TABLE OF CONTENTS

1. Introduction **1-1**
1.1. Project Location 1-1
1.1.1. Landscape Setting and Land Use 1-1
1.1.2. Climate 1-2
1.2. Project Description 1-5
1.3. Laws, Regulations, and Plans 1-5
1.3.1. Federal 1-5
1.3.2. State 1-7
1.3.3. County Management Plans 1-8

2. Biological Baseline Report Approach **2-1**
2.1. Ecological Site Description Approach 2-13
2.2. Water Resources Approach 2-13
2.3. Vegetation Approach 2-13
2.4. Wildlife Approach 2-14

3. Biological Baseline **3-1**
3.1. Ecological Site Description 3-1
3.1.1. Background 3-1
3.1.2. Study Methodology 3-2
3.1.3. Results and Discussion 3-3
3.2. Water Resources Surveys 3-29
3.2.1. Background 3-30
3.2.2. Study Methodology 3-30
3.2.3. Results 3-34
3.3. Vegetation Studies 3-68
3.3.1. Special Status Plant Species 3-68
3.3.2. Butterfly Host Plants 3-82
3.3.3. Noxious Weeds and Invasive Plants 3-93
3.4. Wildlife Studies 3-107
3.4.1. Wildlife Habitat 3-107
3.4.2. General Wildlife 3-117
3.4.3. Migratory and Breeding Birds 3-126
3.4.4. Eagles and Other Raptors 3-141
3.4.5. Burrowing Owls 3-149
3.4.6. Greater Sage-grouse 3-167
3.4.7. Threatened and Endangered Species 3-175
3.4.8. Pygmy Rabbit 3-179
3.4.9. Dark and Pale Kangaroo Mice 3-188
3.4.10. Bats 3-199
3.4.11. Amphibians 3-214
3.4.12. Butterflies 3-222

4. References **4-1**

1. INTRODUCTION

Nevada Gold Mines, LLC (NGM) contracted ERM-West, Inc. (ERM) to conduct biological and noise baseline studies for the proposed Ore Transportation Project (Project). The purpose of this baseline report is to characterize wildlife resources in the study area and support future National Environmental Policy Act (NEPA) analysis. Surveys, inventories, and monitoring were completed using protocols approved by Bureau of Land Management (BLM) and Nevada Department of Wildlife (NDOW). The objective of the biological and noise baseline studies was to inventory and characterize vegetation, soil types, water resources, and wildlife for the Project. The information found in this baseline report will be used to support future permitting needs, including compliance with NEPA. The biological and noise baseline studies presented in this report were completed May through September 2021.

1.1. PROJECT LOCATION

The Project is within Elko, Eureka, and Lander counties, Nevada, and includes approximately 2,660 acres (1,077 hectares) of public lands administered by the Elko and Battle Mountain BLM Nevada District Offices, and approximately 3,962 acres (1,603 hectares) of privately owned lands (Table 1.1-1 and Figure 1.1-1). The Project is located within the U.S. Environmental Protection Agency (USEPA) Central Basin and Range Level III Ecoregion. This ecoregion is characterized by mid- to high-elevation ranges, interspersed with rolling hills, alluvial fans, and valleys. Valleys and lower elevation slopes are dominated by Great Basin sagebrush or saltbush-greasewood vegetation communities, while pinyon-juniper woodland and mountain-mahogany occur at higher elevations. The Central Basin and Range Ecoregion hydrology is internally drained, and most streams are intermittent and ephemeral (Wiken et al. 2011).

Table 1.1-1: Land Jurisdiction within the Project Area

Ownership	BLM Field Office	Acres
BLM Elko District Office	Tuscarora Field Office	2,076.9
BLM Battle Mountain District Office	Mount Lewis Field Office	583.8
Private	-	3,961.5
Total	**-**	**6,622.2**

Source: BLM 2020a

1.1.1. Landscape Setting and Land Use

Land uses in northeastern Nevada include mining, mine exploration, livestock grazing, agricultural use, and off-highway vehicle recreation and occur throughout the Project (Wiken et al. 2011). Elevations within the Project Area range from approximately 9,135 feet above mean sea level (amsl) at the summit of Mount Tenabo in the northern Cortez Mountains, to approximately 4,600 feet (1,450 meters) amsl northwest of the Dunphy rail siding.

1.1.2. Climate

The climate in northeastern Nevada is characterized by a dry, mid-latitude desert climate, with hot summers, cold winters, and wet springs. Precipitation in this area regularly falls in winter as snow, and most rainfall occurs during spring and summer thunderstorms, which is typical of the Central Basin and Range Ecoregion (USGS 2012; Wiken et al. 2011). Annual precipitation in Elko, Eureka, and Lander counties ranges from just under 10 inches to 16 inches (Table 1.1-2). Temperatures during January range from a low of 16 degrees Fahrenheit (°F) to a high of 37.9°F. During the summer, temperatures range from a low of 49°F to a high of 90°F. Table 1.1-2 presents the monthly average precipitation, as well as mean high and low temperatures for Elko, Eureka, and Lander counties.

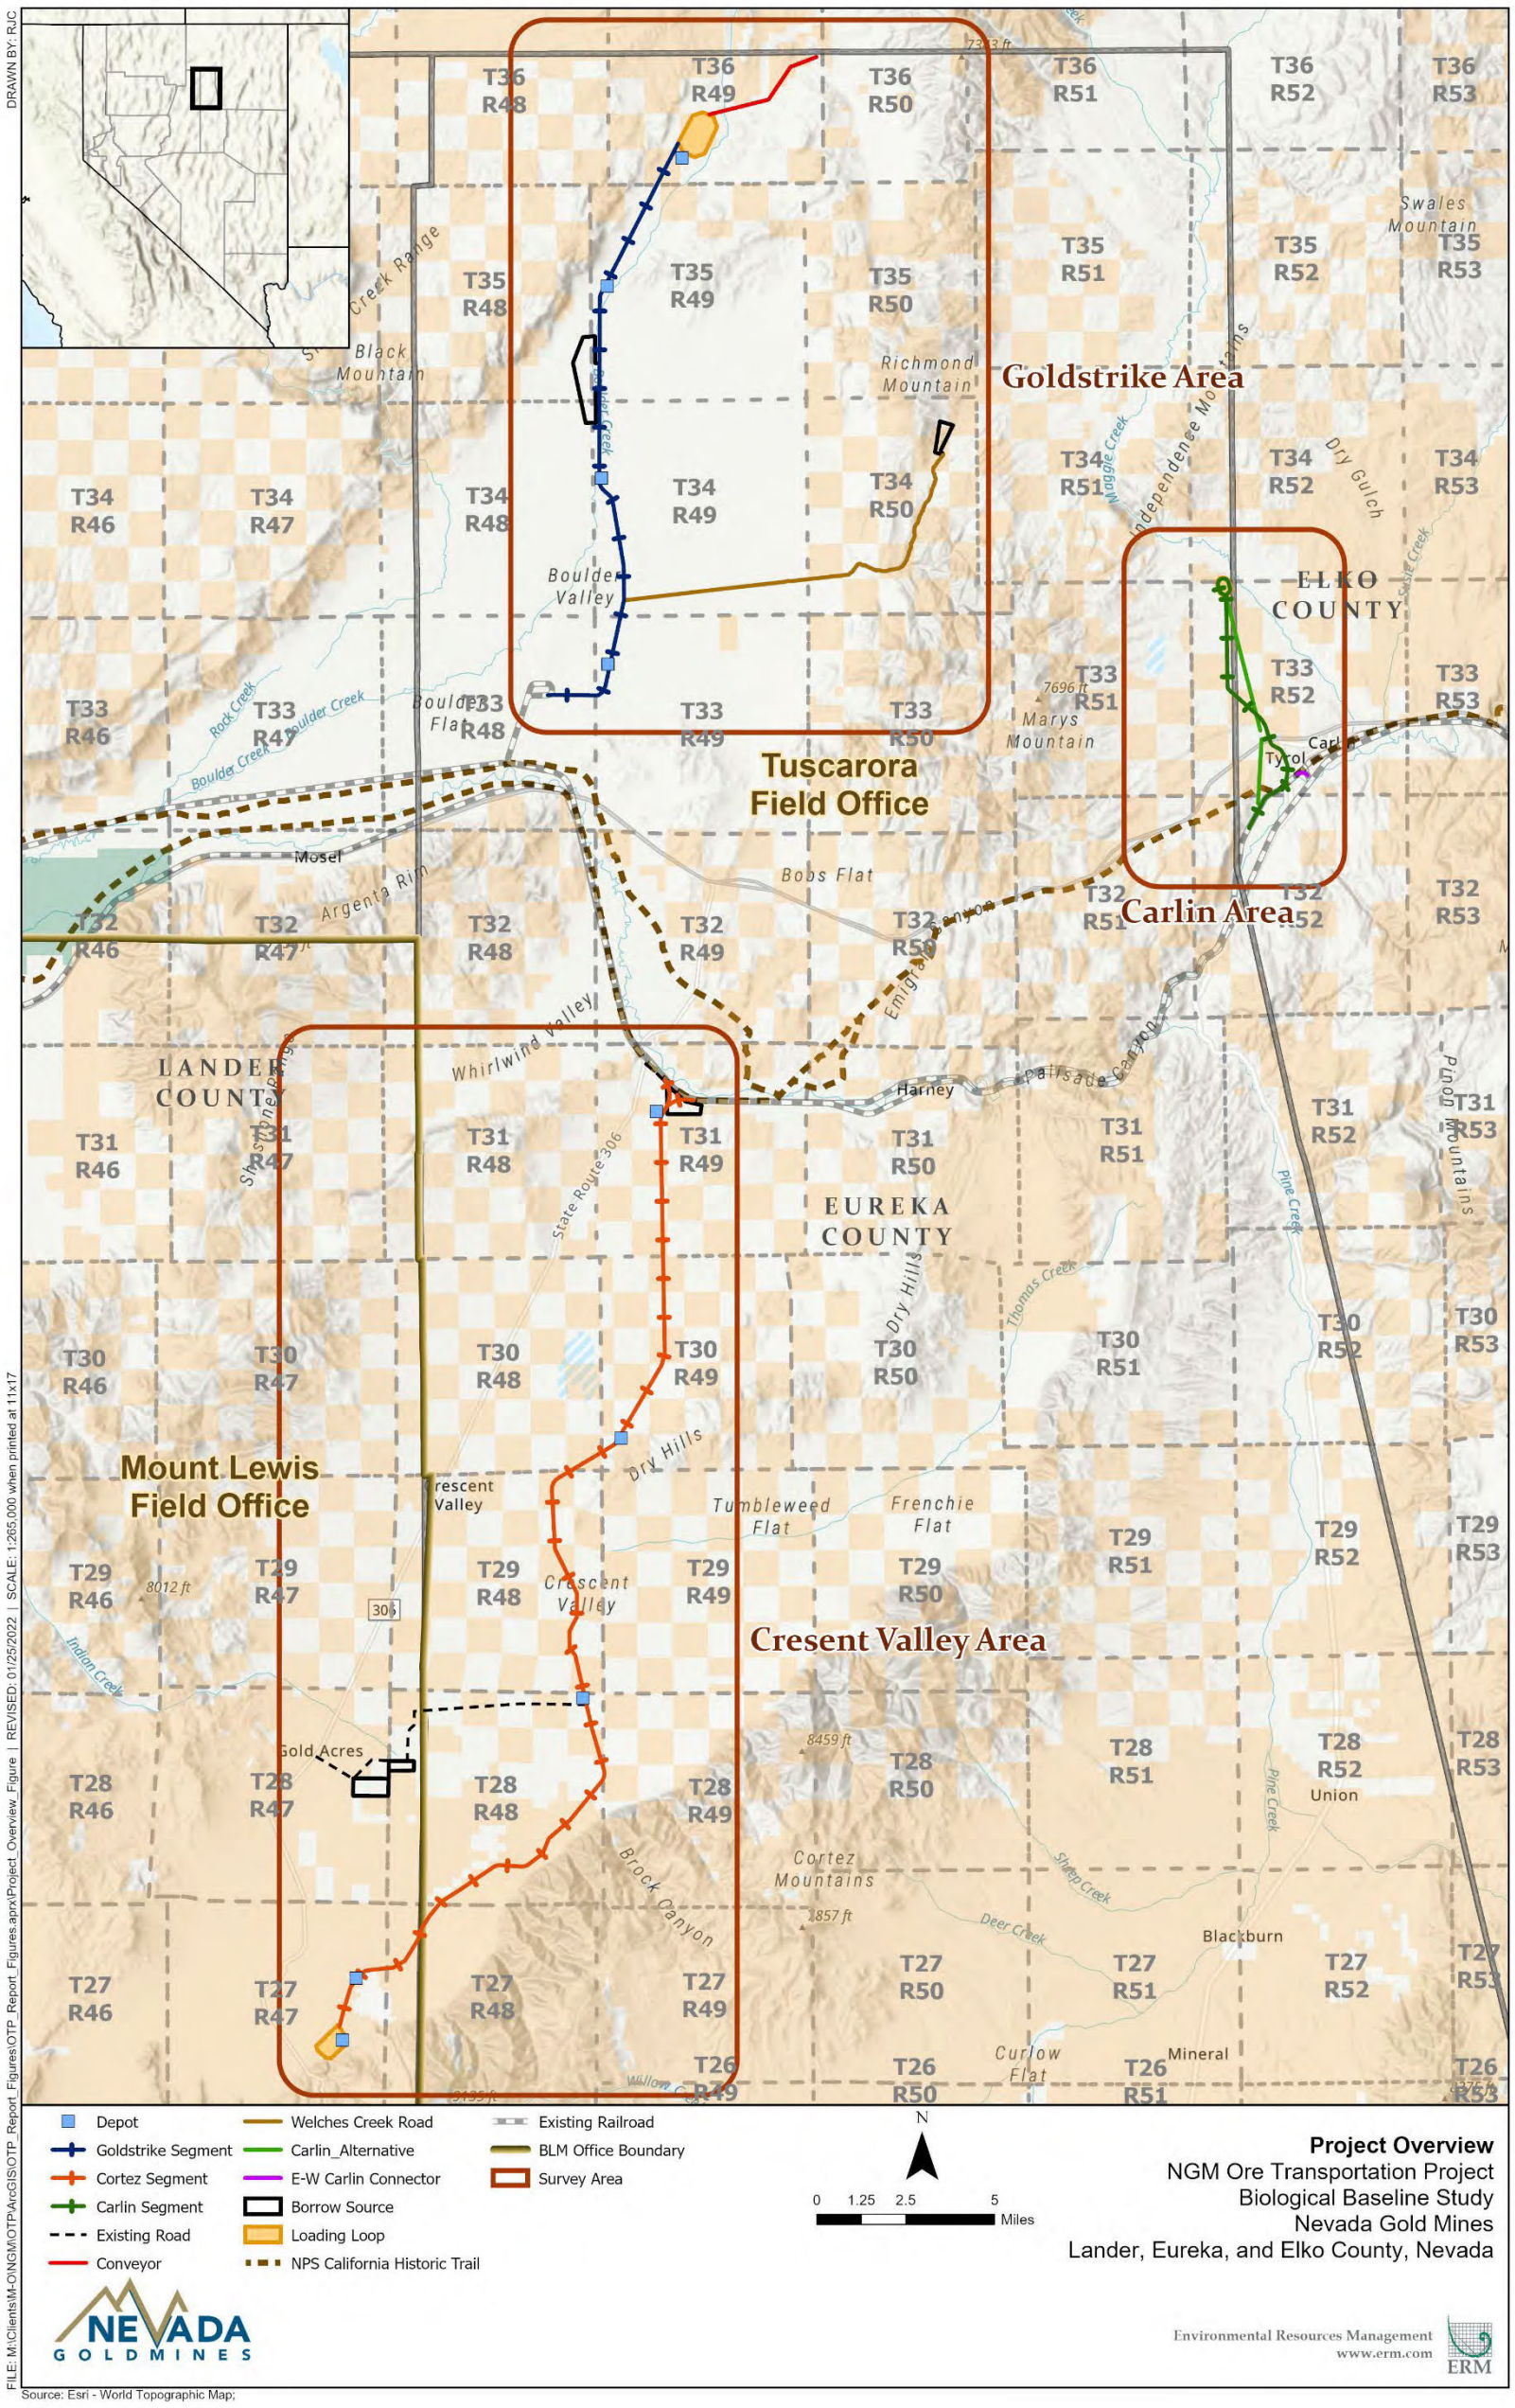

Figure 1.1-1: Project Overview

Page Intentionally Left Blank.

1.2. PROJECT DESCRIPTION

The Project would consist of a newly constructed railway and conveyor system to haul ore from the Cortez Mine District north to the Gold Quarry and Goldstrike mines for processing. The purpose of the Project is to allow for optimized processing, which would improve safety by reducing over-the-road haulage on public highways and would reduce potential air and greenhouse gas emissions. Project specifics include the following:

- New private rail line to be constructed from Cortez to Beowawe where it would connect to the existing Union Pacific Railroad to travel east or west;
- New siding and private rail line would be constructed near Carlin to travel north to Gold Quarry;
- New private railway would be built from the T.S. Power Plant to the east and extend north through Boulder Valley to Goldstrike; and
- Loading/unloading facilities such as stockpiles, rail loops, and conveyors.

This rail system includes temporary borrow source areas and temporary depots (construction laydown yards). The depots and borrow sources will be reclaimed after construction is complete. As shown on Figure 1.1-1, the Project is separated into three distinct surveyed areas: Goldstrike, Carlin, and Crescent Valley. This report will discuss the results based on the three defined areas.

1.3. LAWS, REGULATIONS, AND PLANS

The federal, state, and county regulations and permits pertaining to biological resources and land use management that guided the information collected during the 2021 baseline studies are described below. Land and resource management plans applicable to this biological baseline report and noise study include BLM Resource Management Plans (RMPs), a comprehensive plan prepared by the National Park Service, and county management and master plans.

1.3.1. Federal

The Council on Environmental Quality regulations discuss “human environment” in the Code of Federal Regulations, Title 40, Section 1508.14 (40 CFR 1508.14). This term broadly relates to the biological, physical, social, and economic elements of the environment. It includes the wildlife resources category. Relevant data is to be used in describing the affected environment as the basis for determining the effects (direct and indirect) of a proposed action. The *BLM National Environmental Policy Act Handbook H-1790-1* (BLM 2008a) describes potential NEPA-related federal requirements.

Other federal requirements, such as the Endangered Species Act (ESA) consultations, and critical habitat procedural requirements must be followed. The following sections provide a list of relevant federal regulations.

1.3.1.1. Endangered Species Act

Section 7 of the ESA (19 United States Code [USC] § 1536(c)), as amended, states that any action authorized, funded, or carried out by a federal agency does not jeopardize the continued existence of a federally listed threatened and endangered species, or result in the destruction or adverse modification of federally listed designated critical habitat. Currently there is one federally listed species and one candidate species with potential to occur in the region: Lahontan cutthroat trout (*Oncorhynchus clarkia henshawi*), currently threatened; and the monarch butterfly (*Danaus plexippus*), currently a candidate species for listing under the ESA.

1.3.1.2. The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (BGEPA; 16 USC § 668) prohibits the take, possession, sale, purchase, barter, offer to sell, purchase or barter, transport, export, or import of any bald or golden eagle, alive or dead, including any part, nest, or egg, unless allowed by permit. As defined in the act, a "take" includes "disturbing a bald or golden eagle to a degree that causes, or is likely to cause, injury to an eagle, decrease in its productivity or nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

1.3.1.3. The Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA; 16 USC §§ 703-712) implements various treaties and conventions for the protection of migratory birds. Under this act, taking, killing, or possessing migratory birds (including any part, nest, or egg) is unlawful.

1.3.1.4. Bureau of Land Management

The applicable BLM RMPs are the 1987 Elko RMP, the 1987 Shoshone-Eureka RMP, and amendments to those plans. These two RMPs guide BLM management decisions and actions based on multiple-use and sustained yield, unless otherwise specified by law.

BLM finalized an Approved Resource Management Plan Amendment (ARMPA) to address greater sage-grouse (*Centrocercus urophasianus*) habitat protection measures in Nevada and California (BLM 2015). The 2015 ARMPA provides guidance on measures to avoid and minimize potential impacts resulting from proposed projects in addition to providing appropriate measures to compensate for impacts that are unavoidable to greater sage-grouse (shortened hereafter to GRSG) habitat resulting from development projects.

BLM Nevada Special-status species are species that occur on BLM administered lands in Nevada consistent with Manual Section 6840 and current WO-230 guidance (NV IM [Instruction Memorandum]-2018-003) (BLM 2017b, 2019a). This IM officially updates the List, which includes federally designated threatened, endangered, and proposed species as well as Nevada BLM sensitive species. In addition to the species listed in the IM, the BLM Elko District Office also maintains a sensitive species list (BLM 2019b) BLM's list of special-status species includes the following three categories: 1) federally listed as Threatened or Endangered, Proposed, and Candidate species; 2) Nevada State Protected species; and 3) Nevada BLM Sensitive Species. BLM Sensitive Species are species for which population viability is a

concern; they are managed by the BLM to “ensure that actions authorized, funded, or carried out do not contribute to the need for the species to become listed”; these species are afforded the same level of protection as federal Candidate species.

1.3.1.5. National Park Service

In 1992, Congress established the California National Historic Trail (National Trails System Act, Section 5(a)(18)). As required by the National Trails System Act, a Comprehensive Management and Use Plan was completed for the California National Historic Trail and three other national historic trails (i.e., Oregon, Mormon Pioneer, and Pony Express National Historic Trails) in 1999 (NPS 1999). This plan provides broad-based policies, guidelines, and standards for administering the four trails to ensure the protection of trail resources, their interpretation, and their continued use. The purposes of the California National Historic Trail are to 1) enable all people to envision and experience—in a coherent and convenient way—the heritage and impacts of the western overland migration; and 2) encourage preservation of its history and physical remains.

1.3.2. State

Under Nevada law and regulation, any wildlife receiving the distinction of fully protected species may not be captured, removed, or destroyed at any time except with special permit as provided under Nevada Revised Statutes (NRSs) 503.584-503.589 and Nevada Administrative Code (NAC) 503.093. NAC Chapters 501 and 503 provide information on the protection of threatened, endangered, protected, and sensitive plant and animal species. NAC Chapter 501 establishes broad policies for the protection, propagation, restoration, transplanting, introduction, and management of wildlife in Nevada, while Chapter 503 defines the criteria for classification of species as protected and identifies those species that require protection.

The NDOW manages fish and wildlife populations through objectives specified in various management plans. NDOW has direct responsibility for wildlife protection. NDOW’s Wildlife Action Plan (WAP) (Wildlife Action Plan Team 2012) was completed and approved by the U.S. Fish and Wildlife Service (USFWS) in 2012.

Nevada’s WAP has served as a plan of action for state wildlife conservation and funding by targeting the species of greatest conservation need and the key habitats on which they depend. The WAP serves as a comprehensive, landscape level plan, identifying the species of greatest conservation need and the key habitats on which they depend, with the intent to prevent wildlife species from becoming threatened or endangered. The WAP contains conservation actions to provide guidance to successfully conserve Nevada’s key habitats and priority species.

Many of the conservation actions within the WAP are strategies identified in other existing conservation plans. The WAP’s recommended conservation actions do not represent a mandate or expectation for a given party to carry out or implement these actions. During WAP implementation, conservation actions developed at the state or local level would be used to provide guidance to address site-specific conditions as appropriate. Some of these actions may

be applicable at the land use plan level, and some more appropriately applied at an activity plan or site-specific plan level.

1.3.3. County Management Plans

1.3.3.1. Elko County

Per the planning directives in the *Elko County Public Land Use & Natural Resource Management Plan* (Elko County 2010), all proposed actions on public lands are to be brought to the attention of the Elko County Natural Resource Management Advisory Commission (NRMAC) or the Elko County Board of Commissioners (ECBC) for purposes of review to determine if the federal program is in conformance with Elko County policies pursuant to NEPA requirements and allows the county to cooperate and coordinate with the federal land management agencies. Elko County will coordinate and cooperate with federal agencies on actions that affect public lands within the county.

The Elko County NRMAC will serve in an advisory capacity as liaison to the ECBC. The Elko County NRMAC and ECBC requires consistency between its RMP (Elko County 2010) and all federal land use management, resource management, travel management, and any other federal management plans and actions that apply to Elko County.

1.3.3.2. Eureka County

In 1993, the Eureka County Commissioners created the Eureka County Natural Resources Advisory Commission and appointed a nine-member board to serve on that commission. The Natural Resources Advisory Commission makes recommendations to the Eureka County Commission on issues regarding the goals and policies established in the *Eureka County Master Plan 2010* related to public lands issues, including air space, wild horses, wildlife, grazing allotments, mining and recreation (Eureka County 2010).

1.3.3.3. Lander County

The Conservation and Natural Resource Element of the *Lander County Master Plan 2010* (Lander County 2010) outlines policies and action programs for protecting Lander County's land, water, and air resources as growth and development occurs. The Conservation and Natural Resource Element provides guidelines for conserving the county's important natural resources while satisfying the requirement for a conservation plan as outlined by the NRSs. As defined in the Conservation and Natural Resource Element, land resources include soils, topography, agricultural lands, minerals, public lands, and geothermal resources (Lander County 2010).

Specific goals of the Conservation and Natural Resources Element include protecting important agricultural lands that provide economically productive acreage, important flood management areas, prime or unique farmland, or farmlands of statewide importance; limiting conflicts and encroachment from developing lands on agricultural lands; promoting the development of renewable energy projects; and protecting important environmental resources and open space (Lander County 2010).

2. BIOLOGICAL BASELINE REPORT APPROACH

ERM developed this biological baseline report consistent with the 2021 Work Plan (ERM 2021a) approved by the BLM. This report is organized into four sections: 1) Ecological Site Description (ESD), 2) water resources, 3) vegetation, and 4) wildlife. The appendices for each of these four sections include detailed information, figures, and datasheets from the field surveys conducted during the 2021 pre-field assessments and field surveys. Surveys for biological resources were conducted in each of the Goldstrike, Carlin, and Crescent Valley areas within the Project footprint plus the listed buffer from the centerline of the proposed railway, borrow source areas, access roads, and the proposed construction depots (herein referred to as “Project Area”). ESD, vegetation, and wildlife resources were surveyed within a 200-foot buffer of the centerline (400-foot survey area), and water resources were surveyed within a 400-foot buffer of the centerline (800-foot survey area), as shown on Figure 2-1 through Figure 2-9. These survey areas included the borrow source areas, access roads that include a 50-foot buffer of the centerline (100-foot survey area), and the proposed construction depots.

Page Intentionally Left Blank.

2.1. ECOLOGICAL SITE DESCRIPTION APPROACH

ESD includes rangeland health, soil, and vegetation community verification and mapping within the 400-foot survey area, borrow sources, access roads, and depot locations. Prior to field surveys, existing background information and data were collected. Initially, existing literature and background data for soils, vegetation, and ecological sites were reviewed. Because ecological sites are directly associated with soil types, soil map units and ecological sites incorporate information from U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey tool.

Ecological sites were field-verified by digging at least one soil pit in each of the ecological classes to a minimum depth of 20 inches or the depth of the restrictive layer. Soil texture, landform, and topographic features were recorded for each soil pit. The current condition of the ecological site, including a plant species list, was also recorded at each soil pit.

2.2. WATER RESOURCES APPROACH

Water resources includes information on the water resources, seeps and springs, and proper functioning condition surveys within an 800-foot survey area, borrow sources, access roads, and depot locations. ERM biologists used data from the U.S. Geological Survey (USGS) 7.5-minute Topographic Quadrangles, NRCS Soil Survey Geographic database, USFWS National Wetlands Inventory (NWI), USGS National Hydrography Dataset (NHD) (streamlines and seeps-springs points), Federal Emergency Management Agency National Flood Hazard Layer. In addition, wetland and waters location data were used to identify potential wetland and waters features on maps for use during field surveys.

The entire study area was assessed either on foot or by vehicle, where possible. Wetland and waterbody delineations, feature data points, non-water points, and seeps and springs data were collected utilizing sub-meter accurate Global Positioning Satellite (GPS) units as required for U.S. Army Corps of Engineers (USACE) jurisdictional determinations.

2.3. VEGETATION APPROACH

As described in the ESD section, the survey area for vegetation is the 400-foot survey area, borrow sources, access roads, and depot locations. ERM staff used Southwest Regional Gap Analysis Project (SWReGAP), Soil Survey Geographical Database (SSURGO), and ESD available from NRCS. Field verification and vegetation community condition assessments were conducted that were correlated with the ESD survey state-and-transition model descriptions (Stringham et al. 2015a, 2015b). General vegetation community data was collected concurrently with the ESD field surveys. A vegetation inventory was conducted to meet ESD requirements, as well as collecting data on the presence of noxious weeds, invasive plants, and special status plants.

2.4. WILDLIFE APPROACH

Wildlife includes information on the habitat surveys and surveys conducted for bats, amphibians, and butterflies within a 400-foot survey area, borrow sources, access roads, and depot locations. The general wildlife desktop assessment used existing literature, Geographic Information System (GIS) data, SWReGAP, and survey information from BLM, USFWS, NDOW, Nevada Division of Natural Heritage (NDNH), and Western Association of Fish and Wildlife Agencies (WAFWA). Spatial data available from BLM such as the Western Wildlife Crucial Habitat Assessment Tool or similar databases were used to identify wildlife migration corridors. The desktop assessment and habitat assessment provided information on general wildlife species that may be present in the Project Area.

Field surveys for wildlife included identifying species based on direct observation, scat, tracks, or other methods such as roadside mortality. Wildlife habitat verification and incidental observations were conducted during general vegetation surveys, ESD surveys, and focused species surveys.

3. BIOLOGICAL BASELINE

3.1. ECOLOGICAL SITE DESCRIPTION

3.1.1. Background

Classification of landscapes into ecological sites is based on similar environmental factors used to guide decisions (NRCS 2021b; Brischke et al. 2018; Butler et al. 2003). ESDs are reports that provide detailed information about a particular kind of land—a distinctive ecological site (NRCS 2021b). The NRCS uses four categories of information to describe ecological sites and provide information on resource conditions and trends. These four categories are site characteristics, plant communities, site interpretations, and supporting information (NRCS 2021b). This report provides ecological site information describing site characteristics and plant communities and supporting field data collected during the 2021 field season.

An ecological site is defined as “a distinctive kind of land based on recurring soil, landform, geological, and climate characteristics that differs from other kinds of land in its ability to produce distinctive kinds and amounts of vegetation and in its ability to respond similarly to management actions and natural disturbances” (Caudle et al. 2013; NRCS 2021). Ecological sites are conceptual divisions with physical (climate, geomorphology, geology, soils) and biotic environmental factors (such as vegetation) and natural disturbance regimes (Caudle et al. 2013). An ESD such as R024XY002NV Loamy 8-10 P.Z. is a description of the soils, uses, and potential of land with specific physical characteristics that produce distinctive kinds and amounts of vegetation. The ESD describes the central set of site characteristics (e.g., precipitation); there may be overlap between ESDs (Pellant et al. 2020). The ESD survey objective is to collect background information on the ecological sites, rangeland health, and vegetation communities. In addition, field surveys described existing conditions to support assessing potential effects on vegetation and wildlife habitat.

The Project is within the USEPA Central Basin and Range Level III Ecoregion, and the USDA Northeastern Great Basin physiographic section of the Intermountain Semi-desert and Desert Province (Bailey et al. 1994). This northeast and north-central Nevada area includes the Humboldt and Owyhee High Plateau Major Land Resource Areas (MLRAs) (Stringham et al. 2015, 2017). SWreGAP data refines the ecoregions and MLRAs into land cover types that describe vegetation communities (USGS 2005). Over the last century, vegetation communities have been altered in this area of Nevada. The changes to vegetation communities are associated with climate change, livestock and/or wild horse grazing. Wildfires have also changed the structure and diversity of vegetative communities (Pyke et al. 2016; Knapp 1996).

Normal accumulated precipitation in northeastern Nevada is 9.7 inches, with a recorded range of 4.4 inches (1919) to 18 inches (1983). The 2021 accumulated precipitation through July 15, 2021 was 4.95 inches; normal year to-date accumulated precipitation for the area is approximately 6 inches, as recorded at the Elko National Weather Service Weather Station. Temperatures between May 18 and July 24, 2021, ranged from 33 to 103 °F (NOAA 2021b).

Section 3.1.3, Results and Discussion, provides additional information on annual precipitation and temperatures.

3.1.2. Study Methodology

Ecological sites and soil types were identified for the survey areas using SSURGO (NRCS 2021a). Each unique ecological site and soil type identified during the desktop assessment was verified during the May to July 2021 field surveys.

The following protocols and handbooks were used for the ecological site, soil, and rangeland health surveys:

- *Vegetation and Soils – Baseline Data Collection* (BLM 2014a)
- *Monitoring Manual for Grassland, Shrubland, and Savanna Ecosystems,* Second Edition, Volume I: Core Methods (Herrick et al. 2017)
- *Interpreting Indicators of Rangeland Health,* Version 5 (Pellant et al. 2020) (shortened hereafter to IIRH)
- *Guide to Using AIM and LMF Data in Land Health Evaluations and Authorizations of Permitted Uses,* Tech Note 453 (Kachergis et al. 2020)
- *Final Report for USDA Ecological Site Description State-and-Transition Models by Disturbance Groups, Major Land Resource Area 24 Nevada* (Stringham et al. 2017)
- *Final Report for USDA Ecological Site Description State-and-Transition Models by Disturbance Groups, Major Land Resource Areas 25 Nevada* (Stringham et al. 2015a)
- *International Vegetation Classification Alliances and Associations Occurring in Nevada with Proposed Additions* (Peterson 2008)
- *Incorporating Thresholds and Responses into Grazing Permit/Leases*, NV IM-2018-023 (BLM 2017a)

The BLM Assessment, Inventory, and Monitoring (AIM) Terrestrial Core and Contingent Indicator strategy standard measurements (i.e., indicators) are shown in Table 3.1-1. These indicators were used to quantify land cover types and describe resource conditions and were used in conjunction with other data collected in the Project Area (Taylor et al. 2014; Herrick et al. 2017). Table 3.1-1 lists the terrestrial indicators for the Nevada Northeastern Great Basin Area used during the ESD survey. Section 3.2, Water Resources, includes a discussion of Standard 2, which applies to riparian and wetland sites. Soil data was collected using the IIRH Evaluation Form (see Appendix A.8, Ecological Site Survey Datasheets and Photolog).

Table 3.1-1: Land Health Standards, Indicators, and AIM Indicators

Land Health Standard	Indicator	AIM Terrestrial and Contingent Indicators Associated with Land Health Standard
Standard 1. Upland Sites: Upland soils exhibit infiltration and permeability rates that are appropriate to soil type, climate, and landform.	Indicators are canopy and ground cover including litter, live vegetation, and rock appropriate to the potential of the site.	• Bare ground • Proportion of large gaps between plant canopies • Soil aggregate stability
Standard 3. **Habitat:** Habitats exhibit a healthy, productive, and diverse population of native and/or desirable plant species, appropriate to the site characteristics, to provide suitable feed, water, cover, and living space for animal species and maintain ecological processes. Habitat conditions meet the life cycle requirements of threatened and endangered species.	• Vegetation composition (relative abundance of species) • Vegetation structure (life forms, cover, height, and age classes) • Vegetation distribution (patchiness, corridors)	• Vegetation composition • Vegetation height

Source: BLM 1997 and Kachergis et al. 2020

AIM = Assessment, Inventory, and Monitoring

Notes: Ecological site information for these indicators are listed in Table 3.1-2, and soils were collected from each of the vegetation and soil units shown on Figure 3.1-1 through Figure 3.1-3. Standard 2 applies to riparian and wetland sites, which are covered in Section 3.2, Water Resources.

SWReGAP land cover types and NRCS soil type data were used to identify potential locations for collecting quantitative vegetation as described in the *Monitoring Manual for Grassland, Shrubland, and Savanna Ecosystems,* Second Edition, Volume I: Core Methods and the IIRH (Herrick et al. 2017; Pellant et al. 2020; NRCS 2021a). In addition, provisional ESD Reference Sheets describe an ecological site's ecological potential (i.e., climate, soils, and topographic setting) (Pellant et al. 2020). As described in NV IM-2018-023, ERM field teams used IIRH (Pellant et al. 2020) process for survey sites located in draft ESDs (BLM 2017a).

Vegetation data was collected to meet ESD requirements as well as gather data on the presence of noxious weeds, invasive plants, and special status plants. General vegetation community data was collected between May and July 2021, concurrent with the ESD survey.

3.1.3. Results and Discussion

3.1.3.1. Pre-Field Assessment

Ecological Site Descriptions

Before field surveys, ERM collected existing literature and background data on soils, vegetation, and ecological sites. Vegetation communities were identified and mapped within the Project Area and ESD investigation points are shown on Figure 3.1-1 through Figure 3.1-3. Figure 3.1-1 through Figure 3.1-3 illustrates the SWreGAP land cover types and soil map units within 0.25 mile of the Project Area.

During the pre-field assessment, 18 ESDs were identified within the Project Area; 4 of the ESDs are provisional and 14 ESDs are available as a draft (Table 3.1-2). Table 3.1-2 lists the 18 ESDs and the number of soil map units in the Goldstrike, Carlin, and Crescent Valley survey areas. Within the Project Area, there are a total 234 unique combinations of ESDs and soil map units. Approximately 50 percent of the 234 sites are either the R025XY019NV Loamy 8-10 P.Z. or the R024XY002NV Loamy 5-8 P.Z. ESD.

Table 3.1-2: Project Area Ecological Site Descriptions and Number of Survey Sites[a]

Ecological Site Description	Acres	Percent[b]	Project Area Number of Survey Sites			
			Goldstrike	Carlin	Crescent Valley	Total
R024XY035NV Shallow Loam 10-14 P.Z.	0.7	>1%	1	0	0	1
R024XY002NV1 Loamy 5-8 P.Z.	1,481.8	22%	5	4	44	53

Source: NRCS 2021b

[a] Provisional ecological sites description meets *National Ecological Site Handbook* (NRCS 2019) standards and have been through a Quality Control and Quality Assurance process to assure consistency and completeness.
[b] Totals are greater than 100 percent due to rounding.

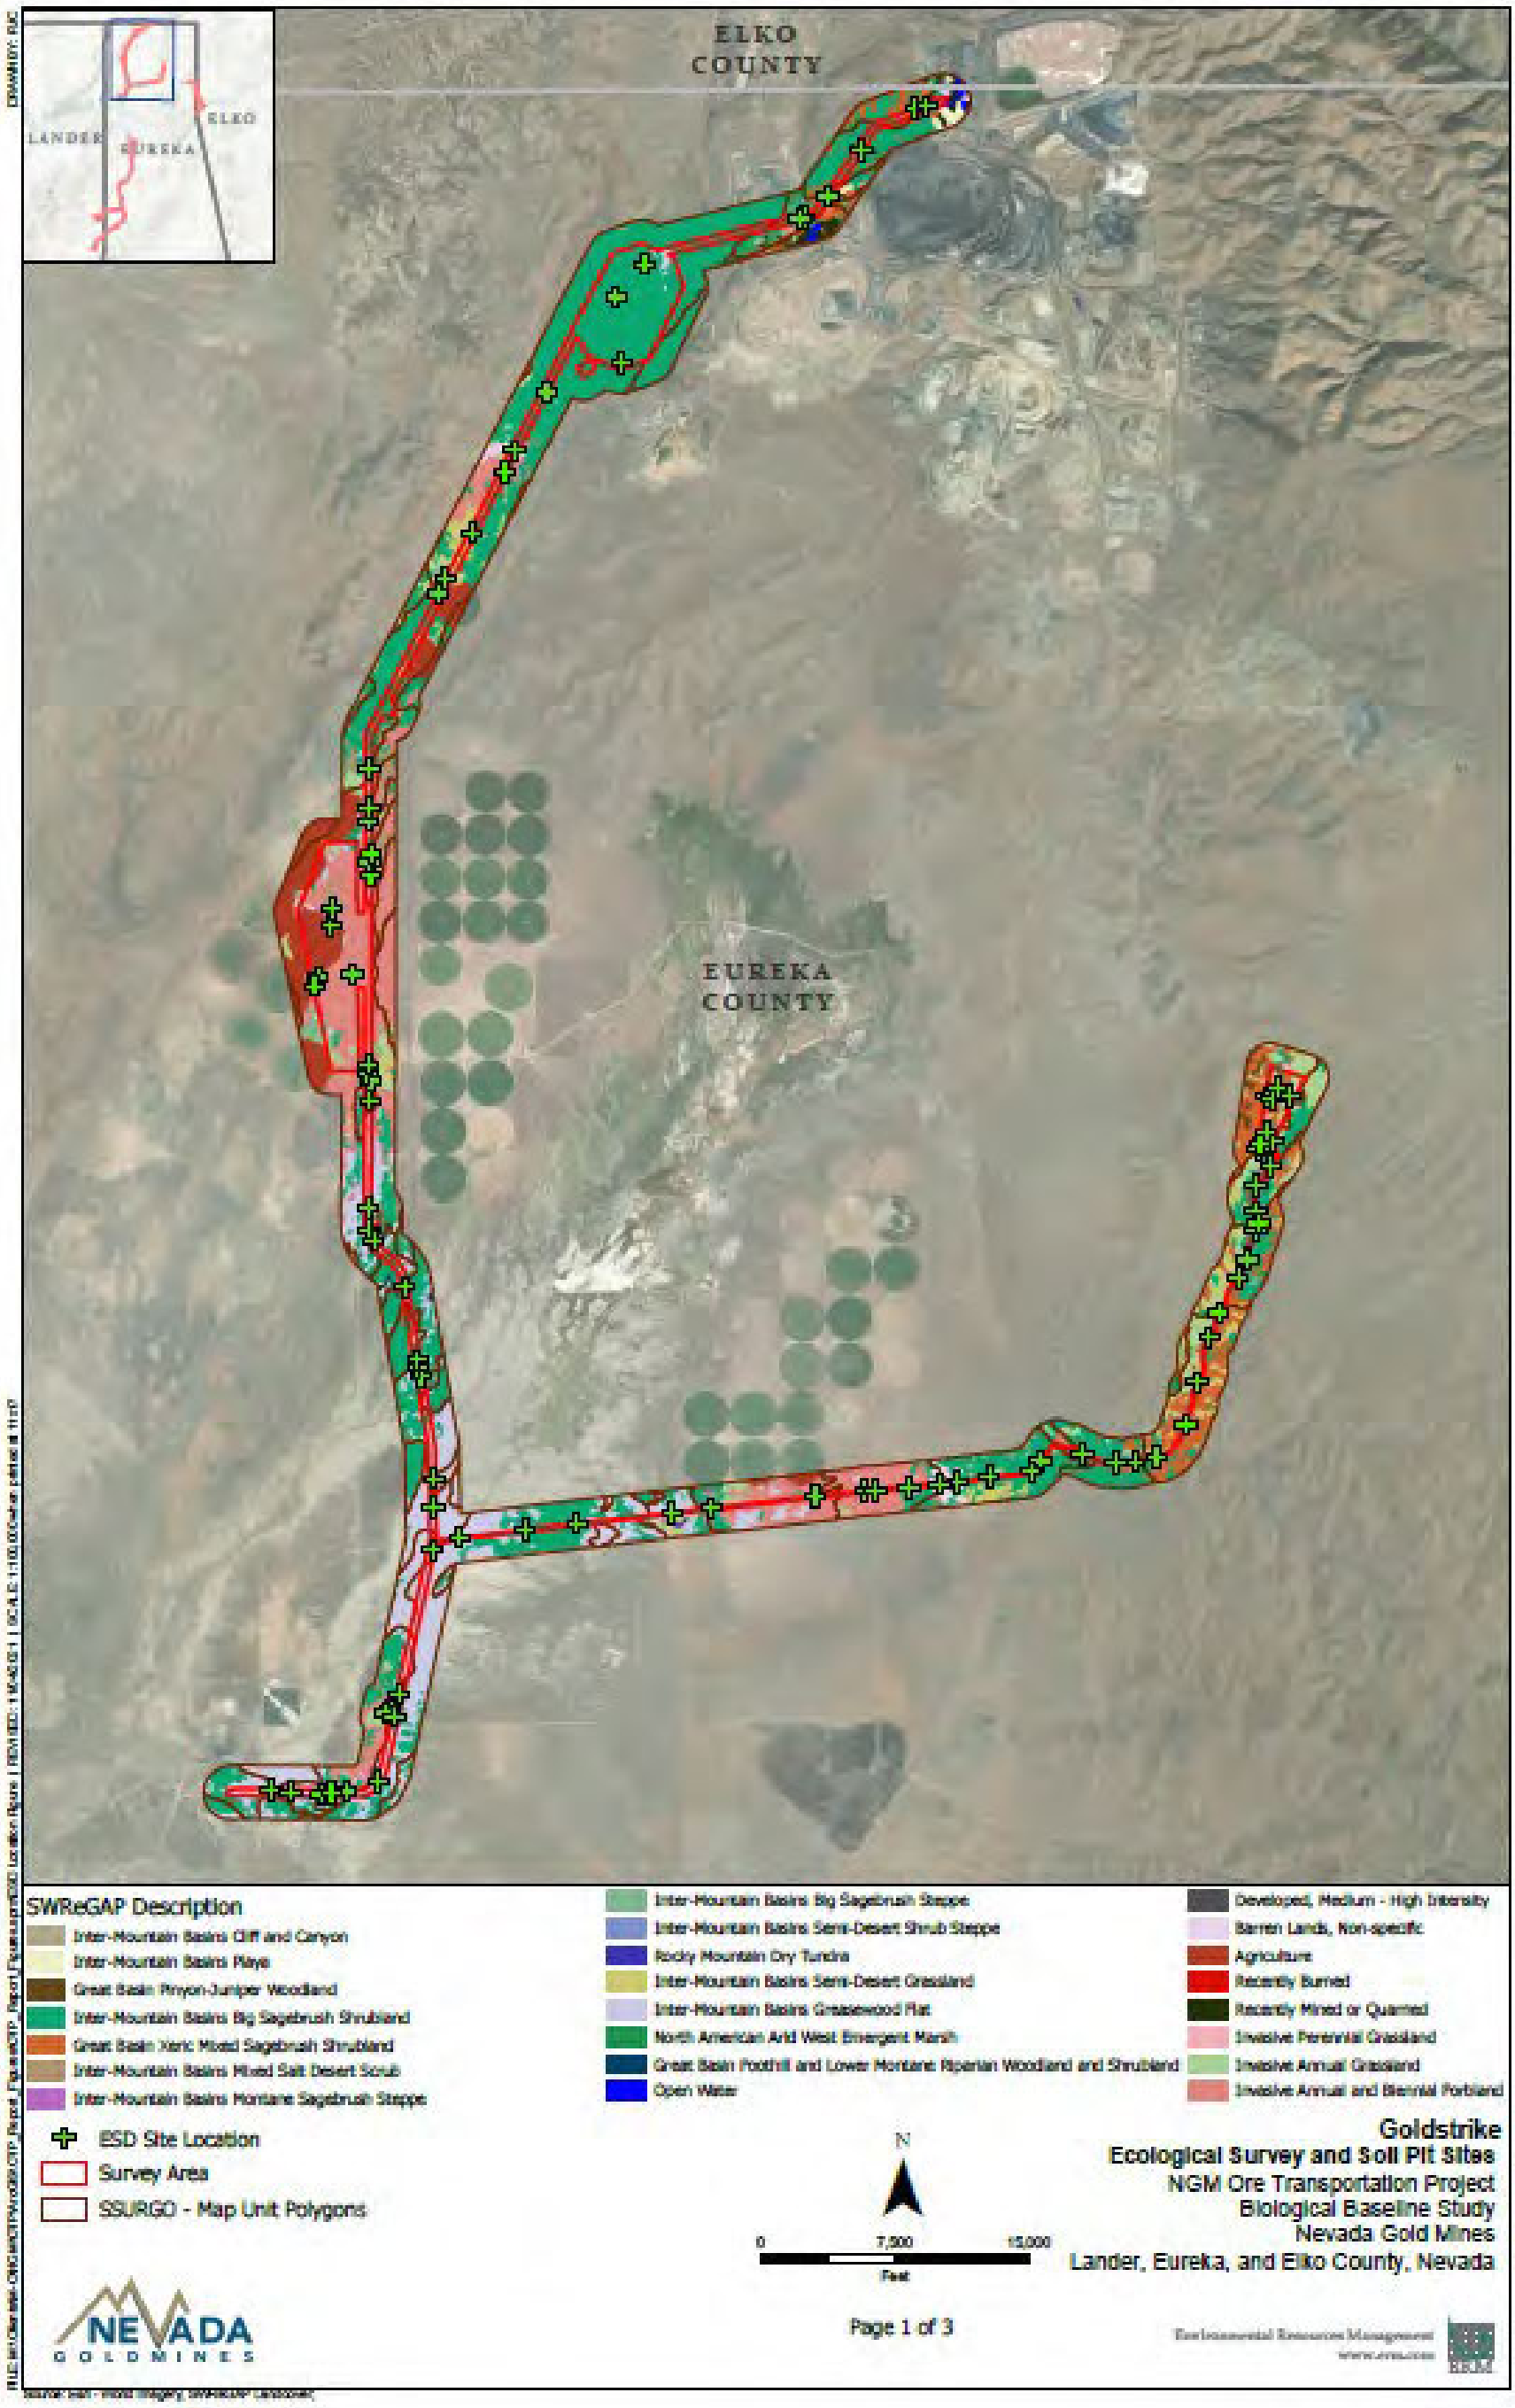

Figure 3.1-1: Goldstrike Ecological Survey and Soil Pit Sites

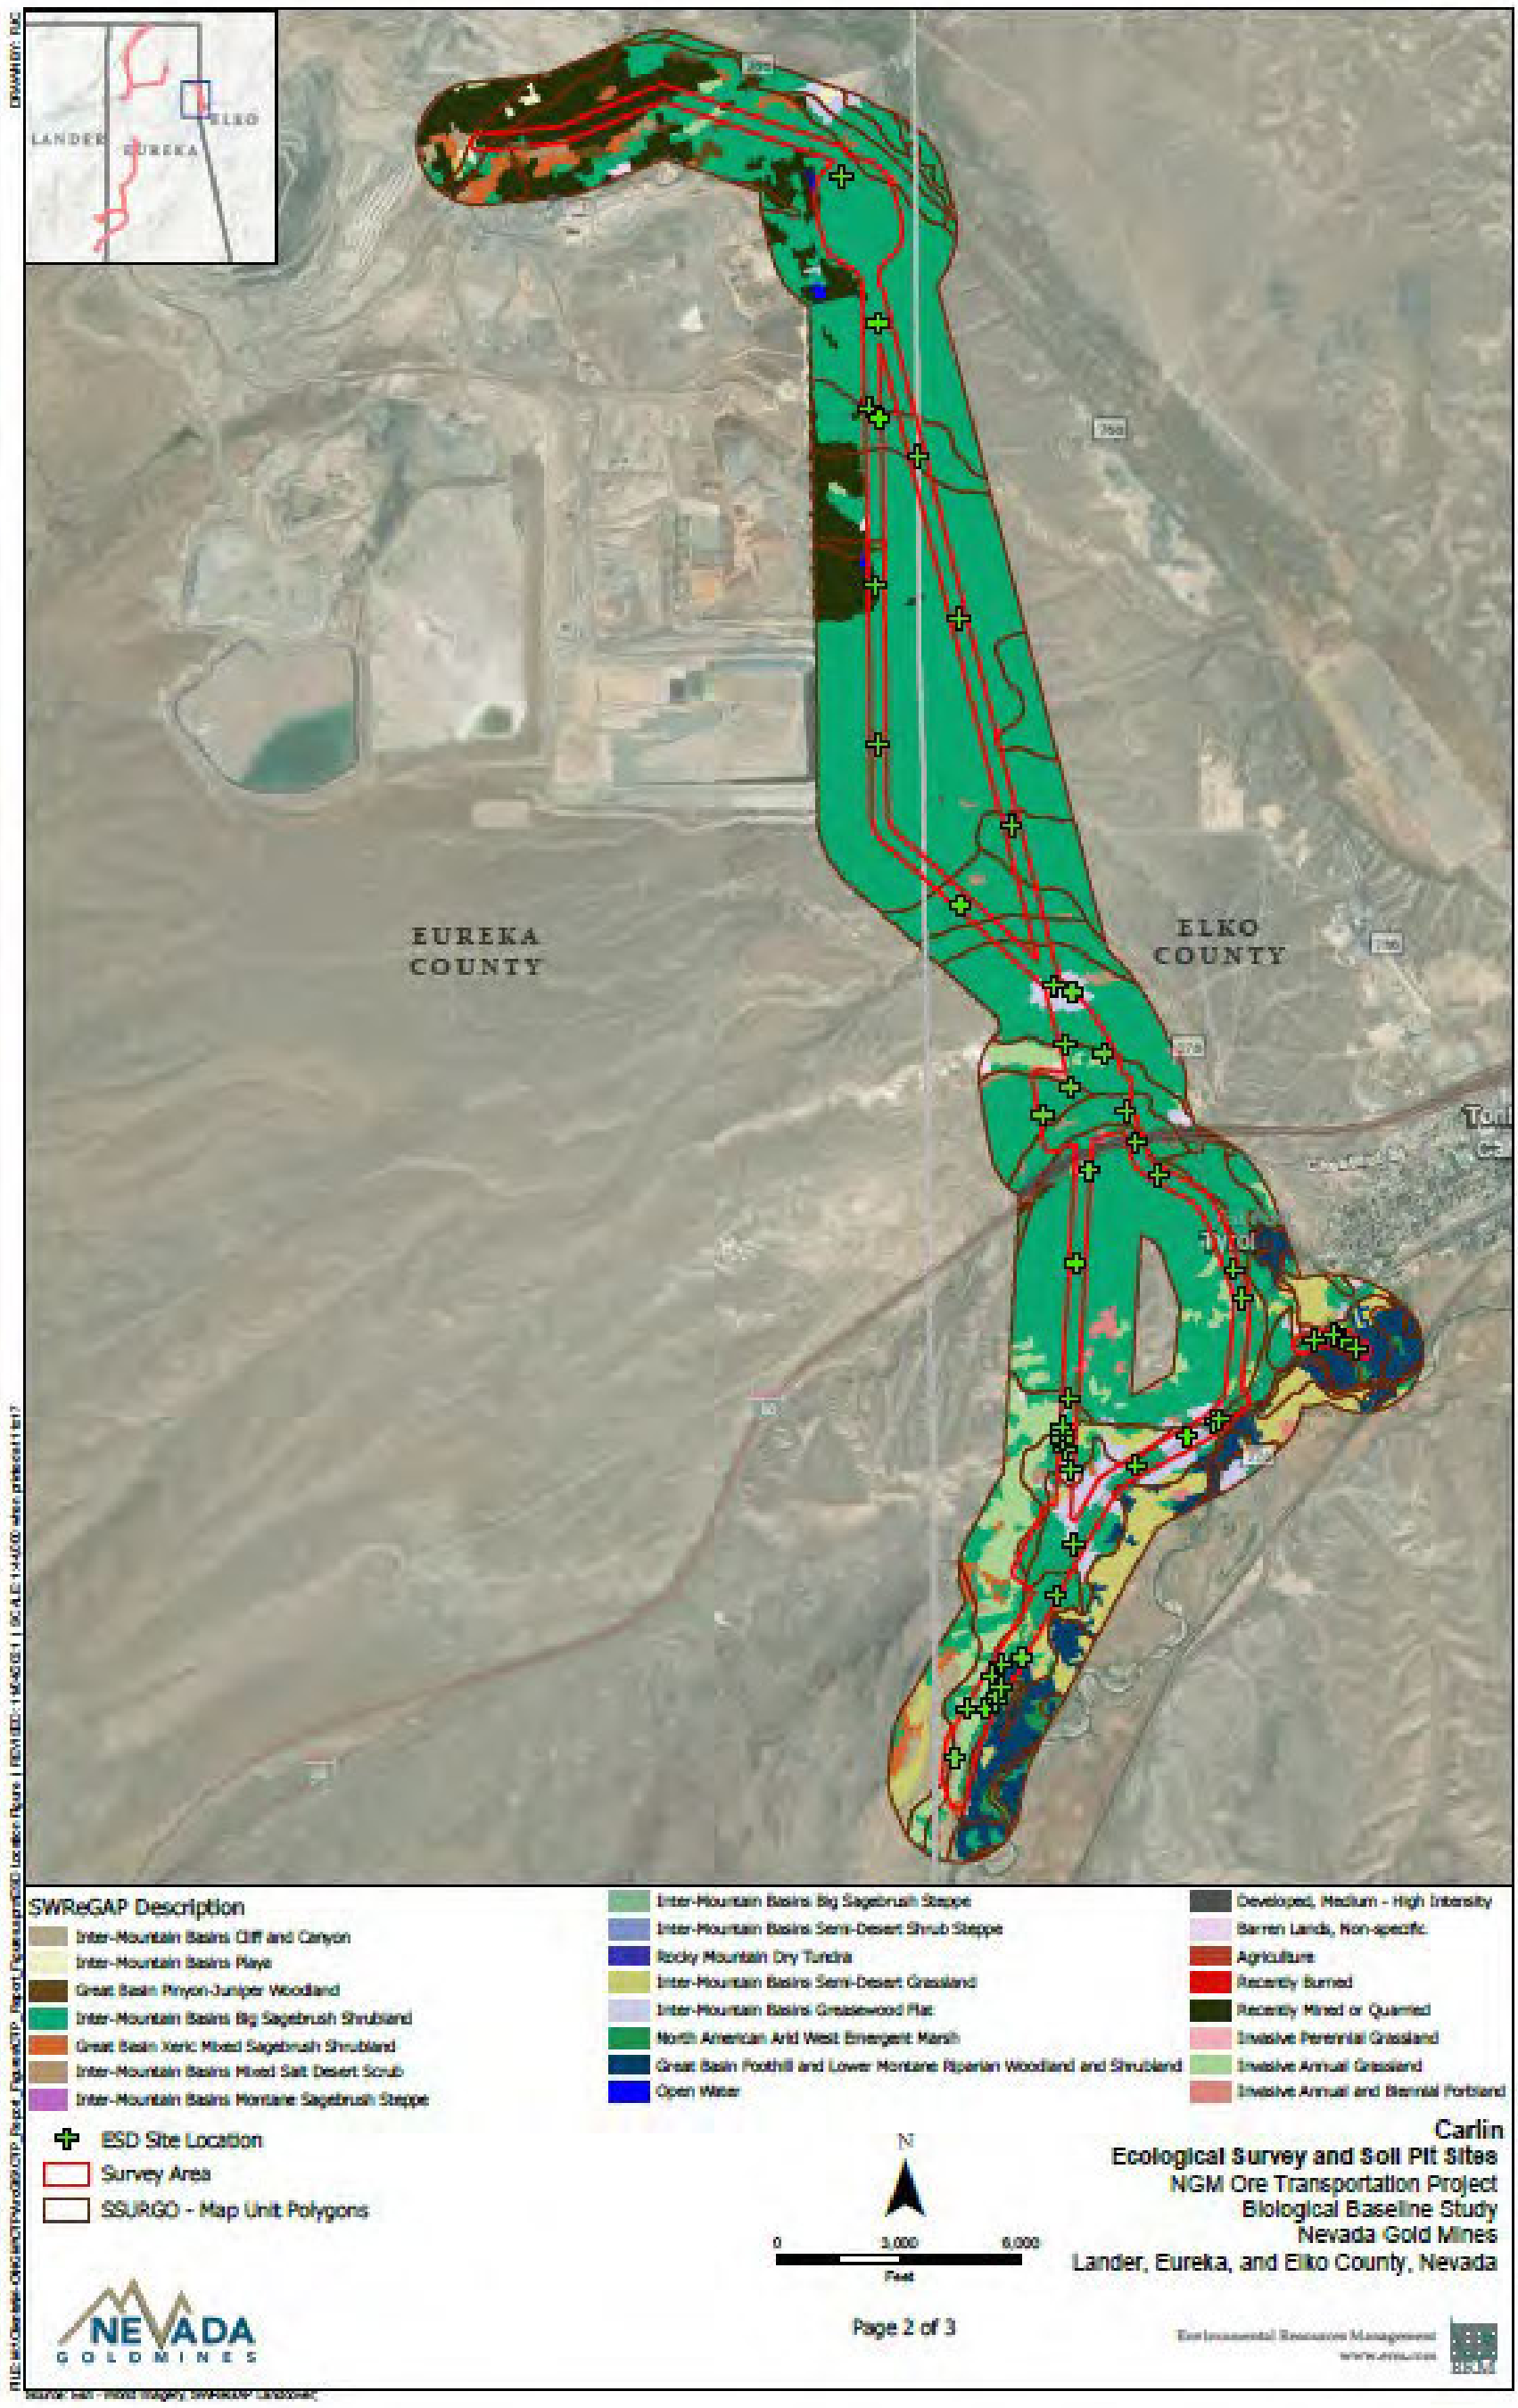

Figure 3.1-2: Carlin Ecological Survey and Soil Pit Sites

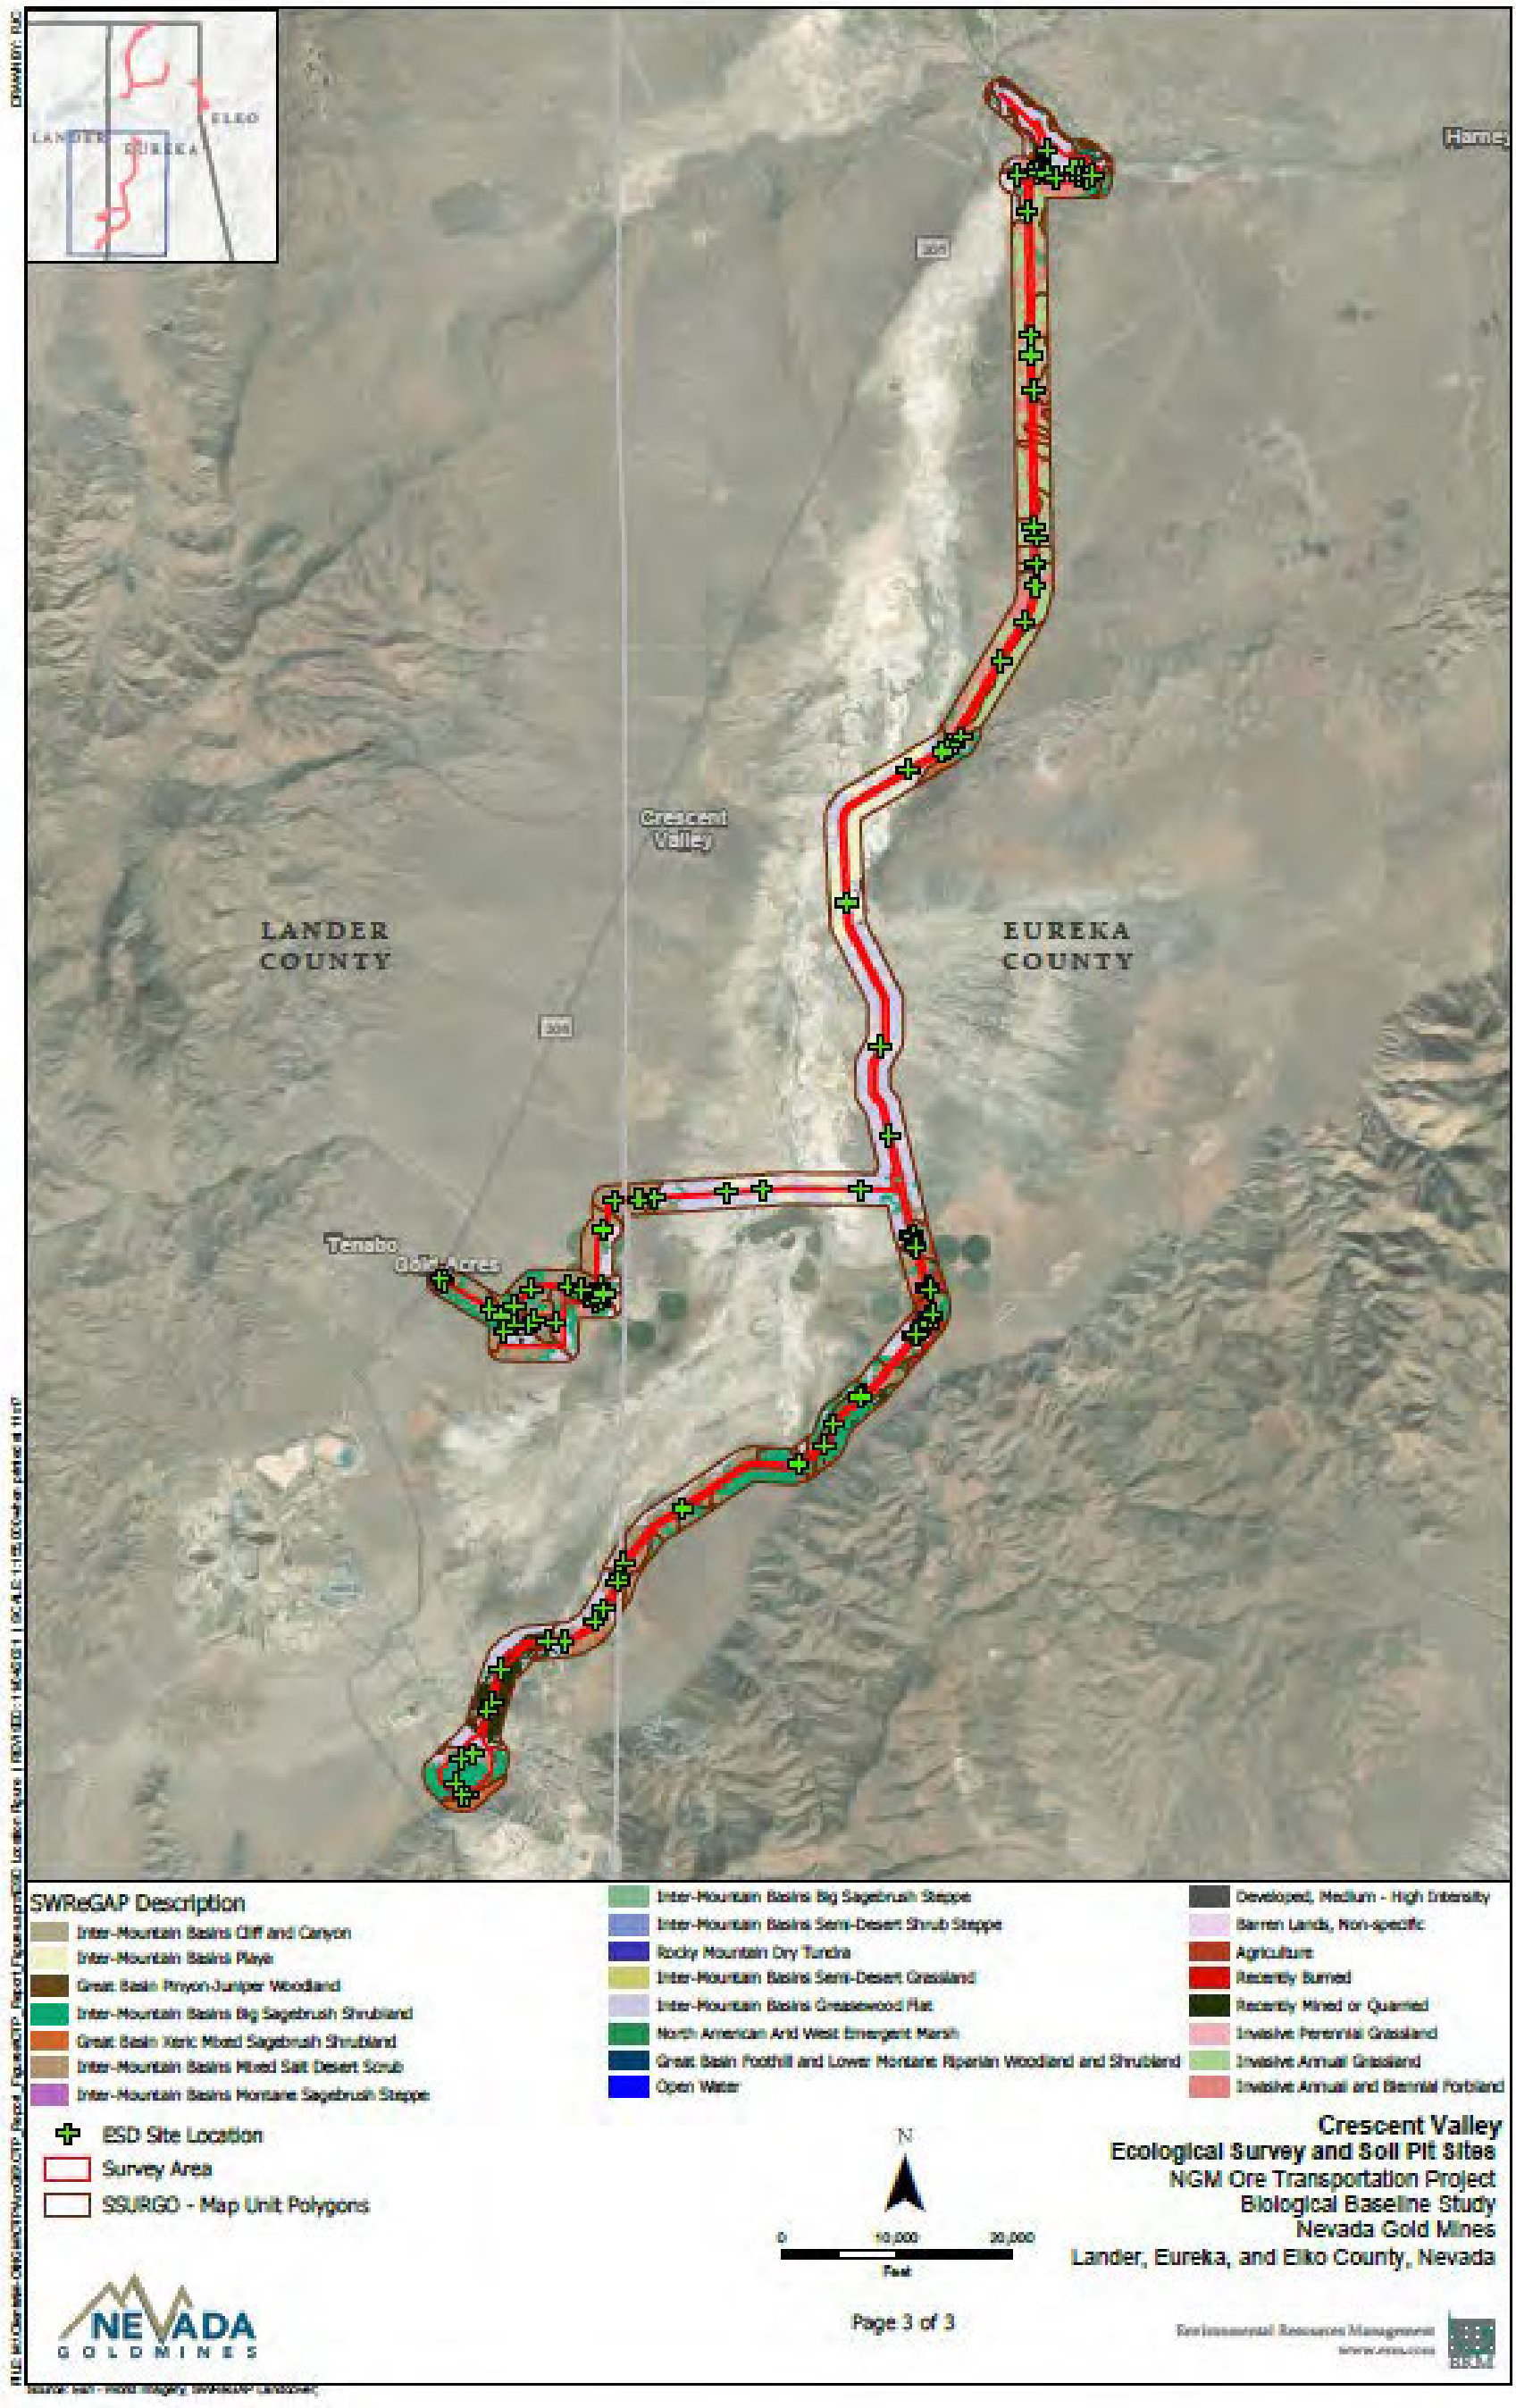

Figure 3.1-3: Crescent Valley Ecological Survey and Soil Pit Sites

Page Intentionally Left Blank.

The *National Ecological Site Handbook* Part 631, Subpart B describes the information and process used to develop ESDs and the contents that a provisional ESD is expected to contain (NRCS 2019). ESDs with the status of provisional include a draft state-and-transition model based on vegetation community data (NRCS 2019). State-and-transition models for the provisional and draft ESDs are organized into states that represent stable, long-term ecological conditions based the sites ecological dynamics. A state may include one or more vegetation community phases that represent an assemblage of plants and soil conditions; transitions are a shift between states within an ESD (Pellant et al. 2020).

The provisional and draft ESDs within the survey area include up to five different states based on differences in vegetation structure and the functioning of ecological processes. Each state and transition model contains one or more community phases that are based on differences in plant species composition and production (NRCS 2021b; Stringham et al. 2015a, 2017).

- State 1 Reference State is where the functional capacities represented by soil/site stability, hydrologic function, and biotic integrity are functioning at a sustainable/resilient level under the natural disturbance regime.
- State 2 Current Potential State is similar to the State 1, as the ecological function has not changed; however, the resiliency of the state has been reduced by the presence of invasive weeds.
- State 3 Shrub States have a shrub overstory and bluegrass understory dominate site resources such that soil water, nutrient capture, nutrient cycling, and soil organic matter are temporally and spatially redistributed.
- State 4 Annual State is where the herbaceous understory is dominated by annual non-native species such as cheatgrass (*Bromus tectorum*) and mustards (*Brassica* spp.).
- State 5 Seeded or Eroded State is where soil moisture, soil nutrients, and soil organic matter distribution and cycling are altered due to degraded soil surface conditions and the regeneration of shrubs is not evident.

An ESD may not include all five of these ecological process states. For example, ESD R024XY 006 NV Dry Floodplain includes the first four states, but does not include State 5. Reference states are representative of the natural range of variability under pristine conditions, while Eroded States are where non-native vegetation or introduced species dominate the site (Pellant et al. 2020).

Rangeland Health

The Northeastern Great Basin Area Resource Advisory Council developed the Standards and Guidelines for Nevada's Northeastern Great Basin Area in 1997 (Appendix C in BLM 1997). Standards for Land Health are similar to the objectives established for healthy and functioning watersheds, native plant communities, and rangelands. The IIRH provides guidance for a qualitative evaluation of ecological processes. Described in the IIRH, Rangeland health is defined by the National Research Council as, “The degree to which the integrity of the soil and ecological processes of rangeland ecosystems are maintained” (Pellant et al. 2020).

Rangeland health assessments are quantitative assessments that evaluate 17 rangeland health indicators. The IIRH defines indicators as components of an ecosystem whose characteristics (e.g., presence or absence, quantity, distribution) provide an index to the three attributes of soil/site stability, hydrologic function, and biotic integrity (Pellant et al. 2020). The 17 rangeland health indicators can relate to more than one associated attribute as shown in Table 3.1-3.

- Soil/site stability is the capacity of an area to limit redistribution and loss of soil resources (including nutrients and organic matter) by wind and water and to recover this capacity when a reduction does occur.
- Hydrologic function is the capacity of an area to capture, store, and safely release water from rainfall, run-on, and snowmelt to resist a reduction in this capacity and to recover this capacity when a reduction does occur.

Biotic integrity is the capacity of the biotic community to support ecological processes within the natural range of variability expected for the site, to resist a loss in the capacity to support these processes, and to recover this capacity when losses do occur. The biotic community includes plants (vascular and nonvascular), animals, insects, and microorganisms occurring both above and below ground (Pellant et al. 2020).

Table 3.1-3: Rangeland Health Indicators and Associated Attributes

Indicator	Associated Attribute
1. Rills	Soil/Site Stability, Hydrologic Function
2. Water Flow Patterns	Soil/Site Stability, Hydrologic Function
3. Pedestals and Terracettes	Soil/Site Stability, Hydrologic Function
4. Bare Ground percent	Soil/Site Stability, Hydrologic Function
5. Gullies	Soil/Site Stability, Hydrologic Function
6. Wind-scours, Blowouts, and Depositional Areas	Soil/Site Stability
7. Litter Movement	Soil/Site Stability
8. Soil Surface Resistance to Erosion	Soil/Site Stability, Hydrologic Function, Biotic Integrity
9. Soil Surface Loss/ Degradation	Soil/Site Stability, Hydrologic Function, Biotic Integrity
10. Plant Community Composition	Hydrologic Function
11. Compaction Layer	Soil/Site Stability, Hydrologic Function, Biotic Integrity
12. Functional/Structural Groups	Biotic Integrity
13. Plant Mortality/ Decadence	Biotic Integrity
14. Litter Amount	Hydrologic Function, Biotic Integrity
15. Annual Production	Biotic Integrity
16. Invasive Plants	Biotic Integrity
17. Perennial Plant Reproduction	Biotic Integrity

Source: Pellant et al. 2020

Natural disturbance, nonnative plants, and human activities within and outside of the Project Area may also influence ecological processes within and outside of surveyed areas. Ecological processes as defined for evaluating rangeland health capture, storage, and redistribution of precipitation, plant growth, and nutrient cycles (Pellant et al. 2020). Natural disturbances from

extreme drought[1] conditions existed in 49 percent of Elko, Eureka, and Lander counties as of September 1, 2021 (NOAA 2021b). The length and severity of a drought influence vegetation communities with potential reductions in canopy cover and litter production, seed production, and increased bare ground. Litter protects the soil surface from raindrop impact, thereby limiting detachment of soil particles and physical crusting of the soil surface. Other natural disturbances within and outside of the Project Area include wildfire and insect outbreaks. Nonnative plants and human activities can disturb ecological processes, resulting in unexpected changes to the natural range of variability (Pellant et al.2020).

Disturbances, both natural and human activities, can alter hydrologic and erosion processes. Reductions in vegetation cover and litter during droughts can increase the amount of bare ground resulting in increased erosion (Pellant et al. 2020). Different ESDs and states within an ESD can have different base erosion predictions (Spaeth et al. 1994; Pellant et al. 2020).

In order to meet Land Health Standard 3 described in Table 3.1-1, wildlife habitats must exhibit a healthy, productive, and diverse population of native and/or desirable plant species appropriate to site characteristics. Habitats meeting this standard provide suitable forage, water, cover, and living space for animal species and maintain ecological processes. Habitat conditions meet the life cycle requirements of wildlife and plant species. As described below, the dominant SWreGAP land cover types are Inter-Mountain Basins Big Sagebrush Shrubland (39.5 percent), Inter-Mountain Basins Greasewood Flat (18 percent), and Invasive Annual and Biennial Forbland (13.9 percent).

Vegetation Communities

As described in the ESD survey, the vegetation communities are those found in the Owyhee High Plateau and Central Nevada Basin and Range. A desktop assessment using SWReGAP, SSURGO, and ESD data was conducted, and field verification and vegetation community condition assessments were correlated with the ESD survey state-and-transition model descriptions (Stringham et al. 2015a, 2015b). SWreGAP land cover types and acres within the Project Area are listed in Table 3.1-4. Land cover types include areas where vegetation communities have been modified by agriculture, development, and recent mining activity. Inter-Mountain Basins Big Sagebrush Shrubland and Inter-Mountain Basins Greasewood Flat land cover types comprise approximately 57 percent of the Project Area. Invasive Annual Grassland and Invasive Annual and Biennial Forbland comprise approximately 20 percent of the Project Area (Table 3.1-4).

[1] Extreme drought is defined as conditions where major crop and pasture losses are common, fire risk is extreme, and widespread water shortages can be expected requiring restrictions (NOAA n.d.).

Table 3.1-4: Southwest Regional GAP Land Cover Type and Project Area

SWreGAP Land Cover Type	Acres				Percent
	Goldstrike Area	Crescent Valley Area	Carlin Area	Total

Soils

Soils within the Project Area are composed of soil series described in reports for Eureka, Lander, and Elko counties (NRCS 2021a). Soil survey information for the Project Area in the SSURGO database contains information about each map unit's component soils and their properties (NRCS 2021a). To complete the desktop assessment, a NRCS SSURGO soil report was generated for the Project Area, which identified 61 soil map units with 63 different soil components (Appendix A, Figure A.7-1 through Figure A.7-3). The Cherry Spring-Cortez-Chiara association, McConnell gravelly fine sandy loam, and Batan-Ocala association are the three largest soil series in the Project Area. Soil map units may be unique to a survey area or found in more than one of the distinct surveyed areas. For example, the Cherry Spring map unit, which includes soil components CH, TN, 561, and CG, is found in the Goldstrike, Carlin, and Crescent

Valley survey areas. Table A.6-1 and Table A.6-2 in Appendix A contains a list of the soil map units and their components for each of the three survey areas.

Soil resources in the Project Area formed MLRAs 24 and 25, which correspond to the Humboldt Area and the Owyhee High Plateau, respectively. Most valleys are drained by tributaries to the Humboldt River; however, playas occur in lower elevation valleys with closed drainage systems. Dominant soil orders in MLRAs 24 and 25 are Aridisols, Entisols, Inceptisols, and Mollisols (Soil Survey Staff 2006). Aridisols form in arid or semi-arid climates and are well developed soils that have a very low concentration of organic matter. Entisols are recent soils that lack soil development because erosion or deposition rates occur faster than the rate of soil development. Inceptisols are generally young mineral soils but have had more time to develop profile characteristics than Entisols. Mollisols are fertile soils with high organic matter and a nutrient-enriched, thick surface (Soil Survey Staff 1999).

Soils in the Project Area are classified by the NRCS as aridic and unsuitable for cultivation without irrigation[2] (Soil Survey Staff 2015). The soil series correlate with 37 ecological classifications (Table 3.1-2), which the NRCS categorizes as a rangeland Ecological Site Type (NRCS 2021c). Soils series in the Project Area are moderately deep to very deep and were formed in alluvium derived from mixed rocks, loess, volcanic rocks, and volcanic ash. Soil components in the Cherry Spring series are moderately deep, with a strongly cemented duripan[3] layer between 36 to 54 inches (NRCS 2021c). Each soils series is composed of multiple soil map units composed of components that describe the properties of natural bodies of soils or miscellaneous areas of non-soil (e.g., rock outcrop, dumps) (Soil Survey Staff 1999).

Slopes for these soil series range from zero to 75 percent. Soils on steeper slopes developed on rock core areas of fan piedmont remnant side slopes, hills, plateaus and mountain ridges, crests, summits, shoulders, and side slopes. Soils formed in clayey alluvium derived from loess over alluvium derived from mixed rocks, volcanic tuff, and basalt. These very deep and poorly drained soils are found on alluvial flats, drainage channels, stream terraces, and floodplains and have slopes ranging from zero to 15 percent (NRCS 2021b).

Soil horizons in arid regions are formed by the downward transport of materials by water and the accumulation of various materials at characteristic depths. The depth at which materials accumulate depends mostly on how much precipitation is received and the type of material that is being transported. Table 3.1-5 provides a general description of soil horizons. Not all horizons are present in every soil map unit, and some horizons may be missing due to past land use activities (Soil Survey Staff 2015).

[2] Arid soils are those where during most years the soil is dry for more than 50 percent of all days when the soil temperature is great then 41 °F at a depth of approximately 19.7 inches (Soil Service Staff 2015).

[3] Duripan is a subsurface soil horizon that is cemented by silica, generally opal or microcrystalline forms of silica. Also called hardpan (USDA 2015).

Table 3.1-5: Soil Horizon Descriptions

Horizon Symbol	General Description
A	Surface mineral soil horizon, generally darkened by accumulating humus. May be buried by newer deposits or underlie an organic horizon.
B	Subsoil mineral horizon, generally characterized by accumulation, removal, or redistribution of constituents such as iron, aluminum, silica, clay, humus, calcium carbonate, calcium sulfate, or sesquioxides. May be at the surface in a truncated soil.
C	Relatively unaltered mineral soil layer underlying the pedogenically developed soil profile. Generally unconsolidated, but includes soft bedrock.
E	Subsurface mineral soil horizon characterized by a loss of iron, aluminum, clay, or organic matter. Generally, has lighter color and coarser texture compared to horizon above.
L	Soil horizon composed of organically derived limnic material that was deposited in water by chemical precipitation or aquatic organisms or came from plants (as modified by organisms). Examples include coprogenous earth, diatomaceous earth, and marl.
M	Root-limiting, human-manufactured layer. Examples include a buried layer of continuous asphalt, landfill liner, and geotextile fabric.
O	Soil horizon composed dominantly of organic soil materials (but not limnic materials). Has relatively low bulk density compared to mineral soil. May be at the surface or buried.
R	Consolidated hard, continuous bedrock.
V	Mineral horizon formed at the soil surface or below a layer of rock fragments (e.g., desert pavement), a physical or biological crust, or recently deposited eolian material. Characterized by the predominance of vesicular pores and having platy, prismatic, or columnar structure.
W	Layer of water within or under the soil (not at the surface). Examples include floating bogs and segregated ice layers.

The Farmland Protection Policy Act of 1981 is intended to minimize the conversion of farmland to nonagricultural uses, farmland includes prime farmland, unique farmland, and land of statewide or local importance (7 CFR Part 658). The Farmland Protection Policy Act applies to farmland defined as “prime” or “unique” as described in FFPA Section 1540(c)(1), or to farmland of statewide or local importance as defined by the appropriate state or local agency. Prime farmland is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops and is available for these uses. Prime farmland and farmland of statewide or local importance includes land includes lands used to produce livestock and timber (7 CFR Part 658).

In Nevada, only irrigated lands have been classified as prime farmlands; within the survey area, none of soils are classified as prime farmland (NRCS 2021d). The Project Area contains 3,627.3 acres of soil map units that are considered farmland of statewide importance for the production of food, feed, fiber, forage, and oilseed crops (Table 3.1-6). Table A.6-1 and Table A.6-2 in Appendix A list the soils map units and soil components that are classified as prime farmland or farmland of statewide importance. Some soil map units such as Orovada, Cherry Spring, and Dunphy are found in one or more of the survey areas. Orovada and Cherry Spring soil map units are found in the Goldstrike and Carlin survey areas, and Rad and Dunphy soil map units are found in the Goldstrike and Crescent Valley survey areas.

Table 3.1-6: Farmland Soil Classification in the Project Area

Farmland Soil Classification	Project Area[a] Acres					
	Goldstrike	Carlin	Goldstrike and Carlin	Crescent Valley	Goldstrike and Crescent Valley	Total Acres
Prime farmland if irrigated	26.6	0	0	0	0	26.6
Prime farmland if irrigated and reclaimed of excess salts and sodium	61.1	11.8	19.1	325.4	92.8	510.2
Farmland of statewide importance	2,117.4	9.3	83.2	1,417.4	0	3,627.3
Not prime farmland	447.0	899.5	110.5	966.8	34.4	2,458.2
Total	2,652.1	920.6	212.8	2,709.4	127.2	6,622.3

Source: NRCS 2021c

[a] A soil map unit may be part of more than one survey area.

Ecological sites are correlated on the basis of soils and the resulting differences in species composition, proportion of species, and total production of the historic climax plant community. Production is determined by measuring the annual aboveground growth of vegetation (Butler et al. 2003). Forage production on rangelands in Nevada can vary from year to year, and production is influenced by precipitation, temperature, litter, and soil characteristics. NRCS soil map unit data include estimates of forage production in yeas with low, average, and above average conditions and are reported in terms of the estimated pounds per acre (NRSC 2021c). Soils in the Project Area have ratings from 350 to 3,500 pounds of forage production in an average year (Table 3.1-7). Table A.6-3 and Table A.6-4 in Appendix A list the estimated forage production from soil map units within each of the surveyed areas.

Table 3.1-7: Soil Type and Forage Production in the Project Area

Project Area[a]	Acres	Range of Soil Map Unit Forage Production[b] in Pounds per Acre		
		Low	Average	High
Goldstrike	2,352.0	200–2000	400–3,500	600–4,500
Carlin and Goldstrike	212.8	400–2,000	600–3,500	800–4,500
Carlin	919.2	300–2,000	450–3,500	750–4,500
Crescent Valley	2704.4	200–1,800	350–2,500	500–3,500
Crescent Valley and Goldstrike	127.2	300	450	600–750

3.1.3.2. Field Survey

The BLM's AIM identifies three attributes essential to describe ecosystem sustainability, soil and site stability, hydrologic function, and biotic integrity (Taylor et al. 2014). Collected data was assessed using the 17 Indicators of Rangeland Health listed in Table 3.1-3 to determine whether these three attributes are achieved and if the Project Area is meeting Standard 1. The 17 Indicators are outlined in IIRH Technical Reference 1734-6 (Pellant et al. 2020).

Ecological Site Surveys

Based on the field data collected using the AIM data, these plots were compared to ESDs and corresponding state-and-transition models (Stringham et al. 2015a, 2017). Within the Project Area, four states and 11 community phases were identified based on the state-and-transition models for the 18 ESDs. A state-and-transition model had not been developed for nine sites (Table 3.1-8 and Figure 3.1-4).

Within the Project Area and off-site, human activities such as agriculture, roads, and utilities influence vegetation communities and ground cover. All three surveyed areas (Goldstrike, Carlin, and Crescent Valley [see Figures 3.1-5 through 3.1-8]) showed evidence of wildfire with annual grasses (e.g., cheatgrass) or annual forb dominating the understory and a loss of dominant and subdominant functional structure groups. The dominance of annual grasses and annual forbs in the understory increases the amount of continuous fine fuels which can modify the fire regime by changing intensity and size of wildfires. Shrubs such as greasewood (*Sarcobatus vermiculatus)* may be killed by severe fires, but re-sprout when fires severity is low to moderate (Stringham et al. 2017). Wildfire in current potential state or shrub state ESDs where the understory is dominated by cheatgrass could transition to an annual state.

Sites classified as State 2 (5 percent as shown in Table 3.1-8 and Figure 3.1-4) showed overall fair to good health with evidence of wildlife and livestock use. Annual forbs and grasses are becoming more common in areas where perennial grasses are heavily grazed or where the site is lacking perennial forbs. Drought conditions may have inhibited the regrowth of shrubs and perennial grasses during the 2021 growing season.

Shrub state and annual states represent conditions in 86 percent of the sites surveyed (Table 3.1-8 and Figure 3.1-4). Cheatgrass and tansymustard (*Descurainia pinnata*) or other mustard species (*Brassica* spp.) dominate the understory. Perennial bunchgrasses and perennial forbs were sparse to missing in the Goldstrike, Carlin, and Crescent Valley areas assessed to be in the shrub or annual state. The shrub community was dominant, but there appeared to be an increasing presence of invasive annuals. The lack of shrub cover after wildfire or other human activities, such as drilling and disking areas during reclamation, could indicate a transition from a shrub state to an annual state has occurred for parts of the Crescent Valley surveyed area.

Seeded or eroded state represent conditions in 5 percent of the sites surveyed (Table 3.1-8 and Figure 3.1-4). Missing expected dominant shrub, perennial grasses, and forbs as well as the increase in annual grasses were characteristic of the 13 sites surveyed assigned to the seeded or eroded state. Cheatgrass comprised up to 95 percent of the residual cover at the 8 sites in the Goldstrike Survey Area and may indicate a transition to an Invasive Annual Grassland as land cover type.

Table 3.1-8: Project Area Survey Sites State and Transition Status

State	State and Transition Phase	Number of Ecological Site Survey Sites				Percent

Rangeland Health

A reference state has been developed for four of the ESDs within MLRAs 24 and 25 (NRCS 2021b). Using the five steps described in the IIRH, Table 3.1-9 provides a summary of the 17 indicators of rangeland health for the provisional ESDs and sites where a reference state has not been developed. Appendix A.8 includes copies of data collected at 234 unique ESD sites and photos that are the basis for the findings presented on rangeland health in the areas surveyed. Table 3.1-9 shows the percent departure from reference conditions for the ecological indicators of soil/site stability, hydrologic function, and biotic integrity within the three survey areas.

Overall for the three surveyed areas, the departure from reference states range from slight-to-none to slight-to-moderate for soil/site stability and hydrologic function (Table 3.1-9). The departure for biotic integrity from the reference states were moderate to moderate-to-extreme for sites within each of the survey areas (Figure 3.1-8).

Land uses such as livestock grazing, roads, and agriculture within the survey areas influenced rangeland health. An informal shooting range is on privately held lands within the Carlin Survey Area. During the field review, vegetation in 196 of the 234 sites (approximately 84 percent) surveyed were influenced by access roads for mine facilities, utilities, agricultural fields, and residential areas.

Table 3.1-9: Summary of Survey Area Departure from Reference State

Ecological Processes Indicators	None to Slight	Slight to Moderate	Moderate	Moderate to Extreme	Extreme

[a] For Ecological Site Descriptions where a reference state has not been defined, the departure categories are based on the rangeland health indictors assessed during the field survey.

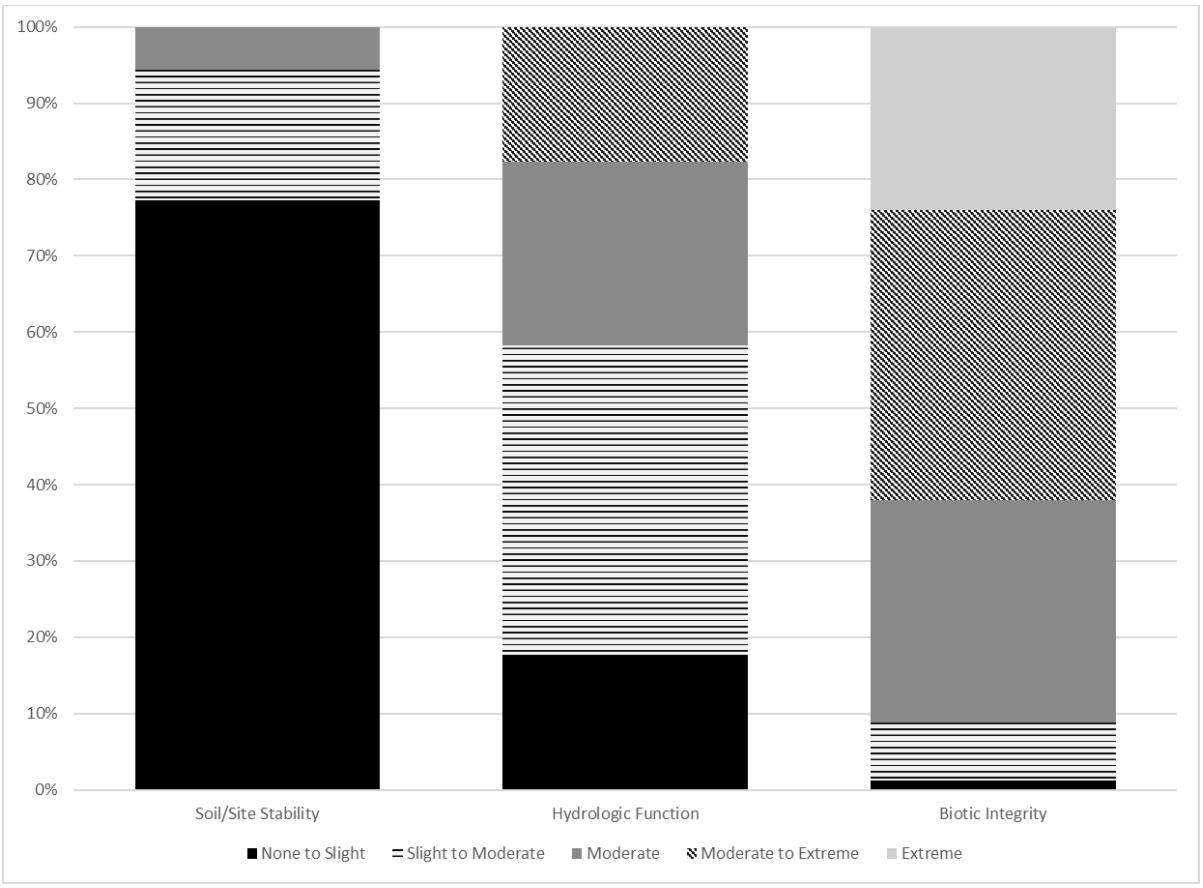

Figure 3.1-8: Ecological Indicators Percent Departure from Reference State

Soil/Site Stability

Within the Project Area, ecological indicators for soil/site stability indicate most sites are within the expected values for the ESD and disturbance is within the natural range of variability. Annual forbs cover and litter from these forbs may contribute to reducing erosion within the Project Area. Sites where soil stability was slight-to-moderate or moderate were due to the lack of dominant and subdominant functional groups or a lack of vegetative cover.

Ground cover acts as a barrier to impede water flow and inadvertently limit water and soil erosion (Pellant et al. 2020). This could contribute to the reduced hydrologic function at surveyed sites as high amounts of bare ground allows for water loss from the site before infiltration occurs. Relative ground cover, including vegetation canopy cover, litter, rock, bare ground, and biotic crusts were evaluated at the 234 sites in the three survey areas (Table 3.1-10). The percent bare ground and percent litter are 2 of the 17 integrated indicators of rangeland health. Vegetative and litter cover can protect surfaces from erosion; however, an increase in litter cover, specifically, may reduce infiltration and negatively affect seed germination and decomposition rates. Areas with higher percentages of bare ground can contribute to soil and water erosion. Large areas of bare ground can indicate a decrease in forage (productivity) and an increase in the risk of invasive plant species becoming established (Pellent et al. 2020).

Table 3.1-10: Ecological Site Description Ground Cover in the Project Area

Average Percent Ground Cover in Survey Area[a]						
Survey Area	**Canopy Cover**	**Bare Ground**	**Litter Cover**	**Biological Crust[b]**	**Rock**	**Residual Cover**
Carlin Area	48	14	14	7	10	7
Crescent Valley Area	55	10	15	9	5	6
Goldstrike Area	40	9	25	4	4	18
Survey Area	48	11	18	7	6	10
Range Percent Ground Cover in Survey Area						
Carlin Area	0–98	0–100	0–46	0–30	0–65	0–28
Crescent Valley Area	18–91	1–45	0–45	0–40	0–47	1–28
Goldstrike Area	3–75	0–43	2–70	0–45	0–33	1–55

[a] Due to rounding, percentages may not equal 100 percent.
[b] Biological crust includes moss, lichen, and cyanobacteria.

Table 3.1-11 presents the range of canopy cover of the perennial and annual grasses, perennial and annual forbs, and shrubs in the three survey areas. Within the 234 sites surveyed, the percent cover of perennial grasses, shrubs, and bare ground indicate a departure from expected reference conditions (NRCS 2021; Stringham et al. 2015a, 2017). This departure could be related to drought, altered fire regimes, disturbance, and livestock grazing. Increases in the percent of bare ground from expected can indicate that the site may have reduced plant productivity. Table A.3-1 through Table A.3-8 in Appendix A provides the percent canopy and ground cover for each survey site in the three survey areas.

Table 3.1-11: Ecological Site Description Canopy Cover in the Project Area

Average Percent Canopy Cover in Survey Area					
Survey Area	**Perennial Grass**	**Annual Grass**	**Perennial Forbs**	**Annual Forbs**	**Shrubs**
Goldstrike Area	7	6	1	10	15
Crescent Valley Area	3	11	1	13	27
Carlin Area	12	4	1	7	24
Range Percent Canopy Cover in Survey Area					
Goldstrike Area	0–64	0–45	0–15	0–40	0–48
Crescent Valley Area	0–48	0–45	0–50	0–50	0–70
Carlin Area	0–75	0–30	0–46	0–43	0–45

Hydrologic Function

For hydrologic function within the areas surveyed, the departure from a reference state is slight-to-moderate to moderate (Table 3.1-9 and Figure 3.1-8). In areas assessed as State 2, current potential state as well as soil and litter movement were short distances with little evidence of rills or gullies. The departure of hydrologic function from the reference state or current potential state is associated with decreased perennial grass cover, the lack of shrub cover, and missing dominant and subdominant functional structure groups. Reduced coverage of deep-rooted bunchgrasses and shrubs may contribute to lower infiltration rates and higher surface runoff. The replacement of perennial bunchgrasses by cheatgrass and bare ground may contribute to reduced infiltration and increased run-off.

Biotic Integrity

Biotic integrity indicates that sites surveyed were mostly in the moderate to moderate-to-extreme departure class except for ESD 024XY020NV Droughty Loam P.Z. Sites surveyed in ESD 024XY020NV Droughty Loam P.Z. were within one departure class (slight-to-moderate; Table 3.1-9). The dominance of non-native invasive plant species, particularly cheatgrass, lack of shrub diversity, and the loss of dominant and subdominant functional structure groups contribute to the departure. Mid- and tall-stature native perennial species were present at levels that maintained adequate nutrient cycling; however, nutrient cycling could be reduced in areas where cheatgrass is present.

The dominant shrub species within the Project Area are big sagebrush (*Artemisia tridentate)* and rabbitbrush (*Chrysothamnus spp*.), which is expected for the majority of the ecological sites. The dominant perennial grass is basin wildrye (*Elymus cinereus*), a deep-rooted bunchgrass present at 27 to 46 percent of the ESD sites in the Project Area (Anderson 2002). Cheatgrass, a shallow-rooted annual species, is present at 34 to 79 percent of the ESD sites in the survey area (Zouhar 2003). Mustards, including tansymustards (*Descurania* spp.) and clasping pepperweed (*Lepidium perfoliatum*) are the most frequently encountered forbs. Table A.4-1 through Table A.4-4 in Appendix A lists the plant species recorded during the ESD survey.

Table 3.1-12 presents the five most frequently encountered grass, forb, and shrub and tree species in each of the three survey areas. Shrubs, non-native annual grasses, and non-native forbs make up a majority of the production for the site, with perennial grasses and native forbs lacking. Weedy species, both annual and perennial, are frequent components of the vegetation community at the sites surveyed.

Over the past several years, drought conditions may also contribute to the frequency of weedy species at sites surveyed. The frequency of plant species can be affected by disturbance type and the intensity of the disturbance. Disturbance from past wildlife in addition to access roads, mining activities, and power lines may influence the percentage of shrub cover in the Goldstrike Survey Area. Reseeding and reclamation activities in these areas could influence the plant species present at these sites.

Table 3.1-12: Project Area Plant Species Frequency

Survey Area	Grass Species		Forb Species		Shrub and Tree Species	
	Species[a]	Percent of Sites	Species[a]	Percent of Sites	Species[a]	Percent of Sites
Goldstrike 92 ESD sites	Basin wildrye	27%	Mustards	31%	Big sagebrush	30%
	Blue bunch wheatgrass	7%	Prickly lettuce	18%	Four-wing saltbush, Green rabbitbrush, and Shadscale	4%
	Cheatgrass	46%	Russian thistle	13%	Greasewood	19%
	Crested wheatgrass	17%	Tansymustards	21%	Rubber rabbitbrush	13%

Survey Area	Grass Species		Forb Species		Shrub and Tree Species	
	Species[a]	Percent of Sites	Species[a]	Percent of Sites	Species[a]	Percent of Sites
	Thurber's needlegrass	11%	Western salsify	18%	Yellow rabbitbrush	10%
Crescent Valley 88 ESD sites	Basin wildrye	46%	Annual forbs	11%	Big sagebrush	24%
	Bottlebrush squirreltail and Squirreltail	17%	Halogeton	8%	Budsage	12%
	Cheatgrass	79%	Mustards	29%	Greasewood	25%
	Crested wheatgras	23%	Pepperweed	22%	Rubber rabbitbrush	9%
	Sandburg's bluegrass	21%	Prickly lettuce	18%	Shadscale	25%
Carlin 44 ESD sites	Basin wildrye	28%	Clasping pepperweed	26%	Big sagebrush	36%
	Cheatgrass	34%	Halogeton	18%	Green rabbitbrush	26%
	Sandburg's bluegrass	26%	Russian thistle	16%	Rubber rabbitbrush	8%
	Squirreltail	22%	Scotch thistle	18%	Shadscale	30%
	Western wheatgrass	12%	Tansymustards	22%	Yellow rabbitbrush	10%

[a] Species are the five most frequent species in the Project Area.

Vegetation Communities

Based on SWreGAP data, Inter-Mountain Basins Big Sagebrush Shrubland, Inter-Mountain Basins Greasewood Flat, and Invasive Annual and Biennial Forblands are the three most abundant land cover types in the three survey areas (Table 3.1-4). Figure 3.1-1 through Figure 3.1-3 show the SWreGAP land cover types within the survey area and a ¼ mile from the centerline of the proposed railway, borrow sources, access roads, and construction depot locations. Vegetation data and the rangeland health evaluations may not represent conditions outside of the Project Area. Appendix A.8 includes the ESD survey site datasheets and site photos.

Non-native annual grasses and forbs were present within the Goldstrike, Crescent Valley, and Carlin survey areas (Table .1-13). Tables A-4.1 through A-4-4 list the plant species found in each of the three survey areas during the field verification. Additional information on noxious weeds and non-native invasive plant species are discussed in Section 3.3, and Appendix C includes a list of noxious weed and invasive plant species found within the three survey areas.

An area's resilience (ability of the ecological site to recover from disturbance) and resistance to invasive species are soil temperature/moisture regimes and the composition and structure of vegetation on the ecological site just prior to the disturbance event. The presence of deep-rooted perennial grasses (e.g., Indian ricegrass [*Achnatherum hymenoides*], and bottlebrush squirreltail [*Elymus elymoides*]) influences ecological site resilience to disturbance, invasive species, and ecological processes (Miller et al. 2013).

Table 3.1-13: Project Area Vegetation Species

Vegetation Type	Species Name
Annual Grass	Annual false wheatgrass (*Eremopyrum triticeum*) Cheatgrass (*Bromus tectorum*)
Perennial Grass	Alkali sacaton (*Sporobolus airoides*) Basin wildrye (*Leymus cinereus*) Bluegrass (*Poa* spp.) Bottlebrush squirreltail (*Elymus elymoides*) Crested wheatgrass (*Agropyron cristatum*) Cultivated wheatgrass (*Agropyron* spp.) Desert saltgrass or Inland saltgrass (*Distichlis spicata*) Indian ricegrass (*Achnatherum hymenoides*) Sandberg bluegrass (*Poa secunda*) Western wheatgrass (*Pascopyrum smithii*)
Annual Forb	Blue mustard (*Chorispora tenella*) Brown-eyed primrose (*Chylismia claviformis*) Bur buttercup (*Ceratocephala testiculata*) Clasping pepperweed (*Lepidium perfoliatum*) Cudweed (*Euchiton involucratus*) Flower baskets (*Mentzelia congesta*) Halogeton (*Halogeton glomeratus*) Lamb's quarter (*Chenopodium album*) Mustard species (*Brassica* spp.) Pepperweed (*Lepidium* spp.) Prickly lettuce (*Lactuca serriola*) Redstem storksbill or storksbill (*Erodium cicutarium*) Russian thistle (*Salsola kali*) Tansy mustard (*Descurainia pinnata*) Thistle species Tumble mustard (*Sisymbrium altissimum*) Wooly star (*Eriastrum densifolium*)
Perennial Forbs	Alfalfa (*Medicago sativa*) Basin yellow catseye (*Cryptantha confertiflora)* Burning bush (*Bassia scoparia*) Desert mallow (*Sphaeralcea ambigua*) Globemallow (*Sphaeralcea* spp.) Poverty weed (*Iva axillaris*) Whitetop (*Cardaria draba*)
Succulents, Shrubs, and Trees	Black sagebrush (*Artemisia nova*) Big sagebrush (*Artemisia tridentate*) Budsage (*Artemisia frigida*) Four-wing saltbush (*Atriplex canescens*) Greasewood (*Sarcobatus vermiculatus*) Green rabbitbrush (*Ericameria teretifolia*) Hopsage (*Grayia spinose*) Littleleaf horsebrush (*Tetradymia glabrata*) Pickleweed (*Allenrolfea occidentalis*) Rabbitbrush (*Ericameria* spp.) Rubber rabbitbrush (*Ericameria nauseosa*) Shadscale (*Atriplex confertifolia*) Spiny horsebrush (*Tetradymia spinosa*)

Soils

The NRCS soil survey identified 61 different soil map units within the three survey areas (NRCS 2021a). During field surveys, 237 soil pits were dug in 234 unique ESD sites to depths up to 32.7 inches. Field crews included more than one soil pit at three ESD locations to characterize the soils. NRCS soil map units in the three survey areas are shown in Figure A.7-1through Figure A.7-3 in Appendix A, and Table A.6-1 and Table A.6-2 summarize the acres of the soil map units in each SWreGAP land cover type.

Actions that affect soil quality include physical characteristics, biotic environmental factors, and natural and human activity disturbance. These activities can result in a variety of impacts that vary in spatial and temporal scale and severity. Vegetation species and ground cover influence water infiltration into soils and erosion rates (Blackburn et al. 1992). Through changes in litter quantity and quality, invasive plant species such as cheatgrass can alter soil characteristics (Norton et al. 2004). As described above, soils may be influenced by off-site human activities such as access roads, railways, agriculture, and utilities.

Soil properties, such as texture and water-holding capacity, are associated with resilience and resistance before and after disturbance (Roundy et al. 2018). Water infiltration and plant growth are related to soil textures, soil depth, and topography. Water infiltration in areas with fine-textured soils such as clays or silts is slower (Singh et al. 1998). Soil texture in the survey areas ranged from clay to silt, with most soils having a sandy loam or sandy clay loam texture (Table 3.1-14).

Table 3.1-14: Project Area Percent Soil Texture[a]

Soil Texture	Goldstrike Project Area	Crescent Valley Project Area	Carlin Project Area	Total
Clay	8%	1%	8%	5%
Sandy Clay	7%	3%	15%	7%
Silty Clay	13%	12%	8%	11%
Sandy Clay Loam	16%	18%	17%	17%
Clay Loam	11%	4%	8%	8%
Silty Clay Loam	16%	17%	9%	15%
Loam	6%	2%	4%	4%
Sandy Loam	15%	30%	24%	23%
Loamy Sand	1%	6%	4%	4%
Sand	0%	1%	2%	1%
Silt Loam	5%	6%	1%	5%
Silt	1%	0%	1%	0%
Total	99%	100%	101%	100%

[a] Due to rounding, percentages may not equal 100 percent.

3.2. WATER RESOURCES SURVEYS

This section describes the survey of water resources including wetlands, waterbodies, seeps, and springs within the Goldstrike, Carlin, and Crescent Valley survey areas. The survey area for water resources encompassed the Project footprint plus a 400-foot buffer from the centerline of the proposed railway (800-foot survey area) (see Figure 2-1 through Figure 2-9).

3.2.1. Background

The objectives of the wetlands and waters study were to:

- Identify and delineate all water resources within the Project Area and survey area.
- Conduct a Proper Functioning Condition (PFC) assessment of all non-ephemeral wetland and water features that have a predominance of wetland vegetation.

The purpose of this document is to inform future assessments of the potential impacts to water resources.

3.2.2. Study Methodology

This survey involved a pre-field desktop review, followed by an on-site field investigation to identify wetlands, waterbodies, seeps, and springs. The delineation of wetland and waterbodies was conducted per U.S. Army Corps of Engineers (USACE) protocol. Additionally, features classified as perennial or intermittent were further assessed using the BLM's PFC assessment. The definitions for wetland, waterbody, and seeps and springs are presented in their respective subsections in Section 3.2.2.2, Field Assessment.

3.2.2.1. Desktop Assessment

Prior to conducting field surveys, a desktop review was conducted to identify potential water resources within the survey areas. The following datasets were reviewed:

- Aerial imagery
- USGS 7.5-minute Topographic Quadrangles
- USGS NHD
- USFWS NWI
- NHD and NGM seeps and springs data
- NRCS Soil Survey
- Federal Emergency Management Agency National Flood Hazard Layer
- Wetland and waters data provided by NGM

Potential wetlands, waters, and seeps/springs features identified during the desktop review were targeted during the field assessment, as described in Section 3.2.2.2.

In addition to the detailed review of water resources information within the Project Area, the desktop review also reviewed the broader regional setting of the survey areas to provide context to the water resources assessment with regards to the regional geography, climate, ecology, vegetation, fire regime, and hydrology.

3.2.2.2. Field Assessment

The Project Area was assessed either on foot or by vehicle to verify potential wetland or waterbody features identified during the desktop assessment, and to document any other

potential features not identified during the desktop review. Surveys occurred during the following timeframes for each survey type:

- Wetlands: May 29, 2021 through July 19, 2021
- Waterbodies: May 27, 2021 through August 9, 2021
- Seeps and springs: May 29, 2021 through July 16, 2021
- PFC: August 17, 2021 through August 19, 2021

Wetland and waterbody delineations, feature data points, non-water points, and seeps and springs data were collected digitally using geographic positioning system (GPS) units with sub-meter accuracy. Data points are identified using the naming convention in Table 3.2-1. After the data was collected, it was reviewed for spatial and descriptive accuracy using ArcGIS and then exported to Microsoft® Excel® spreadsheets for review.

Table 3.2-1: Wetland and Water Resource Naming Protocol for Unique Identifications

Water Resource	Type	Survey Area	Field Crew Letter	Feature Number	Special Designation	Example
Wetland	w = wetland	ca = Carlin	Crew letter (e.g., a, b, c)	001, 002, 003, …	f = PFO [a] e = PEM [a] s = PSS [a]	wcaa001e
Waterbody	s = stream o = open waterbody	cr = Crescent Valley	Crew letter (e.g., a, b, c)	001, 002, 003, …	p = Perennial[b] i = Intermittent [b] e = Ephemeral [b]	scaa001p
Seep or Spring	p = seep or spring	go = Goldstrike	Crew letter (e.g., a, b, c)	001, 002, 003, …	NA	pcaa001
Non-water Point	no = non-water		crew letter (e.g., a, b, c)	001, 002, 003, …	NA	nocaa001

NA = not applicable
[a] Wetland classification/acronym based on *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979):
PEM = palustrine emergent
PFO = palustrine forested
PSS = palustrine scrub-shrub
[b] Flow regime is in accordance with 33 CFR Part 328.

Information was also recorded (such as connections to upstream and downstream waterbodies) that may be used in the future for determining the jurisdictional status of the features and/or for permitting potential impacts to regulated wetlands or waters.

Wetlands

The USACE and the USEPA define wetlands as “areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions” (33 CFR 328.3). Three characteristics are required for an area to meet the above definition: a predominance of hydrophytic vegetation; the presence of hydrology; and the presence of hydric soils under normal circumstances.

The field delineation of wetlands and their boundaries was conducted using methodology described in the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory

1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West (Version 2.0)* (USACE 2010). The *National Wetland Plant List,* Version 3.5 (USACE 2020) was referenced for the determination of plant indicator status, and the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979) was used to classify wetlands based on vegetation type. Areas that were identified as NWI wetlands during the desktop review were field-verified.

Waterbodies

In contrast to wetlands, waters are typically less vegetated or non-vegetated; have a bed, bank, and ordinary high water mark (OHWM); and include streams, rivers, ponds, or lakes (Lichvar and McColley 2008). Areas identified as stream or open water features by the NHD or NWI databases were field-verified. Waterbodies documented during the field survey were categorized as either linear waterbodies or open waterbodies. Streams and open water features may or may not have had flowing water when observed in the field.

For each waterbody feature, numerous descriptive attributes were documented, including hydrologic regime (perennial, intermittent, or ephemeral), type of waterbody (linear or open water), general quality, artificial versus natural, description of sinuosity, substrate type, water depth, presence of riparian zone, dominant bank vegetation, presence of aquatic habitat and organisms, disturbance factors, width of the OHWM, and relevant OHWM indicators. OHWM identification followed the USACE's *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (Lichvar and McColley 2008). Three photos were taken of each waterbody feature.

The following hydrologic regime classifications were applied to each waterbody feature:

- **Perennial**: A stream that has continuously flowing water year-round during a typical year. The water table is located above the stream bed for most of the year, and groundwater is the primary source of water for stream flow. Runoff from rainfall or snowmelt is a supplemental source of water for stream flow.
- **Intermittent**: A stream that typically has flowing water during at least 3 months out of the year, when groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water but may contain pools, and runoff from rainfall is a supplemental source of water for stream flow.
- **Ephemeral**: A stream that has flowing water only during and for a short duration after precipitation events. Ephemeral stream beds are located above the water table year-round; therefore, groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow.

Seeps and Springs

Seeps and springs are areas where the groundwater table discharges at the surface. There is little difference between a seep and a spring. Generally, if the rate of flow is rapid and continuous, it is called a spring. If the flow is slow and intermittent, it is called a seep. Nevada

defines a seep as an area of minor groundwater outflow onto the land surface, whereas a spring is defined as a concentrated discharge of ground water coming out at the surface as flowing water, more or less continuously (NDWR 2021).

Seeps and springs are considered a Nevada Important Habitat because they provide moist oasis areas unique in these types of arid environments to species, including threatened and endangered species. Seeps and springs are treated as wetlands in Nevada, but they may or may not be considered wetlands per USACE protocol, as seeps and springs may not have all three USACE-required parameters present to be considered a wetland. All seeps and springs observed in the field were documented as such, and any associated wetland or water features were recorded separately. Observations about the presence of standing and/or flowing water, substrate, and vegetation was also documented.

Proper Functioning Condition Assessment

PFC assessments qualitatively evaluate the functionality of aquatic systems, including both lotic and lentic systems. Lotic systems are characterized by flowing water (e.g., riparian areas along perennial or intermittent streams) and lentic systems are characterized by still or slow-moving water (e.g., seeps, springs, and other non-riverine wetlands). The PFC assessments were performed following the BLM guidance documents for assessing lentic systems (USDI 2020) and lotic systems (USDI 2015). The PFC assessment was not conducted for features classified as ephemeral, as the PFC method is not intended for use on ephemeral features (USDI 2015).

PFC is both the field assessment method and a defined condition of the feature being assessed. Based on qualitative observation in the field, each feature evaluated was placed into one of three rating categories, described below:

1. **Proper Functioning Condition (PFC)**: Based on the BLM guidance documents (USDI 2015, 2020), an aquatic feature is considered to be in PFC, or functioning properly, when adequate vegetation, soil and/or landform, or woody material are present. The presence of these attributes allows the area to function properly by dissipating energies associated with high water flow events, reducing erosion, filtering and capturing sediment to aid in floodplain development, improving floodwater retention and groundwater recharge, and developing root masses for bank stabilization. An aquatic feature in PFC (either lentic or lotic) will, in turn, provide associated values such as wildlife habitat, recreational opportunities, and good water quality.
2. **Functional–at risk (FAR)**: These aquatic features exhibit limited or impaired functioning condition due to the absence of the attributes described above. The absence of one or more existing hydrologic, vegetative, or soil/geomorphic attributes make them susceptible to impairment.
3. **Nonfunctional (NF)**: These aquatic features clearly are not providing adequate vegetation, soil and landform, or woody material to dissipate energies associated with high water flow events. Examples of attributes that would result in a nonfunctional assessment include absence of a floodplain, actively eroding streambanks, excessive soil compaction, and the presence of upland vegetation in a riparian area.

PFC data was documented on PFC data forms from the BLM guidance documents, photos were taken of each feature, and spatial data was recorded using a handheld GPS unit. In addition, in areas where human-caused alterations have resulted in changes in potential and/or a loss of riparian/wetland characteristics and functions, the procedure for addressing altered potential was followed and an Altered Potential Attachment form was completed.

3.2.3. Results

This section presents the results of the desktop review and the field surveys for water resource features within the region and the Project Area.

3.2.3.1. Regional Setting

Ecology

The ecological setting is described in detail in Section 3.1, Ecological Site Description, and is summarized here. The Project is located in the USEPA Central Basin and Range Level III Ecoregion (Bryce et al. 2003). The Project is located among foothills, alluvial fans, alluvial slopes, fan remnants, playas, salt flats, flats, floodplains, inter-mountains basins, and some montane areas. Agricultural activities, historical mining activities, livestock rotation, and wildfire have altered the landscape by disturbing native soils, vegetation, and local hydrology throughout portions of the region.

Surface and Groundwater Hydrology

The Project is located in the Humboldt River Basin (Region 4), which encompasses an area of nearly 17,000 square miles and contains 34 hydrographic areas (NDWP 1999; Plume and Ponce 1999; USGS 2021b). The USGS and the Nevada Division of Water Resources, Department of Conservation and Natural Resources have divided Nevada into discrete hydrologic units for water planning and management purposes (NDWP 1999; NDCNR 2021). These hydrologic units in Nevada are similar to standard USGS hydrologic units but have slightly different boundaries. The Goldstrike Survey Area lies within the Boulder Flat hydrologic unit, the Carlin Survey Area lies within the Maggie Creek Area and Marys Creek Area hydrologic units, and the Crescent Valley Survey Area lies within the Crescent Valley hydrologic unit (Figure 3.2-1).

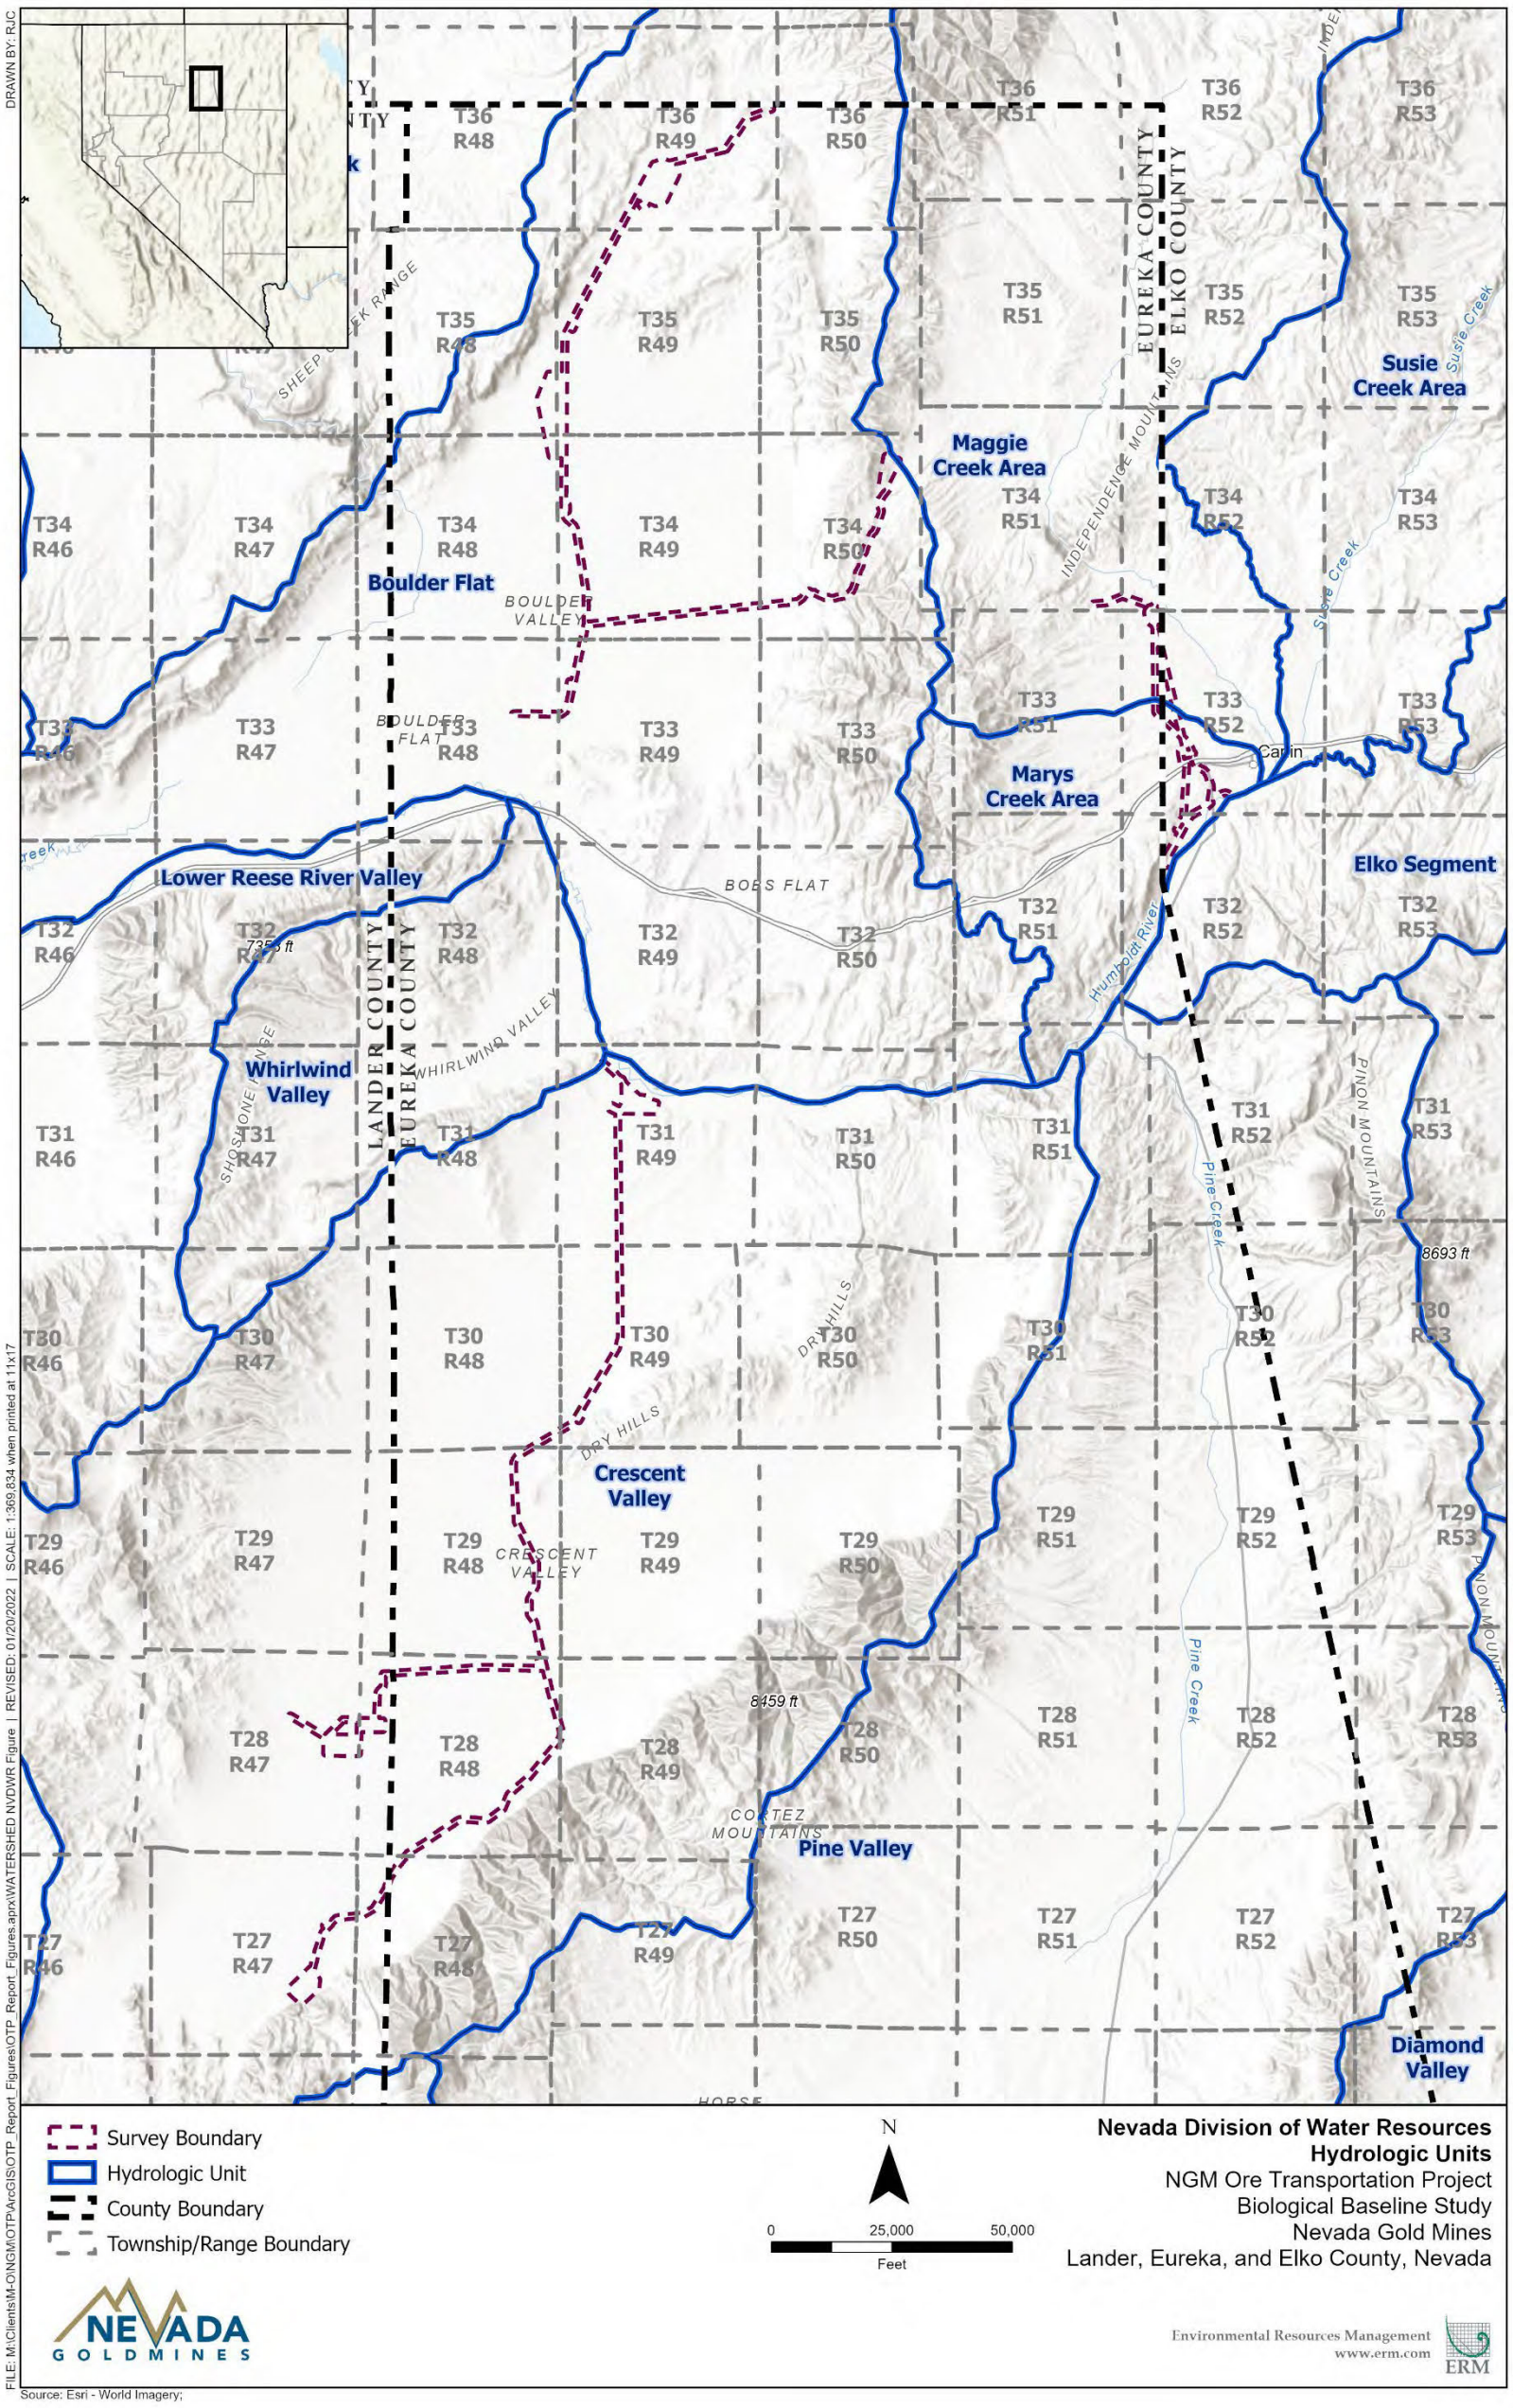

Figure 3.2-1: Nevada Division of Water Resources Hydrologic Units

Page Intentionally Left Blank.

Nevada is the driest state in the United States, and most of the surface waters in Nevada are groundwater dependent ecosystems, relying on groundwater as the main water source (BLM 2021). In turn, the main sources of groundwater recharge include rain, snow, and infiltration of surface streamflow (Plume and Ponce 1999). In areas where the valley floors are composed of fine lake sediments, groundwater recharge can be inhibited resulting in the presence of playa lakes (NDWP 1999). Playas are present in several of the valleys in which storm and spring runoff accumulates and stands until it evaporates. In years of very high runoff, some areas—such as the Crescent Valley, which has a very low gradient—will experience through drainage of the playa (Bredehoeft 1963).

Nevada has very few large rivers and streams compared to other states, and the perennial rivers are relatively small. Ephemeral and intermittent streams make up the majority of surface water features, with spring and summer snowmelt supplying most of the streamflow in Nevada (NDWP 1999). Some streams may exhibit dual characteristics with high-elevation perennial streams becoming intermittent or ephemeral near the valley floors (Goodrich et al. 2018; Eureka County 2016). Runoff patterns vary seasonally and geographically and are mainly determined by precipitation patterns (location and timing) and other climate patterns such as temperature (NDWP 1999).

Droughts and floods are common in Nevada. Years of average streamflows are rarely experienced, and periods of high flows followed by low flows are more typical (NDWP 1999). As of October 7, 2021, the Humboldt River Watershed was at 52 percent of the 20-year average annual precipitation amount (NRCS 2021). The Bartlett Decree of 1931 recognized the seasonal and ephemeral nature of many streams within the Humboldt River Basin, referring to them as “flash streams.” These waters were defined as streams “that have a sudden or flash flow or flush flow for a comparatively brief period of time” (NDWP 1999) due to snow melt or flood events.

Surface waters have historically been used for agricultural purposes, mainly for irrigation and livestock. In addition to being a source of recharge to underlying aquifers, streams and wetlands in the region also provide habitat for wildlife (Plume and Ponce 1999). The surface water resources sustain aquatic, riparian, and phraetophytic ecosystems. These ecosystems, in turn, provide habitat for diverse plants and animals, many of which are endemic or sensitive species (BLM 2021). Groundwater in the region is used for municipal, domestic, and mining purposes (Plume and Ponce 1999). Increased demand for groundwater in Nevada has led to increased administration to manage water resources. Hydrographic basins that are identified as being depleted or are in need of additional groundwater management can be designated as groundwater basins by the Nevada State Engineer (NDWP 1999). The Boulder Flat, Maggie Creek Area, and Crescent Valley basins are *Designated* groundwater basins, and the Marys Creek Area basin is a *Designated – Preferred Use* groundwater basin (NDCNR 2021). *Designated* basins do not have any defined administrative controls, whereas *Preferred Use* basins may list certain types of water uses as preferred, and quantity restrictions may be placed on these preferred uses (NDWP 1999).

3.2.3.2. Wetlands

NWI-mapped water features within the survey areas are presented in Figure 3.2-2 through Figure 3.2-4. The wetland features are typically located within the valley bottoms along stream corridors and historic playas. The NWI-mapped features are classified as either palustrine emergent wetland or palustrine scrub-shrub wetland, palustrine unconsolidated bottom wetland/pond, palustrine unconsolidated shore wetland/pond, riverine intermittent, and riverine unknown perennial.

Table 3.2-2 presents the wetland features documented within and near the survey area during the field survey. An overview of the surveyed wetland features in each survey area is presented in Figure 3.2-5, and more detailed figures of the features are provided in Appendix B-1. The field survey mapped a total of 29 wetland features, for a total of 158.33 acres. One feature was in the Goldstrike Survey Area (0.08 acre), 10 features were in the Carlin Survey Area (24.19 acres), and 18 features were in the Crescent Valley Survey Area (134.06 acres). The photo log in Appendix B-2 presents representative photos of the wetlands documented throughout the survey area.

All of the surveyed wetlands were classified as either palustrine scrub-shrub or palustrine emergent, and are typically associated with one of two types of wetland types. The wetlands in the Carlin Survey Area are typically driven by freshwater and are associated with the Humboldt River floodplain. This type of palustrine emergent wetland was observed to be dominated by desert saltgrass (*Distichlis spicata*), Baltic rush (*Juncus balticus*), celery-leaved buttercup (*Ranunculus sceleratus*), and hardstem bulrush (*Schoenoplectus acutus*). The palustrine scrub-shrub wetlands were dominated by coyote willow (*Salix exigua*).

The second type of wetlands were the highly saline playa wetlands in the Crescent Valley Survey Area. These wetlands were typically very sparsely vegetated with some saltgrass, but occasionally greasewood (*Sarcobatus vermiculatus*), a non-wetland species, was also documented. The greasewood was located on pedestal islands of microtopography within the wetland, and in many cases it exhibited signs of stress (presumably due to periodic flooding and high salt content) and was therefore documented as atypical wetland vegetation in these situations.

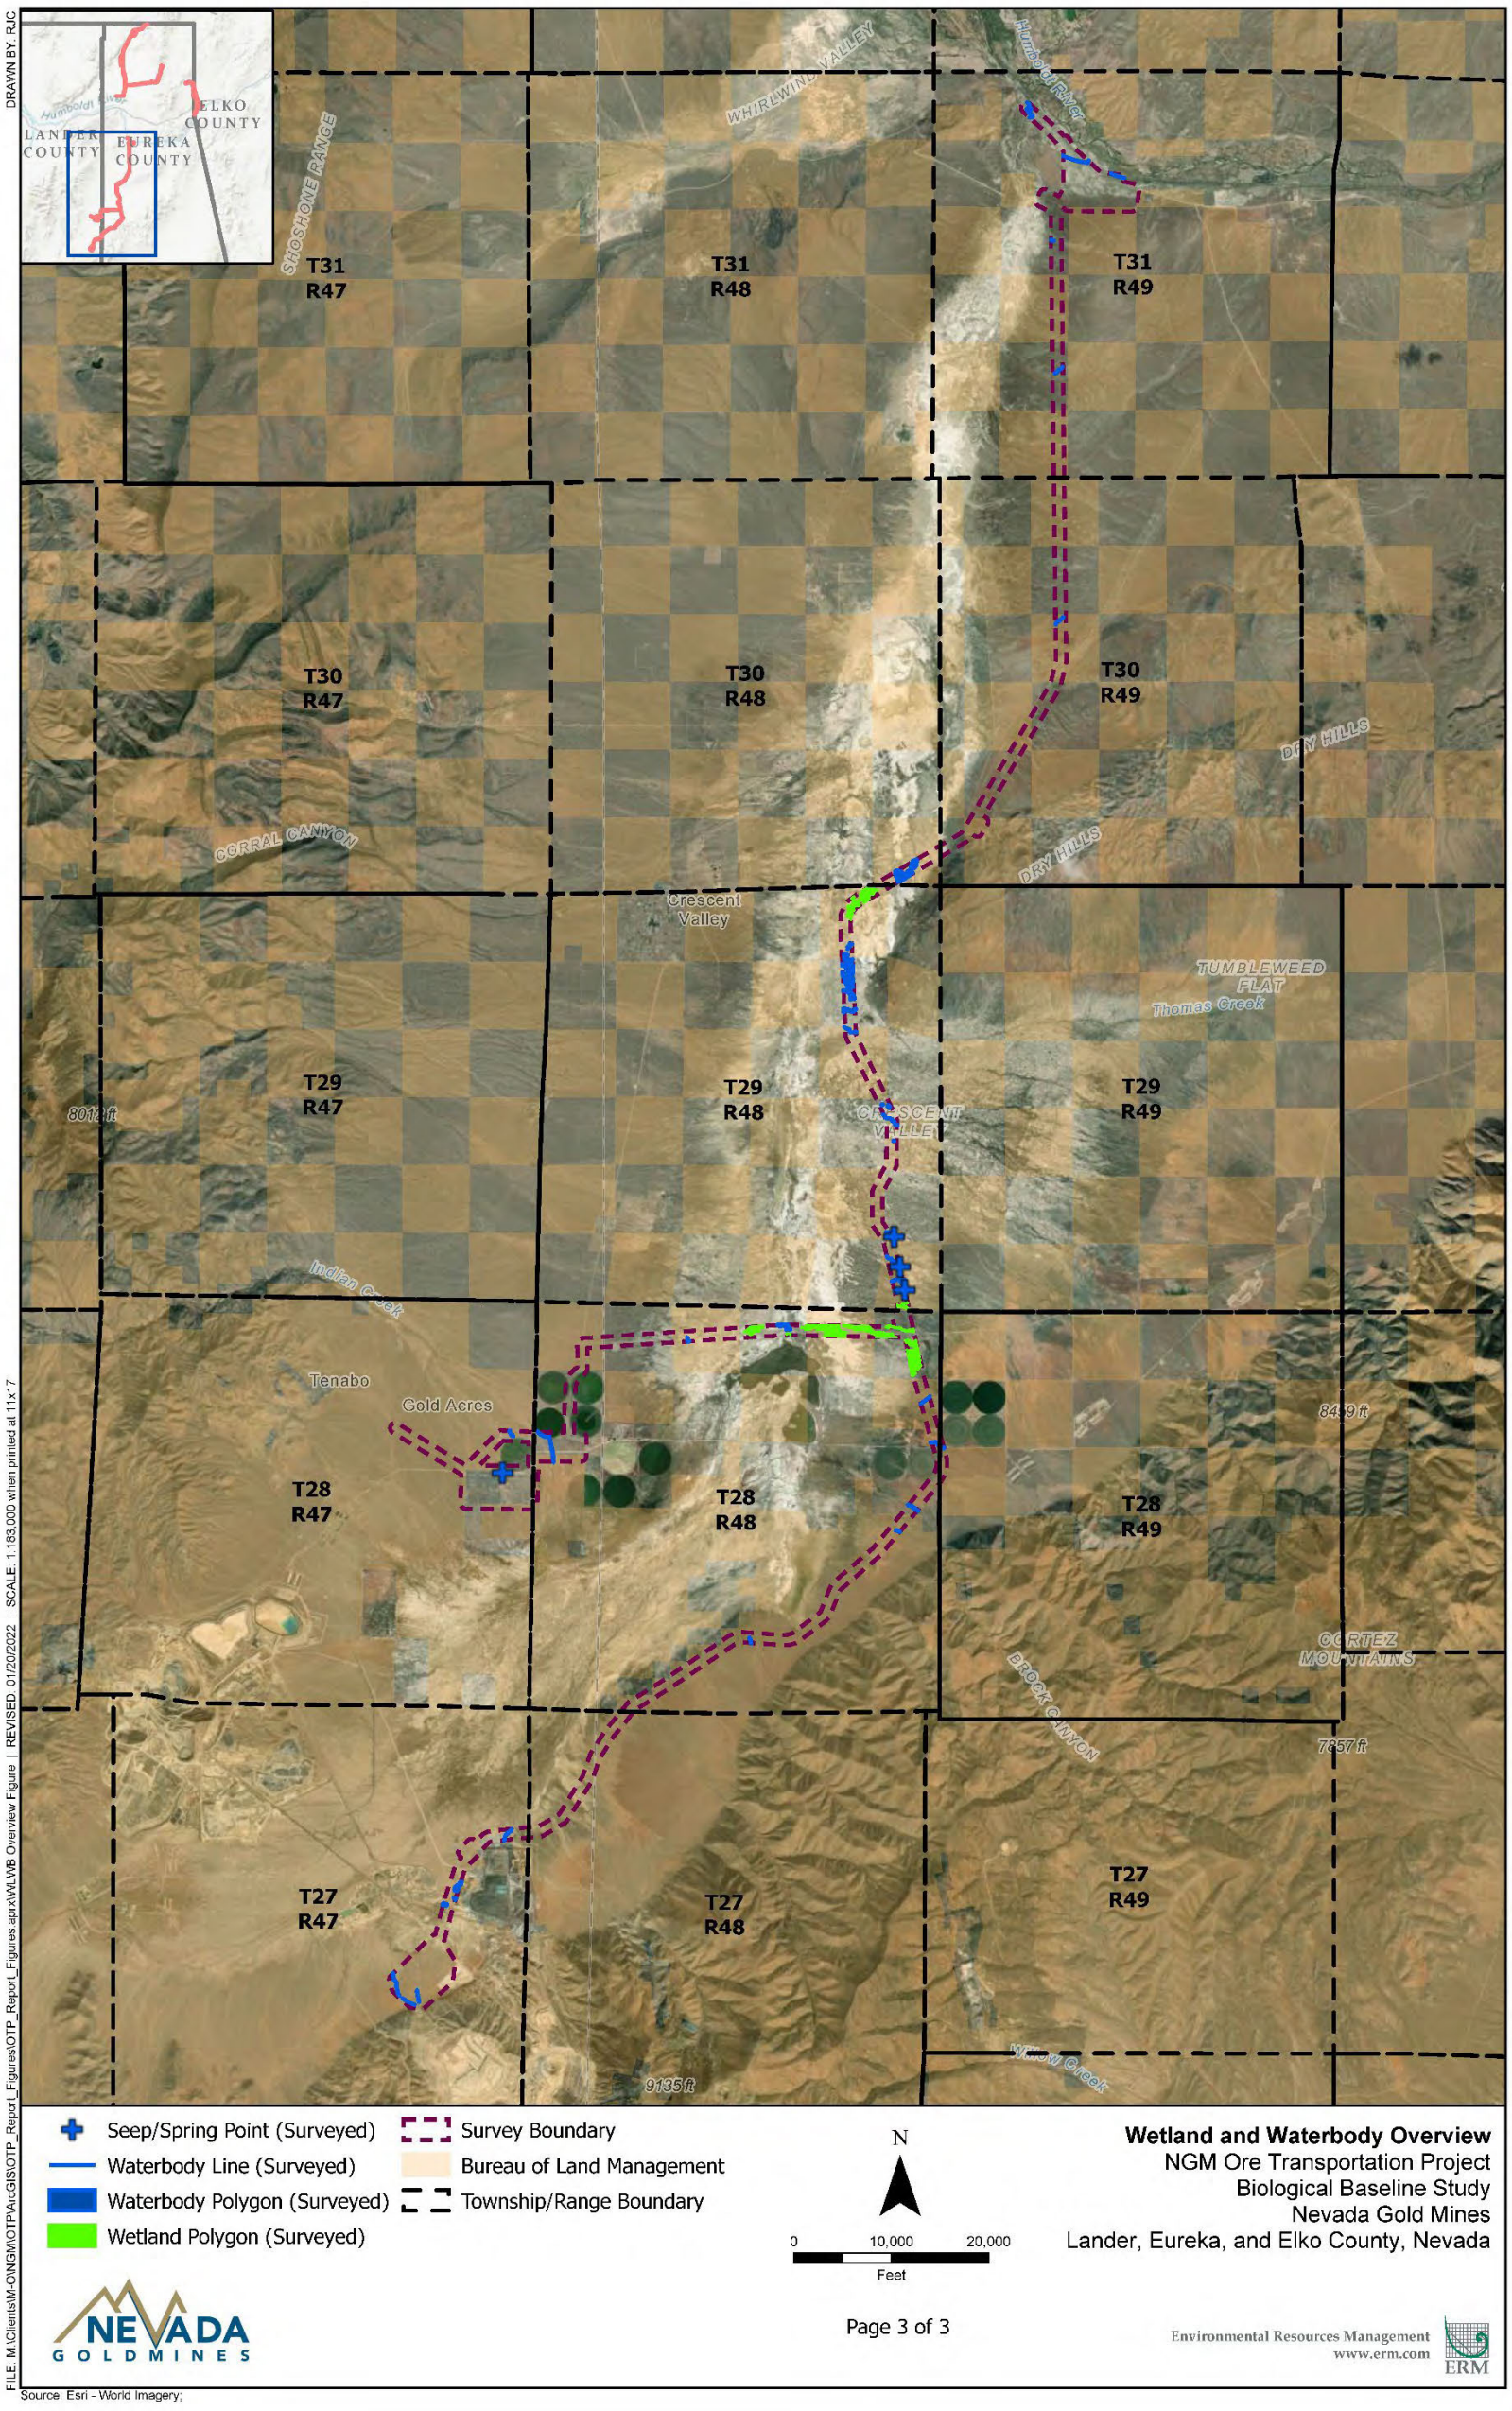

Figure 3.2-5c: Wetland and Waterbody Overview

Page Intentionally Left Blank.

3.2.3.3. Waters

NHD-mapped waters features within the survey areas are presented in Figure 3.2-6 through Figure 3.2-8. The Humboldt River is the only stream feature within the Project Area mapped by NHD as perennial, and is adjacent to the southern portion of the Carlin Survey Area. The remainder of the NHD-mapped features are classified as ephemeral or intermittent. The locations of all NHD features were verified during field surveys. Water features were recorded when present. If no feature was identified, a non-water point was recorded.

The field survey mapped a total of 89 water features, for a total of 40.92 acres of open waterbodies and 107,866 feet (20.4 miles) of streams. The linear water features included natural stream channels as well as artificial or manipulated channels and ditches. Open waterbodies included impounded ponds for stock or mining use and natural ponds and playas.

Table 3.2-3 presents the water features documented within the survey areas, including water regime classification and acreage (for open waterbodies such as ponds and playas) or linear feet (for linear stream features). An overview of the surveyed water features in each survey area is presented in Figure 3.2-5, and more detailed figures of the features are provided in Appendix B-1. Twenty-six features are in the Goldstrike Survey Area (0.59 acre and 58,434 feet), 20 features are in the Carlin Survey Area (0.24 acre and 21,558 feet), and 43 features are in the Crescent Valley Survey Area (40.10 acres and 27,837 feet). Nearly all of the features were classified as ephemeral, with a smaller number of features classified as intermittent or perennial. The condition of these intermittent and perennial waters features is presented in Section 3.2.3.5, Proper Functioning Condition Assessment (Table 2-5). Representative photos of the waterbodies documented throughout the Project Area are included in Appendix B-2.

NA = data not available
[a] Examined for Proper Functional Condition, see Section 3.2.3.5

3.2.3.4. Seeps and Springs

Seeps and springs are common throughout the region. More than 1,600 seeps and springs have been catalogued with Eureka County alone (Eureka County 2016). NGM maintains a dataset of seep and spring locations based on surveys completed for their facilities. Seeps and springs features within the survey areas as mapped by the NHD and NGM are presented on Figure 3.2-5. Five seeps/springs were documented during the field surveys: three in the Goldstrike Survey Area and two in the Carlin Survey Area.

Nine seeps and springs were documented during the field assessment. Table 3.2-4 presents the seeps and springs features mapped within or near the survey areas. The surveyed wetland and/or waters feature associated with each seep or spring (as presented in Tables 2.2-2 and 2.2-3 above) is also cross referenced in Table 3.2-4. Some of the features were a short distance outside the limits of the survey area but were documented and have been included in this report. An overview of the surveyed seeps and springs in each survey area is presented in Figure 3.2-5, and more detailed figures of the features are provided in Appendix B-1. Representative photos of the seeps and springs are presented in Appendix B-2.

The three features in the Goldstrike Survey Area were all associated with stock tanks and adjacent stock ponds that were dry at the time of survey. Both features in the Carlin Survey Area were documented within the OHWM of the Humboldt River. One of the springs (pcac001) had been previously documented by NGM. One of the features in the Crescent Valley Survey Area was associated with a stock tank and a wetland that had formed adjacent to the tank. Two seeps were associated with ephemeral channels. The remaining seep was isolated and not associated with any other features.

Table 3.2-4: Seeps and Springs Mapped in the Survey Areas

BLM = Bureau of Land Management; ID = identification; NGM = Nevada Gold Mine

3.2.3.5. Proper Functioning Condition Assessment

All intermittent or perennial aquatic features including wetlands, waters, seeps, and springs identified during the field surveys were reviewed to determine the need for a PFC assessment, and the features selected were assessed using the PFC method for either lentic or lotic systems (USDI 2020 and 2015, respectively).

From August 17 through 19, 2021, a total of 26 sites were visited for PFC assessments. Table 3.2-5 provides details for each site that was assessed. Appendix B-3 provides figures, data forms, and photographs for each site. All visited sites are summarized below.

Seven of the assessed sites were evaluated as having PFC (PFC-010, PFC-013, PFC-015, PFC-016, PFC-017, PFC-020, and PFC-021). Characteristics of these sites included diverse plant and wildlife communities, geomorphic setting adequate to slow water flow, and presence of meandering stream channels for lotic areas.

Three of the assessed sites were evaluated as non-functional (NF; PFC-007, PFC-009, and PFC-012). Limiting factors noted at the NF-rated sites included unstable channels, the absence of a floodplain, and a lack of point bar development due to high energy water flows. Additionally, evidence of livestock grazing was observed and may be limiting the establishment of riparian vegetation and progression of normal channel evolution processes.

Sixteen of the assessed sites were observed to have undergone human-caused alterations that resulted in changes in potential and/or loss of riparian/wetland characteristics and functions. These alterations included dewatering (upstream or at site), diversion, channelization (ditching), and conversion to agriculture (hayfield). Following the completion of an Altered Potential Attachment form, if the alteration was determined to have resulted in artificial conditions for a substantial part of the site, no PFC assessment was conducted and the assessment was concluded. These features were noted as “Not Applicable (NA) / No riparian functions” or “NA / Limited riparian functions.” Four of these 16 sites were determined to not have any riparian or wetland functions and were therefore not assessed. No data forms were completed for these four sites; however, photos of these locations are included in Appendix B-3. Site PFC-003 was observed to be highly altered into a reservoir and corral area and is managed in such a way as to prevent wetland or riparian processes from occurring. Sites PFC-004, PFC-005, and PFC-006 are stock tanks and are not intended to be managed to allow for riparian or wetland functions. Additionally, the sites appear to have the water shut off when cattle are not being actively managed in the area.

Table 3.2-5: Aquatic Sites Assessed for Proper Functioning Condition in the Survey Areas

Site Name (Site ID)	Associated Surveyed Wetland or Water Feature	Description	Dominant Riparian-Wetland Species	Functional Rating/Type [a]	Comments [b]
Goldstrike Survey Area					
PFC-001 Boulder Creek Reach 1	sgoa004i	Altered potential Dry channel	No riparian species present	NA / No riparian functions	Although cut bank profiles indicate drainage historically supported hydric soils and functional floodplains, flows are now predominantly ephemeral. Large-scale mining operations upstream and in surrounding watershed have altered water supplies as well as sediment supply and transport capacity. Large deposits of sand, gravels, and cobbles are present across flood prone area within the historically incised channel.
PFC-002 Rodeo Creek Reach 1	sgoc012e, sgoc013e	Altered potential Dry channel	Mostly NA; scattered amounts of coyote willow (*Salix exigua)*	NA / No riparian functions	Currently functions as ephemeral drainage. Normal sediment and water supply regimes altered by large-scale upstream mining operations. Tributary to Boulder Creek.
PFC-003, 004, 005 Stock Tanks 1 – 3	None	Livestock watering troughs	No riparian species present	NA / No riparian functions	Not assessed. Troughs supported by mine dewatering pipeline. Stock water ponds have been excavated in vicinity of troughs. Troughs and associated ponds dry at time of inspection with the exception of the pond at Stock Tank 1.
PFC-006 Welches Creek	sgoc008i	Downstream of Reach 3 – Corral and Reservoir	No riparian species present	NA / No riparian functions	Not assessed. This area includes the corral and altered portions of the drainage below Reach 3. This area does not possess any wetland or riparian function and has been highly altered from a natural state.

Site Name (Site ID)	Associated Surveyed Wetland or Water Feature	Description	Dominant Riparian-Wetland Species	Functional Rating/Type [a]	Comments [b]
PFC-007 Welches Creek Reach 3	sgoc007p, sgoc008i	Deeply incised channel with interrupted flow pattern	Scattered amounts Nebraska sedge (*Carex nebrascensis)*, spikerush *(Eleocharis* sp.), and Kentucky bluegrass (*Poa pratensis)*.	NF Lotic	Rosgen G channel type transitioning to Rosgen F or C channel types in lower portion of reach. Some potential for floodplain development where gully becomes flatter and wider; however, current grazing practices preventing colonization and establishment of point bars with riparian species. Scattered riparian communities contracting in response to grazing pressure and lack of persistent soil moisture.
PFC-008 Welches Creek Reach 2	sgoc006i	Deeply incised intermittent channel	Mostly NA; scattered amounts spikerush (*Eleocharis* sp.)	NA / No riparian functions	Rosgen G channel type with intermittent flow characteristics. Limited opportunities for riparian plant establishment and for floodplain development.
PFC-009 Welches Creek Reach 1	sgoa003p, sgoc006i	Deeply incised perennial channel	Scattered amounts of arctic rush (*Juncus arcticus)* and spikerush *(Eleocharis* sp.)	NF Lotic	Rosgen G channel formed as a result of historic head cutting through meadows and fluvial terraces. Modern gully is 10-15 feet deep and 5-10 feet wide. Gully configuration—along with chronic livestock impacts in the form of trampling of moist soils and heavy utilization of limited riparian vegetation—is limiting point bar development and subsequent channel evolution towards a more functional state.

Site Name (Site ID)	Associated Surveyed Wetland or Water Feature	Description	Dominant Riparian-Wetland Species	Functional Rating/Type [a]	Comments [b]
Carlin Survey Area					
PFC-010 Marys Creek Reach 1	wcac004e	Wetland established in bottom of historic gully along lower reaches of Marys Creek	Broadleaf cattail (*Typha latifolia*), common threesquare (*Schoenoplectus pungens*), arctic rush (Juncus arcticus), and spikerush (*Eleocharis* sp.)	PFC Lentic	Functional wetland has developed where bottom of deep gully intercepts groundwater. Cut/fill patterns in bank profiles, buried fence posts, and incongruities in particles distributions all indicate watershed imbalances in sediment supply and transport for Marys Creek. Stream is intermittent above site. Perched coyote willow (*Salix exigua*) communities on adjacent terraces expanding into wetland.
PFC-011 Humboldt River UPRR Reach 2	wcaa001e, wcaa003e, wcaa003s	Altered potential. Historic hay meadow converted to uplands	Mostly NA; small scattered stands of broadleaf cattail (*Typha latifolia*)	NA / No riparian functions	Small fenced pasture boarded by railroad tracks and berms. Site dominated by beardless wildrye (*Leymus triticoides)*. Heavy infestations of weeds including musk thistle *(Carduus nutans)*, broadleaf pepperweed *(Lepidium latifolium),* and Canada thistle *(Cirsium arvense)*.
PFC-012 Humboldt River NV278 Reach 1	scac001p	Sand dominated, entrenched, meandering channel deeply incised in gentle terrain	Coyote willow *(Salix exigua)* with scattered facultative grass/forb communities	NF Lotic	Unstable channel type lacking floodplain development. Although upstream influences limit potential for development of a more functional channel type (i.e., transition from Rosgen F channel to Rosgen C channel), some potential exists for increased colonization and stabilization of point bars within the incised channel. Current livestock grazing practices are limiting establishment of riparian vegetation and progression of normal channel evolution processes.

Site Name (Site ID)	Associated Surveyed Wetland or Water Feature	Description	Dominant Riparian-Wetland Species	Functional Rating/Type [a]	Comments [b]
PFC-013 Carlin South Warm Springs Drainage Reach 1	None	Steep, spring-fed deeply entrenched channel. Rock and geomorphic setting provide stability, control and confinement	Mostly NA; scattered amounts of Nebraska sedge (*Carex nebrascensis)* on limited floodplain areas in lower part of reach	PFC Lotic	Site stabilized from historic modification of high volume spring source. Potential for riparian zone development limited by lack of floodplain development characteristic of Rosgen Aa channels. Where present, riparian plants heavily impacted by livestock. Vegetation is primarily Wood's rose (*Rosa woodsia)* and dense infestations of Scotch thistle (*Onopordum acanthium)* and Russian knapweed (*Acroptilon repens)*. Possible spring snails (*Pyrgulopsis* sp.) abundant on substrates along upper 2/3 of drainage.
PFC-014 Carlin South Warm Springs Drainage Reach 2	wcac002e	Altered potential. Drainage channelized to form diversion ditch	Scattered amounts of broadleaf cattail (*Typha latifolia)* and hardstem bullrush *(Schoenoplectus acutus)*; Facultative forb/grass communities dominate site	NA / No riparian functions	Historic drainage diverted to form ditch expediting water removal from area of fenced pasture. Ditch is stable and well vegetated with diverse mixture of facultative grasses and forbs. Pasture shows high level of disturbance from past agricultural uses. Heavy infestations of Scotch thistle (*Onopordum acanthium)* and Russian knapweed *(Acroptilon repens)*.
PFC-015 Carlin South Warm Springs Wetland Reach 1	wcac002e	Modified site. Stable, emergent wetland	Broadleaf cattail (*Typha latifolia)* with lessor amounts of hardstem bullrush *(Schoenoplectus acutus)*	PFC Lentic	Wetland maintained by groundwater discharge in areas of historic Humboldt River meanders as well as from diverted flows originating from Warm Springs. Wetland is intercepted by railroad, which causes site to be wetter on uphill side and drier on downhill side. Interspersed areas of open water within dense stands of emergent vegetation provide quality habitat for waterfowl and other marsh birds.

Site Name (Site ID)	Associated Surveyed Wetland or Water Feature	Description	Dominant Riparian-Wetland Species	Functional Rating/Type [a]	Comments [b]
PFC-016 Humboldt River UPRR Reach 1	wcac002e	Hay meadow supporting stable riparian-wetland plant communities	Coyote willow *(Salix exigua)*, hardstem bullrush *(Schoenoplectus acutus)*, Nebraska sedge *(Carex nebrascensis)*, and other sedges *(Carex* sp.); mesic grasses/forbs	PFC Lentic	Coyote willow (*Salix exigua)* communities expanding into historically hayed areas. Dense stands of Hardstem bullrush *(Schoenoplectus acutus)* as well as productive meadows are supported by groundwater discharge in depressions created by historic river meanders. Diverse facultative communities as infestations of broadleaf pepperweed (*Lepidium latifolium)* and Canada thistle (*Cirsium arvense)* are common on adjacent uplands.
Crescent Valley Survey Area					
PFC-017 Pivot Wetland Reach 1	wcra006e, wcra006s	Emergent wetland supported by agricultural practices	Broadleaf cattail *(Typha latifolia)*, common threesquare *(Schoenoplectus pungens)*	PFC Lentic	Dense stands emergent wetlands established along ditched area, which drains hay pivots. Some fluctuation in water levels is evident along margins of wetlands; however, age, vigor and distribution of emergent plant communities indicate long-term stability of water supply.
PFC-018 Cottonwood Creek Diversion Reach 1	scra002i	Altered potential. Dry diversion ditch	No riparian species present	NA / No riparian functions	Flows from canyon mouth diverted to supply water for pivots. Dry channel. Water available seasonally only. Heavy infestations of Russian knapweed *(Acroptilon repens)*.
PFC-019 Brock Creek Diversion Reach 1	scra020e	Altered potential. Dry diversion ditch	No riparian species present	NA / No riparian functions	Flows from canyon mouth diverted to supply water for pivots. Water available seasonally only.

Site Name (Site ID)	Associated Surveyed Wetland or Water Feature	Description	Dominant Riparian-Wetland Species	Functional Rating/Type [a]	Comments [b]
PFC-020, 021 Possible Wetland Reaches 1, 2	None	Wetlands formed in historic stock water ponds	Common threesquare *(Schoenoplectus pungens),* arctic rush *(Juncus arcticus),* Nebraska sedge *(Carex nebrascensis),* hardstem bullrush *(Schoenoplectus acutus)* and spikerush *(Eleocharis* sp.)	PFC Lentic	Outside of survey area. Two small, historic ponds within 100 feet of each other filled in and now completely occupied by stable, productive riparian-wetland plant communities. Positioned at bottom of dry alkaline meadows. High insect biodiversity. No evidence of recent use by livestock.
PFC-022, 023, 024, 025 Cortez PoO Wetlands Reaches 1 - 4	ocra004p, ocra005p, ocra003p, ocra002p	Series of excavated alkaline ponds	Scattered stands of Broadleaf cattail *(Typha latifolia),* common threesquare *(Schoenoplectus pungens),* hardstem bulrush (S. *acutus)*, and cosmopolitan bulrush (S. *maritimus)*	NA / Limited riparian functions	Ponds highly alkaline. Exposed shorelines show evidence of widely fluctuating water levels. Scattered stands of emergent wetland vegetation along perimeters. Swallows, shorebirds, wrens, blackbirds, American coots, and several species of ducks using ponds at time of inspection.
PFC-026 Indian Creek Pivot	scra015p	Altered potential. Dry diversion ditch	Mostly NA; Facultative grass/forb communities	NA / No riparian functions	Ditch draining Indian Creek watershed is intercepted by and diverted around active pivots. Ditch is also intercepted by road. No persistent flows or soil moisture. Small amounts mesic grasses and forbs in seasonally moist areas.

ID = identification; NF = Nonfunctional; NA = not applicable; PFC = Proper Functioning Condition

[a] Lentic = Still or very slow moving water including (but not limited to) springs, marshes, meadows, ponds and vegetated drainage-ways; Lotic = Moving water such as rivers, streams and creeks

[b] Rosgen Channel Types (Rosgen 1996):

A Channels: Steep (slopes 4 to 10 percent), low width to depth ratio, laterally confined. Bed forms typically a step/pool morphology with attendant plunge or scour pools. This channel type exhibits a high sediment transport potential and relatively low in-channel sediment storage capacity. **A** channels are over 10 percent.

C Channels: Slightly entrenched (has a floodplain), moderate to high width/depth ratio (wide, shallow), moderate to high sinuosity, mostly low gradients (1 to 2 percent). Generally, functional with high response potential to changes in management.

F Channels: Deeply incised, very high channel width to depth ratio at bankfull, may have high bank erosion rates as well as significant bar deposition. Accelerated channel aggradation and/or degradation with very high sediment supply and storage. Often observed to be working towards re-establishment of functional floodplain inside confines of gully walls. Gradients less than 2 percent.

G Channels: Entrenched (gullied, no floodplain), low width to depth ratio, moderate sinuosity, mostly moderate gradients (2 to 4 percent). G channels are essentially unstable gullies.

3.3. VEGETATION STUDIES

The survey area for obtaining baseline study data for vegetation includes the Project footprint plus a 200-foot buffer of the centerline (400-foot survey area), borrow source areas, access roads, and construction depot sites, for a total of 6,622.2 acres (Figure 2-1 through Figure 2-9). Vegetation studies were conducted to evaluate baseline vegetation community information and determine the presence of special status plant species, butterfly host plants, and noxious weed and invasive plant species. The following sections present the study methodology, results, and discussion for each of the resource sections included as part of the biological baseline studies for vegetation conducted in 2021.

Vegetation communities within the three survey areas (Goldstrike, Carlin, and Crescent Valley) consist of sagebrush steppe and grassland communities and riparian areas along perennial streams and rivers. Section 3.1, Ecological Site Description, describes vegetation communities and rangeland health. Vegetation communities in the Project Area include agricultural; lands developed for roads, railways, and residences; and recently mined areas. Agricultural activities, historical mining activities, livestock rotation, and wildfire have altered the landscape by disturbing native soils, vegetation, and local hydrology throughout portions of the Project Area. Soils and hydrology within the Project Area provide wildlife habitat including host species for special status butterflies, such as monarch butterflies, Nevada viceroy, and Mattoni's blue butterflies.

3.3.1. Special Status Plant Species

3.3.1.1. Background

In addition to administering conservation programs for species listed under the ESA, the BLM also administers programs for sensitive species under guidance from Manual 6840, Special Status Species Management (BLM 2008b). BLM Special Status Species are federal candidate species for listing as threatened or endangered under the provisions of the Act, and those designated by the Director or individual State Directors as BLM sensitive. In addition, the BLM has incorporated into the Special Status Species list the species and subspecies of native plants that are considered to be critically endangered and threatened with extinction (NAC § 527.010). There are 49 BLM plant species listed as sensitive on lands administered by the Battle Mountain and Elko Field offices. Table C.1-1 in Appendix C lists the BLM special status species, their habitat, and the potential for the species to occur in the Project Area.

The purpose of these surveys was to inform future impact analyses on the occurrence and status of special status plant species per the BLM policy, *Survey Protocols Required for NEPA/ESA Compliance for BLM Special Status Plant Species* (BLM 2009). The objective of the vegetation baseline studies was to collect sufficient information to characterize the affected environment for special status plant species that may be present in the Project Area.

Topography within the Project Area is valley floors and alluvial fans that are interspersed with ephemeral, intermittent and perennial streams. Portions of the Crescent Valley Survey Area

(see Figure 2-6 through Figure 2-9) contain playa areas and human-made structures that influence local hydrology and soils.

3.3.1.2. Study Methodology

A pre-field review of BLM special status species lists (BLM 2017b, 2019a); NDNH, NWI, NHD, USGS seeps and springs, NRCS SSURGO, and SWReGAP land cover type data, was completed to identify potentially suitable habitat and to assess which special status plant species were present in the Project Area.

The following protocols were used in this survey:

- *Vegetation and Soils – Baseline Data Collection* (BLM 2014a)
- *Survey Protocols Required for NEPA/ESA Compliance for BLM Special Status Plant* Species (BLM 2009)

Surveys for special status plant species were conducted concurrently with surveys for noxious weeds and invasive plants, and butterfly host plants per the BLM protocols identified above.

Field crews conducted pedestrian surveys for special status plant species from May 18, 2021, through August 31, 2021. Per protocol, if a special status plant species was observed, field crews recorded the Universal Transverse Mercator (UTM) coordinates, collected geo-referenced photographs, estimated the species population size, and noted associated habitat type and plant species.

3.3.1.3. Results and Discussion

Pre-Field Results

The potential for the 49 special status plant species to occur in the Project Area is based on range and habitat requirements, known distribution, SWreGAP land cover type, NNHD vegetation, soils, waters and wetlands, and location of known occurrences in relation to the Project Area (NatureServe 2021). Figure 3.3-1 through Figure 3.3-7 show the SSURGO soils, waters, wetlands, and topography that influence where special status plant species habitat could occur in the Project Area. Based on this evaluation, 14 BLM sensitive plant species are considered to have potential to occur in or near the Project Area. Table 3.3-1 presents information on the range and habitats associated with the 14 special status plant species and their potential to occur in the Project Area. However, there are no documented occurrences of the 14 special status plant species in the Project Area based on NDNH data.

Table 3.3-1: Potential Special Status Plant Species within the Project Area

Species Name	Range and Habitat Requirements	Potential for Occurrence in or near Project Area	BLM District Office
Alkali ivesia (*Ivesia kingii* var. *kingii*)	Sagebrush scrub, alkali sink, wetland-riparian; meadows, playas. Known populations are from Inyo and Mono Counties, California, and from western Nevada, and southwestern Utah.	Low potential as the known populations are several hundred miles southwest of the Project Area.	Battle Mountain and Elko
Broad fleabane (*Erigeron latus*)	Shallow, relatively barren, vernally saturated, otherwise dry, gravelly to sandy soils or bedrock on flats and slopes of volcanic scablands or benches, mostly rhyolitic or basaltic in composition. Found at elevations of 5,250 to 6,560 in the sagebrush steppe and juniper vegetation communities.	Low potential as the known populations are from elevations higher than those in the Project Area.	Elko
Davis peppercress (*Lepidium davisii*)	Hard-bottomed clay playas on volcanic plains in the sagebrush zone with sparse associated *Atriplex confertifolia* and *Artemisia cana*, surrounded by *Artemisia tridentata* vegetation; during spring, the playas are usually inundated up to a foot deep; aquatic or wetland-dependent in Nevada.	Moderate potential as suitable habitat is within the Project Area.	Battle Mountain and Elko
Deeth buckwheat (*Eriogonum nutans* var. *glabratum*)	Sandy, gravelly soil; flats and slopes in saltbush and sagebrush vegetation communities at elevations from 4,900 to 6,200 feet.	Low potential as the known populations are from elevations higher than those in the Project Area.	Battle Mountain and Elko
Eastwood milkweed (*Asclepias eastwoodiana*)	In open areas on a wide variety of basic (pH usually 8 or higher) soils, including calcareous clay knolls, sand, carbonate or basaltic gravels, or shale outcrops, generally barren and lacking competition, frequently in small washes or other moisture-accumulating microsites, in the shadscale, mixed-shrub, sagebrush, and lower pinyon-juniper zones. Known to occur in Esmeralda, Lander, Lincoln, and Nye counties, Nevada at elevations between 3,500 to 7,000 feet.	Moderate potential as suitable habitat is within the Project Area.	Battle Mountain and Elko
Elko rockcress (*Boechera falcifructa*)	Dry, densely vegetated, relatively undisturbed, light-colored silty soils with a high cover of moss and other soil crust components on moderate to steep north-facing slopes in the sagebrush zone, dominated by moss, *Artemisia tridentata* var. *wyomingensis, Chrysothamnus viscidiflorus* var. *puberulus, and Poa secunda* var. *secunda*. Also reported but not confirmed from rock crevices.	Moderate potential as suitable habitat is within the Project Area.	Battle Mountain and Elko
Goose Creek milkvetch	Although most occurrences are restricted to specific sandy rhyolitic ash deposits, some	Low potential as the known populations	Elko

Species Name	Range and Habitat Requirements	Potential for Occurrence in or near Project Area	BLM District Office
(*Astragalus anserinus*)	have been observed spreading into sandy soils of the adjacent zonal sagebrush vegetation with little apparent rhyolitic ash content. Known in Nevada from the Goose Creek drainage, Delano Mountains, and Owyhee Desert.	are geographically distant from the Project Area.	
Grimy mousetails (*Ivesia rhypara* var. *rhypara*)	Mostly on dry, relatively barren, yellowish or light-colored outcrops or badlands of welded, sometimes hydrothermally altered and re-cemented, ash-fall tuff, and on shallow gravel grus derived therefrom, in one case on unsorted cobbly riverbed deposits mixed with underlying volcanic ash, on gentle to steep side, shoulder, or toe slopes with east to south to west aspects, with few and sparse associated species such as *Trifolium andersonii, Poa secunda*, *Ericameria nauseosa*, and *Achnatherum hymenoides*.	Moderate potential as suitable habitat is within the Project Area.	Elko
Grimes vetchling (*Lathyrus grimesii*)	Dry, open, shallow, silty clay soils usually overlain by a thin scree of reddish to yellowish brown gravel floated from an underlying cherty or partly quartzitized mudstone component of the Schoonover Formation, forming relatively barren patches on mostly steep slopes of all aspects, and supporting a sparse to moderately dense vegetation.	Low potential as the known populations are found on landforms not present in the Project Area.	Elko
Least phacelia (*Phacelia minutissima*)	Inhabits vernally saturated, summer-drying, sparsely vegetated, partially shaded to fully exposed areas of bare soil and mud banks in meadows, in sagebrush swales, along creek bed high-water lines, or around springs, in flat to gently sloping areas; aquatic or wetland-dependent. Found at moderate elevations.	Moderate potential as suitable habitat is within the Project Area.	Elko
Lewis buckwheat (*Eriogonum lewisii*)	Dry, exposed, shallow, relatively barren and undisturbed, rocky residual soils on convex ridgeline knolls and crests underlain by siliceous carbonate rocks, on flat to moderately steep slopes of all aspects, but with the densest stands on southerly aspects; occasionally found at lower elevations on clay hills derived from silty carbonate or calcium-rich siliceous rock.	Moderate potential as suitable habitat is within the Project Area.	Elko

Species Name	Range and Habitat Requirements	Potential for Occurrence in or near Project Area	BLM District Office
Meadow pussytoes (*Antennaria arcuata*)	Known from 34 extant occurrences (29 in Wyoming, 4 in Nevada, and 1 in Idaho). Bare, periodically disturbed soil in marginal, seasonally dry parts of moist, often hummocky, alkaline meadows, seeps, and springs, surrounded by sagebrush and grassland associations; aquatic or wetland dependent. Plant populations found at elevations of 4,900 to 7,900 feet.	Moderate potential as suitable habitat is within the Project Area.	Elko
Obscure buttercup (*Ranunculus triternatus*)	Meadow steppe habitat dominated by bunchgrasses and forbs; mostly found on north-facing upper slopes and crests of basalt ridges overlaid by loess deposits of varying depth.	Low potential as the known populations are found on landforms not present in the Project Area.	Elko
Owyhee prickley phlox (*Leptodactylon glabrum*)	Occurs in crevices in steep to vertical, coarse-crumbling volcanic canyon walls, especially on rhyolitic cliffs. It is intolerant of water paths or seeps that may form in the rock crevices. Populations have been found in the Little Humboldt River watershed in northern Nevada at elevations between 2,790 to 5,200 feet.	Low potential as the known populations are found on landforms not present in the Project Area.	Elko

Source: BLM 2017b, 2019a; NatureServe 2021

Section 3.1, Ecological Site Description, describes the soil texture and general characteristics in the Project Area. Soils in MLRAs 24 and 25 indicate soils in the Project Area developed from alluvium, calcareous shales and silts, tuffaceous sedimentary rocks, and sedimentary and volcanic geology (USGS 2021a; Stringham et al. 2015a, 2017). In addition to the soils, portions of the Project Area have been modified by agriculture, mining, utilities and roads.

The SWReGAP land cover in the Project Area consists of mostly Intermountain Basin Big Sagebrush Shrublands, Inter-Mountain Greasewood Flat, and Invasive Annual and Biennial Forblands (see Table 3.1-4 for additional detail). The vegetation communities in the Project Area include areas of mixed salt desert scrub, grasslands, emergent marshes and rocky outcrops and cliffs. Figures 2.1-1 through 2.1-3 show the SWreGAP land cover types in the Project Area. Elevations in the Project Area range from approximately 4,700 feet to 5,800 feet amsl. The lowest elevations are in the Carlin and Crescent Valley survey areas near the Humboldt River. The highest elevation is the Richmond Summit in the Goldstrike Survey Area. Slopes in the Project Area are flat to gently sloping except in the Richmond Summit area (Goldstrike Survey Area), Welches Canyon area (Goldstrike Survey Area), and southwest of Carlin area (Carlin Survey Area). In these areas, slopes range from gently sloping to moderately steep.

Field Survey Results

Field surveys were conducted in the Project Area for the 14 special status plant species from mid-May through early-July 2021. These systematic pedestrian surveys were conducted throughout the Project Area, and field crews examined microhabitats that could potentially support the special status plants species listed in Table 3.3-1. Playa areas, seeps and spring areas, and perennial streams were also surveyed. Playa edges, wetlands, and other unique habitat types were searched for the 14 special status plant species. During the surveys conducted during the 2021 field season, none of the 14 plant species listed in Table 3.3-1 were observed.

Although reference populations and regional rainfall amounts were monitored, potential remains for a false negative survey result. Based on the range and habitats where the 14 species listed in Table 3.3-1 could be present in the Project Area, the vegetation community composition is dominated by native plant species. Section 3.1, Ecological Site Description, describes the vegetation communities in the Project Area and the sites where the vegetation community has transitioned to a cheatgrass (*Bromus tectorum*) or annual forb dominated community. Cheatgrass is effective at using soil water in the upper soil layers, which may inhibit the establishment of native plant species (Germino et al. 2016; Kulpa et al. 2012). The presence of cheatgrass throughout the Project Area may affect the establishment of native plants, including special status species.

3.3.2. Butterfly Host Plants

3.3.2.1. Background

There are 25 BLM insect species listed as sensitive on lands administered by the Battle Mountain and Elko Field offices, and 3 of these species are butterflies. Within the Project Area, vegetation communities may contain milkweed (*Asclepias* spp*.),* slender buckwheat *(Eriogonum microthecum* var. *laxiflorum)* and other host plant species for Monarch butterfly *(Danaus plexippus),* Mattoni's blue butterfly *(Euphilotes pallecens mattonii),* and Nevada viceroy butterfly *(Limenitis archippus lahontani)* (USFWS 2011, Border et al. 2012, NatureServe 2021). Host plants for adult Nevada viceroy butterflies, which resemble adult Monarch butterflies, are willows *(Salix* spp*.),* cottonwoods *(Populus spp.)* and plants with composite flowers (Opler et at. 1999).

Pre-field assessment and field surveys were conducted within the Project Area (Project footprint plus a 200-foot-wide buffer of the centerline), as shown on Figure 2-1 through Figure 2-9. The purpose of the butterfly host plant surveys is to evaluate potential future Project impacts on host plants for Monarch, Mattoni's blue, and Nevada viceroy butterfly species. Surveys for these three butterfly species are presented in Section 3.4.12, Butterflies.

3.3.2.2. Study Methodology

A pre-field (desktop) assessment was conducted using data from NDNH, BLM, NWI, NHD, and SWreGAP land cover types to identify areas with the potential for host plant species to occur.

The following protocols were used in this survey:

- *Initial Survey Instructions for Western Monarch and Milkweed Habitat Suitability Assessment* (USFWS 2016)
- Crucial Habitat Assessment Tool (WAFWA 2021)

Pedestrian field surveys were conducted throughout the Project Area from June 12, 2021, through July 24, 2021. In areas where a butterfly host species was observed, field crews recorded the UTM, collected geo-referenced photographs, estimated the species population size, and noted associated habitat type and plant species. Areas where butterfly host plant species were found were also mapped by walking the area before collecting data, as small plants may be more difficult to observe, thus underestimating the area where the species occur. To capture plant species occurrence data at the appropriate scale, these general protocols were adhered to:

- Points were used for small occurrences measuring up to one-tenth acre in size.
- Lines were used for linear features such as roads, streams, and fence lines.
- Polygons were used for irregular shaped areas greater than one-tenth of an acre in size.

Butterfly host plant species were mapped separately, with each point, line, or polygon feature consisting of only one species. Milkweed species were identified to genus and, where possible, to species based on floristic characteristics. Field crews recorded the percent canopy cover of the butterfly host plant species.

3.3.2.3. Results and Discussion

Pre-Field Results

Milkweed species can be found within a wide range of habitats including xeric or riparian grasslands, shrublands, and woodlands or disturbed areas (Xerces Society 2012; and Border et al. 2012). There are 13 milkweed species native to Nevada. Six of these milkweed species have been found in Elko, Eureka, or Lander counties and have potential to occur in the Project Area (Table 3.3-2). Table C.1-2 lists the 13 milkweed species and their potential to occur in the Project Area. Section 3.1.3.2, Field Survey, describes the vegetation communities and surface soil textures. Section 3.1.3.1, Pre-Field Assessment, describes soil characteristics such as parent material, and Section 3.1.3.2 includes surface soil textures at each of the soil pits dug within the Project Area.

Table 3.3-2: Nevada Milkweed Species with Potential to Occur in Project Area

Common Name	Scientific Name	Range and Habitat
Pallid milkweed or Davis' milkweed	*Asclepias cryptoceras*	Species distribution includes locations in Elko, Eureka, and Lander counties. Species grows in dry, open, barren clay, sand, gypsum, or serpentine soils in sagebrush, salt desert shrublands, or pinyon-juniper vegetation communities. Plants are found at elevations between 2,460 to 8,200 feet and bloom May through June.
Desert milkweed	*Asclepias erosa*	Species distribution includes locations in Lander County. Dry washes, canyons, and roadsides in creosote, shadscale, and sometimes sagebrush vegetation communities. Plants are found at elevations between 500 to 6,725 feet and blooms April to August.
Hall's milkweed	*Asclepias halii*	Species distribution includes locations in Elko and Lander counties. Species found on rocky slopes or roadsides in sagebrush steppe, pinyon-juniper woodlands, ponderosa pine forests and mixed conifer forests. Plants are found at elevations from 6,000 to 8,000 feet and blooms from June to August.
Narrow leaf milkweed	*Asclepias fascicularis*	Species distribution includes locations in Elko County. Species found in pinyon-juniper, sagebrush, and mountain brush communities in moist to dry areas along streams, roadsides, and agricultural fields. Plants are found at elevations from 1,649 to 6,560 feet and bloom from June to August.
Showy milkweed	*Asclepias speciosa*	Species distribution includes locations in Elko, Eureka, and Lander counties. Tolerant of alkaline soils, the species is found in moist to moderately moist, soil in open and sunny areas including wetlands, meadows, and along streams, roads, and railways where there is adequate moisture. Plants are found at elevations between 500 to 8,200 feet and bloom May through August.
Spider milkweed	*Asclepias asperula*	Species distribution includes locations in Elko County. Species grows in gravelly and rocky soil or on exposed talus slopes in pinyon-juniper, sagebrush, and mountain brush communities, Plants are found at elevations between 4,100 to 9,022 feet and bloom from May to July.

Source: Kartesz 2015; Nabhan et al. 2015; Border et al. 2012

Slender buckwheat is found in sagebrush mixed grasslands, salt-desert scrub and juniper woodland vegetation communities. Slender buckwheat grows on sandy or gravel soils at elevations between 330 to 8,200 feet amsl and blooms April through November ('eFloras 2021; NatureServe 2021). Species distribution includes Elko, Eureka, and Lander counties (Kartesz 2015). SWreGAP land cover types where willow and cottonwood species are found along perennial streams include Great Basin Foothill and Lower Montane Riparian Woodland and Shrublands (USGS 2005). Composite flowering plants are present throughout the Project Area in all of the vegetation communities.

Field Survey Results

Pedestrian field surveys for butterfly host plants were conducted within the Project Area as part of special status plant surveys. Field crews documented two species of Monarch host plants (23 occurrences of narrow leaf milkweed [*Asclepias fascicularis*] and six occurrences of showy milkweed [*Asclepias speciose]*) in the Project Area. Table 3.3-3 shows the number of occurrences of milkweed and slender buckwheat butterfly host plants in the Project Area. Narrow leaf milkweed was most abundant and found near agricultural fields in the Project Area and riparian areas along the Humboldt River and Welches Creek (Figure 3.3-8 through Figure 3.3-12). One location of this species was found in the Crescent Valley Survey Area along an ephemeral stream along the east side of the loading/unloading loop. The six occurrences of showy milkweed were in Goldstrike and Carlin survey areas (Figure 3.3-10 and Figure 3.3-11).

Observations of these two species ranged from individual isolated plants to clusters of 30 to 50 plants found in four areas, two clusters in the Goldstrike Survey Area (Figure 3.3-9 and Figure 3.3-10), and one cluster in the Carlin and Crescent Valley survey areas (Figure 3.3-11 and Figure 3.3-12, respectively). The acreage of milkweed clusters in the survey areas is shown in Table 3.3-4. Approximately 0.3 acre of narrow leaf milkweed was found in the Goldstrike and Crescent Valley survey areas. A 0.02-acre (approximately 870 square feet) cluster of showy milkweed was found in the Carlin Survey Area.

In addition to the 29 milkweed species (23 narrow leaf milkweed and 6 showy milkweed) occurrences found during surveys, field crews observed slender buckwheat within the Welches Creek summit borrow source area (Figure 3.3-9 and Table 3.3-3). The slender buckwheat plants were found on a north-facing slope with rocky loamy soils at an elevation of approximately 5,990 feet (Figure 3.3-10).

Table 3.3-3: Milkweed and Slender Buckwheat Plant Occurrences in the Survey Areas

Species	Number of Occurrences			
	Goldstrike	**Carlin**	**Crescent Valley**	**Total**
Narrow leaf milkweed *(Asclepias fascicularis)*	13	1	9	23
Showy Milkweed (*Asclepias speciose*)	2	4	0	6
Total	**15**	**5**	**9**	**29**
Slender buckwheat (*Eriogonum microthecum* var. *laxiflorum*)	1	0	0	1
Total	**16**	**5**	**9**	**30**

Table 3.3-4: Milkweed Clusters (Acres) in the Survey Areas

Species	Acres			
	Goldstrike	Carlin	Crescent Valley	Total
Narrow leaf milkweed *(Asclepias fascicularis)*	0.2	0	0.06	0.3
Showy Milkweed (Asclepias speciose)	0	0.02	0	0.02

Host plants for the Nevada viceroy larvae include willows and cottonwoods; adults may feed on plants with composite flowers, such as rubber rabbitbrush (*Ericameria nauseosa*) and big sagebrush (*Artemisia tridentata*) (Sourakov 2009). Plants with composite flowers are found in all of the land cover types within the Project Area. Willow species were found in the Goldstrike and Carlin survey areas (Figure 3.3-10 and Figure 3.3-11). These small clusters of willows were found in riparian areas associated with Welches Creek and the Humboldt River. Cottonwood trees, which are also a Nevada viceroy host plant species, are near the Humboldt River outside of the Project Area.

3.3.3. Noxious Weeds and Invasive Plants

3.3.3.1. Background

A “noxious weed” is defined in Nevada as any species of plant that is, or is likely to be, detrimental or destructive and difficult to control or eradicate (NRS 555.005). BLM considers plants “invasive” if they have been introduced into an environment where they did not evolve. Federal agencies are directed to prevent the introduction of noxious and invasive species and to follow an Invasive Species Management Plan (Federal Noxious Weed Act 1974 and 1990, Executive Order 13112, and Executive Order 13751). As such, the objective of this survey was to assess the current status of noxious weeds in the Project Area to inform future weed management measures.

NRS 555.150 requires every landowner or occupier within the State of Nevada, including private, city, county, or federal entities, to control all noxious weeds. NAC 555.101 lists the designation and categories of noxious weeds as described in NRS 555.130. Noxious weeds are classified as A, B or C (NRS 555.005).

- Category A weeds are generally not found or are limited in distribution throughout the state. Such weeds are subject to active exclusion from the state and active eradication wherever found, and require active eradication from the premises of a dealer of nursery stock.
- Category B weeds are generally established in scattered populations in some counties of the state. Such weeds are subject to active exclusion where possible and active eradication from the premises of a dealer of nursery stock.
- Category C weeds are generally established and generally widespread in many counties of the state.

In addition to noxious weeds listed by the Nevada Department of Agriculture (NDA), the Nevada Cooperative Extension identified 60 plant species as nuisance weeds. Nuisance weeds can have impacts similar to noxious weeds, but the species is not listed by NDA as a noxious weed. Nuisance weeds are plant species that can spread rapidly and compete with other plant species (Hefner and Kratsch 2018).

Through the National Resources Inventory, NRCS conducts a statistical survey of natural resource conditions and trends on non-federal land in the United States. Rangeland survey of non-federal lands includes information about non-native plant species. These non-native plant species were introduced from other areas and include invasive species and species that are considered beneficial. These species are categorized into five groups of non-native invasive weed (NNIW) species that once introduced become difficult to eradicate (NRCS 2010).

The NDA Noxious Weed Program cooperative weed management areas (CWMAs) work together to address issues associated with noxious weeds in their area. The Project Area includes portions of the Humboldt CWMA and Elko County (NDA 2021a; Elko County 2010). Priority weed species in the Humboldt CWMA are perennial pepperweed or broadleaved pepperweed (*Lepidium latifolium*), hoary cress or white top (*Cardaria draba*), medusahead

(*Taeniatherum caput-medusae*), Scotch thistle (*Onopordum acanthium*), musk thistle (*Carduus nutans*), Canada thistle (*Cirsium arvense*), Russian knapweed (*Rhaponticum [= Acroptilon] repens)*, spotted knapweed (*Centauria [maculosa] biebersteinii*), poison hemlock (*Conium maculatum*), and rush skeletonweed (*Chondrilla juncea*) (NDA 2021a).

3.3.3.2. Study Methodology

Information from NDA, Humboldt CWMA were used to identify potential noxious weed and non-native plant species that could be present in the Project Area. A list of potential federal, state, and county noxious weeds and invasive species was compiled for the field survey from these sources.

The following protocols were used in the field survey:

- *Tiered Sampling Method: Nevada's Protocol* (Wilson et al. 2006)
- *Vegetation and Soils – Baseline Data Collection* (BLM 2014a)

Noxious weeds and invasive plant species were surveyed within the entire Project Area (Project footprint plus a 200-foot-wide buffer of the centerline, as shown on Figure 2-1 through Figure 2-9). Vegetation surveys occurred from May 18, 2021, through August 31, 2021. Field surveys for noxious weeds and invasive plant surveys followed the Tier 1 methods in the established 2006 protocol (Wilson et al. 2006), which includes an emphasis on surveying disturbed sites (such as roadsides) and wet areas.

In Areas where an NDA Category A, B, and C noxious weed was observed, field crews recorded the UTM coordinates, collected geo-referenced photographs, estimated the species population size, and noted associated habitat type and plant species. Areas with any of the Category A, B, and C noxious weeds were mapped by walking the area before collecting data, as smaller plants may be more difficult to observe, thus underestimating the area where the species has become established.

To capture data (point, line, or polygon) at the appropriate scale, these general protocols were adhered to:

- Points were used for small infestations measuring up to one-tenth acre in size.
- Lines were used for linear features such as roads, streams, and fence lines.
- Polygons were used for irregular shaped areas greater than one-tenth of an acre in size.

Noxious weed species were mapped separately, with each point, line, or polygon feature consisting of only one species. Direct overlap of features was used if more than one species occupied the same location as long as the same size and shape were appropriate for the newly copied feature. Field crews recorded the percent canopy cover of noxious weed species.

3.3.3.3. Results and Discussion

Pre-Field Results

Information from the NDA, Humboldt CWMA, and the BLM Nevada Weeds and Invasives Program were reviewed to identify potential noxious weeds and invasive species that could be present in the Project Area. Table C.2-1 in Appendix C lists the Nevada noxious weeds by category.

Noxious weed species reported in the general Project Area include white top, Scotch thistle, muck thistle, Canada thistle, poison hemlock, and common St. Johnswort (*Hypericum perforatum*). Noxious weeds were reported to be especially common along roadsides and at the edges of seeps, springs, or streams (ESCO 2017; Graham and Johnson 2004). Previous studies in the general vicinity noted that the non-native invasive cheatgrass is nearly ubiquitous in northern Nevada (ERM 2018; ESCO 2017). Additional non-native species—crested wheatgrass (A*gropyron cristatum*) and burningbush (*Bassia scoparia*)—were also described as "prevalent... particularly in recently burned and reseeded areas" (ERM 2018).

Land use in the Project Area includes mining, agriculture, livestock grazing, roads, and rural residences. Disturbance, both from land use and natural events, can change vegetation communities. The severity of wildfires, disturbance duration and extent, and vegetation community dynamics influence a vegetation community's resistance to non-native species invasion (Wood et al. 2019). Section 3.1, Ecological Site Description, describes the SWreGAP land cover types in the Project Area, which include areas classified as invasive annual and biennial forblands and invasive annual grasslands. In addition to the surface vegetation community, the seed bank in the Project Area contains non-native invasive plant species seeds, which may prevent establishment of native plant species (Clements et al. 2007).

Field Survey Results

During the 2021 field surveys, 14 species of Category B and C noxious weed species were observed throughout the Project Area. The species, their NDA classification, number of areas, and acreages within the three survey areas are shown in Table 3.3-5. No Category A noxious weed species were observed.

Though most (142) of the 170 locations where Category B and C weeds were mapped are less than 1 acre, one area within the Goldstrike Survey Area (GS-Nox-168, approximately 5 miles north of Dunphy) is approximately 59 acres. Three species (white top, perennial pepperweed, and Tamarisk) were found in this area (Figure 3.3-13). Perennial pepperweed was the dominant species found in this area.

Section 3.1, Ecological Site Description, discusses the status of vegetation communities in the Project Area and their current state. Noxious weed species were found primarily in areas with surface disturbance, with the exception of white top, which was found throughout the entire Project Area (Figure 3.3-13 through Figure 3.3-15).

Table 3.3-5: Acres in Survey Areas with Category B and C Noxious Weeds

BLM Field Office	Survey Area	Number of Areas	Acres within Project Area	Acres outside of Project Area	Total Acres
Tuscarora Field Office	Goldstrike Area	52	128.5	14.3	142.8
	Carlin Area	43	76.8	4.3	81.1
	Crescent Valley Area	29	16.2	1.8	18.8
Mount Lewis Field Office	Crescent Valley Area	46	36.4	2.3	38.7
Project Area Total		170	257.9	22.7	281.4

[a] Noxious weeds where the infestation was less than 1/10 acre are not included in the acres.
[b] Field crews mapped the entire area where Category B and C weeds were established, which could extend outside of the Project Area.

Other noxious weed species observed in the Project Area included spotted knapweed, Russian knapweed, Scotch thistle, and perennial pepperweed. Additional noxious weeds associated with wetlands, depressions, and places where water collect are Canada thistle, musk thistle, perennial or field sowthistle (*Sonchus arvensis*), mayweed chamomile (*Anthemis cotula*), poison hemlock, and tamarisk (*Tamarix* sp.).

The most abundant and widespread species was white top, followed by Scotch thistle and perennial pepperweed. Three species are Class B species (Mayweed, spotted knapweed, and perennial sowthistle). The other 11 noxious weeds observed during the surveys are Class C species (NDA 2021a). While not observed during the surveys, medusahead and ventenata (*Ventenata dubia*; which is also known as wiregrass) have been found in Elko County (NDA n.d.). Appendix C, Table C.2-2 lists the noxious and non-native invasive weed species found during field surveys.

The Goldstrike and Crescent Valley survey areas (Figure 3.3-13 and Figure 3.3-15) include areas used for agriculture. Areas near the agricultural lands are generally where noxious weed species have become established. Noxious weeds are also established along roads, in the Project Area, and the Union Pacific Railroad (UPRR) railway (Figure 3.3-13 through Figure 3.3-19).

The UPRR railway, Interstate 80, and State Highway 278 bisect the Carlin Survey Area (Figure 3.3-14). Scotch thistle was observed at 101 locations, and one occurrence of mayweed chamomile was observed near the UPRR railway at the southern end of the Carlin Survey Area. Spotted and Russian knapweed were also observed in the Carlin and Crescent Valley survey areas (Table 3.3-6).

Table 3.3-6: Number of Noxious Weeds and Invasive Species Observations

Species Name	NDA Class (A, B, C)	Key Characteristics	Number of Observations in Survey Area			Total Number of Observations
			Goldstrike	Carlin	Crescent Valley	
Mayweed chamomile *(Anthemis cotula)*	B	Annual; reproduces by seed		1		1
White top (*Cardaria draba*)	C	Perennial; reproduces through roots and seeds	141	24	241	406
Musk thistle (*Carduus nutans)*	C	Biennial that reproduces by seed and has a deep fleshy taproot		21		21
Spotted knapweed (*Centaurea [maculosa] biebersteinii)*	B	Biennial; reproduces by seed and lateral roots	1	30	29	60
Canada thistle (*Cirsium arvense*)	C	Perennial; reproduces by both roots and seed		6		6
Poison hemlock (*Conium maculatum*)	C	Biennial that reproduces by seed and has a thick, deep taproot		3		3
Perennial or broadleaved pepperweed (*Lepidium latifolium*)	C	Perennial; reproduces by roots and seed	59	46	4	109
Scotch thistle (*Onopordum acanthium*)	C	Biennial; reproduces by seed	56	102	15	173
Russian knapweed (*Rhaponticum repens* formerly *Acroptilon repens*)	C	Perennial; reproduces by roots and seed		29	38	67
Perennial sowthistle (*Sonchus arvensis*)	B	Perennial; reproduces by seed and roots; seed is wind-dispersed		1	1	2
Tamarisk (*Tamarix* spp)	C	Perennial; reproduces by seed, roots and stem fragments	5	1	15	21

3.4. WILDLIFE STUDIES

The survey area for obtaining baseline study data for wildlife includes the Project footprint plus a 200-foot buffer of the centerline (400-foot survey area), borrow source areas, access roads, and construction depots (Figure 2-1 through Figure 2-9). Wildlife studies occurring for the Project were approved by BLM and NDOW and include avian, mammal, aquatic, and invertebrate species. The following sections present the study methodology, results, and discussion for each of these resource sections included as part of the biological baseline studies conducted in 2021.

3.4.1. Wildlife Habitat

Wildlife habitat within the Project Area consists of shrubland and grassland communities with some forblands and riparian areas. Within the majority of the Project Area, these habitats are dominated by invasive vegetation as discussed in Section 3.1, Ecological Site Descriptions, and Section 3.3, Vegetation Studies. Agricultural, developed, and recently mined areas make up a lesser component of the Project Area. Agricultural activities, historical mining activities, livestock rotation, and wildfire have altered the landscape by disturbing native soils, vegetation, and local hydrology throughout portions of the survey area. These habitats within the survey area support a variety of general wildlife species including big game, fish, birds, mammals, bats, reptiles, amphibians, and butterflies.

The NDOW Wildlife Action Plan (WAP) describes wildlife conservation strategies based on 22 “Key Habitats” that occur in the state (Wildlife Action Plan Team 2012). These Key Habitats were derived from SWReGAP, the USGS Geographic Names Information System, and the USGS NHD. The WAP identifies Species of Conservation Priority and groups them into species assemblages. Conservation strategies are directed towards these species' assemblages and consequently address conservation issues related to Key Habitats.

3.4.1.1. Mapping Methods

Section 3.1, Section 3.2, and Section 3.3 present data related to the plant communities occurring in the Project Area. Plant community data was used in conjunction with other supplementary sources, including aerial imagery and SWReGAP data to further describe vegetation communities.

3.4.1.2. Results and Discussion

There are 12 WAP Key Habitats occurring within the Project Area, as shown on Figure 3.4.1-1 through Figure 3.4.1-5. The total acreage of each Key Habitat in the Project Area is shown in Table 3.4.1-1. As mentioned, these Key Habitats are derived in part from the SWReGAP data shown on Figure 2.1-1 through Figure 2.1-3. Descriptions of these Key Habitats are provided below.

Table 3.4.1-1: WAP Key Habitat Acreages in the Project Area

WAP Key Habitat	Acreage in the Project Area
Agricultural Lands	182.2
Barren Landscapes	277.9
Cliffs and Canyons	28.2
Desert Playas and Ephemeral Ponds	155.0
Developed Landscapes	5.8
Grasslands and Meadows	1,482.8
Intermountain Cold Desert Shrub	1,721.2
Intermountain Rivers and Streams	20.1
Lakes and Reservoirs	1.7
Lower Montane Woodlands and Chaparral	0.5
Marshes	5.6
Sagebrush	2,746.0
Total [a]	**6,627**

[a] Approximately 4.9 acres differ from the Project Area acreage due to overlap in the Nevada dataset.

Agricultural Lands

Agricultural Lands in Nevada typically occur from 600 to 7,500 feet in elevation, predominantly in valley bottoms. These areas are considered high value habitats for wildlife, including migratory and breeding birds, mule deer (*Odocoileus hemionus*), and some raptors. Agricultural Lands provide potential wildlife habitat in the form of flooded fields, unharvested crops, and fallow soils. This Key Habitat totals 182.2 acres within the Project Area, most of which occurs in the Goldstrike Survey Area with some in the Crescent Valley Survey Area.

Barren Areas

Historically disturbed areas or areas experiencing ongoing disturbance make up Barren Areas. These locations lack resources, limiting vegetative cover. Although these areas have restricted plant cover, they provide potential habitat for some wildlife species. For example, burrowing owls (*Athene cunicularia*) are known to inhabit Barren Areas, including along roadways. This Key Habitat may also provide corridors for wildlife migration between adjacent habitats. Barren Areas within the Project Area consist of roads, historical or active grazing areas, and historical or active mining areas. Barren Areas make up a significant portion of the total Project Area (277.9 acres).

Cliffs and Canyons

The Cliff and Canyon Key Habitat occurs sparsely within the Project Area (28.2 acres), predominantly within the Welches Creek Borrow Source of the Goldstrike Survey Area. These areas consist of steep slopes or vertical cliff faces with little or no vegetative cover. Cliffs and Canyons provide important shelter from predators and nesting, roosting, and denning areas for wildlife. Various raptor and bat species may utilize this Key Habitat. Additionally, other mammals and reptiles may utilize these areas for protection from predators, denning, or basking.

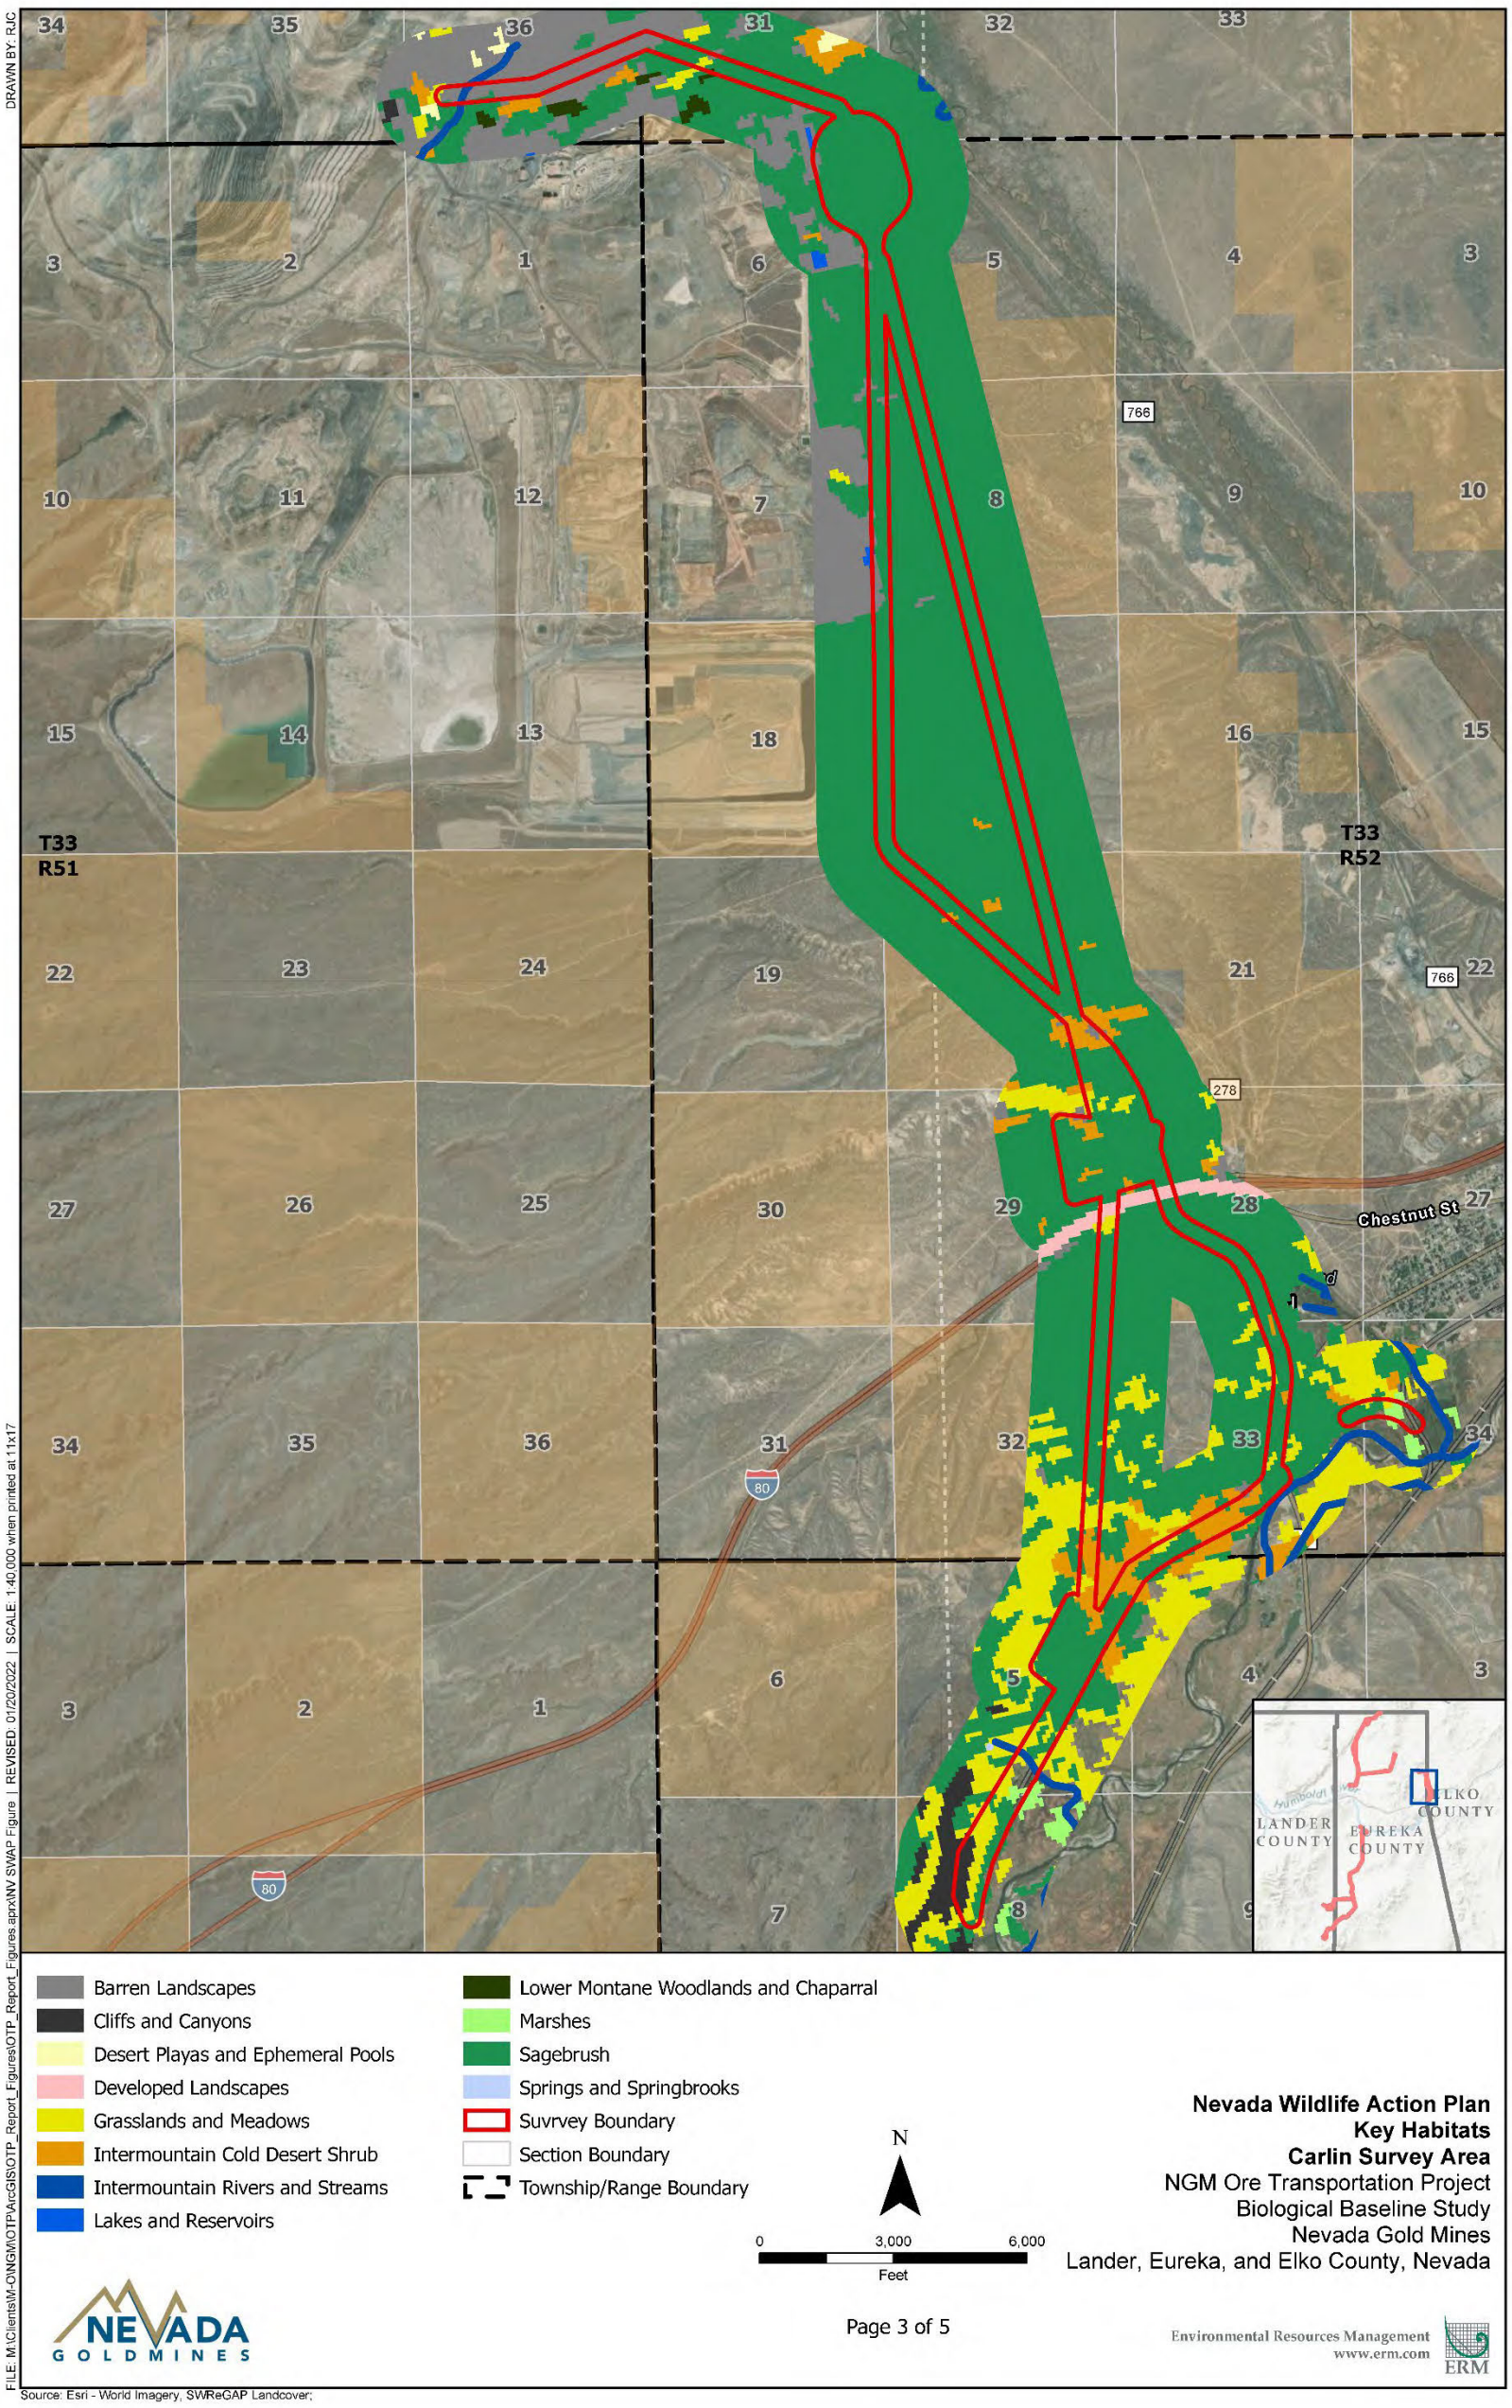

Figure 3.4.1-3: Nevada WAP Key Habitats—Carlin Survey Area

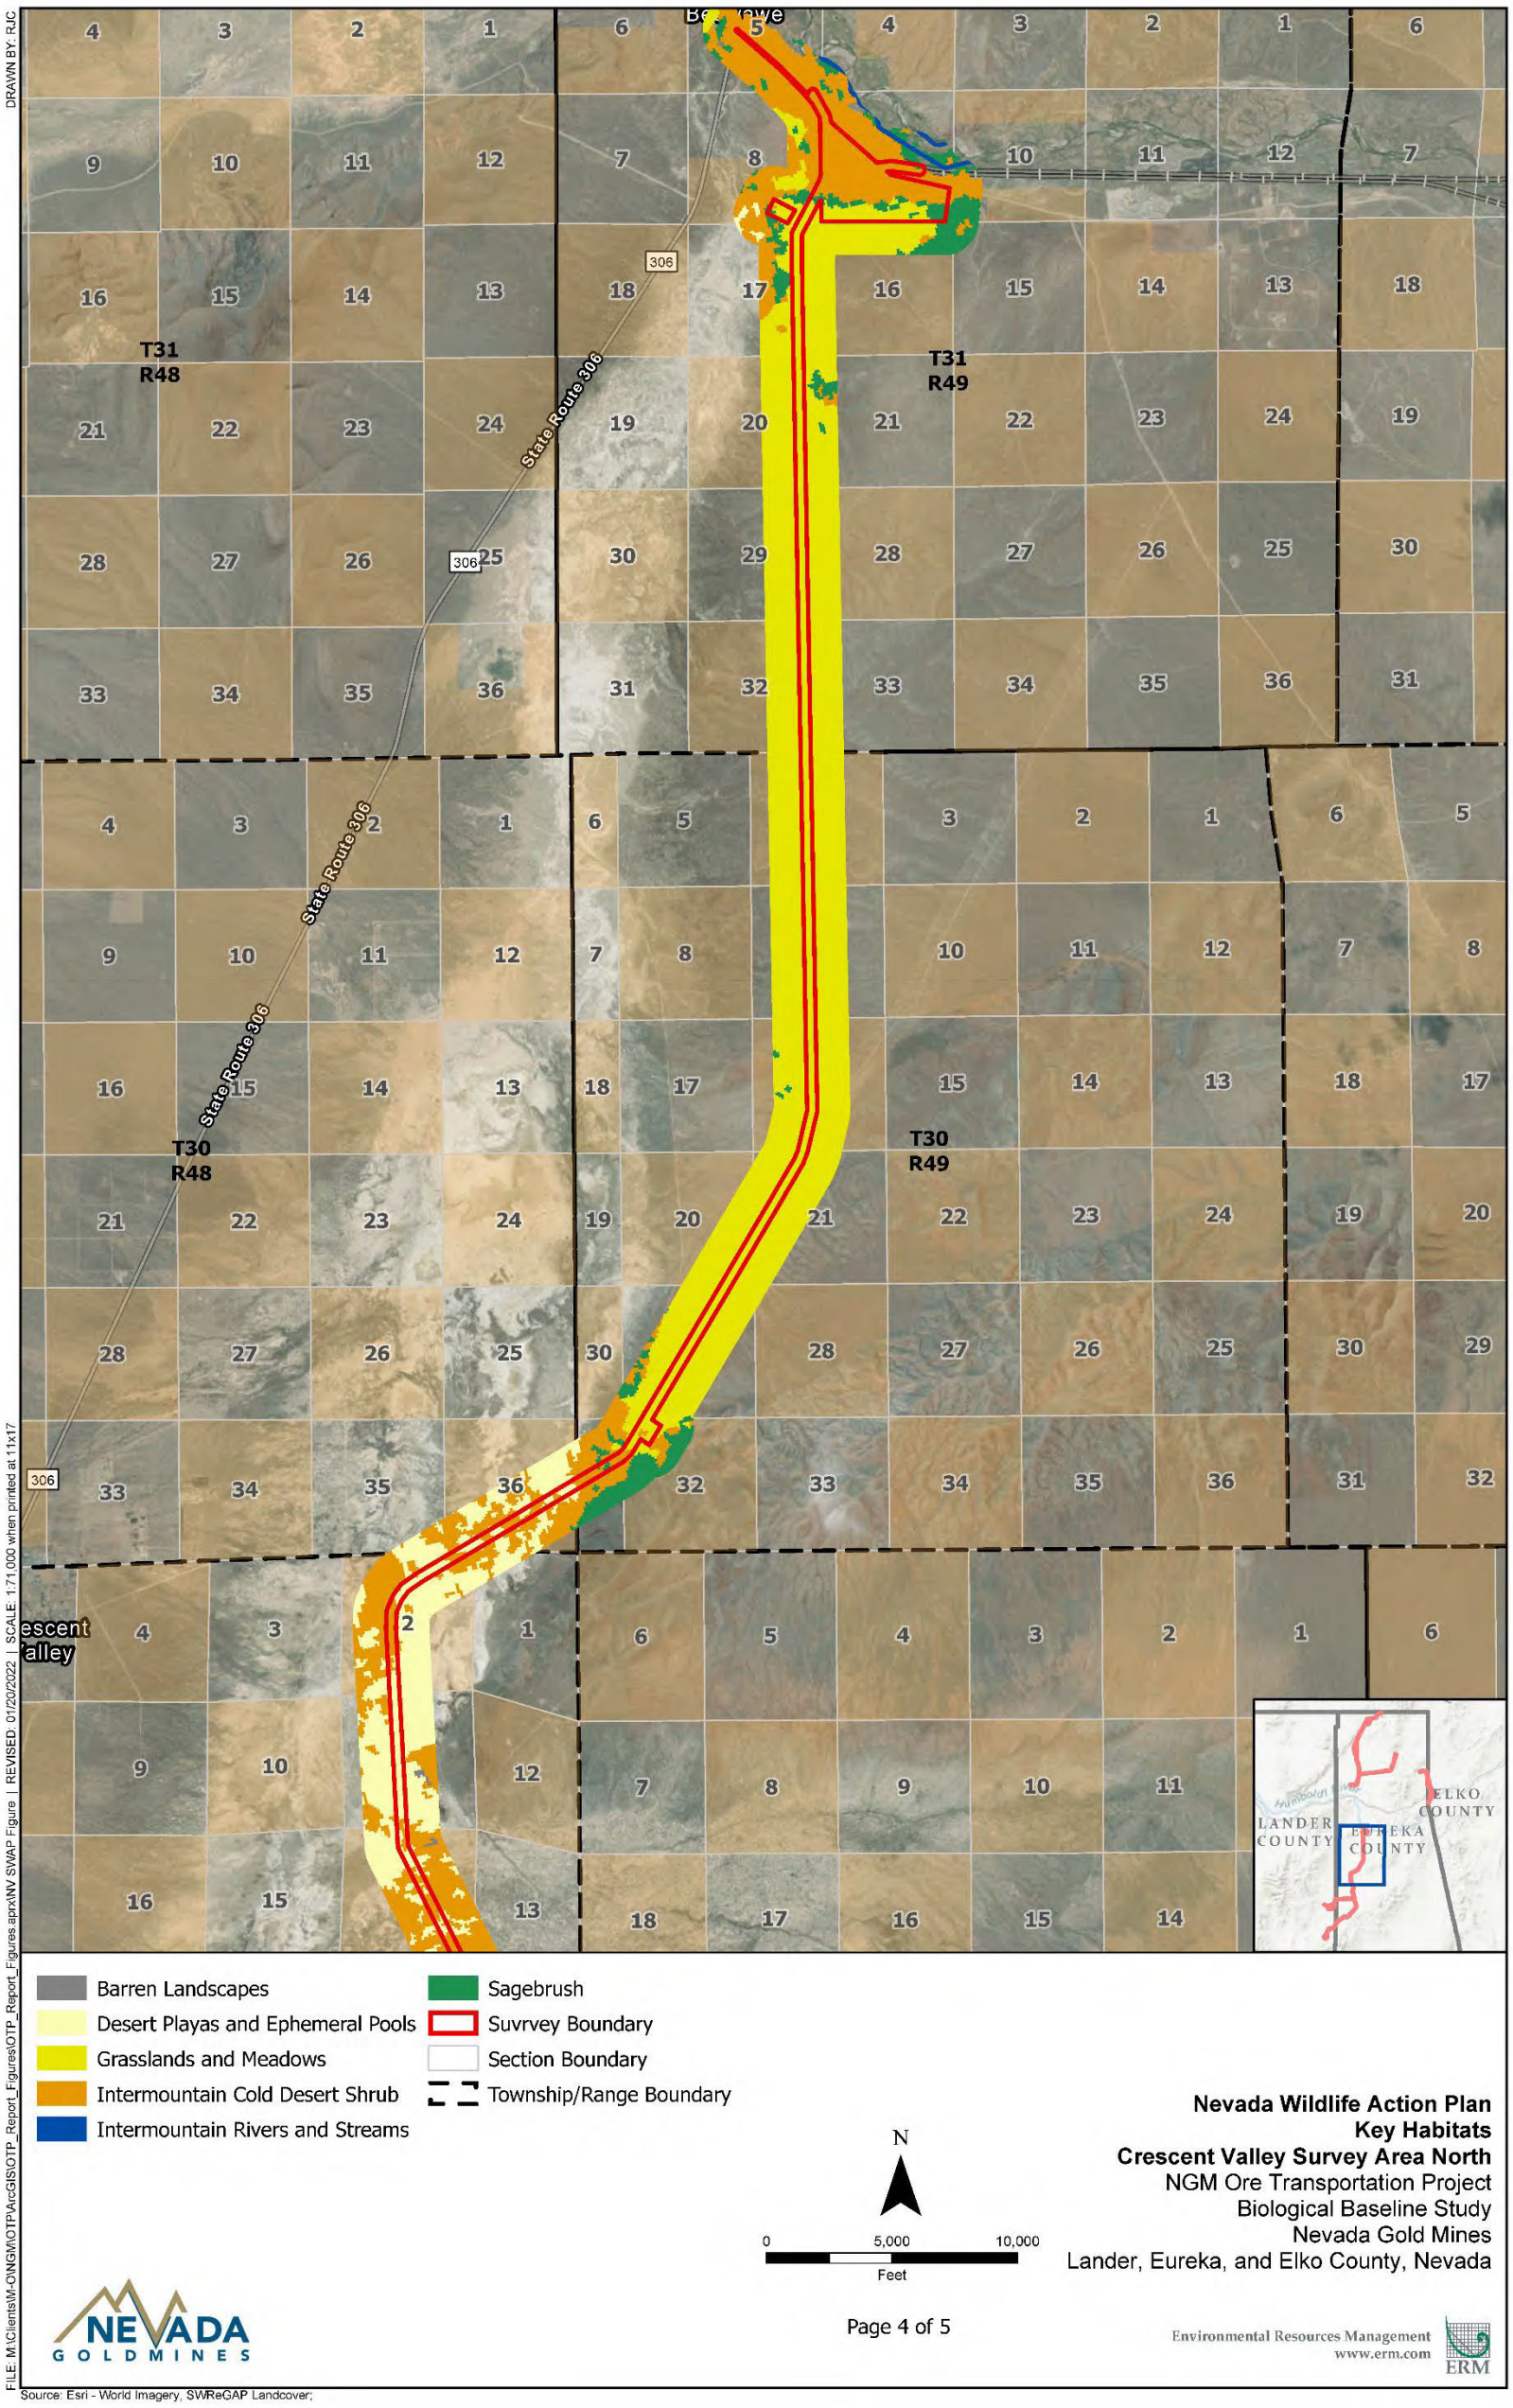

Figure 3.4.1-4: Nevada WAP Key Habitats—Crescent Valley Survey Area North

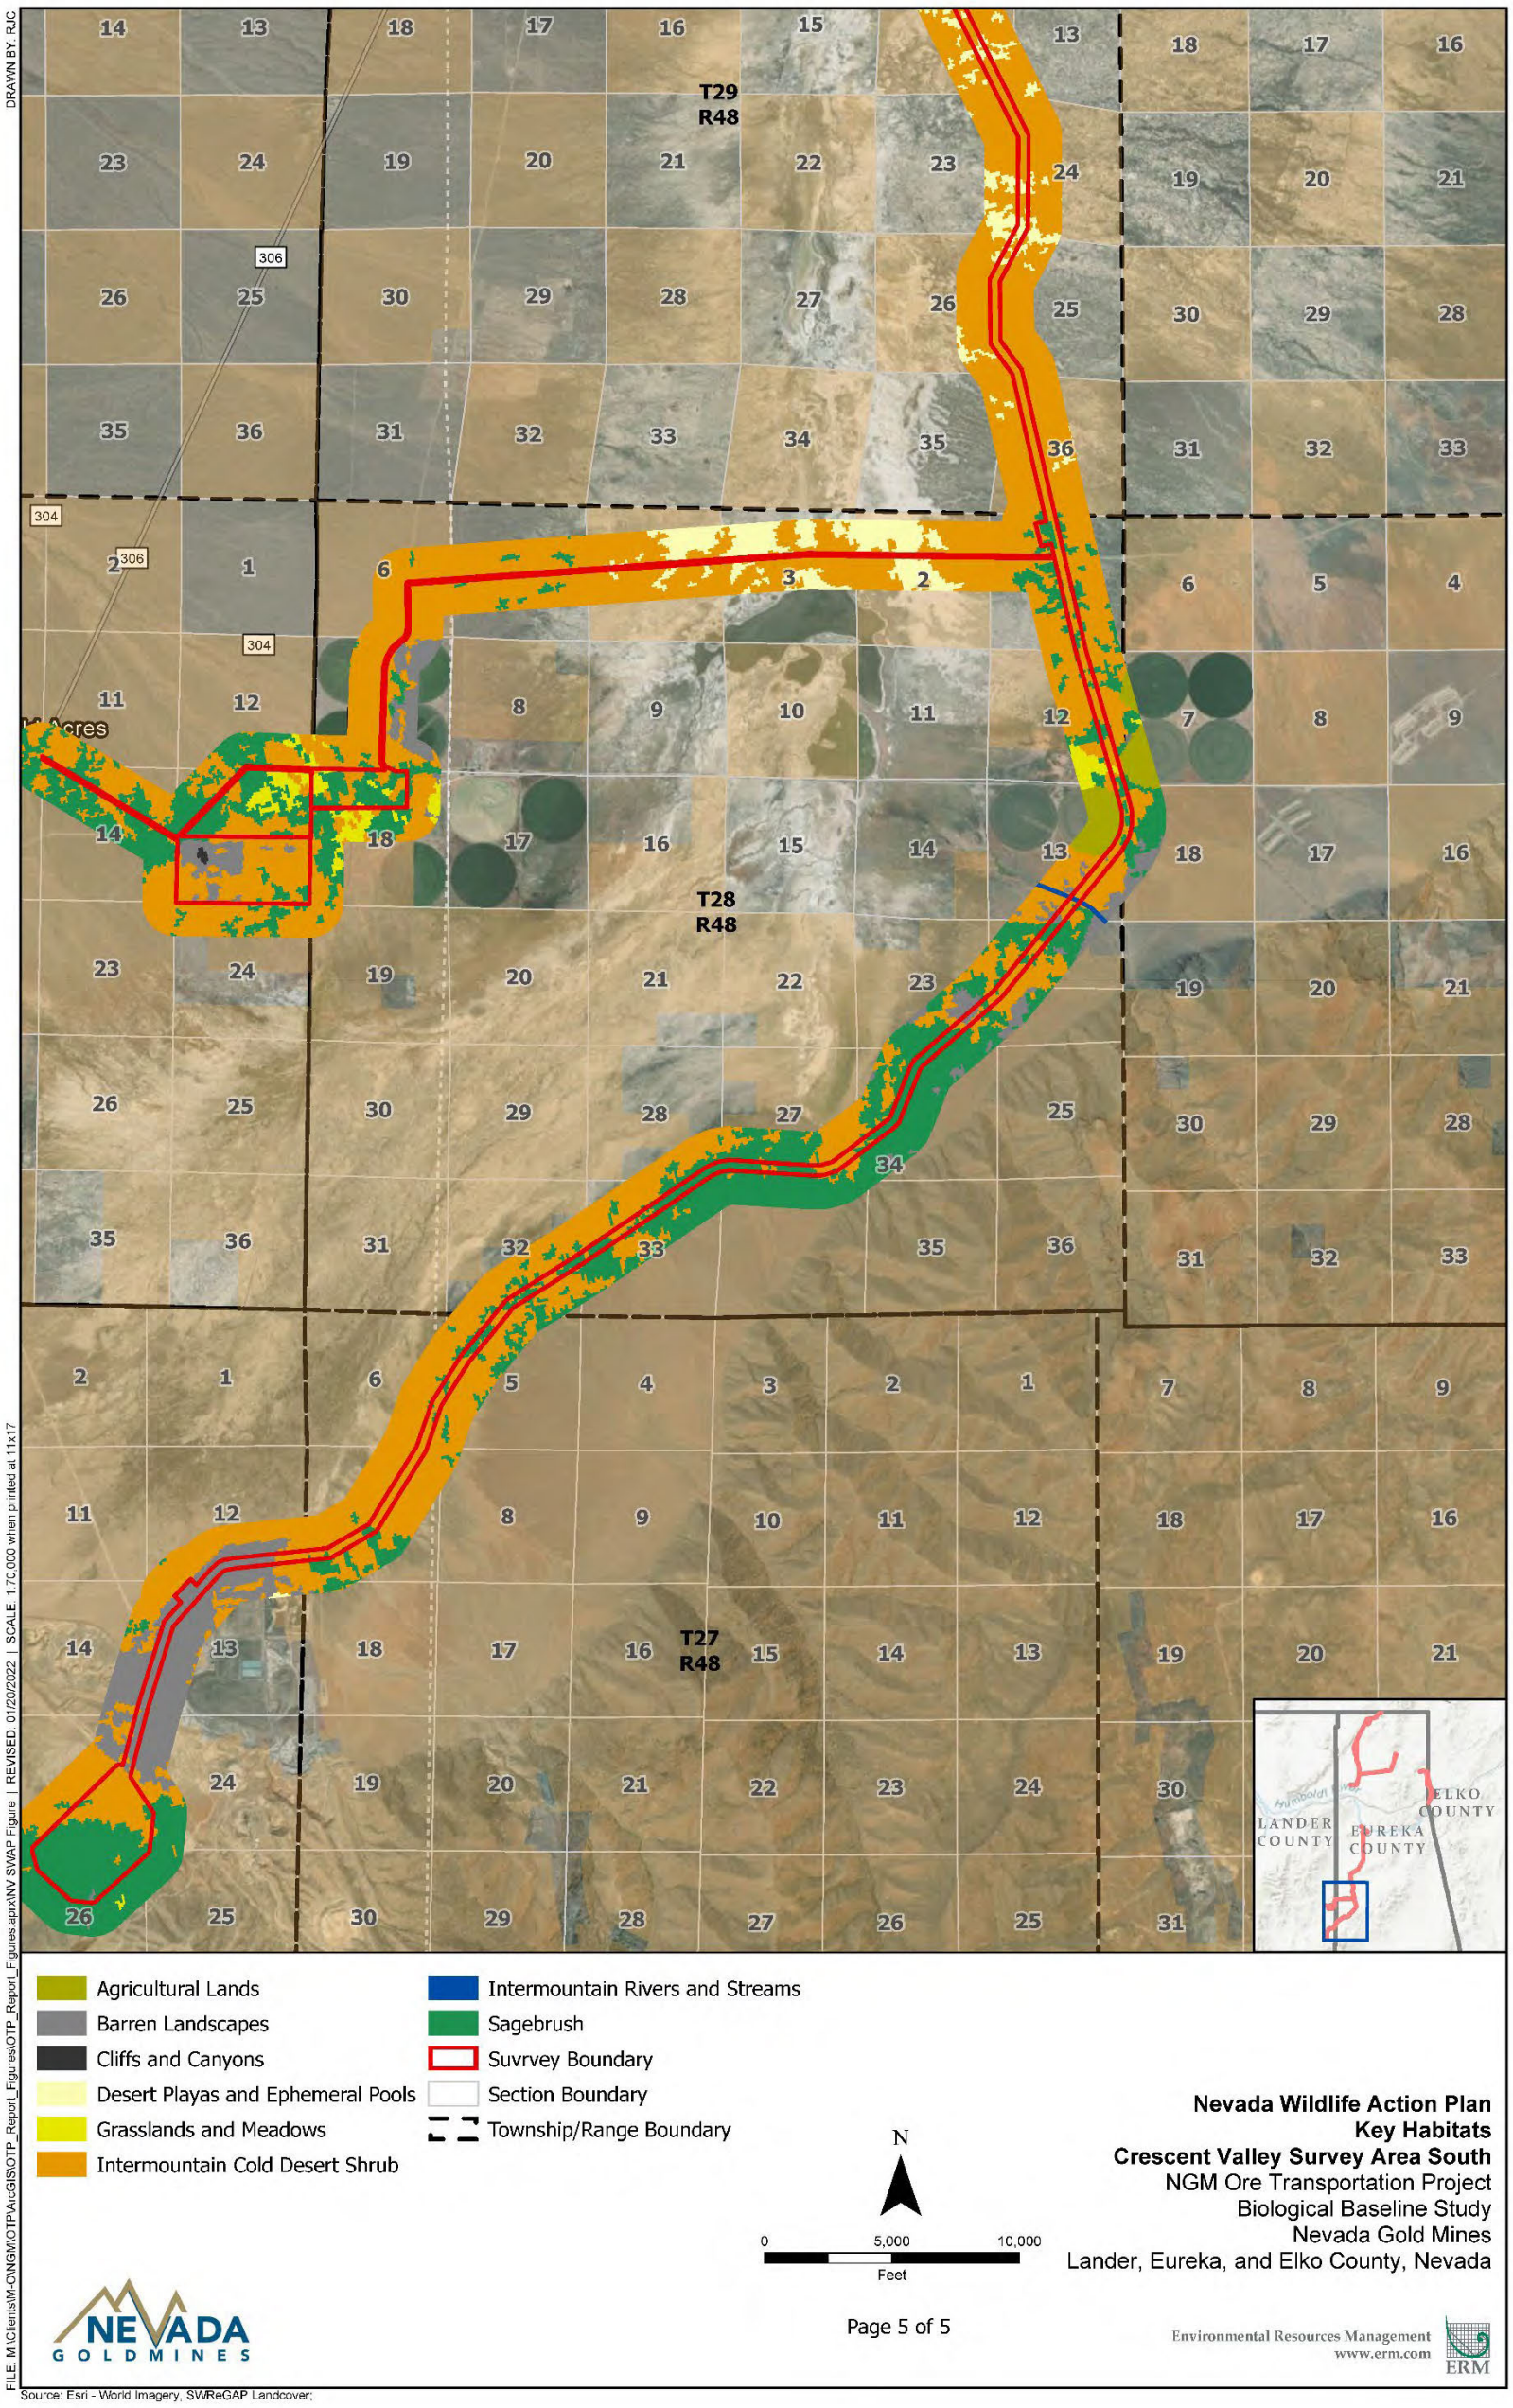

Figure 3.4.1-5: Nevada WAP Key Habitats—Crescent Valley Survey Area South

Page Intentionally Left Blank.

Desert Playas and Ephemeral Pools

Desert Playas and Ephemeral Pools are composed of barren or intermittently vegetated playas on valley bottoms. These habitats are formed by irregular flooding and subsequent evaporation. The associated value of Desert Playas and Ephemeral Pools depends upon the amount and duration of available water. The alteration of aquatic resources within and adjacent to the Project Area may reduce the viability of this Key Habitat. When unaltered, these habitats support various migratory and breeding bird species and some aquatic invertebrate and vertebrate species. Desert Playas and Ephemeral Pools occur predominantly within the Crescent Valley Survey Area, with select areas in the northern section of the Goldstrike Survey Area for a total of 155 acres in the Project Area.

Developed Landscapes

This Key Habitat is characterized by land transformation and includes residential, urban, industrial, and commercial areas. Developed Landscapes can be categorized as open space-low density or medium-high density development. Open space-low density developments retain some form of a plant community. Parcels that are being developed are also considered open space-low density and may have fallow soils and ruderal weed species. Medium-high density development results in reduced soil substrates available for vegetation. This development involves urban, industrial, and commercial land use and features such as ornamental vegetation, smaller covered structures, irrigated lawns, or rock walls. Developed Landscapes and adjacent transitional regions can provide potential habitat for a wide variety of wildlife species including small mammals such as prey and bat species, large mammals or predator species, migratory and breeding birds, and some raptors. This habitat type occurs infrequently throughout the Project Area (5 acres), predominantly in the portion adjacent to the Carlin Survey Area.

Grasslands and Meadows

Grassland and Meadows consist of short-statured grass species and forbs, largely devoid of taller vegetation. With less compacted soils, these areas provide suitable habitat for burrowing species. As a result, raptors may be drawn to Grasslands and Meadows as well. This habitat may also be utilized by a variety of species for foraging. The vegetation community composition largely determines wildlife use. Additionally, recovering burn areas are commonly categorized as grasslands. Grasslands are ubiquitous throughout the Project Area (1,482.8 acres) and occur frequently in the form of invasive annual grasslands or forblands following some form of disturbance. Marginal and limited meadow habitat occurs within and adjacent to the Project Area west of the Carlin Survey Area.

Intermountain Cold Desert Shrub

This Key Habitat occurs in poorly drained valley bottoms with saline soils. This habitat is often dominated by salt-tolerant shrubs. Perennial bunchgrasses may be present and provide food sources for a variety of species. Friable soils contribute to potential habitat for burrowing

species. As a result, raptors and bat species may also utilize Intermountain Cold Desert Shrub. Some species commonly associated with Sagebrush habitat may utilize these areas as secondary habitat. Similar to Grasslands and Meadows, Intermountain Cold Desert Shrub habitat occurs regularly throughout the Project Area (1,721.2 acres).

Intermountain Rivers and Streams

Riparian areas and floodplains adjacent to rivers and streams make up the Intermountain Rivers and Streams Key Habitat. The presence of surface water allows for complex ecosystems with high biodiversity. These highly productive habitats may be utilized by a wide variety of species for foraging, hunting, nesting, and denning. Intermountain Rivers and Streams may also provide migration corridors for local or long-distance migratory species. Birds, amphibians, fish, and bats are commonly found in these habitats. Herbaceous vegetation dominates with some shrub and sapling species present. Intermountain Rivers and Streams occur primarily along perennial aquatic resources. Streams within the survey area are mostly ephemeral and intermittent, containing seasonal runoff and isolated seep and spring sources. Historical Intermountain Rivers and Streams habitat likely occurred at the northern reaches of the Project Area prior to disturbance. Presently, this Key Habitat type is most prevalent along the Humboldt River in the portion of the Project Area immediately west of the Carlin Survey Area and occurs sporadically throughout the remaining Project Area (20.1 acres).

Lakes and Reservoirs

This habitat type includes natural lakes and reservoirs or other impoundments. Seasonal and climatic variation allows these Key Habitats to change in size and storage, maintaining transitional shoreline and emergent areas immediately adjacent to the resource. These habitats are important for migratory and breeding birds, including waterfowl and shorebirds, as well as some fish species. A very limited number of open waterbodies occur throughout the Project Area (1.7 acres), with the majority being ephemeral, manipulated, or potentially historical.

Lower Montane Woodlands and Chaparral

Lower Montane Woodlands and Chaparral habitat consists of predominantly dense woodlands occurring in areas of higher elevation. Soils are loose and gravely, and steep slopes, cliffs, and rock outcrops are common throughout this Key Habitat. Open areas in wooded areas are dominated by scattered shrubs and some hardwoods. In the lower elevation areas of this habitat, shrub species may dominate woodland species. This Key Habitat provides important shelter areas for avian species, bats, and other small mammals. These forests may also provide thermal protection for wildlife. This Key Habitat occurs on only 0.5 acre of habitat in the Project Area.

Marshes

Marsh habitat occurs in areas where soil is inundated or saturated throughout a portion of the year. Marshes can hold water seasonally or year-round. The duration and extent of soil saturation dictates the vegetation communities present in these habitats, ranging from

herbaceous species to tree species. This potentially productive Key Habitat includes wetlands and is important for many migratory and breeding bird species and some amphibians. This habitat relies on hydrology and degrades quickly when hydrologic flow is altered. Few Marshes occur sporadically throughout the Project Area (5.6 acres), predominantly in the Crescent Valley Survey Area.

Sagebrush

Sagebrush habitat is common in valley, foothill, and mountain environments throughout the Great Basin. This Key Habitat generally occurs in mosaics with other habitats. A variety of specialized small mammals, birds, and reptiles depend on Sagebrush habitat for shelter, nesting, and as a source of food. This habitat type is highly susceptible to disturbance and can easily degrade with increasing invasive annual plant species. Over a significant portion of the Project Area (2,746 acres), sagebrush species are at least subdominant, occurring throughout the middle and lower elevations. The majority of the Sagebrush habitat within the Project Area is degraded to varying degrees.

3.4.2. General Wildlife

3.4.2.1. Background

Habitat within the Project Area has the potential to support a variety of flora and fauna. The sections below discuss wildlife species that are not designated as threatened or endangered by the USFWS nor NDOW and includes amphibians, migratory and breeding birds, fish, bats, big game, other small mammals, reptiles, and mollusks. Threatened and endangered wildlife species are discussed in detail in Section 3.4.7, Threatened and Endangered Species, following the general wildlife sections. The objective of the wildlife baseline survey is to collect sufficient information to characterize the affected environment for wildlife and wildlife habitat within the Project Area. Other current and historical data collected in the Project Area for NGM environmental baseline programs will be incorporated into analyses and used as reference to show past and current conditions.

3.4.2.2. Study Methodology

Desktop review of existing literature, GIS data, and survey information from BLM, USFWS, NDOW, NDNH, and WAFWA were used to assess general wildlife species that potentially occur in the Project Area. Wildlife species with potential to occur were identified and mapped within the Project Area and up to a 200-foot buffer of the centerline.

The following protocol was used in this survey:

- BLM Nevada *Statewide Wildlife Survey Protocols* (BLM 2014b)

Species for which field surveys were conducted are discussed in later sections. Incidental observations of general wildlife within the Project Area were recorded by biologists during these species-specific surveys. See Table D.1-3 of Appendix D for a comprehensive list of species observed during these surveys.

3.4.2.3. General Wildlife Results and Discussion

The Great Basin Desert supports a range of habitats across widely varying elevations, including salty lakes, sagebrush valleys, and pinyon-juniper forests. The unique combination of variability in elevation and diversity of habitat has contributed to some wildlife evolving small, isolated populations adapted to niche habitats creating pockets of increased biodiversity (Wildlife Action Plan Team 2012). The WAP assessed wildlife species vulnerability and designated Species of Conservation Priority. See Table D.1-1 in Appendix D for a full list of these species. Additionally, six biological communities described in the NDOW WAP are found in the Project Area: shadscale zone, sagebrush zone, pinyon-juniper community, montane community, alpine community, and riparian community (Wildlife Action Plan Team 2012).

Review of NDOW's WAP indicates that based on the six biological communities present, 57 wildlife species potentially occur in the Project Area. Table 3.4.2-1 lists the 50 Species of Conservation Priority with potential to occur within the Project Area. The remaining species are not expected due to the absence of potential habitat within the Project Area. See Table D.1-2 in Appendix D for details regarding species not expected to occur. The WAP's primary focus is centered on proactively preventing species from being listed as threatened or endangered. The following sections further discuss the various terrestrial and aquatic species, including those with special conservation statuses.

Table 3.4.2-1: Potential Nevada Wildlife Action Plan Species within the Project Area

Common Name	Scientific Name	Nevada Wildlife Action Plan Habitats
Amphibians		
Columbia spotted frog (Great Basin pop.)	*Rana luteiventris*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes,
Northern leopard frog	*Lithobates pipiens*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes
Western toad	*Anazyrus boreas*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes
Birds		
Bald Eagle	*Haliaeetus leucocephalus*	Intermountain Rivers and Streams, Lakes and Reservoirs
Black Rosy-finch	*Leucosticte atrata*	Agricultural Lands, Cliffs and Canyons, Desert Playas and Ephemeral Pools, Grasslands and Meadows, Lower Montane Woodlands and Chaparral, Intermountain Cold Desert Shrub, Sagebrush
Brewer's Sparrow	*Spizella breweri*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Sagebrush
Columbian Sharp-tailed Grouse	*Tympanuchus phasianellus columbianus*	Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Lower Montane Woodlands and Chaparral, Sagebrush

Common Name	Scientific Name	Nevada Wildlife Action Plan Habitats
Ferruginous Hawk	*Buteo regalis*	Agricultural Lands, Cliffs and Canyons, Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Sagebrush
Golden Eagle	*Aquila chrysaetos*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Lower Montane Woodlands and Chaparral, Sagebrush
Gray-crowned Rosy-Finch	*Leucostcte tephrocots*	Agricultural Lands, Cliffs and Canyons, Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Sagebrush
Great Basin Willow Flycatcher	*Empidonax traillii adastus*	Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes
Greater Sage-grouse	*Centrocercus urophasianus*	Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Marshes, Sagebrush
Loggerhead Shrike	*Lanius ludovicianus*	Agricultural Lands, Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Marshes, Sagebrush
Long-billed Curlew	*Numenius americanus*	Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Lakes and Reservoirs, Marshes, Sagebrush
Mountain Quail	*Oreortyx pictus*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Lower Montane Woodlands and Chaparral, Sagebrush
Northern Goshawk	*Accipiter gentilis*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Lower Montane Woodlands and Chaparral, Sagebrush
Peregrine Falcon	*Falco peregrinus*	Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Rivers and Streams, Marshes
Pinyon Jay	*Gymnorhinus cyanocephalus*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Lower Montane Woodlands and Chaparral, Sagebrush
Sage Thrasher	*Oreoscoptes montanus*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Sagebrush
Short-eared Owl	*Asio flammeus*	Grasslands and Meadows, Intermountain Rivers and Streams, Lower Montane Woodlands and Chaparral, Marshes
Western Snowy Plover	*Charadrius nivosus nivosus*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs
Gastropods		
Large gland Carico pyrg	*Pyrgulopsis basiglans*	Marshes
Sada's pyrg	Pyrgulopsis sadai	Marshes
Fish		
Lahontan cutthroat trout	*Oncorhynchus clarki henshawi*	Intermountain Rivers and Streams

Common Name	Scientific Name	Nevada Wildlife Action Plan Habitats
Bats		
Allen's big-eared bat	*Idionycteris phyllotis*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lower Montane Woodlands and Chaparral, Marshes
Brazilian (or Mexican) free-tailed bat	*Tadarida brasiliensis*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lower Montane Woodlands and Chaparral, Marshes
Cave myotis	*Myotis velifer*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lower Montane Woodlands and Chaparral, Marshes
Fringed myotis	*Myotis thysanodes*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Rivers and Streams, Lower Montane Woodlands and Chaparral, Marshes
Hoary bat	*Lasiurus cinereus*	Agricultural Lands, Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lower Montane Woodlands and Chaparral, Marshes
Little brown myotis	*Myotis lucifugus*	Cliffs and Canyons, Lakes and Reservoirs
Long-eared myotis	*Myotis evotis*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Lakes and Reservoirs, Lower Montane Woodlands and Chaparral, Marshes, Sagebrush
Silver-haired bat	*Lasionycteris noctivagans*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Lower Montane Woodlands and Chaparral, Marshes
Spotted bat	*Euderma maculatum*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Lakes and Reservoirs, Lower Montane Woodlands and Chaparral, Marshes, Sagebrush
Western red bat	*Lasiurus blossevillii*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Lower Montane Woodlands and Chaparral, Marshes
Western small-footed myotis	*Myotis ciliolabrum*	Agricultural Lands, Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Lower Montane Woodlands and Chaparral, Sagebrush
Big Game		
Bighorn sheep	*Ovis canadensis spp.*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Grasslands and Meadows, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Lower Montane Woodlands and Chaparral, Sagebrush
Small Mammals		
American water shrew	*Sorex palustris*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes

Common Name	Scientific Name	Nevada Wildlife Action Plan Habitats
Botta's pocket gopher	*Thomomys bottae*	Desert Playas and Ephemeral Polls, Intermountain Cold Desert Shrub, Sagebrush
Dark kangaroo mouse	*Microdipodops megacephalus ssp.*	Desert Playas and Ephemeral Polls, Intermountain Cold Desert Shrub, Sagebrush
Merriam's shrew	*Sorex merriami*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes
Northern river otter	*Lontra canadensis*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes
Pale kangaroo mouse	*Microdipodops pallidus*	Desert Playas and Ephemeral Polls, Intermountain Cold Desert Shrub, Sagebrush
Preble's shrew	*Sorex preblei*	Desert Playas and Ephemeral Pools, Intermountain Rivers and Streams, Lakes and Reservoirs, Marshes
Pygmy rabbit	*Brachylagus idahoensis*	Desert Playas and Ephemeral Polls, Intermountain Cold Desert Shrub, Sagebrush
Reptiles		
Desert horned lizard	*Phrynosoma platyrhinos*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Sagebrush
Great Basin collared lizard	*Crotaphytus bicinctores*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Sagebrush
Greater short-horned lizard	*Phrynosoma hernandesi*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Sagebrush
Long-nosed leopard lizard	*Gambelia wislizenii*	Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Sagebrush
Northern rubber boa	*Charina bottae*	Cliffs and Canyons, Desert Playas and Ephemeral Pools, Intermountain Cold Desert Shrub, Intermountain Rivers and Streams, Sagebrush
Mollusks		
California floater	*Anodonta californiensis*	Intermountain Rivers and Streams, Lakes and Reservoirs

Source: Wildlife Action Plan Team 2012

3.4.2.4. BLM Sensitive Status Species

The BLM, in coordination with state and federal wildlife agencies, identifies species that inhabit BLM-managed public lands and are considered "at-risk" for potential inclusion in the ESA. These "at-risk" species are designated by the BLM as Sensitive Status Species and are managed according to the Special Status Species Management Manual, 6840 (BLM 2008b). A total of 62 BLM Sensitive Status Species have the potential to occur within the Project Area. A comprehensive list of BLM Sensitive Status Species that occur on lands administered by the Battle Mountain and Elko Field offices can be found in Table D.1-1 of Appendix D. Table 3.4.2-2 lists the number of Sensitive Status Species by taxa that may occur within the Project Area.

Table 3.4.2-2: Taxa of BLM Sensitive Status Species within the Project Area

Taxa	Count
Amphibians	4
Arachnids	1
Birds	20
Fish	2
Mammals[a]	21
Reptiles	5
Insects	3
Mollusks	6
Total:	62

Source: BLM 2017b and 2019a

[a] Taxa of mammals includes bats

Big game and Sensitive Status Species of fish within the Project Area are discussed below. Birds, small mammals, bats, amphibians, and insects are further analyzed in later report sections herein where species-specific surveys are discussed. Threatened and endangered species that may occur within the Project Area are further detailed in Section 3.4.7, Threatened and Endangered Species.

3.4.2.5. Big Game

There are three NDOW hunting units within or overlapping the Project Area (065, 068, and 141), as shown on Figure 3.4.2-1. All three hunting units include pronghorn antelope (*Antilocapra Americana*) and mule deer (*Odocoileus hemionus)*—both classified as game species under NAC 503. Hunting unit 068 also includes elk (*Cervus canadensis*), which is also a designated game species under NAC 503, and California bighorn sheep (*Ovis canadensis californiana*), which is a designated game species under NAC 503 and a BLM Sensitive Status Species (BLM 2017b). The information in the following paragraphs summarize information from NDOW's hunting unit maps (NDOW n.d.) and *2020-2021 Big Game Status* report (NDOW 2021a).

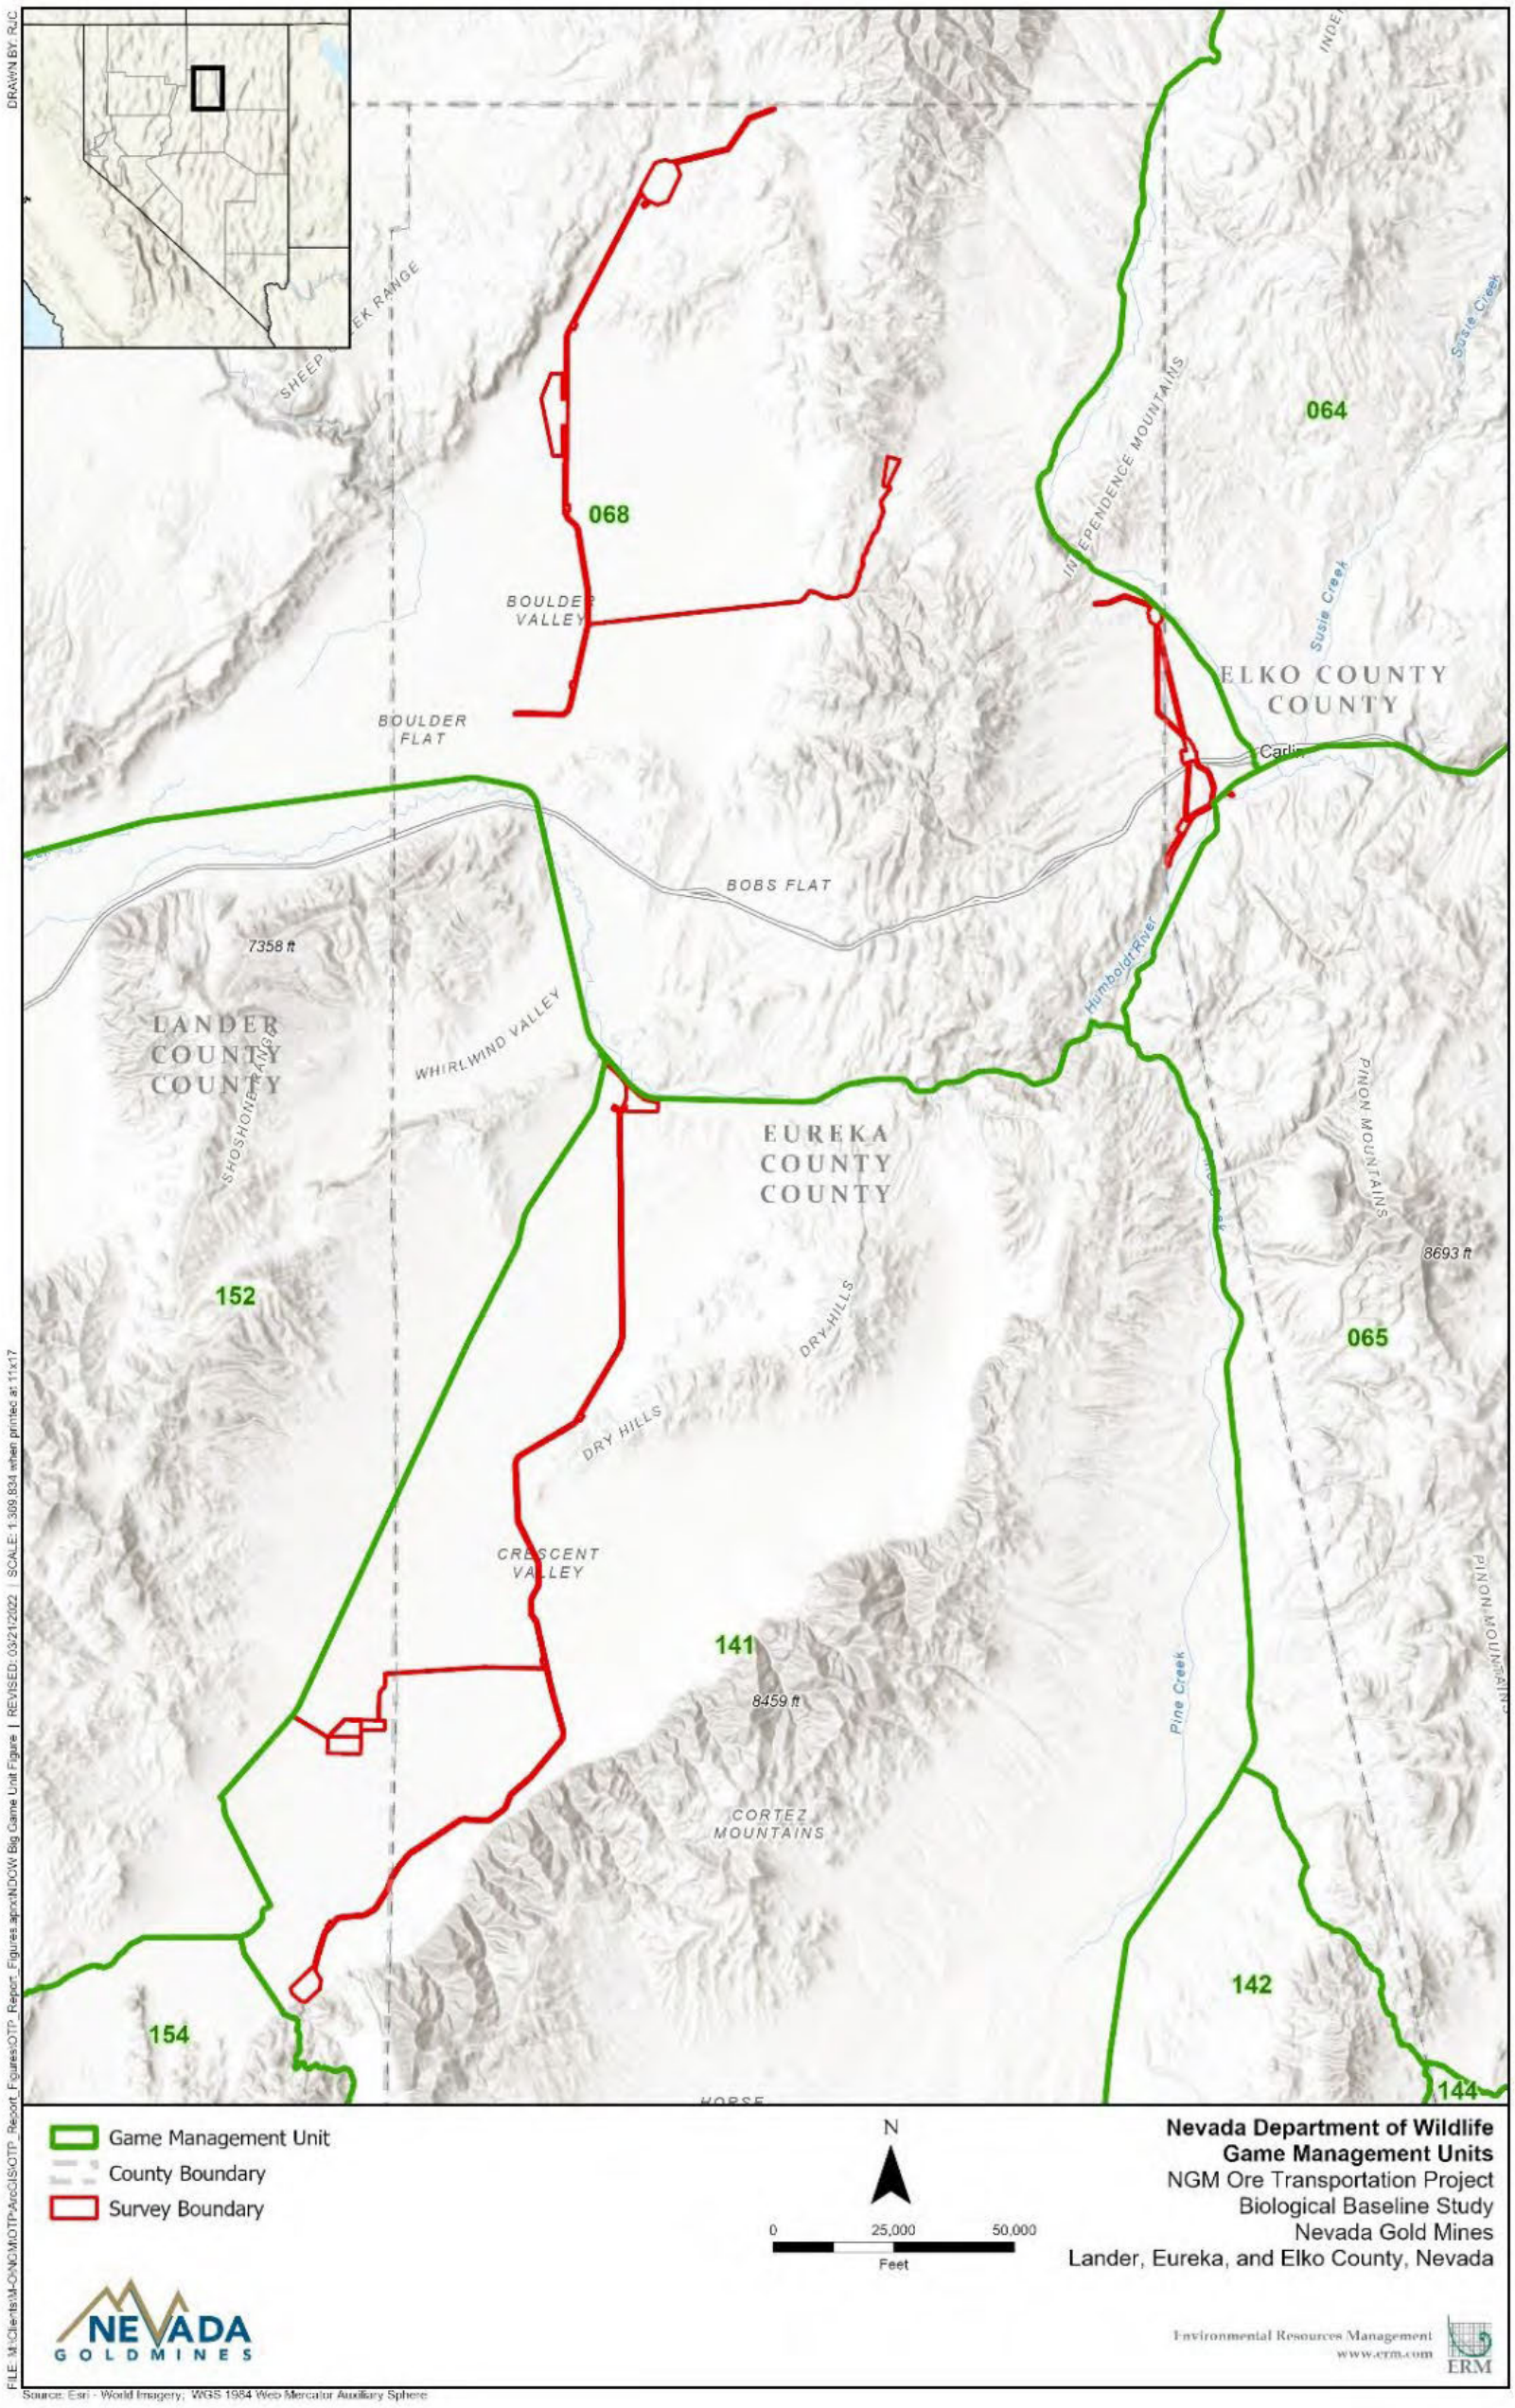

Figure 3.4.2-1: NDOW Big Game Hunting Units within the Project Area

Page Intentionally Left Blank.

Mule Deer

Mule deer use hunting units 065, 068, and 141 for year-round habitat and crucial winter habitat, but populations have been declining across all three areas due to large-scale range fires, a lack of consistent precipitation, the conversion of native shrubs to invasive grasses, and human impact (NDOW 2021a). The exploration of oil, gas, and minerals is affecting the habitat and movement corridors for mule deer, but radio collar monitoring has helped identify movement corridors for segments of this deer herd. Current and potential habitat impacts from increased mining activity within unit 141 are being recognized, and crucial mule deer habitat has been developed (NDOW 2021a). In addition, NGM has an active role in the Mule Deer Working Coalition to assist in managing mule deer habitat and populations in Area 6, which includes hunting unit 068.

Pronghorn Antelope

Pronghorn antelope herds have been stable or steadily increasing within hunting units 065, 068, and 141. The long-term success of these herds will depend on the restoration efforts and proper grazing management. Recovery of the areas burned by wildfires is crucial for providing year-round forage species. Rehabilitation efforts have taken place in crucial wintering habitat areas and have successfully reintroduced crested wheatgrass and forage kochia on the landscape, providing important winter forage species for antelope (NDOW 2021a). Radio collar monitoring has helped identify movement corridors for various antelope herds.

Elk

Elk populations are only located in hunting unit 068, which encompasses the Carlin Survey Area. The population in this hunting unit is comprised of two sub-herds with differing migration strategies during winter but have overlapping summer ranges in the Bull Run Mountains and North Independence Range (NDOW 2021a). Fires from 2018 have affected large portions of seasonal habitat used by elk, which will negatively affect suitability of habitat in the short-term particularly if drought continues as was observed in 2021. However, the flush of perennial grasses and forbs can provide long-term improvements for elk habitat if ranges can naturally recover.

Bighorn Sheep

California bighorn sheep in this region has been actively managed by the NDOW since 2012 to keep population counts at a sustainable level. Management efforts will be crucial to keep sheep herd at or below its current level to ensure favorable conditions for the various species that also rely on this crucial winter range (NDOW 2021a).

Fish

The Project Area is located within the Humboldt River Basin. Most of the surface waters in the Project Area are ephemeral and/or intermittent streams, providing aquatic conditions only seasonally and/or with associated storm runoff or in locations of isolated seeps and springs.

Flowline figures based on the NHD are included in D.9 of Appendix D for each region of the Project Area.

Areas of perennial stream flow are limited to specific reaches of Welches and Rodeo creeks and tributaries of the Humboldt River in the Carlin Survey Area. These areas potentially provide suitable habitat for BLM Special Status Species Lahontan cutthroat trout and the inland Columbia Basin redband trout (*Oncorhynchus mykiss gairdneri*), as well as other fish species found throughout Northeastern Nevada. The Lahontan cutthroat trout is federally threatened and is discussed in more detail in Section 3.4.7, Threatened and Endangered Species.

3.4.2.6. Incidental Wildlife Observations

A comprehensive list of wildlife observations within the Project Area is included in Table D.1-2 of Appendix D. Table D.1-2 includes species that were observed during field surveys and/or observed incidentally throughout the Project Area. Not mentioned above or further discussed below is one incidental sighting of an American mink (*Neogale vison*) and mink den, which occurred within the Carlin Survey Area. While this was the only mink observation and the only observation outside of specifically surveyed species, it gives good indication of potential species success in this region.

3.4.3. Migratory and Breeding Birds

3.4.3.1. Background

Avian species that migrate annually from summer breeding grounds to a different winter range are protected under the Migratory Bird Treaty Act (MBTA). Birds that are protected under the MBTA include but are not limited to raptors, passerines (songbirds), and water birds. The purpose of the migratory and breeding bird surveys is to identify the species that occur within the Project Area as shown on Figure 2-1 through Figure 2-9 to inform the future NEPA analysis. All birds within the Project Area except non-native species are protected under the MBTA.

Birds in the Project Area are those associated with the habitats described in Section 3.4.1, Wildlife Habitat. Seasonal flooding of desert playas and ephemeral pools may support migrating waterfowl and other bird species. Rock outcrops and cliffs, and human-made structures provide potential nest sites for raptors and other birds. The USFWS lists 24 species as Birds of Conservation Concern (BCC) in the Great Basin bird conservation region, and there are 19 BLM special status bird species that could be present within lands administered by the Battle Mountain and Elko Field Offices.

3.4.3.2. Study Methodology

Surveys for migratory birds were designed to identify the presence of bird species protected under the MBTA. Existing literature, GIS data, and survey information from BLM, USFWS, NDOW, NDNH, Great Basin Bird Observatory, and SWReGAP land cover types were evaluated during the desktop assessment. Based on NDOW's species account report, birds that may be present within the Project Area include shorebirds, aquatic birds, ducks, raptors, and passerines.

The following protocols were used in this survey:

- *Nevada Comprehensive Bird Conservation Plan* (GBBO 2010)
- *National Protocol Framework for the Inventory and Monitoring of Breeding Landbirds using Point Counts (*Knutson et al. 2016)

Two qualified biologists conducted migratory bird surveys following the protocols listed above, and sites were selected based on the SWreGAP land cover types within the Project Area. Multiple point count survey sites were established where the land cover has continuous acreages with a width greater than 980 feet. Additional survey points were not added if the same land cover type was encountered nearby. Survey points were visited one time each to document the presence of species. For each bird observation, biologists recorded the survey point location, collected photographs in the four cardinal directions, and recorded notes on habitat, species identified, and the estimated distance of observation. Surveys were conducted from June 21 through July 5, 2021, during favorable weather conditions. Favorable weather conditions are defined as when there is good visibility, little or no precipitation, and winds less than 12 miles per hour (mph). Bird surveys were conducted from approximately 30 minutes before sunrise up to 4 hours after sunrise. At each migratory bird survey site, visual and auditory observations were made for 10 minutes. During the surveys, biologists documented the bird species observed. Figure 3.4.3-1 through Figure 3.4.3-3 show the location of the breeding bird survey points and SWreGAP land cover type. Copies of the datasheets and photographs of the survey points are included in Appendix D.2, Migratory Bird Species.

Page Intentionally Left Blank.

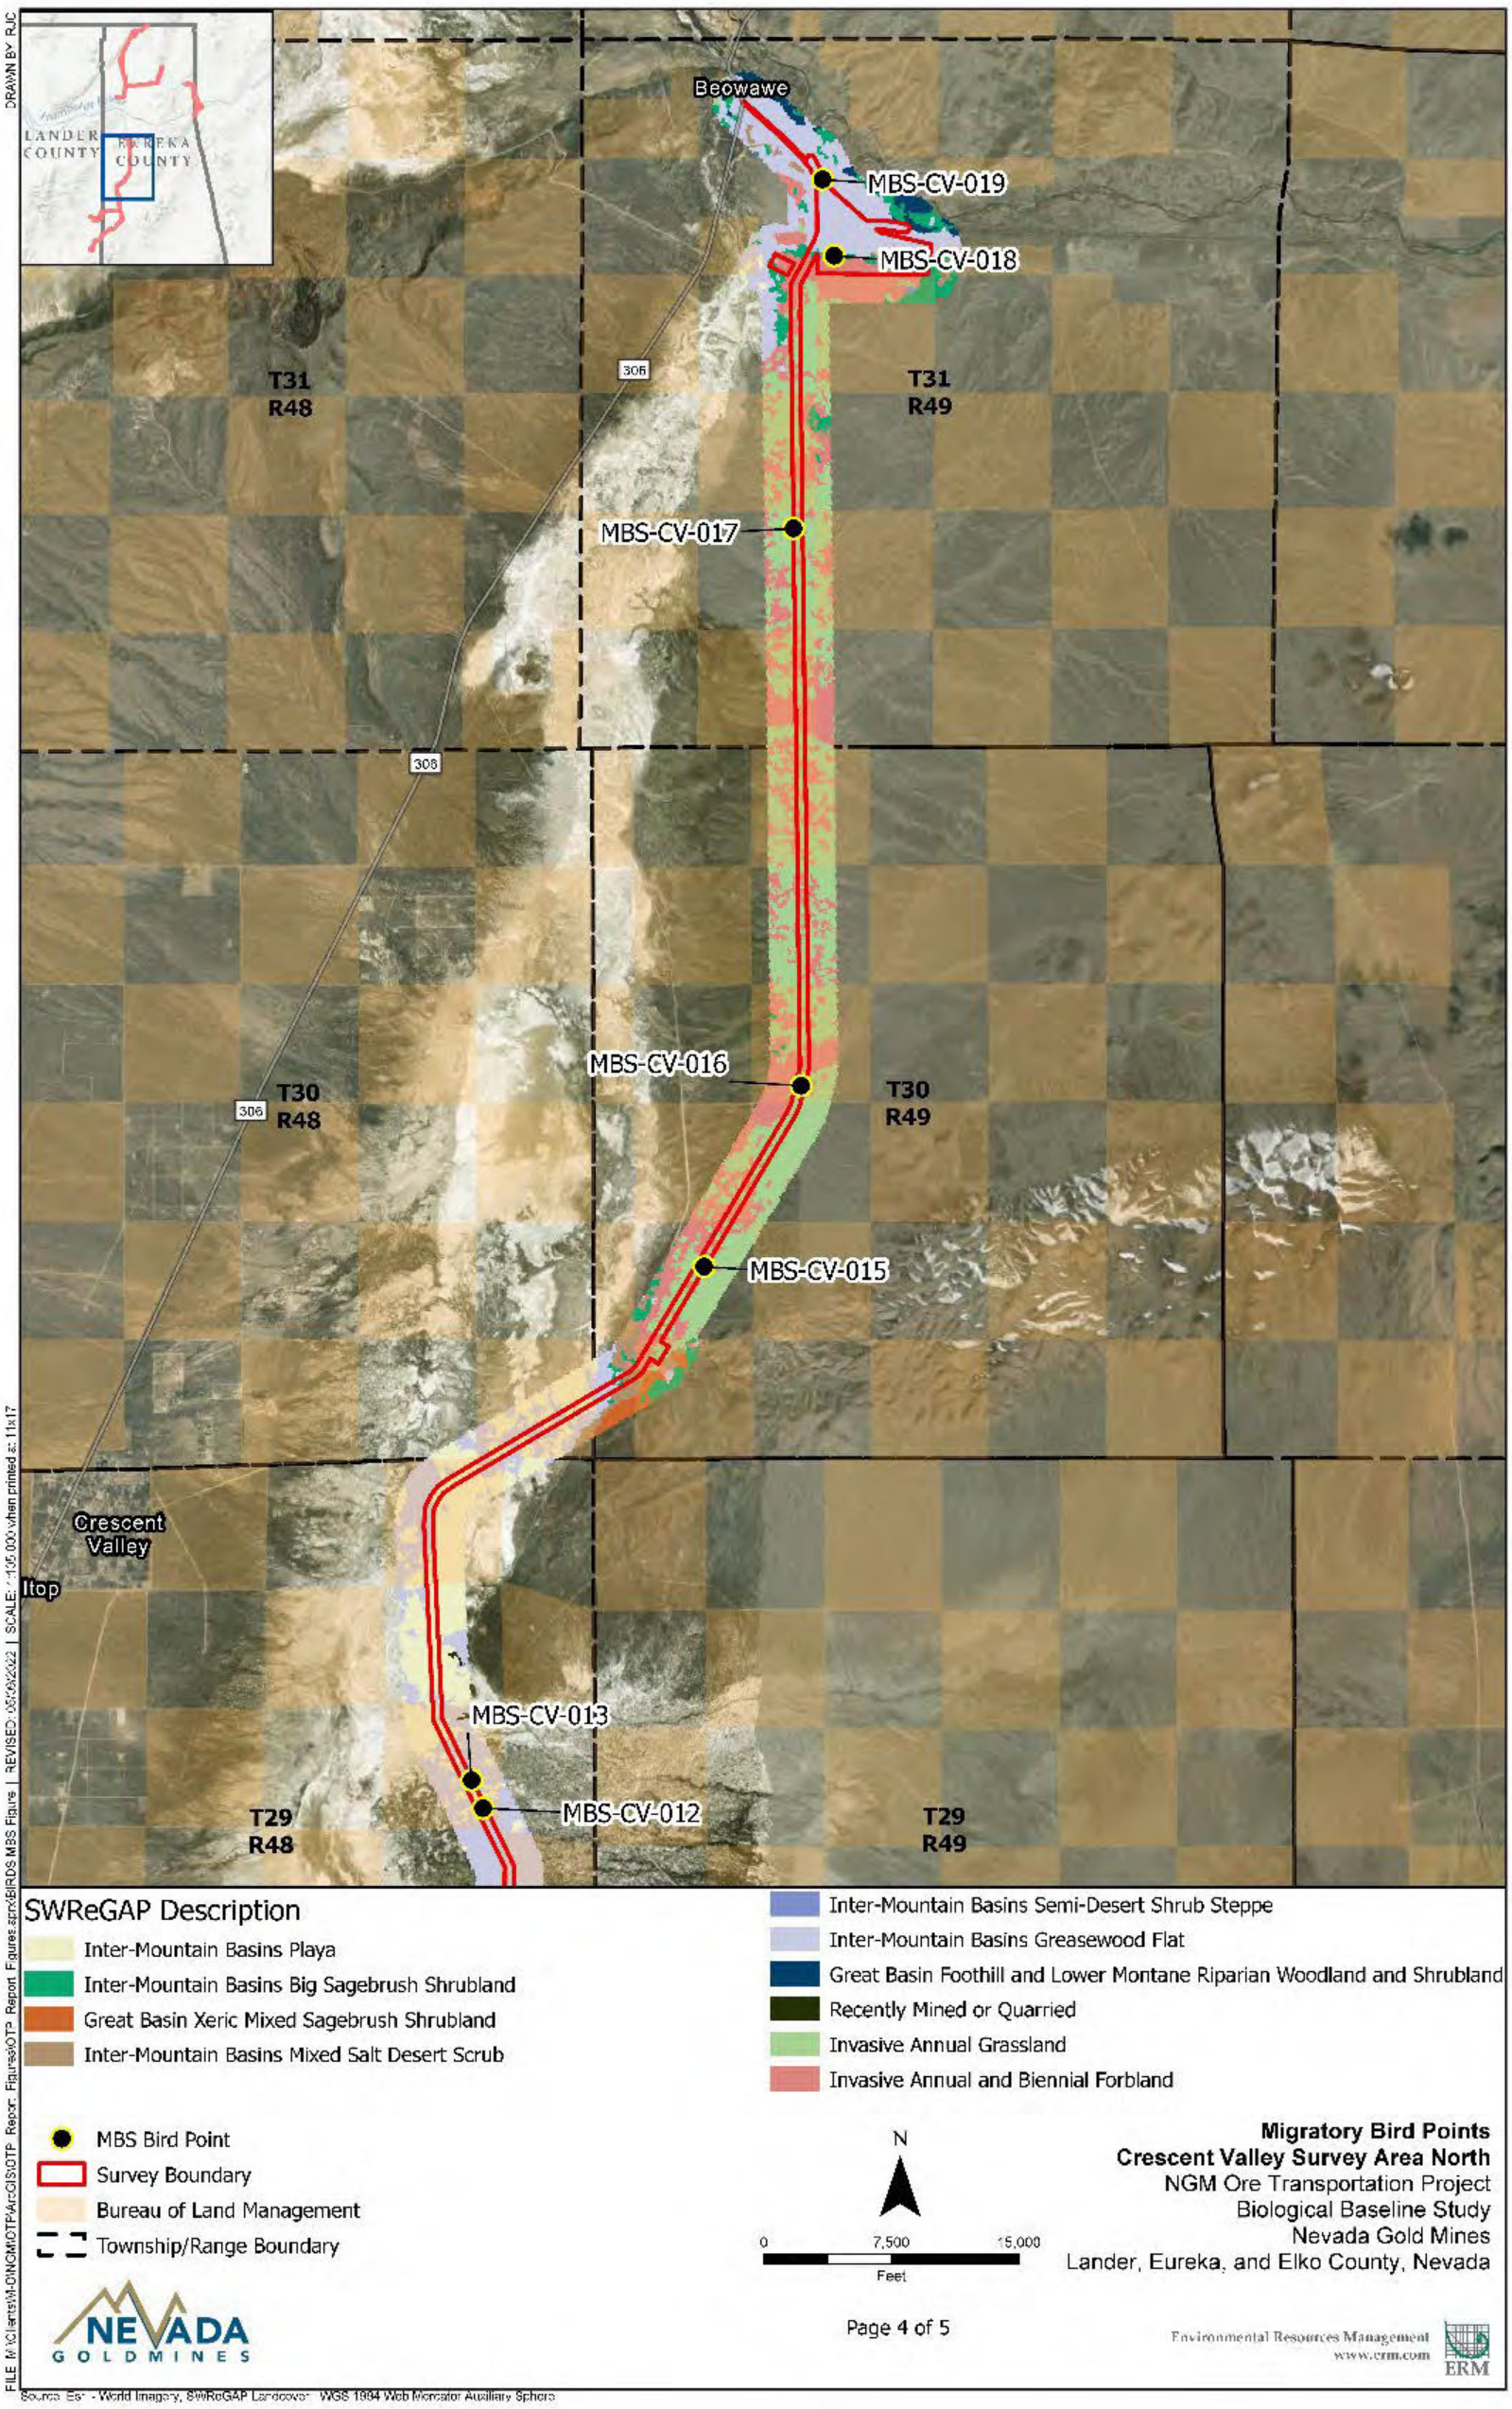

Figure 3.4.3-3: Migratory Bird Survey Points—Crescent Valley Survey Area

Pre-Field Assessment

During the pre-field desktop assessment, a total of 55 survey sites were identified within each of the 14 SWReGAP land cover types with the exception of Developed or Recently Mined/Quarried land cover types (Lowry et al. 2005). Based on the SWreGAP land cover types present in the Project Area, 26 survey points were established in the Goldstrike Survey Area, 11 in the Carlin Survey Area, and 18 in Crescent Valley Survey Area. The location of survey points was determined based on field conditions at the time of survey and were adjusted as needed. Table 3.4.3-1 provides the number of survey points in each SWreGAP land cover type for each of the three survey areas.

Table 3.4.3-1: Number of Migratory Bird Survey Points in each Southwest Regional GAP Land Cover Type

SWReGAP Land Cover Type	Survey Area	Number of Survey Points	Total Number of Survey Points
Agriculture	Goldstrike	2	2

All birds that occur within the Project Area are protected under the MBTA, with the exception of non-native species such as common starling (*Sturnus vulgaris)* and chukar partridge (*Alectoris chukar*). The MBTA prohibits the take or disturbance of a migratory bird or its parts, nests, or eggs. In the Project Area, 10 USFWS BCC, 18 BLM special status species, and five NDOW

sensitive species potentially occur in the Project Area and are listed in Table 3.4.3-2. No bird species listed under the ESA as threatened, endangered, or candidate species are known to occur within the Project Area, although listed species could occur in adjacent areas if suitable habitat is present. Figures in Appendix D-2 include site numbers and the species observed.

Table 3.4.3-2: Potential Special Status Migratory Birds within the Project Area

Species	Agency Status	Habitat	Likelihood of Occurrence
Bald Eagle (*Haliaeetus leucocephalus*)	BLM Sensitive; NDOW Sensitive	Near lakes, reservoirs, rivers, marshes, and coasts; Scattered breeding occurrences in Northern Nevada	Likely; Records document species along the Humboldt River
Black-chinned Sparrow (*Spizella atrogularis*)	USFWS BCC	Dry brushlands, including sagebrush, rabbitbrush, and chaparral habitats	Likely as habitat is present in the Project Area
Black Rosy-finch (*Leucosticte atrata*)	BLM Sensitive	Alpine shrubs and herbaceous cover, interspersed with talus, cliffs and snow pockets; Winter in shrublands within six miles of suitable roost sites	Unlikely; Records of species present near Elko, Nevada, approximately 40 miles east
Brewer's Sparrow (*Spizella breweri*)	BLM Sensitive; NDOW Sensitive	Arid sagebrush steppe greasewood, perennial upland grasses	Likely
Burrowing Owl (*Athene cunicularia*)	BLM Sensitive; USFWS BCC	Breed throughout Nevada in salt desert scrub, Mojave shrub, sagebrush habitat, and agricultural landscapes	Likely
Columbian Sharp-tailed Grouse (*Tymanuchus phasianellus columbianus*)	BLM Sensitive	Sagebrush-grassland and mountain shrub habitats in areas dominated by perennial bunchgrasses	Likely; Records of species near Tuscarora
Ferruginous Hawk (*Buteo regalis*)	BLM Sensitive; USFWS BCC	Breeds in shrublands with isolated pinyon pines or junipers available for nesting and adequate prey	Likely
Golden Eagle (*Aquila chrysaetos*)	BLM Sensitive	Open country, especially around mountains, hills, and cliffs; Use a variety of habitats ranging from arctic to desert, including tundra, shrublands, grasslands, coniferous forests, farmland, and areas along rivers and streams	Likely
Gray-crowned Rosy-finch (*Leucosticte tephrocotis*)	BLM Sensitive	Nests in alpine areas and winters in lower elevation open areas sometimes into forests and towns, especially where there are feeders	Likely

Species	Agency Status	Habitat	Likelihood of Occurrence
Great Basin Willow flycatcher (*Empidonax traillii adastus*)	BLM Sensitive	Montane riparian habitat with lowland riparian areas, including wet meadows	Possible
Green-tailed Towhee (*Pipilo chlorurus*)	USFWS BCC	Sage flats, sagebrush shrub-steppe, high desert, open slopes in the Great Basin, and disturbed habitats	Possible
Loggerhead Shrike (*Lanius ludovicianus*)	USFWS BCC; BLM Sensitive; NDOW Sensitive	Open country with short vegetation and well-spaced shrubs or low trees, agricultural fields, pastures, riparian areas, and desert scrublands	Likely
Long-billed Curlew (*Numenius americanus*)	USFWS BCC; BLM Sensitive	Breed in native dry grasslands and sagebrush prairies, favoring nearby damp low spots	Likely
Peregrine Falcon (*Falco peregrinus*)	BLM Sensitive; NDOW endangered	Breed in open landscapes with cliffs, occur in nearly any open habitat during migration and their winter range	Possible
Pinyon Jay (*Gymnorhinus cyanocephalus*)	USFWS BCC; BLM Sensitive	Pinyon-juniper woodlands, sagebrush, scrub oak, and chaparral communities	Possible
Prairie Falcon (*Falco mexicanus*)	NDOW Sensitive	Breed in open landscapes with cliff habitats; Other habitats include open, tree-less terrain such as prairies, deserts, riverine escarpments, canyons, foothills, and mountains in the arid west	Likely
Sage Thrasher (*Oreoscoptes montanus*)	USFWS BCC; BLM Sensitive	Breeds exclusively in shrub-steppe habitats, requiring dense ground cover for concealment and some bare ground	Likely
Sandhill Crane (*Antigone canadensis*)	BLM Sensitive	Open wetland habitats surrounded by shrubs or trees, marshes, bogs, wet meadows, prairies, and other moist habitats	Possible
Short-eared Owl (*Asio flammeus*)	BLM Sensitive	Large, open areas with low vegetation including prairie and coastal grasslands, heathlands, meadows, shrub-steppe, savanna, tundra, marshes, dunes, and agricultural areas; Winter habitat include large open areas within woodlots, stubble fields, fresh and saltwater marshes, weedy fields, dumps, gravel pits, rock quarries, and shrub thickets	Unlikely; Recorded observations at the Ruby Lake National Wildlife Refuge and Antelope Valley—both locations are more than 50 miles from the Project Area

Species	Agency Status	Habitat	Likelihood of Occurrence
Swainson's Hawk (*Buteo swainsonii*)	BLM Sensitive	Open habitats for foraging; Hay and alfalfa fields, pastures, grain crops, and row crops, or perched atop adjacent fence posts and overhead sprinkler systems	Likely
Western Snowy Plover (*Charadrius nivosus nivosus*)	USFWS BCC; BLM Sensitive	Sparsely vegetated sand beaches, dry salt flats, dune habitat, river bars, and along alkaline or saline lakes, reservoirs, and ponds	Possible; Recorded near South Fork Reservoir, approximately 30 miles east of Project Area
Southwestern Willow Flycatcher (*Empidonax traillii extimus*)	USFWS BCC; BLM Sensitive	Shrubby areas with standing water or along streams	Possible; No recent records of the species in Elko, Eureka, or Lander counties

Source: BLM 2017b, 2019a; USFWS 2021a; Sullivan et al. 2009

BCC = Birds of Conservation Concern; BLM = Bureau of Land Management; NDOW = Nevada Department of Wildlife; USFWS = U.S. Fish and Wildlife Service

Migratory bird species typical of the region include both generalist species and species associated with specific vegetation communities such as sagebrush, grassland, or pinyon juniper. Streamside habitats supportive of riparian specialists are found in the Project Area but are limited to areas alongside perennial and intermittent stream reaches and in the vicinity of some seeps and springs. Open water habitats near the Project Area could support migrating waterfowl and shorebirds. Playas in the Project Area may provide ephemeral open water habitats that support these species. Additionally, cliff and rocky outcrops throughout the Project Area may provide nesting habitat to raptors.

3.4.3.3. Results and Discussion

Habitats within the Project Area provide breeding habitat for songbirds and other upland bird species. Data collected during the survey provided a broad assessment of species present and their breeding status. A list of all birds observed in the Project Area, including incidental observations during other biological surveys, is shown in Table 3.4.3-3. Collectively, 36 bird species were documented in the Project Area, including raptors as well as non-native birds and game birds that are not protected under MBTA. Incidental observations of common ravens (*Corvus corax*) and their nests, raptors such as a Golden Eagle (*Aquila chrysaetos*) and a pair of Swainson's hawks (*Bueto swainsoni*) are included in Section 3.4.4, Eagles and Other Raptors. No birds were observed at two survey sites (MB-GS-012 and MB-GS-017) in the Goldstrike Survey Area. Both of these survey point sites are located in SWreGAP invasive annual and biennial forbland land cover type. Biologists observed 22 bird species within the Inter-mountain Big Sagebrush SWreGAP land cover type.

Horned lark (*Eremophila alpestris*), western meadow lark (*Sturnella neglecta*), and common raven were the most commonly observed species, comprising 52 percent of all observations. Ferruginous Hawk (*Buteo regalis*), mallard (*Anus platyrhynchos*), Swainson's Hawk, and Yellow-headed Blackbirds (*Xanthocephalus xanthocephalus*) were only observed in flight during

the surveys. In total, five BLM special status species including four that are NDOW sensitive and two that are also USFWS BCC were observed at 23 of the survey locations. These five species are Brewer's Sparrow (*Spizella brewe*r), Burrowing Owl (*Athene cunicularia*), Ferruginous Hawk (*Buteo regalis*), Swainson's Hawk (*Buteo swainsonii*), and Long-billed Curlew (*Numenius americanus*). In addition to birds protected under the MBTA, one game bird (chukar partridge) and two non-native species (house sparrow and common starling) were observed. Table D.2-1 in Appendix D lists the bird species observed at each of the survey point sites.

Table 3.4.3-3: Bird Species Observed within the Survey Areas

Species Name	Survey Area Number of Observations			Total Number of Survey Observations
	Goldstrike	Carlin	Crescent Valley	
American Goldfinch (*Spinus tristis*)	1			1
Belted Kingfisher (*Ceryle alcyon*)		1	2	3
Black-throated Sparrow (*Amphispiza bilineata*)	14	7	10	31

House Sparrow (*Passer domesticus)*			2	2

[a] BLM and NDOW Sensitive
[b] BLM Sensitive
[c] USFWS BCC; BLM and NDOW Sensitive
[d] USFWS BCC; BLM Sensitive

Six passerine bird species, including BLM and NDOW sensitive species Brewer's sparrow (*Spizella breweri*), and common ravens were observed during point counts in all three survey areas. The number of bird species observed in each Survey Area were very similar, with 19 different bird species in Goldstrike and Carlin, and 18 different bird species in Crescent Valley. Four passerine bird species were observed at both the Carlin and Crescent Valley survey areas: Belted Kingfisher (*Ceryle alcyon*), Brewer's Blackbird (*Euphagus cyanocephalus*), Northern Mockingbird (*Mimus polyglottos*), and Red-winged Blackbird (*Agelaius phoeniceus*). Chipping Sparrow (*Spizella passerine),* Lark Sparrow (*Chondestes grammacus*), Long-billed Curlew (*Numenius americanus*), and Song Sparrows (*Melospiza melodia*) were documented at both Crescent Valley and Goldstrike survey areas.

The Goldstrike Survey Area had the greatest number of raptor species with four different species (i.e., Prairie Falcon [*Falco mexicanus*], Red-tailed Hawk [*Buteo jamaicensis*], Ferruginous Hawk, and Swainson's Hawk) observed during the surveys. Prairie falcons and red-tailed hawks were documented during surveys only at the Carlin and Goldstrike survey areas.

Breeding Observations

During the migratory bird surveys, biologists recorded evidence of breeding, based on nest sightings, birds observed carrying nesting materials, or mating behaviors. Table 3.4.3-4 lists the 10 species including five BLM special status species (Brewer's Sparrow, Burrowing Owl, Ferruginous Hawk, Long-billed Curlew, and Swainson's Hawk) where breeding evidence was observed during the surveys. Breeding evidence for Brewer's sparrows and loggerhead shrikes (*Lanius ludovicianus*) was observed in all three survey areas. Although long-billed curlews were observed in both the Goldstrike and Crescent Valley survey areas, breeding observations of this species were documented only in the Goldstrike Survey Area.

Burrowing Owls and ferruginous hawks had confirmed breeding observations in Crescent Valley and Goldstrike survey areas respectively. Section 3.4.5 provides information on the Burrowing Owl survey results. Incidental observations in Crescent Valley Survey Area included two raven's

nests. Incidental observations in the Goldstrike Survey Area included a Swainson's hawk nest on a power pole near milepost 9.8 (see Appendix D, Figure D.2-1 through Figure D.2-3).

Table 3.4.3-4: Survey Area Migratory Bird Species with Breeding Evidence

Bird Species	Survey Area	Survey Locations with Breeding Evidence
Black-throated Sparrow (*Amphispiza bilineata*)	Crescent Valley	1
Brewer's Sparrow [a] (*Spizella brewer*i)	Carlin	1
	Crescent Valley	2
	Goldstrike	1
Burrowing Owl [a] (*Athene cunicularia*)	Crescent Valley	1
Chukar Partridge (*Alectoris chukar*)	Goldstrike	1
Common Raven (*Corvus corax*)	Crescent Valley	8
	Goldstrike	1
Ferruginous Hawk [a] (*Buteo regalis*)	Goldstrike	1
Loggerhead Shrike [a] (*Lanius ludovicianus*)	Carlin	1
	Crescent Valley	1
	Goldstrike	2
Long-billed Curlew [a] (*Numenius americanus*)	Crescent Valley	1
	Goldstrike	4
Swainson's Hawk [a] (*Buteo swainsonii*)	Goldstrike	1
Western Meadowlark (*Sturnella neglecta*)	Goldstrike	1

[a] BLM sensitive species

Breeding birds may not be detected due to being obscured by vegetation, birds not vocalizing, or vocalizations not being heard due to background noise.

Bird Density and Diversity

Bird density and species diversity were calculated for each of the three survey areas. Species diversity is a measure of the variety and abundance of species within a data set and includes two components: species richness (the number of different species in a community) and species evenness (the relative abundance of each species within the community). Species richness was assessed based on the range and mean number of species detected at survey points to calculate the Shannon Diversity Index using the number of species recorded in each habitat type over the sampling period. The Shannon Diversity Index measures the diversity of species in a community; values range from 1.5 to 3.5, with larger values indicating greater species richness. Species evenness was assessed by calculating the Shannon Equitability index (see Table 3.4.3-5). The term "evenness" refers to how similar the abundances of different species are in the community.

The mean number of species observed per survey point ranged from 2.5 to 3.5 and averaged 3.0 when combining results from all three survey areas (Table 3.4.3-5). Carlin and Crescent

Valley survey areas had a higher number of species present as shown by the Shannon Diversity Index values of 2.4 and 2.3, respectively.

The Shannon Equitability Index (H) values range from 0 to 1, with values of 1 indicating the species in the three areas showing complete evenness. The term “evenness” is a measure of how similar species observations are between the three survey areas. The range of Shannon Equitability Index values (H) for the three areas ranged from 0.74 to 0.82, indicating that during the 2021 field surveys, similar species were observed in the three survey areas.

Table 3.4.3-5: Number of Species per Survey Point and Species Diversity by Survey Area

Survey Point	Number of Species		Shannon Diversity Index	Shannon Equitability Index (H) [a]
	Mean	Range		
Carlin Area	3	2-7	2.4	0.82
Crescent Valley Area	3.5	2-6	2.3	0.78
Goldstrike Area	2.5	1-7	2.2	0.74
Survey Area	3	1-7	NA	NA

NA = not applicable
[a] The Shannon Equitability Index (H) normalizes the Shannon Diversity Index to a value between 0 and 1. Lower values of H indicate more species diversity while higher values indicate less species diversity; for example, a community with a single species would have a value of 1.

Species Accumulation Curves

A species accumulation curve is a visual representation of the accumulation of the number of species detected with increasing sampling effort. Species accumulation curves are also used to determine if the level of survey effort was sufficient to detect most of the upland bird species present in the survey area. The 2021 point count survey data was divided into the three survey areas and then organized by date and time that the survey occurred. The species detected were listed by individual survey point to assess the rate at which new species were encountered in the survey area. Only bird species observed during the point count surveys were included in the species accumulation survey. The rate of species detection was then graphed and fitted with a logarithmic trend line shown in Figure 3.4.3-4.

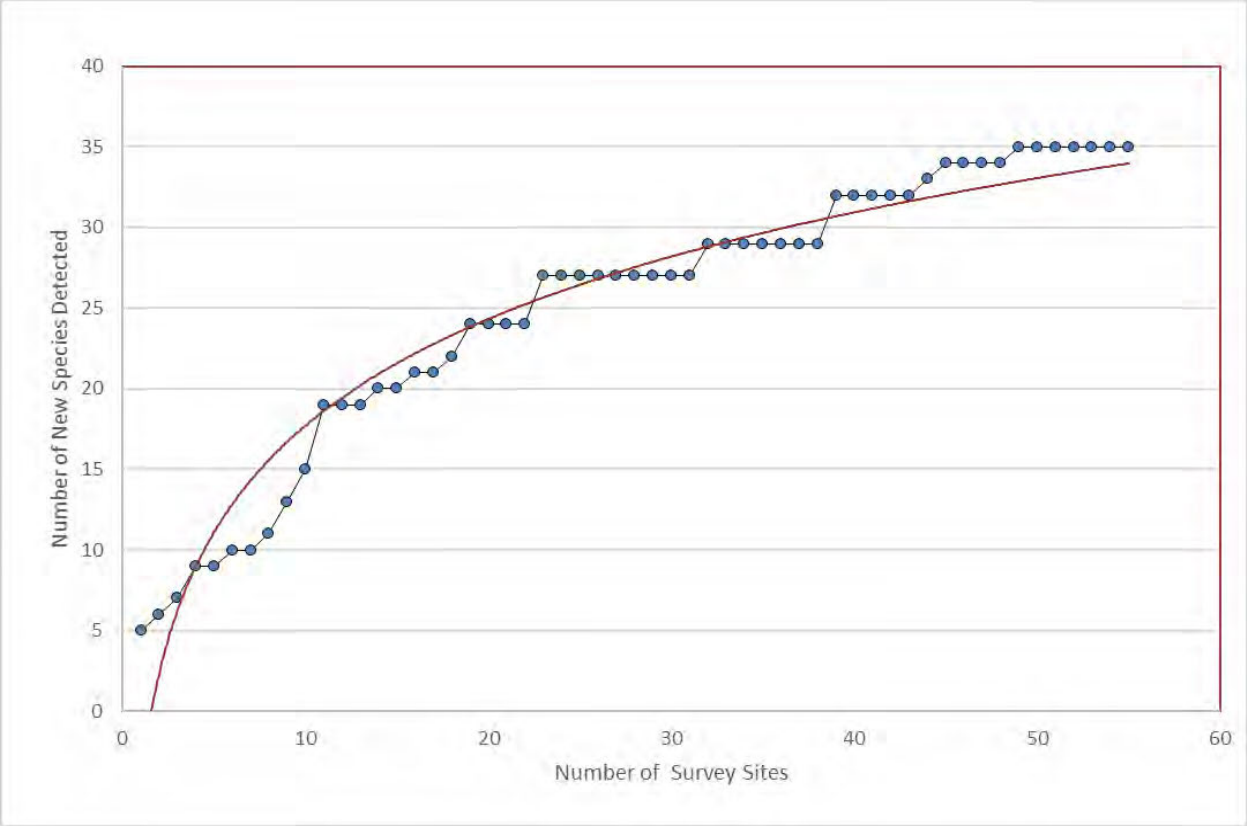

Figure 3.4.3-4: Detection of Bird Species

The species accumulation curve in Figure 3.4.3-4 shows that the rate of new species detection had begun to plateau after completing surveys at 30 survey points, indicating that the 2021 field survey effort was likely sufficient to detect most of the migratory bird species present in the three survey areas.

3.4.4. Eagles and Other Raptors

3.4.4.1. Background

Raptors are protected under the MBTA, and bald and golden eagles have additional protection under the BGEPA (16 USC § 668-668c) of 1940. The BGEPA prohibits the take, possession, sale, purchase, barter, offer to sell, purchase or barter, transport, export, or import of any bald or golden eagle, alive or dead, including any part, nest, or egg, unless allowed by permit. As defined in the BGEPA, a “take” includes disturbing a bald or golden eagle to a degree that causes, or is likely to cause, injury to an eagle or decrease in its productivity or nest abandonment by substantially interfering with normal breeding, feeding, or sheltering behavior.

The purpose of the eagle and raptor surveys is to identify the species that nest within a 10-mile buffer of the Project to inform the future NEPA analysis. The 10-mile buffer is applied to the Project per recommendations from USFWS.

3.4.4.2. Study Methodology

A desktop assessment using publicly available data from NDNH, sensitive data requested from NDOW, and survey data from NGM (Stantec 2018, 2021; JBR 2012a, 2012b, 2013; SRK 2013) was completed to identify suitable habitat and locations of known eagle and raptor nests within the Project Area. To focus on more recent observations and potential nest sites, data were limited to observations from 2010 to present.

No field surveys were completed for eagles and raptors in 2021; however, surveys are proposed for 2022. Incidental observations of raptors were recorded during migratory bird surveys (Section 3.4.3, Migratory and Breeding Birds). Common ravens construct stick nests that may be reused by raptors; and were recorded in the field survey reports discussed above.

The following protocols were referenced for this survey and would be used for future raptor and eagle surveys:

- *Golden Eagle Protection Best Practices, Nevada Mineral Exploration and Mining Industry* (Nevada Mining Association 2018)
- *Interim Golden Eagle Technical Guidance: Inventory and Monitoring Protocols; and Other Recommendations in Support of Golden Eagle Management and Permit Issuance* (Pagel et al. 2010)

3.4.4.3. Results and Discussion

Pre-Field Assessment

Most of Nevada and all of the Project Area is located in the Great Basin Bird Conservation Region (9), for consideration of USFWS BCC. The Project Area also lies within the BLM Elko and Battle Mountain districts, for consideration of BLM sensitive eagle and raptor species. The Project Area contains multiple diverse habitats (e.g., rocky outcrop and cliff/canyon habitats, open valleys, grasslands/forblands, agricultural lands, riparian areas, trees, and transmission line corridors) that may provide suitable nesting and foraging habitat for raptors (Table 3.4.2-1). Eleven species of raptors have the potential to occur within and near the Project Area and are included along with their species status and preferred habitat in Table 3.4.4-1. Of the raptor and eagle species potentially present, two are listed as endangered by NDOW, seven are BLM Sensitive species, and five are USFWS BCC.

Table 3.4.4-1: Potential Raptor Species within the Project Area

Species	Agency Status	Habitat	Likelihood of Occurrence
Bald Eagle (*Haliaeetus leucocephalus*)	BLM Sensitive; NDOW Endangered	Lakes, reservoirs, rivers, marshes, and coasts with scattered breeding occurrences in northern Nevada	Possible, particularly along the Humboldt River
Ferruginous Hawk (*Buteo regalis*)	BLM Sensitive; USFWS BCC [a]	Arid and semi-arid grasslands; open or rolling prairies; foothills or middle elevation plateaus	Likely; Records from past surveys
Golden Eagle (*Aquila chrysaetos*)	BLM Sensitive; USFWS BCC	Open country, shrublands, grasslands, nesting in mountainous cliff habitat	Likely; Records from past surveys and NDOW
Great Horned Owl (*Bubo virginianus*)	N/A	Nests in trees near open areas; Can utilize desert canyons, mountain forests, and agricultural areas	Likely; Records from past surveys
Peregrine Falcon (*Falco peregrinus*)	BLM Sensitive; NDOW Endangered	Breed and nest in open landscapes with cliffs at elevations up to 12,000 feet	Possible
Prairie Falcon (*Falco mexicanus*)	USFWS BCC [a]	Treeless terrain, including prairies, deserts, canyons, and foothills in arid environments, preferring nest sites on cliff ledges	Likely; Records from past surveys and NDOW
Red-tailed Hawk (*Buteo jamaicensis*)	N/A	Grasslands, sagebrush, pinyon -juniper, and riparian/shrub habitats.	Likely; Records from past surveys and NDOW
Short-eared Owl (*Asio flammeus*)	BLM Sensitive; USFWS BCC	Large, open areas with low vegetation, including prairies, meadows, shrub-steppe, savanna, dunes, and agricultural areas	Possible foraging habitat; Unlikely nesting habitat within Project Area
Swainson's Hawk (*Buteo swainsonii*)	BLM Sensitive	Nest in trees near open habitats, including agricultural fields, grasslands, and shrub-steppe habitat	Likely; Records from past surveys
Turkey Vulture (*Cathartes aura*)	N/A	Nests in caves, rock ledges, and abandoned raptor nests adjacent to rangeland, forests, and open areas.	Possible
Western Burrowing Owl (*Athene cunicularia hypugaea*) [b]	BLM Sensitive; USFWS BCC [a]	Breed throughout Nevada in salt desert scrub, Mojave shrub, sagebrush habitat, and agricultural landscapes	Likely; Records from past surveys and NDOW

Table Source: BLM 2017b, 2019a, and USFWS 2021a

BCC = Birds of Conservation Concern; BLM = Bureau of Land Management; N/A = data not available; NDOW = Nevada Department of Wildlife; USFWS = U.S. Fish and Wildlife Service

[a] Ferruginous Hawk, Prairie Falcon, and Western Burrowing Owl are USFWS BCCs in some locations, but not within the Project Area.

[b] Western Burrowing Owl is discussed further in Section 3.4.5, Burrowing Owl.

Historical Data

There are extensive NDOW records of mapped nesting sites for eagles and raptors in the Project Area extending back to the 1970s. This survey is focused on 2010 to 2014 for the most recent years available (data were not available after 2014). During this timeframe, there were 195 mapped nest sites within a 10-mile buffer of the Project Area, as shown in Table 3.4.4-2 and Figure 3.4.4-1. Where the exact species identity was unclear, the nest site was recorded as a general *Buteo* (raptor), Eagle/*Buteo* (eagle or raptor), or *Buteo*/Corvid (raptor or common raven) nest. Nest observations for Burrowing Owl were not included, but are discussed in Section 3.4.5, Burrowing Owls. The Crescent Valley Survey Area contained double the number of nest sites according to the NDOW data as compared to the Carlin or Goldstrike survey areas.

Table 3.4.4-2: NDOW Raptor Species/Nest Sites within Survey Areas, 2010–2014

Species Name/Nests	Survey Area Number of Observations			Total Number of Observations
	Carlin	Crescent Valley	Goldstrike	
Buteo [a]	3	15	8	26
Buteo/Corvid [a]	8	5	4	17
Corvid [a]	3	15	10	28
Eagle [a]	21	29	8	58
Eagle/*Buteo* [a]	10	17	14	41
Falcon (probable and confirmed) [a, b, c, d]	4	7	0	11
Ferruginous hawk [a]	0	6	0	6
Owl [e]	0	1	0	1
Unknown [a, d]	1	6	0	7
Total	**50**	**101**	**44**	**195**

Page Intentionally Left Blank.

Several survey reports were referenced due to their proximity to the Project Area, which are discussed below. In some cases, the survey areas may have been outside of the Project Area 10-mile buffer. Additionally, duplicate recordings of nest sites between the surveys is possible from overlap of survey areas. Therefore, specific observations discussed in the paragraphs below may not align with the combined results in Table 3.4.4-3.

According to fieldwork conducted by Stantec (2021) for the Cortez Mine, 106 occupied or unoccupied raptor and eagle nest sites were documented within the Crescent Valley Survey Area and Carlin Survey Area. Of those nests, 32 were determined to be occupied by raptor species (3 Ferruginous Hawk, 1 Great Horned Owl, 8 Golden Eagle, 7 Prairie Falcon, and 13 Red-tailed Hawk) during survey flights or ground surveys and 33 were occupied by common ravens. Observations of 53 of the identified nests were determined to be Golden Eagle nests; if individuals were not observed or the nest was not occupied, then this was concluded from the size and materials used in the nest or previous occupancy records. While 45 of the Golden Eagle nest sites were unoccupied in the Crescent Valley Survey Area, it is possible that some were alternate nest sites located within the same single eagle territory (Stantec 2021) (Table 3.4.4-3).

A part of the Goldstrike Survey Area was also surveyed in 2018 within a 10-mile radius of the Rossi Mine boundary (Stantec 2018). Within this survey area, 37 nest sites were identified, 13 of which were identified as Golden Eagle. Of these 13 nests, 2 were occupied and 11 were unoccupied. One occupied Prairie Falcon nest and three occupied Red-tailed Hawk nests were also observed during this survey (Table 3.4.4-3).

According to aerial and ground surveys conducted within 10-miles of the Gold Quarry Mine near the Carlin and Goldstrike survey areas, four occupied and one unoccupied Golden Eagle nest sites were identified northwest of Carlin (JBR 2012a). Two occupied Ferruginous Hawk nests, two occupied Prairie Falcon nests, five occupied Red-tailed Hawk nests, and one occupied Swainson's Hawk nest were also documented (JBR 2012a) (Table 3.4.4-3). An additional survey in 2012 near the Goldstrike Survey Area documented no occupied Golden Eagle nests, and two occupied red-tailed hawk nests were documented within 10 miles of the Green Lantern Project (JBR 2012b) (Table 3.4.4-3). In 2013, a follow-up survey within a 10-mile buffer around the Gold Quarry and Green Lantern projects (excluding previously surveyed areas) was conducted (JBR 2013). During these aerial and ground surveys (overlapping portions of the Carlin, Goldstrike, and Crescent Valley survey areas), 3 occupied and 26 unoccupied Golden Eagle nests were documented. Additionally, one occupied Ferruginous Hawk nest, three occupied Prairie Falcon nests, and two occupied Red-tailed Hawk nests were documented. Additional surveys specific to Golden Eagles were conducted within portions of a 10-mile buffer for the Green Lantern and Gold Quarry projects (SRK 2013). One occupied and five unoccupied Golden Eagle nests, three occupied Prairie Falcon nests, and three occupied Red-tailed Hawk nests were observed during this survey with the Goldstrike and Carlin survey areas (Table 3.4.4-3).

Table 3.4.4-3: Raptor Observations and Nest Sites within Survey Areas

Species Name	Number of Nest Observations						Total Occupied Nests	Total Unoccupied Nests
	Carlin		Crescent Valley		Goldstrike			
	Occupied	Unoccupied	Occupied	Unoccupied	Occupied	Unoccupied		
Common Raven (*Corvus corax*)	4	0	33	12	6	5	43	17
Ferruginous Hawk (*Buteo regalis*)	3	2	3	3	0	2	6	7
Great Horned Owl (*Bubo virginianus*)	0	0	1	0	0	0	1	0
Golden Eagle (*Aquila chrysaetos*)	6	25	8	46	4	17	18	88

Source: Stantec 2018, 2021; JBR 2012a, 2012b, 2013; SRK 2013

[a] As nest status was not available for all data sources, this table reflects only nests labeled specifically as occupied or unoccupied. These totals may differ from the discussion above.

[b] Some survey reports noted Canada goose or pack rat nests, which are not summarized here.

The Crescent Valley Survey Area contained more observations of occupied and unoccupied eagle and raptor nests (315 nests) than the Goldstrike and Carlin survey areas (138 nests and 118 nests, respectively). However, annual surveys have been consistently conducted collectively for the Cortez Mine Plan of Operations, Robertson Plan of Operations, and Goldrush Baseline Study Area. This is a much larger area than the other two survey areas, which could result in the number of nests being higher in the Crescent Valley Survey Area.

Tables D.3-1 and D.3-2 of Appendix D contain observations from the historic NDOW data (2010 to 2014) and the survey reports discussed above. Data is included for the species observed, nest status (if available), data source, and the survey area and BLM field office associated with the data point.

Field Assessment

No eagle or raptor surveys were conducted in 2021 due to missing the field survey window. Incidental observations of raptors were recorded during the migratory and breeding bird surveys and are shown in Table 3.4.4-4. There were eight observations of five different raptor species identified during these surveys. One nest on a power pole was also recorded and associated with a nearby Swainson's Hawk observation in the Goldstrike Survey Area. No other raptor nests were recorded during the migratory bird species surveys.

Table 3.4.4-4: Raptor Species Observed within the Survey Areas

Species Name	Survey Area Number of Observations			Total Number of Survey Observations
	Carlin	Crescent Valley	Goldstrike	
Burrowing Owl (*Athene cunicularia*)	0	1	0	1

3.4.5. Burrowing Owls

3.4.5.1. Background

Burrowing Owls are a BLM special status species and protected under MBTA. Most of the breeding population in the state is known to migrate from northern Nevada to the southern United States, northern Mexico, and central America during the winter months; however, Burrowing Owls have been recorded year-round in Nevada. The nesting season for Burrowing Owls is between March 1 and August 31 in the Elko BLM District and between April 1 and July 31 in the Battle Mountain BLM District (BLM 2014b).

Burrowing Owls live in open habitats with sparse vegetation, such as prairies, open grasslands, or shrub steppe generally with canopy coverage of less than 30 percent (CBOC 1993). In Nevada, this species breeds in salt desert scrub, Mojave scrub, and some sagebrush habitat, as well as agricultural landscapes and other disturbed areas. Burrowing Owls typically also use burrows created by fossorial mammals and human-made structures for shelter, protection, and nesting (Henny and Blus 1981).

3.4.5.2. Study Methodology

A desktop assessment was performed using NDNH occurrence data and the USGS Gap Analysis Project (GAP) modeled habitat layer for Burrowing Owls, which applies a deductive habitat model to remotely sensed data layers within the species' known range (USGS GAP 2018). These data were reviewed to identify potential suitable habitat in the Project Area. Figure 3.4.5-1 through Figure 3.4.5-3 show the results from the USGS GAP analysis and NDNH data in the three survey areas.

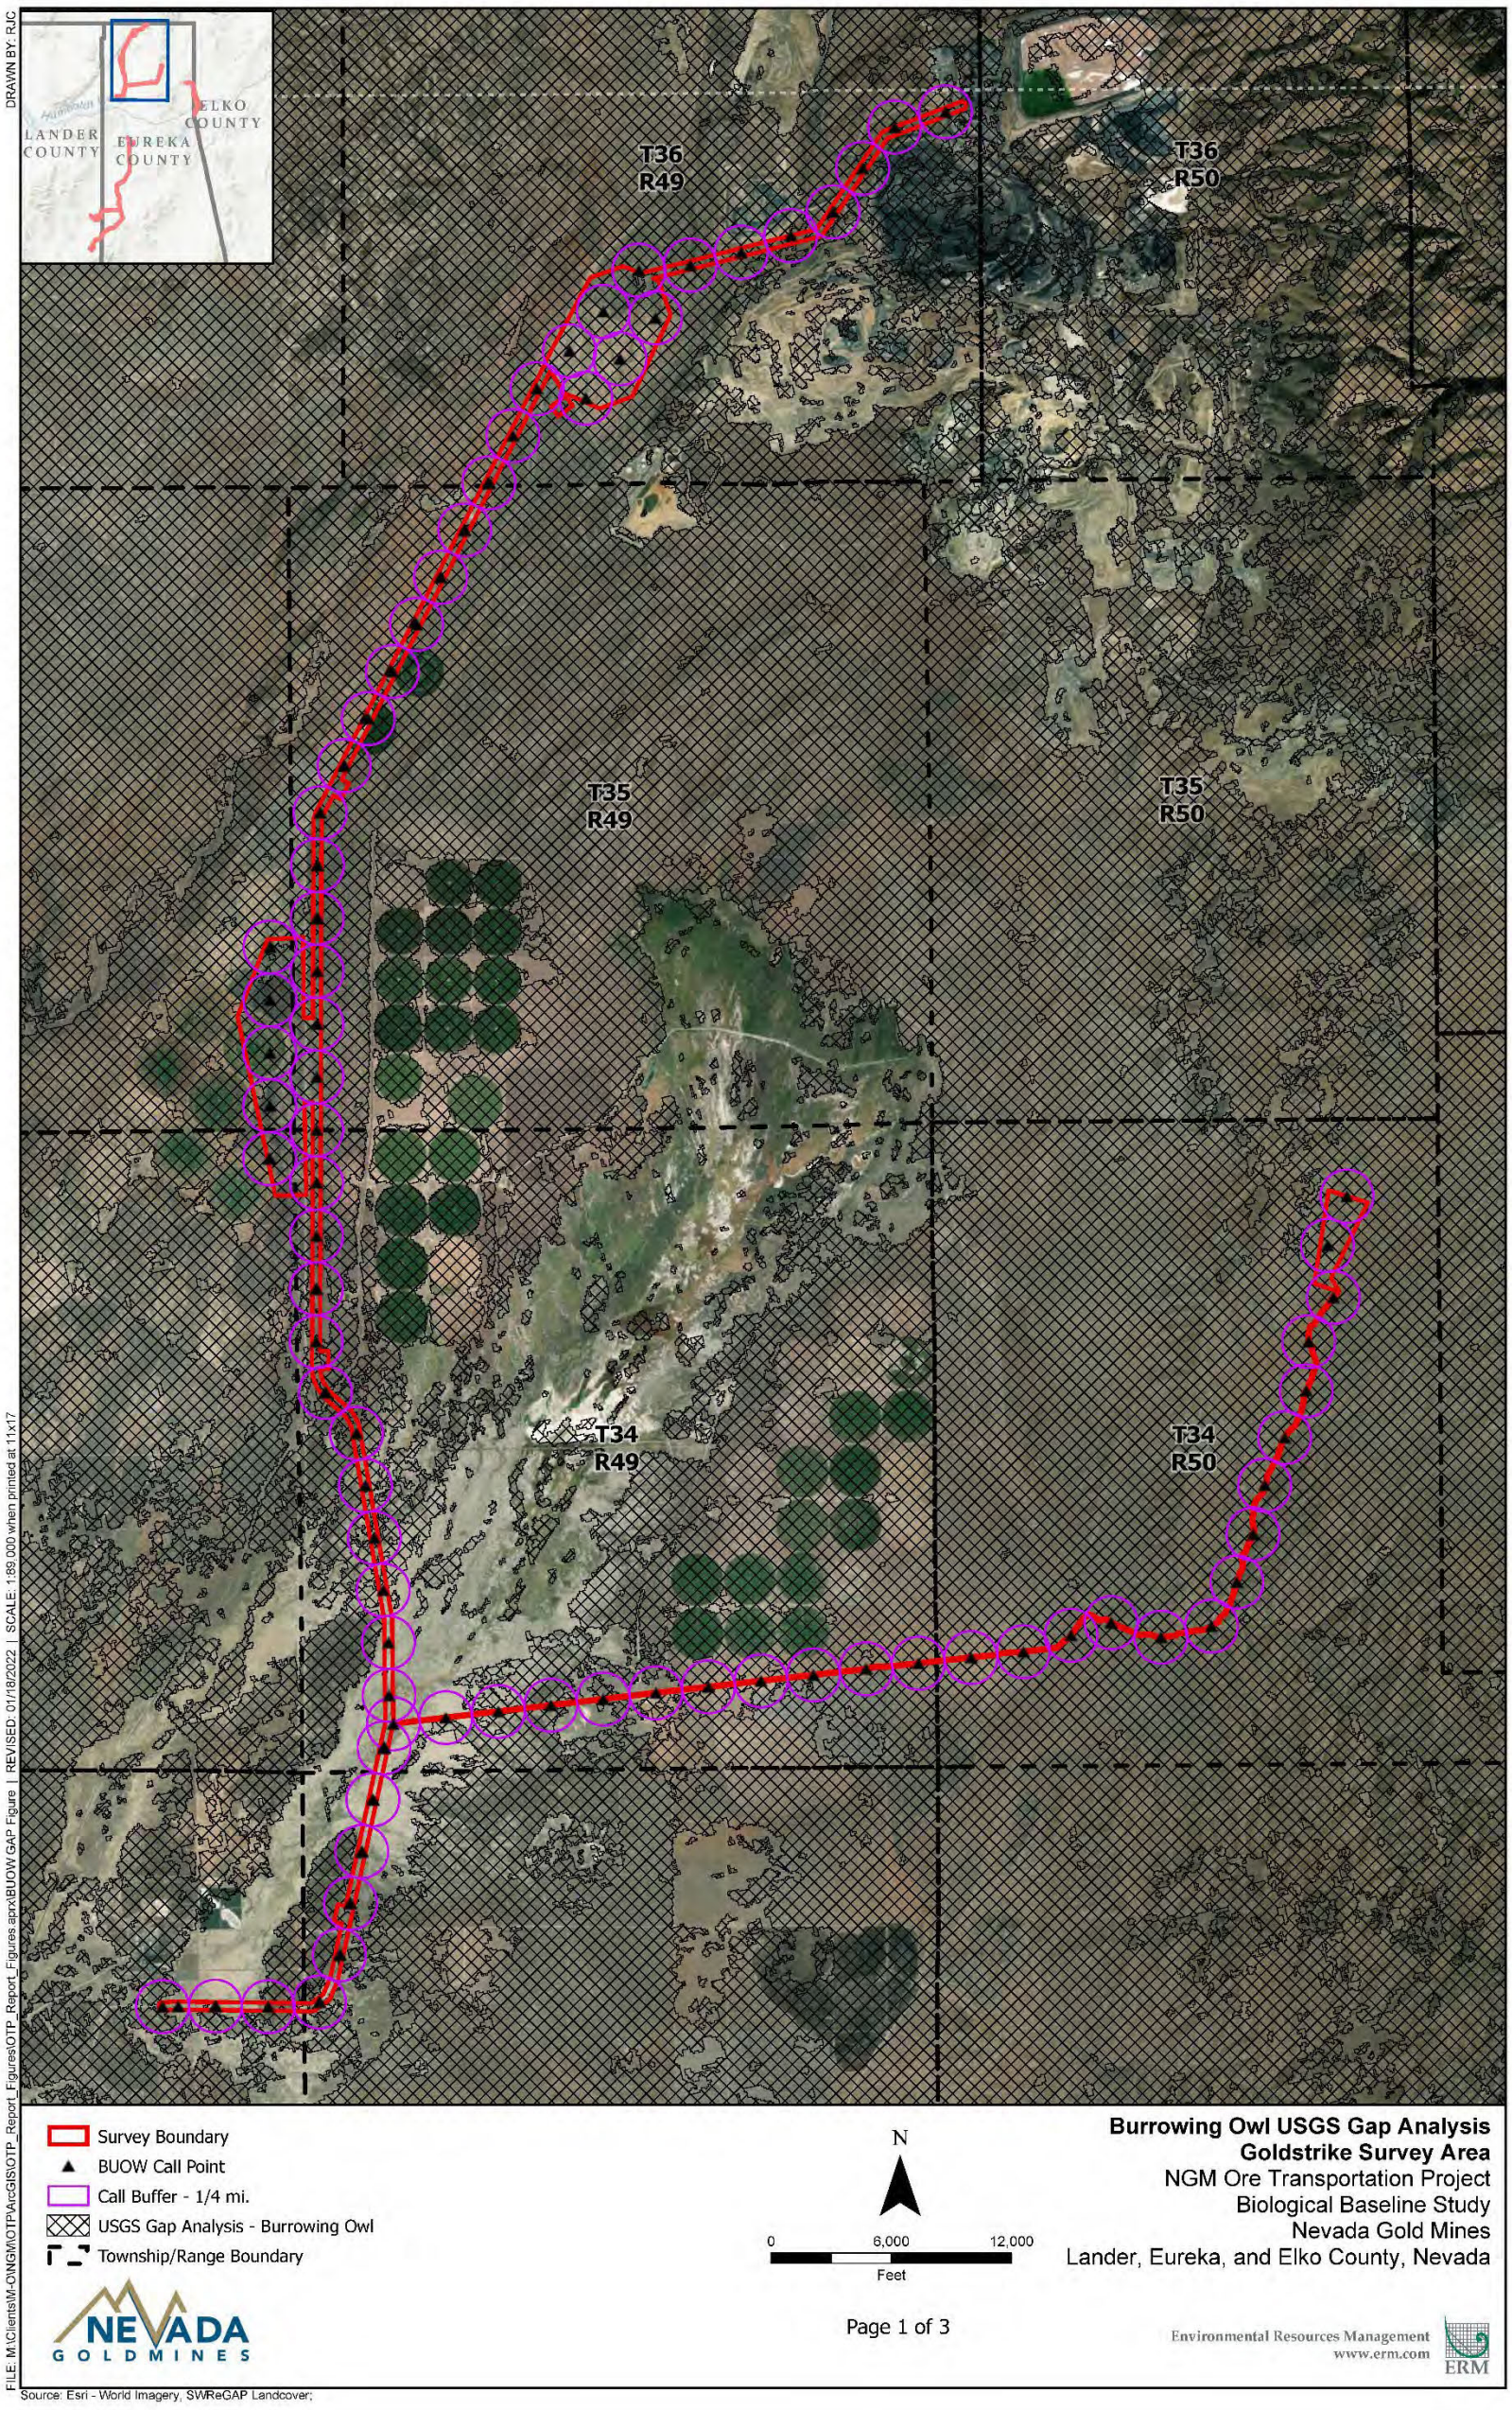

Figure 3.4.5-1: Burrowing Owl USGS GAP Analysis—Goldstrike Survey Area

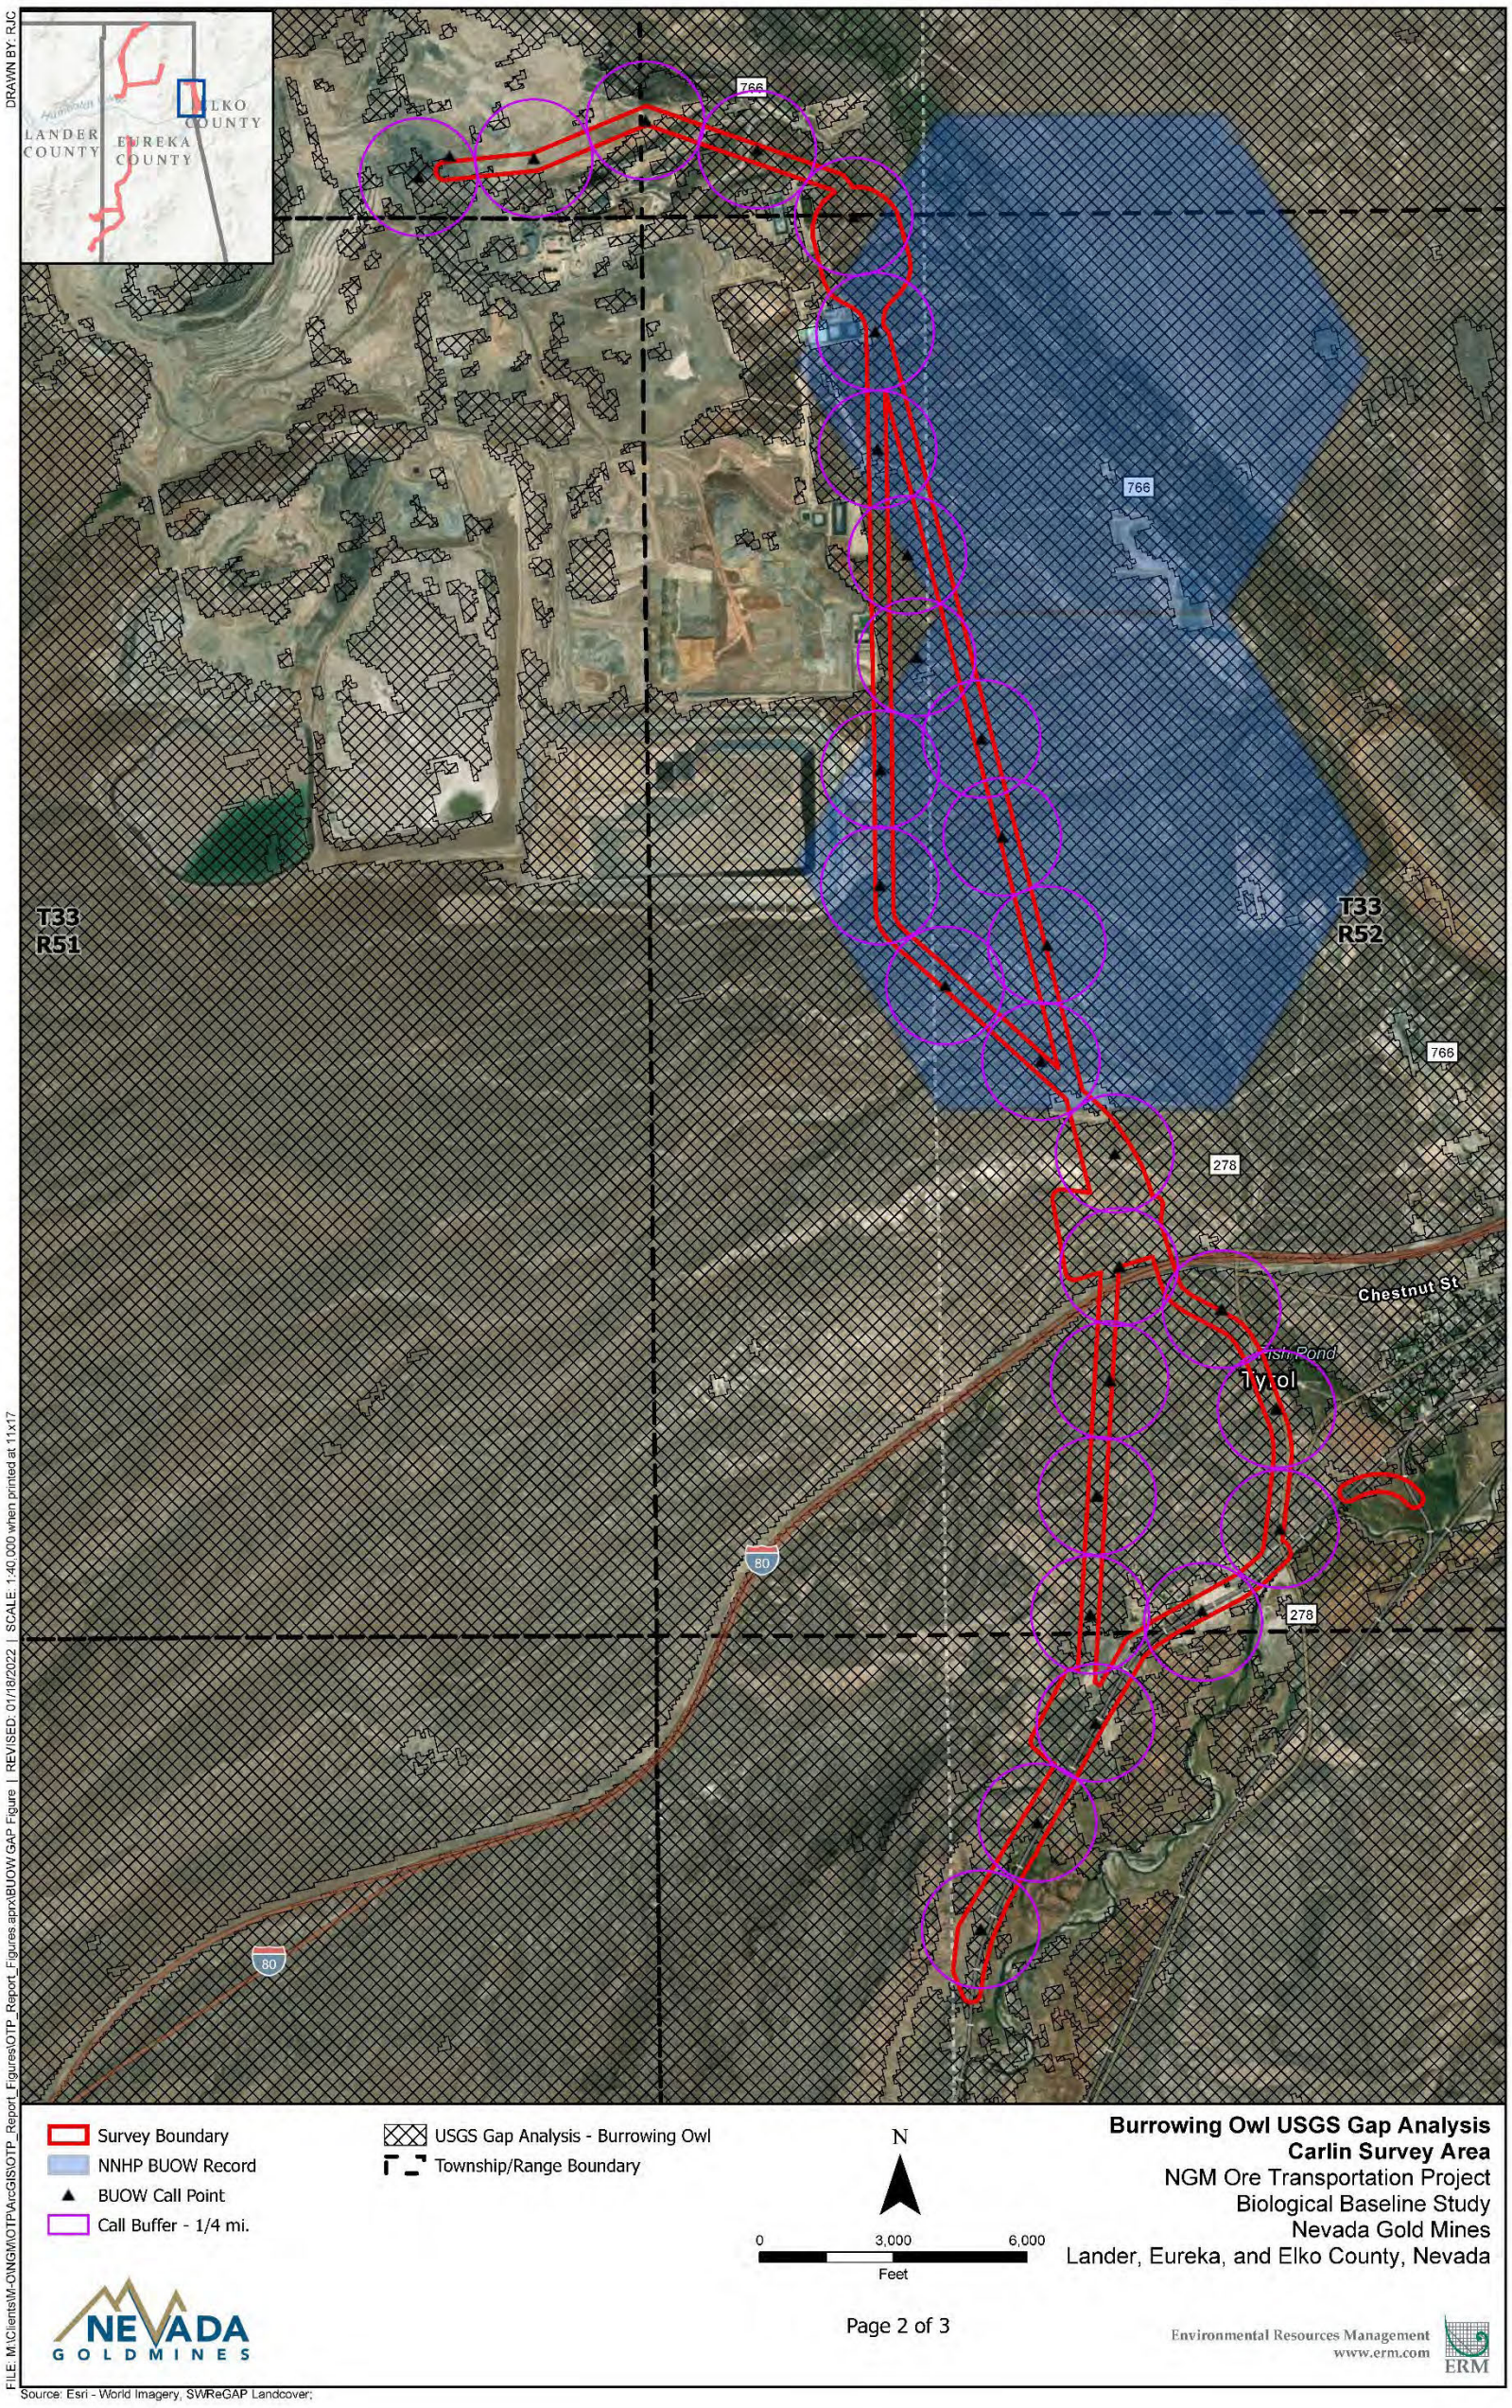

Figure 3.4.5-2: Burrowing Owl USGS GAP Analysis—Carlin Survey Area

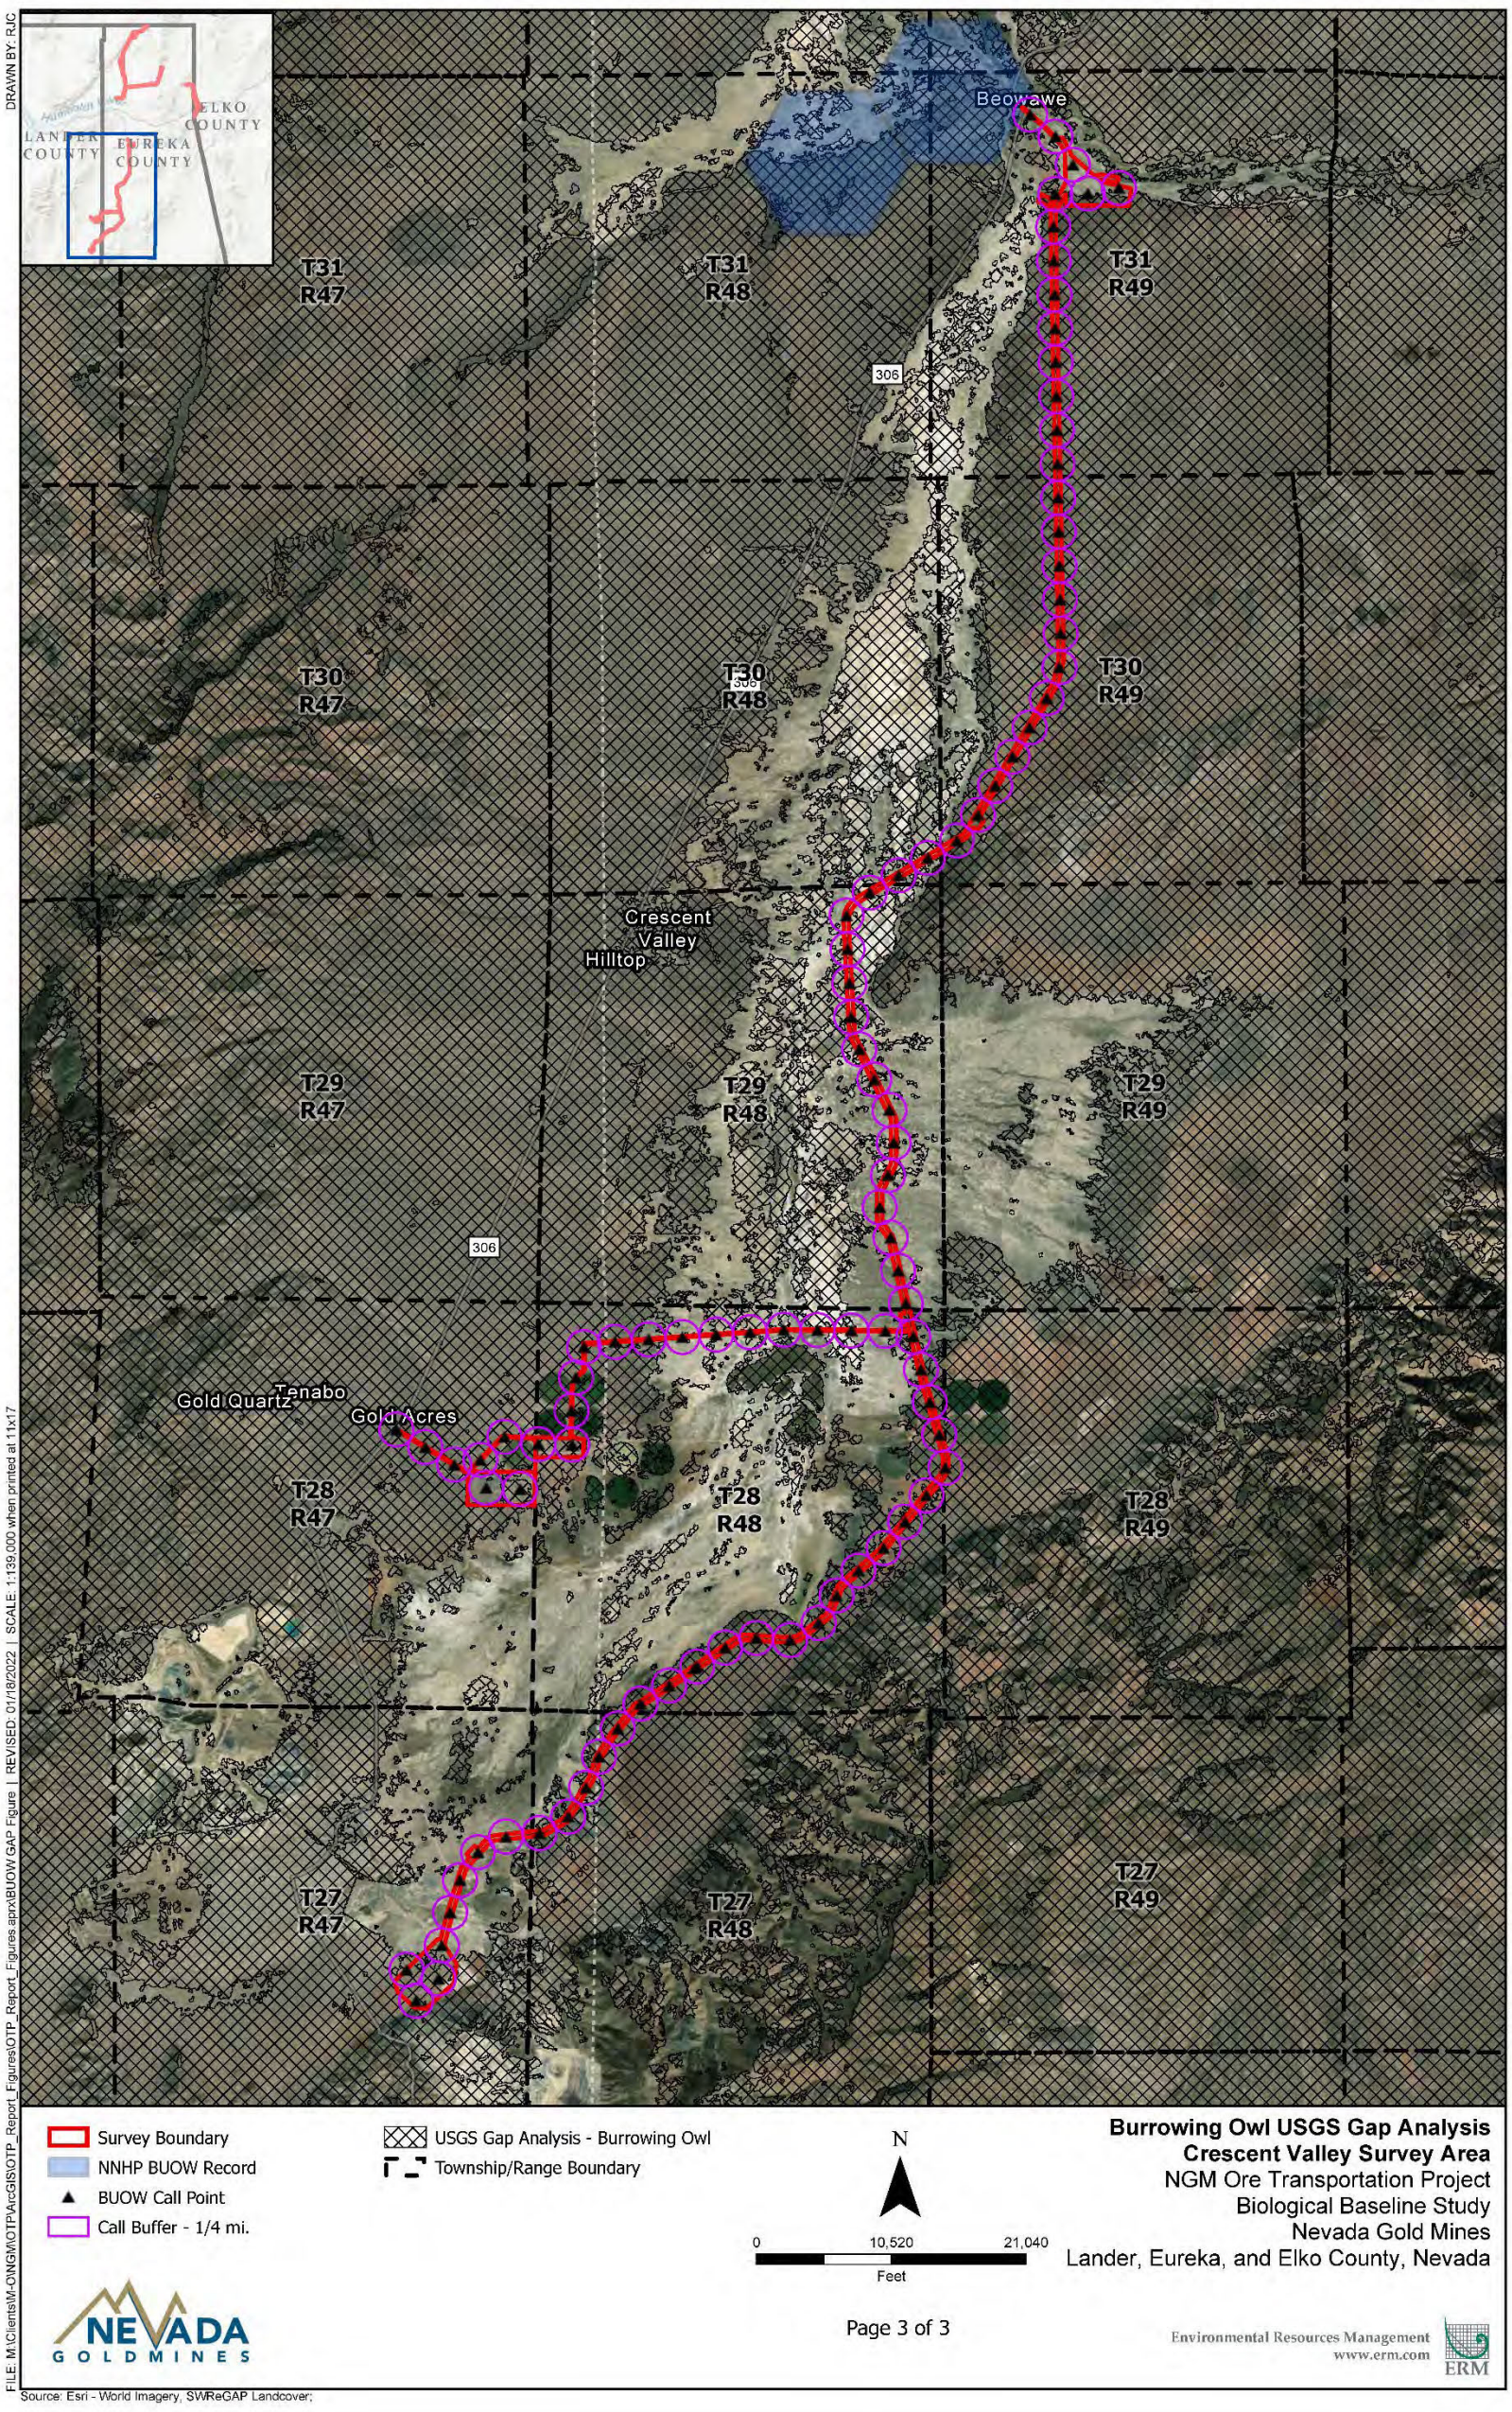

Figure 3.4.5-3: Burrowing Owl USGS GAP Analysis—Crescent Valley Survey Area

Page Intentionally Left Blank.

Comprehensive field studies were conducted to discover the current distribution of Burrowing Owl activity within the Project Area. The following protocols were used in this survey:

- *Statewide Wildlife Survey Protocols* (BLM 2014b)
- *Wildlife Survey Protocols* (BLM 2011)

Field surveys were conducted on three separate survey events between May 28 and June 4 2021, during the nesting season using a total of 201 call survey stations (call points). Based on the GAP layer desktop assessment and guidance from the BLM, call points were arranged 0.5 mile apart throughout the entire Project Area with additional call points within the borrow sources, as shown on Figure 3.4.5-1 through Figure 3.4.5-3. Surveys and calls were conducted in the early morning (30 minutes before sunrise until 2 hours after sunrise) and early evening (2 hours before sunset until 30 minutes after sunset) (BLM 2011). As described in the protocols mentioned above, poor weather conditions may impact the ability to detect Burrowing Owls; therefore, call surveys were conducted when wind speed was no more than 20 mph (the higher wind speed was approved by BLM during the surveys based on daily conditions during the survey), the ambient temperature was greater than 68 °F, and there was no precipitation.

At each call point, surveyors broadcasted the primary male (coo-coo) and alarm (quick-quick-quick) calls at 80 to 90 decibels (measured approximately 3.3 feet from the speaker) and rotated in each cardinal direction during the broadcast. The observers stood and scanned the 360-degree area for Burrowing Owls during the entire call point survey period. The call survey period and sequence of activities were conducted as follows:

- 3 minutes of silence
- 30 seconds call-broadcast of primary call (coo-coo)
- 30 seconds of silence
- 30 seconds call-broadcast of primary call (coo-coo)
- 30 seconds of silence
- 30 seconds call-broadcast of alarm call (quick-quick-quick)
- 30 seconds of silence
- 4 minutes of silence

Surveys were conducted for 10 minutes at each call point to allow adequate time for Burrowing Owls to detect the calls from inside of burrows or for those not present on the site when the call site survey started (BLM 2011). During surveys, observers continually searched 360 degrees around the broadcast call site. Observers also listened for Burrowing Owls while conducting the survey and recorded auditory confirmations concurrently with the visual sightings.

All call points were recorded, and photographs were taken in each cardinal direction. The UTM coordinates and/or delineation of these features and the status of burrows were also recorded. Burrows were considered active if owls were seen entering or exiting the burrow or if there was owl sign (fresh scat or pellets) at the burrow.

3.4.5.3. Results and Discussion

Suitable habitat for Burrowing Owls was identified throughout the Project Area during the desktop assessment, and field surveys were completed at a total of 201 call points: 28 in Carlin Survey Area, 80 in Goldstrike Survey Area, and 93 in Crescent Valley Survey Area. Appendix D.4.2 contains representative photographs for the Burrowing Owl call points. The Carlin Survey Area call points were primarily located in areas with sagebrush habitat, while both Goldstrike and Crescent Valley survey area call points were in areas that have a combination of sagebrush, grassland, greasewood, and invasive (cheat grass / clasping pepperweed / other) habitat types.

Figure 3.4.5-4 through Figure 3.4.5-8 show the location of the call points from the field surveys and location of all identified burrows throughout the Project Area and their status (active or inactive). The survey areas were broken down based on the distribution of active burrows and Burrowing Owls: Goldstrike was divided into 6 defined areas (Goldstrike A-F), Crescent Valley was divided into 5 defined areas (Crescent Valley A-E), and Carlin remained as one defined area due to only one documented active burrow. A comprehensive summary of active and inactive burrows is shown in Table D.4-1 of Appendix D.

Page Intentionally Left Blank.

During field surveys, burrows were observed at 54 of the 201 call points, 31 of which were active. Active burrows were observed in all three survey areas: 1 call point in Carlin Survey Area, 22 call points in Goldstrike Survey Area, and 8 call points in Crescent Valley Survey Area (Figure 3.4.5-4 through Figure 3.4.5-8; Table 3.4.5-1; Table D.4-1 Appendix D). Active burrows were observed primarily in sagebrush or grassland habitat with minimal vegetation coverage and loam soil.

Table 3.4.5-1 summarizes active burrows and Burrowing Owl observations within the survey areas and briefly describes habitat and soil type where the observations occurred. Site identifications (IDs) for Burrowing Owl call points begin with “BUOW” (Burrowing Owl), followed by the survey area (“CR”-Carlin, “GS”-Goldstrike, and “CV”-Crescent Valley) and the call point number.

Table 3.4.5-1: Summary of Active Burrows and Burrowing Owl Observations

Survey Area	Habitat and Field Notes	Site ID [a]	Survey Dates	Active Burrows Present	Number of Owl Sightings
Carlin	Primarily sagebrush community with clay/loam soil. The canopy cover is 0-25 inches high. No predators were seen at the site. The observed burrow showed minimal activity.	BUOW-CR12	7/22/2021	Yes	1 (adult)
Goldstrike A	Primarily consists of invasive plant species (cheat grass / clasping pepperweed / other), loam soil, 0–25-inch canopy cover, no predators seen.	BUOW-GS16	6/18/2021	Yes	1
		BUOW-GS16 BOB	5/19/2021	Yes	1 (adult)
		BUOW-GS16 BOB	5/19/2021	Yes (3)	1 (adult)
Goldstrike B	Habitat consists of invasive plant species (cheat grass / clasping pepperweed / other) with loam soil and 0-25 inches of canopy cover.	BUOW-GS27 BOB	5/19/2021	Yes	1 (adult)
		BUOW-GS27	5/19/2021	Yes	1 (adult)
		BUOW-GS34 BOB	7/5/2021	Yes	1 (adult)

Survey Area	Habitat and Field Notes	Site ID [a]	Survey Dates	Active Burrows Present	Number of Owl Sightings
Goldstrike C	Habitat is primarily invasive plant species (cheat grass / clasping pepperweed / other) with loam soil and 0-25 inches of canopy cover.	BUOW-GS41 BOB	5/19/2021	Yes	1 (adult)
Goldstrike D	This area has loam soil and canopy cover that is 0-25 inches high. Common Ravens, predators of the Burrowing Owl, were seen on site.	BUOW-GS50 BOB	6/21/2021	Yes	1 (adult)
Goldstrike E	Habitat consists primarily of grassland with some invasive plant species (cheat grass / clasping pepperweed / other) with loam soil and has 0-25 inches of canopy cover. There were burrows with feathers, pellets, and whitewash at BUOW-GS69 on 6/23/2021 and 6/30/2021, but no owls were observed.	BUOW-GS67 BOB	6/30/2021	Yes	1 (adult)
		BUOW-GS67 ALT	6/30/2021	Yes	0
		BUOW-GS67	7/7/2021	Yes	0
		BUOW-GS68	6/30/2021	Yes	0
		BUOW-GS69	6/23/2021	Yes	0
		BUOW-GS69	6/30/2021	Yes	1 (adult)
		BUOW-GS69	6/30/2021	Yes	0
		BUOW-GS69	7/4/2021	Yes	1 (adult)
		BUOW-GS69	7/4/2021	Yes	1 (adult)
		BUOW-GS69	7/5/2021	Yes	1 (adult)
		BUOW-GS69	7/5/2021	Yes	0
		BUOW-GS69 BOB	6/30/2021	Yes	2 (adults)

Survey Area	Habitat and Field Notes	Site ID [a]	Survey Dates	Active Burrows Present	Number of Owl Sightings
		BUOW-GS69 BOB	6/30/2021	Yes	0
		BUOW-GS69 ALT	6/30/2021	Yes	1 (adult)
Goldstrike F	Habitat is a combination of invasive plant species (cheat grass / clasping pepperweed / other) and dry, non-native grass/forb community. The soils are primarily loam and there is 0-25 inches of canopy cover.	BUOW-GS74 BOB	5/17/2021	Yes	2 (adults)
Crescent Valley A	Primarily greasewood habitat with loam soil and 26-50 inches of canopy cover.	BUOW-CV16 BOB	7/27/2021	Yes	7 (adults)
Crescent Valley B	Primarily sagebrush community and grassland with loam soil and 0-50 inches of canopy cover. Common ravens were seen in the area. Two adult owls were seen on 5/24/2021, and four adult owls were seen on 7/20/2021 at BUOW-CV23.	BUOW-CV23	7/20/2021	Yes	6 (adults)
		BUOW-CV23 ALT	6/29/2021	Yes	2 (adult + chick)
		BUOW-CV23 BOB	6/21/2021	Yes	0
Crescent Valley C	Active burrows were seen at this call point, but no owls were observed. There were copious amounts of scat, sign, cowpie decoration, bones, and feathers observed on-site. Habitat in this area is primarily mixed salt scrub - shadscale dominated with loam soil and 0-25 inches of canopy.	BUOW-CV38	5/27/2021	Yes	0

Survey Area	Habitat and Field Notes	Site ID [a]	Survey Dates	Active Burrows Present	Number of Owl Sightings
Crescent Valley D	Habitat consists of a combination of invasive plant species (cheat grass / clasping pepperweed / other) and dry, non-native grass/forb community. The soils are primarily loam and there is 0-25 inches of canopy cover. Two adult owls were observed on 5/20/2021 and on 6/16/2021. Tracks and feathers were seen at the mouth of this burrow.	BUOW-CV74	5/20/2021, 6/16/2021	Yes	4 (adults)
Crescent Valley E	A burrow was found on the walk to CV85. The habitat in this area is primarily grassland with loam soil and 0-25 inches of canopy cover.	BUOW-CV85	6/8/2021	Yes	0

BUOW = Burrowing Owl; CR = Carlin; CV = Crescent Valley; GS = Goldstrike; ID = identification
[a] ALT indicates that another burrow from the same owl (or pair of owls) was identified near the original call point. Burrowing Owls often have multiple burrows and may travel to another burrow for protection when the owls are flushed. When this behavior was observed, the second burrow was recorded as an “ALT” site. “BOB” indicates that another burrow from a different owl was identified around the original site.

There were 38 Burrowing Owl observations throughout the survey period (Table 3.4.5-1). Of the 38 sightings, 1 owl was observed in the Carlin Survey Area, 16 owls were observed in the Goldstrike Survey Area, and 21 owls were observed in the Crescent Valley Survey Area. Only one of the owls observed was a chick while the remaining were adults or fully fledged juveniles. Goldstrike E near the loading/unloading loop (seen in Figure 3.4.5-4) was heavily populated with Burrowing Owls and burrows. Call point BUOW-GS69, located inside the loading/unloading loop in Goldstrike E, had the most observations of active burrows (7) of all the call points. This area is primarily grassland with some invasive plant species, such as cheat grass and clasping pepperweed. Call point BUOW-CV16-BOB located in Crescent Valley A had the most observations of individual Burrowing Owls (7) of all the call points. This area is primarily made up of greasewood habitat.

Carlin is the smallest of the three survey areas, but there may be other reasons for relative differences in Burrowing Owl activity. Areas with a high abundance of small burrowing mammals and perching features such as near-to-the-ground fence posts and mounds create good Burrowing Owl habitat (NDOW 2021b).

3.4.6. Greater Sage-grouse

3.4.6.1. Background

The greater sage-grouse (hereafter referred to as "sage-grouse") is designated as a sensitive species by the BLM and as a game bird under NAC 503. The sage-grouse was also listed as a candidate under the ESA until October 2, 2015, when the USFWS determined that listing was unwarranted (80 Federal Register 191 pgs. 59858-59942).

Sage-grouse are a sagebrush-obligate species dependent on multiple shrub-steppe habitats for food, shelter, and rearing (Braun et al. 1976; Connelly et al. 2000). The various sagebrush-steppe communities that sage-grouse rely on are managed by federal, state, and local authorities (BLM 2019c). Sage-grouse have variable seasonal migratory behavior but demonstrate high fidelity to seasonal ranges, returning to the same areas for foraging, courtship, and nesting (Connelly et al. 2000). During the spring breeding season—approximately March 1 through May 15 in Elko, Eureka, and Lander counties—Nevada (BLM 2014b), males gather on leks to perform courtship displays. Typical lek habitat consists of open areas including bare soil, short-grass steppe, windswept ridges, and exposed knolls in close proximity to denser shrub-steppe habitat with substantial cover (Connelly et al. 2004).

3.4.6.2. Study Methodology

Data requested by NDOW identified eight sage-grouse leks within a 4-mile buffer of the Project. Two additional leks were added to the study per request from the agencies. Specific coordinate information for sage-grouse leks is confidential per the data-sharing agreement and confidentiality agreement between NDOW and ERM; therefore, the 10 lek locations shown on Figure 3.4.6-1 are approximate.

Page Intentionally Left Blank.

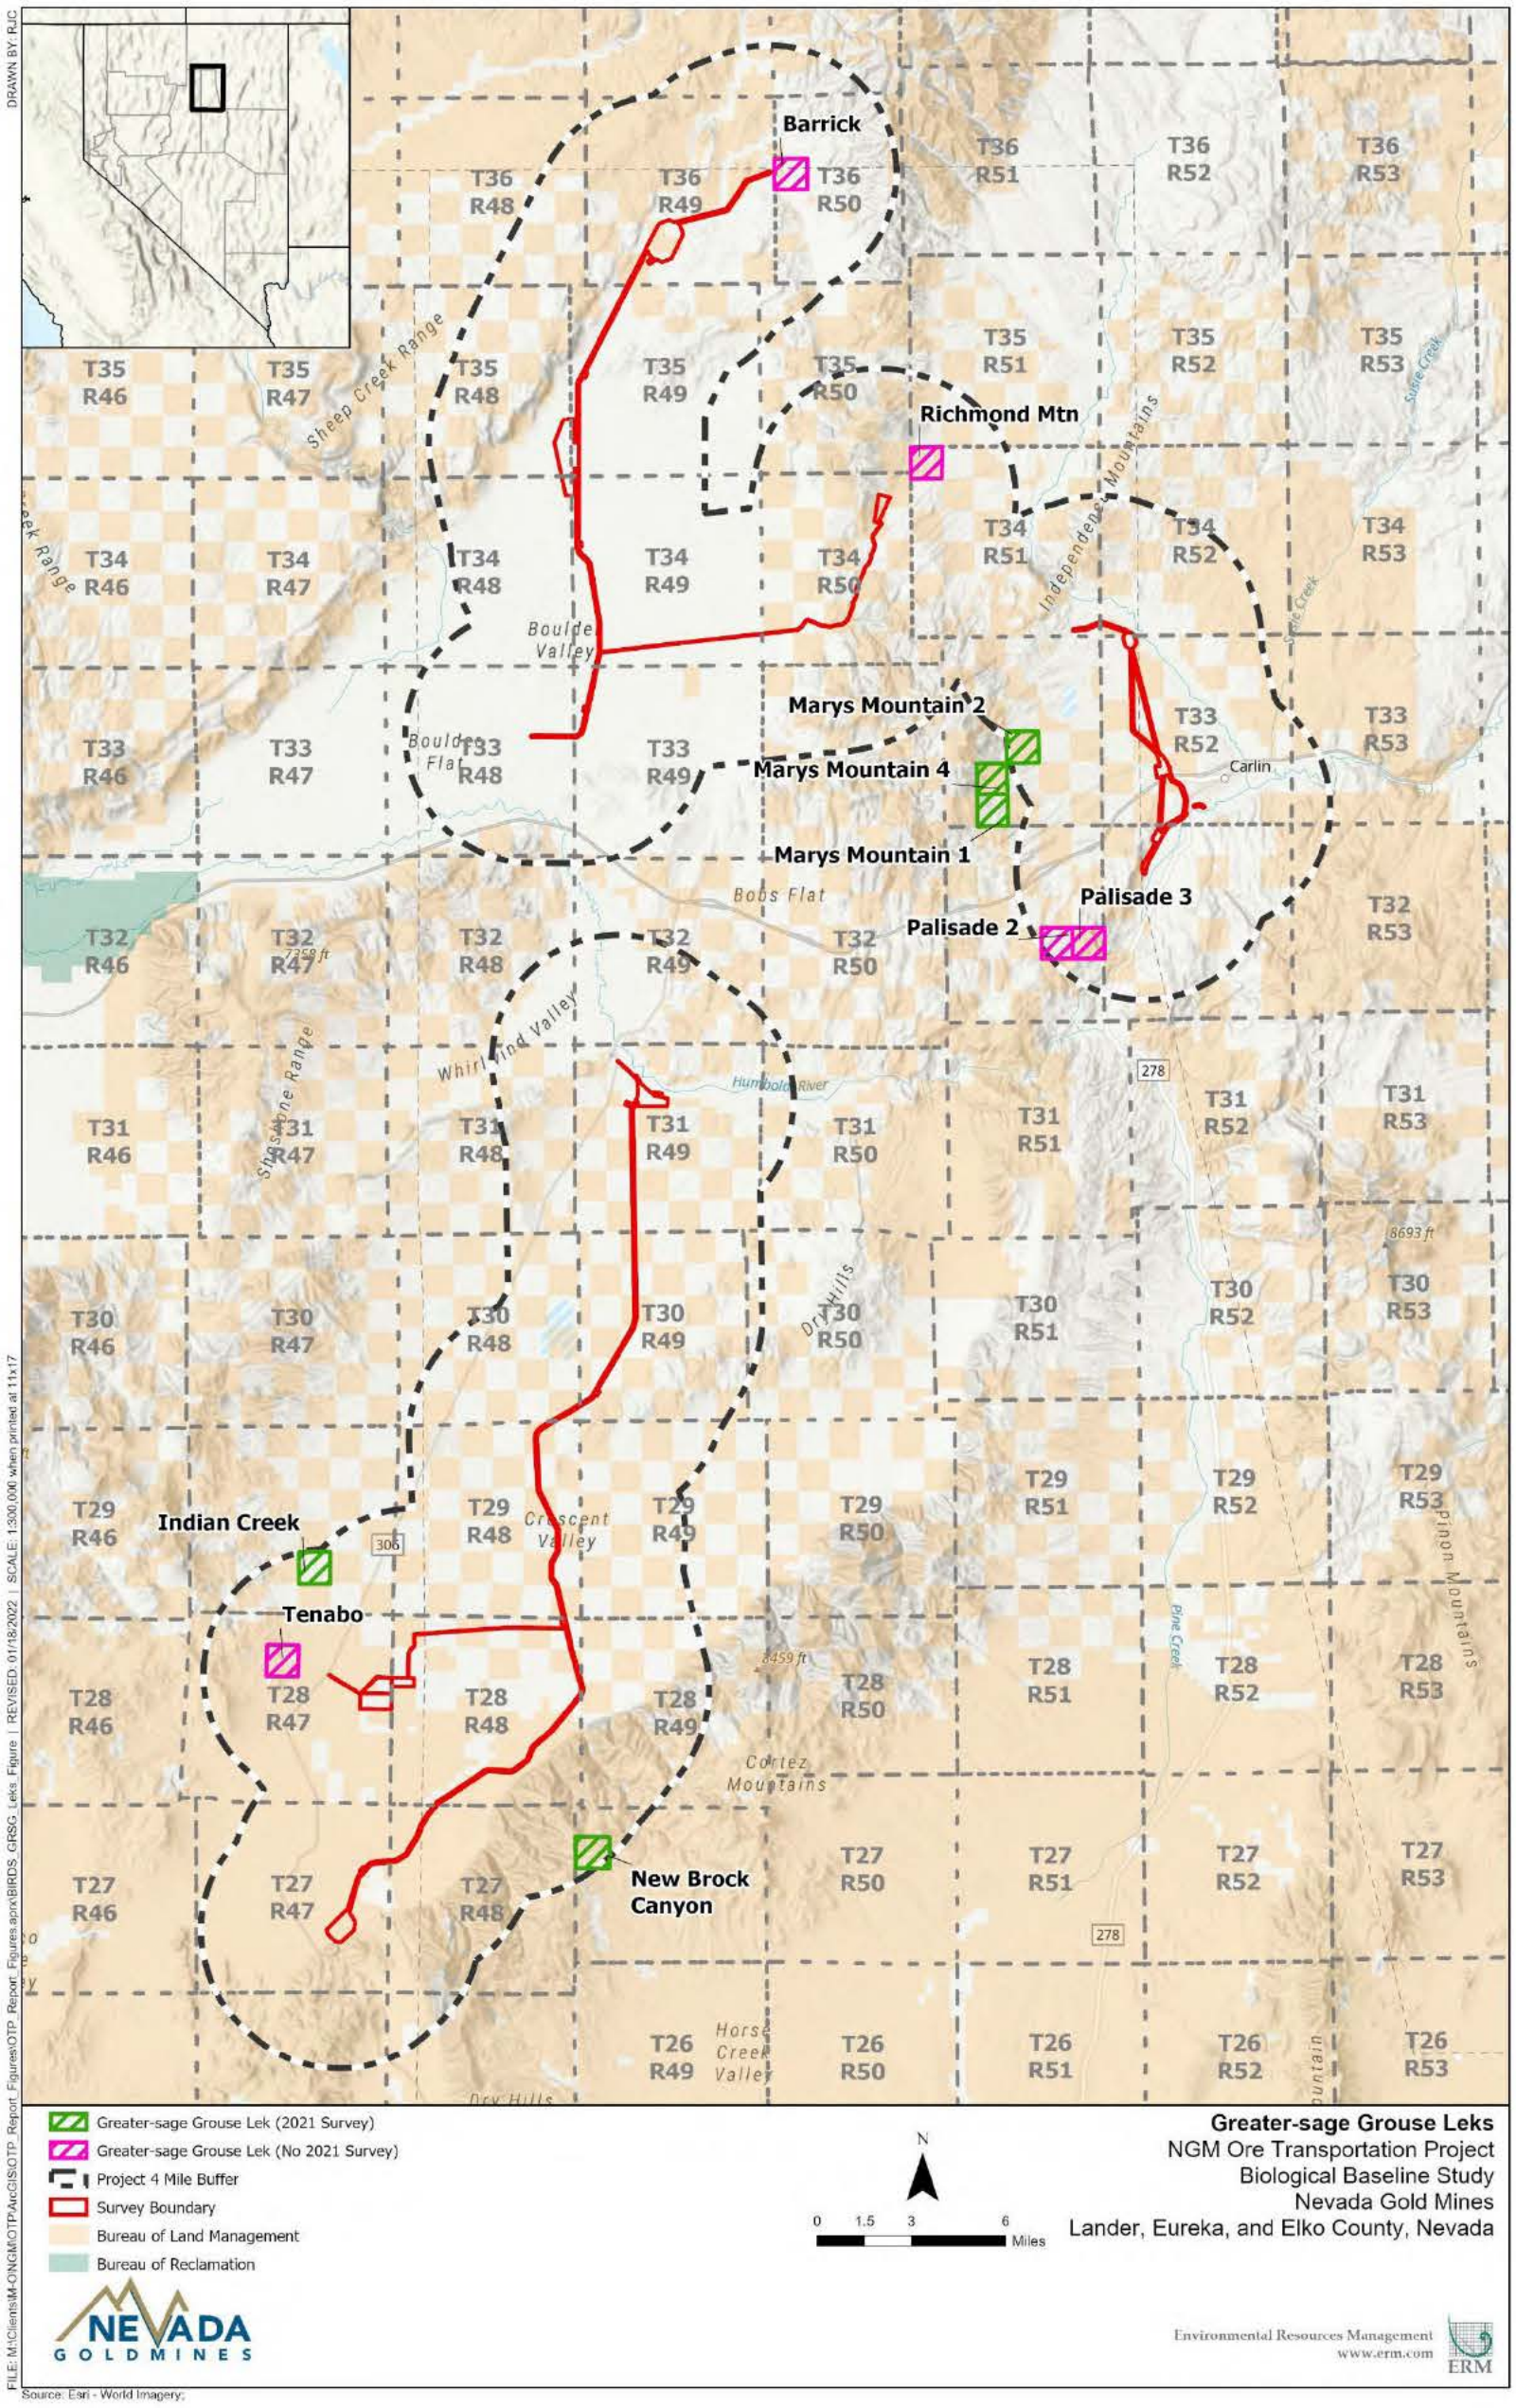

Figure 3.4.6-1: Greater Sage-grouse Leks within the Project Area

Page Intentionally Left Blank.

Ground-based lek counts were conducted by NDOW for the northern Project Area leks and ERM for the southern Project Area leks. ERM surveys were conducted in conjunction with lek monitoring for the Cortez District (ERM 2021b). Table 3.4.6-1 shows the number of times each lek was surveyed in 2021.

Table 3.4.6-1: Overview of Leks Surveyed in 2021

BLM Field Office	Lek	Lek ID	2021 Surveyor	Number of Surveys in 2021
Mount Lewis	Indian Creek	SHO-018	ERM	1

BLM = Bureau of Land Management; ERM = ERM-West, Inc.; ID = identification; NDOW = Nevada Department of Wildlife

[a] Lek located outside of Project Area 4-mile buffer zone, but included per agency request.

Lek monitoring surveys were completed using the following protocol and guidance:

- *Lek Count/Lek Route Protocols* (NDOW 2013)
- Project-specific coordination with the NDOW Eastern Regional Office (ERM 2021b).

For each survey, four counts were obtained at 15-minute intervals between 30 minutes before sunrise and 1.5 hours after sunrise at each surveyed lek (NDOW 2013). If no sage-grouse were observed during a lek survey, biologists would walk the lek listening for lekking activity and searching for sage-grouse signs (i.e., cecal tar, pellets, feathers). The following data was collected for each survey:

- Date
- Arrival time
- Departure time
- Time of sunrise
- Weather (temperature, cloud cover, wind speed and direction, ground conditions)
- Survey start time
- Survey end time
- Number of males and females per count
- Additional notes (e.g., presence of predators, notes on behavior, presence of sign)

Lek count data from NDOW and ERM were used to analyze count data and lek status.

3.4.6.3. Results and Discussion

The 10 leks included in the survey are located throughout three Nevada counties, four Population Management Units (PMUs), and three Biologically Significant Units (BSUs). A PMU is an area where leks are grouped based on the occurrence of short-term genetic interchange across populations, and a BSU is an area where sage-grouse interaction occurs across multiple PMUs and is representative of sage-grouse habitats and seasonal distribution within the sub-region (USFS 2015). Table 3.4.6-2 lists the leks by applicable BLM Field Office and county and displays the relevant PMU and BSU.

Table 3.4.6-2: Greater Sage-grouse Leks within the Project Area

BLM Field Office	County	Lek	Lek ID	PMU	BSU

[a] Lek located outside of Project Area 4-mile buffer zone, but included per agency request

Four of the 10 leks within the Project Area were surveyed in 2021. Table 3.4.6-3 depicts the year of the last survey performed for each lek, as well as the year lekking activity was last observed. It also states the current status of each lek as assigned by NDOW lek status definitions. Applicable lek statuses are (NDOW 2017):

- Active – two or more males on lek for at least twice in the past 5 years
- Pending – two or more males on lek only once in the past 5 years
- Inactive – zero to one male on lek during every visit for the past 5 years; (minimum of 2 visits within the past 5 years)
- Historic – zero to one male on lek during every visit in the last 30 years (minimum of 5 visits)
- Unknown – no other conditions have been met

Table 3.4.6-3: Date of Last Survey and Current NDOW Lek Status

Lek	Lek ID	Last Survey	Last Activity	NDOW Lek Status [d]
Indian Creek	SHO-018	2021	2000	Inactive
Tenabo [a]	SHO-006	2018	Unknown	Unknown

Table Source: NDOW 2021c and ERM 2021b

ID = identification; NDOW = Nevada Department of Wildlife
[a] Tenabo was first located in 1947. Male attendance data cannot be located; therefore, the last activity is unknown. This lek was removed from surveys during coordination between NDOW and ERM in 2019.
[b] Lek data not included in NDOW historical lek data; therefore, last survey, last activity, and/or status is unknown.
[c] Lek located outside of Project Area 4-mile buffer zone, but included per agency request.
[d] Lek status is assigned based on NDOW 2021c Lek Count Data and NDOW 2017 lek status definitions.

A majority of consistent lek data collection occurred between 2010 and 2021. Historical high count lek data from 2010 to 2021 is presented by BLM Field Office in Table 3.4.6-4 and Table 3.4.6-5. Of the four surveyed leks in 2021, only one lek (New Brock Canyon) had birds on lek during surveys.

3.4.7. Threatened and Endangered Species

3.4.7.1. Background

Threatened and endangered wildlife species are protected under the ESA of 1973 (16 USC § 1531, *et seq.*). Under Section 7(a)(2) of the ESA, federal agencies are required to determine whether projects may affect or jeopardize the continued existence of threatened and endangered species and/or critical habitat. Threatened and endangered species habitat were identified and mapped within the Project Area, which includes the Project footprint plus a 200-foot-wide buffer of the centerline (400-foot survey area), as shown on Figure 2-1 through Figure 2-9. The purpose of this assessment is to determine if any threatened and endangered species occur in the Project Area in order to inform future impact analysis.

3.4.7.2. Study Methodology

The USFWS Information for Planning and Consultation (IPaC) was queried to identify federally threatened and endangered species with the potential to occur in the Project Area. The USFWS IPaC query identified two federally listed species and one candidate species: Lahontan cutthroat trout (*Oncorhynchus clarkia henshawi*; threatened), gray wolf (*Canis lupus*; threatened and proposed for listing as endangered), and the monarch butterfly (*Danaus plexippus*; candidate species for listing under the ESA). A desktop assessment of potential suitable habitat in the Project Area for these species was conducted using data from NDNH, SWReGAP land cover, NRCS SSURGO, NHD, and NWI.

The following protocols were used in this survey:

- *Statewide Wildlife Survey Protocols* (BLM 2014b)
- USFWS Species-Specific Protocols
- *Initial Survey Instructions for Western Monarch and Milkweed Habitat Suitability Assessment* (USFWS 2016)

A field reconnaissance was conducted to identify potentially suitable habitat for the Lahontan cutthroat trout (hereafter referred to as LCT) in the Project Area. Field surveys were not conducted for the gray wolf, although scat and tracks were to be recorded along with geo-referenced photographs if evidence of gray wolf was observed during other field surveys. Surveys for monarch butterfly were conducted by identifying locations with known occurrences of milkweeds, which could be used by this species. Section 3.3.2, Butterfly Host Plants, discusses locations of documented milkweeds.

3.4.7.3. Results and Discussion

Pre-Field Results

Lahontan Cutthroat Trout

The LCT is an inland subspecies of cutthroat trout endemic to the Lahontan Basin of northeast California, southeast Oregon, and northern Nevada. The Project Area is located within the

Humboldt River Basin. Historically, the LCT thrived throughout the majority of the Humboldt River and its tributaries (USFWS 1995). In Nevada, most remaining populations of LCT occupy higher elevation, low-order streams (Dunham et al. 1999).

LCT are known to have occurred in the following sub-basins or areas: Mary's River; East Humboldt River area; South Fork Humboldt River; North Fork Humboldt River; Maggie Creek; Pine Creek; Rock Creek; Reese River; and Little Humboldt River (USFWS 1995). Potential habitat for LCT in the vicinity of the Project Area is limited primarily to the Humboldt River. Most streams in the Project Area are ephemeral or intermittent and support aquatic conditions for only limited periods in response to runoff from storm events and snowmelt. Therefore, aquatic conditions throughout the Project Area are variable and heavily dependent on annual patterns of precipitation, snowmelt, and drought. Ephemeral and intermittent streams are more prone to the effects of regional drought conditions and, in addition to inadequate flow, tend to lack necessary habitat characteristics required by LCT, including larger substrate and instream cover. Stream-dwelling LCT require relatively cool, silt-free waters and habitat that provides refuge from high-flow velocities, rocky-riffles, and well-vegetated, stable streambanks (USFWS 2019).

In total, there are four perennial streams, four intermittent streams, and 57 ephemeral streams in the Survey Area (Figure 2.2-2a through Figure 2.2-2c). There is no designated Critical Habitat in the Project Area for the LCT (USFWS 2021b). A detailed discussion of wetlands and waterbodies surveyed across the Project Area is included in Section 3.2., Water Resources Surveys.

Gray Wolf

The gray wolf formerly occurred in most of the conterminous United States and Mexico. Because of widespread habitat destruction and human persecution, the species now occupies only a small part of its original range in these regions. Gray wolves can live in almost any habitat in the Northern Hemisphere but tend to occupy forests, tundra, and grassy plains as well as deserts and mountains. They usually live in packs, forming social bonds and establishing a dominance hierarchy. A pack's territory can be 31 to 1,200 square miles, and they hunt a variety of large herbivores such as deer, elk, moose, and bighorn sheep.

Based on the desktop assessment, there could be potential habitat for gray wolves within the Project Area, including sagebrush shrubland, desert grasslands, greasewood flats and forbland, each of which provides food sources for their preferred prey species. Despite the potential habitat, according to NDOW, the most recent gray wolf observation was of a single gray wolf in 2017. Records indicate the last sighting prior to 2017 was in 1922, making it very unlikely to be present in the Project Area.

Monarch Butterfly

Areas with milkweed species may support Monarch butterflies (Xerces Society 2012). Data and literature from the BLM and NDNH were reviewed to determine potential Monarch butterfly habitat in the Project Area. Milkweed species (*Asclepias* spp.) are a known host plant for the Monarch butterfly. There are 13 species of milkweed native to Nevada; however, 6 species are

more likely to be present in the Project Area: eastwood milkweed (*Asclepias eastwoodiana*), spider milkweed (*Asclepias asperula* ssp. *asperula*), pallid milkweed (*Asclepias cryptoceras*), desert milkweed (*Asclepias erosa*), narrow-leaved milkweed (*Asclepias fascicularis*), and showy milkweed (*Asclepias speciose***)** (Xerces Society 2012).

Milkweed species can be found within a wide range of vegetation communities, including communities along roadsides and open areas on a wide variety of basic soils. The habitable soil types include calcareous clay knolls, sand, carbonate or basaltic gravels, shale outcrops, barren areas, and small washes or other moisture accumulating microsites, shadscale, mixed-shrub, sagebrush, and lower pinyon-juniper zones. Based on NDNH vegetation data, there is potential milkweed habitat throughout the Crescent Valley, Carlin, and Goldstrike survey areas indicating the potential for Monarch butterflies in the Project Area.

Field Reconnaissance Results

Lahontan Cutthroat Trout

A field reconnaissance was conducted in areas that desktop assessment and the PFC assessment indicated could potentially support suitable habitat for LCT. No suitable habitat was documented during 2021 fieldwork within any of the survey areas. Streams and other aquatic features were evaluated from May 24, 2021, to August 25, 2021 (as described in Section 3.2, Water Resources Surveys), and representative photographs of habitat conditions in the study areas are presented in Appendix B.2.

A habitat evaluation was also conducted in April 2022 on Indian Creek in the vicinity of Crescent Valley in reference to suitability for LCT. This evaluation was based on a potential historical sighting of LCT by BLM.[4] At the time of the field assessment, all segments of Indian Creek in the Project Area were dry, with flowing water limited to one section approximately 1 mile in length located 1 mile upstream of the northern survey boundary. The depth of water in this section averaged 5 inches, and the average wetted width of stream was approximately 2 feet. Fish were not observed at any location on Indian Creek during the habitat assessment. Evidence of livestock grazing and cattle activity (trampling, stream crossings, etc.) was common throughout the areas evaluated and appears in many locations to have adversely impacted bank stability, structure, and vegetative cover. Riparian vegetation along Indian Creek was minimal or absent in most areas at the time of survey, and when present, was comprised dominantly of upland vegetative species. Observations of Indian Creek suggest that typical connectivity and habitat conditions do not support resident LCT. Further, the absence of a downstream connection to more perennial waters, or habitat that could provide refugia to stranded fish after a period of peak flow and increased connectivity, suggest that LCT are unable to enter the Project Area from any source water downstream. If LCT historically occurred in this segment of Indian Creek, it likely originated from a location upstream where flows are less seasonally dependent and physical habitat features are supportive to self-sustaining

[4] Descriptive data (date, species confirmation, size of fish) were unreported for this observation. No other historical data indicate the presence of LCT in this region of Indian Creek.

populations of LCT. The technical memorandum and photographs of this assessment are provided as Appendix E.

Flow data of the Humboldt River near Carlin (USGS Gage 10321000) in the vicinity of the Project Area documented periods of peak discharge and median daily discharge well below the 77-year median statistics for these values in 2021 (Figure 3.4.7-1). Peak discharge, typically observed in this region of Nevada in response to snowmelt in late spring and early summer, was the lowest observed value since 2013 in both 2020 and 2021. In the absence of a more typical runoff period, it is expected that a majority of the ephemeral and intermittent streams would be dry or mostly dry at the time of surveys; however, even in years of adequate flow, site habitat characteristics make nearly all of these locations unsuitable for LCT.

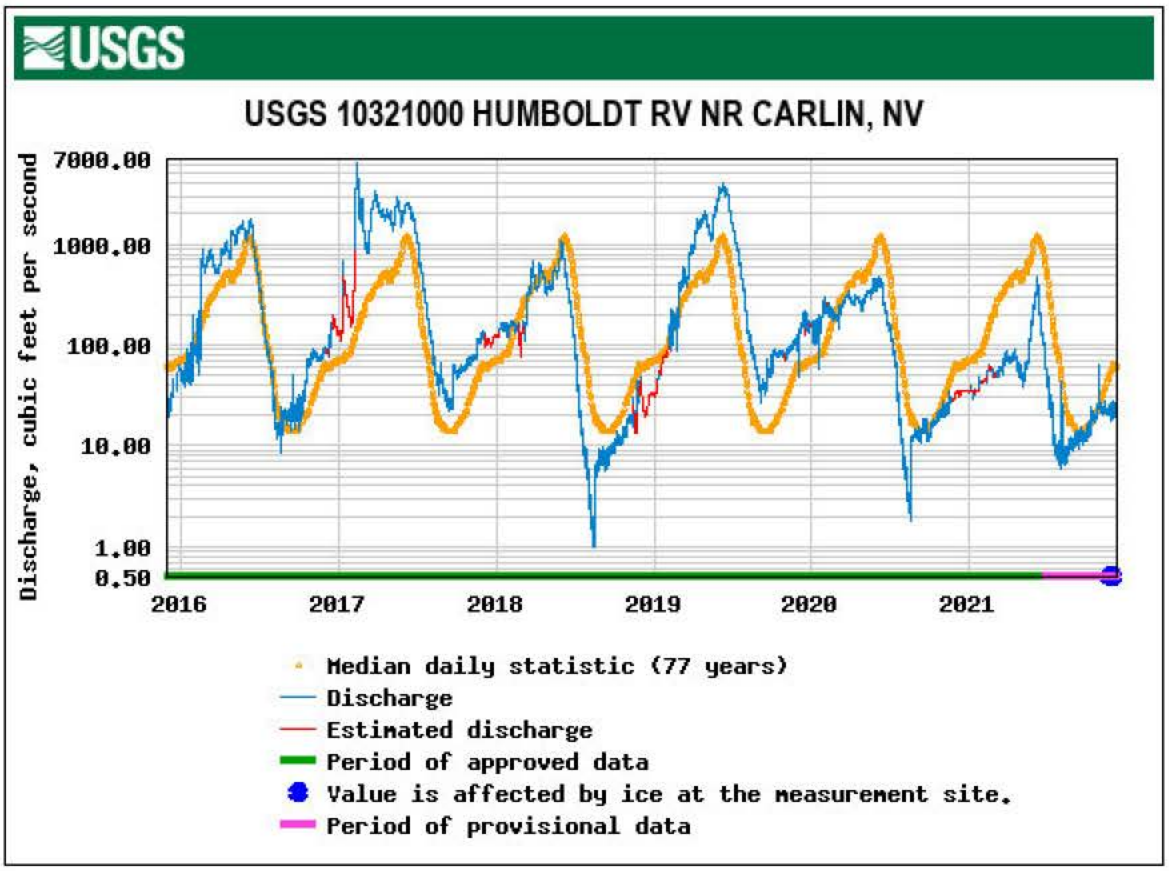

Figure 3.4.7-1: Humboldt River Discharge Near Carlin

The larger size and perennial flow make the most suitable habitat in the vicinity of the Project Area the Humboldt River, which lies just outside the Project Area boundary. The Humboldt River in this location adjacent to the Project Area had adequate flows to support LCT at the time of surveys (Appendix B.2, scac001p). However, the Project is not expected to impact biological resources outside the Project Area boundary.

In the Goldstrike Survey Area, evaluations of Welches Creek, a perennial stream, documented some reaches with aquatic conditions in July surveys (Appendix B.2, sgoa003p and sgoc007p).

Welches Creek was the only perennial stream within the Project Area that was not dry. However, the size of this stream, shallow depth, fine sediments, and fragmented state of these sites on Welches Creek could not support LCT. Both general reconnaissance surveys and the focused habitat evaluation suggest LCT are not likely to occur in the Project Area.

Gray Wolf

No species-specific field surveys were conducted for the gray wolf based on the desktop assessment and historical species data indicating low potential for packs in this region. No incidental observations of scat or tracks were documented during wildlife surveys conducted from May 24, 2021, through July 30, 2021, suggesting gray wolf are not present within the Project Area.

Monarch Butterfly

No Monarch butterflies were identified within the Project Area; however, milkweed species were detected at 29 sites from June 12, 2021, to July 24, 2021. The species identified were Narrow Leaved milkweed (Asclepias fascicularis) and Showy milkweed (Asclepias speciosa), predominantly observed in the Goldstrike Survey Area throughout sagebrush shrubland and semi desert grassland vegetation. More details of the study methodology and field results can be found in Section 3.3.2, Butterfly Host Plants.

3.4.8. Pygmy Rabbit

3.4.8.1. Background

The pygmy rabbit (*Brachylagus idahoensis*) is a BLM special status species in Nevada and is a Game Mammal under NAC 503. Pygmy rabbits are extreme habitat specialists (Gabler et al. 2001) occurring throughout most of the Great Basin. In particular, they are found within sagebrush plains and alluvial fans in clumps of mature sagebrush that are tall and dense relative to the surrounding sagebrush (Ulmschneider 2004), accompanying deep, friable soils. Cover and height of woody vegetation are critical habitat features (Green and Flinders 1980); although, pygmy rabbits have been observed occupying clusters of sagebrush that were taller than the surrounding sagebrush shrubs (Larrucea and Brussard 2008). Pygmy rabbits utilize the sagebrush for food (Green and Flinders 1980) and refuge from predators (Gabler et al. 2001), while softer soils allow burrow construction with multiple entrances (Weiss and Verts 1984). The NDOW WAP indicates that livestock grazing at unsustainable levels can result in loss of sagebrush habitat unless sagebrush habitat is left intact, and soils are not overly compacted (Wildlife Action Plan Team 2012). Additionally, fire impacts, cheatgrass invasion, and pinyon-juniper encroachment decreases habitat suitability for pygmy rabbits as they lead to reduced shrub cover.

A desktop assessment and surveys were conducted within the Project Area, which includes the Project footprint plus a 200-foot-wide buffer of the centerline (400-foot survey area), as shown on Figure 2-1 through Figure 2-9. The purpose of the pygmy rabbit surveys is to identify

potential habitat and document the presence of the species within the Project Area to inform the future NEPA analysis.

3.4.8.2. Study Methodology

A desktop assessment using the USGS GAP modeled habitat layer for pygmy rabbits, SWReGAP, NRCS SSURGO, and NDNH was conducted to identify potential habitat and areas with the highest potential of occurrence within the Project Area.

The following protocols were used in this survey:

- *Statewide Wildlife Survey Protocols* (BLM 2014b)
- *Surveying for Pygmy Rabbits* (Brachylagus idahoensis) (Ulmschneider 2004)
- Pygmy Rabbit Protocol for the Long Canyon Project (*Long Canyon* n.d.)

In addition to the GAP modeled habitat, land cover areas identified as Inter-Mountain Big Sagebrush Shrubland, Great Basin Xeric-Mixed Sagebrush Shrubland, and Inter-Mountain Basins Big Sagebrush Steppe were used to target areas for the field survey of potential pygmy rabbit habitat. Areas identified during desktop review as supporting the above habitat components are presented in Figure 3.4.8-1 through Figure 3.4.8-4.

The following characteristics were used during desktop review to identify areas to survey:

- Elevations ranging from 5,600 to 7,800 feet amsl
- Deep loamy soils
- Friable soils
- Flat to moderate slopes
- Vegetation communities where dense sagebrush and/or rabbitbrush species dominate
- Tall/dense stands of sagebrush
- Dense shrub canopy cover

The desktop assessment was used during the field surveys as a preliminary tool to understand potential habitat distribution across the entire Project Area. Once in the field, adjustments to survey locations were made as needed to account for on-the-ground conditions, including impacts of fire, grazing, and anthropogenic activity.

Field surveys were conducted from May 24, 2021, through July 30, 2021, within areas identified as having potentially suitable pygmy rabbit habitat. Pygmy rabbit presence was evaluated by conducting visual surveys primarily for appropriately sized burrows and pellets. Biologists conducted GPS-tracked pedestrian transects at 100-foot center-to-center spacing in areas characterized as potential habitat, such as the presence of deep loamy soils and established sagebrush and/or rabbitbrush community. Tightly spaced meandering transects were conducted where taller, denser, sagebrush stands were found in order to cover the entire stand. All burrows and tracks were recorded using GPS units. Burrows located during the pedestrian surveys of potential habitat were classified as active, inactive, or collapsed. Pellets occurring in piles under sagebrush, piles along runways, and/or as single pellets of appropriate size (typically ranging from 5 to 7 millimeters [0.2 to 0.3 inche] in diameter) were considered pygmy rabbit sign and classified as fresh (moist, do not crumble, dark in color) or old (dry, crumble easily, brown or

gray in color). Observation of pygmy rabbit individuals, their mounded burrows, or scat/tracks were documented with a georeferenced photo and GPS point or polygon. Observations of individuals, burrows, pellets, and soil types and descriptions of vegetation were also recorded.

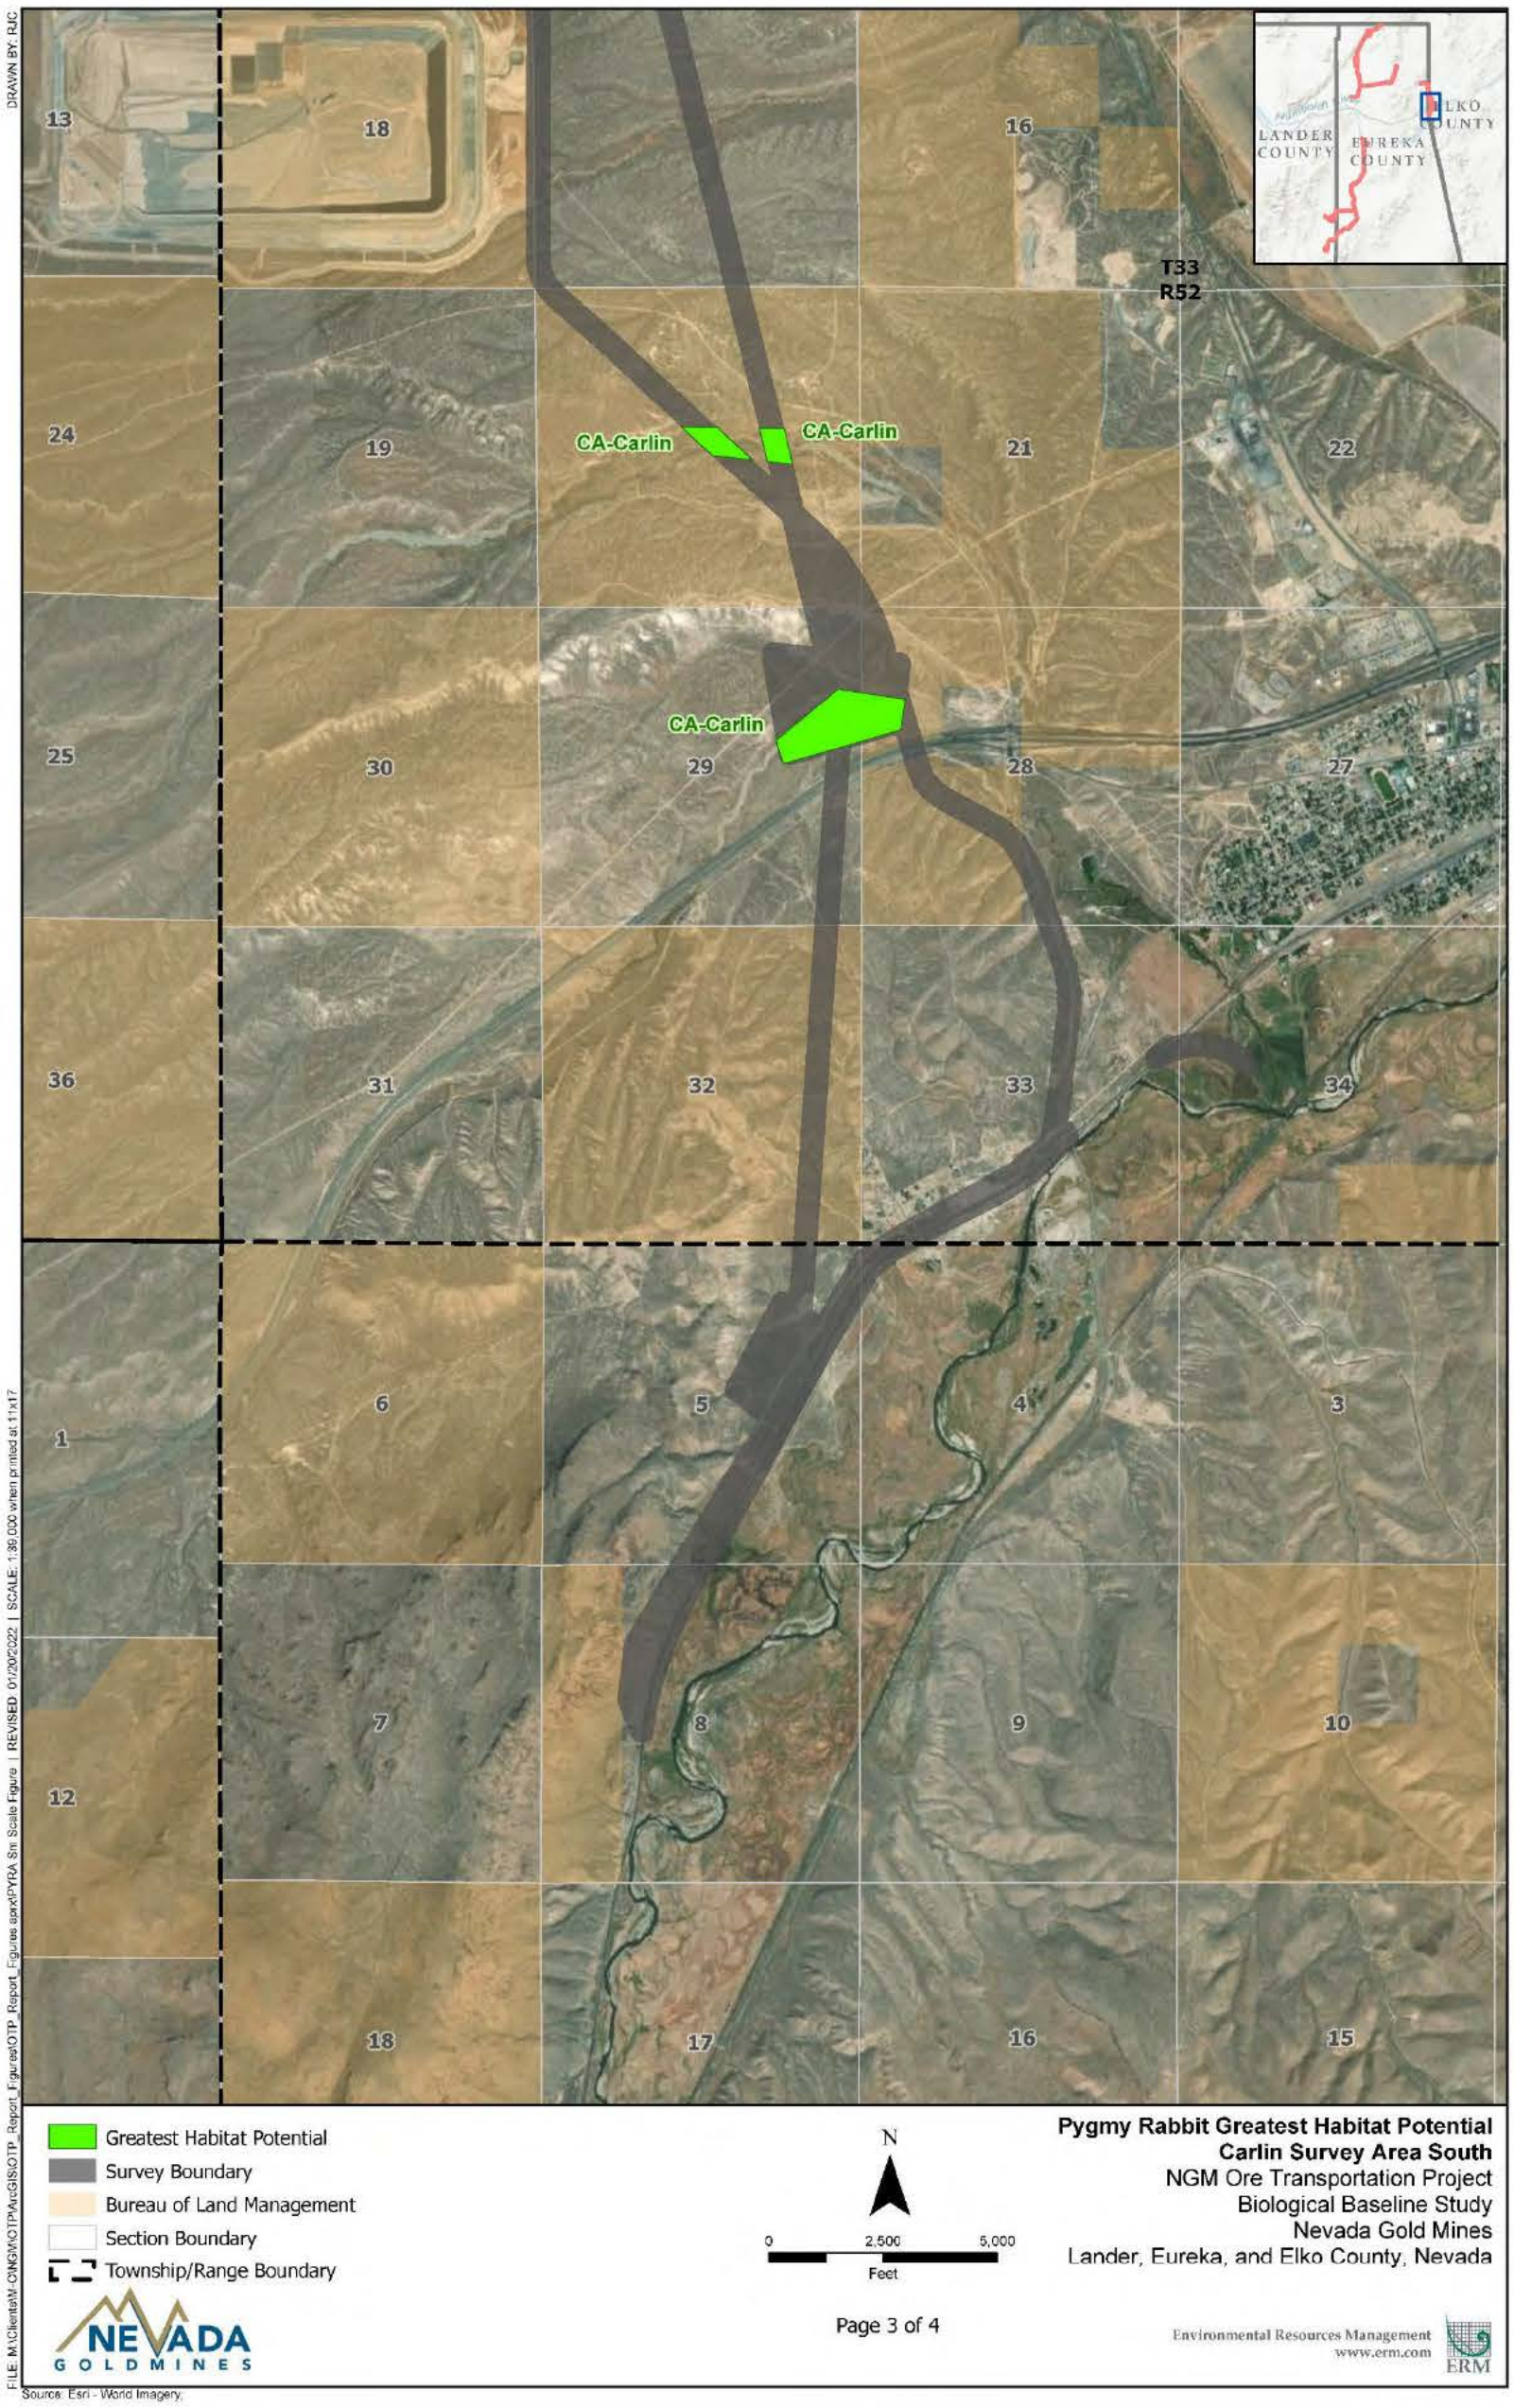

Figure 3.4.8-3: Pygmy Rabbit Greatest Habitat Potential—Carlin Survey Area South

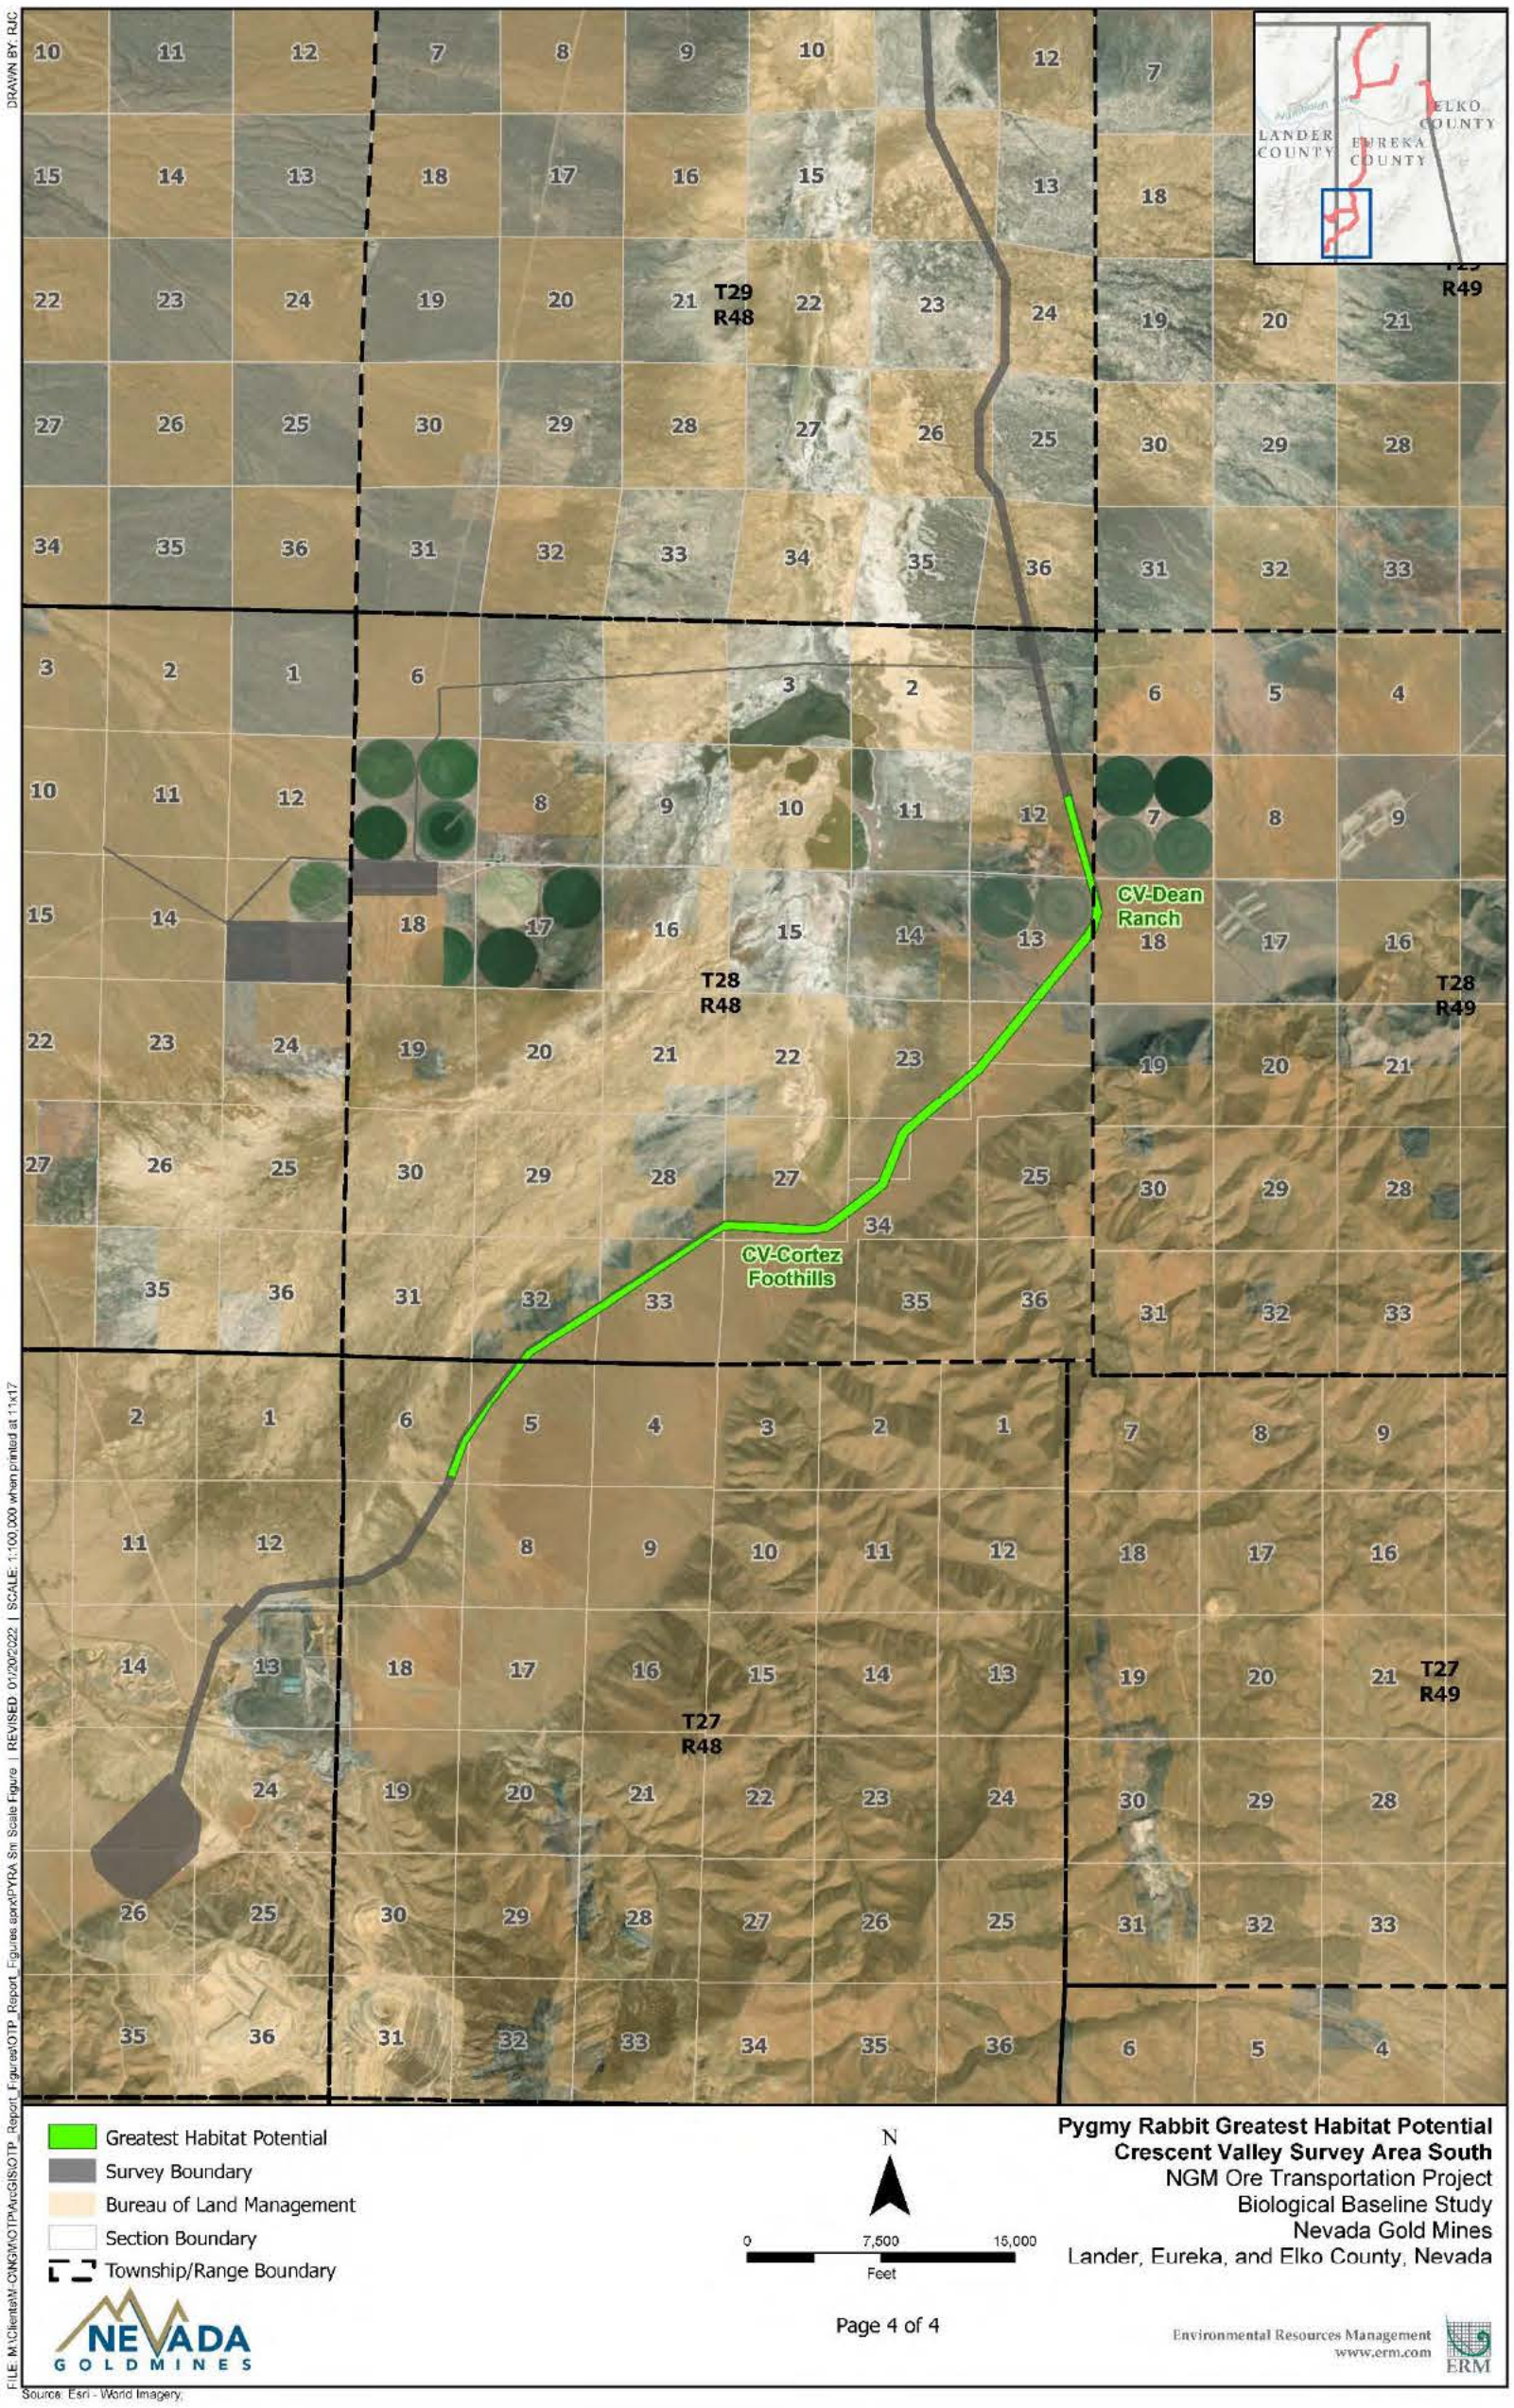

Figure 3.4.8-4: Pygmy Rabbit Greatest Habitat Potential—Crescent Valley Survey Area South

3.4.8.3. Results and Discussion

Field biologists identified potential pygmy rabbit habitat within Goldstrike, Carlin, and Crescent Valley survey areas. The field team surveyed a total of 704 transect miles, as shown in Appendix D.5.1. The Project Area consists of valleys and lower elevation slopes dominated by Great Basin sagebrush or saltbush-greasewood vegetation communities. Prevailing drought conditions, recent fires in the area, and local grazing regimes have reduced areas supporting suitable habitat for pygmy rabbit. As described in detail below for each survey area, no pygmy rabbits were observed during the surveys; however, potential pygmy rabbit habitat was identified within each of the survey areas and, therefore, there is potential for the species to occur within the Project Area.

Areas identified as having the most suitable potential habitat for pygmy rabbit generally supported intact communities of sagebrush and deep, friable soils. Locations with these characteristics were documented in the following areas: Rodeo Creek and the mouth of Welches Creek in the Goldstrike Survey Area; the wash bottoms of the Carlin Survey Area; and the Cortez foothills and Cortez Loop in the Crescent Valley Survey Area.

Figure 3.4.8-1 through Figure 3.4.8-4 present the areas of the greatest habitat potential based on field observations. Table 3.4.8-1 presents suitable habitat in the survey areas, vegetation and soils, and burrow information. Tracks for pygmy rabbit surveys are shown on Figures D.5-1 through D.5-3. Photographs from the field surveys within each of the survey areas is presented in Appendix D.5.2.

Table 3.4.8-1. Pygmy Rabbit Habitat Suitability and Sign within the Survey Areas

Survey Area	Site Name	Habitat	Sign/ Pellets	Individuals Observed	Possible Burrows
Goldstrike	GS-Rodeo Creek	Potential	No	No	No
Goldstrike	GS-Welches Canyon	Potential	No	No	No
Carlin	CA-Carlin	GHP	No	No	No
Crescent Valley	CV-Dean Ranch	GHP	No	No	No
Crescent Valley	CV-Cortez Foothills	GHP	No	No	No

GHP = Greatest habitat potential; SM = sub-marginal habitat

Goldstrike Survey Area

Desktop review of the Goldstrike Survey Area indicated potential pygmy rabbit habitat near the Goldstrike loading/unloading loop to the north, Welches Canyon, and more fragmented habitat observed along Boulder Valley. During the field surveys, the most suitable pygmy rabbit habitat was documented along Rodeo Creek to the northeast of the loading/unloading loop (Figure 3.4.8-1); however, no pygmy rabbit burrows or signs were identified in the Goldstrike Survey Area.

Rodeo Creek within the Welches-Bosco NRCS SSURGO soil map unit is characterized as having very deep, excessively drained soils formed in mixed alluvium, and is commonly associated with basin big sagebrush, cheatgrass, and basin wildrye. Dense stands of

sagebrush, rabbitbrush, and invasive species (including white top and Scotch thistle) were observed and abundant in some places along Rodeo Creek during field surveys. This area supports the highest quality potential habitat for pygmy rabbits in the Goldstrike Survey Area.

ESD survey data (ESD Site WE_3, Appendix A, Figure A.7-1) also documents big sagebrush and yellow rabbitbrush northeast of Rodeo Creek, as well as various species of grass, including basin wildrye, crested wheatgrass, and cheatgrass. The soils at this location were fine sandy clay loam, which are the preferred soils for pygmy rabbit. This area could provide suitable habitat for pygmy rabbits.

Habitat observed south of Rodeo Creek from the loading/unloading loop through Boulder Valley generally lacks sagebrush habitat and is dominated by invasive and noxious weed species. Evidence of the 2017 Rooster Comb Fire is still apparent in this area and has further reduced the suitability of this habitat for pygmy rabbit. The area south of Rodeo Creek is not currently suitable habitat for pygmy rabbits.

Potentially suitable habitat in the Goldstrike Survey Area was also identified in the vicinity of Welches Creek, which is also within the Welches-Bosco association NRCS SSURGO soil map unit, similar to Rodeo Creek. However, during field surveys, big sagebrush was generally absent in this area except near the mouth of Welches Creek and the canyon bottom. Grazing within the canyon has prevented the regeneration of shrub and forb communities. The ESD survey (ESD Site WE_2, Appendix A, Figure A.7-3) documented big sagebrush, rabbitbrush, and greasewood in addition to silty, clay loam soils only at the mouth of Welches Creek. Though fragmented, this area could provide limited areas of suitable habitat to pygmy rabbits.

Grazing was evident throughout the area from the northeast side of Welches Creek to the Summit Borrow Source. Sagebrush shrubs appeared “tree-like” as a result of grazing activity, and bare ground comprised most of the interspace. Soils in this area are highly compacted, and no vegetative understory was observed. Sagebrush is generally absent in this area, likely due to the 2011 Chukkar Canyon and 2015 Boulder fires. The bare uplands of Welches Canyon are not suitable habitat conditions for pygmy rabbits.

Carlin Survey Area

The Carlin Survey Area is within the Welch-Bosco NRCS SSURGO soil map unit, and this area was identified as potentially supporting suitable habitat for pygmy rabbit during the desktop review. Field evaluations of the Carlin Area documented two areas in wash bottoms that contain dense stands of sagebrush Figure 3.4.8-3. Several small mammal burrows were also observed in these areas, as well as cottontail and jackrabbit scat, as shown in Appendix D.5.2, Photo CA-05.

ESD surveys conducted along the wash bottom areas, including ESD Sites WC_4, CF_2, and CF_2a documented a high percentage of big sagebrush and deep, sandy loam soils (Appendix A, Figure A.7-4). In other locations across the Carlin Survey Area, including areas containing sagebrush communities, the soils were highly compacted, and no visible understory was observed, which may have indicated recent grazing activity. Overall, the Carlin Survey Area

supports only relatively small, localized areas of habitat potentially suitable to pygmy rabbits as shown on Figure 3.4.8-3.

Crescent Valley Survey Area

Areas with sagebrush communities were documented during desktop assessment of the Crescent Valley Survey Area. The northern section of the Crescent Valley Survey Area to the south of Beowawe is dominated by greasewood and saline soils made of silty clay loam. Further south, the landscape transitions into playa with more abundant greasewood communities accompanied by saltgrass and shadescale.

The greatest habitat potential in the Crescent Valley Survey Area is located along the Cortez foothills within a large sagebrush community, as shown on Figure 3.4.8-4. ESD Site 822_6 identified this area as a dense community of big sagebrush and greasewood, covered by a thick shrub community, including scattered annual grasses and pepperweed, and alluvial fans with deep, silty clay loam soils (Appendix A, Figure A.7-7). Shrubs present in this location were not dense, and the soils were slightly compacted. Although several burrows were observed in this area, only cottontail or jackrabbit scat was observed. Additionally, single burrow entrances, and not the multiple entrances associated with pygmy rabbits, were documented. Although older scat (grey pellets) was observed next to one burrow that could be of pygmy rabbit (size between 5 to 7 millimeters [0.2 to 0.3 inches] in diameter), the burrow lacked significant diggings, and no fresh diggings were found. The habitat where these pellets were located would provide only marginal habitat for pygmy rabbits, indicating these pellets were likely those of a cottontail rabbit.

Habitat to the south near the Cortez loading/unloading loop was degraded and dominated by invasive and noxious weed species. The habitat is also fragmented by roadways and in close proximity of current mining operations with frequent anthropogenic disturbance. Only one location supportive of a sagebrush shrub community is often confined to a narrow band along the drainages.

3.4.9. Dark and Pale Kangaroo Mice

3.4.9.1. Background

Pale kangaroo mice (*Microdipodops pallidus*) and dark kangaroo mice (*Microdipodops megacephalus*) are BLM special status species in Nevada and Protected Mammals under NAC 503. The dark kangaroo mouse prefers xeric habitats containing loose, friable (meaning exhibiting a crumbly texture) sandy soils (Hafner et al. 1998) associated with shadscale (*Atriplex confertifolia*), rabbitbrush (*Chrysothamnus* spp.), horsebrush (*Tetradymia* spp.), and sagebrush (*Artemisia* spp.) communities (NatureServe 2021) that have an abundance of Indian ricegrass, as noted by Great Basin Ecology (GBE 2016). They typically occur in sandy habitats below elevations where pinyon-juniper occur and above communities of greasewood and saltbrush (Hafner and Upham 2011).

The pale kangaroo mouse is a more highly specialized sand-obligate compared to the dark kangaroo mouse. The pale kangaroo mouse is restricted to habitats with fine, windblown, sandy soils with little or no gravelly overlay; associated with alkali sink and desert scrub; and dominated by shadscale, saltbush, greasewood or big sagebrush (*Artemisia tridentata*) (BLM 2019a). Additionally, the pale kangaroo mouse typically occurs at lower elevations than the dark kangaroo mouse (Hafner and Upham 2011).

Both species primarily forage on seeds and insects (NatureServe 2021; Roach 2016). The NDOW WAP suggests that disturbances such as fire, invasive species, human disturbance and improper livestock grazing decrease habitat suitability (Wildlife Action Plan Team 2012). A desktop assessment and field surveys were conducted within the Project Area, which includes the Project footprint plus a 200-foot-wide buffer of the centerline (400-foot survey area), as shown on Figure 2-1 through Figure 2-9.

3.4.9.2. Study Methodology

A desktop assessment using the USGS GAP modeled habitat layer for kangaroo mouse, SWReGAP, NRCS SSURGO, and NDNH was conducted to identify areas with the most suitable potential habitat.

The following protocols were used in this survey:

- *Statewide Wildlife Survey Protocols* (BLM 2014b)
- *Kangaroo Mouse Survey Protocol for the Barrick Cortez Inc. Plan of Operations* (GBE 2016)

Pedestrian field surveys were conducted throughout the Project Area from May 24 through July 30, 2021. Surveys consisted of single transects within the entirety of the Project right-of-way and meandering transects within the borrow sources, access roads, and depots locations. The survey team scanned each side of the pedestrian transect for potential burrows or kangaroo mouse tracks and focused on habitat consisting of soils with a high sand or sand gravel component (over 12-inches of depth to a restrictive layer) and suitable vegetation. All survey tracks were recorded, and geo-referenced photos were taken for any signs of kangaroo mice, including scat, tracks, or potential burrows. Observations regarding the habitat (e.g., soil types, adjacent vegetation) were also recorded for each burrow site.

3.4.9.3. Results and Discussion

Field surveys were conducted in areas identified during desktop assessment as having potential habitat for kangaroo mouse, covering 178 transect miles over the Project Area (Table 3.4.9-1). Most areas surveyed offered only limited potential habitat for kangaroo mouse, as shown on Figure 3.4.9-1 through Figure 3.4.9-5. Three locations, each within the Crescent Valley Survey Area, were identified as having the greatest potential habitat for kangaroo mouse in the Project Area (Figure 3.4.9-4 and Figure 3.4.9-5). A summary of the desktop review findings and field survey observations for each survey area is discussed below. No kangaroo mice were observed during 2021 field surveys; however, potential habitat was identified and, therefore, there is potential for this species to occur in the Project Area. Trapping will be conducted in 2022 in the areas identified as the greatest habitat potential for kangaroo mouse. Survey tracks and

photographs from the field surveys within each of the survey areas is presented in Appendix D.6.

Table 3.4.9-1 Kangaroo Mouse Habitat Potential in the Survey Areas

Survey Area	Site ID	Habitat Type
Goldstrike Area	Boulder Valley	Limited Suitable Habitat
	Boulder Valley North	Limited Suitable Habitat
	Boulder Playa	Not Suitable Habitat
	Boulder South	Not Suitable Habitat
Carlin	Carlin North Loop	Limited Suitable Habitat
	Carlin North Washes	Limited Suitable Habitat
	Carlin North 1	Not Suitable Habitat
	Carlin North 2	Not Suitable Habitat
	Carlin South	Not Suitable Habitat
Crescent Valley	Crescent Playa Margin 1	GHP
	Crescent Playa Margin 2	GHP
	Cortez Foothills North	GHP
	Crescent Valley North	Limited Suitable Habitat
	Cortez Foothills South	Limited Suitable Habitat
	Crescent Playa 1	Not Suitable Habitat
	Crescent Playa 2	Not Suitable Habitat

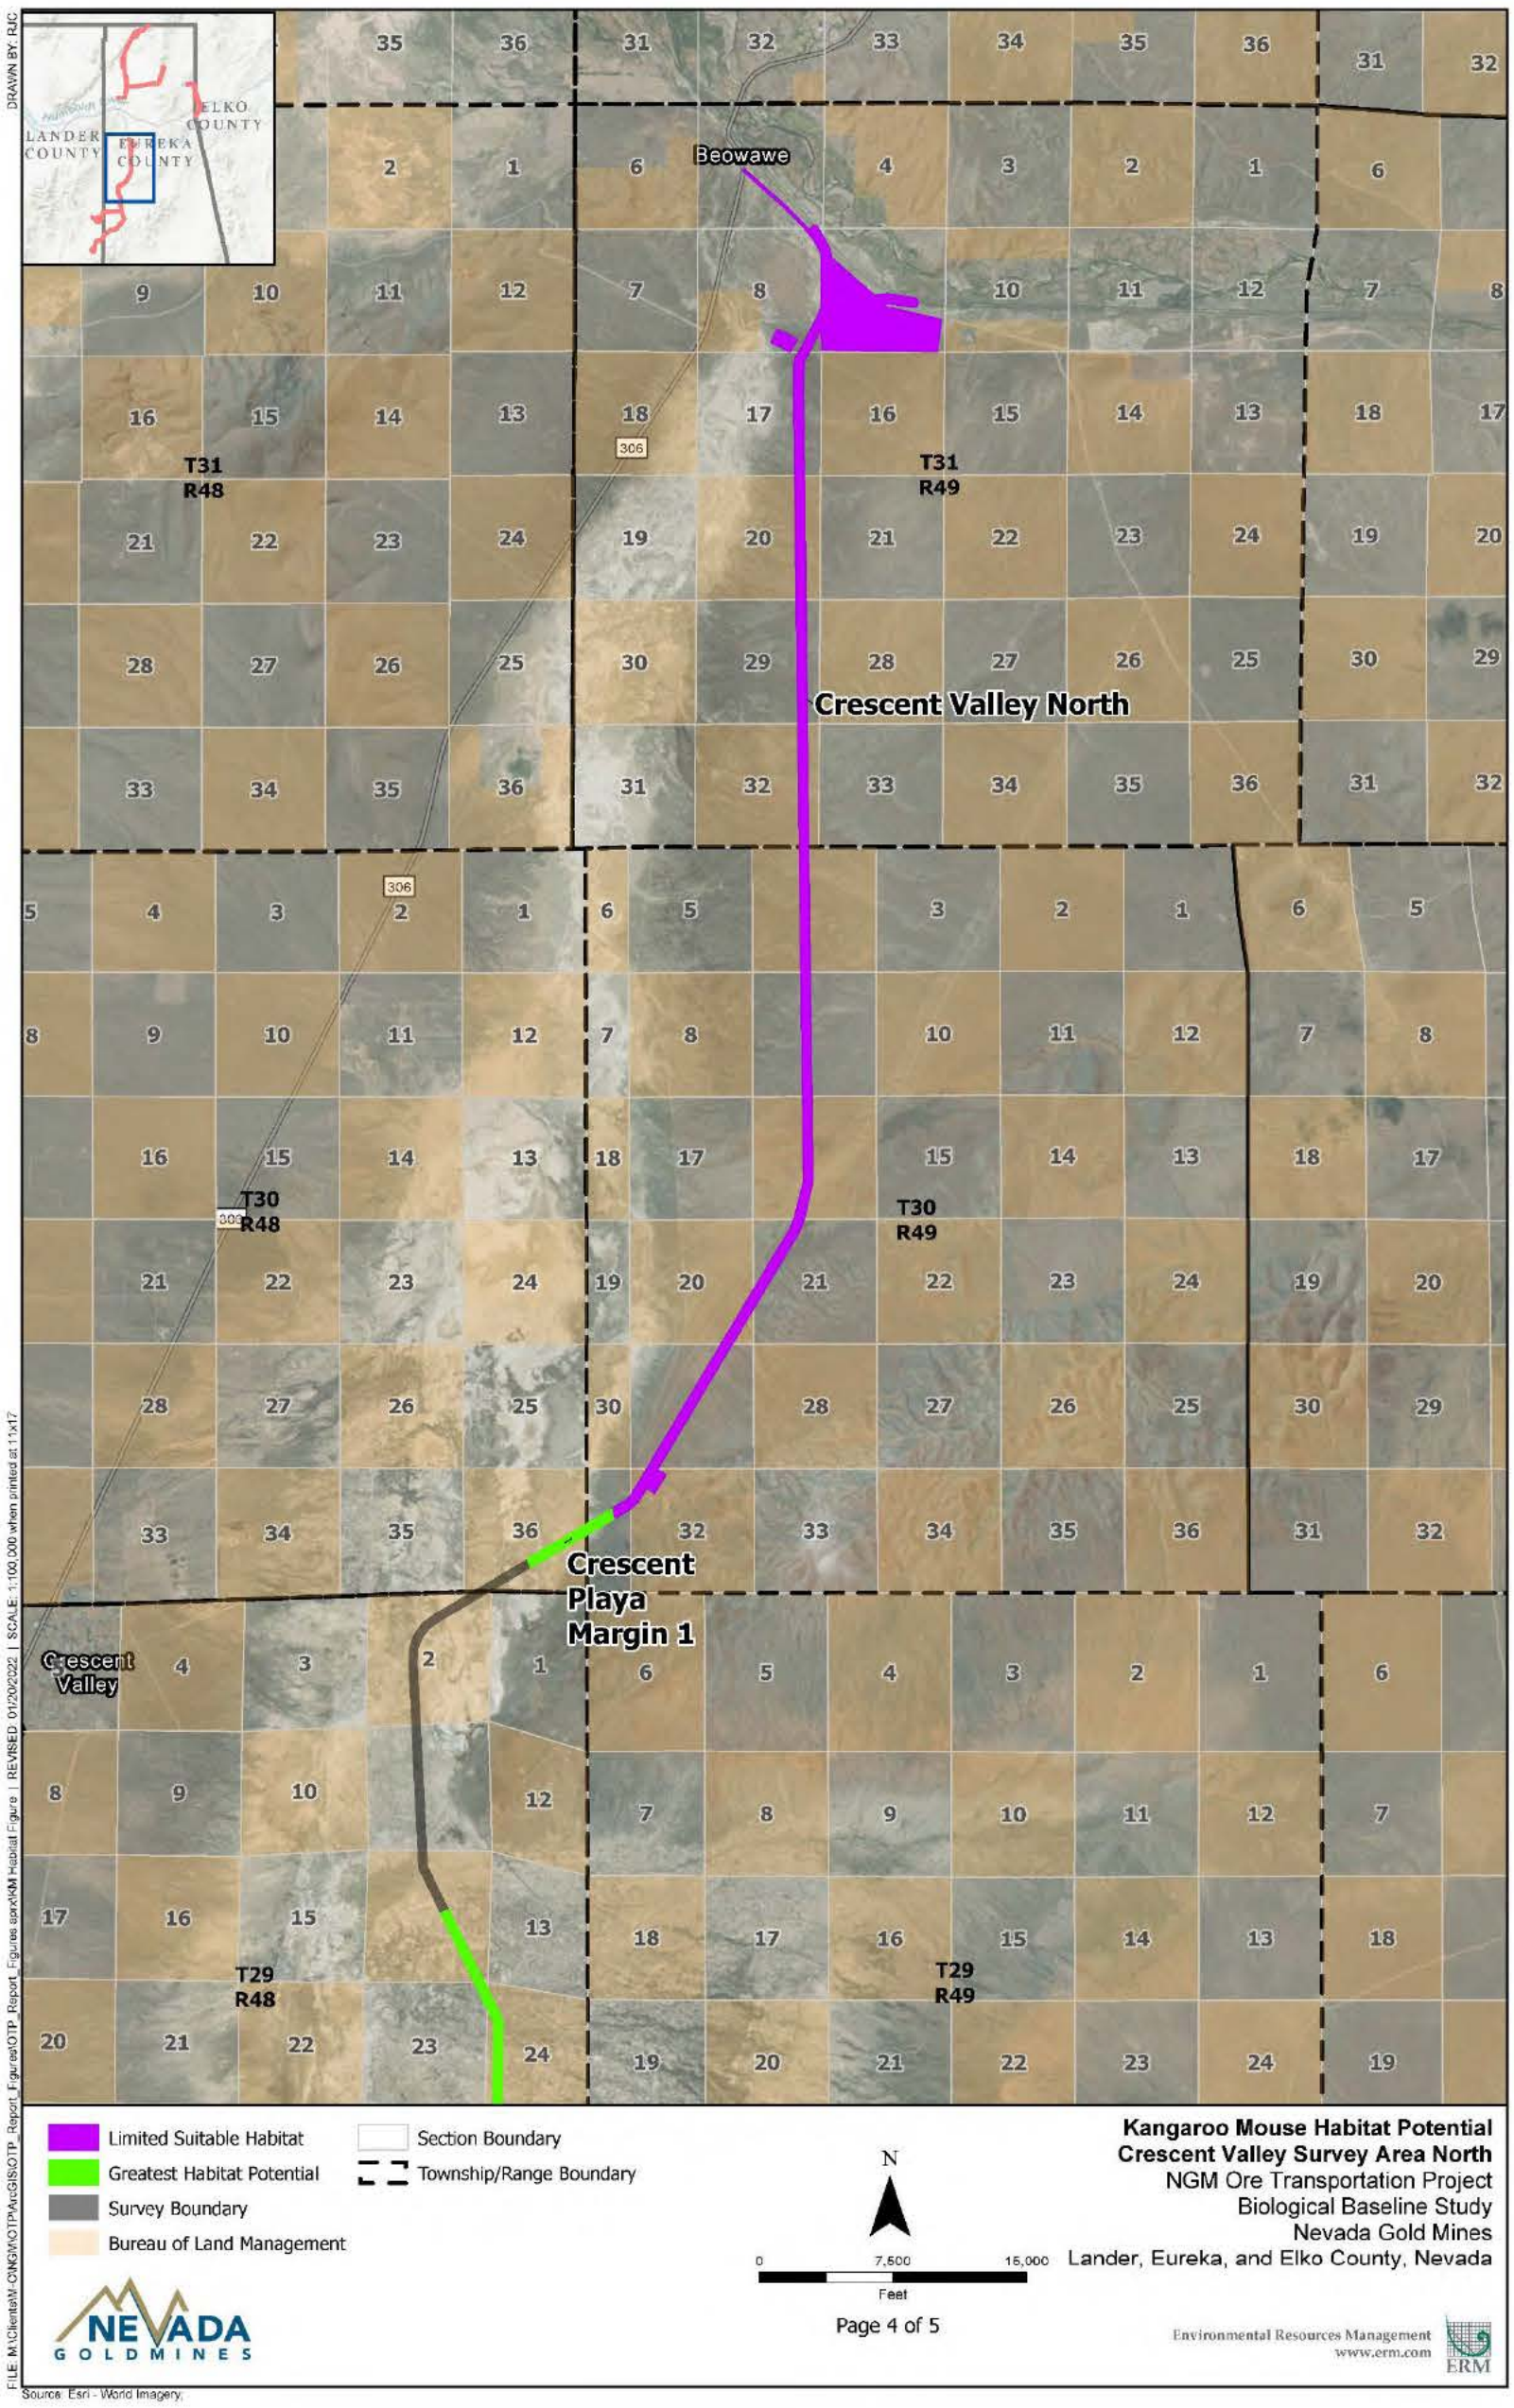

Figure 3.4.9-4: Kangaroo Mouse Habitat Potential—Crescent Valley Survey Area North

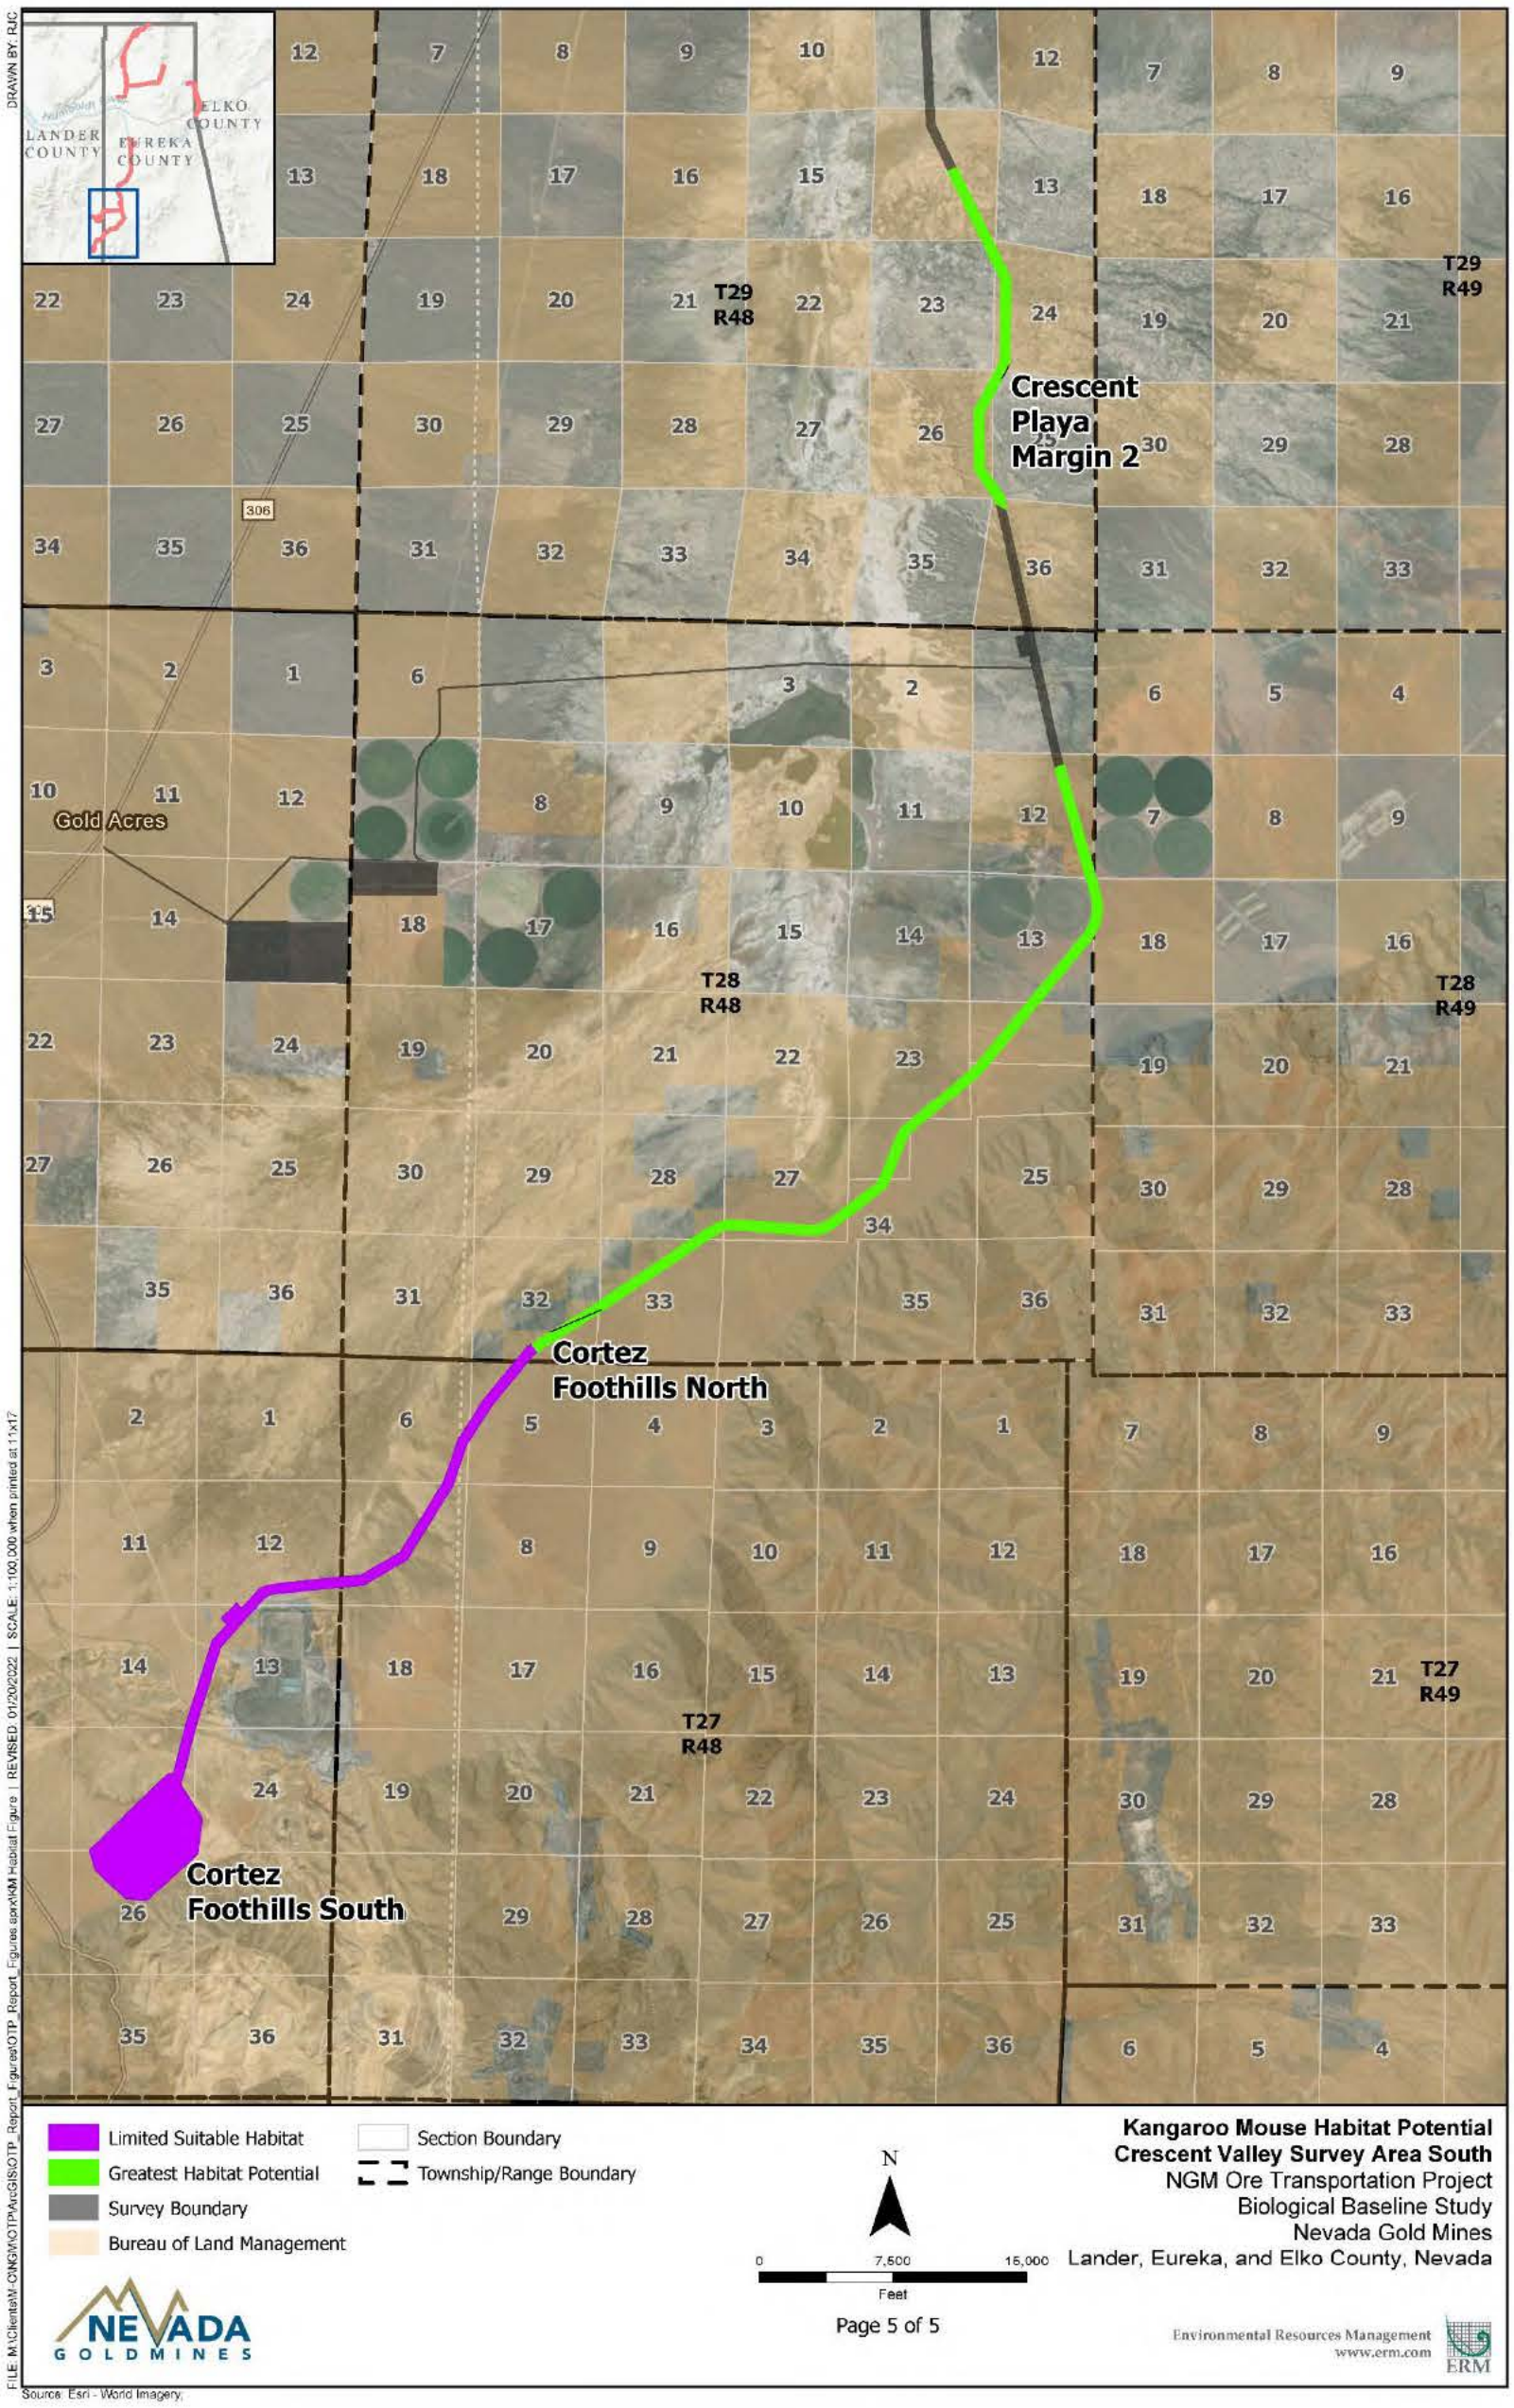

Figure 3.4.9-5: Kangaroo Mouse Habitat Potential—Crescent Valley Survey Area South

Page Intentionally Left Blank.

Goldstrike Survey Area

Suitable habitat for kangaroo mouse in the Goldstrike Survey Area was very limited. No suitable habitat was identified in either the Boulder South or Boulder Playa areas. Some small mammal burrows were observed in both of these areas; however, vegetative and soil characteristics do not provide preferred foraging or habitat conditions required by kangaroo mouse. Surveys in Boulder South documented both grazing and a high abundance of weeds, with silty and saturated soils. Observations of the Boulder Playa Area suggest it is prone to flooding in most years, and preferred forage species of kangaroo mouse were not common.

The Boulder Valley and Boulder Valley North areas had only limited areas of suitable habitat. The Boulder Valley Area continues to undergo impacts from the 2017 Rooster Comb Fire, which has led to a dominance of weedy species in some areas and reduced cover by preferred forage species throughout. Evidence of heavy grazing was also observed on the west side of the Boulder Valley area. The soils in Boulder Valley are silty with some gravel.

Survey of the Boulder Valley North area documented silty soils and a dominance of grassy vegetation, with impacts from the 2017 Rooster Comb Fire still evident. Biologists evaluating this area recorded fair habitat conditions to the northeast portion.

Carlin Survey Area

Field surveys of the Carlin Survey Area documented limited areas of potential suitable habitat. No suitable habitat was identified in surveys of Carlin South, Carlin North 1, or Carlin North 2. Compacted, silty soils and heavy grazing activities were characteristic of each of these locations. The washes in the northern area of Carlin and the Carlin loading/unloading loop contain limited suitable habitat for kangaroo mouse. Soils near the washes have higher concentrations of sand and small gravel, and in both locations, grasses were abundant and multiple kangaroo rat burrows were observed. However, these areas were restricted to the locations of bottom washes.

Crescent Valley Survey Area

The greatest potential habitat for kangaroo mouse in the Project Area was documented within the Crescent Valley Survey Area in three general locations: Crescent Playa Margin 1, Crescent Playa Margin 2, and the Cortez Foothills North (Figure 3.4.9-5). In other locations of Crescent Valley, only limited areas of suitable habitat were observed, including Crescent Valley North, Crescent Playa 1, Crescent Playa 2, and Cortez Foothills South.

Locations with the greatest potential habitat for kangaroo mouse were observed in Cortez Crescent Playa Margin 1, Crescent Playa Margin 2, and Cortez Foothills North. Soils in these locations were generally sandy and friable, with relatively larger areas with forage grass species. Grazing impacts, though observed, were limited. Although numerous small mammal burrows were observed in each of the survey locations, there were no kangaroo mice observed during the surveys.

Surveys at Crescent Valley North documented abundant weed species and silty soils, though some isolated locations of Indian Ricegrass were observed. Overall, this location offered very minimal habitat for kangaroo mouse. Crescent Playa 1 and Crescent Playa 2 areas supported silty soils and a lack of preferred forage species. Both areas are also prone to flooding, as standing water and saturated soils were common observations in both locations. Cortez Foothills South had similar characteristics as Crescent Playa 1 and Crescent Playa 2 sites, but evidence of grazing was also observed. Within the Cortez Foothills South area, greasewood, rabbitbrush, and sagebrush species were documented but were found only in isolated and relatively small areas. Overall, this location has only limited habitat for kangaroo mouse (result of significantly degraded range conditions) and only pockets of preferred habitat conditions.

3.4.10. Bats

3.4.10.1. Background

A total of 16 bat species on lands administered by the Battle Mountain and Elko Field offices are designated as BLM special status species (BLM 2017b, 2019a). Of these, one species, the spotted bat (*Euderma maculatum*), is listed as state-threatened under NAC 503. Additionally, BLM special status species are listed as species of conservation priority by the Wildlife Action Plan Team (2012) and/or as Nevada protected or sensitive species under NAC 503 (NDNH 2021). Bats in the Project Area are those associated with the habitats described in Section 3.4.1, Wildlife Habitat. Particularly, WAP key habitats within the Project Area (see Table 3.4.1-1) including Cliffs and Canyons as well as Lower Montane Woodlands and Chaparral may provide roosting sites for bats, and waterbodies (i.e, desert playas and ephemeral ponds; intermountain rivers and streams; lakes and reservoirs; and marshes) may provide foraging and drinking opportunities for bats. The Grasslands and Meadows WAP key habitat found within the Project Area may also provide foraging habitat for bats. In general, wetland habitats produce insect prey for foraging bats while structures associated with woodlands may provide roosting opportunities (Williams et al. 2006).

The purpose of the bat surveys, which included a desktop assessment and acoustic field surveys, is to assess the potential occurrence of these special status bat species within the Project Area based on habitat suitability and acoustic findings (e.g., presence/probable absence) in order to evaluate future Project impacts to these species and their habitats.

3.4.10.2. Study Methodology

Methods included an assessment of which bat species may be present by conducting literature and desktop reviews, and field surveys using bat automated recording units. A survey of recorded bat echolocation calls was conducted to determine species presence.

Acoustic Survey

Acoustic field surveys were conducted to determine the bat species that may be present within the Project Area. The survey area for bat acoustic surveys encompassed the Project footprint plus up to a 0.25-mile buffer, including borrow sources, access roads, and depots locations. Bat

survey data locations were selected based on coordination with BLM. Survey data locations included detector sites within Carlin, Crescent Valley, and Goldstrike survey areas (see Figure 3.4.10-1 through Figure 3.4.10-3).

The following protocol was used in this survey:

- *Passive Acoustic Monitoring Protocol for Bat Species in Northern Nevada* (Helmig and Martin 2020)

Full spectrum bat acoustic detectors, specifically Wildlife Acoustics ® SM4 FS and Song Meter Mini using Wildlife Acoustics® SMM-U1 or SMM-U2 microphones, were deployed during three survey events in May 2021, July/August 2021, and September 2021. Site selection was based on criteria outlined in Helmig and Martin (2020) and Loeb et al. (2015); detectors were deployed in areas providing the greatest opportunity to detect a diversity of bat species (e.g., placed near a water source and/or foraging area). Survey locations were selected based on their potential as foraging habitat and/or suitable roosting habitat. Potential foraging habitat, which includes the presence of riparian areas and areas that attract flying insects, was considered and selected where possible, as shown in Table 3.4.10-1. Figures showing the location of the acoustic survey sites and SWreGAP land cover are included in Appendix D.7, Figures 7-1 through Figure 7-15.

Bat detector microphones were elevated at each survey location and ranged from 2 to 4 meters above ground. Microphone height varied based on weather patterns (e.g., microphones were placed at 2 meters above ground during high wind nights). Acoustic survey data sheets providing additional detail regarding site information (e.g., GIS coordinates; setup and removal weather conditions; and land use) and detector information (e.g., make, model, and microphone information), including photos of the acoustic survey locations, are included in Appendix D.7.4.

Field surveys were conducted during three separate events. The first survey period was conducted in May (beginning on May 18, 2021), the second in July (beginning on July 19, 2021), and the third in late September (beginning on September 20, 2021). The detectors were programmed to record from 30 minutes before sunset to 30 minutes after sunrise for a minimum of six consecutive nights during each survey event. If weather conditions were not favorable to bat activity (i.e., rain, wind, or low temperatures), detectors remained deployed until a minimum of six consecutive nights of optimal weather conditions were observed. Data from each detector location was recorded following established protocols and survey forms (Helmig and Martin 2020) and is included in Appendix D.7.4.

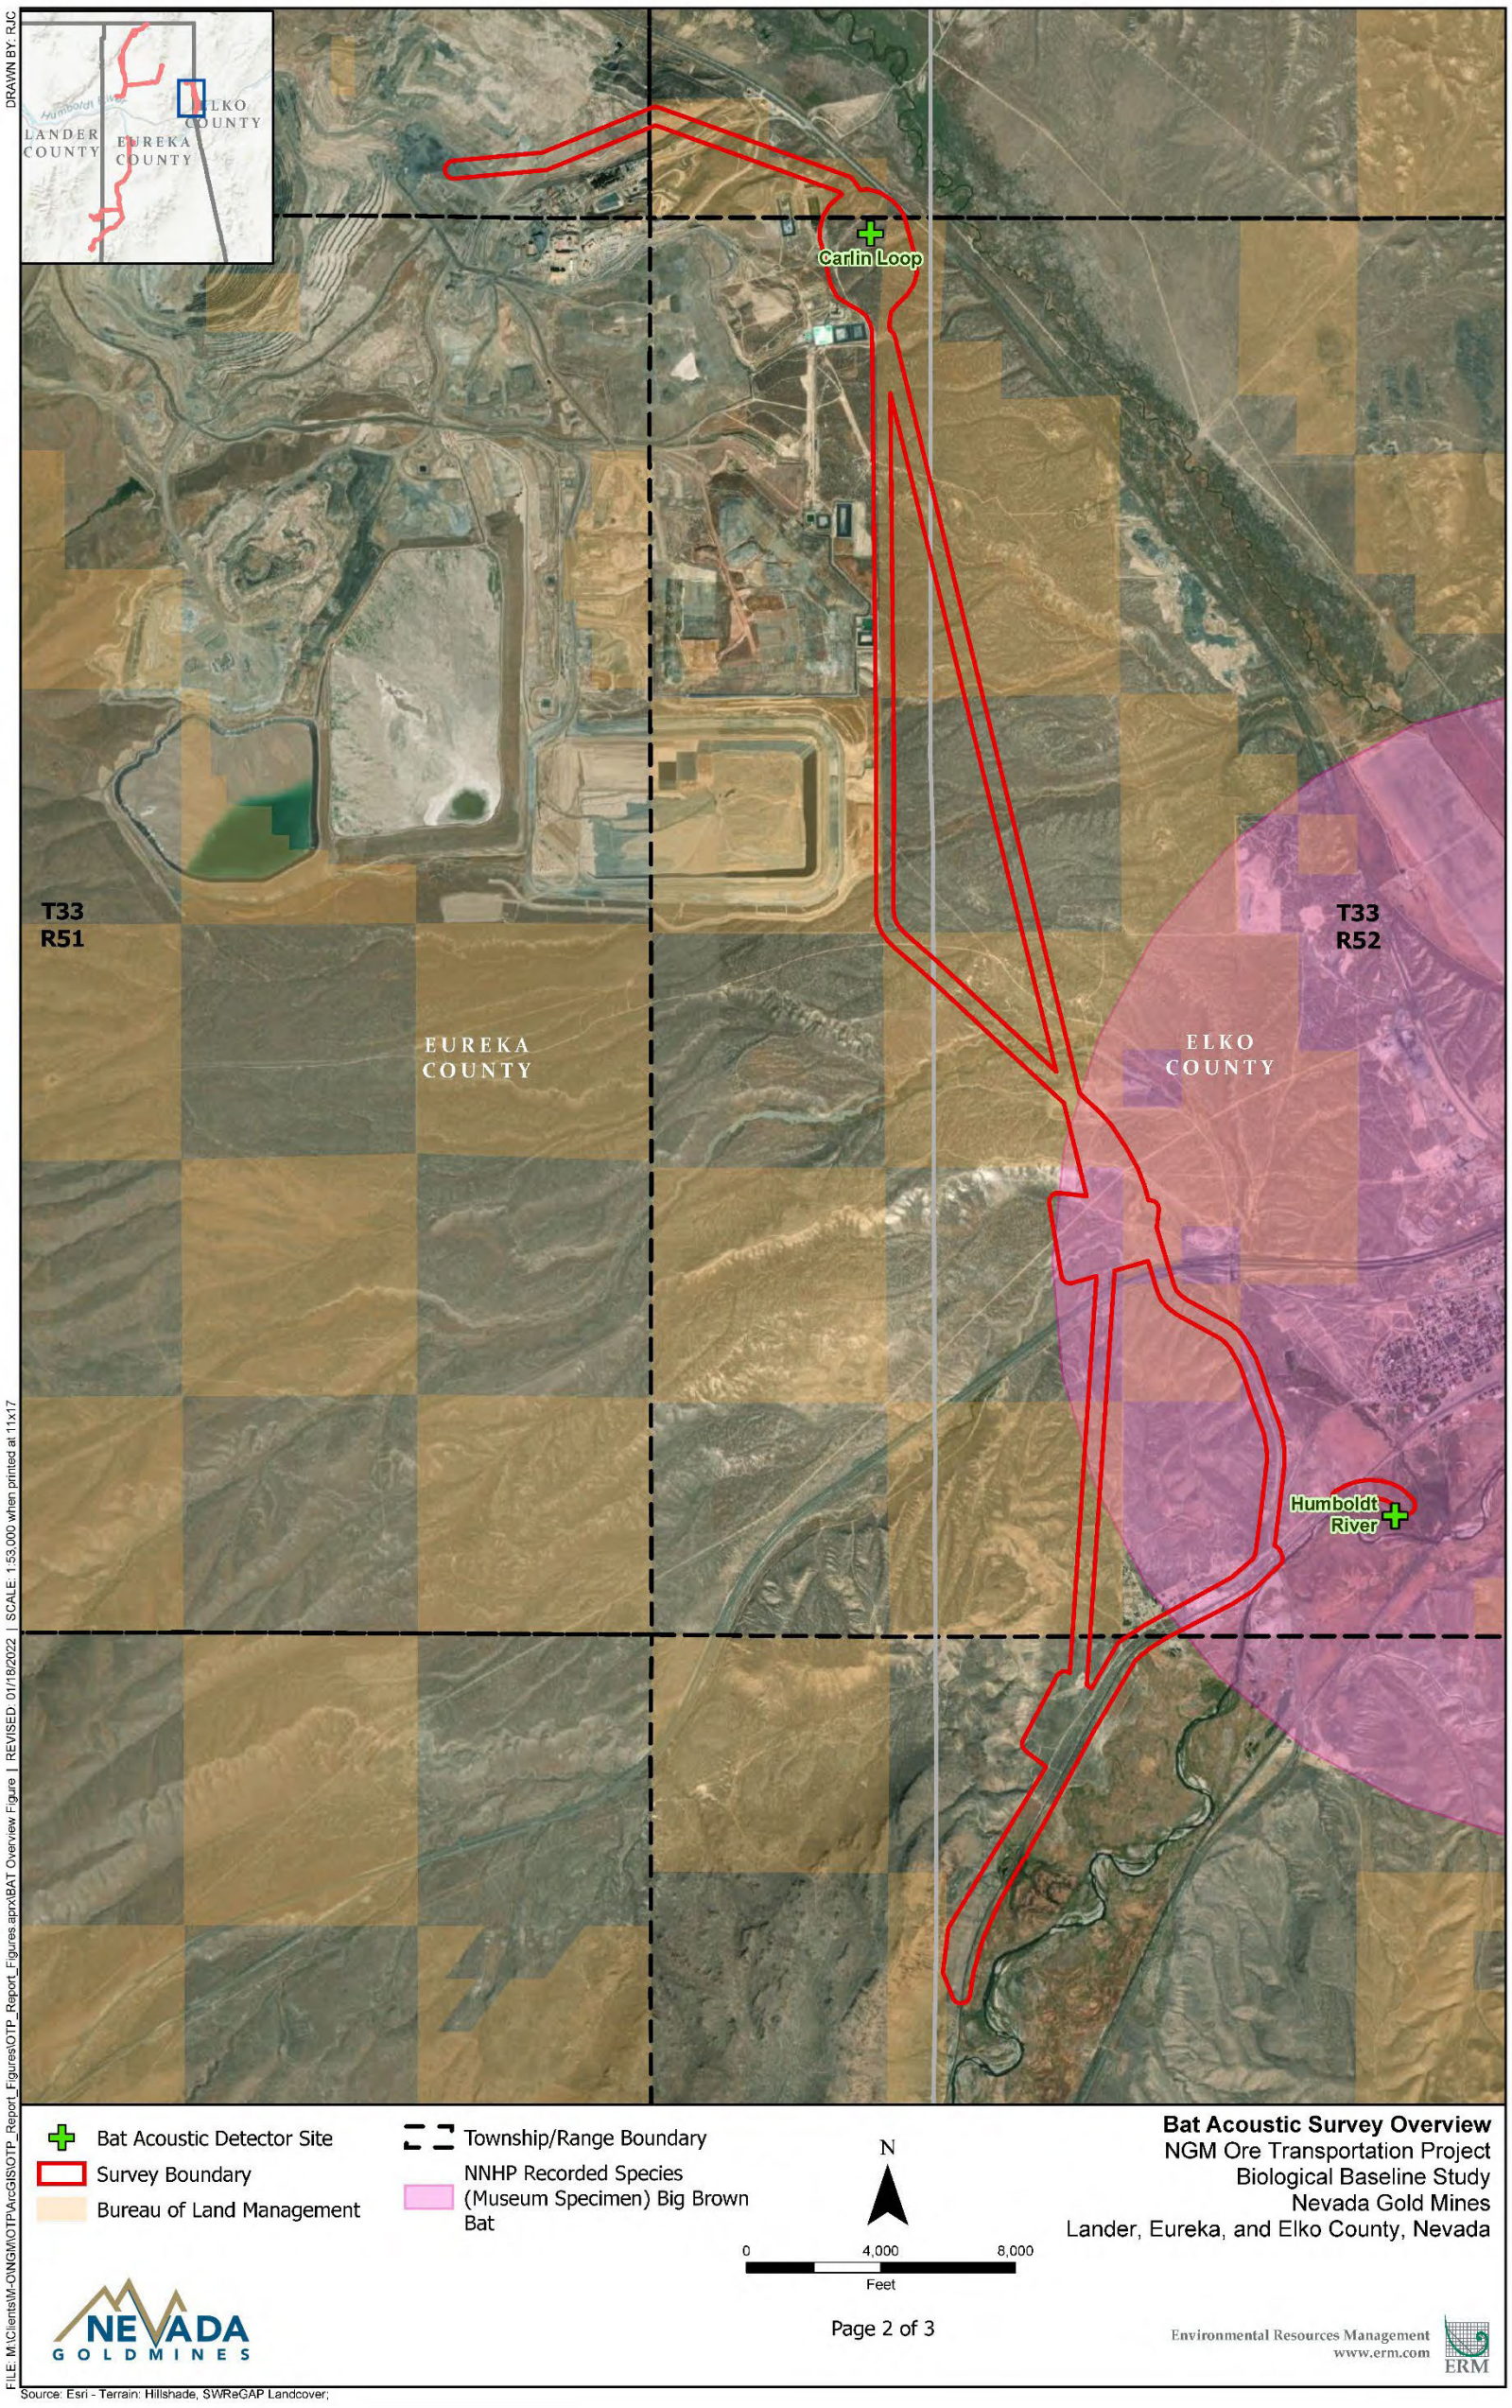

Figure 3.4.10-2: Bat Acoustic Survey Overview—Carlin Survey Area

Page Intentionally Left Blank.

Table 3.4.10-1. Survey Location Selection Criteria

Project Area/ Detector Site	Potential Suitable Foraging Habitat	Potential Suitable Roosting Habitat	Habitat Assessment [a]
Goldstrike			
Bat 12	X		Grazed pasture near Welch's Canyon
Boulder Valley		X	Grassy canyon with exposed rock face
Welch's Canyon	X		Shrubland with perennial stream and nearby woodland
Carlin			
Carlin Loop	X		Open shrubland
Humboldt River	X	X	Riparian woodland and shrubland vegetation
Crescent Valley			
Bat 1	X		Shrubland with desert scrub
Beowawe East	X		Riparian shrubland
Beowawe West	X	X	Shrubland vegetation and riparian woodland
Dean Ranch	X	X	Small woodland adjacent to stock tanks and water sources
DR Pivots	X		Emergent wetland marsh with shrubland/forbland vegetation
Hot Springs East	X	X	Primary successional grassland adjacent to exposed rocky outcrops
Hot Springs West	X		Open shrubland on playa edge with possible ephemeral wetland habitat
Playa North	X		Ephemeral wetland on playa edge
Playa South	X		Open shrubland on playa edge with ephemeral wetland habitat
Thomas Creek	X		Playa/shrubland with ephemeral wetland habitat

[a] See Appendix D.7 for figures showing the location of the acoustic survey sites and SWreGAP land cover.

Acoustic Analysis of Bat Calls

Acoustic survey data (sonogram files) was processed using the software program Kaleidoscope Pro, version 5.4.2 (Wildlife Acoustics 2021). The call library used was version 5.1.0, and files were processed on the "0 Balanced (Neutral)" setting. Other signal parameters were left at default settings. Kaleidoscope Pro has a built-in call library for North American species, which runs auto-ID on recorded calls, based on clustering analyses. Auto-ID is a first step of analysis and provides likely occurrences, reducing manual analysis time. While Auto-ID is both efficient and generally accurate, variation in recording quality and overlap in species calls requires additional manual review to assess confidence in species presence. Bat call analysis was conducted with the Auto-ID for bats using the Nevada Bats of North America 5.4.0 version.

Several challenges are present in identifying bat species by echolocation calls. While foraging, bats emit calls with different frequencies (in kilohertz) and durations (in milliseconds). These are separated into three phases: search, approach, and feeding buzz (also called terminal phase [Murray et al. 2001]). Search-phase calls tend to be spaced apart from one another and are relatively consistent within species. Approach-phase and feeding buzz calls are emitted progressively closer to one another, as the bat identifies and targets the prey item; however, these calls vary greatly within species and even within individuals, so are not considered a good diagnostic for species identification (Simmons, Fenton, and O'Farrell 1979; Fenton and Bell 1981). Even with clear search-phase calls recorded, reliable differentiation between species can be challenging. In particular, several species in the genus *Myotis* have overlapping characteristics of echolocation calls around the 40 kilohertz frequency range (Maxell et al. 2015). Additionally, big brown bats (*Eptesicus fuscus*) and silver-haired bats (*Lasionycteris noctivagans*) have very similar call characteristics and are not always possible to identify to species (Maxell et al. 2015). However, other species contain less overlap and can be identified with greater confidence (e.g., spotted bat, which produces very low frequency calls).

Kaleidoscope Pro's automated results were the starting point for analysis; the results were then reviewed and interpreted by an experienced bat biologist familiar with western bat species and experienced in acoustic analysis of bat calls and the identification of bat species by acoustic characteristics. To confirm presence of each potential species identified by Kaleidoscope Pro, the bat biologist reviewed or vetted a subset of files identified to each species. The bat biologist also reviewed files classified as "NoID" and "Noise" files, with a focus on identifying low intensity files with characteristic call features.

Although there are inherent limitations to acoustic analysis (see Section 1.1.1 in Helmig and Martin 2020), the goal of manual bat call review or vetting was to identify the strongest call types and assess likely presence of species along the Project Area. Calls were not identified to species unless they contained clear pulses indicative of search phase behavior. Presence of species was determined according to confidence levels and assigned a rank of high, medium, or low. Rankings were defined based on the following criteria:

- **High confidence** in presence was assigned to species identified in multiple clear recordings, which included diagnostic characteristics for species identification

(e.g., presence of harmonics or pronounced inflections in call). In some cases, if diagnostic features are unique (e.g., upward hook for Townsend's big-eared bat [*Corynorhinus townsendii*]), a lower number of files or lower quality of call files may lead to high confidence.

- **Medium confidence** in presence was assigned to species where manual review found some evidence to suggest a particular species, including diagnostic characteristics for species identification; however, confidence was limited due to low number of files, poor quality of files, and/or the defining characteristics present overlapped multiple species.
- **Low confidence** in presence was assigned to species where manual review found little evidence for species identification, including the review of only one bat file; high degree of overlap between multiple species; and/or low quality or "quiet" calls.
- **Not likely present** was assigned to species where manual review found no evidence to support the species identification made by the automated program. This includes files where Kaleidoscope Pro made clear misidentifications (false positives), and files where no portion of the call files identified contained search phase behavior.

All acoustic file data is retained by the Project and can be provided to BLM upon request.

3.4.10.3. Pre-Field Assessment

A desktop review identified known and potential bat habitats within 0.25 mile of the Project Area. This review included USGS, BLM, NDOW, NHD, NWI, and NDNH data. Specifically, potential bat species within the Project Area were determined based on reviews of NDOW's species accounts for mammals and the Revised Nevada Bat Conservation Plan (Bradley et al. 2006), as well as communications with the BLM (BLM 2017b, 2019a). Known and historical locations of special status bat species were provided by the BLM and NDNH. The desktop review focused on potential bat hibernacula (abandoned mine lands, shafts, or caves), identification of forested areas with suitability for roosting or foraging, and identification of water features.

Evaluation of Species Presence

Table 3.4.10-2 lists the bat species, associated habitat that may be present within the Project Area, and likelihood of occurrence based on species ranges, available habitat, and known and/or historical record of occurrence. This list was used as the potential species list for identifying recorded bat calls.

An overview map with the locations of known special status bat occurrences is shown in Figure 3.4.10-1 through Figure 3.4.10-3.

Table 3.4.10-2: Potential Bat Species within the Project Area

Species	Agency Status	Habitat	Likelihood of Occurrence [a]
Big brown bat (*Eptesicus fuscus*)	BLM NV Sensitive	Caves and Mines, Cliffs and Canyons, Developed Landscapes, Agricultural Lands, Woodlands and Riparian Areas	Likely; Records document species overlapping Carlin and Humboldt River acoustic detector site
Fringed myotis (*Myotis thysanodes*)	BLM NV Sensitive; NDOW State Protected	Sagebrush, Aspen, Lower Montane Woodlands and Chaparral, Cliffs and Canyons, Caves and Mines, Developed Landscapes	Possible
Hoary bat (*Lasiurus cinereus*)	BLM NV Sensitive	Intermountain Riparian, Warm Desert Riparian, Aspen, Lower Montane Woodlands and Chaparral, Intermountain Coniferous Forests and Woodlands	Possible
California myotis (*Myotis californicus*)	BLM NV Sensitive	Salt Desert Scrub, Woodlands and Riparian Areas, Caves and Mines, Cliff and Canyons	Likely; Records document species west of Beowawe West and south of Dean Ranch acoustic detector sites, respectively
Little brown myotis (*Myotis lucifugus*)	BLM NV Sensitive	Intermountain Riparian, Aspen, Lower Montane Woodlands and Chaparral, Intermountain Coniferous Forests and Woodlands, Caves and Mines, Cliffs and Canyons, Developed Landscapes	Possible
Long-eared myotis (*Myotis evotis*)	BLM NV Sensitive	Aspen, Intermountain Coniferous Forests and Woodlands, Lower Montane Woodlands and Chaparral, Caves and Mines	Likely; Records document species captured during mist net surveys south of Dean Ranch acoustic detector site
Long-legged myotis (*Myotis volans*)	BLM NV Sensitive	Montane Coniferous Forest, Salt Desert Scrub, Sagebrush	Possible
Yuma myotis (*Myotis yumanensis*)	BLM NV Sensitive	Caves and Mines, Cliffs and Canyons, Developed Landscapes, Agricultural Lands, Woodlands and Riparian Areas	Possible
Canyon bat (*Parastrellus hesperus*)	BLM NV Sensitive	Salt Desert Scrub, Sagebrush, Caves and Mines, Cliffs and Canyons	Likely; Records document species detected during acoustic surveys south of Dean Ranch acoustic detector site
Brazilian (Mexican) free-tailed bat (*Tadarida brasiliensis*)	BLM NV Sensitive; NDOW State Protected	Warm Desert Riparian, Intermountain Riparian, Lower Montane Woodlands, Aspen, Intermountain Coniferous Forest, Cliffs and Canyons, Caves and Mines, Developed Landscapes	Possible
Silver-haired bat (*Lasionycteris noctivagans*)	BLM NV Sensitive	Intermountain Riparian, Aspen, Lower Montane Woodlands and Chaparral, Intermountain Coniferous Forests and Woodlands	Likely; Records document species detected during acoustic surveys south of Dean Ranch acoustic detector site

Species	Agency Status	Habitat	Likelihood of Occurrence [a]
Spotted bat (*Euderma maculatum*)	BLM NV Sensitive; NDOW State Threatened	Intermountain Riparian, Lower Montane Woodlands and Chaparral, Intermountain Coniferous Forest and Woodlands, Cliffs and Canyons, Caves and Mines, Developed Landscapes	Possible
Western red bat (*Lasiurus blossevillii*)	BLM NV Sensitive; NDOW State Sensitive	Wooded Riparian, particularly cottonwood/willow or mesquite bosque	Possible
Pallid bat (*Antrozous pallidus*)	BLM NV Sensitive; NDOW State Protected	Salt Desert Shrub, Sagebrush, Caves and Mines, Cliffs and Canyons Woodlands and Riparian Areas,	Likely; BLM records documented at Mill Canyon in 2018
Townsend's big-eared bat (*Corynorhinus townsendii*)	BLM NV Sensitive; NDOW State Sensitive	Lower Montane Woodlands and Chaparral, Caves and Mines	Likely; Records document species, including maternity colony west of Beowawe West and hibernaculum west of Dean Ranch acoustic detector sites, respectively
Western small-footed myotis (*Myotis ciliolabrum*)	BLM NV Sensitive	Salt Desert Shrub, Sagebrush, Aspen, Lower Montane Woodlands and Chaparral, Intermountain Coniferous Forest, Cliffs and Canyons, Caves and Mines, Developed Landscapes, Agricultural Lands	Likely; Records document species west of Beowawe West acoustic detector site

Source: BCI 2021; BLM 2019a; Keinath 2003; NAC 503; NDNH 2021; NDOW 2021d; Wildlife Action Plan Team 2012

[a] Desktop assessment included review of all records; some records are historical (e.g., big brown bat records are from 1912), and some of these species may no longer be present within the Project Area. However, bat surveys are not common and therefore, for the purpose of this table, any record of presence is assumed to indicate likely presence.

3.4.10.4. Results and Discussion

Echolocation calls were recorded on bat acoustic detectors at 15 survey locations within the Project Area between May and September 2021. Two acoustic detector sites, Bat 1 and Bat 12, were only operational for the May deployment as a result of discussions with the BLM in June regarding bat acoustic detector locations. After the May deployment, the bat detector placed at Bat 12 was moved approximately 0.5 mile away to detector site Welch's Canyon, which was deployed and operational for dates in late-July/early August and September. Additionally, detectors were not deployed and operational at Humboldt River and Boulder Valley sites in May, but as a result of discussions with the BLM, were deployed and operational early July and subsequent dates in late-July/early August and September. Acoustic detectors were set at each site for a minimum of six consecutive nights of surveying. Erroneous noise files that did not represent bat activity were removed. Dean Ranch had the majority of recorded activity for each deployment period (i.e., May, July/August, and September), with over 3,000 files recorded in July/August. Hot Springs West and Hot Springs East typically recorded the fewest files for each deployment period, which included less than 20 files per acoustic detector and deployment (Appendix D-7, Table D.7-1).

Acoustic Survey of Bat Calls

Results from the Kaleidoscope Pro Auto-ID suggested potential presence of all bat species of special concern, with the exception of the spotted bat. A total of 6,543 files were identified to species, with the largest portion of identified files (1,379 call files, approximately 21.1 percent) identified as Brazilian (Mexican) free-tailed bat (*Tadarida brasiliensis*). The next most common species was hoary bat (*Lasiurus cinereus*), with 963 files (approximately 14.7 percent), followed closely by the long-legged myotis (*Myotis volans*), with 957 files (approximately 14.6 percent). Additional files were identified as follows:

- Little brown bat (*Myotis lucifugus*) *n*=904, 13.8 percent
- Western small-footed myotis (*Myotis ciliolabrum*) *n*=781, 11.9 percent
- Silver-haired bat (*Lasionycteris noctivagans*) *n*=644, 9.8 percent
- Big brown bat (*Eptesicus fuscus*) *n*=306, 4.7 percent
- Townsend's big-eared bat (*Corynorhinus townsendii*) *n*=187, 2.9 percent
- Long-eared myotis (*Myotis evotis*) *n*=136, 2.1 percent
- Canyon bat (*Parastrellus hesperus*) *n*=49, 0.7 percent
- Yuma myotis (*Myotis yumanensis*) *n*=46, 0.7 percent
- Cave myotis (*Myotis velifer*) *n*=46, 0.7 percent
- California myotis (*Myotis californicus*) *n*=45, 0.7 percent
- Pallid bat (*Antrozous pallidus*) *n*=40, 0.6 percent
- Western red bat (*Lasiurus blossevillii*) *n*=40, 0.6 percent
- Fringed myotis (*Myotis thysanodes*) *n*=8, 0.1 percent
- Western mastiff bat (*Eumops perotis californicus*) *n*=8, 0.1 percent
- Western yellow bat (*Lasiurus xanthinus*) *n*=2, <0.1 percent
- Big free-tailed bat (*Nyctinomops macrotis*) *n*=2, <0.1 percent

See Appendix D-7, Tables D.7-1 through D.7-13, for results of the Kaleidoscope Pro Auto-ID.

Based on manual vetting, bat calls were identified with high, medium, or low confidence for potential bat species of concern within the Project Area, with the exception of the spotted bat, which was not identified through the Kaleidoscope Pro Auto-ID or through manual vetting (see Table 3.4.10-3; and Appendix D-7, Table D.7-14).

Manual vetting confirmed with high confidence the presence of eleven species of special concern. Appendix D-7, Figure 7-1 through Figure 7-15, includes confirmed bat species detections based on high confidence for each acoustic detector site. Additional species including long-legged myotis, California myotis, and pallid bat were verified with medium confidence (Table 3.4.10-3). Multiple clear calls were identified to species, and diagnostic features were present that allowed for confidence in identification (Appendix D.7.3). Overall, there was high confidence in hoary bat presence among all three survey areas (Goldstrike, Carlin, and Crescent Valley) and nearly all bat acoustic detector sites, with the exception of Bat 1. There was medium to high confidence in silver-haired bat presence among all survey areas and bat acoustic detector sites, with the exception of Bat 1 and Hot Springs West.

Page Intentionally Left Blank.

Bats were detected at all sites, but most commonly detected in the southwest portion of the Project Area, specifically within the Crescent Valley Survey Area. Numerous bat species within the Crescent Valley Survey Area were identified with medium to high confidence including Townsend's big-eared bat (medium and high confidence) and pallid bat (medium confidence only) (Table 3.4.10-3). These species, including hibernaculum for Townsend's big-eared bat, have previously been documented west of the Crescent Valley Survey Area, and acoustic results support species presence within the Crescent Valley Survey Area.

There is a diversity of bat species present, with recorded calls suggesting at least 15 special status species. Numerous species not documented in known occurrence data, but with the potential to occur within the Project Area (Table 3.4.10-1), were confirmed present with medium to high confidence. *Myotis* species confirmed with high confidence included fringed myotis, little brown myotis, and Yuma myotis. Non-*Myotis* species that were confirmed with high confidence include Brazilian free-tailed bat, hoary bat, and western red bat.

3.4.11. Amphibians

3.4.11.1. Background

A total of five amphibian species on lands administered by the Battle Mountain and Elko field offices are designated as BLM special status species (BLM 2017b, 2019a). Of these, three species have the potential to occur in the Project Area, as shown in Table 3.4.11-1 (BLM 2017b, 2019a). Two species, the Columbia spotted frog, Great Basin population (*Rana luteiventris*) and the northern leopard frog (*Lithobates pipiens)* are listed as state-threatened under NAC 503. Additionally, BLM special status species are listed as species of conservation priority by the Wildlife Action Plan Team (2012) and/or as Nevada protected or sensitive species under NAC 503 (NDNH 2021).

A desktop assessment and field surveys were conducted to assess the potential occurrence of amphibian species within the Project Area, which includes the Project footprint plus a 200-foot buffer of the centerline (400-foot survey area), as shown on Figure 2-1 through Figure 2-9. The results from this survey will be used to inform the future NEPA to assess potential impacts to any individuals, communities, and/or habitats.

Table 3.4.11-1: Potential Amphibian Species within the Project Area

Species	Agency Status	Habitat	Likelihood of Occurrence
Columbia spotted frog (Great Basin population) (*Rana luteiventris*)	BLM Sensitive NDOW State Threatened	Intermountain Riparian, Wet Meadow, Springs and Springbrooks, Marshes, Lakes and Reservoirs. Closely associated with water, especially oxbow ponds, beaver ponds, and other deep pools with submerged or emergent vegetation	Possible

Species	Agency Status	Habitat	Likelihood of Occurrence
Northern leopard frog (*Lithobates pipiens*)	BLM Sensitive NDOW State Threatened	Marshes, Lakes and Reservoirs, Wet Meadow, Intermountain Riparian, Springs and Springbrooks; Breeding in marshes, ponds, or backwaters with foraging commonly occurring in nearby wet meadows	Possible
Western toad (*Anaxyrus boreas*)	BLM Sensitive NDOW State Sensitive Species	Lower Montane Woodlands, Intermountain Coniferous Forests and Woodlands, Intermountain Riparian, Aspen, Grasslands and Meadows, Springs and Springbrooks, Lakes and Reservoirs; Often associated with seasonal wetlands for breeding and nearby riparian and meadow habitat for foraging	Likely
Boreal toad (*Anaxyrus* nov. sp.)	BLM Sensitive	Wide variety of habitats including desert springs and streams, meadows, marshes, mountain wetlands and agricultural land. It is also known around ponds, lakes, reservoirs, and slow moving rivers and streams; undertake seasonal migrations to and from breeding sites	Not likely; Recent *Anaxyrus* new species limited to Nye County, and genetic analysis groups populations near the Project with western toad (above)
Amargosa toad (*Anaxyrus nelsoni*)	BLM Sensitive	Open, ponded or flowing water with riparian vegetative cover in erly to mid successional stage	Not likely; documented only from the Oasis Valley in southern Nevada

Source: BLM 2017b, 2019a; Wildlife Action Plan Team 2012

3.4.11.2. Study Methodology

A review of existing literature and data from BLM, USFWS, NDOW, and NDNH was conducted for potential occurrence of the species of concern within the Project Area. The desktop assessment used NHD, NWI, USGS, and SWReGAP data to identify target areas for conducting field surveys. Priority areas for surveys included seeps, springs, and wetlands with adequate vegetation. Transects were established along potential suitable habitat features based on the review and field observations during the wetland and waterbody surveys (see Section 2.2, Water Resources).

The following protocols were used and adapted to the Project Area as appropriate for this survey:

- *Instruction Manual and Frog Survey Protocols for Region 1 National Wildlife Refuges, East-side Zone (Great Basin and Great Northern LCCs)* (Rombough 2012)
- *Survey Protocol for the Northern Leopard Frog* (Kendell 2002)
- *Columbia Spotted Frog Visual Encounter Survey Protocol* (Hatch and Simandle 2004)

Amphibian field surveys were conducted in suitable habitat in July 2021 when tadpoles and adults were expected to be present. Biologists conducted a time-restrained visual encounter

survey in accordance with the protocols listed above. After noting location, start time, and surveyors, transect surveys were conducted for a minimum of 20 minutes through suitable habitat with emphasis on shorelines of streams, wetlands, and other habitat types most likely to support targeted amphibians. Observers looked under surface cover when present. The total time spent surveying, the total area searched, the number of individuals observed, and GPS locations and photographs were recorded at each of the surveyed locations.

3.4.11.3. Results and Discussion

Pre-Field Results

The presence of ranid frogs has been documented in the general Project vicinity since 1912, when the University of Michigan's Walker-Newcomb expedition to northeast Nevada collected paratypes of the Columbia spotted frog along Maggie Creek and several other streams and noted the presence of northern leopard frogs; both species were described as common (Thompson 1913). More recent studies documented continued presence of Columbia spotted frogs in upper Maggie Creek, over 2 miles upstream (northwest) of the Carlin Survey Area and at a somewhat higher elevation than the Project (NDOW 2015). There are three populations of Columbia spotted frogs in Nevada: Jarbidge-Independence Range, Ruby Mountains, and Toiyabe Mountains. The Carlin Survey Area is near the southern limit of the largest of these populations—the Jarbidge-Independence population. The Crescent Valley and Goldstrike survey areas do not overlap or approach any of these populations and are not within the known range of this species according to the recent species status assessment (USFWS 2015).

Historic northern leopard frog localities (specific documented occurrences) in northeast Nevada are mostly from 1911 to 1916 along or near the Humboldt River (AmphibiaWeb 2021; Rogers and Peacock 2012). In 2001, surveys were completed at historic northern leopard frog localities and additional areas of suitable habitat in eastern Nevada. During their survey, frogs were present at few locations, and the nearest extant northern leopard frog population was approximately 30 miles east of the Carlin Survey Area (Rogers and Peacock 2012). There have been no other nearby reports of northern leopard frogs since 1916 (AmphibiaWeb 2021), and most Nevada populations are thought to be extirpated (Rogers and Peacock 2012).

The western toad is widespread in the Great Basin region (Gordon 2020), and historical presence was documented in several areas in northern Eureka County, including as part of the Goldrush baseline survey in Lander and Eureka Counties (ERM 2018). The Goldrush baseline survey reported seven toads from three locations (ERM 2018). Older records are also documented in the Humboldt River floodplain (AmphibiaWeb 2021).

Field Results

Field surveys were completed along potential suitable habitat features identified during the wetland and waterbody surveys throughout the Project Area as shown on Figure 3.4.11-1 through Figure 3.4.11-3. The completed transects, waterbody type, linear feet surveyed, and observations for each survey area are shown in Table 3.4.11-2. One special status adult western toad was observed in a seasonal cattail-dominated wetland in the Carlin Survey Area

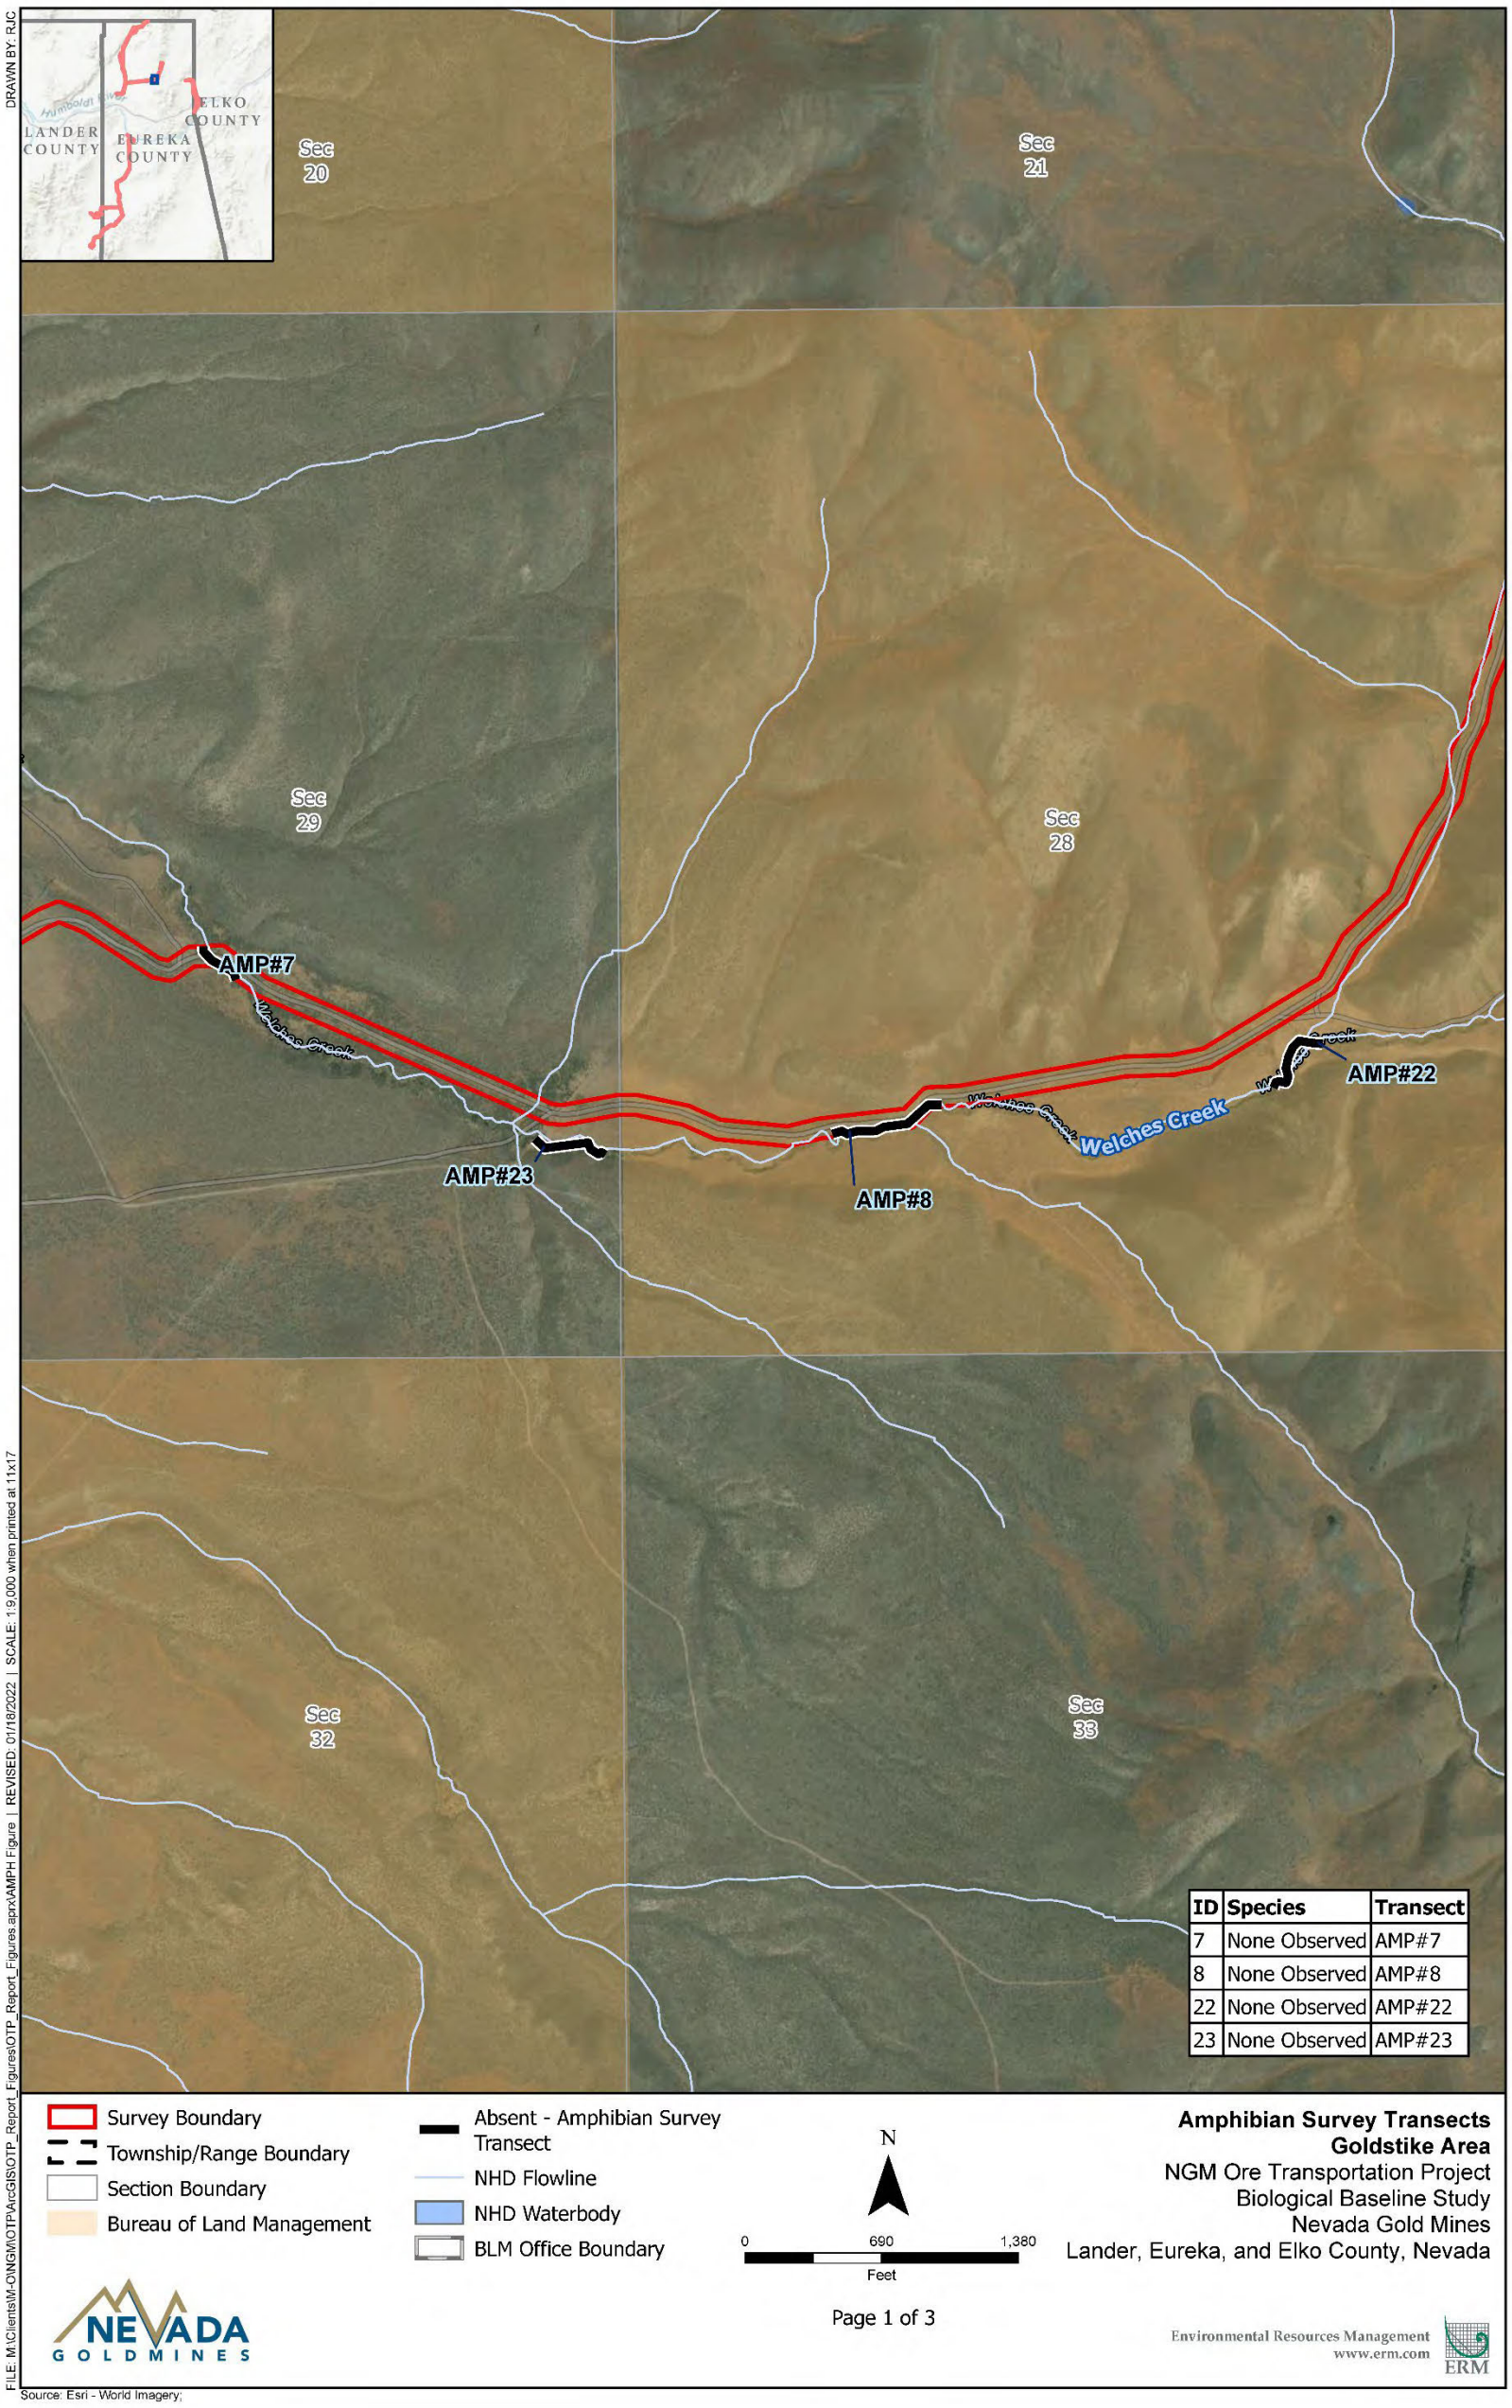

Figure 3.4.11-1: Amphibian Observations—Goldstrike Survey Area

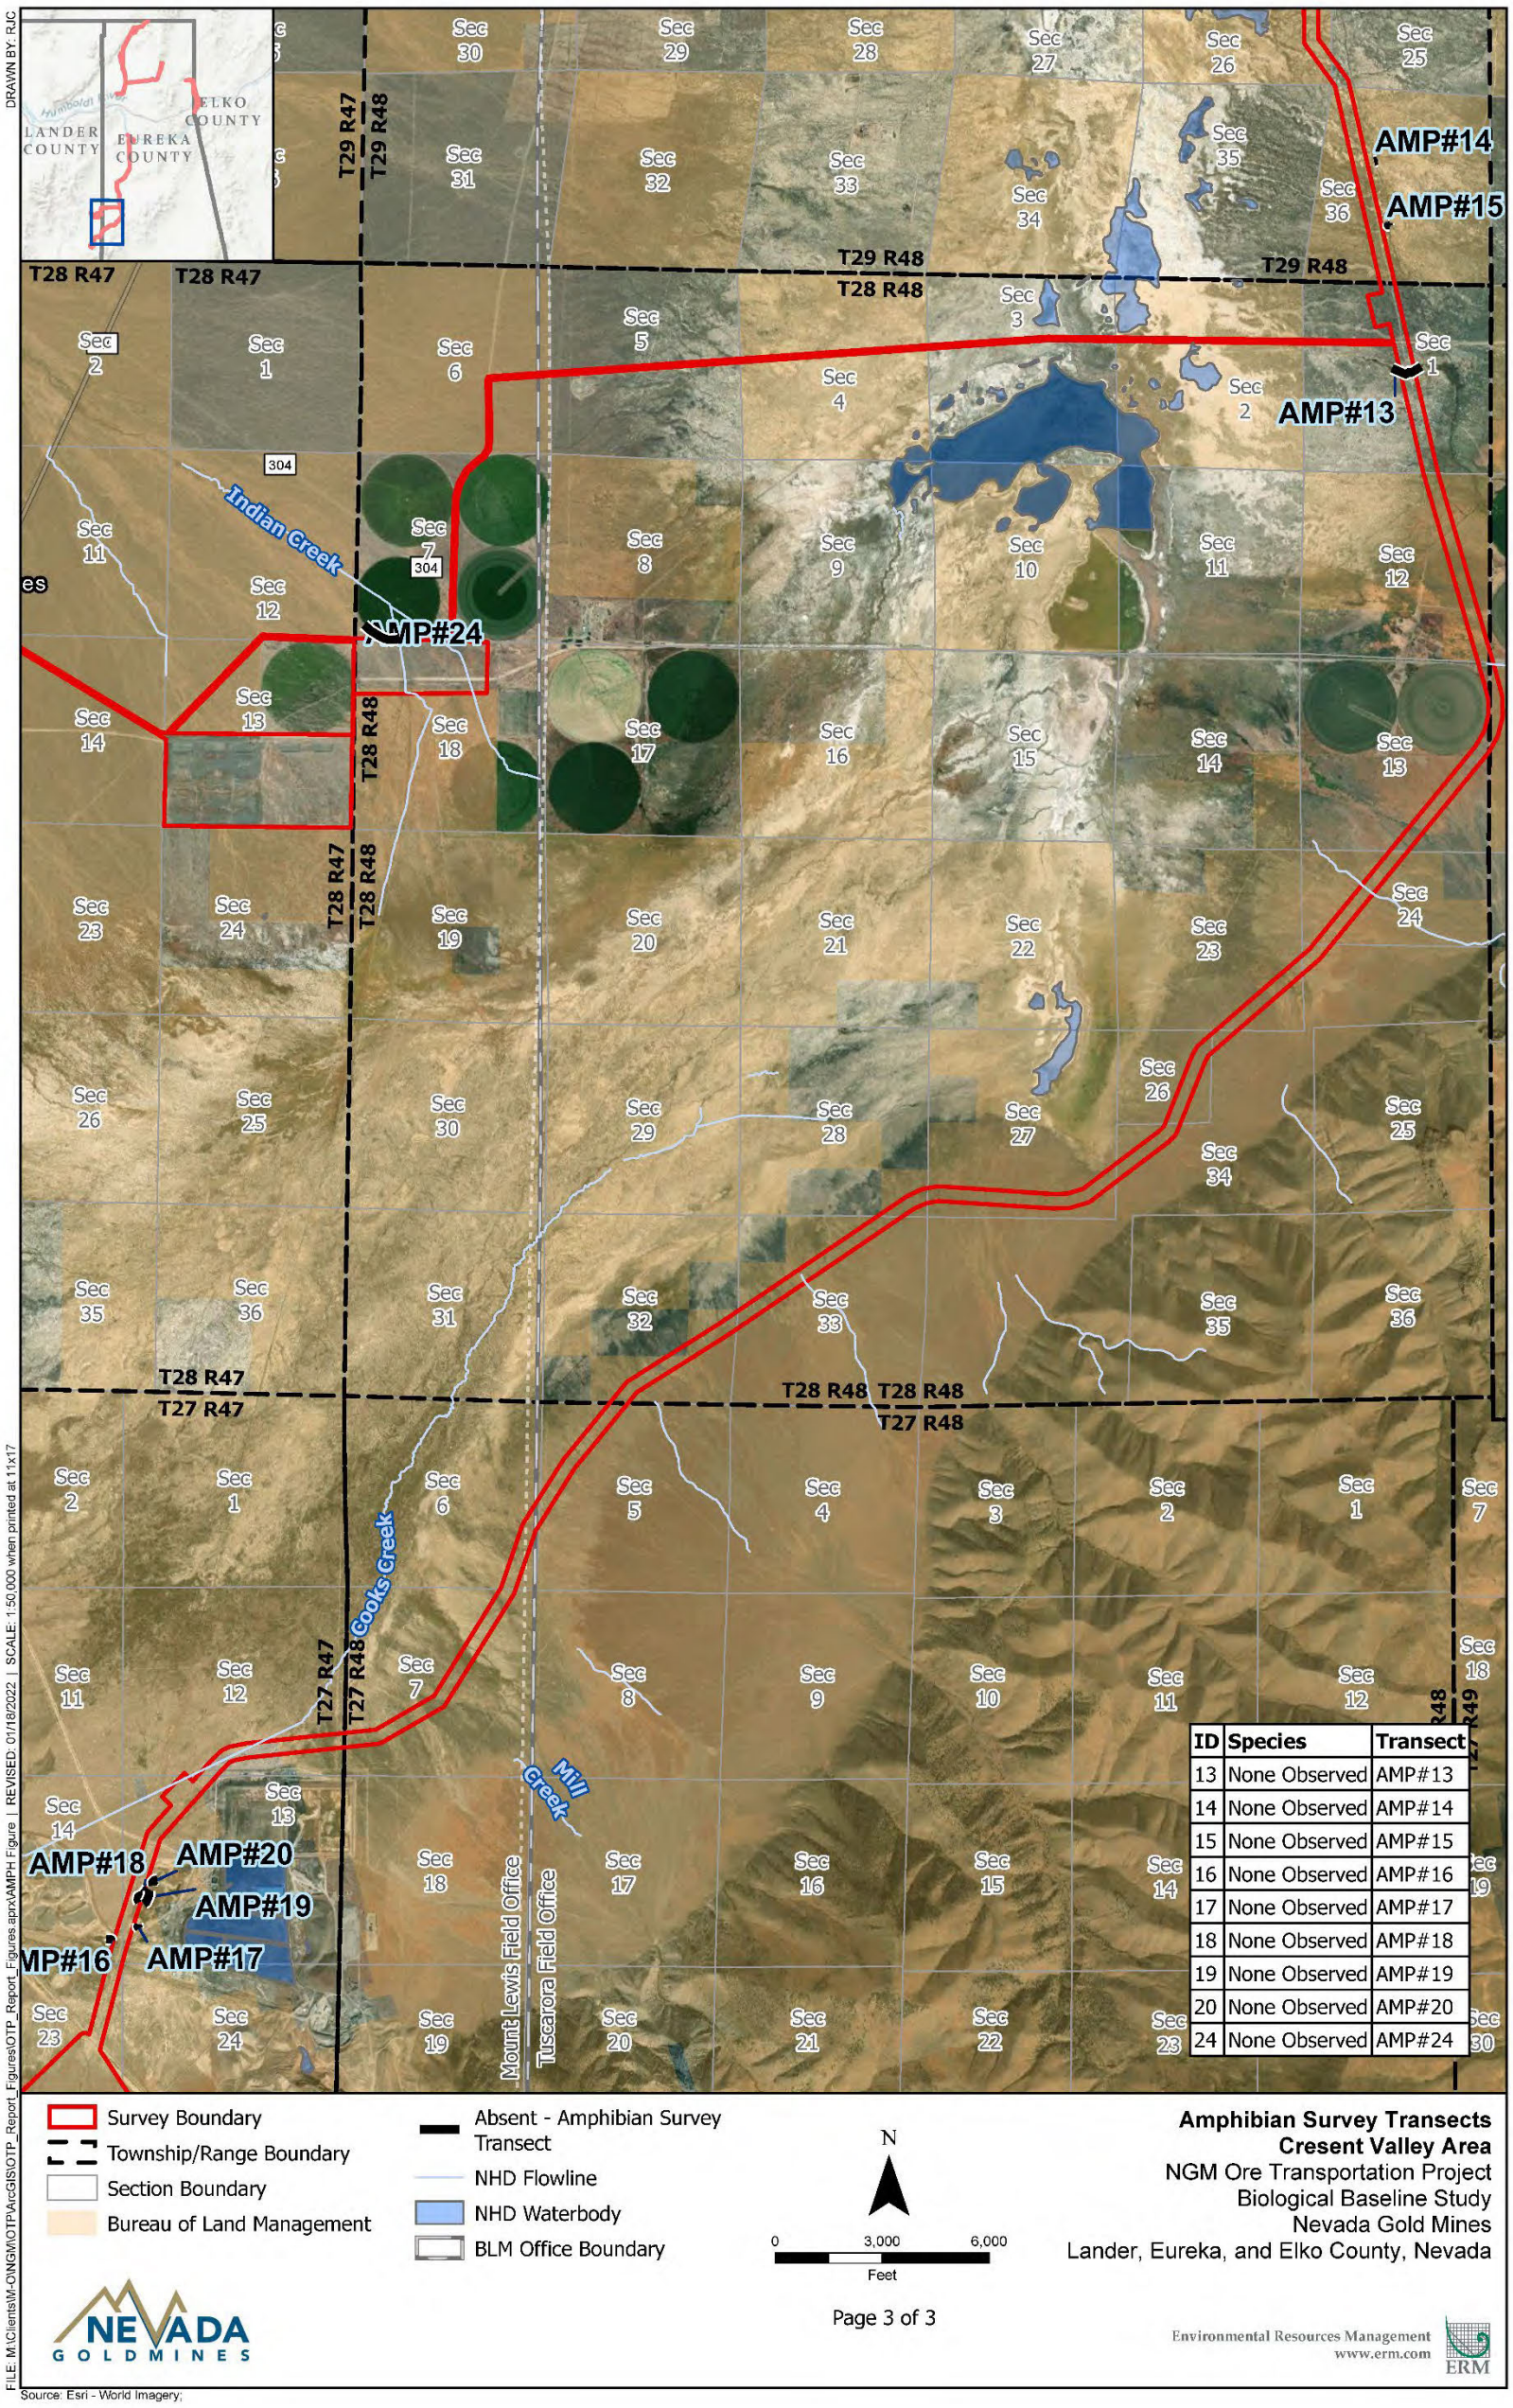

Figure 3.4.11-3: Amphibian Observations—Crescent Valley Survey Area

Page Intentionally Left Blank.

The scarcity of amphibian observations except for bullfrogs in the Humboldt River may be related to drought conditions at the time of the surveys. The statewide drought severity peaked the week of July 7, 2021, and the Project Area remained at moderate drought (D1) levels despite some precipitation later in the year (NOAA 2021b). Recent studies have documented a negative correlation between amphibian captures and extended drought (Bucciarelli et al. 2020).

Western toads may be present at additional locations in all three survey areas, with surface activity limited by drought conditions. At this time, presence of western toads is assumed where suitable habitat conditions (riparian areas and seasonal wetlands) are present based on recent surveys in nearby locations (Gordon 2020; ERM 2018) and because the species tends to occur as scattered populations throughout northern Nevada where adequate seasonal water is available. Additional amphibian surveys are planned for 2022 on transects associated with stream, riparian, and wetland areas identified in Figure 3.4.11-1 through Figure 3.4.11-3.

Presence of northern leopard frog is considered less likely due to presence of bullfrogs and an absence of recent nearby records. Columbia spotted frogs were documented within Maggie Canyon within maximum known dispersal distance (3.7 miles; USFWS 2015) of the Carlin Survey Area, although barriers to movement (developed land) make presence in the Survey Area unlikely; however, as stated above, additional amphibian surveys will be conducted in 2022. The other two survey areas are outside of the known range for this species.

3.4.12. Butterflies

3.4.12.1. Background

The Basin and Range topography of Nevada supports a number of range-restricted butterflies, many of them poorly studied. The BLM Battle Mountain and Elko districts identifies 9 of these as special status butterfly species (BLM 2017b, 2019a). Three species have ranges that include or potentially include the Project Area and were selected by BLM as species to target for surveys, as shown in Table 3.4.12-1 (BLM 2017b, 2019a).

Monarch butterfly (*Danaus plexippus*; candidate species for listing under the ESA as discussed in Section 3.4.7, Threatened and Endangered Species), Nevada viceroy butterfly (*Limenitis archippus lahontani*), and Mattoni's blue butterfly (*Euphilotes pallecens mattonii*) have the potential to occur within the Project. Milkweed species (*Asclepias* spp.) are a known host plant for the monarch butterfly. The Nevada viceroy adult butterfly, a riparian specialist, resembles adult monarch butterflies and utilizes species in the *Salicaceae* family (*Salix* spp. and *Populus* spp.) for host plants, but also favors composite flowers for feeding (Opler et at. 1999). The slender buckwheat (*Eriogonum microthecum*) is the host plant for the Mattoni's blue butterfly.

The survey area for these butterfly species and their preferred host plants includes the Project footprint plus a 200-foot buffer of the centerline (400-foot survey area), as shown on Figure 2-1 through Figure 2-9. The purpose of these surveys is to identify the species that occur with the Project to inform the future NEPA analysis. Host plant surveys are reported in Section 3.3.2, Butterfly Host Plants.

Table 3.4.12-1: Potential Butterfly Species within the Project Area

Species	Agency Status	Habitat	Likelihood of Occurrence
Big Smoky wood nymph (*Cercyonis oetus alkalorum)*	BLM Sensitive	Grassy, alkaline flats; known only from the Big Smoky Valey between the Toiyabe and Toquima ranges in central Nevada	Not likely; Records in central Nevada
Great Basin small blue (*Philotiella speciosa septentrionalis)*	BLM Sensitive	Distribution unknown but type locality is from Fort Churchill Road in Lyon County. Trend unknown considered critically imperiled in Nevada	Not likely; Single record in Lyon County
Mattoni's blue (*Euphilotes pallescens mattonii*)	BLM Sensitive	Found primarily in the upper and lower Sonaran Zones, praires, and sand dunes; found in pinyon-juniper wodlands and rolling prairie grasslands; host plant for the larvae is the buckwheat (*Eriogonum microthecum nutt.* var. *laxiflorum*).	Possible
Monarch butterfly (*Danaus plexippus plexippus)*	USFWS Candidate; BLM Sensitive	Widespread and scattered; requires milkweed (*Asclepiaecae*) or dogbane (*Apocynaceae*) as host plants for larvae; migratory in southern part of state	Possible
Nevada viceroy *(Limenitis archippus lahontani)*	BLM Sensitive	Known from along the Humboldt River and lower tributaries with additional colonies near Fallon and Fernely (WAP 2012)	Likely; NDNH Record near the Project area
Railroad Valley skipper (*Hesperia uncas fulvapalla)*	BLM Sensitive	From alkali meadows on the floor of Railroad Valley in Nye County	Not likely; Recorded only in Nye County
White Mountains skipper (*Hesperia miriamae longaevicola)*	BLM Sensitive	Above tree line (over 10,500 ft) on highest peaks of White Mountains in western NV	Not likely; Recorded only above treeline in the White Mountains
White River Valley skipper (*Hesperia uncas grandiose)*	BLM Sensitive	Alkaline meadows and saltgrass flats in early summer in the White River Valley. Austin and Leary (2008) also documented the subspecies using its apparent hostplant, Mexican rush (*Juncus mexicanus*), in Big Smoky Valley in Nye County	Not likely; Recorded only in Nye County
White River wood nymph (*Cercyonis pegala pluvialis)*	BLM Sensitive	Occurs in bottomland habitats along the White River near the White Pine and Nye county line and in the Steptoe Valley southeast of Ely	Not likely; Recorded only near the White Pine - Nye County line

3.4.12.2. Study Methodology

A desktop assessment was conducted using data from NDNH, BLM, NHD, NWI, and SWReGAP to identify areas with potential suitable habitat and documented occurrences to target during the field surveys for host plants and butterflies.

The following tools and protocols were used in this survey:

- *Initial Survey Instructions for Western Monarch and Milkweed Habitat Suitability Assessment* (USFWS 2016)
- Crucial Habitat Assessment Tool (WAFWA 2021)
- *Mattoni's Blue Butterfly Monitoring Protocol*, Version 1 (Helmig 2020)

The field surveys for butterflies focused on areas where host plants or other suitable habitat elements were identified during vegetation surveys. Riparian corridors, willow stands, and mesic areas were surveyed for Nevada viceroy from June 12 through July 24, 2021. Surveys for Mattoni's blue butterfly were conducted before or after the heat of the day and avoided windy conditions (wind speed below 10 mph) from June 12 through July 24, 2021. Per protocol, field staff used butterfly nets and supplies for specimen collection if little blue butterflies were found in order to capture and identify the species. Incidental observations of monarch, Nevada viceroy, or Mattoni's blue butterflies or caterpillars were also recorded during other surveys. Weather information and a description of habitat were recorded, along with GPS coordinates and photographs.

3.4.12.3. Results and Discussion

Pre-Field Results

Table 3.4.12-1 lists the three butterfly species with potential to occur in the Project Area, their agency status, associated habitat, and likelihood of occurrence based on species ranges, available habitat, and known and/or historical record of occurrence. As described in Section 3.3.2, Butterfly Host Plants, six milkweed species and slender buckwheat host plants have the potential to occur in the Project Area. The Nevada viceroy butterfly was previously identified near the proposed Crescent Valley Survey Area, along the Humboldt River near Beowawe, according to NDNH data.

There are 21 known records of Mattoni's blue butterfly, all from Elko County (Austin and Leary 2008; BLM 2020b). Although no records are known from the immediate Project vicinity, there have been few surveys conducted. This species is challenging to survey, in part because larvae may remain in diapause for several years (WildEarth Guardians 2010).

Field Survey Results

Pedestrian field surveys were conducted for butterflies within the Project Area as part of special status plant and butterfly host plant surveys, as shown on Figure 3.4.12-1 through Figure 3.4.12-5. Nevada viceroys were observed at three locations in the southern part of the Carlin Survey Area, as shown on Figure 3.4.12-3. All observations of this species were associated with willows, which were documented in the Goldstrike and Carlin survey areas, including Welches Creek and the Humboldt River, as described in Section 3.3.2, Butterfly Host Plants. Though few Nevada viceroy individuals were observed, suitable habitat is present in the Goldstrike and Carlin survey areas.

No monarch butterflies or caterpillars were observed during field surveys; however, two species of milkweed (narrow leaf milkweed [23 occurrences] and showy milkweed [6 occurrences]) were identified and mapped in the Project Area, as shown on Figure 3.4.12-1 through Figure 3.4.12-5. Narrow leaf milkweed was identified in all three survey areas, and showy milkweed was identified in the Carlin and Goldstrike survey areas. These milkweeds were identified ranging from isolated individuals to clusters of 30 to 50 plants.

No Mattoni's blue butterflies were observed during the field surveys; therefore, no specimens were collected for further analysis. The Mattoni's blue butterfly host plant, slender buckwheat, was identified in the Goldstrike Survey Area, as shown on Figure 3.4.12-1 and Figure 3.4.12-2. Slender buckwheat was observed within the Welches Creek summit borrow source area.

Table 3.4.12-2: Butterflies and Plant Host Species in each Project Area

Project Area	Landscape Position	Species Observed	Plant Host Species
Goldstrike Survey Area	Canyons, Canyon Meadow, Arid Valley Alkali Flats	Checkered white (*Pontia protodice),* Spring white (*Pontia sisymbrii),* Cabbage white (*Pieris rapae),* Northern blue (*Heliopetes ericetorum)*	Narrow Leaf Milkweed, Showy Milkweed, Slender Buckwheat
Carlin Survey Area	Arid Valley, Wet Meadows, Riparian	Great Basin wood nymph *(Cercyonis sthenele),* Orange sulfur (*Colias eurytheme),* Viceroy (*Limenitis archippus),* Ruddy copper *(Lycaena rubidus),* Purplish copper (*Lycaena helloides),* Western tiger swallowtail (*Papilio rutulus),* White-lined sphinx (*Hyles lineata),* Checkered white (*Pontia protodice),* Spring white (*Pontia sisymbrii)*	Narrow Leaf Milkweed, Showy milkweed
Crescent Valley Survey Area	Arid Valley, Akali Flats, Alluvial Slopes	Orange sulfur (*Colias eurytheme),* Checkered white (*Pontia protodice),* Cabbage white (*Pieris rapae),*	Narrow Leaf Milkweed

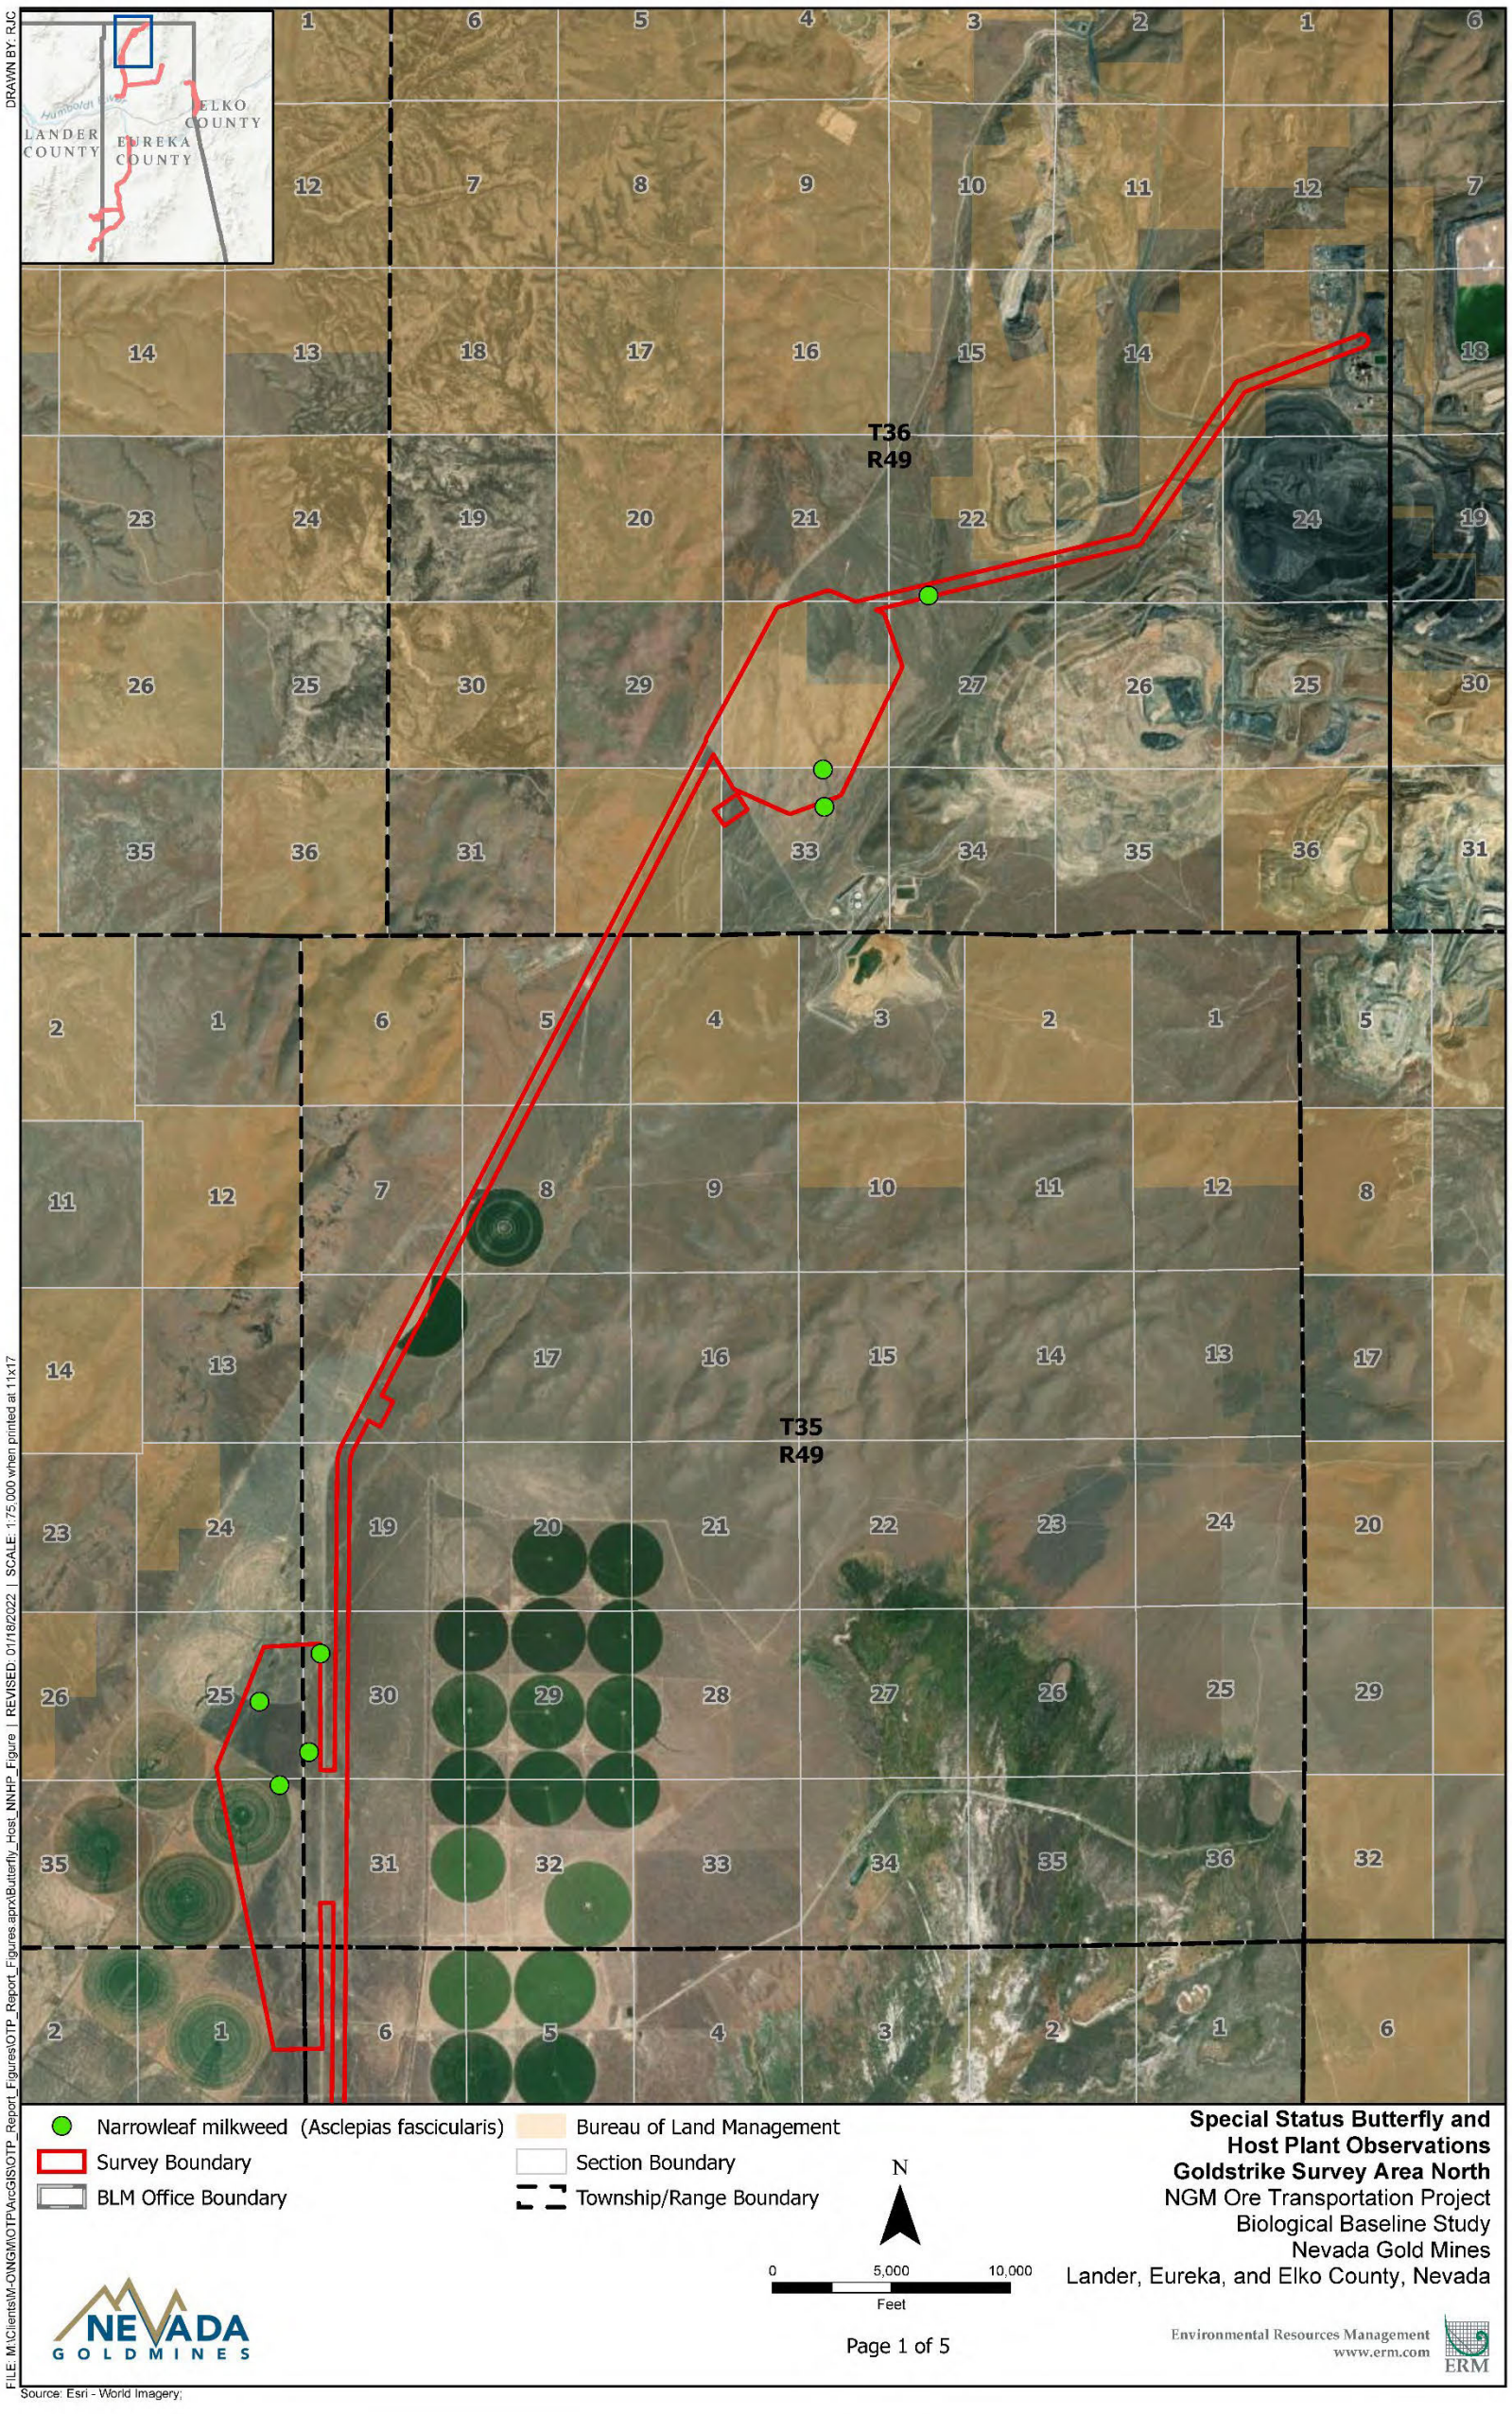

Figure 3.4.12-1. Special Status Butterflies and Host Plants Observations—Goldstrike Survey Area North

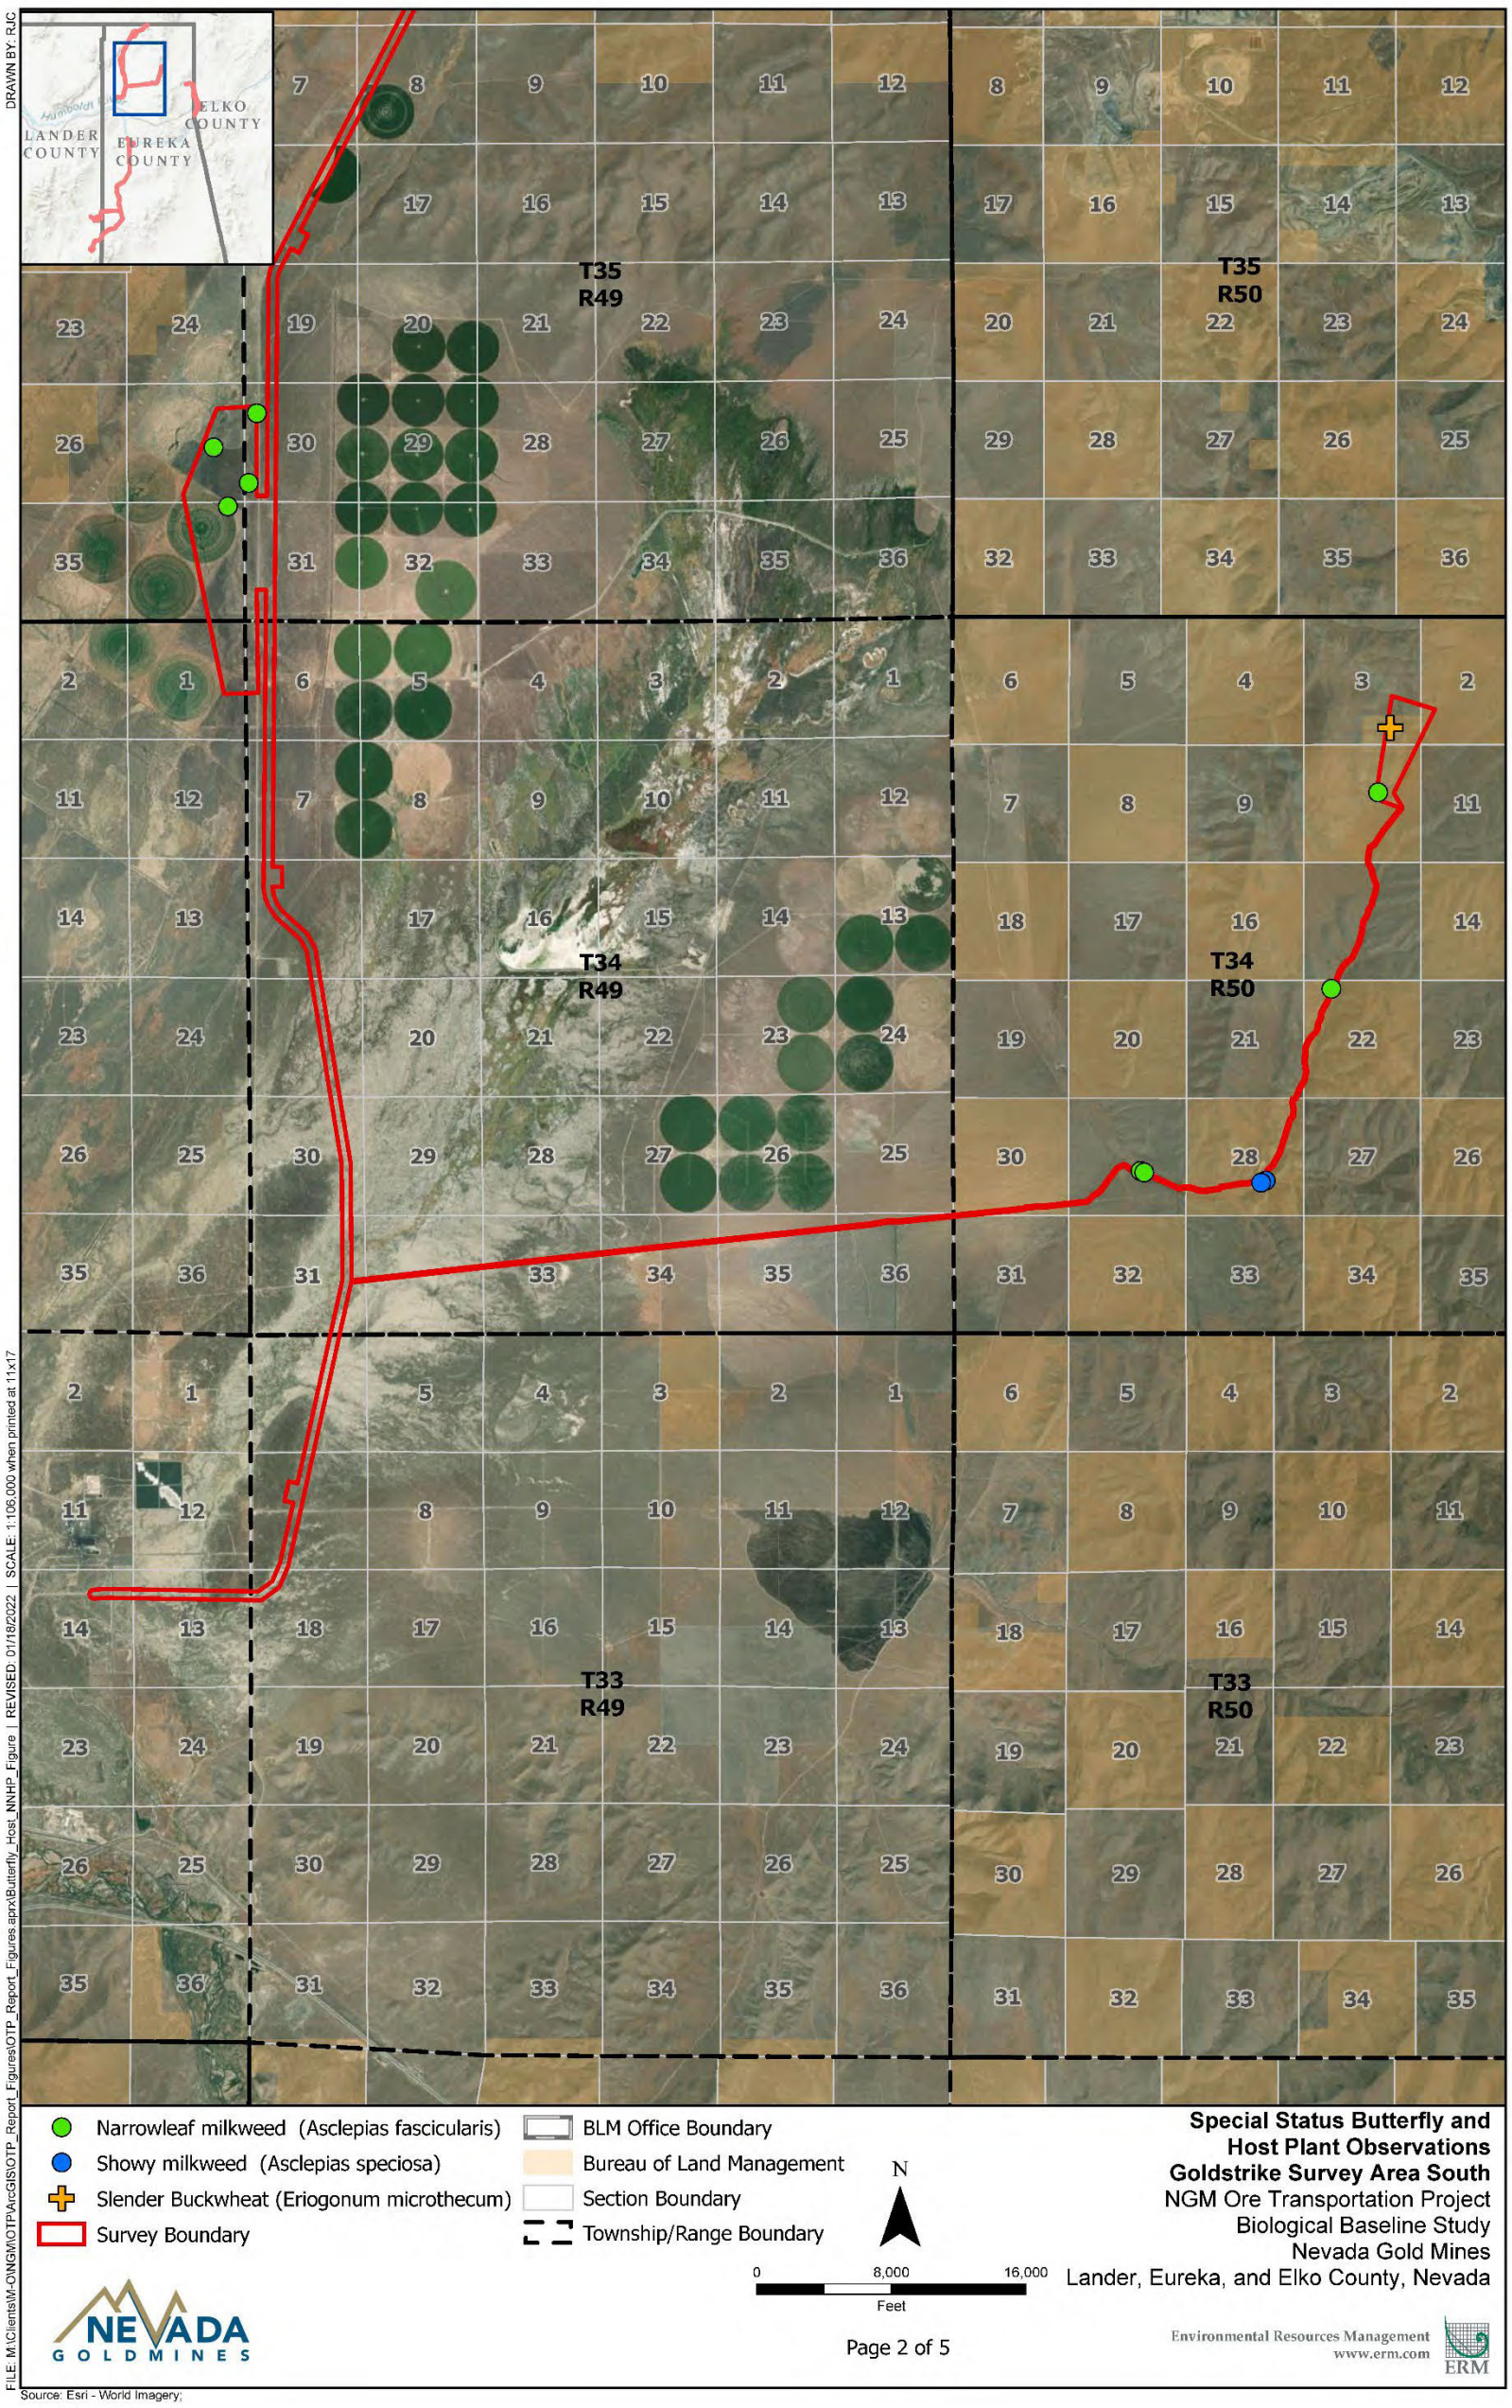

Figure 3.4.12-2: Special Status Butterflies and Host Plants Observations—Goldstrike Survey Area South

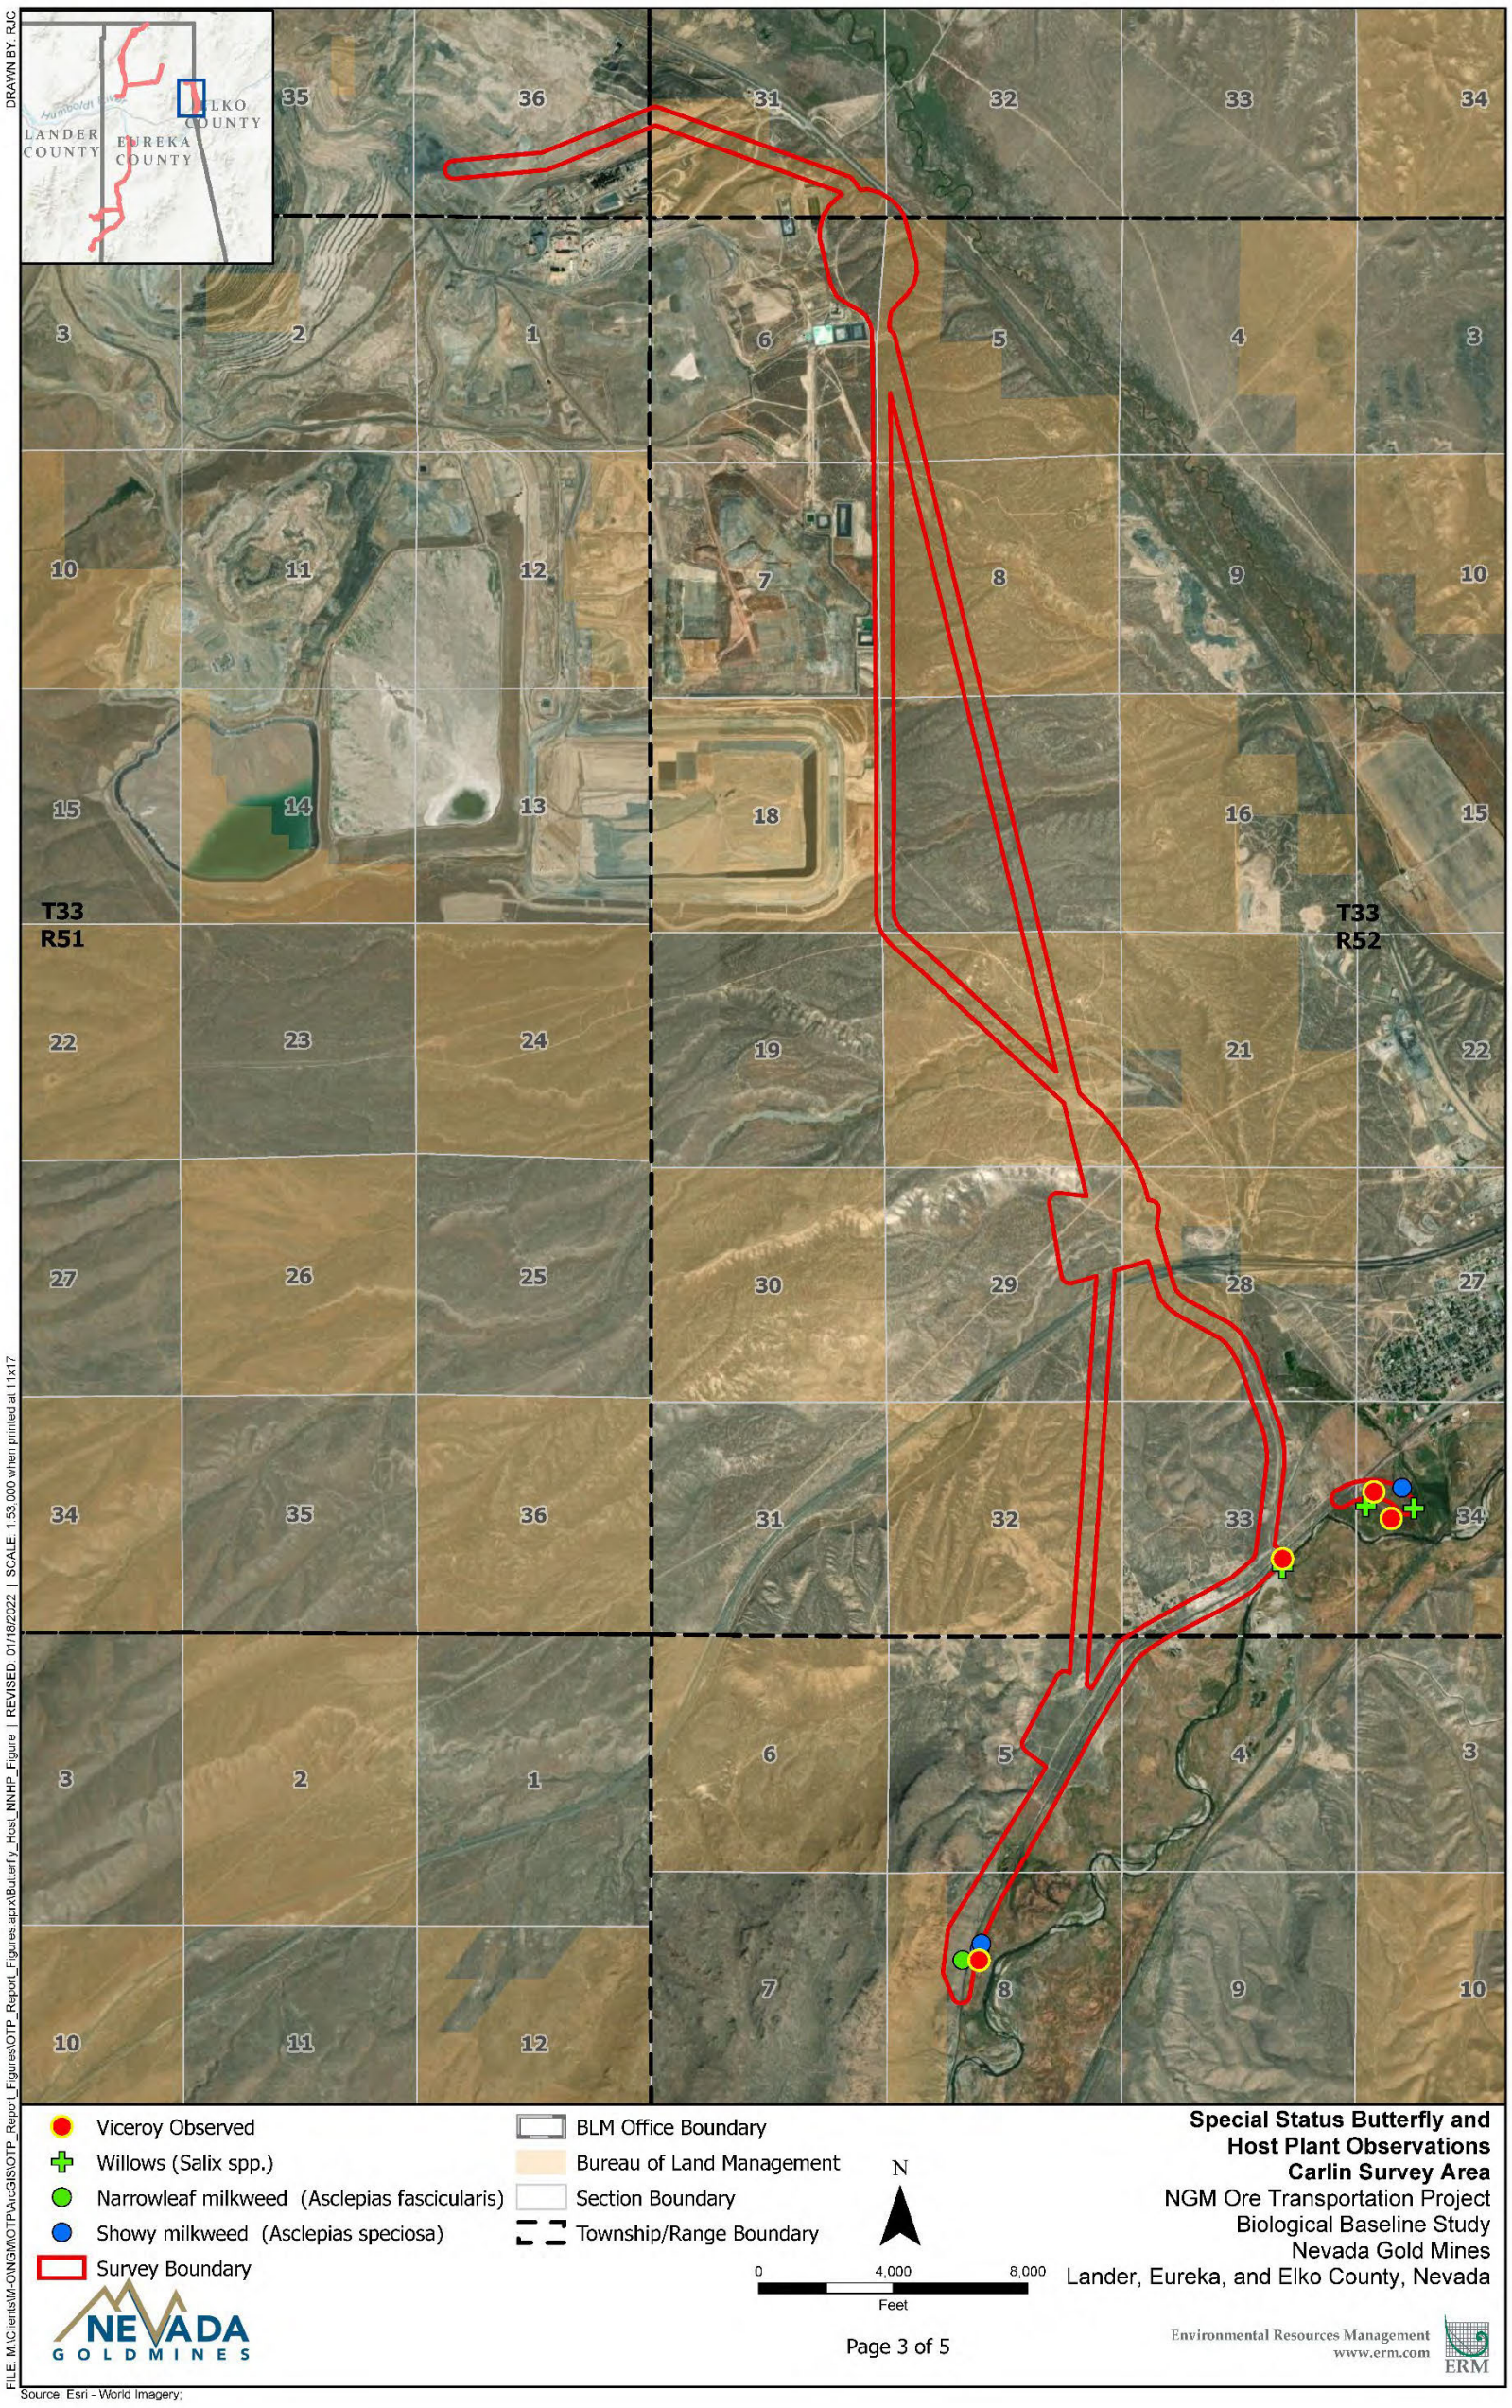

Figure 3.4.12-3: Special Status Butterflies and Host Plants Observations—Carlin Survey Area

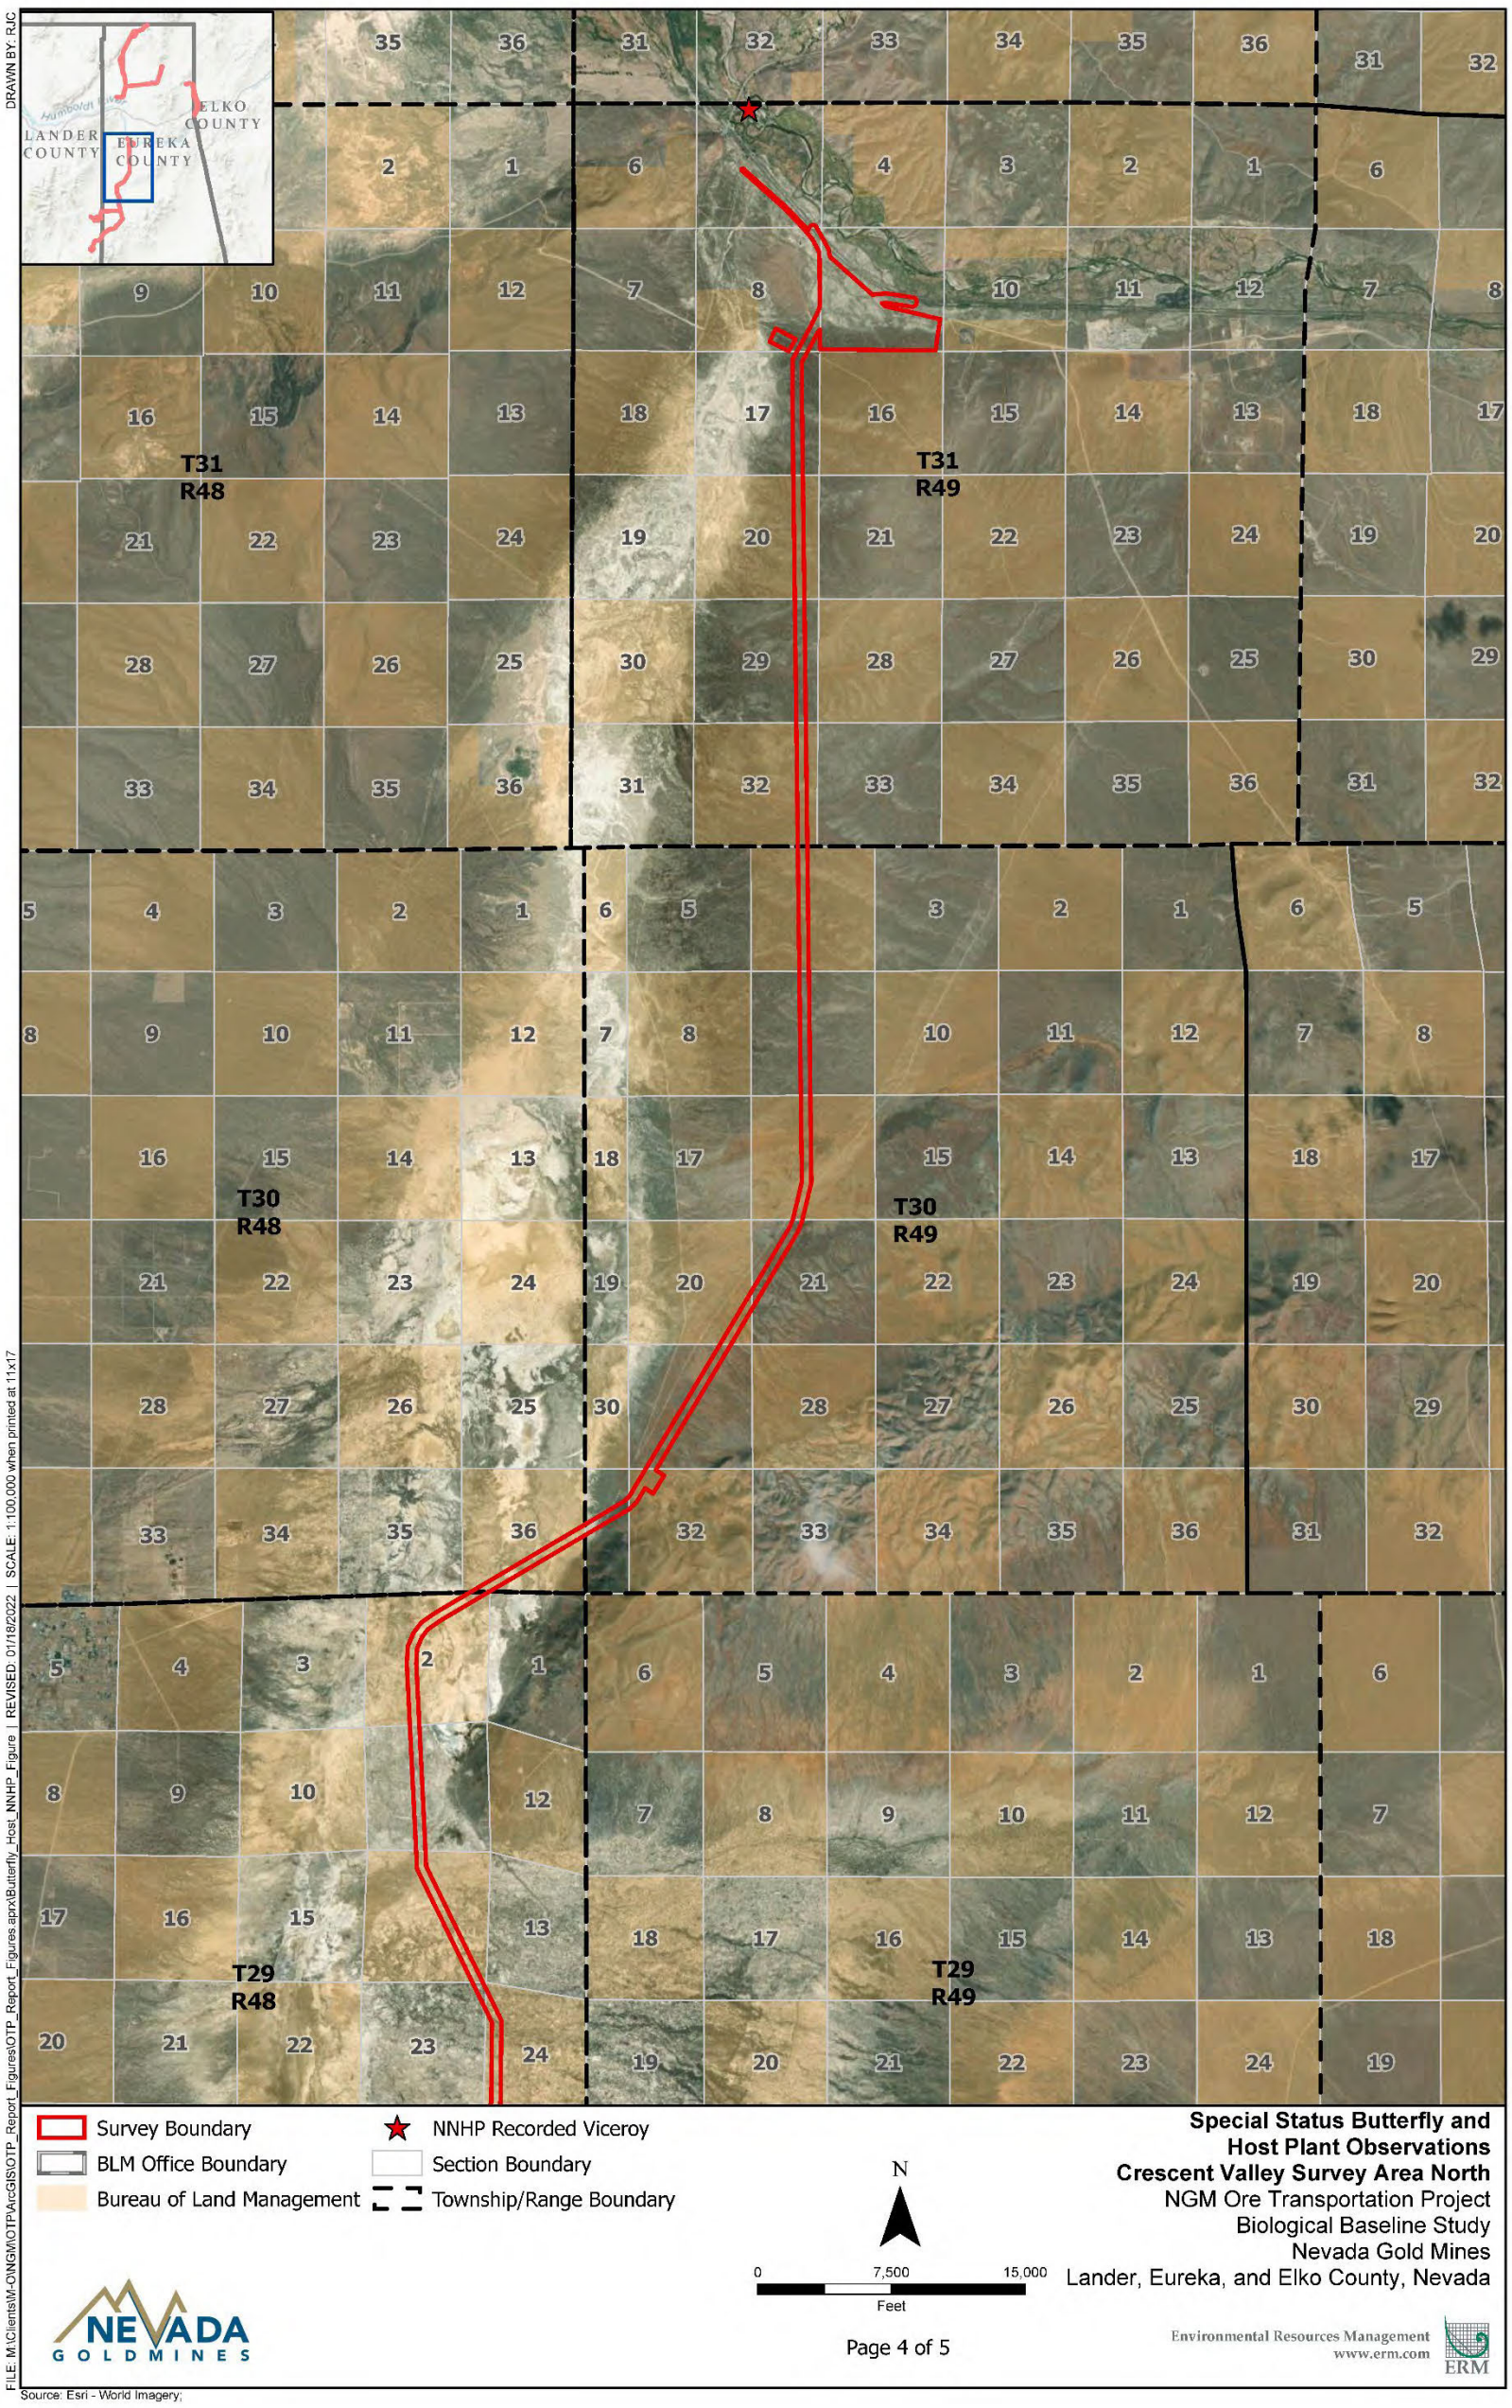

Figure 3.4.12-4: Special Status Butterflies and Host Plants Observations—Crescent Valley Survey Area North

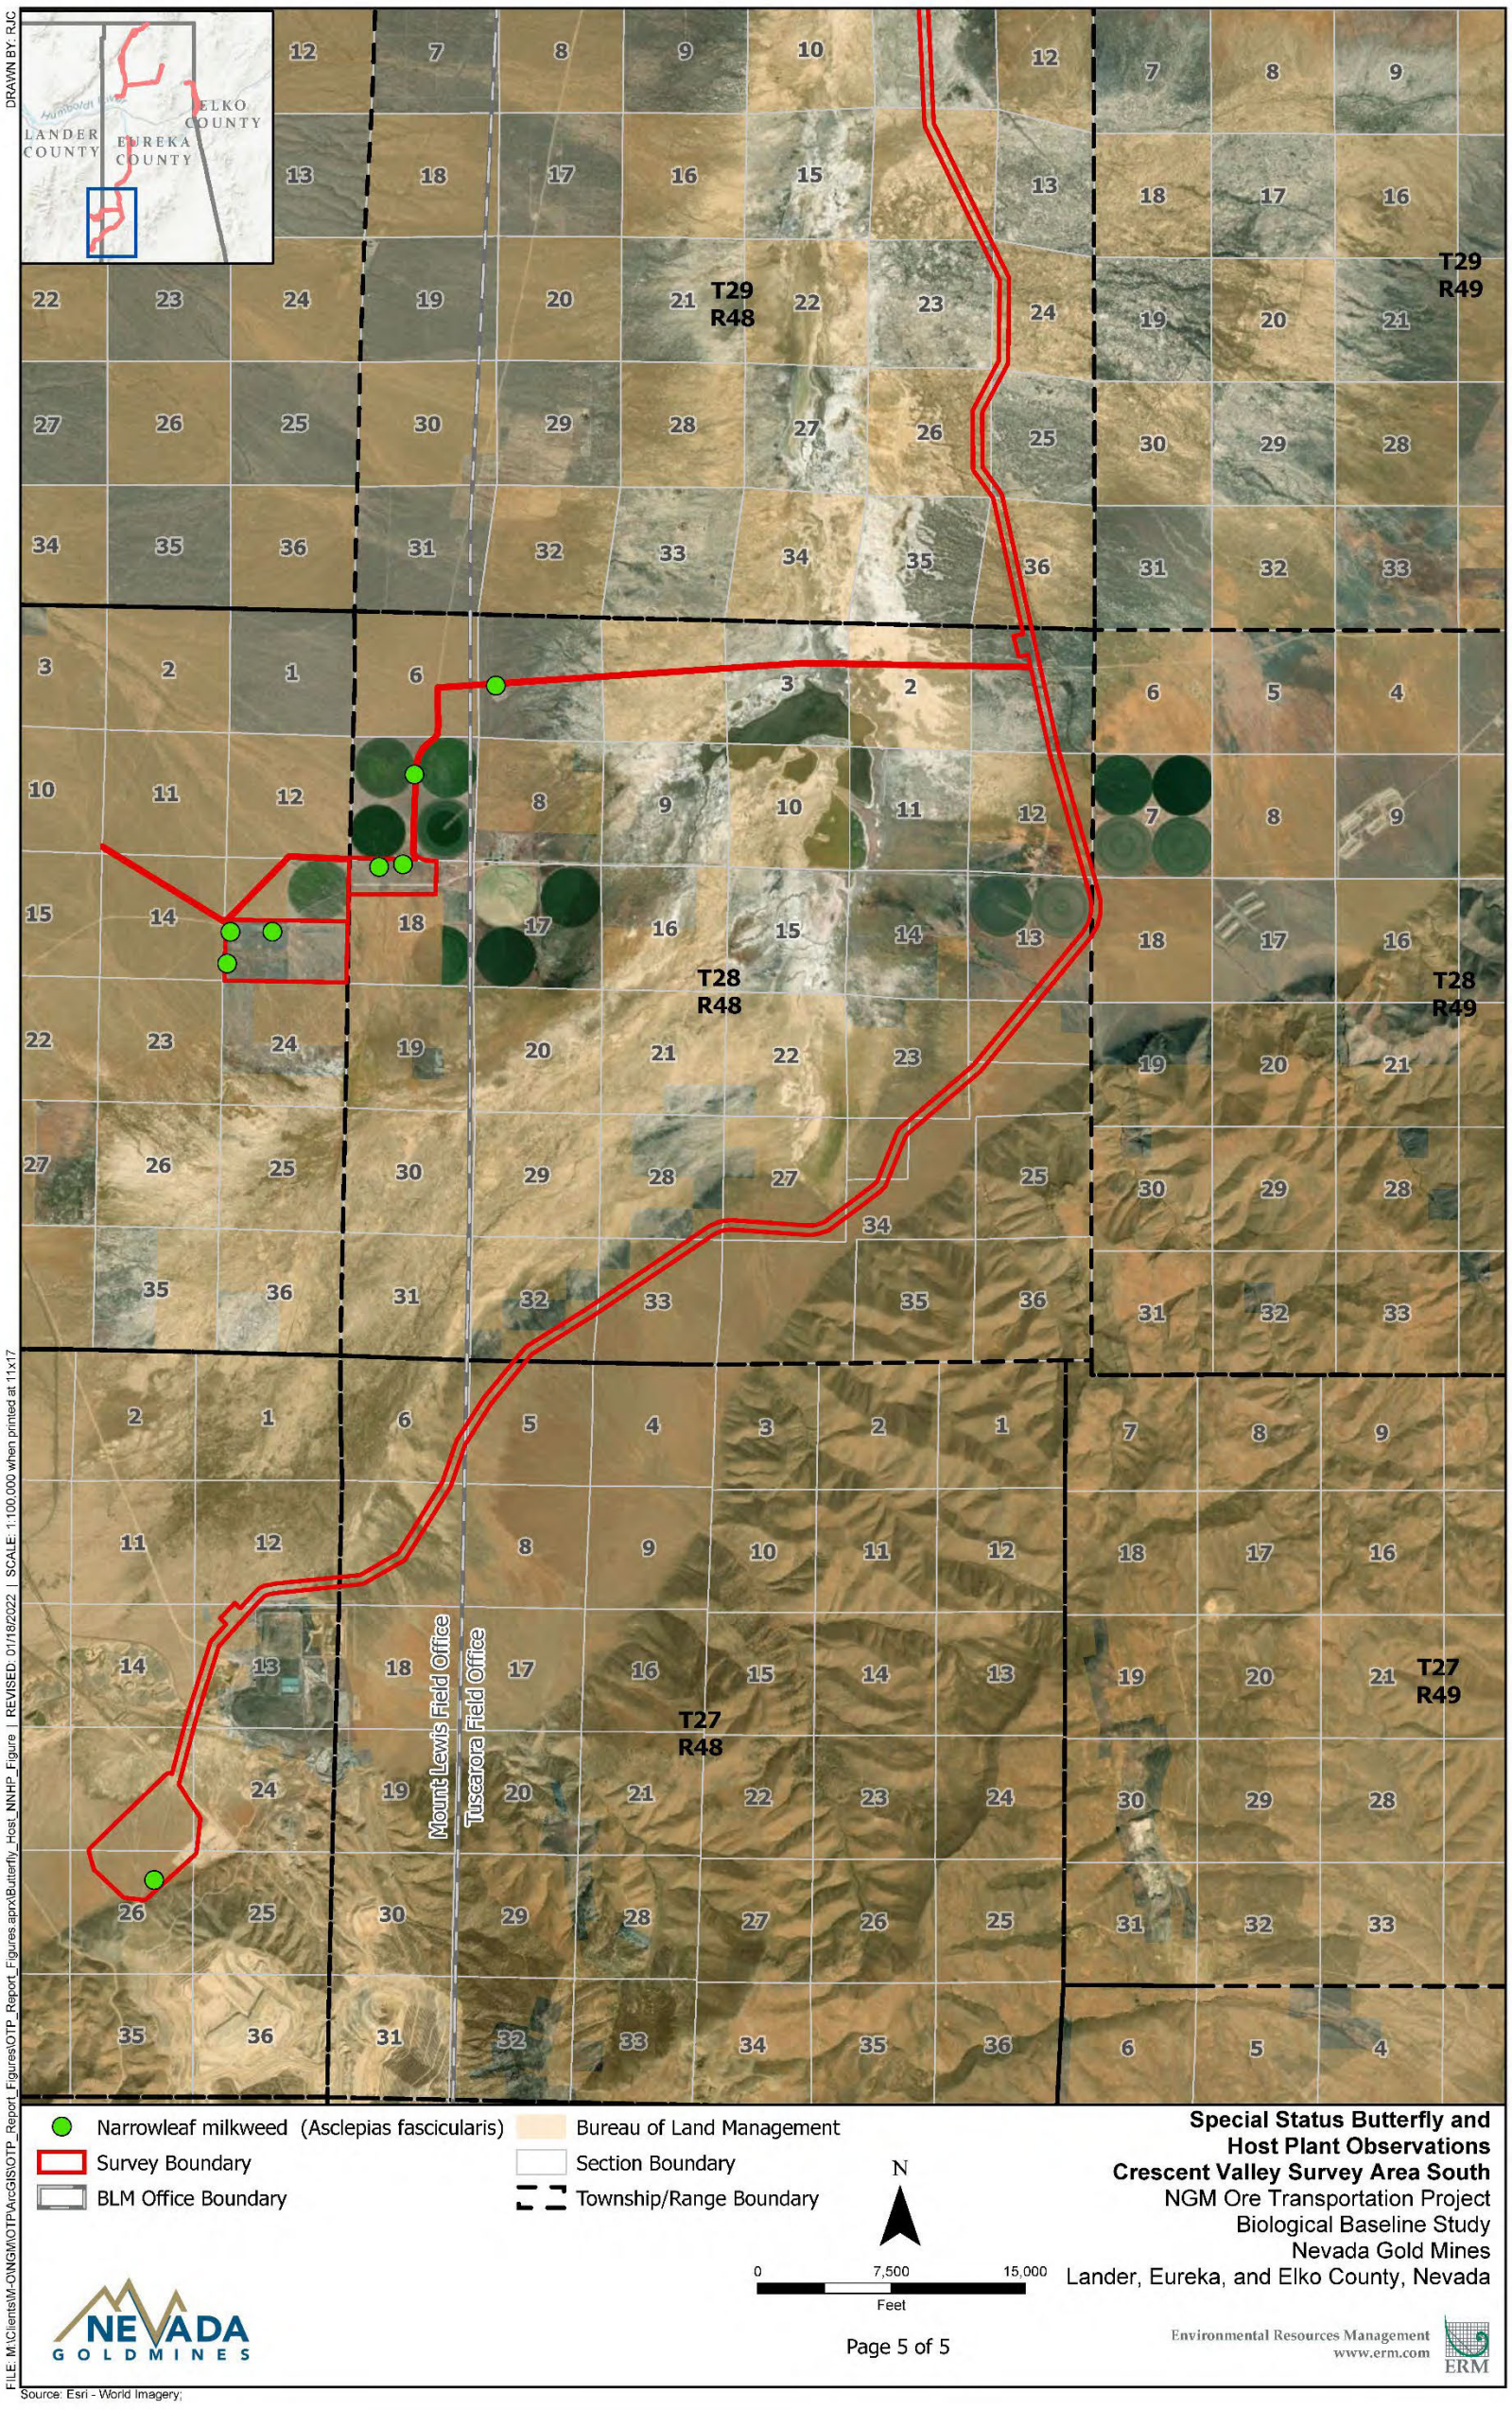

Figure 3.4.12-5: Special Status Butterflies and Host Plants Observations—Crescent Valley Survey Area South

Page Intentionally Left Blank.

Several other butterfly species with no special status were observed across the Project Area. Butterfly observations were greatest in wetlands and wet meadows near the Humboldt River in the Carlin Survey Area. Checkered white *(Pontia protodice*), cabbage white *(Pieris rapae*), orange sulfurs *(Colias eurytheme*), Great Basin wood nymph *(Cercyonis sthenele*), ruddy copper (*Lycaena rubidus*), purplish copper (L*ycaena helloides)*, and western tiger swallowtail (*Papilio rutulus*) butterflies and white-lined sphinx (*Hyles lineata*) were observed in this survey area.

Checkered white and cabbage white butterflies were observed throughout the Goldstrike Survey Area in low numbers. Spring white butterflies (*Pontia sisymbrii*) and one northern blue butterfly (*Heliopetes ericetorum*) were observed in Welch Creek Canyon, just outside the Goldstrike Survey Area.

Checkered white, cabbage whites, and orange sulfur butterflies were observed near agricultural pivot fields in the Crescent Valley Survey Area; however, overall there were few butterfly observations in this Survey Area.

A.1. ECOLOGICAL SITE DESCRIPTIONS

Table A.1-1 contains the ecological site, soil map unit for each of the Southwest Regional GAP (SWreGAP) land cover types and ecological site identification (ID) (Ecological Site Descriptions [ESD] survey and soil pit location). Figure A.7-1 through Figure A.7-3 show the location of the Ecological Site ID, soil map unit symbol (MUSYM), and SWreGAP land cover type.

Table A.1-1: Ecological Site Descriptions and Soil Map Unit Acres in each Southwest Regional GAP Land Cover Type

Ecological Site Description	Soil Map Unit Symbol	Southwest Regional GAP Land Cover Type	Ecological Site ID	Project Area Acres			
				Carlin	Crescent Valley	Goldstrike	Total Acres
R024XY035NV	BM	Invasive Annual Grassland	BM_3			0.7	0.7
R024XY002NV	1041	Inter-Mountain Basins Mixed Salt Desert Scrub	1041_1		0.7		0.7
	1160	Inter-Mountain Basins Greasewood Flat	1160_1		10.2		10.2
	1165	Inter-Mountain Basins Big Sagebrush Shrubland	1165_1		32.6		32.6
	1165	Invasive Annual and Biennial Forbland	1165_2		0.9		0.9

A.4. PLANT SPECIES LIST

Table A.4-1 through Table A.4-4 list the plant species observed during the ecological site and integrated rangeland health field surveys. Data sheets and photos are in Appendix A.8.

Table A.4-1: Tuscarora Field Office Goldstrike Survey Area Ecological Site Survey Plant Species

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
• Cheatgrass (*Bromus tectorum*) • Japanese brome (*Bromus japonicus*)	• Basin wildrye (*Leymus cinereus*) • Bluegrass (*Poa* spp.) • Bluebunch wheatgrass (*Pseudoroegneria spicata*) • Bottlebrush squirreltail (*Elymus elymoides*) • Crested wheatgrass (*Agropyron cristatum*) • Cultivated hay • Desert saltgrass (*Distichlis spicata*) • Indian ricegrass (*Achnatherum hymenoides*) • Sandberg bluegrass (*Poa secunda*) • Slender wheatgrass (*Elymus trachycauls*) • Tall wheatgrass (*Thinopyrum ponticum*) • Thurber's neeedlegrass (*Stipa thureriana*)	• Blue mustard (*Chorispora tenella*) • Brown-eyed primrose (*Chylismia claviformis*) • Bull thistle (*Cirsium vulgare*) • Bur buttercup (*Ceratocephala testiculata*) • Burning bush (*Bassia scoparia*) • Clasping pepperweed (*Lepidium perfoliatum*) • Fleabane (*Erigeron* spp.) • Halogeton (*Halogeton glomeratus*) • Lewis flax (*Linum lewisii*) • Mustard(s) (*Brassica* spp.) • Pepperweed (*Lepidium* spp.) • Prickly lettuce (*Lactuca serriola*) • Prostrate mustard (*Hornungia procumbens*) • Russian thistle (*Salsola kali*) • Storksbill (*Erodium cicutarium*)	• Alfalfa (*Medicago sativa*) • Arrowleaf balsamroot (*Balsamorhiza sagittata*) • Broad-leaved pepperweed (Lepidium latifolium) • Daggerpod (*Anelsonia eurycarpa*) • Fringed puccoon (*Lithospermum incisum*) • Hawksbeard (*Crepis acuminata*) • Hoary cress (*Cardaria draba*) • Globemallow (*Sphaeralcea spp.*) • Knapweed (*Centaurea spp.*) • Lupine (*Lupinus spp.*) • Poverty weed (*Iva axillaris*) • Silvery lupine (*Lupinus argenteus*) • Western stoneseed (*Lithospermum ruderale*)	• Big sagebrush (*Artemisia tridentata*) • Bitterbrush (*Purshia tridentata*) • Dead shrubs • Four-wing saltbush (*Atriplex canescens*) • Greasewood (*Sarcobatus vermiculatus*) • Green rabbitbrush (*Ericameria teretifolia*) • Low sagebrush (*Artemisia arbuscula*) • Rubber rabbitbrush (*Ericameria nauseosa*) • Shadscale (*Atriplex confertifolia*) • Utah serviceberry (*Amelanchier utahensis*) • Winterfat (*Krascheninnikovia lanata*) • Yellow rabbitbrush (*Chrysothamnus viscidiflorus*)

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
		• Tansy mustard (*Descurainia pinnata*) • Tumble mustard (*Sisymbrium altissimum*) • Western salsify (*Tragopogon dubius*) • Wooly star (*Eriastrum densifolium*)		

Table A.4-2: Tuscarora Field Office Carlin Survey Area Ecological Site Survey Plant Species

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
• Cheatgrass (*Bromus tectorum*) • Japanese brome (*Bromus japonicus*)	• Basin wildrye (*Leymus cinereus*) • Bluegrass (*Poa* spp.) • Bluebunch wheatgrass (*Pseudoroegneria spicata*) • Bottlebrush squirreltail (*Elymus elymoides*) • Crested wheatgrass (*Agropyron cristatum*) • Cultivated hay • Desert saltgrass (*Distichlis spicata*) • Indian ricegrass (*Achnatherum hymenoides*) • Sandberg bluegrass (*Poa secunda*) • Slender wheatgrass (*Elymus trachycauls*) • Tall wheatgrass (*Thinopyrum ponticum*) • Thurber's neeedlegrass (*Stipa thureriana*)	• Blue mustard (*Chorispora tenella*) • Brown-eyed primrose (*Chylismia claviformis*) • Bull thistle (*Cirsium vulgare*) • Bur buttercup (*Ceratocephala testiculata*) • Burning bush (*Bassia scoparia*) • Clasping pepperweed (*Lepidium perfoliatum*) • Fleabane (*Erigeron* spp.) • Halogeton (*Halogeton glomeratus*) • Lewis flax (*Linum lewisii*) • Mustard(s) (*Brassica* spp.) • Pepperweed (*Lepidium* spp.) • Prickly lettuce (*Lactuca serriola*) • Prostrate mustard (*Hornungia procumbens*)	• Alfalfa (*Medicago sativa*) • Arrowleaf balsamroot (*Balsamorhiza sagittata*) • Broad-leaved pepperweed (*Lepidium latifolium*) • Daggerpod (*Anelsonia eurycarpa*) • Fringed puccoon (*Lithospermum incisum*) • Hawksbeard (*Crepis acuminata*) • Hoary cress (*Cardaria draba*) • Globemallow (*Sphaeralcea spp.*) • Knapweed (*Centaurea spp.*) • Lupine (*Lupinus spp.*) • Poverty weed (*Iva axillaris*) • Silvery lupine (*Lupinus argenteus*) • Western stoneseed (*Lithospermum ruderale*)	• Big sagebrush (*Artemisia tridentata*) • Bitterbrush (*Purshia tridentata*) • Dead shrubs • Four-wing saltbush (*Atriplex canescens*) • Greasewood (*Sarcobatus vermiculatus*) • Green rabbitbrush (*Ericameria teretifolia*) • Low sagebrush (*Artemisia arbuscula*) • Rubber rabbitbrush (*Ericameria nauseosa*) • Shadscale (*Atriplex confertifolia*) • Utah serviceberry (*Amelanchier utahensis*) • Winterfat (*Krascheninnikovia lanata*)

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
		• Russian thistle (*Salsola kali*) • Storksbill (*Erodium cicutarium*) • Tansy mustard (*Descurainia pinnata*) • Tumble mustard (*Sisymbrium altissimum*) • Western salsify (*Tragopogon dubius*) • Wooly star (*Eriastrum densifolium*)		• Yellow rabbitbrush (*Chrysothamnus viscidiflorus*)

Table A.4-3: Tuscarora Field Office Crescent Valley Survey Area Ecological Site Plant Species Survey

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
• Cheatgrass (*Bromus tectorum*) • wheatgrass (*Eremopyrum triticeum*)	• Alkali sacaton (*Sporobolus airoides*) • Basin wildrye (*Leymus cinereus*) • Bluegrass (*Poa* spp.) • Bluebunch wheatgrass (*Pseudoroegneria spicata*) • Bottlebrush squirreltail (*Elymus elymoides*) • Crested wheatgrass (*Agropyron cristatum*) • Saltgrass (*Distichlis spicata*) • Indian ricegrass (*Achnatherum hymenoides*) • Sandberg bluegrass (*Poa secunda*) • Western wheatgrass (*Pascopyrum smithii*)	• Blue mustard (*Chorispora tenella*) • Brown-eyed primrose (*Chylismia claviformis*) • Bull thistle (*Cirsium vulgare*) • Bur buttercup (*Ceratocephala testiculata*) • Burning bush (*Bassia scoparia*) • Clasping pepperweed (*Lepidium perfoliatum*) • Fleabane (*Erigeron* spp.) • Halogeton (*Halogeton glomeratus*) • lambsquarters (*Chenopodium album*) • Mustard(s) (*Brassica* spp.) • Pepperweed (*Lepidium* spp.)	• Alfalfa (*Medicago sativa*) • Arrowleaf balsamroot (*Balsamorhiza sagittata*) • Broad-leaved pepperweed (*Lepidium latifolium*) • Daggerpod (*Anelsonia eurycarpa*) • Fringed puccoon (*Lithospermum incisum*) • Hawksbeard (*Crepis acuminata*) • Whitetop (*Cardaria draba*) • Globemallow (*Sphaeralcea* spp.) • Knapweed (*Centaurea* spp.) • Lupine (*Lupinus* spp.) • Poverty weed (*Iva axillaris*)	• Big sagebrush (*Artemisia tridentate*) • Bitterbrush (*Purshia tridentate*) • Black sagebrush (*Artemisia nova*) • Budsage (*Artemisia frigida*) • Dead shrubs • Four-wing saltbush (*Atriplex canescens*) • Greasewood (*Sarcobatus vermiculatus*) • Green rabbitbrush (*Ericameria teretifolia*) • Littleleaf horsebrush (*Tetradymia glabrata*) • Low sagebrush (*Artemisia arbuscula*)

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
		• Prickly lettuce (*Lactuca serriola*) • Russian thistle (*Salsola kali*) • Storksbill (*Erodium cicutarium*) • Tansy mustard (*Descurainia pinnata*) • Tumble mustard (*Sisymbrium altissimum*) • Wooly star (*Eriastrum densifolium*)	• Mountain pepperweed (*Lepidium montanum*) • Western stoneseed (*Lithospermum ruderale*) • Yarrow (*Achillea millefolium*)	• Pickleweed (*Allenrolfea occidentalis*) • Rubber rabbitbrush (*Ericameria nauseosa*) • Shadscale (*Atriplex confertifolia*) • Shortspine horsebrush (*Tetradymia spinose*) • Spiny hopsage (*Grayia spinose*) • Utah serviceberry (*Amelanchier utahensis*) • Winterfat (*Krascheninnikovia lanata*) • Yellow rabbitbrush (*Chrysothamnus viscidiflorus*) • Broom snakeweed (*Gutierrezia sarothrae*) • Tamarisk (*Tamarix* ssp.)

Table A.4-4: Mount Lewis Field Office Crescent Valley Survey Area Ecological Site Survey Plant Species

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
• Cheatgrass (*Bromus tectorum*) • wheatgrass (*Eremopyrum triticeum*)	• Alkali sacaton (*Sporobolus airoides*) • Basin wildrye (*Leymus cinereus*) Bluegrass (*Poa* spp.) • Bluebunch wheatgrass (*Pseudoroegneria spicata*) • Bottlebrush squirreltail (*Elymus elymoides*)	• Blue mustard (*Chorispora tenella*) • Brown-eyed primrose (*Chylismia claviformis*) • Bull thistle (*Cirsium vulgare*) • Bur buttercup (*Ceratocephala testiculata*)	• Alfalfa (*Medicago sativa*) • Arrowleaf balsamroot (*Balsamorhiza sagittata*) • Broad-leaved pepperweed (*Lepidium latifolium*) • Daggerpod (*Anelsonia eurycarpa*) • Fringed puccoon (*Lithospermum incisum*)	• Big sagebrush (*Artemisia tridentate*) • Bitterbrush (*Purshia tridentate*) • Black sagebrush (*Artemisia nova*) • Budsage (*Artemisia frigida*) • Dead shrubs (species undetermined)

Annual Grasses	Perennial Grasses	Annual Forbs	Perennial Forbs	Shrubs
	• Crested wheatgrass (*Agropyron cristatum*) • Saltgrass (*Distichlis spicata*) • Indian ricegrass (*Achnatherum hymenoides*) • Sandberg bluegrass (*Poa secunda*) • Western wheatgrass (*Pascopyrum smithii*)	• Burning bush (*Bassia scoparia*) • Clasping pepperweed (*Lepidium perfoliatum*) • Fleabane (*Erigeron* spp.) • Halogeton (*Halogeton glomeratus*) • Lambsquarters (*Chenopodium album*) • Mustard(s) (*Brassica* spp.) • Pepperweed (*Lepidium* spp.) • Prickly lettuce (*Lactuca serriola*) • Russian thistle (*Salsola kali*) • Storksbill (*Erodium cicutarium*) • Tansy mustard (*Descurainia pinnata*) • Tumble mustard (*Sisymbrium altissimum*) • Wooly star (*Eriastrum densifolium*)	• Hawksbeard (*Crepis acuminata*) • Whitetop (*Cardaria draba*) • Globemallow (*Sphaeralcea* spp.) • Knapweed (*Centaurea* spp.) • Lupine (*Lupinus* spp.) • Poverty weed (*Iva axillaris*) • Mountain pepperweed (*Lepidium montanum*) • Western stoneseed (*Lithospermum ruderale*) • Yarrow (*Achillea millefolium*)	• Four-wing saltbush (*Atriplex canescens*) • Greasewood (*Sarcobatus vermiculatus*) • Green rabbitbrush (*Ericameria teretifolia*) • Littleleaf horsebrush (*Tetradymia glabrata*) • Low sagebrush (*Artemisia arbuscula*) • Pickleweed (*Allenrolfea occidentalis*) • Rubber rabbitbrush (*Ericameria nauseosa*) • Shadscale (*Atriplex confertifolia*) • Shortspine horsebrush (*Tetradymia spinose*) • Spiny hopsage (*Grayia spinose*) • Utah serviceberry (*Amelanchier utahensis*) • Winterfat (*Krascheninnikovia lanata*) • Yellow rabbitbrush (*Chrysothamnus viscidiflorus*) • Broom snakeweed (*Gutierrezia sarothrae*) • Tamarisk (*Tamarix* ssp.)

A.5. STATE AND TRANSITION

Table A.5-1 through Table A.5-4 list the state-and-transition community phase for each of the ecological site ID (ESD and soil survey location). Figure A.7-1 through Figure A.7-3 show the location of each of the ecological site IDs and the community phase. Data sheets and photos are in Appendix A.8.

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.96 miles southwest of the Cortez Mine, mile marker 4.6 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.324945 N. Latitude
Section 1/4 Section		m		-116.598285 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock

Offsite influences: Roads, pivots, ranch residence near survey area. Mine site within general proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *1041_1* **Date:** *May 20, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

1. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.
2. Observe and list the F/S groups present in the evaluation area.
3. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in the evaluation area.
4. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the **Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.
5. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.
6. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Indian ricegrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*4*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

					2	*6 - 16 cm*	*Silty Clay Loam*		*Dry 10YR5/3; moist 10YR3/4, some blocky structure, extremely gravelly, medium roots throughout*
					3	*16 - 34 cm*	*Silty Clay Loam*		*Dry 10YR5/4; moist 10YR3/6, gravelly; fine gravel, medium roots throughout*
					4	*34 - 53 cm*	*Silty Clay Loam*		*Dry 10YR7/4; moist 10YR3/6, subangular blockiness, smooth appearance, some fine roots*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.4 miles south of the Cortez Mine, mile marker 3.8 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.233867 N. Latitude
Section 1/4 Section		m		-116.597538 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Mine site	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *1160_1* **Date:** *June 4, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

7. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.
8. Observe and list the F/S groups present in the evaluation area.
9. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in the evaluation area.
10. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the **Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.
11. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.
12. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Small annual forbs*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_1165_1* **Date:** *May 19, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

13. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.
14. Observe and list the F/S groups present in the evaluation area.
15. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.
16. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.
17. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.
18. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Desert mallow*
Non-sprouting shrubs	*Big sagebrush, Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Ranch, pivots, roads	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_1165_2* **Date:** *May 19, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

19. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

20. Observe and list the F/S groups present in the evaluation area.

21. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

22. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

23. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

24. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Annual false wheatgrass, Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *1165_3* **Date:** *May 19, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

25. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

26. Observe and list the F/S groups present in the evaluation area.

27. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

28. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

29. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

30. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Indian ricegrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Lambs quarter, Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*4*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_1165_4* **Date:** *May 19, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

31. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.
32. Observe and list the F/S groups present in the evaluation area.
33. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.
34. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.
35. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.
36. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Desert mallow*
Non-sprouting shrubs	*Big sagebrush, Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	*Plains prickly pear*
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*4*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Cortez Mine, mile marker 1.5 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.296383 N. Latitude
Section 1/4 Section		m		-116.623565 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, wildlife

Offsite influences: Mine site, access road, pivot, pipeline, powerlines

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes

Reference community phase/description[3]: 3.1 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *1165_5* **Date:** *June 15, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

37. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

38. Observe and list the F/S groups present in the evaluation area.

39. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

40. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

41. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

42. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_1169_1* **Date:** *June 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Other*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

43. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

44. Observe and list the F/S groups present in the evaluation area.

45. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

46. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

47. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

48. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Indian ricegrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Blue mustard, Halogeton, Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*5*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

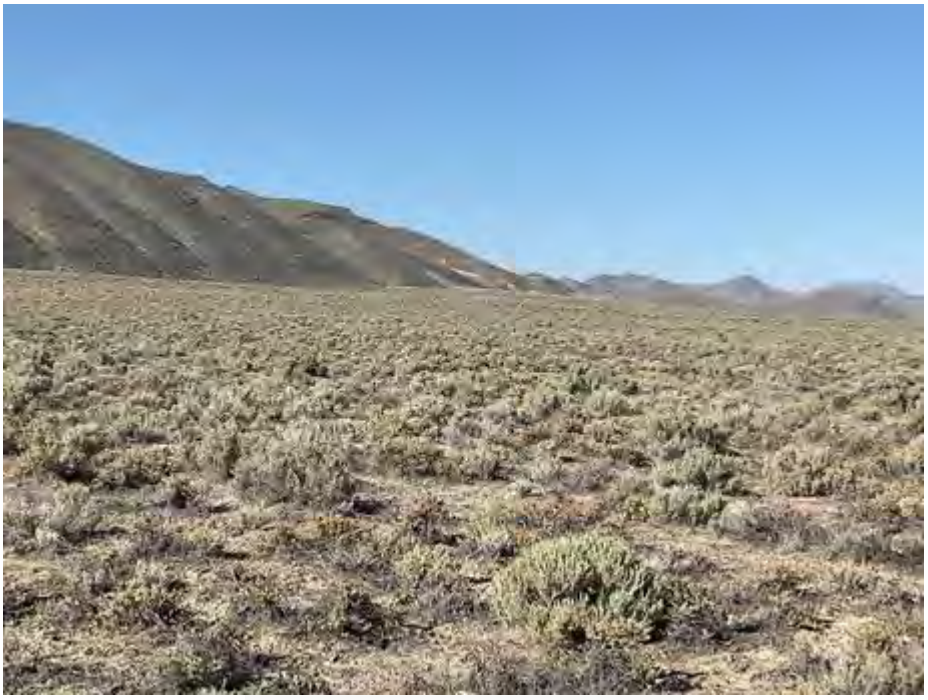

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Cortez Mine, mile marker 0.0 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.191734 N. Latitude
Section 1/4 Section		m		-116.6468 W. Longitude

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock, mining	
Offsite influences: Access roads, mining activity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *1169_2* **Date:** *June 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

49. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

50. Observe and list the F/S groups present in the evaluation area.

51. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

52. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

53. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

54. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *2.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*4*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *1169_3* **Date:** *June 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

55. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

56. Observe and list the F/S groups present in the evaluation area.

57. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

58. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

59. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

60. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Shadscale*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Burr buttercup*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Cortez Mine, mile marker 0.0 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.182897 N. Latitude
Section 1/4 Section		m		-116.646473 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock, mining

Offsite influences: Access roads, mining activity, reclamation area

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes
Reference community phase/description[3]: 3.2 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *1169_4* **Date:** *June 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

61. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

62. Observe and list the F/S groups present in the evaluation area.

63. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

64. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

65. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

66. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *1600_1* **Date:** *June 2, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

67. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

68. Observe and list the F/S groups present in the evaluation area.

69. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

70. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

71. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

72. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Commmunity Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Annual false wheatgrass, Cheatgrass*

Perennial bunchgrass		
Cool-season perennial grasses		
Annual forbs	*Mustard*	
Sprouting succulent		
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*	
Number of expected F/S groups present[2] in evaluation area:		*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:		*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Cortez Mine, mile marker 2.4 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.219708 N. Latitude
Section 1/4 Section		m		-116.614433 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Mine site in close proximity, powerlines with access road	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_167_1* **Date:** *June 7, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

73. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

74. Observe and list the F/S groups present in the evaluation area.

75. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

76. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

77. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

78. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*

Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Cortez Mine, mile marker 3.1 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.224544 N. Latitude
Section 1/4 Section		m		-116.604838 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock

Offsite influences: Mine site in close proximity, fence line with access road	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _*167_3*_____ **Date:** *June 7, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

85. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

86. Observe and list the F/S groups present in the evaluation area.

87. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

88. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

89. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

90. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _*167_4*_____ **Date:** *June 2, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Nicole St John*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

91. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

92. Observe and list the F/S groups present in the evaluation area.

93. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

94. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

95. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

96. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Shadscale*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.73 miles south of the Cortez Mine, mile marker 4.1 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.238584 N. Latitude
Section 1/4 Section		m		-116.595573 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Mine site	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_169_1* **Date:** *June 4, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

97. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

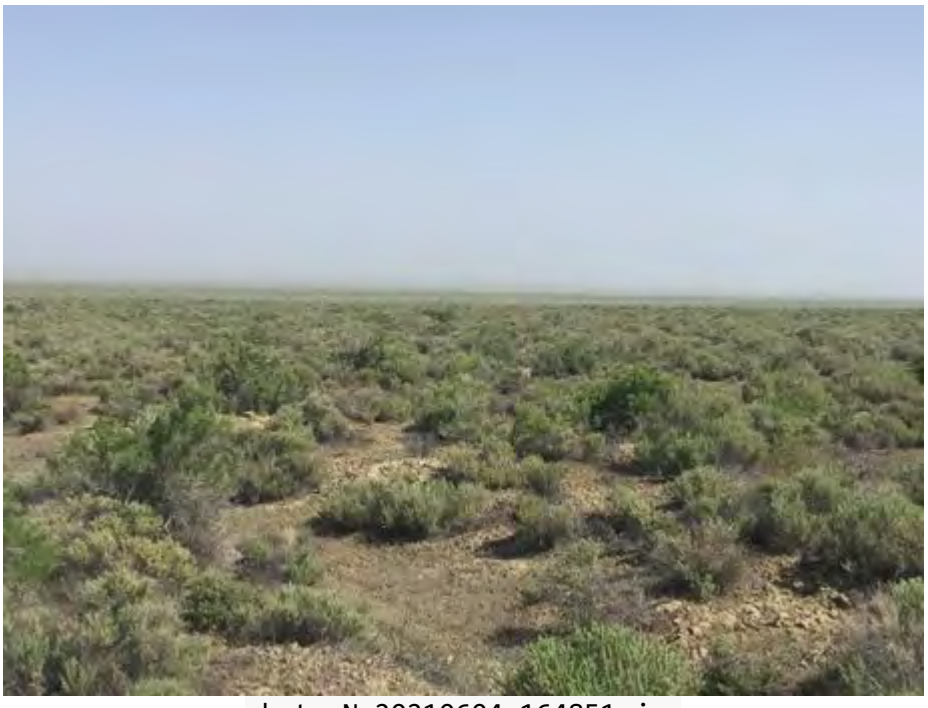
98. Observe and list the F/S groups present in the evaluation area.

99. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

100. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

101. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

102. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.



1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_192_1* **Date:** *June 11, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

109. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

110. Observe and list the F/S groups present in the evaluation area.

111. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

112. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

113. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

114. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Brown-eyed primrose, Mustard, Mustards, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_192_3* **Date:** *June 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

121. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

122. Observe and list the F/S groups present in the evaluation area.

123. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

124. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

125. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

126. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, agriculture, livestock	
Offsite influences: Pivot field in close association within survey site. Pipeline running along pivot edge	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_192_4* **Date:** *June 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

127. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

128. Observe and list the F/S groups present in the evaluation area.

129. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

130. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

131. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

132. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_192_5* **Date:** *June 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

133. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

134. Observe and list the F/S groups present in the evaluation area.

135. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

136. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

137. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

138. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Hopsage*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.95 miles west of the Cortez Mine, mile marker 10.8 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.29499 N. Latitude
Section 1/4 Section		m		-116.500696 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, agriculture, livestock	
Offsite influences: Pivot field in close association within survey site. Pipeline running along pivot edge	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_192_7* **Date:** *June 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

145. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

146. Observe and list the F/S groups present in the evaluation area.

147. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

148. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

149. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

150. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Hopsage*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.52 miles south of the Cortez Mine, mile marker 0.1 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.306018 N. Latitude	
Section 1/4 Section		m		-116.651466 W. Longitude	

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, wildlife

Offsite influences: Mine proximity, access roads

Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_2060_1* **Date:** *May 18, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

151. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

152. Observe and list the F/S groups present in the evaluation area.

153. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

154. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

155. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

156. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Desert mallow*
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Annual false wheatgrass, Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*4*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*5*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_2060_2* **Date:** *May 18, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

157. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

158. Observe and list the F/S groups present in the evaluation area.

159. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

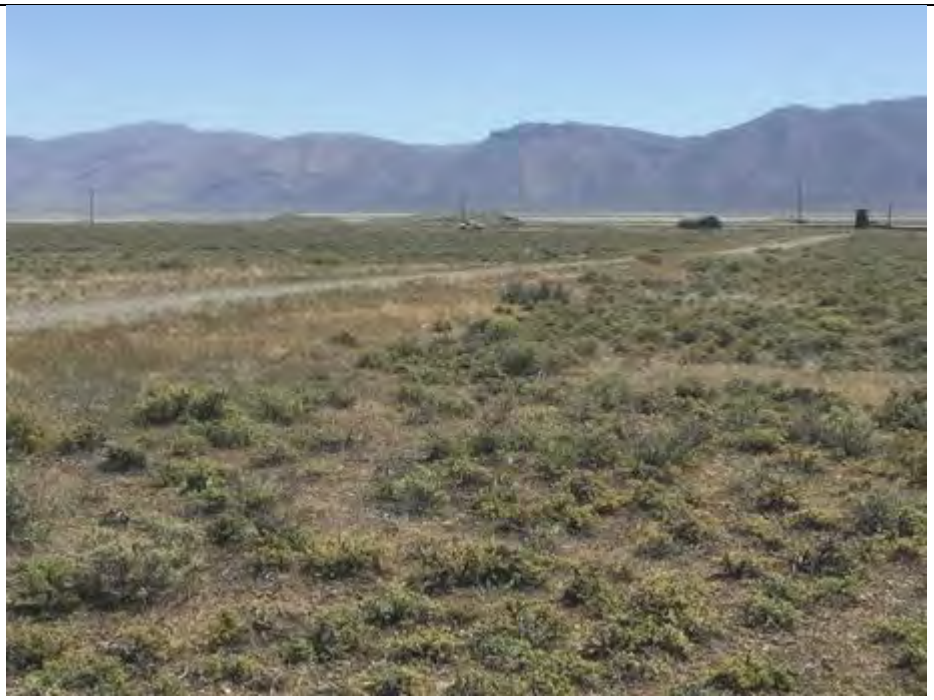
160. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

161. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

162. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Desert mallow*
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Annual false wheatgrass, Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*4*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*5*



[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.47 miles southwest of the Cortez Mine, mile marker 4.1 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.318063 N. Latitude
Section 1/4 Section		m		-116.601688 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, agriculture

Offsite influences: Pivot field of alfalfa, road	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_2060_3* **Date:** *May 20, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

163. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

164. Observe and list the F/S groups present in the evaluation area.

165. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

166. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

167. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

168. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Cultivated wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Alfalfa*
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Annual false wheatgrass, Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Mustards, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*0*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*

Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.09 miles south of the Cortez Mine, mile marker 1.5 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.29994 N. Latitude
Section 1/4 Section		m		-116.629535 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Mine site proximity, pipeline proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *3661_1* **Date:** *May 18, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

175. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

176. Observe and list the F/S groups present in the evaluation area.

177. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

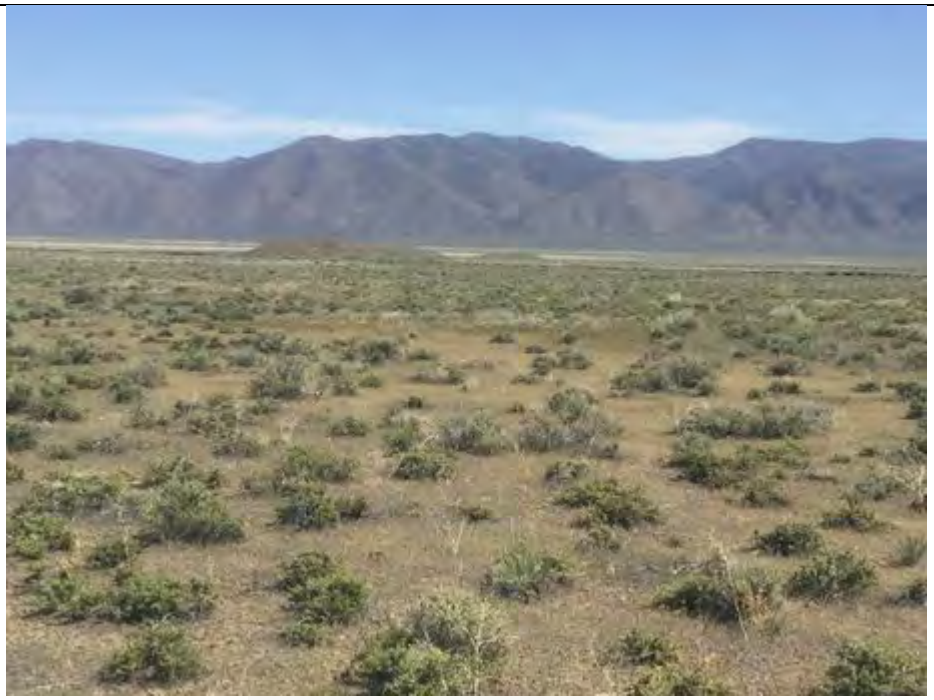
178. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

179. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

180. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Desert mallow*
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*4*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*5*



[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *3661_2* **Date:** *May 18, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

181. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

182. Observe and list the F/S groups present in the evaluation area.

183. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

184. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

185. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

186. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.54 miles south of the Cortez Mine, mile marker 0.0 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.306417 N. Latitude
Section 1/4 Section		m		-116.652693 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, wildlife, and anthropogenic use	
Offsite influences: Mine site proximity, highway proximity, access roads	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *3661_3* **Date:** *May 19, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

187. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

188. Observe and list the F/S groups present in the evaluation area.

189. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

190. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

191. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

192. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Budsage, Shadscale*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*5*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*6*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

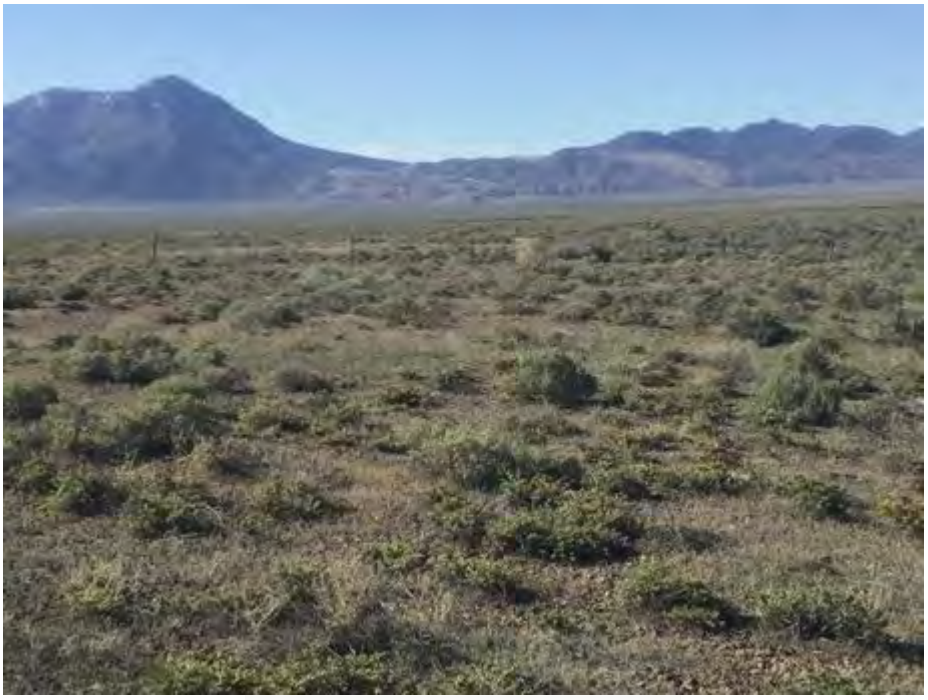

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_3661_4* **Date:** *June 15, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

193. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

194. Observe and list the F/S groups present in the evaluation area.

195. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

196. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

197. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

198. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**

					1	*0 - 4 cm*	*Loamy Sand*		*Dry 50/50 10YR7/3 and 10YR5/3; moist 10YR4/3, coarse gravel; very coarse loamy sand*
					2	*4 - 34 cm*	*Sandy Clay Loam*		*Dry 10YR5/4; moist 10YR4/4, extremely coarse gravel, fine roots throughout; coarse sandy clay loam. Refusal at 34 cm*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Cortez Mine, mile marker 1.3 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.295328 N. Latitude
Section 1/4 Section		m		-116.629215 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Access roads, pipeline, pivot, Mine site proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *3661_5* **Date:** *June 15, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

199. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

200. Observe and list the F/S groups present in the evaluation area.

201. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

202. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

203. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

204. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Budsage, Shadscale*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed, Storksbill, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*4*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_3691_1_2_3* **Date:** *June 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Other*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

205. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

206. Observe and list the F/S groups present in the evaluation area.

207. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

208. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

209. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

210. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Shallow Calcareous Loam 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *3742_1* **Date:** *May 20, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

211. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

212. Observe and list the F/S groups present in the evaluation area.

213. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

214. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

215. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

216. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Flat 6-8 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Budsage*
Sprouting shrubs	*Spiny horsebrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, anthropogenic uses (pipeline)

Offsite influences: Mine proximity, pipeline, pivots, roads

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes
Reference community phase/description[3]: 4.1 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _3742_2 **Date:** May 20, 2021 1:00 PM **Evaluator(s):** Nicole St John / Kevin Cutrera

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

217. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

218. Observe and list the F/S groups present in the evaluation area.

219. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

220. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

221. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

222. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Flat 6-8 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Indian ricegrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Budsage*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Flower baskets*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _3742_3 **Date:** May 20, 2021 1:00 PM **Evaluator(s):** Nicole St John / Kevin Cutrera

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

223. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

224. Observe and list the F/S groups present in the evaluation area.

225. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

226. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

227. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

228. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Flat 6-8 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.59 miles west of the Cortez Mine, mile marker 3.0 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.301456 N. Latitude
Section 1/4 Section		m		-116.602672 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, anthropogenic use (pipeline)

Offsite influences: Pipeline in immediate area, mine proximity, pivot fields, roads	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *3742_5* **Date:** *June 15, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

235. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

236. Observe and list the F/S groups present in the evaluation area.

237. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

238. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

239. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

240. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Annual false wheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Mustards, Russian thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.		
Location description/directions: Approximately 1.69 miles southeast of the town of Carlin, mile marker 3.0 of the Carlin to GQ Private Bush Street project segment.		
Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes

Township Range		OR	m	OR	40.73416 N. Latitude
Section 1/4 Section			m		-116.15465 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): Historical wildfire evidence					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access roads					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.2 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_491_1* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

241. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

242. Observe and list the F/S groups present in the evaluation area.

243. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

244. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

245. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

246. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	*Bluegrass, Sandberg bluegrass*
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_491_1a* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

247. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

248. Observe and list the F/S groups present in the evaluation area.

249. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

250. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

251. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

252. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.		
Location description/directions: Approximately 3.36 miles southeast of the town of Carlin, mile marker 5.2 of the Carlin to GQ Private Bush Street project segment.		
Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes

Township Range	OR	m	OR	40.7646 N. Latitude	
Section 1/4 Section		m		-116.158058 W. Longitude	
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Mining activity, power lines, access roads					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.1 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_491_1b* **Date:** *July 23, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

253. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

254. Observe and list the F/S groups present in the evaluation area.

255. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

256. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

257. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

258. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.		
Location description/directions: Approximately 0.83 miles east of the town of Carlin, mile marker 2.0 of the Carlin to GQ Private Bush Street project segment.		
Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes

Township Range		OR	m	OR	40.724023 N. Latitude
Section 1/4 Section			m		-116.142055 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access roads					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.2 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *491_3* **Date:** *July 22, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

265. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

266. Observe and list the F/S groups present in the evaluation area.

267. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

268. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

269. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

270. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Two track approximately 100 meters to the northwest and dirt road approximately 200 meters to the west	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *525_1* **Date:** *June 17, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

277. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

278. Observe and list the F/S groups present in the evaluation area.

279. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

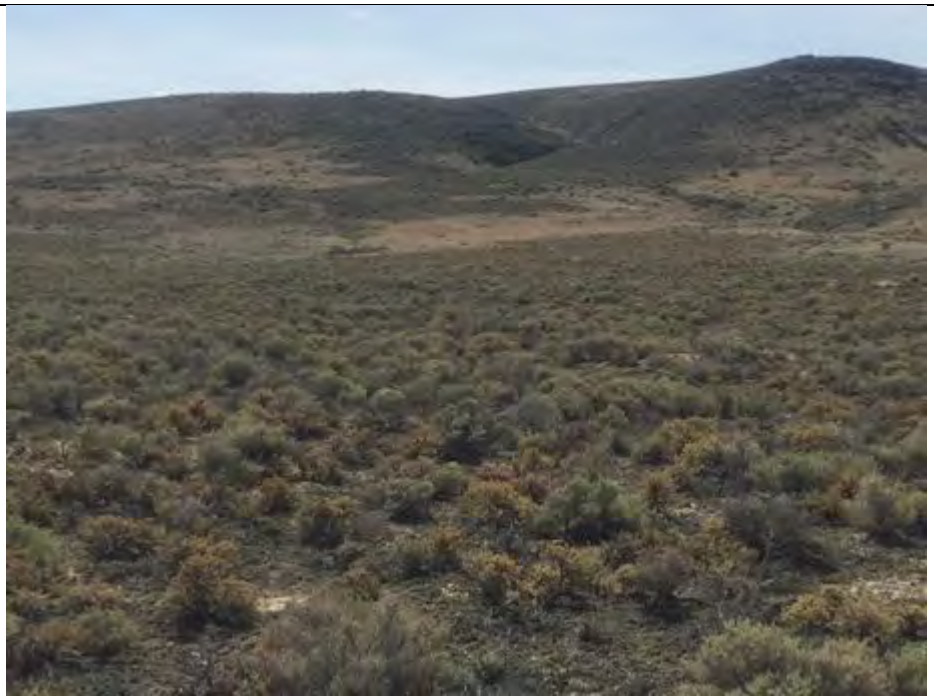
280. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

281. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

282. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Wooly star*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*



[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Interpreting Indicators of Rangeland Health Version 5 Evaluation Form (page 2)

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *561_1* **Date:** *June 17, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

289. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

290. Observe and list the F/S groups present in the evaluation area.

291. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

292. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

293. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

294. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Burning bush*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Halogeton, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Reference community phase/description[3]: 5.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *561_2* **Date:** *June 16, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kristyn Klecko*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

295. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

296. Observe and list the F/S groups present in the evaluation area.

297. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

298. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

299. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

300. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *561_3* **Date:** *July 24, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

301. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

302. Observe and list the F/S groups present in the evaluation area.

303. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

304. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

305. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

306. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, anthropogenic use	
Offsite influences: Pivot field, roads, mine site proximity, pipelines running through survey area.	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *660_2* **Date:** *May 24, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

313. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

314. Observe and list the F/S groups present in the evaluation area.

315. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

316. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

317. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

318. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Dry Floodplain*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Indian ricegrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.67 miles southwest of the Cortez Mine, mile marker 3.0 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*	UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range		m	OR	40.302772 N. Latitude
Section 1/4 Section	OR	m		-116.601644 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Livestock, anthropogenic use	
Offsite influences: Pivot field, roads, mine site proximity, pipelines running through survey area.	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *660_3* **Date:** *May 24, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

319. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

320. Observe and list the F/S groups present in the evaluation area.

321. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

322. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

323. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

324. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Dry Floodplain*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *671_1* **Date:** *June 4, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

325. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

326. Observe and list the F/S groups present in the evaluation area.

327. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

328. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

329. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

330. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Desert prince's plume*
Non-sprouting shrubs	*Big sagebrush, Budsage*
Sprouting shrubs	*Rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Redstem storksbill, Storksbill*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.85 miles west of the Cortez Mine, mile marker 12.1 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.313406 N. Latitude
Section 1/4 Section		m		-116.504257 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Pivots, road proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *741_1* **Date:** *May 27, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

331. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

332. Observe and list the F/S groups present in the evaluation area.

333. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

334. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

335. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

336. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *741_2* **Date:** *May 27, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

337. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

338. Observe and list the F/S groups present in the evaluation area.

339. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

340. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

341. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

342. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	*Spiny horsebrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 6.43 miles southwest of the town of Crescent Valley, mile marker 24.7 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.47115 N. Latitude
Section 1/4 Section		m		-116.46565 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): Evidence of remediation efforts; some re-seeding and tilling

Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: NA	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *741_3* **Date:** *June 16, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

343. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

344. Observe and list the F/S groups present in the evaluation area.

345. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

346. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

347. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

348. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*0*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.73 miles west of the Cortez Mine, mile marker 10.5 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.292368 N. Latitude
Section 1/4 Section		m		-116.504984 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Proximity to pivot field	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_822_1* **Date:** *June 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

355. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

356. Observe and list the F/S groups present in the evaluation area.

357. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

358. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

359. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

360. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *822_2* **Date:** *May 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

361. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

362. Observe and list the F/S groups present in the evaluation area.

363. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

364. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

365. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

366. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.79 miles west of the Cortez Mine, mile marker 10.6 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.292766 N. Latitude
Section 1/4 Section		m		-116.503924 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Proximity to pivot field	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *822_3* **Date:** *June 1, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

367. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

368. Observe and list the F/S groups present in the evaluation area.

369. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

370. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

371. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

372. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *822_4* **Date:** *May 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

373. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

374. Observe and list the F/S groups present in the evaluation area.

375. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

376. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

377. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

378. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Thistles*

Wildlife, livestock, recreation, or other uses: Wildlife, livestock, cropland if irrigated	
Offsite influences: Pivot field, pipelines, and roads in close proximity to the survey area	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *822_5* **Date:** *May 28, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

379. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

380. Observe and list the F/S groups present in the evaluation area.

381. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

382. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

383. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

384. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *822_6* **Date:** *June 3, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

385. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

386. Observe and list the F/S groups present in the evaluation area.

387. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

388. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

389. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

390. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *855_1* **Date:** *June 2, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

391. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

392. Observe and list the F/S groups present in the evaluation area.

393. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

394. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

395. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

396. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Coarse Silty 4-8 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood, Rabbitbrush, Spiny horsebrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton, Mustard, Mustards*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Is within the Cortez Mine, mile marker 1.2 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.213239 N. Latitude	
Section 1/4 Section		m		-116.63429 W. Longitude	

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock, mining	
Offsite influences: Mine site proximity. Pipeline in close proximity	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *855_2* **Date:** *June 2, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

397. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

398. Observe and list the F/S groups present in the evaluation area.

399. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

400. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

401. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

402. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Commmunity Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	*Spiny horsebrush*
Evergreen trees	
Annual grasses	*Annual false wheatgrass, Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *861_1* **Date:** *June 3, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

403. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

404. Observe and list the F/S groups present in the evaluation area.

405. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

406. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

407. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

408. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Mine site, pivot fields	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *861_3* **Date:** *June 3, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

415. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

416. Observe and list the F/S groups present in the evaluation area.

417. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

418. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

419. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

420. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Hopsage*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 4.87 miles west of the Cortez Mine, mile marker 9.2 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.277775 N. Latitude
Section 1/4 Section		m		-116.521636 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Mine site, pivot fields	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *861_4* **Date:** *June 3, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

421. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

422. Observe and list the F/S groups present in the evaluation area.

423. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

424. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

425. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

426. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.3 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Functional/Structural Groups Worksheet

Evaluation Area ID: _ *881_1* **Date:** *May 25, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

427. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

428. Observe and list the F/S groups present in the evaluation area.

429. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

430. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

431. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

432. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Flat 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	*Greasewood, Spiny horsebrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.24 miles west of the Cortez Mine, mile marker 8.7 of the Dean Ranch Agg Road project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.3272 N. Latitude
Section 1/4 Section		m		-116.521138 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Elevated road running through survey area	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *881_2* **Date:** *May 25, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

433. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

434. Observe and list the F/S groups present in the evaluation area.

435. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

436. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

437. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

438. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Flat 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_881_2a* **Date:** *July 24, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

439. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

440. Observe and list the F/S groups present in the evaluation area.

441. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

442. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

443. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

444. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *2.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	*Alkali sacaton*
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	*Desert saltgrass, Saltgrass*
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Four-wing saltbush, Pickleweed, Saltbush*
Sprouting shrubs	*Greasewood, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.39 miles northwest of the town of Crescent Valley, mile marker 14.0 of the Segment #1 - Range Front to UP project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m		OR	40.340107 N. Latitude
Section 1/4 Section		m			-116.512111 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access roads					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 2.3 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *881_2b* **Date:** *July 24, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

445. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

446. Observe and list the F/S groups present in the evaluation area.

447. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

448. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

449. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

450. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Terrace 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Four-wing saltbush, Saltbush, Shadscale*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Halogeton*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 5.84 miles west of the Cortez Mine, mile marker 12.3 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.316191 N. Latitude
Section 1/4 Section		m		-116.505048 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock

Offsite influences: Road influencing hydrology in the survey area

Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *881_3* **Date:** *May 25, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

457. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

458. Observe and list the F/S groups present in the evaluation area.

459. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

460. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

461. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

462. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Flat 6-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	*Greasewood, Spiny horsebrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *881_4a* **Date:** *July 24, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

469. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

470. Observe and list the F/S groups present in the evaluation area.

471. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

472. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

473. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

474. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *2.3 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	*Saltgrass*
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Pickleweed, Saltbush*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_881_4b* **Date:** *July 24, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

475. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

476. Observe and list the F/S groups present in the evaluation area.

477. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

478. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

479. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

480. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Saline Bottom*	**Reference phase for evaluation area:** *2.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	*Saltgrass*
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *881_5* **Date:** *June 16, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

481. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

482. Observe and list the F/S groups present in the evaluation area.

483. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

484. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

485. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

486. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Sodic Flat 6-8 P.Z.*	**Reference phase for evaluation area:** *5.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *901_1* **Date:** *May 24, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

493. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

494. Observe and list the F/S groups present in the evaluation area.

495. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

496. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

497. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

498. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *2.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Indian ricegrass, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush, Shadscale*
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*5*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Livestock, wildlife	
Offsite influences: Road	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 2.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *901_2* **Date:** *May 24, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

499. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

500. Observe and list the F/S groups present in the evaluation area.

501. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

502. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

503. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

504. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Bottlebrush squirreltail, Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Budsage, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*3*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *BB_1* **Date:** *June 17, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

505. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

506. Observe and list the F/S groups present in the evaluation area.

507. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

508. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

509. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

510. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Pepperweed, Russian thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Power line, access road	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *BB_2* **Date:** *June 17, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

511. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

512. Observe and list the F/S groups present in the evaluation area.

513. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

514. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

515. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

516. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Globemallow*
Non-sprouting shrubs	*Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Blue mustard, Clasping pepperweed, Mustard, Pepperweed, Russian thistle, Tumble mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*4*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*4*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BC_1* **Date:** *July 17, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

517. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

518. Observe and list the F/S groups present in the evaluation area.

519. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

520. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

521. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

522. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	*Desert saltgrass, Saltgrass*
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Greasewood, Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Halogeton, Mustard, Mustards, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.99 miles northeast of the town of Carlin, mile marker 0.0 of the Carlin to GQ Private Bush Street project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m		OR	40.698067 N. Latitude
Section 1/4 Section		m			-116.134959 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife habitat					
Offsite influences: Access roads, power lines, railroad tracks,					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.2 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *BC_2* **Date:** *July 17, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

523. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

524. Observe and list the F/S groups present in the evaluation area.

525. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

526. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

527. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

528. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye*
Deep-rooted, warm-season, perennial bunchgrasses	*Alkali sacaton*
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Entire leaf thelypody*
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Halogeton, Mustard, Pepperweed, Prickly lettuce, Tumble mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*3*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BC_3* **Date:** *July 17, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

529. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

530. Observe and list the F/S groups present in the evaluation area.

531. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

532. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

533. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

534. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Globemallow*
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Common purslane, Halogeton, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*2*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.			
Location description/directions: Approximately 1.26 miles northeast of the town of Carlin, mile marker 0.0 of the Carlin to GQ Private Bush Street project segment.			
Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	m		40.69613 N. Latitude

Section 1/4 Section	OR	m	OR	-116.139517 W. Longitude

Supplemental Information & Reference Community Phase	
Recent weather (last 2 years): Drought	
Natural disturbance type(s) and date(s): NA	
Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife habitat	
Offsite influences: Residential properties, access roads, railroad tracks, power lines	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: _ *BC_5* **Date:** *July 17, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

535. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

536. Observe and list the F/S groups present in the evaluation area.

537. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

538. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

539. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

540. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Bf_1* **Date:** *July 17, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

541. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

542. Observe and list the F/S groups present in the evaluation area.

543. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

544. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

545. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

546. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy Bottom 8-14 P.Z.*	**Reference phase for evaluation area:** *3.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Western wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Knapweed, Russian knapweed*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 2.46 miles northeast of the town of Carlin, mile marker 0.0 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes	
Township Range	OR	m	OR	40.680711 N. Latitude	
Section 1/4 Section		m		-116.152126 W. Longitude	

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife, livestock, rail corridor

Offsite influences: Train track, power line

Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.1 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_Bf_2* **Date:** *July 17, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

547. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

548. Observe and list the F/S groups present in the evaluation area.

549. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

550. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

551. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

552. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Wet Meadow*	**Reference phase for evaluation area:** *State-and-Transition models not developed for this draft ecological site description*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	*Common cattail*
Shallow-rooted, warm-season, perennial grasses	*Saltgrass*
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Dock, Knapweed, Milkweed, Whitetop*
Non-sprouting shrubs	
Sprouting shrubs	*Woods' rose*
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BM_1* **Date:** *July 13, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

553. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

554. Observe and list the F/S groups present in the evaluation area.

555. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

556. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

557. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

558. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Basin wildrye, Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce, Russian thistle, Tansy mustard*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 8.07 miles west of the TS Power Plant, mile marker 7.4 of the Welches Creek Road project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m		OR	40.788658 N. Latitude
Section 1/4 Section		m			-116.346686 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): Historical wildfire evidence					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife, livestock					
Offsite influences: Access road					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.2 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BM_2* **Date:** *July 12, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

559. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

560. Observe and list the F/S groups present in the evaluation area.

561. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

562. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

563. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

564. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy Bottom 8-14 P.Z.*	**Reference phase for evaluation area:** *5.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BM_3* **Date:** *July 9, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

565. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

566. Observe and list the F/S groups present in the evaluation area.

567. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

568. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

569. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

570. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Shallow Loam 10-14 P.Z.*	**Reference phase for evaluation area:** *State-and-Transition models not developed for this draft ecological site description*

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.0 miles north of the town of Beowawe, mile marker 32.0 of the Segment #1 - Range Front to UP project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.568549 N. Latitude
Section 1/4 Section		m		-116.458651 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA	
Wildlife, livestock, recreation, or other uses: Wildlife, livestock	
Offsite influences: Railroad in close proximity. Access road to the south	
Photos taken? Yes	Quantitative data collected: No
F/S groups worksheet completed? Yes	
Reference community phase/description[3]: 3.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BpA_1* **Date:** *June 9, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

571. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

572. Observe and list the F/S groups present in the evaluation area.

573. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

574. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

575. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

576. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.1 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Lowland cudweed, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BpA_1a* **Date:** *July 24, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

577. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

578. Observe and list the F/S groups present in the evaluation area.

579. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

580. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

581. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

582. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*

Reference community phase/description[3]: 4.2 Community Phase	

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BpA_2* **Date:** *June 9, 2021 1:00 PM* **Evaluator(s):** *Nicole St John / Kevin Cutrera*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

583. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

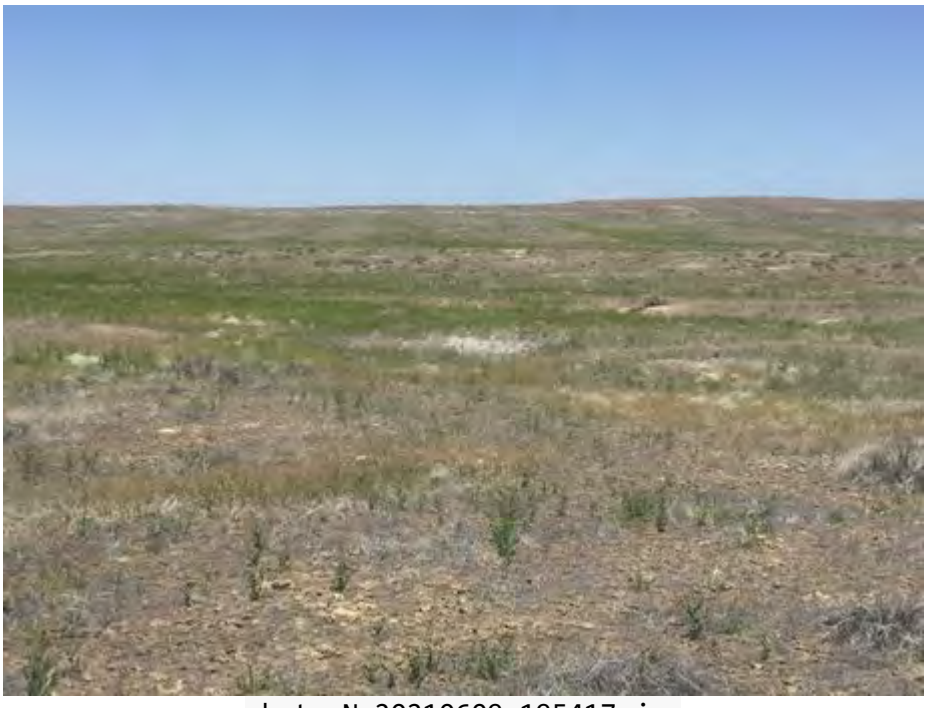
584. Observe and list the F/S groups present in the evaluation area.

585. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

586. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

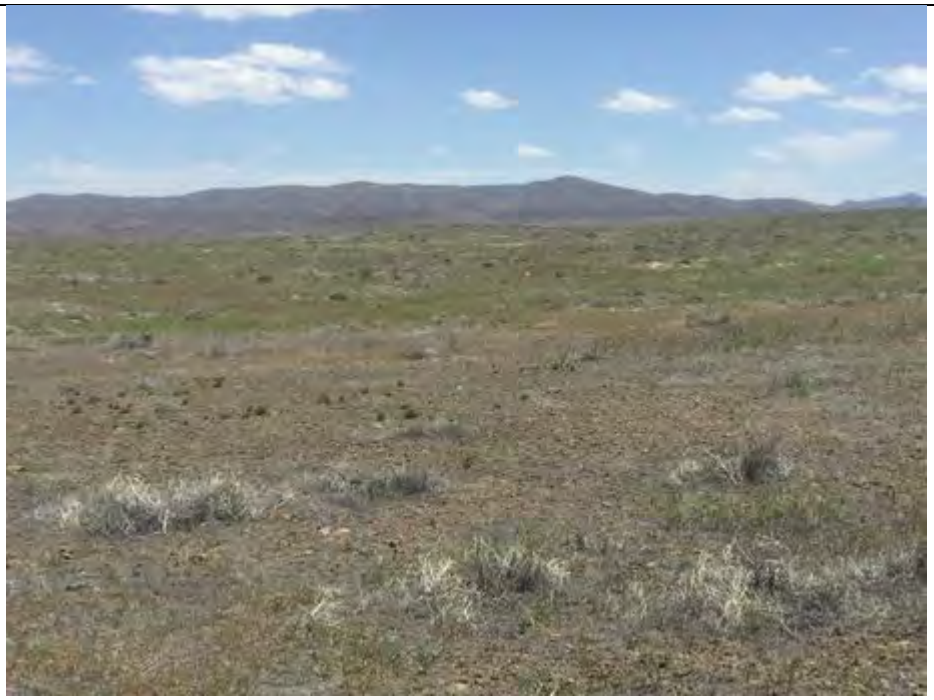
587. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

588. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.



1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Dead shrubs, Shadscale*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Russian thistle*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*1*



[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_BpA_4* **Date:** *June 9, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Nicole St John*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

595. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

596. Observe and list the F/S groups present in the evaluation area.

597. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

598. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

599. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

600. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 5-8 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	*Greasewood*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Annual forbs, Halogeton, Mustard, Mustards*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*1*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*2*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_1* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

601. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

602. Observe and list the F/S groups present in the evaluation area.

603. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

604. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

605. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

606. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *State-and-Transition models not developed for this draft ecological site description*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_2* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

607. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

608. Observe and list the F/S groups present in the evaluation area.

609. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

610. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

611. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

612. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Globemallow*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Pepperweed, Russian thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 0.49 miles east of the town of Carlin, mile marker 0.6 of the Carlin to GQ Private Bush Street project segment.					
Size of evaluation area: *acre*		UTM Zone:	Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m		OR	40.707379 N. Latitude
Section 1/4 Section		m			-116.129919 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): NA					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife habitat					
Offsite influences: Access road, power lines					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 4.2 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_2a* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

613. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

614. Observe and list the F/S groups present in the evaluation area.

615. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

616. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

617. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

618. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Crested wheatgrass*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	*Globemallow*
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Mustard, Pepperweed, Russian thistle, Tansy mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Figure A4.3. Example of a completed page 2 of the evaluation sheet.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_2b* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kristyn Klecko / Henson DeBruler*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

619. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

620. Observe and list the F/S groups present in the evaluation area.

621. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

622. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

623. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

624. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *South Slope 8-12 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	*Rabbitbrush, Rubber rabbitbrush, Yellow rabbitbrush*
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Halogeton, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 1.17 miles east of the town of Carlin, mile marker 1.4 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*	UTM Zone: Datum: *WGS 1984*	Position by GPS? Yes

Township Range		OR	m	OR	40.709857 N. Latitude
Section 1/4 Section			m		-116.144696 W. Longitude
Supplemental Information & Reference Community Phase					
Recent weather (last 2 years): Drought					
Natural disturbance type(s) and date(s): Historical wildfire evidence					
Land treatment type(s) and date(s): NA					
Wildlife, livestock, recreation, or other uses: Wildlife habitat, livestock grazing					
Offsite influences: Access road					
Photos taken? Yes	Quantitative data collected: No				
F/S groups worksheet completed? Yes					
Reference community phase/description[3]: 3.3 Community Phase					

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_2c* **Date:** *July 19, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

625. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

626. Observe and list the F/S groups present in the evaluation area.

627. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

628. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

629. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

630. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *3.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	*Squirreltail*
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_2d* **Date:** *July 23, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

631. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

632. Observe and list the F/S groups present in the evaluation area.

633. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

634. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

635. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

636. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	*Cheatgrass*

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Clasping pepperweed, Pepperweed*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).

Evaluation Area Location

Criteria used to select evaluation area: Randomized selection of a sample point within the soil map unit and land cover type indicated by the SWreGAP.

Location description/directions: Approximately 4.67 miles southeast of the town of Carlin, mile marker 6.8 of the Carlin to GQ Private Bush Street project segment.

Size of evaluation area: *acre*		UTM Zone: Datum: *WGS 1984*		Position by GPS? Yes
Township Range	OR	m	OR	40.783581 N. Latitude
Section 1/4 Section		m		-116.164566 W. Longitude

Supplemental Information & Reference Community Phase

Recent weather (last 2 years): Drought

Natural disturbance type(s) and date(s): NA

Land treatment type(s) and date(s): NA

Wildlife, livestock, recreation, or other uses: Wildlife habitat, livestock grazing

Offsite influences: Highway, mine, power lines

Photos taken? Yes	Quantitative data collected: No

F/S groups worksheet completed? Yes

Reference community phase/description[3]: 4.2 Community Phase

[1] Depth classes: Very shallow < 25 cm; Shallow 25-50 cm; Moderate 50-100 cm; Deep 100-150 cm; Very Deep > 150 cm

[2] Soil effervescence (Eff) codes: NE – non-eff.; VS – very slightly eff.; SL – slightly eff.; ST – strongly eff.; V – violently eff.

[3] If F/S worksheet is not completed, describe expected reference community F/S groups' relative dominance in this field.

Figure A4.2. Example of a completed page 1 of the evaluation sheet.

Completing Page 2 of the Evaluation Sheet

Record indicator ratings and observations and overall attribute ratings and justifications on page 2 of the evaluation sheet. Figure A4.3 provides a completed example of page 2 of the evaluation sheet.

- For each indicator, record the departure rating in the corresponding blank cell. Standardized abbreviations for departure ratings are provided at the top of page 2.
- Write notes supporting each indicator rating in the comments section.

Use of the functional/structural groups worksheet is strongly recommended to support the rating for indicator 12. Detailed instructions for completing this worksheet are provided in this appendix.

Once all 17 indicators have been rated, summarize ratings in the three charts at the bottom of the evaluation sheet, which are used for rating the three attributes. There is one chart, rating box, and rationale space for each attribute. The letters S, H, or B found in the rating column for each indicator identify the attribute(s) to which each indicator is related. For example, bare ground is related to soil/site stability (S) and hydrologic function (H), while annual production is related to biotic integrity (B).

- Populate each attribute's chart by identifying the indicators related to that attribute and writing the indicator number in the appropriate departure category column within the chart. Work from the bottom up to create a histogram of the indicator departure ratings related to the attribute.
- Once the charts have been populated for each of the three attributes, review the indicator departure patterns of each attribute. Use a preponderance of evidence approach to assign a departure rating for each attribute (see Section 7.5).
- To the right of each chart, provide a short rationale for the attribute rating.

A blank evaluation sheet is provided at the end of this appendix.

Functional/Structural Groups Worksheet Instructions

The functional/structural groups worksheet is used to document observed species, functional/structural groups, and relative dominance at an evaluation area. The worksheet is also used to compare those observations to the appropriate reference phase from the functional/structural groups table for indicator 12 in the reference sheet in a consistent manner. An example of a completed functional/structural groups worksheet is provided in Figures A4.4 and A4.5. A blank functional/structural groups worksheet is provided at the end of this appendix.

In section 1 of the worksheet, record the ecological site, and identify the most appropriate reference plant community phase for the evaluation area.

In sections 2 and 3, list the observed functional/structural groups and associated species within each respective group that are found in the evaluation area. Remember that species or functional/structural groups in the evaluation area may be different than the groups or species identified for the selected reference phase. If an unexpected species occurs in the evaluation area, follow the process described for step 2 in Appendix 1b, and assign the species to the appropriate functional/structural group based on its characteristics. If the unexpected species does not fit one of the expected groups, it should be listed under a new functional/structural group name.

In section 4, specify whether plant species composition estimates are based on the current growing season's annual production or foliar cover. Next, refer to the functional/structural groups table for indicator 12 in the reference sheet, and copy the relative dominance information for the selected reference plant community phase in the "Expected" column. If adjustments to the selected reference community phase are needed based on time since disturbances in the evaluation area, record adjustments and rationale in the "Comments" field. See step 1 in Section 7.4.12 for additional information on adjustments. One approach to portraying adjustments is to modify the relative dominance in the "Expected" column to reflect changes in relative dominance described in the "Comments" field.

In the "Observed" column, record the relative dominance of the functional/structural groups observed in the evaluation area. More than one functional/structural group may be assigned to each relative dominance category. Refer to step 3 in Appendix 1b for instructions for calculating relative abundance from quantitative data.

To complete section 5 of the functional/structural groups worksheet, refer to step 4 in Section 7.4.12. Rate the four subindicators by circling the best fit for each on the evaluation matrix included in the worksheet. Finally, in section 6, record the overall departure for indicator 12.

Keep this worksheet with the evaluation sheet to support the ratings and observations made at each evaluation area.

INTERPRETING INDICATORS OF RANGELAND HEALTH *VERSION 5*
Functional/Structural Groups Worksheet

Evaluation Area ID: *_CF_2e* **Date:** *July 21, 2021 1:00 PM* **Evaluator(s):** *Kevin Cutrera / Chris Hensley*

Instructions (Numbers correspond to fields in the worksheet; see Appendix 4 for detailed instructions.):

637. Record the ecological site for the evaluation area. Considering the disturbance and land treatment history at the evaluation area, select the appropriate reference community phase from the F/S groups table in the reference sheet.

638. Observe and list the F/S groups present in the evaluation area.

639. Record the species within each F/S group present in the evaluation area. At the bottom of this section, record the number of expected F/S groups and number of species in expected dominant and subdominant groups observed in theevaluation area.

640. Copy the relative dominance for the selected reference phase from the reference sheet to the **Expected** column. In the**Observed** column, document the relative dominance of F/S groups at the evaluation area. Use the **Comments** field to make notes, including any adjustments to relative dominance and rationale.

641. For each subindicator, circle the departure category description that best fits the observed changes in F/S groups in the evaluation area.

642. Rate the overall departure for the F/S groups indicator by choosing the greatest departure category of the four subindicators.

1) Ecological site: *Loamy 8-10 P.Z.*	**Reference phase for evaluation area:** *4.2 Community Phase*
2) F/S Groups in Evaluation Area	**3) Species List**
Deep-rooted, cool-season perennial bunchgrasses	
Deep-rooted, warm-season, perennial bunchgrasses	
Shallow-rooted, cool-season perennial bunchgrasses	
Shallow-rooted, emergent perennials	
Shallow-rooted, warm-season, perennial grasses	
Shallow-rooted, cool-season, perennial graminoid	
Perennial forbs	
Non-sprouting shrubs	*Big sagebrush*
Sprouting shrubs	
Evergreen trees	
Annual grasses	

Perennial bunchgrass	
Cool-season perennial grasses	
Annual forbs	*Mustard, Prickly lettuce, Tumble mustard*
Sprouting succulent	
Biological soil crusts[1]	*5% cover of mosses and lichens. Cyanobacteria present but not recorded in cover measurements.*
Number of expected F/S groups present[2] in evaluation area:	*NA*
Number of species in expected dominant and subdominant groups present in evaluation groups:	*NA*

[1] Biological soil crust dominance is determined based on cover, rather than production. If biological soil crusts are an expected dominant or subdominant group, the number of expected life forms (e.g., lichen, moss) is listed, rather than number of individual species.

[2] When an F/S group that is expected to be dominant, subdominant, or minor is reduced in the evaluation area to a few remnant individuals, the group is considered to not be "functionally present" and is not included in the number of F/S groups present (12c).

Figure A4.4. Example of a completed functional/structural groups worksheet (sections 1-3).
