National Register Evaluation: This rail segment is recommended **eligible** for listing in the National Register. Originally built between 1893 and 1897, this railroad segment was built as part of the KCP&G as the line traveled south to the Gulf of Mexico. In Oklahoma, the KCP&G was responsible for the development of multiple towns, including Heavener which grew around the railroad station and expanded significantly when the Kansas City Southern Railway made the town a division headquarters. For other towns in Oklahoma and Arkansas the railroad facilitated the movement of crops and livestock. In both states farmers brought cotton, cattle, fruit, and grain to the nearest railroad town and used the Kansas City Southern to ship their products to the Gulf coast or Kansas City. The railroad also provided opportunities for capital investment in previously unexplored mining and timber extraction ventures. This process tied these farmers into a national economy and helped to sustain communities like Heavener and De Queen. The railroad segment is regionally significant under **Criterion A** in the areas of Transportation, Exploration and Settlement, and Commerce. Built by the KCP&G, this segment of the railroad connected the major hub of Kansas City to multiple small agrarian communities in Oklahoma and Arkansas on its way to Port Arthur on the Gulf of Mexico. The railroad, the first major line to pass through this portion of Oklahoma, opened a major regional shipping corridor from the Gulf coast to Kansas City in central Missouri that didn't previously exist. The railroad also directly generated commerce, such as in Heavener, Oklahoma, Mena, Arkansas, and De Queen, Arkansas each of which were made a division headquarters with track yards and repair shops. These three communities and other stops along this railroad segment becoming important local centers for mining, logging, and agricultural trade. Corn, fruit trees, berries, and cotton were grown while cattle and hogs were raised in stock farms. In Mena, large planing mills were built along the railroad tracks as were cold storage buildings.

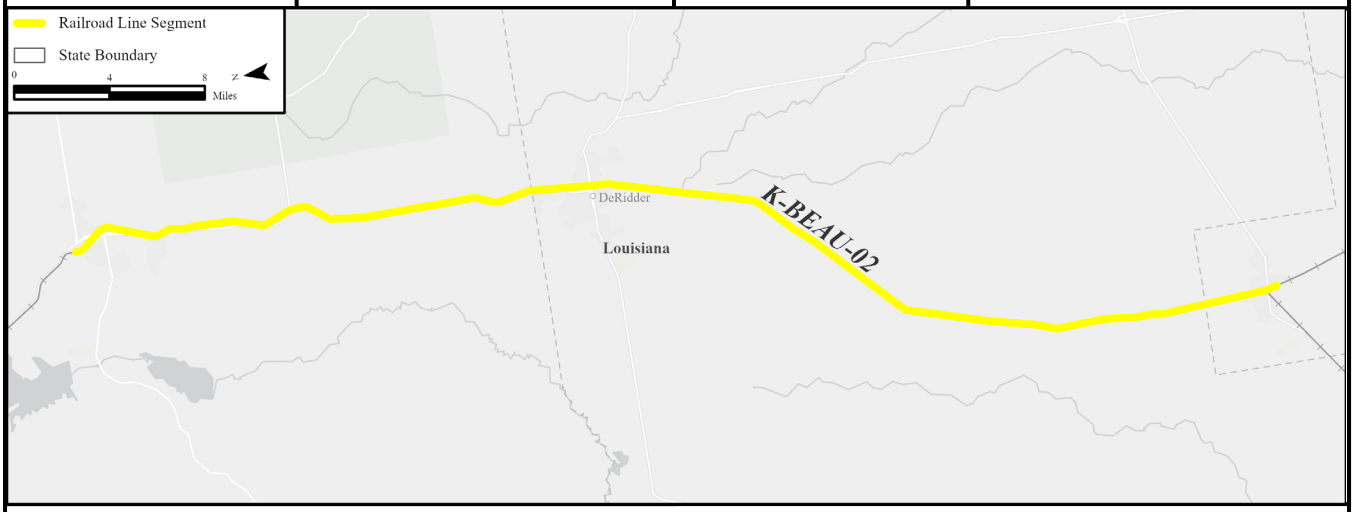
Resource ID:	K-SHRE-01	Resource Type:	Above-Ground
Inventory Number:	TBD	Potential Effect:	Physical
Previous Documentation:	N/A	Location:	De Queen to Heavener, OK

National Register Evaluation (con't): Planing mills of a similar size were also built in De Queen. The extraction and development of these resources was made viable by the passage of the KCS which created a cost-effective shipping corridor to major markets in Kansas City or international markets which could be accessed from the harbor at Port Arthur. Additionally, because the United States began its acquisition of land in eastern Oklahoma long after many of the surrounding states, the railroad played a critical role in determining the location of many towns. **Criterion B:** This railroad segment was built between 1887 and 1892 for the Kansas City, Pittsburg and Gulf Railroad, a precursor to the Kansas City Southern. This segment of railroad is significant for its association with Arthur Stilwell, the founder and driving force behind the expansion of the KCP&G. Arriving in Kansas City in 1888, Arthur Stilwell began to operate his first railroad, the Kansas City Suburban Belt Railway, in 1889. Extending the line south to Pittsburg, Kansas, Stilwell renamed the line the KCP&G. Through the 1890s Stilwell pushed his railroad further south, consolidating his tracks with other lines and laying new railbeds as he strove to reach the Gulf of Mexico. Stilwell secured financial backing for the railroad by selling railroad stock to Dutch investors, a necessity after the United States was rocked by the Panic of 1893. To thank his Dutch investors Stilwell named several towns in Arkansas, Texas, and Louisiana after them and their wives, including Mena, Arkansas. In 1897 Stilwell's railroad reached the Gulf of Mexico where he built the City of Port Arthur, named after himself. In total Stilwell's enterprise laid over 1,200 miles of track through the center of the country and created an alternative shipping corridor that allowed farmers and industrialists in middle America to efficiently export their products and circumvent more distant eastern seaports. **Criterion C:** Detailed survey was undertaken within the APE along a 2.49-mile segment of this 94.6-mile-long segment of railroad near Heavener. An additional 2.04-mile segment was surveyed in Mena, Arkansas. Within the APE, the railroad retains its engineered grade, alignment, tracks, culverts, and a bridge. Since the APE contains only a small portion of the overal 94.6-mile long rail line segment, the overall segment has not been surveyed in detail and no determination about the overall segment under Criterion C can be made at this time. **Criterion D**: This railroad segment does not appear to have the potential to yield further important information or data.

Integrity: The Kansas City Southern corridor segment between Heavener, Oklahoma and De Queen, Arkansas retains integrity of location, design, materials, workmanship, feeling, and association. Though trackage loss has occurred, the portions of the railroad corridor that remain in operation are in their historic footprint. The railroad corridor, still in active use, retains its association and feeling with railroad transit and freight transportation. Though maintenance and upgrades along the line have surely resulted in the loss or alteration of several individual features such as bridges, tracks, culverts, stations, and depot buildings, when structures were replaced, they were often similar in size, scale, and materials to the original features. The workmanship and design of this railroad corridor segment has also been largely maintained. The segment's setting is also generally intact with the railroads generally passing through the outskirts of small towns and long stretches of rural farmland.

Resource ID:	K-BEAU-01	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Frierson to Leesville, LA

Description: This property is a 91.4-mile segment of the Kansas City Southern Railway that travels south from Frierson, Louisiana to Leesville, Louisiana. The railroad segment travels through the towns of Frierson, Mansfield, Converse, Noble, Zwolle, Loring, Many, Hornbeck, and Leesville. For much of its length the railroad segment travels through a rural agrarian landscape. Capital improvements are planned in the vicinity of Mansfield and Loring. The railroad segment remains in active use and has typical features such as steel rail, wooden ties, grade crossings, culverts, bridges, and signaling equipment.



National Register Evaluation: This rail segment is recommended **eligible** for listing in the National Register. Originally built in 1897 this portion of the railroad was originally part of the KCP&G. The railroad reached Shreveport, Louisiana in March 1897 and by September of that same year the line had reached the Gulf coast. After the Civil War companies like the KCP&G began to build trackage in Louisiana and rural towns throughout the state relocated to take advantage of the developing railroad infrastructure. Louisiana railroads typically handled passengers, foodstuffs, and lumber, much of which was directed to major Gulf coast ports like New Orleans and Port Arthur, Texas. The railroad segment is regionally significant in **Criterion A** in the areas of Transportation and Commerce. Built as one of the final portions of the KCP&G, this segment of the railroad played a major role in the ultimate fulfillment of the vision of a link between the Midwest and the Gulf of Mexico. The railroad, the first major line to pass through this section of Louisiana, enabled capitalists and investors to develop large scale farms and timber operations in rural Louisiana. In Sabine, Vernon, and Calcasieu Parishes, short and long leaf pine were harvested for the first time on an industrial scale. Prior to the KCS's arrival, the nearest railroad to these parishes had been 100 miles away. The development of Louisiana's timber industry coincided with the decline of the stands of timber in Michigan, Minnesota, and Wisconsin, all of which had been timbered for decades. Louisiana, with its extremely warm climate, also produced sugar and tropical fruits such as oranges, resources which the KCS could quickly ship to domestic and international markets. The railroad also led to direct commercial investment in Hornbeck, where the KCS built repair shops.
Criterion B: This railroad segment was built between 1887 and 1892 for the Kansas City, Pittsburg and Gulf Railroad, a precursor to the Kansas City Southern. This segment of railroad is significant for its association with Arthur Stilwell, the founder and driving force behind the expansion of the KCP&G. Arriving in Kansas City in 1888, Arthur Stilwell began to operate his first railroad, the Kansas City Suburban Belt Railway, in 1889.

Resource ID:	K-BEAU-01	**Resource Type:**	Above-Ground

Resource ID:	K-BEAU-02	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Leesville to De Quincy, LA

Description: This property is a 50.6-mile segment of the Kansas City Southern Railway that travels south from Leesville, Louisiana to De Quincy, Louisiana. The railroad segment travels through the towns of Leesville, Rosepine, Deridder, Singer, and De Quincy. For much of its length the railroad segment travels through a rural agrarian landscape. Capital improvements are planned in the vicinity of Singer. The railroad segment remains in active use and has typical features such as steel rail, wooden ties, grade crossings, culverts, bridges, and signaling equipment.

National Register Evaluation: This rail segment is recommended **eligible** for listing in the National Register. Originally built in 1897, this portion of the railroad was originally part of the KCP&G. The railroad reached Shreveport, Louisiana in March 1897 and by September of that same year the line had reached the Gulf coast. After the Civil War, companies like the KCP&G began to build trackage in Louisiana and rural towns throughout the state relocated to take advantage of the developing railroad infrastructure. Louisiana railroads typically handled passengers, foodstuffs, and lumber, much of which was directed to major Gulf coast ports like New Orleans and Port Arthur, Texas. The railroad segment is regionally significant under **Criterion A** in the areas of Transportation and Commerce. Built as one of the final portions of the KCP&G, this segment of the railroad played a major role in the ultimate fulfillment of the vision of a link between the Midwest and the Gulf of Mexico. The railroad, the first major line to pass through this section of Louisiana, enabled capitalists and investors to develop large scale farms and timber operations in rural Louisiana. In Sabine, Vernon, and Calcasieu Parishes short and long leaf pine were harvested for the first time on an industrial scale. Prior to the KCS's arrival, the nearest railroad to these parishes had been 100 miles away. The development of Louisiana's timber industry coincided with the decline of the stands of timber in Michigan, Minnesota, and Wisconsin, all of which had been timbered for decades. Rosepine and DeRidder, Louisiana are representative examples of the economic transformation brought about by the arrival of the KCS. In 1897 the railroad came though both towns soon after there were four lumber companies in Rosepine which was incorporated in 1902; in nearby DeRidder two lumber companies were organized after the railroad's arrival while the town was formally incorporated in 1903. Louisiana, with its extremely warm climate, also produced sugar and tropical fruits such as oranges, resources which the KCS could quickly ship to domestic and international markets.

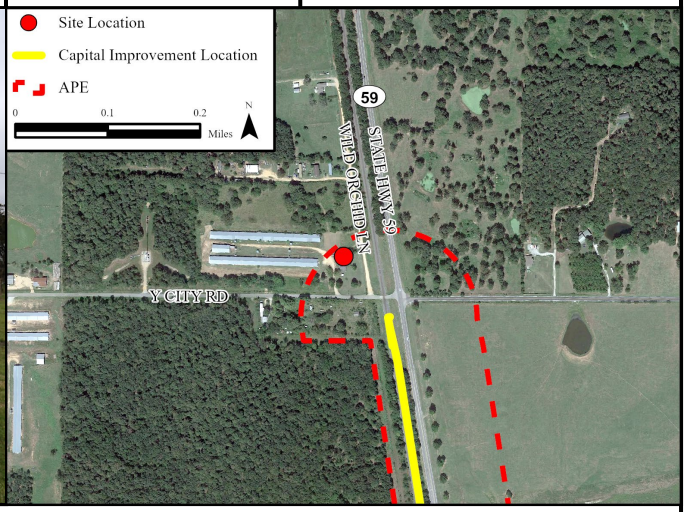
Inventory Number:	TBD	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Leesville to De Quincy, LA

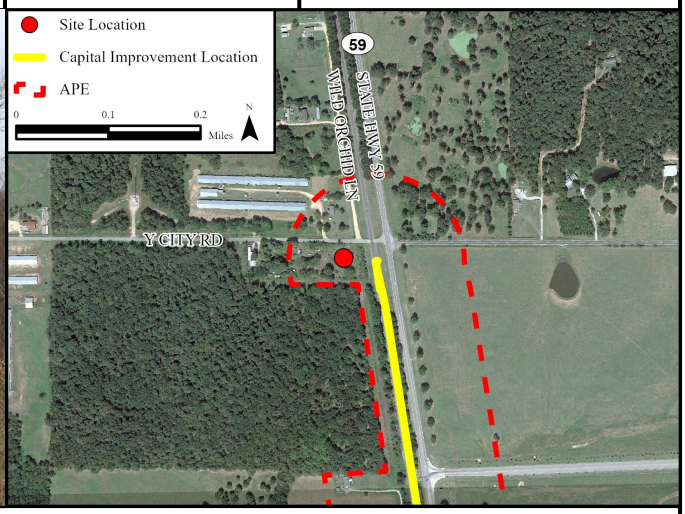


National Register Evaluation (con't.): The railroad also led to direct commercial investment in Hornbeck, where the KCS built repair shops, as well as the creation of DeRidder and DeQuincy Louisiana. **Criterion B:** This railroad segment was built between 1887 and 1892 for the Kansas City, Pittsburg and Gulf Railroad, a precursor to the Kansas City Southern. This segment of railroad is significant for its association with Arthur Stilwell, the founder and driving force behind the expansion of the KCP&G. Arriving in Kansas City in 1888, Arthur Stilwell began to operate his first railroad, the Kansas City Suburban Belt Railway, in 1889. Extending the line south to Pittsburg, Kansas, Stilwell renamed the line the KCP&G. Through the 1890s Stilwell pushed his railroad further south, consolidating his tracks with other lines and laying new railbeds as he strove to reach the Gulf of Mexico. Stilwell secured financial backing for the railroad by selling railroad stock to Dutch investors, a necessity after the United States was rocked by the Panic of 1893. To thank his Dutch investors Stilwell named several towns in Arkansas, Texas, and Louisiana after them and their wives, including DeRidder and DeQuincy. In 1897 Stilwell's railroad reached the Gulf of Mexico where he built the City of Port Arthur, named after himself. In total Stilwell's enterprise laid over 1,200 miles of track through the center of the country and created an alternative shipping corridor that allowed farmers and industrialists in middle America to efficiently export their products and circumvent more distant eastern seaports. **Criterion C:** Detailed survey was undertaken within the APE along a 1.84 mile stretch of this 50.6- mile-long segment of railroad. Within the APE, the railroad retains its engineered grade, alignment, tracks, and grade crossings. Since the APE contains only a small portion of the overall 50.6-mile long rail line segment, the overall segment has not been surveyed in detail and no determination about the overall segment under Criterion C can be made at this time. **Criterion D**: This railroad segment does not appear to have the potential to yield further important information or data.

Integrity: The Kansas City Southern corridor segment between Leesville, Louisiana and De Quincy retains integrity of location, design, materials, workmanship, feeling, and association. Though trackage loss has occurred, the portions of the railroad corridor that remain in operation are in their historic footprint. The railroad corridor, still in active use, retains its association and feeling with railroad transit and freight transportation. Though maintenance and upgrades along the line have surely resulted in the loss or alteration of several individual features such as bridges, tracks, culverts, stations, and depot buildings, when structures were replaced, they were often similar in size, scale, and materials to the original features. The workmanship and design of this railroad corridor segment has also been largely maintained. The segment's setting is also generally intact with the railroads generally passing through the outskirts of small towns and long stretches of rural farmland.

Appendix J – Attachment 2: Arkansas Segment

Resource ID:	BE1974	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	9587 Wild Orchid Lane, Gentry, Arkansas

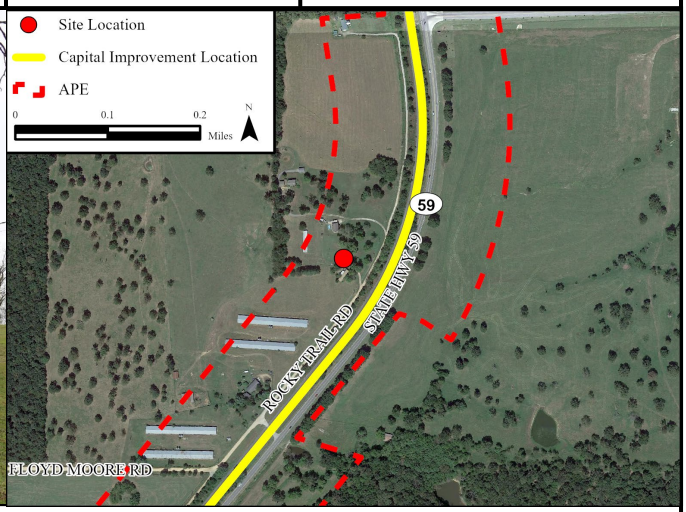


Description: The property is located along the west side of Wild Orchid Lane, within 200 feet west of the existing KCS Railway. The property is a rural 21.3-acre lot in proximity to mid-to-late 20th century agricultural and residential properties. The primary building on the property is a linear Manufactured House type with No Academic Style. The building appears to have been constructed in 2004 based on tax assessor records. Historic aerial photography shows several ancillary agricultural structures onsite in the early 1960s and 1970s. Only one small historic storage shed remains extant. Additional ancillary structures currently on the property include two small non-historic storage sheds, two large non-historic chicken houses, and a non-historic animal pen. Based on a field survey, the property was likely originally used as a poultry farm and appears to function as such in 2022. The house is clad in vinyl siding and features a cross-gabled roof with overhanging eaves and asphalt shingles. A front-gabled portico is situated on the west façade. Fenestration consists of 1/1 metal double-hung windows. The three small storage sheds are clad in replacement metal siding and feature either a metal front-gabled roof or metal shed roof. The two chicken houses are clad in replacement metal siding and feature front-gabled roofs with overhanging eaves and replacement metal. Fenestration consists primarily of 1/1 vinyl double-hung windows. The animal pen is an open-bay front-gabled structure.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. **Criterion A**: While the property is associated with mid-20th century residential and agricultural development in the region, it is not considered individually significant within the historic context of community development or agriculture. **Criterion B**: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C**: The property is largely characterized by late 20th century and early 21st century infill. The historic shed exhibits non-historic replacement materials and no longer conveys its period or method of construction. **Criterion D**: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location as it remains on its original site of construction. The property lacks integrity of setting, design, materials, workmanship, feeling, and association. The setting has been altered with the introduction of non-historic elements including a Manufactured House and ancillary structures. Integrity of design and materials has also been compromised by the addition of non-historic infill and the addition of non-historic materials to the remaining historic shed on the property. These changes disrupt the property's ability to convey its historic workmanship, as well as the feeling of a mid-to-late 20th century agricultural property. The property does not possess the features to convey a significant association with agriculture or architecture.

Resource ID:	BE1975	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	18917 Y City Road, Gentry, Arkansas

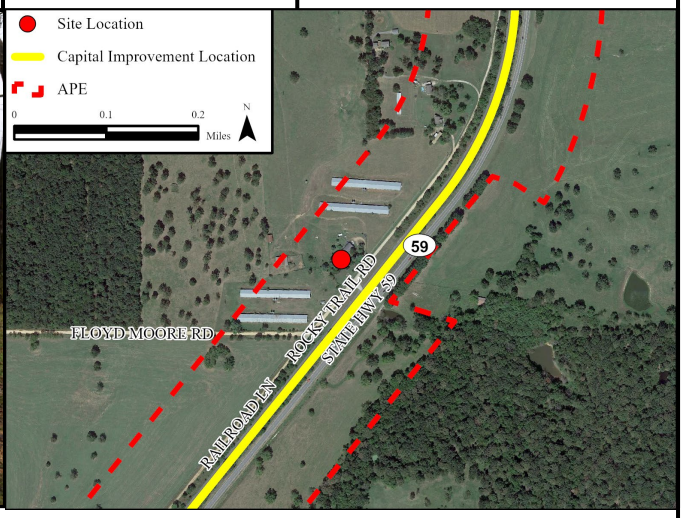


Description: The property is located along the south side of Y City Road, within 150 feet west of the existing KCS Railway. The property is a linear Plain-style frame house that appears to have been constructed in 1910 based on tax assessor records. The property is situated on a slightly overgrown 3.4-acre lot with mature vegetation and shade trees. Several mid-to-late 20th century agricultural and residential properties are in proximity to the north. The one-story, single-family residence features a front-gabled roof with overhanging eaves, asphalt shingles, and exposed rafter tails. The building is clad in horizontal wood siding. The house is accessed by a replacement six-panel wooden door on the east façade. Fenestration consists primarily of pairs of original 1/1 wooden double-hung windows; however, most appear damaged or have been boarded over with plywood.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. **Criterion A**: While the property is associated with early 20th century residential development in the region, it is not individually significant within the historic context of community development. **Criterion B**: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C**: The property does not possess distinctive characteristics or character-defining features of a period or method of construction. Further, the house exhibits the loss of some original wood siding and fenestration due to dilapidation. As a result, the property is not a good or representative example of an early 20th century residential structure. **Criterion D**: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location as it remains on its original site of construction. The property lacks integrity of setting, design, materials, workmanship, feeling, and association. Integrity of setting has been compromised by the addition of several mid-to-late 20th century agricultural and residential properties to the north. Integrity of design and materials has been compromised by the loss of original wood siding and fenestration. These changes disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of an early 20th century residential property. Due to these alterations, the property no longer possesses the features to convey a significant association with early 20th century architecture.

Resource ID:	BE2303	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	19100 Rocky Trail Road, Gentry, Arkansas

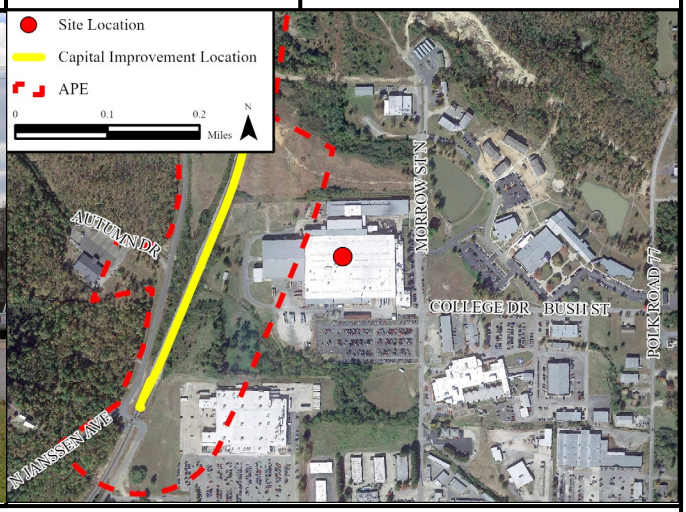


Description: The property is located along the west side of Rocky Trail Road, within 250 feet east of the existing KCS Railway. The property is a rural 2-acre lot in proximity to several mid-to-late 20th century agricultural and residential properties to the north and south. The property includes a one-and-one-half-story Bungalow that appears to have been constructed in the early 1960s based on aerial photography and correspondence with the current property owner. The house is clad in replacement vinyl siding and features a side-gabled roof with overhanging eaves and asphalt shingles. Two interior brick chimney stacks are present towards the center of the roof. A small side-gabled addition is present on the north elevation and a prominent front-gabled portico is centrally placed on the east façade. The portico roof is supported by two stone masonry posts situated on a raised concrete porch floor. The porch floor is accessed by a set of concrete steps and is bounded by a low stone masonry wall. A pair of French doors are present beneath the portico roof and provide access to the house. Fenestration consists primarily of 6/1 vinyl double-hung windows and 8/1 vinyl double-hung windows. A small, historic storage shed stands to the north of the residence. The shed is constructed of stone and features a front-gabled roof with overhanging eaves and asphalt shingles. A small, shed roof awning addition extends from the east elevation.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. **Criterion A**: While the property is associated with mid 20th century residential development in the region, it is not individually significant within the historic context of community development. **Criterion B**: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C**: The property does not possess distinctive characteristics or character-defining features of a period or method of construction. Further, the house exhibits the loss of it historic form with the side-gabled addition and loss of materials with replacement vinyl siding and windows. As a result, the property is not a good or representative example of a mid 20th century residential building. **Criterion D**: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction in an area characterized by mid-to-late 20th century agricultural and residential development. The property lacks integrity of design, materials, workmanship, feeling, and association. Integrity of design and materials has been compromised by the Bungalow's altered form and replacement materials including non-historic vinyl siding and windows. These changes disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of a mid 20th century residential property. Due to these alterations, the property no longer possesses the features to convey a significant association with mid 20th century architecture.

Resource ID:	BE2339	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	19084 Rocky Trail Road, Gentry, Arkansas

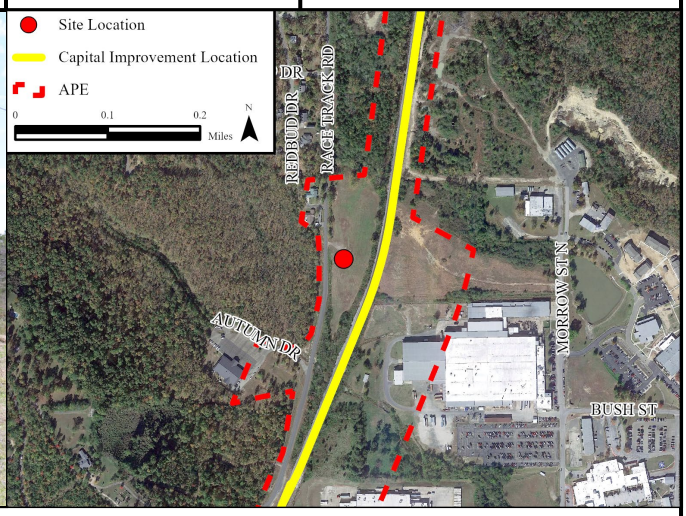


Description: The property is located along the northwest side of Rocky Trail Road, within 200 feet northwest of the existing KCS Railway. The property is a rural 6.4-acre lot in proximity to mid-to-late 20th century agricultural and residential properties to the north and south. The oldest building onsite is a Bungalow that likely dates to the 1930s or 1940s based on its typology and historic materials. However, based on aerial photography, this building is not original to the property and was likely moved onsite ca. 1980. The property also includes four ancillary structures: a large historic open-bay barn, one small historic storage shed, one small non-historic storage shed, and a non-historic linear Manufactured House. The historic Bungalow features a front-gabled roof with overhanging eaves, asphalt shingles, and exposed rafter tails. It is largely clad in replacement asphalt roll siding and stands on a non-historic raised concrete block foundation. A front-gabled, partially-enclosed portico is centrally placed on the southeast façade. Fenestration consists primarily of 1/1 metal double-hung windows of varying sizes. The historic side-gabled barn is clad in replacement metal siding. The historic shed features a shallow gambrel roof and replacement metal siding. A front-gabled non-historic shed is also clad in replacement metal siding. The cross-gabled Manufactured House stands on a concrete block foundation. A central front-gabled portico roof and raised wooden deck are present on the southeast façade. Fenestration consists primarily of 1/1 vinyl double-hung windows with decorative vinyl shutters.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. **Criterion A**: While the property is associated with mid-to-late 20th century residential and agricultural development in the region, it is not individually significant within the historic context of community development. **Criterion B**: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C**: The property is largely characterized by late 20th and early 21st century infill. The historic Bungalow and shed exhibit non-historic replacement materials and no longer convey their period or method of construction. **Criterion D**: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property lacks integrity of location, setting, design, materials, workmanship, feeling, and association. The historic Bungalow appears to have been moved to this property and is surrounded primarily by late 20th and early 21st century ancillary infill. Integrity of design and materials has been compromised by the addition of non-historic infill and the addition of non-historic materials to the Bungalow and historic shed. These changes disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of a mid-to-late 20th century agricultural property. The property does not possess the features to convey a significant association with agriculture or architecture.

Resource ID:	PL0128	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	500 Morrow Street N, Mena, Arkansas



Description: The property is located along the west side of Morrow Street N, within 500 feet east of the existing KCS Railway. The property features a large industrial complex that was first constructed in 1966. Based on aerial photography, the complex was expanded in phases during the late 20th and early 21st centuries. The property historically served as a US Motors Manufacturing facility. It continues to function as an operational manufacturing facility under the ownership of NIDEC. The historic core of the complex is a large 2-story, flat-roofed building with a square footprint. The building is clad in non-historic metal siding and is fronted by a historic 1-story office section along the east façade. The office section is constructed of brick and features several symmetrically placed multi-light and vertical metal industrial windows delineated by wide brick buttresses. A central entryway provides access to the building and is comprised of a large multi-light picture window situated beneath a prominent storefront fascia. The fascia is clad in non-historic metal and bears signage advertising the NIDEC and US MOTORS name. Several large flat-roofed additions are present to the north and west. The property is situated on a paved lot in proximity of several other mid-to-late 20th century commercial and industrial facilities.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. **Criterion A**: While the property is associated with the history of US Motors, the property is not considered individually significant as a representation of regional industrial growth. **Criterion B**: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C**: The property has been extensively altered with non-historic materials and additions. As a result, the property no longer possesses the features to be considered a significant example of mid 20th century industrial architecture. **Criterion D**: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction surrounded by mid-to-late 20th century commercial and industrial facilities. The property lacks integrity of design, materials, workmanship, feeling, and association. Integrity of design has been compromised by several late 20th and early 21st century additions altering the historic footprint of the building. Non-historic replacement materials including non-historic metal siding have resulted in the lack of integrity of design and materials as well. These changes disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of a mid 20th century industrial property. The property does not possess the features to convey a significant association with industry or architecture.

Resource ID:	PL0130	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	203 Polk County Road 117, Mena, Arkansas

Description: The property is located along the east side of Polk County Road, within 250 feet west of the existing KCS Railway. Based on aerial photography, tax assessor's records, and a field survey, the single-pen Plain-style frame house appears to have been constructed in 1971. The building stands on a 2-acre lot in proximity of other mid-to-late 20th century residential architecture. The one-story building has a pier foundation and is clad in horizontal wood siding. It features a side-gabled roof with overhanging eaves and asphalt shingles. A recessed shed porch roof is present along the length of the north façade. The porch roof is supported by four wooden posts situated on a slightly raised wooden deck. Two non-historic 6/6 metal double-hung windows and a single wooden entrance door are present beneath the porch roof. Additional fenestration consists of one non-historic 4/4 metal double-hung window on the west elevation and a single six-panel wooden entrance door on the rear elevation.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. **Criterion A**: While the property is associated with late 20th century residential development in the region, it is not individually significant within the historic context of community development. **Criterion B**: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C**: The property does not possess distinctive characteristics or character-defining features of a period or method of construction. Further, the house exhibits non-historic alterations including metal windows. As a result, the property is not a good or representative example of a late 20th century residential structure. **Criterion D**: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction in proximity to other mid-to-late 20th century residential structures. The property lacks integrity of design, materials, workmanship, feeling, and association. Integrity of design and materials has been compromised by the introduction of non-historic materials including metal windows. These changes disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of a mid-to-late 20th century residential property. Due to these alterations, the property no longer possesses the features to convey a significant association with mid-to-late 20th century architecture.

Resource ID:	3PL1649	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Mena

Description: Site 3PL1649 is a precontact low density lithic scatter. The site was recorded as a single positive shovel test containing three non-diagnostic lithic flakes. The site is bound to the north and south but is unknown from the west and east of the positive shovel test. As a result, the known site boundary is rectangular in shape, measuring 20 m east to west and 10 m north to south. Shovel test MN.A64 exhibited two stratum and bedrock. The upper strata consisted of 45 cm of 10YR 4/3 sandy clay intermixed with pebbles and gravel underlain by yellowish brown (10YR 5/6) sandy clay loam from 45 to 55 cmbs. At 55 cmbs, shale bedrock was reached. Soils appeared to be redeposited and were mounded up along the rail ballast. The artifacts were recovered from a depth of 0 to 30 cmbs and are likely comprised of Pierson chert. The surrounding vegetation was dense pine saplings interwoven with greenbrier and dewberry. A stream is located north and downhill from the location of the positive shovel test. Five delineations at 5m intervals were completed, two north, two south, and one east. A fence line runs north to south along the eastern edge of the railroad ROW. These tests contained some mixed mottled soils including modern railroad materials and increasing amounts of degraded shale bedrock. There is a possibility the soils in this location are fill from construction and clearing of the railroad ROW. In particular, the presence of railroad spikes and clips in the first strata would suggest that the location is disturbed.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition, the site apparently lacks significant data potential. As the site was not fully delineated due to the constraints of the survey area, the eligibility status of site 3PL1649, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

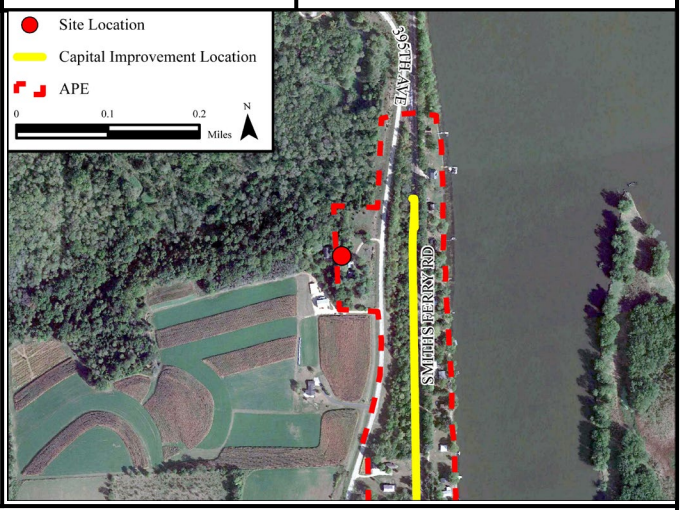
Integrity: Site 3PL1649 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 3PL1649 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Appendix J – Attachment 3: Illinois Segment

Resource ID:	IL-MC-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	5122 N Bennett Rd, Monroe Center, Illinois

Description: The property is a farmstead comprised of a historic I-House farmhouse, historic Transverse Crib barn, historic detached garage, historic shed, and non-historic dovecote. The property is located approximately 470 feet to the south of the railroad. The historic farmhouse and outbuildings are first visible on a 1953 historic aerial photograph. Based on the building types and materials present, the I-House appears to date to the early-to-mid-nineteenth century. As per the historic aerial photographs, the outbuildings most likely date to the 1940s.

The historic farmhouse is an east facing two-story wood framed building with a large one-story historic addition to the rear façade. The house is set on a poured concrete foundation and is covered by a non-historic standing seam side-gabled roof. The house is clad in non-historic vinyl siding and is fenestrated with non-historic 1/1 vinyl windows and historic wood 2/2 windows. The house also features a brick chimney to the left of the front façade and a front-gabled portico supported by squared replacement wooden porch supports. The historic one car garage is located to the south of the I-House. The garage has been heavily altered; it features a non-historic garage door and is contained under a non-historic metal hipped roof. The garage is sided with non-historic wooden siding and features a non-historic 1/1 vinyl window. The historic Transverse Crib barn, historic shed, and non-historic dovecote are located across North Bennett Road from the I-House. Both the barn and the shed are covered with non-historic metal siding and are contained under non-historic standing seam metal roofs. The dovecote is shaped like a silo and is contained under a conical metal roof with hog-wire type siding.

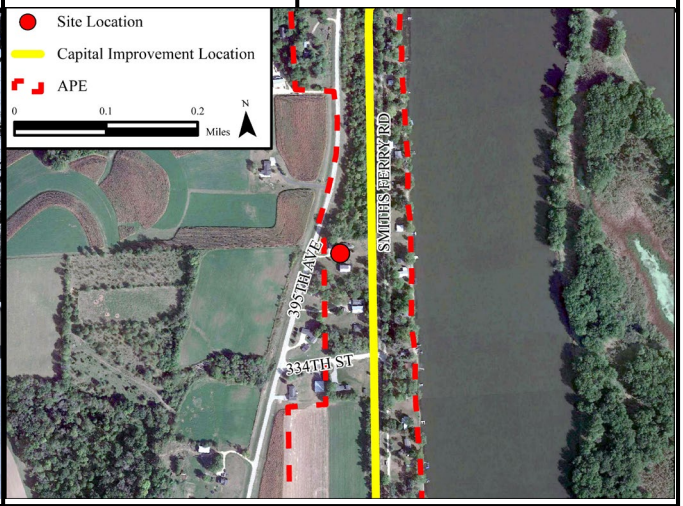


National Register Evaluation: This property is recommended not eligible for the National Register. **Criterion A:** While the property is associated with early-to-mid-nineteenth century residential and agricultural development in the region, it is not individually significant within the historic context of community development or agriculture. **Criterion B:** Research conducted has not identified any connection between the property and any historically significant individuals. **Criterion C:** The property has distinctive characteristics of an I-House; however, it does not serve as a good and representative example due to a lack of integrity. **Criterion D:** The property does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic location and remains in a rural residential setting. The farmhouse remains in use as a residence, and the outbuildings retain their historic association with rural residential and agricultural development in the area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the historic siding and windows on most of the buildings on the property. These substantial alterations have diminished the integrity of feeling and the property no longer conveys the feeling and aesthetic of its period of construction.

Appendix J – Attachment 4: Iowa Segment

Resource ID:	IA-BV-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	I-Sites: 49-00607, 49-00608, 49-00609	**Location:**	33420 395th Ave Bellevue, Iowa

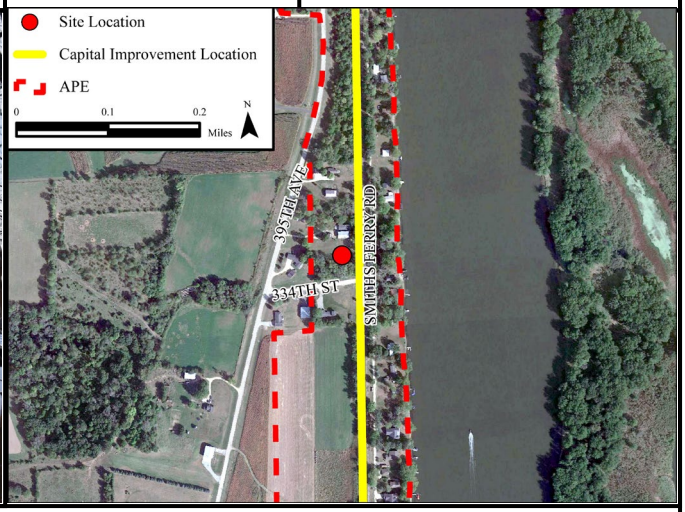


Description: The property is a vernacular gable ell house that was once part of a farmstead and has been significantly altered. The building appears to have been constructed in the late nineteenth or early twentieth century based on tax assessor records and architectural analysis. The property is approximately 350 feet west of the railroad. The building faces east towards the Mississippi River and is in a rural agrarian setting. The house consists of a 2-bay, 2-story, gable front main block and a 2-bay south ell. It is clad in aluminum siding and topped by an asphalt shingle roof; a brick chimney splits the gable. The building's primary entry is in the east elevation of the ell, sheltered beneath a non-historic replacement wood porch which spans the ell and the west half of the façade. The porch has four stone pedestals supporting chamfered wood posts and a flat roof of unfinished lumber; there is no decking. Fenestration throughout consists of 1/1 vinyl replacement windows. On the building's side (south) elevation there is a bay window and a non-historic, deteriorated screened in porch with a shed roof. There is a 1 ½ story garage behind the house. The garage, constructed in the 2000s, is 3 bays and has a gable front standing seam metal roof, vertical metal siding, two rollup garage doors, and vinyl 6/6 windows. A metal cupola splits the gable's ridgeline. There is a gabled barn northwest of the garage; the barn was not clearly visible from the public right of way but appears to be clad in vertical board siding and is in a deteriorated state. A three-sided, 2 bay shed stands to the east of the barn, north of the garage.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with early twentieth century residential development in the region, it is not individually significant to the historic context of the community development. The property was also examined within the context of agriculture due to its history as a farm. Because the historic design of the farmstead is heavily altered with the large garage built in its center in the 2000s, it no longer effectively conveys its historic association with agriculture. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property has distinctive characteristics of a gabled ell house; however. it does not serve as a good representative example of its type due to lack of integrity. **Criterion D:** This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting. It remains at its historic construction site and retains its rural residential and agricultural setting. While it remains in use as a residence, it has lost its historic association with farming due to alterations to the farmhouse and the construction of the garage. The integrity of design, materials, and workmanship have been compromised due to the replacement of historic materials, deterioration of the barn, and construction of the large garage. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	33139-33141 395th Ave, Clinton, Iowa

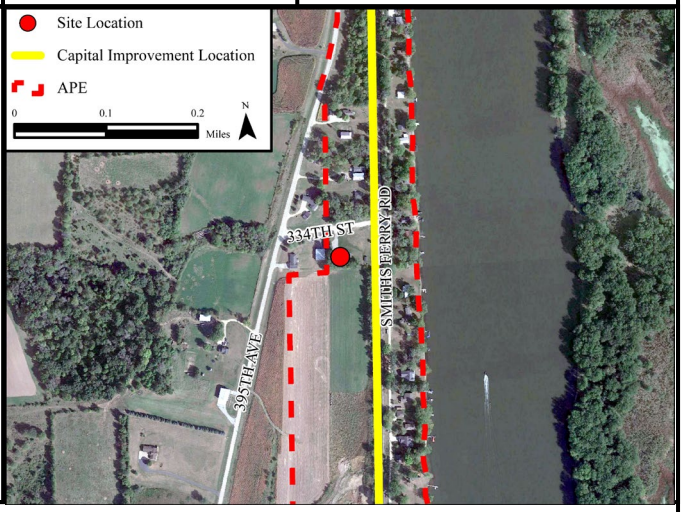


Description: The property consists of one vernacular residential building and two garages. The house and the southerly garage appear to have been constructed in the 1950s based on aerial photographs and tax assessor records. The second garage, located just west of the residence was built around 1995. The property is approximately 100 feet west of the railroad. The property sits in a rural landscape with surrounding buildings consisting of mid-century or later residences. The house is the northeast building of the complex. It is a side gabled, 1-story, 3-bay building with the façade facing south and an easterly extension that was not clearly visible from the public right of way. It is clad in non-historic vinyl siding and has an asphalt shingle roof with an interior brick chimney on the ridgeline. The house is fenestrated with single light vinyl casement windows in single or triple groupings. The historic southerly garage is a simple building with a shallow gable roof, oriented east to west. It is clad in standing seam metal siding and has a standing seam metal roof. It has a tall, metal, rollup garage door on its north and west elevations. The non-historic garage west of the house is a 1 ½ stories, 2 bays wide, gable front building clad in vinyl siding with an asphalt shingle roof. The south elevation has two rollup garage doors and a shed roof porch runs along the east elevation of the building. Fenestration consists of paired single-light, vinyl casement windows; one such window is in the gable above the garage doors, sheltered by a slight projection of the gable peak.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid-twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction and has diminished integrity (see below). **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural area developed with mid twentieth century seasonal residences. Additionally, the property remains in use as a residence and therefore retains its historic association with rural development in the area. Its integrity of design, materials, workmanship, and feeling are greatly diminished. Almost all of the materials on the two 1950s buildings – the northeast house and the southerly garage – are replacement materials. The substantial loss of historic design, materials, and workmanship has diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	32981 395th Avenue, Bellevue, Iowa

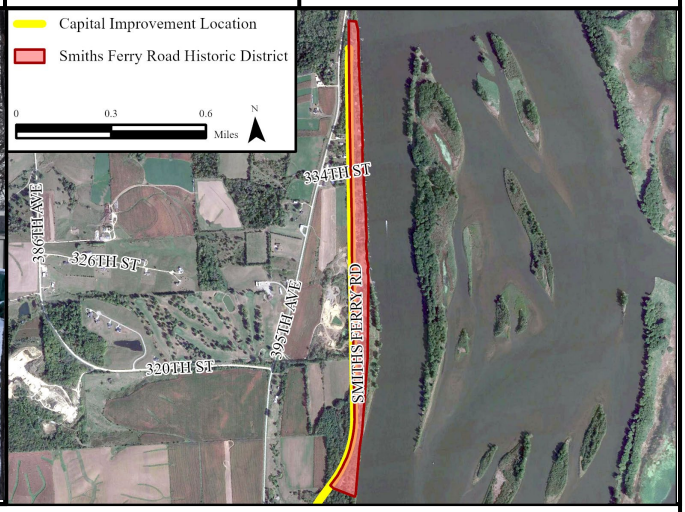


Description: The property is a residence with detached garage which appears to have been constructed in the mid-1940s, based on aerial photographs and tax assessor records. The building is a hipped roof bungalow that sits in a largely rural setting with surrounding properties consisting of mid-twentieth century seasonal camps and late-twentieth century residences. The building is approximately 50 feet west of the railroad. The building's west elevation is not visible from the public right-of-way because of its distance from the road and intervening vegetation. The building is 3 bays wide and 1 story in height, clad in non-historic vinyl siding, and capped by a shallow, asphalt shingle-clad, pyramidal roof with widely overhanging eaves. There is a broad, exterior brick chimney on the west elevation. The east elevation is spanned by an enclosed porch with a central metal storm door and continuous bands of 1/1 aluminum windows that partially wrap around the side elevations. There are two outbuildings situated to the south of the house. One is a small, gabled shed which appears to have been constructed between 1957 and 1966 based on aerial photographs. The other is a larger, gabled garage to the southwest of the house built in the mid-1950s based on aerial photographs. Neither outbuilding is clearly visible from the public right-of-way due to intervening vegetation, but both appear to be clad in vinyl siding and have asphalt shingle roofs.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with early to mid-twentieth century residential development in the region that was driven by the recreational opportunities of the nearby Mississippi River, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property has distinctive characteristics of a hipped roof bungalow; however, it does not serve as a good and representative example due to a lack of integrity (see below). **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting near an enclave of seasonal camps along the Mississippi River. The building remains in use as a residence and thus retains its historic association with rural development in the area. However, the building's integrity of materials, workmanship, and design have been compromised through the replacement of original siding materials with vinyl and the enclosure of the easterly porch with bands of aluminum windows. The enclosure of the porch has erased the deep, open porch, a key design feature of bungalow houses. This substantial alteration has diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-004	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	39609 334th St, Bellevue, Iowa

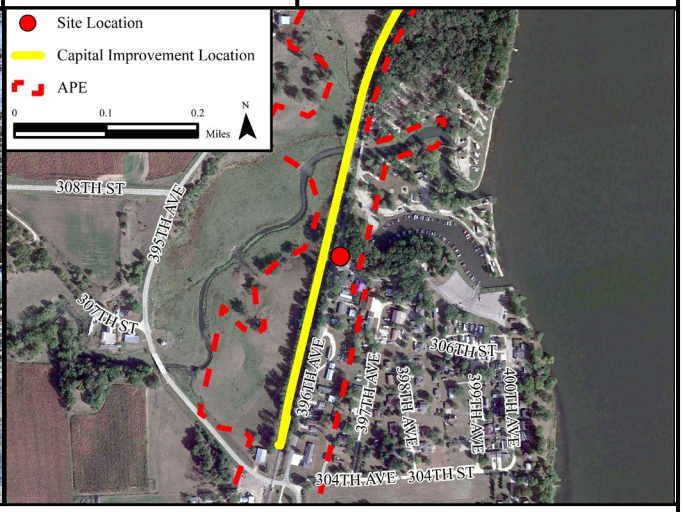


Description: The property is a heavily altered ranch house built in 1974 based on tax assessor records. It is situated in an area consisting of seasonal cottages on the bank of the Mississippi River. The property is approximately 125 feet west of the railroad. The 1-story, side gabled, main block of the ranch house is flanked by a large, gable-front, 2-story addition on the east side and 1-story attached gable-front garage on the west side. The building rises off a concrete foundation, is clad in non-historic vinyl siding, and has asphalt single-clad roofs. The main block contains a centralized primary entrance with a single light door accessed by a set of wooden steps. There is a band of four tall, narrow, replacement vinyl casement windows set beneath a shallow gable east of the entrance. A paired, replacement vinyl casement window and a similar single casement window are to the west of the entrance. The 2-story addition's north elevation has a paired, replacement vinyl casement window on each story while its east elevation has matching paired vinyl casement windows on each story. The garage addition has a broad, shallow, gable and a 2-car, rollup garage door with panels and faux hinges. A small, detached, gable-front garage clad in novelty siding sits to the east of the house. It has one bay enclosed with horizontal wood boards on the north elevation. Based on historic aerial photographs, it was likely built at the same time as the house in 1974.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid-twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction and the building has been significantly altered through additions and replacement materials. **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location ,setting, and association. The property remains at its historic construction site and remains in a rural residential setting nearby an enclave of seasonal camps along the Mississippi River. The building remains in use as a residence and therefore retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of windows and siding, as well as the presence of the two-story addition which obscures the house's original one-story, side gabled, ranch house form. These substantial alterations have diminished the integrity of feeling and the building no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-005	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	Smiths Ferry Road, Bellevue, Iowa

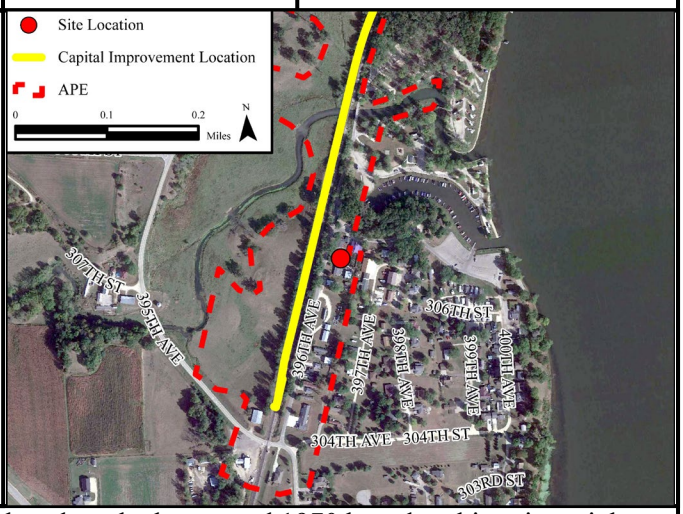


Description: This resource is the Smiths Ferry Road Historic District. Smiths Ferry Road is a linear, north-south road bound to the west by the railroad tracks. The historic district contains 46 residences that front the Mississippi River; 41 of them are on the east side of Smiths Ferry Road and 5 are at the northerly terminus of 396th Ave. Most of the properties are seasonal camps; only several are year-round residences. They are situated on level lawns interspersed with mature trees. Of the 46 houses, 29 were constructed between 1951 and 1960 based on aerial photographs and parcel records, while 5 were built in the 1940s. The properties are owned by the U.S. Army Corps of Engineers and leased to the public as "cottage sites" through the Cottage Site Program. Buildings constructed within the district's historic period of development (around 1940 – 1960) are vernacular camps and share common historic features: wood or concrete block frames; shed, shallow gable, or hipped roofs with asphalt shingles; concrete slab or pier foundations; and aluminum or vinyl siding (just a handful have wood siding). Historic fenestration patterns are somewhat intact although most of the homes have replacement windows that include either sliding casement windows, awning windows, or 1/1 sash windows. Decks or enclosed porches are typically found on the east (river) side of the buildings; most appear to be replacement decks and most of the original porches have been enclosed. Most properties have detached garages and/or small sheds, as well as docks and boat launches. Some of these camps retain historic elements of mid-20th century modern design that include banks of windows facing the river, projecting shed roofs, and/or hipped roofs.

National Register Evaluation: The property is recommended **not eligible** for listing in the National Register. **Criterion A:** The construction of the property is associated with the Army Corps' mid-20th century land management initiatives as a strong example of a planned community developed by the Army Corps between 1951 and 1960 as part of the Cottage Site Program. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** Buildings in the district are examples of mid-20th century modern vernacular architecture. Most have been altered so significantly that they no longer retain integrity as mid-20th century houses resulting in the district lacking overall integrity. **Criterion D:** This recreational property type does not appear to have the potential to yield further important information or data.

Integrity: The historic district retains integrity of location and setting. Its location and limits of improvement endure from the historic development that culminated in 1960. The district's setting on the Mississippi River and the uniform setbacks and parklike character of the building lots are also intact. However, only 13 of the 33 pre-1960 properties retain enough integrity to be contributing resources. The historic design and materials of many camp buildings are no longer intact. The overall historic form, materials, and workmanship of most of the buildings are diminished to the extent that most are unable to convey a sense of their mid-20th century period of construction. Alterations to the district have negatively impacted its feeling and aesthetic as a mid-20th century camp community.

Resource ID:	IA-BV-006	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	30711 396th Ave, Bellevue, Iowa

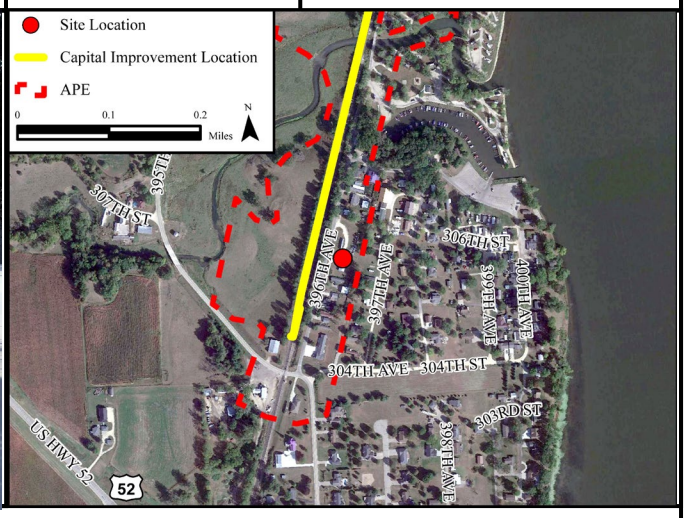


Description: The property, known as Spruce Creek Park, is a 43-acre seasonal park, campground, and marina located adjacent to the east of the railroad. The park was developed in the 1950s or early 1960s based on aerial photographs, which show a similar network of roads as exists today and a small boat marina. However, the park has been altered many times since its development. The park is situated around a small inlet with a marina known as Spruce Creek Harbor. The entrance to the park is at the terminus of 396th Ave. The entrance contains a metal gate and two maintenance buildings. Based on aerials photographs, it appears that the south building was constructed between 1966 and 1972 and the north building was constructed between 1972 and 1982. The buildings are clad in standing seam metal siding with shallow gable metal roofs. The south building has a single light metal door and a metal rollup garage door on the south elevation. A small addition on the east side contains another single light metal door on its south elevation. Two window openings on the west elevation are covered by metal grates. The north building faces the park road and has sliding metal doors on the west side and a metal slab door on the south elevation. The park was not accessible during the field inspection. Some landscaping features observed include roadways, lawns interspersed with trees, and a boat launch area. Wood and stone pavilions and a concrete block building likely containing restrooms and showers were also observed. The park landscape and structures have been altered numerous times since then due to flooding, upgrades, and landscaping efforts to provide more parking.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid-20th century recreational development along the Mississippi River in this region, it is not individually significant within the historic context of riverfront recreation. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** While the property embodies some distinctive characteristics of a campground, many of these features do not date from the park's historic period of development or have been replaced and thus the property lacks integrity. **Criterion D:** This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association, the property remains in its historic development site and its residential and wooded setting on the Mississippi River remains intact. The property conveys its continued use as a campground and therefore it retains its historic association with recreation in this area. The overall historic design of the park's roadways, campsite locations, and central marina remain intact; however, many of these individual components were altered in the 1980s, and buildings and structures have been replaced throughout the years. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-007	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	30665 396th Ave, Bellevue, Iowa

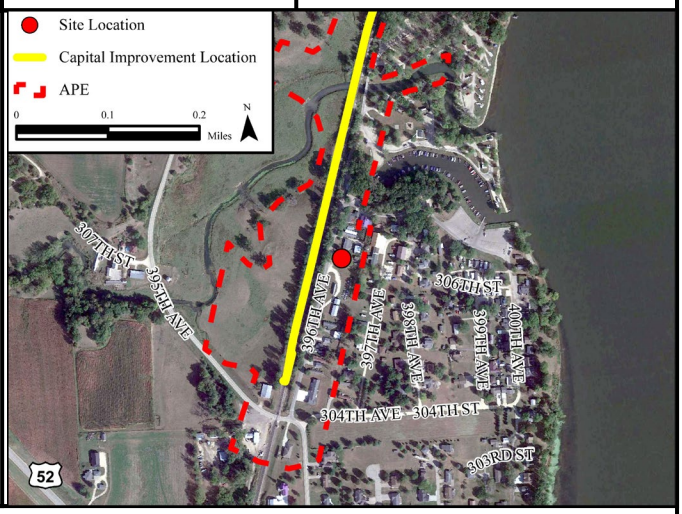


Description: The property is a mobile home that was placed on the lot around 1970 based on historic aerial photographs and a two-car garage built around 1990. Although aerial photographs indicate that other mobile homes were placed in the surrounding area during the 1960s and 1970s, many of these structures were replaced with newer mobile homes and other residences were added to the neighborhood in the 1980s and 1990s. The property is approximately 100 feet east of the railroad. The building is one story, 6 bays in length with a shed roof addition on the north side. It is clad in vinyl siding and topped by a shallow side gable asphalt shingle roof. The addition has a standing seam metal shed roof. The building's façade faces south and is simply fenestrated. The primary entry is located in the third bay from the west and consists of a single light wood door accessed by a low wood stoop. The remaining fenestration consists of replacement 1/1 vinyl double hung windows, a three light vinyl casement window, and a small canted bay window with a shed roof. The west elevation of the addition contains a second entrance sheltered beneath a shallow porch supported by decorative aluminum columns. The porch also shelters two 1/1 double hung vinyl replacement windows. There is a freestanding, non-historic garage directly north of the addition. The garage is 3 bays wide, covered by a gable front asphalt shingle roof, and clad in vinyl siding. Its façade faces west and features a two car roll up garage door and a solid wood pedestrian door.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid to late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property has distinctive characteristics of a mobile home; however, it does not serve as a good and representative example due to a lack of integrity (see below). **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data

Integrity: The property retains integrity of location and association. The property remains at its historic construction site. The mobile home remains in use as a residence and therefore retains its historic association with development in the area. However, the integrity of setting is diminished. Originally placed on a lot within a small complex of mobile homes, newer homes erected after 1982 have resulted in the neighborhood no longer retaining the characteristics of a mobile home park. The integrity of design, materials, and workmanship have been compromised due to altered and replacement fenestration, replacement siding, and the construction of the north addition sometime in the late-1970s. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-008	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	30571 396th Ave, Bellevue, Iowa

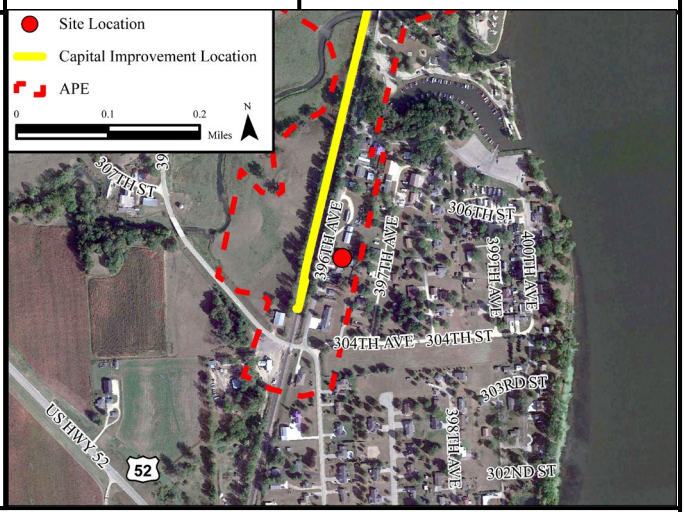


Description: The property is a small commercial complex composed of two garages and a large gas storage tank. Based on aerial photography, the south garage and a gas tank in the same location were erected between 1966 and 1972. The second smaller garage to the north was built between 1972 and 1982 based on aerial photography. The property is approximately 130 feet east of the railroad. The property sits within a dense, residential development that was developed with several mobile homes in the 1960s and 1970s; the neighborhood was expanded in the 1980s and became more densely developed with residential buildings. The historic south building is a 1-story, 5-bay garage that sits on a concrete foundation, is covered with original metal siding, and has a side gabled, standing seam metal roof. The building's façade faces west and each of the façade's 5 bays contains a metal roll up garage door; these doors appear to be replacements. The second building, located just north of the first building, is a taller, 1-story, 3-bay garage. It sits on a concrete foundation, is covered with original metal siding, and has a side gabled, standing seam metal roof. This building's façade also faces west, and it has two tall, roll up metal garage doors as well as a solid metal entry door. Based on their appearance and condition, the doors are likely the original doors. The final component of the property, the gas storage tank, is approximately 35 feet long and sits on two concrete cradles. The gas tank is a newer tank, although it appears to sit on the original concrete cradles.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid-to-late twentieth century commercial development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction due to a lack of integrity. **Criterion D:** This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and association. The property remains at its historic construction site, although its integrity of setting is diminished. When the south garage was erected, its setting was composed of only several mobile homes; this changed in the 1970s and 1980s as the surrounding neighborhood became larger and more densely developed. The integrity of design, materials, and workmanship have been compromised due to the replacement of the garage doors on the south building, a key element of a commercial garage building. The property's overall historic design is also diminished by the later addition of the north building. These alterations have diminished the integrity of feeling and the property no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-010	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	30629 396th Ave, Bellevue, Iowa

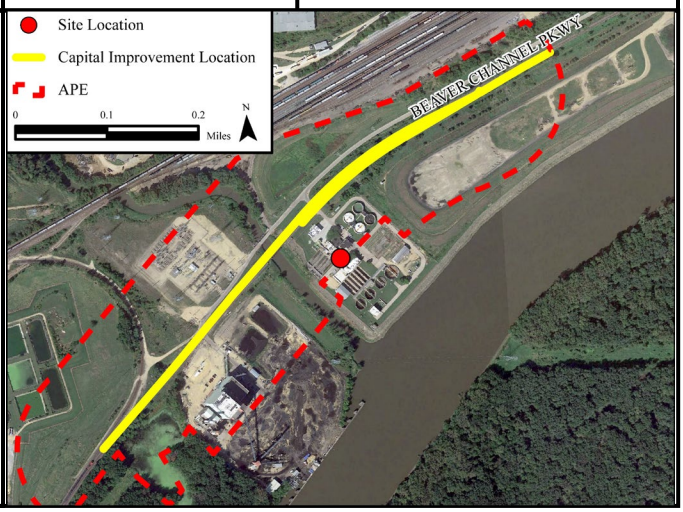


Description: The property is a mobile home that was placed on this lot around 1970 based on aerial photographs. On its north elevation, the building has a carport that was added in the 1990s. It was one of several mobile homes built in this neighborhood during the late 1960s and early 1970s; today, the neighborhood can be characterized as a subdivision containing a mix of mobile homes and non mobile homes, most of which date from the 1980s and 1990s. The building is 1-story, 5-bays, with a shed roof carport on the north side. It is clad primarily in original vertical corrugated metal siding and topped by a shallow side gabled, corrugated metal roof. The building's façade faces south and has two entrances. The entrance in the westernmost bay has a 2 light metal door accessed by wood steps. The easternmost entrance has a single light metal door also accessed by wood steps and sheltered by a metal awning with narrow brackets. There are three windows between the entrances which are a mix of original 1/1 aluminum and replacement 1/1 aluminum sash in different sizes and shapes. The north and south walls of the mobile home project slightly out past the west side elevation wall; these projections support the overhanging west gable. Two replacement 1/1 aluminum sash windows are on this elevation, set within a portion of siding that appears to be non-historic T-111. All windows have vinyl shutters. The carport is constructed of bracketed wood posts with a corrugated metal kneewall and fiberboard enclosing the north side.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property has distinctive characteristics of a mobile home; however, it does not serve as a good and representative example due to a lack of integrity (see below). **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data

Integrity: The property retains integrity of location and association. The property remains at its historic construction site. The mobile home remains in use as a residence and therefore retains its historic association with development in the area. However, the integrity of setting is diminished. Originally placed on a lot within a small complex of mobile homes, newer homes erected after 1982 have resulted in the neighborhood no longer retaining the characteristics of a mobile home park. The integrity of design, materials, and workmanship have been compromised due to some replacement fenestration and siding, and the construction of the carport in the 1990s. This substantial alteration has diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-BV-011	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	30541 396th Ave, Bellevue, Iowa



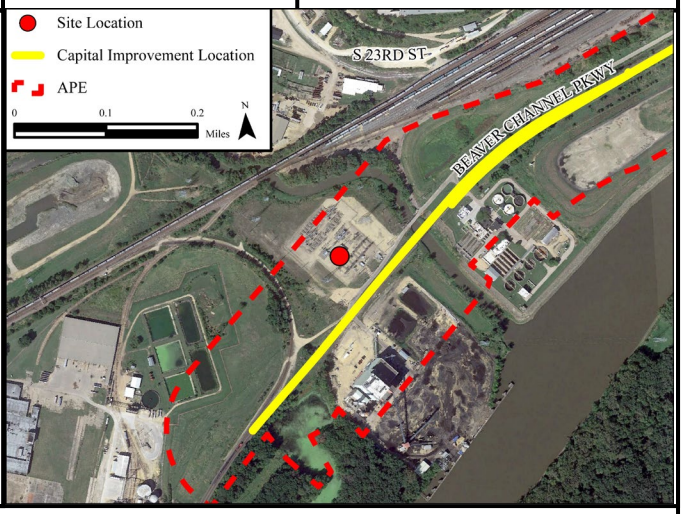
Description: The property consists of a mobile home that was placed on the lot during the late 1960s or early 1970s based on aerial photographs. Although aerial photographs indicate that other mobile homes were placed in the surrounding area during the 1960s and 1970s, many of these structures were replaced with newer mobile homes and other residences were added to the neighborhood in the 1980s and 1990s. The property is approximately 100 feet east of the railroad. The building is 1-story, 6 bays wide, with a combination open and enclosed shed roof porch across the entire south façade. The building is clad in non-historic vinyl siding and topped by a shallow side gabled asphalt shingle roof. The west half of porch, built in the 1990s, is an open porch with square wood posts and a wood balustrade. The primary entrance is sheltered by the porch and consists of a metal door with a storm door. There is a 1/1 window with a metal storm window left of the entrance, and a similar but shorter window is to the east of the entrance. Both windows are flanked by vinyl shutters. While the enclosed porch may date from the building's original construction, its materials have been altered. The enclosed porch has a full width band of 1/1 aluminum storm windows on its south side which partly wrap its west side. A secondary entrance on the west side of the porch contains a metal door with a storm door. The west elevation has a paired window with storm windows and a metal awning set in a gabled projection tucked beneath the overhanging eaves. A tall, 3 bay, gable front garage sits to the southeast of the mobile, built in the 1990s. It has corrugated metal siding and metal rollup garage doors.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property has distinctive characteristics of a mobile home; however, it does not serve as a good and representative example due to a lack of integrity (see below). **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and association. The property remains at its historic construction site. The mobile home remains in use as a residence and therefore retains its historic association with development in the area. However, the integrity of setting is diminished. Originally placed on a lot within a small complex of mobile homes, newer homes erected after 1982 have resulted in the neighborhood no longer retaining the characteristics of a mobile home park. The integrity of design, materials, and workmanship have been compromised due to altered and replacement fenestration, replacement siding, and the addition of the west side of the porch in the 1990s. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-CA-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1901 Beaver Channel Parkway, Clinton, Iowa

Description: The property is the former City of Clinton Water Pollution Control Plant which was constructed in 1958 and expanded over the course of 60 years. It is approximately 290 feet south of the railroad. The plant was retired in 2013 when a new regional facility was constructed nearby, although a concrete pump station building built in 2011 remains in service to accommodate high water flows. The property sits in an industrial area adjacent to Mill Brook and Beaver Channel. It contains buildings, sheds, settling basins, holding tanks, purifiers, pumping and water treatment equipment, and other components typical of sewage treatment plants. The central Administration Building is 1-2 stories tall with multiple wings, a buff brick façade, and a flat roof. Its 1 story northeast wing has International Style elements such as banks of aluminum windows. Remaining windows on this building are single-pane, aluminum casement windows with brick sills. A second building south of the main building has the same brick veneer, as well as a tripartite entrance composed of recessed, aluminum and glass doors and windows with transoms. Additional smaller, mid-twentieth century buildings housing equipment are scattered throughout the complex and have the same materials as the main building. There are four circular tanks at complex's south corner and two rectangular holding tanks to the west. There are also two late 20th century gabled equipment sheds at the east and southwest portions of the property, and a large, gabled, metal and concrete salt storage shed was built in the late-2010s, replacing four concrete tanks.

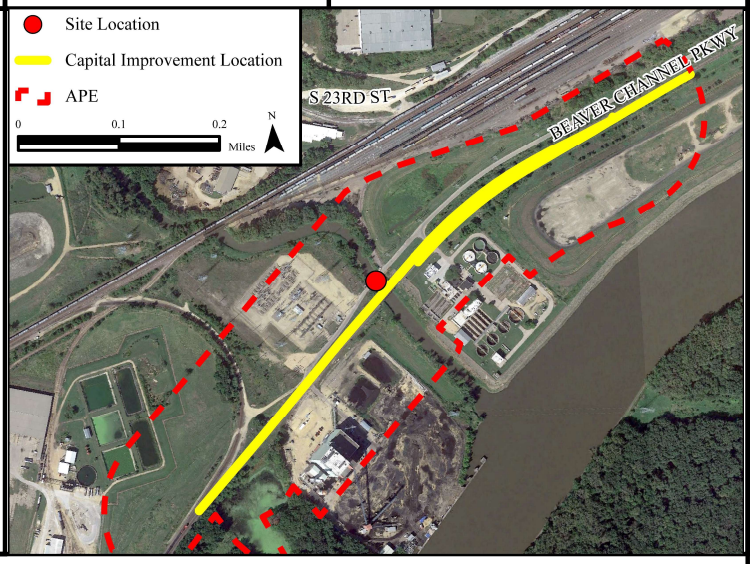


National Register Evaluation: The property is recommended **eligible** for listing in the National Register. **Criterion A:** The property is significant for its association with post-WWII residential, industrial, and commercial growth in the Clinton region, providing a critical public utility to enable this development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property is a good example of a mid 20th century industrial complex. The Central Administration Building has very distinctive elements of the International Style on its northeast wing, which features a bank of floor-to-ceiling aluminum casement windows with spandrels across its entire front elevation, while other elevations exhibit brick veneer. The use of these materials and the mid-century aesthetic carry over into other, secondary buildings in the complex developed through the end of the century, including an additional building as well as circular and rectangular holding tanks, a salt storage shed, and gabled equipment sheds. **Criterion D:** This industrial property type does not appear to have the potential to yield further important information or data.

Resource ID:	IA-CA-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1901 Beaver Channel Parkway, Clinton, Iowa

Integrity: The property retains integrity of location, design, setting, materials, workmanship, feeling, and association. The property remains at its historic construction site and its industrial setting remains intact. The design and materials of the two principal buildings are highly intact, including the buff brick facades and aluminum windows and doors also found on secondary buildings in the complex. These intact features convey a sense of historic workmanship. Due to the collection of intact buildings and the retention of much of the mid 20th century sewage treatment infrastructure, the property retains the feeling and aesthetic of its period of construction. As much of the infrastructure is still in place and the complex occasionally supports the regional water pollution control facility, it retains its historic association with industry and infrastructure.

Resource ID:	IA-CA-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	2004 Beaver Channel Parkway, Clinton, Iowa



Description: The property is a step-down electrical substation built in the late 1950s or early 1960s based on aerial photographs, currently owned and operated by the Interstate Power and Light Company. It is used to decrease transmission line voltages down to subtransmission line levels (69kV) and it supplies power to nearby industrial development. The property is approximately 280 feet north of the railroad. The substation occupies approximately 7 acres of level land in an industrial area adjacent to Mill Creek, the Union Pacific Railroad, and the Camanche Industrial Park. The substation contains components typically found in electrical substations such as steel lattice towers located in the southeast portion of the substation with pointed tops that support transmission lines, lightning protection cables, busbars, and surge arrestors; these lattice towers appear to be historic. There are also ground-mounted transformers clustered in the northwest portion of the substation, ground-mounted circuit breakers and switchgear in the central portion, and a network of transmission/ distribution line towers encircling the substation. These line towers carry electrical power to and from the station. In addition, there is one primary building in the center of the substation that likely houses switchgear. This building is not visible from the public right of way, but it appears to have a gable roof based on aerial photographs. There are several additional buildings clustered in the east portion of the substation that appear to be clad in metal with flat roofs; these building likely house equipment and/or offices.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid 20th century growth and industrial development in the region, it is not individually significant within the historic context of the community development and its associated power station to the south has been demolished. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property has some distinctive characteristic of a step-down electrical substation; however, it does not serve as a good and representative example of this type due to a lack of integrity (see below). **Criterion D:** This industrial property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, design, and feeling. The property remains at its historic construction site. The integrity of setting is diminished by the demolition of the large power plant once located adjacent to the south. The overall design appears intact based on historic aerial photographs and field observations; the substation retains its historic layout, and the lattice towers are likely original features. The intact features allow it to retain the feeling and aesthetic of its period of construction. The integrity of materials and workmanship has been compromised as most of the equipment has likely been replaced. While the building remains in use as a substation, its association with industry is diminished due to the demolition of the former coal-generating power plant that generated its electrical power.

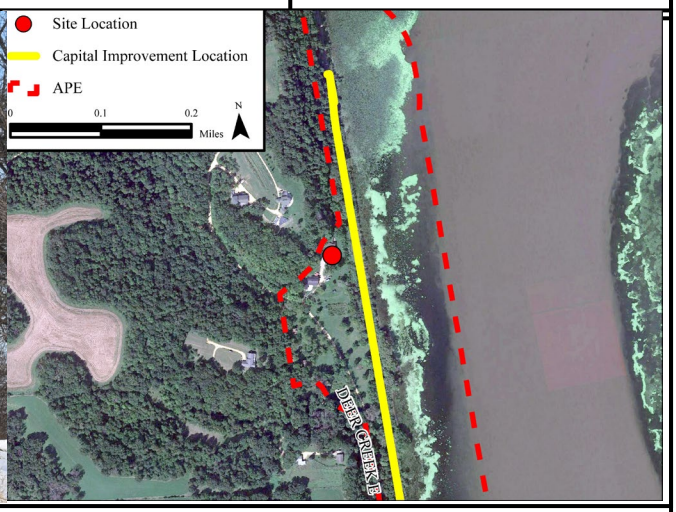
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	Iowa DOT Inventory 1994 – Bridge FHWA No. 002080	**Location:**	Beaver Channel Parkway over Mill Creek

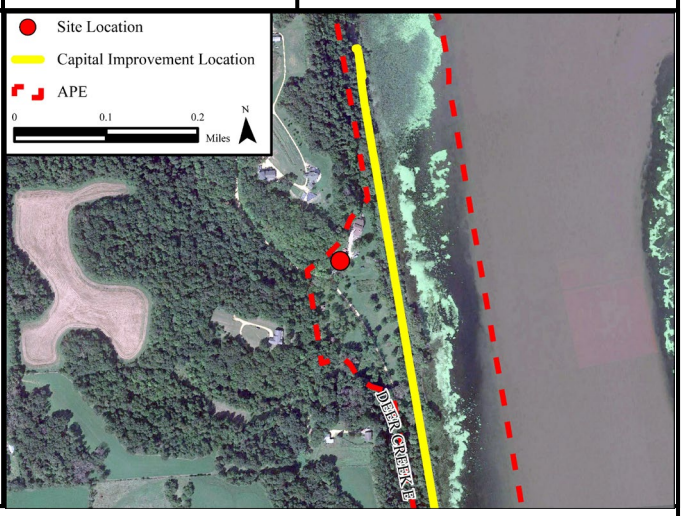


Description: This property is a steel Warren pony truss bridge built in 1920 and rehabilitated in 1960. The bridge carries Beaver Channel Parkway over Mill Creek which is less than 10 feet below. The bridge is located approximately 85 feet northwest of the railroad. Mill Creek is a narrow waterway that drains into the nearby Mississippi River. The Beaver Channel Parkway leads to a large industrial area along the Mississippi River's waterfront. The bridge spans 86 feet. The roadway width is 18 feet. The trusses consist of built-up riveted members and steel vertical members; these vertical members strengthen the trusses, supporting the top chord and bridge deck. The deck is supported by transverse steel beams attached by gusset plates to the bottom chords. On each truss, the railing is composed of two parallel steel box rails spanning the length of the truss. The concrete bridge deck is paved with asphalt, with concrete curbs on both sides. The bridge sits on concrete bridge seats and concrete abutments with concrete wingwalls.

National Register Evaluation: In the 1993 Iowa Historic Bridge Survey by Fraser Design for Iowa DOT Survey, The Beaver Channel Parkway Bridge (FHWA # 002080) was included and was found to be not eligible for the National Register of Historic Places. **Criterion A:** Although the property has impacted the surrounding local industrial land use as part of the transportation network, the property has been determined to lack significance in the area of transportation. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** Although the property is an intact example of a Warren pony truss, the property has been determined to not rise to the level of individual significance under Criterion C. **Criterion D:** This property does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, design, setting, materials, workmanship, feeling, and association. The property remains at its historic construction site. The design and materials of the bridge are intact including the riveted steel trusses, the bridge width, and the original bridge railings. The property retains integrity of setting; originally built in a rural environment the land around Beaver Channel Parkway became increasingly industrialized starting after World War II. The intact features convey a sense of historic workmanship, and the property retains the feeling and aesthetic of its period of construction. The bridge remains in use as a bridge over Mill Creek and retains its historic association.

Resource ID:	IA-DC-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	N/A	**Location:**	1800 Deer Creek East, Clinton, Iowa

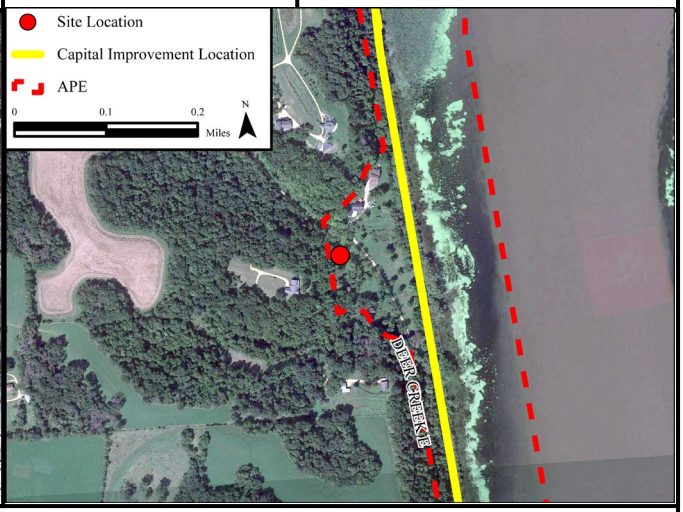


Description: The building is a residence that appears to have been constructed prior to 1951 and significantly expanded between 1956 and 1966 and again between 1983 and 1994 based on aerial photography. The building is set back on a small hill approximately 100 feet west of the railroad in a largely rural and heavily wooded setting, with a retaining wall built into the hill west of the building. The building faces southeast and is comprised of a 2 ½ story, gable front center mass with two shed roof wings which mirror each other; the north wing was added between 1983 and 1994. The southerly wing is punctured by a faux stone chimney. The building is roughly 11 bays wide, clad in clapboard siding, and roofed with asphalt shingles. On its first story, the building's façade features a nine-bay screened in porch. There is an entry left of this porch; right of the porch are two banks of three single light windows. The building's second story is wrapped by a full width deck which extends around to the south elevation; fenestration is a mix of full height single light windows and 1/1 vinyl windows in groups of three. The central, upper half story of the building contains a three-bay wood balcony and paired single light windows that flank a sliding glass door. A fanlight tops the door. A 1-story, 1-bay garage extends from the west elevation of the central mass. In front of the building there is a non-historic 2-bay wood frame shed with vertical wood siding and a gable front standing seam metal roof with a metal cupola. The shed has banks of four and six light fixed casement windows.

National Register Evaluation: The property is recommended not eligible for listing in the National Register of Historic Places. **Criterion A:** While the construction of the property is associated with mid-twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction and has been significantly altered and expanded in recent years. **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in its rural residential setting adjacent to the Mississippi River. The building remains in use as a residence and thus retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to vinyl replacement windows and the significant expansion of the house sometime between 1983 and 1994 with the addition of a northerly wing that has disrupted the building's historic design. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-DC-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1804 Deer Creek East, Clinton, Iowa

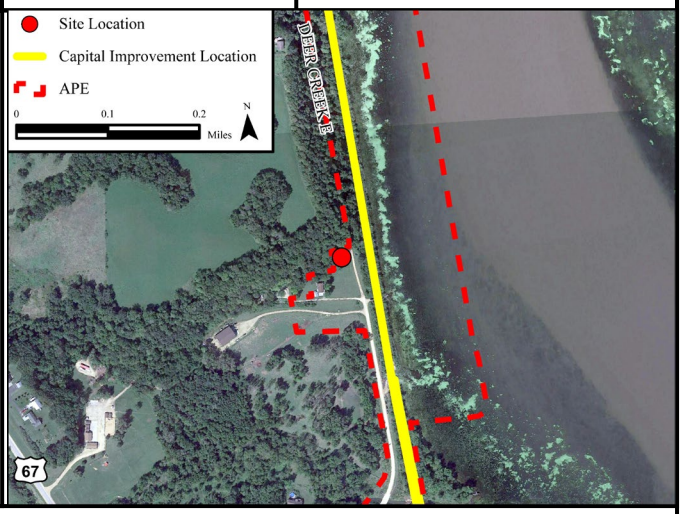


Description: The property is a private residence constructed in the early 1970s as a south facing garage. In 2010, a 5-bay wing was constructed off the building's eastern elevation giving the property its current L-shaped plan. The building is set back on a small hill in a largely rural and heavily wooded setting. The building is 1 ½ stories tall and clad in non-historic corrugated metal siding. The building's 2-bay south facing facade has a front gable roof with widely overhanging eaves while the east facing wing has a gambrel roof; both are covered by standing seam metal. The building is approximately 320 feet from the ROW. The gabled south elevation features a large, two bay garage door flanked to the west by a metal door. On the upper half story there is a single light window and a 1/1 double hung vinyl window. An exterior wooden staircase leads to a second story deck and entry on the east side elevation of this wing. The building's non-historic east wing faces east and features two single bay roll up garage doors. At the center of the gambrel roof there is a wooden hayloft door sheltered beneath a projecting hood. Along the southern elevation of this wing there are regularly spaced, single light, rectangular vinyl windows set just below the roofline.

National Register Evaluation: The property is recommended not eligible for listing in the National Register of Historic Places. **Criterion A:** While the construction of the property is associated with mid twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction as its materials and overall design have been heavily altered. **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting near the Mississippi River. The building remains in use as a residence and retains its historic association with rural development in this area. The integrity of material and workmanship have been compromised due to the replacement of materials such as siding and windows. The integrity of design is diminished by the construction of the gambrel-roof east wing in 2010, which is larger than the original house. These substantial alterations of materials and design have diminished the integrity of feeling and the building no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-DC-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1808 Deer Creek East, Clinton, Iowa

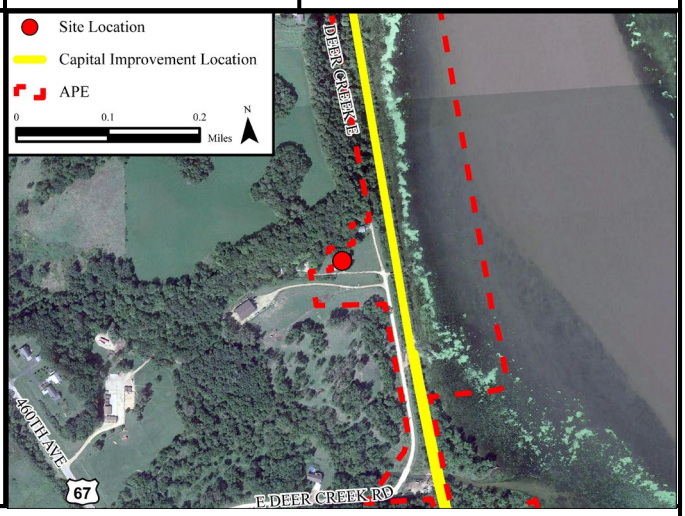


Description: The property comprises a vernacular side gable bungalow and a barn located on a wooded hillside above the Mississippi River. Based on its architecture and bungalow form, the building appears to have been constructed in the early 1900s. Aerial photographs show the property surrounded by agricultural fields suggesting that it was part of a farm, although this farming context is no longer apparent due to reforestation along Deer Creek East. The building is 3 bays wide, 1 ½ stories tall, clad in wide asbestos shingle siding, and topped by a side gable roof with asphalt shingles. The roof's ridgeline is split by an off-center brick chimney. The building's façade faces east towards the Mississippi River and is approximately 400 feet east of the railroad. The entry is sheltered by a full width enclosed porch with continuous banks of 1/1 aluminum storm windows, a non-historic alteration. The north side elevation has three 4/1 double hung windows. There is a shed roof porch with a secondary entry on the south side elevation. The building's upper half story has a gabled dormer above the facade with paired 1/1 double hung aluminum windows. A heavily deteriorated and structurally unsound barn sits south of the house. The barn is 3 bays wide, wood frame, covered by a gable-front asphalt shingle roof, and clad in vertical wood siding. The barn's gable has a projecting hood over its hay track. Two window openings are present within in the barn's north facing gable.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with early twentieth century residential development in the region, it is not individually significant within the historic context of the community development. The property was also evaluated within the context of agriculture due to its history as a farm. Because the property's associated farmland are no longer intact and the barn has substantially deteriorated, it cannot convey its historic association with agriculture. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property has distinctive characteristics of a side gable bungalow; however, it does not serve as a good and representative example due to a lack of integrity. **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location as it remains at its historic construction site. The property's integrity of setting is diminished with the reforestation of cleared agricultural land that once surrounded the buildings. The buildings are vacant, and the farm is no longer operational; therefore, the property is no longer associated with residential development or agriculture in the area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the siding and the enclosure of the front porch, which removed a key design feature of a bungalow house: a large, open front porch. This alteration has diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-DC-004	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1844 Deer Creek East, Clinton, Iowa

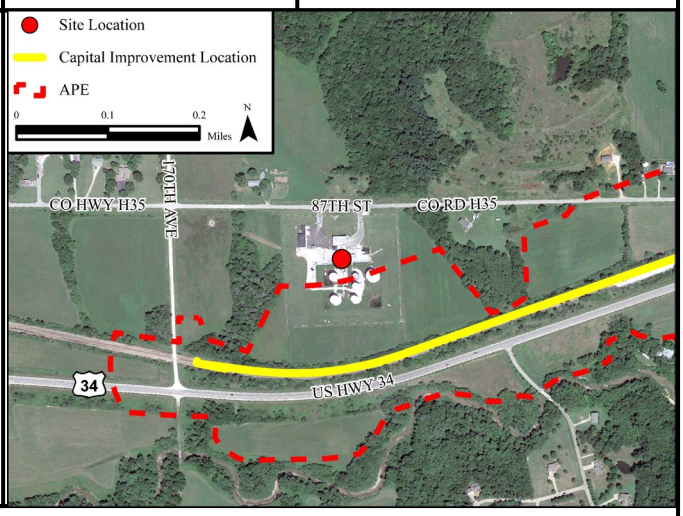


Description: The property is a private residence built in the 1960s based on aerial photographs and tax assessor records. The vernacular house is situated in a largely rural setting and is built into a wooded hillside with a retaining wall. The building is approximately 125 feet east of the railroad. The house is 5 bays wide and 2 stories tall, with a shallow gable roof with slight return eaves; the gable faces eastward while the primary, eaves-front façade faces south. The building is clad in wide vertical wood siding and covered by an asphalt shingle roof. There is a concrete block chimney on the rear elevation, and an interior brick chimney is present on the northern elevation. The primary entry on the south façade consists of a single door with an aluminum screen sheltered beneath a non-historic, second story deck supported by square wooden posts. There is a vertical, three-part hopper window to the right of the door. The deck, which has a wooden balustrade, is accessed by a glass and aluminum door on the second story. Fenestration on the first and second stories of this façade consists primarily of two-light, vinyl casement windows. The east elevation has two non-historic, rollup garage doors on the first story and a continuous bank of 1/1 aluminum windows on the second story that wraps around the north and south elevations.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A**: While the construction of the property is associated with mid-twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B**: Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction. **Criterion D**: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting near the Mississippi River. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of many of the windows, the replacement of the garage doors, and the addition of the wooden deck on the second story. These alterations compromise the building's integrity of design, workmanship, and materials and compromise the building's ability to convey the feeling of its period of construction.

Resource ID:	IA-DC-005	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1846 Deer Creek East, Clinton, Iowa

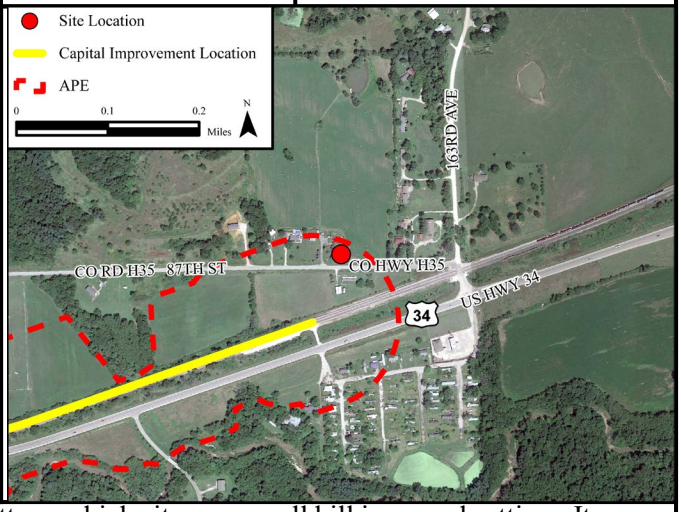


Description: The property is a private residence located in a largely rural setting, built into a slight hill with a concrete retaining wall on the north side of the building. The building faces east and is approximately 320 feet from the ROW. Constructed in the 1960s based on aerial photographs and tax assessor records, the house is 5 bays wide, 2 stories tall, and covered by a side gable, asphalt shingle roof. On the north elevation, an off-center exterior brick chimney rises through the gable, and an off-center exterior concrete block chimney is present on the south elevation. The building is primarily clad in vinyl siding; however, the east façade is covered by non-historic T-111 siding on the first story. The primary entry is located in the center bay and consists of a 9-light door with a metal screen. An octagonal window sits immediately left of the entry, and on either side of the façade there are matching, non-historic 3-light casement windows. Fenestration on the second story of the facade consists of non-historic 2- and 3-light casement windows. The second story also has a large, non-historic wooden deck accessed by a sliding glass door and steps on its north side. There is a garage door opening with an automatic garage door on the building's south elevation. A 1-story, single bay garage sits behind the house and faces south. This garage is clad in vinyl siding and covered by a gable front, standing seam metal roof. The garage door is topped by a shallow triangular pediment, and a solid modern door on the east elevation is topped by a similar pediment.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A**: While the construction of the property is associated with mid-twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B**: Research has not identified any connection between the property and historically significant individuals. **Criterion C**: The property does not embody a distinctive characteristic of a type, period, or method of construction. **Criterion D**: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting near the Mississippi River. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of some siding and all of the windows, and by the addition of the elevated wooden deck. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-OT-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	16848 87th Street Ottumwa, Iowa

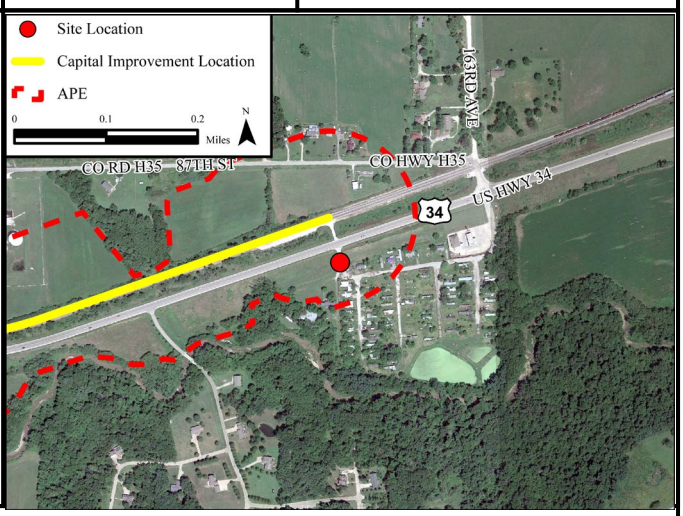


Description: The property is a commercial complex surrounded by a chain-link fence that consists of a main warehouse/administration building, several small outbuildings, a covered filling station, and six large, steel bulk petroleum storage tanks, approximately 330 feet north of the railroad. The complex was developed between 1951 and 1956 based on aerial photographs; two of the storage tanks, an outbuilding, and the main building were built at this time. The remaining petroleum tanks are visible in a 1983 aerial photograph while the filling station was built between 1994 and 2002. The complex is located in an open expanse of relatively flat land in a rural setting. The main building is 1 story and approximately 9 bays wide with a 5-bay wing. The building sits on a low concrete foundation and is topped by a flat roof. The main block has concrete block walls while the walls of the wing appear to be clad in non-historic vinyl. The building's façade faces east and features two roll up loading dock doors and a single glass and metal door, all accessed via a raised concrete walkway. Near the roofline there are regular banks of paired, single light casement windows and a similar window to the right of the glass and metal door. The addition's façade contains two glass and metal doors as well as paired, single light, fixed pane windows, four of which wrap the addition's corner. A non-historic covered filling station comprised of a blank wall on the north side and a canopy sheltering oil pumps sits east of the main building. The small outbuildings are each 1 story, 2-bay, gabled or shed-roof buildings covered by standing seam metal roofs. The six steel bulk tanks are large cylindrical structures approximately 40' in height.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the property is associated with mid-twentieth century commercial development in Ottumwa, it is not individually significant within the historic contexts of commerce or industry. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction due to alterations and the construction of several non-historic wings. **Criterion D:** This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and the setting is largely unchanged. The historic design and most of the historic materials and workmanship of the main building appear intact, although the wing's materials and workmanship have been altered. Additionally, the addition of the non-historic covered filling station and outbuildings diminishes the property's integrity of design and feeling. The complex remains in use as a bulk petroleum storage facility.

Resource ID:	IA-OT-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	16445 87th Street Ottumwa, Iowa



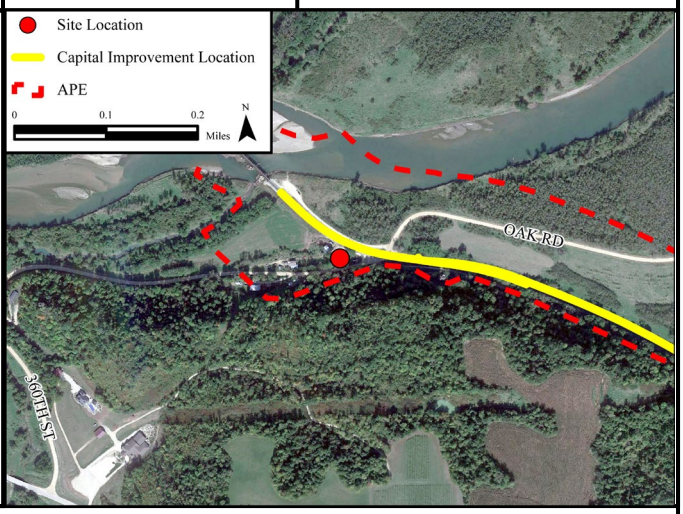
Description: The property is a vernacular gabled ell cottage which sits on a small hill in a rural setting. Its façade faces south toward the railroad, which is approximately 330 feet away. The building appears to have been constructed in the early 1900s, based on tax assessor records. The 1 ½-story, 2-bay, gable-front building has a 1 ½-story easterly ell and a large, ell-shaped addition off its rear elevation. The building is clad in non-historic vinyl siding and its roof is covered in standing seam metal. The building's primary entry is sheltered within a non-historic enclosed porch on the south façade of the ell. The porch has a continuous bank of 1/1 vinyl windows with aluminum storm windows which wrap two sides of the porch. A single light glass door provides access to the porch. There is a wall dormer with a 1/1 double hung vinyl window above the porch. The gable front main block has two 1/1 double hung vinyl windows on the first story and a similar 1/1 window in the gable peak. Two kneewall windows of similar materials are visible under the western eave. The fenestration on the remaining elevations matches that of the façade. The rear addition protrudes slightly west from the main block and is only partially visible from the public right-of-way. Its west side has a cross gable roof, with a 1/1 double hung vinyl window on the south elevation and a two-light casement window on the west elevation. There are several non-historic outbuildings on the property that are not clearly visible from the public right-of-way; most appear to be small, prefabricated, gabled sheds. There is also a non-historic side-gable, metal-clad garage west of the house with a metal rollup garage door on the east elevation.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A**: While the construction of the property is associated with early twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B**: Research has not identified any connection between the property and historically significant individuals. **Criterion C**: The property embodies the basic form of a gabled ell cottage, a common building type. However, it does not embody distinctive characteristic of this building type because most of its original materials have been replaced and a significant rear addition was built. **Criterion D**: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and retains its rural residential setting. The building remains in use as a residence and thus retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of materials such as windows and siding, the enclosure of the ell's porch, and the construction of the large addition. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-OT-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	16440-16442 U.S. Highway 34, Ottumwa, Iowa

Description: The property is a mobile home park, constructed in the 1960s based upon aerial photography and topographic maps. The park is located on the south side of U.S. Highway 34; its main (western) entrance is approximately 175 feet southeast of the railroad. A gas station/convenience store constructed in 2007 sits northeast of the mobile home park, at the western entrance to the park. This mobile home park would be classified as a vernacular residential park. It is located outside of town, it has no specific landscape features that are part of its simple, utilitarian design, and it lacks any identifiable amenities.



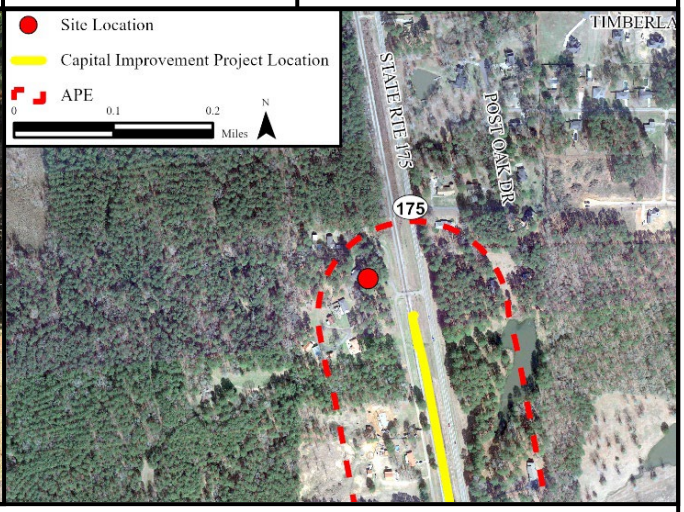
The mobile home park is accessed by two entrances from U.S. Highway 34; a main road runs almost parallel to the highway with four smaller roads extending south from this road. Most of the extant mobile homes are oriented perpendicular to one of these four roads, with the one or two-bay wide narrow elevations facing the roads and entrances on the long elevations. The park itself is heavily deteriorated; many mobile homes have been removed and others are abandoned and/or deteriorating, resulting in the loss of materials. The extant mobile homes are generally clad in sheet metal siding, rest on concrete footings, and have either flat roofs or very shallow gable roofs. Windows on these mobile homes are generally 1/1 aluminum sash in single and paired configurations. Some of the visible mobile homes have a small wooden porch that shelters the entrance or plywood additions. Many mobile homes are vacant due to their severe deterioration.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A**: While the construction of the property is associated with mid-twentieth century mobile home park development, it is not individually significant within the context of the community development. **Criterion B**: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C**: The property does not embody distinctive characteristics of a mobile home park, and original materials and design have been compromised due to the removal and deterioration of mobile homes. **Criterion D**: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: While the property remains at its historic construction site, overall, it lacks integrity. The integrity of setting is diminished by the large gas station constructed adjacent to the park in 2007. The individual mobile homes lack integrity of materials, design, and workmanship due to alterations (addition of porches and plywood additions), and the loss of materials due to deterioration, abandonment, or neglect. The removal of mobile homes causes a loss of integrity of design and feeling. Collectively, these alterations have diminished the historic integrity and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	IA-TR-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	39599 360th St, Guttenberg, Iowa

Description: The property is a vernacular private residence that was constructed in the mid-1970s based on aerial photographs. The property's setting is rural, and it is situated at the bottom of a bluff at the intersection of the Canadian Pacific Railway tracks, 360th Street, and the Turkey River, approximately 50 feet southwest of the railroad. The house is a 1-story, 4-bay vernacular house with a shallow gable roof and a cross gable north addition. The house is clad in vinyl siding, has an asphalt shingle roof, and rests on a concrete slab. A raised wooden deck on the east elevation accesses a single light glass and metal door. There is a 1/1, vinyl sash window with vinyl shutters south of the door. The south elevation has a paired 1/1 vinyl sash window, a triple vinyl casement window, a paired vinyl casement window, and a single vinyl casement window. Only the east elevation of the north addition was visible from the public right of way. It contains a band of three 1/1 vinyl or aluminum sash windows. A shed roof projects approximately 2 feet out from the north elevation of the addition. A 1 ½ story gambrel roof barn sits northwest of the house; the barn appears to have been built in 2010 based on aerial photographs. The barn has standing seam metal siding, a standing seam metal roof with a gabled dormer on its northeast slope and sliding metal barn doors on the southeast elevation. A triple 1/1 sash window is above the doors. A second non-historic outbuilding built in the 1970s sits to the west of the house. Clad in corrugated metal siding with a corrugated metal roof, it has a shallow gable and a shed roof extension on its south side. There is a rollup garage door and a large, open bay on the west side.



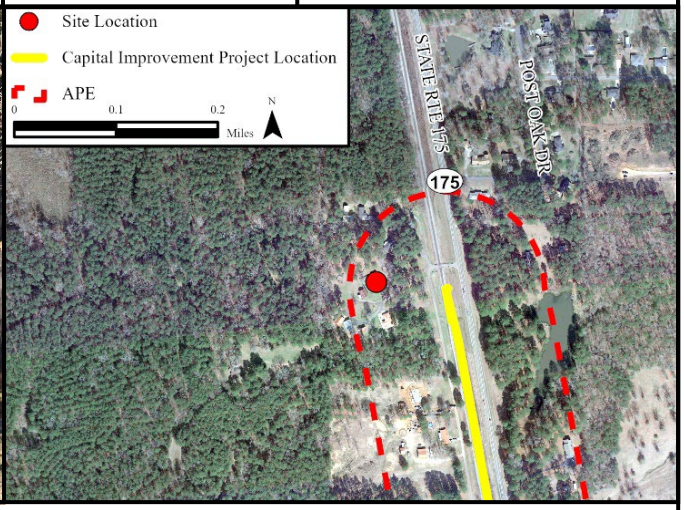
National Register Evaluation: The property is recommended not eligible for listing in the National Register. **Criterion A:** While the construction of the property is associated with mid-twentieth century residential development in the region, it is not individually significant within the historic context of the community development. **Criterion B:** Research has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction, and the building has been significantly altered through additions and replacement materials. **Criterion D:** This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains a low degree of integrity. The property remains in its historic location, retains its association as a residential property, and the setting is largely unchanged since the building's construction. However, the building's design, workmanship, materials, and feeling have been diminished by replacement siding, replacement windows, the addition of the gambrel-roof barn in about 2010, and the addition of a non-historic wooden deck on the east side. The replacement materials have also compromised the property's ability to convey its association with 1970s-era building styles and materials.

Appendix J – Attachment 5: Louisiana Segment

Resource ID:	LA-MA-001	Resource Type:	Above-Ground
Inventory Number:	TBD	Potential Effect:	Visual
Previous Documentation:	none	Location:	130 Holley Hill Drive, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house in the Colonial Revival style. The house appears to have been constructed during the 1960s based on aerial photographs dated 1955 and 1971. The house faces southeast toward Holley Hill Drive and is set back from the road approximately 160 feet; it is roughly 225 feet from the railroad. The immediate surrounding is forested with numerous large conifer trees on the lawn between the house and the street. A metal chain link fence encloses the rear yard. The property sits adjacent to other residential properties of similar size, scale, and age.



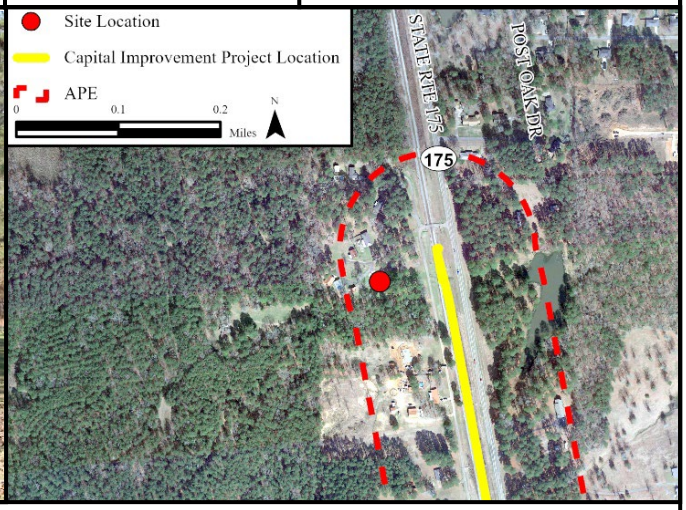
The house is a 1-story, 4-bay Ranch house on a concrete foundation with a hipped roof covered in asphalt shingles. A front-gable projection creates a covered porch on the façade with Tuscan-style columns. No chimneys are present, but several metal vents pierce the roof. The exterior is clad in brick veneer. The primary entrance is centered on the façade under the covered porch and consists of a 4-panel door with fanlight flanked by 3-light, paneled sidelights. Windows consist of 8/8 double-hung, non-historic vinyl windows with brick sills. One window on the façade is smaller than the original opening; the bottom of the opening is infilled with plywood. A 1-car garage is integrated into the façade with a replacement segmented, roll-up garage door.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house with Colonial Revival detailing; however, it does not serve as a good and representative example of this type and style due to a lack of integrity (see below). Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the original windows with vinyl, including one window that is smaller than the original opening, as well as the replacement garage door. These alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-MA-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	138 Holley Hill Drive, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house and several outbuildings. The house appears to have been constructed during the 1960s based on aerial photographs dated 1955 and 1971. The house faces east toward Holley Hill Drive and is set back from the road approximately 250 feet; it is roughly 315 feet from the railroad. The immediate surrounding is forested with numerous large conifer trees on the lawn between the house and the street. A metal chain link fence encloses the rear yard. The property sits adjacent to other residential properties of similar size, scale, and age.



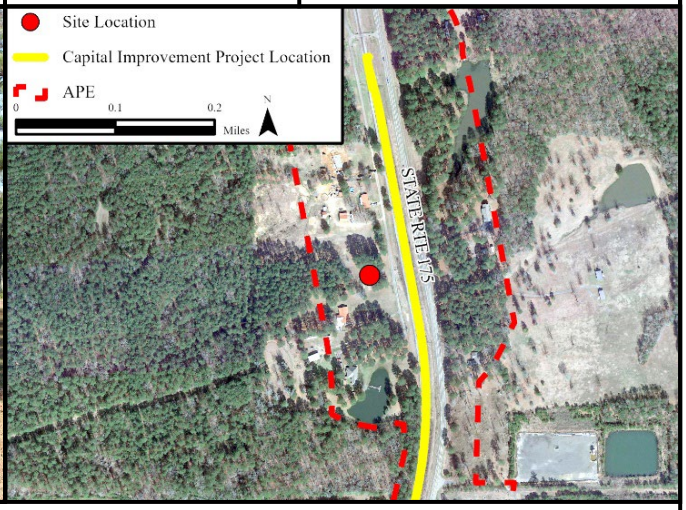
The house is a 1-story, 4-bay Ranch house on a concrete foundation topped with a hipped roof. The roof is covered in non-historic standing seam metal which replaced an asphalt shingle roof after 2013, based on Google Street View images. The exterior is clad in brick veneer with T1-11 siding covering a portion of the facade. One bay is recessed into the façade, creating a covered porch that obscures the primary entrance. Windows consist of 2/2 double-hung aluminum with brick sills and louvered shutters; they are set high on the elevations and may be original. An integrated carport is located on the south elevation. A large, 1-story outbuilding is located behind the house; the building includes a front-gable, metal roof, and the exterior is clad in corrugated metal. Additional smaller outbuildings consist of non-historic metal sheds.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the original asphalt shingle roof with one of standing seam metal in a conspicuous green color. The design of the standing-seam metal compromises the horizontal emphasis that is a key design feature of mid-century Ranch houses. This substantial alteration has diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-MA-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	Holley Hill Drive, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house and several outbuildings. The house appears to have been constructed during the 1960s based on aerial photographs dated 1955 and 1971. The house faces east toward Holley Hill Drive and is set back from the road approximately 250 feet; it is roughly 300 feet from the railroad. The immediate surrounding is forested with several large conifer trees on the lawn between the house and the street. The property sits adjacent to other residential properties of similar size, scale, and age.



The house is a 1-story, 6-bay Ranch house on a concrete foundation topped with a hipped roof. The roof is covered in non-historic standing seam metal with front gable projection supported by narrow, square wood posts. The exterior of the house is clad in brick veneer. The primary entrance is sheltered under the front projection and consists of a paneled wood door. Windows consist of 2/2, double-hung aluminum with brick sills and louvered shutters; they are set high on the elevations under the eaves and may be original. An integrated carport is located on the north elevation of the house. Three large outbuildings are located behind the house to the west; two are located outside of the project area. The outbuilding near the house is a 1-story, 2-bay, non-historic shed with a gambrel roof. An entrance door is located on the east elevation under a metal awning.

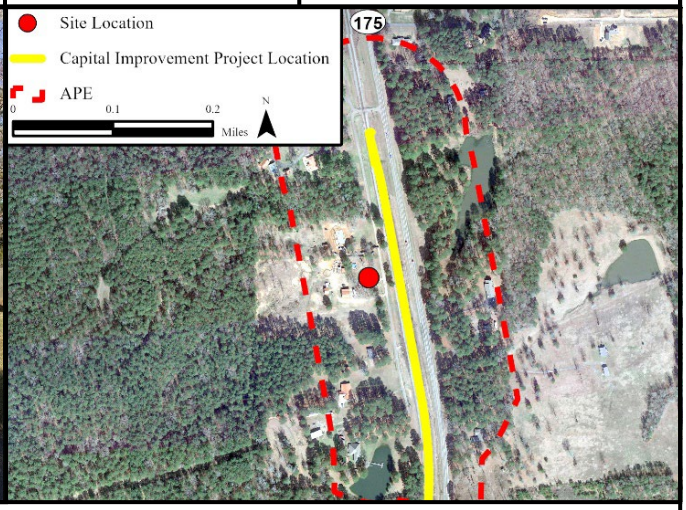
National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the roof with one of standing seam metal in a conspicuous red color. The design of the standing-seam metal compromises the horizontal emphasis that is a key design feature of mid-century Ranch houses. This substantial alteration has diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-MA-004	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	270 Holley Hill Drive, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house. The house appears to have been constructed during the 1960s based on aerial photographs dated 1955 and 1971. The house faces east toward Holley Hill Drive and is set back from the road approximately 100 feet; it is roughly 175 feet from the railroad. The immediate surrounding is forested with several large conifer trees adjacent to the house. The property sits adjacent to other residential properties of similar size, scale, and age.

The house is a 1-story, 5-bay Ranch house on a concrete foundation topped with a low hipped roof with overhanging eaves; the roof is covered in asphalt shingles. The exterior of the house is clad in brick veneer. The primary entrance is sheltered under a covered porch with hipped roof supported by cast iron supports with scroll motif and a concrete floor. The entrance consists of a 9-light, paneled door set flush with the elevation. Windows consist of 2/2 double-hung aluminum with brick sills and louvered shutters; they are set high on the elevations and may be original. An integrated carport is located on the southeast corner of the house featuring cast iron roof supports and railing with scroll motif. Two secondary entrances are located under the carport on perpendicular walls. One door is wood slab, and the other is a 9-light, paneled wood door.



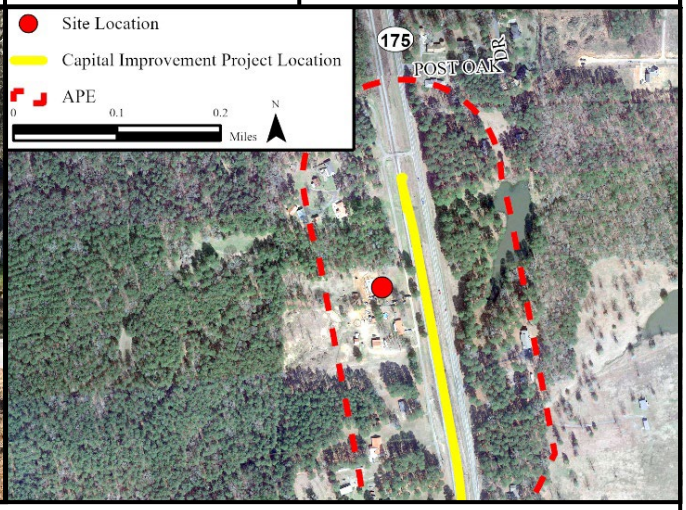
National Register Evaluation: The property is recommended eligible for listing on the National Register under Criterion C. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property is considered eligible for the National Register under Criterion C. It is a well-preserved example of a mid-to-late twentieth century Ranch house, retaining its one-story form with a sense of horizontality emphasized by the wide, overhanging eaves. Original features and materials include characteristic brick veneer, cast iron porch supports, aluminum sash windows, and an integrated carport. D: This residential property type does not appear to have the potential to yield further important information or data.

Resource ID:	LA-MA-004	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	270 Holley Hill Drive, Mansfield, Louisiana

Integrity: The property retains integrity of location and feeling as it remains in its original location and setting along a rural road abutting a forest with woody vegetation immediately surrounding the house. The design and materials of the building are intact, including the overall form, brick veneer, lacy cast iron detailing, and wood windows. The intact features convey a sense of historic workmanship, and the property retains the feeling and aesthetic of its period of construction. The building remains in use as a single-family residence.

Resource ID:	LA-MA-005	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	226 Holley Hill Drive, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house with several outbuildings. The house appears to have been constructed during the 1960s based on aerial photographs dated 1955 and 1971. The house faces east toward Holley Hill Drive and is set back from the road approximately 50 feet; it is roughly 125 feet from the railroad. The setting is a large lot surrounded by forest with several large conifer trees in the side and rear yard; grassy lawn covers the front yard. The property sits adjacent to other residential properties of similar size, scale, and age.



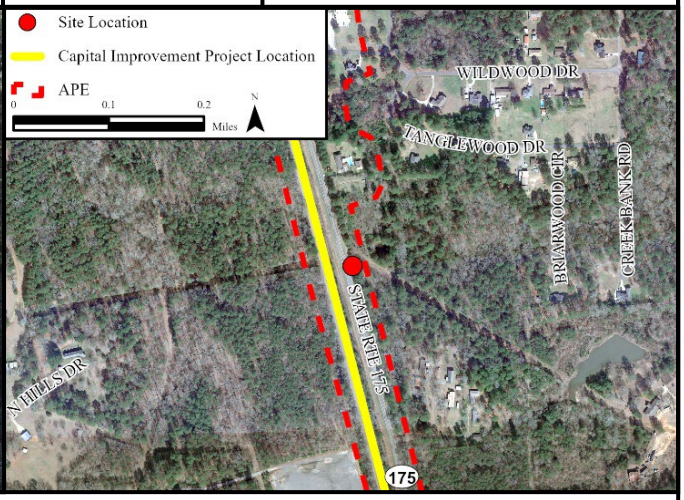
The house is a 1-story, 6-bay Ranch house on a concrete foundation topped with a side-gable roof. The roof is covered in non-historic standing seam metal which replaced an asphalt shingle roof after 2013, based on Google Street View images. The exterior of the house is clad in brick veneer and non-historic vinyl siding. The primary entrance is sheltered under a covered front porch supported by turned wood posts. The entrance consists of a non-historic replacement door with decorative oval light. Windows consist of 6/6, double-hung aluminum with paneled shutters; a large picture window is located under the covered porch. An integrated garage is located on the east elevation of the house with segmented roll-up garage door. Four outbuildings are located behind the house to the west and include two large non-historic, metal, front-gable garages, a front-gable shed that may be historic, and a non-historic metal carport.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the roof with standing seam metal as well as the addition of non-historic vinyl siding. The design of the standing-seam metal compromises the horizontal emphasis that is a key design feature of mid-century Ranch houses. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-MA-006	Resource Type:	Above-Ground
Inventory Number:	TBD	Potential Effect:	Visual
Previous Documentation:	None	Location:	210 Holley Hill Drive, Mansfield, Louisiana

Description: The property is residential and consists of a large corrugated metal shed and a non-historic house. The house was constructed in 2021 as per aerial photographs from 2021, and the outbuilding appears to have been constructed in the 1960s based on aerial photographs dated 1955 and 1971. The buildings are roughly 300 feet from the railroad. The immediate surrounding is forested with several large trees on the lot. The property sits adjacent to other residential properties of similar size, scale, and age.



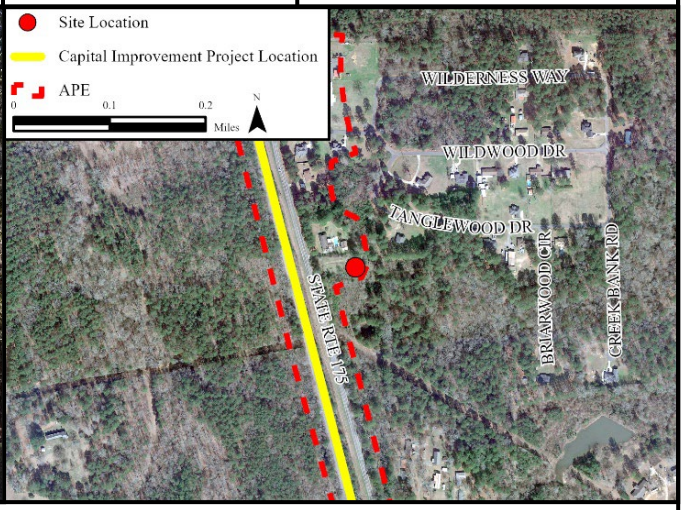
The outbuilding is a 1-story, 1-by-4-bay large shed clad in corrugated metal that faces south, perpendicular to the road. It has a front-gable corrugated metal roof with overhanging eaves. Sections of the roof have been replaced based on the change in color of the metal. A 1/2-glazed wood door provides access on the south elevation (façade). Window openings appear on the side elevation, set high under the eaves, and are infilled with corrugated metal. The shed is similar in appearance to those of other properties along Holley Hill Drive that were constructed during the 1960s. The non-historic house sits in front of the outbuilding, facing east. It is a 1-story, 6-bay house on a concrete foundation topped with a steep hip roof covered in asphalt shingles; the roof has a steep pitch that reminds one of the French Creole architectural style of the region. The house is clad in stucco and brick veneer and has 4/4 double hung sash vinyl windows. A 2-car attached garage is located on the south end of the house.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, design, and materials. The building remains at its historic construction site in a rural residential area with dense woods. The shed maintains its overall form and exterior metal siding and roof, which convey its historic design and materials. The building remains in use as a shed, but the replacement of the original house resulted in a loss of integrity of setting and association with rural development in this area during the mid-to-late twentieth century. The infilled windows and replaced roof sections on the shed have altered the appearance and diminished the integrity of feeling and workmanship. The shed no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-MA-007	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	East side of LA Highway 175 approx. 1,000 feet north of Charles Road., Mansfield, LA

Description: The property is vacant and consists of a small utility building situated adjacent to overhead utility lines. The structure appears to have been constructed during the 1960s based on aerial photographs dated 1955 and 1971. The building faces west toward LA Highway 175 and is set back from the road approximately 50 feet; it is roughly 175 feet from the railroad. The setting is forested with dense understory adjacent to an open linear corridor through which the overhead utility lines run. A wide, metal gate restricted access to what appeared to be an overgrown unimproved access road or driveway.



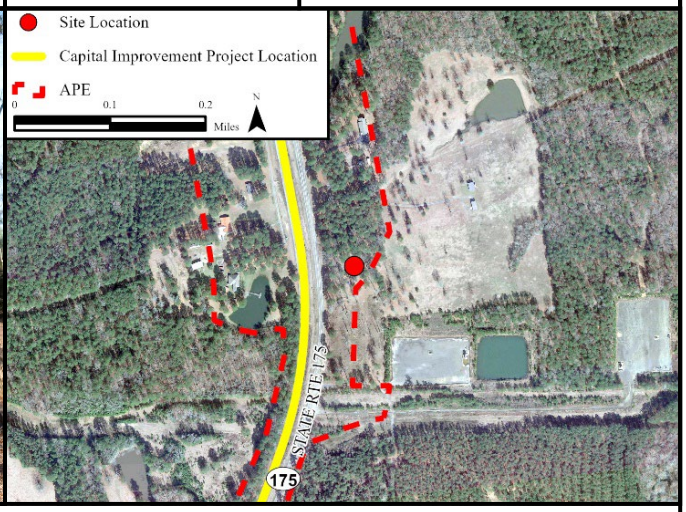
The structure is a small, 1-story, 1-bay structure clad in corrugated metal and topped with a low-pitched gable roof covered in corrugated metal. The foundation was obscured by heavy understory vegetation. The only visible fenestration was a 6/6 double hung wood window that was missing several panes of glass and was partially dislocated from the window frame. The entrance into the structure was not visible from the road. No other buildings or structures appeared to be in association with this structure.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property may be associated with mid-to-late twentieth century rural development in the region as part of the utility services, it is not individually significant within any particular historic context. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting. The property remains at its historic construction site and remains in a rural setting with dense woods adjacent to the utility lines. The integrity of design is retained because the historic form is evident. The integrity of materials and workmanship has been lost because although the historic materials are evident, they are in very poor condition, including windows that are partially dislocated. The building does not appear to be in use and therefore does not retain its historic association. The disuse and deteriorated condition of the structure has resulted in an inability to convey its historic use and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-MA-008	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	13129 LA Highway 175, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house and a small outbuilding. The house appears to have been constructed during the 1960s based on aerial photographs dated 1955 and 1971. The house faces west toward LA Highway 175 and is set back from the road approximately 225 feet; it is roughly 325 feet from the railroad. The immediate surrounding is forested with dense vegetation visually obstructing the house from the roadway; lawn covers the front yard. The property sits adjacent to other residential properties that were constructed in the 1990s.



The house is a 1-story, 6-bay Ranch house on a concrete foundation topped with a side gable roof. The roof is covered in asphalt shingles, and a large exterior brick chimney is located on the facade. The exterior of the house is clad in non-historic vinyl siding. A carport is integrated into the façade on the north end of the house and features lacy cast iron supports. The primary entrance is located on the façade but was obscured by vegetation. Windows consist of 8/8, double-hung sash windows with paneled shutters. The windows are partially obscured by vegetation but appear to be replacements. A small shed with gable roof is located behind the house to the east as shown on aerial photographs but is not visible from the road.

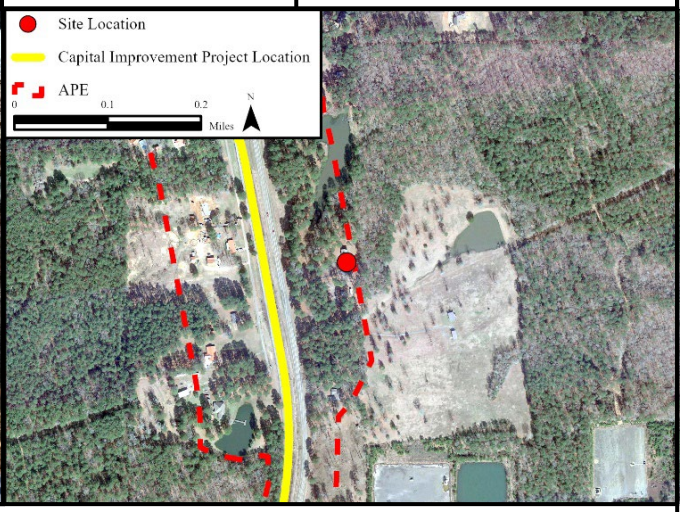
National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the siding and the windows. This substantial alteration has diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-MA-009	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	12669 LA Highway 175, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house. The house appears to have been constructed during the 1960s, based on aerial photographs dated 1955 and 1971. The house faces west toward LA Highway 175 and is set back from the road approximately 150 feet; it is roughly 250 feet from the railroad. The immediate surrounding is forested with large conifer trees between the house and the street. The property sits adjacent to other residential properties of similar size and scale.

The house is a 1-story Ranch house on a concrete foundation topped with a cross-gable roof covered in asphalt shingles. An exterior brick chimney with arch rises from the rear roof slope. The exterior of the house is clad in brick veneer and board and batten siding. The primary entrance is centralized under the façade recessed between two projecting gables. The entrance consists of a pair of double doors with decorative glazing and panels. Windows consist of 12/12 double hung sash in either wood or aluminum that may be original. Louvered shutters flank the windows on the façade. An integrated carport is located prominently on the front of the house with its opening perpendicular to the façade; it is clad with T1-11 siding on the interior. An entrance into the house is sheltered under the carport consisting of a 1/2 glazed wood door.



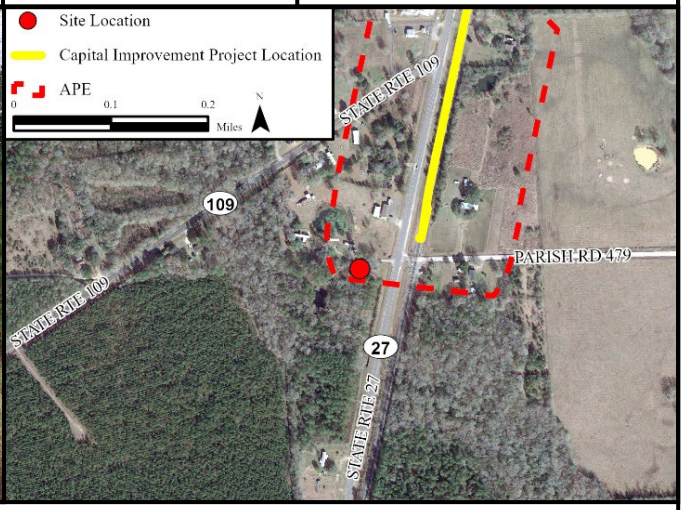
National Register Evaluation: The property is recommended eligible for listing on the National Register under Criterion C. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: This property is eligible under Criterion C as a good representative example of this residential building type, with a form and extant materials specifically associated with the time period of construction. Distinctive features include an asymmetrical plan, integrated carport, and a long, horizontal massing; despite a cross-gabled roofline, the shallow roof slope and deep overhanging eaves emphasize the horizontal axis and keep it low to the ground. Characteristic extant materials include a combination of exterior cladding, consisting of board and batten siding and brick veneer. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Resource ID:	LA-MA-009	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	12669 LA Highway 175, Mansfield, Louisiana

Integrity: The property retains integrity of location and feeling as it remains in its original location and setting along a rural road surrounded by forest with similar rural residential properties in the vicinity. The design and materials of the building are intact, including the overall form, brick veneer, integrated carport, and windows. The intact features are able to convey a sense of historic workmanship, and the property retains the feeling and aesthetic of its period of construction. The building remains in use as a single-family residence.

Resource ID:	LA-MA-010	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	12605 LA Highway 175, Mansfield, Louisiana

Description: The property is residential and consists of a Ranch house with several outbuildings. The house appears to have been constructed during the 1960s, based on aerial photographs dated 1955 and 1971. The house faces west toward LA Highway 175 and is set back from the road approximately 325 feet; it is roughly 450 feet from the railroad. The immediate surrounding is forested with many large conifer trees between the house and the street; a small retention pond is located to the north of the house. The property sits near to other residential properties of similar size and scale.



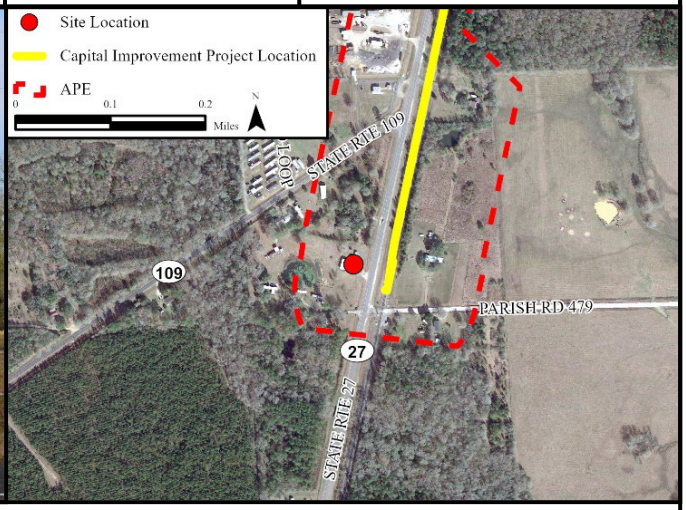
The house is a 1-story, 5-bay Ranch house on a concrete foundation topped with a cross gable roof covered in asphalt shingles. The exterior of the house is clad in T1-11 siding, brick veneer, and non-historic vinyl siding. Deep overhanging eaves on the façade create a covered porch supported by square posts. The primary entrance is sheltered under the covered porch and consists of a paneled door flanked by 5-light sidelights. A large, non-historic 16-light replacement window is located under the covered porch. Other windows consist of non-historic 12/12 and 6/6, double-hung vinyl or aluminum with wood shutters. An integrated carport is located on the south elevation of the house and opens onto a paved driveway. Two outbuildings are located south of the house. One is a square, open-air shelter of concrete block construction with standing-seam metal hipped roof. The other is a corrugated metal shed with gambrel roof. Based on aerial photographs, neither appears to be historic.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the windows and the addition of non-historic vinyl siding. The substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-SI-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	131 Gene Hope Road, Singer, Louisiana

Description: The property is residential and consists of a vernacular house. The house appears to have been constructed during the late 1950s, based on historic aerial photographs dated 1956 and 1982 as well as a USGS quadrangle map dated 1961. The house faces east, perpendicular to Gene Hope Road and is set back from the road approximately 35 feet; it is roughly 275 feet from the railroad. The immediate surrounding is forested with numerous large trees and overgrown vegetation in the yard. The property sits adjacent to other residential properties of similar size and scale.



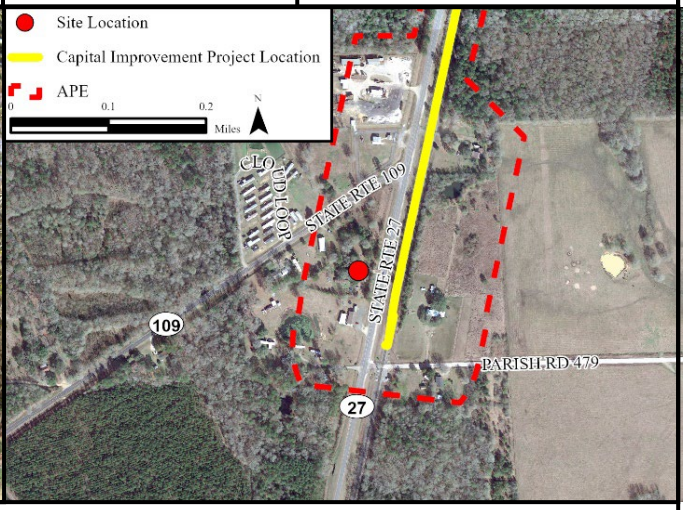
The house is a 1-story, 4-bay vernacular house on a concrete pier foundation topped with a cross gable roof covered in non-historic standing seam metal. A metal chimney pipe rises from the ridgeline near the northern end of the house. The exterior is clad wood clapboards. The primary entrance is on one end of the front, east facing façade, consisting of a non-historic 6-panel door behind a non-historic fully-glazed metal storm door. The door is accessed up a set of concrete steps. A tripartite window is set adjacent to the entrance, consisting of a large wood picture window flanked by smaller 2/2 double hung wood windows. Other windows consist of 2/2, double-hung windows with narrow wood shutters. The windows appear to be historic. An attached 1-car garage is located on the north elevation of the house with non-historic roll-up garage door.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and original materials have been lost. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the roof with non-historic standing seam metal as well as the replacement front door. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-SI-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	10526 LA Highway 27, Singer, Louisiana

Description: The property is commercial and consists of a 1-story commercial buildings with a smaller, non-historic commercial building behind. The building appears to have been constructed during the 1960s, based on aerial photographs dated 1956 and 1982. The building faces east toward LA Highway 27 and is set back from the road approximately 90 feet; it is roughly 190 feet from the railroad. The immediate surrounding is an open lot with woody vegetation partially screening the adjacent properties which are residential lots of varying sizes.



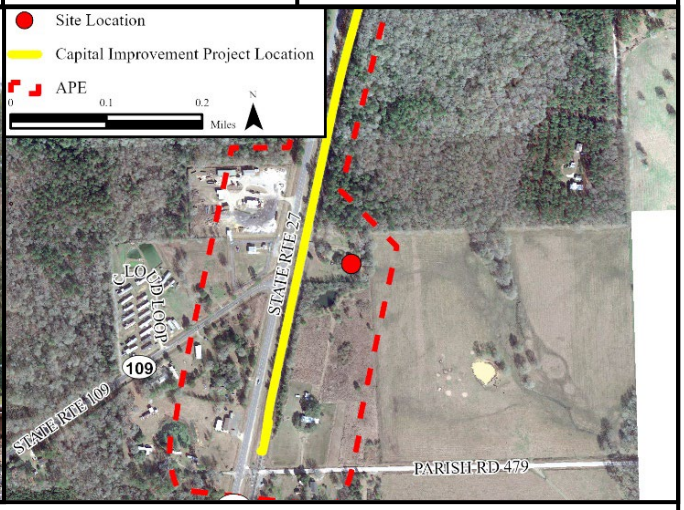
The building is a 1-story, 7-bay commercial building on a concrete foundation topped with a side-gable roof covered in standing seam metal. The exterior is of concrete block construction and the gable ends are clad in wood clapboards. There are two entrances on the façade, one on each end. One entrance consists of a single, 6-panel, non-historic metal door and the other consists of a pair of non-historic wood doors with decorative oval lights. Windows consist of tall, narrow picture windows with aluminum frames that may be original. No windows or doors were located on either the north or south elevations. Historic aerial photographs from 1982 and 1983 show earlier wings on both the north and south elevation; neither wing is extant today. Located immediately behind the house to the west is a non-historic 1-story commercial building with a front-gable, standing-seam metal roof and corrugated metal exterior. A front gable projection with square wood supports creates a covered porch under which two 1/2-glazed doors are located. This building was constructed after 2010, based on recent historic aerial photographs.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century rural commercial development in the region, it is not individually significant within the historic context of commerce. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and original massing has been removed. Criterion D: This commercial property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural setting along a rural highway. The building is not currently used, but its location and overall form convey its historic association as a commercial building. The integrity of design, materials, and workmanship have been compromised due to the loss of the two side wings and the replacement doors. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-SI-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	10506 LA Highway 27, Singer, Louisiana

Description: The property is residential and consists of a vacant house and a non-historic trailer. The house appears to have been constructed during the early twentieth century, based on aerial photographs from 1954; the trailer was added after 1998. The house faces east toward LA Highway 27 and is set back from the road approximately 130 feet; it is roughly 230 feet from the railroad. The immediate surrounding is heavily vegetated with trees and dense understory surrounding the house. Only a portion of the façade was visible. The property sits adjacent to commercial and residential properties of varying sizes.



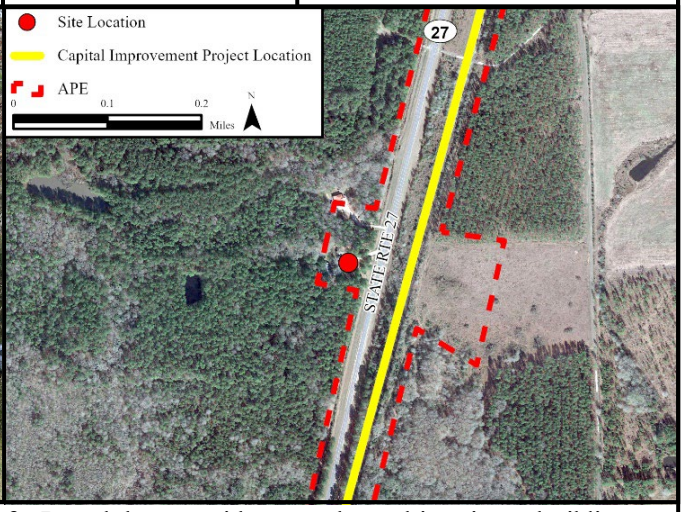
The house is a 1.5-story, 4-bay structure topped with a front-gable roof covered in metal; the foundation was not visible. Large holes are visible in the facade. The exterior is clad in faux brick rolled asphalt siding with large pieces missing. Two entrances are located on the façade; one was missing its door. The remaining door is paneled wood that appears to be original. Windows consist of historic 2/2 double hung wood windows with missing panes of glass. A square opening in the upper half story indicates the location of a former window. The other elevations were visually obscured due to heavily overgrown vegetation. Located adjacent to the vacant house to the southwest is a non-historic, single-wide trailer home with side-gable roof covered in standing seam metal; the exterior is clad in corrugated metal siding.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and original materials have been lost. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting along a rural highway. The original house is unused, but the trailer allows the property to remain use as a residence and retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the loss of doors, windows, and other material to deterioration. The disuse and deteriorated condition of the house has resulted in an inability to convey the feeling and aesthetic of its period of construction.

Resource ID:	LA-SI-004	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	10427 LA Highway 27, Singer, Louisiana

Description: The property is residential and consists of a Ranch house with a detached carport. The house appears to have been constructed during the 1960s, based on aerial photographs dated 1956 and 1982. The house faces west toward LA Highway 27 and is set back from the road approximately 315 feet; it is roughly 230 feet from the railroad and is accessed via a private at-grade crossing. The immediate surrounding includes open lawn with several large trees. A dense forest is adjacent to the property to the north and agricultural fields are to the south and east. The property sits near other residential and commercial properties of varying sizes.



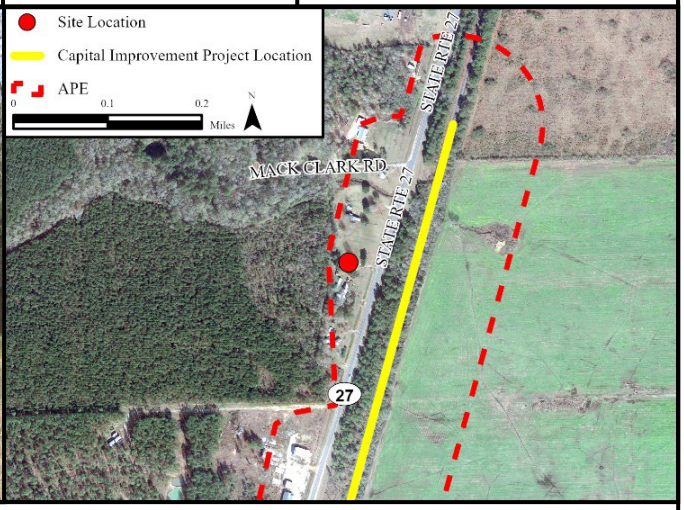
The house is a heavily-modified 1-story, 4-bay Ranch house on a concrete foundation topped with a side gable roof covered in non-historic standing seam metal. A large renovation was undertaken in 2016, as evident on recent historic aerial photographs and Google Street View imagery. During this renovation, a large side wing was added to the north elevation and a full-width front porch with shed roof was added to the façade. The overall roof form was altered from a hipped roof to a side-gable roof and the exterior was clad in vinyl siding. The windows are all non-historic divided light in vinyl or aluminum. The concrete foundation is clad in faux stone veneer. A non-historic detached wood carport with a front-gable standing seam metal roof sits in front of the house to the west.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example of this type and style due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural setting with woods and agricultural fields. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the addition of the side wing, front porch, and vinyl siding. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-SI-005	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	10156 LA Highway 27, Singer, Louisiana

Description: The property is residential and consists of a Ranch house with several non-historic outbuildings. The house appears to have been constructed during the early 1950s, based on aerial photographs from 1954 and its architectural type. The house faces west toward LA Highway 27 and is set back from the road approximately 260 feet; it is roughly 440 feet from the railroad. The immediate surrounding is forested with numerous large trees within the parcel. The property sits adjacent to another residential property of similar size.



The house is a 1-story, 6-bay Ranch house on a concrete foundation topped with a side gable roof covered in non-historic standing seam metal. A front-gable projection extends from the façade to create a covered porch supported by wide square wood posts. An attached carport is located on the south end of the house; based on historic aerial photographs, the carport was added prior to 1983 and is likely an historic addition. The exterior is clad in painted brick veneer. The primary entrance is located under the covered porch and consists of a non-historic 3/4 glazed wood door with decorative fleur-de-lis motif. Windows appear to be non-historic aluminum and include 4/4 and 6/6 double hung sash as well as a 2-light sliding window. Three outbuildings are located on the property, all of which were added after 1982 as per historic aerial photographs. They consist of a large corrugated metal garage, a smaller corrugated metal shed, and a small shed with vertical wood siding.

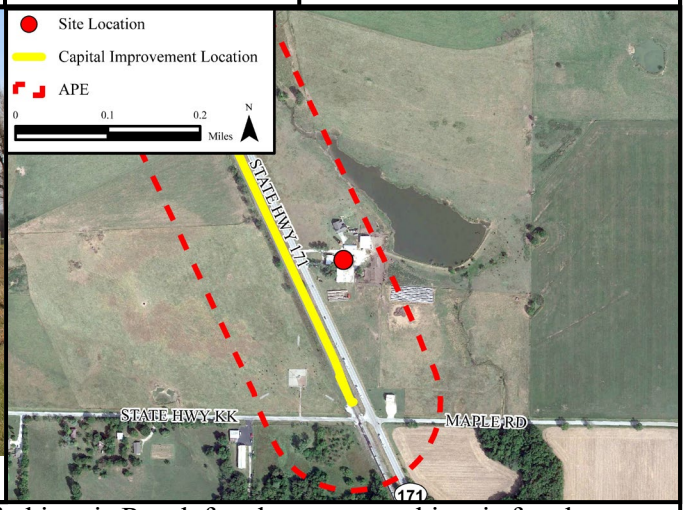
National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example of this type and style due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the addition of a standing seam metal roof as well as replacement windows and door. The design of the standing-seam metal compromises the horizontal emphasis that is a key design feature of mid-century Ranch houses. These substantial alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	LA-SI-006	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	9622 LA Highway 27, Singer, Louisiana

Description: The property is residential and consists of a vernacular house with several non-historic structures on the property. The house was constructed during the 1920s, based on aerial photographs and a discussion with the landowner during survey. The house faces south, perpendicular to LA Highway 27 and is set back from the road approximately 160 feet; it is roughly 360 feet from the railroad. The immediate surrounding is forested with numerous large trees within the lot.

The house is a 1-story vernacular house on a concrete foundation topped with a front-gable roof covered in standing seam metal. The rear portion of the roof appears to have been replaced recently due to a change in color and condition. The exterior is clad in vertical wood siding. A full-width covered front porch projects from the façade. It has a shed roof supported by square wood posts with wood railing that appears to be non-historic based on condition. The windows and entrance under this porch were obscured from view. A shed roof wing extends from the west elevation and appears to be historic. Windows on the north (rear elevation) are non-historic 1/1 aluminum sash. The east side elevation features two shed roof projections with no foundations or fenestration. The shed roofs are covered in asphalt shingles; these are likely non-historic based on the change in materials. Also on the property are several non-historic trailers and a non-historic house with a collapsed roof. Based on historic aerials, these buildings were constructed in the 1980s.



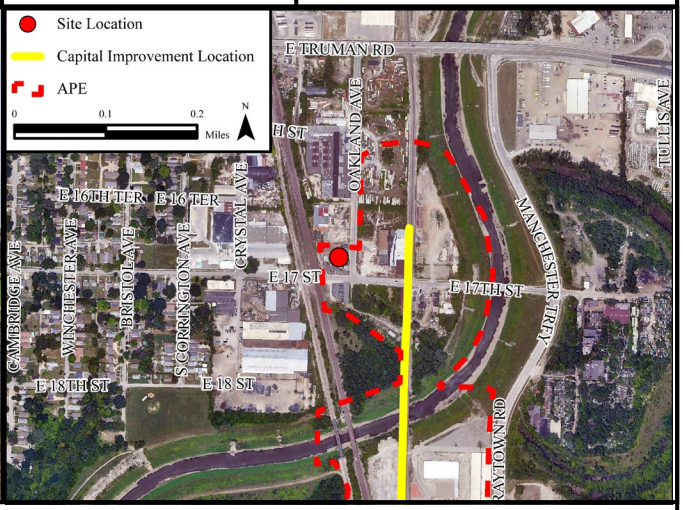
National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and original materials have been lost Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting with dense woods along a rural highway. The building remains in use as a residence and the building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement roof and windows, as well as the potentially non-historic side projections. These alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Appendix J – Attachment 6: Missouri Segment

Resource ID:	MO-AS-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	13196 MO-171, Asbury, Missouri

Description: The property is a farmstead comprised of a historic Ranch farmhouse, a non-historic farmhouse, a historic silo, three non-historic silos, and seven outbuildings. The historic outbuildings include four sheds, a Quonset hut shed, and a pole barn. The property is located approximately 240 feet from the railroad and is separated from the railroad by MO Highway 171. The historic farmhouse and outbuildings are first visible on an 1958 historic aerial photograph and based on type and materials present, they date to the 1950s. The non-historic farmhouse was built in 2010.



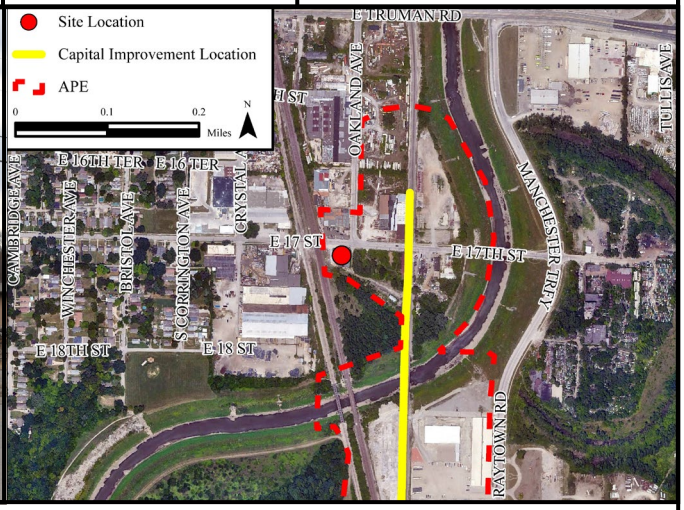
The historic farmhouse and two of the historic sheds are constructed from Ozark stone masonry. The historic farmhouse is a Ranch house with an addition to the right of the front, west facing façade. The addition is covered in non-historic vinyl siding. The house is set on a poured concrete foundation and is covered by a non-historic standing seam side-gabled roof. The house is fenestrated with wood and aluminum 1/1 windows. It also features a front wooden stoop. Two of the historic shed outbuildings are both covered with non-historic standing seam metal roofs and have no windows. The historic Quonset hut appears to have the original exterior replaced with non-historic metal. The historic pole barn also appears to have the historic siding and roofing replaced with non-historic metal sheets.

National Register Evaluation: This property is recommended not eligible for the National Register. Criterion A: While the property is associated with mid-twentieth century residential and agricultural development in the region, it is not individually significant within the historic context of the community development or agriculture. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic location and remains in a rural residential setting. The farmhouse remains in use as a residence, and the buildings retain their historic association with rural residential and agricultural development in this area. The integrity of design, materials, and workmanship, have been compromised due to the replacement of the historic siding and windows on most of the buildings on the property. These substantial alterations have diminished the integrity of feeling and the property no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	MO-BV-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1648 Oakland Avenue, Kansas City, Missouri

Description: The property is industrial and consists of a warehouse with no style. The building appears to have been constructed in the early 1900s, based on historic aerial photographs and Sanborn maps. The warehouse faces south and is located approximately 420 feet from the existing Kansas City Southern line to the east. The immediate surrounding consists of a paved lot with chain link fence bordering the front of the property. The property sits adjacent to other industrial properties built throughout the early to mid 20th century.



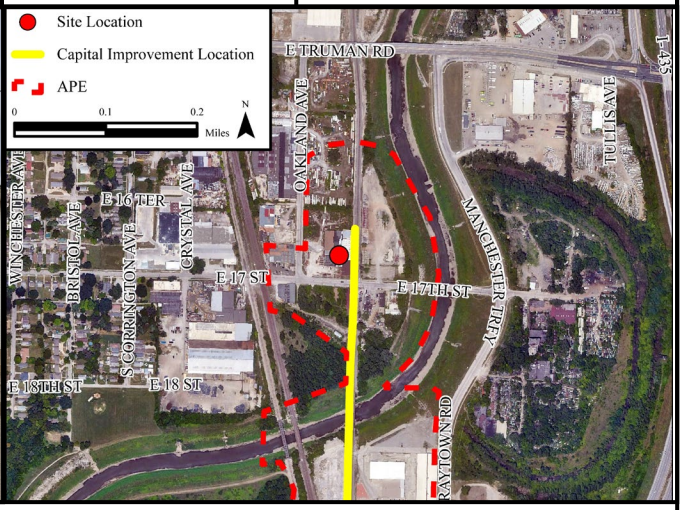
The building is a 1-story, 2-bay warehouse on a slab concrete foundation topped with a flat roof. The roof has 13 sawtooth skylights present, which have been covered with roofing fabric, along with the flat portions of the roof. The building has rectangular massing and is largely clad with galvanized metal siding on the front (south) and side elevations and does not possess any windows. The façade faces south and has some parapeted portions that rise above the flat roofline. The facade is fenestrated with two garage bays that possess rolling metal garage doors. A segment of historic brick foundation and a historic brick chimney are present on the front (south) elevation. The rear elevation of the building is clad with historic brick, and there is evidence of the historic openings having been infilled. Large portions of the historic footprint were removed from the front and rear elevations during the early 2000s, as evidenced in aerial photography and supported with field survey findings.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with early-to-mid twentieth century industrial growth, it is not individually significant within the historic context of commercial development in the region. Criterion B: Background research has not identified any connection between the property and historically significant individuals. Criterion C: The property does not serve as a good and representative example of a type, period, or method of construction due to a lack of integrity. Criterion D: There are no indications that the property is likely to yield significant information in history or pre-history.

Integrity: The property retains integrity of location, setting, and association as it remains on its original site of construction in an industrial area and continues to be in use as an industrial facility. The property lacks integrity of design, materials, workmanship, and feeling. Integrity of design and materials has been compromised by the removal of portions that alter the property's historic footprint and the addition of non-historic infill. These changes also disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of its period of construction.

Resource ID:	MO-BV-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	7435 E 17th Street, Kansas City, Missouri

Description: The property consists of two attached industrial warehouses with no style. The buildings appear to have been constructed concurrently between 1940 and 1950 based on historic aerial photography and Sanborn Maps. The warehouses face north and are located approximately 400 feet east of the existing Kansas City Southern line. The immediate surrounding consists of a gravel and dirt lot with a gravel drive that has become inaccessible due vegetation. The property sits adjacent to other industrial properties built throughout the early to mid 20th century and is bordered to the east by the Kansas City Southern rail line and to the west by the St. Louis and San Francisco, and the Missouri Pacific rail lines.



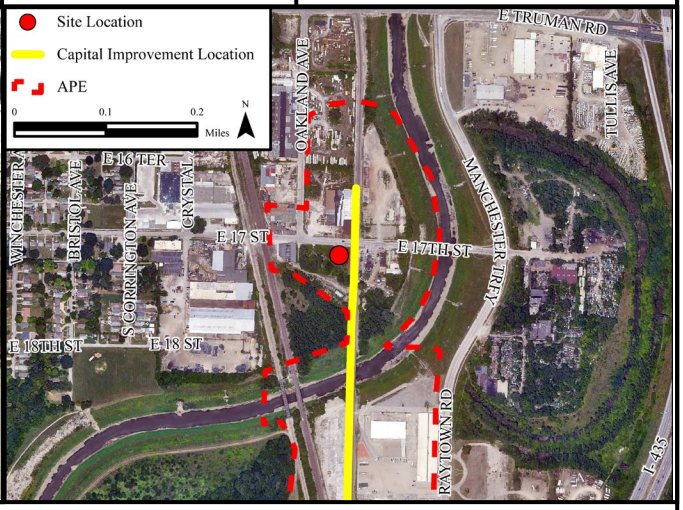
The concrete block buildings are each 1-story, single-bay warehouses with barrel-vaulted roofs and sit atop a concrete slab foundation. The overall massing of the two warehouses is rectangular, and the two buildings appear to share a center wall. The façades feature a plain-style parapet that extends above the barrel-vaulted roof. The warehouse on the eastern side has been clad in galvanized metal siding. The building to the east is fenestrated with a single, 1/1 wood window, a single metal rolling garage door, and a single-light steel entry door on the front (north) elevation. The building to the west is fenestrated with a steel entry door and a single metal rolling garage door on the front (north) elevation.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with early-to-mid twentieth century industrial growth, it is not individually significant within the historic context of commercial development in the region. Criterion B: Background research has not identified any connection between the property and historically significant individuals. Criterion C: While the has seen little change, the property does not serve as a good and representative example of a type, period, or method of construction. Criterion D: There are no indications that the property is likely to yield significant information in history or pre-history.

Integrity: The property retains integrity of location, setting, feeling, and association. The property remains at its historic construction site. The design of the buildings is intact, including the overall form and masonry. The property does not retain integrity of materials as a result of the application of metal siding. The intact features are able to convey a sense of historic workmanship, and the property retains the feeling and aesthetic of its period of construction.

Resource ID:	MO-BV-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	7510-7700 E 17th Street, Kansas City, Missouri

Description: The property is an industrial warehouse building with no style. The building appears to have been constructed during the 1940s-1950s, based on historic aerial photographs and Sanborn maps, and has had numerous additions to the footprint. The warehouse faces south and is located on a 2.37-acre lot roughly 70 feet from the existing Kansas City Southern line to the east. The immediate surrounding consists of a paved lot with chain link fence bordering the front and side of the property. The property sits adjacent to other industrial properties built throughout the early to mid-20th century.



The front office portion of the building consists of a 2-story, 4-bay light industrial building with a flat roof. The office is clad in brick and fenestrated 7 pairs of 8-light metal casement windows. Non-historic vinyl shutters have been applied to the windows on the second story. The portions of the building directly to the rear (north) and side (east) are large non-historic single-story warehouse areas with flat roofs that are clad with galvanized and corrugated metal siding. Rolling metal garage doors are located on the front, side, and rear elevations. A large barrier fence made of steel I-bars has been erected on the property line between the building and the Kansas City Southern directly adjacent. The property includes a single-story shed located on the adjacent lot. The shed consists of 8 bays with a gabled roof clad in galvanized metal siding.

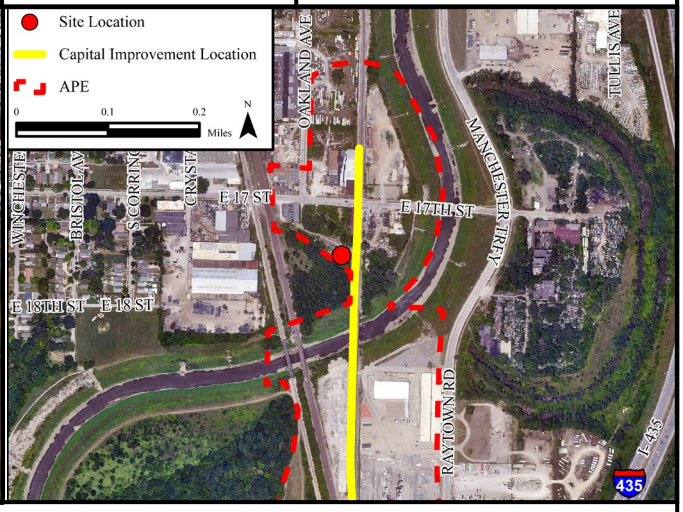
National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with early-to-mid twentieth century industrial growth, it is not individually significant within the historic context of commercial development in the region. Criterion B: Background research has not identified any connection between the property and historically significant individuals. Criterion C: The property does not serve as a good and representative example of a type, period, or method of construction due to a lack of integrity. Criterion D: There are no indications that the property is likely to yield significant information in history or pre-history.

Integrity: The property retains integrity of location, setting, and association as it remains on its original site of construction in an industrial area and continues to be in use as an industrial facility. However, the property lacks integrity of design, materials, workmanship, and feeling. Integrity of design and materials has been compromised by the non-historic additions that alter the property's historic footprint and non-historic infill of windows. These changes also disrupt the property's ability to convey its historic workmanship, as well as the feeling of its period of construction.

Resource ID:	MO-BV-004	**Resource Type:**	Above-Ground
Resource Name:	n/a	**Potential Effect:**	Visual
Previous Documentation:	NA	**Location:**	7535 E 17th Street, Kansas City, Missouri

Description: The property consists of two light industrial open storage buildings with no style. The buildings appear to have been constructed during the 1950s-1960s, based on historical aerial photographs and Sanborn Maps, with the building to the east having been constructed first. The buildings are located on a 1.4-acre lot directly adjacent to the Kansas City Southern line approximately 50 feet to the east. The immediate surrounding consists of a dirt lot overgrown with vegetation and bordered by a chain link fence. The property sits adjacent to other industrial properties built through the early to mid-20th century. The lot was not accessible at the time of field survey due to the encroachment of vegetation and fencing.

The building to the west is a rectangular single-story gable-roofed shed clad with corrugated metal siding and is completely open on both sides. The building to the east is a rectangular single-story shed-roofed open storage shed clad with corrugated metal siding.



Research of the property indicated that it was at one time used by an asphalt manufacturing company. Historic aerial photographs indicate that some structures on the property were demolished between the 1970s to 1980s. The building does not appear to be currently in use.

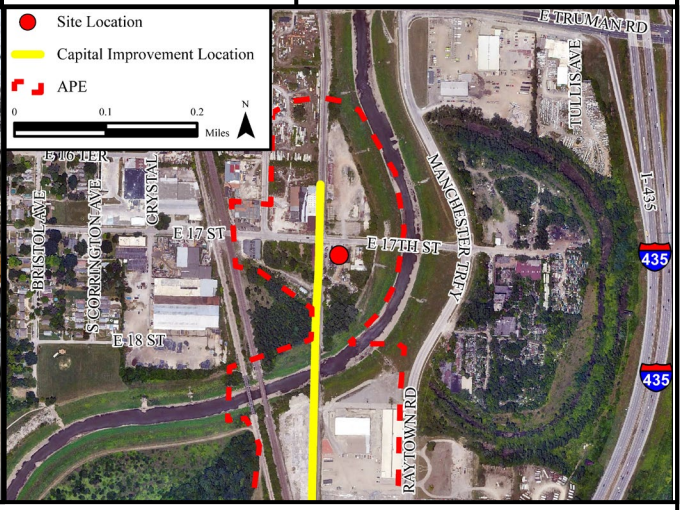
National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with early-to-mid twentieth century industrial growth, it is not individually significant within the historic context of commercial development in the region. Criterion B: Background research has not identified any connection between the property and historically significant individuals. Criterion C: The property does not serve as a good and representative example of a type, period, or method of construction due to a lack of integrity. Criterion D: There are no indications that the property is likely to yield significant information in history or pre-history.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction in an industrial area. The property retains integrity of design, materials, and workmanship as the overall form and materials are intact. Integrity of feeling and association has been lost with the demolition of other structures on the parcel which has removed the association with its historic use. Additionally, the buildings appear to no longer be in use and have been encroached upon by vegetation growth. These changes also disrupt the property's ability to convey its historic workmanship, as well as the feeling of its period of construction.

Resource ID:	MO-BV-005	**Resource Type:**	Above-Ground
Resource Name:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	7501 E 17th Street, Kansas City, Missouri

Description: The property is an industrial open storage building with no style. The building appears to have been constructed during the early 1970s, based on historical aerial photographs and Sanborn Maps. The building is located on a 0.13-acre lot directly adjacent to the Kansas City Southern line roughly 50 feet to the east. The immediate surrounding was not accessible at the time of survey due to vegetative growth but appears to consist of a dirt lot overgrown with vegetation. The property sits adjacent to other industrial properties built through the early to mid-20th century.

The building is a rectangular single-story gable-roofed storage shed that is clad in galvanized metal siding. No fenestration was visible at the time of survey.



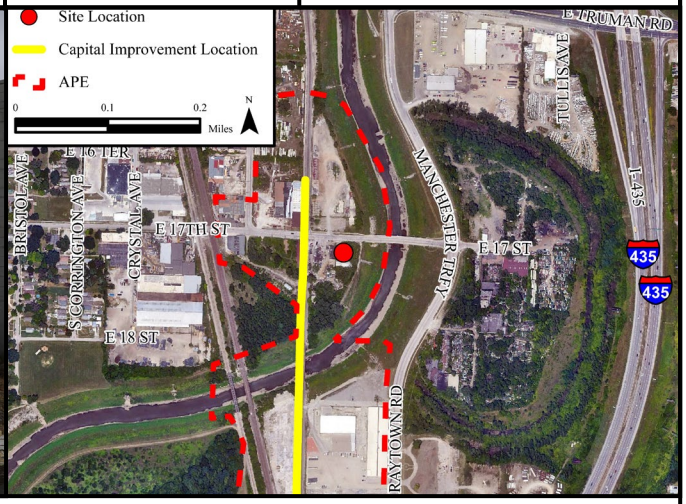
Background research on the property points to it once being in use as part of the Mississippi Lime company. It is unclear if this was the use at the time of construction and the building no longer appears to be in use.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-twentieth century industrial growth, it is not individually significant within the historic context of commercial development in the region. Criterion B: Background research has not identified any connection between the property and historically significant individuals. Criterion C: While the building remains intact and has seen little change, the property does not serve as a good and representative example of a type, period, or method of construction.. Criterion D: There are no indications that the property is likely to yield significant information in history or pre-history.

Integrity: The property retains integrity of location, setting, and association as it remains on its original site of construction in an industrial area. The property also retains integrity of design, materials, and workmanship as the overall form and materials are intact. However, integrity of feeling has been lost as the property no longer appears to serve its historic purpose.

Resource ID:	MO-BV-006	**Resource Type:**	Above-Ground
Resource Name:	n/a	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	7605 E 17th Street, Kansas City, Missouri

Description: The property consists of two industrial buildings with no style. The property faces north and is located roughly 100 feet to east of the existing Kansas City Southern railway. The buildings are located on a partially-paved 0.16-acre lot on slab concrete foundations. Background research of the property indicated it was once owned and operated by Grahn Manufacturing Company. The building on the western side of the property appears to have been constructed during the 1950s based on historic aerial photography and Sanborn maps. The building has a rectangular massing and is of concrete block construction with a flat roof. Many of the historic window openings have been infilled or replaced with non-historic vinyl windows. Three historic 4/1 sash windows remain on the side (west) elevation. Historic decorative terracotta coping can be seen along the roofline on the rear side elevation of the building. A large historic steel storage tank is also present on the side elevation. Aerial photography indicates that multiple storage tanks were removed from the front and side of the property. The rear and side (east) elevations feature garage bays with rolling metal garage doors.



The building on the eastern side of the property appears to have been constructed between 1955 and 1963, based on aerial photographs and Sanborn maps. The building has a rectangular massing and is of concrete block construction with a flat roof. The façade is fenestrated with two aluminum sliding windows while the side elevation is fenestrated with a non-historic plate glass window and aluminum frame door. Two loading docks with wood garage doors are also present on the side elevation.

National Register Evaluation: The property is recommended not eligible for listing in the National Register listing. Criterion A: While the property is associated with mid-twentieth century industrial growth in the area, it is not individually significant within this regional historical context. Criterion B: Background research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not serve as a good and representative example of a type, period, or method of construction due to a lack of integrity. Criterion D: There are no indications that the property is likely to yield significant information in history or pre-history.

Integrity: The property retains integrity of location and setting as it remains at its historic site of construction withing an industrial area. The property retains integrity of association as it is recognizable as an industrial facility. The property lacks integrity of design, materials, and workmanship due to the non-historic changes to the buildings and removal of historic materials such as the steel storage tanks. However, the property lacks integrity of feeling as the buildings no longer appear to be in their historic use.

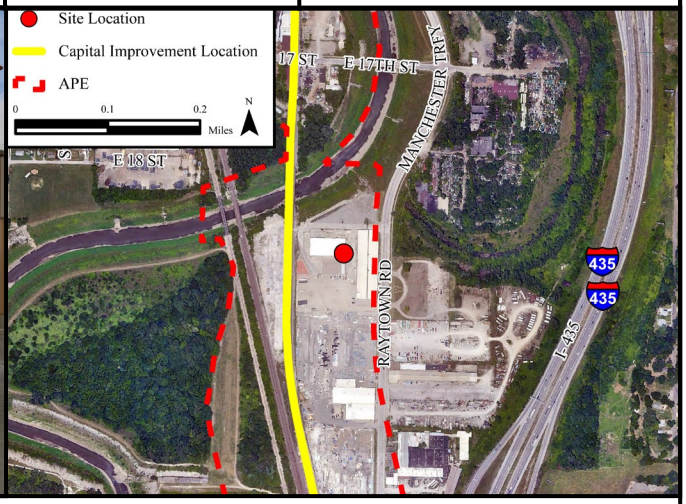
Inventory Number:	TBD	**Location:**	7615 E 17th Street, Kansas City, Missouri
Previous Documentation:	None		

Description: The property is located along the south side of E 17th Street, roughly 160 feet east of the existing KCS Railway. The property is a paved 0.4-acre lot in a semi-industrial area and is in proximity of several operational businesses and industrial facilities along E. 17th Street. A single large industrial building of no type or style is present on the property. The building faces north and is first visible onsite in a 1955 aerial photograph; however, based on the field survey and Sanborn Map research, the building was likely constructed in the 1940s. The property was in derelict condition and appeared abandoned during the site visit.

The main section of the building is a square flat-roof structure constructed of concrete block. Original wood siding can be seen beneath the roof eaves of the side elevation, and a portion of the north façade is clad in non-historic weatherboard siding. Fenestration consists primarily of original 8-pane metal industrial windows; however, most are deteriorated and boarded over with plywood. A metal Quonset hut structure extends from the rear of the main section and connects with a side-gabled masonry structure in the rear yard.

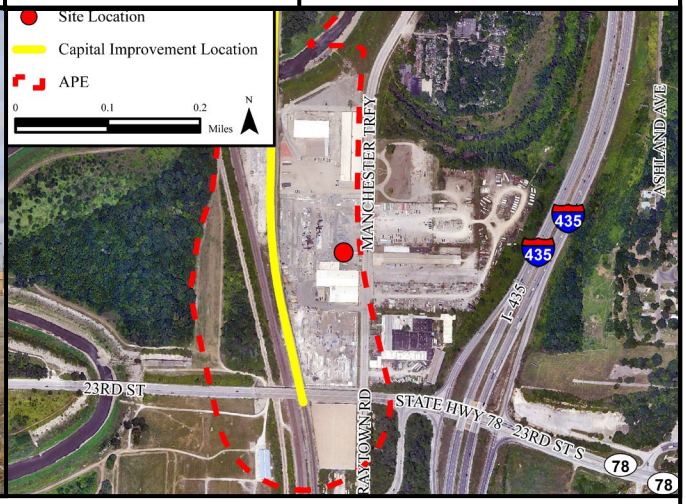


The property's original use could not be determined. Research of the property indicated that it was last occupied and operated by the local plating company, Quality Finishing Industries Inc. in the early 2000s.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the property is associated with mid twentieth century commercial practices in the area, it is not individually significant within this regional historical context. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction. Further, the property is currently abandoned and in derelict condition. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction in an industrial area. The property retains integrity of association as a discernable commercial facility; however, the facility lacks integrity of feeling as it is no longer in use. The property lacks integrity of design, materials, and workmanship. The property's dilapidated condition compromises its original footprint, building materials, and historic components. This state of disrepair also affects the property's ability to convey its historic workmanship and the aesthetic of its period of construction.

Resource ID:	MO-BV-008	**Resource Type:**	Above-Ground
		Potential Effect:	Visual
Inventory Number:	TBD	**Location:**	1900 Manchester Trafficway, Kansas City, Missouri
Previous Documentation:	None		

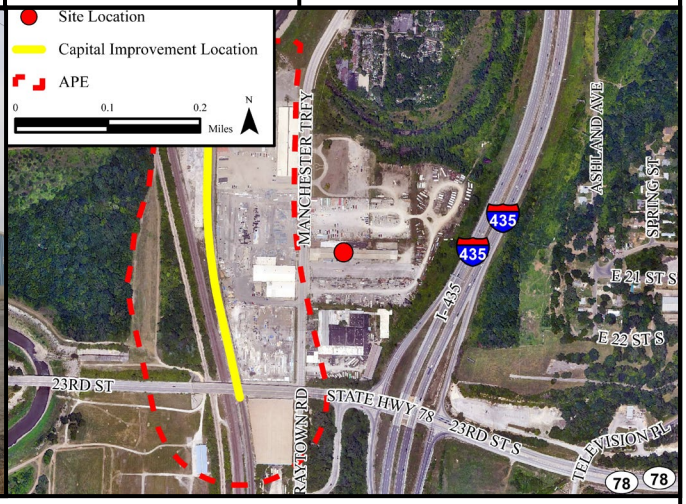


Description: The property is located along the west side of Manchester Trafficway, directly east of the existing KCS Railway. The property is a paved 8.2-acre lot and features three buildings of no type or style: a large rectangular industrial building and two smaller warehouse structures. Based on historic aerial photography and field investigation, the structures onsite were constructed at different times and were once part of a larger industrial complex. Most original structures onsite were demolished in 2019 though remnants of some building foundations as well as some railway track footprints were identified during the site visit. The property's original use is unclear however; Sanborn map research indicated that the property was operated by the Union Wire Rope Corporation in the 1940s. The two extant warehouses onsite were constructed in the 1950s and are closely identical in design. Both buildings face east and feature front-gabled metal roofs, non-historic metal siding, and several non-historic garage bay doors. The larger industrial building faces west and was constructed in 1970. The building is clad in non-historic metal siding and features an asymmetrical front-gabled metal roof and a front-gabled tower on the south façade. Several loading bays and metal louvered vents are present on the façade and side elevations. The property is situated in a semi-industrial area in proximity of several industrial facilities along Manchester Trafficway. The property is bordered by a non-historic chain link fence and is currently used for equipment storage by multiple construction companies.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the property is associated with mid twentieth century industrial practices and development in the area, it is not individually significant within this regional historical context. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction. Further, many historic structures onsite were lost due to demolition in 2019. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction in a semi-industrial area. The property lacks integrity of design, materials, workmanship, association, and feeling. Demolition of multiple structures onsite in 2019 compromise the property's original footprint and design. The extant structures onsite exhibit replacement building materials, and non-historic alterations that affect the property's ability to convey its historic workmanship. The property's original use is unclear, and the loss of several historic elements onsite affect the property's ability to convey its historic use and aesthetic.

Resource ID:	MO-BV-009	**Resource Type:**	Above-Ground
		Potential Effect:	Visual
Inventory Number:	TBD	**Location:**	2100 Manchester Trafficway, Kansas City, Missouri
Previous Documentation:	None		



Description: The property is located along the west side of Manchester Trafficway in a semi-industrial area, directly east of the existing KCS Railway. The property is a paved 10.4-acre lot in proximity of several operational manufacturing businesses and industrial facilities along Manchester Trafficway. A single large mid twentieth century industrial building of no style is present on the property. The building faces east and is first visible onsite in a 1955 aerial photograph; however, based on the field survey and Sanborn Map research, the building was likely constructed in the 1940s. The building is constructed of brick and is situated on a brick foundation. Portions of the side elevation and rear elevation have also been covered in a non-historic concrete block veneer. The building is comprised of two side-by-side front-gabled sections fronted by a stepped brick parapet wall with terracotta copping. Loading bays delineated by decorative brick buttresses span the length of the east façade and side elevation. All bays feature a non-historic bay door and several bays on the façade have been reduced in size or enclosed with non-historic metal sheeting. Additional loading bays are present on the rear elevation; however, most have been enclosed with concrete block and are no longer in use. Fenestration is comprised primarily of metal louvered vents and enclosed industrial windows. The rear property line abuts the KCS Railway and is bordered by a non-historic chain link fence. Several powerlines are also present throughout the property. Research indicated that the building onsite was historically used by Kansas City Mills. Currently, the property is owned and operated by the fence supply company, Stephens Pipe & Steel.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the property is associated with mid twentieth century industrial practices in the area, it is not individually significant within this regional historical context. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: While the property is discernable as a mid twentieth century industrial building, it exhibits several non-historic elements, building materials, and alterations that greatly diminish its overall historical integrity. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction in a semi-industrial area. The property retains integrity of association as a discernable mid twentieth century industrial facility; however, the facility lacks integrity of feeling as it is no longer used for its original purpose. The property lacks integrity of design as several of the original loading bays have been reduced in size or enclosed. The property lacks integrity of materials and workmanship as it exhibits replacement building materials that affects the property's ability to convey the aesthetic of its period of construction.

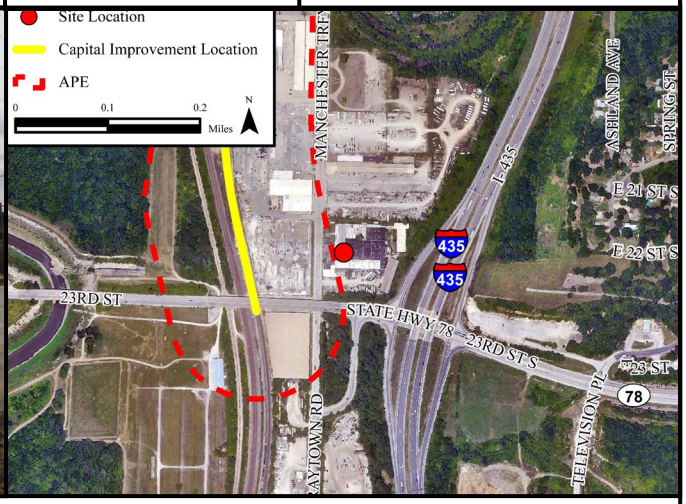
Inventory Number:	TBD	**Location:**	2193 Manchester Trafficway, Kansas City, Missouri
Previous Documentation:	None		

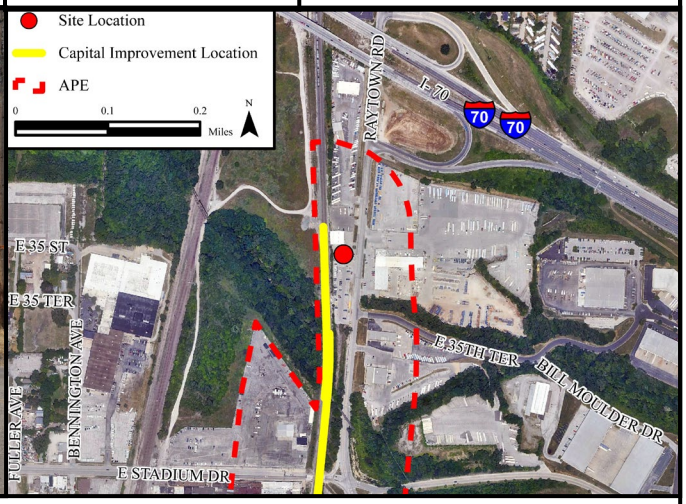


Description: The property is located along the east side of Manchester Trafficway within 500 feet east of the existing KCS Railway. The property is a paved 13.2-acre lot in a semi-industrial area and is in proximity of several operational manufacturing businesses and industrial facilities along Manchester Trafficway. Two large rectangular industrial buildings of no type or style are present onsite. The buildings, both facing west, are situated directly alongside one another and represent two periods of development. The northern building is first visible in a 1955 aerial photograph and was likely built in the 1950s. The building is constructed of brick and features a step-back flat-roof. Several loading bays and non-historic 6-pane industrial metal windows are present on the side elevation. Two additional loading bays are present on the façade; however, both bays have been enclosed with non-historic vertically-paned metal storefront windows. The southern building is a large non-historic two-story structure first visible onsite in a 1983 aerial photograph and was likely constructed in the 1980s. The building is clad in non-historic metal siding and features a front-gabled metal roof, two side shed roof projections, and six loading bays. Based on field investigation, both buildings are currently owned and operated by the steel company, Chicago Metal Rolled Products. Additional buildings onsite include two small non-historic front-gabled manufactured structures clad in metal siding. The property is bounded by a non-historic chain link fence and accessed by several small driveways along Manchester Trafficway.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century industrial growth in the area, it is not individually significant within the historic context of regional commercial development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and is currently comprised largely of non-historic elements. **Criterion D:** There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location, setting, and association as it remains on its original site of construction in a semi-commercial area and continues to be in use as an industrial facility. The property lacks integrity of design, materials, workmanship, and feeling. Integrity of design and materials has been compromised by replacement building materials and non-historic infill that alter the property's original footprint and historic components. These changes also disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of its period of construction.

Resource ID:	MO-BV-011	**Resource Type:**	Above-Ground
		Potential Effect:	Visual
Inventory Number:	TBD	**Location:**	2223 Manchester Trafficway, Kansas City, Missouri
Previous Documentation:	None		



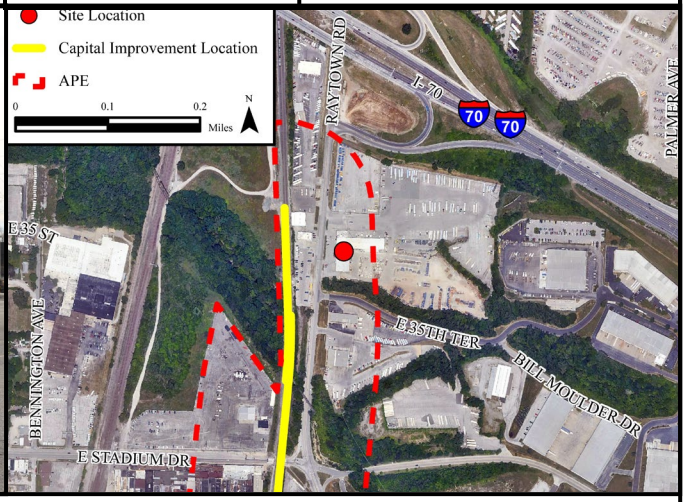
Description: The property is located along the east side of Manchester Trafficway within 500 feet east of the existing KCS Railway. The property is a paved 4.7-acre lot in a semi-industrial area and is in proximity of several operational manufacturing facilities. A complex of industrial buildings of no type or style are present onsite. A small multi-pitched flat roof garage constructed in the 1950s fronts the property along Manchester Trafficway and is the earliest building onsite. The garage faces west and is constructed of concrete block. Several original windows and garage bays have been enclosed. An abandoned rectangular flat-roof office building constructed of brick is situated directly north of the garage and was constructed in the 1960s. The building also faces west and features no fenestration. The largest structure onsite faces north and is located towards the center of the property. Based on historic aerial photography, the building was constructed in stages between 1955 and 1970. The core structure is constructed of concrete block and features both flat roof and front-gabled sections; portions of the structure are also clad in non-historic metal siding. Fenestration consists of multiple original 12-pane industrial windows and several garage bay doors. Three additional non-historic structures are also present onsite. These structures were constructed in the 1980s and include two large flat-roof structures in the rear yard and a small flat-roof office building, all of masonry construction. Research indicated that the property was historically operated by the Libby Welding Co. Based on field investigation, the property is currently used for tire storage by Beck Tire International in 2022.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century industrial growth in the area, it is not individually significant within the historic context of regional industrial development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and currently exhibits non-historic elements and infill. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location, setting, and association as it remains on its original site of construction in a semi-industrial area and continues to be in use as a commercial facility. The property lacks integrity of design, materials, workmanship, and feeling. Integrity of design and materials has been compromised by replacement building materials and non-historic outbuilding infill that alter the property's original layout and historic components. These changes also disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of its period of construction.

Resource ID:	MO-BV-012	**Resource Type:**	Above-Ground
		Potential Effect:	Visual
Inventory Number:	TBD	**Location:**	3500 Manchester Trafficway, Kansas City, Missouri
Previous Documentation:	None		

Description: The property is located along the west side of Manchester Trafficway, directly east of the existing KCS Railway. The property is a paved 0.6-acre lot in a semi-commercial area and is in proximity of several operational commercial businesses along Manchester Trafficway. The property is comprised of a single rectangular flat-roof industrial building with design elements in the Modernist style. The structure faces east and based on aerial photography, was likely constructed in the 1960s. The building is constructed of both concrete block and brick and is situated on a concrete foundation. A prominent Modernist style concrete belt course spans the length of the east façade and portions of the side elevation. A non-historic wraparound front porch is also present on the façade and is comprised of a metal hip roof supported by seven wood posts with V-shaped brackets. Three garage bay doors are present on the side elevation. Fenestration consists of a single historic 9-pane industrial window, three original 1/1 sash windows, and three original 6-pane industrial windows in a tripartite arrangement beneath a non-historic metal awning.



The property is accessed by several small driveways and curb cuts along Manchester Trafficway. A non-historic metal fence encloses the side parking lot, and a non-historic chain link fence runs along the rear property line. The property is currently operated by Premium Truck Sales and used as a car dealership.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century industrial growth in the area, it is not individually significant within the historic context of regional industrial development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: Although the building remains largely intact and continues to exhibit its historic materials and Modernist style design elements, it is not an outstanding or distinctive example of its type. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location as it remains on its original site. The property retains integrity of setting and association as a commercial business in a semi-commercial area; however, there is a loss of integrity of feeling as the property no longer appears to serve its original purpose. The building's facade has been embellished with a non-historic front porch that compromises its original footprint and integrity of design. The building continues to retain most of its original building materials and ability to convey its historic workmanship as a mid-to-late twentieth century commercial structure.

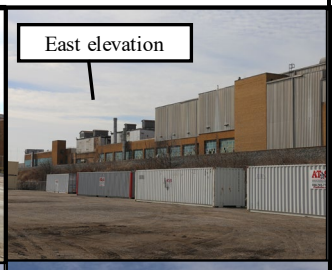
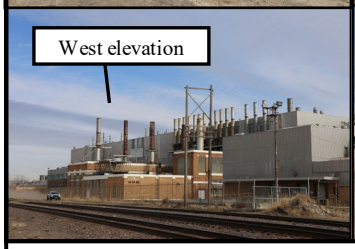
Description: The property is located along the east side of Manchester Trafficway, roughly 250 feet east of the existing KCS Railway. The property is a paved 8.6-acre lot in a semi-commercial area and is in proximity of several operational commercial businesses along Manchester Trafficway. A single large industrial building of no type or style is present onsite. The building is first visible in a 1963 aerial photograph and was likely constructed in the early 1960s. A non-historic addition is present to the north and, based on aerial photography, was likely constructed in the late 1970s to early 1980s. The property is currently owned and operated by the safety equipment supplier, United Rentals-Trench Safety. The main structure is a multi-pitched T-shaped building on a concrete foundation. The building faces west and is comprised of a central front-gabled section constructed of concrete block. This front-gabled section is situated between an asymmetrical front-gabled section to the south and a small non-historic flat-roof addition to the north. The structure is clad in non-historic metal siding and features several garage doors and loading bays on the rear elevation. Fenestration consists of non-historic single-pane metal windows in various pairings, non-historic horizontally-paned 2/1 metal windows, and several original 9-pane industrial windows.

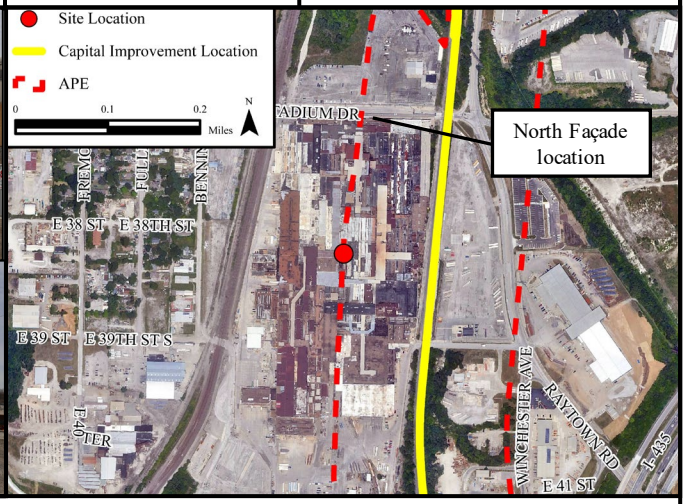


The property is accessed by several small driveways along Manchester Trafficway. A non-historic chain link fence encloses the rear yard, and a wooded area is present along the southern boundary of the property.

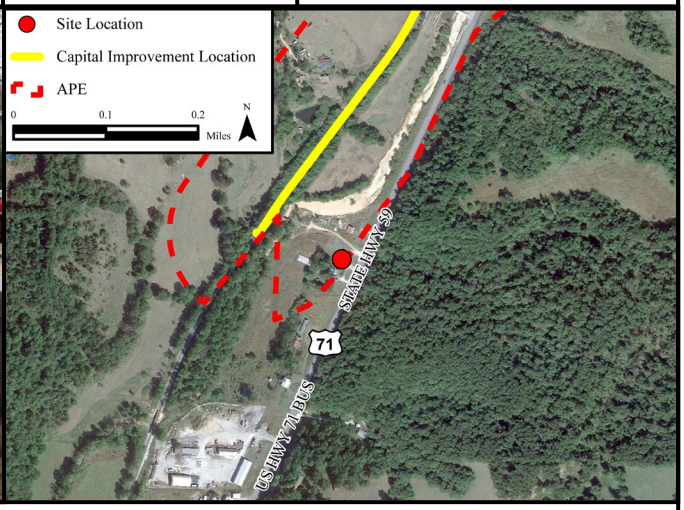


National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with late twentieth century industrial growth in the area, it is not individually significant within the context of regional commercial development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. **Criterion C:** The property does not embody a distinctive characteristic of a type, period, or method of construction and exhibits non-historic alterations and replacement materials. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location, setting, and association as it remains on its original site of construction in a semi-commercial area and continues to be in use as an industrial facility. The property lacks integrity of design, materials, workmanship, and feeling. Integrity of design and materials has been compromised by a large non-historic addition and replacement building materials that alter the property's historic footprint and historic components. These changes also disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of its period of construction.



Resource ID:	MO-BV-014	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	Along E 39th Street, Kansas City, Missouri



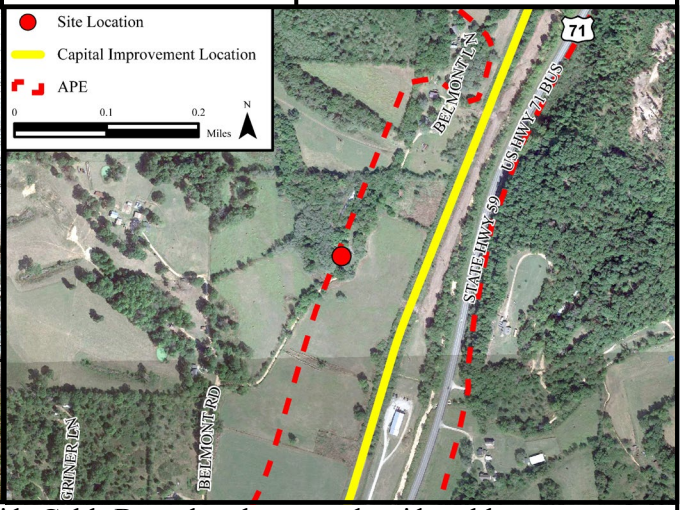
Description: The property is located directly west of the existing KCS Railway. The property is a paved 48-acre lot and features a large industrial complex comprised of several interconnected early-to-mid twentieth century manufacturing structures. The complex was first constructed in 1929 and, based on aerial photography and Sanborn Map research, was expanded in stages from 1930-1970. Research also indicated that the complex was historically used as a General Motors automobile assembling facility from 1929-1988. The facility was largely inaccessible for field survey as several sections were undergoing demolition during field investigation due a recent fire in 2021. The core building onsite is constructed primarily of brick and features several multi-floor flat roof sections with exterior metal exhaust pipes. Portions of the structure are also clad in non-historic metal siding. The north façade is located along Stadium Drive and features several Art Deco style elements including brick dentil detailing, decorative concrete and brick buttresses, and several large vertically-paned non-historic metal windows. Several of these Art Deco style design elements can also be seen on the side elevations of the core structure. Additional fenestration includes historic glass block walls, original horizontally-paned casement windows, original large multi-paned industrial windows, and multiple loading bays. The property is bordered by a non-historic chain link fence and abuts the KCS Railway to the east. The property no longer operates as an active industrial facility and is currently used for some warehouse storage.

National Register Evaluation: The property is recommended eligible for listing on the National Register under Criterion A and C: The property is associated with the history of General Motors which played a notable role in the industrial development of the area in early-to-mid twentieth century. Further, while portions of the property are currently being demolished due to fire damage, the core structure and primary building onsite remains discernable as an early-to-mid twentieth century industrial building with intact Art Deco style design elements. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location and setting as it remains on its original site of construction in an industrial area. The property retains integrity of workmanship and feeling. The facility is discernable as an early-to-mid twentieth century industrial facility and continues to convey its historic workmanship and the aesthetic of its period of construction. The property's integrity of design, materials, and association has been compromised. The property exhibits multiple non-historic components and portions of the building are currently undergoing demolition. These changes greatly alter the property's historic footprint and original building materials. The facility lacks integrity of association as it is no longer used for its original purpose.

Resource ID:	MO-GO-001	Resource Type:	Above-Ground
Inventory Number:	TBD	Potential Effect:	Visual
Previous Documentation:	None	Location:	5267 MO Highway 59, Goodman, Missouri

Description: The property is residential and includes two historic houses and two non-historic outbuildings. The houses were constructed between 1955 and 1959 based on historic aerial photographs. The property is surrounded by residential and agricultural development. The property is an approximately 0.8-acre parcel located approximately 450 feet from the KCS ROW and is separated from the railroad by a swath of trees. The houses face southeast towards MO Highway 59.



The southern house includes a large non-historic addition on the rear elevation resulting in an L-shaped footprint. The side-gable roof is covered by a non-historic standing seam metal, and the exterior features non-historic vinyl siding. Although the entrance has been replaced with a non-historic wood door, the house retains its fixed and 1/1 double-hung wood windows. The front façade features a portico with a shed roof that is supported by wooden porch supports. The house located on the north side of the parcel has a long, rectangular footprint and is covered by a sheet metal shed roof. The house is clad in non-historic vinyl siding and is fenestrated with non-historic 1/1 vinyl windows. The front façade features a front portico that is contained under a standing seam metal shed roof with wooden porch supports with a non-historic cross-and-bible wood door. The outbuildings are non-historic storage sheds.

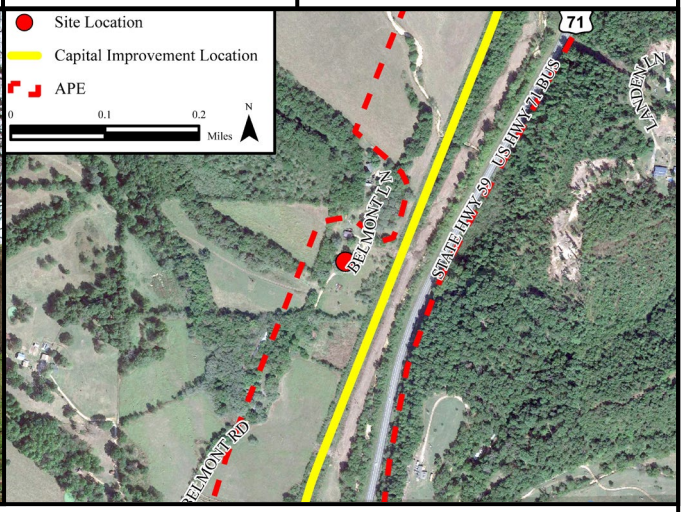
National Register Evaluation: This property is recommended not eligible for the National Register. Criterion A: While the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting. The property remains at its historic location and remains in a rural residential setting. The buildings remain in use as residences and retain their historic association with rural residential development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the historic siding, windows, and the additions to the houses on the property. These substantial alterations have diminished the integrity of feeling, and the property no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	MO-GO-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	373 Belmont Lane, Goodman, Missouri

Description: The property is residential consists of a Side Gable Bungalow house and a side gable garage outbuilding. The house and garage were constructed in the 1920s based on historic aerial photographs and type. The property is set in a residential and agricultural setting. It is surrounded by patches of woods, historic and non-historic residential development, and agricultural fields. The property is located approximately 490 feet from the KCS ROW on a 55-acre parcel and faces east towards Belmont Lane.

The house is a 1½ story Side Gable Bungalow with two large non-historic side additions. The house is covered by an asphalt shingle roof and features a prominent shed-roof dormer on the front façade and a brick chimney. The front verandah is supported by non-historic replacement squared wooden porch supports under a shed roof. The house is clad in non-historic vinyl siding and features replacement 6/6 and 2/2 vinyl windows. The front façade of the house features a large non-historic wooden deck addition. The deck attaches the house to an aboveground pool and is accessed by a sliding glass door.



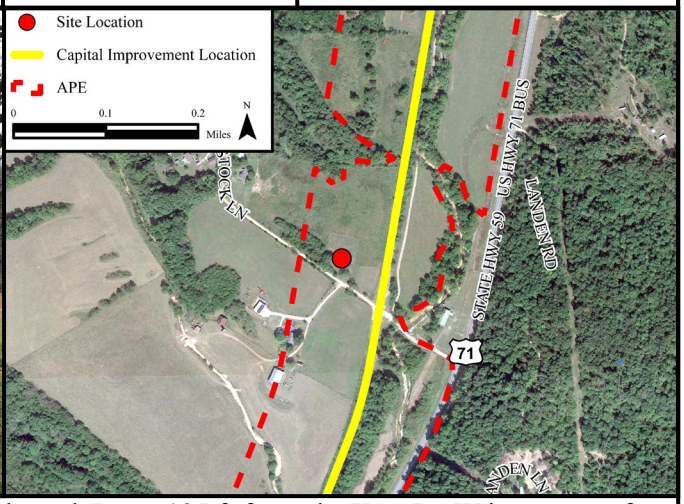
The garage outbuilding is wood framed. It features one garage door and a non-historic cross and bible wooden door. The exterior of the garage is clad in wooden siding and set on a poured concrete foundation.

National Register Evaluation: This property is recommended not eligible for the National Register. Criterion A: While the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Side Gable Bungalow; however, it does not serve as a good and representative example due to a lack of integrity. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The integrity of design, materials, and workmanship, have been compromised due to the replacement of historic materials and the many additions to the house. These include the replacement of the historic siding, windows, and porch supports. The additions to the house including the large side additions as well as the deck further compromise the integrity of design, materials, and workmanship. These substantial alterations have diminished the integrity of feeling, and the house no longer conveys the feeling and aesthetic of its period of construction. The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting. The building remains in use as a residence and the building retains its historic association with rural residential development in this area.

Resource ID:	MO-GO-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	533 Belmont Lane, Goodman, Missouri

Description: The property is residential and consists of a house, a shed outbuilding, and a cellar. The house was built between 1950 and 1955, according to historic aerial photography. The property also includes a cellar that is built into the hill to the rear of the house and a concrete block shed. Due to vegetation obscuring the outbuildings on the historic aerial photographs, the construction date of the outbuildings are unknown; however, based on the materials present, they appear to be historic. The property is located approximately 310 feet from the KCS ROW on an approximately 2.3-acre parcel and is surrounded by historic and non historic residential development as well as patches of woods and agricultural fields.

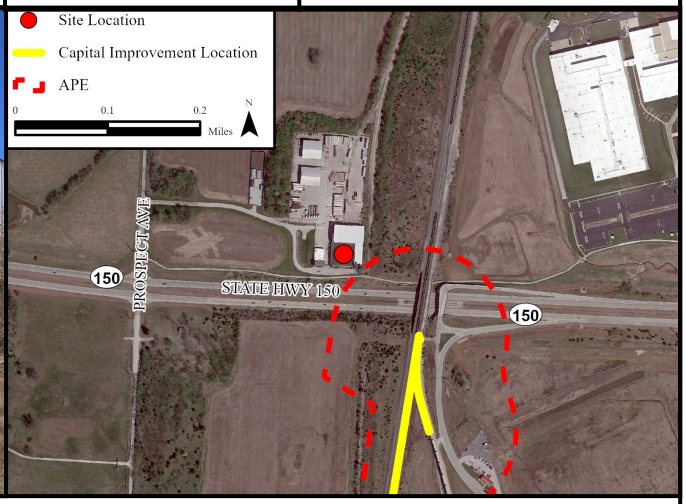


The historic house is located on a poured concrete foundation, is clad in non-historic vinyl siding, has 6/6 vinyl type double hung sash windows, a southeast facing front façade with a prominent brick chimney, and a front gable porch supported by metal porch supports. Many material changes are present. These include the replacement of the historic siding with non-historic vinyl siding, the replacement of the historic windows with non-historic vinyl type windows, and the addition of the non-historic front porch. The cellar appears to be historic and is constructed from poured concrete and has a sheet metal roof. It appears to no longer be in use. The second concrete block outbuilding topped with a front gable roof made of sheet metal and is located close to the house.

National Register Evaluation: This property is recommended not eligible for the National Register. Criterion A: While the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location, setting, and association. The property remains at its historic construction site and remains in a rural residential setting. The building remains in use as a residence. The building retains its historic association with rural development in this area. The integrity of design, materials, and workmanship have been compromised due to the replacement of the front porch, replacement of the exterior siding with non-historic vinyl, and the replacement of the historic windows and front door. These substantial alterations have diminished the integrity of feeling, and no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	MO-GO-004	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	East of 159 Blackstock Lane, Goodman, Missouri



Description: The Mitchell Cemetery is located off Blackstock Lane, 195 ft from the KCS ROW in an area of rural residential development and agricultural fields. The property is approximately 0.85 acres of sloping, open lawn, with a partial border of black walnut and oak trees. The graves are arranged in a linear pattern running relatively north-south with some family plots bounded by cement blocks and bricks. The earliest markers date to 1864 and as late as the 1980s. The markers are primarily constructed of historic marble and granite in tablet, in-ground markers, and bronze in-ground markers. Many markers are carved with decorative flora, geometric designs, emblems of clubs and fraternal organizations, military involvement, and symbols of religious devotion. Some unique markers are in the forms of double hearts. Approximately 99 burials are recorded, of which approximately 97% occurred over 50 years ago. Prominent family names include Mitchell, Friend, and Shearwood. Research has found that the Friend family were some of the earliest settlers in the region and helped to settle the town of Goodman. Gaps between markers could indicate unmarked burials where the headstones have been removed; there is a section of the cemetery that contains the headstones that have either fallen over or have been removed from their associated burial. The cemetery is well maintained, despite some damage to headstones.

National Register Evaluation: The property is recommended eligible for listing in the National Register under Criterion A. Criterion A: The construction of the property is associated with mid-to-late nineteenth century settlement and exploration in the region, it is individually significant within the historic context of community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The cemetery retains its original arrangement and is typical of funerary design for rural cemeteries of the time period; however, it does not serve as a particularly good or representative example of its type and period. Criterion D: This property type does not appear to have the potential to yield further important information or data that is not already available in the extant documentary evidence. Criteria Consideration A: The property's association with the historic event of the settling of Goodman allows for the cemetery to be considered eligible for the National Register.

Integrity: The property retains integrity of location and setting as it is in its original, historic location. It also retains integrity of association because it remains a cemetery with both historic and non-historic burials. The cemetery retains integrity of design and materials as the headstones are in their original designed location and retain their historic materials. The intact features convey a sense of historic workmanship, and the property retains the feeling and aesthetic of its period of construction.

Resource ID:	MO-GV-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	2900 E 47th Street, Kansas City, Missouri

Description: The property is located north of E 47th Street, roughly 400 feet west of the existing Kansas City Southern Railway. The property is an 8.3-acre paved lot in a semi-commercial area and is surrounded by rural fields and some large manufacturing facilities. Two large industrial buildings with Colonial Revival style elements are present onsite. Both buildings face south and were constructed in 1970. The property is currently owned and operated by the regional recycling business, Midwest Shredding Service. The main structure is a multi-pitched flat-roof industrial building on a concrete foundation. The structure is clad in non-historic metal siding and features three garage bay doors on the side elevation. Several non-historic additions were constructed in 2014 and consist of a large open-bay section to the rear of the building and a faux Colonial Revival style façade to the south. The façade is clad in non-historic weatherboard siding and features a two-story front-gabled portico and faux windows. An office building clad in non-historic weatherboard siding is located to the west; the building is comprised of a one-story flat roof section and a two-story side-gabled section. A non-historic two-story flat-roof portico supported by four brick columns and topped by a wooden balustrade is present on the two-story section. Fenestration on both sections consists of non-historic single-pane windows in various pairings and non-historic 6/6 sash windows. Additional structures onsite include two non-historic open-bay storage sheds comprised of front-gabled metal roofs supported by metal posts. These structures are first visible in a 2007 aerial photograph and likely constructed at this time.

National Register Evaluation: The property is recommended not eligible for listing on the National Register. Criterion A: While the construction of the property is associated with late twentieth century industrial growth in the area, it is not individually significant within the history of regional industrial development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and exhibits non-historic alterations and replacement materials. Criterion D: There are no indications that the property is likely to yield significant information in history or prehistory.

Integrity: The property retains integrity of location, setting, and association as it remains on its original site of construction in a semi-commercial area and continues to be in use as an industrial facility. The property lacks integrity of design, materials, workmanship, and feeling. Integrity of design and materials has been compromised by several non-historic additions and replacement building materials that alter the property's historic footprint and historic components. These changes also disrupt the property's ability to convey its historic workmanship, as well as the feeling and aesthetic of its period of construction.

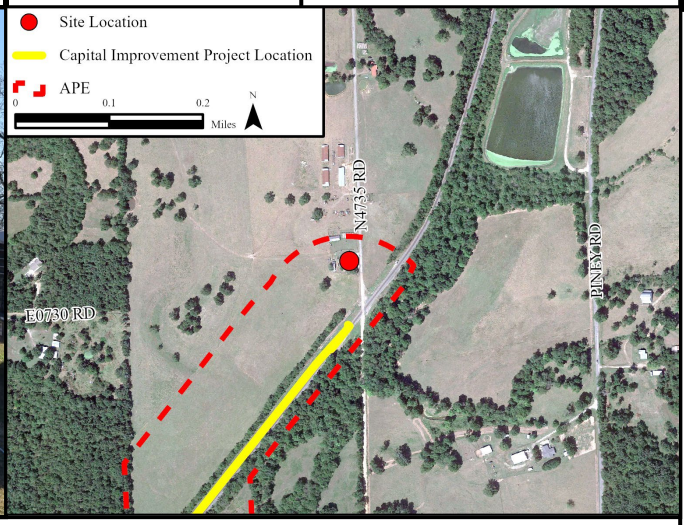
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	Schmits 1983	**Location:**	Grandview

Description: This archaeological resource is a previously recorded historic well/cistern. The site was initially recorded in 1982 by Environmental Systems Analysis for the US Air Force (USAF) (Schmits 1983). A site revisit in 2022 did not relocate any features and the portion of the site within the railroad right-of-way has been destroyed by construction of roadways and the placement of ballast.

Historically, this area was developed as a USAF airfield and was subsequently redeveloped as the International Freight Gateway for Kansas City Southern. The historic site likely predates the airfield based on a structure visible at the location on historical maps (USGS Belton, MO 1934 [HTMC, 1934 ed.] and Belton, MO 1980 [HTMC, 1981 ed.] 1:24,000).



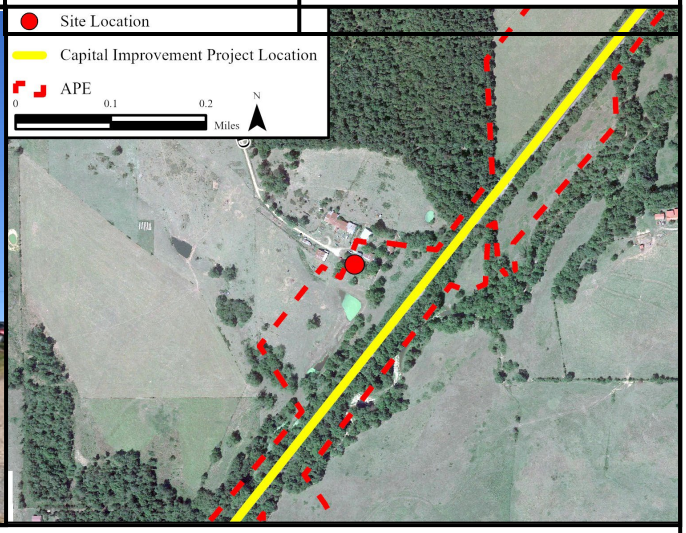
National Register Evaluation: This site is recommended as not eligible for listing on the National Register. The property was evaluated for the National Register under Criterion D; however, no features or artifacts were observed upon this site revisit, as the site has been destroyed. The property does not have the potential to yield further important information or data.

Integrity: Historic properties are evaluated for integrity of location, setting, association, design, materials, and workmanship. This site retains no integrity as no artifacts or features remain.

Appendix J – Attachment 7: Oklahoma Segment

Resource ID:	OK-BA-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	72966 S 4745 Road Westville, Oklahoma

Description: The property comprises a house, detached garage, and large shed in the project area on approximately 20 acres of farmland immediately adjacent to the KCS ROW. The property is currently used for cattle ranching. The Ranch house and detached garage appear to have been constructed during the 1960s, as it first appears on a 1971 historic aerial photograph. The large shed at the rear of the property was constructed in the 1970s but is obstructed from public view by the house and garage.



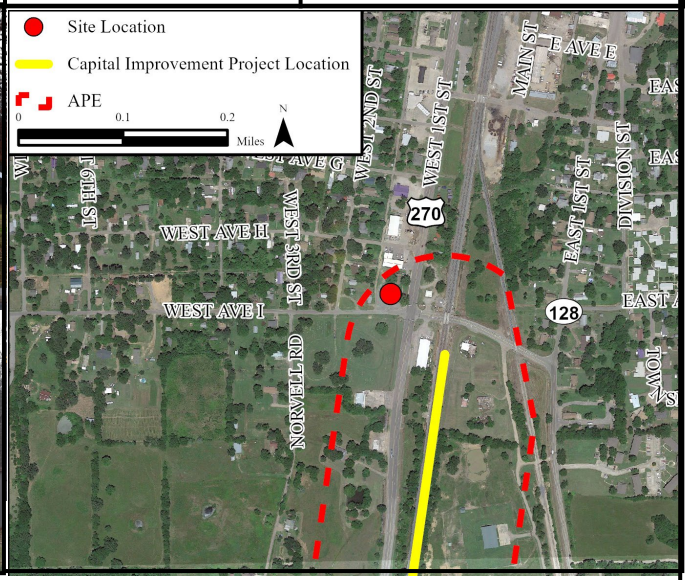
The house is a one-story, wood-frame Ranch house with no distinct style. It is clad in non-historic vinyl and board-and batten siding with stone accents and capped by an asphalt shingle-clad side-gable roof. Windows consist of non-historic single and paired 1/1 double hung sash aluminum replacement windows. The house has several large additions including an attached garage on the north side elevation and large, partially enclosed gable-front porch on the front elevation constructed in the 1980s or early 1990s as per aerial photographs. A front-gabled porch features a partial-width porch supported by vinyl-wrapped Doric columns. The main entrance appears to be inside the partially enclosed porch and is not visible from the public ROW. A secondary entrance with a pair of fully-glazed vinyl door is in the attached garage addition. The detached garage, which sits to the northeast of the house is a corrugated metal-clad, front-gable, wood-frame structure with non-historic vertical wood panel siding.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century agricultural growth in the region, it is not individually significant within the historic context of the agricultural development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction with extensive use of replacement materials and alterations. Criterion D: This residential property does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape, abutting forest, and open agricultural land. The property also retains integrity of association due to its continued agricultural use. The integrity of feeling, design, materials, and workmanship are compromised due to the use of inappropriate replacement materials, alterations, and unsympathetic additions.

Resource ID:	OK-BA-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	73399 S 4740 Road Westville, Oklahoma

Description: The 93.7-acre property comprises a house and three outbuildings in the project spanning the east and west sides of S. 4745 Road. The property is immediately adjacent to the KCS ROW, but the main cluster of buildings in the project area sits approximately 358 feet west of ROW. There is minimal visibility from the public ROW and access was denied to the surveyors by the resident. The property is currently used for cattle ranching and includes agricultural fields, at least seven small ponds, scattered clusters of trees, and is bounded by swaths of woods and vegetation. The house appears to have been constructed during the 1960s and is first visible on a 1971 historic aerial photograph. The outbuildings, consisting of a transverse crib barn and two pre-fabricated metal-frame sheds, date to the 1980s and 1990s.

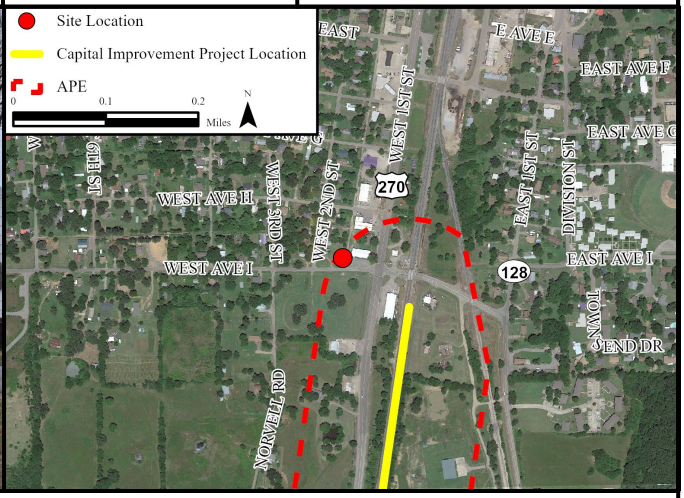


The house is a one-story, wood-frame building with no distinctive style clad in non-historic replacement materials including vinyl siding, 1/1 aluminum-framed replacement windows, and metal-clad front-gable roof. A non-historic side addition has composite clapboard siding, and 1/1 aluminum windows was constructed in 2015. The transverse crib barn is a wood-frame structure clad in metal siding topped by a front-gable metal roof with a side lean-to. The prefabricated sheds are both one-bay, wood-frame structures clad in corrugated metal siding. One shed has a metal-clad gambrel roof and the other has an asphalt shingle-clad front-gable roof.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century agricultural growth in the region, it is not individually significant within the historic context of the agricultural development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction with extensive use of replacement materials and alterations. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape, abutting forest, and open agricultural land. The property also retains integrity of association due to its continued agricultural use. The integrity of feeling, design, materials, and workmanship are compromised due to the use of inappropriate replacement materials, alterations, and unsympathetic additions.

Resource ID:	OK-HE-001	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	1000-1002 W. 1st Street Heavener, Oklahoma



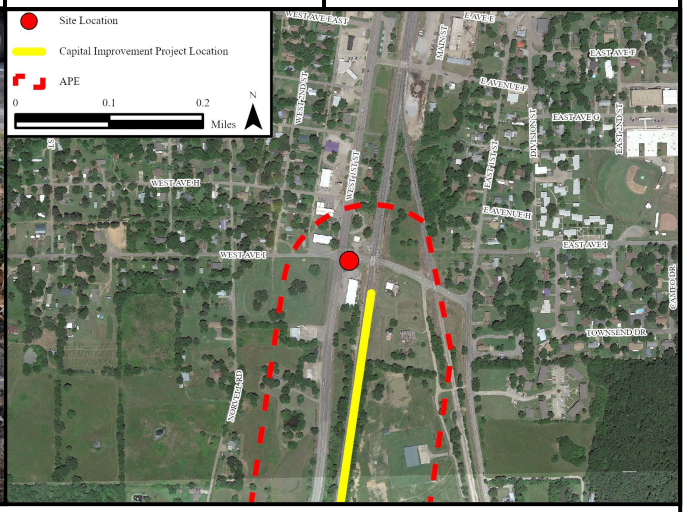
Description: The property consists of a front-gable church, a Ranch house, and a shed that are on a 0.6-acre parcel approximately 225 feet west of the KCS railway. The property is surrounded by both historic and modern residential and commercial structures. The church and the house appear to have been constructed during the 1960s based on materials such as historic aerial photographs; both are visible on a 1976 aerial. The church was expanded to the rear in 2005 as per aerial photography. The house appears to be unoccupied and is most likely used by the neighboring church. The church is clad with vinyl siding and running bond brick veneer, and it is contained under a front-gable standing seam metal roof. The front features a covered, front stoop entrance with concrete stairs, a metal railing, and porch supports that lead to glass and aluminum doors. The church also has two additional side entrances with stoops on the left side elevation and 1/1 aluminum double-hung windows. The house has a concrete block foundation, clad in shiplap wood siding, and an asphalt shingle-clad side-gable roof. A one-story ell that may have formerly been a garage is attached to the right side elevation. Windows consist of original wood, 2/2 double-hung and fixed sash. There are two entrances on the front elevation. The center entrance is located beneath a gable roof porch and consists of a solid door covered by a non-historic aluminum storm door. The second entrance is on the side ell, and it contains a composite panel non-historic door with filled sidelights. The small, non-historic metal shed is located directly to the north of the non-historic ell.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century mixed-use development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a mid-century gable-front church; however, the church nor the residence serve as a good and representative example of their type and style due to a lack of integrity (see below). Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and feeling, as it remains in its original location and setting along a local, rural highway surrounded by mixed-use development. The property also retains integrity of association, since it is still a religious/mixed-use property. The integrity of design, materials, and workmanship are compromised due to the use of inappropriate replacement materials and alterations of both buildings.

Resource ID:	OK-HE-002	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	102 W. Avenue I Heavener, Oklahoma

Description: The property comprises a house in the project area on an approximately 0.5-acre parcel. The was constructed during the 1960s, based on aerial photographs from 1955 and 1976, and sits approximately 335 feet west of the KCS ROW. The house is sited relatively close to the north side of the street and is surrounded by open lawn with a semi-circular dirt driveway to the south.



The house is a one-story, wood-frame building with no distinctive style. It is clad in wide synthetic pressboard siding contained under a replacement aluminum roof situated on a poured cement foundation. A porch on the front elevation features a cement block foundation with a shed asphalt shingle-clad roof and wood porch supports. The house features original 2/2 wood double-hung sash and aluminum replacement sash windows. The main entrance in the center of the front elevation consists of a partially glazed panel replacement door. A small shed-roof historic addition is on the rear elevation of the house.

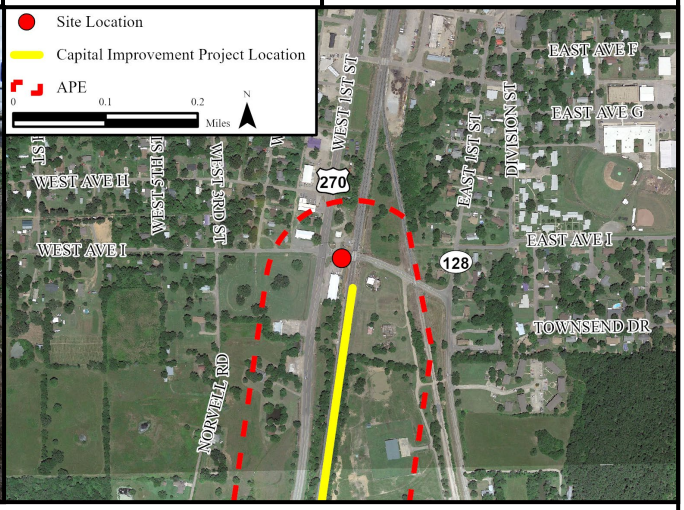
National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction, and most of the original materials have been replaced. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains its integrity of location, setting, feeling, and use as it remains a residential property in its original location and setting along a local, rural highway surrounded by mixed-use development. The integrity of design, materials, and workmanship are compromised due to the use of inappropriate replacement materials and alterations.

Resource ID:	OK-HE-003	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	West of W. Avenue I and W. 1st Street, Heavener, Oklahoma

Description: This system of culverts carried W. 1st Street and a private driveway over a drainage ditch on the north side of OK Highway 128 immediately adjacent to the KCS ROW, in a commercial and light-industrial area south of downtown Heavener. The system comprises two culverts running west-east. The first (west) culvert passes under W. 1st Street, north of the intersection with W. Avenue I. This culvert has one exposed headwall at the northeast corner of the intersection. The second (east) culvert in the system runs beneath the private driveway on the north side of W. Ave I. between W. 1st Street and the KCS ROW.

Both culverts in this system are twin-cell box culverts made up of a concrete top plates, abutments, hammerhead-shaped center walls, and flared wingwalls. They were likely constructed in 1964, based on the known construction date of other similar culverts in the area. Both culverts measure approximately 2-3 feet in height. The east culvert is approximately 30 feet wide with headwalls on the east and west outlets. West 1st Street is approximately 55 feet wide at the west culvert with concrete curbing. The private driveway consists of packed gravel with a narrow grass shoulder.



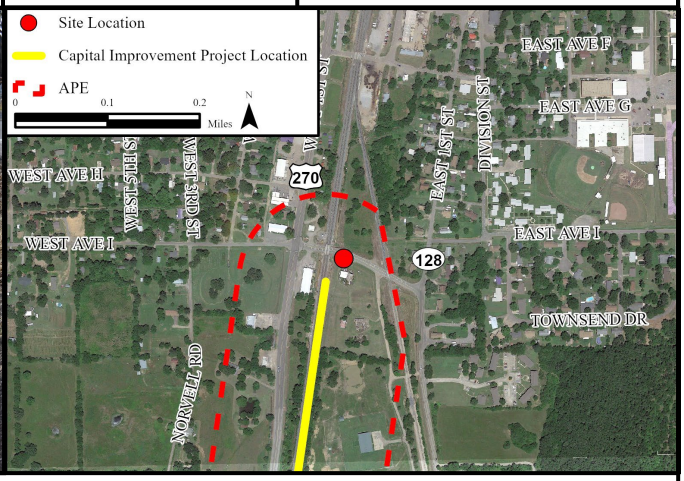
The culverts appear to be in good condition. There is little visible deterioration of the concrete structures.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century development in the region, it is not individually significant within the historic context of transportation within the region. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The culvert retains its original form and is typical of infrastructure projects of the time period; however, it does not serve as a particularly good or representative example of its type, period, or method of construction. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of feeling, location and setting along a local, rural highway in a mixed-use neighborhood. It also retains integrity of association because it remains in use as a part of transportation infrastructure. The design and materials of the culvert system are intact, and they are able to convey a sense of historic workmanship. The culvert retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-004	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	N/A	**Location:**	W. Avenue I, east of W. 1st Street, Heavener, Oklahoma

Description: This culvert carries W. Avenue I over an unnamed stream approximately 100 feet east of the junction with W. 1st Street immediately adjacent to the KCS ROW in a commercial and light-industrial area south of downtown Heavener. The twin-cell box culvert has a concrete structure made up of a concrete top plate and headwall, abutments, hammerhead-shaped center walls, and flared wingwalls. It has a total width of approximately 42 feet. The paved roadway is approximately 40 feet wide with a slightly sloping grassy shoulder. The culvert was constructed in 1964, based on the construction date of similar structures in the area.



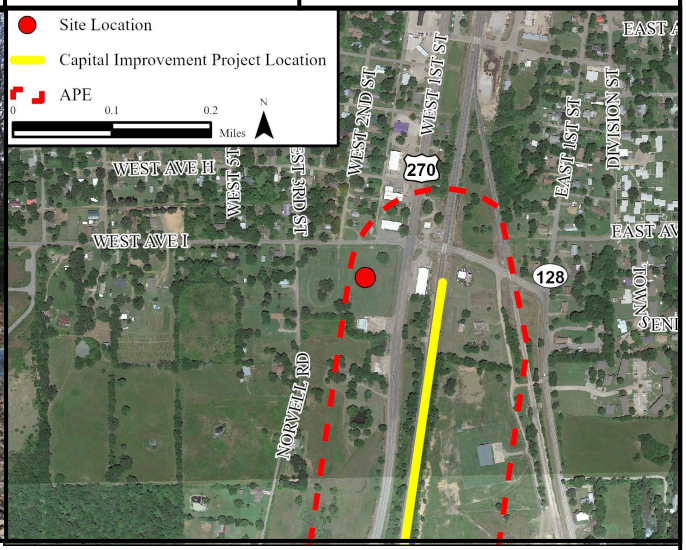
The culvert appears to be in good condition. There is little visible deterioration of the structure.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century development in the region, it is not individually significant within the historic context of the transportation development in the region. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The culvert retains its original form and is typical of infrastructure projects of the time period; however, it does not serve as a particularly good or representative example of its type, period, or method of construction. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of feeling, location and setting along a local, rural highway in a mixed-use neighborhood. It also retains integrity of association because it remains in use as a part of transportation infrastructure. The design and materials of the culvert are intact and able to convey a sense of historic workmanship, and the culvert retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-005	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	NBI No. 15928/Structure # 4046 0004 X (ODOT Inventory)	**Location:**	OK Highway 128 over Oil Branch, east of US 59, Heavener, Oklahoma

Description: This culvert carries OK Highway 128 over the Oil Branch approximately 270 feet east of the intersection with US 59, and immediately east of an at-grade crossing of the KCS in an area of commercial and light-industrial development south of downtown Heavener. The triple-cell box culvert has a prestressed concrete structure made up of a concrete top plate and headwall, abutments, hammerhead-shaped center walls, and flared wingwalls. It was constructed in 1964 as per Oklahoma Department of Transportation (ODOT) records. The culvert measures approximately 34 feet in length and 42 feet in width, of which approximately 40 feet is the roadway. The road is paved with a narrow grassy shoulder beneath the guardrails. The guardrails consist of a reinforced concrete pier-and-rail system.

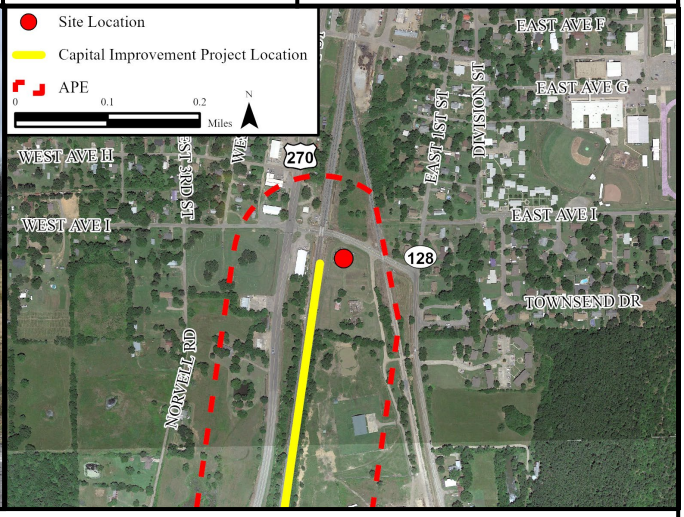


The culvert appears to be in good condition. There is little visible deterioration of the concrete structure. An additional ribbed steel wingwall was installed immediately behind the northwest concrete wingwall at an unknown date to provide additional support against the railroad ROW. The reinforced concrete guardrail has cracked and spalled in some locations, particularly at the junction of the rail and pier. Several rails have also dislodged from the piers.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century development in the region, it is not individually significant within the historic context of transportation. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The culvert retains its original form and is typical of infrastructure projects of the time period; however, it does not serve as a particularly good or representative example of its type, period, or method of construction. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of feeling, location and setting along a local, rural highway in a mixed-use neighborhood. It also retains integrity of association because it remains in use as a part of transportation infrastructure. The design and materials of the culvert is intact and able to convey a sense of historic workmanship, and the culvert retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-006	**Resource Type:**	Above-Ground
		Potential Effect:	Visual
Inventory Number:	TBD	**Location:**	SW corner W. 1st Street and W. Avenue I, Heavener, Oklahoma
Previous Documentation:	n/a		



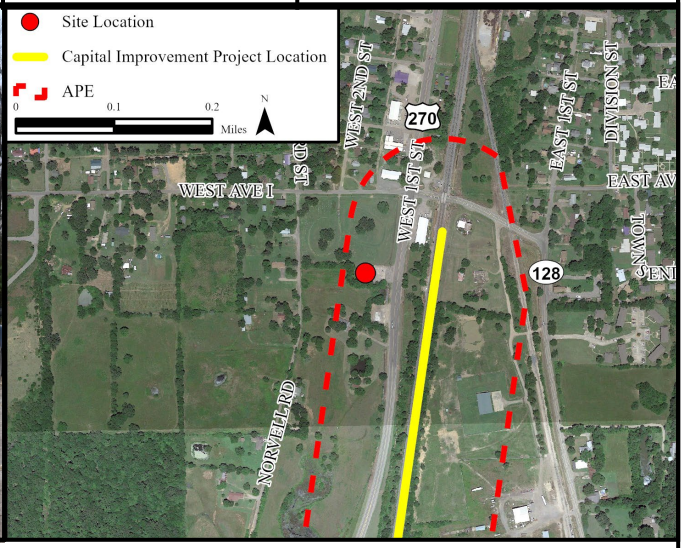
Description: Oakdale Cemetery, also known as Lower Cemetery, is located at the southwest corner of the intersection of W. 1st Street and W. Avenue I, approximately 190 ft from the KCS ROW in an area of mixed-use development south of downtown Heavener. The property is roughly 3.95 acres of relatively level, open lawn with scattered deciduous trees. There is an informal figure-eight shaped grass/dirt roadway near the center of the site, with driveway access off the south side of W. Avenue I. The markers are dated as early as the late nineteenth century and continue through the present day. They are primarily 19th and early 20th century granite, marble, and limestone in tablet and obelisk forms with mid-to-late 20th century polished granite tablet and flush markers. Many of the markers are carved with decorative flora, geometric designs, emblems of clubs and fraternal organizations, and symbols of religious devotion. Some unique markers are in the forms of crucifixes, tree stumps, broken columns, and draped columns and urns. The makers are arranged in informal rows that run north-south and are interrupted by scattered family plots delineated by low granite curbing. Approximately 495 known burials are recorded, of which approximately 90% occurred over 45 years ago. Gaps between markers could indicate unmarked burials; however, several burials are recorded without the presence of a marker. The site appears to be well-maintained and mowed regularly. The markers are in a poor to good condition, with some markers displaced or broken and/or toppled.

National Register Evaluation: This property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with late-nineteenth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The cemetery retains it original arrangement and is typical of funerary design for rural cemeteries of the time period; however, it does not serve as a particularly good or representative example of its type and period, Criterion D: This property type does not appear to have the potential to yield further important information or data that is not already available in the extant documentary evidence.

Integrity: The property retains integrity of feeling, location and setting along a local, rural highway surrounded by mixed-use development. It also retains integrity of association because it remains a cemetery with active burials. The design and materials of the landscape are relatively informal but intact, including the overall arrangement of markers in rows with intermittent family plots. The intact features convey a sense of historic workmanship, and the property retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-007	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	OK Highway 128, northwest of E. 1st Street, Heavener, Oklahoma

Description: The approximately 2.7-acre property contains a commercial building, which appears to be a former auto/maintenance garage now used for storage, with two detached outbuildings. It is on the south side of OK Highway 128, directly between the KCS ROW to the west and a railroad spur to the east. The buildings are surrounded by grassy fields, and they are set south of the main downtown of Heavener. The commercial building and one of the outbuildings were constructed during the 1960s and are first visible on a 1976 historic aerial photograph. The second outbuilding is a non-historic mobile home.



The commercial building is comprised of two attached structures, one to the east and one to the west. The east structure is a one-story, wood-frame structure with corrugated metal siding and a front-gable, metal-clad roof and appears to be older than the west structure based on materials and condition. It has a large corrugated metal sliding door and lacks any windows that are visible from the public ROW. The west structure consists of a one-story concrete block frame with a metal-clad shed roof. The west structure features two wood garage doors and a modern composite door at a pedestrian entrance. The only windows visible from the public ROW are the glass panes in the garage doors of the west structure. The outbuildings are at the back (south) of the property and are not visible from the public ROW.

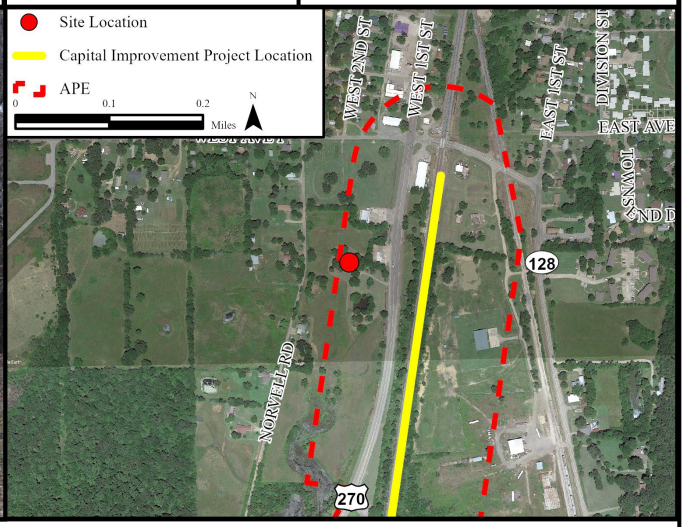
National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century commercial development in the region, it is not individually significant within the historic context of the commercial development of the town. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction due to the incompatible side addition and because the original materials have been replaced or have deteriorated. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by mixed-use development. The integrity of feeling, design, materials, and workmanship are compromised due to the use of inappropriate replacement materials, alterations, and deteriorated condition. It is no longer associated with its original use as a commercial property as it is now being used for storage.

Resource ID:	OK-HE-008	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	100 US 59 Heavener, Oklahoma

Description: The 0.4-acre property contains a single commercial structure that currently functions as a photography studio. The lot consists of an open, paved parking lot surrounded by dense vegetation along three sides. The building is first visible on a 1976 historic aerial and was most likely constructed during the 1960s. The property is south of downtown Heavener, approximately 180 ft west of the KCS ROW, and it is surrounded by residential and industrial/commercial properties.

The building is one-story tall and one room deep, with a long rectangular footprint. It has a non-historic asymmetrical, standing-seam metal-clad, side-gable roof, non-historic board-and-batten siding, and a poured concrete foundation. A concrete front stoop runs the length of the front elevation. The building features two non-historic 2-light composite doors and replacement 6/6 vinyl double-hung sash windows.



The building footprint has not changed since 1976. However, material changes such as the installation of new roof cladding and non-historic vinyl windows are present.

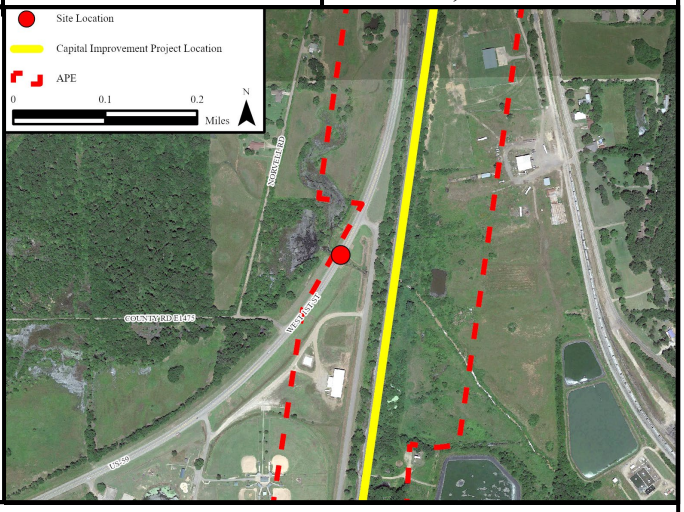
National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century commerce/industry in the region, it is not individually significant within the historic context of the commercial development of the town. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction, and most of the original materials have been replaced. Criterion D: This commercial property does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape. It also retains integrity of association, as it is still used for commercial purposes. The integrity of feeling, design, materials, and workmanship are compromised due to the use of extensive replacement materials and alterations.

Resource ID:	OK-HE-009	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	US Highway 59, south of W. Avenue I, Heavener, OK

Description: The property consists of a house and a detached outbuilding that are only partially visible from the public right-of-way. The property is approximately 180 ft west of the KCS ROW south of downtown Heavener. The buildings sit on a 12.5-acre parcel containing fields and clusters of dense deciduous trees. The house is accessed via a dirt driveway edged by deciduous trees. The house first appears with the outbuilding in a 1955 historic aerial photograph. Its historic form appears to be a front-gable bungalow constructed during the 1940s with a front addition constructed in the 1980s. The outbuilding appears to be contemporaneous with the original construction of the house in the 1940s.

The house is a one-story, wood-frame structure with an L-shaped footprint. It appears to have clapboard siding and an asphalt shingle roof; however, the 1980s addition is the most visible portion of the building. A corrugated metal-clad, shed-roof porch supported by square wood posts extends across at least a portion of the front elevation. Due to the presence of vegetation and the deep setback of the house, further details are not discernable.



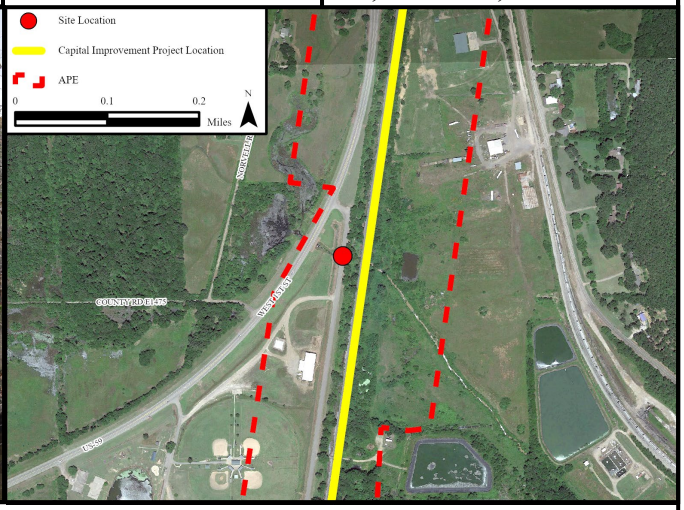
The outbuilding is sited southeast of the house adjacent to a pond. It is also partially obstructed by dense vegetation, but it has a corrugated metal, front-gable roof and corrugated metal panel siding. A large metal barn-type door is under the gable. No fenestration is visible from the public ROW.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with early-to-mid-twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction due to the construction of a large front addition. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and abutting forest. It also retains integrity of association because it is still used as a single-family residence. The integrity of feeling, design, materials, and workmanship are compromised due to extensive alterations and unsympathetic additions.

Resource ID:	OK-HE-010	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	N/A	**Location:**	US 59 over Oil Branch, south of Old US 59, Heavener, Oklahoma

Description: This culvert carries US 59 over a distributary of the Oil Branch approximately 243 feet south of the intersection with Old US 59 about 260 feet west of the KCS ROW along a sparsely developed segment of the rural highway. Based on the construction date of other nearby culverts, the single cell box culvert was likely constructed in 1964. The culvert features a concrete top plate and headwall, abutments, and flared wingwalls; it measures approximately 80 feet wide beneath an approximately 45-foot roadway. The paved roadway is higher than the culvert, with a sloped grass shoulder.



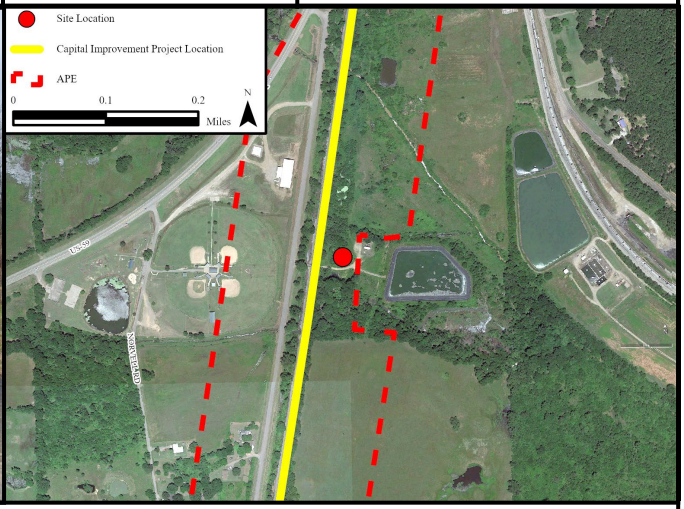
The culvert appears to be in good condition. There is little visible deterioration of the concrete structure.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the structure is associated with mid-to-late twentieth century development in the region, it is not individually significant within the historic context of the transportation development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The culvert retains its original form and is typical of infrastructure projects of the time period; however, it does not serve as a particularly good or representative example of its type, period, or method of construction. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway with sparse residential development. It also retains integrity of association because it is still in use as part of transportation infrastructure. The design and materials of the culvert are intact and able to convey a sense of historic workmanship, and the culvert retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-011	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	N/A	**Location:**	Old US 59 over Oil Branch, southeast of US 59, Heavener, Oklahoma

Description: This culvert carries Old US 59 over distributary of the Oil Branch approximately 355 feet south of the intersection with US 59. The culvert is positioned about 130 feet west of the KCS ROW along the sparsely developed rural highway. It was likely constructed in 1964, based on the documented construction date of other culverts in the area. The single cell box culvert is made up of a concrete top plate and headwall, abutments, a bottom plate, and flared wingwalls. It measures approximately 40 feet wide beneath an approximately 20-foot roadway. The headwall of the culvert creates a low curb along the grass shoulder of the roadway.



The culvert appears to be in good condition. There is little visible deterioration of the concrete structure.

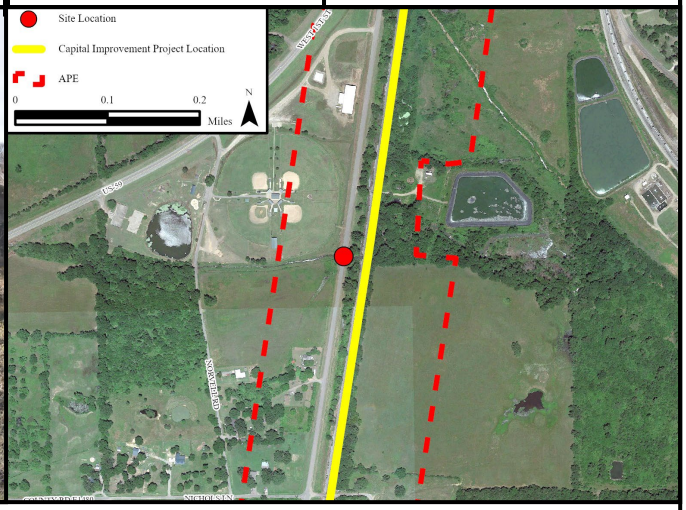
National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century development in the region, it is not individually significant within the historic context of transportation. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The culvert retains its original form and is typical of infrastructure projects of the time period; however, it does not serve as a particularly good or representative example of its type, period, or method of construction. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of feeling, location and setting along a local, rural highway with sparse residential development. It also retains integrity of association because it remains in use as a part of transportation infrastructure. The design and materials of the culvert are intact and able to convey a sense of historic workmanship, and the culvert retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-012	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	East side of Old US 59, south of W. 1st Street, Heavener, Oklahoma

Description: The property is a former wastewater treatment facility on the east side of Old US Highway 59, across from the Heavener Blues Baseball Park and immediately adjacent to the KCS ROW. The approximately 4.6-acre parcel is in a rural setting, and it is only partially visible from the public ROW because it is heavily obscured by vegetation. The property is now abandoned. It contains a one-story historic operations building and two historic clarifying tanks near the west boundary. Two additional concrete structures are partially visible on aerial photographs. In general, the structures on the property are first visible on a 1955 historic aerial photograph and are estimated to date to the 1950s. Between 1980 and 1995 an additional building was constructed, which is visible on aerial photographs, but it cannot be seen from the public ROW.

The one-story operations building is constructed from concrete blocks and topped with a flat roof. It has nine-light steel sash windows that are now missing glass and a partially glazed wood door that is off its hinges.



The two clarifying tanks are poured concrete structures with exhaust and intake vents, a hatch, and a catwalk across the top of the tanks.

National Register Evaluation: The property is recommended not eligible for National Register listing. Criterion A: While the construction of the property is associated with mid-to-late twentieth century development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction and most the original materials have deteriorated. Criterion D: This property does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and abutting forest. The integrity of feeling, design, materials, and workmanship are compromised due to extensive deterioration. The property is vacant and no longer in use, so it does not retain integrity of association.

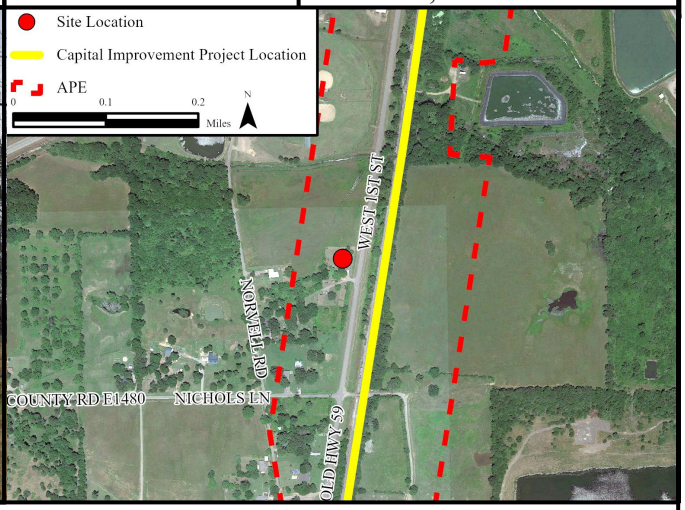
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	NBI No. 6330/Structure # 40N4735E1470008 (Oklahoma DOT Inventory)	**Location:**	Old US 59, north of Nichols Lane, Heavener, Oklahoma

Description: This culvert carries Old US 59 over a distributary of Oil Branch approximately 0.25 miles north of the junction with Nichols Lane. The culvert is sited approximately 125 feet west of the KCS ROW along the sparsely developed rural highway south of downtown Heavener. The triple cell culvert has a prestressed concrete structure made up of a concrete top plate and headwall, abutments, hammerhead-shaped center walls, and flared wingwalls. It was constructed in 1964 and measures approximately 41 feet in length and about 40 feet in width. The paved roadway is slightly narrower than the top plate with a grass shoulder running beneath the guardrails. The guardrails consist of a reinforced concrete pier-and-rail system.

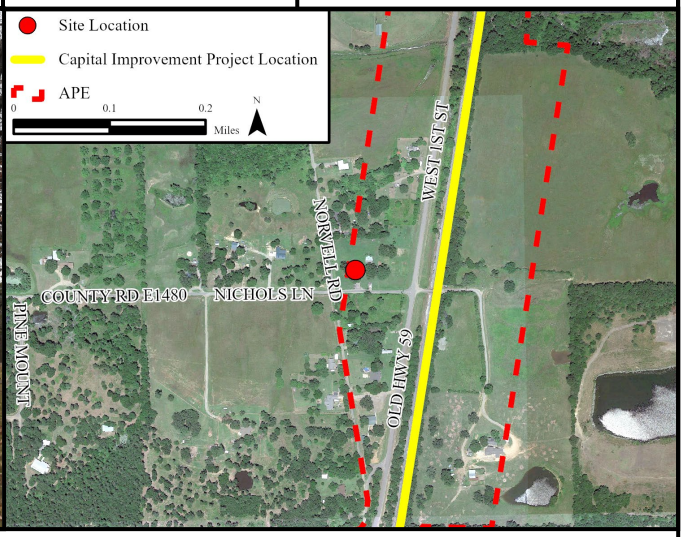


The culvert appears to be in good condition. There is little visible deterioration of the structure. The reinforced concrete guardrail has some chips and what appear to be superficial cracks in some locations.

National Register Evaluation: The property is recommended not eligible for National Register listing. Criterion A: While the construction of the property is associated with mid-to-late twentieth century development in the region, it is not individually significant with the historic context of the transportation within the area. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The culvert retains its original form and is typical of infrastructure projects of the time period; however, it does not serve as a particularly good or representative example of its type, period, or method of construction. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of feeling, location and setting along a local, rural highway with sparse residential development. It also retains integrity of association, as it is still in use as a part of transportation infrastructure. The design and materials of the culvert are intact and able to convey a sense of historic workmanship, and the culvert retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-014	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	OK Landmarks Inventory ID 75314	**Location:**	West side of Old US 59, north of Nichols Lane, Heavener, Oklahoma



Description: The approximately 0.5-acre property is on the west side of Old US 59, approximately 140 feet west of the KCS ROW. It contains a house and three outbuildings, two sheds, and a carport/open storage. The lot is relatively level with clusters of deciduous trees and a grassy lawn. An unnamed local resident related that the house, or a portion of the house, was moved from central Heavener to its current location. If this is the case, the move must have occurred before 1976, as the house is visible at its present location in a 1976 aerial photograph. The house appears to have originally had an I-house form, popular in the early twentieth century in the region, and it is estimated to date to the 1920s. The existing outbuildings appear to date to the late twentieth century based on form and materials. The house is two-story, wood-frame structure with no distinctive style. Based on the interview with a local resident, it has been heavily modified with half of the original building removed. It has an asphalt shingle-clad, side-gable roof, wide synthetic pressboard siding, and a one-and-one-half story addition on the rear elevation. A one-story, flat-roof porch spans the full width of the front elevation, and the main entrance consists of a solid wood, non-historic door. Windows are 2/2 double hung wood and aluminum non-historic sash. The outbuilding closest to Old US 59 is a non-historic, side-gabled carport/open storage structure with an asphalt-shingle clad roof and wood supports. The two outbuildings southwest of the house are partially obscured by vegetation, but they appear to be one-story, gable-roofed structures with corrugated metal panel siding.

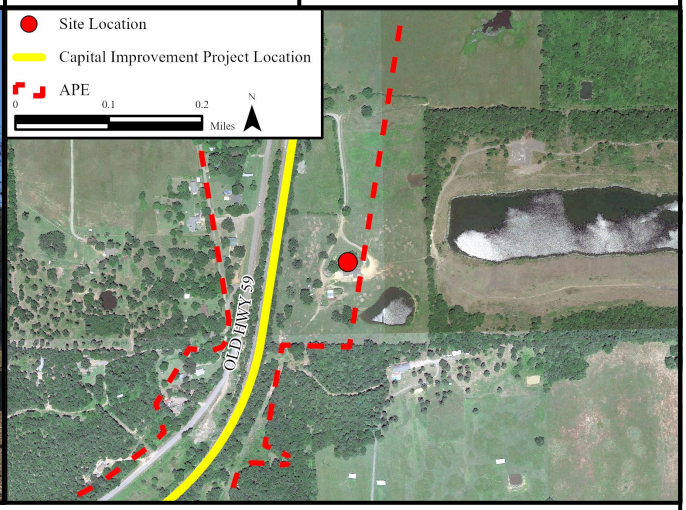
National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: Although this property may have original been representative of the I-House form, due to extensive alterations and use of replacement materials the property does not embody a distinctive characteristic of a type, period, or method of construction. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of setting along a local, rural highway surrounded by a natural landscape and abutting forest. It also retains integrity of association because it remains in use as a single-family residence. However, the house was moved to its existing location, and the integrity of feeling, design, materials, and workmanship are compromised due to the use of extensive inappropriate replacement materials, alterations, and unsympathetic additions.

Resource ID:	OK-HE-015	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	102 Nichols Lane, Heavener, Oklahoma

Description: The property contains a house and four outbuildings on an approximately 3-acre parcel about 400 feet west of the KCS ROW. The buildings are surrounded by open lawn and clusters of deciduous trees on a corner lot. The house is first visible on a historic aerial photograph from 1976 and was most likely constructed during the 1960s as it is not visible on a 1955 historic aerial photograph.

The house is a one-story Ranch house with no distinctive style. The house is clad in original brick veneer and wood vertical board siding set on a poured concrete foundation and covered with a non-historic asphalt shingle cross-gable roof. The house features three entrances with non-historic composite panel doors. Windows consist of paired and single 6/6 non-historic replacement vinyl double hung sash. The front elevation of the house features a pedimented porch with non-historic turned posts resting on a poured concrete foundation with attached brick lined planting beds.



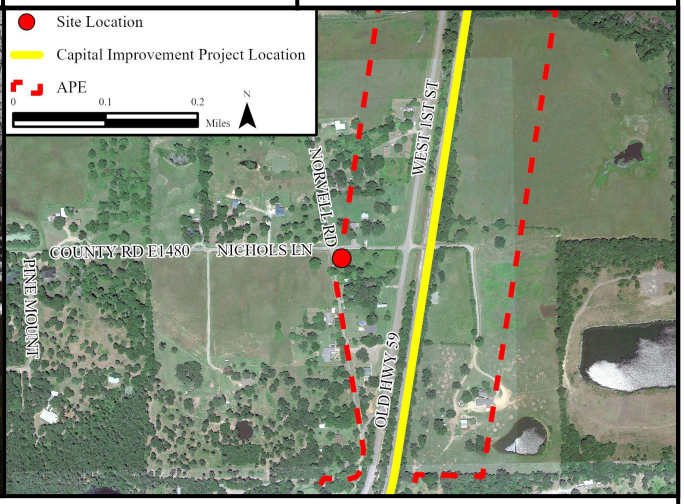
The non-historic outbuildings are located to the rear of the house and consist of two prefabricated wood-frame sheds, a front-gable corrugated-metal shed, and a lean to with partial open wood walls and a shed roof.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a mid-century Ranch house; however, the house does not serve as a good and representative example of their type and style due to a lack of integrity (see below). Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and abutting forest. It also retains integrity of association, as it is still used as a single-family residence. The integrity of feeling, design, materials, and workmanship are compromised due to the use of replacement materials including all the doors and windows.

Resource ID:	OK-HE-016	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	East side of KCS ROW, east of Old US 59 at Nichols Lane, Heavener, Oklahoma

Description: The property is a farm complex located on an approximately 24-acre parcel immediately adjacent to the KCS ROW to the south of downtown Heavener. The structures of an extant farmhouse, stone shed outbuilding, and barn are visible on a 1955 historic aerial photograph. Based on visual observation, historical aerial photography, and the materials present, the buildings appear to date to the 1940s. Smaller outbuildings are visible on aerial photographs from 1985 located behind the stone shed; however, they were obstructed from view during survey and were unable to be fully assessed. A large, non-historic house and detached garage was built on the property between 2016 and 2019 and block the view of the extant historic farmhouse.



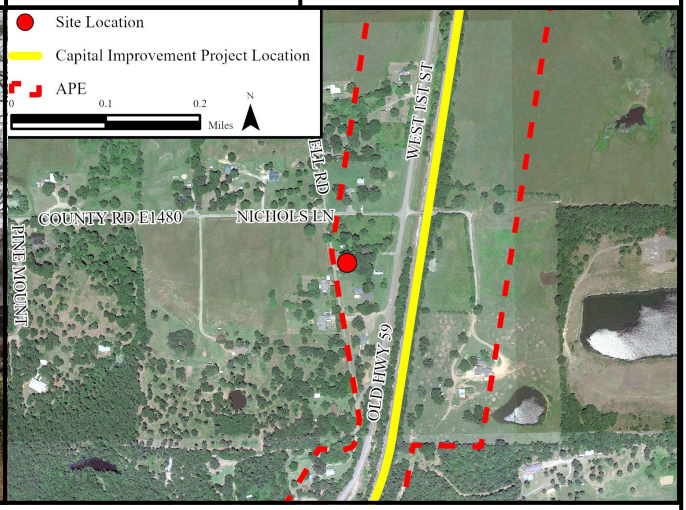
The transverse crib barn outbuilding is wood framed and is currently clad in corrugated sheet metal on the exterior walls and roof. The barn has a two-story front gable main body with one-story shed roofed wings to either side and no visible windows. A sheet metal door provides access to the crib located to the left of the front elevation while an aluminum livestock gate provides access to the main body of the barn. The other historic outbuilding on the property is a side-gable shed constructed from field stone in a simple rectangular footprint. The interior of the shed is accessed through a replacement sheet metal door located off-center to the right of the front elevation. The shed has no windows, is contained under an asphalt roof, and appears to function as a storage facility for farm equipment.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While construction of the property is associated with mid-to-late twentieth century agriculture, it is not individually significant within the historic context of the agricultural development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction, and the majority of the original materials have been replaced. Criterion D: This property does not appear to have the potential to yield further important information or data.

Integrity: The property retains a low to moderate degree of all seven aspects of integrity. The property retains integrity of location and feeling as it remains in its original location and setting along a local, rural highway surrounded by a natural landscape, abutting forest, and open agricultural land. The integrity of design, materials, and workmanship are compromised due to the use of inappropriate replacement materials, alterations, and unsympathetic additions. The property retains its agricultural use.

Resource ID:	OK-HE-017	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	SE corner of Norvell Road and Nichols Lane, Heavener, Oklahoma

Description: The 1.6-acre property includes a house and large outbuilding at the southeast corner of Norvell Road and Nichols Lane approximately 445 feet west of the KCS ROW. The lot is relatively open and level with a lawn, clusters of deciduous trees, and a line of dense trees along the south boundary. Based on historic aerial photography and materials present, the buildings were constructed during the 1940s.

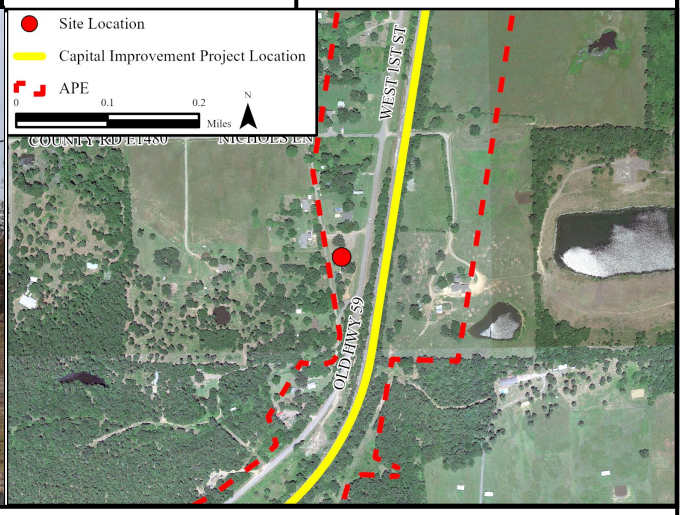


The house is a one-story, wood-frame, front gable bungalow with no distinctive style. The house has an asphalt shingle-clad, front-gable roof and is clad in a combination of non-historic plywood and wood panel board and original shiplap wood siding. A one-story, gable-roof closed porch is on the front elevation and contains the entrance featuring a non-historic composite panel door. A secondary entrance on the side elevation also contains a non-historic panel composite door. The windows include original 1/1 wood double-hung and non-historic vinyl replacement sash. The historic outbuilding appears to be used as a storage facility. It is one-story shed features an exposed wood frame.

National Register Evaluation: The property is recommended not eligible for listing in the National Register Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a front-gable bungalow of the period; however, the house does not serve as a good and representative example of their type and style due to a lack of integrity (see below). Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and scatter residential development. It also retains integrity of association, as it is still a single-family residence. The integrity of feeling, design, materials, and workmanship are compromised due to the use of extensive use of replacement materials and alterations.

Resource ID:	OK-HE-018	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	None	**Location:**	East side of Norvell Road, south of Nichols Lane, Heavener, Oklahoma

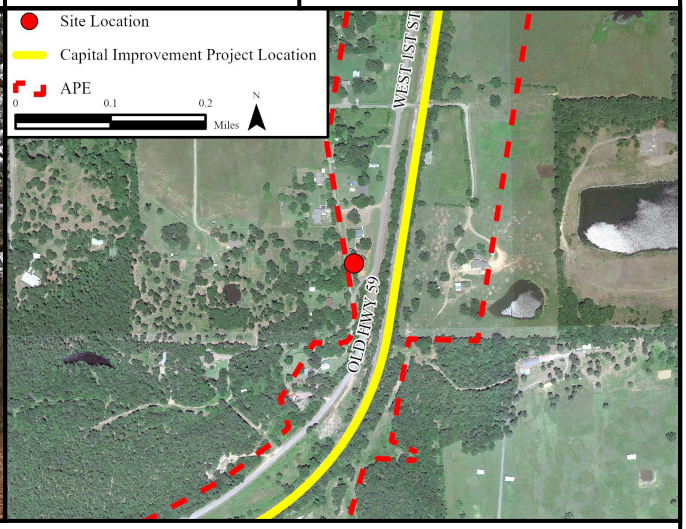


Description: The property consists of a single-family house on a wooded, 1.56-acre parcel located on the east side of Norvell Road, a rural road located south of central Heavener and approximately 375 feet west of the KCS ROW. The house is set on a slight rise, at a modest setback from the road, surrounded by mature trees. Visibility of the house is impeded from the public ROW from several angles due to trees, vegetation, and parked vehicles. No outbuildings associated with the house were observed in the field or on current satellite images. The house was constructed during the 1960s, based on the form, materials, and a 1976 historic aerial photograph of the area. The house is a one-story, wood-frame Ranch house with no distinctive style. It has a non-historic metal, side-gable roof that extends out to cover a partial-width porch addition on the front elevation. The south portion of the front elevation is slightly recessed with a lower roofline and may have originally been an attached garage. The porch is partially enclosed with walls clad in rustic log columns and supports. The house has a combination of historic asbestos siding along with patches of non-historic D-log and synthetic pressboard siding. Although the main entrance of the house is mostly obscured, it appears to consist of non-historic sliding glazed doors opening onto the porch. Most of the visible window openings have been covered with plywood or support portable air conditioning units, but there are some non-historic vinyl and aluminum double-hung replacement windows visible. The condition of the house is poor, with detached roofing and mismatched patches of exterior materials exhibiting open gaps between them.

National Register Evaluation: The property is recommended not eligible for listing in National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property is not a significant example of a Ranch house as there has been extensive material changes and alterations that has removed the house from association with its type. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and scattered residential development. It also retains integrity of association, as it is still used as a singe-family residence. The integrity of feeling, design, materials, and workmanship are compromised due to the use of extensive replacement materials, alterations, and unsympathetic additions.

Resource ID:	OK-HE-019	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	Norvell Road, north Old US 59, Heavener, Oklahoma



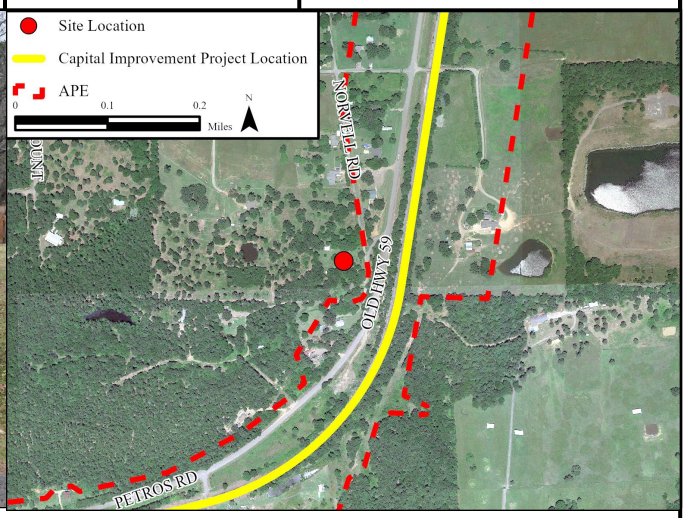
Description: The property consists of a front-gable church and two storage sheds located south of central Heavener on a triangular, 1.1-acre parcel. The property is bounded by Old US 59 on the east and Norvell Road on the west approximately 190 feet west of the KCS ROW. The parcel is flat and generally open, with mature trees scattered throughout the lot, primarily along the residential Norvell Road. The buildings are oriented east toward Old US 59 and exhibit no distinctive style. The church appears to have been constructed during the 1960s based on materials and form and is visible on a 1976 historic aerial photograph. Both storage sheds post-date a 1976 aerial photograph and likely date from the 1980s or 1990s. Outside recreational equipment and fixtures are present on the south portion of the parcel. The one-story front-gable church building has a wide, rectangular footprint set on a concrete pad foundation and capped by a front-gable, aluminum roof. Cladding consists of original brick veneer and non-historic bare concrete block, aluminum panels with a shiplap pattern, and vinyl siding. The off-center main entrance on the front elevation contains paired, non-historic paneled composite doors. The entrance is fronted by a porch with a gabled roof supported by metal trellis porch supports with non-historic siding under the gable. One 6/6 wood double-hung sash window covered by a storm is present on the front elevation and appears to be original. Two pedestrian entrances are located on the south side elevation. A long, narrow storage shed set on a concrete block foundation with corrugated metal cladding and a side gable, standing seam metal roof is southwest of the church. The paneled doors and vinyl double-hung 4/4 windows are non-historic replacements. A pre-fabricated metal shed with a gambrel roof is perched on individual concrete blocks south of the larger shed.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century mixed-use development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a mid-century gable-front church; however, the church does not serve as a good and representative example of their type and style due to a lack of integrity (see below). Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a residential development. The integrity of design, materials, and workmanship are compromised due to the use of inappropriate replacement materials and alterations. These alterations have diminished the integrity of feeling and it no longer conveys the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-020	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	412 Norvell Road, Heavener, Oklahoma

Description: The property comprises a house on an approximately 1.6-acre lot on the west side of the road south of downtown Heavener and approximately 215 feet west of the KCS ROW. The lot is level and primarily covered by dense deciduous trees with some clearing immediately surrounding the house. The house appears to have been constructed during the 1940s based on the form and intact original materials. There are no visible outbuildings.



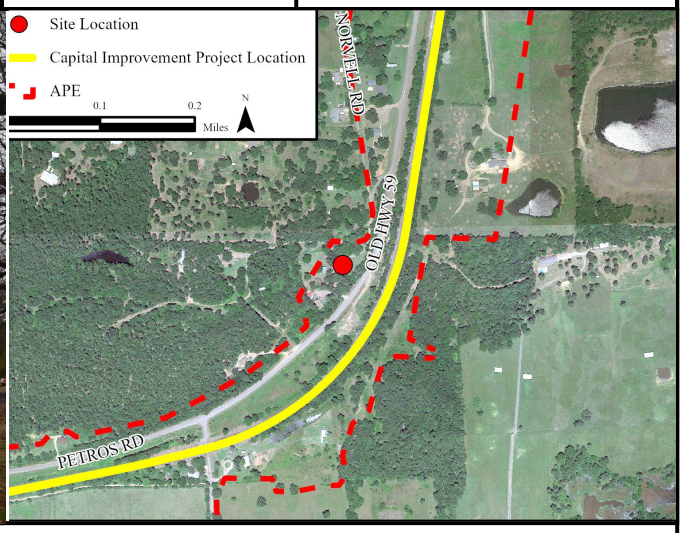
The house is a one-story, wood-frame bungalow with no distinct style. It has an asphalt shingle-clad, side-gable roof with original exposed rafter tails, original shiplap wood siding, and a continuous concrete block foundation. One-story, enclosed porches extend across a portion of the front and side elevations and appear to be original. Aluminum replacement sash windows have been installed within the porches. The entrances are obstructed from view by the porches. The windows are original wood, one-over-one, double-hung sash with wood trim. The house is in good condition and retains a high degree of original materials.

National Register Evaluation: The property is recommended eligible for listing in the National Register under Criterion C. Criterion A: While the construction of the property is associated with early twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property is considered eligible under Criterion C as a good representation of an early twentieth century residential architecture style. The house retains a high degree of original materials and exhibits key characteristics associated with the early twentieth century construction of the bungalow building form and plan. The side-gable roof has exposed rafter tails, the original wood shiplap siding is extant, and the fenestration includes original wood-sash windows with wood trim. Enclosed porches extend across most of the façade and south side elevation, also presumed to be original. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The retention of the original materials and form indicates a high degree of integrity of design, materials, feeling, and workmanship. As the building is still in use as a single-family residence located along a local rural highway in a wooded setting, the property also retains integrity of location, feeling, and setting.

Resource ID:	OK-HE-021	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	N/A	**Location:**	410 Norvell Road South Heavener, Oklahoma

Description: The property comprises a house with an attached garage, detached two-car garage, and a detached carport. The property is an approximately 1.5-acre lot on the east side of the road south of downtown Heavener approximately 290 feet west of the KCS ROW. The lot gradually slopes up from east to west with the house and carport sited closer to the road and the detached garage to the northwest of the house. The house is surrounded by a grassy lawn with foundation plantings and deciduous trees. The house appears to have been constructed during the 1970s, based on the form and aerial photographs taken in 1955 and 1976, with the detached garage and carport constructed during the 2010s.



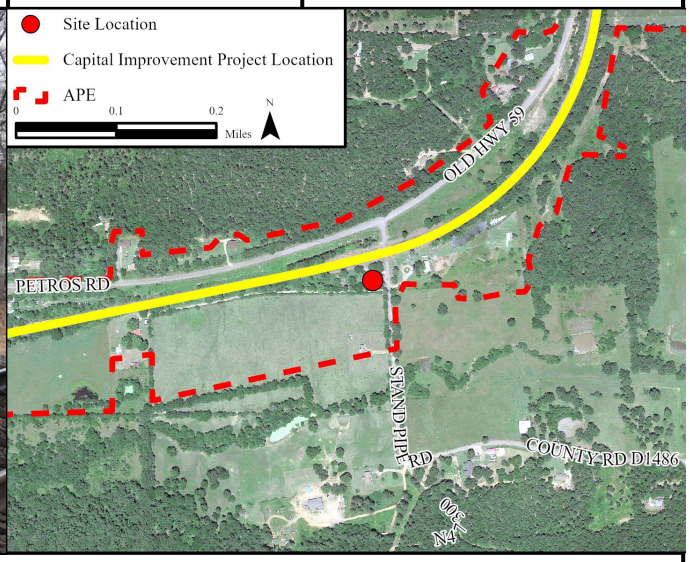
The house is a one-story, wood-frame Ranch house with no distinctive style. It has an asphalt shingle-clad, side-gable roof, and a combination of polychromatic brick veneer and board-and-batten wood siding, which appears to be original. A recessed porch on the front elevation has turned wood posts on a raised concrete pad covered with brick veneer. There are two entrances on the front elevation comprising of non-historic composite panel replacement doors covered by fully glazed, aluminum replacement storm doors. The windows appear to be original wood-frame, 6/6 double-hung and casement sash with one non-historic replacement fixed sash. The attached garage has a non-historic, aluminum overhead rolling door. Original board-and-batten siding is within the gable and the three narrow, recessed openings on the south end of the front elevation. The non-historic detached garage is a one-story, front-gable structure with metal panel cladding and roof and two large aluminum overhead rolling doors. The non-historic carport is a tall structure comprised of round metal posts capped by a front-gable roof.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Ranch house; however, it does not serve as a good and representative example of this type. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a naturally landscaped lawn and abutting forest. It also retains integrity of association, as it is still used as a single-family residence. The design and materials of the building are relatively intact, are able to convey a sense of historic workmanship, and the retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-022	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	415 Norvell Road, Heavener, Oklahoma

Description: The property comprises a house, two detached sheds, and an office/workshop on an approximately 5-acre lot that spans both the west and east sides of Old US 59, which runs north-south to the east of the house. The KCS ROW is approximately 240 feet east of the house. Although the property spans Old US 59, the main access is from Norvell Road. The house and shed sit at the level crest of the property, which slopes down to the roads on the north and east. The house was constructed during the 1940s, based on the building form. The detached shed immediately west of the house appears to be a non-historic structure. The second shed and prefabricated office/workshop are access by a second driveway off Old US 59 and appear to date to the late 20th and early 21st centuries.



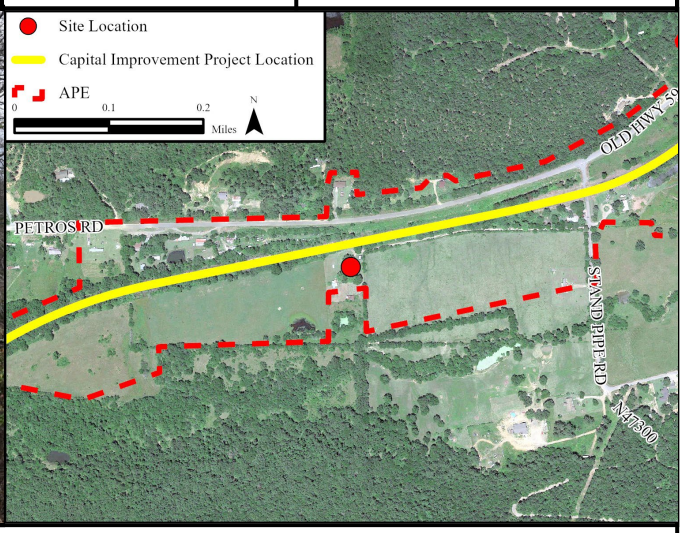
The house is a one-story, wood-frame bungalow with no distinct style. It has an asphalt shingle-clad, front-gable roof with exposed rafter tails, original shiplap wood siding, and a concrete block foundation. The main entrance on the façade is beneath a pedimented entry porch, which is a later addition. The entrance consist of a panel door covered by a non-historic storm door. Two enclosed porches are attached to the rear and side elevations and appear to be additions. Windows are a combination of non-historic aluminum and vinyl double-hung replacement sash throughout the house. The two sheds are both wood-frame structures covered by a combination of salvaged wood, metal siding, roof panels, and recycled windows and doors.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with early twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive characteristics of a Bungalow; however, it does not serve as a good and representative example of this type and style due to a lack of integrity (see below). Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and abutting forest. It also retains integrity of association, as it is still used as a single-family residence. The integrity of feeling, design, materials, and workmanship are compromised due to the use of replacement materials, alterations, and additions.

Resource ID:	OK-HE-023	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	19949 Stand Pipe Road, Heavener, Oklahoma

Description: The property comprises a house and a detached shed on an approximately 1.3-acre lot on the west side of the road and immediately south of the KCS ROW. The lot is relatively level with the house and shed sited near the east side of the property near the road and railroad right-of-way. The buildings are surrounded by clusters of deciduous trees throughout and around the perimeter of the property. The house appears to have been constructed during the 1970s, based on the form and aerial photographs taken in 1955 and 1976, with the detached shed constructed in the 1990s.

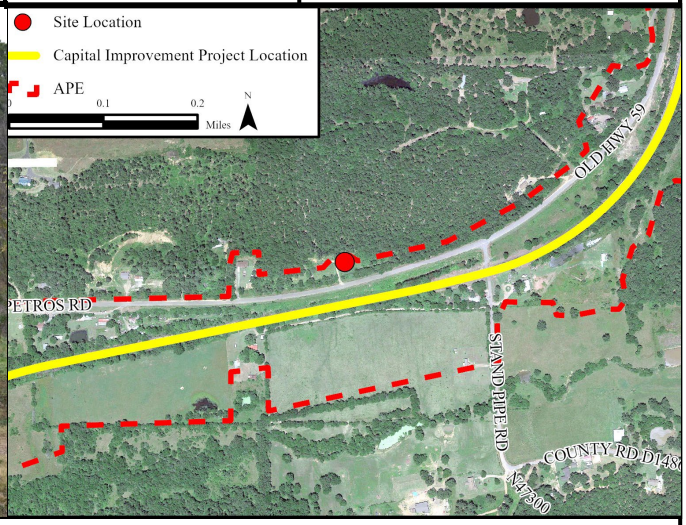


The house is a one-story, wood-frame Ranch with no distinctive style. It has a non-historic standing seam steel-clad, side-gable roof, and the exterior is covered in non-historic shiplap wood siding. A small cross-gable addition is attached to the northwest end of the front elevation. A corrugated metal-clad shed roof porch extends across the façade and wraps around the east (side) elevation. A portion of the porch was enclosed with wood shiplap in 2020. The entrance appears to be in the enclosed porch addition and is not visible from the public ROW. Only the windows in the two additions are visible and consist of non-historic aluminum, double-hung sash. The non-historic detached shed is a one-story, wood-frame structure with an asphalt shingle-clad gable roof, plywood siding, and a lean-to attached to the west elevation.

National Register Evaluation: The property is recommended not eligible for listing in National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction as the majority of the original materials have been replaced and the construction of multiple additions to the front elevation. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and abutting forest. It also retains integrity of association, as it is still used as a single-family residence. The integrity of feeling, design, materials, and workmanship are compromised due to the use of extensive use of replacement materials, alterations, and unsympathetic additions.

Resource ID:	OK-HE-024	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	19943 Stand Pipe Road, Heavener, Oklahoma



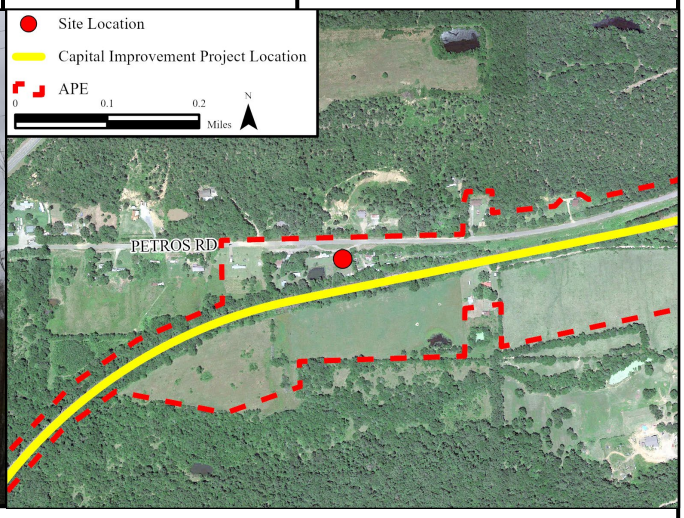
Description: The property comprises a house, two visible detached sheds, and a detached carport on an approximately 2.5-acre lot on the west side of Stand Pipe Road and immediately south of the KCS ROW. There is an additional outbuilding southwest of the house that is only visible in aerial images. The lot is relatively flat with the house and detached carport closer the north end of the property and the two visible sheds to the south and west of the house. The lot is primarily open lawn and field with the area immediately surrounding the house as the most maintained. Deciduous trees line the perimeter of the parcel with a dense cluster of trees around the house. The house and one of the detached sheds were constructed during the 1960s based on the form, style and aerial photography. The other two outbuildings date to the late 20th century based on form and materials. The house is a one-story Ranch house with no distinctive style. It has a non-historic replacement standing-seam aluminum, cross-gable roof, and the exterior of the building is covered with a combination of original wood clapboard and brick veneer siding with brick soldier-course detailing. The primary entrance on the front elevation is recessed beneath the integrated porch. A secondary entrance on the side elevation features a non-historic screen door which obscures the details of the inner door. Windows appear to be original 2/2 aluminum double-hung sash arranged singularly and in pairs. The detached carport is a non-historic prefabricated aluminum structure. The historic south shed is a one-story, wood-frame structure with a metal front-gable roof and an asphalt paper-clad exterior. The non-historic west shed is a one-story, wood-frame structure with an asphalt shingle-clad gambrel roof and clapboard siding.

National Register Evaluation: The property is recommended eligible for listing in the National Register under Criterion C. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The house is a good representation of a mid-twentieth century Ranch house as it retains its original form, plan, windows and cladding material and exhibits characteristics representative of the period. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of feeling, location, and setting along a local, rural highway surrounded by a naturally landscaped lawn and abutting forest. It also retains integrity of association, as it is still used as a single-family residence. The design and materials of the building are intact, including the overall form and brick veneer, and aluminum windows. The intact features convey a sense of historic workmanship, and the property retains the feeling and aesthetic of its period of construction.

Resource ID:	OK-HE-025	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	20160 Old US 59, Heavener, Oklahoma

Description: The property comprises a house and detached shed on an approximately 15-acre property, of which approximately 14.9 acres are dense forest. The house is approximately 200 feet north of the KCS ROW on the north side of Old US 59. The lot gradually slopes up from south to north with an unpaved driveway leading to the house and detached garage to the northwest of the house that is not visible from the public way. The house and shed are surrounded by an open, unmaintained lawn. The house is encompassed by a chain link fence. The house appears to have been constructed during the 1940s based on the style; the detached shed was constructed between 1955 and 1976 as per aerial photographs.



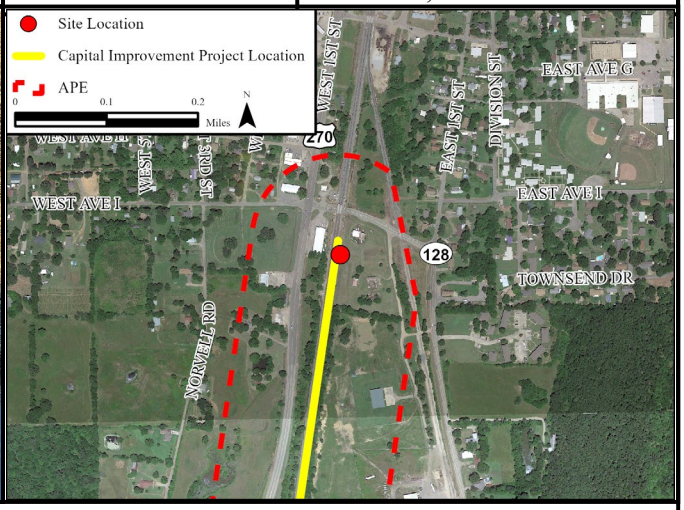
The house is a one-story, wood-frame bungalow with no distinctive style. It has a corrugated steel-clad, front-gable roof with exposed rafter tails, original shiplap wood siding, and a concrete block foundation. A pedimented front porch extends across the south (façade) elevation with round and replacement square posts and a wood railing. The main entrance is in the center of the front elevation and consists of a non-historic composite panel replacement door. Windows are non-historic aluminum, double-hung replacement sash arranged singularly and in pairs. The detached shed has a corrugated metal-clad gable roof with an attached lean-to. The property is vacant. The house is in poor condition due to general deterioration of the cladding and vandalism to the doors and windows.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with early twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property has distinctive form of an early twentieth-century bungalow; however, the house does not serve as a good and representative example of its type and style due to a lack of integrity (see below). Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and abutting forest. The integrity of feeling, design, materials, and workmanship are compromised due to the use of extensive replacement materials, the alterations, and the poor condition of the remaining original materials. The property is vacant and no longer in use, so it does not retain integrity of association.

Resource ID:	OK-HE-026	**Resource Type:**	Above-Ground
Inventory Number:	TBD	**Potential Effect:**	Visual
Previous Documentation:	n/a	**Location:**	20399 Old US 59, Heavener, Oklahoma

Description: The property comprises at least eight structures visible from aerial imagery sited on an approximately 3-acre parcel on the south side of Old US 59 and immediately north of the KCS ROW. Of these eight buildings, five are clearly visible from the public ROW and three are only partially visible. In addition to the eight identifiable buildings, there are numerous small structures that could be ancillary sheds, storage buildings or trailers visible on aerial photography but are not visible from the public ROW. The property is relatively level surrounded by dense deciduous trees. The center of the property is open lawn with a pond to the east side of the lot.



All five fully visible buildings are one-story, wood-frame structures with either side-gable or shed roofs clad in corrugated steel panels. There are two residences constructed during the late 1950s or 1960s; a single family with board-and-batten siding and a concrete foundation at the south end of the site and a duplex in the center of the site with wood panel siding and a concrete slab foundation. Both residential buildings have a mixture of non-historic materials including composite siding, aluminum windows, and corrugated metal roofing. There are two outbuildings near the street constructed during the late 1950s or 1960s; a long open storage structure consisting of wood posts supporting a corrugated metal shed roof and a concrete block garage with a corrugated metal clad side gable roof. There is also one small non-historic shed. Two partially visible shed/garage structures are located at the north end of the site. Both structures have corrugated metal-clad gable roofs with a combination of corrugated metal and wood panel siding.

National Register Evaluation: The property is recommended not eligible for listing in the National Register. Criterion A: While the construction of the property is associated with mid-to-late twentieth century residential development in the region, it is not individually significant within the historic context of the community development. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C: The property does not embody a distinctive characteristic of a type, period, or method of construction nor possesses a high degree of original intact materials. Criterion D: This residential property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of location and setting along a local, rural highway surrounded by a natural landscape and abutting forest. It also retains integrity of association, as it is still used as a residential property with multiple single-family buildings. The integrity of feeling, design, materials, and workmanship are compromised due to the use of extensive replacement materials, alterations, and unsympathetic additions.

Resource ID:	OK-HE-027	Resource Type:	Above-Ground
Inventory Number:	TBD	Potential Effect:	Visual
Previous Documentation:	OK Landmarks Inventory ID 96399	Location:	Oil Branch through Downtown Heavener, Heavener, Oklahoma

Description: The Oil Branch flows within a stone-lined drainage channel through downtown Heavener. The total length of the channel is approximately 0.9 miles; however only 0.1 miles of it is within the project area. The north end of the channel begins immediately south of the KCS railyard at E. Avenue A and follows a sinuous path through the east side of downtown until it reaches Avenue F. After it crosses beneath the KCS east spur, it turns south to run parallel to the east side KCS ROW running beneath Avenue I and terminates approximately 260 feet south of the Avenue I crossing. The Oil Branch channel was constructed in 1939 and is one of at least six Works Progress Administration (WPA) projects completed in Heavener between 1936 and 1939. The channel varies in width from approximately 6 feet to 8 feet, with it being narrower at the north end through downtown Heavener. The walls appear to range in height from 4 to 8 feet along most of its length and taper down to only 2 feet at its southern terminus. The channel walls are constructed of wet laid native Oklahoma sandstone cut in long, narrow rough-hewn blocks. The courses at the base of the walls are stepped toward the bottom of the channel, which is lined with the native Oklahoma sandstone pavers. Concrete sidewalk bridges with metal pipe railings cross the channel at each road crossing and at other intermittent locations providing access between parking areas and buildings. Each road crossing is carried over the channel by concrete, single-cell culverts with concrete top plates, sidewalls and flared wingwalls. The sidewalks and culverts and appear to be constructed contemporaneously to the channel. There appears to be only one short segment of material loss immediately north and south of the culvert that carries Avenue I over the channel, which most likely occurred during the construction of the culvert in 1964.

National Register Evaluation: The property is recommended **eligible** for listing in the National Register. Criterion A: The property is directly associated with early twentieth century development in the region as a result of New Deal programs completed by the WPA and is individually significant within the historic context of WPA infrastructure improvement projects within the region. Criterion B: Research conducted has not identified any connection between the property and historically significant individuals. Criterion C:the channel is a particularly good example of its type, period, method of construction, and use of local materials. Its walls are constructed of wet laid native Oklahoma sandstone cut into long, rough-hewn blocks. Criterion D: This property type does not appear to have the potential to yield further important information or data.

Integrity: The property retains integrity of feeling, location and setting along a local, rural highway in a mixed-use neighborhood in downtown Heavener. It also retains integrity of association because it remains in use as a part of infrastructure of Heavener. The design and materials of the culvert are intact and able to convey a sense of historic workmanship, and the culvert retains the feeling and aesthetic of its period of construction.

Resource ID:	34AD282	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD282 is precontact low density lithic scatter. The site is located atop a relatively flat, low-lying terrace northwest of a creek tributary. The known site area measures 21 m in length and 8 m in width and is bounded by the limits of the APE and the existing railroad berm. A typical shovel test excavated within the identified limits of the site was characterized by an initial A horizon of very dark grayish brown (10YR 3/2) silty loam from 0 to 30 centimeters below the surface (cmbs) (Stratum I), underlain by a B horizon of dark yellowish brown (10YR 4/6) silty clay from 30 to 40 cmbs (Stratum II). The identified B horizon was a culturally sterile clay substratum. The site was identified through the excavation of three positive shovel tests resulting in the recovery of lithic artifacts (n = 5). Artifacts consisted of chert flakes of the Keokuk, Boone, and John's Valley Gravel varieties. The recovered flakes are most likely the result of late-stage lithic retouching and were recorded in Stratum I between 10 and 30 cmbs. The site was not fully excavated to the northwest and southeast due to the limitations of the APE and the existing railroad line.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition, the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD282, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD282 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD282 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD283	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD283 is precontact scatter of lithic tools and debitage located on a well-defined, elevated terrace to the west of a river. The site was identified through the subsurface recovery of approximately 80 non-diagnostic artifacts consisting of Keokuk, John's Valley Gravel, Boone, and Reed Springs chert debitage, as well as 3 PP/K fragments, recorded within 14 positive shovel tests. Shovel testing within the site boundaries generally encountered deep soils. A typical shovel test excavated within the boundaries of 34AD283 was characterized by dark brown (10YR 3/3) silty clay loam from 0 to 40 cmbs (Stratum I), underlain by a layer of strong brown (7.5YR 5/6) silty clay loam from 40 to 80 cmbs (Stratum II), followed by a layer of strong brown (7.5YR 5/8) clay from 80 to 85 cmbs (Stratum III). Impenetrable gravel and compacted cobble prevented further examination of the underlying strata at depths below 85 cmbs. Three diagnostic artifacts were recorded from 34AD283, two of which are identified as Standlee PP/Ks, while the other was identified as a Kings/Patterson Springs PP/K. Based on the presence of these diagnostics, the site is tentatively associated with the Late Archaic/Early Woodland.

The identified depositional strata were observed to be relatively uniform in soil consistency with little to moderate cobble inclusions. It does not appear that atop the preserved landform the deposit present at 34AD283 has been disturbed by prior land use activities. No modern or historic material was recorded during subsurface examination at the site which indicates that the landform to the northwest of the railroad berm is intact. Delineation of the site was bounded by the project APE to the west and by the railroad cut to the east, and therefore the site was not fully delineated.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has not been compromised by railroad construction. The presence of undisturbed cultural deposits and diagnostic artifacts could potentially yield valuable data regarding our understanding of lithic tool manufacturing, resource procurement activities, and subsistence during the Late Archaic to the Early Woodland transitional period. As the site was not able to be fully delineated, the eligibility status of site 34AD283, as a whole, has not been determined. The portion of the site identified within the APE retains integrity under Criterion D of the National Register and is recommended as eligible.

Integrity: Site 34AD283 retains integrity of location, design, materials, and association. The site retains integrity of location and design through the potential for deep, undisturbed soils and artifact deposits. The site retains integrity of materials and association through the abundant debitage recorded as well as the presence of diagnostic artifacts which allow the site to be associated with Late Archaic and Early Woodland cultural periods. Site 34AD283 lacks integrity of setting, workmanship, and feeling. The setting and feeling of the site have been compromised by the disturbance caused by the construction of the railroad, while there were no features identified which could give a sense of workmanship to the site.

Resource ID:	34AD284	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD284 is precontact lithic scatter situated atop a gentle slope approximately 25 m west of a river. The known site area measures 30 m northeast to southwest and roughly 8 meters west to east. The known site area is bounded to the west by the limits of the APE and to the east by the existing railroad berm. A typical shovel test excavated within the site was characterized by an initial A horizon of very dark grayish brown (10YR 3/2) clayey loam from 0 to 20 cmbs (Stratum I), underlain by a B horizon of strong brown (7.5YR 5/8) clay with heavy cobble from 20 to 30 cmbs (Stratum II). The identified B horizon was a culturally sterile clay substratum. The site was identified through the excavation of three positive shovel tests resulting in the recovery of four (n=4) lithic flakes and a utilized flake/scraper (n=1) of Keokuk chert. The recovered artifacts were unremarkable in regard to surface treatment and were all relatively consistent in form and color. The recovered flakes are most likely the result of a single late-stage lithic retouching or maintenance event and were recovered between 0 and 20 cmbs. The recovered scraper was noted to have edge wear consistent with utilization as a tool. It does not conform to any known tradition or shape and should be considered undiagnostic in form. No features were identified during the survey of 34AD284.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition then the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD284, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD284 lacks integrity of design, setting, materials, workmanship, feeling, or association. The setting, design, and feeling of the site has been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD284 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD285	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD285 is a low-density, horizontally diffuse lithic artifact scatter located approximately northwest of a river within a gently rolling plain. Shovel test profiles recorded within the site area can be generally described as shallow with an initial layer of dark brown (10YR 3/3) soil with roots from 0 to 35 cmbs (Stratum I), underlain by a layer of dark gray (10YR 4/1) clayey loam from 35 to 45 cmbs (Stratum II). This layer was followed by densely compacted gravel and cobble fill from 45 to 55 cmbs (Stratum III). The site was identified through the excavation of eight shovel tests containing a total of 21 lithic artifacts of Keokuk, John's Valley Gravels, and Boone chert. The assemblage contains 19 flakes of chert debitage, and two scrapers. None of the recovered artifacts showed evidence of thermal alteration. None of the recovered artifacts were diagnostic. The artifacts were recovered from depths between 0 and 30 cmbs (n=20) with one artifact (n=1) recovered between 35 and 45 cmbs. The majority of the deposit identified at 34AD285 is located within Stratum I. Delineation shovel tests to the southeast at 5 m intervals were possible for most of the positive shovel tests identified at 34AD285. This resulted in a very well-defined southeastern boundary for the site within the plain. To the northwest however, delineations were not possible due to both the limits of the APE and by an existing fence line. The overall site remains undefined outside of the APE.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition then the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD285, as a whole, has not been determined. The portion of the site identified within the APE lacks significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD285 lacks integrity of design, setting, materials, workmanship, feeling, or association. The setting, design, and feeling of the site has been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD285 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD286	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD286 is a moderately dense lithic artifact scatter located atop a flat terrace west of a river. Artifacts recovered during the Phase I survey were identified from just below the ground surface to depths over 1 meter. Positive shovel tests were augured to sterile subsoils, which were reached around 110 cmbs. Artifacts were recovered from depths as deep at 110 cmbs and were recovered just above Pleistocene sediments. A typical shovel test was characterized by dark brown (10YR 3/3) silty clay loam from 0 to 35 cmbs (Stratum I), underlain by a brown (10YR 5/3) silty clay loam from 35 to 60 cmbs (Stratum II), underlain by brown clay (10YR 4/3) from 60 to 90 cmbs (Stratum III). Below this layer was a strong brown (7.5YR5/8) compacted and gravelly clay from 90 to 160 cmbs (Stratum IV). Culturally sterile soils were encountered below 110 cmbs. The site was identified through the excavation of 8 positive shovel tests containing 108 lithic artifacts. The artifacts recovered consist of primary, secondary, and tertiary flake fragments, and a chert core; some of which show evidence of thermal alteration. Chert types recovered include Keokuk, John's Valley Gravels, Boone, and Reed's Springs varieties. No diagnostic artifacts were recovered during survey.

National Register Evaluation: The property was evaluated for the National Register under Criteria D. The depths at which artifacts were recovered indicate a strong potential for 34AD286 to date to either the Paleoindian or Early Archaic periods. The overall density and frequency of the artifact deposit indicates that substantial lithic refinement took place in a horizontally discrete area, and it is possible that features may exist in-situ. As the site was not fully delineated, the eligibility status of site 34AD286, as a whole, has not been determined. However, the portion of the site identified within the APE retains integrity and significant data potential under Criterion D of the National Register and is recommended eligible.

Integrity: Site 34AD286 retains good integrity of location, design, materials, and association. Integrity of location is based on the deeply buried nature of the deposits, which have the potential to inform the geomorphological processes which lead to site formation. Integrity of design is based on the overall density and frequency of the artifact deposit across a horizontally discrete area, which raises the possibility that features may exist in-situ. Integrity of materials and association is based upon the assumption that the deep deposits retain the data potential to increase understanding of how people interacted with their environment during the Paleoindian and Early Archaic periods.

Resource ID:	34AD287	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD287 is a moderate density, horizontally diffuse lithic artifact scatter located atop a flat terrace northwest of a river. The boundaries of the site are irregularly shaped and measure roughly 70 m in length northeast to southwest and 12 m in width northwest to southeast. Shovel test profiles recorded within the site area can be generally described as shallow with an initial layer of dark gray (7.5YR 4/1) soil with roots from 0 to 35 cmbs (Stratum I), underlain by brown (7.5YR 5/4) clay from 35 to 55 cmbs (Stratum II). The onset of clay substrata was relatively shallow. Augered shovel tests through the identified clay layer identified a horizon of dense cobble at approximately 60 cmbs. The site was identified through the excavation of 13 positive shovel tests containing a total of 40 lithic artifacts of Keokuk (n=26), John's Valley Gravels (n=11), and Boone (=3) chert, including 39 chert debitage flakes and one biface. None of the recovered artifacts showed evidence of thermal alteration or reworked, or retouched surface treatments. None of the recovered artifacts were diagnostic. The majority of artifacts were recovered from depths between 0 and 30 cmbs (n=28). A smaller number of artifacts were recorded at depths between 30 and 40 cmbs (n=10), with some artifacts recovered as deep as 50 cmbs (n=2). Full delineation of the site was not possible due to the limits of the APE to the northwest and the existing railroad bermand ballast to the southeast.

National Register Evaluation: The property was evaluated for the National Register under Criteria D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition then the site lacks significant data potential. As the site was not able to be fully delineated, the eligibility status of site 34AD287, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD287 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD287 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD288	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD288 is a low-density lithic artifact scatter located within a flat terrace northwest of a river. The known site area is irregularly shaped and measures 30 m in length northeast to southwest and varies between 8 and 18 m in width northwest to southeast. Shovel test profiles recorded within the site area can be generally characterized by an initial stratum of dark brown (10YR 3/3) silty clay loam from 0 to 20 cmbs (Stratum I), followed by a layer of yellowish brown (10YR 5/4) silty clay loam from 20 to 45 cmbs (Stratum II), underlain by brownish yellow (10YR 6/8) clay with dense cobble inclusions from 45 to 55 cmbs (Stratum III). Stratum III was culturally sterile. The site was identified through the excavation of six positive shovel tests containing a total of 12 lithic artifacts, all of which were non-diagnostic debitage from late state reduction activities. Two recovered flakes show evidence of thermal alteration. The deposit was identified between 10 and 30 cmbs, squarely within the Stratum I and Stratum II transition. None of the artifacts recovered during survey at 34AD288 were located below 30 cmbs. Full delineation of the site was not possible to the southeast due to the presence of the existing railroad berm and ballast and to the northwest due to the existing fenceline that demarcates the APE.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition then the site lacks significant data potential. As the site was not able to be fully delineated, the eligibility status of site 34AD288, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD288 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD288 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD289	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron

Description: Site 34AD289 is a discrete lithic scatter of chert debitage and tools located atop a flat terrace northwest of a river. The known site area measures 25 m in length northeast to southwest and 9 m in width northwest to southeast. The known site area is bounded to the southeast by the existing railroad berm and ballast. A typical shovel test excavated within the identified limits of the site was characterized by dark brown (10YR 3/3) silty clay loam from 0 to 40 cmbs (Stratum I), underlain by strong brown (7.5YR 4/6) silty clay from 40 to 75 cmbs (Stratum II). A culturally sterile, strong brown (7.5YR 5/8) clay substrate was identified from 75 to 85 cmbs (Stratum III). Soil color and consistency was observed as uniform and typical for each of the identified strata. The site was identified through the excavation of three positive shovel tests resulting in the recovery of 27 total artifacts including 25 flakes, 1 utilized flake/scraper, and the partial distal end of a PP/K (Table 15). Although the PP/K is partial, the form is most similar to the expanding/bifurcate stemmed Cossatot River tradition, which dates to the Middle Archaic Period (ca. 2500 B.C. – 200 B.C.) in Eastern Oklahoma. The recovered scraper showed evidence of a utilized edge but was otherwise unremarkable in form. The recovered flakes were largely consistent in regard to form and color though 7 examples showed surface treatment evidence of thermal alteration. The deposit was vertically diffused through the strata with no definitive or discrete occupation zone identified. The majority of artifacts (n=20) were recovered within the initial stratum, Stratum I (0-40 cmbs). The remaining artifacts (n=7) were recovered between 40 and 70 cmbs with the diagnostic recovered between 50 and 70 cmbs.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition, the site lacks significant data potential. As the site was not able to be fully delineated, the eligibility status of site 34AD289, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD289 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD289 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD290	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Cave Spring

Description: Site 34AD290 is a low-density scatter of non-diagnostic lithic debitage located on a flat floodplain west of a creek. The site measures approximately 25 m in length northeast to southwest and 10 m in width northwest to southeast. Shovel testing revealed a uniform soil profile that consists of two strata. Stratum I, a dark grayish brown (10YR 4/2) silty clay loam, extends between the surface and 30 cmbs; recovered cultural materials were limited to this stratum. Stratum II is a hydric and culturally sterile dark brown (10YR 3/3) silty clay that also includes gravel inclusions extending to 60 cmbs. The site was identified through the excavation of three positive shovel tests. Cultural materials recovered at Site 34AD290 consist entirely of non-diagnostic lithic flakes, with six (n=6) being of Keokuk chert and one (n=1) made from a non-specific Novaculite. All of the Keokuk chert flakes were recovered from 0 to 15 cmbs, with the single Novaculite flake recovered from 15 to 20 cmbs. None of the recovered lithic artifacts evidenced thermal alteration, nor were they diagnostic. The site was not fully delineated to the east due to existing railroad berms and ballast and to the west due to the boundary of the APE.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition, the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD290, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD290 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD290 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD291	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Cave Spring

Description: Site 34AD291 is a scatter of horizontally expansive non-diagnostic lithic materials located on a relatively flat floodplain west of a creek. The site boundaries measure approximately 80 m in length northeast to southwest and 10 m in width northwest to southeast. Shovel testing revealed consistent shovel test profiles at the site with two strata present. Stratum I, a dark brown (10YR 3/3) silty clay loam, extends from the surface to 30 cmbs. A culturally sterile Stratum II of dark gray (10YR 4/1) silty clay is present between 20 and 60 cmbs. The water table inundated soils after 60 cmbs. The site was identified through the excavation of three positive shovel tests which yielded lithic debitage. Cultural materials consisted of nine (n=3) non-diagnostic Keokuk chert lithic debitage flakes and a single (n=1) fragment of Keokuk chert angular debris/shatter. The assemblage density was relatively uniform throughout the site with no apparent concentrations of cultural materials, and the site may continue to the southwest. None of the recovered cultural materials are diagnostic, nor do they display evidence of thermal alteration. The site was not fully delineated to the northwest and southwest due to the boundary of the APE.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition, the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD291, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD291 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD291 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD292	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Cave Spring

Description: Site 34AD292 is a scatter of non-diagnostic lithic materials located on a relatively flat floodplain at the base of a hillslope north of a creek. The site measures approximately 12 m in length northeast to southwest and 10 m in width northwest to southeast. Shovel testing revealed consistent shovel test profiles at the site with four strata present. Stratum I, a dark brown (10YR 3/3) silty clay loam, extends from the surface to 20 cmbs. Stratum II of yellowish brown (10YR 5/4) silty clay is present between 20 and 28 cmbs in some tests and appears to be redeposited rather than natural soils. Stratum III consists of mottled dark brown (10YR 3/3) and yellowish brown (10YR 5/4) silty clay loam between 28 and 50 cmbs; this stratum appears to be undisturbed. Stratum IV is a culturally sterile yellowish brown (10YR 5/4) and strong brown (7.5YR 5/6) saturated silty clay. Site 34AD292 was identified during transect shovel testing through the excavation of three positive shovel tests resulting in the recovery of Keokuk chert lithic artifacts (n = 3). Two (n = 2) of these specimens were recovered from Stratum I with a singular flake (n = 1) recovered from Stratum III. The site was not fully excavated to the northeast due to the APE boundary and to the northwest and southeast due to existing ballast.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. The integrity of the site has been compromised by railway construction. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition, the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD292, as a whole, has not been determined. The portion of the site identified within the APE lacks integrity and significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD292 lacks integrity of location, design, setting, materials, workmanship, feeling, or association. The location, design, and setting of the site have been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship and feeling, due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD292 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

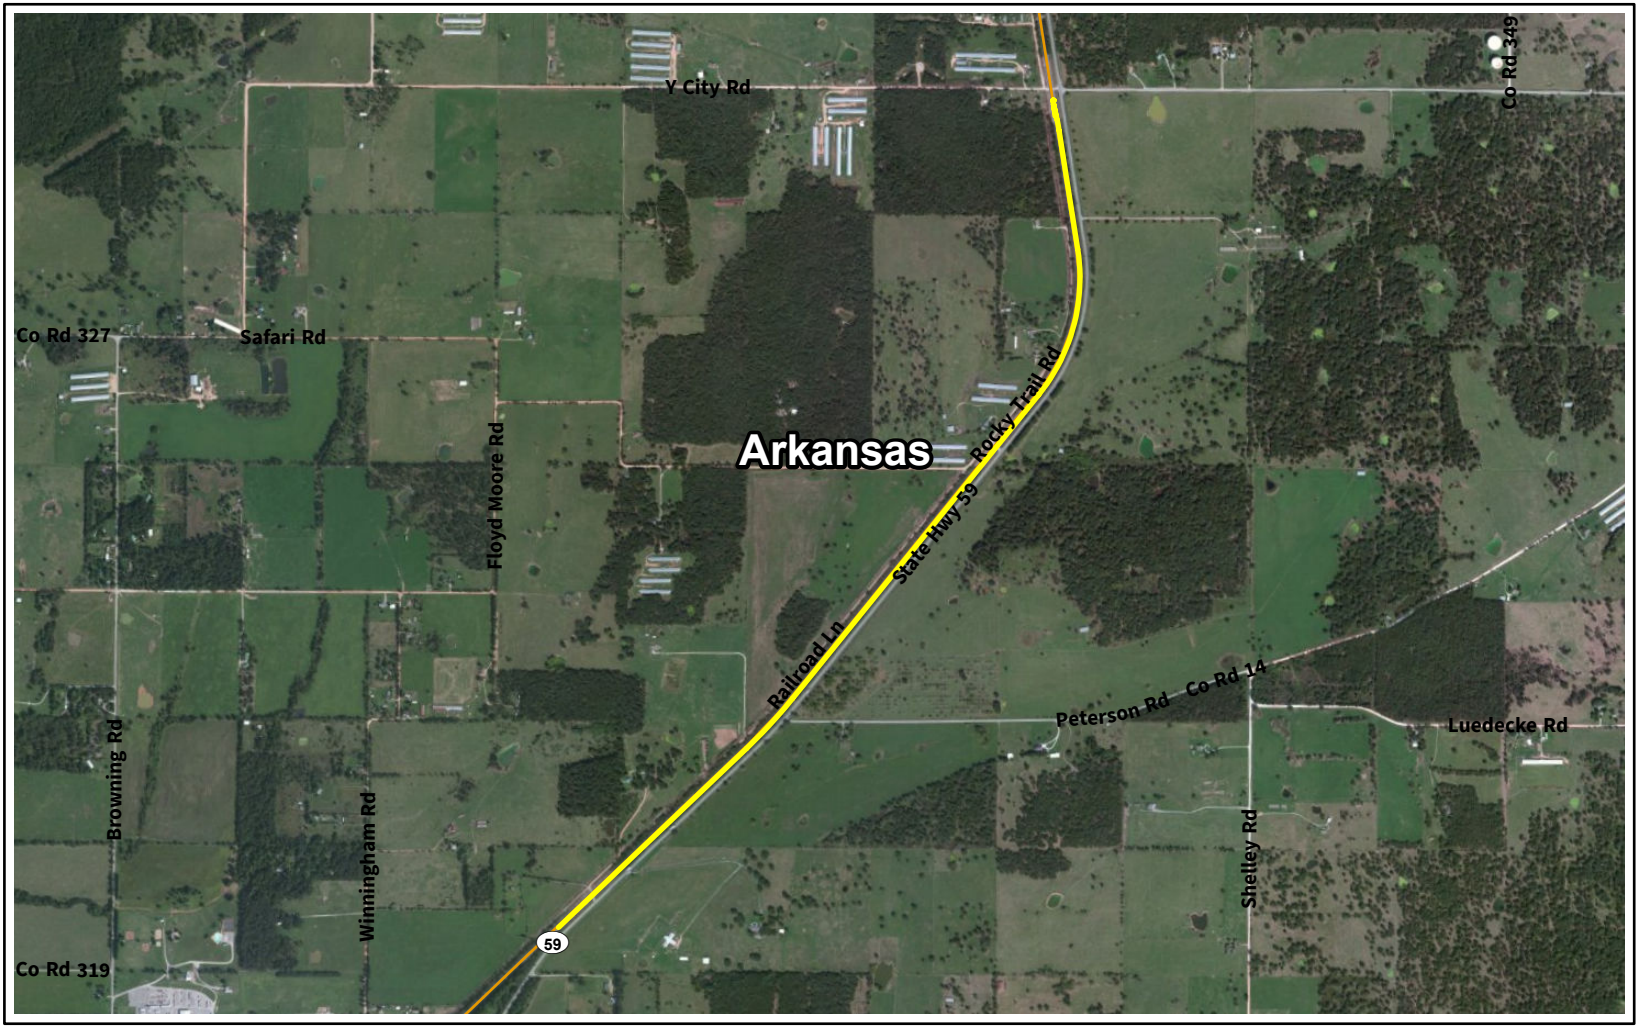
Resource ID:	34AD293	Resource Type:	Below-Ground
Inventory Number:	N/A	Potential Effect:	Physical
Previous Documentation:	N/A	Location:	Baron

Description: Site 34AD293 is a low-density lithic artifact scatter located northwest of a river, at the southwestern edge of a flat, slightly elevated terrace. The site measures 45 m in length northeast to southwest and 14 m in width northwest to southeast. Shovel testing within the identified site boundaries was characterized by an initial A horizon of dark gray (10YR 4/1) silty clay loam from 0 to 25 cmbs (Stratum I), underlain by a B horizon of strong brown (7.5YR 5/8) clay with heavy cobble from 20 to 30 cmbs (Stratum II). The identified B horizon was a culturally sterile clay substratum. Soil color and consistency was observed as uniform and typical for each of the identified strata. The site was identified through the excavation of two positive shovel tests containing five (n=5) lithic flakes of Keokuk (n=3), Boone (n=1), and John's Valley Gravels (n=1) chert. Most of the recovered artifacts were unremarkable in regard to surface treatment; however, one Keokuk chert flake demonstrated evidence of thermal alteration. The recovered flakes are most likely the result of a single late-stage lithic retouching or maintenance event and were recovered between 0 and 25 cmbs. No artifact recovered from the site was diagnostic. No features were identified during subsurface investigations at 34AD293. Due to the low overall number of artifacts, and spatially discrete area within the APE, the site is unlikely to contain features within the identified site area.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition then the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD293, as a whole, has not been determined. The portion of the site identified within the APE lacks significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD293 lacks integrity of design, setting, materials, workmanship, feeling, or association. The setting, design, and feeling of the site has been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD293 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Resource ID:	34AD294	**Resource Type:**	Below-Ground
Inventory Number:	N/A	**Potential Effect:**	Physical
Previous Documentation:	N/A	**Location:**	Baron



Description: Site 34AD294 is a low-density, undifferentiated lithic scatter located west of a river at the base of a steep hillslope atop a flat terrace. The known site area is oval in shape and measures approximately 44 m in length northeast to southwest and 21 m in width northwest to southeast. Shovel testing within the site boundaries was characterized by an initial A horizon of grayish brown (10YR 3/2) loam from 0 to 20 cmbs (Stratum I), underlain by a B horizon of brown (10RYR 4/3) clayey loam from 20 to 50 cmbs (Stratum II), followed by a stratum of strong brown (7.5YR 5/8) clay with heavy (~60%) cobble inclusions from 50 to 60 cmbs (Stratum III). The identified Stratum III was a culturally sterile clay substratum. Soil color and consistency was observed as uniform and typical for each of the identified strata. The site was identified through the excavation of two positive shovel tests containing four (n=4) Keokuk chert flake fragments, including one flake with a utilized edge. Shovel Test A60 contained three artifacts recovered between 20 and 40 cmbs and Shovel Test A61 contained 1 lithic flake recovered between 10 and 20 cmbs. None of the recovered artifacts showed signs of being thermally altered. None of the recovered artifacts were diagnostic. No features were identified during subsurface investigations at 34AD294. Delineations to the northwest were not possible dur to the presence of a steep hillslope, while delineations to the southeast were also restricted dur to the presence of the railroad berm and ballast. Due to the low overall number of artifacts, and small site area, further investigations would be unlikely to identify archaeological features.

National Register Evaluation: The property was evaluated for the National Register under Criterion D. As lithic scatters are common in this region and the recovered cultural materials are not indicative of a specific technological, material, or cultural tradition then the site lacks significant data potential. As the site was not fully delineated, the eligibility status of site 34AD294, as a whole, has not been determined. The portion of the site identified within the APE lacks significant data potential under Criterion D of the National Register and is recommended not eligible.

Integrity: Site 34AD294 lacks integrity of design, setting, materials, workmanship, feeling, or association. The setting, design, and feeling of the site has been compromised by the disturbance caused by the construction of the railroad. The site lacks integrity of workmanship due to the sparse and undiagnostic nature of the artifacts recorded. Site 34AD294 also lacks integrity of association, as the site cannot be directly linked to any important historical event or persons.

Appendix K

Air Quality and Climate Change

This appendix provides technical information on the approach and results used in the analysis of air quality and climate change (*Chapter 3, Section 3.7*).

K.1 Introduction

CP and KCS, the Applicants, operate freight rail services from Canada to Mexico. OEA evaluated how the Proposed Acquisition-related increases in rail activity would affect air quality and greenhouse gases (GHGs). OEA has considered both long-term operational impacts and short-term impacts associated with the planned capital improvements.

K.2 Approach

OEA measured the air quality and greenhouse gas impacts of the Proposed Acquisition by assessing the air quality changes that meet or exceed the Board's thresholds and require an air quality assessment. The assessment includes the operational impacts and the impacts of the planned capital improvements.

For the operational impacts of the Proposed Acquisition, the air quality and greenhouse gases were assessed at the county level for each of the following:

- Rail line segments
- Grade crossings
- Rail yards including railcar switching
- Intermodal facilities including on-the-road trucks, lift equipment, yard trucks

The operational air quality and greenhouse gas impacts also included an assessment of the system-wide truck-to-rail diversions related to the Proposed Acquisition. OEA conducted a study area wide inventory that comprised of all the elements in the operational impacts assessments. The planned capital improvements assessment included a quantification of the air quality impacts of the construction equipment as well as fugitive dust associated with the general construction site work and earthwork.

K.3 Regulatory Context

The Clean Air Act (CAA) amendments, which are implemented by the U.S. Environmental Protection Agency (EPA), set forth guidelines for agencies to follow to achieve attainment of the National Ambient Air Quality Standards (NAAQS). The goal of the regulation is to

improve air quality across the United States to protect public health and welfare. The following sections describe CAA components, including the NAAQS, General Conformity, and Class I Areas.

K.3.1 National Ambient Air Quality Standards

The CAA requires the EPA to set NAAQS (40 C.F.R. Part 50) for six air pollutants known as the criteria pollutants: CO, lead (Pb), nitrogen dioxide (NO_2), ozone (O_3), particulate matter (PM_{10} and $PM_{2.5}$), and SO_2. NAAQS standards are based on human health criteria for the protection of public health (primary standards) and on environmental criteria to prevent environmental and property damage and for the protection of public welfare (secondary standards). **Table K.3-1** presents the current NAAQS.

Table K.3-1. National Ambient Air Quality Standards

Pollutant	Primary or Secondary	Averaging Time	Level	Form
Carbon Monoxide	Primary	8 hours	9 ppm	Not to be exceeded more than once per year
		1 hour	35 ppm	
Lead	Primary and Secondary	Rolling 3-month Average	0.15 µg/m^3	Not to be exceeded
Nitrogen Dioxide	Primary	1 hour	100 ppb	98th percentile of 1-hour daily maximum concentrations; averaged over 3 years
	Primary and Secondary	1 year	53 ppb	Annual Mean
Ozone	Primary and Secondary	8 hours	0.070 ppm	Annual 4th highest daily maximum 8-hour concentration; averaged over 3 years
Particulate Matter 2.5	Primary	1 year	12.0 µg/m^3	Annual mean, averaged over 3 years
	Secondary	1 year	15.0 µg/m^3	Annual mean, averaged over 3 years
	Primary and Secondary	24 hours	35 µg/m^3	98th percentile; averaged over 3 years
Particulate Matter 10	Primary and Secondary	24 hours	150 µg/m^3	Not to be exceeded more than once per year on average over 3 years
Sulfur Dioxide	Primary	1 hour	75 ppb	99th percentile of 1-hour daily maximum concentrations; averaged over 3 years
	Secondary	3 hours	0.5 ppm	Not to be exceeded more than once per year

Source: EPA 2021d
Note: ppm = parts per million; ppb = parts per billion; µg/m3 = micrograms per cubic meter

In consultation with EPA, OEA has determined that certain emissions from Board actions, such as emissions from construction activities related to the jurisdictional construction of a new line of railroad, are subject to the General Conformity regulations because those meet the definition of direct or indirect emissions set forth at 40 C.F.R. § 93.152. However, emissions related to projected increases in rail operations on rail lines or projected increases in activities at rail yards and intermodal facilities resulting from Board decisions are not subject to General Conformity because the Board does not exercise continuing program responsibility over and cannot practically control rail operations on rail lines or activities at

rail yards and intermodal facilities (STB 2021). Accordingly, emissions from projected increases in rail traffic and increased activities at rail yards and intermodal facilities resulting from the Proposed Acquisition are not subject to General Conformity.

The EPA has established *de minimis* emission levels under 40 C.F.R. Part 93, Subpart B. The EPA uses the term *de minimis* across a variety of contexts to describe impacts that are too small or trivial for consideration by regulatory authorities. OEA has compared Proposed Acquisition-related emissions to the *de minimis* thresholds to contextualize the potential air quality impacts of the Proposed Acquisition (presented in **Table K.3-2**).

Table K.3-2. De Minimis Levels

Pollutant	Tons per Year	Area Type
Ozone (VOC or NO_x)	50	Serious Nonattainment
	25	Severe Nonattainment
	10	Extreme Nonattainment
	100	Other Areas Outside an Ozone Transport Region[1]
Ozone (NO_x)	100	Marginal and Moderate Nonattainment Inside an Ozone Transport Region[1]
	100	Maintenance
Ozone (VOC)	50	Marginal and Moderate Nonattainment Inside an Ozone Transport Region[1]
	50	Maintenance Within an Ozone Transport Region[1]
	100	Maintenance Outside an Ozone Transport Region[1]
Carbon Monoxide (CO), Sulfur Dioxide (SO_2) and Nitrogen Dioxide (NO_2)	100	All Nonattainment and Maintenance
Particulate Matter 10 (PM_{10})	70	Serious Nonattainment
	100	Moderate Nonattainment and Maintenance
Particulate Matter 2.5 ($PM_{2.5}$)[2]	100	All Nonattainment and Maintenance
Lead (Pb)	25	All Nonattainment and Maintenance

Source: EPA 2021e

[1] The Ozone Transport Region is composed of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, and the District of Columbia.

[2] Direct emissions, SO_2, NO_x, (unless determined not to be a significant precursor), VOC or ammonia (if determined to be a significant precursor)

K.3.1.2 Class I Areas and Air Quality Related Values

Air quality related values (AQRVs) are environmental resources that may be affected by changes in air quality. These AQRVs can include aspects of visibility, water quality, and the health and vitality of plants, animals, and other life forms that reside in and around federal parks and protected lands. The CAA and federal land management agencies have regulations set forth to particularly address impacts on acid deposition and visibility in Class I areas (Sullivan 2016). As presented in **Table K.3-1**, the secondary NAAQS standards set limits to protect public welfare, including protection against decreased visibility, damage to

animals, crops, vegetation, and buildings where the Class I areas are an environmental resource.

K.3.1.3 Acid Deposition

Acid deposition occurs when sulfur oxides (SO_x) and nitrogen oxides (NO_x) release from various sources and combine in the atmosphere to form acidic substances. These sulfuric and nitric acids damage soil, vegetation, and water quality and particularly, the acid-neutralizing capacity of lakes. EPA provides data on acid deposition levels in units of kilogram per hectare (kg/ha) from the Clean Air Status and Trends Network (CASTNET) (EPA 2021f).

K.3.1.4 Visibility

Visibility impairment occurs when pollutant emissions absorb and scatter light in the atmosphere, and thus result in a haze that reduces clarity of view. This haze is primarily a result of fine particulate emissions, which include $PM_{2.5}$, sulfates, and nitrates. Sulfates and nitrates, which are formed from SO_x and NO_x emissions, are precursors of $PM_{2.5}$. These emissions are induced from natural or anthropogenic sources. The visibility of an area is measured through haze index in "deciviews" or standard visual range (SVR) in miles or kilometers. A low haze index and a high SVR is indicative of improved visibility. The Federal Land Manager Environmental Database provides access to such data from Interagency Monitoring of Protected Visual Environments (IMPROVE) monitors (Colorado State University, nd). IMPROVE monitors provide visibility data for Class I areas throughout the nation.

K.3.2 Pollutant Descriptions and Effects

OEA identified pollutants in the affected environment and their effects on human health and the environment from publicly available regulations and databases provided by EPA. The following sections describe the various pollutants that OEA analyzed in this study and their potential effects on health or the environment.

K.3.2.1 Criteria Pollutants

Air pollution is of concern because of its demonstrated effects on human health. Of particular concern are the respiratory effects of the criteria pollutants for which the NAAQS are set, as described in **Table K.3-3**.

Table K.3-3. Criteria Pollutant Summary

Pollutant	Description
Ozone (O_3)	O_3 is a highly reactive compound of oxygen. At very high concentrations O_3 appears blue in color, is a highly unstable gas and is pungent in odor. At ambient concentrations, O_3 is colorless and odorless. O_3 is not emitted directly into the atmosphere by pollutant sources, but instead is produced by an atmospheric reaction of NO_X and VOCs. Generally, this reaction is most favorable during the warmer summer months when sunlight is stronger. Exposure to O_3 may impair lung function and cause respiratory difficulties to sensitive populations (for example a person with asthma, emphysema or reduced lung capacity).

Table K.3-3. Criteria Pollutant Summary

Pollutant	Description
Sulfur Dioxide (SO_2)	SO_2 emissions are the main components of the "oxides of sulfur," a group of highly reactive gases from fossil fuel combustion at power plants, other industrial facilities, industrial processes, and burning of high sulfur containing fuels by large ships and non-road equipment. High concentrations of SO_2 will lead to formation of other sulfur oxides. By reducing the SO_2 emissions, other forms of sulfur oxides are also expected to decrease. When oxides of sulfur react with other compounds in the atmosphere, small particles that can affect the lungs can be formed. This can lead to respiratory disease and aggravate existing heart disease.
Particulate Matter (PM_{10} and $PM_{2.5}$)	Particulate matter is comprised of small solid particles and liquid droplets. PM_{10} refers to particulate matter with a nominal aerodynamic diameter of 10 micrometers or less, and $PM_{2.5}$ refers to particulate matter with an aerodynamic diameter of 2.5 micrometers or less. Particulates can enter the body through the respiratory system. Particulates over 10 micrometers in size are generally captured in the nose and throat and are readily expelled from the body. Particles smaller than 10 micrometers, and especially particles smaller than 2.5 micrometers, can reach the air ducts (bronchi) and the air sacs (alveoli) in the lungs. Particulates are associated with increased incidence of respiratory diseases, cardiopulmonary disease, and cancer.
Carbon Monoxide (CO)	CO is a colorless and odorless gas that is a product of incomplete combustion. CO is absorbed by the lungs and reacts with hemoglobin to reduce the oxygen carrying capacity of the blood. At low concentrations, CO has been shown to aggravate the symptoms of cardiovascular disease. It can cause headaches, nausea, and at sustained high concentration levels, can lead to coma and death.
Nitrogen Dioxide (NO_2)	When combustion temperatures are extremely high, such as in engines, atmospheric nitrogen gas may combine with oxygen gas to form various oxides of nitrogen. Of these, nitric oxide (NO) and NO_2 are the most significant air pollutants. This group of pollutants is generally referred to as NO_X. Nitric oxide is relatively harmless to humans but quickly converts to NO_2. NO_2 has been found to be a lung irritant and can lead to respiratory illnesses. Nitrogen oxides, along with VOCs, are also precursors to ozone formation.
Lead (Pb)	Pb is a heavy metal that can affect the nervous system, kidneys, immune system, reproductive system, and cardiovascular system when exposed to substantial doses. Pb is emitted through some heavy industrial manufacturing processes, especially those associated with metal processing. The addition of Pb to fuel increases engine performance and reduces valve wear; however, general use of Pb as a fuel additive has been phased out for on-road vehicles in the United States. Since this phase out, Pb concentrations in ambient air are often low. States with no significant lead emitting sources typically do not measure Pb at their ambient air monitoring stations.

Hazardous Air Pollutants

Controlling air toxic emissions became a national priority with the passage of the Clean Air Act Amendments (CAAA) of 1990, whereby Congress mandated that EPA regulate 188 air toxics, also known as hazardous air pollutants (HAPs). EPA has assessed this expansive list in their latest rule on the Control of Hazardous Air Pollutants from Mobile Sources (*Federal Register*, Vol. 72, No. 37), and identified a group of 93 compounds emitted from mobile sources, listed in their Integrated Risk Information System (EPA 2021h). In addition, EPA identified nine compounds with significant contributions from mobile sources that are among the national and regional-scale cancer risk drivers from their 2011 National Air Toxics Assessment (EPA 2021i). The nine compounds are called mobile source air toxics

and are typically associated with transportation sources including motor vehicles, construction equipment, and locomotives. These are 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (diesel PM), ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter. OEA considered these nine compounds in the emissions assessment.

Greenhouse Gases

In nature, carbon dioxide (CO_2) is exchanged continually between the atmosphere, plants, and animals through processes of photosynthesis, respiration, and decomposition, and between the atmosphere and ocean through gas exchange. Oceans and living biomass (i.e., sinks) absorb billions of tons of carbon in the form of CO_2 and emit it to the atmosphere annually through natural and man-made processes (i.e., sources). CO_2, however, constitutes less than $1/10^{th}$ of a percent of the total atmosphere gases. Similar to the glass in a greenhouse, certain gases, primarily CO_2, nitrous oxide (N_2O), and methane (CH_4) absorb heat that the surface of the Earth radiates. Increases in the atmospheric concentrations of these gases can cause the Earth to warm by trapping more heat. The common term for this phenomenon is the "greenhouse effect," and these gases are typically referred to as "greenhouse gases." GHG emissions have effects at the regional and global scale and are thus reviewed at a regional scale. In 2007, the Supreme Court determined that GHGs are anticipated to endanger public health and therefore are part of the EPA's responsibility to regulate under the CAA. In 2009, the EPA signed an endangerment finding in the CAA that stated the current and projected concentrations of the six key GHGs in the atmosphere could threaten the public health and welfare of current and future generations.

EPA has not established ambient air standards for GHGs like the criteria pollutants have under the NAAQS. However, the Council on Environmental Quality (CEQ) has created guidelines for conducting GHG and climate change analyses in NEPA Documents (CEQ 2016). A draft GHG guidance document was released by CEQ in 2019; however, Presidential Executive Order 13990, signed in 2021, rescinded the 2019 draft guidance, making the previously implemented 2016 guidance document the current guidance for use in NEPA documents. The 2016 guidance states that where feasible, federal agencies should include a quantitative analysis of potential GHG emissions from a proposed action. When tools, methodologies, or data inputs are not reasonably available, a qualitative evaluation should be provided. This analysis should consider direct, indirect, and cumulative emissions. It should evaluate both short- and long-term effects of the proposed action and alternatives. When appropriate, mitigation should be considered to avoid, minimize, and compensate for increased GHG emissions.

CP and KCS have both committed to setting science-based targets to reduce GHG emissions in line with the Paris Agreement and the merged entity would continue that work in support of a more sustainable North American supply chain. KCS plans to reduce GHG emissions intensity by 42 percent per million gross ton-miles by 2034 from a 2019 base year (KCS 2021). CP has committed to reduce locomotive emissions by 38 percent by 2030 and non-locomotive emissions by 27.5 percent by 2030 (CP 2021).

K.4 Affected Environment

The affected environment for air quality is determined by the attainment status of the counties in the study area and by identifying proximate Class I Areas. The majority of affected counties with operational impacts and the impacts of the planned capital improvements that exceed the Board's thresholds for environmental analyses are in attainment of all NAAQS. **Table K.4-1** presents the affected counties that are nonattainment or maintenance areas.

Table K.4-1. Attainment Statuses of Affected Counties

State	County	Criteria Pollutants						
		O_3	SO_2	$PM_{2.5}$	PM_{10}	CO	NO_2	Pb
Arkansas	Benton	-	-	-	-	-	-	-
Arkansas	Little River	-	-	-	-	-	-	-

Source*:* EPA 2021b

Note: - = Attainment; M = Maintenance; NA = Nonattainment; O_3 = Ozone; NO_2 = Nitrogen Dioxide; PM_{10} = Particulate Matter 10 microns or less in diameter; $PM_{2.5}$ = Particulate Matter 2.5 microns or less in diameter; SO_2 = Sulfur Dioxide; CO = Carbon Monoxide; Pb = Lead.

[1] Ozone nonattainment designations are ranked by the severity of their exceedance of the NAAQS. The affected counties have "serious" and "marginal" designations which effect the *de minimis* thresholds used to assess the project's emissions.

[2] This county is a former maintenance area for the revoked 1997 Annual $PM_{2.5}$ standard. Areas that have been redesignated to attainment are not required to make transportation or general conformity determinations.

[3] This county is a former maintenance area for the revoked 1979 1-hour Ozone standard. Areas that have been redesignated to attainment are not required to make transportation or general conformity determinations.

[4] This county is a former maintenance area for the respective pollutant. The 20-year maintenance plan has expired, as such transportation and general conformity are no longer applicable.

[5] This county is a former maintenance area for revoked 1997 8-hour Ozone standard. As a result of the *South Coast Air Quality Management District v. EPA* court case, these areas are considered "orphan areas" and are still subject to conformity requirements under their maintenance plans.

K.5 Study Area-Wide Emissions

OEA created a study area-wide emissions inventory by summing all the emissions in the county-level analysis. The study area-wide analysis includes the anticipated reduction in emissions associated with truck-to-rail diversions. **Table K.5-1** presents the study area-wide summary.

Table K.5-1. Study Area Wide Emissions Analysis Summary

	Acquisition-Related Criteria Emissions (tons/year)							Acquisition-Related HAP Emissions (tons/year)							
Source	**NOX**	**VOC**	**PM10**	**PM2.5**	**SO2**	**CO**	**CO2e**	**Acetaldehyde**	**Acrolein**	**Benzene**	**1,3-Butadiene**	**Ethyl Benzene**	**Formaldehyde**	**Napthalene**	**POM**

Note: See individual analyses tables for further information on emissions analyses and assumptions.

K.6 County-Level Emissions

OEA analyzed a county-level emissions inventory for all operational impacts and the impacts of the planned capital improvements that exceeded the Board's thresholds for analysis. OEA conducted county-level emissions analyses for rail line segments, grade crossings, rail yards, and intermodal facilities. OEA estimated emissions for Nitrogen Oxides (NO_X), Volatile Organic Compounds (VOC), Particulate Matter (PM): PM_{10}, and $PM_{2.5}$, Sulfur Dioxide (SO_2), Carbon Monoxide (CO), Carbon Monoxide equivalents (CO_2e), Methane (CH_4), Nitrogen Dioxide (N_2O), and HAPs. OEA calculated CO_2e by deriving CO_2, CH_4, and N_2O emissions and applying global warming potentials (EPA 2021a). **Table K.6-1** presents criteria pollutant emissions and **Table K.6-2** presents HAPs.

Table K.6-1. County-Level Emissions Analysis Summary-Criteria Pollutants and GHG

Note: See individual analyses tables for further information on emissions analyses and assumptions.

K.7 Rail Segment Analysis

OEA conducted an analysis of the emissions changes from locomotives on rail line segments that would meet or exceed the Board's thresholds for environmental analysis. The Applicants provided rail segments that exceeded the Board's analysis thresholds. OEA sub-divided these segments into "sub-segments" at county lines and within counties for partial nonattainment areas that do not compose an entire county for the purpose of air quality analysis. OEA obtained nonattainment area boundaries from EPA (EPA 2021b). OEA encountered ozone and Sulfur Dioxide nonattainment areas in some counties along the analyzed rail segments. The Applicants provided No-Action Alternative and Proposed Acquisition annual gross tons per mile for each segment. OEA obtained the lengths of the sub-segments using geographic information system processing and used them to proportion the total segment gross tons per mile to annual ton-miles for each sub-segment.

OEA converted the ton-mileage for each sub-segment to fuel usage using the fleet-wide fuel efficiency factors. OEA derived these efficiency factors for the No-Action Alternative and Proposed Acquisition based on the fuel efficiency data presented in the Application (contained in the Verified Statement of Michael R. Baranowski). It is anticipated the Proposed Acquisition fuel efficiency would be better than the No-Action Alternative fuel efficiency due to efficiencies gained by the Proposed Acquisition. OEA obtained emission factors for calculating locomotive emissions using EPA methodology (EPA 2009). OEA obtained the mix of emissions tier standards for the combined locomotive fleet from the Applicants. OEA used this mix to create composite fleet wide emission factors by pollutant for the rail segment analysis. OEA converted emission factors into a grams per gallon format using the EPA-provided conversion factor from brake horsepower-hours to gallons (EPA 2009). OEA estimated HAPs emission rates by applying speciation profiles to the VOC or PM emission rates (EPA 2021c). OEA combined the above No-Action Alternative and Proposed Acquisition fuel usages with the emission factors to calculate the emissions inventory for each sub-segment. OEA conservatively estimated emissions using current locomotive fleet information. It is expected that the fleet would become cleaner over the coming years as the acquisition would result in an excess of locomotives that would allow the Applicants to optimize locomotive assignments to the fleet's newest, most fuel-efficient members. The locomotive surplus would also allow the Applicants to continue remanufacturing older locomotives into more fuel-efficient units. Emerging technologies such as hydrogen and battery-electric locomotives may also contribute to cleaner fleet with reduced emissions.

OEA grouped sub-segments by county to create a county-level emissions inventory. OEA calculated the difference between the Proposed Acquisition and No-Action Alternative inventories to determine the Proposed Acquisition-related emissions.

Table K.7-1 and **Table K.7-2** summarize the rail segment analysis. **Table K.7-3** through **Table K.7-8** show analysis by sub-segment. **Table K.7-9** shows the locomotive emissions factors.

Notes:
Segment Ton-Mileage provided by Applicants; Sub Segment ton-mileage proportioned from whole segment based on the Length Proportion
No Action and With Action Fuel Efficiency estimated based on data provided in the "Verified Statement of Michael R. Baranowski" (No Action- 971 ton-miles/gal; With Action- 1024 ton-miles/gal)

Table K.7-4. Rail Segment Analysis- Proposed Acquisition Criteria Pollutant Emissions by Subsegment

Notes:

Segment Ton-Mileage provided by Applicants; Sub Segment ton-mileage proportioned from whole segment based on the Length Proportion

No Action and With Action Fuel Efficiency estimated based on data provided in the "Verified Statement of Michael R. Baranowski" (No Action- 971 ton-miles/gal; With Action- 1024 ton-miles/gal)

Table K.7-5. Rail Segment Analysis- Acquisition-Related Criteria Pollutant Emissions by Subsegment

Notes:

Segment Ton-Mileage provided by Applicants; Sub Segment ton-mileage proportioned from whole segment based on the Length Proportion

No Action and With Action Fuel Efficiency estimated based on data provided in the "Verified Statement of Michael R. Baranowski" (No Action- 971 ton-miles/gal; With Action- 1024 ton-miles/gal)

Table K.7-6. Rail Segment Analysis- No Action HAPs Emissions by Subsegment

					Segment Tons per Mile		Sub-Segment Ton Miles		Sub-Segment Fuel Use		No Action Emissions (tons/year)

Notes:

Segment Ton-Mileage provided by Applicants; Sub Segment ton-mileage proportioned from whole segment based on the Length Proportion

No Action and With Action Fuel Efficiency estimated based on data provided in the "Verified Statement of Michael R. Baranowski" (No Action- 971 ton-miles/gal; With Action- 1024 ton-miles/gal)

Table K.7-7. Rail Segment Analysis- Proposed Acquisition HAPs Emissions by Subsegment

					Segment Tons per Mile		Sub-Segment Ton Miles		Sub-Segment Fuel Use		Proposed Acquisition Emissions (tons/year)

Notes:

Segment Ton-Mileage provided by Applicants; Sub Segment ton-mileage proportioned from whole segment based on the Length Proportion

No Action and With Action Fuel Efficiency estimated based on data provided in the "Verified Statement of Michael R. Baranowski" (No Action- 971 ton-miles/gal; With Action- 1024 ton-miles/gal)

Table K.7-8. Rail Segment Analysis- Acquisition-Related HAPs Emissions by Subsegment

					Segment Tons per Mile		Sub-Segment Ton Miles		Sub-Segment Fuel Use		Acquisition-Related Emissions (tons/year)

Source Criteria Pollutants: "Emission Factors for Locomotives"- EPA 2009
Source GHG: "Emission Factors for Greenhouse Gas Inventories" - EPA, April 2021
Source HAPs: 2017 EPA National Emissions Inventory, "2017Rail_HAP_AugmentationProfileAssignmentFactors_20200128.xlsx".
Notes:

Tier Mix Provided by Applicants for Locomotive fleet
SO_2 factor based on 15 ppm diesel fuel, using calculation from "Emission Factors for Locomotives-EPA2009"
CO_2, CH_4 and N_2O factors from "Emission Factors for Greenhouse Gas Inventories" - EPA, April 2021 HAPs speciation for locomotives from 2017 NEI applied to VOC and $PM_{2.5}$ emission rates, as appropriate.

K.8 Rail Yard Analysis

OEA conducted an analysis of the emissions changes from rail yards that would meet or exceed the Board's thresholds for environmental analysis. The Applicants provided the four yards that exceeded the Board's analysis thresholds. The analysis considered changes in emissions associated with railcar switching. According to the Applicants, block swapping associated with the four yards are unrelated to yard activity and primarily occur outside of the yard boundaries. Block swapping activities are accounted for in the gross tonnage estimates of the Rail Line Segment analysis and block swap cars are included in the car handling counts in the Railcar Switching analysis. For this reason, OEA accounted for block swapping in these analyses rather than separating it out into its own analysis. OEA obtained nonattainment area boundaries from EPA (EPA 2021b). There were four rail yards facilities in an ozone nonattainment area and one in a particulate matter maintenance area. The Applicants provided No-Action Alternative and Proposed Acquisition rail cars processed per day for each yard. OEA grouped yards by county to create a county-level emissions inventory. OEA calculated the difference between the Proposed Acquisition and No-Action inventories to determine the Proposed Acquisition-related emissions.

K.8.1 Railcar Switching Analysis

Emissions from railcar switching are associated with switch locomotives moving railcars around the yard. OEA estimated daily switch engine operating hours by combining the No-Action Alternative and Proposed Acquisition daily railcars processed at each yard by the average switching efficiency of a switch locomotive provided by the Applicants. OEA analyzed and converted daily switch operating hours to fuel usage using a weighted average fuel consumption rate for switch locomotives provided by the Applicants. OEA obtained emission factors for calculating switch emissions using EPA methodology for NO_X, VOC, PM_{10}, $PM_{2.5}$, SO_2, CO, and CO_2 (EPA 2009). OEA estimated HAPs emission rates by applying speciation profiles to the VOC or PM emission rates (EPA 2021c). The Applicants provided the mix of emissions tier standards for the switch fleet. OEA used this mix to create composite fleet wide emission factors by pollutant for the railcar switching analysis. OEA derived emission factors into a grams per gallon format using the EPA provided conversion factor from brake horsepower-hours to gallons (EPA 2009). OEA combined the above No-Action Alternative and Proposed Acquisition fuel usages with the emission factors to calculate the emissions inventory for each yard.

Table K.8-1 and **Table K.8-2** summarize the rail yard analysis. **Table K.8-3** and **Table K.8-4** show the switching activity analysis by yard. **Table K.8-5** shows the switch locomotive emissions factors.

HAPs speciation for locomotives from 2017 NEI applied to VOC and $PM_{2.5}$ emission rates, as appropriate.

K.9 Intermodal Facility Analysis

OEA conducted an analysis of the emissions changes from the intermodal facilities that would meet or exceed the Board's thresholds for environmental analysis. The Applicants identified the six intermodal facilities that exceeded the Board's analysis thresholds. The analysis considered changes in emissions associated with the three primary intermodal facility activities: on the road trucks, lift equipment, and yard trucks. Switch locomotive activity at intermodal facilities is typically minimal as freight is moved around by lift equipment. OEA obtained nonattainment area boundaries from EPA (EPA 2021b). There were four intermodal facilities in an ozone nonattainment area and one in a particulate matter maintenance area. The Applicants provided No-Action Alternative and Proposed Acquisition origin/destination lifts per day, switch lifts per day, and on the road trucks per day for each intermodal facility by the Applicants.

OEA summed on-the-road truck, lift equipment, and yard truck emissions to get total intermodal facility emissions. OEA grouped intermodal facilities by county to create a county-level emissions inventory. OEA calculated the difference between the Proposed Acquisition and No-Action inventories to determine the Proposed Acquisition-related emissions. The following further explains each analysis.

K.9.1 On-the-Road Truck Analysis

Emissions from on-the-road trucks at intermodal facilities are associated with trucks accessing the facility to drop off and/or pick up freight containers. Emissions are primarily due to engine idling while trucks wait in queues to enter or exit the facility and within the facility waiting for their freight to be loaded or unloaded. The Applicants provided the No-Action and Proposed Acquisition on-the-road trucks per day for each facility. OEA annualized these values based on the current operating schedule for each facility. OEA assumed that trucks spend on average 34 minutes idling within the facility based on previous intermodal facility studies (Lindheim 2008 and Souten 2006). OEA used this value to estimate the annual operating hours of the trucks within the facility. OEA combined annual operating hours of the trucks with truck emission factors. OEA derived emission factors for the on-the-road trucks using EPA's Motor Vehicle Emissions Simulator (MOVES3) model (EPA 2022). OEA ran the MOVES3 model for the counties where the intermodal facilities are located using model default inputs. The emission factors represent long haul combination trucks at idle in a grams per hour format. OEA combined the resulting emission factors and operating hours to create an emissions inventory for each intermodal facility related to on-the-road truck activity.

K.9.2 Lift Equipment Analysis

Emissions from lift equipment at intermodal facilities are associated with aerial lifts or forklifts moving freight on and off trains and trucks. The Applicants provided the No-Action and Proposed Acquisition origin/destination lifts per day and switch lifts per day. In addition to origin/destination lifts and switch lifts, other lifts may occur to move freight

around storage areas or between trucks and storage areas. The combination of all lifts is referred to as "total lifts." OEA assumed that for every origin/destination lift and switch lift, an average of 2.14 total lifts would occur based on previous studies of primary and secondary lifts at intermodal facilities (Stewart 2003 and STB 1998). OEA converted total lifts to annual operating hours by dividing by the average lifts per hour and multiplying by the annual operating days. OEA derived the average lifts per hour at each facility based on current handling data presented in the Applicants' application (contained in the Operating Plan). OEA based the annual operating days on the current operating schedules for each facility. OEA estimated Emission Factors for the lift equipment using the Nonroad module within the MOVES3 model (EPA 2022). OEA ran the MOVES3 model for the counties where the intermodal facilities are located using model default inputs. OEA assumed equipment size and age correspond to the model's default population data. OEA assumed all equipment operate on diesel fuel. The emission factors represent aerial lift and forklift equipment in a grams per hour format. OEA conducted a review of aerial imagery to determine if the six intermodal facilities were operating lift gantries. If a facility did not operate gantries, OEA used forklift emission factors to estimate lift equipment emissions. OEA combined the resulting emission factors with load factors and operating hours to create an emission inventory for each intermodal facility related to lift equipment activity (EPA 2010).

K.9.3 Yard Truck Analysis

Emissions from yard trucks at intermodal facilities are associated with on-site trucks moving freight around the yard. The Applicants provided the No-Action and Proposed Acquisition origin/destination lifts per day and switch lifts per day. OEA assumed that for every origin/destination lift and switch lift, on average 1.2-yard truck movements would occur based on previous intermodal facility studies (Lindheim 2008). OEA converted truck movements to annual operating hours by dividing by the number of truck movements per hour and multiplying by the annual operating days. OEA assumed the average truck movements per hour to be 4.5 on average, estimated based on yard work and rail work completed in an 8-hour shift in an emissions study for the Port of Long Beach and Los Angeles (Port of LA 2017). OEA based the annual operating days on the current operating schedule for each facility. OEA derived Emission Factors for the yard trucks using the Nonroad module within the MOVES3 model (EPA 2022). OEA ran the MOVES3 model for the counties where the intermodal facilities are located using model default inputs. OEA assumed equipment size and age correspond to the model's default population data. OEA assumed all equipment operate on diesel fuel. The emission factors represent yard trucks in a grams per hour format. OEA combined the resulting emission factors with load factors and operating hours to create an emission inventory for each intermodal facility related to yard truck activity (EPA 2010).

Table K.9-1 and **Table K.9-2** summarize the intermodal facility analysis. **Table K.9-3** and **Table K.9-4** show the emissions analysis for on-the-road trucks. **Table K.9-5** and **Table K.9-6** show the emissions analysis for lift equipment. **Table K.9-7** and **Table K.9-8** show the emissions analysis for yard trucks. **Table K.9-9** shows the on-road emissions factors. **Table K.9-10** shows the nonroad emissions factors.

Source: Calculated using Nonroad Emissions Model in MOVES3

Emission Factor Notes:

Uses model defaults for each county

Assumes January operations for conservative factors

Load Factors sourced from "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" EPA, 2010, EPA-420-R-10-016

Default Equipment Populations used to estimate hourly factors

N_2O not provided in Nonroad, Estimated using ratio between CH_4/N_2O emission factors based on EPA's "Emission Factors for GHG Inventories" for diesel fuel

K.10 Grade Crossing Analysis

OEA conducted an analysis of the emissions changes from vehicles idling at grade crossings on rail line segments that would meet or exceed the Board's thresholds for environmental analysis. OEA estimated average vehicle delay and vehicles delayed per day in the Grade Crossing analysis in **Appendix H** for grade crossings that met the analysis thresholds. OEA combined and annualized these values to determine the total annual hours of delay at each grade crossing. OEA derived emission factors for a representative vehicle type mix using EPA's Motor Vehicle Emissions Simulator (MOVES3) model (EPA 2022). OEA ran the MOVES3 model to establish a set of representative emission factors for the counties where grade crossing delays occur using model default inputs. The emission factors represent idling vehicles on a rural unrestricted road in a grams per hour format. OEA combined the resulting emission factors and delay data to create an emissions inventory for grade crossings. OEA grouped grade crossings by county to create a county-level emissions inventory. OEA calculated the difference between the Proposed Acquisition and No-Action inventories to determine the Proposed Acquisition-related emissions.

Table K.10-1 and **Table K.10-2** summarize the grade crossing analysis. **Table K.10-3** through **Table K.10-8** show the estimated emissions by crossing. **Table K.10-9** shows the on-road emissions factors.

Note:

Vehicles Delayed and Average Delay provided from the transportation study

Table K.10-9. Grade Crossing Analysis – On-road Vehicle Emission Factors

Roadway Idling Emission Factors (g/hr)

	NOX	VOC	PM10	PM2.5	SO2	CO	CO2	CH4	N2O	Acetaldehyde	Acrolein	Benzene	1,3-Butadiene	Ethyl Benzene	Formaldehyde	Napthalene	POM
2027	5.67	1.29	0.08	0.07	0.03	23.44	4997.9	0.65	0.06	1.4E-02	1.3E-03	1.5E-02	6.0E-04	2.0E-02	2.0E-02	8.0E-04	2.1E-05

Source: MOVES 3

Notes:

State-Level Default Scale with Default Inputs except Average Speed Distribution set to SpeedBin 1
Represents an average of emission factors for all 24 hours and 12 months for weekday
All eight States with an analyzed grade crossing included
All Vehicle and Fuel types included
Rural and Urban Unrestricited Access Roadways included

K.11 Truck-to-Rail Diversion Analysis

OEA conducted an analysis of the emissions changes associated with truck-to-rail diversions that would result from the Proposed Acquisition. OEA estimated anticipated truck activity reduction in vehicle miles traveled (VMT) due to the Proposed Acquisition in *Section 3.4.1*. OEA derived Emission Factors for the on-the-road trucks using EPA's MOVES3 model (EPA 2022). OEA ran the MOVES3 model to establish a set of representative emission factors for all states where VMT reduction is expected using model default inputs. The emission factors represent long haul combination trucks traveling default speed distributions for rural and urban restricted roadways in a grams per mile format. OEA combined the resulting emission factors and VMT data to create an emission inventory for system-wide truck-to-rail diversions.

Table K.11-1 and **Table K.11-2** summarize the truck-to-rail diversion analysis. **Table K.11-3** shows the on-road emissions factors.

Truck VMT Reduction provided from the transportation study

Table K.11-3. Truck to Rail Diversion Analysis- On-road Truck Emission Factors

On Road Truck Emission Factors (g/mi)

States Represented	Vehicle	Nox	VOC	PM10	PM25	SO2	CO	CO2	CH4	N2O	Energy
24 States	Combo Long Haul	2.397	0.078	0.089	0.042	0.005	1.777	1416.183	0.167	0.002	0.018

States Represented	Vehicle	Acetaldehyde	Acrolein	Benzene	1,3-Butadiene	Ethyl Benzene	Formaldehyde	Napthalene	POM
24 States	Combo Long Haul	3.8E-03	3.2E-04	1.6E-04	4.8E-05	6.7E-04	4.1E-03	1.0E-04	2.6E-06

Source: Calculated using MOVES3

Emission Factor Assumptions:

State-Level Default Scale with Default Inputs
Represents an average of emission factors for all 24 hours and 12 months for weekday
All 24 States with anticipated truck diversions included
Diesel Long-Haul Combination Trucks Included
Rural and Urban Restricted Access Roadways included

K.12 Capital Improvements Analysis

The Proposed Acquisition would not require any construction, as the CP and KCS networks already connect in Kansas City. However, the Applicants expect planned capital improvements resulting from the Proposed Acquisition, due to increased traffic on the combined network. OEA expects these planned capital improvements to result in construction of new and extended sidings, a new double track section, and new working track. Because this work is planned within existing rights of way, it does not qualify as jurisdictional rail line construction. In total, there are 25 planned capital improvement sites.

OEA evaluated emissions associated with the construction of these planned capital improvements. The planned capital improvements analysis estimated the potential duration of construction at each site based on the distance of track work and industry standard production rates. Durations were estimated to range between 1 and 18 days for each site. Exact construction dates of the projects are not known because the planned capital improvements would be built as needed based on increasing traffic. OEA estimated emissions assuming an analysis of year of 2027. Since all sites have relatively short construction durations, OEA assumed all emissions to occur within the same year. Emissions from both nonroad equipment and fugitive dust have been quantified for the planned capital improvements analysis as described in the following sections. Equipment and fugitive dust emissions were summed for each site by county to create a county-level emissions inventory associated with the planned capital improvements.

K.12.1 Equipment Emissions

OEA quantified estimated emissions from nonroad equipment at each site based on the list of assumed equipment necessary to complete the new and extended track work (see planned capital improvements description in *Chapter 2*, *Section 2.3.2*). Equipment expected to be used in the track work are front end loaders, dump trucks, compactor, road grader, thermite welder, crane, rail tensor and rail tamper. OEA derived emission factors for the equipment using the Nonroad module within the MOVES3 model (EPA 2022). OEA ran the MOVES3 model for the counties where the planned capital improvements are located using model default inputs. OEA assumed equipment size and age correspond to the model's default population data. OEA assumed all equipment operate on diesel fuel. OEA then aggregated model outputs on a state-level and applied to the individual planned capital improvement sites. OEA estimated hours of equipment operation assuming an eight-hour workday and using the durations derived for each site. OEA combined these operating hours with emission factors and load factors to estimate equipment emissions.

K.12.2 Fugitive Dust Emissions

OEA quantified fugitive dust emissions associated with the planned capital improvements from general site work and earthwork. Fugitive dust emissions are emissions of the criteria pollutant particulate matter. OEA referenced emission factors from "WRAP Fugitive Dust Handbook" for construction emissions and corresponding earthwork emissions (WGA

2006). Per the guidance, OEA quantified fugitive dust emissions based on the hours of general construction and earthwork. OEA assumed general construction hours to be all the operating hours associated with construction at each site. OEA assumed earthwork hours to be 59 percent of the general construction hours based on the compactor and grader load factors. OEA assumed $PM_{2.5}$ emissions to be 10 percent of the PM_{10} emissions as described by the guidance. OEA assumed no control measures.

Table K.12-1 and **Table K.12-2** summarize the construction analysis. **Table K.12-3** and **Table K.12-4** show the estimated emissions from non-road equipment. **Table K.12-5** shows the estimated emissions from fugitive dust.

Notes:

Work Hours estimated based on the distance of track work and industry standard production rates.
Assumed equipment necessary to complete the new and extended track work
Emission Factors were derived for the equipment using the Nonroad module within the MOVES
Nonroad run for 2027 Analysis
Assumes Default Inputs and Population Data
Accounts for all counties and months of year. Emission factors average to create statewide values for use in the analysis.
Load Factors sourced from "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" EPA, 2010, EPA-420-R-10-016 N2O
not provided in Nonroad, Estimated using ratio between CH_4/N_2O emission factors based on EPA's "Emission Factors for GHG Inventories" for diesel fuel

Table K.12-4. Construction Analysis- Equipment Emissions HAPs

					Days of Construction	Total Op Hours	Load	Quantity	State and SCC Code	HAPs Emission Factors (g/hr)								Construction Emissions (tons/year)

Notes:

Work Hours estimated based on the distance of track work and industry standard production rates.
Assumed equipment necessary to complete the new and extended track work
Emission Factors were derived for the equipment using the Nonroad module within the MOVES
Nonroad run for 2027 Analysis
Assumes Default Inputs and Population Data
Accounts for all counties and months of year. Emission factors average to create statewide values for use in the analysis.
Load Factors sourced from "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" EPA, 2010, EPA-420-R-10-016 N2O
not provided in Nonroad, Estimated using ratio between CH_4/N_2O emission factors based on EPA's "Emission Factors for GHG Inventories" for diesel fuel

Table K.12-5. Construction Analysis- Fugitive Dust Emissions

Appendix L

Hazardous Material Release Sites

This appendix provides technical information on the approach used in the analysis of hazardous material release sites (*Chapter 3, Section 3.10*).

L.1 Approach to Analyzing Hazardous Material Release Sites

OEA used the following methods to identify hazardous materials release sites and evaluate each site's potential to affect or be affected by the planned capital improvements related to the Proposed Acquisition of KCS by CP. The study area for hazardous material release sites includes the estimated footprint of each planned capital improvement, plus a 500-foot buffer. OEA identified hazardous material release sites within the study area and within the footprint. OEA also determined if contamination from surrounding properties could migrate (for example, via groundwater) into a planned capital improvement footprint.

In order to search for documented spills and releases of hazardous materials, OEA obtained environmental database reports from Environmental Data Resources, Inc. (EDR) to identify environmental database listings (including hazardous materials release sites) within the study area. The database reports included database listings from federal and state environmental databases, such as reports of spills/releases and hazardous waste generators, similar to those listed in *ASTM Standard 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. The databases that OEA searched as part of this analysis are described below.

L.1.1 Federal Environmental Databases:

- **Federal National Priorities List (NPL, Superfund) Sites:** Operated by the U.S. Environmental Protection Agency (EPA) as an inventory of hazardous materials sites that have been reported to the federal government and determined to be a priority for a federal cleanup.
- **Superfund Enterprise Management System (SEMS) Sites:** Operated by the EPA as an inventory of potential hazardous materials sites that have been reported to the federal government by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act.
- **Resource Conservation and Recovery Act (RCRA) (40 C.F.R. § 30.16) Corrective Action (CORRACTS):** Operated by the EPA as an inventory of hazardous waste

treatment, storage, and disposal facilities requiring federal oversight and which have corrective action activity.

- **RCRA Generator Sites:** Operated by the EPA as an inventory of hazardous waste generators that store hazardous waste. This includes RCRA Large Quantity Generators (RCRA-LQG), RCRA Small Quantity Generators (RCRA-SQG), RCRA Treatment, Storage, and Disposal, and RCRA Very Small Quantity Generators (RCRA-VSQG).
- **Engineering/Institutional Control Sites:** Operated by EPA to provide information on sites with Activity and Use Limitations (AULs), which establish limits and conditions of the future use of a contaminated property.
- **Emergency Release Notification System (ERNS):** Operated by the EPA as an inventory of hazardous materials or petroleum spills.

L.1.2 State and Tribal Environmental Databases:

- **State and Tribal Equivalent SEMS Sites:** Provides information on releases of hazardous materials that have been reported to a state agency.
- **IA ALLSITES:** Provides a list of all the properties listed in the Contaminated Sites Tracking Database specific to Iowa.
- **Landfill or Solid Waste Disposal Sites:** Provides information of active and closed solid waste landfills.
- **Leaking Storage Tank Sites:** Provides information of leaking aboveground storage tanks or leaking underground storage tanks.
- **Registered Storage Tank Sites:** Aboveground storage tank (AST) and underground storage tank (UST) database. Provides a list of all properties with a registered AST or UST.
- **Engineering/Institutional Control Sites:** Provides information of sites with AULs and Environmental Covenants, which establish limits and conditions of the future use of a contaminated property.
- **Voluntary Cleanup Program (VCP) Sites:** Provides information on properties that are listed in a state-level VCP, which allows interested parties to expedite the assessment and remediation of hazardous materials.
- **Brownfield Sites:** Provides information on properties that have been registered for state-level funding to assist in the cleanup of the property.

L.2 Refining Environmental Listings

OEA used the environmental databases to identify environmental listings within the study areas. OEA further assessed these listings to refine the locations of the hazardous material release sites within the study area for each respective planned capital improvement. OEA used the following process for refining the listings:

- The location of environmental listings obtained from EDR are subject to inaccuracies. Therefore, OEA verified environmental database listings provided by EDR using aerial

imagery and available state documentation. In the event that minimal documentation was available, locations were approximated based on available information.

- If OEA determined that an environmental listing was located within the study area, OEA researched the listing further by identifying online files (if available) pertaining to that listing. For example, for state-listed documented releases/spills, the spill reports were located on the respective state's environmental program website and downloaded for review.

After locating hazardous material release sites and rail incidents within the study areas, OEA considered the impacts of potential construction activities related to each planned capital improvement. OEA assessed each hazardous material release site or rail incident for its potential to impact soil or groundwater near the planned capital improvement based on the proximity, regulatory status, and presence of land use restrictions, such as Environmental Covenants or Activity and Use Limitations. OEA identified hazardous material release sites that required further evaluation based on the following criteria:

- Spills or releases of hazardous materials were not evaluated further and were considered unlikely to impact environmental conditions (such as, soil or groundwater) at the planned capital improvement location if the spills or releases were located within the study area but outside the estimated construction footprint; received a "No Further Action" determination by the applicable state agency; and the affected property was not subjected to environmental land use restrictions.
- Environmental listings in the state Registered Storage Tank sites databases (such as AST or UST databases) or federal RCRA Generator Sites databases (such as RCRA-SQG, RCRA-VSQG, RCRA-LQG) were determined unlikely to impact environmental conditions at a planned capital improvement if no known releases or violations were documented. Therefore, these listings were not further evaluated.

L.3 Identifying Hazardous Materials Incidents

In addition to the process noted above, OEA conducted a review of the Federal Railroad Administration's (FRA) database of train collision reports and incidents for the Pipeline and Hazardous Materials Safety Administration (PHMSA) to identify incidents within the planned capital improvement involving hazardous materials and waste. Incidents were identified and evaluated only if environmental media (such as soil, groundwater, sediment) were affected by a spill or release of hazardous materials. OEA used mile marker information of the planned capital improvement projects to determine the locations of rail incidents relative to the planned capital improvement projects.

L.3.1 Hazardous Materials Release Sites: Potential Environmental Consequences of the Proposed Acquisition

If the Board authorizes the Proposed Acquisition, the Applicants intend to make certain planned capital improvements within the existing railroad right-of-way (ROW). Because the Applicants would make the planned capital improvements as needed to support future rail traffic, the Applicants have not yet completed engineering and design for the planned

capital improvements and would not complete engineering and design until after the environmental review process for the Proposed Acquisition is complete. Therefore, the details and timing of construction activities are not known. However, OEA assumes that construction of the planned capital improvements would involve ground-disturbing activities that could encounter hazardous materials if such materials are present.

Based on the criteria described above, OEA concluded that four planned capital improvements have the potential to impact or be impacted by environmental listings located within the study area. The evaluation for these environmental listings, organized by each respective planned capital improvement, is provided below.

L.3.1.1 Camanche Siding Extension – Clinton, Iowa

According to the database report, one property with environmental listings was identified immediately adjacent to and partially within the planned siding extension near Camanche, Iowa. A detailed map of this area can be found in **Figure L.3-1**. An evaluation of the property is below:

- Archer Daniels Midland (ADM) Corn Processing Facility Industrial Waste Landfill, 1251 Beaver Channel Parkway: The property is a permitted industrial landfill that receives waste generated from the ADM Corn Processing Facility located at 1251 Beaver Channel Parkway. The property has accepted various wastes including metals, solvents, and ignitable and corrosive wastes since at least 1995.
- The solid residues disposed of at the landfill include bottom ash, fly ash, river mud, and rubble. Although the landfill has been closed since at least 2000, groundwater, gas, and leachate monitoring at the landfill are ongoing. According to documentation from the Iowa Department of Natural Resources, the existing waste boundary of the landfill is located beneath a portion of the railroad tracks within the proposed Camanche siding location. Although it is unlikely that landfill waste was deposited beneath the railroad tracks, the Iowa Department of Natural Resources indicated that fill material used in the vicinity and beneath the tracks may be indistinguishable from landfill waste.

The planned siding extension would be located within the documented limits of the ADM Corn Processing Facility Industrial Waste Landfill; however, landfill debris is unlikely located beneath the proposed siding location. Subsurface construction activities, if any, could potentially encounter solid waste, debris, and contaminated soils.

OEA identified four additional environmental listings associated with a different property located within the study area for the Camanche siding extension. The evaluation of the environmental listings is provided below.

- Alliant Energy Generating Station, 2001 Beaver Channel Parkway, abutting the planned siding location to the north: The property was the location of the Interstate Power and Light Company power plant, which generated various wastes including metals, ignitable wastes, and spent halogenated and nonhalogenated solvents associated with degreasing agents. The property managed coal combustion residuals generated at the Interstate Power and Light Company plant. Coal combustion residue consisting primarily of fly ash could not be sent to a dry ash silo; and therefore, were sluiced to an ash pond at the

property. The power plant switched to natural gas in mid-2015 and was retired in 2018 (EIA 2022). In November 2016, a Closure Permit Application was submitted for the landfill proposing to leave coal ash residuals in place. No additional documentation regarding the closure of the landfill was obtained; however, the closure was reportedly scheduled to be conducted in 2017.

- Four listings in the ERNS database are associated with the Alliant Energy Generating Station. In August 1990, an overfilling incident caused the release of 700 gallons of sulfuric acid. In January 1999, a continuous release was discovered; the leak caused a release of approximately 29.2 tons of hydrofluoric acid over the course of one year. In March 1995, tank corrosion caused the release of 100 gallons of sulfuric acid. In June 2010, the potential release of approximately 15 gallons of lubricating oil to the Mississippi River was reported.

Based on the proximity of the Alliant Energy Generating Station to the estimated construction footprint of the Camanche planned capital improvement, there is potential for contamination associated with coal sluicing to migrate into the construction footprint. Additionally, the releases associated with the four ERNS listings have the potential to impact soil conditions within the construction footprint.

L.3.1.2 Ottumwa Siding Extension – Wapello, Iowa

According to the available FRA and PHMSA data, at least one incident was documented that impacted environmental media within the Ottumwa planned capital improvement location. A detailed map of this area can be found in **Figure L.3-2**. A summary of this incident, Incident ID I-1985060133, is provided below:

- I-1985060133: Spillage reportedly occurred from a tank car containing acetic acid solution from a defective auxiliary valve. No additional information was obtained regarding the volume of the release or any response actions performed.

Based on the limited documentation associated with I-1985060133, residual concentrations of acetic acid may be present within the construction footprint of the Ottumwa planned capital improvement project.

L.3.1.3 Blue Valley Double-Track – Kansas City, Missouri

Ten properties with environmental listings were identified within the Blue Valley planned capital improvement study area. OEA determined that the environmental listings at three of these properties required evaluation due to their proximity to the estimated construction footprint of the planned double track. A detailed map of this area can be found in **Figure L.3-3** and **Figure L.3-4**. A summary of the evaluations is provided below.

- Kerr-McGee Chemical Corp, 2300 Oakland Avenue, abutting the planned double-track location to the west: The property formerly operated as a wood treatment facility with two impoundments containing "bottom sediment sludge from the treatment of waste-water" (Missouri Department of Natural Resources n.d.). Three Solid Waste Units associated with the impoundments and groundwater contamination are being addressed at the property under the Missouri Hazardous Waste Program. A Deed Notice has been

placed on the Solid Waste Units to prohibit future use. Assessment activities are ongoing to confirm the extent of contamination in groundwater. Based on the ongoing assessment activities at the Kerr-McGee Chemical Corp, there is potential for contaminated groundwater to migrate into the estimated construction footprint of the Blue Valley planned capital improvement project.

- Union Wire Rope, 2100 Manchester Trafficway, abutting the planned double-track location to the east: The property housed a large-scale wire and cable manufacturing company that contaminated soil and groundwater with lead and volatile organic compounds. The responsible party entered into an Administrative Order on Consent with the EPA in June 1990 and EPA oversaw the removal of the landfill at the property, which was completed by December 1992. In December 1992, the requirements of the Consent agreement were met and the property was withdrawn from the Registry of Confirmed Abandoned or Uncontrolled Hazardous Waste Disposal Sites in Missouri. Based on the presence of contaminated soil and groundwater at the property, there is potential for contaminated groundwater to migrate into the estimated construction footprint of the Blue Valley planned capital improvement project.
- Former General Motors Leeds Plant, 6817 Stadium Drive, abutting the planned double-track location to the west: The property historically operated as an automotive assembly manufacturing facility from the early 1920s until the 1990s. The Missouri Department of Natural Resources has been providing oversight of ongoing investigations since 2011, which has included soil and groundwater sampling, ground penetrating radar surveys, and test pitting. Based on the ongoing assessment activities at the former General Motors Leeds Plant, there is potential for contaminated groundwater to migrate into the construction footprint of the Blue Valley planned capital improvement project.

L.3.1.4 Laredo Siding Extension – Grundy, Missouri

According to the available FRA and PHMSA data, at least one incident, associated with Incident ID I-2003060224, was documented at the planned siding location of the planned capital improvement. A detailed map of this area can be found in **Figure L.3-5**. This incident involved the release of approximately 200 gallons of argon from a tank car within the siding location in May 2003 due to a loose valve. The valve was closed and the release was stopped. No additional response actions were performed.

L.3.1.5 Asbury Siding Extension – Jasper, Missouri

According to the database reports, one environmental listing was identified within the Asbury planned capital improvement location. A detailed map of this area can be found in **Figure L.3-6**. A summary of the environmental listing is detailed below.

- Oronogo-Duenweg Mining Belt, various locations: The Superfund site covers approximately 270 square miles of Jasper County and Newton County, Missouri and encompasses the planned Asbury siding location. The Superfund site is associated with former mining and smelting operations which contaminated soil, groundwater, and surface water with lead, zinc, and cadmium. Cleanup activities are ongoing and include the removal of mine waste associated with Operable Unit 1 and assessing the surface water and sediment contamination associated with Operable Unit 2. According to

available EPA documentation, the proposed Asbury siding is not located within an Operable Unit or within an area where mining or smelting occurred. Based on the location of the Asbury planned capital improvement project outside any Operable Units associated with the Superfund site, it is unlikely that contaminated soil or groundwater would be encountered during construction activities.

Appendix M
Noise and Vibration

M.1 Noise and Vibration

This appendix includes technical information on the noise and vibration modeling and measurements used in the analysis presented in *Section 3.5, Noise and Vibration*. This appendix includes figures presenting the noise impacts of the Proposed Acquisition and the No Action Alternative. The appendix includes maps showing the extent of the existing 65 A-weighted decibel (dBA) day-night average sound level (Ldn) contour in the study area, the 65 dBA (Ldn) contour under the Proposed Acquisition, and locations in which adverse noise impacts (65 dBA (Ldn) and a 3 dBA increase) would occur as a result of the Proposed Acquisition. It also includes figures showing the locations of the Bensenville, Schiller Park, Detroit Container Terminal, Wylie, Minneapolis, and International Freight Gateway intermodal facilities, as well as the locations of rail yards and noise sensitive receptors (receptors). Finally, this appendix also includes noise impact assessment results for the 205 cities and towns within the study area.

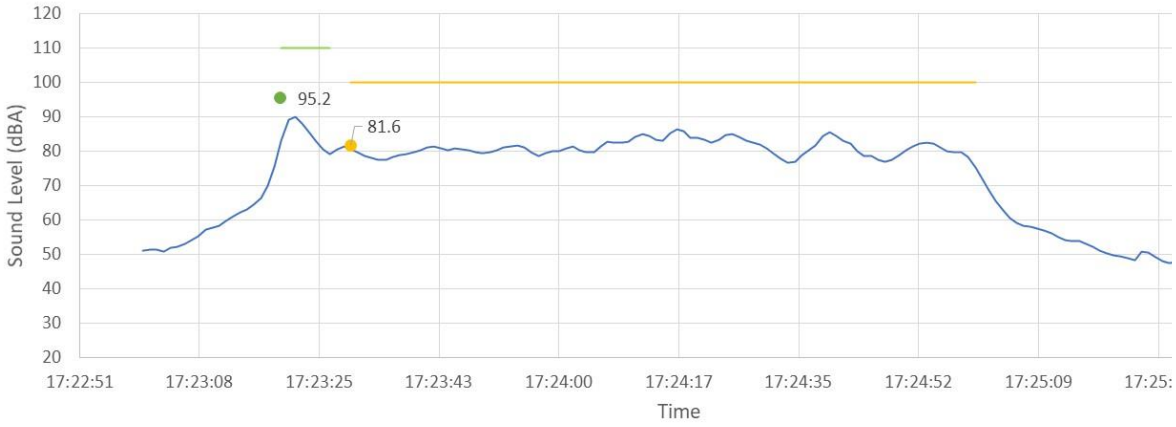
M.1.1 Sound and Vibration Measurements

OEA conducted sound level measurements of freight train operations at 10 locations, and vibration measurements at seven locations in the study area to characterize the sound and vibration emissions of CP and KCS trains. OEA conducted sound level measurements on wayside segments of track and near or at grade-crossings to determine levels with and without the train horn. OEA collected these data to supplement the broader set of data available on sound and vibration emissions of freight trains, and to evaluate actual measurements with the emissions that have been used for prior mergers (Surface Transportation Board 1997; Surface Transportation Board 2015; Surface Transportation Board 2021).

OEA conducted measurements in Davis Junction and Stillman, Illinois; Clinton, Iowa; Kansas City and Grandview, Missouri; and Shreveport, Louisiana between November 29, and December 4, 2021. OEA made observations of train speed, consist, and length for some train events; some measurements were unattended and the actual train speed, consist and lengths were not observed. OEA calculated the sound exposure level (SEL), energy average sound level (Leq), and frequency content of locomotives, railcars, and horns from the sound level measurements.

OEA used Larson Davis model LxT and model 831 sound level meters, which meet Type 1 accuracy according to the American National Standards Institute Standard S1.4, to collect sound level data. The sound level data recorded included overall A-weighted and octave-band sound levels every second. The model 831 sound level meters also collected periodic

and event-based audio recordings. OEA reviewed these recordings to aid in identifying sources of sound in the environment including freight trains. OEA calibrated the sound level meters by a laboratory whose test equipment is confirmed to provide accurate results according to the National Institute of Standards and Technology and in the field prior to and after measurements using a field calibrator.



Vibration data was collected using a Rion DA-21 digital recorder, PCB model 480 E09 power supplies, and PCB Piezotronics model 393A accelerometers. OEA recorded the vibration data as acceleration levels, integrated using digital signal processing software, and analyzed as vibration velocity levels in VdB.

The atmospheric conditions were suitable for sound and vibration measurement and did not adversely influence the measurement results. The air temperature in Davis Junction ranged from 30 to 35 degrees Fahrenheit, wind speeds were generally below 10 mph, and there was no precipitation. The air temperature in Clinton ranged from 32 to 55 degrees Fahrenheit, wind speeds were generally below 10 mph, and there was no precipitation. The air temperature in Kansas City and Grandview ranged from 40 to 71 degrees Fahrenheit, wind speeds were generally 8 mph or less, and there was no precipitation. The air temperature in Shreveport ranged from 55 to 73 degrees Fahrenheit, wind speeds were generally 10 mph or less, and there was no precipitation.

M.1.1.1 Sound Measurement Results

OEA isolated sound levels from each source by reviewing the time history of train pass-by sound levels and separating out periods of time when train horns, locomotives, or railcars were the dominant source. For example, as shown in **Figure M.1-1**, the locomotives (green portion) had an SEL of 95.2 dBA, and the railcars (yellow portion) had an Leq of 81.6 dBA.

Figure M.1-1. Freight Train Pass-By Sounds Level Time History

Source: VHB 2022

As shown in **Table M.1-1**, locomotives generated sound levels from 85 to 100 dBA (SEL), with an average of 92 dBA (SEL) depending on train speed. Horns typically ranged from 106 to 116 dBA (SEL) with an average of 108 dBA (SEL) at locations between ¼-mile and 1/8-mile from grade-crossings and 111 dBA (SEL) at the grade-crossing. Railcars ranged from 63 to 83 dBA (Leq) with an average of 75 dBA (Leq) depending on train speed. For

sound measurements conducted at distances other than 100 feet, OEA adjusted the levels to 100 feet based on a 4.5 dB per distance doubling.

Table M.1-1. Sound Measurement Results

Site	Location	Site Type	Speed (mph)	Sound Level at 100 feet (dBA), Range (Average)		
				Locomotives (SEL)	Horns (SEL)	Railcars (Leq)
M1	Davis Junction, IL Prairie Moon Drive	Wayside	40	88.6 - 95.4 (92.0)		66.0 - 69.9 (68.0)
M2	Stillman Valley, IL E Main Street	Wayside	40	90.7 - 96.7 (93.7)		74.9 - 78.6 (76.7)

Source: VHB 2022

Figure M.1-2 presents the measured locomotive sound level (SEL) versus speed. The measurements primarily reflect trains with two locomotives. The figure also shows the corresponding reference emission level of 98 dBA (SEL) for two locomotives at 40 mph. This figure shows that the measured levels were similar or slightly lower than the reference locomotive level.

Figure M.1-3 presents the measured railcar sound level (Leq) versus speed and the reference emission level of 79 dBA (Leq) for railcars at 40 mph. This figure shows that the measured levels were similar or slightly lower than the reference railcar level.

Figure M.1-4 presents the measured train horn sound level (SEL) versus distance from the crossing and the reference emission levels of 110 dBA (SEL) within 1/8-mile and 107 dBA (SEL) between 1/4 and 1/8-mile from the crossing. This figure shows that the measured levels were similar to the reference horn levels.

Figure M.1-5 presents the average measured sound level spectra for the locomotives, railcars, and train horns. Sound from the train horns is primarily in frequency bands 250-Hz and higher due to the fundamental tone of the horns. Sound from the locomotives and

railcars have relatively similar average spectra with the highest levels in the 500 to 4,000-Hz octave-bands.

Figure M.1-2. Locomotive Sound Exposure Levels at 100 Feet

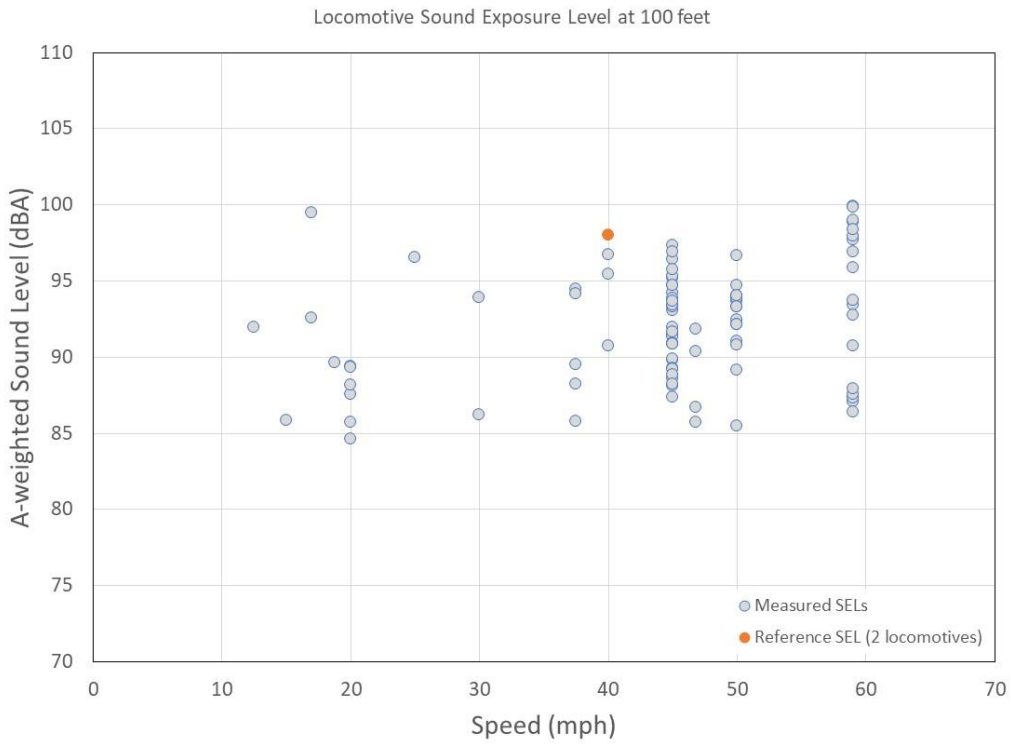

Figure M.1-3. Railcar Leq Levels at 100 feet

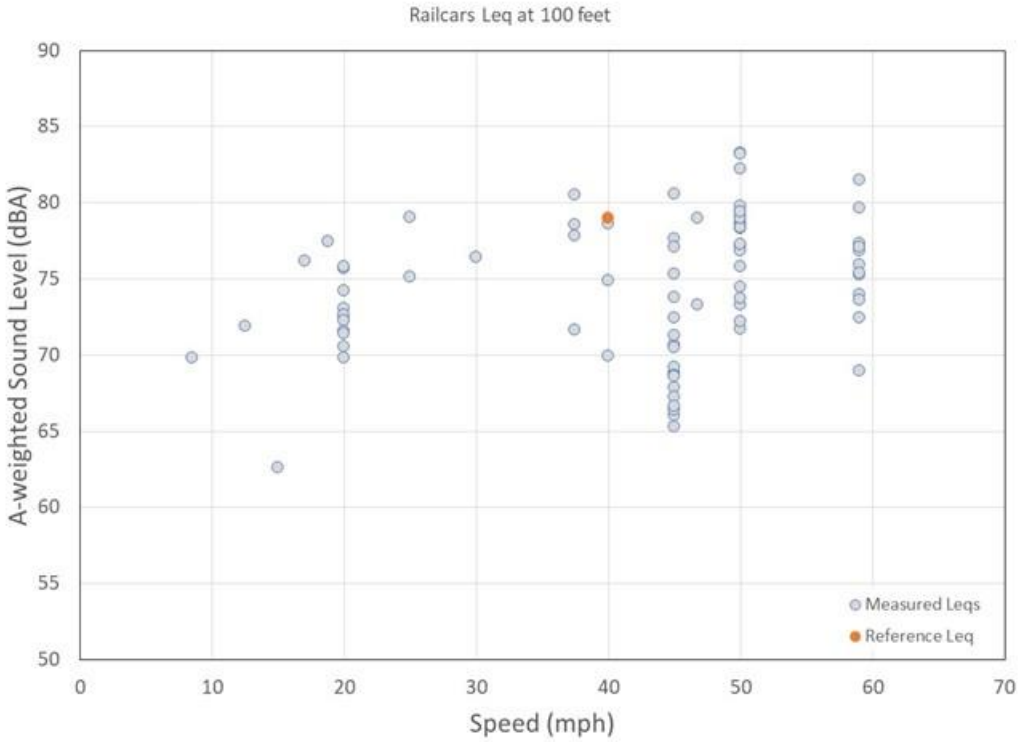

Figure M.1-4. Horn Sound Exposure Levels at 100 feet

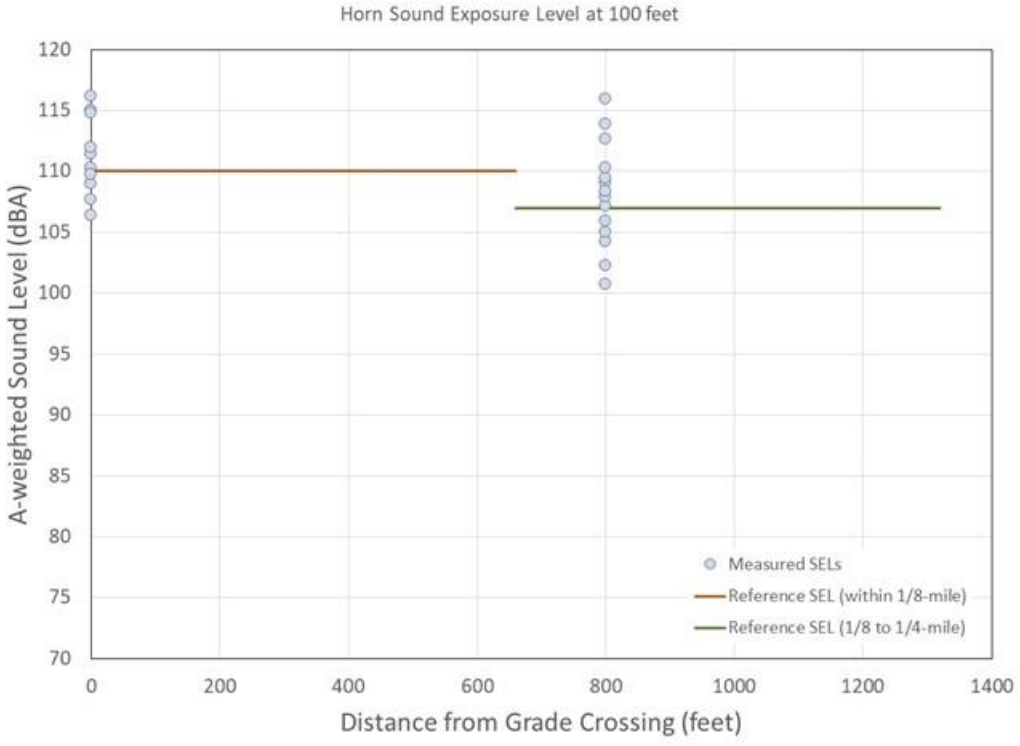

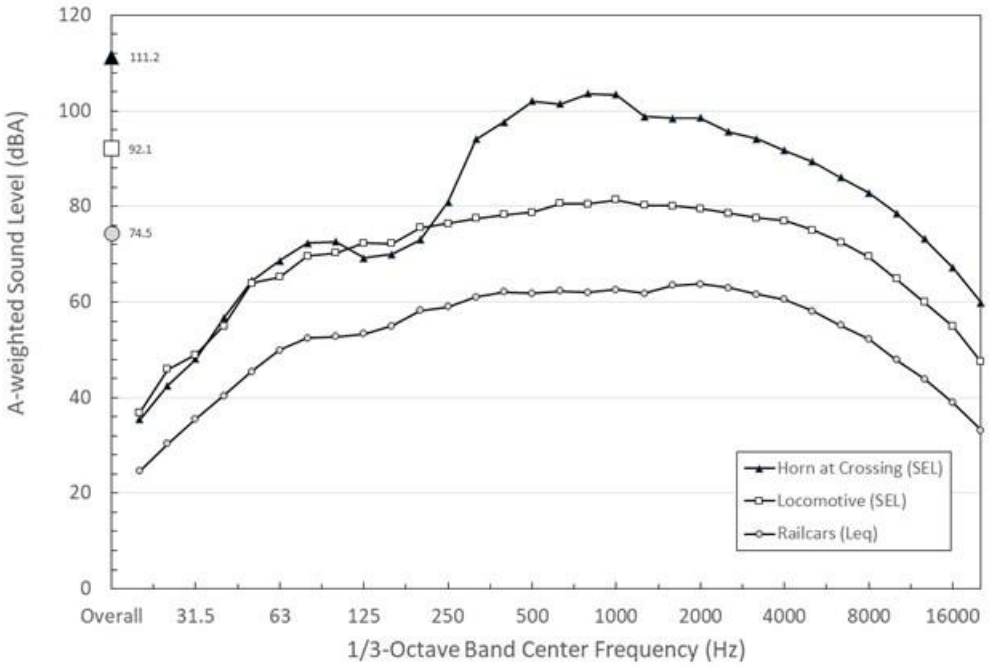

Figure M.1-5. Locomotive, Railcar, and Horn Measured Spectra

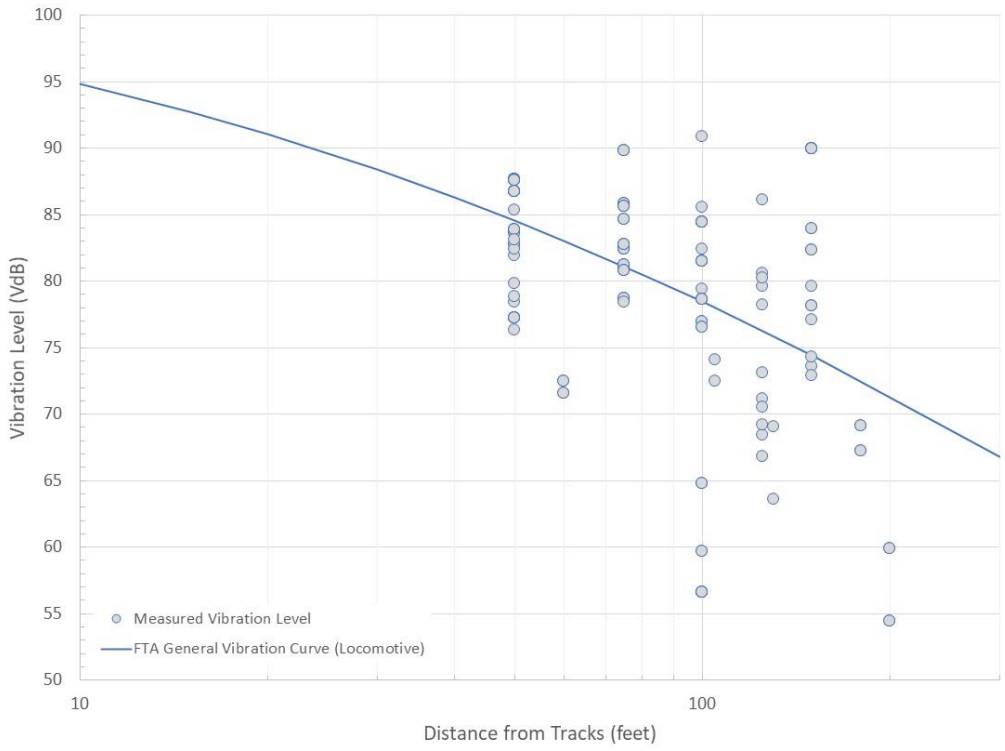
The sound level measurements of freight trains are relatively consistent with the reference emissions used for prior mergers. Since the reference levels used for prior mergers are based on a more extensive set of measurements and observations, modeling has been based on reference levels used in the Conrail (Surface Transportation Board 1997), Tongue River (Surface Transportation Board 2015), and Uinta Basin (Surface Transportation Board 2021) EISs. The reference emissions at 100 feet used include the following:

- A single locomotive at 40 mph generates sound levels of 95 dBA (SEL),
- Railcars at 40 mph generate sound levels of 82 dBA (Leq), and
- Train horns generate sound levels of 107 dBA (SEL) between 1/4 and 1/8-mile from a crossing and 110 dBA (SEL) within 1/8-mile from a crossing.

Idling locomotives are assumed to generate a sound level of 70 dBA (Leq) at 100 feet based on the EPA's Railroad Noise Emission Compliance regulation (40 C.F.R. Part 201.11(b)) for stationary locomotives built after December 1979 under idle throttle operation.



M.1.1.2 Vibration Measurement Results

OEA measured vibration levels from train pass-bys at a range of distances from 50 to 200 feet at seven measurement sites including Davis Junction, Illinois (M1), Stillman Valley, Illinois (M2), Clinton, Iowa (M3 and M4), Kansas City, Missouri (M7), and Shreveport, Louisiana (M9 and M10).

OEA separated the maximum vibration level generated by the locomotives from the vibration pass-by, similar to the method used for determining the noise level from individual sources. **Figure M.1-6** presents the maximum vibration level from the locomotives versus distance from the tracks for all measurement locations as well as the FTA general ground-borne vibration curve for freight locomotives operating at 50 mph.

This figure shows that there is a relatively broad range of vibration levels generated by the trains across the range of distances and sites. The specific reasons that vibration levels vary depend on the vibration propagation characteristics of the soil, train wheel conditions, rail conditions, and train speed. While there are similar trends with the measured vibration levels and FTA general ground vibration curves, the FTA's general curve is based on a more extensive dataset. Therefore, as discussed in the *Vibration Modeling Methodology Section* below, vibration predictions have been based on the FTA's general curve.

Figure M.1-6. Maximum Vibration Levels of Locomotives at 50 mph

M.1.2 Noise Modeling Approach

M.1.2.1 Freight Trains

Noise from the freight operations have been predicted throughout the study area using Cadna-A sound prediction software, which implements the International Standards Organization Standard (ISO) 9613-2:1996 "Acoustics — Attenuation of sound during propagation outdoors — Part 2: General method of calculation". Cadna-A is a three-dimensional model that accounts for the sound emissions of sources in octave bands, terrain, intervening objects such as buildings, ground cover, and atmospheric conditions. Noise

levels from locomotives, railcars, and horns have been modeled in octave-bands from 31.5 to 8,000 Hz.

OEA calculated noise levels (Ldn) for each segment of track at a reference distance of 100 feet using fundamental equations based on the daily train volumes, number of locomotives, train length, and speed assuming flat acoustically soft ground conditions. OEA computed noise levels for wayside track segments (without train horns), the first half of horn sounding segments (within 1/4 to 1/8-mile from the grade-crossing), and the second half of horn sounding segments (within 1/8-mile to the grade-crossing). OEA also modeled noise at proposed new track siding locations where locomotives would idle. Based on freight train emissions used in prior mergers, the sound emissions at 100 feet of a single locomotive at 40 mph is 95 dBA (SEL), railcars at 40 mph is 82 dBA (Leq), train horns are 107 dBA (SEL) between 1/4 and 1/8-mile from a crossing, train horns are 110 dBA (SEL) within 1/8-mile from a crossing, and idling locomotives are 70 dBA (Leq).

OEA used train speeds for each portion of track based on the CP U.S. East and U.S. West Timetables (March 25, 2021), the KCS System Timetable No. 15 (April 1, 2020) and the FRA grade-crossing database (January 5, 2022) for the Union Pacific (UP) Beaumont segment from Beaumont, Texas to Rosenberg, Texas and the Alliance segment from Renner, Texas to Alliance, Texas.

OEA calculated noise from freight operations at 100 feet based on the following equations as used in previous merger projects (Surface Transportation Board 2015 [Tongue River], Surface Transportation Board 2021 [Uinta]):

$$SEL_{cars} = Leq_{cars} + 10Log\left(T_{passby}\right) + 30Log(\frac{S}{S_{ref}}),$$

$$SEL_{locos} = SEL_{1\ loco\ at\ 40\ mph} + 10Log(N_{locos}) - 10Log(\frac{S}{S_{ref}}),$$

$$SEL_{trains} = 10Log(10^{\frac{SEL_{locos}}{10}} + 10^{\frac{SEL_{cars}}{10}} + 10^{\frac{SEL_{horns}}{10}}),$$

$$Ldn_{trains} = SEL_{train} + 10Log(N_d + 10N_n) - 10Log(86{,}400),$$

$$Ldn_{sidings} = Leq_{locomotive\ idling} + 10Log(T_{idle}) + 10Log(N_d + 10N_n) - 10Log(86{,}400);$$

where the SELs and Leqs correspond to each source of sound (i.e., railcars, locomotives, horns, idling locomotives at track sidings), N_{locos} is the number of locomotives per train, N_d is the number of trains during the day (7:00 a.m. to 10:00 p.m.), N_n is the number of trains during the night (10:00 p.m. to 7:00 a.m.), S is the train speed in mph, and T is the time in seconds for a train pass-by or the duration of a train idling at a siding.

Based on freight train emissions used in prior mergers, the sound emissions at 100 feet of a single locomotive at 40 mph is 95 dBA (SEL), railcars at 40 mph is 82 dBA (Leq), train horns are 107 dBA (SEL) between 1/4 and 1/8-mile from a crossing, train horns are 110 dBA (SEL) within 1/8-mile from a crossing, and idling locomotives are 70 dBA (Leq).

Cadna-A has been used to predict train noise beyond 100 feet accounting for terrain, intervening objects, ground cover, and atmospheric conditions. OEA conducted the Cadna-A calculations in a grid with 30-foot spacing at a height of five feet above ground across an area 1/2 of a mile from either side of the tracks. OEA used Digital Elevation Models with

1/3 arc-second resolution from the United States Geological Survey (USGS) in the model for terrain. OEA included buildings and structures from the Microsoft National Building Footprints dataset in the model to identify receptors. OEA categorized buildings as residences, schools, libraries, museums, places of worship, and nursing homes based on review of aerial photography, state and/or municipal zoning maps, and limited field observations.

M.1.2.2 Passenger Train Noise

OEA predicted noise levels from METRA and Amtrak passenger trains in a similar manner to freight noise, with fundamental equations being used to predict noise levels at 100 feet based on the daytime and nighttime train volumes, number of locomotives, train length, and speed assuming flat acoustically soft ground conditions. OEA then used Cadna-A to predict train noise beyond 100 feet accounting for terrain, intervening objects, ground cover, and atmospheric conditions. OEA calculated reference noise levels at 100 feet with and without train horn noise using the FTA's Noise Impact Assessment Spreadsheet (dated October 1, 2018) based on the METRA train schedule (dated July 12, 2021), Amtrak Sunset Limited train schedule (current as of January 5, 2022), METRA train speeds based on the CP US East and US West Timetables (March 25, 2021) for passenger trains, and Amtrak train speeds based on the FRA grade-crossing database (January 5, 2022).

M.1.2.3 Rail Yards and Intermodal Facilities

Noise from the intermodal facilities includes cranes for lifts and trucking operations. Noise from the rail yards includes switching engine movements that process rail cars from the departure yard to the receiving yard, and car impacts from building trains. Impact noise from coupling of railcars during the building of trains is assumed to occur once per block of railcars processed. The rail yards do not include wheel retarders which generate noise when braking railcars.

OEA modeled noise from rail yards and intermodal facilities based on methods used in previous studies (Surface Transportation Board 1997, EPA 1979, FRA 1982). The noise modeling accounts for the volume of lifts, trucking operations, rail cars processed, and the hours of operations of the rail yards and intermodal facilities. OEA calculated noise from rail yards and intermodal facilities based on the following equations:

$$Ldn_{cranes} = SEL_{cranes} + 10Log(N_d + 10N_n) - 49.4 - 10Log\left(\frac{D}{100}\right)^2 - k(D - 100),$$

$$Ldn_{trucks} = 28.2 - 15Log(\frac{D}{450}) + 10Log(\frac{N_{total}(H_d+10H_n)}{(H_d+10H_n)}),$$

$$SEL_{trains} = 10Log(10^{\frac{SEL_{locos}}{10}} + 10^{\frac{SEL_{cars}}{10}} + 10^{\frac{SEL_{horns}}{10}}) \ ,$$

$$Ldn_{intermodal\ facility} = 10Log\left(10^{\frac{Ldn_{cranes}}{10}} + 10^{\frac{Ldn_{trucks}}{10}}\right),$$

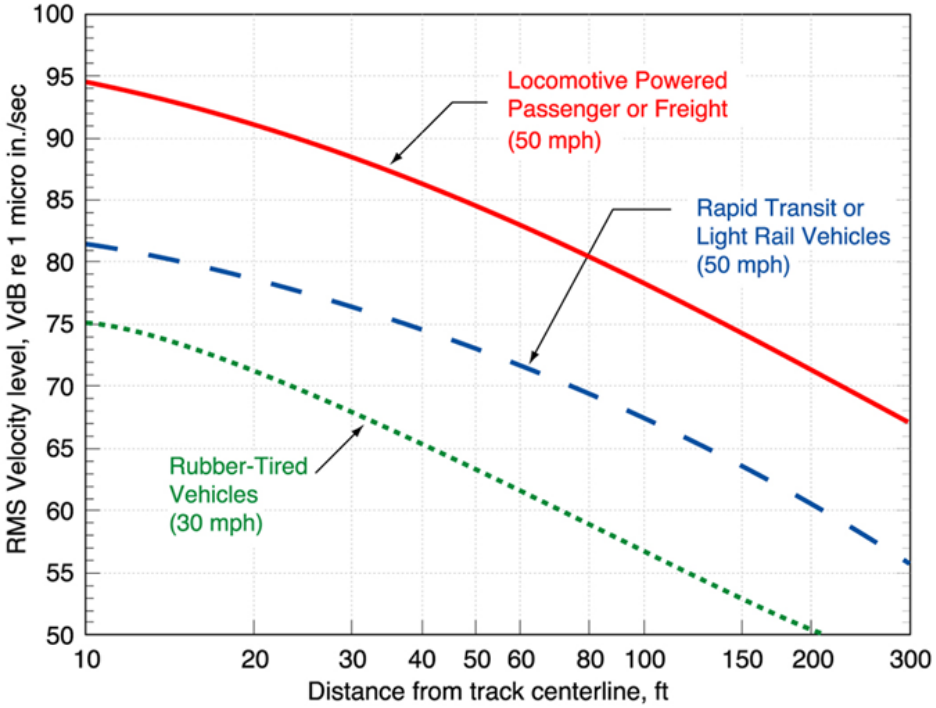
$$Ldn_{car\ impacts} = SEL_{car\ impact} + 10Log(N_d + 10N_n) - 49.4 - 10Log\left(\frac{D}{100}\right)^2 - k(D - 100),$$

$$Ldn_{engines} = SEL_{engines} + 10Log(N_d + 10N_n) - 49.4 - 10Log\left(\frac{D}{100}\right)^1 - k(D - 100),$$

$$Ldn_{rail\ yard} = 10Log\left(10^{\frac{Ldn_{car\ impacts}}{10}} + 10^{\frac{Ldn_{engines}}{10}}\right).$$

Where D is the distance from the receptor to the center of the rail yard or intermodal facility, k is the acoustical absorption (dB reduction per distance), H_d is the number of daytime hours the facility operates, and H_n is the number of nighttime hours the facility operates.

The switching engines are assumed to move 10 railcars at a time from the receiving portion of the yard to the departure portion of the yard at flat yards such as Schiller Park and 50 railcars at a time at hump yards such as the Bensenville yard. The switching engines are assumed to make two movements for each block of railcars.



M.1.3 Vibration Modeling Methodology

Trains generate ground-borne vibration from the forces of the locomotives and railcars on the track. Vibration propagates through the track structure, through the ground, into nearby buildings, and has the potential to cause human annoyance. Locomotives typically generate higher vibration levels compared to railcars due to their greater weight. The FTA has established general ground-borne vibration curves for freight locomotives and railcars (which are characterized similarly to light rail rapid transit and light rail vehicles) that provide the outdoor vibration level based on the distance from the track.

For example, as shown in **Figure M.1-7**, the outdoor vibration level is approximately 85 VdB at a distance of 50 feet from freight locomotives traveling at 50 mph. Vibration levels are reduced as it propagates to farther distances due to the attenuation from the soil and as it propagates inside buildings depending on the type of building construction. For most wood-framed buildings, interior vibration levels are 5 VdB lower than outdoor levels. Larger buildings or heavier masonry buildings generally provide additional vibration attenuation to the interior of the building. An outdoor-to-indoor building vibration attenuation of 5 VdB has been assumed for all buildings in this analysis.

Train speed also affects vibration levels. According to FTA guidelines, a doubling in speed typically corresponds to a 6 VdB difference in vibration level. For example, a train that generates 60 VdB at 50 mph would generate 54 VdB at 25 mph.

M.1.4 Noise Assessment Results by Cities and Towns

Table M.1-2 presents the number of receptors within the 65 dBA (Ldn) for the existing condition, No-Action Alternative, and Proposed Acquisition and the number of noise impacts (65 dBA (Ldn) and 3 dBA increase) within 205 cities and towns throughout the study area. Not all of the receptors are within cities and towns. Those that are not within cities and towns are in unincorporated portions of their respective counties. This table also presents a summary by state of the receptors within cities and towns. The number of receptors within cities and towns include:

- 10,125 of the 12,385 total receptors within the existing 65 dBA (Ldn),
- 19,369 of the 23,742 total receptors within the Proposed Acquisition 65 dBA (Ldn),
- 12,329 of the 15,197 total receptors within the No-Action Alternative 65 dBA (Ldn), and
- 5,158 of the 6,307 total noise impacts.

M.1.5 Noise and Vibration Figures

The following section includes figures throughout the study area presenting the existing, No-Action, and Proposed Acquisition 65 dBA (Ldn) noise contours, the noise impact contours (65 dBA (Ldn) and 3 dBA increase), and the Proposed Acquisition vibration contours. This section also includes figures of the railyards and intermodal facilities showing the closest receptor locations used in the noise impact assessment.
