified as shifting from 3-to-2 competitors post-merger.[108] Exhibit 13 combines small corridors together. There are

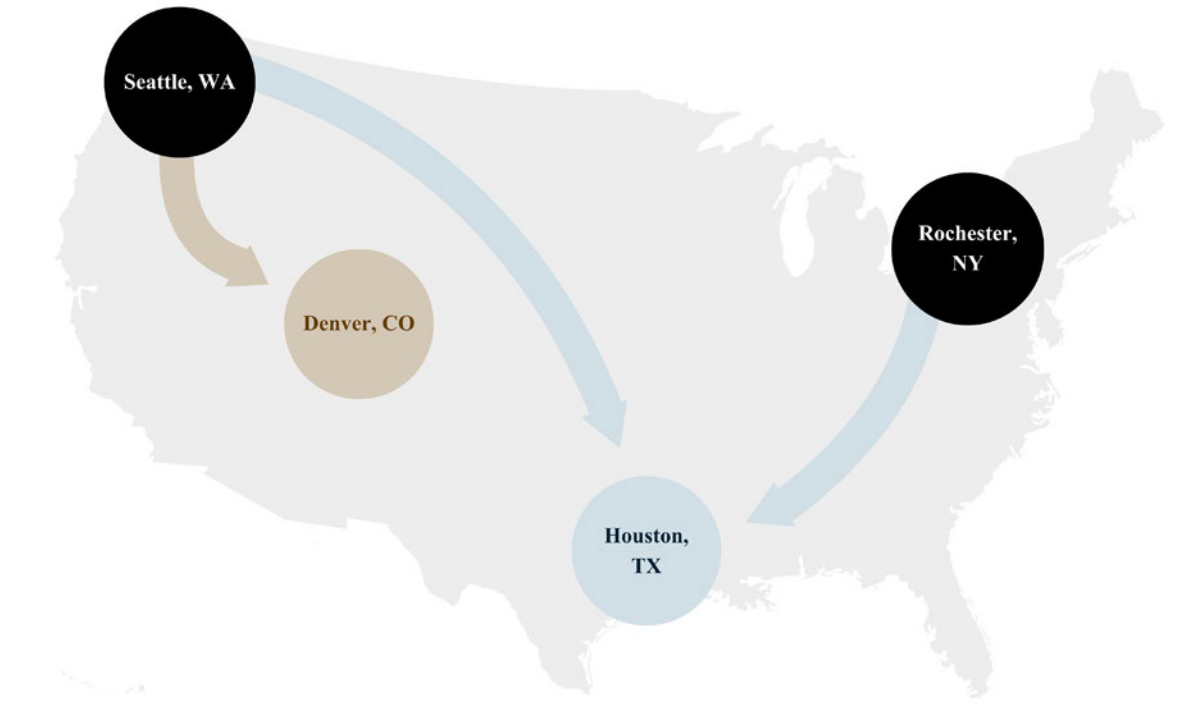
[108] Note that if routings of fewer than 10 carloads in a year are not omitted from the analysis shown in Exhibits 12 and 13 that the total number of 2-to-1 carloads decreases from {{ }} to {{ }} and the total number of 3-to-2 carloads increases from {{ }} to {{ }}. Therefore, omission of the fewer than 10 carload requirement does not affect the substance of my conclusions. *See* workpaper "In-Text Calculations.xlsx."

18 such corridors and their combined number of carloads is shown in Exhibit 13 as {{ }}. For the carloads identified in Exhibit 13, UP and NS are two of only three options (3-to-2) at either the start or end of the corridor. In addition, there are {{ }} 3-to-2 carloads not shown in Exhibit 13 for which both UP and NS operated as a bridge between the originating segment and the terminating segment.[109] Further detailed analyses were not undertaken given the small volume of traffic involved.

4.5 Analysis of Competition Between Corridors – Geographic Competition

4.5.1 Overview

113. Section 4.4 focuses on the role of competition in providing shippers more options for rail transportation from a specific origin to consignees at a specific destination ("within corridor competition"). This section considers the second way that rail competition could benefit shippers at an origin by connecting them to customers in different destinations, providing options to shift freight between corridors in response to price changes. For example, Exhibit 14 below shows a hypothetical shipper of lumber[110] located in Seattle, WA, that may currently ship lumber to Houston, TX. Another destination for lumber may be Denver, CO, which means that the Seattle, WA, shipper could ship its lumber to Denver, CO, if the price of shipping lumber to Houston, TX, were to hypothetically increase. The ability to shift



[109] *See* workpaper "In-Text Calculations.xlsx."

[110] The term "lumber" refers to the 4-digit STCC 2411 ("Primary Forest or Wood Raw Materials"). *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at p. 131.

freight creates destination competition between Houston, TX, and Denver, CO, as well as other locations where lumber is used or processed.

114. Similarly, competition could also benefit customers at a specific destination by connecting them to shippers at different origins. For example, as shown in Exhibit 14, a customer of lumber in Houston, TX, may currently buy from Seattle, WA. Another supplier for lumber could be near Rochester, NY. If the price of lumber from Seattle, WA, increases due to hypothetically higher shipping costs, the Houston, TX, customer could choose to purchase from Rochester, NY, instead. The ability to shift freight creates origin competition between Seattle, WA, and Rochester, NY, as well as other locations where lumber is harvested.

Exhibit 14: Illustrative Example of Origin and Destination Competition

115. Applying an initial screen to flag the potential harm to horizontal geographic competition at origins and destinations due to the proposed merger identifies approximately 140,000

carloads.[111] Further analysis would likely show that many of these initial flags do not raise competition concerns but, in any case, they are not a concern in aggregate after considering the expected benefits from the proposed merger. This total excludes roughly 71,000 carloads of automotive and intermodal commodities where harm is less likely than other commodities in light of statements by the STB about the importance of competition from trucking.[112]

4.5.2 Analysis and results

116. There is horizontal destination competition between UP and NS at an origin when they each originate traffic on routes that connect shippers at that origin to customers located at different destinations. There could also be horizontal destination competition between UP and NS if they both terminate traffic from the origin to customers at any destination.[113] To continue the example from the introduction above, there could be horizontal destination competition between two railroads to serve shippers of lumber in Seattle, WA if one delivered lumber from Seattle to customers in Denver, while the other delivered lumber from Seattle to customers in Houston. Horizontal origin competition between UP and NS at a destination is identified analogously.

117. The between corridor analysis is based on information in the combined waybill data on traffic volume. Information on traffic volume is important because it incorporates the role

[111] *See* Exhibits 16 and 17.

[112] *See* discussion in Section 4.4.

[113] There could also be horizontal competition if they both operate as a bridge between originating and terminating segments of routes to any destination.

The evaluation of prior railroad mergers has included analyses of the effect of a proposed merger on geographical competition between corridors. *See* Majure VS at ¶¶ 72-86. My approach differs in that I focus on horizontal geographic overlaps.

of geography. If only a few carloads of a commodity come from a specific BEA, that origin may be a less effective competitive constraint than a railroad that can originate shipments from a BEA that produces a large amount of the same commodity.

118. The analysis of the scope for potential harm from the loss of geographic competition uses BEAs to identify origins and destinations. Since demand by shippers and consignees for transportation of freight is specific to a commodity, the analysis is conducted by commodity using 4-digit commodity codes. For example, lumber is only shipped from and to certain areas of the United States, so only those origins and destinations are evaluated when assessing railroad competition for lumber. Some commodity codes cover many miscellaneous and potentially unrelated products. These are excluded from the analysis because the results would be uninformative.[114] Consider a final customer at a destination trying to source a specific commodity from different origins. Observing shipments of that commodity from one origin is evidence that there are shippers of the commodity there that the final customer can buy from. But observing shipments of an entirely different commodity from the origin, with different supply conditions, does not provide evidence about the availability of the first commodity.

119. Trucking and water are also included as transport alternatives, and accordingly the analysis uses tons shipped as the measure of volume so that shipments via truck and water are included. Because this analysis is based on traffic volume rather than the number of options,

[114] These commodity codes include 4611 Freight of all kind, 0119 Miscellaneous Field Crops, 0129 Miscellaneous Fresh Fruits or Tree Nuts, 2818 Miscellaneous Industrial Organic Chemicals, 1092 Miscellaneous Metal Ores, 4711 Small Packaged Freight Shipments among others. *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at pp. 117-161.

there is no need to specify a minimum traffic volume for truck. Instead, non-rail modes are treated in the same way an additional railroad on a corridor is treated, attributing non-rail volumes for that commodity on that corridor as an additional option. If non-rail volumes are small, then they are unlikely to affect the results.

120. A 50/10 screen is used to identify instances that require additional review as follows.[115]

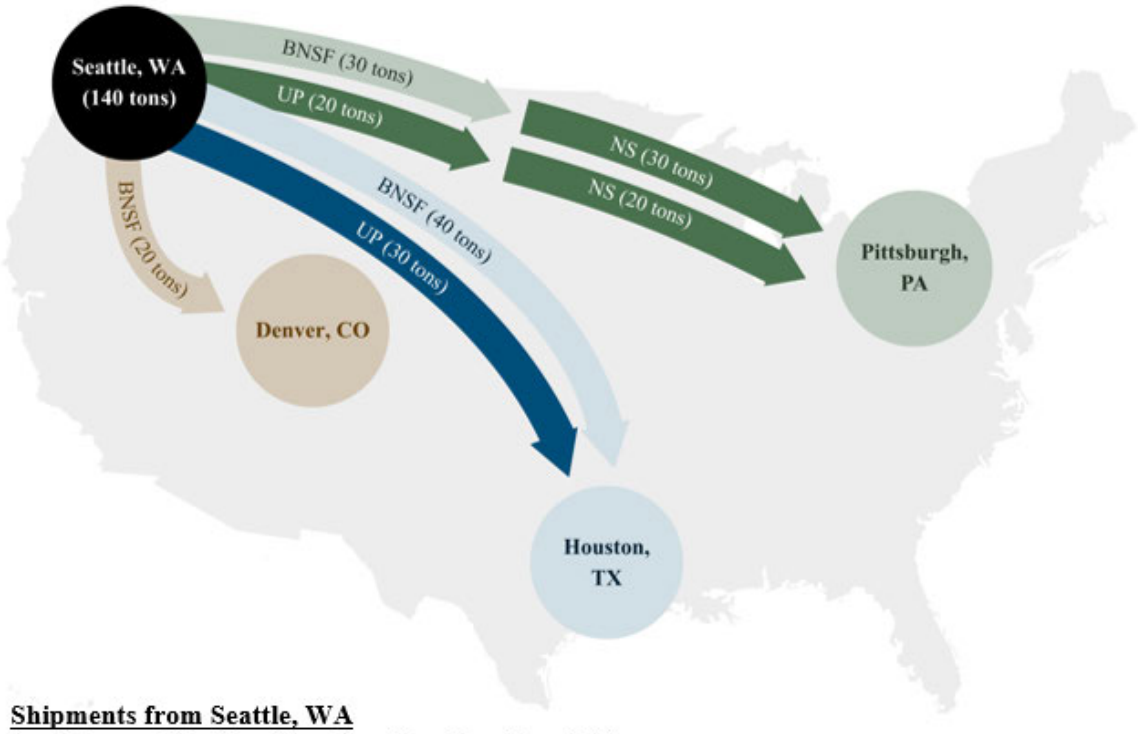
121. Destination **Focus:** For each destination-commodity pair, two screens are used.

    a. Measure the shares of all shipments of the individual commodity delivered to the individual destination from any origin that were originated by UP and NS. If UP and NS combined originated 50 percent of the traffic, and if they each originated at least 10 percent, the destination-commodity pair is flagged.

    b. Conduct the same exercise using the shares that UP and NS terminated instead. Specifically, the analysis measures the shares of all shipments of the individual commodity that were delivered to the individual destination from any origin and were terminated by UP and NS. If UP and NS combined terminated 50 percent of the traffic of the traffic, and if they each terminated at least 10 percent of the traffic, the destination-commodity pair is flagged.

122. **Origin Focus:** For each origin-commodity pair, two analogous screens are used.

    a. Measure the shares of all shipments of the individual commodity that originated at the individual origin, bound for any destination, that were originated by UP and NS. If UP and NS combined originated 50 percent of the traffic, and if they each



[115] The evaluation of prior railroad mergers also relied on the 50/10 screen. My approach differs in that it focuses on horizontal overlaps.

originated at least 10 percent of the traffic, the origin-commodity pair is flagged for further review.

b. Conduct the same exercise using the shares that UP and NS terminated instead. Specifically, the analysis measures the shares of all shipments of the individual commodity that originated at the individual origin and were terminated by UP and NS at any destination. If UP and NS combined terminated 50 percent of the traffic, and if they each terminated at least 10 percent of the traffic, the origin-commodity pair is flagged for further review.

123. A stylized example provided in Exhibit 15 shows how UP, NS, and combined shares for an origin-commodity pair are calculated for the two Origin Focus screens discussed above: (a) the origination screen and (b) the termination screen. In the example, 140 tons of lumber are shipped from Seattle, WA to three destinations – Denver, CO (20 tons), Houston, TX (70 tons), and Pittsburgh, PA (50 tons) – meaning there are three separate destination corridors. This means that a denominator of 140 tons is used for each of the screens (origination and termination) with only their numerators changing depending on the screen. As shown in Exhibit 15, there can be multiple routes within a corridor from an origin to a destination and each route can be served by more than one railroad (e.g., lumber can be transported from Seattle, WA to Pittsburgh, PA by two routes: BNSF-NS and UP-NS).

Exhibit 15: Illustrative Example of Origin Focus 50:10 Screens

Shipments from Seattle, WA
- 140 tons of lumber (30 + 20 + 40 + 30 + 20 = 140)

Origination Screen Shares:	**Termination Screen Shares:**

- NS originates 0 tons of lumber
  - 0 / 140 = 0% share
	- NS terminates 50 tons of lumber
	  - 30 + 20 = 50 tons
	  - 50 / 140 = 35.7% share

- UP originates 50 tons of lumber
  - 20 + 30 = 50 tons
  - 50 / 140 = 35.7% share
	- UP terminates 30 tons of lumber
	  - 30 / 140 = 21.4% share

- UP & NS originate 50 tons of lumber
  - 0 + 50 = 50 tons
  - 50 / 140 = 35.7% share
	- UP & NS terminate 80 tons of lumber
	  - 50 + 30 = 80 tons
	  - 80 / 140 = 57.1% share

A UP-NS combination does not trigger the origination screen
A UP-NS combination triggers the termination screen

124. The gray box in Exhibit 15 shows the tons for UP, NS, and the combined railroad when using the Origin Focus origination screen. The originating carriers in Seattle, WA are BNSF (30, 40, and 20 tons) and UP (20 and 30 tons). UP's and NS's origination volume are their aggregate lumber volume where they are the originating carrier from Seattle, WA. For UP,

this would be the sum of 30 tons (Houston, TX) and 20 tons (Pittsburgh, PA), and for NS, this would be zero since NS does not originate any tons from Seattle – NS carries 50 tons to Pittsburgh, PA, but UP and BNSF are assigned those origination tons since they are the originating carriers for that destination. In this example, UP's share is 35.7 percent (50/140), NS's share is 0 percent (0/140), and their combined share is 35.7 percent (50/140). Here, the combined share is less than 50 percent and the lower of the two shares is less than 10 percent (NS's share is 0 percent), so it does not trigger the 50/10 origination screen.

125. Similarly, the blue box in Exhibit 15 shows the Origin Focus termination screen calculations based on the railroads that are the terminating carrier at the destinations from the Seattle, WA lumber origin. For example, the terminating carriers in Houston, TX are BNSF (40 tons) and UP (30 tons). UP's terminating volume across all the destinations is 30 tons (Houston, TX) and NS's terminating volume is 50 tons (Pittsburgh, PA). As a result, UP's termination share is 21.4 percent (30/140), NS's termination share is 35.7 percent (50/140), and the combined railroad's termination share is 57.1 percent (80/140). The combined share is greater than 50 percent and both UP and NS have shares greater than 10 percent, so the 50/10 termination screen would be triggered for this origin-commodity pair.

126. Summarized below are the origin-commodity pairs and destination-commodity pairs flagged by the 50/10 screen for the year 2023. As discussed above, some routings may not be observed in each year. Therefore, I use data for other years to check where these flagged origin-commodity pairs or destination-commodity pairs would pass the 50/10 screen in other years. If they pass the screen in another year, they are not included in Exhibit 16 and Exhibit 17.

127. Exhibit 16 shows the origin-commodity pairs that are flagged by the 50/10 screens. The table includes the origin, the commodity shipped, the carloads shipped, and the originating and terminating shares for UP and NS. The highlighting indicates whether the screen is triggered by originating shares or terminating shares, or both. For example, UP and NS have combined shares of more than 50 percent at both the originating end and terminating ends of corridors carrying tires and inner tubes from Memphis.

128. The table includes two parts. Part II includes commodities typically carried in intermodal containers as well as motor vehicles and motor vehicle parts, while Part I includes all other commodities. Within each part of the table, records are ordered from highest to lowest carloads shipped. The potential for concerns is greater for origins and destinations flagged in Part I, because the STB has indicated that for commodities included in Part II, there is "effective competition" in the transport of intermodal shipments, motor vehicles, and motor vehicle parts or accessories (as discussed in Section 4.4).

Notes: All 2023 traffic. Net tons are used for rail to non-rail comparisons. Data for 2019-2022, 2024 are used for prior year comparisons. Originating and terminating share must be 10 percent or greater for UP and NS and combined share must exceed 50 percent.
Sources: Combined Waybill Data; *See* workpaper "Exhibit 16, 17.xlsx."

131. Out of approximately 10,000 destination-commodity pairs involving UP or NS, there are 16 destination-commodity pairs served by the combined railroad that are flagged by the 50/10 screen – 13 are in Part I and 3 are in Part II.[117] Almost all of these are triggered by the originating screen and few by the terminating screen. The flagged destination-commodity pairs span a variety of BEAs and a variety of commodities.

132. Exhibit 17 does not take account of the possibility that UP and NS might compete to provide bridges between originating and terminating segments of competing routes. To gauge the possible scope of these concerns, results were screened for destinations where both UP and

[117] *See* workpaper "In-Text Calculations.xlsx."

NS operated as bridge segments of competing routes.[118] This flagged an additional 8,131 carloads in Part I and no carloads in Part II.[119]

133. Between them these horizontal geographical competition analyses flagged 140,413 carloads,[120] excluding 70,633 carloads[121] of automotive and intermodal commodities that both railroads and trucks compete to carry (which was discussed in Section 4.4). The scope for potential horizontal harm represented by the flagged carloads is small compared to the scope of the transaction's projected benefits.

5 CONCLUSION

134. I have analyzed the scope for benefits and the potential for adverse horizontal competitive effects from the proposed merger by looking at the carloads that could be affected by either type of effect.

135. There is substantial scope for benefits from combining the complementary networks of UP and NS. The proposed combined railroad would replace existing UP-NS interline services with single line service, including between points in the eastern and western U.S. that today

[118] This screen considered the traffic flows of specific commodities to that destination that UP and NS participated in regardless of whether they were originating, terminating, or acting as a bridge for that flow. A destination-commodity pair was flagged using this participation screen if (1) the combined railroad would participate in more than 50% of traffic of that commodity to that destination, (2) the share of the combined railroad would be at 10% more than the share of either UP or NS before the merger, (3) the destination-commodity pair was not already flagged with the originating or terminating screen, and (4) UP and NS both operated as a bridge between originating and terminating segments for that destination-commodity pair. Note that an analogous screen was also applied to origin-commodity pairs, but that screen did not yield any flagged carloads.

[119] *See* workpaper "In-Text Calculations.xlsx."

[120] *See* Exhibit 16 Part I and Exhibit 17 Part I: 140,413 carloads = 44,898 (Exhibit 16, Part I) + 87,384 (Exhibit 17, Part I) + 8,131 (UP and NS bridge segments).

[121] *See* Exhibit 16 Part II and Exhibit 17 Part II: 70,633 carloads = 59,679 (Exhibit 16, Part II) + 10,954 (Exhibit 17, Part II).

can be served only by interline service. The proposed combined railroad would also have stronger incentives to make operating improvements, offer more competitive terms, and ensure reliable delivery on these services than UP and NS have today. The proposed merger's benefits could reach not only existing interline traffic (913,000 carloads in 2023), but also traffic attracted to the new interline services from truck and other rail operators (estimated at 1,864,000 carloads), for a combined 2.8 million carloads.

136. The limited geographic overlap of the two networks means there is little scope for adverse horizontal competitive effects. There is only one BEA where the number of railroads that serve the area would fall from 3-to-2, which accounted for only 6,000 carloads in 2023, and none where it would fall from 2-to-1. Traffic that is flagged by 3-to-2 and 2-to-1 BEA-to-BEA corridor screens totals {{ }} carloads. My analysis of geographic competition between origins or between destinations flags a further 140,000 carloads, for a combined {{ }} carloads.

137. Based on this analysis, I find that the substantial competitive benefits and greater economic efficiency that are expected to result from the transaction outweigh the limited potential horizontal anticompetitive effects.

6 CERTAIN ANALYSES REQUIRED BY STB REGULATION 49 CFR § 1180.7 (B)

138. In addition to the analyses described above, Appendices D, E, and F provide certain data and analyses detailed in STB's regulations 49 CFR § 1180.7(b)(2), (3), and (4), respectively. These responses are based on the same data and many of the same analytical steps as the analysis of the scope for potential harm from the loss of horizontal competition. In particular,

the responses to 49 CFR § 1180.7(b)(2), (3), and (4) are related to the analysis in Sections 4.3, 4.4, and 4.5 respectively.

139. The main difference between the analysis of the scope for harm to horizontal competition on the one hand, and the responses to 49 CFR § 1180.7(b)(2), (3), and (4) on the other, is that the STB limits the scope of its requests to "major" groupings in three ways: by major points, major commodities, and major corridors. For the purpose of the Appendices, "major" is interpreted as a practical measure to focus the information reported to the STB to the set of points, corridors, and commodities that account for most, but not all, traffic volume. Importantly, the way "major" groupings are identified does not affect the analysis of the effects of the proposed merger on competition, since those analyses are not limited to "major" categories.

140. In general, the approach to identifying "major" points, corridors, and commodities is, for each type of group, to first rank them from highest to lowest based on UP and NS traffic and then limit the results reported in Appendices D, E, and F to those for the points, corridors, or commodities that account for at least 80 percent of such traffic by volume.

141. See Appendices D, E, and F for details about the data and analyses to address STB's regulations 49 CFR § 1180.7(b)(2), (3), and (4).

I declare under penalty of perjury that the foregoing is true and correct.

Elizabeth M. Bailey

Vice President

PhD, Economics
Massachusetts Institute of Technology

BA, Economics and Mathematics,
Colgate University

Dr. Elizabeth Bailey is a vice president at Charles River Associates with over 20 years of experience in antitrust and competition matters. She is an expert on antitrust, competition policy, and intellectual property issues across a wide variety of industries.

She has advised clients on M&A proceedings before antitrust regulators in the US, Canada, and Europe. Her extensive industry expertise includes retail, packaged consumer goods, healthcare and medical devices, information and data technology, oil and gas, wholesale and retail electricity, among many others.

Dr. Bailey is recognized as a Global Elite Thought Leader by Who's Who Legal, described as "a market leader who 'can gain the trust of c-suite and board-level clients'," an economist that can 'get deals over the line,'" and an "economist who sits among the best in the market." She is "'an absolute go-to for retail mergers' thanks to her 'efficient econometric analysis and strong client-oriented approach.'"

Outside of her consulting practice, Dr. Bailey has taught advanced corporate finance to executives at The Wharton School. She has also been a lecturer in the Finance Group at the Haas School of Business at the University of California, Berkeley, and was an award-winning teacher at the W.P. Carey School of Business at Arizona State University.

Dr. Bailey is frequently invited to speak about issues relating to antitrust and has published many articles on the topic. She was the Editorial Board Economics Vice Chair of the *Antitrust Law Journal* and has edited other ABA antitrust publications, including the *Antitrust Magazine*, and *The Antitrust Source*. She has also published articles in the *American Economic Review*, *The Journal of Industrial Organization*, *Managing IP*, and *The Electricity Journal*, among others.

Intellectual property

"Apportionment Treats the Symptom, Not the Disease." With G. Leonard and M. Lopez. *Law 360*, 2011.

"Making Sense of 'Apportionment' in Patent Damages." With G. Leonard and M. Lopez. *Columbia Science and Technology Law Review*, vol. 12, 2011.

"Three Cases Reshaping Patent Licensing Practice." With Alan Cox and Gregory K. Leonard. *Managing Intellectual Property*, 2010. A condensed version was reprinted in *Commercial Dispute Resolution*, 2010.

Selected Presentations

Antitrust

Panelist, New York State Bar Association, "Taking Aim at Vertical Mergers - A Twin or King-Sized Problem?" 2025 (Virtual).

Panelist, ABA Antitrust Section Spring Meetings, "Has Competition in the U.S. Been Declining," 2025 (Washington DC).

Panelist, GCR Law Leaders Global, "Mergers: Trend Towards Consolidation and Serial Acquisitions: When Are Many Acquisitions Too Many?," 2025 (Miami).

Panelist, ABA Antitrust Section Women's Roundtable, "One Year into the 'New' Merger Guidelines," 2025 (New York City).

Panelist, ABA Antitrust Section Fall Forum, "Are Merger Efficiencies Over-Promised and Under-Delivered," 2024 (Washington DC).

Panelist, GCR Women in Antitrust, "Expanding Merger Control Tools for Non-Traditional Deals and Non-Traditional Theories of Harm," 2024 (Washington DC).

Plenary Session Speaker, ABA Antitrust Section Masters Course, Philadephia, Pennsylvania, 2024.

Panelist, GCR Law Leaders Global, "Mergers: Evolution or Revolution in Evidentiary Trends," 2024 (Miami).

Panelist, Association of General Counsel, "Antitrust in the Biden Administration," Washington DC, 2023.

Speaker, ABA Antitrust Section Judicial Antitrust Law and Economics Institute for Federal Judges, "Antitrust and Intellectual Property," University of Chicago Law School, Chicago, Illinois, 2023.

Panelist, GCR Law Leaders Global, "Mergers: The structural presumption: A path to predicted outcomes or to nowhere at all?" 2023 (Miami).

Panelist, Fourth Annual George Washington University Competition Law Center and Crowell & Moring Antitrust and Tech Conference, "Lessons Learned from Agency Merger Challenges and Policy Developments," 2022 (Virtual Zoom).

Plenary Session Speaker, ABA Antitrust Section Masters Course, Philadephia, Pennsylvania, 2022.

Panelist, GCR Live: Global Merger Control 2022, "Back to the Future: Does There Remain a Role for Economics in Merger Review" 2022 (Brussels, Belgium).

Panelist, "Economic Storytelling with NPR's Planet Money," 2022 ABA Antitrust Law Spring Meetings, April 2022 (Washington DC).

Panelist, Global Antitrust Institute: George Mason Law Review 25th Annual Antitrust Symposium, "Proposals to Change the Antitrust Laws," 2022 (Virtual Zoom).

Panelist, GCR Law Leaders Global, "Mergers: Risk Allocation, Review Strategy and Deal Disputes," 2022 (Virtual Zoom/Miami).

Panelist, Third Annual George Washington University Competition Law Center and Crowell & Moring Antitrust and Tech Conference, "Ignited by Tech: The Next Wave of Merger Guidelines," 2021 (Virtual Zoom).

Panelist, GCR Live Women in Antitrust, "What Role Does Competition Policy Have in Achieving Sustainable Economic Development?," Washington DC and Virtual Zoom, 2021.

Panelist, "Expert Depositions: Just the Facts Ma'am," 2021 ABA Antitrust Law Section Mock Deposition Series, 2021.

Panelist, "Fundamentals—Economics," 2021 ABA Antitrust Law Spring Meetings, 2021.

Panelist, "Dissecting the FTC v. Peabody/Arch Coal Merger Challenge," ABA Antirust Law Section (Transportation & Energy Industries Committee), 2020.

Panelist, "Vertical, Conglomerate, National Champion and Killer Acquisitions: Has Merger Review Abandoned the Chicago School?" Canadian Bar Association Competition Law Fall Conference, 2019.

Panelist, "Antitrust Lawyer and Economist Best Practices," Women@CompetitionAmericas, 2019.

Speaker, "Mergers: Practical Considerations for In-house Counsel," Antitrust Texas – KNect365, 2019.

Speaker, The Women's Antitrust Forum, "Vertical Merger Enforcement Trends," 2019, Washington DC.

Speaker, ABA Brown Bag, "Engaging an Economist on a Merger: Fundamentals of Antitrust Economics Series" (Economics Committee), 2019.

Speaker/Defendant Expert, 2019 ABA Antitrust Law Spring Meetings, "Mock No-Poach Trial" (Trial Practice Committee), 2019, Washington DC.

Panelist, GCR Live Second Annual Women in Antitrust, "Non-Horizontal Mergers," Washington DC, 2018.

Faculty, ABA Antitrust Law Section Merger Practice Workshop in San Francisco, 2018.

Speaker, ABA Antitrust Section Judicial Antitrust Law and Economics Institute for Judges, "Antitrust and Intellectual Property," Boalt Law School at UC Berkeley, Berkeley, California, 2018.

Plenary Session Speaker, ABA Antitrust Section Masters Course, Cambridge, Maryland, 2018.

Speaker, 2018 ABA Antitrust Law Spring Meetings, “Antitrust/Intellectual Property: The Basics,” Washington DC, 2018.

Speaker, 2017 Antitrust Judicial Law & Economics Institute for Judges, “Law and Economics of Horizontal Restraints,” Chicago, 2017.

Speaker, 2017 Antitrust Judicial Law & Economics Institute for Judges, “Market Definition, Market Power, and Competitive Effects,” Chicago, 2017.

Faculty, ABA Antitrust Law Section Merger Practice Workshop in Washington DC, 2017.

Panelist, Eighth Annual Federal Trade Commission Microeconomic Conference, Washington DC, 2015.

Speaker, “The Big Swap: Financial Derivatives Agreements and Alleged Anticompetitive Conduct in US v. KeySpan,” 10th Annual Harvard Law Seminar: Current Developments in EU and US Antitrust Law. Cambridge, Massachusetts, 2011.

Speaker, "Predatory Pricing Conduct," Antitrust Law & Economics Institute for Judges sponsored by the American Bar Association Section of Antitrust Law and the George Mason Judicial Education Program, Arlington, Virginia, 2011.

Panelist, “The Proper Role of Economic Experts" Antitrust Law & Economics Institute for Judges sponsored by the American Bar Association Section of Antitrust Law and the George Mason Judicial Education Program, Arlington, Virginia, 2011.

Energy

Speaker, “California Greenhouse Gas Cap and Trade Program: The First Six Months,” Power Association of Northern California 2013 Annual Seminar. San Francisco, California, 2013.

Panelist, “Panel 2: Benefits of an Energy Data Center to Ratepayers and CA Energy Policy“ as part of the Energy Data Access Workshop (Rulemaking 08-12-009), California Public Utility Commission, San Francisco, California, 2013.

Speaker, “The Big Swap: Using Financial Derivatives to Create Anticompetitive Conduct,” 2011. Energy Institute at Haas Energy Camp 2012, Berkeley, California, 2012.

Speaker, “The Big Swap: Financial Derivatives and Alleged Anticompetitive Conduct.“ In “*U.S. v. KeySpan*, Current Developments in EU & US Antitrust Law,” Tenth Annual Harvard Law School Seminar, Cambridge, MA, 2011.

Intellectual property

Speaker, ABA Antitrust Section Judicial Antitrust Law and Economics Institute for Judges, “Antitrust and Intellectual Property,” Boalt Law School at UC Berkeley, Berkeley, California, 2018.

Speaker, 2018 ABA Antitrust Law Spring Meetings, “Antitrust/Intellectual Property: The Basics”, Washington DC, 2018.

Panelist, “Economic Damages Experts’ Panel,” Conference on Patent Damages (PatDam2) at the University of Texas School of Law. Austin, Texas, 2017.

Speaker, “Economic Lessons from the CAFC on Reasonable Royalty Damage Awards,” The Knowledge Group Congress Live Webcast Series on “Recent Developments in Patent Infringement Damage Awards,” 2010.

Moderator, “New Case Law of Patent Damages: Key Recent Federal Circuit Decisions,” Law Seminars International, 2010.

APPENDIX C
DATA

1 Overview of Data Used in Analyses

1. This appendix describes the data used in the analyses prepared for my statement and to address 49 CFR § 1180.7 (b) (2), (3), and (4) of the STB regulations. In addition to describing the data used, this appendix also provides an overview of how the data were prepared and combined for the analyses.

2 Combined Waybill Data

2. A combined data set of waybills was constructed from multiple sources. First, 100 percent traffic tapes for UP, NS, CN, and BNSF for the years of 2019 to 2024 were combined.[1] Next, these were supplemented with the data from the Confidential Waybill Sample ("CWS") provided by the STB for the years of 2019 to 2023.

2.1 Waybill data from 100 percent traffic tapes

3. Applicants provided 100 percent traffic tapes for UP and NS for 2019 to 2024. Subsequently, 100 percent traffic tapes for the year 2023 for CN and 2019 to 2025 for BNSF. I did not receive traffic tape data from CSX. CPKC traffic tape data for 2023 became available on November 19, 2025 and November 21, 2025 and were therefore not incorporated into these analyses.

[1] Note that data from CN is available for 2023 only.

4. These traffic tape data represent carload-level records (for UP, NS, and BNSF) or waybill-level records (for CN) with origins and destinations provided at the station (SPLC) level.[2] A crosswalk provided by Oliver Wyman maps these SPLCs to BEAs.[3]

2.2 Merging the 2023 and 2022-2024 UP and NS data

5. Two versions of the UP-NS waybills merge was shared with Oliver Wyman. The first version is restricted to 2023[4] and the second version covers 2022-2024.[5] In both versions, some light cleaning of the UP and NS datasets was performed before merging.[6]

6. After removing duplicates and cleaning the fields in both data sets, a cascading series of merges were implemented where the UP and NS records merged in one step are not considered for merging in subsequent steps. In total, 22 rounds of merging between the two datasets were implemented, starting with the strictest set of merge keys in step 1 and

[2] BNSF provides a station identifier (<STN_333>) which is then mapped onto SPLC.

[3] *See* "191-A-FSAC-SPLC-FIPS-BEA.xlsx." (hereafter, "Oliver Wyman FSAC-SPLC-FIPS-BEA Mapping Table").

[4] For the 2023 merge, the raw data files "UPRR_Waybills_2023_20250825.txt" and "2023 NS Waybills With Flags Final.csv." were used.

[5] For the 2022-2024 merge, the following raw data files were used: "UPRR_Waybills_2019_to_2024_20250825.txt," "2021 NS Waybills With Flags.csv," "2022 NS Waybills With Flags.csv," "2023 NS Waybills With Flags.csv," and "2024 NS Waybills With Flags.csv." The merge was limited to records from either UP or NS with a Waybill date in December 2021 or later.

[6] For UP data, duplicate records were removedusing <dup_wb_ind> indicator and remove double dashes and spaces in <mvmt_rte_text>. For NS, the route field (<full_route_information>) was parsed by delimiting every 4 or 5 alternating characters. Duplicate records in the NS data were removed using a series of filters provided by NS in the raw data. *See* Section 2.3.3 for more details.

gradually loosen the merge criteria with each subsequent step. Below are the keys used in each step:[7]

Table C.1: Cascading Merges – UP and NS Data

Step	Merge by the following fields that are in both the UP and NS data (Merge keys)
1	Equipment Initial, Equipment Number, Waybill Number, Waybill Date, BOL Number, Origin FSAC, Destination FSAC, STCC Number, Route, first character of AAR car type
2	Equipment Initial, Equipment Number, Waybill Number, Waybill Date, BOL Number, Origin FSAC, Destination FSAC, STCC Number, first character of AAR car type
3	Equipment Initial, Equipment Number, Waybill Number, Waybill Date, BOL Number, STCC Number, Route, first character of AAR car type
4	Equipment Initial, Equipment Number, Waybill Number, BOL Number, Origin FSAC, Destination FSAC, STCC Number, Route, +/- 7 day Waybill Date difference, first character of AAR car type
5	Equipment Initial, Equipment Number, Waybill Date, BOL Number, Origin FSAC, Destination FSAC, STCC Number, Route, first character of AAR car type
6	Equipment Initial, Equipment Number, Waybill Date, Waybill Number, Origin FSAC, Destination FSAC, STCC Number, Route, first character of AAR car type
7	Equipment Initial, Equipment Number, Waybill Number, Waybill Date, BOL Number, Origin FSAC, Destination FSAC, Route, first character of AAR car type
8	Equipment Initial, Equipment Number, Waybill Number, Waybill Date, BOL Number, first character of AAR car type
9	Equipment Initial, Equipment Number, Waybill Number, Waybill Date, first character of AAR car type
10	Equipment Initial, Equipment Number, Waybill Number, Waybill Date
11	Equipment Initial, Equipment Number, Waybill Number, BOL Number, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type

[7] After merging the UP and NS datasets, a <merge_type> field was created that identifies by which step a set of records is merged in. Neither the UP nor NS data is perfectly unique on the set of merge keys prior to merging. This results in some cases where a single UP record merges to multiple NS records, or vice versa. In a very small number of instances, multiple UP records may merge to multiple NS records. To flag all sets of records that involve a duplicate a decimal place was added to the <merge_type> using the following logic: ".1" for all one-to-one merges, ".2" for many NS records merging to one UP record, ".3" for one NS record merging to many UP records, ".4" for many NS records merging to many UP records.

12	Equipment Initial, Equipment Number, Origin FSAC, Destination FSAC, STCC Number, Route, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type
13	Equipment Initial, Equipment Number, Waybill Number, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type
14	Equipment Initial, Equipment Number, Origin FSAC, Destination FSAC, STCC Number, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type
15	Equipment Initial, Equipment Number, Route, STCC Number, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type
16	Equipment Initial, Equipment Number, BOL Number, STCC Number, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type
17	First three letters of Equipment Initial, Equipment Number, Waybill Number, Waybill Date, BOL Number, LE Code, first character of AAR car type
18	Equipment Initial, Equipment Number, BOL Number, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type
19	Equipment Initial, Equipment Number, Waybill Date, STCC Number, LE Code, first character of AAR car type
20	Equipment Initial, Equipment Number, Waybill Date, LE Code, first character of AAR car type
21	Equipment Initial, Equipment Number, +/- 7 day Waybill Date difference, LE Code, first character of AAR car type
22	Equipment Initial, Equipment Number, +/- 7 day Waybill Date difference, LE Code

7. Merges that occur after step 10 are assumed to be "fuzzy" matches and additional filters on these matched waybills are imposed. First, a flag whether the route is explicitly interlined between UP and NS. To do this, UP's route variable (<mvmt_rte_text>) from the matched record is parsed to identify the string for "NS."[8] For any matches that do not satisfy the first

[8] Also parsed is the <mvmt_rte_text> to get information about the direction of the route (i.e., NS to UP or UP to NS) as well as to identify "bridge" movements, where an intermediate carrier falls in between the two merging carriers.

requirement, the fly-out distance[9] between the UP and NS[10] system locations is calculated.[11] Records that are within a 50 mile distance between the UP and NS waybill pair are retained.

8. For intermodal shipments, records include for both the containers and for the intermodal cars on which the containers are transported. In the UP-NS waybills merged data, matches associated with intermodal cars are dropped and containers are kept.[12]

2.3 Waybill Data Processing

2.3.1 General Data Cleaning

9. Prior to combining the UP, NS, CN, BNSF and CWS data, several general data cleaning steps in each data source are applied.

10. First step is to remove observations associated with empty shipments or non-revenue shipments. Railroads transport empty railcars back to shippers. However, the vast majority of revenues are earned on movement of loaded railcars rather than empty cars. Analysis focuses on waybills for revenue movement of loaded cars only. Specifically, the focus is on

[9] The fly-out distance represents the shortest distance between two sets of geographic coordinates, calculated using the Haversine formula.

[10] The relevant system location fields in UP are retrieved by using "1-A-Raw_UPRR_AAR_Station_Master.txt." (hereafter, "Railinc Station Master"). The relevant system location fields in the NS data that needed to be adjusted are detailed in instructions provided by NS and Oliver Wyman. *See* "C-Traffic data processing_vS.pdf;" "OS Skinny Table.csv."

[11] For UP records, UP's originating/destination Circ 7 is used, and for NS, the NS on/off junction operating station is adjusted by using the NS-provided table ("2023 OS Skinny Table.csv" for the 2023 merge and "OS Skinny Table.csv" for the 2022-2024 merge) to identify on/off junction operating station locations. Station geo files provided by UP and NS ("2-A-Raw_UPRR_internal_location_master.xlsx" and "ABC NODES ROUTE TRAFFIC.xlsx") were used to look up the latitude/longitude values for the NS and UP locations. Using these pairs of coordinates two distances were computed: UP destination to NS origin and NS destination to UP origin. The assumption is that the shorter distance between the two is the correct routing and determines the direction of the record (i.e., NS to UP or UP to NS).

[12] Intermodal cars are records with an AAR equipment type (<aar_car_type>) value of P, Q, or S.

linehaul movements and linehaul revenues (e.g., excluding reciprocal switching moves when indicated in the data)[13]. Empty shipments are identified using any of the following criteria: a native loaded/empty indicator (if available), an STCC number that denotes empty shipments,[14] or a net weight of 0. Non-revenue shipments are identified using indicators provided in the native data, if available. Records for locomotives and caboose are also removed.[15] Finally, any remaining duplicate records, if applicable, are removed.

11. While the availability of certain data fields vary by data source, the fields in each data source were identified and standardized for key fields such as waybill number, waybill date, bill of lading number, origin and termination FSAC, origin and termination SPLC, route, equipment number/initial, STCC code, tonnage, number of units, system/shipment revenues, and Rule 11 shipment indicators. Table C.2 lists the relevant fields from each data source.

Table C.2: Select Key Fields from each Waybill Data Source

	UP	NS	CN	BNSF	CWS[16]
Waybill Number	wb_nbr	wb_nr	waybill_number	wb_numb	waybill_number
Waybill Date	wb_date	waybill_date	waybill_date	wb_dt	waybill_date

[13] While UP records explicitly identify when a movement is a reciprocal switch movement, traffic tapes for the other railroads are far less comprehensive in that regard.

[14] STCC numbers that typically denote empty shipments include values beginning with "42" (returned empty containers), "37421" (new railway cars), "37422" (used railway cars), "37424" (railway car parts and assemblies), and "3741" (railway cars and parts). See my workpapers.

[15] Locomotives are identifiied as records with an AAR equipment type starting with the value "D" and caboose as records with an AAR equipment type of "M930." *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at p. 162.

[16] The CWS data files do not include native field names. *See* workpapers for how the field names are assigned based on the number of positions and data descriptions in Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at p. 43.

	UP	NS	CN	BNSF	CWS[16]
Equipment Initial (or Leading Equipment initial)	eqmt_init/ lead_eqmt_init	equip_initial	equipment_ initial	eqp_init	car_initial (tofc_initial for intermodal shipments)

System Revenue	up_gross_rev_ amt	acctg_ns_prop_ tot_amt	system_ revenue_in_rate	bnsf_net_ revenue	N/A
Shipment Revenue	urrwin_totl_rev_ amt	acctg_tot_rev_ tot_amt	waybill_ revenue_rate	tot_revenue	freight_revenue
Rule 11 Indicator	rule_11_ind	rebill_code	rule_11_code	rule_11_flg	rebill_code
Originating Railroad	shmt_orig_scac	orig_rr	origin_carrier_ abbreviation	carr_abbr_orig	origin_rr_alpha
Terminating Railroad	shmt_dest_scac	term_rr	destination_ carrier_ abbreviation	carr_abbr_dest	termination_ rr_alpha

12. To standardize railroad names in the route variables across the various data sources, Class I subsidiary firm names are replaced with the names of their parent railroad.[17]

13. Traffic volume is measured in carload counts and tons shipped. Loaded carloads include either carload counts or counts of individual intermodal container units. While all sources report some measure of tons shipped, there are some discrepancies in how tons are recorded among different sources.[18] For a small number of observations, the net tons per car reported are higher than 157.5 tons, which is the legal gross weight limit for a rail car.[19] For these observations, net tons are set to 157.5 and these waybills are flagged as having censored tonnage.

2.3.2 Processing the 2019 to 2024 UP data

14. The UP data consists of carload-level traffic tape data for UP shipments covering 2019 through 2024.[20]

15. The UP data sometimes contains multiple observations for the same waybill and railcar. These duplicate records are identified and removed using the Duplicate Waybill Indicator (<dup_wb_ind>) native to the UP traffic data. Further identification and removal of empty

[17] In particular, the replacements are: "CPRS," "CPUS," "KCS," and "KCSM" are replaced with "CPKC;" "CNUS" and "IANR" with "CN;" and "ST" with "CSXT."

[18] For example, the BNSF data reports lading weights, while the CWS primarily reports billing weight. There are some differences between billed and actual lading weights, which can be more significant for certain commodities. *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at pp. 185, 190.

[19] *See,* for example, Union Pacific, "Allowable Gross Weight Shipments," available at https://www.up.com/aboutup/reference/maps/allowable_gross_weight/ (accessed December 13, 2025). The gross weight limit for heavy axle rail cars is 315,000 lbs, which is 157.5 tons.

[20] The following file from UP was used: "UPRR_Waybills_2019_to_2024_20250825.txt."

shipments, [21] non-revenue records [22] as well as shipments reflecting non-line haul movements, such as yard movements or short, local transfers is also performed.[23]

16. While the native route field includes switching and haulage segments, UP also provides a separate field identifying the role of each carrier participating on the route. This field is used to construct a clean route field that excludes switching and haulage segments. [24]

17. The UP data sometimes record a placeholder value ("0000000") in the STCC number (<stcc_nbr>), while the hazardous STCC number field (<hzrd_stcc_nbr>) contains a valid STCC code. To address this, a mapping from hazardous STCC codes to the corresponding standard STCC codes is constructed and used to replace these placeholder values accordingly.

18. To standardize weight, net weight (<net_wgt>) is converted from pounds to tons using the conversion factor of 2,000 pounds per ton.

[21] Shipments were identified as empty when the Load Empty Code was "E," the Revenue Empty Flag equaled "1", Net Weight was "0", or STCC number denotes empty shipments.

[22] Non-revenue records are identified as records where <rev_car_cnt> is not equal to 1.

[23] Non-line-haul freight movements within a local area are identified by <mvmt_type_code> values "A", "T", and "P." *See* "UPRR_Linehaul_Dtls_2023_DataDef_20250825.xlsx."

[24] Carriers associated with any of the following movement types were not considered as linehaul carriers and removed from the route: I-Origin Switch, V-Intermediate Switch, D-Delivery Switch, JO-Junction Settlement Origin, JD-Junction Settlement Destination, H-Haulage Rights, HC-Handling Carrier, and M-Haulage Movement. *See* "UPRR_Linehaul_Dtls_2023_DataDef_20250825.xlsx."

2.3.3 Processing the 2019 to 2024 NS data

19. The NS data consists of carload-level traffic tape data for NS shipments covering 2019 through 2024.[25]

20. The NS traffic data often contains multiple observations for the same railcar and waybill. These duplicate records exist for a variety of reasons and represent entries such as "child" records[26] reflecting partial route information, temporary waybills, and reciprocal switch records, among others. Duplicate records are identified following instructions provided by NS and Oliver Wyman.[27] In the process, empty shipments and non-revenue shipments are also identified.[28]

21. A clean route was created by using the native route variable (<full_route_information>) and standardizing its format to better align with the data from other railroads. Additional variables were created, specifically <reporting_rr_on_junc_fixed> and

[25] The following files from NS were used: "2019 NS Waybills With Flags.csv," "2020 NS Waybills With Flags.csv," "2021 NS Waybills With Flags.csv," "2022 NS Waybills With Flags.csv," "2023 NS Waybills With Flags.csv," "2024 NS Waybills With Flags.csv."

[26] For example, a single interline shipment can appear in the data under multiple "child" records representing separate revenue waybills used for billing purposes, while the "parent" record for that waybill reflects the full route.

[27] A cascading filtering procedure was performed to identify duplicates in the NS raw data. This filtering procedure was implemented so that the result of filtering procedure step 1 is the input for filtering procedure step 2 and so on. *See* "C-Traffic data processing_vS.pdf;" "165-B-Data Dictionary - Duplicate Waybill Flags V2 9-25-25.docx." *See also,* "180-A-NS Waybills Data Dictionary.xlsx."

[28] Shipment records were identified as empty if one or more of the following holds: the variable <load_empty> equals "E", the variable <net_tons> is equal to 0, or the STCC number starts with "42", "37421", "37422", "37424", or "3741." Shipment records were identified as non-revenue if the variable <rev_non_rev_ind> is not "REVENUE" and <acctg_ns_prop_all_amt> is equal to 0.

<reporting_rr_off_junct_fixed>, which are intended to adjust the raw codes for on and off junctions where NS receives and delivers a shipment.[29]

22. While the raw NS data includes the non-hazardous STCC to indicate the commodity the shipment was classified into (<stcc_wo_hazmat_codes>), this field was sometimes populated with the hazardous STCC code instead (i.e., there were <stcc_wo_hazmat_codes> that begin with "49", a prefix specific to hazardous STCC). A crosswalk between hazardous and non-hazardous STCC codes was constructed as described above to create a new variable (<stcc_wo_hazmat_codes_fixed>) that corrects the native field.[30] For any waybills that still had an unassigned non-hazardous STCC after this step, the CWS data was searched for that waybill and CWS's STCC code was used, if available.[31]

23. From the NS data the following types of records were eliminated: duplicated, intra/inter-terminal switch, empty waybill records, and non-revenue records without any revenue

[29] These adjustment follow instructions provided by NS and Oliver Wyman. *See* "C-Traffic data processing_vS.pdf"; "OS Skinny Table.csv."

[30] To create the crosswalk, the CWS and UP data were used to create pairings of hazardous STCC codes and non-hazardous STCC codes, restricted to those where one or more hazardous STCC codes maps to one non-hazardous STCC code, Hazardous STCC codes are more granular than non-hazardous STCC codes. That is, for a given commodity, there are different ways to classify how that commodity is hazardous. For example, shipments with non-hazardous STCC code 1021210 (Copper Concentrates (RQ-5000/2270)) were classified with hazard STCC code 4966106 (Other Regulated Substances, Solid, N.O.S. Class 9 NA3077)), or hazard STCC codes 4966326 and 4966334 (Environmentally Hazardous Substance, Solid, N.O.S. Class 9 U). *See* my workpapers. Therefore, multiple hazardous STCCs can map to one non-hazardous STCC. However, it is not possible for multiple non-hazardous STCCs to map to one hazardous STCC.

[31] CWS records were matched onto NS observations with <stcc_wo_hazmat_codes_fixed> that starts with "49", using waybill number <wb_nr>, waybill date <wb_date>, and the unassigned non-hazardous STCC code from NS <stcc_wo_hazmat_codes_fixed> to match to CWS' waybill number <waybill_number>, waybill date <waybill_date> and hazardous STCC codes <commodity_stcc>. Then, for those that matches to an observation in the CWS sample, a replacement was made for the <stcc_wo_hazmat_codes_fixed> with the non-hazardous <stcc_no_haz> from the CWS sample.

recorded.[32] The data are further restricted by eliminating records whose routes encompass those of the other records for the same railcar and waybill.[33]

24. Last, a check for observations in the same waybill that have different routes, FSACs, or origin/termination railroadis performed.[34] For these, reconciliation is performed within each waybill.[35]

2.3.4 Processing the 2023 CN data

25. The CN data consists of traffic tape data for CN shipments for the year 2023.[36] Unlike the UP, NS, and BNSF traffic data, which are available at the carload-level, CN's data is aggregated at a waybill level, and lead-car equipment information is provided.

26. The CN data sometimes contain duplicate records for the same waybill. To avoid double-counting, these duplicates are removed from the data.[37] While the CN data does not provide a native field indicating empty shipments, empty shipments are identified and removed if

[32] Some of the duplicate observations are flagged for exclusion contain information on revenue and tonnage that complement the observations that were not flagged for exclusion. To ensure that the observations kept have all the relevant information about the shipment, the effort was made to retain the maximum value of the revenue fields (<acctg_tot_rev_all_amt>, <acctg_ns_prop_all_amt>,) and net tons (<net_tons>) for the same waybill number, waybill date, and equipment identifiers prior to removing duplicates.

[33] For records with duplicated <waybill_date>, <wb_nr>, <equip_initial>, and <equip_nr>, the rule is to the records if it is the one with the longest route, or if all the routes are the same, only one record out of the group is kept.

[34] Records in the same waybill are those with common waybill number <wb_nr>, waybill date <waybill_date>, non-hazardous STCC code <stcc_wo_hazmat_codes_fixed>, origin SPLC <osplc>, destination SPLC <dsplc>, and bill of lading number <bill_of_lading>.

[35] *See* workpapers.

[36] The following files from CN traffic tapes were used: "WB Exc Canada Domestic 2023 Q1.xlsx," "WB Exc Canada Domestic 2023 Q2.xlsx," "WB Exc Canada Domestic 2023 Q3.xlsx," "WB Exc Canada Domestic 2023 Q4.xlsx."

[37] Duplicates records were identified when the multi records associated with one single unique waybill number <waybill_number>, waybill date <waybill_date>, equipment number <equipment_number> and equipment initial <equipment_initial>.

the record contains zero "actual tons" is reported or where the STCC value denotes empty shipments.

27. CN's native route field (<waybill_route_text>) appears to include delivery switches, which is identified by searching for routes that end with "-DELY." A clean route variable is then constructed that removes the segment in the route associated with these delivery switches.[38]

2.3.5 Processing the 2019 to 2024 BNSF data

28. The BNSF data consists of carload-level traffic tape data for BNSF shipments covering 2019 through 2024.[39]

29. The BNSF data contains some duplicated records for the same waybill and railcar. To avoid double-counting, these duplicates are removed from the data.[40] In addition, empty shipments are also removed.[41]

30. BNSF did not provide a native route field or complete information allowing me to identify all segments and carriers involved in the shipment. However, BNSF did provide information such as the railroad carrier that originated the shipment, the carrier that BNSF interchanged with or connected to, as well as information on the origin and termination stations and the

[38] For example, the <waybill_route_text> entry "CN – CHGO – NS – STLOU – UP – DELY" was changed to "CN – CHGO – NS" in the new variable <waybill_route_text_updated>.

[39] The following files from BNSF traffic tapes were used: "BNSF_2019_TrafficTapes_11122025.txt," "BNSF_2020_TrafficTapes_11122025.txt," "BNSF_2021_TrafficTapes_11122025.txt," "BNSF_2022_TrafficTapes_11122025.txt," "BNSF_2023_TrafficTapes_09242025_Highly Confidential.txt," "BNSF_2024_TrafficTapes_11122025.txt." In addition, BNSF provided a data dictionary. *See* "BNSF Traffic Tape Field Decoder.xlsx."

[40] The duplicates were identified when multiple records shared the same unique waybill number <wb_numb>, waybill date <wb_dt>, equipment number <eqp_numb>, and equipment initial <eqp_init>.

[41] Empty shipments are shipments where <ld_mty_ind> is "E", with zero total lading weight (i.e., <cst_car_ladg_ton>), or STCC number (i.e., < cmdty_stcc>) denotes empty shipments.

interchange locations. Using this information, a route variable is constructed for use in my analysis.[42] For waybills with inconsistent route information across all railcars in the same waybill, the route across all railcars for that waybill is standardized.[43] Since BNSF does not provide SPLCs for the origin station or destination station, the origin/destination SPLCs were determined by using the initials of the originating/destination railroad carrier, the Official 333 spelling for the origin/destination station, and the state code associated with that station. Using this information, Railinc Station Master Data and the Oliver Wyman FSAC-SPLC-FIPS-BEA Mapping Table were used to complete mapping BNSF records to SPLCs and BEAs for origins and destinations.[44]

2.3.6 Processing the 2019 to 2023 STB CWS data

31. The CWS is a stratified sample of U.S. rail traffic waybills, containing detailed information on origin, destination, commodity, tonnage, and revenue, among others, for each waybill.[45,]

---

[42] The following variables are relied upon to construct BNSF route (i.e., <route>) from the limited information provided by BNSF: initials of the railroad carrier originating the shipment <carr_abbr_orig>, railroad carrier that BNSF interchanges with to receive the car <carr_abbr_on>, abbreviation of the railroad carrier that BNSF connects with to make deliveries <offjct_road>, initials of the common carrier taking the shipment to its destination <carr_abbr_dest>, official 333 spelling for the origin station <ofcl_333_orig>, 333 spelling of the city where BNSF receives a shipment from a foreign carrier <icr_city_333>, 333 spelling of the city where BNSF delivers a shipment to a foreign carrier <icd_city_333>, and official 333 spelling of the destination <ofcl_dest_333>. *See* workpapers. In addition, I created a parent route variable by replacing subsidiaries of Class I railroads in the route with their parent railroad names.

[43] For records sharing the same <wb_numb>, <wb_dt>, <origin_splc>, <destination_splc>, and <cmdty_stcc>, a standardized route variables are created (i.e., <route> and <route_parent_abbr>) by selecting the longest route and, if there were ties, choosing the one most frequently reported. Then I aligned <origin_rr_alpha> and <termination_rr_alpha> to match the first and last points in the chosen <route>.

[44] *See* workpapers. *See also*, Railinc Station Master; Oliver Wyman FSAC-SPLC-FIPS-BEA Mapping Table.

[45] *See* CSX, "Railroad dictionary," available at https://www.csx.com/index.cfm/about-us/company-overview/railroad-dictionary/?i=W (accessed November 24, 2025); Linda Glauber, "Use the Waybill Sample Data to Grow Your Business," RSI Logistics, April 11, 2023, available https://www.rsilogistics.com/blog/use-the-waybill-sample-data-to-grow-your-business/ (accessed November 24, 2025).

[46] Each record in the CWS represents a separate waybill and the sample is designed to be representative of the universe of rail freight waybills terminated by the reporting railroads.[47] Each railroad provides less than 10 percent of its waybills for the year sampled at specific prices, e.g., one out of forty similar waybills as instructed by the STB. While the CWS contains less than 10 percent of waybills for the year, it also includes expansion factors provided by the STB to scale up the CWS so that the data are representative of the U.S. population of waybills.[48] While the CWS data excludes non-revenue records, it does include empty shipments. Empty shipment waybills are removed from the data set used for analyses.[49]

32. The variable for route <route> was created by concatenating several variables based on Accounting Rule 260 information in CWS records. These include the alpha abbreviation for the origin railroad <origin_rr_alpha_fixed>, the alpha abbreviations for up to six bridge railroads (<first_interchange_rr_alpha_fixed> through <sixth_interchange_rr_alpha_fixed>), the alpha abbreviation for the termination railroad (<termination_rr_alpha_fixed>), and the Rule 260 alpha codes for the interchange stations

[46] The CWS does not sample waybills from small railroads. CWS is a stratified sample of carload waybills for all U.S. rail traffic submitted by those rail carriers terminating 4,500 or more revenue carloads annually. *See* Surface Transportation Board, "Carload Waybill Sample," available at https://www.stb.gov/reports-data/waybill/ (accessed November 24, 2025).

[47] *See* Surface Transportation Board, "Carload Waybill Sample," available at https://www.stb.gov/reports-data/waybill/ (accessed November 24, 2025).

[48] The STB provides two types of expansion factors – a theoretical expansion factor and an exact expansion factor, but only the theoretical one is available for all observations, so that is what I use.

[49] Shipments were removed in cases where the loaded or empty status is empty identified as waybills with zero total billed weight, i.e., <billed_weight> = 0, or STCC numbers <stcc_no_haz> denoting empty shipments.

where traffic was transferred to either the terminating carrier or a bridge railroad (<interchange_1_rule260> through <interchange_7_rule260>).[50]

33. The STCC code for records across different segments of the same shipment were standardized and the lead equipment information was replaced with the lead trailer or container information for intermodal shipments.[51] Second, duplicate waybills are removed.[52] Next, waybills for different segments of the same shipment[53] are combined into a single record. The routes are concatenated in sequence based on either the origin/destination SPLCs or the rebill codes[54], and the revenue is summed.

[50] The fields <origin_rr_alpha_fixed>, <first_interchange_rr_alpha_fixed> through <sixth_interchange_rr_alpha_fixed>, and <termination_rr_alpha_fixed> are decoded by using <origin_railroad>, <first_bridge_rr> through <sixth_bridge_rr>, and <termination_rr> based on the guidelines on the CWS. *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf.

[51] See workpapers.

[52] Records are considered duplicates if they match on waybill date, lead equipment/container initial and number, STCC code, and rebill code. If reported by the same railroad, sorting of the records in descending order of accounting period and unique serial number is performed and the first record is kept. If reported by different railroads and their origin/destination SPLCs do not indicate a sequential order, the rule is then to keep the record with the more complete route whenever it exists; otherwise, sort the records in descending order of accounting period and unique serial number, and keep the first record.

[53] Records are considered segments of the same shipment if they match on waybill date, lead equipment/container initial and number, and STCC code, but have different waybill numbers. Most cases involve Rule 11 pricing, resulting in multiple waybills. To harmonize these differences, a single waybill number is assigned to all records in the group, prioritizing the number from UP, NS, BNSF, then CN, in that order. If none of the records are reported by these railroads, the group is sorted by accounting period and unique serial number in descending order and use the waybill number from the first record. See workpapers.

[54] "The Rebill Code indicates where in the overall movement of the shipment the reporting railroad participated." *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at p. 110. Specifically, a value of 1 indicates an "originated-delivered Rule 11 shipment," 2 indicates a "received-delivered Rule 11 shipment," and 3 indicates a "received-terminated Rule 11 shipment."

2.4 Consolidating the Traffic Tape Waybill Data and the CWS Data

2.4.1 Merging the UP and NS waybill data

34. After processing the UP and NS data using the steps outlined above, the UP and NS railcar level data are combined to identify waybills that interlined between UP and NS. This merge is performed on data for 2019-2024.

35. Implementation involved a cascading series of merges where the records merged in one step are not considered for merging in subsequent steps. The NS data is merged to the UP data by the fields outlined in Table C.1. Records from each railroad that matched were combined as a single, joint record. Any NS observations that remained unmatched were then stacked on to the UP data as additional observations.

2.4.2 Merging BNSF data to the UP/NS waybill data

36. After combining the UP and NS data using the steps outlined above, the data were further merged with the BNSF data to identify waybills that interlined between BNSF and UP or NS. This merge was performed for 2019-2024.

37. Implementation was via a cascading series of merges where the records merged in one step are not considered for merging in subsequent steps. The BNSF data is merged onto the combined UP/NS data by the UP fields, if available, and the NS fields, if available. Records from BNSF that matched to the UP/NS data were consolidated into a single, joint record. Any BNSF observations that remained unmatched were then stacked on to the data as

additional observations. The variables used to merge on the combined UP/NS data at each step are identified in the table below.[55]

Table C.3: Cascading Merges – BNSF and UP/NS

Step	Equipment Number/Initial	Waybill Number	Waybill Date	Origin SPLC	Destination SPLC	STCC 4-digit	Bill of Lading
1	Y	Y	Exact	N	N	Y	N
2	Y	Y	Exact	Y	Y	N	N
3	Y	N	Exact	N	N	Y	Y
4	Y	N	Exact	N	N	N	Y
5	Y	Y	+/- 7 Days	Y	N	Y	N
6	Y	Y	+/- 7 Days	N	Y	Y	N
7	Y	Y	+/- 7 Days	N	N	Y	N
8	Y	N	+/- 7 Days	N	N	Y	Y

[55] *See* Appendix C ¶¶ 55–58 for a discussion on adjustments to SPLC.

2.4.3 Merging CN data to the UP/NS/BNSF waybill data

39. After combining the UP, NS, and BNSF data using the steps outlined above, the data were further merged with the CN data to identify waybills that are interlined between CN and UP, NS, or BNSF. This merge was performed for data for 2023 only since this is the only year with available CN data.

40. Implementation involved a cascading series of merges where the records merged in one step are not considered for merging in subsequent steps. The CN data were merged to the combined UP/NS/BNSF data by the UP fields, if available, the NS fields, if available, and the BNSF fields, if available. Any CN waybills that remained unmatched were then stacked on to the data as additional observations.[56]

41. Unlike the combined UP, NS, and BNSF data, CN's traffic data was not provided at the waybill/car level, but rather at the waybill and lead equipment unit level.

[56] *See* Appendix C ¶¶ 55–58 for a discussion on adjustments to SPLCs.

Table C.4: Cascading Merges - CN and UP/NS/BNSF[57]

Step	Lead Equipment Number/Initial	Waybill Number	Waybill Date	Origin SPLC	Destination SPLC	STCC 4-digit	Bill of Lading
1	Y	Y	Exact	N	N	Y	n/a
2	Y	Y	Exact	Y	Y	N	n/a
3	Y	Y	+/- 7 Days	Y	N	Y	n/a
4	Y	Y	+/- 7 Days	N	Y	Y	n/a
5	Y	Y	+/- 7 Days	N	N	Y	n/a

2.4.4 Merging CWS to the UP/NS/BNSF/CN waybill data

42. The combined UP/NS/BNSF/CN waybill data were further supplemented with the CWS to get waybill data for other Class I railroads such as CSX or CPKC and Class II and Class III railroads. The CWS data also allows to supplement the revenue information for waybills.

43. Implementation involved a cascading series of merges where the records merged in one step are not considered for merging in subsequent steps. The CWS data were merged with the combined UP/NS/BNSF/CN data by the UP, NS, BNSF, and CN fields, where available. Any CWS waybills that remained unmatched were then stacked on to the data as additional observations.[58]

[57] The CN data does not contain a field with the bill of lading. Therefore, bill of lading was dropped as a merge criterion.

[58] *See* Appendix C ¶¶ 55–58 for a discussion on adjustments to SPLCs.

Table C.5: Cascading Merges - CWS and UP/NS/BNSF/CN[59]

Step	Lead Equipment Number/Initial	Waybill Number	Waybill Date	Origin SPLC	Destination SPLC	STCC 4-digit	Bill of Lading
1	Y	Y	Exact	N	N	Y	n/a
2	Y	Y	Exact	Y	Y	N	n/a
3	Y	Y	+/- 7 Days	Y	N	Y	n/a
4	Y	Y	+/- 7 Days	N	Y	Y	n/a
5	Y	Y	+/- 7 Days	N	N	Y	n/a

2.5 Preparing the Combined Waybill Data for Analysis

44. For the analysis, the combined waybill data[60] was aggregated to a shipment level by summing up the revenue, car count, and net tons for each waybill number, waybill date, origin SPLC, ending SPLC, and 7-digit STCC code. For shipments for which the waybill numbers, waybill dates, or STCC codes differed across data sources, the values for the first source available were kept in the following order: UP, NS, BNSF, CN, CWS. When determining the route and origin/destination SPLCs for the shipment, priority was assigned

[59] The CWS data does not contain bill of lading. Therefore, bill of lading was dropped as a merge criterion.

[60] The UP, NS, and BNSF data were provided at the car level, which can be aggregated to a waybill level, but the CN and CWS data were provided at the waybill level.

to take the information reported by CN and CWS over the BNSF's information, when available, given that BNSF's route is incomplete, as explained above.[61]

45. Given the sampling nature of the CWS, tonnage, carloads, and revenues for shipments coming exclusively from the CWS data were expanded using the corresponding theoretical expansion factor provided in the CWS.

2.5.1 Identifying related shipments that were not classified as Rule 11 in the traffic data

46. Certain waybills matched across two or more data sources seem to represent different legs of the same shipment but were not identified as Rule 11 by any of the railroads. In these instances, assessing whether the destination SPLCs reported in one railroad's data corresponded to the origin SPLCs in another railroad's data allows a match.[62] If this was found to be the case, the origin SPLCs and ending SPLCs were adjusted to reflect the true origin and destination and updated the route to reflect the various legs.

2.5.2 Calculating railroad revenue for each waybill

47. Section 4 of the statement discusses challenges with revenues data for waybills due to the sampling process of the CWS and the limited information in Rule 11 shipments. Here, further details on the steps undertaken to calculate revenue for each shipment are provided.

---

[61] In the CWS data, the route information reported for Rule 11 records typically reflects only one leg of the shipment. Therefore, BNSF's information is prioritized over CWS's information for any Rule 11 shipment for which CWS did not sample both the first and last leg of the shipment.

[62] For connecting different legs of a shipment together, an attempt to match is made the origin/destination SPLCs using the finalized 6-digit station SPLCs for each railroad, the rate-based SPLCs to each other and the station SPLCs, and the switch SPLCs to each other and the station SPLCs. *See* Appendix C ¶¶ 55–58 for a discussion on adjustments and additions to SPLCs.

The tape data of the four Class I railroads discussed above (i.e., UP, NS, BNSF, and CN) all have columns representing the revenue attributable to their own segment (hereafter, simply "system revenue") and the total waybill revenue.[63] CWS reports the total waybill revenue.[64] Other railroads' segment revenue can be obtained from CWS (i.e., for CPKC, CSX, and other non-Class I railroads) when the waybill is reported as a single line movement, and therefore, the total waybill revenue and the railroad's system revenue are identical.

48. The total waybill revenue represents revenue generated by the entire movement for non-Rule 11 shipments. However, Rule 11 allows each participating railroad to issue its own waybill; therefore, the total waybill revenue reported in the tape data from UP, NS, BNSF, and CN represents only the revenue attributable to their respective segments. Similarly, the total waybill revenue for Rule 11 shipments provides information only on the reporting railroad's revenue, not on total revenue across the entire route from all participating railroads. When a Rule 11 shipment involves only UP, NS, BNSF, and CN, it is possible to construct the revenue for the entire movement from the data each railroad provides for its respective segments. When part of a Rule 11 shipment is handled by other railroads, e.g.,

[63] One caveat is that revenue fields from different data sources may include varying components, and the provided data dictionaries do not always make these components clear. For instance, <up_gross_rev_amt> is used to represent UP's system revenue, which, according to UP's data dictionary, includes total freight, fuel, and other revenue that make up total gross revenue. *See* "UPRR_Linehaul_Dtls_2023_DataDef_20250825.xlsx." However, the system revenue field available in the CN traffic tape data <system_revenue_in_rate> is broadly described as "CN's revenue in USD" in CN's data dictionary. *See* "CN Traffic Tape Fields 2023.xlsx."

[64] In the CWS, the total waybill revenue is stored in the <freight_revenue> field. CWS also includes split revenue fields—such as <origin_rr_split_revenue>, <first_interchange_rr_split_revenue>, …, <termination_rr_split_revenue>—which represent freight revenue expanded by the theoretical expansion factor and allocated based on the number of 100-mile blocks traveled by each participating railroad. These values do not reflect the actual revenue earned by each participating railroad, so I do not rely on them for revenue calculation. *See* Railinc, "2023 Surface Transportation Board Carload Waybill Sample Reference Guide," March 5, 2025, available at https://www.stb.gov/wp-content/uploads/2023-STB-Waybill-Reference-Guide.pdf, at pp. 51, 64-65.

CPKC, CSX, or some other non-Class I railroad, it is possible to identify total shipment revenues if the Rule 11 record for these railroads happens to be sampled in the CWS.

49. Therefore, because the total shipment revenue is either not available for Rule 11 shipments or not always populated in the data for non-Rule 11 shipments, and limited visibility into the revenue collected for all segments of a shipment, the total shipment revenue is underreported in many cases.

50. For non-Rule 11 interline shipments that appear in multiple data sources, total waybill revenue is used as reported from the first source in the following priority order: UP, NS, BNSF, CN, and CWS. For example, an interlined shipment involving UP and NS would appear in both parties' traffic tapes data, and each source would report the total revenue between UP and NS under interline pricing. When there is any inconsistency, priority is assigned to UP's total waybill revenue. When there is a discrepancy between the sum of each involved railroad's system revenue and the total shipment revenue reported in the prioritized data source, priority is assigned to the sum of system revenue.[65]

51. Then, UP and NS's revenue shares are calculated by dividing the system revenue for each carrier's respective segment (as reported in their tape data) by the total shipment revenue. However, because the total shipment revenue is often underreported for the reasons described above, UP and NS's revenue shares are likely overestimated.

[65] Certain additional assumptions were made to reconcile inconsistencies in the revenue fields inter- or intra-data sources. See workpapers.

2.6 Data Quality Controls and Reconciling Discrepancies in these data

52. The data provided by UP, NS, BNSF, and CN, as well as the CWS, are subject to recording errors and inconsistencies. In particular, when the same shipment appears in the traffic tapes data of multiple railroads, certain shipment attributes (e.g., routing, commodity codes, tonnage, or revenue) may differ across sources. In addition, the data dictionaries provided for the 100 percent traffic tape data from UP, NS, BNSF, and CN are limited, requiring the exercise of judgment in interpreting and processing certain fields.

53. To address these issues, extensive quality checks were performed, including comparisons of waybill identifiers, route information, revenue fields, and other shipment attributes across sources, as well as internal consistency checks within each railroad's own traffic tape data. Despite these data quality checks, it is possible that some data issues remain. If material issues are identified in the future, I reserve the right to supplement or update the analyses in my report.

54. Indicator variables, or flags, were created throughout the data construction process to identify records subject to potential limitations, such as incomplete revenue information, censored tonnage, or partial observability due to sampling or Rule 11 treatment. These flags allow the analyses to be restricted, sensitivity-tested, or interpreted appropriately depending on the requirements of each analytical exercise.

55. For instance, the origin and destination SPLCs were validated using station master data from Oliver Wyman.[66] Both station masters map SCAC and FSAC to SPLCs. A combined station master was created by merging the two sources on SCAC and FSAC and, then, verifying that the SPLCs match when a SCAC-FSAC pair appears in both. Additionally, the Railinc Station Master provides switch SPLC, rate base SPLC[67], and an indicator showing whether a station has been purged, along with the related expiration date for each SCAC–FSAC pair.

56. The UP, NS, CN, and CWS data provide the origin and termination FSAC for each waybill. From the routing information, the records identifying the first and last railroads were chosen and treated as the origin and termination railroads. Next the data were cross references with the combined station master on FSAC and origin/termination railroad. If either FSAC–origin railroad or FSAC-termination railroad is missing from the combined station master or marked as purged in the Railinc Station Master, the record is then flagged as unreliable. When SPLCs reported by the sources differ from those associated with the FSAC–railroad pair in the station masters, the reported SPLCs are replaced with those from the combined station master.

[66] Specifically, two sources were itegrated: Railinc Station Master and "20250902 Unified Station Access Master v1.1_StationMaster.csv." (hereafter, "Oliver Wyman Unified Station Master"). Certain SCACs that do not appear on the U.S. Department of Transportation's freight station list on the data portal were omitted. *See* U.S. Department of Transportation Freight Stations Data, available at https://data.transportation.gov/Railroads/Freight-Stations/gag3-mgv7/about_data (accessed December 14, 2025).

[67] Switch SPLC, or revenue switch SPLC, refers to an SPLC assigned to a reciprocal revenue switching area, which may include multiple stations. While most stations have their own unique revenue switch area, some, such as Wood Street Yard, fall within the Chicago reciprocal switching limits. Rate base SPLC is the SPLC that identifies the National Rate Base (NRB), a geographic grouping of all rail stations in the United States and Canada used for rating purposes. *See* Railinc, "Centralized Station Master (CSM) User Guide," January 2024, at https://public.railinc.com/sites/default/files/documents/UG_CSM.pdf, p. 14.

57. BNSF's traffic tape data does not provide origin or termination FSACs, but allow one to infer the origin and termination SPLCs using the initials of the originating/destination railroad carrier, the Official 333 spelling for the origin/destination station, and the state code associated with that station. The BNSF traffic tapes data were merged with the combined station master on SPLC and origin/termination railroad. If either SPLC–origin railroad or SPLC-termination is missing from the combined station master or is not associated with any unpurged station according to the Railinc Station Master, the record as flagged unreliable.

58. Further, switch SPLCs and rate base SPLCs associated with each FSAC/SPLC-railroad pair are retained when merging data sources with the combined station master. A shipment appearing in multiple data sources is flagged as having inconsistent origin or termination station information of those sources disagree on SPLCs and the discrepancies cannot be resolved by generalizing to switch SPLCs or rate-based SPLCs.

59. The following type of records were also flagged as unreliable:

- Records with missing, invalid, or indeterminate commodity codes.
- Records with missing or "000000" origin or destination SPLCs, or identical origin and destination SPLCs.
- Records with materially inconsistent route information across railroads' tape data and the CWS.

2.7 Implications of CWS sampling for disaggregated market analysis

60. As discussed in the statement, there is a limitation in the the combined waybill data to support reliable statistical conclusions. This is due to the nature of the CWS being a

stratified sample with each reporting railroad contributing less than 10 percent of its waybills, and some sampling rates as low as one out of 40 waybills (i.e., for single-car shipments). Although the STB provides expansion factors intended to create a dataset with representative shipment volumes, the CWS remains a sample and therefore limits the number of observed waybills available for analysis within narrowly defined markets.

61. This sampling structure has important implications when traffic is disaggregated to analyze STCC4 commodities. Partitioning traffic simultaneously by origin BEA, destination BEA, and 4-digit commodity substantially reduces the expected number of sampled observations within many corridor-commodity pairs. As a result, even where underlying freight activity exists, a given corridor-commodity market may be represented by only a small number of sampled waybills—or none at all—in a particular year. Expansion factors do not mitigate this limitation because they do not increase the underlying number of observations used to measure competitive outcomes or railroad shares.

62. For this reason, analyses that rely on very small numbers of sampled waybills at the corridor-commodity level may yield misleading measures of competition, particularly where market shares can be mechanically driven by only a few observed shipments. This concern has been recognized in prior railroad transactions, and prior analyses thereof (e.g., Vellturo 2001 VS, Vellturo 2007 VS, Majure VS) have imposed minimum traffic thresholds to ensure that competitive screens are applied only to markets with sufficient underlying

activity to support reliable inference.[68] Consistent with this limits of at least 365 carload shipments per year (corresponding to an average of one carload per day) and at least 10 observed waybills per year are used. These thresholds are intended to account for the sampling limitations of the CWS and ensure that market-level measures are not driven by lower observation count.

63. Accordingly, even when using 4-digit commodity definitions, there remain many instances in which corridor-commodity flows are too limited (either in underlying volume or sampled observations) to support reliable statistical conclusions about competition. Results for markets falling below these thresholds should therefore be interpreted with caution and are excluded from formal competitive screening in my analysis.

64. Moreover, because CWS provides information on UP's and NS's competitors (i.e., CPKC, CSX, and other Class II and III railroads; recall I have 100 percent traffic tape data for UP and NS, as well as BNSF and CN), it is more likely that the analysis of these data would lead to overstating, rather than understating, UP's and NS's involvement in a market.

[68] *See* Majure VS at ¶ 90. "[Measurement] of shares as a reliable description of choices, has been recognized in the Board's recent decision to adjust the Waybill sampling methodology to better capture smaller shipments. With the thin observation of these shipments that was still used in the 2019 Waybill Sample, the initial screen can be triggered by shares based on as few as 2 observed shipments which mathematically has to give one carrier at least 50 percent even if that is not an accurate representation of competition. This issue was indirectly addressed in past implementations of this test by imposing a minimum of one carload per day on candidate BEA area-commodity pairs. I will use an equivalent threshold for reliability of the screen." *See also*, Vellturo 2001 VS at pp. 11-12. "For example, there are only 21 product/DBEA pairs where the combined volumes of the two railroads amount to more than a carload a day… I understand that the Board has stated that it must approve a transaction of this type 'unless there will be adverse competitive impacts that are both 'likely' and 'substantial.' The small CN/WC volumes within the 50/10 product/DBEA pairs indicate that this Transaction will not entail any such anticompetitive effects." *See also*, Vellturo 2007 VS at p. 88.

3 2023 Transearch Data

65. S&P Global Market Intelligence – Transearch Insights freight flows data provides information on non-rail movements. These data contain information on annual freight movement. Each record reports freight flows by origin and destination BEA, 4-digit STCC, transportation mode (e.g., air, pipeline, rail, truck, water, or other), and trade type (e.g., domestic, import, NAFTA).

66. For the analysis in this statement, a 2023 Transearch extract was provided by Oliver Wyman that reports corridor-level freight flows of STCC4-level commodities from origin to destination BEA pairs. Oliver Wyman supplemented Transearch records with estimated revenues for non-rail modes.

67. The Transearch data was merged onto the combined waybill dataset after aggregating the combined waybill data at a consistent unit of observation (i.e., STCC4 and origin and destination BEAs). Specifically, each waybill shipment was assigned an origin BEA and destination BEA using the SPLC-to-BEA crosswalk described above, and aggregate shipment volumes by 4-digit STCC codes. The Transearch corridor data is subsequently merged to the waybill data using these common fields. This merge augments the waybill data with measure of non-rail freight activity in the commodity and origin and destination BEA pairs to my analysis.

4 Geographic Data

68. For the maps presented in Section 2 of the report (Exhibits 1, 2, 4, 5, and 7 to 10), rely on two primary sources of data.

69. For the maps illustrating railroad networks (Exhibits 1, 2, 4, and 7 to 10), data from the STB Railroad Map Depot is used. These datasets provide the information necessary to map each route for Class I railroads, identify the railroad that owns the tracks along the route, and indicate whether other railroads have trackage rights. To improve readability, label for both the states and several major cities across the United States are added.

70. For the map illustrating the BEAs served by UP and NS (Exhibit 5), data from the Railinc Station Master was used. To map each SPLC's associated county to BEA, the BEA-county mapping from the Oliver Wyman FSAC-SPLC-FIPS-BEA Mapping Table is used.[69]

71. Inactive stations were removed by retaining only observations where the purge indicator (<purg_ind>) value is "N."

72. Finally, a review of instances where the data suggests UP or NS have SPLCs beyond the states in which they are known to operate is performed. These appear to be recording errors and are therefore excluded from the analysis.

[69] To improve the results of this mapping, some SPLC county names were standardized before merging: For SPLCs whose associated county does not merge with the Oliver Wyman FSAC-SPLC-FIPS-BEA Mapping Table, instead the BEA is identified by merging the SCAC-SPLC pair from the Railinc Station Master to the Oliver Wyman FSAC-SPLC-FIPS-BEA Mapping Table.

APPENDIX D
MAJOR ORIGINS AND TERMINATIONS

1. To address 49 CFR § 1180.7(b)(2) of the STB regulations, this appendix reports, by railroad, and for each major origin or destination point on the parties' combined system, actual and projected shares based on traffic (measured in carloads) originated or terminated at each such point. It also identifies each such point where the number of serving Class I railroads would drop from two to one or from three to two as a result of the proposed transaction.

2. Carloads originated or terminated are reported for each major origin and destination point for the year 2023 using combined waybill data from 2023. Major origin points are identified by calculating the combined origination volume for UP and NS in carloads, across all commodity groups, shipped for each origin and summing them from highest to lowest volume until 80 percent of UP and NS origination volume is captured.[1] An analogous approach is used to identify the major destination points using combined UP and NS termination volume.

3. This appendix relies on the combined waybill data.[2] Origin and destination points are defined by BEA and all commodities are combined into one for these calculations.[3] As described in Appendix C, the combined 2023 waybill data includes complete traffic for UP, NS, BNSF, and CN but for CPKC and CSX and other railroads the only information

[1] The STB's regulations do not define "major point." I therefore define "major" in response to STB regulations and this definition only affects which information is presented in Appendix Tables D-F. This definition is not used in my competitive assessment of the merger.

[2] See Section 4.2 of my statement for a description of how the combined waybill data was created.

[3] See Section 2.3 of my statement for more information on BEAs.

on traffic comes from CWS. As described in Appendix C, while the use of expanded carloads for CPKC and CSX mitigates lack of complete records, their traffic volumes are less accurate. Furthermore, when records for certain origins or destinations are not sampled, expanded carloads would not exist, and CPKC and CSX traffic would be lower than actual for such origins or destinations and shares for UP, NS, BNSF and CN would be higher than actual. The shares reported should be interpreted with this limitation in mind.

1 Share of all traffic across all commodities that is originated by each railroad and the projected share of the combined railroad

4. Table D1 shows, for each major origin BEA, the total originated traffic volume in carloads across all commodities and the share of originated traffic by railroad (separately for each Class I railroad and all other railroads grouped together).[4] The table also shows the projected share of the combined railroad, which is estimated as the combined share of UP and NS before the proposed merger.

2 Share of all traffic across all commodities that is terminated by each railroad and the projected share of the combined railroad

5. Table D2 shows, for each major destination BEA, the total terminated traffic volume in carloads across all commodities and the share of terminated traffic by railroad (separately for each Class I railroad and all other railroads grouped together). The table also shows the

[4] All other railroads include all non-Class I railroads.

projected share of the combined railroad, which is estimated as the combined share of UP and NS before the proposed merger.

3 Origins and Destinations where the number of Class I railroads serving the origin or destination changes from 2-to-1 or 3-to-2 as a result of the proposed merger

6. There are no major points where the number of Class I railroads serving the point changes from 2-to-1 or 3-to-2 as a result of the proposed merger.

APPENDIX E
WITHIN CORRIDOR

1. To address 49 CFR § 1180.7(b)(3) of the STB regulations, this appendix reports actual and projected shares of revenues and traffic volumes (measured in tons) for major interregional or corridor flows by major commodity group. The data is broken down by mode and, for the railroad portion, by single line and interline routings showing gateways used.

2. Tons and revenues are reported by major corridor-commodity combination using combined waybill data from 2023. Major corridor-commodity combinations are identified by calculating the combined total volume for UP and NS in tons shipped for each corridor-commodity combination and summing them from highest to lowest volume until 80 percent of combined UP and NS volume is captured.[1] Revenue shares are then reported for these same major corridor-commodity combinations.

3. This appendix relies on the combined waybill data for 2023.[2] Corridors are identified by the origin BEA and destination BEA and commodities are identified by the 4-digit STCC.[3] As described in Appendix C, combined waybill data includes complete traffic for UP, NS, BNSF, and CN but for CPKC and CSX and other railroads the only information on traffic comes from CWS. As described in Appendix C, while the use of expanded carloads for CPKC and CSX mitigates lack of complete records, their traffic volumes are less accurate. Furthermore, when records for certain origins or destinations or commodities are not

[1] The STB's regulations do not define "major commodity group" or "major interregional or corridor flows." I therefore define "major" in response to STB regulations and this definition only affects which information is presented in Appendix Tables D-F. This definition is not used in my competitive assessment of the merger.

[2] See Section 4.2 of my statement for a description of how the combined waybill data was created.

[3] See Section 2.3 of my statement for more information on BEAs and Section 4.2 for information on 4-digit STCCs.

sampled, expanded carloads would not exist, and CPKC and CSX traffic would be lower than actual for such origins or destinations or commodities and shares for UP, NS, BNSF and CN would be higher than actual. The shares reported should be interpreted with this limitation in mind.

4. Similarly, as described in Appendix C, in the traffic tapes revenues are not readily observed for non-reporting railroads participating in interline routes, unless Rule 11 pricing is used and the participating railroad's segment is sampled in the CWS. In addition, for some interline routes total revenue is missing. Thus, both total revenues and revenues for railroads other than UP, NS, BNSF, or CN are likely understated. Revenue calculations should be interpreted with these limitations in mind.

1 Actual share of all traffic volume by mode for major corridor-commodity combinations

5. Table E1 shows, for each major corridor-commodity combination, the total traffic volume in tons and the share of traffic volume by mode, specifically for rail, truck, water, pipeline, air, and other. Non-rail traffic volumes come from Transearch data described in the Appendix C.

2 Actual and projected shares of rail traffic volume by route for major corridor-commodity combinations

6. Table E2 shows, for each major corridor-commodity combination included in E1, rail traffic volume by single line and interline routings, where for interline routings, I also include gateways. Traffic volumes are reported in tons and shares, and for share calculations, I include non-rail total traffic and shares as well. Projected shares reflect that interlined NS-UP or UP-NS routings will become single line in the combined railroad.

3 Actual shares of all revenues by mode for major corridor-commodity combinations

7. Table E3 shows, for each major corridor-commodity combination included in Table E1, the total revenues and the share of revenues by mode, specifically for rail, truck, water, pipeline, air, and other. Non-rail traffic volumes come from Transearch data and revenues were augmented as described in the Appendix C.

4 Actual and projected shares of revenues for rail by route for major corridor-commodity combinations

8. Table E4 shows, for each major corridor-commodity combination included in E1, rail revenues by single line and interline routings, where for interline routings, gateways are included. Revenues are reported in current (2023) dollars, and for share calculations, non-rail revenues are included in share calculations. Projected shares reflect that interlined NS-UP or UP-NS routings will become single line in the combined railroad.

APPENDIX F
BETWEEN CORRIDORS

1. To address 49 CFR § 1180.7(b)(4) of the STB regulations, this appendix reports, by railroad, actual and projected shares based on originating and terminating traffic (measured in carloads) and revenue for major origins and destinations by major commodity group.

2. Carloads and revenues for origins and destinations by major commodity group[1] are reported by commodity-origin and commodity-destination combinations for the year 2023. Major commodity-origin combinations are identified by calculating the combined origination volume for UP and NS in carloads shipped for each commodity-origin combination and summing them from highest to lowest volume until 80 percent of combined UP and NS origination volume is captured.[2] An analogous approach is used to identify major commodity-destination combinations using combined UP and NS termination volume. Revenues are then reported for these same commodity-origin and commodity-destination combinations.

3. This appendix relies on the combined waybill data.[3] Origins and destinations are defined by BEA and commodities are identified by the 4-digit STCC.[4] As described in Appendix

[1] Major commodity groups are identified separately for UP and NS based on their combined volume for each 4-digit STCC commodity, calculated separately for originated and terminated volume. From a ranked list of total originated or terminated volume by 4-digit STCC categories those that account for 80 percent of combined volume are treated as major. In constructing this ranked list, the 4-digit STCC codes that do not represent a distinct commodity such as 4611 Freight of all kinds or 0119 Miscellaneous field crops are not counted towards the 80 percent calculations but are included in the reported list of major commodities. This results in a list that accounts for more than 80 percent by origination or termination volume to ensure that distinct individual 4-digit commodities are represented.

[2] I define "major" in response to STB regulations and this definition only affects which information is presented in Appendix Tables D-F. This definition is not used in my competitive assessment of the merger.

[3] See Section 4.2 of my statement for a description of how the combined waybill data was created.

[4] See Section 2.3 of my statement for more information on BEAs and Section 4.2 for information on 4-digit STCCs.

C, while the use of expanded carloads for CPKC and CSX mitigates lack of complete records, their traffic volumes are less accurate. Furthermore, when records for certain origins or destinations or commodities are not sampled, expanded carloads would not exist, and CPKC and CSX traffic would be lower than actual for such origins or destinations or commodities and shares for UP, NS, BNSF and CN would be higher than actual. The shares reported should be interpreted with this limitation in mind.

4. Similarly, as described in Appendix C, in the traffic tapes revenues are not readily observed for non-reporting railroads participating in interline routes, unless Rule 11 pricing is used and the participating railroad's segment is sampled in the CWS. In addition, for some interline routes total revenue is missing at times. Thus, both total revenues and revenues for railroads other than UP, NS, BNSF, or CN are likely understated. Revenue calculations should be interpreted with these limitations in mind.

1 Major commodities' traffic volume by origin that is originated or terminated by each of the railroads and the projected share of the combined railroad

5. Table F1 shows, for each major commodity group and origin BEA, the originating and terminating traffic volume in carloads by destination BEA and railroad (separately by each Class I railroad and all other railroads grouped together).[5] The projected volume of the combined railroad is also shown, which is estimated as the combined volume of UP and NS before the proposed merger.

[5] All other railroads include railroads other than Class I.

2 Major commodities' traffic volume by destination that is originated or terminated by each of the railroads and the projected share of the combined railroad

6. Table F2 shows, for each major commodity group and destination BEA, the originating and terminating traffic volume in carloads by origin BEA and railroad (separately by each Class I railroad and all other railroads grouped together). The projected volume of the combined railroad is also shown, which is estimated as the combined volume of UP and NS before the proposed merger.

3 Major commodities' revenue by origin that is originated or terminated by each of the railroads and the projected share of the combined railroad

7. Table F3 shows, for each major commodity group and origin BEA shown in Table F1, the originating and terminating revenue by destination BEA and railroad (separately for UP, NS, and all other railroads grouped together). The projected revenue of the combined railroad is also shown, which is estimated as the combined revenue of UP and NS before the proposed merger.

4 Major commodities' revenue by destination that is originated and terminated by each of the railroads and the projected share of the combined railroad

8. Table F4 shows, for each major commodity group and destination BEA shown in Table F3, the originating and terminating revenue by origin BEA and railroad (separately for UP, NS, and all other railroads grouped together). The projected revenue of the combined railroad is also shown, which is estimated as the combined revenue of UP and NS before the proposed merger.

I. INTRODUCTION

A. QUALIFICATIONS

1. My name is Mark Israel. I am a Founding Partner at Econic Partners, an economic consulting firm I joined in April 2025. Prior to joining Econic Partners, I was the President of Compass Lexecon, also an economic consulting firm, where I had worked since 2006. From 2000 to 2008, I served on the faculty at the Kellogg School of Management, Northwestern University. I received my Ph.D. in economics from Stanford University in 2001.

2. I specialize in the economics of industrial organization—the study of competition in imperfectly competitive markets, including the study of antitrust and regulatory issues—and applied econometrics. At Kellogg and Stanford, I taught graduate-level courses covering topics including business strategy, industrial organization/competition economics, and econometrics. My research on these topics has been published in leading peer-reviewed economics journals including the American Economic Review, the Rand Journal of Economics, the Journal of Industrial Economics, the Journal of Law and Economics, and the Journal of Competition Law and Economics, among others.

3. My work focuses on the application of economic theory and econometric methods to competitive analysis of the impact of mergers, antitrust issues including a wide variety of single-firm and multi-firm conduct, class certification, and damages estimation. I have analyzed these competition issues on behalf of a wide range of clients, including private companies and government entities. I have specific expertise in the analysis of vertical mergers and vertical foreclosures cases but have also done extensive work analyzing horizontal mergers. I have submitted expert reports, declarations, and affidavits to government agencies and federal and state courts. I have testified in federal court, multiple state courts, and in many regulatory and arbitration proceedings in the U.S. and other countries. I have presented competitive analyses to the U.S. Department of Justice and the Federal Trade Commission on dozens of occasions. My work has included analysis of competition in many transportation-related cases, including previous submissions to the Surface Transportation Board ("STB" or "the Board"), as well as

cases involving airlines, barges, food distribution, and many others. My complete CV is attached to this statement as Attachment 1.

B. ASSIGNMENT

4. I have been asked to provide an economic analysis of the proposed merger of the Union Pacific Railroad ("UP") and Norfolk Southern Railway Company ("NS"). Specifically, I have been asked to focus my analysis on the vertical effects of the proposed merger, in order to determine whether the combined vertical effects enhance competition and serve the public interest. I have also been asked to assess the additional effects of the Committed Gateway Pricing, including whether it further enhances competition and serves the public interest.

C. BACKGROUND

1. Union Pacific

5. The Union Pacific Railroad is a Class I freight railroad operating in 23 states in the western two-thirds of the United States, meaning it has very little overlap with Norfolk Southern, which operates primarily in the eastern United States.[1] The UP network includes 32,880 route miles, (26,291 miles owned by UP, the rest accessed by UP via trackage rights or other agreements).[2] UP provides service to Pacific and Gulf Coast ports, major US gateways along the Mississippi River, and gateways on the Mexican and Canadian borders.[3] UP also maintains coordinated schedules with other carriers in order to move shipments to and from the eastern U.S.[4]

---

1 Union Pacific Corporation, Form 10-K for Fiscal Year Ended December 31, 2024, filed February 7, 2025, p. 5 (hereinafter "UP 2024 10-K") available at https://investor.unionpacific.com/static-files/8cb99809-9965-4d4d-bd6e-612f0d6149f8.

2 UP 2024 10-K, p. 18.

3 UP 2024 10-K, p. 6.

4 UP 2024 10-K, p. 6.

6. UP categorizes its traffic into three large commodity groups: bulk, industrial, and premium.[5] In 2024, shipments of bulk commodities (grain, fertilizer, food, refrigerated products, and coal and renewables) comprised 32% of UP's freight revenue.[6] Industrial shipments (construction, industrial chemicals, plastics, etc.) accounted for 37% of freight revenues, and premium shipments (intermodal and automobiles) accounted for the remaining 31% of freight revenues.[7]

2. Norfolk Southern

7. The Norfolk Southern Railway Corporation is a Class I freight railroad operating primarily in the eastern United States, meaning that it has very little overlap with UP, which operates primarily in the western United States. NS operates on 35,000 miles of rail track[8] (28,300 miles operated or maintained by NS[9], the rest accessed via trackage rights or other agreements) in 22 states and the District of Columbia.[10] The corridors on the NS network with the heaviest freight volume in 2024 include: New York City to Chicago, Chicago to Macon, Central Ohio to Norfolk, Cleveland to Kansas City, Birmingham to Meridian, and Memphis to Chattanooga.[11] NS also serves 43 ports, including all major container ports between New York and Florida; nine lake ports on the eastern Great Lakes including Detroit and Chicago; and ten river ports connecting the eastern and western US.[12]

11 NS 2024 10-K, p. K4.

12 "Ports and International" available at: https://www.norfolksouthern.com/en/ship-by-rail/our-rail-network/ports-international.

8. NS categorizes their freight shipments into three categories: merchandise, intermodal, and coal.[13] In 2024, merchandise traffic accounted for 62% of NS's railway operating revenues[14] and intermodal and coal shipments accounted for 25% and 13% of railway operating revenue, respectively[15]

3. The Proposed Transaction

9. UP seeks to acquire NS, creating a transcontinental railroad operating over 50,000 route-miles in 43 states, serving nearly 100 ports. The proposed merger is an end-to-end, vertical combination of rail networks, which have little overlap today, but rather which meet at the major gateways along the Mississippi River—Chicago, St. Louis, Memphis, and New Orleans—each of which is served by multiple railroads. Today the separate networks of UP and NS can be used to move traffic across the United States, but only with an interchange in the middle. Post-merger, a single rail network will be able to move that same traffic with no interchange required, an inherently cost-reducing, quality-enhancing change.

10. In economic terms, this would be a merger of complementary products that will generate significant efficiencies. The transaction would introduce single-line rail service between points in the eastern and western US that can be served only by interline rail service today. It would enable shippers to ship goods across the country without the need to stop and make an interchange in the middle with all the associated complications, delays, and costs that such interline service entails.[16] Put simply, it would create a more efficient rail system.

11. Nobel Prize-winning economics developed by Bengt Holmström and others explains why vertical integration is the only way to achieve the "faster, more efficient, more reliable

and more accessible way[s] to ship goods" that the merged UP and NS have committed to and will have the incentive to provide.[17] As I discuss in detail below, it would be impossible for other alternatives short of a full merger between the parties (e.g., contracts or trackage agreements) to come close to addressing every possible situation that arises in the daily operations of two independent railroads, and thus, those alternatives could not deliver the benefits that this merger will create. These benefits include: more effective competition and service from increased single-line options—an improvement that will allow rail to compete more effectively with trucks and to serve historically underserved areas; improved quality, faster transit times and increased reliability; and increased investment in the rail network, including planned investment of a billion dollars to accommodate merger-related growth on main lines and in yards and terminals.[18] All of these benefits—the inherent quality improvements from single-line service, the cost reductions from eliminating interchanges, and the incentives to invest more because the combined railroad internalizes the combined benefits on the full network—are inherent to the transaction and cannot be obtained without it. Blocking the transaction would deny shippers and downstream consumers these benefits and thus be anti-competitive and welfare destroying, particularly since any potential vertical competitive concerns—to the extent any are valid—can be dealt with via conditions, as discussed below.

12. To ensure further that the proposed merger enhances competition—including on routes that are not directly affected by the merger in the sense that they do not combine UP service on one end and NS service on the other—UP and NS have offered an additional commitment—their Committed Gateway Pricing ("CGP") proposal. CGP would allow BNSF and CSX to quote through rates to customers on routes that are sole served on each

end based on CGP and without any concurrence process. Thus, the CGP proposal extends the merger's benefits to certain routes and shippers that would otherwise not benefit as directly from the transaction.

II. SUMMARY OF CONCLUSIONS

13. My primary opinion is that the combined vertical effects of the proposed merger of UP and NS are procompetitive, meaning that they will enhance competition in the rail industry, create downward pressure on price relative to the state of the world that would exist absent the merger, and benefit shippers in the form of greater investment, higher quality service, and a more efficient rail network.

14. More specifically, I find:

- The proposed UP/NS merger is an overwhelmingly complementary "end-to-end" merger. As such, fundamental economics teaches that it will generate significant merger-related benefits. Put simply, whereas mergers of substitute products may, in some cases, create competitive concerns including upward price pressure (among others), mergers of complementary products have the *exact opposite effect* (as a matter of the same profit maximization math). Indeed, for reasons developed throughout this report, a merger is *required* to unlock these benefits.
- The main theories of vertical foreclosure that have been developed in the economic literature are ill-matched to this transaction and the railroad industry. This follows for several reasons.
    - First, as is well recognized, a very large percentage of rail rates are set pursuant to negotiations between shippers and railroads, which generally result in contractual terms that are more complex than simply a price per ton or carload at which shippers can ship as much as they want (a so-called "linear price"). Rather, they generally result in "non-linear" contracts that specify an amount that will be charged for a given amount shipped. In such situations, the usual theories of foreclosure simply do not

apply, and instead, fundamental economics teaches that the merger will benefit shippers (or cause them no harm).

- Second, even in those situations where there is not such negotiation between shippers and railroads—i.e., where shippers use other pricing mechanisms—the usual theories of foreclosure remain ill-suited to this industry. In particular, if those shipments are made via Rule 11 pricing—so that separate prices are obtained from each railroad involved in carrying the shipment from its origin to its ultimate destination—standard vertical foreclosure theories do not apply, but rather the transaction gives rise to inherent benefits ("Cournot Complement effects"). And the sparse economic literature on cases where there may nevertheless be harm in such circumstances does not fit the facts of to this case. And for those shipments made via through rates, I explain below how straightforward empirical tests reject the applicability of standard theories of vertical foreclosure.

- Foreclosure theories that have recently been developed based on the highly counterintuitive claim that a merger that provides the merged railroad more information about its combined costs will generate harms are, unsurprisingly, based on unreasonably restrictive assumptions, with the findings reversed once those restrictions are relaxed.

- This is not to say that no economist opposing this transaction will be able to come up with a theory under which foreclosure is possible. The nature of the economic literature on vertical contracting and mergers is that nearly anything is at least theoretically possible. But basing policy and enforcement decisions on what might be possible *in theory* is a recipe for welfare-harming decisions. It is enough to observe that any such foreclosure theory would at most apply to transactions in which shippers do not negotiate non-linear contracts. And even then, for shipments made under Rule 11, I know of no paper in the current economic literature that would support a theory of harm applicable to

such activity. And for through rates, any such theory would be an "edge case," which rests on restrictions on firms' behavior that are unlikely (or rare, at best), as well as other tenuous assumptions. Such a theory should not serve as the basis to block such a beneficial transaction. Rather, the remote possibility of such cases is what the Applicants' Open Gateway Commitments are designed to address.

- With no realistic prospect for material harm to competition from vertical foreclosure and significant demonstrable benefits, the proposed merger unambiguously raises consumer and shipper welfare and enhances competition.

- For multiple reasons, a vertical merger of the Applicants' complementary rail networks is the only means of achieving the significant benefits that this merger will unlock. First, the efficient management of complementary rail networks requires coordinated actions by the railroads that own the networks. Such coordination—such as the ability to eliminate interchanges and provide single-line, cross-country service—requires a single railroad. Second, independent railroads make suboptimal decisions because each railroad considers only its own profit when making decisions and does not appropriately consider the effect of its decisions on the complementary network. So, for example, Union Pacific ignores the benefits that an improved rail network in the West will have on Norfolk Southern in the East. Thus, each separate railroad finds too few such investments profitable from the point of view of the combined railroad or society as a whole. As demonstrated by Nobel Prize-winning economics, in industries with characteristics like those of the railroad industry, there is no way to solve this problem other than a merger; separate railroads will always make suboptimal investment decisions. This follows because:

    - Contracts cannot address the coordination problems created by poor incentives because many of one railroad's actions and activities are

unobservable and/or not verifiable by the other railroad. Unobservable actions imply that contracts cannot prescribe all the actions required for optimal coordination of complementary networks. A contract would have to specify all actions to take in any possible future state of the world, an obviously impossible task.

- In contrast, the merger of the two complementary networks integrates the complementary networks into a single railroad, creating optimal incentives, eliminating the need to coordinate via contracts, and unleashing significant benefits.

- The Committed Gateway Pricing proposal further enhances competition by providing improved pricing options for certain routes that would not directly participate in the vertical benefits of the merger. And while there is no evidence the proposed merger will lessen competition from other sources or regions, the Committed Gateway Pricing will also expand existing product and geographic competitive options to new routes. I demonstrate via economic modeling that the Committed Gateway Pricing proposal should be expected to generate additional substantial benefits.

III. ECONOMIC THEORIES OF FORECLOSURE PROVIDE NO VALID BASIS TO OPPOSE THE TRANSACTION

15. The proposed UP/NS merger is a merger of complementary rail networks that primarily serve different regions of the United States.[19] Combining UP's and NS's networks into a single coast-to-coast rail network will allow the merged railroad to maximize profits across the integrated network, thus creating downward pressure on prices relative to the situation without the merger; enabling the combined carrier effectively to coordinate operations and thus lowering costs and improving quality through single-line service; and enhancing the incentive to invest in the consolidated network. As one particularly

[19] See Verified Statement of Dr. Elizabeth Bailey.

tangible example (but just one of many benefits), integration would allow the merged carrier to bypass congested gateways and thus offer faster, more reliable, lower-cost, single-line service to shippers.

16. In some prior vertical mergers, the STB has indicated a concern that the conditions for vertical foreclosure may be present and questioned whether the merging railroad could foreclose competition post-merger.[20] In particular, the STB has expressed concern regarding foreclosure on routes with one sole-served segment and one competitive segment served by two or more carriers.

17. In this section, I perform a detailed economic analysis of the characteristics of the railroad industry to assess whether any such foreclosure concerns are valid. As outlined in the summary of conclusions above, I find that the economic theories of foreclosure that have been developed in the literature are ill-matched for the railroad industry. In particular

- In a large percentage of cases, shippers are not "price takers," but rather negotiate contracts, generally featuring non-linear pricing (rather than a constant "linear" price at which shippers move each ton or carload of traffic). Standard economic theories of foreclosure do not apply to such cases; rather in these situations the merger will either benefit shippers or leave them unharmed. In particular, economics teaches that shippers and railroads will negotiate efficient contracts pre- and post-merger in such cases, and that those contracts will be as good or better for the shipper post-merger. As I show in Figure 1 below, this case likely covers the clear majority of rail shipments.
- Where there is not negotiation over non-linear contracts, but rather shippers buy according to pricing terms set under Rule 11, the merger generates

---

[20] See, for example, *Canadian Pacific Railway Limited et al., - Control – Kansas City Southern, et al.*, Surface Transportation Board Docket No. FD 36500, Decision No. 35, March 14, 2023 (hereinafter "CPKCS Decision") p. 4 ("Even end-to-end mergers, however, can pose competitive risks, and indeed this decision overturns prior agency precedent that did not sufficiently recognize such concerns.").

benefits by combining complementary products ("Cournot complement effects"), and the theories of countervailing harm from the economic literature do not apply.

- Where there is not negotiation over non-linear contracts, but rather shippers buy according to pricing terms set via through rates, one cannot rule out some of the standard theories of foreclosure based on theory alone (as one can do in the above cases). However, in this case, empirical tests reject the standard theories of foreclosure described in the economics literature. In particular, standard theories of foreclosure—at least those that do not depend on unreasonable restrictions on railroad behavior and other assumptions at odds with the reality of the industry—rely on pre-merger rates being below the level that the vertically merged carrier would charge. Said differently, they rely on there being something preventing the vertically dis-integrated railroad from raising prices pre-merger, even though it provides sole-service on one end. In such cases, the merger could create an incentive to foreclose to eliminate that barrier—whatever it may be —to raising prices. In the economic theories where this below-integrated-level pricing occurs, it occurs when shippers receive their through rate from a railroad that faces competition for its part of the service, rather than receiving their through rate from the sole-serving participating railroad. Hence, if those theories hold, one should see shippers strongly preferring to get through rate pricing from railroads on the competitive end, rather than from the sole-served end, and in those cases where they get pricing from the competitive end, prices should be lower than those obtained from the sole-served end. Using data on actual pricing and shipments in the railroad industry, I show that *neither of those conditions hold*, and thus show that the empirical evidence rejects these theories.

18. Some recent theories of foreclosure have taken a different tack, arguing that the harm from vertical mergers can arise because the merging firm obtains better information about the combined firm's costs—specifically, better information about the costs of the railroad that competed along its part of the route prior to the merger—than it had pre-merger.

This result is counterintuitive however, given that better information about costs would generally be expected to increase efficiency of operations. Indeed, even the paper finding harm to *consumer welfare* from increased information finds that total welfare and output go up with the merger, meaning the industry is operating more efficiently. And I show below that, not surprisingly, the negative result on consumer welfare rests on highly restrictive assumptions, and that once those restrictions are relaxed to more closely reflect actual market conditions, consumer welfare also goes up with improved information.

19. As noted above, an economist opposing this transaction may nevertheless be able to come up with a theory under which foreclosure is possible. In the economic literature on vertical contracting, nearly anything is theoretically possible given enough restrictions on the form of contracting and firm behavior. However, any such theory of foreclosure would at most apply to a very limited set of cases (where shippers do not negotiate non-linear pricing terms with railroads, where they do not obtain pricing directly from the sole-served railroad in the pre-merger case, and—at least according to any economic papers I am aware of—where they do not use Rule 11 pricing) and would depend on restrictions on firm behavior and other assumptions that do not fit the facts of the railroad industry. I deal with many such "edge cases" in Appendix A, explaining why they are ill-suited for the railroad industry and should not raise concerns. More generally, such edge cases based on economic models that do not fit the railroad industry certainly should not serve as the basis to block such a beneficial transaction. Rather, the remote possibility of such cases is what the Applicants' Open Gateway Commitments are designed to prevent.

A. SHIPPERS WHO NEGOTIATE NON-LINEAR TERMS WITH RAILROADS ARE NOT HARMED BY THE MERGER

20. A large fraction of interline rail shipments are governed by sophisticated contracts, which shippers have *negotiated* with the railroads, and which often include terms conditioned on price, volume, and perhaps other factors. Such negotiations can occur in cases where interline prices are obtained via Rule 11 or where prices are obtained via through rates. I will use the term "negotiated non-linear contracts" with shippers to refer to such

situations.[21, 22] As I show below, the merger raises *no competitive risks for such shipments*, but instead, if anything creates benefits—in the form of downward pricing pressure relative to the situation with no merger—for such shipments.

1. Negotiated Non-linear Contracts make up a large percentage of interline rail shipments.

21. A significant fraction of rail shipments moves pursuant to negotiated non-linear contracts. Figure 1 summarizes the various pricing arrangements used by UP, NS and their customers for their interline traffic. The vast majority of the parties' interline traffic in 2024, approximately {{ }} percent for UP and {{ }} percent for NS, involves either long-term contracts, private quotes, or other non-tariff arrangements. Under these pricing mechanisms, railroads and shippers engage in negotiations, and all three pricing arrangements are likely to reflect at least some form of non-linear terms. The only set of traffic that is unlikely to entail any private negotiations or non-linear terms consists of shipments moving under tariff rates—which accounts for only {{ }} percent of interline traffic for UP and NS combined.[23]

---

[21] Pricing is non-linear when the price terms are conditioned on volume in some way, e.g., when price reflects an understanding about expected volumes, or when there are volume discounts (i.e., when prices decline with volume), or in cases where there are volume commitments (i.e., price is available for achieving a specific volume). As one specific example, a contract that specifies both a price and a quantity (p, q)—carrying q amount of traffic for p dollars—is a non-linear contract since it specifies both p and q, rather than setting a linear price at which the shipper can ship as much or as little as it wants.

[22] I focus here on environments where railroads have good information about their interline partners' costs and discuss cases where that is not true in a later section.

[23] "Tariff" traffic consists of movements identified by UP and NS as moving under tariff price authorities and is inclusive of public quotes. While "tariff" traffic as defined here could potentially involve non-linear terms such as rebates, it is the subset of traffic that is least likely to reflect negotiations with non-linear terms.

Figure 1
UP and NS Interline Traffic by Pricing Document Type {{

}}

Notes:
1) "All UP/NS Interline" does not equal the sum of UP and NS panels due to the avoidance of double counting UP and NS interline movements.
2) The document type for 1 percent of NS interline traffic could not be identified.

22. To be clear, I am not claiming that every contract, private quote, or other non-tariff arrangement reflects negotiation between shippers and railroads over non-linear pricing terms. In some of these cases, contractual terms may be quite simple—approximating linear pricing—and in other cases, railroads may largely establish contract terms with limited negotiation. That said, my experience in the industry, the complexity of the contracts, and the fact that even private quotes often take the form of a given quantity at a given price—which is a form of non-linear pricing since it specifies both price and quantity, rather than a per-unit price at which any amount can be shipped—all indicate

that a very large percentage of these cases reflect negotiated non-linear contracts.[24] And in all such cases, economics teaches that there are not foreclosure concerns, but rather the merger will either benefit shippers or leave them unharmed, as I explain next.

2. Where shippers negotiate non-linear contracts, they will not be harmed—but rather are likely to benefit—from the merger

23. It is well established in economics that non-linear contracts between a seller and a buyer—meaning cases in which the price in the contract is conditioned on volume in some way—increase output and enhance efficiency. And, as a matter of economics, when the seller and the buyer negotiate, much of what they do is to divide these efficiency gains between them, meaning each party benefits from setting these efficient pricing terms.

24. In settings where a shipper bargains over non-linear contracts with two complementary rail networks, the same benefits arise. And a merger between the firms selling the complements does not interfere with the generation of these benefits—meaning it does not give rise to foreclosure harms. Rather, a merger often increases benefits. *Put simply, a merger between complementary railroads in settings where individual shippers negotiate sophisticated (non-linear) contracts is either benign or efficiency-enhancing and shipper-welfare enhancing*.

25. The economics behind this conclusion is straightforward. Consider a situation in which a transcontinental route is served by one railroad in the West (UP) and two railroads in the East (NS and CSX). Prior to the merger, the shipper will play the Eastern railroads against each other to get the best rate. The railroads will compete until price falls to the cost of the higher-cost railroad, and then the lower cost railroad will price just under that cost and win the business because the higher cost railroad cannot profitably match that

---

[24] See, for example, United States Government Accountability Office, "Freight Rail Pricing: Contracts Provide Shippers and Railroads Flexibility, but High Rates Concern Some Shippers," Report to Congress, December 2016, available at https://www.gao.gov/assets/gao-17-166.pdf, site accessed November 24, 2025, p. 9 ("Contracts may include additional negotiable terms to the railroad's standard terms such as volume commitments and service standards."), p. 14 ("In 2014 about 76 percent of regulated freight was shipped by contract.").

price. The winning lower-cost railroad will earn a margin roughly equal to the difference between the two railroad's costs. That margin is known in economics as a "Ricardian rent." It is the profit that a firm earns because it has a cost advantage, and it is equal to the size of that cost advantage. Critically, the presence of that Ricardian rent creates a wedge between what is paid to the railroads and what it actually costs to move the goods, and this creates an inefficiency and takes value away from shippers.

26. Prior to the merger, the shipper will also negotiate with Union Pacific in the West. And they will strike the best deal they can given the presence of Ricardian rents in the East. But the inefficiency created by those Ricardian rents reduces the "pie" to be negotiated over and leaves the shipper (and Union Pacific) worse off.

27. Now consider the post-merger situation. Suppose first that CSX is the lower cost Eastern railroad. It still makes sense for the shipper to work with CSX and pay it a price just below NS's cost—that option is cheaper than the merged carrier shipping the goods itself and bearing NS's cost, which is higher than a price just below NS's cost. Therefore, the merger does not alter the factors that determine price; there are still Ricardian rents equal to the difference between the Eastern railroads' costs paid to CSX, and the shipper still negotiates (now with the merged UP) in the presence of those Ricardian rents. The merger has no harm (or benefit) in that case.

28. Suppose instead that NS is the lower cost carrier in the East. Now NS will carry the freight in the East, and the cost is NS's actual lower cost rather than NS's premerger price, which embeds a markup. Hence, the Ricardian rents are eliminated; the merged carrier correctly internalizes the actual cost of carrying the goods in the East. And the merged railroad and the shipper strike a deal in the absence of those Ricardian rents, leaving more value to go around, and thus leaving the parties to the transaction (the shipper and the railroads) better off.

29. Finally, suppose that CSX is the lower cost Eastern railroad pre-merger but due to the efficiencies unlocked by the merger—in particular, the lower cost of interchange when crossing the Mississippi—UP/NS becomes the lower cost option for the Eastern leg post-merger. The merged railroad can win the business with a transfer price for the Eastern

segment that is lower than CSX's price, which once more eliminates a Ricardian rent and internalizes the cost in the East. As a result, there is again a welfare-enhancing outcome where both shippers and railroads are better off.

30. The details showing that the above intuition holds in a formal model are in Appendix A. But the basic point is simple: Either the merger changes nothing or, in the situation where the merged RR has the cheaper competitive leg, the merger creates a better deal for everyone, because it gets rid of the inefficiencies created by Ricardian rents.

B. SHIPPERS THAT ACCEPT RATES UNDER RULE 11 ARE NOT HARMED BY THE MERGER

31. Not all rail contracts involve highly negotiated, sophisticated contracts. Some shippers may accept offers from railroads with little negotiation. In what follows, I consider the two possibilities for such cases: Rule 11 pricing and through rate pricing. Together with the discussion above, this fully covers all situations—those that are negotiated non-linear contracts, and those that are not negotiated non-linear contracts, with the latter divided into Rule 11 and through rates. And below I will further divide through rates into those that are obtained from the sole-served railroad or those that are obtained from one of the railroads on the competitive leg (explaining why only the latter—a small subset of a small subset of traffic—even possibly gives rise to foreclosure concerns, and why even that possibility is rejected empirically in this case).

1. Rule 11 pricing is common and growing

32. Among these other (non-negotiated) cases, Rule 11 is likely to be the most common. As shown in Figure 2, Rule 11 rates are the most common interline arrangement and their use has increased. In 2024, Rule 11 accounted for approximately {{ }} percent of the interline traffic for UP and NS.

33. Given the popularity of Rule 11 rates, it is especially telling that: (i) shipments using Rule 11 (without negotiated non-linear pricing) benefit from the merger (due to the "Cournot Complements effect, which generates downward pricing pressure when complementary railroads merge, as explained below) and (ii) the only theories of harm in the economic

literature for such cases (in which buyers receive prices separately from each provider of a complementary product) do not apply here. I explain these points in more detail next.

Figure 2
UP and NS Interline Traffic by Pricing Arrangement {{

}}

Source: UP and NS Waybill Data 2019-2024
Notes:
1) "All UP/NS Interline" does not equal the sum of UP and NS panels due to the avoidance of double counting UP and NS interline movements.

2. The merger will generate benefits, not harms, for shippers using Rule 11 pricing

34. Under Rule 11, the competitive setting is a variant of what economists refer to as "Cournot Complements" pricing, named for the economist who first analyzed the situation nearly 200 years ago.[25] In this situation there are one or more sellers of each of two or more products that are perfect complements, meaning each component is a necessary component that together constitute a single product. Here the components are the eastern and western legs of transcontinental rail shipments. Pricing incentives and the effects of mergers in Cournot Complements settings—which is what the Rule 11 institution creates—have been widely studied in the economic literature. A general

[25] See Cournot, A. (1838), *Researches into the Mathematical Principles of the Theory of Wealth,* New York: Macmillan; Economides, N. and S. C. Salop (1992), "Competition and Integration Among Complements, and Network Market Structure," *The Journal of Industrial Economics*, 40(1), 105–123; Vives, X. (1999), *Oligopoly Pricing: Old Ideas and New Tools,* MIT Press, pp. 176–177.

conclusion is that mergers in this setting either reduce prices or leave them unchanged, except in certain edge cases that do not apply to the merger at hand.

35. When shippers receive price quotes under Rule 11 but treat the offers as take-it-or-leave-it and do not negotiate with the railroads—the situation at issue in this section, since I dealt with the negotiated case above—they face what are known as Cournot Complements externalities. These externalities typically cause independent railroads to price higher than they would as a merged firm. The logic is as follows. When two complementary producers A and B set prices independently (pre-merger), an increase in the price by one of them raises the "combined price" paid by the customer (the sum of the two prices), which typically reduces the quantity demanded and leads to lower sales of *both* complements. The issue is that neither railroad considers the effect of its price on the profits of the *other* railroad, and thus they each set prices higher than would be optimal to maximize joint profits. This is essentially another version of the reason that separate firms selling complements have lower investment incentives than the combined firm: In both cases, each firm can take a costly action (cut price, invest more) to increase profits, but because they do not consider the profits of the *combined* firm, but rather consider only their own profits, they do not take as much of the costly action as would be jointly optimal. A merger solves both problems, leading to downward pricing pressure (relative to the situation with no merger) and increased investment. Indeed, this is the reason vertical/complementary mergers are rarely found to be anticompetitive.

36. A recent article in the economics literature identifies two edge cases where a complements merger can theoretically harm consumers, but neither edge case applies to this merger.[26] Both edge cases assume that the merged firm engages in "pure bundling" of the merged complements, which in the context of this case would mean the merged firm would refuse to provide a Rule 11 rate to a competing railroad. However, that assumption does not fit the facts of the railroad industry, as shippers have the ability to break the pure bundling strategy. In particular, by rule, the merged carrier must provide a

---

[26] See Kadner-Graziano, A. S. (2023), "Mergers of Complements: On the Absence of Consumer Benefits," *International Journal of Industrial Organization*, 89, Article 102935.

Rule 11 rate if the shipper requesting the rate has arranged service from the competing railroad for the other leg.[27] And critically, an unintegrated railroad has an incentive to provide a Rule 11 rate for a leg that it has a chance of winning—meaning it has an incentive to provide a Rule 11 rate for any leg where it is competitively relevant. This means that in cases where pure bundling could matter, the shipper can prevent it by first getting a Rule 11 rate from an unintegrated railroad and then requesting one from the merged firm. Thus, the pure bundling edge cases do not apply.

37. Even if one were to assume (counterfactually) that pure bundling were feasible, the theories of harm developed in the paper are ill-suited to the railroad industry. The first of them involves using pure bundling to deter entry. For such a theory to be relevant, one would have to believe that entry by railroads onto routes they do not otherwise serve is an important competitive consideration in the railroad industry, and thus build that reality into competitive analysis of railroad transactions, railroad rates, etc. That is not a commonly held view in this industry, as entry is not generally viewed as an important competitive consideration, and thus entry deterrence is an unlikely theory of harm. Further, even if it were relevant, whether pure bundling could even be used in this way is speculative and the welfare effects are ambiguous.[28] The other theory of harm requires that BNSF and CSX (the non-merging railroads) legs are systematically less compatible with one another (in providing interline service) than are other combinations. I know of no evidence that this is true, and, given that eastern and western

---

[27] Surface Transportation Board, Docket No. EP 705, "Competition in the Railroad Industry," January 11, 2011, p. 4 ("Finally, for either type of movement—same-source movements for which a shipper has successfully obtained an alternative routing, or different-source movements that the bottleneck carrier cannot handle in single-line service—the Board held that it could not force the bottleneck carrier to quote a separately challengeable rate for the bottleneck segment unless the requesting shipper had already entered into a rail contract for the non-bottleneck segment at the time that the bottleneck rate was requested.").

[28] Whinston (1990) makes the following observation about the use of pure bundling as an entry deterrence strategy: "Even in the simple models considered here [which are like the model in Kadner-Graziano], which ignore a number of other possible motivations for the practice [pure bundling], the impact of this exclusion on welfare is uncertain." See Whinston, M. D. (1990), "Tying, Foreclosure, and Exclusion," *The American Economic Review*, 80(4), 837–859.

railroads all interchange at common gateways, it is unlikely to hold, meaning this theory is also ill-suited to the railroad industry.

38. In sum then, for shippers who do not negotiate non-linear contracts, but rather receive prices via Rule 11, the merger will generate Cournot Complement benefits, with no offsetting harms, and thus will not lead to foreclosure harms, but rather will benefit shippers.

C. SHIPPERS WHO ACCEPT THROUGH RATES ARE NOT HARMED BY THE MERGER

39. Finally, for completeness, I turn to the smallest case: shippers who do not negotiate non-linear contracts and do not get prices via Rule 11, but rather who receive (non-negotiated) through rates. As seen above, given the prevalence of negotiated contracts and Rule 11 pricing—neither of which gives rise to foreclosure concerns—this is a small category. It is also one in which foreclosure concerns cannot be ruled out as a matter of theory (at least when the shipper receives the through rate from a railroad that faces competition), but where I show that empirical tests reject standard foreclosure theories This leaves only edge cases, which depend on restrictions on firm behavior and other assumptions that do not apply to the railroad industry, and which are addressed not by blocking the merger but rather via Open Gateway Conditions that can "clean up" any edge cases that may slip through.

1. Theoretical possibility of foreclosure for non-negotiated through rates where price is received from a railroad on the competitive end

40. As discussed above, some shippers accept through rates offered by railroads without negotiating. This occurs when rates are quoted to a shipper by a railroad on one leg of an interline route, where the contracting railroad arranges and pays for service by a complementary railroad on another leg. Under this pricing mechanism, the adjoining railroads are in a vertical arrangement where the customer-facing railroad sells the entire route to the shipper.

41. As a pure matter of economic theory, shippers who accept offers of through rates from railroads—without negotiating non-linear contractual terms—*could* face traditional foreclosure concerns. For these theories to hold, it would have to be the case that the

carrier that solely serves one segment of the route can earn greater profits by merging with a competitive carrier and foreclosing the remaining unintegrated carrier(s) on another segment. A long-standing response to these concerns has been that the sole-serving carrier can charge the monopoly rate and earn the monopoly profit *prior to a merger*. If so, then the sole-serving carrier is already earning all the profits possible and cannot increase them by foreclosing an unintegrated carrier, meaning there should be no concern about foreclosure due to the merger. *Hence, any economic theory of foreclosure has to explain why the sole-serving carrier was not earning monopoly profits pre-merger, how the merger will alter that situation, and thus why it would have an incentive to foreclose the independent railroad post-merger.*

42. In general, theories of foreclosure—that is, explanations for why the sole-serving carrier was not earning the monopoly profit pre-merger—do not apply to situations where the shipper gets a price directly from the sole-served carrier. In those cases, the sole-serving carrier gets an input price from the "upstream" railroads (those not facing the shipper directly) and, in turn, sets the final price to the shipper. In that situation, nothing stops the sole-serving carrier from setting the monopoly price (conditional on that input price). Notably it might set a higher than monopoly price if the input price is above the marginal cost of providing that service, but it should not provide a lower than monopoly price (again, absent shipper negotiation over non-linear pricing terms, which are covered elsewhere in this statement).

43. Thus, potential theories of foreclosure come down to a single, narrow case—prices that are not part of negotiated non-linear contracts, are not Rule 11, and are not through rates set by the sole-served carrier but rather are through rates received from one of the railroads on the competitive end. On its own this says that the scope for potential foreclosure is quite narrow, as this describes a narrow sliver of all shipments. And critically, the possibility of foreclosure in this narrow case is just that, a possibility, and one with specific empirical predictions that can be tested. I do so, below, and show that they do not hold.

2. Empirical tests reject the standard models of foreclosure in this case

44. Building on the logic discussed above, the case for foreclosure on non-negotiated through rates received from a railroad on the competitive end (outside of edge cases, relying on unreasonable restrictions on firm behavior, discussed in Appendix A) would be as follows, in simple terms. Something about having to work through two downstream railroads (meaning two competing railroads who compete to win the shipper's business with a through rate) prevents the upstream, sole-served railroad from being able to charge the full monopoly price. Note that this is just a theoretical possibility that does not have to be true: It may be the case that the sole-serving railroad is able to charge the full monopoly price even in this setting. And whether it can or not depends on highly detailed assumptions about things like whether pricing offers are publicly observable or not and what form they take. But if it is true that the sole-serving railroad cannot charge the monopoly price in this case, two things should be observed:

- Shippers should strongly prefer to get through rates from railroads on the competitive end, rather than railroads on the sole-served end, because if they get through rates from the sole-served end they will pay at least the monopoly price, while—if the foreclosure theory holds—if they get through rates from the competitive end, they will pay less; and
- Observed prices when through rates come from the competitive end should be lower than when the rates come from railroads on the sole-served end.

Hence, testing whether those two conditions hold—do shippers flock to getting through rates from the competitive end and are through rates lower when they come from the competitive end—provides a test of whether these theories of foreclosure hold.

45. In the next section (Section III.D), I show that neither condition holds and thus the theory of foreclosure is rejected, even in the one narrow case where it was possible.

46. This analysis shows that the economic theories of anti-competitive foreclosure that make up the bulk of the economic literature do not apply to the railroad industry. Some parties may suggest alternative theories that predict foreclosure. However, these theories will be some combination of: (i) inconsistent with generally accepted economic results; (ii)

inconsistent with the clear empirical evidence in Section III.D; or (iii) based on restrictions on railroad behavior that are inconsistent with the facts of the industry and other unsupportable assumptions. I discuss some of these theories in greater detail in Appendix A. I will respond to specific theories if they are raised by other economists, but even now I can say that they will not provide a basis to block such a beneficial transaction, and, to the extent they raise any concern at all, that is what the Open Gateway Conditions exist to address.

D. EMPIRICAL TESTS DEMONSTRATE THAT FORECLOSURE THEORIES DO NOT APPLY EVEN IN THE NARROW CASES WHERE THEY ARE THEORETICALLY POSSIBLE

47. In this section, I implement the empirical tests described above to test whether standard (non-edge) foreclosure theories hold even in the one narrow case where they might: non-negotiated through rates received from railroads on the competitive end. I show that they do not.

48. In particular, I implement the following tests:

- Where shippers obtain through rates, do they primarily obtain them from a railroad on the competitive end? **Answer: No**
- Are through rates obtained from the competitive end lower than other rates? **Answer: No**.

1. Shippers do not favor obtaining through rates from downstream competitive carriers

49. To implement the first test—assessing whether, when shippers obtain through rates, they primarily obtain them from the competitive end—I rely on data on through rates observed in the UP and NS 2019-2024 waybill data limited to routes with a sole-serving carrier on one end and competition on the other end. I have to make two key implementation decisions: how to define competition (discussed below) and which through rates to study. For the latter, the issue is that this theory of foreclosure only applies to through rates that are not set pursuant to negotiation over non-linear contractual terms. But there is no perfect way to define such through rates in the data, so I consider three approaches:

- Look at all through rates;
- Look at through rates other than contracts (meaning private quotes, other non-tariff rates, and tariffs), in this way eliminating the through rates most likely to reflect negotiations over non-linear price terms (contracts);
- Look only at tariff rates (thus eliminating price quotes and other non-tariff rates, which may also reflect negotiation over non-linear price terms)

I show that all three approaches yield the same conclusion.

50. My analysis considers two alternative definitions of competition: "Competition Version 1," which uses industry location data[29] *and* observed traffic,[30] and "Competition Version 2," which uses only industry location data. Of the two, Competition Version 2 is more likely to label a route-segment as sole served. I show that both approaches yield the same conclusion.

51. In Figure 3, I show the breakdown of UP and NS through rate traffic with a sole-served segment and a competitive segment. Using "Competition Version 1" I find that nearly {{ }} percent of the through rate traffic under consideration is contracted with a carrier on the competitive segment. Similar findings emerge under my alternative competition definition (see lower panel). *Hence, shippers do not flock to getting through rates from a railroad on the competitive end; rather, it is either almost {{ }}. This is not consistent with a theory of foreclosure, as that would involve lower rates when they are received from the competitive end, meaning shippers should strongly prefer that setup.*

---

[29] Access for a given Class I railroad at a particular station is determined using the centralized station master ("CSM") and Serving Carrier/Reciprocal Switch ("SCRS") files such that a particular railroad station, defined as the combination of: SPLC-SCAC-FSAC, is considered to be open to competition from another Class I carrier if the other Class I carrier has open access to one or more customers in common with the railroad/station in question.

[30] In particular, if a Class I railroad is observed originating, terminating, or interchanging more than 1% of carloads for a given group of commodities at a particular station (SPLC-6) in the STB confidential Carload Waybill Sample from 2019-2023, that railroad is determined to be competitive at that origin or destination for shipments of that commodity group.

Notes:
1) "UP/NS Total" does not equal the sum of UP and NS panels due to the avoidance of double counting UP and NS interline movements.
2) I determine who the shipper deals with is determined based on the issuer of the shipment's Price Authority.

52. In Figure 4, I examine this split over time. Again, the chart demonstrates that shippers do not favor dealing with the carriers on the competitive end when obtaining through rates. Instead, the percentage bounces around {{ }}, exactly as one would expect if there was no preference between the two, and the opposite of what one would expect if the theory of foreclosure held.

Figure 4
Through Rates By Who Shipper Deals With
UP/NS, All Traffic, By Year {{

}}

Source: UP and NS Waybill Data 2019-2024, AAR Centralized Station Master (CSM), Serving Carrier Reciprocal Switching Data (SCRS).
Notes:
1) I determine who the shipper deals with based on the issuer of the shipment's Price Authority.

53. As noted above, I conduct a similar analysis using the subset of through rate traffic moving under: (1) everything other than contracts (i.e., private quotes, other non-tariff rates, and tariffs) and (2) tariffs only. Each of these represents a way to zoom in on traffic less likely to reflect negotiations over non-linear pricing terms.

54. As shown in Figure 5, when looking at everything other than contracts, there is no evidence that shippers prefer to obtain rates from a railroad on the competitive end. In fact, in almost every year, more of the non-contract prices are obtained from the *sole-served* end, exactly the opposite of what the foreclosure theory would predict. The fact that shippers using non-contract rates do not seek out rates from the competitive end—as they would under the standard theory of foreclosure where those rates should be lower than rates obtained from the sole-served end—is strong evidence against a theory of foreclosure. Said differently, the standard theory of foreclosure requires that something is holding rates down when they are obtained from the competitive end, meaning shippers should strongly prefer that setup, but that pattern does not hold.

Figure 5
Through Rates By Who Shipper Deals With
Non-Contracted Traffic, By Year {{

}}

Notes:
1) I determine who the shipper deals with based on the issuer of the shipment's Price Authority.

55. Finally, Figure 6 looks at tariffs only. This is the most restricted set of traffic, but also the one least likely to be subject to negotiations over non-linear pricing terms. Again, I find that obtaining through rates from the competitive end is actually less common than obtaining them from the sole-served railroad, occurring only {{ }} percent of the time. Once again, this refutes the standard theory of foreclosure in which the pattern should go the other way.

Figure 6
Through Rates By Who Shipper Deals With
Tariff Traffic, By Year {{

}}

Source: UP and NS Waybill Data 2019-2024, AAR Centralized Station Master (CSM), Serving Carrier Reciprocal Switching Data (SCRS).
Notes:
1) I determine who the shipper deals with is determined based on the issuer of the shipment's Price Authority.

2. Rates are not lower when dealing with the competitive carriers relative to dealing with the sole-serving carrier

56. Next, I turn to the second part of the test: Are through rates lower when they are negotiated on the competitive end? Again, I consider my two definitions for the presence of competition, as well as alternative sets of through rates in an attempt to focus on rates that are not set by negotiation over non-linear contractual terms. As in the prior section these alternative sets are: (1) all traffic; (2) non-contract traffic; (3) tariff traffic only.

57. To implement this test, I run a multivariate regression analysis, comparing through rates obtained from the competitive end with through rates obtained from the sole-served end, after controlling for many other factors that affect rates.[31] Regression analysis is a standard tool used by economists to measure economic relationships between a response variable (also known as a "dependent variable") and a variable of interest, while holding

[31] Data are aggregated to the following unit of observation: railroad, route, commodity, shipper, year-month, car type, car owner, pricing document type, and unit train flag.

constant key confounders (also known as "control variables"). I rely on aggregated UP/NS waybill data from 2019-2024.

58. The measure of price in the regression is the natural logarithm of the rail rate, defined as the revenue per carload. In addition to the variables of interest (which indicates whether the rate comes from the competitive or sole-served side), I include control variables to account for various factors that may also impact pricing on a particular rail shipment, including controls for commodity, car owner, car type, whether it is a unit train, type of pricing arrangement (contract, private quote, etc.), average net weight per car, and the year/month of the observation. I also include what are known as "fixed effects" for each route—a set of control variables that fully account for all differences *across routes*. In this way, the test is implemented by comparing rates obtained from the competitive end and rates obtained from the sole-served end, holding constant the origin and destination—meaning only within-route variation is used to measure the effect, not across-route variation.

59. Figure 7 shows results based on the two methodologies used to define competitive and sole-served segments in prior figures ("Competition Version 1" using industry location data *and* observed traffic and "Competition Version 2" using only industry location data).

Figure 7
Test for Presence of Foreclosure Incentives in Through Rates

Notes:
1) Explanatory variables include fixed effects for: route, STCC3, car owner, AAR car initial, unit train dummy, type of pricing arrangement (contract, private quote, etc.), year-month, reporting railroad dummies; weight and weight^2.
2) ** P-value<0.05; * p-value<.1. Clustered standard errors in brackets (clustering at the route level).
3) "Competition Version 1" uses industry location data and observed traffic. "Competition Version 2" uses only industry location data.

60. The second row measures the difference between through rates when the shipper obtains through rates from the sole-serving carrier vs. through rates when the shipper obtains rates from the competitive end. If shippers receive lower rates when dealing with the competitive carriers this estimate would be positive and statistically significant. However, as shown in the second row of Figure 7, the estimate is actually small, negative (approximately negative 4 percent), and statistically indistinguishable from zero.

61. The second column displays the results from the same test applied using the alternative competition definition ("Competition Version 2"). Again, the estimate is negative—not positive as it would be expected under an operative foreclosure hypothesis—and statistically insignificant.

62. As a further test, I conduct the same regression analysis applied to non-contract traffic, meaning private quotes, other non-tariff rates, and tariffs. By eliminating contract traffic, the analysis eliminates the subset of traffic, which is most likely to reflect negotiations with non-linear terms. These analyses, presented in Figure 8, also find that through rates obtained from the competitive end are not lower. Under both "Competition Version 1"

and "Competition Version 2" the estimates are negative and not positive, as it would be expected under an operative foreclosure hypothesis

3) "Competition Version 1" uses industry location data and observed traffic. "Competition Version 2" uses only industry location data.

63. Finally, I conduct the same regression analysis applied to tariff traffic. This is a small subset of the overall interline traffic, but I study it despite the data limitations because it is least likely to be subject to negotiations over non-linear pricing terms. This analysis, presented in Figure 9, again finds no difference in rates depending on the carrier from which shippers obtain through rates.

64. To sum up the evidence presented in this section, my analyses demonstrate that there is no statistical evidence that shippers negotiate lower rates when they get through rates from the competitive end of a movement. If anything, rates are a bit lower when shippers get them from the sole-served end, although the difference tends to not be statistically significant. Once again, then, the empirical evidence does not support the theory of foreclosure, even in the narrow cases where it might apply.

E. ASYMMETRIC INFORMATION ON COSTS AND OTHER EDGE CASES DO NOT CREATE INCENTIVES FOR ANTICOMPETITIVE FORECLOSURE

65. The analysis above rules out the most prominent theories of foreclosure. In this section, I turn to some other theories of foreclosure that could potentially be raised. First, recent economic literature has raised the counterintuitive possibility that the improved information resulting from a merger could enable a form of foreclosure, through which railroads harm shippers by extracting more value from them. However, even the published literature on this topic finds that more information is efficient, meaning that it increases total output and total welfare. In the case of the railroad industry, this would

mean the industry was more effectively doing its job of moving traffic and that the ultimate consumers of the railroad industry—the downstream buyers who consume the products that are shipped—are better off. And I show that the counterintuitive finding in the literature that more information can harm shippers depends on the unreasonably restrictive assumption that shipper demand does not decline at all with higher prices, and that once this assumption is relaxed, the result is reversed, with more information increasing consumer welfare.

66. I then turn briefly to some other "edge cases"—economic theories where foreclosure may be possible, but which depend on unreasonable restrictions on firm behavior or other assumptions not well suited to the railroad industry. I explain why these theories provide no basis to oppose the merger, but at most point to the value of Open Gateway Commitments to resolve any stray cases. I provide more detail on edge cases in Appendix A.

1. Concerns regarding mergers when the sole-serving railroad has incomplete information

67. A recent model developed by Moresi *et al.* ("Moresi") raises the possibility that foreclosure harms from vertical mergers may occur in settings where downstream competitors have private information.[32] For example, an upstream (non-customer-facing) railroad may have incomplete information about a downstream railroad's costs or the shipper's demand. The downstream, customer-facing railroad, of course, knows its costs and is likely to have better information about the shipper's demand than the upstream firm because it interacts directly with the shipper. A vertical merger of such a downstream railroad with such an upstream monopolist would transfer the downstream railroad's information upstream. The concern raised in the Moresi model is that transferring information to the monopoly railroad through merger would allow the

---

[32] Moresi, S., D. Reitman, S. C. Salop, and Y. Sarafidis (2021), "Vertical Mergers in a Model of Upstream Monopoly and Incomplete Information," *Review of Industrial Organization*, 59(2), 297–336.

merged railroad to price more aggressively and thus more effectively extract shipper surplus.

68. This concern is misplaced. First, even in the Moresi model, both output and total welfare rise. Notably, in the context of the railroad industry, the fact that output increases means that the railroad industry is more effectively doing its job of moving goods, and that downstream consumers (those who buy from shippers) are better off, as more goods are bought and sold. Second, the finding in the Moresi model that the merger lowers consumer surplus is driven by an unrealistic and overly restrictive assumption: that consumers (shippers) have perfectly inelastic demand, meaning that changes in price, in either direction, have no effect on demand. When this assumption is replaced by the more realistic assumption that shippers have downward sloping demand, the merger increases shipper welfare and continues to raise output and total welfare. I develop each these points in more detail in the following paragraphs.

69. The Moresi model has two elements: a vertical merger between an upstream monopolist and one of two downstream oligopolists, and the information transfer that the merger brings about. Given the inherent benefits of vertical mergers, described above, and the fact that information transfer frequently enhances efficiency, it would be surprising if adding an element of information transfer to a vertical merger resulted in a transaction that was harmful to consumer welfare. However, under the highly restrictive and stylized assumption that consumers (shippers) have perfectly inelastic demand with a known reservation price, the Moresi model finds that the merger harms consumer welfare because the improved information enables the merged firm to extract more value from consumers (shippers).

70. In fact, this prediction of the Moresi model is an artifact of the inelastic demand assumption. This assumption is unreasonable in the railroad industry for one or both of the following reasons: (i) shippers are likely to want to ship more in response to a lower price (standard downward sloping demand); and (ii) shippers likely have private information about their valuations for any given shipment, which means that a shipper's expected purchases likely increase as price falls (downward sloping expected demand). The first of these likely holds because shippers sell their goods in downstream markets,

and if shipping costs go up, they are likely to have to pass some of these variable costs on to their consumers, reducing demand for their products, and thus reducing the amount shipped. The second of these holds because even if shippers *do* in fact have a fixed reservation price (or willingness to pay), railroads surely do not know it, and so as railroads raise prices, the probability of going over that reservation price rises, reducing the expected amount sold.

71. Hence, the Moresi model only works under the truly extreme assumption that shippers have a fixed willingness to pay *and* railroads know what it is with certainty. Note how strong the second part of this assumption is in the context of the Moresi model: the sole-serving railroad is assumed to lack information about the other railroad's costs, yet to have perfect information about shippers' willingness to pay. In practice, the sole-serving carrier's uncertainty about shippers' willingness to pay is likely to be *greater than* its uncertainty about the downstream railroad's costs. Railroads are likely to have a reasonable understanding of the cost of rail service between two points. However, there is no reason to assume that a railroad that does not interact directly with a shipper has particularly good information about that shipper's willingness to pay for transportation or the shipper's customers' sensitivity to higher delivered prices. Strikingly, however, to generate its results, the Moresi paper assumes *perfect* information about shippers' willingness to pay, while information about other firms' cost to ship is limited. Such an assumption is not reasonable, yet it is required to generate the result that greater information harms shipper welfare.

72. In the Moresi model, under these extreme assumptions, the merger reduces shipper surplus (in fact, it leads to complete extraction of shipper surplus). However, this finding is an artifact of Moresi's assumptions that: (i) shippers have perfectly inelastic demand and (ii) the sole-serving carrier knows the shipper's reservation price (i.e., the highest price the shipper is willing to pay). In Appendix B, I show that a straightforward extension of the model to allow downward sloping demand for shippers leaves the output and welfare results unchanged—the merger increases output and total welfare—but reverses the shipper welfare result. More specifically, I find that for the case of linear demand and uniformly distributed costs, a merger increases shipper surplus in addition to

increasing output and total welfare. The increase in shipper welfare is the result of the railroad making more sales at lower prices and the fact that it cannot fully extract the shipper's surplus as it can in Moresi. In addition, both the shipper and the railroad benefit from the increase in output that results from the elimination of inefficiently high prices resulting from poor information. These results mirror the standard efficiency effects of vertical mergers in the case of complete information, described above.

73. Put simply, as long as railroads face lower demand as they raise prices—the standard economic assumption—the Moresi result is reversed and greater information increases consumer surplus. For this reason, the information transfer (between UP and NS) engendered by the merger is not a source of competitive concern, but rather a benefit.

2. **Edge Cases**

74. This section has presented strong, general results rejecting foreclosure as a significant concern in the railroad industry. Those results consider carefully the modern literature on cases where foreclosure may occur, but reject those cases as inapplicable—as a matter of theory, marketplace realities, and empirical evidence—to the railroad industry. As I have explained, that is not to say that other economists could not present alternative theories of foreclosure and claim they apply to this industry and this transaction. Here, I can confidently say any such theories would describe, at best, "edge cases," based on unreasonably restrictive assumptions about firm behavior or other assumptions ill-suited to the railroad industry. I briefly discuss these edge cases here and explain why they do not apply to this merger. See Appendix A for more detail.

75. As one example, in complete information settings with an upstream monopolist selling to downstream *differentiated* oligopolists using linear contracts (per-unit "wholesale" prices), a vertical merger can raise prices if downstream firms are highly asymmetric, specifically, if consumer substitution from competitor A to B in response to a reduction in B's price is sufficiently different from the consumer's substitution from B to A in response to a reduction in A's price. However, such theories are ill-suited to the present case for multiple reasons. First, the restriction to linear pricing does not describe the vast majority of railroad transactions, in which terms are more complicated than that. Rather

than involving a single price at which any amount of traffic can be shipped, they include volume commitments, different prices for different volumes, specific agreements on how much to ship, and so on. And second, the specific type of asymmetry such theories require in order to work does not arise when contracts are customer-specific and customers themselves sell products to final consumers, which is the case with shippers in the railroad industry (see Appendix A).[33]

76. As an example that moves beyond linear pricing, in complete information settings with an upstream sole sourcing supplier selling through observable non-linear contracts, and with differentiated downstream oligopolists, the pre-merger price equals the price set by a fully integrated railroad.[34] If a merger occurred in this setting and there was no Rule 11 option, there would be a theoretical possibility that prices to shippers could rise if (i) downstream firms were sufficiently asymmetric, and (ii) the merging firm could not adjust its contract to ensure the fully integrated outcome continues to arise post-merger. However, given that this model assumes that railroads are already engaged in sophisticated non-linear contracting to ensure the fully integrated outcome pre-merger, there is no reason to believe they could not write a contract replicating that outcome post-merger, and in that case, the merger would not change anything. Hence, this is another case where claims of merger harm would be based on unreasonable restrictions on firm behavior in the post-merger case, with those restrictions, not the merger itself, generating the harms.

77. I discuss such edge cases further in Appendix A.

---

[33] The customers in rail freight markets are firms that sell the products they ship to customers, and rail services from different carriers are inputs into their production and sales process. Under the typical assumption that a shipper's profits from manufacturing and selling its product is a continuous function of the prices of different rail inputs, the cross derivatives of the demand for two rail inputs are equal. See Varian, H. R. (1992), *Microeconomic Analysis*, 3rd Edition, W.W. Norton & Company, p. 60.

F. OPEN GATEWAY COMMITMENTS

78. As discussed, the proposed merger does not raise any significant concerns with respect to vertical foreclosure. While I will address any theories of foreclosure raised in opposition to the proposed merger in subsequent reports, they will almost surely be edge cases, not well-suited to this industry. Nevertheless, to the extent there remains any concern that some of these edge cases may "slip through" and apply to isolated, atypical transactions, those are precisely the situations open gateway commitments are designed to address.

79. UP/NS is making a series of commitments to maintain open gateways on commercially reasonable terms. These commitments mirror those imposed in the CP-KCS merger and include:[35]

- Keeping all existing gateways open in perpetuity on commercially reasonable terms (including both rates and service), for both existing and new traffic;
- Offering connecting carriers commercially reasonable rate divisions and negotiating in good faith regarding disagreements;
- Ensuring no new regulatory bottlenecks that could limit STB rate review;
- Providing (upon request) written justification of price increases in excess of inflation; and
- Submitting monthly reports on interchange volumes at gateways during the oversight period.

80. These open gateway commitments provide further support for the conclusion that the merger will not create any material vertical harm. These commitments demonstrate UP/NS' intention to work with interline partners to maintain efficient competitive alternatives and provide monitoring mechanisms and enforceable obligations with respect to UP/NS's treatment of shippers and interline partners.

IV. DUE TO ITS COMPLEMENTARY NATURE, THE UP/NS MERGER WILL GENERATE SIGNIFICANT PRO-COMPETITIVE BENEFITS FOR SHIPPERS

81. As an end-to-end combination, the proposed merger will bring complementary rail networks under the control of a single firm and thus generate significant benefits for shippers that cannot be achieved in any other way. These results follow due to the economics of externalities: Because of the enormous amount of interline traffic, pricing, operational, and investment decisions made by one railroad have large effects on the complementary network. When operating separately, railroads make decisions based on their individual profits rather than the profits for the combined network. They do not take the effects of their decisions on their interline partner into account. Quite simply, then, they consider the wrong profits from the point of view of the combined network, which is the relevant network when it comes to serving the needs of shippers. As a result, prices are set higher than would be optimal when the effects on both networks are considered; too few investments are made relative to what would be optimal for the combined network; and operational decisions are made without regard to the effect on the complementary network. Shippers suffer from each of these outcomes. The merger corrects all of them, and Nobel prize-winning economics proves that no other solution can do so.

82. As discussed below, vertical integration gives optimal incentives to the merged railroad to maximize the value of the combined network. Moreover, the benefits cover all aspects of the operation of the combined network, including pricing that eliminates double marginalization, more efficient scheduling and operations, and greater and better coordinated investment.

A. BENEFITS OF VERTICAL MERGERS

1. Independent railroads operating complementary networks cannot coordinate their operations and investments as efficiently as a single combined railroad

83. Collaborations and cooperation notwithstanding, independent railroads cannot operate complementary railroad networks together as efficiently as a merged railroad can. When operating independently, each railroad maximizes its own profit. Therefore, to provide

efficient incentives to engage in costly activities, each railroad would need to receive all of the marginal profit resulting from its efforts to increase the profitability of the railroads' joint movements. However, it is not possible for each railroad to receive ***all*** of the marginal joint profit— there are two railroads and only one joint profit to share between them. Thus, optimal incentive payments add up to more than the joint profit that they share.[36] In such a situation, each railroad will maximize its own individual profits at the expense of optimal outcome that maximizes joint profits across the complementary networks. This is often referred to as double moral hazard.

84. Notably, there may be certain decisions in the course of operating separate railroads that rest with UP, while others rest with NS. It may be tempting to say that the incentive problem could be solved by giving all of the marginal profit to the relevant railroad in each case. But such a solution is clearly impossible; the relevant railroad varies from decision to decision, multiple times each day, and thus no division of profits between the railroads can possibly create the right incentives for each of them properly to consider effects on overall rail service. Only a merger that brings the railroads under common control can fully align incentives to maximize joint profits and solve this problem.

85. Nor can the problem be solved with sufficiently rich contracts. In practice, it is impossible to write a complete contingent contract that specifies how the two railroads must manage their interline business on a day-to-day basis. Such a contract would require dictating decisions or rules in every state of the world: every service choice, every investment decision, every price, and so on, accounting for every possible outcome of everything that is uncertain. They would have to say how each railroad should operate under any scheduling circumstance, what investment decisions should be made under all operational and economic conditions, how prices should be set under all demand scenarios, and so on. While economists may be able to talk of such "complete contingent

---

[36] Holmstrom B. (1982), "Moral Hazard in Teams," *The Bell Journal of Economics*, 13(2), 324–340.

contracts," they have no relation to industry reality. Once again, only a merger—with its full alignment of incentives—can solve this problem.

86. This intuitive result—that, in the presence of double moral hazard, where each firm takes actions that are not fully observable to the other but which jointly determine the profits of both firms, only a merger can generate optimal outcomes—was developed into a formal proof by Bengt Holmstrom, the winner of the 2016 Nobel Prize for Economics. He showed that as long as each firm must engage in costly noncontractible activities, there is no profit-sharing rule, transfer price schedule, or contract that implements the fully efficient incentives across the two firms' complementary networks. *Only a merger can generate the benefits described in this section.*

87. The solution enabled by a merger is both simple and elegant. The merged railroad receives the full marginal profit from its management efforts across the combined network, so the resulting incentives are optimal for maximizing the network's value. Bringing the two railroads under common ownership and control is the only solution that corrects the railroads' suboptimal incentives. Thus, there is no question that the merger's benefits are, in fact, the result of the merger itself. They cannot be obtained by other means.

2. Double-moral hazard affects all aspects of decision-making regarding joint movements

88. The theory of incentives described above is powerful because it is quite general. The suboptimal incentives of independent railroads operating complementary networks leads to well-recognized inefficiencies, including pricing inefficiencies (referred to by economists as 'double marginalization'), suboptimal operational and scheduling decisions (*i.e.*, failing to consider the benefits to the complementary network), and insufficient investment.

89. One specific example of an inefficiency created by separate networks is double marginalization. Double marginalization occurs because each railroad raises its price to maximize its own profits without regard for the negative impact of its price on the sales of its partner on joint movements. Double marginalization illustrates the problem that

neither railroad has efficient pricing incentives because neither has the optimal *marginal profit incentive*. Each considers only its own marginal profit, rather than the margin of the combined profit on the movement. For example, a carrier negotiating a rate using Rule 11 sets that rate to maximize its own profit. However, an increase in one carrier's rate lowers demand for the service of its interline partner, lowering its partner's profits on the movement. Each carrier sets its price above the optimal level because it does not account for the effect of its price on the full joint profit of the movement. Elimination of double marginalization from the merger puts downward pressure on prices relative to prices that would exist absent the merger. The same problem of inefficient incentives arises in the context of through rates and investment as well.

90. Suboptimal incentives arising from double moral hazard also affect how railroads coordinate operations over long and short time frames. For example, two railroads' schedules could be optimized to work together, which means neither railroad would have an optimal schedule from its own perspective. However, such optimization is difficult to effect when each railroad seeks to maximize its own profits. The two railroads coordinating schedules will invariably view differently the tradeoffs associated with coordinating schedules.

91. Schedules can also be affected in the very short run, such as when a train is running late and may miss an interconnection, raising the question whether to hold the connecting train. The optimal response to a late train may depend on factors such as whether its shipments are time-sensitive, the degree of congestion on the network, and the potential for creating congestion through the response to the late train. Of course, the response that optimizes joint profits will impose different costs and yield different benefits for the independent railroads, making optimal coordination impossible absent a merger.

92. Investment incentives are also suboptimal because an investment that increases demand on one network will increase demand on the partner railroad's complementary network as well. However, the railroad considering the investment will make its investment decision based solely on the impact on its own profitability. One example, which I discuss in more detail in Section IV.B.5, is the scheduled improvements to the UP mainlines. The merged UP/NS plans to invest in double-tracking much of the mainline, improvements

made profitable by the anticipated post-merger increase in traffic. The proposed merger will make a larger number of investments like this one profitable, leading to a redirection and likely increase in investment in the network.

B. THE UP/NS MERGER WILL ENHANCE COMPETITION AND GENERATE SIGNIFICANT PRO-COMPETITIVE BENEFITS

93. The pro-competitive benefits of the merger include (1) costs savings and the elimination of double marginalization, which will put downward pressure on prices relative to a no-merger world, (2) improved scheduling and operations, providing more efficient service to shippers; and (3) greater investment in the rail network. Perhaps the most obvious benefit of this transaction is the improved, single-line, transcontinental service that UP/NS will offer. For shippers, eliminating the need for an interchange is akin to the difference between connecting air travel service and a nonstop option. The introduction of direct, single-line service eliminates the cost, scheduling uncertainty, coordination, and added transit time associated with interchanging traffic, and is a clear benefit to shippers and railroads.

1. Cost Savings

94. I understand that the parties expect the merger will generate substantial cost reductions. When fully implemented (i.e., following the merger when UP and NS are fully integrated and the costs and benefits are annual and recurring[37]), these are expected to total nearly one billion dollars ($965 million).[38] These savings arise from the elimination of redundancies, the adoption of best practices, and the more efficient utilization of resources made possible by bringing both organizations under common control.

95. The anticipated savings come from numerous specific changes in operations designed to optimize the use of existing capital and labor and take advantage of operational changes to provide more efficient transportation services. Examples from the operating plan, as explained by UP/NS, include the following, all of which are consistent with the economic

---

37 Verified Statement of Grant Janke (hereinafter Janke V.S.), ¶ 10.

38 Janke V.S., Table 4. Amounts are expressed in 2023 dollars.

teachings, described above, on the efficiencies that can be unlocked when firms operating complementary networks have the ability and incentive to coordinate their activities.

- More efficient use of locomotives and rolling stock. The improved operation of the integrated network is expected to reduce the number of locomotives and amount of rolling stock required to meet service needs following the merger. "The Optimized operating plan improves railcar utilization through more single-line service, decreased handlings and yard work, reduced dwell time, and optimized movements including increased train speeds."[39] In addition, more efficient railcar distribution will result in fewer empty car miles, improved cycle times, and higher service levels.[40]

- Consolidation, rationalization, and more efficient use of yards, railcars, and locomotive maintenance facilities. By consolidating and re-optimizing across the combined network UP/NS can achieve required levels of operations with fewer resources and lower costs.[41]

- Detailed changes in operations and systems with respect to maintenance-of-way, repair management, track maintenance, crew management, etc. These entail specific changes involving adoption of best practices and applying better systems across the broader UP/NS network[42].

96. In addition to changes in the operating plan and operating improvements, there are reductions in annual administrative costs ($198 million annually) and management costs ($260 million annually) when fully implemented.[43]

97. Merger-related cost savings and efficiency improvements that reduce the marginal cost of rail service or permit the provision of higher quality service at reduced costs improve the

43 Janke V.S., Tables 1 and 3.

competitive position of UP/NS. Reduced costs should be expected to be passed through to consumers in some form, even in industries that are imperfectly competitive.[44] The pass through of efficiencies could take the form of price reductions or the provision of higher-quality service without increasing price. Thus, merger-related efficiencies may permit UP/NS to offer rail transportation at lower rates than would otherwise have been possible or provide higher quality service than would otherwise have been available. Merger-related cost reductions are unambiguously procompetitive.

2. Elimination of Double Marginalization

98. Technically speaking, double marginalization refers to the presence of successive markups in vertical settings, where each of the upstream and downstream firms charges a markup over marginal cost. More generally, double markups result from an externality. When setting its rates, the downstream railroad does not consider the impact of its pricing decisions on the upstream railroad's profits, and vice versa.[45] As a result, under double marginalization prices rise above the price that a vertically integrated firm would charge absent the merger. This is precisely analogous to the Cournot Complements issue, described above, applied to a vertical setting, independent firms selling complements set prices too high because they do not internalize the benefits lower prices convey on one another.

99. Importantly, while the elimination of double marginalization puts downward pressure on rates relative to the state of the world absent the merger, it does not imply that post-merger rates will necessarily be lower than pre-merger levels. Vertical mergers improve pricing incentives and frequently reduce costs, creating downward pressure on rates relative to the state of the world that would exist absent the merger. However, rates regularly go up with inflation, which could offset the elimination of double

---

[44] See, *e.g.*, Miller, N. H., M. Osborne, and G. Sheu (2017), "Pass-Through in a Concentrated Industry: Empirical Evidence and Regulatory Implications," *RAND Journal of Economics*, 48(1), 69–93.

[45] See, e.g., Davis, P., and E. Garcés (2009), *Quantitative Techniques for Competition and Antitrust Analysis*, Princeton University Press, pp. 505–507.

marginalization, for example. Alternatively, the merged railroad could choose to increase quality without raising prices, which is a reduction in the quality-adjusted prices. As described above, these are all versions of the same phenomenon: once combined profits are considered, more costly actions—whether they be lower prices or investments to increase quality—will be undertaken than would be absent the merger. What one can safely say is that the merger puts downward pressure on prices relative to the case with no merger; this pressure may take the form of prices lower than they otherwise would have been, higher quality, or some combination of those, depending on which turns out to be optimal.

3. Empirical demonstration of lower costs and/or elimination of double marginalization

100. To confirm empirically what is known as a matter of economics—that rates will face downward pressure as the result of costs savings and the elimination of double marginalization—I conducted a multivariate regression analysis to test whether prices on comparable routes are lower for single-line service, which the merger is expected to make more broadly available, relative to rates observed on interline traffic. To illustrate in simple terms, the regression compares, for example, UP's single-line rate on a 1,000-mile shipment of plastic pellets to the total interline rate on a 1,000-mile shipment of plastic pellets that originates with UP and is delivered by another Class I carrier. As with my regressions testing for foreclosure, above, I include controls for other factors that affect pricing, including: commodity, car owner, car type, unit trains, type of pricing arrangement (contract, private quote, etc.), the year-month of the shipments, the median rail distance between the origin and destination, and the average net weight per car.[46] I also include control variables for local conditions at both the origin and destination of the move: the number of Class I railroads, GDP per capita, personal income, and population. These explanatory variables ensure that the measured price differences are the result of interlining and not due to differences in shipment characteristics or costs.

---

[46] To allow for flexible, non-linear effects, distance and weight are included as both linear and squared terms.

101. The regression sample is based on UP and NS's combined waybill data. It is limited to single-line movements and interline movements originating and terminating within the United States, where UP or NS's interline partner is another Class I railroad. In the case of Rule 11 traffic, the dataset is further limited to rates for UP-NS interline traffic from 2019 to 2024, for which it has been possible to link up the individual Rule 11 waybills and construct a combined rate that covers both the Eastern and Western portions of the move.

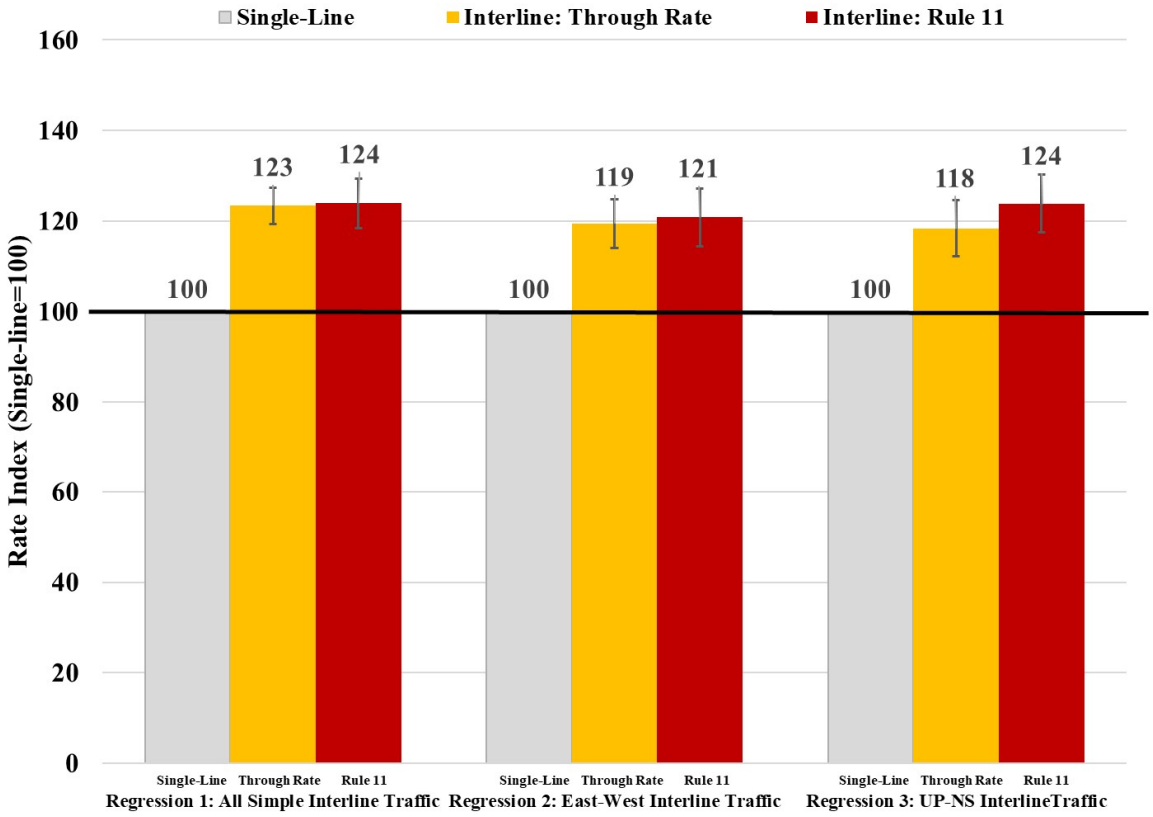
Notes:
1) Fixed Effects: STCC3, car owner, AAR car initial, type of pricing arrangement (contract, private quote, etc.), unit train dummy year-month, reporting railroad dummies. Control variables include distance and distance^2, weight and weight^2, local conditions (at both origin and destination): number of Class Is, (log) GDP per capita, (log) personal income, and (log) population.
2) ** P-value<0.05; * p-value<.1. Clustered standard errors in brackets (clustering at the route level).
3) Simple interline moves defined as traffic involving two line-haul carriers on routes with no single-line service by UP or NS.
4) Rule 11 rates are limited to rates for UP-NS interline traffic, for which it has been possible to link up the individual Rule 11 waybills and construct a combined rate that covers both the Eastern and Western portions of the move.
5) Competition variables based on "Competition Version 1".
6) The effect in % terms is computed as: exp(β) - 1.

102. The results in Figure 10 demonstrate that interline moves are priced substantially higher than comparable single-line moves, consistent with the combination of lower costs and the absence of double marginalization on such movements. The first two columns report the results from estimating the regression on a sample that includes single-line moves, as



well as all "simple interline" traffic, defined as moves involving two line-haul carriers on routes that do not have single-line service by UP or NS. Column (2) shows that, for comparable shipments, through rates are approximately 23 percent higher than single-line rates and Rule 11 rates are approximately 24 percent higher than single-line rates.

103. The finding that interline rates are higher than single-line rates persists across multiple variations of this analysis, demonstrating that this result is robust (meaning not sensitive to small changes in the data or the regression specification). As the first alternative, I conduct the same analysis as above but limit the interline shipments in the data to those crossing the Mississippi River. These are routes that originate, for example, in the West on UP or BNSF and are completed by NS or CSX in the East, and vice versa. This limitation focuses the regression on the types of routes that will transition from being interline routes to single-line routes following the merger. Columns (3) and (4) of Figure 10 present the results from this test. I find a significant interline premium. Through rates are approximately 19 percent higher than comparable single-line rates, and Rule 11 rates are approximately 21 percent higher than comparable single-line rates.

104. For the second alternative regression, I conduct the same analysis limiting the traffic to only UP-NS interline moves. The results of this analysis are shown in columns (5) and (6) in Figure 10. This analysis once again finds a statistically significant and substantial interline premium: approximately 18 percent for through rates and approximately 24 percent for Rule 11 traffic.

105. In Figure 11, below, I present a graphical summary of the regression estimates reported in in Figure 10.

4. Schedule and Operations

106. Merger-related improvements to service and operations will allow UP/NS to offer higher-quality rail transportation than would otherwise have been available. Such improvements are pro-competitive and benefit shippers and the public interest.

107. Shippers will benefit from improved routing and coordination between the formerly separate railroads, yielding higher quality service. In particular, shippers will benefit from: (i) the expansion of single-line service, which will reduce transit times and eliminate costly interchanges; (ii) improved routings that will allow traffic to avoid

congested gateways, reducing delays; and (iii) more seamless interactions to schedule and track shipments.[47]

108. The STB has recognized the benefits of such scheduling and operational improvements from integration, citing service and operational improvements as important benefits of prior rail mergers. For example, in its CPKCS Decision, the Board noted[48]:

> [T]he record indicates that the Transaction should result in qualitative benefits to the shipping public, including more single-line service, new and improved routes, more gateway choices, more reliable service, and reduced terminal delay.

109. In fact, these benefits are borne out in data that show that railroads win a higher percentage of traffic than trucks when single-line service is available versus when it is not available.[49] One benefit of single-line service is the reduction in transit time that results from the elimination of interchange handlings between railroads.[50] The benefits of improved routings and more efficient operations are also explained in detail in the Operating Plan filed with this application.[51] In particular, the parties highlight opportunities to offer faster and more reliable service by eliminating interchanges and implementing new blocking plans.[52] For example, the operating plan notes transit times on routes between Southern California and the Northeast are anticipated to fall by 17 to 19 hours, and transit times between Southern California and the Southeast are anticipated to be cut by 70 to 95 hours.[53]

5. Investment Incentives

110. As explained in Section IV.A, above, independent railroads make sub-optimal investment decisions. Vertical integration corrects these incentives and benefits shippers in the form of greater investment. The economics behind this is simple; separate railroads face the full cost of an investment, but only earn the profit on their part of the complementary network, and thus too few investments will pass the internal financial "hurdle rates" require to be undertaken.

111. A simple example may help to illustrate. If a railroad could take an action that generated $100 of incremental profit for the joint movements across the railroad's networks at a cost of $60, the action should be undertaken. However, if the railroad keeps only 50% of the profits on joint movements, the railroad will not take the efficient action because it would keep only $50 of the benefit, which is less than the $60 cost of taking the action. The same problem exists in more complex form in reality: Business cases for investments may fail to pass muster when only one firm's profits are included, but once the full profits of the merged firm are considered, this outcome will be reversed. As discussed, the solution to this incentive problem is to combine the two complementary rail networks so that the single, integrated railroad receives the full marginal profit from its management efforts across the combined network.

112. Examples of the investments that will be affected are particularly easy to see in this case. Railroads operate as integrated networks such that increases in utilization of one part of the network (e.g., east-west flows through the middle of the country) can require investments at distant locations to maintain efficient and fluid flows of traffic throughout the system. Today, however, when UP, for example, makes an investment in the west, it fails to consider the benefits to NS in terms of traffic carried in the east. Post-merger, this failure to consider all benefits from investments will be corrected and thus investment incentives will expand.

113. The application provides examples of planned future investments that will facilitate efficient routings and increased rail traffic that is expected to be attracted from other railroads and from trucks. UP/NS plans to increase the line capacity on two UP

mainlines, the Sunset Route that connects Southern California to El Paso and the Golden State Route between El Paso and Kansas City.[54] UP/NS plans to increase capacity on two portions of the NS network, the corridor between Kansas City, Missouri, and Butler, Indiana, and the corridor between New Orleans, Louisiana, and Atlanta, Georgia.[55] These investments involve additional double-tracking and extending sidings to support the additional transcontinental traffic that the transaction is expected to generate.

114. To support the additional traffic and integrated operating plan Applicants will also make further investments totaling $443.5 million in terminals and yards.[56] This includes seven intermodal terminals, two manifest yards, and two automotive facilities.[57] UP/NS anticipates capital investments of over $2.1 billion in the first three years following the merger to enable the growth anticipated by the merger and to realize merger synergies and integrate technology.[58]

115. As discussed below, the transaction is expected to divert millions of truckloads from the highways to the UP/NS rail system. The public benefits of moving trucks-to-rail are clear, but the UP/NS system requires additional investments to support the increased volume of intermodal movements. Applicants plan on substantial investments in additional intermodal capacity at numerous locations across the country. On the current UP system, investments in expansion of intermodal facilities are planned at Houston, Texas, Laredo, Texas, West Colton, California (i.e., California Inland Empire), and Council Bluffs, Iowa.[59] On the NS system, UP/NS plans to invest in expansion projects at Croxton, New Jersey, Sharonville, Pennsylvania, and Toledo, Ohio.[60] Absent the ability to attract additional intermodal volumes from trucks—and the increased

investment incentives described above—as a result of the merger, these investments would not occur.

C. EVIDENCE OF THE MERGER'S BENEFITS: MODAL SHARES AND DIVERSIONS

116. As independent railroads, UP and NS carry interline traffic between points in the West and points in the East. Following the proposed merger, that interline service will become single-line service. Some shippers will switch from their current interline option to single-line service on UP/NS, indicating that, as the result of service improvements and investments in the combined UP/NS rail network, the merged carrier offers superior service at lower quality-adjusted prices.

117. Hence, a direct demonstration of the benefits generated by the merger comes from the fact that the merged carrier's single-line service is expected to attract business from its competitors. This follows from the law of demand—a railroad offering lower prices and/or better service, which together mean lower quality-adjusted prices, will make sales at the expense of its competitors. Evidence of customer switching—which I analyze below using modal shares and diversions—is the clearest way to demonstrate the benefits of single-line service that the merger unlocks.[61]

1. Modal Shares

118. The benefits of single-line service—as demonstrated by shippers' preference for such service—can be assessed by analyzing routes with both single-line and interline options. The Application contains an analysis of rail's modal share compared to truck for county-to-county routes of merchandise traffic where rail can provide single-line service and where it cannot. The figure shows that rail's modal share is often approximately three times higher (e.g., increases from 15% to 51% for lengths of haul between 1,000 to 1,499 miles) for routes where single-line service is available compared to routes where only

---

[61] When shippers switch to the merged firm's service, that is direct evidence that the merged firm's service offering has a lower quality adjusted price. This means that when merger-related improvements in quality are considered, the merged firm's offering is more attractive to customers than other offerings even if the price has not decreased.

interline service is available.[62] For long-distance intermodal traffic (i.e., greater than 1,500 miles), when single line service is available, rail obtains approximately 30 percentage points more of the total traffic than it does when only interline service is available.[63] Such an enormous increase in rail share provides strong evidence of the benefits of single-line service and thus of the benefits from the merger.

119. A similar analysis finds that for inter-watershed lanes (i.e., those lanes with either an origin or destination within the watershed region near the gateways of Chicago, IL; St. Louis, MO; Memphis, TN; and New Orleans, LA) single-line service is chosen by shippers over interline service by a wide margin.[64] The analysis also shows that, for all lengths of haul, single-line rail service captures at least 82 percent of rail traffic, and frequently greater than 90 percent.

120. It is important to recognize that options to move rail traffic via single-line service from the west to the east of the U.S. or vice versa today are limited.[65] This simple fact demonstrates the fundamental improvement in industry performance that the proposed merger unlocks, an improvement that comes with no material risk of foreclosure, as demonstrated above.

121. Each of these analyses demonstrates that shippers prefer single-line service to interline service and will benefit not only from the expansion of single-line options, but from a new and valuable transcontinental single-line service that is not currently available to shippers.

---

62 Hunt-Schabas V.S., Exhibit 3-1.

63 Hunt-Schabas V.S., Exhibit 3-2.

64 Hunt-Schabas V.S., Exhibit 4-11.

65 Examples of exceptions include BNSF service to Birmingham, Alabama, and NS service to Kansas City, Missouri. See BNSF and NS Rail Network Maps, available at https://www.bnsf.com/ship-with-bnsf/maps-and-shipping-locations/index.page and https://www.norfolksouthern.com/en/ship-by-rail/our-rail-network.

2. **Diversions**

122. The extent to which shippers will switch to UP/NS single-line service provides a direct indication of the value they place on UP/NS's post-merger single-line service relative to UP and NS's premerger interline service. The *projected diversion* of traffic to UP/NS's single-line service can be used to estimate the value that all shippers (including current UP/NS shippers) place on the improved service. Specifically, with an estimate of price elasticity of demand, one can estimate the percentage change in price that would have generated the same predicted diversions as the merger. Said more simply, one can ask, "what price reduction would have been required to generate a traffic diversion of the same size as that predicted from the merger?" Intuitively, that price reduction provides a monetary equivalent to the value of the merger benefits.[66]

123. The economic literature has demonstrated that, under straightforward assumptions, that equivalence is more than intuitive. In fact, this equivalent price reduction can provide a precise measure of the consumer welfare gains from the merger. That is, this equivalent price change provides a measure of the increase in the value of UP/NS's higher-quality single-line service relative to their premerger interline services.[67]

124. Applicants' largest category of diversions numerically is the diversion of truckload movements to intermodal containers moving by rail; hence it is natural to use this diversion to estimate the increase in quality from the merger. While I focus on this particular category of diversion, the implication for the quality improvements from the merger apply more generally: The ability to divert intermodal traffic from truck to rail provides a way to quantify the quality improvements that all shippers can benefit from.

125. I rely on the cross-price elasticity of demand between truck and rail options to quantify the benefit. The cross-price elasticity of demand quantifies the percentage change in truck traffic on a route from a 1% change in the price of rail service on the route. Truck

---

66 The hypothetical price change does not indicate whether diversion resulted from lower prices, better service, or both from UP/NS.

67 See Willig, R. D. (1978), "Incremental Consumer's Surplus and Hedonic Price Adjustment," *Journal of Economic Theory,* 17(2), 227–253.

traffic increases or decreases depending on whether the rail price goes up or down. Given an estimated cross-price elasticity and quantity of diversions, the shipper benefit resulting from the new UP/NS single-line option can be estimated. Applicants estimate diversions of approximately 1.17 million intermodal containers from truck out of a possible 3.1 million containers.[68] This represents a change in the quantity of truck traffic (i.e., diversion share) of 38 percent. I conservatively use a value of 4, reflecting values in the economic literature, for the truck-rail cross-price elasticity.[69] This cross-price elasticity implies that a 1% price *decrease* in the price of rail intermodal would cause a *decrease* in truck traffic of 4%, which would be diverted to the now less-costly (or equivalently in this case, higher-quality) rail service. A cross-price elasticity of 4 reflects a quite high degree of elasticity between truck and rail. Using this cross-price elasticity and the truck diversion share of 38 percent indicates that the *value* provided by the new UP/NS option is estimated to be equivalent to a 9.4% percent reduction in price.[70] Based on this estimate, it is clear that the projected traffic diversions from the merger imply large benefits to both current and new UP/NS shippers, equivalent in value to substantial reductions in price.

126. Applicants also estimate non-intermodal (i.e., merchandise and auto) Truck-to-Rail diversions of approximately 804,000 trucks or 188,000 equivalent railcars annually.[71] In aggregate it is estimated that {{ }} percent of divertible trucks tons will be diverted to UP/NS on routes where diversion to rail occurs.[72] While I do not have cross-price

---

68 Hunt-Schabas V.S., Section 5.4. The number of potentially divertible containers is the "addressable market" for truck to rail intermodal diversion, see Hunt-Schabas V.S., Sections 5.1 to 5.2.

69 See, *e.g.*, Austin, D. (2018), "Pricing Overland Freight Transport to Account for External Costs," *Journal of Transport Economics and Policy,* 52(1), 45–67, Table 5. McCullough, G. J. and I. Hadash (2019), "Price Effects in Truck Competitive Railroad Markets," in *U.S. Freight Rail Economics and Policy: Are We on the Right Track*, J. T. Macher and J. W. Mayo (Eds.), Routledge, 114–126, at Table 5.5 shows truck-rail elasticities generally lower than for rail-truck elasticities.

70 (1 / 4) * (1.166 / 3.095) = 0.094

71 Hunt-Schabas V.S., Section 4.1.

72 See my backup materials.

elasticities from the literature to calculate a precise implied value for these diversions, the estimated Truck-to-Rail diversions for non-intermodal traffic are large and provide further evidence of the significant benefits to both current and new UP/NS shippers from the proposed transaction.[73]

127. Applicants also estimate rail-to-rail diversions of 442,000 cars or units across merchandise, intermodal, bulk, and automotive traffic.[74] The majority of Applicants estimated rail to rail diversions come from BNSF and CSX. Diversions from CSX represent approximately 4 percent of units handled by CSX in 2023, and for BNSF diversions represent approximately 3 percent of units handled by BNSF in 2023.[75] In aggregate for rail-to-rail diversions, Applicants estimate diversions of {{ }} percent (of divertible carloads or units) for merchandise traffic, {{ }} percent for bulk traffic, {{ }} percent for automotive traffic, and {{ }} percent for intermodal traffic.[76] While I do not have precise cross-price elasticities from the literature to calculate an implied value of these diversions, these estimated diversions are large and further make clear that the levels of diversion projected from the merger imply large benefits to current and new UP/NS shippers.[77]

128. The benefits demonstrated by the level of diversions accrue to more than just the traffic that is diverted. The diversions demonstrate the anticipated value to shippers from the improved quality—and thus the improved option in the marketplace—that the merged carrier will provide. But this improved service will also be available to existing UP-NS interline shippers on these routes. In addition, to the extent the improvements generated

---

73 In general, the cross-price truck-rail elasticities for these other (non-auto) types of commodities that would be diverted from truck into railcars tend to be lower than for intermodal traffic. The implication is that for the same share of truck traffic of this type diverted, the equivalent price percentage drop is greater.

74 Hunt-Schabas V.S., Exhibit 6-1.

75 Hunt-Schabas V.S., Section 6.1.

76 See my backup materials.

77 See, e.g., McCullough, G. J. and I. Hadash (2019), "Price Effects in Truck Competitive Railroad Markets," in *U.S. Freight Rail Economics and Policy: Are We on the Right Track*, J. T. Macher and J. W. Mayo (Eds.), Routledge, 114–126, at Table 5.5.

by the merger induce a response from competing railroads and other transportation modes in terms of lower prices or improved service, such competitive responses generate additional benefits induced by the merger, making my quantification of direct benefits from the UP/NS quality improvements conservative.

129. In addition to the private benefits obtained by shippers from higher quality intermodal service to be provided by the Applicants, Truck-to-Rail diversions generate substantial external public benefits beyond that reflected in the improved service quality shippers receive.[78] Per ton-mile moved, compared to freight rail transportation, trucks generate more pollution, are more dangerous in terms of injuries and deaths, and create congestion on highways and roads.[79] Moreover, trucks utilize publicly funded transportation networks whereas the rail network is privately-owned and operated and receives limited government funding. Diversions from truck to rail generated by the merger create additional unpriced benefits to society that are not captured in the price-equivalent service improvements received by shippers.

D. IMPLICATIONS FOR POTENTIAL FUTURE MERGERS

130. The STB requests parties include an analysis of whether and how potential future mergers of Class I railroads (proposed in response to this proposed transaction), could affect the structure of the industry and the public interest. I understand the Applicants address this requirement in their Application.

---

78 See Verified Statement of Mathew Graham for a discussion of certain external benefits of diversions of truck to rail arising from the merger.

79 Austin, D. (2019), "Accounting for External Costs in Freight Transport: Eight Policy Options," in *U.S. Freight Rail Economics and Policy: Are We on the Right Track*, J. T. Macher and J. W. Mayo (Eds.), Routledge, 81–113 at Table 4.1. The estimated differential external costs for truck and rail transportation range from 2.32 to 5.04 cents per ton-mile, in 2014 dollars, based on minimum and maximum estimates by mode. Applicants estimate a net reduction of 50 billion truck freight ton-miles due to merger-induced truck-to-rail diversions, see Hunt-Schabas V.S. Exhibit B-58. Using a simple assumption of 3 cents per ton mile in differential external costs between truck and rail and an equivalent offsetting increase in rail freight ton-miles, the predicted truck diversions reduce unpriced external social costs by $1.5 billion per year.

131. From an economic perspective, and as I have discussed, the merger of UP and NS will generate significant vertical benefits for shippers. These vertical benefits—including the expansion of single-line service, more efficient service and operations, and increased investment—are unlikely to be undermined by any subsequent mergers. Instead, a future U.S. transcontinental merger would also tend to be predominantly vertical with similar effects. To the extent such a merger generated efficiency improvements it would put more competitive pressure on UP/NS.

132. That said, two points are worth emphasizing:

- Even if no subsequent merger occurs, the analysis of this merger stands on its own. It generates substantial pro-competitive benefits without a realistic risk of foreclosure and thus it is pro-competitive and beneficial to shippers on its own terms.
- Any proposed future merger must be evaluated on its own merits and would have to be evaluated based on the specific elements of that application, including detailed analysis of how that proposal impacts shippers and the overall rail network. That analysis may indicate that specific conditions should be placed on that future merger that are distinct from those placed on the present transaction due to distinct characteristics of that merger. In addition, that analysis may reveal circumstances that require adjustments to components of (or conditions placed on) this transaction in order to protect shippers and the overall public interest. Such decisions can be made if and when a future transaction is proposed and its details are known.

V. UP/NS'S COMMITTED GATEWAY PRICING IS DESIGNED TO ENHANCE COMPETITION

133. For the reasons I discuss above, the proposed transaction will generate significant benefits for customers and the broader public and enhance competition. Hence, the merger is pro-competitive and shipper-welfare enhancing in its own right.

134. To further enhance these competitive effects, UP and NS have also included in their application a proposal to establish Committed Gateway Pricing designed to enhance competition further, by providing competitive options to certain shippers and routes that would otherwise not directly benefit from the vertical integration of UP and NS.

135. Committed Gateway Pricing accomplishes this by using UP/NS rates—rates that reflect the benefits of improved pricing incentives and cost reductions generated by the merger—to determine the rates that may be used *by CSX and BNSF* to set through rates for eligible traffic. Moreover, because CGP also incorporates rates established on routes with existing intra-modal competition between UP/NS and CSX and BNSF, CGP extends the benefits of that competition to routes that are otherwise sole-served and do not benefit from such competition.

A. THE COMMITTED GATEWAY PRICING METHOD

136. CGP is a market-based mechanism that allows BNSF and CSX to offer the benefits of existing competition, as well as improved pricing incentives and cost reductions flowing from the merger, to certain shippers and shipments that otherwise would not benefit from either. The CGP method is explained in detail elsewhere in this application, but broadly consists of three steps:[80]

- Identify relevant traffic by commodity and distance, designed to reflect commodity groupings subject to similar market forces and costs structures; [81]

---

[80] See Verified Statement of Katherine N. Novak (hereinafter "Novak V.S."), including Appendix A, for the description of CGP.

[81] The comparable traffic groups consist of 23 market categories based on commodity classification and four distance categories, resulting in 92 groupings based on commodity and distance. Certain traffic, such as intermodal, finished vehicles, and unit trains, are not covered by CGP.

- Identify UP/NS rates for traffic in the relevant commodity and distance categories and set the Committed Gateway Price to the 70th percentile of the UP/NS rate (in dollars per car-mile);[82]and
- Provide to BNSF and CSX, separately, Committed Gateway Price for each commodity and distance group.[83]

137. The Committed Gateway Price is the guaranteed rate at which UP/NS will provide service on the UP/NS segment of eligible interline moves. For purposes of CGP, eligible traffic is defined as manifest traffic to or from facilities solely served by UP/NS (or a short line interchanging traffic solely with UP/NS) that interchanges across one of the east-west gateways—Chicago, St. Louis, Memphis, or New Orleans—and is solely-served by BNSF or CSX (or a short line interchanging traffic solely with BNSF or CSX) at the other end. Because CSX or BNSF can use the Committed Gateway Price to quote a through rate that undercuts a high division or Rule 11 rate offered by UP/NS, the Committed Gateway Price effectively caps the rates that UP/NS can charge for these movements. However, nothing prevents the shipper from utilizing existing options including negotiating for a potentially lower rate Rule 11 rate from UP/NS and/or a lower total rate for the full movement.

---

82 The identified groupings are populated with rates based on UP/NS traffic movements for a twelve-month period. For each commodity-distance grouping the rate and distance associated with a corresponding UP/NS shipment is collected, and the rate per car-mile is calculated. If there are 100 or more shipments in a grouping during the period, then the rate calculation will be determined based on shipments in that grouping. If fewer than 100 shipments are within a grouping, then aggregated data for the distance range will be used to determine the car-mile rate. Requiring a minimum number of shipments reduces the likelihood that outliers or non-representative observations affect the calculated rates. For purposes of determining shipments, a combination of waybill date and equipment identifier is used, which means that in most cases 100 carloads, not in unit trains, will be sufficient to populate a cell in the table. Twelve cells, eight for CSX and four for BNSF would potentially fall under the 100-shipment threshold, using 2024 UP and NS waybill data, and would have their CGP rates derived from the aggregated distance groupings without commodity specific information.

83 To account for the fixed costs associated with originating or terminating a rail movement, a minimum price based on 250 miles is applied to the car-mile rates for a commodity grouping to otherwise adjust for very short moves. See Novak V.S., § I.B.2.

B. COMMITTED GATEWAY PRICING EXTENDS BENEFITS TO ROUTES THAT OTHERWISE WOULD NOT DIRECTLY OBTAIN MERGER BENEFITS

138. The proposed merger brings benefits to shippers by connecting two complementary networks to create a seamless, single-line, rail service connecting the east and west coasts. As described above, the combined UP/NS will provide improved single-line service and will introduce efficiencies throughout the network, benefiting shippers on many east-west routes. While the benefits of the proposed merger extend to the entire US rail industry, only routes served by UP on one end and NS on the other benefit directly.

139. In contrast, routes served by UP on one end but only CSX on the other, or NS on one end but only BNSF on the other, do not benefit as directly from the vertical integration of UP and NS. By providing BNSF and CSX access to the Committed Gateway Price—for routes that are sole-served by them on one end and UP/NS on the other—the CGP provides the benefit of existing rail competition and benefits from the merger to shippers on routes that would not otherwise see such benefits.

140. The CGP proposal also directly addresses concerns that vertical mergers may limit source and geographic competition. CGP's potential of lower rates—and at least a cap—on the UP/NS portion of interline moves will enhance geographic and source competition for other routes moving the same or similar commodities. The ability of, for example, an industrial chemicals producer sole-served by UP/NS to reach a CSX sole-served consumer, using a Committed Gateway Price that is below the rate that UP/NS otherwise have charged, provides an enhanced competitive option in both the production and consumption of the industrial chemical.

C. EXPERIENCE FROM THE I-5 CORRIDOR SHOWS SIMILAR RATE AGREEMENTS ENHANCE COMPETITION

141. An existing analogous agreement—the I-5 Agreement between BNSF and UP regarding movements and rates between the Pacific Northwest and the U.S. Southwest—demonstrates the competition-enhancing effects of market-based gateway rates. The I-5 Agreement, provides UP the ability to market transportation services directly to BNSF-served shippers for transportation across the Portland gateway without the direct

involvement of BNSF.[84] In this way it is very similar to CGP and served as an inspiration for parts of the CGP proposal, although CGP has been modified to improve the proposal, based on lessons learned from the I-5 Agreement.

142. The I-5 Agreement arose in conjunction with the UP-SP merger and was imposed by the Board as a condition of its approval of that merger. It was not intended, however, to remedy specific competitive harms arising from the transaction. Rather, UP agreed to sell a rail line to BNSF that created single-line BNSF service between western Canada and southern California. This created a single-line competitor to UP along much of the I-5 corridor. The I-5 Agreement then provided UP access to BNSF-served locations in the Pacific Northwest with market-determined rates determined under the agreement. The agreement represents a pro-competitive component of a larger agreement that permanently rationalized ownership and operation of rail lines between California and Washington state.

143. The I-5 Agreement and the CGP proposal share a number of fundamental elements. Both define the range of shippers, locations, and movements to which the guaranteed rates may be applied. Both are limited to movements across a defined gateway or gateways. Each utilizes information on market rates derived from corresponding traffic from the incumbent carrier—BNSF for the I-5 Agreement and UP/NS for the CGP. These rates are then used by the non-incumbent carrier(s) to establish a guaranteed rate for interline service. They also both provide for non-discriminatory service level commitments, means for auditing, rules and schedules for data collection, processing and establishing of rates, and mechanisms for managing periods of limited or missing data.

144. Critically for the present transaction, UP's experience with the I-5 Agreement demonstrates that carefully designed market-based gateway rates can successfully enhance competition, and that this occurs in ways beyond simply sharing rates. The I-5

---

[84] The "I-5 Agreement," also known as BNSF Proportional Rate Agreement, was analyzed by the STB in its approval of the UP-SP merger. See *Union Pacific Corporation, et al.—Control and Merger—Southern Pacific Rail Corporation, et al.,* STB Docket No. FD 32760, Decision No. 44, August 6, 1996 (hereinafter "UPSP Decision"). The agreement also provides UP with access to connections for certain locations in western Canada.

Agreement also generated significant non-price benefits and resulted in a more competitive overall product. UP was able to respond to new opportunities at BNSF-served locations without being dependent on BNSF to establish a rate to UP destinations. And UP was able to offer shippers the higher-quality customer experience that comes with working with a single railroad.

145. Shippers have made extensive use of this competition under the I-5 Agreement. Figure 12 shows that since 2009 UP has moved over {{ }} carloads under the I-5 Agreement, accounting for nearly {{ }} billion in revenue to UP.[85] The volume of traffic moving under the I-5 agreement has generally grown over this period, with carload volume in 2024 more than {{ }} of 2010 volume.

Figure 12
UP I-5 Agreement Traffic: 2009 – 2024 {{

}}

Source: UP I-5 History Data
Notes:
1) UP Net Revenue removes the revenue paid to BNSF.

[85] 2009 is the earliest date for which I have data.

146. UP has used the I-5 Agreement to compete successfully against BNSF for all major commodities moving over the I-5 corridor. Southbound traffic predominates over this corridor, and, as shown in Figure 13, UP has achieved higher volumes than BNSF for {{ }} of the top ten commodities over this corridor. Given the product mix, forest products (largely STCC2 24 and 26) moving southbound from the Pacific Northwest have accounted for a {{ }} of I-5 traffic and UP has achieved {{ }}.[86]

[86] See my backup materials. This traffic reflects movement over the I-5 corridor but includes UP movements not utilizing the I-5 Agreement proportional rate.

Figure 13
BNSF and UP Carloads Over the I-5 Corridor
2023 Top Ten Southbound 2-digit STCCs {{

}}

Source: STB Confidential Carload Waybill Sample
Note: CCWS traffic is limited to Southbound shipments covered under BNSF and UP's 1997 I-5 Agreement. Southbound traffic is defined as BNSF or UP traffic originating in an I-5 Northern region and terminating in the I-5 Southern Region. Based on CCWS and subject to variance arising from sampling. Given limitations of the CCWS, this traffic also includes UP movements not using the I-5 Agreement proportional rate but moving between the areas covered by the Agreement,

147. The I-5 Agreement enhanced geographic competition through improved competitive options to otherwise sole-served shippers; the CGP proposal will do the same.[87] UP obtains access to BNSF-served shippers located in the Pacific Northwest through gateway prices provided under the I-5 Agreement; CGP provides CSX the ability to market directly to sole-served UP shippers, and BNSF the ability to market directly to

[87] The I-5 Agreement was not limited to BNSF sole-served locations, but in the region served by BNSF there was little if any additional competitive rail options serving these locations.

sole-served NS shippers, for shipments over the east-west gateways. As explained by the STB, looking at wood products producers in the Pacific Northwest:[88]

> When Oregon lumber moves south to California, competition from the north has been limited because access to California required interline arrangement with [UP-predecessor] SP. The BNSF PRA [the I-5 Agreement] opens that access, thereby intensifying source competition. From the standpoint of destination competition, an Oregon shipper has the choice of directing lumber either to eastern markets or to California depending on product market conditions and transportation options. These forms of geographic competition were highly effective pre-merger, and with the BNSF PRA, will improve post-merger.

148. In the UPSP merger, the primary objection to the I-5 Agreement was from shippers that were not eligible to participate and were concerned about the enhanced competitiveness the I-5 Agreement provided to shippers covered by it.[89] But this concern is a feature not a bug; it demonstrates the extra competition spurred by the Agreement. CGP provides similar "intensified" source and geographic competition arising from CSX (and BNSF) access to UP (and NS) shippers across the east-west gateways.

D. ANALYSIS OF THE COMMITTED GATEWAY PRICING PROPOSAL

1. Lessons learned from the I-5 Agreement

149. Although the I-5 Agreement has been successful on its own terms, all programs can be improved. UP's multiple decades of experience with the I-5 Agreement have provided lessons for improving the operation of CGP. These improvements are designed to provide a more stable, useful, and effective mechanism through which CSX and BNSF can utilize the available rates to market to shippers on routes between a UP sole-served location and a CSX sole-served location, or between an NS sole-served location and a BNSF sole-served location.

150. One significant improvement in the CGP proposal is how 'cells'—the category that determines the traffic from which the Committed Gateway Price is calculated and the

---

88 UPSP Decision, p. 403.

89 UPSP Decision, pp. 401 and 467-468.

traffic to which it is applied—are defined. In the I-5 Agreement, cells were entries in a multidimensional matrix, determined based on the 3-digit STCC of the freight, direction (i.e., north- or south-bound), five northern regions, car type, car ownership, and train size. This resulted in thousands of possible cells, most of which remained empty, but still with thousands of different possible rates depending on the traffic characteristics. This enormous number of cells, most of which were either empty or populated by very little data, has created significant logistical challenges in implementing the I-5 rates. CGP, in contrast, is categorized by twenty-three freight groupings and four distance ranges, resulting in fewer than 100 possible rate categories for each interline railroad, a much more manageable setup generating significant benefits, described next.

151. The reduced number of rate cells makes the CGP cells more likely to be populated, stable, and representative of market rates. By aggregating UP/NS price data into fewer cells based on only two criteria—commodity group and distance—the resulting rates are based on much more data, which means they can more reliably reflect current market conditions. The CGP proposal also provides a mechanism by which all cells will always have a rate available for use by BNSF and CSX in serving shippers. In contrast, under the I-5 Agreement, if no movement is made by BNSF in a cell category, no rate exists to be used by UP for the potential benefit of shippers. When no actual rates exist for a given cell, cells are updated using an alternative mechanism that is not based on actual movements, meaning cells populated in this way are not based on relevant market conditions.

152. CGP incorporates several additional improvements over the I-5 Agreement. First, the Committed Gateway Prices are updated annually, while the I-5 Agreement's prices are updated quarterly. This annual cycle provides greater stability in pricing for other railroads to market to shippers based on the available gateway rates, without the rates quoted to shippers varying wildly. Additionally, CGP includes other elements that make it more practical and reduce potential negative consequences of market-based gateway pricing.

- The movements used to determine the Committed Gateway Prices are distinct from the movements to which the price is applied. This avoids potential unsustainable feedback in rate making (whereby the use of rates under CGP in one year affects the rates available under CGP in future years, potentially leading to instability in the distribution of rates).
- The Committed Gateway Price is based on the 70th percentile (weighted by carloads) of the distribution of rates, rather than the average. As discussed below, using a percentile to establish the Committed Gateway Price rather than an average reduces the incentive of the incumbent railroad (i.e., BNSF for the I-5 Agreement, and UP/NS here) to compete less aggressively for certain traffic and better retains the incentive to pass on the benefits of the merger to shippers. The 70th percentile provides a reasonable balance between the enhancement of competition provided by the availability of CGP and the incentives discussed below.
- Rates are based on car-miles, rather than ton-miles. This is more consistent with current rate making, avoids disputes over car weights, and mitigates the influence of outliers (i.e., lightly-loaded cars) in establishing rates.

153. UP/NS proposes that CGP terminate at the end of the oversight period. Market conditions change over time, therefore, CGP should be reviewed to ensure it continues to operate as intended. UP/NS indicates that if the anticipated public benefits of the merger fail to materialize in a timely manner, the Board could extend the availability of CGP.[90]

2. Mitigation of adverse incentives

154. I find that CGP is welfare enhancing for shippers and the economy. However, using the incumbent carrier's rate (UP/NS in this application) as an input for establishing the gateway rates can potentially create an incentive for the incumbent carrier to compete less aggressively and transact at rates higher than would otherwise occur absent the

[90] Novak V.S., § I.B.6.

gateway rate mechanism. In this case, the impact of this adverse incentive is limited for several important reasons and, as I show below, the benefit of CGP to shippers outweighs any negative effect of incentives to compete less aggressively for some traffic. So, bottom line, even considering this potential effect on pricing incentives in the markets where prices are set, CGP increases shipper welfare by extending competitive benefits to routes that would not otherwise benefit as directly from the merger.

155. **First**, the adverse incentive is only even potentially relevant with respect to traffic that is used to calculate Committed Gateway Prices, a subset of overall traffic. And critically, as I show below, because the proposal uses a percentile rather than an average to establish the Committed Gateway Prices, the adverse incentive applies to only a small portion of even that traffic.

156. **Second**, the Committed Gateway Prices are calculated using the largest practical group of shipments and is applied narrowly, which means that the potential benefits of competing less aggressively will be small (because they will only apply to the set of traffic where CGP is applied) relative to the loss of profits from doing so (which will apply to the large set of traffic on which the Committed Gateway Prices are computed). Specifically, the Committed Gateway Price (for CSX) is calculated using traffic moving on *all routes* served by UP in the west and interconnecting with NS or CSX in the east. Only traffic between sole-served UP and sole-served CSX locations is excluded. The resulting Committed Gateway Price is available to CSX only to and from its sole-served customers in the east and only on routes that are sole-served by UP in the west. (Corresponding rates available to BNSF are established using traffic between NS locations in the east and UP and BNSF locations in the west.) Using the largest practical traffic group to calculate the Committed Gateway Price also makes it more difficult for the incumbent carrier to manipulate rates effectively, because changing the rate of any particular shipment will have limited to no effect on the Committed Gateway Price.

157. Based on recent UP and NS traffic data, the Committed Gateway Prices available to CSX will be calculated based on nearly {{ }} annual carloads comprised of UP-CSX and UP-NS interline shipments and will be available to only approximately {{ }}

annual UP-CSX sole-served interline shipments.[91] On the BNSF side, the Committed Gateway Prices will be calculated based on nearly {{ }} annual carloads comprised of NS-BNSF and NS-UP interline shipments and will be eligible to only roughly {{ }} annual NS-BNSF sole-served interline shipments. CGP is designed to apply across a broad range of commodities, but shippers of chemical, plastic, agriculture, and food product commodities would have approximately {{ }}} annual shipments eligible for CGP.

158. **Third**, the Committed Gateway Price is determined using a percentile rather than an average. If the Committed Gateway Price were established using an average of rates, the incumbent carrier would have the small incentive to price less aggressively on all traffic that goes into the determination of the average gateway rate available to other railroads. However, using the 70th percentile as the basis for CGP means the incentive to price less aggressively is concentrated only on transactions around those that form the 70th percentile of the rate distribution. For most transactions below this level, there is no direct effect of any change in rate on CGP. Instead, the ability to influence the Committed Gateway Price arises only from a change in volume shipped under those rates which then alters which transaction establishes the 70th percentile rate. As shown below, this incentive is small.

159. **Fourth and critically**, the use of the 70th percentile in CGP and UP/NS' incentive to raise the Committed Gateway Price would also create a countervailing incentive for UP/NS to lower the rates for traffic associated with the highest rates on routes that determine the Committed Gateway Price. Similar to the incentive below the 70th percentile, one way to increase the 70th percentile rate is to increase the volume of traffic that would otherwise be transacted at rates above the 70th percentile, thus increasing the price at which the 70th percentile falls (since more traffic in the top of the distribution means a higher price is required such that only 30 percent of traffic moves at prices higher than that level). This can be achieved via *decreasing* the rates that are above the

---

[91] My estimations of carloads within the input and eligible segments of CGP are based on defining sole-served stations based on a combination of CSM and SCRS information.

70th percentile rate and encouraging additional volume from these shippers. Therefore, in addition to lowering the rates potentially offered to shippers for whom CGP applies, CGP may also benefit shippers who face the highest rates on routes from which the Committed Gateway Price is determined.

160. As shown below, the net effect of CGP is to enhance competition and improve the welfare of shippers. Any small incentive for UP/NS to compete less aggressively on some routes is more than offset by the benefits sole-served shippers receive from CGP in capping the rates UP/NS may charge on its portion of the interline shipments to which CGP applies.

E. WELFARE EFFECTS OF THE COMMITTED GATEWAY PRICING PROPOSAL

1. Period in which UP/NS cannot influence CGP Rates

161. In the initial period during which CGP is implemented, rates will be based on historical rates that were transacted prior to the merger and before CGP is implemented. Any adverse incentives for UP/NS to compete less aggressively on routes that determine the Committed Gateway Prices will not be reflected in those rates. During any time when CGP rates are based on rates that UP/NS cannot influence, the effect of CGP will be purely welfare enhancing, benefiting shippers on routes where CGP applies by providing lower rates to interline partners that can be shared with shippers.

162. To estimate the potential savings that CGP will offer during its first year of implementation, I calculate the hypothetical Committed Gateway Prices that will be available to CSX and BNSF separately for each of the commodity and distance groups in the CGP proposal based on UP and NS rates distribution in 2024. I then calculate the amount of traffic on eligible UP-CSX and NS-BNSF interline routes that had rates on UP or NS in 2024 that are above the calculated Committed Gateway Prices—the volume of traffic that could benefit from CGP—and the amount of potential savings that these shippers could receive from CGP. This estimated eligible volume of traffic and potential savings are reported in Figure 14, below. In total, I estimate that a potential savings of up

to $43.6 million from CGP in the first year could be available to shippers.[92] Note that this estimate represents a lower bound on the total benefits that CGP will offer in the first year, as this calculation does not take into account the output expansion effect of the lower rates offered by CGP; rather it is pure rate reduction on existing traffic with no output expansion.[93]

Figure 14
Estimated Potential Benefits from CGP in the First Year of Application

Commodity Group	Carloads Used for Calculation of CGP	Carloads Eligible for the CGP	Carloads Potentially Benefiting from the CGP	Estimated Potential Benefit from the CGP
Industrial Chemicals	98,342	15,153	2,311	$7,203,947
Refrigerated	12,524	4,603	2,362	$6,808,708

Sources: UP and NS Waybill Data 2024, AAR Centralized Station Master (CSM), Serving Carrier Reciprocal Switching Data (SCRS), UP Short Line Access Information

92 The actual savings available to shippers will depend on the responses of BNSF and CSX in through rates offered to shippers as a result of the lower rates provided to them under CGP by UP/NS.

93 With regards to the inclusion of sole-served short lines, the calculation of potential benefits uses information provided by UP as well as information from the CSM and SCRS to determine which short lines are served by a single Class I railroad. Shipments from sole-served short lines represent an approximately 11,000 of the input carloads, approximately 8,500 of the eligible carloads, and approximately $2.5 million in potential benefit in the first year shown above.

2. Simulation model of CGP effects going forward

163. To evaluate the welfare effects of the CGP proposal on shipper welfare going forward, I have developed a simulation model in which railroads set rates to maximize their profits given shippers' choices of routes and contracting arrangements. The model is calibrated to observed data on rates and volume of traffic from interline shipments that will be used as inputs to calculate the Committed Gateway Prices, as well as from interline shipments eligible to use CGP, along with information on UP's and NS's average margins.[94] I use the model to simulate the profit maximizing rates that UP/NS and the interline partners will set under different post-merger scenarios. I evaluate the welfare effects of CGP on shippers by comparing the rates that UP/NS has the incentive to set with and without CGP. The mathematical and computation detail of this simulation model is provided in Appendix C.

164. For interline shipments that are used as *inputs* to calculate the Committed Gateway Prices, CGP has multiple effects that go in different directions, all captured by my model. As explained above, the CGP proposal creates an incentive to compete less aggressively on some of the shipments used in the generation of the Committed Gateway Prices. Most of this incentive is focused around the 70th percentile rate, with *much smaller* incentive to compete less aggressively for rates below the 70th percentile.[95] Notably, however, above the 70th percentile—that is, for the highest rates in these input markets—the incentive is reversed, and the pricing pressure from CGP is downward. UP/NS has an incentive to reduce rates on higher-priced shipments, thereby inducing additional volumes above the CGP percentile threshold. These two opposing incentives are illustrated in Figure 15, below, using as an example the model simulation results for the commodity group "Forest Products I" and the distance band "1,500 Miles or Greater," focusing on the Committed Gateway Price that would be available to CSX. For this CGP cell, my

---

94 Due to data limitation, I am not able to accurately determine BNSF's and CSX's rates for shipments that involve short lines. For this reason, I excluded short line shipments for the purpose of this simulation.

95 To the extent higher rates below the 70th percentile reduce output, it will tend to shift upward the 70th percentile price.

simulation model estimates that UP/NS will compete less aggressively on the set of shipments that faces rates below {{ }} per car-mile due to CGP, raising the 70th percentile rate from {{ }} per car-mile to {{ }} per car-mile. However, as also shown in the figure, UP/NS will also be pricing more aggressively and lowering rates for about {{ }} percent of traffic, and importantly, this will be for the traffic that faces the highest rates for this set of shipments.

Figure 15
Simulation Results: UP/NS's Optimal Rates for Shipments from which the Committed Gateway Price is Calculated {{

}}

165. Most importantly, for interline shipments that are eligible to utilize CGP, the CGP proposal provides unambiguous shipper-welfare benefits. CGP provides the interchange railroad an option to utilize the lower Committed Gateway Price rather than the rate UP/NS would otherwise provide on its portion of the move. The interchange railroad, with the ability to use CGP, has the incentive to price more aggressively and pass some

or all of that reduction in the UP/NS rate due to CGP onto the shipper.[96] This provides direct benefits to the shipper, and with a lower through rate, the incentive expands the volume of shipments on that route. Figure 16 demonstrates this benefit for shipments that are eligible to utilize CGP, for the CGP cell that is used as an example in Figure 15 above. For this set of shipments, the Committed Gateway Price of {{ }} per car-mile represents the {{ }} percentile rate, which means that {{ }} percent of the traffic would face a lower rate as a result of CGP.

[96] Although the degree to which reductions in UP/NS rate will be passed through from the interchange railroad to shippers generally depends on various supply and demand factors, when faced with a marginal cost reduction, a profit maximizing firm typically has an incentive to pass some or all of the savings it receives onto customers in the form of lower prices, just as it has the incentive to raise prices when marginal cost increases. In certain cases, firms may also lower prices by an amount that exceeds the marginal cost savings (i.e., a pass-through rate that exceeds 100 percent). See, e.g., Miller, N. H., M. Osborne, and G. Sheu (2017), "Pass-Through in a Concentrated Industry: Empirical Evidence and Regulatory Implications," *The RAND Journal of Economics*, 48(1), 69–93.

Figure 16
Simulation Results: UP/NS's Optimal Rates for Shipments to which CGP is Applicable {{

}}

166. As shown in the above example, except for the volume of traffic concentrated around the 70th percentile rates for interline shipments included in the calculation of the Committed Gateway Price, UP/NS's incentive to compete less aggressively tends to result in rate increases that are much smaller in magnitude compared to the direct benefits that shippers are likely to receive on interline shipments to which CGP is applicable. This suggests that CGP will be beneficial overall. To confirm that intuition, I implement the simulation model that I described above (and in more detail in Appendix C), calibrated to actual data from 2024, to measure the benefits. For the particular example shown in Figure 15 and Figure 16 above, I find that the direct benefits of CGP dominate any potential upward price pressure in the input markets, resulting in an increase in overall shippers' consumer surplus by about $592 thousand a year.

167. Due to data limitations, I am only able to perform this simulation for 27 CGP cells where I have sufficient data to estimate shippers' demand and margins of railroads reliably.[97] *Strikingly—and consistent with the simulation results in the example discussed above—I find that the direct benefits of CGP outweigh any potential welfare reductions in all of these 27 CGP cells, resulting a total net increase in shippers' consumer surplus of about $10.3 million a year across these cells*.

168. To put into perspective the magnitude of this welfare effect estimate of $10.3 million a year, I multiply this estimate by the ratio of the volume of traffic in the data to the volume of traffic included in my simulation. I calculate this ratio using two different approaches to obtain a range of potential welfare effects of CGP on all affected shipments. First, I calculate this ratio for all interline shipments from which CGP is calculated and all interline shipments to which CGP applies. Using this approach, I obtain a net increase in shippers' consumer surplus of $61.8 million a year. Second, I calculate the above ratio using only interline shipments to which CGP applies, which produces a more conservative lower bound estimate of $39.4 million a year.[98]

169. The welfare effect estimated by my simulation model is almost surely an underestimate of welfare benefits of CGP to shippers, however. Although my simulation model accounts for the response of existing shippers on existing routes to changes in rates as a result of CGP, the model does not account for new interline traffic that CSX or BNSF may be able to attract as a result of CGP. The availability of CGP provides CSX and BNSF the opportunity to market directly to UP/NS sole-served shippers and enables them to provide rates to UP/NS sole-served shippers without the concurrence of UP/NS. For example, CSX can approach a UP sole-served shipper directly with a through rate using

---

97 One main data limitation I face is that I do not observe the rates set by CSX and BNSF in UP-CSX and NS-BNSF interline shipments, when the shippers have chosen to use Rule 11 to negotiate rates separately with the two railroads.

98 Because the number of carloads that is missing from the model is higher for the set of shipments that is used to calculate CGP (increasing this set of shipments would lower UP/NS's incentive to raise rates), calculating the above ratio using only data from shipments to which CGP applies produces a conservative lower bound on the estimate of the total welfare effects of CGP.

UP/NS's Committed Gateway Price for delivery to a CSX sole-served location. Thus, CSX can unilaterally compete against UP/NS for a sole-served UP shipper for movement to a CSX destination, in potential geographic competition against a UP/NS alternative, in a manner that was not previously available and is not accounted for in the simulation.

170. The ability of CSX and BNSF to market to shippers using CGP absent any required concurrence from UP/NS can open multiple alternative origins or destinations that may not have otherwise been economically feasible to serve if rates and concurrences from UP/NS were required. Indeed, as seen with the experience of the I-5 Agreement, the ability to market directly to shippers—rather than having to rely on joint negotiation or concurrences—opened up new markets and permitted substantial volumes of traffic to compete with the pre-existing markets and locations. Shippers taking advantage of these new market opportunities provided by CGP represent an unambiguous welfare enhancement to shippers and the economy.

VERIFICATION

I, Mark A. Israel, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed this 17th day of December, 2025.

Appendix A

This Appendix explains in more detail, including reference to the economics literature, the basis for my conclusions about the lack of realistic foreclosure concerns from the transaction.

Framework

There are five main ways in which railroad transport service between the eastern and western U.S. is sold:

1. 1*1 routes: both routes are sole served.
2. 2*1 routes: there is customer-facing monopoly on one leg and duopoly on the other.
3. 1*2 routes: there is customer-facing duopoly on one leg and monopoly on the other leg.
4. 2*2 routes: there is duopoly on both legs.
5. Rule 11: the shipper gets quotes for both legs; potentially applies to any of 1-4.

In addition, arrangements vary depending on whether shippers negotiate contractual terms with railroads or whether they are price takers, whether pricing terms are linear or nonlinear, and whether railroads have private cost information. I discuss the scope for harm in cases, 2, 3, and 5, which are the situations where STB has expressed some concern about possible foreclosure.[1]

Throughout the discussion I use the terminology "fully integrated price," "fully integrated outcome," and "fully integrated wholesale prices" as follows:

> *Fully integrated price*: For routes that are sole served on at least one end, the fully integrated price is the full price (a through rate or the sum of the prices of each leg) the shipper would pay if all sellers were vertically integrated.
>
> *Fully integrated outcome*: The equilibrium values of all the relevant variables associated with the outcome that generates the fully integrated prices.
>
> *Fully integrated wholesale prices*: The wholesale prices (*i.e.*, the prices customer facing railroads pay for the other leg) that induce the fully integrated outcome.

Negotiated Nonlinear Contracts with Shippers

As observed in Section III.A, shippers who negotiate nonlinear contracts with railroads in settings with complete information are not harmed and may benefit from the merger. This section provides additional analytical support for that finding.

Consider the following illustration. Suppose a shipper has a demand for shipments from San Francisco to New York and will ship more the lower the price. Suppose the western leg is

[1] Notably, routes on which each segment is sole served (case 1 above) have no foreclosure risk, and shippers would benefit from the proposed merger on the route from the elimination of successive monopoly.

sole served by UP at unit cost c_U, and the eastern leg can be served by CSX at unit cost c_X or by NS at unit cost c_N. Suppose the shipper negotiates the quantity it would like to ship along with a price that divides the surplus with each railroad.

To analyze this problem, the first step is to recognize that the shipper will play CSX and NS against one another to determine the price for the eastern leg. For my first illustration assume that $c_N < c_X$, i.e., NS can supply the eastern leg at lower cost than CSX. In this case, NS will win the competition to serve the eastern leg at a per-unit price approximately equal to $p_E = c_X$.

The second step is to recognize that given an eastern leg price $p_E = c_X$, UP and the shipper will negotiate a western leg price and quantity that maximizes and divides their joint surplus. The quantity that maximizes their joint surplus is the quantity the shipper would purchase if it paid a price equal to UP's cost.[2] Call this quantity Q, and denote the gross shipper surplus at quantity Q by V. The shipper pays NS $C_X = p_E Q = c_X Q$, and UP incurs cost $C_U = c_U Q$. Therefore, the net surplus divided by the shipper and UP after taking out UP's cost and the eastern leg price is $V - C_X - C_U$. This is the surplus that UP and the shipper divide. Under the standard bargaining solution used in the economic literature, the Nash bargaining solution, UP and shipper will split the surplus equally. The total payment that splits the surplus equally is $P = \frac{V - C_X - C_U}{2}$. If the total cost of the eastern and western legs, $C_X + C_U$, is less than the shipper's valuation V, the shipment will be made, and the shipper's consumer surplus will be $V - C_X - P = \frac{V + C_U - C_X}{2}$.

Now consider what happens if UP and NS merge. The shipper and UP both recognize that NS can supply the eastern leg at lower cost than CSX and that the jointly optimal strategy still has UP and NS supplying the legs. However, whereas prior to the merger the quantity chosen reflected a price for the eastern leg that exceeded NS's cost (because competition between NS and CSX allowed NS to win buy just undercutting CSX's higher cost), after the merger the jointly optimal quantity will reflect NS's lower cost. Thus, the jointly optimal quantity will rise, as will the surplus available for UP and the shipper to divide.[3] For this reason, the merging firms and shipper all experience benefits from the merger.

---

[2] Conditional on the eastern leg price, negotiations over a nonlinear contract by UP and the shipper lead to a variant of first-degree price discrimination where the shipper shares part of the increase in joint surplus from that strategy. The solution to the first degree price discrimination problem is widely understood: "It is well known that a perfectly discriminating monopolist produces a Pareto efficient amount of output," which means that the output choice maximizes joint surplus (quoting Varian, H. R. (1989), "Price Discrimination," *Handbook of industrial organization*, Vol 1, 597–654). The main nuance surrounding this strategy in the railroad context is that shippers with bargaining power share in the benefits of the strategy.

[3] Formally, let the $D(c_U + c)$ be the quantity sold when the marginal price for the UP leg is c_U and the marginal price of the eastern leg is c. The joint surplus of UP and the shipper is then.

Next, consider the case where CSX has the lower cost and wins the competition for the eastern leg. The same logic as above implies that the shipper's pre-merger surplus will now be $\frac{V+C_U-C_N}{2}$, which is the same as before but replacing C_X with C_N because CSX's price reflects its ability to win the eastern leg with a price that just undercuts NS's cost. Post-merger, the merged firm recognizes that the most efficient strategy is to continue using CSX for the eastern leg—since paying CSX will be cheaper than the cost of carrying the goods itself—and in this case, the bargaining situation between the merged firm and the shipper is the same both pre- and post-merger; the surplus that the merged firm and shipper maximize and divide does not change. This means that the outcome for the merged firm and the shipper do not change with the merger. In particular, the merger has no impact on the shipper.

This stylized example illustrates a more general point: In a setting with perfect complements (here two rail networks) where the end customer negotiates nonlinear contracts with suppliers of complementary inputs, a merger benefits shippers in some cases (i.e., in the example, cases where NS has lower costs for the eastern leg than CSX) and has no effect on shippers in other cases (i.e., where NS has higher costs for the eastern leg than CSX).

Non-Negotiated Linear Prices with Shippers

On 2*1 routes, the merger raises no significant risk of competitive harm. If each duopolist writes an efficient contract with the customer facing monopoly, the fully integrated outcome arises with or without the merger.[4] If firms face contracting frictions, there is double marginalization prior to the merger that leads to a price higher than the fully integrated price. The merger then eliminates double marginalization between the merging firms and lowers final product prices in standard cases. Notably the non-standard case in which the elimination of double marginalization can actually raise the final price is unlikely to apply to the railroad

$$JS(c_U + c) = \int_{c_U+c}^{\infty} D(t)dt.$$

The effect of a small reduction in c on JS is

$$-JS'(c_U + c) = D(c_U + c) > 0.$$

Thus, a reduction in the cost of the eastern leg increases the joint surplus that UP and the shipper split, and under Nash bargaining, they both benefit.

[4] The generalization of the result that nonlinear contracts induce the fully integrated outcome under bilateral monopoly to the case of two (or more) differentiated upstream sellers and a downstream monopolist appears in O'Brien, D. P. and G. Shaffer (1997), "Nonlinear Supply Contracts, Exclusive Dealing, and Equilibrium Market Foreclosure," *Journal of Economics & Management Strategy*, *6*(4), 755–785. See also Bernheim, B. D. and M. D. Whinston (1998), "Exclusive Dealing," *Journal of Political Economy*, 106(1), 64–103. Because the efficient pre-merger contract involves a marginal transfer price equal to marginal cost, a vertical merger does not change incentives when nonlinear contracts are feasible.

industry, as in the benchmark case of linear demand, it never occurs when Slutsky symmetry holds, as it does when customers are firms (e.g., shippers) and contracts are customer specific.[5]

On 1*2 routes, the primary risk arises when bilateral contracting externalities exist that hold price below the fully integrated level.[6] As a matter of theory, this can occur under two types of circumstances: (i) when contracts are bilateral and private information[7], and/or (ii) when downstream firms have sufficient bargaining power.[8] However, the frequent choices by shippers

[5] An "edge" case where the elimination of double marginalization can raise the final price is "Edgeworth Tax Paradox," which is an oddity in which a reduction in the marginal cost of one of a multiproduct downstream monopolist's products leads to increases in the final prices of all products. (See Edgeworth, F. (1925), "The Pure Theory of Monopoly," in *Papers Relating to Political Economy*, Vol 1, New York: Burt Franklin; and Salinger, M. A. (1991), "Vertical Mergers in Multi-Product Industries and Edgeworth's Paradox of Taxation," *The Journal of Industrial Economics*, 39(5), 545–556. In the benchmark case of linear demand, this paradox never occurs when Slutsky symmetry holds, as it does when customers are firms (e.g., shippers) and contracts are customer specific.

[6] Bilateral contracting externalities arise when the contract between one pair of complements affects the profits of third parties. See Segal, I. (1999), "Contracting with Externalities," *The Quarterly Journal of Economics*, 114(2), 337–388. In this report, I highlight cases where bilateral contracting externalities lead to marginal transfer prices such that final prices are below the fully integrated level, as those are the cases in the literature on bilateral contracting where harm vertical mergers can occur.

[7] In a series of papers in the early 90s, researchers showed that if downstream firms have private information about their contract offers and each downstream firm believes that offers to rivals do not change when the supplier makes an unexpected (off-equilibrium path) offer, the equilibrium marginal transfer price equals marginal cost. See Hart, O. and J. Tirole (1990), "Vertical Integration and Market Foreclosure," *Brookings Papers on Economic Activity. Microeconomics*, 205–286 (downstream Cournot competition); O'Brien, D. P. and G. Shaffer (1992), "Vertical Control With Bilateral Contracts," *The RAND Journal of Economics*, 23(3), 299–308 (downstream Bertrand competition); and McAfee, R. P. and M. Schwartz (1994), "Opportunism in Multilateral Vertical Contracting: Nondiscrimination, Exclusivity, and Uniformity," *The American Economic Review*, 84(1), 210–230 (examines the role of alternative off-equilibrium path beliefs and discusses how commitments to contract uniformity can solve the problem.). For a survey that covers these papers, see Rey, P. and J. Tirole (2007), "A Primer on Foreclosure," *Handbook of Industrial Organization*, Vol 3, 2145–2220. When the pre-merger marginal transfer price is marginal cost, a vertical merger raises downstream prices. As noted in the text, the fact that shippers choose the 2*1 arrangement much more frequently than the 1*2 arrangement rejects the presences of these effects.

[8] When firms bargain over linear prices, two circumstances can lead to wholesale prices below the fully integrated wholesale prices. First, when the wholesale price is negotiated before downstream prices are set, the equilibrium wholesale prices are below the fully integrated level if downstream competition is sufficiently intense. See O'Brien, D. P. (2014), "The Welfare Effects of Third-Degree Price Discrimination in Intermediate Good Markets: The Case of Bargaining," *The RAND Journal of Economics*, *45*(1), 92–115, and Daniel O'Brien (1989), *The Uniform Settlements Policy in International Telecommunications: A Non-Cooperative Bargaining Model of Intermediate Product Third Degree Price Discrimination*, (Doctoral Dissertation), Northwestern University. O'Brien showed that under linear demand and downstream Cournot competition, price exceeds the fully integrated level if there are two or fewer downstream firms. For downstream Bertrand competition, see Panhans, M. (2024), "Vertical Integration in a Sequential Model of a Supply Chain with Bargaining," Bureau of Economics Working Paper No. 349, Federal Trade Commission and Moresi, S. (2020), "Vertical Mergers and Bargaining Models: Simultaneous Versus Sequential Pricing," Working Paper available at SSRN 3541099. Second, when wholesale prices are negotiated at the same time as downstream prices are set, if downstream firms have sufficiently higher bargaining power as measured by their Nash bargaining weights, the pre-merger wholesale prices will be less than the fully integrated wholesale prices. See Sheu, G. and C. Taragin (2021), "Simulating Mergers in a Vertical Supply Chain with Bargaining," *The RAND Journal of Economics*, *52*(3), 596–632. See also Moresi (2020). As noted in the text, the fact that shippers choose the 2*1 arrangement much more frequently than the 1*2 arrangement rejects the presence of bilateral contracting externalities that hold price below the fully integrated level.

to seek through rates from the customer facing monopolist indicates the absence of bilateral contracting externalities that hold price below the fully integrated level. The reason is that through rates obtained from customer facing monopolists cannot be lower than the fully integrated rate except in edge cases (discussed in the following paragraph). If shippers could get a lower price by seeking a through rate from customer facing duopolists, they would do so, but they typically do not do so, which rejects the assumption that bilateral contracting externalities hold price below the fully integrated level. In this case, this theory of harm is inapplicable. Further, the direct empirical evidence finds that prices in 1*2 situations are *not* lower than in 2*1 situations, further rejecting this theory of harm.

As a matter of theory, there can be edge cases in the 1*2 setting where a vertical merger can have anticompetitive effects in the absence of bilateral contracting externalities that hold pre-merger prices below the fully integrated level. Under linear contracting, this can happen when the demand for duopoly products is asymmetric and has asymmetric cross derivatives.[9] However, this situation does not apply to the railroad industry because the cross derivatives are equal when customers are firms and contracts are firm specific as they typically are in railroads.

In both the 1*2 and 2*1 structures, Rule 11 allows the customer to obtain bids for each leg directly from railroads rather than a rate from railroad(s) serving only the upstream or downstream leg. In settings with nonlinear contracting between the shipper and the railroads, the effect of a merger under Rule 11 is to leave price unchanged or lower it, as discussed above.

In Rule 11 settings with no shipper bargaining and linear pricing, Rule 11 creates a Cournot complements setting where independent firms tend to price too high.[10] The high price caused by independent pricing in the Cournot complements setting is analogous to double marginalization that arises in vertical contracting.[11] The merger, which leads to joint pricing of the complements, mitigates or eliminates this Cournot complements concern and thus creates direct benefits.

An edge case in the Cournot complements setting in which a complements merger can have foreclosure effects can arise if the merged firm can engage in pure bundling of the merging

---

[9] See Lu, S., S. Moresi, and S. Salop (2007), "A Note on Vertical Mergers with an Upstream Monopolist: Foreclosure and Consumer Welfare Effects," Working Paper.

[10] See Cournot, A. (1838), *Researches into the Mathematical Principles of the Theory of Wealth,* New York: Macmillan; Economides, N. and S. C. Salop (1992), "Competition and Integration Among Complements, and Network Market Structure," *The Journal of Industrial Economics*, 40(1), 105–123; Vives, X. (1999), *Oligopoly Pricing: Old Ideas and New Tools,* MIT Press, pp. 176–177.

[11] Vertical contracting via linear prices is formally equivalent to a Cournot complements pricing game with sequential rather than simultaneous timing. For a formal proof, see O'Brien, D. P. (2008), "The Antitrust Treatment of Vertical Restraints: Beyond the Possibility Theorems," in *The Pros and Cons of Vertical Restraints*, Konkurrensverket, Swedish Competition Authority, Stockholm, p. 50, footnote 19.

complements following the merger.[12] Pure bundling means selling the complements only as a package, which in the interline rail service context would mean refusing to offer Rule 11 rates (i.e., UPNS would refuse to quote UP and NS legs separately). However, it is unlikely that UP and NS could pursue such a strategy given regulation in the railroad industry. A shipper can compel a Rule 11 (unbundled) offer whenever it has an offer in hand for the other interline leg. Because unintegrated railroads have incentives to provide such offers if they have a chance of being selected, a shipper is likely to be able to compel a Rule 11 offer from UPNS in cases where unbundling matters, which is when unintegrated carriers have a chance of winning the competition for one of the legs. In this case, the pure bundling edge case would not apply.

Even if one were to assume (counterfactually) that pure bundling were feasible, the theories of harm developed in this paper are ill-suited to the railroad industry. The first of them involves using pure bundling to deter entry. For such a theory to be relevant, one would have to believe that entry by railroads onto routes they do not otherwise serve is an important competitive consideration in the railroad industry, and thus build that reality into competitive analysis of railroad transactions, railroad rates, etc. That is not a commonly held view in this industry, as entry is not generally viewed as an important competitive consideration, and thus entry deterrence is an unlikely theory of harm. Further, even if it were relevant, whether pure bundling could even be used in this way is speculative and the welfare effects are ambiguous.[13] The other theory of harm requires that BNSF and CSX (the non-merging railroads) legs are systematically less compatible with one another (in providing interline service) than are other combinations. I know of no evidence that this is true, and, given that eastern and western railroads all interchange at common gateways, it is unlikely to hold, meaning this theory is also ill-suited to the railroad industry.

[12] See Kadner-Graziano, A. S. (2023), "Mergers of Complements: On the Absence of Consumer Benefits," *International Journal of Industrial Organization*, 89, Article 102935.

[13] Whinston (1990) makes the following observation about the use of pure bundling as an entry deterrence strategy: "Even in the simple models considered here [which are like the model in Kadner-Graziano], which ignore a number of other possible motivations for the practice [pure bundling], the impact of this exclusion on welfare is uncertain." See Whinston, M. D. (1990), "Tying, Foreclosure, and Exclusion," *The American Economic Review*, 80(4), 837–859.

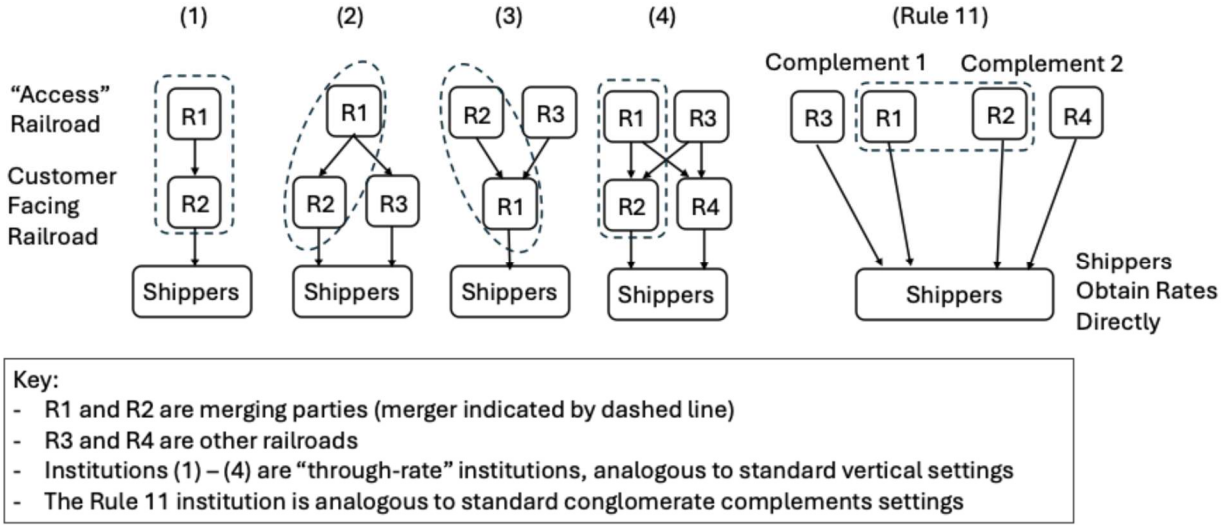
Appendix B

Introduction

This appendix presents an analysis of the effects of the merger when there are no bilateral contracting externalities that hold price below the fully integrated level (defined in Appendix A) and duopoly-side railroads have private cost information. In this setting, a vertical merger has two types of effects: (i) standard incentives effects involving the elimination of double marginalization and potential incentives to raise rivals' costs, and (ii) effects due to the information transfer that occurs when the merged railroad gains knowledge of what was previously private information on one of the legs. Importantly, these effects interact.

Established results in the economics of vertical mergers show that in the absence of bilateral contracting externalities that hold price below the fully integrated level, vertical mergers tend to be pro-competitive. A challenge to that conclusion is presented in a paper by Moresi, Reitman, Salop, and Sarafidis (2021) (hereinafter "MRSS") on the effects of a vertical merger (in a setting where bilateral contracting externalities do not hold price below the fully integrated level) when downstream railroads have private cost information.[1] They find that when the shipper is a single customer (or a set of identical customers) with perfectly inelastic demand and known reservation price, a vertical merger reduces expected shipper surplus (although it increases output and total surplus). This appendix shows that that unambiguous conclusion from their model is an artifact of the inelastic demand assumption. In a benchmark case with linear demand and uniformly distributed downstream costs, we find that a vertical merger reduces expected price and increases expected output, total surplus, and shipper surplus.

Background and Motivation



There are five main pricing institutions discussed in the economic literature on vertical and conglomerate complements mergers, shown in Figure 1: four "through-rate" institutions (borrowing that term from the railroad context), and the "Rule 11" institution (also borrowing that term the railroad context). Although Figure 1 could apply to any industry with vertical or conglomerate complements relationships, I will describe it in the context of railroad transportation service and this merger. R1 and R2 are the merging railroads, and R3 and R4 are their rivals. R1 and R3 operate in one part of the country (e.g., the west), and R2 and R4 operate in the other part (e.g., the east). Two railroads from different parts of the country are

[1] Moresi, S., D. Reitman, S. C. Salop, and Y. Sarafidis (2021), "Vertical Mergers in a Model of Upstream Monopoly and Incomplete Information," *Review of Industrial Organization*, 59, 363–380.

complements because transport legs across the west and across the east are required inputs into rail transport between the west and the east.

The through-rate institutions (1) – (4) in Figure 1 are interpreted as follows. The "Customer Facing Railroad" is the one that offers a through rate to the customer for shipping between east and west (in either direction). The "Access Railroad" supplies the leg of the route not supplied by the customer facing railroad. For example, in institution (2), railroad R1 supplies access to its leg to duopoly railroads R2 and R3, who compete to supply the leg in the other part of the country in quoting through rates to shippers. The four through rate institutions correspond to the two-stage game framework with upstream/downstream railroads (with the customer facing railroads being downstream) used in the economic literature to analyze vertical mergers.

Figure 1: Railroad Through-Rate Pricing Institutions

The Rule 11 institution is interpreted as follows. The shipper seeks bids from suppliers on each leg directly rather than obtaining a through rate quote from railroads operating on either leg. This institution corresponds to the conglomerate complements framework used in the economic literature to examine conglomerate complements mergers. The shipper effectively assembles a product—rail transport between the east and the west—by purchasing the required components and putting them together, much like a datacenter server producer combines hardware and software components in producing servers.

In through rate institutions (1) – (3), a vertical merger very often eliminates double marginalization (a benefit) or is benign (the "one-monopoly rent" idea), and in through rate institution (4), competition at both levels constrains pricing both pre- and post-merger, working

against harmful effects.[2] Analogous arguments apply to the Rule 11 institutions where the shipper obtains quotes for each leg directly.[3] In settings with complete information and without contracting externalities holding prices below the fully integrated level, a single vertical merger tends to be pro-competitive in all five pricing institutions.[4]

When firms have private cost information, however, a vertical merger has more complex effects. MRSS showed that a vertical merger in institution (2) can reduce shipper surplus when the duopoly side railroads have private cost information, even when bilateral contracting externalities are absent (which is true in MRSS). However, a strong and unrealistic assumption in that model is that the shipper has perfectly inelastic demand with a willingness to pay that is known by all sellers. In the remainder of this Appendix, I show that modifying that assumption to allow downward sloping demand, using a linear demand curve (a common benchmark case) and uniformly distributed costs (also a common benchmark), leads to a different conclusion: a vertical merger reduces the expected price and raises shipper welfare in institution (2), and in fact, in all 5 institutions.

Model and Notation

I focus my analysis on through rate institutions (2) and (3) and the Rule 11 institution, as the merger does not raise significant concerns under through rate institutions (1) (where EDM is the only price effect) and (4) (where competition on both legs constrains prices). I consider different assumptions about the timing of information revelation post-merger, as discussed below. I model the effects of a vertical merger in each case under the same set of assumptions about costs, demand, and private cost information. Notation for each case is the following:

Duopoly side marginal costs: $c_i \sim U[0,1]$ $(i = 1, 2)$
Distribution of c_i: $F(c_i) = c_i, c \in [0,1]; f(c_i) = 1$
Maximum of two draws: $c = \max\{c_1, c_2\}$
Distribution of c: $G(c) = c^2$, $c \in [0,1]$; $g(c) = 2c$
Duopoly side price: p^D
Duopoly side profit: π_i^D

Sole-serving side cost: 0
Sole-serving side price: p^M
Sole-serving side profit: π^M

Full price: $p^F = p^M + p^D$
Shipper Demand: $D(p^F) = 1 - p^F$

[2] See the main body of the report and Appendix A for a discussion of edge cases in which vertical mergers can have harmful effects and why they do not apply to this merger.

[3] *Id.*
[4] *Id.*

Throughout this appendix, I assume that the merger is between railroad 1 on the duopoly side and the sole-serving railroad. I examine the following six cases.

Case 1: Rule 11, the sole-serving railroad makes a take-it-or-leave-it ("TIOLI") offer at the same time as the duopoly side second price auction takes place.

- *Pre-merger*, the sole-serving railroad does not observe the private costs of the duopolists or the outcome of the duopoly side auction before making the TIOLI offer.
- *Post-merger*, the sole-serving railroad observes the private cost of the integrated duopolist, but not the outcome of the duopoly side auction, before making the TIOLI offer on the access leg of the route.

Case 2: Rule 11, the duopoly side second price auction takes place first, and then the sole-serving railroad makes a TIOLI offer.

- *Pre-merger*, the sole-serving railroad does not observe the private costs of the duopolists or the outcome of the duopoly side auction before making the TIOLI offer.
- *Post-merger*, the sole-serving railroad observes the private cost of the integrated duopolist and the outcome of the duopoly side auction before making the TIOLI offer.

Case 3: Rule 11, the sole-serving railroad makes a TIOLI offer first, and then the duopoly side second price auction takes place.

- *Pre-merger*, the sole-serving railroad does not observe the private costs of the duopolists or the outcome of the duopoly side auction before making the TIOLI offer.
- *Post-merger*, the sole-serving railroad observes the private cost of the integrated duopolist, but not the outcome of the duopoly side auction, before making the TIOLI offer.

Case 4: 2*1 Routes, the duopoly side second price auction takes place first, and then the sole-serving railroad makes a TIOLI offer. The sole-serving railroad sets the full price.

- *Pre-merger*, the sole-serving railroad observes the outcome of the duopoly side auction, but not the private costs of the duopolists, before making the TIOLI offer.
- *Post-merger*, the sole-serving railroad observes the private cost of the integrated duopolist and the outcome of the duopoly side auction before making TIOLI offer.

Case 5: 1*2 Routes, the sole-serving railroad makes a TIOLI offer first, and then the duopoly side second-price auction takes place. The winner of the duopoly side auction sets the full price equal to the sum of the sole-serving railroad's TIOLI offer and the auction price.

- *Pre-merger*, the sole-serving railroad does not observe the private costs of the duopolists or the outcome of the duopoly side auction before making the TIOLI offer.

- *Post-merger*, the sole-serving railroad observes the private cost of the integrated duopolist, but not the outcome of the duopoly side auction, before making the TIOLI offer.

Case 6: 1-Up/2-Down. This case is the same as case 5, but the shipper has inelastic demand $D(p^F) = 1\{p^F \leq 1\}$ (*i.e.*, the MRSS case).

Summary of Results

In this section, I summarize my main results and the intuition that drives them.

Table 2 summarizes the pre- and post-merger prices, quantities, profits, shipper- and total surplus values, and the change in these values caused by the merger. Observe first that the merger reduces the expected full price and increases expected output, shipper surplus, and total surplus in every case except Case 6, where the merger reduces shipper surplus. Case 6 assumes that the shipper has perfectly inelastic demand with a known reservation price, as in MRSS. A conclusion from Table 2 is that the unambiguous finding that a vertical merger reduces shipper surplus in Case 6 is an artifact of the assumption that the customer has perfectly inelastic demand with known reservation price.

To understand the relevance of the inelastic demand assumption, I first discuss the results in Cases 5 and 6, which differ only in the demand assumption—downward sloping demand in case 5, and perfectly inelastic in case 6.

Prior to the merger, in both cases downstream competition yields an expected downstream mark-up over the wholesale price equal to the maximum of the competing railroads' marginal costs. Each downstream railroad's profit is zero if it loses the auction, so it maximizes its expected profit conditional on winning. The dominant strategy under the second price auction rule for each railroad is to bid marginal cost, which for each railroad is the wholesale price plus its production marginal cost. Under the second price auction rule, this leads to a mark-up over the wholesale price equal to second lowest downstream production marginal cost. The full price is random (because the second lowest cost is random), and when positive sales occur, the full price is less than the shipper's reservation price in Case 6 and less than its the shipper's choke price in Case 5. Therefore, shipper surplus is positive in each case.

After the merger, it remains a dominant strategy for the unintegrated rival to bid cost in each case, but this is not true for the vertically integrated downstream railroad, *i.e.*, the standard second price auction result (bid cost) no longer holds. Post-merger, the merged railroad's expected profit depends not only on its profit conditional on winning the downstream auction, but also on its profit conditional on losing because in that event its profit comes from selling the input to the downstream rival. Conditional on winning, the merged railroad's profit is unaffected by its bid to the downstream rival (under the second price auction rule), but conditional on losing, its profit is what it extracts from the rival in selling the access leg. In this case, the demand assumptions matter a lot—in particular, the extreme assumption that the shipper has perfectly inelastic demand (meaning a reservation price that is known by the railroad) drives the result that the merger harms shipper welfare.

When the shipper has inelastic demand (Case 6), the merged railroad's profit upon losing equals its wholesale margin times a fixed quantity of inelastic demand. The profit that the merged railroad can capture from the rival without making the rival's participation unprofitable is higher the more surplus the rival captures from the shipper. Under the second price auction rule, the merged railroad maximizes this downstream surplus capture (and thus its profit) by bidding a price equal to the shipper's reservation price. This strategy implies that the unintegrated rival wins the auction with a bid just slightly below the shipper's reservation price, effectively leaving the buyer with no surplus in the event the rival wins. That is, by raising its bid to the sole-served price (the shipper's reservation price), the merged railroad ensures that if the rival wins the auction, it captures the entire shipper surplus given the second-price auction setup. Note as well that when the merged railroad wins the auction with that bid, it also collects the entire shipper surplus because the rival will have bid price that is weakly higher price.[5] Either way, the shipper earns zero surplus after the merger, and it is profit-maximizing for the merged railroad to bid in a way that ensures this. Thus, a vertical merger in Case 6 with inelastic demand reduces expected shipper surplus from a positive level pre-merger to zero post-merger.

This result is an artifact of the inelastic demand assumption, as I now explain. When the shipper has downward sloping demand, the merged railroad recognizes that conditional on losing the auction, it earns more if the rival sells more. Starting from the pre-merger wholesale price, the merged railroad has an incentive to shade its bid downward so that conditional on losing, the price charged by the rival is lower and the merged railroad sells more. This effect, which tends to lower the merged railroad's price to the downstream rival does not exist in the inelastic-demand case. In the linear demand/uniformly distributed cost case that we examine, the merged firm does raise the wholesale price post-merger, but the desire to sell more in the event it loses the auction combined with the elimination of double marginalization together dominate the higher wholesale price in determining ultimate effect on the shipper. This result mirrors the prediction of the effects of vertical mergers in full information settings with one upstream firm,

[5] Implicitly, the shipper's reservation price is a reserve price in the second price auction.

two downstream railroads, linear demand and Slutsky symmetry: a vertical merger in that setting is always procompetitive. My analysis shows that the presence of private cost information for the downstream railroads does not overturn this standard result.

Derivations

Case 1: Rule 11, the sole-serving railroad makes a TIOLI offer at the same time as the duopoly side second price auction takes place.

Pre-Merger

The price on the duopoly side is determined in a standard second price auction, in which both railroads bid their true costs, the lowest bid wins, and the duopoly side price is equal to the highest of the two costs:

$$p^{D,Pre} = c,$$

and its expectation is

$$E[p^{D,Pre}] = \int_0^1 cg(c)dc = \int_0^1 2c^2 dc = \frac{2}{3} \quad \text{(or 0.6667)}.$$

The sole-serving railroad sets its price p to maximize its expected profit, which is given by

$$\begin{aligned} E[\pi^{M,Pre}(p)] &= \int_0^{1-p} p(1-p-c)\, g(c)dc \\ &= -\frac{1}{3}p^4 + p^3 - p^2 + \frac{1}{3}p. \end{aligned}$$

Note that demand, and therefore the sole-serving railroad's profit, is 0 if $p + c > 1$ (i.e., $c > 1 - p$). The first order condition with respect to p is

$$\frac{\partial E[\pi^{M,Pre}(p)]}{\partial p} = -\frac{4}{3}p^3 + 3p^2 - 2p + \frac{1}{3} = 0.$$

The roots to this equation are 1 and $\frac{1}{4}$. Therefore, the profit maximizing price is

$$p^{M,Pre} = \frac{1}{4} \quad \text{(or 0.25)},$$

and the sole-serving railroad's expected profit is

$$E[\pi^{M,Pre}(p^{M,Pre})] = \frac{9}{256} \quad \text{(or 0.0352)}.$$

The duopolists' expected profits are given by:

$$E[\pi_1^{D,Pre}] = E[\pi_2^{D,Pre}]$$

$$= \int_0^{1-p^{M,Pre}} \left(\int_{c_1}^{1-p^{M,Pre}} (c_2 - c_1)\left(1 - \frac{1}{4} - c_2\right) f(c_2)\, dc_2 \right) f(c_1) dc_1$$
$$= \int_0^{\frac{3}{4}} \left(-\frac{1}{6}c_1^3 + \frac{3}{8}c_1^2 - \frac{9}{32}c_1 + \frac{9}{128} \right) dc_1$$
$$= \frac{27}{2048} \quad \text{(or 0.0132)},$$

and the expected joint profit of the sole-serving railroad and the integrating duopolist is

$$E\left[\pi^{Joint,Pre}\right] = E[\pi^{M,Pre}] + E\left[\pi_1^{D,Pre}\right]$$
$$= \frac{9}{256} + \frac{27}{2048} = \frac{99}{2048} \quad \text{(or 0.0483)}.$$

The expected full price is

$$E[p^{F,Pre}] = p^{M,Pre} + E[p^{D,Pre}] = \frac{1}{4} + \frac{2}{3} = \frac{11}{12} \quad \text{(or 0.9167)},$$

and expected output is

$$E[D(p^{F,Pre})] = \int_0^{1-\frac{1}{4}} \left(1 - \frac{1}{4} - c\right) g(c) dc$$
$$= \int_0^{\frac{3}{4}} \left(\frac{3}{4} - c\right) 2c dc$$
$$= \frac{9}{64} \quad \text{(or 0.1406)}.$$

Expected shipper surplus is

$$E[CS^{Pre}] = \int_0^{1-p^{M,Pre}} \left(\frac{1}{2}\right)(1 - c - p^{M,Pre})^2 g(c)\, dc$$
$$= \frac{1}{2}\int_0^{\frac{3}{4}} \left(\frac{3}{4} - c\right)^2 2c dc$$
$$= \int_0^{3/4} \left(c^3 - \frac{3}{2}c^2 + \frac{9}{16}c\right) dc$$
$$= \frac{9}{32}\left(\frac{3}{4}\right)^2 - \frac{1}{2}\left(\frac{3}{4}\right)^3 + \frac{1}{4}\left(\frac{3}{4}\right)^4$$
$$= \frac{27}{1024} \quad \text{(or 0.0264)},$$

and expected total surplus is

$$
\begin{aligned}
E[TS^{Pre}] &= E[CS^{Pre}] + E\left[\pi_1^{D,Pre}\right] + E\left[\pi_2^{D,Pre}\right] + E[\pi^{M,Pre}] \\
&= \frac{27}{1024} + \frac{27}{2048} + \frac{27}{2048} + \frac{9}{256} \\
&= \frac{45}{512} \quad \text{(or 0.0879).}
\end{aligned}
$$

Post-Merger

On the duopoly side, it is still the dominant strategy for the unintegrated railroad to bid its true cost, c_2. The integrated duopolist, however, internalizing the profit of the vertically integrated railroad, will optimally bid $b \leq c_1$.

The monopolist learns the realization of the integrated duopolist, c_1, prior to making the TIOLI offer. However, it does not observe the outcome of the duopoly side auction. Therefore, the merged railroad chooses the sole-served side price p and the duopoly side bids b to maximize the expected joint profit of the merged railroad, conditional on c_1.

Let p be the price of the sole-serving railroad. If the integrated duopolist bids $b \leq c_2$, then it wins the auction, and the joint profit of the merged railroad is

$$\pi_{Win}^{Post}(p) = (p + c_2 - c_1)(1 - p - c_2)$$

provided that $c_2 \leq 1 - p$ (otherwise the profit is 0). Note that this does not depend on b. If the integrated duopolist bids $b > c_2$, then it loses the auction, and the joint profit of the merged railroad is

$$\pi_{Lose}^{Post}(p, b) = p(1 - p - b)$$

as long as $b \leq 1 - p$. If $b > 1 - p$, the joint profit is guaranteed to be 0 and therefore the integrated duopolist would never bid above $1 - p$.

The expected joint profit of the merged railroad, conditional on c_1, is given by

$$
\begin{aligned}
&E\left[\pi^{Joint,Post}(p, b) \mid c_1\right] \\
&= \Pr[c_2 < b]\, \pi_{Lose}^{Post}(p, b) + \Pr[b \leq c_2 \leq 1 - p]\, E[\, \pi_{Win}^{Post}(p) \mid c_1, b \leq c_2 \leq 1 - p] \\
&= bp(1 - p - b) + (1 - p - b) \int_b^{1-p} (p + c_2 - c_1)(1 - p - c_2) \frac{1}{(1 - p - b)} dc_2 \\
&= bp(1 - p - b) + \int_b^{1-p} (p + c_2 - c_1)(1 - p - c_2)\, dc_2
\end{aligned}
$$

$$= bp(1-p-b) + \frac{1}{6}(b+p-1)^2(2b-3c_1+2p+1).$$

The FOCs for the profit-maximizing values of b and p are

$$\frac{\partial E\left[\pi^{Joint,Post}(p,b) \mid c_1\right]}{\partial b} = b^2 - (1+c_1)b + (1-p)c_1 = 0$$

and

$$\frac{\partial E\left[\pi^{Joint,Post}(p,b) \mid c_1\right]}{\partial p} = p^2 - (1+c_1)p + (1-b)c_1 = 0,$$

and the solutions to this system of equations are

$$(p,b) = (0,1), (1,0), \text{and} \left(c_1 + \frac{1}{2} \pm \frac{\sqrt{4c_1^2+1}}{2}, c_1 + \frac{1}{2} \pm \frac{\sqrt{4c_1^2+1}}{2}\right).$$

Note that $(p,b) = (0,1)$ and $(p,b) = (1,0)$ guarantee a profit of 0 and, therefore, cannot be the optimal solution. Similarly,

$$\frac{1}{2} + \frac{\sqrt{4c_1^2+1}}{2} \geq 1,$$

which means that $c_1 + \frac{1}{2} + \frac{1}{2}\sqrt{4c_1^2+1}$ cannot be the optimal solution. Finally, note that $c_1 + \frac{1}{2} - \frac{1}{2}\sqrt{4c_1^2+1}$ is increasing in c_1 and it is equal to $\frac{3}{2} - \frac{\sqrt{5}}{2} = 0.3820$ when $c_1 = 1$, which means that

$$(p^{M,Post}, b^{D,Post}) = \left(c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2+1}}{2}, c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2+1}}{2}\right)$$

satisfies $b^{D,Post} \leq 1 - p^{M,Post}$ and is the optimal solution. The expected joint profit of the merged railroad is therefore

$$\begin{aligned}
&E\left[\pi^{Joint,Post}(p^{M,Post}, b^{D,Post})\right] \\
&= \int_0^1 E[\pi^{Post}(p^{M,Post}, b^{D,Post}) \mid c_1] f(c_1) dc_1 \\
&= \int_0^1 \left(b^{D,Post} p^{M,Post}(1 - p^{M,Post} - b^{D,Post}) \right. \\
&\qquad \left. + \frac{1}{6}(b^{D,Post} + p^{M,Post} - 1)^2(2b^{D,Post} - 3c_1 + 2p^{M,Post} + 1) \right) dc_1 \\
&= \int_0^1 \left(2c_1^2 \frac{\sqrt{4c_1^2+1}}{3} - \frac{1}{2}c_1 - \frac{4}{3}c_1^3 + \frac{\sqrt{4c_1^2+1}}{6} \right) dc_1
\end{aligned}$$

$$= \frac{\log\left(\sqrt{5}+2\right)}{32} + \frac{13\sqrt{5}}{48} - \frac{7}{12} \quad \text{(or 0.0674).}$$

The expected profit of the merged railroad on the duopoly side is

$$E\left[\pi_1^{D,Post}\right] = \int_0^1 \left(\int_{b^{D,Post}}^{1-p^{M,Post}} (c_2 - c_1)\,(1 - p^{M,Post} - c_2) f(c_2)\, dc_2 \right) f(c_1) dc_1$$

$$= \int_0^1 \left(-\frac{4}{3}c_1^3 + \left(\frac{2\sqrt{4c_1^2+1}}{3} + 2 \right) c_1^2 - \left(\sqrt{4c_1^2+1} \right) c_1 - \frac{\sqrt{4c_1^2+1}}{12} + \frac{1}{4} \right) dc_1$$

$$= \frac{2}{3} - \frac{13\sqrt{5}}{48} - \frac{\log\left(\sqrt{5}+2\right)}{32} \quad \text{(or 0.0160).}$$

The expected profit of the merged railroad on the sole-served side is

$$E[\pi^{M,Post}] = E\left[\pi^{Joint,Post}\right] - E\left[\pi_1^{D,Post}\right]$$

$$= \frac{\log\left(\sqrt{5}+2\right)}{16} + \frac{13\sqrt{5}}{24} - \frac{5}{4} \quad \text{(or 0.0514),}$$

and the expected profit of the unintegrated duopolist is

$$E\left[\pi_2^{D,Post}\right]$$

$$= \int_0^{\frac{3}{2}-\frac{\sqrt{5}}{2}} \left(\int_{c_1 : b^{D,Post} = c_2}^{1} (b^{D,Post} - c_2)\,(1 - p^{M,Post} - b^{D,Post}) f(c_1)\, dc_1 \right) f(c_2) dc_2$$

$$= 0.0141.$$

The expected sole-served side price is

$$E[p^{M,Post}] = \int_0^1 \left(c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2+1}}{2} \right) f(c_1) dc_1$$

$$= 1 - \frac{\sqrt{5}}{4} - \frac{\log\left(\sqrt{5}+2\right)}{8} \quad \text{(or 0.2605),}$$

and the expected duopoly side price is

$$E[p^{D,Post}] = \int_0^1 \left(\Pr[c_2 \le b^{D,Post}]\, b^{D,Post} + \Pr[c_2 > b^{D,Post}]\; E[c_2 \mid c_2 > b^{D,Post}] \right) f(c_1) dc_1$$

$$= \int_0^1 \left((b^{D,Post})^2 + \int_{b^{D,Post}}^1 c_2 f(c_2) dc_2 \right) f(c_1) dc_1$$

$$= \int_0^1 \left((b^{D,Post})^2 + \frac{1}{2} - \frac{1}{2}(b^{D,Post})^2 \right) dc_1$$

$$= \frac{11}{8} - \frac{\sqrt{5}}{3} - \frac{\log(\sqrt{5}+2)}{16} \quad \text{(or 0.5394).}$$

The expected full price is therefore

$$E[p^{F,Post}] = E[p^{M,Post}] + E[p^{D,Post}] = \frac{19}{8} - \frac{7\sqrt{5}}{12} - \frac{3\log(\sqrt{5}+2)}{16} \quad \text{(or 0.7999),}$$

and the expected output is

$$E[D(p^{F,Post})]$$

$$= \int_0^1 (\Pr[c_2 < b^{D,Post}]\,(1 - p^{M,Post} - b^{D,Post}) + \Pr[b^{D,Post} \le c_2 \le 1 - p^{M,Post}]\,E[\,(1 - p^{M,Post} - c_2\,)|\,c_1, b^{D,Post} \le c_2 \le 1 - p^{M,Post}])\,f(c_1)\,dc_1$$

$$= \int_0^1 \left(b^{D,Post}(1 - p^{M,Post} - b^{D,Post}) + \int_{b^{D,Post}}^{1-p^{M,Post}} (1 - p^{M,Post} - c_2)\,dc_2 \right) dc_1$$

$$= \frac{\log(\sqrt{5}+2)}{8} + \frac{\sqrt{5}}{4} - \frac{1}{2} \quad \text{(or 0.2395).}$$

Expected shipper surplus is

$$E[CS^{Post}]$$

$$= \frac{1}{2}\int_0^1 (\Pr[c_2 < b^{D,Post}]\,(1 - p^{M,Post} - b^{D,Post})^2 + \Pr[b^{D,Post} \le c_2 \le 1 - p^{M,Post}]\,E[(1 - p^{M,Post} - c_2\,)^2|\,c_1, b^{D,Post} \le c_2 \le 1 - p^{M,Post}])\,f(c_1)\,dc_1$$

$$= \frac{1}{2}\int_0^1 \left(b^{D,Post}(1 - p^{M,Post} - b^{D,Post})^2 + \int_{b^{D,Post}}^{1-p^{M,Post}} (1 - p^{M,Post} - c_2)^2\,dc_2 \right) dc_1$$

$$= \frac{23}{12} - \frac{5\sqrt{5}}{6} \quad \text{(or 0.0533),}$$

and expected total surplus is

$$E[TS^{Post}] = E[CS^{Post}] + E\left[\pi_1^{D,Post}\right] + E\left[\pi_2^{D,Post}\right] + E[\pi^{M,Post}]$$
$$= 0.1348.$$

Case 2: Rule 11. The duopoly side second price auction takes place first, and then the sole-serving railroad makes a TIOLI offer.

Pre-Merger

The per-merger outcome on the duopoly side is the same as the outcome in Case 1, with prices given by

$$p^{D,Pre} = c$$
$$E[p^{D,Pre}] = \frac{2}{3} \quad (\text{or } 0.6667),$$

and the duopolists' expected profits are

$$E\left[\pi_1^{D,Pre}\right] = E\left[\pi_2^{D,Pre}\right] = \frac{27}{2048} \quad (\text{or } 0.0483).$$

The pre-merger outcome on the sole-served side is also the same as the outcome in Case 1. The sole-serving railroad does not observe the outcome of the duopoly side auction, and it sets price to maximize its expected profit. The profit maximizing price is

$$p^{M,Pre} = \frac{1}{4} \quad (\text{or } 0.25).$$

The sole-serving railroad's expected profit is

$$E[\pi^{M,Pre}(p^{M,Pre})] = \frac{9}{256} \quad (\text{or } 0.0352),$$

and the expected joint profit of the sole-serving railroad and the integrating duopolist is

$$E\left[\pi^{Joint,Pre}\right] = \frac{99}{2048} \quad (\text{or } 0.0483).$$

The expected full price is

$$E[p^{F,Pre}] = \frac{11}{12} \quad (\text{or } 0.9167),$$

and the expected output is

$$E[D(p^{F,Pre})] = \frac{9}{64} \quad (\text{or } 0.1406).$$

Expected shipper surplus is

$$E[CS^{Pre}] = \frac{27}{1024} \quad (\text{or } 0.0264),$$

and expected total surplus is

$$E[TS^{Pre}] = \frac{45}{512} \quad \text{(or 0.0879).}$$

Post-Merger

On the duopoly side, it is still the dominant strategy for the unintegrated railroad to bid its true cost, c_2. The integrated duopolist, however, internalizing the profit of the merged railroad, will optimally bid $b \leq c_1$.

The sole-serving railroad learns the realization of the integrated duopolist, c_1, and the outcome of the duopoly side auction prior to making its TIOLI offer. Therefore, the sole-serving railroad chooses the sole-served side price p to maximize the joint profit of the merged railroad, conditional on c_1 and the outcome of the duopoly side auction.

Let p be the price on the sole-served side. If the integrated duopolist bids $b \leq c_2$, then it wins the auction, and the joint profit of the merged railroad is

$$\pi_{Win}^{Post}(p) = (p + c_2 - c_1)(1 - p - c_2)$$

provided that $c_2 \leq 1 - p$ (otherwise the profit is 0). Note that this does not depend on b.

The profit maximizing FOC with respect to p is

$$\frac{\partial \pi_{Win}^{Post}(p)}{\partial p} = 1 - 2p + c_1 - 2c_2 = 0,$$

and the profit maximizing sole-served side price is

$$p_{Win}^{M,Post} = \frac{1 + c_1 - 2c_2}{2}.$$

The full price, conditional on the integrated duopolist winning the auction, is

$$p_{Win}^{F,Post} = \frac{1 + c_1 - 2c_2}{2} + c_2 = \frac{1 + c_1}{2}$$

which does not depend on c_2. Therefore, the joint profit of the merged railroad, conditional on the integrated duopolist winning the duopoly side auction, is

$$\pi_{Win}^{Post}\left(p_{Win}^{M,Post}\right) = \left(\frac{1 + c_1 - 2c_2}{2} + c_2 - c_1\right)\left(1 - \frac{1 + c_1 - 2c_2}{2} - c_2\right) = \left(\frac{1 - c_1}{2}\right)^2.$$

If the integrated duopolist bids $b > c_2$, then it loses the auction, and the joint profit of the merged railroad is

$$\pi_{Lose}^{Post}(p, b) = p(1 - p - b)$$

as long as $b \leq 1 - p$. If $b > 1 - p$, the joint profit is guaranteed to be 0 and, therefore, the integrated duopolist would never bid above $1 - p$. The profit maximizing FOC with respect to p is

$$\frac{\partial \pi_{Lose}^{Post}(p, b)}{\partial p} = 1 - 2p - b = 0,$$

and the profit maximizing sole-servied side price, conditional on the integrated duopolist losing the duopoly side auction, is

$$p_{Lose}^{M,Post} = \frac{1 - b}{2}.$$

The full price, conditional on the integrated duopolist losing the auction, is

$$p_{Lose}^{F,Post} = \frac{1 - b}{2} + b = \frac{1 + b}{2}.$$

The joint profit of the merged railroad, conditional on the integrated duopolist losing the duopoly side auction and the bid b, is

$$\pi_{Lose}^{Post}\left(p_{Lose}^{M,Post}, b\right) = \left(\frac{1 - b}{2}\right)\left(1 - \frac{1 - b}{2} - b\right) = \left(\frac{1 - b}{2}\right)^2.$$

Now consider the optimal bid for the integrated duopolist in the duopoly second price auction. Conditional c_1, the expected joint profit of the merged railroad is

$$\begin{aligned}
&E\left[\pi^{Joint,Post}\left(p_{Win}^{M,Post}, p_{Lose}^{M,Post}, b\right) \mid c_1\right] \\
&= \Pr(c_2 > b)\, \pi_{Win}^{Post}\left(p_{Win}^{M,Post}\right) + \Pr(c_2 \leq b)\, \pi_{Lose}^{Post}\left(p_{Lose}^{M,Post}, b\right) \\
&= (1 - b)\left(\frac{1 - c_1}{2}\right)^2 + b\left(\frac{1 - b}{2}\right)^2 \\
&= \frac{1}{4}b^3 - \frac{1}{2}b^2 + \left(\frac{1}{4} - \left(\frac{1 - c_1}{2}\right)^2\right)b + \left(\frac{1 - c_1}{2}\right)^2,
\end{aligned}$$

and the profit maximizing FOC with respect to b is

$$\frac{\partial E\left[\pi^{Joint,Post}\left(p_{Win}^{M,Post}, p_{Lose}^{M,Post}, b\right) \mid c_1\right]}{\partial b} = \frac{3}{4}b^2 - b + \frac{1}{4} - \left(\frac{1 - c_1}{2}\right)^2 = 0.$$

The roots to this equation are

$$b = \frac{2}{3} \pm \frac{\sqrt{4 - 6c_1 + 3c_1^2}}{3}.$$

Note that $\sqrt{4 - 6c + 3c^2}$ is decreasing in c_1 in the interval $[0,1]$ and it is equal to 1 when $c_1 = 1$, which means the $\frac{2}{3} + \frac{1}{3}\sqrt{4 - 6c_1 + 3c_1^2}$ cannot be the optimal bid. Therefore, the optimal bid for the integrated duopolist is

$$b^{D,Post} = \frac{2}{3} - \frac{\sqrt{4 - 6c_1 + 3c_1^2}}{3}.$$

The expected joint profit of the merged railroad is therefore

$$\begin{aligned}
&E\left[\pi^{Joint,Post}\left(p_{Win}^{M,Post}, p_{Lose}^{M,Post}, b^{D,Post}\right)\right] \\
&= \int_0^1 E\left[\pi^{Joint,Post}\left(p_{Win}^{M,Post}, p_{Lose}^{M,Post}, b^{D,Post}\right) \mid c_1\right] f(c_1) dc_1 \\
&= \int_0^1 \left(\frac{1}{4}(b^{D,Post})^3 - \frac{1}{2}(b^{D,Post})^2 + \left(\frac{1}{4} - \left(\frac{1 - c_1}{2}\right)^2\right) b^{D,Post} + \left(\frac{1 - c_1}{2}\right)^2\right) dc_1 \\
&= \frac{\sqrt{3}\log\left(\sqrt{3} + 2\right)}{432} + \frac{7}{72} \quad \text{(or 0.1025).}
\end{aligned}$$

The expected profit of the merged railroad on the duopoly side is

$$\begin{aligned}
E\left[\pi_1^{D,Post}\right] &= \int_0^1 \left(\int_{b^{D,Post}}^1 (c_2 - c_1)\left(1 - p_{Win}^{M,Post} - c_2\right) f(c_2) dc_2\right) f(c_1) dc_1 \\
&= \int_0^1 \left(\int_{b^{D,Post}}^1 (c_2 - c_1)\left(\frac{1 - c_1}{2}\right) dc_2\right) dc_1 \\
&= \frac{79}{1296} - \frac{\sqrt{3}\log\left(\sqrt{3} + 2\right)}{432} \quad \text{(or 0.0557).}
\end{aligned}$$

The expected profit of the merged railroad on the sole-served side is

$$\begin{aligned}
E[\pi^{M,Post}] &= E\left[\pi^{Joint,Post}\right] - E\left[\pi_1^{D,Post}\right] \\
&= \frac{\sqrt{3}\log\left(\sqrt{3} + 2\right)}{216} + \frac{47}{1296} \quad \text{(or 0.0468).}
\end{aligned}$$

and the expected profit of the unintegrated duopolist is

$$\begin{aligned}
&E\left[\pi_2^{D,Post}\right] \\
&= \int_0^{\frac{1}{3}} \left(\int_{c_1 : b^{D,Post} = c_2}^1 (b^{D,Post} - c_2)\left(1 - p_{Lose}^{M,Post} - b^{D,Post}\right) f(c_1) dc_1\right) f(c_2) dc_2
\end{aligned}$$

$$= \int_0^{\frac{1}{3}} \left(\int_{c_1 : b^{D,Post} = c_2}^{1} (b^{D,Post} - c_2) \left(1 - \frac{1 + b^{D,Post}}{2} \right) dc_1 \right) dc_2.$$
$$= 0.0096.$$

The expected sole-served side price is

$$E[p^{M,Post}] = \int_0^1 \left(\Pr[c_2 \le b^{D,Post}] p_{Lose}^{M,Post} + \Pr[c_2 > b^{D,Post}] \, E\left[p_{Win}^{M,Post} | c_2 > b^{D,Post} \right] \right) f(c_1) dc_1$$
$$= \int_0^1 \left(b^{D,Post} \left(\frac{1 - b^{D,Post}}{2} \right) + \int_{b^{D,Post}}^1 \left(\frac{1 + c_1 - 2c_2}{2} \right) dc_2 \right) f(c_1) dc_1$$
$$= \frac{1}{2} \int_0^1 \left(b^{D,Post}(1 - b^{D,Post}) + (b^{D,Post} - c_1)(b^{D,Post} - 1) \right) f(c_1) dc_1$$
$$= \frac{\sqrt{3} \log\left(\sqrt{3} + 2\right)}{36} + \frac{13}{108} \quad \text{(or 0.1837)},$$

and the expected duopoly side price is

$$E[p^{D,Post}] = \int_0^1 \left(\Pr[c_2 \le b^{D,Post}] \, b^{D,Post} + \Pr[c_2 > b^{D,Post}] \; E[c_2 \mid c_2 > b^{D,Post}] \right) f(c_1) dc_1$$
$$= \int_0^1 \left((b^{D,Post})^2 + \int_{b^{D,Post}}^1 c_2 f(c_2) dc_2 \right) f(c_1) dc_1$$
$$= \int_0^1 \left((b^{D,Post})^2 + \frac{1}{2} - \frac{1}{2} (b^{D,Post})^2 \right) dc_1$$
$$= \frac{11}{18} - \frac{\sqrt{3} \log\left(\sqrt{3} + 2\right)}{27} \quad \text{(or 0.5266)}.$$

The expected full price is therefore

$$E[p^{F,Post}] = E[p^{M,Post}] + E[p^{D,Post}] = \frac{79}{108} - \frac{\sqrt{3} \log\left(\sqrt{3} + 2\right)}{108} \quad \text{(or 0.7104)}.$$

Expected output is

$$E[D(p^{F,Post})]$$

$$= \int_0^1 \left(\Pr[c_2 < b^{D,Post}]\left(1 - p_{Lose}^{F,Post}\right) + \Pr[b^{D,Post} \le c_2]\left(1 - p_{Win}^{F,Post}\right)\right) f(c_1)\, dc_1$$

$$= \int_0^1 \left(b^{D,Post}\left(1 - \frac{1 + b^{D,Post}}{2}\right) + (1 - b^{D,Post})\left(1 - \frac{1 + c_1}{2}\right)\right) dc_1$$

$$= \frac{29}{108} + \frac{\sqrt{3}\log\left(\sqrt{3} + 2\right)}{108} \quad \text{(or 0.2896).}$$

Expected shipper surplus is

$$E[CS^{Post}]$$

$$= \frac{1}{2}\int_0^1 \left(\Pr[c_2 < b^{D,Post}]\left(1 - p_{Lose}^{F,Post}\right)^2 + \Pr[b^{D,Post} \le c_2]\left(1 - p_{Win}^{F,Post}\right)^2\right) f(c_1)\, dc_1$$

$$= \frac{1}{2}\int_0^1 \left(b^{D,Post}\left(1 - \frac{1 + b^{D,Post}}{2}\right)^2 + (1 - b^{D,Post})\left(1 - \frac{1 + c_1}{2}\right)^2\right) dc_1$$

$$= \frac{7}{144} + \frac{\sqrt{3}\log\left(\sqrt{3} + 2\right)}{864} \quad \text{(or 0.0513),}$$

and expected total surplus is

$$E[TS^{Post}] = E[CS^{Post}] + E\left[\pi_1^{D,Post}\right] + E\left[\pi_2^{D,Post}\right] + E[\pi^{M,Post}]$$
$$= 0.1633.$$

Case 3: Rule 11, the sole-served side makes a TIOLI offer first, and then the duopoly side second price auction takes place.

Pre-Merger

The per-merger outcome on the duopoly side is the same as the outcome in Case 1, with prices given by

$$p^{D,Pre} = c$$
$$E[p^{D,Pre}] = \frac{2}{3} \quad (\text{or } 0.6667),$$

and the duopolists' expected profits are

$$E\left[\pi_1^{D,Pre}\right] = E\left[\pi_2^{D,Pre}\right] = \frac{27}{2048} \quad (\text{or } 0.0132).$$

The pre-merger outcome on the sole-served side is also the same as the outcome in Case 1. The sole-serving railroad does not observe the outcome of the duopoly side auction, and it sets price to maximize its expected profit. The profit maximizing price is

$$p^{M,Pre} = \frac{1}{4} \quad (\text{or } 0.25).$$

The sole-serving railroad's expected profit is

$$E[\pi^{M,Pre}(p^{M,Pre})] = \frac{9}{256} \quad (\text{or } 0.0352),$$

and the expected joint profit of the sole-serving railroad and the integrating duopolist is

$$E\left[\pi^{Joint,Pre}\right] = \frac{99}{2048} \quad (\text{or } 0.0483).$$

The expected full price is

$$E[p^{F,Pre}] = \frac{11}{12} \quad (\text{or } 0.9167),$$

and expected output is

$$E[D(p^{F,Pre})] = \frac{9}{64} \quad (\text{or } 0.1406).$$

Expected shipper surplus is

$$E[CS^{Pre}] = \frac{27}{1024} \quad (\text{or } 0.0264),$$

and expected total surplus is

$$E[TS^{Pre}] = \frac{45}{512} \quad \text{(or 0.0879).}$$

Post-Merger

The post-merger outcomes on both the duopoly side and the sole-served side are the same as the outcomes in Case 1.

On the duopoly side, it is still the dominant strategy for the unintegrated duopolist to bid its true cost. The integrated duopolist, on the other hand, would optimally bid

$$b^{D,Post} = c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2 + 1}}{2}.$$

The expected price on the duopoly side is

$$E[p^{D,Post}] = \frac{11}{8} - \frac{\sqrt{5}}{3} - \frac{\log(\sqrt{5}+2)}{16} \quad \text{(or 0.5394).}$$

On the sole-served side, the optimal TIOLI offer is

$$p^{M,Post} = c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2 + 1}}{2},$$

and its expected value is

$$E[p^{M,Post}] = 1 - \frac{\sqrt{5}}{4} - \frac{\log(\sqrt{5}+2)}{8} \quad \text{(or 0.2605).}$$

The expected profit of the merged railroad on the duopoly side is

$$E[\pi_1^{D,Post}] = \frac{2}{3} - \frac{13\sqrt{5}}{48} - \frac{\log(\sqrt{5}+2)}{32} \quad \text{(or 0.0160),}$$

and the expected profit of the unintegrated duopolist is

$$E[\pi_2^{D,Post}] = 0.0141.$$

The expected profit of the merged railroad on the sole-served side is

$$E[\pi^{M,Post}] = \frac{\log(\sqrt{5}+2)}{16} + \frac{13\sqrt{5}}{24} - \frac{5}{4} \quad \text{(or 0.0514),}$$

and the expected joint profit of the merged railroad is therefore

$$E[\pi^{Joint,Post}] = E[\pi_1^{D,Post}] + E[\pi^{M,Post}] = \frac{\log(\sqrt{5}+2)}{32} + \frac{13\sqrt{5}}{48} - \frac{7}{12} \quad \text{(or 0.0674).}$$

The expected full price is

$$E[p^{F,Post}] = E[p^{M,Post}] + E[p^{D,Post}] = \frac{19}{8} - \frac{7\sqrt{5}}{12} - \frac{3\log\left(\sqrt{5}+2\right)}{16} \quad \text{(or 0.7999)}$$

and expected output is

$$E[D(p^{F,Post})] = \frac{\log\left(\sqrt{5}+2\right)}{8} + \frac{\sqrt{5}}{4} - \frac{1}{2} \quad \text{(or 0.2395).}$$

Expected shipper surplus is

$$E[CS^{Post}] = \frac{23}{12} - \frac{5\sqrt{5}}{6} \quad \text{(or 0.0533),}$$

and expected total surplus is

$$\begin{aligned} E[TS^{Post}] &= E[CS^{Post}] + E\left[\pi_1^{D,Post}\right] + E\left[\pi_2^{D,Post}\right] + E[\pi^{M,Post}] \\ &= 0.1348. \end{aligned}$$

Case 4: 2*1 Routes, the duopoly side second price auction takes place first, and then the sole-served side makes a TIOLI offer. The sole-serving railroad sets the full price.

Pre-Merger

On the duopoly side, it is the dominant strategy for the duopolists to bid their costs, as it is in Case 1. The prices on the duopoly side auction are given by

$$p^{D,Pre} = c$$
$$E[p^{D,Pre}] = \frac{2}{3} \quad (\text{or } 0.6667).$$

On the sole-served side, the sole-serving railroad observes the outcome of the auction before making the TIOLI offer. It then sets the full price equal to the sum of the winning price in the duopoly side auction, $p^{D,Pre} = c$, and its TIOILI offer. That is, the sole-serving railroad chooses the sole-served side price p to maximize its profit, which is given by

$$\pi^{M,Pre}(p) = p(1 - p - c) = -p^2 + p - cp.$$

The first order condition with respect to p is

$$\frac{\partial \pi^{M,Pre}(p)}{\partial p} = -2p + 1 - c = 0.$$

Therefore, the profit-maximizing sole-served side price is

$$p^{M,Pre} = \frac{1 - c}{2},$$

and its expectation is

$$E[p^{M,Pre}] = \int_0^1 \frac{1 - c}{2} g(c) dc = \int_0^1 (1 - c)c \, dc = \frac{1}{6} \quad (\text{or } 0.1667).$$

The expected profit of the sole-serving railroad is

$$\begin{aligned} E[\pi^{M,Pre}(p^{F,Pre})] &= \int_0^1 \left(-\left(\frac{1 - c}{2}\right)^2 + \frac{1 - c}{2} - c\frac{1 - c}{2} \right) g(c) dc \\ &= \int_0^1 \left(\frac{1}{2}c^3 - c^2 + \frac{1}{2}c \right) dc \\ &= \frac{1}{24} \quad (\text{or } 0.0417). \end{aligned}$$

The duopolists' expected profits are given by

$$\begin{aligned} E\left[\pi_1^{D,Pre}\right] &= E\left[\pi_2^{D,Pre}\right] \\ &= \int_0^1 \left(\int_{c_1}^1 (c_2 - c_1) \left(1 - \frac{1 - c_2}{2} - c_2 \right) f(c_2) dc_2 \right) f(c_1) dc_1 \end{aligned}$$

$$= \int_0^1 \left(-\frac{1}{12}c_1^3 + \frac{1}{4}c_1^2 - \frac{1}{4}c_1 + \frac{1}{12}\right) dc_1$$
$$= \frac{1}{48} \quad \text{(or 0.0208)},$$

and the expected joint profit of the sole-serving railroad and the integrating duopolist is

$$E\left[\pi^{Joint,Pre}\right] = \frac{1}{24} + \frac{1}{48} = \frac{1}{16} \quad \text{(or 0.0625)}.$$

The expected full price is

$$E[p^{F,Pre}] = E[p^{M,Pre}] + E[p^{D,Pre}] = \frac{1}{6} + \frac{2}{3} = \frac{5}{6} \quad \text{(or 0.8333)},$$

and expected output is

$$E[D(p^{F,Pre})] = \int_0^1 \left(1 - \frac{1-c}{2} - c\right) g(c) dc$$
$$= \int_0^1 \left(\frac{1-c}{2}\right) 2c \, dc$$
$$= \frac{1}{6} \quad \text{(or 0.1667)}.$$

Expected shipper surplus is

$$E[CS^{Pre}] = \int_0^1 \left(\frac{1}{2}\right)\left(1 - \frac{1-c}{2} - c\right)^2 g(c) \, dc$$
$$= \int_0^1 \left(\frac{1-c}{2}\right)^2 c \, dc$$
$$= \int_0^1 \left(\frac{1}{4}c^3 - \frac{1}{2}c^2 + \frac{1}{4}c\right) dc$$
$$= \frac{1}{48} \quad \text{(or 0.0208)},$$

and expected total surplus is

$$E[TS^{Pre}] = E[CS^{Pre}] + E\left[\pi_1^{D,Pre}\right] + E\left[\pi_2^{D,Pre}\right] + E[\pi^{M,Pre}]$$
$$= \frac{1}{48} + \frac{1}{48} + \frac{1}{48} + \frac{1}{24}$$
$$= \frac{5}{48} \quad \text{(or 0.1042)}.$$

Post-Merger

The post-merger outcomes on both the duopoly side and the sole-served side are the same as the outcomes in Case 2.

On the duopoly side, it is still the dominant strategy for the unintegrated duopolist to bid its true cost. The integrated duopolist, on the other hand, would optimally bid

$$b^{D,Post} = \frac{2}{3} - \frac{\sqrt{4 - 6c_1 + 3c_1^2}}{3}.$$

The expected price on the duopoly side is

$$E[p^{D,Post}] = \frac{11}{18} - \frac{\sqrt{3}\log(\sqrt{3}+2)}{27} \quad \text{(or 0.5266).}$$

On the sole-served side, the sole-serving railroad learns the outcome of the duopoly side auction prior to making the TIOLI offer. The optimal TIOLI offer conditional on winning the auction is

$$p_{Win}^{M,Post} = \frac{1 + c_1 - 2c_2}{2},$$

and the optimal TIOLI offer conditional on losing the auction is

$$p_{Lose}^{M,Post} = \frac{1 - b}{2},$$

and its expected sole-served side price is

$$E[p^{M,Post}] = \frac{\sqrt{3}\log(\sqrt{3}+2)}{36} + \frac{13}{108} \quad \text{(or 0.1837).}$$

The expected profit of the merged railroad on the duopoly side is

$$E[\pi_1^{D,Post}] = \frac{79}{1296} - \frac{\sqrt{3}\log(\sqrt{3}+2)}{432} \quad \text{(or 0.0557),}$$

and the expected profit of the unintegrated duopolist is

$$E[\pi_2^{D,Post}] = 0.0096.$$

The expected profit of the merged railroad on the sole-served side is

$$E[\pi^{M,Post}] = \frac{\sqrt{3}\log(\sqrt{3}+2)}{216} + \frac{47}{1296} \quad \text{(or 0.0468),}$$

and the expected joint profit of the merged railroad is therefore

$$E[\pi^{Joint,Post}] = E[\pi_1^{D,Post}] + E[\pi^{M,Post}] = \frac{\sqrt{3}\log(\sqrt{3}+2)}{432} + \frac{7}{72} \quad \text{(or 0.1025).}$$

The expected full price is

$$E[p^{F,Post}] = E[p^{M,Post}] + E[p^{D,Post}] = \frac{79}{108} - \frac{\sqrt{3}\log(\sqrt{3}+2)}{108} \quad \text{(or 0.7104)},$$

and expected output is

$$E[D(p^{F,Post})] = \frac{29}{108} + \frac{\sqrt{3}\log(\sqrt{3}+2)}{108} \quad \text{(or 0.2896)}.$$

Expected shipper surplus is

$$E[CS^{Post}] = \frac{7}{144} + \frac{\sqrt{3}\log(\sqrt{3}+2)}{864} \quad \text{(or 0.0513)},$$

and expected total surplus is

$$\begin{aligned} E[TS^{Post}] &= E[CS^{Post}] + E\left[\pi_1^{D,Post}\right] + E\left[\pi_2^{D,Post}\right] + E[\pi^{M,Post}] \\ &= 0.1633. \end{aligned}$$

Case 5: 1*2 Routes, the sole-served side makes a TIOLI offer first, and then the duopoly side second price auction takes place. The winner of the duopoly side auction sets the full price equal to the sum of the sole-served railroad's TIOLI offer and the auction price.

Pre-Merger

Suppose the sole-served side TIOLI price is p^M and both railroads on the duopoly side observe this prior to bidding in the duopoly side second price auction. The winner of the auction will combine the products on the sole-served side and the duopoly side and sell it to the shipper at price $p^F = p^M + p^D$, where p^F is determined in the second price auction and p^D is simply the difference between p^F and p^M.

Given p^M, the full cost of duopolist i is $c_i + p^M$. Suppose duopolist i bid b_i in the duopoly side auction and suppose that the buyer has a reserve price of 1 in the second price auction. Then, the bidder with the lowest bid wins the auction and the winning price is

$$p^F = \min\{\max\{b_1, b_2\}, 1\}.$$

If duopolist i loses the auction, its profit is zero. If duopolist i wins the auction, i.e., $b_i < b_j$ where $j \neq i$, its profit is

$$(p^F - p^M - c_i)(1 - p^F) = \big(\min\{b_j, 1\} - p^M - c_i\big)\big(1 - \min\{b_j, 1\}\big).$$

Pre-merger, duopolist i's bid b_i does not affect its profit conditional on winning or losing. So, following the standard second price auction logic, it is the dominant strategy for both duopolists to bid their true cost, $c_i + p^M$, and the equilibrium full price pre-merger is

$$p^{F,Pre}(p^M) = \min\{c + p^M, 1\}$$

where $c = \max\{c_1, c_2\}$.

Because the price is capped at 1, duopolist i will not participate in the auction if $c_i > 1 - p^M$, which happens with probability $1 - F(1 - p^M)$. If $c > 1 - p^M$, then there will be no sale, and the probability of this event is

$$\Pr[\text{No Sale}] = 1 - \big(F(1 - p^M)\big)^2 = p^M(2 - p^M).$$

Given $p^{F,Pre}$ and p^M, the expected output is

$$\begin{aligned} &E\big[D\big(p^{F,Pre}(p^M)\big)\big] \\ &= \int_0^{1-p^M} \left(\int_0^{1-p^M} \big(1 - p^{F,Pre}(p^M)\big) f(c_2) dc_2 + \int_{1-p^M}^{1} (1-1) f(c_2) dc_2 \right) f(c_1) dc_1 \\ &\qquad + \int_{1-p^M}^{1} \left(\int_0^{1-p^M} (1-1) f(c_2) dc_2 + \int_{1-p^{M,Pre}}^{1} (0) f(c_2) dc_2 \right) f(c_1) dc_1 \end{aligned}$$

$$= -\int_0^{1-p^M} \left(\int_0^{1-p^M} \max\{c_1, c_2\} f(c_2) dc_2 \right) f(c_1) dc_1 + (1-p^M)\big(F(1-p^M)\big)^2$$
$$= -\int_0^{1-p^M} \left(c_1 F(c_1) + \int_{c_1}^{1-p^M} c_2 f(c_2) dc_2 \right) f(c_1) dc_1 + (1-p^M)\big(F(1-p^M)\big)^2$$
$$= \frac{1}{3}(1-p^M)^3.$$

On the sole-served side, the sole-serving railroad chooses price p^M to maximize its expected profit, which is given by

$$\begin{aligned} E[\pi^{M,Pre}(p^M)] &= p^M E\big[D\big(p^{F,Pre}(p^M)\big)\big] \\ &= \frac{1}{3} p^M (1-p^M)^3 \\ &= -\frac{1}{3}(p^M)^4 + (p^M)^3 - (p^M)^2 + \frac{1}{3}(p^M). \end{aligned}$$

The optimal pre-merger sole-served side price, $p^{M,Pre}$, is the solution to the following profit maximizing FOC

$$\frac{\partial E[\pi^{M,Pre}(p^M)]}{\partial p^M} = -\frac{4}{3}(p^M)^3 + 3(p^M)^2 - 2p^M + \frac{1}{3} = 0.$$

The roots to this equation are 1 and $\frac{1}{4}$. Therefore, the profit maximizing price is

$$p^{M,Pre} = \frac{1}{4} \quad \text{(or 0.2500)},$$

and the sole-serving railroad's expected profit is

$$E[\pi^{M,Pre}(p^{M,Pre})] = \frac{9}{256} \quad \text{(or 0.0352)}.$$

The expected full price is

$$\begin{aligned} E[p^{F,Pre}] &= \int_0^{1-p^{M,Pre}} (c + p^{M,Pre}) g(c)\, dc + \int_{1-p^{M,Pre}}^{1} g(c)\, dc \\ &= \int_0^{\frac{3}{4}} \left(c + \frac{1}{4}\right) 2c\, dc + \int_{\frac{3}{4}}^{1} 2c\, dc \\ &= \frac{55}{64} \quad \text{(or 0.8594)}, \end{aligned}$$

and the expected duopoly side price is

$$E[p^{D,Pre}] = E[p^{F,Pre}] - E[p^{M,Pre}] = \frac{55}{64} - \frac{1}{4} = \frac{39}{64} \quad \text{(or 0.6094)}.$$

The duopolists' expected profits are given by

$$\begin{aligned}
E\left[\pi_1^{D,Pre}\right] &= E\left[\pi_2^{D,Pre}\right] \\
&= \int_0^{1-p^{M,Pre}} \left(\int_{c_1}^{1-p^{M,Pre}} (c_2 - c_1)(1 - p^{M,Pre} - c_2)\, f(c_2)\, dc_2 \right) f(c_1) dc_1 \\
&= \int_0^{\frac{3}{4}} \left(-\frac{1}{6} c_1^3 + \frac{3}{8} c_1^2 - \frac{9}{32} c_1 + \frac{9}{128} \right) dc_1 \\
&= \frac{27}{2048} \quad (\text{or } 0.0132),
\end{aligned}$$

and the expected joint profit of the sole-served and the integrating duopolist is

$$\begin{aligned}
E\left[\pi^{Joint,Pre}\right] &= E[\pi^{M,Pre}] + E\left[\pi_1^{D,Pre}\right] \\
&= \frac{9}{256} + \frac{27}{2048} = \frac{99}{2048} \quad (\text{or } 0.0483).
\end{aligned}$$

Expected output is

$$\begin{aligned}
E[D(p^{F,Pre})] &= \frac{1}{3}(1 - p^{M,Pre})^3 \\
&= \frac{9}{64} \quad (\text{or } 0.1406).
\end{aligned}$$

Expected shipper surplus is

$$\begin{aligned}
E[CS^{Pre}] &= \int_0^{1-p^{M,Pre}} \left(\frac{1}{2}\right)(1 - c - p^{M,Pre})^2 g(c)\, dc \\
&= \frac{1}{2} \int_0^{\frac{3}{4}} \left(\frac{3}{4} - c\right)^2 2c\, dc \\
&= \int_0^{3/4} \left(c^3 - \frac{3}{2} c^2 + \frac{9}{16} c \right) dc \\
&= \frac{9}{32}\left(\frac{3}{4}\right)^2 - \frac{1}{2}\left(\frac{3}{4}\right)^3 + \frac{1}{4}\left(\frac{3}{4}\right)^4 \\
&= \frac{27}{1024} \quad (\text{or } 0.0264),
\end{aligned}$$

and expected total surplus is

$$\begin{aligned}
E[TS^{Pre}] &= E[CS^{Pre}] + E\left[\pi_1^{D,Pre}\right] + E\left[\pi_2^{D,Pre}\right] + E[\pi^{M,Pre}] \\
&= \frac{27}{1024} + \frac{27}{2048} + \frac{27}{2048} + \frac{9}{256} \\
&= \frac{45}{512} \quad (\text{or } 0.0879).
\end{aligned}$$

Post-Merger

Let p^M be the price on the sole-served side and let b_1 be the bid submitted by the integrated duopolist. First, note that it is still the dominant strategy for the unintegrated duopolist to bid its true cost, $c_2 + p^M$. Second, it is never optimal for the integrated duopolist to bid $b_1 > 1$ as that would guarantee that it loses the auction, and so we can assume $b_1 \leq 1$. Finally, since the profit on the sole-served side is now part of the merged railroad's joint profit, the true cost of the integrated duopolist is c_1 and not $c_1 + p^M$. This means that the integrated duopolist will always participate in the duopoly side auction.

The sole-served railroad learns the realization of the integrated duopolist, c_1, prior to making the TIOLI offer p^M. However, it does not observe the outcome of the duopoly side auction. Therefore, the merged firm chooses the sole-served side price p^M and the duopoly side bid b_1 to maximize the expected joint profit of the merged railroad, conditional on c_1.

If $c_2 \leq 1 - p^M$, then the unintegrated duopolist would participate in the auction. The joint profit of the merged railroad when the integrated duopolist wins the auction is

$$\begin{aligned}\pi_{Win}^{Post}(p^M) &= (\min\{c_2 + p^M, 1\} - c_1)(1 - \min\{c_2 + p^M, 1\}) \\ &= (p^M + c_2 - c_1)(1 - p^M - c_2).\end{aligned}$$

If the integrated duopolist loses the auction, then the joint profit of the merged railroad is

$$\pi_{Lose}^{Post}(p^M, b_1) = p^M(1 - b_1).$$

If $c_2 > 1 - p^M$, then the unintegrated duopolist does not participate in the auction and the integrated duopolist always wins and $p^F = 1$. In this case, the joint profit of the merged railroad is

$$\pi_{Win}^{Post}(p^M) = (1 - c_1)(1 - 1) = 0.$$

The expected joint profit of the merged railroad, conditional on c_1, is given by

$$\begin{aligned}&E\left[\pi^{Joint,Post}(p^M, b_1) \mid c_1\right] \\ &= \Pr[c_2 < b_1 - p^M]\, \pi_{Lose}^{Post}(p^M, b_1) \\ &\quad + \Pr[b_1 - p^M \leq c_2 \leq 1 - p^M]\, E[\, \pi_{Win}^{Post}(p^M) \mid c_1, b_1 - p^M \leq c_2 \leq 1 - p^M] \\ &= (b_1 - p^M)p^M(1 - b_1) + \int_{b_1 - p^M}^{1 - p^M} (p^M + c_2 - c_1)(1 - p^M - c_2)\, dc_2 \\ &= (b_1 - p^M)p^M(1 - b_1) + \frac{1}{6}(b_1 - 1)^2(2b_1 - 3c_1 + 1)\end{aligned}$$

and the profit maximizing FOCs with respect to p^M and b_1 are

$$\frac{\partial E\left[\pi^{Joint,Post}(p^M, b_1) \mid c_1\right]}{\partial p^M} = p^M(2b_1 - 2) - b_1^2 + b_1 = 0,$$

and

$$\frac{\partial E\left[\pi^{Joint,Post}(p^M, b_1) \mid c_1\right]}{\partial b_1} = b_1^2 - (1 + 2p^M + c_1)b_1 + (p^M)^2 + p^M + c_1 = 0.$$

The solutions to this system of equations are

$$(p^M, b_1) = (1,1), (0,1), \text{and} \left(c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2 + 1}}{2}, 2\left(c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2 + 1}}{2}\right)\right).$$

Note that $(p, b) = (1,1)$ and $(p, b) = (0,1)$ guarantee a profit of 0 and therefore cannot be the optimal solution. Also, note that $c_1 + \frac{1}{2} - \frac{1}{2}\sqrt{4c_1^2 + 1}$ is increasing in c_1 and it is equal to $\frac{3}{2} - \frac{\sqrt{5}}{2} = 0.3820$ when $c_1 = 1$.

The optimal solution to the merged railroad's joint profit maximization problem is therefore

$$p^{M,Post} = c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2 + 1}}{2} \quad \text{and} \quad b^{D,Post} = 2\left(c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2 + 1}}{2}\right),$$

and the expected joint profit of the merged railroad is

$$\begin{aligned} E\left[\pi^{Joint,Post}(p^{M,Post}, b^{D,Post})\right] &= \int_0^1 E\left[\pi^{Joint,Post}(p^{M,Post}, b^{D,Post}) \mid c_1\right] f(c_1) dc_1 \\ &= \int_0^1 \left(2c_1^2 \frac{\sqrt{4c_1^2 + 1}}{3} - \frac{1}{2}c_1 - \frac{4}{3}c_1^3 + \frac{\sqrt{4c_1^2 + 1}}{6}\right) dc_1 \\ &= \frac{\log\left(\sqrt{5} + 2\right)}{32} + \frac{13\sqrt{5}}{48} - \frac{7}{12} \quad \text{(or 0.0674).} \end{aligned}$$

The expected profit of the merged railroad on the duopoly side is

$$\begin{aligned} E\left[\pi_1^{D,Post}\right] &= \int_0^1 \left(\int_{b^{D,Post} - p^{M,Post}}^{1 - p^{M,Post}} (c_2 - c_1)\,(1 - p^{M,Post} - c_2) f(c_2)\, dc_2\right) f(c_1) dc_1 \\ &= \int_0^1 \left(-\frac{4}{3}c_1^3 + \left(\frac{2\sqrt{4c_1^2 + 1}}{3} + 2\right)c_1^2 - \left(\sqrt{4c_1^2 + 1}\right)c_1 - \frac{\sqrt{4c_1^2 + 1}}{12} + \frac{1}{4}\right) dc_1 \\ &= \frac{2}{3} - \frac{13\sqrt{5}}{48} - \frac{\log\left(\sqrt{5} + 2\right)}{32} \quad \text{(or 0.0160).} \end{aligned}$$

The expected profit of the merged railroad on the sole-served side is

$$E[\pi^{M,Post}] = E\left[\pi^{Joint,Post}\right] - E\left[\pi_1^{D,Post}\right]$$
$$= \frac{\log\left(\sqrt{5}+2\right)}{16} + \frac{13\sqrt{5}}{24} - \frac{5}{4} \quad \text{(or 0.0514)},$$

and the expected profit of the unintegrated duopolist is

$$E\left[\pi_2^{D,Post}\right]$$
$$= \int_0^1 \left(\int_0^{b^{D,Post}-p^{M,Post}} (b^{D,Post} - c_2 - p^{M,Post})\,(1 - b^{D,Post}) f(c_2)\,dc_2 \right) f(c_1)\,dc_1$$
$$= \int_0^1 \left(-\frac{1}{8}\left(2c_1 - \sqrt{4c_1^2+1}\right)\left(2c_1 + 1 - \sqrt{4c_1^2+1}\right)^2 \right) f(c_1)\,dc_1$$
$$= \frac{\log\left(\sqrt{5}+2\right)}{32} + \frac{53\sqrt{5}}{48} - \frac{5}{2} \quad \text{(or 0.0141)}.$$

The expected sole-served side price is

$$E[p^{M,Post}] = \int_0^1 \left(c_1 + \frac{1}{2} - \frac{\sqrt{4c_1^2+1}}{2} \right) f(c_1)\,dc_1$$
$$= 1 - \frac{\sqrt{5}}{4} - \frac{\log\left(\sqrt{5}+2\right)}{8} \quad \text{(or 0.2605)},$$

and the expected full price is

$$E[p^{F,Post}] = \int_0^1 \left(\int_0^{b^{D,Post}-p^{M,Post}} b^{D,Post} f(c_2)\,dc_2 + \int_{b^{D,Post}-p^{M,Post}}^{1-p^{M,Post}} (c_2 + p^{M,Post})\, f(c_2)\,dc_2 \right.$$
$$\left. + \int_{1-p^{M,Post}}^1 f(c_2)\,dc_2 \right) f(c_1)\,dc_1$$
$$= \int_0^1 \left(c_1 + 1 - \frac{\sqrt{4c_1^2+1}}{2} \right) f(c_1)\,dc_1$$
$$= \frac{3}{2} - \frac{\sqrt{5}}{4} - \frac{\log\left(\sqrt{5}+2\right)}{8} \quad \text{(or 0.7605)}.$$

The expected duopoly side price is therefore

$$E[p^{D,Post}] = E[p^{F,Post}] - E[p^{M,Post}] = \frac{1}{2} \quad \text{(or 0.5000)},$$

and expected output is

$$E[D(p^{F,Post})] = \int_0^1 \left(\int_0^{b^{D,Post}-p^{M,Post}} (1 - b^{D,Post})\, f(c_2)\, dc_2 + \int_{b^{D,Post}-p^{M,Post}}^{1-p^{M,Post}} (1 - c_2 - p^{M,Post})\, f(c_2)\, dc_2 \right) f(c_1)\, dc_1$$

$$= \int_0^1 \left(\frac{\sqrt{4c_1^2 + 1}}{2} - c_1 \right) f(c_1)\, dc_1$$

$$= \frac{\log\left(\sqrt{5} + 2\right)}{8} + \frac{\sqrt{5}}{4} - \frac{1}{2} \quad \text{(or 0.2395).}$$

Expected shipper surplus is

$$E[CS^{Post}] = \frac{1}{2} \int_0^1 \left(\int_0^{b^{D,Post}-p^{M,Post}} (1 - b^{D,Post})^2\, f(c_2)\, dc_2 + \int_{b^{D,Post}-p^{M,Post}}^{1-p^{M,Post}} (1 - c_2 - p^{M,Post})^2\, f(c_2)\, dc_2 \right) f(c_1)\, dc_1$$

$$= \frac{23}{12} - \frac{5\sqrt{5}}{6} \quad \text{(or 0.0533),}$$

and expected total surplus is

$$E[TS^{Post}] = E[CS^{Post}] + E\left[\pi_1^{D,Post}\right] + E\left[\pi_2^{D,Post}\right] + E[\pi^{M,Post}]$$

$$= \frac{\log\left(\sqrt{5} + 2\right)}{16} + \frac{13\sqrt{5}}{24} - \frac{7}{6} \quad \text{(or 0.1348).}$$

Case 6: 1*2 Routes, the sole-served side makes a TIOLI offer first, and then the duopoly side second price auction takes place. The winner of the duopoly side auction sets the full price equal to the sum of the sole-serving railroad's TIOLI offer and the auction price. The shipper has perfectly inelastic demand.

Pre-Merger

Suppose the sole-served side TIOLI price is p^M and both railroads on the duopoly side observe this prior to bidding in the duopoly side second price auction. The winner of the auction will combine the products on the monopoly side and the duopoly side and sell it to the shipper at price $p^F = p^M + p^D$, where p^F is determined in the second price auction and p^D is simply the difference between p^F and p^M.

Given p^M, the full cost of duopolist i is $c_i + p^M$. Suppose duopolist i bid b_i in the duopoly side auction and suppose that the buyer has a reserve price of 1 in the second price auction. Then, the bidder with the lowest bid wins the auction and the winning price is

$$p^F = \min\{\max\{b_1, b_2\}, 1\}.$$

If duopolist i loses the auction, its profit is zero. If duopolist i wins the auction, i.e., $b_i < b_j$ where $j \neq i$, its profit is

$$(p^F - p^M - c_i) = \big(\min\{b_j, 1\} - p^M - c_i\big).$$

Pre-merger, duopolist i's bid, b_i, does not affect its profit conditional on winning or losing. So, following the standard second price auction logic, it is the dominant strategy for both duopolists to bid their true cost, $c_i + p^M$, and the equilibrium full price pre-merger is

$$p^{F,Pre}(p^M) = \min\{c + p^M, 1\}$$

where $c = \max\{c_1, c_2\}$.

Because the price is capped at 1, duopolist i will not participate in the auction if $c_i > 1 - p^M$, which happens with probability $1 - F(1 - p^M)$. If $\min\{c_1, c_2\} > 1 - p^M$, then there will be no sale and the probability of this event is

$$\Pr[\text{No Sale}] = \big(1 - F(1 - p^M)\big)^2 = (p^M)^2.$$

Given $p^{F,Pre}$ and p^M, the expected output is

$$E\big[D\big(p^{F,Pre}(p^M)\big)\big] = 1 - \Pr[\text{No Sale}] = 1 - (p^M)^2.$$

On the sole-served side, the sole-serving railroad chooses price p^M to maximize its expected profit, which is given by

$$E[\pi^{M,Pre}(p^M)] = p^M(1 - (p^M)^2)$$

$$= -(p^M)^3 + p^M.$$

The optimal pre-merger sole-served side price, $p^{M,Pre}$, is the solution to the following profit maximizing FOC

$$\frac{\partial E[\pi^{M,Pre}(p^M)]}{\partial p^M} = -3(p^M)^2 + 1 = 0.$$

The roots to this equation are $-\frac{1}{\sqrt{3}}$ and $\frac{1}{\sqrt{3}}$. Therefore, the profit maximizing price is

$$p^{M,Pre} = \frac{1}{\sqrt{3}} \quad \text{(or 0.5574)},$$

and the sole-served railroad's expected profit is

$$E[\pi^{M,Pre}(p^{M,Pre})] = \frac{2\sqrt{3}}{9} \quad \text{(or 0.3849)}.$$

The expected full price is

$$\begin{aligned} E[p^{F,Pre}] &= \int_0^{1-p^{M,Pre}} (c + p^{M,Pre}) g(c)\, dc + \int_{1-p^{M,Pre}}^{1} g(c)\, dc \\ &= \int_0^{1-\frac{1}{\sqrt{3}}} \left(c + \frac{1}{\sqrt{3}}\right) 2c\, dc + \int_{1-\frac{1}{\sqrt{3}}}^{1} 2c\, dc \\ &= \frac{1}{3} + \frac{10\sqrt{3}}{27} \quad \text{(or 0.9748)}, \end{aligned}$$

and the expected duopoly side price is

$$E[p^{D,Pre}] = E[p^{F,Pre}] - E[p^{M,Pre}] = \frac{1}{3} + \frac{\sqrt{3}}{27} \quad \text{(or 0.3975)}.$$

The duopolists' expected profits are given by

$$\begin{aligned} E\left[\pi_1^{D,Pre}\right] &= E\left[\pi_2^{D,Pre}\right] \\ &= \int_0^{1-p^{M,Pre}} \left(\int_{c_1}^{1-p^{M,Pre}} (c_2 - c_1) f(c_2)\, dc_2 \right. \\ &\qquad \left. + \int_{1-p^{M,Pre}}^{1} (1 - p^{M,Pre} - c_1) f(c_2)\, dc_2 \right) f(c_1)\, dc_1 \\ &= \int_0^{1-\frac{1}{\sqrt{3}}} \left(\frac{1}{2}c_1^2 - c_1 + \frac{1}{3}\right) dc_1 \\ &= \frac{\sqrt{3}}{27} \quad \text{(or 0.0642)}, \end{aligned}$$

and the expected joint profit of the sole-served railroad and the integrating duopolist is

$$E\left[\pi^{Joint,Pre}\right] = E[\pi^{M,Pre}] + E\left[\pi_1^{D,Pre}\right]$$
$$= \frac{2\sqrt{3}}{9} + \frac{\sqrt{3}}{27} = \frac{7\sqrt{3}}{27} \quad \text{(or 0.4491).}$$

Expected output is

$$E[D(p^{F,Pre})] = 1 - (p^{M,Pre})^2$$
$$= \frac{2}{3} \quad \text{(or 0.6667).}$$

Expected shipper surplus is

$$E[CS^{Pre}] = \int_0^{1-p^{M,Pre}} (1 - c - p^{M,Pre}) g(c)\, dc$$
$$= \int_0^{1-\frac{1}{\sqrt{3}}} \left(1 - c - \frac{1}{\sqrt{3}}\right) 2c\, dc$$
$$= \frac{2}{3} - \frac{10\sqrt{3}}{27} \quad \text{(or 0.0252),}$$

and expected total surplus is

$$E[TS^{Pre}] = E[CS^{Pre}] + E\left[\pi_1^{D,Pre}\right] + E\left[\pi_2^{D,Pre}\right] + E[\pi^{M,Pre}]$$
$$= \frac{2}{3} - \frac{10\sqrt{3}}{27} + \frac{\sqrt{3}}{27} + \frac{\sqrt{3}}{27} + \frac{2\sqrt{3}}{9}$$
$$= \frac{2}{3} - \frac{2\sqrt{3}}{27} \quad \text{(or 0.5384).}$$

Post-Merger

Let p^M be the price on the sole-served side and let b_1 be the bid submitted by the integrated duopolist. First, note that it is still the dominant strategy for the unintegrated duopolist to bid its true cost, $c_2 + p^M$. Second, it is never optimal for the integrated duopolist to bid $b_1 > 1$ as that would guarantee that it loses the auction, and so we can assume $b_1 \leq 1$. Finally, since the profit on the sole-served side is now part of the merged railroad's joint profit, the true cost of the integrated duopolist is c_1 and not $c_1 + p^M$. This means that the integrated duopolist will always participate in the duopoly side auction.

The sole-served railroad learns the realization of the integrated duopolist, c_1, prior to making the TIOLI offer p^M. However, it does not observe the outcome of the duopoly side auction. Therefore, the merged railroad chooses the sole-served side price p^M and the duopoly side bid b_1 to maximize the expected joint profit of the merged railroad, conditional on c_1.

Suppose $c_1 > 1 - p^M$:

If $c_2 \leq 1 - p^M$, then the unintegrated duopolist would participate in the auction. The joint profit of the merged railroad when the integrated duopolist wins the auction is

$$\pi_{Win}^{Post}(p^M) = \min\{c_2 + p^M, 1\} - c_1 = p^M + c_2 - c_1.$$

If the integrated duopolist loses the auction, then the joint profit of the merged railroad is

$$\pi_{Lose}^{Post}(p^M) = p^M > 1 - c_1.$$

Note that in this case

$$\pi_{Win}^{Post}(p^M) = p^M + c_2 - c_1 < p^M + (1 - p^M) - (1 - p^M) = p^M = \pi_{Lose}^{Post}(p^M)$$

which means that the integrated duopolist would be better off losing the auction.

If $c_2 > 1 - p^M$, then the unintegrated duopolist does not participate in the auction and the integrated duopolist always wins and $p^F = 1$. In this case, the joint profit of the merged railroad is

$$\pi_{Win}^{Post}(p^M) = 1 - c_1,$$

which does not depend on b_1.

Therefore, the optimal bid for the integrated duopolist when $c_1 > 1 - p^M$ is

$$b_1 = 1,$$

which guarantees that it would lose the auction if the unintegrated duopolist participates in the auction and win the auction if the unintegrated duopolist does not participate.

The expected joint profit of the merged railroad, conditional on $c_1 > 1 - p^M$, is then

$$\begin{aligned} &E\left[\pi^{Joint,Post}(p^M, b_1) \mid c_1 > 1 - p^M\right] \\ &= \Pr[c_2 \leq 1 - p^M]\, \pi_{Lose}^{Post}(p^M) + \Pr[c_2 > 1 - p^M]\, \pi_{Win}^{Post}(p^M) \\ &= (1 - p^M)p^M + p^M(1 - c_1), \end{aligned}$$

and the profit maximizing FOC with respect to p^M is

$$\frac{\partial E\left[\pi^{Joint,Post}(p^M, b_1) \mid c_1 > 1 - p^M\right]}{\partial p^M} = 2 - 2p^M - c_1 = 0,$$

which gives the optimal sole-served side price

$$p^M = 1 - \frac{1}{2}c_1.$$

Suppose now $c_1 \leq 1 - p^M$:

If $c_2 \leq 1 - p^M$, then the unintegrated duopolist participates in the auction. The joint profit of the merged railroad when the integrated duopolist wins the auction is

$$\pi_{Win}^{Post}(p^M) = p^M + c_2 - c_1 \leq p^M + (1 - p^M) - c_1 = 1 - c_1.$$

and the joint profit of the merged railroad when it loses the auction is

$$\pi_{Lose}^{Post}(p^M) = p^M \leq 1 - c_1.$$

If $c_2 > 1 - p^M$, then the unintegrated duopolist does not participate in the auction and the joint profit of the merged railroad is

$$\pi_{Win}^{Post}(p^M) = 1 - c_1.$$

This implies that the merged railroad profit is at most $1 - c_1$ when $c_1 \leq 1 - p^M$. However, as shown above, if the merged railroad chooses p^M such that $c_1 > 1 - p^M$, it earns a profit of $1 - c_1$ when the unintegrated duopolist does not participate in the auction and $p^M > 1 - c_1$ when it does. Therefore, the merged railroad would never choose p^M such that $c_1 \leq 1 - p^M$.

The optimal solution to the merged railroad's joint profit maximization problem is therefore

$$p^{M,Post} = 1 - \frac{1}{2}c_1 \quad \text{and} \quad b^{D,Post} = 1,$$

and the expected joint profit of the merged railroad is

$$\begin{aligned} E\left[\pi^{Joint,Post}(p^{M,Post}, b^{D,Post})\right] &= \int_0^1 E\left[\pi^{Joint,Post}(p^{M,Post}, b^{D,Post}) \mid c_1\right] f(c_1) dc_1 \\ &= \int_0^1 \left((1 - p^{M,Post})p^{M,Post} + p^{M,Post}(1 - c_1)\right) dc_1 \\ &= \int_0^1 \left(\frac{1}{4}c_1^2 - c_1 + 1\right) dc_1 \\ &= \frac{7}{12} \quad (\text{or } 0.5833). \end{aligned}$$

The expected profit of the merged railroad on the duopoly side is

$$\begin{aligned} E\left[\pi_1^{D,Post}\right] &= \int_0^1 \left(\int_{1-p^{M,Post}}^1 (1 - p^{M,Post} - c_1) f(c_2) dc_2 \right) f(c_1) dc_1 \\ &= \int_0^1 \left(\frac{1}{4}c_1^2 - \frac{1}{2}c_1\right) dc_1 \\ &= -\frac{1}{6} \quad (\text{or } -0.1667), \end{aligned}$$

the expected profit of the merged railroad on the sole-served side is

$$E[\pi^{M,Post}] = E\left[\pi^{Joint,Post}\right] - E\left[\pi_1^{D,Post}\right]$$
$$= \frac{7}{12} - \left(-\frac{1}{6}\right) = \frac{3}{4} \quad \text{(or 0.7500)},$$

and the expected profit of the unintegrated duopolist is

$$E\left[\pi_2^{D,Post}\right] = \int_0^1 \left(\int_0^{1-p^{M,Post}} (b^{D,Post} - p^{M,Post} - c_2)\, f(c_2)\, dc_2 \right) f(c_1) dc_1$$
$$= \int_0^1 \left(\int_0^{\frac{1}{2}c_1} \left(\frac{1}{2}c_1 - c_2\right) dc_2 \right) dc_1$$
$$= \int_0^1 \left(\frac{1}{8}c_1^2\right) dc_1$$
$$= \frac{1}{24} \quad \text{(or 0.0417)}.$$

The expected sole-served side price is

$$E[p^{M,Post}] = \int_0^1 \left(1 - \frac{1}{2}c_1\right) f(c_1) dc_1$$
$$= \frac{3}{4} \quad \text{(or 0.7500)},$$

and expected full price is

$$E[p^{F,Post}] = \int_0^1 (\Pr[c_2 \le 1 - p^{M,Post}]\, b^{D,Post} + \Pr[c_2 > 1 - p^{M,Post}]\ 1)\, f(c_1) dc_1.$$
$$= 1$$

The expected duopoly side price is therefore

$$E[p^{D,Post}] = E[p^{F,Post}] - E[p^{M,Post}] = 1 - \frac{3}{4} = \frac{1}{4} \quad \text{(or 0.2500)},$$

and expected output is

$$E[D(p^{F,Post})] = 1.$$

Expected shipper surplus is

$$E[CS^{Post}] = 0,$$

and expected total surplus is

$$E[TS^{Post}] = E[CS^{Post}] + E\left[\pi_1^{D,Post}\right] + E\left[\pi_2^{D,Post}\right] + E[\pi^{M,Post}]$$
$$= \frac{5}{8} \quad \text{(or 0.6250).}$$

APPENDIX C: COMMITTED GATEWAY PRICING SIMULATION MODEL

I. OVERVIEW

1. This appendix describes the model that I have developed to simulate the shipper-welfare effects of the parties' Committed Gateway Pricing ("CGP") proposal.[1] Throughout this appendix, I use the term "input set" to describe the set of routes where the shipments and their associated rates will be used as inputs in calculating the CGP tables. Similarly, I use the term "application set" to describe the set of routes that are eligible to utilize the CGP.

2. Broadly speaking, the parties' CGP proposal creates two CGP tables—one for CSX and one for BNSF.[2] Each table consists of 92 cells, based on 23 commodity categories and 4 distance bands.

3. The shipments in the input sets for each table are mutually exclusive of the shipments in the application sets. The input sets for the CSX CGP table includes all UP-NS and legacy UP-CSX interline shipments, except for legacy UP-CSX interline shipments on routes that are sole-served by UP on one end and sole-served by CSX on the other end. The rates derived from these input sets will be utilized to establish Committed Gateway Prices that CSX can apply to shipments on sole-served to sole-served UP-CSX interline routes across the gateways.[3]

4. Similarly, the input sets for the BNSF CGP table includes all UP-NS and legacy NS-BNSF interline shipments, except for legacy NS-BNSF interline shipments on routes that

---

[1] See Verified Statement of Katherine R. Novak (hereinafter "Novak V.S."), including Appendix A, for the authoritative description of the CGP proposal.

[2] The CGP will apply to shipments between customer facilities served solely by UP/NS or a short line interchanging traffic solely with UP/NS, on the one hand, and customer facilities served solely by BNSF or CSX or a short line interchanging traffic solely with BNSF or CSX, on the other hand. See Novak V.S., Appendix A.

[3] Certain types of shipments are ineligible for the CGP proposal. These include shipments to or from facilities owned by rail carriers or their affiliates, shipments to and from storage-in transit facilities, finished vehicle shipments, intermodal shipments, unit train shipments, Toxic Inhalation Hazard and Poison Inhalation Hazard materials shipments, and Dimensional Loads. See Novak V.S., Appendix A.

are sole-served by NS and BNSF. The rates derived from these input sets will be utilized to establish the Committed Gateway Prices that BNSF can apply to shipments on the set of sole-served to sole-served interline routes.

5. To estimate the welfare effects of the parties' CGP proposal on shippers, I use a simulation model in which different railroads set rates to maximize their profits given a shipper's choices of shipment routes and railroads. I calibrate the parameters of the model using shipment data, railroads' margins, based on a set of optimality equations implied by the pre-merger equilibrium of the model.

6. Once the model parameters are calibrated, I first use the model to simulate a post-merger equilibrium without the CGP proposal, in which UP and NS set rates as a single entity to maximize their joint profit and eliminate any double marginalization that existed pre-merger. Then, I use the model to simulate the post-merger equilibrium of interest, in which the CGP proposal would create incentives for UP/NS to adjust rates *both* upward and downward in the input sets, but it would only create incentive to lower rates in the application sets. Compared to the post-merger equilibrium without the CGP proposal, the CGP proposal will generally result in higher rates on average in the input set but lower rates in the application set. I use the model to estimate changes in consumer surplus for each shipper going from the equilibrium without CGP to the equilibrium with CGP in both the input and application sets. The overall welfare effects of the CGP proposal can then be calculated by comparing the corresponding changes in shippers' consumer surplus in the input and application sets.

7. I perform the simulation separately for cells in the CSX CGP table and the BNSF CGP table. The welfare effects are simulated for a total of 27 CGP cells, for which I have sufficient data to calibrate the model and perform the simulation.

8. I find that the overall welfare effects of the CGP proposal on shippers is positive in each of these CGP cells. I then extrapolate these estimated welfare effects to the CGP cells for which I do not have sufficient information to perform the simulation, based on the relative carloads of these CGP cells, to obtain an estimated range of the total welfare effects of the CGP proposal.

II. TECHNICAL MODEL

A. PRE-MERGER EQUILIBRIUM

1. Input Set

9. Consider an input set with N^I shippers, whose shipments' origins and destinations are operated by two different railroads, railroads r and s, where $r \in \{UP, NS\}$, $s \in \{NS, CSX\}$ if $r = UP$, and $s \in \{UP, BNSF\}$ if $r = NS$. For each shipper $i = 1, \ldots, N^I$, let $d_i^I = d_{i,r}^I + d_{i,s}^I$ denote the total mileage of shipper i's chosen shipment route, where $d_{i,j}^I$ is the mileage of the segment operated by railroad $j \in \{r, s\}$. In this model, each shipper's choice of route and contracting arrangement are treated as exogenously given and I focus on modeling the railroads' pricing incentives after these choices have been made.[4]

10. Shipper i has demand function $q_i^I(p_i^I)$, where p_i^I is the rate per car-mile faced by shipper i, and $q_i^I(p_i^I)$ is the number of carloads associated with shipper i's shipment given rate p_i^I. I assume that $q_i^I(p_i^I)$ is log-linear in the product of d_i^I and p_i^I:

$$q_i^I(p_i^I) = \exp(a_i^I - b_i^I d_i^I p_i^I)$$

where $a_i^I, b_i^I > 0$. Furthermore, I assume that railroad $j \in \{r, s\}$ has constant marginal cost, $c_{i,j}^I$, of serving shipper i.

11. For any shipment that has origin and destination operated by two different railroads, the rate per car-mile faced by shipper i, p_i^I, can be expressed as the mileage-weighted average of the rates set by railroads r and s. That is,

$$p_i^I = p_i^I(p_{i,r}^I, p_{i,s}^I) \equiv \frac{d_{i,r}^I}{d_i^I} p_{i,r}^I + \frac{d_{i,s}^I}{d_i^I} p_{i,s}^I,$$

where $p_{i,j}^I$ is the rate per car-mile for the segment of the shipment route operated by railroad $j \in \{r, s\}$.

---

[4] Routings under the CGP will follow existing routing protocols, so the routes can be treated as fixed for purposes of the model.

12. Pre-merger, given the demand parameters (a_i^I, b_i^I) and marginal costs $(c_{i,r}^I, c_{i,s}^I)$, which I assume are common knowledge, railroads r and s choose rates $p_{i,r}^I$ and $p_{i,s}^I$ to maximize their profit functions $\pi_{i,r}^I(p_{i,r}^I, p_{i,s}^I)$ and $\pi_{i,s}^I(p_{i,r}^I, p_{i,s}^I)$, respectively. The functional forms of railroads' profits generally depend on whether shipper i chooses to (i) negotiate with one of the two railroads to obtain a through rate for its shipment, or (ii) negotiate with both railroads separately and obtain two separate rates for the two segments of its shipment route using Rule 11. However, as I show below, under the assumption of log-linear demand and the assumption that all negotiations take the form of railroads making linear take-it-or-leave-it offers to the shipper i, the functional forms of railroad profits and their optimal rates do not vary between through rate and Rule 11 negotiations, which greatly simplifies the computation of the model.[5]

(a) Shipper negotiates a through rate with railroad r

13. First, I consider the case in which shipper i chooses to negotiate with railroad r to obtain a through rate for its entire shipment route. In this case, railroad r must obtain the rate $p_{i,s}^I$ per car-mile from railroad s for the segment of the shipment route that it operates. Given $p_{i,s}^I$, railroad r chooses $p_{i,r}^I$ to maximize its profit function, which is given by

$$\pi_{i,r}^I(p_{i,r}^I, p_{i,s}^I) = q_i^I\left(p_i^I(p_{i,r}^I, p_{i,s}^I)\right) d_i^I\left(p_i^I(p_{i,r}^I, p_{i,s}^I) - \frac{d_{i,r}^I}{d_i^I} c_{i,r}^I - \frac{d_{i,s}^I}{d_i^I} p_{i,s}^I\right)$$
$$= q_i^I\left(\frac{d_{i,r}^I}{d_i^I} p_{i,r}^I + \frac{d_{i,s}^I}{d_i^I} p_{i,s}^I\right) d_{i,r}^I(p_{i,r}^I - c_{i,r}^I).$$

14. The first order condition for profit maximization is

$$\frac{\partial \pi_{i,r}^I(p_{i,r}^I, p_{i,s}^I)}{\partial p_{i,r}^I} = \frac{\partial q_i^I(p_i^I)}{\partial p_i^I} \frac{\partial p_i^I(p_{i,r}^I, p_{i,s}^I)}{\partial p_{i,r}^I} d_{i,r}^I(p_{i,r}^I - c_{i,r}^I) + q_i^I(p_i^I) d_{i,r}^I = 0$$

and railroad r's best response function, given $p_{i,s}^I$ and the log-linear demand assumption, is

[5] This is consistent with the results on Rule 11 and through rates I report in Section III.

$$p_{i,r}^I(p_{i,s}^I) = c_{i,r}^I + \frac{1}{b_i^I d_{i,r}^I}.$$

Note that this best response function does not depend on $p_{i,s}^I$, and therefore the optimal rate for railroad r is

$$p_{i,r}^{I*} = c_{i,r}^I + \frac{1}{b_i^I d_{i,r}^I}.$$

15. Given railroad r's best response function $p_{i,r}^I(p_{i,s}^I)$, railroad s chooses $p_{i,s}^I$ to maximize its profit function, which is

$$\pi_{i,s}^I(p_{i,r}^I(p_{i,s}^I), p_{i,s}^I) = q_i^I\left(p_i^I(p_{i,r}^I(p_{i,s}^I), p_{i,s}^I)\right) d_{i,s}^I(p_{i,s}^I - c_{i,s}^I).$$

The first order condition for profit maximization is

$$\frac{d\pi_{i,s}^I(p_{i,r}^I(p_{i,s}^I), p_{i,s}^I)}{dp_{i,s}^I} = \frac{\partial q_i^I(p_i^I)}{\partial p_i^I}\frac{d\left(p_i^I(p_{i,r}^I(p_{i,s}^I), p_{i,s}^I)\right)}{dp_{i,s}^I} d_{i,s}^I(p_{i,s}^I - c_{i,s}^I) + q_i^I(p_i^I) d_{i,s}^I$$
$$= 0$$

and the optimal rate for railroad s, $p_{i,s}^{I*}$, is

$$p_{i,s}^{I*} = c_{i,s}^I + \frac{1}{b_i^I d_{i,s}^I}.$$

(b) Shipper negotiates a through rate with railroad s

16. Next, I consider the case in which shipper i chooses to negotiate a through rate with railroad s, who must first obtain the rate of $p_{i,r}^I$ per car-mile from railroad r for the segment of the shipment route that it operates.

17. This case is symmetrical to the previous case, where railroad r determines the through rate. The profit functions of railroads r and s are

$$\pi_{i,r}^I\left(p_{i,r}^I, p_{i,s}^I(p_{i,r}^I)\right) = q_i^I\left(p_i^I\left(p_{i,r}^I, p_{i,s}^I(p_{i,r}^I)\right)\right) d_{i,r}^I(p_{i,r}^I - c_{i,r}^I)$$

and

$$\pi_{i,s}^I(p_{i,r}^I, p_{i,s}^I) = q_i^I\left(\frac{d_{i,r}^I}{d_i^I}p_{i,r}^I + \frac{d_{i,s}^I}{d_i^I}p_{i,s}^I\right) d_{i,s}^I(p_{i,s}^I - c_{i,s}^I),$$

respectively, where $p_{i,s}^I(p_{i,r}^I)$ is railroad s's best response function given $p_{i,r}^I$.

18. Under the log-linear demand assumption, the profit maximizing rates are

$$p_{i,r}^{I*} = c_{i,r}^I + \frac{1}{b_i^I d_{i,r}^I} \quad \text{and} \quad p_{i,s}^{I*} = c_{i,s}^I + \frac{1}{b_i^I d_{i,s}^I}.$$

(c) Shipper uses Rule 11

19. Finally, I consider the case in which shipper i chooses to use Rule 11 to negotiate with both railroads r and s and obtain rates $p_{i,r}^I$ and $p_{i,s}^I$ for the two segments of its shipping routes separately. I assume these two negotiations take place simultaneously and the two railroads do not observe each other's decision before setting their own rates.

20. Given $p_{i,s}^I$, railroad r chooses $p_{i,r}^I$ to maximize its profit function

$$\pi_{i,r}^I(p_{i,r}^I, p_{i,s}^I) = q_i^I(p_i^I) d_{i,r}^I(p_{i,r}^I - c_{i,r}^I).$$

The first order condition for profit maximization is

$$\frac{\partial \pi_{i,r}^I(p_{i,r}^I, p_{i,s}^I)}{\partial p_{i,r}^I} = \frac{\partial q_i^I(p_i^I)}{\partial p_i^I} \frac{\partial p_i^I}{\partial p_{i,r}^I} d_{i,r}^I(p_{i,r}^I - c_{i,r}^I) + q_i^I(p_i^I) d_{i,r}^I = 0$$

and railroad r's best response function, given $p_{i,s}^I$, is

$$p_{i,r}^I(p_{i,s}^I) = c_{i,r}^I + \frac{1}{b_i^I d_{i,r}^I}.$$

21. By symmetry, railroad s's best response function, given $p_{i,r}^I$, is

$$p_{i,s}^I(p_{i,r}^I) = c_{i,s}^I + \frac{1}{b_i^I d_{i,s}^I}.$$

Therefore, the optimal rates, $p_{i,r}^{I*}$ and $p_{i,s}^{I*}$, are

$$p_{i,r}^{I*} = c_{i,r}^I + \frac{1}{b_i^I d_{i,r}^I} \quad \text{and} \quad p_{i,s}^{I*} = c_{i,s}^I + \frac{1}{b_i^I d_{i,s}^I}.$$

2. **Application Set**

22. Let N^A be the number of shippers in the application set, whose shipments' origins and destinations are operated by two different railroads, railroads r and s, where $(r, s) \in$

$\{(UP, CSX), (NS, BNSF)\}$. For each shipper $i = 1, \dots, N^A$, let $d_i^A = d_{i,r}^A + d_{i,s}^A$ denote the total mileage of shipper i's chosen shipment route, where $d_{i,j}^A$ is the mileage of the segment of the route operated by railroad $j \in \{r, s\}$.

23. I assume that shipper i in the application set has demand function $q_i^A(p_i^A)$, where p_i^A is the rate per car-mile faced by shipper i, and $q_i^A(p_i^A)$ is the number of carloads associated with shipper i's shipment given rate p_i^A. I assume that $q_i^A(p_i^A)$ is log-linear in my model and it is given by

$$q_i^A(p_i^A) = \exp(a_i^A - b_i^A d_i^A p_i^A)$$

where $a_i^A, b_i^A > 0$. Railroad $j \in \{r, s\}$ is assumed to have constant marginal cost, $c_{i,j}^A$, of serving shipper i.

24. Similar to the assumption I made regarding the input set, I assume that all negotiations between railroads and shippers take the form of linear take-it-or-leave-it offers, in which case railroads r and s choose per car-mile rates $p_{i,r}^A$ and $p_{i,s}^A$ to maximize their profits $\pi_{i,r}^A(p_{i,r}^A, p_{i,s}^A)$ and $\pi_{i,s}^A(p_{i,r}^A, p_{i,s}^A)$, which can be written as follow under the log-linear demand assumption:

$$\pi_{i,r}^A(p_{i,r}^A, p_{i,s}^A) = q_i^A\left(p_i^A(p_{i,r}^A, p_{i,s}^A)\right) d_{i,r}^A(p_{i,r}^A - c_{i,r}^A)$$

and

$$\pi_{i,s}^A(p_{i,r}^A, p_{i,s}^A) = q_i^A\left(p_i^A(p_{i,r}^A, p_{i,s}^A)\right) d_{i,s}^A(p_{i,s}^A - c_{i,s}^A),$$

respectively, where

$$p_i^A(p_{i,r}^A, p_{i,s}^A) \equiv \frac{d_{i,r}^A}{d_i^A} p_{i,r}^A + \frac{d_{i,s}^A}{d_i^A} p_{i,s}^A.$$

The optimal rates for railroad r and s, $p_{i,r}^{A*}$ and $p_{i,s}^{A*}$, are

$$p_{i,r}^{A*} = c_{i,r}^A + \frac{1}{b_i^A d_{i,r}^A} \quad \text{and} \quad p_{i,s}^{A*} = c_{i,s}^A + \frac{1}{b_i^A d_{i,s}^A}.$$

B. POST-MERGER EQUILIBRIUM WITHOUT CGP

1. Input Set

25. Post-merger, UP and NS will operate as a single entity and jointly set a through rate to maximize their combined profit on the set of routes that were previously operated by UP on the one end and NS on the other end (shippers will no longer be able to use Rule 11 on this set of routes after the merger). That is, for any shipper i who has chosen a shipment route that was operated by railroads r and s pre-merger, where $(r,s) \in \{(UP,NS),(NS,UP)\}$, the shipper now faces a rate p_i^I per car-mile that is chosen to maximize the joint profit function of UP/NS:

$$\pi_{i,UP/NS}^I(p_i^I) = q_i^I(p_i^I)d_i^I\left(p_i^I - \frac{d_{i,r}^I}{d_i^I}c_{i,r}^I - \frac{d_{i,s}^I}{d_i^I}c_{i,s}^I\right).$$

26. The first order condition for joint profit maximization is

$$\frac{\partial \pi_{i,UP/NS}^I(p_i^I)}{\partial p_i^I} = \frac{\partial q_i^I(p_i^I)}{\partial p_i^I}d_i^I\left(p_i^I - \frac{d_{i,r}^I}{d_i^I}c_{i,r}^I - \frac{d_{i,s}^I}{d_i^I}c_{i,s}^I\right) + q_i^I(p_i^I)d_i^I = 0$$

and the optimal rate, p_i^{I**}, is therefore

$$p_i^{I**} = \frac{d_{i,r}^I}{d_i^I}c_{i,r}^I + \frac{d_{i,s}^I}{d_i^I}c_{i,s}^I + \frac{1}{b_i^I d_i^I}$$

27. For the set of routes that are operated by UP or NS on one end and CSX or BNSF on the other end, the optimal rates will remain unchanged from the pre-merger equilibrium. That is

$$p_{i,r}^{I**} = p_{i,r}^{I*} \quad \text{and} \quad p_{i,s}^{I**} = p_{i,s}^{I*}$$

where $(r,s) \in \{(UP,CSX),(NS,BNSF)\}$.

2. Application Set

28. The application set, which does not include any UP-NS interline route, is not affected by the proposed merger without the CGP proposal. Therefore, the pre-merger optimal rates in the application set continue to be the optimal rates post-merger. That is,

$$p_{i,r}^{A**} = p_{i,r}^{A*} \quad \text{and} \quad p_{i,s}^{A**} = p_{i,s}^{A*}$$

where $(r, s) \in \{(UP, CSX), (NS, BNSF)\}$.

C. POST-MERGER EQUILIBRIUM WITH CGP

29. Let $r = UP/NS$ and let $p_r^I = \left(p_{1,r}^I, \dots, p_{N^I,r}^I\right)$ denote the vector of all UP/NS's rates in the input set. Define $p^{70}(p_r^I)$ as the 70th percentile UP/NS rates in the input set based on the number of carloads. That is, for any UP/NS input set rate vector, p_r^I, $p^{70}(p_r^I)$ is the smallest $\tilde{p}$ such that

$$\frac{\sum_{i=1}^{N^I} 1\{p_{i,r}^I \leq \tilde{p}\} q_i^I(p_i^I)}{\sum_{i=1}^{N^I} q_i^I(p_i^I)} \geq 0.70.$$

30. Under the CGP proposal, when railroad $s \in \{CSX, BNSF\}$ is setting the through rate in the application set, it will have the option to pay UP/NS at a rate of $p^{70}(p_r^I)$ per car-mile for the UP/NS's portion of the shipment associated with shipper i if $p_{i,r}^A > p^{70}(p_r^I)$.[6] Given $p_{i,r}^A$ and p_r^I, railroad s now chooses the through rate $p_{i,s}^A$ for shipper i's shipment to maximize the following profit function

---

[6] The CGP proposal also includes a minimum mileage threshold of 250 miles to account for the fixed costs associated rail transportation and prevents disproportionately low rates on short haul movements. Suppose the UP/NS's mileage for a particular shipment is 125 miles and the Committed Gateway Price is $3 per car-mile for the CGP cell. In this case, the effective Committed Gateway Price for this shipment will be $3 × 250 ÷ 125 = $6 per car-mile. To implement this minimum mileage threshold calculation, UP/NS will calculate the effective Committed Gateway Price based on the lower of the two Committed Gateway Prices from the "0 to less than 500 miles" and "500 to less than 1,000 miles" distance bands. See Novak V.S., Appendix A.

For legibility reason, the mathematical notations I use to describe CGP here do not explicitly account for the minimum mileage threshold, but the threshold of 250 miles is implemented in my model. However, because I perform the simulations of my model separately for each CGP cell, I simplify this minimum mileage threshold calculation by using only the Committed Gateway Price from the "0 to less than 500 miles" distance band. The implication of this simplification is that my model will underestimate the welfare benefits in the application set for shipments with UP/NS's mileage below 250 miles.

$$\pi_{i,s}^{A}\left(p_{i,r}^{A}, p_{i,s}^{A}; p_{r}^{I}\right)$$

$$= \overbrace{1\{p_{i,r}^{A} \leq p^{70}(p_{r}^{I})\}\, q_{i}^{A}\left(\frac{d_{i,r}^{A}}{d_{i}^{A}} p_{i,r}^{A} + \frac{d_{i,s}^{A}}{d_{i}^{A}} p_{i,s}^{A}\right) d_{i,s}^{A}\left(p_{i,s}^{A} - c_{i,s}^{A}\right)}^{\text{UP/NS's rate does not exceed the CGP}}$$

$$+ \overbrace{1\{p_{i,r}^{A} > p^{70}(p_{r}^{I})\}\, q_{i}^{A}\left(\frac{d_{i,r}^{A}}{d_{i}^{A}} p^{70}(p_{r}^{I}) + \frac{d_{i,s}^{A}}{d_{i}^{A}} p_{i,s}^{A}\right) d_{i,s}^{A}\left(p_{i,s}^{A} - c_{i,s}^{A}\right)}^{\text{UP/NS's rate exceeds the CGP}}$$

and railroad s's best response function, $\tilde{p}_{i,s}^{A}\left(p_{i,r}^{A}; p_{r}^{I}\right)$, is

$$\tilde{p}_{i,s}^{A}\left(p_{i,r}^{A}; p_{r}^{I}\right) = \begin{cases} p_{i,s}^{A}\left(p_{i,r}^{A}\right) & \text{if } p_{i,r}^{A} \leq p^{70}(p_{r}^{I}) \\ p_{i,s}^{A}\left(p^{70}(p_{r}^{I})\right) & \text{if } p_{i,r}^{A} > p^{70}(p_{r}^{I}) \end{cases}$$

where $p_{i,s}^{A}\left(p_{i,r}^{A}\right)$ is railroad s's best response function in the post-merger equilibrium without CGP.

31. Because the Committed Gateway Price, $p^{70}(p_{r}^{I})$, depends on the full distribution of UP/NS's rates in the input set, to maximize profit, UP/NS must choose $p_{r}^{I} = \left(p_{1,r}^{I}, \ldots, p_{N^{I},r}^{I}\right)$ and $p_{r}^{A} = \left(p_{1,r}^{A}, \ldots, p_{N^{A},r}^{A}\right)$ jointly to maximize its combined profit in the input and application sets. However, given p_{r}^{I}, UP/NS's optimal rates in the application set, $p_{i,r}^{A***}$, is identical to its optimal rates without CGP, $p_{i,r}^{A**}$, as long as $p_{i,r}^{A**} \leq p^{70}(p_{r}^{I})$:

$$p_{i,r}^{A***}(p_{r}^{I}) = \begin{cases} p_{i,r}^{A**} & \text{if } p_{i,r}^{A**} \leq p^{70}(p_{r}^{I}) \\ p^{70}(p_{r}^{I}) & \text{if } p_{i,r}^{A**} > p^{70}(p_{r}^{I}) \end{cases}.$$

Although the CGP applies only when a shipper is negotiating a through rate with railroad $s \in \{CSX, BNSF\}$, I assume that it will also constrain UP/NS's rate setting decision in the application set when UP/NS sets the through rate or when the shipper is using Rule 11. That is, I assume that UP/NS will also set its rate according to the strategy $p_{i,r}^{A***}(p_{r}^{I})$ in those cases.

32. Therefore, UP/NS's optimal input set rate vector, p_{r}^{I***}, is the solution to the following profit maximization problem:

$$\max_{p_r^I} \pi_{UP/NS}^{I+A}\left(p_r^I, p_s^I(p_r^I), p_r^{A***}(p_r^I), \tilde{p}_s^A(p_r^{A***}(p_r^I); p_r^I)\right)$$

$$= \sum_{i=1}^{N^I} \overbrace{1\{s = UP/NS\}\, q_i^I(p_{i,r}^I) d_i^I \left(p_{i,r}^I - \frac{d_{i,r}^I}{d_i^I} c_{i,r}^I - \frac{d_{i,s}^I}{d_i^I} c_{i,s}^I\right)}^{\text{Shipment routes in the input set where UP/NS operates on both ends}}$$

$$+ \sum_{i=1}^{N^I} \overbrace{1\{s \neq UP/NS\}\, q_i^I\left(p_i^I\left(p_{i,r}^I, p_{i,s}^I(p_{i,r}^I)\right)\right) d_{i,r}^I (p_{i,r}^I - c_{i,r}^I)}^{\text{Shipment routes in the input set where UP/NS only operates on one end}}$$

$$+ \sum_{i=1}^{N^A} \overbrace{1\{p_{i,r}^{A**} \leq p^{70}(p_r^I)\}\, q_i^A\left(p_i^A\left(p_{i,r}^{A**}, \tilde{p}_{i,s}^A(p_{i,r}^{A**}; p_r^I)\right)\right) d_{i,r}^A (p_{i,r}^{A**} - c_{i,r}^A)}^{\text{Shipment routes in the application set where UP/NS's rate does not exceed the CGP}}$$

$$+ \sum_{i=1}^{N^A} \overbrace{1\{p_{i,r}^{A**} > p^{70}(p_r^I)\}\, q_i^A\left(p_i^A\left(p^{70}(p_r^I), \tilde{p}_{i,s}^A(p_{i,r}^{A**}; p_r^I)\right)\right) d_{i,r}^A (p^{70}(p_r^I) - c_{i,r}^A)}^{\text{Shipment routes in the application set where UP/NS's rate exceeds the CGP}}$$

where $s \in \{CSX, BNSF\}$, $p_{i,s}^I(p_{i,r}^I)$ is railroad s's best response function in the input set without CGP.[7] The solution to this profit maximization problem generally do not have any closed-form solution and therefore it must be solved numerically.

33. Note that UP/NS's total profit function $\pi_{UP/NS}^{I+A}\left(p_r^I, p_s^I(p_r^I), p_r^{A***}(p_r^I), \tilde{p}_s^A(p_r^{A***}(p_r^I); p_r^I)\right)$ is discontinuous in p_r^I because of the percentile function $p^{70}(p_r^I)$ is a discontinuous function. To reduce computational burden and improve numerical accuracy, to solve for UP/NS's profit maximizing input set rate vector, p_r^{I***}, I use the following algorithm to

[7] For $s \in \{CSX, BNSF\}$, railroad s will have an incentive to deviate from its optimal strategy in the post-merger equilibrium without CGP in the input set, as the rate that it chooses can influence the distribution UP/NS's optimal input set rates, which may lower the Committed Gateway Price and increases railroad s's profit in the application set. However, this is a third-order incentive and therefore its effect is likely to be extremely small. For tractability and computational reason, I assume that railroad s will use the same optimal rate setting strategy in the input set with and without the CGP proposal.

reformulate this discontinuous unconstrained optimization problem into N^I continuous constrained optimization problem:[8]

1) Compute the post-merger equilibrium without CGP and obtain $p_r^{I**} = (p_{1,r}^{I**}, \dots, p_{N^I,r}^{I**})$.

2) Sort the N^I shippers in the input set based on p_r^{I**} such that $p_{k,r}^{I**} \leq p_{k+1,r}^{I**}$ for all $k = 1, \dots, N^I - 1$.

3) For $k = 1, \dots, N^I$, numerically solve the following continuous constrained optimization problem:

$$\max_{p_r^I} \ \pi_{UP/NS}^{I+A}\left(p_r^I, p_s^I(p_r^I), p_r^{A***}(p_r^I), \tilde{p}_s^A(p_r^{A***}(p_r^I), p_r^I)\right)$$

subject to

i. $CGP = p_{k,r}^I$;

ii. $p_{l,r}^I \leq p_{l+1,r}^I$ for all $l = 1, \dots, N^I - 1$;

iii. $\frac{\sum_{i=1}^{k} q_i^I(p_i^I)}{\sum_{i=1}^{N^I} q_i^I(p_i^I)} \geq 0.7$; and

iv. $\frac{\sum_{i=1}^{k-1} q_i^I(p_i^I)}{\sum_{i=1}^{N^I} q_i^I(p_i^I)} < 0.7$.

4) Compare the N^I UP/NS's total profits obtained from the N^I constrained optimization problems in the step 3. Suppose the m-th constrained optimization problem yields the highest profit, then p_r^{I***} is the solution to the m-th constrained optimization problem.

---

[8] I solve this constrained optimization problem using the non-linear optimization solver Artelys KNITRO (https://www.artelys.com/solvers/knitro/), which is an optimization solver commonly used and recommended in the economic literature. See, e.g., Dubé, J.-P., J. T. Fox, and C.-L. Su (2012), "Improving the Numerical Performance of Static and Dynamic Aggregate Discrete Choice Random Coefficients Demand Estimation," *Econometrica,* 80(5), 2231–2267, and Conlon, C., and J. Gortmaker (2020), "Best Practices for Differentiated Products Demand Estimation with PyBLP," *The RAND Journal of Economics*, 51(4), 1108–1161.

34. Given the optimal rates in the post-merger equilibrium with CGP, (p^{I***}, p^{A***}), the change in shipper i's consumer surplus in the input set due the CGP proposal can be calculated as

$$\Delta CS_i^I = 1\{p_i^{I**} > p_i^{I***}\} \int_{p_i^{I***}}^{p_i^{I**}} d_i^I q_i^I(p) dp - 1\{p_i^{I**} < p_i^{I***}\} \int_{p_i^{I**}}^{p_i^{I***}} d_i^I q_i^I(p) dp.$$

Similarly, the change in shipper i's consumer surplus in the application set due to the CGP proposal can similarly be calculated as

$$\Delta CS_i^A = 1\{p_i^{A**} > p_i^{A***}\} \int_{p_i^{A***}}^{p_i^{A**}} d_i^A q_i^A(p) dp - 1\{p_i^{A**} < p_i^{A***}\} \int_{p_i^{A**}}^{p_i^{A***}} d_i^A q_i^A(p) dp.$$

The overall change in shippers' consumer surplus across the two sets can then be calculated as

$$\sum_{i=1}^{N^I} \Delta CS_i^I + \sum_{i=1}^{N^A} \Delta CS_i^A.$$

III. MODEL CALIBRATION AND SIMULATION

35. I calibrate the parameters of the model, $\{a_i^I, b_i^I, c_{i,r}^I, c_{i,s}^I\}_{i=1}^{N^I}$ and $\{a_i^A, b_i^A, c_{i,r}^A, c_{i,s}^A\}_{i=1}^{N^A}$, using observed per car-mile shipment rates, $\{p_{i,r}^I, p_{i,s}^I\}_{i=1}^{N^I}$ and $\{p_{i,r}^A, p_{i,s}^A\}_{i=1}^{N^A}$, carloads, $\{q_i^I\}_{i=1}^{N^I}$ and $\{q_i^A\}_{i=1}^{N^A}$, mileage, $\{d_{i,r}^I, d_{i,s}^I\}_{i=1}^{N^I}$ and $\{d_{i,r}^A, d_{i,s}^A\}_{i=1}^{N^A}$, as well as UP's and NS's average margins, m_{UP} and m_{NS}. This calibration is preformed separately for each CGP cell.

36. I calculate shipment rates, carloads, and mileages separately for each shipper in each CGP cell using UP's and NS's 100 percent Waybill data from 2024. The Waybill data are limited to UP-CSX, NS-BNSF, and UP-NS interline shipments that are included in the input and application sets under the CGP proposal.[9] Within each CGP cell, a shipper

[9] Due to data limitation, I am not able to accurately determine BNSF's and CSX's rates for shipments that involve short lines. This is because I impute BNSF's and CSX's rate for each through rate shipment as the difference between UP/NS's reported through rate revenue (i.e.,

in the model is defined as a unique combination of shipper, route (origin SPLC6 to destination SPLC6), contracting railroads, contracting arrangement (e.g., through rate or Rule 11), and time period. I use a time period of six months (from January to June and from July to December) to define shippers in the model. I do so because shippers typically have contracts that dictate their shipment rates over a period of a year, but contract end dates generally do not align with the calendar year, and they differ across shippers. Hence, assuming contract end dates are evenly distributed throughout a year, each observed contract will expire in 6 months on average. I calculate average rate per car-mile, average shipment mileage, and count of carloads separately for each shipper.

37. I calculate UP's and NS's average margins using the total revenue and total variable cost information from the Confidential Carload Waybill Sample for the year 2023, which is the most recent version available from the STB. I limit the sample to non-intermodal Rule 11 shipments, and I calculate average margins separately for each CGP cell, and separately for UP and NS.

38. Because I do not observe the railroads' marginal costs for each individual shipment, simplifying assumptions must be made to calibrate the model parameters. I assume that UP's marginal cost per car mile is the same for all shipments within each CGP cell, i.e., $c^I_{i,UP} = c_{UP}$ for all $i = 1, \dots, N^I$ and $c^A_{i,UP} = c_{UP}$ for all $i = 1, \dots, N^A$, and I calibrate c_{UP} using the following equations for all UP-NS and UP-CSX interline shipments:

$$\frac{\sum_{i=1}^{N^I} 1\{r = UP\} q^I_i d^I_{i,r} \left(p^I_{i,r} - c_{UP}\right) + \sum_{i=1}^{N^A} 1\{r = UP\} q^A_i d^A_{i,r} \left(p^A_{i,r} - c_{UP}\right)}{\sum_{i=1}^{N^I} 1\{r = UP\} q^I_i d^I_{i,r} p^I_{i,r} + \sum_{i=1}^{N^A} 1\{r = UP\} q^A_i d^A_{i,r} p^A_{i,r}} = m_{UP}.$$

including all rail portions of the shipment) and the reported revenue for the UP/NS's portion of the shipment. For a shipment involving a short line, this would incorrectly attribute the short line revenue to BNSF or CSX. For this reason, I excluded short line shipments for the purpose of this simulation.

For NS-BNSF interline shipments, I make the same assumption and use an analogous equation to calibrate c_{NS} from m_{NS}.[10]

39. The approach described in the previous paragraph allows me to calibrate the marginal cost per car-mile of one of the two railroads, either c_{UP} or c_{NS}, for each shipment included in the model. Once c_{UP} or c_{NS} is calibrated, I calibrate the demand parameters, (a_i^I, b_i^I) and $\left(a_i^A, b_i^A\right)$, as well as the marginal cost of the other railroad, using (i) the demand equation, (ii) the profit maximizing first order condition of railroad r, and (iii) the profit maximizing first order condition of railroad s. Specifically, for the input set, I calibrate these parameters using the following equations:

$$b_i^I = \frac{1}{d_{i,r}^I\left(p_{i,r}^I - c_r\right)}$$

$$a_i^I = \log(q_i^I) + b_i^I d_i^I \left(\frac{d_{i,r}^I}{d_i^I} p_{i,r}^I + \frac{d_{i,s}^I}{d_i^I} p_{i,s}^I\right)$$

$$c_{i,s}^I = p_{i,s}^I - \frac{1}{b_i^I d_{i,s}^I}$$

where $r \in \{UP, NS\}$. Similarly, I calibrate these parameters for the application set using the following equations:

$$b_i^A = \frac{1}{d_{i,r}^A\left(p_{i,r}^A - c_r\right)}$$

$$a_i^A = \log\left(q_i^A\right) + b_i^A d_i^A \left(\frac{d_{i,r}^A}{d_i^A} p_{i,r}^A + \frac{d_{i,s}^A}{d_i^A} p_{i,s}^A\right)$$

$$c_{i,s}^A = p_{i,s}^A - \frac{1}{b_i^A d_{i,s}^A}.$$

---

[10] If the calibrated marginal cost implies a markup of less than \$0.01 per car-mile for a particular shipment, due to an unusually low observed rate per car-mile, I recalibrate the marginal cost for that shipment such that the UP's (or NS's) margin of that shipment is equal to m_{UP} (or m_{NS}). This is done to prevent extremely large or negative calibrated b_i^I or b_i^A that can lead to numerical instability in the main optimization problem of the simulation. This occurs only for a very small number of shipments in the data.

40. Once I have calibrated these model parameters, I use the numerical algorithm described in the previous section to simulate the welfare effects of the CGP proposal on shippers separately for each cell in the CSX CGP table and the BNSF CGP table.

41. One main data limitation I face in calibrating the model calibration and performing the simulation is that I do not observe the rates set by CSX and BNSF for those UP-CSX and NS-BNSF interline shipments where the shippers have chosen to use Rule 11. For these shipments, the mileage information is typically also missing for the CSX and BNSF segments of the shipment routes. Because of this data limitation and other missing information, a large number of (predominantly Rule 11) shipments are excluded from the model, which results in many CGP cells for which I do not have shipment data in either the input set or the application set.

42. In implementing my model, I focus on the set of CGP cells for which I have sufficient data to calibrate the model to ensure the simulation results are representative. Using UP's and NS's 100 percent Waybill data, I am able to determine the total number of carloads shipped in each of the input and application sets, regardless of whether I have sufficient information to include these shipments in the model. I perform the model calibration and simulation on the set of CGP cells where at least 10 percent of the number of carloads in both the input and application sets (before the redistribution of carloads excluded from the model) have sufficient information to be included in the model. For each of these 27 CGP cells, I redistribute the number of carloads excluded from the model, due to missing information, among the set of included shipments.[11] This procedure is done to ensure that the relative and total sizes of the input and application sets in the model are as close to their true sizes in the data as possible, in order to accurately capture the incentives UP/NS to set rates across both sets.

43. Figure 1 shows the estimated welfare effects for each of these CGP cells. As shown in Figure 1, my simulation model finds that the overall welfare effects of the CGP proposal

---

[11] This redistribution of carloads is applied to shipments in which the identities of the railroads are identical. I do not redistribute excluded carloads associated with UP-CSX Rule 11 shipments to UP-NS shipments that are included in the model, for example. See my backup materials for detail.

is positive in each of these CGP cells. In total, I estimate a net increase in shippers' consumer surplus of $10.3 million a year from shipments included in these CGP cells.

Figure 1

Total Welfare Effects of the CGP Proposal on Shippers for Included CGP Cells

		Change in Shippers' Consumer Surplus ($ / Year)		
Commodity Group	**Distance Band**	**Input Set**	**Application Set**	**Overall**
BNSF CGP Table				
SPECIALIZED MARKETS	500 TO LESS THAN 1,000 MILES	-$1,109,047	$2,863,551	$1,754,504
METALS & ORES I	500 TO LESS THAN 1,000 MILES	-$372,549	$742,022	$369,473

FOREST PRODUCTS I	1,000 TO LESS THAN 1,500 MILES	-$1,308	$1,638	$330
FOREST PRODUCTS I	500 TO LESS THAN 1,000 MILES	-$121,987	$122,307	$320
Subtotal		-$8,301,786	$16,017,680	$7,715,893
Total		-$11,318,286	$21,627,305	$10,309,019

44. To extrapolate this total welfare effects estimate to all CGP cells, I multiply the estimated total change in shippers' consumer surplus among the set of CGP cells included in the model by the following ratio:

$$\frac{\text{Total Number of Carloads in the Data}}{\text{Total Number of Carloads Included in the Model}}.$$

This ratio is calculated separately for the CSX CGP table and the BNSF CGP table, and I use the sum of these two resulting numbers as my estimate of the CGP proposal's total welfare effects on shippers.

45. I first calculate the above ratio combining the number of carloads in both the input and application sets. As an alternative, I calculate the above ratio using only the number of carloads in the application sets. Because the number of carloads that is missing from the model is higher in the input set (a larger input set would lower UP/NS's incentive to raise rates), calculating the above ratio using only data from the application sets produces a conservative lower bound on the estimate of the total welfare effects. These two ratios together give me an estimated range, from $39.4 million a year to $61.8 million a year, of the total welfare effects of the CGP proposal on all shippers. These calculations are presented in Figure 2.

Figure 2

Total Welfare Effects of the CGP Proposal on Shippers

BNSF CGP Table	**Application Set**	**Input and Application Sets**
Number of Carloads in Data	46,805	308,430
Number of Carloads Included in Model	11,911	36,321
Ratio	3.93	8.49

CSX CGP Table	**Application Set**	**Input and Application Sets**
Number of Carloads in Data	75,409	394,793
Number of Carloads Included in Model	19,919	76,657
Ratio	3.79	5.15

Total Welfare Effects	
ΔCS for Included CGP Cells	**$ Million / Year**
BNSF CGP Table	$2.59
CSX CGP Table	$7.72
Total	$10.31
ΔCS for All CGP Cells	
Based on Total Carloads ($2.59 x 8.49 + $7.72 x 5.15)	$61.76
Based on Application Sets Carloads ($2.59 x 3.93 + $7.72 x 3.79)	$39.40

AREAS OF EXPERTISE

- Industrial organization economics; Antitrust and Competition economics
- Applied econometrics
- Economic and econometric analysis of horizontal and vertical mergers
- Economic and econometric analysis of antitrust litigation topics, including: Class certification, damages, and liability issues in cases involving price fixing, exclusive dealing, monopolization, bundling, price discrimination, and exclusionary practices

INDUSTRIES OF EXPERTISE AND CASE HIGHLIGHTS

- Particular expertise in industries including: Wireline and wireless telecommunications; Digital advertising; Internet and other high technology markets; Media; Sports; Airlines; Railroads; Consumer Packaged Goods; Distribution services; Financial exchanges; Biotech; Healthcare; Hotels; Rental Cars; Insurance markets; Credit Cards; Energy markets; Retail
- Selected litigation highlights: CCB v. Rogers/Shaw; FTC v. Tempur Sealy/Mattress Firm; FTC v. Sysco/US Foods; DOJ and Private Google AdTech Litigation; DOJ v. Google Search Litigation; Various matters against Reynolds & Reynolds and CDK Global; 10X v. Vizgen; Various litigation matters involving Acthar; Rail Fuel Surcharge Litigation; NFL Sunday Ticket Antitrust Litigation; PGA Tour v. LIV Golf; Viamedia v. Comcast; Capacitors Price Fixing Jury Trial; Verizon-Tracfone Hearings; Sprint-T-Mobile Hearings; DOJ v. AT&T/Time Warner; Determination of Cable Royalty Funds
- Research published in leading scholarly and applied journals including *The American Economic Review*, *The Rand Journal of Economics*, *The International Journal of Industrial Organization, The Review of Industrial Organization, The Journal of Law and Economics, The Journal of Competition Law and Economics, Economics Letters,* and *The Review of Network Economics*
- Co-author of the chapter on Econometrics and Regression Analysis in the ABA Treatise, *Proving Economic Damages: Legal and Economic Issues,* 2017

SELECTED EXPERT WORK IN REVIEW OF MERGERS/TRANSACTIONS

Successful acquisition of Lumen's mass market fiber business by AT&T, 2025. Served as lead economic expert for the merging parties. Made multiple submissions to the Department of Justice and contributed to white paper demonstrating benefits from the transaction due to complementarity between Lumen's fiber business and AT&T's wireless business, as well as lack of any basis to find harm due to de minimis overlap. Deal cleared with no second request.

Successful acquisition of General Mills' US Yogurt Business by Lactalis, 2025. Served as lead economic expert for General Mills. Made multiple presentations to the Department of Justice showing lack of material substitution between General Mills' yogurt products and Lactalis' yogurt products and explaining the deficiencies in the DOJ's economic modeling approach. Deal cleared with no conditions.

Successful acquisition of Viterra by Bunge Global, 2025. Served as lead economic expert for the merging parties in the United States and Canada. Performed extensive economic analysis and modeling to show lack of horizontal or vertical merger harms and significant efficiencies across a wide variety of agricultural products. Responded to modeling performed by a Canadian economic expert. Deal ultimately cleared with conditions.

ATTACHMENT 1

Successful acquisition of Ansys by Synopsys, 2025. Served as lead economic expert for the merging parties. Developed economic analysis demonstrating lack of concern over vertical foreclosure issues for presentation to competition agencies in the US, EU, and UK.

Successful acquisition of NWEA by Houghton Mifflin Harcourt, 2023. Served as lead economic expert for Veritas Capital, owner of Houghton Mifflin Harcourt. Provided analyses demonstrating no significant competitive overlaps, no significant vertical concerns, and substantial pro-competitive benefits via integration of curriculum materials and assessment tools. Deal cleared by DOJ without a second request.

Successful merger of NortonLifelock and Avast to form Gen Digital, 2022. Served as lead economic expert for the parties in the United States. Presented economic analyses demonstrating very low levels of customer overlap between the two consumer cybersecurity firms and thus lack of horizontal merger concerns. Deal cleared by DOJ.

Successful acquisition of Sanderson Farms by Joint Venture of Cargill and Continental Grain, 2022. Served as potential testifying expert on behalf of all three parties. Presented economic analyses demonstrating lack of horizontal concerns to the DOJ.

Successful merger of Sony's Cruncyhroll and AT&T's Funimation anime streaming platforms. 2021. Served as lead economic expert for AT&T. Made multiple presentations to DOJ, extremely limited consumer switching between them, as well as extensive competition with a broader marketplace including Netflix, Amazon, and others. DOJ closed the investigation allowing the merger to proceed with no conditions.

Successful acquisition of Innovative Industries, Inc. by Ex Libris. 2020. Served as lead economist in interactions with FTC. Demonstrated that the acquisition would not harm competition due to the *de minimis* extent of head-to-head competition between Ex Libris and Innovative and the recent decline of Innovative' s business. FTC closed investigation allowing acquisition to proceed with no conditions.

Successful acquisition of TD Ameritrade by Charles Schwab. 2020. Served as lead economist in interactions with DOJ. Presented analyses demonstrating broad market for investor dollars rather than narrow market for RIA Custodian Services. DOJ closed investigation allowing acquisition to proceed with no conditions.

Successful acquisition of Reinhart Foodservice by Performance Food Group Company. 2019. Served as lead economic expert on behalf of the parties in the FTC's investigation of the merger. Presented data analyses showing ample competition and lack of harm to competition in any geographic market. FTC closed the investigation with no conditions.

Successful acquisition of SGA's Food Group of companies by US Foods. 2019. Served as lead economic expert on behalf of the parties in the FTC's investigation of the merger. Presented detailed economics and econometric analyses showing ample competition and lack of harm to competition in any geographic market. FTC cleared the merger subject to divestitures in three geographic markets in the Fall of 2019.

ATTACHMENT 1

Successful acquisition of Time Warner by AT&T Inc. 2017-2019. Lead economist throughout the DOJ investigation. Then director of all economic work during trial, serving as the central connection point between all experts and counsel and directing development of all aspects of the economic case. Defendants ultimately prevailed in trial and the merger closed in June 2018.

Successful acquisition of Keystone Foods by Tyson Foods, Inc. 2018. Served as lead economic expert for U.S. jurisdiction. Presented economic analyses demonstrating that competition would remain strong post-merger. Ultimately, antitrust agencies in the U.S., China, Japan, and Korea cleared the transaction.

Successful acquisition of NEX Group PLC by CME Group Inc. 2018. Co-lead economic expert with Thomas Stemwedel. Presented several econometric analyses demonstrating that Treasury futures contracts and cash Treasury securities were economic complements rather than substitutes. Based heavily on these Compass Lexecon submissions, the DOJ and CMA closed their investigations without requiring any divestitures.

Successful acquisition of VCA Inc. by Mars, Inc. 2017. Co-lead economic expert with Mary Coleman. Made multiple presentations to FTC demonstrating ample competition in general, emergency, and specialty veterinary services, including econometric analyses showing lack of direct competitive impact of Mars and VCA on one another. Transaction was ultimately cleared subject to a small number of divestitures.

Successful acquisition of Mobileye by Intel. 2017. Served as lead economic expert for Intel. Assisted counsel in preparing FTC presentations and materials demonstrating lack of significant head-to-head competition and lack of valid vertical foreclosure theories. Investigation was closed without Second Request.

FTC litigation against DraftKings, Inc. and FanDuel Inc. (Civil Action No. 17-cv-1195 (KBJ)). 2017. Served as economic expert for FTC and prepared to serve as FTC's testifying expert against the merger, prior to the parties' abandonment of the deal. Developed economic and econometric evidence that the merging parties were closest substitutes and thus likely would have increased prices as a result of their proposed merger.

Successful merger of ASE Group and SPIL. 2017. Lead economic expert on behalf of ASE Group. Submitted reports and testified to the Taiwan Fair Trade Commission, which ultimately cleared the transaction, then made multiple presentations to U.S. FTC, which also cleared the transaction. Economic analyses focused on implications of profit margins for market definition and competitive effects, ultimately demonstrating that the transaction was unlikely to cause significant harm to competition.

Successful acquisition of Alarm.com of two business units (Connect and Piper) from iControl Networks. 2017. Led team that demonstrated substantial and growing competition in home security and connected home marketplace and thus lack of competitive harm from acquisition. Work focused on importance of downstream market definition as well as empirical evidence of impact of competition on Alarm.com pricing and profitability.

Successful acquisition of Samsung Electronics, Ltd.'s printer business by HP Inc. 2016. Led team in evaluating the competitive effects of the acquisition, including assessing shares and competitive effects in overlap areas. Notably, the transaction gained regulatory approval in the U.S. during the initial review period without issuing a Second Request.

ATTACHMENT 1

Successful acquisition of Sun Products Corp. by Henkel AG. 2016. Led team demonstrating lack of competitive impact despite overlaps in laundry detergent and related products.

Successful acquisition of Starwood Hotels & Resorts by Marriott International. 2016. Led team that performed detailed analysis of competitive conditions, extensive econometric analysis of pricing, and full review of Marriott's internal pricing models to demonstrate that Starwood and Marriott were not close competitors, combined ownership of the brands would not lead to upward pricing pressure, and competition would remain robust post-merger.

Successful acquisition of PR Newswire by GTCR. 2016. Lead economic expert for GTCR. Made presentations to DOJ showing lack of competitive harm from the transaction, based on detailed analysis of win/loss data, including calculations showing no possible upward pricing pressure (UPP) concerns regardless of the level of margins.

Successful acquisition of Schurz Communications' Broadcast Stations by Gray Television. 2015. Lead economic expert for Gray. Made presentations to DOJ demonstrating output expanding effects of proposed transaction in light of the scale economies in television production and advertising and the small size of the DMAs affected by the transaction.

Successful acquisition of the Communications Business of Danaher Corporation by NetScout Systems. 2015. Lead economic expert for NetScout. Made presentations to DOJ describing proper economic framework for analysis of competition and potential merger harms, and demonstrated that the presence of multiple viable competitors and numerous other credible threats to be used by powerful buyers in a dynamic industry made theories of anti-competitive harm from the merger implausible.

Successful acquisition of Windmill Distribution Co. by Manhattan Beer Distributors. 2015. Lead economic expert for Manhattan Beer Distributors. Submitted White Paper to DOJ demonstrating, based on margin data, that the merger would be highly unlikely to lead to anti-competitive effects. Transaction was granted early termination from the Hart Scott Rodino process by the DOJ.

Proposed acquisition of Time Warner Cable by Comcast Corporation. 2014-2015. Served as lead economic expert on broadband issues on behalf of Comcast Corporation. Submitted multiple Declarations and made multiple presentations to DOJ and FCC, explaining lack of horizontal, bargaining, or vertical/foreclosure concerns with regard to broadband competition as a result of the transaction.

Successful acquisition of Leap Wireless by AT&T. 2014. Lead economic expert for AT&T. Submitted multiple Declarations to FCC and made presentation to DOJ, demonstrating the transaction would generate substantial consumer benefits, while generating at most minimal upward pricing pressure in a properly defined mobile wireless services market and no issues related to spectrum concentration or other competitive concerns.

Successful merger of American Airline and US Airways. 2013. Lead consulting expert, managing Compass Lexecon team of over 25 economists supporting multiple experts. Made multiple presentations to DOJ, worked on expert reports in litigation, and assisted counsel with the analysis leading to settlement of litigation, permitting transaction to close.

ATTACHMENT 1

Successful merger of T-Mobile USA and MetroPCS. 2013. Lead economic expert for T-Mobile USA. Conducted economic analyses of competitive effects and consumer benefits from the transaction, as well as consumer benefits from reduced costs and increased network quality. Presented analyses to both DOJ and FCC.

FTC investigation of acquisition of Dollar Thrifty Automotive Group by Hertz. 2012. Served as a lead economic expert for FTC and prepared to serve as FTC's testifying expert against the merger, prior to case settlement. Conducted empirical analyses based on previous rental car mergers demonstrating likely price increases from the transaction.

Decision by Federal Communications Commission not to extend the ban on exclusive contracts for satellite-delivered, cable-affiliated networks. 2012. Lead economic expert for National Cable and Telecommunications Association. Submitted economic analysis demonstrating that the ban on exclusive distribution of satellite-delivered, cable affiliated networks is no longer warranted given increased marketplace competition. FCC made decision to allow the ban to sunset.

Successful sale of wireless spectrum by SpectrumCo and Cox ("Cable Companies") to Verizon Wireless and successful completion of related commercial agreements. 2012. On behalf of the Cable Companies, performed economic analyses demonstrating lack of competitive harm from the transaction on markets for backhaul and Wi-Fi services. Presented analyses to FCC.

Successful acquisition by LIN Media of broadcast television stations from NVTV. 2012. Lead economic expert for LIN Media. Prepared economic analysis demonstrating lack of competitive concern over potential issues related to SSA and JSA Arrangements.

Proposed acquisition of T-Mobile USA by AT&T. 2011. Served as one of the lead economists, initially for T-Mobile (along with Michael Katz) and ultimately for both parties (along with Michael Katz and Dennis Carlton). Made multiple presentations to DOJ and FCC. Appeared in FCC Workshop, ex parte meeting.

S*uccessful application for antitrust immunity by Delta and Virgin Blue*. 2010. Together with Robert Willig, Bryan Keating, and Jon Orszag, prepared economic analyses demonstrating substantial net consumer benefits from antitrust immunity. Submitted results in expert reports to Department of Transportation.

Successful joint venture between Comcast and NBC Universal (and ultimate full acquisition of NBC Universal by Comcast). 2010. Served as one of the lead economists (along with Michael Katz) on behalf of the merging parties. Wrote multiple reports submitted to FCC (with Michael Katz) demonstrating lack of significant competitive concerns from the transaction. Made multiple presentations to DOJ and FCC. Appeared in FCC Workshop of economists, ex parte meeting.

Successful application for antitrust immunity for oneworld alliance and associated joint venture of American Airlines, British Airways, and Iberia Airlines. 2009-2010. Together with Robert Willig and Bryan Keating, prepared economic analyses demonstrating substantial net consumer benefits associated with antitrust immunity for the joint venture. Submitted results in expert reports to Department of Transportation.

ATTACHMENT 1

Successful acquisition by PepsiCo of bottlers, PBG and PAS. 2009. Performed econometric and simulation analyses demonstrating pro-competitive effect of merger on PepsiCo's own brands, other brands distributed by PBG and PAS, and overall marketplace. Presented results to FTC (together with Dennis Carlton).

Successful merger of Delta Airlines and Northwest Airlines. 2008. In support of Dennis Carlton, developed empirical and theoretical analyses to demonstrate merger's pro-competitive nature. Work focused on (ultimately settled) private litigation opposing the merger.

Successful acquisition of Harcourt Education by Houghton Mifflin. 2007. Along with Daniel Rubinfeld and Frederick Flyer, developed econometric analyses demonstrating lack of competitive harm from proposed merger. Presented results to DOJ.

Successful acquisition of Chicago Board of Trade by Chicago Mercantile Exchange. 2007. Along with Robert Willig and Hal Sider, developed and presented multiple empirical analyses demonstrating lack of competitive harm from merger. Submitted multiple white papers and made multiple presentations to DOJ.

1. Qualifications

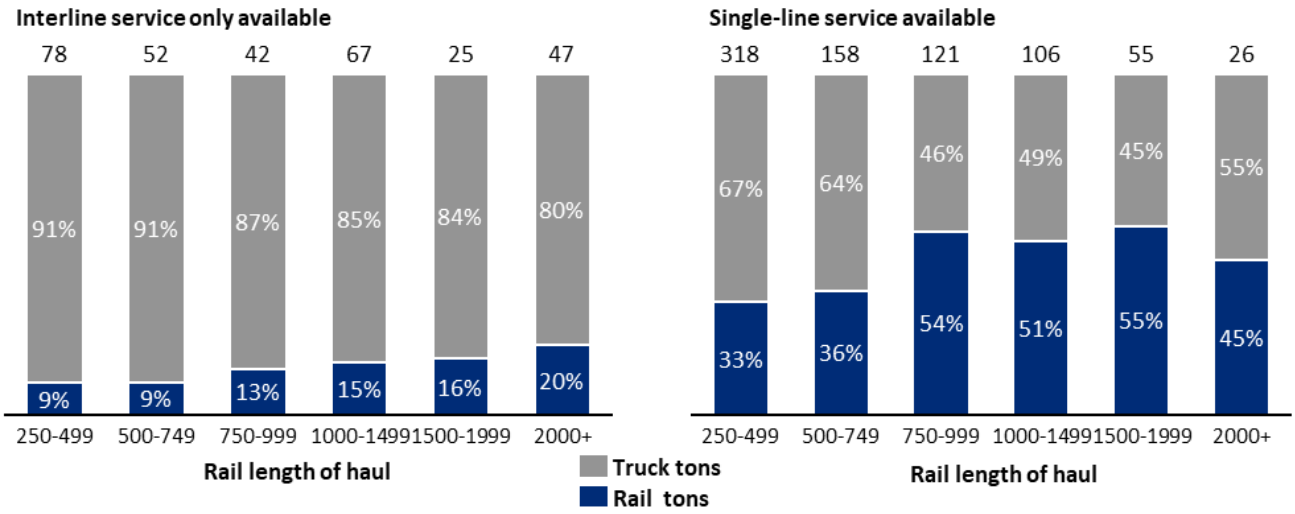
This verified statement was prepared by David T. Hunt and Matthew Schabas. Mr. Hunt is a Vice President and Mr. Schabas is a Principal with Oliver Wyman, a leading general management consulting firm with more than 60 offices in 31 countries. Oliver Wyman maintains one of the largest practices in the world dedicated to the transportation and logistics sectors. Oliver Wyman's transportation clients include national and regional governments on six continents, as well as many of the world's largest users of rail services, railroads, motor carriers, leasing companies, and industrial and consumer manufacturing firms.

Mr. Hunt: My office address is 1 University Square, Suite 100, Princeton, NJ 08540. I have been a consultant in the transportation sector for more than 40 years. I joined Oliver Wyman in 2008, specializing in strategic planning, regulatory issues, and operations for freight railroads and other freight transportation providers. Prior to joining Oliver Wyman, I was a consultant at Cambridge Systematics, Wilbur Smith Associates, and ALK Associates. While at ALK from 1983 through 2000, I provided services to clients in connection with all of the Class I railroad mergers that occurred during that period. I also was responsible for the annual calibration of and updates to ALK's Advanced Traffic Diversion Model that was used in ICC and STB merger proceedings. I hold a bachelor's degree in civil engineering from West Virginia University and a master's degree in civil engineering and operations research from Princeton University. My resume is included in Appendix D.

Mr. Schabas: My office address is 1166 Avenue of the Americas, New York City, New York 10036. I have been a consultant in the transportation sector for more than a decade, specializing in network design, business planning, commercial strategy, and freight operations.

I have led multiple projects for Class I railroads focused on railroad service design, traffic analysis, operational efficiency, and intermodal operations.

Prior to joining Oliver Wyman, I worked at Seabury Aviation Consulting, a boutique advisory firm, and as a researcher and teaching assistant in transportation policy while in graduate school. I hold a bachelor's degree, master's degree, and Master of Engineering from the University of Cambridge, United Kingdom, and a master's in city planning from the University of California, Berkeley in the transportation program. My resume is included in Appendix D.



2. Summary of Key Findings

The purpose of this Verified Statement is to provide an analysis and estimate of potential rail-to-rail and truck-to-rail diversions that would occur as the result of a merger of Union Pacific Railroad Company ("UP") and Norfolk Southern Railway Company ("NS"). The companies have reviewed and verified the information used to develop the diversion estimates. Our key findings are:

1. Rail customers prefer single-line service. As shown in Exhibit 2-1, in truck-competitive merchandise/bulk markets, rail's market share is materially greater where single-line service is available than where service is limited to interline routings. The same holds true for intermodal markets. Customers strongly favor single-line service over interline service because of its lower costs, improved reliability, and faster transit times.

Exhibit 2-1: Rail vs. trucking in merchandise/bulk markets, where single-line service available or interline service only[1]

Millions of tons; % rail vs. truck

2. Shippers benefit from meaningfully lower pricing on single-line routes, which consistently show lower railroad revenue per ton-mile across distance bands (Exhibit 2-2). In the 1,000 to

[1] See workpaper "t2merch_watershed_summary_vF.ipynb."

1,500-mile range, for example, the price of interline service is 34% higher on average than for single-line service for general merchandise.

Exhibit 2-2: Rail revenue per ton-mile: single-line vs. interline service[2]

	General merchandise Service type 1			Intermodal Service type 2			Bulk Service type 3			Automotive Service type 4		
LOH (miles)	**0-500**	**500-1000**	**1000-1500**	**0-500**	**500-1000**	**1000-1500**	**0-500**	**500-1000**	**1000-1500**	**0-500**	**500-1000**	**1000-1500**
Single-line	0.090	0.061	0.048	0.128	0.082	0.079	0.076	0.037	0.023	0.468	0.237	0.196
Interline	0.113	0.077	0.065	0.127	0.096	0.108	0.082	0.047	0.027	0.785	0.232	0.205
Difference	**0.023**	**0.016**	**0.017**	**-0.000**	**0.015**	**0.029**	**0.007**	**0.009**	**0.004**	**0.318**	**-0.005**	**0.010**

3. By offering the single-line rail service customers prefer, a merged UP-NS would attract an estimated 1.86 million rail carloads and intermodal units annually (Exhibit 2-3). 442,000 diversions are from other railroads, 67,000 are extensions of UP intermodal moves that dray over 250 miles, and 1.36 million are from traffic currently moving by truck. This growth opportunity represents an increase of 11% over combined UP-NS 2023 base year traffic.

Exhibit 2-3: Estimated total annual diversions from a UP-NS merger[3]
Thousands of carloads/intermodal units

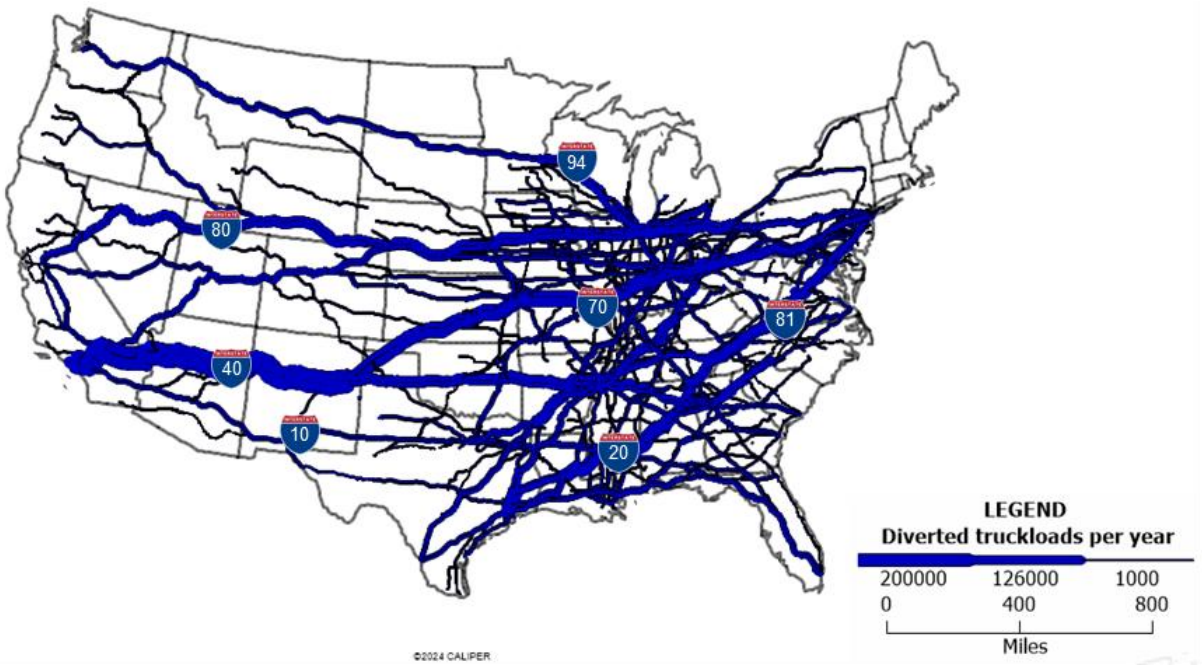
	Merchandise	Intermodal	Bulk	Automotive	Total
A. Total rail-to-rail diversions	162	204	28	47	442
A1. Rail-to-rail extended haul diversions	*107*	*131*	*17*	*34*	*288*
A2. Rail-to-rail new traffic	*56*	*73*	*12*	*13*	*153*
B. Total truck-to-rail diversions	183	1,166	-	5	1,355
C. Long-haul drayage diversions	-	67	-	-	67
D. Total gross diversions	**346**	**1,438**	**28**	**52**	**1,864**
E. Rail-to-rail extended haul offsets	(71)	(131)	(34)	(26)	(262)
F. Long-haul drayage offsets	-	(67)	-	-	(67)
G. Net diversions	**275**	**1,239**	**(6)**	**26**	**1,535**

[2] Totals and subtotals on tables may not sum due to rounding. See workpaper "rev_per_tmile_by_service_type.sql."
[3] A1. Rail-to-rail extended haul diversions is the granular output of the model (many small O&Ds) for merchandise, bulk and automotive. E. Rail-to-rail extended haul offsets is calculated from the representative lanes to fully offset the car-miles (rather than number of waybills) in the compressed traffic dataset for merchandise, bulk and automotive (see Appendix C)

4. A combined UP-NS would launch new intermodal train services with truck-competitive transit times in several lanes and enable new rail services in other lanes via Chicago, IL (e.g., Los Angeles, CA – Boston, MA) that eliminate costly drayage interchanges. There are five key lanes that would experience a high share of intermodal growth as part of the projected 1.44 million intermodal unit shift to new UP–NS single-line service. They are:
   - Los Angeles, CA – New York, NY
   - Los Angeles, CA – Atlanta, GA and Charlotte, NC
   - Laredo, TX and Houston, TX – Atlanta, GA and New York, NY
   - San Francisco, CA and Oakland, CA – New York, NY
   - Los Angeles, CA – Cincinnati, OH, Columbus, OH, and Detroit, MI
5. Watershed markets stand to gain as merchandise and bulk freight shifts from truck to rail carload. The "watershed region" is defined as any county within 250 miles of four gateway cities: Chicago, St. Louis, Memphis, and New Orleans. Over 50% of the projected merchandise/bulk diversions from truck are attributable to creating integrated single-line service to, from, and within the watershed region.[4]
6. Multiple shipper segments would realize substantial benefits from improved single-line service. These include:
   - Chemical and petroleum manufacturers, especially those located in Texas and Louisiana and shipping to New Jersey, Ohio, Pennsylvania, and other eastern states;
   - Food product producers located in Iowa, Nebraska, Minnesota, and other western food-producing regions, shipping products east;

[4] Intra- (10%) and inter-watershed (47%) lanes. Watershed lane types defined in Appendix B.5.3.

- Retailers and shippers of consumer products with national supply chains, due to new truck-competitive intermodal services that bypass Chicago interchanges, and new lanes from South Texas to the Southeast and Northeast; and
- Finished vehicle manufacturers, especially from Michigan and Indiana, moving vehicles to California and Texas.



7. By moving large volumes of long-haul freight off highways and onto rail, the merger would improve roadway safety and reduce wear on public infrastructure. Our analysis projects a major reduction in long-haul truck traffic on key interstate highway corridors as freight converts to rail under the merger. As shown in Exhibit 2-4, an estimated 2.04 million equivalent truckloads, excluding new local drayage to serve intermodal diversions, are projected to convert from roadways to rail annually due to the merger. The truckloads diverted to rail equate to 3.1 billion truck-miles and are long-haul, with an average haul of more than 1,519 miles.

Exhibit 2-4: Estimated total truckloads and truck-miles removed from roadways[5]
Excludes local drayage mileage for intermodal diversions

Service type	Truckloads (thousands)	Truck-miles (thousands)	Avg. miles per unit
Intermodal	1,166	2,048,000	1,756
Long-haul drayage	67	18,300	273
Intermodal subtotal	*1,233*	*2,066,300*	*1,675*
Merchandise	797	1,014,900	1,273
Auto	7	13,600	1,890
Total	**2,038**	**3,094,900**	**1,519**

[5] See workpaper "Trucks diverted from highway vF.xlsx." The 2.04 million truckloads result in 1.35 million rail carloads and intermodal units. Trucks to intermodal units are one-to-one conversions, while trucks to rail carloads account for the ability of a railcar to haul more tons than a truck. Full conversion details explained in Appendix B.12.

Exhibit 2-5: Density map of estimated truckloads diverted from roads due to a UP-NS merger[6]
All highway lanes with at least 1,000 annual truckloads diverted in at least one direction

8. Finally, following full implementation of the merger, diverted traffic is estimated to generate $4.21 billion in new revenue annually for UP-NS, which represents an 11.6% increase over UP and NS combined 2023 operating revenue of $36.2 billion.[7] New intermodal service is projected to generate 52% of the estimated $4.21 billion in new business.[8] This freight revenue estimate is based on reported revenues per ton-mile from 2023, inclusive of fuel surcharge and adjusted for length-of-haul, for loads as reported in the Board's Confidential Carload Waybill Sample ("CCWS") Total Revenue field and adjusted using the Board's Freight Commodity Statistics report.[9] Revenue is calculated using the estimated diverted

[6] Based on county origin–destination pairs, using TransCAD's all-or-nothing assignment. Some links may appear spatially disjointed from the larger network when the minimum threshold is applied. See workpaper "Trucks diverted from highway vF.xlsx"; see Appendix B.11 for converting truckloads to carloads/intermodal units. Map created using TransCAD Transportation Planning Software and Oliver Wyman diversion analysis data.
[7] Analysis of Class I Railroads, 2023, Line 1, Total Operating Revenue, Association of American Railroads.
[8] Freight revenue estimate based on reported revenues from 2023, inclusive of fuel surcharge, as reported in the STB Confidential Carload Waybill Sample 2023, Total Revenue field; see workpaper "Revenue_Calculation_vF.xlsx."
[9] See Section 8. Revenue for more details. Sources: "Expanded Total Revenue" (field 102), Confidential Carload Waybill Sample, op. cit.; Freight Commodity Statistics 2023, Surface Transportation Board.

traffic loaded into the operating plan. We "compressed" the traffic so that the long tail of low-volume merchandise diversion lanes could be effectively modeled. The compression methodology took the largest lanes by STCC2 as representative traffic flows and grossed up the number of cars in a diversion lane to keep the total car-miles from merchandise diversions the same. This resulted in a small increase in diverted merchandise carloads of ~10,000 in the operating plan (see Appendix C.1 for full details).

3. Basis for Truck-To-Rail and Rail-to-Rail Diversion Models

Shippers selecting freight modes and carriers consider numerous factors in their decision-making. Shippers, however, consistently report three factors as particularly important: price, reliability, and transit time. The Organization for Economic Co-operation and Development ("OECD") confirmed this in a recent study:

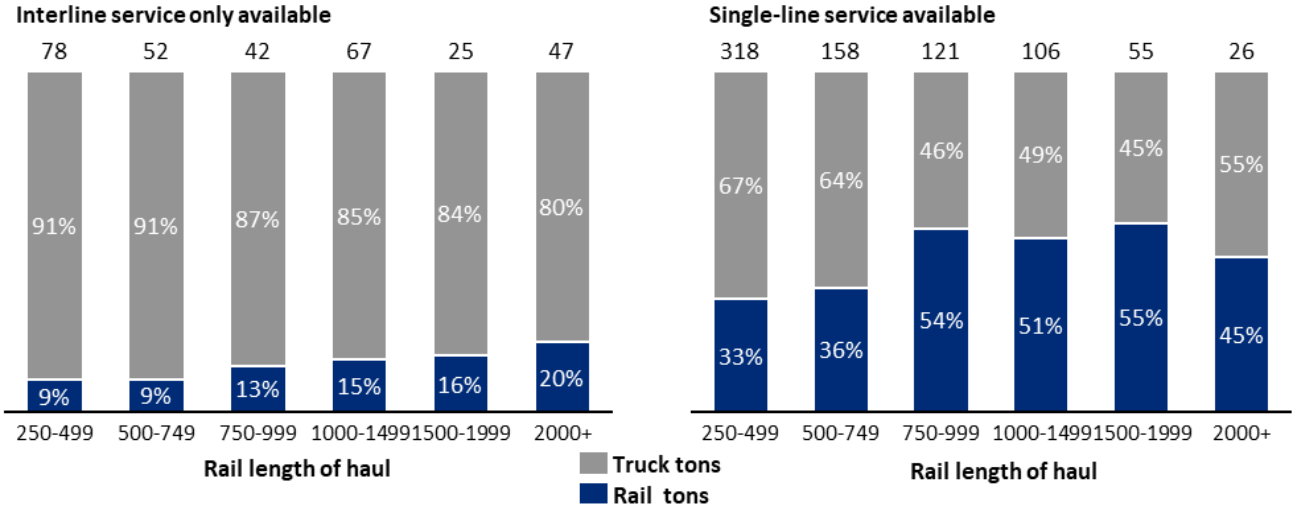
> "A huge number of studies deal with the criteria that shippers or their intermediaries – like freight forwarders – take into account when choosing their transport mode. Independently of who has conducted the studies, costs, transit time, and reliability have been found to play the most important role in transport mode choice."[10]

Oliver Wyman's diversion models estimate how much traffic would shift to a single-line UP-NS system by focusing on the factors shippers value most: price, reliability, and transit time. **Section 3.1** shows that single-line service captures significantly more market share than interline service in both truck-versus-rail and rail-versus-rail markets, because single-line service better aligns with these preferences. **Sections 3.2 through 3.4** explain how single-line operations improve each factor relative to interline service. **Section 3.5** summarizes the two diversion models: the truck-to-rail model, which groups lanes by price and transit-time competitiveness and uses the number of junctions as a proxy for reliability, and the rail-to-rail logit model, which evaluates route choice based on rail miles, junction impedance, and the number of interchanges.

3.1. The Impact of Interchanges on Rail Market Share

Rail's competitiveness with trucking is materially stronger where single-line rail service is available rather than only interline service.[11] As shown in Exhibits 3-1 and 3-2, rail market share

[10] "Mode Choice in Freight Transport," Research Report, International Transport Forum, OECD, 2022, pp. 13-14.
[11] A "market" is defined by an origin, destination, and commodity. The commodity may be general, such as merchandise/bulk or intermodal, or may be a specific STCC. Merchandise and bulk shipments are combined into one category, since it is unlikely that entire unit trains of bulk commodities (such as grain) would be diverted, especially from truck to rail.

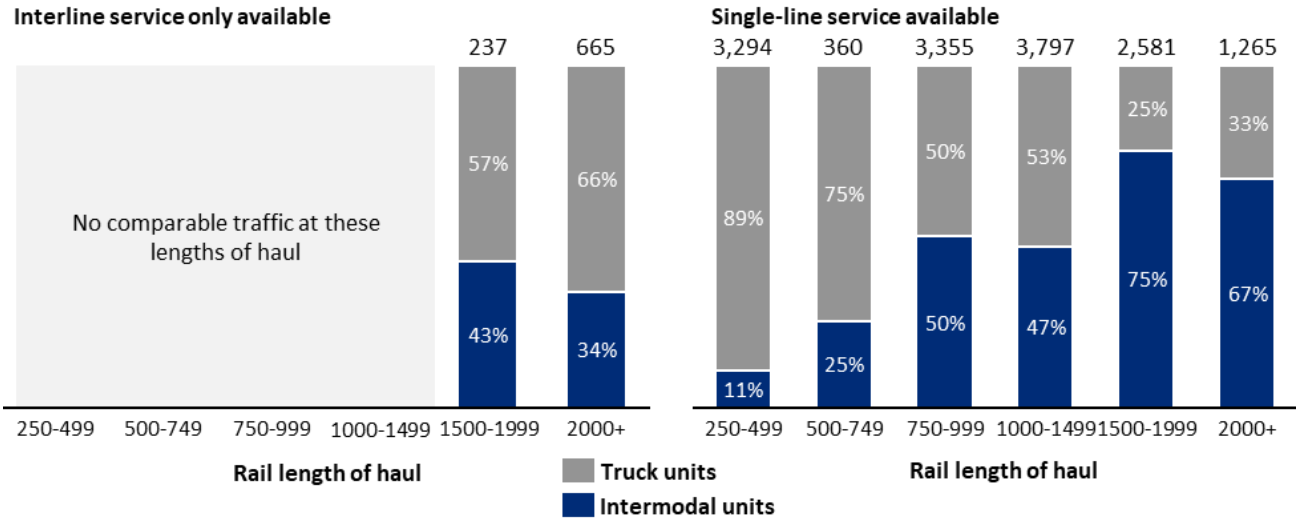


is substantially higher at every length of haul where single-line service is available, both for merchandise/bulk and intermodal traffic, demonstrating the significant competitive advantage such service provides.

For example, for merchandise and bulk shipments, rail captures only 13% of tons in 750- to 999-mile markets if only interline service is available but 54% if single-line service is available. Similarly, in intermodal markets with a 1,500- to 1,999-mile length of haul, interline-only rail has a 43% share compared to truck, while single-line rail has a 75% market share.

Where interline is the only intermodal linehaul option, market share is 32 to 33 percentage points lower than if single-line service is available in the same length of haul bands. Particularly for intermodal services, additional transit time from executing a steel-wheel interchange and the unreliability this frequently introduces makes it more difficult, particularly at shorter lengths of haul, for intermodal to offer a competitive product to truck.

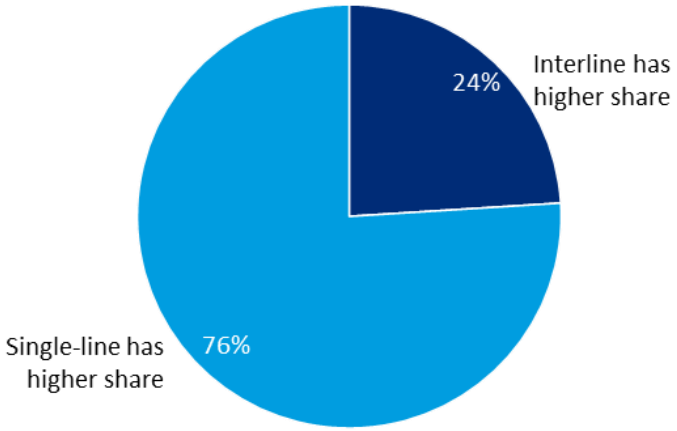
Exhibit 3-1: Rail competitiveness vs. trucks in merchandise/bulk markets, where single-line service available or interline only[12]



Millions of tons; % rail vs. truck

[12] Transearch, S&P Global Markets, 2023; Confidential Carload Waybill Sample, op. cit., includes "competitive" county-county lanes where both truck and rail compete, with additional exclusions applied (see Exhibit B-27); workpaper "t2merch_watershed_summary_vF.ipynb."

Exhibit 3-2: Rail competitiveness vs. trucks in intermodal markets, where single-line service available or interline only[13]



Thousands of truckloads/intermodal units; % rail vs. truck

Shippers' strong preference for single-line service also is revealed in markets where single-line and interline rail service compete directly, as single-line service has a higher share of traffic 76% of the time (Exhibit 3-3).

Exhibit 3-3: Rail single-line vs. interline service market share[14]

Number of markets with the same origin, destination, and commodity

[13] Transearch, op. cit.; Confidential Carload Waybill Sample, op. cit. includes "competitive" county-county lanes where both truck and rail compete and where current truck traffic is greater than 0; workpaper "Current state IM SLS vs Interline Market Share Comparison.xlsx."

[14] 2023 traffic base of record (see Appendix A.2); Confidential Carload Waybill Sample, op. cit. selected markets where the minimum JF = 0 and the average JF > 0. Market defined as origin SPLC, destination SPLC, and 7-digit STCC; see workpaper "rail_sl_vs_inl_mkt_share_vF.sql."

Finally, the difference in rail versus truck share is stark where markets that currently have single-line service are compared to markets where a merged UP-NS would introduce new single-line service. As shown in Exhibit 3-4, current single-line service lanes consistently have higher market shares compared to truck, by 5x to 20x, than where single-line service is yet to be introduced. Using tank trucks as an example, single-line rail service on average has a 64% share of tonnage versus trucks. In lanes where UP-NS would introduce new single-line service, the pre-merger rail share against tank trucks averages only 7% (9.1x less).

Exhibit 3-4: Pre-merger comparison of truck/rail share for (a) markets that currently have single-line rail service, and (b) markets where UP-NS would improve service[15]
Merchandise/bulk traffic; millions of tons

	(a) Truck/rail competitive with single-line rail service (pre-merger shares)			(b) Truck/rail competitive lanes where UP-NS would improve service (pre-merger shares)		
Alternative to rail truck type	**Truck tons**	**Rail tons**	**Rail share**	**Truck tons**	**Rail tons**	**Rail share**
Bulk	89.5	60.4	40%	14.4	0.4	2%
Dry van	230.6	122.3	35%	21.8	1.5	6%
Flatbed	63.5	26.3	29%	7.8	0.4	4%
Reefer	24.7	23.8	49%	5.5	0.6	10%
Tank	51.6	90.5	64%	12.2	0.9	7%

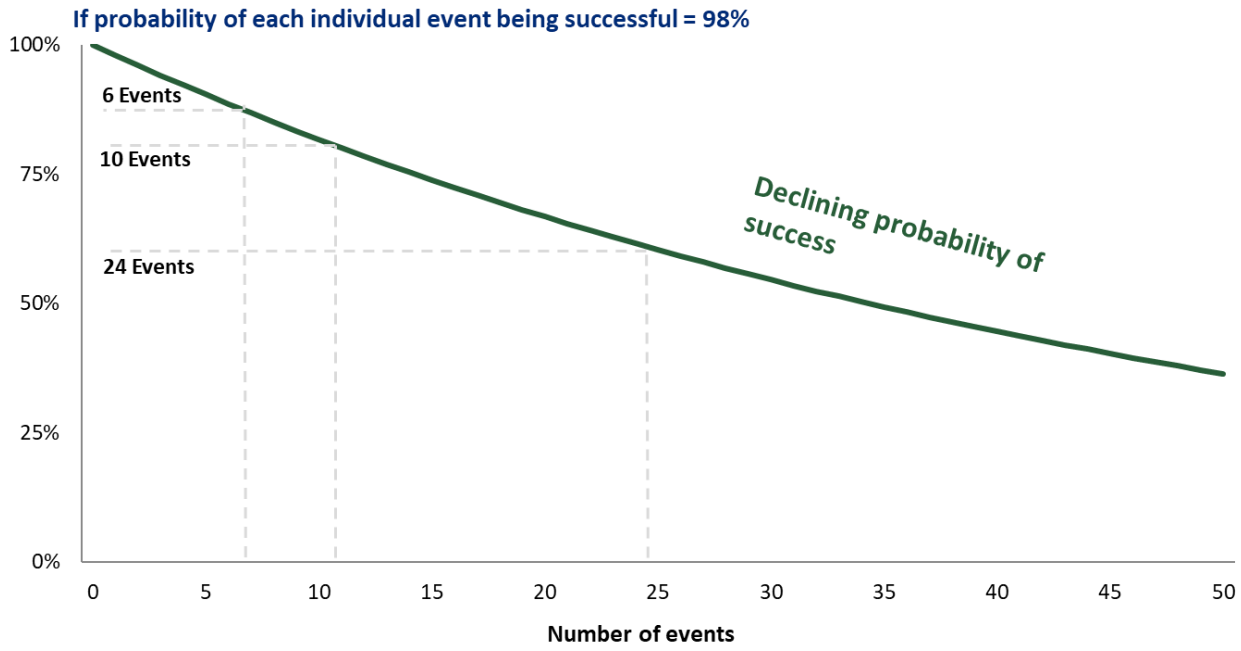
3.2. The Impact of Interchanges on Rail Price

A leading factor in why shippers choose single-line rail service rather than interline is that routes offering single-line service are consistently priced lower on a revenue per ton-mile basis, across all lengths of haul (Exhibit 3-5). For example, revenue per ton-mile for general merchandise traffic moving 1,000 to 1,500 miles is on average 34% higher for interline moves than for single-line service in the same distance band.

[15] Transearch, op. cit.; Confidential Carload Waybill Sample, op. cit.; workpaper "t2merch_lane_archetype_exhibits_vF.ipynb." Note Transearch also includes truck types for hauling livestock and wet cement, which were not considered since these are not commodities moved by railroads.

Exhibit 3-5: Rail revenue per ton-mile: single-line vs. interline service[16]

	General merchandise Service type 1			Intermodal Service type 2			Bulk Service type 3			Automotive Service type 4		
LOH (miles)	**0-500**	**500-1000**	**1000-1500**	**0-500**	**500-1000**	**1000-1500**	**0-500**	**500-1000**	**1000-1500**	**0-500**	**500-1000**	**1000-1500**
Single-line	0.090	0.061	0.048	0.128	0.082	0.079	0.076	0.037	0.023	0.468	0.237	0.196
Interline	0.113	0.077	0.065	0.127	0.096	0.108	0.082	0.047	0.027	0.785	0.232	0.205
Difference	**0.023**	**0.016**	**0.017**	**-0.000**	**0.015**	**0.029**	**0.007**	**0.009**	**0.004**	**0.318**	**-0.005**	**0.010**



3.3. The Impact of Interchanges on Rail Reliability

Reliability is crucial for shippers, since uncertain and late delivery times can disrupt operations and create the need for additional inventory levels. For example, a chemicals manufacturer faced with delayed input shipments could incur a costly disruption to operations if it runs out of necessary feedstock for a process, while an automobile assembly plant might have to stop an assembly line if a critical part arrives late.

It is not possible to include a direct measure of reliability by market in the traffic diversion models, since this data does not exist on a lane-by-lane basis nationally. But the impact of reliability can be considered indirectly by looking at junction frequency (i.e., the number of rail interchanges) as a proxy. Simply put, the more interchanges, the greater the risk that a railroad will not be able to meet its service hand-off plan for a railcar. And even if the risk of failure for an individual event is small, the overall risk of failure increases as more events are added to a railcar move, as shown in Exhibit 3-6.[17] The result is that single-line service typically will be more reliable than interline service.

[16] Confidential Carload Waybill Sample, op. cit. Single-line defined as junction frequency=0 and rebill flag=0. Interline defined as junction frequency>0 and rebill flag=0; workpaper "rev_per_tmile_by_service_type.sql."
[17] This adverse effect of interchanges on service reliability was established in the 1970s by the Massachusetts Institute of Technology, under funding from the US Department of Transportation Freight Car Utilization Program.

Exhibit 3-6: The probability of successfully executing a railcar trip plan decreases as the number of switch events increases[18]

3.4. The Impact of Interchanges on Rail Transit Time

Transit time is another important consideration for shippers in managing freight movements to support their supply chains. One reason is that more time spent in transit increases inventory costs and represents a lost opportunity for that shipment to be used or sold sooner.

Shippers do not expect railroads to be faster than truck but are more likely to switch from truck to rail if railroads can narrow the gap, while improving reliability and remaining below the cost of truck. And interchanges between railroads in interline service add significant transit time.

Using railroad performance data reported to the Board, the average system terminal dwell time of 22 hours (excluding cars on run-through trains) provides a good approximation for the

[18] Note: A 98% probability of performing each individual switching event according to plan is above levels normally experienced by the Class I railroads. The probability of meeting a trip plan is equal to the probability of performing each individual switching event according to plan, raised to the power of the number of switching events. Sources: Testimony of William J. Rennicke: Before the STB in the Matter of Ex Parte No. 711, Petition for Rulemaking to Adopt Revised Competitive Switching Rules, March 25, 2014, handout, p. 7; "Freight Car Utilization and Railroad Reliability: Conclusions and Recommendations," The Industry Task Force on Reliability Studies, October 1977, Final Report.

time a railcar or container spends at each interchange. Even at large gateways, most railcars must be handled twice (at the originating and terminating railroads' terminals) before continuing. A single railroad can perform the same move with just one handling, saving an intermediate handling and the time associated with it.

The issue of interchange time is most acute for intermodal, which is the most time-sensitive rail service product. Some interline lanes offered through Chicago, IL require containers to be drayed between railroad terminals, typically adding a day to transit time. Shippers so dislike extended transit times due to interchange that, for example, they will dray containers over 250 miles east from Chicago, IL and Memphis, TN instead of using interline rail service (see discussion in Section 5.5).

For example, if we consider the approximately 700-mile trip from Minneapolis, MN to Columbus, OH, a two-carrier rail move would take an estimated 130 hours to complete. A single-line move can reduce that by 17%, to 108 hours; still higher than but more competitive with the transit time for trucks (see Exhibit B-52 for assumptions).

3.5. Diversion Modeling of Price, Reliability, and Transit Time

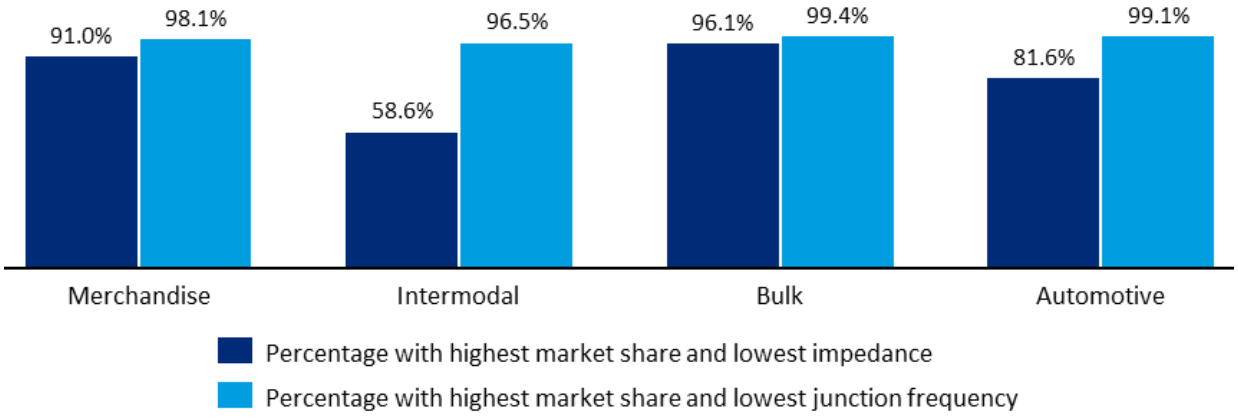
Oliver Wyman's diversion models are designed to capture the core factors that drive shipper mode and route choice: price, reliability, and transit time.

The **truck-to-rail** diversion model predicts how a lane will respond to improved rail service by examining outcomes in comparable markets. This mirrors reference-class forecasting, which bases projections on the performance of similar real-world cases rather than on assumptions about a single lane. The model groups markets by distance and commodity type, and by transit-time and price differences relative to truck service. Where the UP–NS merger would create new single-line opportunities, the model matches those lanes to existing markets with similar service

characteristics. These "lookalike" or "archetype" markets provide the observed shipper behavior used to forecast how the improved lane is likely to perform once mature.

For example, a 1,500-mile Houston-Cleveland tank-truck lane that would gain single-line service post-merger is matched to similar lanes where single-line rail service already exists. The rail share observed in those comparable markets is then used to predict the rail share for the improved lane. This approach naturally incorporates the key drivers of shipper choice – price, reliability, and transit time – because it relies on actual shipper behavior in markets where single-line rail competes directly with truck.

The rail-to-rail diversion model, by contrast, is a logit model of route choice. The model evaluates relative attractiveness of rail routes based on two key variables:



- Impedance, a quantitative measure that incorporates length-of-haul and expected interchange-related delay; and
- Junction frequency, the number of interchanges on a route.

These two measurable characteristics serve as practical proxies for the underlying factors that drive shipper preferences on price, reliability, and transit time. The route with higher impedance generally has longer transit time. Additional interchanges increase price, reduce reliability, and lengthen transit time, making a route less competitive. The logit model uses these two key variables to estimate the probability that shippers will select each available route. The model is calibrated using historical data to ensure that predicted choices reflect the way shippers have actually responded to cost, reliability, and transit time differences in real markets.

Importantly, actual traffic data confirms that impedance and junction frequency reliably predict shipper choices. Exhibit 3-7 shows that the highest share route in a market almost always has the lowest impedance and the fewest junctions. For merchandise traffic, the highest share

route has the lowest impedance 91% of the time and the lowest junction frequency 98% of the time. Nearly all other service categories exceed 80%, with intermodal lower (59%) due to being modeled at a broader BEA-to-BEA level. Even so, the lowest-impedance intermodal route still has the highest share nearly 60% of the time.

Exhibit 3-7: Percentage of markets where the highest market share route has the lowest market impedance and/or junction frequency[19]

In sum, both models are appropriate for this forecasting exercise. The truck-to-rail model relies on close analogues in real markets to capture how improvements to single-line service will shift shipper mode choice from truck to rail. The rail-to-rail model uses a well-established logit framework to quantify how clearly defined and measurable route attributes – impedance and junctions – drive shipper routing choice among rail alternatives. Both approaches are grounded in real-world shipper behavior (revealed in routing and market shares) and align with the core economic drivers of freight transportation markets.

[19] See workpaper "HC Filtered CCWS Calibration.xlsx."

4. Truck-to-Carload Rail Traffic Diversions

4.1. Truck-to-Carload Rail Introduction

For the purposes of the analysis, all commodities were classified as either likely to ship by carload or intermodal when converted to rail.[20] This section focuses solely on carload commodities moving by truck (e.g., chemicals, grain, steel). The diversion of trucks carrying intermodal commodities (e.g., retail, furniture, machinery) is covered in Section 5.

A UP-NS merger would remove an estimated 804,000 truckload movements from roads by converting this traffic to rail carload movements. This would be expected to add, for a merged UP-NS, 183,000 new carloads of merchandise/bulk[21] traffic and 5,000 new multilevels transporting finished vehicles (Exhibit 4-1).[22]

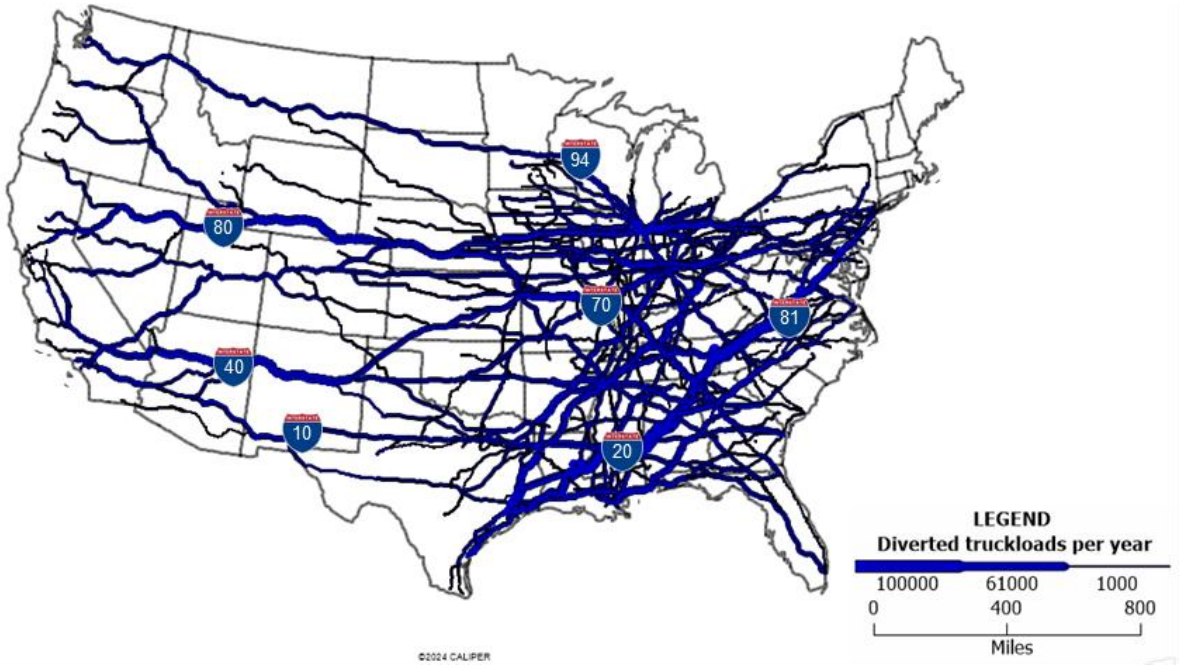
Exhibit 4-1: Estimated truck-to-rail carload diversions to a merged UP-NS[23]

Category	Estimated trucks diverted	Equivalent carloads
Merchandise/bulk	797,000	183,000
Finished vehicles	7,000	5,000
Total	**804,000**	**188,000**

The primary roadways that could see a significant reduction in trucks as a result are between the Southeast, Midwest, and Northeast. Key corridors along these routes include I-81, connecting the Northeast and Southeast; I-20, running across the Southeast/Texas; and I-70, connecting the Northeast and the Midwest/watershed region (Exhibit 4-2).

[20] See workpaper "STCC4-CLvsIM.xlsx."
[21] "Merchandise/bulk" as used in this section includes all truck commodities that are not intermodal or finished vehicles and that could be potentially divertible to rail.
[22] Multilevel railcars are used to transport finished vehicles (STCC 3711).
[23] See workpapers "All_Results_vF.xlsx," "T2R Carload Diversions to UP-NS vF.sql," and "Trucks diverted from highway vF.xlsx." Reflects loads only, no empties.

Exhibit 4-2: Estimated truck-to-rail carload diversions for a merged UP-NS[24]
State-to-state lanes with more than 10,000 estimated annual diverted truckloads (bidirectional, no empties)



State	State	Estimated diverted truckloads (bi-directional)	Selected interstates likely to see reductions in trucks
Texas	Ohio	27,000	I-70, I-44, I-20
Texas	Alabama	23,000	I-20, I-10
Texas	Pennsylvania	21,000	I-80, I-70, I-44, I-20
Texas	Georgia	19,000	I-20
Texas	Tennessee	16,000	I-30, I-40
Texas	Indiana	15,000	I-70, I-44, I-20, I-55, I-40, I-30
Louisiana	Georgia	14,000	I-20, I-65
Iowa	Ohio	13,000	I-80, I-74, I-70
Texas	Michigan	12,000	I-94, I-74, I-55, I-57, I-44, I-20
Texas	New Jersey	12,000	I-20, I-30, I-40, I-70, I-78, I-80, I-81
Texas	New York	12,000	I-20, I-30, I-40, I-70, I-78, I-80, I-81
Texas	North Carolina	12,000	I-85, I-20, I-10
Louisiana	Ohio	12,000	I-10, I-20, I-55, I-40, I-65, I-71
Iowa	Indiana	12,000	I-80, I-65, I-74
Texas	Virginia	11,000	I-20, I-10, I-30, I-40, I-81, I-64

This traffic will benefit from new single-line services in the UP-NS Optimized Plan, which will be further enhanced in the UP-NS Growth Plan as the network onboards new traffic. Two planned new trains will be key enablers for converting this freight from trucks to the manifest carload rail service: The new North Platte-Conway manifest train, which bypasses the Chicago gateway, will provide single-line service and remove handlings in lanes from the Western USA and Iowa into the Midwest (Ohio, Indiana, etc.). The new North Little Rock-Conway manifest train pair via Sidney, IL will eliminate multiple handlings and out-of-route miles via the St. Louis gateway for traffic moving in lanes that run between Texas and the states of Indiana,

[24] See workpapers "All_Results_vF.xlsx" and "T2R carload diversions state-to-state lanes vF.sql."

Michigan, northern Ohio, and the Northeast.[25] Both trains will reduce transit time for this freight and improved reliability as handlings at the gateway interchanges are removed.

Exhibit 4-3: Estimated truckloads removed from roadways by truck-to-carload rail diversions[26]
All highway lanes with at least 1,000 annual truckloads diverted in at least one direction

Below, **Section 4.1.1** provides a high-level overview of the traffic diversion modeling approach for finished vehicles and merchandise/bulk (see Appendix B for details). **Sections 4.2 and 4.3** then break down total carload diversions from trucks by merchandise/bulk and finished vehicles, respectively.

4.1.1. Overview of Truck-To-Carload Rail Diversion Modeling Assumptions

The following key assumptions were made in modeling truck-to-carload rail traffic diversions for finished vehicles and merchandise/bulk. See Appendix B for additional detail.

[25] STB Finance Docket No. 3687, Union Pacific Corporation et. al. – Control – Norfolk Southern Corporation et. al., Operating Plan Verified Statement, Figure 26.
[26] Based on county origin–destination pairs using TransCAD's all-or-nothing assignment. Some links may appear spatially disjointed from the larger network when the minimum threshold is applied. See workpaper "Trucks diverted from highway vF.xlsx"; see Appendix B.11 for converting truckloads to carloads/intermodal units. Map created using TransCAD Transportation Planning Software and Oliver Wyman diversion analysis data.

Exhibit 4-4: Key assumptions for truck-to-rail diversion modeling

Assumption	Description
Base year for traffic	• The base year for all traffic is 2023, with no forecast of future years
Traffic sources	• STB 2023 Confidential Carload Waybill Sample for rail traffic • Transearch, S&P Global Markets, 2023 freight flow database for truck traffic – Modes include truckload, private trucks, and trucks not elsewhere classified. Less-than-truckload excluded, since unlikely to divert to rail – For merchandise/bulk, five truck types considered: dry van, tank, bulk, reefer, and flatbed. Note we excluded STCC4 refrigerated commodities from Transearch that UP and NS recommended would not convert to rail (see Exhibit B-26). All others were allowed as potential diversions – For finished vehicles, only STCC 3711 was considered
Geography/ markets/traffic types	• All geography at a county-to-county level, the base level of Transearch • A "market" is based on an origin county, destination county, and traffic type • Traffic types are merchandise/bulk and finished vehicles, based on commodity[27] • Traffic O/Ds remained fixed. Source competition and geographic substitution were not modeled
Rail industry changes since 2023	• The base 2023 traffic does not include industry changes since 2023 from mergers/acquisitions involving CP-KCS, CSXT-Pan Am,[28] and CN-Iowa Northern, and other network changes involving BNSF-Montana Rail Link • These combinations were considered when determining if UP-NS would provide improved rail service in a market. No effort was made to estimate any truck diversions that might have occurred from prior mergers/acquisitions or other network changes
Permitted diversions	• Only permitted in markets where UP-NS service is expected to be better than current rail service (including recent mergers and acquisitions), where "better" is defined as shorter distance, lower price, and/or lower transit time

4.2. New Merchandise/Bulk Rail Carloads

4.2.1. Approach, Assumptions, and Market Definitions

We treated merchandise and bulk commodities the same way in the diversion model, since it is unlikely that any truck-to-rail carload diversions will be of sufficient point-to-point volume to result in the unit train service that railroads typically provide for bulk commodities. All diversions are thus treated, for revenue estimation and operations planning, as merchandise carloads that would move on the manifest train network.

[27] See workpaper "STCC4-CLvsIM.xlsx."
[28] Although Springfield Terminal Railways (SCAC = ST) became part of CSXT in its 2022 acquisition of Pan Am Railways, traffic records in 2023 continued to use ST.

A lookalike analysis was utilized to estimate the number of trucks transporting merchandise/bulk commodities that a UP-NS merger could divert from road to conventional railcar loads. As discussed briefly in Section 3, the theory behind using a lookalike analysis is that shippers' mode choice is based on price, transit time, and reliability, and shippers of a given commodity behave consistently on a national basis. Therefore, rail lanes with similar characteristics versus truck are expected to have a similar rail market share. If service characteristics change, then market share will change as well to match the most relevant existing lanes.

A lookalike analysis is appropriate for estimating diversions of merchandise/bulk trucks because it captures the key features of complex shipper behavior, without relying on false precision from estimating door-to-door transit times and prices for truck and rail. Lookalike analysis is a common methodology used in digital marketing to identify potential customers with similar characteristics to existing customer profiles. We applied this approach to compare freight markets with improved rail service post-merger to existing freight markets that have comparable levels of rail service already.

Exhibit 4-5: Comparison of truck vs. rail share for all merchandise/bulk markets, pre-merger and post-merger with improved service[29]

Millions of tons

	(a) All competitive single-line lanes: Pre-merger			(b) Lanes diverted: Pre-merger			(c) Lanes diverted: Post-merger		
Truck equipment type	**Truck tons**	**Rail tons**	**Rail share**	**Truck tons**	**Rail tons**	**Rail share**	**Truck tons**	**Rail tons**	**Rail share**
Bulk	89.5	60.4	40%	8.0	0.0	0%	5.3	2.7	34%
Dry van	230.6	122.3	35%	15.4	0.1	0%	9.6	5.9	38%
Flatbed	63.5	26.3	29%	3.9	0.0	1%	2.8	1.2	29%
Reefer	24.7	23.8	49%	3.8	0.0	0%	2.1	1.7	45%
Tank	51.6	90.5	64%	10.6	0.2	2%	4.5	6.3	59%

[29] Transearch, op. cit.; Confidential Carload Waybill Sample, op. cit.; workpaper "t2merch_lane_archetype_exhibits_vF.ipynb."

In Exhibit 4-5 above, we walk through how the lookalike analysis performs as expected. For all the competitive[30] lanes where single-line rail service exists today (a), rail competes strongly against truck, particularly in the tank truck market. Next, in those lanes that we estimate would divert due to a UP-NS merger (b), those lanes today severely underperform compared to truck (0%-2% market share).

After the UP-NS merger improves service in these lanes, primarily by turning interline service into single-line (c), the lookalike analysis compared them to groups of existing, similarly competitive single-line lanes. The result is that these improved lanes are predicted to divert trucks to reach a rail share much closer to existing single-line lanes. Tank truck diversions are a prime example: on average, rail has a 64% market share for single-line served lanes; the predicted market share on lanes improved by the merger is 59%, up from 2% currently.

We outline a specific example of how the model predicts rail market share below, using the largest tank truck-to-rail carload diversion from Nueces County, TX to Morgan County, AL, which the model predicts will divert 1,938 carloads of chemicals. The UP-NS merger would improve service by converting this lane to single-line service, thus decreasing rail transit time and price for shippers. This would cause the lane characteristics to change, resulting in a move from 0% rail market share now to an estimated 79% market share post-merger (Exhibit 4-6).

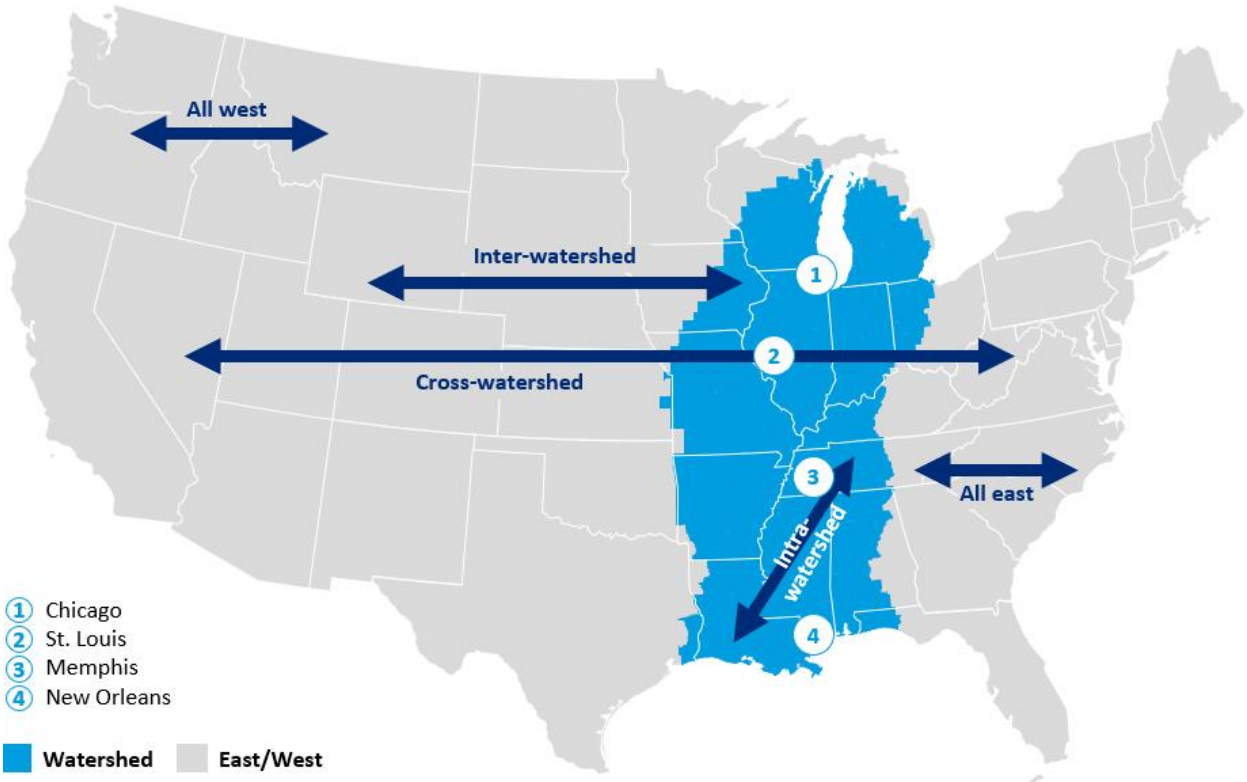
[30] "Competitive" defined as county-county lanes where truck and rail both offer service. See Appendix B.5.1 for what is included in this traffic.

Exhibit 4-6: Pre-merger vs. post-merger rail characteristics for a Nueces County, TX-Morgan County, AL chemicals lane[31]

	Pre-merger	Post-merger
Miles	1,064	976
Interchanges	1	0
Transit hours	180	146
Revenue per ton-mile	$0.069	$0.057
Rail market share	0%	79%

Exhibit 4-7 shows some of the largest lanes comprising the new group of similar lanes to which this lane would now belong. This group's rail market share is 79%, calculated from a weighted average of 3,859 lanes by total rail plus truck market. Complete details on the lookalike methodology can be found in Appendix B.5.2.C.

Exhibit 4-7: Top 10 lanes by total market size that make up the archetype to which the Nueces County, TX to Morgan County, AL chemicals lane would belong post-merger[32]



Origin county/region	Destination county/region	STCC2	Single-line or interline	Rail market Share	Total market (tons)
Sweetwater County, WY	Cowlitz County, WA	28	S	100%	715,506
Brazoria County, TX	Cook County, IL	28	S	84%	219,148
Quebec, Canada	Ramsey County, MN	28	S	100%	120,742
Calcasieu Parish, LA	Cook County, IL	28	S	72%	115,977
Platte County, NE	Harris County, TX	28	S	97%	109,336
Cook County, IL	Harris County, TX	28	S	98%	102,964
Cook County, IL	Charleston County, SC	28	S	99%	89,373
Yazoo County, MS	Ontario, Canada	28	S	98%	83,284
Madison County, IL	New Castle County, DE	28	S	99%	63,125
Madison County, IL	Duval County, FL	28	S	99%	60,543
All other				Average: 5%	1,717,215

[31] See workpaper "t2merch_lookalike_market_share_vF.xlsx." Transit hours methodology available in Appendix B.8. Revenue per ton-mile methodology available in Appendix B.6.
[32] See workpaper "t2merch_lookalike_market_share_vF.xlsx."

4.2.2. Carload Rail Merchandise/Bulk vs. Truck Performance in the Watershed Region

Much of the Class I interline traffic in the US involves traffic within or crossing the watershed region, the traditional dividing line between eastern and western US railroads (Exhibit 4-8). In 2023, the top five rail junctions by traffic volume were all key gateways in the watershed region: Chicago, IL; Meridian, MS; St. Louis, MO; Shreveport, LA; and Memphis, TN.[33]

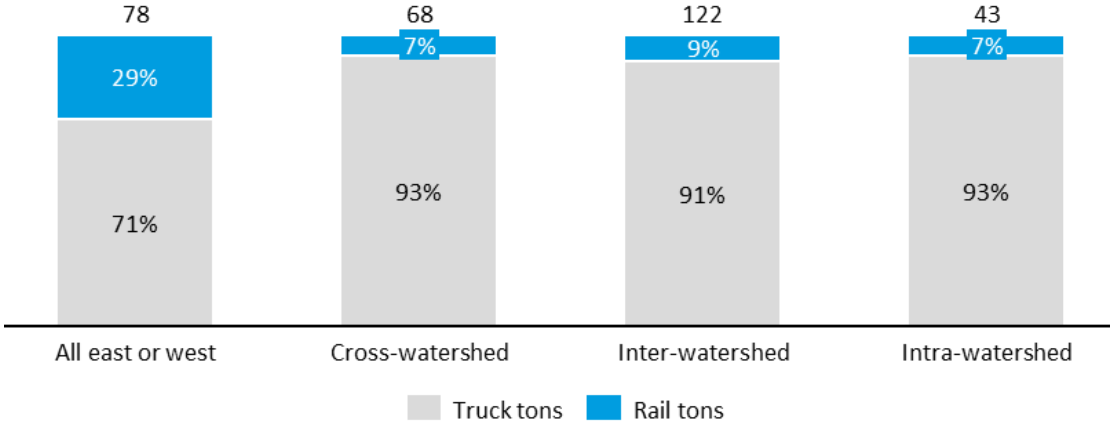


Exhibit 4-8: Watershed region and lane type definitions[34]

Rail historically underperforms against trucks for traffic within the watershed region or crossing the watershed, especially for carload merchandise/bulk traffic, as shown in Exhibit 4-9.

[33] See workpaper "Top_ClassI_rail_junctions_by_traffic_VF." Traffic data includes all Class I records from the CCWS where the junction frequency = 1 and rebill = 0 (rebilled records excluded since true origin/destination railroad unknown).
[34] The "watershed region" is defined as any county within 250 miles of four gateway cities: Chicago, St. Louis, Memphis, and New Orleans. See Appendix B.5.3 for more details on the watershed region definition.

Exhibit 4-9: Rail modal share for lanes with interline service, by lane type[35]
Millions of tons; percentage of rail vs. truck

As discussed in Section 3.1, freight movement involving a single railroad can compete against trucks more effectively for traffic than can a movement requiring two or more railroads (see Exhibit 3-1). Rail will have a lower share when only interline movements are available versus truck due to the associated costs and delays of interchanges, which make rail less attractive to shippers than trucking. Within the same length-of-haul range, the revenue per ton-mile shippers must pay to railroads is higher when multiple railroads are involved in the movement versus single-line service (see Exhibit 3-5). At a 500-1,000 mile length-of-haul, for example, single-line general merchandise rail service has an average revenue/ton-mile of $0.061, compared to $0.077 for interline moves.

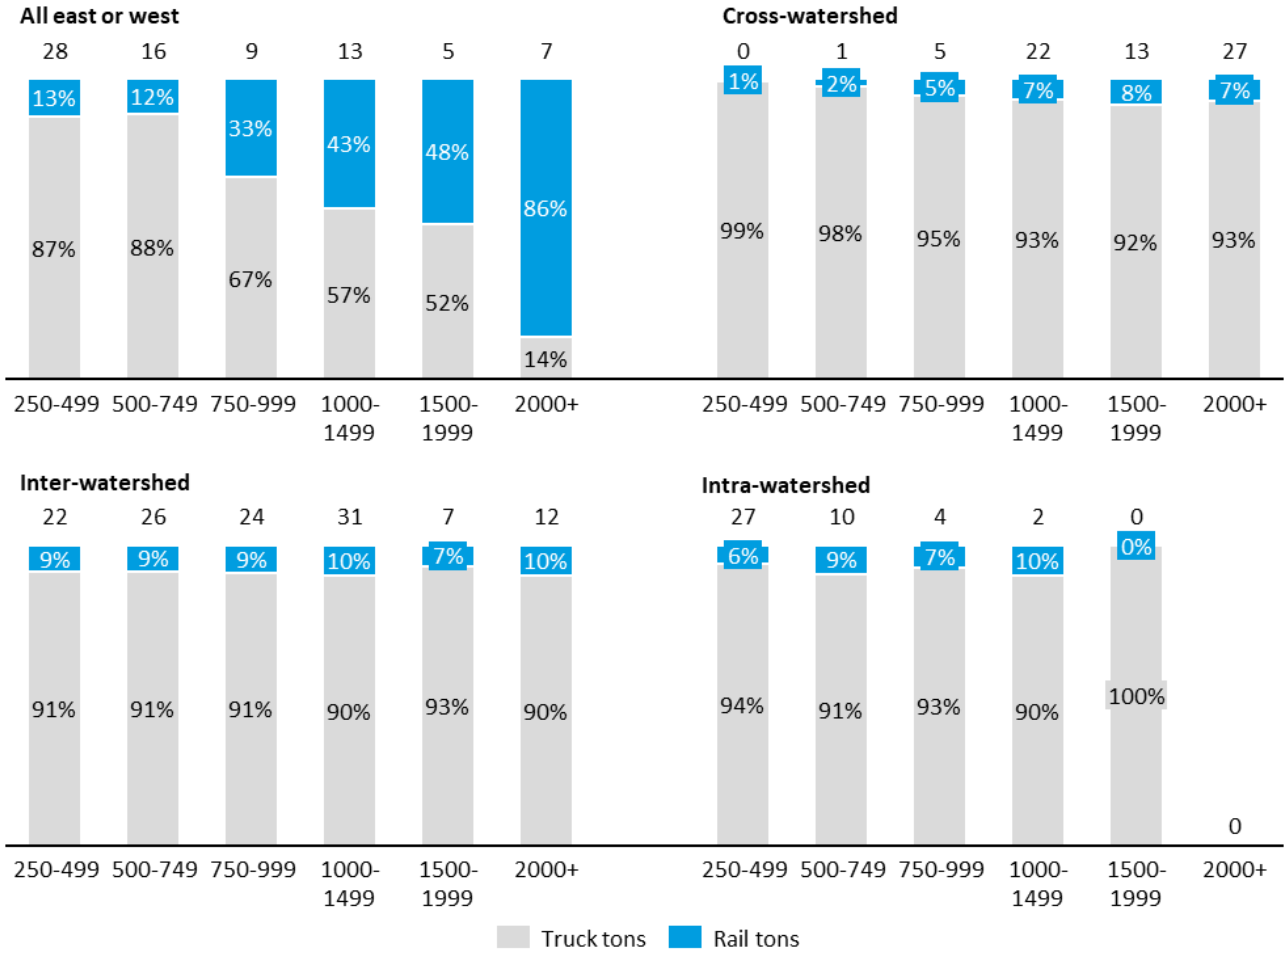
For traffic that only moves in the western or eastern US (as defined in Exhibit 4-8 as "All east or west"), Exhibit 4-10 shows that trucks have a 67% share of tons for merchandise/bulk commodities in the 750- to 999-mile length of haul distance band, while rail has a 33% share. For traffic that crosses the watershed, where no single-line rail service is available, trucks have a 95% share versus 5% for rail at the same length of haul – a share drop of 28 percentage points –

[35] See workpaper "t2merch_watershed_summary_vF.ipynb."

driven by the higher all-in cost to shippers of interline compared to single-line rail service. Inter-watershed and intra-watershed show a similar trend: interline rail underperforms at all lengths of haul in these watershed markets compared to lanes all east or west.

Exhibit 4-10: Rail modal share for lanes with interline service, by lane type and length of haul in miles[36]

Millions of tons; percentage rail vs. truck



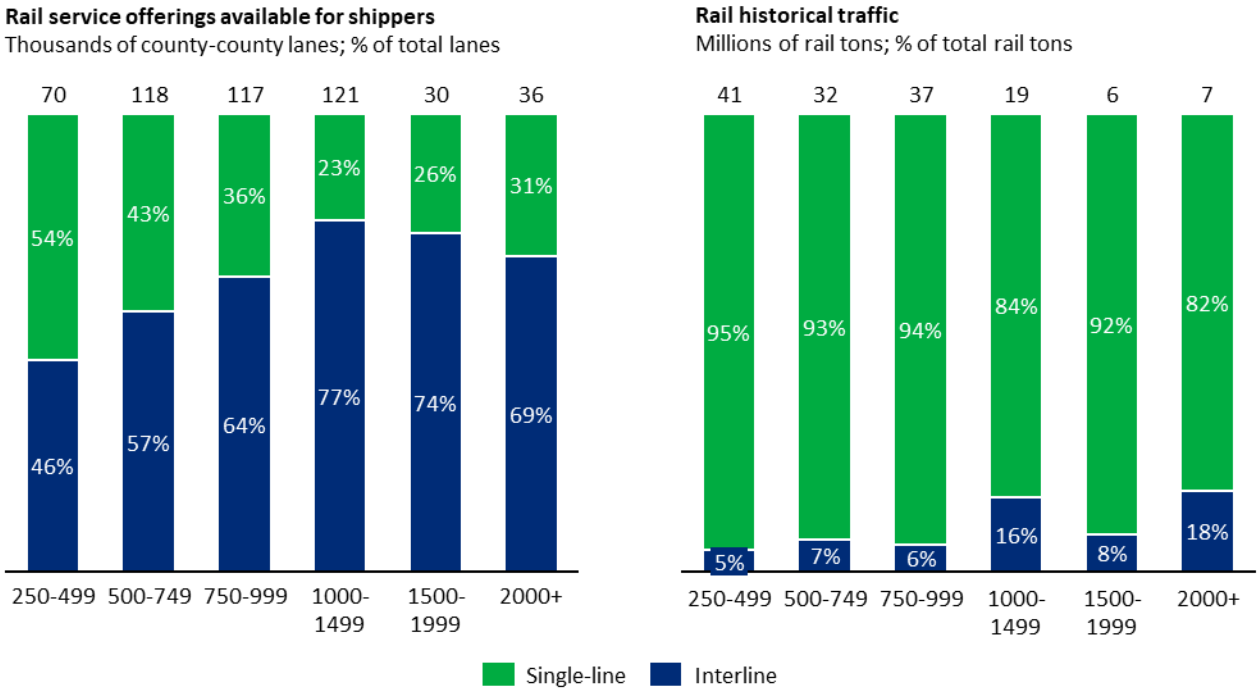


Exhibit 4-11 further demonstrates how single-line service outperforms interline service. In inter-watershed lanes, most of the available rail service currently is interline. Yet, the minority single-line lanes dominate the market in terms of share, accounting for more than 80% of rail

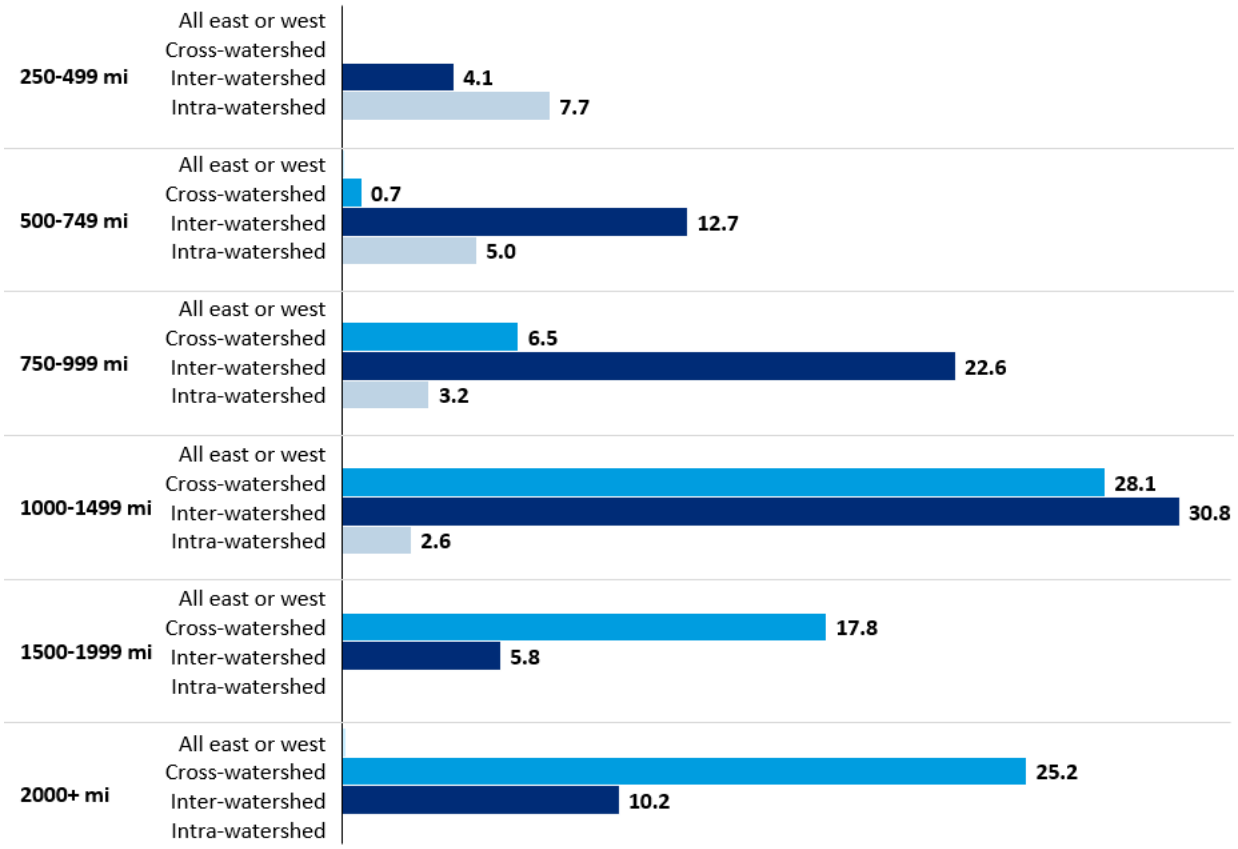
[36] See workpaper "t2merch_watershed_summary_vF.ipynb."

traffic in all length of haul bands. As a UP-NS merger introduces more single-line service, we would expect more traffic to divert to these new single-line lanes.

Exhibit 4-11: Inter-watershed lanes: current service offerings and historical traffic[37]



4.2.3. Estimated Traffic Diversions for Merchandise/Bulk to Conventional Rail Carload

We estimate that the UP-NS merger would divert approximately 797,000 merchandise and bulk truckloads from highways to conventional rail service, equivalent to about 183,000 rail carloads (Exhibit 4-12; see Appendix B.12 for conversion methodology). Most of these diversions are projected to occur in cross-watershed and inter-watershed lanes, reflecting improved single-line service between the western United States and the eastern portion of the watershed region.

[37] Ibid.

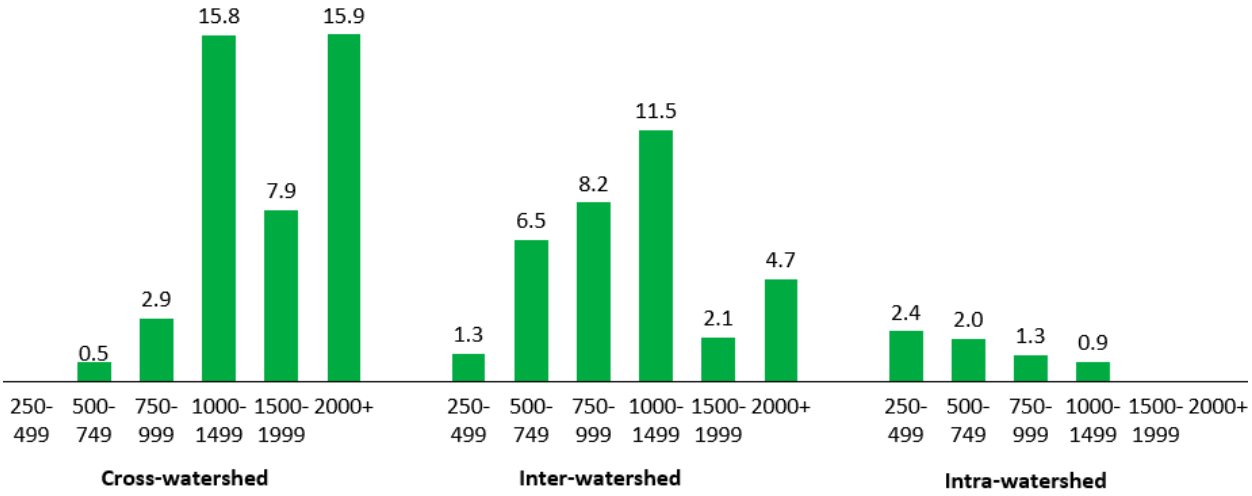


Exhibit 4-12: Estimated merchandise/bulk truck-to-rail carload diversions by lane type[38]
Thousands of rail carloads; total = 183,000 carloads

These diversions are driven by the merger's creation of single-line service in lanes solely served by interline rail movements today. As shown in Exhibit 4-13, we estimate that the merger would introduce 84,000 new single-line county-county lanes; 51% of these lanes would cross the watershed, while 41% would be inter-watershed lanes.

[38] Ibid.

Exhibit 4-13: New single-line lanes introduced by a UP-NS merger[39]
Thousands of county-county lanes; total = 84,000

The state-to-state lanes expected to generate the largest merchandise and bulk truck-to-rail diversions all cross the watershed, including Texas-Ohio, Texas-Pennsylvania, and Texas-Alabama. Texas, Louisiana, and Iowa are projected to be the leading origin states, with Texas and Louisiana primarily contributing chemicals, petroleum products, and food products; and Iowa, Arkansas, California, and Georgia contributing food products along with chemicals, nonmetallic ores, lumber, and petroleum.

Ohio, Pennsylvania, and Georgia are expected to be the principal destination states. The top ten destination states collectively account for 63% of projected truck-to-rail diversions. Chemicals, food products, and petroleum products represent the most frequently diverted commodities (Exhibit 4-14; see Appendix B.11 for detail).

The UP-NS Growth Plan incorporates new manifest train services to accommodate this traffic, including six new train pairs on legacy interline routes and 12 within the legacy networks. The six interline routes specifically support watershed traffic. Notably, a new North Little Rock,

[39] Ibid.

AR–Conway, PA train pair will enable efficient movement of Texas/Louisiana originations bypassing the major gateways over Sidney, IL to destinations in the Ohio Valley and Northeast, and empty returns. These services, developed by the railroads' service design teams, demonstrate how the UP-NS Growth Plan is designed to deliver the transit time improvements necessary to successfully convert freight from the highway.

Exhibit 4-14: Top 10 O/D pairs diverting truck-to-rail merchandise/bulk traffic[40]

Lane	Estimated diverted carloads	Top commodities diverted
TX-OH	5,000	• Chemicals or allied products • Petroleum or coal products • Food and kindred products
TX-PA	5,000	
TX-AL	4,000	• Chemicals or allied products • Petroleum or coal products • Lumber or wood products, excluding furniture

4.3. New Finished Vehicle Rail Carloads

4.3.1. Approach, Assumptions, and Market Definitions

This section outlines our approach for estimating the finished-vehicle traffic that could realistically divert from truck to rail as a result of the UP-NS merger. Using the 2023 S&P Global Transearch database as the baseline, we began with 47.7 million tons of finished vehicles (STCC 3711) moving by truck and systematically narrowed this universe to isolate lanes where diversion to rail is operationally feasible and commercially realistic. Through a series of quantitative screens and a subsequent qualitative review informed by UP and NS subject-matter experts, we identified 418,000 tons as potentially divertible under improved single-line service. Applying additional market- and facility-access criteria reduced this to 123,000 tons across 36 origin-destination lanes. The steps in this filtering process are detailed below.

To calculate the potentially divertible tonnage of 418,000 from the 47.7 million total finished vehicle tons in Transearch, the following records were eliminated from consideration based on discussions with UP and NS personnel with knowledge of finished vehicle markets:

- Lanes less than 250 miles in length, which are not likely addressable by rail;
- Lanes that due to geographic data limitations we were unable to accurately identify;
- Origin points with no automotive assembly plant or port;
- Cross-border traffic, since this mostly travels by rail already;
- Ports, since finished vehicles arriving at a port are not generally trucked long-haul across the watershed region;
- Traffic originating in counties with Class 6-8 truck, school bus, and RV OEM assembly plants, as these types of vehicles are not suitable for transport by rail; and
- Lanes without rail service or where a UP-NS merger would not improve service.

The 418,000 tons of potentially divertible truck traffic were then divided into lanes based on the county of origin to the BEA of destination. The origin represents the county containing an automotive plant and the destination represents the larger market where final delivery from a rail ramp to a dealership is done by truck. This produced a limited set of lanes, which we then manually reviewed to identify feasible potential diversions. Lanes were eliminated if they failed any of the following criteria:

- The destination BEA does not have a UP or NS auto ramp.
- UP or NS does not have access to the originating OEM assembly plant.
- The OEM is known to have long-term contracts with other carriers.
- The OEM sells premium automobiles that have a higher sensitivity to transit times and risk of damage, like Mercedes in Alabama and BMW in South Carolina, and thus this traffic is less likely to shift to rail.[41]

This left a total of 123,000 tons in 36 county-to-BEA lanes that we considered to be realistic potential truck-to-rail diversions of finished vehicle traffic.

4.3.2. Estimated Traffic Diversions for Finished Vehicles

The finished vehicle market has unique infrastructure considerations, a consolidated shipper landscape, and high final-mile costs to deliver to dealerships compared to intermodal and merchandise/bulk traffic. Given these unique characteristics, we concluded that an "all or nothing" approach for diversions was appropriate for two reasons. First, as shown in Exhibit 4-15, the average revenue rail receives from moving a finished vehicle is significantly less than what trucks receive, particularly at longer lengths of hauls. If railroads can provide improved service, as single-line UP-NS moves would, then the traffic is highly likely to shift from truck to

[41] As evidenced by rail's limited penetration for domestic finished vehicle deliveries, despite providing rail service from these plants to export ports.

rail. Second, since shippers in this industry often enter into long-term, exclusive contracts with carriers, we expect that any diversions to UP-NS based on improved service would be all-or-nothing. Therefore, we diverted all 123,000 tons of finished vehicle traffic identified in Section 4.3.1 as potential diversions.

Exhibit 4-15: Average transportation price per finished vehicle (VIN), truck vs. rail[42]

Length of haul (miles)	Truck[43]	Rail[44]
250-499	835	564
500-749	1,055	730
750-999	1,395	890
1000-1499	1,875	1,117
1500-1999	2,513	1,373
2000+	3,196	1,752

We translated these 123,000 tons of finished vehicle traffic into 5,000 new carloads for UP-NS (see Section B.4.2), and an equivalent 7,000 truckloads removed from the roadways. Originations in Michigan and Indiana would account for 86% of finished vehicle traffic diversions, with Alabama, Ohio, and Texas providing the other 14%. Arizona, California, and Texas would account for 80% of destinations. Michigan to Arizona and Michigan to California are the two highest volume lanes for diversions (Exhibit 4-16).

Exhibit 4-16: Top five lanes for truck-to-carload rail diversion of finished vehicle traffic[45]

Lane	Estimated diversions (carloads)
MI-AZ	1,037
MI-CA	843
IN-CA	504
MI-TX	456
AL-AZ	409

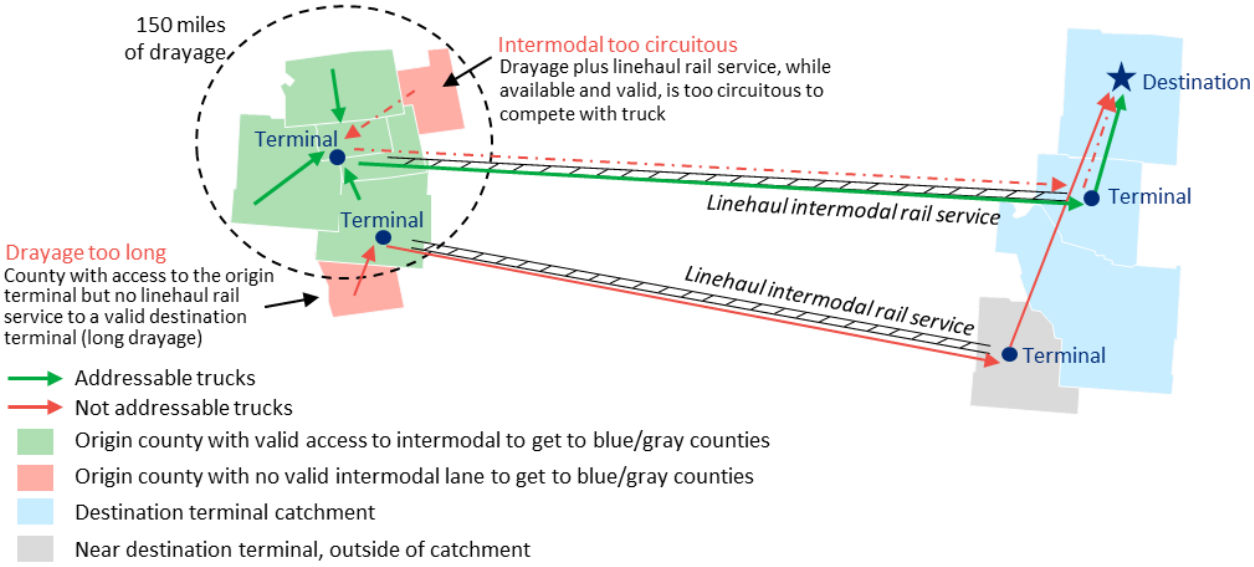
5. Truck-to-Intermodal Rail Traffic Diversions

5.1. Truck-to-Intermodal Rail Introduction

A UP-NS merger would remove an estimated 1.2 million truckload movements from the roads by converting truck traffic to intermodal rail traffic. This traffic is separate and distinct from the addressable market for truckload traffic converted to conventional railcar movements described in Section 4. All commodities were classified as likely to ship by carload or intermodal when converted to rail for these two separate analyses at the STCC4 level (see Appendix B.2). We do not consider specific commodities in this section but instead focus on the diversion of truckloads[46] to intermodal containers on a one-for-one basis.



5.2. Approach, Assumptions, and Market Definitions

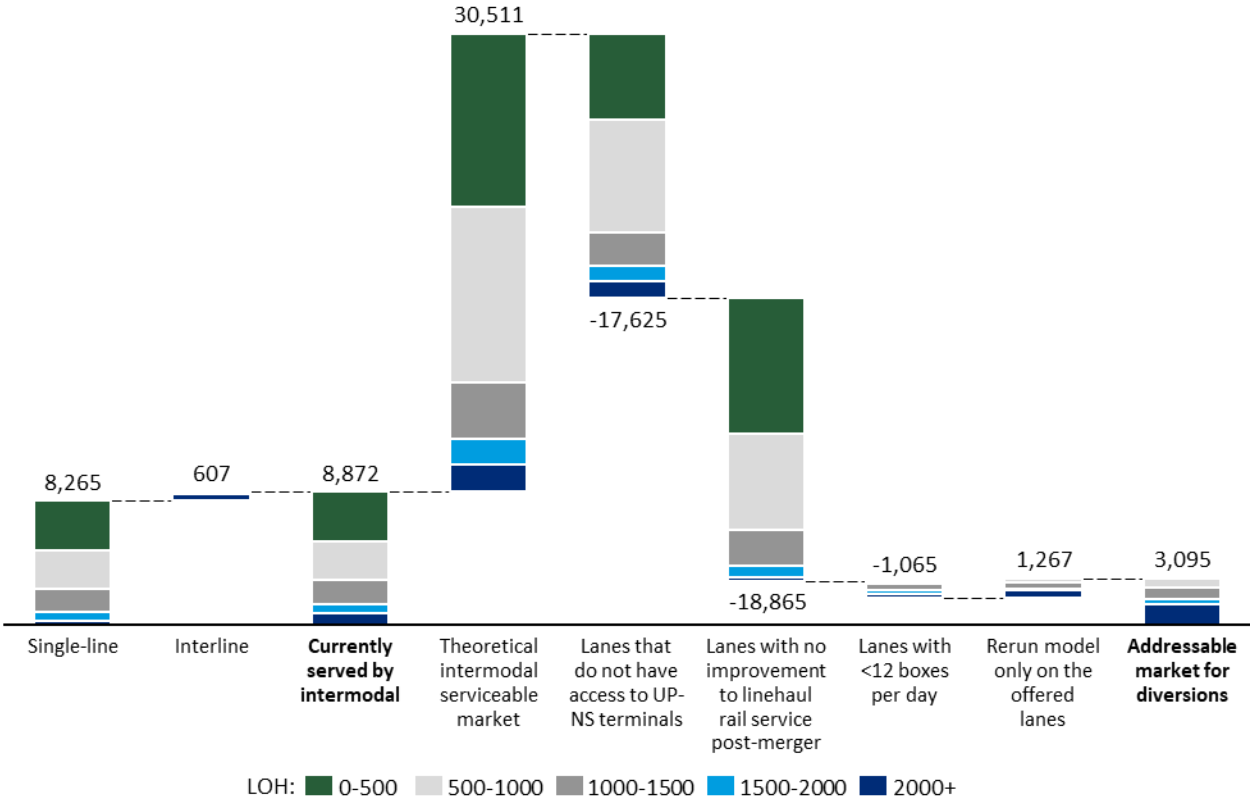
This section describes our approach to estimating the volume of truck traffic that could divert to domestic intermodal rail service under a UP-NS merger. Using Transearch county-to-county trucking data in combination with CCWS domestic intermodal movements, we applied a terminal catchment area model to identify the portion of the broader truck market that is realistically serviceable by intermodal rail. This model incorporates drayage economics, availability of linehaul rail service and railroad terminals, and minimum service-density thresholds to distinguish theoretical opportunities from ones in lanes where a viable rail offering could be provided. We then applied a lane-level lookalike methodology to assess modal shift potential based on observed shipper behavior in comparable markets, followed by operational feasibility tests with the railroads to ensure that any identified diversions could be competitively served by the combined network. The details of this methodology and resulting estimate of the addressable and serviceable intermodal market are presented below.

[46] Reported in Transearch, op. cit.

We began by combining Transearch county-to-county trucking data with CCWS domestic intermodal data[47] and used the terminal catchment area model (see Exhibit 5-1 and Appendix B.3.3.A) to develop a realistic sizing of serviceable trucks, a subset of the addressable market, that could be diverted from truck-to-rail intermodal traffic by lane.

Exhibit 5-1: Illustrative: creation of intermodal lanes

Once drayage economics and operational feasibility considerations were applied (see Section 5.3), we estimated that the addressable market for diversions to rail intermodal as a result of the merger would be 3,095,000 truckloads (Exhibit 5-2). This includes 310,000 truckloads moving transborder between Mexico and the eastern United States (see Exhibit B-5).



The methodology we used first identified all trucks in county-to-county lanes that, incorporating business rules on drayage economics, compete with existing single-line and interline domestic rail intermodal lanes (8,872,000 truckloads) where linehaul intermodal rail service is available (terminal to terminal) based on the 2023 CCWS (Exhibit 5-2).

[47] Transearch, op. cit., Confidential Carload Waybill Sample op. cit.

As shown in Exhibit 5-2, in addition, 30,511,000 truckloads move in lanes that theoretically could be serviceable by intermodal if every intermodal rail terminal had linehaul rail service to every other intermodal rail terminal (referred to as "everywhere to everywhere"). Some of this traffic (17,625,000 truckloads) however, is in lanes where UP and NS do not have terminals available at both origin and destination. An additional 18,865,000 truckloads are in lanes that would see no improvement to linehaul rail service post-merger. And a further 1,065,000 truckloads are in lanes with insufficient volume to ensure operation of daily intermodal service when the diversion modal share estimate is applied. For modeling purposes, the threshold was set at 12 boxes per day (two railcars per day).

The terminal catchment area model was then rerun with this new set of valid lanes: existing lanes and new lanes where the merger could improve linehaul rail service, UP or NS have terminals at origin and destination, and the minimum volume density threshold is met. This added back 1,267,000 truckloads to the addressable market for diversion that preferred theoretical lanes in the everywhere to everywhere model that will not be available post-merger (i.e., from the 17,625,000 trucks in lanes that do not have access to UP-NS terminals and the 1,065,000 trucks in low-volume lanes based on the everywhere-to-everywhere model).

Exhibit 5-2: All addressable truckloads for truck-to-intermodal rail diversion[48]
Thousands of units

We employed a lookalike methodology at the lane level to size the potential intermodal traffic gains that could result from the merger. This relied on the following overarching assumptions:

- Given similar trade-offs between truck and rail freight products (transit time, price, and service differentials), shippers will make their mode choice consistently across the United States.
- New UP-NS terminal-to-terminal single-line service options would result in new truck-competitive intermodal linehaul products with characteristics comparable to existing single-line service lanes offered by Class I railroads.

[48] See workpaper "intermodal_diversions_model_vF.xlsx."

- There will be a meaningful improvement in the existing interline intermodal lanes offered today, and these lanes will behave like the existing single-line service lanes offered by Class I railroads.
- Decisions are made at the margin on a lane-by-lane basis, meaning shippers do not make all-or-nothing buying decisions between truck and rail.
- All domestic intermodal traffic is treated as a "gray box," meaning that the analysis did not consider any differences based on the choice of railroad or channel partner.

Intermodal lanes were grouped into groups with similar characteristics ("archetypes"), including length-of-haul, interline or single-line service, transit time versus truck, and price versus truck. The first two characteristics are rail-centric and capture how intermodal typically takes higher share in longer haul lanes and to show the difference between interline and single-line lanes in the current state. The second two capture key decision factors for shippers; that is, when intermodal can offer transit times of truck plus one day and offer a 10% lower price than truck, a shipper is likely to consider intermodal as a competitive substitute for truck. Archetypes are described in detail in Appendix B.3.4.B.

The lookalike analysis was applied to all lanes that post-merger would see an improvement in the impedance of the best available linehaul terminal to terminal rail route. Rail route impedance is defined in the same way as in the rail-to-rail analysis, where impedance is the sum of rail miles and junction impedance and is a proxy for the quality of rail service in a lane. Post-merger improvement could shift existing lanes from one archetype to another. Unlike merchandise traffic, however, there are many terminal-to-terminal intermodal lanes that do not have linehaul rail service today. If these unserved lanes showed reduced impedance post-merger

(i.e., service could improve) in the model, then the model tested to see if sufficient trucks would divert to meet the minimum volume threshold.

After the lookalike analysis estimated the modal shift potential, operational considerations were applied (see Section 5.3). For a railroad to offer linehaul rail service, minimum density and feasible train service must be available, in addition to a UP or NS terminal being available at the origin and destination.

With these criteria, the list of existing and feasible lanes was then used to size the serviceable market a second time and apply the lookalike analysis to develop the final estimate of truck traffic volume that could potentially divert to rail intermodal as a result of the merger.

5.3. Operational Considerations

To shift from truck to rail intermodal, a key requirement would be for linehaul rail service to be on offer. A railroad requires sufficient traffic density and a feasible route to offer such service. This step in the analysis ensured that the final diverted traffic was realistically distributed into lanes with the scale necessary to operate linehaul rail service. This analysis was reviewed by both railroads' intermodal marketing and service design experts to reflect operational realities.

For potential modal shift growth to be captured, for rail-to-rail and truck-to-intermodal, the criteria in Exhibit 5-3 must be met.

Exhibit 5-3: Mode shift truck-to-intermodal rail diversion criteria

Criterion	Comments
Volume density: At least 12 units per day across all existing plus all diverted traffic (rail-to-rail, truck-to-intermodal, long-haul dray)	• Includes existing international volume on an origin terminal to destination terminal basis in the headhaul direction (i.e. higher loaded volume) on a lane • Applied on an O/D basis and does not allow for the potential to consolidate traffic and use switching, load centering, or rubber-tire connections to build density • Provided at least the headhaul[49] achieves the minimum density, the backhaul lane is also available to take diversions, as it is rare for a railroad to offer one-way only on a lane
Terminal availability: UP and/or NS must have a terminal in both the origin and destination intermodal markets	• Third-party terminals are generally excluded, with four exceptions: – Huntsville, AL (owned by the state of Alabama, served by NS) – Titusville (Orlando), FL (owned by NS, served by the FEC) – Miami/Fort Lauderdale, FL (owned and served by the FEC) – Council Bluffs, IA (owned and served by the IAIS) These terminals are all currently served by UP or NS as part of existing commercial agreements • Intermodal markets that only have terminals serving the international segment are generally not available for diversion growth – UP Phoenix, AZ that is currently used for international intermodal service from the Ports of Los Angeles and Long Beach was not considered for domestic intermodal, as the capacity footprint is small, and the Phoenix, AZ market can be accessed from Wilmot (Tucson), AZ – All on-dock and port controlled terminals were excluded – Exception: NS Charleston, SC was included as a feasible domestic intermodal market, even though today it only handles international freight, as it is owned and operated by NS • Idle NS terminals at McCalla, AL (Birmingham, AL intermodal market) and Greencastle, PA (Baltimore-Washington-Northern Virginia intermodal market) were made available for diversion traffic, as these can be reopened to add capacity and serve these markets • No new greenfield terminals on either railroad were considered
Terminal capacity: There must be sufficient terminal capacity or a reasonable expansion plan for growth lanes, and if not, then only the highest volume lanes divert until the terminal is full	• Traffic is capped at the current stretch capacity for the Twin Cities Intermodal Terminal (Minneapolis, MN) on UP because it cannot be expanded to capture all potential growth on the current footprint • In specific multi-terminal markets, lanes were rearranged between terminals or idle terminals reactivated to ensure all the growth could be handled • All other intermodal markets where volumes exceed capacity have the potential for terminal expansion, which was confirmed during meetings with UP and NS terminal capacity and operations experts
Train service: There must be a feasible routing plan using intermodal trains that is able to offer competitive transit times	• After review with the service design teams, all lanes from Texas to /from Huntsville, AL were removed because the intermodal train plan and mainline network only offer circuitous routes via Atlanta or Memphis, which would have uncompetitive transit times with truck

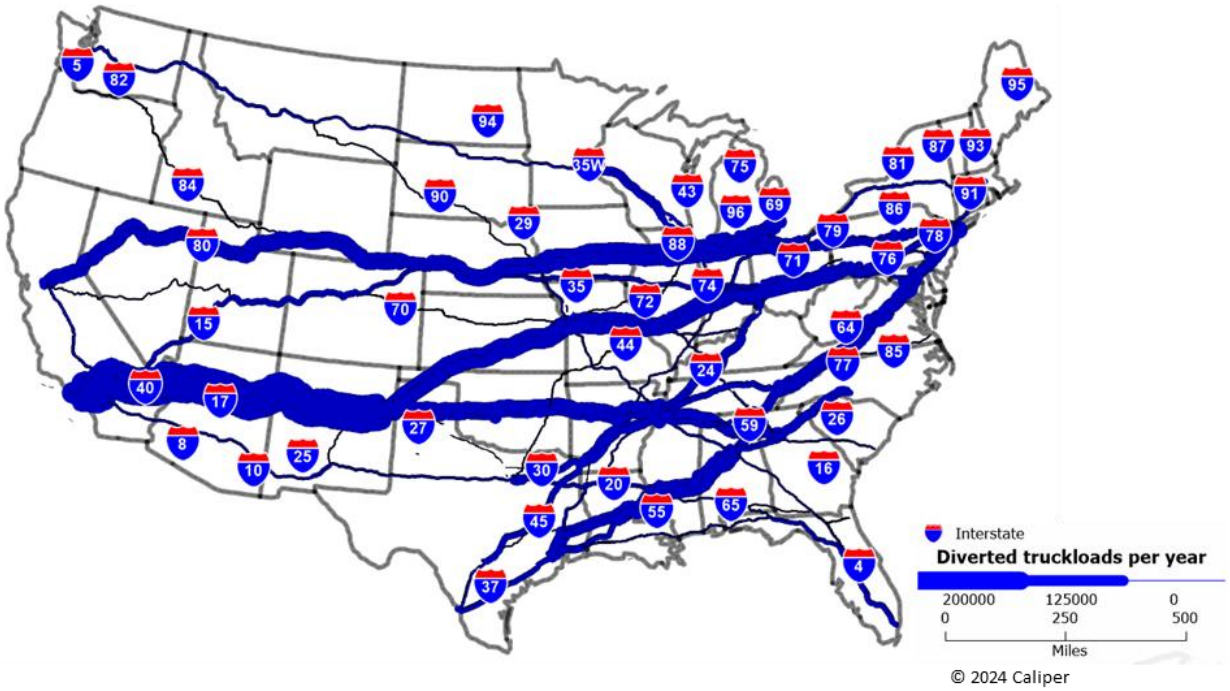
[49] "Headhaul" refers to the primary direction that loaded freight is moving. "Backhaul" is the return journey of empty or loaded containers.

Criterion	Comments
	• We considered but decided to retain new lanes from Twin Cities Intermodal Terminal (Minneapolis, MN) to eastern destinations – The shortest route goes via Wisconsin and Chicago, IL and the infrastructure currently only permits single-stack intermodal operation – Service Design developed a feasible routing with double-stack clearance that, while it adds some circuity, is still expected to achieve truck-competitive transit times for lower priority freight

These operational considerations were applied in two stages. After calculating the theoretical intermodal traffic at the everywhere-to-everywhere stage, where linehaul rail is set to be available between any two terminals, the lanes were down selected based on sufficient traffic density and the availability of UP-NS terminals at both origin and destination. Lanes which either had existing service or unserved lanes that met the criteria and gain improved linehaul rail service post-merger were carried forward to the next stage as future-state lanes.

After this screening stage, the drayage model was run a third time to assign intermodal addressable trucking to future-state lanes. Once the lookalike segmentation model was applied to serviceable trucking in those lanes, the operational criteria was applied again to confirm that there was sufficient volume from all traffic sources (existing, rail-to-rail, long-haul drayage extended hauls) and UP-NS terminal availability.

We then iterated with service designers to ensure that within a terminal catchment, there was sufficient terminal capacity to handle the diversion traffic. This required reorganizing some existing lane-terminal assignments. We do not believe any of these changes would impact the drayage economics for those lanes. This resulted in the elimination of some lanes from Twin Cities Intermodal Terminal (Minneapolis, MN), which cannot be easily expanded.



Finally, we worked with the service designers to ensure that the train service to operate the lane was feasible and truck-competitive. This resulted in the elimination of all lanes from Texas to Huntsville, AL.

5.4. Estimated Truck-to-Intermodal Rail Diversions

When the lookalike segmentation was applied to the addressable market for diversions, this projected that 1,166,000 of the total 3,095,000 identified intermodal-serviceable truckloads in lanes that see improved rail service are convertible to domestic intermodal units on the post-merger rail network, after all criteria were applied.

We identified a further 67,000 extended haul diversions from converting long-haul drayage moves over 250 miles to a longer rail transit across the watershed in two markets: Chicago, IL drayage to Detroit, MI and Toledo, OH; and Memphis, TN drayage to Huntsville, AL. These are discussed in Section 5.5.

Exhibit 5-4: Estimate of intermodal truckloads removed from roadways due to a UP-NS merger[50]

Some 56% of these unit-miles would move in long-haul lanes over 2,000 miles. For longer hauls, intermodal is closer to truck on transit times than other rail services, particularly once the

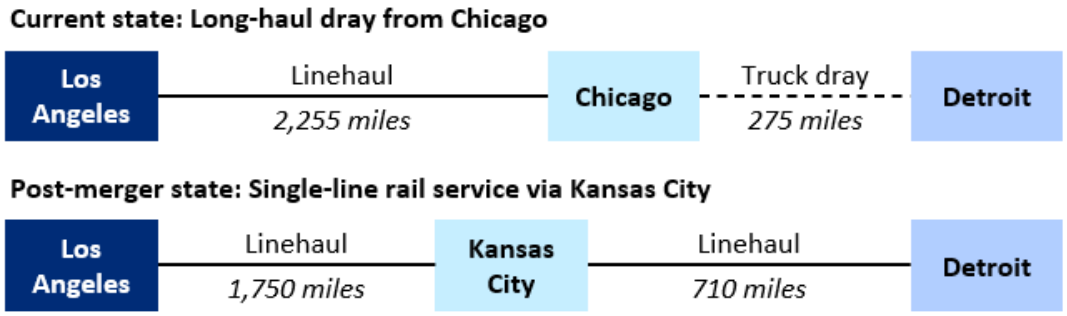
[50] Map created using TransCAD Transportation Planning Software and Oliver Wyman diversion analysis data; see workpaper "Trucks diverted from highway vF.xlsx."

interchange delay is removed due to single-line service. Thus, longer hauls have the potential to be a source of significant growth. The diversions have an average length of haul of 1,697 door-to-door miles, which compares well with J.B. Hunt, the largest private asset intermodal operator, which reported an average length of haul of 1,673 door-to-door miles in 2023 (Exhibit 5-5).[51]

Exhibit 5-5: Estimated truck-to-rail intermodal diversions by truck length of haul[52]

Truck mileage band	Truckloads (thousands)	Truck-miles (millions)	Average LOH (miles)
0-500	n/a	n/a	n/a
500-1000	156	118	757
1000-1500	260	319	1,224
1500-2000	273	480	1,756
2000-2500	353	801	2,271
2500+	124	330	2,658
Total	1,166	2,048	1,756

No assumption has been made to gross-up for empty miles. Industry-leading national trucking companies typically achieve 14% empty miles on their irregular route dry van operations.[53] The empty miles percentage is higher for drayage, as empty domestic containers must frequently be repositioned to a shipper for the next load by rail, leading to more drayage miles returning empty containers to the terminal. We would thus expect the national reduction in truck-miles to be higher than the numbers calculated for loads.[54]



5.5. Long-Haul Drayage Extended Haul

In addition, the addressable opportunity to convert truck traffic to rail intermodal includes extending the haulage of existing intermodal services, where a long-haul dray over 250 miles is currently required (Exhibit 5-6). There are two geographic markets where this is relevant:

[51] 2023 J.B. Hunt annual report; see reference source "JB_Hunt_2023_annual_report_VF.pdf."
[52] See workpaper "intermodal_diversions_model_vF.xlsx."
[53] 2023 Knight Swift annual report (14.3% empty miles) and Werner annual report (14.4%) for irregular route, for-hire trucking; see reference sources "Knight_Swift_2023_annual_report_VF.pdf" and "Werner_2023_annual_report_VF.pdf."
[54] See workpaper "Trucks diverted from highway vF.xlsx."

drayage from Chicago, IL to Detroit, MI and the northern Ohio region; and drayage from Memphis, TN to Huntsville, AL and northern Alabama.[55] Total addressable intermodal units, based on drayage moves from Transearch, is sized at 134,000 (both directions).[56]

Exhibit 5-6: Long-haul drayage extended haul diversion opportunity[57]
Example intermodal lane: Los Angeles to Detroit

We assumed that the linehaul intermodal leg of this long-haul drayage traffic is currently split 50:50 between the two western Class I railroads. This traffic was validated with UP subject matter experts, who have detailed data on the true origin/destination ZIP codes for a sizeable percentage of their intermodal traffic. The diversions are sized at 67,000 extended hauls substituting for a merged UP-NS.

We used UP internal traffic data to assign a true origin/destination in the Western United States to the 67,000 extended haul diversions. This review concluded that given the lanes in question and that shippers already use intermodal in these lanes, the post-merger addition of single-line service linking terminals closer to the freight could result in 100% of this traffic switching to an extended haul. Shippers would benefit from reducing drayage miles and, as a result, their door-to-door cost per shipment. This analysis is further detailed in Appendix B.3.3E.

[55] Chicago, IL to Detroit, MI drayage distance is approximately 284 miles according to Google Maps; Memphis, TN to Huntsville, AL drayage distance is approximately 216 miles according to Google Maps.
[56] See workpaper "intermodal_diversions_model_vF.xlsx."
[57] Mileages from workpaper "T2R_R2R_Intermodal_Diversions_vF.csv."

6. Rail-to-Rail Traffic Diversions

6.1. Rail-to-Rail Introduction

A UP-NS merger would create new, more efficient routes for rail shippers, particularly those that ship between the eastern and western United States, and that previously did not have access to a single-line carrier. Using 2023 historic traffic flows as a foundation for this analysis, since this is the most up-to-date sample of waybills the Board can provide, we estimate that a merged UP-NS would divert approximately 237,000 carloads and 204,000 containers annually of existing business that currently moves on other railroads. Extended hauls – that is, traffic currently handled by UP or NS with another carrier in interline service – are estimated to account for 66% of total rail diversions. New traffic accounts for 34% of estimated rail diversions.

Exhibit 6-1: Estimated rail-to-rail diversion to UP-NS[58]

Service type[59]	Extended haul	New traffic	Total cars/units
General merchandise	107,000	56,000	162,000
Intermodal	131,000	73,000	204,000
Bulk	17,000	12,000	28,000
Automotive	34,000	13,000	47,000
Total	**288,000**	**153,000**	**442,000**

Most of the estimated new traffic on UP-NS would be diverted from CSXT and BNSF. For CSXT, the estimated 249,000 carloads/units diverted represent 4.1% of the 6.1 million units handled by CSXT in 2023.[60] The estimated 246,000 units diverted from BNSF represent 2.7% of the 9.0 million units handled by BNSF in 2023.[61] Estimated diversions of carloads and intermodal units from the Class I carriers are shown in Exhibit 6-2.

[58] See workpapers "R2R_Diversions_Haul_Carrier.xlsx."
[59] Service type uses the Board definition found in the STB 2023 Confidential Carload Waybill Sample Reference Guide, March 5, 2025, Railinc, p. 63.
[60] Analysis of Class I Railroads 2023, Association of American Railroads, Line 713.
[61] Ibid.

Exhibit 6-2: Estimated Class I carriers with the largest loss in cars/units handled, where loss exceeds 1,000 cars/containers annually[62]

Carrier	General merchandise	Intermodal	Bulk	Automotive	Net change
CSXT	-92,000	-127,000	-2,000	-28,000	-249,000
BNSF	-69,000	-138,000	-21,000	-18,000	-246,000
CN	-18,000	-	-9,000	-6,000	-32,000
KCS	-10,000	-7,000	-	-2,000	-19,000
CPRS	-7,000	-4,000	-1,000	-	-11,000
KCSM	-1,000	-	-	-1,000	-2,000

No other railroad is expected to gain traffic exceeding five cars per day as a result of diversion. Diversions do not rely on other railroads to make changes to their service or capacity.

Section 6.2 provides a high-level overview of the traffic diversion modeling approach and the modeling assumptions. Further details of the rail-to-rail diversion model are provided in Appendix A. **Section 6.3** breaks out the estimated rail-to-rail diversion results in more detail for each of the four service types.

6.2. Approach and Assumptions

6.2.1. High-Level Description of Rail-to-Rail Modeling Approach

We utilized a traffic diversion model known as a "discrete choice model."[63] The model estimates the probability that a shipper selects a rail route (either a single railroad or combination of railroads) based on the characteristics of that route relative to all other competitive routes in the market. When rail industry changes occur, such as with a merger, the route characteristics of available routes in some markets will change, thus changing the probability of a shipper selecting a particular route. This change in probabilities is converted into an expected traffic diversion. If

[62] See workpaper "R2R_Diversions_Haul_Carrier.xlsx." Note that for railroads in the same "family" (e.g., CPRS, KCS, and KCSM) the railroads are listed as they appeared in the 2023 traffic data. The total estimated diversion from CPKC, for example, will be less than the sum of CPRS, KCS, and KCSM due to double and triple counting of cars handled.
[63] Discrete Choice Analysis: Theory and Application to Travel Demand, Moshe Ben-Akiva and Steven R. Lerman, MIT Press, 1985, Sections 5.1 "Theory of Multinomial Choice" and 5.2 "The Multinomial Choice Model."

there are no changes to the characteristics of any route in a market, then no diversions will occur in that market.

The following definitions are used for this diversion analysis:

- **Market**: a market is defined for purposes of this analysis as an origin, destination, and service type, where the four Board service types are used (general merchandise, intermodal, bulk, and automotive).
- **Characteristics**: refers to changes in the railroad network. For this modeling effort, the characteristics were the route costs (measured as impedance) and the number of non-corporate family railroads involved in the move (measured as junction frequency).
- **Impedance**: rail miles plus a miles-equivalent for the impact of each interline junction (interchange) on a route. The miles-equivalent for a junction is set based on the quantity of traffic that passes through the junction, varying between 90 miles (for intermodal run-through lanes) and 650 miles (for low-volume interchanges). This reflects the additional time and complexity cost for an interline handling (see Appendix A.6.4).
- **Junction frequency**: the number of interchanges between railroads that a railcar must undergo to get from its origin to its destination. In effect, this measure reflects the opportunity to use more efficient physical routings due to the merger and the elimination of interchange complexity between the merging railroads.

This specific form of discrete choice model is known as a "multinomial logit model" and is a common method for modeling transportation mode choice.[64] A detailed explanation of the rail-to-rail traffic diversion model is provided in Appendix A. The use of impedance and junction

[64] Ibid.

frequency to identify the routes most often selected by shippers is consistent with what is seen in the traffic data, as was shown in Exhibit 3-7.

6.2.2. Model Assumptions

Traffic diversion outputs are an estimate of how 2023 traffic would likely have moved over the rail network had UP and NS operated as a single railroad. Traffic diversion estimates are not constrained by line, yard, equipment, or other potential capacity constraints. Capacity is separately addressed in the UP-NS Operating Plan.[65] Key assumptions for the rail-to-rail traffic diversion model are shown in Exhibit 6-3.

Exhibit 6-3: Key rail-to-rail traffic diversion model assumptions
See Appendix A for additional detail

Assumption	Description
Base year for traffic	• The base year for traffic is 2023, with no forecast of future years, since this is the most current sample of waybills available • 2023 CCWS used to calibrate the model, to prevent any potential biasing of the model to railroads where 100% traffic was available • 2023 combined traffic file used to run the model. This includes full traffic records for UP, NS, BNSF, and CN, with the CCWS providing remaining traffic[66]
Recent industry changes not fully reflected in 2023 data	• The base 2023 traffic does not include or fully reflect recent industry changes from mergers/acquisitions involving CP-KCS, CSXT-Pan Am,[67] and CN-Iowa Northern, and other network changes such as BNSF-Montana Rail Link • No effort was made to estimate the impact of these mergers/acquisitions independently on changes to the base 2023 traffic • These railroad mergers/acquisitions were, however, allowed to compete for traffic as single-line railroads in the post-merger scenario
Modeling by service type	• Four versions of the traffic diversion model were used to estimate diversions. The four versions subset the traffic into the four Board-defined service types of general merchandise, intermodal, bulk, and automotive

[65] STB Finance Docket No. 3687, Union Pacific Corporation et. al. – Control – Norfolk Southern Corporation et. al., Operating Plan Verified Statement.
[66] A description of how the 2023 traffic base of record was created is provided in Appendix A.2.
[67] Although Springfield Terminal Railways (SCAC = ST) became part of CSXT in its 2022 acquisition of Pan Am Railways, traffic records in 2023 continued to use ST.

Assumption	Description
Market definition and parameters	• Markets were defined as origin, destination, and service type • Traffic origins and destinations remain fixed; source competition was not modeled • Only revenue movements were diverted
Competitive rail traffic definition based on BEA/SPLC	• Intermodal traffic was defined as competitive at a BEA level, with a small number of adjustments recommended by UP and NS to more accurately reflect real-world competition.[68] Thus, if a railroad can offer competitive service in both the origin and destination BEA (either single-line or via interchange), then that railroad can compete for the traffic • Automotive traffic was defined as competitive on an origin SPLC to destination BEA level • All other traffic was defined as competitive at an SPLC level, based on the definitions in the Switching Carrier/Reciprocal Switching ("SCRS") data,[69] which shows if a railroad can access or has reciprocal switching rights at a station – If a freight station in a SPLC was classified as "closed" in SCRS, then traffic at that station was treated as sole served by the serving carrier – Stations classified as "open" or "mixed" in SCRS were considered competitive by the serving railroad and all railroads listed by SCRS with access – This was applied to general merchandise and bulk at both the origin and destination, and automotive at the origin only
Competitive rail traffic based on historical service	• Any railroad or combination of railroads historically moving traffic between an origin and destination for a service type were defined as competitive routes in that market • Additionally, railroads (or combinations of railroads) able to provide service between the origin and destination but historically having zero volume were added. These rail routes were determined to be competitive if: – They are not part of an interline move with a carrier able to directly service the customer in the market – The route does not have an impedance that is more than twice the minimum impedance (i.e., lowest impedance route) in the market
Impedance	• Total impedance is the final "cost" of a route – calculated from the physical route distance (rail miles) and the assigned cost of the interchange(s) in mile-equivalents • All inter-railroad interchanges are assigned a cost (impedance) reflecting the delay and costs of interchanges • Interchange impedances were set to 350, 450, 550, or 650 miles. Historically high-volume interchanges receive an impedance of 350, while historically low-volume interchanges receive an impedance of 650. An impedance of 350 can be thought of as a 350-mile "cost" • Intermodal trains that operate run-through haulage service were given an impedance of 90 miles, reflecting an approximate three-hour delay for a crew change and the 2023 average reported intermodal train velocity in 49 CFR 1250.[70] These include UP, CPKC, and NS for traffic on the Meridian Speedway, BNSF-CSXT for traffic to/from Northwest Ohio and Atlanta Fairburn terminals, and CN-INRD for traffic to/from Indianapolis (see Appendix A for full list)

[68] See Appendix D.1.
[69] The Serving Carrier Reciprocal Switching database is maintained by Railinc. SCRS contains all active railroad freight stations and lists the serving carrier and an indication of whether the station is open to other railroads or closed. If open, the railroads with access are listed. (See Appendix A.3).
[70] US Code of Federal Regulations, Title 49, Part 1250 Railroad Performance Data Reporting.

Assumption	Description
	• Railroads in the same corporate family have a zero-interchange impedance (e.g., the CPKC family of CPRS, KCS, and KCSM) • Post-merger, UP-NS was modeled as a single-line railroad, with no inter-railroad penalties at interchanges
Removed traffic	• Some potentially diverted traffic was removed based on discussions with UP and NS personnel. This traffic typically involved long-term contracts by the incumbent railroad or lack of access by UP-NS. (Removed traffic is detailed in Section 6.3)

6.3. Estimated Rail-to-Rail Traffic Diversions by Service Type

6.3.1. General Merchandise Traffic

We estimate that a merged UP-NS would attract 162,000 carloads of general merchandise traffic currently moving on other railroads, as shown in Exhibit 6-4. When calculating the impacts on other railroads, each diverted carload counts once for each railroad in the trip, so a BNSF-CSXT interline move would count as a gain of one carload of new traffic for UP-NS and a loss of one carload for each of BNSF and CSXT.

Exhibit 6-4: Estimated Class I rail-to-rail annual diversion of general merchandise traffic[71]

Carrier	Extended hauls	New traffic from third parties	Total carloads
UP-NS	**107,000**	**56,000**	**162,000**
CSXT	-53,000	-39,000	-92,000
BNSF	-27,000	-42,000	-69,000
CN	-7,000	-10,000	-18,000
KCS	-7,000	-3,000	-10,000
CPRS	-5,000	-2,000	-7,000
KCSM	-	-1,000	-1,000

An estimated 58% of traffic projected to be diverted from CSXT would involve an extended haul move on UP-NS. Most of this traffic historically moved over UP-CSXT but would likely shift to a single-line UP-NS route. The remaining 42% of projected diversions from CSXT

[71] See workpaper "R2R_Diversions_Haul_Carrier.xlsx." UP-NS gains are less than the losses on other railroads due to multiple counting. For example, a diversion from BNSF-CSXT to UP-NS counts as one carload lost by BNSF and one carload lost by CSXT, but only one carload gained by UP-NS.

involve traffic not historically handled by UP or NS, but this traffic moves in lanes where UP and/or NS have historically offered rail service. BNSF shows the opposite pattern, with the majority (61%) of projected diversions involving new traffic for UP or NS, as opposed to 39% involving extended hauls if moving from a NS-BNSF route to UP-NS.

The base 2023 traffic does not include industry changes since 2023; thus, CPKC is reported as three separate railroads (CPRS, KCS, and KCSM). We allowed railroads that had merged or otherwise become part of the same corporate family since 2023 to compete as a single railroad for traffic in the model but made no effort to estimate the impact of these mergers/acquisitions independently on changes to the base 2023 traffic. In Exhibit 6-4, we report CPKC as three separate railroads as reflected in the 2023 data. If the same shipment is handled more than once by CPKC corporate family members, adding the totals of the three carriers would cause some cars to be counted more than once.[72]

A breakout of rail-to-rail diversions by key commodity is provided in Exhibit 6-5. The largest category of diversions is chemicals, which accounts for 23% of the estimated rail-to-rail diversion of general merchandise traffic. Over half of chemical diversions are from extended haul moves, where UP or NS currently participates in the move with another carrier. Other top commodities diverted include food and kindred products (19%), hazardous materials (19%), and primary metal products (14%).

[72] For example, a movement from Calgary to Mexico City will show as three car handlings in the traffic data (CPRS to KCS to KCSM) and will count as three cars diverted from CPKC family members.

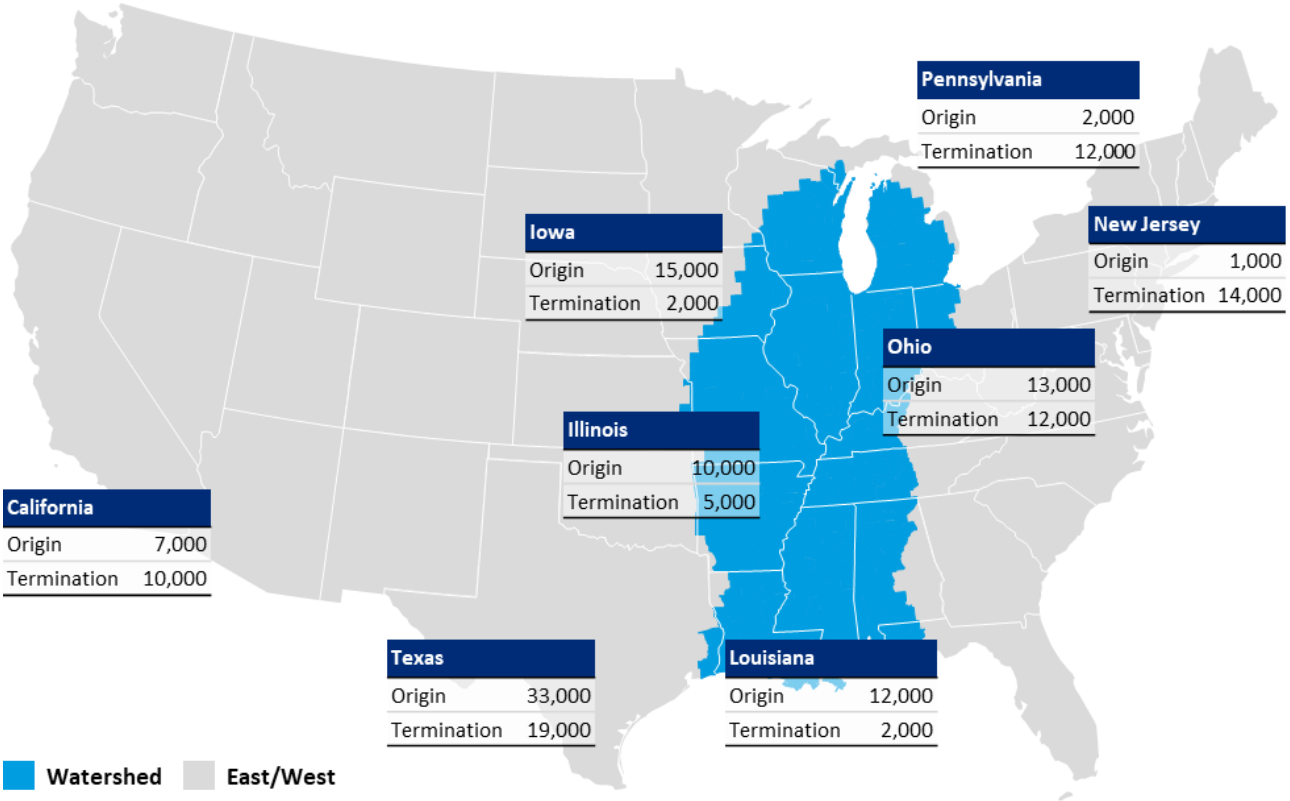


Exhibit 6-5: Estimated rail-to-rail diversion of general merchandise traffic by key commodity[73]

Commodity (STCC2)	Extended haul	New traffic in existing lanes	Total carloads
Chemicals or allied products (28)	26,000	12,000	38,000
Food and kindred products (20)	22,000	9,000	31,000
Hazardous materials (49)	21,000	10,000	31,000
Primary metal products (33)	13,000	10,000	23,000
Pulp, paper, or allied products (26)	6,000	4,000	10,000
Clay, concrete, glass, or stone products (32)	3,000	3,000	6,000
Transportation equipment (37)	2,000	3,000	5,000
Petroleum or coal products (29)	3,000	2,000	5,000
Lumber or wood products, excluding furniture (24)	3,000	1,000	4,000
Nonmetallic ores, minerals, excluding fuels (14)	3,000	-	3,000
Waste or scrap materials not identified by producing industry (40)	1,000	1,000	2,000
Farm products (01)	1,000	1,000	2,000
All other	0	0	1,000
Total	107,000	56,000	162,000

As shown in Exhibit 6-6, the states that would originate the most general merchandise diversions are Texas, Iowa, Ohio, Louisiana, and Illinois. These five states account for 51% of general merchandise diverted origins. The states with the most terminations of general merchandise diversions are Texas, New Jersey, Ohio, Pennsylvania, and California. The top five terminating states account for 41% of diversions.

[73] See workpapers "R2R_Diversions_Haul_Carrier.xlsx."

Exhibit 6-6: Top originating/terminating states for estimated rail-to-rail diversion of general merchandise traffic[74]

The top ten state-to-state lanes for estimated diversions of general merchandise traffic are led by Iowa to New Jersey, and then the Ohio-Texas corridor (Exhibit 6-7). There were no adjustments made to estimated traffic diversions for general merchandise traffic based on reviews with the railroads' commercial teams.

[74] See workpapers "All_Results_vF.xlsx" and "Top origin-termination states for R2R diversion of merch vF.sql."

Exhibit 6-7: Top state-to-state lanes and primary commodities for rail-to-rail diversion of general merchandise traffic[75]

Lane	Estimated carload diversions	Primary commodities
IA-NJ	5,000	• Hazardous materials • Chemicals or allied products • Food and kindred products
OH-TX	5,000	• Primary metal products • Hazardous materials • Transportation equipment
TX-OH	4,000	• Chemicals or allied products • Hazardous materials • Transportation equipment
AL-TX	3,000	• Primary metal products • Chemicals or allied products • Pulp, paper, or allied products
TX-IN	3,000	• Chemicals or allied products • Hazardous materials • Primary metal products
TX-GA	3,000	• Chemicals or allied products • Hazardous materials • Clay, concrete, glass, or stone products
TX-NJ	3,000	• Hazardous materials • Chemicals or allied products • Petroleum or coal products
TX-TN	3,000	• Hazardous materials • Chemicals or allied products • Food and kindred products
OH-CA	3,000	• Primary metal products • Food and kindred products • Hazardous materials
TX-SC	3,000	• Chemicals or allied products • Hazardous materials • Petroleum or coal products
Top 10 total	**35,000**	
All other total	**127,000**	
Grand total	**162,000**	

[75] See workpaper "All_Results_vF.xlsx" and "Top state to state lanes and primary commodities for R2R merch diversion vF.sql."

6.3.2. Intermodal Traffic

We estimate that a merged UP-NS would attract 204,000 intermodal containers currently moving on other railroads, as shown in Exhibit 6-8. When calculating the impacts on other railroads, each diverted container counts once for each railroad in the trip, so a BNSF-CSXT interline move would count as a gain of one unit of new traffic for UP-NS and a loss of one unit for each of BNSF and CSXT.

If a railroad submits revenue empties for private containers as loads, then the model will divert these empties. The model does not, at this stage, seek to balance any flows with empty repositioning. Empties are generated in the UP-NS Operating Plan.[76]

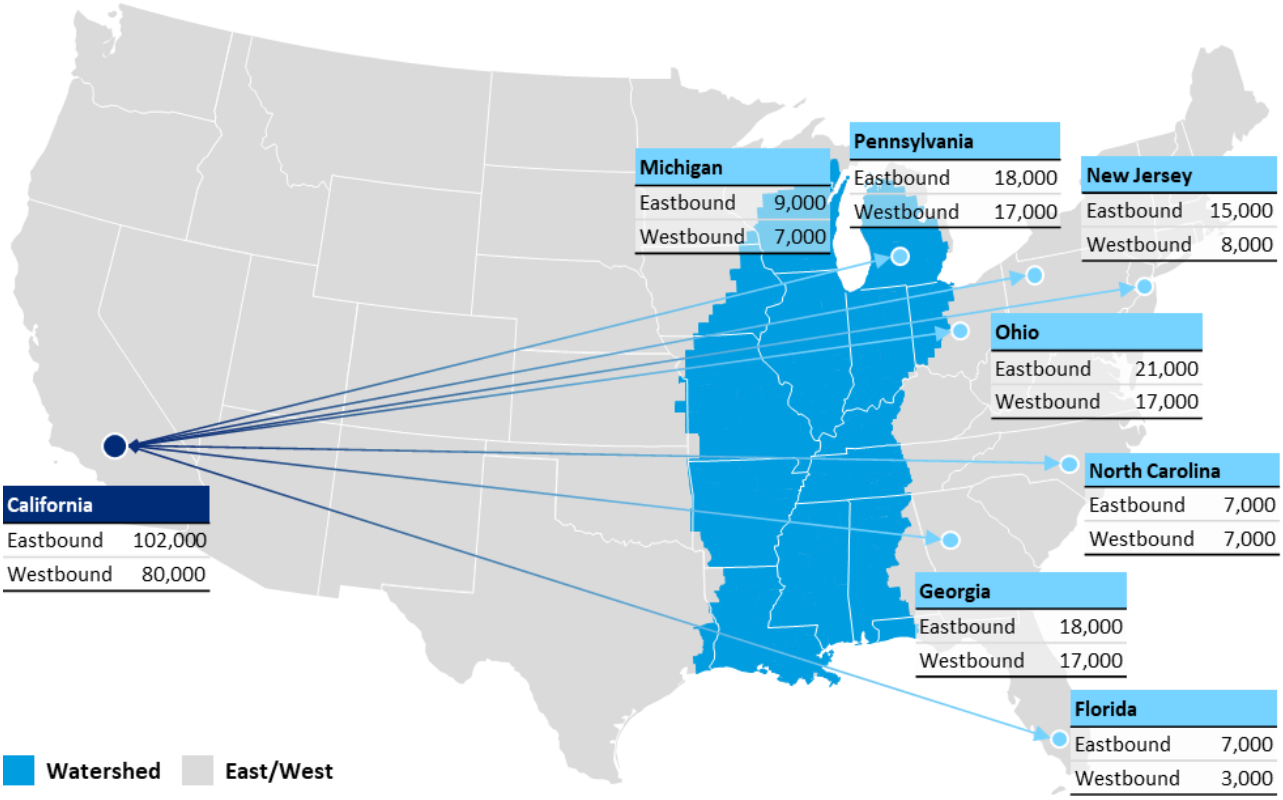

Exhibit 6-8: Estimated Class I rail-to-rail diversion of intermodal containers[77]

Carrier	Extended haul	New traffic	Total intermodal units
UP-NS	**131,000**	**73,000**	**204,000**
BNSF	-67,000	-71,000	-138,000
CSXT	-63,000	-64,000	-127,000
KCS	-1,000	-5,000	-7,000
CPRS	-	-4,000	-4,000

As can be seen in Exhibit 6-9, most of the traffic diversions would involve traffic between California and eastern states. These are lanes where single-line rail service is not currently available. The largest diversions would occur in cross-watershed lanes, including the intermodal trains added to serve Southern California-Northeast via Kansas City, and Southern California-Southeast via Meridian Speedway routes in the UP-NS Optimized Plan. These routes are further enhanced in the UP-NS Growth Plan, where additional new single-line service train pairs are added to serve this traffic.

[76] STB Finance Docket No. 3687, Operating Plan Verified Statement, op. cit.
[77] See workpapers "R2R_Diversions_Haul_Carrier.xlsx."

Exhibit 6-9: Traffic to/from California accounts for 89% of estimated rail-to-rail intermodal diversions[78]

Two adjustments were made to the estimated traffic diversions for intermodal containers. First, the estimate of 204,000 diverted containers does not include intermodal diversions between Dallas, TX and the Southeast. This lane was excluded because NS currently has an interline steel-wheel service in this market today over the Meridian Speedway, which will not be impacted by the merger. Second, the estimate of 204,000 diverted containers does not include lanes that do not exceed a minimum volume threshold. Unlike merchandise traffic, where a single carload can be shipped between any two stations, intermodal requires that the railroad(s) offer linehaul terminal-to-terminal service. We allowed diversions only in lanes (for a defined UP-NS terminal to UP-NS terminal), where the total of existing traffic (domestic and international), rail-to-rail diversions, truck-to-rail diversions, and conversion of long-haul

[78] See workpapers "All_Results_vF.xlsx" and "Top origin-termination states for R2R diversion of IM vF.sql." The California eastbound/westbound numbers are for all California traffic and not just the seven states listed.

drayage to an extended haul in a lane (origin terminal to destination terminal) would be of sufficient density for UP-NS to consider offering intermodal service in the future. This minimum threshold was set at 4,380 units per year, or 12 units per calendar day, which is two articulated 3-well intermodal stack cars per day. See further discussion in Appendix B.3.3.C.

6.3.3. Bulk Traffic

We estimate that a merged UP-NS would attract 28,000 carloads of bulk traffic currently moving on other railroads, as shown in Exhibit 6-10.

Exhibit 6-10: Estimated Class I rail-to-rail diversion of bulk traffic[79]

Carrier	Extended haul	New traffic	Total carloads
UP-NS	**17,000**	**12,000**	**28,000**
BNSF	-11,000	-10,000	-21,000
CN	-2,000	-7,000	-9,000
CSXT	-1,000	-1,000	-2,000

A majority of estimated bulk diversions (approximately 59%) would be from extended haul traffic; moves that either UP or NS already participate in pre-merger. The largest projected loss is for BNSF and stems from coal shipments from the Powder River Basin to Michigan and Georgia.

A breakout by commodity for rail-to-rail diversion of bulk traffic is provided in Exhibit 6-11. Coal originating in Wyoming is the primary diverted commodity, followed by grain originating in Illinois, Minnesota, Iowa, Kansas, and Nebraska.

[79] See workpaper "R2R_Diversions_Haul_Carrier.xlsx."

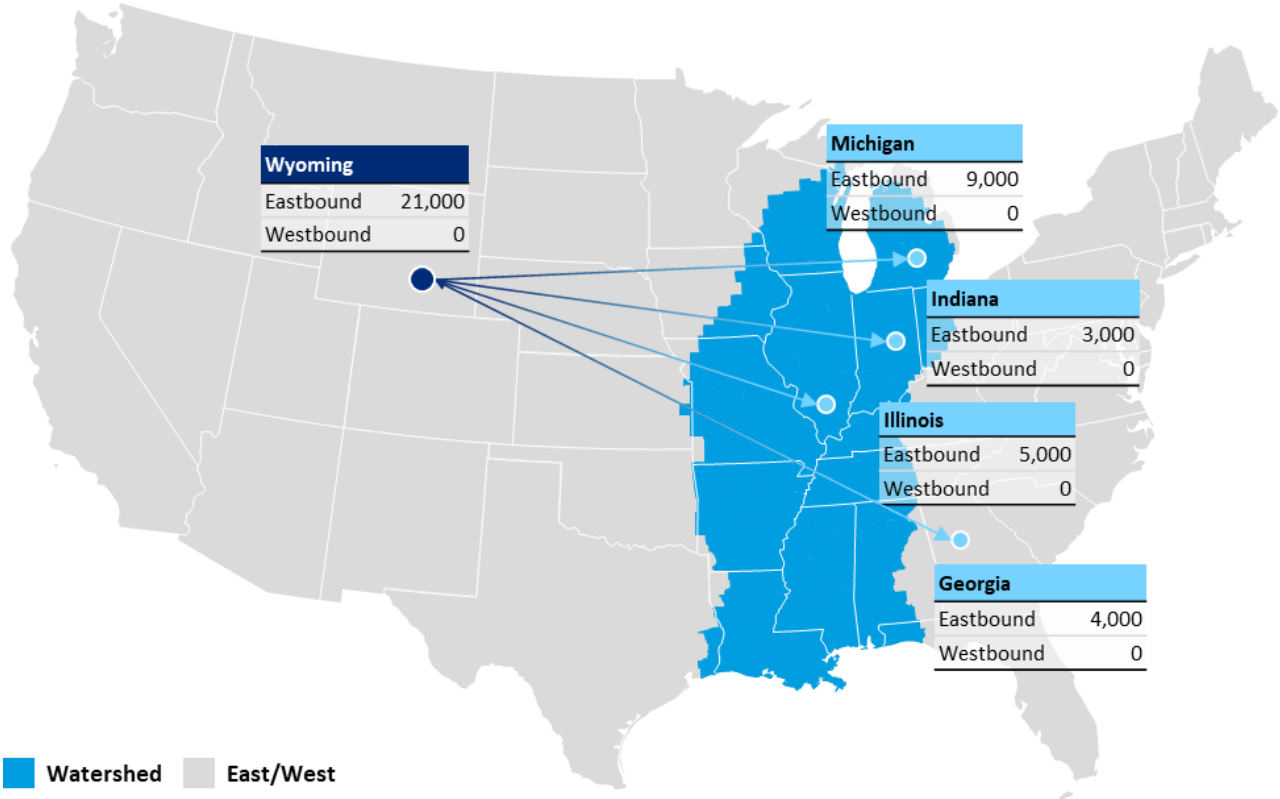

Exhibit 6-11: Estimated rail-to-rail diversion of bulk traffic by key commodity[80]

Commodity (STCC2)	Extended haul	New traffic	Total carloads
Coal (11)	13,000	9,000	22,000
Farm products (01)	3,000	2,000	5,000
Petroleum or coal products (29)	0	1,000	1,000
Total	**17,000**	**12,000**	**28,000**

Exhibit 6-12 shows that 75% of the estimated diversion of bulk traffic would originate in Wyoming. Almost all of this traffic would be delivered to four states, with Michigan and Georgia being states predominantly served by eastern railroads, and Illinois and Indiana being in the watershed region, but destinations that currently are inaccessible by the western railroads. In all cases, UP-NS could offer these shippers new single-line rail service where previously it has been unavailable. There were no adjustments made to the estimated traffic diversions for bulk.

[80] Ibid.

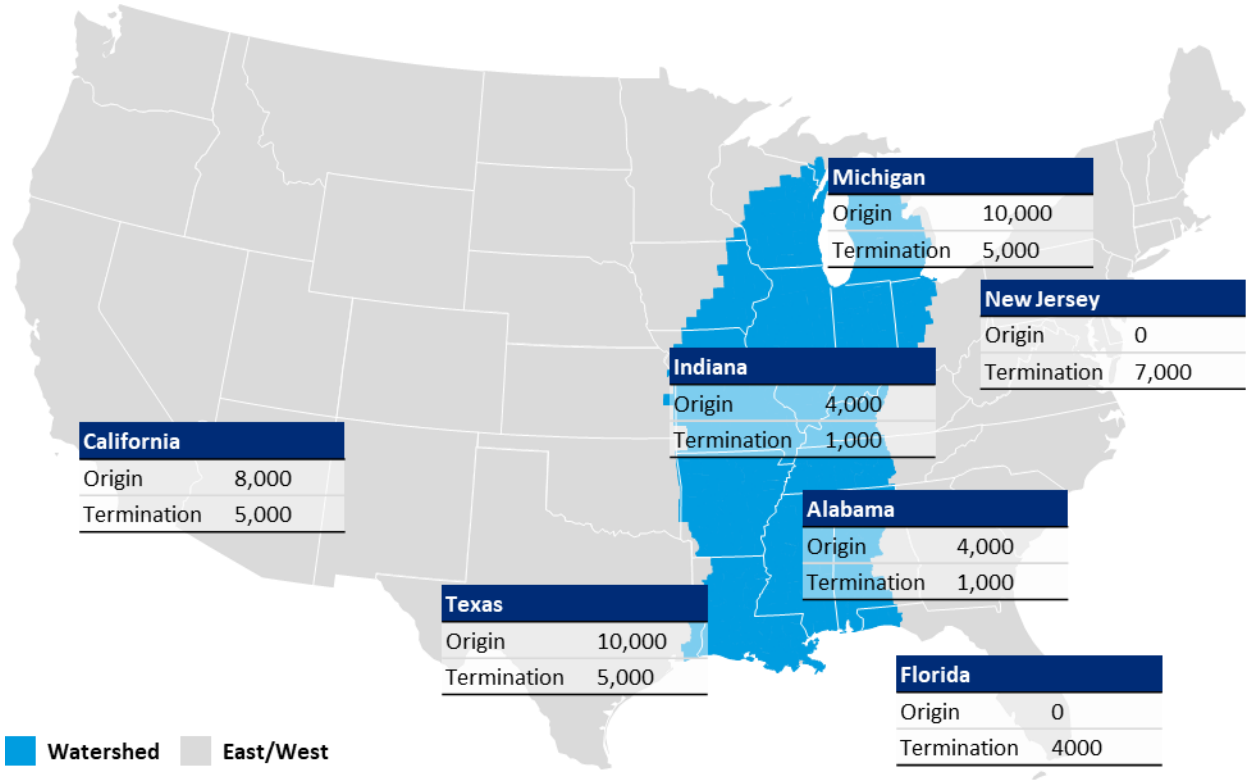
Exhibit 6-12: Top originating/terminating states for estimated rail-to-rail diversion of bulk traffic[81]

6.3.4. Automotive Traffic[82]

We estimate that a merged UP-NS would attract 47,000 carloads of automotive traffic currently moving on other railroads, as shown in Exhibit 6-13.

Exhibit 6-13: Estimated Class I rail-to-rail diversion of automotive traffic[83]

Carrier	Extended haul	New traffic	Total carloads
UP-NS	**34,000**	**13,000**	**47,000**
CSXT	-19,000	-9,000	-28,000
BNSF	-7,000	-11,000	-18,000
CN	-3,000	-3,000	-6,000
KCS	0	-1,000	-2,000
KCSM	0	-1,000	-1,000



[81] See workpapers "All_Results_vF.xlsx" and "Top origin-termination states for R2R diversion of bulk vF.sql." Eastbound is for all Wyoming markets, not just the top four shown.
[82] Includes both finished vehicles and parts.
[83] See workpaper "R2R_Diversions_Haul_Carrier.xlsx."

Over 70% of the estimated diversions would be the result of extended hauls, with the largest portion likely to be diverted from a historic UP-CSXT interline move to a new single-line UP-NS route. The states that would originate the most automotive estimated diversions are Texas, Michigan, California, Indiana, and Oregon (Exhibit 6-14). These five states account for 71% of diverted origins. The states with the most diverted terminations would be New Jersey, Michigan, Texas, California, and Florida. The top five terminating states account for 55% of diversions.

As described in the Operating Plan Verified Statement, in addition to an improved service product from conversion of interline to single-line service, the railroads intend to rationalize automotive terminals at the Chicago, IL; Kansas City, MO; and St. Louis, MO gateways; and invest in capacity expansion at multiple terminals.[84] Consolidating service to a single location in a metro area generally improves automotive final-mile haul-away economics. OEMs prefer one location in a metro area or region because it builds density for full truckloads to dealerships. The UP-NS Operating Plan also considers optimization opportunities for empty multilevel railcars. The single network creates opportunities to reduce empty miles, improving the competitiveness of the UP-NS automotive offering to OEMs beyond single-line service improvements.

[84] STB Finance Docket No. 3687, Operating Plan Verified Statement, op. cit.

Exhibit 6-14: Top originating/terminating states for estimated rail-to-rail diversion of automotive traffic[85]

The top ten state-to-state lanes for estimated diversions of automotive traffic are shown in Exhibit 6-15. The leading corridor for estimated rail-to-rail diversions of automotive traffic would be California to New Jersey, followed by Michigan to Texas, and Texas to New Jersey.

[85] See workpapers "All_Results_vF.xlsx" and "Top origin-termination states for R2R diversion of auto vF.sql."

Exhibit 6-15: Top state-to-state lanes for rail-to-rail diversion of automotive traffic[86]
Loaded direction only

Origin-destination lane	Estimated carload diversions
CA-NJ	4,000
MI-TX	3,000
TX-NJ	3,000
CA-FL	2,000
TX-FL	2,000
CA-MD	1,000
MI-CA	1,000
OR-MI	1,000
MI-OR	1,000
TX-MD	1,000
Top 10 total	**20,000**
All other	**27,000**
Grand total	**47,000**

Operational and commercial adjustments

Adjustments were made to remove diversions in the model to locations that, based on Oliver Wyman knowledge and confirmation with subject matter experts at UP and NS, do not have active auto ramps in the area to handle the traffic. Any existing auto traffic to/from those BEAs represents either an OEM assembly plant or a private facility. The diversion estimate above has excluded this traffic.

[86] See workpapers "All_Results_vF.xlsx" and "Top state to state lanes for R2R diversion of auto vF.sql."

7. Total Traffic Diversions

7.1. Total Intermodal Diversions

We estimate that a total of 1,437,000 diverted intermodal units could result from the UP-NS merger. This includes 1,166,000 truck-to-rail intermodal diversions, 204,000 rail-to-rail intermodal diversions, and 67,000 from length of haul extensions.

Some rail-to-rail and all long-haul drayage diversions are length of haul extensions, where either UP or NS already serve part of the move. We generated new intermodal traffic movements that reflected the revised origin and destination of these movements. Since we already had a traffic record for the historic, shorter move in our base traffic, we had to reduce the volumes in the historic lane so as to avoid double counting. For example, conversion of a long-haul dray from Memphis, TN to Huntsville, AL, which is part of a trip originating in Southern California, must be offset by reducing the quantity of Southern California – Memphis, TN intermodal units. The total offsets are 131,000 for rail-to-rail and 67,000 for long-haul dray.

The net impact on UP-NS intermodal traffic would be an increase of 1,239,000 loaded intermodal units compared to the current volume of 7,385,000 intermodal units, a 17% increase. The merger would unlock single-line intermodal service for a number of major freight lanes. These corridors are a key source of traffic growth and split into three categories:

- Existing UP-NS interline intermodal lanes that receive improved service through the removal of interchanges and miles;
- Lanes offered by other railroads as interline, where UP-NS would be able to offer new single-line service; and
- New intermodal lanes that are not currently served by any railroad.

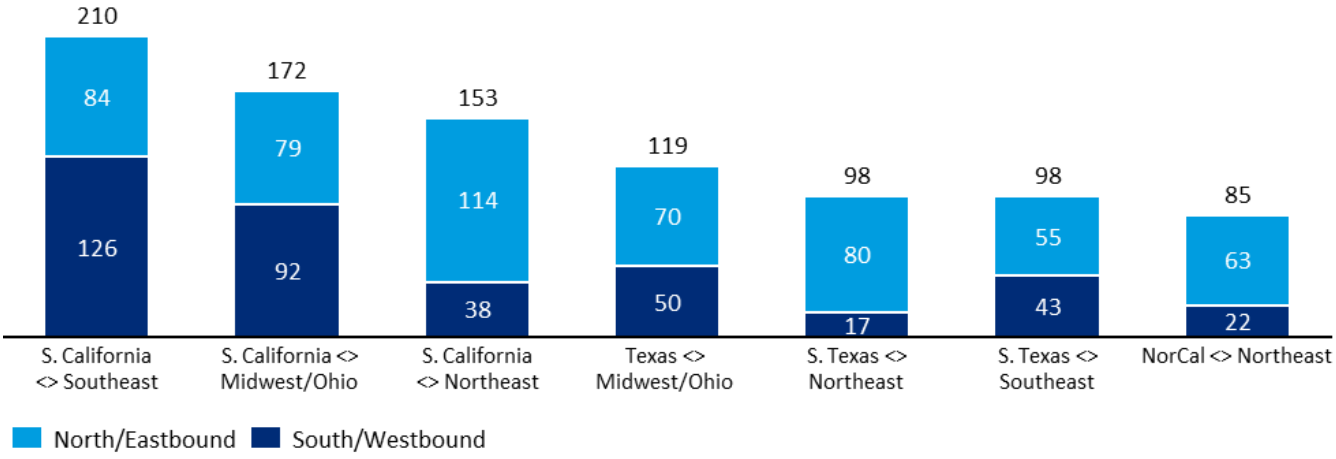
Existing UP-NS or competitor interline lanes are 73% of diverted units, where UP-NS would offer an improvement in terms of the lowest linehaul rail impedance. The largest of these traffic flows use the Shreveport, LA interchange, where rail linehaul would improve by reducing a three-party move today (UP, CPKC, NS) to a two-party move (UP-NS, CPKC) post-merger. These lanes skew long-haul, cross the watershed, and account for 77% of unit-miles.[87]

The merger also would enable new shorter-haul lanes crossing the watershed. Examples of these include from South Texas to the Southeast and from the Midwest into the Ohio Valley and Northeast. The UP-NS Operating Plan offers 24 new single-line domestic lanes that are not currently offered by any railroads on a single-line or interline basis.[88] These new domestic lanes account for 27% of diverted units and 23% of unit-miles.

The top 15 lanes by revenue are shown in Exhibit 7-1; the full list of lanes with existing and diverted traffic is included in the referenced workpaper.

[87] See workpaper "Revenue_Calculation_vF.xlsx"
[88] See workpaper "intermodal_diversions_model_vF.xlsx."

Exhibit 7-1: Top 15 state-state intermodal lanes by revenue (all diversions) [89]
Units, unit-miles, and revenue in thousands



Origin state	Destination state	Net diversions (units)	Net diversions (unit-miles)	Net diversions (revenue)
Ohio	California	111	270,372	$204,145
California	Pennsylvania	100	250,178	$194,412
California	New Jersey	93	285,334	$184,534
Texas	Ohio	74	124,711	$108,562
California	Ohio	62	145,738	$113,258
Texas	New Jersey	60	111,279	$98,051
Pennsylvania	California	59	139,713	$113,828
North Carolina	California	54	137,884	$102,749
Ohio	Texas	53	88,616	$78,797
Georgia	California	47	111,217	$86,709
Alabama	California	41	83,779	$72,914
Texas	Pennsylvania	35	70,098	$56,837
Minnesota	Ohio	34	55,079	$41,907
California	Michigan	32	79,146	$59,109
Texas	Massachusetts	31	68,033	$51,843

7.1.1. Key Traffic Flows

Approximately 65% of diverted intermodal traffic falls into seven key traffic flows where there is projected to be sufficient volume to launch new truck-competitive intermodal service (Exhibit 7-2).

[89] Includes truck-to-rail, extensions to long-haul dray, and rail-to-rail. Top 15 intermodal flows not a source of rail-to-rail revenue offsets. See workpaper "Revenue_Calculation_vF.xlsx."

Exhibit 7-2: Key intermodal lanes where new UP-NS single-line service is planned[90]
Thousands of units; total = 934,000 units

These traffic flows would receive single-line intermodal service, and often direct train service without intermediate handlings in the proposed UP-NS Operating Plan, for the first time. The seven regional traffic flows will be served by new trains designed in the UP-NS Growth Plan to offer truck-competitive transit times, faster than what can be achieved today. We worked closely with the railroad service design team in developing the UP-NS Growth Plan to ensure that train service in these key traffic flows would meet the needs of shippers and be truly truck-competitive. This will be accomplished in each flow as follows:

- **Southern California – Southeast (Georgia, North Carolina, Florida).** As a single railroad and with projected growth, UP-NS would see sufficient density to consolidate domestic and international traffic in the corridor to go via Shreveport, LA. This would allow for additional daily departures, effectively improving door-to-door transit time (due to reduced schedule delay). One eastbound train per day which today terminates in Atlanta, GA will be extended to Jacksonville, FL. One westbound train will originate in Charlotte, NC instead of Atlanta, GA. These train extensions will eliminate intermediate handlings in Atlanta, GA. The result

[90] STB Finance Docket No. 3687, Operating Plan Verified Statement, op. cit.

is a truck plus 24 hours door-to-door offer in both directions. The operating teams also expect improved reliability, as Shreveport, LA–Meridian, MS haulage would go from a three-party coordination exercise to two (UP-NS, CPKC).

- **Southern California – Midwest and Ohio Valley.** As a single railroad, UP-NS would be able to efficiently serve these lanes via the Kansas City Gateway. UP-NS would introduce a new Los Angeles, CA to Detroit, MI train. This also would carry traffic for the Kansas City market. At the NS Voltz, MO terminal, the eastbound train from Los Angeles, CA would split and combine with two existing NS intermodal trains: one that runs daily to Detroit, MI and the other that serves the "W Line" terminals at St. Louis, MO; Louisville, KY; Cincinnati, OH; and Columbus, OH. This would provide a direct single-line intermodal train to Detroit, MI from Southern California for the first time, which will be between truck plus zero hours and truck plus 24 hours, and service to other Ohio Valley markets with a single block swap.
- **Southern California – Northeast (Pennsylvania and New York-New Jersey).** Shippers currently using existing interline services via Chicago, offered by all Class I railroads, will benefit from new single-line service in two ways:
  - A new direct train service (ZCICX / ZCXCI in the operating plan) with no intermediate handlings that crosses from legacy UP to legacy NS in Kansas City, MO, reducing the total mileage versus going through existing rail interchange points in Chicago, IL; and
  - The merged railroads will invest in infrastructure that neither would be able to justify independently, such as reopening and investing in the NS terminal at E-Rail in New Jersey and upgrading sidings and mainline running speeds between Voltz, MO and Butler, IN on the NS line.

The UP-NS Growth Plan would reduce terminal to terminal transit in these lanes by 17 hours to 95 hours, versus a door-to-door truck transit of 111 hours, enabling a truck plus zero hours to truck plus 24 hours intermodal service offering. In addition, the train will have no intermediate work events between City of Industry in Southern California and Harrisburg, PA which should result in more reliable transit times than existing interline services.

- **Texas – Midwest/Ohio Valley.** Combining UP-NS unlocks viable intermodal lanes between Texas and the Ohio Valley (Louisville, KY; Cincinnati, OH; Columbus, OH). Interline service is not currently competitive with truck because of the interchange delay and the short hauls on one or both legs of the trip. The merger enables new intermodal lanes from southern Texas (Houston and Laredo) via the New Orleans gateway because there would now be sufficient density to offer this train service in the UP-NS Growth Plan when combined with traffic to the Southeast and Northeast.
- **South Texas – Northeast and Southeast.** These are new lanes that have not been offered before on a single-line basis. Houston to Atlanta and the Southeast is only 800 miles, making it challenging to offer on an interline basis. There is sufficient demand from diversions for two new train pairs in the UP-NS Growth Plan via New Orleans between South Texas (Port Laredo and Houston) and Atlanta, with one continuing to Croxton, NJ. Both will be able to offer a planned schedule of truck plus 24 hours for door-to-door intermodal service. The new train from Laredo, TX to Croxton, NJ enables, for the first time, direct intermodal rail service without intermediate handlings between the Mexican border crossing and key East Coast distribution hubs (Atlanta, GA; Charlotte, NC; Harrisburg, PA; and New Jersey). This is a significant improvement on existing interline alternatives, typically involving rubber-tire interchange in Chicago, IL.

- **Northern California – Northeast.** With truck-to-rail diversions there is sufficient demand to introduce a new intermodal train pair between Lathrop, CA and Croxton, NJ that would bypass Chicago, IL. This removes intermediate handlings required in the UP-NS Optimized Plan. The new train has no planned work event in Chicago. The planned terminal-to-terminal transit time end-to-end is 83 hours eastbound, 20 hours faster than solo driver truck transit time. This will provide shippers with intermodal service between truck plus zero hours and truck plus 24 hours. The train also will serve Toledo, OH and Harrisburg, PA.

These trains were developed by the railroads' service designers to meet the needs of the identified intermodal growth. They are described here to illustrate that the UP-NS Growth Plan can execute truly truck-competitive or truck plus 24 hours door-to-door transit times in these key lanes. The planned terminal-to-terminal transit times are shown in Exhibit 7-3, compared with door-to-door solo truck transits. Depending on the exact schedules and shipper locations, adding 18-36 hours to the terminal-to-terminal rail transits yields an approximate door-to-door transit for intermodal to account for drayage, loading, and unloading. All proposed services can provide a truck plus 24 hours intermodal door-to-door transit time.

Exhibit 7-3: Key planned UP-NS intermodal service transit time improvements (linehaul terminal-terminal) compared to trucks (door-door, solo driver)[91]

Note: add 18-36 hours to the rail linehaul terminal-to-terminal hours to get door-to-door intermodal transit

Eastbound

Train symbol	Origin	Destination	Gateway	Total current hours	Total Plan hours	Improve-ment (hours)	Highway mileage	Truck transit hours

7.2. Total Carload Diversions

UP-NS is projected to attract a total of 425,000 carloads of new traffic, with 373,000 in merchandise/bulk traffic and another 52,000 in multilevels hauling finished vehicles. Of this 425,000 total, 237,000 is due to rail-to-rail diversions, both new traffic and extended hauls on

[91] STB Finance Docket No. 3687,Operating Plan Verified Statement, op. cit. Current and planned transit times are sourced from the UP-NS Operating Plan, highway mileage based on Google Maps, truck transit hours based on assumptions detailed in Appendix B.10. Truck transit times estimated based on Google Maps mileages and applying the Federal Motor Carrier Safety Administration's hours of service regulations to a solo driver.

[92] Los Angeles Transportation Center Intermodal Terminal, operated by UP.

[93] Long Beach Intermodal Container Transfer Facility, operated by UP.

[94] Inland Empire Intermodal Terminal, operated by UP in Southern California.

existing UP and/or NS traffic, while the remaining 188,000 are diverted from trucks.[95] As a practical measure, the merchandise/bulk diversions are compressed to 3,622 representative lanes, so that each STCC2 has traffic in origin-destination lanes based on the largest diversion flows, thus adding 10,000 cars while preserving total diverted car-miles for the purposes of modeling the UP-NS Operating Plan. Thus, the UP-NS Operating Plan shows 383,000 diverted merchandise/bulk cars.

A merged UP-NS network would open new direct rail service for shippers wanting to move goods between states that previously required two railroads for the movement. We estimate there are over 100 such state-to-state pairs where the total traffic in both directions exceeds 1,000 loaded cars per year. Lanes such as Ohio-Texas, California-New Jersey, Iowa-Pennsylvania, and Minnesota-North Carolina are some of the state pairs where shippers would be able to leverage new single-line rail service. Exhibit 7-4 provides the top 15 state pairs, which account for 28% of total diversions; the other 72% of diversions are distributed across many state combinations – an indication of the nationwide benefits shippers could realize from the first US transcontinental railroad.

[95] See workpaper "All_Results_vF.xlsx."

Exhibit 7-4: State-to-state carloads diversions of rail and truck traffic to UP-NS[96]
Totals are loaded cars in both directions

State pairs	Diversions sum of both directions	Cumulative share
OH<->TX	14,940	3.5%
AL<->TX	10,745	6.0%
NJ<->TX	9,700	8.3%
MI<->WY	9,520	10.5%
GA<->TX	9,489	12.8%
IN<->TX	9,434	15.0%
MI<->TX	9,338	17.2%
PA<->TX	7,943	19.0%
TN<->TX	7,540	20.8%
CA<->NJ	6,231	22.3%
CA<->OH	6,153	23.7%
IA<->NJ	5,503	25.0%
SC<->TX	5,450	26.3%
NC<->TX	5,238	27.5%
GA<->LA	5,188	28.7%

A small sampling of the industries we expect to benefit from a UP-NS system include:

- Food products shippers that could utilize faster, direct rail service from producing states like Iowa, Nebraska, and California to move products to US Northeast and Southeast consumers;
- Chemical manufacturers moving products from the Chemical Coast in Southeast Texas and Southwest Louisiana to Ohio, Pennsylvania, and Georgia;
- Petroleum refineries in Texas and Louisiana moving refined products to consumers in the US Northeast and Southeast;
- Shippers of non-metallic minerals moving products from Wisconsin to Ohio and North Carolina; and
- Lumber producers moving products from Arkansas to Virginia and Georgia.

[96] Cumulative percentage based on total of 425,000 diverted carloads. See workpaper "All_Results_vF.xlsx."

8. Revenue

We calculated revenue after the estimated rail-to-rail, truck-to-rail, and intermodal long-haul drayage diversion traffic had been consolidated and processed for the UP-NS Operating Plan. (See Appendix C for details.)

To estimate revenue, we used a revenue-per-ton mile figure calculated from the CCWS and multiplied that by the miles traffic would travel on the UP-NS network for that route, as calculated within the UP-NS Operating Plan. We subtracted any pre-existing revenue that would be offset as a result of any extended haul rail-to-rail or long-haul drayage diversions. Appendix C.3 provides full details on this calculation. Note that there are rail-to-rail diversions for commodities that move on UP or NS in bulk trains (e.g., frac sand). This is why the bulk offsets exceed the bulk gains, because some offsets to merchandise traffic are captured here.

The expected revenue impact is shown in Exhibit 8-1. We estimate that the diverted traffic will generate $4.2 billion in revenue, with more than half (approximately $2.2 billion) coming from all intermodal diversions. Overall, the primary contributor to revenue uplift is diversion from trucks, which is anticipated to account for 63% of total new revenue.[97]

Exhibit 8-1: Total diversion revenue estimate[98]
$ millions

Service type	Rail-to-rail	Truck-to-rail	Long-haul drayage	Offsets	Net revenue
Merchandise	$1,059.6	$1,213.9	$0	$364.5	$1,909.0
Intermodal	$378.4	$1,995.2	$112.8	$298.7	$2,187.7
Bulk	$126.7	$0	$0	$128.6	-$2.0
Automotive (multilevels)	$213.6	$22.2	$0	$116.5	$119.4
Total	$1,778.3	$3,231.3	$112.8	$908.3	$4,214.1

[97] 3,231 million truck-to-rail / (3,231 million truck-to-rail + 1,778 million rail-to-rail + 113 million long-haul drayage).
[98] See Appendix C.2 for explanation of why bulk revenue is reported as a net loss. See workpaper "Revenue_Calculation_vF.xlsx."

Appendix A. Rail-to-Rail Diversion Model

A.1. Overview

The elements of Oliver Wyman's rail-to-rail model appear below in Exhibit A-1 and are described in detail in the following sections.

Exhibit A-1: Oliver Wyman rail-to-rail diversion model overview

We estimated the likely diversion of rail traffic to a combined UP-NS system by examining the network improvements that the merger could achieve relative to other potential rail options. The key assumptions used in modeling the potential rail-to-rail diversions due to a UP/NS merger are:

- A market is defined as an origin, destination, and service type.
- Impedance[99] and junction frequency[100] are surrogates for price, reliability, and transit time, which are properties that influence shipper route choice selection.

[99] Total route impedance = miles + interchange penalties in miles.
[100] The number of interchanges a rail route contains.

A.2. Rail Traffic Sources

In the analysis, we relied on traffic flows from the 2023 CCWS and a merged traffic file that combines 100% of the 2023 waybills from four Class 1 railroads (UP, NS, BNSF, CN) that were available at the time this analysis was prepared.[101] We consolidated these waybills with the CCWS to produce a 2023 traffic base of record that captured rail shipments more precisely than the CCWS alone. This increased fidelity comes in part from accurately capturing the full route of a shipment, even for Rule 11 shipments.[102] In the CCWS, the full path of a shipment is not captured when Rule 11 is invoked (i.e., the shipment is rebilled); whereas in the actual waybills the true origin and destination are captured even if the shipment is rebilled.

Rule 11 has significant implications for calculating diversions, since understanding the full path of a move is essential for determining if and how a shipment would theoretically divert in a post-merger state, as well as sizing the extent of interline traffic between carriers. This was especially important for a transcontinental merger, since most rebills occur at the interchanges within the watershed region, such as Chicago, Memphis, St. Louis, and New Orleans. Therefore, by relying on 100% waybills for the Class I carriers for which we had data, we were able to provide the model with more accurate inputs for current-state rail traffic. For this same reason, we removed rebilled records from CCWS, since they only capture part of the full movement, leaving only records where the rebill code = 0. Given we did not have 100% waybills for CPKC and CSXT at the time we created the consolidated file, the interline traffic between these two

[101] BNSF and CN traffic tapes were both provided to Applicants' counsel in September. Although CSX later in October provided its 100% traffic tape, Oliver Wyman had already begun the process of consolidating waybills. CPKC did not provide its 100% traffic tape.

[102] Rule 11, commonly known as the Freight Mandatory Rule, allows railroads to rebill deregulated traffic for quicker revenue settlements and competitiveness. This accounting method, primarily seen in waybills, gives the appearance of local movements while actually indicating long-distance traffic rebilled in key locations like Chicago. The rebilling process can lead to overstated tonnage and carload units, as each rebilled waybill effectively double counts the originating shipment, while understating the length of haul in the data. See 2023 STB Waybill Reference Guide, p. 186 for a complete Rule 11 overview.

carriers (estimated at 17,000 carloads) was omitted from the final output, because we could not accurately capture their interline traffic that did not involve one of the Class I railroads for which we had 100% waybills. The other advantage of creating a 2023 traffic base of record with available 100% waybills is that these records fully capture 2023 rail shipments, rather than relying on an extrapolated sample from the CCWS.

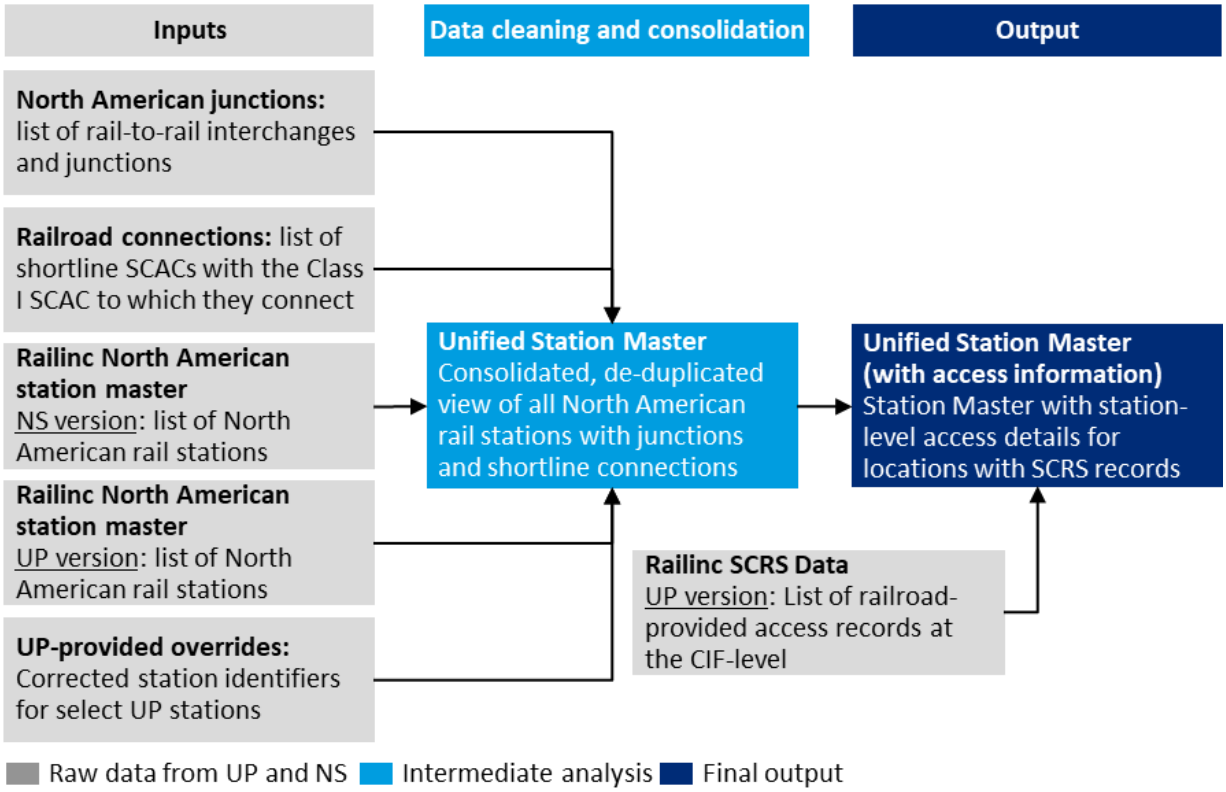
Charles River Associates ("CRA") provide a de-duplicated UP-NS interline file, which enabled combining the UP and NS 100% waybill files without double counting UP-NS interline moves. We then processed the 2023 waybills from BNSF and CN as follows:

- Assigned service type to all records based on the definition used by the agency[103]
- [BNSF only] Translated 333 location names to FSAC, SCAC, and SPLC using the Railinc North American Station Master provided by NS and UP and manual mappings. Less than 1% of records were not positively identifiable and were dropped.
- [CN only] Dropped all records involving NS and UP to prevent redundancies
- [BNSF only] Dropped all records involving NS, UP, and CN to prevent redundancies

We then processed the CCWS according to the following procedure:

- Stitched artificial Canada-US border crossings for CPKC and CN traffic to reconcile duplicate records (i.e., removed references in the CCWS to CNUS and CPUS, and adjusted the junction frequency)
- Dropped all records involving NS, UP, CN, and BNSF from the CCWS to prevent redundancies

[103] STB 2023 Carload Waybill Sample Reference Guide, March 5, 2025, p. 63.



- Included only local traffic (i.e., not a Rule 11 shipment) or interline traffic where Rule 11 was not invoked (i.e., rebill = 0) to mirror the true origin and true destination provided in the 100% waybills
- Dropped approximately 17,000 carloads of interline traffic between CPKC and CSXT, since we did not have 100% waybills for these carriers, so their mutual interline traffic could not be accurately captured from CCWS alone.

A.3. Station Master and SCRS Database Creation

Railinc maintains both a North American Station Master and a Serving Carrier Reciprocal Switching ("SCRS") database. The former is intended to serve as a comprehensive list of rail stations in North America by Freight Station Accounting Code ("FSAC") and Standard Carrier Alpha Code ("SCAC"). SCRS is a compilation of Customer Identification Files ("CIFs"), which are railroad-provided records of individual shipper agreements at a given facility that dictate access and reciprocal switching rights at a location for a specific shipper. To understand the competitive implications of the merger, we generated a Unified Station Master with station-level access information where available (Exhibit A-2).[104] In doing so, we were able to categorize the stations as sole-served, multi-served, or "mixed," meaning a combination of the two, based on shipping agreements. Ultimately, this file provides a framework for identifying where the competitive landscape could theoretically shift in a post-merger state.

[104] See "20250902 Unified Station Access Master v1.1_SCRS.csv."

Exhibit A-2: Unified station access master database creation

To create a comprehensive Unified Station Master, we aggregated and deduplicated the NS and UP versions of Railinc's North American Station Master provided by NS and UP, including OpSta (NS) and CIRC 7 (UP) codes where available. Certain stations in the input data are no longer in service, meaning there are more locations in the consolidated Station Master than appear in the 2023 waybills from NS and UP.

To add access information at a given station, we mapped Railinc's SCRS data provided by UP to assign an access type at each station (open, restricted, local, or closed) based on the CIFs associated with each station.[105] For stations with multiple CIFs having conflicting access types, we assigned a station-level access category of "mixed" and listed the constituent CIF access

[105] "Open" is open to reciprocal switching; "Restricted" is conditionally open under specified conditions or only for selected commodities; "Local" only one carrier serves a location that is not within the switch limits of another station served by multiple carriers; and "Closed" is closed to reciprocal switching.

types. For CIFs with conflicting records, we trusted the least-restrictive access type for that CIF. There are more locations in the consolidated Station Master than in the input SCRS data; these additional stations do not have SCRS access information. For stations with SCRS data available, we included the list of known accessing carriers beyond the named serving carrier.

We used a list of North American junctions to add junction information for applicable stations. We also leveraged a list of railroad connections, which indicates to which Class I network a given interline connects, to populate "access via short line" columns for stations where relevant. We applied UP-provided overrides to update stations with missing or outdated identifiers (i.e., FSAC, latitude/longitude, etc.). We derived additional columns to identify alternate FSACs for co-located Class I stations at the same customer facility by identifying shared CIFs.

The final output was a Unified Station Master, which is a comprehensive list of North American rail stations with key identifiers and inferred access information based on CIF-level records associated with a given station in the SCRS data when available.

A.4. Market Definition

We defined markets at either the city (based on SPLC) or Business Economic Areas ("BEA") level to reflect the physical and commercial drivers of each rail service. Merchandise and bulk (service types 1 and 3) markets are city-to-city[106] to capture local competition and station access. Automotive (service type 4) markets are city to BEA to reflect plant origins serving broader regional markets, Intermodal (service type 2) markets are BEA to BEA to better represent the broader competitive geographic regions for intermodal origins and destinations. We

[106] A 6-digit Standard Point Location Code (i.e., SPLC) is used to refer to a city or municipal region.

relied on the CCWS/PUWS assignment of FSAC-county Federal Information Processing Standards ("FIPS") to BEA mappings, with adjustments for intermodal.[107]

We used a 6-digit SPLC, which represents a city, as the origin and destination locations. Freight stations (i.e., FSACs), representing customer locations or other traffic generators, were aggregated within a SPLC, allowing railroads to compete for traffic. To more accurately reflect competition, the SCRS file was used to identify which FSACs are open or closed, and which railroads have access. Traffic at closed FSACs was not considered for diversion to another railroad at the closed station.

The origin, origin railroad, destination, and destination railroad are referred to as a "quad." For each unique quad, the route with the minimum cost (impedance) was selected (see Appendix A.6.4). For each origin and destination, we identified the railroads that can serve that location, using the Station Level SCRS Consolidation file for automotive, merchandise, and bulk traffic. For intermodal traffic, we determined which FSACs and SCACs have intermodal service based on the presence of intermodal traffic within the CCWS. For automotive traffic, we used all FSACs with terminating automotive traffic in a BEA to determine which railroads to include in the available quads. Service types follow Board definitions.[108]

A.5. Generation of Feasible Routes

We calibrated and executed the rail-to-rail diversion model on a set of feasible routes based on combinations of railroads serving the origin and destination SPLC. All historical traffic revenue routes are included in the calibration phase.

There also are competitive routes with no historical volume included in the analysis. Incorporating these competitive routes with no historical volume ensures the analysis reflects

[107] Adjustments are listed within Appendix D.1.
[108] 1 – General Merchandise; 2 – Intermodal; 3 – Bulk, 4 – Automotive.

competitive rail options that existed but were unused for whatever reason in the base year. This approach enables more realistic calibration, since there may be some routes with no volume that have a lower impedance and/or fewer interchanges than the routes selected by the shipper. Also, in the post-merger scenario, it generates competitive UP-NS routes where that railroad combination did not move traffic pre-merger.

We eliminated competitive routes with no historical volume that are not viable based on the following set of competitiveness criteria:[109]

- Multicarrier routes in intranodal markets (i.e., same SPLC), as no diversions are allowed to occur in the model if the origin and destination locations are identical.
- Multicarrier routes where the origin or termination railroad can offer local service in the market.
- Multicarrier routes where the originating or terminating railroad can offer local service within its railroad family in a market.
- Multicarrier routes where the total impedance (total rail miles plus interchange penalty, see Appendix A.6.4) is more than twice the minimum impedance in the market, to avoid assigning share to routes that are not competitive.

These rules are conservative to retain possible competitive routes while eliminating non-competitive combinations.

We then combined railroads with different reporting marks into one "family," so the model calculates junction impedances and competitive routes with no historical volume as if the railroads in a family are a single system (Exhibit A-3). While CN, CPKC, and CSXT all include

[109] See FD 32549, Verified Statement of Mark Hornung of ALK Associates.

railroads within their corporate family, we also combined reporting marks for BNSF and Montana Rail Link.

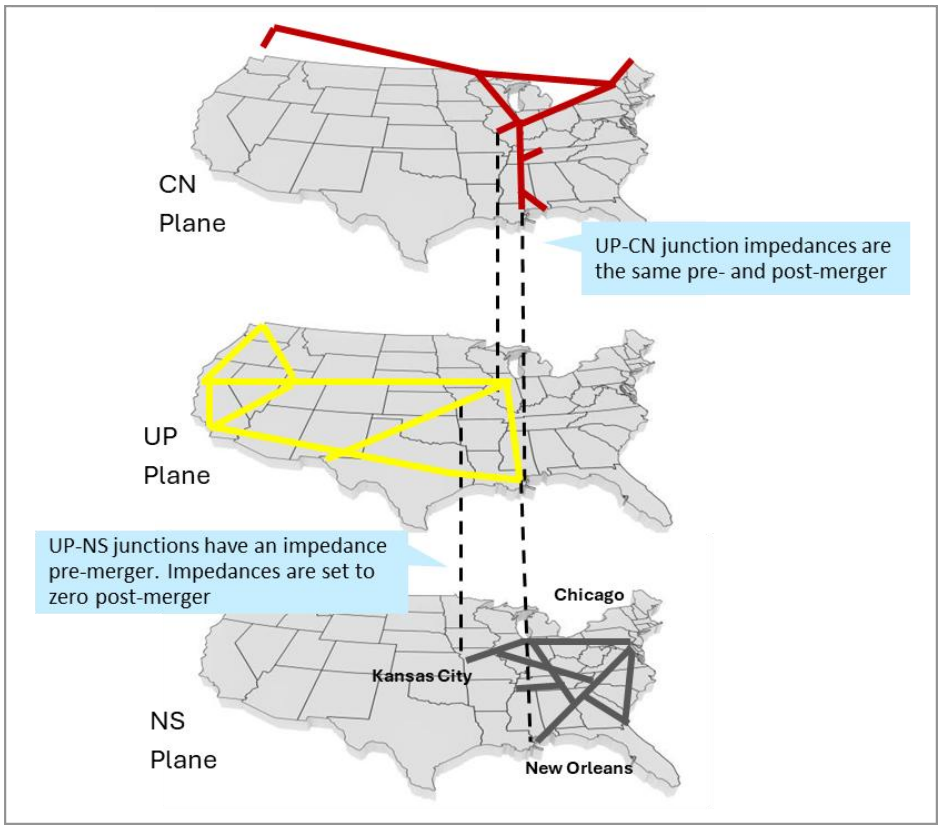
Exhibit A-3: Railroad reporting mark combinations[110]

Railroad family	Combined reporting marks
CN	CN, CNUS, IANR
CPKC	CPKC, CPRS, CPUS, KCS, KCSM
CSXT	CSXT, PAS, ST
BNSF	BNSF, MRL

A.6. Rail Mileage Calculation

A.6.1. Overview

To isolate the impacts of the merger on price, reliability, and transit time – properties that influence shipper route choice selection – we established a clear baseline (pre-merger) and a corresponding future state (post-merger). We used Oliver Wyman's proprietary software, Quantanet, to compute both route mileage and interchange penalties (impedance) across the quads, which allows the model to keep routing logic constant across scenarios while varying only the junction impedance assumptions that change under the merger. The cost and service quality, represented by total route impedance and junction frequency, were subsequently used in statistical analyses.



A.6.2. Quantanet Description

Oliver Wyman's Quantanet uses the Federal Railroad Administration ("FRA") North American Lines and Nodes[111] as the base network in a path-finding software module. We used Quantanet to estimate, for each route in the waybill file, rail miles, total route impedance, and the number of interchanges (Exhibit A-4).

[110] See workpaper "Railroad families.xlsx."
[111] FRA nodes represent stations where freight can originate or terminate, while FRA lines represent track segments that one or more railroads can operate under trackage rights.

For each origin station and carrier to each destination station and carrier in the rail traffic file described in Appendix A.2, Quantanet calculates the least impeded path between the origin and destination nodes on the network. The least impeded path is the path that minimizes the total impedance.

Exhibit A-4: Oliver Wyman Quantanet (illustrative)

A.6.3. Geocoding Procedure

Each rail station, defined as a unique combination of FSAC and SCAC, needs to be assigned (i.e., geocoded) in Quantanet. This is accomplished by selecting the closest FRA node that is served by the specific railroad in the Unified Station Master. Rail stations that cannot find a match within 50 miles of their established location within the Unified Station Master are added to a list of stations that cannot be accurately geocoded. Any generated quads with originating or terminating participation in this list are removed as viable competitive candidates due to bad

quality data. This screening removed approximately 3% of merchandise, bulk, and automotive routes, and approximately 2% of intermodal routes, with no impact on volume.

A.6.4. Junction Impedances

Junction impedances refer to the impedance assigned to a rail path as a penalty for interchanging. The junction impedances are based on the volume of loaded units per day (Exhibit A-5).

Exhibit A-5: Junction impedances based on 2023 CCWS interchange volumes[112]

	Junction impedance (mileage equivalent)	Notes
No impedance at the interchange	0	Same family
<2 loaded units/day	650	<730
2 to 10 loaded units/day	550	730 to <3,650
10 to 50 loaded units/day	450	3,650 to < 17,800
>50 loaded units/day	350	17,800+
Run-through intermodal unit train	90	Reflects a 3-hour delay to change crews

We balanced junction impedance at each interchange so that all carriers that are not in the same corporate family receive the same penalty at that location. For example, if pre-transaction volumes imply CN/UP should have an impedance of 350 and CN/BNSF should have 450 at the same location, we set both to 350 to preserve fair competition among carriers.

There are some junctions known to have traffic restrictions. The junction impedance between UP/NS at Shreveport is set to 10,000, to restrict access to non-intermodal traffic interchanging at Shreveport, as this type of interchange is not available today. A separate intermodal junction impedance table was used for intermodal to ensure the model does not create intermodal routes through non-intermodal gateways (e.g., New Orleans, LA does not have any steel-wheel intermodal interline service).

[112] See workpaper "CCWS interchanges.xlsx."

To model the improvement of rail service before and after the UP/NS merger, junction impedances between the UP and NS were reduced from their pre-merger impedances to 0. Additionally, a 0-impedance junction was added at Sidney, IL to reflect the additional possibility of single-line service through that interchange location. This gateway between the legacy UP and legacy NS networks is used in the UP-NS Optimized and Growth Operating Plans to introduce new train service which increases car velocity and bypasses the Chicago gateway, so it is right to introduce it in the post-merger network.[113]

A.6.5. Run-Through Haulage Adjustments for Junction Impedance

Run-through intermodal trains with haulage agreements operate closer to a crew change than a regular interchange, which we reflected with a lower impedance than the standard 350 miles-equivalent for an interchange with >50 loaded units per day. This is set at 90-mile equivalent, which represents three hours at an average train speed of 30 miles per hour, as a realistic representation of the additional complexity from the hand-off. In the future state, we removed one interchange from the Meridian Speedway for the traffic via Shreveport, because it changes from three carriers (i.e., UP, NS, CPKC) to two carriers (UP-NS, CPKC) and is a short bridge move. This was validated with both railroads operations departments.

The following adjustments are made to route impedances to better reflect the penalties of run-through haulage agreements being lower than true interchanges:

- Intermodal
  - The UP-CPKC-NS interchange lanes via Shreveport, LA onto the Meridian Speedway receives 180 impedance in the pre-merger case (interchange at Shreveport, LA and

[113] STB Finance Docket No. 3687, Operating Plan Verified Statement, op. cit.

Meridian, MS), and 90 impedance post-merger (simplified to a UP-CPKC haulage agreement).

- The BNSF-CSX interchange at Birmingham receives 90 impedance in both the pre- and post-cases for the BNSF lanes to/from Atlanta Fairburn and the Southeast.
- All BNSF-CSXT traffic between BNSF's Los Angeles terminals and CSX's NW Ohio terminal in North Baltimore, OH receives 90 impedance.

  The NS-KCS interchange at Meridian receives 90 impedance for lanes to/from the Wylie terminal in Dallas, TX.

• All service types: All routes that include NS and Ayer, MA receive 90 impedance.

A.7. Rail Logit Model

A.7.1. Overview

We used a multinomial logit model, a form of logistic regression,[114] to estimate the market share a particular route would receive based on the characteristics of total route impedance and junction frequency.

A.7.2. Calibration

We calibrated the rail-to-rail diversion model using CCWS instead of the 2023 traffic base of record, so the model is not skewed by the influence of any single shipper or regional market that is of higher resolution in the complete waybill data. This data collection of modal characteristics is based on the total route impedance, which is the total rail distance plus any penalties added at interchanges, as well as the number of rail-to-rail interchanges, collected from Quantanet.

[114] A standard textbook describing the nested logit model is Discrete Choice Analysis: Theory and Application to Travel Demand, op. cit., see Chapter 10.

Instead of using the absolute values of total route impedance and junction frequency, we computed a market's minimum impedance and its junction frequency, then indexed every route in that market to those minimums using the formulas below, to ensure that the features of total route impedance and junction frequency are treated equally and, on a market-by-market basis. We used the indexes because it reflects the percentage difference to the market regardless of the length of haul. The formulas for indexing impedance and junction frequency are as follows:

$$Indexed\ impedance = \frac{Total\ route\ impedance}{Market\ minimum\ impedance}$$

$$Indexed\ junction\ frequency = \frac{Route\ junction\ frequency + 1}{Market\ minimum\ junction\ frequency + 1}$$

With an indexed impedance and indexed junction frequency for every route in every valid market, we calculated coefficients alpha (α) and beta (β) that minimize the sum of squares between the predicted market shares and the actual market shares, given the following formula:[115]

$$S_i = \frac{e^{-\alpha x_i - \beta y_i}}{\sum_{i=1}^{n} e^{-\alpha x_i - \beta y_i}}$$

Where:

S_i = Predicted share for route i

α = Calibrated coefficient for indexed impedance

x = Route indexed impedance

β = Calibrated coefficient for indexed junction frequency

y = Route indexed junction frequency

n = Number of rail routes in market

This yields the following calibrated coefficients for the execution of the logit model (Exhibit A-6).

[115]Discrete Choice Methods with Simulation, Second Edition, Cambridge University Press, Train, Kenneth E., pp. 37-38.

Exhibit A-6: Calibrated coefficients for logit model[116]

Service type	Merchandise	Intermodal	Bulk	Automotive
Alpha (Impedance)	1.5689	1.7919	2.6284	0.0157
Beta (Jct. Freq.)	3.0995	0.5536	4.6150	3.1134

The use of impedance and junction frequency to identify the routes most likely to be selected by shippers is consistent with what is seen in the calibration data. Exhibit A-7 categorizes records as either having the market minimum impedance or not, as well as a share equal to the maximum historical share of the market or not.

Exhibit A-7: Percentage of calibration records by low impedance and maximum share of market criteria[117]

Market segment	Lowest impedance	Non-lowest impedance
Merchandise		
Max share of market	56%	6%
<Max share of market	5%	33%
Intermodal		
Max share of market	18%	13%
<Max share of market	13%	56%
Bulk		
Max share of market	69%	3%
<Max share of market	3%	25%
Automotive		
Max share of market	41%	9%
<Max share of market	10%	40%

If we consider a "positive match rate" to include routes where either the max-share/low impedance or non-max share/non-low impedance condition holds, Exhibit A-8 shows the match rate table produced for impedance, with all service types scoring over 70% matches. Exhibit A-9 shows a similar analysis comparing historical market share to junction frequency.

[116] See workpaper "HC Filtered CCWS Calibration.xlsx."
[117] Ibid.

Exhibit A-8: Percentage of calibration records by service type, where the positive match rate criteria holds for impedance[118]

Service type	Meets positive match rate criteria, impedance
Merchandise	89%
Intermodal	74%
Bulk	94%
Automotive	81%

Exhibit A-9: Percentage of calibration records by low junction frequency (JF) and max share of market criteria[119]

Service type	Lowest JF	Non-lowest JF
Merchandise		
Max share of market	60%	1%
<Max share of market	12%	27%
Intermodal		
Max share of market	30%	1%
<Max share of market	59%	10%
Bulk		
Max share of market	72%	0%
<Max share of market	7%	21%
Automotive		
Max share of market	50%	0%
< Max share of market	29%	21%

Merchandise, bulk, and automotive traffic all exhibit positive match rates above 70%, while intermodal is lower at 40% (Exhibit A-10). The 59% of intermodal routes with the lowest junction frequency and sub-maximal market share reflects that many of the largest intermodal lanes are single-line (e.g., Los Angeles-Chicago and Los Angeles-Dallas). Where interline intermodal rail service has been able to capture share has been in run-through service, such as NS-CPKC on the Meridian Speedway.

[118] Ibid.
[119] Ibid.

Exhibit A-10: Percentage share of calibration routes by maximum share of market and lowest market junction frequency status[120]

Service type	Meets positive match criteria, junction frequency
Merchandise	87%
Intermodal	40%
Bulk	93%
Automotive	71%

A.7.3. Execution

We used the calibrated coefficients on the 2023 traffic base of record to estimate the market share of each route using the pre-merger and post-merger total route impedances and junction frequencies indexed to the market minimums. If no routes in a market were altered based on the changes to Quantanet, no diversions would occur in that market. In markets where UP-NS would lower the market minimum impedance and number of interchanges, traffic would be attracted to the UP-NS network, resulting in a diversion. The change in the predicted share of the market a route receives multiplied by the market size (e.g., number of carloads) becomes the amount of diverted traffic**.** If rail shares increase on one route, the model output will show the rail share decreases on other routes.

For merchandise and bulk traffic, commodity allocations were applied based on the historical percentage of flows of each commodity in every market for revenue calculations. Automotive traffic was assigned to STCC2 code 37 (i.e., transportation equipment), and intermodal traffic was assigned to STCC2 code 46 (i.e., miscellaneous mixed shipments).

We excluded certain flows from the top-line diverted car totals to focus on traffic that can realistically divert on the combined UP-NS network:

[120] Ibid.

- Intermodal markets between Dallas and all Southeast BEAs, because NS offers interline service with CPKC haulage on the Meridian Speedway, which will not change post-merger.
- Intermodal diversions in origin-destination lanes that do not carry at least 4,280 units per year (i.e., 12 units per day) across existing traffic, rail-to-rail intermodal diversions, truck-to-intermodal diversions, and long-haul drayage diversions, less the impact of offsets.
- Automotive flows that originate or terminate in Amarillo, Jackson, Indianapolis, Scottsbluff, Fargo–Moorhead, Billings, Chattanooga, and Belvidere, and automotive flows that terminate in Warren, OH, due to lack of auto-ramp access on the combined UP-NS network.
- Automotive flows that originate or terminate in Greensburg or Indianapolis, as trackage rights with CSXT would not be used to divert this traffic.
- Automotive diversions from CSXT in the Chicago area, because these are considered unlikely to divert.
- Automotive flows terminating in Lordstown, because the NS ramp is idled and would not be reopened for this volume.
- Automotive flows in markets with less than 10 cars per year.
- Automotive flows that terminate in the following BEAs could not be destinations of loaded multilevels for diversions: Indianapolis IN (067), Nashville TN (071), Mobile AL (077), Minneapolis MN (113), Oklahoma OK (138), South Dakota (142), and Montana (144).

A.8. Rail-to-Rail Final Diversions and Traffic Compression

Although the rail-to-rail model was calibrated to minimize the differences between historical and model estimated pre-merger shares, no model can exactly replicate historical market shares by route. Individual shippers rarely split their traffic between competing routes, as the contract rate model favors selecting a single vendor for a period of time.

Consequently, the rail-to-rail diversion opportunity is sized by comparing the routes that UP-NS participate in pre-merger and post-merger. The model vs. model difference between the two is the forecast diversions for the route. This is irrespective of the existing market share that UP-NS already hold. It is important, particularly for the merchandise service type, that the bottom-up analysis from the SPLC-SPLC level is most appropriate to view in aggregate. The model predicts share shift market-by-market and the overall net increase in share is what is important. Overall, we expect that post-merger market share for UP-NS will increase by 15-26%, depending on service type.

In aggregate across all markets, rail-to-rail model pre-merger estimates of UP-NS predict the higher market share UP-NS had historically in the set of lanes where service will improve post-merger (Exhibit A-11). This results in post-merger traffic shares (actual UP-NS traffic plus diversions) generally below what the model predicts post-merger, had the difference in the model pre- and post-estimates simply been applied to the existing historical UP-NS share. This gives confidence that the additional cars from rail-to-rail diversions are a realistic projection for post-merger share shift. We assume that some of the difference between model pre-merger prediction and the historical traffic reflects commercial agreements, SCRS industry access, and other factors that are not captured in the model. These would continue to exist, and on average, result in a continued lower share than the logit model predicts.

Only in intermodal do the two railroads together outperform the UP-NS pre-merger model prediction by a small amount (33,000 intermodal units per year, or 90 per day). For context, this is less than 0.5% of the current combined intermodal units for UP plus NS (7.4 million after de-duplicating interline and removing rubber-tire conversions). There is more than sufficient other

intermodal traffic across these markets (which total 1.2 million units) to consider this a realistic projection for the post-merger state.

The highest predicted market share post-merger is for automotive: 61%. A 46% market share in automotive was used for the UP-NS Operating Plan (actual traffic plus diversions) and revenue calculations. Given long-term, network-wide commercial agreements with automotive OEMs, continuing to have share below the model prediction is reasonable.

Exhibit A-11: Comparison of UP-NS historical traffic vs. rail-to-rail diversion model pre-merger and post-merger estimates[121]

Thousands of carloads/intermodal units

	Total market	Actual UP-NS carloads	Model: Est. UP-NS carloads pre-merger	Model: Est. UP-NS carloads post-merger	Diversions (post-minus pre-)	Traffic (actual UP-NS + diversions)	Diff: traffic minus post-
Merchandise	780	252	277	439	162	414	(25)
Intermodal	1,217	379	346	550	204	583	33
Bulk	192	53	87	115	28	81	(34)
Automotive	201	41	72	124	52	93	(31)
Total	*2,390*	*725*	*782*	*1,228*	*447*	*1,171*	*(57)*

Percentage of market

	Total market	Actual UP-NS cars	Model: Est. UP-NS share pre-merger	Model: Est. UP-NS share post-merger	Diversions (post-minus pre-)	Traffic (actual UP-NS + diversions)	Diff: traffic minus post-
Merchandise	100%	32%	36%	56%	21%	53%	-3%
Intermodal	100%	31%	28%	45%	17%	48%	3%
Bulk	100%	28%	45%	60%	15%	42%	-18%
Automotive	100%	20%	36%	61%	26%	46%	-15%

The model predicts the diverted traffic on a SPLC-to-SPLC basis. The nature of the merchandise segment is that the traffic is highly fragmented (21,000 merchandise markets have diversions). When adding STCC2 to the records by prorating using historical commodity proportions, this further fragmented the traffic lanes. Since we used the pre- versus post-

[121] Note: Except intermodal, UP-NS underperforms theoretical model pre-merger, total traffic is less than model prediction, and where UP-NS share of markets in estimated to be 50% or less is generally where UP-NS plans to offer new single-line service. See workpapers "R2R_Merchandise_Bulk_Diversions_vF.csv.", R2R_Auto_Diversions_vF.csv," and "Intermodal - R2R highly confidential.xlsx."

calculation to predict diversions, the outputs are best viewed in aggregate, and we took the practical step to compress the traffic into approximately this data. As described further in Appendix C.1, we algorithmically identified ~2,000 lanes to represent the diversions in a way which the operating plan could model effectively. The 2,000 lanes are the largest origins to destinations by volume across the different STCC2 codes. The volume of diversions on these lanes was adjusted to ensure that the total car-miles, by STCC2, for the diversions were retained. The 2,000 representative lanes were then used to estimate revenue.

A.9. Estimated Diversion Impact on Other Railroads

We estimated the net change in carloads handled from rail-to-rail diversions to estimate the UP–NS merger impact on each railroad. Where a route would lose diverted carloads to the UP-NS network, we treated every reporting railroad on that route as losing the handlings of the diverted car count.

Conversely, where a route would gain diversions, we treated every reporting railroad on that route as gaining the number of handlings. The gain or loss of carloads handled does not sum to the total diversions, because each carload handled applied to each railroad on the route that would lose cars. For example, when traffic shifts from a BNSF-CSXT routing to a UP-NS routing in the model, the diverted carloads are recorded as reductions for both BNSF and CSXT. As a result, the aggregate diversions reported for CPRS, KCS, and KCSM overstate the net impact on the combined CPKC network, because the 2023 waybill data reports each SCAC as a separate railroad, and no adjustments were made to consider other railroad families as single entities. The net change in carloads handled (i.e., carloads handled gained – carloads handled lost) is reported for each railroad family member.

Appendix B. Truck-to-Rail Diversion Model

B.1. Freight Market Sources

B.1.1. Transearch, S&P Global Markets, 2023

The truck traffic data for the truck-to-rail analysis came from the Transearch, S&P Global Markets, 2023 freight database, which includes essentially all freight flows within, into, and out of the United States with county-to-county geographic detail and commodities at a 4-digit STCC level, for seven modes of transportation.

Transearch is broadly used by private-sector transportation-related firms such as Class I and short-line railroads for market sizing purposes. Public sector users such as state departments of transportation also often use the database as a key input to federally mandated freight and rail plans. The database was developed 40 years ago and has been recognized as long-term market tested and proven, with validation quality control measures in place during each year's processing cycle. Transearch is constructed and released annually, where validation is performed using the Bureau of Transportation Statistic's Commodity Flow Survey ("CFS") and the Federal Highway Administration's Freight Analysis Framework ("FAF").

B.1.2. STB Confidential Waybill Sample, 2023

For our rail traffic source, we used the STB Confidential Carload Waybill Sample, 2023 ("CCWS"). We first processed the CCWS for data handling.[122] CCWS codes traffic for railroads Canadian National and Canadian Pacific differently, depending on whether it is in the US or Canada. To ensure the model treated them as a single railroad, we removed artificial junctions between Canadian National (CN) operating in Canada and in the US (CNUS), as well as junctions between Canadian Pacific Railway (CPRS) operating in Canada and operating in the

[122] See workpaper "Raw_CCWS_Processing_vF.ipynb."

US (CPUS). In this process, we also fixed seven data issues found during our review of the CCWS – instances of mismatches between railroad code and railroad names for the New England Central Railroad (NECR) and CSX.

Since Transearch is a county-to-county (FIPS-to-FIPS) geography and is based on sampled data, we opted to use the CCWS rather than the 100% data used in the rail-to-rail model. The purpose of the rail data was to establish county-to-county rail shares versus truck at a rail industry level rather than an individual railroad. The precision of the CCWS was sufficient for this purpose.

B.2. In-Scope Trucking

Transearch includes four truck-related transportation modes. We defined "trucks" as Truck Truckload and Truck Private (Domestic US traffic only), and Truck NEC (NAFTA traffic only). We did not include Truck Less-Than-Truckload (LTL) as part of this study, given this type of trucking includes multiple pick-ups and stops along the route and is not a type of truck traffic UP-NS would be likely to divert. LTL only makes up 187 million tons (2%) of total Transearch trucking (see Exhibit B-1). We believe these three truck modes are representative of all the domestic and transborder types of trucking that could be potentially impacted by the merger.

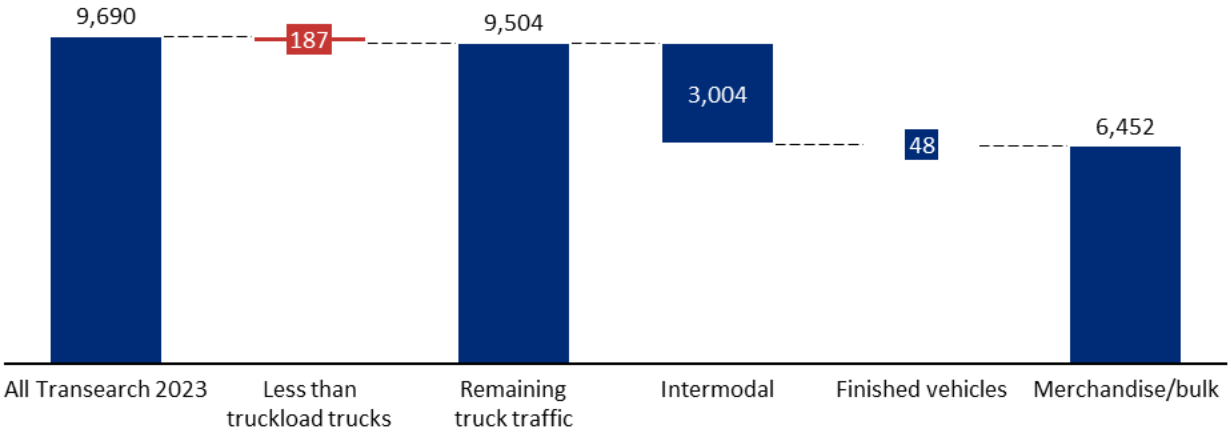


Exhibit B-1: Transearch truck transportation modes and total tonnage[123]

Num.	Description	Total tons (millions)	Included in analysis
4	Truck Truckload – Domestic US traffic only	5,085	Included
5	Truck Less-Than-Truckload – Domestic US traffic only	187	Excluded
6	Truck Private – Domestic US traffic only	4,206	Included
7	Truck NEC – NAFTA traffic only	212	Included

[123]Transearch, op. cit.; see workpaper "Transearch truck modes and tonnage vF.sql."

After excluding LTL from the Transearch truck traffic, the remaining truck traffic was broken across intermodal (31%), finished vehicles (0.5%), and merchandise/bulk (67%) (Exhibit B-2).

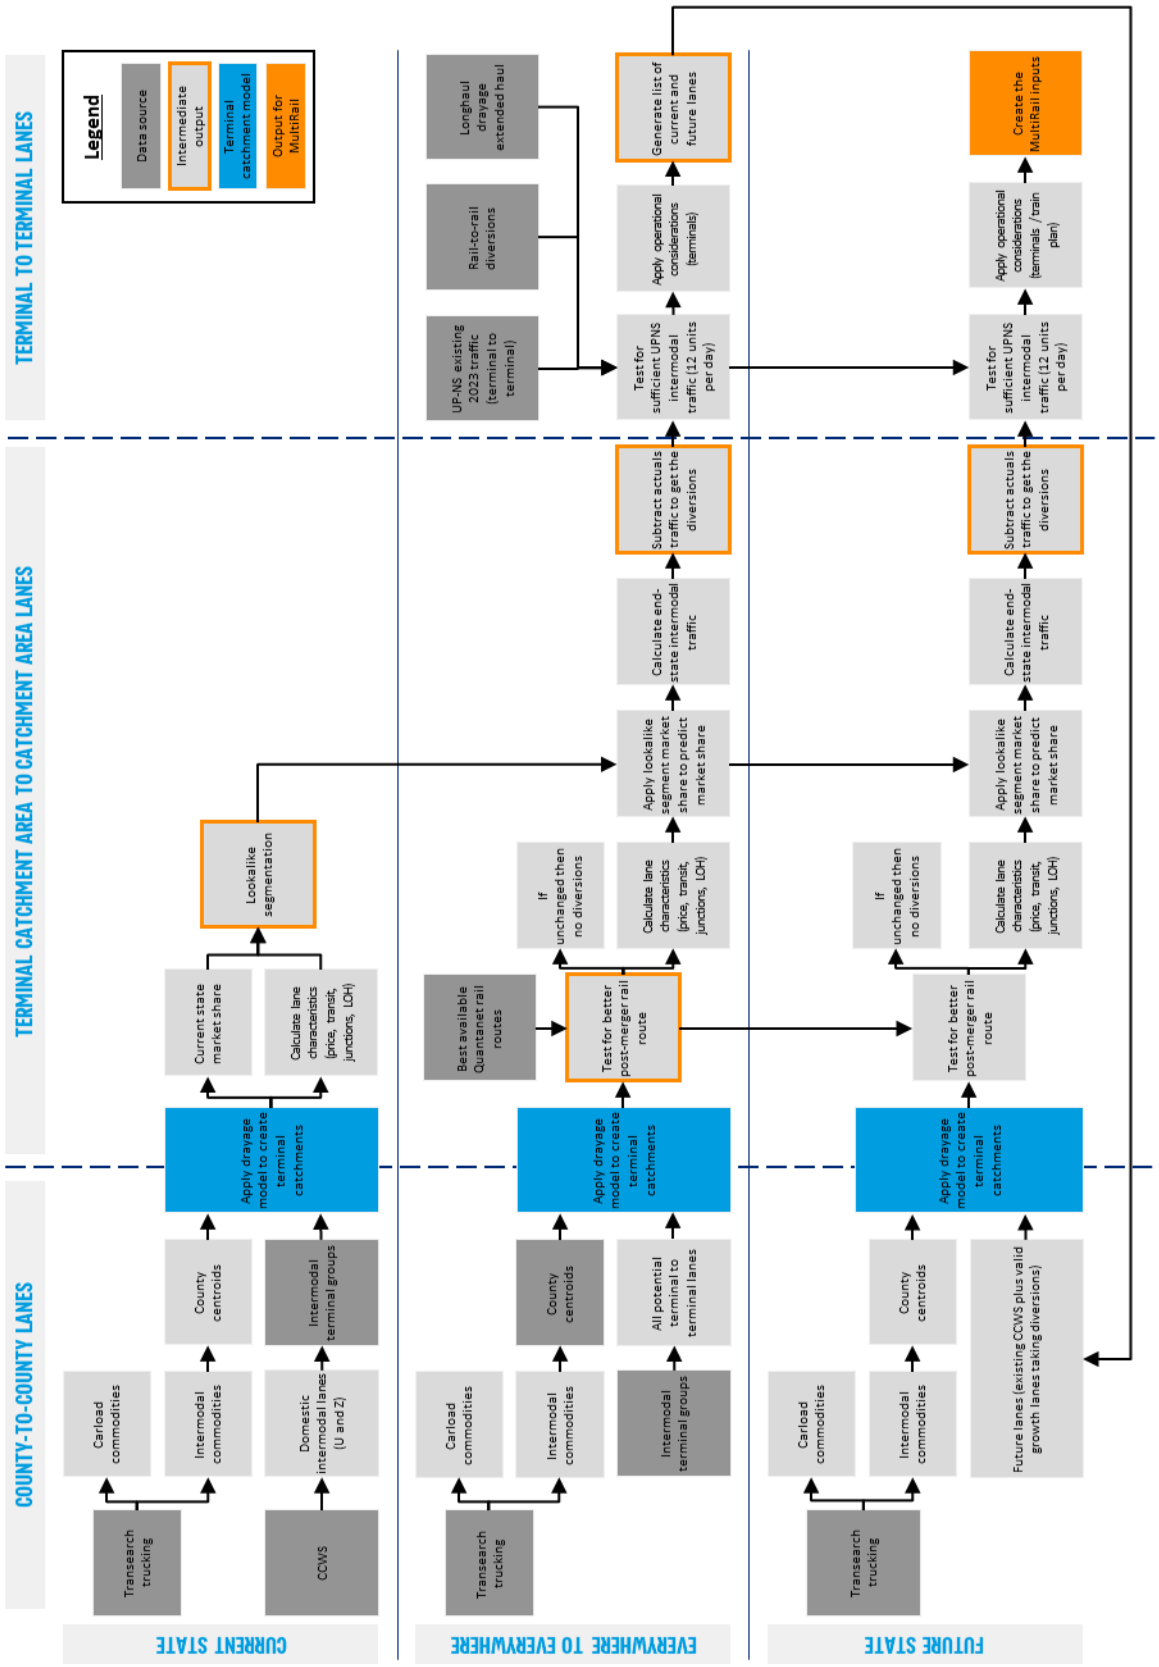
Exhibit B-2: Breakdown of Transearch trucking to intermodal, finished vehicles, and merchandise/bulk[124]
Millions of tons

These three types of traffic are segmented when calculating diversions due to the different geographic areas this traffic competes in, and because this represents different segments of potential business for the merged UP-NS. We estimated diversions separately across these three segments, as explained in the next three subsections. We segmented the traffic based on the following rules:

- **Finished vehicles:** Only STCC 3711 commodity, finished vehicle, was considered**.**
- **Intermodal and merchandise/bulk:** Transearch provides no visibility into the likely rail service that truck traffic would convert to; it only provides commodities and the truck equipment type. The best way to infer the likely rail service type (intermodal, carload, automotive, bulk) is the commodity. Based on the Public Use Waybill Sample, we calculated the frequency each STCC4 commodity travels in rail intermodal containers vs. carload. Any

[124] Transearch, op. cit.; see workpaper "Transearch trucking to IM, VIN, and merch vF.sql."

commodities with over 50% of their rail traffic in intermodal containers were treated as an intermodal-favored commodity.[125]



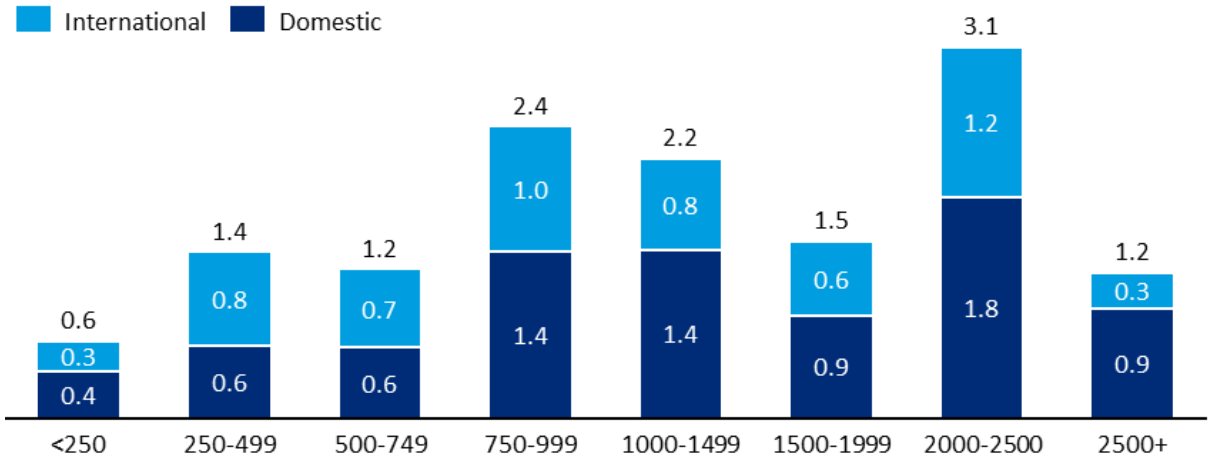
B.3. Intermodal Analysis

Exhibit B-3 illustrates the architecture of the truck-to-intermodal diversion analysis. This was an iterative three-step process:

1. The **current-state** intermodal share by lane of each lane's serviceable addressable market (truckloads plus intermodal units moving catchment to catchment) was calculated, for lanes where linehaul intermodal service is available based on the CCWS traffic, to calibrate the intermodal share by segment, after segmenting the lanes by price vs. truck, transit time vs. truck, length-of-haul, and interchange junctions.
2. The **everywhere-to-everywhere** opportunity was sized; this is where we first allowed linehaul service between every pair of catchment areas and tested for improvement in rail service as a result of the merger. For those which improved, we applied the modal share by segment and then tested for operational considerations to determine if new lanes are feasible.
3. The **future state** is based on linehaul rail service being available in the existing lanes (Step 1) plus the new lanes (Step 2). Segmentation and operational considerations were then applied, including converting the output to the exact terminal-to-terminal lane for use with MultiRail.[126]

[125] See workpaper "STCC4-CLvsIM.xlsx."
[126] STB Finance Docket No. 3687, Operating Plan Verified Statement, op. cit. MultiRail is Oliver Wyman's proprietary network modeling software, which was used to develop diversion data.

Exhibit B-3: Intermodal truck-to-rail diversion model



B.3.1. Total Addressable Market

The total addressable market for truck diversion to rail intermodal was defined as all trucking with a length of haul over 250 miles and with a commodity defined as intermodal (Exhibit B-4).[127] This translates to 72 million truckloads out of a total of 606 million truckloads (an equivalent 3,004 million tons).

The CCWS shows 13.6 million intermodal units in 2023, split between 53-foot domestic intermodal service (8.0 million units) and international intermodal service (5.6 million units), based on the IMSvcCodes field in the CCWS.[128] All modal shift is assumed to be from truck to domestic 53-foot intermodal containers.

Exhibit B-4: Rail intermodal units by length of haul[129]
Millions of units

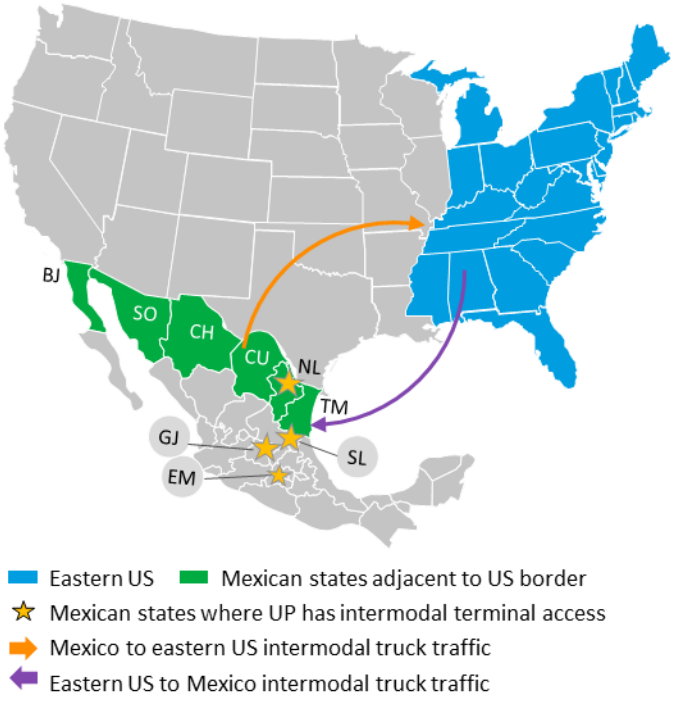
The total addressable market of truck and intermodal units over 250 miles under consideration is 79.4 million (71.9 million truck units plus 7.5 million intermodal units, as a 53-foot truckload is approximately equivalent to a 53-foot container in capacity. However, it is

[127] Two hundred and fifty miles was set as a minimum threshold for intermodal to be a feasible alternative to truck, as shorter hauls would be uncompetitive on transit time and price. Categorization of commodities as intermodal, merchandise/bulk, and finished vehicles described in Appendix B.2 In Scope Trucking.
[128] Domestic intermodal is defined using the service type code(s) ['A', 'B', 'C', 'D', 'E', 'F', 'G', 'H', 'I', 'K', 'L', 'M', 'N'] in the field IMSvcCodes in the CCWS.
[129] STB Confidential Carload Waybill Sample, 2023. Domestic service includes CCWS field IMSvcCodes IN (A-we and K-N).| Excludes revenue empty moves (i.e., CCWS ExpandedTons > 0). See workpaper "IM units by LOH vF.sql."

important to appreciate that while all domestic intermodal is serviceable by the trucking industry, the reverse is not true (that is, some containerized trucking cannot be serviced by rail intermodal), due to the current terminal footprint and railroad linehaul service offerings.

The potential for improved rail service because of the merger is a key input to sizing the modal shift opportunity. Improved rail service is defined as when the best rail route, terminal catchment area to terminal catchment area, would see a decrease in impedance (rail miles plus junction impedance) from pre- to post- merger. This further reduces the number of trucks available to convert as a result of a UP-NS merger.

Mexico and Canada assumptions



Within the addressable intermodal market, there are 854,000 truck units between Mexico and the eastern United States. These lanes will gain improved intermodal linehaul rail service as a result of the merger. NS does not have interchange access to FXE or KCSM via Eagle Pass, TX, El Paso, TX, or Laredo, TX. The merger would create the opportunity to launch single-line service into the eastern US from these points and serve the transborder trucking market.

However, the transborder market is complex, with moves often involving three trucking carriers and a customs broker. UP does not control access to the terminals in Mexico and would need to rely on a Mexican rail partner to provide access to capacity and commercial control to penetrate this segment.

The addressable market for diversion of trucks to rail intermodal was set at the Mexican states adjacent to the border, with all other long-haul trucking from further into Mexico not addressable. Conceptually, this is based on 1) the lower barrier to converting freight from truck directly to a container (the northern Mexican states are within realistic drayage distance of Port Laredo, TX; Santa Teresa, NM (El Paso, TX); Southern California; and Wilmot (Tucson), AZ

intermodal terminals). This reduces the serviceable addressable market to 310,000 truck units to and from the Mexican border states.

Exhibit B-5: Addressable transborder truckloads traveling between Mexico and eastern US[130]
Thousands of truckloads

Mexican states	Trucks going to eastern US	Trucks arriving from eastern US
Nuevo León (NL)	101	41
Baja California (BJ)	62	14
Tamaulipas (TM)	23	8
Coahuila (CU)	7	15
Sonora (SO)	6	7
Chihuahua State (CH)	6	20
México (EM)	101	43
Guanajuato (GJ)	47	19
Distrito Federal (DF)	41	12
Jalisco (JA)	41	8
Querétaro (QA)	38	15
San Luis Potosí (SL)	27	14
Puebla (PU)	25	9
Aguascalientes (AG)	11	5
Rest of Mexico	74	13
Total	**611**	**243**

Canadian transborder trucking is not addressable for diversion, because the merger would not enable the creation of any new single-line lanes or clear service improvements. Both UP and NS already have interchange access to both Canadian Class I railroads so nothing will change post-merger.

Other assumptions

The analysis assumed no geographic substitution or changes to the siting of logistics facilities as a result of the merger. Large and sophisticated shippers consider the holistic cost of their supply chain from supplier to buyer. Over the time horizon of this analysis, shippers would

[130] Note: Truck units defined as transborder trucks carrying intermodal commodities traveling between Mexico and eastern US. UP has intermodal terminal access in the Mexican states of Nuevo León, México and Guanajuato via FXE, and in México, San Luis Potosí, and Nuevo León via CPKC. See workpaper "MX to US East IM Truck Traffic vF.xlsx."

not be able to reshape the geography of their supply chains to utilize any rail service improvements created by the merger (e.g., relocating national distribution centers to new metro areas). There was no attempt to include the effects of onshoring, changing import/export ports-of-entry or other macro supply chain strategies that might change post-merger.

B.3.2. Run-Through Haulage Adjustments for Junction Impedance

Run-through intermodal trains with haulage agreements operate closer to a crew change than a regular interchange, which we reflected with a lower impedance than the standard 350 miles-equivalent for an interchange with >50 loaded units per day. This is set at 90-mile equivalent, which represents three hours at an average train speed of 30 miles per hour, as a realistic representation of the additional complexity from the hand-off. In the future state, we removed one interchange from the Meridian Speedway for the traffic via Shreveport, because it changes from three carriers (i.e., UP, NS, CPKC) to two carriers (UP-NS, CPKC) and is a short bridge move. This was validated with both railroads operations departments.

The following adjustments are made to route impedances to better reflect the penalties of run-through haulage agreements being lower than true interchanges:

- Intermodal
  - The UP-CPKC-NS interchange lanes via Shreveport, LA onto the Meridian Speedway receives 180 impedance in the pre-merger case (interchange at Shreveport, LA and Meridian, MS), and 90 impedance post-merger (simplified to a UP-CPKC haulage agreement).
  - The BNSF-CSX interchange at Birmingham receives 90 impedance in both the pre- and post-cases for the BNSF lanes to/from Atlanta Fairburn and the Southeast.

All BNSF-CSXT traffic between BNSF's Los Angeles terminals and CSX's NW Ohio terminal in North Baltimore, OH receives 90 impedance.

The NS-KCS interchange at Meridian receives 90 impedance for lanes to/from the Wylie terminal in Dallas, TX.

- All service types: All routes that include NS and Ayer, MA receive 90 impedance.

B.3.3. Serviceable Addressable Market

We then defined the serviceable addressable market (SAM) to reflect the door-to-door economics of trucking versus rail intermodal, which must reflect realistic terminal catchment areas, availability of linehaul rail service, and drayage costs.

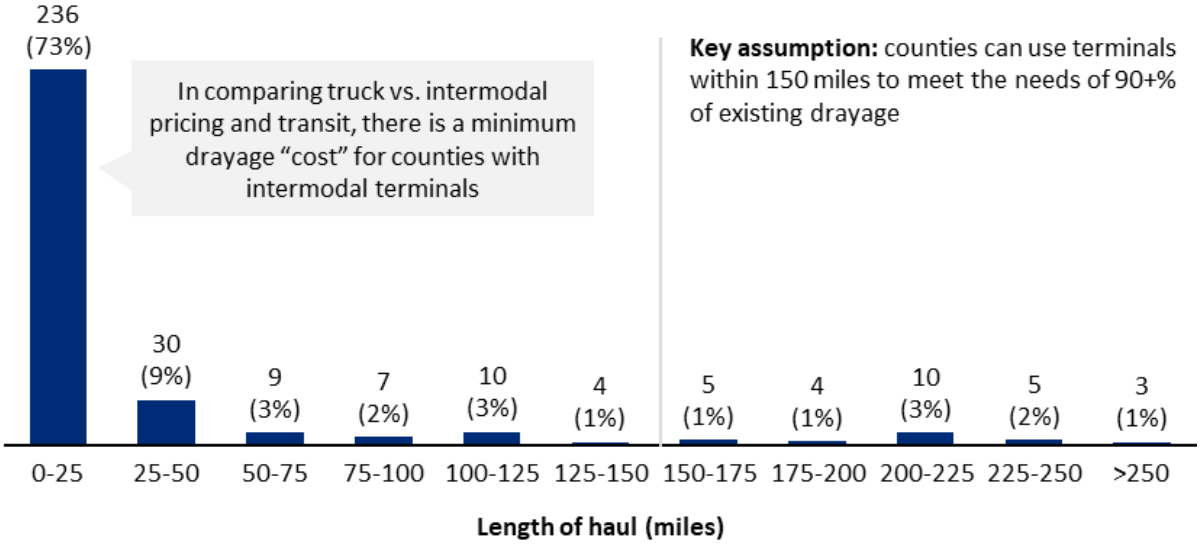
A. Terminal catchment areas

Transearch trucking data is on a county-to-county basis, which must be aligned with door-to-door intermodal service, which is a three-stage process: origin drayage (shipper to origin intermodal terminal), linehaul rail service (from origin intermodal terminal to destination intermodal terminal), and terminal drayage (from destination intermodal terminal to the receiver).

Defining the serviceable market for an intermodal lane required establishing a catchment area for the terminal to determine which counties are served. The catchment area will vary based on the length of haul to fairly reflect drayage economics, where a longer drayage move at the origin or destination could still be competitive for a long-haul truck move.

The catchment areas also will be asymmetric. An eastbound trip at a given length of haul will be less competitive for an origin county to the east of the intermodal terminal than to the west, because the intermodal move will be circuitous and add cost and transit time.

To create realistic and dynamic lane catchment areas, the model considered available terminals, linehaul rail service, and business rules on circuity for all county-to-county pairs. Each county was converted to a "freight centroid" (i.e., a point center of mass for freight) based on the density of railroad FSACs, as an approximation for freight activity or the population centroid if that was not available. This is fully detailed in Appendix B.3.3.B.



Intermodal terminals also were grouped into intermodal markets that are largely aligned with BEAs. The adjustments to the BEA assignment of CCWS traffic data is shown in Appendix D. Larger BEAs were partitioned to better reflect the different intermodal markets and align with the UP-NS terminal network (e.g., Laredo, TX was separated from San Antonio, TX, which are grouped together in the CCWS), to ensure diversion growth traffic was assigned to the correct terminal(s) on the UP-NS network.

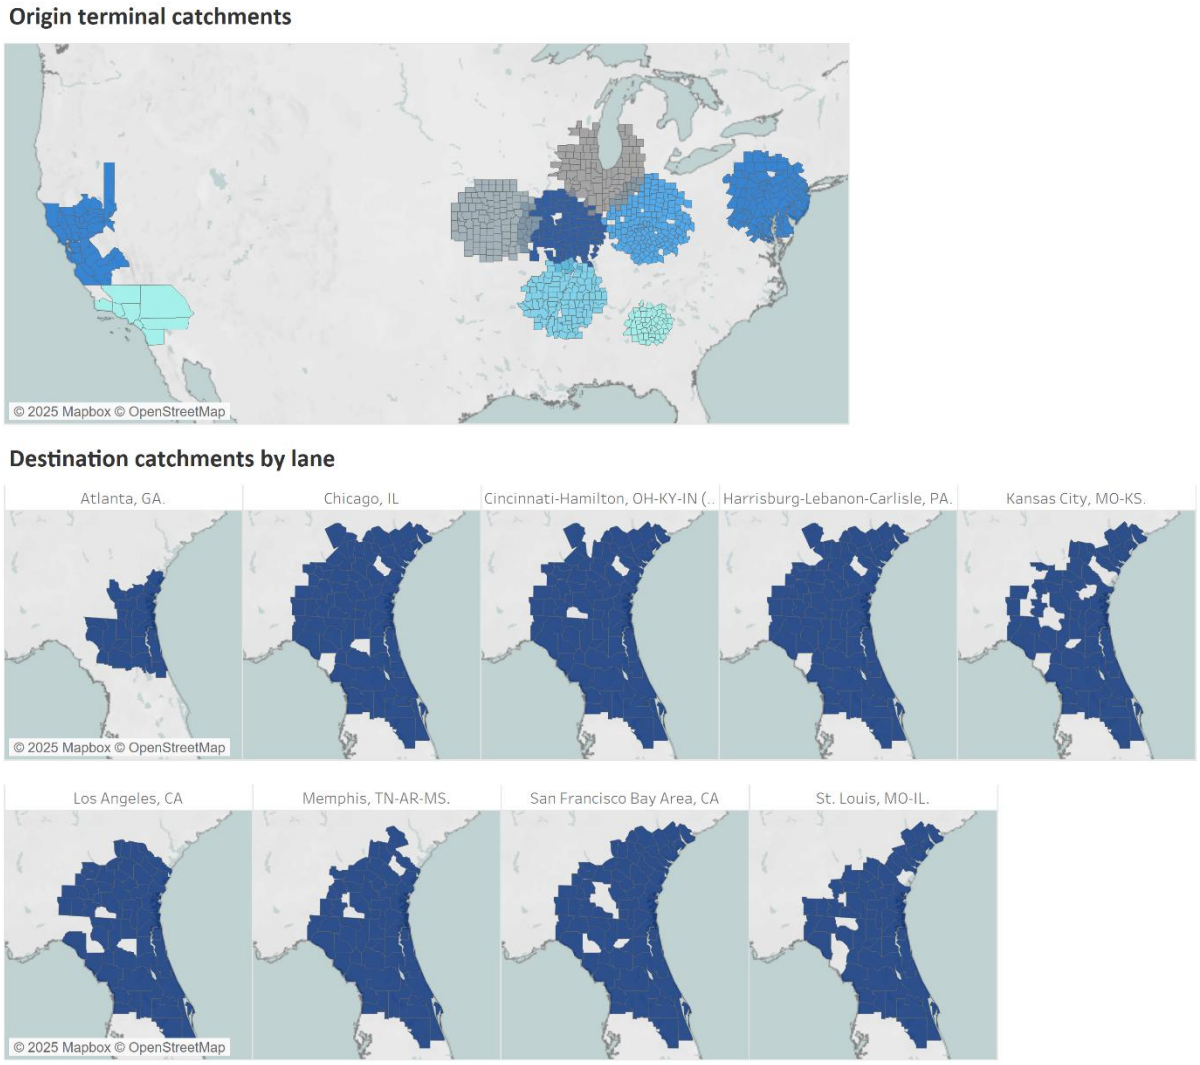
The county (FIPS code) with the most intermodal originations plus terminations in the CCWS was considered the primary terminal county for each intermodal terminal group for the purposes of measuring drayage distances.

For a county-to-county truck lane to be considered part of the serviceable market for an intermodal terminal-to-terminal lane, the following criteria had to be met:

- Maximum drayage distance: Both origin and destination county centroid must be within 150 miles of the centroid for at least one primary terminal location county for an intermodal terminal market. Based on Transearch data, over 90% of all drayage is under 150 miles as shown in Exhibit B-6. The 150-mile maximum was set based on this data analysis as a realistic basis for mode share calculations.

Exhibit B-6: 2023 origin plus destination rail intermodal drayage by length of haul[131]
Millions of tons; total = 320 million

- Available linehaul rail service: There must be rail service between the origin and destination intermodal markets
- Drayage economics: Total drayage mileage must be less than [20%] of total intermodal mileage (origin drayage plus linehaul rail plus destination drayage mileage). In our judgement, this is a reasonable modeling assumption and was confirmed with the railroad intermodal marketing departments. Drayage is an important part of the intermodal service offering, as it drives a disproportionate amount of the cost to the shipper compared with door-to-door mileage.
- Circuity: Door-to-door circuity versus truck must be below 1.57 defined as intermodal mileage divided by truck mileage. This is based on average rail to truck circuity plus 25 percentage points, since the purpose of these criteria is to set an upper bound on what is the valid serviceable market for an intermodal lane.



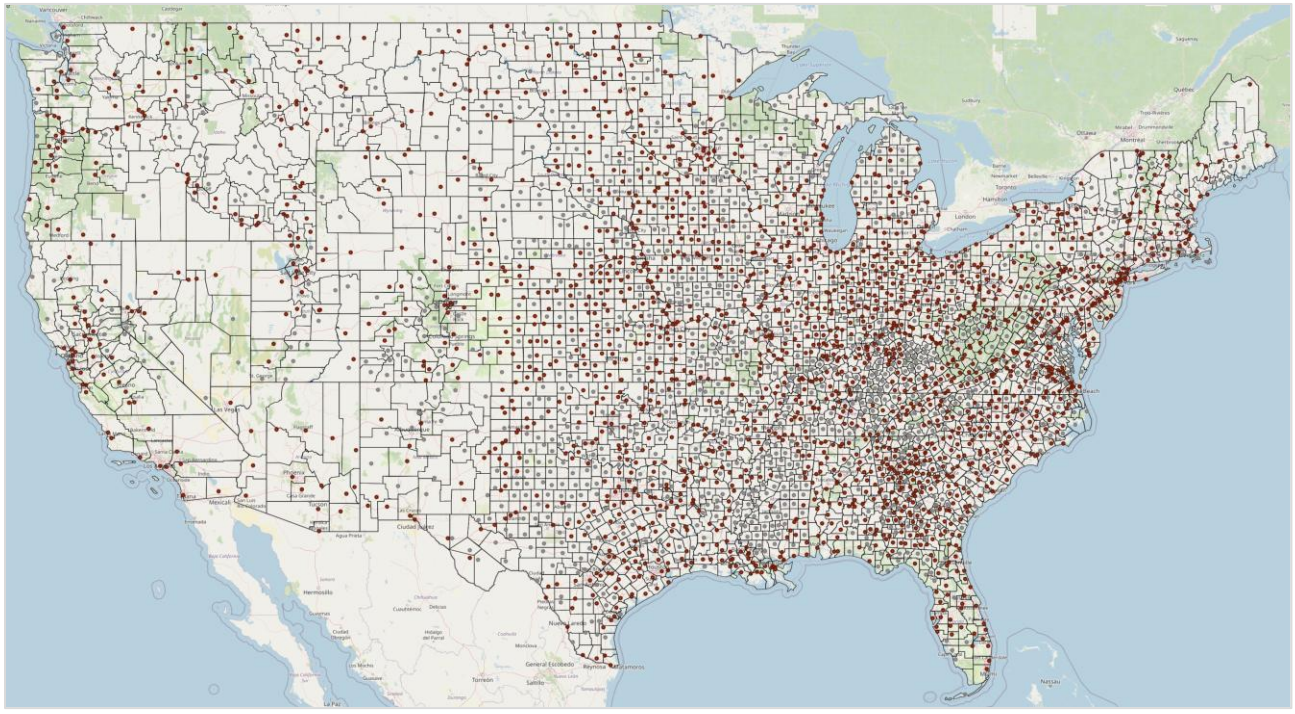
[131] Transearch, op. cit.; see workpaper "Rail intermodal drayage by LOH vF.sql."

To match county-to-county lanes to intermodal terminal-to-terminal lanes, the model takes a simple approach to picking the best intermodal lane when multiple valid options are available: The best intermodal lane will have the lowest door-to-door cost. It scores each valid lane based on drayage and intermodal mileage using a 6.6:1 ratio.[132] This captures the difference in average price per mile for shorthaul trucking, based on DAT data, of $5.48, which is representative of a drayage price, and the average revenue per mile for an intermodal unit for the linehaul move of $0.84, as reported in the CCWS. While simplified, the logic will capture the trade-off shippers make between trucking versus drayage to the nearest intermodal terminal – even if this adds circuity or total door-to-door mileage.

As an illustration of the outcome of this model, consider the example of Jacksonville, FL (Exhibit B-7). The model looks at all county-to-county truck lanes into the Jacksonville, FL catchment area. It applies the drayage economics to create appropriate terminal catchments. Note that the Atlanta, GA lane catchment is smaller – at both ends – compared to longer haul lanes. Where other nearby terminals offer alternative service, the catchment areas will differ by lane. Most lanes to Jacksonville, FL have a larger destination catchment than the Los Angeles lane. This is because the model has also identified Los Angeles, CA to Charleston, SC as a truck-to-rail diversion lane. This means trucking to counties further north will begin to prefer using Charleston, SC over Jacksonville, FL because of the reduced drayage mileage.

[132] The 6.6:1 ratio is the DAT shorthaul truck price divided by the average intermodal unit revenue per mile (rounding of inputs is what is shown here, the actuals results in 6.6:1)

Exhibit B-7: Drayage catchment areas: example of domestic intermodal lanes to/from Detroit-Toledo for sizing truck-to-rail diversions; counties shaded where served[133]



The model was applied at each stage of the iterative analysis: 1) existing terminal-to-terminal rail service, 2) everywhere to everywhere rail service (i.e., every possible terminal pair offered, regardless of railroad), and 3) post-merger terminal-to-terminal rail service where all lanes exceed the minimum volume threshold and other operational criteria.

[133] See workpaper "truck_to_intermodal_mapping.twb."

B. County centroid methodology

A centroid for each county was estimated using a weight-based method where CCWS station data was available and a population-based method otherwise. For the freight-based approach, we calculated a weight for each freight station equal to its total tons originated or terminated in the CCWS, assigned each station a latitude and longitude from the unified station master, and computed the county's freight centroid as the weighted average of the coordinates of all CCWS-represented stations located within that county. For counties with no stations represented in the 2023 CCWS, the US Census Bureau's 2020 Census Population centroid dataset was used to approximate the county's center of economic activity.

Exhibit B-8: County centroids for the lower 48 states[134]
Freight weighted in brown and population weighted in gray

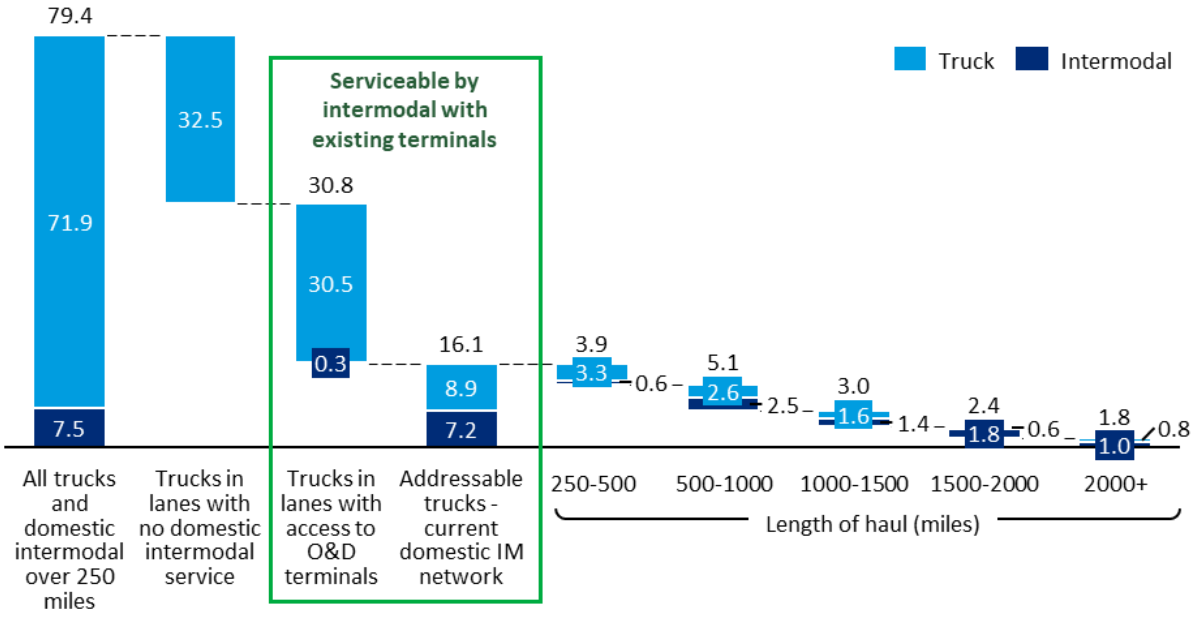
[134] See workpaper "Center_of_Freight_Mapping.ipynb."

C. Existing terminal-to-terminal rail service

There is terminal-to-terminal domestic intermodal rail service in 97 directional origin-destination catchment areas.[135] Current service is based on existing domestic intermodal terminal-to-terminal traffic in the CCWS, where the traffic exceeds an average of 12 units per day in at least one direction (4,380 units per year). This threshold to qualify as offering intermodal service is based on two 3-well articulated intermodal stack cars per day and agreement with the railroad marketing departments as a realistic minimum volume to offer scheduled 5 or 7 day per week service. Domestic intermodal is defined using the service type code(s) 'A', 'B', 'C', 'D', 'E', 'F', 'G', 'H', 'I', 'K', 'L', 'M', 'N' in the field IMSvcCodes in the CCWS.

There are a small number of intermodal rail services under 500 miles in operation today, including Jacksonville, FL to Miami, FL (FEC – 350 miles) and Atlanta, GA (NS/CSX – 350 miles). We used 250 miles as approximately the maximum range a truck driver can drive a round trip (out and back) in a single day averaging 50 mph.

D. Serviceable truck market and intermodal modal share



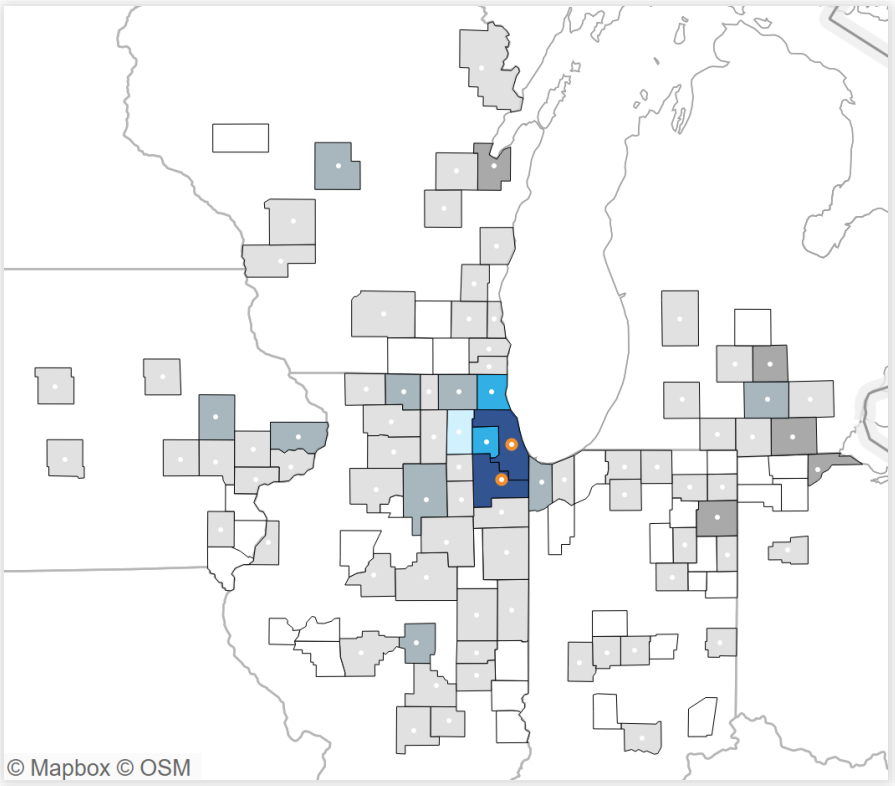
Based on the model's analysis of the current network of domestic intermodal lanes and terminal catchments as described above, 9 million truckloads are in lanes that also are currently served by rail intermodal.

A further 31 million truckloads of intermodal-addressable freight is in lanes that could theoretically be served by intermodal using the existing intermodal terminal network under the "everywhere to everywhere rail service" scenario. This does not consider the feasibility of offering linehaul rail service that would enable a truck-competitive intermodal rail service

[135] See workpaper "intermodal_diversions_model_vF.xlsx."

product. It is included to show how the serviceable market could expand through the addition of new routes, which is projected to be a key source of growth traffic from the UP-NS merger.

Exhibit B-9: Serviceable addressable market for truck-to-rail intermodal diversion[136]
Millions of truck/intermodal units



E. Extended haul to substitute for long-haul drayage

In addition, the addressable opportunity to convert truck traffic to rail intermodal includes extended haul of existing intermodal, where a long-haul dray over 250 miles is required. There are two geographic markets where this is relevant: drayage from Chicago, IL to the Detroit, MI and northern Ohio region; and drayage from Memphis, TN to Huntsville, AL and northern Alabama. The total addressable intermodal units, based on drayage moves, is sized at 134,000.

[136] Ibid.

B-10: Heatmap of drayage from Chicago by destination county[137]
Darker colored indicates more drayage activity, orange dots indicate Chicago area intermodal terminals

The intermodal drayage traffic reported by Transearch (STCC codes 5021 and 5022) in these lanes was approximately matched up with the linehaul rail move to and from the western US using data provided by UP's marketing department. This data was derived from UP's internal container waybill data, which includes information on the true origin and destination of shipments at the ZIP code level. This was treated as a representative sample and used to convert 67,000 long-haul drayage moves into the true origin to true destination, which could ultimately divert into an extended haul rail move (e.g., moving by rail from California to Detroit, MI instead of California to Chicago, IL).

[137] Transearch op. cit., mapped using Tableau.

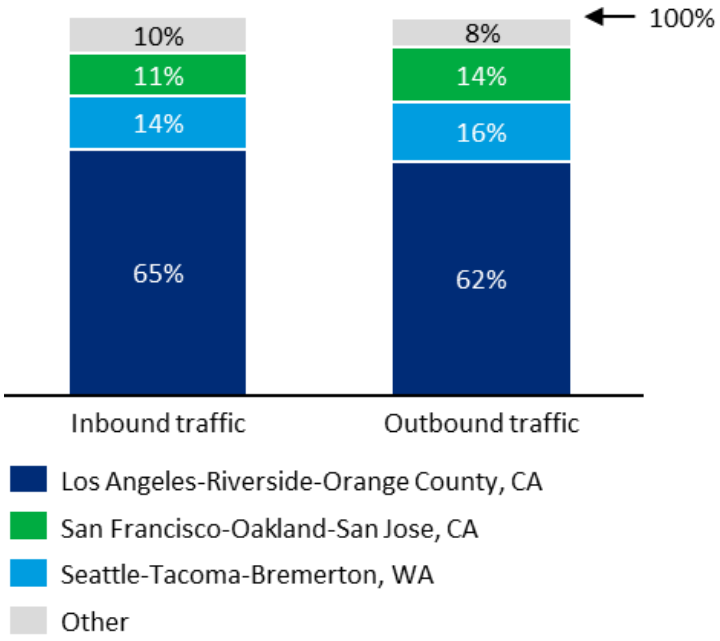
Percentage of intermodal traffic



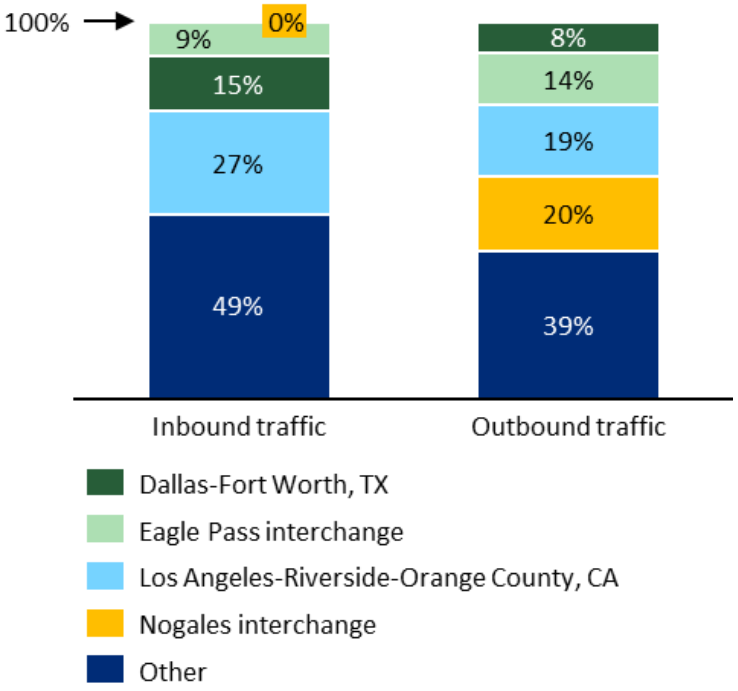


Exhibit B-12: UP mix of intermodal traffic to long-haul drayage O/D BEAs from Chicago, IL[139]
Percentage of intermodal traffic

B.3.4. Model Methodology

A. Mode shift sizing methodology

We employed a "lookalike" methodology at the lane level to size the intermodal traffic modal shift that could result from the merger. This relied on the following overarching assumptions:

- Given similar trade-offs between truck and rail freight products (transit time differentials, price differentials, service differential), shippers will make their mode choice consistently across the United States.
- New UP-NS terminal-to-terminal single-line service options will result in new truck-competitive intermodal linehaul products with characteristics comparable to existing single-line service lanes offered by Class I railroads.
- There will be a meaningful improvement in the existing interline intermodal lanes offered today and these lanes will behave like the existing single-line service lanes offered by Class I railroads.
- Decisions are made at the margin on a lane-by-lane basis, meaning shippers do not make all-or-nothing buying decisions between truck and rail.
- All domestic intermodal traffic, existing plus the mode shift growth opportunity, is treated as a "gray box," meaning that the analysis did not consider any differences that could occur as a result of the available domestic intermodal channel partner.

After the "lookalike" analysis estimated the modal shift potential, operational considerations were applied. For the railroad to offer linehaul rail service, minimum density and feasible train

[138] See workpaper "Long-haul dray vF.xlsx."
[139] Ibid.

service must be available, in addition to a UP or NS terminal being available at the origin and destination.

With this criteria, the list of existing and feasible lanes was then used to size the serviceable market a second time and apply the "lookalike" analysis to get to the final diverted truck traffic volume that could potentially shift to rail intermodal as a result of the merger.

B. Segmentation and lane "lookalike" analysis

The "lookalike" approach compares each lane that would receive improved rail service post-merger with the appropriate group of other current-state lanes with similar characteristics. Over time, shippers would evaluate their mode choices in the same way as other lanes today and the end-state rail market share would increase to that level.

Intermodal lanes were grouped based on the following characteristics: length-of-haul, interline or single-line rail linehaul, transit time versus truck, and price versus truck. The first two characteristics are rail-centric and capture how intermodal typically takes higher share in longer haul lanes and to show the difference between interline and single-line lanes in the current state. The second two capture key decision factors for shippers: price and transit. Based on Oliver Wyman's collective experience, when intermodal can offer transit times of truck plus one day and offer a 10% lower price than truck, a shipper is likely to strongly consider intermodal as a competitive substitute for truck.

Each of these factors was analyzed for each intermodal lane using the following methodology:

- **Length of haul** is based on average intermodal mileage. Intermodal mileage is the sum of the linehaul rail mileage (terminal-to-terminal) and the average drayage mileage (origin and destination).

- The rail miles are the terminal-to-terminal rail miles for the lowest impedance route, as calculated using Oliver Wyman's Quantanet model, for that intermodal market to intermodal market lane.
- The average drayage mileage is the weighted average distance from the terminal county to the centroids of all counties in the catchment area, for origin plus destination. Length-of-haul is segmented in 500 mile increments up to 2,500 miles.

- **Interline or single-line rail linehaul** comes directly from Oliver Wyman's Quantanet model. For the best rail route, the number of Rule 260 Junctions was calculated.
  - The Quantanet model applies an impedance factor to the junctions, so that the "best route" reflects the benefits of single-line service. For this analysis, the junction impedance was increased at gateways which do not have any steel wheel interline intermodal service today (e.g. New Orleans, LA).
  - This generated a set of feasible routes for each lane that represent where intermodal linehaul rail service is available today or could be readily offered.
- **Transit time** differences between modes were calculated for trucks and intermodal differently to reflect the difference in mode.
  - For truck, the Federal Motor Carrier Safety Administration hours-of-service rules were applied to the average truck mileage in the lane and a 50 mph truck velocity (see Appendix B.9). The average truck mileage was weighted and averaged across all the Transearch county-to-county traffic records in the intermodal lane.
  - The intermodal door-to-door transit time is the sum of five stages of the trip: origin drayage, origin terminal dwell, linehaul rail linehaul, destination terminal dwell and destination drayage. The assumptions used are shown in Exhibit B-13.

Exhibit B-13: Assumptions for intermodal door-to-door transit time

Assumption	Description
Intermodal train velocity	30.7 miles (STB EP724[140], unweighted average) to convert linehaul rail miles to transit time
Interchange dwell	22 hours (STB EP724, unweighted terminal dwell)
Average origin dwell	6 hours (Oliver Wyman experience plus validation with railroads)
Average destination dwell	12 hours (Oliver Wyman experience plus validation with railroads)
Minimum drayage transit time	2 hours
Drayage truck velocity	50 mph

What is most important is the difference in transit time between truck and intermodal, not the absolute transit time. The intermodal lanes were segmented into three categories: truck plus 24 hours, plus 72 hours, and worse than plus 72 hours.

- **Price differences** between modes were taken from the DAT 2023 lane level data for trucks and estimated for intermodal using the drayage cost, based on industry knowledge and the intermodal linehaul revenue by lane segment, estimated using CCWS data and a multivariate regression model. The multivariate regression model for linehaul rail used three input variables to capture length-of-haul and headhaul/backhaul economics to estimate the linehaul terminal-to-terminal price. Drayage was then added as the higher of the mileage times the shorthaul trucking rate ($5.68) and $200 (based on Oliver Wyman experience) as a minimum drayage move price for a load, including empty return. The regression model takes the following form:

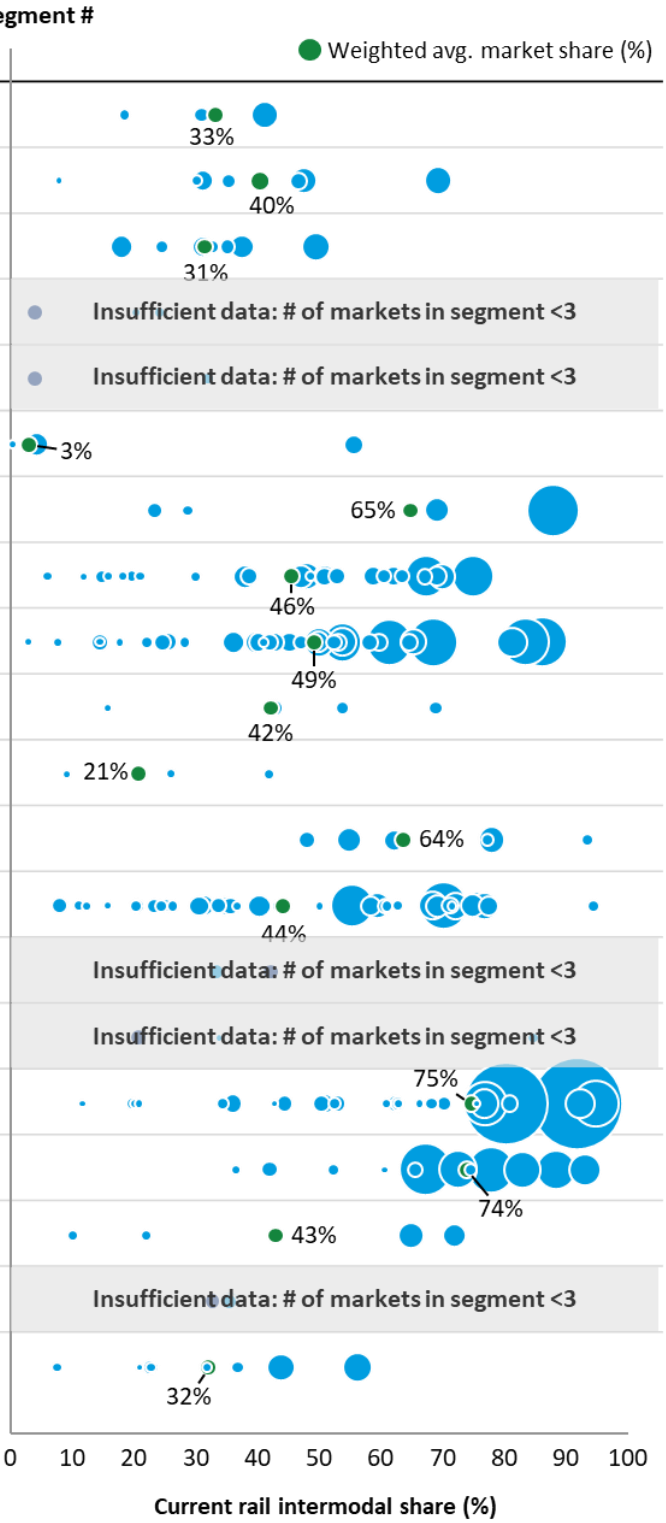
$$im\ price\ per\ unit = 0.6738 \times railmiles + 4.442 \times avgtons + 568 \times HHBH$$

- Rail miles is the average linehaul terminal to terminal miles reported in CCWS for the lane.
- Average tons is the average tons per trailer-container unit reported in CCWS for the directional O&D lane.

[140] US Code of Federal Regulations, Title 49, Part 1250, op. cit.

- HHBH is a headhaul/backhaul indicator, defined as the directional total expanded tons divided by the sum of expanded tons in both directions on an OD. So, 0.5 would be a perfectly balanced O&D lane.

This regression performs strongly with an R^2 of 0.91. A review of the errors showed that these are generally symmetrical without any obvious bias.



This pricing analysis was used to segment intermodal lanes based on the typical discount to truck on a door-to-door basis into 10+% premium to truck, within 10% of truck and a 10+% discount to truck.

For all the segmentation categories, the relevant intermodal lanes were used to calculate the weighted average intermodal mode share ([total intermodal units] divided by [total truck plus intermodal units]). A minimum of three intermodal lanes was required for the segment to be calculated and considered a valid reference mode share.

Exhibit B-14: Weighted average intermodal rail market share for 20 segments[141]

Markets in segment = # of bubbles, size of bubble = # of intermodal units in market

Segment Characteristics					Segment #
JF	LOH	Transit time	Price	# of markets	
0	0-500	T+24	>10% expensive	3	1
0	0-500	T+24	+-10%	8	2
0	0-500	T+24	10+% better	7	3
0	0-500	T+72	>10% expensive	2	4
0	0-500	T+72	+-10%	1	5
0	0-500	T+72	10+% better	3	6
0	500-1000	T+24	>10% expensive	5	7
0	500-1000	T+24	+-10%	25	8
0	500-1000	T+24	10+% better	32	9
0	500-1000	T+72	+-10%	4	10
0	500-1000	T+72	10+% better	3	11
0	1000-1500	T+24	+-10%	6	12
0	1000-1500	T+24	10+% better	36	13
0	1000-1500	T+72	+-10%	1	14
0	1000-1500	T+72	10+% better	2	15
0	1500-2000	T+24	10+% better	27	16
0	2000+	T+24	10+% better	12	17
1+	1000-1500	T+72	10+% better	4	18
1+	2000+	T+24	10+% better	2	19
1+	2000+	T+72	10+% better	9	20

[141] See workpaper "T2R Intermodal segmentation dataset vF.xlsx."

For segments with insufficient existing lanes, a filling process was used. The assumption was that intermodal mode share should perform at least as well at a shorter length of haul. If looking at the shorter length of haul categories does not produce a valid result, the matching criteria looked at the same length of haul and gradually relaxed the matching criteria. First, it considered lanes with a different price difference category, then transit time, and then finally relaxed the requirement to match on junctions. This ensured that all relevant combinations produced a realistic intermodal share.

The intermodal lanes which could receive improved rail service post-merger were segmented based on their post-merger characteristics. The weighted average mode share was then applied to the serviceable addressable market (truck plus any existing intermodal traffic) to determine potential post-merger traffic once the lane reaches maturity.

C. Extended haul to substitute for long-haul drayage

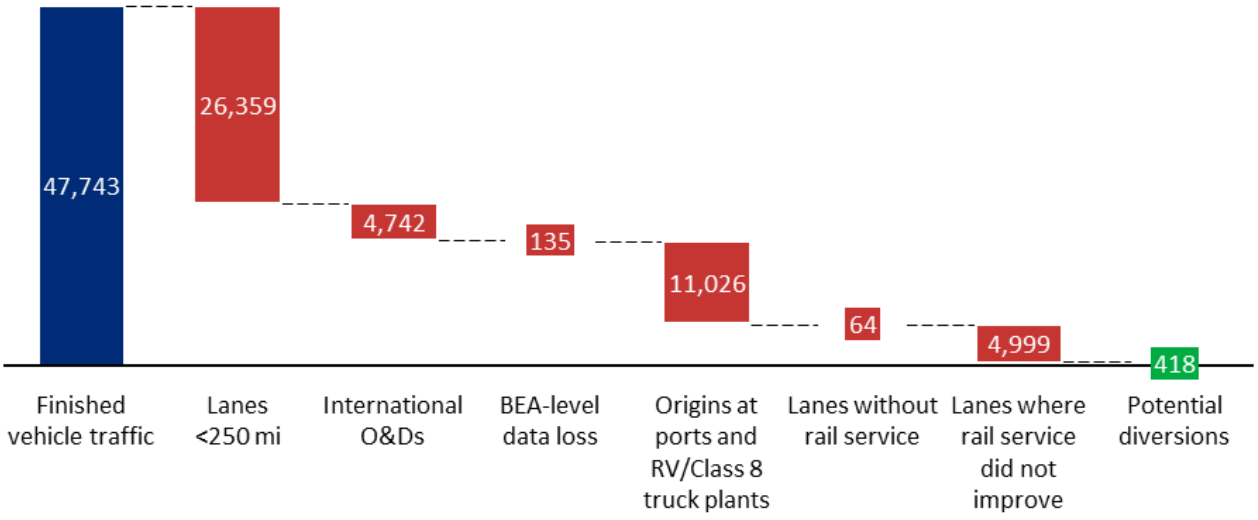
The methodology applied here to size the mode shift opportunity was based on the following assumptions:

- The addressable long-haul drayage splits 50:50 between UP and BNSF, because both offer the full range of lanes from West Coast and Texas markets to/from the Chicago, IL and Memphis, TN markets.
- Post-merger, UP would market the extended haul at legacy NS network terminals at Detroit, MI, Toledo, OH, and Huntsville, AL to the existing customer base as an alternative to bypass Chicago.
- Shippers would choose this option for 100% of their existing intermodal freight moving on UP in these true origin to true destination lanes, because the linehaul rail service would improve versus a short-haul move after a steel-wheel interchange, which is the current

alternative. The longer rail move would save shippers money and time versus their current intermodal move to the gateway and expensive long-haul drayage. If intermodal was already meeting the needs of this freight to the gateway city, then a longer haul across the watershed would also meet these needs.

The result of applying these assumptions adds 67,000 units of extended haul diversions. This would add 26,256,000 unit-miles to the network of incremental traffic. The traffic, in units, is unchanged, as these units already involve a long-haul move on UP.

B.4. Finished Vehicles Analysis



B.4.1. Addressable Market

We defined finished vehicle traffic as automotive shipments (STCC = 3711) from Transearch (47.7 million tons) (Exhibit B-15). To determine feasible diversion cases from this initial pool of truck traffic, we applied a series of exclusions to identify lanes where rail could capture market share. From these exclusions, we estimated that 418,000 tons, less than 1%, has the potential to be diverted by the UP-NS merger. We developed the following exclusions in close collaboration with UP and NS subject matter experts:

- Lanes less than 250 miles are not likely to be addressable by rail.
- International origins and destinations: finished vehicles crossing the border are typically already shipped via rail or NS and UP do not have access to the plant.
- Lanes that were unable to be accurately identified, due to data limitations.
- Traffic originating in counties with Class 6-8 truck, schoolbus, and RV OEM assembly plants, as these vehicles are not suitable for transport by rail.
- Ports, since finished vehicles arriving at a port are not generally trucked long-haul across the watershed region, and rail has fully penetrated this segment.
- Lanes without rail service where a UP-NS merger would not improve service.

- Lanes where rail service would not improve post-merger.

Exhibit B-15: Breakdown of addressable finished vehicle truck traffic[142]
Thousands of tons

The top 10 origins excluded as ports or as Class 8/RV OEMs, accounting for 11 million tons of finished vehicle traffic, are shown in Exhibit B-16.

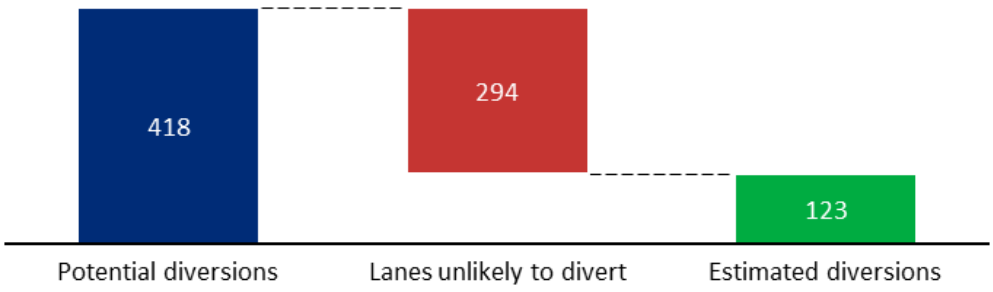
Exhibit B-16: Top 10 truck origins excluded as a port of Class 8/RV OEM[143]

County	Originating truck tons (shipments >250 miles)	Port or OEM
Glynn County, GA	1,141,953	Port
Baltimore City, MD	829,690	Port
Pulaski County, VA	808,795	Class 8/RV OEM
Denton County, TX	668,305	Class 8/RV OEM
Ross County, OH	662,233	Class 8/RV OEM
Duval County, FL	580,064	Port
Pierce County, WA	355,517	Port
Ventura County, CA	340,832	Port
Rowan County, NC	311,316	Class 8/RV OEM
Multnomah County, OR	277,999	Port

[142] Transearch op. cit., see workpaper "t2r_auto_addressable_market_to_diversions_VF."
[143] See workpaper "truck-to-rail_finished_vehicle_ports_and_rev_class8_VF.sql."

B.4.2. Process to Estimate Diversions

We next analyzed which finished vehicle lanes for trucking would most likely divert to a combined UP-NS network. We constructed lanes with county origin and destination BEAs, providing visibility into how domestic automotive traffic flows from individual plants to markets across the US. Given the unique infrastructure considerations and limited pool of shippers for finished vehicle traffic, we used a manual approach to select truck-to-rail finished vehicle diversions. Specifically, we evaluated the following criteria to determine which finished vehicle lanes could be potentially diverted. We developed these criteria in close collaboration with NS and UP experts (see also Exhibit B-17):



- Excluded economic area destinations without an auto ramp
- Excluded OEM origins to which neither NS nor UP has access/contract. OEMs with existing long-term contracts with other shippers also were excluded under this condition, even if NS or UP technically has access to the customer facility.
- Excluded OEM origins that have lower volumes but higher sensitivity to transit time. Per experts at NS and UP, plants like Mercedes in Alabama and BMW in South Carolina were excluded under this criterion.

Exhibit B-17: Example exclusions for finished vehicle lanes unlikely to divert[144]

Location	Reason
Tuscaloosa County, AL	Mercedes-Benz, the OEM at this origin, has a higher sensitivity to transit time and a lower output volume compared to non-luxury OEMs
Hamilton County, TN	Volkswagen, the OEM at this origin, has a contract with CSXT, so unlikely to divert truck volume to NS/UP post-merger
Spartanburg County, SC	BMW, the OEM at this origin, has a higher sensitivity to transit time and a lower output volume compared to non-luxury OEMs
Talladega County, AL	Honda, the OEM at this origin, has a contract with CSXT, so unlikely to divert truck volume to NS/UP post-merger
St. Charles County, MO	Lanes to Kansas City, MO were excluded due to the short distance

After manually filtering out 1,250 lanes unlikely to divert to UP-NS and adding back one lane (Wayne County, MI to Shreveport, LA) we deemed a prime candidate for diversion, the output is 123,00 tons across 36 county-to-BEA lanes, which we consider to be the true potential for truck-to-rail finished vehicle diversions (Exhibit B-18); all truck tonnage in these lanes was considered as likely to divert. 100% of the truck tonnage in these lanes was considered as likely to divert.

Exhibit B-18: Estimated truck-to-rail finished vehicle diversions, based on manual lane analysis[145]
Thousands of tons

This more manual approach for estimating truck-to-rail diversions for finished vehicle traffic reflects the unique infrastructure considerations, consolidated shipper landscape, and high drayage costs for vehicle traffic compared to intermodal and merchandise/bulk traffic.

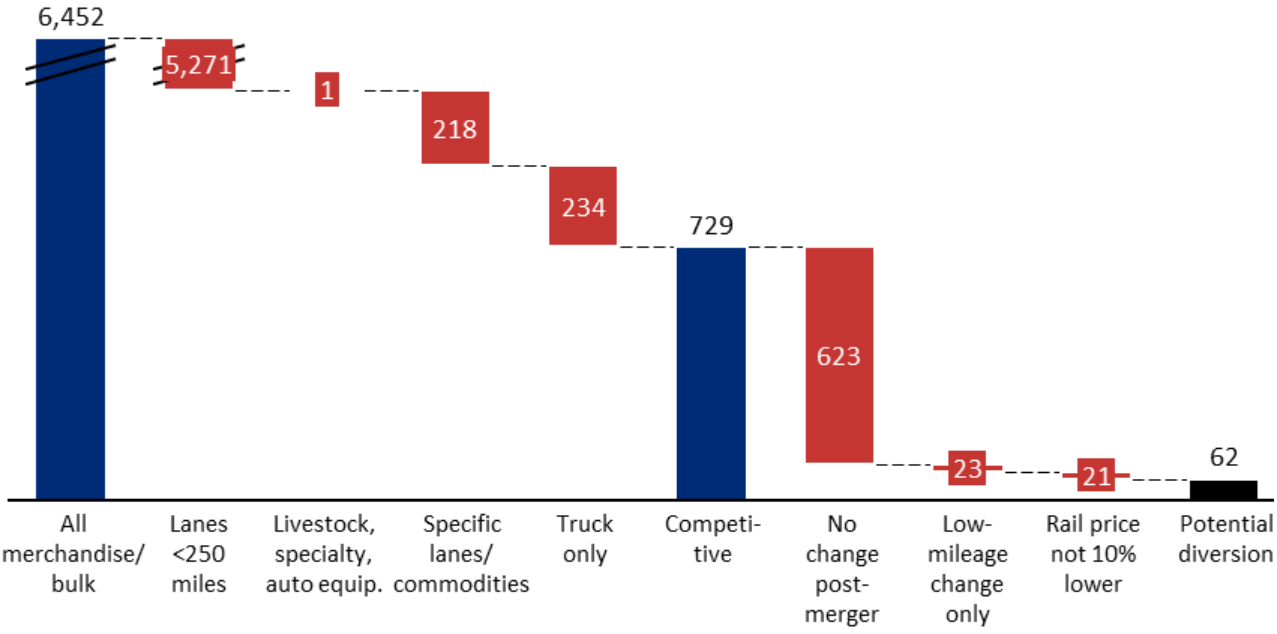
[144] See workpaper "truck-to-rail_finished_vehicle_lane_filtering_VF.sql."
[145] See workpaper "t2r_auto_addressable_market_to_diversions_VF.sql."

Exhibit B-19 shows a price per finished vehicle comparison between truck and rail pre-merger for the same county-to-county flow, where the number of finished vehicles is derived using the following formula:

# of finished vehicles flowing between county pairs = (truck tons + rail tons) / 2.5 tons per finished vehicle.[146]

Exhibit B-19: Finished vehicle traffic: price per finished vehicle, truck vs. rail pre-merger by LOH[147]
Average $/finished vehicle

Length of haul (miles)	Truck	Rail (per-merger)[148]
250-499	835	564
500-749	1,055	730
750-999	1,395	890
1000-1499	1,875	1,117
1500-1999	2,513	1,373
2000+	3,196	1,752



B.5. Merchandise/Bulk Traffic Analysis

B.5.1. Addressable Market

Within the merchandise/bulk market, we estimate there are 729 million tons in county-county lanes where both truck and rail compete. We estimate that 62 million tons of this competitive market, around 9%, has the potential to be diverted by the UP-NS merger.

[146] Based on 2024 preliminary vehicle weight (lbs.) of 4,419 (rounded up to 2.5 tons) as reported in Table 3.1. Vehicle Attributes by Model Year, 2024 Automotive Trends Report, US Environmental Protection Agency, p. 42.
[147] See workpaper "T2Auto Rail vs Truck price per finished vehicle comparison vF.sql."
[148] Includes a flat haul-away cost of $181.42 per finished vehicle derived from revenue per unit of company deliveries reported in Proficient Auto Logistics' Q3 2025 financial results, op. cit.

Exhibit B-20: Breakdown of addressable merchandise/bulk truck traffic[149]
Millions of tons

Estimated diversions were based on eliminating from consideration all truck traffic where:

- Lanes are less than or equal to 250 miles long.
- Traffic travels on specific truck equipment types that we do not believe have the potential to divert to rail. This includes livestock, specialty equipment (which is primarily wet cement trucks), and automotive trucks.
- Upon detailed review of Transearch trucking data and discussions with UP and NS experts , specific lanes and commodities were excluded for various reasons, as shown in Exhibit B-21.
- County-to-county lanes where rail service was not identified ("truck only") or where the merger would not improve rail service were excluded from the addressable market.

[149] Transearch, op. cit.; see workpaper "t2merch_lookalike_analysis.ipynb" and "t2merch_addressable_breakdown.sql."

- Lanes that were improved but less than 163 miles were excluded; as 163 miles per day is the average distance for a railcar to travel in one day,[150] and this is not seen as a large enough improvement to attract a shipper to switch from truck to rail service.
- Lanes where the rail price was <10% better than the truck price were excluded.[151]

Note that is difficult to accurately match Mexican transborder rail traffic to Transearch truck traffic due to data limitations. Thus, this traffic also is excluded from the analysis, which instead focuses on US domestic traffic and Canadian transborder traffic.

Exhibit B-21: Specific lane/commodity exclusions from Transearch data

Lane	STCC4	STCC4 Name	Truck equipment type	Tonnage excluded	Reason
Muskegon County, MI to Harris County, TX	1441	Gravel or sand	Bulk, Tank	All	Per UP Industrial team review
Harris County, TX to Philadelphia County, PA	2815	Cyclic Intermediates or Dyes	Bulk, Tank	All	Per UP Industrial team review
Harris County, TX to Jasper County, SC	2815	Cyclic Intermediates or Dyes	Bulk, Tank	All	Per UP Industrial team review

B.5.2. Model Methodology

A. Truck and rail traffic matching

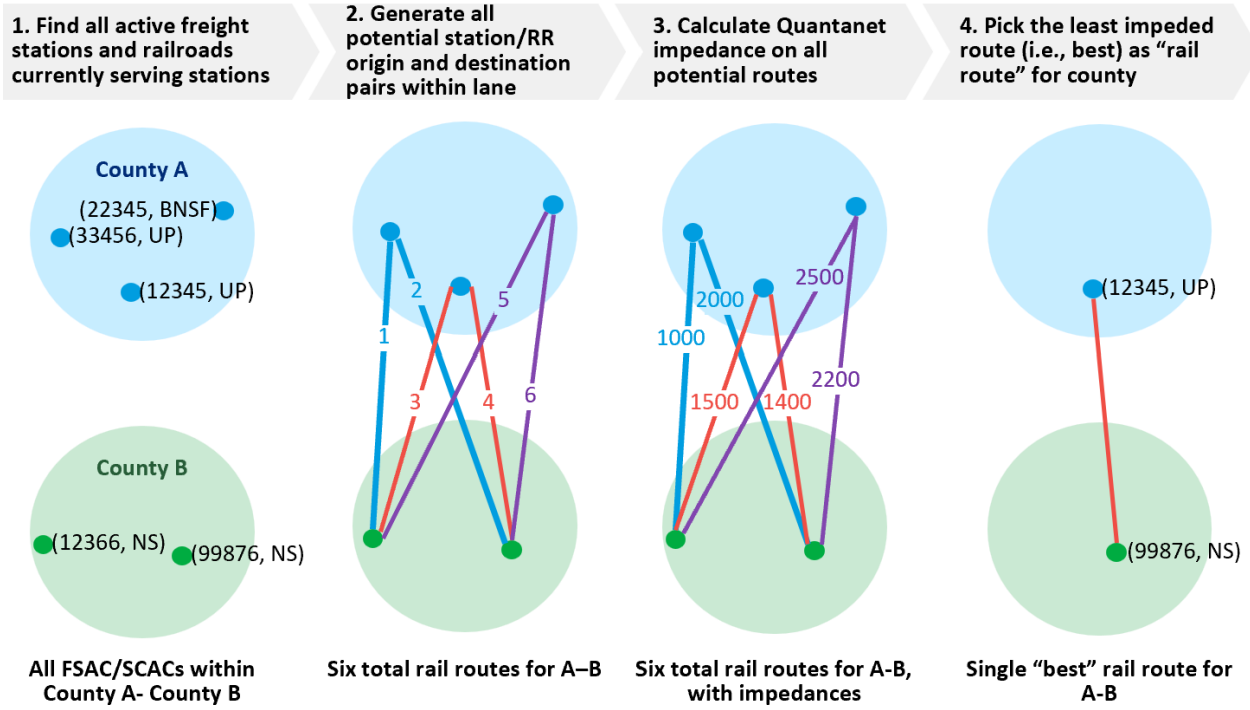
We matched the truck traffic from Transearch and rail traffic from CCWS to create a merchandise truck and rail database, where each row represents a single county-county-STCC2 commodity lane. For CCWS, we rolled up from the STCC6 or STCC7 level. We similarly rolled up Transearch from a STCC4 level to STCC2 to be comparable.

Transearch reports truck traffic with both commodities and truck equipment types, which was necessary to calculate a representative truck price. To spread the rail tonnage in that lane, we assumed the spread of a commodity's truck tons across equipment types would be the same for rail. We outline an illustrative example of this spread in the exhibit below.

Exhibit B-22: Illustrative example of spreading CCWS rail traffic across truck equipment types[152]

CCWS			
OFIPS	DFIPS	STCC2	Rail tons
12345	22345	20	200
12345	22345	14	20
12345	22345	11	30
12345	22345	28	50

Combined merchandise truck and rail database					
OFIPS	DFIPS	STCC2	Truck equipment type	Truck tons	Rail tons
12345	22345	20	Dry Van	50	100
12345	22345	20	Reefer	50	100
12345	22345	14	Bulk	100	20
12345	22345	11	Bulk	100	30
12345	22345	28	Tank	100	50



B. Rail county-county mileage

Because Transearch is at the county-to-county breakdown, a single rail route for each county-county lane is required to compare to the truck route. To get a single rail route, we chose the "best" rail route available; thus, if a shipper is choosing truck over rail, we assumed it is because the truck route is a more attractive option over all the rail routes available in that county.

To do so, for every county-county pair, as shown in Exhibit B-23, we generated every possible rail route option in that lane, using the rail mileage program described in Appendix A.6. We then selected the "best" rail route, which is defined as the lowest impended route. This process was completed twice – once to create the pre-merger network, and a second time to create the post-merger network. Where the UP-NS merger would improve service in certain lanes, that becomes a better route within that county to compete against truck options.

[152] Illustrative example of analysis within workpaper "MerchBuildAll_vF.sql"

Exhibit B-23: Illustrative process to choose a single rail route for each county-to-county lane

C. Lookalike model to estimate diversions

To estimate merchandise truck diversions, we used a lane "lookalike" analysis. The assumption is that rail lanes with similar characteristics will have a similar rail market share. We created lane "archetypes" based on similar characteristics; these archetypes are built off all county-county routes where both rail and truck have competing service (see Exhibit B-20 for the size of this set). We then grouped these "competitive" county-county routes into county-county-STCC2 lanes and into different "archetypes" based on similar characteristics.

As the UP-NS merger would improve service in specific lanes, it would shift some of these improved lanes into a different archetype. We assumed that lanes post-merger could be applied to the same rail market share as pre-merger. This lookalike analysis was performed across each of the five truck types as provided by Transearch: bulk, reefer, dry van, tanker, and flatbeds.

Lane archetypes: we utilized three key characteristics to group the lanes into archetypes: rail mileage, rail transit hours, and rail price. As a backup, we created a simplified archetype based on rail mileage and the distinction between single-line and interline service. This simplified archetype was used only when an improved lane post-merger fell into a new primary archetype that was not previously defined. We only used this simplified archetype for 55 lanes.

To create the archetypes, different "bins" were applied for each characteristic:

- Rail mileage was split into 250-mile increments: 250-499, 500-749, 750-999, 1000-1249, 1250-1499, 1500-1749, 1750-1999, 2000+.
- Rail transit hours were split into 15-hour increments, with bottom bin <50 miles, and top bin 350+ miles; 15-hours roughly equates to 100 car-miles based on agency sources (see "Rail Transit Time" section, where 163 car miles per day. A 100 car-mile difference we believe is a large enough change that shippers might reconsider their shipping mode choice.
- Rail price bins were calculated separately for each truck equipment type. We used the average price difference between pre-merger and post-merger prices within that equipment type to determine the bin sizes, given that pricing is the most significant difference between equipment types (see Exhibit B-24).

Exhibit B-24: Average rail price difference between pre- and post-merger by truck equipment type[153]

Equipment type	Avg. rail price difference
Bulk	$0.0057
Reefer	$0.0066
Dry van	$0.0083
Tank	$0.0031
Flatbed	$0.0059

[153] See workpaper "t2merch_lookalike_analysis.ipynb."

We used a range of 68-227 unique archetypes across the five truck types. The average rail market share for each of these archetypes comprises a set of current-state competitive lanes. The average number of lanes in each archetype ranges between 2,342 to 10,384 lanes across the five truck types, which provides confidence that the archetypes are representative. Only dry vans, flatbeds, and tanks have any archetypes with <30 observations, and these 21 low-observation archetypes only involve 19 diverted carloads. See Exhibit B-25 for a summary of this performance. The robustness of these archetypes provides strong confidence in the outputs of this analysis.

Exhibit B-25: Truck to rail carload, merchandise/bulk archetype robustness[154]

Equipment type	# of unique archetypes used	Avg. observations per archetype	# of archetypes composed of <30 observations	Diverted carloads attributed to these <30 observations
Bulk	203	4,882	1	1
Dry van	216	10,384	8	4
Reefer	68	4,452	0	0
Tank	227	2,342	8	12
Flatbed	195	3,974	4	2

Market share estimation: We calculated the average rail market share for each archetype based on all the lanes categorized within that archetype pre-merger. This average was weighted by the total market tons (defined as rail + truck tons within that lane). By doing this, higher-volume traffic lanes exert a greater influence on the archetype's average rail market share, under the assumption that market dynamics are more consistent with increased volume.

This current-state average market share by archetype was then directly applied to post-merger lanes, reflecting the new archetype classification following expected UP-NS

[154] See workpaper "t2merch_lookalike_market_share_vF.xlsx."

improvements. Consequently, most lanes that would be enhanced by the UP-NS merger transition into a new archetype, often characterized by a higher rail market share.

Diversion calculation: For lanes improved by the UP-NS merger, we calculated the estimated rail market size post-merger by multiplying the estimated rail market share by the current total market size. Potentially divertible traffic was determined by subtracting the current-state rail tons from the estimated rail tons post-merger.

After review of these quantitatively driven diversions, we excluded diverted traffic to better reflect what traffic would realistically be converted:

- In many cases, truck traffic is being diverted in the model to rail in counties where the potential for rail service exists today, but UP-NS does not have any existing traffic. In some of these cases, the rail volume being diverted is so low that UP-NS would not realistically begin service. Thus, if the origin county did not show at least two carloads a week of existing plus diverted traffic in the model, we excluded the diversion.
- The model identified 414 diverted carloads in South Dakota, Montana, and North Dakota, which are currently sole served by short lines but UP can access. We excluded those diversions because converting this traffic is complex and would rely on short-line partnerships, which is out of scope for this analysis.
- We excluded 1,938 carloads (see Exhibit B-26) that upon further inspection of the routes, the routing algorithm found little to no improvement to warrant a change in rail market share.

Exhibit B-26: Excluded diversions due to little to no improvement in routings[155]

Equipment type	Diverted carloads
Bulk	645
Dry van	63
Reefer	907
Tank	224
Flatbed	99
Total	1,938

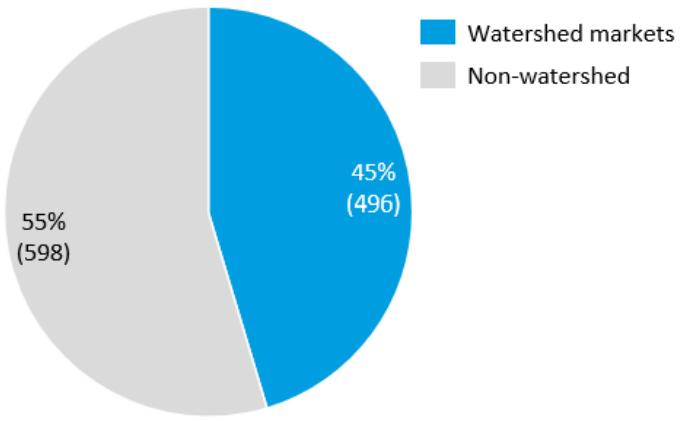
- If rail already performed better pre-merger than predicted to perform post-merger, we excluded these diversions. This was <1% of all diversions (see Exhibit B-27).

Exhibit B-27: Excluded diversions where rail performance already better pre-merger[156]

Equipment type	% of diverted lanes
Bulk	0.39%
Dry van	0.53%
Reefer	0.58%
Tank	0.45%
Flatbed	0.86%

We then converted diverted traffic, calculated in tons given the comparison to truck traffic, to railcar units. From the Public Use Waybill Sample, we calculated tons/railcar for each STCC2 commodity and applied this conversion to the diversions.[157]

B.5.3. Watershed Region Definition



Watershed markets are defined as inter-watershed and intra-watershed lanes. These lanes accounted for 45% of the merchandise/bulk truck and rail traffic in 2023, while non-watershed lanes accounted for 55% (Exhibit B-28).

[155] Ibid.
[156] See workpaper "t2merch_lookalike_analysis.ipynb."
[157] Public Use Waybill Sample, op. cit.; see workpaper "2023 Tons per Car PUWS.xlsx."

To observe the relative impact on merchandise/bulk traffic in/across the watershed compared to the rest of the US, we categorized existing lanes and estimated diversions as one of four lane types:

- **Inter-watershed:** a lane either originating or terminating in the watershed region
- **Intra-watershed:** a lane both originating and terminating in the watershed region
- **Cross-watershed:** a lane originating east of the watershed and terminating west of the watershed or a lane originating west of the watershed and terminating east of the watershed
- **All east or all west:** a lane that originates and terminates in either west or east

Exhibit B-28: Watershed vs. non-watershed merchandise/bulk markets[158]
Millions of tons; US Total = 1,094 million tons

We defined the watershed by identifying counties that fall within a 250-mile radius of one of four key gateways in this region: Chicago, St. Louis, Memphis, and New Orleans, as shown in Exhibit 4-8.[159] We selected this range to capture traffic at these four major interchange points at the convergence of existing US rail networks, as well as shippers located in and around these gateways. We then assigned all US counties outside these radii a designation of east or west, based on which side of the watershed they fall. We used these county designations to categorize

[158] See workpaper "t2merch_watershed_summary_vF.ipynb."
[159] A full list of counties included in this watershed region are available in the workpaper "all_fips_250_lookup.csv."

all lanes for both existing traffic and calculated estimated diversions for the four lane types by determining in which county each lane originates and terminates.

B.5.4. Rail Performance vs. Truck

A. Single-line vs. interline performance compared to truck

To determine rail's performance against trucking on routes with single line vs. only interline service available, we analyzed all "competitive" county-county merchandise lanes that are served by both rail and truck today. The exclusions that have been applied to these "competitive" lanes are explained in Section B.2.4 "Addressable Market: Merchandise/Bulk."

We looked at the best rail option available (as defined in Section B.3.) on each competitive lane and classified it as either single-line service (0 interchanges) or interline service (1+ interchanges). By the current-state rail length of haul, we then added truck and rail tons across single-line vs. interline lanes. The rail market share is the rail tons divided by total rail + truck market tons. The results in Exhibit B-29 show that rail is much less competitive against truck in lanes where only interline service is available to shippers.

Exhibit B-29: Rail performance across merchandise lanes, where single-line service vs. only interline service is available today[160]

Rail LOH	Single-line service available: truck tons (millions)	Single-line service available: rail tons (millions)	Single-line service available: rail market share	Only interline service available: truck tons (millions)	Only interline service available: rail tons (millions)	Only interline service available: rail market share
250-499	213.3	105.1	33%	70.4	7.2	9%
500-749	100.4	57.4	36%	47.4	5.0	9%
750-999	55.9	64.8	54%	36.0	5.6	13%
1000-1499	51.7	53.9	51%	57.2	10.3	15%
1500-1999	24.5	30.4	55%	20.7	4.1	16%
2000+	14.0	11.7	45%	37.5	9.6	20%

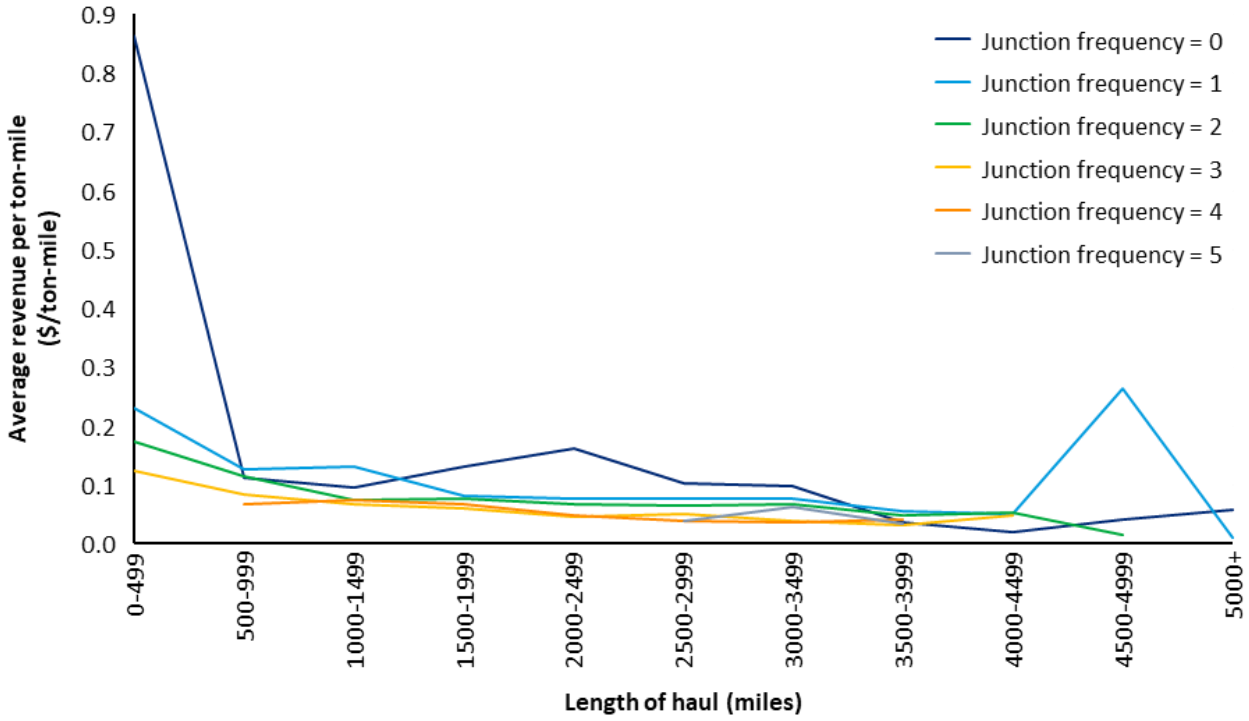
[160] See workpaper "t2merch_watershed_summary_vF.ipynb."

B. Single-line vs. interline performance compared to truck in the watershed

To evaluate merchandise rail performance against truck specifically within the watershed, we conducted the same analysis as done across all merchandise lanes but then split additionally by the four watershed lane types (cross watershed, inter-watershed, intra-watershed, and all east/west; see Section B.4 "Impacts on the Watershed Region" for lane-type definitions). The results show that lanes in the watershed with only interline service available underperform by 20-22 ppts compared to lanes in the East or West.

Exhibit B-30: Rail performance across merchandise lanes where single-line service vs. only interline service is available today, by lane type[161]

Lane Type	Single-line service available: truck tons (millions)	Single-line service available: rail tons (millions)	Single-line service available: rail market share	Only interline service available: truck tons (millions)	Only interline service available: rail tons (millions)	Only interline service available: rail market share
Cross-watershed	1.1	0.3	24%	63.4	4.8	7%
Inter-watershed	139.7	130.3	48%	110.5	11.3	9%
Intra-watershed	31.7	29.7	48%	40.1	3.1	7%
All east/west	287.4	163.0	36%	55.1	22.6	29%



B.6. Merchandise/Bulk Price Methodology

To estimate the cost per ton-mile for a merchandise train haul, we used data from the 2023 CCWS, as it is the most comprehensive and accurate source for rail pricing data in the industry that contains expanded revenue, expanded tons, and mileage information representative of all 2023 waybills. While the revenue per ton-mile figures from CCWS could be directly applied as a pricing lookup, the data also includes commercial considerations, which resulted in inexplicable increases in revenue per ton-mile as the rail mileage increased when all other factors were held

[161] Ibid.

constant, despite common industry knowledge suggesting an inverse relationship between these two variables (see Exhibit B-31).

Exhibit B-31: CCWS average revenue per ton-mile for all STCC2 commodities and service types by length of haul and junction frequency[162]

Due to these abnormalities seen in the raw CCWS data, we smoothed the price curves so that it is reflective of more logical behaviors and real-world pricing patterns. To produce new revenue per ton-mile curves for merchandise train types, we used power-law regression to regress revenue per ton-mile onto rail mileage for all CCWS merchandise train waybill records (service type = 1) not billed as a Rule 11 shipment (rebill code = 0). This regression was performed three times – once on waybills with no junction frequency (i.e., singe-line service), a second time on waybills with one junction frequency, and a third time on all remaining waybills with two or more junction frequencies. We assumed that when all other variables were held

[162] See workpaper "Raw - CCWS-Rail rev per ton mile by STCC2.xlsx."

constant, revenue per ton-mile would be the same for all merchandise train hauls with two or more interchanges. This assumption was adopted because the CCWS dataset contains very few records with more than two junction frequencies, so there was insufficient data to justify fitting a regression curve for these waybills (Exhibit B-32).

Exhibit B-32: Number of records and expanded cars in CCWS by junction frequency[163]

# of junction frequencies	Count of waybill records	# of expanded cars
0	1,880,986	30,645,562
1	203,759	2,261,278
2	23,044	237,061
3	812	4,240
4	8	40

Because these regressions were not done at a commodity-specific level, we indexed the CCWS revenue per ton-mile for each STCC2 commodity to the overall average revenue per ton-mile across all STCC2s to get a commodity-specific adjustment ratio. Given CCWS revenues account for tariff rates, we also applied another revenue adjustment ratio based on the revenue per ton-mile reported by the 2023 FCS for each STCC2, to more accurately capture the rate that shippers pay.

After all revenue adjustments were applied, a table of revenue per ton-mile by STCC2 commodity, length of haul (100-mile increments), and junction frequency was produced, to be used as a lookup to match revenue per ton-mile values to each merchandise train move. The resulting revenue per ton-mile curves averaged across all STCC2 commodities are summarized in Exhibit B-33.

[163] See workpaper "CCWS_by_JF_VF.sql."

Exhibit B-33: Adjusted CCWS revenue per ton-mile averaged across all commodities by length of haul and junction frequency for merchandise trains[164]

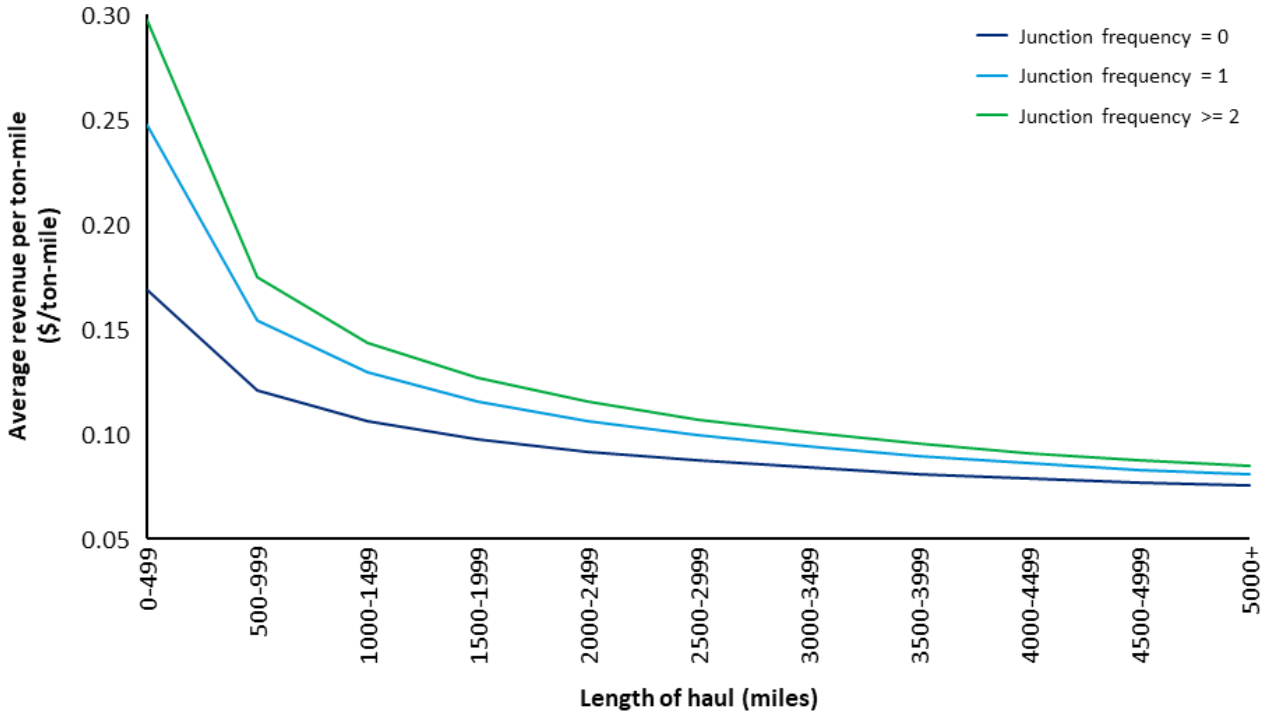


Exhibit B-34 depicts the entire rail price estimation process for merchandise trains, Exhibit B-35 shows summarized outputs of average rail price per ton-mile for merchandise trains pre-merger by length of haul.

[164] See workpaper "Revised revenue per ton mile.xlsx."

Exhibit B-34: Process used to estimate rail price per ton-mile pre/post-merger for merchandise trains

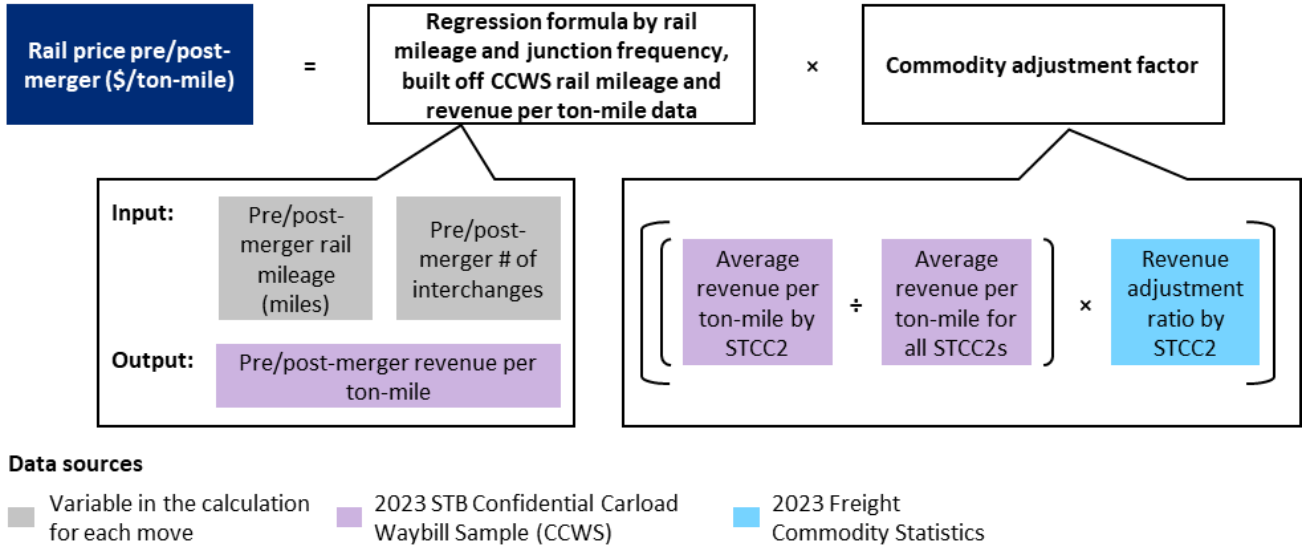

Exhibit B-35: Summarized outputs of average price per ton-mile for merchandise trains pre-merger by length of haul for merchandise/bulk traffic[165]

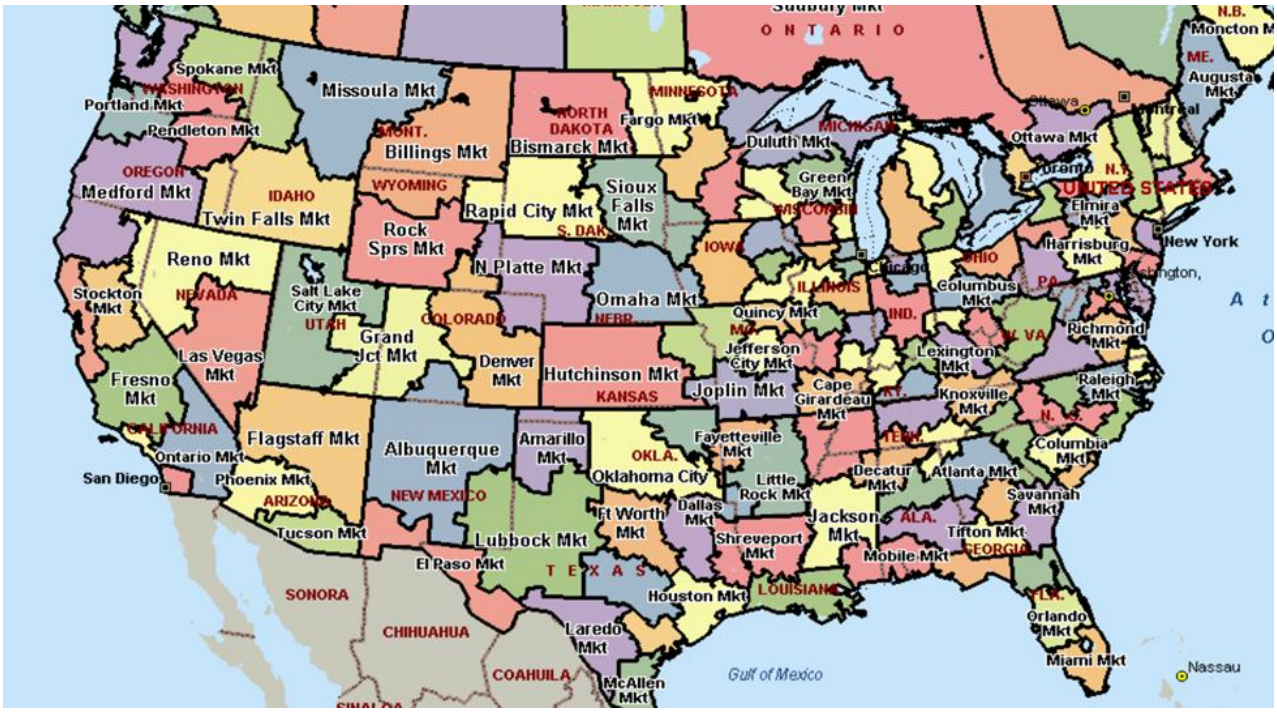
Rail length of haul (miles)	Avg. price per ton-mile pre-merger for merchandise trains	
	Single line	Interline
250-499	0.089	0.115
500-749	0.081	0.102
750-999	0.077	0.094
1000-1499	0.071	0.085
1500-1999	0.066	0.074
2000+	0.060	0.064



B.7. Truck Price Assumptions

To estimate the cost per ton-mile for a truck haul, we used data purchased from DAT Freight & Analytics ("DAT") which details average spot and contract rates for the 10,000 highest volume US dry van lanes for 2023. DAT is North America's largest truckload freight marketplace and leads the industry in freight data analytics. DAT dry van cost per-mile is

[165] See workpaper "avg_rail_price_per_ton_mile_pre_VF.sql."

provided at the key market area ("KMA") lane level, where each origin and destination key market area is defined as a combination of multiple 3-digit ZIP code regions (Exhibit B-36).

Exhibit B-36: DAT key market areas (KMAs)

To match DAT lanes with Transearch lanes, which are defined at the more granular county level, the origin and destination KMAs were mapped to their corresponding counties, and the same spot/contract rates were assigned to every lane that originated and terminated in counties contained within each origin-destination KMA pair.

Since DAT only includes costs for US-based lanes and there is not a comparable source for transborder trucking, we estimated truck costs to/from Canada or Mexico using DAT's average rates by length of haul. For any lanes lacking DAT pricing, spot and contract rates were estimated using group averages by length-of-haul (LOH) across all county-to-county lanes with DAT cost data, after mapping KMAs to counties (Exhibit B-37).

Exhibit B-37: Average DAT contract and spot rate per mile by length of haul for merchandise/bulk traffic[166]

Length of haul (miles)	Average contract rate per mile ($/mile) for dry vans	Average spot rate per mile ($/mile) for dry vans
250-499	3.999	3.997
500-749	1.829	1.830
750-999	1.709	1.710
1000-1499	1.582	1.583
1500-1999	1.502	1.503
2000+	1.332	1.334

Once a dry van contract/spot rate per mile had been matched to every Transearch county-to-county lane, a dry van cost per-mile was calculated using the formula below:

> *Dry van cost per mile for lane = (average spot rate for lane + average contract rate for lane)/2 + $0.44 per mile of average fuel surcharge rate*

Since DAT only carries cost per mile information for dry vans, we adjusted those rates to represent the broader set of truck equipment in Transearch, by applying various truck cost to dry van cost ratios reported by the American Transportation Research Institute ("ATRI") to more accurately reflect prices for the different truck equipment types contained in Transearch (Exhibit B-38). In our experience, ATRI is another data source that provides credible and useful insights on trucking costs.

Exhibit B-38: ATRI 2023 average respondent total cost per mile by type of truck[167]

Transearch truck type	Equivalent ATRI truck type	Total cost per mile, $ reported by ATRI	Cost to dry van ratio
Tank – liquid bulk	Tanker	$3.87	1.33
Refrigerated	Refrigerated van	$3.41	1.17
Flatbed	Flatbed/oversize	$3.29	1.13
Bulk	Flatbed/oversize	$3.29	1.13
Dry van	Truckload dry van	$2.92	1.00

[166] See workpaper "Truck price per mile_vF.ipynb."
[167] Source: ATRI-Operational-Cost-of-Trucking-06-2024.pdf.

While ATRI reported total cost per mile information on most truck types, it did not report on automotive hauler cost per mile figures. As such, the ratio of automotive hauler cost to dry van cost is derived separately using 10-K filings from 2024 Proficient Auto Logistics ("PAL"), a publicly traded auto-hauler company that has one of the largest auto transportation fleets in North America.

Exhibit B-39: Proficient Auto Logistics reported 2023 miles driven and operating expenses[168]
10-K filings for the year ended Dec 31, 2024

Total operating expenses in 2023	Total # miles driven in 2023	Approximate total cost per mile	ATRI dry van total cost per mile	Automotive cost to dry van cost ratio
$125,402,539	10,000,000	$12.54	$2.92	4.30

The final step to calculate truck cost per ton-mile is as follows:

Truck cost per ton-mile = truck cost per-mile derived from DAT ÷ total truck tons in each county-to-county lane

Exhibit B-40 depicts the entire truck price estimation process, Exhibit B-41 shows summarized outputs of the truck price per mile by length of haul, and Exhibit B-42 shows summarized outputs of the truck price per ton-mile by length of haul.

[168] Source: Form 10-K for Proficient Auto Logistics.pdf

Exhibit B-40: Process used to estimate truck price per ton-mile

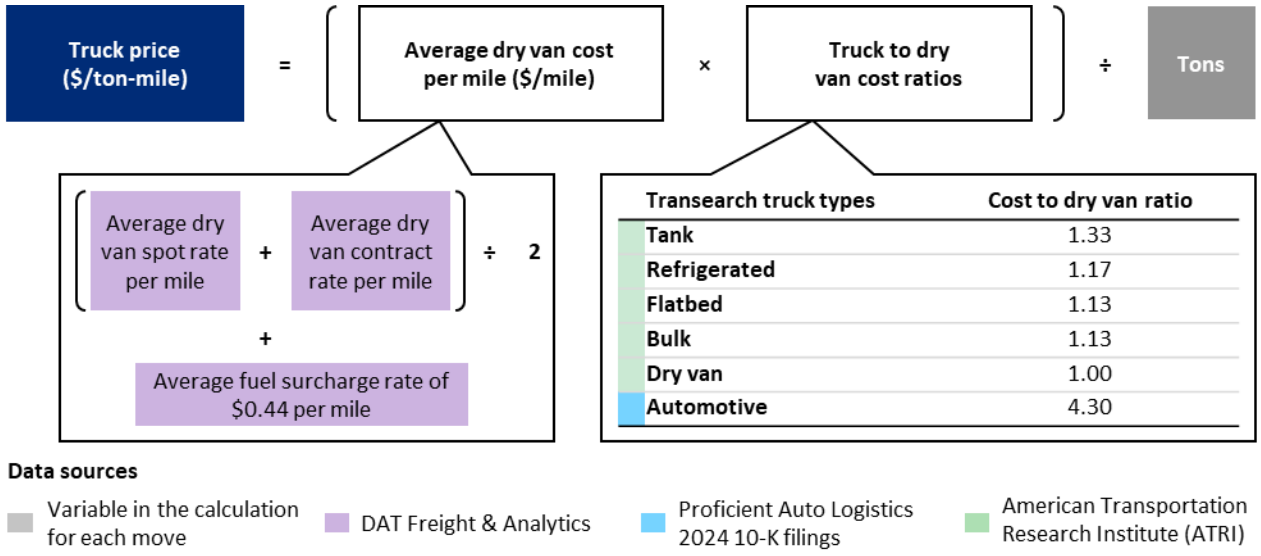


Exhibit B-41: Summary output for average truck price per mile by truck equipment type and length of haul for merchandise/bulk traffic[169]

LOH (miles)	Automotive	Bulk	Dry van	Flatbed	Refrigerated	Tank
250-499	13.98	5.94	3.97	4.63	4.57	5.24
500-749	10.16	2.56	2.28	2.54	2.68	3.00
750-999	9.89	2.41	2.16	2.39	2.57	2.84
1000-1499	9.10	2.28	2.02	2.23	2.43	2.66
1500-1999	8.35	2.19	1.93	2.17	2.29	2.58
2000+	7.62	2.00	1.76	1.97	2.09	2.34

Exhibit B-42: Summary output for average truck price per ton-mile by truck equipment type and length of haul for merchandise/bulk traffic[170]

LOH (miles)	Automotive	Bulk	Dry van	Flatbed	Refrigerated	Tank
250-499	1.01	0.30	0.17	0.24	0.20	0.30
500-749	0.73	0.12	0.10	0.14	0.12	0.19
750-999	0.71	0.11	0.10	0.14	0.11	0.18
1000-1499	0.66	0.11	0.10	0.13	0.11	0.16
1500-1999	0.60	0.11	0.10	0.13	0.10	0.15
2000+	0.55	0.09	0.08	0.11	0.09	0.13

[169] See workpaper "avg_truck_price_per_mile_by_eqip_type_VF.sql."
[170] See workpaper "avg_truck_price_per_ton_mile_merch_VF.sql."

B.8. Merchandise/Bulk Train Transit Time

Merchandise/bulk rail transit time is calculated as the customer pick up to customer drop off transit time for a given shipment. Rail transit time is estimated in hours for both pre- and post-merger scenarios, with the key assumption for weekly average car-miles per day taken from data reported publicly to the STB in Docket No. EP 770 (Sub-No. 1). This proceeding required all Class I rail carriers to temporarily submit two broad categories of data (rail service and employment) starting in 2022. The agency ended the service data reporting component after December 31, 2023.

We excluded CSXT data given the reported weekly average number of car-miles per day was abnormally low across all car ownership types when compared to other Class I railroads (Exhibit B-43). We also excluded any data reported as TTX-owned car types when calculating merchandise train velocity, given the TTX fleet consists primarily of intermodal railcars that travel at much faster speeds than merchandise railcars.

Exhibit B-43: Comparison of 2023 weekly average number of car-miles per day by railroad and car ownership type[171]

Ownership type	CSXT	Average across all other Class I's
Private	51	161
Railroad	80	166
TTX	114	217

Using this official data collected by the agency in 2023 across all railroads, excluding CSXT, we computed a weekly average of car miles per day for private and railroad-owned cars, weighted by weekly average number of cars per day in service with mileage, to arrive at an estimated 163 car-miles per day. While railroads have different methodologies to calculate

[171] See workpaper "EP770 and EP724 Summary.xlsx."

average car miles per day, this value typically represents an all-encompassing operating metric that takes into account the train speed from origination yard to destination yard, as well as the time that the railcar spends in a yard; this is comparable to the activities included in the truck transit time explained in Section B.5. Exhibit B-44 shows the detailed methodology for the weighted average calculation.

Exhibit B-44: Weighted average calculation of 2023 car-miles per day for all railroads[172]

Ownership type	Weekly average number of cars per day in service with mileage	% of total cars per day in service (excl. TTX)	Weekly average number of car-miles per day	Weighted average number of car-miles per day
Private	30,290	69%	161.39	(69% × 161.39 car miles/day) + (31% ×166.20 car miles/day) = 163 car miles/day
Railroad	13,604	31%	166.20	

Because the car-miles per day reported in EP770 (Sub-No. 1) already include all move dwell times (e.g., train reclassification, crew changes, block swapping), we did not add any further dwell time to transit duration. However, to more realistically capture terminal operations at the origin and destination, we added a two-hour warehouse handling time to every rail haul to reflect loading and unloading times, based on a commercial review with UP and NS.

For interline moves, additional interchange dwell must be accounted for at each junction. We therefore drew on railroad performance data reported to the Board under 49 CFR part 1250 (which requires Class I carriers to report specified service metrics) and applied the 2023 average system terminal dwell time of 22 hours (excluding cars on run-through trains) as the estimate of time spent at each interchange. Exhibit B-45 summarizes the key expert assumptions made when calculating merchandise train transit time, and Exhibit B-46 depicts the entire rail transit time

[172] Ibid.

estimation process. Comparisons of the average rail transit times pre and post-merger are summarized in Exhibit B-47.

Exhibit B-45: Summary of Oliver Wyman expert assumptions when calculating merchandise train transit time[173]

Metric	Assumed value	Source
Merchandise railcar velocity	163 miles per day	2023 weighted average car-miles per day for all railroads (excluding CSXT and TTX car types) reported to the STB under EP770
Warehouse handling time[174]	2 hours	Assumption made from OW experience working with trucking carriers
Average dwell time per interchange	22 hours	2023 average system terminal dwell time (excluding cars on run-through trains) reported to the STB under 49 C.F.R part 1250

Exhibit B-46: Process used to estimate rail transit time pre and post-merger

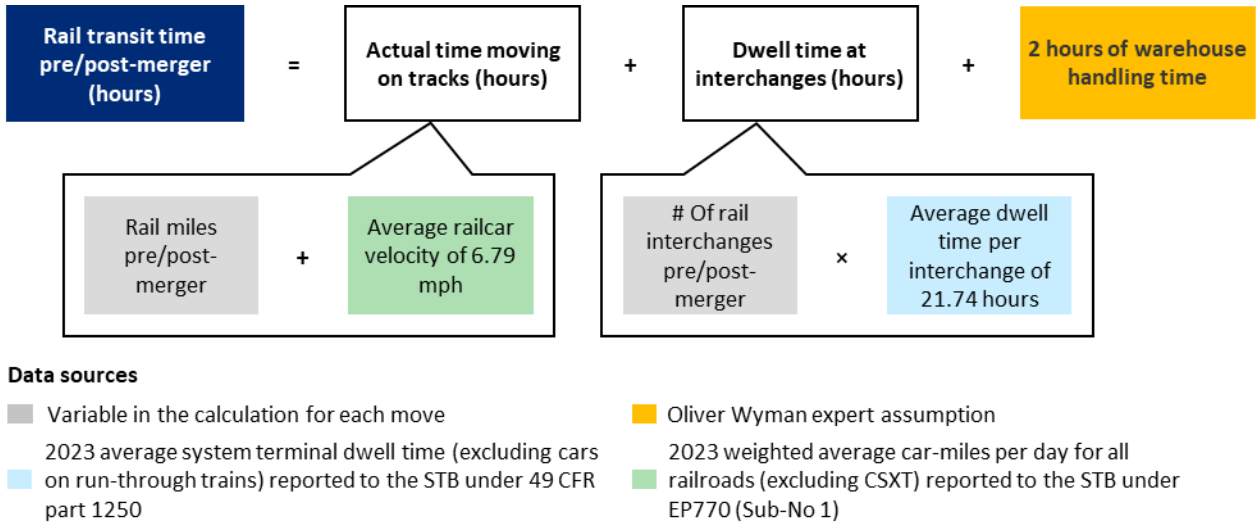

Exhibit B-47: Summary output for rail transit time pre-merger for merchandise/bulk traffic[175]

Rail length of haul (miles)	Average rail transit time pre-merger (hours)	
	Single Line	Interline
250-499	58	84
500-749	93	118
750-999	129	155
1000-1499	178	207
1500-1999	258	279
2000+	336	404

[174] Includes total load/unload time.
[175] See workpaper "rail_transit_time_pre_by_LOH_VF.sql."

B.9. Truck Transit Time Assumptions

Truck transit time is calculated as a door-to-door transit time for a given shipment. We assumed that all truck types travel at an average velocity of 50 miles per hour based on industry experience for a single driver. This velocity assumption includes activities comparable to those included in rail transit velocity (see Section B.4, e.g., handling within the route). Beyond this velocity assumption, truck transit time has been estimated to comply with US Federal Motor Carrier Safety Administration's ("FMCSA") hours of service ("HOS") regulations for property-carrying drivers. We solely focused on the rules and regulations prescribed by the FMCSA, given it is the agency within the US Department of Transportation that regulates and enforces safety standards for commercial motor vehicles ("CMVs"), including large trucks and buses. FMCSA limits on daily driving hours introduce real-world constraints that affect truck transit time calculations:

- **11-hour driving limit:** drivers may drive a maximum of 11 hours after 10 consecutive hours off duty
- **30-minute driving break:** drivers must take a 30-minute break when they have driven for a period of 8 cumulative hours without at least a 30-minute interruption. The break may be satisfied by any non-driving period of 30 consecutive minutes (i.e., on-duty not driving, off-duty, sleeper berth, or any combination of these taken consecutively). We assumed that drivers will use this 30-minute break efficiently to refuel and will not need to make additional refueling stops at any other time.
- **14-hour limit:** Although there is a rule that drivers may not drive beyond the 14th consecutive hour after coming on duty, a simplifying assumption is made that the driver will

maximize the 11-hour driving limit in this 14-hour window and hence duty time will not be a limiting factor for truck transit time.

Similar to how rail transit time accounts for additional origin/destination dwell to reflect reality, we included a two-hour dwell to all truck transit times to reflect truck loading and unloading work required. Exhibit B-48 summarizes the key expert assumptions made when calculating truck transit time, Exhibit B-49 depicts the entire truck transit time estimation process, and Exhibit B-50 shows summarized outputs of average truck transit time in hours by truck length of haul.

Exhibit B-48: Summary of Oliver Wyman expert assumptions when calculating truck transit time

Metric	Assumed value	Source
Truck velocity for all truck types	50 miles per hour	Oliver Wyman experience working with large trucking carriers
Total load/unload time	2 hours	Oliver Wyman experience working with large trucking carriers
Consecutive driving time before required 30-min break	8 hours	FMCSA hours of service regulations for property-carrying drivers (Summary of Hours of Service Regulations, FMCSA)
Length of break after 8 hours of driving	0.5 hours	
Consecutive driving time allowed on duty	11 hours	
Length of rest after 11 consecutive hours of driving	10 hours	

Exhibit B-49: Process used to estimate truck transit time

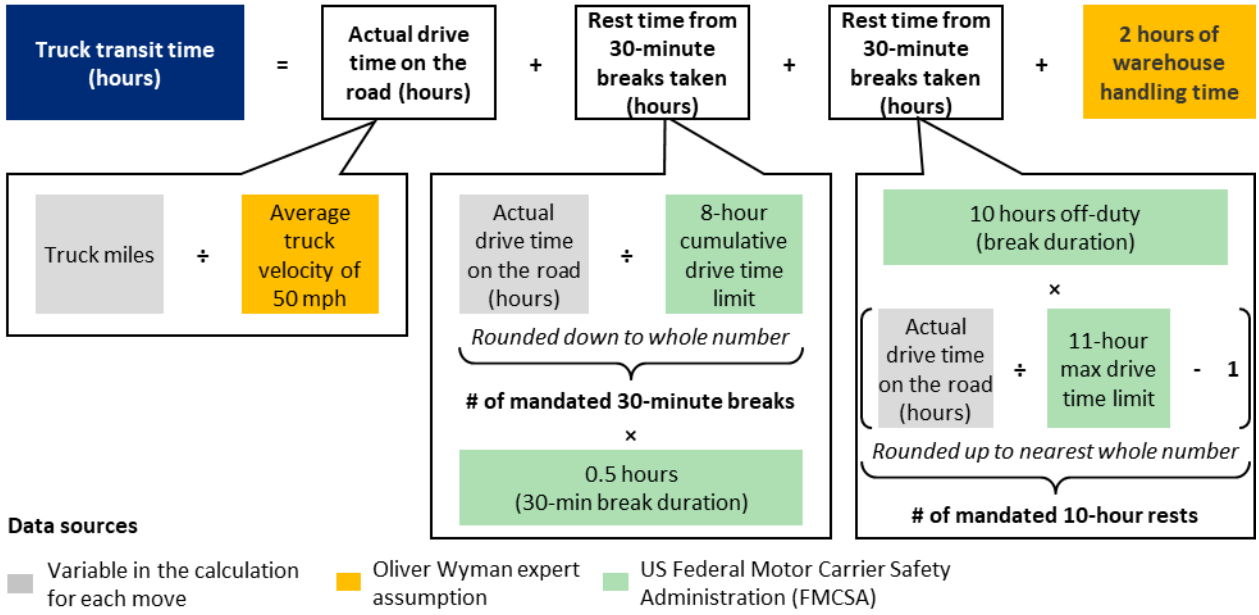

Exhibit B-50: Summarized output of average truck transit time by length of haul for merchandise/bulk traffic[176]

Truck length of haul (miles)	Average truck transit time (hours)
250-499	9
500-749	22
750-999	30
1000-1499	45
1500-1999	64
2000+	91

B.10. Assumptions for Transit Time Comparison

Exhibit B-51 summarizes the key assumptions made when calculating merchandise railcar and truck transit times.[177] Applying these assumption to an example lane between Minneapolis, MN and Columbus, OH, a single-line move can improve transit time by 17% over an interline

[176] See workpaper "avg_truck_transit_time_by_LOH_merch_VF.sql."
[177] Truck transit times are regulated by the US Federal Motor Carrier Safety Administration's ("FMCSA") hours of service ("HOS") regulations.

move (Exhibit B-52). While truck is still faster, a single-line rail service can narrow the transit time gap to improve rail's competitiveness.[178]

Exhibit B-51: Summary of assumptions for calculating transit times

Metric	Assumed value	Source
Merchandise railcar		
Merchandise car-miles per day	163 miles per day	2023 weighted average car-miles per day for all railroads (excluding CSXT and TTX car types) reported to the STB under EP770
Warehouse handling time[179]	2 hours	Assumption made by Oliver Wyman and validated with UP and NS
Handling time at an interchange	22 hours	2023 average system terminal dwell time (excluding cars on run-through trains) reported to the STB under 49 CFR part 1250
Truck		
Truck velocity for all truck types	50 miles per hour	Oliver Wyman experience working with large trucking carriers
Total load/unload time	2 hours	
Consecutive driving time before required 30-min break	8 hours	FMCSA hours of service regulations for property-carrying drivers (Summary of Hours of Service Regulations, FMCSA)
Length of break after 8 hours of driving	0.5 hours	
Consecutive driving time allowed on duty	11 hours	
Length of rest after 11 consecutive hours of driving	10 hours	

Exhibit B-52: Illustrative example of impact of railroad interchange on transit time, Minneapolis, MN-Columbus, OH[180]

	Rail interline	Rail single-line	Truck	Notes
Mileage	720	720	720	Use same mileage for this illustrative example
Mph	6.79	6.79	50	Average speed
Hours moving	106.0	106.0	14.4	Hours while train or truck is in motion
Hours not moving	22	0	10.5	Interchange for rail, mandatory rests for truck
Load/unload hours	2	2	2	Loading/unloading time
Total hours	129.8	108.0	26.9	Sum of hours in motion, stationery, at end points
Rail hrs/truck hrs	4.8	4.0		Rail hours relative to truck hours

[178] (129.8 hours – 108.0 hours) / 129.8 hours = 17%.

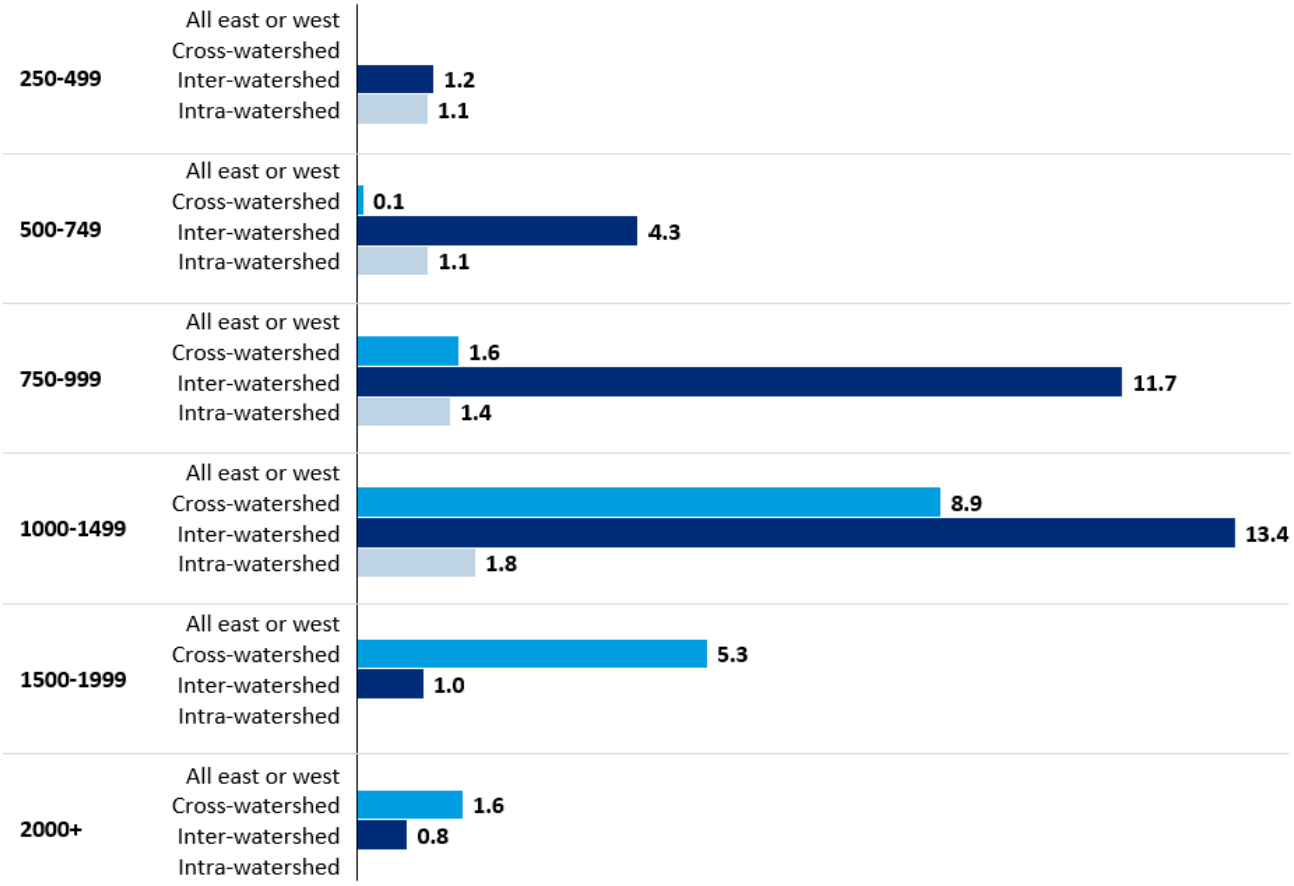
Commodity-specific truck-to-carload rail merchandise/bulk diversions

Exhibit B-55 shows the estimated diversions in rail carloads by distance band and by geography relative to the watershed region for food products. There are an estimated 65,000 carloads of diverted food products. Focusing on the 1000-1499 mileage band, the majority of carloads are cross-watershed or inter-watershed diversions. Cross-watershed moves include Iowa to eastern locations, such as Pennsylvania and New Jersey. Inter-watershed moves include lanes like Iowa to Indiana, which is one of the top 10 diverted lanes.

[182] See workpapers "All_Results_vF.xlsx." and "Top 10 states terminating T2R merch diversions vF.sql."

Exhibit B-55: Estimated truck-to-carload rail diversions of food products, by distance band and watershed region[183]

Thousands of rail carloads; total = 65,000 carloads



The estimated diversions for chemicals follow a similar pattern as food products, with most diversions occurring in the cross-watershed and inter-watershed regions (Exhibit B-56). Inter-watershed moves include lanes such as Texas to Pennsylvania and Texas to New Jersey. The largest category of chemical diversions is 13,000 carloads in the 1000-1499 distance band for inter-watershed moves.

[183] Food products = STCC 20. See workpaper "t2merch_watershed_summary_vF.ipynb."

Exhibit B-56: Estimated truck-to-carload rail diversions of chemicals, by distance band and watershed region[184]

Thousands of rail carloads; total = 55,000 carloads

We estimate that primary metals will be another large source of merchandise/bulk diversions from trucks, totaling 24,000 new rail carloads (Exhibit B-57 below). The top state-state lanes expected to see this majority of this new traffic are Ohio-Texas, Alabama-Texas, and Ohio-California. The top 15 lanes are expected to account for 58% of these diversions.

[184] Chemicals = STCC 28. See workpaper "t2merch_watershed_summary_vF.ipynb."

B.12. Converting Diverted Carloads/Units Into Diverted Truckloads

To estimate the number of trucks diverted off the highway per railcar, we used the following methodology:

- For intermodal diversions, we assumed that one container equals one truckload, resulting in the same number of truckloads off the road as estimated truck to rail diverted intermodal units. Each intermodal unit will create two loaded local drayage moves. These were sized based on the average drayage miles for each lane. No empty repositioning miles are assumed for either the reduction in over-the-road trucking or the incremental drayage. For over-the-

[185] Primary metals = STCC 33. Includes rail-to-rail and truck-to-rail diversions. See workpaper "All_Resulsts_vF.xlsx." and "Top primary metal state to state diversions vF.sql."

road trucking, industry leaders operate 14% empty miles.[186] For drayage, the number is higher as empty containers must be repositioned to a load or returned to the terminal.

- For finished vehicles, we estimated diversions in carloads, so calculated the tons per average carload carrying finished vehicles (STCC 3711) from the CCWS (20.5 tons/carload).[187] Then, we used Transearch to calculate the average tons/truckload for STCC 3711 (14.1 tons/truckload).[188] No empty repositioning miles are assumed. Empty miles for final mile automotive delivery, and most over-the-road lanes, will be close to 50% as it is rare for a dealership to also load cars.
- For merchandise/bulk, we calculated tons per truck unit by STCC2 commodity and truck equipment type from Transearch. We then used this ratio to convert the estimated diverted tons to truckloads off the highway. No empty repositioning miles are assumed. For dry van and flatbed traffic, the empty miles will be similar to general over-the-road trucking. This will increase to 50% for tanker and bulk trucks as these rarely have backhaul loads.

Exhibit B-58 shows the summary statistics for trucking diverted to rail. This shows that the drayage truck-miles and ton-miles created by converting from truck to intermodal is very small compared with the truck traffic removed from highways, excluding empty miles.

A GTM estimate for trucks is included, assuming a 15-ton tare weight for a tractor and semi-trailer (all types). This allows for comparison of GTMs removed from the highway with GTMs added to the railroad network. No empty miles for rail is included in the GTM calculation – this is loads versus loads. The GTMs are estimated using the shortest path mileage.

[186] 2023 Knight Swift annual report (14.2% empty miles) and Werner annual report (14.4%) for irregular route, for-hire trucking; see reference sources "Knight_Swift_2023_annual_report_VF.pdf" and "Werner_2023_annual_report_VF.pdf." Note that empty miles percentages shown here are [empty miles] / ([loaded miles] + [empty miles])

Appendix C. Diversion Model Application

C.1. Transition to Operating Plan

The processing of the diversion traffic to the operating plan was divided into three layers:

- **Rail-to-rail diversions**. This process removed some diversions, deleted many small flows in an 80-20 situation, and identified existing flows in the operating plan where a part of a diversion overlapped with that flow.
- **Truck-to-rail diversions**. Most of the diversions were small, but there were hundreds of thousands of them that needed to be consolidated for the operating plan, while ensuring that the operating plan would have valid volumes for blocks, trains, and yards.
- **Intermodal diversions**. The intermodal diversion traffic had been already screened to ensure there is sufficient density to offer service and matched to origin-destination terminals. No further adjustments were performed, other than the addition of empty flows to balance each terminal's growth.

C.1.0. Rail-to-Rail Diversions to the Operating Plan

After estimating merchandise/bulk and automotive rail-to-rail diversions, we applied selected adjustments to prepare and compress the data before inputting into MultiRail:[190]

- Removed diversions that experts from NS and UP thought were unlikely due to either physical network connectivity issues (such as the ability to reach the assembly location), existing long-term contracts with other railroads, or rail-on-waterway lanes. This impacted certain loaded auto (multilevel) moves detailed in Section A.7.3 above, and diversions from the CGR train ferry between Alabama and Mexico.
- Mapped all diverted traffic to MultiRail nodes.

[190] See workpaper "R2R_Diversions_2_MR_V2.ipynb."

- Restricted diversions to the ~3,300 nodes capable of originating or terminating blocks.
- Reassigned diversions to block-handling nodes within a 50 mile radius as needed. Diversion locations had SPLCs that needed to be translated into valid blocking locations.
- For automotive diversions, mapped traffic to nodes with auto ramps. Input from experts at UP-NS informed which locations are capable of handling additional automotive traffic.

• Rationalized the "long tail" of lanes with fractional annual diverted cars and grossed up diversions accordingly to preserve total cars. For example, the bulk diversions decreased by 2% when the "long tail" was removed, and the bulk car counts for each lane were increased by 102% (98% x 102% = 100%) to compensate. Auto traffic was had no gross-up – less than 0.5% of the traffic was rationalized and it felt important to align the loaded diversions with the empty multi-level logic.

• Examined the path of each diversion and compared it to the original path to see if the diversion was an extended haul, new diversion, or existing lane.
  - New diversion: If the original traffic flow was from AAA to BBB on BNSF and BBB to CCC on CSXT, and the diversion was AAA to CCC on the combined UP/NS railroad, this would be considered a new diversion.
  - Extended haul: If the original traffic flow was AAA to BBB on UP, and then BBB to CCC on CSXT, and the diversion was AAA to CCC on the combined railroad, this was considered an extended haul. That is, the original UP/NS flow was from AAA to BBB and then extended to CCC.
  - Existing lane**:** If the original traffic flow was AAA to BBB on UP, and then BBB to CCC on NS, and the diversion estimated that more traffic will be attracted to route, then the diversion is onto an existing UP/NS lane.

- In the output of this process, we recorded the origin/destination and railroad (UP or NS) of the extended hauls. How this is used is discussed in the next section.
- Modeled the movement of empty cars generated by the diverted traffic.
  - For merchandise and bulk, added empties on a one-to-one basis for rail-to-rail diversions.
  - For automotive, the empties were modeled based on the combined rail-to-rail and truck-to-rail diversions, plus the auto traffic from the 2023 base traffic. This was done to represent the more efficient industry wide movement of empty multilevels.
- Obtained representative net- weight, tare and length for the cars in a diversion lane. This was based on examining the traffic data in MultiRail (whose origins were waybills) to obtain appropriate average weights and lengths.

C.1.1. Rail-to-Rail Offsets to the Operating Plan

As described above, the rail-to-rail diversions were classified either as new, extended, or existing. For extended haul, it was important to back out the original traffic. For example, if the original traffic as AAA to BBB on UP and BBB to CCC on CSXT, and the diversion was 10 cars on the AAA to CCC on UP/NS, then we added that traffic record to the operating plan but had to identify existing traffic records in the operating plan that went from AAA to BBB and subtracted a total of 10 cars from them. A gross-up was applied in a small number of cases to ensure that any lanes where no traffic to offset in the compressed traffic file is available that kept the total car-miles to offset the same.

That identification was routine for most cases. We might find five traffic records from AAA to BBB with slightly different characteristics (such as the from/to railroad) with a total of 40 cars. We reduced the traffic by 25% for each of those five traffic records.

Due mostly to remapping waybill locations to MultiRail nodes, there were times when an exact lane could matching the extended how could not be found. A common situation was in Chicago with many nodes and the same SPLC. We could not always find the exact lane that matched the diversion route, so we used the MultiRail lane that was closest to it (the two end points of the diversion extended haul lane were close to the two end points of the MultiRail lane).

C.1.2. Truck-to-Rail Diversions to the Operating Plan

The truck-to-rail conversion to the MultiRail operating plan had the following steps:[191]

- Translated the FIPS codes that were used as origins and destinations of the diversions into the ~3,300 blocking locations in MultiRail.
- Reduced the traffic to a manageable set for inclusion into the operating plan.

Traffic reduction needed a different approach than what was used for rail-to-rail diversions, where a cutoff of 10 cars per year was used. In that case, a significant number of the lanes were kept, and the gross-up factors were not large. This approach was sufficient to ensure that the trains and the blocks in the operating plan would have reasonable volumes.

For truck-to-rail, a simple cutoff of, for example, 10 cars per year would result in using only 1.3% of traffic lanes. The concern was that a simple gross-up based on car counts might not reflect the varying distances of the diversion lanes, which would lead to inaccurate block and train volume estimates with the operating plan.

A different approach for grossing up was used – we maintained car-miles by STCC and car-type instead of car counts. Using car-miles better reflects the increases found in the diversion model and gave reasonable block and train volumes (which aggregate traffic to various levels). However, using car-miles does result in the number of cars changing.

[191] See workpaper "T2R_Diversions_2_MR.ipynb."

As a result of this compression, diverted carloads increased from ~183,000 to ~193,000 for truck-to-rail merchandise. Total diverted car-miles remained unchanged for all diversion types. Diverted finished vehicles were only in 36 lanes and there was no need to change that.

C.2. Adjustment for Refrigerated Railcars

Diversions for lanes originally classified as truck equipment type code "R," or refrigerated trucks, were reallocated AAR Car Types. After review with UP and NS subject matter experts, and consultation with Transearch, some of the commodities that Transearch classified to move in refrigerated trucks we determined would not need to move by refrigerated railcars ("R"). This is because the underlying commodities (e.g., 2046 – Wet Corn Milling or Milo) will move in refrigerated tanker trucks and other specialty trailers for food transportation. When these commodities move by rail, they do not do so in refrigerated boxcars ("R").

Therefore, we partially reallocated these refrigerated truck diversions to other AAR Car Types beyond refrigerator cars, specifically types equipped box cars ("A"), unequipped box cars ("B"), covered hopper cars ("C"), and tank cars ("T"). The re-allocation of diversion traffic between these 5 car types, including car type R, was determined based on a combination of the share of STCC4 commodities to be diverted on the given lane and the share of railcar types which a STCC4 commodity historically ships on.[192] Only STCC4 codes within STCC2 20 (food products) are considered for this analysis. The original refrigerated truck volume and revenue was re-allocated to other car types based on this calculated railcar share to retain the same car count, car-miles and gross-ton-miles (we assume minimal tare weight difference). This reallocation had no impact on the total revenue numbers since revenue is indifferent to equipment type (see Appendix C.3 for full revenue calculation).

[192] See workpaper "Reefer_railcar_vF.xlsx."

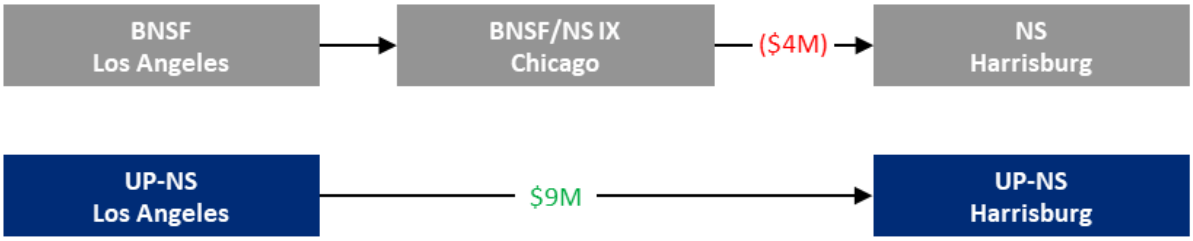
C.3. Revenue Calculation

We estimated the revenue impact from the diversion analysis output after we delivered the estimates to the operating plan to create a more realistic revenue estimate. The model estimates were compressed to flow over in the operating plan (see A.C.1 "Transition to Operating Plan"), and offsets from extended haul traffic were made during this step.[193]

To estimate the UP-NS revenue increase from rail-to-rail and truck-to-rail diversions, we used the following formulas:

Revenue = Diverted Net Tons × Miles on UPNS network × Revenue per Ton-Mile - Offset Revenue

For all traffic, we calculated revenue per ton-mile from the CCWS by plotting the data in Microsoft Excel and fitting a trendline, where a regression based on a power curve provided the best fit for the trendline (see Appendix B.6 for an explanation of the regression curve and the results). Three regressions were applied to estimate revenue per-ton-mile.[194]Merchandise and bulk traffic utilized a lookup table based on the regression analysis, adjusting for STCC2 commodity, junction frequency, and length of haul based on CCWS Service Type 1 (general merchandise) and 3 (bulk) traffic. Intermodal traffic utilized a lookup table based on the regression analysis of CCWS Service Type 2 (intermodal) traffic, adjusting for junction frequency and length of haul only, without an adjustment for the commodities of the goods traveling by container. Automotive traffic utilized a lookup table based on the regression analysis of CCWS finished vehicle (STCC 3711) traffic, adjusting for junction frequency and length of haul only.



For the miles traveled on the UP-NS network, we use a shortest path distance as calculated in the Operating Plan, defined as the shortest distance between two points on the MultiRail

[193] See STB Finance Docket No. 3687, Operating Plan Verified Statement, op. cit.
[194] See workpaper "RevenuePerTM_Distance_JF.xlsx" for all revenue-per-ton mile calculations.

network. The shortest path distance, as opposed to the block distance, is selected for congruity with the revenue per ton-mile figures derived from the CCWS which is also based on a shortest path calculation performed by the Board.

We created a revenue offset to subtract revenue that was previously assigned to a routing when the same traffic was switched to a different route after a merger. This prevented double counting revenue. As an illustrative example, when Los Angeles-Chicago-Harrisburg traffic was moved from BNSF-NS to UP-NS, we removed the revenue currently recorded on the BNSF-NS routing (the offset) before assigning the revenue to the UP-NS routing (see Exhibit C-1).

Exhibit C-1: Revenue offset procedure (illustrative)

Offset removal steps:

1. Identify diverted traffic revenue to add ($5M+4M = $9M)
2. Subtract revenue from portion of original routing to avoid counting twice ($4M)
3. Result is that only net increases in diversion traffic contribute to revenue estimate ($5M)

Several merchandise diversions had offsets that were only found in the historical UP or NS bulk traffic data. This is due to the agency classifying certain traffic (e.g., frack sand) as merchandise, while the railroads consider this to be bulk traffic in their operating plans. We considered the diversions to UP-NS to be categorized as merchandise, while considering the offsets to be bulk traffic, leading to a negative revenue figure for bulk diversions after the offsets were applied.

Appendix D. Geographic Definitions

D.1. Intermodal BEAs With Adjustments

The intermodal catchment areas were defined based on where intermodal traffic terminates and originates in the CCWS. Each of these locations was grouped based on BEA or in some specific cases into a new intermodal catchment area. Each catchment area had a primary county (FIPS_gp – Exhibit D-1) which contained the most intermodal lifts (originations + terminating trailer container units. The counties identified in FIPS_gp represent terminals and were used in the truck to intermodal analysis for calculating the intermodal lane catchment areas. Similarly, for the rail-to-rail analysis, this list of groups was used to define the competitive set of FIPS and hence terminals in the CCWS.

There are BEAs that are sufficiently large as to represent multiple non-overlapping intermodal markets. These were broken apart as such and highlighted in the table below:

- BEA 10 – New York-No. New Jersey-Long Island, NY-NJ-CT-PA (CMSA-70) is split into "New Jersey" (Croxton- NS, ERail-NS, North Kearney-CSXT, North Bergen-CSXT terminals), Lehigh Valley (Bethlehem-NS, Taylor-NS) and moving two terminals into the Boston/New England market (Hartford-CSXT and Springfield-CSXT)
- BEA 134 – San Antonio, TX is split into San Antonio (SAIT) and Laredo, TX (Port Laredo-UP and Laredo-CPKC)

One group of BEAs is partially combined to more accurately capture the market dynamics of Detroit, MI and that the Detroit market is served from nearby terminals in Ohio (Toledo, OH and North Baltimore, OH). These terminal FIPS are grouped together into "Detroit and Toledo" to reflect how the market views these as competitive choices to serve the freight.

Appendix E. Witness Qualifications

David T. Hunt

Mr. Hunt, a Vice President in Oliver Wyman's Transportation practice, has over 40 years of experience in the areas of transportation operations and strategic planning, national and regional transportation policy, and network modeling and operations research. Mr. Hunt focuses on projects involving regulatory and policy analysis, strategic planning, and operational improvements. His projects include:

- Developed truck-to-rail and rail-to-rail diversion analyses for the merger of two Class I railroads, both for the entirety of the merged railroads and for a potential line spinoff.
- Developed a market share model that predicted truck/rail shares and volumes under various scenarios, including autonomous truck technologies and the potential responses by the rail industry.
- Prepared several policy white papers filed with the U.S. Department of Transportation, addressing issues such as positive train control, use of electronically controlled pneumatic brakes, single-person crews, and open access of the US rail network.
- Called as an expert witness in rail capacity modeling as part of an international arbitration case in South America.
- Participated in discussions with the Mexican government that led to a favorable ruling for the rail industry regarding proposed regulatory action to promote competition through expanded interconnection of rail services.
- Managed the design and development of BlueNet, a facility location model used in network design.
- Developed a simulation model that showed the benefits of operating a nationwide railcar pool, the results of which were used in a Surface Transportation Board proceeding to reauthorize the operation of the pool.
- Worked with a Class I North American railroad to explore opportunities and value of adopting predictive maintenance practices for their railcar fleet.

Prior to joining Oliver Wyman, Mr. Hunt was a Senior Associate at Cambridge Systematics (CS). Mr. Hunt was also a Vice President at ALK Associates where he participated in several Class I railroad mergers by estimating rail-to-rail traffic diversions using the Princeton Transportation Network Model Advanced Traffic Diversion software (PTNM-ATD).

Mr. Hunt is the 2025 president of the Institute for Operations Research and the Management Sciences (INFORMS), where he was the recipient of the 2017 INFORMS President's Award.

Mr. Hunt earned a BS in civil engineering from West Virginia University and a MSE from the Civil Engineering and Operations Research Department at Princeton University.

Matthew Schabas

Mr. Schabas is a Principal in Oliver Wyman's Transportation practice. He has over ten years of consulting experience with transportation operators, primarily across freight railroads, surface transportation, and airline commercial strategy.

Examples of prior work include:

- Demand forecasting and business planning for a Class I railroad's intermodal franchise, a large intermodal equipment provider, and a start-up intermodal operator
- Leading multiple projects for a Class I railroad during an operational efficiency transformation that included a rapid 10% reduction in cars on-line, implementing new local service strategies for car management, and locomotive shop footprint
- Leading multiple projects for a Class I railroad transforming its intermodal terminal and operations technology capabilities to support its roadmap for growth.
- Diagnostic of intermodal and merchandise train service performance for a Class I railroad, which identified root causes and proposed a roadmap for restoring service
- Diligence, synergy sizing and post-merger integration for a >$2 billion enterprise value acquisition of a freight forwarder by a strategic investor to combine with its North American LTL network.
- Post-merger integration for a >$1 billion revenue freight forwarder that had acquired a national LTL operator to insource North American domestic ground transportation.
- Inorganic growth strategy for a leading rail services and equipment provider.
- Locomotive mechanical footprint analysis for a Class I railroad that rationalized underutilized shops.
- Multiple due diligence projects in the intermodal, freight and logistics value chain for investors and operators.

Prior to joining Oliver Wyman, Mr. Schabas was a consultant at Seabury Aviation Consulting, a boutique advisory firm focused on airline commercial strategy, and as a researcher and teaching assistant in transportation policy while in graduate school. During his time as a researcher, he published several peer reviewed academic research papers including on the impact to competition from airline mergers in the United States.

Mr. Schabas holds a Masters in City Planning from the University of California, Berkeley in the transportation program, and a BA, MA (Cantab.) and M. Eng in civil engineering from the University of Cambridge, UK.

OPERATING PLAN (EXHIBIT 13)

JOINT VERIFIED STATEMENT

OF

ERIC GEHRINGER AND JOHN F. ORR

1. Introduction

1.1. Witness Qualifications

1. This Operating Plan is sponsored and verified by Eric Gehringer, Executive Vice President-Operations for Union Pacific Railroad Company ("UP") and John F. Orr, Executive Vice President and Chief Operating Officer for Norfolk Southern Railway Company ("NS"). We have been responsible for developing the Operating Plan (Exhibit 13 to the Application), which describes in detail how the merged UP/NS system will deliver faster, more reliable, more efficient service to customers and attract new business, providing increased competition to trucks and other rail carriers. We developed the Operating Plan with the assistance of numerous professionals from a variety of disciplines at both companies, each of whom contributed to the process of identifying opportunities to improve service and realize efficiencies by combining UP and NS routes, facilities, and strengths.

2. *Gehringer*: I have been employed by UP since 2006. I joined UP as a management trainee and have served in numerous positions during my tenure at the company, including Senior Vice President-Transportation and Chief Mechanical Officer and Chief Engineer in the Operating department. I was appointed to my present position in 2021. As Executive Vice President-Operations, I am responsible

for all aspects of UP's operations, including the Transportation, Engineering, Mechanical, Network Planning & Operations, Dispatching, Customer Care and Support, and Premium Operations functions. Before joining UP, I held positions at Northwest Airlines and DaimlerChrysler. I graduated St. Louis University with a Bachelors of Science in aerospace engineering, received an MBA from the University of Nebraska-Lincoln, and have completed the Advanced Management Program at Harvard University. I serve on the Board of Directors for the Children's Nebraska Foundation, and I am a member of the United States Strategic Command Council—a group of senior business and community leaders who advise the U.S. Strategic Command and support its initiatives.

3. *Orr*: I have been employed by NS since 2024. In my current position, I am responsible for leading NS's railway operations, including safety, transportation, network planning and operations, engineering, and equipment maintenance. Previously, I served as Executive Vice President and Chief Transformation Officer at Canadian Pacific Kansas City ("CPKC"), and before that, I was Executive Vice President of Operations at Kansas City Southern Railway. I began my career at Canadian National Railway, where I held various operating and network positions, including Chief Safety and Sustainability Officer and was ultimately promoted to Senior Vice President and Chief Transportation Officer. I received a Bachelor of Arts degree in environmental studies from the University of Waterloo and have completed the Advanced Management Program at Harvard University.

1.2. Purpose and Scope

4. This Operating Plan describes how a unified UP/NS system will operate to serve its customers and grow the amount of freight moving by rail. It encompasses three major functional areas: transportation, mechanical, and engineering. In each area, the Operating Plan shows how UP and NS will integrate activities, personnel, and facilities following consummation of the proposed transaction; the operational changes expected to result; and the gains in safety, service, operating efficiencies, and other benefits anticipated from the merger. The Operating Plan specifically addresses the effects of integration on patterns of service, yard activity, commuter and passenger services, equipment requirements and utilization, traffic density, and labor forces.

1.3. Overview

5. The merger of UP and NS will unite a western railroad with an eastern railroad to establish the first American transcontinental railroad. We know customers strongly prefer single line service because of the operating advantages it provides in terms of speed and reliability and the commercial advantages it provides in terms of ease of doing business. The end-to-end combination of UP and NS will establish new competitive rail services in lanes dominated by trucks and create significant opportunities to improve service and efficiency for traffic moving across the middle of the country.

6. By operating as one network, UP/NS will move traffic in seamless, single-line service that eliminates interchanges, reduces handlings, and optimizes traffic more efficiently and safely than is possible today. The merger will transform

thousand of lanes of traffic to single-line lanes. Applicants project implementation of their optimized plan will remove approximately 2,400 handlings of cars and containers per day and save approximately 60,000 car miles per day.[1] This translates into a savings of approximately 876,000 handlings per year and 21.9 million fewer car miles per year. In addition, UP/NS will combine UP and NS routes to create new, more efficient through routes and provide faster and more reliable service for customers from coast to coast—especially those in "watershed" markets where UP or NS would haul traffic less than 250 miles before or after interchange.

7. For example, UP/NS will combine UP's efficient route from Southern California to Kansas City with NS's efficient route from Kansas City to the Northeast to establish a new train pair carrying intermodal traffic between Southern California and the Northeast. The new route will eliminate the need to interchange in Chicago and will save approximately 17 hours of transit time on traffic moving eastbound from Southern California to the Ohio Valley, Pennsylvania, and New Jersey, and approximately 19 hours on traffic moving westbound between the same locations. As another example, by routing traffic via Shreveport and Meridian rather than via Memphis, UP/NS will save approximately 70 hours of transit time on traffic moving from Southern and Northern California to the Southeast, including Georgia, Florida, and North Carolina, and approximately 95 hours on traffic moving in the opposite direction.

[1] *See* Workpaper "C-251124 Operating Plan Metrics vF.xlsx," Tab "Growth Plan," Cells D17 and D25.

8. UP/NS will also implement new train and blocking plans that allow manifest traffic, including traffic moving to and from watershed areas, to move faster and more reliably with fewer handlings. For example, for traffic moving from the legacy UP's network west of Iowa to the Ohio Valley and Northeast, UP/NS will operate a new train through the Chicago terminal area without interchanging.

9. UP/NS will also introduce new trains to provide truck-competitive service in watershed areas. For example, UP/NS will operate a new train for traffic moving from Texas, Louisiana, and Arkansas to Michigan, Ohio, Pennsylvania, and New Jersey. UP/NS will also introduce new trains for traffic moving between Texas, Louisiana, Arkansas, and western points on the legacy UP system, and Kentucky, Alabama, Tennessee, and northeastern and southeastern points on legacy NS system.

10. Applicants' plan to improve service by combining UP's route to Kansas City with NS's route from Kansas City to Butler, Indiana, illustrates why the benefits of this transaction cannot be achieved without a merger. Although the possibility of avoiding interchanging traffic in Chicago could provide a motivation for voluntary cooperation, the economic incentives for two independent railroads to use their assets jointly are limited. As separate railroads, UP and NS naturally focus on maximizing their own revenues and minimizing their own costs, and each is understandably reluctant to invest substantial resources when realizing the returns depends on the future actions of the other. The same considerations create the "watershed" problem, in which railroads lack incentives to pursue interchange traffic originating or

terminating near gateways because they receive a low return on management and capital investment in short-hauls.

11. After merging, UP/NS will focus on outcomes for the combined company and its customers. A combined UP/NS will internalize all the costs and benefits of operating changes. It will not need to rely on a partner's continued motivation to perform and willingness to contribute resources to a joint activity. As a result, UP/NS not only will redesign transportation plans to combine UP and NS routes, but also plans to invest in two core mainline corridors that bridge the former UP and NS networks. Applicants expect to spend approximately $136.6 million to improve NS's line between Kansas City and Butler, and $172.3 million to improve NS's line between New Orleans and Atlanta.[2] Both of these planned mainline improvements will improve service for existing customers and provide additional capacity so customers can grow their businesses. In this Operating Plan, we describe the transportation plan changes and additional investments Applicants plan to make as they pursue a unified strategy to provide customers faster, more reliable, safer, and more competitive service.

12. In developing the Operating Plan, Applicants recognized that changes to their transportation plans will primarily affect traffic they currently interchange at gateways from Chicago to New Orleans. The Operating Plan describes those changes and shows how they will allow Applicants to improve existing services and

[2] *See* Janke VS Workpaper "Synergies Transportation - Operating.xlsx," Tab "Capital Investment," Cells H32:H55.

establish new truck-competitive services while freeing capacity to accommodate growth at gateway locations. In addition, although most train operations on UP's routes in the West and NS's routes in the East will not change as a result of the merger, Applicants anticipate system-wide improvements in service reliability and efficiency and customer experience as the merged UP/NS adopts each company's best practices and takes advantage of the combined company's resources. The Operating Plan describes the merged company's plans to combine and coordinate services and facilities at current interchange points, integrate locomotive and car fleets, improve efficiency of mechanical and engineering services, and combine management and oversight of operations.

13. In Applicants' planning process, we carefully considered the capacity implications of planned operating changes for lines, yards and terminals, interchanges with other railroads, passenger and commuter operations, equipment supply, and the workforce. We identified infrastructure improvements necessary to achieve anticipated merger benefits and developed plans to complete the improvements. We took care to ensure the Operating Plan and anticipated traffic increases will not adversely affect existing interchanges with other railroads or Amtrak or other passenger service. We also took care to ensure UP/NS will have sufficient employees in the right locations to implement the plan and achieve the merger's service and efficiency benefits. Many of these issues are also addressed in the Application's Service Assurance Plan.

14. As described below, the Operating Plan is designed to improve operations and effectively accommodate growth at key points on the U.S. rail network. For example, UP/NS will improve operations in Chicago, the busiest gateway in the United States and the major point of interchange between UP and NS today. The Operating Plan will reduce the volume of trains that would otherwise move through Chicago and reduce drayage of intermodal containers between UP and NS facilities (called "rubber tire interchanges") in Chicago. Some trains that transit through Chicago will no longer require handlings or work events there, and operations at terminals and yards will be optimized to reduce complexity and improve fluidity. UP/NS will also improve operations in the St. Louis gateway, where today eastbound traffic interchanged between UP and NS moves first to the Alton & Southern Railway ("A&S") Gateway Yard, then is transferred to the Terminal Railroad Association of St. Louis ("TRRA"). Under the Operating Plan, eastbound cars will be blocked at Gateway Yard and launched from there into the legacy NS network, reducing handlings and transit time. The Kansas City gateway will also benefit from streamlined operations that will reduce the need for transfers between yards. And in New Orleans the Operating Plan will reduce congestion by reducing interchange activities on the NS Back Belt line. These optimizations will not only streamline UP/NS operations, they will also improve the overall U.S. rail network, improve service for customers, and ensure continued efficient operations for passenger and commuter providers hosted on UP/NS lines like Amtrak and Metra.

15. Developing the Operating Plan involved three steps, as further described below in Section 2. First, Applicants created a picture of the pre-transaction operations of UP and NS as independent companies, which we call the "Base Plan." Second, Applicants designed plans to optimize operations of UP and NS as a single, integrated network, but without the additional traffic an integrated UP/NS would attract. We call this the "Optimized Plan." Third, Applicants designed operations that would accommodate the traffic growth projected to be achieved by a fully integrated UP/NS three years after the transaction. We call this the "Growth Plan." As part of this three-step process, Applicants also calculated the operations-related costs and quantified some of the many operations-related public benefits of the merger.

16. The Operating Plan takes into account the phased realization of anticipated traffic growth over the first three years. Applicants assumed 40 percent of the traffic gains to UP/NS would be realized by the end of the first year of unified operations, 70 percent by the second year, and 100 percent by the third year. The Operating Plan also considers the impact of phased efficiency gains to account for the time required to complete planned infrastructure upgrades and other steps in the integration process. Applicants address the specific timing of capital expenditures for planned upgrades in their capital improvement plan and accompanying work papers, which are part of the accompanying Service Assurance Plan. But because we expect the traffic growth will be phased in, there is ample opportunity to phase in the necessary capital investment as well. This Operating Plan and the accompanying workpapers address the specific timing of expected efficiency improvements. In

computing savings and expenditures, revenues and costs were developed at 2023 levels.

17. The sections below show Applicants will safely provide faster, more reliable, more efficient services than UP and NS can offer today as independent companies and will provide new truck-competitive services where competitive rail options do not exist today. They also show Applicants will be able to generate significant operating efficiencies while accommodating the traffic growth anticipated from the merger and without adversely affecting customer service or the operations of other freight and passenger railroads.

2. Development of the Operating Plan

18. UP and NS today have well-designed operating plans that allow each railroad to provide safe, reliable, and efficient service. Today UP's operating plan is optimized for UP, and NS's operating plan is optimized for NS, accounting for traffic patterns resulting from commercial arrangements and the capital investments that each railroad has made in pursuing its individual interests. The combined UP/NS will have an optimized plan designed to serve the interest of the combined railroad, which will allow for efficiencies and public benefits even before the expected traffic growth from the proposed transaction.

19. While UP and NS each have internal planning systems that allow them to develop, deploy, and maintain operating plans for their separate systems, we had to create a new plan for the combined UP/NS. We also had to create metrics that could be used to quantify the impacts of the changes resulting from the merger for the Application. For this purpose, we and our teams used MultiRail, a well-established

software application used for rail service design planning. MultiRail simulates network plans against a designated set of traffic and allows service designers to adjust plan parameters (trains, blocks, main lines, yards) and compare outputs against the capacity of each to develop even more efficient plans. MultiRail has been used for more than 25 years to design operating plans in rail merger proceedings, including Canadian Pacific's recent acquisition of Kansas City Southern. Various railroads in the United States, Europe, and Asia use MultiRail for their day-to-day transportation planning. Both UP and NS have used MultiRail to design their own transportation plans. And both railroads have service design experts who are proficient in using service design tools, including the current version of MultiRail.

20. Developing the Operating Plan was a team effort that relied on both the expertise of experienced service design personnel from UP and NS and a team from Oliver Wyman, the firm that created and licenses MultiRail. The combined team validated the Base Plan and identified potential changes to train and yard operations for the Optimized Plan and Growth Plan. MultiRail was used to refine those changes and create metrics and comparisons that could be used to quantify the impacts of the changes.

21. The following sections describe in more detail how Applicants used MultiRail to develop the Base, Optimized, and Growth Plans. MultiRail also generated a series of system-wide and lane- and yard-specific outputs related to each plan, including train counts, gross ton-miles, running car-miles, handlings, crew changes, estimated lane transit times, and other operating statistics. The process

resulted in three feasible transportation plans for a UP/NS network, along with metrics that can be used to assess the operating impacts of the transaction.

2.1. The Base Plan

22. The first step in designing the Operating Plan for a combined UP/NS was to build the Base Plan, which serves as the baseline for comparison with post-merger operations.[3] Building the Base Plan required three basic components: (1) a MultiRail representation of the combined UP/NS network; (2) UP's and NS's July 2025 pre-merger operational designs—that is, their blocking and train plans; and (3) UP's and NS's 2023 pre-merger traffic.[4]

23. Applicants loaded MultiRail with detailed representations of each railroad's current physical networks and operating plans (blocks, trains, and train-to-train connections). We then flowed UP's and NS's traffic through MultiRail to simulate planned operations. We used traffic data from 2023 because it is consistent with the most recently available Confidential Waybill Sample Data, which is used to develop traffic diversion data used in the Growth Plan.[5] MultiRail traffic data has a

[3] *See generally* Workpaper "C Base Plan_vS.pdf."

[4] Dr. Elizabeth Bailey's team from Charles River Associates ("CRA") performed the work to create a combined 2023 traffic file. Appendix C to Dr. Bailey's Verified Statement describes CRA's methodology. Oliver Wyman used the combined traffic file to develop a compressed file for input into MultiRail. *See* Workpaper "Operating Plan Traffic Pipeline.pdf."

[5] We concluded that using 2023 UP and NS traffic, adjusted to account for new and idled facilities, with July 2025 UP and NS blocking and train plans, provided the most realistic and credible way to reflect current and projected operating conditions while using 2023 traffic that can be compared and validated against the most recent data from the Board's Confidential Waybill Sample.

"traffic category" assigned based on each railroad's existing classification, or the car type, commodity and, for hazmat, additional commodity data fields. This is derived from 2023 waybills. The traffic categories are intermodal, auto, bulk, hazmat, and manifest.

24. MultiRail initially generated separate network simulations for UP and NS. After each railroad validated its network simulation, the two networks and transportation plans were merged into the Base Plan. As shown in Table 1, which compares operating statistics reported in UP's Form R-1 and NS's Form R-1 with statistics from the stand-alone base scenarios and the Base Plan, MultiRail's Base Plan representation is an accurate representation of observed operations.

Table 1[6]
Actual Operating Statistics vs. MultiRail Base Plan

	UP+NS R-1	Base Plan	Variance %
Gross-Ton Miles (000s)	1,173,575,798	1,179,146,429	– %
Car-Miles (Loaded)	7,770,137	7,657,292	(1)%
Car-Miles (Empty)	5,293,491	5,068,753	(4)%

25. Statistics regarding Base Plan operations (segment-level train counts, traffic densities, yard activities) are reported in Electronic Appendices E and F and set forth in the workpapers accompanying this Operating Plan.[7]

[6] *See* Workpaper "Base_R1_Validation_Report 251125.xlsx," Tab "Updated Summary Sheet."

[7] *See* Workpaper "Line Segment Tables from Model vF.xlsx," Tab Line Segment Table_Base"; "Yard_Details_Report_T1_20251202_vF.xlsx," Tab "Yard_Output_T1."

2.2. The Optimized Plan

26. After ensuring the Base Plan accurately represents UP and NS pre-merger operations, the next phase in our planning process was to identify merger-related opportunities to improve service and efficiency.[8] Our service design experts developed new routing, train, and blocking plans based on how a single railroad would handle the 2023 UP and NS traffic. As part of that exercise, they adjusted certain traffic flows to reflect changes that included facility consolidations and reduced drayage of intermodal containers between UP and NS facilities (called "rubber tire interchanges"). The service designers constructed the new Optimized Plan in MultiRail, and flowed the traffic to simulate operations under the Optimized Plan. They then analyzed the model outputs to determine whether the plans were feasible given existing network constraints and to identify additional opportunities for improvement, iteratively revising the plans and rerunning the model until they were satisfied they had achieved the Optimized Plan.

27. The objective of the Optimized Plan was to identify operating changes Applicants could implement upon authorization of common control to improve service and efficiency on the combined network. We identified significant opportunities to route traffic more efficiently and change blocking plans so traffic could bypass intermediate handling in the traditional gateway cities. Reducing intermediate handlings improves service reliability for customers by eliminating events that introduce variability into the system and creates capacity in yards to accommodate

[8] *See generally* "C-Optimized Plan_vS.pdf."

traffic growth. In addition, reducing intermediate handlings improves operational safety for employees by limiting the exposure of personnel to the working environments in which most incidents occur. Finally, these routing changes and reductions in intermediate handlings allow locomotives and rail cars to cycle faster, which reduces the resources required to move traffic and generates savings for the railroads and private car fleet owners.

28. Changes to the blocking plan and train plans in the Optimized Plan relative to the Base Plan are shown in Electronic Appendices G and H and the workpapers accompanying this Operating Plan.[9]

29. The key metrics comparing the Optimized Plan with the Base Plan are shown below in Table 2.

Table 2[10]
Changes in Daily Operating Statistics Resulting from Optimized Plan

Description	Base Plan	Optimized Plan	Optimized vs Base Plan	Optimized vs. Base Plan
Gross ton-miles	3,239,413,267	3,233,425,065	(5,988,202)	(0.2)%
Car-miles	34,961,663	34,901,418	(60,245)	(0.2)%
Total Handlings	193,797	191,398	(2,400)	(1.2)%
Train miles (freight)	478,461	473,761	(4,700)	(1.0)%

[9] *See* Workpaper "T1_T2_T3_Block_Comparison.xlsx," Tab "New Blocks"; "T1_T2_T3_Train_Comparison.xlsx," Tab "T1 to T2 Train Changes."

[10] *See* Workpaper "C-251124 Operating Plan Metrics vF.xlsx," Tab "Growth Plan."

30. Statistics regarding Optimized Plan segment-level train counts, traffic densities, and yard activity are reported in Electronic Appendices I and J and set forth in the workpapers accompanying this Operating Plan.[11]

2.3. The Growth Plan

31. The Growth Plan reflects how the fully integrated UP/NS network would operate and accommodate the traffic Applicants expect to attract through the service improvements projected to result from merged operations and new services introduced.[12] The Growth Plan also incorporates Applicants' plans to invest in new capacity to serve the additional traffic, including track, terminal capacity, and modernized signal systems.[13]

32. Applicants used the Optimized Plan scenario in MultiRail to flow the pre-merger and growth traffic across the network. Service design experts from both railroads then modified the plan to accommodate the added traffic. Most of the additional traffic could be absorbed directly into the Optimized Plan's train and blocking plan without changes, except that trains and blocks become larger and more

---

[11] *See* Workpaper "Line Segment Tables from Model vF.xlsx," Tab "Line Segment Table_Optimized"; "Yard_Details_Report_T2_20251202_vF.xlsx," Tab "Yard_Output_T2."

[12] *See generally* Workpaper "Growth Plan_vS.pdf."

Applicants' merger-related traffic growth expectations are described in the Joint Verified Statement of David T. Hunt and Matthew Schabas. The Growth Plan also includes major changes in traffic volume that are expected to continue (*e.g.*, large new and lost contracts) from the Base Plan traffic. *See* Workpaper "Major Traffic Wins and Losses Since 2023.pdf."

[13] In addition, in developing the Growth Plan, Applicants accounted for returning to full operations several intermodal facilities that are idle in 2025.

efficient. In other instances, the additional volume required new train starts on existing routes. In still other instances, the additional traffic allowed for changes that further improve service. For example, projected traffic from Mexico and Texas to the Ohio Valley, Southeast, and Northeast created a lane density opportunity to introduce a new train pair. As another example, Applicants project that increased demand for service will support a new intermodal train service between Northern California and the Northeastern United States.

33. In designing the Growth Plan, we recognized that transaction-related growth will not precisely follow the predicted pattern. Transportation markets are dynamic and highly competitive, and changes affecting the demand for rail transportation will occur between the filing of this Application and the full integration of UP/NS. Because UP/NS will compete aggressively for all available customer traffic and our competitor railroads and trucking providers will do so as well, it is impossible to predict the outcome of all the customer decisions made in the new competitive environment that the proposed transaction will unlock. But Applicants have made their best estimates of anticipated traffic growth, and the Growth Plan shows how UP/NS operations would be structured to handle those best estimates. The Growth Plan was designed to ensure that the proposed operations of the combined railroad are realistic and practical, and UP/NS will have the resources needed to adjust to a changing world as the transaction is implemented.

34. Changes made in the Growth Plan's blocking plan and train plans relative to the Optimized Plan are shown in Electronic Appendices K and L and set forth in the workpapers accompanying this Operating Plan.[14]

35. The following table summarizes the operational effects of incorporating merger-related traffic changes into the Growth Plan.

Table 3[15]
Changes in Daily Operating Statistics Incorporating the Growth Plan

Description	Base Plan	Optimized Plan	Optimized vs. Base Plan	Growth Plan	Growth vs. Optimized Plan
Gross ton-miles	3,239,413,267	3,233,425,065	(0.2)%	3,801,942,247	17.6%
Car-miles	34,961,663	34,901,418	(0.2)%	39,998,653	14.6%
Total Handlings	193,797	191,398	(1.2)%	214,610	12.1%
Train-miles (freight)	478,461	473,761	(1.0)%	512,606	8.2%

36. Details regarding Growth Plan segment-level train counts, traffic densities, and yard activity are reported in Electronic Appendices M and N and set forth in the workpapers accompanying this Operating Plan.[16]

---

[14] *See* Workpaper "T1_T2_T3_Block_Comparison.xlsx," Tab "New Blocks"; "T1_T2_T3_Train_Comparison.xlsx," Tab "T2 to T3 Train Changes."

[15] *See* Workpaper"C-251124 Operating Plan Metrics vF.xlsx," Tab "Growth Plan."

[16] *See* Workpaper "Line Segment Tables from Model vF.xlsx," Tab "Line Segment Table_Growth;" "Yard_Details_Report_T3_20251202_vF.xlsx."

In reviewing the Operating Plan workpapers, Applicants noted that certain blocks and trains were shown in the MultiRail model as using track segments they would not actually use. The issue affected less than 0.04% of GTMs. The issue did not affect the planning process or comparisons of operating statistics because the service design team knew which segments the trains use, and trains were routed consistently across different versions of the Operating Plan. Applicants corrected the train counts and density data on affected corridors outside of the MultiRail model. *See* Workpaper "Line Segment Tables from Model vF.xlsx," Tab "Changes Log."

3. Patterns of Service

37. The maps submitted as Exhibit 1 to the Application and the density charts submitted as Exhibit 14 and as Electronic Appendices C and D show the principal rail lines and routes of UP and NS. The routes are also shown in the Geospatial Information System ("GIS") map files included in Applicants' workpapers.[17] Below, we describe these routes in more detail.

3.1. Principal Routes – UP

38. UP operates approximately 32,880 route miles in 23 states in the western two-thirds of the United States. Information regarding traffic density and numbers of trains on all main and secondary lines on UP's system is provided in the density charts submitted as Exhibit 14 and the workpapers relating to the Base Plan.[18]

39. UP operates across 13 units, organized into two regions. UP's Northern Region includes the following service units:

- Chicago—covers parts of Illinois and Wisconsin with connections to Iowa and includes the Chicago gateway;
- Great Lakes—connects Nebraska, Iowa, Minnesota, and Wisconsin;
- Heartland—spans New Mexico, Texas, Kansas, and Missouri with connections to Oklahoma, Illinois, Nebraska, and includes the Kansas City gateway;
- Great Plains—connects Northeastern Kansas, Nebraska, Eastern Wyoming, through Colorado and into central Utah;

[17] *See* Workpaper "GIS Shape Files."

[18] *See* Workpaper "Line Segment Tables from Model vF.xlsx," Tab "Line Segment Table_Base."

- Rocky Mountain—includes parts of Montana, East-Central Idaho, Utah, Southern Nevada, and Wyoming with connections into Southern California;

- Northern California—spans Central and Northern California through Northern Nevada; and

- Pacific Northwest—covers Washington, Oregon, and Western Idaho, and includes the international gateway at Eastport, Idaho.

The Southern Region includes the following service units:

- Mid-America—spans parts of Illinois, Missouri, Kentucky, and Tennessee through Arkansas and into East Texas and North Louisiana, and includes the gateways at Shreveport and Memphis;

- Gulf Coast—covers Louisiana with a connection to East Texas and includes the gateway at New Orleans;

- Houston—spans parts of Texas including the greater Houston area with connections towards Dallas and Longview, including the gateway at Brownsville;

- South Texas—includes parts of Texas with connections between Alpine, Taylor, and Hearne through San Antonio, including gateways at Eagle Pass and Laredo;

- Texoma—spans parts of Oklahoma and Texas from the greater Dallas/Fort Worth area through West Texas, including the gateway at El Paso; and

- Los Angeles—covers Southern California, Arizona and into New Mexico, including the gateways at Nogales and Calexico.

40. UP has eight principal routes. Three routes are anchored in Chicago and include UP's main line between Chicago and Granger, Wyoming, before branching to the ports and terminals of Seattle and Portland in the Pacific Northwest ("Chicago-Pacific Northwest"); Oakland in Northern California ("Chicago-Northern California"); and Los Angeles in Southern California ("Chicago-Salt Lake City/Southern California"). UP also has three routes anchored in Los Angeles that

include UP's main line between Los Angeles and El Paso, Texas, before branching to Chicago via Kansas City and St. Louis ("Southern California-Kansas City/St. Louis/Chicago"); Memphis via Central Texas and Shreveport ("Southern California-Central Texas/Shreveport/Memphis"); and New Orleans via South Texas ("Southern California-South Texas/New Orleans"). UP also has a route between border crossings in Mexico and Chicago via Memphis and St. Louis ("Mexico/Texas-Memphis/St. Louis/Chicago"), and a route between Seattle and Los Angeles ("Pacific Northwest-Southern California").

41. UP has 64 network, regional, and local yards with various capacities and functions. UP also has 31 intermodal facilities (27 of which UP owns and four of which are private or publicly owned), and serves 31 automotive ramps (26 of which UP owns and five of which are privately owned). UP serves approximately 60 ports, including ocean, river, and inland ports, and seven border crossings. UP also connects with more than 190 short lines.[19] UP also serves major gateways in Minneapolis-St. Paul, Chicago, St. Louis, Kansas City, Memphis, Shreveport, and New Orleans, where it interchanges with other Class I railroads and significant belt or terminal railroads, such as Belt Railway of Chicago ("BRC"), Indiana Harbor Belt Railway ("IHB"), and the TRRA. A list of locations at which UP interchanges more than 2000 cars annually is provided in Electronic Appendix O and in the workpapers accompanying this Operating Plan.[20]

---

[19] *See* Workpaper "UP Locations_Auto-Port-Intermodal-Yards-Border-Mech-ShortLine.xlsx."

[20] *See* Workpaper "Consolidated Interchange Counts FY 2024.xlsx."

3.1.1. Chicago-Pacific Northwest Route

42. UP's Chicago-Pacific Northwest route extends between Chicago and Seattle via North Platte, Granger, and Portland. From Chicago to Granger, in Southwestern Wyoming, where the Central Corridor branches to the Northwest, Northern California, and Southern California, UP's route boasts a double-track high-capacity line with segments of triple-track along the Geneva Subdivision in Chicago and between Gibbon and O'Fallons in Central Nebraska. The route and other lines connecting with the route are shown below in Figure 1 and in the GIS map files provided in Applicants' workpapers.

Figure 1: Chicago-Pacific Northwest Route

3.1.1.1. Chicago-Pacific Northwest Route Products

43. General categories of traffic moving over UP's Chicago-Pacific Northwest route and lines connecting to the route primarily include bulk (coal, fertilizer, food products, and grain), industrial (soda ash, forest products, and metals), and premium (international and domestic intermodal, finished vehicles, auto parts).

3.1.1.2. Chicago-Pacific Northwest Route Connections to Short Lines, Ports, and Border Crossings

44. UP's Chicago-Pacific Northwest route and lines connecting to the route connect with several short lines, including two Chicago-area belt railroads (BRC and IHB), Nebraska Central Railroad ("NCRC"), and Eastern Idaho Railroad. Applicants' workpapers include a table showing UP-connecting short lines by state.[21] The GIS map files provided in Applicants' workpapers show UP's connections with short lines.

45. UP's Chicago-Pacific Northwest route and lines connecting to the route also provide access to ports in the Pacific Northwest, including the Port of Seattle and the Port of Tacoma. Applicants' workpapers include a table showing the ports served by UP.[22] The GIS map files provided in Applicants' workpapers also show the ports served by UP.

46. UP's Chicago-Pacific Northwest route does not connect directly to any international border crossing, but lines connecting to the route extend to the border crossings at Eastport, Idaho, where UP connects with CPKC. Applicants' workpapers

---

[21] *See* Workpaper "UP Locations_Auto-Port-Intermodal-Yards-Border-Mech-ShortLine.xlsx," Tab "Short Lines."

[22] *See id.*, Tab "Port Locations."

include a table showing border crossings served by UP.[23] The GIS map files provided in Applicants' workpapers also show the border crossings served by UP.

3.1.1.3. Chicago-Pacific Northwest Route Yards and Major Repair Facilities

47. UP supports rail operations on its Chicago-Pacific Northwest route, and lines connecting to the route, with several manifest terminals and repair facilities, including Proviso in Illinois, Council Bluffs in Iowa, North Platte in Nebraska, Pocatello in Idaho, and Hinkle and Albina in Oregon. Applicants' workpapers include a table showing UP's network and regional yards,[24] as well as its major locomotive and car shops.[25] The GIS map files provided in Applicants' workpapers also show yard and shop locations on UP.

3.1.1.4. Chicago-Pacific Northwest Route Intermodal and Automotive Ramps

48. UP has several intermodal and automotive facilities on its Chicago-Pacific Northwest route and lines connecting to the route. Intermodal ramps include Global 2 and Global 4 in Chicago, Brooklyn in Portland, Tacsim in Tacoma, and Argo in Seattle. Auto facilities include West Chicago, Belvidere, Council Bluffs, Portland (Barnes), and Seattle (Kent). Applicants' workpapers include a table showing UP's intermodal and automotive ramps. The GIS map files provided in Applicants' workpapers also show intermodal and automotive ramps on UP.

---

[23] *See id.*, Tab "Border Crossings."

[24] *See id.*, Tab "Yard Locations."

[25] *See id.*, Tab "Mechanical Facility Locations."

3.1.2. Chicago-Northern California Route

49. UP's Chicago-Northern California route extends between Chicago and Northern California via North Platte, Granger, and Sacramento. At Granger, the Chicago-Northern California route connects to UP's Central Corridor and continues as a double-track, high-capacity route to Ogden, Utah. From Ogden/Salt Lake City, the route includes parallel main lines to Sacramento acquired through prior mergers with Western Pacific Railroad and Southern Pacific Railroad. The dual routes between Ogden/Salt Lake City and Northern California enable UP's premium products to traverse the more direct route via Donner Pass, while loaded bulk shipments can leverage the former Western Pacific Feather River Canyon route to take advantage of more advantageous grades crossing the Sierra Nevada mountain range. The Chicago-Northern California route and other lines connecting with the route are shown below in Figure 2 and in the GIS map files provided in Applicants' workpapers.

Figure 2: Chicago-Northern California Route

3.1.2.1. Chicago-Northern California Route Products

50. General categories of traffic moving over UP's Chicago-Northern California route and lines connecting to the route include bulk (coal, food and beverage, grain products), industrial (construction products, metals, forest products), and premium (domestic intermodal, international intermodal, finished vehicles).

3.1.2.2. Chicago-Northern California Route Connections to Short Lines, Ports, and Border Crossings

51. UP's Chicago-Northern California route and lines connecting to the route connect with several short lines, including BRC, IHB, NCRC, Salt Lake Garfield and Western Railway ("SLGW"), and California Northern Railroad. Applicants' workpapers include a table showing UP connecting short lines by state.

The UP GIS map files provided in Applicants' workpapers show UP's connections with short lines.

52. UP's Chicago-Northern California route and lines connecting to the route also provide access to ports in Northern California, including the Port of Oakland, the Port of Stockton, and the Port of Benicia. The GIS map files provided in Applicants' workpapers show the ports served by UP.

53. UP's Chicago-Northern California route does not connect to any international border crossing.

3.1.2.3. Chicago-Northern California Route Yards and Major Repair Facilities

54. UP supports its rail operations on the Chicago-Northern California route and lines connecting to the route with several manifest terminals and repair facilities, including Proviso, Council Bluffs, North Platte, Ogden, Roper (Salt Lake) in Utah, and Roseville, California. The GIS map files provided in Applicants' workpapers show yard and shop locations on UP.

3.1.2.4. Chicago-Northern California Route Intermodal and Automotive Ramps

55. UP has several intermodal and automotive facilities on its Chicago-Northern California route and lines connecting to the route. Western intermodal locations along this route include Salt Lake ("SLCIT"), Sparks, Nevada, and Oakland, California. In addition, the route serves auto facilities in the west including Roper as well as Benicia and Milpitas (both in the greater San Francisco area). The GIS map files provided in Applicants' workpapers show intermodal and automotive ramps on UP.

3.1.3. Chicago-Southern California Route

56. UP's Chicago-Southern California route extends between Chicago and Southern California via North Platte, Granger, Ogden, Las Vegas, and Los Angeles. Connecting to UP's Central Corridor at Granger, the Chicago-Southern California route provides access to the Utah Valley and Las Vegas markets and is one of two ways in which UP connects Southern California to Chicago markets. The route and other lines connecting with the route are shown below in Figure 3 and in the GIS map provided in Applicants' workpapers.

Figure 3: Chicago-Southern California Route

3.1.3.1. Chicago-Southern California Route Products

57. General categories of traffic moving over UP's Chicago-Southern California route and lines connecting to the route include bulk (coal, food and

beverage), industrial (construction products, metals), and a large volume of premium traffic (international and domestic intermodal, auto parts, finished vehicles).

3.1.3.2. Chicago-Southern California Route Connections to Short Lines, Ports, and Border Crossings

58. UP's Chicago-Southern California route and lines connecting to the route connect with several short lines, including BRC, IHB, NCRC, SLGW, and Pacific Harbor Line ("PHL"). Applicants' workpapers include a table showing UP-connecting short lines by state. The GIS map files provided in Applicants' workpapers show UP's connections with short lines.

59. UP's Chicago-Southern California route and lines connecting to the route also provide access to several ports in Southern California, including the Port of Los Angeles and the Port of Long Beach. The GIS map files provided in Applicants' workpapers show the ports served by UP.

60. UP's Chicago-Southern California route does not connect to any international border crossing.

3.1.3.3. Chicago-Southern California Route Yards and Major Repair Facilities

61. UP supports its rail operations on the Chicago-Southern California route and lines connecting to the route with several manifest terminals and repair facilities, including Proviso, Council Bluffs, North Platte, Ogden, Roper, and West Colton, California. The GIS map files provided in Applicants' workpapers show yard and shop locations on UP.

3.1.3.4. Chicago-Southern California Route Intermodal and Automotive Ramps

62. UP has several intermodal and automotive facilities on its Chicago-Southern California route and lines connecting to the route, including the previously mentioned Chicago facilities, an intermodal ramp in Las Vegas, and five intermodal facilities in the greater Los Angeles area: City of Industry, East Los Angeles ("Commerce"), Inland Empire Intermodal Terminal ("IEIT"), Intermodal Container Transfer Facility ("ICTF"), and Los Angeles Transportation Center ("LATC"). A major auto destination on this route is Mira Loma, California. The GIS map files provided in Applicants' workpapers show intermodal and automotive ramps on UP.

3.1.4. Southern California-Kansas City/St. Louis/Chicago Route

63. UP's Southern California-Kansas City/St. Louis/Chicago route extends between Southern California and Chicago via El Paso and Kansas City. The portion from Southern California to El Paso, along the legacy Southern Pacific Sunset route, is a high-capacity line that enables efficient transit for premium freight to and from Southern California markets. At El Paso, the Sunset route runs East while the Kansas City/St. Louis/Chicago route continues along UP's Golden State route to Kansas City, a streamlined route connecting El Paso to Kansas City by cutting diagonally across New Mexico, the Texas and Oklahoma panhandles, and Kansas. A substantial portion of UP's route between Kansas City and Chicago includes trackage rights over BNSF Railway ("BNSF") lines between Hutchinson, Kansas, and Nerska, Illinois; however, UP can also access Chicago through St. Louis where two routing options to Chicago exist or via Council Bluffs and the Central Corridor towards

Chicago. The route and other lines connecting with the route are shown in Figure 4 below and the GIS map files provided in Applicants' workpapers.

Figure 4: Southern California-Kansas City/St. Louis/Chicago Route

3.1.4.1. Southern California-Kansas City/St. Louis/Chicago Route Products

64. General categories of traffic moving over UP's Southern California-Kansas City/St. Louis/Chicago route and lines connecting to the route include bulk (grain, grain products, beverages), industrial (construction, metals, government shipments), and large volumes of premium (international and domestic intermodal).

3.1.4.2. Southern California-Kansas City/St. Louis/Chicago Route Connections to Short Lines, Ports, and Border Crossings

65. UP's Southern California-Kansas City/St. Louis/Chicago route and lines connecting to the route connect with several short lines, including PHL, Kansas City Terminal Railway ("KCT"), the A&S and TRRA terminal railroads in the St. Louis area, and BRC and IHB in the Chicago area. The GIS map files provided in Applicants' workpapers show UP's connections with short lines.

66. UP's Southern California-Kansas City/St. Louis/Chicago route and lines connecting to the route provide access to several ports in Southern California, including the Port of Los Angeles and the Port of Long Beach. The GIS map files provided in Applicants' workpapers show the ports served by UP.

67. UP's Southern California-Kansas City/St. Louis/Chicago route and lines connecting to the route connect to international border crossings at Calexico, Nogales, and El Paso.

3.1.4.3. Southern California-Kansas City/St. Louis/Chicago Route Yards and Major Repair Facilities

68. UP supports its rail operations on the Southern California-Kansas City/St. Louis/Chicago route and lines connecting to the route with several manifest terminals and repair facilities, including West Colton, Tucson, Alfalfa (El Paso), and Kansas City 18th Street. The GIS map files provided in Applicants' workpapers show yard and shop locations on UP.

3.1.4.4. Southern California-Kansas City/St. Louis/Chicago Route Intermodal and Automotive Ramps

69. UP has several intermodal and automotive facilities on its Southern California-Kansas City/St. Louis/Chicago route and lines connecting to the route. While also serving Los Angeles-area facilities, this route includes intermodal facilities in Phoenix, Santa Teresa (west of El Paso), Kansas City, St. Louis (Dupo), and Chicago (Global 4 and Global 2), and automotive facilities in Mira Loma, Santa Rosa, New Mexico, Kansas City (Muncie and Fairfax), and Chicago (Chicago Heights, West Chicago, and Belvidere). The GIS map files provided in Applicants' workpapers show intermodal and automotive ramps on UP.

3.1.5. Southern California-Central Texas/Shreveport/Memphis Route

70. UP's Southern California-Central Texas/Shreveport/Memphis route extends between Southern California and Shreveport/Memphis via El Paso and Dallas/Fort Worth. From Southern California to El Paso, this route follows the legacy Southern Pacific Sunset route. From El Paso, the route continues in an easterly direction across the route of the former Texas and Pacific Railway ("T&P") to the Dallas/Fort Worth metroplex. Continuing along the legacy T&P track east of Dallas/Ft. Worth, the route then follows the north/south high capacity directional running routes of the former Southern Pacific and Missouri Pacific to/from North Little Rock and Pine Bluff, Arkansas. At Memphis, the route provides connections to BNSF, Canadian National Railway ("CN"), CSX Transportation ("CSXT"), and NS.

The route and other lines connecting with the route are shown below in Figure 5 and in the GIS map files provided in Applicants' workpapers.

Figure 5: Southern California-Central Texas/Shreveport/Memphis Route

3.1.5.1. Southern California-Central Texas/Shreveport/Memphis Route Products

71. General categories of traffic moving over UP's Southern California-Central Texas/Shreveport/Memphis route and lines connecting to the route include bulk (food and beverage), industrial (construction materials, plastics, industrial chemicals, paper products), and premium (international and domestic intermodal, auto parts, finished vehicles).

3.1.5.2. Southern California-Central Texas/Shreveport/Memphis Route Connections to Short Lines, Ports, and Border Crossings

72. UP's Southern California-Central Texas/Shreveport/Memphis route and lines connecting to the route connect with several short lines, including PHL, the Dallas, Garland & Northeastern Railroad, Fort Worth & Western Railroad, and Santa Teresa Southern ("STS"). The GIS map files provided in Applicants' workpapers show UP's connections with short lines.

73. UP's Southern California-Central Texas/Shreveport/Memphis route and lines connecting to the route provide access to several ports in Southern California, including the Port of Los Angeles and the Port of Long Beach, as well as the Port of Little Rock operated by Little Rock Port Railroad. The GIS map files provided in Applicants' workpapers show the ports served by UP.

74. UP's Southern California-Central Texas/Shreveport/Memphis route and lines connecting to the route connect to international border crossings at Calexico, Nogales, and El Paso.

3.1.5.3. Southern California-Central Texas/Shreveport/Memphis Route Yards and Major Repair Facilities

75. UP supports operations on its Southern California-Central Texas/Shreveport/Memphis route and lines connecting to the route with several manifest terminals and repair facilities, including West Colton, Tucson, Alfalfa, Fort Worth, North Little Rock, and Pine Bluff. The GIS map files provided in Applicants' workpapers show yard and shop locations on UP.

3.1.5.4. Southern California-Central Texas/Shreveport/Memphis Route Intermodal and Automotive Ramps

76. UP has several intermodal and automotive facilities on its Southern California-Central Texas/Shreveport/Memphis route and lines connecting to the route. In addition to serving Los Angeles-area facilities, this route serves major auto and intermodal markets in the Dallas area (Arlington and Mesquite) and Shreveport area (Reisor). The GIS map files provided in Applicants' workpapers show intermodal and automotive ramps on UP.

3.1.6. Southern California-South Texas/New Orleans Route

77. UP's Southern California-South Texas/New Orleans route extends between Southern California and New Orleans via El Paso, San Antonio, and Houston. At El Paso, the Sunset route runs to the southeast toward San Antonio and then directly east to Houston across the Glidden Subdivision. From Houston, paired routes continue through Beaumont and then diverge. The Southern California-South Texas/New Orleans routes continues to DeQuincy, Louisiana, on track owned by CPKC, then through Kinder and Livonia, Louisiana, to New Orleans on track owned by UP. The southerly route continues from Beaumont to Iowa Junction, Louisiana, where it splits to the northeast toward Kinder, and east towards New Orleans on a line UP jointly owns with BNSF. The route and other lines connecting with the route are shown in Figure 6 and the GIS map files provided in Applicants' workpapers.

Figure 6: Southern California-South Texas/New Orleans Route

3.1.6.1. Southern California-South Texas/New Orleans Route Products

78. General categories of traffic moving over UP's Southern California-South Texas/New Orleans route and lines connecting to the route include large quantities of industrial products (plastics, chemicals, petroleum products, metals, construction products) and premium (international and domestic intermodal).

3.1.6.2. Southern California-South Texas/New Orleans Connections to Short Lines, Ports, and Border Crossings

79. UP's Southern California-South Texas/New Orleans route and lines connecting to the route connect with several short lines, including PHL, STS, Port Terminal Railroad Association, and the New Orleans Public Belt Railroad ("NOPB").

The GIS map files provided in Applicants' workpapers show UP's connections with short lines.

80. UP's Southern California-South Texas/New Orleans route and lines connecting to the route provide access to several ports in Southern California, including the Port of Los Angeles and the Port of Long Beach, as well ports on the Gulf Coast, including the Port of Houston, and the Port of Beaumont. The GIS map files provided in Applicants' workpapers show the ports served by UP.

81. UP's Southern California-South Texas/New Orleans route and lines connecting to the route connect to international border crossings at Calexico, Nogales, El Paso, Eagle Pass, Laredo, and Brownsville.

3.1.6.3. Southern California-South Texas/New Orleans Route Yards and Major Repair Facilities

82. UP supports its rail operations on its Southern California-South Texas/New Orleans route and lines connecting to the route with several manifest terminals and repair facilities, including West Colton, Tucson, Alfalfa, San Antonio, Englewood and Settegast in Houston, and Livonia. The GIS map files provided in Applicants' workpapers show yard and shop locations on UP.

3.1.6.4. Southern California-South Texas/New Orleans Route Intermodal and Automotive Ramps

83. UP's Southern California-South Texas/New Orleans route and lines connecting to the route serve several intermodal and automotive facilities. In addition to facilities in the Los Angeles area, this route serves automotive and intermodal

facilities in San Antonio, Houston, and Southern Louisiana. The GIS map files provided in Applicants' workpapers show intermodal and automotive ramps on UP.

3.1.7. Mexico/Texas-Memphis/St. Louis/Chicago Route

84. UP's Mexico/Texas-Memphis/St. Louis/Chicago route extends between Eagle Pass/Laredo, Texas, and Chicago via San Antonio and Little Rock/Pine Bluff. This north/south route connects the Chicago and St. Louis markets and gateways with Mexico, Texas, and Arkansas via international connection points at Laredo (CPKC) and Eagle Pass (Ferromex). The route leverages UP's route network in Texas, bolstered by UP's bidirectional running capability from Texas through North Little Rock and Pine Bluff to Dexter, Missouri. At Gorham, Illinois, the Mt. Vernon and Salem Subdivisions provide a route that bypasses the St. Louis gateway and enables future connectivity to the NS system at Sidney, Illinois. The route and other lines connecting with the route are shown in Figure 7 and the GIS map files provided in Applicants' workpapers.

Figure 7: Mexico/Texas-Memphis/St. Louis/Chicago Route

3.1.7.1. Mexico/Texas-Memphis/St. Louis/Chicago Route Products

85. General categories of traffic moving over UP's Mexico/Texas-Memphis/St. Louis/Chicago route and lines connecting to the route include bulk (beverages, grain), industrial (metals, construction materials), and premium (auto parts, finished vehicles, domestic intermodal).

3.1.7.2. Mexico/Texas-Memphis/St. Louis/Chicago Route Connections to Short Lines, Ports, and Border Crossings

86. UP's Mexico/Texas-Memphis/St. Louis/Chicago route and lines connecting to the route connect with several short lines, including A&S and TRRA in St. Louis, BRC and IHB in Chicago, Arkansas Midland Railroad, and Missouri & Northern Arkansas Railroad. The GIS map files provided in Applicants' workpapers show UP's connections with short lines.

87. UP's Mexico/Texas-Memphis/St. Louis/Chicago route and lines connecting to the route also provide access to the Port of Little Rock, operated by the Little Rock Port Railroad.

88. UP's Mexico/Texas-Memphis/St. Louis/Chicago route and lines connecting to the route connect to international border crossings at Eagle Pass, Laredo, and Brownsville.

3.1.7.3. Mexico/Texas-Memphis/St. Louis/Chicago Route Yards and Major Repair Facilities

89. UP supports its rail operations on its Mexico/Texas-Memphis/St. Louis/Chicago route and lines connecting to the route with several manifest terminals and repair facilities including San Antonio, North Little Rock, Pine Bluff, and Chicago (Yard Center). The GIS map files provided in Applicants' workpapers show yard and shop locations on UP.

3.1.7.4. Mexico/Texas-Memphis/St. Louis/Chicago Route Intermodal and Automotive Ramps

90. There are several intermodal and automotive facilities on UP's Mexico/Texas-Memphis/St. Louis/Chicago route and lines connecting to the route.

Intermodal facilities are located in Laredo, San Antonio, St. Louis (Dupo), Marion, Arkansas, and Chicago. Automotive facilities are located in San Antonio, Taylor, Texas, Memphis (Gavin), St. Louis (Centerville), and Chicago. The GIS map files provided in Applicants' workpapers show intermodal and automotive ramps on UP.

3.1.8. Pacific Northwest-Southern California Route

91. UP's Pacific Northwest-Southern California route extends between Seattle and Los Angeles and is also called the "I-5" route. The I-5 route connects Pacific Northwest customers, ports, and markets, as well as markets accessible using UP's I-5 Agreement with BNSF and a connection with CPKC at Eastport, with Northern and Southern California markets. While Applicants' proposed merger does not directly impact this north-south route, the I-5 route is an important component of UP's franchise, connecting shippers in California, Oregon, Washington, Idaho and Canada. The route and other lines connecting with the route are shown in Figure 8 and the GIS map files provided in Applicants' workpapers.

Figure 8: Pacific Northwest-Southern California Route

3.1.8.1. Pacific Northwest-Southern California Route Products

92. General categories of traffic moving over UP's Pacific Northwest-Southern California route and lines connecting to the route include bulk (fertilizer, food products, grain products), industrial (construction products, forest products, metals) and premium (international and domestic intermodal).

3.1.8.2. Pacific Northwest-Southern California Route Connections to Short Lines, Ports, and Border Crossings

93. UP's Pacific Northwest-Southern California route and lines connecting to the route connect with several short lines, including Central Oregon & Pacific Railroad, Portland & Western Railroad, and San Joaquin Valley Railroad. The GIS map files provided in Applicants' workpapers show UP's connections with short lines.

94. UP's Pacific Northwest-Southern California route and lines connecting to the route also provide access to several ports in the Pacific Northwest (including the Port of Seattle and the Port of Tacoma), Northern California (including the Port of Stockton), and Southern California (including the Ports of Los Angeles and Long Beach). The GIS map files provided in Applicants' workpapers show the ports served by UP.

95. UP's Pacific Northwest-Southern California route and lines connecting to the route connect to the international border crossing at Calexico, California.

3.1.8.3. Pacific Northwest-Southern California Route Yards and Major Repair Facilities

96. UP supports operations on its Pacific Northwest-Southern California route and lines connecting to the route with several manifest terminals and repair facilities including Albina (Portland), Roseville, and West Colton. The GIS map files provided in Applicants' workpapers show yard and shop locations on UP.

3.1.8.4. Pacific Northwest-Southern California Route Intermodal and Automotive Ramps

97. There are many intermodal and automotive facilities on the Pacific Northwest-Southern California route and lines connecting to the route. The route

primarily serves intermodal markets in the major West Coast cities. The GIS map files provided in Applicants' workpapers show intermodal and automotive ramps on UP.

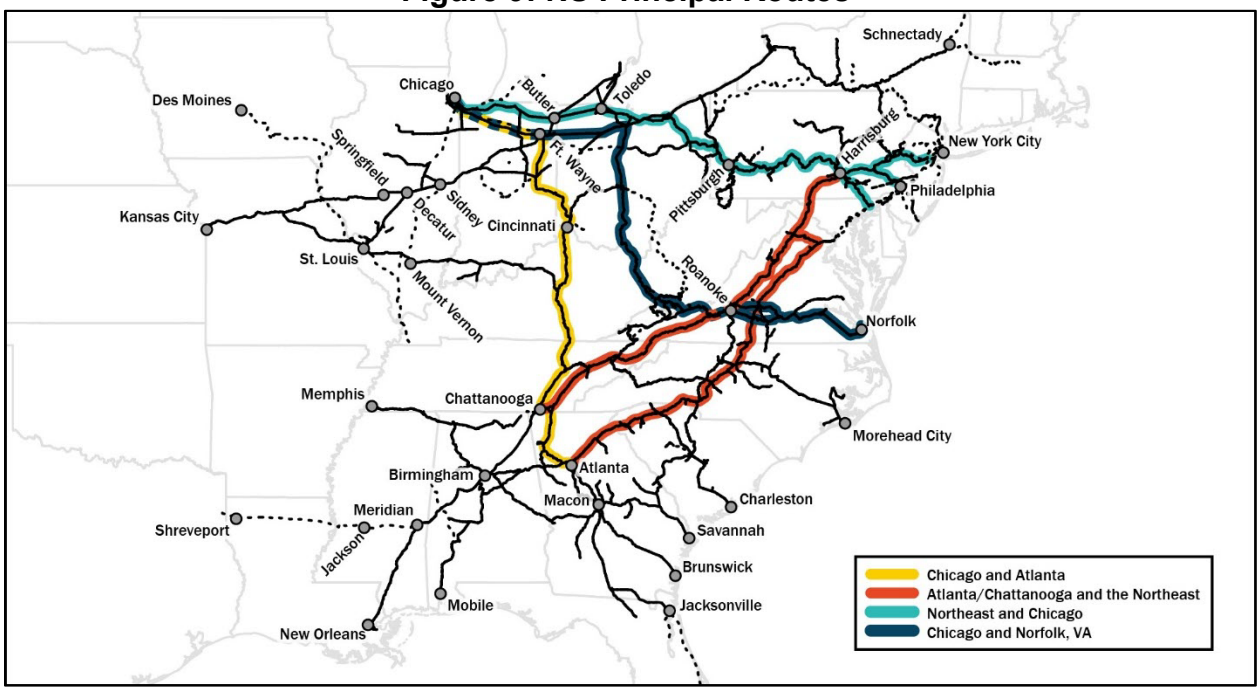
3.1.9. Secondary Routes and Feeder Lines

98. UP has secondary routes between Denver and Salt Lake City, Denver and Kansas City, and Minnesota/Iowa and Texas. UP also has a network of feeder lines in Northern Iowa, Minnesota, and Wisconsin, and feeder lines in Idaho and Montana, including a line to the Canadian border at Eastport. These routes and lines are shown in the GIS map files provided in Applicants' workpapers.

3.2. Principal Routes – NS

99. Norfolk Southern operates approximately 19,200 route miles in 22 eastern states and the District of Columbia. The density charts submitted as Exhibit 14 and the workpapers related to the Base Plan provide information about traffic density and numbers of trains on all main and secondary lines on NS's system.[26] NS operates across six divisions organized into two regions. The Northern Region includes the following divisions:

- Great Lakes—connects Northern Ohio, Michigan, Northern Indiana and Chicago and other parts of Northern Illinois;
- Keystone—runs through parts of Virginia, Maryland, and West Virginia, as well as Eastern Ohio and across Pennsylvania and into New Jersey and New York; and
- Midwest—stretches from Kentucky and Southern Ohio through Southern Indiana, Southern Illinois, Missouri, and Iowa.



[26] *See* Workpaper "Line Segment Tables from Model vF.xlsx," Tab "Line Segment Table_Base."

NS's Southern Region includes these divisions:

- Blue Ridge—connects North Carolina, most of NS's Virginia lines, parts of West Virginia, and Southern Ohio;
- Gulf—includes Louisiana, Alabama, Mississippi, Tennessee, and small sections in North Carolina and Kentucky; and
- Coastal—covers the Carolinas, Georgia, and Florida.

100. Four principal routes comprise the core of NS's network, as displayed in Figure 9 below. The first three routes form a triangle covering the eastern United States. These three routes run between Chicago and Atlanta; Atlanta/Chattanooga and the Northeast; and the Northeast and Chicago. The fourth route runs from Chicago to Norfolk, Virginia. Most of the core network is double tracked, with all of it equipped for double stacking intermodal containers. Outside of these core routes, most of the network is single track with passing sidings. NS also serves several gateways that connect to these core routes, as well as feeder routes that serve significant origins or destinations.

Figure 9: NS Principal Routes

101. NS has 28 hump, system, and region flat manifest yards of various sizes across its network. Six are currently operated as hump yards.[27] NS has the most extensive intermodal network in the Eastern United States and provides service to 41 active intermodal facilities, 29 of which it owns and 12 of which are private or publicly owned port facilities.[28] NS also serves 40 auto terminals that unload and load finished vehicles to and from railcars.

102. NS interchanges traffic with over 250 short line railroads (some of which are indirectly connected). NS also interchanges in gateway cities and ports with several significant belt or terminal railroads such as Conrail, BRC, IHB, and TRRA.

[27] *See* Workpaper "NS Locations_Auto-Port-Intermodal-Yards-Mech-Shortline.xlsx."

[28] NS's expanded reach is 56 intermodal markets when including access via a short line partner and intermodal markets where NS currently has no active intermodal terminal.

A list of locations at which NS interchanges more than 2000 cars annually is provided in Electronic Appendix P.[29]

103. Chicago serves as the western anchor for three of the core NS routes and has the highest total density of trains on NS's network with well over 80 trains operating on these routes on any given day. In Chicago, NS owns six intermodal facilities to support the core routes. The largest by volume is Chicago 47th Street, which largely feeds the Chicago to Northeast route. Chicago 63rd Street supplements Chicago 47th Street and primarily handles domestic freight. Calumet is the primary terminal serving the Chicago to Southeast route. Landers is the primary terminal for NS's East Coast port services. Ashland Avenue Yard in Chicago and Colehour Yard in Hammond, Indiana, support most of NS's steel wheel intermodal interchanges with other railroads.

104. Chicago is also the primary interchange location for NS's non-intermodal traffic. Just about every commodity handled by NS moves through Chicago, including coal, grain, ethanol, oil, automobiles, steel, food and other general merchandise. Interchanges between NS and the other five Class I railroads, as well as many short lines, are accommodated through direct interchanges between the carriers or through one of two intermediate switching carriers in Chicago: BRC and IHB. In addition, the Gary Railway Company and South Chicago & Indiana Harbor Railroad ("SCIH") short lines play a major role in servicing key customers in the Chicago market. While Chicago is the primary terminus on NS's Great Lakes

[29] *See* Workpaper "Consolidated Interchange Counts FY 2024.xlsx."

Division, the railroad extends further west on the Kankakee and Streator Lines, with the furthest western point being Hennepin, Illinois.

3.2.1. Chicago to Southeast Route

105. The Chicago to Southeast route extends approximately 785 miles between Chicago and Atlanta. The route proceeds east out of Chicago on the former Nickel Plate line to Fort Wayne, Indiana. At that point, the route turns south and connects with the Cincinnati, New Orleans & Texas Pacific Railway ("CNO&TP") between Cincinnati and Chattanooga. This line had been owned by the City of Cincinnati—but operated by NS and its predecessors—for over 150 years until NS purchased the line in 2024. South of Chattanooga, the line continues past Austell, Georgia, and into Atlanta.

106. NS also has trackage rights between Gary, Indiana, and Bucyrus, Ohio, on the Chicago, Fort Wayne & Eastern Railroad. Although the route is not currently heavily used, it creates some flexibility and redundancy for NS operations.

107. The Chicago to Southeast route and other lines connecting with the route are shown in Figure 10 and the GIS map files provided in Applicants' workpapers.[30]

[30] *See* Workpaper "GIS Shape Files."

Figure 10: Chicago to Southeast Route

3.2.1.1. Chicago to Southeast Route Products

108. As discussed above, the Chicago to Southeast Route hosts a considerable amount of intermodal freight, with eight to ten intermodal trains per day moving on some or all of the route. While every commodity type NS ships can be found on the route, NS sees significant volumes of agricultural products moving from the Midwest to the Southeast, particularly feed and grains moving to the Southeast poultry

markets and some export traffic moving through Southeast and Gulf ports, as well as ethanol and fertilizer. There is also a considerable amount of steel products moving from the Midwest to processing centers in the Southeast to support the automotive and construction industries. Finally, NS has significant finished vehicle shipments on this line, both from manufacturers that are located on or near this route, as well as shipments from Midwest manufacturers to southeast markets.

3.2.1.2. Chicago to Southeast Route Connections to Short Lines, Ports, and Border Crossings

109. The Chicago to Southeast route serves numerous short lines, including Gary Railway Company and SCIH, and the two area belt railroads, BRC and IHB. Each of these is a significant participant on the route. While this route does not have any direct border crossings, it does handle Canadian freight interchanged to NS in Chicago. There are no significant port facilities on this route.

3.2.1.3. Chicago to Southeast Route Yards and Major Repair Facilities

110. Decatur, Illinois Yard, East Wayne Yard in Indiana, DeButts Yard in Chattanooga, and Inman Yard in Atlanta all support the Chicago to Southeast Route. There are significant locomotive shops in Atlanta (Inman), and Chattanooga, Tennessee. Small repairs can also be done at shops in Chicago and Fort Wayne, Indiana. Major terminals with car repair facilities include Atlanta (Inman) and Chattanooga.

3.2.1.4. Chicago to Southeast Route Intermodal and Automotive Ramps

111. Auto ramps served by this route include those in Chicago; Georgetown, Kentucky; Commerce, Georgia; and Atlanta (Hapeville at Poole Creek). Calumet is the primary Chicago area intermodal terminal serving this route with terminals from north to south in Sharonville, Ohio; Cincinnati; Georgetown; Austell, Georgia; and Atlanta (Inman).

3.2.2. Northeast to Southeast Route

112. The second portion of the core triangle of the NS network runs between the Northeast region—including the New York, New Jersey, and eastern Pennsylvania area—and two separate legs in the Southeast that respectively reach Atlanta, and Knoxville and Chattanooga, Tennessee. The route and other lines connecting with the route are shown in Figure 11 and the GIS map files provided in Applicants' workpapers.

Figure 11: Northeast to Southeast Route

113. From Atlanta, the route extends approximately 785 miles to Harrisburg, Pennsylvania. Starting in Atlanta on the former Southern Mainline the route runs northeast through Georgia, South Carolina, North Carolina, and to Northern Virginia. The route crosses from the Coastal Division to the Blue Ridge Division as it enters Virginia, and it crosses the Blue Ridge Mountains on the B-Line west of Manassas, Virginia.

114. From Chattanooga, the line runs approximately 705 miles to Harrisburg through Knoxville, via the A Line. From Knoxville, the route continues northeast through Bristol, Tennessee to Roanoke, Virginia, then up the Shenandoah Valley to Front Royal, Virginia, on the H Line where it connects to the B Line. This route connects the Gulf Division to the Blue Ridge Division.

115. These two branches meet at Front Royal and use the H-Line into Hagerstown, Maryland. North of Hagerstown, traffic traverses former Conrail lines to reach major terminal facilities at Harrisburg. Cars moving deeper into the Northeast use the routes detailed in the subsequent Chicago to Northeast section.

3.2.2.1. Northeast to Southeast Route Products

116. As discussed above, the Northeast to Southeast route also hosts a considerable amount of intermodal freight, with 10 to 12 intermodal trains per day moving on some or all of the route. While every commodity type NS ships touches this route, NS sees considerable shipments of waste move from the Northeast to landfills in Alabama and Virginia; Forest Products from the Southeast to Northeast markets; and Chemicals moving from the Gulf and Mid Atlantic to Southeast destination.

3.2.2.2. Northeast to Southeast Route Connections to Short Lines, Ports, and Border Crossings

117. This route includes short line interchanges such as Lancaster and Chester Railroad outside of Charlotte; Buckingham Branch Railroad connecting in Charlottesville, Virginia; and Palmetto Railways' connecting locations in South Carolina. The route does not have any border crossings.

3.2.2.3. Northeast to the Southeast Route Yards and Major Repair Facilities

118. Of NS's significant yards, only Inman Yard in Atlanta and DeButts Yard in Chattanooga directly serve the route. Major mechanical facilities include Chattanooga and Shaffers Crossing in Roanoke.

3.2.2.4. Northeast to Southeast Route Intermodal and Automotive Ramps

119. Significant intermodal terminals in Atlanta; Greer, South Carolina; Charlotte; Greensboro; Virginia Inland Port in Front Royal; and Rutherford, Pennsylvania support this route from South to North. Winston-Salem, North Carolina, has an automotive terminal that supports traffic moving over this route.

3.2.3. Chicago to Northeast Route

120. The third portion of the NS core triangle, sometimes referred to as the Premier Corridor, runs between the northeastern United States and Chicago. The route runs 900 miles between Chicago and Northern New Jersey, starting along the Chicago Line or old Nickel Plate Line, to Cleveland. From there, the former Pennsylvania Railroad Mainline brings this route through Pittsburgh into Harrisburg. NS reaches deeper into the Mid-Atlantic on former Conrail routes to reach Newark, Philadelphia, Wilmington, and Baltimore. This route also includes the former Nickel Plate, Conrail, and Delaware and Hudson Railway lines connecting Cleveland to Schenectady, New York. Finally, these lines provide connections to the Detroit industrial centers—including automotive traffic coming from Detroit to eastern locations such as Wilmington and Doremus, New Jersey—as well as the Monongahela coal mining region south of Pittsburgh. The Chicago to Northeast Route

includes the highest density line segments on NS's system. The route and other lines connecting with the route are shown in Figure 12 and the GIS map files provided in Applicants' workpapers.

Figure 12: Chicago to Northeast Route

3.2.3.1. Chicago to Northeast Route Products

121. The Chicago to Northeast route hosts the greatest intermodal volume on NS's network by far, with up to 30 intermodal trains per day touching a portion of

this corridor. Every commodity NS ships can be found on this route, with some of the most notable volumes including coal entering the NS network in Chicago and heading to Detroit Edison, as well as coal from the Monongahela region to export and utility facilities in the east. NS sees a considerable amount of fuel inputs on this line including agrifuels, crude oil and liquid gasses supporting the refineries in the east. Raw materials for steel as well as finished steel are prevalent on this route, as well as significant shipments of vehicles from Midwest plants to the Northeast market. Finally, NS carries considerable shipments of fracking sand for the Marcellus shale region along this route.

3.2.3.2. Chicago to Northeast Route Connections to Short Lines, Ports, and Border Crossings

122. The Chicago to Northeast Route includes the greatest concentration of short line connections on NS's network. In addition to the four Chicago area short lines, NS connects to Conrail in Detroit, Northern New Jersey, and the Philadelphia (South Jersey) area. Conrail is a large switching railroad that is owned by NS and CSXT, with Shared Asset Areas that were created to ensure that competitive shipping options are available to customers in these three key markets. While Conrail is NS's largest short line connection by volume, other major connecting carriers along different parts of the route include Pan Am Southern ("PAS," another joint venture owned by NS and CSXT and operated by the Berkshire & Eastern Railroad); Columbus & Ohio River Railroad; Wheeling & Lake Erie Railroad; Reading, Blue Mountain & Northern Railroad; and Delmarva Central Railroad Company.

123. This route represents NS's highest concentration of port facilities including the major east coast ports of New York/New Jersey, Philadelphia, Wilmington, and Baltimore, as well as Great Lake Ports in Indiana, Toledo, Cleveland, and Sandusky, Ohio.

124. Finally, this route supports three border crossings including interchanges on the US side of the border with CPKC at Detroit, Buffalo, and Rouses Point, New York, and on the Canadian side of the border with CN in Fort Erie, Ontario.

3.2.3.3. Chicago to Northeast Route Yards and Major Repair Facilities

125. There are several significant NS yards between Chicago and the Northeast. Moving west to east, these include Elkhart and Fort Wayne, Indiana, Conway, Pennsylvania (near Pittsburgh), and Enola Yard near Harrisburg. Moorman Yard in Bellevue, Ohio, also serves this route as well as the Chicago to Norfolk route. Other key yards include Oakwood outside of Detroit and Binghamton, New York.

126. The most significant mechanical facility along this route is Juniata, NS's largest locomotive mechanical facility, located in Altoona, Pennsylvania. There are smaller mechanical facilities in Fort Wayne, Elkhart, Bellevue, Harrisburg, and Enola.

3.2.3.4. Chicago to Northeast Route Intermodal and Automotive Ramps

127. NS has its highest concentration of intermodal assets on this route. Anchored by the Chicago 47th Street, Chicago 63rd Street, Ashland Avenue (Chicago), and Colehour (Hammond, Indiana) yards in the west, NS serves major

markets headed east including Toledo, Detroit, Cleveland (Maple Heights), Pittsburgh (Pitcairn), Harrisburg (through ramps at Harrisburg and Rutherford), Trenton, New Jersey (Morrisville, Pennsylvania), Bethlehem, Pennsylvania, Croxton, New Jersey, and finally Northern New Jersey. In Northern New Jersey, NS serves three major intermodal container terminals at the Port of New York and New Jersey. Moving east of Cleveland, NS also serves Buffalo, Scranton, Pennsylvania, Albany (Mechanicville, New York), and Boston (Ayer, Massachusetts).

128. There are auto ramps in Chicago, Elkhart, Fostoria, Ohio, and Jefferson Terminal in Detroit. Melvindale, Michigan, is the major automotive terminal serving Detroit to the north. Conrail's Doremus automotive terminal serves as NS's primary ramp in the Mid-Atlantic region. East of Cleveland, NS has vehicle unloading facilities in Buffalo, Mechanicville (Albany), and Ayer (Boston).

3.2.4. Chicago to Norfolk Route

129. The fourth and final core route of NS's network is Chicago to Norfolk, Virginia. This route extends over 1000 miles from Chicago through Fort Wayne and Bellevue on the former Nickel Plate then south through Columbus, Roanoke, Petersburg, Virginia, and Norfolk on the former Norfolk & Western line. This route is sometimes referred to as the "Heartland Corridor." In 2009, NS in conjunction with federal and state agencies, completed a double-stack clearance project on this route allowing for direct, double-stack access between Norfolk and the Midwest. As part of this project, NS also constructed a major new intermodal terminal at Rickenbacker Airport just south of Columbus, Ohio. The route and other lines connecting with the

route are shown in Figure 13 below and the GIS map files provided in Applicants' workpapers.

Figure 13: Chicago to Norfolk Route

3.2.4.1. Chicago to Norfolk Route Products

130. The Chicago to Norfolk route hosts considerable intermodal traffic, with up to 10 intermodal trains per day touching all or a portion of this corridor. The route has historically served to connect rich coal mining regions in Virginia, West Virginia,

and Kentucky to global markets through NS's Lamberts Point coal export facility in Norfolk. Other key commodities that travel on the Chicago to Norfolk route include feed and corn going to southeast feeders and processors, as well as occasional export moves through Chesapeake, Virginia. Finally, the route carries vehicle traffic going to large distribution centers in North Carolina and Virginia.

3.2.4.2. Chicago to Norfolk Route Connections to Short Lines, Ports, and Border Crossings

131. The Chicago to Norfolk route includes a connection to one of NS's largest short line partners, the Kanawha River Railroad connecting in Columbus, Ohio, and Deepwater Creek, West Virginia. Other connections include Columbus & Ohio River Rail Road near Columbus, Commonwealth Railway in Portsmouth, Virginia, and Norfolk & Portsmouth Belt Line Railroad ("NPBL") in Chesapeake.

132. NS's Lamberts Point facility currently handles 12 to 18 million tons of export coal per year, including almost 140,000 export carloads in 2024. In addition, NS services two major Virginia Port Authority container terminals: Virginia International Gateway in Portsmouth and Norfolk International Terminals in Norfolk. NS also serves the Purdue export facility via the NPBL in Chesapeake, VA, as well as a rail to barge riverport in Wheelersburg, Ohio.

133. This route does not directly support any border crossings.

3.2.4.3. Chicago to Norfolk Yards and Major Repair Facilities

134. There are several significant yards between Chicago and Norfolk, including Bellevue (Moorman Yard) and Portsmouth in Ohio; Bluefield, West Virginia; and Roanoke, Crewe, Portlock, and Lamberts Point in Virginia. Portsmouth,

Bluefield, and Lamberts Point primarily support coal while the other yards support a larger portfolio of shipments.

135. A string of mechanical facilities are also located along the route. The most significant is Shaffer's Crossing in Roanoke, with other shops in Bellevue and Portsmouth, Ohio.

3.2.4.4. Chicago to Norfolk Route Intermodal and Automotive Ramps

136. This route is anchored by the Landers Intermodal terminal in Chicago. Moving east, NS has intermodal terminals in Columbus, Ohio (Rickenbacker) and Norfolk, Virginia (Portlock). In addition, as noted above, NS serves Virginia Port Authority's Virginia International Gateway and Norfolk International Terminals.

137. NS's automotive footprint includes terminals in Petersburg, Virginia, and Winston Salem, North Carolina.

3.2.5. Gateway Routes

138. NS also has many key gateway routes that connect to its core routes.

139. *Kansas City/St. Louis*. Traffic that runs south of Chicago or west from Indiana via Decatur Yard to St. Louis and west from Louisville to St. Louis can then run west to Kansas City, all on NS's Midwest Division along the lines of the old Wabash Railroad. Traffic can also run east/west between St. Louis and Kentucky on the W Line.

140. St. Louis hosts its own lift facility and is also served by Class I rail carriers BNSF, CPKC, CSXT, and UP. NS and the other Class I carriers each own minority shares of TRRA. Currently, UP and NS engage in directional interchange.

UP traffic bound for NS is interchanged via A&S then TRRA, while NS traffic bound for UP is interchanged via A&S. There are also automotive ramps at Wentzville, Missouri, and Kansas City. On the W Line, in addition to Kansas City, there are significant automotive terminals in Princeton, Indiana, Shelbyville, Kentucky, and Georgetown, Kentucky.

141. Kansas City also has Class I railroad access to BNSF, CPKC, and UP. KCT serves the city and NS owns a minority share in the terminal railroad, the remaining shares of which are owned by other Class I railroads.

142. Just further north, NS has haulage rights on BNSF and the Iowa Interstate Railroad to access Des Moines, Iowa, where NS owns a small amount of track which it uses for local service.

143. *Memphis*. NS hosts interchanges with BNSF, CN, CSXT, and UP at Memphis. Traffic from the other Class I railroads is then forwarded to interior parts of NS's network. Yards at Sheffield, Alabama, and Chattanooga, Tennessee, support classification work for cars moving through the Memphis gateway. The intermodal facilities at Rossville, Tennessee, and Huntsville, Alabama, serve the Memphis and northern Alabama local markets, respectively.

144. *Meridian/New Orleans*. Meridian, Mississippi, is the eastern terminus of the Meridian Speedway, a joint venture between CPKC and NS from Meridian to Shreveport. NS has haulage rights on the Meridian Speedway for intermodal traffic to and from points in the West. NS and CPKC also use the Meridian Speedway to

support interline services between Dallas and Mexico in the West-Southeast markets on NS.

145. New Orleans is another significant gateway for NS, with both port traffic and Class I carriers serving points west. Among other products, there is significant chemical traffic along the Gulf of America. The New Orleans gateway receives service from Class I railroads BNSF, CN, CPKC, and UP.

146. Norris Yard in Birmingham, Alabama, handles most of the traffic in this area. Traffic from New Orleans and Meridian headed northeast is routed through DeButts Yard in Chattanooga. In addition, Oliver Yard in New Orleans handles a significant amount of interchange traffic in the gateway.

147. *Jacksonville*. NS's Coastal Division runs south from Atlanta to Jacksonville, Florida. From there, NS interchanges intermodal, automotive, and merchandise traffic to the Florida East Coast Railway for forwarding to central and southern Florida. In addition to several Florida east coast ports, there are auto terminals in Titusville and Jacksonville. Jacksonville also has one of the largest intermodal terminals and one of the most significant auto lifts (Westlake) in the NS system. The NS yard at Macon, Georgia, facilitates the sorting of merchandise traffic moving to and from Jacksonville and other Florida markets.

148. *New England*. NS enters upstate New York on the old Delaware & Hudson South Line. Now part of NS's Keystone Division, the line connects to the Albany area (Schenectady and Mechanicville, New York) and is NS's gateway to New England. The Albany area is the site of intermodal and automotive ramps. NS's New

England intermodal traffic funnels through an intermodal terminal in Ayer, Massachusetts, via PAS or alternatively via trackage rights on CSXT to Worcester, Massachusetts. The trackage rights route avoids height restrictions and allows for double stacked containers into Boston. New England automotive traffic goes over PAS to a ramp in Ayer.

3.2.6. Feeder Routes

149. As explained below, NS also has what it sometimes refers to as "feeder routes" in and out of the core network.

150. *Birmingham / Mobile*. NS connects to the Port of Mobile via Birmingham (Norris Yard). Terminal Railway Alabama State Docks is the terminal railroad for the Port of Mobile, and Mobile is also served by CN and CSXT. The route between Mobile and Birmingham serves myriad merchandise customers whose traffic enters the core network at Birmingham.

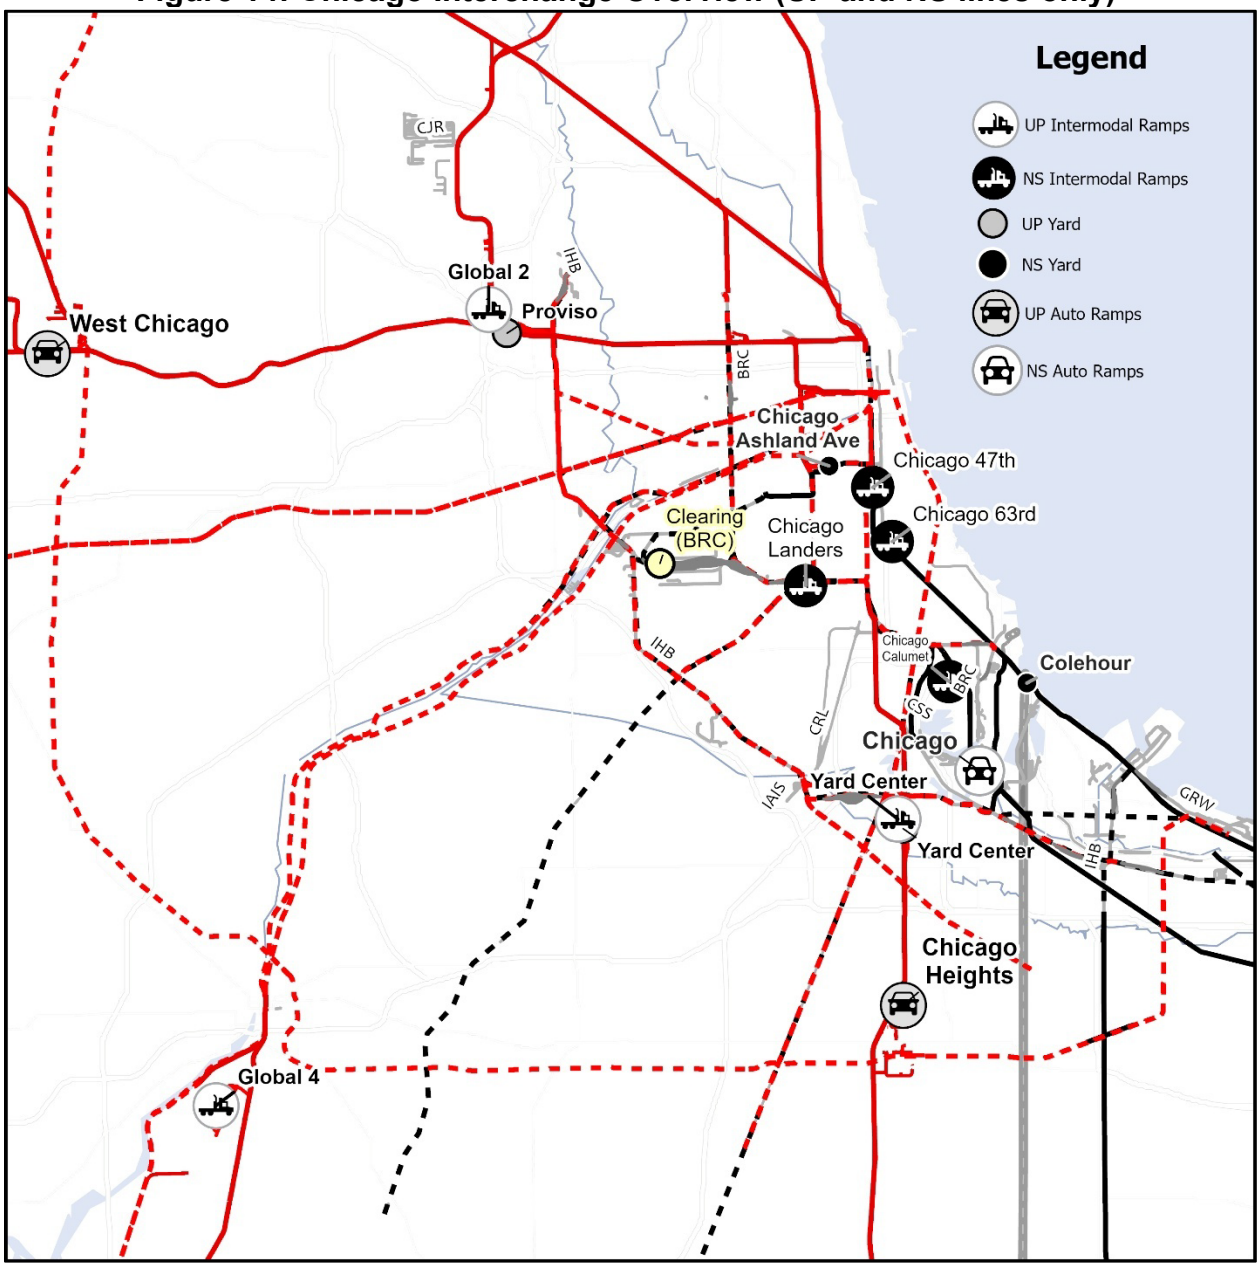
151. *Southeast to Charleston and Savannah*. NS also connects to ports in the Southeastern United States including Brunswick and Savannah, Georgia, and Charleston, South Carolina. Brunswick is served via the Brosnan Yard in Macon and has a significant auto lift. Golden Isles Terminal Railroad is the port's terminal railroad. Savannah is similarly served via the Brosnan Yard. Savannah Port Terminal Railroad is the local short line. NS has direct access to Savannah's main port facilities, including the Mason Mega Rail Terminal for international intermodal lifts. NS also interchanges with both Georgia Central Railway and Georgia Southern Railway in the area. Charleston is home to both a port and an intermodal terminal.

Charleston is served via Columbia, South Carolina, site of an NS Thoroughbred Bulk Transfer Terminal transload facility.

3.3. Current UP/NS Patterns of Service

152. UP and NS currently interchange traffic at the mid-continent gateways of Chicago, St. Louis, Kansas City, Memphis, Shreveport, and New Orleans. In 2023, the two railroads interchanged approximately 1,637 cars of manifest traffic, 1,648 containers of intermodal traffic, and 122 cars of bulk shipments per day.[31] In the following sections, Applicants describe current patterns of service for traffic UP and NS interchange using each gateway.

3.3.1. Chicago



153. Chicago is the busiest gateway in the United States. It is the major point of interchange for traffic moving between UP and NS. In 2023, UP and NS interchanged approximately 454 cars of manifest traffic and 1,139 containers of intermodal traffic per day in Chicago.[32] They interchanged approximately 243 of the cars and all containers directly and via rubber tire interchange.[33] UP and NS interchanged the remaining railcars using BRC and IHB.

[31] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "Summary," Cells D31, D32, and D36.

[32] *See id.*, Cells D7, D8, and D9.

[33] *See id.*, Cell K7.

Figure 14: Chicago Interchange Overview (UP and NS lines only)

3.3.1.1. Chicago – Intermodal Operations

154. UP has intermodal ramps in three yards in Chicago: Global 2, Global 4, and Yard Center. UP uses Global 2 for domestic traffic, Global 4 for domestic and international traffic, and Yard Center primarily for traffic moving to and from Texas

and Mexico. UP also uses Global 3 to interchange intermodal traffic with CSX and NS.[34]

155. NS has intermodal ramps in four yards in Chicago: 47th Street, 63rd Street, Calumet Yard, and Landers Yard. NS uses 47th Street for domestic service to the Northeast, 63rd Street for domestic service to New England and the Northeast, Calumet for domestic service to the South, and Landers for domestic and international to Columbus and East Coast ports. NS also uses Ashland Avenue Yard in Chicago and Colehour Yard in Indiana to interchange intermodal traffic with UP and BNSF.

156. UP brings most NS-bound intermodal traffic into Global 3, routing trains from the Pacific Northwest, Northern California, and Southern California to that yard. At Global 3, UP builds two trains for NS: one with blocks for locations in the Ohio Valley and Northeast, and one with blocks for locations in Columbus, Cincinnati, and the South. UP delivers the Ohio Valley/Northeast blocks to Ashland Avenue and the Columbus/Cincinnati/South blocks to Calumet.

157. UP brings NS-bound domestic intermodal traffic from lower density lanes into Global 2, Global 4, and Yard Center. UP deramps this traffic, which is then drayed to NS terminals in Chicago in a "rubber tire interchange."

158. NS brings most UP-bound domestic intermodal traffic from the Northeast to Global 2. NS brings UP-bound domestic intermodal traffic from lower

[34] UP consolidated Global 1 operations into Global 2 in June 2023.

density lanes into 47th Street, 63rd Street, Calumet, and Landers. NS deramps this traffic, which is then drayed to UP terminals in Chicago.

159. NS brings UP-bound international traffic from the Northeast and the Ohio Valley to Colehour, where it builds a train for Global 4. A UP crew brings the train from Colehour to Global 4.

3.3.1.2. Chicago – Manifest Operations

160. UP uses three Chicago yards to support manifest operations: Proviso Yard, Yard Center, and West Chicago Yard. Most manifest traffic interchanged with NS flows through Proviso. UP also interchanges manifest traffic to NS via BRC's Clearing Yard.

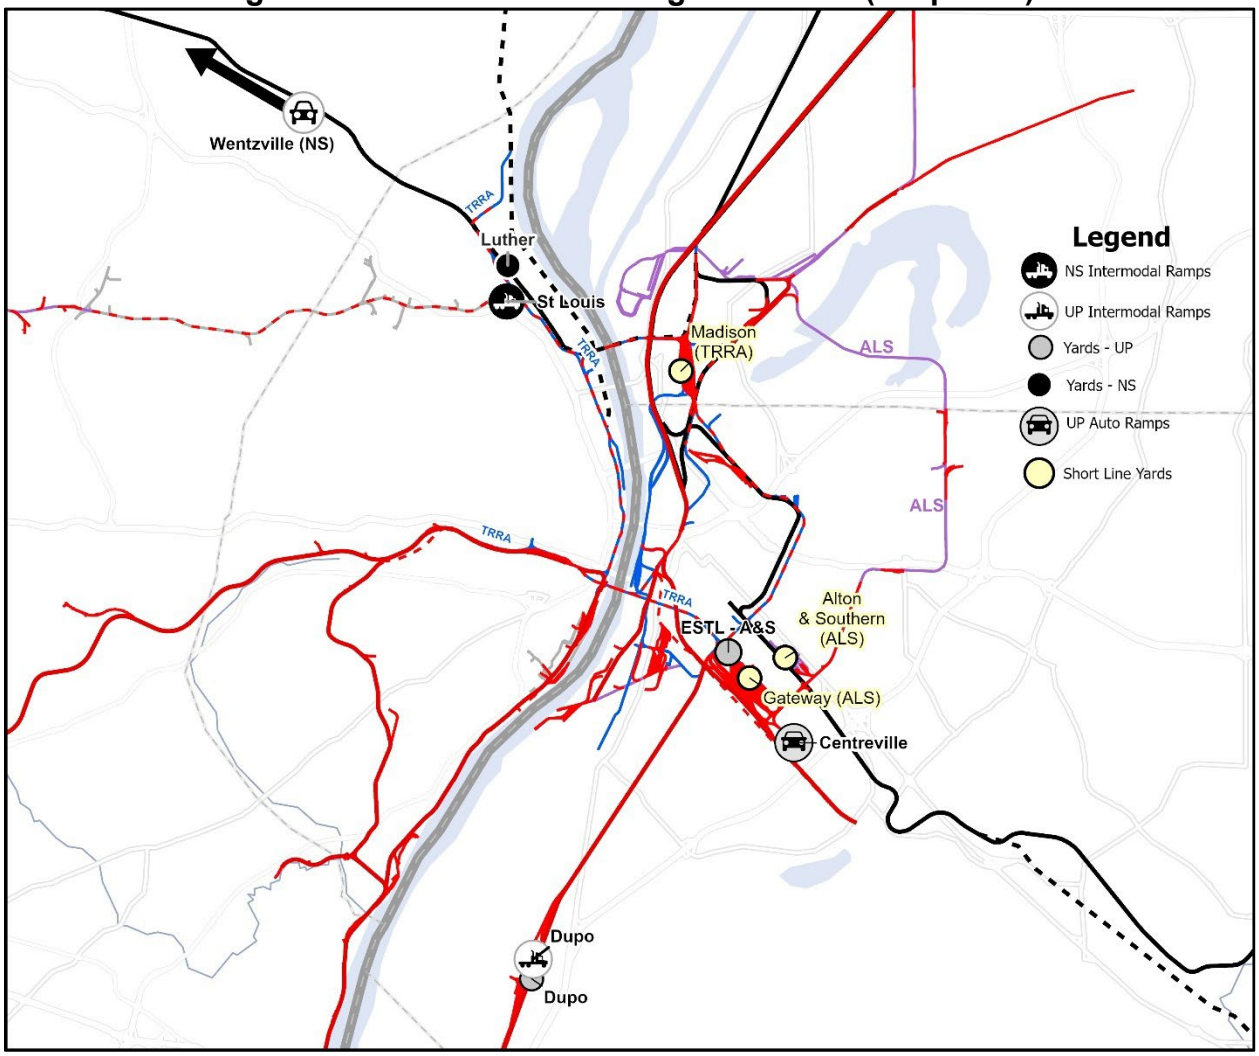
161. NS primarily relies on its Elkhart Yard in Indiana and BRC's Clearing Yard to support its manifest operations in Chicago.

162. UP brings most NS-bound manifest traffic originating west of North Platte, Nebraska, into UP's North Platte Yard, where it builds an Elkhart block and launches it on a train to Proviso. At Proviso, UP builds a train that picks up additional Elkhart blocks with NS-bound traffic from Wisconsin and Minnesota and continues to Ashland Avenue. UP brings some NS-bound automotive traffic from Texas into Yard Center, and a local train operating from Yard Center sets out a Baltimore block for NS at Ashland Avenue. UP also uses intermediate carriers to interchange manifest traffic with NS in Chicago. UP routes traffic originating in the upper Midwest to Clearing Yard, where BRC builds trains for NS. UP also uses IHB to transfer automotive traffic to NS within Chicago.

163. NS routes traffic destined to UP locations west of North Platte to Elkhart, where it builds a North Platte block that it delivers to Proviso/Global 2. NS delivers all other UP-bound manifest traffic to Clearing, where BRC builds trains for UP. NS also delivers automotive traffic, excluding destinations west of North Platte, through IHB.

3.3.2. St. Louis

164. Although UP and NS do not interchange intermodal traffic over the St. Louis gateway, both railroads have intermodal ramps in St. Louis. UP provides intermodal service from its Dupo Intermodal Terminal. NS provides intermodal service from its St. Louis Intermodal Facility.



165. In 2023, UP and NS interchanged approximately 382 cars of manifest traffic per day in St. Louis.[35] UP routes NS-bound manifest traffic originating primarily in Texas, Louisiana, and Arkansas, as well as automotive traffic originating in Texas and Mexico and destined primarily to the Ohio Valley and Northeast, to NS via A&S. Three times a day, A&S transfers the NS-bound traffic to TRRA, which builds trains for NS. Therefore, all this UP-NS traffic is handled twice in St. Louis—once by A&S and once by TRRA. In 2023, UP and NS interchanged approximately 206 cars per day that were handled by both A&S and TRRA in St. Louis.[36]

[35] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "Summary," Cell D12.

[36] *See id.*, Cell B12.

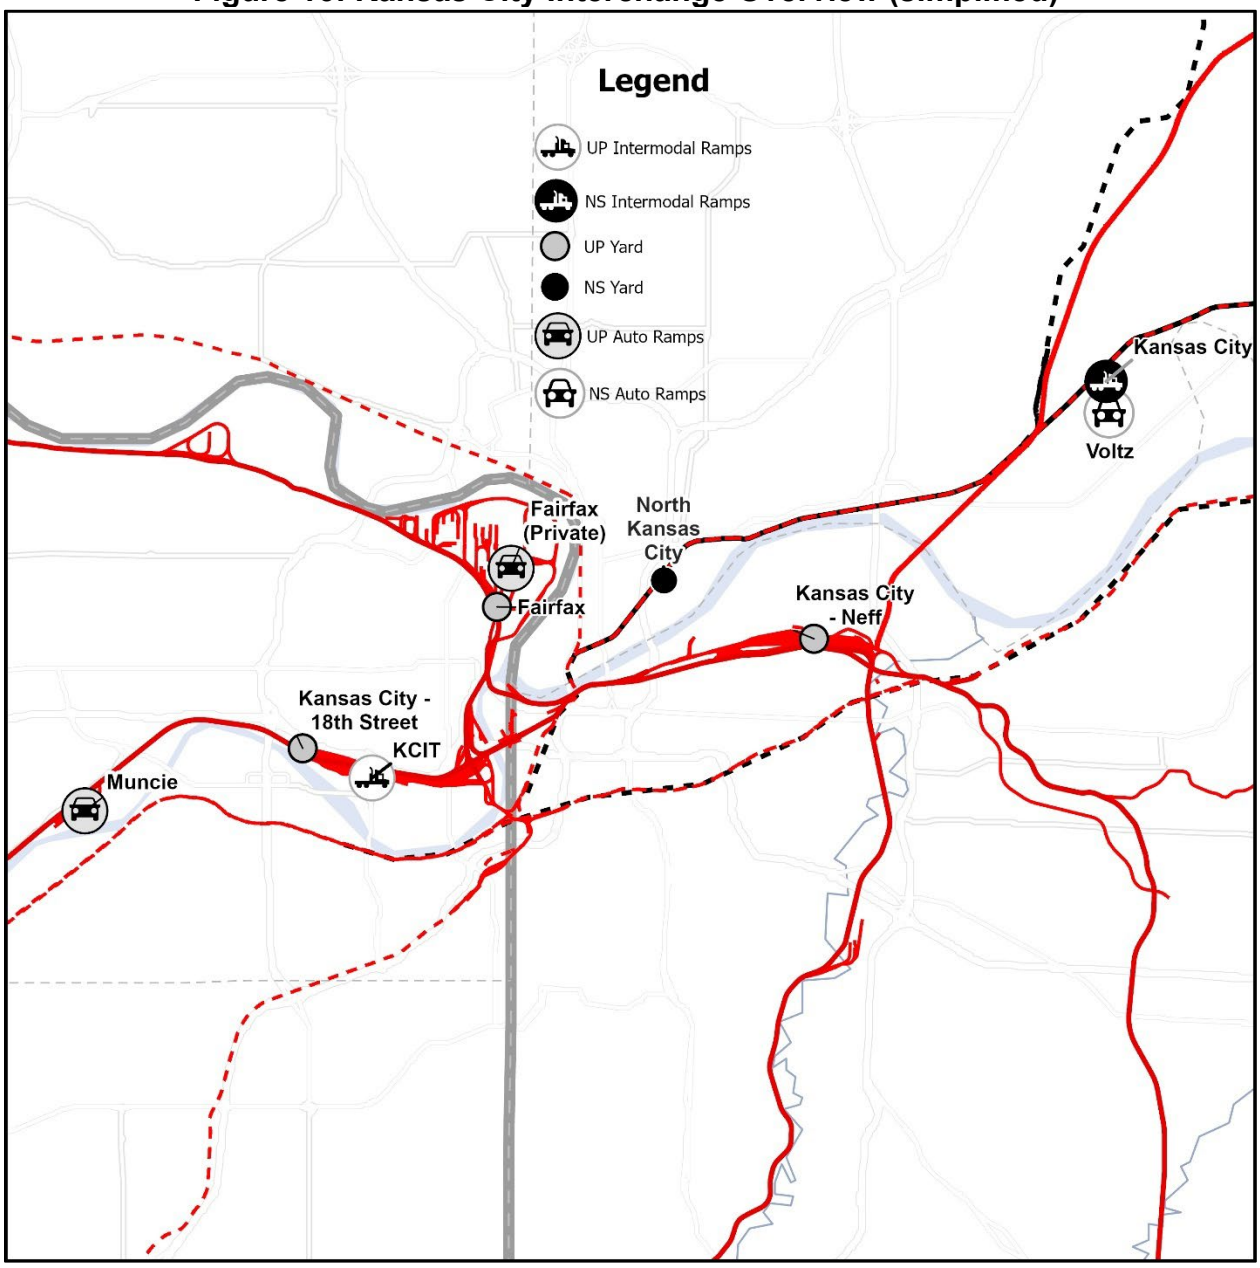
166. NS routes UP-bound manifest traffic—originating primarily in the Ohio Valley and the Northeast and destined primarily to Texas and the Gulf Coast—via A&S, which builds trains for UP.

Figure 15: St. Louis Interchange Overview (simplified)

3.3.3. Kansas City

167. UP and NS both have intermodal ramps in Kansas City. UP recently relocated its intermodal operations from Neff Yard, a repurposed hump yard, to its new Kansas City Intermodal Terminal ("KCIT"). NS conducts intermodal operations out of Voltz Yard. The only intermodal traffic UP and NS interchange over the Kansas

City gateway is traffic moving from UP's West Coast ramps to Louisville, Kentucky, which is deramped in KCIT and drayed to Voltz.



168. In 2023, UP and NS interchanged approximately 196 cars of manifest traffic per day over the Kansas City gateway.[37] UP and NS interchanged all this traffic directly. UP's primary manifest yard in Kansas City is its 18th Street Yard. NS's primary manifest yard is its North Kansas City Yard.

169. UP interchanges NS-bound traffic by building a train for NS in Topeka, Kansas. In North Platte, UP builds NS and Topeka blocks that consolidate traffic from the western portion of its network that is destined to Kansas City or interchange with NS in Kansas City. In Topeka, UP adds Kansas City-area cars that it first moved west for classification in Topeka, typically including automotive traffic from its Fairfax Automotive Facility, then launches the interchange train. The train sets out cars in UP's 18th Street Yard before terminating in NS's North Kansas City Yard.

170. NS interchanges UP-bound traffic using a train that originates in Cincinnati and picks up additional traffic as it passes through Kentucky, Indiana, and Missouri. The NS train carries a variety of traffic, including automobiles destined to UP's Mira Loma Automotive Facility in California. NS brings this traffic to UP's 18th Street Yard, where UP builds several blocks, including a Mira Loma block that rides an intermodal train toward California.

[37] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "Summary," Cell D16.

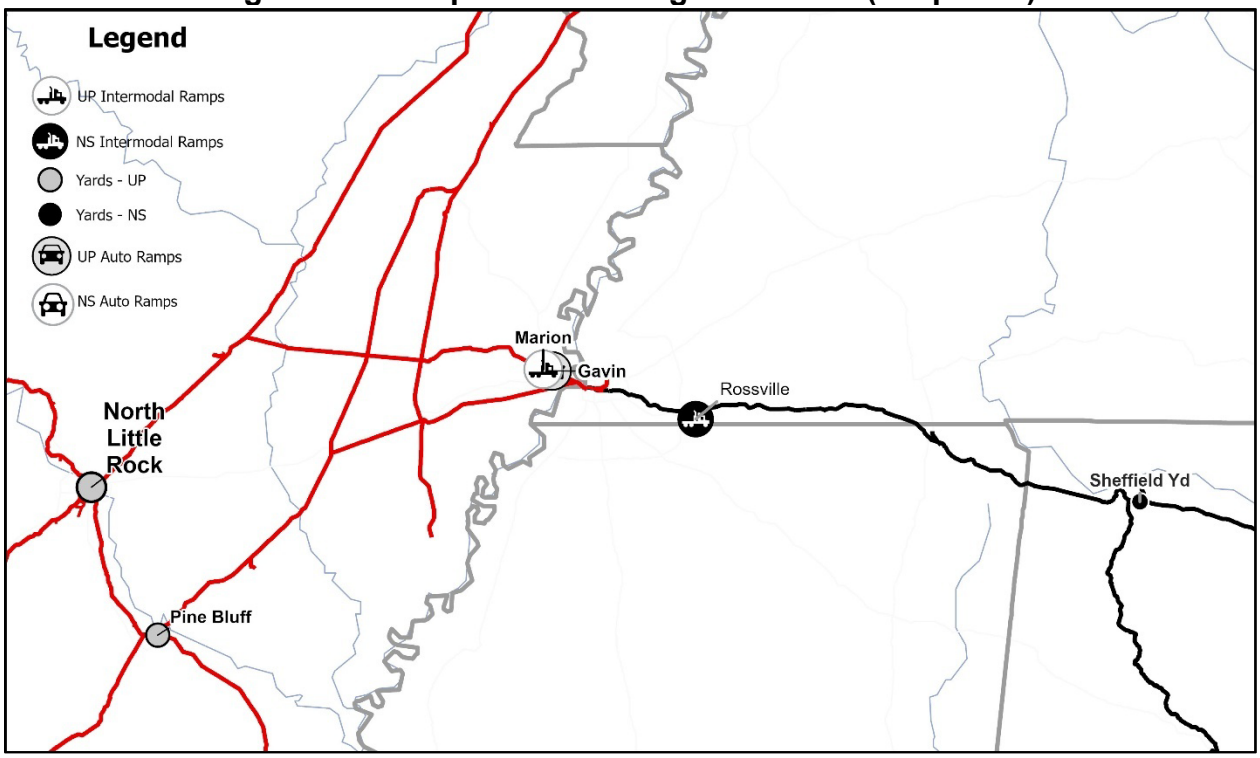


Figure 16: Kansas City Interchange Overview (simplified)

3.3.4. Memphis

171. In 2023, UP and NS interchanged approximately 275 cars of manifest traffic and 139 containers of intermodal traffic per day in Memphis.[38] They interchanged all of this traffic directly.

Figure 17: Memphis Interchange Overview (simplified)

3.3.4.1. Memphis – Intermodal Operations

172. UP and NS both have intermodal ramps in Memphis. UP's facility is the Marion Intermodal Terminal, located in Marion, Arkansas. NS's facility is in Rossville, Tennessee. UP and NS operate daily transfer trains between the two facilities. UP uses the Memphis gateway for traffic from Northern and Southern California and Laredo, Texas, moving to NS-served locations in the Southeast.

[38] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "Summary," Cells D20 and D21.

Conversely, NS uses the Memphis gateway for traffic moving between the Southeast and UP-served locations in Northern and Southern California.

3.3.4.2. Memphis – Manifest Operations

173. UP manifest traffic moving over the Memphis gateway to NS runs through UP's yard in North Little Rock. UP combines traffic moving from the western part of its network through North Platte and the southern part of its network through Fort Worth, and builds a train it launches to NS's yard in Sheffield, Alabama. At Sheffield, NS builds blocks for destinations deeper in the NS system, including a substantial block for Chattanooga. UP also has a small yard in Memphis called Sargent Yard, but it does not use the yard for interchange operations with NS.

174. NS manifest traffic moving over the Memphis gateway to UP flows in the reverse. NS builds a train at Sheffield by combining traffic from Sheffield, Chattanooga, and Birmingham, and launches the train to North Little Rock. At North Little Rock, UP reclassifies the traffic for movement deeper into its network. NS uses its Rossville facility to conduct local operations in Memphis.

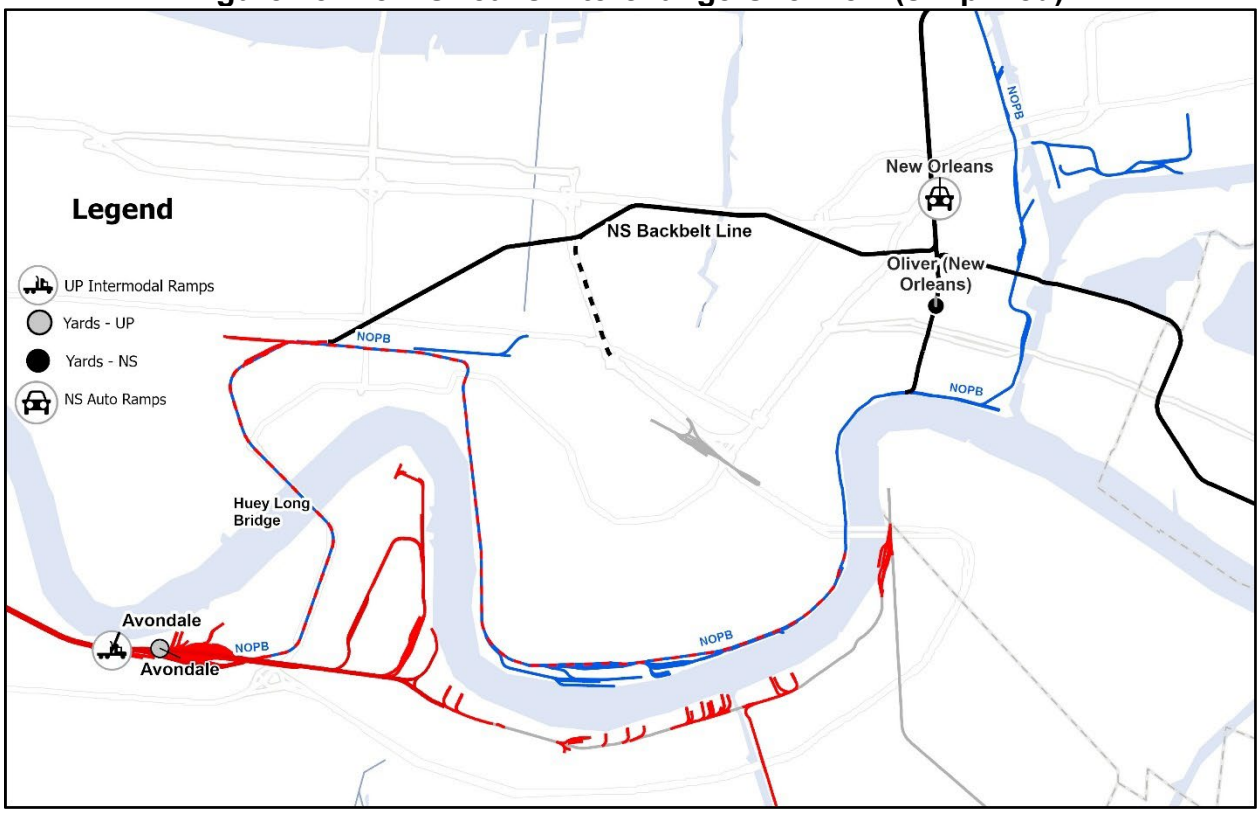
3.3.5. Shreveport/Meridian

175. In 2023, UP and NS interchanged approximately 363 containers per day of intermodal traffic using the Shreveport/Meridian gateway.[39] Under a longstanding agreement with Kansas City Southern (now CPKC), NS has rights to use the Meridian Speedway, which connects with UP in Shreveport and NS in Meridian.

[39] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "Summary," Cell D25.

Under the agreement, UP and NS can commercially interchange intermodal traffic at Shreveport, with CPKC providing the transportation between Shreveport and Meridian. UP uses the Meridian gateway for intermodal traffic originating in Northern and Southern California and destined to NS-served locations in Atlanta, Charlotte, and Jacksonville. NS uses the Meridian gateway for intermodal traffic moving in the opposite direction to UP.

3.3.6. New Orleans



176. UP and NS do not interchange intermodal traffic over the New Orleans gateway. Although UP has a small intermodal ramp in New Orleans, NS does not have a New Orleans ramp.

177. In 2023, UP and NS interchanged approximately 330 cars of manifest traffic per day in New Orleans.[40] Manifest traffic moving over the New Orleans gateway from UP to NS primarily originates in Southern California, Texas, and Louisiana. UP uses two trains to move manifest traffic over the New Orleans gateway to NS: one is destined to Birmingham, while the other train is destined for Chattanooga, including a block for East Point, Georgia. UP launches both trains from its yard in Livonia, Louisiana. UP crews take the trains over the NOPB's Huey P. Long Bridge to NS's Back Belt Line and stage them for NS. NS crews board the trains and work them in NS's Oliver Yard before departing to Birmingham or Chattanooga.

[40] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "Summary," Cell D28.

178. NS uses the New Orleans gateway for manifest traffic moving to UP destinations in Texas, Louisiana, and the southern part of the UP network. NS moves the traffic in two trains: one destined to UP's Englewood yard in Houston, and the other destined to Livonia. NS launches one train from Chattanooga and one from Birmingham. NS moves the trains into New Orleans and stages them on its Back Belt Line for interchange with UP.

Figure 18: New Orleans Interchange Overview (simplified)

4. Description of Combined Network – Optimized Plan

4.1. Optimized Plan – Principal Routes

179. Because UP and NS meet end-to-end at mid-continent gateways, their merger will not fundamentally alter the principal routes currently operated by UP or NS. The combined system will continue using UP's and NS's principal routes to serve

customers on either side of the gateways and move traffic to and from the gateways. At the same time, the UP/NS merger offers major opportunities to improve service and efficiency by eliminating interchanges between the two railroads and safely implementing train and blocking plans that allow traffic to move faster and more reliably. Applicants will achieve these improvements by implementing a unified transportation plan designed to optimize outcomes for the merged UP/NS, rather than separate plans designed to maximize outcomes separately for UP and NS. Applicants project that implementation of their optimized plan will avoid approximately 2,400 handlings per day and save approximately 60,000 car miles per day.[41]

180. Optimizing UP/NS's transportation plan will begin producing significant public benefits almost immediately upon consummation of the merger. That is, benefits will begin to accrue even before UP/NS attract new traffic through the single-line service offerings and one-stop shopping that will make the merged railroad a stronger competitor to trucks and other railroads. Once new train and blocking plans are in place, customers of both railroads will experience faster, more reliable service on shipments across mid-continent gateways, which translates into lower customer inventory costs and savings in equipment ownership costs.

181. Applicants' plans to move traffic more efficiently involve changes to how and where traffic currently interchanged at mid-continent interchange locations will

[41] *See* Workpaper "C-251124 Operating Plan Metrics vF.xlsx," Tab "Growth Plan," Cells D17 and D25.

be handled in the future. At the same time, UP/NS will keep open all existing gateways, both commercially and operationally. In addition, Applicants expect that UP/NS will continue interchanging substantial volumes of traffic with other railroads at those gateways. Applicants have taken care in the planning process to ensure their operational changes will not degrade the operations of connecting freight and passenger railroads.

4.2. Optimized Plan – Consolidation of Main-Line Operations

182. Applicants are not planning to change UP's or NS's principal routes or to abandon or divest any lines as a result of the consolidation. Rather, the combined UP/NS will be positioned to improve service for traffic currently interchanged between UP and NS. Eliminating interchanges at mid-continent gateways will immediately improve transit times for this traffic.

183. In addition, Applicants will change the way traffic currently flows through current interchanges to implement more efficient train and blocking concepts they have developed in the planning process. Applicants' development of these more efficient plans helps show why the benefits of this merger could not be achieved through cooperative agreements. Railroads, including UP and NS, often cooperate to make their own operations more efficient. One common example is classifying blocks of cars for interchange: one railroad sorts cars destined to a common location on the receiving railroad's lines and moves them in one group. This type of arrangement allows the receiving railroad to move the cars further on its network before sorting the cars again. However, railroads require such efforts to be reciprocated: a railroad will not take on an unequal amount of extra blocking work,

even when doing so would be more efficient overall for shippers and the receiving railroad. With a merger, there is no "us" and "them"—no balance to maintain—the objective is to optimize outcomes for customers and the merged system.

184. The planned changes to current traffic flows centrally involve creating new trains with deeper network blocking while optimizing movements through mid-continent gateways. The new trains do not increase the total number of trains moving over the combined network, but instead follow more efficient routes and implement more efficient train and blocking plans for moving the same traffic between the same points. We discuss these planned new trains below, and Appendix A provides additional details regarding the Optimized Plan train changes.[42]

185. *Southern California-Northeast Intermodal* (ZLCCX/ZHBLC). Applicants intend to introduce a new intermodal train pair between Southern California and the Northeast via Kansas City, Springfield, and Sidney, Illinois, leveraging UP's efficient routing from Southern California to Kansas City and NS's efficient routing from Kansas City to the Northeast. The new routes will be as much as 252 miles shorter than the current interline routing[43] and will save approximately 17 hours of transit time eastbound and 19 hours westbound[44] for approximately 435 containers per day.[45] The new trains are shown in Figures 19 and 20.

---

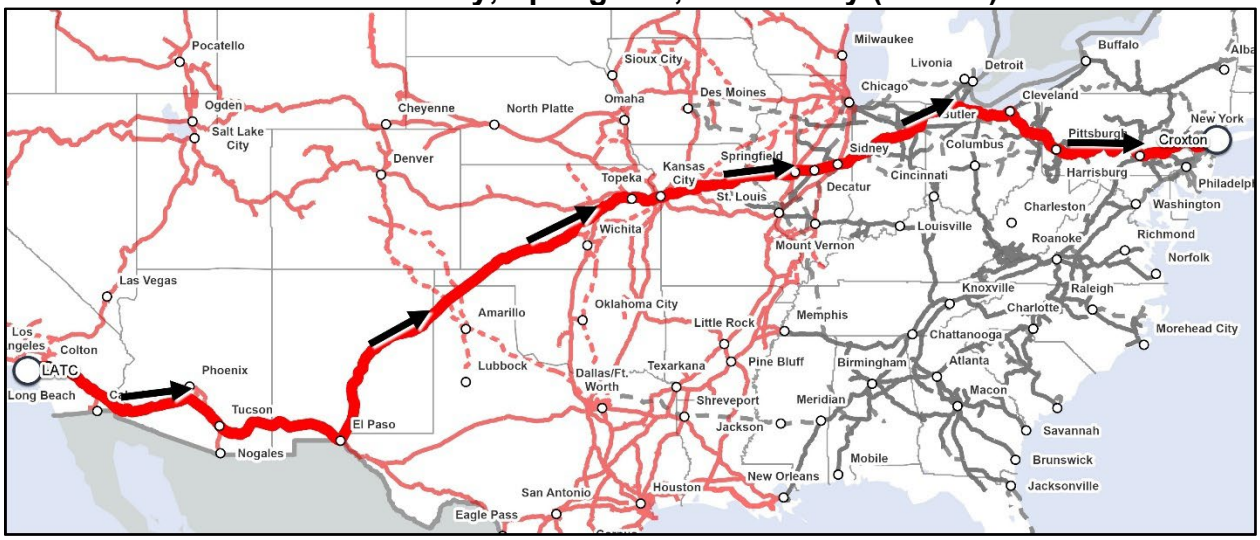
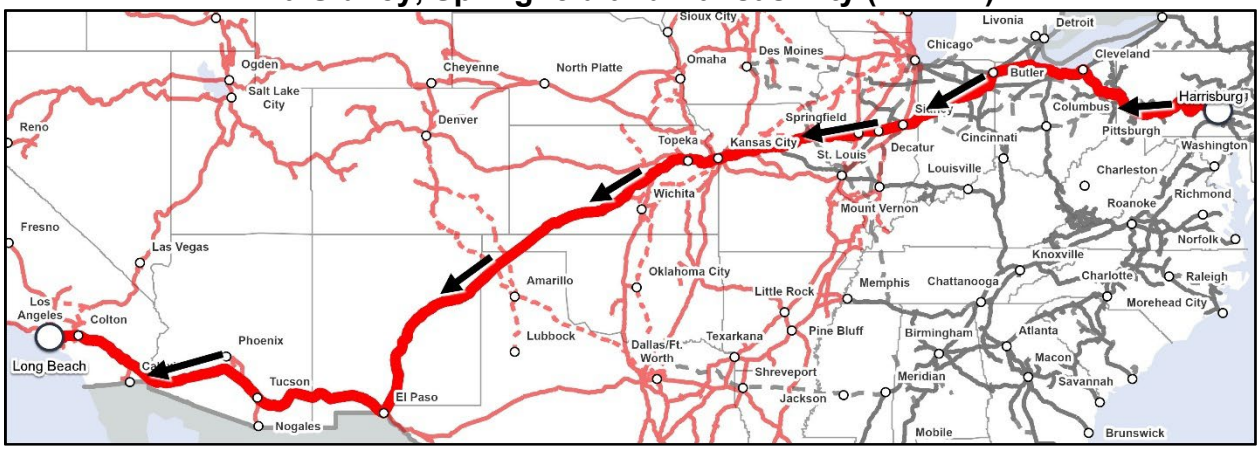
Figure 19: Southern California-Northeast Intermodal via Kansas City, Springfield, and Sidney (ZLCCX)





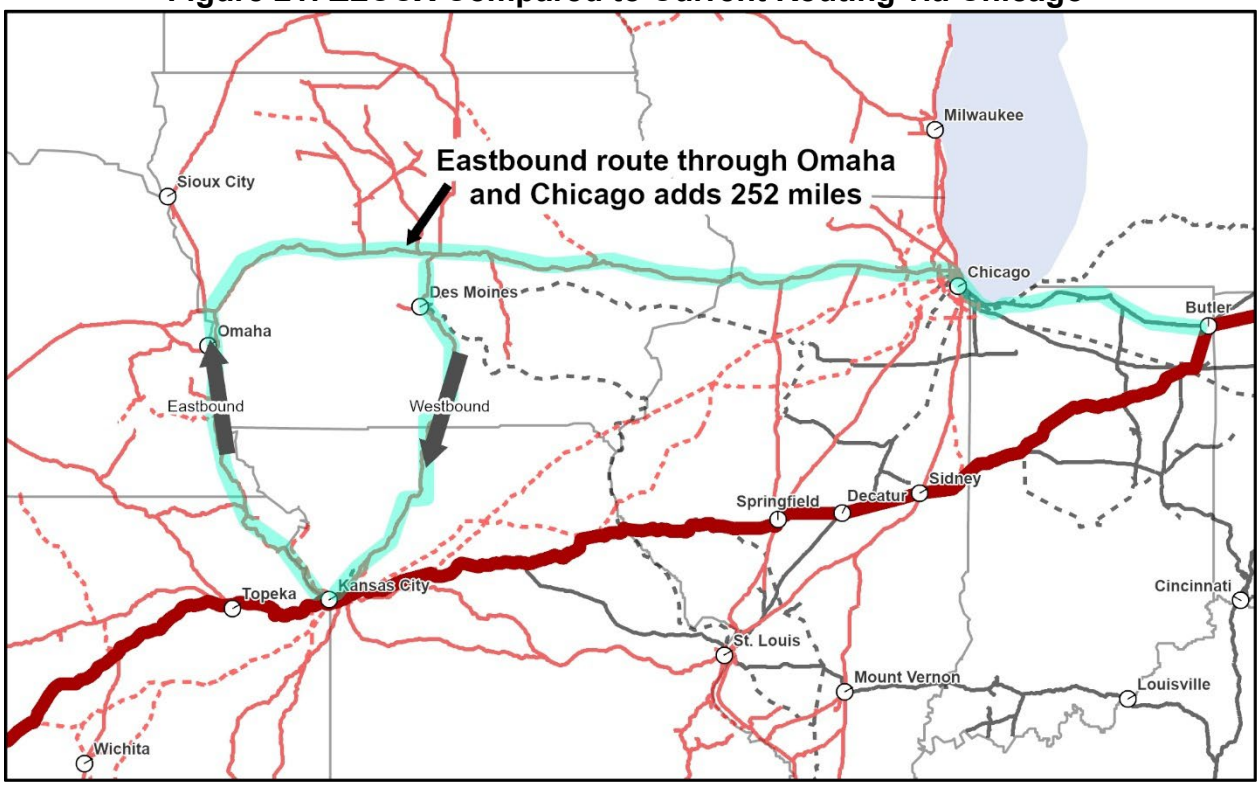


Figure 20: Northeast-Southern California via Sidney, Springfield and Kansas City (ZHBLC)

186. Figure 21 illustrates how, compared to current routing through Chicago, the new trains will make trips shorter and faster.

Figure 21: ZLCCX Compared to Current Routing via Chicago

187. By carrying traffic that UP and NS otherwise would interchange in Chicago, UP/NS's new Southern California-Northeast trains will bring broader benefits, too. These new trains should improve other railroads' Chicago-area operations by reducing train movements in the terminal. The new trains will also remove current traffic from Chicago area commuter routes and Amtrak routes between Chicago and Porter, Indiana, and Chicago and Butler, Indiana.

188. In addition, some traffic the new train will carry is traffic UP and NS currently interchange in Chicago by truck. Currently, UP and NS interchange approximately 532 containers per day by draying them between UP and NS

intermodal terminals in Chicago.[46] Applicants project approximately 92 of those containers will ride the new train, entirely avoiding Chicago and Chicago roadways, which will benefit roadway users in Chicago and the condition of the roads themselves.[47] Overall, this operating change and other operational improvements enabled by the merger will eliminate approximately 350 rubber tire interchanges per day in Chicago.[48]

189. *Southern California-Southeast Intermodal* (ZLBAT/ZCTLB). To improve a current route via Memphis, UP/NS will route a new intermodal train pair between Southern California and the Southeast via the Meridian Speedway. The new route will be 123 miles shorter than the current route[49] and will save 70 to 95 hours of transit time[50] for approximately 400 containers per day.[51] The new trains are shown in Figures 22 and 23.

Figure 22: Southern California-Southeast Intermodal via Meridian (ZLBAT)

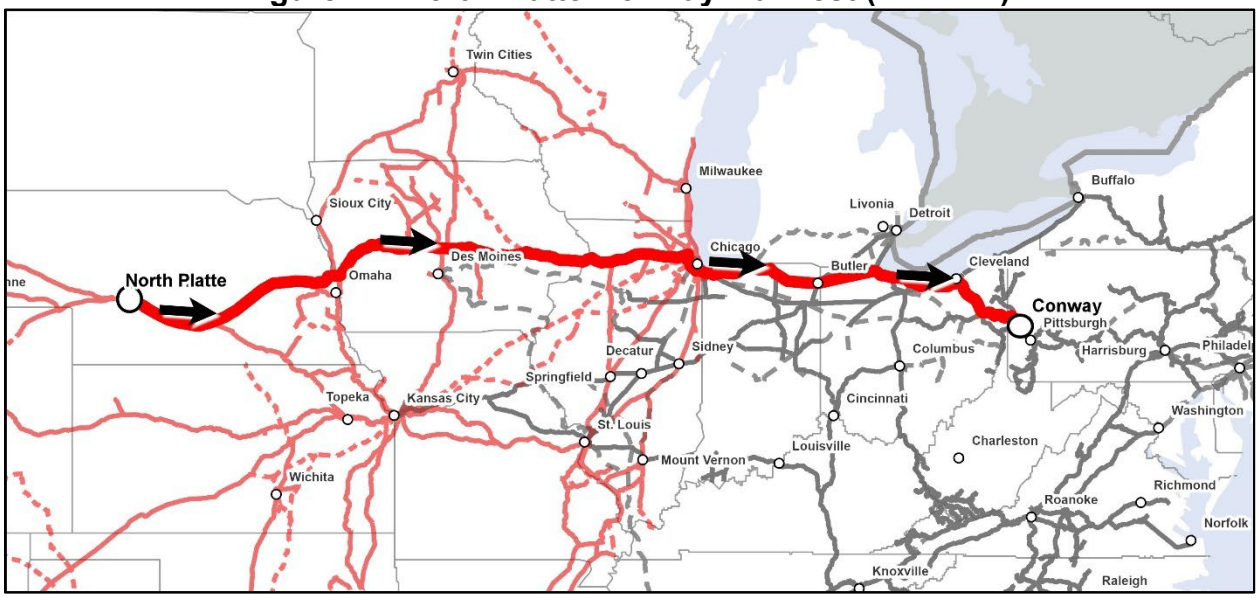

Figure 23: Southeast-Southern California Intermodal via Meridian (ZCTLB)

190. *North Platte-Conway Manifest* (MNPCW). UP/NS will operate a new manifest train from North Platte to Conway, Pennsylvania, with blocks for Elkhart, Indiana, Bellevue, Ohio, and Conway, Pennsylvania, that will remove car handlings in Chicago and at Elkhart Yard. The new train, which will carry traffic moving from UP's network west of North Platte and Iowa to the Ohio Valley and Northeast, will

eliminate 220 handlings per day.[52] The route of the new train is shown in Figure 24. The MNPCW will improve traffic flow compared to UP's and NS's current independent operations, and benefit Chicago's Metra commuter rail system and Amtrak.

Figure 24: North Platte-Conway Manifest (MNPCW)

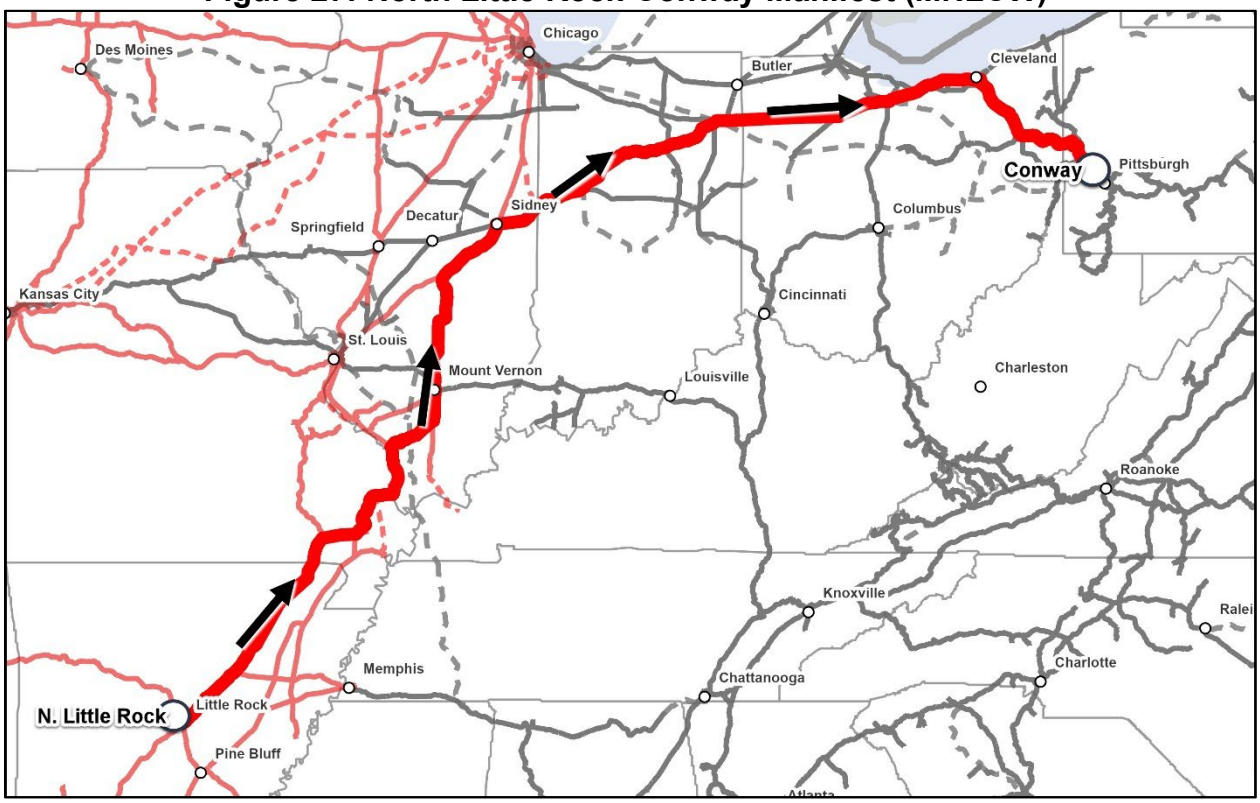
191. *Altoona-Elkhart Manifest* (MALEK). UP/NS will operate a new manifest train from Altoona, Wisconsin, to Elkhart, with blocks for Elkhart, Conway, and Corning, New York. The new train—which will carry traffic moving from Wisconsin and Minnesota to Indiana, Ohio, Michigan, Virginia, Pennsylvania, and New York—will remove the need for 151 handlings per day, including a block swap and reduced switching in Elkhart.[53] The new train's route is shown in Figure 25.

[52] *See* Workpaper "Manifest T1 vs T2 111825.xlsx," Tab "MNPCW," Cell I10.

[53] *See* Workpaper "Manifest T1 vs T2 111825.xlsx," Tab "MALEK," Cell I21.

Figure 25: Altoona-Elkhart Manifest (MALEK)

192. *Conway-Altoona Manifest* (MCWAL). UP/NS will operate a new manifest train from Conway to Altoona that will pick up blocks for Adams and Altoona, Wisconsin, at Bellevue and Elkhart. Building blocks at Corning, Conway, and Elkhart will enable traffic to go deeper across the Applicant's combined network. The new train will reduce switching demand at the BRC on approximately 110 cars daily for traffic moving from New York, Pennsylvania, Ohio, and Virginia to Illinois, Wisconsin, and Minnesota.[54] The new train is shown in Figure 26.



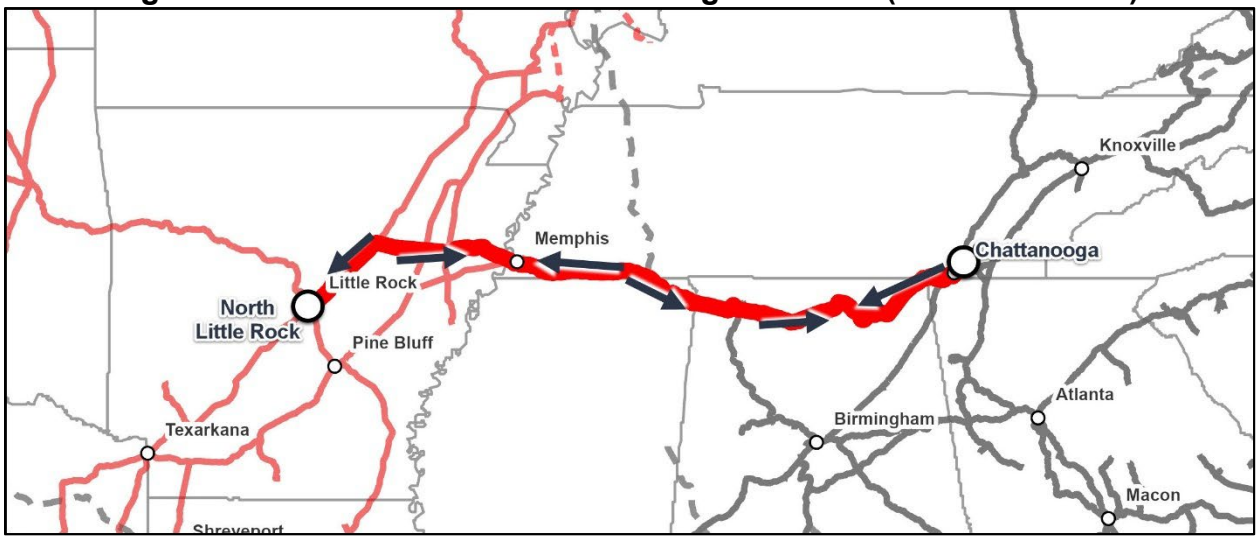
[54] *See* Workpaper "Manifest T1 vs T2 111825.xlsx," Tab "MCWAL," Cell H23.

Figure 26: Conway-Altoona Manifest (MCWAL)

193. *North Little Rock-Conway Manifest* (MNLCW). Using UP's line via Salem, Illinois, and NS's line via Sidney, Illinois, UP/NS will operate a new manifest train from North Little Rock to Conway, with blocks for Detroit, Bellevue, and Conway. The new train is shown in Figure 27.

Figure 27: North Little Rock-Conway Manifest (MNLCW)

194. The new route will be approximately 41 miles shorter than the current interline route from North Little Rock to Conway through East St. Louis and, each day, reduce one or two handlings on approximately 80 cars launched out of North Little Rock.[55] In addition, the new train will eliminate multiple car touches in the St. Louis gateway. In total, the North Little Rock-Conway train will help reduce approximately 144 daily handlings for traffic moving from Texas, Louisiana, and Arkansas to Michigan, Ohio, Pennsylvania, and New Jersey for traffic that UP and NS currently interchange in East St. Louis.[56] The new route also should benefit other railroads that rely on TRRA for intermediate switching in St. Louis, because it will



[55] *See* Workpaper "Manifest T1 vs T2 111825.xlsx," Tab "MNLCW," Cell F6.

[56] *See* Workpaper "Manifest T1 vs T2 111825.xlsx," Tab "MNLCW," Cell I6.

help reduce switching and transfer moves where northbound and eastbound traffic interchanged between UP and NS first moves through A&S and then TRRA.

195. *North Little Rock-Chattanooga Manifest* (MNLCT/MCTNL). UP/NS will operate a new manifest train pair between North Little Rock and Chattanooga, with blocks for Sheffield, Birmingham, and Chattanooga. The North Little Rock-Chattanooga train will carry traffic moving between Texas, Louisiana, Arkansas, and western points on UP, on the one hand, and Kentucky, Alabama, Tennessee, and northeastern and southeastern points on NS, on the other hand. The new train pair will eliminate car handlings at Sheffield for eastbound traffic moving to Birmingham and Chattanooga and a block swap at Sheffield for westbound traffic moving to North Little Rock, eliminating 124 handlings per day on traffic moving between North Little Rock and Chattanooga.[57] The new train pair is shown in Figure 28.

Figure 28: North Little Rock-Chattanooga Manifest (MNLCT/MCTNL)

[57] *See* Workpaper "Manifest T1 vs T2 111825.xlsx," Tab "MNLCT.MCTNL," Cell I15.

196. As discussed below in Section 7, Applicants' planning process has ensured affected lines will have capacity to accommodate the new trains. Most of these trains replace existing trains, using more efficient train and blocking plans. In net, the Optimized Plan will eliminate approximately 25 daily through freight crew starts and 4,700 daily train miles.[58] Applicants' planning process also ensured the changes would not have detrimental impacts on other freight or passenger railroads.

4.3. Yard and Terminal Activity Changes

197. Applicants' optimization of an integrated UP/NS system will affect the role of UP and NS manifest yards and intermodal terminals at gateways and locations deeper in the combined system. As discussed below, Applicants will consolidate some yard and terminal operations at gateways, making more efficient use of available capacity. Additionally, as traffic moves on new trains and new, longer-distance blocks, the number of cars per day going into yards will change, with some experiencing higher volumes while others experiencing reductions in workloads.

198. Tables 4 and 5 list key manifest yards and intermodal terminals expected to experience a change in workload of at least 25 cars or containers processed per day between the Base Plan and the Optimized Plan. The full list of

[58] *See* Workpaper "C-251124 Operating Plan Metrics vF.xlsx," Tab "Growth Plan," Cells D22 and D23.

anticipated processing changes at yards and terminals is provided in our workpapers.[59]

199. The increases and decreases in cars and containers processed per day in manifest yards and intermodal terminals under the Optimized Plan result from the routing changes described above in Section 4.2 as well as the yard and terminal rationalizations and changes to blocking plans described in this Section 4.3. For

[61] *See* Workpaper "Consolidated Terminal Data.xlsx," Tab "C.1.d Intm T1vT2."

example, the increase in cars processed at Chattanooga is the result of originating and terminating more trains and blocks deeper in the merged network. The increases in cars processed at Gateway Yard and North Little Rock are primarily the result of routing cars to North Little Rock for block creation, driving cars deeper into the present day NS network and removing handlings from the St. Louis gateway. The increase in cars processed at 18th Street is largely the result of the consolidating operations at North Kansas City into 18th Street. The increase in cars processed at Livonia is driven by building deeper eastbound blocking (*i.e.*, Macon) and supporting the New Orleans gateway through interchange optimization.

200. On the intermodal side, the increase in lifts per day at 47th Street Yard is largely the result of consolidating Yard Center's intermodal operations into 47th Street. Similarly, the increases at Marion and Global 2 reflect the consolidation of 63rd Street Yard into Global 2 and the rebalancing of Rossville and Marion traffic.[62] Harrisburg's reduced lift counts are offset by an increase in lift counts at Rutherford, as in the combined UP/NS network North Texas to Northeast traffic will likely be routed via Atlanta to the Northeast, reducing steel wheel and rubber tire connections in Chicago.

201. In the following subsections, we first discuss how Applicants' optimization plans will change yard and terminal operations in locations where UP and NS currently interchange traffic. We then briefly explain why Applicants'

[62] Applicants are continuing to evaluate plans for rebalancing Rossville and Marion, but for purposes of developing the Operating Plan, Applicants have assumed Rossville would be consolidated into Marion.

optimization plans change yard and terminal workloads in certain other locations identified in Tables 4 and 5. Applicants have ensured affected yards and terminals have capacity to accommodate additional activity, as discussed below in Section 7.2. Applicants' planning also has protected against detrimental impacts on other freight railroads as explained throughout the following discussion, or passenger railroads as discussed in Section 8.

4.3.1. Chicago-Area Yards and Terminals

202. Applicants' integration of UP and NS will reduce the overall level of manifest yard and intermodal terminal activity in Chicago, before accounting for merger-related traffic growth.

203. For intermodal traffic, UP/NS will shift UP's intermodal operations at Yard Center to NS's 47th Street intermodal terminal. The operational change will reduce duplicative operating expenses, create additional capacity to accommodate manifest traffic growth at Yard Center, reduce train and vehicle congestion around Dolton Tower/Yard Center, and help create surge manifest capacity in the Chicago gateway. NS's 47th Street Yard has sufficient capacity to absorb Yard Center's intermodal operations without capital improvements. UP currently interchanges some of the intermodal traffic it brings to Yard Center with CN via Markham, Illinois, and UP/NS will continue this interchange. The operational change will slightly increase freight operations (by one train pair) on Metra's Southwest line between 74th Street and 59th Street (a portion of the line owned by NS but leased to Metra and operated using retained trackage rights), but the line is double track and has ample capacity to accommodate the additional train pair.

204. UP/NS also will shift NS's intermodal operations in 63rd Street Yard to UP's Global 2. The operational change will reduce duplicative operating expenses, and Global 2 has sufficient capacity to absorb the additional operations. As a result of the change, which involves an extension of service from 63rd Street Yard to Global 2 , two additional intermodal train pairs per day will move over a small portion of UP's Geneva Subdivision that is also used by Metra, but that recently-improved triple-track segment has provided a minimum of 25 trains per day of slack capacity which will enable the route to accommodate the additional traffic. The change will also eliminate approximately 130 rubber tire interchanges per day that currently occur in the Chicago complex, which will benefit Chicago-area motorists.[63]

205. In addition, as discussed in Section 4.1, UP/NS will reduce yard activity in Chicago by routing a Southern California-Northeast intermodal train via Kansas City, Springfield, and Sidney, which will reduce eastbound traffic moving between Global 3 and Ashland Avenue and westbound traffic moving between Colehour and Global 2 and Colehour and Global 4.

206. For manifest traffic, Applicants' yards will retain their same basic functions. However, UP/NS will change the UP and NS blocking plans to reduce car handlings and allow trains to move through gateways without interchanging. As discussed above in connection with UP/NS's new North Platte-Conway train, rather than create just an Elkhart block at North Platte that is block swapped at Proviso

[63] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "RIC 63rd into G2," Cell A5.

and then interchanged at Ashland Avenue, UP/NS will also build blocks for Bellevue and Conway, which will reduce the need for switching at Elkhart. As another example, rather than deliver certain trains for BRC to build blocks at Clearing Yard for other traffic moving through Chicago on the combined UP/NS network, UP/NS will build its own efficient blocks outside the Chicago area, namely in Iowa, Wisconsin, Elkhart, Corning, and Conway, that do not require classification in Chicago.

207. UP/NS also will reduce complexity and consolidate automotive shipment distribution by shifting operations from UP's Chicago Heights automotive facility into NS's Hegewisch automotive facility, eliminating intermediate handlings between the two facilities.

208. These changes to UP's and NS's Chicago-area operations will not affect interchanges with other carriers in Chicago. Applicants plan to continue to interchange with other carriers in Chicago just as UP and NS interchange with those carriers today.

209. In particular, BRC and IHB will continue to play important roles in the Chicago area, performing local operations and handling traffic interchanged in Chicago between UP/NS and other Class I railroads. Applicants anticipate reducing intermediate switching demand by approximately 200 cars daily at the BRC as a

result of the transaction.[64] By rationalizing handling of UP/NS traffic, the UP/NS merger will increase BRC's and IHB's capacity to serve other railroads in Chicago.

4.3.2. St. Louis-Area Yards and Terminals

210. Applicants' integration of UP and NS will reduce the overall level of yard classification activity in St. Louis, before accounting for merger-related traffic growth.

211. NS's Luther Yard will be maintained as an intermodal terminal and a local manifest serving yard to ensure continuance of high levels of local service to existing NS customers in the St. Louis complex. Intermediate manifest switching performed at Luther will be transferred to A&S's Gateway Yard, allowing the cars to be blocked deeper into the NS network.

212. For manifest traffic, UP/NS will reduce overall yard activity by building blocks for eastbound traffic using A&S, which has capacity to accommodate the additional activity, rather than having A&S transfer eastbound traffic to TRRA for blocking. In addition, UP/NS will offset some of the additional work being performed by A&S by building blocks in North Little Rock and Bellevue that travel deeper into the combined network, thus reducing classification demand at A&S.

213. Finally, UP/NS will leverage latent capacity at UP's Centreville automotive facility in St. Louis to unload traffic destined to NS's Wentzville automotive facility. Balancing automotive unloading capability in the St. Louis

[64] *See* Workpaper "251120 NS-UP Interchange Summary by Gateway vShare.xlsx," Tab "Summary," Cell K6.

complex will enable future automotive growth and improve cycle times for empty autoracks.

214. These changes to UP/NS's St. Louis-area operations will not affect interchanges with other carriers in St. Louis. Applicants plan to continue to interchange with other carriers in St. Louis just as UP and NS interchange with those carriers today.

215. TRRA also will not be significantly affected by changes in Applicant's St. Louis-area operations. TRRA will continue to play an important role in the St. Louis area in performing local operations and handling traffic interchanged in St. Louis between UP/NS and other carriers. By rationalizing the handling of UP/NS traffic, the UP/NS merger will increase TRRA's capacity to serve other railroads in St. Louis.

4.3.3. Kansas City-Area Yards and Terminals

216. Applicants' integration of UP and NS will streamline yard activity in Kansas City.

217. For intermodal traffic, UP/NS will use UP's Kansas City Intermodal Terminal and NS's Voltz Yard primarily for separating domestic and international shipments. Additionally, Voltz will be used as an entry and exit point for traffic connecting between Southern California/West Coast and Lower Ohio Valley terminals. This will facilitate UP/NS's creation of a new intermodal route between Southern California and the Ohio Valley via Kansas City.

218. For manifest traffic, UP/NS will consolidate NS's North Kansas City Yard into UP's 18th Street Yard. UP's 18th Street Yard has sufficient capacity to

accommodate the work being done at North Kansas City. As a result, eastbound and westbound trains will no longer need to stop at North Kansas City. However, UP/NS will continue operating local trains out of North Kansas City with traffic shuttled between 18th Street Yard and North Kansas City. UP/NS will also reduce switching that currently occurs after NS delivers westbound automotive traffic to 18th Street by pre-blocking rail cars destined for Mira Loma, California, and setting them out at Voltz, where they will be picked up by originating UP's current Kansas City-Long Beach intermodal train at Voltz with the Mira Loma block.

219. Finally, Applicants will consolidate UP's Muncie automotive facility into Voltz Yard, which also has an automotive facility. Removing the need to work the Muncie automotive facility will reduce congestion on the west side of the Kansas City complex. UP/NS interchanges with CPKC, BNSF, Missouri & Northern Arkansas Railroad, and KCT will be adjusted in accordance with the terminal consolidations described above. This will reduce interchange moves and congestion in the Kansas City gateway. Applicants will continue to serve all existing interchange partners. These changes will not affect Amtrak, which moves though the Kansas City terminal on triple track controlled by KCT.

4.3.4. Memphis-Area Yards and Terminals

220. Applicants' integration of UP and NS will streamline intermodal activities in Memphis. UP/NS plan to rebalance intermodal operations between NS's Rossville Yard and UP's Marion Intermodal Terminal, which has sufficient capacity to accommodate the additional activity. UP/NS will start a second local train from

UP's Sargent Yard or a new local train from NS's yard in Sheffield to serve customers previously served by an NS local operating out of Rossville.

221. These changes to Applicants' Memphis-area operations will not affect interchanges with other carriers. Applicants plan to continue to interchange with other carriers in Memphis just as UP and NS interchange with those carriers today.

222. The changes in operations will not impact Amtrak, which interacts with UP in Memphis only at a crossing directly south of Amtrak's station. The consolidation of UP and NS operations will maintain similar frequency of freight train density through the Memphis complex.

4.3.5. New Orleans-Area Yards and Terminals

223. Applicants' integration of UP and NS will streamline activity in New Orleans and free capacity currently consumed when UP and BNSF interchange trains with NS.

224. Currently, operations in the New Orleans area can become congested as a result of interchange activities between UP and NS and BNSF and NS. UP and NS interchange four trains each day on NS's Back Belt Line. UP moves eastbound trains across the Huey P. Long Bridge and interchanges them with NS on the Back Belt near Interstate 10. NS moves westbound trains to the Back Belt and interchanges them with UP near 17th Street. BNSF and NS interchange traffic in NS's Oliver Yard. BNSF moves eastbound trains across the Huey P. Long Bridge to Oliver Yard, and BNSF crews board westbound trains in Oliver Yard and return to BNSF's terminal at Avondale.

225. The merger will free capacity on the Back Belt by reducing the quantity of interchange moves between UP, NS, and other connecting carriers. This change will improve operational fluidity on the Back Belt and over the Huey P. Long Bridge. In addition, UP/NS will shift BNSF's interchange with NS from Oliver Yard to a UP/NS-BNSF interchange at UP's Avondale Yard. This change will further improve operational fluidity in New Orleans by reducing the need for NS-BNSF interchange traffic to move over the Huey P. Long Bridge and the Black Belt.

226. These changes to UP/NS's New Orleans-area operations will not negatively affect interchanges with other carriers in New Orleans. Applicants plan to continue using Oliver Yard to support interchange operations with CN, CPKC, and NOPB, but there will be additional opportunities to streamline New Orleans-area operations by shifting NS's current interchanges with CN and CPKC through Livonia to Baton Rouge, which will further reduce congestion in New Orleans.

227. Amtrak will benefit from these changes to Applicants' operations in New Orleans. In particular, increased operational fluidity on the Back Belt will benefit Amtrak's Crescent and Mardi Gras trains when they enter and depart the Union Passenger Terminal in New Orleans. Amtrak will also benefit from planned pre-merger capital improvements on the Back Belt.

4.3.6. Other Yards and Terminals with Notable Changes

228. In addition to the terminal changes described above, Applicants expect train routing in the Optimized Plan will result in increased activity of 50 cars or more per day at three additional terminals. Chattanooga and North Little Rock will experience increased traffic as Applicants route traffic into those large hump yards

to remove connections in smaller terminals and build deeper overhead blocks across the integrated network. Livonia will see more traffic to create greater density for deeper eastbound blocking and to help support terminal consolidations in the New Orleans gateway.

229. Finally, Applicants plan to consolidate NS's operations in Des Moines, Iowa, into UP's Short Line Yard in Des Moines. Currently, NS reaches Des Moines using haulage rights over BNSF. After the merger, traffic to Des Moines-area customers served by the legacy NS will instead move over UP's lines and through UP's Short Line Yard. Local customers will continue receiving the same service they receive today.

4.3.7. Blocking Plan Changes

230. As discussed above, significant improvements in service and efficiency from optimizing UP and NS operations are created by building new blocks that travel deeper into the network of the combined railroad. Two notable additions to the many examples provide above are:

- UP/NS will improve transit time for finished automobiles moving from Georgetown, Kentucky, to Mira Loma, California, by routing the traffic to Kansas City rather than via Chattanooga and Memphis, which removes handlings at Chattanooga. This strategy also allows Applicants to build a Mira Loma block from automotive traffic originating in Kentucky, Indiana, and Missouri, removing handlings at 18th Street Yard in Kansas City. This enhancement will save approximately one handling on each of 36 daily cars.[65]
- UP/NS will enhance blocking on a manifest train operating from Elkhart to North Platte (MEKNP/39E). At Elkhart, Applicants will build a new Green River block that will be set out at Global 3 and picked up by a

[65] *See* Workpaper "Mira Loma Kansas City 112025.xlsx," Tab "ML KC," Cell J8.

different train (IG4SE) for movement to Green River, eliminating handlings at North Platte, and also a new Boone block, eliminating handlings by BRC. These new blocking plans will eliminate a classification event for 22 cars moving to Green River and eliminate a handling for 34 cars moving to Iowa in the Boone block.[66]

231. Table 6 below lists UP/NS yards that will build more blocks under the Optimized Plan, as compared to the Base Plan. Complete details of changes to blocks can be found in Electronic Appendix G.

Table 6[67]
Additional Long Distance Blocks by Yard
Base Plan to Optimized Plan

Yard	Additional Blocks
Elkhart, IN	5
Gateway Yard (St Louis), IL	5
Moorman (Bellevue), OH	3
North Little Rock, AR	3
Bellevue, OH	2
Avondale, LA	2
18th Street (Kansas City), KS	2
Beverly, IA	1

4.4. Optimized Plan – Automotive Service

232. Applicants' integration of UP and NS will allow implementation of a streamlined service that optimizes routing of loaded automotive shipments from OEMs on the legacy NS system to UP's Mira Loma auto facility in Southern California.

---

[66] *See* Workpaper "MEKNP 39E Blocks Elkhart 111925.xlsx," Tab "Summary," Cells C5 and C6.

[67] *See* Workpaper "T1_T2_T3_Block_Comparison.xlsx," Tab "Block Change by Terminal," Cells B3:B9.

233. Mira Loma auto traffic from Georgetown, Kentucky, Princeton, Indiana, Shelbyville, Kentucky, and other points on the NS system will be blocked before flowing into the Kansas City complex and connect directly to UP's current ZKCLB and IKCLB trains, which will now originate at Voltz terminal, eliminating 36 terminal handlings per day in Kansas City.[68]

234. Additionally, UP/NS will route some finished automobiles originating in Michigan and destined to Mira Loma through the IHB in Chicago to connect to UP's ZG2LC. This new routing will avoid connections in Decatur, Illinois, and Kansas City and eliminate 9 terminal handlings per day in Kansas City.

4.5. Optimized Plan – Local Train Service

235. Applicants' optimization of an integrated UP/NS system will result in changes to local train service. Applicants currently plan to continue operating local services from yards that are being consolidated into other yards, with the exception of NS's Rossville (Memphis) local that will be shifted to Sargent or operated out of Sheffield. In addition, a reduction of interchange transfer jobs between UP and NS (*e.g.*, elimination of IG3CL and MPRAH in Chicago) will reduce freight train activity at gateways, especially Chicago. Applicants will continue to look for opportunities to adjust local assignments to improve customer service as we integrate and refine our operating plans to provide transit times, service timing, and service frequency that meet customer needs and allow us to achieve the benefits of the merger.

[68] *See* Workpaper "Mira Loma Kansas City 112025.xlsx," Tab "ML KC," Cell J8.
