Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_3* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

643. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

644. Observe and list the F/S groups present in the evaluation area.

645. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

646. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

647. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

648. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Halogeton, Mustard, Pepperweed, Russian thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife habitat

Offsite influences: Highway

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes

Reference community phase/description[3]: 3.2 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CF_5* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

649. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

650. Observe and list the F/S groups present in the evaluation area.

651. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

652. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

653. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

654. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_6* **Date:** *July 23, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

655. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

656. Observe and list the F/S groups present in the evaluation area.

657. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

658. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

659. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

660. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.72 miles southeast of the town of Carlin, mile marker 3.0 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.739496 N. Latitude
Section 1/4 Section		m		-116.15005 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife habitat, livestock grazing

Offsite influences: Access roads

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes

Reference community phase/description[3]: 3.2 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_6a* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

661. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

662. Observe and list the F/S groups present in the evaluation area.

663. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

664. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

665. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

666. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Pepperweed, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CG_1* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

667. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

668. Observe and list the F/S groups present in the evaluation area.

669. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

670. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

671. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

672. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Alfalfa*
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton, Mustard, Mustards, Prickly lettuce*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Goldstrike Mine, mile marker 17.7 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.990802 N. Latitude
Section 1/4 Section		m		-116.396369 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): N/A

Land treatment type(s) and date(s): N/A

Wildlife, livestock, recreation, or other uses: N/A

Offsite influences: N/A

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes

Reference community phase/description[3]: 4.2 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CG_2* **Date:** *July 13, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

679. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

680. Observe and list the F/S groups present in the evaluation area.

681. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

682. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

683. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

684. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *State-and-Transition models not developed for this draft ecological site description*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass		
Cool-season perennial grasses		
Annual forbs		
Sprouting succulent		
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*	
Number of expected F/S groups present[2] in evaluation area:		*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:		*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.34 miles northeast of the Goldstrike Mine, mile marker 17.0 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.953843 N. Latitude
Section 1/4 Section		m		-116.460565 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power lines, power plan, mining activity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CG_3* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

685. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

686. Observe and list the F/S groups present in the evaluation area.

687. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

688. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

689. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

690. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CG_3a* **Date:** *July 20, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

691. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

692. Observe and list the F/S groups present in the evaluation area.

693. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

694. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

695. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

696. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.14 miles east of the Goldstrike Mine, mile marker 17.7 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.968435 N. Latitude
Section 1/4 Section		m		-116.446323 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): Historical wildfire evidence	
Land treatment type(s) and date(s): Evidence of remediation efforts	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power lines, mining activity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CG_3b* **Date:** *July 20, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

697. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

698. Observe and list the F/S groups present in the evaluation area.

699. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

700. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

701. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

702. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CG_3c* **Date:** *July 20, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

703. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

704. Observe and list the F/S groups present in the evaluation area.

705. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

706. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

707. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

708. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CG_4* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

709. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

710. Observe and list the F/S groups present in the evaluation area.

711. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

712. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

713. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

714. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton, Mustard, Prickly lettuce, Tansy mustard, Tumble mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CG_5* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

715. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

716. Observe and list the F/S groups present in the evaluation area.

717. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

718. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

719. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

720. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton, Mustard, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CG_6* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

721. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

722. Observe and list the F/S groups present in the evaluation area.

723. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

724. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

725. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

726. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 2.85 miles northeast of the Goldstrike Mine, mile marker 15.4 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.932358 N. Latitude
Section 1/4 Section		m		-116.475897 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access road, power line	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CG_8* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

733. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

734. Observe and list the F/S groups present in the evaluation area.

735. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

736. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

737. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

738. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton, Mustard, Pepperweed, Tansy mustard, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.05 miles east of the town of Carlin, mile marker 2.3 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.728213 N. Latitude
Section 1/4 Section		m		-116.144743 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CH_1* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

739. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

740. Observe and list the F/S groups present in the evaluation area.

741. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

742. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

743. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

744. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CH_2* **Date:** *July 21, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

745. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

746. Observe and list the F/S groups present in the evaluation area.

747. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

748. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

749. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

750. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Prickly lettuce, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 2.62 miles southeast of the town of Carlin, mile marker 4.5 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.753594 N. Latitude
Section 1/4 Section		m		-116.154543 W. Longitude
Supplemental Information & Reference Community Phase				
Recent weather (last 2 years): Drought				
Natural disturbance type(s) and date(s): NA				
Land treatment type(s) and date(s): NA				
Wildlife, livestock, recreation, or other uses: Wildlife, livestock				
Offsite influences: Residual mining activity, power lines				
Photos taken? Yes	Quantitative data collected: No			
F/S groups worksheet completed? Yes				
Reference community phase/description[3]: 4.2 Community Phase				

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CH_2a* **Date:** *July 23, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

751. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

752. Observe and list the F/S groups present in the evaluation area.

753. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

754. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

755. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

756. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CH_3* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

757. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

758. Observe and list the F/S groups present in the evaluation area.

759. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

760. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

761. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

762. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass		
Cool-season perennial grasses		
Annual forbs		
Sprouting succulent		
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*	
Number of expected F/S groups present[2] in evaluation area:		*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:		*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Soil horizon	Depth	Texture	Eff[2]	Other	Soil horizon	Depth	Texture	Eff[2]	Other
					1	*0 - 9 cm*	*Sandy Loam*		*Dry 10YR5/3; moist 10YR3/3, loose, large subangular structure, slightly sticky, some fine gravel, fine roots throughout, litter mixed in*
					2	*9 - 21 cm*	*Sandy Loam*		*Dry 10YR5/3; moist 10YR3/3, some weak subangular structure, very friable, slightly sticky, some gravel, roots throughout*
					3	*21 - 58 cm*	*Loamy Sand*		*Dry 10YR5/3; moist 10YR3/3, weak subangular structure, firm in profile, very friable, gravelly (~20%), fine to coarse gravel, coarse roots, tubular pores*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.98 miles east of the town of Carlin, mile marker 1.9 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes
Township Range	m	40.721779 N. Latitude

Section 1/4 Section	OR	m	OR	-116.145051 W. Longitude

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Recreation: shooting range, wildlife, livestock	
Offsite influences: Access roads, shooting range, highway	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CH_4* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

763. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

764. Observe and list the F/S groups present in the evaluation area.

765. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

766. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

767. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

768. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *CH_5* **Date:** *July 23, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

769. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

770. Observe and list the F/S groups present in the evaluation area.

771. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

772. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

773. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

774. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

					3	*31 - 53 cm*	*Clay Loam*		*Dry N/A; moist - 10YR3/4, moist, subangular, blocky, fine gravel throughout, lots of fibrous roots with salt coating*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 2.2 miles south of the TS Power Plant, mile marker 7.0 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.816377 N. Latitude
Section 1/4 Section		m		-116.490424 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power lines, substation	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 2.3 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Cr_1* **Date:** *June 25, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

775. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

776. Observe and list the F/S groups present in the evaluation area.

777. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

778. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

779. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

780. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Burning bush*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Mustards, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Cr_2* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

781. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

782. Observe and list the F/S groups present in the evaluation area.

783. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

784. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

785. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

786. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *Do_1* **Date:** *June 21, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

787. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

788. Observe and list the F/S groups present in the evaluation area.

789. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

790. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

791. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

792. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Shadscale*
Sprouting shrubs	*Greasewood, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prostrate mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *Do_3* **Date:** *June 21, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

799. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

800. Observe and list the F/S groups present in the evaluation area.

801. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

802. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

803. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

804. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Shadscale*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed, Prostrate mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 3.36 miles west of the TS Power Plant, mile marker 2.5 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.781442 N. Latitude
Section 1/4 Section		m		-116.43653 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Stock pond, pivot fields, power plant, two track running through survey area	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *Do_4* **Date:** *June 30, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

805. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

806. Observe and list the F/S groups present in the evaluation area.

807. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

808. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

809. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

810. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *Do_5* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

811. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

812. Observe and list the F/S groups present in the evaluation area.

813. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

814. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

815. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

816. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 4.33 miles south of the TS Power Plant, mile marker 9.3 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.848139 N. Latitude
Section 1/4 Section		m		-116.49715 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power lines, some mining activity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Do_6* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

817. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

818. Observe and list the F/S groups present in the evaluation area.

819. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

820. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

821. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

822. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *2.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Dp_1* **Date:** *June 8, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

823. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

824. Observe and list the F/S groups present in the evaluation area.

825. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

826. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

827. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

828. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.8 miles north of the town of Beowawe, mile marker 31.6 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.571116 N. Latitude
Section 1/4 Section		m		-116.463411 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Highway, access road, and railroad within close proximity.	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Dp_2* **Date:** *June 8, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

829. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

830. Observe and list the F/S groups present in the evaluation area.

831. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

832. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

833. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

834. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Dp_2a* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

835. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

836. Observe and list the F/S groups present in the evaluation area.

837. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

838. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

839. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

840. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Four-wing saltbush, Saltbush*
Sprouting shrubs	*Greasewood, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.88 miles north of the town of Beowawe, mile marker 31.5 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.569872 N. Latitude	
Section 1/4 Section		m		-116.464671 W. Longitude	

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Highway, access roads, and railroad all within close proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Dp_3* **Date:** *June 9, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

841. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

842. Observe and list the F/S groups present in the evaluation area.

843. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

844. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

845. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

846. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

					3	*34 - 47 cm*	*Sandy Clay*		*Dry 10YR6/3; moist 10YR3/3, subangular blocky texture, hard, small cobbles present*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.65 miles northeast of the Goldstrike Mine, mile marker 12.2 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.890109 N. Latitude	
Section 1/4 Section		m		-116.497132 W. Longitude	

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Rangeland, wildlife	
Offsite influences: Access road, pivot fields, power plant, ranch	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *Ge_2* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

853. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

854. Observe and list the F/S groups present in the evaluation area.

855. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

856. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

857. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

858. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Dry Floodplain*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*0*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_ls_1* **Date:** *June 24, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

859. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

860. Observe and list the F/S groups present in the evaluation area.

861. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

862. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

863. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

864. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Mf_1* **Date:** *June 25, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

865. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

866. Observe and list the F/S groups present in the evaluation area.

867. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

868. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

869. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

870. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Mf_3* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

877. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

878. Observe and list the F/S groups present in the evaluation area.

879. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

880. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

881. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

882. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 6.15 miles south of the TS Power Plant, mile marker 11.1 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.874616 N. Latitude
Section 1/4 Section		m		-116.504715 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Power plant, pivot fields, access roads	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Mf_4* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

883. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

884. Observe and list the F/S groups present in the evaluation area.

885. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

886. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

887. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

888. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Mf_5* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

889. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

890. Observe and list the F/S groups present in the evaluation area.

891. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

892. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

893. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

894. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 2.74 miles south of the TS Power Plant, mile marker 7.7 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.825182 N. Latitude	
Section 1/4 Section		m		-116.497604 W. Longitude	

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access road, power plant	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Mf_7* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

901. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

902. Observe and list the F/S groups present in the evaluation area.

903. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

904. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

905. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

906. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	*Cultivated hay*
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.33 miles south of the TS Power Plant, mile marker 10.3 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.862774 N. Latitude
Section 1/4 Section		m		-116.508339 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Access road, pivot fields, power plant, ranch	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Mf_8* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

907. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

908. Observe and list the F/S groups present in the evaluation area.

909. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

910. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

911. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

912. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Mf_9* **Date:** *June 29, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

913. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

914. Observe and list the F/S groups present in the evaluation area.

915. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

916. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

917. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

918. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Wooly star*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 6.03 miles northeast of the Goldstrike Mine, mile marker 11.7 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.883018 N. Latitude
Section 1/4 Section		m		-116.496801 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Pivot fields, access road, power plant	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Ms_1* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

919. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

920. Observe and list the F/S groups present in the evaluation area.

921. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

922. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

923. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

924. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*0*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Ms_2* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

925. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

926. Observe and list the F/S groups present in the evaluation area.

927. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

928. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

929. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

930. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*0*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 6.11 miles northeast of the Goldstrike Mine, mile marker 11.6 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR		40.881732 N. Latitude
Section 1/4 Section		m			-116.497186 W. Longitude

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, heavy livestock use	
Offsite influences: Access roads, power lines, historical mining infrastructure	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Ms_3* **Date:** *June 28, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

931. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

932. Observe and list the F/S groups present in the evaluation area.

933. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

934. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

935. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

936. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.51 miles north of the town of Beowawe, mile marker 31.9 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes

Township Range		OR	m	OR	40.575455 N. Latitude
Section 1/4 Section			m		-116.461137 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Railroad with large access road running parallel, highway, powerlines					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *Ok_1* **Date:** *June 7, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

943. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

944. Observe and list the F/S groups present in the evaluation area.

945. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

946. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

947. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

948. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Evaluation Area Location					
Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.					
Location description/directions: Approximately 5.87 miles west of the TS Power Plant, mile marker 5.0 of the Welches Creek Road project segment.					
Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.785086 N. Latitude	
Section 1/4 Section		m		-116.388668 W. Longitude	
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access road					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_OSB_2* **Date:** *July 14, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

955. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

956. Observe and list the F/S groups present in the evaluation area.

957. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

958. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

959. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

960. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Russian thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *OSB_3* **Date:** *July 14, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

961. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

962. Observe and list the F/S groups present in the evaluation area.

963. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

964. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

965. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

966. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.52 miles west of the TS Power Plant, mile marker 4.7 of the Welches Creek Road project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m		OR	40.784593 N. Latitude
Section 1/4 Section		m			-116.395395 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access road, pivot					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.2 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *OSB_4* **Date:** *July 20, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

967. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

968. Observe and list the F/S groups present in the evaluation area.

969. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

970. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

971. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

972. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce, Russian thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.37 miles southwest of the TS Power Plant, mile marker 6.0 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.802595 N. Latitude
Section 1/4 Section		m		-116.487309 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power lines, power plant	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Pk_1* **Date:** *June 25, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

979. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

980. Observe and list the F/S groups present in the evaluation area.

981. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

982. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

983. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

984. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Dry Floodplain*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*0*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *Pk_2* **Date:** *June 24, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

985. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

986. Observe and list the F/S groups present in the evaluation area.

987. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

988. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

989. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

990. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Dry Floodplain*	**Reference phase for evaluation area:** *3.1 Community Phase*

					2	*6 - 37 cm*	*Clay Loam*		*Dry N/A, moist - 10YR4/3, subangular, blocky, moist, sticky, medium to coarse gravel, lots of fibrous roots throughout*
					3	*37 - 54 cm*	*Sandy Loam*		*Dry N/A; moist 5.5YR5/4, 10YR4/3, subtle redox features, hard compacted soil pieces throughout ranging from 1-4 cm, some fibrous roots, some fine gravel*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.51 miles southwest of the TS Power Plant, mile marker 6.2 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.805175 N. Latitude	
Section 1/4 Section		m		-116.487897 W. Longitude	

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power plants, power lines	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *RaA_1* **Date:** *June 25, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

991. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

992. Observe and list the F/S groups present in the evaluation area.

993. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

994. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

995. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

996. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *2.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Broad-leaved pepperweed, Burning bush*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RaA_2* **Date:** *June 25, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

997. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

998. Observe and list the F/S groups present in the evaluation area.

999. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1000. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1001. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1002. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 3.77 miles west of the TS Power Plant, mile marker 2.9 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.782104 N. Latitude
Section 1/4 Section		m		-116.428652 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): Appears to have been a fire at some point. Evidence of some charred shrub remnants and some disturbance to the soils.	
Land treatment type(s) and date(s): Potentially some re-seeding efforts within larger survey area; crested wheatgrass present just outside our survey area	
Wildlife, livestock, recreation, or other uses: Wildlife, Livestock	
Offsite influences: Two track running through survey area, pivot fields, power plant	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RaB_1* **Date:** *June 30, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1003. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1004. Observe and list the F/S groups present in the evaluation area.

1005. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1006. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1007. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1008. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Dead shrubs*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Mustards, Pepperweed, Prickly lettuce, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RaB_2* **Date:** *June 30, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1009. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1010. Observe and list the F/S groups present in the evaluation area.

1011. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1012. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1013. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1014. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Interpreting Indicators of Rangeland Health Version 5 Evaluation Form (page 2)

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_1* **Date:** *June 10, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1015. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1016. Observe and list the F/S groups present in the evaluation area.

1017. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1018. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1019. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1020. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Mustard, Mustards, Pepperweed, Wooly star*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

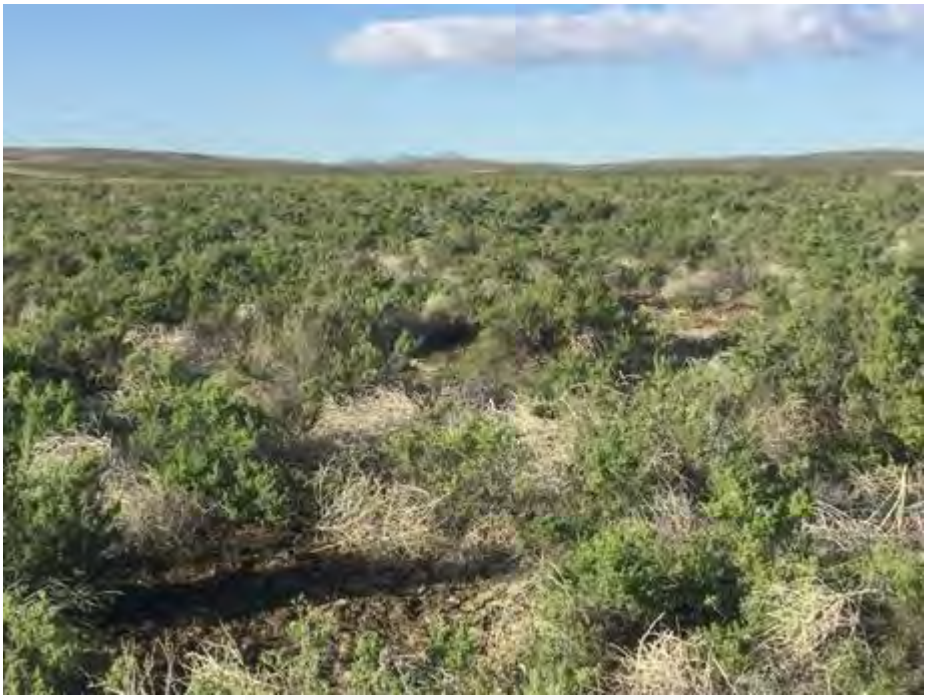

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Interpreting Indicators of Rangeland Health Version 5 Evaluation Form (page 2)

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_2* **Date:** *June 10, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1027. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1028. Observe and list the F/S groups present in the evaluation area.

1029. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1030. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1031. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1032. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

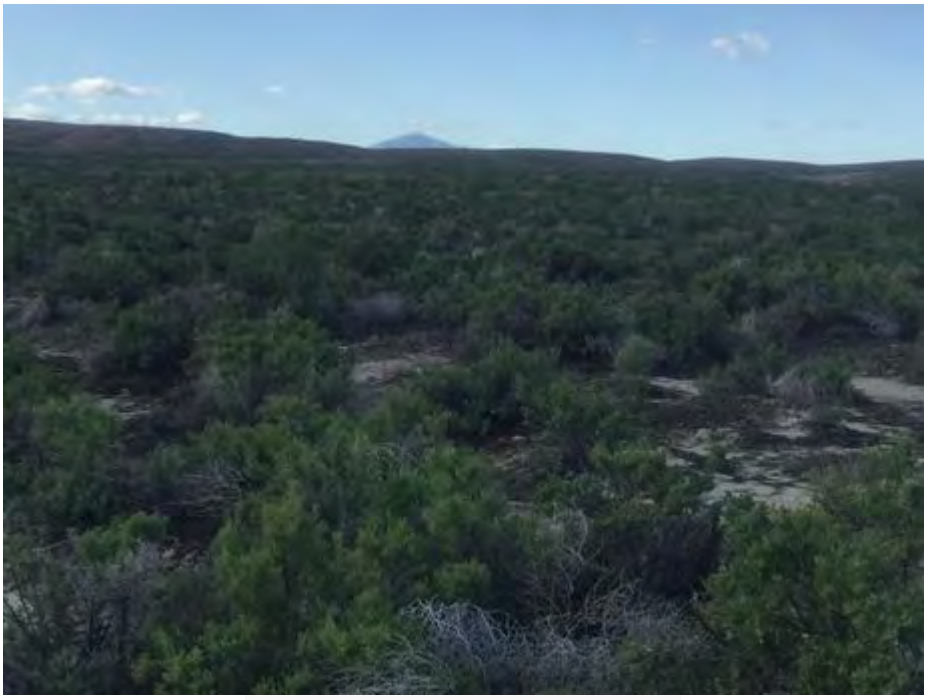

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_4* **Date:** *June 10, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1039. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1040. Observe and list the F/S groups present in the evaluation area.

1041. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1042. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1043. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1044. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*0*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access road and railroad within close proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_5* **Date:** *June 10, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1045. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1046. Observe and list the F/S groups present in the evaluation area.

1047. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1048. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1049. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1050. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_6* **Date:** *June 21, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1051. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1052. Observe and list the F/S groups present in the evaluation area.

1053. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1054. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1055. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1056. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Burning bush*
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.3 miles west of the TS Power Plant, mile marker 2.3 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.750889 N. Latitude
Section 1/4 Section		m		-116.494834 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Power plant within close proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_7* **Date:** *June 21, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1057. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1058. Observe and list the F/S groups present in the evaluation area.

1059. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1060. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1061. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1062. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Burning bush*
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Mustards, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_8* **Date:** *June 21, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1063. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1064. Observe and list the F/S groups present in the evaluation area.

1065. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1066. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1067. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1068. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the TS Power Plant, mile marker 1.0 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.73847 N. Latitude	
Section 1/4 Section		m		-116.507866 W. Longitude	

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Power plant, power line, access roads	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RbB_9* **Date:** *June 21, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1069. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1070. Observe and list the F/S groups present in the evaluation area.

1071. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1072. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1073. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1074. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RE_1* **Date:** *July 16, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1075. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1076. Observe and list the F/S groups present in the evaluation area.

1077. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1078. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1079. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1080. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Bluebunch wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Green rabbitbrush, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed, Russian thistle, Scotch thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.4 miles east of the town of Carlin, mile marker 0.0 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.700725 N. Latitude
Section 1/4 Section		m		-116.145429 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power line, nearby houses	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RE_1a* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1081. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1082. Observe and list the F/S groups present in the evaluation area.

1083. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1084. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1085. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1086. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RE_2* **Date:** *July 16, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1087. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1088. Observe and list the F/S groups present in the evaluation area.

1089. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1090. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1091. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1092. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Droughty Loam 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Bluebunch wheatgrass, Slender wheatgrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood, Green rabbitbrush, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Scotch thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*4*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type

indicated by the SWreGAP.					
Location description/directions: Approximately 2.6 miles northeast of the town of Carlin, mile marker 0.0 of the Carlin to GQ Private Bush Street project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR		40.679762 N. Latitude
Section 1/4 Section		m			-116.154728 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Train track, power line					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RE_3* **Date:** *July 16, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1093. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1094. Observe and list the F/S groups present in the evaluation area.

1095. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1096. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1097. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1098. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RE_3a* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1099. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1100. Observe and list the F/S groups present in the evaluation area.

1101. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1102. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1103. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1104. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Droughty Loam 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Indian ricegrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Mustards, Pepperweed, Tumble mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 8.5 miles north of the Goldstrike Mine, mile marker 11.5 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.844772 N. Latitude
Section 1/4 Section		m		-116.315641 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, possibly open to livestock

Offsite influences: Access roads	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 5.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RF_1* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1105. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1106. Observe and list the F/S groups present in the evaluation area.

1107. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1108. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1109. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1110. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Cobbly Claypan 8-12 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Slender wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Daggerpod*
Non-sprouting shrubs	*Big sagebrush, Bitterbrush, Utah serviceberry*
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RF_2* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1111. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1112. Observe and list the F/S groups present in the evaluation area.

1113. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1114. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1115. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1116. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

Annual forbs	*Lewis flax, Prickly lettuce, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 8.45 miles north of the Goldstrike Mine, mile marker 11.5 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.846069	N. Latitude
Section 1/4 Section		m		-116.313298	W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): Evidence of a past wildfire	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock access likely	
Offsite influences: Access road, remnant mining activity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RF_3* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1117. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1118. Observe and list the F/S groups present in the evaluation area.

1119. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1120. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1121. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1122. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Indian ricegrass, Slender wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Daggerpod, Fringed puccoon, Hawksbeard*
Non-sprouting shrubs	
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Bull thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _*RF_4*_____ **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1123. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1124. Observe and list the F/S groups present in the evaluation area.

1125. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1126. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1127. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1128. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 8.85 miles north of the Goldstrike Mine, mile marker 11.5 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.83933	N. Latitude
Section 1/4 Section		m		-116.315709	W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock access	
Offsite influences: Access roads, remnant mining activity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *RF_5* **Date:** *July 5, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1129. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1130. Observe and list the F/S groups present in the evaluation area.

1131. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1132. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1133. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1134. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Bluebunch wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Daggerpod*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_RF_6* **Date:** *July 5, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1135. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1136. Observe and list the F/S groups present in the evaluation area.

1137. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1138. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1139. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1140. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Bluebunch wheatgrass, Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Globemallow, Western stoneseed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Bull thistle, Mustard, Prickly lettuce, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Ru_1* **Date:** *June 21, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1141. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1142. Observe and list the F/S groups present in the evaluation area.

1143. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1144. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1145. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1146. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Ru_2a* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1153. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1154. Observe and list the F/S groups present in the evaluation area.

1155. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1156. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1157. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1158. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Four-wing saltbush, Saltbush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.1 miles west of the TS Power Plant, mile marker 0.2 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.777846 N. Latitude
Section 1/4 Section		m		-116.479618 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, coal processing plant, power lines	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Ru_2c* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1165. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1166. Observe and list the F/S groups present in the evaluation area.

1167. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1168. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1169. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1170. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Four-wing saltbush, Saltbush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Halogeton, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.35 miles west of the TS Power Plant, mile marker 2.4 of the Segment #2 TS Power Plant Loop to GS project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.751336 N. Latitude
Section 1/4 Section		m		-116.49386 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Power plant within close association	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SBB_1* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1177. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1178. Observe and list the F/S groups present in the evaluation area.

1179. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1180. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1181. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1182. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Knapweed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Green rabbitbrush, Rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass, Japanese brome*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Prickly lettuce, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 9.36 miles north of the Goldstrike Mine, mile marker 11.2 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.831062 N. Latitude
Section 1/4 Section		m		-116.317927 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): Potential past reseeding efforts; crested wheatgrass present.	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Two track running through survey area	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 5.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SBB_2* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1183. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1184. Observe and list the F/S groups present in the evaluation area.

1185. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1186. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1187. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1188. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 8.99 miles north of the Goldstrike Mine, mile marker 11.5 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.836789 N. Latitude
Section 1/4 Section		m		-116.317272 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Two track, stock pond	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SBB_4* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1195. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1196. Observe and list the F/S groups present in the evaluation area.

1197. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1198. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1199. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1200. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SBB_5* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1201. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1202. Observe and list the F/S groups present in the evaluation area.

1203. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1204. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1205. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1206. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Tall wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Buckwheat*
Non-sprouting shrubs	*Big sagebrush, Utah serviceberry*
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

					1	*0 - 4 cm*	*Loam*		*Dry 10YR5/3; moist 10YR3/4, weak subangular structure, porous, fine roots throughout, gravelly; fine in size*
					2	*4 - 12 cm*	*Silty Clay Loam*		*Dry 10YR5/3; moist 10YR3/3, platy and subangular blocky in structure, extremely gravelly; coarse gravel, stones present, and some roots. Refusal at 12 cm.*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 8.96 miles north of the Goldstrike Mine, mile marker 11.5 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.837988 N. Latitude
Section 1/4 Section		m		-116.314578 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): Evidence of a potential wildfire or prescribed burn

Land treatment type(s) and date(s): Sagebrush appears to have been burned and cut; no longer present in survey area.	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Two track running through survey area, stock pond	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SBB_6* **Date:** *July 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1207. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1208. Observe and list the F/S groups present in the evaluation area.

1209. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1210. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1211. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1212. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Lupine*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Green rabbitbrush, Rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Blue mustard, Mustard, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SD_1* **Date:** *July 8, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1213. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1214. Observe and list the F/S groups present in the evaluation area.

1215. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1216. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1217. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1218. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce, Storksbill, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SD_2* **Date:** *July 9, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1219. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1220. Observe and list the F/S groups present in the evaluation area.

1221. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1222. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1223. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1224. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bluebunch wheatgrass, Crested wheatgrass, Slender wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SD_3* **Date:** *July 8, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1225. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1226. Observe and list the F/S groups present in the evaluation area.

1227. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1228. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1229. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1230. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Bluebunch wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Western stoneseed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SD_4* **Date:** *July 9, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1231. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1232. Observe and list the F/S groups present in the evaluation area.

1233. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1234. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1235. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1236. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Bull thistle, Mustard, Tansy mustard, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 9.0 miles west of the TS Power Plant, mile marker 8.9 of the Welches Creek Road project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m		OR	40.800939 N. Latitude
Section 1/4 Section		m			-116.330084 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): Historical wildfire evidence					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access roads					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.2 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SD_5* **Date:** *July 9, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1237. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1238. Observe and list the F/S groups present in the evaluation area.

1239. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1240. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1241. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1242. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	*Desert saltgrass, Saltgrass*
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Bull thistle, Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*

Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SG_1* **Date:** *July 8, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1243. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1244. Observe and list the F/S groups present in the evaluation area.

1245. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1246. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1247. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1248. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Western stoneseed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 9.75 miles north of the Goldstrike Mine, mile marker 10.8 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.825341 N. Latitude	
Section 1/4 Section		m		-116.317342 W. Longitude	

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): Some evidence of a historic wildfire

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: NA	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *SG_2* **Date:** *July 5, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1249. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1250. Observe and list the F/S groups present in the evaluation area.

1251. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1252. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1253. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1254. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _SG_3 **Date:** *July 8, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1255. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1256. Observe and list the F/S groups present in the evaluation area.

1257. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1258. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1259. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1260. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Bull thistle, Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*

Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 9.82 miles north of the Goldstrike Mine, mile marker 10.7 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.824196	N. Latitude
Section 1/4 Section		m		-116.318103	W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s):	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power lines	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _SG_4 **Date:** *July 5, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1261. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1262. Observe and list the F/S groups present in the evaluation area.

1263. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1264. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1265. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1266. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 10-12 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Bluebunch wheatgrass, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Western stoneseed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _SG_5 **Date:** *July 8, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1267. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1268. Observe and list the F/S groups present in the evaluation area.

1269. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1270. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1271. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1272. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 6.39 miles west of the TS Power Plant, mile marker 5.6 of the Welches Creek Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.785869 N. Latitude
Section [1]/4 Section		m		-116.378762 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock

Offsite influences: Access road

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes

Reference community phase/description[3]: 4.2 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_1* **Date:** *July 14, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1273. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1274. Observe and list the F/S groups present in the evaluation area.

1275. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1276. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1277. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1278. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.		
Location description/directions: Approximately 7.28 miles west of the TS Power Plant, mile marker 6.5 of the Welches Creek Road project segment.		
Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes
Township Range	m	40.788953 N. Latitude

Section	1/4 Section	OR	m	OR	-116.361887 W. Longitude

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access road	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_3* **Date:** *July 12, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1285. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1286. Observe and list the F/S groups present in the evaluation area.

1287. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1288. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1289. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1290. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *5.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Globemallow*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards, Prickly lettuce*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.52 miles northeast of the town of Carlin, mile marker 0.0 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes
Township Range	m	40.695889 N. Latitude

Section	1/4 Section	OR	m	OR	-116.145265 W. Longitude

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, train track, nearby houses, power lines	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: State-and-Transition models not developed for this draft ecological site description	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_4* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1297. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1298. Observe and list the F/S groups present in the evaluation area.

1299. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1300. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1301. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1302. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_5* **Date:** *July 12, 2021 1:00 PM* **Evaluator(s):** *Henson DeBruler / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1303. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1304. Observe and list the F/S groups present in the evaluation area.

1305. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1306. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1307. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1308. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*

- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_5a* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1309. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1310. Observe and list the F/S groups present in the evaluation area.

1311. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1312. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1313. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1314. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_6* **Date:** *July 14, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1315. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1316. Observe and list the F/S groups present in the evaluation area.

1317. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1318. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1319. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1320. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_TN_6a* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1321. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1322. Observe and list the F/S groups present in the evaluation area.

1323. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1324. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1325. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1326. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Train track, power line					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_8* **Date:** *July 16, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1333. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1334. Observe and list the F/S groups present in the evaluation area.

1335. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1336. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1337. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1338. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Halogeton, Mustard, Pepperweed, Silverscale saltbush, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.48 miles northeast of the town of Carlin, mile marker 0.0 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.698453 N. Latitude
Section 1/4 Section		m		-116.146005 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Access roads, power lines, train track, nearby houses	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_8a* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1339. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1340. Observe and list the F/S groups present in the evaluation area.

1341. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1342. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1343. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1344. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Storksbill, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *TN_9* **Date:** *July 17, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1345. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1346. Observe and list the F/S groups present in the evaluation area.

1347. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1348. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1349. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1350. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	*Common cattail*
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Dock*
Non-sprouting shrubs	
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.18 miles north of the town of Carlin, mile marker 0.4 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.703871 N. Latitude
Section 1/4 Section		m		-116.119833 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Railroad tracks, access roads, power lines	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: State-and-Transition models not developed for this draft ecological site description	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Wc_1* **Date:** *July 15, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1351. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1352. Observe and list the F/S groups present in the evaluation area.

1353. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1354. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1355. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1356. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Wet Meadow*	**Reference phase for evaluation area:** *State-and-Transition models not developed for this draft ecological site description*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Western wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	*Alkali sacaton*
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass, Timothy*
Shallow-rooted, emergent perennials	*Broad-leaf cattail*
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Baltic rush, Broad-leaved pepperweed, Knapweed, Rocky Mountain iris, Russian knapweed*
Non-sprouting shrubs	*Currant*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	*Russian olive*
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mapleleaf goosefoot, Musk thistle, Pepperweed, Prickly lettuce, Scotch thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.15 miles northeast of the town of Carlin, mile marker 0.5 of the Carlin to GQ Private Bush Street project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m		OR	40.704811 N. Latitude
Section 1/4 Section		m			-116.121637 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access roads, railroad tracks, power line					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: State-and-Transition models not developed for this draft ecological site description					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Wc_3* **Date:** *July 15, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1363. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1364. Observe and list the F/S groups present in the evaluation area.

1365. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1366. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1367. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1368. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Wet Meadow*	**Reference phase for evaluation area:** *State-and-Transition models not developed for this draft ecological site description*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass, Timothy*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Broad-leaved pepperweed, Knapweed, Russian knapweed, Smartweed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Musk thistle, Mustard, Pepperweed, Prickly lettuce, Scotch thistle, Tansy mustard, Tumble mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Wc_4* **Date:** *July 15, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1369. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1370. Observe and list the F/S groups present in the evaluation area.

1371. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1372. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1373. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1374. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Wet Meadow*	**Reference phase for evaluation area:** *State-and-Transition models not developed for this draft ecological site description*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Western wheatgrass*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.		
Location description/directions: Is within the Goldstrike Mine, mile marker 17.7 of the Segment #2 TS Power Plant Loop to GS project segment.		
Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes

Township Range		OR	m	OR	40.983674 N. Latitude
Section 1/4 Section			m		-116.403319 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): Historical wildfire evidence					
Land treatment type(s) and date(s): Evidence of mitigation and revegetation efforts					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access roads, heavy mining activity, power lines					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_WE_1* **Date:** *July 13, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1375. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1376. Observe and list the F/S groups present in the evaluation area.

1377. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1378. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1379. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1380. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy Bottom 8-14 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	*Desert saltgrass, Saltgrass*
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce, Western salsify*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _*WE_2*_____ **Date:** *July 12, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1381. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1382. Observe and list the F/S groups present in the evaluation area.

1383. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1384. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1385. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1386. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy Bottom 8-14 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Bottlebrush squirreltail, Crested wheatgrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.					
Location description/directions: Is within the Goldstrike Mine, mile marker 17.7 of the Segment #2 TS Power Plant Loop to GS project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*	Position by GPS? Yes	
Township Range	OR	m	OR	40.980266 N. Latitude	
Section 1/4 Section		m		-116.408872 W. Longitude	
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): Historical wildfire evidence					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access roads, heavy mining activity, power lines					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_WE_3* **Date:** *July 13, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1387. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1388. Observe and list the F/S groups present in the evaluation area.

1389. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1390. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1391. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1392. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy Bottom 8-14 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Hoary cress, Poverty weed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Fleabane, Mustard, Prickly lettuce, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_WE_4* **Date:** *July 13, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1393. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1394. Observe and list the F/S groups present in the evaluation area.

1395. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1396. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1397. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1398. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy Bottom 8-14 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Prickly lettuce*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Interpreting Indicators of Rangeland Health Version 5 Evaluation Form (page 2)		
Evaluation area name or ID: *WE_5*		Date: *July 21, 2021 1:00 PM*
Departure from Expected	**Code**	**Instructions**
None to slight Slight to moderate Moderate Moderate to extreme Extreme to total	N-S S-MM M-E E-T	(933) Assign 17 indicator ratings, record comments and any measurements. (934) In the attribute rating tables at the bottom of the form, write the indicator number in the appropriate column for each indicator applicable to the attribute. (935) Assign overall rating for each attribute based on preponderance of evidence. (936) Provide rationale for each attribute rating in writing.
Indicator	**Rating**	**Comments**

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_WE_5* **Date:** *July 21, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1399. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

1400. Observe and list the F/S groups present in the evaluation area.

1401. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

1402. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

1403. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

1404. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy Bottom 8-14 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

DRAFT

B.2. REPRESENTATIVE PHOTOGRAPHS

Representative Photographs – Wetlands

Site ID: wgoc001e	**Survey Area:** Goldstrike
Date: 07/09/2021	**Description:** PEM wetland

Representative Photographs – Wetlands

Site ID: wcaa002e	**Survey Area:** Carlin
Date: 07/14/2021	**Description:** PEM wetland; Humboldt River floodplain; historic channel bed

Representative Photographs – Wetlands

Site ID: wcaa003e	**Survey Area:** Carlin
Date: 07/15/2021	**Description:** PEM wetland

Site ID: wcaa003s	**Survey Area:** Carlin
Date: 07/15/2021	**Description:** PSS wetland

Representative Photographs – Wetlands

Site ID: wcac001e	**Survey Area:** Carlin
Date: 07/16/2021	**Description:** PEM wetland; vegetation is becoming stressed especially along edges; not normal circumstances due to drought conditions

Representative Photographs – Wetlands

Site ID: wcac001e	**Survey Area:** Carlin
Date: 07/16/2021	**Description:** PEM wetland; vegetation is becoming stressed, especially along edges; not normal circumstances due to drought conditions

Representative Photographs – Wetlands

Site ID: wcac002e	**Survey Area:** Carlin
Date: 07/16/2021	**Description:** PEM wetland; water culverted and manipulated to run under railroad tracks; flow altered; soil so saturated and dark unable to see redox, assumed due to the saturation

Representative Photographs – Wetlands

Site ID: wcac002e	**Survey Area:** Carlin
Date: 07/16/2021	**Description:** PEM wetland; water culverted and manipulated to run under railroad tracks; flow altered; soil so saturated and dark unable to see redox, assumed due to the saturation

Representative Photographs – Wetlands

Site ID: wcac004e	**Survey Area:** Carlin
Date: 07/19/2021	**Description:** PEM wetland

Representative Photographs – Wetlands

Site ID: wcac004e	**Survey Area:** Carlin
Date: 07/19/2021	**Description:** PEM wetland

Representative Photographs – Wetlands

Site ID: wcra002s	**Survey Area:** Crescent Valley
Date: 05/29/2021	**Description:** PSS wetland; greasewood shrubs are on pedestals that show extreme signs of stress; seep wetland in depressional area at break of topography; area near seep is continually saturated and has formed gleyed soils

Site ID: wcra004e	**Survey Area:** Crescent Valley
Date: 05/31/2021	**Description:** PEM wetland; salt crust, bio crust, position, hydro veg, saturation

Representative Photographs – Wetlands

Site ID: wcra006e	**Survey Area:** Crescent Valley
Date: 05/31/2021	**Description:** PEM wetland; hydric soils, hydrology, hydro veg

Site ID: wcra007s	**Survey Area:** Crescent Valley
Date: 07/06/2021	**Description:** PSS wetland; distressed greasewood on islands/terraces; hydrology, hydro plants, and hydric soils; surface water on portions, saturation, stressed scrub

Representative Photographs – Wetlands

Site ID: wcra008s	**Survey Area:** Crescent Valley
Date: 06/12/2021	**Description:** PSS wetland

Site ID: wcra009e	**Survey Area:** Crescent Valley
Date: 06/14/2021	**Description:** PEM wetland; overflow from cattle trough

Representative Photographs – Wetlands

Site ID: wcrc002e	**Survey Area:** Crescent Valley
Date: 06/22/2021	**Description:** PEM wetland; Salt crusts on herbs, some distressed herbs; stream floodplain

Representative Photographs – Waterbodies
Non-Water Points

Site ID: nocra002	**Project Area:** Crescent Valley Area
Date: 05/27/2021	**Description:** Non-water; this appears to be an old ditched feature that does not function; small areas that suggest ephemeral ponding

Representative Photographs – Waterbodies
Non-Water Points

Site ID: nocra003	**Project Area:** Crescent Valley Area
Date: 05/27/2021	**Description:** Non-water; this appears to be an old ditched feature that does not function

Representative Photographs – Waterbodies
Non-Water Points

Site ID: nogoc003	**Project Area:** Goldstrike Area
Date: 06/24/2021	**Description:** Non-water

Site ID: nogoc004	**Project Area:** Goldstrike Area
Date: 06/24/2021	**Description:** Non-water

Representative Photographs – Waterbodies
Non-Water Points

Site ID: nogoc010	**Project Area:** Goldstrike Area
Date: 06/28/2021	**Description:** Non-water

Representative Photographs – Waterbodies
Open Waterbodies

Site ID: ocac001e	**Project Area:** Carlin Area
Date: 07/21/2021	**Description:** Ephemeral open waterbody

Site ID: ocac002e	**Project Area:** Carlin Area
Date: 07/21/2021	**Description:** Ephemeral open waterbody; dry at time of visit

Representative Photographs – Waterbodies
Open Waterbodies

Site ID: ocra001e	**Project Area:** Crescent Valley Area
Date: 05/31/2021	**Description:** Ephemeral open waterbody; episodic ephemeral playa pond/lake

Site ID: ocra002p	**Project Area:** Crescent Valley Area
Date: 06/02/2021	**Description:** Perennial open waterbody

Representative Photographs – Waterbodies
Open Waterbodies

Site ID: ocra003p	**Project Area:** Crescent Valley Area
Date: 06/02/2021	**Description:** Perennial open waterbody

Site ID: ocra006e	**Project Area:** Crescent Valley Area
Date: 06/07/2021	**Description:** Ephemeral open waterbody; excavated pit area

Representative Photographs – Waterbodies
Open Waterbodies

Site ID: ocrc002e	**Project Area:** Crescent Valley Area
Date: 06/22/2021	**Description:** Ephemeral open waterbody; noticeable soil surface change including texture and presence of cracks, visible depressional area; dry at time of visit

Site ID: ogoa001e	**Project Area:** Goldstrike Area
Date: 06/30/2021	**Description:** Ephemeral open waterbody; stock pond

Representative Photographs – Waterbodies
Open Waterbodies

Site ID: ogoa003e	**Project Area:** Goldstrike Area
Date: 07/01/2021	**Description:** Ephemeral open waterbody; bermed stock pond

Site ID: ogoa005e	**Project Area:** Goldstrike Area
Date: 07/05/2021	**Description:** Ephemeral open waterbody; low quality stock pond

Representative Photographs – Waterbodies
Streams

Site ID: scaa001e	**Project Area:** Carlin Area
Date: 07/14/2021	**Description:** Ephemeral linear feature

Site ID: scaa002e	**Project Area:** Carlin Area
Date: 07/22/2021	**Description:** Ephemeral linear feature; does not appear to function any longer; manipulated at mine upstream; filling in; banks degrading

Representative Photographs – Waterbodies
Streams

Site ID: scaa003e	**Project Area:** Carlin Area
Date: 07/23/2021	**Description:** Ephemeral linear feature

Representative Photographs – Waterbodies
Streams

Site ID: scac001p	**Project Area:** Carlin Area
Date: 07/16/2021	**Description:** Perennial linear feature (Humboldt River)

Representative Photographs – Waterbodies
Streams

Site ID: scac006e	**Project Area:** Carlin Area
Date: 07/21/2021	**Description:** Ephemeral linear feature

Site ID: scac009e	**Project Area:** Carlin Area
Date: 07/22/2021	**Description:** Ephemeral linear feature; dry at time of visit

Representative Photographs – Waterbodies
Streams

Site ID: scac009e	**Project Area:** Carlin Area
Date: 07/22/2021	**Description:** Ephemeral linear feature; dry at time of visit

Site ID: scac012e	**Project Area:** Carlin Area
Date: 07/23/2021	**Description:** Ephemeral linear feature (Marys Creek); dry at time of visit

Representative Photographs – Waterbodies
Streams

Site ID: scra001e	**Project Area:** Crescent Valley Area
Date: 05/27/2021	**Description:** Ephemeral linear feature

Representative Photographs – Waterbodies
Streams

Site ID: scra002i	**Project Area:** Crescent Valley Area
Date: 05/28/2021	**Description:** Intermittent linear feature (Cottonwood Creek); very manipulated

Representative Photographs – Waterbodies
Streams

Site ID: scra004e	**Project Area:** Crescent Valley Area
Date: 05/29/2021	**Description:** Ephemeral linear feature

Representative Photographs – Waterbodies
Streams

Site ID: scra011e	**Project Area:** Crescent Valley Area
Date: 06/07/2021	**Description:** Ephemeral linear feature; maintained ditch; no evidence of flow

Site ID: scra012e	**Project Area:** Crescent Valley Area
Date: 06/07/2021	**Description:** Ephemeral linear feature (Coyote Creek); very weak ephemeral channel, many swale sections, but all continuous; borderline jurisdictional "stream"

Representative Photographs – Waterbodies
Streams

Site ID: scra012e	**Project Area:** Crescent Valley Area
Date: 06/07/2021	**Description:** Ephemeral linear feature (Coyote Creek); very weak ephemeral channel, many swale sections, but all continuous; borderline jurisdictional "stream"

Site ID: scra014e	**Project Area:** Crescent Valley Area
Date: 06/10/2021	**Description:** Ephemeral linear feature; maintained ditch

Representative Photographs – Waterbodies
Streams

Site ID: scra015p	**Project Area:** Crescent Valley Area
Date: 06/10/2021	**Description:** Perennial linear feature; manipulated; culverts, discharge pipes, artificial channelized with berms

Representative Photographs – Waterbodies
Streams

Site ID: scra022e	**Project Area:** Crescent Valley Area
Date: 07/08/2021	**Description:** Ephemeral linear feature; weak ephemeral channelization; from/to overland erosional flow

Representative Photographs – Waterbodies
Streams

Site ID: scrc003e	**Project Area:** Crescent Valley Area
Date: 06/23/2021	**Description:** Ephemeral linear feature; dry at time of visit

Representative Photographs – Waterbodies
Streams

Site ID: sgoa001e	**Project Area:** Goldstrike Area
Date: 06/29/2021	**Description:** Ephemeral linear feature (Boulder Creek); large ephemeral desert wash

Representative Photographs – Waterbodies
Streams

Site ID: sgoa002e	**Project Area:** Goldstrike Area
Date: 06/30/2021	**Description:** Ephemeral linear feature; ephemeral drainage through invasive annual grass and forb area

Representative Photographs – Waterbodies
Streams

Site ID: sgoa003p	**Project Area:** Goldstrike Area

Boulder Creek - Reach 1 8-18-21

lotic
~~Lentic~~ Riparian-Wetland Assessment Area Information Form – Evans, Barrett

Altered Potential Attachment

See appendix D for instructions and examples for addressing these questions.

1. **Have the alterations created artificial conditions for a substantial part of the site (and riparian-wetland functions are not present or expected)?**

Yes. Large scale mining operations in upstream areas and in surrounding watershed have altered normal water and sediment supply regimes. Soil profiles show evidence of historic riparian and floodplain functions; now currently functions as emphemeral or intermittent channel with no or limited riparian functions. Evidence of excessive gravel, cobble, sand deposit across floodprone area.

2. **Are alterations present, but the potential of the site remains unchanged?**

3. **Has a new lentic riparian-wetland area been created in a former upland area?**

4. **Are alterations present that have changed the potential of an existing lentic site (but have not created artificial site conditions described in question #1 for a substantial part of the site)?**

lotic Rodeo Creek - Reach 1

~~Lentic~~ Riparian-Wetland Assessment Area Information Form

Altered Potential Attachment

See appendix D for instructions and examples for addressing these questions.

1. **Have the alterations created artificial conditions for a substantial part of the site (and riparian-wetland functions are not present or expected)?**

Yes. Large scale mining operations upstream and in surrounding watershed have altered historic water and sediment supply regimes. Currently functions as emphemeral channel. No riparian plant communities present with exception of a few scattered clumps of SAEX. Tributary to Boulder Creek, now essentially a dry wash.

2. **Are alterations present, but the potential of the site remains unchanged?**

3. **Has a new lentic riparian-wetland area been created in a former upland area?**

4. **Are alterations present that have changed the potential of an existing lentic site (but have not created artificial site conditions described in question #1 for a substantial part of the site)?**

Reach Information Form (Lotic)

I. **Background information:** Date: 8-18-21

Riparian area/stream name: Welcher Creek Reach ID: 3

Management unit (allotment/pasture, other): Several pastures

Administrative unit/state: BLM Allotment - TS Allotment

ID team members: Evans / Bennett

Assessment method: Reach length (miles/km): 0.36 miles

- ☐ Complete reconnaissance
- ☐ Selective inspection of representative areas
- ☐ Remote imagery with selective ground inspection

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with reach breaks indicated.

II. **Reach break location:**

Reach starting point (upstream)	Reach ending point (downstream)
40.788389 N. Lat. UTM E _____ m	40.790944 N. Lat. UTM E _____ m
or	or
116.349841 W. Long. N _____ m	116.355798 W. Long. N _____ m

Positions by GPS? ☒ Yes ☐ No Photos taken? ☒ Yes ☐ No UTM Zone: _____

Datum: ☐ NAD27 ☐ NAD83 ☐ WGS84 ☐ Other (specify): _____

Rationale for reach breaks: Upper end: Reach Break more natural for response when dry gulch above lower end; end of assessment area, channel becomes more intermittent/ephemeral below.

III. **Description of potential and rationale** (should include description of hydrologic regime, stream type(s), and riparian plant communities at potential; may include additional information such as valley type, gradient, entrenchment ratio, sinuosity, width/depth ratio, and bed and bank materials):

The reach is an interrupted intermittent reach marked by fluctuations in the depth to water. In places the water daylights and supports small communities of wetland obligates. In many places small floodplains or terraces support 'CANE2', but shows signs of water stress

in many places.
The channel type varies between a G and C channel and has some limited floodplain development in places. In other places, historic floodplains have developed but been abandoned by channel down cutting.

Channel gradient is overstraightened and over steepened relative to the natural landscape setting as a result of historic gullying. Channel entrenchment is high and sinuosity is low.

Grazing impacts are generally high on the channel as well as the adjacent uplands.

IV. Other assessment or monitoring data or information about the reach:
- Limited function intermittent drainage
- Historic Gullying
- Interrupted flows
- Potential to have limited recovery inset within gully and maybe more intermittent flows throughout reach

Stands of narrowleaf milkweed (Asclepias sp.) (?) and a few scattered plants of showy milkweed (ASSP) in lower part of reach. No evidence of use by Monarch butterflies.

Int. Reach

PFC Assessment Form (Lotic)

Riparian area/stream name: Welches Creek Reach ID: 3 Date: 8-18-21

Yes	No	NA	HYDROLOGY
	✓		1) Floodplain is inundated in "relatively frequent" events.

Rationale: Periodic small floodplains have developed in past within confined gully. Relatively recent incision has caused localized abandonment of these small floodplains.

		X	2) Beaver dams are stable.

Rationale: No evidence past or present occupancy by beaver. Site currently not suitable.

	X		3) Sinuosity, gradient, and width/depth ratio are in balance with the landscape setting (i.e., landform, geology, and bioclimatic region).

Rationale: Channel is over straightened and oversteepened. Generally, still a Rosgen G gully although where gully width has increased, some evidence of G channel starting to transition to C channel.

	X		4) Riparian area is expanding or has achieved potential extent.

Rationale: Limited riparian zone in areas where soil moisture is adequate to support riparian species is contracting due to current livestock grazing practices as well as small scale localized incision of small floodplains.

X			5) Riparian impairment from the upstream or upland watershed is absent.

Rationale: Historically, severely affected by aggradation and erosion associated with condition of upstream channel and watershed, however watershed not currently being impaired. Now in state of arrested degradation.

Yes	No	NA	VEGETATION
✓			6) There is adequate diversity of stabilizing riparian vegetation for recovery/maintenance.
Rationale: Intermittent channel with limited requirements for stabilizing species. Riparian species which provide for stability in this setting are Eleocharis sp. and JUAR2. POPR also provides for some stability in this setting.			
	X		7) There are adequate age classes of stabilizing riparian vegetation for recovery/maintenance.
Rationale: limited herbaceous riparian communities including Eleocharis sp, JUAR2 and small amounts of PANE2 present on remnant floodplain are contracting.			
	X		8) Species present indicate maintenance of riparian soil-moisture characteristics.
Rationale: where soil moisture is sufficient to support at least some riparian species, species are absent or show severe stress from drying and heavy grazing.			
	X		9) Stabilizing plant communities capable of withstanding moderately high streamflow events are present along the streambank.
Rationale: Potential for development of stabilizing plant communities limited by lack of soil moisture and by lacking. lack of floodplain development. However, where potential is present for establishment of appropriate species for site, developing plant communities stressed by recent small scale incision and by chronic heavy grazing pressure.			
	X		10) Riparian plants exhibit high vigor.
Rationale: Riparian species on small floodplain including PANE2 show water and grazing stress. Yellow coloration and stunted growth forms.			
	X	X	11) An adequate amount of stabilizing riparian vegetation is present to protect banks and dissipate energy during moderately high flows.
Rationale: NO, where applicable in places where floodplains can develop and where soil moisture is sufficient to grow riparian plants. Some dry rocky areas NA			

		X	12) Plant communities are an adequate source of woody material for maintenance/recovery.

Rationale: Interm. Hdtt gully setting. Gully widening is mechanism for energy dissipation/ recovery at this stage.

Yes	No	NA	GEOMORPHOLOGY
	X		13) Floodplain and channel characteristics (i.e., rocks, woody material, vegetation, floodplain size, overflow channels) are adequate to dissipate energy.

Rationale: Channel is too gullied to dissipate energy. Where small, inset floodplains have formed in recent past, these are abandoned from recent incision.

	X		14) Point bars are revegetating with stabilizing riparian plants.

Rationale: Relatively recently formed small, inset floodplains actively eroding. Plant communities on these small floodplains dying and contracting.

	X		15) Streambanks are laterally stable.

Rationale: Overall channel is deep, narrow gully, but where small inset floodplains have formed, streambanks are poorly vegetated and unstable.

X			16) Stream system is vertically stable (not incising).

Rationale: Probably at base level on rocky bed acting as control against further large-scale incision.

	X		17) Stream is in balance with the water and sediment that is being supplied by the drainage basin (i.e., no excessive erosion or deposition).

Rationale: The severity and extent of the modern gully that now characterizes Welches Creek is a strong indication of excessive erosion resulting from imbalances of water and sediment being supplied by watershed. However, gully is legacy from past events. Currently, weak no due to localized incision and abandonment of small developing inset floodplains indicating gully still concentrates too much energy for setting.

Summary Determination

Functional rating (check one)

- ☐ Proper functioning condition
- ☐ Functional–at risk
- ☒ Nonfunctional

Trend (check one)

Monitored trend	Apparent trend
☐ Upward	☐ Upward
☐ Downward	☒ Downward
☐ Static	☐ Not apparent

Rationale for rating: Where system ran and should develop functionality (i.e. where sufficient soil moisture is present and where activity has widened somewhat) conditions are deteriorating. Small inset floodplains are drying out and riparian species show high levels of stress.

Overall, system has somewhat limited potential for response.

Rationale for trend: Drying and abandonment of small inset floodplain riparian communities present high stressed from lack of water and chronic heavy grazing impacts (both utilization and trampling and compaction of moist soils).

Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

☐ Yes ☒ No

If yes, what are those factors? Check all that apply.

☐ Flow regulations ☐ Road encroachment

☐ Mining activities ☐ Oil field water discharge

☐ Upstream channel conditions ☐ Augmented flows

☐ Channelization ☐ Other (specify:) Current grazing practices

Explain factors preventing achievement of PFC:

Current grazing practices preventing establishment of riparian plant communities in areas of persistent soil moisture.

Current gully limits potential, however changes in current grazing practices would allow for some progress towards achieving PFC and/or more desirable conditions.

(Revised 2014)

Reach Information Form (Lotic)

I. **Background information:** Date: 8-18-21

Riparian area/stream name: Welches Creek Reach ID: 2

Management unit (allotment/pasture, other): several pastures

Administrative unit/state: BCNI Allotment - TS Allotment

ID team members: Burch, Evans

Assessment method: Reach length (miles/km): 0.25 mi.

- ☑ Complete reconnaissance
- ☐ Selective inspection of representative areas
- ☐ Remote imagery with selective ground inspection

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with reach breaks indicated.

II. **Reach break location:**

Reach starting point (upstream)	Reach ending point (downstream)
40.787980 N. Lat. UTM E _____ m	40.788389 N. Lat. UTM E _____ m
or	or
116.34553 W. Long. N _____ m	116.34984 W. Long. N _____ m

Positions by GPS? ☑ Yes ☐ No Photos taken? ☑ Yes ☐ No UTM Zone: _____

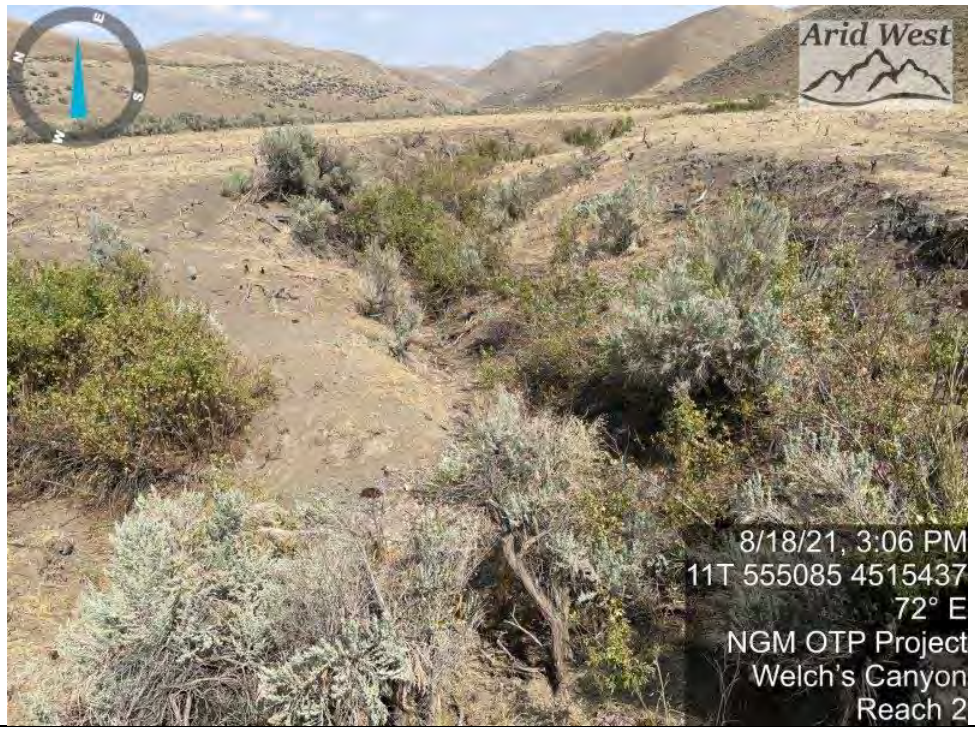
Datum: ☐ NAD27 ☐ NAD83 ☐ WGS84 ☐ Other (specify): _____

Rationale for reach breaks: Upper end: end of perennial flow, start of intermittent reach, lower end: start of intermittent reach with more potential for function

III. **Description of potential and rationale** (should include description of hydrologic regime, stream type(s), and riparian plant communities at potential; may include additional information such as valley type, gradient, entrenchment ratio, sinuosity, width/depth ratio, and bed and bank materials):

Similar to Reach 1 but persistent surface flows lacking. Stream channel is in very deep narrow gully with minimal potential for aggradation or widening.

Potential is for development of FAC and/or uplond plant communities dominated by RCWD within confines of gully walls. Scattered patches of Eleocharis sp. occur along very limited remnants of small floodplains. These sparse Eleocharis communities are dead and/or dying from lack of moisture. Overall low energy intermittent drainage with very little potential for change from deep ROSGR to channel (gully). Plant community composition unlikely to change due to lack of water as well as gully configuration and current grazing practices.



IV. Other assessment or monitoring data or information about the reach:

Heavy livestock use along drainage and surrounding uplands. Wildfires have reduced stabilizing watershed cover and increased threat of loss.

Reach Information Form (Lotic)

I. Background information: Date: 8-18-21

Riparian area/stream name: Welches Creek Reach ID: Reach 1

Management unit (allotment/pasture, other): several pastures

Administrative unit/state: BLM Allotment - TS Allotment

ID team members: Barrett / Evans

Assessment method: Reach length (miles/km): 0.61 miles

- [x] Complete reconnaissance
- [ ] Selective inspection of representative areas
- [ ] Remote imagery with selective ground inspection

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with reach breaks indicated.

II. Reach break location:

Reach starting point (upstream)	Reach ending point (downstream)
40.789650 N. Lat. UTM E _____ m	40.787980 N. Lat. UTM E _____ m
or	or
116.335362 W. Long. N _____ m	116.334531 W. Long. N _____ m

Positions by GPS? [x] Yes [ ] No Photos taken? [x] Yes [ ] No UTM Zone: _____

Datum: [ ] NAD27 [ ] NAD83 [ ] WGS84 [ ] Other (specify): _____

Rationale for reach breaks: Upper end: Project area boundary, lower end: end of perennial flow

III. **Description of potential and rationale** (should include description of hydrologic regime, stream type(s), and riparian plant communities at potential; may include additional information such as valley type, gradient, entrenchment ratio, sinuosity, width/depth ratio, and bed and bank materials):

Potential is for very limited herbaceous riparian community with bottom of very deep narrow gully. / Minimal floodplain development. Rosgen G-5 or 6 channel (estimated) modern gully is about 10-15' deep and about 5-10' wide in bottom.

Historically channel likely functioned on top of cracked across deep alluvial fill (meadow) within canyon setting. High levels of grazing combined with loss of stabilizing watershed cover, flood events, fires and naturally erosive soils likely caused severe downcutting which migrated up through alluvium as well as filled in pond at top of reach. The gullying event also created an avulsion on the south side of the valley. Especially here, but elsewhere as well channel is severely overstraightened. In the absence of mechanical intervention, channel will likely remain indeeply gullied setting for many decades or even centuries.

IV. Other assessment or monitoring data or information about the reach:

Current levels of grazing are very heavy and preventing any riparian zone development. Floodplain width is also lacking in gully setting. Riparian communities occur primarily as scattered patches of Eleocharis spp and JUNCUS. Willow could occur here but seed sources completely lacking. Stream meanders series of pasture fences. All pastures have trample present and show effects of chronic, hot season grazing.

Stream power lacking to widen gully.

PFC Assessment Form (Lotic)

Riparian area/stream name: Welch's Creek Reach ID: Reach 1 Date: 8/18/21

Yes	No	NA	HYDROLOGY
	X		1) Floodplain is inundated in "relatively frequent" events.
Rationale: Historic belly of the drainage created a deep gully that is absent of a floodplain in most locations. In place small floodplains may be attempting to form, but current geology is prohibiting permanent formation.			
		X	2) Beaver dams are stable.
Rationale:			
	X		3) Sinuosity, gradient, and width/depth ratio are in balance with the landscape setting (i.e., landform, geology, and bioclimatic region).
Rationale: Reach is over straightened and over steepened by cutting. With no change in grazing management, recovery of stream ~~width~~ inset within the gully may be possible over time; limited opportunity for floodplain development			
	X		4) Riparian area is expanding or has achieved potential extent.
Rationale: recruitment and establishment of willow and cottonwood vegetation is limited by current grazing management.			
X			5) Riparian impairment from the upstream or upland watershed is absent.
Rationale: Uplands are burned and grazing impacts may be excessive, but uplands are not impacting the current state in to current state.			

Yes	No	NA	VEGETATION
	X		6) There is adequate diversity of stabilizing riparian vegetation for recovery/maintenance.
Rationale:	Limited pockets of Eleocharis sp. and CAREZ ; but overall Limited Diversity of colonizing riparian vegetation = Grazing management & sustaining wetland Veg		
	X		7) There are adequate age classes of stabilizing riparian vegetation for recovery/maintenance.
Rationale:	Small pockets of riparian veg but recruitment is Limited and bare ground is present. Grazing management supporting recruitment of wetland veg		
	X		8) Species present indicate maintenance of riparian soil-moisture characteristics.
Rationale:	Limited to No recruitment of wet Veg and bare ground present. FAC species common along stream edges.		
	X		9) Stabilizing plant communities capable of withstanding moderately high streamflow events are present along the streambank.
Rationale:	Limited to no wetland veg capable to stabilizing banks present, bare ground and FAC to wetland veg common along rocky		
	X		10) Riparian plants exhibit high vigor.
Rationale:	Limited to No recruitment of wetland or riparian veg only a few pockets were wet veg present. FAC species along stream edge in rocky locales		
	X		11) An adequate amount of stabilizing riparian vegetation is present to protect banks and dissipate energy during moderately high flows.
Rationale:	Bare ground & FAC Sp are most common along stream edge. Limited to No stabilizing Veg		

	X	X	12) Plant communities are an adequate source of woody material for maintenance/recovery.

Rationale: No Woody Species - No willow Very limited cover in places.

Yes	No	NA	GEOMORPHOLOGY
	X		13) Floodplain and channel characteristics (i.e., rocks, woody material, vegetation, floodplain size, overflow channels) are adequate to dissipate energy.

Rationale: Limited to the floodplain development within the drainage.

	X		14) Point bars are revegetating with stabilizing riparian plants.

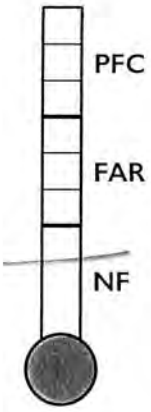
Rationale: Limited to no recruitment of stabilizing plant species - Limited to no point bar development

X			15) Streambanks are laterally stable.

Rationale: Drainage is confined in a steep incised gully - walls of the gully may be unstable for recovery to stable as stream energy may slow bank erosion

X			16) Stream system is vertically stable (not incising).

Rationale: Stream is at a base elevation and Not able to continue to cut to a lower elevation.



X			17) Stream is in balance with the water and sediment that is being supplied by the drainage basin (i.e., no excessive erosion or deposition).

Rationale: Deep gully - Historic incision but aggrying processes currently not active. Further incision arrested by basel level rock controls. Further gully widening may be limited by efficiency of narrow, deep gully to transport water and by lack of large flows in watershed (i.e. small stream).

Summary Determination

Functional rating (check one)

- ☐ Proper functioning condition
- ☐ Functional–at risk
- ☒ Nonfunctional

Trend (check one)

Monitored trend	Apparent trend
☐ Upward	☐ Upward
☐ Downward	☐ Downward
☐ Static	☒ Not apparent

Rationale for rating: Stream is a narrow gully with limited floodplain development, limited Recruitment of wetland veg and grass + management to maintain/improve recruitment of what was necessary to begin floodplain development. Further widening of the gully is required to ~~development~~ develop inset floodplains - but unlikely to occur naturally in a long timeframe

Rationale for trend: Stuck in a deep gully with low streams energy

Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

☒ Yes ☐ No

If yes, what are those factors? Check all that apply.

- ☐ Flow regulations
- ☐ Mining activities
- ☐ Upstream channel conditions
- ☐ Channelization
- ☐ Road encroachment
- ☐ Oil field water discharge
- ☐ Augmented flows
- ☐ Other (specify:)

Explain factors preventing achievement of PFC: Grazing management preventing recruitment of wetland veg

(Revised 2014)

Lentic Riparian-Wetland Assessment Area Information Form

I. Background information: Date: 8-17-21

Riparian-wetland area name: Marys Creek Area ID: Reach 1

Management unit (allotment/pasture, other): Chinese Gardens Park area

Administrative unit/state: City of Carlin

ID team members: Barrett, Evans

Areal extent of riparian-wetland assessment area: 0.05 miles (acres/hectares – circle one)
Thin stringer ≈ 10-30' wide

Assessment method:

- [x] Complete ground reconnaissance
- [ ] Ground inspection of selected representative areas
- [ ] Remote imagery with selective ground inspection of representative or other areas requiring closer inspection

II. Location of riparian-wetland assessment area:

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with the riparian-wetland assessment area delineated. Use GIS in the office or GPS in the field to obtain a representative location to affix a point to the riparian-wetland assessment area.

GIS/GPS point location of riparian-wetland assessment area

Latitude: 40.712025 N Longitude: 116.130516 W

or

UTM E _____ m UTM N _____ m

Datum: [ ] NAD27 [ ] NAD83 [ ] WGS84 [ ] Other (specify): _____

UTM Zone (required for UTM coordinates): _____

III. Description of potential and rationale: Should include description of hydrologic regime, geomorphic setting, important soil properties, and riparian-wetland plant communities at potential (if altered potential is present, use the "Altered Potential Attachment" below):

Potential is for small, stable diverse wetland-riparian community established in bottom of deep historic gully which appears to have

intercepted ground-water. Streamflow from upstream Marys Creek and tributary provides seasonal flow inputs.

Potential riparian plant communities are very diverse and include obligate wetland species including Typha, SCPU10, JUAR2 Eleocharis species that occur in patches. Dense willow communities are dominated by SAEX. Site at potential also supports a variety of diverse mesic forbs species on drier edges of wetland.

IV. Other assessment or monitoring data or information about the riparian-wetland assessment area:

Cutbank profiles and visible evidence of very high levels of aggraded sediments indicate area has been influenced by flood events which have included both excessive deposits and excessive gullying. Modern gully is about 10 feet deep but appears to have stabilized vertically. Standing water is present in channel bottoms in this portion of gully but stream channel is dry and apparently intermittent upstream. Old fence segments are buried by deep flood deposits.

Site may be currently close to potential for this deeply incised, narrow gully. SAEX communities have extensively colonized available areas through rhizomatous expansion.

PFC Assessment Form (Lentic)

Riparian-wetland area name: Marys. Creek Date: 8/17/21

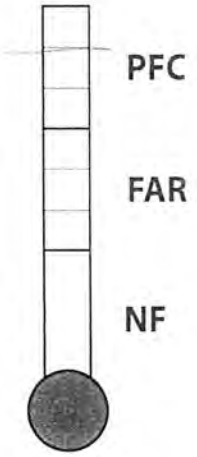
Assessment ID team members: Evans, Barrett

Riparian-wetland area ID: Reach 1

Yes	No	NA	HYDROLOGY
X			1. Riparian-wetland area is saturated at or near the surface or inundated in "relatively frequent" events.
Rationale: System is saturated @ Site supports wetland obl. Vegetation with surface water present throughout the Bottom of the gully. Groundwater supports site			
X			2. Fluctuation of water levels is within a range that maintains hydrologic functions and riparian-wetland vegetation.
Rationale: Site supports a diverse community of wetland vegetation comprising the sparsely the Bottom of the gully. Wetland Veg is vigorous.			
X			3. Riparian-wetland area is enlarging or has achieved potential extent.
Rationale: Site at potential extent - wetland veg in gully Bottom and SAEX community extends into uplands - Site may be slowly expanding - willow expanding			
X	X		4. Riparian-wetland impairment from the contributing area is absent.
Rationale: Uplands stable and not impairing Wetland functions. Uplands/ areas adjacent to "creek" are comprised of fines and alluvium - but system may be naturally flashy - Site is a lentic in bottom of gully			
X			5. Water quality is sufficient to support riparian-wetland plants.
Rationale: No signs of impairment in the Vegetation - Wetland Veg healthy and vigorous throughout the Site			

X			6. Disturbances or features that negatively affect surface- and subsurface- flow patterns are absent. These disturbances/features include but are not limited to hoof action, dams, dikes, levees, spring boxes, diversions, trails, roads, rills, gullies, drilling activities.
Rationale: Site is contained within the confines of a gully - but historic gullying is not adversely affecting the current wetland functions.			
		X	7. Impoundment structure accommodates safe passage of flows (e.g., no headcut affecting dam or spillway).
Rationale:			

Yes	No	NA	VEGETATION
X			8. There is adequate diversity of stabilizing riparian-wetland vegetation for recovery/ maintenance.
Rationale: Site supports a diverse community of wetland veg including Typhea, Juncus, Spike Rush, bulrush and willows extending ~~into uplands and~~ into gully			
X			9. There are adequate age classes of stabilizing riparian-wetland vegetation for recovery/maintenance.
Rationale: Wetland veg at potential extent dominated by a diverse community of wetland species comprising multiple age classes.			
X			10. Species present indicate maintenance of riparian-wetland soil-moisture characteristics.
Rationale: Wetland veg dominates the gully bottom and fills ~~the~~ space where groundwater is. Present			



X			11. Stabilizing plant communities are present that are capable of withstanding overland flows (e.g., storm events, snowmelt), and wind and wave actions, and can resist physical alteration.
Rationale: System appears to be naturally "fleshy" and may be subject to extreme flows moving large amounts of sediments, but community present is able to withstand reasonable flow events			
X			12. Riparian-wetland plants exhibit high vigor.
Rationale: Wetland community at potential extent - where conditions allow, Wetland vegetation present and vigorous - Likely expanding			
X	X		13. An adequate amount of stabilizing riparian-wetland vegetation is present to protect soil surfaces and shorelines, to dissipate energy from overland flows and wind and wave actions, and to resist physical alteration.
Rationale: System naturally fleshy and gully walls may Concentrate High flow events - but current community robust and able to withstand "normal" flow events - rationale adjusted for Lotic site supporting lentic system			
X			14. Abnormal frost or hydrologic heaving is absent.
Rationale: No abnormal frost heaving			
		X	15. Favorable microsite condition (e.g., woody material, water temperature) is maintained by adjacent site characteristics.
Rationale:			

Yes	No	NA	SOILS/GEOMORPHOLOGY
X			16. Accumulation of chemicals affecting plant productivity/composition is absent.
Rationale: No observation of chemical accumulation			
		X	17. Saturation of soils (i.e., ponding, flooding frequency, and duration) is sufficient to compose and maintain hydric soils.
Rationale: Hydrology sufficient to maintain wetland veg. Hydric soils building - Weak yes!			
X			18. Underlying geologic material/soil material/permafrost is capable of restricting water percolation.
Rationale: Site is supported by ground water and underlying Structure is sufficient to support and maintain Wetland Veg.			
X	X		19. Riparian-wetland area is in balance with the water and sediment being supplied by the watershed (i.e., no excessive erosion or deposition).
Rationale: ??? question for site - Site is on back side in bottom of stream gully. The system is flashy and moves large amounts of sediment in Large storms and cut a deep gully. Between floods Lentic system traps sediments and rebuilds site			
		X	20. Islands and shoreline characteristics (i.e., rocks, coarse and/or large woody material) are adequate to dissipate wind- and wave-event energies.
Rationale: Site is Not an open water wetland			

Summary Determination

Functional rating (check one)

- [x] Proper functioning condition
- [ ] Functional–at risk
- [ ] Nonfunctional

Trend for FAR rating (check one)

Monitored trend	Apparent trend
[ ] Upward	[x] Upward
[ ] Downward	[ ] Downward
[ ] Static	[x] Not apparent

Rationale for rating: Stable lentic system with a diverse community of wetland species present supported by groundwater. System may be subject to extreme flood events. Not typical for a lentic setting. System is likely aggrading but may be cut by future flood events.

Rationale for trend (for FAR rating):

Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

☐ Yes ☐ No NA

If yes, what are those factors? Check all that apply.

☐ Flow regulation ☐ Land ownership ☐ Road encroachment

☐ Mining activity ☐ Dewatering ☐ Oil field water discharge

☐ Watershed condition ☐ Dredging activity ☐ Augmented flows

☐ Other (specify): _____

Explain factors preventing achievement of PFC: Site is at PFC

Large floods may lead to further aggradation at the site.

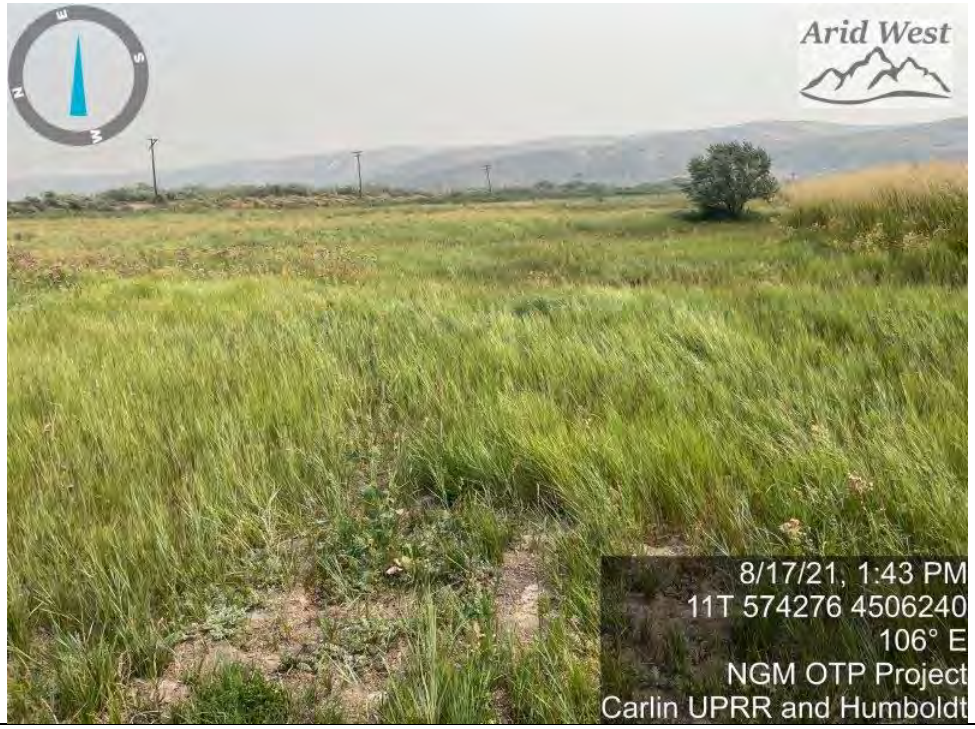
Humboldt River UPRR - Reach 2

Lentic Riparian-Wetland Assessment Area Information Form – Altered Potential Attachment

Barrett, Evans

See appendix D for instructions and examples for addressing these questions.

1. **Have the alterations created artificial conditions for a substantial part of the site (and riparian-wetland functions are not present or expected)?**



Yes. FAC hay meadow. Altered from historic functions, no longer supports riparian functions. Heavy infestations of weeds including PANU4, LELA2, CIAR4, LETR5, ARAN7 and Agropyron sp. common on site. Small TYLA communities where moisture accumulates along RR tracks. Center: 40, 7/2025, 116.130516 0.40 acres

2. **Are alterations present, but the potential of the site remains unchanged?**

3. **Has a new lentic riparian-wetland area been created in a former upland area?**

4. **Are alterations present that have changed the potential of an existing lentic site (but have not created artificial site conditions described in question #1 for a substantial part of the site)?**

Reach Information Form (Lotic)

I. Background information: NV278 Date: 8-17-21

Riparian area/stream name: Humboldt River Reach ID: NV278-1

Management unit (allotment/pasture, other): Private pasture

Administrative unit/state: Private pasture along Humboldt River

ID team members: Barrett, Evans

Assessment method: Reach length (miles/km): 0.3 miles

- ☐ Complete reconnaissance
- ☑ Selective inspection of representative areas
- ☐ Remote imagery with selective ground inspection

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with reach breaks indicated.

II. Reach break location:

Reach starting point (upstream)	Reach ending point (downstream)
40.699985 N. Lat. UTM E _____ m	40.698873 N. Lat. UTM E _____ m
or	or
116.129868 W. Long. N _____ m	116.131356 W. Long. N _____ m

Positions by GPS? ☑ Yes ☐ No Photos taken? ☑ Yes ☐ No UTM Zone: _____

Datum: ☐ NAD27 ☐ NAD83 ☐ WGS84 ☐ Other (specify): _____

Rationale for reach breaks: Upper end: Highway, management/land ownership change; lower end: delineated reach boundary for assessement area boundary

III. Description of potential and rationale (should include description of hydrologic regime, stream type(s), and riparian plant communities at potential; may include additional information such as valley type, gradient, entrenchment ratio, sinuosity, width/depth ratio, and bed and bank materials):

Currently entrenched Rosgen F5 (estimated) channel with potential to transition to more of a sinuous F4 channel with some point bar and floodplain development, as well as increased sinuosity. Potential riparian community is coyote willow dominated with EAW and mesic species for understory.

Humboldt River NV278-1

Extensive upstream modification of Humboldt River channel and surrounding watershed limit potential for natural channel evolution processes.

IV. Other assessment or monitoring data or information about the reach:

Comparison to upstream pasture above reach shows potential for willow community development and very early floodplain development. In assessment reach current grazing practices and channel type (Rosgen F channel) have the effect of arresting degradation in place. Difficult to start floodplain development process in entrenched E channel with minimal establishment of riparian vegetation, especially willow communities.

PFC Assessment Form (Lotic)

Riparian area/stream name: Humboldt River Reach ID: NV278-1 Date: 8-17-21

Yes	No	NA	HYDROLOGY
☐	☑	☐	1) Floodplain is inundated in "relatively frequent" events.
Rationale:			Floodplain lacking — Rosgen F5 channel - entrenched
☐	☐	☑	2) Beaver dams are stable.
Rationale:			should be here but insufficient willow community development to support.
☐	☑	☐	3) Sinuosity, gradient, and width/depth ratio are in balance with the landscape setting (i.e., landform, geology, and bioclimatic region).
Rationale:			Overstraightened, very high width to depth ratio, no floodplain. Entrenched channel -
☐	☑	☐	4) Riparian area is expanding or has achieved potential extent.
Rationale:			Very limited riparian vegetation present - no floodplain development
☐	☑	☐	5) Riparian impairment from the upstream or upland watershed is absent.
Rationale:			Upstream historic and on-going alteration of Humboldt River channel affects recovery potential and opportunities to develop floodplains and sinuosity within this overstraightened and entrenched reach.

Concrete riprap on south streambank may also prevent floodplain widening to some degree

Yes	No	NA	VEGETATION
☐	☑	☐	6) There is adequate diversity of stabilizing riparian vegetation for recovery/maintenance.
Rationale:			Some scattered amounts of JUAR2 and Eleocharis are present, but communities of stabilizers lacking, willows lacking.
☐	☑	☐	7) There are adequate age classes of stabilizing riparian vegetation for recovery/maintenance.
Rationale:			Only scattered amounts of herbaceous riparian vegetation present. Not expanding, willows lacking.
☐	☑	☐	8) Species present indicate maintenance of riparian soil-moisture characteristics.
Rationale:			FAC plant communities on point bars and mid channel bars
☐	☑	☐	9) Stabilizing plant communities capable of withstanding moderately high streamflow events are present along the streambank.
Rationale:			Streambanks cut and eroding - stabilizing plant communities not present on streambanks.
☐	☑	☐	10) Riparian plants exhibit high vigor.
Rationale:			Minimal evidence of establishment and expansion of riparian plant communities.
☐	☑	☐	11) An adequate amount of stabilizing riparian vegetation is present to protect banks and dissipate energy during moderately high flows.
Rationale:			Minimal evidence of stabilizing riparian plant communities along streambanks.

☐	☐	☑	12) Plant communities are an adequate source of woody material for maintenance/recovery.

Rationale: Energy dissipation mechanism is for increased sinuosity across larger, more functional floodplain.

Yes	No	NA	GEOMORPHOLOGY
☐	☑		13) Floodplain and channel characteristics (i.e., rocks, woody material, vegetation, floodplain size, overflow channels) are adequate to dissipate energy.

Rationale: - Entrenched Rosgen F channel energy concentrated - needs floodplain to dissipate energy.

☐	☑	☐	14) Point bars are revegetating with stabilizing riparian plants.

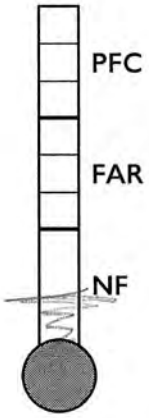
Rationale: Some scattered establishment of colonizers on transient, low flow point bars.

☐	☑	☐	15) Streambanks are laterally stable.

Rationale: Streambanks along majority of reach poorly vegetated, unstable and eroding.

☑	☐		16) Stream system is vertically stable (not incising).

Rationale: No longer actively downcutting.



☐	☑		17) Stream is in balance with the water and sediment that is being supplied by the drainage basin (i.e., no excessive erosion or deposition).

Rationale: Excessive aggradation as evidenced by presence of unvegetated point and mid channel bars.

Summary Determination

Functional rating (check one)

- ☐ Proper functioning condition
- ☐ Functional–at risk
- ☑ Nonfunctional

Trend (check one)

Monitored trend	Apparent trend
☐ Upward	☐ Upward
☐ Downward	☐ Downward
☐ Static	☑ Not apparent

Rationale for rating:

Rosgen F channel - Degraded, lacking attributes for functionality. Minimal floodplain development, lacking riparian plant communities, unstable, unvegetated streambanks. Excessive aggradation - sediments not being used by system.

Rationale for trend:

Channel recovery processes arrested in degraded state. Current grazing practices and upstream influences preventing recovery towards more functional state.

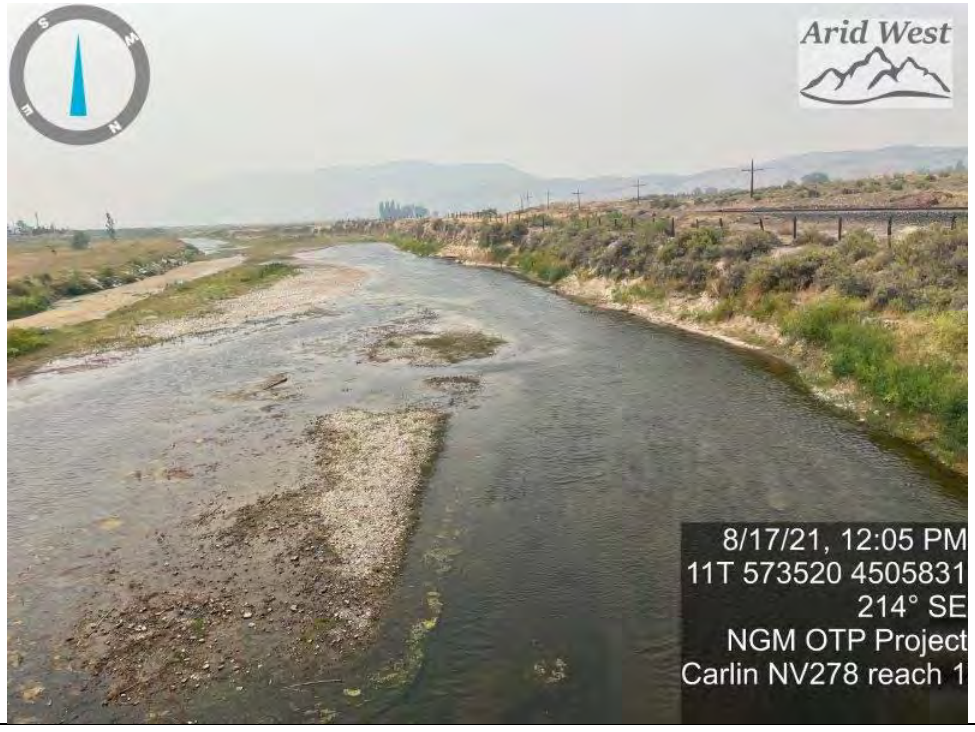
Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

☑ Yes ☑ No

If yes, what are those factors? Check all that apply.

☐ Flow regulations	☐ Road encroachment
☐ Mining activities	☐ Oil field water discharge
☑ Upstream channel conditions	☐ Augmented flows
☐ Channelization	☑ Other (specify:) livestock grazing practices.

Explain factors preventing achievement of PFC. Explain factors both within and outside control of management:



As evidenced by upstream pasture with similar channel conditions, better livestock grazing practices are allowing for some establishment of riparian plant communities and for some limited floodplain development within entrenched channel type.

A lotic riparian area is considered to be in PFC or "functioning properly when adequate vegetation, landform, or woody material is present to:

- Dissipate stream energy associated with high waterflow, thereby reducing erosion & improving water quality.
- Capture sediment and aid floodplain development.
- Improve floodwater retention and ground-water recharge.
- Develop root masses that stabilize streambanks against erosion.
- Maintain channel characteristics.

(Revised 2014)

Warm Springs Drainage

Reach Information Form (Lotic)

I. **Background information:** Date: 8-17-21

Riparian area/stream name: Carlin South Reach ID: 1

Management unit (allotment/pasture, other): BLM Grazing Allotment

Administrative unit/state: BLM - Public

ID team members: Barrett, Evans

Assessment method: Reach length (miles/km): 0.12 mi

- ☑ Complete reconnaissance
- ☐ Selective inspection of representative areas
- ☐ Remote imagery with selective ground inspection

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with reach breaks indicated.

II. **Reach break location:**

Reach starting point (upstream)	Reach ending point (downstream)
40.684488 N. Lat. UTM E _____ m	40.683661 N. Lat. UTM E _____ m
or	or
116.154393 W. Long. N _____ m	116.15247 W. Long. N _____ m

Positions by GPS? ☑ Yes ☐ No Photos taken? ☑ Yes ☐ No UTM Zone: _____

Datum: ☐ NAD27 ☐ NAD83 ☐ WGS84 ☐ Other (specify): _____

Rationale for reach breaks: Upper end: Start of spring source, lower: fence line and ownership/management change. Area highly impacted by livestock grazing, below fence current impacts limited.

III. **Description of potential and rationale** (should include description of hydrologic regime, stream type(s), and riparian plant communities at potential; may include additional information such as valley type, gradient, entrenchment ratio, sinuosity, width/depth ratio, and bed and bank materials):

Area of source highly disturbed by historic water and grade control activities. Drainage fed by high volume flow originating from spring source. Flow at source completely captured and discharged by buried pipe. Flow is estimated to be in excess of 100 gal./min. Area just below pipe is well armored naturally by

rock as well as addition of boulders and possible iron grade control structure. Area near source also appears to have been excavated historically to create ponds. Area below reach (75% of reach) occurs as downcut gully confined by narrow canyon walls. Channel stabilized by high rock content in bed and streambanks.

-Potential is for Rosgen A a.. channel type (estimated) stabilized by high content of boulder and cobble. Relatively minimal floodplain development with limited potential for development and expansion of riparian plant communities. Grazing imparts heavy and currently supressing potential for limited increase in riparian zone.

IV. Other assessment or monitoring data or information about the reach:

Small snails found (shells open to (ext). We assume these represent previously known springsnail population documented for Warm Springs. "Scuds" freshwater shrimp also documented. Area heavily infested by ACRE3 and ONAC.
Dominant upland and riparian/aquatic species include POPR, Pomos, Rumex sp., Carex sp., Veronica sp., MAOF, ROWO.
Gradient found to be around 13%.

Snails abundant in most of reach. Scattered amounts CANE2. where small potential for limited floodplain development.

PFC Assessment Form (Lotic)

Riparian area/stream name: Carlin Soc4m (Warm Springs) Reach ID: 1 Date: 8-17-21

Yes	No	NA	HYDROLOGY
☐	☐	☑	1) Floodplain is inundated in "relatively frequent" events.
Rationale: Naturally does not support floodplain – Rosgen A4a channel – Rock controls			
☐	☐	☑	2) Beaver dams are stable.
Rationale: No evidence of beaver. Not a beaver site.			
☐	☑		3) Sinuosity, gradient, and width/depth ratio are in balance with the landscape setting (i.e., landform, geology, and bioclimatic region).
Rationale: Weak no. Sinuosity and width to depth ratio naturally controlled by geomorphic setting. However lower portion of reach has some potential to decrease width to depth ratio with increase in establishment of riparian species.			
☐	☑	☐	4) Riparian area is expanding or has achieved potential extent.
Rationale: Limited potential for expansion. Pearl flatheads are in lower portion and has somewhat more potential for establishment of a very limited riparian zone. Heavy grazing impacts and high width to depth ratio in this area affect riparian zone development.			
☑	☐		5) Riparian impairment from the upstream or upland watershed is absent.
Rationale: Historic disturbance is extensive but not currently affecting functionality under condition of somewhat changed potential (modification of spring source).			

Yes	No	NA	VEGETATION
☐	☐	☑	6) There is adequate diversity of stabilizing riparian vegetation for recovery/maintenance.
Rationale: Dominant condition of reach is Rosgen Aa3 channel primarily controlled by high bank and bed rock content.			
☐	☐	☑	7) There are adequate age classes of stabilizing riparian vegetation for recovery/maintenance.
Rationale: Reach stabilized by rock controls.			
☐	☑	☐	8) Species present indicate maintenance of riparian soil-moisture characteristics.
Rationale: Weak na where potential for limited flood plain development in lower part of reach. FAC communities occupy areas that should support riparian species.			
☐	☐	☑	9) Stabilizing plant communities capable of withstanding moderately high streamflow events are present along the streambank.
Rationale: Majority of reach is Rosgen Aa 3/4 channel stabilized by rock controls, very lower end of reach has potential for small floodplain and development of stabilizing communities. Scattered units of CANE2 present where present. Overall, site controlled by high rock content. Very heavy and chronic grazing impacts affect vigor of limited riparian plant communities.			
☐	☑	☐	10) Riparian plants exhibit high vigor.
Rationale:			
☐	☐	☑	11) An adequate amount of stabilizing riparian vegetation is present to protect banks and dissipate energy during moderately high flows.
Rationale: Insufficient in limited areas where small floodplains present. Overall, stabilization provided by rock controls.			

☐	☐	☑	12) Plant communities are an adequate source of woody material for maintenance/recovery.

Rationale: Energy dissipation/control provided by rock.

Yes	No	NA	GEOMORPHOLOGY
☑	☐		13) Floodplain and channel characteristics (i.e., rocks, woody material, vegetation, floodplain size, overflow channels) are adequate to dissipate energy.

Rationale: Rock provides high degree stability, control.

☐	☐	☑	14) Point bars are revegetating with stabilizing riparian plants.

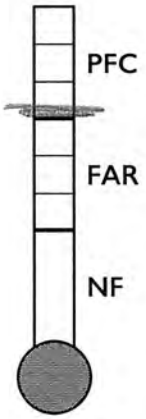
Rationale: Not a point bar system.

☑	☐	☐	15) Streambanks are laterally stable.

Rationale: Structurally controlled by geology and rock.

☑	☐		16) Stream system is vertically stable (not incising).

Rationale: Vertical stability controlled by rock.



☑	☐		17) Stream is in balance with the water and sediment that is being supplied by the drainage basin (i.e., no excessive erosion or deposition).

Rationale: Historic and current disturbance but site currently stabilized. High rock content plays major role.

Summary Determination

Functional rating (check one)

- [x] Proper functioning condition
- [ ] Functional–at risk
- [ ] Nonfunctional

Trend (check one)

Monitored trend	Apparent trend
[ ] Upward	[ ] Upward
[ ] Downward	[ ] Downward
[ ] Static	[x] Not apparent

Rationale for rating:

Rosgen Aa3/4ch zones structurally controlled by geomorphology and rock represent dominant condition. Functionality issues present in very lower part of reach where slope flattens and potential exists for some limited floodplain development. Grazing practices prevent recovery in these planes.

Rationale for trend:

Stabilized by high bed and bank rock content.

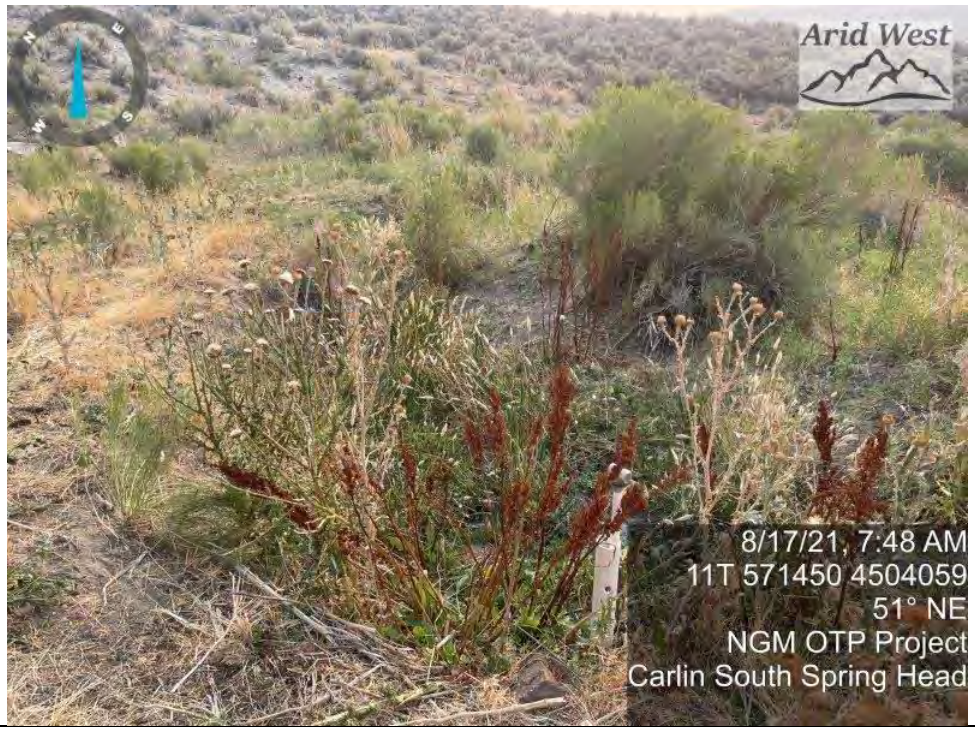
Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

☐ Yes ☑ No

If yes, what are those factors? Check all that apply.

☐ Flow regulations	☐ Road encroachment
☐ Mining activities	☐ Oil field water discharge
☐ Upstream channel conditions	☐ Augmented flows
☐ Channelization	☐ Other (specify:)

Explain factors preventing achievement of PFC. Explain factors both within and outside control of management:



Historic disturbance but site has stabilized.

A lotic riparian area is considered to be in PFC or "functioning properly when adequate vegetation, landform, or woody material is present to:

- Dissipate stream energy associated with high waterflow, thereby reducing erosion & improving water quality.
- Capture sediment and aid floodplain development.
- Improve floodwater retention and ground-water recharge.
- Develop root masses that stabilize streambanks against erosion.
- Maintain channel characteristics.

(Revised 2014)

Reach Information Form (Lotic)

I. Background information: Warm Springs Date: 8-17-21

Riparian area/stream name: Carlin South Drainage Reach ID: 2

Management unit (allotment/pasture, other): Private Pasture

Administrative unit/state: Private

ID team members: Barrett, Evans

Assessment method: Reach length (miles/km): 0.08 mi

- ☑ Complete reconnaissance
- ☐ Selective inspection of representative areas
- ☐ Remote imagery with selective ground inspection

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with reach breaks indicated.

II. Reach break location:

Reach starting point (upstream)	Reach ending point (downstream)
40.683661 N. Lat. UTM E _____ m	40.682725 N. Lat. UTM E _____ m
or	or
116.154393 W. Long. N _____ m	116.151313 W. Long. N _____ m

Positions by GPS? ☑ Yes ☐ No Photos taken? ☑ Yes ☐ No UTM Zone: _____

Datum: ☐ NAD27 ☐ NAD83 ☐ WGS84 ☐ Other (specify): _____

Rationale for reach breaks: Upper end: Fence landownership change channelized ditch Reach potential change Lower end: Natural lentic area, railroad/tracks, fence

III. Description of potential and rationale (should include description of hydrologic regime, stream type(s), and riparian plant communities at potential; may include additional information such as valley type, gradient, entrenchment ratio, sinuosity, width/depth ratio, and bed and bank materials):

See Altered Potential Attachment - Ditched Reach

Common plant species: Trifolium sp., Agropyron species, LETR5, CIMA2*, CIVU, ACRE3, LELA2, NAOF, and small amounts TYLA and SPAC3.

Heavy noxious weed infestations.

* may be CIDO (water hemlock rather than Poison water hemlock).

IV. Other assessment or monitoring data or information about the reach:

8-17-21 Lotic Warm Springs-ditched Area

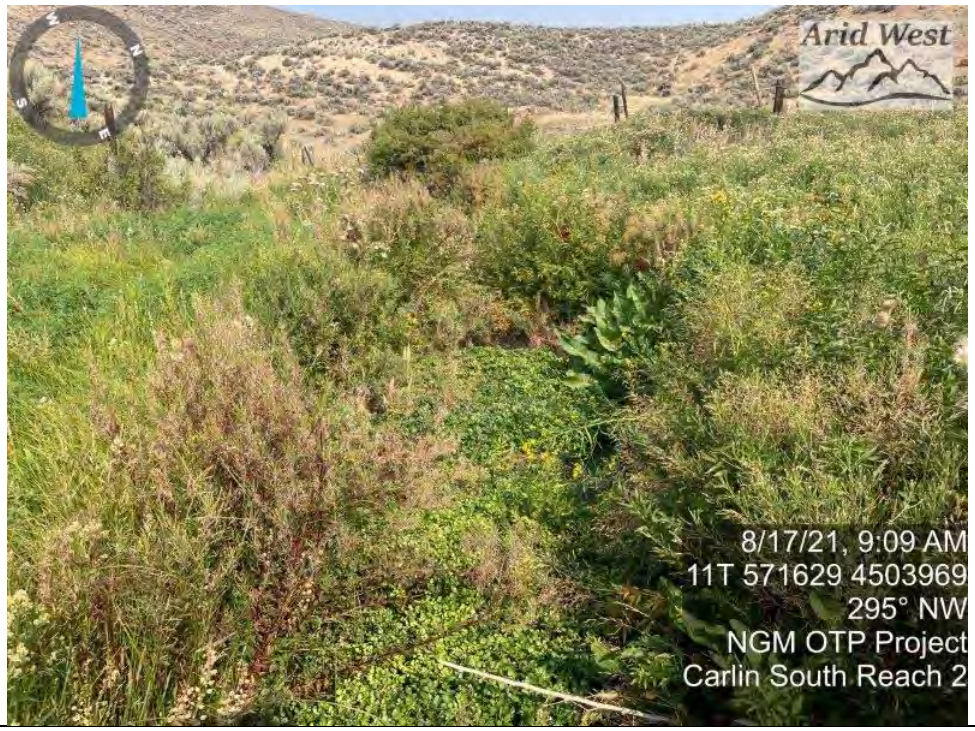
~~Lentic~~ Riparian-Wetland Assessment Area Information Form – Altered Potential Attachment

South Curlew Reach 2

See appendix D for instructions and examples for addressing these questions.

1. **Have the alterations created artificial conditions for a substantial part of the site (and riparian-wetland functions are not present or expected)?**

Lotic



Yes- Spring flow channel emanating from Warm Springs channelized to create a ditch which directs flow through pasture towards Railroad. Flow continued to stabilized ditch. Limited riparian vegetation established on ditch banks. Flow supplies cattail wetland in lower part.

2. **Are alterations present, but the potential of the site remains unchanged?**

3. **Has a new lentic riparian-wetland area been created in a former upland area?**

4. **Are alterations present that have changed the potential of an existing lentic site (but have not created artificial site conditions described in question #1 for a substantial part of the site)?**

Lentic Riparian-Wetland Assessment Area Information Form

I. Background information: Date: 8/17/21

Riparian-wetland area name: Carlin South - Reach 2 Area ID: _____

Management unit (allotment/pasture, other): Private Pasture

Administrative unit/state: _____

ID team members: Evans, Barrett

Areal extent of riparian-wetland assessment area: 17.8 (acres/hectares – circle one)

Assessment method:

- [x] Complete ground reconnaissance
- [ ] Ground inspection of selected representative areas
- [ ] Remote imagery with selective ground inspection of representative or other areas requiring closer inspection

II. Location of riparian-wetland assessment area:

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with the riparian-wetland assessment area delineated. Use GIS in the office or GPS in the field to obtain a representative location to affix a point to the riparian-wetland assessment area.

GIS/GPS point location of riparian-wetland assessment area

Latitude: 40.682189 N Longitude: 116.151403 W

or

UTM E _____ m UTM N _____ m

Datum: [ ] NAD27 [ ] NAD83 [ ] WGS84 [ ] Other (specify): _____

UTM Zone (required for UTM coordinates): _____

III. Description of potential and rationale: Should include description of hydrologic regime, geomorphic setting, important soil properties, and riparian-wetland plant communities at potential (if altered potential is present, use the "Altered Potential Attachment" below):

Lentic site is fed by warm springs and has perennial flows site has been altered in shape ~~and function~~ by channelization of Lotic Reach 2 and bisected by UPRR w/ culvert under tracks at East end of site. Typha dominant with small stands of Hordeum w/ in site. Site may also receive groundwater From Historic Humboldt River meander.

Potential of site is a ~~cat~~ Typha marsh
The shape of the site may have been changed
by UPRR. North side of site is wetter than
south because Rail Road may have created
dyke. Holding back water

IV. Other assessment or monitoring data or information about the riparian-wetland assessment area:

PFC Assessment Form (Lentic)

Riparian-wetland area name: Carlin South Warm Springs wetland Date: 8-17-21

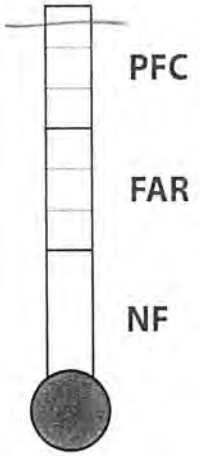
Assessment ID team members: Barrett, Evans

Riparian-wetland area ID: Reach 1

Yes	No	NA	HYDROLOGY
X			1. Riparian-wetland area is saturated at or near the surface or inundated in "relatively frequent" events.
Rationale: Spring Fed lentic area supports Large Typha marsh Some groundwater may be present tied to Humboldt River Hardstem bulrush on perimeter - Marsh is dominated by Wetland obl. species and standing surface water present throughout site			
X			2. Fluctuation of water levels is within a range that maintains hydrologic functions and riparian-wetland vegetation.
Rationale: dominated by wetland obl. vegetation			
X			3. Riparian-wetland area is enlarging or has achieved potential extent.
Rationale: At potential extent			
X			4. Riparian-wetland impairment from the contributing area is absent.
Rationale: At potential - No signs of impairment from surrounding Environment			
X			5. Water quality is sufficient to support riparian-wetland plants.
Rationale: Dense community of wetland veg - Spring source present in contributing drainage.			

X			6. Disturbances or features that negatively affect surface- and subsurface- flow patterns are absent. These disturbances/features include but are not limited to hoof action, dams, dikes, levees, spring boxes, diversions, trails, roads, rills, gullies, drilling activities.
Rationale: Rail line has breached with creating a dike through Wetland area. Grazing impacts are at low level of management. Although changed - Site is functioning properly			
		X	7. Impoundment structure accommodates safe passage of flows (e.g., no headcut affecting dam or spillway).
Rationale:			

Yes	No	NA	VEGETATION
X			8. There is adequate diversity of stabilizing riparian-wetland vegetation for recovery/ maintenance.
Rationale: Dense Typha and bulrush			
X			9. There are adequate age classes of stabilizing riparian-wetland vegetation for recovery/maintenance.
Rationale: Dense Typha and bulrush			
X			10. Species present indicate maintenance of riparian-wetland soil-moisture characteristics.
Rationale: Site is dominated by Wetland obl. Vegetation			



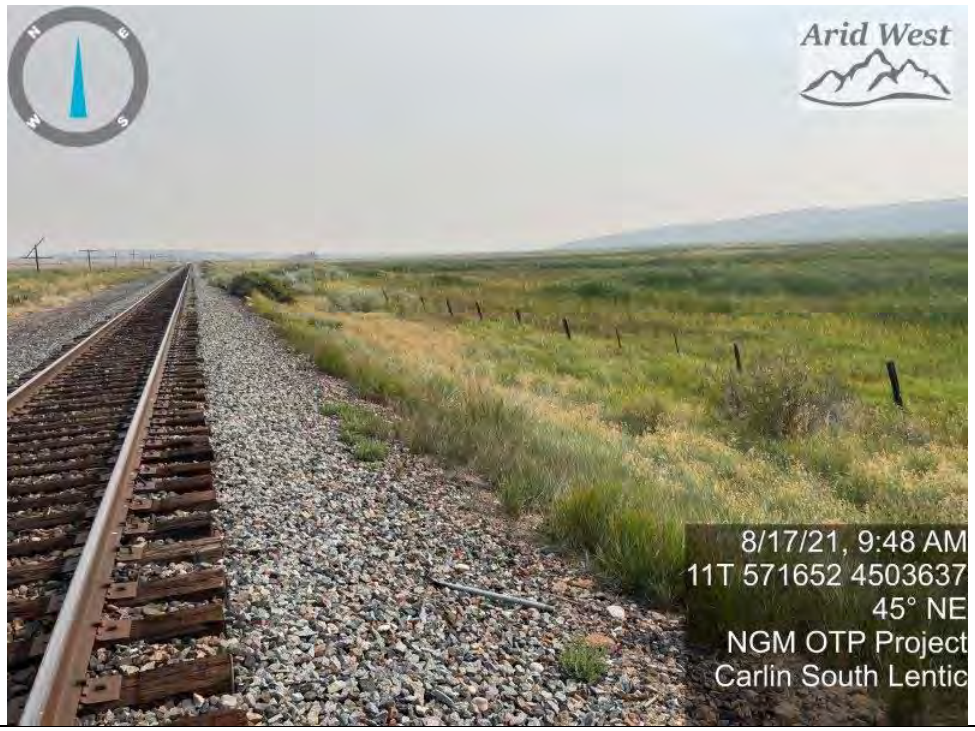
X			11. Stabilizing plant communities are present that are capable of withstanding overland flows (e.g., storm events, snowmelt), and wind and wave actions, and can resist physical alteration.
Rationale: Most of Typha provides deep roots capable of withstanding overland flow.			
X			12. Riparian-wetland plants exhibit high vigor.
Rationale: Large, dense, stand of typha covers entire extent of site.			
X			13. An adequate amount of stabilizing riparian-wetland vegetation is present to protect soil surfaces and shorelines, to dissipate energy from overland flows and wind and wave actions, and to resist physical alteration.
Rationale: dense Typha covers 100% of lentic site			
X			14. Abnormal frost or hydrologic heaving is absent.
Rationale: Dense vegetation - minimal grazing impacts			
		X	15. Favorable microsite condition (e.g., woody material, water temperature) is maintained by adjacent site characteristics.
Rationale:			

Yes	No	NA	SOILS/GEOMORPHOLOGY
X			16. Accumulation of chemicals affecting plant productivity/composition is absent.
Rationale: No Chemical accumulation present			
X			17. Saturation of soils (i.e., ponding, flooding frequency, and duration) is sufficient to compose and maintain hydric soils.
Rationale: Standing Surface water present on site - Spring Provides consistant inflow			
X			18. Underlying geologic material/soil material/permafrost is capable of restricting water percolation.
Rationale: Ponded surface water present - Building Hydric Soils on Site.			
X			19. Riparian-wetland area is in balance with the water and sediment being supplied by the watershed (i.e., no excessive erosion or deposition).
Rationale: Dense Wetland alb. vegetation present able to Resist erosion and trap Sediment			
X			20. Islands and shoreline characteristics (i.e., rocks, coarse and/or large woody material) are adequate to dissipate wind- and wave-event energies.
Rationale: Dense wetland alb. vegetation present throughout site able to dissipate wave energy.			

Summary Determination

Functional rating (check one)

- [x] Proper functioning condition
- [ ] Functional–at risk
- [ ] Nonfunctional



Trend for FAR rating (check one)

Monitored trend	Apparent trend
[ ] Upward	[ ] Upward
[ ] Downward	[ ] Downward
[ ] Static	[x] Not apparent

Rationale for rating: Stable Marsh dominated by typha and bulrush. Consistent water supplied by warm springs. South side of site may be drier than North because of UPRR, similar functional conditions exist on both sides of UPRR.

Rationale for trend (for FAR rating): Very stable site at potential

Lentic Riparian-Wetland Assessment Area Information Form

I. Background information: Date: 8-17-21

Riparian-wetland area name: UPRR Humboldt Area ID: Reach 1

Management unit (allotment/pasture, other): Private Pasture

Administrative unit/state: _____

ID team members: Evans, Barrett

_____

Areal extent of riparian-wetland assessment area: 11 acres (acres/hectares – circle one)

Assessment method:

- [X] Complete ground reconnaissance
- [ ] Ground inspection of selected representative areas
- [ ] Remote imagery with selective ground inspection of representative or other areas requiring closer inspection

II. Location of riparian-wetland assessment area:

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with the riparian-wetland assessment area delineated. Use GIS in the office or GPS in the field to obtain a representative location to affix a point to the riparian-wetland assessment area.

GIS/GPS point location of riparian-wetland assessment area

Latitude: 40.704376	N	Longitude: 116.121838	W
or			
UTM E _____	m	UTM N _____	m

Datum: [ ] NAD27 [ ] NAD83 [ ] WGS84 [ ] Other (specify): _____

UTM Zone (required for UTM coordinates): _____

III. Description of potential and rationale: Should include description of hydrologic regime, geomorphic setting, important soil properties, and riparian-wetland plant communities at potential (if altered potential is present, use the "Altered Potential Attachment" below):

Site is a historic meander of the Humboldt that was converted into a hay meadow - appears "up keep" of the meadow is no longer occurring and site is being taken over by Expanding Salt and bulrush communities

With a mix of meadow grasses and carex species where water is sufficient. The site appears to be supported by groundwater and rainy areas with bulrush did not have surface water present at the time of assessment.

IV. Other assessment or monitoring data or information about the riparian-wetland assessment area:

PFC Assessment Form (Lentic)

Riparian-wetland area name: UPRR Humboldt Date: 8-17-21

Assessment ID team members: Barrett, Evans

Riparian-wetland area ID: Reach 1

Yes	No	NA	HYDROLOGY
✓			1. Riparian-wetland area is saturated at or near the surface or inundated in "relatively frequent" events.
Rationale: Where appropriate. Wetland species occur along old river meanders and in depressions. Wetland species including SCAC3, CANE2, and Carex sp. are present over most of area indicating presence of persistent near surface water.			
✓			2. Fluctuation of water levels is within a range that maintains hydrologic functions and riparian-wetland vegetation.
Rationale: Wetland plant communities dominated by SCAC and Carex sp. are well established indicating consistent availability of water supplies.			
✓			3. Riparian-wetland area is enlarging or has achieved potential extent.
Rationale: Potential extent. Availability of persistent near surface soil moisture determines extent of riparian-wetland area. Suitable areas are completely colonized by wetland-riparian communities.			
✓			4. Riparian-wetland impairment from the contributing area is absent.
Rationale: Although area historically altered by agricultural practices as well as road/berm construction, site not currently being affected by past disturbance with exception of heavy weed infestations.			
✓			5. Water quality is sufficient to support riparian-wetland plants.
Rationale: No evidence of water quality impairment.			

✓			6. Disturbances or features that negatively affect surface- and subsurface- flow patterns are absent. These disturbances/features include but are not limited to hoof action, dams, dikes, levees, spring boxes, diversions, trails, roads, rills, gullies, drilling activities.
Rationale: Surface flows of wetland areas not currently being impacted by past agricultural disturbances.			
		✓	7. Impoundment structure accommodates safe passage of flows (e.g., no headcut affecting dam or spillway).
Rationale:			

Yes	No	NA	VEGETATION
✓			8. There is adequate diversity of stabilizing riparian-wetland vegetation for recovery/ maintenance.
Rationale: Primary stabilizing riparian-wetland communities include stands of SCAC3 and wet meadow dominated by CANEZ, Carex sp with lesser amounts of JUAR2. wet meadow areas include diversity of mesic forbs on perimeters.			
✓			9. There are adequate age classes of stabilizing riparian-wetland vegetation for recovery/maintenance.
Rationale: Dense, well established stands of wetland communities indicate adequate reproduction is available to occupy site.			
✓			10. Species present indicate maintenance of riparian-wetland soil-moisture characteristics.
Rationale: where applicable including historic river meander bends which interrept groundwater. These sites well colonized by wetland plant communities.			

✓			11. Stabilizing plant communities are present that are capable of withstanding overland flows (e.g., storm events, snowmelt), and wind and wave actions, and can resist physical alteration.

Rationale: site very well vegetated and stabilized.

✓			12. Riparian-wetland plants exhibit high vigor.

Rationale: Riparian-wetland plants show excellent vigor, this is especially evident for CAREX which is attaining heights of up to ≥ 20".

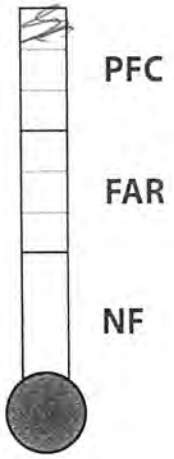
✓			13. An adequate amount of stabilizing riparian-wetland vegetation is present to protect soil surfaces and shorelines, to dissipate energy from overland flows and wind and wave actions, and to resist physical alteration.

Rationale: site very well vegetated and stabilized with no evidence of erosion.

✓			14. Abnormal frost or hydrologic heaving is absent.

Rationale: No evidence of abnormal frost or hydrologic heaving.

		✓	15. Favorable microsite condition (e.g., woody material, water temperature) is maintained by adjacent site characteristics.



Rationale:

Yes	No	NA	SOILS/GEOMORPHOLOGY
✓			16. Accumulation of chemicals affecting plant productivity/composition is absent.
Rationale: No evidence of impairment from chemicals in soil or water.			
✓			17. Saturation of soils (i.e., ponding, flooding frequency, and duration) is sufficient to compose and maintain hydric soils.
Rationale: As evidenced by persisence of well established obligate wetland communities (i.e. SCAC3)			
✓			18. Underlying geologic material/soil material/permafrost is capable of restricting water percolation.
Rationale:			
✓			19. Riparian-wetland area is in balance with the water and sediment being supplied by the watershed (i.e., no excessive erosion or deposition).
Rationale: No evidence of erosion or deposition. Site very stable.			
		✓	20. Islands and shoreline characteristics (i.e., rocks, coarse and/or large woody material) are adequate to dissipate wind- and wave-event energies.
Rationale:			

Summary Determination

Functional rating (check one)

- [x] Proper functioning condition
- [ ] Functional–at risk
- [ ] Nonfunctional

Trend for FAR rating (check one)

Monitored trend	Apparent trend
[ ] Upward	[ ] Upward
[ ] Downward	[ ] Downward
[ ] Static	[x] Not apparent

Rationale for rating: Site very stable and well vegetated with no evidence of deterioration.

All available areas within site occupied by appropriate plant communities – SCAC3, Carex communities in wet areas FAC, FACW plant communities on drier margins. Note very heavy infestations of noxious weeds including LELA2, CIAR4.

Mesic species on fringes include Chenopodium.

Note that SAEX is expanding from rhizomes into previously hayed areas.

Rationale for trend (for FAR rating): NA – looks very stable in current condition.

Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

☐ Yes ☑ No

If yes, what are those factors? Check all that apply.

☐ Flow regulation ☐ Land ownership ☐ Road encroachment

☐ Mining activity ☐ Dewatering ☐ Oil field water discharge

☐ Watershed condition ☐ Dredging activity ☐ Augmented flows

☐ Other (specify): _____

Explain factors preventing achievement of PFC: _____

Lentic Riparian-Wetland Assessment Area Information Form

I. Background information: Date: 8-19-21

Riparian-wetland area name: Pivot wetland Area ID: 1

Management unit (allotment/pasture, other): BCM Allotment - public

Administrative unit/state: BCM

ID team members: Barrett / Evans

Areal extent of riparian-wetland assessment area: 1.1 AC (acres/hectares – circle one)

Assessment method:

- [x] Complete ground reconnaissance
- [ ] Ground inspection of selected representative areas
- [ ] Remote imagery with selective ground inspection of representative or other areas requiring closer inspection

II. Location of riparian-wetland assessment area:

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with the riparian-wetland assessment area delineated. Use GIS in the office or GPS in the field to obtain a representative location to affix a point to the riparian-wetland assessment area. Center pt.

GIS/GPS point location of riparian-wetland assessment area

Latitude: 40.324827	N	Longitude: 116.507608	W
	or		
UTM E	m	UTM N	m

Datum: [ ] NAD27 [ ] NAD83 [ ] WGS84 [ ] Other (specify):

UTM Zone (required for UTM coordinates):

III. Description of potential and rationale: Should include description of hydrologic regime, geomorphic setting, important soil properties, and riparian-wetland plant communities at potential (if altered potential is present, use the "Altered Potential Attachment" below):

The site is an artificial wetland that may be fed by ag runoff by nearby pivots. The site supports a large Typha community with bulrush communities along the edges

as well as minor components of other Wet and FAC(W) species. The area assessed is located within a grasseswood community that is adjacent to other playas and alkaline wetlands depending on elevation. The source of the water supporting this site is thought to be artfied but the site supports a large functioning community of emergent wetland veg. and possesses significant wetland function.

IV. Other assessment or monitoring data or information about the riparian-wetland assessment area:

PFC Assessment Form (Lentic)

Riparian-wetland area name: Pivot Wetland Date: 8-19-21

Assessment ID team members: Barrett/Evans

Riparian-wetland area ID: 1

Yes	No	NA	HYDROLOGY
X			1. Riparian-wetland area is saturated at or near the surface or inundated in "relatively frequent" events.
Rationale: Standing water throughout — Almost exclusively colonized by obligate wetland communities dominated by THLA and SCPU5			
X			2. Fluctuation of water levels is within a range that maintains hydrologic functions and riparian-wetland vegetation.
Rationale: Some fluctuation on margins of wetlands as a result of upstream agricultural practices; however, obligate wetlands communities being maintained throughout site.			
X			3. Riparian-wetland area is enlarging or has achieved potential extent.
Rationale: Potential extent, obligate wetland communities completely occupy site.			
X			4. Riparian-wetland impairment from the contributing area is absent.
Rationale: Although wetland is artificially created by agricultural practices, conditions outside immediate area of wetland are not currently affecting conditions offsite			
X			5. Water quality is sufficient to support riparian-wetland plants.
Rationale: Dense vigorous stands of cattail/rush communities present indicating water quality is adequate for growth of these species.			

X			6. Disturbances or features that negatively affect surface- and subsurface- flow patterns are absent. These disturbances/features include but are not limited to hoof action, dams, dikes, levees, spring boxes, diversions, trails, roads, rills, gullies, drilling activities.
Rationale: Although area may have been trenched historically as part of the pipeline construction. Surface and sub-surface flow patterns not affected. Standing water present in road cut side.			
		X	7. Impoundment structure accommodates safe passage of flows (e.g., no headcut affecting dam or spillway).
Rationale:			

Yes	No	NA	VEGETATION
X			8. There is adequate diversity of stabilizing riparian-wetland vegetation for recovery/ maintenance.
Rationale: THLA and SCPU10 provide adequate diversity of stabilizers for this site.			
X			9. There are adequate age classes of stabilizing riparian-wetland vegetation for recovery/maintenance.
Rationale: obligate wetland communities completely occupy all available area indicating successful reproduction and replacement of older age classes			
X			10. Species present indicate maintenance of riparian-wetland soil-moisture characteristics.
Rationale: obligate wetland communities completely occupy site indicating riparian-wetland soil moisture characteristics are being maintained.			

X			11. Stabilizing plant communities are present that are capable of withstanding overland flows (e.g., storm events, snowmelt), and wind and wave actions, and can resist physical alteration.

Rationale: Excellent stabilizers including THLA and SCPU10 dominate site.

X			12. Riparian-wetland plants exhibit high vigor.

Rationale: Stands of THLA and SCPU10 show excellent vigor

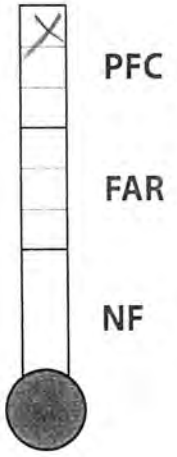
X			13. An adequate amount of stabilizing riparian-wetland vegetation is present to protect soil surfaces and shorelines, to dissipate energy from overland flows and wind and wave actions, and to resist physical alteration.

Rationale: Site completely vegetated by stabilizing wetland communities. No evidence of erosion or alteration from flow, wind or wave events.

X			14. Abnormal frost or hydrologic heaving is absent.

Rationale: No evidence of abnormal frost or hydrologic heaving

		X	15. Favorable microsite condition (e.g., woody material, water temperature) is maintained by adjacent site characteristics.



Rationale:

Yes	No	NA	SOILS/GEOMORPHOLOGY
X			16. Accumulation of chemicals affecting plant productivity/composition is absent.
Rationale: Although site is highly alkaline, riparian-wetland plant communities are adapted to these salt affected soil.			
X			17. Saturation of soils (i.e., ponding, flooding frequency, and duration) is sufficient to compose and maintain hydric soils.
Rationale: Obligate wetland plant communities completely dominate site indicating hydric soils are being maintained or are in process of developing.			
X			18. Underlying geologic material/soil material/permafrost is capable of restricting water percolation.
Rationale: No evidence of percolation or loss of surface flows to groundwater. Position of wetland in valley and proximity to natural wetlands indicates naturally high water.			
X			19. Riparian-wetland area is in balance with the water and sediment being supplied by the watershed (i.e., no excessive erosion or deposition).
Rationale: No evidence of erosion or deposition in wetland area.			
		X	20. Islands and shoreline characteristics (i.e., rocks, coarse and/or large woody material) are adequate to dissipate wind- and wave-event energies.
Rationale:			

Summary Determination

Functional rating (check one)

- [X] Proper functioning condition
- [ ] Functional–at risk
- [ ] Nonfunctional

Trend for FAR rating (check one)

Monitored trend	Apparent trend
[ ] Upward	[ ] Upward
[ ] Downward	[ ] Downward
[ ] Static	[X] Not apparent

Rationale for rating: Very stable well vegetated emergent wetland dominated by THLA and SCPU10 communities. No evidence of impairment. Saturated at surface, riparian-wetland communities completely occupy all available area.

Rationale for trend (for FAR rating): Site looks completely stable.

Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

Lentic Riparian-Wetland Assessment Area Information Form

I. Background information: Date: 8-18-21

Riparian-wetland area name: Possible wetlands Area ID: Reach 1 and 2

Management unit (allotment/pasture, other): BLM pasture - Public

Administrative unit/state: BLM allotment

ID team members: Barrett / Evans

Areal extent of riparian-wetland assessment area: 2.1 AC (both reaches) very small (acres/hectares – circle one)

Assessment method:

- [x] Complete ground reconnaissance
- [ ] Ground inspection of selected representative areas
- [ ] Remote imagery with selective ground inspection of representative or other areas requiring closer inspection

II. Location of riparian-wetland assessment area:

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with the riparian-wetland assessment area delineated. Use GIS in the office or GPS in the field to obtain a representative location to affix a point to the riparian-wetland assessment area. Reach 2: 40.261715, 116.561660

GIS/GPS point location of riparian-wetland assessment area

Reach 1

Latitude: 40.261422 N Longitude: 116.561916 W

or

UTM E _____ m UTM N _____ m

Datum: [ ] NAD27 [ ] NAD83 [ ] WGS84 [ ] Other (specify): _____

UTM Zone (required for UTM coordinates): _____

III. Description of potential and rationale: Should include description of hydrologic regime, geomorphic setting, important soil properties, and riparian-wetland plant communities at potential (if altered potential is present, use the "Altered Potential Attachment" below):

Very small stable wetland sites in close proximity situated at lower ends of dry, alkaline meadow areas. At least one of the sites

appears to have been a spring which was escavated to creat a small pond. There is evidence of old fence posts in area. Both sites are completed filled and stabilized with obligate wetland plant communities. The larger site (Reach 1) is dominated by SCPU10 with lesser amounts of CANE2 JUAR2 Eleocharis sp. and Muehenbergia sp. Second, smaller site (Reach 2) is within 100 ft of Reach 1 and also appears to have been a spring or mesic site which was escavated to form a small stock pond. Reach 2 dominated by SCAC3 and JUAR2. Both sites at potential.

IV. Other assessment or monitoring data or information about the riparian-wetland assessment area:

Excellent condition. No recent evidence of livestock use. Yellow garden spiders abundant in webs around site perimeters.

Sites are located at lower end of dry alkaline meadow. Abundant insect life.

PFC Assessment Form (Lentic)

Riparian-wetland area name: Possible Lentic Date: 8/19/21

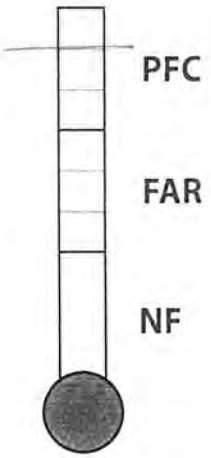
Assessment ID team members: Evans Barrett.

Riparian-wetland area ID: Reach 1 & 2

Yes	No	NA	HYDROLOGY
X			1. Riparian-wetland area is saturated at or near the surface or inundated in "relatively frequent" events.
Rationale: Standing surface water on site supporting a diversity of Wetland obl. Veg.			
X			2. Fluctuation of water levels is within a range that maintains hydrologic functions and riparian-wetland vegetation.
Rationale: Water levels appear relatively static, Site may have been dug out ~~and~~ in the past but is now rebuilding hydric soils and supporting a diversity of wetland vegetation			
X			3. Riparian-wetland area is enlarging or has achieved potential extent.
Rationale: Site is at potential and has filled the dug-out basin with Wetland Vegetation			
X			4. Riparian-wetland impairment from the contributing area is absent.
Rationale: Dry Meadow above the site is stable, Past disturbance may have made the East side of the site susceptible to [illegible] but is now stabilized and revegetated			
			5. Water quality is sufficient to support riparian-wetland plants.
Rationale: No indicators of vegetative impairment as a result of [illegible]			

X			6. Disturbances or features that negatively affect surface- and subsurface- flow patterns are absent. These disturbances/features include but are not limited to hoof action, dams, dikes, levees, spring boxes, diversions, trails, roads, rills, gullies, drilling activities.
Rationale: Site appears to have been dug-out in the past, but has since recovered and is rebuilding hydric soils.			
		X	7. Impoundment structure accommodates safe passage of flows (e.g., no headcut affecting dam or spillway).
Rationale:			

Yes	No	NA	VEGETATION
X			8. There is adequate diversity of stabilizing riparian-wetland vegetation for recovery/ maintenance.
Rationale: Site is occupied by a diverse mix of wetland obl veg including Carex, bulrush, spike rush, Juncus, Poa sp.			
X			9. There are adequate age classes of stabilizing riparian-wetland vegetation for recovery/maintenance.
Rationale: Entirety of site is covered with stabilizing wetland vegetation. No issue with recruitment of wetland veg			
X			10. Species present indicate maintenance of riparian-wetland soil-moisture characteristics.
Rationale: Site covered by wetland vegetation - no signs of water stress - soil surface saturated.			



X			11. Stabilizing plant communities are present that are capable of withstanding overland flows (e.g., storm events, snowmelt), and wind and wave actions, and can resist physical alteration.
Rationale: Thick mat of stabilizing wetland vegetation covers and protects the surface of the site			
X			12. Riparian-wetland plants exhibit high vigor.
Rationale: No signs of water stress and good Recruitment of stabilizing wetland also seen			
X			13. An adequate amount of stabilizing riparian-wetland vegetation is present to protect soil surfaces and shorelines, to dissipate energy from overland flows and wind and wave actions, and to resist physical alteration.
Rationale: good Recruitment of wetland veg with No bare ground Present - site is well [illegible] to energy and [illegible]			
X			14. Abnormal frost or hydrologic heaving is absent.
Rationale: No abnormal frost or hydrologic heaving			
		X	15. Favorable microsite condition (e.g., woody material, water temperature) is maintained by adjacent site characteristics.
Rationale:			

Yes	No	NA	SOILS/GEOMORPHOLOGY
X			16. Accumulation of chemicals affecting plant productivity/composition is absent.
Rationale: No signs of chemical accumulation on site			
X			17. Saturation of soils (i.e., ponding, flooding frequency, and duration) is sufficient to compose and maintain hydric soils.
Rationale: Soils saturated at the surface and support vigorous community of wetland veg that is building and maintaining hydric soils			
X			18. Underlying geologic material/soil material/permafrost is capable of restricting water percolation.
Rationale: Site is saturated at the surface and does not show signs of fluctuation of water levels			
X			19. Riparian-wetland area is in balance with the water and sediment being supplied by the watershed (i.e., no excessive erosion or deposition).
Rationale: Site is well armored to resist erosion			
		X	20. Islands and shoreline characteristics (i.e., rocks, coarse and/or large woody material) are adequate to dissipate wind- and wave-event energies.
Rationale: No open water			

Summary Determination

Functional rating (check one)

- [x] Proper functioning condition
- [ ] Functional–at risk
- [ ] Nonfunctional

Trend for FAR rating (check one)

Monitored trend	Apparent trend
[ ] Upward	[ ] Upward
[ ] Downward	[ ] Downward
[ ] Static	[x] Not apparent

Rationale for rating: Site supports a diversity of wetland obl. veg and maintains saturated soils that continue to build and maintain hydric soils. Site is well vegetated and armored to resist erosion. No [illegible] and is supported by current grazing impacts.

Rationale for trend (for FAR rating): Site very stable, but small overgrazing would not take much.

Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

☐ Yes ☐ No NA

If yes, what are those factors? Check all that apply.

☐ Flow regulation ☐ Land ownership ☐ Road encroachment

☐ Mining activity ☐ Dewatering ☐ Oil field water discharge

☐ Watershed condition ☐ Dredging activity ☐ Augmented flows

☐ Other (specify): _____

Explain factors preventing achievement of PFC: Site may have been altered in the past but has recovered well and now supports a diverse community of wetland obligate vegetation

Cortez POD Wetlands 1-4 8-19-21 Barrett, Evans

Lentic Riparian-Wetland Assessment Area Information Form – Altered Potential Attachment

See appendix D for instructions and examples for addressing these questions.

1. **Have the alterations created artificial conditions for a substantial part of the site (and riparian-wetland functions are not present or expected)?**

2. **Are alterations present, but the potential of the site remains unchanged?**

3. **Has a new lentic riparian-wetland area been created in a former upland area?**

Yes, Series of four ponds, excavated in alkaline flats presumably to provide livestock water sources. Riparian functions limited. Small scattered stands of THLA, SCAC3 and SCMA8 on margins. Some Tamarix present. Exposed shorelines indicate large fluctuations in water levels. Abundant wildlife use: dowitchers, sandpipers, American coots, marsh wrens, Brewer's blackbirds, several species ducks.

4. **Are alterations present that have changed the potential of an existing lentic site (but have not created artificial site conditions described in question #1 for a substantial part of the site)?**

	Locations	Size
Pond 1:	40.207987, 116.635533	0.23 AC
Pond 2:	40.209173, 116.634326	4.30 AC
Pond 3:	40.205805, 116.635926	0.23 AC
Pond 4:	40.204544, 116.639030	0.86 AC

Indian Pivot 8-19-21

~~Lentic~~ Riparian-Wetland Assessment Area Information Form – Altered Potential Attachment

Barrett, Evans

See appendix D for instructions and examples for addressing these questions.

1. **Have the alterations created artificial conditions for a substantial part of the site (and riparian-wetland functions are not present or expected)?**

Yes. Flow: diversion from Indian Creek drainage. Ditch intercepted by and diverted around active pivots. Ditch also intercepted by road. Site dominated by Xanthium sp. and ACRE3. Mostly dry channel but low areas near pivot support mesic forb communities. May drain excess pivot water out onto valley floor.
Point: 40.304606, 116.609388

2. **Are alterations present, but the potential of the site remains unchanged?**

3. **Has a new lentic riparian-wetland area been created in a former upland area?**

4. **Are alterations present that have changed the potential of an existing lentic site (but have not created artificial site conditions described in question #1 for a substantial part of the site)?**

APPENDIX C
VEGETATION

C-1. Special Status Plant Species

C-2. Non-Native and Invasive Plant Species

Page Intentionally Left Blank

C. VEGETATION

C.1. SPECIAL STATUS PLANT SPECIES

Table C-1: BLM Sensitive Status Plant Species within the Battle Mountain and Elko Districts

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Alkali ivesia	*Ivesia kingii var. Kingii*	Sagebrush Scrub, Alkali Sink, wetland-riparian; meadows, playas	NS-S (S3); NS (G4)	X	X	Native to California and limited areas in Nevada and Utah and may occur in the Project Area.
Amargosa niterwort	*Nitrophila mohavensis*	Limited to highly alkaline, moist, salt-encrusted clay soils within the southern Carson Slough	FWS (E); NAC (CE); NS-S (S1); NS (G1)	X		Unlikely to be present, as it is narrowly confined to limited soil within the southern portion of Carson Slough. Only known for five occurrences between Inyo County, CA and Nye County, NV.
Ash Meadows mousetail	*Ivesia kingii var. eremica*	A Nevada endemic that occurs in saline seep areas. Moist alkaline areas in openings of saltbrush scrub near springs. In alkali washes throughout Ash Meadows; moist, clay soils with prominent salt crust	FWS (T); NAC (CE); NS-S (S1S2); NS (G4T1T2Q)	X		Unlikely to be present, as it is narrowly confined to a single spring-fed desert wetland area with extremely saline soils.
Bashful beardtongue	*Penstemon pudicus*	Steep, rocky slopes in pinyon-juniper woodlands, especially along partially shaded washes. (7,500-9,000 ft.) Occurs in crevices, soil pockets, and coarse rocky soils of felsic volcanic outcrops, boulder piles, steep protected slopes, and drainage bottoms in the subalpine sagebrush, mountain mahogany, and upper pinyon-juniper zones.	USFS (S); NS-S (S1); NS (G1)			Unlikely to be present within the Project Area, as it tends to grow in higher elevations than present in the Project Area.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Barren Valley collomia	*Collomia renacta*	Rocky soils on south-facing slopes at elevations ranging from 4,900-7,500 feet and is associated with *Lomatium* spp., *Arabis* spp., and *Eriogonum* spp.	NS-S (S1); NS (G1)		X	Unlikely to be present in the Project Area, known only from the Pequop Range in Nevada.
Beatley buckwheat	*Eriogonum beatleyae*	Dry, volcanic outcrops, in the sagebrush/pinyon-juniper zone between 5,600 to 9,200 feet.	NS-S (S3); NS (G2Q)	X	X	Unlikely to be present in the Project Area, tends to grow in higher elevations than present at Project Area.
Blaine pincushion	*Sclerocactus blainei*	Alkaline calcareous and volcanic gravelly-clay soils in open valley bottom areas in the shadscale and lower sagebrush zones. Greasewood, galleta grass, shadscale, and sagebrush communities on limestone and igneous gravels with a clay matrix. 4,800 to 6,000 feet elevations.	NAC (CY); NS-S (S1); NS (G1G2Q)	X		Unlikely to be present in the Project Area. Species preference at higher elevations.
Broad fleabane	*Erigeron latus*	Shallow, relatively barren, vernally saturated, otherwise dry, gravelly to sandy soils or bedrock on flats and slopes of volcanic scablands or benches, mostly rhyolitic or basaltic in composition, in the sagebrush steppe and juniper zones. 5,200 to 6,500 feet elevations.	NS-S (S1); NS (G3)		X	Unlikely to be present in the Project Area due to lower elevations within the Project Area than preferred.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Cima milkvetch	*Astragalus cimae var. cimae*	Dry, open, relatively barren calcareous gravel slopes or clay hills, commonly among sagebrush. Include Great Basin scrub, Joshua tree "woodland", and pinyon and juniper woodlands. 4,700 to 6,600 feet elevations.	NS-S (S2); NS (G3T2)	X		Unlikely to be present in the Project Area. Species habitat requires higher elevations.
Clarke phacelia	*Phacelia filiae*	Light colored outcrops and soils of calcareous and sometimes gypsiferous sandstone, siltstone, tuffaceous claystone, or limestone, on foothills and valley floors above the playas, in the creosote-bursage, shadscale, mixed-shrub, and blackbrush zones	NS-S (S2); NS (G2)	X		Known from fewer than 20 occurrences in a small area of south-central Nevada making it unlikely to be present in the Project Area.
Cottam cinquefoil	*Potentilla cottamii*	A regional endemic known only from the Pilot Range in Elko County, Nevada, and from the Raft River, Deep Creek, and Stansbury Mountains in Box Elder, Juab, and Tooele Counties, Utah. Cracks and crevices and in crevasses of quartzite outcrops, often shaded from direct midday sunlight. 7,200-10,500 feet.	NS-S (S1); NS (G1)		X	Unlikely to be present in Project Area due to the limited endemic range and lower elevation ranges than preferred.
Currant milkvetch	*Astragalus uncialis*	Dry, open, sparsely-vegetated, calcareous sandy-clay soils on flats and gentle slopes of hillsides and alluvial fans. With sagebrush in gullied foothills at 5,250 – 6,000 feet elevation.	USFS (S); NS-S (S2); NS (G2)	X		Unlikely to be present in the Project Area due to limited endemic range in Nye County and higher elevation needs.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Davis peppercress	*Lepidium davisii*	Hard-bottomed clay playas on volcanic plains in the sagebrush zone	NS-S (S1); NS (G3)	X	X	May occur in the Project Area based on suitable habitat within the Project Area.
Deeth buckwheat	*Eriogonum nutans var. glabratum*	In sandy gravelly soil. This taxon occurs in sand on flats and slopes within saltbrush and sagebrush communities at elevations of 4,900 – 6,300 feet.	NS-S (S2S3); NS (G5T2T3)	X	X	May occur in the Project Area based on suitable habitat elevations.
Eastwood milkweed	*Asclepias eastwoodiana*	In open areas on a wide variety of basic soils, including calcareous clay knolls, sand, carbonate or basaltic gravels, or shale outcrops, generally barren and lacking competition, frequently in small washes or other moisture-accumulating microsites, in the shadscale, mixed-shrub, sagebrush, and lower pinyon-juniper zones at 3,500-7,000 feet.	USFS (S); NS-S (S2S3); NS (G2Q)	X	X	Based on suitable habitat and elevation needs, may occur in the Project Area.
Elko rockcress	*Boechera falcifructa*	Dry, densely vegetated, relatively undisturbed, light colored silty soils with a high cover of moss and other soil crust components on moderate to steep north-facing slopes in the sagebrush zone	NS-S (S1S2); NS (G1G2)	X	X	Endemic to Nevada, predominantly in Elko County so may occur in the Project Area.
Goodrich biscuitroot	*Cymopterus goodrichii*	Moderate to steep scree and talus slopes of dark angular slate or limestone at elevations of 6,500 – 11,150 feet in the upper subalpine and lower alpine zones	USFS (S); NS-S (S1); NS (G1)	X		Unlikely to be present in the Project Area based on higher elevation needs.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Goose Creek milkvetch	*Astragalus anserinus*	Although most occurrences are restricted to specific sandy rhyolitic ash deposits, some have been observed spreading into sandy soils of the adjacent zonal sagebrush vegetation with little apparent rhyolitic ash content. Locally endemic to a portion of the Goose Creek basin near where the borders of Nevada, Idaho and Utah join.	NS-S (S2); NS (G2)		X	Endemic to the Goose Creek basin, therefore, unlikely to be present in the Project Area.
Grimy mousetails	*Ivesia rhypara var. rhypara*	Mostly on dry, relatively barren, yellowish or light-colored outcrops or badlands of welded, sometimes hydrothermally altered and re-cemented, ash-fall tuff, and on shallow gravel grus derived therefrom, in one case on unsorted cobbly riverbed deposits mixed with underlying volcanic ash.	NS-S (S2); NS (G2T2)		X	Occurs in the western United States, in southeastern Oregon and northern Nevada, therefore, may occur in the Project Area.
Grimes vetchling	*Lathyrus grimesii*	Dry, open, shallow, silty clay soils usually overlain by a thin scree of reddish to yellowish brown gravel floated from an underlying cherty or partly quartzitized mudstone component of the Schoonover Formation, forming relatively barren patches on mostly steep slopes of all aspects, and supporting a sparse to moderately dense vegetation	USFS (S); NS-S (S2); NS (G2)		X	As a locally abundant Nevada endemic, found in the northern Independence Mountains, it may occur in the Project Area.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Holmgren lupine	*Lupinus holmgrenianus*	Dry desert slopes, sandy washes, and valleys, sometimes on volcanic substrates. Found within Artemisia tridentata - dominated communities to Pinyon-Juniper Woodlands 4500 - 8000 ft	NS-S (S2); NS (G2)	X		Unlikely to be present in the Project Area based on elevation needs.
Idaho beardtongue	*Penstemon idahoensis*	Restricted to tuffaceous outcrops of the Salt Lake Formation; these are silica-rich, Tertiary-age rocks formed from lake deposits. Soils tend to be dry, pale, fine-textured, and hard. Outcrops that weather to very sandy substrates or large, fractured rock are apparently unsuitable. Found on gentle to steep slopes of all aspects, but most frequently on south to southwest exposures. Most associated with Utah juniper (Juniperus osteosperma) communities from 4,900-5,700 ft.	NS-S (S1); NS (G2)		X	Unlikely to be present in the Project Area based on elevation needs and elevations within the Project Area.
Lahontan beardtongue	*Penstemon palmeri* var. *macranthus*	Along washes, roadsides, and canyon floors, particularly on carbonate-containing substrates, usually where subsurface moisture is available throughout most of the summer; unknown if restricted to calcareous substrates	NS-S (S2?); NS (G4G5T2?)	X		Endemic to western Nevada, unlikely to be present in the Project Area.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Least phacelia	*Phacelia minutissima*	Vernally saturated, summer-drying, sparsely vegetated, partially shaded to fully exposed areas of bare soil and mud banks in meadows, at perimeters of Veratrum californicum (corn lily), Wyethia amplexicaulis , and/or Populus tremuloides (aspen) stands, in sagebrush swales, along creek bed high-water lines, or around springs, in flat to gently sloping areas; aquatic or wetland-dependent.	USFS (S); NS-S (S2); NS (G3)		X	May occur in the Project Area based on limited microsites in the Project Area where there is aquatic or wetland habitat.
Lewis buckwheat	*Eriogonum lewisii*	Dry, exposed, shallow, relatively barren and undisturbed, rocky residual soils on convex ridge-line knolls and crests underlain by siliceous carbonate rocks, on flat to moderately steep slopes of all aspects, but with the densest stands on southerly aspects; occasionally found at lower elevations on clay hills derived from silty carbonate or calcium-rich siliceous rock	USFS (S); NS-S (S3); NS (G2G3Q)		X	Known only from Elko and Eureka Counties in Nevada, so may occur in the Project Area.
Lone Mountain goldenheads	*Tonestus graniticus*	Crevices of granitic cliffs and outcrops on protected exposures (north to east aspects, deep canyons, etc.) in the pinyon-juniper zone	NS-S (S1); NS (G1)	X		Known only from the Great Basin in the western United States, from the east side of Lone Mountain in Esmeralda County, Nevada, so unlikely to be present in the Project Area.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Low feverfew	*Parthenium ligulatum*	Relatively barren clay or sandy-clay knolls, slopes, and flats in the pinyon-juniper woodland zone	NS-S (S1); NS (G3)	X		Only known in Eureka County, Nevada and grows at higher elevations. Unlikely to be present in the Project Area.
Lunar Crater buckwheat	*Johanneshowellia crateriorum*	Three occurances in Nye Co	NS-S (S1); NS (G1)	X		Only 3 occurrences in Nye County, Nevada making it unlikely to occur within the project area
Meadow pussytoes	*Antennaria arcuata*	Bare, periodically disturbed soil in marginal, seasonally dry parts of moist, often hummocky, alkaline meadows, seeps, and springs, surrounded by sagebrush and grassland associations, aquatic or wetland dependent. 5,000 – 7,900 feet elevations.	USFS (S); NS-S (S1); NS (G3)		X	Unlikely to be present in the Project Area based on higher elevation needs and wetland dependent habitat criteria.
Monte Neva paintbrush	*Castilleja salsuginosa*	Damp, open, alkaline to saline clay soils of hummocks and drainages on travertine hot-spring mounds at elevations around 6,000 feet.	NAC (CE); NS-S (S1); NS (G1Q)	X		Unlikely to be present in the Project Area based on desired elevations.
Mojave thistle (Virgin River thistle)	*Cirsium mohavense (or C. virginense)*	Damp soils around desert springs, streams, and ditches; 1,500 to 9,000 feet elevation; Open, moist, alkaline clay soils of seep and spring areas or gypsum knolls. aquatic or wetland dependent in Nevada	NS-S (SNR); NS (G2G3)	X		Unlikely to be present in the Project Area based on elevation and water requirements.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Nachlinger catchfly	*Silene nachlingerae*	Generally dry, exposed or somewhat sheltered carbonate (rarely quartzite) crevices in ridgeline outcrops, talus, or very rocky soils on or at the bases of steep slopes or cliffs, on all aspects but predominantly on northwesterly to northeasterly exposures, mainly in the subalpine conifer zone at 9,500 – 10,0150 feet.	USFS (S); NS-S (S2); NS (G2)		X	Unlikely to be present in the Project Area based on much higher elevation habitat needs.
Nevada willowherb	*Epilobium nevadense*	Limestone soils, talus, cliffs, and rock outcrops with slopes of varying steepness from 5 to 45 percent.	USFS (S); NS-S (S2); NS (G3)	X		Nevada populations concentrated in the extreme southern part of the state, therefore, unlikely to be present in the Project Area.
Nye pincushion (Tonopah pincushion)	*Sclerocactus nyensis*	Dry rocky soils and low outcrops of rhyolite, tuff, and possibly other rock types, on gentle slopes in open areas or under shrubs in the upper salt desert and lower sagebrush zones	NAC (CY); NS-S (S1); NS (G1Q)	X		Unlikely to be present in the Project Area as it is endemic to Nye and Esmeralda Counties, Nevada and prefers higher elevations.
Obscure buttercup	*Ranunculus triternatus*	Meadow steppe habitat dominated by bunchgrasses and forbs; mostly found on north-facing upper slopes and crests of basalt ridges overlaid by loess deposits of varying depth	NS-S (S1?); NS (G5T2)		X	Endemic to the Columbia River Gorge and is found only in Oregon and Washington making it unlikely to be present in the Project Area.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
One-leaflet Torrey milkvetch	*Astragalus calycosus monophyllidius*	Open gravelly hillsides, in scattered juniper and pinyon forest, on limestone. Lower foothill and valley habitats at 5,200 – 6,600 ft.	NS-S (S3); NS (G5T2Q)		X	Known from Elko County and adjacent counties but unlikely to be present in the Project Area due to lower elevations than their desired habitat.
Owyhee prickly phlox	*Leptodactylon glabrum*	Occurs in crevices in steep to vertical, coarse-crumbling volcanic canyon walls, especially on rhyolitic cliffs. It is intolerant of water paths or seeps that may form in the rock crevices. It occurs at elevations of 2,790-5,200 feet elevation.	NS-S (S1); NS (G2)		X	Based on elevation requirements, this may occur in the Project Area.
Pahute Mesa beardtongue	*Penstemon pahutensis*	In loose soil and rock crevices among boulders in pinyon-juniper woodlands and sagebrush shrublands. 5,800 – 7,500 feet elevations.	NS-S (S3); NS (G3)	X		Unlikely to be present in the Project Area based on higher elevation needs.
Railroad Valley globemallow	*Sphaeralcea caespitosa var. williamsiae*	Occurs in the greasewood, shadscale, and mixed shrub zones on dry, open, flat to gently sloped, gravelly carbonate soils on alluvium and valley fill, often more abundant on recovering disturbances such as washes and roadsides.	USFS (S); NS-S (S2); NS (G2T2)	X		Endemic to Nye County, Nevada. It is a very localized variety, making it unlikely to be present in the Project Area.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Reese River phacelia	*Phacelia glaberrima*	Open, dry to moist, alkaline, nearly barren, sometimes scree covered, whitish to brownish shrink-swell clay soils derived from fluviolacustrine volcanic ash and tuff deposits, generally on the steeper slopes of low hills, bluffs, and badlands in the shadscale-greasewood, sagebrush, and lower pinyon-juniper zones at 4,000-6,000 feet elevations.	NS-S (S3?); NS (G3?)	X		Endemic to northcentral and northwestern Nevada, but unlikely to be present in the Project Area based on elevation limitations.
Rock violet	*Viola lithion*	In cracks and crevices and along narrow ledges of limestone and quartzite outcrops where moisture and shade are available. Seasonally wet crevices in steep carbonate or quartzite outcrops in shaded northeast-facing avalanche chutes and cirque headwalls at 7,800-10,480 feet elevation. Found in the subalpine conifer zone with Symphoricarpos oreophilus, Ribes montigenum, Heuchera rubescens, Aquilegia scopulorum, Thalictrum fendleri, Pinus flexilis, and Populus tremuloides	NS-S (S1); NS (G1)		X	Unlikely to be present in the Project Area due to preferred higher elevations than in the Project Area.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Sand cholla	*Grusonia pulchella*	Sand of dunes, dry-lake borders, river bottoms, washes, valleys, and plains in the desert." Dependent on sand dunes or deep sand in Nevada	NAC (CY); NS-S (S2S3); NS (G4)	X		Occurs in the Humboldt-Toiyabe National Forest and on BLM land, but unlikely to be present in the Project Area based on the dependency on deep sand.
Spring-loving centaury	*Centaurium namophilum*	Open, moist alkali areas, including seeps and meadows at elevations from 2,100 to 3,500 feet	FWS (T); NAC (CE); NS-S (S2); NS (G2Q)	X		Unlikely to occur in the Project Area based on moisture and soil preferences.
Tecopa birdbeak	*Cordylanthus tecopensis*	Open, moist to saturated, alkali-crusted clay soils of seeps, springs, outflow drainages, and meadows below 2,500 feet.	NS-S (S2); NS (G2)	X		Only known to Nye and Esmeralda Counties in Nevada so unlikely to be present in the Project Area based on elevation preferences.
Tiehm beardtongue	*Penstemon tiehmii*	Neutral sandy-loam soil pockets on steep, southerly-facing volcanic talus and scree slopes. Near mountain summit, on glacial cirque slopes and below decomposing rock outcrops at 7,200 to 10,000 feet elevations.	NS-S (S1); NS (G1)	X		Endemic in central Nevada, but unlikely to be present in the Project Area based on elevation preferences.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Tiehm blazingstar	*Mentzelia tiehmii*	Occurs on hill tops and knolls with white or calcareous soils, rich in gypsum that are sparsely vegetated. It occurs at elevations of 4,900 to 5,200 feet and is endemic to the White River Valley in Nevada, including areas of Lincoln and Nye Counties.	NS-S (S2); NS (G1G2)		X	Unlikely to be present in the Project Area based on elevation preferences.
Tiehm buckwheat	*Eriogonum tiehmii*	Dry, open, relatively barren, light-colored rocky clay soils derived from a formation of interbedded clay stones, shales, tuffaceous sandstones, and limestones, on all aspects with slopes up to about 50%, in pure stands or with a sparse cover	NS-S (S1); NS (G1)	X		Unlikely to be present in the Project Area since it's an edaphic endemic, known only from a tiny area in the Silver Peak Range of Esmeralda County, Nevada.
Tonopah milkvetch	*Astragalus pseudiodanthus*	Deep loose sandy soils of stabilized and active dune margins, old beaches, valley floors, or drainages, with Sarcobatus vermiculatus and other salt desert shrub taxa. Dependent on sand dunes or deep sand in Nevada at 5,500 feet.	NS-S (S2); NS (G3Q)	X		Unlikely to be present in the Project Area based on the need for higher elevation.
Toquima milkvetch	Astragalus toquimanus	Dry, stiff, sandy to gravelly, generally somewhat basic or calcareous soils; mostly on flats or gentle slopes, frequently growing under or up through shrubs	USFS (S); NS-S (S2); NS (G2)	X		Unlikely to be present in the Project Area as it is known only from the Monitor and Toquima ranges in Nye County, Nevada.

Species Common Name	Species Scientific Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project area
Whitebark Pine	*Pinus albicaulis*	Subalpine and timberline zones; grows in cold, snowy, and generally moist climates; on semiarid ranges it is most common on cold, moist sites, whereas it is most common on warm, dry sites on moist ranges; common on ridges and near timberline, where trees are exposed to strong, desiccating winds at 4,300 to 12,000 feet elevations.	FWS(C); USFS (S); NS-S (S3); NS (G3G4)	X	X	Unlikely to be present in the Project Area based on the need for much higher elevations than present in the Project Area.
Williams combleaf	*Polyctenium williamsiae*	Relatively barren sandy to sandy-clay or mud margins and bottoms of non-alkaline seasonal lakes perched over volcanic bedrock in the sagebrush, pinyon-juniper, and mountain sagebrush zones	USFS (S); NAC (CE); NS-S (S2); NS (G2Q)	X		The only known observation in Nevada is outside of Reno, making it unlikely to be present in the Project Area.
Windloving buckwheat	*Eriogonum anemophilum*	High elevations on dry, exposed, relatively barren and undisturbed, gravelly, limestone or volcanic ridges and ridgeline knolls, on outcrops or shallow rocky soils over bedrock. At low elevations on dry, relatively barren and undisturbed knolls and slopes of light-colored, platy volcanic tuff weathered to form stiff clay soils	NS-S (S3); NS (G2G3)	X		Restricted to high elevations in the mountains of northwestern Nevada, it is unlikely to be present in the Project Area.

Table C-2 Milkweed Species Native to Nevada

Species Common Name	*Species Scientific Name*	Habitat	Nevada Locations	Potential to Occur in Project Area
Spider milkweed	*Asclepias asperula ssp.asperula*	Gravelly and rocky soil or on exposed talus, in pinyon-juniper woodland and open ponderosa pine woods	Widely distributed in eastern Nevada including Elko County	Based on suitable habitat and elevation needs, not likely to occur in the Project Area.
Pallid milkweed	*Asclepias cryptoceras*	Dry, open, barren places in clay, sand, gypsum, and serpentine soils, from the sage-brush or shadscale zones to the pinyon-juniper and aspen zones.	Found in most of Nevada including Elko, Eureka, and Lander counties	Based on suitable habitat and elevation needs, may occur in the Project Area.
Eastwood milkweed	*Asclepias eastwoodiana*	In open areas on a wide variety of basic soils, including calcareous clay knolls, sand, carbonate or basaltic gravels, or shale outcrops, generally barren and lacking competition, frequently in small washes or other moisture-accumulating microsites, in the shadscale, mixed-shrub, sagebrush, and lower pinyon-juniper zones at 3,500-7,000 feet.	Endemic to central Nevada and historical record from Lander County in 1945.	Based on suitable habitat and elevation needs, may occur in the Project Area.
Desert milkweed	*Asclepias erosa*	Dry washes, gulches, canyons, and roadsides in open deserts; in creosote bush, shadscale, and sometimes sagebrush com-munities.	Found from north to south through the center of the state including Lander County.	Based on suitable habitat and elevation needs, may occur in the Project Area
Narrow-leaved milkweed or Mexican whorled milkweed	*Asclepias fascicularis*	Streambanks, roadsides, agricultural areas, and other moist to dry places, including irrigation ditches and fallowed fields	Scattered populations across north and central areas of Nevada including Elko and Lander counties.	Based on suitable habitat and elevation needs, may occur in the Project Area
Showy milkweed	*Asclepias speciosa*	Moist or moderately moist soil in open, sunny areas including wetlands, meadows, cultivated fields, pastures, forest clearings, and along roadsides, railways and waterways. Widely tolerant of alkaline soils.	May be found in almost every county including Elko, Eureka, and Lander counties.	Based on suitable habitat and elevation needs, may occur in the Project Area

Species Common Name	*Species Scientific Name*	Habitat	Nevada Locations	Potential to Occur in Project Area
Halls's milkweed	*Asclepias hallii*	Sandy, gravelly soil; prairies, wash-bottoms, sagebrush, woodlands. (pinyon-juniper, cottonwood, ponderosa pine, aspen) at elevations from 9,400 to 9,900 feet.	Found in Elko and Lander counties.	Unlikely to occur in Project Area as the Project Area's elevations is below 5,000 feet.
Heartleaf milkweed or purple milkweed	*Ascelepias cordifolia*	Milkweed grows in clumps beside roadways and on abandoned farmlands and other open areas,	Found in Washoe, Carson City, and Douglas counties	Unlikely to occur in Project Area as the nearest records are for locations several hundred miles west.
Horsetail milkweed	*Ascelpias subverticillata*	Found in open woodlands and grasslands, edges of streams and cienegas but can also be found in disturbed areas like roadsides and pastures at elevations from 3,000 to 8,000 feet.	Found in Lincoln County, Nevada, Washington County Utah, and Mohave County Arizona	Unlikely to occur in Project Area as the nearest records are for locations several hundred miles south.
Mojave milkweed	*Ascelepias nyctaginifolia*	Washes, slopes, roadsides of deserts, grasslands, and open woodlands and at springs between 1,600 to 6,500 feet elevation.	Found in Clark County, Nevada, San Bernardino County California, and Mohave County Arizona.	Unlikely to occur in Project Area as the nearest records are for locations several hundred miles south.
Rusby's milkweed	*Asclepias rusbyi*	Riparian corridors in piñon-juniper woodlands, high semi-arid steppe, and ponderosa pine forests and mixed pine-fir forests at elevations from 3,500 to 7,000 feet elevation.	Found in Lincoln County, Nevada, Washington County Utah, and Mohave County Arizona.	Unlikely to occur in Project Area as the piñon-juniper woodlands, ponderosa pine forests and mixed pine-fir forests vegetation communities is not present
Ruth's milkweed	*Asclepias uncialis*	Grasslands, found on sandy to rocky soils at elevations between 5,000 to 7,000 feet.	Found in Lander, Nye, Lincoln, and Esmerelda counties.	Unlikely to occur in Project Area as the Project Area's elevations is below 5,000 feet.

Species Common Name	*Species Scientific Name*	Habitat	Nevada Locations	Potential to Occur in Project Area
Swamp milkweed	*Ascelpias incarnata*	In swamps, marshes and cienega edges, low fields and pastures, along rocky stream beds and openings in pine to pine-oak woodlands at elevations between 500 to 5,000 feet.	Found in Lincoln, County, Nevada and Juab and Box Elder counties in Utah.	Unlikely to occur in Project Area as the nearest records are for locations several hundred miles south or east.

Decker 2006, Nabhan et al. 2015.

C.2. NON-NATIVE AND INVASIVE PLANT SPECIES

Table C.2-1: Nevada Department of Agriculture's February 2, 2021, Noxious Weed List by Category

Common Name	Scientific Name
Category A Weeds: Category A noxious weeds are weeds that are generally not found or that are limited in distribution throughout the state.	
African rue	*Peganum harmala*
Austrian fieldcress	*Rorippa austriaca*
Austrian peaweed	*Sphaerophysa salsula*
Barbed goatgrass	*Aegilops triuncialis*
Bufflegrass	*Pennisetum ciliare*
Camelthorn	*Alhagi pseudalhagi*
Common crupina	*Crupina vulgaris*
Curly-leaf pondweed	*Potamogton crispus*
Desert knapweed	*Volutaria tubuliflora*
Dyer's woad	*Isatis tinctoria*
Eurasian water-milfoil	*Myriophyllum spicatum*
Flowering rush	*Butomus umbellatus*
Giant salvinia	*Salvinia molesta*
Goats rue	*Galega officinalis*
Green foutain grass	*Pennisetum setaceum*
Houndstongue	*Cynoglossum officinale*
Hydrilla	*Hydrilla verticillata*
Iberian starthistle	*Centaurea iberica*
Jointed goatgrass	*Aegilops cylindrical*
Klamath weed	*Hypericum peerforatum*
Malta starthistle	*Centaurea melitensis*
Mediterranean sage	*Salvia aethiopis*
Purple loosestrife	*Lythrum salicaria*
Purple starthistle	*Centaurea calcitrapa*
Rush skeletonweed	*Chondrilla juncea*
Squarrose knapweed	*Centaurea virgata*
Sulfur cinquefoil	*Potentilla recta*
Syrian bean caper	*Zygophyllum fabago*
Ventenata	*Ventenata dubia*
Yellow starthistle	*Centaurea solstitialis*
Yellow toadflax	*Linaria vulgaris*
Category B Weeds: Category B listed noxious weeds are weeds that are generally established in scattered populations in some counties of the btate.	
Black henbane	*Hysocyamus niger*
Carolina horse nettle	*Solanum carolinense*
Dalmation toadflax	*Linaria dalmatica*
Diffuse knapweed	*Centaurea diffusa*
Giant reed	*Arundo donax*
Leafy spurge	*Euphorbia esula*
Medusahead	*Taeniatherum caput-medusae*
Mayweed chamomile	*Anthemis cotula*
Perennial sowthistle	*Sonchus arvensis*
Sahara mustard	*Brassica tournefortii*

Common Name	Scientific Name
Silverleaf nightshade	*Solanum elaeagnifolium*
Spotted knapweed	*Centaurea maculosa*
Category C Weeds: Category C listed noxious weeds are weeds that are generally established and generally widespread in many counties of the state.	
Canada thistle	*Cirsium arvense*
Hoary cress or white top	*Cardaria draba*
Johnson grass	*Sorghum halepense*
Musk thistle	*Caduus nutans*
Perennial pepperweed	*Lepdium latifolium*
Poison hemlock	*Conium maculatum*
Puncture vine	*Tribulus terrestris*
Russian knapweed	*Acroptilon repens*
Salt cedar	*Tamarix spp.*
Scotch thistle	*Onopordum acanthium*
Water hemlock	*Cicuta maculata*

Table C.2-2: Noxious Weeds and Non-native Invasive Plant Species Observed in Survey Areas

Name	Common Name	Code	Class (NDA)	Tuscarora Field Office			Mount Lewis Field Office
				Carlin	Crescent Valley	Goldstrike	Crescent Valley
Anthemis cotula	stinking chamomile	ANCO2	B	Y			
Aroptilon repens	Hardheads or Russian Knapweed	ACRE3	C	Y	Y	Y	Y

Table D.1-1: 2012 Nevada Wildlife Action Plan Species of Conservation Priority

Common Name	Scientific Name
Mollusks	
California floater	*Anodonta californiensis*
Gastropods	
Amargosa tryonia	*Tryonia variegata*
Antelope Valley pyrg	*Pyrgulopsis pellita*
Ash Meadows pebblesnail	*Pyrgulopsis erythropoma*
bifid duct pyrg	*Pyrgulopsis peculiaris*
Big Warm Spring pyrg	*Pyrgulopsis papillata*
Blue Point pyrg	*Pyrgulopsis coloradensis*
Butterfield pyrg	*Pyrgulopsis lata*
Camp Valley pyrg	*Pyrgulopsis montana*
Corn Creek pyrg	*Pyrgulopsis fausta*
Crystal Spring pyrg	*Pyrgulopsis crystalis*
Distal-gland pyrg	*Pyrgulopsis nanus*
Dixie Valley pyrg	*Pyrgulopsis dixensis*
Duckwater pyrg	*Pyrgulopsis aloba*
Duckwater Warm Springs pyrg	*Pyrgulopsis villacampae*
Elko pyrg	*Pyrgulopsis leporina*
elongate Cain Spring pyrg	*Pyrgulopsis augustae*
elongate Mud Meadows pyrg	*Pyrgulopsis notidicola*
elongate-gland pyrg	*Pyrgulopsis isolata*
Emigrant pyrg	*Pyrgulopsis gracilis*
Fairbanks pyrg	*Pyrgulopsis fairbanksensis*
Flag pyrg	*Pyrgulopsis breviloba*
flat-topped Steptoe pyrg	*Pyrgulopsis planulata*
Fly Ranch pyrg	*Pyrgulopsis bruesi*
grated tryonia	*Tryonia clathrata*
Hardy pyrg	*Pyrgulopsis marcida*
Hubbs pyrg	*Pyrgulopsis hubbsi*
Humboldt pyrg	*Pyrgulopsis humboldtensis*
Kings River pyrg	*Pyrgulopsis imperialis*
Lake Valley pyrg	*Pyrgulopsis sublata*
Landyes pyrg	*Pyrgulopsis landyei*
large gland Carico pyrg	*Pyrgulopsis basiglans*
Lockes pyrg	*Pyrgulopsis lockensis*
longitudinal gland pyrg	*Pyrgulopsis anguina*
median-gland Nevada pyrg	*Pyrgulopsis pisteri*
minute tryonia	*Tryonia ericae*
Moapa pebblesnail	*Pyrgulopsis avernalis*
Moapa Valley pyrg	*Pyrgulopsis carinifera*
monitor tryonia	*Tryonia monitorae*
neritiform Steptoe Ranch pyrg	*Pyrgulopsis neritella*
northern Soldier Meadow pyrg	*Pyrgulopsis militaris*
northern Steptoe pyrg	*Pyrgulopsis serrata*
northwest Bonneville pyrg	*Pyrgulopsis variegata*
Oasis Valley pyrg	*Pyrgulopsis micrococcus*

Common Name	Scientific Name
ovate Cain Spring pyrg	*Pyrgulopsis pictilis*
Pahranagat pebblesnail	*Pyrgulopsis merriami*
Pleasant Valley pyrg	*Pyrgulopsis aurata*
Point of Rocks tryonia	*Tryonia elata*
Pyramid Lake pebblesnail	*Fluminicola dalli*
Sada's pyrg	*Pyrgulopsis sadai*
small gland Carico pyrg	*Pyrgulopsis bifurcata*
smooth juga	*Juga interioris*
southeast Nevada pyrg	*Pyrgulopsis turbatrix*
southern Duckwater pyrg	*Pyrgulopsis anatina*
southern Soldier Meadow pyrg	*Pyrgulopsis umbilicata*
southern Steptoe pyrg	*Pyrgulopsis sulcata*
sportinggoods tryonia	*Tryonia angulata*

squat Mud Meadows pyrg	*Pyrgulopsis limaria*
Steptoe hydrobe	*Eremopyrgus eganensis*
sterile basin pyrg	*Pyrgulopsis sterilis*
sub-globose Steptoe Ranch pyrg	*Pyrgulopsis orbiculata*
transverse gland pyrg	*Pyrgulopsis cruciglans*
turban pebblesnail	*Fluminicola turbiniformis*
Twentyone Mile pyrg	*Pyrgulopsis millenaria*
Upper Thousand Spring pyrg	*Pyrgulopsis hovinghi*
Vinyards pyrg	*Pyrgulopsis vinyardi*
Virginia Mountains pebblesnail	*Fluminicola virginius*
White River Valley pyrg	*Pyrgulopsis sathos*
Wong's pyrg	*Pyrgulopsis wongi*
Fishes	
Alvord chub	*Gila alvordensis*
Ash Meadows Amargosa pupfish	*Cyprinodon nevadensis mionectes*
Ash Meadows speckled dace	*Rhinichthys osculus nevadensis*
Big Smoky Valley speckled dace	*Rhinichthys osculus lariversi*
Big Smoky Valley tui chub	*Gila bicolor ssp. (unnamed)*
Big Spring spinedace	*Lepidomeda mollispinis pratensis*
bonytail chub	*Gila elegans*
bull trout (Jarbidge River basin pop)	*Salvelinus confluentus* pop. 4
Clover Valley speckled dace	*Rhinichthys osculus oligoporus*
Cui-ui	*Chasmistes cujus*
desert dace	*Eremichthys acros*
Devils Hole pupfish	*Cyprinodon diabolis*
Diamond Valley speckled dace	*Rhinichthys osculus* ssp. (unnamed)
Fish Lake Valley tui chub	*Gila bicolor* ssp. (unnamed)
flannelmouth sucker	*Catostomus latipinnis*
Hiko White River springfish	*Crenichthys baileyi grandis*
Independence Valley speckled dace	*Rhinichthys osculus lethoporus*
Independence Valley tui chub	*Gila bicolor isolata*
Lahontan cutthroat trout	*Oncorhynchus clarkii henshawi*
Little Fish Lake Valley tui chub	*Gila bicolor* ssp. (unnamed)
Meadow Valley speckled dace	*Rhinichthys osculus* ssp. (unnamed)
Meadow Valley Wash desert sucker	*Catostomus clarkii* ssp. (unnamed)
Moapa dace	*Moapa coriacea*
Moapa speckled dace	*Rhinichthys osculus moapae*
Moapa White River springfish	*Crenichthys baileyi moapae*

Common Name	Scientific Name
Monitor Valley speckled dace	*Rhinichthys osculus* ssp. (unnamed)
Moorman White River springfish	*Crenichthys baileyi thermophilus*
mountain whitefish	*Prosopium williamsoni*
Oasis Valley speckled dace	*Rhinichthys osculus* ssp. (unnamed)
Pahranagat roundtail chub	*Gila robusta jordani*
Pahranagat speckled dace	*Rhinichthys osculus velifer*
Pahrump poolfish	*Empetrichthys latos latos*
Preston White River springfish	*Crenichthys baileyi albivallis*
Railroad Valley springfish	*Crenichthys nevadae*
Railroad Valley tui chub	*Gila bicolor* ssp. (unnamed)
razorback sucker	*Xyrauchen texanus*
relict dace	*Relictus solitarius*
Sheldon tui chub	*Gila bicolor eurysoma*
tui chub of Dixie Valley	*Gila bicolor* ssp. 9
Virgin River chub	*Gila seminuda*
Virgin River chub (Muddy River pop.)	*Gila seminuda* pop. 2
Virgin River spinedace	*Lepidomeda mollispinis mollispinis*
Wall Canyon sucker	*Catostomus* sp.
Warm Springs Amargosa pupfish	*Cyprinodon nevadensis pectoralis*
Warner Valley redband trout	*Oncorhynchus mykiss* pop. 4
White River desert sucker	*Catostomus clarkii intermedius*
White River speckled dace	*Rhinichthys osculus* ssp. 7
White River spinedace	*Lepidomeda albivallis*
White River springfish	*Crenichthys baileyi baileyi*
woundfin	*Plagopterus argentissimus*
Yellowstone cutthroat trout	*Oncorhynchus clarkii bouvieri*
Amphibians	
Amargosa toad	*Anaxyrus nelsoni*
Arizona toad	*Anaxyrus microscaphus*
Columbia spotted frog (Great Basin pop.)	*Rana luteiventris* pop. 3
Great Basin spadefoot	*Spea intermontana*
Great Plains toad	*Anaxyrus cognatus*
northern leopard frog	*Lithobates pipiens*
relict leopard frog	*Lithobates onca*
Sierra Nevada yellow-legged frog	*Rana sierra*
western toad	*Anaxyrus boreas*
Reptiles	
chuckwalla	*Sauromalus ater*
desert night lizard	*Xantusia vigilis*
desert horned lizard	*Phrynosoma platyrhinos*
desert iguana	*Dipsosaurus dorsalis*
desert tortoise (Mojave Desert pop.)	*Gopherus agassizii*
Gila monster	*Heloderma suspectum*
long-nosed leopard lizard	*Gambelia wislizenii*
Great Basin collared lizard	*Crotaphytus bicinctores*
greater short-horned lizard	*Phrynosoma hernandesi*
northwestern pond turtle	*Actinemys marmorata marmorata*
northern rubber boa	*Charina bottae*
pygmy short-horned lizard	*Phrynosoma douglasii*
Panamint alligator lizard	*Elgaria panamintina*
ring-necked snake	*Diadophis punctatus*
rosy boa	*Lichanura trivirgata*

Common Name	Scientific Name
Shasta alligator lizard	*Elgaria coerulea shastensis*
sidewinder	*Crotalus cerastes*
Sierra alligator lizard	*Elgaria coerulea palmeri*
Smith's black-headed snake	*Tantilla hobartsmithi*
Sonoran mountain kingsnake	*Lampropeltis pyromelana*
spotted leaf-nosed snake	*Phyllorhynchus decurtatus*
western banded gecko	*Coleonyx variegatus*
western brush lizard	*Urosaurus graciosus*
western red-tailed skink	*Plestiodon gilberti rubricaudatus*
Mojave shovel-nosed snake	*Chionactis occipitalis*
western threadsnake	*Rena humilis*
Birds	
American Avocet	*Recurvirostra americana*
American Bittern	*Botaurus lentiginosus*
American White Pelican	*Pelecanus erythrorhynchos*
Bell's Vireo	*Vireo bellii*
Bald Eagle (Contiguous US Pop)	*Haliaeetus leucocephalus*
Bank Swallow	*Riparia riparia*
Bendire's Thrasher	*Toxostoma bendirei*
Black Rosy-Finch	*Leucosticte atrata*
Black Tern	*Chlidonias niger*
Black-chinned Sparrow	*Spizella atrogularis*
Bobolink	*Dolichonyx oryzivorus*
Brewer's Sparrow	*Spizella breweri*
California Spotted Owl	*Strix occidentalis occidentalis*
Canvasback	*Aythya valisineria*
Cassin's Finch	*Carpodacus cassinii*
Columbian Sharp-tailed Grouse	*Tympanuchus phasianellus columbianus*
Common Loon	*Gavia immer*
Common Nighthawk	*Chordeiles minor*
Dusky Grouse	*Dendragapus obscurus*
Ferruginous Hawk	*Buteo regalis*
Flammulated Owl	*Otus flammeolus*
Gilded Flicker	*Colaptes chrysoides*
Golden Eagle	*Aquila chrysaetos*
Gray-crowned Rosy-Finch	*Leucosticte tephrocotis*
Great Basin Willow Flycatcher	*Empidonax traillii adastus*
Greater Sage-Grouse	*Centrocercus urophasianus*
Greater Sandhill Crane	*Grus canadensis tabida*
Le Conte's Thrasher	*Toxostoma lecontei*
Lewis's Woodpecker	*Melanerpes lewis*
Loggerhead Shrike	*Lanius ludovicianus*
Long-billed Curlew	*Numenius americanus*
Long-billed Dowitcher	*Limnodromus scolopaceus*
Mountain Quail	*Oreortyx pictus*
Northern Goshawk	*Accipiter gentilis*
Northern Pintail	*Anas acuta*
Olive-sided Flycatcher	*Contopus cooperi*
Peregrine Falcon	*Falco peregrinus*
Pinyon Jay	*Gymnorhinus cyanocephalus*
Prairie Falcon	*Falco mexicanus*
Redhead	*Aythya americana*

Common Name	Scientific Name
Red-necked Phalarope	*Phalaropus lobatus*
Rufous Hummingbird	*Selasphorus rufus*
Sage Sparrow	*Amphispiza belli*
Sage Thrasher	*Oreoscoptes montanus*
Scott's Oriole	*Icterus parisorum*
Short-eared Owl	*Asio flammeus*
Sierra Nevada Mountain Willow Flycatcher	*Empidonax traillii brewsteri*
Sooty Grouse	*Dendragapus fuliginosus*
Southwestern Willow Flycatcher	*Empidonax traillii extimus*
Tricolored Blackbird	*Agelaius tricolor*
Virginia's Warbler	*Vermivora virginiae*
Western Burrowing Owl	*Athene cunicularia hypugaea*
Western Least Bittern	*Ixobrychus exilis hesperis*
Western Sandpiper	*Calidris mauri*
Western Snowy Plover	*Charadrius alexandrinus nivosus*
Western Yellow-billed Cuckoo	*Coccyzus americanus occidentalis*
White-faced Ibis	*Plegadis chihi*
White-headed Woodpecker	*Picoides albolarvatus*
Wilson's Phalarope	*Phalaropus tricolor*
Yuma Clapper Rail	*Rallus longirostris yumanensis*
Mammals	
Allen's big-eared bat	*Idionycteris phyllotis*
American marten	*Martes americana*
American pika	*Ochotona princeps*
American water shrew	*Sorex palustris*
bighorn sheep	*Ovis canadensis*
Botta's pocket gopher	*Thomomys bottae*
California leaf-nosed bat	*Macrotus californicus*
cave myotis	*Myotis velifer*
dark kangaroo mouse	*Microdipodops megacephalus*
desert kangaroo rat	*Dipodomys deserti*
desert pocket mouse	*Chaetodipus penicillatus*
fringed myotis	*Myotis thysanodes*
hoary bat	*Lasiurus cinereus*
Humboldt yellow-pine chipmunk	*Neotamias amoenus celeris*
Inyo shrew	*Sorex tenellus*
little brown myotis	*Myotis lucifugus*
long-eared myotis	*Myotis evotis*
Merriam's shrew	*Sorex merriami*
Mexican free-tailed bat	*Tadarida brasiliensis*
Mono Basin mountain beaver	*Aplodontia rufa californica*
montane shrew	*Sorex monticolus*
mountain pocket gopher	*Thomomys monticola*
mule deer	*Odocoileus hemionus*
northern flying squirrel	*Glaucomys sabrinus*
northern river otter	*Lontra canadensis*
Pahranagat Valley montane vole	*Microtus montanus fucosus*
pale kangaroo mouse	*Microdipodops pallidus*
Palmer's chipmunk	*Neotamias palmeri*
Preble's shrew	*Sorex preblei*
pygmy rabbit	*Brachylagus idahoensis*
sagebrush vole	*Lemmiscus curtatus*

Common Name	Scientific Name
shadow (Allen's) chipmunk	*Neotamias senex*
Sierra Nevada snowshoe hare	*Lepus americanus tahoensis*
silver-haired bat	*Lasionycteris noctivagans*
spotted bat	*Euderma maculatum*
Townsend's big-eared bat	*Corynorhinus townsendii*
western jumping mouse	*Zapus princeps*
western red bat	*Lasiurus blossevillii*
western small-footed myotis	*Myotis ciliolabrum*
Wyoming ground squirrel	*Spermophilus elegans nevadensis*

Table D.1-2: BLM Sensitive Status Species within the Battle Mountain and Elko Districts

Species Name	Habitat	Designation and Ranking of Others	Battle Mountain District	Elko District	Potential to Occur in Project Area [1]
Amphibians					
Amargosa Toad *(Anaxyrus nelson)*	Open, ponded, or flowing water, with riparian vegetative cover in an early-to-intermediate successional stage to form a partial canopy for shade with minimal emergent vegetation at the water's edges; adults also require adjacent vegetated uplands for nocturnal foraging No critical habitat designated or recovery plans for this species	NDOW (SP); NS-S (S2); NS (G2)	x		No; The Amargosa toad occurs only in Oasis Valley, Nevada, specifically along a 10-mile stretch of the Amargosa River and upland springs. (NatureServe 2021)
Boreal toad *(Anaxyrus boreas ssp.)*	Wide variety of habitats including desert springs and streams	No rankings		x	No; Recently described new species of Anaxyrus limited to Nye County, genetic analysis of specimens from the Project vicinity group with western toad (see below)
