Columbia spotted frog (including Toiyabe spotted frog subpopulation) (Rana luteiventris)	Meadows, marshes, woodland, mountain wetlands and agricultural land. It is also known from around ponds, lakes, reservoirs, and slow-moving rivers and streams; undertake seasonal migrations to and from breeding sites; newly metamorphosed young form large aggregations and migrate en masse to upland foraging areas.This species exhibits breeding site fidelity	NDOW (SP); USFS (S); NS-S (S2S3); NS (G4T2T3Q)	x	x	Yes; Known northwest of Carlin

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Northern leopard frog *(Lithobates pipiens)*	Permanent ponds, swamps, marshes, and slow-moving streams throughout forest, open, and urban areas; normally inhabit water bodies with abundant aquatic vegetation.	NDOW (SP); NS-S (S2S3); NS (G5)	x	x	Yes; Historic records, none recent
Western toad *(Anaxyrus boreas)*	Wide variety of habitats ranging from desert springs to mountain wetlands; various upland habitats around ponds, lakes, reservoirs, and slow-moving rivers and streams; sometimes they move up to a few kilometers through uplands; egg laying sites include shallow areas of ponds, lakes, or reservoirs, or pools of slow-moving streams	NS-S (S4); NS (G4)	x		Yes
Arachnids					
Nevada water mite *(Thermacarus nevadensis)*	Hot springs; distribution and ecology are incomplete	NDOW (EB); NS-S (SH); NS (GH)		x	Yes
Birds					
Bald Eagle *(Haliaeetus leucocephalus)*	Near lakes, reservoirs, rivers, marshes, and coasts; scattered breeding occurances in Northern Nevada	FWS (DELISTED 2009); NDOW (SE); NS-S (S1B, S3N); NS (G5)	x	x	Yes
Black Rosy-finch *(Leucosticte atrata)*	Breeds in alpine areas, usually near rock piles, and cliffs; winters in open country, including mountain meadows, high deserts, valleys, and plains	NS-S (S3); NS (G4)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Brewer's Sparrow *(Spizella breweri)*	Arid sagebrush steppe; winter, occupy sagebrush shrublands similar to the breeding grounds, as well as a range of desert scrub habitats consisting mainly of saltbush and creosote	NDOW (SB); NS-S (S4B); NS (G5)	x	x	Yes
Burrowing Owl *(includes Western Burrowing Owl) (Athene cunicularia (A. c. hypugaea Western Burrowing Owl))*	Live in open habitats with sparse vegetation such as prairie, pastures, desert or shrubsteppe, and airports. In parts of their range they are closely associated with prairie dogs and ground squirrels, whose burrows they use for nests; Western Burrowing Owls breed throughout Nevada in salt desert scrub, Mojave shrub, and some sagebrush habitat, as well as in agricultural landscapes; winters most frequently in the southern half of Nevada, but has been recorded throughout the state during all months	NS-S (S3B); NS (G4); Western Burrowing Owl NS-S (S3B); NS (G4T4)	x	x	Yes
Columbian Sharp-tailed Grouse *(Tymanuchus phasianellus columbianus)*	Sagebrush-grassland and mountain shrub habitats during summer; use areas dominated by perennial bunchgrasses like luebunch wheatgrass or Idaho fescue and the shrub layer, if present is dominated by big sagebrush and/or antelope bitterbrush; tall, broad-leaved mountain shrub and riparian	NDOW (GB); NS-S (G4T3); NS (G4)		x	No; Small, introduced population in northeastern NV (WAP 2012).

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	cover types are critical components of winter habitat for sharp- tailed grouse; often move to higher elevations to get into moister sites that support greater amounts of these types of shrubs.				
Crissal Thrasher *(Toxostoma crissale)*	Uncommon in Nevada during all seasons; dense brush along desert streams, mesquite thickets; habitat varies; may be found in the densest mesquite thickets along washes, but also in sparse brush in open areas; occurs in dense chaparral, among manzanita and other scrub, in the southwestern mountains.	NS-S (S3); NS (G5)	x		No; Restricted to the southernmost part of Nevada (Audubon 2021).
Ferruginous hawk *(Buteo regalis)*	Preferred habitat arid and semiarid grassland regions; open, level, or rolling prairies; foothills or middle elevation plateaus largely devoid of trees; and cultivated shelterbelts or riparian corridors	NS-S (S2); NS (G4)	x	x	Yes
Flammulated Owl *(Psiloscops flammeolus)*	Open pine forest in mountains	NS-S (S4B); NS (G4)	x	x	No; Breeds in scattered ranges across the state with coniferous forest, including the Carson Range, Spring Mountains, Schell Creek Range, Ruby Mountains, and Snake Range, among others (WAP 2012)
Golden Eagle *(Aquila chrysaetos)*	Open country, especially around mountains, hills, and cliffs; use a variety of habitats	NS-S (S4); NS (G5)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	ranging from arctic to desert, including tundra, shrublands, grasslands, coniferous forests, farmland, and areas along rivers and streams				
Gray-crowned Rosy-Finch *(Leucostcte tephrocots)*	Breeds in alpine areas, usually near snow fields or glaciers, talus, rockpiles, and cliffs; winters in open country, including mountain meadows, shrublands, roadsides, towns, cultivated areas, rocky hillsides, and margins of dry ditches	NS-S (S3N); NS (G5)	x	x	Yes
Great Basin Willow Flycatcher *(Empidonax traillii adastus)*	Montane riparian habitat, with some spilloverinto lowland riparian areas; found in both lowland and montane riparian habitats, and occasionally in other inundated areas such as aspen stands or wet meadows; uses the lower Colorado River corridor during migration.	USFS (S); NS-S (S1S2); NS (G5T5)	x	x	Yes
Greater Sage-grouse (including Bi-State DPS) *(Centrocercus urophasianus)*	Sagebrush steppe; nest in areas with relatively dense cover from big sagebrush; may use areas with rabbitbrush, greasewood, and grassy areas; leks are located in clear areas such as broad ridgetops, grassy swales, dry lakebeds, and sometimes recently burned areas. chick rearing areas include irrigated pastures,	NDOW (GB); NS-S (S3); NS (G3G4)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	wet meadows, and alfalfa fields, in addition to sagebrush.				
Le Conte's Thrasher *(Taososstoma leconte)*	desert scrub, mesquite, tall riparian brush and, locally, chaparral	NS-S (S2); NS (G4)	x		No; Restricted to the southernmost part of Nevada (WAP 2012).
Least Bittern (includes Western Least Bittern) *(Ixobrychus exilis; includes Ixobrychus exilis hesperi)*	Habitat consists of tall emergent vegetaton in marshes, primarily freshwater. Prefers marshes with scattered bushes or other woody growth. Forages in shallow water or along banks. Heavy growths of cattail, bulrush, wild rice, burreed, water smartweed, and reeds are favored feeding sites.	NS-S (S2B); NS (G5T3T4)	x		Yes
Lewis's Woodpecker *(Melanerpes lewis)*	Open pine woodlands, and other areas with scattered trees and snags; unlike other American woodpeckers, it enjoys sitting in the open as opposed to sitting in heavy tree cover	NS-S (S3); NS (G4)	x	x	No; Restricted to woodlands (WAP 2012).
Loggerhead Shrike *(Lanius ludovicianus)*	Open country with short vegetation and well-spaced shrubs or low trees, particularly those with spines or thorns; frequent agricultural fields, pastures, old orchards, riparian areas, desert scrublands, savannas, prairies, golf courses, and cemeteries; are often seen along mowed roadsides with	NDOW (SB); NS-S (S4); NS (G4)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	access to fence lines and utility poles.				
Long-billed Curlew *(Numenius americanus)*	High plains, rangeland; Breeds in Nevada but does not overwinter; breeding habitat is mostly native dry grassland and sagebrush prairie; may favor areas with some damp low spots nearby, to provide better feeding area for the young; may nest in pastures that are not too heavily grazed, rarely in agricultural fields; in migration and winter often in farm fields, marshes, coastal mudflats, in addition to grasslands; on mostly featureless terrain, often chooses site close to conspicuous rock, shrub, or other object; nest is shallow scrape in ground, usually with sparse lining of grass, weeds; may have slight rim built up around edge.	NS-S (S2S3B); NS (G5)	x	x	Yes
Mountain Quail *(Oreortyx pictus)*	Dense brush in wooded foothills and mountains; most common in pine-oak woodland, coniferous forest, and chaparral; sometimes in pinyon-juniper woods or in scrub at lower elevations; may be common in areas of second-growth brush after fires or clearcuts; requires dense low thickets for cover;	NDOW (GB); NS-S(S3); NS (G5)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	during hot weather, rarely found more than a mile from water.				
Northern Goshawk *(Accipiter gentilis)*	Nest in mature and old-growth forests with more than 60% closed canopy; often build nests near breaks in the canopy, such as a forest trail, jeep road, or opening created by a downed tree, and prefer sites with a creek, pond, or lake nearby; hunt in the forest, along riparian corridors, and in more open habitat, such as the sagebrush steppes	USFS(S); NDOW (SB); NS-S (S2); NS (G5)	x	x	Yes
Peregrine Falcon *(Falco peregrinus)*	Breed in open landscapes with cliffs (or skyscrapers) for nest sites; nesting at elevations up to about 12,000 feet, as well as along rivers and coastlines or in cities, ; migration and winter in nearly any open habitat, but with a greater likelihood along barrier islands, mudflats, coastlines, lake edges, and mountain chains.	USFS (S); FWS (delisted 1999); NDOW (EB); NS-S (S2); NS (G4)	x	x	Yes
Phainopepla (*Phainopepla nitens)*	Desert, riparian woodlands, and chaparral; it is territorial, actively defending nesting and foraging sites, while in the woodlands it is colonial, with as many as four nesting pairs sharing one large tree; particularly notable for its enigmatic pattern of breeding	NS-S (S2B); NS (G5)	x		No; Restricted to the southernmost part of Nevada (Audubon 2021).

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	twice each year, in two different habitats.				
Pinyon Jay *(Gymnorhinus cyanocephalu)*	Pinyon-juniper woodland, sagebrush, scrub oak, and chaparral communities, and sometimes in pine forests; specialized for feeding on pine seeds.	NS-S (S3S4); NS (G5)	x	x	Yes
Ridgway's rail (Yuma Clapper Rail)	Freshwater marshes containing dense stands of cattails and bulrushes; mature stands along margins of shallow ponds with stable water levels ; generally in freshwater and alkali marshes dominated by stands of emergent vegetation interspersed with areas of open water and drier, upland benches; Nests probably on dry hummocks or in small shrubs among dense cattails or bulrushes along the edges of shallow ponds in freshwater marshes with stable water levels.	FWS (E); NVDOW (EB); NS-S (S1); NS (G5T3)	x		No; Restricted to the southernmost part of Nevada (WAP 2012).
Sage Thrasher *(Oreoscoptes montanus)*	Breeds exclusively in shrubsteppe habitats; require relatively dense ground cover for concealment, but also some bare ground for foraging and for getting around on their feet, which they often do in preference to flying; use arid or semiarid open country with scattered bushes, grasslands, and	NDOW (SB); NS-S (S5B); NS (G4)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	open pinyon- juniper woodlands.				
Sandhill Crane (both Greater and Lesser) *(Antigone Canadensis)*	Breed in open wetland habitats surrounded by shrubs or trees; nest in marshes, bogs, wet meadows, prairies, burned-over aspen stands, and other moist habitats, preferring those with standing water; breeders gravitate toward the edges between wetland and upland habitats, while nonbreeders may prefer open, grassy sites; winter roosting on shallow lakes or rivers at night and spending the day in irrigated croplands, pastures, grasslands, or wetlands.	NS-S (S2B, S3M); NS (G5T5)	x	x	Yes
Short-eared Owl *(Asio flammeus)*	Live in large, open areas with low vegetation, including prairie and coastal grasslands, heathlands, meadows, shrubsteppe, savanna, tundra, marshes, dunes, and agricultural areas; winter habitat is similar, but is more likely to include large open areas within woodlots, stubble fields, fresh and saltwater marshes, weedy fields, dumps, gravel pits, rock quarries, and shrub thickets.; if food is plentiful, winter areas often become breeding areas.	NS-S (S4); NS (G5)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Southwestern Willow Flycatcher *(Empidonax trailii extimus)*	Found along the Virgin River, lower Muddy River, Colorado River, and Pahranagat Valley; breeds in relatively dense riparian tree and shrub communities associated with rivers, swamps, and other wetlands including lakes and reservoirs; habitat patches must be at least 0.25 ac in size and at least 30 feet wide; historically the southwestern willow flycatcher nested in native vegetation including willows, seepwillow, boxelder, buttonbush, and cottonwood; subspecies still nests in native vegetation, but also uses thickets dominated by non-native tamarisk and Russian olive, or in mixed native non-native stands.	FWS (E); USFS (E); NDOW (EB); NS-S (S1B); NS (G5T2)	x		No; Restricted to the southernmost part of Nevada (WAP 2012).
Swainson's Hawk *(Buteo swainsoni)*	Favor open habitats for foraging; hay and alfalfa fields, pastures, grain crops, and row crops, or perched atop adjacent fence posts and overhead sprinkler systems; they rely on scattered stands of trees near agricultural fields and grasslands for nesting sites.	NS-S (S2B); NS (G5)	x	x	Yes
Western Snowy Plover (does not include the protected DPS found along the Pacific Coast)	Barren to sparsely vegetated sand beaches, dry salt flats in lagoons, dredge spoils deposited on beach or dune habitat, levees and flats at	NS-S (S3B); NS (G3T3)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
(Charadrius nivosus nivosus)	salt-evaporation ponds, river bars, along alkaline or saline lakes, reservoirs, and ponds				
Western Yellow-billed Cuckoo *(Coccyzus americanus oxidentalis)*	Use wooded habitat with dense cover and water nearby, including woodlands with low, scrubby, vegetation, overgrown orchards, abandoned farmland, and dense thickets along streams and marshes	USFWS (T); FWS (T); NDOW (SB); NS- S (S1B); NS (G5)	x		No; Restricted to the southernmost part of Nevada (WAP 2012).
Fish					
Big Smoky Valley speckled dace *(Rhinichthys osculus lariversi)*	Endemic to Big Smoky Valley	NDOW (SF); NS-S (S1); NS (G5T1)	x		No; Endemic to Big Smoky Valley in Nye County, NV (BLM 2017 and BLM 2019)
Big Smoky Valley tui chub *(Siphateles bicolor ssp. 8)*	Endemic to Big Smoky Valley	NDOW (SF); NS-S (S1); NS (G4T1)	x		No; Endemic to Big Smoky Valley in Nye County, NV (BLM 2017 and BLM 2019)
bull trout (Jarbidge River Basin) *Salvelinus confluentus pop 4)*	Cold-water fish of relatively pristine stream and lake habitats; most specific habitat requirements of salmonids, including the "Four	USFS (T); FWS (T); NDOW (GF); NS-S (S1); NS (G4T1Q)		x	No; Distribution is believed to consist of a single population in the East Fork, West Fork, and mainstem Jarbidge River and headwater tributaries (WAP 2021)
Charnock Ranch tui chub (Charnock Springs tui chub) (*Siphateles bicolor ssp. 10)*	C's": Cold, Clean, Complex and Connected habitat.	NS-S (S1); NS (T1)	x		No; Narrow endemic outside of Project Area (NatureServe 2021)
Clover Valley speckled dace *(Rhinichthys osculus oligoporus)*	Confined to three springs and outflows in the Clover Valley in Elko County	FWS (E); NDOW (EF); NS-S (S1); NS (G5T1)		x	No; Endemic to three spring systems in Clover Valley, Elko Co., NV (WAP 2021)
Fish Lake Valleyx tui chub	Occupies sub-montane (valley floor) isolated	NDOW (SF); NS-S (S1); NS (G4T1Q)	x		No; Narrow endemic outside of Project Area (NatureServe 2021)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
(Siphateles bicolor ssp. 4)	spring/pool and wetland habitats				
Hot Creek Valley tui chub (*Siphateles bicolor ssp. 5)*	Ralston-Stone Cabin Valleys	NS-S (S1); NS (G4T1Q)	x		No; Narrow endemic outside of Project Area (NatureServe 2021)
Independence Valley speckled dace *(Rhinichthys osculus)*	Known only in Independence Valley Springs system in Elko County NV	FWS (E); NDOW (EF); NS-S (S1); NS (G5T1)		x	No; Isolated spring and marsh/outflow system in Independence Valley, Elko Co., NV (WAP 2012)
Independence Valley tui chub (*Siphateles bicolor isolate)*	Known only from Ralph's Warm Spring complex in Independence Valley, Elko County, Nevada, USA	NS-S (S1); NS (G4T1)		x	No; This species is known only from Ralph's Warm Spring complex in Independence Valley, Elko County, Nevada, USA (NatureServe 2021).
inland Columbia Basin redband trout (*Oncorhynchus mykiss gairdneri)*	Strongly correlated with riparian cover components, including undercut banks, large woody debris, and overhanging vegetation; higher gradient channels, often in riffles or with substrates dominated by boulders, cobbles, and pocket water; also occupy lower gradient streams; pools, which provide important holding and rearing habitat, resting places, over-wintering areas, and refuges from floods, drought, and extreme temperatures for juvenile and adult salmonids should be available, and requirements for spawning include loose gravelly substrates to provide for	NS-S (S2); NS (G5T4)		x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	oxygenation of eggs and embryos in redds in streams.				
Lahontan cutthroat trout (*Oncorhynchus clarki henshawi)*	Found in a wide variety of cold-water habitats including large, terminal, alkaline lakes; alpine lakes; slow, meandering rivers; mountain rivers; and small headwater tributary streams : spawning occurs in streams, generally in riffle areas over gravel substrate; spawning and nursery habitat is characterized by cool water, approximate 1:1 pool-riffle ratio, well-vegetated and stable stream banks, and relatively silt-free rocky substrate in riffle-run areas: fry may move out of spawning tributaries shortly after emergence or may remain in nursery streams for 1- 2 years ; Humboldt cutthroat trout does well in streams with relatively unstable flow and can be found in summer in isolated pools in streambeds; evidently these trout are tolerant of relatively warm water temperatures, and they apparently do well also in relatively turbid, eutrophic reservoirs; introduced populations exist outside of native range.	USFS (T); FWS (T); NDOW (GF); NS-S (S3); NS (G4T3)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Little Fish Lake Valley tui chub (*Siphateles bicolor ssp. 6)*	only in springs at northern end of Little Fish Lake	NS-S (S1); NS (G4T1)	x		No; Endemic to springs at northern end of Little Fish Lake in Nye County, NV (BLM 2017 and BLM 2019)
Monitor Valley speckled dace (*Rhinichthys osculus ssp 5)*	Monitor Valley NV	NDOW (SF); NS-S (S1); NS (G5T1)	x		No; Endemic to Monitor Valley in Nye County, NV (BLM 2017 and BLM 2019)
Northern leatherside chub (*Lepidomeda copei)*	Sluggish pools and backwaters, usually over mud or sand, of creeks and small to medium rivers; adults occur in rocky flowing pools, sometimes riffles, of cold creeks and small to medium rivers; young occupy brushy areas or in quiet pockets near shore; occupied habitat: current usually moderate; vegetation frequently sparse; water depths usually 60-90 cm or less; substrate with low percentage of sand-silt or gravel.	NS-S (S1); NS (G3)		x	No; Narrow endemic outside of Project Area (NatureServe 2021)
Oasis Valley speckled dace *(Rhinichthys osculus ssp. 6)*	Endemic to Oasis Valley; occurs in flowing water, desert springs, and shallow desert streams	NDOW (SF); NS-S (S1); NS (G5T1)	x		No; Limited populations exist in a few springs and outflows including portions of the Amargosa River within Oasis Valley (WAP 2012)
Railroad Valley springfish (*Crenichthys nevadae)*	Endemic to Railroad Valley; warm spring pools, outflow streams, and adjacent marshes; able to tolerate high temperatures and low dissolved oxygen.	USFS (T); FWS (T); NDOW (SF); NS-S (S2); NS (G2)	x		No; Endemic to thermal springs and outflows in Railroad Valley, Nye County, NV (WAP 2012)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Railroad Valley tui chub (*Siphateles bicolor* ssp. 7)	Cold springs in the Railroad Valley Basin	NDOW (SF); NS-S (S1); NS (G4T1Q)	x		No; endemic to Railroad Valley in Nye County, NV (BLM 2017 and BLM 2019)
relict dace (*Relictus solitaries*)	Occupies isolated spring, springbrook and wetland habitats.	NDOW (SF); NS-S(S2S3); NS (G2G3)		x	No; Scattered locations in Spring, Steptoe, Ruby, Bute, and Goshute valleys, east-central Nevada (WAP 2012)
Yellowsstone cutthroat trout (*Oncorhynchus clarki bouvieri*)	Upper northeast part of Goose Creek; restricted in range; southern most population.	NDOW (GF); NS-S (S1); NS (G4T4)		x	No; Found only in extreme northeast NV, in Goose Creek and its tributaries, including Litle Goose, Trout, Piney, and Coon creeks (WAP 2012)
Bats					
Allen's big-eared bat (Allen's lappet-browned bat) (*Idionycteris phylloti*)	In southern Nevada; records limited to Clark County, primarily in the Spring Mountains; may be in southern Lincoln and Nye counties as well; in summer, generally occupies high elevation pine and oak woodland but also uses a variety of riparian woodland across a wide elevational gradient; winter found at lower elevations from creosote bush to pinyon-juniper habitats; current Nevada records indicate this species is distributed between 1,670- 6,000 ft; ROOST HABITAT: Generally prefers to day roosts in trees (large dead snags) but mines and caves are also used. RESIDENT STATUS:	NDOW (P); NS-S (S1); NS (G4); WBWG (high)	x		No; Restricted to Clark County although there is speculation this species could occur in some areas of Nye and Lincoln counties (WAP 2012)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	probably year round resident, but shifts elevation from summer to winter; WINTER STATUS: hibernates but periodically arouses to actively forage and drink in the winter				
big brown bat (*Eptesicus fuscus*)	Found throughout the state, from low to high elevations (720 to > 9,800 ft); occurs in a variety of habitats, including pinyon- juniper, blackbrush, creosote, sagebrush, agriculture, and urban habitats; better adapted to human habitation than most species; ROOST HABITAT: Selects a variety of day roosts including caves, trees (e.g., Ponderosa pine, quaking aspen and oaks), mines, buildings and bridges; often night roosts in more open settings in buildings, mines and bridges; roosts in groups up to several hundred; RESIDENT STATUS: year round resident; WINTER STATUS: Hibernates but periodically arouses to actively forage and drink in the winter; characteristics and locations of winter hibernacula in Nevada are completely unknown, and poorly	NS-S (S4); NS (G5); WBWG (low)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	understood throughout this species range.				
big free-tailed bat (*Nyctinomops macrotis*)	In the southern portion of Nevada, from one location in the Las Vegas area and the other a historical unspecified locality; detected acoustically in moderate numbers within the Muddy River drainage from September through October; during July through September 2003, detected acoustically in Meadow Valley Wash, Eagle Valley, and Clover Creek in Lincoln County; associated primarily with very rocky country (canyon lands); found in arroyo, scrub desert, riparian areas, woodland habitats, although generally a floodplain-arroyo association; typically low elevation, although has been found 8,000 ft and higher outside of Nevada; ROOST HABITAT: Day roosts primarily in crevices in cliff faces, although occasionally in buildings and caves; generally roost in groups less than 100; RESIDENT STATUS: transient but possible summer resident; recors for this species are sparse and scattered;	NS-S (S1S2M); NS (G5); WBWG (low to high)	x		No; Restricted to the southernmost part of Nevada (BLM 2017 and BLM 2019)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	WINTER STATUS: probably does not hibernate.				
Brazilian (or Mexican) free- tailed bat (*Tadarida brasiliensis*)	Found through most of the state, ranging from low desert to high mountain habitats; found in a wide variety of habitats; although predominantly a lower elevation species has been found from 720 to > 11,480 ft in the Sierra Nevada; recent acoustic surveys reveal it is more widespread and common, at least in southern Nevada, than previously thought; current Nevada records indicate this species is distributed between 690-8,370 ft; ROOST HABITAT: selects a variety of day roosts including cliff faces, mines, caves, buildings, bridges, and hollow trees; although colonies number in the millions in some areas, colonies in Nevada are generally several hundred to several thousand (largest known colonies have been estimated at ca. 70,000-100,000); some caves may be used as long term transient stopover roosts during migration; some evidence suggests that the colony at Rose Cave arrives in July and departs in mid	NDOW (PM); NS-S (S3S4B); NS (G5): WBWG (low to medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	October; RESIDENT STATUS: summer resident; recent observations susggest pockets of year-round residents in southern Nevada; WINTER STATUS: Migrations of 1140 mi are documented for this species; migrates away from colder regions and winters in areas with predominantly non-freezing temperatures but has been found to hibernate in northern California; migratory animals appear to be active in the winter range; winter activity has been observed recently in the low desert of southern Nevada				
California myotis (*Myotis californicus*)	Found throughout Nevada, primarily at the low and middle elevations (to 6,000 ft), although occasionally found at higher elevations; more common in the southern half of the state; found in a variety of habitats from Lower Sonoran desert scrub to forests; current Nevada records indicate this species is distributed between 680-9,000 ft; ROOST HABITAT: crevice roosting; selects a variety of day roosts including mines, caves, buildings, rock crevices, hollow trees, and	NS-S (S4); NS (G5); WBWG (low to medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	under exfoliating bark; night roosts in a wider variety of structures; generally roost singly or in small groups, although some mines in the Mojave Desert shelter colonies of over 100 in both the summer and winter; RESIDENT STATUS: year round resident; WINTER STATUS: hibernates but periodically arouses to actively forage and drink in the winter				
Canyon bat (formerly western pipestrelle) (*Parastrellus Hesperus*)	Found througout most of the state, primarily in the souther and western protions; most common n low and middle elevation (6,000 ft), although occasionally found at higher elevations (>8,000 ft); lower and upper Sonoran desert habitats of blackbrush, creosote, salt desert shrub and sagebrush, with occasional occurrence in Ponderosa pine and pinyon-juniper, usually in association with rock features such as ganite boulders and canyons; current nevada recores indicate this species is distrubted between 690-8,400 ft; ROOST HABITAT: day roosts primarily in rock crevices but may include mines, caves, or occasionally	NS-S (S4); NS (G5): WBWG (low to medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	in buildings and vegetation; generally roost singly or in small groups; RESIDENT STATUS: year round resident; WINTER STATUS: hibernates but periodically arouses to actively forage and drink in water.				
Cave myotis (*Myotis velifer*)	Single historical record (1964) from the southern portion of the Lake Mead National Recreation Area west of Lake Mojave; this mine was recently relocated and verified to still contain the species, although apparently numbers not high as what was previously reported; found primarily at lower elevations in arid habitat dominated by creosote bush, palo verde, brittlebush, cactus, and desert riparian; ROOST HABITAT: day roosts in caves and mines, and occasionally buildings and bridges;olerates summer roost temperatures as high as 37° C; night roosts may be same structures used for day roosts, but locations nearest the entrance are preferred; found repeatedly in swallow nests, particularly in nonreproductive season; hibernacula elsewhere are generally mines or caves;	NS-S (S1B); NS (G4G5); WBWG (low to medium)	x		No; Restricted to the southernmost part of Nevada (BLM 2017 and BLM 2019)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	RESIDENT STATUS: summer resident; WINTER STATUS: hibernates, but a few individuals have been found active in mines in winter.				
fringed myotis (*Myotis thysanodes*)	Found throughout central and southern Nevada; probably occurs in northern Nevada, as well; found in a wide range of habitats from low desert scrub habitats to high elevation coniferous forests; found from upper elevation creosote bush desert to pinyon-juniper and white fir (7,000 ft) in the White Pine Range; current Nevada records indicate this species is distributed between 1,400-7,000 ft; ROOST HABITAT: day and night roosts in mines, caves, trees, and buildings; maternity colony of approximately 200 individuals was found in a mine in creosote bush scrub in the Mojave Desert; two maternity colonies have recently been found in mine adits on the Nevada Test Site in blackbrush habitat; has been radio tracked to tree hollows, particularly large conifer snags in Oregon and Arizona, and rock crevices in cliff faces in southern California;	USFS (S); NDOW (PM); NS-S (S2); NS (G4): WBWG (medium to high)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	known hibernacula are generally mines or caves; RESIDENT STATUS: year round resident; WINTER STATUS: hibernates but capable of periodic winter activity.				
greater western mastiff bat (*Eumops perotis*)	Multiple acoustic records collected from the Spring Mtns, Las Vegas Wash, Meadow Valley Wash, and along the Colorado river near Laughlin; found in a variety of habitats from desert scrub to chaparral to montane coniferous forest; have been detected in montane meadows above 8,000 ft; distribution is tied to availability of suitable roosting habitat and can sometimes be predicated based on presence of signifcant rock features (e.g. large granite or basalt formations); ROOST HABITAT: day roosts primarily in crevices in cliff faces and cracks in boulders, occasionally buildings; generally roost in groups less than 100; RESIDENT STATUS: probable transient; WINTER STATUS: active all winter at lower elevations.	NDOW (SM); NS-S (S1); NS (G5G4); WBWG (medium to high)	x		No; Restricted to the southernmost part of Nevada (BLM 2017 and BLM 2019)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
hoary bat (*Lasiurus cinereus*)	Distribution patchy known mostly from the capture of single animals while foraging or acoustic records; **roosting locations are not well known**; tree-associated species; found primarily in forested upland habitats, as well as in gallery-forest riparian zones and agriculture habitats; in valley basins in pure stands of Rocky Mountain juniper (Juniperus scopulorum); may occur in park and garden settings in urban areas; current records indicate distributed between 1,870-8,270 ft; ROOST HABITAT: solitary; day roosts in trees, within foliage 10-40 ft above the ground in both coniferous and deciduous trees; unusual roosting situations have been reported in caves, beneath a rock ledge, in a woodpecker hole, and in a squirrel's nest; RESIDENT STATUS: summer resident; been captured at 5,900 ft in Spring Valley, east-central Nevada in Rocky Mtn juniper habitat; captured near Yucca Mountain at 3,250 ft; captured over a well pond (3,250 ft) in Mojave Desert scrub vegetation; captured in	NS-S (S3N); NS (G3G4); WBWG (medium)	x	x	Maybe; Although widely distributed across the state where appropriate forested or riparian habitat is available, populations are patchy and mostly known from the capture of single animals while foraging. Roosting locations are not well known (WAP 2012).

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	a dry wash; recent acoustic and capture surveys in the Muddy River and Meadow Valley Wash drainages documented arrival and continued presence from early April through late May; prolonged presence from March through June was recorded in the upper Moapa Valley; until recently, records from southern Nevada were from the spring; however, two localities at the Nevada Test Site and the Spring Mountains have yielded records in the fall ; records from the northeast span 15 July to 21 August; documented in July at Key Pittman Reservoir and in September in Eagle Valley, Lincoln County; WINTER STATUS: migrates but probably hibernates in parts of its winter range; records are primarily from the spring and fall but migratory patterns in Nevada are not known.				
little brown bat (*Myotis lucifugus*)	Found primarily throughout the northern part of the state, but little is known of its distribution and abundance.Found primarily at higher elevations and higher latitudes, often associated with coniferous forest;	NS-S (S3); NS (G3); WBWG (low to medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	requires a nearby water source; occurrence in Dixie Valley, (4,400) has been documented acoustically: ROOST HABITAT: day roosts in hollow trees, rock outcrops, buildings, and occasionally mines and caves; one of the species most commonly found in human structures; night roosts may be same structures used for day roost but locations nearest the entrance are preferred; hibernacula elsewhere are generally mines or caves; often found in the same roost sites with *Myotis yumanensis.* RESIDENT STATUS: probably a year round resident; WINTER STATUS: hibernates but no hibernating colonies have been found in Nevada. It is suspected that there are elevational movements between summer and winter roosts; no large aggregations of this species, like those known in the eastern U.S. have been found.				
long-eared myotis (*Myotis evotis*)	Found throughout the state, primarily at the higher elevations associated with coniferous forest; more widespread and common in the northern half of the state;	NS-S (S4); NS (G5): WBWG (low to medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	primarily a forest- associated species. In southern Nevada, only found in Ponderosa pine or above; found in pinyon-juniper in the northern portion of Nevada Test Site; in northern Nevada common in pinyon-juniper and above, but also found in sagebrush and desert scrub habitats; current Nevada records indicate this species is distributed between 2,300-10,100 ft; ROOST HABITAT: Day roosts in hollow trees, under exfoliating bark, crevices in small rock outcrops, and occasionally in mines, caves, and buildings; night roosts have been found in caves, mines, and under bridges. Generally roost singly or in small groups; RESIDENT STATUS: year round resident; WINTER STATUS; presumed to be non-migratory and to hibernate locally.				
long-legged myotis (*Myotis Volans*)	Found throughout the state but more widespread and common in the northern half; occurs from mid to high elevations. Absent from the low desert; found in pinyon-juniper, Joshua tree woodland, and montane coniferous forest habitats;	NS-S (S4); NS (G4G5); WBWG (low to medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	occasionally found in Mojave and salt desert scrub, and blackbrush, mountainshrub, and sagebrush. Current Nevada records indicate this species is distributed between 930-3,420 m; ROOST HABITAT: day roosts primarily in hollow trees, particularly large diameter snags or live trees with lightning scars; uses rock crevices, caves, mines, and buildings when available; caves and mines may be used for night roosts; hibernacula elsewhere are generally mines or caves; RESIDENT STATUS: probably a year round resident; WINTER STATUS: hibernates but has the capability of winter activity; it is suspected that there are elevational and latitudinal movements between summer and winter roosts; transient colonies in the spring on the east side of the Sierra Nevada.				
pallid bat (*Antrozous pallidus*)	Found throughout the state, primarily in the low and middle elevations (5,900 ft), although has been found at over 10,200 ft; variety of habitats from low desert to brushy terrain to coniferous	USFS (S); NDOW (PM); NS-S (S3); NS (G4); WBWG (medium to low)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	forest and non-coniferous woodlands; in pinyon- juniper, blackbrush, creosote, sagebrush, and salt desert scrub habitats; ROOST SITES: Selects a variety of day roosts including rock outcrops, mines (maternity colonies have been found in geothermally-influenced adits), caves, hollow trees, buildings, and bridges. Night roosts very commonly under bridges, but also caves and mines. Intolerant of roosts in excess of 40° C; RESIDENT STATUS: year round resident WINTER STATUS: hibernates but periodically arouses to actively forage and drink in winter.				
silver-haired bat (*Lasionycteris noctivagans*)	Widely distributed in the state, but confined primarily to forested habitats; found in riparian habitats in the south and in woodland and riparian habitats in the central and northern portions of the state;forest-associated species, more common in mature forests; found primarily at higher latitudes and altitudes; found in coniferous and mixed deciduous/coniferous forests of pinyon juniper, subalpine fir, white fir, limber pine,	NS-S (S3B); NS (G3G4); WBWG (medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	aspen, cottonwood and willow; usually found at lower elevations in southern Nevada associated with riparian corridors; current Nevada records indicate this species is distributed between 1,570-8,200 ft. ROOST HABITAT: Roosts almost exclusively in trees in summer; maternity roosts are generally in woodpecker hollows and under the loose bark of large diameter snags. They are generally located at least 50 ft above ground; uses multiple roost sites, switching them frequently; small groups and single animals will roost under exfoliating bark; winter roosts include hollow trees, rock crevices, mines, caves, and houses; also has been found roosting under leaf litter; RESIDENT STATUS: Poorly understood; recent August records of seven post-lactating females and fourjuveniles in mixed subalpine fir/limber pine/aspen habitat (Bradley, 2000b) and four lactating females in mixed coniferous/deciduous forest indicates maternity activity in northeast Nevada; WINTER				

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	STATUS: Migrates but probably hibernates in some parts of its winter range; migratory patterns not well understood; recent October records of migrating individuals				
spotted bat (*Euderma maculatum*)	Known from only twelve localities, but scattered distribution throughout Nevada; distribution is patchy and linked to availability of cliff roosting-habitat. Recent studies have documented significant activity throughout the summer months in the Muddy River drainage; there are recent high elevation records from the Sierra Nevada in California; found in a wide variety of habitats from low elevation desert scrub to high elevation coniferous forest habitats, including pinyon- juniper, sagebrush, riparian and on urban high-rise (cliff analog) habitats; closely associated with rocky cliffs; current Nevada records indicate this species is distributed between 1770-7,000 ft; ROOST HABITAT: Day roosts primarily in crevices in cliff faces but some indication that mines and caves may occasionally be used,	USFS (S); NDOW (TM); NS-S (S2); NS (G4); WBWG (medium to high)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	primarily in winter; sas been found roosting on/in buildings but reliance on such roosts is unclear. Likely roosts singly; RESIDENT STATUS: year round resident; WINTER STATUS: Hibernates but periodically arouses to actively forage and drink in the winter; **characteristics and locations of winter hibernacula in Nevada are completely unknown, and poorly understood throughout this species range**				
Townsend's big-eared bat	Found throughout the state, from low desert to high mountain habitats. Observed foraging in krumholz bristlecone pine as high as 11,500 ft in the Snake Range of eastern White Pine County; distribution is strongly correlated with the availability of caves and abandoned mines; highly associated with caves and mines; found primarily in rural settings from deserts to lower, mid to high-elevation mixed coniferous-deciduous forest. Current Nevada records indicate this species is distributed between 690-11,500 ft primarily in pinyonjuniper- mahogany,	USFS (S); NDOW (SM); NS-S (S2); NS (G4); WBWG (high)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	white fir, blackbrush, sagebrush, salt desert scrub, agricultural, and occasionally in urban habitats. ROOST SITES: A cavern-dwelling species that uses mines, caves, trees and buildings; very dependent on mines and caves; trees and buildings must offer "cave-like" spaces in order to be suitable.; will night roost in more open settings, including under bridges; **recent studies indicate that use of roosts is variable within seasons and among years, and multiple surveys may be required before use can be documented**.RESIDENT STATUS: year round resident; WINTER STATUS: hibernates in mixed sex aggregations of a few to many hundred; periodically arouses to move to alternate roosts and to actively forage and drink in the winter; hibernation prolonged in colder areas, and intermittent where climate is predominantly non-freezing.				
western red bat (*Lasiurus blossevillii*)	Historically known from only two locations, one of which (Fallon area) yielded additional specimens in 1958; third location near Dyer was	NDOW (SM); NS-S (S1M); NS (G4); WBWG (high)	x	x	Maybe; Thought to be restricted to riparian habitats along the western and southern edges of Nevada, so range is probably not extensive; Confirmed

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	documented in September 1999; recent acoustic sampling in the Muddy River drainage in Clark County have yielded records of occurrence in late spring and early summer 2000, and three females and two males were captured between July and September in the same drainage; been detected acoustically in the northern portion of the Nevada Test Site during the summers of 1999 and 2000; two acoustic records were obtained near the Truckee River west of Fernley; aoustic records from two localities in Lincoln County were documented in 2003; found primarily in wooded habitats, including mesquite bosque and cottonwood/willow riparian areas; Current Nevada records indicate this species is distributed between 1,380-6,600 ft; ROOST HABITAT:solitary rooster; day roosts in trees, within the foliage and presumably in leaf litter on the ground; RESIDENT STATUS: thought to be a migrant but may be a summer resident in the Fallon and Muddy River areas; WINTER STATUS: **winter**				breeding in Fallon in 2009 (WAP 2012); Potential habitat may exist

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	behavior poorly understood; thought to be migratory in NV, although migratory patterns are not well documented. This species is reported to be highly migratory throughout most of its range.				
western small-footed myotis (*Myotis ciliolabrum)*	Found throughout the state; in the south, primarily found at the middle and higher elevations (> 5,900 ft), although occasionally found at lower elevations; in central and northern part of the State it is more common at valley bottoms (3,400-5,900 ft); inhabits a variety of habitats including desert scrub, grasslands, sagebrush steppe, and blackbrush, greasewood, pinyon-juniper woodlands, pine-fir forests, agriculture, and urban areas; current Nevada records indicate distribution between1,600- 9,000 ft; ROOST HABITAT: roosts have been found in caves, mines, and trees; roosting preferences expected to be similar to those for *Myotis californicus* ; RESIDENT STATUS: year round resident; WINTER STATUS: hibernates; in some areas may tolerate drier and colder	NS-S (S3); NS (G5): WBWG (low to medium)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	hibernacula than some other species; hibernates individually or in large colonies. A large colony (>100 individuals) was found at a depth of 450 ft in an abandoned mine near Eureka				
Yuma myotis (*Myotis yumanensis)*	Found at least in the southern and western half of the state, primarily at low to middle elevations; recent collection in east central Nevada and a large colony near Rye Patch Reservoir suggests a wider distribution in the state; found in a wide variety of habitats from low to mid-elevations, including sagebrush, salt desert scrub, agriculture, playa, and riparian habitats; one of the species that is most tolerant of human habitation and one of the few that thrives in a relatively urbanized environment; often considered to be a "building" bat, it is also found in heavily forested settings elsewhere; current Nevada records indicate this species is distributed between 1,500-10,900 ft; ROOST HABITAT: day roosts in buildings, trees, mines, caves, bridges, and rock crevices; night roosts usually associated with buildings, bridges, or other	NS-S (S3S4); NS (G5); WBWG (low to medium)	x	x	Maybe; Found mostly in the southern and western half of Nevada (BLM 2017 and BLM 2019) but may have a wider distribution than known; Potential habitat may exist

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	man- made structures; RESIDENT STATUS: year round resident; WINTER STATUS: hibernates; no large winter aggregations have been found in Nevada.				
Big Game					
bighorn sheep (California, desert, Rocky Mountain) (*Ovis canadensis* spp.)	In alpine meadows, mountain slopes, and foothills. They like areas with rocky slopes that they can climb to evade predators	For desert bighorn sheep USFS (S); NDOW (GM); NS-S (S4); NS (G4T4)	x	x	Yes
Small Mammals					
American water shrew (*Sorex palustris)*	Most abundant along small cold streams with thick overhanging riparian growth; around lakes, ponds, marshes, bogs, and other lentic habitats; normally associated with water, may disperse long distances away from water to establish new territories; nest sites are near water in underground burrows, rafted logs, beaver lodges, and other areas providing shelter	NS-S (S2); NS (G5)		x	Yes
dark kangaroo mouse (includes Desert Valley kangaroo mouse and Fletcher dark kangaroo mouse *M.m.albiventer* and *nasutus*) *(Microdipodops megacephalus* ssp.)	Dark kangaroo mice prefer loose sands and gravel; found in shadscale scrub, sagebrush scrub, and alkali sink plant communities; may occur in sand dunes near the margins of their range	NSOW (PM); NS-S (S2); NS (G4T2)	x	x	Yes
Inyo shrew *(Sorex tenellus)*	Habitats include riparian zones and canyon bottoms;	NS-S (S2); NS (G4)		x	No; Formerly only known from western and southwestern NV

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	rocky mountain habitat in areas with logs, boulders, or sagebrush scrub; and red fir communities; species may be more tolerant of dry habitat than are closely related shrews. In Great Basin National Park, this shrew was found at 3,000 m elevation in habitat dominated by Engelmann spruce				and one isolated spot in northwestern Nevada (WAP 2012)
Merriam's shrew (*Sorex merriami)*	Primarily in various grassland habitats, including grasses in sagebrush scrub/pinyon-juniper habitat, and also in mountain- mahogany and mixed woodlands	NS-S (S3); NS (G4)		x	Yes
northern river otter (*Lontra canadensis pacific)*	Prefer bog lakes with banked shores containing semi-aquatic mammal burrows and lakes with beaver (Castor canadensis) lodges, and they avoid water bodies with gradually sloping shorelines of sand or gravel; during the dry season, will retreat from marshland and move to permanent ponds where water is available and food is more concentrated; habitat features preferred for latrine sites include large conifers, points of land, beaver bank dens and lodges, isthmuses, mouths of permanent streams, or any object that protrudes from the water	NDOW (FM); NS-S (S2); NS (G5TNRQ)		x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Pahranagat Valley montane vole (*Microtus montanus fucosus)*	Alpine meadows in the south and mountain valleys in the north. They are found in wet meadows, cropland, especially fields and pastures of grass and legumes along fence rows; grassy areas by streams and lakes. They occupy shallow burrows and surface runways	NDOW (SM); NS-S (S1S2); NS (G5T2)	x		No**;** range is less than 40 square miles in the White River Valley, NV (WAP 2012)
pale kangaroo mouse (*Microdipodops pallidus)*	Nearly restricted to fine sands in alkali sink and desert scrub dominated by *Atriplex confertifolia* (shadscale) or *Artemisia tridentata* (big sagebrush); often burrows in areas of soft, windblown sand piled at the bases of shrubs	NDOW (PM); NS-S (S2); NS (G3)	x		Maybe; mostly found in west and west-central NV and extreme eastern CA, although studies are incomplete (WAP 2012); Potential habitat may exist
Preble's shrew (*Sorex preblei)*	Include arid and semiarid shrub-grass associations, openings in montane coniferous forests dominated by sagebrush, willow- fringed creeks, marshes, bunchgrass associations, sagebrush-aspen associations, sagebrush-grass associations, alkaline shrubland	NS-S (S1S2); NS (G4)		x	Maybe; Found in Elko Co, near Sheep Creek in the Independence Mountains, and along Mary's River (WAP 2012); Potential habitat may exist
pocket gopher (includes Botta's (*Thomomys botae*); **Fish Spring pocket gopher** (*T. b. abstrusus*) and **San Antonio pocket gopher** (*T. b. curatus*)	Associated with a wide range of vegetation and soil types. Residents of open habitats and meadows, where soils are deep enough to maintain permanent burrow systems. Two subspecies of priority interest are isolated to two	Botta's NS-S (SNR); NS (G5); Fish Springs and San Antonio (NS-S (SH); NS (G5TH);	x		Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
(*Thomomys bottae)*	valleys, T. b. abstrusus in Fish Spring valley (also known as Litle Fish Lake Valley) in Nye County, and T. b. curtatus in Big Smoky Valley. A third isolate occurs near Eastgate.				
pygmy rabbit *(Brachylagus idahoensis)*		USFS (S); NDOW (GM); NS-S (S3); NS (G4)	x	x	Yes
		Reptiles			
desert horned lizard (inlcuding nothern and southern subspecies) (*Phrynosoma platyrhinos (includes P.p. platyrhinos* and *P.p. calidiarum*))	Typically found in open sandy areas in deserts, chaparral, grassland, often near ant hills. Often seen basking on asphalt roads or low rocks in the morning or afternoon.	NS-S (S4); NS (G5)	x	x	Yes
Great Basin collared lizard *(Crotaphytus bicinctores)*	Occurs mainly in xeric, sparsely vegetated rocky areas, on alluvial fans, lava flows, hillsides, rocky plains, and in canyons; perches atop rocks and hides under rocks and be found from sea level to about 7,500 ft.	NS-S (S4); NS (G5)	x	x	Yes
greater short-horned lizard (*Phrynosoma hernandesi)*	Ranges from semiarid plains to high mountains (2,000 - 10,500 ft above sea level); occupies a variety of habitats, including sagebrush, and open PJ, pine-spruce and spruce-fir forests; substrate may be stony, sandy, or firm but some fin loose soil is usually present.	NS-S (S2); NS (G5)	x	x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
long-nosed leopard lizard (*Gambelia wislizenii)*	Found in sandy and gravelly desert and semidesert areas with scattered shrubs or other low plants (e.g. bunch grass, alkali bush, sagebrush, creosote bush) especially areas with abundant rodent burrows; occurs from sea level to approximately 6,000 ft	NS-S (S4); NS (G5)	x	x	Yes
Mojave desert tortoise (*Gopherus agassizii)*	Live in creosote bush scrub habitat at elevations ranging from 1,000 to 3,000 feet above sea level, although they are known to occur in suitable habitats up to about 5,000 feet in elevation; within suitable habitat they occur over a relatively large region including the Mojave and Sonoran Deserts of California, Nevada, Utah and portions of Arizona	USFS (T); FWS (T); NDOW (TR); NS-S (S2S3); NS (G3)	x		No; Found in the Mojave Desert, southern NV (WAP 2012)
Northern rubber boa (*Charina bottae)*	Rubber boa habitat includes woodlands, forest clearings, patchy chaparral, meadows, and grassy savannas, generally not far from water; also riparian zones in arid canyons and sagebrush in some areas (Nussbaum et al. 1983, Brown et al. 1995, St. John 2002, Stebbins 2003). Generally this snake is found in or under rotting logs or stumps, under rocks or in	NS-S (S3S4), NS (G5)		x	Yes

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
	crevices, or under the bark of dead fallen trees (WAP 2012)				
pygmy short-horned lizard (*Phrynosoma douglassii)*	Habitats of this lizard range from semiarid plains to high mountains; usually the species is in open, shrubby, or openly wooded areas with sparse vegetation at ground level	NS-S (SNR); NS (G5)	x		No; Occurs in extreme northwestern portion of the state WAP 2012)
Western red-tailed skink *(Plestiodon (Eumeces) gilberti rubricaudatus)*	Found in a variety of habitats, this lizard is most common in early successional stages or open areas of late successional stages. Heavy brush and densely forested areas are generally avoided	NS-S (S2S3); NS (G5T4Q)	x		No; Restricted to Southern NV (WAP 2012)
Insects					
aegialian scarab beetle (*Aegialia knighti)*	Known only from low, red sand hills and sand blow-outs in an area of ca. 12 km sq that extends South of Mormon Mesa ridge and North and East of the Meadow Valley Wash - Weiser Wash - Muddy River drainage system from the Longandale - Overton exchange on Interstate 90 southward ca. six km to Longandale, Nevada. Site is comprised by typical Mojave Desert vegetation characterized by creosote bush, Mojave yucca, white bur sage, brittlebush, *Opuntia* cactus, and *Atriplex sp* .	NS-S (S1); NS (G1?)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Big Smoky wood nymph (*Cercyonis oetus alkalorum)*	Grassy, alkaline flats; known only from the Big Smoky Valley between the Toiyabe and Toquima ranges in central Nevada	NS-S (S1); NS (G5T1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019); Known only from central Nevada
Crescent Dunes aegialian scarab *(Aegialia crescent)*	Crescent Dunes complex in Nye County, near Tonopah NV	NS-S (S1); NS (G1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Crescent Dunes aphodius scarab (*Aphodius sp. 2)*	Crescent Dunes complex in Nye County, near Tonopah NV	NS-S (S1?); NS (G1?Q)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Crescent Dunes serican scarab *(Serica ammomenisco)*	Crescent Dunes complex in Nye County, near Tonopah NV	NS-S (S1); NS (G1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Great Basin small blue (*Philotiella speciosa septentrionalis)*	Distribution unknown but type locality is from Fort Churchill Road in Lyon County. Trend unknown considered critically imperiled in Nevada	NS-S (S1); NS (G3G4T1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019); Known from a single locality in Lyon County
Mattoni's blue (*Euphilotes pallescens mattonii*)	Found primarily in the upper and lower Sonaran Zones, praires, and sand dunes; found in pinyon-juniper wodlands and rolling prairie grasslands; host plant for the larvae is the buckwheat (Eriogonum microthecum nutt. Var. laxiflorum).	NS-S (S1); NS (G3G4T1)		x	Yes
Mojave gypsum bee (*Andrena balsamorhizae)*	School Springs all within 1.2 miles of each other	NS-S (S2); NS (G2)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Mojave poppy bee (*Perdita meconis)*	Restricted to habitat of its associated plant species - large- flowered plants of the poppy family *Arctomecon* and *Argemone*	NS-S (S2); NS (G2)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Monarch butterfly (*Danaus plexippus plexippus)*	Widespread and scattered; requires milkweed (*Asclepiaecae*) or dogbane (*Apocynaceae*) as host plants for larvae; migratory in southern part of state	FWS (PETITIONED 2014); NS-S (SNR); NS (G4T3)	x	x	Yes
Nevada viceroy *(Limenitis archippus lahontani)*	Apparently restricted to Nevada (see Austin in Emmel, 1998). Known from along the Humboldt River and lower tributaries with additional colonies near Fallon and Fernely (WAP 2012)	NS-S (S1S2); NS (G5T1T2)		x	Yes
Pahranagat naucorid bug (*Pelocoris shoshone Shoshone)*	White River and Amargosa River systems; quiet waters under overhanging turf banks	NS-S (S1); NS (G1G3T1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Railroad Valley skipper (*Hesperia uncas fulvapalla)*	From alkali meadows on the floor of Railroad Valley in Nye County	NS-S (S1); NS (G5T1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019); Known only from Nye County
White Mountains skipper (*Hesperia miriamae longaevicola)*	Above tree line (over 10,500 ft) on highest peaks of White Mountains in western NV	NS-S (S1); NS (G2G3T1T2)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019); known only above treeline in the White Mountains
White River Valley skipper (*Hesperia uncas grandiose)*	Alkaline meadows and saltgrass flats in early summer in the White River Valley. Austin and Leary (2008) also documented the subspecies using its apparent hostplant, Juncus mexicanus (Mexican rush), in Big Smoky Valley in Nye County	NS-S (S1); NS (G5T1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019); Known only from Nye County
White River wood nymph	Occurs in bottomland habitats along the White River near	NS-S (S2); NS (G5T2)	x		No; Endemic to area outside of Project Area (BLM 2017 and

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
(*Cercyonis pegala pluvialis)*	the White Pine and Nye county line and in the Steptoe Valley southeast of Ely				BLM 2019); known only near White Pine / Nye County line
Mollusks					
California floater (*Anodonta californiensis)*	Shallow areas of clean, clear lakes, ponds and large rivers. They prefer lower elevations and a soft, silty substrate in which to burrow	NS-S (S1); NS (G3Q)	x		Yes
carinate Duckwater pyrg *(Pyrgulopsis carinata)*	Nye Co	NS-S (S1); NS (G1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Cortez hills pebblesnail (*Pyrgulopsis bryantwalkeri)*	Endemic to a single state or province (NatureServe 2021)	NS-S (S1); NS (G1)		x	No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Duckwater pyrg (*Pygulopsis aloba)*	Two unmaned springs northwest and southeast of Duckwater	NS-S (S1); NS (G1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Duckwater Warm Springs pyrg (*Pyrgulopsis villacampae)*	Big Warm Springs complex in Nye Co NV	NS-S (S1); NS (G1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Goshute mountain snail (*Oreohelix loisae)*	Restricted to limestone features; mining in areas	NS-S (S2); NS (G1G3)		x	No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Humboldt pyrg (*Pyrgulopsis humboldtensis)*	Restricted to the Lahontan Basin	NS-S (S1); NS (G1)		x	No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
large-gland Carico pyrg (*Pyrgulopsis basiglans)*	Insufficient surveys to delineate habitat requirements	NS-S (S1); NS (G1)	x		Yes
Median-gland Nevada pyrg (*Pyrgulopsis pisteri)*	Located at Marsh Spring, North Scruggs Springs, and below	NS-S (S1); NS (G1)		x	No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Oasis Valley pyrg (*Pyrgulopsis micrococcus)*	Springs in the Oasis Valley	NS-S (S1); NS (GNR)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
ovate Cain Spring pyrg (*Pyrgulopsis pictilis)*	Spring pools within the Reese River valley	NS-S (S1); NS (G1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Sada's pyrg (*Pyrgulopsis sadai)*	Only in two locations in Elko north of Carlin	NS-S (S1S2); NS (G1G2)		x	Yes
southern duckwater pyrg (*Pyrgulopsis anatine)*	Ocurs at a single spirng southeast of Old Collins Spirng	NS-S (S1); NS (G1)	x		No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Vinyards pyrg (*Pyrgulopsis vinyardi)*	Restricted to the Lahontan Basin	NS-S (S1); NS (G1)		x	No; Endemic to area outside of Project Area (BLM 2017 and BLM 2019)
Western pearlshell	This species prefers cold clean creeks and rivers that support salmonid populations. It can inhabit headwater streams less than a few feet wide, but is more common in larger rivers.Gravel, and cobble are preferred substrates (NatureServe 2021)	NS-S (S1); NS (G5)		x	Yes
Western ridged mussel (*Gonidea angulate)*	Found in abundance in Humboldt River Basin.	NS-S (S1); NS (G3)	x	x	Yes

[1] Yes/Maybe indicates potential suitable habitat within the Project Area based on habitat characteristics listed in the table. No includes specific information on why the species is not present within the Project Area.

Table D.1-3: Comprehensive List of Species Observed During Field Surveys

Species	Survey Area		
	Goldstrike	Carlin	Crescent Valley
American bullfrog (*Lithobates catesbeianus)*		X	
Belted kingfisher *(Megaceryle alcyon)*		X	X
Big brown bat *(Eptesicus fuscus)*			X
Black throated sparrow (*Amphispiza bilineata)*	X	X	X
Brazilian free-tailed bat (*T. brasiliensis)*		X	X
Brewers blackbird *(Euphagus cyanocephalus)*		X	X
Brewers sparrow *(Spizella breweri)*	X	X	X
Burrowing owl *(Athene cunicularia)*	X	X	X
California myotis *(Myotis californicus)*			X
Canyon bat *(Parastrellus hesperus)*	X	X	X
Chipping Sparrow *(Spizella passerina)*	X		X
Cliff swallow *(Petrochelidon pyrrhonota)*		X	
Common nighthawk *(Chordeiles minor)*		X	
Common raven *(Corvus corax)*	X	X	X
Ferruginous hawk *(Buteo regalis)*	X		
Fringed myotis *(Myotis thysanodes)*	X		
Goldfinch *(Spinus tristis)*		X	
Greater sage-grouse *(Centrocerus urophasianus)*		X	X
Green-tailed towhee *(Pipilo chlorurus)*		X	
Grey flycatcher *(Empidonax wrightii)*	X		
Hoary bat *(Lasiurus cinereus)*	X	X	X
Horned lark *(Eremophila alpestris)*	X	X	X
Lark sparrow *(Chondestes grammacus)*	X		X
Little brown bat *(Myotis lucifugus)*	X	X	X
Loggerhead shrike *(Lanius ludovicianus)*	X	X	X
Long-billed curlew *(Numenius americanus)*	X		X
Long-eared myotis *(Myotis evotis)*	X	X	X
Long-legged myotis *(Myotis volans)*			X
Mourning dove *(Zenaida macroura)*	X		
Nevada viceroy butterfly *(Limenitis archippus)*		X	
Northern mockingbird *(Mimus polyglottos)*		X	X
Pallid bat *(Antrozous pallidus)*			X
Prairie falcon *(Falco mexicanus)*	X	X	
Red-tailed hawk *(Buteo jamaicensis)*	X	X	
Red-winged blackbird *(Agelaius phoeniceus)*		X	X
Sagebrush sparrow *(Artemisiospiza nevadensis)*	X	X	X

Species	Survey Area		
	Goldstrike	Carlin	Crescent Valley
Say's phoebe *(Sayornis saya)*			X
Savannah sparrow *(Passerculus sandwichensis)*			X
Silver-haired bat *(Lasionycteris noctivagans)*	X	X	X
Song sparrow *(Melospiza melodia)*	X		X
Swainson's hawk *(Buteo swainsoni)*	X		
Townsend's big-eared bat *(Corynorhinus townsendii)*			X
Turkey vulture *(Cathartes aura)*	X		
Western kingbird *(Tyrannus verticalis)*		X	
Western meadowlark *(Sturnella neglecta)*	X	X	X
Western red bat *(Lasirurs blossevillii)*			X
Western small-footed myotis *(Myotis ciliolabrum)*	X	X	X
White-crowned sparrow *(Zonotrichia leucophrys)*		X	
Woodhouse's toad *(Anaxyrus woodhousii)*		X	
Yellow headed blackbird *(Xanthocephalus xanthocephalus)*	X		
Yuma myotis *(Myotis yumanensis)*		X	X

D.2. MIGRATORY BIRD SPECIES

D.2.1. Tables

Table D.2-1 lists the total counts of migratory and other bird species observed during surveys as recorded on the Great Basin Bird Observation datasheets. Survey sites and Southwest Regional GAP (SWReGAP) land cover types are shown on Figure D.2-1.

Table D.2-1: Migratory Bird Species in Survey Sites and Southwest Regional GAP Land Cover Type

Survey Site	Southwest Regional GAP Land Cover Type	Species	Count of Species
Goldstrike Project Area Migratory Bird Survey Sites			
MBS-GS-001	Inter-Mountain Basins Greasewood Flat	Horned Lark	2

Memo

To	Steve Grosz, Nevada Gold Mines
From	Morriah Fickes, Fisheries Biologist
Date	29 April 2022
Reference	Ore Transportation Project Baseline Studies
Subject	Indian Creek Aquatic Habitat Evaluation

Summary

At the request of Nevada Gold Mines (NGM), ERM biologists conducted a field habitat assessment of Indian Creek and evaluated aquatic habitat conditions in reference to suitability for Lahonton Cutthroat Trout (*Oncorhynchus clarki henshawi*). Findings from this evaluation indicate there is a low likelihood of Lahonton Cutthroat Trout (LCT) occurring in the segment of Indian Creek within the Ore Transportation Project (Project) Area, or in the immediate vicinity upstream and downstream of the Project.

Project Location

The section of Indian Creek evaluated in this field assessment is located in the Crescent Valley Survey Area, approximately a half mile south of Hilltop Road (SR 304) and approximately 2 miles east of State Route 306. ERM biologists surveyed approximately 4 linear miles of Indian Creek, extending from Photo Site 22 downstream to Photo Site 1 (Figure 1).

Habitat Characterization and Suitability for Lahonton Cutthroat Trout

Subsequent to a desktop review of the Indian Creek drainage in the Project and immediate vicinity, ERM conducted a field habitat characterization of Indian Creek on 15 April 2022. The habitat assessment documented current surface hydrology, including depth and temperature if water was present, presence/absence of aquatic life, bank stability/vegetation, grazing disturbance, instream habitat, and substrate composition. The field assessment confirmed that there is no distinguishable connection to any other stream or waterbody at the most downstream point of Indian Creek (Photo Sites 1 and 2). At the time of the field assessment, all segments of Indian Creek in the Project Area were dry, with flowing water limited to one section approximately 1 mile in length located 1 mile upstream of the northern survey boundary (Photo Site 20 and 22). The depth of water in this section averaged 5 inches, and the average wetted width of stream approximately 2 feet. Cattle and livestock use of this area was prominent. Fish were not observed at any location on Indian Creek during the habitat assessment.

Active and historical agricultural activities have altered the landscape surrounding Indian Creek in and around the Project, causing disturbance to soils, vegetative riparian buffer and species, and the natural water flow (Photo Site 10 and 19). Evidence of livestock grazing and cattle activity (e.g., trampling, stream crossings) was common throughout the areas evaluated, and appears to have adversely impacted bank stability, structure, and vegetative cover in

many locations (Photo Site 8 and 16). Riparian vegetation along Indian Creek was minimal or absent in most areas at the time of survey and, when present, was comprised predominantly of upland vegetative species (Photo Sites 13 and 21). A small number of willows were documented only in the area with flowing water (Photo Site 22). Although visual evidence of historical flows was observed within the Project survey area, including distinct channels, larger instream substrates, cracked ground, and human-made diversion structures and dams (Photo Site 4, 9, and 17), no evidence of recent flow was documented, and the significant disturbance of the streambanks from livestock, lack of vegetative cover/instream habitat, and eroding banks would indicate that Indian Creek provides very limited habitat to LCT, even if adequate flows were present (Photo Site 2, 13, and 19).

Conclusion

The observations made during the habitat assessment suggest that typical connectivity and habitat conditions in this segment of Indian Creek do not support resident LCT. Further, the absence of a downstream connection to more perennial waters—or habitat that could provide refugia to stranded fish after a period of peak flow and increased connectivity—suggest that LCT are unable to enter the Project from any source water downstream. If LCT historically occurred in this segment of Indian Creek, it likely originated from a location upstream where flows are less seasonally dependent and physical habitat features are supportive to self-sustaining populations of LCT.

1. INTRODUCTION

Nevada Gold Mines, LLC (NGM) contracted ERM-West, Inc. (ERM) to conduct biological and noise baseline studies for the proposed Ore Transportation Project (Project). The purpose of the baseline studies was to inventory and characterize water, wildlife, and vegetation resources for the Project to support future National Environmental Policy Act (NEPA) analysis. Surveys, inventories, and monitoring were completed over 2 years using protocols approved by the Bureau of Land Management (BLM) and the Nevada Department of Wildlife (NDOW).

The Year 1 biological baseline studies were completed May through September 2021 and focused on water resources, vegetation and soil types, habitat assessments, and wildlife surveys (ERM 2022a). The Year 2 biological baseline studies presented in this report were completed March through July 2022 and focused on additional taxa-specific surveys and/or trapping. The information from both years of baseline studies will be used to support future permitting needs, including compliance with NEPA.

A noise monitoring study was also completed to assess baseline ambient noise levels along the proposed Project route, and a cumulative report providing the detailed methodology and results of the noise assessment was submitted under separate cover (ERM 2022b). Results regarding the noise monitoring study are not discussed in this report.

1.1. PROJECT LOCATION

The Project is within Elko, Eureka, and Lander counties, Nevada, and includes approximately 2,660 acres of public lands administered by the Elko and Battle Mountain BLM Nevada District Offices, and approximately 3,962 acres of privately owned lands (Table 1.1-1 and Figure 1.1-1). The Project is located within the U.S. Environmental Protection Agency Central Basin and Range Level III Ecoregion. This ecoregion is characterized by mid- to high-elevation ranges interspersed with rolling hills, alluvial fans, and valleys. Valleys and lower elevation slopes are dominated by Great Basin sagebrush or saltbush-greasewood vegetation communities, while pinyon-juniper woodland and mountain-mahogany occur at higher elevations. The Central Basin and Range Ecoregion hydrology is internally drained, and most streams are intermittent and ephemeral (Wiken et al. 2011).

The Project is separated into three distinct survey areas: Goldstrike, Carlin, and Crescent Valley. Biological resource surveys were conducted in these survey areas within the Project footprint plus varying species-specific buffer distances from the centerline of the proposed railway, borrow source areas, access roads, and the proposed construction depots (herein referred to as the “Project Area”).

1.1.1. Landscape Setting and Land Use

Land use in northeastern Nevada includes mining, mine exploration, livestock grazing, agricultural use, and off-highway vehicle recreation, which occur throughout the Project Area (Wiken et al. 2011). Elevations within the Project Area range from approximately 9,135 feet above mean sea level at the summit of Mount Tenabo in the northern Cortez Mountains, to approximately 4,600 feet above mean sea level northwest of the Dunphy rail siding.

1.1.2. Climate

The climate in northeastern Nevada is characterized by a dry, mid-latitude desert climate, with hot summers, cold winters, and wet springs. Precipitation in this area regularly falls in winter as snow, and most rainfall occurs during spring and summer thunderstorms, which is typical of the Central Basin and Range Ecoregion (USGS 2012; Wiken et al. 2011). Annual precipitation in Elko, Eureka, and Lander counties ranges from just over 9 inches to almost 11 inches. Temperatures during January range from a low of 12.8 degrees Fahrenheit (°F) to a high of 46.2 °F. During the summer (July through September), temperatures range from a low of 39.9 °F to a high of 99.5 °F. Table 1.1-2 presents historic monthly climate normals for precipitation, as well as mean high and low temperatures for Elko, Eureka, and Lander counties. Historic precipitation and temperatures from the National Oceanic and Atmospheric Administration includes data from 1991 to 2020 (NOAA 2022a).

1.2. PROJECT DESCRIPTION

The Project would consist of a newly constructed railway and conveyor system to haul ore from the Cortez Mine District north to the Gold Quarry and Goldstrike mines for processing. The purpose of the Project is to allow for optimized processing, which would improve safety by reducing over-the-road haulage on public highways and would reduce air and greenhouse gas emissions. Project specifics include the following:

- New private rail line would be constructed from Cortez to Beowawe, where it would connect to the existing Union Pacific Railroad to travel east or west;
- New siding and private rail line would be constructed near Carlin to travel north to Gold Quarry;
- A new private railway would be built from the T.S. Power Plant to the east and extend north through Boulder Valley to Goldstrike; and
- Loading/unloading facilities such as stockpiles, rail loops, and conveyors.

This rail system includes temporary borrow source areas and temporary depots (construction laydown yards). The depots and borrow sources will be reclaimed after construction is complete. As shown on Figure 1.1-1, the Project is separated into three distinct surveyed areas: Goldstrike, Carlin, and Crescent Valley. This report will discuss the results based on the three defined areas.

1.3. LAWS, REGULATIONS, AND PLANS

A detailed list and description of the federal, state, and county regulations and permits pertaining to biological resources and land use management that guided the information collected for the 2022 baseline studies are described below. Land and resource management plans applicable to this *Year 2 Biological Baseline Report* include BLM Resource Management Plans (RMPs), a comprehensive plan prepared by the National Park Service, and county management and master plans.

1.3.1. Federal

The Council on Environmental Quality regulations discuss “human environment” in the Code of Federal Regulations, Title 40, Section 1508.14 (40 CFR 1508.14). This term broadly relates to the biological, physical, social, and economic elements of the environment. It includes the wildlife resources category. Relevant data is to be used in describing the affected environment as the basis for determining the effects (direct and indirect) of a proposed action. The *BLM National Environmental Policy Act Handbook H-1790-1* (BLM 2008) describes potential NEPA-related federal requirements.

Other federal requirements such as critical habitat procedural requirements must be followed. The following sections provide a list of relevant federal regulations.

1.3.1.1. Bureau of Land Management

The applicable BLM RMPs are the 1987 Elko RMP, the 1987 Shoshone-Eureka RMP, and amendments to those plans. These two RMPs guide BLM management decisions and actions based on multiple-use and sustained yield, unless otherwise specified by law.

BLM finalized an Approved Resource Management Plan Amendment (ARMPA) to address Greater Sage-grouse (*Centrocercus urophasianus*; hereafter referred to as "sage-grouse") habitat protection measures in Nevada and California (BLM 2015). The 2015 ARMPA provides guidance on measures to avoid and/or minimize potential impacts resulting from proposed projects in addition to providing appropriate measures to compensate for impacts that are unavoidable to sage-grouse.

habitat resulting from development projects.

BLM Nevada Special status species are species that occur on BLM-administered lands in Nevada consistent with Manual Section 6840 and current WO-230 guidance (NV Instruction Memorandum [IM]-2018-003) (BLM 2018, 2019a). This IM officially updates the list, which includes federally designated threatened, endangered, and proposed species as well as Nevada BLM sensitive species. In addition to the species listed in the IM, the BLM Elko District Office also maintains a sensitive species list (BLM 2019a). BLM's list of special status species includes the following three categories: 1) federally listed as Threatened or Endangered, Proposed, and Candidate species; 2) Nevada State-Protected species; and 3) Nevada BLM Sensitive species. BLM sensitive species are species for which population viability is a concern; they are managed by the BLM to, "ensure that actions authorized, funded, or carried out do not contribute to the need for the species to become listed." These species are afforded the same level of protection as federal candidate species.

1.3.1.2. National Park Service

In 1992, Congress established the California National Historic Trail (National Trails System Act, Section 5(a)(18)). As required by the National Trails System Act, a Comprehensive Management and Use Plan was completed for the California National Historic Trail and three other national historic trails (i.e., Oregon, Mormon Pioneer, and Pony Express National Historic Trails) in 1999 (NPS 1999). This plan provides broad-based policies, guidelines, and standards for administering the four trails to ensure the protection of trail resources, their interpretation, and their continued use. The purposes of the California National Historic Trail are to 1) enable all people to envision and experience—in a coherent and convenient way—the heritage and impacts of the western overland migration; and 2) encourage preservation of its history and physical remains.

1.3.2. State

Under Nevada law and regulation, any wildlife receiving the distinction of fully protected species may not be captured, removed, or destroyed at any time except with special permit as provided under Nevada Revised Statutes (NRSs) 503.584-503.589 and Nevada Administrative Code (NAC) 503.093. NAC Chapters 501 and 503 provide information on the protection of threatened,

endangered, protected, and sensitive plant and animal species. NAC Chapter 501 establishes broad policies for the protection, propagation, restoration, transplanting, introduction, and management of wildlife in Nevada, while Chapter 503 defines the criteria for classification of species as protected and identifies those species that require protection.

The NDOW manages fish and wildlife populations through objectives specified in various management plans. NDOW has direct responsibility for wildlife protection. NDOW's Wildlife Action Plan (WAP) (Wildlife Action Plan Team 2013) was completed and approved by the U.S. Fish and Wildlife Service (USFWS) in 2005.

Nevada's WAP has served as a plan of action for state wildlife conservation and funding by targeting the species of greatest conservation need and the Key Habitats on which they depend. The WAP serves as a comprehensive, landscape level plan, identifying the species of greatest conservation need and the Key Habitats on which they depend, with the intent to prevent wildlife species from becoming threatened or endangered. The WAP contains conservation actions to provide guidance to successfully conserve Nevada's Key Habitats and priority species.

Many of the conservation actions within the WAP are strategies identified in other existing conservation plans. The WAP's recommended conservation actions do not represent a mandate or expectation for a given party to carry out or implement these actions. During WAP implementation, conservation actions developed at the state or local level would be used to provide guidance to address site-specific conditions as appropriate. Some of these actions may be applicable at the land use plan level, and some more appropriately applied at an activity plan or site-specific plan level.

1.3.3. County Management Plans

1.3.3.1. Elko County

Per the planning directives in the *Elko County Public Land Use & Natural Resource Management Plan* (Elko County 2010), all proposed actions on public lands are to be brought to the attention of the Elko County Natural Resource Management Advisory Commission (NRMAC) or the Elko County Board of Commissioners (ECBC) for purposes of review to determine if the federal program is in conformance with Elko County policies pursuant to NEPA requirements and allows the county to cooperate and coordinate with the federal land management agencies. Elko County will coordinate and cooperate with federal agencies on actions that affect public lands within the county.

The Elko County NRMAC will serve in an advisory capacity as liaison to the ECBC. The Elko County NRMAC and ECBC requires consistency between its RMP (Elko County 2010) and all federal land use management, resource management, travel management, and any other federal management plans and actions that apply to Elko County.

1.3.3.2. Eureka County

In 1993, the Eureka County Commissioners created the Eureka County Natural Resources Advisory Commission and appointed a nine-member board to serve on that commission. The

Natural Resources Advisory Commission makes recommendations to the Eureka County Commission on issues regarding the goals and policies established in the *Eureka County Master Plan 2010* related to public lands issues, including air space, wild horses, wildlife, grazing allotments, mining and recreation (Eureka County 2010).

1.3.3.3. Lander County

The Conservation and Natural Resource Element of the *Lander County Master Plan 2010* (Lander County 2010) outlines policies and action programs for protecting Lander County's land, water, and air resources as growth and development occurs. The Conservation and Natural Resource Element provides guidelines for conserving the county's important natural resources while satisfying the requirement for a conservation plan as outlined by the NRSs. As defined in the Conservation and Natural Resource Element, land resources include soils, topography, agricultural lands, minerals, public lands, and geothermal resources (Lander County 2010).

Specific goals of the Conservation and Natural Resources Element include protecting important agricultural lands that provide economically productive acreage, important flood management areas, prime or unique farmland, or farmlands of statewide importance; limiting conflicts and encroachment from developing lands on agricultural lands; promoting the development of renewable energy projects; and protecting important environmental resources and open space (Lander County 2010).

2. BIOLOGICAL BASELINE REPORT APPROACH

ERM developed this biological basesline report consistent with the 2022 Work Plan (ERM 2021a) approved by the BLM. The Year 2 baseline studies included field surveys for sage-grouse, amphibians (egg mass survey and call baiting), and springsnail species (Superfamilies *Truncatelloidea* and *Cerithioidea*); trapping for pale (*Microdipodops pallidus*) and dark kangaroo mice (*Microdipodops megacephalus*), and shrews (*Sorex* spp). The appendices for each of these sections contain detailed information, figures, and datasheets from the field surveys conducted during the 2022 field surveys. Wildlife resources were surveyed within suitable habitat identified during the 2021 field studies within a 200-foot buffer of the centerline (400-foot survey area) for small mammals, a 400-foot buffer of the centerline (800-foot survey area) for amphibians and springsnails, and a 4-mile buffer for sage-grouse as shown on Figure 2-1 through Figure 2-9. These survey areas included the borrow source areas, access roads that include a 50-foot buffer of the centerline (100-foot survey area), and the proposed construction depots.

3. BIOLOGICAL BASELINE STUDIES—YEAR 2

The survey area for obtaining biological baseline data for Year 2 included targeted areas of suitable habitat identified during the 2021 surveys within the Project footprint plus a varying buffer distance dependent on the wildlife species as described in Section 2, Biological Baseline Report Approach (Figure 2-1 through Figure 2-9). Resource sections provided in this report include sage-grouse, dark and pale kangaroo mouse, shrews, amphibians, and springsnails.

As described in the Year 1 report (ERM 2022a), wildlife habitat within the Project Area consists of shrubland and grassland communities with some forblands and riparian areas. Within the majority of the Project Area, these habitats are dominated by invasive vegetation. Agricultural, developed, and recently mined areas make up a lesser component of the Project Area. Agricultural activities, historical mining activities, livestock rotation, wild horses, and wildfire have altered the landscape by disturbing native soils, vegetation, and local hydrology throughout portions of the survey area. These habitats within the survey areas support a variety of general wildlife species including big game, fish, birds, mammals, bats, reptiles, amphibians, and butterflies.

The NDOW WAP describes wildlife conservation strategies based on 22 “Key Habitats” that occur in the state (Wildlife Action Plan Team 2013). The WAP also identifies Species of Conservation Priority and groups them into species assemblages. Conservation strategies are directed towards these species' assemblages and addresses conservation issues related to Key Habitats. A complete discussion of the 12 WAP Key Habitats within the Project Area is provided in the Year 1 report (ERM 2022a).

Habitat within the Project Area has the potential to support a variety of flora and fauna. General wildlife, threatened and endangered wildlife, BLM special status species, and big game species of the Project Area are described in detail in the Year 1 report (ERM 2022a). The sections below describe taxa-specific evaluations conducted based on information collected during the Year 1 studies and provide detailed information on the status of these species in the Project Area.

3.1. GREATER SAGE-GROUSE

3.1.1. Background

The sage-grouse is a BLM special status species and a state-managed game bird under NAC 503. The sage-grouse was listed as a candidate species under the Endangered Species Act until October 2, 2015, when the USFWS determined that listing was unwarranted (80 Fed. Reg. 59858–59942). After this determination was made, BLM and U.S. Forest Service land use plans were updated to focus on the conservation of important sage-grouse habitat across the 11 states this species can be found. Sage-grouse for the Project are managed under the BLM Nevada and Northern California ARMPA (BLM 2015, 2019b).

Sage-grouse are a sagebrush-obligate species, dependent on multiple shrub-steppe habitats for food, shelter, and rearing (Braun et al. 1976; Connelly et al. 2000). The various sagebrush-steppe communities that sage-grouse rely on are managed by federal, state, and local

authorities (BLM 2019b). Sagebrush is a primary food source for sage-grouse throughout the year and is often the only available food source during the late fall and winter (Connelly et al. 2004). Although sage-grouse display variable seasonal migratory behavior, they demonstrate high fidelity to seasonal ranges, returning to the same areas for foraging, courtship, and nesting (Connelly et al. 2000). Productive nesting habitat for sage-grouse includes sagebrush with a diverse canopy and healthy understory of native forbs and grasses (Wakkinen 1990; Gregg 1991; Schroeder et al 1999; Connelly et al 2000). During the spring breeding season—approximately March 1 through May 15 in Elko, Eureka, and Lander counties, Nevada (BLM 2014)—males gather on breeding grounds called “leks” to perform courtship displays. Typical lek habitat consists of open areas including bare soil, short-grass steppe, windswept ridges, and exposed knolls near denser shrub-steppe habitat with substantial cover (Connelly et al. 2004).

In order to identify and incorporate appropriate protection measures for these essential habitats, sage-grouse habitat on BLM-administered lands was categorized in the ARMPA as Priority Habitat Management Areas (PHMAs), General Habitat Management Areas (GHMAs), Other Habitat Management Areas (OHMAs), and non-habitat. A summary description of these categories is presented below:

- PHMAs are identified as having the highest value to maintaining sustainable sage-grouse populations. PHMA largely coincide with areas identified as Priority Areas for Conservation by the USFWS. These areas include breeding, late brood-rearing, winter concentration areas, and migration or connectivity corridors.
- GHMAs are those occupied by the sage-grouse on a seasonal or year-round basis that lie outside PHMAs. Some special management conditions, including infrastructure avoidance areas, post-fire treatment prioritization, integrated pest-management approaches, and other strategies, may apply to these areas to sustain sage-grouse populations.
- OHMAs were identified using updated modeling data and are defined as habitat that is unmapped within the planning area and contains seasonal habitat or connectivity corridors.
- Non-habitat areas are outside of mapped sage-grouse habitats (PHMA, GHMA, and OHMAs) that do not contain suitable habitat for sage-grouse life-history requirements.

Figure 3.1-1 illustrates the BLM Habitat Management Areas from the 2019 ARMPA and the lek locations within the Project Area.

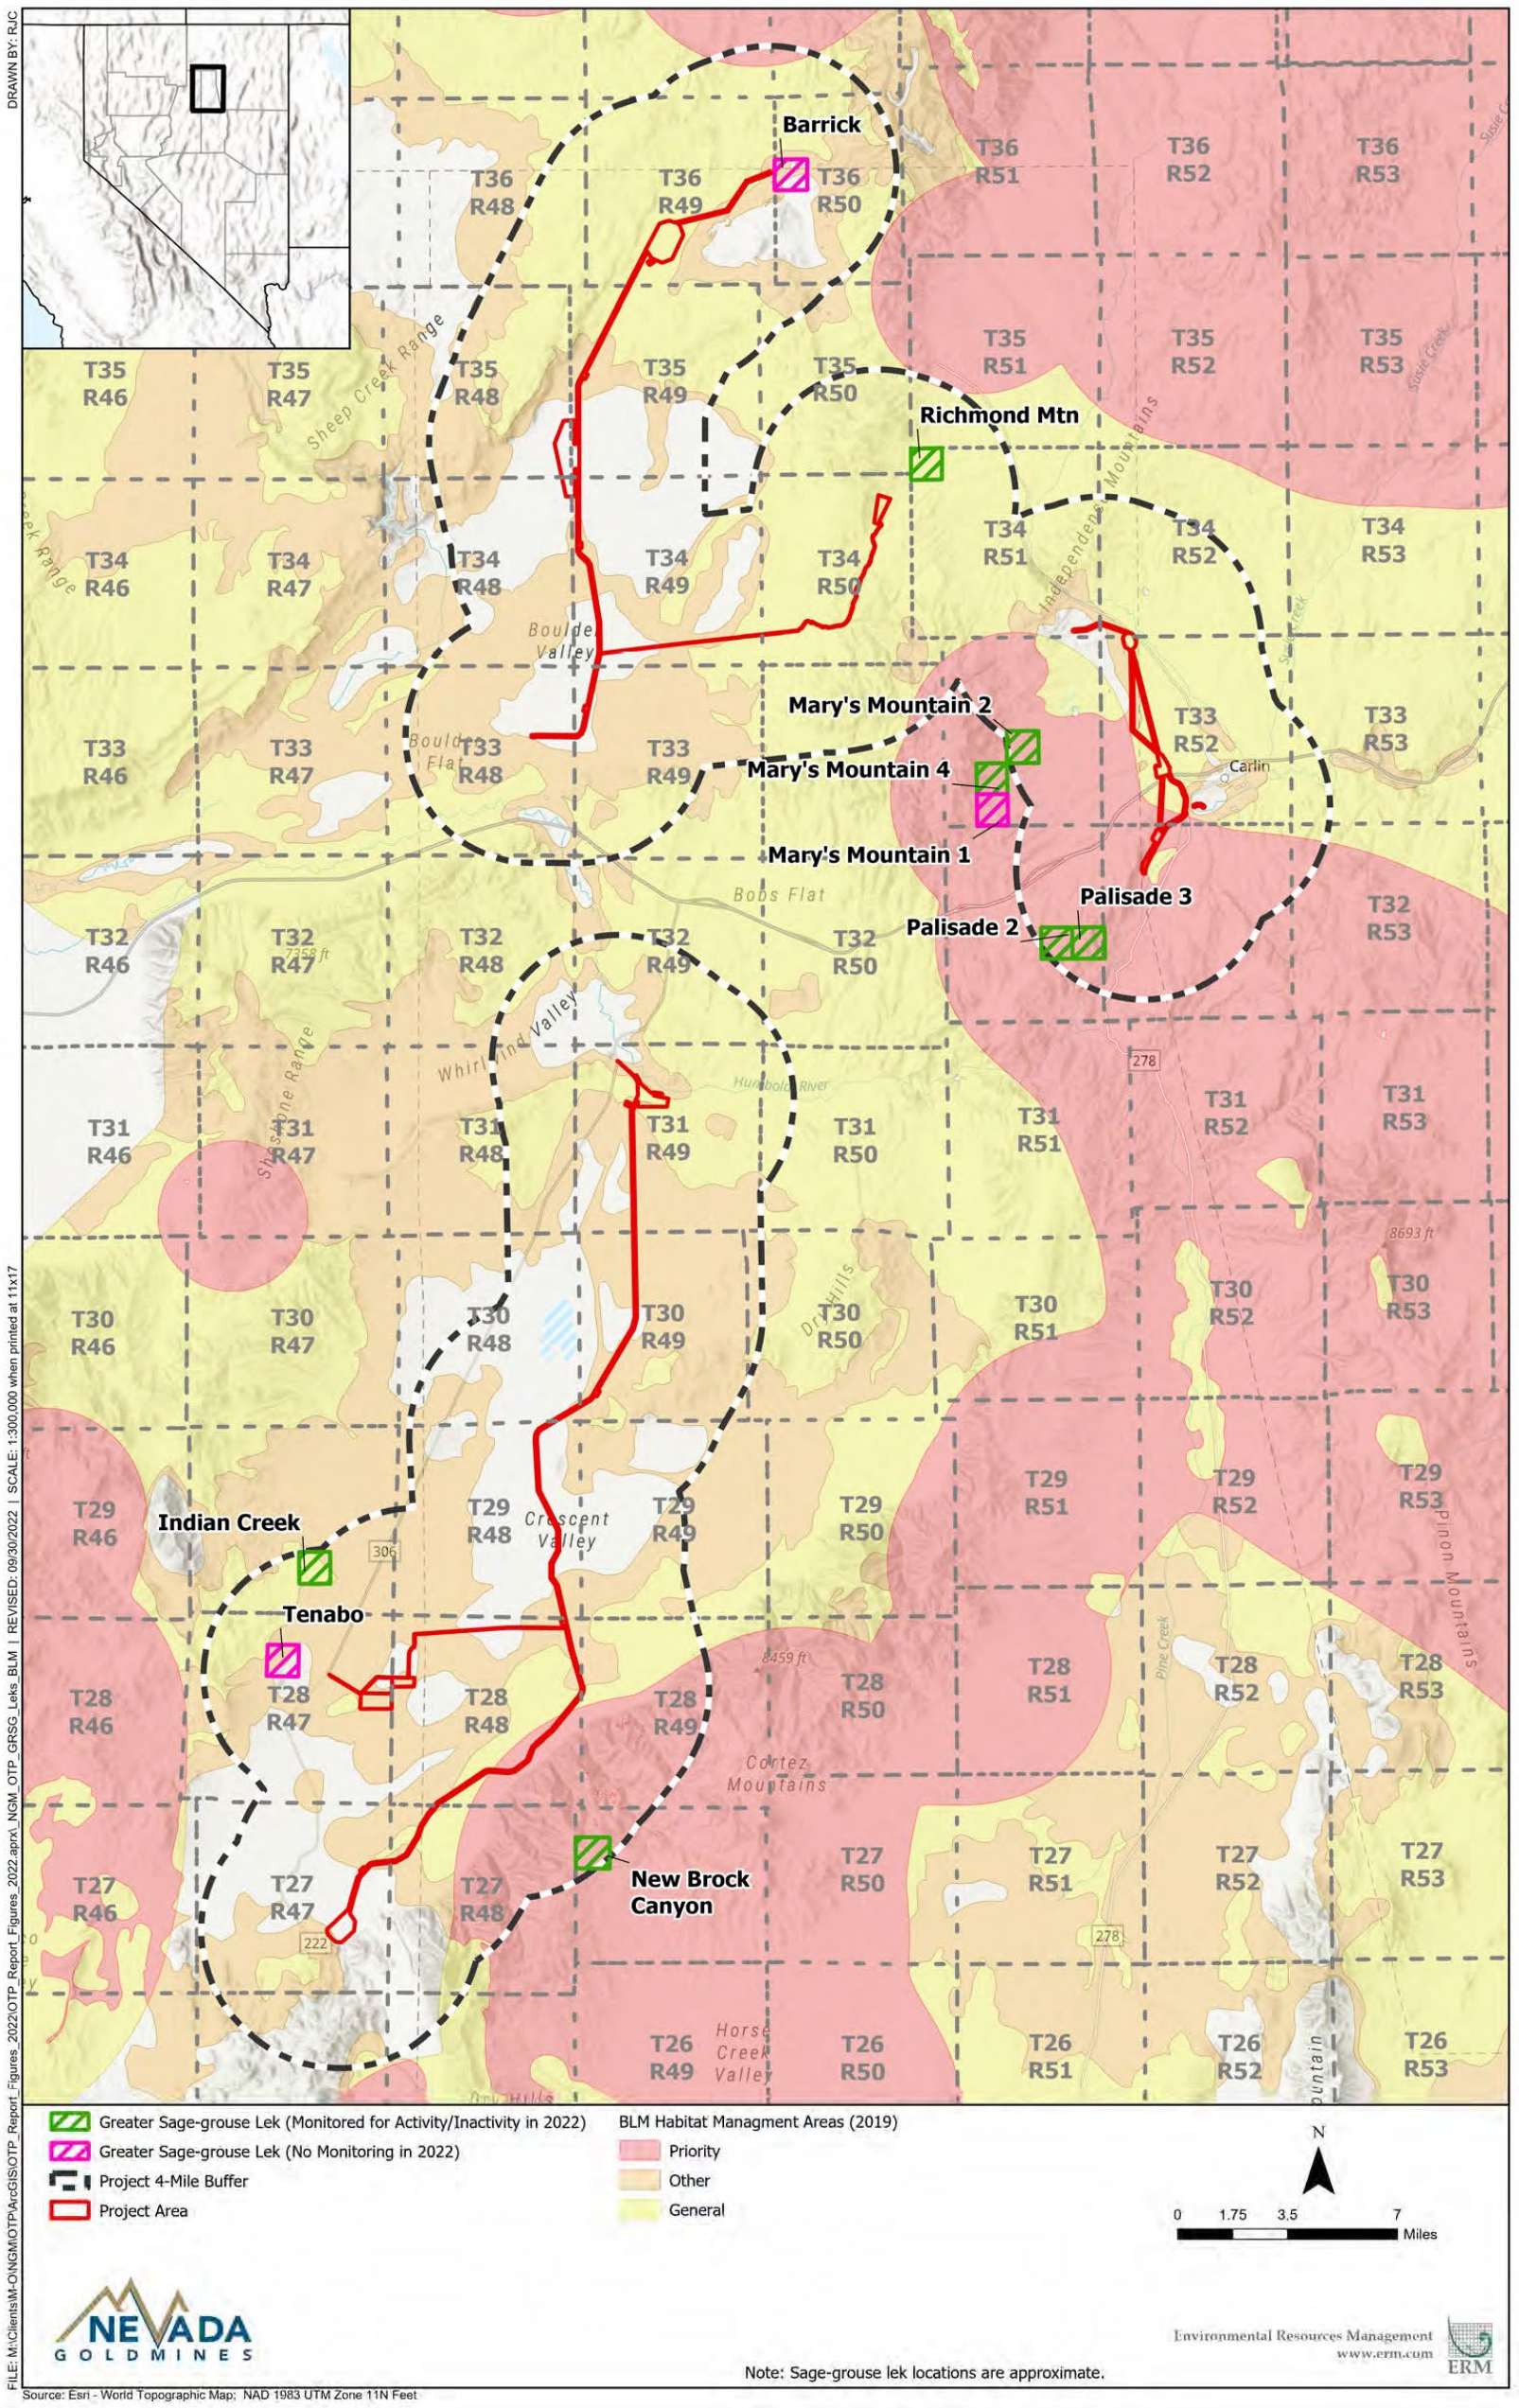

Figure 3.1-1: Greater Sage-grouse Leks and BLM Habitat Management Areas

Page Intentionally Left Blank.

3.1.2. Study Methodology

As described in the *Year 1 Biological Baseline Report* (ERM 2022a), eight sage-grouse leks within a 4-mile buffer of the Project were identified using data obtained from NDOW through a sensitive data request. Additionally, two leks located outside of the 4-mile buffer (Mary's Mountain 1 and Mary's Mountain 4) were included in the 2022 monitoring plan per request by NDOW during coordination on December 3, 2021, one of which was later removed from monitoring efforts (Mary's Mountain 1). The 4-mile buffer was applied based on the BLM ARMPA for lek buffer distances when approving NEPA actions (BLM 2015). In spring 2021, ground-based lek counts were performed at 4 of the 10 known leks by either NDOW or ERM, in conjunction with annual surveys occurring for NGM in the Cortez District. Lek count data from the remaining six leks was compiled to support the 2022 monitoring efforts, including date of last survey, date of last activity, and current NDOW lek status.

Prior to conducting the Year 2 baseline surveys, ERM in coordination with NDOW developed a monitoring plan to confirm the leks to be monitored and the number of surveys required at each lek. The required monitoring efforts for these leks were confirmed with NDOW on March 3, 2022, and are presented in Table 3.1-1.

Table 3.1-1: Sage-grouse NDOW Lek Status and 2022 Monitoring Plan

Lek	Lek ID	NDOW Lek Status [a]	Last Survey Year	2022 Monitoring Plan
Mary's Mountain 1 [b]	COR-007	Pending [c]	2019	No Monitoring
Mary's Mountain 2	COR-006	Active	2021	Monitor for activity
Mary's Mountain 4	COR-031	Pending [c]	2021	Monitor for activity
Palisade 2	COR-018	Inactive	2019	Monitor for inactivity
Palisade 3	COR-015	Active	2019	Monitor for activity
New Brock Canyon [d]	COR-032	Active	2021	Monitor for activity
Indian Creek [d]	SHO-018	Inactive	2021	Monitor for inactivity
Tenabo [b]	SHO-006	Unknown	2016	No monitoring
Barrick [b]	TUS-078	Unknown	2007	No monitoring
Richmond Mountain	NOFO-139	Unknown	2014	Monitor for activity

ID = identification; NDOW = Nevada Department of Wildlife
[a] Received from NDOW in January 2022.
[b] NDOW confirmed no monitoring required.
[c] Official NDOW status changed from *Inactive* in 2021 to *Pending* in 2022.
[d] 2022 monitoring efforts at these leks were coordinated with other NGM-related projects conducted by ERM.

The monitoring plan was developed based on each lek's official NDOW status. The NDOW-classified statuses of these leks included three leks categorized as *Active*, two leks categorized as *Inactive*, two leks categorized as *Pending*, three leks categorized as *Unknown,* and zero categorized as *Historic*. The official NDOW lek status for two leks (Mary's Mountain 1 and Mary's Mountain 4) was updated between 2021 and 2022. The official NDOW lek statuses are based on the following criteria (NDOW 2017):

- *Active*—Two or more males observed at least twice in the last 5 years.
- *Pending*—Two or more males observed only once in the last 5 years.

- *Inactive*—Zero to one male observed during every visit, for a minimum of two visits, in the last 5 years.
- *Historic*—Zero to one male observed during every visit, for a minimum of five visits in the last 30 years.
- *Unknown*—None of the above-described conditions have been met.

Mary's Mountain 1 (categorized as *Pending* by NDOW), Tenabo (categorized as *Unknown* by NDOW), and Barrick (categorized as *Unknown* by NDOW) were not required to be monitored per coordination with NDOW. Based on the monitoring plan, ERM surveyed a total of seven leks, as shown on Figure 3.1-1. Specific coordinate information for sage-grouse leks is confidential per the data-sharing agreement and confidentiality agreement between NDOW and ERM; therefore, the lek locations shown on Figure 3.1-1 are approximate.

Monitoring events were conducted by a team of two ERM biologists following the Statewide Wildlife Survey Protocols (BLM 2014) and NDOW Lek Survey Protocol (NDOW 2013). All leks slated for monitoring in 2022 with an NDOW lek status of *Active*, *Pending*, or *Unknown* were surveyed three times and at least 7 days apart to monitor for activity. *Inactive* leks were surveyed once to confirm inactivity, with the exception of Palisade 2, which was surveyed three times in concurrent effort with Palisade 3 due to proximity. All lek surveys were conducted in March and April during spring breeding season.

Prior to monitoring, biologists performed a reconnaissance of each lek location to determine the best vantage point(s) and accessibility. For each monitoring event, biologists arrived at the lek vantage point a minimum of 45 minutes before sunrise and maintained a minimum distance of 200 yards from the lek to minimize disturbance to sage-grouse. For survey locations with obstructed visibility, viewing was attempted on foot from separate vantage points to gain full coverage of the lek. Once visibility was confirmed, the area was surveyed with either binoculars or a spotting scope.

Four counts, in which biologists scan the lek location and surrounding landscape for visual observations of sage-grouse, were obtained during each monitoring event at 15-minute intervals between 30 minutes before and 90 minutes after sunrise, with the exception of the Indian Creek survey where the "lek route protocol" was used. The lek route protocol (NDOW 2013)—a method approved for ERM use by NDOW in 2021—is used when sage-grouse are not visually or audibly identified during a monitoring event. When using this protocol, four counts are obtained at 2-minute intervals within the same monitoring period, as opposed to 15-minute intervals, while walking the lek to look and listen for sage-grouse and search for recent sign (e.g., cecal tar, scat, tracks, feathers).

Lek locations and vantage points were mapped using ArcGIS Field Maps. All survey data were collected electronically in ArcGIS Survey123 using the NDOW Lek Count Data Collection Form (NDOW 2013). The following data were documented during each monitoring event.

- Biologists recorded the following upon arrival:
  - Lek name, activity, and sign of recent activity
  - Coordinates of the survey vantage point
  - Date and time of survey
  - Time of sunrise
  - Wind speed (miles per hour)
  - Temperature (Fahrenheit)
  - Cloud Cover
  - Precipitation
- Males and females were distinguished during counts. Per NDOW protocol, if the sex of the bird could not be identified, the sex was recorded as *Unknown*.
- Any predators observed were recorded by species, time, and type of activity.
- Any presence of Common Ravens (*Corvus corax*) at a lek during a survey was recorded per request from NDOW on March 4, 2022.
- Evidence of any recent sign was recorded during the lek route protocol (NDOW 2013).
- The survey end time and departure time were recorded.

Any birds that were not counted during a count but were discovered after all four counts were completed (i.e., were located while walking the lek to look for sign) were noted by the biologist and added into the count data, where appropriate, to ensure inclusion in the final dataset.

3.1.3. Results and Discussion

Leks in the Project Area are primarily located in open, sparsely vegetated areas along windswept ridges and hillsides and adjacent to sagebrush-steppe communities. The sagebrush-steppe communities at the leks vary from dense, big sagebrush (*Artemisia tridentata*) to sparse, low-growing sagebrush species, such as low sagebrush (*Artemisia nova*) and budsage (*Artemisia spinescens*). Lek activity is typically observed in the sagebrush habitat, particularly in areas containing the low-growing species. Figure 3.1-2 through Figure 3.1-4 show the general lek locations in relation to the U.S. Geological Survey (USGS) Southwest Regional Gap Analysis Project (SWReGAP) landcover types. The lek locations are dominated by four landcover types: Inter-Mountain Basins Big Sagebrush Shrubland (46 percent), Great Basin Xeric Mixed Sagebrush Shrubland (14 percent), Inter-Mountain Basins Montane Sagebrush Steppe (10 percent), and Invasive Annual Grassland (10 percent) (Lowry et al. 2005).

Of the seven leks monitored in 2022, five are contained within BLM PHMAs or areas of BLM-administered land identified as having the highest value to maintaining sustainable sage-grouse populations (Figure 3.1-1; BLM 2019b). The other two leks are located primarily within GHMAs and provide seasonal breeding habitat for sage-grouse.

Page Intentionally Left Blank.

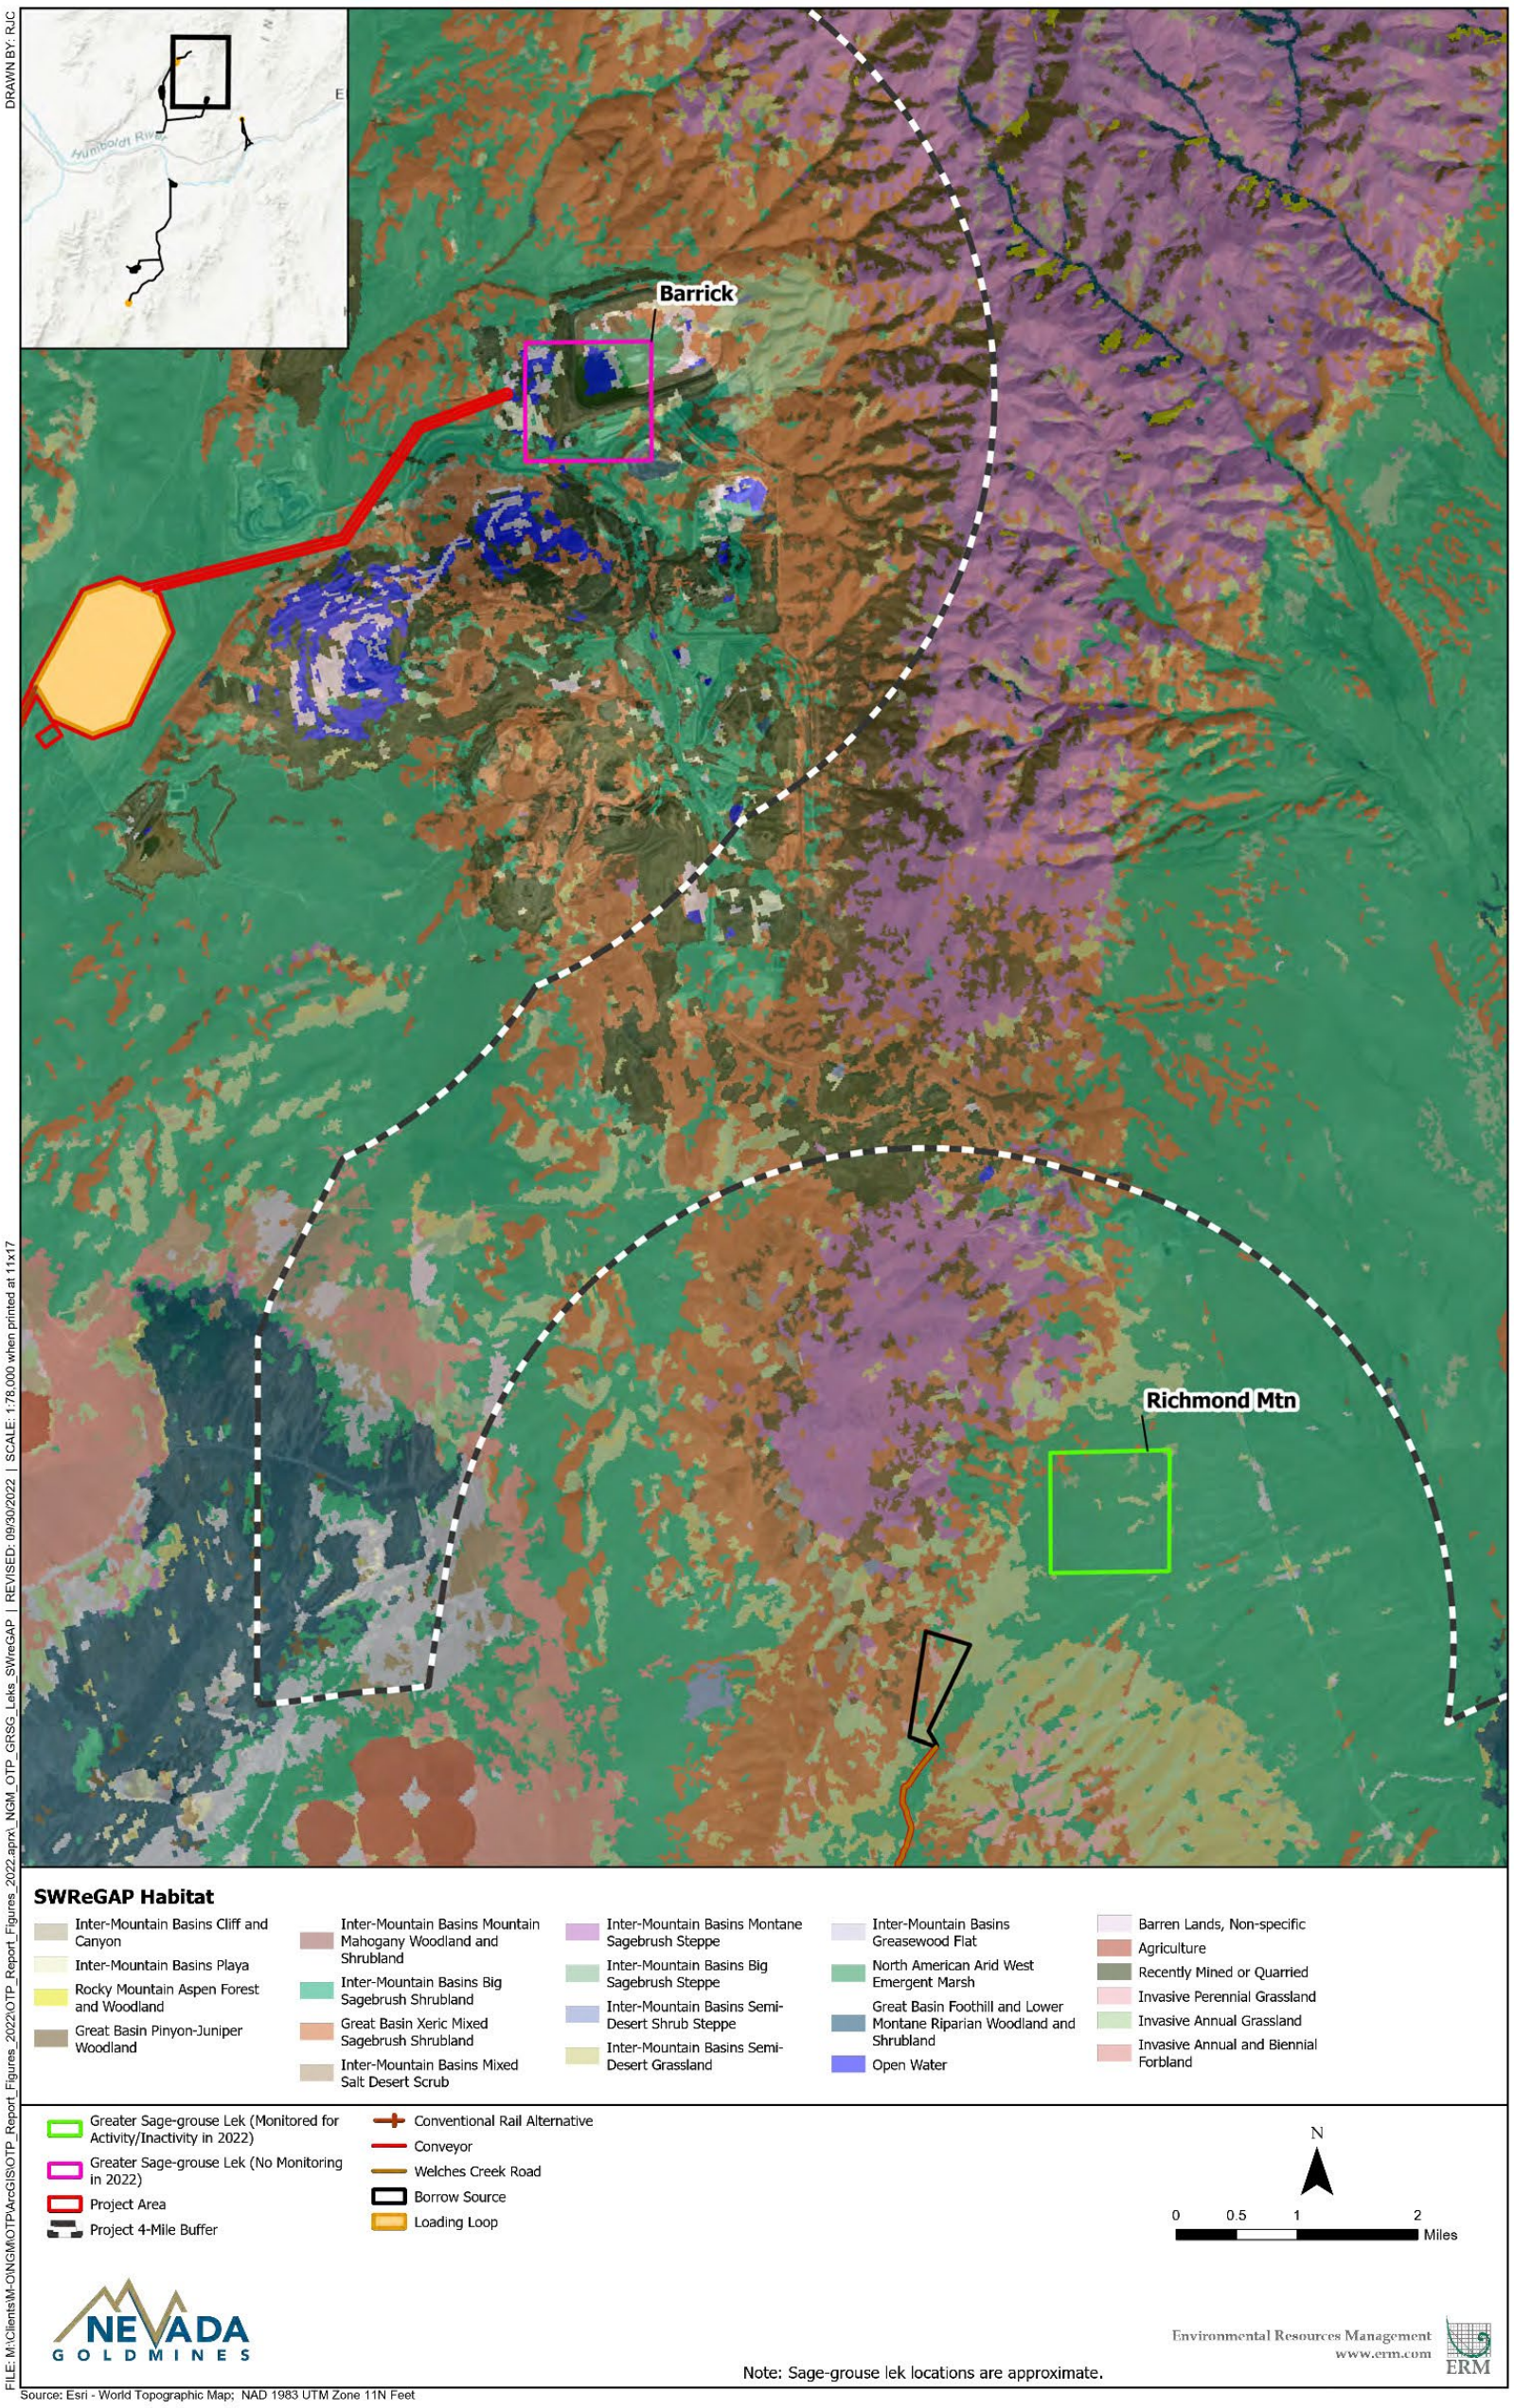

Figure 3.1-3: Greater Sage-grouse Leks Locations and USGS Landcover Types—Goldstrike Survey Area

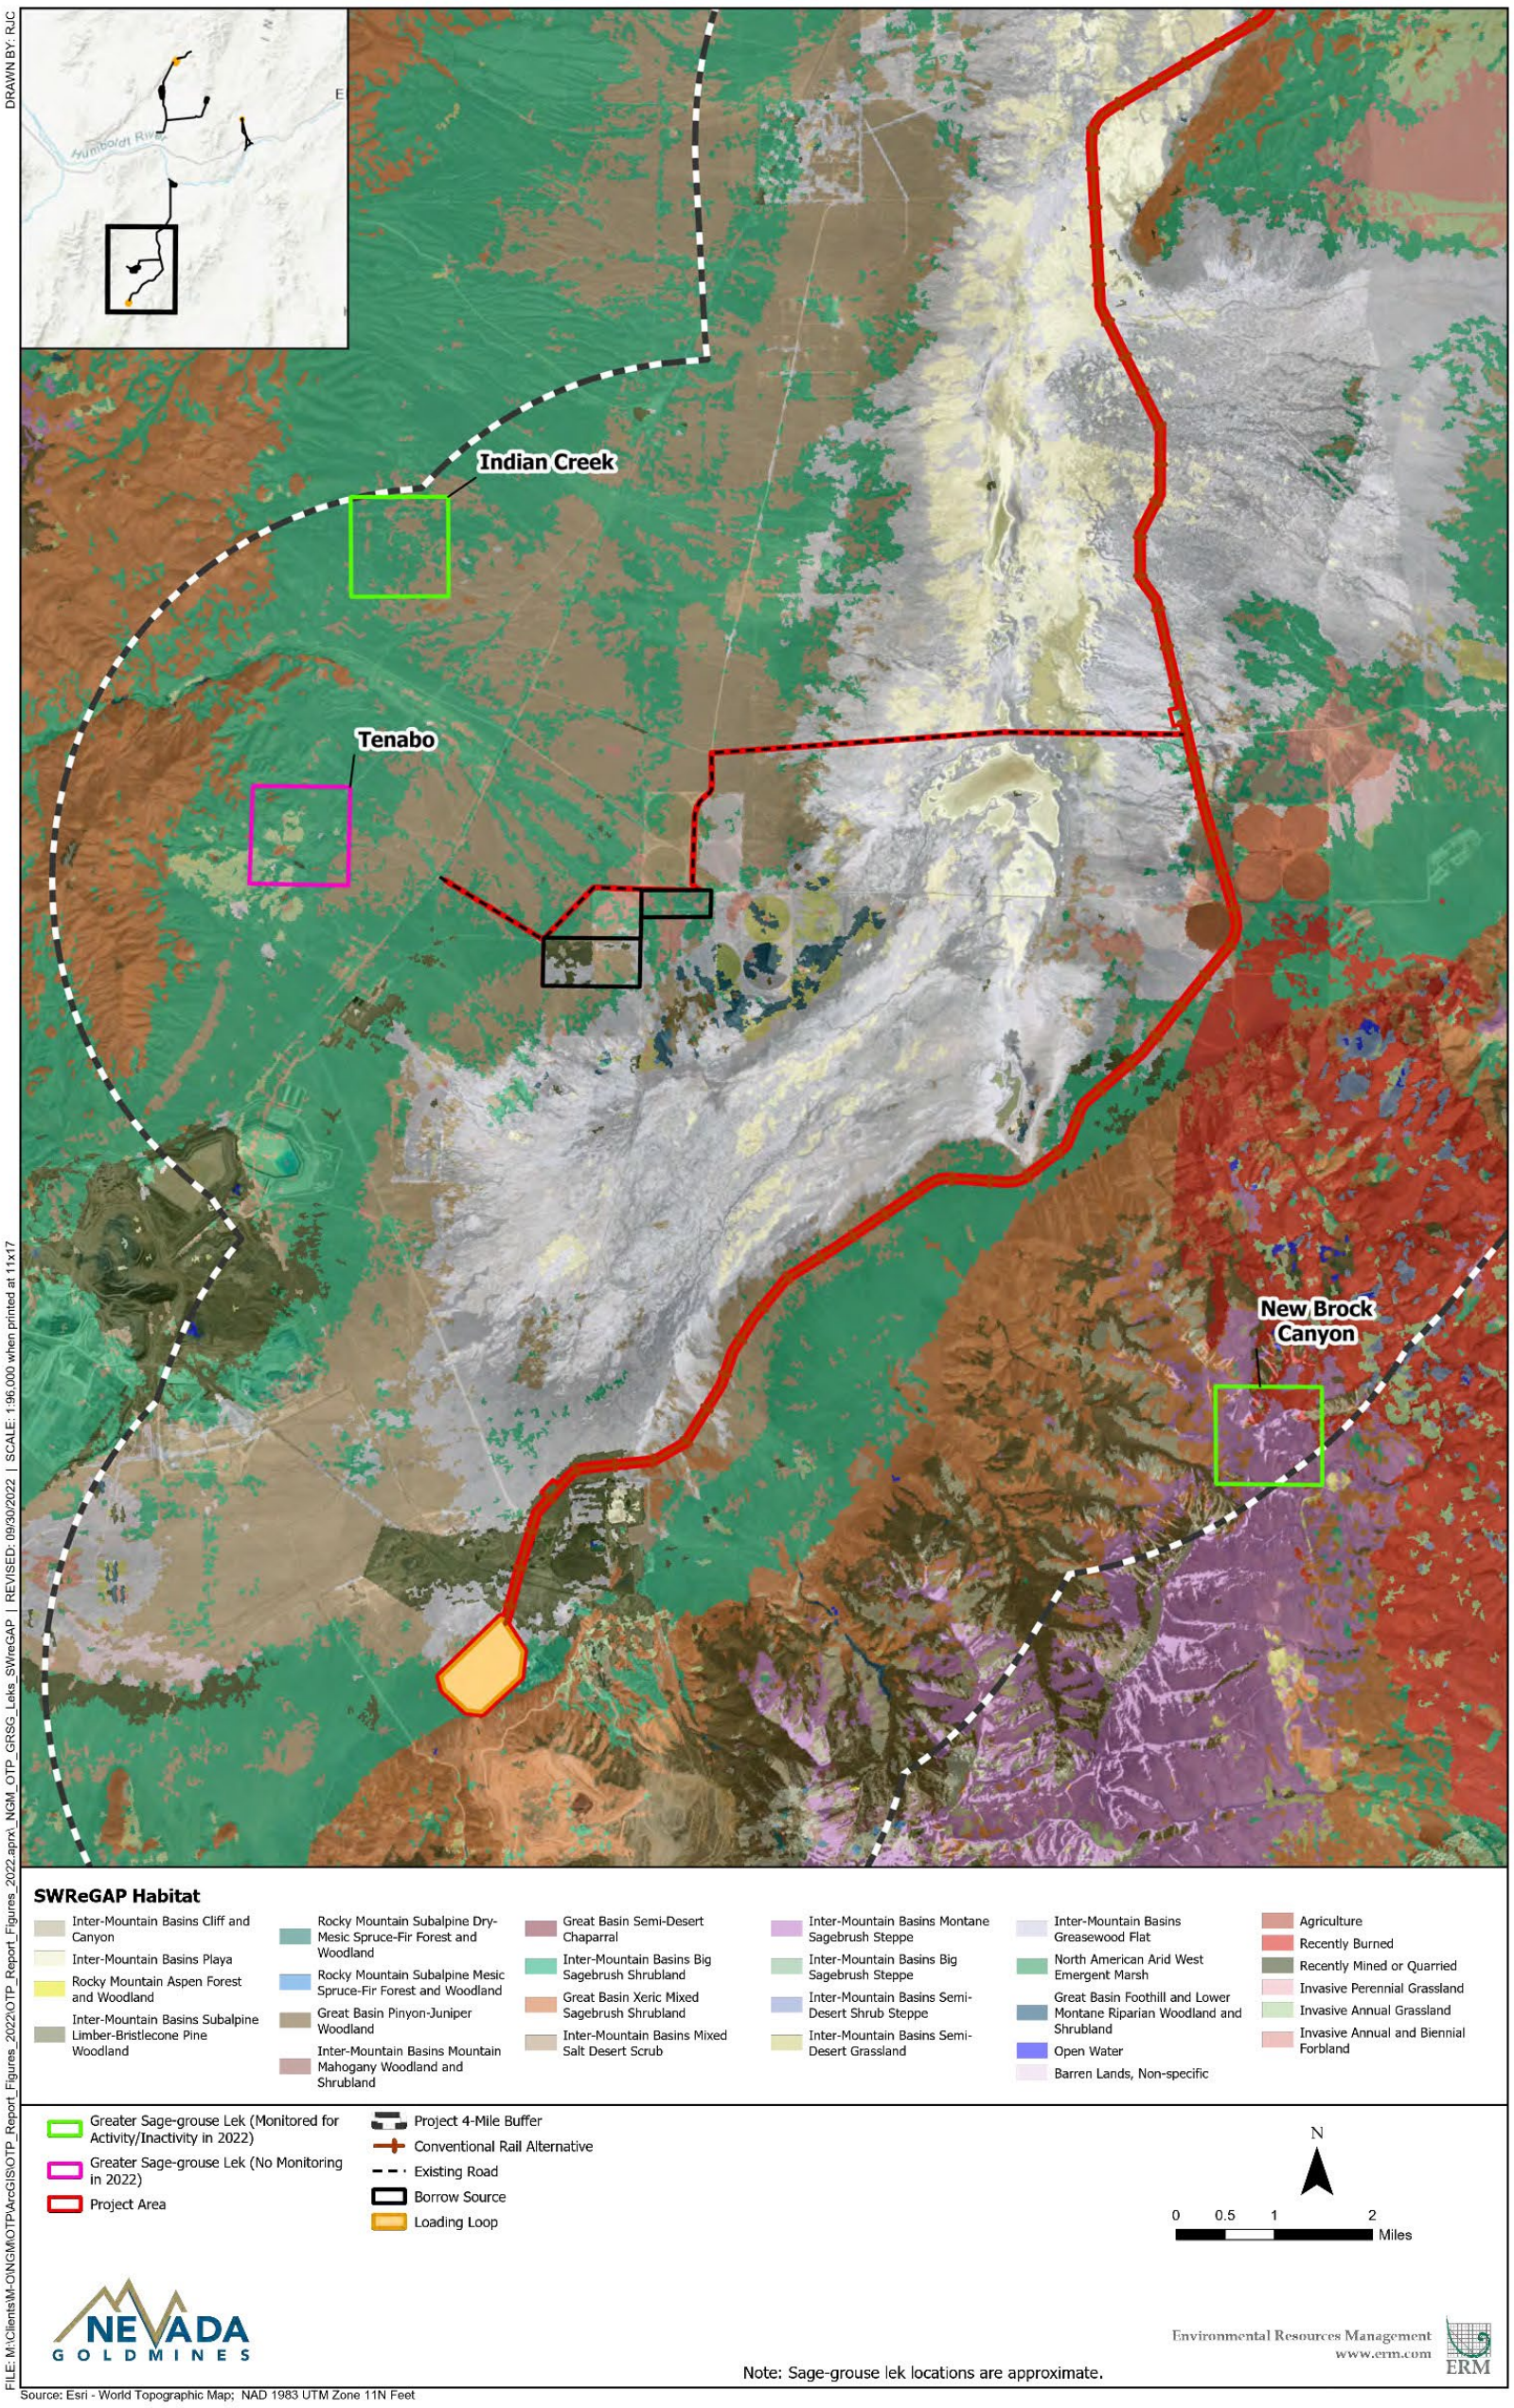

Figure 3.1-4: Greater Sage-grouse Leks Locations and USGS Landcover Types—Crescent Valley Survey Area

Page Intentionally Left Blank.

Seven leks were monitored during the Year 2 baseline studies, of which two leks had male and/or female sage-grouse on the lek or in the immediate area. New Brock Canyon had the highest count of males on a lek (28), and Mary's Mountain 2 had the highest count of females (2). The remaining five leks did not have any sage-grouse activity or recent sage-grouse sign observed during the monitoring events. Table 3.1-2 summarizes survey dates and high counts for the monitored leks. Detailed survey form results can be found in Appendix A, Greater Sage-grouse Data.

Table 3.1-2: Summary of 2022 Lek Survey Dates and High Counts

Lek	Lek ID	Survey 1 Date	Survey 2 Date	Survey 3 Date	High Count Males	High Count Females	High Count Unknowns
Mary's Mountain 2	COR-006	04/05/22	04/19/22	04/27/22	0	2	2
Mary's Mountain 4	COR-031	04/05/22	04/19/22	04/27/22	0	0	0
Palisade 2	COR-018	04/02/22	04/11/22	04/21/22	0	0	0
Palisade 3	COR-015	04/02/22	04/11/22	04/21/22	0	0	0

Indian Creek	SHO-018	03/11/22	-	-	0	0	0
Richmond Mountain	NOFO-139	04/06/22	04/16/22	04/29/22	0	0	0

ID = identification

During Year 2 monitoring, sage-grouse at the New Brock Canyon lek were dispersed across a larger area than previously documented and there was a 6 percent decrease in male high counts observed compared to Year 1. This may be attributed to the presence of Golden Eagles (*Aquila chrysaetos*) and Common Ravens on the lek, which were observed during two of the three survey events. During the April 4, 2022, monitoring event, a Golden Eagle flushed several birds off the lek during the first count, resulting in a significantly lower survey count than the other monitoring events. In total, the Year 2 season high count for New Brock Canyon was 28 males and 1 female.

At Mary's Mountain 2, a total of three females and two birds of an *Unknown* sex were observed near the lek or flushed from surrounding areas, but no active lekking was recorded on the lek during the Year 2 monitoring. During the first monitoring event on April 4, 2022, two *Unknown* sage-grouse were flushed approximately 0.25-mile south of the documented lek area and fresh sign was observed. During the second and third monitoring events, three female sage-grouse were flushed approximately 0.25 mile southwest from the lek location in sagebrush shrubland. Based on the 2022 monitoring events, Mary's Mountain 2 lek activity may be shifting south/southwest of the documented location to an area with slightly more vegetation cover and further distance from the existing two-track road and Gold Quarry Mine. Small shifts in lek locations can occur due to changes in vegetation abundance, anthropogenic disturbance or

activity, and other undetermined factors. In total, the 2022 season high count for Mary's Mountain 2 was zero males and two females.

Palisade 2 and Palisade 3 leks were monitored concurrently, and no sage-grouse or recent sign was observed at either lek. Cattle were present at both lek locations, and noise from the Union Pacific Railroad and Interstate 80 could be heard during the first survey event on April 2, 2022, at Palisade 3.

Similar to the Palisade leks, Indian Creek, Mary's Mountain 4, and Richmond Mountain leks had no sage-grouse or recent sign observed during the 2022 surveys. Mining-related noise could be heard at the Richmond Mountain lek during the first two survey events on April 6, 2022, and April 16, 2022.

As referenced in the Year 1 report (ERM 2022a), the most consistent historical lek count data for the Project Area was collected within the last 10 to 15 years. Conventionally, historical high-count data only represents high counts for males. Table 3.1-3 and Table 3.1-4 present historical high-count lek data for the leks surveyed in 2022 categorized by the Mount Lewis and Tuscarora BLM Field Offices. Figure 3.1-5 provides a graphical representation of male sage-grouse high counts at the seven leks monitored in 2022 (ERM 2021b; NDOW 2021).

There are relatively insufficient historic lek data available for the seven leks monitored in 2022 to suggest statistically meaningful biological trends in sage-grouse populations for the Project, as the most consistent data for the majority of the leks only started recently in 2010. Additionally, data are highly variable due to several years of gaps in monitoring. However, lek data collected since 2010 show that Mary's Mountain 2, Mary's Mountain 4, Palisade 2, and Palisade 3 leks have had birds on lek in 2010 or more recently but have since gone to zero birds observed in 2022. Furthermore, historic lek data for Indian Creek and Palisade 2 leks date back to 1971 and 1991, respectively, and both leks have seen a decline in sage-grouse over the last 30 to 50 years. Despite high-count numbers between 20 and 60 at the New Brock Canyon lek over the last 11 years, no clear trend can be observed to date.

The decoupling or decline in sage-grouse populations throughout their range has been documented over the past few decades (Garton et al. 2015; WAFWA 2015; Coates et al. 2021). Reasons for this decline can be attributed to a variety of environmental and anthropogenic factors, including habitat loss and degradation from prolonged grazing, invasion of exotic vegetation, energy development, and an increasing wildfire regime, in addition to both localized and large-scale climate-related events (ERM 2022c).

3.2. DARK AND PALE KANGAROO MICE

3.1.1 Background

Dark kangaroo mouse (*Microdipodops megacephalus*) and pale kangaroo mouse (*Microdipodops pallidus*) are BLM special status species in Nevada and are Protected Mammals under NAC 503.030 (Table 3.2-1). Both species are nocturnal, emerging from their burrows during low-light conditions (Amos 2017; Peterson 2000). Kangaroo mice are predominantly herbivorous, foraging primarily on seeds and grains but incorporate insects in dry summer months to meet caloric requirements (NatureServe 2022; Roach 2016). Specialized kidneys and metabolism allow kangaroo mice to persist in arid environments and meet water requirements through diet alone (Amos 2017; Peterson 2000). Kangaroo mice are thought to be almost exclusively bipedal (use two feet) when aboveground. Long hind limbs with stiff hairs along the foot margins and muscular tails allow the two species to move quickly in sandy soils, while smaller forelimbs aid in turning at high speeds (Peterson 2000).

Table 3.2-1: Agency Status and General Habitat for Special Status Kangaroo Mice

Species	Agency Status	Nevada Wildlife Action Plan Habitat Description
Dark kangaroo mouse (*Microdipodops megacephalus*)	BLM Nevada Sensitive; NDOW Protected Mammal	Inter-Mountain Cold Desert Scrub, Sagebrush, Mojave Warm Desert and Mixed Desert Scrub, Grasslands and Meadows, Sand Dunes and Badlands, Desert Playas and Ephemeral Pools
Pale kangaroo mouse (*Microdipodops pallidus*)	BLM Nevada Sensitive; NDOW Protected Mammal	Inter-Mountain Cold Desert Scrub, Sagebrush, Grasslands and Meadows, Sand Dunes and Badlands

Source: BLM 2018; NDOW 2022; Wildlife Action Plan Team 2013

BLM = Bureau of Land Management; NDOW = Nevada Department of Wildlife

The dark kangaroo mouse requires loose sand and gravelly soils (Hafner et al. 1998; Ghiselin 1970) associated with vegetative communities of rabbitbrush (*Chrysothamnus* spp.), horsebrush (*Tetradymia* spp.), sagebrush (Artemisia spp.), and Indian ricegrass (*Oryzoipsis hymenoides*) (GBE 2016; NatureServe 2022). The dark kangaroo mouse is mainly solitary, living independently from other kangaroo mice (Amos 2017) and maintaining home ranges approximating 1.6 acres for males and 0.9 acre for females (Amos 2017; Roach 2016). While home territories may overlap between two individuals, dark kangaroo mice actively defend their burrows from other kangaroo mice. They are known to store excess seed and grains within their burrows for winter, at which currently it is thought they hibernate (Amos 2017). Typically, burrow complexes occur between 3,940 feet to 6,725 feet in elevation, below pinyon-juniper communities but above communities of greasewood (*Sarcobatus vermiculatus*) and saltbrush (*Atriplex* spp.) (Amos 2017; Hafner and Upham 2011).

The pale kangaroo mouse is a more highly specialized sand-obligate compared to the dark kangaroo mouse (Hafner et al. 2008). The pale kangaroo mouse is restricted to habitats with fine, windblown, sandy soils with little or no gravelly overlay. The pale kangaroo mouse is associated with alkali-sink and desert scrub environments dominated by shadscale (*Atriplex*

confertifolia), saltbush, and greasewood (BLM 2019a). Burrows of pale kangaroo mouse are usually situated near the base of shrubs or along open sand banks. Pale kangaroo mouse burrows are relatively simplistic compared to the burrows excavated by dark kangaroo mouse. The pale kangaroo mouse is thought to be as solitary as the dark kangaroo mouse but more aggressive towards intruders of the same species (Peterson 2000). Pale kangaroo mice also likely store food for winter; and although it is unknown whether they hibernate, there is evidence they can enter torpor (a lethargic state) when temperatures are very high or very low and food sources are scarce (Peterson 2000; Zeiner et al. 1990). Pale kangaroo mice maintain similar sized home ranges for males and females as the dark kangaroo mouse (Peterson 2000), with burrows occurring between 3,600 feet to 8,200 feet in elevation, typically above creosote (*Larrea tridentata*) habitat but below sagebrush communities (Hafner and Upham 2011; Peterson 2000).

Habitat alteration, particularly the introduction of weedy grasses, conversion of land for agricultural and livestock use, and irrigation of dry sink habitats, is thought to negatively affect both pale and dark kangaroo mice populations (Amos 2017; Hefner et al. 1998; Peterson 2000). Habitat alterations resulting from wildfires, anthropogenic activity, and overgrazing of livestock also decrease habitat suitability for kangaroo mice (Wildlife Action Plan Team 2013; GBE 2016).

The Year 2 baseline studies for kangaroo mouse consisted of trapping surveys conducted in locations identified during the Year 1 baseline field assessment (ERM 2022a) as containing the highest potential habitat for kangaroo mouse (Table 3.2-2).

3.1.2 Study Methodology

Trapping surveys for kangaroo mice were conducted according to Statewide Wildlife Survey Protocols (BLM 2014) and the Modified Hycroft *Microdipodos* Survey Protocol (BLM et al. 2019). Through discussions between ERM and the BLM Elko District Office, modifications to methodology, such as trap site location and number of transects per trapping site, were approved. The first dark and pale kangaroo mice trapping event was conducted May 4 to 7, 2022, when ambient nighttime temperatures reached or exceeded 32 °F. Because no kangaroo mice were trapped during the first event, a second 4-day trapping event was conducted in the same locations June 11 to 14, 2022, in accordance with protocol and coordination with the BLM Elko District Office.

Two teams of two biologists set small, folding, aluminum Sherman live traps (dimensions 2 inches by 2.5 inches by 6.5 inches) to capture kangaroo mice. Sherman live traps are reusable and provide safe capture and protection for small mammals. The length of each transect, the number of traps per transect, and timing of each trapping event was determined in coordination between ERM and the BLM Elko District Office. Approximately 165-foot-long transects were established with 10 Sherman traps each. Table 3.2-2 summarizes the National Resource Conservation Service's (NRCS) soil map units, SWReGAP landcover types and acreage, and the number of transects required per trap site. The three trap sites identified during Year 1 surveys and evaluated in Year 2 are shown on Figure 3.2-1 through Figure 3.2-4.

Table 3.2-2: Locations of Kangaroo Mouse Trapping

Survey Area	Trap Site	NRCS Soil Map Units	SWReGAP Landcover Type	Area (acres)	Number of Transects and Traps
Crescent Valley	Crescent Playa Margin 1 (Trap Site 1)	Batan-Ocala Association	Inter-Mountain Basins Big Sagebrush Shrubland	0.5	20 traps across two approximately 165-foot transects
			Inter-Mountain Basins Greasewood Flat	22.3	
			Inter-Mountain Basins Mixed Salt Desert Scrub	0.2	
			Inter-Mountain Basins Playa	14.9	
	Crescent Playa Margin 2 (Trap Site 2)	Batan-Ocala Association	Inter-Mountain Basins Greasewood Flat	118.2	30 traps across three approximately 165-foot transects
			Inter-Mountain Basins Playa	23.1	
	Cortez Foothills North (Trap Site 3)	Enko-Davey-McConnel Association Zineb gravelly loam, 2 to 8 percent slopes Batan-Ocala Association	Agriculture	7.1	50 traps across five approximately 165-foot transects
			Barren Lands, non-specific	4.6	
			Inter-Mountain Basins Big Sagebrush Shrubland	183	
			Inter-Mountain Basins Greasewood Flat	38	
			Inter-Mountain Basins Mixed Salt Desert Scrub	113.5	
			Invasive Annual and Biennial Forbland	2.4	
			Recently Mined or Quarried	5.7	

Source: NRCS 2019; Lowry et al. 2005

NRCS = National Resource Conservation Service; SWReGAP = Southwest Regional Gap Analysis Project

Transects were placed in transitional zones between SWReGAP landcover types. Transitional areas are spaces between different landcover types that contain characteristics of both landcover types and habitats. Precise trap placement was where prevailing habitat conditions were most suitable and chances of trapping success were highest, such as sandy areas near shrub bases or sandy soil inclusions in mixed shrub habitats with abundant grass communities. In accordance with the trap grid design (BLM et al. 2019), a pair of traps was set approximately every 33 feet along 165-foot-long transects. Ten traps were placed along each transect 33 feet apart. In total, 100 traps were deployed during each trapping night. Trap Site 1 contained 20 traps across two transects, Trap Site 2 contained 30 traps across three transects, and Trap Site 3 contained 50 traps across five transects each trapping night.

Kangaroo mouse activity is highest immediately after sunset and continues through the night (Manley et al. 2006). All traps were set approximately 1 hour before sunset and checked within 1 hour of sunrise the following morning. Prior to each survey night, traps were baited with a mixture of rolled oats, peanut butter, and birdseed and insulated with poly-fill material. Bait and insulation were replaced as needed prior to each survey night. Traps were left in place over the entire 4-day trapping event but were closed during the day when not in use to reduce capture of non-target species.

All captured animals were handled as described in the 2016 Guidelines of the American Society of Mammalogists (Sikes 2016). Non-target species captured were identified and released without further evaluation.

As part of the field survey, biologists searched for kangaroo mouse sign, such as scat, tracks, and burrows. Kangaroo mouse scat is similar in size to a grain of rice and appears desiccated as opposed to larger, more hydrated scat produced by rats, voles, and shrews. Mouse and rat scat often appears scattered along wildlife trails while shrews and voles leave scat in larger piles (“latrines”) near water sources. The distinct gait of kangaroo mice leaves unique tracks in loose sand that appear as long, parallel rear footprints with deep tail drag marks between the footprints. Due to low adult weight (0.4 ounce to 0.6 ounce) of kangaroo mice, footprints are often only discernable on loose or wet soils, along sand dunes, or in powdery playa salt deposits (Amos 2017; Peterson 2000). While similar in structure to kangaroo rat tracks, kangaroo mouse tracks are noticeably smaller and shallower. Discerning the burrows of kangaroo mice is difficult as they are similar in appearance to other small mammals and some reptiles; however, burrows within sandy soils with scat and/or confirmed kangaroo tracks leading to the burrow entrance assist in properly identifying kangaroo mouse burrows (iNaturalist n.d.).

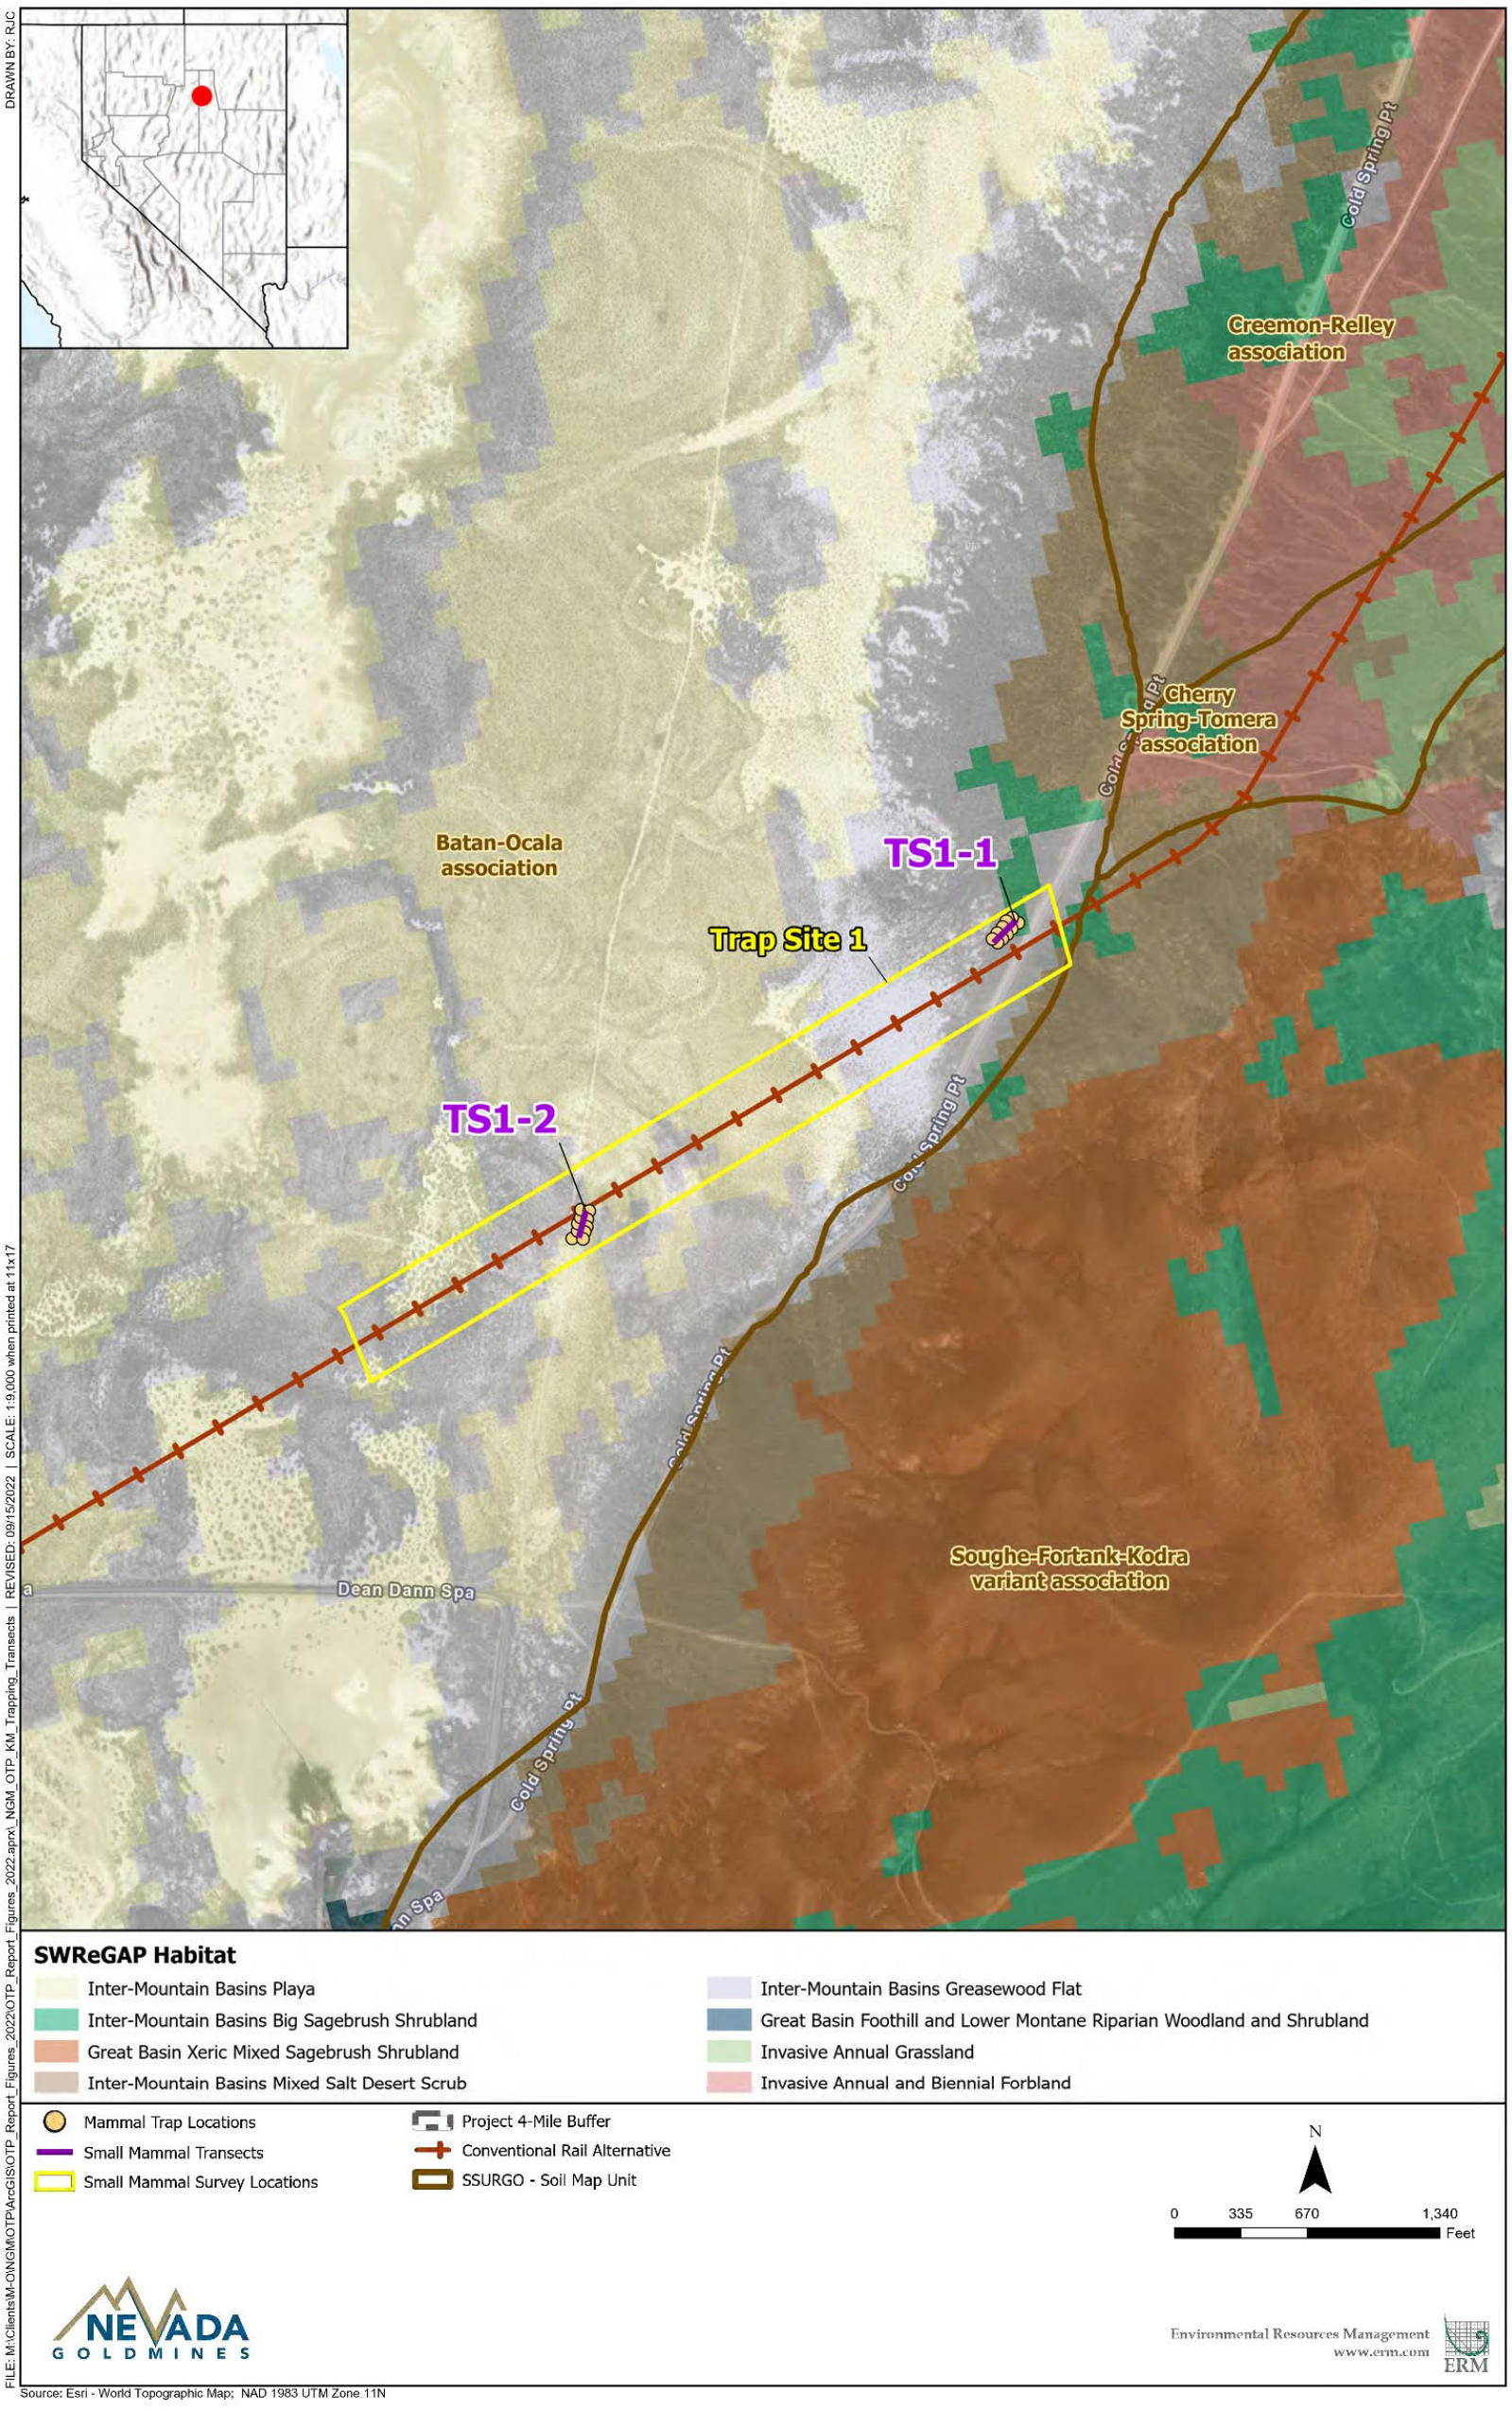

Figure 3.2-1: Kangaroo Mouse Trapping Areas and Transects—Trap Site 1

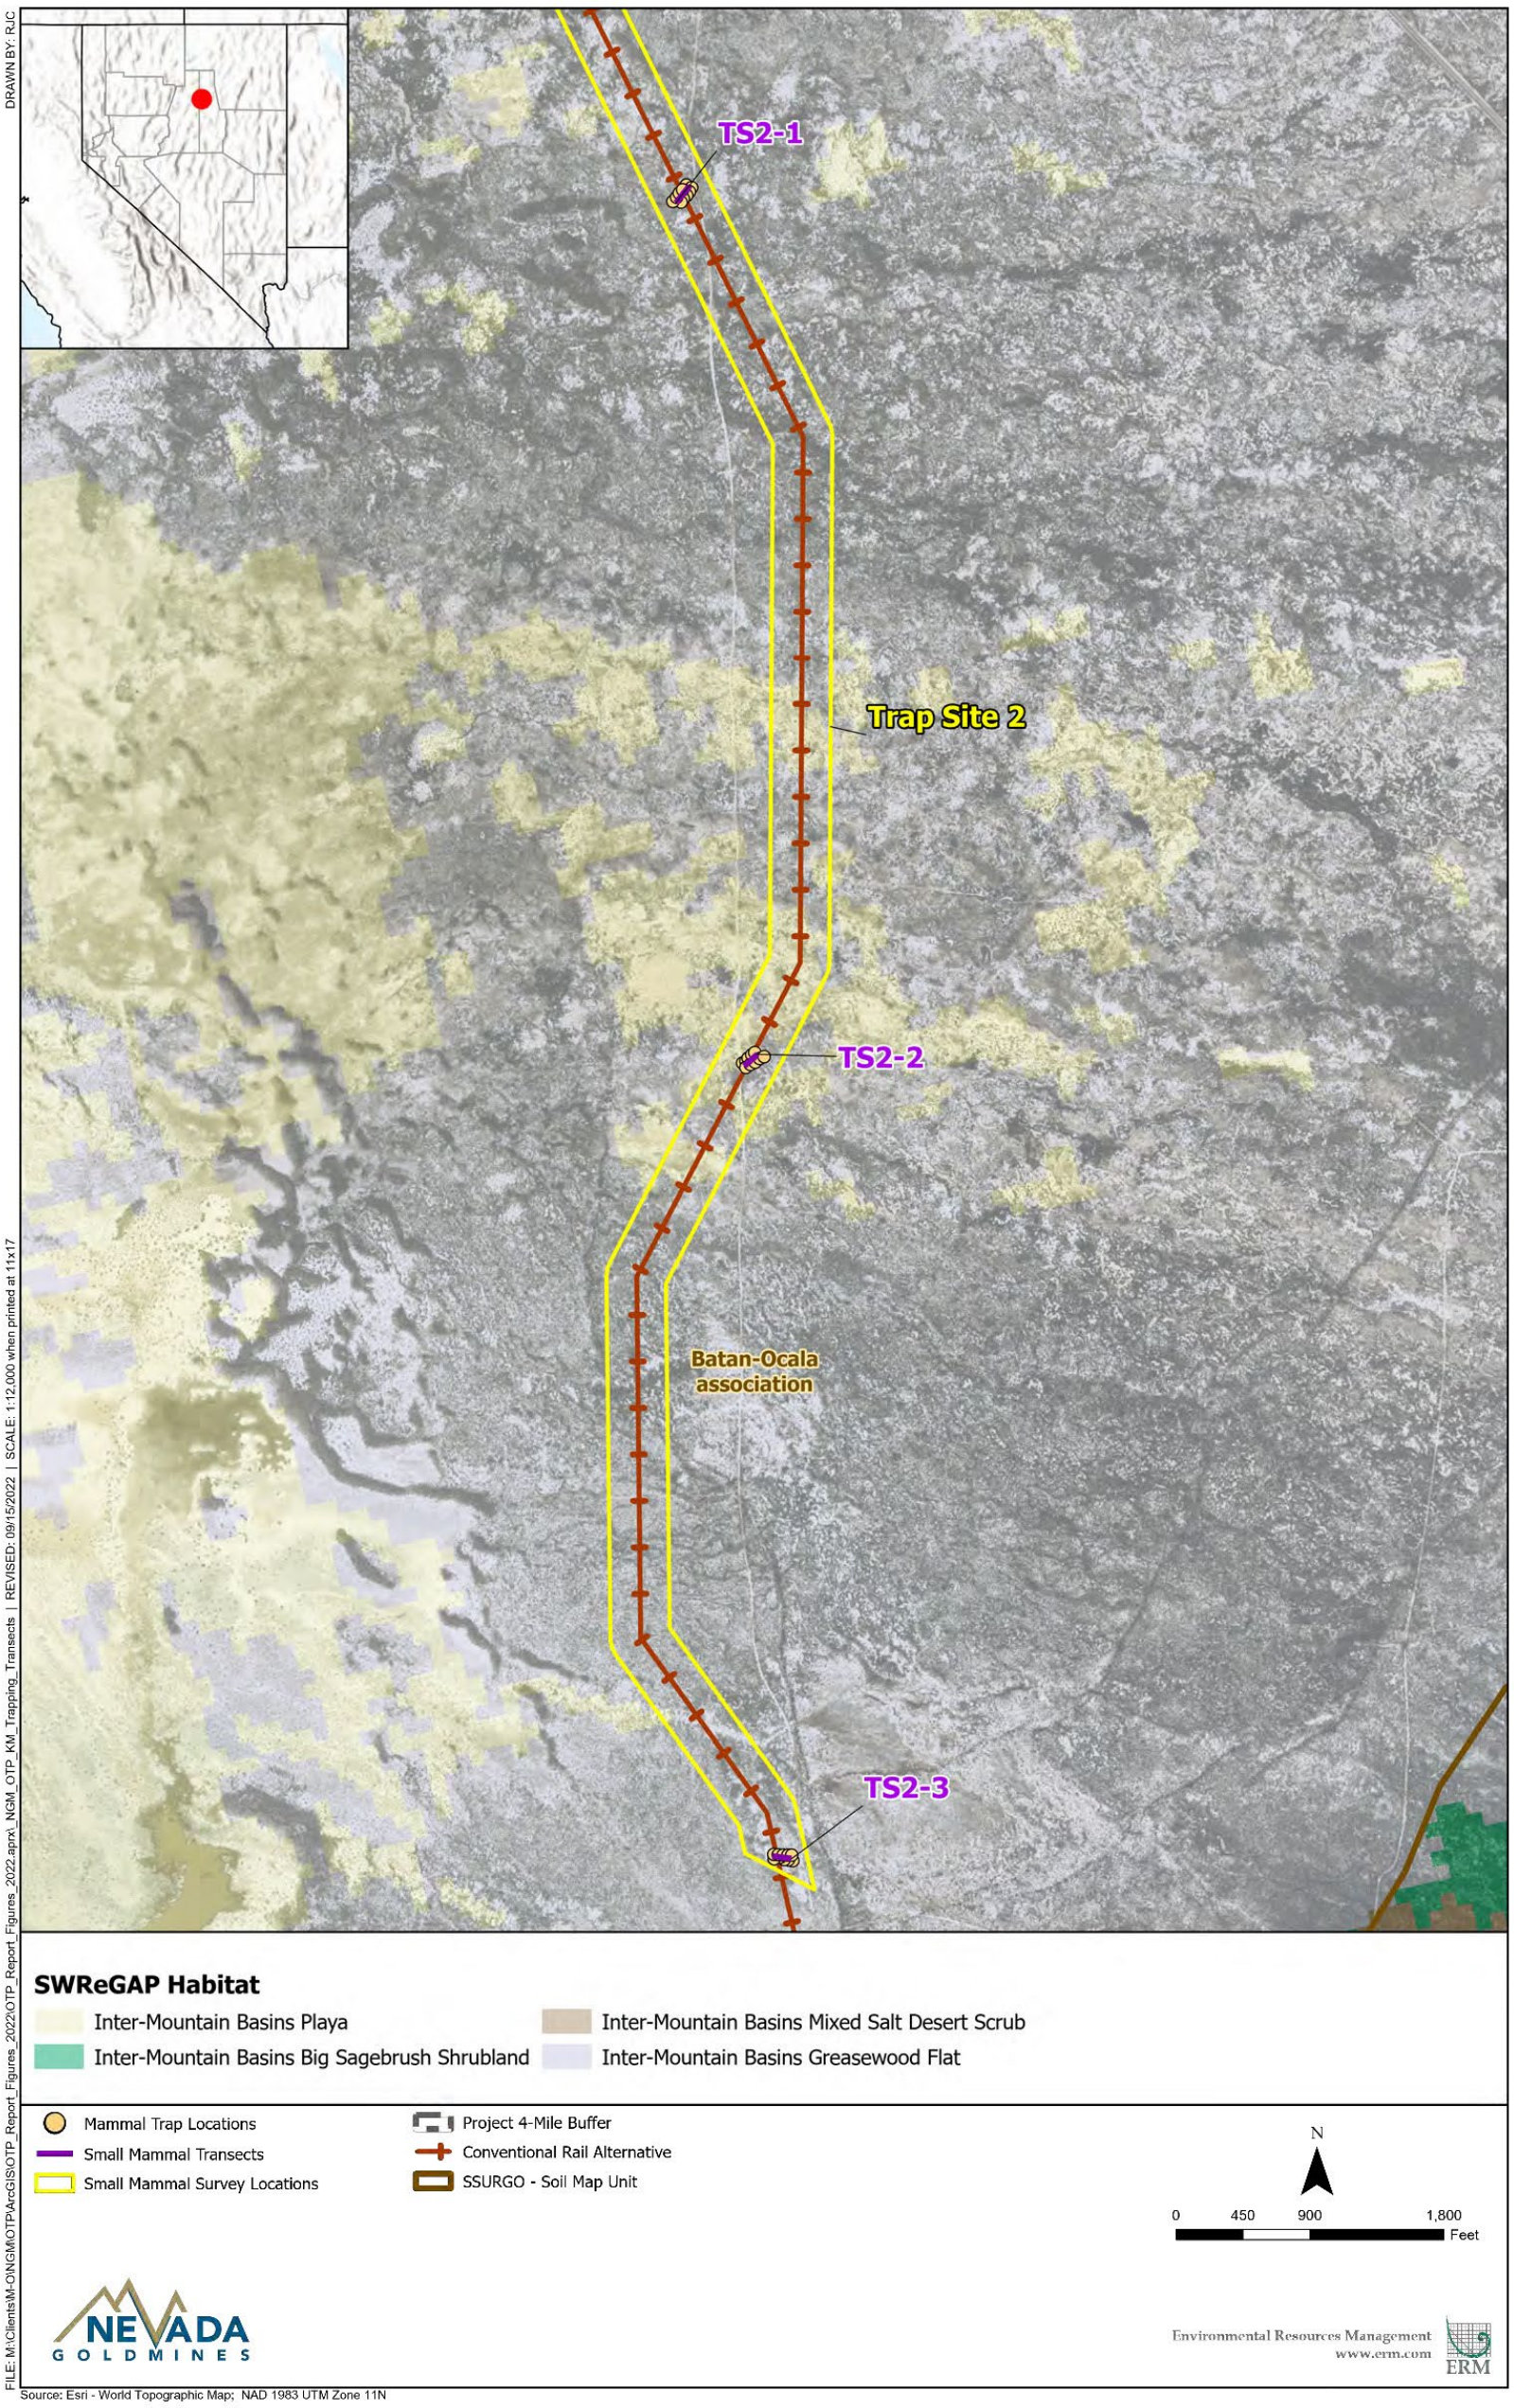

Figure 3.2-2: Kangaroo Mouse Trapping Areas and Transects—Trap Site 2

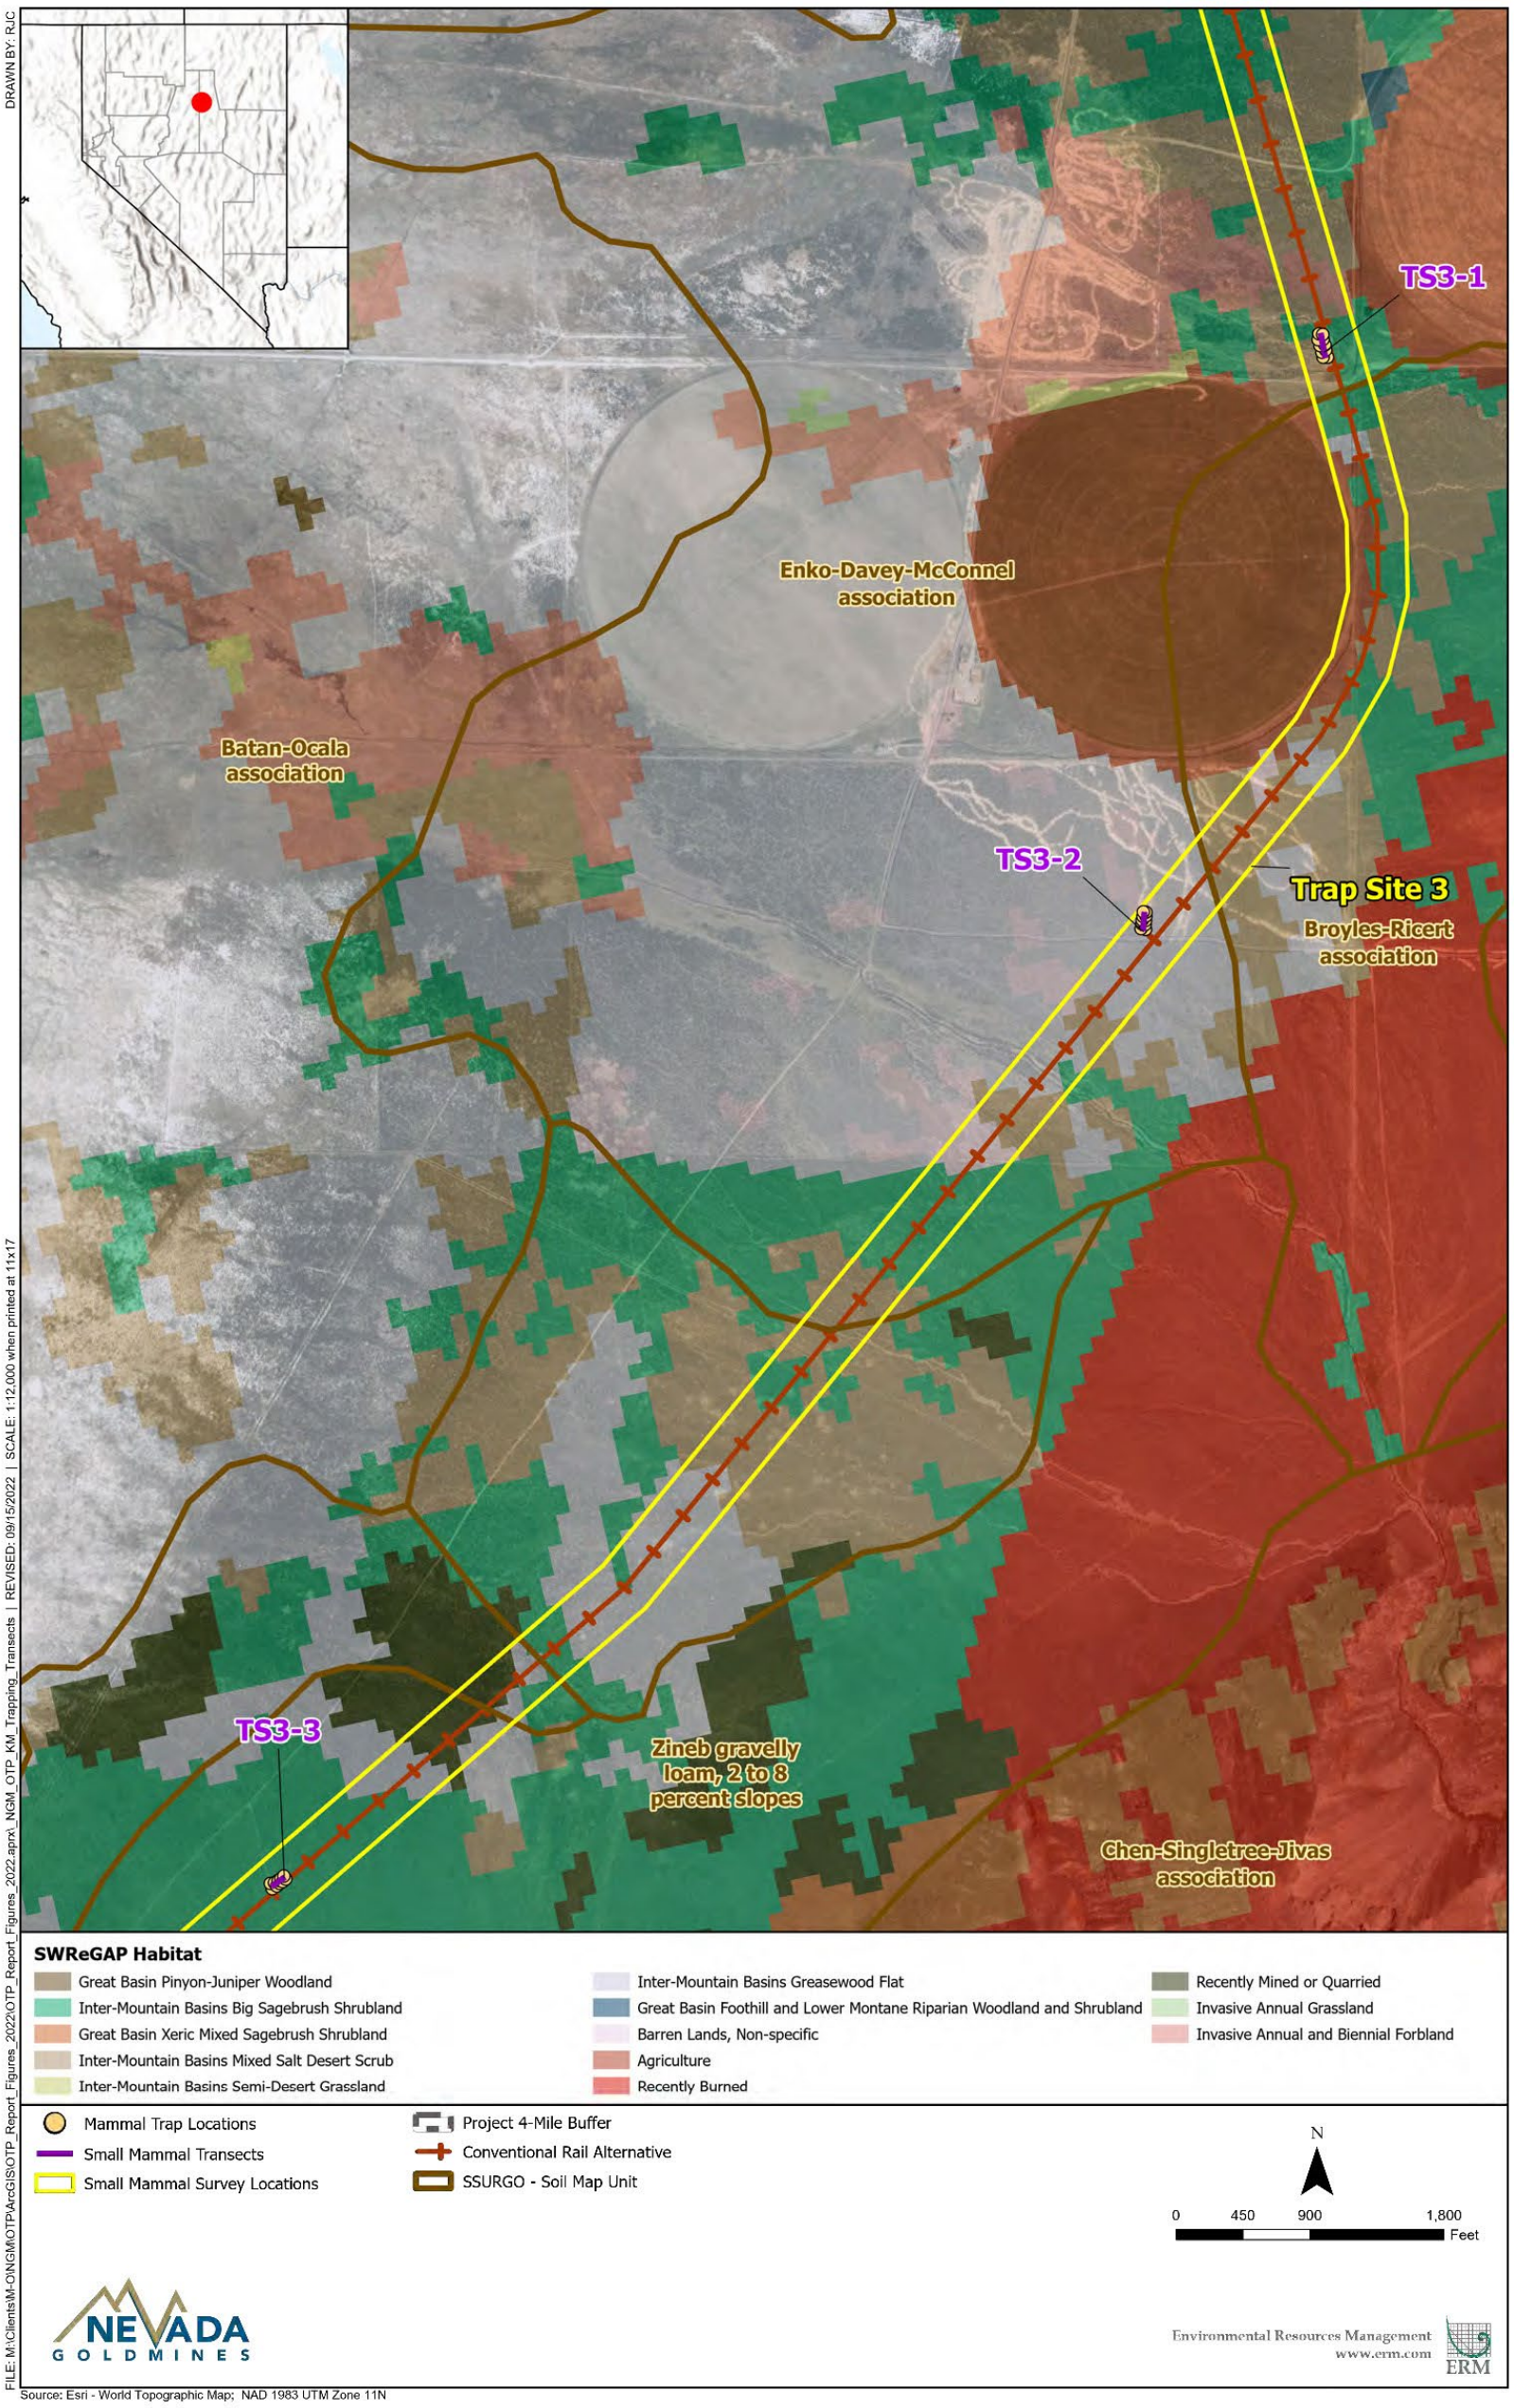

Figure 3.2-3: Kangaroo Mouse Trapping Areas and Transects—Trap Site 3 North

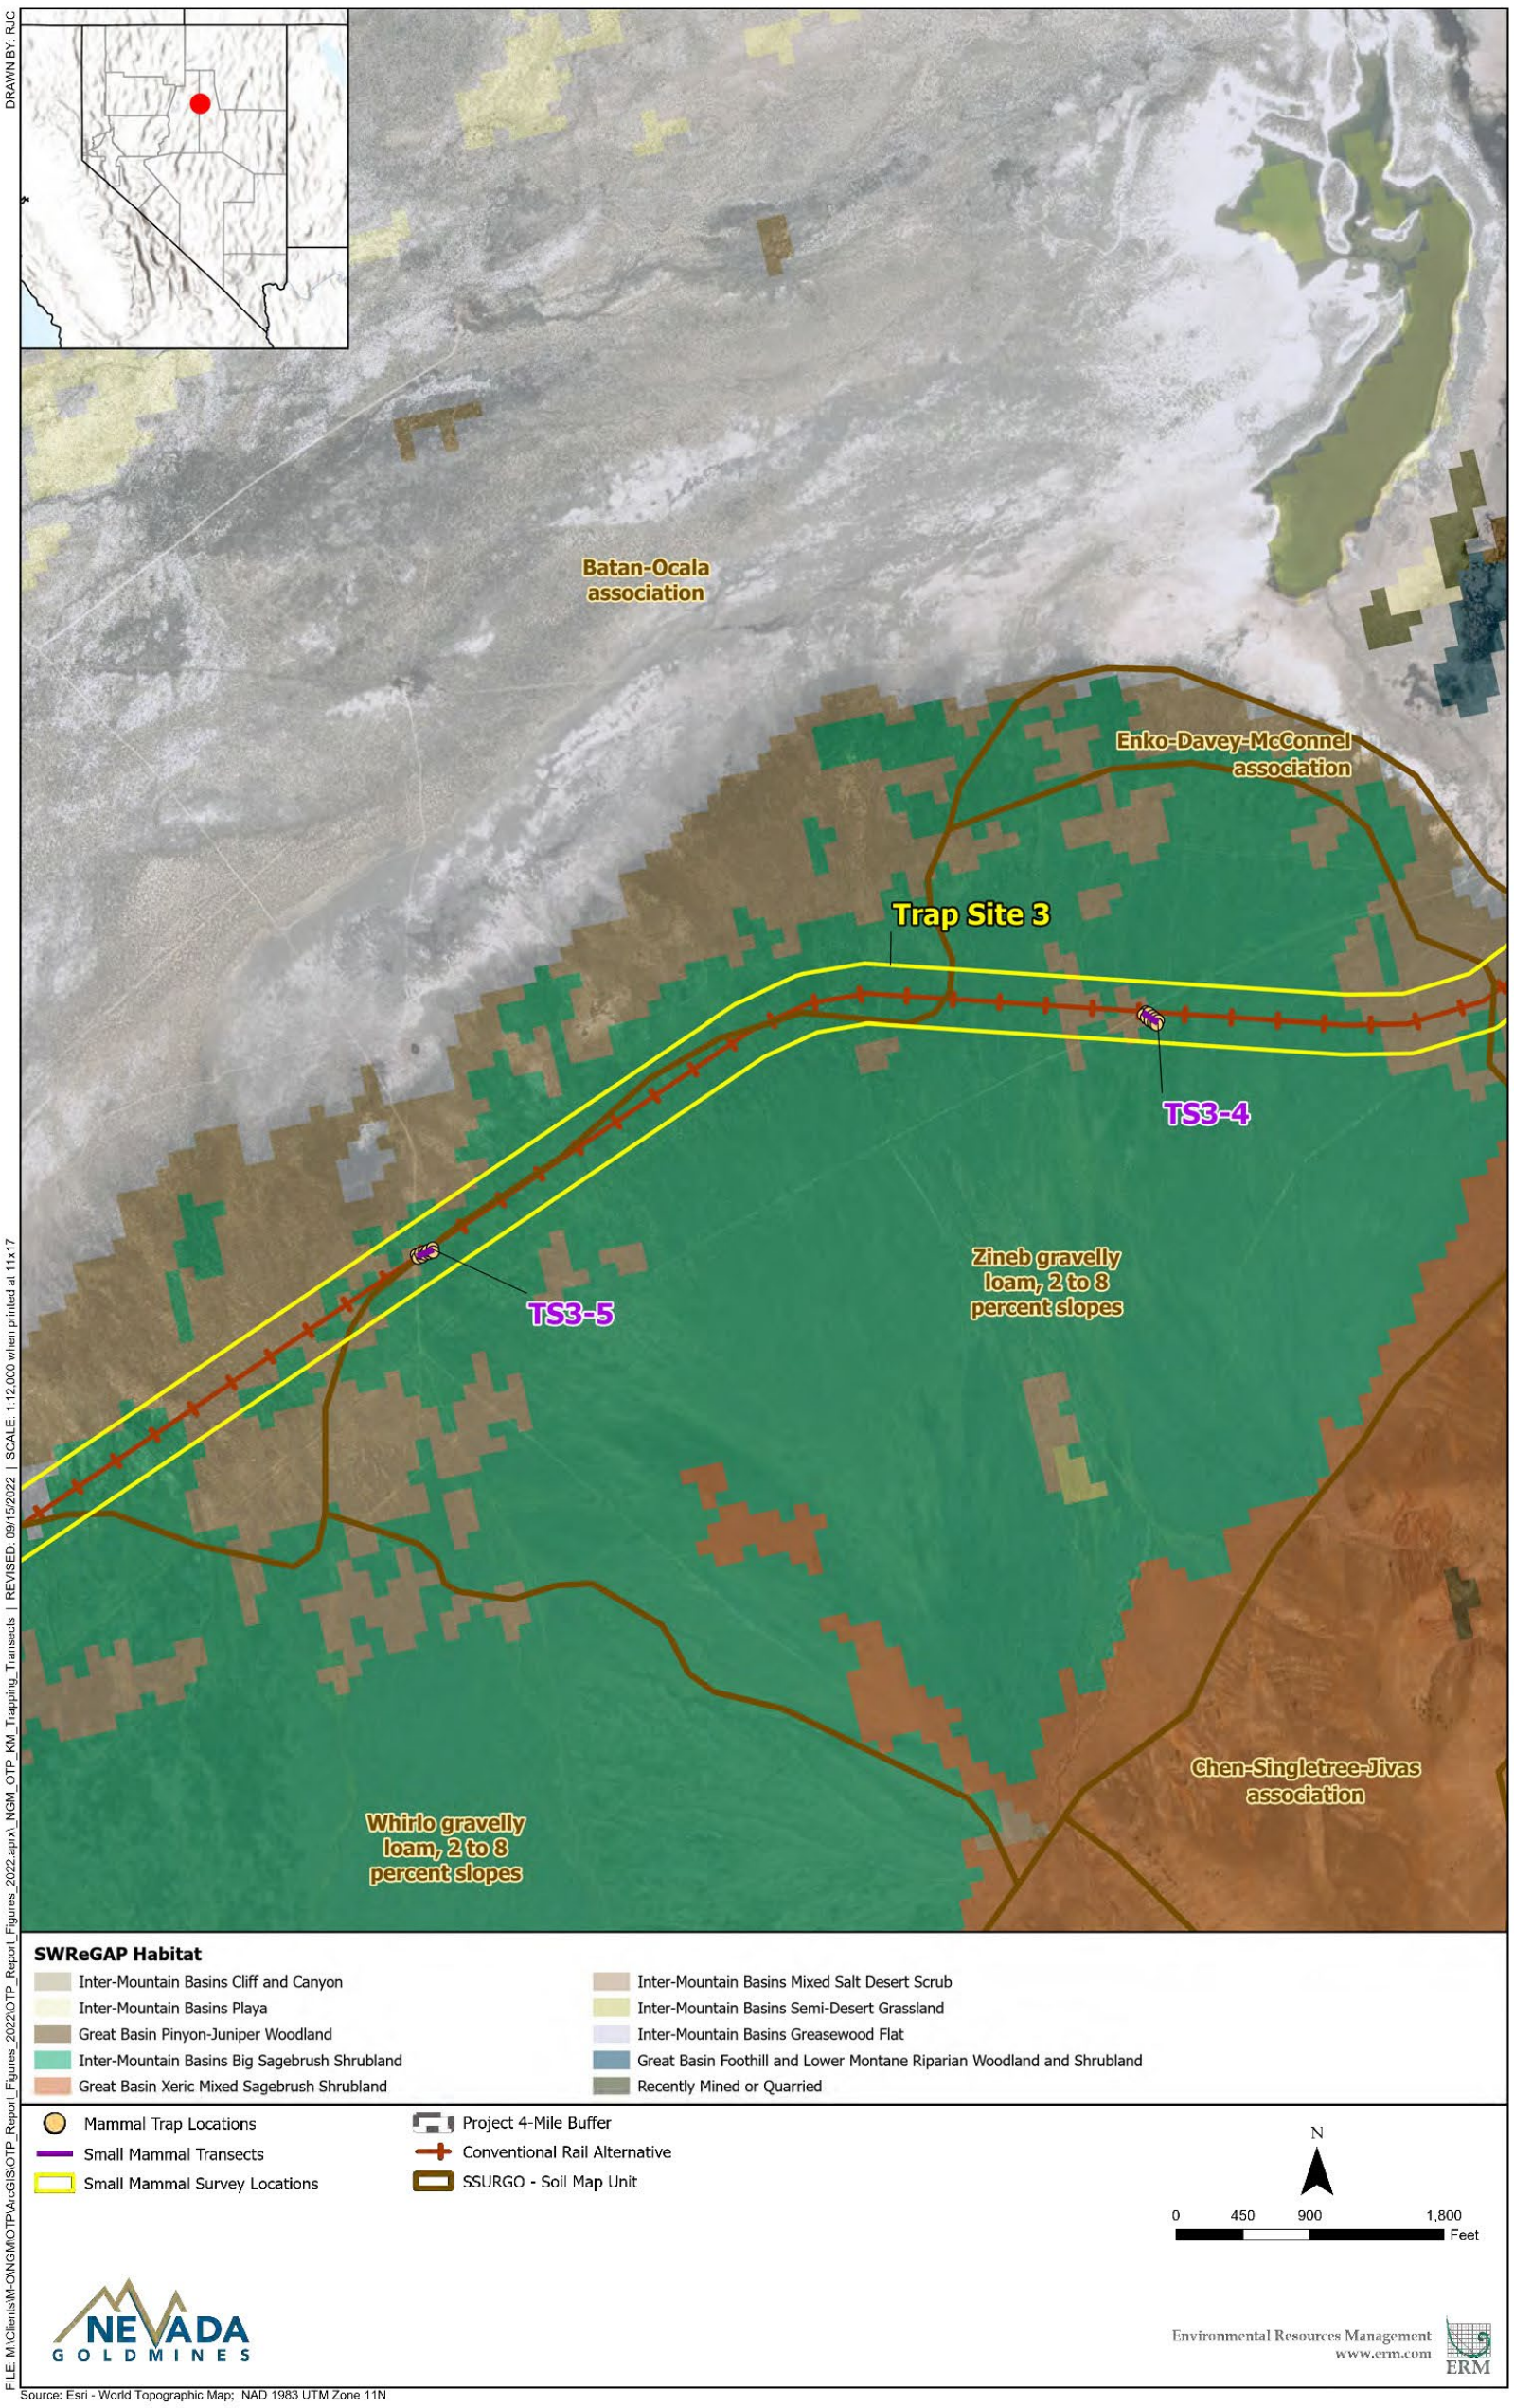

Figure 3.2-4: Kangaroo Mouse Trapping Areas and Transects—Trap Site 3 South

Biologists recorded the Universal Transverse Mercator coordinates of each trap and georeferenced these locations using the ArcGIS Field Maps application. Information gathered from each trap location included: trap identification number, date, start/end time, surveyor names, SWReGAP landcover type, temperature, wind speed, cloud cover, precipitation, habitat description, species identification, sex, condition, and condition of specimen upon release (live-release or mortality). Photographs were taken and georeferenced during each trapping event. All data collected by field biologists were recorded using ArcGIS Survey123 electronic data forms.

3.1.3 Results and Discussion

Trapping for kangaroo mice occurred over two separate 4-day events: the first trapping event was conducted May 4 to 7, 2022, and the second trapping event was conducted June 11 to 14, 2022. No kangaroo mice were captured during either trapping event, and no sign of kangaroo mice was observed. Figure 3.2-1 through Figure 3.2-4 depict the trapping locations and transects within the three trap sites.

During the first trapping event, two small mammal species were captured and identified: deer mouse (*Peromyscus maniculatus*) and Great Basin pocket mouse (*Perognathus parvus*). During the second trapping event, four small mammal species were captured and identified: deer mouse, Great Basin pocket mouse, Merriam's kangaroo rat (*Dipodomys merriami*), and least chipmunk (*Neotamias minimus*). Deer mice were the most abundant small mammal captured, comprising 70.3 percent of the total captures, followed by Great Basin pocket mice (24.6 percent), Merriam's kangaroo rat (3.4 percent), and least chipmunk (1.7 percent). Table 3.2-3 summarizes the total number of each species captured at each trap site during the baseline trapping events. Detailed Survey123 field data and photographs are in Appendix B, Dark and Pale Kangaroo Mice Data.

Table 3.2-3: Small Mammal Captures Summary

Trap Site	Species Collected	Total Number Captured
Trap Site 1	Deer mouse (*Peromyscus maniculatus*)	5
	Great Basin pocket mouse (*Perognathus parvus*)	5
	Merriam's kangaroo rat (*Dipodomys merriami*)	3
Trap Site 2	Deer mouse (*Peromyscus maniculatus*)	54
	Great Basin pocket mouse (*Perognathus parvus*)	6
	Least chipmunk (*Neotamias minimus*)	2
Trap Site 3	Deer mouse (*Peromyscus maniculatus*)	24
	Great Basin pocket mouse (*Perognathus parvus*)	18
	Merriam's kangaroo rat (*Dipodomys merriami*)	1

At transect 1-1, the shrub community is comprised of black greasewood and shadscale saltbrush with sparse stands of big sagebrush, while the herbaceous community was dominated by saltgrass (*Distichlis spicata*), whitetop (*Lepidium draba*), and clasping pepperweed (*Lepodium perfoliatum*). The transect is within the Batan-Ocala association NRCS soil unit, which is described as moderately well-drained saline silt loam over fine sandy loam to silty clays (NRCS 2019). Biological crusts ("bio-crusts") and pioneering lichen communities were observed at soils near the base of shrubs along transect 1-1, indicating ground disturbance in this area (such as burrow construction by mice) has not occurred in recent years. Overall, friable (spongy) soils within the greasewood flat component of the transitional habitat provided suitable soil conditions for kangaroo mice in discreet locations; however, compacted soils within open playa depressions and along wildlife trails observed in this area were the dominant condition observed and limit suitability for kangaroo mice in most of the area surrounding transect 1-1 (see Photos 7, 9, and 10 in Section B.2 of Appendix B, Dark and Pale Kangaroo Mice Data).

Transect 1-2 shrub community consisted of black greasewood with some shadscale, while the herbaceous layer was sparsely vegetated with saltgrass and halogeton (*Halogeton glomeratus*). The transect is within the Batan-Ocala association NRCS soil unit, which is described as moderately well-drained saline silt loam over fine sandy loam to silty clays (NRCS 2019). Observed soils along transect 1-2 was bare, with a thin, hard salt crust in several locations, reducing suitability for burrowing (see Photos 13 and 20 in Section B.2 of Appendix B). In some locations along transect 1-2, there was suitable loose, gravelly, sandy soils surrounding shrubs and some areas with powdery, windblown salt, though these conditions were uncommon at transect 1-2 (see Photo 18 in Section B.2 of Appendix B). Though soil conditions meet the burrowing needs for kangaroo mouse in some locations, the absence of native grasses in the immediate landscape and the hard salt crusts observed reduces the suitability of habitat throughout transect 1-2.

The shrub community at transects 2-1, 2-2, and 2-3 was dominated by black greasewood with sparse amounts of fourwing saltbrush (*Atriplex* canescens), spiny hop sage (*Grayia spinosa*), and shadscale. The herbaceous community was dominated by saltgrass and pickleweed (*Salicornia* spp.) with some Great Basin wild rye (*Leymus cinereus*) (see Photos 23, 34, and 45 in Section B.2 of Appendix B). Dry playa depressions were observed around each transect, and bare soils and evaporate salt crusts occupied areas between shrub stands (see Photos 28, 40, and 51 in Section B.2 of Appendix B). All three transects are within the Batan-Ocala association NRCS soil unit, which consists of moderately well-drained saline silt loam over fine sandy loam to silty clays (NRCS 2019). Observed soils within the transects was a mix of sand and light gravel with some areas developing bio-crusts, particularly near dense shrub stands. Sparse amounts of shallow sand and windblown salt banks were concentrated in areas immediately around shrub bases (see Photos 29, 39, and 52 in Section B.2 of Appendix B), but continuous windblown sand banks were not observed within or adjacent to the three transects. In general, the presence of native herbaceous grasses provides ideal foraging for kangaroo mice, but the lack of continuous loose, sandy soils limits this area for use by kangaroo mouse burrowing.

At transect 3-1, the shrub community included big sagebrush with a sparse amount of black greasewood, and a heavily disturbed herbaceous community dominated by cheatgrass (*Bromus*

tectorum) and sparse amounts of clasping pepperweed and halogeton (see Photos 57 and 61 in Section B.2 of Appendix B). Cattle disturbance was observed immediately south of the transect. The transect is within the Enko-Davey-McConnel association, which consists of well-drained saline loams to sandy loams with extremely gravelly coarse sandy stratifications (NRCS 2019). Observed soils were composed of loamy sand with pockets of loose sand, providing suitable conditions for kangaroo mouse. However, the abundance of weedy herbaceous species and significant livestock disturbance in the area reduces habitat suitability for kangaroo mice in area of transect 3-1 (Wildlife Action Plan Team 2013; GBE 2016).

The shrub community at transect 3-2 was composed solely of sparse black greasewood, and the herbaceous community was dominated by bluegrass (*Poa pratensis*), blue mustard (*Chorispora tenella*), and cheatgrass (see Photo 67 in Section B.2 of Appendix B). Supplemental hay bales and cattle activity were observed south of the transect. The transect is within the Enko-Davey-McConnel association, which consists of well-drained saline loams to sandy loams with extremely gravelly coarse sandy stratifications (NRCS 2019). Observed soils were sandy loam, which provide adequate burrowing opportunities for small mammals and meet the habitat requirements of kangaroo mice; however, the coverage of weedy herbaceous species and lack of bare sandy soils reduce kangaroo mouse habitat suitability.

Big sagebrush comprised nearly all the shrub community at transects 3-3 and 3-4, while the herbaceous community was dominated by cheatgrass and clasping pepperweed, with sparse amounts of halogeton and Indian ricegrass (see Photos 78 and 89 in Section B.2 of Appendix B). These transects are within the Zineb gravelly loam 2 to 8 percent slopes soil unit, which consists of well-drained non-saline to slightly saline gravelly loams to extremely cobbly sandy loams (NRCS 2019). Observed soils consisted of loose, loamy sand with a significant gravel component, providing suitable soil conditions for dark kangaroo mouse, but windblown sand banks were not observed.

At transect 3-5, the shrub community was dominated by black greasewood and shadscale with lesser amounts of big sagebrush, yellow rabbitbrush (*Chrysothamnus viscidiflorus*), and rubber rabbitbrush (*Ericameria nauseosa*) (see Photos 101 and 105 in Section B.2 of Appendix B). The herbaceous community was disturbed and dominated by cheatgrass and clasping pepperweed and sparse amounts of Great Basin wild rye, Indian ricegrass, and bottlebrush squirreltail (*Elymus elymoides*). This transect crosses two NRCS soil units. The Zineb gravelly loam 2 to 8 percent slopes soil unit consists of well-drained non-saline to slightly saline gravelly loams to extremely cobbly sandy loams. The Batan-Ocala association soil unit consists of moderately well-drained saline silt loam over fine sandy loam to silty clays (NRCS 2019). Soils were sandy with substantial amounts of gravel. Sand banks and bare soils were absent within the transect (see Photo 107 in Section B.2 of Appendix B). The inclusions of native grasses provide an important food source for small mammals, and the sandy, gravelly soils provide adequate soil characteristics for kangaroo mouse habitat; however, the coverage of weedy herbaceous species reduces overall habitat suitability for kangaroo mice.

The results of both the Year 1 habitat assessment and the Year 2 trapping events indicate that kangaroo mouse habitat suitability is low across the Project Area. In total, 800 traps were

deployed over two trapping events, covering 97.1 percent of all SWReGAP landcover types within areas identified as having the most suitable vegetation and soil supportive of kangaroo mice. The remaining 2.9 percent of landcover types not incorporated within transects was either not observed within the vicinity of trap sites, such as Recently Mined or Quarried and Invasive Annual and Biennial Forbland landcover types, or was actively irrigated agricultural land not suitable for trapping surveys. Weather conditions and the timing of trapping events were within the acceptable range suggested by field protocols (BLM et al. 2019; BLM 2014). Although habitat conditions suitable to kangaroo mouse were observed in small, fragmented patches along many of the trapping transects, including areas with sandy, gravelly soils and preferred shrub communities, the encroachment of weedy plant species such as cheatgrass and clasping pepperweed have reduced the development of sand banks and open sand habitat most supportive to kangaroo mouse habitation. These developments have led to the absence of large areas with suitable characteristics; instead, there are areas supporting only a mosaic of small patches with marginal suitable habitat. Additionally, substantial livestock disturbance, particularly at Trap Site 3, has reduced the quality of both soil conditions and vegetative characteristics required by kangaroo mice.

3.3. SHREWS

3.3.1. Background

Four species of shrew including the American water shrew (*Sorex palustris*), Inyo shrew (*Sorex tenellus*), Merriams' shrew (*Sorex merriami*), and Preble's shrew (*Sorex preblei*) potentially occur in the Project Area and are BLM special status species (Table 3.3-1). *Sorex* species are associated with inter-mountain scrub habitat and are found in areas with shadscale *(Atriplex confertifolia),* sagebrush *(Artemisia tridentata)*, and alkali-sink plant communities with riparian features (BLM 2018, 2019a; Wildlife Action Plan Team 2013). Shrew habitat generally includes riparian zones adjacent to flowing streams, wet meadows, areas surrounding springs, and seasonally inundated playas and surrounding vegetation (EBP et al. 2020). Riparian zones or riparian corridors are transitional areas where the terrestrial ecosystem is substantially affected by the presence of water (or the aquatic ecosystem is substantially affected by the lack of water), often resulting in a unique plant community composition along the terrestrial-aquatic ecosystem boundary (USFS 2004).

Shrews are generally solitary invertivores (diet of invertebrates) that can also forage on small fish or amphibians. Shrews maintain an extremely high metabolism relative to other mammals and require nearly constant foraging (NatureServe 2022). While many small mammals hibernate during winter months, shrews instead reduce their energy needs when food sources are scarce (Pucek 1965). Shrew species remain active through winter months and create networks of tunnels under snow banks. Shrews are thought to vigorously defend their burrows from other shrews and animals (Carmen 2001).

Table 3.3-1: Agency Status and General Habitat for Special Status Shrews

Species	Agency Status	Nevada Wildlife Action Plan Habitat Description
American water shrew (*Sorex palustris*)	BLM Nevada Sensitive	Most abundant along small streams with thick riparian growth around lakes, ponds, marshes, bogs, and other lentic habitats.
Inyo shrew (*Sorex tenellus*)	BLM Nevada Sensitive	Habitats include riparian zones and canyon bottoms, rocky mountain habitat in areas with logs, boulders, or sagebrush scrub and red-fir communities. In Great Basin National Park, this shrew was found at 9,800 feet in habitat dominated by Engelmann spruce.
Merriam's shrew (*Sorex merriami*)	BLM Nevada Sensitive	Primarily found in various grassland habitats, including grasses in sagebrush scrub/pinyon-juniper habitat, as well as in mountain-mahogany and mixed woodlands.
Preble's shrew (*Sorex preblei*)	BLM Nevada Sensitive	Habitats include arid and semiarid shrub-grass associations, openings in montane coniferous forests dominated by sagebrush, willow-fringed creeks, marshes, bunchgrass, sagebrush-aspen and sagebrush-grass associations, and alkaline shrublands.

Source: BLM 2018; Wildlife Action Plan Team 2013

BLM = Bureau of Land Management

The American water shrew is approximately 6 inches long from head to tail and weighs less than an ounce. The tip of the tail is tufted, and its pelage is typically all black, while the ventral (belly) side is black, silvery white, or light brown. The feet are large and webbed on the hind limbs (Reid 2006). The American water shrew is a widely distributed species across North America with populations spanning from the Appalacian Mountains to the Sierra Nevada and Cascade Ranges, northward to eastern Alaska, and as far south as Arizona's White Mountains. In Nevada, the American water shrew is restricted to riparian habitats associated with stagnant pools, wet meadows, wetlands, and streams that contain significant overhanging vegetation demonstrating diversity of suitable habitat (EBP et al. 2020). The primary diet of the water shrew is aquatic and terrestrial invertebrates, tadpoles, and small fish (Johnson 1999). Instream features such as overhanging vegetation, fallen logs or snags, and rocky bottom substrate provide habitat for invertebrates and thereby increase foraging access and habitat suitability for water shrews (NatureServe 2022; Smith 2013).

Adult Inyo shrews can grow to 4.1 inches long and weigh approximately 0.1 ounce (Reid 2006). The dorsal (top) side of Inyo shrews range in color from light gray to brown, and the ventral side ranges from silver to gray. The light brown tail has a small black tuft at the end (Reid 2006). The distribution of the Inyo shrew in North America is poorly documented but known to occur throughout the California-Nevada border from the Sierra Nevada mountain range to the Spring Mountain range, with disjunct populations also in Nevada's Great Basin National Park and the west-central ranges in Utah (NatureServe 2022). The Inyo shrews have been known to specialize on mollusks in addition to typical invertivorous items (NatureServe 2022). Although detailed habitat preferences of the Inyo shrew are not well documented, they have been described in the Great Basin National Park in rocky-riparian habitat of spruce-fir forests and in aspen woodlands (Rickart and Robson 2005). In general, suitable habitat for Inyo shrew in Nevada likely includes riparian zones in montane woodlands, pinyon-juniper woodlands, sagebrush scrub, and alkali desert scrub (Johnson 2008).

The Merriam's shrew can achieve lengths of 4 inches and weigh approximately 0.75 ounce. The Merriam's shrew has a white belly and a light gray-brown back. Relative to other shrew species occurring in the region like the vagrant shrew (*Sorex vagrens*), the Merriam's shrew's fur is short and its ears are prominent. The tail is slightly bicolor with light brown on the dorsal side and a short tuft of hair at the tip (Reid 2006). The Merriam's shrew occurs widely across the western United States, including the Great Basin, Columbia Plateau, northern Great Plains, and southern Rocky Mountains (NatureServe 2022). The Merriam's shrew has been documented in a diverse range of grassland habitats, including grasslands associated with sagebrush scrub, pinyon-juniper woodlands, and mountain mohagany (*Cercocarpus* spp.) shrublands. The Merriam's shrew has the strongest bite force of all shrew species and specializes on larger, hard-bodied insects in addition to other invertabrates (NatureServe 2022). Merriam's shrews can use vole runways and have been known to occupy vole burrows where their ranges overlaps.

The Preble's shrew reaches a maximum length of 3.2 inches and can weigh up to approximately 0.1 ounce (Reid 2006). The Preble's shrew is brown dorsally and laterally (sides), except in winter when their pelage turns grey. Portions of its feet are pale, and the tail is brown with no discernable tuft (Reid 2006). It occurs from the Columbia Plateau to the northern Great Plains and southward to northern New Mexico. The Preble's shrew has been documented at elevations ranging between 4,200 and 8,350 feet in arid environments including shrub-grassland associations, willow-fringed creeks, marshes, xeric and mesic sagebrush-grass communities, and alkaline shrubland, and is considered rare throughout its range (NatureServe 2022).

Livestock activity and land development threaten shrew populations by causing habitat loss, habitat fragmentation, and the displacement of preferred shrew habitats, such as sagebrush-grassland communities—particularly important to the Preble's and Merriam's shrews. The introduction and expansion of weedy species, such as cheatgrass (*Bromus tectorum*), prevailing drought conditions, and increased prevalence of wildfires have led to further loss of native sagebrush-grassland habitat (WDFW 2022). Shrew populations are known to be negatively affected by intensive livestock browsing and trampling of riparian zones; however, significant data gaps for Preble's and Merriam's shrew species still exist (Schmidt et al. 2009; Natureserve 2022). The American water shrew is primarily vulnerable to loss or degradation of riparian and aquatic habitats (Natureserve 2022). Anthropogenic activities, which negatively affect shrew populations, include construction of roads, mining, agriculture, and logging and act to fragment large swaths of high quality sagebrush-grassland habitats. Specific negative disturbances to Inyo shrews have not yet been determined, but it is believed their populations are affected in a similar way as other *Sorex* species listed above (NatureServe 2022).

The Year 2 baseline studies for shrews consisted of trapping surveys conducted in locations identified during the Year 1 baseline field assessment (ERM 2022a) as containing the highest potential habitat for the four shrew species detailed above. Figure 3.3-1 displays the locations identified during the Year 1 field assessment and evaluated in Year 2.

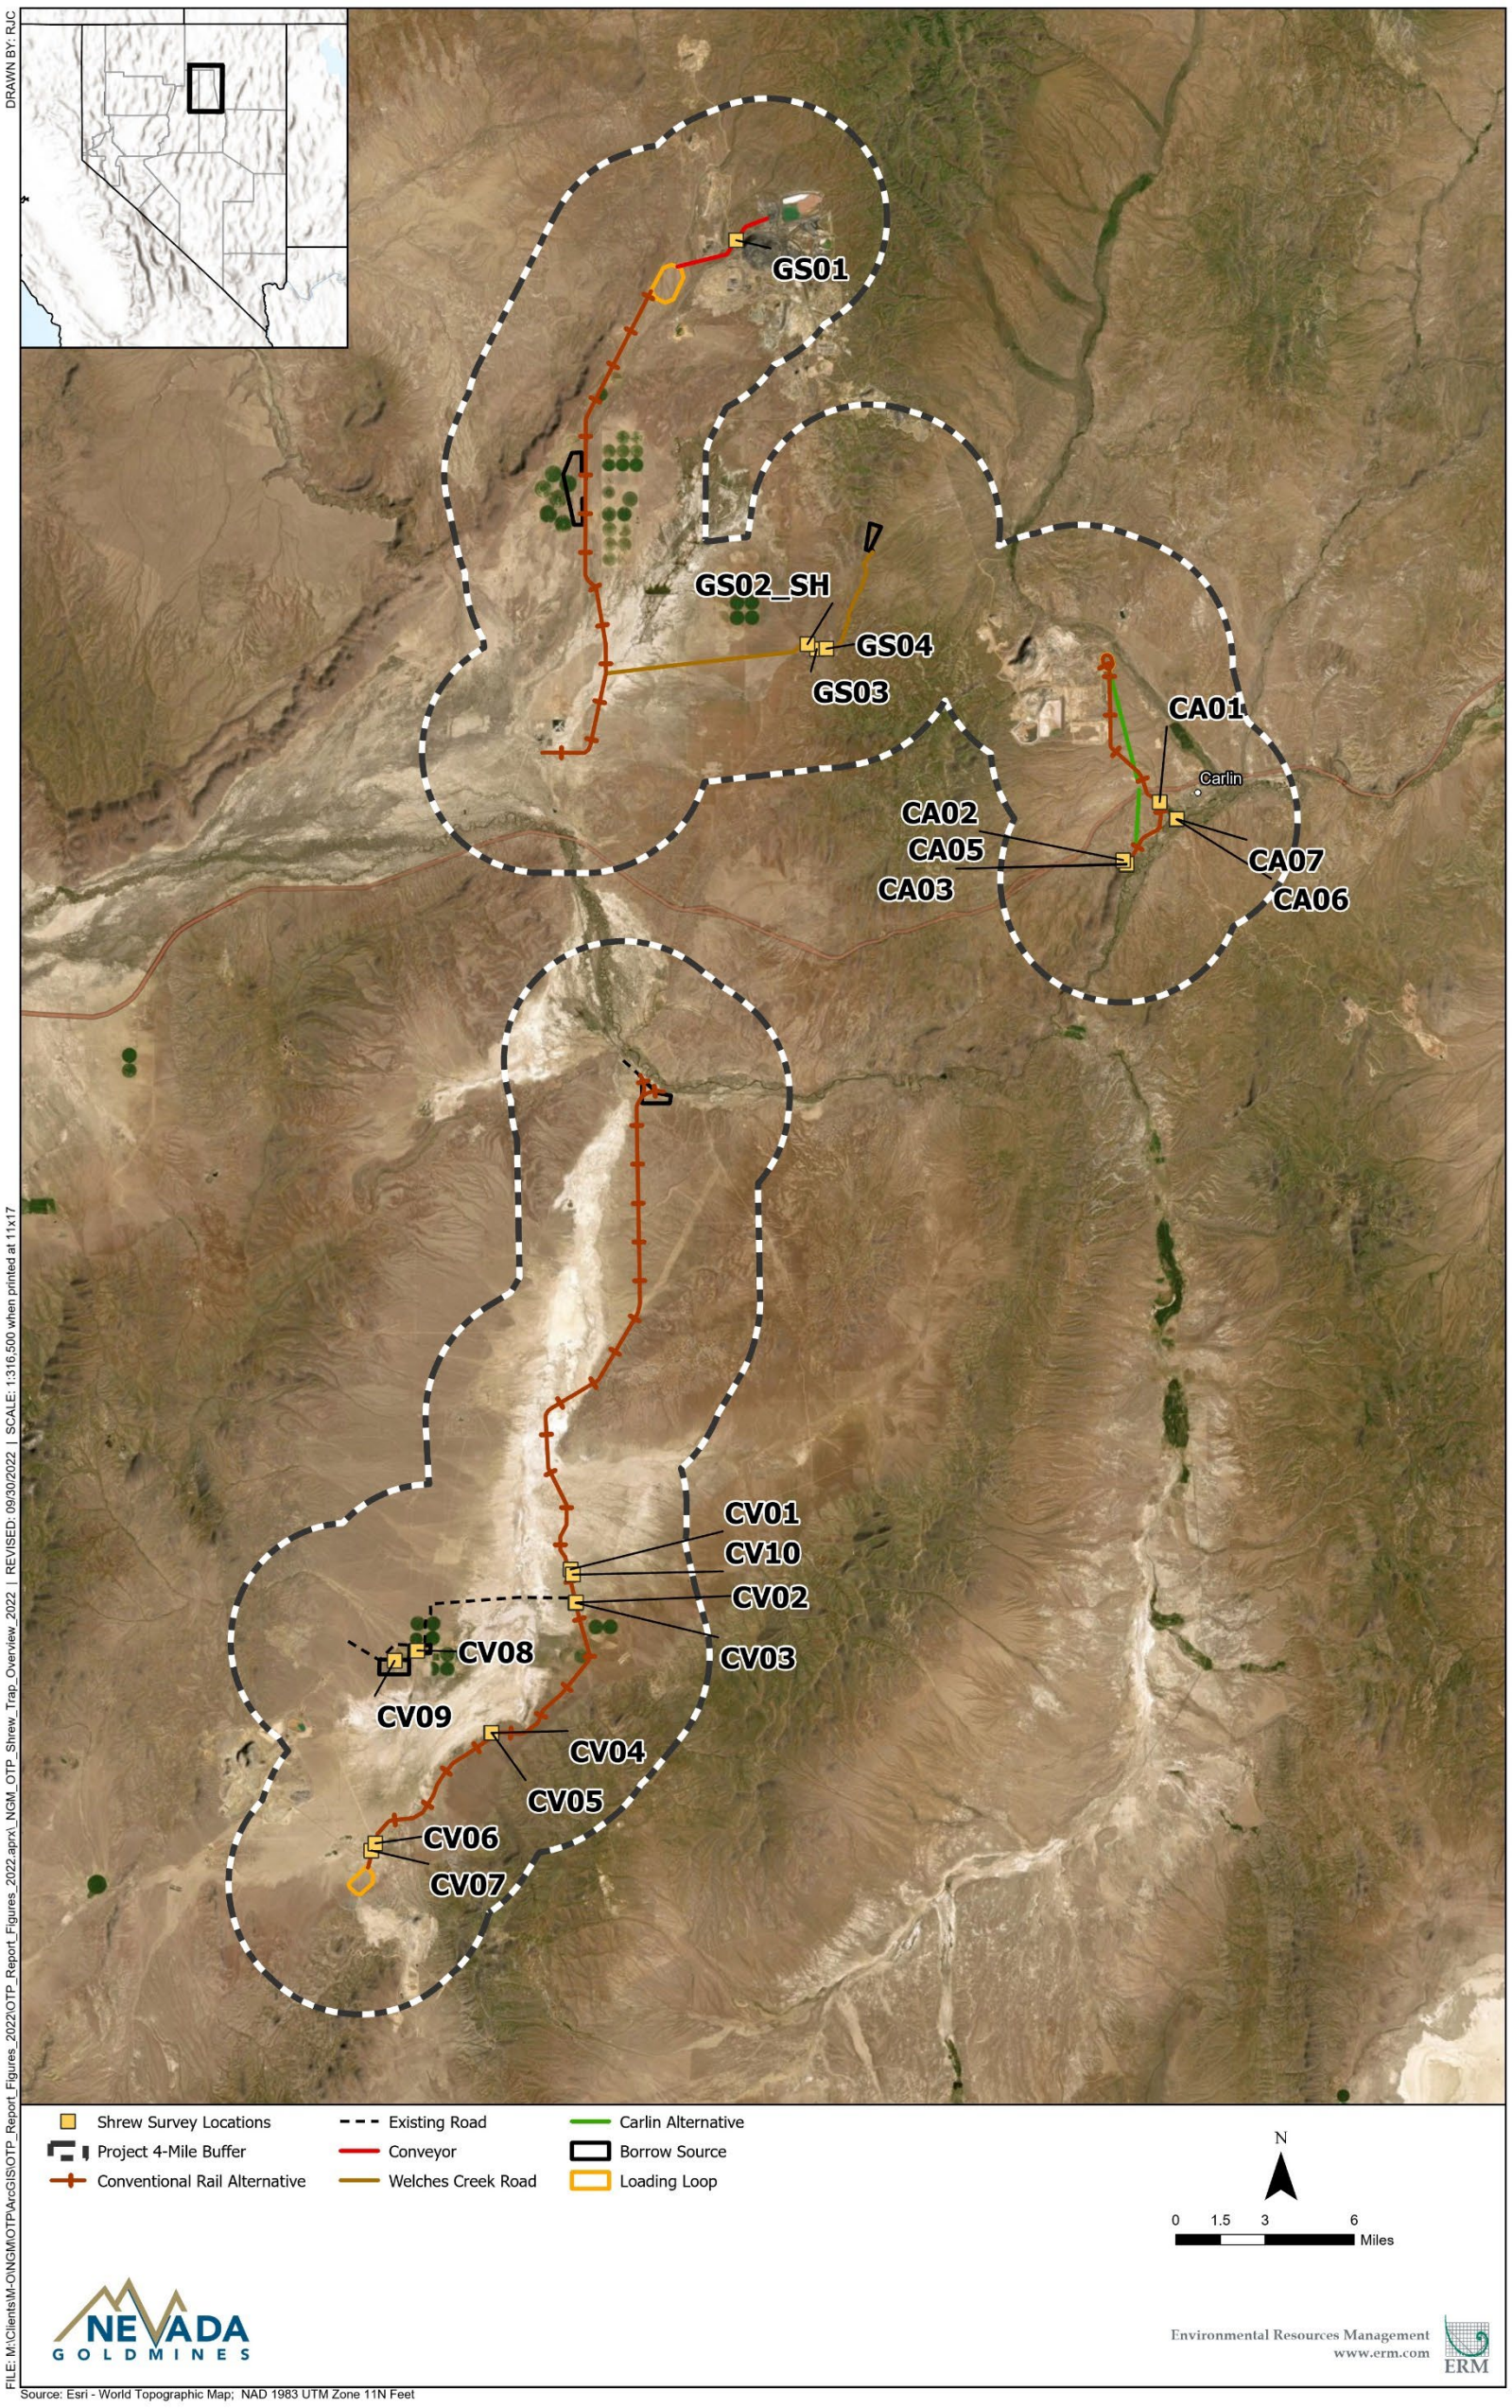

Figure 3.3-1: Shrew Trap Locations—Project Area

Page Intentionally Left Blank.

3.3.2. Study Methodology

Trapping surveys for shrews were conducted according to the *Sorex Capture and Handling Protocol for Northern Nevada* (EBP et al. 2022). Precise locations for trapping sites, number of traps, and the survey timing were determined during a discussion between ERM and the BLM Elko District Office. Table 3.3-2 displays the SWReGAP landcover type for each trapping location. In total, 20 trap locations were set, including 6 in Carlin, 10 in Crescent Valley, and 4 in the Goldstrike Survey Areas. Four-day trapping events at the 20 selected sites were split into two separate survey events with 10 trapping locations surveyed during each trapping event. The first trapping event was conducted May 25 to 28, 2022, in the Crescent Valley Survey Area, and the second trapping event was conducted June 4 to 7, 2022, in the Goldstrike and Carlin Survey Areas.

Table 3.3-2: Areas of Shrew Trapping and Associated Landcover—Year 2

Survey Area	Trapping Location	SWReGAP Landcover Type
Goldstrike Area	GS01	Inter-Mountain Basins Big Sagebrush Shrubland

SWReGAP = Southwest Regional Gap Analysis Project

Small, folding, aluminum Sherman live traps (dimenions 2 inches by 2.5 inches by 6.5 inches) were used to capture shrews during the trapping event. All traps were set approximately 1 hour before sunset and checked within 1 hour of sunrise the following morning. Prior to each survey night, traps were baited with a mixture of rolled oats, peanut butter, mealworms, and insulated with poly-fill material. Bait and insulation were replaced as needed prior to each survey night.

Traps were left in place over the entire 4-day trapping event but were closed during the day when not in use to reduce capture of non-target species.

In accordance with protocol (EBP et al. 2020), biologists conducted a single 4-day trapping event in each of the 20 trapping locations, resulting in a total of four trap checks during the trapping events. Trapping events for shrews were completed using either a parallel or linear transect array. In both arrays, traps were placed approximately 33 feet apart along respective transects. Parallel transects of five traps were placed in two habitats: directly adjacent to streams and within upland habitat adjacent to the riparian corridor. Linear transects were used at three trapping locations (CA02, CV02, and CV03), where the bed and banks of playa wetlands were less distinct, or where the stream and its associated riparian corridors were comparatively thin. Within these habitats, transects were placed in locations with the highest chances of shrew trapping success, such as areas with the lowest annual grass and forb coverage; where there is highest shrub or tree cover; and where rodent paths were observed. Biologists recorded the positions of each transect using the ArcGIS Field Maps application.

Field survey data, including the Trap Check and the Trapping Site Description datasheets, were collected electronically using ArcGIS Survey123. Trap Check datasheets were completed for each trap during each trap check and used for documenting the trap identification number, date, temperature, windspeed, cloud cover, precipitation, geo-location, surveyor names, start/end time, number of successful traps, number of false trips, and all non-target species captured. The Trapping Site Description form was completed once for each transect and was used for documenting transect name, geo-location, surveyor names, trap set date, trap removal date, habitat type, stream/waterbody type, and evidence of habitat disturbances within or adjacent to the trapping location. Detailed Survey123 field data are provided in Section C.1 of Appendix C, Shrews Data.

All captured animals were handled as described in the 2016 Guidelines of the American Society of Mammalogists (Sikes 2016). Any mortalities of captured small mammals were recorded and reported to NDOW. Non-target species captured were identified and released without further evaluation.

As part of the field survey, biologists searched for shrew sign such as scat, burrows, and runways. Shrew burrows are not unlike other small mammal or reptile burrows in terms of size and shape. However, shrews often excavate their burrows or occupy other mammal burrows that are directly adjacent to a water source. Shrew scat is generally 0.05 inch in diameter and can be up to 0.25 inch in length with a distinctive curl and tapered ends. Unlike mouse or rat scat, which can be dispersed along runways, shrews often maintain one or several scat piles (“latrines”) near the waters’ edge where they deposit their scat. Although runways can be used by several different species at any time, runways that lead to the water along with identification of distinct latrines along the runway aid in the proper identification of shrew sign.

3.3.3. Results and Discussion

ERM biologists conducted shrew trapping in the Crescent Valley Survey Area May 25 to 28, 2022, and in the Goldstrike and Carlin Survey Areas June 4 to 7, 2022. In total, 800 traps were deployed in areas identified as having the most suitable hydrological and vegetative characteristics for shrew species in the Carlin, Goldstrike, and Crescent Valley Survey Areas. No shrews were captured during the trapping events. Though several trapping locations support habitats suitable to shrew species, including dense riparian vegetation, abundant shrub coverage, and aquatic conditions, locations with these characteristics also exhibited substantial cattle activity and/or anthropogeic disturbances from railroads and/or road traffic.

Non-target species captured included 94 deer mice (*Peromyscus maniculatus*), comprising 98.9 percent of captured mammals, and 1 house mouse (*Mus musculus*), comprising 1.1 percent of captured mammals. Table 3.3-3 summarizes captured species for each of the trapping locations. The 20 trapping locations identified during Year 1 surveys and evaluated in Year 2 are shown on Figures 3.3-2 to 3.3-4.

Table 3.3-3: Small Mammal Captures Summary

Trapping Location	Species Collected	Total Number Captured
GS01	Deer mouse (*Peromyscus maniculatus*)	21
GS02	Deer mouse (*Peromyscus maniculatus*)	2
GS03	Deer mouse (*Peromyscus maniculatus*)	8
GS04	--	--
CA01	Deer mouse (*Peromyscus maniculatus*)	21

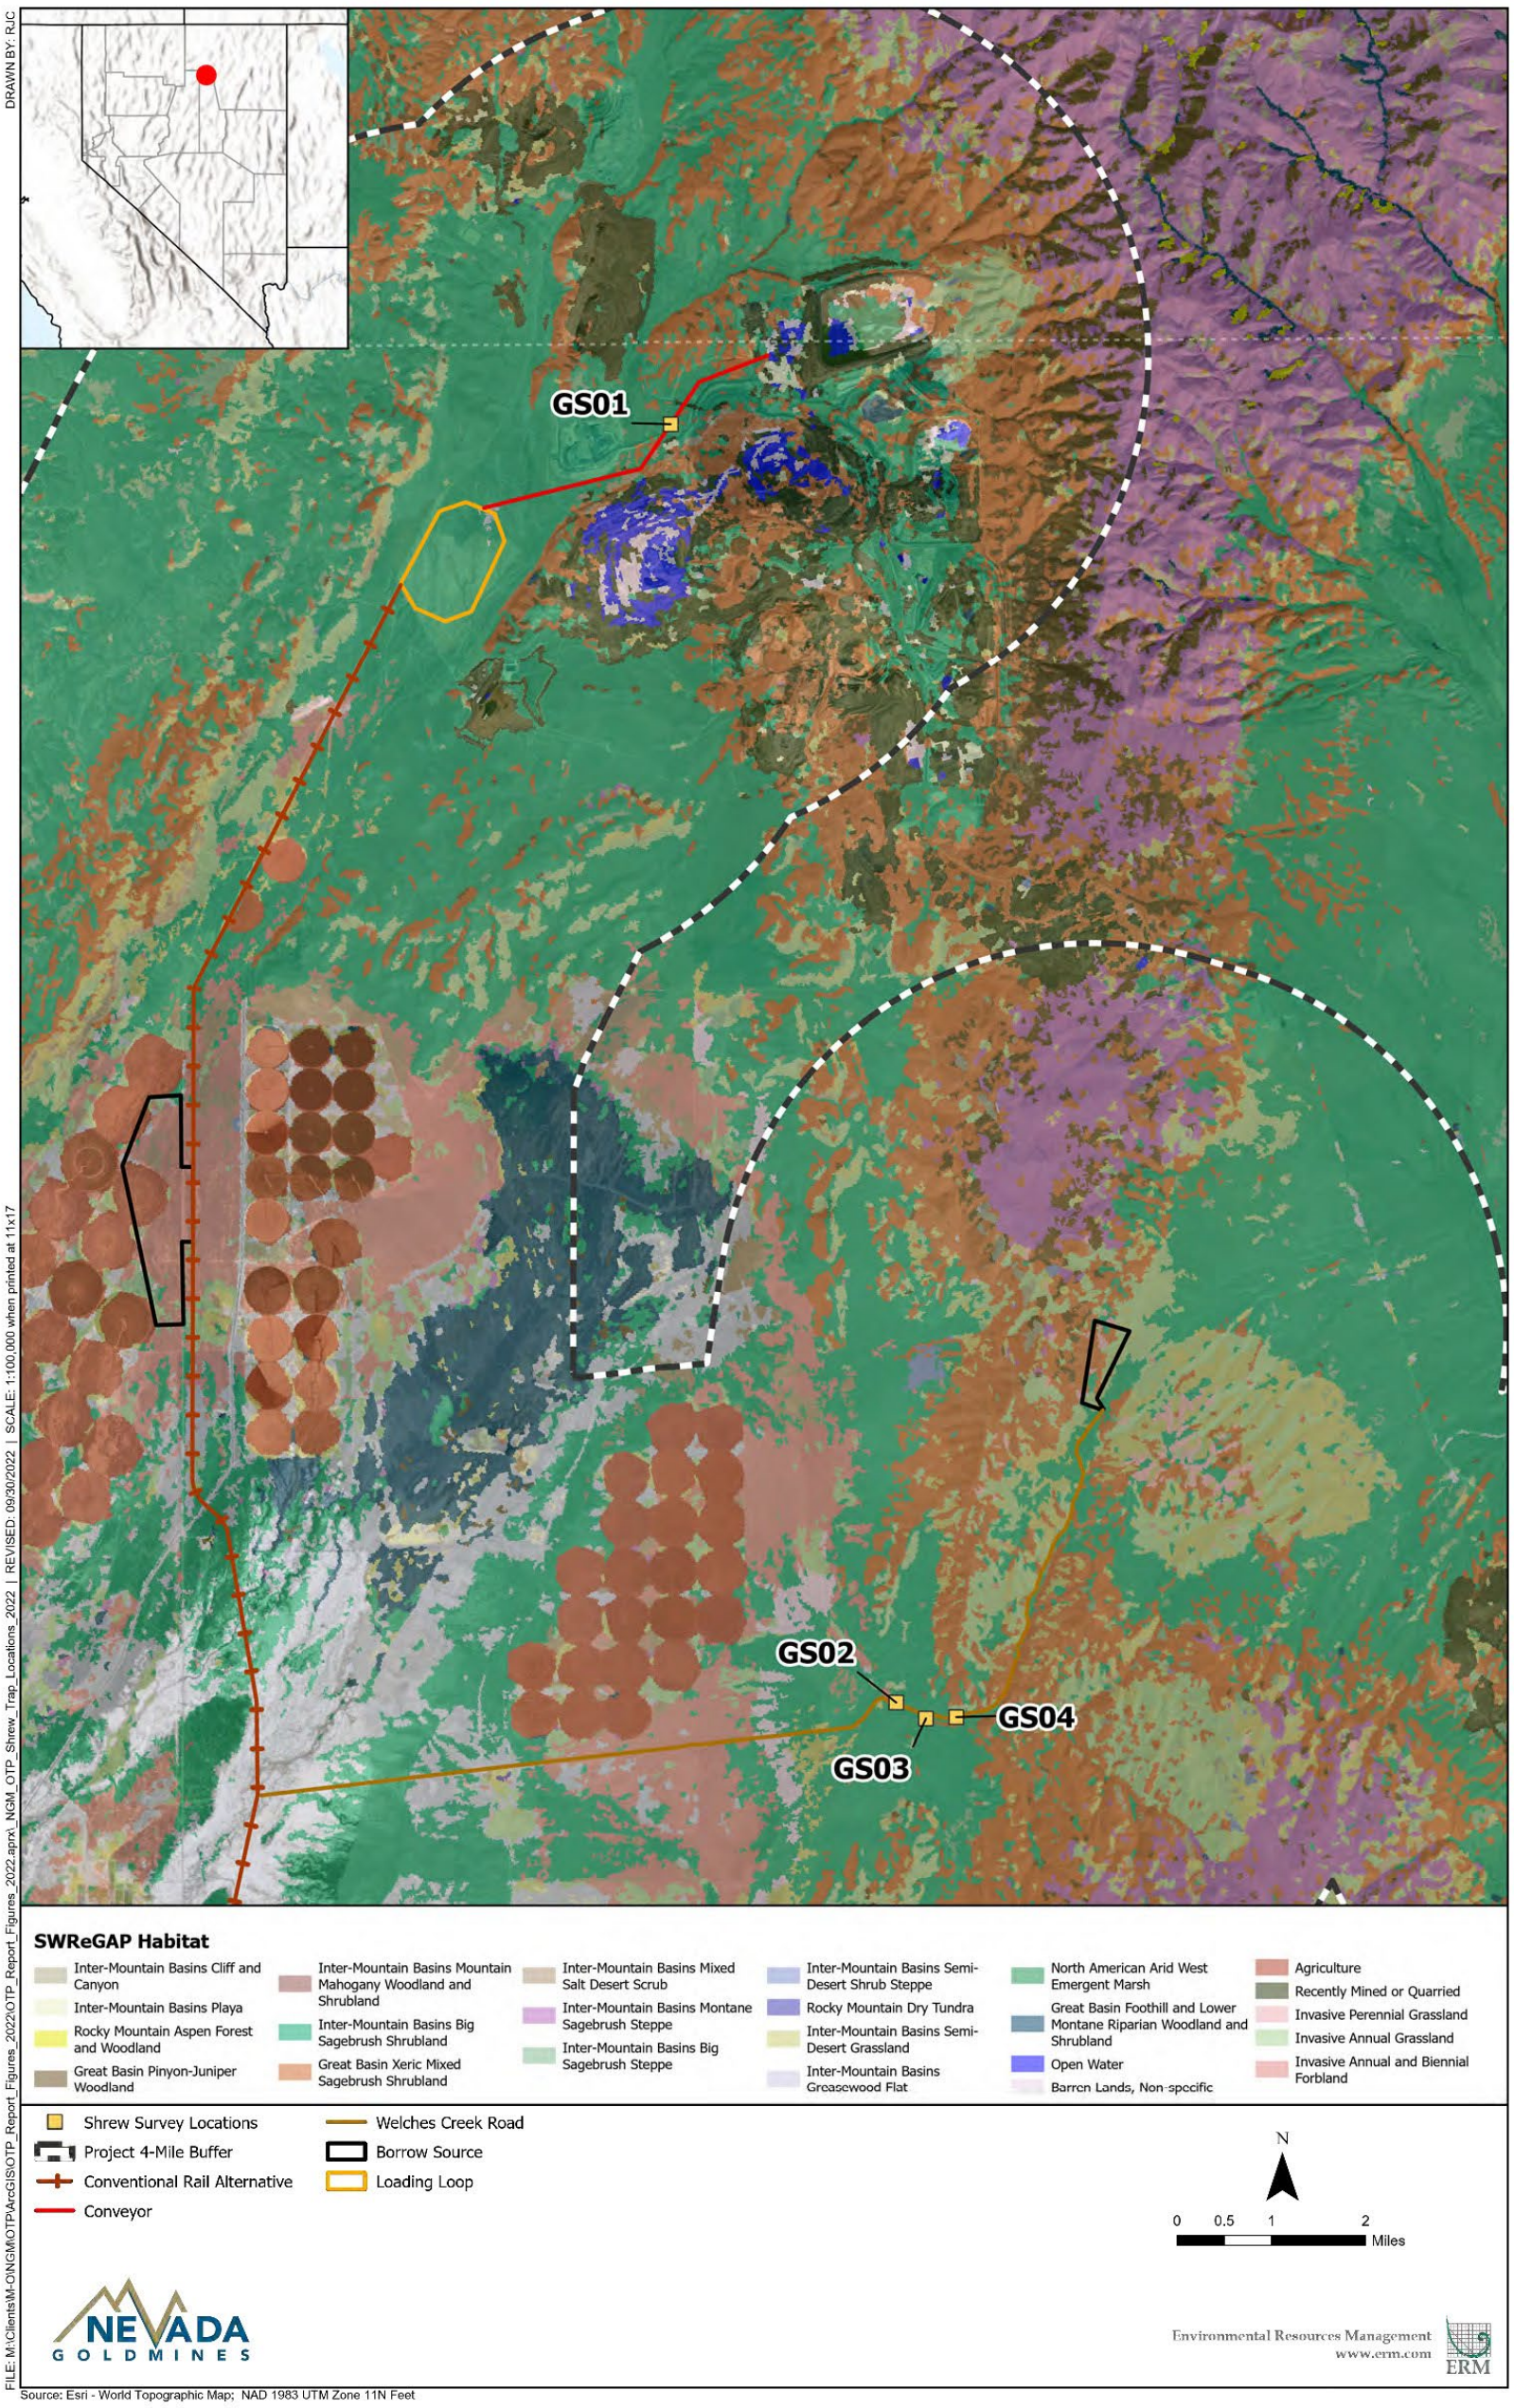

Figure 3.3-2: Shrew Trap Locations—Goldstrike Survey Area

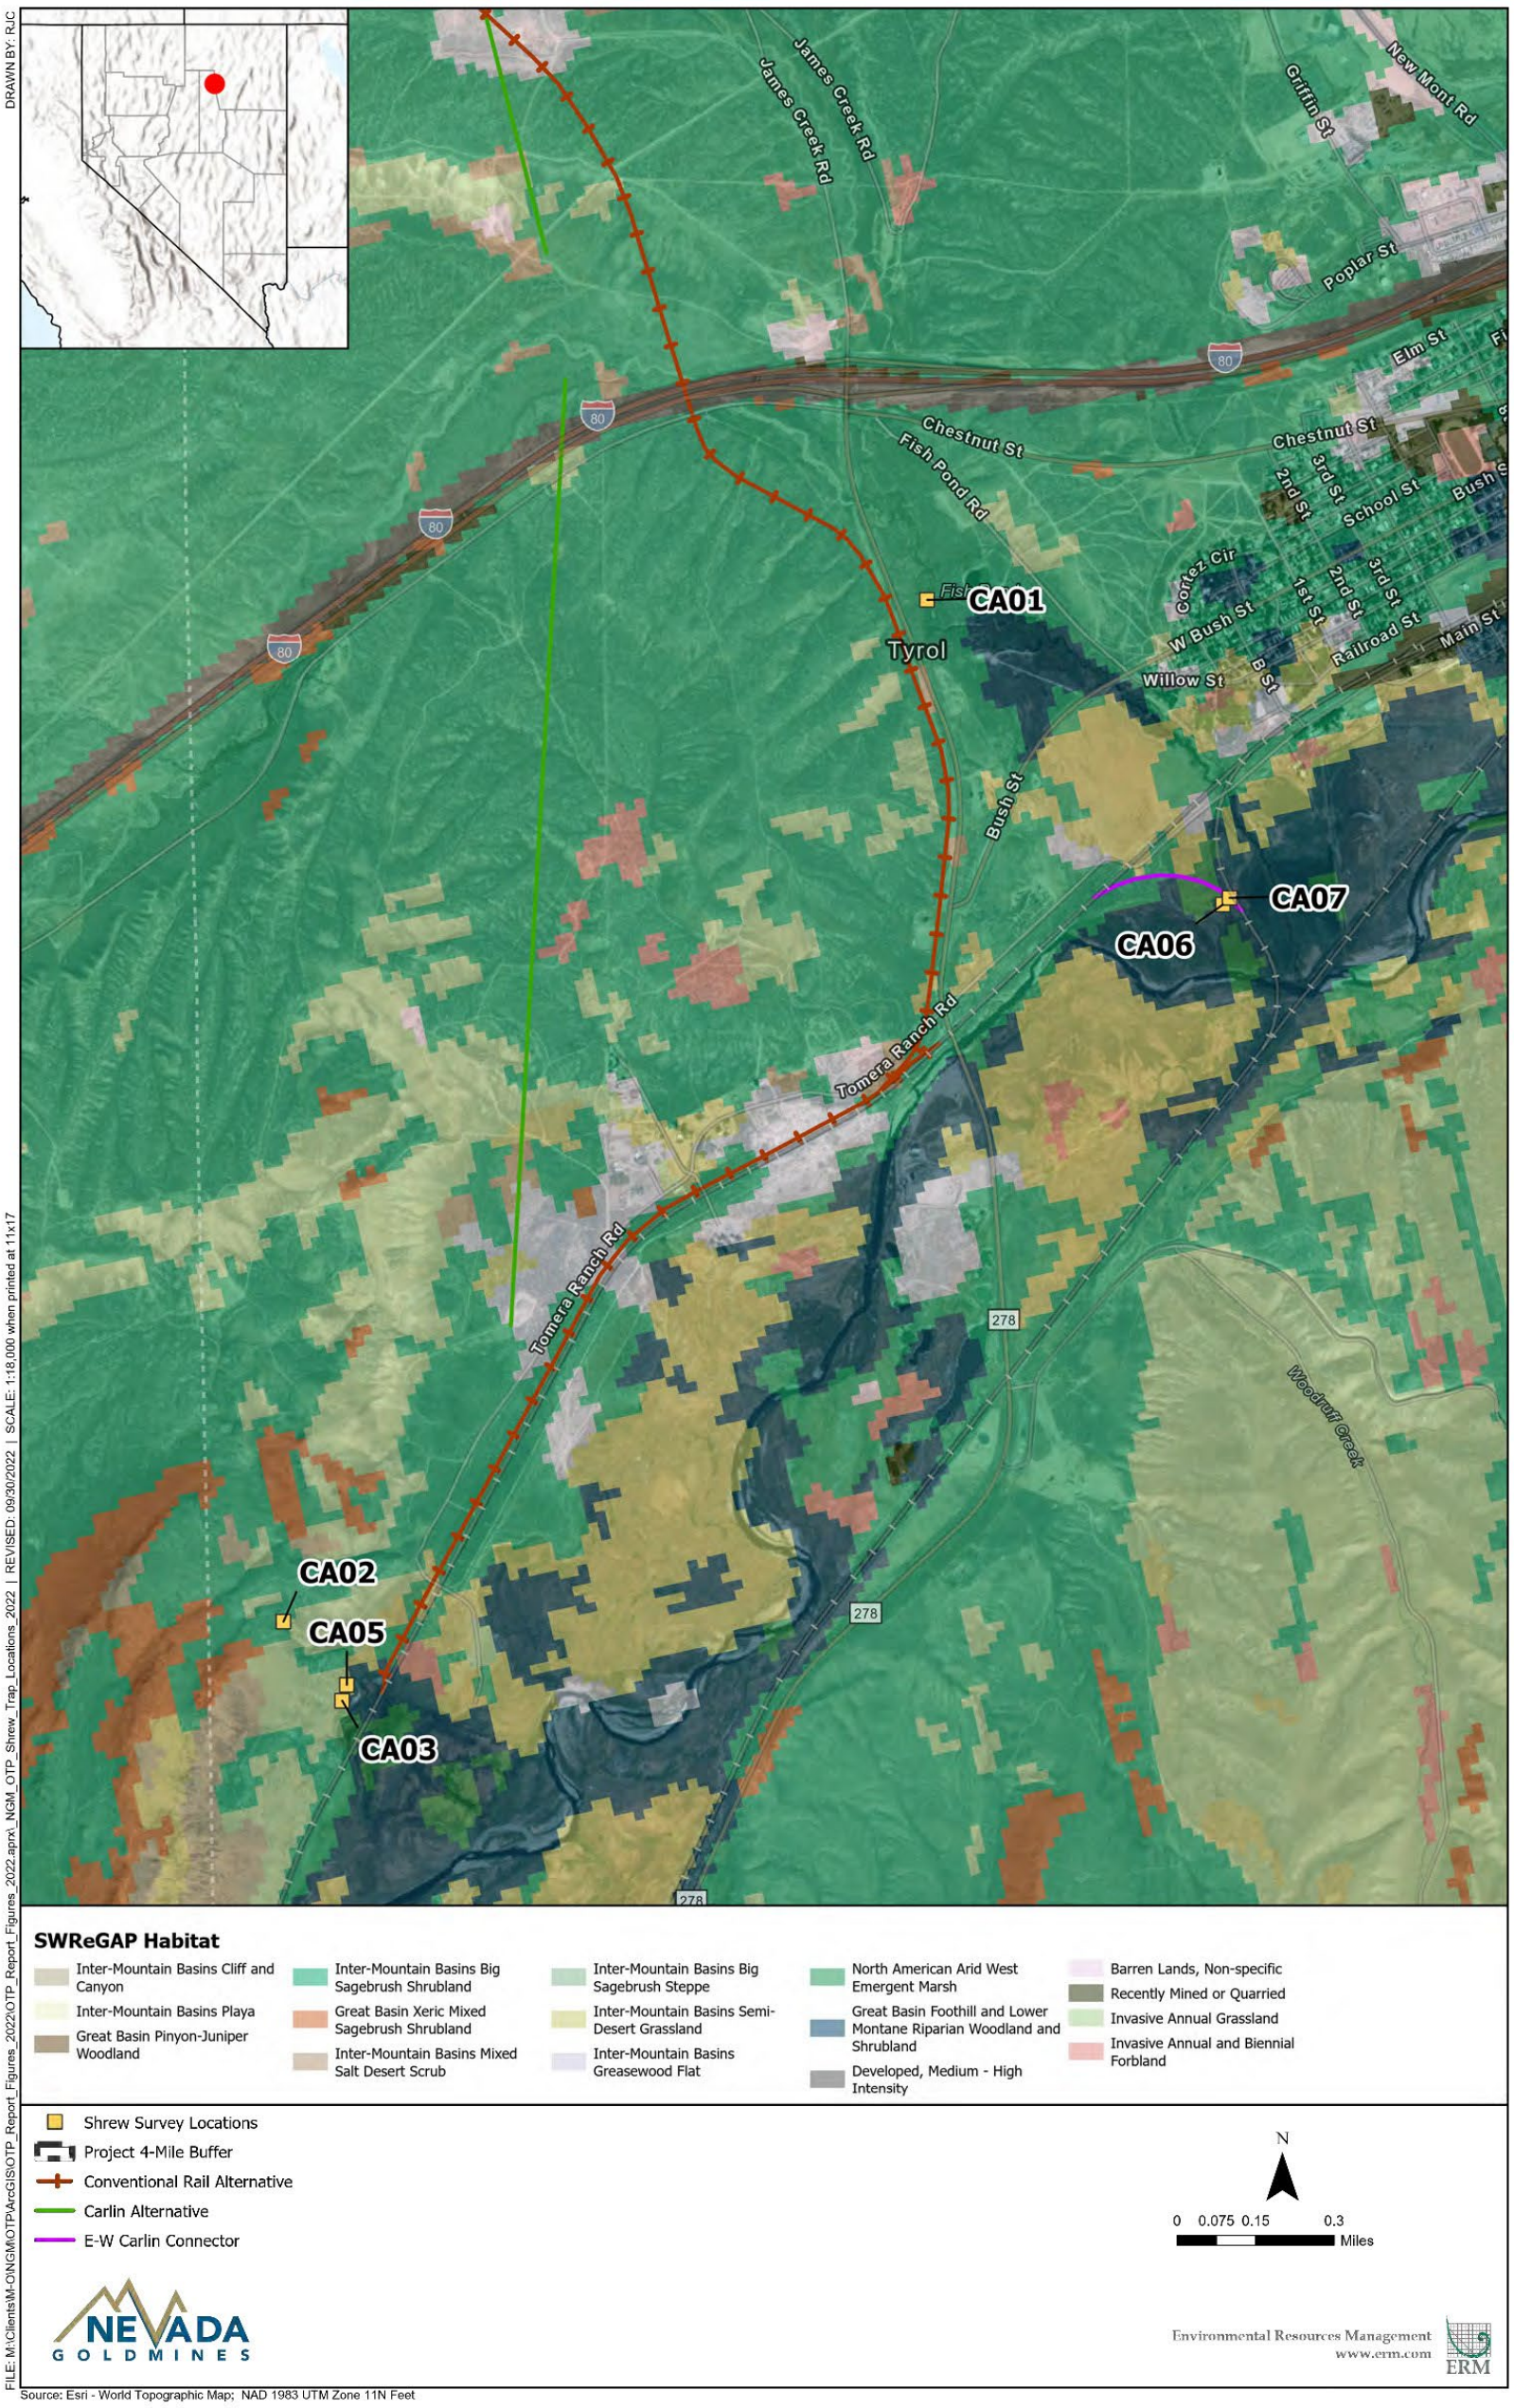

Figure 3.3-3: Shrew Trap Locations—Carlin Survey Area

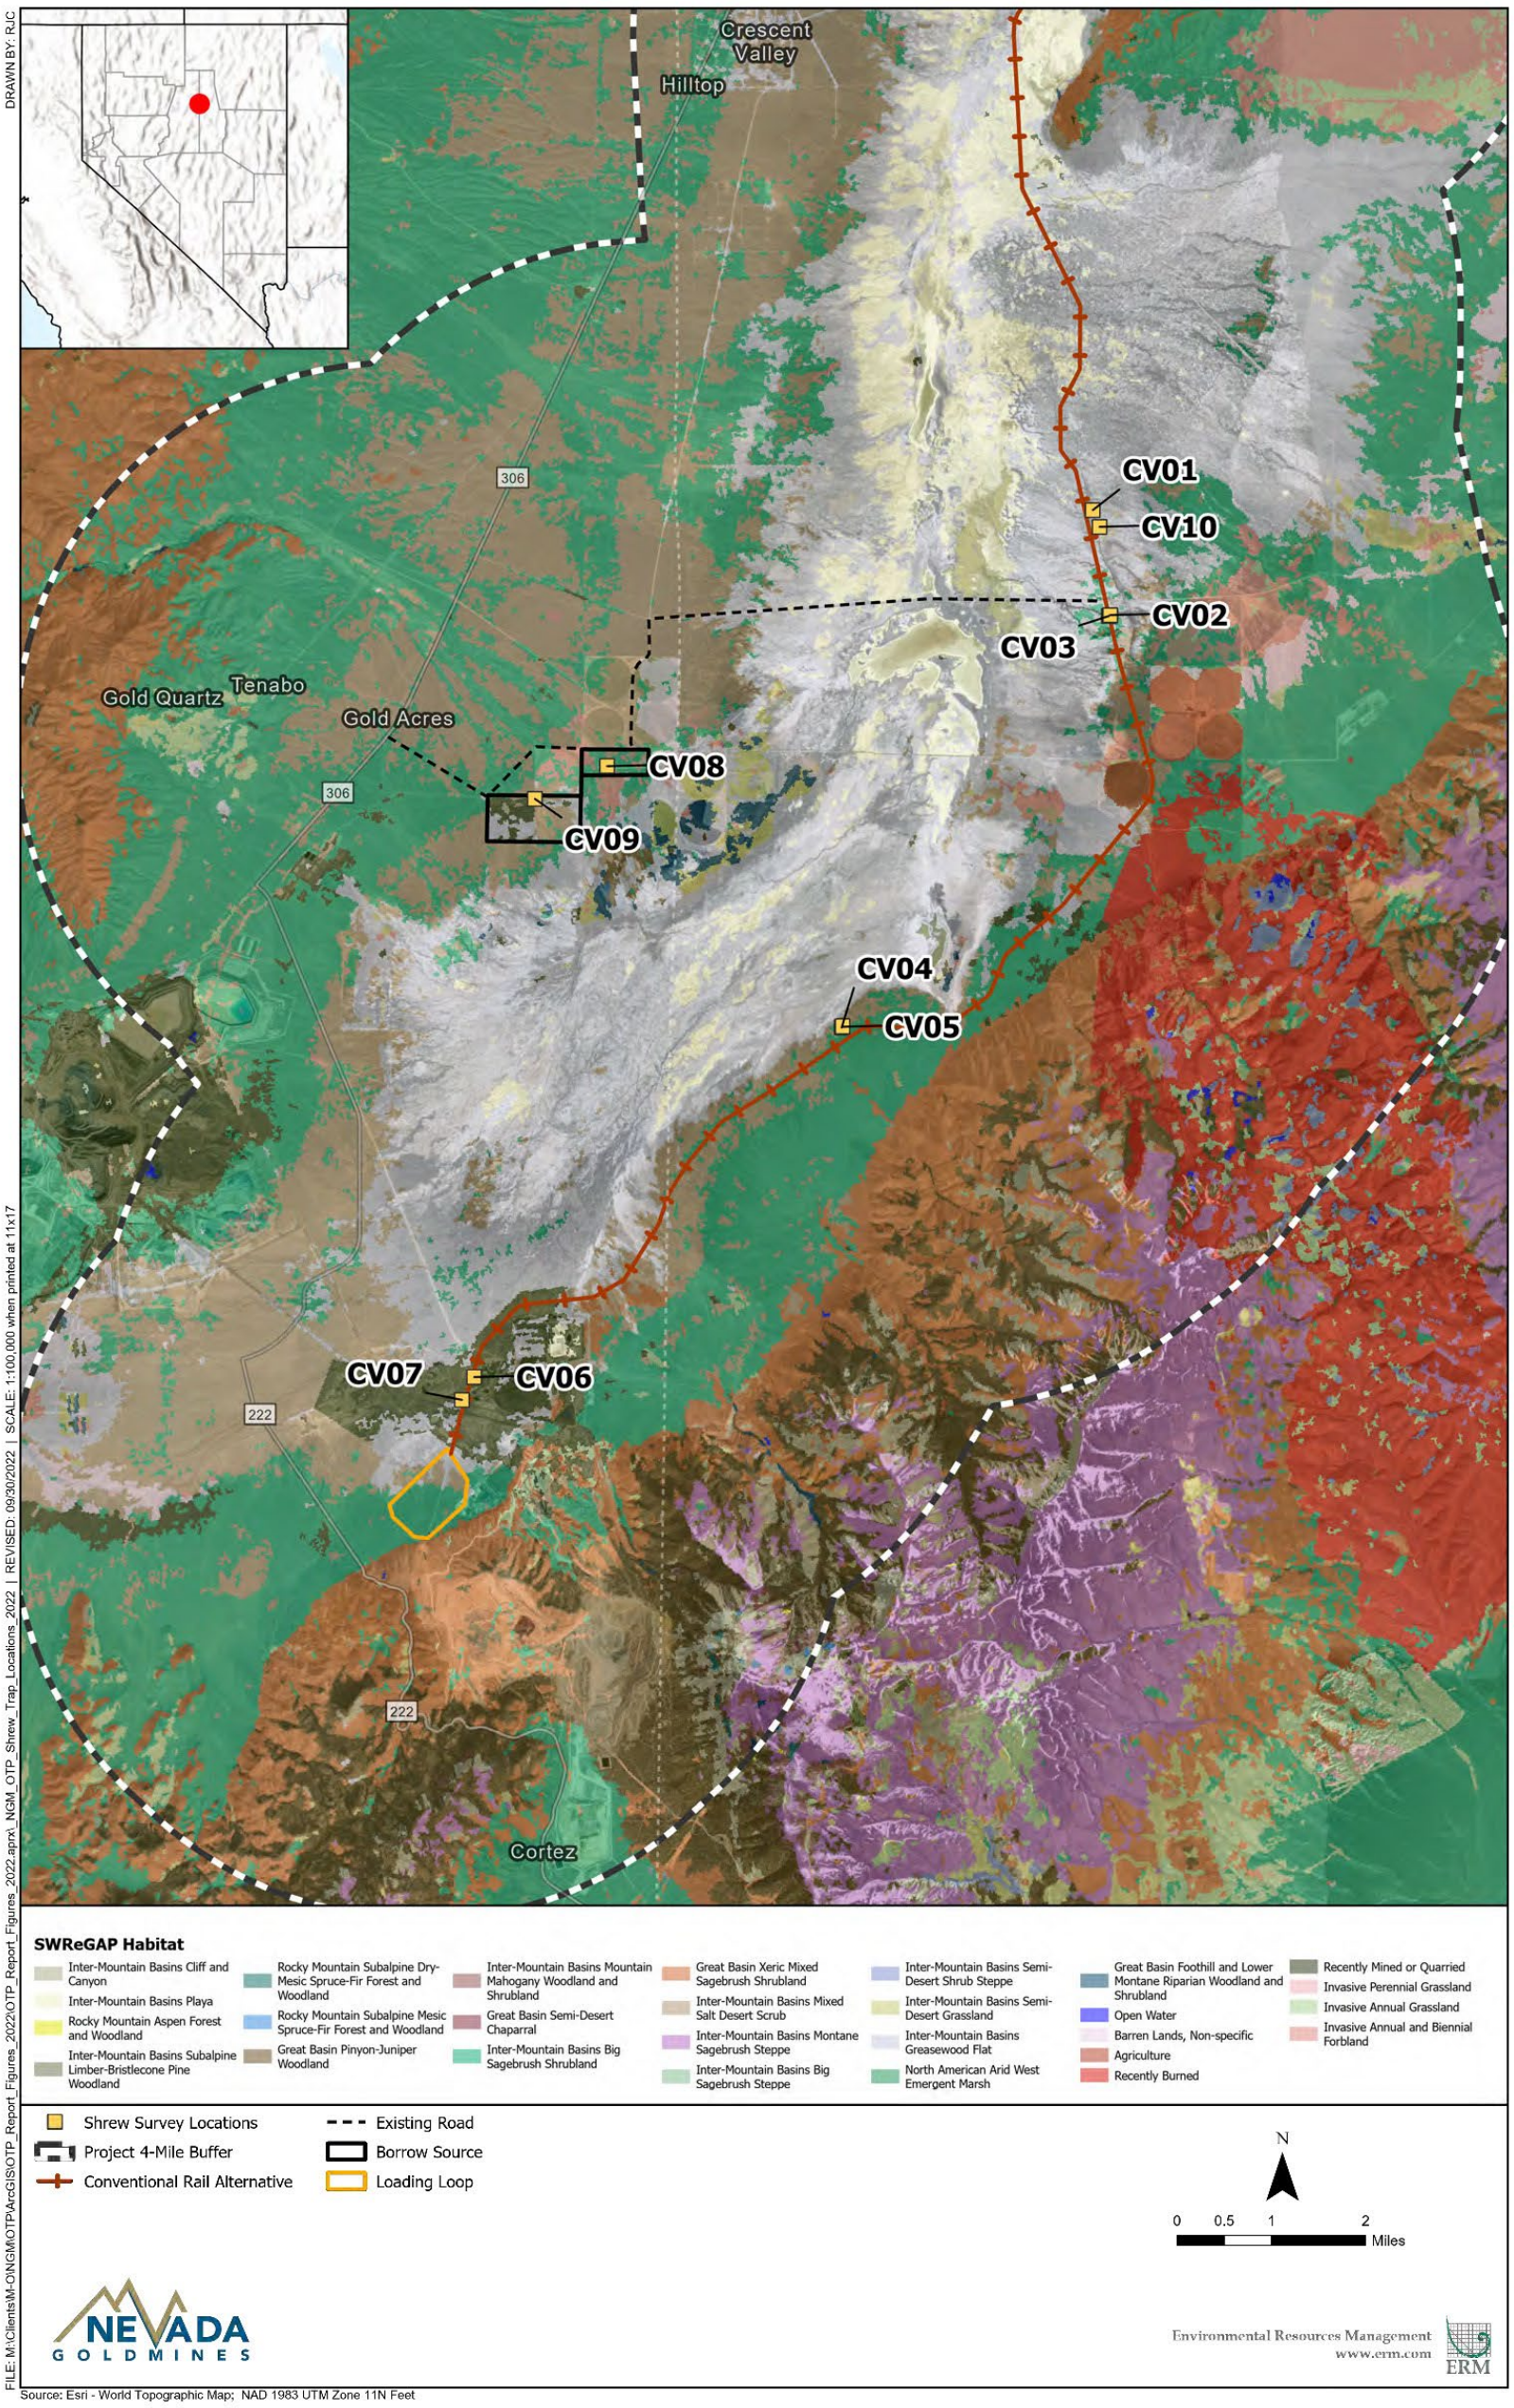

Figure 3.3-4: Shrew Trap Locations—Crescent Valley Survey Area

Page Intentionally Left Blank.

3.3.3.1. Goldstrike Results and Discussion

The Goldstrike Survey Area consists of only one landcover type: Inter-Mountain Basins Big Sagebrush Shrubland. The habitat includes flat to steeply sloping uplands on alluvial fans and terraces, draws, badlands, and deep, well-drained alluvial bottomland foothills and basins that are consistent with preferred shrew habitat; however, no shrew species were captured in this survey area as shown in Table 3.3-3.

The GS01 trapping location was placed in Inter-Mountain Basins Big Sagebrush Scrub in the vicinity of a small flowing stream surrounded by wet meadows on each side (see Photos 1, 3, and 4 in Section C.2 of Appendix C, Shrews Data). Dense populations of cattail (*Typha* spp.) were established throughout the stream channel, particularly in areas where the stream banks widened. Areas with shallow water were dominated by rushes (*Juncus* spp.). Soils were saturated throughout the heavily vegetated riparian corridor, and several suspected mammal burrows and runways existed throughout the habitat (see Photo 9 in Section C.2 of Appendix C). The shrub community in this area was comprised mostly of big sagebrush, while the herbaceous community supported a mosaic of Great Basin wild rye (*Leymus cinereus*), bottlebrush squirreltail (*Elymus elymoides*), Indian ricegrass (*Oryzopsis hymenoides*), crested wheatgrass (*Agropyron cristatum*), and cheatgrass (see Photos 10, 11, and 12 in Section C.2 of Appendix C). Anthropogenic disturbances observed in the area included an aboveground water pipe surrounded by a mowed right-of-way 130 feet southwest, and an active mine haul road located within 600 to 1,000 feet north, south, and east of the transect (see Photos 3 and 4 in Section C.2 of Appendix C). An active open-pit mine exists beyond the haul road east, and mining activity (drills, traffic, miscellaneous machinery) was audible throughout the survey period. The suitability of this site for shrews may be reduced by the existing haul road traffic and mining activity at this trapping location.

Trapping locations GS02, GS03, and GS04 were located along Welch Creek—an incised intermittent stream—in Inter-Mountain Basins Big Sagebrush (see Photos 16, 29, and 45 in Section C.2 of Appendix C). The riparian corridor and upland areas were dominated by big sagebrush, with herbaceous community including foxtail barley (*Hordeum jubatum*), bluegrass (*Poa secondo*), cheatgrass, and sparse amounts of Great Basin wild rye. During the trapping event, GS02 and GS03 contained damp soils and isolated stagnant pools, while GS04 supported flowing water (see Photos 25, 39, and 52 in Section C.2 of Appendix C). Cattle disturbance was observed at all three trapping locations in the form of scat and tracks throughout the bed and bank of the stream channel. The trampling of stream banks causes sedimentation in the streambed and reduces the potential development of overhanging vegetation (Ehrhart and Hansen 1997). Some anthropogenic disturbance was also observed in the area, including a corral and cattle gate approximately 450 feet west of the GS02 trapping location, and a dirt road directly adjacent to the western riparian corridors of all three trapping locations. The relatively dense riparian community and aquatic habitat at this location is suitable shrew habitat, but the cattle disturbance in the riparian corridor and the streambed and bank reduced the overall habitat suitability for shrews.

3.3.3.2. Carlin Results and Discussion

The Carlin Survey Area consists of three SWReGAP landcover types: Inter-Mountain Basins Big Sagebrush Shrubland; Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland; Invasive Annual Grassland. The proximity to the Humboldt River and its tributaries, as well as adjacent grasslands, willow-fringed creeks, and areas dominanted by sagebrush has the potential to provide suitable riparian habitat for shrew species listed in Table 3.3-1; however, no shrew species were collected within this survey area as shown in Table 3.3-3.

Three locations in the Carlin Survey Area identified for trapping during the Year 1 Baseline Study (CA03, CA04, and CA05) were inundated and could not be sampled in 2022. As a result, biologists adjusted the positioning of CA03 and CA05 (referred to as CA03_SH_Alt and CA05_SH_Alt in Appendix C, Shrews Data) to the margins of the wetland, approximately 150 feet northeast of their previous positions. Due to spatial constraints imposed by the repositioning of CA03 and CA05, trapping location CA04 was removed from the Carlin Survey Area and a compensatory trapping location (CV10) was added in the Crescent Valley Survey Area. Figure 3.3-3 displays the trapping locations within the Carlin Survey Area.

Trapping location CA01 was placed along a deeply incised perennial stream in Inter-Mountain Basins Big Sagebrush Shrubland. At the time of survey, minimal surface flow was observed. In the stream channel, dense populations of sedges (*Carex* spp.), cattail, watercress (*Nasturtium officinale*), and filamentous algae were observed (see Photos 73 and 79 in Section C.2 of Appendix C, Shrews Data). The shrub layer within the riparian corridor was dominated by dense stands of arroyo willow (*Salix lasiolepsis*) and small stands of big sagebrush. The herbaceous layer was comprised of bluegrass, cheatgrass, whitetop, tall whitetop (*Lepidium latifolium*), scotch thistle (*Onopordum acanthium*), musk thistle (*Carduus nutans*), and sparse amounts of dock (*Rumex* spp.) (see Photos 83 in Section C.2 of Appendix C). The proximity to water and the densely vegetated riparian zone provided suitable habitat for shrew species within the trapping location.

Trapping location CA02 was placed along a perennial stream within the Invasive Annual Grassland. Water is present in this location as a result of a corrugated pipe conveying water from a natural spring into the channel (see Photos 71 and 73 in Section C.2 of Appendix C, Shrews Data). The streambed has cobble substrate, but dense watercress mats cover approximately 50 percent of the total wetted width. The riparian corridor was densely vegetated but comprised mostly of weedy plant species such as Canada thistle, whitetop, scotch thistle, and Russian knapweed (*Rhaponticum repens*). Cattle scat and tracks were observed within the riparian corridor of the stream, and the dense weedy species established in the area are likely a result of preferential grazing. The hydrologic condition, cobble substrate, and dense riparian vegetation provide adequate cover and suitable habitat, particularly for the American water shrew; however, cattle disturbance both instream and within the riparian zone reduced the overall habitat suitability for all shrew species at this trapping location.

Trapping locations CA03 and CA05 were placed along a riparian corridor adjacent to an emergent wetland in Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland. Dense stands of cattail and dark green bulrush were observed (see Photo 88 in

Section C.2 of Appendix C). Several small mammal runways were observed in riparian grass communities (see Photo 95 in Section C.2 of Appendix C). Cattle disturbance was observed throughout the landscape in the form of tracks and scat within the upland areas, but the riparian corridor appeared free of cattle disturbance. Active railroad tracks are located approximately 200 feet southeast of the trapping locations and form the eastern boundary of the wetland. The absence of dense riparian vegetative cover reduced the overall habitat suitability for all shrew species at these trapping locations.

Trapping locations CA06 and CA07 were placed in the riparian corridor surrounding a wet meadow and emergent wetland in Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland. Surface water was only present in the deepest, central portion of the wetland feature, and soils within the adjacent meadow were dry. In the riparian corridor, herbaceous vegetative species included bluegrass, dense stands of cattail, and rushes (*Juncus* spp.). Dessicating mudflats were present in the margins of the wetland. Sparse amounts of big sagebrush and rubber rabbitbrush (*Ericameria nauseosa*) were located in the rocky foundation of nearby railroad tracks located approximately 5 to 6 feet above the surrounding landscape and were not within the riparian corridor (see Photo 104 and 105 in Section C.2 of Appendix C, Shrews Data). Both trapping locations are positioned approximately 50 feet west of an active railroad and are within a rotating cattle paddock. Canada thistle, whitetop, and Russian knapweed were the dominant species in the riparian corridors of the trapping locations. The absence of a shrub layer in the riparian zone and disturbances from both railroad and cattle reduced the overall habitat suitability at these locations for shrew species.

3.3.3.3. Crescent Valley Results and Discussion

The Crescent Valley Survey Area consists of four SWReGAP landcover types. Greasewood and desert scrub playa habitats are dominant in this area and are consistent with shrew species preferred habitat, specifically the Preble's shrew and Inyo shrew; however, no shrew species were collected within this survey area, as shown in Table 3.3-3. Trapping locations CV01 and CV10 were both located in areas with groundwater seeps in Inter-Mountain Basins Greasewood Flat landcover. Groundwater seeps are geological features where groundwater reaches the soil surface, resulting in year-round soil saturation. The soils in these two seeps were damp in the lowest areas, and the vegetative community was dominated by saltgrass (*Distichlis spicata*) and sedges (*Carex* spp.). Sparse amounts of Great Basin wild rye were identified in some locations where dryer soil was present. The margins of the seep were dominated by yellow rabbitbrush (*Chrysothamnus viscidiflorus*) and greasewood (*Sarcobatus vermiculatus*) (see Photos 132 and 135 in Section C.2 of Appendix C, Shrews Data). Cattle scat and tracks were observed in the immediate area of the seep, resulting in trampling of the herbaceous layer outside of the seep. The dense riparian vegetation provides suitable cover for shrew species, but evidence of cattle activity noted in the surrounding area may have contributed to the reduced quality of this habitat for shrew species.

Trapping locations CV02 and CV03 were located along a boundary between an emergent and scrub-shrub wetland. Some surface flow was observed in the emergent wetland flowing eastward, but no surface water existed in the adjacent scrub-shrub wetland (see Photos 150

and 164 in Section C.2 of Appendix C). Big sagebrush and greasewood were the dominate shrub vegetation (see Photos 147 and 161 in Section C.2 of Appendix C), and the herbaceous layer was dominated by thick stands of Great Basin wild rye. Cattle tracks were observed in the surrounding landscape but not within the wetland features or riparian corridors. The wetland was dominated by cattail (*Typha* spp.), with inclusions of dark green bulrush (*Scirpus atrovierens*) and spike-rushes (*Eleocharis* spp.). Within the riparian corridor, local concentrations of Great Basin wildrye and other native grasses provided heavy vegetation with suitable habitat for shrews.

Trapping locations CV04 and CV05 were in two side-by-side groundwater seeps in Inter-Mountain Basins Mixed Salt Desert Shrub landcover. Within the seeps, saltgrass dominated the vegetative community while the margins supported greasewood and big sagebrush, with some inclusions of fourwing saltbrush (*Atriplex canescens*) and shadscale (*Atriplex confertifolia*) (see Photos 177 and 192 in Section C.2 of Appendix C, Shrews Data). Disturbance from cattle in the form of tracks and trampled and/or grazed herbaceous plants were observed in the seep margins, as well as the surrounding landscape. Cattle tracks and scat within the seep was also observed. The dense vegetative cover surrounding the groundwater seeps provides suitable cover for shrews, but disturbance by cattle reduced overall quality of this habitat for shrew species.

Trapping locations CV06 and CV07 were placed along riparian corridors of two open-water habitats. These two artificial ponds provide a perennial source of water, likely sourced from groundwater. At both locations, a similar shrub community of horsebrush (*Tetradymia* spp.) and yellow rabbitbrush was present, but the CV07 trapping location supported a more densely vegetated riparian zone than the CV06 trapping location (see Photos 205 and 218 in Section C.2 of Appendix C). Saltgrass and Russian thistle (*Salsola tragus*) with inclusions of cheatgrass were the dominant herbaceous layer. Cattle were present during trap checks at both transects, and trampling and browsing of riparian vegetation were observed. CV06 provided only marginally suitable habitat due to the sparse riparian vegetation and cattle disturbance noted at the trapping location. The densely vegetated riparian corridor at CV07 provided suitable habitat for shrews; however, the cattle disturbance reduced the overall suitability at this trapping location.

Trapping location CV08 was placed along an ephemeral stream within the Inter-Mountain Basins Big Sagebrush Shrubland. At the time of the survey, surface water was not observed in the channel and sediments were dry. Soil appeared to have been added to the streambanks, resulting in the top of bank to sit approximately 3 feet above the surrounding upland landscape and approximately 5 feet above the channel bottom (see Photos 233 and 234 in Section C.2 of Appendix C). No riparian corridor or riparian habitat was found at this location, likely a result of the soil disturbance and modifications of the streambank. The area adjacent to the stream channel was sparsely vegetated and comprised mostly of bare soil and weedy plant species such as Russian thistle, western tanseymustard (*Descurainia pinnata*), whitetop (*Lepidium draba*), and cheatgrass. Big sagebrush shrubs occurred intermittently throughout the trapping location but provided minimal cover relative to the amount of bare soil. The lack of riparian

habitat, absence of hydrology, and lack of dense riparian vegetation reduced the suitability of this trapping location for shrews.

Trapping location CV09 was placed along a wetland within Inter-Mountain Basins Mixed Salt Desert Scrub. The wetland at this site is created by water overtopping a cattle trough roughly 75 feet northwest of the trapping location (see Photo 246 in Section C.2 of Appendix C, Shrews Data). Outside the margins of the wetland, bare soils dominated the trapping area, with sparse vegetation comprised mostly of weedy plant species including western tanseymustard, clasping pepperweed (*Lepidium perfoliatum*), Russian thistle, and whitetop (see Photos 254 to 258 in Section C.2 of Appendix C). Sparse stands of dark green bulrush (*Scirpus atrovirens*) occupied the margins in some locations of the wetland, and dense free-floating algae was observed in middle portion of the wetland (see Photos 248 to 253 in Section C.2 of Appendix C). The absence of vegetative cover in the riparian zone and disturbance by cattle indicate this area has reduced suitability for shrews.

3.4. AMPHIBIANS

3.4.1. Background

Amphibians potentially occurring in the Project Area designated as BLM sensitive species include the Columbia spotted frog (*Rana luteiventris*, Great Basin population), northern leopard frog (*Lithobates pipiens*), and western toad (*Anaxyrus boreas*). The Columbia spotted frog and the northern leopard frog are also NDOW state-protected species covered under NAC 503.075.2 (NDOW 2022). All three species occur in wetlands and slow-moving streams or in uplands adjacent to aquatic habitats (BLM 2018). Table 3.4-1 describes the agency status and general habitat for each amphibian species discussed in this section.

Table 3.4-1: BLM and NDOW Special Status Amphibian Species

Species	Agency Status	Nevada Wildlife Action Plan Habitat Description
Columbia spotted frog (*Rana luteiventris*, Great Basin population)	BLM Nevada Sensitive; NDOW State Protected	Closely associated with clear, slow-moving or ponded surface waters with little shade and relatively constant water temperatures; Overwintering occurs in spring heads and deep undercuts with overhanging vegetation and ice-covered deep ponds
Northern leopard frog (*Lithobates pipiens*)	BLM Nevada Sensitive; NDOW State Protected	Permanent ponds, swamps, marshes, and slow-moving streams throughout forest, open, and urban areas; Normally inhabit waterbodies with abundant aquatic vegetation
Western toad (*Anaxyrus boreas*)	BLM Nevada Sensitive	Found in a wide variety of habitats ranging from desert springs to mountain wetland and various upland habitats around ponds, lakes, reservoirs, and slow-moving rivers or streams

Source: BLM 2018; NDOW 2022; Wildlife Action Plan Team 2013

BLM = Bureau of Land Management; NDOW = Nevada Department of Wildlife

The Columbia spotted frog can reach lengths up to 4 inches and is characterized by two ridged, dorsolateral folds along the back. It can range in color from beige and olive brown to brick red and has black spots with ragged edges and light centers (WDFW 2022a). The Great Basin population inhabits clear, slow-moving waters and ponds with little shade and relatively constant temperatures (NatureServe 2022a). Suitable habitat includes riparian corridors, wetlands, and areas supporting a mix of wetland/upland habitats. Breeding occurs in stagnant or slow-moving water, and successful egg deposition requires shallow water (NatureServe 2022a). Eggs are normally deposited in water at temperatures of approximately 57 °F, with larval metamorphosis requiring periods of warmer temperatures. Waters fed continuously by cold-water springs or otherwise prevented from warming during the day are unlikely to support successful breeding of the Columbia spotted frog (Patla and Keinath 2005).

The historical range of Columbia spotted frogs in Nevada included central and northwestern Nevada in Lander and Humboldt counties, respectively. However, more recent studies indicate only central and northeastern parts of Nevada retain these populations, including Nye, Elko, and Eureka counties at elevations of 5,600 to 8,700 feet (NatureServe 2022a). Nevada has three geographically distinct subpopulations of Columbia spotted frogs: the Jarbidge-Independence Range, Ruby Mountain, and the Toiyabe Mountain populations. Columbia spotted frogs potentially occurring in the Project Area are part of the Jarbidge-Independence subpopulation (Patla and Keinath 2005).

The northern leopard frog can reach lengths up to 4.5 inches and ranges in color from green-brown to yellowish-green with a white or cream-colored belly. This species has distinguishing dark oval spots outlined by lighter halos, and a pair of continuous white- or cream-colored dorsolateral ridges extends from behind the eyes to the lower back (Kendell 2002). The northern leopard frog requires a mix of aquatic and upland habitats, with linkages between them. During the winter months, they hibernate underwater in ponds, lakes, or on the bottom of streams or springs that do not freeze and are well-oxygenated (USFWS 2015). Breeding habitat includes a variety of aquatic habitats—preferably permanent pools—along marshy edges or the side channels of streams, rivers, springs, wetlands (NPS 2015). Leopard frogs can be heard calling soon after hibernation periods (hibernation occurs from September or October through March or April), when water and air temperatures reach approximately 50 °F (Kendell 2002; MNHP and MFWP 2022). Eggs are laid and larvae develop in shallow, still, perennial waters exposed to sunlight. Eggs are attached to vegetation just below the water surface, and each female leopard frog deposits one egg mass annually (Kendell 2002).

The western toad is a wide-bodied, short-legged, warty-skinned amphibian that ranges in size from 2 to 5 inches long. This species can be brown, green, gray, or reddish-brown and is identifiable by a thin light-colored strip running along the middle of the back, with two obvious oval glands located behind the eyes on the top of the head. The underside of the western toad is light with dark markings (WDFW 2022b). According to the Montana Field Guide, the western toad is known to use a wide variety of habitats, including desert springs and streams, meadows and woodlands, mountain wetlands, beaver ponds, marshes, ditches, and backwater channels of rivers where they prefer shallow areas with mud bottoms (MNHP and MFWP 2022). Western toads return to the same breeding sites every year, gathering in large numbers to breed

communally for a 1- to 2-week period between April and May, typically breeding in shallow, sandy margins of waterbodies (NatureServe 2022b). Western toads are active in daylight during cool weather of late winter and spring, but most activity is at night during warmer weather (NatureServe 2022b).

These species are each susceptible to disturbances that threaten aquatic habitat, including water diversion, habitat degradation, and drought (Wildlife Action Plan Team 2013). Livestock activities and anthropogenic changes to the regional landscape can also reduce both quality and quantity of aquatic habitats. Additionally, the introduction of the non-native American bullfrog (*Rana catesbeiana*) has caused declines in native frogs in Nevada, impacting native amphibians via predation and competition, particularly when native amphibians are in the tadpole stage (Patla and Keinath 2005).

As described in the *Year 1 Biological Baseline Report* (ERM 2022a), Visual Encounter Surveys were conducted in 24 areas with potentially suitable amphibian habitat, and sightings of several American bullfrogs (*Lithobates catesbeianus*) and one western toad were documented. Of the 24 areas, four locations in the Project Area were determined to have the highest potential for special status amphibians to occur, all of which were within the Carlin Survey Area. The objective of the Year 2 baseline studies was to conduct egg mass monitoring and nocturnal call baiting to further evaluate the most suitable of these areas for the occurrence of amphibian species within the locations identified in Year 1.

3.4.2. Study Methodology

Biologists conducted one egg mass survey event in April 2022 and two nocturnal call baiting survey events in June and July 2022. Amphibian egg mass surveys were conducted in accordance with the *Survey Protocol for the Northern Leopard Frog* (Kendell 2002) and *Instruction Manual and Frog Survey Protocols for Region 1 National Wildlife Refuges, East-side Zone (Great Basin and Great Northern LCCs)* (Rombough 2012). Call baiting surveys were conducted in accordance with the *North American Amphibian Monitoring Program* protocol (USGS 2015).

Surveys took place at four transects along suitable habitat features within locations established during the Year 1 baseline surveys. All transects were located within the Carlin Survey Area (Table 3.4-2; Figure 3.4-1 and Figure 3.4-2).

Table 3.4-2: Locations of Amphibian Surveys

Transect	Egg Mass Survey Locations	Call Baiting Stations	SWReGAP Landcover Type(s)	Length (feet)
1	AMP#1	AMP1_1	Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland	736
		AMP1_2	North American Arid West Emergent Marsh	
2	AMP#2	AMP2_1	North American Arid West Emergent Marsh	646
		AMP2_2	Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland	
3	AMP#3	AMP3_1	Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland	938
		AMP3_2	Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland	
		AMP3_3	North American Arid West Emergent Marsh	
12	AMP#12	AMP12_1	Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland	967
		AMP12_2	Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland	
		AMP12_3	Great Basin Foothill and Lower Montane Riparian Woodland and Shrubland	

SWReGAP = Southwest Regional Gap Analysis Project

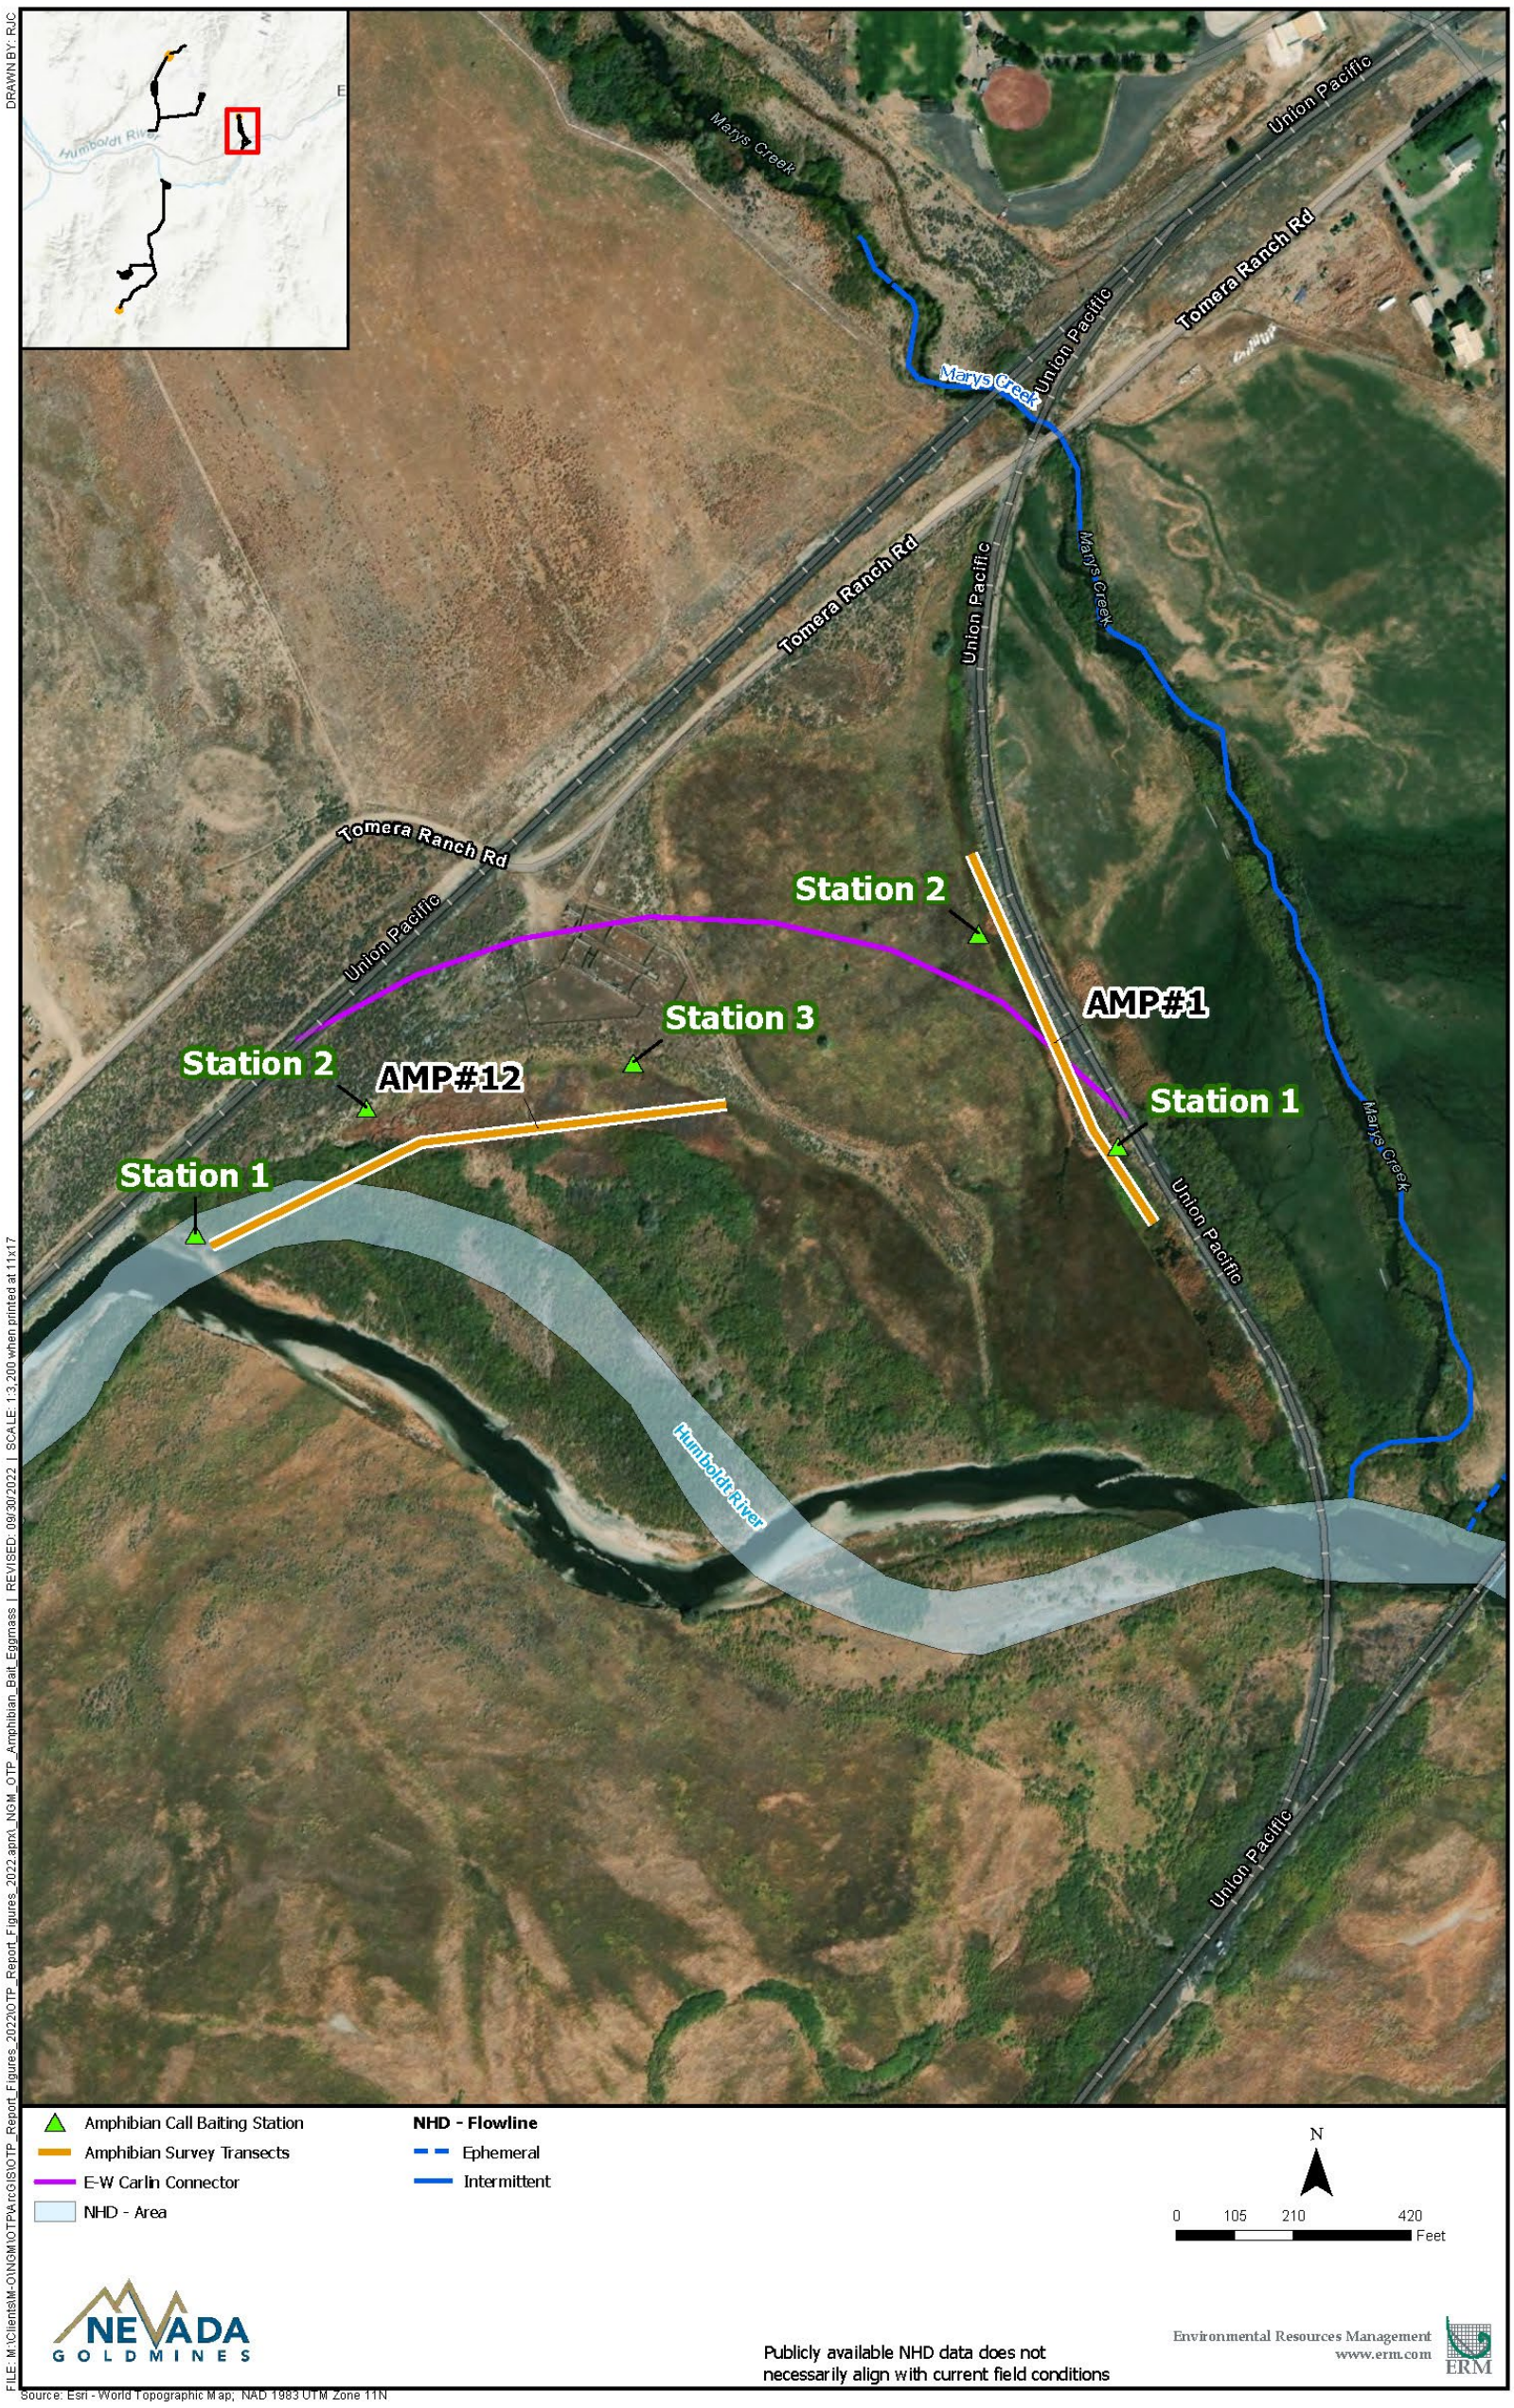

Figure 3.4-1: Amphibian Call Baiting Stations and Egg Mass Transects (1)—Carlin Survey Area

Figure 3.4-2: Amphibian Call Baiting Stations and Egg Mass Transects (2)—Carlin Survey Area

3.4.2.1. Egg Mass Surveys

A team of two biologists conducted egg mass surveys in areas supporting the most suitable habitat for amphibian egg deposition within the four transects (Table 3.4-2). Transects were located running the length of suitable habitat and parallel to the direction of water drainage. Surveys were completed in April 2022 when temperatures remained above 50 °F (Kendell 2002).

Surveys involved slowly walking the entire transect while carefully and systematically looking for suitable breeding habitat, paying particular attention to shallow waters with ample sunlight exposure and emergent, aquatic vegetation. If no emergent vegetation was present or if water depths were shallow, biologists focused on the floor and substrate of the waterbody where egg masses may be deposited. Biologists also looked under surface cover when present. Monitoring was not time-restrained and concluded when the entire transect was walked. Surveys were conducted during late morning to early afternoon in order to maximize light penetration and increase visibility as egg masses are often located at or below the water surface (Rombough 2012).

During each survey, biologists recorded the survey start and end times; date; location; current weather conditions; waterbody descriptions including waterbody type, dominant emergent vegetation, average water depth, turbidity, drainage regime, flow, and substrate. If incidental observations for amphibians outside of the targeted species occurred, the location of observation, species identified, and amphibian life stage (egg mass, tadpole, metamorph [recently transformed frog or toad], or adult) were noted (Rombough 2012). Photographs were taken of representative habitat at each transect and are included in Section D.1 of Appendix D, Amphibians Data. All collected data were recorded electronically using ArcGIS Survey123 following the Northern Leopard Frog Survey Data Sheet (Kendell 2002) as a guide for data collection.

3.4.2.2. Call Baiting Surveys

To evaluate the presence or absence of Columbia spotted frog, northern leopard frog, and western toad in the Project Area, 10 call baiting stations were established within the four transects from which egg mass surveys were conducted in April. Survey protocols followed the *North American Amphibian Monitoring Program* protocol developed by the USGS (2015). The protocol describes call baiting surveys as conducted by driving along roads and listening at established stations along each route. This protocol was modified for use in pedestrian-based surveys by reducing the distance between listening stations from 0.5 mile to 330 feet (100 meters). Protocol modifications were approved by BLM during coordination regarding the 2022 work plan (ERM 2021a) and prior to the start of fieldwork. Before conducting the surveys, biologists studied vocalizations of the three BLM Sensitive species.

Two listening stations each were established for transects AMP#2 and AMP#3, and three listening stations each were established for transects AMP#12 and AMP#1 (Figure 3.4-1 and Figure 3.4-2). Listening stations were accessed by foot and placed as close to the habitat as

feasible without causing disturbance to species. Nocturnal surveys began no earlier than 30 minutes after sunset and were completed no later than 1:00 a.m.

At each listening station, biologists performed call baiting by playing a recording of vocalizations of the Columbia spotted frog, northern leopard frog, and western toad to illicit a response from nearby amphibians. Biologists used an EcoTrek speaker for playing recordings of frog and toad calls, which has a 100-watt amplifier for broadcasting. Vocalizations were played for 1 minute at each listening station prior to a 5-minute listening interval. To the extent possible, listening stations were positioned away from roads or other sources of ambient noise that could mask amphibian calls or interfere with listening. If there was noise lasting longer than 1 minute, the listening period of 5 minutes was paused and resumed after noise subsided. At each call station, biologists documented the survey start times, date, current weather conditions, the call index for each species present, latitude and longitude coordinates, and general notes including any noise.

3.4.3. Results and Discussion

Field biologists completed egg mass surveys along the four transects on April 19 and 20, 2022, and nocturnal call baiting surveys at 10 listening stations within the same four transects over two, 2-day events June 2 and 3 and July 14 and 15, 2022 (Figure 3.4-3 and Figure 3.4-4). No amphibian egg masses were observed during the survey events, and one BLM special status species (i.e., western toad) was heard during call baiting surveys. For reference, the location of the western toad observation from the Year 1 baseline studies is included on Figure 3.4-4.

Figure 3.4-4: Amphibian Species Observations and Vocalizations; Year 1 and Year 2 (2)—Carlin Survey Area

3.4.3.1. Transect Habitat

All four transects were located within wetlands in the greater Humboldt River floodplain and were adjacent to the Union Pacific Railroad (UPRR) (Figures 3.4-1 and 3.4-2). Surface water was present in three of the four transects (AMP#1, AMP#3, and AMP#12) located in historic drainage channels and one stream (AMP#3). These transects contained aquatic habitat in the form of shallow, standing water, and submerged vegetation root mats, as outlined in Table 3.4-3. The dominant emergent vegetation within the survey areas included bulrush species (*Schoenoplectus* spp.), residual cattail (*Typha* spp.), and sedges (*Carex* spp.).

Table 3.4-3: Aquatic Habitat at Transect Locations

Transect ID	Aquatic Habitat	Waterbody Descriptions		Species Observed and Life Cycle	Emergent Vegetation Abundance	Emergent Vegetation Species
		Average Water Depth (inches)	Flow			
AMP#1	Shallow, standing water	5.5	None	None	25–50%	Residual bulrush and cattail spp.
AMP#2	None	Dry	None	None	>50%	Bulrush spp.
AMP#3	Drainage channel with flow	19.6	Slow	American bullfrog - Metamorph	>50%	Bulrush spp.
AMP#12	Partly-submerged vegetation in inundated portion of wetland	4.7	None	None	>50%	Sedges, bulrush, and cattail spp.

ID = Identification

Transect AMP#1 was placed in a wetland located approximately 30 feet west of the UPRR (Figure 3.4-1). When water is present, this wetland drains southeast into the Humboldt River and outside of the Project Area. At the time of surveys, the wetland was not connected hydrologically to the Humboldt River. Transect AMP#1 was 736 feet long, with aquatic conditions over approximately 400 feet along in the southern section. The remaining section on the northern portion was dry. Dominant wetland vegetation consisted of bulrush and cattail species (see Photo 7 in Section D.1 of Appendix D, Amphibians Data).

Transect AMP#2 is 646 feet long and was placed in a wetland approximately 1,320 feet northwest of the Humboldt River and approximately 180 feet northwest of the UPRR (Figure 3.4-2). During egg mass surveys, no standing water was observed within the transect, but saturated soils were present following a drainage feature running along the transect. Water marks on vegetation adjacent to the drainage feature (see Photo 2 in Section D.1 of Appendix D, Amphibians Data), indicated water levels along this transect fluctuate and habitat in this area may be lacking permanent water sources required for egg mass deposition. Dominant wetland vegetation within the transect consisted of bulrush species.

Transect AMP#3 is located approximately 30 feet northwest of the UPRR and approximately 100 feet southwest of AMP#2 (Figure 3.4-2). The transect is 939 feet long and runs along two drainage channels and associated wetlands. The drainage channel in the northern section of the transect was dry during the time of surveys (see Photo 4 in Section D.1 of Appendix D, Amphibians Data). The drainage in the southern portion of the transect receives flows from the abutting wetlands and supported low flows at the time of survey as it drained northwest to a culvert under the UPRR. Bulrush was the dominant emergent wetland vegetation observed.

AMP#12 is located within wetland adjacent to the Humboldt River and southwest of the town of Carlin (Figure 3.4-1). The transect is 967 feet long, of which approximately 800 feet of the northern section was dry at the time of egg mass surveys. As the wetland drains towards the Humboldt River, several drainage channels have formed (shown on Photo 5 in Section D.1 of Appendix D, Amphibians Data). Dominant wetland vegetation consisted of sedges, bulrush, and cattail with some scattered willow shrubs (*Salix* spp.) along the edges of the wetland area.

3.4.3.2. Egg Mass Surveys

No amphibian egg masses were observed during surveys. Biologists identified only one species of amphibian, metamorph American bullfrogs, within a slow-moving drainage channel at Transect AMP#3. An incidental sighting of bullfrog tadpoles and adult bullfrogs that occurred in the Humboldt River approximately 140 feet southwest of Transect AMP#12 suggests bullfrogs are common in this area where aquatic habitat occurs.

3.4.3.3. Call Baiting Surveys

During the first call baiting event in June, three western toad vocalizations were heard from the listening station closest to the Humboldt River at Transect AMP#12 (Listening Station 1; AMP12_1). American bullfrogs were heard at two call stations, one within AMP#3 (Listening Station 3; AMP3_3) and one within #AMP2 (Listening Station 1; AMP2_1). The call of a western toad was suspected at AMP2_1 but could not be confirmed as the vocalization was faint. Noise from traffic on the I-80 roadway was heard during surveys at AMP#1 and AMP#12 but did not interfere or necessitate pausing the survey; however, the survey was paused for over 1 minute due to a passing train at call stations AMP1_1, AMP12_2, and AMP2_2. Detailed survey data can be found in Appendix D, Amphibians Data.

During the second survey event in July, no species of concern were heard but as many as 10 American bullfrogs were chorusing at 5 of the 10 call stations at (Table 3.4-3).

Table 3.4-4: Call Baiting Survey Data Summary

Transect	Site ID	Call Baiting Results	
		June Survey	July Survey
1	AMP1_1	None	None
	AMP1_2	None	None
2	AMP2_1	American bullfrog	American bullfrog
	AMP2_2	None	American bullfrog
3	AMP3_1	None	None

Transect	Site ID	Call Baiting Results	
		June Survey	July Survey
	AMP3_2	None	None
	AMP3_3	American bullfrog	American bullfrog
12	AMP12_1	Western toad	American bullfrog
	AMP12_2	None	None
	AMP12_3	None	American bullfrog

ID = identification

Amphibian abundance in the Project Area has likely been negatively impacted by ongoing regional drought. In Elko County, 2022 was the 4th driest year to date since 1894 (NOAA 2022b). The U.S. Drought Monitor classified the town of Carlin as in severe drought (D2) during April, June, and July (NOAA 2022b), coinciding with egg mass and call baiting surveys. A negative correlation between amphibian captures and extended drought has been documented in various studies (Bucciarelli et al. 2020; Hitchcock 2001).

Records of northern leopard frogs in northeast Nevada date back to 1911 to 1916 along and near the Humboldt River (AmphibiaWeb 2022; Rogers and Peacock 2012). Rogers and Peacock (2012) conducted surveys at historic northern leopard frog monitoring locations and additional areas with suitable habitat in eastern Nevada in 2001, identifying northern leopard frogs at only 18 of the 97 historical sites, with the nearest population identified approximately 30 miles east of the Carlin Survey Area. There have been no other nearby reports of northern leopard frogs since 1916 (AmphibiaWeb 2022), and most Nevada populations are thought to be extirpated (Rogers and Peacock 2012).

Columbia spotted frogs have been documented in Maggie Creek since 1912 and more recently within 3.7 miles—the maximum known dispersal distance—of the Carlin Survey Area (USFWS 2015; NDOW 2015). However, recent barriers to movement such as land development and drought are fragmenting habitat populations, making presence in the Project Area from the Maggie Creek location unlikely. Activity and movement patterns are generally unknown for the Columbia spotted frog, but activity is sporadic in May and early June with frogs remaining underwater during periods of low temperatures (Patla and Keinath 2005). No presence of Columbia spotted frog was observed or heard during the 2022 surveys.

One western toad was observed at AMP#2 during the Year 1 baseline surveys, and western toad vocalizations were confirmed at AMP#12 during the 2022 call baiting surveys in June, suggesting this species is present within the Carlin Survey Area and thus the Project Area. Activity of western toads varies seasonally and geographically, potentially explaining the observations and vocalizations occurring in different transect locations. Because western toads return to the same breeding site every year, it is possible that drought conditions have limited the number of toads returning to these sites, or that toads have had to use other locations for breeding instead. The presence of American bullfrogs throughout the study may also impact western toad activity, from predation on tadpoles early in the season to competition with native species for resources.

3.5. SPRINGSNAILS

3.5.1. Background

Springsnails are small aquatic gastropods (snails) that live in fresh and brackish waters and are often endemic to specific seep and spring ecosystems (Springsnail Conservation Team 2020). Because the springs and seeps they occupy are often widely dispersed and disconnected, most springsnail populations are highly isolated (Wildlife Action Plan Team 2013). Many springsnails have specialized adaptations to the particular geochemistry and temperature of the individual springs and occur at only one or a few water sources (Stevens et al. 2022). Springsnails are particularly diverse in arid Nevada and Utah, where at least 103 taxa have been documented (Springsnail Conservation Team 2020; Stevens et al. 2022). The size and featureless shells of springsnails make them difficult to study, and there is limited information available for described species (Hershler and Liu 2017). The 13 springsnail species listed as BLM special status species potentially occurring in the Project Area are described in Table 3.5-1. Additionally, springsnail genera *Eremopyrgus*, *Fluminicola*, *Juga*, *Pyrgulopsis*, and *Tryoniaare* are included in NDOW's 2013 WAP and are at moderate risk of extinction because of their localized ranges, small population sizes, and site-specific endemism (Wildlife Action Plan Team 2013).

Table 3.5-1: Agency Status and General Habitat for Springsnails

Species	Agency Status	Nevada Wildlife Action Plan Habitat Description
California floater (*Anodonta californiensis*)	BLM Nevada Sensitive	Shallow areas associated with clean, clear lakes, ponds, and large rivers. Prefer lower elevations and soft, silty substrate for burrowing.
Carinate Duckwater pyrg (*Pyrgulopsis carinata*)	BLM Nevada Sensitive	Known to inhabit Little Warm Spring in Duckwater Valley, Nye County, Nevada.
Duckwater pyrg (*Pyrgulopsis aloba*)	BLM Nevada Sensitive	Only known to inhabit two unnamed springs northwest and southeast of Duckwater, Nevada.
Duckwater Warm Springs pyrg (*Pyrgulopsis villacampae*)	BLM Nevada Sensitive	Known to inhabit Big Warm Springs complex in Duckwater Valley, Nye County, Nevada.
Goshute mountain snail (*Oreohelix loisae*)	BLM Nevada Sensitive	Restricted to limestone spring features. Only known to inhabit two springs in the Goshute Mountains, Elko County, Nevada.
Humboldt pyrg (*Pyrgulopsis humboldtensis*)	BLM Nevada Sensitive	Restricted to the aquatic systems in the Lahontan Basin.
Large-gland Carico pyrg (*Pyrgulopsis basiglans*)	BLM Nevada Sensitive	Known to inhabit two springs along Crooks Creek in Carico Lake Basin, Lander County, Nevada. Insufficient surveys to delineate habitat requirements.
Median-gland Nevada pyrg (*Pyrgulopsis pisteri*)	BLM Nevada Sensitive	Known to inhabit Marsh Springs, North Scruggs Springs, and below School Springs (all within 1.2 miles of each other).
Oasis Valley pyrg	BLM Nevada Sensitive	Known to inhabit springs in Oasis Valley, Nevada.

Species	Agency Status	Nevada Wildlife Action Plan Habitat Description
(*Pyrgulopsis micrococcus*)		
Ovate Cain Spring pyrg (*Pyrgulopsis pictilis*)	BLM Nevada Sensitive	Known to inhabit springs within the Reese River Valley, Nevada.
Sada's pyrg (*Pyrgulopsis sadai)*	BLM Nevada Sensitive	Known to inhabit two springs north of Carlin, Nevada.
Southern duckwater pyrg (*Pyrgulopsis anatine*)	BLM Nevada Sensitive	Known to inhabit a single spring southeast of Old Collins Springs near Duckwater, Nevada.
Vinyards pyrg (*Pyrgulopsis vinyardi*)	BLM Nevada Sensitive	Restricted to springs in the Lahontan Basin.

Source: BLM 2018; Wildlife Action Plan Team 2013

BLM = Bureau of Land Management

Seeps and springs providing suitable habitat for springsnails are prevalent throughout the Project Area region, with more than 4,000 springs occurring in Nevada and 1,600 seeps and springs documented in Eureka County (Wildlife Action Plan Team 2013; Eureka County 2016). Seeps and springs occur where deep or shallow groundwater flows from bedrock or natural fill (aquifers) onto the land surface and forms surface flow or a waterbody (Wildlife Action Plan Team 2013). Seeps and springs represent rare and important habitat because they provide moist oases in otherwise arid environments. Springsnails typically occur at elevations of less than 6,550 feet (Stevens et al. 2022).

Impacts to aquatic habitats and springsnails can result from pumping of groundwater (Hershler et al. 2014), livestock activity, and the establishment of non-native aquatic organisms (Wildlife Action Plan Team 2013). The introduction of non-native crayfish, particularly the red swamp crayfish (*Procambarus clarkii*), virile crayfish (*Orconectes virilis*), and rusty crayfish (*Orconectes rusticus*), has been linked to the collapse or reduction of springsnail populations through intense predation in various Nevada springs (Springsnail Conservation Team 2020). Parasites within non-native aquatic organisms, such as the trematode in some red-rimmed melania snail (*Melanoides tuberculate*), can impact populations by reducing successful reproduction of native springsnails. Additionally, the invasive New Zealand mudsnail (*Potamopygrus antipodarum*) are able to asexually reproduce and outcompete native springsnail populations that rely on sexual reproduction (Springsnail Conservation Team 2020).

3.5.2. Study Methodology

During Year 1 Baseline Field Studies, areas supporting aquatic habitat suitable to springsnails were identified within the Project Area (ERM 2022a). Based on this evaluation, 11 locations with suitable springsnail habitat were evaluated for springsnail species during Year 2 baseline studies, including 4 locations in both the Goldstrike and Carlin Survey Areas and 3 locations in the Crescent Valley Survey Area (Table 3.5-2). Springsnail surveys were conducted May 18 to 20, 2022, and completed in accordance with the *Nevada Springsnail Survey Protocol* (Helmig et al. 2018).

Table 3.5-2: Springsnail Survey Locations

Survey Area	Location	Name
Goldstrike	GS01	Rodeo Creek
	GS02	Boulder Creek
	GS03	Welches Creek Reach 2
	GS04	Welches Creek Reach 1
Carlin	CA01	Warm Springs Reach 1 and 2
	CA02	Wetland
	CA03	Wetland
	CA04	Wetland
Crescent Valley	CV01	Cottonwood Creek Diversion
	CV02	Brock Creek Diversion
	CV03	Indian Creek

Two biologists conducted presence/absence surveys at each of the 11 locations. The location of each surveyed spring was recorded to sub-meter accuracy using a Trimble R1 receiver and the ArcGIS Field Maps application. The type of spring was documented as a limnocrene spring, which occur when groundwater flows into one or more pools before entering a channel; rheocrene spring, which emerge and immediately enter a channel; or a helocrene spring, which emerge diffusely in a marshy, wet meadow and lack a discrete source (Stevens et al. 2020; Helmig et al. 2018). In addition to identifying the spring type, biologists collected water quality information using a YSI Pro1020 handheld meter to measure temperature, specific conductance, and pH. If water was flowing, biologists recorded the flow status, turbidity, water depth, and wetted width. All data were recorded electronically using ArcGIS Survey123 data forms.

Starting from the springhead or most upstream portion of the water source, biologists searched opposing sides of the channel for springsnails, moving in a downstream direction. Both biologists moved in tandem to reduce duplicating search effort. Springsnails are often attached to the surface of gravel, cobbles, and other instream substrate and biologists searched through the channel substrate, picking up individual rocks or sticks and examining each side before moving downstream. Care was taken to not stir fine sediments and reduce visibility. Submerged stems of living and/or dead vegetation present within the channel were also examined for springsnails. The survey continued until either the first live snail was detected or the search time reached 10 minutes. If a live snail was detected, biologists recorded the distance from the beginning of the reach and time to the first detected live snail. Upon detecting a springsnail, the second protocol for the timed observation count occurred.

The second protocol (i.e., the timed observation count) consisted of an additional 10-minute search of the channel, moving downstream from the location of the first snail encounter. Biologists again searched the channel substrate and submerged vegetation for springsnails in tandem and maintained separate counts. At the end of the 10-minute search, the sum of each biologists' counts was recorded as the total number of observed springsnails for the location. Biologists documented the total occupied length, which is the length of the wetted run occupied

by springsnails. Notable habitat disturbance and if other aquatic species were present were also documented. If springsnails were present, habitat and water quality data was recorded for the springhead, mid-point of run, and the end of the occupied length. If springsnails were not observed, habitat, water quality, vegetation, and substrate type were recorded only for the springhead. Water quality monitoring equipment and field biologists' apparel were decontaminated between each location.

3.5.3. Results and Discussions

Field surveys were conducted at 11 locations within the Project Area during the Year 2 baseline studies May 18 to May 20, 2022 (Figures 3.4-1 through 3.4-3). Surveys included four locations in the Goldstrike Survey Area, four locations in the Carlin Survey Area, and three locations in the Crescent Valley Survey Area. Springsnails were observed at one location within the Carlin Survey Area (see Photo 15 in Section E.2 of Appendix E, Springsnail Data). Table 3.5-3 summarizes the springsnail survey data, including spring type, presence of springsnails, and water quality data. Detailed Survey123 field data forms and representative photographs can be found in Appendix E, Springsnail Data.

Table 3.5-3: Springsnail Survey Results

Location	Spring Type	Total Wetted Length (feet)	Springsnails Observed	Number of Springsnails Observed	Total Occupied Length (feet)	Water Quality		
						pH	Flow Conditions	Temp (°F)

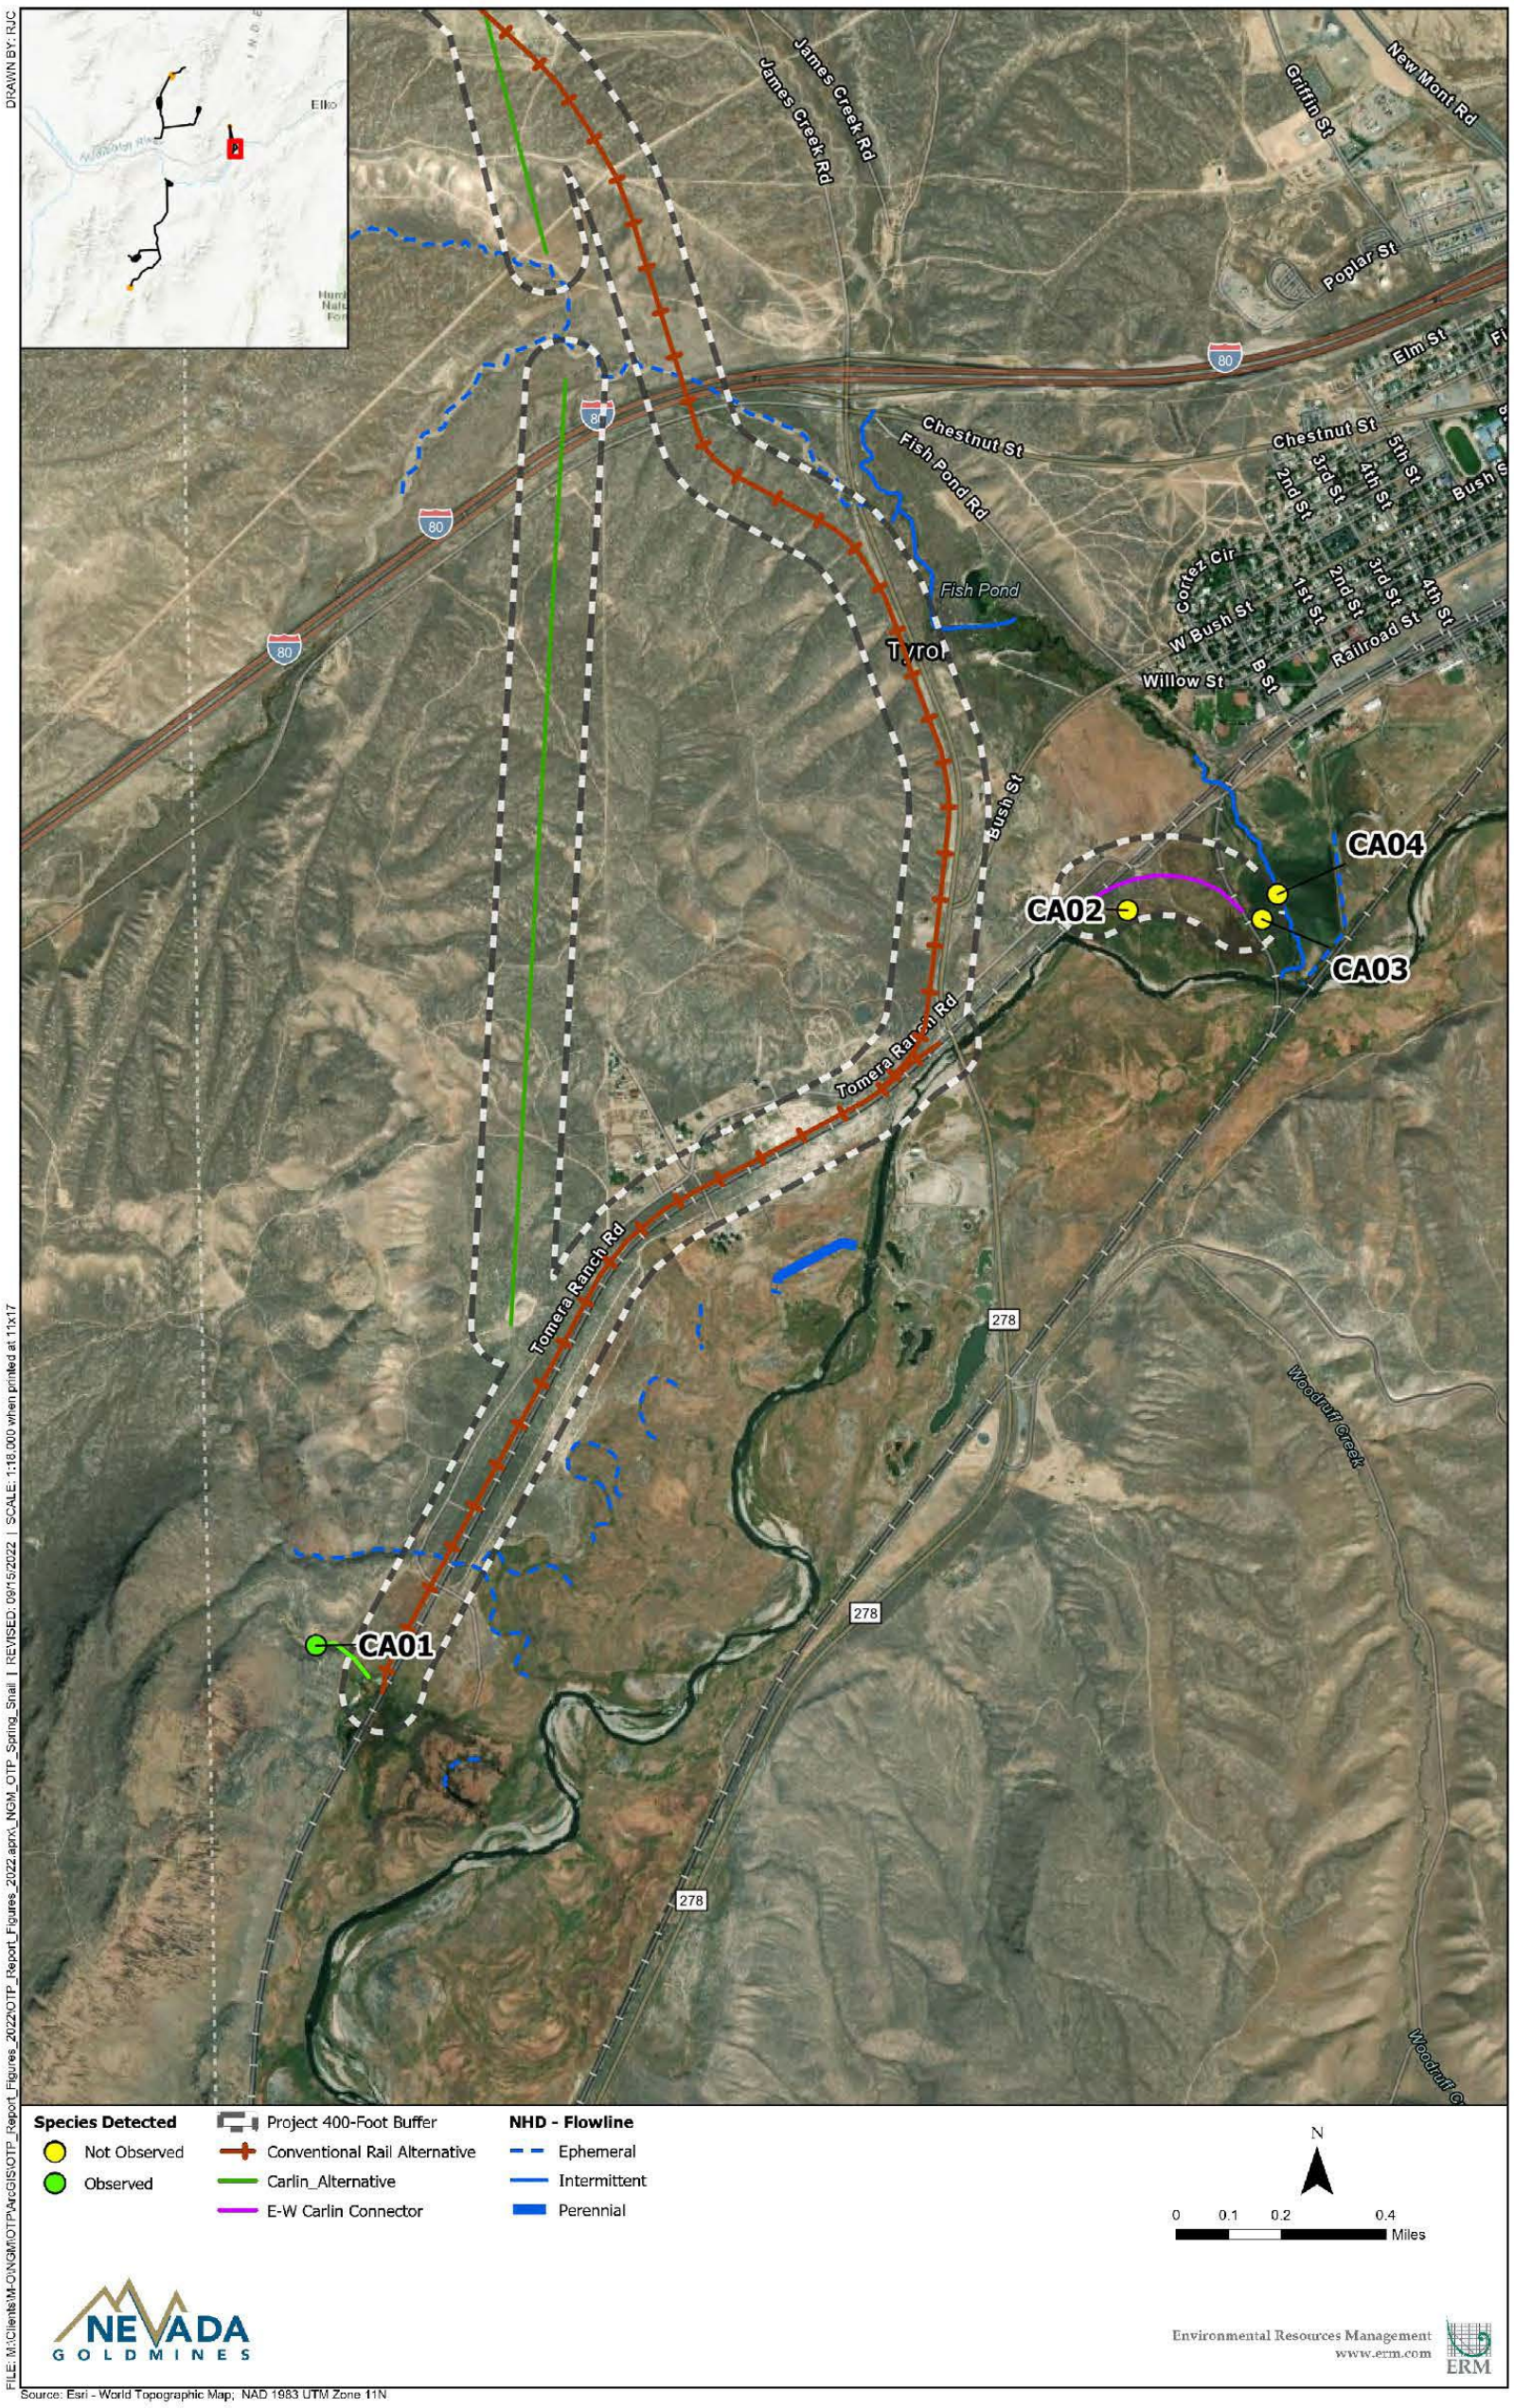

Figure 3.5-2: Springsnail Survey Locations—Carlin Survey Area

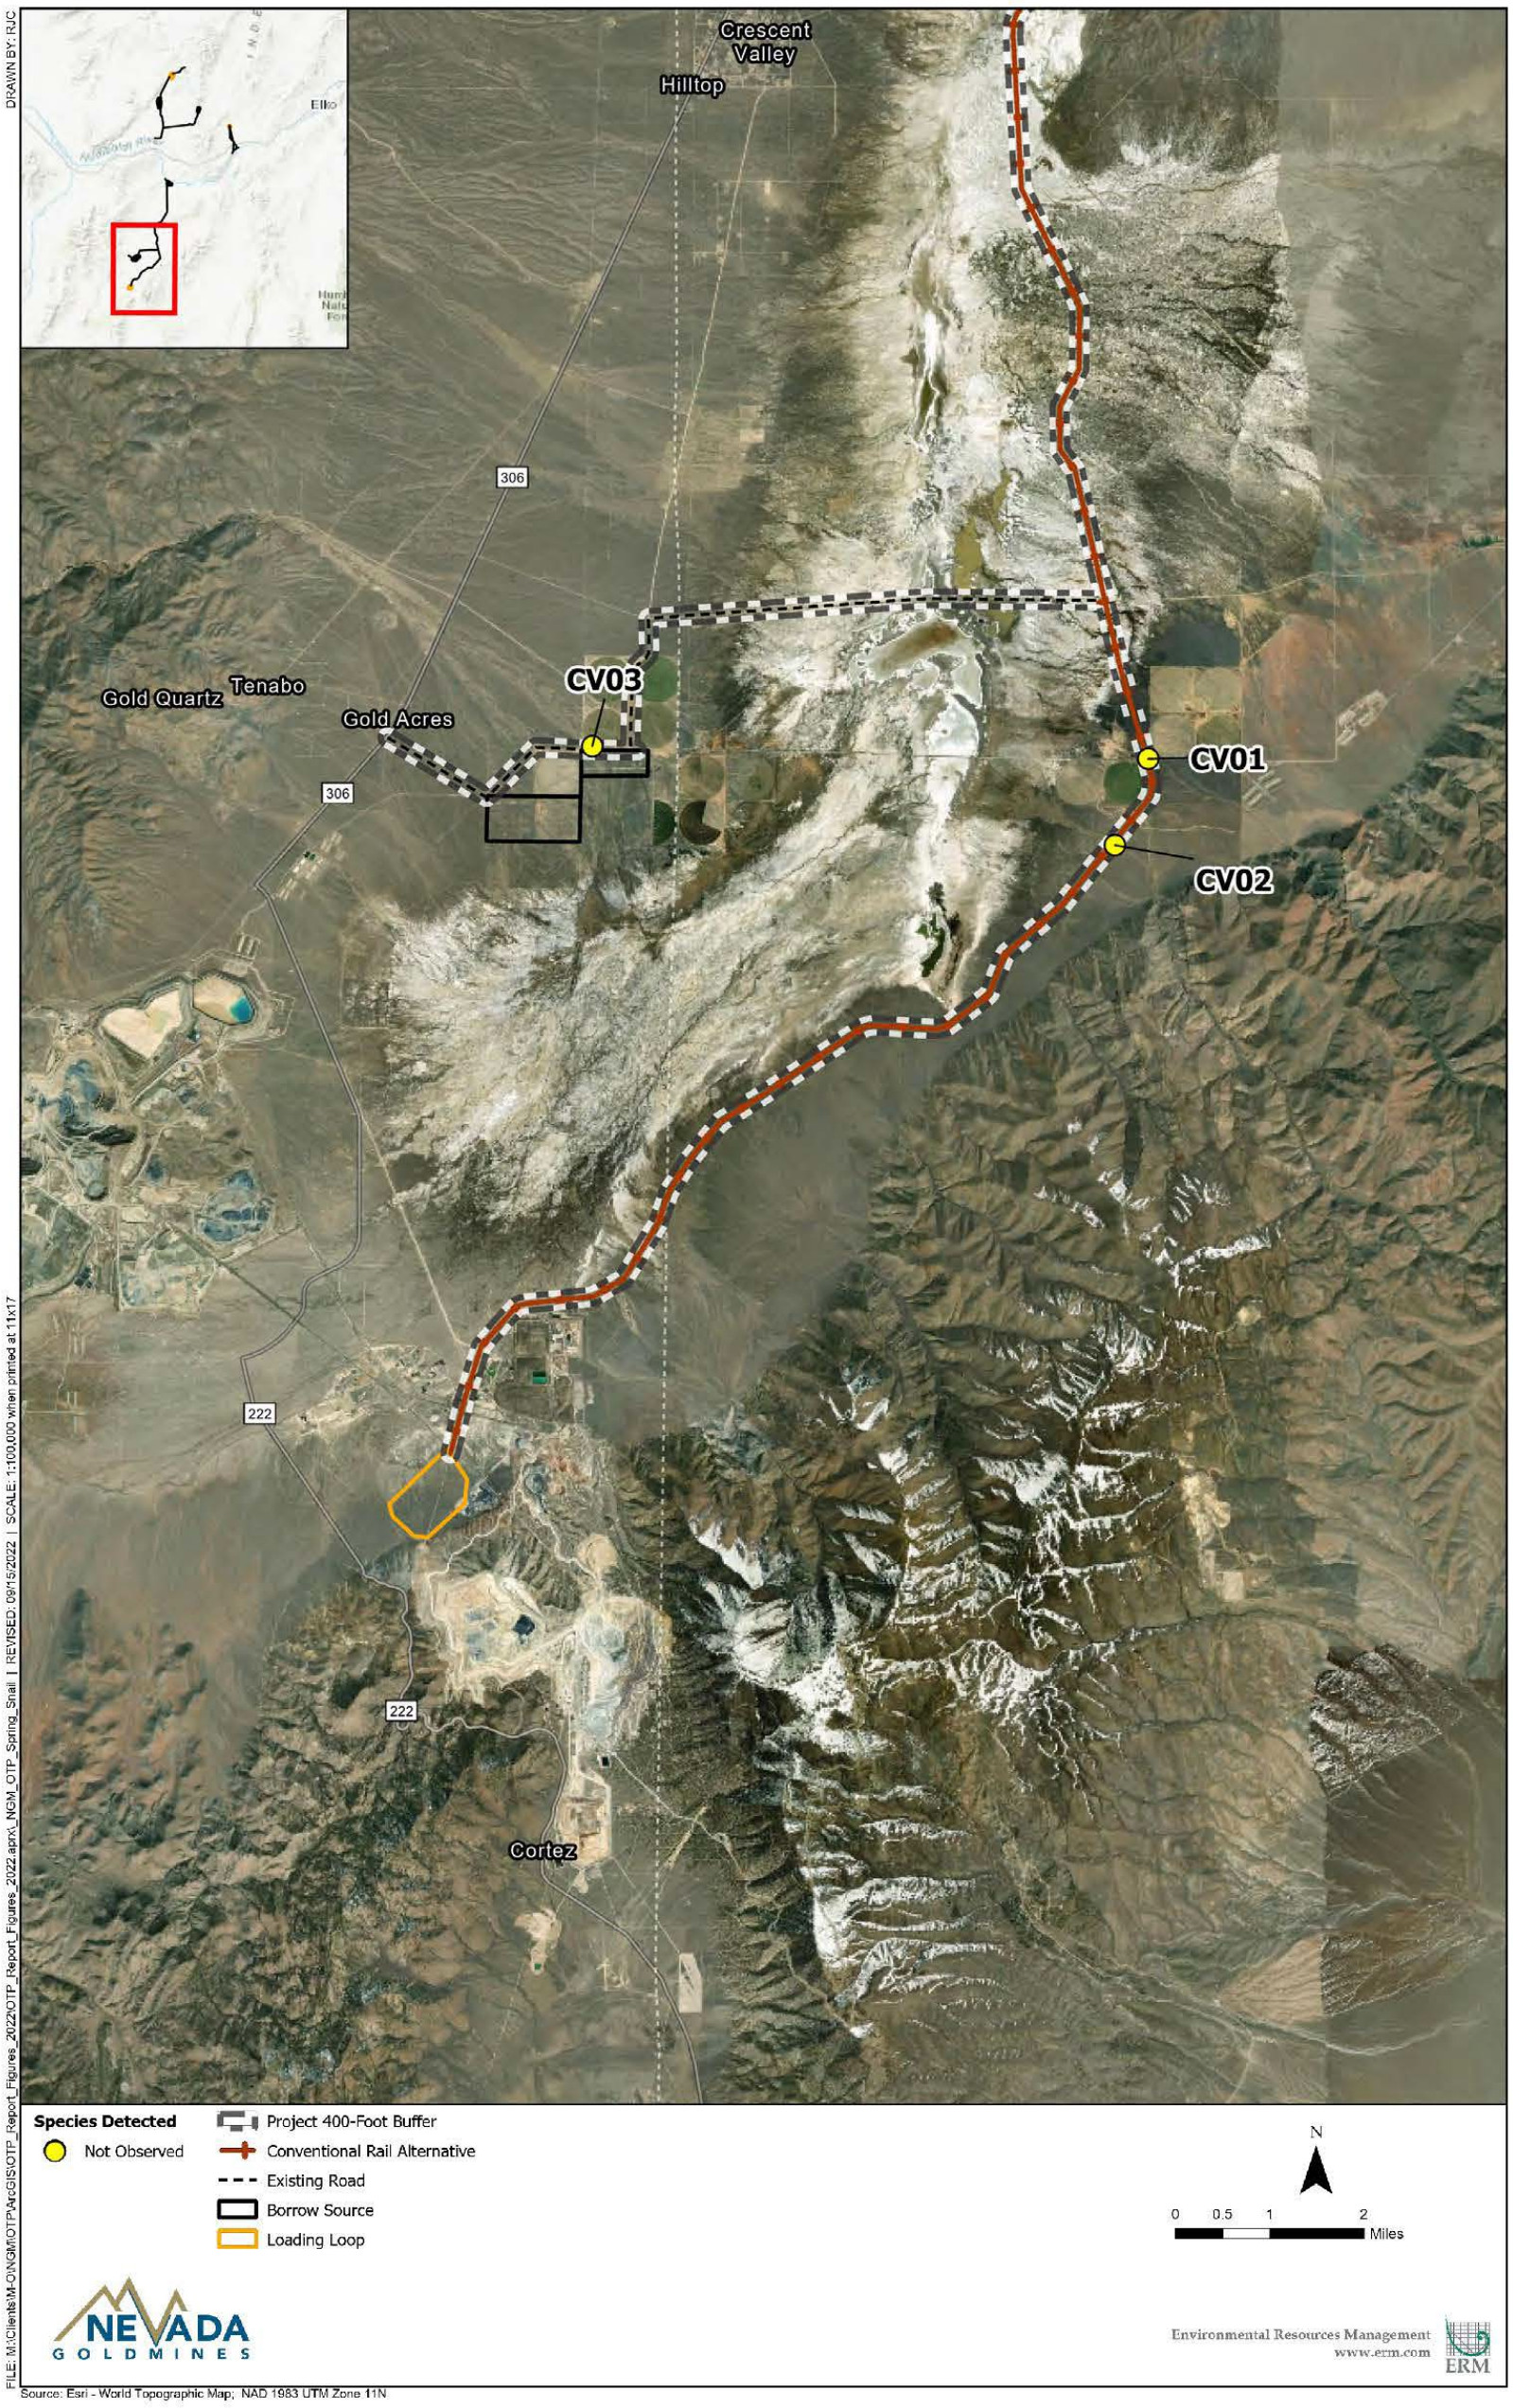

Figure 3.5-3: Springsnail Survey Locations—Crescent Valley Survey Area

Page Intentionally Left Blank.

The four locations surveyed in the Goldstrike Survey Area were GS01, GS02, GS03, and GS04. Sites GS01 and GS02 were dry at the time of survey, and flowing water was observed at sites GS03 and GS04 (see Photos 1, 3, 5, and 7 in Section E.2 of Appendix E, Springsnails Data). All four locations are rheocrene springs. Big sagebrush (*Atemisia tridentata*) and cheatgrass (*Bromus tectorum*) were the dominate vegetation in the riparian and upland areas of each site. Non-native plants were observed, specifically cheatgrass along the banks and common mullein (*Verbascum thapsus*) along the tops of the banks and scattered throughout the greater floodplain. Livestock paths were concentrated along the riparian zones.

The locations along GS03 (downstream) and GS04 (upstream) had clear, flowing water, with sand and silt as the dominant substrate in upstream areas and gravel dominating in downstream areas. GS04 was narrow, with steep banks and moderate flow (see Photo 8 in Section E.2 of Appendix E). Free-floating algae was attached to dead vascular vegetation, with some duckweed (*Lemnoideae* spp.) in areas with shallow pools. No other aquatic vegetation was observed at this site. The riparian zone provided some shade along the streambank. As the channel widened in GS03, the total wetted width decreased. The vegetation community in the downstream area was similar to GS04 but included additional bunch grasses (*Poaceae* spp.) and Woods' rose (*Rosa woodsii*) along the bank. Beetles (*Coleoptera)* were the only aquatic macroinvertebrate observed.

The four locations surveyed in the Carlin Survey Area were CA01, CA02 (emergent/scrub-shrub wetland boundary), CA03 (emergent/scrub-shrub wetland boundary), and CA04 (emergent/scrub-shrub wetland boundary). The surveyed locations included a variety of identified spring types: rheocrene (CA01), helocrene (CA02, CA03), and limnocrene (CA04) (Figure 3.5-1). Locations CA02, CA03, and CA04 were dry during the Year 2 springsnail survey, but CA01 contained flowing water (see Photos 9, 16, 18, and 20 in Section E.2 of Appendix E). Biologists observed springsnails at location CA01 and counted 396 springsnails during the timed observation count. To determine total occupancy of the spring, biologists checked downstream sections, concluding presence throughout the spring from the springhead to the point of intersection with a larger wetland southeast of the spring. The total wetted length and total distance of springsnail occupancy of the spring was 758 feet.

Location CA01 consisted of a cobble and gravel substrate with a steady to high flow and little to no habitat disturbance. The riparian vegetation community consisted of big sagebrush, bunch grasses, and wild rose. Emergent vegetation within the spring included sedges (*Carex* spp.), seep monkeyflower (*Erythranthe guttata*), in the downstream reaches the spring opens into a larger wetland body to the southeast and is dominated by willows (*Salix* spp.), watercress (*Nasturtium officinale*), and cattail (*Typha* spp.) (see Photos 13 and 14 in Section E.2 of Appendix E). Other aquatic macroinvertebrate species found at the CA01 location included beetle larvae (*Coleoptera* spp.) and caddisfly larvae (*Trichoptera* spp.), which were both observed on submerged rocks along with springsnail species.

Location CA02 was dry during the Year 2 baseline springsnail survey. The emergent vegetation community consisted of cattail and dark green bulrush (*Scirpus*) with stands of willow within the wetland (see Photos 16 and 17 in Section E.2 of Appendix E). Soil saturation was difficult to gauge due to the large amount of residual (dead, fallen) cattail and bullrush from previous

growing seasons. Disturbance from livestock was apparent throughout the wetland, including paths leading up the northern banks creating mild erosional channels. Location CA03 had 55.8 feet of wetted length, with little to no flow and no springsnails observed. The emergent vegetation community was dominated by cattail with willows (*Salix* spp.) scattered throughout the wider floodplain (see Photos 18 and 19 in Section E.2 in Appendix E). Location CA04 is within Mary's Creek, a tributary of the Humboldt River, and maintained a wetted length of 541 feet with moderate flow. Shallow rooted bunch grasses dominated the sandy banks, while a dense stand of willows was established beyond the grass community, dominating sections of the floodplain. No emergent vegetation was observed at this location. Impacts from livestock observed in the area included thinning of the riparian zone and trampling of the streambed and bank (see Photos 20 and 21 in Section E.2 of Appendix E). Cattle were observed in the field adjacent to the site.

The Crescent Valley Survey Area had three survey locations: CV01, CV02, and CV03. All three locations were rheocrene spring types; however, CV02 was the only location observed with flowing water during the surveys (see Photos 22, 24, and 26 in Section E.2 in Appendix E). No springsnails were observed at the three Crescent Valley Survey Area locations (Figure 3.5-3). All survey locations showed sign of disturbance from livestock and/or anthropogenic activities, which are described below.

Location CV01 was dry with no soil saturation and had been manipulated for water diversion. Large diameter water pipes were placed in the creek bed and led to a confluence of several similar pipes east of the location, likely for agricultural use on adjacent farms (see Photos 22 and 23 in Section E.2 of Appendix E). Cheatgrass was the only vegetation within the creek bed; however, rabbitbrush (*Chrysothamnus* spp.), cheatgrass, and patches of Great Basin wild rye (*Leymus cincereus*) were observed in the greater floodplain. Location CV02 was a narrow waterbody with moderate water flow and substrate dominated by gravel and cobble. Little to no emergent vegetation and a small amount of free-floating algae masses along the banks was observed (see Photos 24 and 25 in Section E.2 of Appendix E). The banks were moderately barren with cheatgrass dominating the understory between rabbitbrush, common muellin, sagebrush, and stinging nettle (*Urtica dioica*) on adjacent hillslopes. Location CV03 was dry and the streambed was dominated by cheatgrass (see Photos 26 and 27 in Section E.2 of Appendix E). Scotch thistle (*Onopordum acanthium*) and tumble mustard (*Sisymbrium* altissimum) were observed along the banks and in the greater floodplain.

Similar to other aquatic habitats in the Project Area, spring habitats provide water for livestock, wild horses, and agricultural or pastoral diversions, which can put spring and seep habitats at risk of disturbance and cause other negative impacts to springsnails. Springsnails are highly susceptible to local disturbances that affect the quantity and quality of water in which they reside. Livestock was the most common local disturbance observed throughout the springsnail survey areas, causing mobilization of sediments along banks, and extensive browsing and trampling of riparian vegetation. Springsnails were documented at one location (CA01) during Year 2 baseline studies. The area at CA01 was relatively undisturbed with the least evidence of livestock activity. Additionally, the riparian zone was intact and moderate-to-high flows were observed in the stream channel.

APPENDIX A
GREATER SAGE-GROUSE DATA

A-1. Detailed Greater Sage-grouse Survey Results

Page Intentionally Left Blank

A.1 Detailed Greater Sage-grouse Survey Results

Lek Name	Date	Time of Sunrise	Arrival Time	Surveyor #1	Surveyor #2	Lek Activity?	Wind Speed (mph)	Temperature (°F)	Cloud Cover	Precipitation	Survey Start Time	Count 1 (Males)	Count 1 (Females)	Count 1 (Unknown)	Count 2 (Males)	Count 2 (Females)	Count 2 (Unknown)	Count 3 (Males)	Count 3 (Females)	Count 3 (Unknown)	Count 4 (Males)	Count 4 (Females)	Count 4 (Unknown)	Survey End Time	High Count (Males)	High Count (Females)	High Count (Unknown)	Recent Sign Observed?	Departure Time	Notes
Indian Creek	3/11/2022	6:03	5:14	Austin Linville	Sean Basilio	No	1	16	0-25%	None	05:59	0	0	0	0	0	0	0	0	0	0	0	0	06:25	0	0	0	No	06:58	No birds or recent sign observed. Used lek route protocol.
Marys Mountain 2	4/5/2022	06:21	05:08	Kelsey Uligian	Kelsey Uligian	Yes	11	36	25-50%	None	06:15	0	0	2	0	0	0	0	0	0	0	0	0	07:25	0	0	2	Yes	08:01	No active lekking observed or heard; however, 2 unknown greater sage-grouse flushed and flew overhead prior to start of survey. Included in count 1. Walked lek after count to look for more lekking birds and recent sign. Fresh sign found approximately 1/4 mile south of the lek coordinates. No additional greater sage-grouse observed.
Marys Mountain 2	4/19/2022	05:59	05:03	Kelsey Uligian	Kelsey Uligian	Yes	8	42	25-50%	None	05:45	0	0	0	0	0	0	0	0	0	0	1	0	07:05	0	1	0	Yes	07:22	No birds observed lekking, but lek was walked for last count and a female flushed roughly 1/4 mile southwest of lek location. No other greater sage-grouse found.
Marys Mountain 2	4/27/2022	05:48	04:42	Kelsey Uligian	Kelsey Uligian	Yes	3	37	0-25%	None	05:35	0	0	0	0	0	0	0	0	0	0	2	0	06:39	0	2	0	Yes	06:58	No lekking activity observed; however, observed 2 females approximately 1/4 mile southwest of lek coordinates, near location of flush and recent sign from previous surveys. Did not walk lek or area where birds and sign have been observed to avoid disturbance during this survey.
Marys Mountain 4	4/5/2022	06:21	05:51	Nicole St. John	Nicole St. John	No	11	41	75-100%	None	06:04	0	0	0	0	0	0	0	0	0	0	0	0	07:02	0	0	0	No	07:10	Ground wet from little bit of rain this morning. Windy conditions. Walked lek to look and listen for birds and look for sign. No birds or recent sign observed.
Marys Mountain 4	4/19/2022	05:59	05:21	Nicole St. John	Nicole St. John	No	5	43	50-75%	None	05:44	0	0	0	0	0	0	0	0	0	0	0	0	06:43	0	0	0	No	06:58	Walked lek to look and listen for birds and look for recent sign. No birds or recent sign observed. Mary's Mountain 4.
Marys Mountain 4	4/27/2022	05:48	04:33	Nicole St. John	Nicole St. John	No	1	38	0-25%	None	05:35	0	0	0	0	0	0	0	0	0	0	0	0	06:41	0	0	0	No	06:47	Mary's Mountain 4. Walked lek to look and listen for birds and look for recent sign. No birds or recent sign observed.
New Brock Canyon	4/4/2022	06:24	05:31	Nicole St. John	Kelsey Uligian	Yes	11	34	50-75%	None	06:15	13	0	0	2	0	0	2	0	0	1	0	0	07:11	13	0	0	Yes	07:29	Birds flushed off lek during first count. Ravens circling lek and calling throughout survey. One Golden Eagle observed on the ground near the lek in between first and second counts. Lekking activity quiet. Any birds left on the lek after first count were just sitting on lek and not actively lekking. Windy conditions.
New Brock Canyon	4/21/2022	05:58	05:08	Henson DeBruler	Tim Wilson	Yes	9	36	25-50%	None	06:03	28	1	0	28	0	0	27	0	0	27	0	0	06:50	28	1	0	Yes	07:12	Female flew off lek between counts 1 and 2.
New Brock Canyon	4/28/2022	06:44	06:01	Kelsey Uligian	Tim Wilson	Yes	10	39	75-100%	None	06:40	22	0	0	24	0	0	22	0	0	18	1	0	07:31	24	1	0	Yes	07:48	Golden Eagle soaring roughly 1,200 meters northwest of lek starting first count. Two pronghorn on lek during first count. Wind picked up over the course of the survey.
Palisade 2	4/2/2022	06:26	05:50	Kelsey Uligian	Kelsey Uligian	No	3	34	0-25%	None	06:15	0	0	0	0	0	0	0	0	0	0	0	0	07:20	0	0	0	No	07:32	No birds observed or heard, no sign (old or recent) and no predators. Cows grazing 600 meters from lek location. Not great lekking habitat, limited sagebrush around.
Palisade 2	4/11/2022	06:11	05:30	Kelsey Uligian	Kelsey Uligian	No	9	26	50-75%	None	05:55	0	0	0	0	0	0	0	0	0	0	0	0	06:48	0	0	0	No	07:00	No sign, no calls heard or birds observed. Cows on the lek location, but no predators around.
Palisade 2	4/21/2022	05:56	04:57	Kelsey Uligian	Kelsey Uligian	No	3	36	50-75%	None	05:44	0	0	0	0	0	0	0	0	0	0	0	0	06:37	0	0	0	No	06:47	No birds or calls heard. No sign observed. Lek walked for last count.
Palisade 3	4/2/2022	06:26	05:53	Nicole St. John	Nicole St. John	No	2	34	0-25%	None	06:18	0	0	0	0	0	0	0	0	0	0	0	0	07:16	0	0	0	No	07:34	Noise from railroad and highway is very prevalent. No birds or recent sign observed. Some old sign located approximately 220 meters southwest of lek coordinates. Cattle present at lek. Pronghorn on lek.
Palisade 3	4/11/2022	06:11	05:30	Nicole St. John	Nicole St. John	No	9	26	75-100%	None	05:55	0	0	0	0	0	0	0	0	0	0	0	0	07:01	0	0	0	No	07:04	Walked lek to look for sign and listen/look for birds. No recent sign or birds observed.
Palisade 3	4/21/2022	05:56	04:57	Nicole St. John	Nicole St. John	No	4	38	50-75%	None	05:43	0	0	0	0	0	0	0	0	0	0	0	0	06:44	0	0	0	No	06:49	Walked lek to look and listen for birds and look for recent sign. No birds or recent sign observed.
Richmond Mtn	4/6/2022	06:20	05:22	Nicole St. John	Kelsey Uligian	No	3	24	0-25%	None	06:01	0	0	0	0	0	0	0	0	0	0	0	0	07:02	0	0	0	No	07:22	Walked lek to listen and look for birds. No birds or sign observed. Mine noise prevalent at lek.
Richmond Mtn	4/16/2022	06:03	04:48	Kelsey Uligian	Nicole St. John	No	3	29	25-50%	None	05:45	0	0	0	0	0	0	0	0	0	0	0	0	06:41	0	0	0	No	06:50	No birds or sign observed, no lekking noises heard. Mine noise very prevalent. Walked the Lek during the 4th count.
Richmond Mtn	4/29/2022	5:45	5:01	Kelsey Uligian	Nicole St. John	No	3	37	25-50%	None	5:30	0	0	0	0	0	0	0	0	0	0	0	0	6:23	0	0	0	No	6:35	No birds observed or sign found. Walked lek for 3rd and 4th count.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-1 transect	0642316

Photo No.	Date:
1	5/3/2022

Direction Photo Taken:
Southwest

Description:
Overview of the TS1-1 transect. Dominant shrubs species are black greasewood and shadscale.

Photo No.	Date:
2	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 1 within the TS1-1 transect. Soils are loose and friable near bases of shrubs, soil cracks observed as a result of ephemeral saturation.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-1 transect	0642316

Photo No.	Date:
3	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 2 within the TS1-1 transect. Soils are loose and friable near bases of shrubs, soil cracks observed as a result of ephemeral saturation.

Photo No.	Date:
4	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 3 within the TS1-1 transect. Soils are most friable near bases of shrubs but expand in some area.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-1 transect	0642316

Photo No.	Date:
5	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 4 within the TS1-1 transect. Soils are loose and friable near bases of shrubs, soil cracks observed as a result of ephemeral saturation.

Photo No.	Date:
6	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 5 within the TS1-1 transect. Soils are most friable near bases of shrubs, soil cracks observed as a result of ephemeral saturation. Evidence of bio-crusts shown in right of image near shrub base.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-1 transect	0642316

Photo No.	Date:
7	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 6 within the TS1-1 transect. Soils are most friable near bases of shrubs. Wildlife paths with relatively more compacted soils cross the landscape.

Photo No.	Date:
8	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 7 within the TS1-1 transect. Soils are loose and friable near bases of shrubs. Some evidence of ephemeral pooling in top-left of image.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-1 transect	0642316

Photo No.	Date:
9	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 8 within the TS1-1 transect. Soils are most friable near bases of shrubs. Wildlife paths with relatively more compacted soils cross the landscape.

Photo No.	Date:
10	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 9 within the TS1-1 transect. Soils are loose and friable near bases of shrubs. Wildlife paths with relatively more compacted soils cross the landscape.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-1 transect	0642316

Photo No.	Date:
11	5/3/2022

Direction Photo Taken:
Southwest

Description:
Close view of trap 10 within the TS1-1 transect. Soils are most friable near bases of shrubs. Large bunches of shrubs often results in larger areas of loose, friable soil.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-2 transect	0642316

Photo No.	Date:
12	5/3/2022

Direction Photo Taken:
South

Description:
Overview of the TS1-1 transect. Increasing amounts of open bare soils were observed as transects neared playa habitats.

Photo No.	Date:
13	5/3/2022

Direction Photo Taken:
South

Description:
Close view of trap 1 within the TS1-2 transect. Soil cracks and thin salt layer evidence of ephemeral saturation. Friable soils near shrub bases.

PHOTOGRAPHIC LOG

Client Name:	Site Location:	Project No.:
Nevada Gold Mines	TS1-2 transect	0642316

Photo No.	Date:
14	5/3/2022

Direction Photo Taken:
South

Description:
Close view of trap 2 within the TS1-2 transect. Soil cracks and thin salt layer evidence of ephemeral saturation. Friable soils near shrub bases. Habitat within a transition zone between greasewood flat and playa-type habitat.

Photo No.	Date:
15	5/3/2022

Direction Photo Taken:
South

Description:
Close view of trap 3 within the TS1-2 transect. Soil cracks and thin salt layer evidence of ephemeral saturation. Friable soils near shrub bases. Habitat within a transition zone between greasewood flat and playa-type habitat.

Northeast

Description:
Close view of trap 7 within the TS3-5 transect. Open areas within the transect were dominated by desiccated cheatgrass and clasping pepperweed. Great Basin wild rye, bottlebrush squirreltail, and Indian ricegrass was spares throughout the transect. Sand banks are not present.

CV03_SH	5/24/2022	19:46	5/28/2022	06:12	SeanBasilio	DanRobison	72	None	Calm	0-25	10	Linear	Riparian Corridor	Perennial	Reed	8	5	Greasewood	n/a	Yes	No	No	No	No	No	No	Yes	Cow droppings, trails observed.
CV04_SH	5/24/2022	19:44	5/28/2022	06:38	AustinLinville	MichaelRobison	67	None	Calm	0-25	10	Parallel	Spring Source	Perennial	Rush	10.5	0	Rabbitbrush, Sagebrush	No	Yes	No	No	Yes	No	No	No	Yes	Cow droppings, trails observed. Two posts and spare barbed wires coiled in northwest portion of spring. The spring area resembles a wet meadow, soils are saturated.
CV05_SH	5/24/2022	20:24	5/28/2022	06:30	SeanBasilio	DanRobison	67	None	Calm	0-25	10	Parallel	Spring Source	Perennial	Rush	10	0	Rabbitbrush, Sagebrush	No	Yes	No	No	No	No	No	No	Yes	Cow droppings, trails observed. The spring area resembles a wet meadow, soils are saturated.
CV06_SH	5/24/2022	19:03	5/28/2022	06:05	AustinLinville	MichaelRobison	75	None	Light	0-25	10	Parallel	Riparian Corridor	Perennial	Rush	2	75	Rabbitbrush	n/a	Yes	No	No	Yes	Yes	Yes	No	Yes	Cow droppings, trails observed. The waterbody appears artificial. Within Cortez PoO boundary. Dense cattail (*Typha*) stands in waterbody.
CV07_SH	5/24/2022	18:47	5/28/2022	05:56	AustinLinville	MichaelRobison	77	None	Light	0-25	10	Parallel	Riparian Corridor	Perennial	Other	4	16	Greasewood	n/a	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Cow droppings, trails observed. The waterbody is likely artificial. Salt cedar observed on western shoreline of waterbody. Within Cortez Plan of Operations boundary. Cheatgrass and halogeton in understory.
CV08_SH	5/24/2022	18:06	5/28/2022	05:26	AustinLinville	MichaelRobison	77	None	Light	0-25	10	Parallel	Riparian Corridor	Ephemeral	Other	0	0	Sagebrush	n/a	Yes	No	No	Yes	No	No	No	Yes	Cow droppings, trails observed. The waterbody appears channelized with several large diameter above ground water pipes immediatly south of trapping location. There is gravel and sand piled up on banks. No water, no soil moisture, and no mesic vegetation. Vegetation along banks include: Russian thistle, big sagebrush, Western tansymustard, whitetop, cheatgrass.
CV09_SH	5/24/2022	17:36	5/28/2022	05:12	AustinLinville	MichaelRobison	76	None	Light	0-25	10	Parallel	Riparian Corridor	Perennial	Rush	4	6	Sagebrush	n/a	Yes	Yes	No	Yes	No	No	Yes	Yes	Cow droppings, trails observed. Shallow tire tracks on either side of waterbody observed. The water originates at cattle trough, and area is fenced in for cattle. Cheatgrass, and clasping pepperweed observed
CV10_SH	5/24/2022	18:48	5/28/2022	05:31	SeanBasilio	DanRobison	74	None	Light	0-25	10	Parallel	Spring Source	Perennial	Rush	3	1	Rabbitbrush	No	Yes	No	No	Yes	No	No	No	Yes	Cattle droppings observed. Old fence line observed near transect.
GS01_SH	6/3/2022	19:16	6/7/2022	05:16	AustinLinville	MichaelRobison	72	None	Calm	50-75	10	Parallel	Wet Meadow	Perennial	Rush	22	2	Sagebrush	n/a	No	No	No	Yes	Yes	No	Yes	Yes	Located within Goldstrike Plan of Operations. Haul roads surround the area, and an aboveground pipeline is directly south of the site. Cheatgrass within the immediate area.
GS02_SH	6/3/2022	17:28	6/7/2022	06:18	AustinLinville	MichaelRobison	72	None	Calm	0-25	10	Parallel	Riparian Corridor	Ephemeral	Other	1.5	0	Sagebrush	n/a	Yes	Yes	No	No	No	No	Yes	Yes	Cattle droppings observed. Established two-track immediately north of site. Cheatgrass, narrowleaf milkweed, common nettle along stream banks. The stream reach is dry, but has sparse moist spots in thalweg (deepest part of channel).
GS03_SH	6/3/2022	17:48	6/7/2022	06:23	AustinLinville	MichaelRobison	70	None	Calm	0-25	10	Parallel	Riparian Corridor	Perennial	Rush	0.5	0.75	Sagebrush	n/a	Yes	No	No	No	No	No	Yes	Yes	Cattle droppings observed. Cheatgrass within the immediate area.
GS04_SH	6/3/2022	18:18	6/7/2022	06:27	AustinLinville	MichaelRobison	70	None	Calm	0-25	10	Parallel	Riparian Corridor	Perennial	Rush	1.5	0.75	Sagebrush	n/a	Yes	Yes	No	No	No	No	Yes	Yes	Cattle droppings observed. Established two-track immediatly north of trap location. Cheatgrass within the immediate area.

Springsnail Survey: Habitat Data

Habitat Description:

Completely dry stream bed with no soil saturation present. Little vegetation observed, cheatgrass has dominated the area. Sagebrush dominant within the floodplain.

Spring Run Physical Measurements			Water Quality Parameters					Dominant Vegetation*	Substrate Composition (as Percent Cover)					
Total Wetted Length of Run (m)	Width (m)	Depth (cm)	Flow*	Turbidity	Temp (C)	pH	Cond (uS)	Species or Type	Clay	Silt	Sand	Gravel	Cobble	Boulder
0														
Total Occupied Lengh (m)	-	-	-	-	-	-	-	BRTE	-	-	-	-	-	-
0														

Evidence of Habitat Disturbance	Present*			Notes
Springhead Modification	Y	N	**N/A**	
Ungulate Use	**Y**	N	N/A	Cattle disturbance throughout, paths up banks causing erosion.
Off-trail OHV Use	Y	N	**N/A**	
Wildfire	Y	N	**N/A**	
Human Disturbance	Y	N	**N/A**	
Oil, Gas, Mineral, Geothermal	Y	N	**N/A**	
Aquatic Invasive Spp.	Y	N	**N/A**	
Riparian Invasive Spp.	**Y**	N	N/A	Cheatgrass prevalent throughout survey area.
Drought	**Y**	N	N/A	
Other	Y	N	**N/A**	

Sketch of Spring (Identify spring head [SH], path of spring run flowing downslope, end of water, other features like pooled water, spring box, etc.)

Spring Run Aspect
(Direction of Flow)

N/A

*Definitions

Substrate Composition Approximate Size Comparison	Spring Flow Qualitative Estimate
Boulder = 600mm (beach ball) Cobble = 64mm (tennis ball) Gravel = 2mm (match head) Sand = 1.5-0.1mm Silt = <0.1mm	L = Little/no flow; mostly stagnant M = Moderate flow; moves fine particles H = High Flow w/ turbulance; strong riff

Springsnail Survey: Habitat Data

Habitat Description:

Altered waterbody in a channel, very narrow and slow flowing water. Mostly barren banks and no real floodplain due to alterations. Cheatgrass, common muellin, and stinging nettle with sagebrush beyond the channel. Little to no emergent vegetation.

Spring Run Physical Measurements			Water Quality Parameters					Dominant Vegetation*	Substrate Composition (as Percent Cover)					
Total Wetted Length of Run (m)	Width (m)	Depth (cm)	Flow*	Turbidity	Temp (C)	pH	Cond (uS)	Species or Type	Clay	Silt	Sand	Gravel	Cobble	Boulder

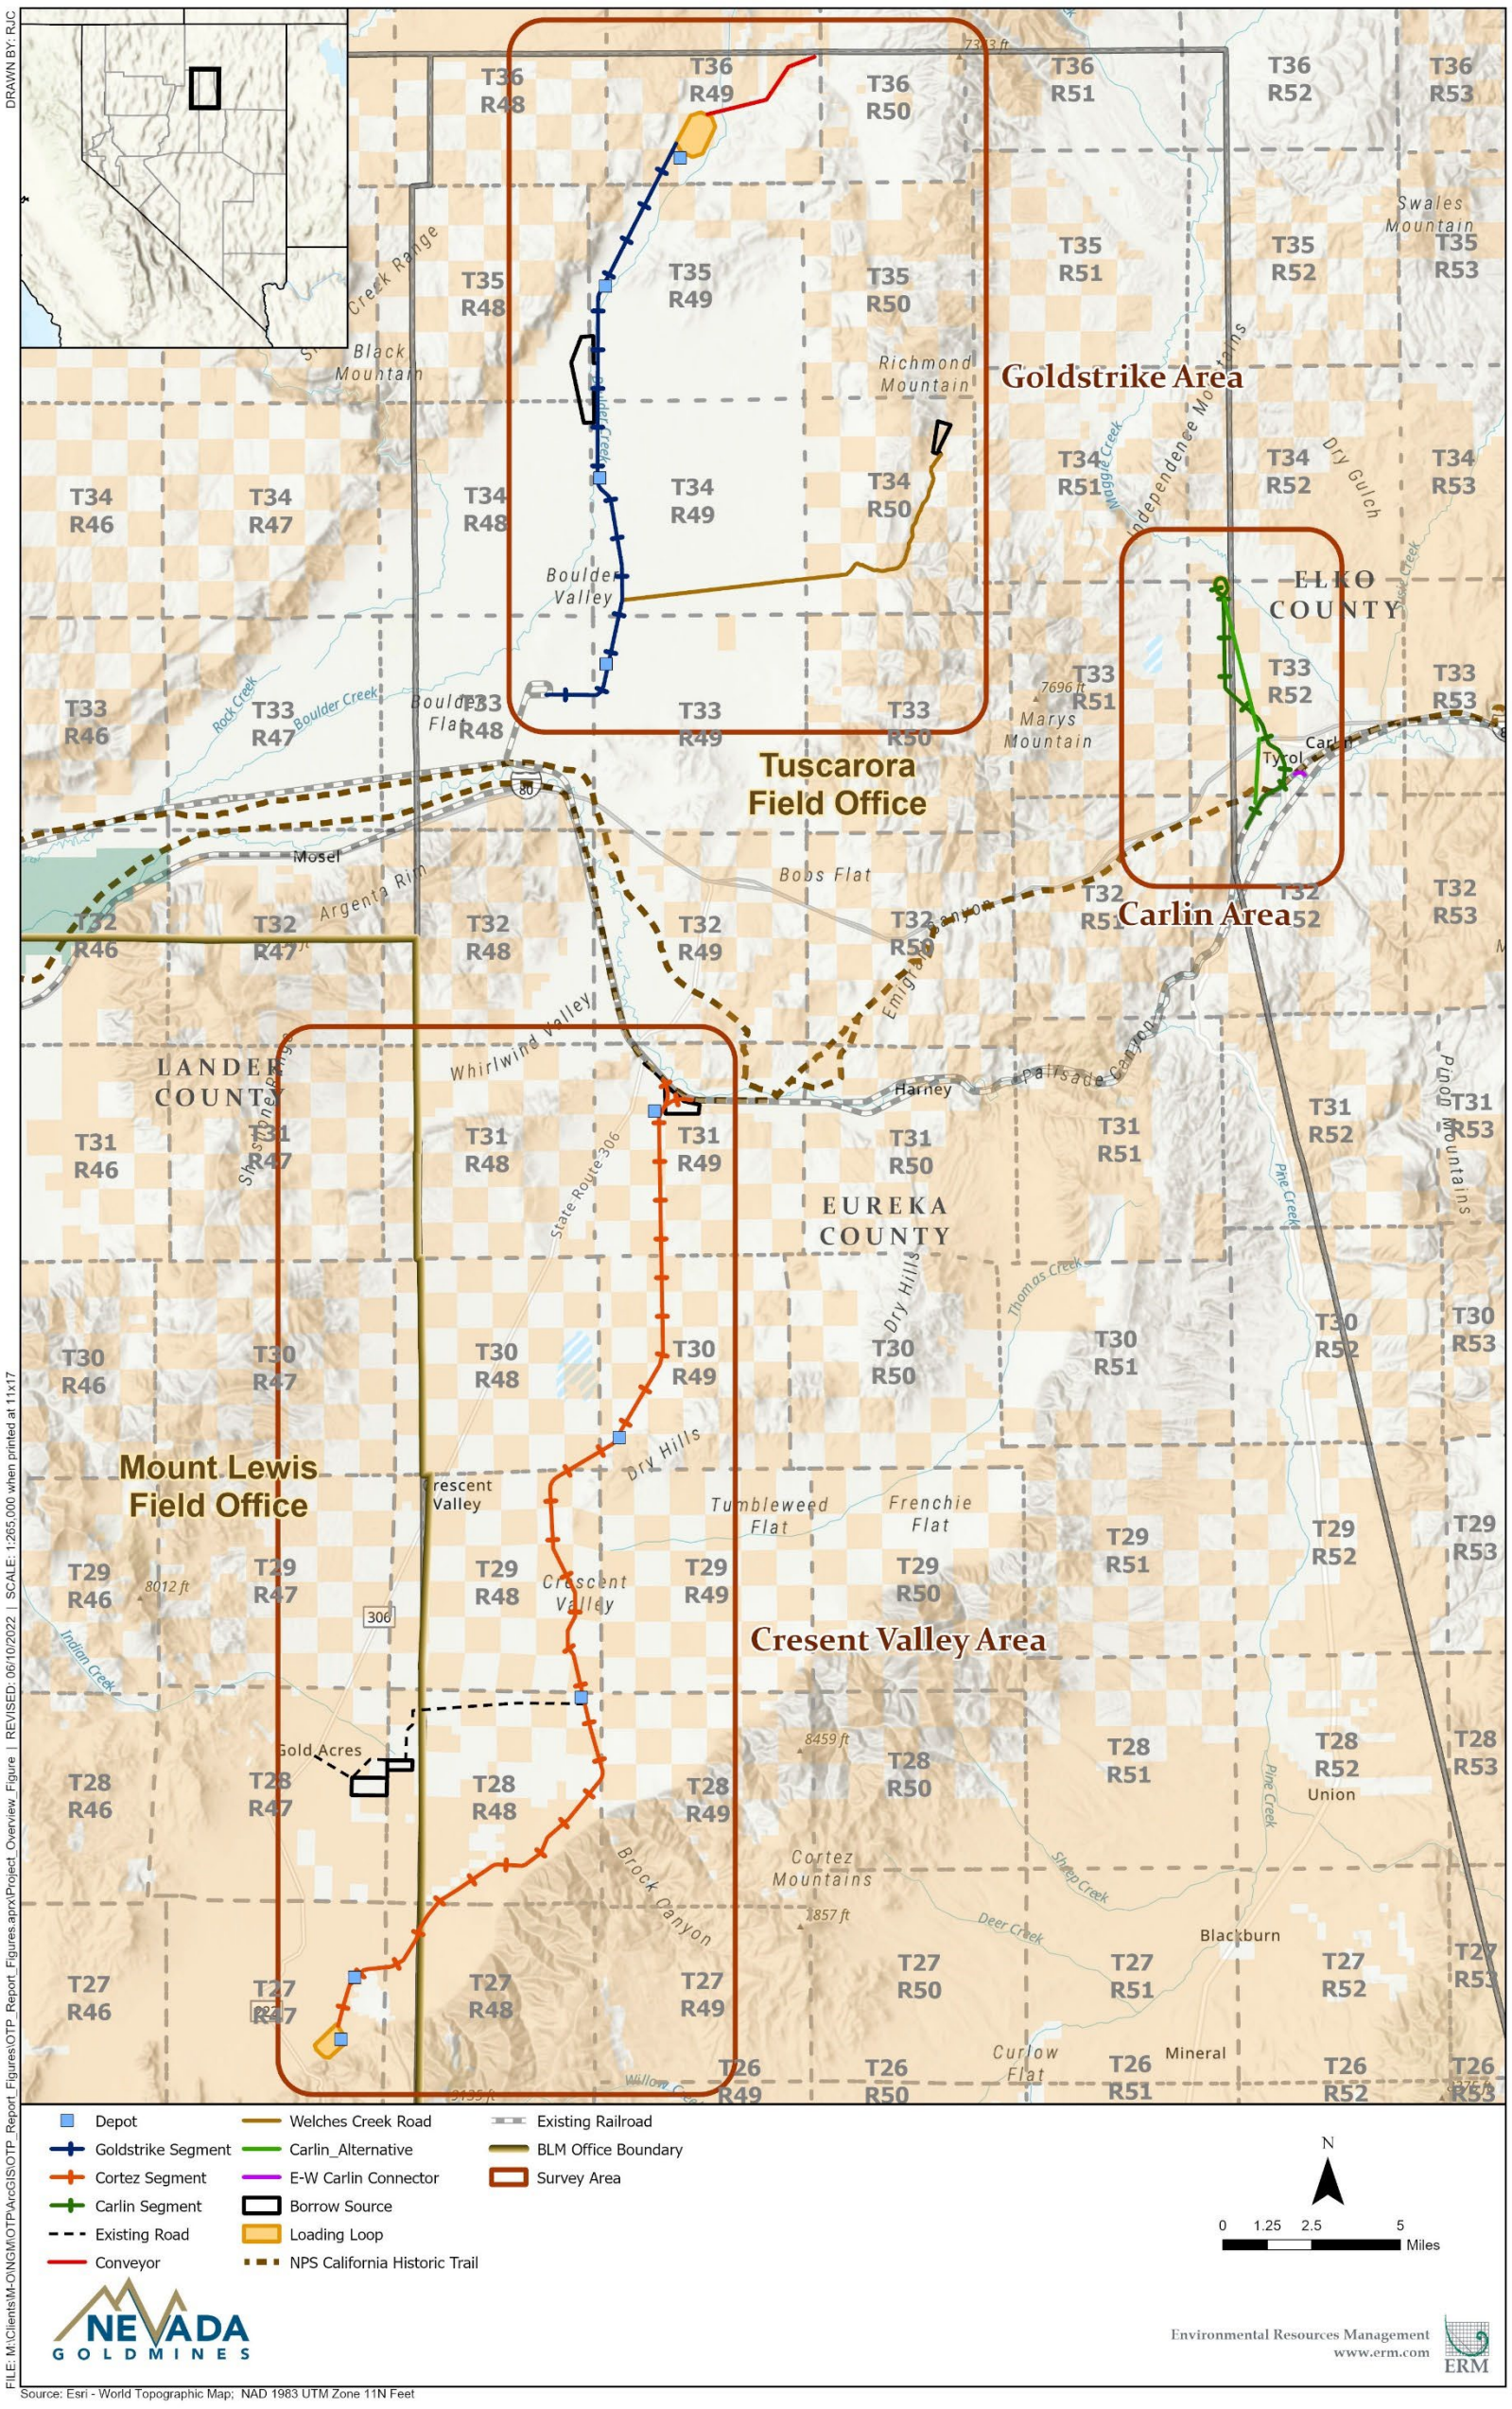
1 INTRODUCTION



Nevada Gold Mines, LLC (NGM) contracted ERM-West, Inc. (ERM) to conduct a noise baseline study for the Ore Transportation Project (herein referred to as the "Project") and prepare a noise monitoring report for review by the Bureau of Land Management (BLM) and Nevada Department of Wildlife (NDOW). This Noise Monitoring Report is a supplemental document to the 2021 and 2022 NGM Biological Baseline Reports and provides a detailed methodology of the noise monitoring study for the Project. Noise monitoring was completed to assess baseline ambient noise levels along the proposed Project route and up to a 4-mile buffer of the Project (Project Area). Noise levels were assessed for both human and wildlife receptors—specifically Greater Sage-grouse (*Centrocercus urophasianus*; hereafter referred to as sage-grouse), bats, amphibians, and the Golden Eagle (*Aquila chrysaetos*). Noise monitoring for wildlife receptors was completed using protocols approved by BLM and NDOW. The data collected during the noise baseline study will be used in the future National Environmental Policy Act (NEPA) analysis of potential Project-related noise impacts on wildlife and the human environment. The noise baseline study was divided into two working seasons, each including a desktop and field assessment. The first season of the study was completed in September 2021 and included human receptors, bats, and amphibians; the second season was completed in April 2022 and included Golden Eagles and sage-grouse.

1.1 Project Location and Setting

The Project is located in Elko, Eureka, and Lander counties, Nevada, and includes approximately 2,660 acres (1,077 hectares) of public lands administered by the Elko and Battle Mountain BLM Nevada District Offices, and approximately 3,962 acres (1,603 hectares) of privately owned lands as shown on E-W = east to west; NPS = National Park Service

Figure 1. The Project Area is within 0.5 mile of two human populated areas: Beowawe and Carlin. Land uses in the Project Area include BLM-managed undeveloped land, agricultural, residential, mining/industrial, and transportation corridors, such as existing roadways and railroad lines.

Existing ambient noise sources consist of vehicular traffic along Interstate 80 and other roadways; rail traffic along the Union Pacific Railway mainline; human activity in residential areas; noise from agricultural and mining activities; and natural sources, such as wind and wildlife.

E-W = east to west; NPS = National Park Service

Figure 1: Project Overview

1.2 Noise Regulatory Framework

1.2.1 Federal, State, and Local Noise Ordinances

BLM Resource Management Plans (RMPs) applicable to the Project are the 1987 Elko RMP (BLM 1987a), the 1987 Shoshone-Eureka RMP (BLM 1987b), and amendments to those plans. The RMPs guide BLM management decisions and actions to manage the public lands based on multiple-use and sustained yield, unless otherwise specified by law. ERM did not identify any noise criterion applicable to the Project within these RMPs.

ERM did not identify any Nevada state-level noise ordinances to which the Project would be subject. Elko County restricts loud or unusual noises that could be qualified as disturbing the peace under Elko County, Nevada, Ordinances Chapter 7, Section 7-1-7. Similarly, Lander County restricts loud or unusual noise that would maliciously or willfully disturb the peace under Lander County, Nevada, Ordinances Chapter 9, Section 9.08.020. Based on their descriptions, these ordinances would not apply to Project activities.

In addition to these noise regulations to protect human receptors, multiple state and federal laws prohibit the injury of, or disturbance to, protected wildlife species. The *Nevada and Northeastern California Greater Sage-Grouse Approved Resource Management Plan Amendment* limits noise from discretionary activities (during construction, operation, and maintenance) to 10 decibels (dB) above ambient sound levels at least 0.25 mile from active and pending leks, from 2 hours before to 2 hours after sunrise and sunset during the breeding season (BLM 2015). These laws also require an assessment of a project's potential impacts on protected species, including noise impacts associated with construction and operation, which will be completed at a later date. These data may also be used in assessing impacts on non-listed wildlife species during the NEPA analysis.

The noise monitoring procedures for human receptors were based on International Finance Corporation's (IFC) *Environmental, Health, and Safety Guidelines* for baseline noise assessments (IFC 2007). The noise monitoring procedures for wildlife receptors were based on the NDOW February 2018 sage-grouse noise monitoring recommendations (NDOW 2018) and the 2020 *Interim Sage-Grouse Noise Protocol Clarifications* (NDOW 2020).

2 PROJECT DESCRIPTION

The Project consists of constructing a new railway and conveyor system to haul ore from the Cortez District north to the Gold Quarry and Goldstrike Mines for processing. The purpose of the Project is to improve safety by reducing over-the-road haulage on public highways, reduce potential air and greenhouse gas emissions, and allow for optimized processing. Project specifics include the following:

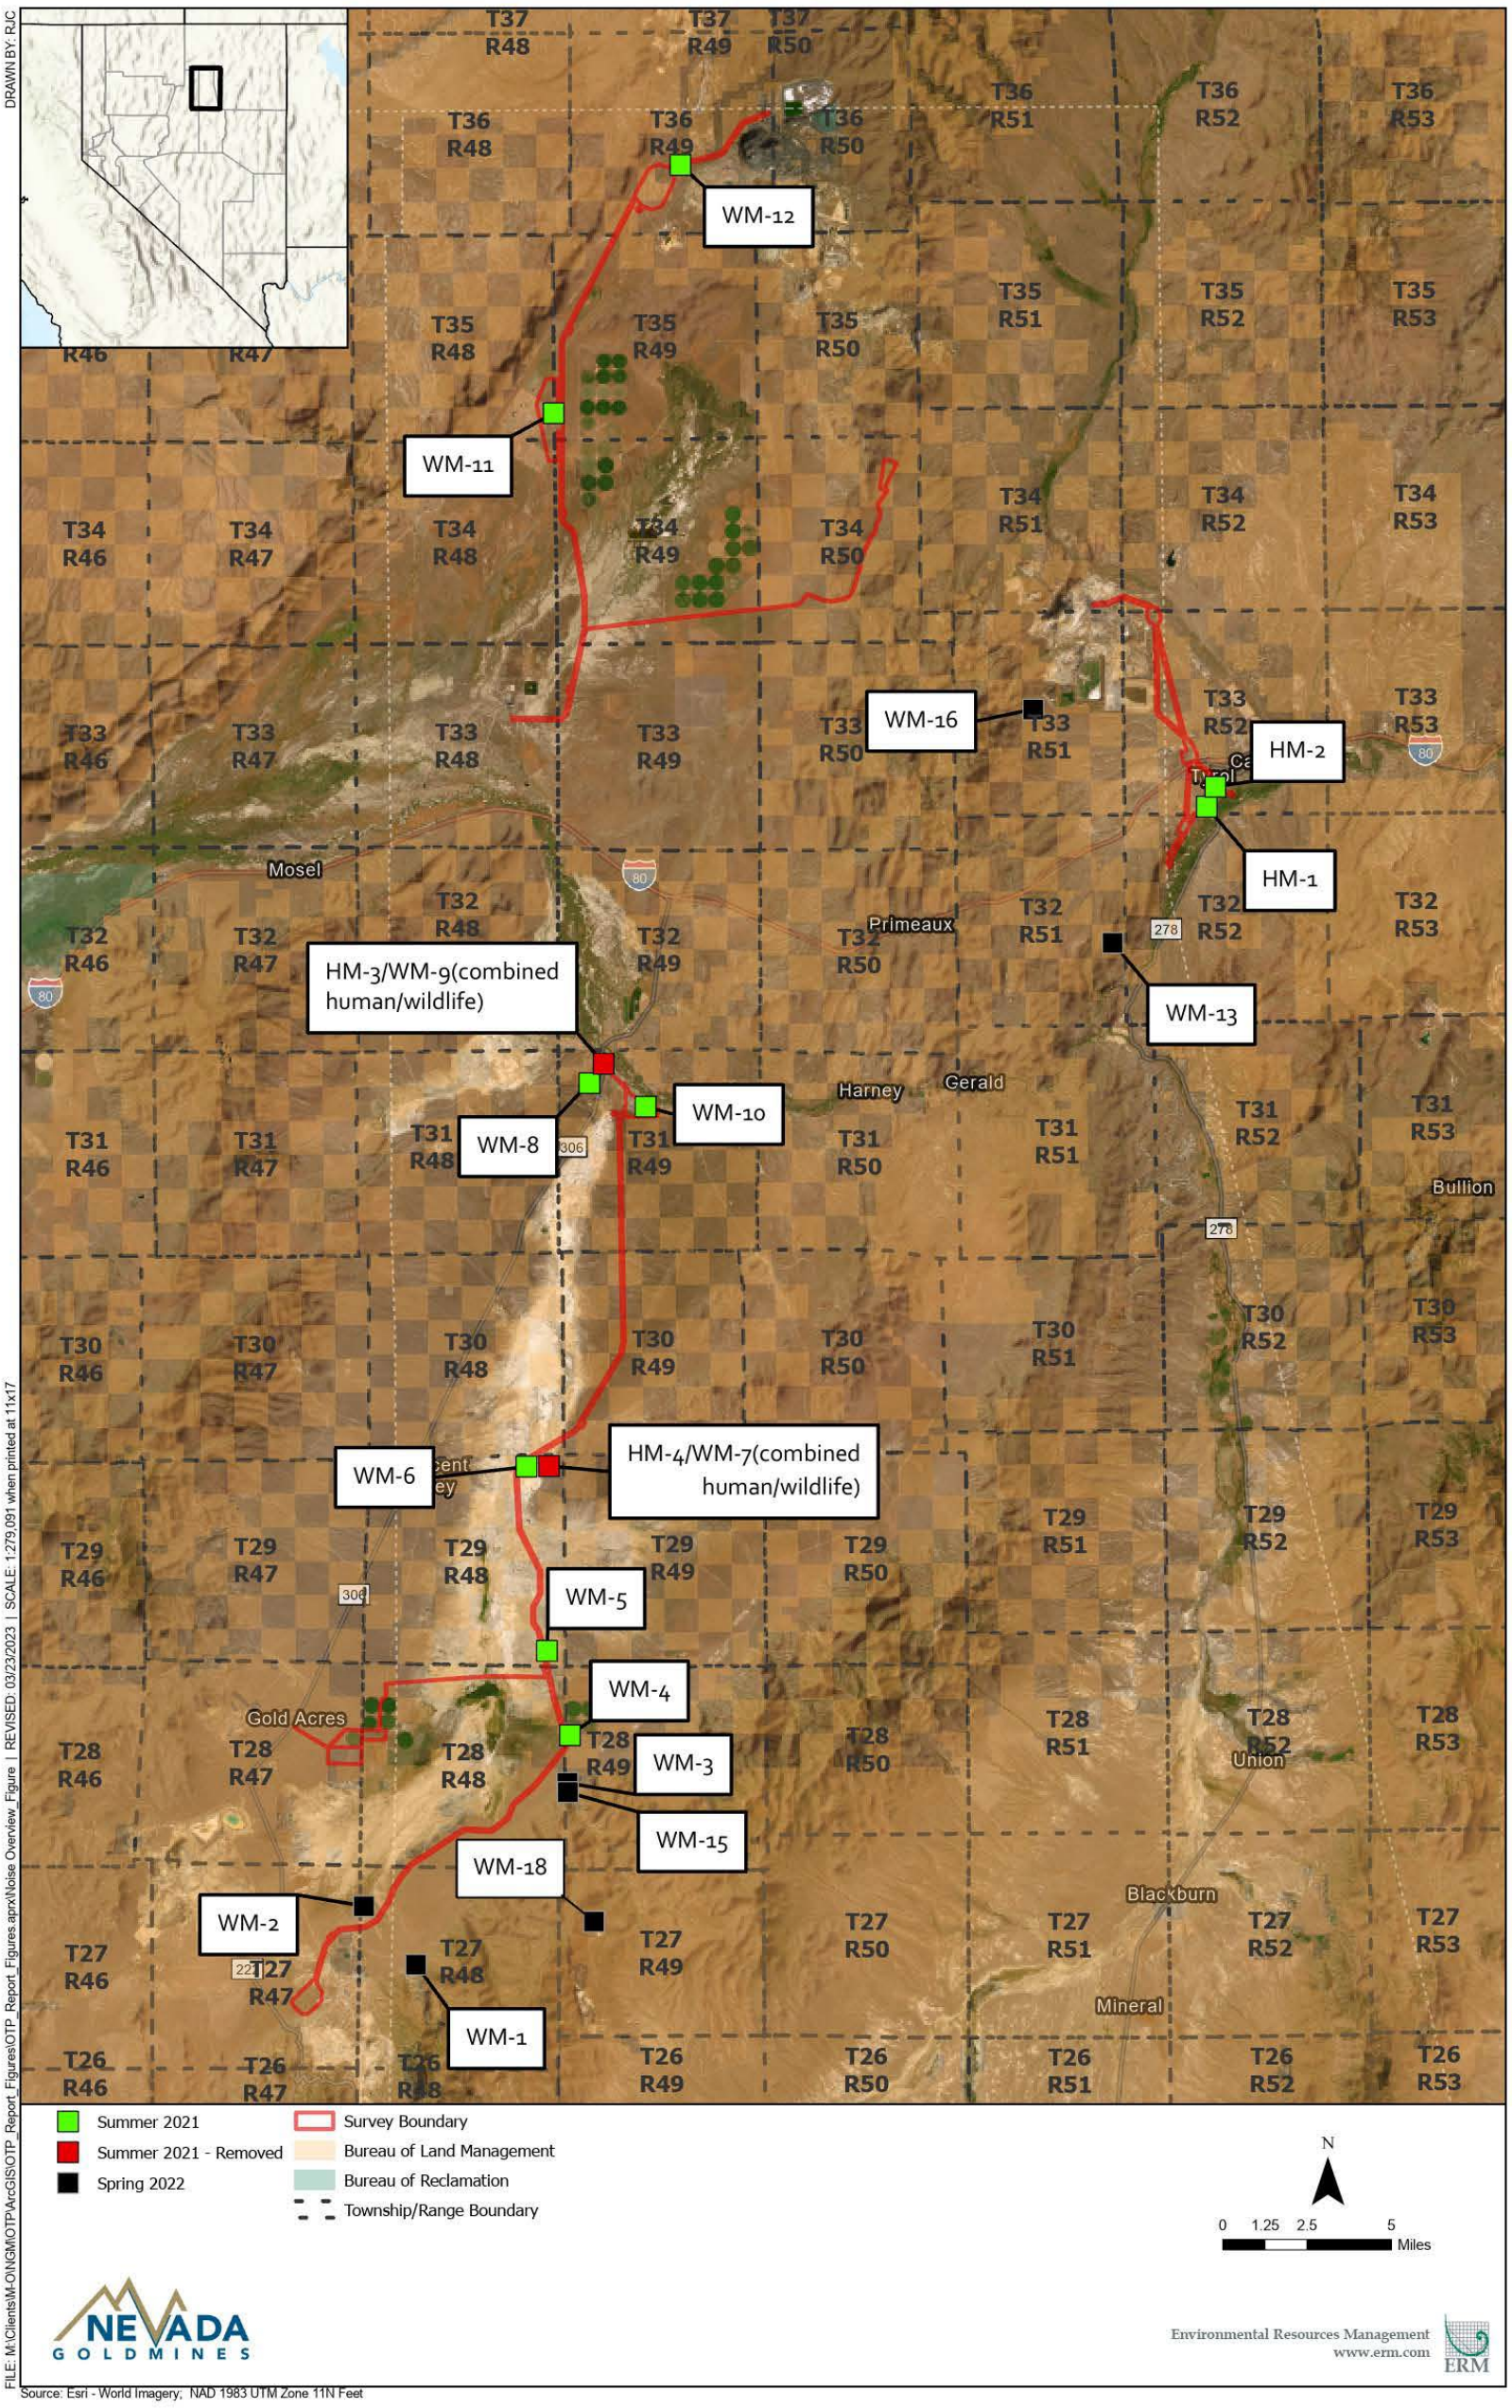
- New private rail line to be constructed from Cortez to Beowawe, where it would connect to the existing Union Pacific Railroad to travel east or west;
- New siding and rail line would be constructed near Carlin to travel north to Gold Quarry;
- New private railway will be built from the T.S. Power Plant to the east and extend north through Boulder Valley to Goldstrike; and
- Loading/Unloading facilities, such as stockpiles, rail loops, and conveyors.

This rail system includes temporary borrow source areas and temporary depots (construction laydown yards). The depots and borrow sources would be reclaimed after construction is complete. The Project includes the railway and conveyors, existing roads, five borrow sources, and 9 depot locations as shown on Figure 1.

3 SCOPE OF WORK

A baseline ambient noise assessment was completed to provide data that will be used to assess potential noise impacts associated with Project construction and operation on human and wildlife receptors. The first season of noise baseline studies was conducted from July through September 2021, and the second season of noise baseline studies was conducted from February through April 2022. The noise baseline studies were divided into two working seasons to collect data during sensitive periods (i.e., March 1 to June 30 for sage-grouse) and to avoid excess disturbance to eagles during sensitive nesting periods (late February to late May).

To identify noise-sensitive[1] areas, ERM conducted a desktop assessment that:



- Reviewed aerial imagery;
- Reviewed NDOW, Nevada Natural Heritage Program, and BLM wildlife data; and
- Assessed National Wetlands Inventory, National Hydrography Dataset, U.S. Geological Survey Seeps and Springs data, and U.S. Geological Survey caves and shafts data.

ERM established noise monitoring locations for wildlife based on the following items:

- 0.5-mile buffer for general species impacts and human impacts;
- 2-mile buffer for Golden Eagle nests (based on data from NDOW);
- 4-mile buffer for sage-grouse leks (based on data from NDOW);
- Documented occurrences of bats (based on data from Nevada Natural Heritage Program and BLM); and
- Water features capable of supporting amphibian species.

Once the desktop analysis was completed, individual noise monitoring locations were selected and approved by BLM and NDOW.

[1] A noise-sensitive property includes real property normally used for sleeping or as schools, churches, hospitals, or public libraries. Property used for industrial or agricultural activities is not considered noise-sensitive property.

Note: Combined Human and Wildlife Receptors HM-3/WM-9 and HM-4/WM-7 were removed from this study due to invalid data. See Section 4.3 for more information.

Figure 2: Noise Monitoring Locations

3.1 Noise Monitoring—Human Receptors

This section describes the noise monitoring procedures for human receptors. A desktop assessment using the most recent available aerial imagery identified residential properties within 0.5 mile of the Project to inform placement of the human receptor monitors. Human receptor monitoring sites were placed next to residential properties in locations with similar topography and proximity to the Project while remaining publicly accessible. Monitoring protocols followed the IFC (2007) guidelines.

3.1.1 Noise Monitoring Locations

Table 1 provides the two noise monitoring locations for human receptors along with a description of the selection criteria used in choosing the monitoring location. These monitoring locations are presented on Figure 2.

Table 1: Noise Monitoring Locations—Human Receptors

Site ID	Description	Latitude	Longitude
HM-1	Carlin – Tomera Subdivision	40.69886	-116.13436
HM-2	West Carlin – six residences	40.70742	-116.12939

3.1.2 Measurement Schedule

Noise measurements were collected at each of the identified measurement locations in one 48-hour measurement period (Table 2).

Table 2: Noise Monitoring Recording Overview—Human Receptors

Location	Start Time	End Time	Duration (hours)
HM-1	7/7/2021 9:20 a.m.	7/9/2021 1:31 a.m.	40:11:30 (1.7 days)
HM-2	7/9/2021 9:53 a.m.	7/11/2021 9:53 a.m.	48:00:00 (2 days)

The measurement period for HM-1 extended 40 hours rather than the planned 48-hours due to an issue with the instrument battery. ERM is confident that the 40-hour measurement duration, which covers both day-time and night-time periods, is a suitable representation of the soundscape in the area and that additional data is not needed in this location.

3.1.3 Equipment

The following equipment was used to conduct background sound level measurements:

- Type 1 sound level meter with 1/3 octave band analyzer (Larson-Davis 824)
- Weather-proof windscreen
- Camera tripod
- Sound level meter calibrator
- Geographic positioning system (GPS) or phone capable of documenting latitude and longitude
- Camera

3.1.4 Measurement Procedures

Prior to beginning the measurement period, the sound level meter was programmed to record at 1-minute intervals for the duration of the 48-hour measurement period. The sound level meter was set to slow response and recorded unweighted 1/3 octave band sound pressure level (12.5 to 20,000 hertz); equivalent sound pressure level (L_{eq}); minimum sound pressure level (L_{min}); maximum sound pressure level (L_{max}); and the 10, 50, and 90 percent exceedance sound pressure levels (L_{10}, L_{50}, L_{90}) in A-weighted decibels (dBA). The sound level meter was field-calibrated before and after the measurement period.

The sound level meter microphone was fastened to a tripod approximately 5 feet above the ground and at least 10 feet from any reflective surface (e.g., house, building wall, solid fence) to avoid changes surfaces may cause to the soundscape. Then, the microphone was fitted with a weather-proof windscreen. The sound level meter was placed inside an environmental enclosure, which was locked and secured to a sturdy object. Photographs were taken of the sound level meter setup as viewed from each cardinal direction and are provided in Appendix A.

During the initial setup, field personnel recorded meteorological data, including wind speed and direction, temperature, relative humidity, barometric pressure, and cloud coverage. Following the measurement period, sound level data was downloaded from the sound level meter. Calibration certificates were scanned upon completion of the monitoring event and are shown in Appendix B.

3.2 Noise Monitoring—Wildlife Receptors

This section describes the noise monitoring procedures for wildlife receptors. Monitoring protocols for wildlife followed established protocols from NDOW and were approved by BLM.

3.2.1 Noise Monitoring Locations

Table 3 provides the 14 noise monitoring locations for wildlife receptors during the 2021 and 2022 field seasons, along with a description of the selection criteria used in choosing the monitoring location. These monitoring locations are presented on Figure 2.

Table 3: Noise Monitoring Locations—Wildlife Receptors

Site ID	Description	Monitoring Year	Latitude	Longitude
WM-1	Mill Creek bats and amphibians	2022	40.20398	-116.58408

3.2.2 Measurement Schedule

Noise measurements for the wildlife receptors were collected at each of the identified locations in 10- to 14-day measurements. Equipment battery and recording status were checked 1 week into the measuring period at each location.

Table 4: Noise Monitoring Recording Overview—Wildlife Receptors

Location	Start Time	End Time	Duration (hours)
WM-1	2/7/2022 10:42 a.m.	2/20/2022 1:54 p.m.	315:11 (13 days)
WM-2	4/1/2022 10:21 a.m.	4/15/2022 8:42 a.m.	334:21 (14 days)
WM-3	2/8/2022 11:58 a.m.	2/22/2022 8:08 a.m.	292:38 (12.5 days)
WM-4	7/12/2021 5:24 p.m.	7/22/2021 4:04 p.m.	238:40 (10 days)
WM-5	8/24/2021 12:23 p.m.	9/5/2021 9:00 a.m.	284:37 (12 days)
WM-6	7/8/2021 4:00 p.m.	7/18/2021 9:13 p.m.	245:13 (10 days)
WM-8	8/23/2021 11:57 a.m.	8/30/2021 10:55 a.m.	166:58 (7 days)
WM-10	8/23/2021 12:46 p.m.	9/3/2021 2:00 a.m.	253:14 (10 days)
WM-11	8/23/2021 4:52 p.m.	9/5/2021 12:53 p.m.	308:01 (13 days)
WM-12	8/23/2021 5:33 p.m.	8/30/2021 10:11 p.m.	172:38 (7 days)
WM-13	4/5/2022 12:45 p.m.	4/19/2022 8:32 a.m.	331:47 (14 days)
WM-15	2/8/2022 12:21 p.m.	2/22/2022 8:37 a.m.	332:15 (14 days)
WM-16	4/5/2022 7:49 a.m.	4/19/2022 6:35 a.m.	334:45 (14 days)
WM-18	4/4/2022 12:34 p.m.	4/18/2022 2:48 a.m.	297:51 (12.5 days)

Seven days of data were collected at WM-8 and WM-12 due to battery issues. After further discussion with BLM and NDOW, it was determined that 7 days of data were sufficient to characterize baseline sound conditions in these locations.

3.2.3 Equipment

The following equipment was used to conduct the background sound level measurements:

- Type 1 sound level meter with 1/3 octave band analyzer (Larson-Davis 813C with low-noise microphone, or similar)
- Two or three 12-volt lithium-ion batteries
- Digital recorder with separate dedicated microphone
- Weather-proof windscreens for sound level meter and recorder microphones
- Stakes to secure microphones
- Sound level meter calibrator
- GPS or phone capable of documenting latitude and longitude
- Camera

3.2.4 Measurement Procedures

Before the measurement period began, the sound level meter was programmed to record at 1-second intervals for the 14-day recording period. Per NDOW guidance, the sound level meter was set to fast response and recorded unweighted 1/3 octave band sound pressure level; equivalent sound pressure level (L_{eq}); minimum sound pressure level (L_{min}), maximum sound pressure level (L_{max}) dBA, C-weighted decibels (dBC), and unweighted decibels (dBZ); and the 10, 50, and 90 percent exceedance sound pressure levels (L_{10}, L_{50}, L_{90}) in dBA. The sound level meter was field-calibrated before and after the measurement period. The microphone was fitted with a weather-proof windscreen and fastened to a stake so that the top of the microphone was approximately 1 foot above the ground. The sound level meter was outfitted with two to three external lithium-ion batteries based on availability and placed inside an environmental enclosure, which was locked and secured to a sturdy object. An additional digital sound logger (recorder) was used to record sound during the 14-day monitoring event. Photographs were taken of the sound level meter setup as viewed from each cardinal direction and are provided in Appendix A.

Prior to beginning the measurement period, field personnel took record of meteorological data, including wind speed and direction, temperature, relative humidity, barometric pressure, and cloud coverage.

Field personal visited each location 1 week into the measuring period to check the equipment. During these visits, the batteries and storage capacity were checked to verify whether enough data was being recorded to satisfy the 10- to 14-day monitoring period. No changes to the monitoring setup were made during these visits. To minimize disturbance to sage-grouse leks, these 1-week visits were not made during the noise monitoring surveys at locations WM-13, WM-15, WM-16, and WM-18.

Following the measurement period, sound level data was downloaded from the sound level meters. The calibration certificate on the sound meters were scanned upon completion of the monitoring event and are shown in Appendix B.

4 DEVIATIONS FROM PROCEDURES

4.1 Calibration Corrections

After the noise surveys were complete, ERM discovered that there were calibration issues associated with some of the meters used for these measurements. The problems with the calibrations were caused by discrepancies between the Casella meters and the calibrators' settings that resulted in inaccurately low values at some locations and inaccurately high values at others. Measurements that were discovered to have this issue were corrected by retroactively re-calibrating the data based on earlier, accurate calibrations that were recorded on the meters.

To re-calibrate the data, accurate calibration values that were recorded on the meter from previous calibrations were subtracted from the calibration value used for the measurement period. This calculation provided values that could be added or subtracted from all the sound-level metrics. The values used to re-calibrate each monitoring location's data are included in Table 1 of Appendix C.

4.2 Noise Floor Corrections

Sound level meters have a lower measurement limit that is referred to as the "noise floor." When sound levels are within 10 dB of the noise floor, the electrical noise of the instrument influences decibel readings. When this occurs, actual environmental sound levels are lower than the level reported (Ambrose and Florian 2020). Thus, corrections were made to all wildlife sound-level metrics that came within 10 dB of the noise floor.

The noise floor of each system used was determined by selecting the lowest of the following values:

- The lowest Lmin value, measured over the monitoring period, found for 2 consecutive hours (e.g., 04/01/2019, 2100 hours Lmin = 4.0 dBA and 04/01/2019 2200 hours Lmin = 4.0 dBA),
- The lowest Lmin value, measured over the monitoring period, found at five or more individual, non-consecutive times during the monitoring period (e.g., five hourly averages spread across the monitoring period where the Lmin = 4.0 dBA),
- The manufacturer specification (Larson-Davis 831C sound level meters and microphones used in this study have a noise floor of approximately 6.5 dBA).

Once the noise floor value was determined, 0.1 dBA was subtracted from that value to ensure the correction was conservative. This correction was applied to each sound-level metric reported except for the unweighted 1/3 octave band metrics. The noise floor value and noise floor correction used for each monitoring location's data are also included in Table 1 of Appendix C.

4.3 Removal of HM-3/WM-9 and HM-4/WM-7 Monitoring Locations

ERM conducted noise monitoring at two locations that have since been removed from this noise report. Human receptor monitoring locations HM-3 and HM-4 were combined with wildlife receptor monitoring locations WM-9 and WM-7, respectively, to minimize disturbance to wildlife in the area and optimize equipment use. These monitoring locations were selected due to their similar topographies and proximity to the Project.

During data processing, it was discovered that some of the metrics reported in the analytics software for these monitoring locations were default values, signaling invalid data. It was concluded that HM-3/WM-9 and HM-4/WM-7 contained corrupt data that were unable to be recovered by ERM or by the equipment vendor/noise program developer. The cause of the corrupt data was due to a fault related to the hardware in addition to software limitations.

As the data for monitoring locations (1) HM-3/WM-9 and (2) HM-4/WM-7 were considered unreliable in the context of this noise study, these two combined monitoring locations and associated data were removed from this report.

ERM and NDOW have confirmed that data obtained from other monitoring locations in the vicinity (WM-6 and WM-8) sufficiently represents noise levels of the human and wildlife receptors associated with HM-3/WM-9 and HM-4/WM-7.

5 REPORTING

Noise data collected for human receptors are reported following the parameters described in Section 3.1, Noise Monitoring—Human Receptors, as an average of the 48-hour data collection period. Noise data collected for the wildlife receptors are reported following the parameters described in Section 3.2 Noise Monitoring—Wildlife Receptors, based on NDOW's *Acoustic Impacts and Greater Sage-grouse: A Review of Current Science, Sound Measurement Protocols, and Management Recommendations* (NDOW 2018).

Noise measurements were taken to establish baseline ambient noise conditions at monitoring positions near the proposed Project.

Weather conditions observed at each monitoring location during equipment setup are summarized in Table 5.

Table 5: Weather Data

Location	Season	Wind Speed (mph)	Wind Direction	Temp (°F)	Barometric Pressure (Mb)	Humidity (%)
HM-1	Summer 2021	2	SE	82	1009	22
HM-2	Summer 2021	2	W	84	1018	12

Source: Weather Underground 2022

The human receptors' overall A-weighted equivalent sound levels (Leq) were 59.5 at HM-1 and 50.9 at HM-2.

Wildlife receptors' Leq values ranged from 24.4 to 51.1 dBA and averaged approximately 40.5 dBA (Table 6 and Table 7, respectively). Of the wildlife receptors, WM-16 had the highest levels of noise and WM-5 had the lowest. dBC and dBZ for wildlife receptors are presented in Table 8 and Table 9, respectively.

Maximum noise levels were typically recorded during daytime hours (7 a.m. to 10 p.m.), except for WM-18, where the maximum sound level was recorded at 12:54 a.m. There was no clear pattern for when minimum noise levels were typical to occur, as approximately half of the monitoring locations had minimum noise levels occur during daytime hours and the other half during night-time hours.

Hourly sound-level data for each wildlife monitoring location can be found in Appendix D. Daily sound level data for each wildlife monitoring location can be found in Appendix E. Further analyse was done for sound levels during sensitive times of day for sage grouse. Summary sound level data between 4 a.m. and 9 a.m. (the hours 0400 and 0900) for each wildlife monitoring location is reported in Appendix F. Appendix G shows summary sound level data between 6 p.m. and 8 p.m. (the hours 1800 and 1000) per the *Nevada and Northeastern California Greater Sage-Grouse Approved Resource Management Plan Amendment* requirement (BLM 2015).

WM-18	81.0	29.8	107.0

The data summarized in this report will serve as a baseline noise assessment for the Project. An impact assessment will be performed when Project plans and alternatives have been finalized to estimate the impacts that Project-related construction and operation could have on human and wildlife receptors in the Project Area using the baseline data collected in 2021 and 2022.

APPENDIX B CALIBRATION CERTIFICATES

Calibration Certificate

Certificate Number 2021004034
Customer:
LARSON DAVIS - A PCB PIEZOTRONICS DIV.
1681 West 820 North
Provo, UT 84601, United States
716-684-0001

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	10115	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	8 Apr 2021		
Initial Condition	AS RECEIVED same as shipped	***Calibration Due***			
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Temperature***	23.48	°C	± 0.25 °C
		Humidity	51.9	%RH	± 2.0 %RH
		Static Pressure	85.71	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 036756 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

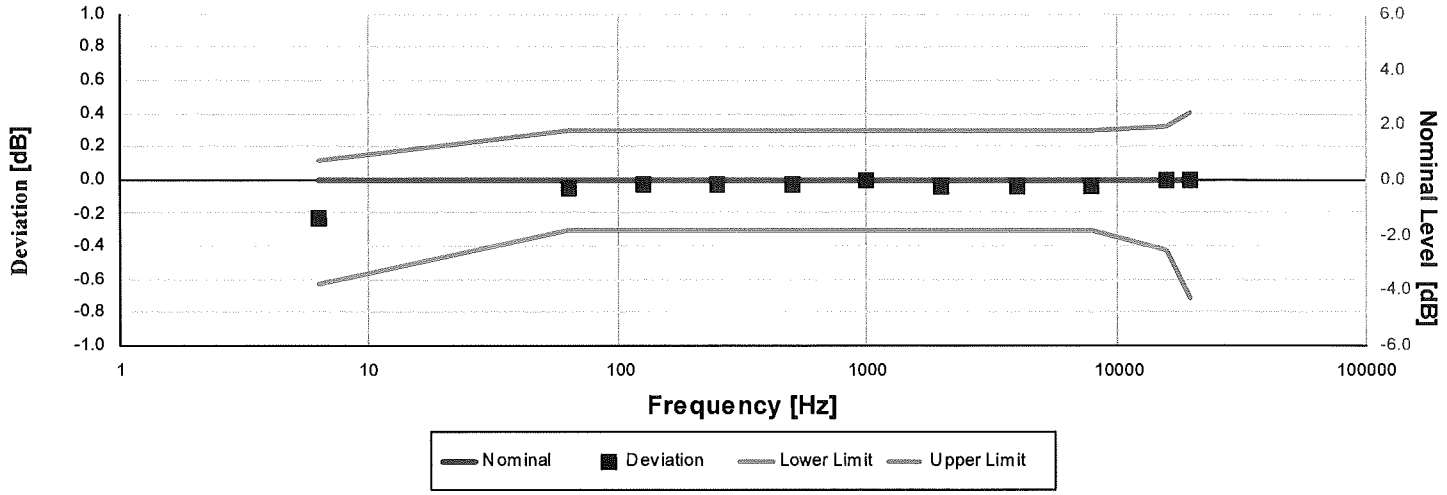
Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.



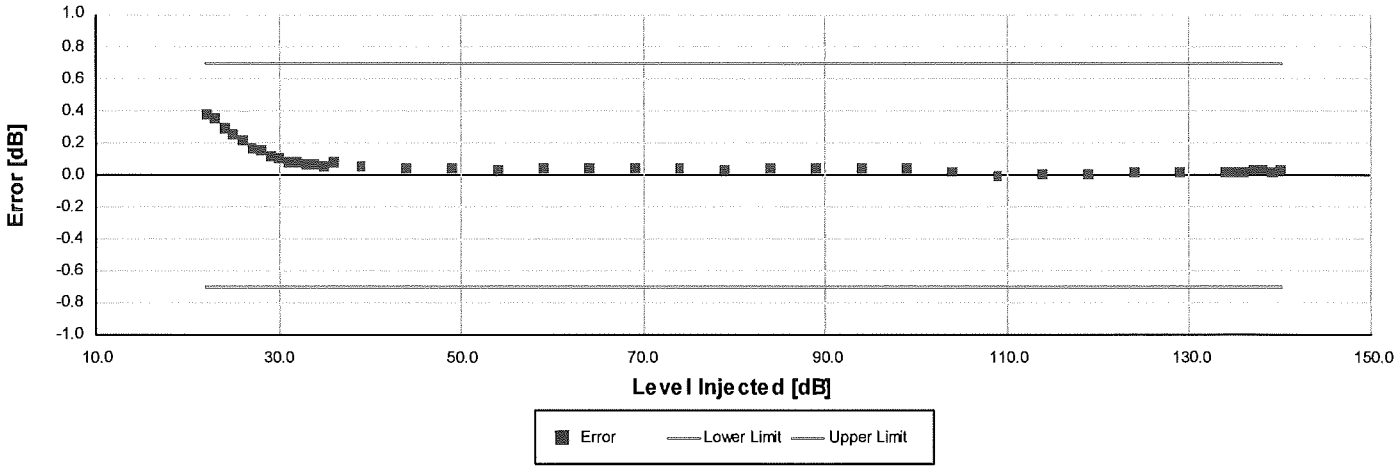
Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Standards Used

Description	Cal Date	Cal Due	Cal Standard
Hart Scientific 2626-S Humidity/Temperature Sensor	2020-05-12	2021-05-12	006943
SRS DS360 Ultra Low Distortion Generator	2021-01-05	2022-01-05	007118

Z-weight Filter Response



Electrical signal test of frequency weighting performed according to IEC 61672-3:2013 13 and ANSI S1.4-2014 Part 3: 13 for compliance to IEC 61672-1:2013 5.5; IEC 60651:2001 6.1 and 9.2.2; IEC 60804:2000 5; ANSI S1.4:1983 (R2006) 5.1 and 8.2.1; ANSI S1.4-2014 Part 1: 5.5

	10	OVLD	± 1.50	0.15 ‡	Pass
118.00	3	-0.14	± 0.50	0.15 ‡	Pass
	5	-0.15	± 1.00	0.15 ‡	Pass
	10	-0.18	± 1.50	0.15 ‡	Pass
108.00	3	-0.15	± 0.50	0.15 ‡	Pass
	5	-0.12	± 1.00	0.15 ‡	Pass
	10	-0.16	± 1.50	0.16 ‡	Pass

-- End of measurement results--

Gain

Gain measured according to IEC 61672-3:2013 17.3 and 17.4 and ANSI S1.4-2014 Part 3: 17.3 and 17.4

Measurement	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
0 dB Gain	94.07	93.92	94.12	0.15	Pass
0 dB Gain, Linearity	28.14	27.32	28.72	0.16	Pass
20 dB Gain	94.03	93.92	94.12	0.15	Pass
20 dB Gain, Linearity	23.22	22.32	23.72	0.16	Pass
OBA High Range	94.02	93.20	94.80	0.15	Pass
OBA Normal Range	94.03	93.92	94.12	0.15	Pass

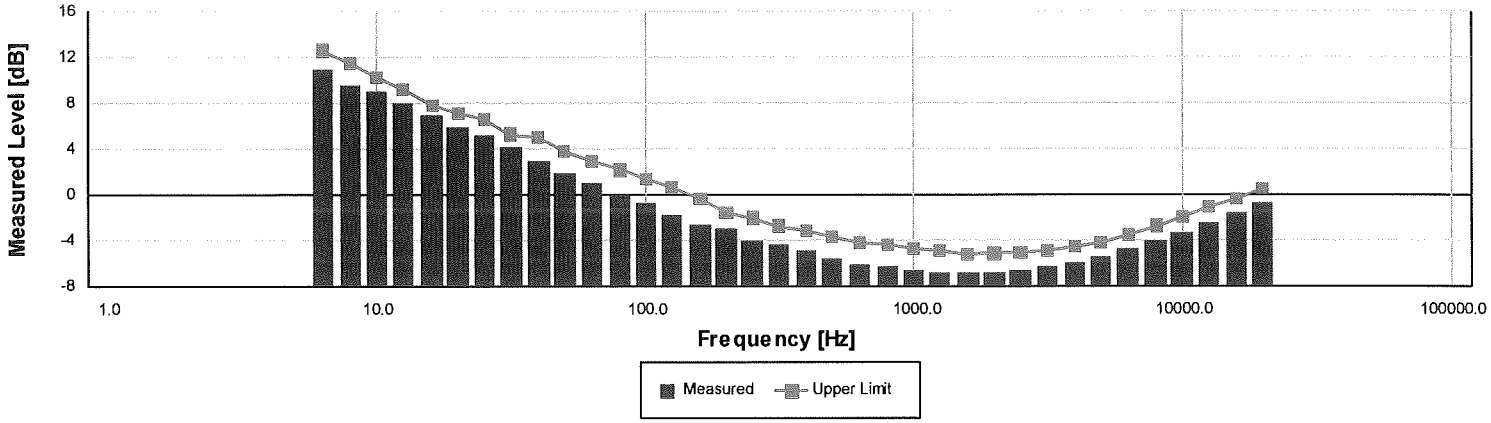
-- End of measurement results--

Broadband Noise Floor

Self-generated noise measured according to IEC 61672-3:2013 11.2 and ANSI S1.4-2014 Part 3: 11.2

Measurement	Test Result [dB]	Upper limit [dB]	Result
A-weight Noise Floor	6.56	9.00	Pass
C-weight Noise Floor	12.04	15.00	Pass
Z-weight Noise Floor	21.74	25.00	Pass

-- End of measurement results--



Total Harmonic Distortion

Measured using 1/3-Octave filters

Measurement	Test Result [dB]	Lower Limit [dB]	Upper Limit [dB]	Expanded Uncertainty [dB]	Result
10 Hz Signal	137.49	137.20	138.80	0.15	Pass
THD	-75.78		-60.00	1.30 ‡	Pass
THD+N	-74.83		-60.00	1.30 ‡	Pass

-- End of measurement results--

1/3-Octave Self-Generated Noise

The SLM is set to normal range and 20 dB gain.

ACCREDITED
Cert. #3622.01

LARSON DAVIS
A PCB PIEZOTRONICS DIV.

Calibration Certificate

Certificate Number 2021006796

Customer:

LARSON DAVIS - A PCB PIEZOTRONICS DIV.
1681 West 820 North
Provo, UT 84601, United States
716-684-0001

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	10505	***Technician***	Eric Olson		
Test Results	**Pass**	***Calibration Date***	8 Jun 2021		
Initial Condition	AS RECEIVED same as shipped	***Calibration Due***			
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.2R1	***Temperature***	23.63	°C	± 0.25 °C
		Humidity	52.7	%RH	± 2.0 %RH
		Static Pressure	85.68	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 036756 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

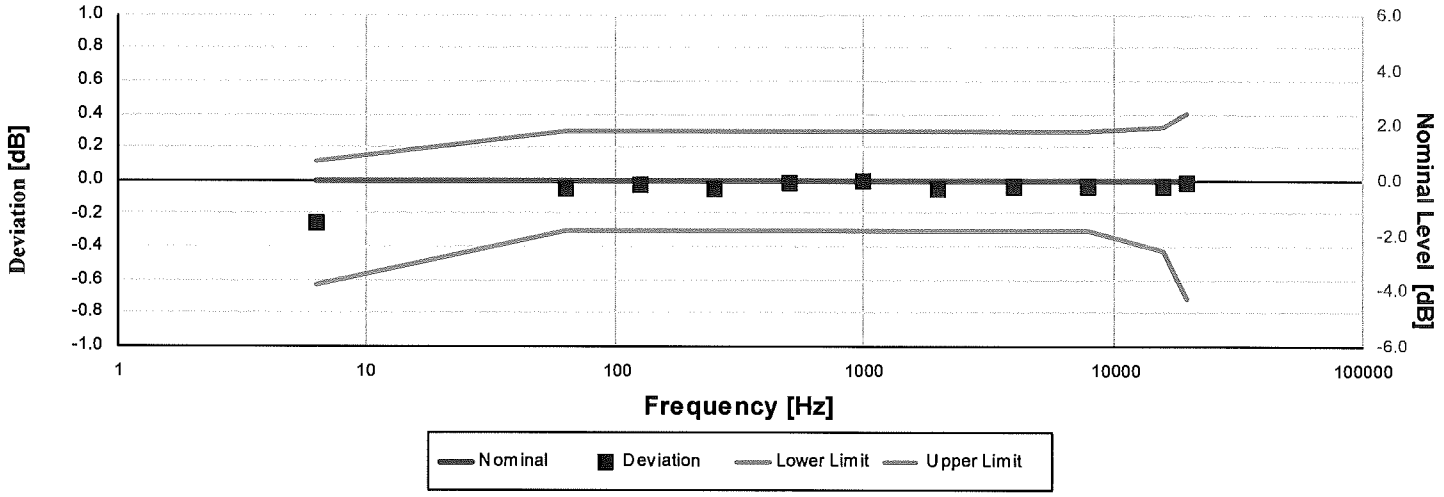
Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.



Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

LARSON DAVIS - A PCB PIEZOTRONICS DIV.
1681 West 820 North
Provo, UT 84601, United States
716-684-0001

Model Number	831C	***Procedure Number***	D0001.8378
Serial Number	10420	***Technician***	Ron Harris
Test Results	**Pass**	***Calibration Date***	8 Apr 2021
Initial Condition	AS RECEIVED same as shipped	***Calibration Due***	
		Temperature	23.87 °C ± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Humidity***	50.9 %RH ± 2.0 %RH
		Static Pressure	85.72 kPa ± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 029590 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Certificate

Certificate Number 2021001067

Customer:

The Modal Shop
10310 AeroHub Boulevard
Cincinnati, OH 45215, United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	10731	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	27 Jan 2021		
Initial Condition	AS RECEIVED same as shipped	***Calibration Due***			
		Temperature	23.56	°C	± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.5.1R0	***Humidity***	51.8	%RH	± 2.0 %RH
		Static Pressure	86.31	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 036756 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Calibration Certificate

Certificate Number 2020013908

Customer:

The Modal Shop
10310 AeroHub Boulevard
Cincinnati,OH 45215,United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	10534	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	15 Dec 2020		
Initial Condition	AS RECEIVED same as shipped	***Calibration Due***			
		Temperature	23.09	°C	± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.5.1R0	***Humidity***	53.1	%RH	± 2.0 %RH
		Static Pressure	86.74	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 029590 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

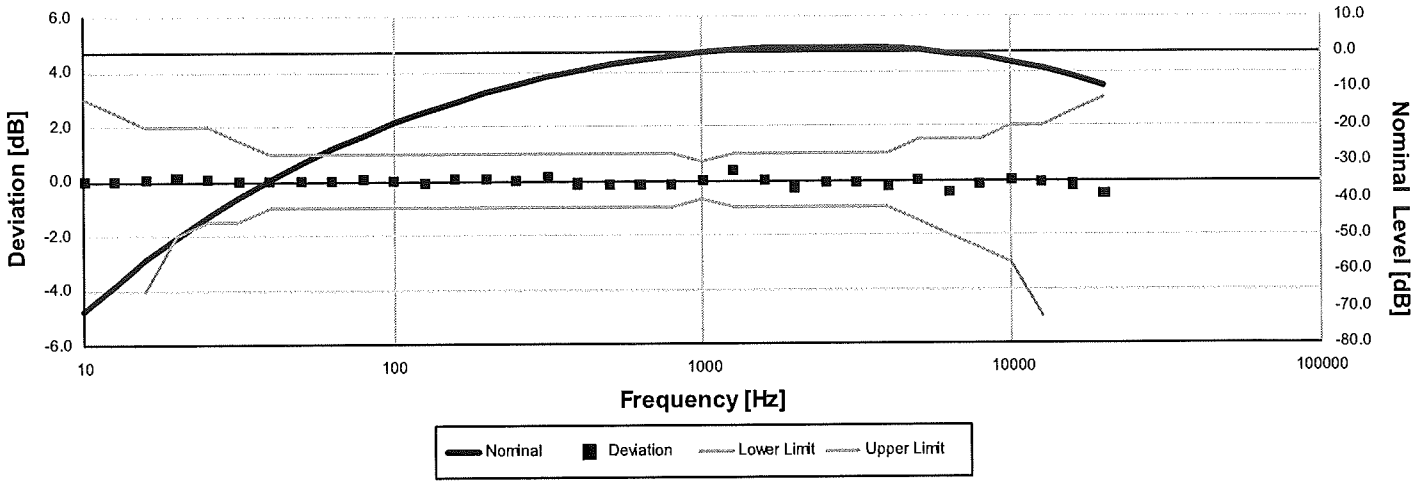
Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Periodic tests were performed in accordance with precedures from IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part3.

No Pattern approval for IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 available.

The sound level meter submitted for testing successfully completed the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 or correction data for acoustical test of frequency weighting were not provided in the Instruction Manual and (b) because the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3 cover only a limited subset of the specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1.

Periodic tests were performed in accordance with precedures from IEC 61260-3:2016 Part 3 and ANSI/ASA S1.11-2016 Part 3.



No Pattern approval for IEC 61260-1:2014 Part 1 and ANSI/ASA S1.11-2014 Part 1 available.

The filter submitted for testing successfully completed the periodic tests of IEC 61260-3:2016 Part 3 and ANSI/ASA S1.11-2016 Part 3, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the filter to the full specifications of IEC 61260-1:2014 Part 1 and ANSI/ASA S1.11-2014 Part 1 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of filter fully conformed to the class 1 specifications in IEC 61260-1:2014 Part 1 and ANSI/ASA S1.11-2014 Part 1 and (b) because the periodic tests of IEC 61260-3:2016 Part 3 and ANSI/ASA S1.11-2016 Part 3 cover only a limited subset of the specifications in IEC 61260-1:2014 Part 1 and ANSI/ASA S1.11-2014 Part 1.

-- End of measurement results--

Slow Detector

Toneburst response performed according to IEC 61672-3:2013 18 and ANSI S1.4-2014 Part 3: 18 for compliance to IEC 61672-1:2013 5.9, IEC 60651:2001 9.4.2, ANSI S1.4:1983 (R2006) 8.4.2 and ANSI S1.4-2014 Part 1: 5.9

Amplitude [dB]	Duration [ms]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
137.00	200	-7.59	-7.92	-6.92	0.15	Pass
	2	-27.19	-29.99	-25.99	0.15	Pass

-- End of measurement results--

Fast Detector

Toneburst response performed according to IEC 61672-3:2013 18 and ANSI S1.4-2014 Part 3: 18 for compliance to IEC 61672-1:2013 5.9, IEC 60651:2001 9.4.2, ANSI S1.4:1983 (R2006) 8.4.2 and ANSI S1.4-2014 Part 1: 5.9

Amplitude [dB]	Duration [ms]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
137.00	200.00	-1.09	-1.48	-0.48	0.15	Pass
	2.00	-18.30	-19.49	-16.99	0.16	Pass
	0.25	-27.53	-29.99	-25.99	0.15	Pass

-- End of measurement results--

Sound Exposure Level

Toneburst response performed according to IEC 61672-3:2013 18 and ANSI S1.4-2014 Part 3: 18 for compliance to IEC 61672-1:2013 5.9, IEC 60651:2001 9.4.2, ANSI S1.4:1983 (R2006) 8.4.2 and ANSI S1.4-2014 Part 1: 5.9

Amplitude [dB]	Duration [ms]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
137.00	200.00	-7.04	-7.49	-6.49	0.15	Pass
	2.00	-27.07	-28.49	-25.99	0.15	Pass
	0.25	-36.18	-39.02	-35.02	0.15	Pass

-- End of measurement results--

Peak C-weight

C-weighted peak sound level performed according to IEC 61672-3:2013 19 and ANSI S1.4-2014 Part 3: 19 for compliance to IEC 61672-1:2013 5.13 and ANSI S1.4-2014 Part 1: 5.13

Level [dB]	Frequency [Hz]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
135.00	31.50	138.08	135.50	139.50	0.15	Pass
135.00	500.00	138.51	137.50	139.50	0.15	Pass
135.00	8,000.00	137.67	136.40	140.40	0.15	Pass
135.00, Negative	500.00	137.04	136.40	138.40	0.15	Pass
135.00, Positive	500.00	137.17	136.40	138.40	0.15	Pass

-- End of measurement results--

Peak Z-weight

Z-weighted peak sound level performed according to IEC 60651:2001 9.4.4 and ANSI S1.4:1983 (R2006) 8.4.4

Amplitude [dB]	Duration[µs]		Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
136.00	100	Negative Pulse	135.96	133.88	137.88	0.15	Pass
	100	Positive Pulse	136.09	134.01	138.01	0.15	Pass
126.00	100	Negative Pulse	125.95	123.87	127.87	0.15	Pass
	100	Positive Pulse	126.08	124.00	128.00	0.15	Pass
116.00	100	Negative Pulse	115.96	113.88	117.88	0.15	Pass
	100	Positive Pulse	116.09	114.01	118.01	0.15	Pass
106.00	100	Negative Pulse	105.94	103.86	107.86	0.15	Pass
	100	Positive Pulse	106.09	104.00	108.00	0.15	Pass

-- End of measurement results--

Overload Detector

Overload indication performed according to IEC 61672-3:2013 20 and ANSI S1.4-2014 Part 3: 20 for compliance to IEC 61672-1:2013 5.11, IEC 60804:2000 9.3.5, IEC 61252:2002 11, ANSI S1.4 (R2006) 5.8, and ANSI S1.4-2014 Part 1: 5.11, ANSI S1.25 (R2007) 7.6, ANSI S1.43 (R2007) 7

Measurement	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
Positive	140.90	140.00	142.00	0.16	Pass
Negative	140.90	140.00	142.00	0.16	Pass
Difference	0.00	-1.50	1.50	0.15	Pass

-- End of measurement results--

Peak Rise Time

Peak rise time performed according to IEC 60651:2001 9.4.4 and ANSI S1.4:1983 (R2006) 8.4.4

Amplitude [dB]	Duration [µs]		Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
139.00	40	Negative Pulse	135.77	134.43	136.43	0.15	Pass
		Positive Pulse	135.91	134.56	136.56	0.15	Pass
	30	Negative Pulse	134.95	134.43	136.43	0.15	Pass
		Positive Pulse	135.05	134.56	136.56	0.15	Pass

-- End of measurement results--

Positive Pulse Crest Factor

200 µs pulse tests at 2.0, 12.0, 22.0, 32.0 dB below Overload Limit

Crest Factor measured according to IEC 60651:2001 9.4.2 and ANSI S1.4:1983 (R2006) 8.4.2

Amplitude [dB]	Crest Factor	Test Result [dB]	Limits [dB]	Expanded Uncertainty [dB]	Result
138.00	3	OVLD	± 0.50	0.15 ‡	Pass
	5	OVLD	± 1.00	0.15 ‡	Pass
	10	OVLD	± 1.50	0.15 ‡	Pass
128.00	3	-0.12	± 0.50	0.15 ‡	Pass
	5	-0.11	± 1.00	0.15 ‡	Pass

118.00	3	-0.13	± 0.50	0.15 ‡	Pass
	5	-0.12	± 1.00	0.15 ‡	Pass
	10	-0.22	± 1.50	0.15 ‡	Pass
108.00	3	-0.14	± 0.50	0.15 ‡	Pass
	5	-0.14	± 1.00	0.15 ‡	Pass
	10	-0.25	± 1.50	0.15 ‡	Pass

-- End of measurement results--

Negative Pulse Crest Factor

200 µs pulse tests at 2.0, 12.0, 22.0, 32.0 dB below Overload Limit

Crest Factor measured according to IEC 60651:2001 9.4.2 and ANSI S1.4:1983 (R2006) 8.4.2

Amplitude [dB]	Crest Factor	Test Result [dB]	Limits [dB]	Expanded Uncertainty [dB]	Result
138.00	3	OVLD	± 0.50	0.15 ‡	Pass
	5	OVLD	± 1.00	0.15 ‡	Pass
	10	OVLD	± 1.50	0.15 ‡	Pass
128.00	3	-0.11	± 0.50	0.15 ‡	Pass
	5	-0.11	± 1.00	0.15 ‡	Pass
	10	OVLD	± 1.50	0.15 ‡	Pass
118.00	3	-0.13	± 0.50	0.15 ‡	Pass
	5	-0.12	± 1.00	0.15 ‡	Pass
	10	-0.09	± 1.50	0.15 ‡	Pass
108.00	3	-0.13	± 0.50	0.15 ‡	Pass
	5	-0.13	± 1.00	0.15 ‡	Pass
	10	-0.07	± 1.50	0.16 ‡	Pass

-- End of measurement results--

Tone Burst

2kHz tone burst tests at 2.0, 12.0, 22.0, 32.0 dB below Overload Limit

Tone burst response measured according to IEC 60651:2001 9.4.2 and ANSI S1.4:1983 (R2006) 8.4.2

Amplitude [dB]	Crest Factor	Test Result [dB]	Limits [dB]	Expanded Uncertainty [dB]	Result
138.00	3	OVLD	± 0.50	0.15	Pass
	5	OVLD	± 1.00	0.15	Pass
128.00	3	-0.09	± 0.50	0.15	Pass
	5	-0.02	± 1.00	0.15	Pass
118.00	3	-0.07	± 0.50	0.15	Pass
	5	-0.07	± 1.00	0.15	Pass
108.00	3	-0.06	± 0.50	0.15	Pass
	5	0.01	± 1.00	0.15	Pass

-- End of measurement results--

Impulse Detector - Repeat

Impulse Detector measured according to IEC 60651:2001 9.4.3 and ANSI S1.4:1983 (R2006) 8.4.3

Amplitude [dB]	Repitition Rate [Hz]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
140	100.00	-2.85	-3.71	-1.71	0.15	Pass
	20.00	-7.79	-9.57	-5.57	0.20	Pass
	2.00	-8.98	-10.76	-6.76	0.16	Pass
Step	2.00	4.95	4.00	6.00	0.16	Pass

-- End of measurement results--

Impulse Detector - Single

Impulse Detector measured according to IEC 60651:2001 9.4.3 and ANSI S1.4:1983 (R2006) 8.4.3

Amplitude [dB]	Duration [ms]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
140	20.00	-3.75	-5.11	-2.11	0.15	Pass
	5.00	-8.88	-10.76	-6.76	0.15	Pass
	2.00	-12.61	-14.55	-10.55	0.16	Pass
Step	2.00	10.01	9.00	11.00	0.16	Pass

-- End of measurement results--

Gain

Gain measured according to IEC 61672-3:2013 17.3 and 17.4 and ANSI S1.4-2014 Part 3: 17.3 and 17.4

Measurement	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
0 dB Gain	94.01	93.92	94.12	0.15	Pass
0 dB Gain, Linearity	28.09	27.32	28.72	0.16	Pass
20 dB Gain	94.03	93.92	94.12	0.15	Pass
20 dB Gain, Linearity	23.07	22.32	23.72	0.16	Pass
OBA High Range	94.02	93.20	94.80	0.15	Pass
OBA Normal Range	94.01	93.92	94.12	0.15	Pass

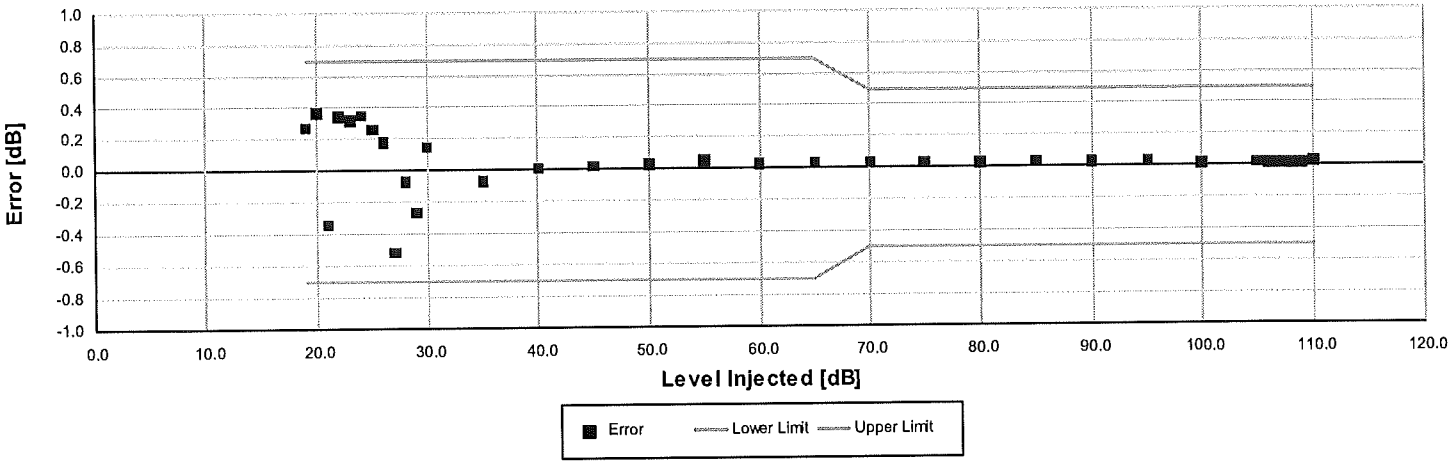
-- End of measurement results--

Broadband Noise Floor

Self-generated noise measured according to IEC 61672-3:2013 11.2 and ANSI S1.4-2014 Part 3: 11.2

Measurement	Test Result [dB]	Upper limit [dB]	Result
A-weight Noise Floor	6.44	9.00	Pass
C-weight Noise Floor	12.19	15.00	Pass
Z-weight Noise Floor	21.81	25.00	Pass

-- End of measurement results--



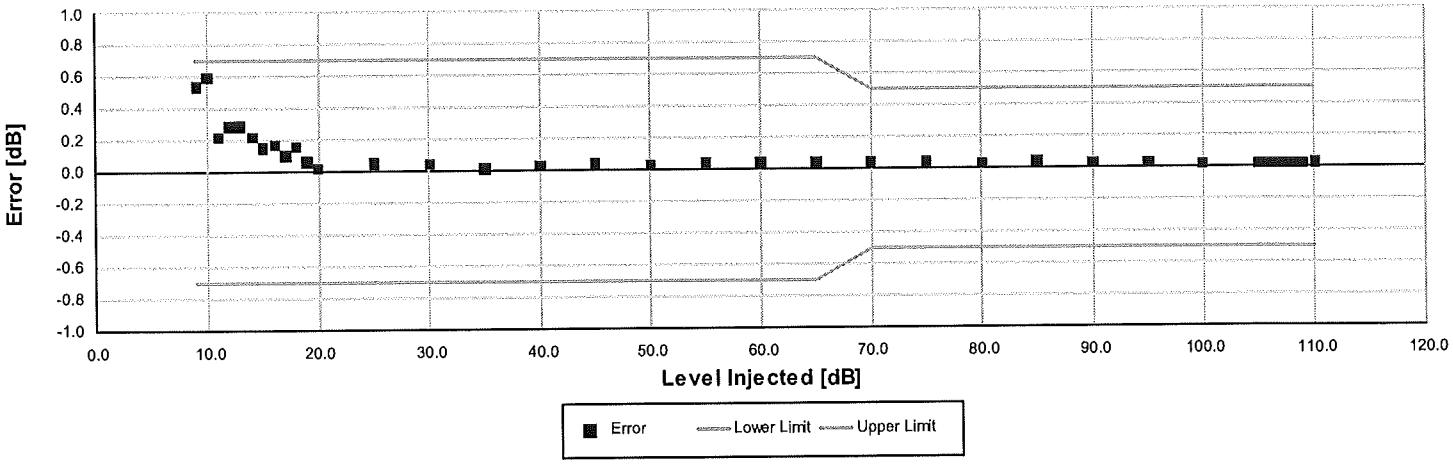
Total Harmonic Distortion

Measured using 1/3-Octave filters

Measurement	Test Result [dB]	Lower Limit [dB]	Upper Limit [dB]	Expanded Uncertainty [dB]	Result
10 Hz Signal	137.49	137.20	138.80	0.15	Pass
THD	-78.85		-60.00	1.30 ‡	Pass
THD+N	-77.57		-60.00	1.30 ‡	Pass

-- End of measurement results--

1/1 Octave Log Linearity: 31.50 Hz



1/1 octave level linearity at normal range with 0 dB gain performed according to IEC 61260-3:2016 11 and ANSI S1.11-2016 Part 3 11 for compliance to IEC 61260-1:2014 5.13 and ANSI S1.11-2014 Part 1 5.13

Calibration Certificate

Certificate Number 2021003244

Customer:

The Modal Shop
10310 AeroHub Boulevard
Cincinnati, OH 45215, United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	10172	***Technician***	Jason Grace		
Test Results	**Pass**	***Calibration Date***	24 Mar 2021		
Initial Condition	AS RECEIVED same as shipped	***Calibration Due***			
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Temperature***	23.5	°C	± 0.25 °C
		Humidity	51.8	%RH	± 2.0 %RH
		Static Pressure	85.72	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 015279 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

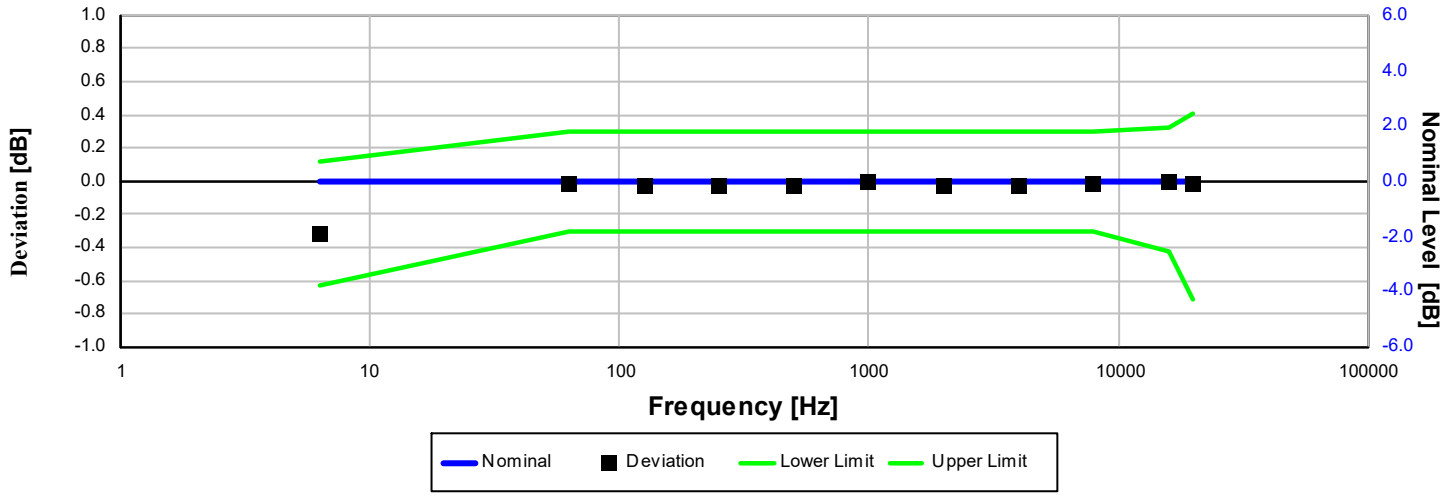
IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.



This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Calibration Certificate

Certificate Number 2021003380
Customer:
The Modal Shop
10310 AeroHub Boulevard
Cincinnati, OH 45215, United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	11445	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	26 Mar 2021		
Initial Condition	As Manufactured	***Calibration Due***			
		Temperature	23.32	°C	± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Humidity***	50.9	%RH	± 2.0 %RH
		Static Pressure	85.16	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 071087 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

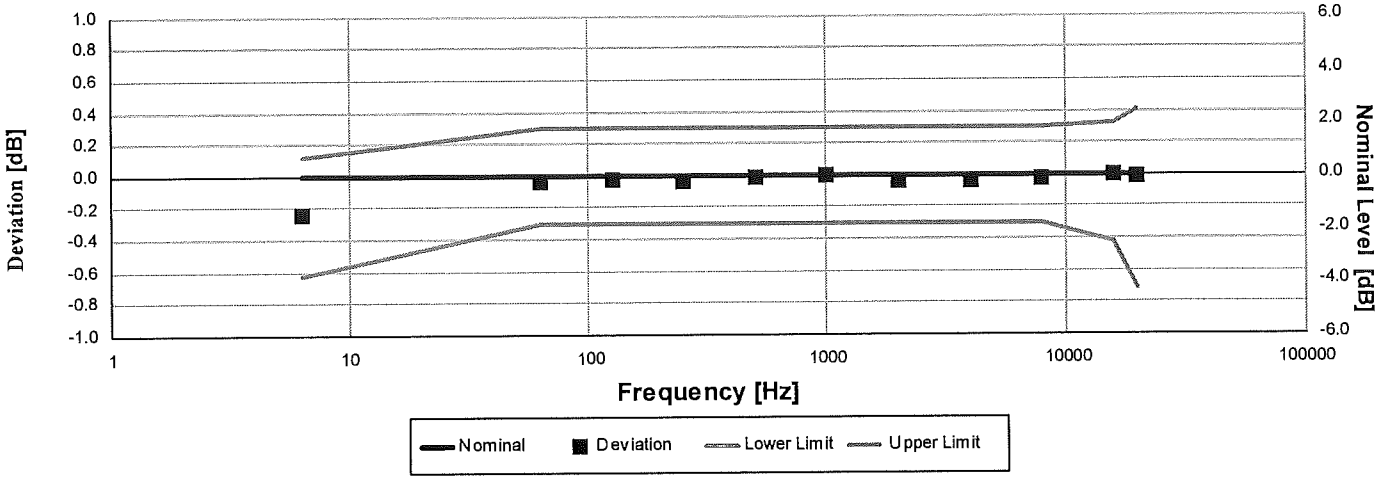
IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.



This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

ACCREDITED
Cert. #3622.01

LARSON DAVIS
A PCB PIEZOTRONICS DIV.

Calibration Certificate

Certificate Number 2021003820

Customer:

The Modal Shop
10310 AeroHub Boulevard
Cincinnati, OH 45215, United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	11465	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	5 Apr 2021		
Initial Condition	As Manufactured	***Calibration Due***			
		Temperature	23.78	°C	± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Humidity***	50.8	%RH	± 2.0 %RH
		Static Pressure	84.62	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 036756 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

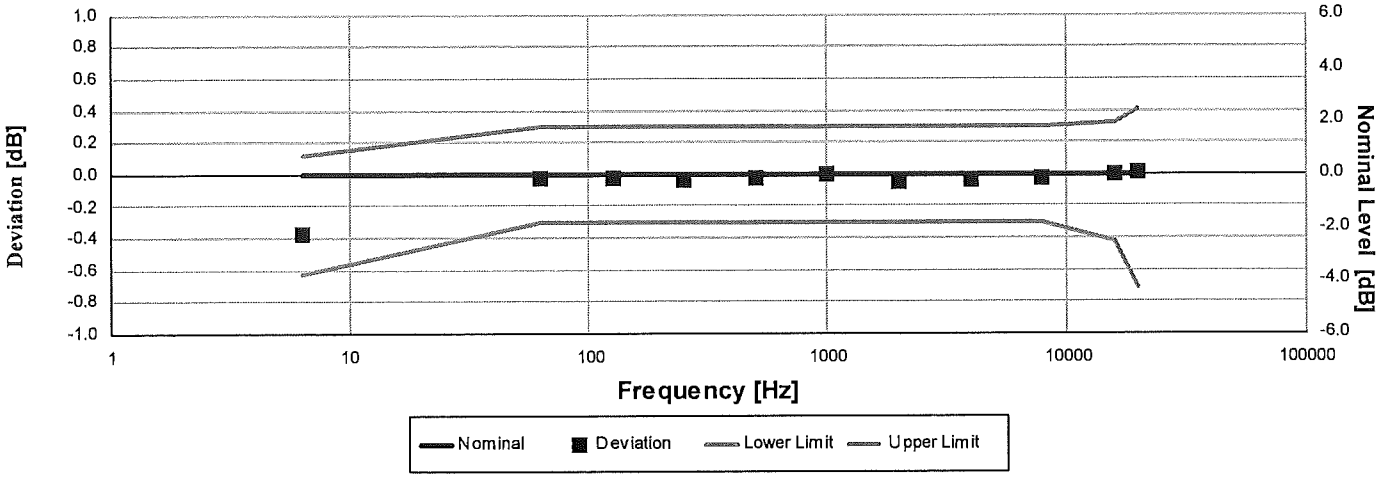
IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.



This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

ACCREDITED
Cert. #3622.01

LARSON DAVIS
A PCB PIEZOTRONICS DIV.

Calibration Certificate

Certificate Number 2021003828

Customer:

The Modal Shop
10310 AeroHub Boulevard
Cincinnati, OH 45215, United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	11466	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	6 Apr 2021		
Initial Condition	As Manufactured	***Calibration Due***			
		Temperature	23.33	°C	± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Humidity***	52.4	%RH	± 2.0 %RH
		Static Pressure	85.63	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 029590 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

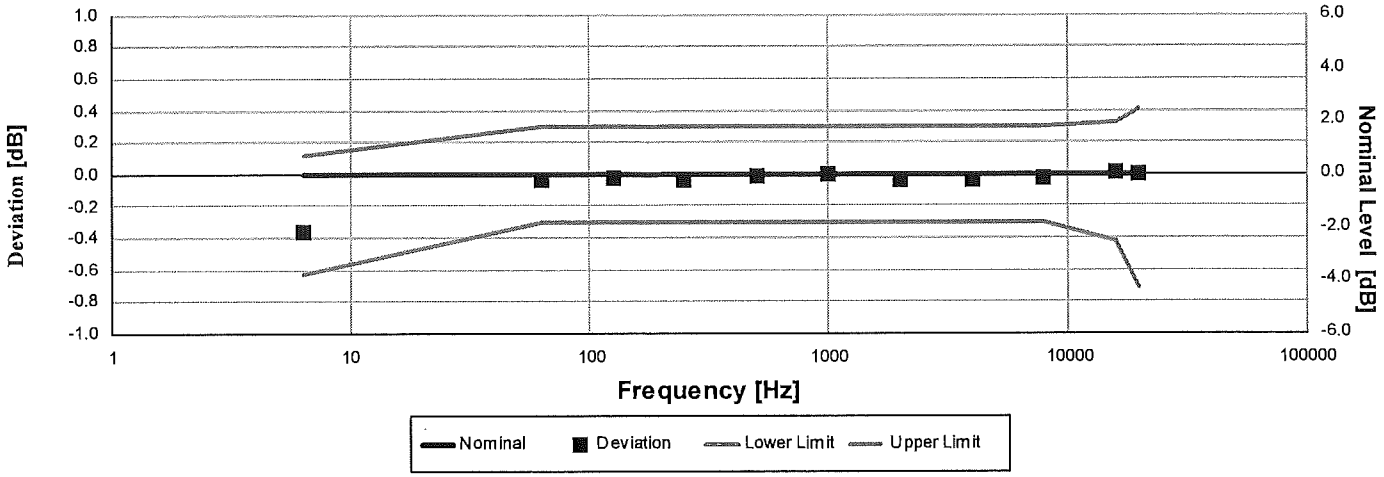
IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.



This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

716-684-0001

ACCREDITED Cert. #3622.01

LARSON DAVIS
A PCB PIEZOTRONICS DIV.

Calibration Certificate

Certificate Number 2021003827
Customer:
The Modal Shop
10310 AeroHub Boulevard
Cincinnati, OH 45215, United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	11467	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	6 Apr 2021		
Initial Condition	As Manufactured	***Calibration Due***			
		Temperature	23.26	°C	± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Humidity***	52.5	%RH	± 2.0 %RH
		Static Pressure	85.63	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 036756 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

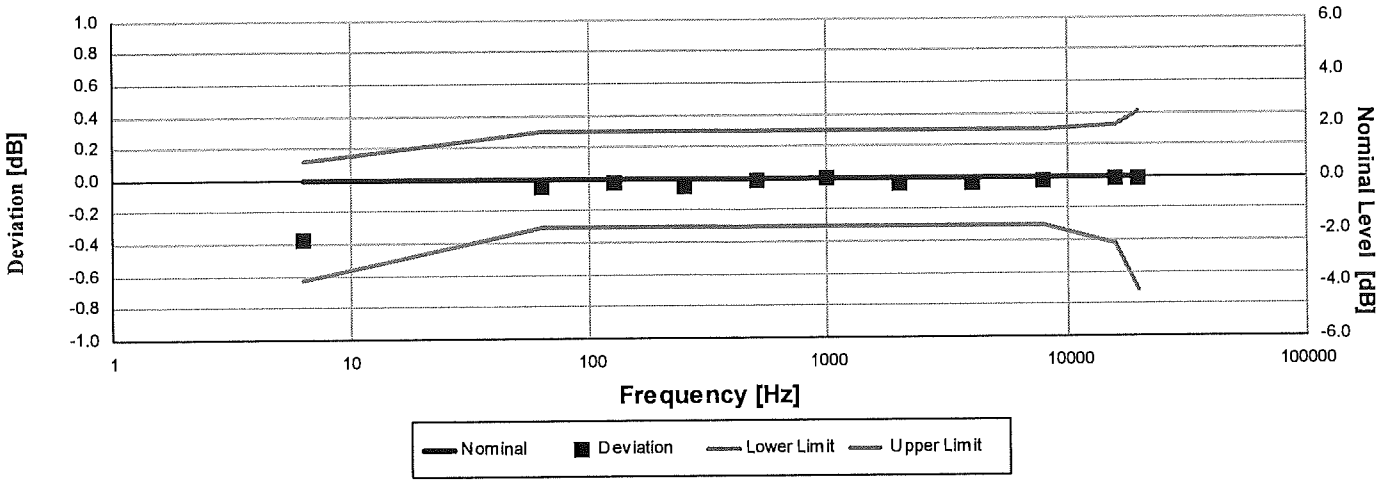
IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.



This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

716-684-0001

ACCREDITED Cert. #3622.01

LARSON DAVIS
A PCB PIEZOTRONICS DIV.

Calibration Certificate

Certificate Number 2021003818
Customer:
The Modal Shop
10310 AeroHub Boulevard
Cincinnati, OH 45215, United States

Model Number	831C	***Procedure Number***	D0001.8378		
Serial Number	11470	***Technician***	Ron Harris		
Test Results	**Pass**	***Calibration Date***	5 Apr 2021		
Initial Condition	As Manufactured	***Calibration Due***			
		Temperature	23.86	°C	± 0.25 °C
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.0R0	***Humidity***	52.9	%RH	± 2.0 %RH
		Static Pressure	84.64	kPa	± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRM831 S/N 029590 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

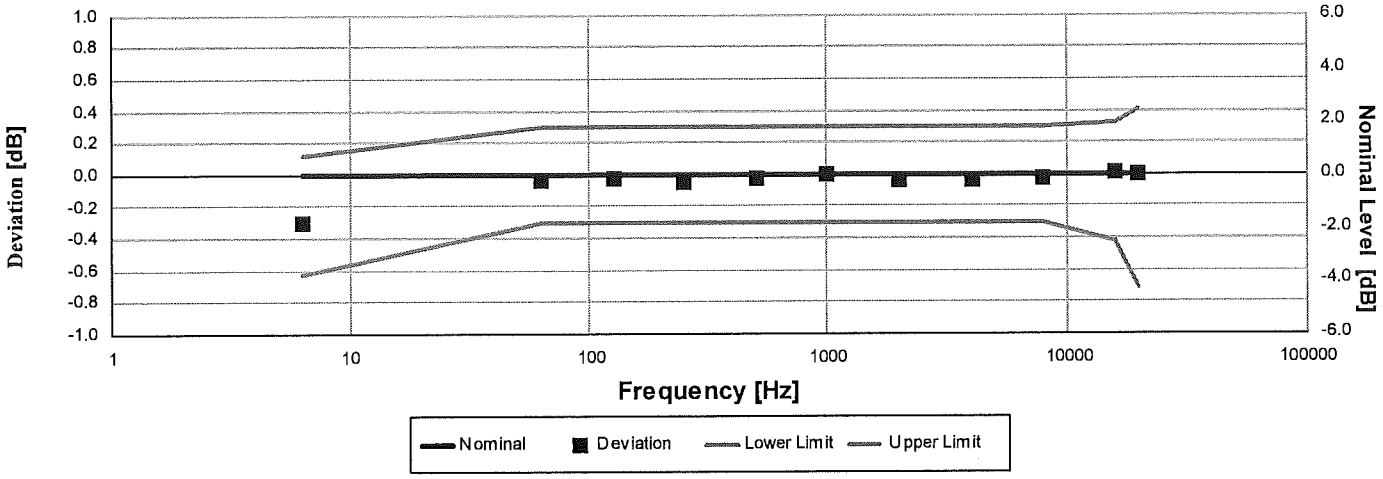
IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.



This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Frequency sweep performed with B&K UA0033 electrostatic actuator.

Condition of Unit

As Found: In Tolerance

As Left: In Tolerance

Notes

1. Calibration of reference equipment is traceable to one or more of the following National Labs; NIST, PTB or DFM.
2. This certificate shall not be reproduced, except in full, without written approval from PCB Piezotronics, Inc.
3. Calibration is performed in compliance with ISO 10012-1, ANSI/NCSL Z540.3 and ISO 17025.
4. See Manufacturer's Specification Sheet for a detailed listing of performance specifications.
5. Open Circuit Sensitivity is measured using the insertion voltage method following procedure AT603-5.
6. Measurement uncertainty (95% confidence level with coverage factor of 2) for sensitivity is +/-0.20 dB.
7. Unit calibrated per ACS-20.

Notes

1. Calibration of reference equipment is traceable to one or more of the following National Labs; NIST, PTB or DFM.
2. This certificate shall not be reproduced, except in full, without written approval from PCB Piezotronics, Inc.
3. Calibration is performed in compliance with ISO 10012-1, ANSI/NCSL Z540.3 and ISO 17025.
4. See Manufacturer's Specification Sheet for a detailed listing of performance specifications.
5. System Sensitivity is measured following procedure AT603-13.
6. Measurement uncertainty (95% confidence level with coverage factor of 2) for sensitivity is +/- 0.5 dB.
7. Unit calibrated per ACS-156.

		Temperature	25	°C	± 0.3 °C
Description	Larson Davis CAL200 Acoustic Calibrator	***Humidity***	26	%RH	± 3 %RH
		Static Pressure	101.3	kPa	± 1 kPa

Evaluation Method The data is aquired by the insert voltage calibration method using the reference microphone's open circuit sensitivity. Data reported in dB re 20 µPa.

Compliance Standards Compliant to Manufacturer Specifications per D0001.8190 and the following standards:
IEC 60942:2017 ANSI S1.40-2006

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the SI through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017.
Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

A PCB PIEZOTRONICS DIV.

Model CAL200 Relative SPL vs. Temperature

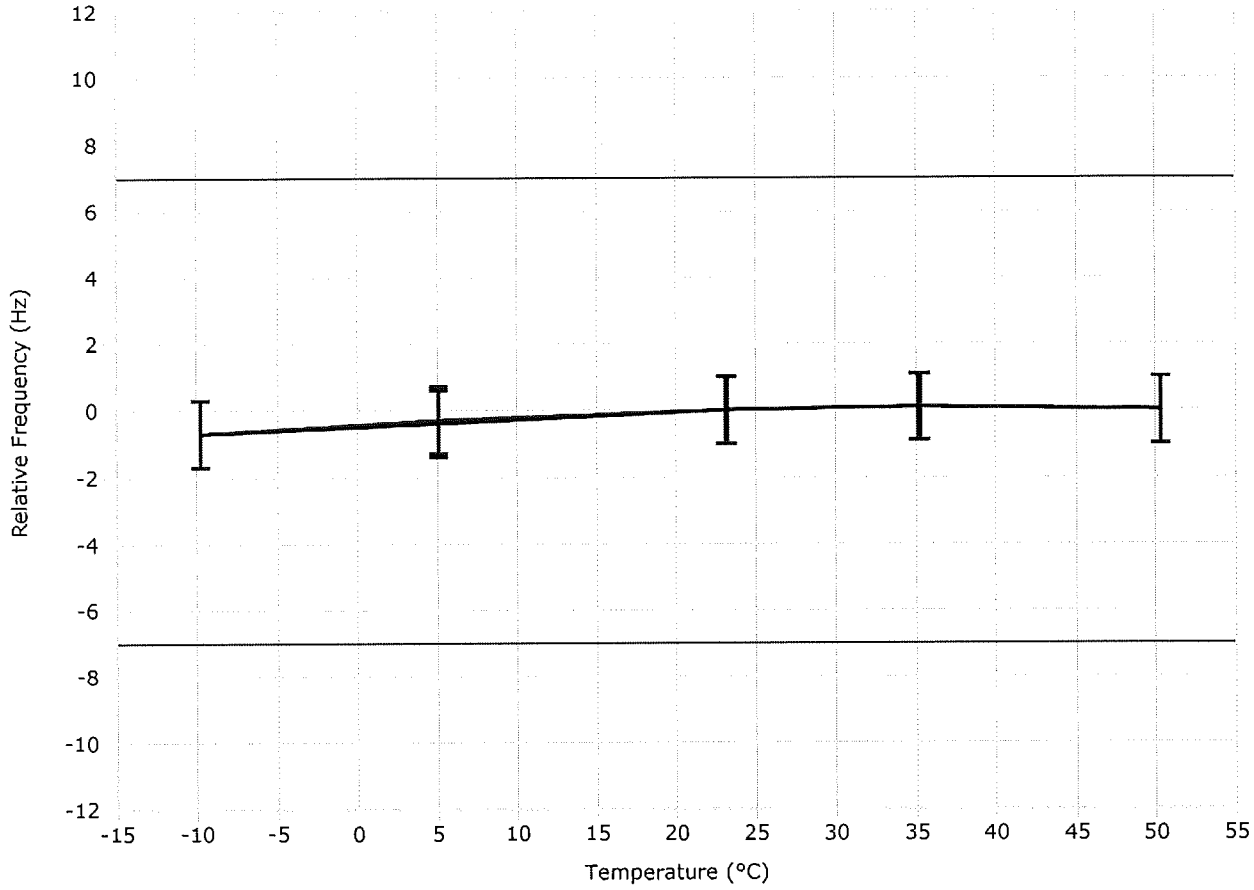
Larson Davis Model CAL200 Serial Number: 18981

Model CAL200 Relative SPL vs. Temperature at 50% RH.
A 2559 Mic (SN: 2957) with a PRM901 Preamp (SN: 0193), station 11 was used to check the levels.

Test Date: 19 May 2021 2:55:34 PM

0.1dB expanded uncertainty at ~95% confidence level (k=2)

Sequence File: CAL200.SEQ



Test Location: Larson Davis, a division of PCB Piezotronics, Inc.
1681 West 820 North, Provo, Utah 84601
Tel: 716 684-0001 www.LarsonDavis.com

Model CAL200 Relative Frequency vs. Temperature

Larson Davis Model CAL200 Serial Number: 18981

Model CAL200 Relative Frequency vs. Temperature at 50% RH.
A 2559 Mic (SN: 2957) with a PRM901 Preamp (SN: 0193), station 11 was used to check the levels.

Test Date: 19 May 2021 2:55:34 PM

1.0 Hz expanded uncertainty at ~95% confidence level (k=2)

Sequence File: CAL200.SEQ

Test Location: Larson Davis, a division of PCB Piezotronics, Inc.
1681 West 820 North, Provo, Utah 84601

PCB 377B02. S/N 335801
Larson Davis CAL291. S/N 0108
Larson Davis CAL200. S/N 9079
Larson Davis PRM831. S/N 076995

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8378:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017.
Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev B, 2017-03-31

For 1/4" microphones, the Larson Davis ADP024 1/4" to 1/2" adaptor is used with the calibrators and the Larson Davis ADP043 1/4" to

1/2" adaptor is used with the preamplifier.

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Periodic tests were performed in accordance with precedures from IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part3.

No Pattern approval for IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 available.

The sound level meter submitted for testing successfully completed the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 or correction data for acoustical test of frequency weighting were not provided in the Instruction Manual and (b) because the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3 cover only a limited subset of the specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1.

Larson Davis CAL291. S/N 0108
Larson Davis PRM831. S/N 076996
Larson Davis CAL200. S/N 9079
PCB 377B02. S/N 336515

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8378:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017.
Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev B, 2017-03-31

For 1/4" microphones, the Larson Davis ADP024 1/4" to 1/2" adaptor is used with the calibrators and the Larson Davis ADP043 1/4" to

1/2" adaptor is used with the preamplifier.

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Periodic tests were performed in accordance with precedures from IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part3.

No Pattern approval for IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 available.

The sound level meter submitted for testing successfully completed the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 or correction data for acoustical test of frequency weighting were not provided in the Instruction Manual and (b) because the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3 cover only a limited subset of the specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

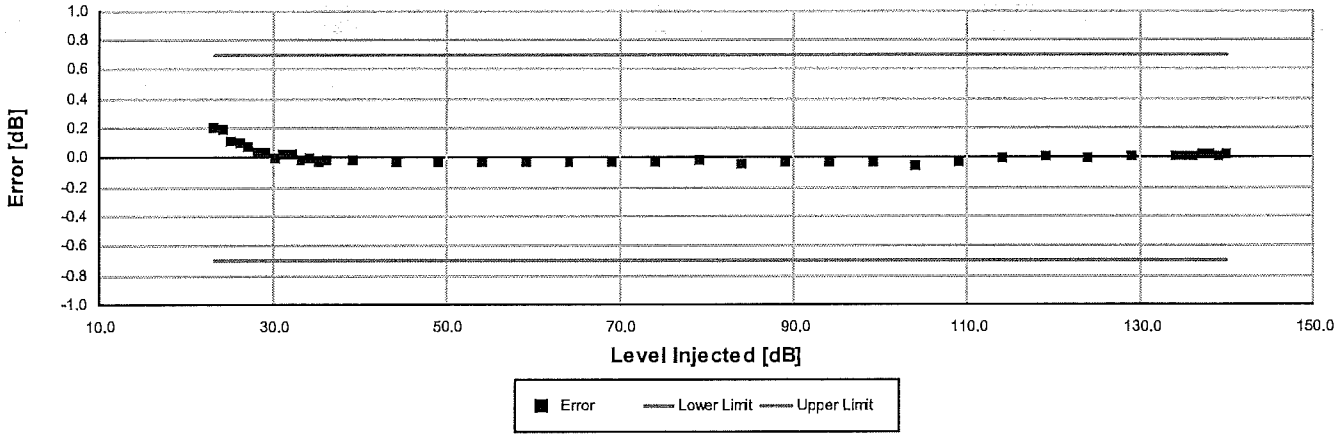
Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev M, 2019-09-10

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Standards Used			
Description	**Cal Date**	**Cal Due**	**Cal Standard**
Hart Scientific 2626-H Temperature Probe	2021-02-04	2022-08-04	006767
SRS DS360 Ultra Low Distortion Generator	2021-04-13	2022-04-13	007635

Z-weight Filter Response



Electrical signal test of frequency weighting performed according to IEC 61672-3:2013 13 and ANSI S1.4-2014 Part 3: 13 for compliance to IEC 61672-1:2013 5.5; IEC 60651:2001 6.1 and 9.2.2; IEC 60804:2000 5; ANSI S1.4:1983 (R2006) 5.1 and 8.2.1; ANSI S1.4-2014 Part 1: 5.5

	10	0.03	± 1.50	0.16 ‡	Pass

-- End of measurement results--

Gain

Gain measured according to IEC 61672-3:2013 17.3 and 17.4 and ANSI S1.4-2014 Part 3: 17.3 and 17.4

Measurement	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
0 dB Gain	94.00	93.91	94.11	0.15	Pass
0 dB Gain, Linearity	28.06	27.31	28.71	0.16	Pass
20 dB Gain	94.02	93.91	94.11	0.15	Pass
20 dB Gain, Linearity	23.07	22.31	23.71	0.16	Pass
OBA High Range	94.01	93.20	94.80	0.15	Pass
OBA Normal Range	94.01	93.91	94.11	0.15	Pass

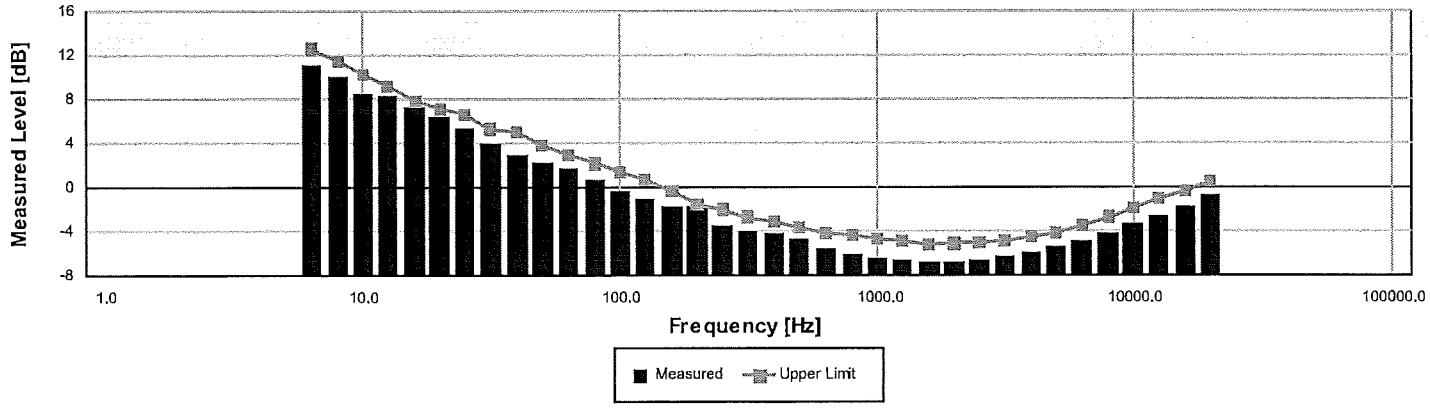
-- End of measurement results--

Broadband Noise Floor

Self-generated noise measured according to IEC 61672-3:2013 11.2 and ANSI S1.4-2014 Part 3: 11.2

Measurement	Test Result [dB]	Upper limit [dB]	Result
A-weight Noise Floor	6.60	9.00	Pass
C-weight Noise Floor	12.39	15.00	Pass
Z-weight Noise Floor	22.48	25.00	Pass

-- End of measurement results--



Total Harmonic Distortion

Measured using 1/3-Octave filters

Measurement	Test Result [dB]	Lower Limit [dB]	Upper Limit [dB]	Expanded Uncertainty [dB]	Result
10 Hz Signal	137.50	137.20	138.80	0.15	Pass
THD	-76.23		-60.00	1.30 ‡	Pass
THD+N	-75.27		-60.00	1.30 ‡	Pass

-- End of measurement results--

1/3-Octave Self-Generated Noise

The SLM is set to normal range and 20 dB gain.

APPENDIX C DEVIATIONS FROM PROCEDURES

Table 1. Calibration and Noise Floor Corrections

Monitoring ID	Calibration Corrections	Noise Floor Corrections
WM1	Calibration value used in measurement: -17.94 dB Previous accurate calibration value: -8.00 dB Correction made: -9.94 dB	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4 dBA
WM2	Calibration value used in measurement: -17.92 dB re. 1V/Pa Previous accurate calibration value: -7.98 dB re. 1V/Pa Correction made: -9.94 dB	Noise Floor: 6.5 dBA (Lowest Lmin value for two consecutive hours) Noise Floor Correction: 6.4 dBA
WM3	Calibration value used in measurement: -17.95 dB re. 1V/Pa Previous accurate calibration value: -7.98 dB re. 1V/Pa Correction made: -9.97 dB	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4 dBA
WM4	Calibration value used in measurement: -7.92dB re. 1V/Pa No calibration correction was needed.	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4 dBA
WM5	Calibration value used in measurement: 2.12 dB re. 1V/Pa Previous accurate calibration value: -7.73 dB re. 1V/Pa Correction made: +9.95 dB	Noise Floor: 4.1 dBA (Lowest Lmin value for two consecutive hours) Noise Floor Correction: 4.0 dBA
WM6	The meter only had PRM831 data logged. Calibration data from meters WM1, WM2, and WM3 (had similar PRM831 values) were used to recalibrate data for WM6. Correction made: -9.95 dB	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4dBA
WM8	Calibration value used in measurement: -18.27 dB re. 1V/Pa Previous accurate calibration value: -7.73 dB re. 1V/Pa Correction made: -10.54 dB	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4dBA
WM10	Calibration value used in measurement: 2.19 dB re. 1V/Pa Previous accurate calibration value: -7.64 dB re. 1V/Pa Correction made: +9.28 dB	Noise Floor: 6.1 dBA (Lowest Lmin value for two consecutive hours)) Noise Floor Correction: 6.0 dBA
WM11	Calibration value used in measurement: 2.08 dB re. 1V/Pa Previous accurate calibration value: -7.57 dB re. 1V/Pa Correction made: +9.65 dB	Noise Floor: 5.65 dBA (Lowest Lmin value for two consecutive hours) Noise Floor Correction: 5.55 dBA
WM12	Calibration value used in measurement: 2.22 dB re. 1V/Pa Previous accurate calibration value: -8.07 dB re. 1V/Pa Correction made: +10.29 dB	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4 dBA
WM13	Calibration value used in measurement: -17.42 dB re. 1V/Pa Previous accurate calibration value: -7.69 dB re. 1V/Pa	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4dBA

	Correction made: -9.73 dB	
WM15	Calibration value used in measurement: -18.09 dB re. 1V/Pa Previous accurate calibration value: -7.17 dB re. 1V/Pa Correction made: -10.92 dB	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4dBA
WM16	Calibration value used in measurement: -17.98 dB re. 1V/Pa Previous accurate calibration value: -7.17 dB re. 1V/Pa Correction made: -10.81 dB	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4dBA
WM18	Calibration value used in measurement: -17.92 Previous accurate calibration value: -7.63 Correction made: -10.29	Noise Floor: 6.5 dBA (manufacturer specification) Noise Floor Correction: 6.4dBA
