A tunnel option could also be contemplated. The vertical distance below the depth of the dredged channel including the vertical depth of rail tunnel would be approximately half the height of an elevated structure and therefore have approximately half the length of approach grade. Nonetheless the water table, soil condition, the need for ventilation and potential for flooding of the tunnel make such a concept impractical. However, from an operational perspective, the effects of a high-level bridge can be

assessed by running the RTC model on a theoretical rail network with zero (0) bridge lifts. This will allow an assessment and isolation of the operational impacts based upon bridge lifts as well as the opportunity for sensitivity analysis by varying the number of bridge lifts.

A mid-level crossing with its 50 foot vertical clearance (stationary bridge) is essentially defined as being adjacent to (and along the south side of) the existing Interstate 10 crossing of the Neches River.

A low-level crossing could essentially occur at any location. However, it needs to be acknowledged that at points south of the existing river bridge additional lifts would be required as the Port of Beaumont has much river traffic that accesses the Port. At points north of the existing bridge, the same number of lifts would be required as occur at the existing river bridge. In terms of navigation distance there is a limited length between the rail bridge (Mile 19.5) and the Interstate 10 bridge (Mile 20.7). Consequently as any new river crossing is physically close to the existing bridge, it can be assumed that operationally both bridges may be open at or nearly at the same time. This in turn essentially creates a system interruption in the network similar to what occurs today.

In developing design parameters to determine potential locations for alternative alignments and bridge crossings of the Neches River, the vertical clearance over the river as a navigable waterway becomes critical. Information on vertical clearance was received from the United States Coast Guard (USCG) which states: "The existing vertical lift railroad bridge across Neches River at mile 19.5 in Beaumont has a horizontal clearance of 200 feet and a vertical clearance of 13 feet above high (underline added) water in the closed position and 145 feet above high water in the open position. The existing clearances have been adequate to date, as we have not received any complaints from waterway users. "

Copies of drawings for the Neches River rail bridge, dated 1940, were obtained from KCS. These drawings confirm a horizontal clearance of 200 feet yet state a vertical clearance of 18.32 feet above the mean low water (elevation + 2.68) in the closed position and 150 feet above the mean low water in the open position. A note on the drawings adds that elevations provided are from the KCS datum and are in feet above M.G.L., Biloxi, Miss. elevation +2.68 KCS datum equals elevation 0.00 U.S. datum. Review of the vertical clearances in the closed and open positions suggests that the "water surface reference" (elevation datum) has changed since the Neches River rail bridge was constructed. Comparison to the IH-10 bridge crossing presents similar references to mean low water for clearance and notes a 50 foot clearance at IH-10. Mean low water is designated at elevation 0.30.

Equally important to evaluating the feasibility of the physical aspects of a new river crossing is the electronic contour information used to establish existing and proposed profiles. Based upon the electronic contour files, the known junction point of the KCS and UPRR rail lines (near Tower 31) is shown at elevation 14.6. Track chart from the KCS call out an elevation of 18.0 at this point which would include the difference in datum elevation for the KCS. The water surface elevation for the Neches River is shown at elevation 0.0. Consequently for the purposes of this study, the stated vertical clearance of 50 feet for the IH-10 bridge is proposed for this conceptual design. Later on should the concepts proceed to any further design level, additional and more detailed topographic data will be collected and coordinated through the various review agencies including the U. S. Army Corps of Engineers.

At the existing Neches River rail bridge location, the navigation channel is skewed to the alignment of the railroad bridge. The skewed width of the navigation channel with an allowance for a fendering system and support piers requires center to center pier spacing greater than the 200 foot minimum horizontal navigation channel clearance. Consequently the center pier spacing was lengthened for initial investigations. In order to provide for potential future expansion, the typical bridge sections were designed to accommodate a double track section with a center to center distance of 15 feet.

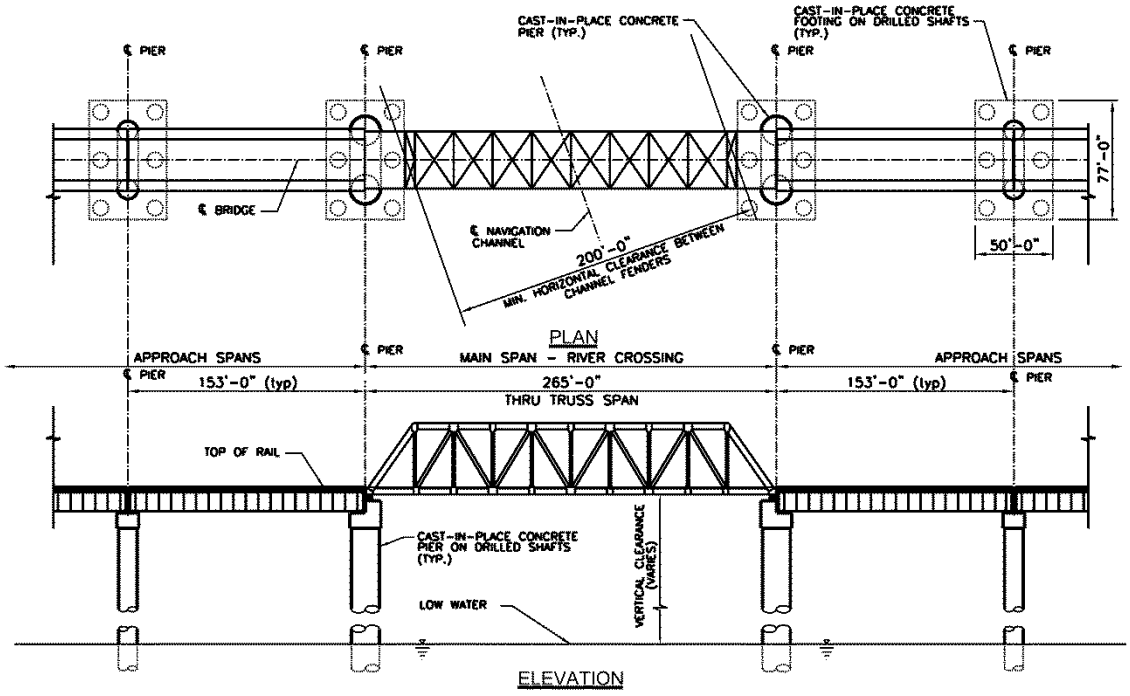
If a new alignment were to span land owned by the Port of Beaumont on both sides of the Neches River, a new roadway crossing has been requested by the Port in addition to a rail crossing. Therefore, a bridge section to accommodate both rail and highway traffic was developed. To avoid any at-grade crossing of the new rail line, the two-way vehicular roadway would be placed adjacent to the rail bridge. In the case of a lift bridge option, a separate two-way roadway lift bridge would be need to be constructed adjacent to the proposed rail bridge in order to provide a balanced typical section for the lift bridge support structure. Later in the "alternatives considered" section and eventually the "alternatives evaluated" section of this chapter, a vehicular circulation concept is illustrated (see Exhibits 2 and 3 in the Appendix) that includes a crossing of the Neches River as well as a grade separation over the KCS rail corridor connecting the two Orange County parcels of the Port of Beaumont.

Several options were considered including a stationary bridge (navigation clearance level to be determined based upon river crossing location) and a lift bridge. Again, the lift height will be dependent upon the river crossing location. In general, any point south of the existing river bridge should provide the 150 foot clearance as currently provided. Points immediately north of the existing bridge (at least to the limits of the dredged channel) should also provide the 145 foot clearance above high water. Immediately adjacent to the IH-10 bridge (approximately 1.7 navigation miles north of the KCS rail bridge), a lower clearance can be used to match the existing clearance afforded by the IH-10 structure (50 feet above mean low water). NOAA indicates the limits of the dredged channel to be approximately 0.8 navigation miles north of the existing KCS rail bridge.

Stationary Bridge

For planning purposes, the Neches River bridge as a stationary bridge would consist of a 260' – 0" double track thru truss main span, with a composite concrete deck, and 153' – 0" welded steel deck plate girder spans with a composite concrete deck for both approach spans. The main span will provide a minimum horizontal clearance of 200 ft. with 265' – 0" pier spacing to account for a skewed navigation channel. Piers for the bridge would be a cast-in-place concrete pier cap, two concrete columns, with a cast-in-place footing supported on drilled shafts. The approach spans, outside of the river floodway, would be either pre-stressed concrete modified AASHTO I girder spans or welded steel deck plate girder spans. Piers would be a cast-in-place concrete pier cap, with two concrete columns. Depending on the height of the columns; they will be either supported on a cast-in-place footing supported on drilled shafts or supported directly on drilled shafts. The span lengths and girder type could vary depending on the approach alignment, topographic and other environmental/hydraulic constraints. Illustrations of a stationary bridge with general plan and elevations as well as a typical section are shown in Figures 3.5 and 3.6.

Figure 3.5 – Stationary Bridge General Plan and Elevation



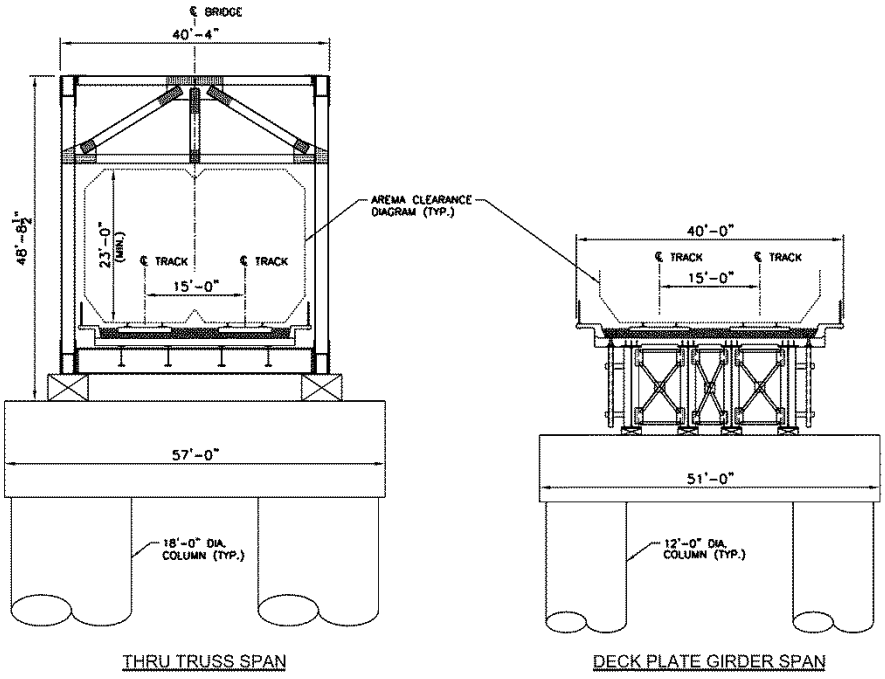


Figure 3.6 – Stationary Bridge Typical Section

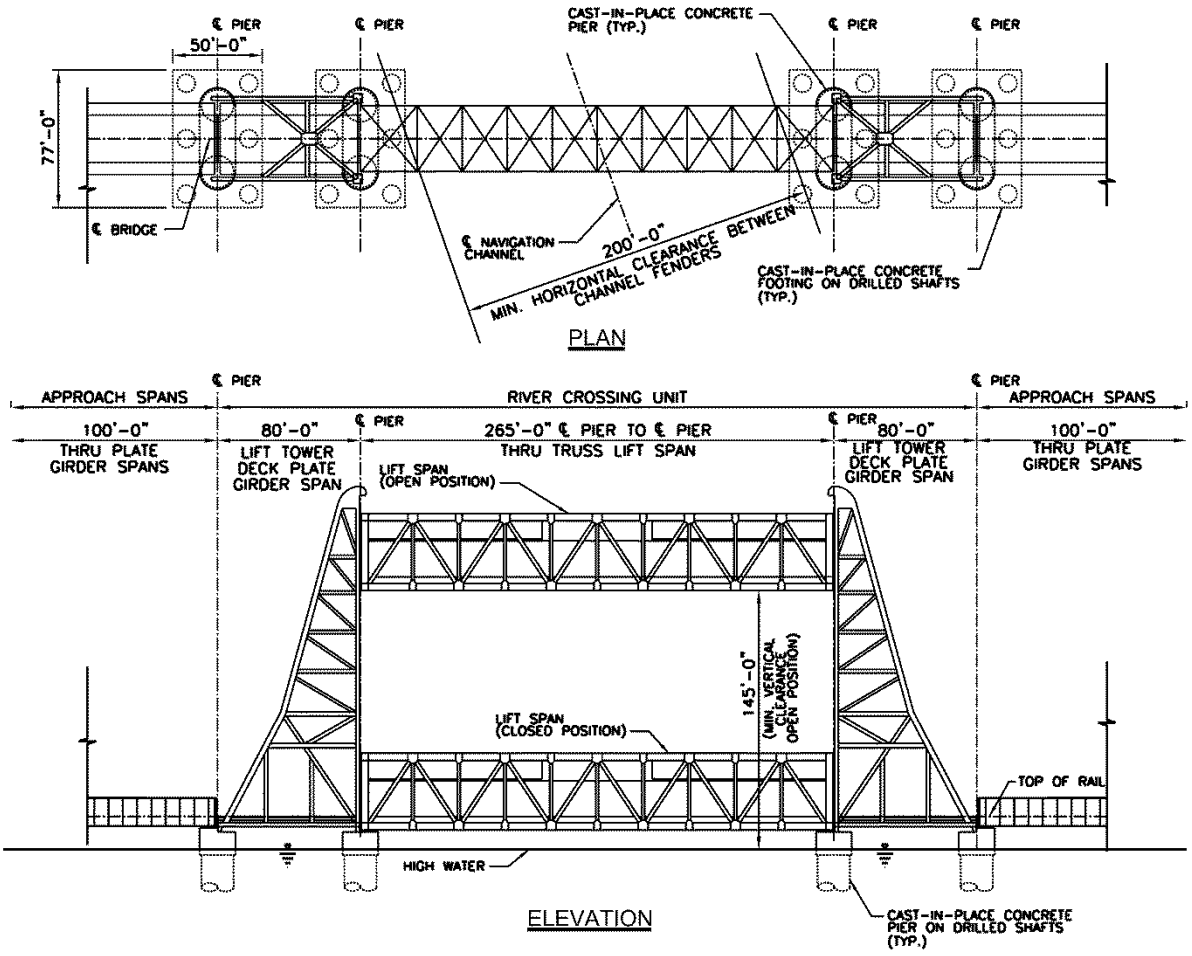
A stationary bridge at the 145 foot vertical clearance above high water would be excessively long and by definition extremely expensive. The Rainbow bridge (for vehicles) in Port Arthur provides the navigation clearance for the Neches River. The total length of the bridge is over 1.5 miles. The grades on the approach spans are estimated at four percent. The maximum grade for the rail would be one percent resulting in a comparable length of nearly six miles. Consequently, consideration was also given to establishing an elevation of the bridge in the closed position that would allow say 80 percent of the navigation traffic to pass under the bridge without requiring a lift. Several factors are required to establish this elevation; the appropriate reference water surface elevation, the height of boats using the river and an acceptable minimum clearance allowing boats (and its tow) to pass without requiring the bridge to be opened. Setting this elevation would require coordination with the U. S. Army Corps of Engineers and the U. S. Coast Guard. Lift data from the KCS railroad indicates that the maximum height requested on one occasion (during a sample week) was 70 feet. This height is higher than the clearance afforded by the IH-10 bridge. The average lift request (mathematically) was for 48.6 feet. Only three of the seven lifts requested that week were below 50 feet.

Lift Bridge

This option would be similar to the existing bridge though the new bridge would be capable of supporting two main line tracks, and would be longer to account for the skewed width of the wider double track truss and the larger piers needed to support the additional weight of the second track. A vertical lift bridge typically offers several advantages. For span lengths greater than 150 ft. a steel through truss, vertical lift bridge is the typical structure type used for railroad movable bridges. An open deck system (timber ties supported on steel stringers and floor beams) is recommended to reduce the weight for the lift span. A ballasted deck system would approximately double the span's weight.

Some advantages of vertical lift bridges include:



- Longer span lengths and wider navigation openings can be achieved more easily than with other movable span types (i.e. swing or bascule spans).
- The lift span is a standard design (simply supported span), similar to a stationary bridge.
- It is conceivable to design the lift span with a ballasted deck.

Some disadvantages of vertical lift bridges include:

- Towers are required to lift the vertical span and access to the top can be difficult especially on towers approaching 200 feet in height. Service elevators can be provided for tower driven spans that require frequent access to the top.
- The mechanical and electrical systems require periodic maintenance.
- Providing a sufficient number of adequately sized counterweight ropes, a flexible power cable, a large enough sheave groove radius, and adjustable rope termination take-up devices must be considered in the design.

A general plan and elevation as well as a typical section of a lift bridge are shown in Figures 3.7 and 3.8.

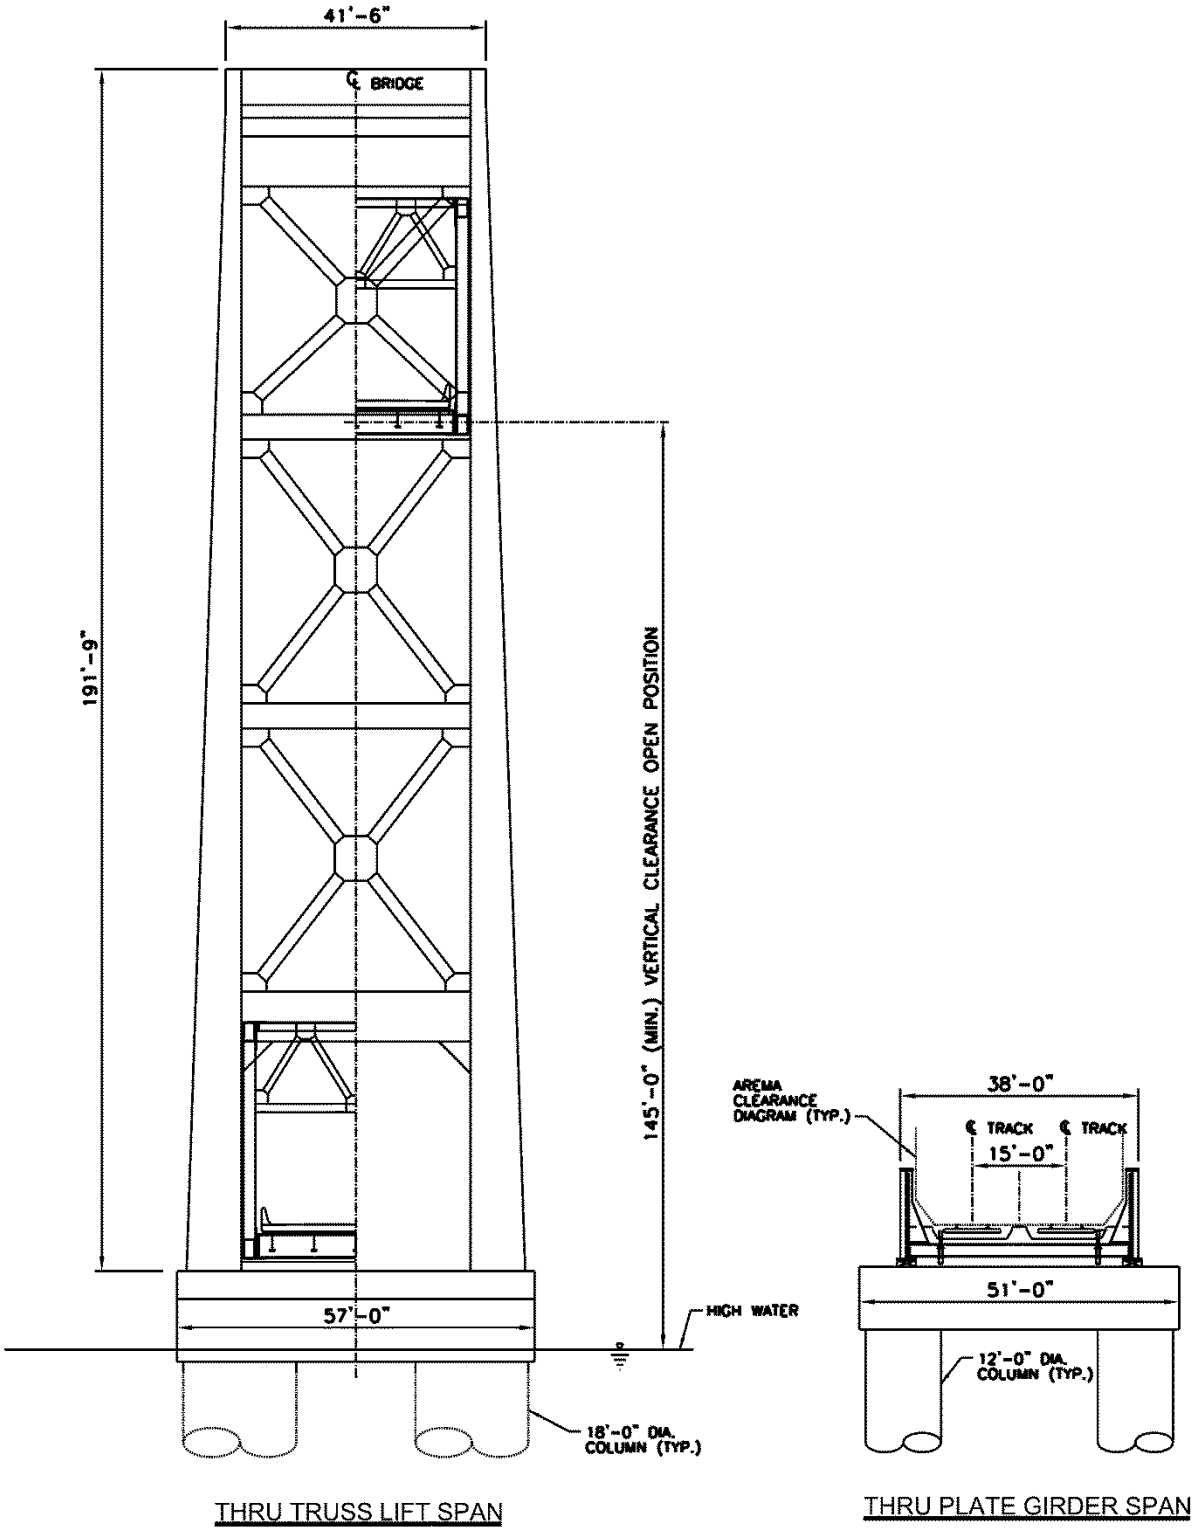


Figure 3.7 – Lift Bridge General Plan and Elevation

The piers adjacent to the navigation channel require a fender system to protect the bridge from vessel impact. Movable bridges are particularly susceptible to service interruptions as a result of vessel collision. Even minor impact on the substructure can cause mechanical equipment to fail.

From a review of the existing Pier Plan – Profile Sheet, dated Feb. 1940, it appears that the channel was about 30 foot deep measured from low water (KCS datum). The boring logs indicate that between elevations -38 to -124, the soil profile consists of alternating layers of hard to very hard clays and course to course packed sand. The foundations for the 1940 construction consisted of caissons or drilled shafts varying from 7 to 18 feet in diameter. The estimated tip was at elev. -90. For tall columns, those exceeding 30 feet ± above ground line, the columns are to be supported on a concrete pile cap or footing founded on drilled shafts. For columns less than 30 feet ± above ground line, the columns are to be supported directly on the drilled shafts or on pile footings. Because of the heavier loads anticipated from the new construction, it is estimated that the tip for drilled shafts to be elevation -110.

Figure 3.8 – Lift Bridge Typical Section

The United States Corp of Engineers will require that the low steel elevation of the approach spans be a specified distance above the high water elevation. To provide a smaller structure depth (top of rail to low steel), through plate girder spans will be used within the river floodway. The approach spans, outside of the river floodway, would be either pre-stressed concrete girder spans, or steel deck plate girder spans or thru plate girder spans. The span lengths and girder type could vary depending on the approach alignment, topographic and environmental / hydraulic constraints. The costs for the stationary and lift bridge options were developed in two forms; the span over the navigation channel and the unit costs for the approach spans assuming a consistent uniform length. This format was deemed suitable for initial considerations. Outside of the river, the span lengths and girder types will vary to provide the most cost effective combination. The costs include the potential for a variety of structural types such as cast-in-place and pre-cast, pre-stressed concrete spans, and steel deck plate girder and through plate girder spans. The costs do not include truss spans, because of the variation in types and lengths, nor for foundations in water requiring special construction techniques. Such costs would be identified at a later stage of design as a separate line item. With specific horizontal and vertical alignments across the Neches River, an accurate length of the bridge approaches and associated probable costs will be determined.

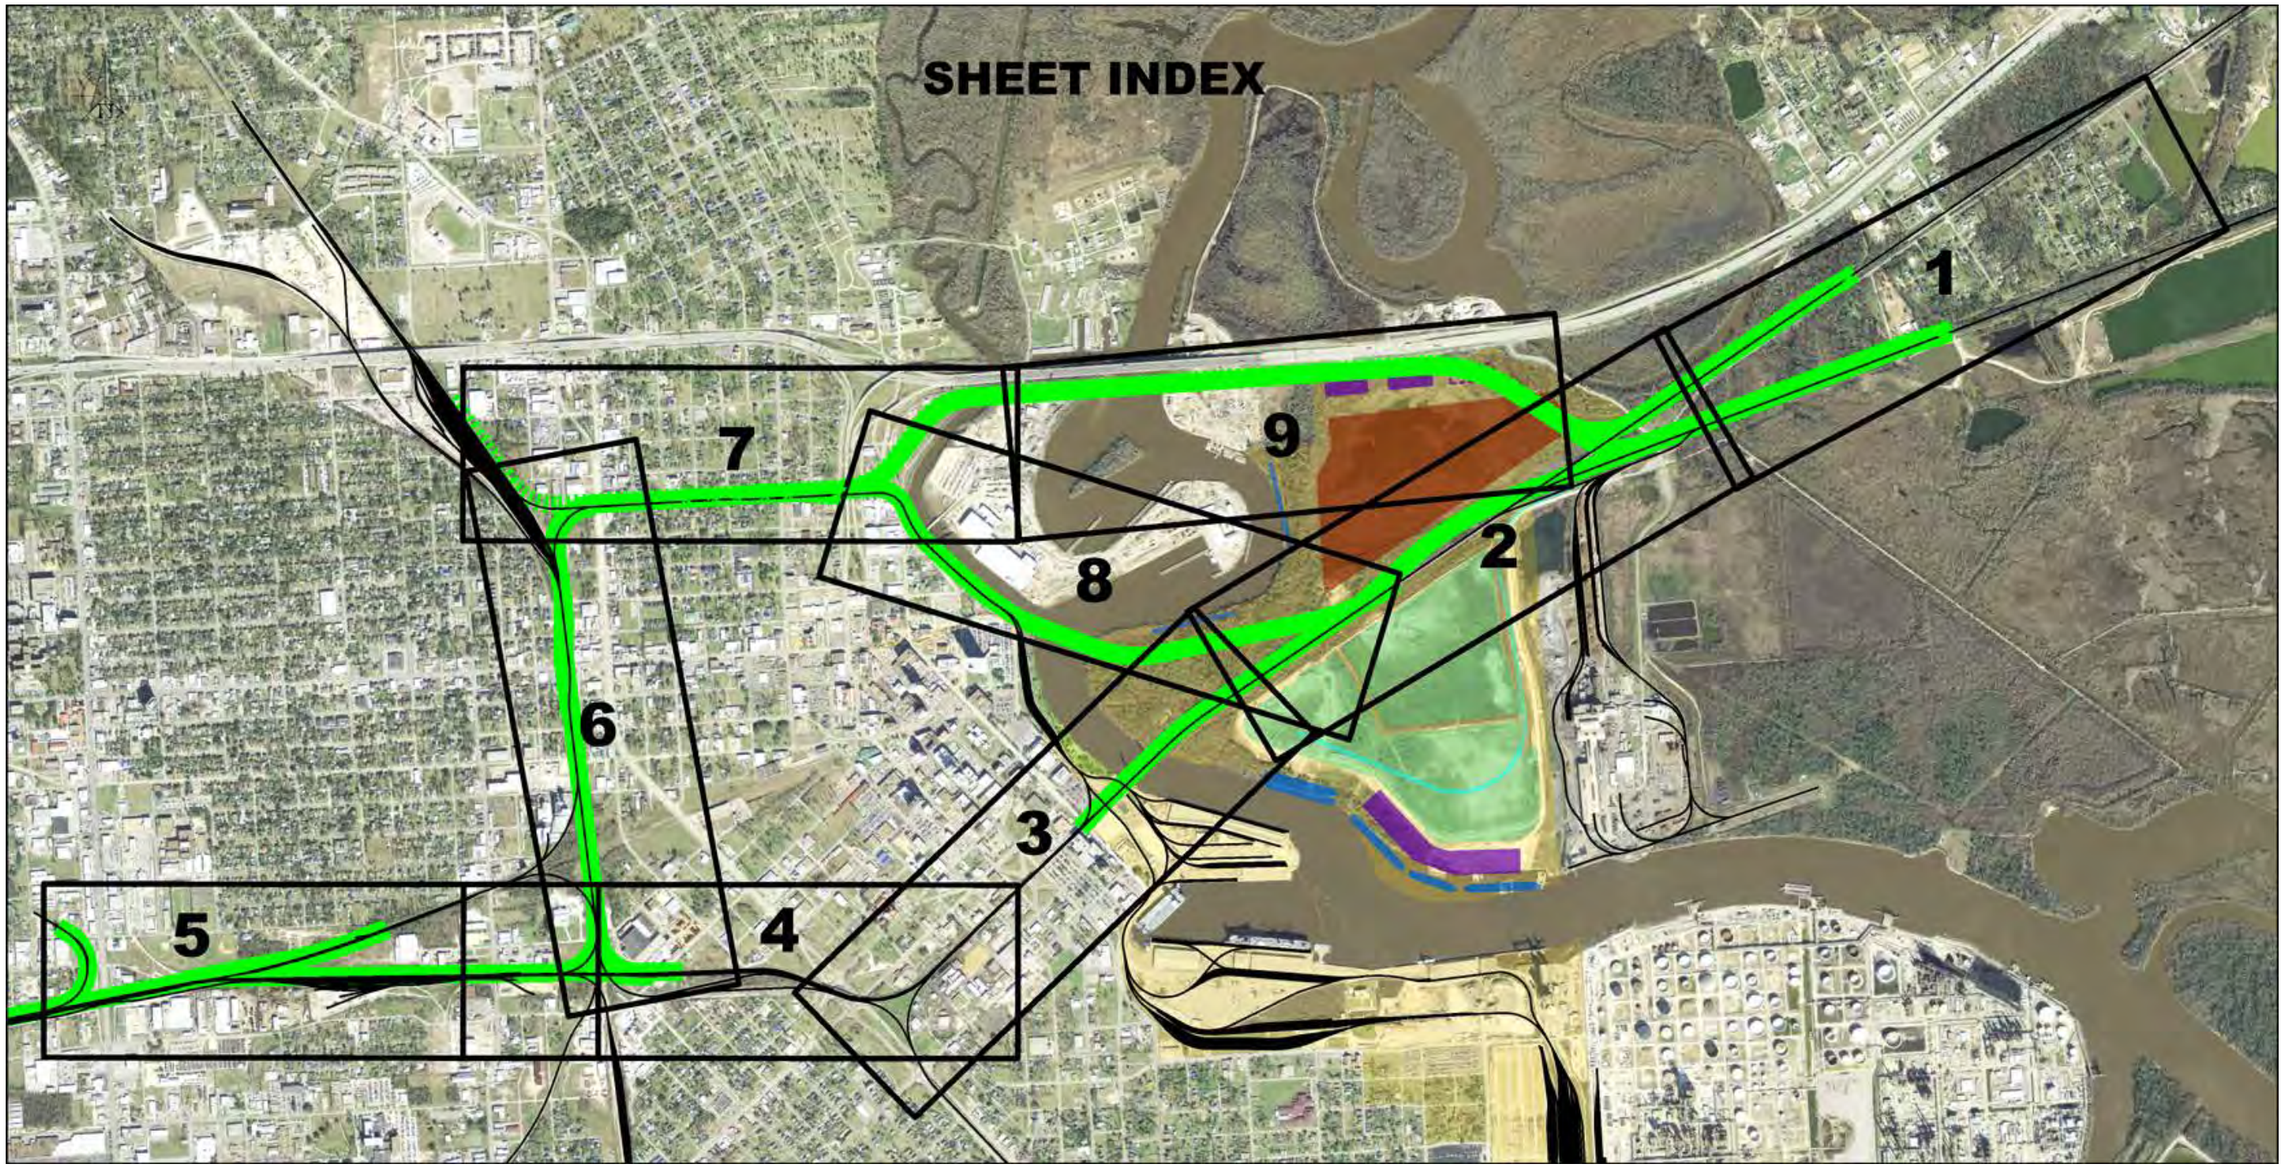
Whether the main span over the navigation channel were constructed as a stationary bridge or as a lift span, the span length of the thru truss element would be set to allow a 200' – 0" minimum horizontal clearance between the navigational channel and fendering system. Because of the potential for skewed alignment crossings of the river, the actual length of the thru truss span may be longer. The approaches in the river would typically be 150' long welded deck plate girder spans. The estimated probable construction cost (in 2012 dollars) of the stationary river bridge is on the order of $30 to $35 million. The lift span over the navigation channel will be constructed to a minimum of 13' above the mean low water level. Because the minimum navigation vertical clearance required is 150' above mean low water, a lift span is required. The estimated probable construction cost of a lift span bridge is on the order of $40 million for a single track and up to $80 million for a double track. If the vertical clearance over the river in the fixed position were higher than 13 feet which in turn reduces the total lift, then the cost of the lift span bridge may be less. This opinion of probable costs are for construction elements only and do not include costs for engineering design, permitting, or construction inspection services.

Alternatives Considered

The alignment location must pass three elements to determine feasibility, an initial review of the technical aspects (typically related to the physical environment), then a financial feasibility test with reasonable costs, and finally a political feasibility where potential impacts are not significant and there is support from applicable partners. Conceptually any new alignment must connect to the existing rail system. For this study area that essentially means connecting from a point near Tower 31 (KCS/UPRR split in Orange County) to the Union Pacific overpass of 11th Street near the existing Amtrak station. To assist in reviewing the location and the surrounding context of the alternatives to be evaluated, see Figure 3.9. A series of 1" equals 200' scale aerial maps of the alternative alignments are included in the Appendix.

For a stationary bridge concept, the alignment location begins by setting the bridge location and then attempting to create the appropriate tie-ins on the east and west sides of the Neches River crossing. For lift bridge concepts, a combination of rail alignment and river crossing location (for navigation traffic and minimizing span length) are given consideration. Operations and connections are also considered when creating the overall rail alignment. The descriptions follow the railroad mileposts which typically increase when travelling westward.

Stationary bridge



The initial alignment developed for a stationary bridge attempts to create a crossing where interruptions from navigation traffic do not occur. The best location for a stationary bridge is north of the existing KCS bridge near the existing IH-10 bridge over the Neches River. Here, the closest existing rail corridor to IH-10 on the west side of the Neches River is the BNSF spur to and through the Port's interchange yard.

On the east side of the Neches River, the KCS/UPRR split at Tower 31 presents a challenge in connecting to both the KCS and UPRR lines which are diverging. In order to create an appropriate crossover, a grade separation is envisioned. Since the bridge location under consideration is north of the existing KCS line, then the KCS line is to be crossed. The vertical design criteria at this concept planning level is set at 24 foot vertical clearance from the top of rail plus an assumed six foot depth of structure, for a total of 30 feet. The maximum grade is one percent and in general this would mean a 3,000 foot long transition. The straight line distance from the UPRR split to the IH-10 bridge is over 5,500 feet.

The horizontal alignment is conceived to be parallel to the existing track when applicable. The UPRR line includes a new second track as previously described under the Gulf Coast High Speed Rail (GCHSR) initiative. While this initiative may not yet be a committed or funded project, for purposes of a long range planning study, the new rail is shown as an element to be considered and requires coordination. The GCHSR line is shown on the north side of the existing UPRR tracks. Track centers are depicted at 20 foot centers. The spacing of track centers changes to 15 feet on center when the rail is on a structure. This change in dimension is made as a cost-sensitive design. Consequently the new alignment track would run parallel on a retaining wall section close to the proposed GCHSR track before connecting to that track. An access road on embankment is possible on the north side. However, Baird's Bayou and the existing timber viaduct structures on the order of 900 feet for UPRR and 1,000 feet for the KCS would indicate that a structural support system is needed for a portion of the track before transitioning to retaining walls and embankment.

The east tie-in is also further complicated by the at-grade crossing of Old US-90 on the KCS line. A more desirable situation would be a grade separation of this roadway and the KCS tracks. That would necessitate either raising the existing KCS track over Old US-90 or bringing Old US 90 over the KCS tracks. While the road structure would typically be less expensive than a rail structure, the proximity of Baird's Bayou as well as maintaining access across the UPRR track to George Brown Road and access to the Gerdeau Steel complicates any grade separation. In other words, the close proximity of the UPRR crossing to the KCS crossing needs to be treated as one crossing.

Figure 3.9 – Sheet Index Map of Alternatives Evaluated in Appendix

Further to the east on the KCS line is the Vidor siding. Operational consideration could be given to extending the second mainline track to points further east, such as to (or potentially past) the Vidor siding. It should be noted that the Vidor siding track is to the south of the existing mainline track, while the proposed track is on the north side of the existing track.

Any new alignment east of the Neches River and north of the existing KCS tracks will impact the Port of Beaumont's Orange County property. While this part of the Port is currently undeveloped, impacts will be assessed based upon the Port's proposed Master Plan.

The west tie-in is conceived to tie in near the BNSF spur line which occupies the center of Long Avenue. As such, the concept envisions that a new rail corridor providing room for two additional tracks would be acquired. While both sides of Long Avenue could be considered for potential expansion, the north side affords the necessary horizontal clearance between pier supports beneath the US-90 structure over Long Avenue. However, the north side also has an electrical substation located on the northeast corner of Long Avenue and Ewing Street. There are also numerous at-grade crossings to evaluate. Coordination with the BNSF indicated that they found no serious issues with either side of Long Avenue.

The Long Avenue alignment must also cross Martin Luther King Jr. Parkway. The current crossing is at-grade and is equipped with flashers and gates. Martin Luther King Jr. Parkway is six lanes wide and currently carries more than 30,000 vehicles per day. Increased train traffic crossing this roadway may necessitate modifications to the type of warning devices and even a potential grade separation.

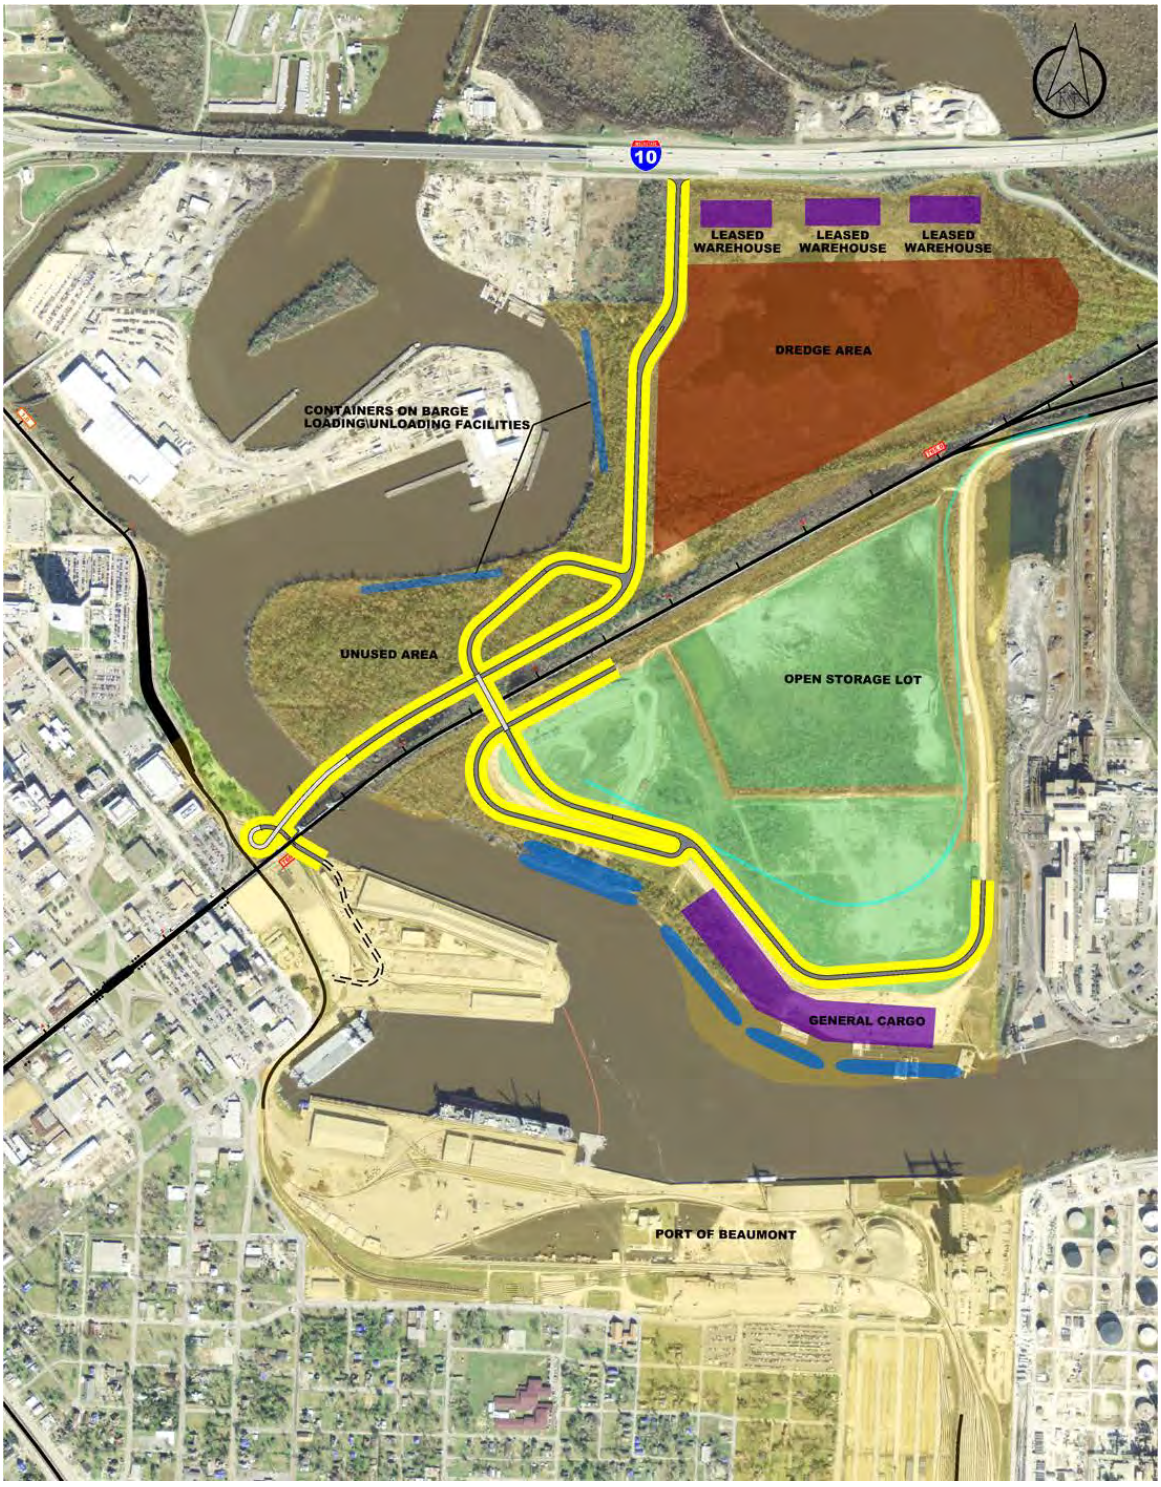
Immediately west of Martin Luther King Jr. Parkway is the wye into the BNSF Beaumont Yard. The new track would connect to the run-through track of the BNSF Yard and to provide future double-track service connections. A second track is proposed along with upgrades to the existing track between the BNSF Yard and the existing UPRR-KCS interchange. Along this half-mile long segment, there are seven at-grade crossings.

Overall, the proposed route for a stationary bridge adjacent to IH-10 is approximately 6.0 miles long while the existing route is 5.9 miles long. The operating speeds and lengths along the proposed routes become input to the RTC model and its evaluation of operations.

Lift Bridge

When considering a lift bridge, one must acknowledge that a request for a lift at the existing bridge location will likely translate to a similar request for lift at any new location north of the existing lift bridge. This is especially true for recreational/pleasure craft which are likely utilizing the Beaumont Yacht Club immediately north of the IH-10 bridge. Navigation use by industry vessels may be dependent upon any industrial development including the Port of Beaumont's development of its Orange County facilities. The Port's Master Plan identifies the potential for two container-on-barge loading facilities north of the existing KCS bridge. Such docks would require additional bridge lifts which are not currently occurring. Consequently, the best location for a lift bridge may be as close as practical to and immediately north of the existing lift bridge.

The currently developed parcels of the Port are all located south of the existing KCS river bridge. Current vehicular access from the Jefferson County facilities to the Orange County facilities on the other side of the Neches River necessitates travel north along US-90, then east along IH-10 to Exit 856 continuing east along the Frontage Road to Old US 90 then south across the KCS tracks to George Brown Road crossing the UPRR tracks. All concepts for new alignments being considered (including along the existing river crossing) are located north of the existing river bridge. Consequently to access the new bridges for vehicular use requires crossing the existing KCS tracks on the west side of the river and again on the east side of the river to get to the Port's south parcel.



A potential concept for vehicular traffic to cross on the west side is via a grade separation of the existing KCS rail line that utilizes the current "low water" rail crossing beneath the bridge. Review of as-built plans would suggest that the vertical clearance is sufficient for trucks yet only one direction of travel could be permitted because of lateral clearance. However a second opening of similar dimensions is immediately adjacent and could be used for travel in the opposite direction (southbound). A parcel (currently a surface parking lot) in the northwest quadrant from the existing bridge would be utilized as a loop ramp from the passage beneath the bridge to the surface level of the bridge for vehicular traffic. Access from within the Port to this potential loop ramp would require at-grade crossings of numerous service rail lines. Once crossing the river, the vehicles would be on the north side of the KCS tracks.

A concept to connect the south/north parcels of the Port (separated by the railroad) via a grade separation utilizes a crossing point located approximately half-way between UPRR/KCS junction at Tower 31 and the river bridge. The crossing would be over the KCS tracks at a height of 24 feet clearance plus an assumed six foot depth of structure. The maximum grade for trucks to reach this level is 4% which results in a ramp of approximately 750 feet long. Vehicular access to the Port's Orange County facilities may be best achieved along the IH-10 Frontage Road (assuming that access rights have not previously been acquired). However the western edge of the Port property line is located less than 500 feet west of the physical gore point of the eastbound off ramp which may influence where the best location of an access point could be placed. While access via Old US 90 has some merit to limit potential out-of-distance travel of over a mile to reach an entry west of the eastbound gore, the concept of an at-grade crossing of the KCS tracks is less than desirable for a potentially major facility. The crossing location identified also requires a crossing of other industry track. See Figure 3.10 for a depiction of a roadway circulation concept connecting the Port of Beaumont's Jefferson and Orange County facilities.

The closest existing rail corridor north of the existing river bridge is the Port's Interchange Yard with a connection to BNSF's spur line along Long Avenue. Another rail corridor worth potential consideration is the former Southern Pacific (SP) line which has a direct connection on the west side to the UPRR main line. The SP bridge over the Neches River was a bascule bridge. The former timber supports for the approach spans still remain in Orange County. On the other hand, developments in Downtown Beaumont as well as the Port's Interchange Yard are physical issues that would result in potentially significant impacts.

Figure 3.10 – Roadway Circulation Concept

Connecting Port of Beaumont Jefferson and Orange Counties

A new lift bridge adjacent to the existing lift bridge could be expected to experience vertical clearance issues similar to the "low water" rail crossing beneath the existing bridge. Design options are limited to improving the clearance. Further lowering of the track creates additional constraints with water levels. Raising the track would further restrict the types of rail cars that could pass through. And raising the new bridge to a higher elevation to create additional clearance to solve one issue, would create another issue by interfering with the ability to maintain the existing diamond crossing. While a phased approach might be considered, the clearance at the existing river bridge would remain a constraint until the existing bridge may be replaced. In fact, the Port's implementation of a new rail access and expanded capacity at Dreyfus Yard are intended to allow for the removal of the Port's Interchange Yard. With the completion of these improvements, and the redirection of Port traffic, the low water level crossing should become a moot issue.

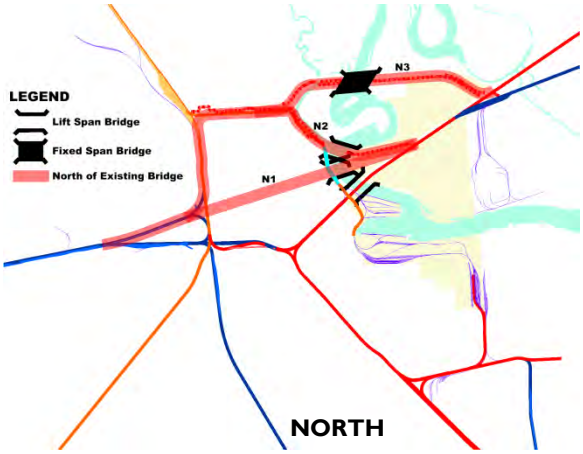
If one were to consider a lift bridge south of the existing KCS river bridge then a potential location could be along the Port's eastern edge (adjacent to Gerdeau Ameristeel) and cross the Neches River onto Jefferson County side of the Port of Beaumont connecting into the Dreyfus Yard. By connecting to the Dreyfus Yard, rail system connections could be made into the KCS at the wye north of Chaison Yard. While potentially physically possible, any crossing south of the Port of Beaumont will experience a significant increase in the number of bridge lifts to accommodate navigation traffic. Consequently this concept was dismissed.

When an alignment connects to the existing rail corridor west of the KCS- UPRR split at Tower 31, train movements to either rail corridor are direct. However, this at-grade connection will cause delays at Old US 90 and limit access to the industries and the Port of Beaumont due to trains waiting to cross the bridge. The horizontal alignment is conceived to be parallel to the existing track and again this study assumes a proposed second track associated with the GCHSR initiative. Consequently this alignment's new track should be considered a third track with the second track extending eastward along the KCS line to Vidor. To accomplish a grade separation, bringing Old US 90 over the KCS tracks would appear to be a logical opportunity.

Again any new alignment east of the Neches River and north of the existing KCS tracks will impact the Port of Beaumont's Orange County property. This time the lift bridge river crossing location and approach alignment bisects the Port property and creates difficulties for access across the railroad tracks and potentially creating useless remnants of land of reasonable size. While this part of the Port is currently undeveloped, impacts will be assessed based upon the Port's proposed Master Plan.

The west tie-in is conceived to tie in near the Elizabeth Street turn of the BNSF spur line along Long Avenue. Improvements for operating speed and future double track push the alignment east of the existing BNSF track close to the edge of Brake's Bayou and likely will require a retaining wall along the west bank of the bayou. Similar issues as already described along Long Avenue and the south connection on the BNSF line to UPRR would remain with an equivalent number of crossings and potentially a few more associated with Pine Street unless Pine Street is closed to through traffic as conceived and shown in the Appendix exhibits.

This proposed route for the lift bridge is approximately 6.3 miles long while the existing route is 5.9 miles long. Again, the operating speeds and lengths along the proposed routes become input to the RTC model and its evaluation of operations.



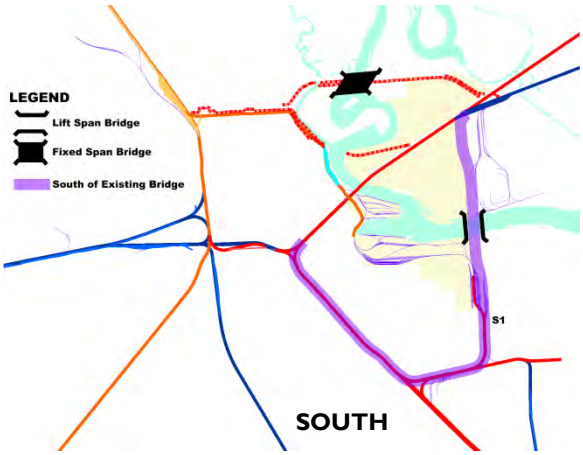
An alternate alignment could move the new river crossing a bit further south and utilize the former SP corridor. While much of the former SP corridor remains intact, the eastern edge close to the Neches River within the study area is densely developed and is designated a Historic District. This presents a challenge in finding an alignment that does not have significant property or other direct impacts. The alignment concept would require the new rail to be elevated over the BNSF track which in turn provides a higher vertical clearance for the river span when in the closed position. Nonetheless, the number of lifts is estimated to remain the same as the minimum requested clearance (based upon sample data) for the existing lift bridge was a 30 foot lift. The alignment would then remain elevated on structure and traverse through Downtown over several streets including the one-way couplet of US-90, Martin Luther King Jr. Parkway and the BNSF line before beginning descending to meet existing track. A grade separation would also be envisioned at 4th Street and dependent upon tie-in locations, a widened grade separation may also be needed at 11th Street.

Summary of Alternatives Considered, Screened and to be Evaluated

A "long list" of options were considered and screened. Concepts of high-level structures (with a vertical clearance of 150 feet) were considered but found to be both physically and financially impractical. Concepts for a lift bridge located south of the existing KCS bridge would have significant impacts on river navigation and the increase in the number of lifts would adversely affect rail operations. And while consideration of a former rail corridor is philosophically often a reasonable approach, the former SP alignment through Downtown Beaumont is heavily developed with numerous street crossings. Creating an elevated rail corridor through Downtown Beaumont would have significant property and visual impacts. Figure 3.11a depicts the broad corridors of these concepts considered and screened. Figure 3.11b depicts the broad corridors of the concepts to be evaluated in the next chapter.

Design aspects to accommodate the GCHSR are also considered and attempt to follow the guidance provided in the August 2004 plan and profile sheets at a 1" equals 3000' scale through Beaumont. Those plans include, as part of a Phase 2 component of the GCHSR study, a proposed rail line along the existing UPRR-KCS rail corridor on the north side of the existing rail alignment. This concept is directly reflected by illustrating a third main west of the GCL junction through UPRR's east yard and continuing further westward to the directional running split. In Orange County, a proposed rail line is also shown along the existing UPRR-KCS rail corridor on the north side of the existing rail alignment. Placing a second UPRR track on the north side of the existing rail requires a crossing of the KCS rail. Placing the second UPRR track on the south side might eliminate the need for a crossing yet with the extensive existing right-of-way width on the north side between the Neches River bridge and the KCS-UPRR split at Tower 31, design options were considered to accommodate a crossing with proposed rail on the north side.

Figure 3.11a – Concepts Considered



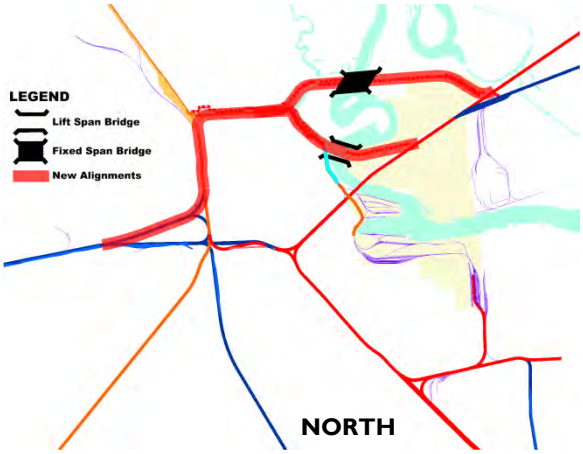


Figure 3.11b – Concepts to be Evaluated

In order to provide a level at-grade rail crossing, the new rail alignment should cross at a tangent and then begin its horizontal curvature. This geometric design may necessitate minor additional right-of-way acquisition. Another option could be grade separation, though obviously this has cost implications. An assessment of an appropriate design can be determined when more information on potential future operations is available. Considerations may even need to be given to the potential for double track alignments coming together along both the UPRR and the KCS routes at the KCS-UPRR split at Tower 31.

Three build alternatives are evaluated in more detail and include:

- Existing Alignment
    - North side of KCS tracks (lift span bridge)
- New Alignments
    - Interstate 10 alignment (fixed span bridge)
    - Pine Street alignment (lift span bridge)

RTC model assumptions

For the alternatives with new railroad alignments, the RTC model assesses an initial single-track configuration with centralized traffic control. Physical planning allows for expansion to double-track configuration though that concept does not affect operations. Maximum permitted speeds are assigned to the various rail segments based upon initial horizontal and vertical curvature as well as existing of adjacent operating speeds. The model is coded in such a way that the new alignment (whichever one is being tested) is preferred, but train traffic will be assigned to the existing route if it minimizes congestion delay. The modified bridge openings for future conditions (16 lifts per week) are retained on the existing railroad route in all alternative simulations, so that the bridge times are a constant, not an independent variable that would skew results.

With the alternate of the double track crossing of the existing route, a second track is simply added in the model to the KCS line relatively independent of physical design elements. Due to the close proximity of the two bridges, it was assumed that any call to lift the bridge for maritime traffic would require the new lift bridge to operate at the same time as the existing lift bridge.

Initially, the alternative alignments previously described in this chapter were screened utilizing existing train traffic volumes. The IH-10 alignment and the Pine Street alignments utilize some common segments including the North-South corridor and the Long Avenue corridor (both currently operated by BNSF). For location of these segments see Sheet Index Maps 6 and 7 respectively. The initial RTC model runs discovered that the North-South corridor was forecasted to experience a significant increase in delays as an existing single-track operation. Consequently, additional RTC model runs with projected train traffic were modified to include a double-track operation. The RTC model does not specifically include the existing BNSF Long Avenue rail as part of its network, although train traffic is accounted for in the model. And since the design concept is to construct a separate new track adjacent to Long Avenue, the only modification was to add the proposed track as part of the RTC model run.

For the IH-10 alignment, a significant operational modification included the railroad grade separation at the KCS-UPRR split at Tower 31 on the east side of the Neches River. Initial design thoughts were to physically tie into the existing rail corridors as quickly as possible in order to minimize construction costs and probable impacts. However the navigation vertical clearance and minimum desirable grades physically required additional horizontal length for the profile to transition over the Neches River before return to existing ground and the existing rail routes. On the east side of the Neches River, this resulted in the new alignment creating a split where one rail tied into the KCS towards DeQuincy while another rail was grade separated over the KCS line before tying into the UPRR towards Connell. This rail grade separation resulted in operational improvements on the east side of the Neches River that was not evident in the alternative without this rail grade separation.

Due to the project scope addressing only the Neches River area, the model assumptions change only the RTC's model rail infrastructure or network within the Beaumont area. Other potential improvements discussed in prior studies, such as the Texas Rail Plan, specifically those in and around the Houston area which would have a direct and positive effect upon operations east of Houston towards Beaumont are not included in the rail network for this study.

4.0 Evaluation of Alternatives

The different route options are evaluated by means of a selection of performance measures. To organize the evaluation, the framework provided by the Texas Department of Transportation's *Guidebook for Rail Project Prioritization* (May 2012) was consulted. As this is a rail capacity/facility improvement project, the measures used focus on the Transportation impacts, e.g., congestion relief and system capacity, of the proposed infrastructure changes. While the focus is on transportation impacts, an assessment is also made of an alternative's performance in the areas of Sustainability, e.g., environmental / social, and Implementation, e.g., project development, as data and known conditions permit.

Three alternative crossings of the Neches River are to be evaluated. These include an alignment along the existing river crossing corridor as well as new alignment alternatives with different types of river bridge crossings; stationary or lift span. Essentially these were determined to be the best of the options considered for alignment location and bridge type. The three alternatives are:

- Add capacity adjacent to existing KCS alignment with new lift bridge, as shown in Figure 4.1
- Add capacity on new alignment adjacent to Interstate-10 with stationary bridge, as shown in Figure 4.2a, and
- Add capacity on new alignment along Pine Street corridor with new lift bridge, as shown in Figure 4.2b

Figure 4.1 – Existing Alignment Evaluated
(New lift bridge adjacent to existing)

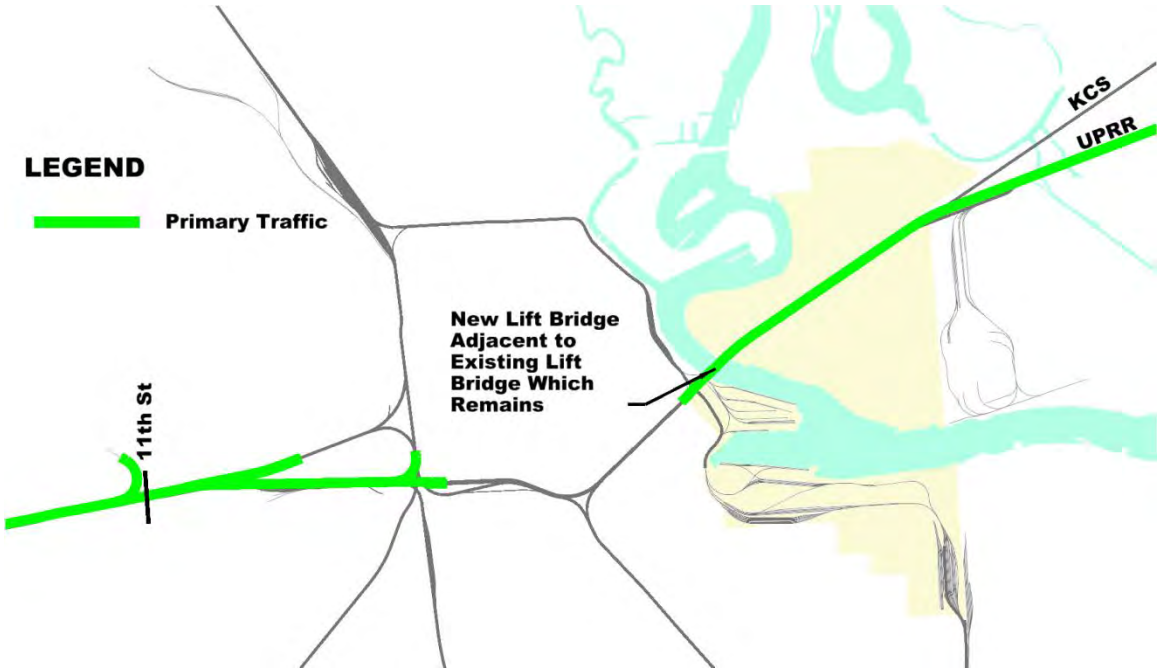

Figure 4.2a – New Alignment Evaluated (IH-10 Fixed bridge)

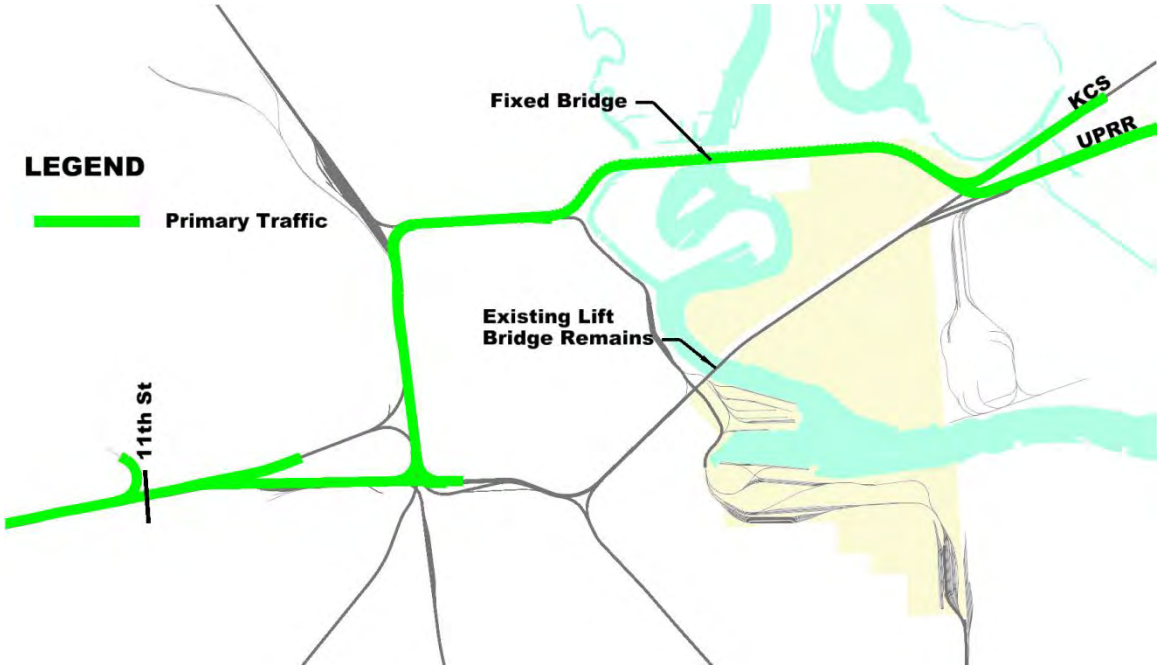

Figure 4.2b – New Alignment Evaluated (Pine Street Lift bridge)

Evaluation Measures

The measures used in the evaluation are discussed below. The performance of rail system given the assumptions underlying each alternative was estimated using Rail Traffic Controller (RTC, Berkeley Simulation Software) and GradeDec.net (Federal Railroad Administration). Each alternative will generate a set of performance measurements for the overall network. These results will be compared to the projected base case, i.e., the Project No-Build. Results may also be reported for the individual railroads (though at an aggregate level) to assess whether impact vary by carrier from a given alternative.

Transportation

The evaluation of transportation impacts includes a review of river, rail, and highway operations. The rail operations are based upon the output from the RTC model while highway operations focus upon the output from GradeDec.net for the at-grade rail-highway crossings along the corridor being evaluated. River impacts are discussed based upon the degree of obstruction to navigation traffic.

Rail Operations

All alternatives offer the option to route trains via either the existing rail lines or the alternate route, depending upon circumstances. In effect when combined, the existing route and proposed alignments create at least two main tracks, and to some extent three, between the UPRR Beaumont Yard and the KCS-UPRR split at Tower 31. This added capacity offers more flexibility than just the existing route alone.

The rail operations measures developed by RTC include total system train miles, total system weekly trains and total system weekly train delay. While 582 trains are dispatched, not all trains complete their runs within the week long measurement window. Delays accumulate over the week and some trains are behind the measurement window at the time it expires. The evaluation of an improved river crossing to provide double track capacity along either the existing route or a new location, as presented in Table 4.1, shows a significant reduction compared to the "no-build" condition (on the order of a factor of three to four). However in comparison to existing conditions this represents an increase in delay by a factor of two or more. Train traffic has also doubled and the delay hours per day may not be unrealistic when considering the Beaumont area as limited distance of a slow-speed terminal with the existing bridge as a bottleneck.

Table 4.1
RTC Freight Train Performance – Alternatives with 2035 projected volumes

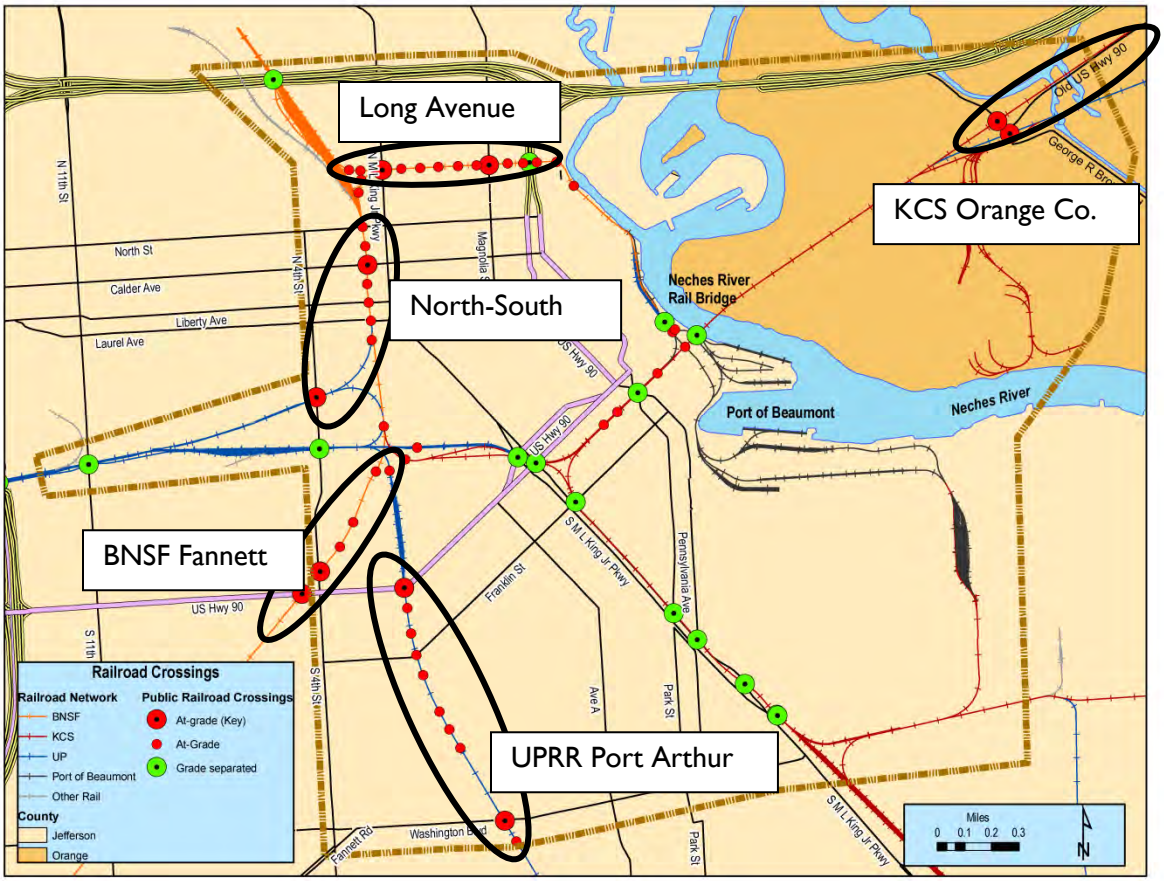
Projected 2035 Case	Train Count	Delay Hours / Day	Delay Minutes/100 Train-Miles	Bridge Lifts per Week	# tracks crossing Neches River
"no-build"	582	69.7	306.4	16	1
double track existing route	573	23.4	158.1	16	2
IH-10 new alignment alternative	573	17.3	113.9	16	2

The IH-10 rail alignment alternative, as a fixed bridge, attracts approximately 37% of the total weekly train traffic. However, this represents nearly half of what could be classified as "through" train traffic crossing the Neches River. This amount of rerouting of trains is an indication that the existing rail corridor has a sizeable degree of local service that crosses the Neches River, including trains accessing the Port of Beaumont. While the new alignment option represents an overall operational improvement compared to the double tracking of the existing alignment, all of the options are more congested than current conditions. Comparing the new alignment between existing and projected train volumes, it becomes obvious that the increase in train traffic has the most significant effect upon operations.

River Navigation Impacts

River navigation impacts address the potential to affect the movement of water borne vessels. The concept of additional capacity with a second lift span river bridge adjacent to the existing bridge should not adversely affect river navigation. One central clearinghouse for raising the lift bridge(s) would remain. However, since the two structures would be aging at different rates, the older structure may experience more malfunctions and require more maintenance. The concept of a second lift bridge only 0.3 nautical miles north of the existing bridge, such as shown with the Pine Street alignment, will require both bridges to be in the open position to accommodate river traffic and could potentially increase rail delays. The fixed span rail bridge concept adjacent to the IH-10 alignment at the same vertical clearance afforded by the IH-10 structure would not have any impacts to river navigation, yet the existing lift bridge would still remain.

Key At-Grade Crossings



An assessment of critical at-grade crossings for grade separation was conducted utilizing the GradeDec.net software. The software package includes the base condition (type of crossing control) with alternate improvements in a hierarchical manner from passive control to lights, to gates, to new technology to grade separation or closure. A benefit – cost ratio is then determined based upon inputted train volumes, growth rates (both for rail and road) as well as estimated costs for improvements. To conduct the assessment, the input was entered using the base information developed by the RTC runs used for this analysis for the new and existing track configurations. A grade separation concept was developed for the segments analyzed along with an opinion of probable costs. The evaluation can help determine if a grade separation is beneficial.

The five rail segments for assessment via GradeDec.net and are shown in Figure 4.3. These segments were selected as representing corridors with both heavily trafficked vehicular and railroad at-grade crossings based upon projected conditions and their options. Information on these critical crossings and others along the corridors being evaluated is provided in the Appendix.

Three of the five rail segments are essentially evaluated under future conditions (increased train and vehicular volumes) and include:

- BNSF Gulf Silsbee MP 62.9 towards Fannett
- UPRR Lafayette branch Sabine towards Port Arthur, and
- KCS/UPRR in Orange County

Figure 4.3 – Crossing Corridors
(Key at-grade crossings evaluated for grade separation)

The remaining two rail segments have the potential to be directly affected by the alternate alignments under consideration. These include:

- Long Avenue and
- North-South segment (supplemented with 4th Street)

The BNSF Gulf Silsbee segment is assessed from milepost (MP) 74.58 – Washington Blvd. to 76.29 Crockett St., a distance of less than two miles. A total of ten crossings are included in this segment of the BNSF corridor. Grade separations were considered at US-90 (College) and immediately adjacent at 4th Street. Because of the proximity to each other and the major signalized intersection of College and 4th Streets, the grade separations must be viewed together and not separately. The construction costs are estimated in excess of $18 million. Right-of-way costs associated with the surrounding commercial properties may be in excess of $6 million. The overall benefit/cost ratio is significantly less than 1 at 0.229. The major source of benefits (38%) is from travel time savings.

The UPRR branch towards Port Arthur is assessed from milepost (MP) 28.35 – Euclid Ave. to 29.98 Crockett St. a distance of approximately 1.5 miles. A total of eleven crossings are included in the

corridor. Grade separations were considered at Washington Blvd. and at US-90 (College). These crossings are nearly one mile apart from each other. The construction costs are estimated on the order of $9 million for each crossing. Right-of-way costs could range from$1 to $3 million. The overall benefit/cost ratio is significantly less than 1 at 0.299. The major source of benefits (54%) is from travel time savings and is associated with US-90 and its higher level of traffic volume.

The KCS Orange County segment is assessed from milepost (MP) 761.03 – N Dewitt St. to 764.61 Old US-90 a distance of more than 3.5 miles. A total of five crossings are included in the corridor. A grade separation was considered at Old US-90. This crossing is physically very close to the UPRR track as well as the access road (George Brown Drive) leading to the Port of Beaumont. The construction cost is estimated on the order of $11 million for the grade separation of both crossings. Right-of-way costs could reach up to $2 million. The overall benefit/cost ratio is significantly less than 1 at 0.241. The major source of benefits (67%) is from safety benefits. The analysis as conducted only considers the Old US 90 crossing for potential benefits.

The Long Avenue segment is assessed for a distance of approximately 2/3rd of a mile. The existing track is operated by BNSF and is located in the middle of the roadway. A total of ten crossings are included in the corridor under evaluation. Several scenarios could be considered, ranging from a "no-build" scenario to the alternative alignment adjacent to the existing rail line. The concept for rail operations within this corridor would leave the existing BNSF track as is for service to the port and a new alignment would accommodate "through" movements and cross the river near IH-10. Currently only two trains per day utilize the existing track. An estimate of as many as 16 trains per day could be diverted to the new alignment under existing train volume conditions on "opening day" based on RTC simulations. Growth in future years is forecasted to 32 trains per day. Grade separations were considered at MLK Jr. Parkway and at Magnolia Street within the corridor limits. These crossings are nearly 0.4 miles apart from each other. The construction costs are estimated in excess of $13 million and $9 million respectively. Combined right-of-way costs approach $1 million. The overall benefit/cost ratio is 0.863 based upon an initial 16 trains per day. The major source of benefits (78%) is from vehicular travel time savings. The overall benefit/cost ratio increases to more than 1 at 1.596 based upon the future 32 trains per day. The major source of benefits (85%) is from travel time savings. While not specifically evaluated, the "no-build" scenario with just the existing service track would result in a benefit/cost ratio less than 1.0.

The North-South segment is assessed for a distance of approximately ¾ of a mile. The existing crossings include three different sets of milepost designations. A total of eight crossings are included in the corridor under evaluation. Again, several scenarios could be considered, ranging from a "no-build" scenario to the alternative alignment adjacent to the existing rail line. The concept for rail operations would leave the existing BNSF track as is for service use and a new alignment would accommodate "through" movements. Currently as many as six trains per day utilize the track. An estimate of as many as 16 trains per day could be diverted to the new alignment under existing train volumes resulting in a total of 22 trains per day estimated in the Base Case RTC model. Grade separations were considered at Calder Ave. and at 4th Street. These crossings are nearly 0.6 miles apart from each other. The construction costs are estimated at approximately $9 million each. Combined right-of-way costs approach $1.2 million. The overall benefit/cost ratio is significantly less than 1 at 0.240 based upon an

initial six trains per day. The major source of benefits (49%) is from travel time savings. The overall benefit/cost ratio increases to close 1 at 0.805 based upon the new alignment diversion with a total of 22 trains per day. The major source of benefits (78%) is from travel time savings.

Table 4.2
Highway and Railroad Crossing Evaluations

	BN Fannett	UP Port Arthur	Long Avenue		North-South corridor		KCS Orange Co.
			New (16)	New (32)	Existing	Alternate	
Safety Benefits ($1,000)	$ 972	$ 816	$ 957	$ 1,083	$ 582	$ 828	$ 1,145
Travel Time Savings ($1,000)	$ 1,493	$ 2,792	$ 10,888	$ 21,775	$ 1,921	$ 10,242	$ 18
Environmental Benefits ($1,000)	$ 7	$ 14	$ 51	$ 101	$ 8	$ 46	$ -
Veh Operating Cost Benefit ($1,000)	$ 117	$ 216	$ 714	$ 1,428	$ 118	$ 630	$ 1
Network Benefits ($1,000)	$ 9	$ 16	$ 46	$ 93	$ 13	$ 66	$ -
TOTAL BENEFITS ($1,000)	$ 3,918	$ 5,193	$ 13,903	$ 25,719	$ 3,905	$ 13,080	$ 1,703
TOTAL COSTS ($1,000)	$ 17,145	$ 17,393	$ 16,116	$ 16,116	$ 16,242	$ 16,242	$ 7,802
Net Benefits ($1,000)	$ (13,227)	$ (12,200)	$ (2,213)	$ 9,603	$ (12,336)	$ (3,162)	$ (5,378)
Benefit Cost Ratio	0.229	0.299	0.863	1.596	0.240	0.805	0.241

In summary, of the five segments analyzed for grade separation, only the Long Avenue corridor has a positive benefit cost ratio and that is only with increased and diverted train traffic associated with the new rail alignment alternative adjacent to IH-10. The existing low volume service line today would not reach a level to suggest the need for a grade separation. If a new rail alignment alternative is pursued, additional benefits could be investigated with the potential closure of one or more local streets' at-grade crossing along Long Avenue.

Sustainability

The evaluation of sustainability impacts includes a review of potential environmental and social impacts. Elements from the transportation and implementation impacts cross over to provide additional input on such factors as property impacts and transportation which have an effect upon air quality and energy use.

Property Impacts

Right of way acquisition includes right of way impacts created by new railroad construction and any associated roadway improvements, such as grade separations. Four quantitative measures are utilized based on information available in the Jefferson and Orange County Assessor's files and interpretation of aerial photography. These quantitative measures are: Number of Parcels which quantify the parcels that might be impacted, the total area of those parcels, and the area that might be most directly impacted or acquired, and Parcel Ownership which indicates an interpretation of ownership for each parcel based upon the name associated with the parcel in the Assessor's File. Another factor is the land use which was determined through a review of aerial photography. Parcels were categorized as being residential, commercial / industrial, open space / vacant, or other.

The number of properties impacted was determined by combining parcels with a common account number in the Assessor's file. Note however, that not all parcels in the file had account numbers. Assessed value for Jefferson County parcels was estimated by summing the land and improvement value

for each identified property. As was the case with the account numbers, not every property had land or improvement values. This assessed value should not be interpreted as representing probable costs to acquire the right of way as it is not a reflection of market value, does not include any relocation assistance, and values were not available for all parcels potentially impacted. Nonetheless it allows for a relative comparison. Table 4.3 summarizes the results of the analysis of potential right-of-way impacts. The Appendix contains a series of maps that illustrate the parcels potentially impacted by each alignment, the assumed ownership of each parcel, and the land use for each parcel.

Table 4.3 – Potential Property Impacts

ROW Impacts	Alternatives					
	Existing Alignment		New Alignments			
			IH-10 Fixed Bridge		Pine Street Lift Bridge	
	Jefferson Co.	Orange Co.	Jefferson Co.	Orange Co.	Jefferson Co.	Orange Co.
Parcels

Total Assessed Value	$1,270,000	N/A	$1,570,000	$4,870	$2,180,000	$938

Table Note: Not all parcels had a value associated with them. Total Assessed Value includes only parcels where a valuation was available and adjusts the value for parcels that may only be partially impacted.

Potential Environmental Impacts

The potential for environmental impact is driven by construction activities associated with the implementation of an alternative's infrastructure. The focus is upon key environmental issues and impacts as well as the complexity of permits. Several of the attributes described under the existing conditions such as population, households, income, race and employment are represented by the surrogate of property impacts by land use categories. Residential impacts would affect population and

households, while commercial and industrial impacts would affect employment and income. Impacts to water resources including wetlands and floodplains are indicated by assumed areas of potential right-of-way. Often these natural areas are habitat and consequently serve as a surrogate for threatened and endangered species. For a list of threatened and endangered species for Jefferson and Orange counties from the Texas Parks and Wildlife Department, see the Appendix. Specific sites that could be affected are identified for archeological, historic and community facilities including public lands and parks. Impacts to these attributes are represented by four degrees of impact ranging from no impact to low impact to medium impact to high impact. The degree of impact is neither based upon an absolute value nor is it relative to the other alternatives. A summary of potential environmental impacts is shown at the end of this section in Table 4.4.

Superfund Site - Superfund is the name given to the environmental program established to address abandoned hazardous waste sites. It is also the name of the fund established by the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended. This law was enacted in the wake of the discovery of toxic waste dumps such as Love Canal and Times Beach in the 1970s. It allows the EPA to clean up such sites and to compel responsible parties to perform cleanups or reimburse the government for EPA-lead cleanups. There is one Superfund site within the Study Area. The name of the site is International Creosoting located at 1110 Pine Street, Beaumont, Jefferson County. The new IH-10 alignment runs through the middle of this site. This site is listed as number 11 out of 25 on the State of Texas Superfund registry that identifies those facilities that have been determined to pose an imminent and substantial endangerment. The Registry, along with a background and history of the International Creosoting site, appear in the Appendix.

Ecologically Significant Stream Segment - As a result of the passage of Texas Senate Bill 1 (SB1) in 1997, water planning in Texas became the domain of regional planning groups rather than the Texas Water Development Board (TWDB). As a part of the planning process, each regional planning group may include recommendations for the designation of ecologically unique river and stream segments in their adopted regional water plan. Stream segment designation is to be supported by a recommendation package that includes a physical description, maps, photographs, literature citations, and data pertaining to each candidate stream segment.

The Neches River is an Ecologically Significant Steam Segment from the confluence with the Sabine Lake in Orange County upstream to Town Bluff Dam in Jasper/Tyler County. Documentation available from the State of Texas Parks and Wildlife Department describes this stream segment as follows:

- Biological function - extensive freshwater wetland habitat displays significant overall habitat value[27]
- Riparian conservation area - Big Thicket National Preserve; Lower Neches River Wildlife Management Area ; Part of the Great Texas Coastal Birding Trail
- High water quality/exceptional aquatic life/high aesthetic value - exceptional aesthetic value[28]
- Threatened or endangered species/unique communities - unique, exemplary, and unusually extensive natural community (NPS, 1995); Paddlefish (SOC/St.T) (TPWD, 1998) ; The most abundant and diverse unionid assemblage found to date in Texas; largest known population of

sandbank pocketbook freshwater mussels in Texas; one of the two largest populations of rare, endemic Texas heelsplitter freshwater mussels remaining[29]

Emergent Wetland – According to the USGS, the Emergent Wetland Class is characterized by erect, rooted, herbaceous hydrophytes, excluding mosses and lichens. This vegetation is present for most of the growing season in most years. These wetlands are usually dominated by perennial plants. All water regimes are included except subtidal and irregularly exposed. In areas with relatively stable climatic conditions, Emergent Wetlands maintain the same appearance year after year. In other areas, such as the prairies of the central United States, violent climatic fluctuations cause them to revert to an open water phase in some years (Stewart and Kantrud 1972). Emergent Wetlands are found throughout the United States and occur in all Systems except the Marine. Emergent Wetlands are known by many names, including marsh, meadow, fen, prairie pothole, and slough.

Forested / Shrub Wetland – According to the USGS, the Class Forested Wetland is characterized by woody vegetation that is 6 m tall or taller. All water regimes are included except subtidal. Forested Wetlands are most common in the eastern United States and in those sections of the West where moisture is relatively abundant, particularly along rivers and in the mountains. They occur only in the Palustrine and Estuarine Systems and normally possess an overstory of trees, an understory of young trees or shrubs, and an herbaceous layer.

Table 4.4 – Potential Environmental Impacts

Environmental Challenge	Alternatives		
		New Alignments	
	Existing Alignment	IH-10 Fixed Bridge	Pine St. Lift Bridge
Superfund Site		Yes	
Ecologically Significant Stream Segment	Yes	Yes	Yes
Freshwater Emergent Wetland		Yes	
Freshwater Forested /Shrub Wetland		Yes	Yes
FEMA Q3 Zone A (100 Year)	Yes	Yes	Yes

Implementation

The evaluation of implementation impacts includes a review of probable construction costs as part of a cost effectiveness assessment. Property impact costs, while not specifically estimated at this time, are discussed in broader terms as an influence upon project development.

Probable Construction Costs

The construction costs for the alignment concepts have been developed based upon major elements such as the river crossing bridge as well as the length of structural approach spans. These approach spans can be very long considering the potential height of the proposed rail, topography, and local soil conditions. For alignment comparisons, the quantity and associated costs of the rail were estimated

based upon new rail alignment and existing rail alignment. The existing rail alignments also considered whether the proposed track was within the existing rail right-of-way or adjacent to but outside existing rail right-of-way. The costs of track was varied depending upon upgrade of existing track, new track on-grade, new track on fill (typically up to 16 feet), new track on structure, and new track on river bridge. Only one of the two potential tracks is initially proposed for new track on structure and the river bridge. In order to be consistent with the structural availability for a second track, the earthwork for the future second track is included. If necessary, new rail sidings and connections are quantified. At this stage, the rail traffic control and signaling system as well as improvements to crossing warning devices at highways are included in the contingencies. Later on as roadway modifications (if necessary) are defined, separate line items may be included.

The costs shown in Table 4.5 only account for construction activities in today's 2012 dollars. The costs do not include right-of-way acquisition, design, permitting or construction inspection costs, or any annual maintenance costs. The potential for such costs should be considered when comparing alignments, particularly on those alignments that have significant property impacts. For comparative purposes, a summary of assessed values for potentially affected properties is provided and discussed in the sustainability section.

It is worth noting that when planning for a double track structure yet only initially constructing one of the two tracks, additional up-front costs are incurred to build a structure capable of supporting the second track. Consequently, alternatives with lengthy bridge structures include costs for initial construction but also future expansion. The new alignment adjacent to Interstate 10, which is primarily structure along its entire length, has initial costs to accommodate future expansion that are greater than the costs to install future track.

Table 4.5 – Probable Construction Costs

Including contingencies in 2012 $ millions

Segment	Existing Alignment	New Alignment	
	Lift Bridge	IH-10 Fixed Bridge	Pine Street Lift Bridge
Orange County	$ 40	$ 185	$ 35
Neches River bridge	$ 40		$ 80
Long Avenue	$ -	$ 5	$ 5
BNSF Connection	$ -	$ 10	$ 10
UPRR 3rd Main	$ 40	$ 40	$ 40
TOTAL	$ 120	$ 240	$ 170

Benefits

The projected conditions provide a means to assess potential future operations under an assumed growth scenario. Operational analysis indicates that current train volumes would benefit from a second track along the current river crossing. A no-action alternative would result in significant congestion. When reviewing the forecasted train volumes with additional track across the Neches River, delays are reduced by half when compared to a single track (existing physical conditions) scenario. In addition, as modeled through RTC, the lift bridge operations result in some delays, however that level is relatively minor. Future growth will demand a second track across the Neches River.

The IH-10 alignment with its fixed bridge has greater overall benefits than a second track on the existing lift bridge alignment. However review of where the benefits accrue indicates that the grade separation at the KCS-UPRR split at Tower 31results in a significant portion of those reduced delays.

Summary of Alternatives

Four alternatives have been assessed under forecasted conditions. The projected "no-build" alternative attempts to establish a baseline for comparison. This alternative establishes the fact that Beaumont's rail network would benefit from an additional river crossing. In addition to the "no-build" alternative, three "build" alternatives were evaluated that involved improving capacity by providing additional track as well as exploring operational issues associated with the lift bridge over the Neches River. The three alternatives concentrated on improving the existing rail route with a new adjacent lift bridge, a new rail alignment also with a lift bridge near the existing rail corridor, and a new rail alignment with a fixed river bridge crossing north of the existing rail corridor. A brief summary of the pros and cons of each build alternative are provided.

<u>Expand existing route to double track river crossing (lift bridge)</u>
This keeps the existing bridge in place and assumes it to be operational with a projected 16 lifts per week in the future case. In addition, a second lift bridge is considered immediately adjacent and north of the existing structure. While the RTC model's performance measures with the double track conditions improve over the "no-build" conditions, the delays under the projected train volumes are greater than under the 'base case'. This alignment alternative does not intrinsically address the delays associated with the KCS-UPRR split at Tower 31. As the proposed improvements remain adjacent to or within the existing rail corridors, impacts to the community are minimized. Infrastructure costs only for this improvement in the Beaumont area are estimated in 2012 construction dollars approach $120 million.

<u>New Pine Street alignment (lift bridge over Neches River)</u>
This keeps the existing bridge in place and assumes it to be operational with a projected 16 lifts per week. The Pine Street alignment was initially tested through the RTC model with a potential fixed river bridge crossing. However physical limitations determined that the only practical fixed river bridge crossing lies immediately adjacent to the IH-10 corridor. Consequently it was determined that the Pine Street alignment would be analyzed with a lift bridge. Nonetheless, that new lift bridge location created its own set of design issues that result in additional costs compared to constructing an adjacent rail bridge to the existing rail's river crossing. The alignment's tie in on the west side is likely to create significant adverse impacts to a neighborhood with property acquisition as well as impacts to vehicular operations at critical at-grade crossings that will only add to the probable construction costs. This

alignment alternative does not intrinsically address the delays associated with the KCS-UPRR split at Tower 31. Costs for this alignment are estimated in 2012 construction dollars approach $170 million.

New IH-10 alignment (fixed bridge over Neches River)

This keeps the existing bridge in place and assumes it to be operational with a projected 16 lifts per week. The new IH-10 rail alignment has potentially significant operational benefits by addressing two key issues, the delays associated with the lift operations of the river crossings as well as the grade separation of the KCS-UPRR split at Tower 31 on the east side of the Neches River. However, the alignment tie in on the west side is likely to create significant adverse impacts to a neighborhood with property acquisition as well as impacts to vehicular operations at critical crossings that will only add to the probable construction costs. This alignment is located close to an EPA Superfund site. Costs for this alignment are substantial and are estimated in 2012 construction dollars approach $240 million. While viewed from a railroad operational viewpoint this new alignment is the best within this study area. The overall rail network operations indicate that more systemic improvements outside the Beaumont area are required. The high degree of cost and probable impacts may be offset by any additional operational benefits.

Funding

Up to this point in the evaluation of alternatives, the emphasis of the analysis has been on the benefits, costs, and impacts of the different alternatives. Given that the alternatives under consideration are conceptually quite similar, it has been the assumption that the selection of a preferred alternative would not be significantly impacted by an analysis of funding options. Nonetheless, all three railroad companies would need to agree upon a specific solution and its funding which in turn could make public funding sources available. While the determination of potential funding sources for the proposed improvements is beyond the scope of this effort, a cursory review may be beneficial. For example, the presence of the Existing Alignment Alternative within a corridor currently used by Amtrak and that is part of the proposed Gulf Coast High Speed Rail project may make it eligible for funding programs that the other alternatives are not.

Funding mechanisms such as tolls, user's fees based on cars and/or weight, or the creative use of public / private partnerships would seem to be options for all the alternatives. The Texas State Rail Plan also presented a summary of Federal and State programs and grants available to Texas to fund improvement projects. This summary is in the Appendix. MAP-21, the Moving Ahead for Progress in the 21st Century Act (P.L. 112-141), was signed into law by President Obama on July 6, 2012. Funding surface transportation programs at over $105 billion for fiscal years (FY) 2013 and 2014, MAP-21 is the first long-term highway authorization enacted since 2005. SAFETEA-LU expired on September 30, 2009 and had ten extensions.

Summary Matrix

Utilizing the Transportation, Sustainability and Implementation categories of TxDOT's rail project prioritization framework, this Neches River Bridge Feasibility Study provides an assessment of the three "build" alternatives under consideration. The assessment is preliminary and the values assigned to the various criteria are subject to change with input from TxDOT. The matrix as shown in Table 4.6 offers an overview and a comparison of the potential impacts of the alternatives.

Figure 4.6 – Summary Matrix

Category	Criterion	Measures	Alternatives			Qualtitative Assessment
			Existing Alignment (new lift bridge adjacent to existing bridge)	New Alignments		
				IH-10 fixed bridge	Pine St. Lift bridge	
Sustainability	Economc Impact	Jobs	5	7	5	Higher construction cost will create more jobs, though this may be in conflict with program financial resources.
		Train Delay	3	5	3	While overall delays are the least with the fixed bridge option, the projected level of train volumes would result in significant delays throughout the entire rail network.
		Fuel Cost	3	5	3	Fewer delays result in less fuel consumption and therefore less cost, however in absolute terms the increase in delays is significant enough to result in increased fuel costs across the board.
	Environmental / Social Impact	Air Quality	3	5	3	Again, the alternatives can be compared on a relative scale amongst each other. Here the least train delay results in the best air quality and review of at-grade crossings indicates minimal enviornmental benefits. Under an absolutre scale, the overall network performance indicates a significant increase in delay and therefore a reduction in air quality.
		Energy Use	3	5	3	Again, the alternatives can be compared on a relative scale amongst each other. Here the least train delay results in the best energy use and review of at-grade crossings indicates minimal enviornmental benefits. Under an absolutre scale, the overall network performance indicates a significant increase in delay and therefore adverse energy use.
		Environmental	3	7	5	The Interstate 10 alignment may have the most significant environmental impacts. It goes through a Superfund Site, has the second longest crossing of Ecologically Sensitive Stream Segment, and crosses the greatest distance in wetlands/floodplains that may be home to T&E species.
		Social Impacts	3	7	7	Both of the new alignments will likely have the greatest community impacts. Homes, businesses, and churches will need to be acquired for the purposes of ROW. Livibility will be reduced as remaining properties will be impacted by increased noise and vibrations from increased train traffic. Right of way will essentially form a barrier between the north and south sides of the neighborhood. Social Justice will likely be a concern as well as the Long Avenue corridor is home to a relatiely low income minority population
	Asset Preservation	ROW	5	7	7	Either new alignment will help to preserve the Long Ave ROW. The improve existing KCS corridor with benefiots for passenger rail will help to preserve the rail corridor between College Street and Milam Street that crosses the existing Neches River rail bridge.
Transportation	Safety and Security	Safety	3	7	7	Increase number of grade separated crossings or improved at-grade rail crossing should help to improve safety. An increase in rail traffic along Long Avenue may increase the potential for accidnets in this residential area. While potentially offset from grade separations, such structres add costs and have other property impacts.
		Security	3	5	5	Communtiy access - more trains will mean a reduction in community access which will most likely be an issue along Long Avenue.
	Connectivity		5	5	5	Existing conenctivity is maintained through use of the existig rail corridor. All three alternatives are equal in this matter.
	Congestion Relief	Rail Travel Times	3	5	3	Improved travel times equate to less congestion - but may be off set by increased train traffic.
		Grade Separations	3	7	7	Reduced number of at grade crossings should help to relieve congestion.
	System Capacity	River Crossing Capacity	5	7	5	All alternatives increase capacity; perhaps the lift bridge alternatives less so than the stationary span
		Track Capacity	5	5	5	The "build" alternatives were specifically developed to provide an equal and comparable set of capacity improvements.
		Improved Signaling	3	3	3	Improved signalling is inherently provided within the rail network improvements. All three alternatives are equal in this matter.
Implementation	Cost Effectiveness	Cost Benefit	5	4	3	The overall cost effectiveness of any of the alternatives assessed is weakened by the operational analysis for the projected train volumes. While relative comparisons can be made amongst the alternatives, it can also be said that none of the alternatives achieve an adequate operation.
	Project Development	What stage is project at?	3	3	3	Each of the "build" alternatives is at the same stage of project development.
		Land Acquisition	3	7	7	The new alignment alternatives impact the largest number of parcels. In both cases the majority of these parcels appear to be privately owned. Both new alignment options also impact residential properties; but, also a relatively large number of parcels that are vacant / open space. These two alignments also have a high assessed valuation.
	Partnerships	Partnerships	5	7	7	The two new alignment alternatives require additional partnering efforts to determine ownership, maintenance, operational and fianncial structure and organization.
	Innovation	Technological	3	5	3	The high-level navigational clearance over the Neches River for a fixed bridge will result in structurally significant eleemnt on the landscape.
		Institutional	3	7	5	Construction adjacent to the existing railroad maintains the institutional status quo. The new alignments would require discussing a potentially new organization structure.

Legend
10 = Exceptonal level of impact/benefit
7 = Significant level of impact/benefit
5 = Moderate level of impact/benefit
3 = Minor level of impact/benefit
0 = No level of impact/benefit

REPLY VERIFIED STATEMENT OF JASON WILKERSON

TABLE OF CONTENTS

I. THE HOUSTON TERMINAL HAS TREMENDOUS CAPACITY WHEN OPERATED EFFECTIVELY 4

II. KCS'S THROUGH TRAINS IMPOSE MINIMAL STRESS ON HOUSTON-AREA CAPACITY 8

III. MY RECENT VISIT TO HOUSTON CONFIRMS THAT THERE ARE MANY OPPORTUNITIES TO IMPROVE OPERATIONS FOR THE BENEFIT OF ALL RAILROADS AND THEIR CUSTOMERS. 11

IV. THE CONTRACTUAL ARRANGEMENTS UNDER WHICH UP, BNSF, AND KCS SHARE TRACKAGE IN HOUSTON ARE WELL UNDERSTOOD AND PROVIDE FOR CAPACITY EXPANSION WHEN APPROPRIATE 12

1. I am Jason Wilkerson. I am employed by Canadian Pacific Railway Company as CP's Assistant VP for Transportation Canada. Previously, I was General Manager of the Prairie North Division, and prior to that I served as General Manager of the Eastern Division. I have been working in the railroad industry for more than twenty-four years in a wide variety of positions and have a great deal of experience in many aspects of railroad operations. Before joining CP, I spent nearly nineteen years working for Union Pacific Railroad in a variety of positions, in a scope that progressed from unionized jobs (track laborer, yardmaster), to management roles (yard and terminal manager, senior manager, director), and then to executive positions (superintendent, general superintendent).

2. I am providing this statement to address claims by Union Pacific Railroad Company ("UP") and BNSF Railway ("BNSF") that the anticipated growth in the number of CPKC trains operating through Houston following the implementation of the CP/KCS Transaction could cause "serious congestion and service issues" in "critical areas such as Houston" (BNSF-9-61), and that "additional capacity would be necessary at several locations in the terminal to prevent the projected jump in traffic from endangering operations in Houston." (UP-10 at 59).

3. I am in a position to address those assertions because, prior to coming to CP, I served in a number of operating positions at UP, including one that gave me an in-depth understanding of operations and capacity in the Houston terminal and the UP-owned lines radiating from Houston, including those over which KCS and BNSF operate. In particular, I served as Director of Transportation Services (DTS) for the Houston Service Unit from 2009 to 2013. In that role, I reported directly to the General Superintendent and had responsibilities for service levels and efficient operations for all trains that traversed the Service Unit including the

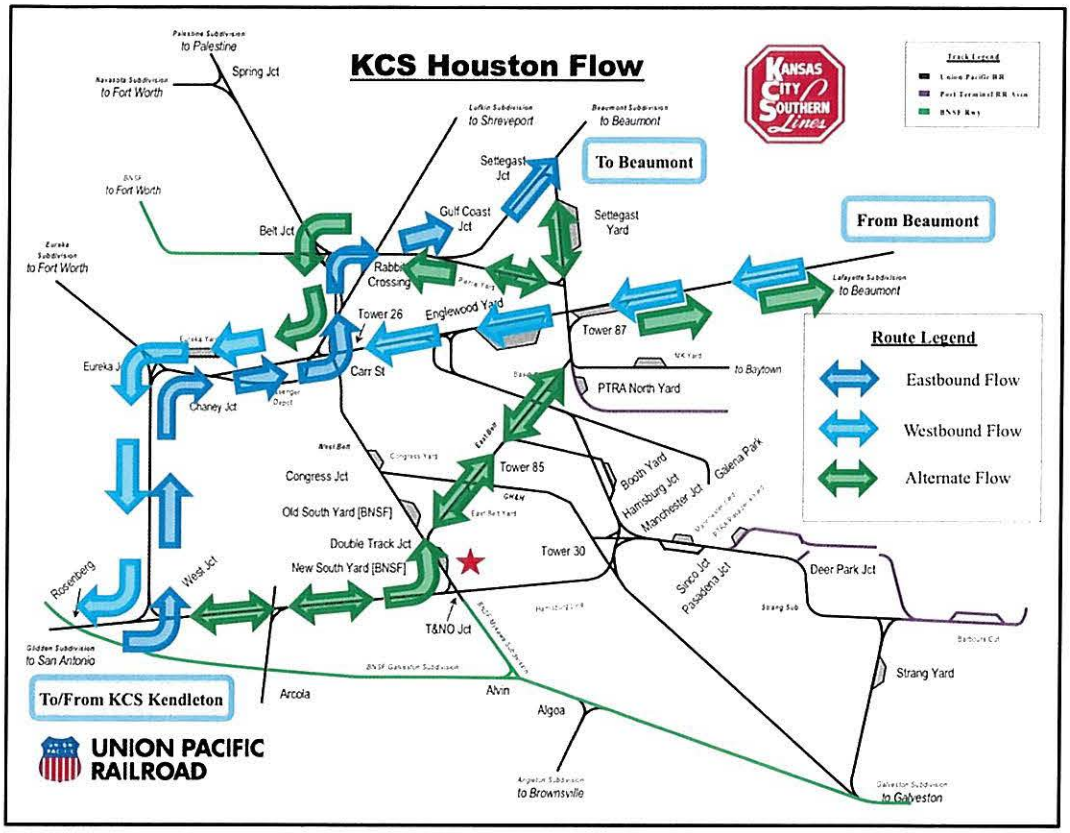
Houston complex, all yard and local trains, and all operations within yard and local facilities. Those responsibilities also included first and last mile service to local industries. Further, they included evaluating the operational changes that would be needed to accommodate business to ensure that it could be transported in the area without adversely affecting existing customers. As part of my DTS role, all field personnel, including yard and terminal personnel, reported up through me. I also had lead responsibility for the Houston Service Unit when the general superintendent was away.

4. My work for UP in the Houston terminal gave me an intimate understanding of how KCS and other railroads operate there, and the kinds of interactions that occur routinely among those railroads. For example, UP held monthly meetings with BNSF, which I attended, regarding strategic issues and longer term issues. UP also interacted with BNSF and KCS more frequently and as needed regarding tactical issues that arose from day-to-day in Houston operations. My responsibilities required me to work closely with the joint (UP-BNSF-KCS) Spring Dispatching Center (SDC) in Spring, TX (just north of Houston), from which all of the lines radiating from Houston are dispatched. KCS had a representative there along with UP and BNSF personnel (though KCS was not a full-fledged joint participant), and that representative was a regular point of contact for UP's interface with KCS over daily Houston operations. My role also involved regular interaction with the Port Terminal Railroad Association, the major switching railroad serving numerous customers in and around the Port of Houston. In short, cooperation among all the railroads serving Houston was well established from before my time at Houston, and there were clear lines of communications among those railroads, typically directly involving myself and the Spring Dispatching Center (SDC) as the UP representative.

5. To supplement the knowledge I gained while managing the Houston terminal for UP, I have reviewed available information about the current configuration of the infrastructure in the Houston terminal used by KCS trains and the operations that affect those trains. In late May and early June 2022, I visited the Houston complex onsite, allowing me to bring context to the current conditions based on the knowledge I had developed when I was previously responsible for running those same operations.

6. As I explain in the balance of this statement, I can say with confidence that UP and BNSF's assertions about the impact of the CP/KCS Transaction on Houston rail capacity are overblown. The Houston terminal complex has been capable of handling ebbs and flows in rail traffic that exceed--by a wide margin--the potential modest increases in CPKC train counts anticipated from the Transaction. The Houston terminal has ample capacity to handle that traffic, assuming that UP's and BNSF's own operations – which consume the lion's share of available capacity – are well managed, and that all of the railroads serving Houston are able to work together cooperatively to make things work for the benefit of all users. To the extent additional infrastructure turns out to be useful to improve the efficiency, the existing trackage rights terms among UP, BNSF, and KCS provide a well-understood and appropriate mechanism for ensuring those investments get made and the railroads using those assets share appropriately in their costs.

I. THE HOUSTON TERMINAL HAS TREMENDOUS CAPACITY WHEN OPERATED EFFECTIVELY



7. The Houston Terminal can be tremendously busy, but its infrastructure is built to handle those volumes. When I was UP's DTS in Houston, the complex regularly handled daily train volumes ranging from around 100 daily trains at the low end to 135 or more during busier periods. The mainline trackage serving the core of the Houston Terminal (and which KCS uses

to traverse Houston) is primarily double- or triple-tracked, and – unlike many terminals – it is configured in a way that provides multiple alternative paths from one side of the terminal to the other.

8. The efficiency of these operations is aided by the fact that dispatchers/representatives for all of the railroads in the Houston area – UP, BNSF, and KCS – are co-located in the Spring Dispatching Center. This coordination ensures that nobody's trains show up in Houston by surprise, enabling the routing of trains to be planned ahead of time to avoid evolving chokepoints. The availability and coordination of alternative routes is another major advantage for fluidity.

9. Figure 1 below is a diagram of Houston's basic mainline track layout, showing the alternative routes that are available for KCS trains moving across the terminal. This diagram was prepared by UP in the ordinary course to guide the UP dispatchers who control train movements in the terminal.

FIGURE 1
UP DIAGRAM SHOWING DIRECTIONAL FLOW OF KCS THROUGH TRAINS

10. The typical path KCS trains take across the terminal are shown with blue purple arrows. KCS's eastbound trains (heading towards Beaumont) move across UP's line from Rosenberg to West Junction, where they continue on UP's Houston Subdivision to downtown Houston, and then proceed via the Houston West Belt Subdivision to North Belt Junction and then traverse the Houston East Belt Subdivision to Gulf Coast Junction, leading them to UP's Beaumont Subdivision, which then moves into Settegast Junction and onto the eastbound directional running toward Beaumont, Texas. KCS's westbound trains (coming from Beaumont) arrive in Houston on UP's Houston Subdivision (which used to be called the Lafayette Subdivision as shown on this diagram), proceed past UP's Englewood Yard through Eureka Junction down to West Junction, entering the Glidden Subdivision and then continuing onward to Rosenberg. But as the diagram shows, there are well-understood alternative routes that can be

used to bypass congestion and keep trains moving. Furthermore, the diagram does not show all of the available routes, which include but are not limited to the East Belt, West Belt, Bell Main, and the Harrisburg Subdivision. Under the Board's "any clear route" dispatching protocol, KCS trains can use any of these routes, and UP's dispatchers should use that discretion to keep trains moving and preserve the fluidity of the complex for all railroads.

11. During my time in Houston, UP was continually investing in infrastructure replacement and capital expansion. UP did substantial work in the area to reinvest in existing infrastructure and bring it up to UP standards during my tenure on the Houston Service Unit, which resulted in increased capacity. For example, at Englewood Yard, UP installed new ties, made upgrades to the hump facility, and improved the Bell Main. At Settegast Yard, various projects were undertaken, including a tie program. In addition, on a portion of the Palestine Subdivision between Belt Junction and Spring Junction, concrete ties were installed. Similar upgrades were made during my time at UP within the Houston complex and across the service unit. In addition, UP initiated numerous capital expansion projects during my tenure, including creosote expansion, multiple tower connections, Hardy Toll Road staging tracks, Settegast Yard staging tracks, and double-tracking a portion of the Glidden Subdivision from West Junction just short of the Brazos River Bridge near Rosenberg. Significant improvement and capital expansion continued–and new projects were initiated--even after my time there, in order to further enhance fluidity, remove bottleneck issues, and improve customer service.

12. During my time at UP, the company recognized that its growth in the Southern Region would put strains on its infrastructure, particularly in the Houston complex. There was a lot of talk about the benefits associated with UP's planned investment in an entirely new hump yard (known as Brazos Yard) in Hearne, Texas, about 100 miles northwest of Houston. UP's

plan to reallocate capital dollars to that yard would improve operations and enhance customer satisfaction at existing UP facilities within the Houston Service Unit (in particular in the Houston complex) as well as throughout the entire Southern Region. I understand that plans for Brazos Yard were substantially cut back after I left UP and the project has since been moth-balled.

13. During the time I was in Houston, train volumes in the terminal fluctuated a good deal for a variety of reasons – some seasonal, some driven by business cycles, some by strategic decisions made by the operating railroads serving Houston, and many others. If CPKC is successful in attracting the anticipated traffic growth, the extra eight trains a day or so that might operate across Houston would fall well within the range of the normal ebb and flow of volumes. The current infrastructure is well equipped to handle this traffic.

II. KCS'S THROUGH TRAINS IMPOSE MINIMAL STRESS ON HOUSTON-AREA CAPACITY

14. In Houston, like in many other terminals, not every train imposes equal demands on railroad capacity. KCS's operations (just like CPKC's future operations) are at one end (the *low end*) of this spectrum. By plan, KCS through trains traverse Houston without stopping for work or to change crews. From a dispatching perspective, they are the easiest trains to move, provided other operations are well managed so that those other operations do not occupy the mainline track capacity needed for fluid through-train operations. CPKC's planned new train services will operate through Houston the same way, imposing minimal burdens on Houston infrastructure, especially in comparison to the operations of UP and BNSF.

15. In my years as UP's DTS in Houston, I do not recall any issue with KCS's operations, other than maybe one locomotive failure. KCS was never the root cause of a problem within the Houston complex. In fact, KCS was a highy collaborative partner. For example, the KCS and UP operations and service design teams collaborated in 2010 after Hurricane Alex to design new interchange and blocking options to mitigate customer impact and

train congestion, not only through UP's Houston Service Unit but throughout both railroad's networks. I never heard a complaint or issue that arose because of KCS within the Houston complex.

16. The operations of UP and BNSF, on the other hand, place much more intense and complex demands on Houston rail infrastructure. These railroads operate far more trains into and out of Houston than KCS does, or than CPKC will. In addition, each of those trains consumes more of the Terminal's capacity than KCS (or CPKC) trains. UP and BNSF use Houston as a crew change point, and they originate, terminate and (especially in UP's case) classify massive volumes of carload traffic in yards within the Houston complex. That means that trains must enter and exit yards, and at times must be staged outside of yards waiting for yard track space.

17. Dozens of UP trains enter and exit UP's Houston-area yards – especially the Englewood hump yard, but also Settegast, Strang, and others – on a daily basis, and those yards also serve dozens of local switching operations of BNSF, UP, and PTRA. To the extent traffic volumes create challenges in Houston, it is because of these activities, not getting KCS through trains across town. But good management of these issues enables the terminal to work smoothly. To reiterate, there are available alternative routes. If these are used effectively by dispatchers and coordinated well by the yards, they ought to be available to ensure that large numbers of through trains can traverse the Houston terminal without undue delay, and without themselves interfering with the operations of other trains.

18. To be sure, there were times during my Houston tenure when UP struggled to dispatch KCS trains across Houston in a timely manner. But this had nothing to do with the operational needs of the KCS trains. Instead, it happened when other aspects of UP's and

BNSF's operations were not working as smoothly as they should. Most often, problems in the Houston complex arose from a lack of operational planning/execution in and around yards.

19. For example, when UP's inbound trains have to wait to enter Englewood Yard or Settegast Yard, or when UP is short of crews for outbound trains and needs to move trains to make space inside the yard to process incoming trains, available mainline capacity can be reduced. More specifically, the ability of Englewood, Settegast, and--to a lesser degree--the satellite yards (Strang, Basin, Galena Park, etc.) to take the trains as they arrived tended to be the key determining factor. These types of issues at UP affected the ability of KCS's trains to move in and through the terminal.

20. Service interruptions at BNSF and UP –such as a locomotive failure, crew unavailability, mechanical car issue, weather, etc. – were also big drivers of issues in the terminal. These failures, if not managed properly, have the potential to cause further cascading effects such as blocked mainlines, occupied interlockers, crews running out of allowable work time, and similar problems.

21. A portion of the issues caused by BNSF arose at shipper facilities that UP and BNSF jointly served. When BNSF did not pull cars as scheduled, UP was prevented from spotting and/or pulling their own cars on schedule. This caused trains to consume branch line or mainline capacity, which could cause rippling effects in the terminal.

22. In my experience, there is ample capacity in the Houston terminal for projected traffic as long as the terminal is managed properly. I explained above how UP or BNSF problems could cause cascading issues that impact the fluidity of the terminal and KCS trains. However, the impact of these issues on mainline throughput depends primarily on how well UP (and to a lesser extent BNSF) manages their own operations in the area. If issues are managed

properly and effectively compartmentalized, delays and congestion do not have to cascade. I know how the terminal operates. It is complex. However, KCS trains should be free to navigate through the complex as long as UP and BNSF manage the property well and execute their plans efficiently to make sure the flow is maintained. If problems arise, it is imperative that all parties commit to real-time transparency and collaboration in order to minimize negative impacts to the overall complex.

III. MY RECENT VISIT TO HOUSTON CONFIRMS THAT THERE ARE MANY OPPORTUNITIES TO IMPROVE OPERATIONS FOR THE BENEFIT OF ALL RAILROADS AND THEIR CUSTOMERS.

23. My recent visit to the Houston area revealed that there are considerable opportunities to improve operations in the Houston area with more attention, transparency, effective communication, collaborative planning, tactical execution, accountability, and long-term strategic vision.

24. For railroads, infrastructure additions are not the first solution for potential capacity constraints. The first option is always an analysis of the current operations and opportunities to improve. Houston is ripe with such opportunities, and CPKC would look forward to working with both UP and BNSF to improve operations in that area for the benefit of all three railroads and their customers.

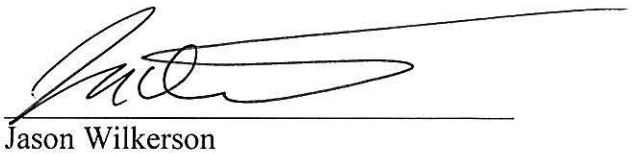
25. By way of example, on my Houston visit in May/June, I engaged with a number of KCS managers and train crews. There is no doubt that there are opportunities to improve mainline capacity utilization by making operational design adjustments. To my surpise, some of the problems are the same issues we had overcome during my time with UP in the Houston complex. For example, dispatching protocol in and out of Englewood, blocking of critical interlockers, operational design, capital and engineering renewal programs, and overall collaboration and communication. Union Pacific may not have fully considered the effects on

the broader network in Houston when redesigning, unwinding past practices, and planning its own operations for its own convenience. It was evident to me that it would be highly beneficial to have CPKC management on the ground, with open lines of communication between UP and BNSF representatives. CPKC would look forward to working with all stakeholders in Houston to find mutually beneficial strategies to improve fluidity and customer satisfaction.

26. I obviously do not have a complete grasp of all of the constraints that affect UP and BNSF operational planning choices. However, the principals of transparency and communication remain vital and there are opportunities to improve. During my visit, I learned that UP has stopped sharing certain information and key operational metrics relevant to the Houston terminal. By properly sharing these metrics, all railroads will improve their ability to identify systemic issues in real-time and via data mining. This would enable tactical adjustments, root-cause analysis, development of countermeasures, communication/transparency of countermeasures, implementation and execution, and appropriate consequences if applicable.

27. My on-the-ground observations also confirmed my judgment that that there is plenty of capacity to operate trains through Houston. Since my time working in Houston, there has been substantial investment in additional capacity, providing even more ability to move trains across the Houston terminal.

IV. THE CONTRACTUAL ARRANGEMENTS UNDER WHICH UP, BNSF, AND KCS SHARE TRACKAGE IN HOUSTON ARE WELL UNDERSTOOD AND PROVIDE FOR CAPACITY EXPANSION WHEN APPROPRIATE



28. I understand that both BNSF and UP have suggested that CPKC be required to go through a special process to identify and pay for capacity needs before adding any traffic though Houston. This makes no sense to me. There is a well-established procedure and a long-standing precedent determining how capital is allocated based on joint-use assets and trackage rights agreements. Based upon my knowledge of the Houston complex, the current infrastructure is

more than sufficient to handle the additional CPKC trains on top of the normal variable volume from the other carriers, and this doesn't even include the soon-to-be completed projects.

VERIFICATION

I, Jason Wilkerson, declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on this 11 day of July, 2022.

Jason Wilkerson

1. I am Nick Walker, CP's Vice President of Operations for the Western Region. I started at CP in 2005 as a conductor. I was based in Bensenville, Illinois between 2005 and 2013, where I took on increased responsibility for CP's operations there. I was promoted to Yardmaster in 2009, Field Placement Coordinator in 2010, Supervisor of Operations later in 2010, and Chicago Trainmaster in 2011.

2. In July of 2013, I was transferred to St. Paul, MN, where I worked as Trainmaster and then Assistant Superintendent. I then worked as the Assistant Superintendent for the Winnipeg Terminal briefly in 2016 before returning to Bensenville as the Superintendent for the U.S. East – Bensenville Terminal from July 2016 to April 2017. After serving in that position I stayed in Chicago until 2020 as CP's General Manager for the U.S. East and then Assistant Vice President of Operations. In those positions I was principally responsible for CP's design of its planned reconfiguration of Bensenville Yard discussed in the Amended Operating Plan.[1] I worked on Bensenville and Chicago operations and dispatching throughout this time. I also have years of experience managing CP's relations with Metra, including during my time as Superintendent for the U.S. East – Bensenville Terminal.

3. In September 2020, I was promoted to my current position, and am now based in Calgary, Alberta. CP's operating team still regularly consults with me concerning Chicago-area rail operations. My years of knowledge and experience with Chicago give me a thorough and unique understanding of CP's operations in Chicago and how those operations interface with the operations of Metra and other freight railroads.

4. Given my experience, I was asked recently to review Metra's Comments and Request for Conditions and Supplemental Comments in this proceeding. I am providing this

[1] *See, e.g.* Amended Operating Plan ¶¶ 168, 303-07.

Reply Verified Statement to address assertions by Metra made therein regarding CP's dispatching of Metra's MD-W and MD-N lines and performance of Metra trains on those lines.

5. As discussed below, I have concluded that Metra's criticisms regarding delays on the MD-N and MD-W lines are unfair, misleading, and in many cases incorrect. Leaving aside that only delays west of Bensenville on the MD-W line are even relevant – because the Transaction will not otherwise increase traffic on those lines – I emphasize several points.

- First, most of the delays Metra refers to concern delays at Bensenville Yard, which will be alleviated by the Bensenville Reconfiguration I helped design.
- Second, while Metra suggests that there are a large number of delays on these lines, the number of delays – when viewed in proportion to the total number of Metra trains on these lines – is small. Metra's overall on-time performance on CP-dispatched lines is good, and delays associated with freight trains are a small fraction of all the delays to Metra's trains that figure into the OTP calculations. Metra's performance on CP-dispatched lines compares favorably to its performance on other nearby freight railroads that host Metra service.
- Third, taking dispatching away from CP is unwarranted and would harm – not help – the efficiency of rail operations on the lines Metra and CP share, to the disadvantage of Metra and CP alike.
- Fourth, Metra's various other concerns are simply unfair. Metra suggests that CP sometimes wrongly dispatches Metra trains on the other side of the tracks from the side anticipated by passengers, but this is not standard practice and when it does happen it is neither unsafe nor inappropriate, but good dispatching.
- Fifth, Metra's complaint about two instances in early 2019 when CP and Metra did not agree about the addition of Metra off-peak trains on the MD-N line ignores the circumstances of these requests and also ignores the long history of CP supporting the expansion of service on both the MD-N and MD-W lines.
- Finally, I point out that Metra's complaints about PTC implementation involve matters that are in the past and – like Metra's other complaints – have nothing to do with the CP/KCS Transaction

I. CP DISPATCHES THE LINES IT SHARES WITH METRA RESPONSIBLY AND WELL

6. As I explain in this part of my testimony, CP is responsible for dispatching all freight and passenger operations on the lines that CP and Metra share – Metra's MD-N and MD-

W lines which are part of CP's Chicago and Milwaukee and Elgin Subdivisions. CP performs those responsibilities well, with proper and diligent regard for the priority to which Metra is entitled under the governing trackage rights agreement between CP and Metra. Metra's assertions that CP does a poor job dispatching Metra's trains are wrong.

A. CP Dispatchers Understand the Importance of Giving Metra Priority

7. CP dispatches the MD-W and MD-N lines from its U.S. dispatching center in Minneapolis, MN, which will be moving to Kansas City as part of CP/KCS's consolidated headquarters there. CP's dispatchers are experienced and well trained to handle all trains on the lines and dispatch them efficiently. They are supervised by the Director of Dispatching and given instruction in the priorities of the scheduled passenger trains that operate over the MD-N and MD-W lines (both Amtrak and Metra), and in Metra's case they understand the peak-period windows during which CP's trains are not to interfere with Metra's trains except in emergencies. Dispatchers oversee safe and efficient train movements, plan meets and look out to ensure proper planning for inbounds, outbound and over the road performance.

8. CP takes concrete steps to help ensure that Metra's trains perform well on the MD-W and MD-N lines. CP's freight trains on these lines are scheduled to operate outside of Metra's peak windows, either overnight or between the morning and afternoon rush hour periods. As I explain below, we time the departures and arrivals of CP's freight trains to minimize the possibility that they result in delays to Metra trains. And, when Metra's own operations encounter difficulty, we step in to help. For example, I know of situations where CP has interrupted its yard operations to dispatch a yard locomotive to move a disabled Metra train, allowing other Metra trains to proceed and preventing Metra passengers from being stranded.

9. I have reviewed Metra's allegations about instructions given to CP dispatchers by CP "senior management" regarding the treatment of Metra's trains. I am personally offended by

Metra's suggestion that there has been a lack of leadership commitment to supporting Metra. That is just not the case. As I explain further below, CP has worked hard to perform well for Metra.

10. Metra witnesses make the specific accusation that "dispatchers have been directed by senior management to move CP trains, regardless of the impact on the network." METR-7 at 38. Metra ultimately acknowledged that it was referring to "management," not "senior management."[2] Either way, this assertion is unfounded. Metra knows or should know that CP's "senior management" has been and remains committed to supporting Metra's operations and honoring CP's obligations to dispatch Metra's trains well, with or without the Transaction. In addition, CP dispatchers consider a number of factors and circumstances when dispatching a train, many of which Metra is not privy to, and no decision to move CP trains instead of Metra trains would ever be made "regardless of the impact on the network."[3]

11. I looked closely at the specific examples cited by Metra regarding supposed "directions" by senior management (based on the identification supplied in Metra's discovery responses),[4] and while I was not personally involved in any of the specific dispatching decisions Metra refers to, it is very clear that there was no direction "to move CP trains, regardless of the impact on the network." *Id.* Instead it appears that CP's dispatching decisions were made with a

[2] *See* Deposition of Rich Oppenheim, dated June 7, 2022 ("Oppenheim Dep Tr.") at 195:21-23 ("I would be very happy if you . . . wanted to take the word 'senior' out of that statement and just say it was management.").

[3] *See id.* at 182:7-184:22 (Mr. Oppenheim acknowledging that he did not know the "operating circumstances" informing a dispatching decision he criticized).

[4] *See* METR-7, Oppenheim Verified Statement ("Oppenheim V.S.") at 11 (citing Exh. B-2 at 329); METR-7 Godfrey Verified Statement ("Godfrey V.S."), at 6; Metra, Objections and Responses to Applicants' First Requests at 6-9, 14-16 (Apr. 11, 2022) (Exhibit 1 hereto); Oppenheim V.S., Exhibit B-2 at 204, 252-53, 256, 291, 331.

broader appreciation of the network – including both passenger and freight trains taken together – than Metra realizes. (I explain below how CP's broader network perspective actually benefits Metra's trains operations.)[5] There may be room for a difference of opinion about how individual decisions were made about the specific facts and circumstances in front of a CP dispatcher (and it would be fair to say that from time to time some dispatching decisions can be criticized, especially with the benefit of hindsight). I am not intending to say that every single dispatching decision that Metra says delayed its trains was the correct one. But I am saying that it is impossible to judge those decisions without access to all of the details – network-wide – about the circumstances that informed them. More importantly, none of the decisions cited by Metra reflect any "direction" to disregard impacts on Metra trains. In fact, it would have been counterproductive for CP to make decisions that disregarded those impacts, since blocking Metra's trains needlessly would clog up the network, undermining the movement of all trains – freight trains included.

12. I also note that one of the emails that Metra's witness Mr. Oppenheim cites as support for his claims includes some very positive comments about CP's general approach toward Metra. Before laying out some perceived facts about a single incident in question, the email says: "Let me preface this by saying *how much we appreciate CP's recent willingness to discuss our respective operational concerns* and the need to work together to insure that our goals [are] met," and it goes on to say that, "[a]s we have said repeatedly on our calls, we *truly believe that CP's intentions are sincere in trying to protect Metra's schedules*."[6] In this email, Mr. Oppenheim goes on to describe a single incident where he alleges that a Metra train was

5 *See* Part II.B below.

6 Oppenheim V.S., Exh. B-2 at 204 (emphasis added).

delayed unfairly by a dispatching decision that did not properly respect Metra's peak windows. I was not involved in this incident and do not know why this decision was made or who made it. CP has investigated this allegation, but has been unable to definitively determine who was involved or what happened – in part due to Mr. Oppenheim's own unwillingness to divulge the details CP would need to properly investigate.[7] Nonetheless, if Mr. Oppenheim's description of the incident is accurate (and I have no idea whether it is), I agree that the dispatching decision as he describes it was unacceptable. But I believe that Mr. Oppenheim's focus on this one incident is the exception that proves the rule: It shows that CP *does* respect Metra's windows; otherwise Mr. Oppenheim would have been able to come up with more than one incident like this one. I have never allowed a dispatching decision like the one Mr. Oppenheim alleges to occur on my watch, and have no intention of doing so in the future.

B. Metra's Own Performance Data Confirms that CP Dispatches Metra's Lines Effectively

13. In addition to Metra's misguided suggestion that CP dispatchers are "directed" to ignore delay to Metra's trains, Metra also implies that CP dispatchers are bad at their jobs. Metra fills page after page cataloging delays that it blames on CP dispatchers and asserts that CP's dispatching of Metra trains is subject to "continual," "routine[]," "weekly," "intentional," "troubling," "serious," and "inevitable" delays. METR-7 at 11, 17, 33, 38, 61, 66, Godfrey V.S. at 6.

14. I strongly disagree with Metra's characterizations. No railroad – even one that only hosts passenger operations – is free from delays relating to dispatching and other causes.

[7] Oppenheim Dep. Tr., at 170:4-8, 171:9-10 (Q. "I'm entitled to ask about circumstances and try – and try and see whether you have knowledge that's accurate and what that information is. We're entitled to respond to your allegations." . . . . A. "[T]his name was given to me in confidence.").

The MD-W and MD-N lines are no exception. But CP's dispatchers perform well, and the delays that do occur are simply the product of the vagaries of railroad operations, especially in a complex operating environment like Chicagoland where dispatchers must make difficult decisions based on the entire network, not an individual train. As Metra's chief dispatcher, Mr. Godfrey explains, even at Metra dispatchers are taught to prioritize an individual freight train over an individual passenger train if that is better for the network in that instance.[8]

15. More importantly, and contrary to the inference that Metra wants drawn from its "delay" data, the objective hard facts show that CP performs well, and Metra is wrong to denigrate CP's performance. A review of all of the data – drawn directly from Metra's own reporting – shows that Metra's portrayal of train performance on the MD-N and MD-W lines is incredibly misleading.

16. There are three principal ways in which Metra's presentation of delay data is misleading:

- Metra witnesses focus solely on trains that were delayed, and not the much larger group of trains that were not delayed at all.
- Metra witnesses examine only the delays that were associated with CP freight trains and not the much larger group of delays that had nothing to do with CP.
- Metra witnesses report delays regardless of whether those delays had anything to do with CP's dispatching performance, or relate at all to the portion of Metra's lines that will be affected by the CP/KCS Transaction.

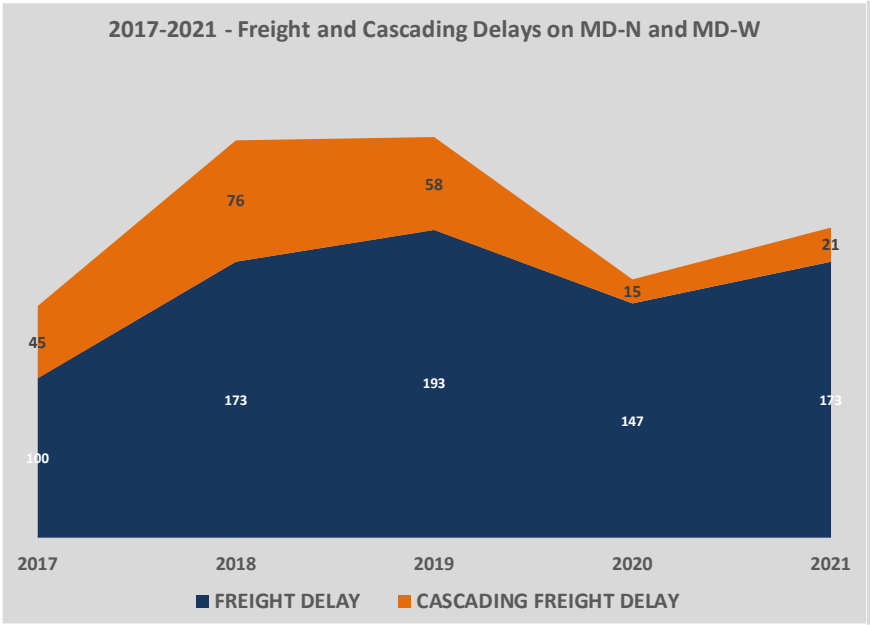
17. I review all of that data below to demonstrate that CP in fact dispatches Metra trains quite well.

18. I start with the data presented by Metra witness Greg Godfrey, Metra's chief dispatcher since late 2019. He draws on Metra's "TOPS" database to present the delays incurred

[8] *See* Deposition of Greg Godfrey, dated June 9, 2022 ("Godfrey Dep. Tr.") at 81:17-86:10.

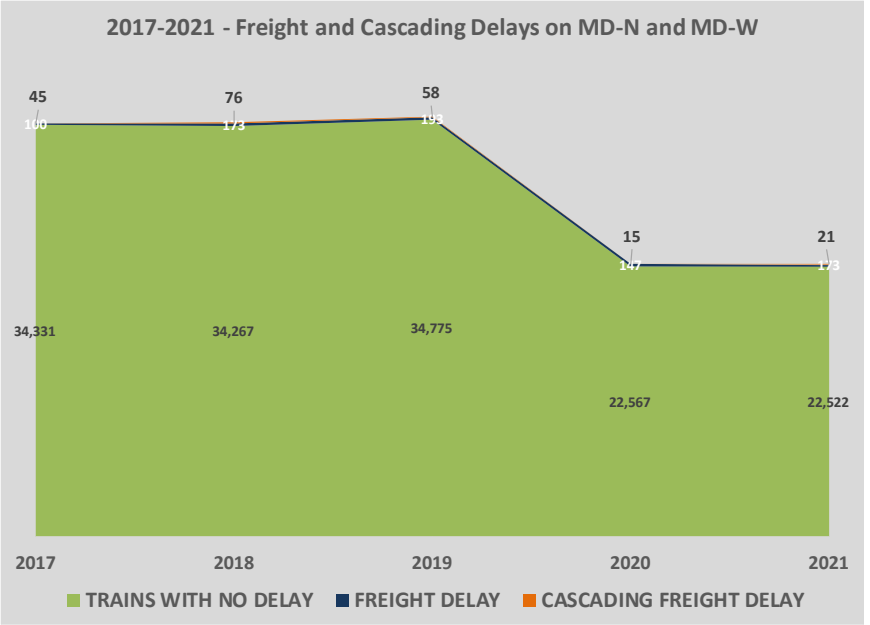
by Metra trains since 2000 as a result of the presence of CP freight trains, a small set of all the delays Metra trains experienced, and an even smaller set when compared to all the trains Metra operated that were not delayed at all. He uses this data to support his claim that "from 2000 to 2021 on MD-N and MD-W . . . freight-related delays impacted 1.23 million Metra customers with delays totaling 57,048 minutes, or nearly 40 days and nights."[9]

19. This presentation is incredibly misleading. First of all, the only "delays" presented were those related to CP freight trains. As Mr. Godfrey testified at his deposition, those delays were only 12 percent of the delays that Metra trains, and passengers, incurred. The balance – i.e., the vast majority (88 percent) – were the result of causes having nothing to do with CPs freight trains.[10] These causes include Metra equipment issues, delays loading and unloading passengers, and many other causes.



20. Second, Mr. Godfrey presents the delays supposedly caused by CP freight trains entirely out of context. His presentation fixates solely on the Metra trains that were delayed but ignores all of the Metra trains that were not delayed. When compared to the total number of trains that Metra operated over the MD-W and MD-N lines over the same period, the delays are tiny. Less than about one percent of Metra's trains incurred delays as a direct result of some issue relating to CP freight trains. In the chart set forth in Figure 1 on the next page, I recreate Mr. Godfrey's chart for the period 2017-2021 (the period for which Metra's TOPS data is available on Metra's website in its monthly on-time performance reports). And then, in the right-hand panel, I add in (in the green-shaded area) the trains *that did not incur* the direct and indirect delays that Mr. Godfrey reports. As the chart on the right shows, the supposed freight-

9 Godfrey V.S., at ¶ 9.



10 Godfrey Dep. Tr., at 45:3-14.

caused delays (the blue and orange lines) are almost invisible when considered against the backdrop of Metra's overall performance on the lines dispatched by CP. Metra witnesses have in effect chosen to keep out of view the much larger part of the iceberg that is underwater.

FIGURE 1[11]
METRA'S MISLEADING PRESENTATION OF "DELAY DATA"

AS PRESENTED BY METRA WITNESS GODFREY

REVISED TO INCLUDE METRA TRAINS NOT DELAYED BY "FREIGHT"

11 *See* "Workpaper_Walker_Godfrey_Rodriguez.xlsx," Tabs "Godfrey 2017 to 2021" and "Godfrey 2017 to 2021 Revised."

21. I also looked at a separate set of data that Mr. Godfrey presents, which was compiled by Metra witness Rodriguez (and attached to his Verified Statement). The dataset was intended by Metra to reflect a more "systematic" review of delays associated with CP freight trains.[12] That data, however, is equally inconsistent with the rhetoric of the Metra witnesses.

22. Mr. Rodriguez kept track of all delays to Metra trains on the MD-N and MD-W lines between February 2020 and October 2021 caused by CP's freight trains (a subset of all freight train-cased delay, given that UP, IHB, BRC, and other railroads can contribute to freight-caused delays on these lines).[13] This data was presented as more complete because it included delays that did not necessarily result in the train being late at its final destination. The total number of delays over this period was only 337, meaning that the presence of CP freight trains caused delays to only 0.81% percent of Metra's 41,709 trains on these lines over the 21 months according to Mr. Rodriguez's "systematic" data. [14] That is hardly an indictment of CP's dispatching performance.

23. Focusing on the MD-W line, which is the only line where the Transaction will affect train counts, tells a similar story. Of the 273 MD-W line delays Mr. Rodriguez lists as having been "caused" by CP freight trains, 44 were "non-controllable" by CP and had nothing to do with CP's dispatching – like trains going into emergency or broken knuckles on CP freight trains.[15] Another meaningful portion – 25 – were so-called "indirect" delays, which reflected

[12] *See* Godfrey V.S. ¶ 10.

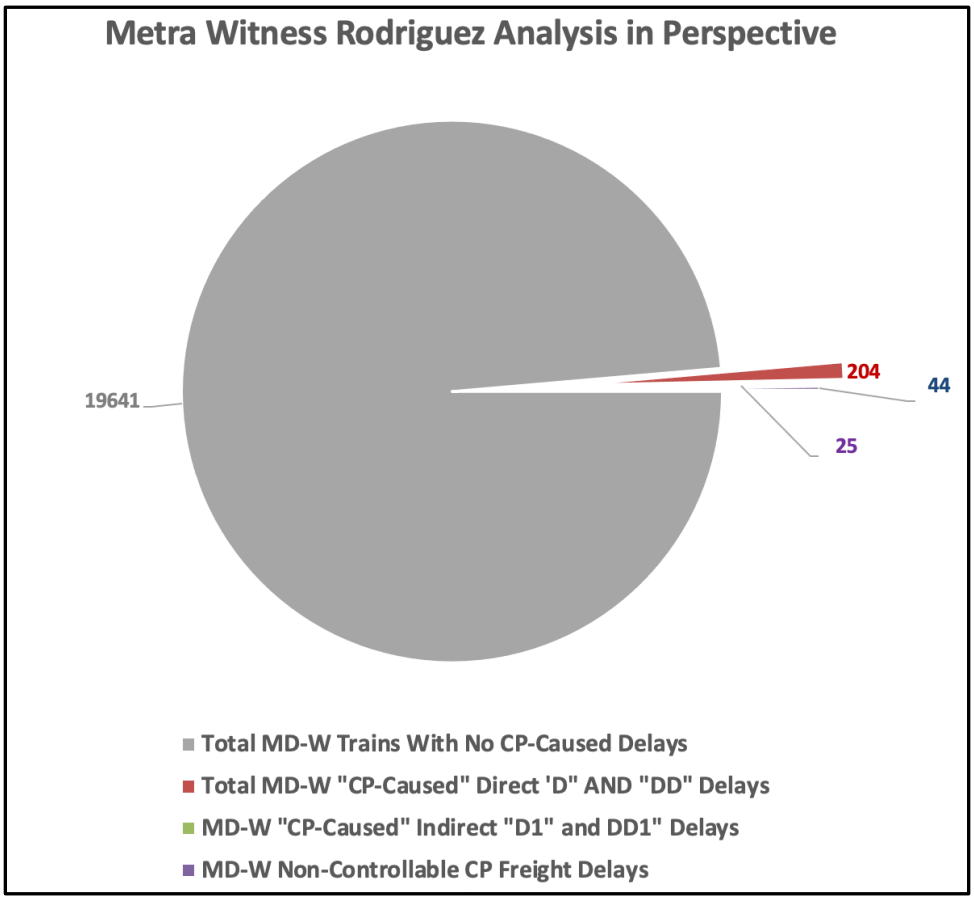
[13] *See* Rodriguez V.S., Exh. D-2; *see also* Deposition of David Rodriguez dated June 8, 2022 ("Rodriguez Dep. Tr.") at 45:3-9, 68:17-25.

[14] *See* Rodriguez V.S., Exh. D-1; "Workpaper_Walker_Godfrey_Rodriguez.xlsx," Tab "Rodriguez Data."

[15] *See* Rodriguez V.S., Exh. D-1.

Metra trains starting out late at origin because of a prior delay to the same equipment.[16] A proper assessment of the number of incidents where CP freight trains or CP dispatching decisions led to a delay would exclude these events, a point Metra witnesses agreed with.[17] Indeed, Mr. Rodriguez admitted that some delays captured in his spreadsheet could not have been avoided and may not have been CP's fault, or that better dispatching may not have been able to prevent the delay.[18] For example, Metra's data does not distinguish to delays caused by CP's dispatchers from delay that resulted from decisions by another railroad's dispatchers – like IHB, UP, or BRC – affecting the movement of CP freight trains moving to or from those lines.[19]

24. Removing the "uncontrollable" and "indirect" categories from Mr. Rodriguez's tally yields 204 "controllable" delays supposedly caused by CP freight trains over a 21 month period. Figure 2 below puts this figure in context with the total number of trains Metra operated over this line during the same period. In short, 99 percent of all MD-W trains did not encounter any CP-caused freight train interference or dispatcher-cased delay.



16 *Id.*

17 *See* Godfrey Dep. Tr., at 100:22-102:15.

18 *See* Rodriguez Dep. Tr., at 90:21-91:8, 91:23-92:7.

19 Godfrey Dep. Tr., at 59:16-60:7.

FIGURE 2[20]
NEARLY ALL OF METRA'S MD-W TRAINS INCUR NO CP-CAUSED DELAY

25. Another interesting feature of Mr. Rodriquez's "systematic" data review is that it essentially disproves Metra's suggestion that its own TOPS data is incomplete and overlooks lots of delays caused by CP freight trains that do not result in the trains being late at their final destinations. In fact, over 21 months Mr. Rodriguez identified only nine occasions when this occurred (the lines shown in black on Mr. Rodriquez's exhibit).[21] That's an "extra" (not in TOPS) very short delay only every two months and ten days or so.

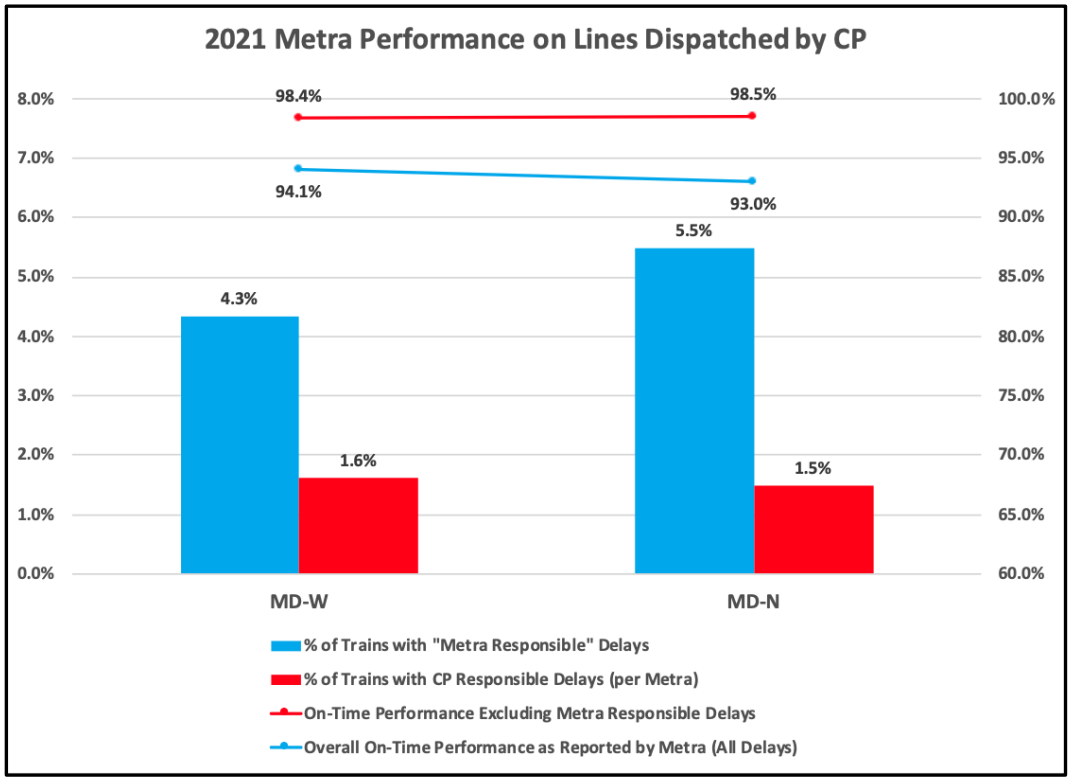
[20] *See* "Workpaper_Walker_Godfrey_Rodriguez.xlsx," Tab "Rodriguez in Perspective."

[21] Rodriguez Dep. Tr., at 78:25-79:8, 81:3-14; Rodriguez V.S., Ex. D-1.

26. Nonetheless, looking only at the MD-W line delays and including the brief delays that did not cause Metra trains to be late, I totaled up the number of minutes of direct *and indirect* delays (for delays Metra classifies as controllable (or "semi-controllable")) that appeared in Mr. Rodriguez's delay data. All of that delay works out to an average of *7.2 seconds* of delay per Metra train that traversed the MD-W line in that timeframe.[22]

27. To put all of this in context, I examined more deeply Metra's own data reflecting the performance of Metra's passenger trains on CP-dispatched lines and the various sources of train delay reported publicly by Metra on a monthly basis in its "On Time Performance Reports" published on Metra's website. As Metra's reports explain, Metra treats trains as being on time if they arrive at their destination in fewer than six minutes of the scheduled time, and Metra states that its goal is to achieve 95 percent on-time performance.[23] For every train that is delayed, Metra assigns a reason for the delay – some of which are the responsibility of the freight railroad over which Metra operates (*e.g.*, freight train interference) and some are the responsibility of Metra (*e.g.*, mechanical breakdowns and weather). Unlike Metra's witnesses, who focused solely on freight train related delays, I looked more broadly at the performance of Metra's trains overall.

28. Assessed against Metra's own standards, CP's dispatching on the MD-W and MD-N lines over which Metra operates is superlative. Figure 3 below reports Metra data covering all of 2021 to demonstrate the following:



- On both the MD-N and MD-W lines, Metra's overall average on-time performance is close to Metra's 95 percent target, as shown by the blue line. This means that nearly 95 out of every 100 trains are *not delayed for any reason*.

[22] *See "*Workpaper_Walker_Godfrey_Rodriguez.xlsx," Tab "Rodriguez Data."

[23] METRA WEBSITE, https://metra.com/time-performance-reports#Metra_and_On_Time_Performance (excerpts are Exhibit 8 hereto); METR-7, at 24.

- Removing the delays to Metra's trains on these lines that were *caused by Metra and not by CP* shows that only 1.5-1.6 percent of all Metra trains were delayed for reasons attributable to CP (dispatching or otherwise), as shown by the red bars. In other words, absent the delays caused by Metra, Metra's on-time performance *would exceed 98 percent* on both lines, as shown by the red line. Delays attributable to Metra (the blue bars) far exceed those attributable to CP and drive down Metra's on-time performance.

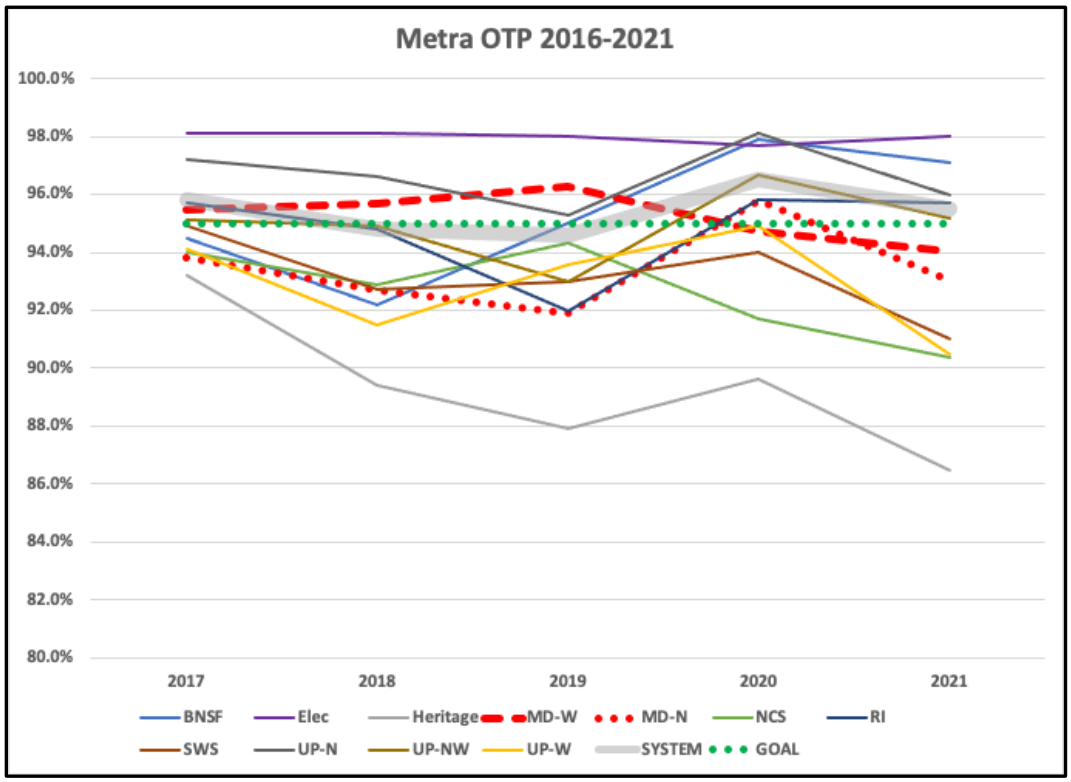


FIGURE 3[24]
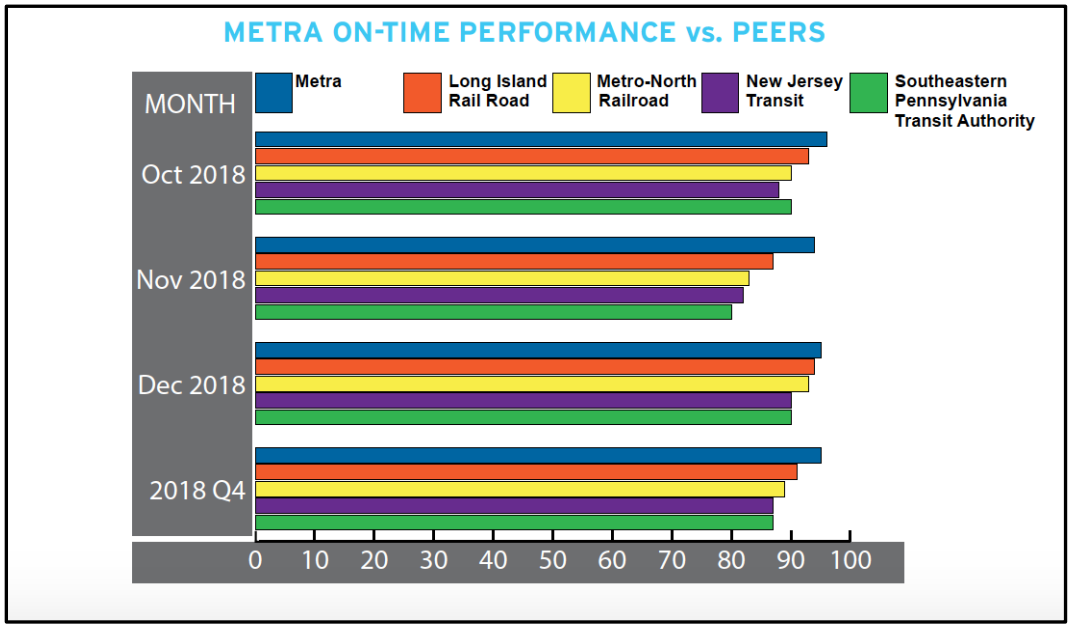
METRA PERFORMANCE ON CP-DISPATCHED MD-W AND MD-N LINES

29. It is also instructive to examine Metra's on-time performance on the MD-W and MD-N lines in comparison to the other lines over which Metra operates. Figure 4 below does this using the same Metra performance data. The MD-W and MD-N lines are shown by thick red lines, and are right in the middle of the pack, bracketing Metra's 95-percent on-time performance goal (shown by the dotted green line).

[24] Source: Metra, "*On-Time Performance - December 2021*," *available at* https://metra.com/sites/default/files/inline-files/On-Time%20Performance%20Report%20-%20December_2021.pdf (excerpts are Exhibit 2 hereto); *see* "Metra Data Workpaper," Tab "Fig 3."

FIGURE 4[25]
METRA OTP RELATIVE TO OTHER METRA LINES AND METRA'S 95% OTP GOAL



30. Interestingly, Metra's public statements show that it is quite proud of the on-time performance levels it achieves as compared with its peer commuter operations in New York and Philadelphia. Metra is far out in the lead relative to each of these commuter railroads, and

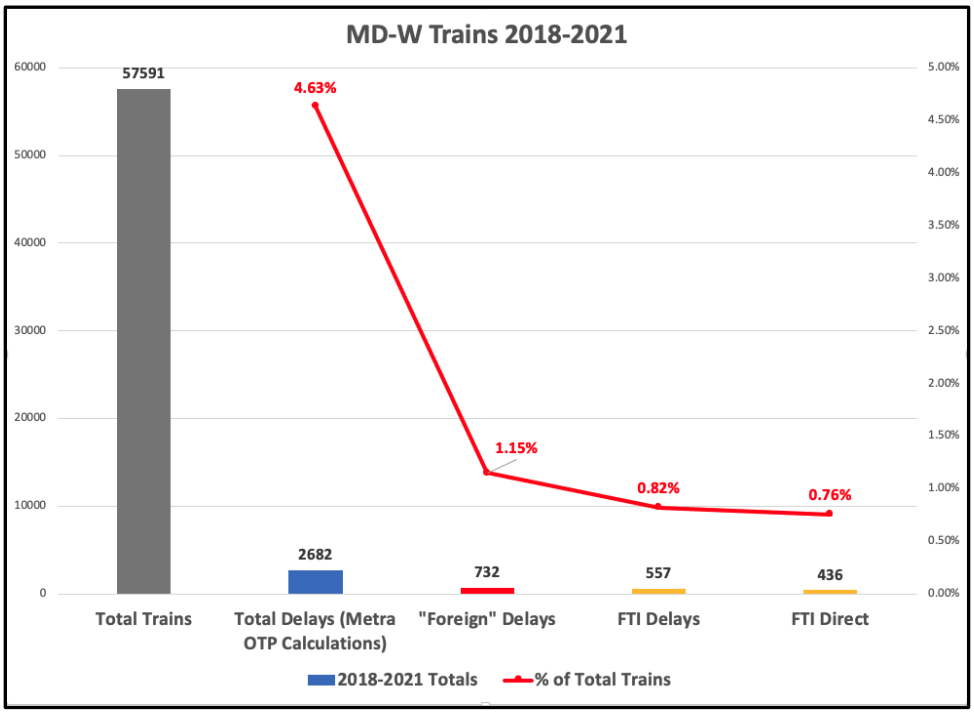
[25] Metra, "*On-Time Performance - December 2021*," *available at* https://metra.com/sites/default/files/inline-files/On-Time%20Performance%20Report%20-%20December_2021.pdf (excerpts are Exhibit 2 hereto); Metra, "*On-Time Performance - December 2020*," *available at* https://metra.com/sites/default/files/inline-files/On-Time%20Performance%20Report%20-%20December%202020.pdf (excerpts are Exhibit 3 hereto); Metra, "*On-Time Performance - December 2019*," *available at* https://metra.com/sites/default/files/assets/planning/on-time_performance_report_-_december_2019.pdf (excerpts are Exhibit 4 hereto); Metra, "*On-Time Performance - December 2018 (Revised)*," *available at* https://metra.com/sites/default/files/assets/planning/ridership/on-time_performance_report_-_december_2018-revised.pdf (excerpts are Exhibit 5 hereto); Metra, *"Commuter Rail System On-Time Performance Report - December 2017*," *available at* https://prod.metrarail.com/sites/default/files/assets/planning/ridership/december_2017_standalone_otp_report.pdf (excerpts are Exhibit 6 hereto); *see* "Metra Data Workpaper," Tab "Fig 4."

Metra's freight railroad partners – including CP – contribute to that excellent performance despite Chicago being by far the busiest freight hub in the Nation.

FIGURE 5[26]
METRA COMPARISON OF ITS ON-TIME PERFORMANCE WITH THAT OF OTHER COMMUTER RAILROADS

31. In the charts that follow, I focus on Metra's MD-W line. I do so for simplicity and also because that is the only line where the CP/KCS Transaction will increase the number of freight trains. (The patterns would be the same for Metra performance on the MD-N line.)

32. Metra presents data on delays experienced by MD-W and MD-N trains that Metra characterizes as "continual" and "routine[]."[27] This is a terribly misleading characterization. In fact, as I hope the preceding figures already demonstrate, CP performs very well, and according to Metra's own data, CP dispatching and freight operations are almost always successful in



[26] Metra *"Metra 2019 Fact Book at 19," available at* https://metra.com/sites/default/files/assets/2019_fact_book.pdf (excerpts are Exhibit 7 hereto).

[27] METR-7 at 21, 30-31; Metra Comments, Vol. 3, Exhs. C-5-7.

avoiding any delay to Metra trains from CP freight trains (in other words, less than two percent of the time).

33. Despite the excellent percentage on-time performance of Metra's trains on the MD-W line, Metra's approach is to focus only on delayed trains while ignoring all of the trains that are not delayed. Figure 6 below (based on Metra's data) shows that 57,591 trains were scheduled to operate on the MD-W line between 2018 and 2021. Of these, only 2,682 trains suffered any delay meeting Metra's definitions. In other words, only 4.6% of these trains experienced any delay for any reason at all (as shown by the red line in the second column of Figure 6), corresponding to the above 95 percent on-time performance Metra reports for the period 2018-2021.

FIGURE 6[28]
A VERY SMALL PERCENTAGE OF METRA MD-W TRAINS ARE DELAYED

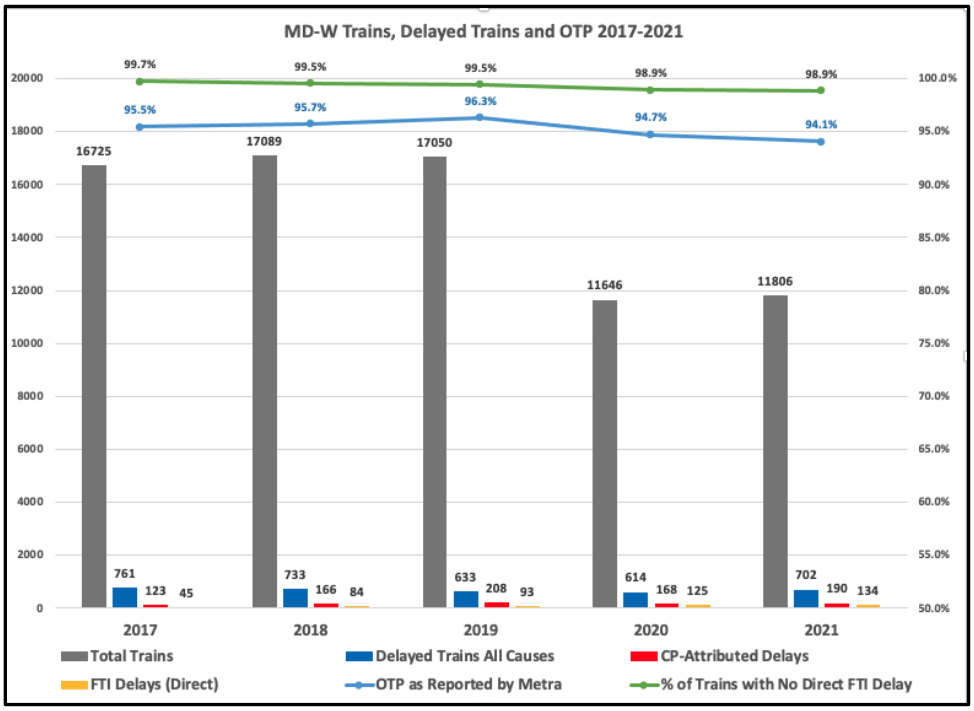
28 *See* "Metra Data Workpaper" Tab "Fig 5."

34. Metra wants the Board to focus only on the 2,682 delayed trains, using that figure to criticize CP's dispatching performance, while ignoring the 54,000+ trains that were not delayed. In fact, even the 2,682 provide no support for Metra's arguments about CP's dispatching performance. Metra's own data breaks down the sources of delays and which Metra trains were involved. As Figure 6 shows, of the 2,682 trains that were delayed for any reason, only 732 of them – in other words, only 1.15% of Metra's MD-W trains – were delayed for reasons attributable to CP.[29] And of these, CP-responsible delays associated with "freight train interference" (the only delays related to dispatching) accounted for only 557 delays – or less than one percent of all MD-W trains. This is shown in the fourth column of Figure 6.

35. Even this small number overstates the occasions when CP freight trains cause delay to Metra's trains. As Metra explains, many of the trains that suffer delay do so because of so-called "cascading" delays. Metra provides an illustration: a train that is delayed en route to destination by some event, and as a result of the equipment arriving late at its last station, another train (the returning equipment) is delayed when it heads back in the other direction.[30] As a result, a single instance of a dispatching decision that causes delay to Metra can result in multiple reported delays, even though it is just one instance – one dispatching event. Metra's OTP reports call these cascading delays "indirect" delays.[31] "Direct" delays are the better measure of the number of occasions when Metra perceives that CP's dispatching decisions have caused a Metra train to be delayed, a sentiment that Metra shares.[32] As shown in Figure 6, over the four years

[29] Metra's OTP reports refer to CP as the "Foreign Carrier."

[30] METR-7 at 32.



[31] Metra, "*On-Time Performance - December 2021*," *available at* https://metra.com/sites/default/files/inline-files/On-Time%20Performance%20Report%20-%20December_2021.pdf (excerpts are Exhibit 2 hereto).

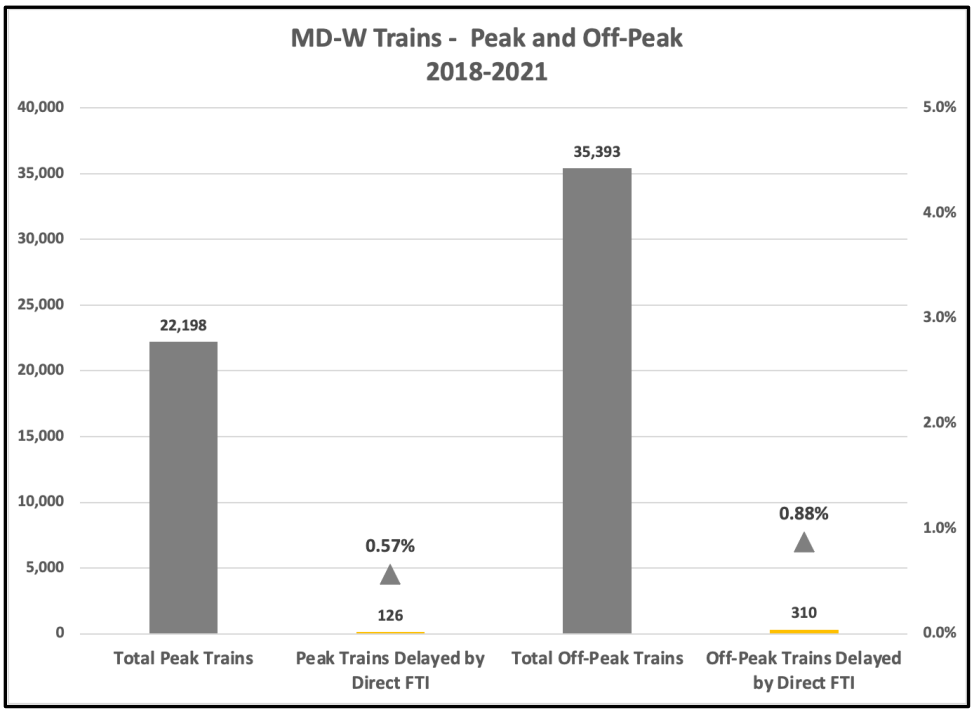
[32] *See* Godfrey Dep. Tr., at 43:12-43:23.

from 2018 through 2021 there were only 436 such occasions, representing *just 0.76% of all Metra MD-W trains* (as shown in the rightmost column in Figure 6).

36. Figure 7 below disaggregates the portrayal in Figure 7 and examines the same data points year-by-year, revealing a consistent set of relationships. CP dispatchers consistently support Metra operations at very high levels of on-time performance, with 98-99 percent of trains receiving no direct freight-train interference delays according to Metra's own records (as shown by the green line).

FIGURE 7[33]
METRA MD-W DELAYS AND OTP 2017-2021

37. Viewed another way, even if CP could wave a magic wand for Metra and *remove every single one of its freight trains from the lines shared with Metra*, Metra's on-time performance would only tick up by a tiny fraction. In 2021, Metra's 702 delays on the MD-W



33 *See* "Metra Data Workpaper," Tab "Fig 6."

line would have been reduced by at most 190, leaving 512 delays,[34] for an on-time performance of 95.7 percent – *only 1.6 percentage points higher than with all of CP's freight operations about which Metra complains*.

38. Metra's Comments are particularly critical of CP's dispatching during Metra's so-called "Peak Periods." CP does not schedule freight trains during these periods, but CP is not prohibited by contract from doing so provided it does not "interfere" with Metra's operations during those windows. Unfortunately, Metra does occasionally report delays to its trains during Metra's peak windows. CP strives to avoid this outcome, but sometimes railroad operations do not play out precisely as planned despite our best intentions. As Figure 8 below shows, however, this happens very rarely. Again focusing on the trains that suffer "direct" delays due to freight train interference, only about half of one percent (0.57 percent) of Metra's 22,198 peak-period trains between 2018 and 2021 experienced such delays. This amounted to 126 total delays over the course of four years, or about *one delay every eight business days*. In other words, in roughly fifteen out of every sixteen of Metra's peak rush hour windows (there are two each weekday), not a single Metra train experienced a delay resulting from freight train interference. Delays occur slightly more often – but still less than one percent of the time – for Metra's off-peak trains.

[34] The CP-attributed delays removed in this thought experiment include mechanical and other delays having nothing to do with CP's dispatching of freight trains.

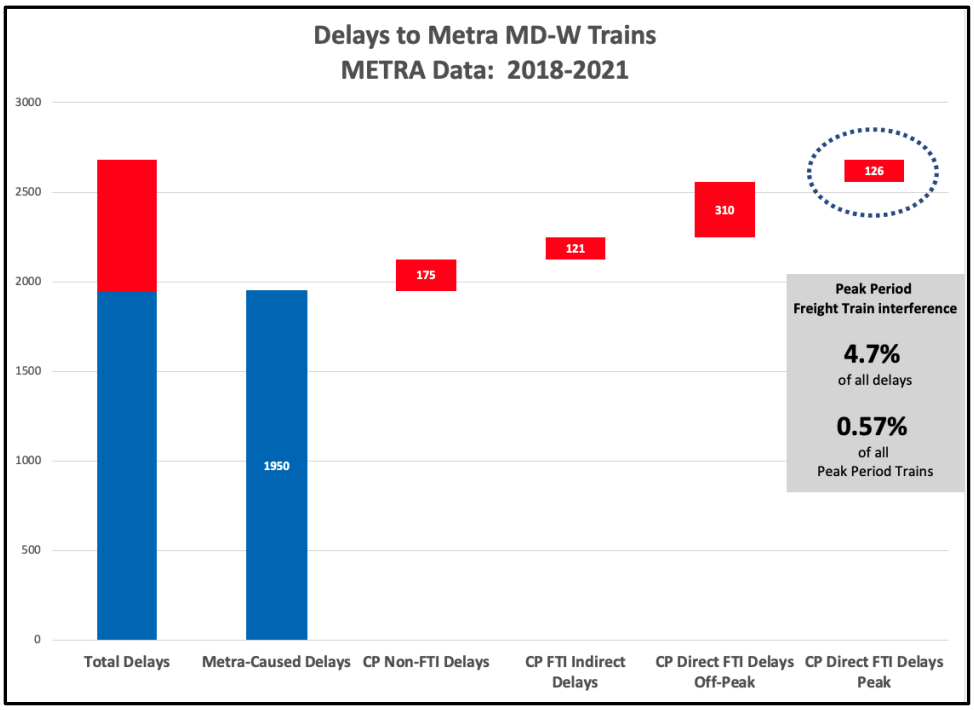


FIGURE 8[35]
MD-W FREIGHT TRAIN INTERFERENCE DELAYS PEAK VS. OFF-PEAK

39. Another useful perspective – similarly not conveyed in Metra's Comments – is how the delays attributable to CP compare to the delays that Metra attributes to itself (in other words, delays that Metra agrees are outside CP control). As Figure 9 below shows, the small numbers of delays attributable to freight train interference is dwarfed by the delays caused by Metra's own actions. Metra's Comments unfairly lump all of these delays together and blame CP for all of them.

35 *See* "Metra Data Workpaper," Tab "Fig 7."

FIGURE 9[36]
SOURCE OF DELAYS TO METRA MD-W TRAINS 2018-2021

40. I know from my railroad experience that there is always room for improvement, and I also know that CP regrets the rare occasions when its decisions might have led to delay that could have been avoided. But the record that Metra's data reveals is one of which any railroad could be proud. It is certainly not a basis for fundamentally re-writing longstanding contractual rights.

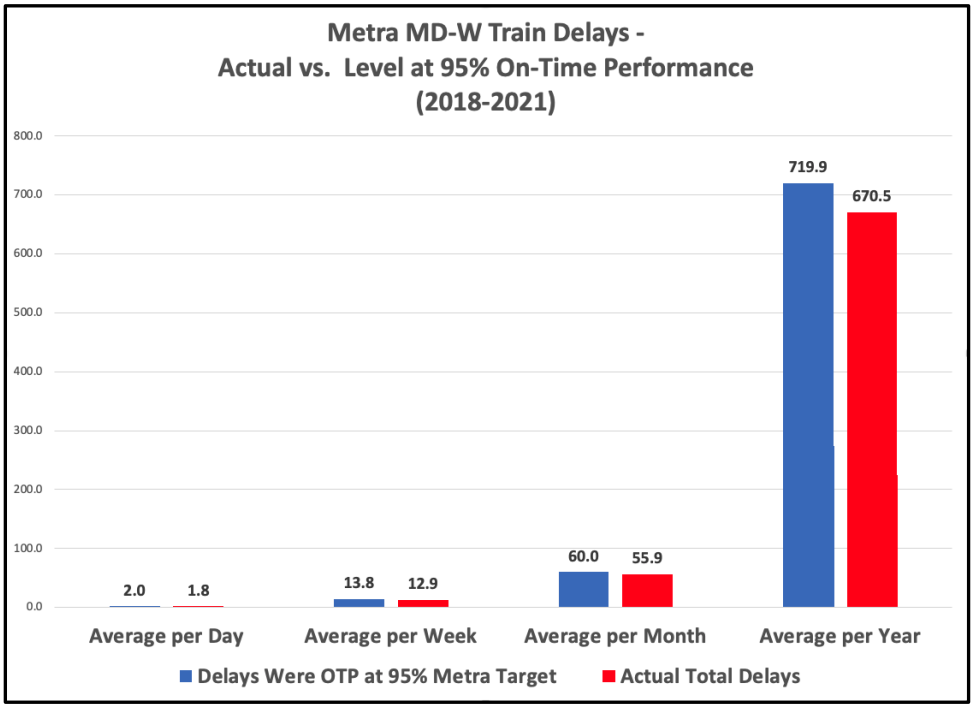
41. Another way to understand how well Metra trains have performed on the CP-dispatched MD-W line is to consider that performance in comparison to Metra's own stated on-time performance target of 95 percent. Outside of this proceeding, Metra acknowledges to its customers that no railroad – Metra, CP, nor any other – is perfect, and that conditions preclude achieving 100% on-time performance. That is why Metra measures only delays that are six minutes or longer. To quote Metra's website:

36 *See* "Metra Data Workpaper," Tab "Fig 8."

> "Like other commuter railroads, Metra considers a train to have operated on time if it reaches its final destination within five minutes and 59 seconds of its scheduled arrival. That standard filters out some of the delays that are beyond a railroad's control, so the resulting rate is a truer reflection of the railroad's efforts to control the delays that are controllable. The goal is to use this information to ultimately improve service. And, we believe this approach provides us with relevant information to measure how we are doing and where we need to improve."[37]

42. Likewise, Metra sets a 95 percent on-time goal rather than a 100 percent goal for the same reasons: because delays are inevitable no matter how hard railroads try to perform perfectly. Again, quoting Metra's website:

> "[T]here will always be variations that can cause trains to be delayed.
>
> "That's because Metra's schedules are designed to be most successful in 'best case,' normal operating conditions. In other words, if Metra picked up the exact same number of people every day, from the same exact location, and they all used the exact same doors, in the same weather, with the same equipment, etc., then it would be easy to stay on schedule and hit every stop within a minute of the schedule. To not design schedules based on these conditions would result in increased idling time in between stations and longer overall train trips on days when conditions are normal.
>
> "Unfortunately, every day, there are scores of unpredictable variations from those perfect conditions that can have small but cascading impacts on Metra's schedule. These variations can occur for a host of reasons – from the need to deploy a wheelchair lift, to an unusual number of riders at one or more stops to a medical emergency. Other factors that impact schedules include rain and snow, which can easily slow boarding, freight interference issues and mechanical problems. The list goes on."[38]



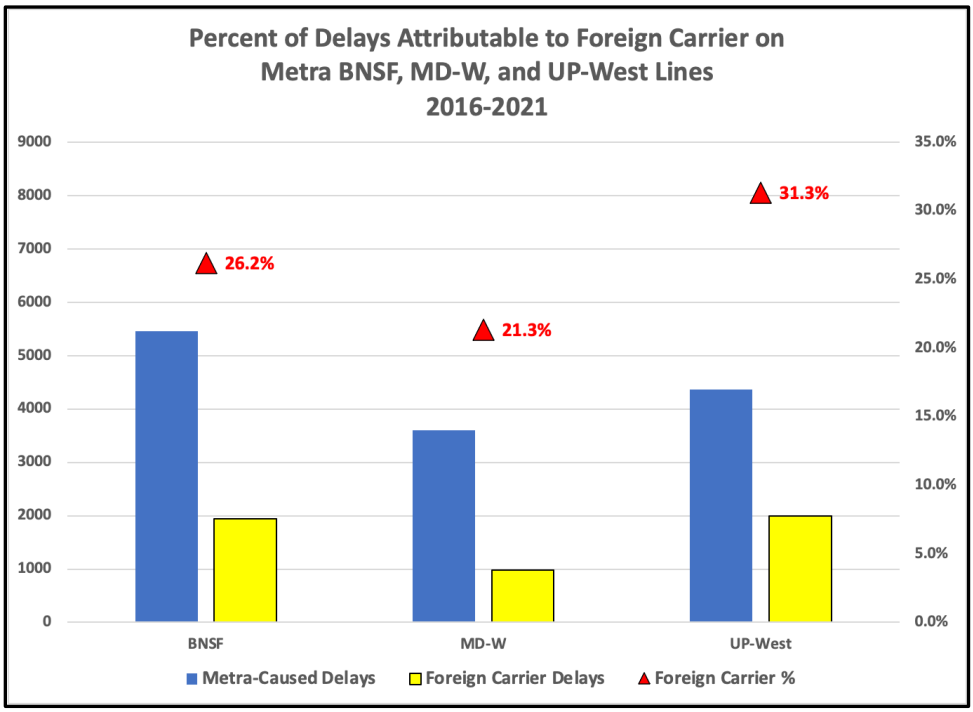
43. Using Metra's train performance data, it is easy to assess how many delays Metra's MD-W trains would have experienced had Metra just achieved its 95 percent on-time

[37] METRA WEBSITE, https://metra.com/time-performance-reports#Metra_and_On_Time_Performance (Exhibit 8 hereto).

[38] *Id.*

goal, and then to compare that amount of delay with what Metra experienced. Figure 10 below presents that comparison. With the 57,591 trains Metra scheduled on the MD-W line between 2018 and 2021 (*i.e.*, 40+ trains every weekday), Metra's own 95% on-time performance goal acknowledges that one would expect delays every single day, week in and week out, totaling up to 719 delayed trains annually. CP's dispatching allowed Metra's trains to realize *fewer actual delays* than they would have had Metra's 95 percent on-time goal been met precisely.

FIGURE 10[39]
FEWER DELAYS TO METRA MD-W TRAINS 2018-2021 THAN IF OTP HAD BEEN 95%



44. Metra's data also confirms that Metra's MD-W trains perform well in comparison with Metra trains operating on other Metra routes that are dispatched by freight railroads. Though it is hard to draw conclusions from the relative number or percentages of delays on different Metra lines, given the inherently different operating conditions, it is worth noting that

39 *See* "Metra Data Workpaper" Tab "Fig 9."

the portion of total delays to MD-W trains that Metra attributes to CP is meaningfully lower than the portion of delays it attributes to UP or BNSF on nearby lines that those railroads dispatch for Metra, as shown in Figure 11 below.

FIGURE 11[40]
PORTION OF DELAYS ATTRIBUTABLE TO "FOREIGN CARRIER

45. My review of the objective performance data should demonstrate that the specific examples of "freight interference" that Metra presents are just the anecdotal illustrations of the reasons why things do not always go as well *as they almost always do*. Those examples merely reflect normal railroading, not bad dispatching.

C. Metra's Complaint About Trains Dispatched on the "Wrong Tracks" Is Misguided and Unfair

46. One set of Metra's complaints about CP's dispatching has nothing to do with keeping Metra trains on schedule, but with the claim that CP "regularly dispatches Metra trains

40 "Metra Data Workpaper" Tab "Fig 10."

on different main line tracks from the ones that Metra has identified for use by its passengers heading in a specified direction." METR-7 at 27. According to Metra, this "regular" practice results in dangerous situations where "passengers must get to the opposite side of the tracks, often by darting across the tracks in the face of an oncoming freight train, or around a stationary one." *Id.* at 28.

47. This complaint is misguided and unfair. First of all, Metra's MD-W and MD-N infrastructure is *designed* to support trains in any direction on any track. Both lines are high-speed, double-track railroad, with multiple high-speed cross-overs permitting trains to operate in either direction on both tracks. This configuration helps ensure that there is ample ability to maintain Metra schedules in the presence of other Metra trains, Amtrak trains, and CP freight trains. Metra's station platforms are likewise set up to allow Metra trains moving in either direction to embark and disembark safely no matter which track the train is operating on.

48. Second, Metra's Comments make it sound like CP dispatchers disregard Metra's desire for its trains to use certain tracks as a matter of routine. That is not so. CP's dispatching practice is to run Metra and CP trains in a current of flow consistent with U.S. highways – in other words, on the right-hand track in double-track territory. This means that on the MD-W line, inbound Metra trains normally operate on the southern mainline track (which we call Track 2). Contrary to Metra's implication, CP does not seek to dispatch CP freight trains on the "wrong" track, forcing Metra's trains heading in the other direction to also operate on the wrong track. It is telling that Metra does not attempt to provide any quantification of how often its trains are dispatched in a way that has them arriving at certain stations on a different track from what commuters might expect, because it a relatively rare exception and not the norm.

49. Metra cites a few examples of Metra riders complaining in social media posts about freight trains passing through stations while passenger trains were about to load or unload passengers. METR-7 at 28-29. Examining the photos in those posts, however, provides no indication whether the Metra trains were operating on the "wrong" track, just that freight trains passed by.[41] In fact, all four posts were taken from locations that have level crossings over tracks that passengers must wait at and cross to get to the opposite platform; thus the customers were most likely complaining about having to cross the level crossing *not* that a train was operating on the "wrong" track. It also bears mentioning that these posts depict freight trains operating *outside Metra's peak periods not during them*; Metra's claim to the contrary failed to adjust the timestamps of the posts to account for local Chicago time.[42] As such, nothing about these posts implies anything different from normal operations.

50. Third, when CP's dispatchers send Metra trains onto the opposite track from what commuters might expect, there are good reasons for it, and there is nothing unsafe about it. Running an express Metra train around slower local trains, or running Metra trains around slower CP freight trains are good examples of why a Metra train might end up on the "wrong" track for some of its station stops. This is *good dispatching*, aimed at ensuring that Metra trains maintain their schedules while simultaneously accommodating other operations on the line. Metra wants CP dispatchers to do this.[43]

[41] *Id.*; *see also* Metra, Objections and Responses to Applicants' First Requests at 5-6 (Exhibit 1) (Apr. 11, 2022) ("Metra does not possess this information [concerning] . . . which railroad's freight trains are purportedly obstructing Metra's trains in the social media posts.").

[42] METR-7 at 28 n.98.

[43] Oppenheim Dep. Tr., at 252:4-9 (Q: "[T]he right dispatching move is to cross the Metra train from track 2 to track 1 to avoid delay; isn't that right?" A: "No, if that is the only way – the only option that you have to run, yes.").

51. If there were a rule that prohibited using both tracks, it would interfere with the fluid operations of the line. The result would be a significant loss in the capacity of the MD-W and MD-N lines, and situations that could bring all operations to a halt. Metra knows this, as shown by its request for a condition requiring CP to *add several crossovers* on the MD-W line.[44] Those crossovers would make sense only if they allowed trains – including Metra trains – to cross from one mainline track to the other. And that means that at some stations, those Metra trains would arrive on the "wrong" track.

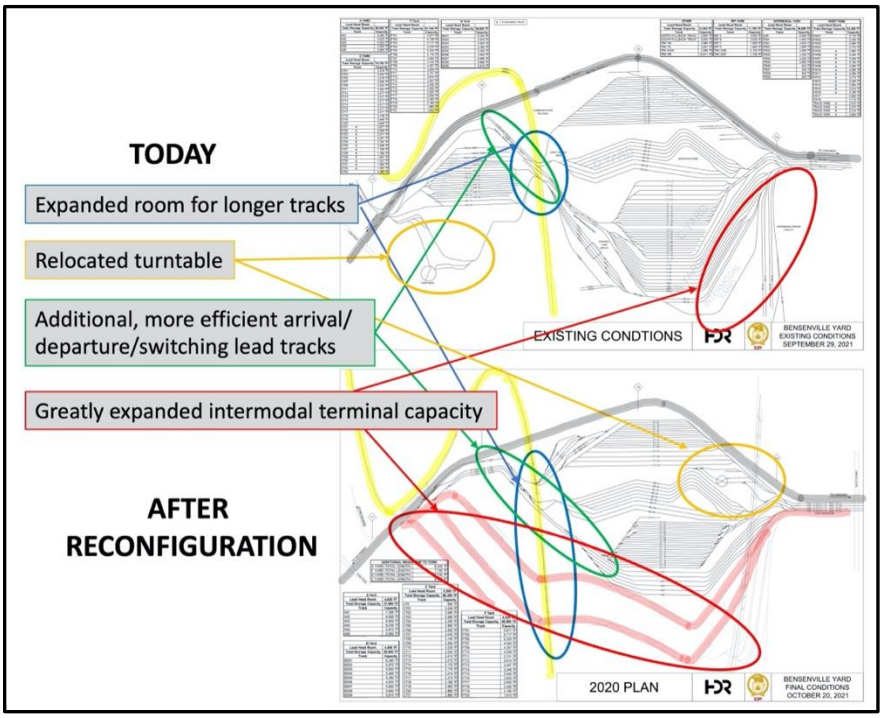
52. There is absolutely nothing unsafe about Metra trains arriving on different tracks from the norm when good dispatching calls for it. As noted, Metra's stations have multiple platforms that are set up to allow this. From a passenger's standpoint, crossing the tracks is a routine part of their daily commute. Whichever platform a train is going to use, the passengers that arrive at the station from the "other side" of the tracks (where they park their car, arrive on foot, or whatever) will have to cross the tracks to get to their train, almost always at a level crossing.[45]

53. In addition, Metra's stations are equipped with loudspeakers that provide advance announcements regarding arriving trains and the tracks they will be on, giving passengers ample time to get to the correct platform. Standard train operating practice is for arriving trains to come into the station at slow speeds, in order to ensure that they can stop short if pedestrians are crossing in front of the train.

[44] METR-7 at 22, 70.

[45] Oppenheim Dep. Tr., at 151:23-24 ("I would say that on a regular basis, passengers do cross the tracks.").

D. Developments Independent of the Transaction Will Further Improve the Performance of Metra's Trains on Lines Shared with CP



54. I have examined the examples of delays that Metra cites, and one thing that stands out is that a significant portion of those delays relate to freight trains entering and exiting CP's Bensenville Yard. As explained in the Application, independent of the CP/KCS Transaction CP is embarking on a major reconfiguration of Bensenville Yard that will dramatically improve the ability of this facility to receive and depart trains efficiently, sharply reducing the occasions when Metra trains will realize these sorts of delays.

55. Bensenville is CP's only major yard in the Chicago area. It sits at the apex of CP's lines to the Twin Cities (via Milwaukee) and Kansas City, and connects those lines with other railroads at Chicago and with CP's routes to Detroit and Eastern Canada. Figure 12 below presents schematics of the Bensenville Yard before and after the planned reconfiguration. As indicated on the "before" schematic, the intermodal facility in the southeast corner of the yard is physically constrained and requires that cuts of intermodal cars be pulled east of the yard and backed into the ramp tracks. In addition, the yard does not have sufficient numbers of long departure and receiving tracks to support the arrival and departure of multiple long trains. These conditions result from the narrow "waist" in the yard created by the embankment that supports UP's mainline line between Milwaukee and UP's Proviso Yard to the south (circled in blue on Figure 11). In addition, the location of the turntable in the southwest corner of the yard (circled in yellow) typically requires power for eastbound trains moving to/from the turntable to traverse the interlocking at Tower B17 (at the west end of the yard), potentially conflicting with through movements at that location.

56. These physical shortcomings occasionally lead to conflicts between CP's freight operations and Metra's operations today. Although Metra operates over two mainline tracks that

bypass the yard, CP's freight trains to/from Milwaukee must cross those tracks. Trains to/from Kansas City operate over tracks shared with Metra west of Tower B17. And intermodal trains entering and exiting the intermodal facility on the east end of the yard often need to use mainline tracks shared with Metra.

FIGURE 12
BENSENVILLE YARD RECONFIGURATION

57. The reconfiguration is made possible by the elimination of the UP embankment, in favor of a series of bridges, that will unlock a much wider footprint supporting longer yard tracks. The intermodal facility will be moved and allow for the straight-ahead movement of intermodal trains into and out of the yard. The much greater capacity of the new facility will allow for the repurposing of the nearby Schiller Park terminal, eliminating the movement of intermodal trains to and from that facility (across tracks shared with Metra). The turntable will be relocated to the east side of the yard, where it will be accessible to both ends of the yard without requiring locomotives to move through the B17 interlocking switches. Likewise,

additional, more efficient manifest receiving and departure tracks will be added. Even with increased numbers of trains between Bensenville Yard and points west resulting from the CP/KCS Transaction, opportunities for delays to Metra operations will be significantly reduced.

58. When this work is complete, many (perhaps the vast majority) of the situations that in the past led to conflicts between CP freight trains and Metra passenger trains will no longer occur.

E. The Vast Majority of the Historical Delays Metra Complains About Are Not Relevant to the Potential Impact of the CP/KCS Transaction

59. The vast majority of the "delays" and supposed dispatching issues that Metra's witnesses identify and complain about have no relationship at all to any effects of the CP/KCS Transaction. As Mr. Elphick explains in more detail, the only part of the lines CP shares with Metra where the Transaction will lead to an increased number of freight trains is the double-track mainline between the west end of Bensenville Yard and Big Timber Road as the west end of the MD-W line. This line has tremendous capacity, and Metra's schedules leave numerous slots throughout the day (both mid-day between the morning and evening commuter ("peak period") windows and overnight) when it will be easy to dispatch CPKC freight trains without causing any interference to Metra trains whatsoever. In fact, I understand that Metra's witness Oppenheim maintains a document reflecting his view of these freight operating windows on the MD-W line, and that document (a copy of which is attached as Exhibit 9 to my Statement)[46] shows numerous periods during which freight trains can move without interfering with Metra's trains: he shows 11 windows of 40-100 minutes in duration during the day on weekdays

[46] *See* "B17 and B12 – Freight windows – A – Referenced in Deposition Held on 06-07-2022.xls" (Exhibit 9). Mr. Oppenheim explains this document in his deposition. Oppenheim Dep. Tr., at 175:4-13; Mr. Elphick discusses the freight capacity associated with these extensive operating windows in his Reply Verified Statement. Elphick R.V.S. at ¶¶ 19-21.

(between 8am and 9am, between 9am and 10am, between 11am and 1pm), and a six hour period overnight. He even shows a window of time during the morning peak period when CP trains can operate.

60. Dispatching other parts of the lines CP shares with Metra can be more complex, especially where there is a need to interface with other railroads in order to move trains off of Metra trackage. For example, at Tower A20 on the MD-N Line, CP freights heading to Bensenville Yard from the north (or coming from Bensenville heading north) must enter or exit UP trackage. Also at Tower B17, freight trains heading north from Bensenville (or south from Bensenville) must enter or leave UP-dispatched trackage, and at Tower B12, CP freights to and from eastern carriers must gain access to trackage dispatched by the Indiana Harbor Belt or Belt Railway of Chicago. CP dispatchers do a good job at managing these interfaces, but delays can occur as Metra's witnesses point out. But my point is that none of this will be affected by the CP/KCS Transaction because the Transaction will not result in CPKC operating more trains through these interfaces than CP does pre-Transaction.

61. Mr. Oppenheim's list of the most important "issues with CP's joint operation and dispatching" (which is at pages 11-12 of his Verified Statement) identifies categories of concerns about dispatching that have nothing to do with the Transaction. At least three of his categories (items (2)-(4)) involve issues relating to Bensenville Yard that will be addressed by the reconfiguration I summarize above. The other four (items (1) and (5)-(7)) involve issues on the MD-N line,[47] or on the UP segment connecting the MD-N line with Bensenville Yard. As I have

[47] Mr. Oppenheim mistakenly states that trains between Rondout and Tower A20 are on the MD-W line. That is incorrect; they are on the MD-N line.

explained, the CP/KCS Transaction *will not increase train counts* on the MD-N line or the UP segment connecting MD-N with Bensenville Yard.

62. I understand that Mr. Oppenheim may have been under the misimpression that the Transaction would increase the number of CPKC trains moving between Bensenville and the north (on the MD-N line) because Metra's consultants suggested that CPKC would divert Kansas City-St. Paul trains off of the Marquette Subdivision and through Chicago, which Mr. Oppenheim testified would cause growth in "trains between Kansas City and St. Paul that operate via Chicago," and "trains between points north of Chicago and Kansas City."[48] But as Mr. Elphick explains, that is just not the case. Those trains will not come through Chicago (except perhaps in emergencies).

63. A review of the delay data put forward by Metra's other witnesses confirms that Mr. Oppenheim's catalog of the areas raising the most issues was correct. The available information reflecting the location and cause of delays to Metra's trains confirms that the vast majority relate to the categories Mr. Oppenheim lists, none of which involve CP operations that will be affected by the Transaction. At his deposition, Metra witness Rodriguez confirmed that the delay spreadsheet he prepared shows delays that occurred in connection with CP operations that will not be impacted by the Transaction.[49]

II. CP RESPONSIBILITY FOR DISPATCHING IS CRITICAL TO FREIGHT OPERATIONS AND BENEFITS METRA

64. Metra's request for a condition compelling CP to relinquish responsibility for dispatching to Metra, contrary to the governing trackage rights agreement between CP and

[48] Oppenheim Dep. Tr., at 95:4-100:1.

[49] *See* Rodriguez Dep. Tr. at 96:22-99:9.

Metra, would be both unwarranted and affirmatively detrimental to efficient rail operations for both CP's freight trains and Metra's commuter trains, as well as for the Amtrak trains that also operate over the MD-W line. Shifting dispatching makes no sense given the strong performance CP has proven year in and year out. In addition, a shift of dispatching responsibility would harm overall rail operations: (a) it would replace CP's 24/7/365 dispatchers who are focused on around-the-clock rail operations with Metra dispatchers who would be focused on the operation of passenger trains between the early morning hours and late evening hours; and (b) it would undermine the efficient coordination of freight and passenger operations on the lines shared by CP and Metra and divide responsibility for dispatching CP's lines to/from Chicago into two separately accountable groups, undermining coordination and thus creating a greater potential for interference between freight and passenger trains.

A. CP Dispatchers Are Attentive to Rail Operations Around the Clock

65. Like most commuter operations, Metra does not operate trains on the MD-W and MD-N lines around the clock. Its first weekday trains are scheduled to depart at 4:52 AM on the MD-W line and 4:46 AM on the MD-N line. And its last weekday trains are scheduled to arrive at their destinations at 12:05 AM and 12:12 AM, respectively. Between the last train of the night and the first train of the morning, Metra's operations go dark. On weekends and holidays this dark period is even longer.

66. CP's freight operation, by contrast operates around the clock, 365 days a year, and its dispatching center is staffed to support this cadence. There are no gaps in coverage. Giving Metra responsibility for dispatching would risk degrading freight operations during these overnight hours, when Metra's dispatching center would be reduced to a skeleton staff to support only CP's freight trains during the overnight hours.

67. Finally, there is good reason to be concerned that Metra does not appreciate the greater complexity associated with dispatching freight operations relative to scheduled commuter trains. For one, Metra's dispatchers do not look at the broader CP network on a day-to-day basis and do not interact with the conditions of Bensenville Yard, despite Metra's acknowledgment that the appropriate dispatching decision in a particular case needs to consider the implications of a particular move on the entire network, not just for one train.[50] Moreover, in contrast to scheduled commuter trains, freight trains do not adhere to schedules as precisely, must be received by yard tracks that are available to handle them, must meet one another at sidings that are the proper length to handle them, operate at more varied speeds, and encounter a far more diverse array of potential conditions (broken knuckles, overheated bearings, etc.) that disrupt operations on lines of road. Metra's dispatchers would need to develop the experience and expertise to handle all of these conditions, but would start out far behind CP's dispatchers on the learning curve.

68. While Metra dispatchers have some experience dispatching a handful of freight trains on other lines in the Chicago area, they lack the experience of CP's dispatchers. In response to discovery requests, Metra was able to identify only "Metra's Rock Island Line and portions of the Southwest Service Line" as lines where its dispatchers "dispatch both passenger and freight trains."[51] On the Rock Island Line, Metra dispatches only about "four daily freight trains," and on the Southwest Service Line it dispatches only "one Norfolk Southern train along the entire length of the line."[52] Metra did also note that its dispatchers dispatch freight train

50 *See* Godfrey Dep. Tr., at 122:2-122:23 and 83:25-86:10.

51 Metra, Objections and Responses to Applicants' First Requests at 4 (Apr. 11, 2022). See

52 *Id.*

traffic on the MD-W, MD-N, and Waukesha Subdivisions,[53] but in reality what Metra is describing is the work of former tower operators – which Metra now calls "dispatchers" – whose job is to line switches and signals in order to implement the dispatching judgments made by CP.[54] This inexperience would inevitably jeopardize efficient rail operations on the lines CP and Metra share, as well as disrupting CP's freight operation far beyond the boundaries of those lines.

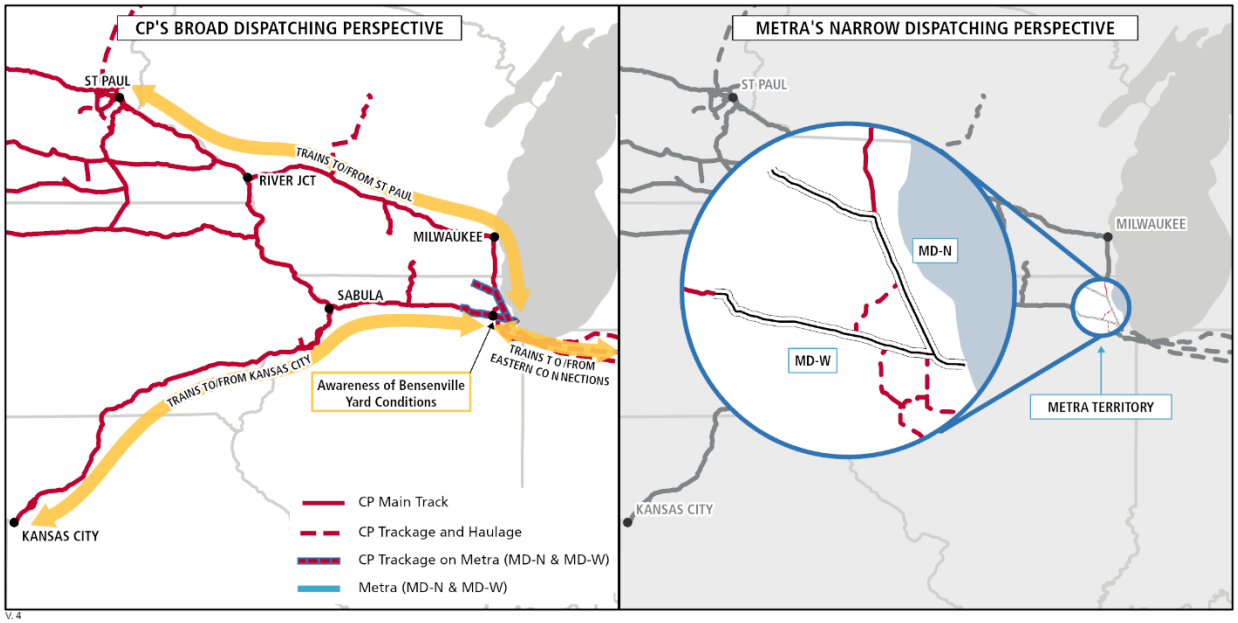
69. It is not surprising to me that all of the lines over which Metra operates that have the largest volumes of freight traffic are dispatched by the freight railroad operator, not by Metra. BNSF dispatches Metra's BNSF line, UP dispatches Metra's UP-West line, CN dispatches Metra's Heritage Corridor and North Central Service north of Tower B12, and as we have seen CP dispatches Metra's MD-N and MD-W lines. That allocation makes good sense from the standpoint of ensuring the most efficient operation of the railroad for the benefit of all users, freight and passenger alike.

B. CP Dispatching Enables More Efficient Coordination of Freight and Passenger Operations

70. Apart from the greater experience and acumen of CP's dispatchers, CP's responsibility for dispatching enables far greater operational efficiency on the MD-W and MD-N lines than could be achieved were Metra responsible for dispatching. This is because CP's dispatchers have visibility across the network and can coordinate activities that affect the efficiency of freight and passenger operations alike.

53 *Id.*

54 Godfrey Dep. Tr., at 116:11-117:9.



71. Good dispatching requires broad awareness of all parts of the rail network that could affect future operations over the line being dispatched. Mr. Oppenheim, at his deposition, objected to giving Metra dispatching rights over only half the MD-W line because the MD-W line is "a through operation" and "needs to be handled as such."[55] He explained that "[s]ituations occur on one . . . side of the dividing line that would have to be rectified on the other side of the dividing line," so it "would just be very awkward" for Metra "trying to hand things off" on the other side of the line.[56] But Metra has not explained why this principle should not apply more broadly than just the MD-W line—why a dispatcher on the MD-W line should not have awareness of issues that occur outside the dividing line that would have to be rectified on the MD-W line.

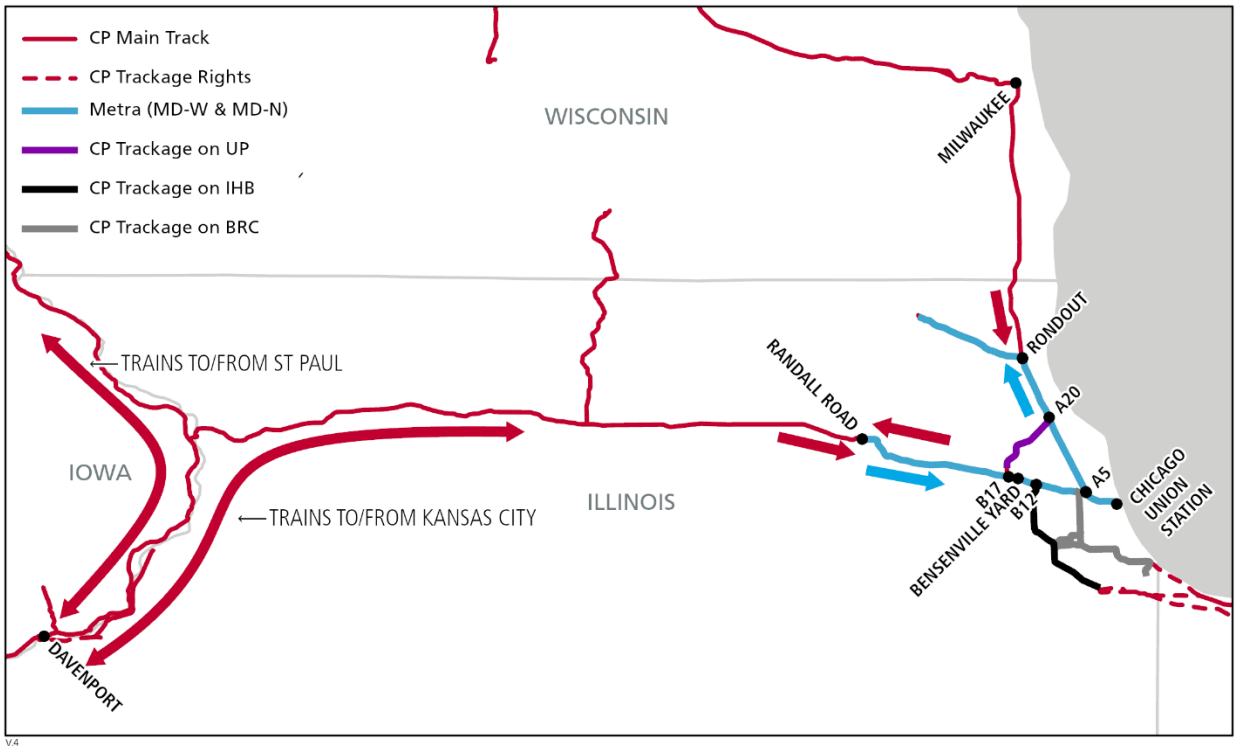
72. In fact, the efficient dispatching of freight and passenger operations on the Metra MD-W and MD-N lines require awareness and coordination of operating conditions well beyond the boundaries of those lines. CP dispatchers must interface with UP, IHB, BRC, and other dispatchers controlling freight lines in the Chicago terminal. They must coordinate with CP's Bensenville yard operations, and they must coordinate with CP freight operations as far away as Kansas City and St. Paul, MN. CP responsibility for dispatching delivers this coordination. Metra responsibility would bring a much narrower perspective, jeopardizing operations on the lines CP shares with Metra and far beyond. The different perspectives are depicted in Figure 13 below.

55 Oppenheim Dep. Tr., at 292:8-17.

56 *Id.*

FIGURE 13
DIFFERENT PERSPECTIVES OF CP AND METRA DISPATCHERS

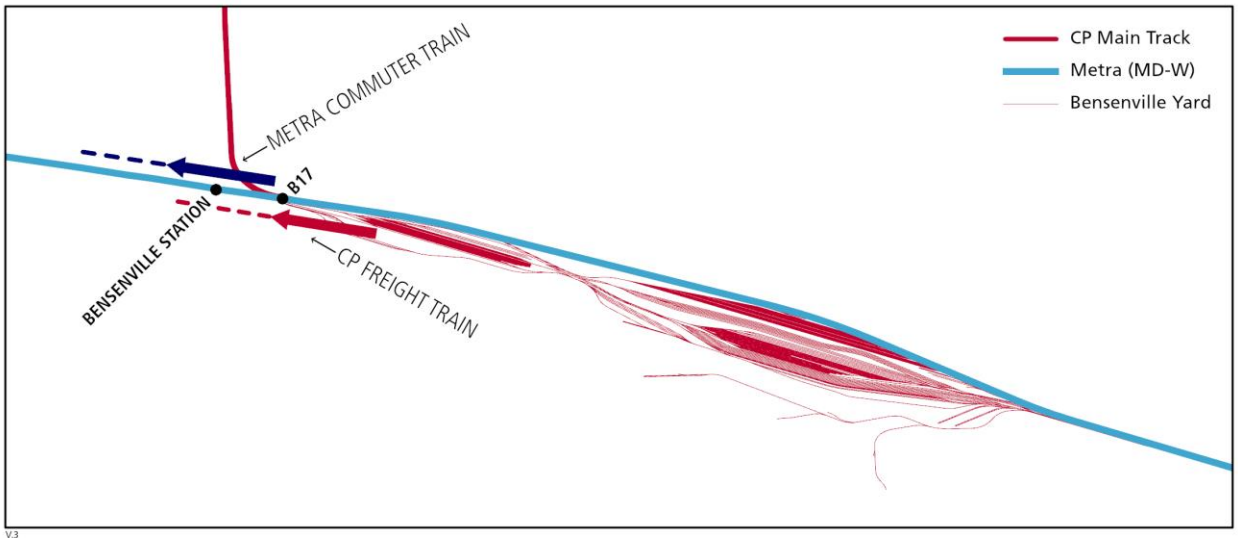
73. As Figure 13 tries to depict, CP's dispatchers dispatching CP's freight trains and Metra's passenger trains in the Chicago area can focus in on the specific trains needing attention, but they bring to that effort a broader awareness of conditions across the railroad that can improve decision-making. This perspective lets them see in multiple dimensions (in terms of a broader geography and a broader temporal scope – *i.e.*, what will conditions look like later if I make a different decision now), rather than being myopically focused on resolving individual train conflicts as they arise.



74. I will illustrate this point with a few real-world examples.

75. First, consider a CP freight train heading toward Chicago from Kansas City. A CP dispatcher responsible for dispatching across the entire territory will have awareness of Metra operations, the availability of open tracks in Bensenville Yard to receive the train, and many other conditions affecting fluid operations. That dispatcher can stage Chicago-bound freights at

appropriate locations west of the MD-W line both to avoid interference with Metra's operations as well as avoid blocking CP freight trains heading north or west from Chicago.



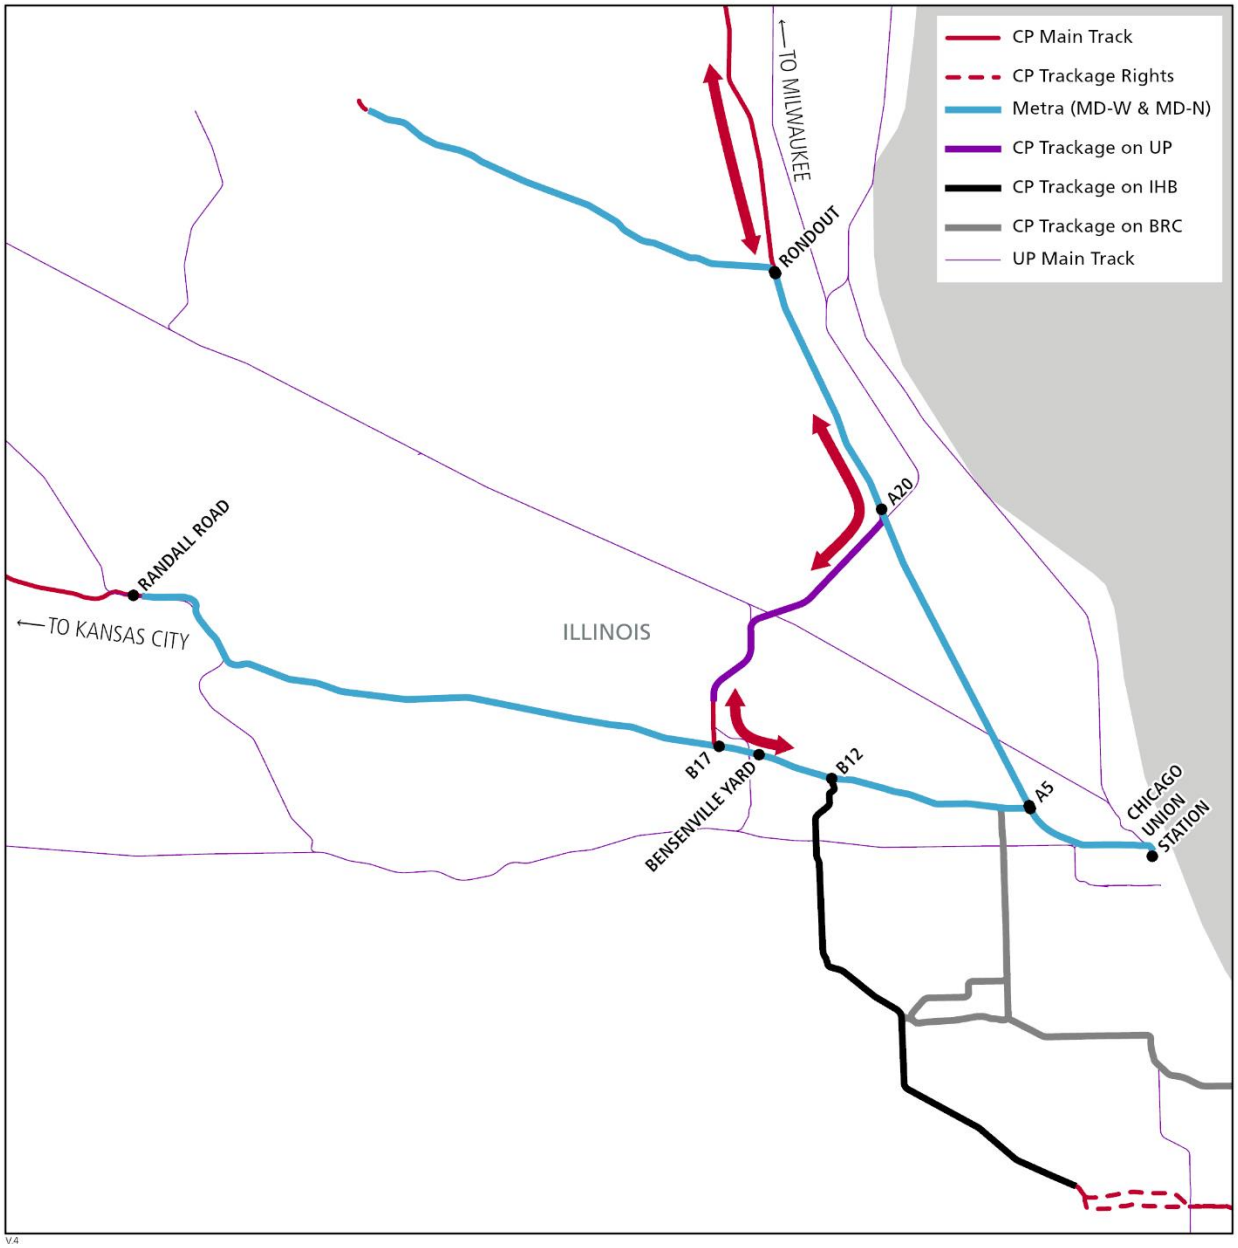
76. Were dispatching divided between Metra (on just the MD-W lines) and CP (on CP's lines west of Randall Road), this efficient coordination would be curtailed. CP dispatchers would no longer be able to coordinate the flow of Chicago-bound trains in a way that optimized operations in light of conditions on the MD-W line. Because CP's dispatchers would not know whether or when a Metra dispatcher would allow the train onto the MD-W line, those trains could end up arriving at the west end of the MD-W line too early, thus blocking westbound freights, or too late because they held far from Chicago. A coordinated flow would be replaced with a queuing system (as shown in Figure 14 below) that would consume capacity and likely be inferior from Metra's perspective as well because westbound freight trains would be affected along with the eastbounds. The disruption would be exacerbated by Metra's peak windows during which Metra dispatchers would refuse access to the MD-W line regardless of whether there was room to move an arriving freight.

FIGURE 14
COORDINATION OF TRAINS BOTH ON AND OFF METRA LINES

77. Second, consider a CP freight train originating at Bensenville Yard and heading west toward Kansas City during the mid-day hours between Metra's peak period operating windows. Today, it is standard practice for CP's dispatcher to depart such a train immediately after an outbound Metra train clears Tower B17 at the west end of Bensenville Yard. By doing this, the freight train will stay behind the commuter train and have no difficulty reaching the west end of Metra's double-track line (at Randall Road) long before the next outbound commuter train catches up. This supports efficient freight operations while also avoiding interference with Metra. This sequence is shown in Figure 15, below.

FIGURE 15
COORDINATION OF CP YARD ACTIVITY WITH METRA TRAIN MOVEMENTS

78. But to make this work requires a lot of coordination between the CP dispatcher and CP's operating personnel at Bensenville. Long before the outbound Metra train gets to B17, the dispatcher must coordinate with the CP trainmaster and train crew to ensure that the westbound freight is made up, has completed any required brake tests, and is ready to go. The CP dispatcher will be proactively monitoring the activity associated with preparing that freight train for departure – making sure there are no crew issues, no power issues, no miscommunications, no paperwork issues, and nothing else that could delay its departure. Then when the Metra train passes B17, stops to discharge passengers at Bensenville station, and starts to pull out of the station, the CP dispatcher can give the CP freight the green light to proceed so that it reaches the end of Metra's line with plenty of time to spare ahead of the next Metra train (usually an hour later). Without all of this coordination – which could not possibly work as smoothly were Metra responsible for dispatching – this coordination would break down and either Metra would hold CP trains for long periods of time inefficiently, or the risk of freight train interference would increase rather than decrease. This would be particularly



counterproductive with the increased number of freight trains that CP anticipates operating over this line as a result of the CP/KCS Transaction.

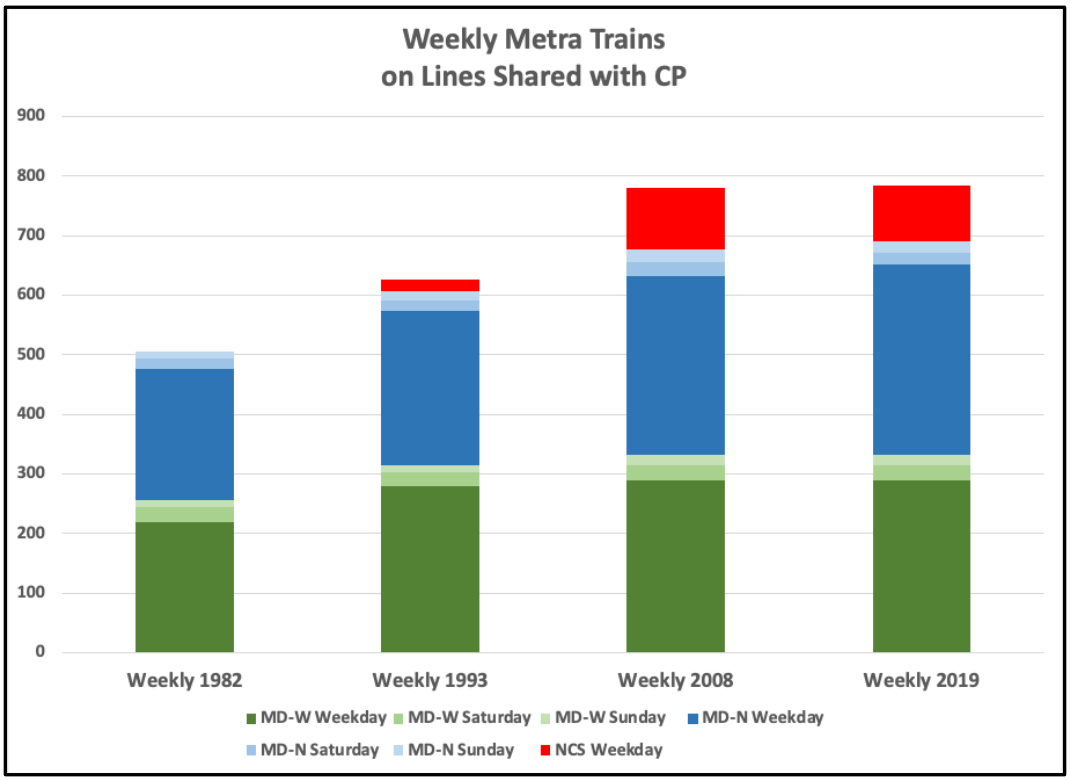
79. Third, consider CP freight trains operating between Bensenville Yard and Milwaukee. The CP/KCS Transaction will not affect operations or train counts on this route, but Metra's dispatching could disrupt operations severely. As shown in Figure 16 below, the typical path these trains take is to depart the west end of Bensenville Yard, cross the MD-W line at Tower B17, operate on UP trackage rights to Tower A20, and then traverse the MD-N line to Rondout. Southbound trains operate in the reverse direction.

80. Dispatching these trains requires the same kind of coordination between CP dispatchers and Bensenville Yard operations, and in addition close coordination with UP dispatchers who are responsible for the segment between Tower A20 and Tower B17. CP dispatchers have visibility into both ends of the UP segment, as well as the CP line beyond Rondout. CP dispatchers are also able to coordinate with UP Proviso Yard, which also provides key planning inputs daily. Transferring responsibility for the MD-N and MD-W lines to Metra would multiply the complexity associated with this coordination, and inevitably result in CP freight trains stranded at A20 (either on the UP or MD-W line), CP trains held up in Bensenville Yard, reduced capacity to move other trains into the yard, and any number of other bad outcomes.

81. This track configuration is shown in Figure 16 below.

FIGURE 16
COORDINATION OF TRAINS MOVING ACROSS UP TRACKAGE
BETWEEN BENSENVILLE AND POINTS NORTH

82. I could offer a nearly endless series of additional examples. Good dispatching requires broad and holistic awareness of, and close communication with, all of the parts of the rail network that could affect future operations over the line being dispatched. CP dispatchers have that vantage and communicate hourly with other freight railroads and Metra about the ebb



and flow of freight operations in and affecting Chicago. That awareness benefits Metra's operations by keeping the MD-N and MD-W lines fluid. Metra dispatching could not match this performance.

III. CP HAS CONSISTENTLY SUPPORTED GROWTH IN METRA OPERATIONS ON MD-N AND MD-W LINES

83. Metra's operations on lines shared with CP have grown significantly since their inception. When Metra first began operating commuter trains on Milwaukee Road's lines in 1982, the governing trackage rights agreement – entered into between Metra and Milwaukee's bankruptcy trustee – spelled out separate weekday and weekend train schedules, with a total of 44 daily trains on weekdays, 24 on Saturdays, and 12 on Sundays on the MD-W line and a total of 44 daily trains on weekdays, 18 on Saturdays, and 12 on Sundays on the MD-N line. When CP assumed Milwaukee's freight operations on the MD-W and MD-N lines in 1986, Metra's schedules remained the same.

84. By the end of 2019, prior to Metra's COVID-related service reductions, the number of trains on the MD-W and MD-N lines had grown tremendously, all with the support of CP, as shown in Figure 17 below.

FIGURE 17[57]
EXPANSION OF METRA SERVICE ON LINES SHARED WITH CP

85. In 1993, CP agreed to support significant increases in the number of Metra trains on both the MD-W and MD-N lines. In addition, CP supported adding Metra trains on the portion of the MD-W line east of Tower B12 (just east of Bensenville Yard) to support Metra's new "North Central Service," which diverges at Tower B12 onto CN's former Wisconsin Central mainline to Antioch, IL. In addition, CP allowed for a 45-minute extension of peak period for westbound trains from Chicago Union Station to Elgin from 5:30 AM to 8:00 AM to 5:15 AM to 8:30 AM.

86. I understand that Metra has expressed frustration with correspondence from CP in April 2019 regarding Metra's proposed addition of several off-peak trains on the MD-N line. Metra claims that it "sought CP's consent (which cannot be unreasonably withheld)" to

[57] "Metra Data Workpaper," Tab "Fig. 16."

"*reinstate* four Saturday and two Sunday commuter trains that were eliminated in 2018 due to budgetary issues."[58] It asserts "CP refused, stating that there was limited or no capacity on the line, even though these slots were not being used for freight." *Id.* Similarly, in March 2019, Metra proposed "the addition of 4 non-peak trains," and Metra now asserts CP denied this addition even though "time slots were empty," because of similar capacity issues.[59] At the outset, I note that Metra may not add non-peak trains "without CP's prior written consent," and one reasonable basis for CP to withhold consent is if the added trains will "materially interfere with freight operations."[60]

87. I was involved in CP's consideration of Metra's 2019 proposals, and can make several points. First, CP did not decline to agree to the addition of these additional Metra trains because there would have been insufficient capacity on this line. As Metra itself pointed out, CP had previously operated up to ten additional trains per day on the MD-W and MD-N lines without affecting Metra.[61]

88. Second, based on my direct communications with Metra at the time, Metra's proposal to add four non-peak trains stemmed from its plan to experiment with "reverse commuter trains" designed to take workers from their homes in downtown Chicago to their jobs in the northern suburbs. The additional trains would have been just outside Metra's existing peak periods.

89. My analysis of the situation was that adding these additional trains just outside Metra's peak periods, without reducing the number of off-peak trains operated at other times,

58 METR-7 at 42.

59 *Id.*

60 METR-7, Ex. A-3.

61 Metra Comments, Vol. 2, Exh. H-1 (Mar. 26, 2019 letter)

would have in effect extended those peak periods when CP's freight operations are almost entirely shut down for an additional hour and forty-five minutes each morning and evening. That would have effectively squeezed all CP freight operations – which must coexist with off-peak Metra trains as well as Amtrak trains on the MD-N line – into shorter and inflexible operating periods. With uncertainty at the time about the future expansion in Amtrak service on this line and CP's at-the-time recent experience of very heavy train traffic from North Dakota and Alberta destined for interchange with other carriers at Chicago, we were reluctant to agree to a permanent reduction in the period during the day when we could operate freight trains. We offered to let Metra add as many new reverse-commute trains as they wished by *shifting their peak* windows to include these proposed trains (leaving the windows the same duration but ending later or starting earlier), but we did not want to forever relinquish the ability to run our trains when Metra's added trains would be entitled to priority.

90. Metra's April 2019 proposal to add six weekend trains to the MD-N line on a "trial basis" got caught up in the same discussion with Metra about accommodating the needs of CP, Amtrak, and Metra on this line. Freight operations had changed since Metra had removed those trains from its schedule in early 2018, and as noted the potential need to accommodate increased Amtrak trains also needed to be considered. CP was not intending to tell Metra that it could never add additional off-peak trains to the lines CP shares with Metra. At the time, the weekend trains Metra was already operating on the line were not running at or even near capacity. In requesting to add additional Metra trains, Metra was unable to provide any reason to think there was demand for these additional trains; rather Metra just wanted to experiment. CP was not telling Metra that it could never add additional off-peak trains to the lines CP shares with Metra, but CP felt it could not agree to add these trains without a more involved assessment of

their impacts on CP's future operation flexibility and a further consideration of available alternatives.

IV. METRA'S COMPLAINTS ABOUT CP'S PTC IMPLEMENTATION ON LINES SHARED WITH METRA ARE NOT WELL FOUNDED

91. Metra also criticizes the fact that Metra and PTC have had to work together to implement new dispatching software to support positive train control ("PTC") on the lines CP and Metra share. I am baffled by this critique, which seems entirely contrived to bolster Metra's misguided effort to force a shift in dispatching responsibility to Metra. In fact, CP cooperated closely with Metra and Metra's software vendor ("Wabtec") to implement Metra's TMDS software on CP's dispatching systems, so that Metra could be the party responsible for PTC on the lines CP and Metra share.

92. CP went to considerable expense to accommodate Metra, and to the extent there were delays and occasional glitches associated with that implementation, they were no different in kind or extent from the hard work all railroads have endured implementing PTC and fine-tuning the various operational aspects of PTC, such as delays by vendors in releasing the original software and software updates, defects found in the host company's software, the various challenges of integrating, testing and validating vendor software and interoperability between the host and tenant railroad software.[62]

93. To the extent Metra is suggesting that forcing a shift in dispatching authority would simplify Metra's own PTC implementation, that is not correct. First of all, the work of integrating TMDS into CP's dispatching systems is already substantially complete. In addition,

[62] CP and Metra were far from the only rail companies to experience these problems. *See* United States Government Accountability Office, Positive Train Control: As Implementation Progresses, Focus Turns to the Complexities of Achieving System Interoperability (July 31, 2019), available at https://www.gao.gov/assets/gao-19-693t.pdf.

no matter who has "control" of dispatching, CP freight trains controlled by PTC would still need to transition safely between CP-owned and dispatched trackage (where CP deploys CTC, OCS and TGBO dispatching software) and Metra-owned (and Metra-dispatched were the Board to force a shift) trackage where Metra's TMDS system would need to accommodate safe and efficient handoffs. Maintaining a safe and efficient PTC system that accommodates handoffs and shared use of trackage by multiple railroads is intrinsically burdensome, and Metra dispatching would not make these issues go away.

VERIFICATION

I, Nicholas C. Walker, declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on this 12th day of July, 2022.

REDACTED PUBLIC RECORD VERSION

BEFORE THE
SURFACE TRANSPORTATION BOARD

FINANCE DOCKET NO. 36500

CANADIAN PACIFIC RAILWAY LIMITED, *ET AL*. – CONTROL – KANSAS CITY SOUTHERN, *ET AL*.

WALKER R.V.S. EXHIBIT 1

METRA, OBJECTIONS AND RESPONSES TO APPLICANTS' FIRST REQUESTS AT 6-9, 14-16 (APR. 11, 2022)

BEFORE THE
SURFACE TRANSPORTATION BOARD

STB Finance Docket No. 36500

CANADIAN PACIFIC RAILWAY LIMITED; CANADIAN PACIFIC RAILWAY COMPANY; SOO LINE RAILROAD COMPANY; CENTRAL MAINE & QUEBEC RAILWAY US INC.; DAKOTA, MINNESOTA & EASTERN RAILROAD CORPORATION; AND DELAWARE & HUDSON RAILWAY COMPANY, INC. – CONTROL – KANSAS CITY SOUTHERN, THE KANSAS CITY SOUTHERN RAILWAY COMPANY, GATEWAY EASTERN RAILWAY COMPANY, AND THE TEXAS MEXICAN RAILWAY COMPANY

OBJECTIONS AND RESPONES BY COMMUTER RAIL DIVISION OF THE REGIONAL TRANSPORTATION AUTHORITY D/B/A METRA TO INTERROGATORIES, REQUESTS FOR PRODUCTION OF DOCUMENTS, AND REQUESTS FOR ADMISSION FORM APPLICANTS CANADIAN PACIFIC RAILWAY LIMITED, *ET AL.*

The Commuter Rail Division of the Regional Transportation Authority d/b/a Metra ("Metra"), by and through counsel, hereby responds and objects as follows to the First Set of Interrogatories, Requests for Production of Documents, and Requests for Admission served March 25, 2022 ("Discovery Requests"), submitted by Canadian Pacific Railway Limited, Canadian Pacific Railway Company, Soo Line Railroad Company, Central Maine & Quebec Railway US Inc., Dakota, Minnesota & Eastern Railroad Corporation, and Delaware and Hudson Railway Company, Inc. (collectively, "Canadian Pacific" or "CP") and Kansas City Southern, The Kansas City Southern Railway Company, Gateway Eastern Railway Company, and The Texas Mexican Railway Company (collectively, "KCS"; together with CP, the "Applicants").

GENERAL OBJECTIONS

Each and every one of Metra's responses to the Discovery Requests is subject to and incorporates the following general objections, as applicable. These objections are set forth here to avoid the duplication and repetition of restating them for each request. Some general objections may be referred to in a given answer for purposes of clarity. The failure to list a particular general objection in a given answer should not be construed as a waiver of that objection.

1. Metra objects to these Discovery Requests to the extent that they call for the disclosure of information protected by the attorney-client privilege, the common-interest privilege, or other privilege and/or the right of privacy.

2. Metra objects to these Discovery Requests to the extent that they call for the disclosure of information protected by the attorney work-product privilege.

3. Metra objects to these Discovery Requests to the extent that they impose any obligations on Metra beyond those imposed by the Code of Federal Regulations, the United States Code, or order of the Surface Transportation Board ("STB").

4. Metra objects to these Discovery Requests to the extent that they call for information that neither is relevant to the subject matter of the pending proceedings, nor appears reasonably calculated to lead to the discovery of admissible evidence. The issue before the STB as relevant to Metra is whether Applicants' proposed merger is in the public interest. Discovery regarding other matters is not relevant to this matter and is not likely to be reasonably calculated to lead to the discovery of admissible evidence.

5. Metra objects to these Discovery Requests to the extent that they request information that is publicly available, or that either previously originated from or was received by Applicants on the basis that such a request serves only to annoy the party burdened with producing the documents.

6. Metra objects to these Discovery Requests to the extent that they are unduly burdensome, and the time and effort required to attempt to compile all responsive information or documents outweighs the potential discoverability or probative value thereof.

7. Metra objects to these Discovery Requests to the extent that they are designed to cause undue annoyance, harassment, or oppression.

8. Metra objects to these Discovery Requests to the extent that they are overly broad with respect to scope, context, and/or time period.

9. Metra objects to these Discovery Requests to the extent that they are vague, indefinite, or ambiguous, and as such would require Metra to speculate as to the meaning or scope of the discovery request and potentially responsive information.

10. Notwithstanding these objections, Metra's responses to these Discovery Requests are based upon a diligent search by Metra and its counsel. Discovery and other investigation and research concerning these proceedings are continuing. Metra, therefore, reserves the right to amend or supplement its responses at any time in light of deposition testimony, further investigation, research, or analysis, to the extent permitted or required by law, and to introduce any and all evidence in these proceedings.

RESPONSES TO INTERROGATORIES

Interrogatory No. 1:

Describe Metra's dispatching practices for any line for which it dispatches both commuter and freight trains, including but not limited to (i) whether Metra's dispatchers on such lines are available 24 hours a day to dispatch freight trains overnight, (ii) how many freight trains a day Metra dispatches on such lines, (iii) Metra's dispatchers' interaction process with other Class I railroads that have dispatching authority over adjacent or nearby subdivisions, and (v) which subdivisions Metra's dispatchers monitor and factor into their dispatching decisions.

Response to Interrogatory No. 1:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that is not in Metra's possession or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that its dispatchers currently dispatch both passenger and freight trains on the Metra's Rock Island Line and portions of the Southwest Service Line. In addition, Metra's dispatchers working under the supervision of CP's dispatching control station dispatch freight train traffic operating on Metra's MD-W and MD-N on CN's Waukesha Subdivision where it crosses MD-W. Metra's dispatchers on these lines are available 24 hours a day to dispatch freight trains overnight.

On Metra's Rock Island Line, Metra dispatches approximately four daily freight trains—two CSX trains and two Iowa Interstate trains. Metra's dispatching of this line also requires it to

handle approximately 8-10 daily freight train crossings at the Canadian National Railway's Leighton Subdivision crossing east of Joliet.

On Metra's Southwest Service Line, Metra dispatches one Norfolk Southern train along the entire length of the line, as well as approximately 8 daily Norfolk Southern freight trains on this line between a connection at 59th Street and a connection with the BRC at 74th Street, and between 4 and 8 daily trains on another segment between Chicago Ridge and Landers. Metra's dispatchers are also involved in handling approximately 20 daily trains on 5 crossings along the segment between 59th Street and 74th Street.

On Metra's MD-N Line at Control Tower A5, Metra's dispatchers control dispatching under supervision and authority of CP's dispatching center and dispatch all freight and passenger traffic crossing that tower for both CP's C&M and Elgin Subdivisions. On Metra's MD-W Line at Control Tower B12, Metra's dispatchers control dispatching under supervision and authority of CP's dispatching center and dispatch all freight and passenger traffic crossing that tower for CP's Elgin Subdivision as well as the Galewood East and Cicero West (connection with Belt Railway Company of Chicago ("BRC")) Control Points. Under CP dispatcher authority, they also control movements in and out of the east end of Bensenville Yard through the Control Point Franklin Park West, as well as movements to and from the Indiana Harbor Belt Railway at the Control Point Edgington.

Interrogatory No. 2:

Identify which railroad's freight trains are purportedly obstructing Metra's trains in the social media posts in Figure 4 of Metra's Comments and Request for Conditions filed on March

15, 2022, and the direction of travel and track on which the depicted Metra and freight trains were operating. Produce all Documents in support of that identification.

Response to Interrogatory No. 2:

Metra specifically objects to this request on the basis that it requests information that is not in Metra's possession or would require Metra to conduct unduly burdensome additional research.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra does not possess this information.

Interrogatory No. 3:

Describe in detail each instance in which Greg Godfrey and his staff allegedly "witnessed CP dispatchers who [were] able to prioritize or avoid delay to Metra being directly told by senior management to move CP trains, regardless of the impact on the network" and that "sometimes Metra train dispatchers are even forced and required by CP to follow these instructions to display signals for freight trains ahead of Metra trains" as asserted on page six of the Verified Statement of Greg Godfrey (Exhibit E to Metra's Comments and Request for Conditions filed on March 15, 2022) and, for each such instance, identify (i) the date and time it occurred and (ii) the Metra employees, the CP dispatchers and the CP senior management personnel who were allegedly involved.

Response to Interrogatory No. 3:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it

requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that it has already produced this information. These instances are discussed in detail in the documents already provided to Applicants attached to Metra's Comments. *See*, *e.g.*, METR-7, Ex. B-2 at 204, 252-53, 256, 291, 331.

Interrogatory No. 4:

Identify the "daily operations decisions" that CP dispatchers make which "clearly favor their freight operations, both in and outside of the peak-periods" as asserted on page 10 of the Verified Statement of Richard P. Oppenheim (Exhibit B to Metra's Comments and Request for Conditions filed on March 15, 2022), including but not limited to specific examples and the dates and times of those actions.

Response to Interrogatory No. 4:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating it has already provided this information to Applicants. This is discussed in the documents already provided to Applicants attached to Metra's Comments. *See*, *e.g.*, METR-7, Ex. B at 11-12; *id*. Ex. B-2 at 1-333. Further information regarding specific

examples with dates and times is also provided in the additional documentation produced in response to Applicants' Request for Production No. 4, below.

Interrogatory No. 5.:

Explain in detail how CP "could schedule night service to avoid interference with Metra's trains" as asserted on page 10 of the Verified Statement of Richard P. Oppenheim (Exhibit B to Metra's Comments and Request for Conditions filed on March 15, 2022), including but not limited to how such a practice would work under current operating procedures.

Response to Interrogatory No. 5:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that, as discussed in Metra's Comments, Metra operates dozens of passenger trains on MD-W and MD-N. None of Metra's inbound trains operate scheduled service for over seven hours between 9:45 pm and 4:52 am during the week, and none of its outbound trains operate scheduled service for over six hours between 12:05 am and 6:21 am during the week. *See* https://schedules.metrarail.com/pdf/alternative/MD-W.pdf and https://schedules.metrarail.com/pdf/alternative/MD-N.pdf. These windows, which are similar during the weekend, constitute a significant proportion of time available for freight movements that are not appropriate for passenger service. Typically, the only CP freight train that operates

during this night-time window on the C&M Sub is a 471 (now relabeled 255) train. On the Elgin Subdivision, sporadic movements between Bensenville Yard and the BRC connection at Cicero West could easily be augmented with additional freight traffic. The rest of CP's freight trains regularly operate during the times when Metra trains also operate.

Interrogatory No. 6:

Describe in detail each instance in which CP dispatchers have allegedly "ignored or disabled the hot line, leaving [Mr. Oppenheim] and [his] staff without expeditious recourse when CP dispatching decisions are either the cause of CP-related issues on Metra's lines or CP-related issues could be resolved or mitigated through dispatching" as asserted on page 17 of the Verified Statement of Richard P. Oppenheim (Exhibit B to Metra's Comments and Request for Conditions filed on March 15, 2022) and, for each such instance, identify (i) the date and time it occurred and (ii) the Metra employees and CP employees who were allegedly involved.

Response to Interrogatory No. 6:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has already provided this information to Applicants. This is discussed in detail in the documents already provided to Applicants attached to Metra's Comments. *See, e.g.*, METR-7, Ex. B-2 at 29, 252-54.

Interrogatory No. 7:

Describe in detail each instance in which CP's dispatchers have allegedly "require[d] passengers to cross tracks unnecessarily, dodge on-coming freight trains, or circumnavigate idling freight trains at Metra stations" as asserted on page 25 of Metra's Comments and Request for Conditions filed on March 15, 2022, and identify the date and time of each such instance.

Response to Interrogatory No. 7:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has already produced this information to Applicants. CP dispatchers create this dangerous and inconvenient situation on a constant basis in the process of rerouting Metra trains around or past freight trains. This occurs often and Metra does not have a specific count of the times it has occurred. However, Metra has documented a number of these events, which are discussed in detail in the documents already provided to Applicants attached to Metra's Comments. *See, e.g.*, METR-7, Ex. B-2 at 21, 28, 34, 41, 48, 54, 55, 56, 57, 58, 59, 62, 65, 75, 78, 85, 86, 95, 115, 131, 139, 140, 141, 147, 160, 220, 231, 233, 235, 238, 239, 293, 295, 299, 301, 308, 312, 314, 317, 328, 332.

Interrogatory No. 8:

Describe in detail each instance in which CP has allegedly "demonstrated a lack of regard for constrains on its operating and dispatching authority for the MD-W and MD-N" as asserted on page 79 of Metra's Comments and Request for Conditions filed on March 15, 2022 and, for each such instance, identify (i) the date and time it occurred and (ii) the Metra employees and CP employees who were allegedly involved.

Response to Interrogatory No. 8:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating this is discussed in detail in the documents already provided to Applicants attached to Metra's Comments. *See, e.g.*, METR-7, Verified Statement of Richard Oppenheim, Ex. B at 11-12; *id*. Ex. B-2 at 1-333. Further information regarding specific examples with dates and times is also provided in the additional documentation produced in response to Applicants' Request for Production No. 4, below.

Interrogatory No. 9:

For the period from January 1, 2016 until February 28, 2022, describe in detail each instance in which CP has "dispatche[d] Metra trains on different main line tracks from the ones that Metra has identified for use by its passengers heading in a specified direction" as asserted on

page 27 of Metra's Comments and Request for Conditions filed on March 15, 2022, and, for each such instance, identify (i) the date and time it occurred and (ii) the reason it occurred.

Response to Interrogatory No. 9:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that CP dispatchers dispatch Metra trains on different main line tracks from the ones that Metra has identified for use by its passengers heading in a specified direction on a constant basis in the process of rerouting Metra trains around or past freight trains. This occurs often and Metra does not have a specific count of the times it has occurred. However, Metra has documented a number of these events, which are discussed in detail in the documents already provided to Applicants attached to Metra's Comments. *See, e.g.*, METR-7, Ex. B-2 at 21, 28, 34, 41, 48, 54, 55, 56, 57, 58, 59, 62, 65, 75, 78, 85, 86, 95, 115, 131, 139, 140, 141, 147, 160, 220, 231, 233, 235, 238, 239, 293, 295, 299, 301, 308, 312, 314, 317, 328, 332.

RESPONSES TO REQUESTS FOR PRODUCTION

Request No. 1:

Please produce the workpaper titled "GG-CP-Analysis-FINAL-3-15-2022 MDDATA" in Excel (or other) native format.

Response to Request No. 1:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra will produce this document in native format in its virtual document room.

Request No. 2.

Produce data showing 100% of the trains operated on the lines and for the periods covered in the workpaper titled "GG-CP-Analysis-FINAL-3-15-2022 MDDATA".

Response to Request No. 2:

Metra specifically objects to this request on the basis that it is overly broad, unduly burdensome, and not proportional to the scope of the issues raised in this proceeding. Metra also objects on the basis to the extent that this request requires Metra to conduct a special study to obtain this data.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that it has already produced data for "100% of the trains operated on the lines" within the parameters and purposes for which the data was used, i.e. Metra trains delayed due to CP's dispatching and operations.

Request No. 3:

Produce all Documents providing support for the assertions made on page six of the Verified Statement of Greg Godfrey (Exhibit E to Metra's Comments and Request for Conditions filed on March 15, 2022) that "[o]n a number of recent occasions [Godfrey's] staff and [he] have witnessed CP dispatchers who are able to prioritize or avoid delay to Metra being directly told by senior management to move CP trains, regardless of the impact on the network" and that "sometimes Metra train dispatchers are even forced and required by CP to follow these instructions to display signals for freight trains ahead of Metra trains."

Response to Request No. 3:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has already produced the documents requested. *See* METR-7, Exs. B-2 and B-3.

Request No. 4:

Produce all Documents providing support for the assertion made on page 10 of the Verified Statement of Richard P. Oppenheim (Exhibit B to Metra's Comments and Request for Conditions filed on March 15, 2022) that "CP dispatchers make daily operations decisions which clearly favor their freight operations, both in and outside of the peak-periods."

Response to Request No. 4:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has already produced the documents requested. *See* METR-7, Exs. B-2 and B-3; *id.*, Ex. D-1. In addition, Metra is producing additional documents documenting details regarding specific occurrences in its virtual document room.

Request No. 5:

Produce all Documents providing support for the assertion made on page 10 of the Verified Statement of Richard P. Oppenheim (Exhibit B to Metra's Comments and Request for Conditions filed on March 15, 2022) that CP "could schedule night service to avoid interference with Metra's trains."

Response to Request No. 5:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that the Documents that Metra possesses supporting this

statement are already publicly available. *See* https://schedules.metrarail.com/pdf/alternative/MD-W.pdf and https://schedules.metrarail.com/pdf/alternative/MD-N.pdf.

Request No. 6:

Produce all Documents providing support for the assertion made on page 17 of the Verified Statement of Richard P. Oppenheim (Exhibit B to Metra's Comments and Request for Conditions filed on March 15, 2022) that "CP dispatchers have at times ignored or disabled the hot line, leaving [Mr. Oppenheim] and [his] staff without expeditious recourse when CP dispatching decisions are either the cause of CP-related issues on Metra's lines or CP-related issues could be resolved or mitigated through dispatching."

Response to Request No. 6:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has already produced the documents requested. *See, e.g.*, METR-7, Ex. B-2 at 29, 252-54.

Request No. 7:

Produce all Documents providing support for the assertion made on page 19 of Metra's Comments and Request for Conditions filed on March 15, 2022, that Metra encounters "regular interference" during peak periods.

Response to Request No. 7:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has already produced the documents requested. *See* METR-7, Exs. B-2 and B-3; *id.*, Ex. D-1. *See also* the additional documentation provided in response to Request No. 4.

Request No. 8:

Produce all Documents providing support for the assertion made on page 25 of Metra's Comments and Request for Conditions filed on March 15, 2022, that "CP's dispatching decisions too often require passengers to cross tracks unnecessarily, dodge on-coming freight trains, or circumnavigate idling freight trains at Metra stations."

Response to Request No. 8:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that it has already provided this information to Applicants. This

occurs often and Metra does not have a specific count of the times it has occurred. However, Metra has documented a number of these events, which are discussed in detail in the documents already provided to Applicants attached to Metra's Comments. *See*, *e.g.*, METR-7, Ex. B-2 at 21, 28, 34, 41, 48, 54, 55, 56, 57, 58, 59, 62, 65, 75, 78, 85, 86, 95, 115, 131, 139, 140, 141, 147, 160, 220, 231, 233, 235, 238, 239, 293, 295, 299, 301, 308, 312, 314, 317, 328, 332.

Request No. 9:

Produce all Documents providing support for the assertion made on page 79 of Metra's Comments and Request for Conditions filed on March 15, 2022, that "CP has in the past demonstrated a lack of regard for constraints on its operating and dispatching authority for the MD-W and MD-N."

Response to Request No. 9:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has already produced the documents requested. METR-7, Exs. B-2 and B-3; *id.*, Ex. D-1. *See also* the additional documentation provided in response to Request No. 4.

Request No. 10:

Produce all Documents providing support for the assertion made on page 27 of Metra's Comments and Request for Conditions filed on March 15, 2022, that "CP regularly dispatches Metra trains on different main line tracks from the ones that Metra has identified for use by its passengers heading in a specified direction."

Response to Request No. 10:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that it has already provided this information. This occurs often and Metra does not have a specific count of the times it has occurred. However, Metra has documented a number of these events, which are discussed in detail in the documents already provided to Applicants attached to Metra's Comments. *See, e.g.*, METR-7, Ex. B-2 at 21, 28, 34, 41, 48, 54, 55, 56, 57, 58, 59, 62, 65, 75, 78, 85, 86, 95, 115, 131, 139, 140, 141, 147, 160, 220, 231, 233, 235, 238, 239, 293, 295, 299, 301, 308, 312, 314, 317, 328, 332.

Request No. 11:

Produce all Documents relating to any proceeding before the Interstate Commerce Commission or the Surface Transportation Board concerning Metra's acquisition of ownership of the MD-W Line.

Response to Request No. 11:

Metra specifically objects to this request on the basis that the word "concerning" is vague, indefinite and ambiguous. Additionally, Metra objects on the basis that this request is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce when it is already readily available to Applicants through publicly accessible means.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has no Documents responsive to this request.

Request No. 12:

Produce all Documents reflecting the transfer of ownership of the MD-W Line to Metra.

Response to Request No: 12:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra is producing responsive documents in its virtual document room.

Request No. 13:

Produce all Documents studying, analyzing, discussing, or reflecting CP's common carrier obligations with respect to the MD-W Line.

Response to Request No. 13:

Metra specifically objects to this request on the basis that it is unduly burdensome and not proportional to the scope of the issues raised in this proceeding, and to the extent that it requests information that Metra has already provided to Applicants, that is not in Metra's possession, or would be unduly burdensome for Metra to produce.

Subject to and without waiving the above General Objections and specific objections raised, Metra responds by stating that Metra has no Documents responsive to this request.

RESPONSES TO APPLICANTS' REQUESTS FOR ADMISSION

Request for Admission No. 1:

Admit or deny that Metra is not a freight common carrier with respect to any part of the MD-W Line.

Response to Request for Admission No. 1:

Admit.

Request for Admission No. 2:

Admit or deny that CP is a freight common carrier possessing a common carrier obligation with respect to the MD-W Line.

Response to Request for Admission No. 2:

Metra objects on the basis that responding to this request requires Metra to reach a legal conclusion. Subject to this objection and without waiving its right to respond further regarding this request, Metra admits.

Request for Admission No. 3:

Admit or deny that CP is the only freight common carrier with the right to operate its locomotives over the MD-W Line.

Response to Request for Admission No. 3:

Deny.

Request for Admission No. 4:

Admit or deny that the rights that CP possesses under its agreements with Metra governing CP's operations over the MD-W Line support CP's discharge of its common carrier obligations with respect to the MD-W Line.

Response to Request for Admission No. 4:

Admit.

Respectfully Submitted,

METRA, "ON-TIME PERFORMANCE - DECEMBER 2021" (EXCERPTS)

On-Time Performance

December 2021

Prepared by the Division of Strategic Planning & Performance

On-Time Performance
December 2021

This report presents an analysis of December 2021 train delays as reported for Metra's eleven rail lines. On-time is defined, for this analysis, as those regularly scheduled trains arriving at their last station stop less than six minutes behind schedule. Trains that are six minutes or more behind schedule, including annulled trains (trains that do not complete their scheduled runs), are regarded as late. "Extra" trains (trains added to handle special events but not shown in the regularly published timetables) are excluded from on-time performance calculations unless shown in special-event schedules that include all intermediate station stop times and are distributed publicly via Metra's website or on paper flyers. Cancelled (not annulled) trains and non-revenue trains are also excluded from on-time performance calculations.

On-Time Performance Tables

Table 1 shows the total number of scheduled and delayed trains for each line by service period for the current month and year-to-date.

Table 2 lists on-time percentages by line for each month and year since 2016.

Table 3 lists each weekday train that was less than 85% on-time for the current month, in order of line, train, and dates delayed. The codes in the *Delay Code* column of Table 3 are defined and shown sorted by cause category and carrier designation in Table 4. Effective January 1, 2020, and November 1, 2021, Metra is using an updated set of delay codes and delay cause categories. Changes to the delay cause categories used for Tables 5 through 7 have been applied retroactively to prior year data; totals by cause category for prior years may not match what was previously reported.

Table 5 shows the number of delays by cause and line for the current month, including a 5-year average. The table highlights the top two delay causes for each line.

Table 6 shows the number of delays by cause and line for year-to-date, including a 5-year average. The table highlights the top two delay causes for each line.

Table 7 shows the number of delays by cause and month for the current year and prior year. The table highlights the top two delay causes for each month.

For Tables 5 through 7, delays by cause are separated into *Metra/PSA* and *Foreign* designations, where applicable. *Metra/PSA* refers to delays that may be directly or indirectly attributed to Metra or Metra Purchase of Service Agreement partners (BNSF and UP) in commuter rail operation. *Foreign* refers to delays that may be directly or indirectly attributed to other carriers, including freight carriers, Amtrak, and NICTD, that affect Metra trains. *Foreign* also includes delays attributable to BNSF and Union Pacific freight operations. See Table 4 for a detailed breakdown of delay codes by cause category and carrier designation.

Table 8 shows the number of delays by duration and service period for each line.

Table 9 shows the annual number of train delays and annual on-time performance by line for the past five years. Table 9 is only included in the December monthly report.

Table 10 shows the annual number of train delays by cause and line for the past five years. Table 10 is only included in the December monthly report.

Reporting Calculations for Temporary Schedules and Special Events

Planned construction projects or special events can adversely affect on-time performance. Metra occasionally publishes full temporary schedules, which supersede the standard published schedules, to inform riders of possible delays or modifications to regular service. Metra also may publish informational notices to accompany temporary schedules. On-time performance is calculated using the temporary schedules and any accompanying notices.

Alternate Service Schedules due to the Coronavirus (COVID-19) Pandemic

On Monday, March 23, 2020, Metra began operating alternate weekday schedules on all lines, except the Heritage Corridor (HC), to adjust for the reduced number of riders due to school closures, work-from-home mandates and other consequences of the coronavirus pandemic. Through the month of April Metra continued to operate regularly scheduled weekday service on the HC Line as well as normal weekend service. On May 4 Metra reduced weekday service on the HC, North Central Service (NCS) and SouthWest Service (SWS) lines, and on May 9 reduced Saturday service to Sunday service levels on all lines except the Metra Electric (ME), thus eliminating all SWS Saturday service. Metra increased weekday service on the ME on May 18 as required for implementation of the Positive Train Control (PTC) safety system on that line. Metra increased weekday service on the RI on June 15 and on the HC, NCS and SWS on June 29. As of July 4, Metra decreased Saturday service on the ME to match Sunday service, thus eliminating Saturday service on the ME Blue Island Branch. Beginning August 3, Metra added two weekday BNSF trains and four weekday RI trains. Metra added four weekday UP-N trains and six weekday UP-NW trains on November 2.

On January 11, 2021, Metra added two weekday MD-N trains and four weekday MD-W trains, and on February 1 added 10 weekday RI trains. Metra added four weekday BNSF and MD-N trains and two NCS trains on April 12. Metra added four weekday ME trains on May 10, four Saturday ME trains on May 15 and four Sunday ME trains on May 16. On May 29 Metra restored Saturday service on the BNSF, MD-N, MD-W, RI, UP-N, UP-NW, and UP-W lines, resulting in an increase of 46 Saturday revenue trains systemwide.

In July, Metra launched pilot schedules on the BNSF, ME and UP-N (July 12), and the RI (July 19) that added off-peak options to meet post-COVID needs for riders. Metra also implemented minor weekday peak-period service increases on all other lines and restored ME Saturday service effective July 12. These changes resulted in an increase of 148 weekday trains and 38 Saturday trains systemwide in July. Schedule adjustments on September 13 resulted two fewer weekday trains on both the UP-N and UP-W. A schedule adjustment on November 15 resulted in eight fewer weekday BNSF trains. There were no schedule adjustments in December.

Under these pilot and alternate schedules Metra operated 558 regularly scheduled revenue trains each weekday in December, which is a 19 percent reduction from Metra's pre-pandemic weekday service of 692 scheduled revenue trains. Metra operated 269 regularly scheduled revenue trains each Saturday in December, which is a one percent reduction from the 273 Saturday trains Metra operated pre-pandemic. Metra operated 185 regularly scheduled revenue trains each Sunday in December, which is a two percent increase from the 181 Sunday revenue trains Metra operated pre-pandemic. As a result of the changes under these alternative and pilot schedules, Metra operated about 16 percent fewer total revenue trains in December 2021 than in December 2019, but about 36 percent more total revenue trains than in December 2020.

Metra has developed a set of service restoration principles to guide schedule design as service is added back. These principles will help Metra meet the needs of riders as travel demand approaches a new normal. Metra will continue to monitor ridership and will add service back incrementally throughout the system to stay ahead of the ridership growth curve and ensure that adequate service is in place to provide social distancing and encourage ridership.

METRA, "ON-TIME PERFORMANCE - DECEMBER 2020" (EXCERPTS)

On-Time Performance

December 2020

Prepared by the Division of Strategic Planning & Performance

On-Time Performance
December 2020

This report presents an analysis of December 2020 train delays as reported for Metra's eleven rail lines. On-time is defined, for this analysis, as those regularly scheduled trains arriving at their last station stop less than six minutes behind schedule. Trains that are six minutes or more behind schedule, including annulled trains (trains that do not complete their scheduled runs), are regarded as late. "Extra" trains (trains added to handle special events but not shown in the regularly published timetables) are excluded from on-time performance calculations unless shown in special-event schedules that include all intermediate station stop times and are distributed publicly via Metra's website or on paper flyers. Cancelled (not annulled) trains and non-revenue trains are also excluded from on-time performance calculations.

On-Time Performance Tables

Table 1 shows the total number of scheduled and delayed trains for each line by service period for the current month and year-to-date.

Table 2 lists on-time percentages by line for each month and year since 2015.

Table 3 lists each weekday train that was less than 85% on-time for the current month, in order of line, train, and dates delayed. The codes in the *Delay Code* column of Table 3 are defined and shown sorted by cause category and carrier designation in Table 4. Effective January 1, 2020, Metra is using an updated set of delay codes and delay cause categories. Changes to the delay cause categories used for Tables 5 through 7 have been applied retroactively to prior year data; totals by cause category for prior years may not match what was previously reported.

Table 5 shows the number of delays by cause and line for the current month, including a 5-year average. The table highlights the top two delay causes for each line.

Table 6 shows the number of delays by cause and line for year-to-date, including a 5-year average. The table highlights the top two delay causes for each line.

Table 7 shows the number of delays by cause and month for the current year and prior year. The table highlights the top two delay causes for each month.

For Tables 5 through 7, delays by cause are separated into *Metra/PSA* and *Foreign* designations, where applicable. *Metra/PSA* refers to delays that may be directly or indirectly attributed to Metra or Metra Purchase of Service Agreement partners (BNSF and UP) in commuter rail operation. *Foreign* refers to delays that may be directly or indirectly attributed to other carriers, including freight carriers, Amtrak, and NICTD, that affect Metra trains. *Foreign* also includes delays attributable to BNSF and Union Pacific freight operations. See Table 4 for a detailed breakdown of delay codes by cause category and carrier designation.

Table 8 shows the number of delays by duration and service period for each line.

Table 9 shows the annual number of train delays and annual on-time performance by line for the past five years. Table 9 is only included in the December monthly report.

Table 10 shows the annual number of train delays by cause and line for the past five years. Table 10 is only included in the December monthly report.

Reporting Calculations for Temporary Schedules and Special Events

Planned construction projects or special events can adversely affect on-time performance. Metra occasionally publishes full temporary schedules, which supersede the standard published schedules, to inform riders of possible delays or modifications to regular service. Metra also may publish informational notices to accompany temporary schedules. On-time performance is calculated using the temporary schedules and any accompanying notices.

Alternate Service Schedules due to the Coronavirus (COVID-19) Pandemic

On Monday, March 23, Metra began operating alternate weekday schedules on all lines, except the Heritage Corridor (HC), to adjust for the reduced number of riders due to school closures, work-from-home mandates and other consequences of the coronavirus pandemic. Through the month of April Metra continued to operate regularly scheduled weekday service on the HC Line as well as normal weekend service. On May 4 Metra reduced weekday service on the HC, North Central Service (NCS) and SouthWest Service (SWS) lines, and on May 9 reduced Saturday service to Sunday service levels on all lines except the Metra Electric (ME), thus eliminating all SWS Saturday service. Metra increased weekday service on the ME on May 18 as required for implementation of the Positive Train Control (PTC) safety system on that line. Metra increased weekday service on the RI on June 15 and on the HC, NCS and SWS on June 29. As of July 4, Metra decreased Saturday service on the ME to match Sunday service, thus eliminating Saturday service on the ME Blue Island Branch. Beginning August 3, Metra added two weekday BNSF trains and four weekday RI trains. There was no change in the number of daily scheduled trains in September or October. Metra added four weekday UP-N trains and six weekday UP-NW trains on November 2. There was no change in the number of daily scheduled trains in December.

Under these alternate schedules, Metra operated 392 scheduled revenue trains each weekday in December, which is a 43 percent reduction from Metra's normal weekday service of 692 scheduled revenue trains. Metra operated 181 revenue trains each Saturday in December, which is a 34 percent reduction from the 273 Saturday trains Metra normally operates. There has been no change in the number of Sunday trains. As a result of these reductions under the alternative schedules, Metra operated about 39 percent fewer revenue trains in December 2020 than in December 2019. The reduced schedules will remain in effect until health officials deem the crisis has passed and/or ridership begins to return to normal. Metra will continue to monitor ridership and may adjust service levels on a line-by-line basis to meet the ridership demands.

METRA, "ON-TIME PERFORMANCE - DECEMBER 2019" (EXCERPTS)

On-Time Performance

December 2019

Prepared by the Division of Strategic Planning & Performance

On-Time Performance
December 2019

This report presents an analysis of December 2019 train delays as reported for Metra's eleven rail lines. On-time is defined, for this analysis, as those regularly scheduled trains arriving at their last station stop less than six minutes behind schedule. Trains that are six minutes or more behind schedule, including annulled trains (trains that do not complete their scheduled runs), are regarded as late. "Extra" trains (trains added to handle special events but not shown in the regularly published timetables) are excluded from on-time performance calculations unless shown in special-event schedules that include all intermediate station stop times and are distributed publicly via Metra's website or on paper flyers. Cancelled (not annulled) trains and non-revenue trains are also excluded from on-time performance calculations.

On-Time Performance Tables

Table 1 shows the total number of scheduled and delayed trains for each line by service period for the current month and year-to-date.

Table 2 lists on-time percentages by line for each month and year since 2014.

Table 3 lists each weekday train that was less than 85% on-time for the current month, in order of line, train, and dates delayed. The codes in the *Delay Code* column of Table 3 are defined and shown sorted by cause category and carrier designation in Table 4.

Table 5 shows the number of delays by cause and line for the current month, including a 5-year average. The table highlights the top two delay causes for each line.

Table 6 shows the number of delays by cause and line for year-to-date, including a 5-year average. The table highlights the top two delay causes for each line.

Table 7 shows the number of delays by cause and month for the current year and prior year. The table highlights the top two delay causes for each month.

For Tables 5 through 7, delays by cause are separated into *Metra/PSA* and *Foreign* designations, where applicable. *Metra/PSA* refers to delays that may be directly or indirectly attributed to Metra or Metra Purchase of Service Agreement partners (BNSF and UP) in commuter rail operation. *Foreign* refers to delays that may be directly or indirectly attributed to other carriers, including freight carriers, Amtrak, and NICTD, that affect Metra trains. *Foreign* also includes delays attributable to BNSF and Union Pacific freight operations. See Table 4 for a detailed breakdown of delay codes by cause category and carrier designation.

Table 8 shows the number of delays by duration and service period for each line.

Table 9 shows the annual number of train delays and annual on-time performance by line for the past five years. Table 9 is only included in the December monthly report.

Table 10 shows the annual number of train delays and annual on-time performance by cause and line for the past five years. Table 10 is only included in the December monthly report.

Reporting Calculations for Temporary Schedules & Special Events

Planned construction projects or special events can adversely affect on-time performance. Metra occasionally publishes full temporary schedules, which supersede the standard published schedules, to inform riders of possible delays or modifications to regular service. Metra also may publish informational notices to accompany temporary schedules. On-time performance is calculated using the temporary schedules and any accompanying notices.

METRA, "ON-TIME PERFORMANCE - DECEMBER 2018 (REVISED)" (EXCERPTS)

On-Time Performance

December 2018

(Revised)

Prepared by the Division of Strategic Capital Planning

On-Time Performance
December 2018

This report presents an analysis of December 2018 train delays as reported for Metra's eleven rail lines. On-time is defined, for this analysis, as those regularly scheduled trains arriving at their last station stop less than six minutes behind schedule. Trains that are six minutes or more behind schedule, including annulled trains (trains that do not complete their scheduled runs), are regarded as late. "Extra" trains (trains added to handle special events but not shown in the regularly published timetables) are excluded from on-time performance calculations unless shown in special-event schedules that include all intermediate station stop times and are distributed publicly via Metra's website or on paper flyers. Cancelled (not annulled) trains and non-revenue trains are also excluded from on-time performance calculations.

On-Time Performance Tables

Table 1 shows the total number of scheduled and delayed trains for each line by service period for the current month and year-to-date.

Table 2 lists on-time percentages by line for each month and year since 2013.

Table 3 lists each weekday train that was less than 85% on-time for the current month, in order of line, train, and dates delayed. The codes in the *Delay Code* column of Table 3 are defined and shown sorted by cause category and carrier designation in Table 4.

Table 5 shows the number of delays by cause and line for the current month, including a 5-year average. The table highlights the top two delay causes for each line.

Table 6 shows the number of delays by cause and line for year-to-date, including a 5-year average. The table highlights the top two delay causes for each line.

Table 7 shows the number of delays by cause and month for the current year and prior year. The table highlights the top two delay causes for each month.

For Tables 5 through 7, delays by cause are separated into *Metra/PSA* and *Foreign* designations, where applicable. *Metra/PSA* refers to delays that may be directly or indirectly attributed to Metra or Metra Purchase of Service Agreement partners (BNSF and UP) in commuter rail operation. *Foreign* refers to delays that may be directly or indirectly attributed to other carriers, including freight carriers, Amtrak, and NICTD, that affect Metra trains. *Foreign* also includes delays attributable to BNSF and Union Pacific freight operations. See Table 4 for a detailed breakdown of delay codes by cause category and carrier designation.

Table 8 shows the number of delays by duration and service period for each line.

Table 9 shows the annual number of train delays and annual on-time performance by line for the past five years. Table 9 is only included in the December monthly report.

Table 10 shows the annual number of train delays and annual on-time performance by cause and line for the past five years. Table 10 is only included in the December monthly report.

Reporting Calculations for Temporary Schedules & Special Events

Planned construction projects or special events can adversely affect on-time performance. Metra occasionally publishes full temporary schedules, which supersede the standard published schedules, to inform riders of possible delays or modifications to regular service. Metra also may publish informational notices to accompany temporary schedules. On-time performance is calculated using the temporary schedules and any accompanying notices.

Changes in Reporting

In continued efforts to streamline and enhance the information provided in this report, Metra staff modified or removed the following tables effective with the March 2018 Report:

- *Table 1: Scheduled and Delayed Trains, and On-Time Performance by Service Period and Line* – Modified to include a year-to-date time period.
- *Table 2: On-Time Performance by Line and Branch* – Made minor formatting changes.
- *Table 3: List of Weekday Trains less than 85% On-Time* – Made minor formatting changes.
- *Table 4: Delay Incident Codes and Definitions* – Removed
- *Table 5: Delay Incident Codes Sorted by Cause Category & Carrier Designation* – Made minor formatting changes. Changed table number and title to *Table 4: Delay Codes by Cause Category & Carrier*.
- *Table 6: Frequency of Train Delays by Control and Line* – Removed
- *Table 7: Number of Delays by Date* – Removed
- *Table 8: Frequency of Train Delays by Cause and Line* – Added shading to highlight the top two delay causes for each line. Changed table number and title to *Table 5: Train Delays by Cause and Line*.
- *Table 9: Frequency of Train Delays by Cause and Line* – Added shading to highlight the top two delay causes for each line. Changed table number and title to *Table 6: Train Delays by Cause & Line – YTD*.
- *Table 10: Frequency of Train Delays by Cause & Month* - Added shading to highlight the top two delay causes for each month. Changed table number and title to *Table 7: Train Delays by Cause & Month*.
- *Table 11*: *Freight Delays* – Removed
- *Table 12: Frequency of Lift-Deployment Train Delays by Line & Month* - Removed
- *Table 13: Frequency of Train Delays by Duration* – Included delay information for the Saturday and Sunday service periods. Changed table number and title to *Table 8: Train Delays by Duration*.
- *Table 14: Average Length of Delay by Service Period, in Minutes* – Removed
- *(December monthly report only) Table 15: Annual Train Delays and On-Time Performance* – Made minor formatting changes. Changed table number and title to *Table 9: Annual Train Delays and On-Time Performance*.
- *(December monthly report only) Table 16: Frequency of Train Delays by Cause and Line* – Removed

- *(December monthly report only) Table 17: Annual System Causes of Delay* – Made minor formatting changes. Changed table number and title to *Table 10: Annual System Causes of Train Delays*.
- *(December monthly report only) Table 18: Frequency of Train Delays by Duration* – Removed
- *(December monthly report only) Table 19: Frequency of Train Delays by Duration and Line* – Removed

METRA, "COMMUTER RAIL SYSTEM ON-TIME PERFORMANCE REPORT - DECEMBER 2017"

(EXCERPTS)

COMMUTER RAIL SYSTEM

ON-TIME PERFORMANCE REPORT

December 2017

Metra

Division of Strategic Capital Planning **February 2018**

COMMUTER RAIL ON-TIME PERFORMANCE
December 2017

This report presents an analysis of the December 2017 train delays as reported for Metra's eleven commuter rail lines. On-time is defined, for this analysis, as those regularly scheduled trains arriving at their last station stop less than six minutes behind schedule. Trains that are six minutes or more behind schedule, including annulled trains (trains that do not complete their scheduled runs), are regarded as late. “Extra” trains (trains added to handle special events but not shown in the regularly published timetables) are excluded from on-time performance calculations unless shown in special-event schedules that include all intermediate station stop times and are distributed publicly via Metra's website or on paper flyers. Cancelled (not annulled) trains and non-revenue trains are also excluded from on-time performance calculations.

On-Time Performance Tables

Table 1 presents the number of train delays by rail line and service period. During December 2017, Metra operated 16,184 scheduled trains, including scheduled “extras”, if any. 989 of these trains were delayed (late or annulled), representing an on-time performance rate of 93.9%. Table 2 lists on-time percentages by line for each month and year since 2012.

Table 3 lists each train that was on time for less than 85% of its weekday runs in December 2017, in order of line, train, and dates delayed. The codes in the 'Delay Code' column of Table 3 are defined in Table 4 and shown sorted by delay-cause category and carrier designation in Table 5. Effective January 1, 2012, January 1, 2014, and July 1, 2016, Metra is using an expanded set of delay codes, to provide more detail about the cause of and responsibility for each train delay.

Table 6.a shows the frequency of train delays by delay-cause control and by line during December 2017. Of the 989 delays systemwide in December 2017, all but 513 (52%) were beyond Metra's control. Table 6.b shows the average frequencies over the previous five Decembers, and Table 6.c shows the differences between Table 6.a and Table 6.b., illustrating that in December 2017, 237 more delays than the average over the previous five Decembers were controllable. Table 6.d shows the delay-cause control frequencies since the beginning of the year. Of the 8,541 delays in 2017, all but 4,242 (50%) were beyond Metra's control.

Table 7 provides a daily listing of the number of delays by line and branch for December 2017.

Table 8.a shows the frequency of train delays by delay-cause category and by line during December 2017. Table 8.b shows the average frequencies over the previous five Decembers, and Table 8.c shows the differences between Table 8.a and Table 8.b. There were 989 delays systemwide in December 2017, 301 more than the average over the previous five Decembers. Table 9.a shows delays from the beginning of the year through December 2017. Table 9.b shows the average frequencies from the beginning of the year through December of each of the previous five years, and Table 9.c shows the differences between Table 9.a and Table 9.b. Tables 10.a and 10.b display the systemwide frequency of train delays by cause and by month, for 2017 and 2016 respectively, and Table 10.c shows the difference between the two. From January through December of 2017, a total of 8,541 trains were delayed, compared to 8,053 trains delayed in the same twelve months of 2016.

In Tables 8 through 10, delays by cause are separated into 'Metra/PSA' and 'Foreign' designations, where applicable. 'Metra/PSA' refers to delays that may be directly or indirectly attributed to Metra or Metra Purchase of Service Agreement partners (BNSF and UP) in commuter rail operation. 'Foreign' refers to

delays that may be directly or indirectly attributed to other carriers, including freight carriers, Amtrak, and NICTD, that affect Metra trains. 'Foreign' also includes delays attributable to BNSF and Union Pacific freight operations. See Table 5 for a detailed breakdown of delay codes by cause category and carrier designation.

Table 11 shows, by line and month, all train delays caused by freight operations over the past 24 months. In December 2017 freight operations delayed 110 trains systemwide, compared to 94 a year earlier. Tables 12.a and 12.b display the frequency of lift-deployment train delays by line and month, for 2017 and 2016 respectively. A total of 28 trains were delayed by lift deployment in December 2017.

A review of December 2017 late trains by duration of delay is shown in Table 13. The range with the greatest number of delays was, as usual, six-to-ten minutes, accounting for 45.8% of all late trains. Table 14 shows that the average length of delay was 15.9 minutes in December 2017. It should be noted that these averages relate only to reportable delays (i.e., trains late by six minutes or more).

Tables 15 to 19 report year-end statistics. Table 15 presents annual train delays and on-time performance by line. Table 16 displays the frequency of 2017 annual train delays by cause and by line. The top two causes for each line are highlighted. Annual system causes of delay for 2012 to 2017 are shown in Table 17. The annual frequencies of train delays by duration for the Metra system are shown in Table 18, and for each line in Table 19.

Changes in On-Time Performance Reporting Calculations

“Extra” Trains

“Extra” trains (trains added to handle special events but not shown in the regularly published schedules) are excluded from on-time performance calculations, except for those “extra” trains whose special-event schedules include all intermediate station stop times and are distributed publicly via Metra's website or on paper flyers.

Intermediate station departure times and final station arrival times for some “extra” trains are either unknown (departures of some “extra” trains are held until after the completion of the respective special event) or not published. On-time performance for these two types of “extra” trains cannot be calculated, as arrival times are not known ahead of time; these trains are therefore excluded from on-time performance calculations. However, on-time performance can be calculated for “extra” trains that have full published schedules.

Temporary Schedules and Notices, for Construction and Special Events

Planned construction projects or special events can adversely affect on-time performance. Metra occasionally publishes full temporary schedules, which supersede the standard published schedules, to inform riders of possible delays or modifications to regular service. Metra also may publish informational notices to accompany temporary schedules. On-time performance is calculated using the temporary schedules and any accompanying notices.

Delays data for most recent month is final (01/25/18) version from TOPS. P:\ONTIME\report\[Delays&TrainsByServPeriod.xls]OTPbyLine&Month 1/26/2018

'2012-2016 average' calculated by summing the delays over the five years, summing the trains run over the five years, and calculating their ratio.

TABLE 3: LIST OF WEEKDAY TRAINS LESS THAN 85% ON-TIME
December 2017

Line	Train	Date	Minutes Late	Delay Code	Delay Explanation
BNSF	1234	Mon, Dec 04	8	G1	2B SW @ BERWYN
70% OT		Tue, Dec 05	8	UF1	LATE FLIP FROM 1206

EXHIBIT 7: THE 2003 SOO-METRA AMENDMENT AGREEMENT – AMENDMENT AGREEMENT BETWEEN COMMUTER RAIL DIVISION OF THE REGIONAL TRANSPORTATION AUTHORITY AND SOO LINE RAILROAD COMPANY (APR. 1, 2003) (ALSO METRA COMMENTS EXH. A-4)

1. I am Adolph Gameiro. I am the Managing Director Interline and Network Strategy at Canadian Pacific. I have held that role since April 2021. Prior to this role, I served as Director Interline Agreements since 2011. I am responsible for CP's trackage rights and other joint facility agreements with other railroads and commuter rail agencies in the United States and Canada.

2. The purpose of this Verified Statement is to address (a) assertions made by Metra regarding the contractual relationship between CP and Metra concerning the Chicago area trackage that CP and Metra share and (b) assertions by BNSF that it may in the future ask the Board to grant new trackage rights for BNSF to operate over CP trackage between Savanna, IL and Clinton, IA.

3. As I explain below, the trackage that CP and Metra share was part of Milwaukee Road's network. CP's affiliate Soo Line Railroad Company ("Soo Line") acquired the core Milwaukee Road network, including its access to Chicago via the shared lines. CP's rights over those lines were and remain governed by agreements entered into in connection with the transfer of Milwaukee Road's assets, and subsequently renegotiated multiple times between CP and Metra. I will discuss the significance of these agreements in more detail in this statement.

I. THE GOVERNING CONTRACTS REQUIRE METRA TO SHARE ITS LINES WITH CP'S FREIGHT TRAFFIC

4. The governing agreements grant CP the right to operate freight trains on Metra's MD-W and MD-N lines. The agreements place no limit on the number of freight trains CP may operate, provided that CP's trains may not interfere with Metra's passenger operations during specified peak periods. Conversely, the agreements preclude Metra from adding non-peak trains that would materially interfere with CP's freight operations. Changes in commuter train schedules, including the addition of new train service, required the Milwaukee Road's consent

and likewise now require CP's consent. The agreements also preserve freight railroad control (with CP as successor to Milwaukee Road), including the right to dispatch all freight and passenger operations on the lines.

5. I review the history of these rights and the ways that Metra's proposals in this proceeding would override specific contractual provisions that are important to CP's ability to conduct freight operations.

A. Milwaukee Road's Bankruptcy Led to the Bifurcation of Freight Operating Rights and Commuter Agency Ownership

6. The Milwaukee Road declared bankruptcy in 1977, and was ceasing its commuter operations in Chicago soon thereafter. This led to a series of transactions that split freight and commuter operating rights in order to continue both sets of transportation services.

7. First, to continue commuter service, the Milwaukee Road bankruptcy trustee entered into a Trackage Agreement in 1982 with the Regional Transportation Authority (the commuter rail operating division of which is Metra) granting it the right to operate commuter trains on the Milwaukee Road lines that had hosted commuter trains. The 1982 Agreement is attached to Metra's submission, as Exhibit A-1 to the Verified Statement of Rocio Gentil. For convenience, I reattach excerpts from this Agreement as Exhibit 1 hereto. Under the 1982 Agreement, the Milwaukee Road maintained control and dispatch of the Joint Line, had rights to run unlimited numbers of freight trains over the lines, and recognized the priority of commuter trains only during specified peak periods.

8. Second, the Milwaukee Trustee developed a plan for preserving freight service on the viable portions of the Milwaukee Road system, essentially the lines east of Kansas City and the Twin Cities. This part of the network, of course, included Milwaukee Road's essential freight operations to and from the Chicago gateway via both the Chicago and Milwaukee

Subdivision (between Milwaukee and Chicago) and the Elgin and Chicago Subdivisions (between Chicago and Savanna, Illinois). After a vigorous bidding war for these assets and dueling applications at the Interstate Commerce Commission, in 1984 the ICC approved Soo Line's proposal.[1]

9. In 1984, the Trustee obtained the approval of the federal bankruptcy court handling the matter to convey Milwaukee Road's freight assets to Soo Line.[2] The Trustee and Soo Line entered into an Asset Purchase Agreement ("APA") that provided for Soo Line's acquisition of those assets. Excerpts from this Agreement are Exhibit 2 hereto. The Trustee retained ownership of Milwaukee's "Commuter Service Properties," namely the lines over which Metra operates. Notably, the Commuter Assets expressly excluded Milwaukee Road's (now CP's) Bensenville Yard. *See* APA, Exhibit C-1.

10. But the Trustee conveyed to Soo Line all of the rights other than ownership that Milwaukee Road had possessed under the 1982 Trackage Agreement relative to the excluded Commuter Assets. This kept in place the integral nature of the Milwaukee Road network, preserving its connection to the vital Chicago gateway. Specifically, the APA provided that Soo Line would be granted "*permanent* trackage rights in and over the Commuter Service Properties substantially in the form attached as Exhibit G to this Agreement." APA § 15(d) (emphasis added). "Exhibit G" in turn stated that the agreement itself was "[to be furnished]" but made clear that the agreement would "provide for Soo and SLRCO's use of the Commuter Service

---

[1] *Chicago, Milwaukee, St. Paul & Pacific R.R. – Reorganization – Acquisition by Grand Trunk Corp.*, 2 I.C.C.2d 161, 274 (1984).

[2] The formal acquirer of the Milwaukee Road assets under the APA was SLRCO, Inc., an affiliate of Soo Line.

Properties on terms no less favorable to Soo and SLRCO than those under which the Trustee [*i.e.,* Milwaukee Road] currently operates over such trackage." *Id.*, Exh. G.

11. This Agreement was expressly approved by the Bankruptcy Court's Order No. 809, entered February 19, 1985, a copy of which is attached as Exhibit 3.

12. In 1985, Soo Line's SLRCO affiliate and the Trustee entered into a Trackage Agreement granting precisely these rights. Although the 1985 Trackage Agreement terminates in 2083, the conveyance of Milwaukee Road's assets, including rights to the "Commuter Service Properties," was permanent as noted in the previous paragraph. In addition, as the Board knows, under the "*Tex Mex* Doctrine," CP's rights could not be discontinued or abandoned without an order of the Board authorizing such a discontinuation. The 1985 Trackage Agreement is attached to Metra's submission, as Exhibit A-2 to the Verified Statement of Rocio Gentil. For convenience, I reattach excerpts from the 1985 Trackage Agreement as Exhibit 4 hereto. I discuss the significance of the terms of this Agreement below.

13. A few years later, in 1987, the Trustee conveyed Milwaukee's "Commuter Service Properties" to Metra in a condemnation sale. That conveyance, of course, was subject to the permanent rights granted to Soo Line in 1985. It is noteworthy that Metra did not seek authorization from the ICC to acquire ownership of these former-Milwaukee Road rail lines. Instead, Metra indemnified the Trustee's successor from any liability associated with "the absence of a request for ICC approval of, or the lack of ICC approval of, the condemnation of the Acquired Property." Stipulation in Condemnation Matter, § 10.1(c) (METR_FD36500_012882) (Excerpts are Exhibit 5 hereto). Metra's decision not to seek ICC approval is another indication that Metra understood that the rights granted to Soo Line in the 1985 Trackage Agreement ensured that Metra's acquisition would not have any effect on – and not interfere in any way

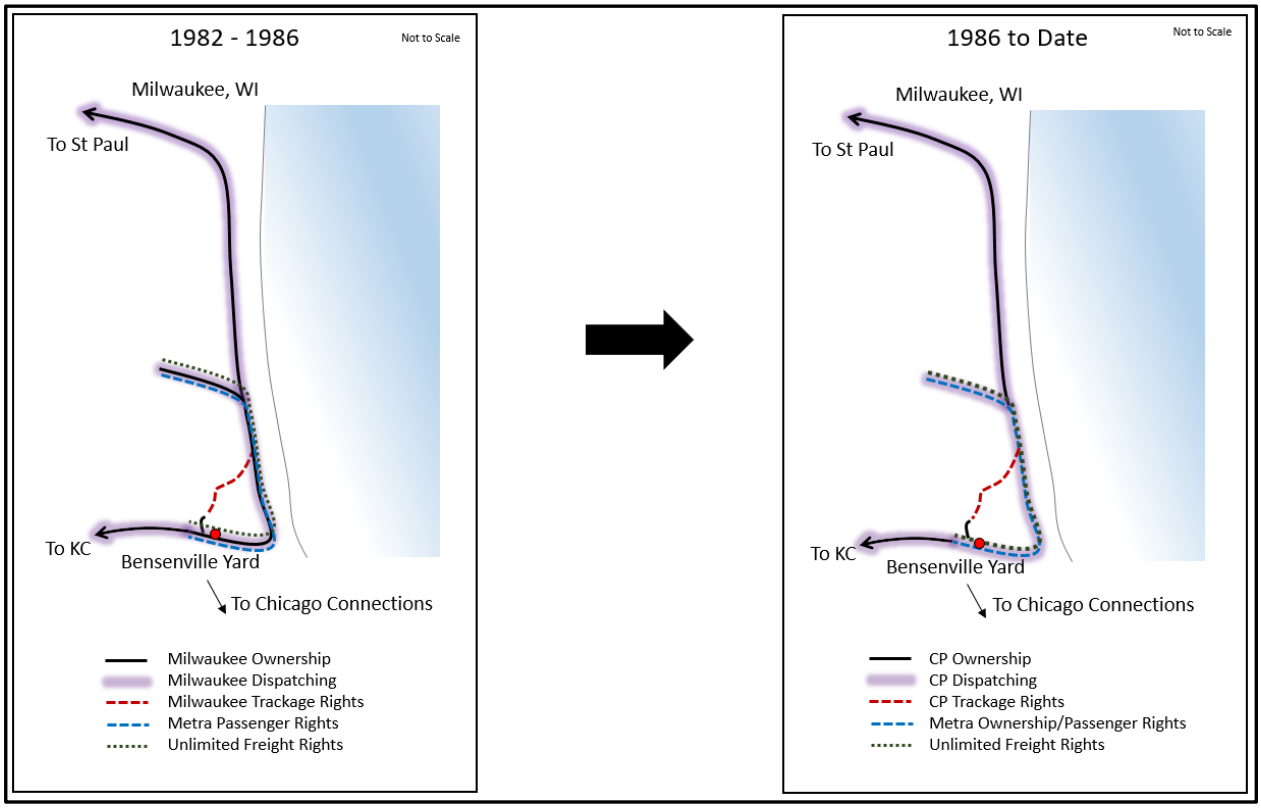
with – Soo Line's freight operations or dispatching on the line in the discharge of Soo Line's common carrier obligations.

14. In 1993, CP and Metra supplemented the 1985 Trackage Agreement to make clear that CP was the successor to SLRCO under that agreement, to give Metra responsibility for maintaining the line, and to incorporate certain concepts from the 1982 Trackage Agreement that had been left out of the 1985 Trackage Agreement – namely the existence of "peak period" windows during which Metra trains would have priority and provisions addressing processes for Metra to alter its schedules or to add trains. The core provisions of the 1985 Trackage Agreement giving Soo Line unrestricted rights to conduct freight operations (subject to avoiding interference with Metra during peak periods) and to dispatch all freight and passenger trains on the line remained intact. The 1993 Supplemental Agreement is attached to Metra's submission, as Exhibit A-3 to the Verified Statement of Rocio Gentil. For convenience, I reattach excerpts from this Agreement as Exhibit 6 hereto.

15. In 2003, when CP admitted the Iowa, Chicago & Eastern Railroad to operate freight trains over a portion of Metra's MD-W line (west of Bensenville), CP and Metra comprehensively renegotiated the compensation terms governing CP's use of the Metra-owned lines over which it operates and amended the 1995 Trackage Agreement. The 2003 Amendment Agreement is attached to Metra's submission, as Exhibit A-4 to the Verified Statement of Rocio Gentil. For convenience, I reattach excerpts from this Agreement as Exhibit 7 hereto.

B. The 1985 Trackage Agreement Grants CP Rights that Are the Equivalent to Those Milwaukee Had When It Owned the Metra Lines

16. Consistent with the clear statement in the 1984 Asset Purchase Agreement that Soo's permanent rights to operate on the Metra-owned lines would be "no less favorable to Soo … than those under which the Trustee [*i.e.*, Milwaukee Road] currently operates over such



trackage," the 1985 Trackage Agreement, as supplemented by the 1993 Supplemental Agreement, preserved the key attributes of the 1982 Trackage Agreement allowing Metra to operate over Milwaukee Road. Table 1 below compares the key provisions of these agreements that bear on the rights of the freight railroad (Milwaukee in 1982 and CP today) to operate in conjunction with Metra's commuter operations.

TABLE 1
KEY TERMS OF 1982 AND 1985/1993 TRACKAGE AGREEMENTS

RIGHTS	1982 AGREEMENT	1985 AND 1993 AGREEMENTS
Owner of Track Assets	Freight RR	Metra
Freight railroad responsible for directing the movement of all freight and passenger trains (i.e., dispatching)	☑ § 9.1	☑ 1985 § 8.1
Operation of all freight and passenger trains over the line subject to freight railroad direction	☑ § 9.2	☑ 1985 § 8.2
No limit on growth in freight operations	☑	☑
Addition of sidings necessitated by increased traffic left to judgment of freight railroad	☑ § 4.1	☑ 1985 § 3.1
Freight railroad consent required to add trains beyond those specifically provided for by agreement	☑ § 9.8	☑ 1993 § 8.16
Priority given to commuter trains during defined peak periods	☑ § 9.8	☑ 1993 § 8.15
Freight railroad shall not "unreasonably disrupt or delay" non-peak period commuter trains	☑ § 9.8	☑ 1993 § 8.15

17. As summarized in Figure 1 below, the only fundamental change is a shift of ownership from Milwaukee Road to Metra, and not any alteration in the freight railroad's rights to add freight trains to the lines and dispatch all operations on the lines (again with priority for commuter trains only during peak periods).

FIGURE 1
METRA'S PURCHASE OF THE MD-W AND MD-N LINES
HAD NO EFFECT ON CP'S FREIGHT OPERATING RIGHTS

C. Metra's Proposed Conditions Would Disrupt the Permanent Contractual Rights Granted to CP

18. Several of the conditions that Metra seeks in this proceeding would significantly alter the contractual rights set forth in the governing agreements between CP and Metra.

19. First, Metra asks for a condition requiring that CP "amend its Trackage Agreement with Metra to transfer dispatching control to Metra." METR-7 at 70-73. This on its face would alter CP's contractual rights, which by their express terms give CP complete operational control over all freight and passenger trains on the MD-W and MD-N lines in perpetuity. The importance of CP retaining these rights is discussed in the Reply Verified Statement of Nick Walker.

20. To the extent Metra has complaints about how CP dispatches Metra trains, the existing agreements provide Metra with contractual rights that it can seek to enforce if it chooses to do so, including through specific performance in certain circumstances. *See* 1985 Trackage Agreement, § 17.5.

21. Second, Metra seeks a condition imposing a "standard and process for Metra schedule changes and new trains" based on the claim that Metra has a "right to use capacity on MD-W and MD-N, which it owns." METR-7 at 74. With respect, although Metra does own the track assets associated with the MD-W and MD-N lines, as I have explained the longstanding agreements between CP and Metra do not give Metra "ownership of the operational capacity" on these lines any more than they give such ownership to CP. Rather, they provide for a set of capacity-allocation rules that vary between (a) Metra's peak periods, during which CP may not interfere with Metra and Metra is free to add trains without limitation beyond the physical capabilities of the infrastructure, and (b) all other times of the day and night, when the agreements provide for an agreed number of Metra trains and a set schedule for those trains, devoting all remaining capacity to CP's freight operations (so long as those trains do not unreasonably disrupt or delay Metra trains) and requiring CP consent (not to be unreasonably withheld) for changes to Metra's schedules or the addition of new Metra trains.

22. By requesting a "binding mechanism" for adding trains, Metra is saying that it should have the contractual entitlement to add trains regardless of the physical capabilities of the infrastructure and the demands placed on that infrastructure by CP's freight operation. In effect, Metra is seeking to extend its peak period windows across the entire day. This concept is fundamentally at odds with the rights CP purchased (and which the ICC authorized and the Bankruptcy Court approved) to increase its freight operations so long as doing so did not

interfere with Metra during its peak periods or "unreasonably disrupt or delay" non-peak period commuter trains.

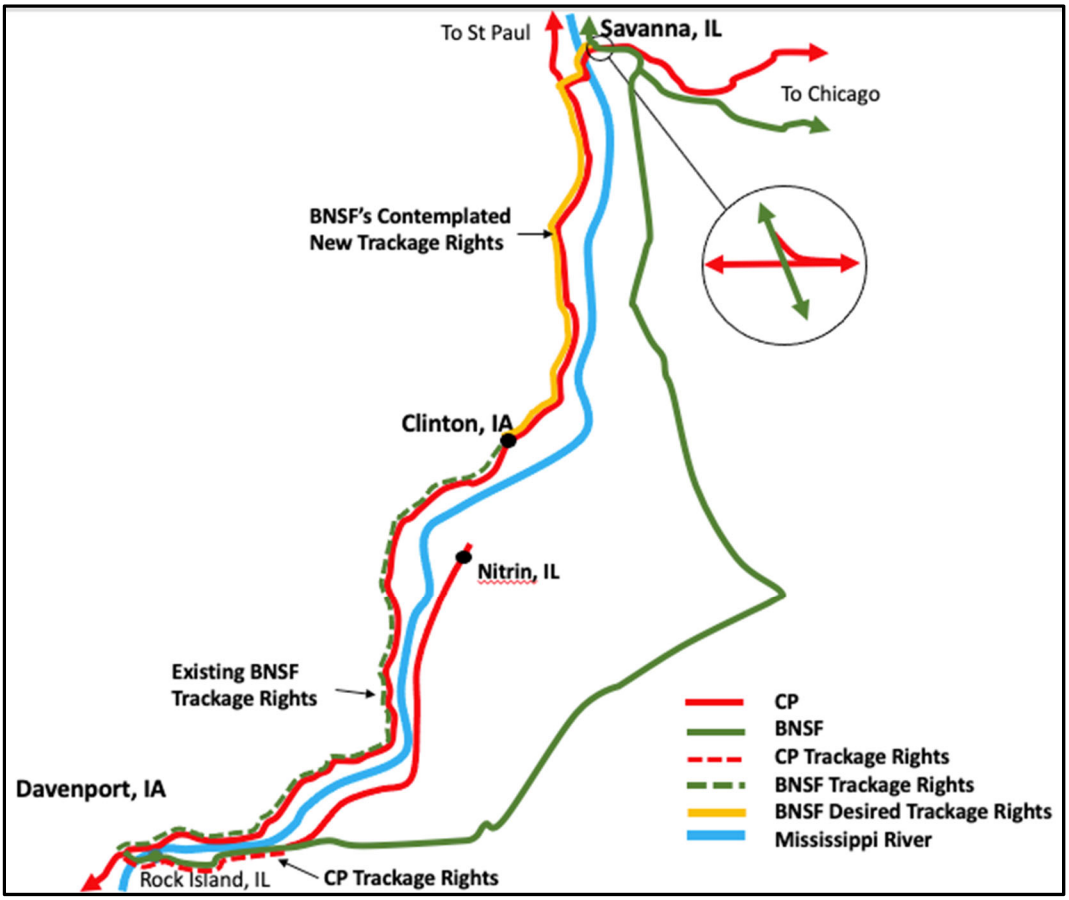
23. Third, Metra proposes a blizzard of conditions addressing so-called "financial" issues, including a condition requiring CP to pay for the full cost of capital projects on the MD-W and MD-N lines "if increases in its traffic volume, weight, and frequency, as well as the length of trains, is the reason that the capital project is pursued," a requirement to "compensate Metra for maintenance … by changing CP's maintenance contribution from a flat fee to a fee based on train counts and gross ton miles," and a "change on CP's rental terms from a flat fee to a dollar per car mile." METR-7 at 77-78. All of these requests would alter the economic terms and basic structure of the agreements. In addition, Metra proposes to insert into those agreements a variety of new "performance penalties" that are not contained in the existing agreements. *Id.* at 78.

24. Metra also appears to ignore the fact that the agreement (as amended in 2003) already contains mechanisms for adjusting compensation based on increases in CP freight traffic. *See* 2003 Amendment Agreement (Exh. 7 hereto), §§ 6, 19. Metra is asking the Board to grant it terms it did not negotiate, and without which Metra has nonetheless expanded its service over the years.

25. These requests reflect a one-way demand to renegotiate the governing agreements in Metra's favor, despite the fact that nothing about the CP/KCS Transaction requires any adjustment to those agreements. Again, the agreements allow for CP to increase its freight traffic on the lines without restriction. If they did not, they would have interfered with CP's common carrier rights and obligations, and required Metra to get the Board's (or ICC's) approval to acquire the MD-W and MD-N lines from the Milwaukee Road Trustee.

26. Metra's request to change the compensation formulas in the agreements is particularly one-sided and ill-considered. The flat fee approach of the existing agreements makes sense given that Metra has been and will remain by far the dominant user on these lines, and its high-speed, precisely-scheduled passenger service drives significantly greater costs for capital and maintenance on the lines. In addition, passenger trains consume considerably greater line capacity than do freight trains, a feature that is reflected in the compensation structure of the existing agreement. (The difference between freight needs and passenger needs is even acknowledged in the 1993 Supplemental Agreement, at Section 7.6).

27. Metra's dissatisfaction with the existing compensation terms appears to be that CP's freight operations will be growing as a share of total traffic on the MD-W line (though no change is anticipated on the MD-N line). But Metra appears to be ignoring that when these compensation terms were established, freight trains accounted for a higher share of traffic than CP trains will represent even after the full implementation of the CPKCS transaction. During the 1980s and 1990s, there were approximately 12 scheduled freight trains on the MD-W line west of Bensenville Yard daily, plus locals.[3] The CP/KCS transaction will yield only about the same number.[4] Meanwhile, Metra's train counts have increased tremendously, as Mr. Walker explains in his Reply Verified Statement. These circumstances make it even less appropriate for Metra to request an order requiring the revisions to the compensation terms of the CP-Metra agreements.



[3] This is borne out both by the deposition testimony of Metra's witness Oppenheim (Tr. at { [redacted]) and records of Milwaukee Road train schedules (which I am including with my workpapers).

[4] *See* Amended Operating Plan, App. T at 6 (segment 81).

II. BNSF'S SUGGESTION THAT IT MAY SEEK TRACKAGE RIGHTS OVER CPKC BETWEEN CLINTON, IA AND SAVANNA, IL IS OVERREACHING

28. Today, BNSF has trackage and solicitation rights over CP's trackage along the west side of the Mississippi River between Davenport, IA, and Clinton, IA. BNSF's trackage rights over CP were granted as part of a reciprocal exchange of rights in 1995 that gave CP trackage and solicitation rights over BNSF trackage along the east side of the Mississippi at Rock Island, IL, Moline IL, and other points. Both BNSF and CP reach their rights via the Crescent Bridge, which is a weight-restricted bridge over the Mississippi River at Davenport. These existing rights are shown in the map set forth as Figure 2 below.

FIGURE 2
MAP OF CP AND BNSF LINES DAVENPORT TO SAVANNA

29. In discussions with CP, BNSF has long sought trackage rights allowing it to reach Clinton (and points south) via a connection with CP at Savanna rather than Davenport. I personally met with BNSF in Calgary to discuss this BNSF request in 2011.

30. CP has not been willing to grant such rights. Among other things, there is no connection between CP and BNSF at Savanna that would allow "straight ahead" operation of BNSF trains. The only connection is in the northeast quadrant of the at-grade crossing at Savanna, meaning that BNSF trains would have to perform a backing move on CP mainline trackage there, which would disrupt mainline operations. In addition, were BNSF to access its Clinton-Davenport rights via Savanna, BNSF trains would operate over an additional 19.6 miles of CP mainline trackage, introducing additional operational complexity there and fundamentally altering the reciprocal nature of the rights exchanged in 1995.

31. Were CP to agree to grant BNSF such rights, it would only be part of a mutually agreeable negotiated outcome that provided benefits to both parties, not just BNSF.

VERIFICATION

I, Adolph Gameiro, declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on this ___ day of July, 2022.

TRACKAGE AGREEMENT

THIS AGREEMENT, made and entered into this 16th day of September, 1982, by and between RICHARD B. OGILVIE, TRUSTEE OF THE PROPERTY OF CHICAGO, MILWAUKEE, ST. PAUL AND PACIFIC RAILROAD COMPANY, DEBTOR ("Milwaukee"), and the REGIONAL TRANSPORTATION AUTHORITY, a municipal corporation organized under the provisions of the Regional Transportation Authority Act of the State of Illinois ("Authority").

W I T N E S S E T H:

WHEREAS, Milwaukee owns and operates lines of railroad between Chicago and Fox Lake, Illinois and between Chicago and Almora, Illinois, which lines of railroad are shown on Exhibit A; and

WHEREAS, Milwaukee has discontinued the rail passenger commuter service over such lines; and

WHEREAS, the Authority believes that the continuance of rail passenger commuter service is in the public interest; and

WHEREAS, the Authority is willing to commence operations of the rail passenger commuter service discontinued by the Milwaukee over trackage facilities owned or used by the Milwaukee on the terms and conditions contained herein;

NOW THEREFORE, the parties hereto agree as follows:

ARTICLE I.

JOINT LINE DEFINED

1.1 The term "Joint Line" refers to the following trackage, as shown in approximation on Exhibit A, and ancillary facilities between Madison Street, Chicago, Illinois (Mile Post 0.2) and Fox Lake, Illinois (Mile Post 49.79) ("North Line") and between Tower A-5 (Mile Post 5.26) and Almora, Illinois (Mile Post 40.26) ("West Line"): (a) the right of way and improvements thereto, including, but not limited to, rails, ties, ballast, switches, turnouts, wyes, crossovers, bridges, culverts, fills, cuts, right of way fences, embankments, tunnels and grade crossings and grade crossing signals; (b) sidings and spurs, except industry spurs; (c) signals and communication facilities; (d) interlocking devices; (e) towers, sheds, buildings and structures; and (f) such other property, equipment and facilities necessary to the provision of Commuter Service on the North line and West Line and used by the Milwaukee in the normal course of providing Commuter Service in the past 3 years. The Joint Line shall not include air rights (except for such air rights as have been necessary to the operation of the Commuter Service in the past 3 years).

1.2 For the purposes of equitably dividing the monthly expenses for billing purposes between the two parties, the Joint Line shall be divided on a zone basis as follows:

a. North Line

Zone 1 (1 main). Between Fox Lake, Illinois (Mile Post 49.79) and Rondout, Illinois (Mile Post 32.25).

Zone 2 (1 and 2 mains). Between Rondout, Illinois (Mile Post 32.25) and Deerfield, Illinois (Mile Post 24.58).

Zone 3 (1 and 2 mains). Between Deerfield, Illinois (Mile Post 24.58) and Tower A-20, Techny, Illinois (Mile Post 20.63).

Zone 4 (1 and 2 mains). Between Tower A-20, Techny, Illinois (Mile Post 20.63) and Tower A-5, Chicago, Illinois (Mile Post 5.85).

Zone 5 (1, 2 and 3 mains). Between Tower A-5, Chicago, Illinois (Mile Post 5.85) and Tower A-2, Chicago, Illinois (Mile Post 3.02).

Zone 6 (1, 2 and 3 mains). Between Tower A-2, Chicago, Illinois (Mile Post 3.02) and Canal Street, Chicago, Illinois (Mile Post 0.57), such mains being jointly owned by Milwaukee and The Consolidated Rail Corporation ("Conrail") under an Agreement dated February 7, 1873, as amended.

Zone 7 (1 and 2 mains). Between Lake Street, Chicago, Illinois (Mile Post 0.55) and Madison Street, Chicago, Illinois (Mile Post 0.20), such mains being jointly owned by Milwaukee and Conrail under an Agreement dated February 7, 1873, as amended.

b. West Line (1 and 2 Mains)

Zone 8. Between Almora, Illinois (Mile Post 40.26) and Elgin, Illinois (Mile Post 36.64).

Zone 9. Between Elgin, Illinois (Mile Post 36.64) and Spaulding, Illinois (Mile Post 32.75).

Zone 10. Between Spaulding, Illinois (Mile Post 32.75) and Tower B-17, Bensenville, Illinois (Mile Post 16.87).

Zone 11. Between Tower B-17, Bensenville, Illinois (Mile Post 16.87) and Tower B-12, Franklin Park, Illinois (Mile Post 12.82).

Zone 12. Between Tower B-12, Franklin Park, Illinois (Mile Post 12.82) and Tower A-5, Chicago, Illinois (Mile Post 5.11).

ARTICLE II.

GRANT FOR OPERATION OF AUTHORITY TRAINS

2.1 Milwaukee grants to the Authority the non-exclusive right to use the Joint Line solely for the purpose of operating Commuter Service (as defined in the Transition Agreement between the Milwaukee and the Authority dated August __, 1982) over the Joint Line. The Authority's right to use the Joint Line shall be in common with the Milwaukee and such other railroad company or companies previously or subsequently admitted to the use of any part of the Joint Line; provided that:

(a) The Milwaukee shall not operate, and shall not cause or allow any third party to operate, Commuter Service over the Joint Line; provided, however, nothing in

this Trackage Agreement shall be construed to limit the right of the National Railroad Passenger Corporation, its successors and assigns, to provide intercity rail passenger service over the Joint Line under the provisions of any law or agreement. For purposes of this Agreement, "intercity rail passenger service" means rail passenger service other than commuter and short-haul service in metropolitan and suburban areas, which commuter and short-haul service is usually characterized by reduced fare, multiple-ride and commutation tickets and by morning and evening peak period operations.

(b) Except for (1) FRA track inspections, (2) emergencies and (3) temporary detour usage of less than 30 days in a 12 month period, the Milwaukee shall not admit any third party to the use of any part of the Joint Line ("Third Party Use") if:

(A) such Third Party Use interferes with the Authority's use of the Joint Line as contemplated by this Agreement, or

(B) with respect to Joint Line facilities which were paid for in whole or in part by or through the Authority, such Third Party Use may result in deterioration of such facilities in excess of the deterioration which could be expected if such Third Party Use were not allowed, unless (i) with respect to fixed facilities subject to the Fixed Facili-

ties Agreements (as defined in Section 7A of the Transition Agreement), the Authority is compensated in accordance with the provisions of section 7.B.6 of the Transition Agreement, or (ii) the Authority is compensated pursuant to a separate agreement with respect to such Third Party Use.

(c) The Authority shall not permit any third party to use or detour over any portion of the Joint Line or agree to operate on the Joint Line the trains, engines and cars which in the normal course of business would not be considered the trains, engines or cars of the Authority engaged in Commuter Service; provided, however, that the Authority may move Commuter Service trains, engines and cars of other railroads over Zones 5, 6 and 7 of the Joint Line for the purpose of maintenance, repair, rebuilding and storage of cars and engines at the Western Avenue Coach Yard.

2.2 The Authority may ingress and egress to and from the Joint Line at the following connections only: (a) the Western Avenue Coach yard, (b) the Fox Lake yard, (c) Chicago Union Station, (d) the Elgin yard, and (e) any yard or station built at Almora or Spaulding.

2.3 The rights herein granted to the Authority to use the Joint Line are limited solely to the operation of Commuter Service; nothing in this Agreement shall be construed to give the Authority or any third party the right to

operate freight or intercity passenger service trains over the Joint Line.

2.4 If necessary to the safe and efficient operation of the Commuter Service due to an emergency, construction or repair work, the Authority may set out, use or operate trains, engines and cars on non-Joint Line tracks, yards or other facilities as may be designated by and under direction of Milwaukee's train dispatcher. All terms and conditions of this Trackage Agreement shall be applicable to such use or operation by the Authority as though such tracks, yards or other facilities were part of the Joint Line.

ARTICLE III.

CONNECTION TRACKS

3.1 The Milwaukee shall, upon the request of the Authority and at the Authority's sole cost, construct such connecting tracks as may be necessary or useful to the operation of Commuter Service conducted by the Authority; provided that connecting tracks shall not unreasonably interfere with the Milwaukee's operations over the Joint Line. Any such connecting tracks shall be the property of the Authority, but shall, upon the request of the Authority, be maintained, repaired and renewed by the Milwaukee at the Authority's sole expense.

ARTICLE IV.

CONSTRUCTION OF ADDITIONAL SIDINGS

4.1 As of the date of this Agreement, the sidings which exist on the Joint Line are sufficient to permit safe and efficient operation of the existing level of Commuter Service, intercity passenger service and freight rail traffic over the Joint Line. The Milwaukee shall construct any additional sidings which are made necessary in its judgment by increased levels of traffic over the Joint Line or which are requested by the Authority. The costs of the construction of these additional sidings shall be paid by:

(a) the Authority, if the sidings are made necessary solely due to an increase in the operations of the Authority or are requested by the Authority;

(b) the Milwaukee, if the sidings are made necessary solely due to increases in the operations of the Milwaukee or in the operations of a third party admitted to the use of the Joint Line;

(c) both parties pursuant to a separate agreement allocating such costs if the sidings are made necessary by increases in the operations of both (i) the Authority and (ii) the Milwaukee or any third party admitted to the use of the Joint Line.

4.2 Additional sidings constructed under this Agreement shall be considered personal property and title to an additional siding shall vest in the Milwaukee and the

Authority in proportion to the costs paid by each party for the construction. The additional sidings shall be maintained, repaired and renewed by the Milwaukee but the costs therefor shall be allocated in the proportion to the costs of construction paid by each party.

ARTICLE V.

RADIO COMMUNICATIONS EQUIPMENT

5.1 As of the date of this Agreement the radio communications equipment on or in the Authority's trains, engines and cars is sufficient for their safe and efficient operation on the Joint Line. The cost of installation and maintenance of additional radio communications equipment on the Authority's trains, engines and cars shall be paid by Milwaukee if the additional radio communications equipment is required by the Milwaukee, or shall be paid by the Authority if the additional radio communications equipment is requested by the Authority or is required by federal, state or local law or regulation.

5.2 The Authority shall, at its sole expense, maintain, repair and replace, as necessary, all radio communications equipment on its trains, engines and cars to permit safe and efficient operation on the Joint Line. The Authority shall comply with the plans and specifications which are reasonably required by the party requiring the purchase, installation and maintenance of such radio communications equipment.

5.3 The radio communications equipment shall become the property of the party paying for such equipment.

ARTICLE VI.

PAYMENT BY AUTHORITY

6.1 The Authority shall pay to the Milwaukee the amounts described in this Article VI. Payment shall be made in accordance with Article VII.

6.2 As used in this Agreement, the following terms shall have the meanings ascribed to them:

(a) Estimated RTA Summary Expense Bill -- the Milwaukee's reasonable and good faith estimate of the Authority's proportionate share of Reimbursable Expenses for a calendar month.

(b) RTA Summary Expense Bill -- the monthly bill submitted by the Milwaukee to the Authority for the Authority's proportion of Reimbursable Expenses for a calendar month, as computed pursuant to Section 6.5.

(c) Property Tax Bill -- the annual bill submitted by the Milwaukee to the Authority for the payment of Authority's proportionate share computed pursuant to Section 6.4 for general real estate taxes with respect to the Joint Line and the property leased to the Authority in the counties of Cook, Lake, DuPage and Kane within the State of Illinois.

(d) Gross Ton Mile Proportion -- the ratio determined by dividing the gross ton miles generated by all

trains, engines, cars and contents (including passengers) by or on behalf of the Authority in each zone of the Joint Line during a calendar month by the total number of gross ton miles generated by all trains, engines, cars and contents (including passengers) by or on behalf of the Milwaukee, the Authority and any third parties in each zone during that month. Deadhead, backup and industry switching movements shall be excluded in determining Gross Ton Miles Proportion except deadhead movements initiated by the Authority after the Commencement Date (as defined in the Transition Agreement) in excess of 51 per week-day shall be used in determining gross ton miles. The number of passengers on each Authority or third party train during a month shall be determined on the basis of an annual joint study of the Authority and the Milwaukee.

(e) Train Count Proportion -- the ratio determined by dividing the number of trains operated by or on behalf of the Authority in each zone of the Joint Line during a calendar month by the total number of all trains operated by or on behalf of the Milwaukee, the Authority and any third parties in each zone during that month. Deadhead, backup and industry switching movements shall be excluded in determining the train count proportion except deadhead movements initiated by the Authority after the Commencement Date in excess of 51 per week-day shall be included.

(f) Reimbursable Expenses -- Reimbursable Expenses means the following expenses incurred by the Milwaukee:

(1) the expenses are incurred during, and attributable to, the Agreement term as recorded in the Milwaukee's accounts;

(2) the expenses are properly chargeable to the zones defined in Section 1.2 of this Agreement;

(3) the expenses are incurred for material, labor, health and welfare benefit, fuel, equipment rentals, payroll taxes (including "head" taxes), sales taxes, use taxes and excise taxes and miscellaneous expenses in maintaining, operating, repairing and renewing the Joint Line.

Reimbursable Expenses shall be accounted for by the accrual method of accounting in the Milwaukee's accounts, consistently applied, in accordance with the Uniform System of Accounts prescibed by 49 CFR Part 1201. Except as required by applicable ICC regulations, changes made by the Milwaukee in its accounting system shall not affect the timing of recognition of Reimbursable Expenses under this Agreement.

6.3 The Authority shall pay the Milwaukee a fixed rental each month during the term of this Agreement as follows:

(a) From the date the Authority commences operations of rail passenger commuter service on the Joint Line through December 31, 1983, the fixed rental shall be $51,743.31 each month.

(b) Beginning January 1, 1984, the fixed rental described in subparagraph 6.3(a) shall be increased by the percentage increase in the Consumer Price Index ("CPI") for

the City of Chicago of the Bureau of Labor Statistics, U.S. Dept. of Labor, from October, 1982 through November, 1983.

(c) The fixed rental for February, 1984 shall be increased or decreased from the rental for January, 1984 by the percentage increase or decrease in the CPI between November, 1983 and December, 1983. The fixed rental for each succeeding month shall be determined by the same method, that is; the fixed rental shall increase or decrease on the first day of each subsequent month after February, 1984 during the term of the Agreement, by the same percentage as the CPI for the most recently reported month shall have increased or decreased from the CPI used in determining the prior month's fixed rental, provided that the fixed rental shall never be reduced below $51,743.31 per month. In the event that the CPI as hereinabove defined ceases to exist, then the Milwaukee shall substitute therefor the index replacing the CPI and if none is available, a comparable index based upon changes in the cost of living or purchasing power of the consumer dollar published by an appropriate U.S. governmental agency.

(d) The fixed rental shall be adjusted pro-rata for partial months at the beginning and termination of this Agreement.

6.4 General real estate taxes with respect to the Joint Line and the premises leased to the Authority referred to in the Transition Agreement for Cook, Kane, DuPage and Lake counties shall be based on the total real estate taxes

levied against all property of the Milwaukee located within those counties. These taxes shall be allocated to the Joint Line and the premises leased to the Authority referred to in the Transition Agreement, separately, for each county, on the basis of the ratio of the Joint Line route miles within each county to the total Milwaukee owned route miles within the county. The Authority's proportion of this allocation shall be determined by the ratio of the unit-miles of the locomotives, cars and cabooses operated by or on behalf of the Authority over the entire Joint Line during a calendar year to the unit-miles of all locomotives, cars and cabooses operated over the entire Joint Line during that year. Each yearly Property Tax Bill shall be initially based on the tax bills for the preceding year for which a definite tax bill is available and movements for the preceding year, and shall be adjusted, based on actual movements and actual tax bills, within 30 days of receipt of the actual tax bills for each year during the term of this Trackage Agreement. The Property Tax Bill for each year shall be submitted by the Milwaukee to the Authority on or after August 1 of the year to which it applies, beginning with the year 1982 (for 1982 taxes), payable by the 15th day of the month after the month of receipt of the bill. The Property Tax Bill shall be pro-rated for a partial year; such prorations shall be made within 30 days after definite data requiring the proration becomes available.

The Milwaukee shall pay any balances due pursuant to such adjustment or proration within 30 days of an adjustment or proration; the Authority shall pay any balance due pursuant to an adjustment or proration within 30 days after receipt of an invoice from the Milwaukee.

Any special assessments levied against the Joint Line shall be amortized over the useful life of the facility for the construction or improvement of which the special assessment was levied. The amount of such special assessment applicable to each calendar year of this Agreement shall be allocated between the parties, billed, paid, prorated and adjusted on the same basis as general real estate taxes.

6.5 The Authority shall pay its proportion of Reimbursable Expenses as follows:

(a) Maintenance of way and structures expenses incurred for each zone of the Joint Line shall be allocated on a monthly basis between the parties on the Gross Ton Mile Proportion. These expenses are currently accounted for in the Milwaukee's primary accounts reflected in Exhibit B.

(b) Transportation, signal and communication systems expenses and maintenance expenses of non-Milwaukee owned equipment incurred for each zone of the Joint Line shall be allocated on a monthly basis between the parties on a Train Count Proportion. These expenses are currently accounted for in the Milwaukee's primary accounts reflected in Exhibit C.

(c) Expenses for train dispatchers (currently primary account numbers 372, 409 and 532) incurred in operating the Joint Line shall be allocated on a monthly basis by the average of the Train Count Proportions for all zones of the Joint Line.

(d) The Authority's monthly allocated share of labor and fringe benefits expenses (including payroll taxes) determined in accordance with subparagraphs (a) through (c) above shall be increased for administrative overhead and vacation and holidays in accordance with Exhibit D.

(e) Monthly expenses incurred for joint facilities which are part of the Joint Line not solely owned by the Milwaukee, identified in Exhibit E, shall be allocated on a Train Count Proportion in the zone in which each facility is located.

(f) Rental rates for the use on the Joint Line of equipment and vehicles which equipment and vehicles are owned by the Milwaukee or leased to the Milwaukee under a lease with a term of at least 12 months will be charged at the rates prescribed in accordance with the Milwaukee Comptroller's Circular Number 41, in effect at the time incurred (but not in excess of the General Managers' Association of Chicago's (GMA) rates if any for specific equipment).

(g) Monthly expenses for material allocated to the Authority under subparagraphs (a) through (c) above shall be increased by an amount calculated in accordance with Exhibit F.

(h) The expenses referred to in subparagraphs (a) through (e) above are recorded in the Milwaukee's primary accounts prescribed by the Interstate Commerce Commission's Uniform System of Accounts in effect on December 31, 1977 ("old U.S.O.A."). If the Milwaukee changes its accounting system to the Interstate Commerce Commission's Uniform System of Accounts in effect January 1, 1978 ("new U.S.O.A.") the old U.S.O.A. will be converted to the new U.S.O.A. on the basis prescribed in 49 CFR part 1201.

6.6 All amounts to be paid by either party under this Agreement shall bear interest from the date the amount was due in accordance with this Agreement until paid, at a rate equal to the lesser of: (a) the maximum rate permitted by law to be paid by the Authority, or (b) the prime commercial rate in effect at the time the amount was originally due. "Prime commercial rate" means the interest rate publicly announced by the largest commercial banking institution located in Illinois (measured in terms of total assets) for 90 day unsecured borrowings by its most credit worthy commercial customers.

6.7 The Authority shall not be obligated to pay: (a) any part of the Capital Expenditures (as defined in 49 CFR part 1201) of the Milwaukee with respect to the Joint Line, except as otherwise specifically provided in Articles III, IV and VIII hereof; (b) any expenses incurred with respect to additions, betterments, improvements, or maintenance to the Joint Line contributed or paid by any third

party and not required to be repaid by the Milwaukee; (c) expenses with respect to a particular matter to the extent the Milwaukee would recover from the Authority and other sources more than 100% of its expenses; or (d) amounts covering expenses of the Milwaukee for which the Authority has been billed by the Milwaukee pursuant to another provision of this Agreement.

6.8 The Authority shall have no liability for any payments or other obligations arising out of its use of the Joint Line pursuant to this Agreement except as provided in this Article VI or specifically provided in another provision of this Agreement.

6.9 At the end of each calendar year (or for the lesser period from Commencement Date to December 31, 1982 and any lesser period in the event of the termination or expiration of this Agreement (hereinafter "lesser period")), the Milwaukee shall recalculate the Authority's proportion of the charges set forth in section 6.5 on the basis of the Authority's gross ton mile proportion and train count proportion for such calendar year (or lesser period). Such recalculation shall be computed within 45 days after the expiration of such calendar year (or lesser period).

In the event that the Authority's proportion of such charges for such calendar year (or lesser period) exceeds the sum of the Authority's proportion of such charges for each of the individual months during such calendar year (or the individual months during a lesser period), the

Authority shall pay the Milwaukee such difference within 30 days of such recalculation; and in the event that the Authority's proportion of such charges for such calendar year (or lesser period) is less than the sum of the Authority's proportion of such charges computed for each of the individual months during such calendar year (or the individual months during a lesser period), the Milwaukee shall pay the Authority such difference within 30 days of such recalculation or credit the Authority with such amount in the next Estimated RTA Summary Expense Bill.

ARTICLE VII.

MANNER OF PAYMENT -- INSPECTION OF RECORDS

7.1 The Authority shall pay on the fifteenth day of each month the fixed monthly rent defined in Section 6.3.

7.2 The Authority shall pay the annual Property Tax Bill on or before the 15th day of the month following the month in which it was received.

7.3 On the first day of each calendar month the Milwaukee shall submit to the Authority an Estimated RTA Summary Expense Bill for that month, due within 15 days of receipt. The Milwaukee shall submit to the Authority within 45 days after the end of each calendar month the RTA Summary Expense Bill for that month. If the Estimated RTA Summary Expense Bill exceeds the RTA Summary Expense Bill, the Milwaukee shall credit the Authority with the excess in the

following month's Estimated RTA Summary Expense Bill or pay the excess to the Authority within 15 days. If the Estimated RTA Summary Expense Bill is less than the RTA Summary Expense Bill, the Authority shall pay the difference by the 15th day of the month following the month in which the RTA Summary Expense Bill is received.

7.4 The Authority shall furnish to Milwaukee, within 15 days after the end of each calendar month during the term of this Agreement, a statement showing for that month: (a) the train count for the trains operated by or on behalf of the Authority over each zone of the Joint Line; and (b) the gross ton miles generated by the trains, engines and cars and contents operated by or on behalf of the Authority over each zone of the Joint Line. Deadhead movements in in excess of 51 per weekday shall be reported by the Authority for (a) and (b) above. The statement shall be subject to verification and correction by the Milwaukee. If the Authority fails to furnish the statement within the 15 day period, the Milwaukee may submit an RTA Summary Expense bill for that month based on to the Gross Ton Proportion and Train Count Proportion during the preceding 12 month period. That bill shall be adjusted upon receipt of the required statement from the Authority.

7.5 The Authority's portion of the costs of the projects described in sections 3.1, 4.1(a), 4.1(c), 8.4(b) 8.4(c) and 8.4(d), shall be billed as incurred and paid on the 15th day of the month following the month in which the

bill is received, subject to verification of the costs and progress of the work.

7.6 The Authority may deduct from any payments due to Milwaukee under this Agreement any undisputed amounts which are due and payable to Authority from the Milwaukee under this Agreement, the Transition Agreement or the Agreements contemplated by the Transition Agreement. In making such deductions, the Authority shall comply with the following procedure: (a) the Authority shall send a written bill to the Milwaukee itemizing the amounts due and payable to the Authority and the reasons for such charges; (b) the Milwaukee shall have 21 days from receipt of a bill from the Authority to send to the Authority a written Notice of Objection to all or a portion of a bill from the Authority which Notice shall set forth the Milwaukee's objections on a detailed basis; and (c) if the Authority receives no Notice of Objection or a Notice objecting to only a portion of the amounts contained in a bill from the Authority within 21 days after receipt by the Milwaukee of a bill sent by the Authority, then the Authority shall have the right to deduct the amounts set forth in the bill or any portions thereof to which the Milwaukee has not objected from its next payment due to the Milwaukee provided that the Authority shall at the time of making such payment or at the time such payment is due, if no payment is made, notify the Milwaukee of what amounts are being deducted and identify the bill containing such amounts and the items giving rise to such amounts. The

Authority may not deduct or offset from any amount due under this Agreement any amounts due to Authority under any other agreement or arrangement (other than the Transition Agreement or the Agreements contemplated by the Transition Agreement).

7.7 No payment shall be delayed because of an error or dispute in a bill. Errors of less than $5,000 shall be adjusted in the next Estimated or Summary Expense Bill. Bills containing errors or disputed items in excess of $5,000 may be reduced by the amount of the disputed item.

7.8 The amounts required to be paid by the Authority shall be paid by check or by wire transfer to the Trustee's account #50-30048 at The First National Bank of Chicago or another account designated by the Milwaukee.

7.9 Except as otherwise provided in this Agreement all payments under this Agreement are due and payable within 30 days of receipt of the bill or invoice.

7.10 Records of each party reasonably relating to payment or allocation of expenses under this Agreement shall be open to inspection during regular business hours. Each party shall provide sufficient office space for these inspections together with reasonable assistance in conducting an inspection. Records shall be closed to audit, and no bills as to which no exception has been taken shall be adjusted, after three (3) years from December 31 of the year of the invoice date.

7.11 The amounts reflected in audit exceptions made by the Authority and overpayments by the Authority to

the Milwaukee which in each case are not resolved within 30 days after furnished or claimed in writing to the Milwaukee shall if resolved in favor of the Authority bear interest at the rate specified in Section 6.6 from the expiration of the 30 day period until paid or credited.

ARTICLE VIII.

JOINT LINE CAPITAL EXPENDITURES

8.1 The Milwaukee may effect capital projects, including significant maintenance projects, in the Joint Line necessary or desirable for the economical and safe operation of trains, engines or cars over the Joint Line, or which are required by applicable law or regulations.

8.2 A report reflecting such capital projects, including significant maintenance projects, for the Joint Line for the periods April-September and October-March shall be furnished by the Milwaukee to the Authority within 60 days after execution of the Transition Agreement and thereafter on February 1 and August 1 of each year during the Agreement Term. This report shall show in reasonable detail new projects, progress on existing projects, an estimate of the Authority's share of the project costs and estimated completion dates. Except in emergencies the Milwaukee shall give 60 days prior notice to the Authority of substantial changes to previously reported projects and previously unreported new projects which the Milwaukee anticipates will

be commenced prior to the submission of the next semi-annual report.

8.3 The Milwaukee shall not charge to the Authority the costs of a capital project, including a significant maintenance project, for which the Authority is liable to pay in the aggregate in excess of $15,000 unless the Authority has consented in writing to such project; provided the Milwaukee may upon sixty days notice to the Authority (or upon reasonable notice of less than 60 days where a 60 day notice period is not possible) effect without the consent of the Authority any such project to comply with the directive of a government agency having jurisdiction.

8.4 The costs of capital projects, including significant maintenance projects, shall be paid by:

(a) the Milwaukee, if required solely by the operations of the Milwaukee or of third parties admitted to the use of the Joint Line by the Milwaukee;

(b) the Authority, if required solely by the operations of the Authority and the requirements of Section 8.3 have been met;

(c) both parties, in accordance with the allocation formulas for operating expense contained in Section 6.5 applied to capitalized expenses, for projects required by the operations of both the Authority and the Milwaukee or third parties admitted to the use of the Joint Line by the Milwaukee which projects are accounted for in the Milwaukee's accounts described in Exhibit I, and with respect to which

the Authority's share of the allocated costs shall not exceed $15,000 for a single project or the Authority has consented pursuant to Section 8.3 above;

(d) both parties pursuant to a separate fixed facilities agreement allocating such costs, if the provisions of subsection (c) are inapplicable and if the project is required by the operations of both the Authority and the Milwaukee or third parties admitted to the use of the Joint Line by the Milwaukee.

8.5 The Milwaukee shall determine whether a capital project, including a significant maintenance project, constructed pursuant to this Section is required by the operations of the Authority, the Milwaukee or a third party.

8.6 The Milwaukee shall effect capital projects, including significant maintenance projects, requested by and at the sole expense of the Authority unless such projects would substantially interfere with the Milwaukee's operations over the Joint Line or the rights of a third party admitted to the use of the Joint Line.

8.7 Capital projects, including significant maintenance projects, effected pursuant to this Section shall be considered personal property and title to such projects shall vest in the Authority and Milwaukee in proportion to the costs paid by each party.

ARTICLE IX.

OPERATION AND MAINTENANCE OF JOINT LINE

9.1 The Milwaukee shall control and manage the Joint Line and shall direct the movement of all trains, engines, cars and inspection vehicles over the Joint Line. All track, bridge, signal and communication work, materials and track operated machinery and equipment used will be in accordance with the Milwaukee's standards, specifications and procedures, which shall be consistent with industry standards.

9.2 The operation of trains over the Joint Line by or on behalf of the Authority is subject to the direction and control of the Milwaukee, and shall at all times be in accordance with reasonable safety and operating rules, regulations and operating timetables prescribed by the Milwaukee. The management of the Authority's Commuter Service is vested solely in the Authority and Authority's trains, engines and cars shall be operated solely by the Authority's employees or agents and at the Authority's sole expense.

9.3 The Milwaukee shall maintain the Joint Line with its own supervision and labor in accordance with the terms and conditions of this Agreement. The Milwaukee shall maintain the track structure of the Joint Line to the level of FRA Class III in accordance with the applicable standards of the Federal Railroad Administration, or any successor

agency, so as to permit operation of commuter trains at a speed of not less than 60 miles per hour. If the Authority withholds its consent to financial participation in any capital or maintenance project required to maintain the track structure to these standards, the Milwaukee shall be relieved to that extent of its obligation under this Section 9.3. The Milwaukee shall maintain minimum clearances on the Joint Line to tolerances in effect as of the date the Authority commences operations of rail passenger commuter service on the Joint Line.

9.4 A report reflecting significant maintenance projects for the Joint Line for the periods April-September and October-March will be furnished by the Milwaukee to the Authority within 60 days after execution of the Transition Agreement and thereafter on February 1 and August 1 of each year during the term of this Agreement. This report shall show in reasonable detail new projects, progress on existing projects, an estimate of the Authority's share of these projects and estimated completion dates. Except for emergencies, the Milwaukee shall give 60 days prior written notice to the Authority of substantial changes to significant maintenance projects and previously unreported new projects which the Milwaukee anticipates will be commenced prior to the submission of the next semi-annual report.

9.5 If the use of or traffic over the Joint Line is interrupted or delayed at any time, the Milwaukee shall expeditiously restore the line for the passage of trains and

if reasonably feasible under the circumstances, prior to the scheduled departures of the peak period trains (defined in Section 9.8, below) immediately following the disruption or delay. Any train, engine or car derailed or damaged on the Joint Line shall be expeditiously picked up or removed by the Milwaukee or its emergency service contractor. The expenses incurred in picking up and removing derailed or damaged trains and the cost of restoration of the Joint Line resulting from a derailment or accident shall be paid by the party whose train was involved in the derailment or accident and shared equally if the trains of both parties are involved. If a minor derailment on the Joint Line to an Authority train, engine or car occurs which can be promptly corrected solely by rerailers and blocking carried on the derailed train, the Authority may with the permission of the Milwaukee train dispatcher rerail the derailed equipment at its expense.

9.6 If the Milwaukee fails to maintain the Joint Line in accordance with Section 9.4 or fails to restore the Joint Line in accordance with Section 9.5, the Authority may on notice to the Milwaukee, subject to the Milwaukee's reasonable direction and subject to non-interference with the Milwaukee's labor arrangements and practices, correct the defects or restore the Joint Line required to maintain and continue the commuter operations contemplated by and in accordance with the schedules provided for in this Agreement. The reasonable costs incurred by the Authority in making the correction or restoration shall be allocated in

accordance with Article VI and to the extent applicable, Section 9.5, above. The provisions of this section shall not be construed to impose any obligation on the Authority to repair, restore or maintain the Joint Line.

9.7 The Milwaukee shall (a) maintain all joint facility agreements, interlocking agreements and similar arrangements necessary to the operations of the Commuter Service over the Joint Line contemplated by this Agreement; (b) pay and discharge when due and payable all lawful governmental charges or levies imposed with respect to the Joint Line (except to the extent and while the validity thereof is contested by appropriate proceedings or when deferred pursuant to an order of the Reorganization Court having jurisdiction over the Milwaukee); (c) provide for utility services necessary to the operations of Commuter Service over the Joint Line; and (d) take all other action necessary to permit the Joint Line to be used for Commuter Service by the Authority.

9.8 The Milwaukee recognizes the priority of Commuter Service operations on the Joint Line on Monday through Friday, inclusive, with respect to trains which depart from their originating stations during the times and in the zones identified below and maintain timetable schedule (the "peak period trains"):

Elgin to CUS -- eastbound

5:30 a.m. - 8:00 a.m.
4:30 p.m. - 6:30 p.m.

CUS to Elgin -- westbound

5:30 a.m. - 8:30 a.m.
4:00 p.m. - 6:15 p.m.

Rondout to CUS -- southbound

6:00 a.m. - 7:50 a.m.
4:20 p.m. - 6:00 p.m.

CUS to A-20 -- northbound

6:25 a.m. - 8:45 a.m.
4:15 p.m. - 6:10 p.m.

A-20 to Rondout -- northbound

7:00 a.m. - 8:15 a.m.
4:30 p.m. - 6:20 p.m.

Fox Lake to Rondout -- southbound

5:00 a.m. - 8:30 a.m.

Rondout to Fox Lake -- northbound

4:30 p.m. - 6:45 p.m.

Except as required by an emergency, the Milwaukee shall not interfere or permit any third party to interfere with peak period trains. The Milwaukee shall not object to the Authority's operations of peak period trains on the grounds that those operations unreasonably interfere with the Milwaukee's or third parties' ability to provide efficient freight or intercity passenger service. The Milwaukee may make reasonable adjustments to the operations of traffic on the Joint Line which do not unreasonably disrupt or delay trains which are not peak period trains.

9.9 Except as provided in this section 9.9, the operation of the Commuter Service on the Joint Line shall be

subject to the schedule attached to this Agreement as Exhibit G. The Authority may not change the schedule without the Milwaukee's prior written consent, except that: (a) the Authority may upon 45 days prior written notice, change the schedules during peak period, subject to the intercity passenger service schedule then in effect; (b) during the term of this Agreement, upon 45 days prior written notice the Authority may add not more than eight (8) trains as follows: (i) one morning peak period train in each direction on the West Line; (ii) one evening peak period train in each direction on the West Line; (iii) one morning peak period train in each direction on the North Line; and (iv) one evening peak period train in each direction on the North Line; and (c) at any time upon 10 days prior written notice decrease the number of Commuter Service trains.

ARTICLE X.

EXAMINATION OF AUTHORITY EMPLOYEES

10.1 All employees of the Authority engaged in or connected with Commuter Service over the Joint Line shall at all times comply with the Milwaukee safety and operating rules operating timetable special instructions and shall be required to pass periodic examinations on the rules annd regulations of the Milwaukee.

10.2 An officer of Milwaukee shall conduct examinations every two years on the consolidated code of operating

rules and Milwaukee safety rules of the Authority's principal operating officers. These Authority offficers in turn shall test Authority employees. Testing of Authority employees may be audited by the Milwaukee.

10.3 The Authority shall bar from the Joint Line any Authority employee who does not comply with the Milwaukee's safety and operating rules or who fails to pass required examinations. If the Authority fails to bar such employee from the Joint Line, the Milwaukee may bar that Authority employee from the Joint Line.

ARTICLE XI.

SWITCH KEYS AND RULE BOOKS

11.1 The Milwaukee shall supply the employees of the Authority with necessary books of rules and switch keys. The Authority shall deposit with Milwaukee $3.00 for each book of rules and each switch key supplied. This deposit shall be refunded upon the return of such books of rules or switch keys.

ARTICLE XII.

TIME TABLES

12.1 The expenses, including costs of composition, printing, binding and distribution, incurred by Milwaukee in the issuance of revised operating time tables required by

changes in the operations of the Authority, the Milwaukee or third parties shall be allocated proportionately among the parties whose operations required the change, except that the incremental cost of changes made by the Milwaukee with respect to its freight or intercity passenger service in connection with a revision required by the Authority shall be paid by the Milwaukee.

ARTICLE XIII.

COMPLIANCE WITH LAWS AND OTHER PUBLIC REGULATIONS

13.1 Each party shall comply with all applicable federal, state and local laws, regulations and rules with respect to the use of and the conduct of its operations over the Joint Line. If a party's non-compliance results in any fine, penalty, cost or charge being imposed or assessed on or against the other party, the non-complying party shall defend on notice from the other party, and shall promptly reimburse and indemnify the other party for or on account of such fine, penalty, cost or charge and all expenses and attorneys' fees incurred in defending, any action which may be brought against the other party on account thereof.

ARTICLE XIV.

INSURANCE: PROPERTY DAMAGE AND CONSEQUENTIAL DAMAGE WAIVERS: FORCE MAJEURE

14.1 The Authority waives and shall require its insurers to waive all rights of recovery from the Milwaukee

for direct physical loss of all property of the Authority located or occurring on the Joint Line during the term of this Agreement. The Authority shall either (a) require third parties whose property is on the Joint Line by permission of the Authority to waive and their insurers to waive all rights of recovery from the Milwaukee for direct physical loss to all property of such third parties (including luggage) located or occurring on the Joint Line during the term of this Agreement; or (b) indemnify the Milwaukee for such loss paid by the Milwaukee.

14.2 The Milwaukee waives and shall require its insurers to waive all rights of recovery from the Authority for direct physical loss to all property of the Milwaukee (including cargo) located or occurring on the Joint Line during the term of this Agreement. The Milwaukee shall either (a) require third parties whose property is on the Joint Line by permission of the Milwaukee to waive and their insurers to waive all rights of recovery from the Authority for direct physical loss to all property of such third parties (including cargo) located or occurring on the Joint Line during the term of this Agreement; or (b) indemnify the Authority for such loss paid by the Authority.

14.3 Neither the Authority nor the Milwaukee shall be liable to the other or any third party for delays, interruptions or the failure to perform its obligations under this Agreement due to causes beyond their reasonable control, including: acts of God; any act, delay or failure to act on

the part of any governmental authority or agency (other than the Authority); insurrection or riot; fires; strikes; work stoppages; wrecks; major equipment breakdowns; failure or delay beyond the control of the Authority or the Milwaukee in obtaining necessary labor, materials or manufacturing facilities or acts of the other party.

14.4 Neither the Milwaukee nor the Authority shall be liable to the other in contract or in tort (including negligence) under any theory of strict liability, or otherwise, for any special, incidental or consequential loss or damage of any nature arising at any time or from any cause under or related to the performance of this Agreement.

14.5 Except as expressly provided in Sections 14.1 and 14.2 hereof, nothing in this Agreement shall be construed as affecting or impairing any rights of the Milwaukee or the Authority to contribution or indemnity arising out of claims of third parties.

14.6 During the term of this Agreement, the Milwaukee and the Authority shall each provide and maintain in effect with respect to the Joint Line and the respective operations of each on and affecting the Joint Line contemplated by this Agreement minimum insurance coverage as follows:

Type of Coverage	Limits of Liability
Third Party Liability Insurance including FELA coverage	$50,000,000 per occurrence

Deductibles and coinsurance provisions with respect to the above policies shall be determined by and shall be assumed by the party furnishing the policy; provided that the deductible portion with respect to such coverage shall not be greater than $2,000,000.

14.7 The Authority and the Milwaukee shall give each other notice of any proposed settlement of claims involving joint liability, and the party proposing to enter into a settlement agreement shall make itself reasonably available to meet with the other before entering into such settlement agreement.

ARTICLE XV.

CLAIMS AND REPORTS

15.1 If a claim is made by a third party against the Milwaukee or the Authority for which the other may be liable, in whole or in part, the party against whom the claim is made shall give prompt notice to the other.

15.2 Initial reports of all injuries to or death of persons and loss or destruction of or damage to property on the Joint Line resulting from occurrences involving either party shall be made by that party and a copy furnished to the other party within twenty four (24) hours of the occurrence.

15.3 All claims involving personal injury or death of an employee or property damage of either party shall be

investigated by the party whose employee is injured or whose property is damaged. If employees or property of both parties are involved, the parties shall agree which one of them shall make the investigation.

ARTICLE XVI.

SECURITY DEPOSIT; DEFAULT; REMEDIES

16.1 The Authority shall, on the Commencement Date of this Agreement, deposit the sum of Five Hundred Thousand Dollars ($500,000) ("deposit") in a separate escrow account in a bank of the Authority's choice pursuant to the form of escrow agreement attached to this Agreement as Exhibit H. The deposit shall be held for the benefit of and disbursed under the terms of this Agreement. Interest on the $500,000 shall belong to the Authority and shall not be held for the benefit of or disbursed to Milwaukee; such interest may be withdrawn at any time by the Authority. The unused portion of the deposit (plus interest) shall be returned to the Authority on termination of this Agreement.

16.2 If the Authority fails to make any payment due to the Milwaukee under this Agreement within 90 days of the due date, the Milwaukee may withdraw in accordance with the terms of the Escrow Agreement, the amount due plus any interest on such amount due from the escrow account established under Section 16.1. This withdrawal shall constitute payment of the amount due to the extent of the withdrawal.

16.3 If (a) the principal balance of the escrow account is less than $500,000 for a period of more than 10 days and (b) payment of outstanding bills owed to the Milwaukee under this Agreement are not made within 30 days of their respective due dates and cannot be satisfied in full from the escrow account, the Milwaukee may terminate its obligations under this Agreement on 10 days written notice to the Authority unless the Authority prior to the expiration of the 10 day period both restores the escrow account principal balance to $500,000 and satisfies all outstanding amounts owed to the Authority which are overdue by more than 30 days at the end of the 10 day period.

ARTICLE XVII.

EFFECTIVE DATE AND DURATION

17.1 This Agreement shall become effective on the date established in Section 3 of the Transition Agreement.

17.2 This Agreement shall terminate on December 31, 1984; provided that if the Authority files prior to January 1, 1985 an eminent domain action against the Milwaukee with respect to all or substantially all of the Joint Line, either for the taking of an easement or license for the use of or the taking of the Milwaukee's entire interest, this Agreement shall be extended ("Extended Term") from the period January 1, 1985 through the earlier of (a) the date on which the Authority makes payment for the interest in the

Premises taken in the eminent domain action, or (b) December 31, 1988, subject in each case to the following modifications and conditions:

(a) Prior to January 1, 1985 the Authority shall discharge in full all amounts owed to the Milwaukee under the terms of the Trackage Agreement which have not been paid within 30 days from the invoice date.

(b) If the Reorganization Court has jurisdiction over the Milwaukee at the time an eminent domain action is to be filed which would extend the Trackage Agreement, the Authority shall file that action in the reorganization proceeding, subject to the jurisdiction of the Reorganization Court.

17.3 Upon the termination of this Agreement, the Authority may: (a) remove its rolling stock from the Joint Line; and (b) remove the fixed facilities and equipment, title to which is vested in whole or in part in the Authority, provided that the Milwaukee may, at its option, pay the Authority the value of the Authority's portion of such fixed facilities and equipment determined on the basis of net depreciated cost using a straight line basis.

ARTICLE XVIII.

ABANDONMENT BY EITHER PARTY OF ITS OPERATION OVER THE JOINT LINE

18.1 The Authority may at any time abandon or discontinue its operation over the Joint Line, and on 60 day

prior written notice may terminate this Agreement as of the date the abandonment or discontinuance becomes effective.

18.2 If the Milwaukee abandons, embargoes or discontinues its common carrier operations over the Joint Line or the Reorganization Court orders the liquidation of the Joint Line, the Milwaukee shall use its best efforts to sell or transfer its interest in the Joint Line for continued use as railroad property.

18.3 The Trustee waives any right to reject or disaffirm this Trackage Agreement and agrees that any sale or transfer of any part of the Joint Line to any purchaser other than the Authority, its successors or affiliates, shall be subject to the rights of the Authority under this Agreement.

ARTICLE XIX.

NOTICES -- HOW GIVEN

19.1 All requests, notices, demands, authorizations, directions, consents or waivers or other documents required or permitted under this Agreement shall be in writing and shall be delivered in person to, or deposited postage pre-paid in the registered or certified mails of the United States addressed to the Authority at:

Contract Manager
Regional Transportation Authority
300 North State Street
Chicago, Illinois 60610

or to the Milwaukee at:

Trustee
Chicago, Milwaukee, St. Paul and
Pacific Railroad Company
874 Union Station Building
516 West Jackson Boulevard
Chicago, Illinois 60606

or at such other address as either party may at any time or from time to time designate by notice to the other.

ARTICLE XX.

SECTION HEADINGS

20.1 Section headings are inserted for convenience only and shall not affect any construction or interpretation of this Agreement.

ARTICLE XXI.

NOT FOR BENEFIT OF THIRD PARTIES

21.1 The provisions of this Agreement, are intended for the exclusive benefit of the Milwaukee and the Authority and not for the benefit of any third party.

ARTICLE XXII.

SUCCESSORS AND ASSIGNS; ASSIGNMENT

22.1 This Agreement shall be binding upon the successors of the parties hereto. The respective rights and

obligations the Authority under this Agreement may not be assigned or delegated without the written consent of the Milwaukee except to the Northeast Illinois Regional Commuter Railroad Corporation.

ARTICLE XXIII.

AGREEMENT LIMITATIONS ON TRUSTEE

23.1 This Agreement is binding on Richard B. Ogilvie, not as an individual, but solely in his capacity as Trustee of the property of Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Debtor.

ARTICLE XXIV.

EQUAL EMPLOYMENT OPPORTUNITY

24.1 It is understood and agreed that the parties hereto are subject to, and that to the extent applicable, will comply with all federal and state laws and regulations relating to equal employment opportunity for all persons without regard to race, color, creed, sex, or national origin, and those federal laws and regulations relating to non-segregated facilities, minority business enterprises, the employment of veterans and handicapped persons, including, without limitations, Executive Order No. 11246, 41 CFR Part 60-1, et seq., 41 CFR Part 1-1.1310-2, 41 CFR Part 60-741 et seq., Executive Order No. 11701, and 41 CFR Part

60-250.1 et seq. and 49 CFR Part 265, and the Illinois Human Rights Act, 1981 Ill. Rev. Stat., Ch. 68, §1-101 et seq.

ARTICLE XXV.

OTHER MISCELLANEOUS PROVISIONS

25.1 No modification, addition or amendment to this Agreement shall be effective unless in writing executed by the authorized officers or agents of each party.

25.2 This Agreement shall be governed by the laws of the State of Illinois.

25.3 The provisions of this Agreement shall be interpreted where possible in a manner necessary to sustain their legality and enforceability. The unenforceability of any provision of this Agreement in a specific situation shall not affect the enforceability of: (a) that provision in another situation; or (b) the other provisions of this Agreement if such other provisions could then continue to conform with the purposes of this Agreement and the terms and requirements of applicable law.

25.4 The Milwaukee warrants and represents that it has not paid and agrees not to pay any bonus, commission, fee or gratuity to any employee or official of the Authority for the purpose of obtaining this Agreement. In addition to the obligations imposed by Section 3 of "An Act to Prevent Fraudulent and Corrupt Practices in the Making or Accepting of Official Appointments and Contracts by Public Officers,"

approved April 9, 1872, as amended (1981 Ill. Rev. Stat. Ch. 102, §3), no officer, director, employee or professional consultant or advisor of or to the Authority shall be admitted by Milwaukee to any financial share of this Agreement or to any financial benefit arising therefrom.

25.5 The failure of the Authority or the Milwaukee to insist upon strict performance by the other of its obligations under this Agreement or the failure or delay in exercising any rights or remedies provided under this Agreement or at law shall not be deemed or construed as a waiver of any claims or rights. No waiver of a breach of any provision of this Agreement shall constitute or be construed as a waiver of any other breach or of that provision.

25.6 All obligations of the Authority which may, from time to time, be incurred by it under provisions of the Regional Transportation Authority Act which authorize secured, unsecured, short term, long term, equipment trust certificate or other borrowing shall be superior to and have priority over any and all obligations of the Authority under this Agreement.

25.7 Nothing in this Agreement shall in any way either authorize the Authority to exercise or preclude the Authority from exercising any of its powers of eminent domain.

25.8 If the Milwaukee or the Authority refuses to perform its obligations under this Agreement in accordance with its terms and that action results in the inability of

either the Milwaukee or the Authority to use the Joint Line substantially on the terms contemplated by this Agreement, the non-defaulting party shall, in addition to the remedies available to it at law, be entitled to specific performance of the affected provisions of this Agreement.

IN WITNESS WHEREOF, the parties hereto have caused this document to be executed in at least quadruplicate as of the day and year first hereinabove written.

TRACKAGE AGREEMENT

EXHIBIT D

EXHIBIT D

METHODOLOGY FOR ALLOCATION OF VACATION AND HOLIDAY EXPENSES

Expenses to be Allocated (A):

Vacation and holiday expenses properly distributed to operating expense accounts as prescribed by the Interstate Commerce Commission's Uniform System of Accounts in 49 CFR part 1201.

Expenses specifically not allocable:

Labor expenses of officers on the exempt payroll, separation allowance payments and productivity fund payments.

Labor Base to Which Vacation & Holiday Expenses are to be Applied (B):

Direct Labor, exclusive of vacation and holiday payments and other payments mentioned above; paid to all employees.

Procedure for Allocation:

Divide the expenses to be allocated (A) by the labor base to which vacation and holiday expenses apply (B). Multiply the resulting ratio by (1) the applicable labor and fringe benefits properly charged or allocated to each zone on the joint line for commuter service and (2) labor and fringe benefit expenses charged for dispatching on the joint line.

Example Allocation (Unaudited):

Vacation and holiday expenses = $14,891,180

Labor base = $154,624,225

Vacation and holiday expense ratio = $14,891,180 ÷ $154,624,225 = 9.631%

Labor and fringe benefit expenses allocated to zone of commuter line = $10,500

Vacation and holiday expenses allocated to zone = $10,500 x 9.631% = $1,011.26

Allocation Statistic Update Procedures:

Update annually in January utilizing data from previous calendar year.

METHODOLOGY FOR ALLOCATION OF ADMINISTRATIVE OVERHEAD EXPENSES

Labor Expenses to be Allocated (A):

Expenses for Superintendence and General Administration properly charged to operating expense accounts as prescribed by the Interstate Commerce Commission's Uniform System of Accounts in 49 CFR part 1201.

Expenses specifically not allocable:

Expenses properly chargeable to the following functional areas or accounts are specifically not allocable (B):

> Marketing, Car Management, Freight Claim Prevention, Customer Services, Freight Adjustment, Regional Accounting, Revenue/Interline Accounting, and operating expense accounts properly chargeable as shop and store expense.

Labor Base to Which Administrative Overhead Expenses are to be Applied (C):

Labor and vacation and holiday expenses properly charged to operating expense accounts as prescribed in 49 CRR part 1201 and excluding expenses reported in sections A and B.

Procedure for Allocation:

Divide the expenses to be allocated (A) by the labor base to which administative overhead expenses apply (C). Multiply the resulting ratio by (1) the applicable labor, vacation and holiday expenses, fringe benefits and miscellaneous expenses properly charged or allocated to each zone on the joint line for commuter service and (2) labor, vacation and holiday expenses, fringe benefits and miscellaneous expenses charged for dispatching on the joint line.

Example Allocation (Unaudited):

Administrative overhead expenses = $2,086,187

Labor base = $8,711,933

Administrative overhead expense ratio = 23.946%

Labor, vacation and holiday expenses, fringe benefits and miscellaneous expenses allocated to zone of commuter line = $11,511

Administrative overhead expenses allocated to zone = $2,756.42

Allocation Statistic Update Procedures:

Update monthly based on actual expenses.

TRACKAGE AGREEMENT

EXHIBIT F

Exhibit F

(i) To the chargeout (including taxes and foreign line freight charges) of all items of material, fuel and supplies used (including working timetables and rule books), add 15% to cover inspection, accounting, purchasing, handling and transportation to point of use or point from which handled by work train.

(ii) In all cases of salvage credit in connection with the maintenance of operation, there shall first be deducted 15% to cover expenses in connection with accounting, handling and transportation of such salvaged material.

(iii) When a non-Joint Line track breaks out of a Joint Line track, the Joint Line track shall be charged with 50% of the cost of material to repair or renew the turnout. The material considered as part of the turnout is the frog, switch, guard rails, guard rail clamps, switch stand, switch lamps, switch ties, and ballast and track fastenings. The cost of rail shall be charged to the Joint Line on the same basis as material. Work train services shall be charged to the Joint Line on the same basis as labor.

(iv) Separation of material as between track and signal shall be based on the accounts to which the

material is charged under the ICC Classifications, that is, Maintenance Accounts "Ties," and "Other Track Material," shall be classed as track material and charged to whose track structure it is applied. Signal and interlocker material, and material for highway protection when part of the Joint Line interlocking plant, charged to Investment Account "Signals and Interlockers" and Maintenance Account "Signals and Interlockers" shall be classed as signal and interlocker material and charged to the Authority on bases provided in this Agreement.

Item of material considered as:

Track

- Switches and derails, derail points, switch points and moveable frog points with fastenings.
- Switches, derail and movable point frog timbers or ties.
- Guage or tie plates with or without insulation and with or without extensions, to tie operating or locking movements in relation to rail, together with fastenings.
- Toe or butt plates with fastenings.
- Rail braces with fastenings.
- Riser plates with fastenings.
- Transit or switch clips with fastenings.
- Switch rods with or without insulation with fastenings.
- Insulated rail joints.
- Head rod guides for derails with fastenings.

Signal and Interlocker

° Tie straps with fastenings.

° Front and lock rods with switch lugs or feet and fastenings.

° Throw rods, with switch adjustments and fastenings.

° Machine, tail or base plates with fastenings.

° All cranks and stands with fastenings.

° Switch circuit controllers with rods, point lugs and fastenings.

° Switch and lock movements with fastenings.

° Bolt locks with rods and fastenings.

° Bolt lock base plates with fastenings.

° Bond wires applied in connection with ordinary maintenance of plant, or construction of new plant. (Cost of bond wires or other items of signal material applied in connection with program of rail renewals or other track changes shall be apportioned on basis provided for Track material instead of Signal and Interlocker material.)

Escrow No. _____

ESCROW AGREEMENT

To: Bank of LaGrange Park
Oak Avenue at Sherwood
LaGrange Park, Illinois 60525

The following property is deposited with you by the Regional Transportation Authority:

Five Hundred Thousand Dollars ($500,000)

As Escrowee, you are hereby directed to hold, deal with and dispose of the aforesaid property and any other property at any time held by you hereunder in the following manner, subject however, to the terms and conditions hereinafter set forth:

1. For purposes of this Agreement, the following terms shall have the following meanings:

(a) "Authority" -- The Regional Transportation Authority.

(b) "Claim Notice" -- A notice from the Milwaukee to the Escrowee, which notice shall: (i) be signed by the principal operating officer of the Milwaukee or, in his absence, the Milwaukee's Vice-President of Finance; (ii) state that the Authority has failed to pay the amounts specified in the Applicable Provisions of the Subject Agreements within the time period prescribed for such payment by such provisions; (iii) specify the amounts which the Authority has failed to pay, the date or dates on which such payments were to be made by the Authority, and the basis for claiming that the payment was to be made by the Authority and that the Authority has failed to make such payments within the prescribed time period; and (iv) state that the Milwaukee has given to the Authority, at least ___ business days prior to Milwaukee's submission of the Claim Notice to the Escrowee, a copy of such Claim Notice.

(c) "Milwaukee" -- Richard B. Ogilvie, Trustee of the property of the Chicago, Milwaukee, St. Paul and Pacific Railroad Company.

(d) "Applicable Provisions of the Subject Agreements" -- Section 16.2 of the Trackage Agreement dated _____ between the Milwaukee and the Authority; Section 7 of the Lease of Stations and Station Grounds dated _____ between the Milwaukee and the Authority; Section ___ of the Lease of Western Avenue Yard dated _____ between the Milwaukee and the Authority; Section __ of the Lease of the Fox Lake Yard dated _____ between the Milwaukee and the Authority; and Section ___ of the Lease of the Elgin Yard dated _____ between the Milwaukee and the Authority.

2. Upon receipt of a Claim Notice from the Milwaukee, you are directed to pay, from the principal amount then on deposit with you, to the Milwaukee the amount which the Milwaukee has, pursuant to subparagraph 1(b) of this Escrow Agreement, stated that the Authority has failed to pay. You shall give notice to the Authority of such payment immediately after making such payment.

3. The Milwaukee shall not submit a Claim Notice to the Escrowee unless and until the Milwaukee gives the Authority, at least 3 business days prior to the Milwaukee's submission of the Claim Notice to the Escrowee, a copy of such Claim Notice.

4. At the direction of the Authority, you are directed to invest the principal balance held by you hereunder in such investments in which the Authority is authorized by law to invest with a maturity not in excess of 31 days.

5. Upon receipt of any investment earnings, you are directed to pay such earnings to the Authority.

6. To the extent necessary to make any payment pursuant to paragraph 2 above, you are directed to liquidate investments made pursuant to paragraph 4 above.

7. Each time the principal balance held by you hereunder is less than $500,000 for a period of more than 10 days, you are directed to notify the Milwaukee and the Authority of the principal balance and the date on which such balance last was $500,000 or more. For the purpose of determining the principal balance held by you, you are directed to value any investments at your cost.

8. Upon receipt from the Milwaukee and the Authority of notice of the termination of this Agreement, you are directed to distribute all the property held hereunder to the Authority.

9. This Agreement is binding on Richard B. Ogilvie, not as an individual, but solely in his capacity as Trustee of the property of Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Debtor. After approval by the Reorganization Court the Milwaukee waives any right pursuant to section 77 of the Bankruptcy Act or any other federal law to reject or disaffirm this Agreement.

TERMS AND CONDITIONS

10. Your duties and responsibilities shall be limited to those expressly set forth in these escrow instructions, and you shall not be subject to, nor obliged to recognize, any other agreement between, or direction or instruction of, any or all of the parties hereto even though reference thereto may be made herein: provided, however, with your written consent,

these escrow instructions may be amended at any time or times by an instrument in writing signed by all the then parties in interest.

11. You are authorized, in your sole discretion, to disregard any and all notices or instructions given by any of the undersigned or by any other person, firm or corporation, except only such notices or instructions as are hereinabove provided for and orders or process of any court entered or issued with or without jurisdiction. If any property subject hereto is at any time attached, garnished, or levied upon under any court order or in case the payment, assignment, transfer, conveyance or delivery of any such property shall be stayed or enjoined by any court order, or in case any order, judgment or decree shall be made or entered by any court affecting such property or any part thereof, then and in any of such events you are authorized in your sole discretion, to rely upon and comply with any such order, writ, judgment or decree which you are advised by legal counsel of your own choosing is binding upon you; and if you comply with any such order, writ, judgment or decree you shall not be liable to any of the parties hereto or to any other person, firm or corporation by reason of such compliance even though such order, writ, judgment or decree may be subsequently reversed, modified, annulled, set aside or vacated.

12. You shall not be personally liable for any act taken or omitted hereunder if taken or omitted by you in good faith and in the exercise of your own best judgment. You shall also be fully protected in relying upon any written notice, demand, certificate or document which you in good faith believe to be genuine.

13. Unless otherwise specifically indicated herein you shall proceed as soon as practicable to collect any checks or other collection items at any time deposited hereunder. All such collections shall be subject to the usual collection agreement regarding items received by your commercial banking department for deposit or collection. You shall not be required to have a duty to notify anyone of any payment or maturity under the terms of any instrument deposited hereunder, nor to take any legal action to enforce payment of any check, note or security deposited hereunder. You shall have no liability to pay interest on any money deposited or received hereunder (except as provided in paragraphs 4 and 5 above).

14. You shall not be responsible for the sufficiency or accuracy of the form, execution, validity or genuineness of documents or securities now or hereafter deposited hereunder, or of any endorsement thereon, or for any lack of endorsement

thereon, or for any description therein, nor shall you be responsible or liable in any respect on account of the identity, authority or rights of the persons executing or delivering or purporting to execute or deliver any such document, security or endorsement or these escrow instructions.

15. Any notices which you are required or desire to give hereunder to any of the undersigned shall be in writing and may be given by mailing the same to the address indicated below opposite the signature of such undersigned (or to such other address as said undersigned may have theretofore substituted therefor by written notification to you), by United States mail, postage prepaid. For all purposes hereof any notice so mailed shall be as effectual as though served upon the person of the undersigned to whom it was mailed at the time it is deposited in the United States mail by you whether or not such undersigned thereafter actually receives such notice. Notices to you shall be in writing and shall not be deemed to be given until actually received by your employee or officer who administers this escrow. Whenever under the terms hereof the time for giving a notice or performing an act falls upon a Saturday, Sunday or holiday, such time shall be extended to the next business day. Notices between the Milwaukee and the Authority shall not be deemed to be given until actually received.

16. In case you become involved in litigation on account of being escrowee hereunder or on account of having received property subject hereto, your costs, expenses and reasonable attorneys' fees shall be paid by the party that does not prevail in the litigation or as agreed by the parties in any settlement of the litigation.

17. You shall be paid your reasonable fees for your services and reimbursed for your costs and expenses hereunder by the Authority.

18. If your fees, costs expenses, or reasonable attorneys' fees provided for herein, are not promptly paid, you shall have the right to sell a sufficient portion of the property held hereunder to provide for such payment and reimburse yourself therefor from the proceeds of such sale or from the cash held hereunder.

19. It is understood that you reserve the right to resign as Escrowee at any time by giving 30 days written notice of your resignation, specifying the effective date thereof, to the undersigned. Within 30 days after receiving the aforesaid notice, the Authority shall appoint a successor Escrowee to which you may distribute the property then held hereunder, less

your fees, costs and expenses. If a successor Escrowee has not been appointed and has not accepted such appointment by the end of the 30 day period, you may apply to a court of competent jurisdiction for the appointment of a successor Escrowee, and the Authority shall pay the costs, expenses and reasonable attorneys' fees which you incur in connection with such a proceeding.

20. If, by its terms, this escrow shall not have previously terminated, then it shall terminate on December 31, 1989, at which time the property then held hereunder, less your fees, costs and expenses shall be distributed to the Authority.

21. This escrow agreement shall be construed, enforced, and administered in accordance with the laws of the State of Illinois. The Authority may assign its rights hereunder to the Northeast Illinois Regional Commuter Railroad Corporation.

22. The undersigned Escrowee hereby acknowledges receipt of the property described in the above Escrow Agreement and agrees to hold, deal with and dispose of said property and other property at any time held by it hereunder in accordance with the foregoing Escrow Agreement.

23. Executed this ____ day of _____, 1982 at Chicago, Illinois.

AND PACIFIC RAILROAD COMPANY,	)	a Railroad
	)	
Debtor.	)	No. 77 B 8999
	)	Thomas R. McMillen, Judge

ORDER NO. 809

Upon consideration of the matter of the sale, pursuant to Sections 4 and 5(b) of the Milwaukee Railroad Restructuring Act ("MRRA"), notice having been given to all parties, of the Rail Assets, as defined in and pursuant to an Asset Purchase Agreement dated April 6, 1984, as amended (the "APA"), to be entered into between Richard B. Ogilvie, not personally, but solely as trustee ("Trustee") of the property of the Chicago, Milwaukee, St. Paul and Pacific Railroad Company ("Milwaukee") and the Soo Line Railroad Company, a Minnesota corporation ("Soo"), and SLRCO, Inc., a Minnesota corporation ("SLRCO"), the Court, acting as the Court of Reorganization for the Milwaukee pursuant to Section 77 of the Bankruptcy Act of 1898 and pursuant to Section 4 and Section 5(b) of the MRRA finds and concludes as follows:

1. Soo and SLRCO filed an application with the Interstate Commerce Commission (the "Commission") seeking approval of a purchase of the Rail Assets. In addition, Chicago and North Western Transportation Company ("CNW") filed its application seeking the purchase of essentially similar assets.

2. The Commission rendered its decision on September 26, 1984 with respect to the application of Soo and SLRCO to purchase the assets specified in the APA. That decision, inter alia, approved the application pursuant to Section 11344(b) of the Interstate Commerce Act, Section 5(b) of the MRRA, and Section 77 of the Bankruptcy Act of 1898. The Commission served its further decision with respect to CNW's modified application on January 11, 1985, which decision incorporated certain portions of its September 26, 1984 decision.

3. The Court has ~~heard~~ considered the evidence adduced, heard the arguments of counsel, and the oral and written applications of various parties in interest seeking review of and commenting upon the Commission's September 26, 1984 and January 11, 1985 decisions, including those of the Trustee, Burlington Northern Railroad Company, Chicago Milwaukee Corporation, Escanaba and Lake Superior Railroad Company, First National Bank of Chicago (as Indenture Trustee), Grand Trunk Corporation, Bruce E. Hendry and Mobil Oil Corporation, the

Commission, LaSalle National Bank (as Successor Corporate Trustee), the City of Milwaukee, Wisconsin, CNW, the Chicago, Milwaukee, St. Paul and Pacific Railroad Bond and Debenture Holders Protective Committee (the "Protective Committee"), Railway Labor Executives' Association, Soo, States of Iowa, Minnesota and Wisconsin Departments of Transportation, the United States, United Transportation Union Local No. 528, Wisconsin Power and Light Company, Green Hills Regional Planning Commission, North Dakota Public Service Commission, Seaboard System Railroad, Inc., Harold E. Spencer, Peter N. Todhunter and Richard James Stevens, State of Missouri, South Dakota Department of Transportation, Coalition to Save The Milwaukee and "Certain Employees for the Milwaukee".

4. Section 5(b)(2) of the MRRA empowers this Court to review the order of the Commission entered under that Section only under Sections 706(2)(A), 706(2)(B), 706(2)(C), and 706(2)(D) of title 5 of the United States Code. The Commission has certified to this Court the full record of proceedings before it in connection with the decision of September 26, 1984 and the decision of January 11, 1985. The Court has considered and reviewed the findings and decisions of the Commission filed with this Court, pursuant to the requirements of those sections. The Court has further considered the allegations of error contained in

the petitions for review and comments and has found that the Commission's findings and decisions should be and are approved by this Court, since the findings and decisions were in accordance with law and were not arbitrary, capricious, an abuse of discretion, contrary to constitutional right, power, privilege or immunity, in excess of statutory jurisdiction, authority or limitations, short of statutory right, or without observance of procedure required by law.

5. The Court has ~~heard~~ considered the evidence adduced, the arguments of counsel, and the oral and written arguments of various parties in interest expressing a preference for or objecting to the approval of the sale to either the Soo and SLRCO or CNW, including those of the Trustee, Burlington Northern Railroad Company, Chicago Milwaukee Corporation, Escanaba and Lake Superior Railroad Company, First National Bank of Chicago (as Indenture Trustee), Grand Trunk Corporation, Bruce E. Hendry and the Mobil Oil Corporation, LaSalle National Bank (as Successor Corporate Trustee), the City of Milwaukee, Wisconsin, North Dakota Public Service Commission, CNW, the Protective Committee, Railway Labor Executives' Association, Soo, States of Iowa, Minnesota and Wisconsin Departments of Transportation, Stickney Corporation, the United States, United Transportation Union Local No. 528, Wisconsin Power and Light Company, Green Hills Regional Planning Commission, Seaboard System Railroad,

Inc., State of Missouri, South Dakota Department of Transportation, Coalition to Save The Milwaukee and "Certain Employees of the Milwaukee". The Court has considered the Commission's findings with respect to the public interest, the Commission's vote and basis for its preference for the Soo and SLRCO over CNW, the consideration to be paid to the Debtor's estate, the amount of wages to be paid to employees and other relevant matters. The prompt sale of the Rail Assets to Soo and SLRCO for the continued provision of common carrier service in return for the consideration specified in the APA (including the assumption of certain liabilities of the Milwaukee's estate) is in the best interest of the Milwaukee's estate and of ultimate reorganization of the Milwaukee, and is consistent with the public interest. ~~Soo and SLRCO are bona fide purchasers within the meaning of Rule 8-703 of the Bankruptcy Rules of the Supreme Court of the United States.~~

6. The immediate execution by the Trustee of the APA, and the prompt closing of the transactions in the manner and time contemplated by the APA, are in the best interests of the Milwaukee's estate.

7. The Trustee has issued certain Trustee Certificates during the course of these proceedings which were purchased by the United States Department of Transportation ("DOT") and the Federal Financing Bank pursuant to Sections

505 and 511 of the Railroad Revitalization and Regulatory Reform Act of 1976 and Section 7 of the MRRA. The estate also is liable to the DOT under the terms of its Series I Redeemable Preference Shares issued in 1977 prior to the Milwaukee's filing for reorganization. The Trustee's obligations under the above Trustee Certificates and under the Preference Shares will be assumed at closing by Soo and SLRCO in the manner provided in the APA.

8. The purchase of the Rail Assets together with prior purchases approved by this Court constitute the purchase of substantially all of the Milwaukee Railroad for purposes of Section 7(h)(1)(B) of the MRRA (as amended by Section 701(c)(1) of the Staggers Rail Act of 1980), 45 USC §906(h)(1)(B), and all obligations to the United States or any agency or instrumentality of the United States incurred pursuant to Section 7 of the MRRA by the Milwaukee or the Trustee, including Trustee Certificates 1980 A and B are waived and cancelled.

9. The sale of the Rail Assets and the assignment and assumption of the trackage agreements, joint facilities and operating rights over segments of the rail properties now operated by the Trustee are in the public interest (as determined by the Commission and affirmed by this Court) and are in the best interest of the estate as

found by this Court. The assignment and assumption of the trackage agreements, interests in or agreements with respect to joint facilities, leases, operating rights and all other rights and interests of the Trustee being assigned pursuant to the APA will not effect a termination of the Trustee's rights and interests under the contracts, leases and agreements granting those rights and interests, and those rights and interests are [redacted] assignable to Soo and SLRCO in accordance with the terms of the APA, and notwithstanding any provisions in any such contracts, leases or agreements to the contrary.

10. Section 5 of the MRRA mandates that the Court require the carrier to provide a fair arrangement at least as protective of the interests of employees as that required under Section 11347 of title 49 of the United States Code. In prior sales of lines of railroad pursuant to Section 5, the Court imposed "Appendix B Conditions" (report of the Special Master dated February 20, 1980) which were found to be as protective as statutorily required and consistent with both the scheme and language of the MRRA by the Court of Appeals for the Seventh Circuit in Matter of Chicago, Milwaukee, St. Paul & Pacific Railroad Company, Consolidated Appeals of Railway Labor Executives' Association, 658 F.2d 1149 (7th Cir. Aug. 17, 1981), cert. den. 455 U.S. 1000 (Mar. 8, 1982).

11. Section 5 of the MRRA does not require that labor protective conditions be imposed with respect to employees of The Milwaukee Motor Transportation Company, and the Court finds that such conditions ~~are unnecessary~~ should not be imposed. then

12. The additional findings and conclusions of law, not inconsistent with the provisions of this Order, made pursuant to Rule 52 by the Court orally on February 8, 1985, are incorporated in this Order by reference and made a part of this Order.

NOW, THEREFORE, IT IS ORDERED, ADJUDGED AND DECREED as follows:

1. That the sale and assignment to Soo and SLRCO, in accordance with the APA and this Order, of the Trustee's right, title and interest in the Rail Assets are approved and confirmed in all respects. The Rail Assets shall, upon conveyance, be free and clear of all liens, security interests, claims and encumbrances, of whatever nature, whenever arising, including without limitation those arising from federal, state and local tax claims or liens, those arising from that certain First Mortgage dated as of January 1, 1944 with Continental Illinois National Bank and Trust Company of Chicago, Indenture Trustee, and the General Mortgage dated as of January 1, 1944 with Harris Trust and Savings Bank, Indenture Trustee, and all mortgages supplemental thereto, except only liens, security interests,

claims and encumbrances created by, or specifically permitted to remain on the Rail Assets pursuant to, the APA.

2. That the Trustee is authorized and directed to execute promptly and deliver to Soo and SLRCO the APA, to consummate promptly the sale as set forth in the APA and to execute and deliver on or as soon as practicable after the Closing Date (as defined in the APA), all deeds, bills of sale, assignments, certificates of title, and other documents, and to take such other actions, as shall be required or appropriate to effectuate the transactions contemplated by the APA, including to the extent necessary under the circumstances as determined by the Trustee, modifications to the APA or the transaction required to result in a fully taxable transaction, so that for federal income tax purposes gain or loss will be fully recognized by the Milwaukee on the consummation of the sale, and that the net operating loss carry forwards and tax credits available to the Milwaukee immediately prior to the closing of the sale will be preserved to the Milwaukee.

3. That the Trustee is authorized and directed to assign to Soo or SLRCO, as appropriate, all of his rights under contracts as provided by the APA.

4. That the Trustee is authorized and directed to assign to Soo or SLRCO, as appropriate and in accordance with the APA, all of the trackage agreements, joint facili-

ties and operating rights necessary for Soo or SLRCO, as the case may be, to operate the Railroad (as defined in the APA).

5. That the Trustee is authorized and directed to assign to Soo or SLRCO, as appropriate, all labor contracts (including collective bargaining agreements) with respect to employees of the Trustee required by the APA to be offered employment by Soo or SLRCO.

6. That Soo and SLRCO, or either of them, assume each of the obligations and liabilities arising under the contracts or agreements assigned by the Trustee in accordance with paragraphs 3, 4 and 5 of this Order. In addition, Soo and SLRCO, or either of them, shall assume the Trustee's obligations under the Wage Deferral Agreement and the last two sentences of Paragraph 2b of the Wage Reduction Agreement, as specified in the APA as modified in the December 4, 1984 letter agreement between the Soo and the Trustee, the obligations of the Trustee under the Trustee Certificates issued to DOT and the Federal Financing Bank pursuant to Sections 505 and 511 of the Railroad Revitalization and Regulatory Reform Act of 1976 or Section 7 of the MRRA (excluding Trustee Certificates 1980 A and B), the obligations with respect to the Series I Redeemable Preference Shares, the obligations of the Trustee with respect to any labor conditions imposed with respect to the transactions contemplated by the APA and other obligations and liabilities

of the Trustee to be assumed by Soo and SLRCO, or either of them, pursuant to the APA. After the Closing (as defined in the APA), all obligations and liabilities of the Trustee to be assumed by Soo or SLRCO in accordance with this Order or the APA and not otherwise discharged shall be the sole obligation of Soo or SLRCO, or both, as the case may be, and the Trustee and the Milwaukee shall be relieved from any and all liabilities in connection with or arising out of such obligations except as expressly may be provided otherwise by the APA, whether occuring after the Closing or arising out of the conveyance or assignment; provided, however, the foregoing shall not impose on Soo or SLRCO any liability or obligation not imposed upon or assumed by them in accordance with the terms of the APA.

7. That all prepetition obligations and debts of the Trustee and Debtor and its subsidiaries to Soo and its subsidiaries are cancelled. In addition, all outstanding debts and obligations of the Trustee and Debtor and any of its subsidiaries arising out of facilities embargoed or abandoned prior to Closing are cancelled.

8. That the sale, transfer and assigment of the Rail Assets is without warranties, representations or guaranties of any kind, expressed or implied, except as specifically stated in the APA.

9. That upon consummation of the transactions contemplated by the APA, all common carrier obligations of the Trustee and Debtor be assumed by Soo and SLRCO, and shall cease as to the Trustee and Debtor.

10. Subject to the agreement of Soo and SLRCO with representatives of employees to labor protection conditions at least as protective as those specified below, the conditions contained in Appendix B to the Report of the Special Master dated February 20, 1980 are adopted for the protection of employees of Soo and Milwaukee Road affected by the transactions contemplated by the APA; Section 4(e) is included therein as specified in Order No. 276B; Appendix B is also modified as provided in Order No. 409A. Notwithstanding the foregoing, no labor protective conditions are imposed with respect to the employees of The Milwaukee Motor Transportation Company.

11. That the Court shall retain jurisdiction over this matter for the purpose of implementing and carrying out the APA and resolving any disputes arising under or with respect to the APA, this Order or the Closing. The ICC shall have such continuing jurisdiction over this transaction as is by law vested in it.

12. That the rights, claims, liens and interests of any creditor of, or claimant against, the Debtor's estate which are not assumed by Soo or SLRCO in accordance with

this Order or adjudicated by this Order as applying to the Rail Assets which are sold, transfered or assigned pursuant to this Order shall be, upon the Closing, transferred from the Rail Assets to the net proceeds of the sale; such net proceeds shall, until further order of this Court, be deposited and retained in the existing trust account bearing the designation "Escrow Agent Account" No. 13-01043-4 at the Continental Illinois National Bank and Trust Company of Chicago and shall be invested pursuant to this Court's Order No. 536 in accordance with instructions from the Trustee or a person designated by him.

13. That following the closing of the sale and pending the earlier of (i) further order of this Court, (ii) the date on which this Order authorizing the sale shall not have been reversed and no further appeal may be taken by any party or (iii) 90 days after the Closing Date, Soo and SLRCO are directed to conduct the operations of the Railroad, (as defined in the APA), and to maintain the Rail Assets, subject to additions and dispositions in the ordinary course, on a basis reasonably designed to account for the operations of the Railroad and the identification of the Rail Assets subsequent to their transfer to Soo and SLRCO.

14. All requests for relief pertaining to the subject matter of this Order not otherwise granted by this Order shall be considered denied.

15. Directions contained in this Order shall be carried out forthwith.

GAMEIRO R.V.S. EXHIBIT 4

THE "1985 TRACKAGE AGREEMENT" - TRACKAGE AGREEMENT BETWEEN RICHARD B. OGILVIE, TRUSTEE OF THE PROPERTY OF THE CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC RAILROAD COMPANY, DEBTOR AND SLRCO, INC. (FEB. 19, 1985) (EXCERPTS) (ALSO METRA COMMENTS EXH. A-2)

EXHIBIT A-2

SLRCO 1985 Inc. Trackage Agreement

T 00640

EXHIBIT G-1

TRACKAGE AGREEMENT

THIS AGREEMENT, made and entered into this 19th day of February, 1985, by and between RICHARD B. OGILVIE, TRUSTEE OF THE PROPERTY OF CHICAGO, MILWAUKEE, ST. PAUL AND PACIFIC RAILROAD COMPANY, DEBTOR ("Milwaukee"), and SLRCO, INC. a Minnesota corporation ("SLRCO").

The parties hereto agree as follows:

ARTICLE I.

JOINT LINE DEFINED

1.1 The term "Joint Line" refers to the following trackage, as shown in approximation on Exhibit A, and ancillary facilities between Madison Street, Chicago, Illinois (Mile Post 0.2) and Fox Lake, Illinois (Mile Post 49.79) ("North Line") and between Tower A-5 (Mile Post 5.26) and Almora, Illinois (Mile Post 40.26) ("West Line"): (a) the right of way and improvements thereto, including, but not limited to, rails, ties, ballast, switches, turnouts, wyes, crossovers, bridges, culverts, fills, cuts, right of way fences, embankments, tunnels and grade crossings and grade crossing signals; (b) sidings and spurs, except industry owned spurs; (c) signals and communication facilities; (d) interlocking devices;

(e) towers, sheds, buildings and structures; and (f) such other property, equipment and facilities necessary to the provision of freight service and intercity passenger service ("Service") on the North line and West Line and used by the Milwaukee in the normal course of providing Service. The Joint Line shall not include air rights.

1.2 For the purposes of equitably dividing the monthly expenses for billing purposes between the two parties, the Joint Line shall be divided on a zone basis as follows:

a. North Line

Zone 1 (1 main). Between Fox Lake, Illinois (Mile Post 49.79) and Rondout, Illinois (Mile Post 32.25).

Zone 2 (1 and 2 mains). Between Rondout, Illinois (Mile Post 32.25) and Deerfield, Illinois (Mile Post 24.58).

Zone 3 (1 and 2 mains). Between Deerfield, Illinois (Mile Post 24.58) and Tower A-20, Techny, Illinois (Mile Post 20.63).

Zone 4 (1 and 2 mains). Between Tower A-20, Techny, Illinois (Mile Post 20.63) and Tower A-5, Chicago, Illinois (Mile Post 5.85).

Zone 5 (1, 2 and 3 mains). Between Tower A-5, Chicago, Illinois (Mile Post 5.85) and Tower A-2, Chicago, Illinois (Mile Post 3.02).

Zone 6 (1, 2 and 3 mains). Between Tower A-2, Chicago, Illinois (Mile Post 3.02) and Canal Street, Chicago,

Illinois (Mile Post 0.57), such mains being jointly owned by Milwaukee and The Consolidated Rail Corporation ("Conrail") under an Agreement dated February 7, 1873, as amended.

Zone 7 (1 and 2 mains). Between Lake Street, Chicago, Illinois (Mile Post 0.55) and Madison Street, Chicago, Illinois (Mile Post 0.20), such mains being jointly owned by Milwaukee and Conrail under an Agreement dated February 7, 1873, as amended.

b. West Line (1 and 2 Mains)

Zone 8. Between Almora, Illinois (Mile Post 40.26) and Elgin, Illinois (Mile Post 36.64).

Zone 9. Between Elgin, Illinois (Mile Post 36.64) and Spaulding, Illinois (Mile Post 32.75).

Zone 10. Between Spaulding, Illinois (Mile Post 32.75) and Tower B-17, Bensenville, Illinois (Mile Post 16.87).

Zone 11. Between Tower B-17, Bensenville, Illinois (Mile Post 16.87) and Tower B-12, Franklin Park, Illinois (Mile Post 12.82).

Zone 12. Between Tower B-12, Franklin Park, Illinois (Mile Post 12.82) and Tower A-5, Chicago, Illinois (Mile Post 5.11).

ARTICLE II.

GRANT FOR OPERATION OF TRAINS

2.1 Milwaukee grants to SLRCO the non-exclusive right to use the Joint Line solely for the purpose of providing Service over the Joint Line, and the exclusive right to provide Service to industries on the Joint Line. SLRCO's right to use the Joint Line shall be in common with the Regional Transportation Authority and its assignee, Northeast Illinois Regional Commuter Railroad Corporation (collectively "RTA") pursuant to a Trackage Agreement dated September 16, 1982 between the Milwaukee and RTA (the "RTA Agreement") and such other railroad company or companies previously or subsequently admitted to the use of any part of the Joint Line; provided that:

(a) Except for (1) FRA track inspections, (2) emergencies and (3) temporary detour usage of less than 30 days in a 12 month period, the Milwaukee shall not admit any third party to the use of any part of the Joint Line ("Third Party Use") which materially interferes with SLRCO's use (or the use of any third party admitted by SLRCO) of the Joint Line as contemplated by this Agreement.

(b) SLRCO shall not permit any third party (except Amtrak) to use or detour over any portion of the Joint Line or agree to operate on the Joint Line the trains, engines and cars

which in the normal course of business would not be considered the trains, engines or cars of SLRCO engaged in Service, except that SLRCO may admit a third party to use of the Joint Line in accordance with Section 2.3.

2.2 The rights herein granted to SLRCO to use the Joint Line are limited solely to the provision of Service; nothing in this Agreement shall be construed to give SLRCO or any third party the right to operate Commuter Service as defined in the RTA Agreement.

2.3 SLRCO may admit a third party to use of the Joint Line as long as:

(a) the third party's use of the Joint Line would not materially interfere with any other prior user of the Joint Line;

(b) the third party is not allowed any use of the Joint Line which would not be permitted to SLRCO under this Agreement; and

(c) the third party pays the Milwaukee an amount equal to its proportionate share of Reimbursable Expenses (defined below) and capital expenditures upon the same terms provided in this Agreement with respect to SLRCO, plus a fixed rental at least equal to a base rental of $645,000 per year escalated from March, 1984 in accordance with the provisions of Section 5.2(g) multiplied by the ratio of the route miles the

third party is admitted to use to the route miles of the entire Joint Line.

ARTICLE III.

CONSTRUCTION OF ADDITIONAL SIDINGS

3.1 As of the date of this Agreement, the sidings which exist on the Joint Line are sufficient to permit safe and efficient operation of the existing level of Commuter Service and Service over the Joint Line. The Milwaukee shall construct any additional sidings which are made necessary in its judgment by increased levels of traffic over the Joint Line or which are requested by SLRCO. The costs of the construction of these additional sidings shall be paid by:

(a) SLRCO, if the sidings are made necessary solely due to an increase in the operations of SLRCO or are requested by SLRCO;

(b) A third party, if the sidings are made necessary solely due to increases in the operations of a third party (including RTA) admitted to the use of the Joint Line;

(c) SLRCO and a third party pursuant to a separate agreement allocating such costs if the sidings are made necessary by increases in the operations of both SLRCO and a third party (including RTA) admitted to the use of the Joint Line.

ARTICLE IV.

RADIO COMMUNICATIONS EQUIPMENT

4.1 SLRCO shall, at its sole expense, maintain, repair and replace, as necessary, all radio communications equipment on its trains, engines and cars to permit safe and efficient operation on the Joint Line.

ARTICLE V.

PAYMENT

5.1 SLRCO shall pay to the Milwaukee the amounts described in this Article V. Payment shall be made in accordance with Article VI.

5.2 As used in this Agreement, the following terms shall have the meanings ascribed to them:

(a) Estimated SLRCO Summary Expense Bill -- the Milwaukee's reasonable and good faith estimate of SLRCO's proportionate share of Reimbursable Expenses for a calendar month.

(b) SLRCO Summary Expense Bill -- the monthly bill (or credit) submitted by the Milwaukee to SLRCO for SLRCO's proportion of Reimbursable Expenses for a calendar month, as computed pursuant to Section 5.4.

(c) Property Tax Bill -- the annual bill submitted by the Milwaukee to SLRCO for the payment of SLRCO's proportion-

ate share computed pursuant to Section 5.3 for general real estate taxes with respect to the Joint Line in the counties of Cook, Lake, DuPage and Kane within the State of Illinois.

(d) Gross Ton Mile Proportion -- the ratio determined by dividing the gross ton miles generated by all trains, engines, cars and contents (including passengers) by or on behalf of SLRCO in each zone of the Joint Line during a calendar month by the total number of gross ton miles generated by all trains, engines, cars and contents (including passengers) by or on behalf of the SLRCO and any third parties (including RTA) in each zone during that month. The number of passengers on each SLRCO or third party (including RTA) train during a month shall be determined on the basis of an annual joint study of the RTA and SLRCO.

(e) Train Count Proportion -- the ratio determined by dividing the number of trains operated by or on behalf of Parent in each zone of the Joint Line during a calendar month by the total number of all trains operated by or on behalf of the SLRCO and any third parties (including RTA) in each zone during that month.

(f) Reimbursable Expenses -- Reimbursable Expenses means the following expenses incurred by or on the account of the Milwaukee or on the account of SLRCO:

(1) the expenses incurred during the term of this Agreement and attributable to this Agreement as recorded in the Milwaukee's or SLRCO's accounts;

(2) the expenses properly chargeable to the zones defined in Section 1.2 of this Agreement;

(3) the ordinary and necessary expenses incurred for material (including normal handling charges), labor, health and welfare benefit, fuel, equipment rentals, payroll taxes (including "head" taxes), sales taxes, use taxes and excise taxes and miscellaneous expenses in maintaining, operating, repairing and renewing the Joint Line.

Reimbursable Expenses shall be accounted for by the accrual method of accounting in the Milwaukee's and SLRCO's accounts, consistently applied. Except as required by applicable ICC regulations, changes made by SLRCO or the Milwaukee in its accounting system shall not affect the timing of recognition of Reimbursable Expenses under this Agreement.

(g) Fixed Expense -- Fixed Expense shall mean $645,000 per year, payable in 12 equal monthly installments, which shall be adjusted in accordance with this paragraph. As of the first of March in each year beginning March 1, 1985, Fixed Expense shall be adjusted based on the ratio of the Consumer Price Index - Urban, All Items, United States City Average ("CPI-U") as published by the U.S. Department of Labor for that month to the CPI-U for March 1984. The adjustment shall be based on the first published final index for March of that year, or if not available, the first published final index for the most recently available prior month. Any adjustment based upon an index for a prior month shall be provisional, and

revisions to this provisional adjustment, if necessary, will be made at the time the first published final index for March is available. Should the CPI-U be discontinued or the basis for its calculation be substantially modified, a proper index shall be substituted by mutual agreement of the parties.

5.3 General real estate taxes payable by the Milwaukee with respect to the Joint Line on a county by county basis shall be allocated on the basis of the ratio of the unit-miles of the locomotives, cars and cabooses operated by or on behalf of SLRCO over the entire Joint Line during a calendar year to the unit-miles of all locomotives, cars and cabooses operated over the entire Joint Line during that year. Each yearly Property Tax Bill shall be initially based on the tax bills for the preceding year for which a definite tax bill is available and movements for the preceding year, and shall be adjusted, based on actual movements and actual tax bills, within 30 days of receipt of the actual tax bills for each year during the term of this Agreement. The Property Tax Bill for each year shall be submitted by the Milwaukee to SLRCO on or after August 1 of the year to which it applies, beginning with the year 1984 (for 1984 taxes), payable by the 15th day of the month after the month of receipt of the bill. The Property Tax Bill shall be pro-rated for a partial year; such prorations shall be made within 30 days after definite data requiring the proration becomes available.

The Milwaukee shall pay any balances due pursuant to such adjustment or proration within 30 days of an adjustment or proration; SLRCO shall pay any balance due pursuant to an adjustment or proration within 30 days after receipt of an invoice from the Milwaukee.

Any special assessments levied against the Joint Line shall be amortized over the useful life of the facility for the construction or improvement of which the special assessment was levied. The amount of such special assessment applicable to each calendar year of this Agreement shall be allocated between the parties, billed, paid, pro-rated and adjusted on the same basis as general real estate taxes.

5.4 SLRCO and the Milwaukee shall allocate Reimbursable Expenses as follows:

(a) Maintenance of way and structures expenses incurred for each zone of the Joint Line shall be allocated on a monthly basis between the parties on the Gross Ton Mile Proportion.

(b) Transportation, signal and communication systems expenses and maintenance expenses of non-Milwaukee owned equipment (used in the operation or maintenance of the Joint Line) incurred for each zone of the Joint Line shall be allocated on a monthly basis between the parties on a Train Count Proportion.

(c) Expenses for train dispatchers incurred in operating the Joint Line shall be allocated on a monthly basis by

the average of the Train Count Proportions for all zones of the Joint Line.

(d) The monthly allocated share of labor and fringe benefits expenses (including payroll taxes) determined in accordance with subparagraphs (a) through (c) above shall be increased for administrative overhead and vacation and holidays in accordance with Exhibit B.

(e) Monthly expenses incurred for joint facilities which are part of the Joint Line not solely owned by the Milwaukee, identified in Exhibit C, shall be allocated on a Train Count Proportion in the zone in which each facility is located.

5.5 All amounts to be paid by either party under this Agreement shall bear interest from the date the amount was due in accordance with this Agreement until paid at a rate equal to 2% in excess of the corporate base rate of interest announced from time to time by The First National Bank of Chicago, changing as and when such corporate base rate changes.

5.6 SLRCO shall have no liability for any payments or other obligations arising out of its use of the Joint Line pursuant to this Agreement except as provided in this Article V or specifically provided in another provision of this Agreement.

5.7 At the end of each calendar year the Milwaukee shall recalculate SLRCO's and the Milwaukee's respective pro-

portions of the charges set forth in section 5.4 on the basis of SLRCO's Gross Ton Mile Proportion and Train Count Proportion for such calendar year. Such recalculation shall be computed within 45 days after the expiration of such calendar year.

In the event that SLRCO's proportion of such charges for such calendar year exceeds the sum of SLRCO's proportion of such charges for each of the individual months during such calendar year, SLRCO shall pay the Milwaukee such difference within 30 days of such recalculation; and in the event that SLRCO's proportion of such charges for such calendar year is less than the sum of SLRCO's proportion of such charges computed for each of the individual months during such calendar year, the Milwaukee shall pay SLRCO such difference within 30 days of such recalculation or credit SLRCO with such amount in the next Estimated SLRCO Summary Expense Bill.

ARTICLE VI.

MANNER OF PAYMENT -- INSPECTION OF RECORDS

6.1 SLRCO shall pay Fixed Expense installments on the first day of each month, and shall pay the annual Property Tax Bill on or before the 15th day of the month following the month in which it was received.

6.2 On the first day of each calendar month the Milwaukee shall submit to SLRCO an Estimated SLRCO Summary

Expense Bill for that month. If the Estimated SLRCO Summary Expense Bill shows that SLRCO owes the Milwaukee, the amount owing shall be due within 15 days of receipt of the Estimated SLRCO Summary Expense Bill. If the Estimated SLRCO Summary Expense Bill shows that the Milwaukee owes SLRCO, the amount shall be paid to SLRCO within 30 days of the date of the Estimated SLRCO Summary Expense Bill.

The Milwaukee shall submit to SLRCO within 45 days after the end of each calendar month the SLRCO Summary Expense Bill for that month. If the Estimated SLRCO Summary Expense Bill showed more owing by SLRCO or less owing by the Milwaukee than the SLRCO Summary Expense Bill, the Milwaukee shall credit SLRCO with the excess in the following month's Estimated SLRCO Summary Expense Bill or pay the excess to SLRCO within 15 days. If the Estimated SLRCO Summary Expense Bill showed less owing by SLRCO or more owing by the Milwaukee than the SLRCO Summary Expense Bill, SLRCO shall pay the difference by the 15th day of the month following the month in which the SLRCO Summary Expense Bill is received.

6.3 SLRCO shall furnish to Milwaukee, within 15 days after the end of each calendar month during the term of this Agreement, a statement showing for that month: (a) the train count for the trains operated by or on behalf of SLRCO over each zone of the Joint Line; (b) the gross ton miles generated by the trains, engines and cars and contents operated by or on

behalf of SLRCO over each zone of the Joint Line; and (c) any expenses claimed by SLRCO as a reduction of Reimbursable Expenses. The statement shall be subject to verification and correction by the Milwaukee. If SLRCO fails to furnish the statement within the 15 day period, the Milwaukee may submit a SLRCO Summary Expense bill for that month based on the Gross Ton Proportion and Train Count Proportion during the preceding 12 month period, and assuming no reduction of Reimbursable Expenses. That bill shall be adjusted upon receipt of the required statement from SLRCO. Milwaukee shall furnish to SLRCO copies of RTA's statements to the Milwaukee pursuant to Section 7.4 of the RTA Agreement.

6.4 SLRCO's portion of the costs of the projects described in sections 3.1(a), 3.1(c), 7.2(b) 7.2(c) and 7.2(d), shall be billed as incurred and paid on the 15th day of the month following the month in which the bill is received, subject to verification of the costs and progress of the work.

6.5 No payment shall be delayed because of an error or dispute in a bill. Errors of less than $5,000 shall be adjusted in the next Estimated or Summary Expense Bill.

6.6 The amounts required to be paid by SLRCO shall be paid by check or by wire transfer of immediately available funds to the Trustee's account #50-30048 at The First National Bank of Chicago or another account designated by the Milwaukee.

6.7 Except as otherwise provided in this Agreement all payments under this Agreement are due and payable within 30 days of receipt of the bill or invoice.

6.8 Records of each party reasonably relating to payment or allocation of expenses under this Agreement shall be open to inspection during regular business hours. Each party shall provide sufficient office space for these inspections together with reasonable assistance in conducting an inspection. Records shall be closed to audit, and no bill as to which no exception has been taken shall be adjusted, after three (3) years from December 31 of the year of the invoice date.

ARTICLE VII.

JOINT LINE CAPITAL EXPENDITURES

7.1 The Milwaukee may effect capital projects, including significant maintenance projects, in the Joint Line necessary or desirable for the economical and safe operation of trains, engines or cars over the Joint Line, or which are required by applicable law or regulations.

7.2 The costs of capital projects, including significant maintenance projects, shall be paid by:

(a) a third party, if required solely by the operations of third parties (including RTA) admitted to the use of the Joint Line;

(b) SLRCO, if required solely by the operations of SLRCO;

(c) SLRCO and a third party, in accordance with the allocation formulas for operating expense contained in

Section 5.4 applied to capitalized expenses, for projects required by the operations of both SLRCO and third parties (including RTA) admitted to the use of the Joint Line.

(d) SLRCO and a third party pursuant to a separate fixed facilities agreement allocating such costs, if the provisions of subsection (c) are inapplicable and if the project is required by the operations of both SLRCO and third parties (including RTA) admitted to the use of the Joint Line.

7.3 The Milwaukee shall effect capital projects, including significant maintenance projects, requested by and at the sole expense of SLRCO unless such projects would substantially interfere with the rights of a third party (including RTA) admitted to the use of the Joint Line.

ARTICLE VIII.

OPERATION AND MAINTENANCE OF JOINT LINE

8.1 SLRCO shall direct the movement of all trains, engines, cars and inspection vehicles over the Joint Line. All track, bridge, signal and communication work, materials and track operated machinery and equipment used will be in accordance with industry standards. The priority of the Commuter Service operations and schedules of RTA over the Joint Line shall be observed in accordance with the provisions of the RTA Agreement.

8.2 The operation of all trains over the Joint Line is subject to the direction of SLRCO, and shall at all times be in accordance with reasonable safety and operating rules, regulations and operating timetables prescribed by SLRCO. The management of RTA's Commuter Service is vested solely in the RTA and RTA's trains, engines and cars shall be operated solely by RTA's employees or agents and at RTA's sole expense.

8.3 The Milwaukee shall (a) maintain all joint facility agreements, interlocking agreements and similar arrangements necessary to the operations of the Service over the Joint Line contemplated by this Agreement; (b) pay and discharge when due and payable all lawful governmental charges or levies imposed with respect to the Joint Line (except to the extent and while the validity thereof is contested by appropriate proceedings or when deferred pursuant to an order of the Reorganization Court having jurisdiction over the Milwaukee); (c) provide for utility services necessary to the operations of Service over the Joint Line; and (d) take all other action necessary to permit the Joint Line to be used for the Service by SLRCO.

ARTICLE IX.

TIME TABLES

9.1 The expenses, including costs of composition, printing, binding and distribution, incurred by SLRCO in the

issuance of revised operating time tables required by changes in the operations of SLRCO or third parties (including RTA) shall be allocated proportionately among the parties whose operations required the change, except that the incremental cost of changes made by SLRCO with respect to its freight or intercity passenger service in connection with a revision required by RTA shall be paid by SLRCO.

ARTICLE X.

COMPLIANCE WITH LAWS AND OTHER PUBLIC REGULATIONS

10.1 Each party shall comply with all applicable federal, state and local laws, regulations and rules with respect to the use of and the conduct of its operations over the Joint Line. If a party's non-compliance results in any fine, penalty, cost or charge being imposed or assessed on or against the other party, the non-complying party shall defend on notice from the other party, and shall promptly reimburse and indemnify the other party for or on account of such fine, penalty, cost or charge and all expenses and attorneys' fees incurred in defending, any action which may be brought against the other party on account thereof.

ARTICLE XI.

INSURANCE; PROPERTY DAMAGE AND
CONSEQUENTIAL DAMAGE WAIVERS; FORCE MAJEURE

11.1 SLRCO waives and shall require its insurers to waive all rights of recovery from the Milwaukee for direct physical loss of all property of SLRCO located or occurring on the Joint Line during the term of this Agreement. SLRCO shall either (a) require third parties whose property is on the Joint Line by permission of SLRCO to waive and their insurers to waive all rights of recovery from the Milwaukee for direct physical loss to all property of such third parties (including luggage and cargo) located or occurring on the Joint Line during the term of this Agreement; or (b) indemnify the Milwaukee for such loss paid by the Milwaukee.

11.2 The Milwaukee waives and shall require its insurers to waive all rights of recovery from SLRCO for direct physical loss to all property of the Milwaukee (including luggage and cargo) located or occurring on the Joint Line during the term of this Agreement.

11.3 Neither SLRCO nor the Milwaukee shall be liable to the other or any third party for delays, interruptions or the failure to perform its obligations under this Agreement due to causes beyond their reasonable control, including: "acts of God"; wars (or similar military action); any act, delay or failure to act on the part of any governmental authority or

agency; insurrection or riot; fires; strikes; work stoppages; wrecks; major equipment breakdowns; failure or delay beyond the control of SLRCO or the Milwaukee in obtaining necessary labor, materials or manufacturing facilities or acts of the other party.

11.4 Neither the Milwaukee nor SLRCO shall be liable to the other in contract or in tort (including negligence) under any theory of strict liability, or otherwise, for any special, incidental or consequential loss or damage of any nature arising at any time or from any cause under or related to the performance of this Agreement.

11.5 Except as expressly provided in Sections 11.1 and 11.2 hereof, nothing in this Agreement shall be construed as affecting or impairing any rights of the Milwaukee or SLRCO to contribution or indemnity arising out of claims of third parties.

11.6 During the term of this Agreement, SLRCO shall provide and maintain in effect with respect to the Joint Line and its operations on and affecting the Joint Line insurance coverage of the types and in amounts customary for a line similar to the Joint Line.

ARTICLE XII.

DURATION

12.1 This Agreement shall terminate on December 31, 2083; provided, however, this Agreement may be earlier

terminated by SLRCO with respect to any zone on 180 days written notice. The Fixed Expense shall be proportionately reduced in the event of termination of a zone on the basis of the route miles of the zone to the route miles of the entire Joint Line. Upon the termination of this Agreement, SLRCO shall remove its rolling stock from the Joint Line.

12.2 If SLRCO terminates this Agreement with respect to a zone, SLRCO may remove at its expense any sidings or other capital projects in that zone entirely paid for by SLRCO, subject to the Milwaukee's right to purchase any or all of the sidings or other capital projects at their net liquidation value.

ARTICLE XIII.

NOTICES -- HOW GIVEN

13.1 All requests, notices, demands, authorizations, directions, consents or waivers or other documents required or permitted under this Agreement shall be in writing and shall be delivered in person to, or deposited postage pre-paid in the registered or certified mails of the United States addressed to SLRCO at:

SLRCO, Inc.
516 West Jackson Boulevard
Chicago, Illinois 60606

Attention: President

or to the Milwaukee at:

Trustee
Chicago, Milwaukee, St. Paul and
Pacific Railroad Company
P.O. Box 6205
597 West Jackson Boulevard
Chicago, Illinois 60680-6205

or at such other address as either party may at any time or from time to time designate by notice to the other.

ARTICLE XIV.

SECTION HEADINGS

14.1 Section headings are inserted for convenience only and shall not affect any construction or interpretation of this Agreement.

ARTICLE XV.

SUCCESSORS AND ASSIGNS; ASSIGNMENT

15.1 This Agreement shall be binding upon the successors of the parties hereto. The respective rights and obligations of SLRCO under this Agreement may not be assigned or delegated without the written consent of the Milwaukee, except to a successor in interest to SLRCO (whether by merger, consolidation, or acquisition of all or substantially all of SLRCO's assets) or to another corporation which controls, is controlled by, or is under common control with, SLRCO.

15.2 The respective rights and obligations of the Milwaukee under this Agreement shall be considered to run with and be a burden on the Joint Line and shall be binding on any successor to the Milwaukee. Effective as of any transfer of the title of the Milwaukee to any third party, including for that purpose to SLRCO, the Milwaukee shall to the extent title is transferred have no further rights under and shall be relieved of all obligations under this Agreement, except for rights and obligations accrued as of the date of transfer.

ARTICLE XVI.

AGREEMENT LIMITATIONS ON TRUSTEE

16.1 This Agreement is binding on Richard B. Ogilvie, not as an individual, but solely in his capacity as Trustee of the property of Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Debtor.

ARTICLE XVII.

OTHER MISCELLANEOUS PROVISIONS

17.1 No modification, addition or amendment to this Agreement shall be effective unless in writing executed by the authorized officers or agents of each party.

17.2 This Agreement shall be governed by the laws of the State of Illinois.

17.3 The provisions of this Agreement shall be interpreted where possible in a manner necessary to sustain their legality and enforceability. The unenforceability of any provision of this Agreement in a specific situation shall not affect the enforceability of: (a) that provision in another situation; or (b) the other provisions of this Agreement if such other provisions could then continue to conform with the purposes of this Agreement and the terms and requirements of applicable law.

17.4 The failure of SLRCO or the Milwaukee to insist upon strict performance by the other of its obligations under this Agreement or the failure or delay in exercising any rights or remedies provided under this Agreement or at law shall not be deemed or construed as a waiver of any claims or rights. No waiver of a breach of any provision of this Agreement shall constitute or be construed as a waiver of any other breach or of that provision.

17.5 If the Milwaukee or SLRCO refuses to perform its obligations under this Agreement in accordance with its terms and that action results in the inability of the SLRCO or any third party (including RTA) to use the Joint Line substantially on the terms contemplated by this Agreement, the non-defaulting party shall, in addition to the remedies available to it at law, be entitled to specific performance of the affected provisions of this Agreement.

IN WITNESS WHEREOF, the parties hereto have caused this document to be executed as of the day and year first above written.

Re: Trackage Agreement dated February 19, 1985, by and between Richard B. Ogilvie, Trustee of the Property of Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Debtor, and SLRCO, Inc. (the "Trackage Agreement")
Law Department files: 533, 1083

Gentlemen:

The Trackage Agreement refers to Exhibits A, B, and C. Unfortunately, the Exhibits were apparently never attached to the originals of the Trackage Agreement; either that, or they were subsequently lost or misplaced.

The purpose of this letter is to evidence our agreement that the documents attached hereto as Exhibits A, B, and C (which documents are described more particularly below) are in fact true copies of the correspondly-lettered Exhibits to the Trackage Agreement. We are also in agreement that the attached Exhibits A, B, and C, or copies thereof, may be attached to the executed originals of the Trackage Agreement in lieu of the missing Exhibits.

The attached documents are described more fully as follows:

Exhibit A: A composite Exhibit consisting of eleven maps, which maps are identified as follows --

Zone 1 schematic showing track layout between Rondout and Fox Lake, IL., bearing date of March 3, 1982, and revision date of July 15, 1982.

REDACTED PUBLIC RECORD VERSION

Zone 2 schematic showing track layout between Deerfield and Rondout, IL., bearing date of March 4, 1982, and revision date of July 15, 1982.

Zone 3 schematic showing track layout between Techny and Deerfield, IL., bearing date of March 3, 1982, revision date of April 2, 1982, and revision date of July 15, 1982.

Zone 4 schematic showing track layout between Pacific Jct. (A-5) and Techny (A-20), bearing date of March 1, 1982, and revision date of 4-2-82.

Zone 5 schematic showing track layout between Western Ave. (A-2) and Pacific Jct. (A-5), bearing date of February 24, 1982, and revision date of July 15, 1982.

Zone 6 & 7 schematic showing track layout between Union Station and Western Ave. (A-2), bearing date of 2/24/82 and revision date of 7/15/82.

Zone 8 schematic showing track layout between Elgin and Almora, bearing date of March 1, 1982, and revision date of July 15, 1982.

Zone 9 schematic showing track layout between Spaulding and Elgin, bearing date of March 1, 1982, and revision date of July 15, 1982.

Zone 10 schematic showing track layout between Bensenville (B-17) and Spaulding, bearing date of March 1, 1982, and revision date of July 15, 1982.

Zone 11 schematic showing track layout between Franklin Park (B-12) and Bensenville (B-17), bearing date of 2/24/82 and revision date of 7/15/82.

Zone 12 schematic showing track layout between Pacific Jct. (Tower A-5) and Franklin Park (Tower B-12), IL., bearing date of February 22, 1982, revision date of April 2, 1982, and revision date of July 15, 1982.

Exhibit B: A two-page Exhibit pertaining to the allocation of vacation, holiday, and administrative overhead expense.

Exhibit C: A one-page Exhibit entitled "JOINT FACILITY AGREEMENTS."

Very truly yours,

PDG/jr

FEBRUARY 22, 1980
REV. APRIL 2, 1982
REV. JULY 15, 1982

METHODOLOGY FOR ALLOCATION OF VACATION AND HOLIDAY EXPENSES

Expenses to be Allocated (A):

Vacation and holiday expenses properly distributed to operating expense accounts as prescribed by the Interstate Commerce Commission's Uniform System of Accounts in 49 CFR part 1201.

Expenses specifically not allocable:

Labor expenses of officers on the exempt payroll, separation allowance payments and productivity fund payments.

Labor Base to Which Vacation & Holiday Expenses are to be Applied (B):

Direct Labor, exclusive of vacation and holiday payments and other payments mentioned above; paid to all employees.

Procedure for Allocation:

Divide the expenses to be allocated (A) by the labor base to which vacation and holiday expenses apply (B). Multiply the resulting ratio by (1) the applicable labor and fringe benefits properly charged or allocated to each zone on the joint line for commuter service and (2) labor and fringe benefit expenses charged for dispatching on the joint line.

Example Allocation (Unaudited):

Vacation and holiday expenses = $14,891,180

Labor base = $154,624,225

Vacation and holiday expense ratio = $14,891,180 ÷ $154,624,225 = 9.631%

Labor and fringe benefit expenses allocated to zone of commuter line = $10,500

Vacation and holiday expenses allocated to zone = $10,500 x 9.631% = $1,011.26

Allocation Statistic Update Procedures:

Update annually in January utilizing data from previous calendar year.

EXHIBIT B
p. 1 of 2

METHODOLOGY FOR ALLOCATION OF ADMINISTRATIVE OVERHEAD EXPENSES

Labor Expenses to be Allocated (A):

Expenses for Superintendence and General Administration properly charged to operating expense accounts as prescribed by the Interstate Commerce Commission's Uniform System of Accounts in 49 CFR part 1201.

Expenses specifically not allocable:

Expenses properly chargeable to the following functional areas or accounts are specifically not allocable (B):

> Marketing, Car Management, Freight Claim Prevention, Customer Services, Freight Adjustment, Regional Accounting, Revenue/Interline Accounting, and operating expense accounts properly chargeable as shop and store expense.

Labor Base to Which Administrative Overhead Expenses are to be Applied (C):

Labor and vacation and holiday expenses properly charged to operating expense accounts as prescribed in 49 CRR part 1201 and excluding expenses reported in sections A and B.

Procedure for Allocation:

Divide the expenses to be allocated (A) by the labor base to which administative overhead expenses apply (C). Multiply the resulting ratio by (1) the applicable labor, vacation and holiday expenses, fringe benefits and miscellaneous expenses properly charged or allocated to each zone on the joint line for commuter service and (2) labor, vacation and holiday expenses, fringe benefits and miscellaneous expenses charged for dispatching on the joint line.

Example Allocation (Unaudited):

Administrative overhead expenses = $2,086,187

Labor base = $8,711,933

Administrative overhead expense ratio = 23.946%

Labor, vacation and holiday expenses, fringe benefits and miscellaneous expenses allocated to zone of commuter line = $11,511

Administrative overhead expenses allocated to zone = $2,756.42

Allocation Statistic Update Procedures:

Update monthly based on actual expenses.

REGIONAL TRANSPORTATION AUTHORITY, an Illinois municipal corporation,	)	
Plaintiff,	)	
vs.	)	No. 85 C 5969
CMC REAL ESTATE CORPORATION; 1,132 ACRES OF LAND, MORE OR LESS, comprising a certain railroad right-of way between Canal Street in Chicago Illinois and Rondout, Illinois, between Rondout, Illinois and Fox Lake, Illinois, and between Pacific Junction (tower A-5) and Almora, Illinois; certain personal property related to the operation of commuter rail services over said right-of-way; and certain UNKNOWN OWNERS,	)	Honorable Prentice H. Marshall
Defendants.	)	

S T I P U L A T I O N

The undersigned parties hereto, CMC Real Estate Corporation ("CMC"), the Regional Transportation Authority ("RTA"), and the Commuter Rail Division of the Regional Transportation Authority ("METRA"), enter into this Stipulation ("Stipulation") after being fully advised by their respective

counsels, for the purpose of defining the property and property rights of CMC to be taken pursuant to the above-captioned proceedings ("Condemnation Proceedings") and the property and property rights not to be acquired and to which the taking is subject, agreeing on an award of just compensation for the taking and the manner of its payment, and providing for other terms, conditions, and rights related to the foregoing, all as set forth herein and in the Schedules and Exhibits attached hereto.

SECTION 1. PROPERTY TO BE ACQUIRED

Subject to the exceptions set forth in Section 2 hereof and in reliance on the representations, covenants, and warranties set forth herein, on the Effective Date (as hereinafter defined) the parties hereto agree as follows:

1.1 Real and Personal Property. RTA shall acquire pursuant to the Condemnation Proceedings, and shall simultaneously deed, convey, assign, and transfer to METRA, all of the right, title, and interest of CMC in:

(a) all fixtures, land, and realty, all rights of way, easements, and the like pertaining or relating thereto as described in Exhibit 1-A attached hereto;

(b) all structures, fixtures, and improvements and appurtenances thereto (i) located within the areas outlined on the maps attached hereto as Exhibit 1-B ("Maps") from the west side of Canal Street, Chicago, Illinois (Mile Post 0.57) to Rondout, Illinois (Mile Post 32.52); from Rondout,

Illinois (Mile Post 32.52) to Fox Lake, Illinois (Mile Post 49.79); and from Tower A-5 (Mile Post 5.26) to Almora, Illinois (Mile Post 40.26) commonly known as the Milwaukee Road North and West Commuter Lines (collectively "Commuter Rail Lines"), including without limitation retaining walls, roadbeds, main and connecting tracks, rails, ties, ballast, switches, turnouts, wyes, crossovers, tunnels, grade crossings, sidings, depots, yards, storage and parking areas, culverts, fills, cuts, right of way fences, embankments, bridges, sheds, buildings, structures, communication and signal facilities and equipment, interlocking towers, commuter stations and platforms or (ii) located adjacent to the areas outlined on the Maps if such property is either primarily held for use or primarily used in connection with the management, operation, and maintenance of the commuter rail operations over the Commuter Rail Lines ("Commuter Rail Service") or other rail operations on the Commuter Rail Lines (but specifically excluding parking lots or industry lead tracks not located within the areas outlined on the Maps); and

(c) all machinery, equipment, tools, signal relays, cables and equipment, supplies, telephone cables, circuits, and equipment, relays or parts of relays held as replacement equipment, all valuation maps and records, all reproducible drawings, tracings, microfilm and the like, all books and

records, and any other personal property primarily used or held for use, in any manner whatsoever, in connection with the Commuter Rail Service or the Commuter Rail Lines.

1.2 Assumed Contracts. Subject to the prorations set forth in Section 4.5 hereof, METRA shall acquire pursuant to the Condemnation Proceedings all of CMC's right, title, interest, and shall assume all of CMC's obligations in, to, and under, the Assumed Contracts (as hereinafter defined). Notwithstanding the foregoing,

(a) CMC hereby retains the benefit of any and all rights of indemnification from third parties under the Assumed Contracts with respect to liabilities arising out of events or occurrences occurring prior to the Effective Date; provided, however, that to the extent METRA or RTA is held liable for any such event or occurrence as a consequence of its ownership of the Acquired Property or its assumption of the Assumed Contracts, the foregoing retention is hereby limited so as to provide that the benefits of such rights of indemnification shall first accrue to METRA and/or RTA, as the case may be, to the extent of such liability, unless CMC has hereunder indemnified METRA and/or RTA, as the case may be, against such liability; and

(b) to the extent any Assumed Contract pertains to real or personal property not comprising the Acquired Property (the "Non-Acquired Property"), CMC hereby retains those rights, benefits and obligations under such Assumed Contract which arise directly out of the Non-Acquired Property.

1.3 Other Terms.

(a) The real property, personal property, interests, and other assets described in Sections 1.1 and 1.2 above (but excluding the Exceptions and Reservations as set forth in Section 2 below), shall be collectively referred to as the "Acquired Property".

(b) In the event of any conflict between the descriptions of the land comprising the Acquired Property set forth on Exhibits 1-A and 1-B, the description of the land established by the black outlines on Exhibit 1-B shall control.

(c) Any fixture, improvements, or structures comprising the Acquired Property lying on land adjacent to the areas outlined on the Maps of which METRA does not take possession of, exert control over, or utilize within any two (2) year period following the Effective Date may, upon sixty (60) days written notice to Metra, at CMC's option be deemed abandoned, and in such event, CMC may remove, demolish, or otherwise dispose of such property; provided, however, that Metra may,

within the sixty (60) day period following such notice, take possession of (and shall demonstrate a bona fide need for) or remove or dispose of such property.

SECTION 2. EXCEPTIONS AND RESERVATIONS

The Acquired Property shall not include the following property, rights, and interests:

2.1 Excluded Assets. All personal property set forth on Schedule 2.1 attached hereto.

2.2 Excluded Air Rights. The volume of air space as set forth on Schedule 2.2 attached hereto.

2.3 Excluded Fiber Optics Revenues. The revenues from fiber optics contracts retained by CMC as set forth in the Fiber Optics Agreement attached hereto as Exhibit 4.3(a).

2.4 Easements.

(a) CMC Easements. The easements or fees ("CMC Easements") as set forth on Exhibits 2.4(a)(1) through 2.4(a)(25) hereto, but subject to the terms and conditions contained therein. The terms and conditions of the CMC Easements are subject to requests for variations therein made by CMC; provided, however, such variations must be in form and substance acceptable to METRA and such acceptance by Metra shall not be unreasonably withheld or withheld at all if in the same form and substance customarily used for similar such easements by railroads which conduct commuter passenger service. CMC may assign, transfer, lease, license,

or grant an easement or subeasement ("Transfer") in any and all CMC Easements to any third party or parties ("Transferees") with or without consideration subject to METRA's approval, such approval not to be withheld with respect to the transferee's set forth on Schedule 2.4(a)(II). In the event of a Transfer of any CMC Easement, CMC shall be released from any liabilities or obligations thereunder accruing after the Transfer to the extent that the Transferee assumes such liabilities or obligations. CMC shall keep and retain any and all monies that it receives or has received in connection with the Transfer of any and all CMC Easements, and METRA and RTA hereby waive all claims to such monies. If, with METRA's written approval, a CMC Easement is transferred after the date hereof and prior to the Effective Date, such CMC Easement shall be deemed an Assumed Contract as if described on Schedule 2.6 hereto.

(b) Galewood Easements. Four (4) easements for grade crossings at the Galewood Yard ("Galewood Easements") as set forth in Exhibit 2.4(b) attached hereto, but subject to the terms and conditions contained therein. The terms and conditions of the Galewood Easements are subject to requests for variations therein made by CMC; provided, however, such variations must be in form and substance acceptable to METRA and such acceptance by Metra shall not be unreasonably

withheld or withheld at all if in the same form and substance customarily used for similar such easements by railroads which conduct commuter passenger service.

(c) Certain Terms and Conditions of Galewood Easements. All Galewood Easements are subject to the following terms and conditions: (i) cost of construction, including without limitation grade crossings, signal systems, and crossing devices or cost of maintenance of any Galewood Easement is at the sole cost and expense of CMC or any successor or partial successor to CMC's interest, but such construction and maintenance shall be performed by METRA or persons employed by it or acting on its behalf as requested by CMC or its successor, or as Metra may deem appropriate; (ii) any construction, development, or alteration pertaining to any Galewood Easement, or any portion thereof is subject to METRA's prior approval, such approval not to be unreasonably withheld and; (iii) any use, assignment, transfer, lease, license, grant of any easement or subeasement, construction, development, or alteration, pertaining to any Galewood Easement, or any portion thereof by CMC or any successor or partial successor to CMC's interest may not interfere with the safety or efficient operation of any rail service over the Commuter Rail Lines.

2.5 CRC's Interest. All right, title, and interest of Consolidated Rail Corporation ("CRC") as an owner of any undivided interest in any of the Acquired Property.

2.6 Assumed Contracts. All right, title, and interest of all parties (including without limitation any parties claiming by or through such other parties) other than CMC in, to, and under the contracts, contract rights, leases, permits, and licenses ("Assumed Contracts") set forth on Schedule 2.6 attached hereto.

2.7 Certain Excluded Real Estate. Subject to the transfers effected by Section 1.1(b)(ii) hereof, CMC retains the real property and improvements thereon described in Exhibits 2.7(a) and 2.7(b) hereto.

SECTION 3. CONSIDERATION

3.1 Cash Consideration. The parties hereto agree that just compensation for the Acquired Property shall be SIXTY-SEVEN MILLION NINE HUNDRED THOUSAND DOLLARS ($67,900,000).

3.2 4.04 Obligations.

(a) The consideration shall be paid by RTA to CMC by the Notes, issued pursuant to Illinois Revised Statutes Chapter 111 2/3, paragraph 704.04, pursuant to the General Ordinance adopted August 5, 1985, as amended July 23, 1986 and November 20, 1986, and the Series Ordinance adopted August 6, 1987 (collectively, the Note, the General Ordinance and the Series Ordinance are referred to as the "4.04

Obligations"), all as set forth in Exhibit 3.2 attached hereto and subject to the terms and conditions contained therein.

(b) The 4.04 Obligations shall not be assigned, transferred or otherwise disposed of except (i) pursuant to a sale or pledge of all or substantially all of CMC's assets, (ii) to an entity resulting from a merger or consolidation with CMC, (iii) to a successor in interest to CMC by operation of law, or (iv) to CMC's parent or an entity in which CMC or its parent holds a fifty percent (50%) or greater controlling interest; provided, however, that no such transfer shall be undertaken for the purpose, in whole or in part, of obtaining a premium on the principal balance of the 4.04 Obligations. Any transaction undertaken in violation of this Section 3.2(b) shall be without force or effect. In no case shall a transfer of the 4.04 Obligations be made in violation of the Securities Act of 1933 or the Securities Exchange Act of 1934, as amended, or the rules and regulations promulgated thereunder.

3.3 Assumption of Liabilities. METRA shall undertake, assume, pay, perform, and discharge (and shall indemnify and defend CMC against and hold CMC harmless from) all debts, liabilities, and commitments, absolute or contingent (other than as attributable to the intentional or negligent acts or omissions on or after the Effective Date of CMC or a CMC Affiliate (as

hereinafter defined)) accruing or arising on or after the Effective Date out of (i) the Assumed Contracts (but specifically excluding debts, liabilities or obligations arising out of rights or obligations pertaining to Non-Acquired Property), and/or (ii) the Acquired Property.

SECTION 4. FURTHER AGREEMENTS

4.1 Termination of Agreements. CMC and RTA or METRA shall terminate as of the Effective Date those contracts, agreements, and understandings ("Terminated Contracts") as set forth on Schedule 4.1 attached hereto. The following terms and conditions shall apply to the termination of all Terminated Contracts:

(a) Any audit rights under the Terminated Contracts which have not been barred by orders of the reorganization court shall survive the termination.

(b) Any rights, liabilities, and obligations of CMC, RTA, or METRA under the Terminated Contracts (which have not been barred by orders of the reorganization court) accruing or arising from events or time periods occurring prior to the Effective Date shall survive the termination, whether or not asserted until after the Effective Date.

(c) Any payments, charges, credits, offsets, or portions thereof which relate to a period prior to the Effective Date shall be prorated according to the terms of such Terminated Contracts or if a Terminated Contract contains no such terms, the number of days in such period

(e) Except as set forth above, any monies received by CMC or METRA to which another party hereto is entitled pursuant to this Stipulation, and which are not subject to the proration, reproration, and settlement addressed in Section 4.5, shall be held in trust by the party receiving such monies on behalf of the party so entitled to such monies, and shall be paid over to the party so entitled to such monies within 15 days after the other party's receipt thereof; provided, however, that each party shall be permitted to co-mingle such funds with other of its general funds.

SECTION 10. INDEMNIFICATIONS

10.1 METRA's Indemnification. METRA hereby agrees to indemnify and hold CMC and its successors and assigns forever harmless from and against any and all liabilities, claims, demands, actions or causes of action, assessments, losses, costs, damages, or expenses, including reasonable attorneys' fees, sustained or incurred by CMC:

(a) resulting from or arising out of any misrepresentation or breach of warranty or nonfulfillment of any covenant on the part of METRA contained in this Stipulation or other instrument or document furnished by METRA pursuant hereto or in connection herewith; or

(b) resulting from or arising out of any liability or obligation under the Assumed Contracts (but specifically excluding liabilities or obligations arising out of non-Acquired Property) or relating to the Acquired Property accruing or arising from events occurring on and after the Effective Date, other than events attributable to the negligent or intentional acts or omissions after the Effective Date of CMC, any CMC Affiliate or any other party indemnified under this Section 10.1; or

(c) resulting from or relating to the absence of a request for ICC approval of, or the lack of ICC approval of, the condemnation of the Acquired Property.

10.2 RTA's Indemnification. RTA hereby agrees to indemnify and hold CMC and its successors and assigns forever harmless from and against any and all liabilities, claims, demands, actions or causes of action, assessments, losses, costs, damages or expenses, including reasonable attorneys' fees, sustained or incurred by CMC resulting from or arising out of any misrepresentation or breach of warranty or nonfulfillment of any covenant on the part of RTA contained in this Stipulation.

10.3 CMC's Indemnification. CMC hereby agrees to indemnify and hold RTA and METRA and their successors and assigns forever harmless from and against any and all liabilities, claims,

demands, actions or causes of action, assessments, losses, costs, damages or expenses, including reasonable attorneys' fees, sustained or incurred by RTA or METRA:

(a) resulting from or arising out of any misrepresentation or breach of warranty or nonfulfillment of any covenant on the part of CMC contained in this Stipulation or other instrument or document furnished by CMC pursuant hereto or in connection herewith;

(b) accruing or arising from events occurring prior to the Effective Date which result from or arise out of (i) any liability or obligation of CMC under the Assumed Contracts or (ii) the Acquired Property, except (x) as otherwise provided for in any lease or other agreement by and between CMC and RTA or METRA in effect prior to the execution of this Stipulation, (y) as caused by events prior to the Effective Date creating or permitting to exist a physical condition out of which such liability arises after the Effective Date or (z) as arising out of events attributable to the intentional or negligent acts or omissions of METRA, RTA or any other party indemnified under this Section 10.3;

(c) resulting from or arising out of the CMC Easements, except as to which CMC is relieved of liability under Section 2.4 hereof or the agreements contemplated thereby; or

(d) accruing or arising out of any claims pertaining to the sites identified on Schedule 5.6 and which (i) arise under federal, state or local environmental laws or regulations, or (ii) otherwise arise out of any environmental hazards present at such sites; notwithstanding anything to the contrary contained herein, CMC hereby retains liability, if any, for all such claims pertaining to the sites identified on Schedule 5.6.

(e) accruing or arising out of any liability directly or indirectly imposed upon METRA or RTA under Section 902(d) of the Illinois Income Tax Act and Section 5(j) of the Illinois Retailers Occupation Tax Act with respect to taxes owed by CMC or any CMC Affiliate to the State of Illinois or any subdivision thereof.

10.4 Procedure Re: Indemnification.

(a) If any party entitled to indemnification hereunder ("Indemnified Party") shall discover or have actual notice of facts giving rise or which may give rise to a claim for indemnification under this Section 10, or shall receive notice of any demand, assertion, claim, action, or proceeding, judicial or otherwise ("Action"), with respect to any matter for which indemnification may be claimed, the Indemnified Party shall, within twenty (20) days following service of process (or within such shorter time as may be necessary to give the party required by the terms hereof to

provide indemnification therefor ("Indemnifying Party") a reasonable opportunity to respond to such service of process) or within thirty (30) days after any other such notice, notify the Indemnifying Party in writing thereof together with a statement of such information respecting such matter as the Indemnified Party then has; it being understood and agreed that any failure or delay of the Indemnified Party to so notify the Indemnifying Party shall not relieve the Indemnifying Party from liability hereunder except and solely to the extent that such failure or delay shall have materially adversely affected the Indemnifying Party's ability to defend against, settle, or satisfy any such Action. Following such notice, the Indemnifying Party shall have the right, at its sole cost and expense, to contest or defend such Action through attorneys, accountants, and others of its own choosing (the choice of such attorneys, accountants, and others being subject to the approval of the Indemnified Party, such approval not to be unreasonably withheld) and in the event it elects to do so, it shall promptly notify the Indemnified Party of such intent to contest or defend such Action. If within twenty (20) days following such notice (or within such shorter time as may be necessary to give the Indemnifying Party a reasonable opportunity to respond to service of process or other judicial or administrative action) from the Indemnified

Party, the Indemnified Party has not received notice from the Indemnifying Party that such Action will be contested or defended by the Indemnifying Party, the Indemnified Party shall have the right to (i) authorize attorneys satisfactory to it to represent it in connection therewith and/or (ii) at any time settle, compromise, or pay such action, in either of which events the Indemnified Party shall be entitled to indemnification therefor subject to this Section 10. Following any notice of an indemnification claim not based on an Action, the Indemnifying Party shall promptly reimburse the Indemnified Party for all amounts owed to it by reason of such indemnification obligation.

(b) In the event and so long as the Indemnifying Party is actively contesting or defending against an Action as hereinabove provided, the Indemnified Party shall cooperate with the Indemnifying Party and its counsel in such contest or defense, shall join in making any appropriate counterclaim or cross-claim in connection with the Actions, and shall provide such access to the books and records of the Indemnified Party as shall be necessary in connection with such defense or contest, all at the sole cost and expense of the Indemnifying Party. Notwithstanding that an Indemnifying Party is actively conducting such defense or contest, any Action may be settled, compromised, or paid by the Indemnified Party without the consent of the Indemnifying

Party, provided however, that if such action is taken without the Indemnifying Party's consent, its indemnification obligations in respect of such claim shall thereby be nullified. No such Action may be settled, compromised, or paid by the Indemnifying Party without the Indemnified Party's consent, provided that if an offer of compromise, settlement, or payment shall be rejected by the Indemnified Party, the liability of the Indemnifying Party in respect of such Action shall in no event exceed the amount of such offer, less any legal fees and costs incurred by the Indemnifying Party after such offer.

(c) In the event any Action involves matters partly within or partly outside the scope of the indemnification by the Indemnifying Party hereunder, then the attorneys' fees, costs, and expenses of contesting or defending such Action shall be allocated between the Indemnified Party and the Indemnifying Party as they shall agree. If such an allocation cannot be agreed upon, the Indemnifying Party, at its sole expense, shall contest or defend those matters involved in the Action that fall within the scope of the indemnifications hereunder, and the Indemnified Party, at its sole expense, shall contest or defend those matters involved in the Action that fall outside the scope of the indemnifications hereunder.

parties hereto agree that the Court in the Condemnation proceedings retains jurisdiction for the determination and adjudication of any matters which may arise with respect to the Acquired Property, or any other matters relating to the terms, rights, and obligations set forth in this Stipulation or the Schedules and Exhibits and Schedules attached hereto.

IN WITNESS WHEREOF, each of the parties hereto has duly executed this Agreement as of this 3 day of September, 1987 and year first above written.

GAMEIRO R.V.S. EXHIBIT 6

THE 1993 SOO-METRA SUPPLEMENTAL AGREEMENT – SUPPLEMENTAL AGREEMENT BETWEEN COMMUTER RAIL DIVISION OF THE REGIONAL TRANSPORTATION AUTHORITY AND SOO LINE RAILROAD COMPANY (MAY 27, 1993) (EXCERPTS) (ALSO METRA COMMENTS EXH. A-3)

EXHIBIT A-3

Metra-CP 1993 Supplement

METRA COUNTERPART

SUPPLEMENTAL AGREEMENT

THIS SUPPLEMENTAL AGREEMENT, made and entered into this 27TH day of May, 1993, by and between the Commuter Rail Division of the Regional Transportation Authority, a division of a municipal corporation (hereafter referred to as "Metra"), and Soo Line Railroad Company, d/b/a CP Rail System (hereinafter referred to as "CP"). Collectively hereinafter Metra and CP shall be referred to as "the Parties".

PRELIMINARY STATEMENT

SLRCO (a predecessor in interest to CP) and Richard B. Ogilvie, Trustee of the Property of Chicago, Milwaukee, St. Paul and Pacific Railroad (a predecessor in interest to Metra) entered into a Trackage Agreement dated February 19, 1985 ("Trackage Agreement") whereby SLRCO acquired certain rights to use of the Joint Line as therein defined to provide service over the Joint Line; and

Metra desires to assume certain maintenance obligations on the Joint Line and the Parties wish to supplement the Trackage Agreement to establish the terms and conditions under which Metra will provide such maintenance; and

The Parties desire to incorporate in the Trackage Agreement certain provisions from the September 16, 1982 Trackage Agreement between Richard B. Ogilvie, Trustee of the Property of Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Debtor and the Regional Transportation Authority and the March 2, 1988, Letter Agreement between the Parties.

In consideration of the terms and conditions hereinafter contained, the Parties agree to amend and supplement the Trackage Agreement as follows:

1. All references to Richard B. Ogilvie, Trustee of the Property of Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Debtor ("Milwaukee") shall be deemed to be references to Metra, and all references to SLRCO, Inc. ("SLRCO") shall be deemed to be references to CP.

2. Amend Article 1 as follows:

(i) Delete Zone 7 from Section 1.2 a

(ii) Amend Article 1.2 b to add to the end of the sentence under Zone 11:

", including Tracks No. 3, 4, 5, and 6 as shown in Attachment 5 only for the purpose of maintaining signal circuits for the crossings shown in Attachment 5."

(iii) Amend Section 1.2 b to add the following: "Zone 13 (#3 main). Between Pacific Junction (Mile Post 5.85) and Tower B-12 (Mile Post 12.82).

3. Amend Article II as follows:

(i) Add the following to the end of the first sentence of Section 2.1:

", including the right to operate self-propelled maintenance of way equipment and inspection equipment. CP shall be required to provide qualified operators when

operating such equipment on the Joint Line."

(ii) Delete the parenthetical "(except Amtrak)" from Section 2.1 (b)

(iii) Add to the end of Section 2.1(b) the following:

"; provided however, that CP and its connecting freight carriers shall have the right to carry out normal interchange activities in the Chicago area (cars not destined to or from CP shall in no event be considered interchange cars), and cars and trains of connecting carriers shall be considered those of CP for purposes of compensation to Metra, billing, and liability under this Supplemental Agreement.

(iv) Add a new Section 2.3 (d) to read as follows:

(d) Prior to April 30, 1996, Amtrak shall be considered a third-party admitted by CP, and until such date CP shall be entitled to all payments due from Amtrak for use of the Joint Line. No additional or other compensation shall be due Metra for Amtrak's use of the Joint Line other than compensation paid by CP for its use of the Joint Line.

(v) Add a new Section 2.4 to read as follows:

2.4 At any time after April 30, 1996, Metra shall have the right to admit Amtrak to use of the Joint Line and shall be entitled to all compensation due from Amtrak for such use. Amtrak's use of the Joint Line as of and after such aforesaid date shall be considered for

all purposes hereunder as use by Metra trains.

(vi) Add a new Section 2.5 as follows:

2.5 Metra agrees that nothing contained in this Agreement shall in any way be construed or acted upon when such would impede the ability of CP to meet its obligations under the Rail Passenger Service Act of 1970, 45 U.S.C. Section 501, et seq., or under existing and future contracts executed pursuant thereto with the National Railroad Passenger Corporation ("Amtrak"). In such circumstances, the offending provision shall be considered by the Parties to be null and void.

4. Amend Article V as follows:

(i) Section 5.1 shall be amended to read as follows:

"The Parties shall apportion between them the amounts described in this Article V and all payments due under this Article V shall be subject to the special provisions of Attachment 1 attached hereto. Payment shall be made in accordance with Article VI."

(iii) Section 5.2(d) shall be amended to add the following sentence after the first sentence thereof:

"Light engine, backup and industry switching movements shall be excluded in determining Gross Ton Miles Proportion except light engine movements initiated by Metra in excess of 51 per weekday shall be included."

(iv) Amend Section 5.2(e) to add the following sentence

after the first sentence thereof:

"Light engine, backup and industry switching movements shall be excluded in determining the Train Count Proportion except light engine movements initiated by Metra in excess of fifty-one (51) per weekday shall be included."

(v) Amend Section 5.4 (d) by adding the following at the end of the section:

", subject to the provisions of Attachment 1 of this Supplemental Agreement."

(vi) The word "Parent" in Section 5.2(e) shall be amended to read "either Party."

5. Article VI shall be amended as follows:

(i) Section 6.2 shall be amended to add at the beginning of the paragraph the following:

"Except for the first calendar month following the Commencement Date,"

(ii) The last sentence of Section 6.3. is amended to read as follows:

Metra shall furnish to CP within 15 days after the end of each calendar month during the term of this Agreement, a statement showing for that month: (a) the train count for the trains operated by or on behalf of Metra over each zone of the Joint Line; and (b) the

gross ton miles generated by the trains, engines and cars and contents operated by or on behalf of Metra over each zone of the Joint Line. Light engine movements in excess of fifty-one (51) per weekday shall be reported by Metra for (a) and (b) above. The statement shall be subject to verification and correction by CP. If Metra fails to furnish the statement within the fifteen (15) day period, the Summary Expense bill for that month shall be based on the Gross Ton Proportion and Train Count Proportion during the preceding twelve (12) month period. That bill shall be adjusted upon receipt of the required statement from Metra.

(iii) All words after to in the third line of Section 6.6 shall be deleted and replaced with:

"Metra's account 140003100 at Amalgamated Trust and Savings Bank at Chicago or another account designated by Metra."

6. Article VII is deleted in its entirety and replaced with the following:

Section 7. JOINT LINE CAPITAL EXPENDITURES

Definitions: For purposes of this Agreement "Capital Projects" shall mean a project that deals specifically with capital related improvements (e.g.; rehabilitation, replacement, renewal, modernization, or expansion of facilities or equipment) as contained in Attachment 2, as amended from time to time.

7.1. Metra may effect Capital Projects on the Joint Line necessary or desirable for the economical and safe operation of

trains, locomotives or cars over the Joint Line, or which are required by applicable law or regulations. Attachment 2 contains the Five Year Capital Projects Plan through calendar year 1997.

7.2. The costs of Capital Projects shall be paid by:

(a) Metra, if required solely by the operations of Metra or of third parties admitted to the use of the Joint Line by Metra;

(b) CP, if required solely by the operations of CP or of third parties admitted to the use of the Joint Line by CP; provided that CP shall pay the entire cost of the renewal in kind of turnouts for industry spurs used solely for freight operations except those paid for by the industry;

(c) Metra and CP have agreed to an allocation of costs for the Capital Projects identified on Attachment 2. As future Capital Projects are included in amended Attachment 2's, allocation of costs shall be agreed upon; however, in no event shall CP be required to contribute more than fifty percent (50%) of the cost of any Capital Project for the joint benefit of the Parties.

The Parties hereto further agree that the budget figures contained in Attachment 2 are estimates only and will be adjusted to actual expenditures as the work is completed.

7.3. Metra shall effect Capital Projects requested by and at the sole expense of CP unless such projects would substantially interfere with Metra's operations over the Joint Line or the rights

of a third party admitted to the use of the Joint Line.

7.4. Capital Projects effected pursuant to this Section shall be considered personal property and title to such projects shall vest in CP and Metra in proportion to the costs paid by each Party; provided that upon expiration of the useful life (as determined by standard accounting rules) of the project, title to such materials shall automatically transfer to and vest in Metra, except for industry spurs used solely for freight operations.

7.5. The designated representatives from Metra's Engineering Department and CP's Engineering Department shall make an annual joint inspection of the Metra Joint Line for the purpose of determining the Capital Projects to be undertaken and developing the Five Year Capital Program.

A report reflecting Capital Projects for the Metra Joint Line shall be furnished by Metra to CP within thirty (30) days after the annual joint inspection referred to in this Section 7.5 but not later than May 1 of each year. This report shall show in reasonable detail new projects, progress on existing projects, an estimate of total project costs and estimated completion dates. Metra shall not charge to CP the costs of any Capital Project for which CP has not given consent and authorization for expenditure in writing. Such consent shall not be unreasonably withheld, conditioned, or denied.

7.6. In reaching agreement as to allocation, the Parties shall be guided by the following guidelines: CP has no need for the main line tracks to be maintained to higher than FRA Class 3 for freight trains and FRA Class 4 for intermodal trains, and any additional cost needed to meet the Metra Track Standards shall be borne solely by Metra.

7.7. Each Party shall bill the other Party and the Parties shall pay each other in accordance with Article VI Section 6.4.

7. Article VIII is amended to add the following:

8.3. Metra shall furnish all labor and material and shall maintain, repair and renew the Joint Line, as amended in this Supplemental Agreement, in accordance with the terms of this Agreement, provided that CP shall maintain with its own forces, and at its sole expense, the portion of industry spurs and the portion of side tracks and yards including, but not limited to, those at Spaulding, Rondout, Galewood, Morton Grove, Schaumberg, Itasca, and similar trackage at other locations used exclusively for freight operations all as shown in green on Attachment 3; provided that such trackage owned by Metra shall be maintained by CP to not less than FRA Class 1 standards. Notwithstanding any provision hereof Metra shall perform the entirety of any publicly funded grade crossing improvement project on the Joint Line as amended in this Supplemental Agreement.

8.4. The Parties shall maintain all track, interlocking and crossing signals on the Joint Line as provided in Attachment 4, except the maintenance of the signal system at five (5) grade crossings in Franklin Park shall be governed by Attachment 5.

8.5. Metra shall own and maintain the tower structures at Rondout, A-2, A-5, B-12 and B-17, regardless of which Party operates the towers.

8.6. Metra shall assume maintenance responsibility for the entirety of all bridges spanning or carrying any portion of the Joint Line, but only to the extent CP is currently performing such

maintenance or Metra's predecessors were obligated to perform such maintenance.

8.7. CP shall maintain communication facilities that are related to the control of freight train movements including those related to commuter operations when such facilities overlap with freight operations. CP shall also maintain the CDRC (Centralized Dispatcher Radio Control) communication network including the base stations located at Fox Lake, Rondout, Spaulding, and A-5 and the local radios at Towers B-12, B-17, and Rondout. CP shall maintain the intercom network connecting Towers B-12, B-17, and CP's Bensenville Yard Office and hump tower.

Metra shall maintain the local radio at Towers A-2, A-5, and Track 19 (i.e.; Union Station) including the talk back speakers at those locations. Metra shall also maintain the pole line whether located on Metra property, CP property or third party property.

MCI shall continue to maintain the fiber optics cable. In the event MCI no longer desires to retain fiber optics cable between Cragin and Milwaukee, CP shall have the right to assume MCI's rights to the extent CP uses them for railroad operations.

CP shall continue to own and maintain the T1 equipment, located at the CDRC radio base station building at Rondout and at Bensenville. This equipment is associated with the 24 channel fiber optics circuit between Bensenville and Rondout which is used (or in the process of being used) for the CDRC network, CTC, and telephone circuit.

8.8. CP shall have the right to store inventory at reasonable locations on Metra property for no charge by providing Metra thirty (30) days written notice of its intent to do so, but such storage

shall be at its sole risk and responsibility. The location at which the inventory is stored shall not interfere with Metra's operations. Both CP and Metra shall have such reasonable vehicular and pedestrian access to the other's property as shall be required for their respective maintenance obligations. Each Party shall have the right to locate equipment and other property necessary for its commuter or freight operation on the other Parties property at no charge to the other Party; provided that such equipment and property shall not interfere with the operation of the owning Party. Requests to locate any additional equipment or property on the other Party's property in the future shall be made not less than sixty (60) days in advance of the need to do so and approval of such request shall not be unreasonably withheld.

8.9. As used herein, "Metra Track Standards" means the Class 4 standard of the Federal Railroad Administration or any successor agency ("FRA") for all aspects of track maintenance except track geometry, and the FRA Class 5 standard for track geometry, so as to facilitate the operation of Metra's trains at 70 miles per hour. Metra shall maintain the Joint Line main line tracks to the Metra Track Standards. Exceptions: (i) main line Track No. 3 between Pacific Junction, Chicago, Tower B-12 need only be maintained to FRA Class 2; and (ii) the double main line tracks between Rondout (Mile Post 32.25) and the termination of Metra ownership (Mile Post 32.52) shall be maintained to FRA Class 4 standards for all aspects of track maintenance including geometry. Joint Line facilities other than main line tracks shall be maintained by Metra in accordance with reasonable standards jointly agreed by CP and Metra. Metra shall maintain minimum clearances as are in effect as of the effective date of this Agreement. Track standards necessary for freight operations on the No. 1 and No. 2 main lines (except for intermodal trains and Amtrak) shall be a maximum of FRA Class 3 standards. Track standards necessary for the operation of intermodal trains and Amtrak shall be

not more than FRA Class 4 and 70 miles per hour respectively (79 miles per hour between Mile Post 29 and Mile Post 32.25) in the zones used for such operation.

8.10. If the use of or traffic over the Joint Line is interrupted or delayed at any time, the Parties shall expeditiously restore the line for the passage of trains. Any Metra train, locomotive, or car derailed or damaged on the Joint Line shall be expeditiously picked up or removed by Metra or its emergency service contractor. Any CP train, engine or car derailed or damaged on the Joint Line shall be expeditiously picked up or removed by CP or its emergency service contractor; provided that in the event CP does not so act expeditiously, Metra shall have the right to provide such removal services. The expenses incurred in picking up and removing derailed or damaged trains and the cost of restoration of the Joint Line resulting from a derailment or accident shall be paid in accord with the provision of Section 11.7 hereof.

8.11. In the event Metra fails to meet its obligations under this Section, and if CP gives written notice specifying the failure and requesting that it be remedied, and if Metra fails to remedy such failure within 30 days of receipt of such written notice, then CP shall have the right to correct such failure. With respect to any such corrective work, CP shall also be entitled to deduct from any payments due Metra, Metra's proportionate share of CP's costs of correction, including CP overheads.

8.12. Metra shall (a) maintain all joint facility agreements, interlocking agreements and similar arrangements necessary to the operations controlled by these facilities, with the expense therefore allocated between the Parties as provided in this Agreement; (b) pay and discharge when due and payable all lawful governmental charges or levies imposed with respect to the Joint Line (except to the extent

and while the validity thereof is contested by appropriate proceedings); (c) provide for utility services necessary to operations over the Joint Line; and (d) take all other action necessary to permit the Joint Line to be used for the joint benefit of the Parties and their admittees.

8.13. The routine maintenance forces to be utilized by Metra are specified in Exhibit F of the Transition Agreement. These routine maintenance forces are to remain at or below the levels contained in Exhibit F for the purpose of allocating track and signal maintenance expenses to CP under the Section 5.4 and Attachment 1.

8.14. For costs hereunder, each Party shall bill the other Party and the Parties shall pay each other in accordance with Article V and Article VI, subject to the provisions of Attachment 1.

8.15. CP recognizes the priority of commuter service operations on the Joint Line on Monday through Friday, inclusive, with respect to trains which depart from their originating stations during the times and in the zones identified below and maintain timetable schedule (the "peak period trains"):

Big Timber Road to CUS -- eastbound

5:15 a.m. - 7:45 a.m.
4:30 p.m. - 6:30 p.m.

B-12 to CUS -- eastbound

6:05 a.m. - 8:35 a.m.
5:15 p.m. - 7:15 p.m.

CUS to B-12 & Big Timber Road -- westbound

5:15 a.m. - 8:30 a.m.
4:00 p.m. - 6:15 p.m.

Rondout to CUS -- southbound

6:00 a.m. - 7:50 a.m.
4:20 p.m. - 6:00 p.m.

CUS to A-20 -- northbound

6:25 a.m. - 8:45 a.m.
4:15 p.m. - 6:10 p.m.

A-20 to Rondout -- northbound

7:00 a.m. - 8:15 a.m.
4:30 p.m. - 6:20 p.m.

Fox Lake to Rondout -- southbound

5:00 a.m. - 8:30 a.m.

Rondout to Fox Lake -- northbound

4:30 p.m. - 6:45 p.m.

Except as required by an emergency, CP shall not interfere or permit any third party to interfere with peak period trains. CP shall not object to Metra's operations of peak period trains on the grounds that those operations unreasonably interfere with CP's or third parties' ability to provide efficient freight or intercity

passenger service. CP may make reasonable adjustments to the operations of traffic on the Joint Line which do not unreasonably disrupt or delay trains which are not peak period trains.

8.16. Except as provided in this Section 8.16, the operation of the commuter service on the Joint Line during times outside the peak periods shall be subject to the schedules effective April 25, 1993, for the west line and May 9, 1993 for the north line attached as Attachment 6. Metra may not change the schedule on Attachment 6 without CP's prior written consent, which may not be unreasonably withheld; providing that such change shall not materially interfere with freight operations. However, CP agrees that Metra may add trains to the Joint Line on the new service route between Chicago Union Station and Antioch during the off peak periods as scheduled below:

Eastbound:

Train	Depart	Time
106	B-12	10:38 a.m.
108	B-12	2:38 p.m.

Westbound:

Train	Depart	Time
103	CUS	11:40 a.m.
105	CUS	2:30 p.m.

Additionally, Metra may add, subject to consultation with CP regarding the schedule and CP's consent (whose consent shall not be unreasonably withheld providing that the trains do not materially

interfere with freight operations), ten (10) trains during the off-peak periods as follows: (i) one (1) train in each direction between Tower B-12, Franklin Park and Chicago Union Station (CUS); (ii) Two (2) trains in each direction between Elgin and CUS; (iii) two (2) trains in each direction between Fox Lake and CUS. At any time upon ten (10) days prior written notice, Metra may decrease the number of commuter service trains.

8.17. CP shall operate the interlocking towers, with the exception of Towers A-2 and A-5 which shall be operated by Metra, all under the direction of the CP dispatcher. Billing for the operator positions for Towers A-2 and A-5 shall be in accordance with Article V, Section 5.4 without regard to Attachment 1, subject, however, to the staffing levels contained in Exhibit F.

8. Article XI is amended to add a new Section 11.7 which shall read as follows:

Section 11.7 LIABILITY

Definition: Whenever the expression "proportionally by the Parties" is used in this Section, it means that expenses will be borne in proportion to the total gross ton miles handled by each Party in the zone in which the incident occurred in the month prior to the occurrence, or if it cannot be determined in which zone the incident occurred or if the incident occurred in more than one zone, the expenses will be borne in proportion to the total gross ton miles handled by each Party over the entire Joint Line in the month prior to the occurrence. Until April 30, 1996, the locomotives, trains, cars, property, passengers or employees of National Railroad Passenger Corporation (Amtrak) shall be considered CP for liability purposes in this Section 11.7. After such date, said locomotives, trains, cars, property,

passengers, or employees shall be considered Metra for purposes of liability under this Section 11.7. Wisconsin & Calumet Railroad's (WICT) locomotives, trains, cars, and property shall be considered as Metra.

(a) Both Parties shall undertake to comply with all applicable federal and state laws or regulations, and all applicable rules, regulations or orders promulgated by any municipality, board or commission. If any failure of either Party to comply with such laws, rules, regulations or orders in respect to the use of the Joint Line results in any fine, penalty, cost or charge being assessed against the other Party, the Party which failed to comply agrees to reimburse promptly and indemnify the other Party for such amount.

(b) The employees of either Party while operating, maintaining or directing operation along the Joint Line shall not be considered as joint employees but will remain the sole employees of either Party. However, when any sole employee of CP or Metra is engaged in maintaining, repairing, renewing, removing, or inspecting the Joint Line, or in dispatching, giving orders for or directing the movement of trains over the Joint Line, or performing other service involving the Joint Line for the common benefit of the Parties, and the death of, injury to, or loss of property of the sole employee arises out of such service for the common benefit of the Parties, then the liability shall be borne proportionally by the Parties, except for cases covered by Sections 11.7(c) and 11.7(h) below, which losses shall be divided between the Parties in accord with the provisions thereof.

(c) Liability for injury to or death of any persons or loss of or damage to any property, including the Joint Line

and turnouts therefrom, in any manner resulting from or in connection with the operation of locomotives, trains or cars of either Party, or in connection with the presence on the Joint Line of locomotives, trains, cars, property, passengers or employees of either Party, shall be borne and paid by the Parties as follows:

(i) When the same shall involve the train of only one of the Parties, or a defect in or failure of the Equipment of one of the Parties, liability will be borne by that Party. "Equipment" in this Subparagraph means rolling stock, locomotives and cabooses and includes cars of any ownership which are on the Joint Line in the account of one of the Parties, in which event such cars will be considered to be equipment of the Party in whose account they are unless the car has been repaired by the other Party after it arrived on the Joint Line and the liability is traceable to that repair, in which case that car will be considered to be in the account of the Party performing the repair.

(ii) When the same shall be due to the acts or omissions of any sole employee of a Party, and that employee is not performing service for the common benefit, liability shall be born by that Party, regardless of any other provision of this Agreement.

(iii) When the same shall involve the trains of both Parties, the liability shall be borne by each Party as to its own employees, passengers, property, or property in its custody, and as to third party property or persons (other than passengers) the

liability shall be borne proportionally by the Parties.

(iv) When the same shall be due to any acts or defects not provided for in this Agreement, liability shall be borne by each Party as to its own employees, passengers, property, or property in its custody, but as to third party property or persons (other than passengers) the liability shall be borne by the Party whose locomotive, train or car is involved in the accident causing the loss, damage, injury or death, and if the locomotives, trains or cars of both Parties were involved in causing such accident, then such liability shall be borne proportionally by the Parties.

(v) Third-party claims for loss or damage to property arising out of the killing or injuring of livestock or the setting of fires on or along the Joint Line, when caused by the locomotive, train or car of one of the Parties, shall be handled or settled by the Party whose locomotive, train or car caused such loss or damage, but if it cannot be determined whose locomotive, train or car caused such loss or damage, the claim will be handled or settled on behalf of both Parties in the first instance by Metra, and the loss will then be borne proportionally by the Parties.

(vi) Notwithstanding anything to the contrary herein, claims which are caused by or arise out of the sole negligence of CP train dispatchers or CP or Metra tower operators performing service under the control

of CP or Metra supervision shall be borne by the Party providing such supervision.

(d) Except when Section 11.7(b) is applicable, in the event no locomotive, train or car of either Party is involved, liability shall be borne by each Party as to its own employees, passengers, property, or property in its custody, and as to third party property or persons (other than passengers) the liability shall be borne proportionally by the Parties.

(e) Each Party agrees that it will pay for all loss, damage and expense, the risk of which it has herein assumed, the judgment of any court to the contrary notwithstanding, and will forever indemnify and save harmless the other Party, its successors and assigns, from such judgment.

(f) In the event that both Parties hereto shall be liable under this Agreement for any claim, demand, suit or cause of action, and the same shall be compromised and settled by voluntary payment of money or valuable consideration by one of the Parties, release from liability will be taken in the name of both Parties. Neither Party shall make any such compromise or settlement in excess of $5,000 without authority of the other Party having liability, but any settlement made by one Party in consideration of $5,000 or less shall be a settlement releasing all liability of both Parties and shall be binding upon the other Party having liability.

(g) In case a lawsuit or lawsuits shall be commenced against either Party hereto for or on account of any damage or injury for which the other Party would be solely or jointly liable under this Agreement, the Party thus sued shall give

the other Party timely written notice of the pendency of such suit, and thereupon the Party so notified shall assume or join in the defense thereof, and if the Party so notified is liable therefor under this Agreement, such Party shall save harmless the Party so sued from all loss, cost and expense so determined by this Agreement. Neither Party shall be concluded by any judgment against the other Party unless it shall have been so notified and shall have had reasonable opportunity to assume or join in the defense of the action. When so notified, and said opportunity to join in the defense of the action afforded, the Party so notified shall to the extent of its liability under this Agreement be concluded by such judgment.

(h) It is understood and agreed that a number of vehicular crossings of the Joint Line presently exist, or may be constructed. The Parties agree to accept all crossings in their design and configuration as they may be during the term of this Agreement and further agree that rules of liability in this Section 11.7 shall apply to crossing accidents, and such rules shall not be subject to any offset or defense based on such design or configuration.

Supplemental Agreement
Metra/CP Rail

IN WITNESS WHEREOF, the Parties hereto have caused this Agreement to be executed by their respective officers thereunto duly authorized.

THE 2003 SOO-METRA AMENDMENT AGREEMENT – AMENDMENT AGREEMENT BETWEEN COMMUTER RAIL DIVISION OF THE REGIONAL TRANSPORTATION AUTHORITY AND SOO LINE RAILROAD COMPANY (APR. 1, 2003) (EXCERPTS) (ALSO METRA COMMENTS EXH. A-4)

EXHIBIT A-4

Metra-CP 2003 Amendment Agreement

AMENDMENT AGREEMENT

THIS AMENDMENT AGREEMENT is made and entered into this 15 day of April, 2003, by and between the Commuter Rail Division of the Regional Transportation Authority, a division of a municipal corporation (hereafter referred to as "Metra") and the Soo Line Railroad Company, a Minnesota corporation d/b/a Canadian Pacific Railway (hereafter referred to as either "CP" or "CPR"), sometimes collectively referred to below as the "Parties" and sometimes individually referred to below as a "Party."

PRELIMINARY STATEMENT

SLRCO, Inc. (a predecessor in interest to CPR), and Richard B. Ogilvie, Trustee of the Property of Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Debtor (a predecessor in interest to Metra) entered into a Trackage Agreement, dated February 19, 1985 (as amended by agreements executed May 27, 1993, May 11, 1995, June 3, 1996, September 28, 2001, and June 17, 2002) ("Trackage Agreement") whereby CPR acquired certain rights to use the Joint Line as therein defined and to admit a third party to the Joint Line; and

CPR and Metra amended certain aspects of the Trackage Agreement through a Supplemental Agreement, dated May 27, 1993, ("Supplemental Agreement"). In an Agreement, dated April 7, 1997, CPR and Metra acknowledged that CPR was admitting, but not assigning rights to, I&M Rail Link, LLC ("IMRL") pursuant to CPR's rights under the Trackage Agreement; and

In view of the sale of IMRL's assets to the Iowa, Chicago & Eastern Railroad Corporation ("IC&E"), and the discontinuance of IMRL's rail operations, CPR has decided that it will admit IC&E to Zones 8 through 13 of the Joint Line pursuant to its rights under the Trackage Agreement, and Metra has concluded, subject to the following undertakings and subject to those contained in a separate Trackage Rights Agreement executed simultaneously with this Amendment Agreement ("IC&E Trackage Rights Agreement"), that the traffic projected by IC&E for the period immediately following its admission to Zones 8 through 13 of the Joint Line does not at present materially interfere with the current level of traffic on the Joint Line.

The Parties agree that fixing the Base Cap amount is intended to simplify the administration of the existing Base Cap mechanism, and is consistent with the economic arrangement and the protections afforded to CPR by the Base Cap that the Parties agreed to in the 1993 Supplemental Agreement.

The Parties agree it is mutually beneficial to eliminate the monthly compilation of gross ton miles and train counts for the purpose of the equitable allocation of expenses related to the Joint Line as defined in the February 19, 1985 Trackage Agreement as amended.

NOW THEREFORE, in consideration of the terms and conditions contained in this Amendment Agreement and in the IC&E Trackage Rights Agreement, the parties agree to amend and supplement the Trackage Agreement as follows:

1. CPR has determined that it will exercise its right under Section 2.3 of the Trackage Agreement to admit IC&E to Zones 8 through 13 of the Joint Line as a replacement for CPR's former admittee, IMRL, effective April 1, 2003. The operations and traffic of IC&E, or any successor to IC&E, shall be governed by the IC&E Trackage Rights Agreement, which

designates Metra as a third party beneficiary with the authority to enforce the terms of the Trackage Rights Agreement in accordance with Section 8.4 thereof. Based upon statements made by IC&E in filings it has made at the Surface Transportation Board in Finance Docket No. 34177, Metra has determined that current operations of the IC&E will not materially interfere with traffic currently on the Joint Line, including Metra's traffic. The Parties agree that IC&E is being admitted as a third party admittee and not as a result of an assignment of a portion of CPR's trackage rights under the Trackage Agreement.

2. The Parties agree that the terms "Existing Traffic," "Increased Traffic," "Coal Trains," "Force Majeure Trains," and "Excess Trains" as used in this Agreement shall have the same meanings as set forth in Section 1.6 of the IC&E Trackage Rights Agreement.

3. The terms of the Trackage Agreement, as amended, will continue to prevail with respect to maintenance, operation and compensation, and the current formula and procedures for capital improvements will stay in effect without modification so long as IC&E's traffic does not include Increased Traffic, Excess Trains, or Coal Trains over any zone(s) to which it has been admitted on the Joint Line. CPR will direct IC&E to report to Metra any increases relative to Increased Traffic, Coal Trains and Excess Trains.

4. In the event IC&E seeks to operate Increased Traffic, Excess Trains, or Coal Trains over the Joint Line, the Trackage Agreement as amended will continue in effect but certain provisions will be modified as expressly provided by this Amendment Agreement. In such an event, CPR will enforce the procedures specified in Sections 2.13 and 2.14 of the IC&E Trackage Rights Agreement, including the refusal to admit Coal Trains, Increased Traffic, or Excess Trains, except as permitted by those Sections, and will assist and cooperate with Metra in Metra's efforts to enforce those provisions. The Parties shall promptly notify each other of any

failure of IC&E to abide by the terms of the IC&E Trackage Rights Agreement entered into between IC&E and CPR. Should CPR's refusal to dispatch or admit IC&E's Increased Traffic, Excess Trains, or Coal Trains pursuant to the terms of that Agreement result in the issuance of an order of the Surface Transportation Board ("STB"), its successor, or a court of law with competent jurisdiction requiring that CPR dispatch or admit said traffic onto the line, Metra agrees that any CPR compliance with such order shall not constitute breach of this Agreement or the Trackage Agreement and that Metra shall have no cause of action arising from CPR's compliance with such order.

5. Section 5.4(a) shall be deleted and replaced with the following language: "Maintenance of way and structures expenses incurred for each zone of the Joint Line not included in expenses governed by the CPR Base Cap or the Fixed Cap shall be allocated based upon the average Gross Ton Mile Proportion for the applicable zone(s) between the Parties for the preceding Fiscal Year. Five years from June 1, 2004, and at five (5) year intervals thereafter, either Party may reopen and reevaluate this allocation at their expense by notice given to the other at least 30 days prior to the end of each five (5) year period and the Parties shall determine the need to agree to a new allocation."

Section 5.4(b) shall be deleted and replaced with the following language: "Transportation, signal and communication systems expenses and maintenance of non-Milwaukee owned equipment (used in the operation or maintenance of the Joint Line) incurred for each zone of the Joint Line not included in expenses governed by the CPR Base Cap or the Fixed Cap shall be allocated based upon the average Train Count Proportion for the applicable zone(s) between the Parties for the preceding Fiscal Year. Five years from June 1, 2004, and at five (5) year intervals thereafter, either Party may reopen and reevaluate this allocation at their

expense by notice given to the other at least 30 days prior to the end of each five (5) year period and the Parties shall determine the need to agree to a new allocation."

Section 5.4(c) shall be deleted and replaced with the following language: "Expenses for train dispatchers incurred in operating the Joint Line shall be allocated based upon the average Train Count Proportion for all zones between the Parties for the preceding Fiscal Year. Five years from June 1, 2004, and at five (5) year intervals thereafter, either Party may reopen and reevaluate this allocation at their expense by notice given to the other at least 30 days prior to the end of each five (5) year period and the Parties shall determine the need to agree to a new allocation."

Section 5.4(e) shall be deleted and replaced with the following language: "Monthly expenses incurred for joint facilities which are part of the Joint Line and not solely owned by the Milwaukee, identified in Exhibit C, and not included in expenses governed by the CPR Base Cap or the Fixed Cap shall be allocated based upon the average Train Count Proportion for the applicable zone(s) between the Parties for the preceding Fiscal Year. Five years from June 1, 2004, and at five (5) year intervals thereafter, either Party may reopen and reevaluate this allocation at their expense by notice given to the other at least 30 days prior to the end of each five (5) year period and the Parties shall determine the need to agree to a new allocation."

6. CPR and Metra agree that the computation for the Base Cap for the year beginning June 1, 2003 under Attachment 1 to the Supplemental Agreement shall include, in addition to other CPR traffic, all IMRL and IC&E traffic, as set forth in (i), (ii), and (iii) below, as CPR trains, and shall be based upon applicable IMRL and IC&E operating statistics for the period June 1, 2002 to May 31, 2003 that will be the sum of the following calculations:

(i) for the period June 1 through July 29, 2002, the applicable operating statistics shall be the actual level of IMRL traffic over the Metra Trackage;

(ii) for the period July 30, 2002 through August 29, 2002, the applicable operating statistics shall be the average applicable operating statistics for the level of IC&E traffic over the Metra Trackage by IC&E trains from the time period August 30, 2002 through the date of this Agreement, that being the time period during which IC&E trains moved over the Metra Trackage by way of that certain Detour Agreement with Metra; and

(iii) for the period from August 30, 2002, through May 31, 2003, the applicable operating statistics shall be the actual applicable operating statistics of IC&E trains over the Metra Trackage, whether operated under that certain Detour Agreement or under the IC&E Trackage Rights Agreement.

As of June 1, 2004, CPR's Base Cap as defined in Section (A)(1)(a) of Attachment 1 of the May 27, 1993 Supplemental Agreement shall be referred to as the "Fixed Cap," and shall be established as the greater of $1,765,137.78 adjusted by the annual average of the CPI-U-Chicago Index (as calculated based on the sum of the monthly Index numbers for the preceding 12 months, divided by 12 ("Index"), for the period beginning June 1, 2003 and ending May 31, 2004), or the annual Base Cap paid by CPR to Metra as set forth above for the period of June 1, 2003 through May 31, 2004, adjusted by the Index for the period beginning June 1, 2003 and ending May 31, 2004. The Fixed Cap shall be adjusted by Metra, on or before August 1 of each fiscal year, being the period of June 1st through May 31st in any one year ("Fiscal Year"), in accordance with the Index ("Fiscal Year Adjustment"). In the event that the CPI-U-Chicago Index ceases to be published, or the methodology by which it is derived is materially altered, the parties shall determine the most appropriate substitute index that most closely matches the

structure of the canceled/altered CPI-U-Chicago Index. Such replacement index will be used for the remainder of the Agreement, unless and until it ceases to be published, or is materially altered, and is replaced in the manner stated above.

CPR shall pay the annual Fixed Cap in twelve (12) equal installments in the following manner: On or before August 1st of each Fiscal Year, Metra shall issue twelve (12) monthly invoices to CPR, and CPR shall pay the amounts due under said invoices in U.S. currency within thirty-five (35) days after the first day of each of the following months, including the month of August, in the Fiscal Year. Fixed Cap Installments paid for the months of June and July shall be the same as the monthly amount paid in the prior Fiscal Year and shall be billed or credited retroactively based on the amount of the Fiscal Year Adjustment and, if billed, shall be paid in U.S. currency within thirty (30) days of CPR's receipt of an invoice for the retroactive amount due. Other than annual CPI-U adjustments, the Fixed Cap shall remain fixed for five (5) year periods starting June 1, 2004, and may be reevaluated at the written request of either party by notice given to the other at least 30 days prior to the end of each five (5) year period. In the absence of such request, the Fixed Cap shall continue for the next five (5) year term. The terms upon which either party may request a reevaluation of the Fixed Cap are as follows:

(1) Changes in FRA Standards or government mandates which cause an increase or decrease in the maintenance expense incurred by Metra.

(2) Increases in the allowable gross weight per car that is currently authorized at 286,000 pounds.

(3) Increases or decreases in expenses experienced by Metra as a result of improvements installed to the Joint Line on behalf of CPR or to accommodate the Existing Traffic of CPR's third party admittee, provided that the additional

expenses are offset by any reduction in expenses due to the removal of replaced structures.

(4) Material changes to maintenance procedures of Metra or traffic levels of Metra or CPR (including Existing Traffic of CPR's third party admittee, but excluding Increased Traffic, Coal Trains or Excess Trains of CPR's third party admittee).

In the event a Party requests a reevaluation of the Fixed Cap in accordance with the terms of this Agreement, CPR agree to continue to pay the Fixed Cap in accordance with the current formula for the Fixed Cap as adjusted by the Index. At such time as the Parties agree to the amount of the reevaluated Fixed Cap, the new Fixed Cap amount shall be applied retroactively to the beginning of the five (5) year term for which the reevaluation was requested.

7. Effective the first month during which Increased Traffic, Excess Trains, or Coal Trains are transported on the Joint Line, CP shall in addition direct IC&E to pay directly to Metra the GTM Excess Train Charge or the GTM Coal Train Charge in accordance with the terms of the IC&E Trackage Rights Agreement (representing IC&E's obligation for Increased Traffic, Excess Trains, and Coal Trains and for which IC&E must either pay directly or indirectly and reimburse CP). Under the IC&E Trackage Rights Agreement, IC&E has agreed to pay these charges directly to Metra if directed to do so by CPR. Said GTM Excess Train Charge or GTM Coal Train Charge, as applicable, shall be consistent with the charges set forth in Sections 3.1 and 3.2 of the IC&E Trackage Rights Agreement for any IC&E Increased Traffic, Excess Trains or Coal Trains that are transported over the Joint Line. The GTM Train Charge as defined and set forth in the IC&E Trackage Rights Agreement shall be adjusted effective July 1 of each year, beginning July 1, 2003, on the basis established in Appendix A hereto to compensate Metra for increases in the cost of labor, materials and other expenses plus applicable

additives. These charges represent the exclusive charges payable to Metra for all expenses associated with the operation of ICE Increased Traffic, Excess Trains, or Coal Trains other than capital expenditures.

8. To address additional capital expenditures that are necessary to accommodate IC&E's Increased Traffic, Excess Trains, and Coal Trains on the Joint Line, Section 7.2 of the Trackage Agreement, as amended by Section 6 of the Supplemental Agreement, is further amended by substituting the following sentences for the second sentence of subsection (c):

> As future Capital Projects are included in amended Attachments 2, allocation of costs shall be agreed upon, however, in no event shall CP be required to contribute more than fifty percent (50%) of the cost of any Capital Project for the joint benefit of the Parties, unless the Capital Project is in part necessitated by the introduction of Increased Traffic, Excess Trains, or Coal Trains. Where introduction of such Increased Traffic, Excess Trains, or Coal Trains causes the need for the Capital Project, the procedures set forth in Sections 2.14, 3.4, 3.6, 3.7, and 3.8 of the IC&E Trackage Rights Agreement shall be used to determine the allocation of such Capital Project costs among Metra, CPR and IC&E. CP, subject to Section 7.2(e), shall be solely responsible for that portion of the Capital Project, plus no more than 50% of the remaining portion of the Capital Project attributable to other CP and Metra traffic. CP's allocation for Capital Projects involving signals, dispatching and communications facilities shall be based upon the Train Count Proportion for the year prior to adoption of the plan for the Capital Project, plus no more than 50% of the remaining portion of the Capital Project attributable to other CP and Metra traffic, except that CP, subject to Section 7.2(e), shall be solely responsible for that portion of the Capital Project attributable to the increase in its Train Count as modified

by projections of future traffic growth for IC&E Increased Traffic and Coal Trains. It is agreed that to the degree that operation of Increased Traffic, Excess Trains, and Coal Trains diminishes the remaining useful life of an existing capital structure as established by Metra and approved by the Federal Transit Administration for commuter rail operations or requires an upgrading of capital structures to prevent annual maintenance expenses from exceeding the average level of annual expenses computed in constant dollars over the preceding ten years, CP shall be solely responsible for that portion of the Capital Project.

An example of the foregoing computations is set forth in Appendix B to this Agreement.

9. Section 7.2 of the Trackage Agreement is further modified by inserting the following new subsections:

(d) Subject to Section 7.2(e), CP, if required solely by the transportation of Increased Traffic, Excess Trains, or Coal Trains on the Joint Line; or if required solely because Increased Traffic, Excess Trains, or Coal Trains causes the remaining useful life of the existing and future rail facilities on the Joint Line to diminish below the "useful life" standards set by Metra and reported to the Federal Transit Administration.

(e) CP will not be responsible to Metra for payments for Capital Projects attributable to Increased Traffic, Excess Trains, or Coal Trains; *provided* that CP creates the Escrow Account described by Section 3.6 of the IC&E Trackage Rights Agreement, including arrangements for Metra to verify the sufficiency of funds deposited therein and to promptly receive payment upon submission of the

appropriate documentation, and cooperates with Metra to insure that the Escrow Account is administered as required by Section 3.6.

10. Section 8.15 to the Supplemental Agreement is amended by adding the following sentence at the end of the Section:

CP shall not admit or permit IC&E trains, including those transporting coal, to operate within Zones 8 through 13 during the periods when peak period trains are operating in those Zones.

11. CPR shall insure that all IC&E engineers and train crews are properly certified to operate on the Joint Line in compliance with the Trackage Agreement, as amended. CPR acknowledges that from time to time Metra will conduct spot inspections including a review of crew certification activities. IC&E trains, equipment and employees will be treated as CPR trains, equipment and employees with regard to liability.

12. CPR waives any claim or cause of action against Metra relating to or arising from any delay in the admission of IC&E to the Metra Trackage or in Metra's refusal to consent to an assignment of the CPR-IMRL Trackage Rights Agreement dated April 4, 1997, or for any delay in completion of capital improvements needed prior to admission of Coal Traffic.

13. Section 6.3 (ii) is amended to eliminate, commencing May 31, 2003, the requirement of both Parties to furnish statements of train counts and gross ton mileage per zone on a monthly basis. CPR shall furnish statements of train counts and gross ton mileage per zone to Metra on an annual basis. Notwithstanding the foregoing, in order for Metra to accurately invoice CPR and confirm that payments received from CP are in accordance with Section 4 of this Agreement, CPR agrees to obtain from IC&E and to forward to Metra gross ton mileage data

described in Section 2.15 of the IC&E Trackage Rights Agreement within 15 days of the close of the calendar month.

14. In Section 11.7, the definition "proportionally by the Parties" shall be modified by the substitution of the following sentences for the existing first sentence: "Whenever the expression 'proportionally by the parties' is used in this Section, it means that expenses will be borne in proportion to the total gross ton miles in the preceding year for the applicable zone in which the incident occurred, or if it cannot be determined in which zone the incident occurred or if the incident occurred in more than one zone, the expenses will be borne in proportion to the total gross ton miles handled by each party over the entire Joint line during the preceding year. Five years from June 1, 2004, and at five (5) year intervals thereafter, either Party may review and reevaluate this allocation at their expense by notice given to the other at least 30 days prior to the end of each five (5) year period and the Parties shall determine the need to agree to a new allocation."

15. Nothing in this Agreement shall be construed to give CPR's admittee the right to operate any commuter service over the Joint Line, or any portion thereof, or otherwise use the Joint Line, or any portion thereof, to provide any passenger service, unless and until CPR's admittee has first received Metra's prior written consent.

16. The Parties agree that a purchaser of all or substantially all of the assets of IC&E shall be permitted to enter into a new trackage rights agreement as provided in Section 8.3 of the IC&E Trackage Rights Agreement. Furthermore, in the event of a sale by IC&E of all or substantially all of its assets, Metra shall enter into a new amendment agreement with CPR containing the same terms and conditions as this Amendment Agreement recognizing said purchaser as CPR's admittee under the terms of the Metra Agreement.

17. The Parties agree that the Amendment Agreement between them dated April 7, 1997 is terminated and shall be of no further force and effect, and that the Chicago Trackage Rights Agreement between CPR and IMRL dated April 4, 1997 shall also be of no further force and effect.

18. CPR agrees that CPR shall not enter into any agreements to amend, revise, or otherwise alter the IC&E Trackage Rights Agreement in any manner that may affect or affects Metra's rights, remedies, or obligations thereunder without Metra's prior written consent, which consent shall not be unreasonably withheld or delayed.

19. In any case where the Parties, after attempting to negotiate with each other for a reasonable period of time, are unable to reach an agreement regarding any of the provisions of Sections 5 and 6 of this Agreement, then either Party may request mediation or binding arbitration to resolve the dispute in accordance with the procedure set forth below.

a. Such dispute shall be submitted to a single arbitrator; said arbitrator to be chosen in accordance with the Commercial Arbitration Rules of the American Arbitration Association.

b. In the event of the death or disability of the arbitrator during the pendency of an arbitration, a substitute arbitrator shall be chosen in the manner the original arbitrator was appointed.

c. The arbitration shall proceed in an expeditious manner with any hearings that are deemed necessary to resolution of the issues properly before the arbitrator, and the arbitrator shall render a decision and, if appropriate, an award. The arbitration shall take place in Chicago, Illinois, unless the Parties otherwise agree. At the discretion of the arbitrator, the Commercial Rules of the

American Arbitration Association may be used, in whole or in part, to govern the conduct of the proceedings (except insofar as they contradict any provision of this Agreement, in which case this Agreement shall take precedence and control). Pending the final resolution of any dispute arising under or relating to this Agreement, the Parties shall continue to perform all obligations in accordance with the terms and conditions of this Agreement.

[SIGNATURE PAGE FOLLOWS]

IN WITNESS WHEREOF, the Parties hereto have caused this Amendment Agreement to be executed by their respective officers who are duly authorized.

Amendment Agreement

ESCALATION

The GTM Train Charges established in the Trackage Rights Agreement and referenced in this Amendment Agreement shall be escalated upward or downward effective July 1 of each year, beginning July 1, 2003, to compensate for the increase or decrease, if any, in the cost of labor and material, excluding fuel, as reflected in the Annual Indexes of Charge-Out Prices and Wage Rates (1977 = 100), Series Q-MPW, included in "Indexes of Railroad Material Prices and Wage Rates" and supplements thereto, issued by the Association of American Railroads. In making such determination, the final "Material prices, wage rates and supplements combined (excl. fuel) " index for the Western District shall be used and the final index figure for the calendar year 2001 of 325.0 shall be taken as the base ("Base Charge"). The method of escalating the GTM Train Charges shall be determined by calculating the percent of increase or decrease in the index of the year to be escalated as related to the base year, and applying that percent to the Base Charge.

By way of example, assuming "A" to be the Material prices, wage rates and supplements combined (excl. fuel) final index figure for the year 2001, "B" to be the "Material prices, wage rates and supplements combined (excl. fuel) for the year 2002; "C" to be the Base Charge and "D" to be the percent of increase or decrease, the escalated charge effective as of July 1, 2003 would be determined by the following formula:

(1) $(B - A) \div A = D$

(2) $(D \times C) + C =$ escalated charge effective 7/1/03

If the base for the annual Indexes of Charge-Out Prices and Wage Rates issued by the Association of American Railroads shall be changed from the year 1977, appropriate revision shall be made in the base (established as herein provided) for the calendar year 2001. If the Association of American Railroads or any successor organization discontinues publication of the Annual Indexes of Charge-Out Prices and Wage Rates (or of any relevant component), an appropriate substitute for determining the percentage of increase, or decrease, shall be negotiated by the Parties.

Appendix B
To
Amendment Agreement

Example of Methodology for Allocation of Capital Project Costs if Necessitated In Part by the Introduction of IC&E Increased Traffic, Coal Trains or Excess Trains

Estimated Cost of Capital Project for zones covered by Agreement provisions relating to allocation of Capital Project Costs	$1,000,000	
Gross Ton Miles:		
CP Rail (Including IC&E Existing Traffic)	13,500,000	GTM
Metra	16,500,000	GTM
IC&E Increased Traffic, Coal Trains, and Excess Trains	10,000,000	GTM
Total GTM for Line	40,000,000	GTM
IC&E Increased Traffic, Coal Trains, and Excess Trains as a percentage of Total Gross Ton Miles (10,000,000÷40,000,000)	25%	GTM
IC&E Share of capital costs due to IC&E Increased Traffic, Coal Trains, and Excess Trains	$250,000	
Metra & CPR to further split the balance per the Metra Agreement based upon GTM allocation (up to a Maximum of 50% for CP if for benefit of both parties)		
CP Rail Share (all or a portion of which may be the obligation of IC&E based upon the CPR/IC&E Existing Traffic GTM pro ration)	375,000	
Metra Share	375,000	
Total Capital Cost	$1,000,000

IV. UP and BNSF Comments Amount to a Criticism of the Mexican Regulatory Scheme, Not a Criticism of This Transaction.....14

V. BNSF's Request for "Springing" Trackage Rights Has Nothing To Do With This Transaction; It Is Only an Attempt to Get an Unfair Advantage for a Possible Future Attempt to Obtain a Concession to Operate in Mexico. 16

1. My name is Oscar Augusto Del Cueto Cuevas. I am the Presidente, Gerente General y Representante Ejecutivo (President, Executive Representative and General Manager) of Kansas City Southern de México, S.A. de C.V. (KCSM). I am also a member of KCSM's Board of Directors.

2. I have been with KCSM since it began operating its concession from the Mexican government in 1997.[1] I have served in my current role since August 1, 2020. I previously served as Vice President and General Director from November 2018 to July 2020 and as Vice President-Operations from January 2009 to October 2018. Prior to 2009, I held various other leadership positions working for KCSM. In all, I have nearly 32 years of railway industry experience, working in institutional relations, communication, operations, planning and logistics.

3. In my role as President of KCSM, I also serve as a director of Ferrocarril y Terminal del Valle de México, S.A. de C.V. (Ferrovalle), the terminal railroad in the Mexico City area,[2] and have served as the head of the Asociatión Mexicana de Ferrocarriles (the Mexican Railroad Association).

4. My educational background includes a master's degree in business administration from the University of Monterrey and a bachelor's degree in communications. I also have

[1] KCSM initiated railroad operations on June 24, 1997 as TFM, S.A. de C.V. (TFM, formerly Ferrocarril del Noreste, S.A. de C.V.). TFM was owned 80% by Grupo Transportacion Ferroviaria Mexicana, S.A. de C.V. (Grupo TFM) (formerly Transportacion Ferroviaria Mexicana, S. de R.L. de C.V.) - a joint venture of Kansas City Southern Industries, Inc., and Transportacion Maritima Mexicana, S.A. de C.V. (TMM) – and 20% by the Mexican government. In 2005, Kansas City Southern acquired the interests of TMM and of the Mexican government. Following that acquisition, TFM was renamed Kansas City Southern de México, S.A. de C.V. Also, during my career working for KCSM I was an employee of KCSM Servicios, S.A. de C.V. (Servicios), a KCSM subsidiary that employed everyone who provided services to KCSM except KCSM's president. Servicios was merged into KCSM in July 2021. For simplicity, I will refer to my work with KCSM, its subsidiary and predecessors simply as work for KCSM.

[2] Ferrovalle is owned 25% by Ferrocarril Mexicano, S.A. de C.V. (Ferromex), 25% by Ferromex's affiliate Ferrocarril del Sureste, S.A. de C.V. (Ferrosur), 25% by KCSM and 25% by the Mexican government through the Secretaría de Infraestructura, Comunicaciones y Transportes (SICT).

completed advanced studies in Mexico and the United States, such as the University of Michigan Railroad Administration Program certificate and certificate programs at the Center for Transportation Technology, in Pueblo, Colorado.

5. My office is in Mexico City, but my responsibilities take me to many places throughout Mexico as I interface with KCSM's customers, employees and with the many local, state and federal officials with which KCSM works in providing its service across Mexico. A substantial portion of my responsibilities involves working with our customers and our regulators to manage compliance with our regulatory responsibilities while meeting our customers' needs.

6. I am submitting this Reply Verified Statement to provide real-world context regarding Mexican railroad laws and regulations that comments filed with the Surface Transportation Board (Board or STB) by Union Pacific Railroad Company (UP) and BNSF Railway Company (BNSF) in this proceeding failed to analyze. I will also address KCSM compliance with these regulations, how BNSF and UP's proposed "conditions" are not related to impacts of the Transaction and how, from the perspective of Mexican regulatory authorities, BNSF's and UP's proposed conditions are not properly before the Board.

I. KCSM Has Provided Huge Benefits to the Mexican Rail System and Its Customers in KCSM's First Twenty-Five Years; The STB Should Not Reach Across International Borders to Interfere With That Success.

7. Before turning to discussion of the testimony of UP and BNSF's paid experts, I want to provide some real-world context about what KCSM is and how it functions in the Mexican transportation system.

8. As this statement is being finalized, KCSM has just completed the celebration of its first 25 years as the operator of Mexico's northeast rail concession. During that celebration, KCSM had occasion to look back over the vast changes that it has been able to help bring to the

Mexican rail system and its customers. Some of those changes, highlighted in a recent KCS company newsletter, include:

- In 1997, 12-14 trains a day crossed the International Bridge between Nuevo Laredo, Tamaulipas and Laredo, Texas. Today, 28-32 trains cross the bridge daily.
- In 1997, the average train length was 55-60 rail cars per train. Today, trains are as long as 120 rail cars.
- In 25 years, KCSM evolved from a load capacity of 1,000 metric tons and average speeds of 9.5 kilometers per hour to 16,000 metric tons and speeds of up to 110 kilometers per hour.
- In 1997, most rail was 90-pound jointed rail. Today, most of the KCSM network is 136-pound welded rail, allowing KCSM to move larger trains at higher speeds for better fluidity and better customer service.
- Railroad sector participation in Mexico's freight transportation system increased from 12 percent of total cargo moved in 1997 to today's 26 percent of all freight transported. KCSM represents 30 percent of all freight transported by rail in Mexico.
- Before KCSM's acquisition of the northeast concession, the majority of Mexico's railroad switches were operated by hand. Today, most of the network has Centralized Traffic Control.
- Total KCSM carloads have increased significantly. In 1988, the network moved approximately 570,000 loaded rail cars. In 2021, KCSM moved 920,000 loaded rail cars.

- In 25 years, KCSM has invested more than $4.4 billion to maintain excellent service through new and better infrastructure.

9. These facility improvements, this growth in traffic and these investments are not indicative of an anticompetitive business functioning in the unregulated, anything-goes environment that UP and BNSF witnesses hypothesize. Rather, these are signs of a business that seeks to grow and to serve customers and the public interest better.[3] They are not signs of something that a U.S. regulatory agency should reach across the border to hobble, as UP and BNSF invite this agency to do.

II. The Mexican Rail System is Governed by a Robust Legal and Regulatory System, Including Protections Relating to Rates, Competitive Access, and Anticompetitive Conduct.

10. As background for this statement, I have reviewed the statements by Dr. Aaron Dychter Poltolarek, in support of BNSF's comments, and Dr. Luis De la Calle, in support of UP's comments. Both identify some of the applicable law and regulations and identify the appropriate regulatory agencies.

11. However, neither Dr. Dychter nor Dr. De la Calle analyze how KCSM operates (or how a post-Transaction CPKC would operate) under the Mexican regulatory system or real-life market conditions. Instead, both Dr. Dychter and Dr. De la Calle make only generic

[3] The International Transport Forum at the Organisation for Economic Co-operation and Development (OECD) wrote in 2014, "Mexico has seen a transformation of its railway in the last fifteen years, from a declining operation increasingly dependent on large government subsidies to what we have found to be a very productive and technologically improved system that operates profitably without public subsidy. This performance has lessons for other countries…". It added that, "[i]nvestment in the main railway concessions in Mexico since reform has transformed a declining and unreliable system into a reliable and technologically competent railway, with improved track and signaling systems permitting the use of heavier, more productive trains. The productivity of Ferromex and Kansas City Southern Mexico railways is higher by a large margin than any other general freight rail carrier in Latin America." Peer Review of Railway Freight Development in Mexico, Report of the International Transport Forum, February 2014 at 7, 33.

criticisms of how Mexico regulates Mexico's railroad industry. With all due respect, their analyses are both hypothetical and incomplete.

12. KCSM and other Mexican railroads exist within a robust legal and regulatory environment. As both Dr. Dychter and Dr. De la Calle note, the applicable Mexican laws and regulations cover, among other things, rates, competition, merger control, and anticompetitive conduct, and provide remedies ranging from rate regulation, opening access to improve competition, and investigations and penalties for anticompetitive conduct.

13. The essential argument by both Dr. Dychter and Dr. De la Calle seems to be that Mexican legal and regulatory systems -- systems they both indicate that they had a hand in creating -- are inadequate, and that the Mexican government would not mind if the STB reached across the border to remedy supposed deficiencies of Mexican law and regulation by giving BNSF and UP certain control of KCSM's rates and operations. De la Calle VS, page 3 and Sections I and III; Dychter VS, Section III. In my view, that argument is simply wrong.

A. Background on the Development of Mexican Railroad Concessions

14. In the mid-1990s, the Mexican government granted concessions for operation of the formerly state-owned rail system to encourage revitalization of the Mexican rail industry. The then Secretariat of Communication and Transport (now named Secretariat of Infrastructure, Communications, and Transport (SICT)) divided the national rail system into three large and several smaller sections, and auctioned to private businesses concessions to improve, maintain, and operate the rail systems on those separate sections of the network.

15. On June 1, 1997, the Mexican government issued the Northeast rail concession to TFM. TFM was owned 20% by the Mexican government and 80% by Grupo TFM, a joint venture of Kansas City Southern Industries, Inc., and Transportacion Maritima Mexicana, S.A. de C.V. (TMM).

16. On June 24, 1997, TFM began operating the Northeast rail concession, which extended from that concession's connections to the U.S. rail network at Laredo and Brownsville, TX, through Monterrey and Mexico City, to the Pacific Coast port of Lazaro Cardenas and to Veracruz and Tampico on the Gulf Coast. The other two major concessions were granted to Ferromex and Ferrosur.

17. KCSM and other concessionaires each remain subject to the Regulatory Railway Transportation Law (Ley Reglamentaria del Servicio Ferroviario)(the Rail Law) and the Regulations of the Railway Transportation Service (Reglamento del Servicio Ferroviario)(the Rail Regulations, together with the Rail Law, referred to as Mexican Regulations). These regulations generally encouraged private investment in the Mexican rail network while allowing the Mexican government to continue oversight to ensure a free and competitive market. Pursuant to Mexican Regulations, concessionaires must provide authorized services on an on-going basis in a uniform and equitable manner, without discriminating and under equal conditions as regards to time, quality, and price. *See* Rail Law, Article 24, first paragraph, which can be translated as, "Rail services shall be provided to all requesting users on a permanent, uniform and fair basis in terms of opportunity, quality and price."

18. The rail systems operated by concessionaires are property of the Mexican government, and revert back to the government at the expiration or termination of the concession, effectively operating somewhat like a lease of the government-owned assets. Major concessions such as the ones that KCSM and Ferromex operate were granted for terms of 50 years, with the possible extension of another 50 years subject to certain provisions of the Mexican Regulations.[4] TFM's concession included a 30-year exclusivity period in which only

[4] Some smaller concessions were granted for shorter periods.

TFM/KCSM can render rail services on its concessioned system, except for authorized trackage rights or as may otherwise be agreed with other concessionaires (the Exclusivity Period).

19. On October 6, 2004, Mexico's Foreign Investment Commission (FIC) notified KCS of its approval of KCS's application for authority to acquire TMM's interest in TFM. This approval was necessary for a foreign company to become a majority owner of a Mexican railway company. In 2005, KCS bought out its joint venture partner TMM and subsequently acquired the Mexican government's 20% interest in TFM to become the sole ultimate parent of TFM. KCS then changed the name of TFM to KCSM.

B. Mexican Railroads Are Governed by a Robust Legal and Regulatory System that Supports the Stated Goals of the Mexican Government

20. There are four Mexican governmental agencies that have jurisdiction over railroads. They are the Mexican rail authority (Agencia Reguladora del Transporte Ferroviario (the ARTF)) - and the Rail Development and Multimodal General Directorate (Dirección General Desarrollo Ferroviario y Multimodal) (DGDFM), both under the SICT; the SICT itself; and the Mexican antitrust authority, the Comisión Federal de Competencia Económica (COFECE).

21. The ARTF establishes regulations concerning railway safety and operations, and is responsible for resolving disputes between railways and customers. KCSM must register its maximum rates with the ARTF and make regular reports to the ARTF and the SICT. The DGDFM regulates certain projects such as permits for transload terminals, "comodatos", and other matters.

22. COFECE is Mexico's competition authority. Among its responsibilities, it conducts merger control and investigations under the Federal Economic Competition Law (Ley Federal de Competencia Economica)(Competition Law). If the ARTF or another party considers

there to be no effective competition for a particular rail service, they may request an opinion from the COFECE regarding market conditions. If the COFECE determines that there is no effective competition for particular movements, the ARTF could set rates for those movements or grant limited trackage rights to another railroad while the condition of no effective competition remains.

23. Similar to railroad regulations in the United States, Mexican Regulations allow railroads to take the initiative in setting their rates. Unlike the United States, however, concessionaires must register maximum rates, referred to as TUCE rates, and can be sanctioned by the government for charging a customer more than the TUCE rate.

24. Drs. Dychter and De la Calle each imply that the registration of TUCE rates is a simple matter and that KCSM is largely free to set whatever TUCE rate it wants. In fact, though, quite the opposite is true. KCSM personnel spend weeks discussing changes in TUCE rates with regulators, going through various cost and other justifications and making adjustments to satisfy the agency, before the ARTF will accept the annual change in KCSM's TUCE rates. Translated to English, Article 46 of the Rail Law describes this process as follows:

> "Any modification to the maximum rates of different services and charges must be registered before the Agency prior to its application, with the concessionaire accompany the relevant justification. The Agency may issue recommendations on the proposed increases. The Agency may also, at any time, if appropriate, request the opinion of the Federal Economic Competition Commission to proceed in terms of its powers."

In short, the process of registering TUCE rates is not as easy or as unregulated as Drs. Dychter and De la Calle imply.

25. Further, Article 170 of the Mexican Regulations imposes a non-discrimination requirement on rates. Concessionaires may implement discount programs or promotions, but only under equitable conditions and without discrimination, taking into account the specific

characteristics of each service such as volume, equipment, and distance. Concessionaires cannot discriminate based on interline partner, unless cost differentiations justify those differences.

26. Shippers and other market participants have viable processes and recourse for violations of the Mexican Regulations. For example, as noted by Dr. De la Calle, the COFECE conducted an investigation of competition in transport of four hazardous chemicals to customers south of Veracruz. The COFECE concluded that there was a lack of effective competition for shipments of those chemicals on 20 of 31 routes considered.[5] The COFECE's conclusion triggered the ARTF's imposition of price controls on shipments of those chemicals on those routes. While KCSM has challenged the ARTF's action in court, that court action did not prevent ARTF's rate limitations from taking effect. My understanding is that this process is somewhat similar to U.S. processes, where the STB makes a finding of market dominance before it can regulate a challenged rate, and that a party disappointed with the STB's decision can appeal that decision in court.

27. Had it chosen to do so, the ARTF also could have imposed trackage rights to resolve the COFECE's concerns about a lack of effective competition in the involved markets. Article 36 of the Rail Law allows for the compelled access by one concessionaire to another's track in the event COFECE finds a lack of effective competition in a particular route or routes.

28. The ARTF can also impose rate limitations on its own initiative in instances where the COFECE has found a lack of effective competition. (Rail Regulations, Article 174.)

29. Moreover, the regulatory agencies have the ability to levy significant penalties. Concessionaires operate at the behest of the Mexican federal government and can even lose their

[5] The COFECE's investigation covered shipments of anhydrous ammonia, chlorine, ethylene oxide, and caustic soda with an origin or destination in the southern region of the State of Veracruz not served directly by KCSM. KCSM was involved in limited segments of only 5 out of such 20 routes, and only in connection with the shipments of chlorine and ethylene oxide.

concession -- for which they may have paid hundreds of millions of dollars and invested even more to upgrade -- if the ARTF imposes sanctions on the concessionaire for a significant infraction three times in a period of five years. (Rail Law, Article 21.)

30. Due to its public responsibilities and the serious potential consequences of violations of Mexico's rail law or regulations, including penalties as serious as revocation of its concession, KCSM takes great care to comply with all applicable law and regulations. We have a robust regulatory compliance process to ensure our continuing compliance with the law. Neither Dr. Dychter nor Dr. De la Calle offers any evidence of non-compliance by KCSM. Nor should they, as KCS and KCSM maintain compliance with all applicable laws and regulations. KCSM has not received any penalty from these agencies in its twenty-five years operating its concession.

31. What Drs. Dychter and De la Calle seem to be saying, rather, is that Mexico's application of its laws and regulations is uncertain and, also, that perhaps Mexican regulatory authorities do not care about international traffic.

32. If by uncertain they mean that there is not a long history of application of railroad laws and regulations by the COFECE, the ARTF, and the SICT, that is not surprising. The Mexican rail system was concessioned only 25 years ago; prior to that it was part of the government. In those 25 years, there has been one major rewrite of the Rail Law, and the COFECE and the ARTF each were established only within the past ten years, replacing previous agencies that had somewhat similar responsibilities. Necessarily these agencies will not have a long history of regulatory enforcement activity.

33. However, a lack of a long regulatory history does not mean regulatory inertia or disinterest. The ARTF and the COFECE are quite active, always seeking additional information

from concessionaires, conducting frequent audits, and performing studies on the functioning of the rail system. KCSM must provide reports on investments; traffic volumes; theft and vandalism on the general right of way; customer complaints; fuel consumption; numbers of locomotives, railcars, and employees; activities around maintenance of way, sidings and spurs; and numerous financial matters. While KCSM is able to take the initiative in establishing its rates on a non-discriminatory basis, up to the maximum rates registered with the ARTF, at any time the ARTF may request additional information regarding the determination of such rates and may issue recommendations with respect to proposed rate increases. A lack of enforcement decisions does not mean a lack of attention by the regulatory agencies.

34. The contention that Mexican authorities perhaps do not care about international traffic is puzzling. Article 48 of the Law[6] specifically addresses international rail transport, indicating that the Mexican government *does* care about the activities of Mexico's railroads with respect to cross-border traffic. And, as stated above, concessionaires cannot discriminate based on interline partner.

35. The main thesis of Drs. Dychter and De la Calle that Mexican rail regulators are incapable of defending shippers' interests is wrong. The ARTF, the SICT and the COFECE form a powerful regulatory trio that is very involved in concessionaires' activities. That is the real world, which is very different from the hypothetical one that UP's and BNSF's witnesses discuss.

[6] Article 48 can be translated as follows standards: "The international rail transport is the one operated from another country to the national territory, or vice versa, and shall conform to the terms and conditions provided for in the applicable international treaties or, failing that, to the conventions concluded between the participating railway undertakings."

III. BNSF and UP Fail to Consider How KCSM Operates, and How a Post-Transaction CPKC Would Operate, in Real World Market Conditions

36. Not only are the regulatory constraints on KCSM much stronger than UP and BNSF suggest, the transportation marketplace also would prevent KCSM from engaging in the manipulations of Mexican rates that UP and BNSF claim.

37. First, KCSM already has the incentive to maximize the rate it can achieve for its services while still earning the customer's business. KCSM does this now, just as I am sure UP and BNSF do on the U.S. side of the border. Indeed, BNSF's complaint that KCSM Rule 11 rates[7] and other practices that fully comply with Mexican law create a lack of transparency that prevents BNSF from knowing what it can charge to capture a shipper's business is really BNSF saying that it does not know how high it can make its rate without driving away the business.[8] BNSF's demand for "transparency" of rates covering transportation within Mexico really is just a way for BNSF to get the highest rate it can on the U.S. side of the border.

38. Second, KCSM is restrained by the marketplace. KCSM competes with other rail transport as well as with water and truck transportation.[9] This competition presses KCSM to keep its rates low to attract business.

---

[7] Article 36 Ter. of the Rail Law specifically allows shippers to request separate rates from each carrier, saying (as translated), "When the public cargo or passenger transport service requested by the user refers to routes involving the participation of more than one concessionaire, the user shall have the right to choose between agreeing a rate independently with each concessionaire on the portion of the route that corresponds or in an integral way on the total of the route with the originating concessionaire or the destination concessionaire." In addition, there are certain tax implications of through rates on shipments from the U.S. into Mexico that can be mitigated by using Rule 11 rates.

[8] Also, transportation service contracts in Mexico remain subject to inspection by the ARTF. Article 46 of the Rail Law says in part, "those rates that are mutually agreed between concessionaires and users, which must be available at all times at the request of the Agency." I understand that by law in the United States, transportation contracts are not subject to any regulatory oversight, even though most U.S. rail traffic moves under such contracts. Seemingly this makes U.S. rates less 'transparent' than BNSF claims is the case for rates in Mexico.

[9] UP's witness John Turner claims that much rail traffic is not compatible with truck transport. Rocker/Turner VS at 17. In fact, though, a smaller portion of rail traffic in Mexico is rail-dependent than in the United States, because Mexican railroads do not have the same high amount of coal and ore

39. Further, all traffic that KCSM handles in Mexico, regardless of the U.S. interline partner, is KCSM business that earns revenue for KCSM's parent, whether that is KCS or CPKC. Single-line CPKC business will only be a fraction of the total Mexico movements. It would be against KCSM's and its parent's own self-interest to push rates so high that its customers would choose a non-rail option over KCSM/UP or KCSM/BNSF.

40. Finally, KCSM does not want to jeopardize its concession. As explained above, concessionaires operate at the behest of the government. The ARTF, the SICT, and the COFECE together can impose a number of penalties for violations of the Mexican Regulations, including stripping a concessionaire of its concession. KCS has invested billions of dollars in its Mexican and cross-border business. KCS and CPKC have every incentive not to jeopardize that investment.

IV. UP and BNSF Comments Amount to a Criticism of the Mexican Regulatory Scheme, Not a Criticism of This Transaction.

41. This Transaction has no effect on the supposed deficiencies of the Mexican regulatory system and legal system that UP and BNSF allege. The merger does not change any regulations, laws, process, timeline, or agency authority. Nor does the merger change KCSM's abilities, rights or obligations, or that of any shipper. KCSM will remain a separate entity as part of the CPKC network. The merger makes no impact on the application of Mexican law or agency authority. Legal and regulatory options available to shippers remain the same both before and after the Transaction.

---

shipments as U.S. railroads. *See* Peer Review of Railway Freight Development in Mexico, Report of the International Transport Forum, February 2014 at 15: "Comparisons of the traffic densities, modal shares and cost levels of freight railway systems should always distinguish between those that serve heavy concentrated mining flows (like coal and iron ore) and those that do not have such favourable base-load traffics but must rely on general industrial and agricultural cargoes. … The Mexican railway system is predominantly a general cargo railway, a characteristic that must be considered when reviewing the different aspects of its performance."

Del Cueto Cuevas R.V.S. at 14

42. Neither Dr. Dychter nor Dr. De la Calle argue that there is anything specific to the CP/KCS transaction that creates a unique situation under Mexican law. Both describe the current state of regulation in Mexico. Both hypothesize, without evidence, that post-merger a future KCSM would act with anticompetitive intent. It is only that assumed hypothetical intent which allows them to list out their criticisms.

43. Despite their hypothetical criticisms of the Mexican legal and regulatory system, both Drs. Dychter and De la Calle effectively admit that system works. For example, Dr. De la Calle and Dr. Dychter mention a number of investigations that have been opened, reports published by COFECE, including one investigation that resulted in a finding of a lack of effective competition. In fact, Dr, Dychter admits that the lack of enforcement can be equally explained by the railroad's compliance with policies where no shipper has felt the need to litigate. (Dychter VS, paragraph 18.)

44. I hope that as a government agency, the STB will take more seriously than UP and BNSF do the political and economic consequences of UP's and BNSF's invitation to regulate across the border and interfere with Mexican authorities' power to regulate Mexican railroads operating in Mexico under Mexican statutes and regulations. If the situation were reversed, would the STB sit idly by and allow the ARTF to regulate the behavior of railroads in the U.S.? Isn't regulation of railroads in Mexico beyond the authority given to the STB by the U.S. Congress?

45. Moreover, the conditions proposed by UP and BNSF would not resolve the alleged deficiencies of the Mexican regulatory system. The verified statement in this filing by my colleague Mike Naatz, KCS's Executive Vice President and Chief Marketing Officer, provides an in-depth analysis of the proposed mileage pro-rate mechanism proposed by UP and

BNSF and how that mechanism would simply tie KCSM's hands for UP's and BNSF's benefit. Also, because of the anti-discrimination requirements of the Rail Law, UP and BNSF's proposed control of some rates could indirectly affect other rates, with undetermined overall impact on KCSM. In short, none of the concerns raised by BNSF or UP (lack of transparency, regulatory precedent, or experience in dispute resolution) are fixed by their conditions.

V. BNSF's Request for "Springing" Trackage Rights Has Nothing To Do With This Transaction; It Is Only an Attempt to Get an Unfair Advantage for a Possible Future Attempt to Obtain a Concession to Operate in Mexico.

46. In its Comments, BNSF argues that it will seek a concession to operate as a railroad in Mexico at some point in the future. Further, BNSF admits that its request for potential future trackage rights over KCS to Laredo is about "ensur[ing] that BNSF may access Mexico when the Mexican Government opens its rail lines to additional competition." And that "[t]o obtain such a concession, BNSF would need to be able to demonstrate to the Mexican government that it has a credible plan for accessing Mexico, which would require direct access to Laredo." (BNSF Comment at 50) (BNSF-9-54.)

47. KCSM does not believe that Mexican law allows the type of concession that BNSF describes itself getting. But even if the law did allow that, whether BNSF could ever get a concession to operate a railroad in Mexico depends on a number of things, including future conditions under Mexican regulation and policy, BNSF's ability to present an acceptable application, and BNSF's ability to find a willing Mexican co-venturer.[10] None of these required showings would be changed by the Transaction.

48. More importantly, though, the reason BNSF says that it needs trackage rights on KCS's line from Robstown to Laredo is to show in its concession application that it can connect

[10] Article 17 of the Rail Law translates as, "Foreign investment may participate up to forty-nine percent in the share capital of the concessionary companies referred to in this Law."

to the Mexican rail system. But BNSF doesn't need trackage rights from Robstown to Laredo to connect to the Mexican rail system because BNSF already has trackage rights to connect to KCSM via UP's Brownsville Subdivision, and BNSF also connects with Ferromex at San Diego, California and El Paso and Eagle Pass, Texas. My understanding is that BNSF has never used its trackage rights on UP's Brownsville Subdivision, but if BNSF needed to show that it has trackage rights to connect to KCSM in Mexico (in addition to its own multiple track connections to other Mexican gateways), BNSF already has such rights. It does not need trackage rights on KCS.

49. Again, BNSF's request for potential future trackage rights to Laredo does not relate to a problem created by the Transaction. BNSF argues the Board should grant it trackage rights over KCS to Laredo because the Mexican Government may want a "credible plan for accessing Mexico," but BNSF already accesses Mexico through multiple other gateways except Laredo. It is entirely speculative that the Mexican Government would require BNSF to access all gateways, especially since CPKC now and in the future only access a single gateway.

2.1. Overview of the flaws in Commenters' critiques of my analysis of potential vertical effects from the CP/KCS combination 10

2.2. Professor Salop's vertical theories do not prove actual harm, or even the risk of harm from a CP and KCS combination 19

2.3. Dr. Reishus's vertical analysis is internally inconsistent and does not establish that a CP and KCS combination is likely to result in harm 30

3. Commenters' critiques of my analysis of Laredo traffic and other empirical foreclosure arguments are flawed and do not change my conclusion 38

3.1. Commenters analysis of southbound traffic is methodologically flawed and misleading 43

3.2. Commenters' analyses that compare shares over time and for subsets of traffic ignore patterns in the data consistent with stronger competition from KCS and cannot be interpreted as Commenters suggest. 46

3.3. BNSF and CSXT's argument that I have defined areas served by KCS too broadly is flawed 62

3.4. Dr. Reishus's incomplete and misleading analysis does not support his claims that BNSF has been foreclosed by KCS 67

3.5. Professor Mayo's analysis of corridors where CPKC will allegedly choose to foreclose interline options with NS in favor of new CPKC single-line service is flawed and misleading 86

4. Remedies proposed by Commenters purport to resolve competitive harms that do not exist and would be anticompetitive in any event 92

4.1. The "remedy" proposed by Professor Salop and Dr. Reishus to regulate CPKC interline rates would be anticompetitive and would ensure UP and BNSF do not face fully competitive single-line pricing from CPKC 92

4.2. CN's proposed divestiture seeks to resolve an alleged harm that does not exist and instead would create risk of harm to horizontal competition 116

5. Other Commenters that raise issues of "competiton" do not raise an issue of competitive effects due to a CP/KCS combination 120

6. Technical appendix: analysis showing the anticompetitive effect of the proposed mileage-prorate "remedy," additional details..... 127

1. QUALIFICATIONS AND ASSIGNMENT

1.1. Qualifications

1. My name is W. Robert Majure. I am a Vice President at Cornerstone Research. Prior to joining Cornerstone Research, I worked for approximately 25 years in the Antitrust Division of the U.S. Department of Justice ("DOJ") as an economist, Assistant Section Chief, Section Chief, and ultimately as the Director of Economics.

2. I earned my Ph. D. in Economics from Massachusetts Institute of Technology in 1994 and a B.A. from the University of Virginia in 1990. My main area of expertise is the economics of industrial organization – particularly issues of competition.

3. While at the DOJ, I performed and supervised economic analyses of competition issues in various industries, including transportation, telecommunications, banking, computer software and hardware, heavy industry, mining and drilling, healthcare, entertainment, and railroads. I submitted testimony on competitive effects in the merger of the Union Pacific and Southern Pacific Railroads and on the suitability of remedy in *U.S. v. SBC Communications Inc. and AT&T Corp.* and *U.S. v. Verizon Communications Inc. and MCI, Inc.* I also served on the committee that drafted the 2010 Horizontal Merger Guidelines. I received awards for my work at the DOJ, including presidential recognition for my contributions as a senior executive of the civil service.

4. A copy of my *curriculum vitae* is attached as Appendix A.

1.2. Assignment

5. In the context of these proceedings, on April 30, 2021 and at the request of counsel for Canadian Pacific ("CP"), I submitted an expert statement ("Initial Statement") to describe my preliminary findings on the competition issues related to the proposed acquisition of Kansas City Southern ("KCS") by Canadian Pacific, and to compare them to competitive issues that would be raised in an acquisition of KCS by Canadian National ("CN").[1]

6. On June 28, 2021, at the request of counsel for CP, I submitted a second expert statement ("Voting Trust Statement"), in the context of the proceedings related to the proposed acquisition of KCS by CN.[2] In the Voting Trust Statement, I provided an economic analysis of the voting trust arrangement that had been proposed by CN for its potential acquisition of KCS, and showed that a voting trust arrangement would have given CN an immediate incentive to implement its part of the anticompetitive horizontal consequences of a CN/KCS combination. I also provided additional analysis that confirmed the proposed merger of CN and KCS should have been treated as a horizontal merger, and that CN's proposed divestiture was insufficient to

resolve the horizontal competition issues that would have been created by the transaction.

7. On October 29, 2021, I submitted a third expert statement ("Application Statement") at the request of counsel for CP evaluating whether the proposed acquisition of KCS by CP is likely to generate any procompetitive benefits or cause any competitive harms.[3]

8. On February 28, 2022, UP, BNSF, NS, CN, and CSXT filed comments on the merger application of CP and KCS. Included in these comments are responses to my Application Statement, as well as other arguments and analyses assessing the potential competitive effects of a CP/KCS combination. Several other parties also filed comments expressing particular concerns they describe as related to competition. I have been asked to submit a fourth expert statement at the request of counsel for CP responding to these submissions.

9. Cornerstone Research is being compensated at my standard billing rate of $955 per hour. I have been assisted by staff of Cornerstone Research, who worked under my direction. Cornerstone Research's compensation in this matter is not in any way contingent or based on the content of my opinion or the outcome of this or any other matter, nor is my compensation.

[3] Expert Statement of W. Robert Majure, Ph.D., *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, October 29, 2021 ("Application Statement").

10. Appendix B contains a list of materials I have relied upon in preparing this statement. I reserve the right to supplement my analysis if additional information and data become available as these proceedings continue.

1.3. Summary of opinions

11. My economic analysis continues to support the following main conclusion: a CP/KCS combination is a vertical transaction of two complementary networks that would create opportunities for procompetitive benefits throughout the CP/KCS network and would not substantially lessen competition.

12. Commenters on behalf of competing railroads have largely ignored my analysis and conclusion that a combination of CP and KCS will not have adverse horizontal competitive effects within any corridor or between corridors. They focus their attention on arguments that an end-to-end railroad merger *might* have adverse vertical competitive effects. In doing so, they incorrectly dismiss the Board's past findings that such effects are not likely in this industry and otherwise ignore the facts and circumstances of the railroad industry. When those facts are considered, I find that the Commenters offer no reason for concluding that adverse vertical effects are likely in an end-to-end railroad merger and, in particular, in a CP/KCS combination.

13. Commenters have variously proposed "remedies" for their perceived competitive concerns. In addition to failing to establish any need for such remedies, I find that the proposed remedies are self-serving and would not enhance competition. Indeed,

"remedies" proposed by UP and BNSF would impair competition by raising the cost to CPKC of offering shippers attractive rates for single-line service – both existing single-line service as well as the new single-line service made possible by the combination.

14. I organize my economic analysis that supports these conclusions with respect to the various arguments raised by different Commenters as follows:

- In section 2, I consider Commenters' analysis of end-to-end railroad mergers and the possibility of vertical competitive effects based on economic theories. I show that Commenters are incorrect to characterize the Board's past findings as a presumption based on a specific economic theory. Rather, the Board has repeatedly assessed end-to-end railroad mergers in a manner consistent with the framework recently articulated in the Vertical Merger Guidelines, which call for investigation of whether an industry is prone to incentive and ability elements necessary for a vertical competitive effect. In contrast, Professor Salop articulates a framework which *presumes* an incentive and ability based on his assumption that railroads are limited in the ways they can set or adjust prices amongst themselves – an assumption that is not consistent with the facts of the industry. And, Dr. Reishus posits a numerical example of cross-border movements that is consistent with neither the facts of Mexican non-discrimination regulation on such movements nor with basic economic rationality.
- In section 3, I consider Commenters' analyses that purport to show foreclosure as an empirical matter. This includes Professor Mayo's analysis of interline movements involving NS and the Meridian Speedway as well as various Commenters' responses to my analysis of whether the current flows of traffic through Laredo rule out allegations made at the time of KCS's acquisition of TM and TFM that competition north of Laredo would be largely foreclosed. I show that these responses are flawed both in concept and in methodology, as well as inconsistent with the factual record. I examine Commenters' representations of various changes that have occurred in the intervening years and show that these comparisons fail to account for a number of innocuous

changes affecting cross-border traffic in general and for specific commodities. Moreover, the changes illuminate that competition has been enhanced through improved single-line service provided by KCS and KCSM and through investments in competitive routings (including investments by others that have made other gateways on the Mexican border more competitive for UP and BNSF). I show that, as Eagle Pass (for UP and BNSF) and El Paso (for BNSF) have become more competitive on cross-border traffic that might have crossed at Laredo, overall this cross-border traffic has not been restrained and, instead, {{{[redacted]}}} since the acquisition of TM and TFM.

- In section 4, I consider "remedy" proposals made by UP, BNSF, and CN. I show that the similar proposals of UP and BNSF to regulate CPKC interline rates would harm competition. This unnecessary regulation would create a disincentive for CPKC to offer competitive rates to shippers. UP and BNSF would benefit from not facing the full competitive force of new single-line service from CPKC while shippers, including shippers that currently use single-line service on KCS that would be swept up in this effect, are likely to see higher prices from such a "remedy." I also show that CN's proposal that the Board award it a specific portion of KCS's track is equally self-serving. CN has not shown that either current or prospective competition is likely to be adversely affected if this track is part of CPKC.
- In section 5, I consider comments from shippers or from certain other parties that suggest other issues they associate with competition. I find that the issues articulated in these comments are not reasons to consider likely any adverse competitive effect of the CP/KCS combination.

2. COMMENTERS' ANALYSIS OF VERTICAL ECONOMIC THEORY DO NOT ESTABLISH A RISK OF VERTICAL HARM FROM THE CP/KCS COMBINATION

15. In my Application Statement, I concluded that neither CP nor KCS would have the incentive and ability as a combined firm to foreclose rivals or otherwise lessen competition as a result of vertical integration. Commenters responded with theoretical critiques of my conclusion. In this section, I address their arguments and explain why they do not change my conclusion. In section 2.1, I provide an overview of the flaws in Commenters' reasoning in their theoretical critiques of my conclusions regarding potential effects from a CP/KCS combination. In section 2.2, I address the specific theoretical arguments presented by Professor Steve Salop on behalf of UP. In section 2.3, I respond to the specific theoretical arguments presented by Dr. David Reishus on behalf of BNSF.

2.1. Overview of the flaws in Commenters' critiques of my analysis of potential vertical effects from the CP/KCS combination

16. Commenters have not disputed the basic framework of vertical effects analysis I used in reaching my opinion. Vertical effects require that a merger creates both an *ability* for the merging parties to achieve some new objective – i.e., that the arrangements they could reach independently were limited in a way that the merger resolves – and that they have an *incentive* to pursue the new objective – i.e., they do not already earn the same profits or greater profits in some other form. Those vertical effects can be anticompetitive, if the previously unexploited incentive and ability

relate to impairing competition, or procompetitive, if they relate to enhancing the combined product or terms of the merging parties.

17. In the combination of CP and KCS, there is a clearly procompetitive vertical effect in the ability to operate as a single-line to offer shippers a more efficient and effective service. The incentive to offer such service is the fundamentally procompetitive drive to win business by offering shippers a better option.

18. In my Application Statement, I noted that the Board has repeatedly examined the industry facts relevant to end-to-end railroad mergers and, in case after case, has determined that there is neither an ability nor an incentive to support anticompetitive vertical effects from combinations such as CP and KCS.[4] In considering ability, the Board has examined whether various past combinations are likely to change the set of constraints facing the merged firms and found that this is not likely.[5] In considering incentive, the Board has noted that, to the extent that a railroad may have power over a shipper, the pricing and practices in the industry do not support the assumption that the railroad is significantly constrained in ways that a merger would affect, and therefore, the railroad's ability to earn profit is not an incentive to anticompetitive effects.[6]

---

[4] *See* Application Statement, § 3.2, ¶ 13, fns. 3, 4; ¶ 22, fn.10.

[5] *See* Application Statement, § 3.2, ¶ 25, fn. 12.

[6] The Board decisions use language for this incentive issue dating back to Bork (1954) in the academic literature and so speak of the potential profit a railroad may earn as its "lump" and whether the railroad is already earning that full potential as the "one lump" theory. See Application Statement, § 3.2, ¶, fn. 11; *See* Robert Bork, "Vertical Integration and the Sherman Act: The Legal History of an Economic Misconception," *The University of Chicago Law Review*, 22(1), 1954, pp. 157–201.

19. For the most part, Commenters do not offer any new theories or facts about the industry for the Board to examine in this case. Rather than engage with the facts of the industry or show some other reason to think that the Board was wrong in its past investigations, Commenters have mischaracterized the Board decisions as merely presumptions based on a single theory and proceed to knock down this straw man of the "one lump" theorem.[7] I discuss Commenters' straw-man attacks on the "one lump presumption" in section 2.1.1.

20. To the extent Commenters suggest any theories that might apply to the railroad industry, they either fail to connect those theories to facts of the industry or make the same claims that have been rejected on the facts in prior Board proceedings.[8] For example, Commenters claim that Mexican non-discrimination regulations make the Laredo gateway a special situation – this claim was alleged and rejected during the

[7] Commentators do this, despite taking contrasting positions during prior Board investigations of their own proposed combinations. For example, economic expert opinion submitted on behalf of BN during the investigation of its acquisition of the Santa Fe Railroad argued that the "one lump" theory "assumes neither automatic foreclosure nor automatic gains from integration," "has long been accepted by many economists as a sound starting point for analysis,"...and is a "widely useful and cogent theory," while also noting that "the ICC, too, has accepted the one-lump theory, and concluded, rightly in my view, that it should be applied in all but exceptional circumstances." *See* Rebuttal Verified Statement of Richard L. Schmalensee, *Burlington Northern Inc., et al. – Control and Merger – Santa Fe Pacific Corporation, et al.*, Finance Docket Nos. 32549, 32549 (Sub-No. 1), June 9, 1995, BNSF0001523 – 97 ("Schmalensee R.V.S. 1995") at BNSF0001550 – 1, BNSF0001554.

[8] That Commenters lack a theory that is both (i) connected to the facts of the railroad industry and (ii) predicts vertical harm is consistent with their observations during past investigations. For example, expert opinions submitted on behalf of BN during the investigation of its acquisition of the Santa Fe Railroad stated that, ("It is well recognized that the circumstances under which 'vertical foreclosure' leads to post-merger reductions in competition in relevant markets are extremely limited, and that such circumstances are generally absent from railroad markets.") Verified Statement of Joseph P. Kalt, *Burlington Northern Inc., et al. – Control and Merger – Santa Fe Pacific Corporation, et al.*, Finance Docket No. 32549, October 1994, BNSF0002026 – 117 ("Kalt V.S. 1994") at BNSF002126.

Board's investigation of the KCS-TM-TFM combinations.[9] I address the specific claims and theoretical arguments of Professor Salop in section 2.2 and of Dr. Reishus in section 2.3.

21. Having failed to demonstrate any reason to expect some heretofore unseen incentive and ability for an end-to-end railroad merger to impair competition, Commenters resort to relabeling the likely procompetitive effects as "anticompetitive" without engaging in some consideration of why the CP/KCS combination would differ from all the end-to-end railroad mergers that have come before. They take the extreme view that any instance where CP and KCS have identified an opportunity to win business with the enhanced single-line service their combination allows would instead be an opportunity that CPKC would win through anticompetitive effects.[10] Further, they fail to suggest any reason why, assuming CPKC did have some anticompetitive means to accomplish the same ends, they would choose such a strategy and not the straightforward path of winning this business by offering a better service. As I discuss in section 2.1.2, even assuming that CPKC might face such a choice between anticompetitive activity and competing on the merits, Commenters offer no evidence that CPKC would choose the former, nor

10 *See*, *e.g.*, Verified Statement of Steven C. Salop, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, February 27, 2022 ("Salop V.S."), ¶ 12; Verified Statement of David Reishus, Ph.D., *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, February 28, 2022, BNSF-9-400 – 77 ("Reishus V.S."), ¶ 16; Verified Statement of Professor John Mayo, Ph.D., *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, February 28, 2022 ("Mayo V.S."), ¶¶ 9–10.

do they describe this hypothetical anticompetitive activity with the specificity necessary to assess such a question.

2.1.1. Commenters' straw man arguments about a "one lump presumption" are misguided

22. Instead of offering any reason of their own to doubt the Board's past findings, Commenters inaccurately describe the Board's past findings as having been based strictly on the *presumptions* of a single economic model – namely, the "one lump" theory. They then proceed to attack this straw-man, rather than the Board's actual assessments of the facts. In doing so, Commenters ignore all the ways in which the Board's discussions in those past decisions are inconsistent with the particularly strict application of the "one lump" theory that the Commenters wish to knock-down. Those inconsistencies suggest that, in these decisions, the Board is simply borrowing terminology from that theory to help describe the incentive element in the Board's more nuanced view.

23. In these decisions, the Board often uses the terms "lump" and "one lump theory," but does so to discuss incentives generally not to employ the strict straw-man version of that theory Commenters attack. The Board discusses the potential profit a railroad may realistically earn from whatever power it may have as the degree to which that railroad has a profit—or a "lump"—that it can earn.[11] The Board refers to the "one

[11] *See*, *e.g.*, *CSX Corporation, et al. – Control and Operating Leases/Agreements – Conrail Inc., et al.*, Finance Docket No. 33388 (Decision No. 89 served July 23, 1998) ("CSX-Conrail Decision"), p. 269, fn. 107 ("Further, Kalt has shown that Kahn/Dunbar have made no attempt to

lump theory" as a reflection of the basic incentive issue – that is, the fact that alternative ways for the railroad to earn the "lump" do not create an incentive for merger effects unless they create some opportunity to expand the "lump." Unlike the theory from which this terminology is taken, however, the Board was *not* assuming an absolute ability to extract rents absent a merger. Indeed, the discussion of degrees of a railroad's "lump" that the Board uses as a premise clearly distinguishes the Board's usage from a strict application of the theory.[12]

24. Thus, Commenters miss the point with their observations that the "one lump" theory, *if it were strictly applied*, would fail to match real-world facts of the industry.[13] The question is whether the incentive issue that the Board is considering when it uses language borrowed from the "one lump" theory is still relevant.

---

control for competitive factors that affect the size of the profit opportunities, or "lump," available to the railroads."); KCS-TM-TFM Decision, p. 59 ("Market forces that prevent a lump from being taken prior to a control transaction will continue to prevent that lump from being taken even after vertical firms have come under common control.").

12 *See*, *e.g.*, CSX-Conrail Decision, p. 268 ("the one-lump theory does not predict that bottleneck carriers will always be able to execute a perfect price squeeze; it merely predicts that vertical integration will not increase the bottleneck carrier's market power over shippers."), p. 269 ("Kahn/Dunbar are simply wrong in asserting that the general applicability of the one-lump theory to mergers requires a set of explicit and rather implausible assumptions, and thus 'the circumstances in which the pure one-lump theory is likely to hold represent an 'extreme example.' They appear unaware that this very argument has been considered and rejected by the ICC, with the ICC's reasoning specifically affirmed by the court."); *Burlington Northern Inc., et al. – Control and Merger – Santa Fe Pacific Corporation, et al.*, Finance Docket No. 32549 (Decision No. 38 served Aug. 23, 1995), 10 I.C.C.2d ("BN-SF Decision"), p. 751 ("We do not think that the one lump theory requires the series of perfect conditions that the utilities claim must be present for the theory accurately to represent the coal transportation markets at issue here. Our focus here is properly on *substantial* harm to competition…Conversely, when certain factors are present that limit a carrier's ability to take full advantage of a bottleneck, those factors will remain in place as effective safeguards after the merger.") and ("The fact that a bottleneck carrier might not have sufficient information to execute a perfect price squeeze or to extract the last penny of economic profits does not mean that *substantial* benefits to shippers will be lost when the bottleneck carrier merges with a connecting carrier.").

13 *See*, *e.g.*, Salop V.S., ¶ 32; Reishus V.S., ¶ 39.

Commenters have not tried to suggest that the incentive issue, rather than the specific theory, is irrelevant.

25. The incentive issue, however one refers to it, remains relevant. The modern incarnation of this fundamental economic consideration is seen in the 2020 Vertical Merger Guidelines' requirement of an incentive for vertical effects.[14] Thus, Commenters' focus on the specific model, and not on the incentive issue, is misguided and fails to recognize that the Board's decisions, though phrased in the language of "one lump," are nevertheless an examination of relevant economic incentives and of the facts in the railroad industry.

2.1.2. *Relabeling procompetitive effects of single-line service "anticompetitive" is not only unfounded, it fails to consider reasons that CPKC would prefer to win traffic through better service*

26. Another common mistake among Commenters' analyses is to assume that opportunities CP and KCS have identified for new single-line service are

[14] U.S. Department of Justice and the Federal Trade Commission, "Vertical Merger Guidelines," June 30, 2020, available at https://www.ftc.gov/system/files/documents/reports/us-department-justice-federal-trade-commission-vertical-merger-guidelines/vertical_merger_guidelines_6-30-20.pdf ("Vertical Merger Guidelines"), p. 5. As I noted in my Application Statement, on September 15, 2021, the FTC voted to withdraw from these guidelines. The majority statement in that decision took issue with a separate section of the 2020 VMG related to efficiencies while endorsing the sections that discussed the incentive and ability elements: "The 2020 VMGs represent a substantial improvement over the 1984 guidelines that they replaced and address important principles such as raising rivals' costs, foreclosure, and misuse of competitively sensitive information." *See* Federal Trade Commission, "Statement of Chair Lina M. Khan, Commissioner Rohit Chopra, and Commissioner Rebecca Kelly Slaughter on the Withdrawal of the Vertical Merger Guidelines," Commission File No. P810034, September 15, 2021, available at https://www.ftc.gov/system/files/documents/public_statements/1596396/statement_of_chair_lina_m_khan_commissioner_rohit_chopra_and_commissioner_rebecca_kelly_slaughter_on.pdf, p. 2

opportunities to win traffic through some anticompetitive action.[15] In doing so, these Commenters imply a perverse equivalence – in their logic, any opportunity to compete is an opportunity to restrain competition. It is not clear why they would draw such an equivalence, but it is clear that, by doing so, they skip over the required elements of analyzing the hypothesized anticompetitive action – what it is, why the merger creates an ability to pursue it, and why CPKC would have an incentive to pursue it, rather than other actions. Most critically, they fail to recognize that, in the face of CPKC's demonstrated opportunity to win the traffic through a better product – and expand the market in the process – Commenters' hypothesis that CPKC would pursue the traffic through anticompetitive actions of some sort is particularly unlikely.[16]

27. Commenters correctly identify the traffic at issue, i.e., interline traffic that could be served by a CPKC single-line service post-merger, but overlook the fact that *how* that traffic is won can have very different consequences for CPKC. It is important to distinguish the incentive implications of a prize, such as the traffic that might be won, from the overall incentive to engage in a particular strategy to win that prize. For example, I have an incentive to win the lottery, and may even buy a ticket. However,

---

15 Salop V.S., ¶ 12; Reishus V.S., ¶¶ 16, 45; Mayo V.S., ¶¶ 9–10.

16 Economic experts submitting statements on behalf of BNSF argued a similar position when discussing the traffic diversions forecasted by the combined BN-SF. One expert explained that these diversions would "arise from improvements in the service offerings to customers" and are "not the consequence of any exercise in market power." Kalt V.S. 1994, BNSF0002125. Another expert explained that, "this merger is likely to yield substantial efficiencies and service improvement. This means that, with increased efficiency and expanded service, BN/Santa Fe would likely gain business from competitors. This result is exactly what would be expected under competition and has nothing to do with anticompetitive foreclosure." Schmalensee R.V.S. 1995, BNSF001561.

I would certainly not pursue other strategies for winning that have different overall costs (e.g., stealing a ticket or trying to rig the numbers). These strategies have the same prize with the same contribution to overall incentives, but each strategy has its own costs and risks. When vertical merger theory considers a firm's incentives, it considers the profits of a particular strategy, not an unbridled assessment of the incentive to win the prize by any strategy. Commenters have confused the incentive to win the prize – the traffic capable of being won – with an incentive to engage in unspecified strategies to win the prize. As this confusion means Commenters have not even identified what the anticompetitive strategy is that they are hypothesizing, its risks and costs – its incentives as a strategy – cannot be assessed. Commentators are, in effect, making the same sort of unfounded presumption about vertical effects that they accuse the Board of making – though they would have it as a presumption of harm

28. In general, Commenters have failed to justify their mis-identification of opportunities to win traffic through new single-line service as opportunities to engage in some unspecified anticompetitive strategy. Moreover, even if such a strategy could be shown to be relevant, they fail to explain why CPKC would pursue it instead of competing – especially since the pro-competitive choice expands the market available to be won.

2.2. Professor Salop's vertical theories do not prove actual harm, or even the risk of harm from a CP and KCS combination

29. Professor Salop makes the straw-man argument discussed above, taking aim not at the relevant analysis, but the "one lump" theory. To this argument, he adds two observations about possible contracting difficulties to further support his non sequitur that the "one-lump" theory as he conceives it is inappropriate in the railroad context. As I discussed above, that argument is a straw-man and does nothing to undermine all of the Board's past findings about the railroad industry and why anticompetitive vertical effects are unlikely in end-to-end railroad mergers. Similarly, and as explained below, the particular contracting realities Professor Salop points out are also not reasons to conclude that the Board was wrong in all of its past examinations of the industry.

30. In addition to attacking the "one lump" theory, Professor Salop also presents his own theory, based on an unfounded assumption about how interline prices are set, and conducts simulation analysis of this theory, which he claims evaluates the effects of the CP/KCS combination. As I explain below, Professor Salop's model is built on an assumed contracting mechanism that is inconsistent with ordinary practice in the railroad industry. Taking account of that ordinary practice eliminates any incentive or ability for vertical effects suggested by Professor Salop's model. Thus, as the effects he models and simulates would not occur in actual railroad markets, his model does not suggest, much less establish, that a CP/KCS combination poses any significant risk of the theoretical harm he identifies.

31. In this section, I unpack Professor Salop's observations and assumptions about the railroad industry. I show that his observations that railroads have imperfect information about their interline partners and that rail service is a differentiated product for shippers do not undermine the Board's previous findings related to a "one lump," nor the Board's past conclusions that vertical effects are not likely in end-to-end railroad mergers. I also discuss the foundation of Professor Salop's theory of vertical harm – that railroads cannot negotiate both a combined price to the shipper in interline movements and the allocation of the profits of such a movement between them – and why it is not a good description of actual negotiations over interline movements. Finally, I conclude that Professor Salop's theoretical model's reliance on assumptions in place of actual industry conditions leads the model to presume an anticompetitive concern in any vertical merger in any industry, with the only question for overall effect one of whether this concern is outweighed by a particular efficiency that is also not specific to any facts of the railroad industry. Professor Salop's model is thus of little use in assessing the CP/KCS combination.

2.2.1. Professor Salop's observations of the rail industry do not establish that anticompetitive vertical effects are likely in end-to-end railroad mergers

32. Professor Salop makes two observations about actual conditions in the railroad industry. First, he observes that railroads often have imperfect information about other railroads involved in an interline movement.[17] He is correct to note that

[17] Salop V.S., § 3.2.

uncertainty is not a feature included in the original "one lump" model. However, uncertainty alone is not a reason to ignore the more general principle illuminated by the "one-lump" theory – the need to examine incentives and whether the contracts between independent vertically related firms could already provide a means to achieve the profit that might be earned from a hypothesized anticompetitive effect. If railroads have means other than mergers to achieve those profits, there is little reason to expect that a merger will result in anticompetitive behavior to achieve those same profits.

33. Professor Salop fails to consider that the economics literature has explored a variety of ways that contracting parties routinely cope with uncertainty. Indeed, a whole area of economics has been developed around the design of mechanisms to solve such problems and ensure truthful revelation of private information.[18] Of course, the original "one lump" model was not meant to explore such issues and so it is no surprise that the model does not assume either uncertainty or solutions to uncertainty. However, to go from that observation to an implication that railroads can only solve uncertainty issues through vertical mergers requires that railroad

[18] *See*, *e.g.*, Dirk Bergemann and Juuso Välimäki, "Information in Mechanism Design," in *Advances in Economics and Econometrics: Theory and Applications, Ninth World Congress*, Volume I, eds. Richard Blundell, Whitney K. Newey, and Torsten Persson, eds. (Cambridge: Cambridge University Press, 2006), pp. 186–221 at p. 186 ("The basic issue in mechanism design is how to truthfully elicit private and decentralized information in order to achieve some private or social objective. The task of the principal is then to design a game of incomplete information in which the agents have indeed an incentive to reveal the information."). *See*, *e.g.*, R. Preston McAfee and John McMillan, "Auctions and Bidding," *Journal of Economic Literature*, 25(2), 1987, pp. 699–738; Alexander Teytelboym, Shengwu Li, Scott Duke Kominers, Mohammad Akbarpour, and Piotr Dworczak, "Discovering Auctions: Contributions of Paul Milgrom and Robert Wilson," *The Scandinavian Journal of Economics*, 123(3), 2021, pp. 709–750 for surveys of literature on bidding mechanisms under asymmetric information.

executives faced with uncertainty are as limited in the scope of contractual provisions they can employ as Professor Salop's model is.[19]

34. Professor Salop has shown nothing of the sort.

35. Second, Professor Salop observes that shippers perceive railroads' service as a differentiated product.[20] That is, each railroad offers some unique characteristics that shippers value, so the shipper's choice of railroads is a product of the values they place on each of these characteristics as well as the price.[21] Again, this is an aspect of real markets that the original "one lump" model was not attempting to capture. However, rather than proving CP and KCS have some incentive and ability to foreclose rival railroads after the CP/KCS combination, the fact that shippers view rail service as a differentiated product actually illustrates one of the reasons CPKC would want to continue working with other railroads. The unique characteristics of those other railroads create value for some customers, and the only way to be part of that value is for CPKC to work with the railroad that shipper particularly wants to use.

---

[19] In Professor Salop's model, while one interpretation of downstream competition between carriers is that they each submit a bid to the shipper for a through rate, in the upstream market, the hypothesized monopoly carrier is limited to set a through-rate and there is no bidding or other mechanisms allowed to affect the terms of interchange between railroads. Salop V.S., Appendix C.

[20] Salop V.S., § 3.3.

[21] Sources of product differentiation cited by Professor Salop include distances between shippers' locations to the origin stations, speed, reliability, and frequency of service, other dimensions of customer service, terms of payment, etc. *See* Salop V.S., ¶ 40.

36. In concluding that product differentiation is, instead, a reason to assume that anticompetitive effects are likely, Professor Salop offers only his model and simulations. However, as I discuss next, that model depends critically on another assumption that Professor Salop makes and which is a particularly poor fit to industry practice.

2.2.2. *Professor Salop's theoretical model depends on an assumed tension that disappears if actual conditions in the railroad industry are taken into account*

37. The potential vertical harm Professor Salop asserts with his theoretical analysis is driven by his assumption that railroads have to set interline prices in a specific, limited way. Although economists commonly make similar assumptions in order to simplify vertical relationships into a mathematical model, those assumptions are not necessarily a good description of any particular industry. For railroads, it is not a good description of the way interline rates are actually set and negotiated. Similarly, Professor Salop's simulation analysis is untethered to industry facts and thus provides no basis for the alleged risk of vertical issues from the CP/KCS combination.

38. Professor Salop's theory of vertical harm rests on an assumption that the upstream firm is restricted to employ only a linear pricing mechanism (i.e., the railroad sets or agrees to a price per unit which is the entire arrangement that railroad is allowed to have with its interline partners).[22] Thus, under Professor Salop's basic framework, the upstream railroad with hypothesized monopoly power only has this one contracting

[22] Salop V.S., ¶ 26.

tool – and no other levers – to accomplish two conflicting goals. The first goal is to maximize the size of available joint profits. His hypothesized monopolist could only achieve this goal by *lowering* the price to the downstream firms.[23] The second goal of Professor Salop's hypothesized monopolist is to maximize its own share of the available joint profit. Professor Salop's pricing assumption means the hypothesized monopolist can only accomplish this goal by *raising* its price to the downstream firms.

39. Thus, Professor Salop's framework is built upon an assumed tension. The harm from a vertical merger it predicts is a result of the merger relaxing the restriction created by his linear price assumption. Relaxing this restriction gives the merged firm separate ways to collect profits and set total prices for shippers – that is, the hypothesized monopolist gains direct control of one of the interlining railroad's prices and profits and affects its willingness to work with other railroads where the tension is assumed to constrain it.

40. However, the economics literature has established that a wide range of more creative pricing arrangements resolve the tension inherent in Professor Salop's model and thus eliminate the incentive for any effect of a vertical merger. Essentially, if the two goals (optimize the end price to maximize joint profits and allocate those profits

[23] In particular, the upstream carriers are assumed to influence downstream pricing by offering them through-rate divisions based on the upstream firm's profit-maximizing incentives, which the downstream firms can then use to maximize their profits. *See* Salop V.S., ¶¶ 26, 55, Appendix C, p. C-1.

between the interlining railroads) can be achieved with the pricing tools available to real-world executives, there is no incentive for anticompetitive vertical effects.

41. The kind of prices Professor Salop's model depends on are, at most, the starting point from which actual railroad interline pricing is determined. I understand railroad contract terms may include volume discounts, volume commitments, and service guarantees.[24] Moreover, railroad contracting involves more than setting a unit-price, and contract negotiations play out in ways not contemplated by Professor Salop's model.

42. Unlike in the assumed price setting of Professor Salop's model, in real-world railroad interline pricing there is opportunity for negotiations, with shippers and between interline partners, before final contract terms are set. A shipper may request a combined interline rate from one railroad, which will request and incorporate a rate from its prospective interline partner. When the shipper receives that bid, it can compare the terms with alternatives. It can then return to the railroad with a request for improved terms, including an amount by which the combined rate must decrease

[24] For example, I reviewed a negotiation between KCS and a shipper in which the terms reviewed by KCS management include { [redacted] }. *See* Kansas City Southern, {{ [redacted] }} (Majure R.V.S. Exhibit C-1), p. 10. In another example, this one involving CP, CP renegotiated a contract with {{ [redacted] }}. *See* Email chain from {{ [redacted] }} (Majure R.V.S. Exhibit C-2).

to win the business.[25] At that point, the railroad can begin negotiating with its interline partner over how to adjust their combined bid in order to win the business.[26]

43. A shipper can also request separate rates directly from each interline partner, with the same effect. After receiving these individual bids, the shipper can return to one or both railroads, again with a request for improved terms, including an amount the two would-be interline partners need to reduce their combined rates to win the business. The prospective interline partners can then, again, begin negotiating adjustments to their individual bids in order to reach an effective combined rate that can win the business. In either scenario, a rational shipper will be indifferent to the divisions

[25] I understand such negotiations are common. For example, { }}. *See* Email chain from {{ }} (Majure R.V.S. Exhibit C-3) {{ }

[26] For instance, {{ }}. *See* Email chain from {{ }} (Majure R.V.S. Exhibit C-3). As another example of the negotiations between interlining railroads, consider the interaction between {{ }} *See* Email chain from {{ }} (Majure R.V.S. Exhibit C-4).

between the two railroads, and the two railroads have the ability to negotiate between themselves.

44. Although Professor Salop asserts that his model holds if extended to negotiated rates, he artificially restricts the subject of those negotiations between railroads to be solely over each railroad's per-unit interline rate, which he assumes constitutes the entirety of the arrangement between them. In limiting the contracting to a single term (a linear per-unit price), Professor Salop precludes the possibility that negotiations *simultaneously* address (i) any transfer or split among the railroads and (ii) the end-price (or that the split might make the payments between railroads contingent on or proportional to the rate ultimately negotiated with the shipper).[27] If Professor Salop had included this fact of real negotiations over interline rates, the tension in his model would have been resolved.[28] The hypothesized monopolist would be able to agree

[27] Salop V.S., pp. C-3, D-2. In Professor Salop's negotiation framework, even though both sides of the negotiation know that agreeing to any particular split rate will result in an end price to the shipper that is higher than the rate that would maximize their joint profits, they cannot bring that issue to the negotiating table. That is, they simply take the inefficient markups that will happen after they agree to a split rate as inevitable and proceed to negotiate only over that one tool which, under this assumption, naturally carries the same tension between the same two goals as Professor Salop's model relied upon without negotiation.

[28] Professor Salop claims that his model covers situations when more general contracts (e.g., volume rebates) are negotiated between railroads. He claims in these situations that vertical integration with one competing carrier and foreclosure of the other allows the hypothesized monopoly carrier to extract the full monopoly profit that it could not pre-merger. However, in these situations Professor Salop adds that railroads face an additional contracting constraint – that one competing carrier does not observe the contract terms between the other competing carrier and the hypothesized monopoly carrier. Essentially, there is another goal – coordinating the beliefs of the two interline partners about the overall strategy – to absorb the additional tool (e.g., the volume rebates) which maintains the tension of too many goals for the number of tools he allows in his model. The new contracting issue he notes also has solutions that are recognized in the economics literature. *See* Salop V.S, fn. 10; Patrick Rey and Jean Tirole, "A Primer on Foreclosure," in *Handbook of Industrial Organization*, Volume 3, eds. Mark Armstrong and Robert H. Porter (Amsterdam: North-Holland, 2007), pp. 2145–2220 at pp. 2167–2168.

with interline partners on the end-price and simultaneously negotiate the split of joint profits. And, as I explained above, without that tension there is no incentive in Professor Salop's model for any anticompetitive effect of a vertical integration.

2.2.3. *Professor Salop's simulation model would presume an anticompetitive concern in all vertical mergers in all industries, and incorrectly assumes that only one form of efficiency applies in vertical mergers*

45. Professor Salop's simulations, which are based on his model, are not a reason to expect harm from vertical integration. As discussed above, such harm is an artifact of his modeling assumption that does not fit the reality of railroad pricing. His simulations are also untethered to industry facts beyond the pricing mechanisms. He acknowledges that none of his parameters are calibrated to industry data points.[29] Thus, there is no factual basis for the assertion that these simulations demonstrate a risk of vertical issues from the combination of CP and KCS.

46. In further disregard for actual conditions in the railroad industry, Professor Salop also assumes that one, and only one, form of efficiency applies to vertical mergers. In particular, Professor Salop's pricing assumption creates an efficiency through the elimination of double-marginalization.[30] However, he excludes from his analysis the

[29] Salop V.S., fn. 43 ("In this regard, I want to emphasize that the models are not calibrated.").

[30] Salop V.S., ¶¶ 45–47.

possibility of efficiencies in the form that is actually most relevant to the railroad industry – enhanced quality associated with single-line service.[31]

47. Professor Salop's theoretical framework would presume an anticompetitive concern in *every* vertical merger across *all* industries. Rather than analyze whether the facts of the railroad industry fit his theory, Professor Salop simulates the effects of the merger as if the theory always holds. The only relevant question Professor Salop's approach would allow is to investigate whether the incentive to foreclose is outweighed by the particular efficiency of reduced double marginalization.[32]

48. Given the lack of connection to the railroad industry in Professor Salop's approach, it is not surprising that his presumptions are inconsistent with the Board's fact-based conclusion in all of its past investigations of end-to-end railroad mergers. That is, to the extent constraints prevent railroads from achieving monopoly rents on an entire move through their control of an endpoint, it is not, despite the assumption in Professor Salop's model, a lack of creative pricing mechanisms that constrains them. Moreover, the constraints that bind them are also ones that are not likely to be relaxed to the detriment of shippers just because a merger lets a railroad work more closely with its former interline partner to set a final price to shippers. Professor Salop's theory, which is so disconnected from the relevant facts and realities of the railroad industry, offers no reason to re-examine these basic determinations that both

31 *See*, *e.g.*, Application Statement, § 3.1.

32 Salop V.S., ¶ 51.

incentive and ability for anticompetitive vertical effects are lacking in these end-to-end railroad mergers.

2.3. Dr. Reishus's vertical analysis is internally inconsistent and does not establish that a CP and KCS combination is likely to result in harm

49. Dr. Reishus makes the same straw-man argument of a "one lump" presumption and makes a similar observation as Professor Salop; namely that interline partners possess imperfect information about each other. Nevertheless, unlike Professor Salop, he acknowledges that end-to-end rail mergers are typically pro-competitive with benefits such as providing new single-line service and operational efficiencies.[33] As a reason to believe the CP/KCS combination may be an exception, Dr. Reishus points to a particular fact that would apply at the Laredo gateway – regulation in Mexico against discriminatory pricing.[34] This is, incidentally, the same constraint that Professor Hausman suggested, on behalf of UP, might generate an incentive and ability for vertical effects when KCS was acquiring TM and TFM, and which the Board at the time found unlikely to lead to vertical effects.[35] In an attempt to revive this rejected theory, Dr. Reishus presents a numerical example that he claims illustrates how the regulation could lead to a merger effect.[36] Dr. Reishus's

---

33 Reishus V.S., ¶¶ 23–28.

34 Reishus V.S., § C.

35 *See* Verified Statement of Jerry A. Hausman, *Kansas City Southern – Control – The Kansas City Southern Railway Company, et al.*, Finance Docket No. 34342, August 1, 2003 ("Hausman V.S. 2003"), pp. 11–16.

36 Reishus V.S., Figure 3.

assumption about the way that this regulation operates is incorrect. Even if it did operate as he assumes, though, his illustrative example is not economically coherent and fails to establish the vertical foreclosure incentive and harm to shippers that he claims.

50. Consider how Dr. Reishus's example works. He assumes a monopoly railroad (M) is subject to Mexican regulation. This railroad interconnects with three U.S. railroads (A, B, and C) that are each the only way to serve three different shippers. He also assumes that M sets a single price that applies to all three interconnections, which is the way he assumes the regulation binds M. Specifically, he assumes that this price leaves zero profit for railroads B and C (who each carry their respective traffic at their marginal cost of $10 in his example) but a positive profit for railroad A (who is also assumed to have marginal cost of $10, but a shipper willing to pay $3 more than the shippers B and C serve). If Dr. Reishus's numbers were credible, M would like to charge A more than it charges B and C, but because he assumes Mexican law does not allow any differences in price, he concludes that M has an incentive and ability after a merger with B to raise its price to all three carriers. His assumption that C is already pricing at marginal cost is what makes this model a prediction of anticompetitive effects, as it leads to his conclusion that M's decision would mean foregoing the movement to C's shipper at this higher price.

51. Before getting into why Dr. Reishus's numbers are not credible as a matter of economics, it is worth noting that Mexican regulation does not preclude differences in prices that apply to the segment within Mexico in the way Dr. Reishus assumes in his

example. In particular, Dr. Reishus assumes away the possibility that non-discriminatory prices can include different pricing for otherwise similar shipments that differ by volume. This assumption is contrary to my understanding of Mexican pricing regulation.[37]

52. There is no effect of the merger in Dr. Reishus's numerical example if carrier M can comply with Mexican regulation and set a schedule of rates that is non-discriminatory (in the sense that the same schedule is available to any shipper) but which results in a different effective rate for A's shipper than would apply to B or C. In particular, because Dr. Reishus's simplified example relies on A's shipper handling half the volume, a $3 surcharge on all large shipments would give M all of the possible profit without any effect from a merger while still complying with Mexican regulation.

[37] *See*, *e.g.*, Reply Verified Statement of Oscar Augusto Del Cueto Cuevas, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al*., Finance Docket No. 36500, July 12, 2022, ¶ 25 ("Further, Article 170 of the Mexican Regulations imposes a non-discrimination requirement on rates. Concessionaires may implement discount programs or promotions, but only under equitable conditions and without discrimination, taking into account the specific characteristics of each service such as volume, equipment, and distance. Concessionaires cannot discriminate based on interline partner, unless cost differentiations justify those differences."). *See also* Kansas City Southern de México,{{ }}, KCSR-HC-00020713 – 9 ("{{ }}").

53. Even if Dr. Reishus were correct about the way that regulation in Mexico works, his numerical example only shows the effect it does because he assumes a set of prices and quantities that defy economic principles. In particular, the prices Dr. Reishus assumes are ones that do not constitute an economic equilibrium. That is, one or more of the railroads in his example would make more profit with a different price than with the price he assumes. I illustrate this flaw in Exhibit 1. I show that railroad C would make more profit by charging a higher price – one above marginal costs – than Dr. Reishus assumes.

EXHIBIT 1
Flaws in Dr. Reishus's numerical example

Railroad	Cost[1]	Price[2]	Quantity	Profit[3]	Total Shipper Price Paid	Max Price of Complete Move[4]	Acceptable Total Price For Shipper[5]
Dr. Reishus's prices and quantities pre-merger							
Mexican Railroad							
M	$10	$15	100	$500			
Interconnecting U.S. Railroads							
A	*$10*	*$13*	*50*	*$150*	*$28*	*$28*	*Yes*
B	*$10*	*$10*	*30*	*$0*	*$25*	*$25*	*Yes*
C	$10	$10	20	$0	$25	$25	Yes
Response 1: Carrier C charges $10.50, M does not lower its price[6]							
Mexican Railroad							
M	$10	$15	80	**$400**			
Interconnecting U.S. Railroads							
A	*$10*	*$13*	*50*	*$150*	*$28*	*$28*	*Yes*
B	*$10*	*$10*	*30*	*$0*	*$25*	*$25*	*Yes*
C	$10	**$10.50**	0	$0	$26	$25	**No**
Response 2: Carrier C charges $10.50, M lowers its price[7]							
Mexican Railroad							
M	$10	**$14.50**	100	**$450**			
Interconnecting U.S. Railroads							
A	*$10*	*$13.50*	*50*	*$175*	*$28*	*$28*	*Yes*
B	*$10*	*$10.50*	*30*	*$15*	*$25*	*$25*	*Yes*
C	$10	**$10.50**	20	$10	$25	$25	Yes

Source: Reishus V.S., Figure 3
Note:
[1] The marginal cost per carload for each rail segments.
[2] The rate per carload set by each railroad for its segment.
[3] Calculated as the difference between the price and marginal cost for each railroad multiplied by the quantity.
[4] The maximum rates per carload that can be charged for the shipments to different receivers across the three interconnecting railroads (Reishus's model of shipper demand).
[5] Describes whether the total price paid by the receivers, i.e., the price for the Mexican segment plus the interline price, is no greater than the maximum price that can be charged for the shipments to different receivers in Reishus's model of demand.
[6] In this response, Reishus's model of demand posits that railroad C would have zero quantity becuase the total price charged exceeds the maximum rate from the corresponding receiver.
[7] In this response, railroad M lowers its price to $14.50 per carload which, in Reishus's model of demand, ensures that the movement over railroad C occurs as the total price does not exceed the maximum rate from the corresponding receiver.

54. As I show in the top panel of Exhibit 1, Dr. Reishus assumes that railroad C makes zero profit carrying 20 units of traffic at its marginal cost of $10. But, in an economically rational equilibrium of this example railroad C would not settle for zero profit, and M has no mechanism by which to force C to settle for zero profit. If railroad C in this model charged $10.50, instead, then railroad M would face a choice between continuing to charge $15 as Dr. Reishus assumes (foregoing the traffic with C) and making $400 in profit (Response 1 in the middle panel of the exhibit) or lowering its price to $14.50 to carry all of the traffic and making $450 in profit (Response 2 in the lower panel of the exhibit). As railroad C should expect M to choose the larger profit between these choices, charging $10.50 to make some profit is clearly better for C than making zero profit and Dr. Reishus's assumed behavior for C is not rational.[38]

55. This flaw in Dr. Reishus's numerical example is critical to the effect he uses the example to demonstrate. Recall that the reason he predicts an anticompetitive effect is that, in his example, he assumes railroad C is already pricing at its marginal cost and cannot further lower price to retain the business when M tries to get more of the profit that he assumes is left to A. In an economically rational equilibrium, railroads B and C would not settle for zero profit, and C would not be in the precarious position necessary for Dr. Reishus's prediction. Indeed, this assumption is inconsistent with the realities of the railroad industry. In the real world, railroads earn profits, including

[38] Railroad B would be in a similar position with an ability to make higher profit than Dr. Reishus's numbers assume it would settle for.

on their interline traffic. For instance, UP and BNSF report that in 2019 they earned 39 and 34 percent in operating margins, respectively.[39]

56. More generally, when Dr. Reishus assumes that "railroad M is in a position to capture as much of the available profit as possible" his numbers fail to reflect that the amount that is possible is actually a product of bargaining with the other railroads over the split of profits.[40] That split, the bargaining over it, and the other limitations on a real railroad's ability to earn "as much profit as possible" are the facts that the Board noted as defusing vertical effects from Mexican non-discrimination regulations

[39] Union Pacific Corporation, SEC Form 10-K for period ended December 31, 2019, filed on February 7, 2020, pp. 1–98 at p. 24; Burlington Northern Santa Fe, LLC, SEC Form 10-K for period ended December 31, 2019, filed on February 21, 2020, pp. 1–48 at p. 16. I understand that, in particular, UP and BNSF {{{ }}} on their cross-border traffic through the Laredo gateway. Michael Baranowski has examined the profitability of these routes using RVC ratios, which, for a movement or a set of movements, are calculated as the ratio of revenue to a measure of variable costs (referred to as URCS) which was developed by the Board and is reported in the Confidential Waybill Sample ("CWS"). Mr. Baranowski finds that, on average, in 2019, UP's RVC was {{{ }}}. He also finds that, on average, in 2019, BNSF's RVC was {{ }}. *See* Rebuttal Verified Statement of Michael R. Baranowski, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, July 12, 2022 ("Baranowski R.V.S."), Table 6.

[40] It is also possible that Dr. Reishus may have meant to assert yet another constraint, that M sets its price before any other railroad and is somehow constrained to never change that price. While I am not aware of any evidence that such a constraint applies anywhere in the pricing of interline railroad movements, it is an assumption that sometimes appears in the academic economics literature and would make Dr. Reishus's numbers rationalizable, if not credible, due to a well-studied extreme case of bargaining game theory referred to as ultimatum games. The theory of subgame perfection applied in these games suggests one can predict a party with no profits at stake will act however one chooses (i.e., that Dr. Reishus can assume B and C will carry the traffic if left with zero profit whether they do so or not). Laboratory experiments of ultimatum games, however, have shown repeatedly that it is not credible to assume B or C would make the choice that M wants after M's price setting leaves them with no chance to make a profit of their own. *See*, *e.g.*, Werner Güth, Rolf Schmittberger, and Bernd Schwarze, "An experimental analysis of ultimatum bargaining," *Journal of Economic Behavior & Organization*, 3(4), 1982, pp. 367–388; Daniel Kahneman, Jack L. Knetsch, and Richard H. Thaler, "Fairness and the Assumptions of Economics," *The Journal of Business*, 59(4), 1986, pp. S285–S300.

the last time this possibility was raised. Dr. Reishus's failure to incorporate these considerations in his numerical example makes the scenario he posits irrelevant to the analysis of vertical effects.

3. COMMENTERS' CRITIQUES OF MY ANALYSIS OF LAREDO TRAFFIC AND OTHER EMPIRICAL FORECLOSURE ARGUMENTS ARE FLAWED AND DO NOT CHANGE MY CONCLUSION

57. In my Application Statement, I explained that "neither CP nor KCS would have the incentive and ability as a combined firm to foreclose rivals or otherwise lessen competition as a result of vertical integration."[41] To support this conclusion, I provided analysis of northbound traffic KCSM brings to the Laredo gateway to "illustrate how the overall effects on rivals of a combination of CP and KCS are likely to stem, not from CP/KCS foreclosing those rivals, but from enhanced competition as shippers freely choose newly-created CP/KCS single-line options."[42]

58. In response, Commenters have provided empirical analyses of their own in which they find that KCS handles different shares of traffic when they look at different cuts of data or different subsets of traffic than I did. They point to these different percentages as suggesting that some UP or BNSF traffic may have been foreclosed by KCS in the years since it acquired TFM-TM, and argue that my analysis cannot rule out this possibility. In the rest of this section, I address these analyses, but first, I explain the overarching reason why the approach taken by Commenters is misguided, flawed, and does not show what they claim it shows.

59. In the previous section, I established that Commenters have not offered any new theories to support anticompetitive vertical effects from mergers of end-to-end railroads, such as CP and KCS. Commenters' empirical arguments suffer from this

41 Application Statement, ¶ 12.

42 Application Statement, ¶ 12.

same fundamental flaw – their analyses do not test a theory for how a CP/KCS combination would create a new incentive and ability that my analysis did not already rule out. Instead, they offer empirical observations they claim could be consistent with the outcome of some heretofore-unspecified theories of foreclosure.

60. The analysis I presented in my Application Statement tested, and ruled out, the only foreclosure theory posited by Commenters UP and BNSF at the time of the KCS-TFM-TM merger. The theory implied that KCS could divert a substantial amount of traffic at the Laredo gateway by foreclosing UP and BNSF:

- Professor Hausman, UP's expert witness, pointed to the non-discrimination regulation in Mexico as a constraint and argued that KCS would raise TFM's rate following the merger, disadvantaging UP and hurting shippers with the amount of the increase determined by the ability to give a rebate on traffic diverted to KCS. Thus, for his theory to predict a significant effect on competition, a significant volume of traffic would have to be diverted to KCS.[43]
- Dr. Reishus, BNSF's witness at the time, argued that "to the extent that BNSF provides a competitive discipline to UP at Laredo and Brownsville, this alternative could be lost or reduced if [KCS] were to inefficiently favor its own traffic through its routing over the Laredo and Brownsville gateways." He did not suggest a theory of how the merger would remove some constraint that could generate the requisite incentive or ability for such a prediction. However, he did suggest that BNSF could lose all competitive relevance from KCS foreclosure after the TFM-TM combination, implying a similarly substantial amount of foreclosure.[44]

[43] Professor Hausman claimed that almost half of the traffic at Laredo (corresponding to 75 percent of UP traffic at the time) could be diverted to KCS following the acquisition. *See* Hausman V.S. 2003, pp. 15–16.

[44] Verified Statement of David Reishus, *Kansas City Southern – Control – The Kansas City Southern Railway Company, et al.*, Finance Docket No. 34342, August 4, 2003, pp. 73–74.

61. These theories suggest that the appropriate benchmark is a relatively obvious one. As Professor Salop admits, the shares I report in my analysis are "inconsistent with a claim of complete foreclosure."[45] Professor Hausman's rebate theory may not imply as precise a benchmark, but the implication is clear enough to examine in the data: a finding that, as of 2019, KCS does not handle a substantial fraction of the traffic at Laredo—despite doing so being most consistent with the theorized KCSM power—is sufficient to show that neither of these theories were borne out. Indeed, this is what I found. In my analysis of northbound traffic at Laredo I found that KCS hands over to UP or BNSF {{[redacted]}} of the traffic it takes to Laredo from Mexico.[46]

62. Commenters' response to this is to produce different cuts of my analysis and then to point to the ones where KCS keeps a higher share of movements at Laredo in 2019, suggesting that my analysis cannot rule out *all* potential theories of *partial* foreclosure that could apply to these subsets of traffic.[47] This exercise does not prove that KCS is foreclosing UP or BNSF as interline partners on particular subsets of traffic. In suggesting there is some unrefuted theory of foreclosure that could be consistent with the observed shares, Commenters simply assume that out of all possible reasons shares may have evolved, some partial foreclosure is the relevant explanation.[48] They do not offer any evidence that might help distinguish between

---

45 Salop V.S., ¶ 89.

46 Application Statement, Exhibit 2.

47 Reishus V.S., ¶¶ 62–63, Table 2; Verified Statement of Professor Julie M. Carey and Dr. Albert W. Bremser, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, February 28, 2022 ("Carey/Bremser V.S."), pp. 17–18, Figure 2; Salop V.S., ¶¶ 94–96, Figure 8.

48 Reishus V.S., § 4; Salop V.S., § 5.

their vague, unspecified theories, procompetitive explanations, and other unrelated changes in traffic patterns to explain the differences in shares observed in the data. Instead, their exercise only proves there is a lot of variation in how different subsets of the traffic were affected by the many reasons that shares may change over the intervening 15 years since the KCS-TFM-TM transaction.

63. While Commenters are correct that my analysis cannot rule out *all possible* theories of foreclosure as an explanation of share changes over time, they have not addressed the question of whether any of these possible theories are *relevant.* As I explained above, only one serious theory of potential foreclosure, the theory that was suggested at the time of the KCS-TFM-TM transactions, has actually been suggested; other theories, to the extent they are discernible, are disconnected from the facts of the industry or even from economic principles for the reasons described elsewhere in my statement. My analysis is sufficient to rule out that theory.

64. Thus, to the extent Commenters suggest examining how KCS shares evolved over time relative to a but-for scenario, this greater precision would only be needed to rule out additional theories that were not even suggested at the time of the KCS-TFM-TM transaction. As I discussed in section 2, despite how readily experts have pointed out that presumptions should not govern the analysis of vertical effects, they have collectively failed to present any theories consistent with facts of the railroad industry – beyond what have already been rejected by the Board in past investigations including at the time of the KCS-TFM-TM transactions and again by my analysis – to explain why a CP and KCS combination would create a new incentive and ability to

foreclose. In fact, as discussed in section 2.1.2, with no justification they adopt a presumption that any share gain is the result of anticompetitive conduct.

65. In the rest of this section, I address Commenters' analyses in more detail. I organize my response to their arguments as follows. In section 3.1, I explain that Commenters' analysis of KCS shares of southbound traffic, which naively inverts my analysis of northbound traffic, is theoretically flawed and misleading. In section 3.2, I demonstrate that an examination of cross-border traffic patterns reveal Commenters' analyses comparing shares over time are incomplete, ignore patterns in the data consistent with stronger competition from KCS, and cannot be interpreted as Commenters suggest. In section 3.3, I address Commenters' flawed critique of my use of BEAs to identify destinations where KCS could compete for northbound traffic from Laredo. In section 3.4, I respond to analyses presented by BNSF and demonstrate why they do not provide evidence of KCS foreclosure of BNSF. Finally, in section 3.5, I evaluate Professor Mayo's analysis that he claims identifies risk of foreclosure by CPKC and explain that it is methodologically flawed and based on the unfounded, perverse logic that I discussed in section 2.1.2 – which presumes that all opportunities to compete are opportunities to restrain competition.

3.1. Commenters analysis of southbound traffic is methodologically flawed and misleading

66. Commenters present an analysis in which they naively invert my analysis of northbound traffic to examine southbound traffic moving through Laredo.[49] In this section I explain that, unlike my analysis of northbound flows, Commenters' analyses of southbound flows cannot reliably test the hypothesis that KCS is using its position at Laredo to foreclose its interline partners, UP and BNSF, on southbound movements. To examine the reverse flow of traffic, Commenters' experts would have needed to control for several differences that complicate the interpretations of their analyses. What they have done, instead, is not comparable to the analysis of northbound traffic that I put forward in October and is not informative about KCS's incentive and ability to foreclose its interline partners at Laredo.[50]

67. The foreclosure theories posited at the time of the KCS-TFM-TM merger predict that KCSM would favor KCS on cross-border traffic at Laredo to get a longer haul. For example, according to these theories, KCS may try to hold onto a northbound movement carried to Laredo by KCSM and either deliver it to its final destination or to an interline partner at another gateway located farther into KCS's U.S. network than Laredo.

---

[49] Reishus V.S., ¶¶ 62–63, Table 2; Carey/Bremser V.S., pp. 17–18, Figure 2; Salop V.S., ¶¶ 94–96, Figure 8.

[50] I noted in my Application Statement that an analysis based on reversing the direction of my Laredo traffic flow analysis from northbound to southbound would not be an appropriate test of KCS's potential foreclosure incentives. *See* Application Statement, Exhibit 2, fn. 17.

68. My analysis of northbound traffic provided a direct and clean test of the theory. Laredo is the only gateway through which KCSM can deliver northbound cross-border shipments. Thus, for a shipment moving north from Mexico to the U.S. or Canada, which KCSM delivered to the border, Laredo represents the first gateway along that shipment's route at which KCS could use the alleged market power of KCSM to force a longer haul for itself. This means that Laredo is the gateway at which KCS's incentives to foreclose interline partners would be strongest. By taking over the shipment directly from KCSM at Laredo, KCS maximizes its length of haul. Thus, my analysis of the share of northbound traffic that KCSM hands to UP or BNSF at Laredo tests the posited theory that alleged KCSM market power at Laredo provided KCS with the incentive and ability to foreclose UP and BNSF.

69. It is not possible however to replicate a similar test for traffic headed south to Mexico by examining KCS shares of southbound traffic at Laredo. First, the numerator (i.e., the traffic that KCS carries to Laredo) is not the right measure to serve as a test of the theory, because it obscures any distinction between traffic that was handed off as early as possible and traffic that was not. Southbound traffic arrives at Laredo from multiple origins and could theoretically transit through multiple gateways along the way. Rather than identifying traffic that had a longer haul on KCS than its minimum possible, the numerator used by Commenters merely identifies traffic that KCS handled on both sides of the border. Whether that traffic could have been or was handed off as early as practical, or was held longer than practical, is simply not being tested with this numerator.

70. Second, the denominator used by Commenters is misleading and artificially inflates the share attributed to KCS at Laredo. In focusing on the northbound traffic that KCSM brings to Laredo, I identified a base of traffic to study that allowed for all of the possible market power the theory would assume. That is, the theory assumes that vertical effects might alter the choice of carrier and route north of Laredo, but KCSM has no reason to distort traffic it is already carrying in Mexico. Examining southbound traffic requires considering that the originating carrier, UP, or BNSF, may have reasons to encourage movements over other border gateways. I understand that UP has been working with FXE (particularly once it acquired a 26 percent stake in FXE) to improve the flow of traffic at Eagle Pass.[51] As KCS does not serve Eagle Pass on either side of the border, traffic that UP or BNSF may route over that gateway is missing from the analysis. Taking this traffic out of the denominator – traffic that can only be associated with UP or BNSF's share of overall southbound movements – mechanically inflates the share attributed to KCS at Laredo.

71. Additionally, Commenters' analysis of southbound traffic suffers from a data-availability issue that similarly biases their calculations to show larger shares for KCS. Specifically, shipments that FXE delivers to locales that are alternatives to delivery on KCSM should be included in the denominator of a southbound analysis. Given the {{[redacted]}} amount of traffic that UP and BNSF can be identified as

[51] Union Pacific Railroad, "1999 Fact Book," September 2000, available at https://www.up.com/investors/factbooks/factbook99/factbook99.pdf, p. 24 ("Union Pacific increased its investment in the Ferromex (FXE) railroad from 13 [percent] to 26 [percent]. The FXE is a 4,000-mile rail network serving four of the six gateways to the United States.").

handling at Eagle Pass and Brownsville,[52] the lack of relevant FXE data is a significant flaw in Commenters' analysis of southbound movements.[53]

3.2. Commenters' analyses that compare shares over time and for subsets of traffic ignore patterns in the data consistent with stronger competition from KCS and cannot be interpreted as Commenters suggest

72. In this section, I demonstrate that the analyses Commenters offer comparing shares over time or across different subsets of traffic cannot be interpreted as a reliable test, even of some unspecified theory of partial foreclosure. Despite Commenters' suggestions otherwise, the patterns they observe in the data are likely capturing variations in traffic that follow from procompetitive and other explanations unrelated to whatever vague, unspecified theory Commenters may have in mind.

3.2.1. Growth in traffic at the Eagle Pass gateway may explain some of the patterns in UP, BNSF, and KCS shares presented by Commenters

73. One big change in traffic patterns since the KCS-TFM-TM transactions is the growth of the Eagle Pass gateway. This growth, which Commenters ignore, makes it difficult to assess the evolution over time of traffic that would have been handled into

---

52 *See* § 3.2.1.

53 FXE traffic tapes have not been produced in these proceedings. UP and BNSF traffic tapes – which provide some information on movements handled by FXE – were produced after I submitted my Application Statement. I have not examined whether the information about FXE terminations that may be available in UP and BNSF tapes is sufficient to rectify Commenters' error as the issue with the numerator I describe above would still make such an exercise misleading.

and out of Laredo by UP or BNSF in some but-for scenario without the KCS-TFM-TM transaction.

74. Growth at Eagle Pass may explain some of the seeming loss in UP and BNSF traffic that Commenters point to at Laredo.[54] Analyses presented by Professor Salop and Dr. Reishus of cross-border traffic shares are limited to traffic that crosses the Mexican border at the Laredo gateway.[55] Their analyses do not include traffic crossing the border at the Eagle Pass or Brownsville gateways. To the extent growth at Eagle Pass, in particular, demonstrates that it is an increasingly good alternative to Laredo and that the growth likely includes some traffic that otherwise would have transited at Laredo, looking only at shares of traffic at Laredo over time is misleading. UP and BNSF both handle U.S. traffic into and out of Eagle Pass and Brownsville, while KCS does not connect to either these two gateways.[56] So, growth in UP and BNSF traffic at Eagle Pass or Brownsville mechanically makes KCS appear to be gaining share at Laredo, even if the amount of U.S.-Mexico traffic handled by each railroad did not change.

---

54 For example, as I discuss in section 3.4 below BNSF appears to have shifted {{ }} grain traffic from Laredo to Eagle Pass.

55 Reishus V.S., Table 2; Salop V.S., Figure 8.

56 UP owns tracks to Eagle Pass, where it connects with FXE. BNSF has trackage rights over UP that allow it to directly access the FXE network at Eagle Pass, whereas BNSF's access to Laredo begins in Robstown located around 150 miles away from Laredo. BNSF also has trackage right over UP to access the Brownsville gateway where it connects to KCSM network. *See, for example*, Union Pacific Railroad, "Union Pacific System Map," available at https://www.up.com/aboutup/reference/maps/system_map/index.htm; BNSF Railway, "Mexico System Map," available at https://www.bnsf.com/bnsf-resources/pdf/ship-with-bnsf/maps-and-shipping-locations/mexico-system-map.pdf.

75. El Paso is another gateway to Mexico that can be relevant as an alternative to Laredo, particularly for BNSF. Indeed, as I discuss in section 3.4.3, BNSF has {{[redacted]}}. For example, BNSF traffic {{[redacted]}} on BNSF's main route from Chicago to Southern California (its "Southern Transcon" line), rather than depending on trackage rights over UP as it does to Laredo, Eagle Pass, and Brownsville.[57] Consistent with this, BNSF traffic at El Paso {{{[redacted]}}} since the time of the KCS-TFM-TM transaction.[58] Indeed, as of 2019, BNSF handles {{{[redacted]}}} through El Paso and Eagle Pass than through Laredo and Brownsville.[59]

76. I have not included traffic through El Paso in the analysis of cross-border flows that I present in what follows, however, to avoid possible complications in interpretation. First, UP's network does not appear to have similar advantages for El Paso relative to Laredo (or Eagle Pass), so diversion to El Paso may be a more BNSF-

---

57 *See* § 3.4.3. BNSF's reliance on trackage rights from UP to access Laredo, Eagle Pass, or Brownsville and its connection over owned tracks between El Paso and BNSF's Southern Transcon line at Belen, NM can be seen in BNSF Railway, "Mexico System Map," available at https://www.bnsf.com/bnsf-resources/pdf/ship-with-bnsf/maps-and-shipping-locations/mexico-system-map.pdf; BNSF Railway, "Rail Talk – BNSF Railway's Southern Transcon: Rail's Super Highway," October 23, 2018, available at https://www.bnsf.com/news-media/railtalk/service/southern-transcon.html.

58 BNSF traffic at El Paso {{{[redacted]}}} between 2006 and 2019. A rough estimate of BNSF traffic over El Paso to/from U.S. points east of El Paso shows this traffic has also {{{[redacted]}}}. *See* my workpaper 1.

59 *See* my workpaper 1.

specific phenomenon. Second, even focusing on BNSF traffic, the El Paso gateway is also BNSF's {{{[redacted]}}} for traffic out of the Western U.S.,[60] so excluding El Paso ensures the traffic in my analysis is more focused on traffic that KCS competes for via the Laredo gateway. Nevertheless, the prospect of BNSF substitution to El Paso is a reason to consider my analyses in this section a lower bound.

77. In Exhibit 2, I present cross-border traffic volumes at the Laredo, Eagle Pass, and Brownsville gateways in 2006 and 2019 for UP, BNSF, and KCS.[61] I find that UP and BNSF {{{[redacted]}}} cross-border traffic across these three gateways

[60] Based on comparing BNSF traffic through El Paso, Eagle Pass, Laredo, and Brownsville, I find that the share of El Paso traffic originating or terminating in the Western U.S. is {{{[redacted]}}} than the other three gateways, handling around {{{[redacted]}}} percent of all Western U.S. traffic in 2006 and 2019. *See* my workpaper 1. In his deposition, Mr. Hirsch identified San Diego, CA as the only other BNSF gateway along the Mexican border. According to publicly available traffic data presented by Dr. Reishus the San Diego gateway handles small amounts of traffic. The data presented by Dr. Reishus include two additional gateways: Calexico, CA and Nogales, AZ. Based on its "Mexico System Map," BNSF does not have access to these two other gateways either through its own tracks, nor through trackage rights on UP's network from which these gateways are accessible. *See* Remote Zoom Videotaped Deposition of Paul Hirsch, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, June 3, 2022 ("Hirsch Deposition"), pp. 28–29; Reishus V.S., Figure 2; BNSF Railway, "Mexico System Map," available at https://www.bnsf.com/bnsf-resources/pdf/ship-with-bnsf/maps-and-shipping-locations/mexico-system-map.pdf.

[61] For 2019 traffic, I rely on combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT traffic tapes ("Combined Tapes"). These data provide information on all 2019 movements crossing the Mexican border that involve CP, KCS, UP, or BNSF. Similar traffic tapes are not available in this proceeding for 2006. Thus, for 2006 traffic, I rely on the CWS. Due to limitations in the CWS, for 2006 I approximate cross-border traffic by assuming for traffic observed originating or terminating at one of the border stations at Eagle Pass, Brownsville, or Laredo (and, by extension, Robstown or Corpus Christi by BNSF) that the ultimate origin or the ultimate destination for the movement is in Mexico. This method may understate movements through Eagle Pass because through-movements terminated by FXE in Mexico are not reported in the CWS. The conclusions of my analyses in § 3.2 are qualitatively unchanged if for 2019 traffic, rather than use the 2019 Combined Tapes, I use the same methodology I used for 2006 on the 2019 CWS to approximate cross-border traffic. *See* my workpaper 2.

in 2019 than they did in 2006.[62] While BNSF traffic volume {{{[redacted]}}} between 2006 and 2019.[63] For UP, {{{[redacted]}}}.[64] As overall traffic across the three gateways grew, UP and BNSF cross-border traffic at Eagle Pass grew {{{[redacted]}}}. By 2019, Eagle Pass accounted for approximately {{[redacted]}} percent of all traffic crossing the three gateways, {{{[redacted]}}} percent in 2006.[65]

[62] Considering all three gateways combined, UP {{{[redacted]}}} its total cross-border traffic from {{{[redacted]}}}; BNSF {{{[redacted]}}} its total traffic from {{{[redacted]}}}. *See* my workpaper 3. My analysis is also consistent with {{[redacted]}} BNSF traffic through Mexico since the KCS-TFM-TM transaction that is documented by BNSF. *See* BNSF Railway, {{[redacted]}}, BNSF0002839 – 57 at BNSF0002842.

EXHIBIT 2
Traffic {{{ }}} through Eagle Pass has increased

{{{

}}}

Source: Confidential Waybill Sample, 2006; Combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT Traffic Tapes, 2019; CP Intermodal Containers to Railcar Conversion Factor.xls
Note: This analysis considers traffic southbound and northbound to/from Mexico, including movements identified in the CWS and the Combined Tapes as terminating/originating in Mexico and passing through the Laredo, Eagle Pass, and Brownsville gateways, or movements identified in the 2006 CWS as terminating/originating in the SPLC of Laredo (including SPLCs for Robstown/Corpus Christi for BNSF), Eagle Pass, or Brownsville, regardless of rebill code. Movements are considered handled by a carrier if the carrier is observed handling the movement to the gateway or terminating/originating the shipment at the SPLC of a gateway. Volume of traffic is reported in expanded carloads when relying on the CWS. Intermodal units in the 2006 CWS and in the Combined Tapes are converted to carloads using 4.7 units per flat car, which corresponds to a system average for CP in 2019.

78. The {{{ }}} is consistent with evidence of investments made by UP to improve the quality of its service at Eagle Pass and encourage shippers to use UP's routings through Eagle Pass for movements between Mexico and the U.S. For example, by 2015, UP expanded its

Eagle Pass yard capacity and constructed double track infrastructure.[66] In the same year, it expanded its "Eagle Premium Service" offered in conjunction with FXE for intermodal and automotive traffic.[67] UP currently advertises its Eagle Premium intermodal service as the "Industry's Best Mexico Service."[68]

79. In light of this significant growth of Eagle Pass, Commenters are incorrect to focus on traffic only at Laredo. By calculating shares only at the one gateway, they incorrectly ignore the fact that changes over time in the choice among border gateways generates an artificial appearance of increases in KCS's share.

3.2.2. Procompetitive or innocuous factors that would have affected shares have been ignored by Commenters which invalidates their conclusion that any changes in UP, BNSF, and KCS shares can be attributed to anticompetitive effects

80. In addition to the growth at Eagle Pass discussed in the prior section, many other changes across more than 15 years since the TM and TFM transactions will have affected traffic patterns – including changes that reflect the enhanced competitiveness of various movements. In particular, Commenters fail to account for any efficiencies

of single-line service created by the merger of KCS with TM and TFM. Commenters also ignore the effect of countless other factors, instead attributing any differences in KCS's share over time for all border traffic or for subsets of traffic to a possibility of some partial foreclosure theory.

81. In Exhibit 3**,** I show the volume of traffic that each of UP, BNSF, and KCS carried to and from the Mexican border through one of the three gateways, Laredo, Eagle Pass, and Brownsville, in 2006 and in 2019. The exhibit presents the same volume figures shown in Exhibit 2 above, but considers the direction in which the traffic flows rather than the gateway through which it goes, first combining northbound and southbound traffic, and then showing each direction separately. Each bar shows the traffic handled by each of UP, BNSF, and KCS.

EXHIBIT 3
Traffic through the three Mexican gateways increased from 2006 to 2019 {{{[redacted]}}}

}}}

Source: Confidential Waybill Sample, 2006; Combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT Traffic Tapes, 2019; CP Intermodal Containers to Railcar Conversion Factor.xls

Note: This analysis considers traffic southbound and northbound to/from Mexico, including movements identified in the CWS and the Combined Tapes as terminating/originating in Mexico and passing through the Laredo, Eagle Pass, and Brownsville gateways, or movements identified in the 2006 CWS as terminating/originating in the SPLC of Laredo (including SPLCs for Robstown/Corpus Christi for BNSF), Eagle Pass, or Brownsville, regardless of rebill code. Movements are considered handled by a carrier if the carrier is observed handling the movement to the gateway or terminating/originating the shipment at the SPLC of a gateway. Volume of traffic is reported in expanded carloads when relying on the CWS. Intermodal units in the 2006 CWS and in the Combined Tapes are converted to carloads using 4.7 units per flat car, which corresponds to a system average for CP in 2019.

82. Consistent with what I presented in Exhibit 2, total traffic between the U.S. and Mexico through these three gateways, combining both northbound and southbound movements, increased {{{[redacted]}}}. The {{{[redacted]}}} demonstrate that

traffic patterns are likely to have changed significantly for reasons other than any possible foreclosure by KCS.

83. Looking at the northbound traffic, I find increases in volume {{{ }}} relative to 2006. {{{ }}} These patterns show an expansion of northbound traffic, not an anticompetitive reduction in output. Regardless of what interpretation Commenters may put on shares, their failure to consider the expansion in overall traffic belies their supposition that this data suggests KCS may have made the markets for this traffic less competitive.[72]

84. A review of southbound traffic supports the same point. Overall southbound traffic volume also increased between 2006 and 2019. {{{ }}} Looking more closely at the

69 *See* my workpaper 7.

70 *See* my workpaper 7.

71 *See* my workpaper 8.

72 When I look at the data for the specific commodity types (automotive and intermodal) that constituted about {{{ }}} percent of northbound movements in 2006, I find similar patterns. Total volumes handled by {{{ }}} between 2006 and 2019. *See* my workpaper 9.

73 *See* my workpaper 10.

74 *See* my workpaper 10.

commodity composition of the southbound traffic reveals that many different factors have likely affected the changes in shares for each carrier.

85. In Exhibit 4, I present southbound cross-border traffic for different commodity types. I categorize commodities according to the same "lines of business" that Brown and Zebrowski used for their diversion analysis: Automotive, Energy, Grain, Intermodal, and Other.[75] KCS's {{{ }}}. However, the situation appears to vary considerably from category to category which suggests that category-specific factors are particularly important to understanding these changes.

[75] The "Other" category combines all other lines of business considered by Brown and Zebrowski. *See* Verified Statement of Richard W. Brown and Nathan S. Zebrowski, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, October 28, 2021 ("Brown/Zebrowski V.S."), ¶ 25.

EXHIBIT 4
Decomposition of southbound traffic through the three gateways by carrier and commodity type

{{{ [redacted] }}}

Source: Confidential Waybill Sample, 2006; Combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT Traffic Tapes, 2019; CP Intermodal Containers to Railcar Conversion Factor.xls
Note: This analysis considers traffic southbound and northbound to/from Mexico, including movements identified in the CWS and the Combined Tapes as terminating/originating in Mexico and passing through the Laredo, Eagle Pass, and Brownsville gateways, or movements identified in the 2006 CWS as terminating/originating in the SPLC of Laredo (including SPLCs for Robstown/Corpus Christi for BNSF), Eagle Pass, or Brownsville, regardless of rebill code. Movements are considered handled by a carrier if the carrier is observed handling the movement to the gateway or terminating/originating the shipment at the SPLC of a gateway. Volume of traffic is reported in expanded carloads when relying on the CWS. Intermodal units in the 2006 CWS and in the Combined Tapes are converted to carloads using 4.7 units per flat car, which corresponds to a system average for CP in 2019. I use the line of business ("LOB") classifications that were part of the backup materials to the Brown/Zebrowski V.S., which categorize 7-digit STCCs into coarser commodity groupings.

86. For example, Automotive movements from the U.S. to Mexico are a declining area of traffic {{{ [redacted] }}} but are also the only category with overall declines – likely a result of new auto manufacturing facilities in Mexico.[76] The reduced

[76] According to a study by the Federal Reserve Bank of Chicago, Mexico light vehicle production increased from around 1.5 million in 2004 to almost 3.5 million in 2016. The study notes that most of the increase in auto output was exported, with the United States remaining the principal

{{{ }}} traffic in this commodity seems to be explained by the overall decrease in this type of movement, rather than as a consequence of some foreclosure by KCS. {{{ }}}.[77] Southbound Automotive volume handled by KCS {{{ }}}, while BNSF handled {{{ }}} of southbound Automotive traffic in either year.[78] Rather than suggesting a diversion of traffic, as Commenters' comparisons would suggest, these changes suggest the most important factor to explain this traffic is the overall decline in demand for such movements.

87. For the Energy category, which also includes chemicals and plastics, total southbound volume increased by {{{ }}} carloads in 2006 to {{ }} in 2019.[79] Although KCS {{{ }}} its volume of southbound Energy traffic {{{ }}} over this period, UP

destination. *See* Thomas H. Klier and James Rubenstein, "Mexico's Growing Role in the Auto Industry Under NAFTA: Who Makes What and What Goes Where," *Economic Perspectives*, 41(6), September 2017, available at https://www.chicagofed.org/publications/economic-perspectives/2017/6, pp. 5, 23. As of 2020, Mexico produced about 3.0 million automobiles and exported about 2.7 million automobiles. *See* Reuters, "Mexican auto production falls for fourth year running," January 10, 2022, available at https://www.reuters.com/business/autos-transportation/mexican-auto-production-falls-second-year-running-2022-01-07/.

78 *See* my workpaper 12.

79 *See* my workpaper 13.

volumes {{{[redacted]}}} and BNSF volumes {{{[redacted]}}}.[80]

88. The expansion of Energy traffic moving from the U.S. to Mexico over this time period is consistent with a liberalization in the Mexican energy sector which began in 2013 and by 2016 allowed for Mexican receivers to import refined energy products.[81] The regulatory change opened up new southbound business for U.S. carriers to compete for. Thus, changes since the KCS-TFM-TM transaction in shares of southbound traffic handled by UP, BNSF, and KCS would not reflect changes in the terms of interconnecting existing traffic, as Commenters' comparisons would suggest, but would mostly reflect each carrier's relative ability to win this new business moving refined energy products to Mexico. To that extent, the single-line service enabled by the KCS-TFM-TM transaction was particularly relevant in helping shippers served by KCS's U.S. network efficiently reach new markets in Mexico.[82]

---

[80] In 2006 {{{[redacted]}}}, in 2019 {{[redacted]}}. For Intermodal traffic, {{{[redacted]}}}. *See* my workpaper 14.

[81] David Alire Garcia, "UPDATE 1-Mexico fuel prices to begin liberalization at end of March," *Reuters*, December 21, 2016, available at https://www.reuters.com/article/mexico-gasoline/update-1-mexico-fuel-prices-to-begin-liberalization-at-end-march-idINL1N1EG0PN.

[82] For example, as Mr. Naatz explains in his Reply V.S., in December 2017, ExxonMobil began shipping gasoline and diesel fuel from the Jefferson Energy Terminal near Beaumont to San Luis Potosi and San Jose Iturbide, in Mexico. UP, BNSF and KCS all have access to the Jefferson Energy Terminal and bid for this traffic. KCS won the contract with Exxon. *See* Reply Verified Statement of Michael J. Naatz, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, July 12, 2022 ("Naatz R.V.S."), ¶ 44. As Mr. Naatz explains, unlike UP or BNSF, KCS can offer single-line service to and has rail infrastructure in the eastern part of Mexico, which, at the time, was the focus of Exxon's strategy for the commercialization of gasoline and diesel. *See* Naatz R.V.S., ¶ 45.

89. For the Grain category, the pattern is again different. Total grain shipments increased by about {{{ }}} percent.[83] {{{ }}}.[84] But, the fact that KCS has {{{ }}} its grain shipments is completely understandable as a result of competing effectively through its relationship with Bartlett Grain.

90. Bartlett is a major shipper of grain to Mexico,[85] and over the past two decades has become KCS's largest grain customer.[86] Over this time, KCS and Bartlett have invested in and built a mutually beneficial partnership. In the 2005-2006 timeframe KCS introduced a shuttle train service for grain, partly in response to Bartlett's interest in a 75-car cross-border service.[87] Their collaboration continued to grow and KCS and Bartlett signed a long-term contract in 2012.[88] Since signing the contract with KCS, Bartlett has made considerable investments in its grain operations, including the launch of a new multimillion-dollar grain elevator facility in

83 *See* my workpaper 15.

87 Naatz R.V.S., ¶ 93.

88 Naatz R.V.S., ¶ 93.

Jacksonville, IL,[89] upgrades at other U.S.-based elevator facilities,[90] and the acquisition and further expansion of facilities in Mexico at Aguascalientes in 2015, Cuautitlan in 2017, and San Louis Potosi in 2019.[91] Over the same period, KCS has also made investments in their grain service infrastructure, with the goal of improving reliability and reducing cycle times.[92] This mutually beneficial relationship has resulted in KCS's grain shipments for Bartlett {{ }} carloads in

[89] Bartlett invested $25 million in the construction of the Jacksonville, IL grain terminal. The terminal, located on a KCS line, launched operations in July 2013 with capacity for about 2.2 million bushels of grain and the ability to accommodate 100-cars trains. According to commentary by KCS at the time, the facility added another strategic origination point from which KCS could service Bartlett grain shipments and would "enhance the supply chain to Mexico." *See* Progressive Railroading, "KCS helps Bartlett Grain inaugurate Illinois facility, installs Smith as AVP," August 12, 2013, available at https://www.progressiverailroading.com/kansas_city_southern/news/KCS-helps-Bartlett-Grain-inaugurate-Illinois-facility-installs-Smith-as-AVP–37236.

[90] Naatz R.V.S., fn. 34 ("Facilities that Bartlett upgraded include the Council Bluffs north facility in 2013, the Kansas City River Rail facility in 2014, the Council Bluffs south facility in 2016, and the Atchison, Kansas elevator in 2019.").

[91] Verified Statement of Mr. Bob Knief, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, June 20, 2022, ¶ 9 ("To support our Mexico business, Bartlett has bought and made significant investments in three train unloading facilities in Mexico. Specifically, we bought facilities at Aguascalientes in 2015, Cuautitlan in 2017, and San Louis Potosi in 2019. Each of those has been expanded since we purchased them to add capacity.").

[92] For example, a KCS ordinary course document indicates that {{ }}. *See* {{ }} (Naatz R.V.S. Exhibit 1), p. 5. Also in 2013 KCS invested in 450 jumbo grain hoppers to support its grain franchise and had upgraded approximately 40 percent of the corridor between Monterrey and Laredo which allowed it to increase train speeds. *See* Kansas City Southern, "2013 Annual Report," March 2014, available at https://www.annualreports.com/HostedData/AnnualReportArchive/k/NYSE_KSU_2013.pdf, "Letter to Our Stockholders."

2003 to {{ }} in 2019.[93] As of 2019, Bartlett accounts for over {{ }} percent of KCS grain shipments through Laredo.[94]

91. Commenters' failure to account for these and many other possible procompetitive and innocuous changes underlying the changes over time in each carrier's share makes their attempted attribution of any differences in KCS's share over time for all border traffic or for subsets of traffic to a possibility of some partial foreclosure theory meaningless.

3.3. BNSF and CSXT's argument that I have defined areas served by KCS too broadly is flawed

92. In my analysis of northbound Laredo traffic, I rely on U.S. BEA areas to identify destination areas that "KCS serves."[95] Admittedly, this label could have been clearer, and at deposition I did clarify that the point was to capture an area where KCS has had the potential to win business that it either directly serves or could have served.[96] That is, if the opposition theory in KCS-TM-TFM were correct, the BEA area around KCS's current service should be where KCS's hypothesized foreclosure allowed it to expand service by inducing customers to transload, relocate, build out, etc., as well as by inducing a switch of directly served locations.

93 Naatz R.V.S. Figure 6, Workpaper – HC – Bartlett KCS Grain Cars Shipped.

94 *See* my workpaper 17.

95 Application Statement, Exhibit 2.

96 Remote Videotaped Deposition of W. Robert Majure, Ph.D., *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, February 7, 2022 ("Majure Deposition"), pp. 194–195.

93. Dr. Reishus and Drs. Carey and Bremser criticize my use of the BEA area, and present a version of my analysis that replaces the BEA area with a more narrowly defined area. In this section, I respond to their arguments and explain that my use of BEA areas was reasonable and that their analyses exclude relevant forms of competition between railroads, which renders the KCS shares they present unreliable for the purposes of testing any alleged theory of KCS foreclosure.

94. In my analyses, the BEA area defines the endpoint (origin or destination) for a particular movement or corridor, and is used to reflect the area over which competition could be realized over time between two railroads that both serve the area.[97] Thus, in identifying the size of the area used to define endpoints, it is important to consider whether, of all the different ways that two nearby railroads may compete, the identified area captures the relevant ones. The Board has identified a number of ways that nearby railroads can compete that it views as relevant in examining a proposed transaction, such as a CP/KCS combination.[98] As I explained in my Application Statement and again in my deposition, BEA areas are well suited to capture the possibilities contemplated by the Board,[99] and are a "reasonable

---

97 Majure Deposition, p. 112:4–10.

98 Specifically, the Board asked about the possibility of the "elimination of shippers' buildout, transloading, plant siting, and production shifting choices when two railroads serving overlapping areas merge." *See* Application Statement, ¶ 45; Majure Deposition, p. 110:10–23; and *Canadian National Railway Company, et al. – Control – Kansas City Southern, et al.,* Finance Docket No. 36514 (Decision No. 5 served Aug. 31, 2021), p. 4.

99 Application Statement, ¶ 47 ("The factors used to construct a BEA area correspond well to the kinds of economic decisions underlying local competition possibilities that have been considered by the Board.").

representation of areas in which a shipper is likely to look for 'nearby' railroad competition."[100]

95. Yet, Commenters argue my choice of BEA areas is too broad, and propose narrower areas to define corridor endpoints. While Dr. Reishus and Drs. Carey and Bremser suggest different alternative areas, both proposals suffer from the same fundamental error – they exclude forms of competition between railroads that are relevant to my analysis and thereby bias upwards the KCS shares they present.

96. Dr. Reishus uses the Brown-Zebrowski diversion methodology to narrow the definition of areas where "KCS serves," suggesting this methodology is a "better, if imperfect, categorization of traffic moving through the Laredo gateway that KCS could potentially serve in single-line service in competition with UP and BNSF."[101] Yet, in making this assessment, Dr. Reishus mistakenly ignores the implications for his test of using two fundamentally different approaches to identifying areas of potential railroad competition. The approach contemplated by the Brown-Zebrowski diversion study is appropriately focused on areas around its current service where a railroad is most likely to expand its service in a relatively short time. By restricting attention to such areas, rather than all areas where a railroad is reasonably likely to offer competitive options to shippers, Dr. Reishus is effectively counting KCS's share only where it was already most likely to offer service. Dr. Reishus offers no

100 Application Statement, ¶ 46.

101 Reishus V.S., ¶ 77.

adjustment or explanation to make this measure a relevant test of any foreclosure theory.

97. The goal of the Brown-Zebrowski diversion study, as I understand it, is to identify traffic that would be most readily available for potential diversion by a new CP-KCS single-line service "within three years" of the CP/KCS combination.[102] My subject—potential effects on competition—incorporates a longer time horizon and considers additional potential competitive scenarios, which the Board identified and which I discussed in my Application Statement.[103]

98. Applying the Brown-Zebrowski approach to an analysis looking at how competition could have evolved over the 15 years since the TFM and TM transactions would inherently exclude much of the relevant shipper activity and, instead, over-focus on the most likely traffic to be served by KCS. In particular, over this longer horizon the potential forms of railroad competition that are relevant includes shippers relocating within a community, transloading, or building out. As I explained above, the BEA area is a reasonable and reliable representation for this purpose.

99. Thus, by applying the Brown-Zebrowski methodology to define what areas "KCS serves," Dr. Reishus constructs a measure based on the traffic *already* most likely to

---

[102] Brown/Zebrowski V.S., ¶ 27 ("…opportunities we expect would experience some level of traffic diversions within the *three years* following consummation of the CP/KCS merger.") (emphasis added).

[103] For example, Brown and Zebrowski note, "Our analysis…does not consider other potentially significant traffic opportunities that would arise from …investments by CP/KCS in growth opportunities unlocked by a combined CP/KCS network." *See* Brown/Zebrowski V.S., fn. 1.

see KCS service, without any adjustment to reflect the correspondingly higher expectation that KCS would serve this traffic in any event. The fact that he finds in his Table 6 a higher share for KCS within this restricted set of traffic is due to the nature of the restriction and not a valid way to test any alleged theory of KCS foreclosure.[104]

100. Drs. Carey and Bremser make a similar, and arguably more extreme, version of Dr. Reishus's error. Drs. Carey and Bremser apply an even narrower definition of what constitutes the relevant forms of competition between railroads for the purpose of testing alleged KCS foreclosure. Specifically, they assume KCS's ability to compete for traffic is limited to traffic that is originating from or destined for stations (9-digit SPLCs) that KCS currently serves.[105] As I explained in my Application Statement, defining an endpoint very narrowly, like Drs. Carey and Bremser have, only allows for very restricted forms of competition between railroads.[106] Such a narrow definition of competition does not allow for many of the ways the Board has recognized that railroads could compete over time for traffic in an area. More critically, this further restriction around traffic KCS is most likely to serve, further inflates KCS's expected share. Indeed, their methodology approaches counting KCS's share among its existing customers. With no recognition of this effect of their

104 Reishus V.S., Table 6.

105 Carey/Bremser V.S., pp. 18–19, Figure 3.

106 Application Statement, ¶ 44 ("For example, one candidate for defining a corridor's endpoints might be the exact location at which a movement starts and the exact location at which it ends. Such a narrow definition would count only competition among railroads that serve these exact locations and would not allow consideration of other potential forms of competition.").

restrictions, the KCS shares presented by Drs. Carey and Bremser in their Figure 3 are unreliable for the purposes of testing any alleged theory of KCS foreclosure.

3.4. Dr. Reishus's incomplete and misleading analysis does not support his claims that BNSF has been foreclosed by KCS

101. I now turn to the claims made by Dr. Reishus that BNSF has been foreclosed by KCS at Laredo after the TFM-TM transaction. Dr. Reishus asserted that, according to BNSF's witness Mr. Paul Hirsch, a rate increase that KCS put in place for cross-border movements after the TFM-TM transaction resulted in a decline of BNSF carload traffic at Laredo. Dr. Reishus portrayed this price increase as a unilateral move by KCS, like Mr. Hirsch, and suggested that this is inconsistent with a lack of vertical anticompetitive effects following a vertical merger.[107] In support of this claim, Dr. Reishus has presented an analysis of BNSF cross-border traffic at Laredo and asserted these patterns, showing a decline in carload traffic since the TFM-TM acquisitions, as evidence in support of his claim of foreclosure by KCS at Laredo.[108]

102. In this section, I first explain why Dr. Reishus mischaracterizes and misinterprets the rate increase following the TFM-TM transaction (§ 3.4.1). I then explain that the analysis Dr. Reishus presents as supporting his foreclosure claim cannot distinguish between his vague claims of foreclosure, procompetitive

[107] Reishus V.S., ¶ 82, fn. 71; Verified Statement of Paul Hirsch, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, February 28, 2022, BNSF-9-192 – 211, p. 7.

[108] Reishus V.S., ¶¶ 83–87.

explanations, and other unrelated changes in traffic patterns to explain the differences in shares and traffic volumes observed in the data (§ 3.4.2). Next, I demonstrate that by looking only at Laredo Dr. Reishus ignored the fact that BNSF can route Mexican traffic across the border through other gateways, and thus omits important context for evaluating his foreclosure claim. Indeed, his approach assumes away the strategy BNSF appears to have taken following the KCS-TFM-TM transaction (§ 3.4.3). Finally, I revisit the data presented by Dr. Wilson and illustrate how this traffic illuminates the flaws in BNSF's allegation that it has been foreclosed at Laredo (§ 3.4.4).

3.4.1. Dr. Reishus mischaracterizes and misinterprets the KCS rate increase he claims foreclosed BNSF

103. Dr. Reishus's characterization of BNSF's experience since the TFM-TM merger is premised on the presumption that KCS increased a particular rate in order to foreclose BNSF.[109] However, one long-recognized benefit of mergers is that new management can lead to better decision making. That appears to be what happened with the rate Dr. Reishus references in his analysis. As I explain below, KCS management identified a rate that was insufficient to cover costs and thus inconsistent with profit-maximizing behavior. Bringing that rate up for the first time in about a decade ended a particularly favorable deal for BNSF, but facing market rates (or even

[109] Reishus V.S., ¶ 82.

rates sufficient to cover the other railroad's costs) is not at all the same as being foreclosed.

104. Following the KCS acquisition of TM, the management of KCS reviewed the price TM had been charging on the 150-mile stretch that connects BNSF's network at Robstown/Corpus Christi to the Laredo gateway. At the time, the rate was approximately $260 and had not been raised in years.[110] After the acquisition of TM, KCS's management announced a new rate of $525 and maintained it at that level until 2015 when it increased it to $595, the level at which it currently stands.[111] I understand with these increases, KCS rates exceed the variable costs it likely incurs on such movements, but by a small margin.[112] This in turns implies that, at a $260 rate, these movements were most likely unprofitable for TM.[113]

---

110 Naatz R.V.S., ¶ 12 ("At the time KCS took control of Tex Mex, Tex Mex was offering BNSF a rate of $260 per car if BNSF hit certain volume requirements, which I am told they always did."); ¶ 14 ("It is true that KCS did raise Tex Mex's division requirements. KCS did so because the then rates existing prior to the merger were not remunerative and had not been raised in years.").

111 Naatz R.V.S., ¶ 18 ("After control was implemented, KCS did raise its rate for movements over the Tex Mex rail lines, initially to $525 and now, with adjustements, it stands at $595.").

112 In his R.V.S., Michael Naatz, Chief Marketing Officer of KCS, has calculated that the RVC ratio of KCS rates to 2020 URCS variable costs on the Robstown to Laredo route and on the Corpus Christi to Laredo route are equal to 114 and 107 percent, or $75 and $43 over URCS variable costs, respectively. Mr. Naatz also calculated that at the time when KCS first increased the rates, these ratios stood at 121 and 115, or $96 and $71 over 2006 URCS variable costs, respectively. *See* Naatz R.V.S., Tables 1, 2.

113 Naatz R.V.S., ¶ 21 ("I did not have access to the 2004 URCS costs, but the 2004 costs should not be that dissimilar to the 2006 costs. Assuming such 2004 URCS costs were like those in 2006, and when one considers that prior to 2005 Tex Mex was charging approximately $260 per car or less for grain, intermodal, and automotive traffic, Tex Mex *was charging hundreds of dollars less than URCS costs*.") (emphasis in original).

105. BNSF was understandably not pleased that these rates increased. But rather than negotiate, BNSF reportedly decided to route more traffic over Eagle Pass by offering a price for its single-line service to Eagle Pass that is lower than what the through-rate would be for a BNSF-KCS interline to Laredo. This would encourage BNSF shippers to use the Eagle Pass crossings instead of Laredo.[114]

106. According to testimony by Mr. Hirsch, BNSF was forced to pursue this strategy of shifting to Eagle Pass because the increase in rates proposed by KCS would force BNSF to {{[redacted]}} to service Mexican traffic via Laredo.[115] However, it is telling to compare the markup on this rate to the markup on rates BNSF charges its shippers on the Mexican traffic it does serve via Laredo. Mr. Naatz reported that the rate KCS currently charges BNSF to Laredo is 7 to 14 percent above its URCS variable costs,[116] while I understand the markup BNSF charges shippers is on average {{{[redacted]}}} percent above its URCS variable costs for carload

---

114 Naatz R.V.S., ¶ 6 ("It is BNSF that is intentionally keeping its division requirement high and has steadfastly refused to lower its division requirements to make a joint BNSF/KCSR interline movement competitive with UP or the BNSF single-line movement."); ¶ 23 ("We understand from customers that BNSF's single-line rates to Eagle Pass at grain origins where BNSF, KCS, and/or UP compete are lower by approximately the difference between the current KCSR rate and the original $260 Tex Mex rate.").

115 Hirsch Deposition, pp. 149:11–150:14 ("{{[redacted]}}").

116 Naatz R.V.S., Table 1.

traffic and {{{ }}} percent above URCS for intermodal traffic, {{{ }}}.[117] So, what BNSF considers acceptable for shippers to pay is apparently {{{ }}} than it considers acceptable for KCS to charge it. Indeed, as these ratios suggest, BNSF's claim is not one of foreclosure as much as it is an admission that reducing its division slightly and continuing to {{{ }}} movements through Laredo was not as attractive as the profit it could make serving Mexico through Eagle Pass. By choosing, instead, to focus on Eagle Pass and to price so that shippers are encouraged to choose Eagle Pass, BNSF has exercised a competitive option. And, as much as foreclosure is not defined as an inability to get and set the prices BNSF finds acceptable, foreclosure is particularly not defined by BNSF engaging in competitive options to avoid even a small reduction in its margins.

107. The evidence on which Dr. Reishus relies to characterize this particular rate change as anticompetitive is inadequate for such a conclusion. He has only noted that the rate increased,[118] and has not demonstrated that it increased to some supracompetitive level. He has not examined the effect of the price change on competition – he has not looked at whether any of BNSF's Laredo traffic was diverted to KCS or to UP. In addition, to the extent any traffic was diverted and

[117] Mr. Baranowski finds that, on average, in 2019, BNSF's RVC was {{ }}. *See* Baranowski R.V.S., Table 6.

[118] Reishus V.S., ¶ 82.

ended up on UP, he has not explained why such an outcome would be anything other than a consequence of BNSF's refusal to negotiate over a market rate.

108. Rather, the analysis Dr. Reishus has presented is a recitation of share and volume changes since the TFM-TM combination that provide no way to distinguish between his vague claims of foreclosure, procompetitive explanations, and other unrelated changes in traffic patterns to explain the differences in shares observed in the data.

3.4.2. Dr. Reishus's analysis cannot distinguish his hypothesis of foreclosure from the many unrelated factors that affect BNSF traffic volumes and shares

109. Evidence from BNSF ordinary course documents makes clear that many factors other than alleged foreclosure caused these traffic share changes, and that there is a lot of variation in how different subsets of the traffic were affected over the intervening 15 years since the KCS-TFM-TM transaction. Dr. Reishus does not attempt to control for these factors, does not identify any change in shares that is not explained by them, and consequently does not identify any change that would be explained by his hypothesized foreclosure.

110. First, BNSF documents highlight changes in Mexican cross-border traffic for BNSF (and other railroads) that correspond to changes in macroeconomic trends, such as the strength of the Mexican economy and overall Mexican-U.S. trade volume. This includes {{[redacted]}} in both the macroeconomic indicators and in traffic which

happened to follow the KCS-TFM-TM transaction. Dr. Reishus's analysis would associate these {{ }} in traffic with his alleged foreclosure. For example, {{ .}} Yet, BNSF documents highlight that at this time Mexico's economy was slowing considerably, and {{ }}[119] After 2009, the Mexican economy and total Mexico-U.S. trade increased, and {{ }}[120]

111. Second, although Dr. Reishus points to aggregate changes in overall Mexican cross-border BNSF traffic, BNSF documents demonstrate that these aggregate

[redacted]}} – factors specific to this line of business and not indications of any foreclosure by KCS. Dr. Reishus's analysis cannot account for the many different factors that affected specific categories of BNSF traffic, and thus cannot distinguish any effect to associate with his alleged foreclosure from the many unrelated reasons that BNSF traffic volumes may have changed over the last 15 years.

113. Finally, BNSF documents demonstrate {{[redacted]}} Since at least 2008, BNSF has systematically tracked {{[redacted]}}[125] An examination of these reports suggests that while {{[redacted]}} This pattern is consistent with competition from UP affecting BNSF volumes.[126] Dr. Reishus's

[125] *See*, *e.g.*, BNSF Railway, {{[redacted]}}, BNSF0002814 – 28 at BNSF0002820; BNSF Railway, {{[redacted]}}, BNSF0002839 – 57 at BNSF0002846, BNSF0002849; BNSF Railway, {{[redacted]}}, BNSF0002798 – 813 at BNSF0002806, BNSF0002807; and BNSF Railway, {{[redacted]}}, BNSF0002910 – 29 at BNSF0002913, BNSF0002916.

These patterns in { [redacted]

analysis, however, does not consider this possibility – changes in BNSF cross border traffic volumes that were the result of competition with UP would be incorrectly ascribed in his analysis to his hypothesized foreclosure of BNSF.

3.4.3. Dr. Reishus' analysis only looks at traffic to Laredo ignoring the fact that BNSF can route Mexican traffic across the border through other gateways

114. Another flaw in Dr. Reishus's analysis is that he looked only at BNSF's traffic to Laredo and not the ease with which BNSF has substituted other border gateways in its offerings to shippers. As I discussed above, BNSF electing to use a competitive option rather than sacrifice any of its margin on Mexican traffic by adjusting divisions on the Laredo route is not an example of foreclosure. By excluding BNSF's use of options other than Laredo for its Mexican traffic, Dr. Reishus's analysis incorrectly treats this traffic as evidence of foreclosure when it is not.

115. {{

}} *See* BNSF Railway, {{ }}, BNSF0002839 – 57 at BNSF0002846; BNSF Railway, {{ }}, BNSF0002798 – 813 at BNSF0002806; BNSF Railway, {{ }}, BNSF0002910 – 29 at BNSF0002913.

[redacted]}} Dr. Reishus ignores these options.

116. As early as 2003 – prior to the KCS-TFM-TM transaction – {{[redacted]}} In one document, BNSF {{[redacted]}} For example, the document noted that {{[redacted]}}[127] And, BNSF noted {{[redacted]}}[128]

117. Similarly, a 2016 BNSF document assessed BNSF's {{[redacted]

[130] Hirsch Deposition, pp. 171:18–172:13 ("{{[redacted]}}").

[131] In the document BNSF describes { [redacted] } BNSF Railway, {{[redacted]}}, BNSF0000166 – 8 at BNSF0000166 – 7.

Mexican traffic through different gateways, even prior to the KCS-TFM-TM combination. Yet, in his analysis, Dr. Reishus assumes away the relevance of these other gateways by limiting his analysis to Laredo.

120. In the analysis I present below, I show that by limiting his analysis to Laredo, Dr. Reishus omits relevant context for evaluating his claims of foreclosure. As a result, his analysis is incomplete and cannot reliably support his claims of foreclosure. In Exhibit 5 below, I present the volume of BNSF's cross-border traffic by gateway in 2006 and 2019.[132] As I did in my analysis of traffic flows in section 3.2, I consider flows through Eagle Pass, Laredo, and Brownsville.[133] I consider both total traffic as well as the specific categories of traffic considered by Dr. Reishus: Carload, Automotive, and Intermodal.[134] Traffic volumes, including for Intermodal movements, are expressed in terms of carloads.[135]

[132] For 2019 traffic, I rely on BNSF's traffic tapes. These data provide information on all 2019 movements involving BNSF. Similar traffic tapes are not available in this proceeding for 2016. Thus, for 2016 traffic, I rely on the CWS. *See* § 3.2 for additional details.

[133] To the extent El Paso is also seen in BNSF documents as a viable alternative for certain traffic from Laredo, including traffic flows through El Paso would further underscore the limitations and incompleteness of Dr. Reishus's analysis. BNSF traffic at El Paso {{{[redacted]}}} between 2006 and 2019. A rough estimate of BNSF traffic over El Paso to/from U.S. points east of El Paso shows this traffic has also {{{[redacted]}}}. *See* my workpaper 1.

[134] I combine together loaded and empty Intermodal movements to ease the exposition. Intermodal traffic volumes broken down by loaded and empty movement are available in my workpapers. *See* my workpaper 18.

[135] As in my Application Statement, I convert volumes of Intermodal traffic from containers to carloads by dividing the number of reported carloads by 4.7, which describes the CP-system average number of containers-per-flat-car. *See* Application Statement, Exhibit 2.

EXHIBIT 5
Since 2006 BNSF has moved {{{ }}} carload traffic over Eagle Pass and {{{ }}} intermodal traffic over Laredo

{{{

}}}

Source: Confidential Waybill Sample, 2006; Combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT Traffic Tapes, 2019; CP Intermodal Containers to Railcar Conversion Factor.xls

Note: This analysis considers traffic southbound and northbound to/from Mexico, including movements identified in the CWS and the Combined Tapes as terminating/originating in Mexico and passing through the Laredo, Eagle Pass, and Brownsville gateways, or movements identified in the CWS as terminating/originating in the SPLC of Laredo (including SPLCs for Robstown/Corpus Christi for BNSF), Eagle Pass, or Brownsville, regardless of rebill code. Movements are considered handled by BNSF if BNSF is observed handling the movement into the gateway or terminating the shipment at a gateway SPLC. Volume of traffic is reported in expanded carloads. Intermodal units in the 2006 CWS and in the Combined Tapes are converted to carloads using 4.7 units per flat car, which corresponds to a system average for CP in 2019.

121. As shown in the exhibit, traffic at Eagle Pass constituted {{{ }}} percent of BNSF traffic crossing the border at these gateways (in either direction) in 2006 and it {{{ }}} percent in 2019.[136] In terms of volume, BNSF went from

136 *See* my workpaper 19.

{{{ }}} carloads through Eagle Pass in 2006 to {{ }} carloads in 2019.[137] And, by category, over this period, the fraction of Carload movements through Eagle Pass {{{ }}}, and for Automotive traffic {{{ }}}.[138]

122. Moreover, the traffic BNSF has {{{ }}} at Laredo has mostly been the Intermodal category that it {{{ }}} prior to the combination of KCS with TM and TFM. Among these three gateways, BNSF {{{ }}}. Specifically, {{{ }}}.[139]

123. By omitting traffic at Eagle Pass from his analysis, Dr. Reishus has assumed away the strategy BNSF appears to have adopted – diverting its business to another border gateway. Ignoring BNSF's actual choices inherently understates BNSF's share of the relevant traffic, and counting only traffic that did transit at Laredo mechanically overstates KCS's share, since BNSF can handle traffic through Eagle Pass and KCS cannot. This omission is critical to Dr. Reishus's interpretation of the rate change as some sort of foreclosure of BNSF at Laredo.

124. By not presenting any analysis of BNSF's ease of substitution between Laredo and other gateways, and Eagle Pass in particular, Dr. Reishus has not offered the

137 *See* my workpaper 20.

138 *See* my workpaper 21.

139 *See* my workpaper 22.

proper context through which to interpret the dispute between BNSF and KCS over the rate increase for the Laredo-Robstown route. The significant {{{[redacted]}}} of Carload and Automotive traffic that I can observe at Eagle Pass suggests that BNSF is not at KCS's mercy, but rather that it has viable alternatives to use in a negotiation, or at least good enough alternatives to be willing to let the negotiation be protracted for over a decade.

3.4.4. The data presented by Dr. Wilson illuminate the flaws in BNSF's foreclosure claim

125. Dr. William W. Wilson, another BNSF expert witness, presented an account of BNSF grain shipments through Laredo and Eagle Pass.[140] According to Dr. Wilson, these data indicate that BNSF appears to have been foreclosed at Laredo because BNSF grain traffic has shifted to Eagle Pass even though that route is more circuitous.[141]

126. In what follows, I revisit the data presented by Dr. Wilson and illustrate how this traffic instead illuminates the flaws in BNSF's allegation that it has been foreclosed at Laredo. As I discuss below, the shift in BNSF grain traffic from Laredo to Eagle Pass demonstrates that BNSF's use of these two gateways is a fluid situation across this span of years, reacting dynamically to a number of changes that seem to have affected

[140] Verified Statement of William W. Wilson, Ph.D., *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, February 28, 2022, BNSF-9-497 – 527 ("Wilson V.S."), Figures 11, 12.

[141] Wilson V.S., pp. 4, 16–19.

one or both of the gateways at various points, rather than alleged foreclosure by KCS at Laredo.

127. In Exhibit 6 below, I present annual shipments of grain that BNSF carried over the Mexican border between 2000 and 2019 as presented by Dr. Wilson. Each bar describes the total carload volume handled each year, while the shading of the bars indicates how much of this traffic was handled through Eagle Pass (blue) and Laredo (orange).

EXHIBIT 6
BNSF corn, wheat, and soybean volumes moving via Eagle Pass and Laredo gateways: 2000–2019

{{

}}

Source: BNSF Shipment Records, 2000 – 2019 from BNSF Wilson Production, March 29, 2022
Note: This analysis considers northbound and southbound grain movements presented by Dr. Wilson in his Verified Statement. Movements are first identified as transiting through the Laredo or Eagle Pass gateways based on the Mexican Gateway variable available in the data provided by Dr. Wilson. Movements are then aggreated to compute annual total volumes of traffic and shares of traffic moving through each gateway. Volumes of traffic are reported in carloads as recorded in Dr. Wilson's data.

128. The data in Exhibit 6 suggest that BNSF shifted grain traffic {{[redacted]}} a pattern Dr. Reishus's analysis could not reveal because he omits traffic at Eagle Pass. From 2000 to 2002, {{[redacted]}}. After the acquisition and from 2006 to 2007, {{[redacted]}}. While the volume of grain traffic through Laredo {{[redacted]}}

129. Moreover, the {{[redacted]}} in grain volume lamented by Dr. Wilson and Dr. Reishus occurred {{[redacted]}}. This suggests that something other than alleged KCS foreclosure, such as a drop in demand for BNSF grain shipments or BNSF difficulties competing with UP, which also serves both gateways, likely underlie the patterns presented in Exhibit 6.

130. Further, between 2011 and 2014 combined volume at Eagle Pass and Laredo {{[redacted]}}. In 2015 and 2016 it {{[redacted]}}

142 *See*, *e.g.*, Reishus V.S., Figure 6; Wilson V.S., pp. 4, 16–19.

[redacted]}}.

Over this period (2011 – 2019), {{[redacted]}} BNSF grain traffic {{[redacted]}} over Eagle Pass.

131. Consequently, it took over {{[redacted]}} years after the KCS-TFM-TM merger for the alleged "exclusion" of BNSF grain traffic from Laredo to occur. At that same time, the Eagle Pass grain shipments of BNSF {{[redacted]}} even though the alleged explanation of foreclosure cannot apply to those movements. The alleged foreclosure also has not prevented BNSF from {{[redacted]}}. Moreover, the allegedly inferior Eagle Pass gateway has been handling {{[redacted]}} BNSF grain shipments {{[redacted]}}. None of these patterns are consistent with the foreclosure explanation Dr. Wilson and Dr. Reishus hypothesize.

132. As I explained in section 3.2, KCS's success in grain shipments has depended on the establishment of long-term relationships with large shippers as well as the investment that those shippers made in the U.S. *and* in Mexico. And KCS witnessed rapid growth once those relationships and investments came to fruition. Without any explanation provided by Dr. Wilson and Dr. Reishus for the patterns presented in Exhibit 6 above, other than vague claims of foreclosure by KCS, and based on the experience I have detailed for KCS's grain franchise, I interpret the large swings in total grain volume and the emergence of Eagle Pass as the border crossing of choice for BNSF grain as consistent with underlying competitive dynamics and market

forces rather than some foreclosure by KCS at Laredo. In particular, the pattern observed seems consistent with geographic competition the Board has identified as important, including commodity flows shifting to alternative destinations or from alternative origins in response to improvements in transportation alternatives.[143]

3.5. Professor Mayo's analysis of corridors where CPKC will allegedly choose to foreclose interline options with NS in favor of new CPKC single-line service is flawed and misleading

133. In this section, I address the analysis presented by Professor Mayo in which he claims to show that a "substantial number of rail traffic routes are subject to potential incentives for anticompetitive conduct in the wake of the proposed CP/KCS merger."[144] The traffic Professor Mayo claims is at risk of competitive harm is traffic within corridors he identifies (via an unreliable methodology) as corridors with the potential for new CPKC single-line service. Thus, at the core of Professor Mayo's analysis is the mistaken notion, which I discussed in section 2, that any opportunity to win business with the enhanced single-line service a CP/KCS combination allows can be identified as an opportunity for CPKC to impair competition. Rather than presenting any evidence that might show CPKC would have the incentive and ability to pursue a foreclosure strategy, he bases his conclusions on an assumption that CPKC will foreclose interline partners in these corridors. Thus, despite reiterating the straw-man attack on the "one lump presumption" I addressed above, Professor Mayo

[143] I understand Mr. Hirsch claimed that traffic through Eagle Pass {{[redacted]}}. However, this is not inconsistent with geographic competition. *See*, *e.g.*, Hirsch Deposition, pp. 139:4–141:5, 145:8–148:21, 158:4–160:6.

[144] Mayo V.S., ¶ 46.

offers no facts, nor even a theory, to dispute the Board's prior findings that end-to-end railroad mergers are unlikely to have anticompetitive vertical effects.

134. I first discuss the methodology used by Professor Mayo to select his {{{[redacted]}}} "potential new single-line corridors that will be created by the merger."[145] He starts from the methodology I used for a preliminary analysis of traffic that might benefit from CPKC single-line service as part of a statement I filed more than a year ago to aid the Board's analysis of CN's proposal to use a Voting Trust to acquire KCS.[146] However, Professor Mayo makes substantive modifications to relax the criteria defining a potential single-line opportunity for CPKC. Given that Professor Mayo worked from a methodology that has been supplanted by a more detailed and rigorous analysis in the Application, one would expect him to impose more caution, rather than less, in drawing inferences from the data about where a CPKC single-line service would be commercially feasible and could expect significant diversion of traffic.[147]

135. However, Professor Mayo relaxes the definition considerably, despite his claim that he's only "modifying [the methodology] slightly." In particular, he makes the following changes:

- He assumes away limitations on CPKC service. In some cases, a railroad may be more competitive terminating traffic in an area than in originating or *vice*

145 Mayo V.S., ¶ 46.

146 Voting Trust Statement, § 5.2.

147 For more details on Applicants' estimated diversions, *see* Brown/Zebrowski V.S., pp. 11–19.

versa. This may even be a matter of feasibility if, for example, observed movements involve trackage rights with restrictions on the type of movements that can be served.[148] In my preliminary analysis, I respected this issue by requiring that one of CP or KCS serves the origin but not the destination, and the other serves the destination but not the origin, in order to identify a corridor as having the potential for a new CPKC single-line service. Professor Mayo removes the directional element and assumes any service proves that all service is available.[149]

- He ignores circuity altogether.[150] Every instance of railroad competition involves one route that is technically more circuitous than another which, in ordinary situations, can be offset with better service, better rates, or other characteristics shippers may value. Professor Mayo takes the extreme position that circuity never becomes so great as to make such competitive pressure too limited – that even a CPKC route starting in Mexico, crossing into Canada, circling the great Lakes, and returning south to reach the Mid-Atlantic region is one he is willing to assume shippers would choose often enough that foreclosure to induce such a route could be profitable. Such routes are not expected to divert traffic with the benefits of single-line service in my preliminary analysis or in the analysis of Brown and Zebrowski, which is explicitly focused on estimating likely diversions.[151]

136. To illustrate how Professor Mayo's assumptions undercut his analysis by relaxing the identification of potential CPKC single-line service, I focus on the Houston BEA area as an example. Professor Mayo identified Houston as an endpoint in {{{[redacted]}}} of the {{{[redacted]}}} corridors in his analysis, representing more than

148 *See*, *e.g.*, Brown/Zebrowski V.S., pp. 17–18, fn. 11.

149 Mayo V.S., p. 96, fn 73 ("Modifying Dr. Majure's assumptions slightly, I consider a corridor to be a potential candidate for a new single line service when CP and KCS are present (originated or terminated traffic in 2019) in respective origin and destination locations. That is, for this analysis, I consider a corridor a "potential route" even if it would involve CP originating from (terminating at) a location in which CP was only observed terminating at (originating from), and similarly vis-a-vis KCS."); Voting Trust Statement, p. 39.

150 Dr. Mayo only considers the circuity of a route as a characteristic in a robustness check presented in the Appendix of his statement. *See* Mayo V.S., p. 94, fn. 73, and Appendix Exhibits 1, 2.

151 Voting Trust Statement, pp. 39–40.

{{{[redacted]}}} percent of the total Class I carrier revenue for which he claims there is risk of anticompetitive harm by a combined CP/KCS.[152] As explained in the Wahba/Naatz V.S. and the Brown/Zebrowski V.S., KCS's access to the area relies on UP trackage rights that restrict the type of traffic KCS can originate or terminate in Houston.[153] For that reason, my preliminary analysis, as well as Brown/Zebrowski's detailed diversion analysis excluded any potential routes that involved Houston.[154]

137. More generally, Professor Mayo's methodology leads to a set of corridors that are, for the most part, demonstrably unlikely to see any effects on competition. Of the {{{[redacted]}}} corridors he identifies, {{{[redacted]}}} are corridors where one of CP or KCS is not involved in any movement of any commodity seen in the 2019 CWS.[155] That is, these are corridors which dropped out at the very first step of my within-corridor analysis of competitive effects. [156] Even though that analysis was focused on

153 Verified Statement of Jonathan Wahba and Michael J. Naatz, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, October 29, 2021 ("Wahba/Naatz V.S."), p. 24 ("KCS already operates an intermodal facility in Kendleton, TX, near Houston, but restrictions in KCS's trackage rights over UP between Beaumont and Houston (which KCS must use to reach Kendleton) prohibit intermodal traffic originating or terminating at Kendleton and moving to/from points north."); Brown/Zebrowski V.S., p. 18 ("As another example, KCS does not currently have rights to move traffic over UP trackage between Houston and Beaumont unless that traffic has had a prior or subsequent haul on the Tex Mex Laredo-Robstown/Corpus Christi line or is moving to/from shipper facilities on KCS's "Wharton Line" between Rosenberg and Victoria, TX.").

154 Voting Trust Statement backup materials; Brown/Zebrowski V.S., p. 18 ("As a result, our analysis excluded movements between Houston and CP territory from potential diversion.").

155 *See* my workpaper 25.

156 I draw similar conclusions for the subset of the {{{[redacted]}}} corridors that are of specific interest for NS – those where NS interlines with CP or KCS: {{{[redacted]}}} of the {{{[redacted]}}} such corridors dropped out in this first stage review of whether CP and KCS both have involvement in moves for that corridor. *See* my workpaper 26.

horizontal competition, this first step – ensuring that each of CP and KCS is capable of winning some part of some movements in the corridor – also establishes a foundation for any possible anticompetitive vertical effects in the corridor.[157] Additionally, {{{[redacted]}}} of the corridors Professor Mayo identifies were screened as 1-to-1.[158] That is, these corridors already have some railroad that is involved in every route observed in the data for movements in the 2019 CWS, so shippers already have no ability to negotiate with an independent route. This is another way in which Professor Mayo's list is over-inclusive.[159]

138. For the few corridors in Professor Mayo's list that would remain after eliminating the over-inclusive entries, there is an unaddressed question of why any anticompetitive vertical effect would be likely. Professor Mayo asserts in his Exhibit 4 that many of these corridors have what he labels [redacted]}}} as a result of the CP/KCS combination.[160] However, these labels are misleading and are based only on *assumptions* about CPKC's behavior post-merger. His {{{[redacted]}}} is an assumption that *if* the merged firm chose to foreclose *all* its current interline partners, the only routing in the corridor would be a CPKC single-line service. Similarly, his

---

157 Professor Mayo glosses over this issue by identifying the corridors he finds concerning as having some reliance on CP or KCS. But, to have an effect following from the combination, the other party should be contributing something to the route, otherwise incentives and ability can hardly be expected to change.

158 *See* my workpaper 27.

159 Application Statement, § 4.

160 Professor Mayo's Exhibit 4 focuses specifically on the {{{[redacted]}}} of the {{{[redacted]}}} corridors where NS interlines with CP or KCS. He describes this narrowed focus on these corridors relevant to NS traffic as an "illustrative example."

{{{[redacted]}}} is based on another assumption: {{{[redacted]}}}[161] Professor Mayo provides no evidence that CPKC would have the incentive or ability to pursue such strategies in these corridors. Professor Mayo's presumption of harm aside, there is no reason to conclude an anticompetitive vertical effect of the CP/KCS combination is likely.

[161] Mayo V.S., Exhibit 4, notes.

4. REMEDIES PROPOSED BY COMMENTERS PURPORT TO RESOLVE COMPETITIVE HARMS THAT DO NOT EXIST AND WOULD BE ANTICOMPETITIVE IN ANY EVENT

139. Several Commenters have proposed "remedies" to be included by the Board as conditions for approval of a CP/KCS combination. In this section, I address "remedies" proposed by Professor Salop, Dr. Reishus, and CN. I show that these "remedies" purport to resolve competitive harms that do not exist, and in the case of the "remedies" suggested by Professor Salop and Dr. Reishus, would be anticompetitive to the benefit of the carriers, UP and BNSF, that propose them.

4.1. The "remedy" proposed by Professor Salop and Dr. Reishus to regulate CPKC interline rates would be anticompetitive and would ensure UP and BNSF do not face fully competitive single-line pricing from CPKC

140. Both UP and BNSF responses include proposed "remedies" which would regulate the interline rates that KCSM can charge in Mexico so that any single-line price CPKC offers on a movement that crosses the border entitles UP and BNSF to use KCSM at a mileage prorated portion of the CPKC single-line price.[162] Commenters argue that this regulation allows CPKC to realize the benefits of any

[162] To illustrate how the proposal would work, consider the following example. Suppose that CPKC sets a particular single-line rate for movements from Rio Verde, Mexico, to Chicago, IL. The proposed remedy fixes the rate that CPKC can charge for the segment from Rio Verde, Mexico, to the Laredo Gateway to be the single-line rate scaled by the share of Mexican segment miles relative to the total CPKC route miles to reach Chicago. If the segment length from Rio Verde to the Laredo Gateway were 25 percent of the total CPKC miles between Rio Verde and Chicago, then CPKC's Mexican interline rate would be regulated at 25 percent of its single-line rate from Rio Verde to Chicago. For a description of BNSF's proposal, *see Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (Comments of BNSF Railway Company dated Feb. 28, 2022), BNSF-9-1 – 581 ("Comments of BNSF Railway Company"), p. 46–47. For UP's proposal, *see* Salop V.S., ¶¶ 117, 119.

efficiencies derived from the combination while alleviating UP and BNSF's (unfounded) concerns that CPKC will engage in anticompetitive behavior to foreclose UP and BNSF from winning traffic at the Mexican border.[163] In this section, I demonstrate that Commenters are wrong – their proposal to regulate CPKC interline rates would be anticompetitive and would ensure UP and BNSF do not face the full competitive pressure they would otherwise face from a combined CPKC.

141. Before addressing the core reason the proposed "remedies" would be anticompetitive, I note that through the process of regulating CPKC's interline rates to align with its single-line rates, both proposals would create the opportunity for CPKC's competitors to learn CPKC's single-line rates. The proposals, perhaps in recognition of the implication for competition if rivals can observe CPKC's offers, each provide mechanisms intending to keep UP and BNSF from learning CPKC's single-line rates with certainty. These mechanisms, however, are likely to be weak protections. In BNSF's proposal, based on an existing arrangement between BNSF and UP at the Portland Gateway (i.e. "I-5 Prop Rate Agreement"),[164] the history of CPKC single-line rates is still revealed.[165] In UP's proposal, although the CPKC rates

163 Salop V.S., ¶¶ 12–13; Reishus V.S., ¶ 16; Comments of BNSF Railway Company, p. 45.

164 Reishus V.S., ¶¶ 98–104. I have examined the I-5 Prop Rate Agreement. I observe that the agreement was negotiated between two parties as part of a larger exchange of interests. As might be expected, the I-5 Prop Rate Agreement is complicated, reflecting the outcome of negotiations between sophisticated parties. Attempting to impose a similar arrangement as a condition, rather than negotiated agreement, is not only unlikely to resolve any of Dr. Reishus's illusory concerns, but is also likely to create new problems. *See* Proportional Rate Agreement between BNSF Railway Company, Union Pacific Railroad Company, and Southern Pacific Transportation Company, May 22, 1997, BNSF0003706 – 61.

165 The underlying single-line rates are based on the average single-line rates charged for similar traffic in the prior period. A third-party entity would calculate the average single-line rates and the

are provided directly to the shipper, the shipper would need to reveal to UP the price of the KCSM portion in order to discuss the total price of UP's offer and the mechanism makes recovering the CPKC price simple math from that point.[166] This leakage of CPKC's private, commercially valuable information is one way in which the proposed remedies are likely to harm competition.[167]

142. This revelation of CPKC's competitive information, however, is not the main reason the proposals are anticompetitive. Both proposals erect a disincentive for CPKC to price its single-line service as competitively as it otherwise might, and, in doing so, act as a tax on single-line rates offered by CPKC that insulates UP and BNSF from facing fully competitive single-line pricing from a combined CPKC. To see this, assume for illustrative purposes that Commenters are right in the premise upon which they rely in arguing the need for the "remedy." That is, assume that KCSM has some particular power over shippers in Mexico that would give KCSM the ability to charge a higher rate on the Mexican segment than might typically be earned on a segment with more competition. If not constrained from doing so by this "remedy" regulation, CPKC's ability to offer new single-line service would put even more competitive pressure on the carriers competing to win the segment north of the

implied mileage-based prorates for the Mexican segments. The interline carriers would then observe the mileage-based prorates to use them to quote shippers a through-rate that includes both the Mexican and U.S. segments. *See* Reishus V.S., ¶¶101–103.

166 In UP's proposal, CPKC would quote to inquiring shippers both a single-line rate and a mileage-based prorate for the Mexican segment. *See* Salop V.S., ¶¶ 19, 118, 120. UP and BNSF would not directly observe these interline rates, but shippers would need to reveal the provided CPKC interline quote to prospective interline partners in order to negotiate over the total rate for the interline movement. With this information, UP or BNSF would know CPKC's single-line rate as well.

167 Professor Salop notes the value of private information for carriers in his discussion of strategic bargaining incentives. *See* Salop V.S., ¶ 105.

border. The enhanced offer by CPKC would drive down the effective price to shippers of a given level of service.

143. However, if the proposed "remedy" is allowed to regulate the relationship between CPKC's single-line and interline rates, even maintaining its existing end-to-end pricing on an interlined CP-KCS route would require CPKC to give up revenue it was otherwise making on the interline segment in Mexico. So, before CPKC can even begin to compete with a new single-line service, it would face a regulatory "tax" on its Mexican revenue that it can only mitigate by raising its single-line rate or abandoning its own end-to-end offer. Only where KCSM currently earns *less* than its U.S. interline partners on a prorated basis, a scenario that is not at all consistent with Commenters' justification for the proposal, could this proposal fail to impair competition.

144. Indeed, the proposed "remedy" would have this effect of taxing CPKC's ability to compete with single-line service anywhere that interline rates on the KCSM segment happen to be higher than a mileage-based prorate for any reason – not just a hypothesized power over shippers. This is indeed the effect the proposed "remedies" would have on CPKC. In this way, the "remedy" serves as a tax on CPKC's ability to compete, and has the effect of insulating from that competition the same carriers who proposed the "remedy" – UP and BNSF.

145. In the rest of this section, I establish the anticompetitive effect of these proposed "remedies" in more detail. In section 4.1.1, I show that market-based rates in the

industry do not align with mileage-based prorates. Where interline segment rates are above a mileage-based prorate, the "remedy" would inhibit competition, even if Commenters are wrong in their theory that KCSM possesses market power that it leverages in its rate setting. In section 4.1.2, I demonstrate how the "remedies" act as a tax on CPKC single-line service and insulate UP and BNSF from facing competition from CPKC, creating an impetus to raise prices faced by shippers on many cross-border movements. In section 4.1.3, I explain that Commenters' "remedies" are, despite their claims otherwise, economically similar to the "rate equalization" conditions previously shown to be anticompetitive.

4.1.1. Market rates for interline traffic are not set based on prorated mileage

146. In this section, I show that market rates for interline traffic generally are not set based on prorated mileage. Although the "remedies" proposed by UP and BNSF intend to regulate CPKC so it could not set KCSM interline rates higher than a mileage-based prorate, rates for many interline segments are already higher than what would be implied by a mileage prorate.[168]

[168] UP and BNSF discuss their proposals with reference only to interchanges at or near Laredo. The examples in this section are meant to demonstrate that interchanges throughout the U.S. commonly demonstrate one railroad earning a higher prorated rate without even the veneer of concern which UP and BNSF have raised specifically about Laredo. To the extent the proposed "remedies" would apply to these market-based rates wherever CPKC happens to currently have some reason for the higher rate and a prospect of single-line service, they would also impose distortions to competition affecting shippers on such routes.

147. The segment-level freight revenue and distances from the 2019 traffic tape data confirm that market-based rates for interline movements are not set based on mileage alone. These data show that market rates for interline segments do not align with the prorated mileage covered by the segment. Other market-based factors determine whether a carrier earns more or less revenue than would be implied by its segment's share of the movement's revenues.

148. In Exhibit 7, I focus on interline movements within the U.S. or between the U.S. and Canada in the 2019 traffic tape data. In particular, I analyze interline movements in which KCS or CP interlines with UP, BNSF, or each other.[169] For these movements, I show the relationship between the share of miles and the share of revenues earned by each carrier.

149. There are four panels, one for each of KCS, CP, UP, and BNSF. In each panel, the x-axis describes the share of miles handled by that carrier on the interline movement, and the y-axis describes the share of total movement revenue earned by that carrier on the same movement. For example, the top left panel shows the mileage share handled by KCS on routes it interlines with either UP, BNSF, or CP along the x-axis, and the share of KCS revenue earned on each interlined route along the y-axis.

150. If interline rates were typically set based on mileage, then the movement-level dots would tend to fall along the 45-degree line in each panel of Exhibit 7. However,

[169] This analysis is limited to interline movements that involve two or three Class I carriers for traffic in which we observe all interline carriers' segment-level revenues and distances in the data.

many movements are above and many are below the 45-degree line, indicating that market-based rates on interline movements generally do not simply reflect the share of mileage handled by the carrier. All four carriers, including UP and BNSF, earn more than their mileage-share would imply on many movements, and less than their mileage-share would imply on many others. In addition, shorter hauls often earn more than their mileage-share (that is, movements to the left of the 50 percent Share of Mileage on the x-axis tend to be above the 45-degree line). This is true for {{[redacted]}}.

EXHIBIT 7
KCS, UP, BNSF, and CP interline rates do not align with a mileage prorate, Movements within the U.S. or between the U.S. and Canada

{{

}}

Source: Combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT Traffic Tapes, 2019; CP Intermodal Containers to Railcar Conversion Factor.xls

Note: Each of the colored dots in each panel describes the Share of Mileage and the Share of Revenue earned by each of the four carriers, KCS, UP, BNSF, and CP, on segments that it interlines with one of the other carriers on movements in the U.S. or in the U.S. and Canada. The Share of Revenue is defined as the revenue for each carrier divided by the total revenue on the relevant interline movements. A similar method is used to calculate Share of Mileage. The opacity of the dots indicate the frequency of traffic where darker shades indicate more instances of traffic with that Share of Mileage and Share of Revenue.

4.1.2. The proposed "remedy" imposes a tax on KCSM's revenue in Mexico that CPKC can only mitigate by reducing or avoiding competition with UP and BNSF – making it a regulation to prevent rather than enhance competition as UP and BNSF claim

151. In this section, I explain how the proposed "remedies" would be anticompetitive, incentivize CPKC to raise prices on single-line offerings, and insulate UP and BNSF

from facing fully competitive single-line pricing from a combined CPKC. I first demonstrate that the "remedy" would act as a tax on KCSM's revenue in Mexico wherever it currently earns a higher share of through revenues than its share of miles and would otherwise enhance competition with CPKC single-line service. As I showed in the previous section, the share of revenue a carrier earns on an interline movement frequently does not align with the share of miles covered by the carrier's segment. Therefore, and as I show in this section, the anticompetitive effect of the proposed "remedy" would reduce competition for a substantial volume of traffic, to the benefit of UP and BNSF.[170] Finally, I explain why Professor Salop's defenses of his proposed "remedy" are flawed and misleading.

152. In my assessment of the competitive implications of the proposed "remedy," I use the following notation:

- For interline routes involving other railroads (e.g., UP or BNSF), the rate that CPKC earns on its Mexican segment is *r*.
- Without the "remedy," the total through-rate for a CPKC single-line movement between an origin-destination pair is noted as *P*.
- The share of total movement miles accounted for by KCSM's Mexican segment in a CPKC single-line route is *d.*
- With the "remedy," the CPKC single-line rate is *S,* and the rate for the Mexican-segment that the "remedy" would require CPKC make available for interlines

[170] Both UP and BNSF have focused their proposed "remedies" on traffic handled by KCSM through the Laredo gateway. Thus, the discussion and analysis in this section focus on the potential effect of the "remedies" on KCSM traffic through Laredo. However, the remedy proposed by UP and Professor Salop could potentially be interpreted as applying more broadly to any combination of CPKC single-line route with a related shorter segment interlining with other carriers, regardless of whether it crosses to or from Mexico. To the extent this broader application of the "remedy" is intended, it would create anticompetitive effects like those discussed in this section for additional traffic beyond Laredo traffic.

with UP or BNSF is *dS* (i.e., the mileage prorate of the CPKC single-line rate).[171]

153. To see how the "remedy" creates a tax on revenues in Mexico, I focus on traffic for which the Mexican-segment rate earned by CPKC is more than the implied mileage prorate for that segment. That is, traffic where $r > dP$. I then ask the following question: under the proposed "remedy," what single-line rate would CPKC need to set in order to maintain the Mexican-segment revenue CPKC would earn in the absence of the "remedy"? That is, what CPKC single-line price would "keep them whole" for a given volume of traffic?

154. It is straightforward to show that the single-line price (S) CPKC would have to set to satisfy this condition will be greater than the pre-"remedy" interline price (P) – that is, when $r > dP$, then $S > P$.[172] The difference between S and P is the tax that the "remedy" would create and is an incentive for CPKC to *raise* its single-line prices simply to avoid losing revenue it would have earned without the "remedy."[173]

---

171 Similarly, after imposing the "remedy," CPKC would be required to make available to UP *dS* on all of its interline routes that are also served by KCSM-KCS.

172 The revenue neutrality condition shows that $SQ + dSq = PQ + rq$, where Q is CPKC's current single-line volume and q is CPKC's current interline volume. Rearranging terms to solve for S, shows that $S = (PQ + rq) / (Q + dq)$. Using this we know that $S > P$ when $(PQ + rq) / (Q + dq) > P$, which can be rearranged to be $r > dP$. The inequality, $r > dP$, compares the rates that KCS currently earns on interline movements with other carriers, such as UP, BNSF, or CP, to the mileage-based prorates it *would* earn on CPKC single-line service if current rates were prorated according to KCS's share of total movement mileage.

173 Note that movements in which $r < dP$ would not necessarily lead to a tax from the "remedy," but they are also not likely to lead to a "rebate," or single-line price reduction for shippers, as the remedy is not binding in this direction. That is, UP and BNSF already obtain an interchange rate lower than the one the "remedy" would offer them and are unlikely to avail themselves of the opportunity to pay CPKC more. Consequently, I do not draw any conclusions about the "remedy" for such movements. In addition, I am not considering scenarios where the new single-line service would

155. To make this more concrete, consider an example in which CPKC earns $40 on the Mexican segment of its interline route, CPKC earns $100 on its single line, and the Mexican segment of the CPKC single-line route accounts for 30 percent of the total movement miles. Because $40 is greater than 30 percent of $100, the price CPKC would have to charge for its single-line after the remedy to remain revenue neutral will be greater than $100. Exactly how much larger will depend on volumes. If CPKC's single-line volume is 20 and CPKC's interline volume is 100, before the "remedy" revenue is $100*20 + $40*100 = $6,000. With the "remedy," the single-line price CPKC would need to charge to remain revenue neutral would be $120 (with the "remedy" dictating an interline rate of $120 * 30% = $36), which gives the same $6,000 of revenue broken down as $120 on 20 units and $36 on 100 units. Thus, in this example the tax that the "remedy" would create is the $20 difference between the single-line price CPKC would otherwise set ($100) and the price it would have to set to stay revenue neutral ($120).[174]

156. UP and BNSF benefit twice from this tax on CPKC. First, they get the proceeds of the tax in the form of room to raise their rates to shippers (by $4 in the example) before the shipper sees any overall increase in rates. Then, they gain a cushion ($20 in

be so efficient that just as a result of that efficiency shippers would never be inclined to choose any interline service, as such extremes would both obviate Commenters' premise for a remedy of any sort and make irrelevant the "remedy" they have proposed.

[174] The analysis presented in this section, as well as the example just discussed, assume that CPKC single-line volume and interline volumes are fixed. *See* Appendix § 6 for additional details, including for elastic quantities.

the example) on their own pricing before they face the competitive pressure of CPKC single-line rates.

157. I now analyze the traffic tape data to identify traffic for which the "remedy" would create this regulatory tax. In particular, I focus on two categories of traffic through the Laredo gateway, and show that for each the "remedy" would reduce CPKC's incentive to compete aggressively on a substantial volume of traffic.[175] I first look at Laredo traffic on routes where KCSM-KCS already offers a single-line. I show that the "remedy" effectively imposes a tax of {{[redacted]}} percent on single-line revenues on routes where I currently observe both KCS interline and single-line service for the same commodity.[176] There is approximately {{[redacted]}} million of current KCS single-line service, all of which, as I discuss below, would be subject immediately to the issues of this tax.[177] I then look at the effect of the "remedy" on movements where CPKC has identified the combination would create particular procompetitive opportunities for CPKC to compete with its new single-line service.[178] Based on the forecast of these new services in the absence of a "remedy," I

---

175 Although I focus on these two sets of CPKC traffic, the "remedy" could have such an anticompetitive effect on additional traffic. For example, there may be additional corridors that could be served by CPKC that were not identified as diversion opportunities in which CPKC's incentive to compete with a single line would be reduced. In addition, my analysis focuses on traffic that moves between Mexico and the U.S., which is largely the focus of the "remedies" proposed by Dr. Reishus and Professor Salop; however, if the "remedy" were to be expanded beyond the Mexican-border traffic, more shippers would be subject to the anticompetitive effect of this regulatory tax.

176 *See* my workpaper 28.

177 According to the 2019 KCS traffic tapes. *See* my workpaper 29.

178 To identify these corridors, I use the corridors identified by Brown and Zebrowski as diversion opportunities for new CPKC single-line service. These are corridors where CPKC has identified that a CP/KCS combination would promote enhanced competition and provide better service and value. Brown/Zebrowski V.S., p. 7, Parts II–III.

estimate below the tax that the "remedy" would effectively impose on this traffic is approximately {{[redacted]}} million.[179] For both categories of traffic, the only way for CPKC to mitigate the tax is to compete less aggressively with UP and BNSF.

158. In Exhibit 8**,** I focus on the first category of movements – Laredo traffic on routes where I observe that KCS already offers interline and single-line service for the same commodity[180] – and identify for which of these movements the "remedy" would act as a regulatory tax on the single-line traffic that KCS already has.[181] As I explained above, the "remedy" acts as a regulatory tax on traffic for which KCSM interline rates are greater than the implied mileage-based prorate, i.e., $r > dP$, or $r/P > d$.[182] I find that this is true for approximately {{[redacted]}} percent of this KCS traffic – corresponding to the traffic above the 45-degree line (the red dots).[183] It is also

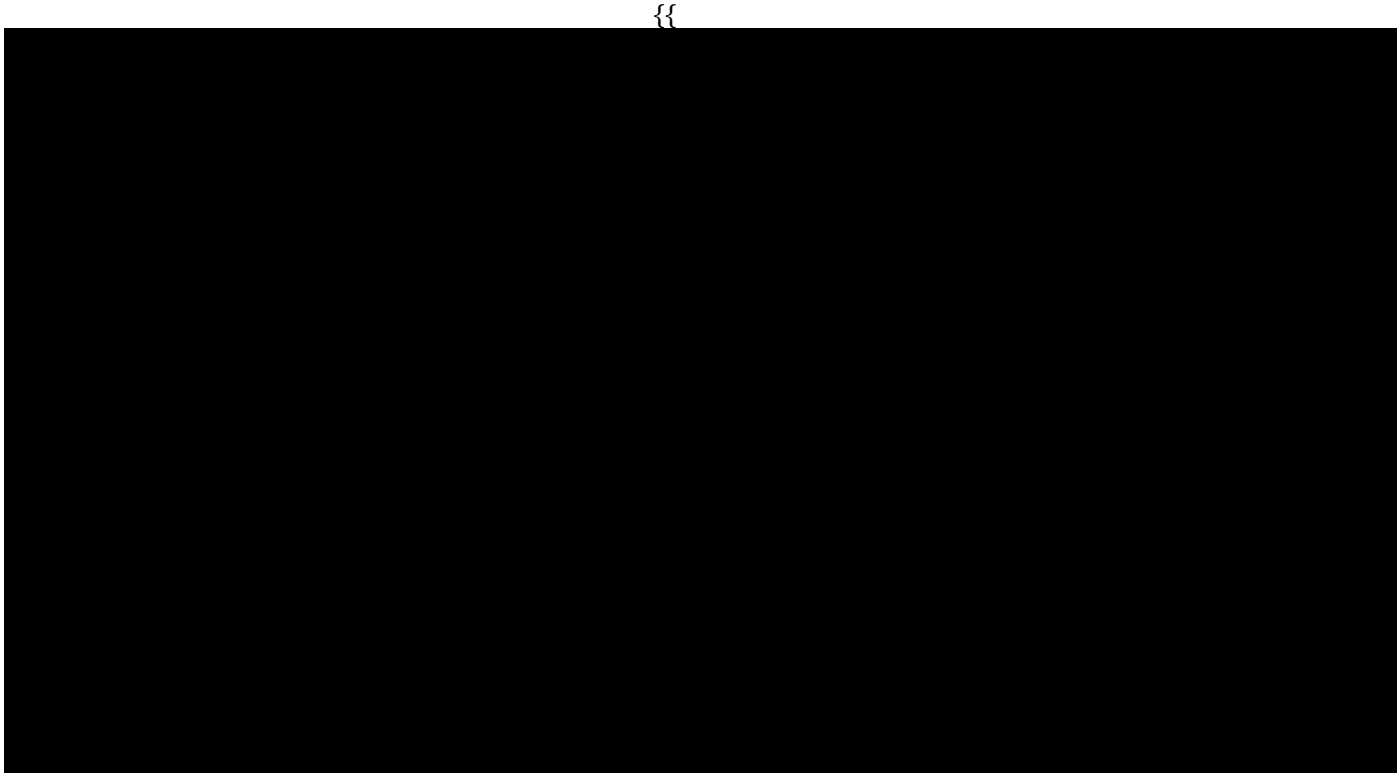
179 *See* my workpaper 30.

180 In particular, I identify all of the origin-destination-commodity ("ODC") triplets where KCSM-KCS offers a single-line service and KCSM offers interline service with UP or BNSF in the 2019 Combined Tapes, using BEAs to identify ultimate endpoints.

181 That is, under the "remedy," for which of these movements would KCS (CPKC) have an incentive to raise its KCSM-KCS single-line rates in order to maintain "revenue neutrality" with what it was earning absent the "remedy."

182 I calculate the implied mileage-based prorate as the share of distance handled by KCSM on its single-line traffic (d) times the total revenue-per-car earned for the KCSM-KCS single-line traffic (P). I then pair the average mileage-based prorate from the KCSM-KCS single-line traffic with KCSM's interline rates (r) on KCSM interline traffic for the same ODC triplets.

183 Competing interlines in this analysis serve the same BEA as the existing KCS movements. As I have explained, routes serving the same BEA compete with each other for shipper business, accounting for the multiple dimensions of competition the Board has noted as relevant for assessing railroad competition. Thus, UP or BNSF interlines serving the BEA compete with these existing KCS movements, even if UP or BNSF would need to take some additional steps or motivate the shipper to take additional steps in order to serve a specific shipper. These additional steps would still be needed before UP or BNSF can implement service using the "remedy" terms. However, the competitive pressure of their ability to do so was already deemed to bind on CPKC's decisions without the "remedy," so CPKC would appropriately add the tax into their decision-making in such situations. *See* my workpaper 31.



straightforward to calculate the effective tax rate the "remedy" would immediately impose on the traffic shown in Exhibit 8. For this traffic – traffic on routes where I currently observe KCS interline and single-line service for the same commodity – the "remedy" would impose an effective tax rate of {{ }} percent on KCS single-line revenues.[184]

[184] For each of the movements above the 45-degree line, the amount of tax is essentially the vertical distance to the 45-degree line ($r - dP$) scaled by the volume of traffic represented by the dot. For each of the movements below the 45-degree line $r<dP$, and as I explained above, the "remedy" would not necessarily lead to a tax, but it is also not likely to lead to a "rebate," or single-line price reduction for shippers, as the remedy is not binding in this direction. The effective tax rate for these movements is the total tax divided by the total revenue. *See* my workpaper 28.

EXHIBIT 8

The proposed "remedies" would create an incentive to raise prices for a large volume of traffic for routes where KCS already provides both interline and single-line service

{{

}}

Source: Combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT Traffic Tapes, 2019; CP Intermodal Containers to Railcar Conversion Factor.xls

Note: Describes the Share of Single-Line Mileage and the Interline Revenue earned by KCSM divided by the average KCSM-KCS single-line price to serve those corridors in 2019. Specifically, the y-axis shows *r/P* – the ratio of (i) revenue earned on the Mexican segment of a KCSM interline route with UP or BNSF and (ii) KCSM-KCS single-line revenue earned on similar traffic. The x-axis shows *d* – the share of miles covered by the KCSM segment on the KCSM-KCS single-line serving the same corridor. Traffic is plotted for all ODC triplets that can be served by a KCSM-KCS single-line service and that compete with a KCSM-interline service with either BNSF or UP through the Laredo Gateway. Each dot describes traffic for interline routes observed in the 2019 Combined Tapes data. The opacity of the dots indicate the frequency of traffic where darker shades describe more instances of particular traffic types. The size of the dots indicates the amount of traffic handled that are of particular traffic types.

159. There is approximately {{ }} million in current KCS single-line service through Laredo.[185] All of this traffic would immediately be subject to the issues of the tax imposed by the "remedy." Even where I observe single-line service but do not

185 *See* my workpaper 29.

observe KCS currently offering an interline service for the same commodity,[186] the "remedy" would force KCS to make an interline offer if requested by a shipper. While it is not clear the extent to which shippers would choose this interline option – KCS does not currently provide it – one way to think about the effect of the "remedy" on KCS's pricing incentives when making its offer is that this same {{[redacted]}} percent tax will apply.[187] This is a tax on existing *KCS* single-line traffic – that is, a tax on traffic that is, in terms of the alleged concern this "remedy" purportedly addresses, unaffected by the CP/KCS combination.

160. Moreover, any tax on the {{[redacted]}} million in existing KCS single-line revenues is a subset of the potential effect of the tax created by the "remedy."[188] For instance, in markets where KCS does not currently provide single-line service, but could provide it in the future, this tax would create a disincentive for KCS to invest in providing that single-line service and winning traffic. In addition, there is approximately {{[redacted]}} million in current KCS interline service through Laredo where KCS interchanges north of Laredo.[189] If the "remedy" is intended to cover these longer hauls, by requiring KCS to price short hauls to Laredo according to the mileage prorate of its longer haul service, then the issues of this tax could also apply

186 Routes for which I do observe both a KCS interline and single-line service for the same commodity are included in Exhibit 8.

187 *See* my workpaper 28.

188 *See* my workpaper 29.

189 This is calculated according to the 2019 Combined Tapes and limited to KCS interlines that are not identified as new single-line opportunities by Brown and Zebrowski and where CP is not the only interconnecting railroad. *See* my workpaper 32. *See* also Brown/Zebrowski V.S. Backup Materials, 8 – Diversion Identification.xlsx.

to this traffic. All of this harm is to competition in markets where CPKC essentially *is* KCS. In these markets, there should not be changes to incentives due the CP/KCS combination, so any incentive changes are solely the result of the distortionary effects of the "remedy."

161. I next turn to the second category of movements – where CPKC has identified the combination would create particular procompetitive opportunities for CPKC to compete with its new single-line service, focusing on opportunities involving Laredo. As I did in Exhibit 8, I identify for which of these movements the "remedy" would tax CPKC's revenues. However, this analysis differs from that one because for these movements CPKC does not yet offer single-line service. Rather, these are commodity-corridors where CPKC anticipates being able to enhance competition with new single-line service after the CP/KCS combination. Thus, for this particular analysis, the relevant question is not whether the "remedy" would create an incentive to raise prices on existing CPKC movements, but instead whether the "remedy" would reduce CPKC's incentive to price its new single-line service as aggressively as it would have without the "remedy." Specifically, I evaluate whether the "remedy" would create a disincentive for CPKC to price its new single-line service at the same level as current interline rates.

162. In Exhibit 9, the y-axis is the ratio of KCSM interline revenue to the revenue CPKC would earn on a single-line if it set the price of that new service equal to observed KCSM-UP or KCSM-KCS-BNSF interline rates (which I use as a

"hypothetical CPKC single-line revenue").[190] The x-axis is the KCSM share of CPKC single-line mileage.[191] Almost all of this traffic (more than {{[redacted]}} percent) is above the 45-degree line.[192] For this traffic, the "remedy" would tax CPKC's single-line revenue, giving CPKC an incentive to set its new single-line service at a price higher than existing interline prices. Shippers that utilize these routes would not benefit from fully competitive single-line pricing from CPKC.

[190] Note that for this traffic, the revenue neutral condition is based on a pre-"remedy" single-line rate P^* that is the observed through rate on traffic KCS interlines with UP or BNSF.

[191] I identify traffic in the 2019 Combined Tapes data with origin and termination SPLCs and commodities identified at the 7-digit STCC that has also been identified by the Brown/Zebrowski V.S. analysis as corridors and commodities with diversion opportunities because of the CP/KCS combination. Each dot in Exhibit 9 describes a movement that is a potential diversion opportunity for CPKC, capturing the ratio of KCSM interline rates over the hypothetical single-line rate along the y-axis and the KCSM interline-segment share of the single-line mileage. *See* Brown/Zebrowski V.S., p. 7, Parts II–III.

[192] *See* my workpaper 23.

EXHIBIT 9
KCSM interline rates are often greater than a mileage-based prorate for a competitive interline route on routes with CPKC diversion opportunities

{{

}}

Source: Combined CP-KCS-KCSM-UP-BNSF-CN-NS-CSXT Traffic Tapes, 2019; 8 – Diversion Identifiation.xlsx (Brown/Zebrowski V.S. backup materials); CP Intermodal Containers to Railcar Conversion Factor.xls
Note: Describes the Share of Single-Line Mileage and the Interline Revenue earned by KCSM divided by the average CPKC single-line price to serve those corridors in 2019. The y-axis shows *r/P* – the ratio of (i) revenue earned on the Mexican segment of a KCSM interline route with UP or BNSF and (ii) interline revenue earned on the same traffic in each corridor. The x-axis shows *d* – the share of miles covered by the KCSM segment on CPKC single-line serving the same corridor. The opacity of the dots indicate the frequency of traffic where darker shades describe more instances of particular traffic types. The size of the dots indicates the amount of traffic handled that are of particular traffic types. The traffic is limited to corridors and commodities identified by the Brown/Zebrowski V.S. analysis as diversion opportunities.

163. For this category of traffic, the tax would apply to movements CPKC could reasonably expect to win if its incentive to compete for traffic on these routes were not constrained by the "remedy." To forecast this traffic, I use the estimates of CPKC diversions from Brown and Zebrowski. With that forecast of volume for CPKC traffic on these routes, I can approximate the total tax the "remedy" effectively imposes on

such traffic. [193] Aggregating across all relevant movements in the forecast, the total tax imposed on these CPKC movements is more than {{[redacted]}} million.[194] This is a tax of more than {{[redacted]}} million on traffic that CPKC otherwise expects to win as a result of the enhanced single-line service CPKC would offer. In other words, this is a direct tax on the enhanced competition and procompetitive benefits of the CP/KCS combination, and has the effect of insulating from that competition the same carriers who proposed the "remedy" – UP and BNSF.

164. Dr. Reishus links his proposed "remedy" to an agreement reached between BNSF and UP during the latter's acquisition of the SP (the I-5 Prop Rate Agreement). He repeatedly points to how long this agreement has remained in effect as an indication of its procompetitive durability. However, considering the benefit UP and BNSF would each receive from an agreement that is reciprocal and may therefore discourage each of them from pricing aggressively, this durability hardly proves the agreement is procompetitive.[195] That his proposed "remedy" is based on such an agreement does not obviate the need to examine its consequences. And, as I have

---

[193] For each of the movements above the 45-degree line, the amount of tax is essentially the vertical distance to the 45-degree line ($r - dP$) scaled by the volume of traffic represented by the dot. For each of the movements below the 45-degree line $r<dP$, and as I explained above, the "remedy" would not necessarily lead to a tax, but it is also not likely to lead to a "rebate," or single-line price reduction for shippers, as the remedy is not binding in this direction.

[194] *See* my workpaper 30.

[195] Indeed, as a BNSF {{[redacted]}} on the I-5 Prop Rate Agreement explains, {{[redacted]}}
See BNSF Railway, {{[redacted]}},
BNSF0003672 – 83 at BNSF0003674.

shown here, those consequences mean that this would not be a good policy provision to promote or preserve competition for railroad services.

165. I now explain why Professor Salop's defenses of his proposed "remedy" are flawed and misleading. In defense of his proposed "remedy," Professor Salop argues that the "goal and impact" of the "remedy" is to "prevent price foreclosure that would otherwise occur, and which would lead to *higher* single-line rates and *higher* rates charged on interline routes."[196] He also provides a simple numeric example that he purports to show that under his proposed "remedy," CPKC would still have an incentive to reduce its single-line rates.[197] First, as I explain throughout this report, Professor Salop is wrong that the CP/KCS combination would result in price foreclosure and higher rates.

166. Second, Professor Salop's numeric example is inconsistent with his own theory and does not show what he claims it does. His example assumes the pre-merger KCSM "monopoly" interline rate is *already* prorated based on mileage. Yet, Professor Salop's theory, were it true, suggests that KCSM, today, has some power over shippers that enables it to charge a higher rate for the Mexican segment than might typically be earned on a segment with more competition. It is this "monopoly" power over the Mexican segment that Professor Salop's theory suggests CPKC will be able to leverage to implement the alleged "price foreclosure" after the combination. Professor Salop's "remedy" is thus targeted at existing marker power—

196 Salop V.S., ¶ 123 (emphasis in original).

197 Salop V.S., ¶ 124.

whether real or imagined—and not an effect of the CP/KCS combination. In Professor Salop's numerical example, he assumes away the very "monopoly" power his theory of vertical harm and his justification for the "remedy" are based upon.

167. Further, in my analysis, I evaluated the effect of the "remedy" where KCSM *does* currently earn more than its mileage prorate on the Mexican segment (whether via some form of market power, as Professor Salop alleges, or some other reason). As I demonstrated above, the effect of the "remedy" on such routes would be the opposite of what Professor Salop claims – it would actually *create* an incentive to *raise* prices. Thus, for the routes that are potentially relevant for Professor Salop's theory (and for many routes that happen to have a rate above prorated mileage for innocuous reasons), the proposed "remedy," does not maintain competition, and instead deters competition by imposing a regulatory tax on CPKC that would discourage CPKC from competing as aggressively. The reduced competition would benefit UP and BNSF by insulating them from the full competitive pressure they would otherwise face from a combined CPKC.

4.1.3. UP and BNSF's attempts to distance their proposed "remedy" from the reasons that made the DT&I conditions anticompetitive are wrong

168. Conditions originally established as part of the approval to merge in the Detroit, Toledo & Ironton R.R. et al. Control, Etc. ("DT&I") matter were rescinded by the ICC as anticompetitive. Commenters for both BNSF and UP recognize this and try to

distance their "remedy" proposals from the DT&I conditions.[198] However, although the Commenters' proposed "remedies" may not immediately appear to restrict rate-setting behavior in the same way as the DT&I conditions, they do, like the DT&I conditions, ultimately lead to reduced flexibility in rate setting and, as my analysis in the previous section shows, anticompetitive outcomes.

169. The DT&I conditions required merging carriers to continue offering interline routes, rates, and services available to shippers through gateways affected by the new combination, with the ostensible goal of prohibiting discrimination in favor of the post-merger entity, e.g., a new single-line service.[199] When the ICC rescinded the DT&I conditions in 1982 as anticompetitive, it recognized that enforcement of the conditions "prevented carriers from pricing more efficient routes at lower rates," led to rate equalization and rate freezing, and "encouraged unnecessary utilization."[200] In its decision to revoke routine application of the DT&I conditions, the ICC stated that,

---

198 Comments of BNSF Railway Company, pp. 47–48; Salop V.S., ¶ 121.

199 The first condition required the consolidated carrier to "keep open all routes and channels of trade via existing junctions and gateways." This condition was interpreted by the ICC to require rate equalization because it was feared that a lower single-line rate without a lower interline rate would lead to shipper diversion to the single-line service and lead to closure of the interline option, violating the condition. The second and fourth conditions disallowed any discrimination in service provided on interline traffic. The third condition required the carrier to maintain "present traffic and operating relationships." The fifth condition allowed industries operating on the consolidated carriers' network to have all pre-merger routes and gateways open to them. *See* Interstate Commerce Commission Decision, Ex Parte No. 282 (Sub-No. 5), *Rulemaking Concerning Traffic Protective Conditions in Railroad Consolidation Proceedings* (Decided Mar. 9, 1982), 366 I.C.C. 122, 1982 WL 28412, p. 1.

200 The Commission found the DT&I conditions to be "anticompetitive and contrary to the public interest." *See* Interstate Commerce Commission Decision, Ex Parte No. 282 (Sub-No. 5), *Rulemaking Concerning Traffic Protective Conditions in Railroad Consolidation Proceedings* (Decided Mar. 9, 1982), 366 I.C.C. 122, 1982 WL 28412, pp. 1–2.

"instead of restraining potential monopolistic behavior, they [the DT&I conditions] were found to prevent the realization of merger efficiencies and public benefits."[201]

170. The Commenters for UP and BNSF argue that their proposals would not lead to the same concerns raised by the DT&I conditions such as rate equalization or rate freezing.[202] Rather, they claim that their proposed remedies are "far narrower than the DT&I conditions," do "not constrain the single-line rate of the merged firm," and do not diminish carriers' incentives to pass on cost savings to shippers.[203]

171. Yet, the "remedy" proposals put forward by the Commenters are similarly restrictive, reducing carriers' rate-setting flexibility and leading to forms of rate equalization. Under the proposed "remedies," CPKC will have less flexibility setting lower prices for its single-line service because those rates would necessarily be tethered to its interline rates. CPKC would not be able to pass on cost savings related to single-line service to its single-line customers without also passing on proportional reductions to its interline customers. Absent price-setting flexibility for its single-line service, CPKC would not be able to "use its assets to the fullest" by providing the

201 Daniel Smith, "The Evolution of Rail Merger Policy," in *Proceedings – Twenty-fourth Annual Meeting*, Volume XXIV, Number 1 (Transportation Research Forum, 1983), available at https://ageconsearch.umn.edu/record/311628, pp. 558–565 at p. 564.

202 Comments of BNSF Railway Company, p. 47 ("By allowing Applicants to adjust their rates to reflect post-merger efficiencies, a proportional rate mechanism would avoid the issues associated with the anti-competitive 'rate equalization' conditions imposed by the ICC on mergers after its decision in Detroit, Toledo & Ironton R.R. et al. Control, Etc., 275 I.C.C. 455 (1950)."); Salop V.S., ¶ 121 ("Applicants might attempt to argue that the CRR formula will force rate equalization and deter rate reductions driven by lower costs in the same way as the now-discredited DT&I conditions. However, this criticism is not well-founded.").

203 Salop V.S., ¶¶ 121, 122.

"cheapest and most efficient transportation service possible."[204] In addition, these "remedies" may lead to higher rates for shippers, because CPKC may be unwilling to pay the tax – i.e., to forgo the lost profits on its interline rates,[205] or they may not benefit from improved single-line service altogether because CPKC will have reduced incentive to invest in it.

172. Thus, in contrast to Commenters' claims, the "remedies" they propose share the key competitive implications, such as a degree of rate equalization leading to less flexible rate setting and less benefit of single-line service to shippers, that made the DT&I conditions anticompetitive and ultimately led the Commission to revoke them.

4.2. CN's proposed divestiture seeks to resolve an alleged harm that does not exist and instead would create risk of harm to horizontal competition

173. In my Application Statement, I demonstrated that a combination of CP and KCS would not have any adverse horizontal competitive effects.[206] CN argues otherwise, claiming my analysis did not consider potential horizontal concerns related to KCS's line between Kansas City and Springfield, IL, which connects to a CN line between

---

204 Interstate Commerce Commission Decision, Ex Parte No. 282 (Sub-No. 5), *Rulemaking Concerning Traffic Protective Conditions in Railroad Consolidation Proceedings* (Decided Mar. 9, 1982), 366 I.C.C. 122, 1982 WL 28412, p. 4 (citing *Seaboard Coast Line Railroad Company, et al.—Investigation of Control and Modification of Traffic Conditions*, Finance Docket No. 21215 (Sub-No. 2) (Served Feb. 22, 1979)), p. 5 ("In direct contrast [to the DT&I conditions], the recent legislation has emphasized the need for rail carriers to have the flexibility to make individual ratemaking and routing choices.").

205 *See* § 4.1.2.

206 Application Statement, §§ 4, 5.

Springfield and Chicago – specifically as part of a route with CN to serve Chicago and beyond.[207] CN uses this alleged competitive concern as a basis to demand divestiture of the entire KCS Springfield/St. Louis Line – to CN.[208]

174. In this section, I address CN's claims, and explain that CN's concern is exclusively about speculative potential future competition that has not been borne out by past experience. The CP/KCS combination presents no significant horizontal competitive concern based on traffic currently moving in corridors involving service over this line. CN's assertion is, instead, premised on a series of assumptions. First, that there are potential benefits which could be unlocked through investments in this line that require partnership with CN to achieve. Second, that these benefits outweigh the benefits of investments CPKC would make in this line and elsewhere on its network without such a partnership. And, finally, that CPKC would choose to forego a share in the benefits of such a partnership with CN. None of these assumptions are particularly justified, but the final assumption is contrary to basic profit-maximizing behavior and has no place in an economic analysis of competitive effects.

175. The analysis I presented in my Application Statement demonstrated that, with respect to traffic movements observed to occur, the CP/KCS combination creates no

---

207 *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (CN's Comments on Application and Request for Conditions dated Feb. 28, 2022) ("CN's Comments on Application and Request for Conditions"), p. 39 ("The CP-KCS merger raises a significant horizontal competitive concern that must be addressed by the Board. As CN had demonstrated, the Springfield Line is part of a direct competitive alternative to CP's route between Kansas City and Chicago, and beyond to Detroit and Eastern Canada.").

208 CN's Comments on Application and Request for Conditions, Part IV.A.

risk of significant horizontal concerns. My within-corridor analysis examined all corridors observed in the 2019 CWS, including those CN identifies as involving the Springfield/St. Louis Line, and demonstrated that in none of these corridors would there likely be a reduction in competition from a CP/KCS combination.[209] My initial screen identified {{{[redacted]}}} involving the Springfield/St. Louis Line that even warranted some detailed review: the {{{[redacted]}}} corridor. However, that further examination showed that shippers are unlikely to experience a significant competitive effect from not having an independent KCS on this corridor.[210] Similarly, my between-corridor analysis fully included traffic over the Springfield/St. Louis Line in demonstrating that the CP/KCS combination would not likely affect cross-corridor competition in any area in North America.[211]

176. Thus, CN's argument must be understood to be about traffic that is not currently moving over the Springfield/St. Louis Line. That is, the claim of competitive effects is an assertion about the magnitude of two unquantifiable amounts – the potential benefits of CP investment on this line *vs* the potential benefits of CN investments on this line. For the most part, CN's assertion in this regard is simply that CPKC will not

209 Application Statement, Exhibit 3.

210 This corridor screens as a potential 5-to-4 corridor. As I noted in my Application Statement, the Board has historically focused on 3-to-2 and 2-to-1 reductions as most relevant. Shippers in the corridor would have four independent single-line routes available {{{[redacted]}}}, even without an independent KCS. Moreover, KCS's observed involvement in the corridor was minimal, {{{[redacted]}}}, consistent with the KCS routing option not being one of the better options among the many available to shippers. *See* Application Statement, ¶ 70.

211 Application Statement, §§ 5, 7, and backup materials.

have an incentive to invest because it has another line to Chicago.[212] CN has offered no support for the proposition that CPKC would not maintain the Springfield/St. Louis Line.[213] However, to the extent one does assume there is a project that would enhance options for some shippers to Chicago or beyond in a way that CPKC cannot achieve without partnering with CN, there is no rational basis to assume CPKC would choose to spite CN rather than choosing the course of maximizing its return to its own shareholders. Consequently, there is no basis for predicting any difference in the potential that will be realized and there is no effect on potential competition to justify CN's demand to be given the Springfield/St. Louis Line.

177. Further, the proposed divestiture is not harmless. Forcing CPKC off the Springfield/St. Louis Line would impair the benefits of the CP/KCS combination, ultimately depriving shippers of some of the enhanced competition the CP/KCS combination would otherwise generate.

212 CN's Comments on Application and Request for Conditions, pp. 40–41, 44.

213 CN's Comments on Application and Request for Conditions, §§ III.A.1–2.

5. OTHER COMMENTERS THAT RAISE ISSUES OF "COMPETITON" DO NOT RAISE AN ISSUE OF COMPETITIVE EFFECTS DUE TO A CP/KCS COMBINATION

178. I have been asked by counsel to review Comments from several parties expressing particular concerns they describe as related to competition. In this section, I explain that the issues raised in those Comments do not concern competitive effects of a CP/KCS combination. Some do not appear to involve issues of competition at all. Others appear to be general concerns about the importance of competition among Class I railroads – something a CP/KCS combination will not worsen and is likely to improve. To that end, the "remedies" called for in these Comments would be counter-productive – restraining the ability for a CP/KCS combination to reverse the perceived trend and enhance competition and expand shippers' choices.

179. First, several Commenters have asserted a competitive effect in the possibility of CPKC adopting CP's tariff and insurance requirements for transporting TIH/PIH hazardous chemicals. I understand that CP and KCS currently have different provisions covering transportation of these materials and that these Commenters would like for the Board to preserve the terms they view as more favorable to them for movements on the current KCS network.[214] I have reviewed these Commenters' claims. I believe that it is plausible that CPKC will attempt to follow a consolidated

[214] *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (Comments and Request for Conditions of The American Chemistry Council, The Fertilizer Institute, and The National Industrial Transportation League dated Feb. 28, 2022), p. 2; *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (Amended Comments of The Chlorine Institute dated June 9, 2022), p. 4; Letter from Karenanne Stegmann (OxyChem) to Martin Oberman, et al. (Surface Transportation Board), "RE: STB Finance Docket No. 36500, Canadian Pacific Railway – Control – Kansas City Southern," February 28, 2022, p. 2.

policy which necessarily involves some change. However, the reason for such change is not any loss of competition. CP and KCS's current management have each made their own business decisions regarding the potential liabilities associated with transporting hazardous materials and those decisions affect their respective choices of tariff and insurance provisions. These business decisions reflect the experience and knowledge of each railroad's management. As with any business combination or indeed any change in management, it is efficient for the combined CPKC to benefit from the combination of that experience and knowledge into a common management team. This process may well result in a consolidated policy, which necessarily involves some changes for movements over at least one of the two railroads' current systems, but for reasons that are not a reflection of competition between the two railroads. Thus, the choice of provisions that the combined firm will make for the CPKC network is not an indication of any potential competitive effect of the CPKC transaction.

180. Second, Texas International Terminals ("TxIT"), a multi-modal facility for deep draft vessels located along the Galveston Ship Channel, identifies conditions which it believes could enhance competition.[215] These conditions appear unrelated to any competitive effect of the CP/KCS combination and instead appear aimed at improving TxIT's relative competitive position, rather than preserving competition. Specifically, TxIT requests the Board to require CPKC to market to shippers some

[215] *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (Comments and Request for Conditions of Texas International Terminals Ltd dated Feb. 28, 2022) ("TxIT Request for Conditions, 2022"), pp. 2–3.

KCS access rights to Galveston so that TxIT can add CPKC to the existing competition it enjoys between UP and BNSF.[216] I understand these access rights were granted to KCS after the UP-MKT transaction, and that KCS has "not effectuated or sought to aggressively market" these rights to date.[217] On its face, TxIT's preference for KCS to "aggressively" utilize its Galveston rights cannot be an issue of the CP/KCS combination reducing competition in any market. KCS made an independent decision that predates the CP/KCS combination and which precludes any potential competitive effects from the combination. Conditions that would force a different choice on CPKC are presumptively impositions of a bad business decision that would inhibit CPKC from using its resources to compete most effectively where it can do so.

181. Third, several Commenters raise concerns about international trade policy and their belief that U.S. wheat producers are at a competitive disadvantage relative to Canadian wheat producers. In particular, three associations of U.S. wheat growers – the NAWG, USWA, and NDWC – argue that by extending CP's network in the U.S. and into Mexico a CP/KCS combination would distort competition between Canadian wheat growers and U.S. wheat growers.[218] Even assuming the premise of unfair

---

216 TxIT Request for Conditions, 2022, pp. 8–9.

217 TxIT Request for Conditions, 2022, p. 4.

218 *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (U.S. Wheat Associates Comments and Request for Conditions dated Feb. 28, 2022) ("USWA Request for Conditions, 2022"), pp. 4, 14–16; *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (North Dakota Wheat Commission Request for Conditions dated Feb. 28, 2022) ("NDWC Request for Conditions, 2022"), p. 5; Letter from David Milligan (National Association of Wheat Growers) to Martin Oberman, et al. (Surface Transportation Board), "RE: Canadian Pacific Railway Limited – Control – Kansas City Southern (Docket No. FD 36500)," February 28, 2022 ("NAWG Request for Conditions, 2022"), p. 2.

international competition were accurate, merger review is not about insulating U.S. shippers from competition with other shippers. The push for such a strategy in these Comments amounts to preventing competition by preventing a CP/KCS combination from offering some shippers the benefit of more competitive terms.

182. In arguing that the Board should keep these concerns in mind when evaluating the CP/KCS combination, these wheat industry Comments mischaracterize the issues as related to potential competitive effects of the combination.[219] I understand that John Brooks has reviewed the Canadian policies that Commenters point to and has explained that these policies do not apply to wheat movements from Canada to U.S. or Mexican destinations, and thus could not be relevant for the competitive effects of the CP/KCS combination on U.S. wheat growers.[220] In addition, in my Application Statement, I evaluated whether the CP/KCS combination would result in potential reductions in competitive options for shippers, including U.S. wheat growers and destinations that might substitute Canadian sources of wheat, and showed the combination would not result in adverse competitive effects.[221] The CP/KCS combination could affect competition in markets accessed by U.S. wheat growers by *enhancing* competition through new single-line options connecting growers, including those in the Upper Midwest and Canada, to destinations on the KCS

220 Reply Verified Statement of John Brooks, *Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500, July 12, 2022 ("Brooks R.V.S."), ¶ 81.

221 Application Statement, ¶ 12, §§ 4, 5.

network, including those in the South Central United States and Mexico.[222] That enhanced competition should be encouraged both in merger review and in international trade negotiations so that markets, rather than regulators, determine the success of individual shipper groups in their competition with one another.

183. Finally, a number of Commenters, including some of the shipper groups discussed above as well as others, have requested that the Board impose various forms of open access, reciprocal switching conditions, and rate restrictions that are loosely based on a general observation that past consolidation in the rail industry has reduced competition and harmed shippers.[223] However, that concern is misguided as to the CP/KCS combination.

184. Unlike a number of past consolidations, the CP/KCS combination is an end-to-end railroad merger. As I demonstrated in my Application Statement, the CP/KCS combination would not generate any significant reduction in competition within any corridor nor the competition between corridors (either source or destination

---

222 Mr. Brooks also comments on the potential benefits to U.S. wheat growers from the CPKC transaction. *See* Brooks R.V.S., ¶¶ 76–78.

223 TxIT requests that the Board "require Applicants to adhere to their pledge to maintain open gateways and interchanges, and impose conditions which allow for enforcement of these conditions." *See* TxIT Request for Conditions, 2022, p. 9. The PRFBA requests that the Board require reciprocal switching for "any shipper on the new CP/KCS system that is subject to market dominance or receives inadequate service" as a condition of the merger. *See Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (PRFBA Request for Condition dated Feb. 28, 2022), p. 12. The IMA requests that the Board "limit any rate increases to captive shippers for five years after the transaction is approved to 10 [percent] of that time." Other conditions stipulated by the IMA align very closely with the proposals from the wheat grower associations. *See Canadian Pacific Railway Limited, et al. – Control – Kansas City Southern, et al.*, Finance Docket No. 36500 (IMA-NA Request for Conditions dated Feb. 28, 2022), pp. 12–13.

competition).[224] In that regard, this combination stands out from almost every past rail merger for how purely end-to-end it is. There is no loss of competition from this transaction for these proposed remedies to resolve.

185. And, as a particularly end-to-end railroad merger, the CP/KCS combination presents opportunities to enhance competition with improved options to shippers and enhanced competition through new single-line service. The Comments reflect these shippers' perception that past railroad mergers have generally been associated with a trend of reduced competition and worse options for shippers, but a CP/KCS combination is the kind of merger that goes against any such trend. It is, indeed, a chance to mitigate the history about which these shipper organizations express concern and to enhance the competition for affected shippers.

186. To the extent that past railroad mergers may have reduced competition and harmed shippers, the solution is not to burden the CPKC with unwarranted conditions that would limit CPKC's ability to compete better in markets it will serve. As I showed with respect to the "remedy" proposals of BNSF and UP, imposing such a restriction on CPKC would tax the ability of CPKC to compete and would lead to less competitive prices for shippers. Perversely, the only beneficiaries of such a restriction are the very railroads whose past consolidations these shippers identify with lost competition. The proposed restrictions insulate those railroads from the new competition a CP/KCS combination would otherwise bring for shippers. To advance

[224] Application Statement, ¶ 12, § 5.

the Board's objective of fostering rail competition, and to address the concern of these shippers, the better way to proceed is to force the railroads responsible for that concern to face an unfettered CPKC.

6. TECHNICAL APPENDIX: ANALYSIS SHOWING THE ANTICOMPETITIVE EFFECT OF THE PROPOSED MILEAGE-PRORATE "REMEDY," ADDITIONAL DETAILS

187. In section 4.1.2, I show that the proposed mileage-prorate "remedy" would create a tax on Mexican revenues. In demonstrating this, I focused on the following question: under the proposed "remedy," what single-line rate would CPKC need to set in order to maintain the Mexican-segment revenue CPKC would earn in the absence of the "remedy"? And, I showed this would be true under the following "revenue neutrality condition:" $SQ + dSq = PQ + rq$, where Q is CPKC's current single-line volume and q is CPKC's current interline volume, and that $S > P$ when $r > dP$. In this appendix I provide additional details and explanation of this analysis.

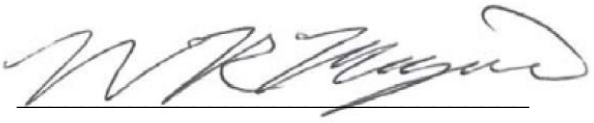
188. Without the "remedy," CPKC would earn total revenue of $PQ + rq$ on these movements. On its single-line movements, without the remedy, CPKC earns P. On the interline, KCS earns r. Thus, total CP and KCS revenues without the remedy would be $PQ + rq$. Note that one could also redefine P to be the pre-combination total price on an interline between CP and KCS (with CP's portion being $P - r$ and KCS's portion being r) and get the same relationship. Under the "remedy," CPKC would earn total revenues of $SQ + dSq$.[225]

189. Thus, for CPKC to remain revenue neutral after the "remedy" is imposed, CPKC needs to charge a single-line price S so that $SQ + dSq = PQ + rq$. This equality is the "revenue neutrality condition" I discussed above. This describes the condition for which CPKC earns the same total revenues on its single-lines and interlines with UP

[225] CPKC earns S on each single-line movement and dS on each interline movement.

(or BNSF) as CPKC did without the "remedy." To the extent the effect of the "remedy" is to incent CPKC to charge a higher single-line rate than it would have absent the "remedy" in order to maintain its pre-merger revenues, this could incent some shippers to switch to the KCS-UP (KCS-BNSF) interline. If the *S* that satisfies revenue neutrality is greater than *P,* then the "remedy" has created an incentive for CPKC to raise single-line prices after the combination.

190. It is straightforward to show that the single-line price that satisfies revenue neutrality will be greater than the pre-"remedy" interline price for all traffic where $r > dP$. The revenue neutrality condition shows that $SQ + dSq = PQ + rq$. Rearranging terms to solve for S, shows that $S = (PQ + rq) / (Q + dq)$. Using this we know that $S > P$ when $(PQ + rq) / (Q + dq) > P$, which can be rearranged to be $r > dP$. The inequality compares the rates that KCS currently earns on interline movements with other carriers, such as UP, BNSF, or CP, to the mileage-based prorates it *would* earn on a CPKC single-line service if current rates were prorated according to KCS's share of total movement mileage.



191. Instances in which $S > P,$ i.e. when single-line rates are higher compared to the interline alternative, could lead some shippers to switch away from the single-line option to the interline option. In a scenario with diversion to a competing interline route, the S^* that achieves revenue neutrality is generally larger than the *S* with no diversion, confirming that there would still be incentive for CPKC to raise its single-line rate in order to maintain its pre-merger revenue. In particular, the revenue neutrality condition becomes $S^*(Q - e) + dS^*(q + e) = PQ + rq,$ where $e < Q$ is a

positive number denoting the diversion from the single-line to the interline option for the given price difference. The revenue neutrality condition can then be re-arranged to solve for $S^* = (PQ + rq) / [Q + dq + (d - 1)e]$, and since $(d - 1) < 0$, then $[Q + dq + (d - 1)e] < (Q - d)$. This implies that $S^* > S$, suggesting that there is a greater incentive for CPKC to raise its single-line rates when there is diversion.

VERIFICATION

I, W. Robert Majure declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further I certify that I am qualified and authorized to file this statement.

Executed this 12th day of July, 2022

W. Robert Majure

ACADEMIC BACKGROUND

1990 – 1994 **Massachusetts Institute of Technology** Cambridge, MA
Ph.D., Economics
Specialization: Industrial Organization, Microeconomics, Econometrics
Thesis: Disequilibrium Game Theory

1986 – 1990 **University of Virginia** Charlottesville, VA
B.A., Economics and Mathematics

PROFESSIONAL EXPERIENCE

2019 – Present **Cornerstone Research, Inc.** Washington, DC
Vice President
Provide financial and economic analysis for commercial litigation matters. Support experts in preparing for deposition and trial testimony.

2010 – 2018 **Antitrust Division – U.S. Department of Justice** Washington, DC
Director of Economics
Senior career executive supervising the Antitrust Division's Economic Analysis Group. Helped formulate economic evidence and testimony for cases in industries such as software (*U.S. v. H&R Block, Inc., et al.*), telecommunications (*U.S. and Plaintiff States v. AT&T Inc., et al.*), video (*U.S. v. AT&T Inc., DirecTV Group Holdings, LLC, and Time Warner Inc.*), publishing (*U.S. v. Apple, Inc., et al.*), airlines (*U.S., et al. v. US Airways Group, Inc. and AMR Corp.*), oilfield services (*U.S. v. Halliburton Co. and Baker Hughes Inc.*), and health insurance (*U.S. and Plaintiff States v. Aetna Inc., and Humana Inc.* and *U.S. and Plaintiff States v. Anthem, Inc. and Cigna Corp.*).

2003 – 2010 **Antitrust Division – U.S. Department of Justice** Washington, DC
Chief of Competition Policy Section
Managed a section of about 18 economists and other staff. Supervised economic analysis of antitrust investigations in various industries including computer software (*U.S. v Oracle Corp.*), real estate (*U.S. v Kentucky Real Estate Commission*), and telecommunications (*U.S. v Cingular Wireless et al*). Testified in *U.S. v SBC Communications Inc. and AT&T Corp.* and *U.S. v. Verizon Communications Inc. and MCI, Inc.* Consulted on appellate arguments of the United States in Circuit Court (including *FCC v Prometheus Radio Project*).

1997 – 2003 **Antitrust Division – U.S. Department of Justice** Washington, DC
Assistant Chief of Economic Regulatory Section

Assisted with the management of a section of about 18 economists and other staff. Supervised economic analysis of antitrust investigations in various industries including telecommunications (*U.S. v WorldCom and Sprint*), computer software (*U.S. v Mathworks and Wind River*), publishing, radio and television advertising (*U.S. v Univision and Hispanic Broadcasting Corp*), electricity, and airlines. Consulted on appellate arguments of the United States in Circuit Court and the U.S. Supreme Court (including *Iowa Utilities Board v FCC and U.S.*).

1994 – 1997 **Antitrust Division – U.S. Department of Justice** Washington, DC
Economist
Performed economic analysis in antitrust investigations. Applied developments in the fields of industrial organization, microeconomics, and econometrics to practical questions raised in antirust analysis. Examined mergers or practices in telecommunications (including *U.S. v Sprint and Joint Venture Co.*), computer software, and banking. Testified in the merger of Union Pacific Railroad and Southern Pacific Railroad (before the Surface Transportation Board).

TESTIMONY

Library of Congress Copyright Royalty Judges Case No. 16-CRB-0009 CD (2014-17) – Submitted testimony in re: Distribution of Cable Royalty Funds on behalf of joint sports claimants.

STB Finance Docket No. 36500 – Submitted testimony in support of the application by Canadian Pacific Railway Limited, *et al.* to combine with Kansas City Southern, *et al*. Testified in deposition.

STB Finance Docket No. 36514 – Submitted testimony on behalf of Canadian Pacific Railway Limited analyzing prospective combination of Canadian National Railway Company, *et al.* with Kansas City Southern, *et al.*

Real Estate Exchange, Inc. v Zillow, Inc. et al. – Filed declaration in support of motion for preliminary injunction.

U.S. v SBC Communications Inc. and AT&T Corp. and *U.S. v. Verizon Communications Inc. and MCI, Inc.* – Filed declarations in Tunney Act proceeding to explain the economic analysis of the United States for the proposed mergers and of the proposed consent decrees.

ICC Finance Docket No. 32760 – Submitted testimony on behalf of the U.S. Dept. of Justice analyzing prospective merger of Union Pacific Railroad and Southern Pacific Railroad. Testified in deposition.

IV. TRAFFIC DATA SHOW THAT KCS-CN ROUTES VIA SPRINGFIELD PLAY NO MEANINGFUL COMPETITIVE ROLE....58

APPENDIX A....61

I. INTRODUCTION

1. We are Richard W. Brown and Nathaniel S. Zebrowski of FTI Consulting, Inc. We previously submitted a verified statement to the Surface Transportation Board ("STB") in this proceeding on October 29, 2021, included in Canadian Pacific Railway's ("CP") Application for Control of Kansas City Southern ("KCS"). In that opening verified statement ("O.V.S."), we estimated the amount of existing railroad traffic the combined CP/KCS system would attract, commonly referred to as "rail-to-rail diversion" traffic. We determined that CPKC will attract 216,675 units of existing railroad traffic annually, representing $513.1 million in revenues at 2019 levels, by the third year of combined operations. Details on our methodology and results are provided in our O.V.S.

2. In this statement, we address various claims made by other Class 1 railroads concerning our estimate of traffic CPKC is likely to attract.[1] Generally speaking, the railroads do not dispute that the categories of traffic we identified as likely to shift to CPKC would be affected by the proposed Transaction, nor do they argue there were categories we should have identified but did not. Instead, the railroads express in various ways the view that much of the traffic we estimated would move to CPKC would only do so via foreclosure because CPKC routes would often be somewhat longer than existing routes. CN further alleges that we erred by not adjusting diversion percentages on a lane-by-lane basis to account for differences in relative route lengths. Despite making these assertions, none of the railroads address the analysis provided in our initial statement demonstrating that modest differences in relative route lengths minimally affect traffic shares. In fact, CN's own rail-to-rail diversion analysis corroborates

[1] We did not identify any claims directly addressing or critiquing our estimate in the comments of non-Class 1 railroad parties.

both that the diversion percentages we apply are reasonable, and that it would be inappropriate to adjust them formulaically as a function of route length.

3. CSX and CN mistakenly believe we should have assumed that rate reductions will be required to attract traffic to CPKC, and the absence of such reductions means CPKC can only attract traffic by foreclosing competitors. By design, our study estimates the amount of traffic that CPKC would attract absent foreclosure. As we explain, if we had assumed CPKC reduced its rates while railroads competing for eligible traffic did not, we would have found higher levels of traffic moving to CPKC.

4. Additionally, various other claims made by the railroads are unfounded, as we explain. These claims include allegedly understating traffic that CPKC may attract, making technical errors developing revenue estimates, and double counting existing and growth-related traffic diversion volumes. None of the railroads' comments merit any adjustments to our initial estimate of traffic that CPKC may attract. We believe our estimate is reasonable and accurate and fully supports the sufficiency of CP's Application.

5. This statement also addresses the rail-to-rail traffic diversion estimates put forward by Mr. David Hunt in support of CN's Responsive Application. As discussed in Section III, there are several major flaws and inconsistencies that make his methodology unreliable and his results unrealistic. First, approximately one third of his diversion traffic is specialized RoadRailer service that CN does not provide. Second, he found substantial amounts of additional diversion traffic by forcing his model to ignore the fact that CN already has existing single-line routes to St. Louis. These and numerous other problems are addressed in detail in Section III.

6. At the request of counsel for CP and KCS, we also provide an analysis of the traffic moving on KCS's Kansas City-Springfield/St. Louis Line, as well as an analysis of historical traffic patterns over corridors where KCS's Springfield Line could be used as part of a KCS-CN interline routing alternative for movements in corridors between Kansas City and/or Mexico, on one end, and Chicago, Detroit, or Toronto on the other end. This analysis shows that in recent history, the Springfield Line has rarely been used (in fact almost not at all) by traffic moving over these corridors (including traffic that travelled over these corridors as part of a broader movement). Instead, the traffic moves over a wide variety of other routes, many of which are single-line. Thus, there appears to be no practical cases where a CP/KCS combination could theoretically affect competition or lead to the foreclosure of any interline routes.

7. We have organized the remainder of our statement into three sections. Section II responds to critiques of our traffic study, specifically: Section II(A) explains that our identification of traffic groups providing opportunities for traffic CPKC will attract is sound and largely undisputed; Section II(B) explains that our process for estimating the traffic CPKC will attract uses the most appropriate approach supported by the data, and addresses the various incorrect claims made by other railroads concerning route circuity, foreclosure, and rate changes; Section II(C) discusses why our revenue estimates are accurate and the criticisms raised by CN are wrong; and Section II(D) describes how the existing railroad traffic we estimate will move to CPKC is aligned with the growth traffic estimated in the Verified Statement of Jonathan Wahba and Mike J. Naatz ("Wahba/Naatz O.V.S."). Section III addresses CN's Responsive Application, including Mr. David Hunt's flawed rail-to-rail diversion estimates. Section IV provides an analysis of traffic patterns relevant to KCS's Springfield line.

II. OUR TRAFFIC STUDY PROVIDES A RELIABLE ESTIMATE OF THE LIKELY IMPACT OF THE CP/KCS COMBINATION ON RAIL TRAFFIC

A. Our Identification of Traffic Groups Providing Opportunities for Shifting to CPKC Is Sound and Largely Undisputed

8. To start, we initially identified 33 individual groups of commodity-specific regional traffic flows, totaling 569,166 units (at 2019 levels), which represents the individual rail freight movements where shippers would gain new competitive options immediately after the CP/KCS combination, regardless of what portion actually moves to CPKC.[2] Class 1 railroads offered various critiques of this population, to which we will respond in this section. Specifically:

- BNSF's witness Benton Fisher argues we may have generally understated the population of theoretically divertible traffic;
- CSX queries whether two of the groups involving automotive diversions to Kansas City are properly treated as Transaction-related; and
- CN questions the validity of two other groups of lumber and grain traffic not tied to specific existing 2019 station-to-station movements.

9. Besides these limited items, no railroads or shippers raised any specific concerns about the validity of the 33 traffic groups or argued other groups should have been included. We explain below why the alleged issues raised by the Class 1s, all minor in nature, are either invalid or do not justify adjustments to our estimate. We also affirm our initial findings accurately identified the amount of traffic that would benefit from new competitive options under the CP/KCS combination.

[2] *See* Table 5 of our O.V.S.

1. BNSF Witness's Speculation Why Our Estimate May Be Understated Does Not Justify Increasing Our Estimate

10. BNSF's Witness Benton Fisher offers three reasons suggesting why he believes we may have underestimated the amount of traffic that would be attracted to CPKC single-line service. However, he does not attempt to quantify the additional amount he believes will move to CPKC. None of the reasons he provides merit adjustments to our estimate.

11. First, Mr. Fisher suggests that the amount of traffic we identified as potentially moving to CPKC may have been understated due to the exclusion of 361,000 units during the initial screening process.[3] This is the same alleged issue raised by UP in its November 19, 2021, filing petitioning the STB to reject the Application as incomplete, and sufficiently addressed by Applicants in their November 22, 2021 reply. Again, it may be addressed with a simple look at the traffic in question—a step neither BNSF nor UP appeared to have taken as a part of formulating their criticisms: the large majority of the traffic in this category is clearly not eligible to move to CPKC.[4] Over 210,000 of the 361,000 excluded units are intermodal movements originating or terminating in locations where CP or KCS do not currently have intermodal facilities.[5] As we explained in our initial statement, and as Applicants explained in the

---

[3] *See* BNSF-9, Verified Statement of Benton V. Fisher ("Fisher V.S.") at 13-14. We confirm the correct figure is 361,000; not the 380,000 figure inadvertently referenced in our O.V.S.

[4] This is seen based on review of the traffic characteristics for all 361,000 units in question that are readily available in our workpapers. *See* "8 – Diversion Identification.xlsx," tab "Calculations," at Columns B to AA.

[5] Specifically, these locations are: 1) The northeastern states of New York, Pennsylvania, New Jersey, and Massachusetts; 2) Portland, OR; 3) Memphis, TN; and 4) Houston, TX. *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Non-Divertable Summary." Regarding Houston, while KCS does have an intermodal facility at Kendleton outside of Houston, due to trackage rights restrictions this facility cannot be used for traffic moving to/from CP-served territories, as explained in footnote 11 of our initial statement.

November 22, 2021 filing[6], our estimate is limited to traffic that can be handled by existing CP and KCS facilities, clearly excluding intermodal traffic without intermodal facilities.[7] Another nearly 50,000 units involve traffic originating or terminating in Kentucky, Ohio, or other states where CP has only limited operating rights over other carriers' lines, and where CP generally does not provide direct service options.[8] It also would not have been inappropriate to include in our estimates much of the remaining traffic—about 100,000 units, representing less than one-tenth of all traffic screened, for various reasons. As examples, this traffic may be automotive traffic moving to destinations where CP or KCS have no automotive facilities, or, consist of movements originating or terminating in Houston where KCS likely does not have local access rights. As explained in our initial statement, we considered the small portion of this traffic remaining as too heterogeneous to reliably classify as potentially moving to CPKC.[9] Unsurprisingly, neither BNSF nor UP identified any subset of the 361,000 units in question they assert would likely be attracted to CPKC.

12. Second, Mr. Fisher identifies minor discrepancies in our assignment of four lanes (out of the thousands we reviewed) to traffic groups.[10] Specifically, he provides "as examples" four lanes where we included only a portion of the traffic in the automotive line of business as

---

6 *See* CP-33/KCS-21, Applicants' Reply to Union Pacific's "Petition to Reject Application as Incomplete" at 6 and 7.

7 This is not to say that in the future CPKC could not pursue investment initiatives seeking to attract such types of growth-related traffic. We take no opinion on this, but only point out that these hypothetical future opportunities are properly not included in the scope of our study of existing rail-to-rail traffic that could be attracted to CPKC.

8 *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Non-Divertable Summary." Much of this traffic was only picked up in the initial screening model due to anomalous station reporting in the CSM as explained in footnote 11 of our initial statement.

9 *See* Brown/Zebrowski O.V.S. at 17.

10 *See* Fisher V.S. at 14.

eligible for diversion.[11] These four lanes are not just examples of such discrepancies; they in fact comprise nearly all of such cases.[12] Accordingly, addressing this minor lane classification issue would involve adding a few hundred units at most to our estimate of over two hundred thousand units—a negligible impact on our findings that does not warrant adjustment.[13]

13. Third, Mr. Fisher claims that the CWS understates UP's Mexico-U.S. cross-border traffic by approximately 20 percent overall, which he argues may in turn result in our estimate being understated. [14] His concern is largely moot due to our use of KCSM 100-percent traffic tape data, not CWS data, for quantifying the majority of diversions involving this traffic group. Only about {{{[redacted]}}} estimated diverted units involving UP's Mexico-U.S. cross-border traffic, i.e., the portion interchanged with FXE and not included in KCSM 100% traffic tape data, are derived from CWS data.[15] To put this in context, even assuming the 20 percent understatement ratio estimated by Mr. Fisher was an appropriate adjustment to apply, this would only increase our diversion estimate by about {{{[redacted]}}} of 216,675

---

[11] This minor discrepancy is mostly related to inadvertently omitting shipments reporting the 7-digit STCC code for trucks while including shipments reporting the 7-digit STCC code for automobiles.

[12] *See* Fisher V.S. at 14 where Mr. Fisher claims there to be "many instances of shipments of the same commodity on the same traffic lane for which Applicants dropped a portion…and concluded another portion would divert to new single-line service on the combined CP-KCS system." The four examples identified account for 730 units that were dropped due to this minor lane classification issue. After review of the remainder of lanes screened in our diversion process, we only found an additional 110 units that may be affected by this type of classification issue identified by Mr. Fisher. *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Lane Classification Analysis."

[13] Mr. Fisher also speculates that there may be additional discrepancies based on application of radial adjustments, but does not provide any examples of this.

[14] *See* Fisher V.S. at 16 and 17.

[15] The 55,440 units of traffic originating in Mexico as reported in the 2019 CWS cited by Mr. Fisher do not include the large portion of traffic originating in Mexico that is reported in the CWS as originating at a border crossing location such as Laredo, Eagle Pass, or El Paso. As such, this figure does not provide a meaningful reference point.

estimated units.[16] However, applying such an adjustment would be speculative at best, since Mr. Fisher's calculations provide no way to know whether the portion of UP's Mexico-U.S. cross-border traffic eligible to move to CPKC is proportional to the entire set of traffic on which his adjustment is based. Our approach[17] is consistent with the guiding principle of past rail-to-rail diversion studies to use the best data available at the time the study is performed.[18]

2. CSX Witnesses Wrongly Assert that Two Relatively Small Traffic Groups of New Traffic Are Not Merger-Related

14. CSX witnesses Julie Carey and Albert Bremser question whether two groups of traffic, consisting of automotive traffic moving from Canada to Kansas City and Mexico to Kansas City, are properly treated as Transaction-related since, for the two groups respectively, CP and KCS can already serve both origin and destination territories.[19] As explained in our initial statement and discovery responses, the Transaction will improve CPKC's ability to attract

---

[16] *See* workpaper "8 – Diversion Identification Reconciliation.xlsx," at tab "Cross-border CWS Summary."

[17] The 2019 100% traffic tape data produced by UP and BNSF after our traffic diversion study was performed confirm the CWS data available to us at the time is well-aligned with the traffic flows interchanged with FXE at Eagle Pass relevant to our study. Excluding southbound grain, which our diversion methodology treats separately from waybill data (it is instead based on overall U.S. trade export statistics) BNSF and UP's internal waybill data report {{[redacted]}} loaded revenue units through Eagle Pass, and the CWS data reports {{{[redacted]}}} units through Eagle Pass. This difference of {{{{[redacted]}}}} indicates that the drivers of the overall differences Mr. Fisher observes are related to other traffic flows not relevant to our quantification of diversions. *See* workpaper "CWS and Tape Data Comparison.xlsx," at tab "Summary Figures."

[18] *See, e.g., Burlington Northern Inc. and Burlington Northern R.R. Co. – Control and Merger – Santa Fe Pacific Corp. and the Atchison, Topeka and Santa Fe Ry. Company*, Finance Docket No. 32549, BN/SF-7, Verified Statement of Mark Hornung (*BN/ATSF* Rail-to-Rail Diversion study), at 6 (in workpapers); *see also Canadian National Ry., et al. – Control – Illinois Central Corp., et al.*, Finance Docket No. 33556 at 4, CN-IC 7, Verified Statement of George Woodward (*CN/IC* Rail-to-Rail Diversion study) (in workpapers).

[19] *See* CSX-8, Verified Statement of Professor Julie M. Carey and Dr. Albert W. Bremser ("Carey/Bremser V.S.") at 33. Their vague suggestion that perhaps CP could acquire rights to use IFG from KCS without the combination is unfounded and contrary to the expressed views of CP company witness Mr. John Brooks related to past coordination efforts between the two independent companies. *See* Brooks O.V.S. at paragraphs 30-6.

such traffic because it will enable CP to gain access to an automotive ramp in Kansas City (at International Freight Gateway) for the first time as well as create economies from increased automotive movements across the combined system through Kansas City.[20]

3. CN Witness Erroneously Rejects Two Groups of Traffic Not Directly Linked to Specific Station-to-Station Movements

15. CN's Witness David Hunt claims that we have no basis for including lumber traffic from Canada to Dallas or grain traffic from the Midwest to Mexico because, unlike the rest of the rail traffic predicted to shift to CPKC in our estimate, these amounts are not directly tied to individual station-to-station moves in the 2019 traffic data.[21] Mr. Hunt's reasoning is at odds with the purpose of a rail-to-rail traffic analysis and is not followed by his own approach for estimating traffic shifts for purposes of CN's Responsive Application.

16. As previously explained both in our O.V.S. and by Mr. Wahba and Mr. Naatz, these traffic shifts are likely because CP origins capable of supplying volumes of lumber and grain will benefit from single-line access to destinations demanding these commodities.[22] In other words, had CP and KCS functioned as a combined system in 2019, and single-line service been available, incremental amounts of traffic to certain KCS and KCSM destinations would likely have originated on locations on CP. This is driven by the common sense fact that grain does not grow at grain elevators, and trees do not grow at sawmills. Instead, producers choose which rail origin to move their grain and lumber products to from the field, and this decision is influenced by what route options and destinations are efficiently accessed at the different origin alternatives. Mr. Hunt recognizes in his own diversion study that grain "has some flexibility in

---

20 *See* Brown/Zebrowski O.V.S. at ¶¶ 14 and 66.

21 *See* CN-13, Verified Statement of David Hunt ("Hunt Comments V.S.") at 21-23.

22 *See* Brown/Zebrowski O.V.S. at ¶¶ 36-44, 79-81 and Wahba/Naatz O.V.S. at ¶¶ 21-22, 96-98.

rail loading and unloading locations," indicating he agrees with the core premise specific to our grain diversion analysis.[23] Indeed, one of the fundamental features driving beneficial railroad combinations is the creation of enhanced single-line transportation linkages efficiently connecting underutilized origins supplying product with new destination options demanding this product. Not accounting for such synergies would have been inappropriate, and opened us to criticism from railroads and others that our estimate failed to address groups of traffic that CPKC would be reasonably anticipated to attract.

17. Mr. Hunt also disputes our application of a 15 percent growth rate to this lumber diversion calculation. We applied this growth rate in order to properly account for a known and quantifiable change in the market. That said, this adjustment only results in approximately {{[redacted]}} additional diversion units, so its effect on our overall diversion estimate is negligible.[24] In response to Mr. Hunt's allegation that there was no analysis to support these figures, we refer to the verified statement of Messrs. Wahba/Naatz referencing the "demand for lumber for the hot housing and construction markets...especially the Dallas/Fort Worth metropolitan area…," *see* Wahba/Naatz O.V.S. at ¶ 97, to changes in BNSF and UP's lumber traffic levels between 2019 and 2021 reported in their Quarterly Commodity Statistics, and to 2019 to 2021 changes in local housing starts in the Dallas area.[25]

18. Mr. Hunt's claim is ironic because he estimates diversions involving the Port of Montreal in CN's Responsive Application in a comparable manner, although he provides

---

23 *See* CN-14, Verified Statement of David Hunt ("Hunt Application V.S.") at 37.

24 {{[redacted]}} *See* Brown/Zebrowski O.V.S. at ¶ 81.

25 *See* workpaper "Available Lumber Figures.xlsx," at tab "Summary Figures."

significantly less supporting analysis and rationale.[26] The purpose of a rail diversion study is to analyze where shifts of existing rail traffic are expected to occur and identify the corresponding amount of diversion traffic.[27] It is appropriate, and even necessary, to include any diversions from anticipated traffic pattern changes in a diversion study, as we both have done in different instances with different degrees of support. His suggestion that we did not provide explanations for this traffic appears to overlook substantial portions of our initial statement providing explanations.[28]

B. Our Estimate of the Portion of Traffic Likely to Be Attracted to New CPKC Options Uses the Most Appropriate Approach Supported by the Data and Provides Accurate Results

19. As discussed above, the other railroads express few concerns with our identification of traffic that will have new competitive options introduced by the Transaction. The issues they do raise relate to the portion of traffic attracted to CPKC single-line routes from these railroads' existing routes. We address their various claims and explain why our method is the most appropriate data-supported approach, and provides accurate results.

---

[26] Specifically, his diversion estimate assumes that 15 percent of volumes currently moving through New York and New Jersey ports would instead move through the Port of Montreal were CN to gain a single-line route to Kansas City. He does not provide any source for this 15 percent assumption, which appears strictly as a hard coded figure in his workpapers. *See* Hunt Application V.S. at 19-20. In contrast, as discussed in our initial statement, our assumption that CPKC would gain a 5 percent market share in specific grain origin areas is provided by CP's Vice President Jonathan Wahba, who based this specific assumption on his overall knowledge of the grain market, as detailed in his verified statement. Our assumption that CPKC would gain a 5 percent market share at CP-accessible lumber origins to supply Dallas is also directly related to an understanding of the current market shares of lumber supply to the Dallas area, and KCS's capacity to handle additional lumber to supply the Dallas area. *See* Wahba/Naatz O.V.S. at ¶¶ 21 and 98 and Brown/Zebrowski O.V.S. at ¶ 80.

[27] *See* 1180.7 (a) which includes analysis identifying "the anticipated effects of the transaction on traffic patterns."

[28] *See* Brown/Zebrowski O.V.S. at ¶¶ 36-44 and 79-81.

20. The other railroads do not deny that CPKC will have abundant opportunities to compete, but argue that the portion of traffic we estimate CPKC will attract is overstated, or depends on theorized use of foreclosure tactics or specific rate reductions not included in the scope of our study to achieve. As we explain, these claims are incorrect, and misconstrue the nature of the analysis we performed to estimate the portion of traffic that will shift to CPKC. We estimate that 201,707 of 569,116 units of the traffic potentially susceptible to movement over CPKC routes (i.e., "eligible" for potential diversion) will be attracted to CPKC within three years of the combination. This figure is determined by applying, on a lane-specific basis, several different diversion percentages that vary depending on the route options available to the traffic. The diversion percentages are set based on the average distributions of actual traffic shares observed across hundreds of county-to-county pairs with route options comparable to those of the divertible traffic. Overall, our analysis considered traffic distributions among routes presenting different types of competitive situations involving over 100 million units of traffic in the 2015-2019 CWS travelling on over 1,000 distinct county-to-county pairs.

21. For example, when determining the appropriate diversion percentage to apply to carload traffic currently using an independent interline route, i.e., where a new CPKC single-line route would be competing against an interline route not involving CP or KCS, we look at the average share of traffic that uses a single-line route option for county-to-county pairs where there is at least one interline route option involving two other railroads that is also used. In this case, there are 221 such county-to-county pairs involving rail movements over 1,000 miles in the

2015-2019 CWS data and the average share using the single-line route option is 56 percent. Our use of a 50 percent diversion rate for comparable traffic is driven by this data finding.[29]

22. Our data-driven approach is based on average traffic share distributions across hundreds of individual regional traffic flows for rail traffic with route options and competitive characteristics similar to those of the divertible traffic. Applying average shares derived from this analysis to hundreds of identified divertible lanes with like characteristics provides an accurate and statistically sound method for estimating the average amount of traffic that will move to CPKC in a given period across eligible lanes.

1. The Criticisms of CN's Witness David Hunt Related to CPKC Route Length Are Contrary to Both What His and Our Data Analysis of Traffic Distributions Show

23. CN's Witness David Hunt alleges that our estimate of the portion of eligible traffic CPKC would attract is overstated due to CPKC often having relatively longer routes. However, to reach this conclusion, he dismisses the results of our data analysis and his own data analysis on the topic, both of which show that it would be wrong to conclude that modest differences in route mileage strongly influence the portion of traffic a competing carrier is likely to attract. Mr. Hunt submitted both a Verified Statement supporting CN's Comments addressing CP's Application ("Comments V.S."), including our estimate of rail-to-rail traffic shifts CPKC will attract, and a separate Verified Statement supporting CN's Responsive Application, which estimated diversions relating to the proposed forced divestiture of KCS's Springfield line to CN

[29] As explained in our opening statement and in discovery responses to UP, BNSF, and CSX, considering all relevant factors—including relative route length and the larger size of the Class 1 railroads that would compete against CPKC—we select a 50% diversion percentage as a reasonable assumption to use in our estimate. Given the overall breadth of the analysis, and use of average outcomes across large sets of traffic, we think using a more specific diversion percentage, e.g., 56%, would provide an unjustified level of precision disproportionate to the purpose of the study. Such a level of detail would not materially alter the results of our study and could lead to a misleading sense of precision.

("Responsive V.S."). In Mr. Hunt's Comments V.S., his main criticism is that our approach does not accurately identify the specific movements of traffic that will be attracted to CPKC, and overstates the amount of traffic that will move to CPKC. Specifically, he asserts that we err (i) by not adjusting individual lane diversion percentages based on differences in relative route lengths, (ii) by not basing our diversion percentages on any data analysis[30] and, (iii) somewhat contradictorily, our data analysis demonstrating that differences in route length do not heavily influence traffic shares is flawed.[31] We agree that distance is an important component to consider in transportation modelling, which is why our initial statement discusses and analyzes the issue of relative route length in depth,[32] but Mr. Hunt errs by concluding that the distance component must be used in a formulaic way to adjust predicted traffic shares, regardless of what the relevant data analysis actually shows.

24. While he calls our statistical analysis "flawed," he does not provide any reasons disputing our methodology. The data analysis we conducted was properly performed and correctly interpreted to show that traffic shares are only minorly influenced by modest differences in route length. For example, Figure 1 below, which is a reproduction of Figure B3 in our initial statement, very clearly shows that there is no definitive pattern of rail traffic shares changing as relative route distance changes.

---

30 *See* Hunt Comments V.S. at 13 ("…they offer no data, analysis, or other evidence to support such inflexible percentage-based diversion assumptions").

31 *See* Hunt Comments V.S. at 9. ("They conducted a statistical analysis comparing the relationship between rail carriers' length-to-haul and their historical market share…" and "…using their flawed analysis as justification…[they] applied a set of fixed percentage-based diversion rules.").

32 *See* Brown/Zebrowski O.V.S. at ¶¶ 28 & 30-31 and Appendix B.

FIGURE 1
REPRODUCING FIGURE B3 FROM BROWN/ZEBROWSKI O.V.S.{{{

}}}

It would be wrong to review the above data and conclude, as Mr. Hunt appears to do, that diversion percentages should formulaically be adjusted on a lane-by-lane basis based on relative route mileages. Accordingly, we correctly used diversion percentages that do not vary based on relative mileages, rather than introduce misleading assumptions about the effects of relative route length that were unsupported by the data.[33] While use of that sort of approach is unsupported,

[33] As explained in our initial statement, even though we conclude it is inaccurate to formulaically adjust diversion percentages based on relative route lengths, this does not mean we dismissed the effects of relative route lengths on traffic shares as Mr. Hunt wrongfully claims (*see* Hunt Comments V.S. at 14: "Brown and Zebrowski apparently concluded that such substantial route-distance disadvantages would not affect CPKC's ability to divert traffic from carriers with more efficient routes"). Specifically, based on review of the data we recognized that on aggregate the "carrier having the shorter route likely to take a slightly larger share of the traffic," and "we have considered that CP/KCS single-line routes for the diversion opportunities average 10 to 20 percent longer than those of the shortest rival route." (Appendix B ¶¶ 6 and 15). This is one of the factors that led us to select diversion percentages that "err on the side of conservatism in estimating the likely lane shares that CPKC offerings would achieve."

the data does support treating diversion routes that are significantly longer that other existing options as unlikely to attract rail traffic shifts. Accordingly, we applied a filter to remove from consideration potential shifts to routes that were more than 50% or 500 miles longer than the shortest possible existing route.[34] In contrast, despite fixating on how diversion percentages should be adjusted formulaically based on relative route length, Mr. Hunt in his own analysis did not apply any such filter to avoid (incorrectly) identifying diversions to highly-circuitous routes.[35]

25. Tellingly, if Mr. Hunt's method for estimating rail-to-rail diversions for the CN Responsive Application were applied to our analysis, the majority of new CP/KCS single-line routes would be considered *similar to or more efficient* than existing routes. Mr. Hunt states that each interchange adds impedance equivalent to between 350 and 650 route miles, so by his own standards, single-line CP/KCS routes would be *preferable* to interline routes even if they were 350 to 650-miles longer, and, as Mr. Hunt notes, CPKC routes will on average be only 217-miles longer.[36] In other words, although he claims that our estimate is overstated due to CP/KCS often having somewhat longer routes, his own analysis recognizes that on average CP/KCS has more

---

[34] As explained in our discovery response to BNSF, this filter was informed based on the observation that few lanes had multiple routes participating where one route was more than 50% longer than the other. *See* CP response to interrogatory number 2 in BNSF's second set of discovery requests ("The witnesses' examination of traffic distributions described in their Appendix B (Application Vol. 2 at 2-175 to -184) demonstrates that in the majority of cases where multiple rail routes are used to connect the same county-to-county pairs, the route lengths are within 50 percent of one another.").

[35] As a result, he predicts traffic diverting to much more highly circuitous lanes. For example, he would divert {{{ }}} from CP's local lane between Calgary and Kansas City to the CN route using KCS's Springfield line which is over 500 miles longer. *See* Hunt workpaper "HC- 2022January_R2R_Auto_v4.xlsx," tab "New2Existing," at Rows 53 and 54.

[36] Even assuming there was only one junction on the existing route, and it were assigned the lowest 350-mile equivalent impedance, this would still be higher than the 217-mile average additional length of CP/KCS routes he cites.

favorable single-line routes for diversion traffic than currently moves on interline routes, which represents over two-thirds of our estimated diversion traffic.[37]

26. In addition, Mr. Hunt's approach produces results where relative route lengths barely influence diversion percentages. In fact, Mr. Hunt's approach goes so far as to produce *higher* diversion percentages precisely because the routes are *longer*. For example, Mr. Hunt's approach would divert 39.2% of carload traffic from a 1,000 mile interline-line route to a 1,000 mile new single-line route, but would divert 39.7% to a 2,000 mile new single-line route. In other words, he would divert more traffic to a route simply because it is twice as long, which clearly contradicts his criticisms of us for not lowering diversion percentages when routes are relatively longer. In other cases, while the diversion percentages would slightly decline based on relative route length, the changes are negligible. For example, his approach would divert 39.2% from one 1,000 mile single line route to a 1,000 mile new single-line route, but would divert 38.5% to a 2,000 mile new single-line route.[38]

27. Not only does his diversion analysis contradict his criticisms of our treatment of relative route distances, but his own analysis provides statistical confirmation that our determination not to adjust diversion percentages based on relative route lengths is correct. At a high level, this occurs because he uses insufficient statistical techniques to "fit" the coefficients of his regression model against the data. Consequently, he does not generate the standard statistical information required to see that the coefficient in his model that is related to mileage is statistically insignificant. Specifically, he compares the traffic shares predicted by his "logit"

---

[37] *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Interline Share."

[38] The above percentages show results for his grain/other model, but similar results are also produced for Mr. Hunt's automotive and intermodal models. *See* workpaper "Diversion Percentage Analysis.xlsx," at tab "Summary Figures."

equation with actual traffic shares across lanes served by multiple routes, and forces Microsoft Excel to solve for the coefficients in this equation that yield the minimum square of the difference between the two shares across all observations. However, this approach does not allow for measuring the relevant statistical parameters required to properly assess the resulting coefficients, in particular, the standard deviations necessary to construct confidence intervals to determine whether the coefficients are statistically significant.

28. To address this deficiency, we imported his regression data for each of his three regressions (which underlie his intermodal, automotive, and carload "logit" equations) into a standard statistical software platform (called "R") and re-ran the analysis using the same regression parameters and equation form as he did. We generated similar coefficients, but found that the coefficients related to mileage are statistically insignificant in each case.[39] Table 1 below provides the statistical parameters we developed for assessing Mr. Hunt's regression for predicting non-automotive carload diversions.

[39] The reason why our coefficients are slightly different is because his method using "Solver" in Excel differs from a proper application of regression fitting equations contained in a standard statistical software program. As such, we view our results as more accurate.

TABLE 1[40]
STATISTICAL PARAMETERS FOR ASSESSING HUNT REGRESSION

Results:	Mr. Hunt's Coefficients Determined Using Statistically Incomplete Excel "Solver" Method	Coefficients Fitted Using Statistical Software	P-value (greater than 5% is statistically insignificant at the 95% confidence level)	Statistically Significant?
Intercept	n/a	2.510	0.0%	Yes
Junction Frequency Variable	-2.099	-2.306	0.0%	Yes
Impedance (mileage-related) Variable	**-0.044**	**-0.045**	**24.8%**	**No**

29. Table 1 shows that his mileage-related variable is not statistically significant. We confirmed this is also the case for his automotive and intermodal diversion equations, as detailed in our workpapers.

30. In other words, Mr. Hunt did not perform his regressions in a statistically robust way and failed to identify his mileage-related coefficients are statistically insignificant. This is important because in past diversion studies, when a coefficient in the regression model was statistically insignificant, it was dropped from the equation predicting diversion percentages.[41] That his own regressions confirm that such a variable is not statistically significant undercuts his criticism that we erred by not including this variable in our analysis.

31. The examples Mr. Hunt provides where he claims our diversion percentages err by not changing based on relative mileage illustrate the illogic of his criticisms. In Table 2

---

40 *See* workpaper "Regression Fitting Analysis.xlsx," at tab "Final Table."

41 *See* CN-IC-7, Woodward V.S. at II-25.

below, we apply the traffic shares his approach would assign to the lane examples where he alleges our diversion percentages are too high and/or do not properly change based on relative mileage.[42]

TABLE 2[43]
THE EXAMPLE DIVERSION LANES USED BY MR. HUNT TO ATTEMPT TO CRITICIZE OUR DIVERSION PERCENTAGES SUPPORT THE SUPERIORITY OF OUR METHOD

From Exhibit 4-1 in CN Comment Verified Statement of David Hunt:							FTI Calculation:
Origin	Destination	Current RR	Current RR Miles	CPKC Miles	Difference in Miles	Assigned Diversion Percentage	Diversion Percentage Under Mr. Hunt's Method
New Orleans, LA	Superior, WI	BNSF	2023	1675	-348	25%	21.1%
New Orleans, LA	Elkhart, IN	NS	1075	1476	401	25%	27.3%
Chicago, IL	San Angelo, TX	BNSF	1274	1499	225	25%	27.5%

32. Table 2 shows that for each example he raised in attempts to criticize our use of a 25% diversion percentage, diversion percentages under his approach would both be generally similar to ours, and would minimally change depending on mileage. The one case where his approach yields a slightly lower diversion percentage than we would use is, nonsensically, the lane between New Orleans and Superior where CPKC has the shorter route. In light of this, his criticisms that our diversion percentages are overstated and do not identify the specific traffic that will be attracted to CPKC should be rejected.

---

[42] We apply this method by including routes that were not historically used, since his approach does this in at least some instances. Were we not to include such routes, this would result in higher estimated diversion percentages, but the dynamics of how they varied minimally based on relative mileage would not change.

[43] *See* workpaper "Diversion Percentage Analysis.xlsx," at tab "Summary Figures."

2. The Diversion Levels We Estimate Accurately Account for the Effects of Relative Route Distance, and Assertions by Other Railroads to the Contrary Overlook Both What the Data Show and the Real-World Factors That Drive Shipper Choices

33. Although the preceding sections have already refuted the mistaken notion that modestly longer CP/KCS routes would fail to attract to CPKC the levels of traffic we predict, given the prevalence of this theme echoed by other railroads, we provide additional context on why our data-driven findings on the role of relative route length are reasonable and accurate in light of the dynamics of shipper preferences and railroad industry operations.

34. Several other railroad witnesses, including Carey/Bremser for CSX and Messrs. Haley, Salop, and Rocker/Turner for UP, all suggest in one way or another that CP/KCS's relatively longer routes would fail to attract traffic to CPKC voluntarily, and, based on this flawed premise, reason that CPKC would attempt to use foreclosure tactics.[44] The views of UP are particularly relevant, because our study estimates that approximately {{[redacted]}} intermodal containers and {{[redacted]}} carloads would shift from routes involving UP through Laredo to CPKC single-line routes as a result of the Transaction.[45] While none of the other railroads' witnesses purport to have performed any traffic analysis to support their critiques and do not offer any substantive criticisms of our traffic analysis, we further explain why our results are reasonable.

---

[44] *See* Carey/Bremser V.S. at 30-31; UP-10, Verified Statement of Thomas Haley at 21-22; UP-10, Verified Statement of Kenny Rocker and John Turner ("Rocker/Turner V.S.") at 8-11; and UP-10, Verified Statement of Steven Salop at 29-31.

[45] *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "UP Traffic Through Laredo."

35. For starters, it should be recognized that there are many aspects that influence how shippers value competing transportation options, and the relative weight shippers assign different aspects. For example:

- A shipper that cares most about running consistent operations based on predictable supply chain schedules may value service reliability the most.
- A shipper with adequate storage inventory and railcar capacity may value price above service factors. Shippers that owned their own rail cars would also factor equipment utilization levels and turn times into the equation when determining the lowest cost option.
- A shipper with more complicated or intense industry switching service or changing requirements may prefer one line haul carrier over a second regardless of rates or service times.
- A shipper with multiple origins or destinations may select a line haul carrier based on the best option for all of its business, which may mean suboptimizing a single location.

These are just a few examples, and shippers may value multiple elements of service and price simultaneously at different relative weights, but this list illustrates why we cannot base shipper preferences solely on the relative length of different routes. If this were true, the traffic that could be attracted to CPKC would already be travelling on the shortest existing route. As we have already demonstrated, and the other railroads have not disputed, this is not the case.[46]

36. This reality is well recognized in the railroad industry. For example, Oliver Wyman released a survey in 2020 that found the three elements of railroad service the shippers valued most were "on-time performance, shipment visibility, and the availability of equipment and capacity."[47] Since route length or fastest transit time (which is not synonymous with route

---

46 *See* Brown/Zebrowski O.V.S. at Table 6.

47 *See* workpaper "2020 Rail Service Survey Article.pdf."

length) are not even identified as any of the top elements of service, any assertions about the singular importance of relative route length should be viewed skeptically.

37. Even when shippers value transit time above all else, it would be wrong to suppose the shorter route would necessarily provide the faster transit time. For example, assuming average train velocity of 20 miles per hour, a CP/KCS single-line route would have the same transit time as an interline route up to 480 miles longer using the rule of thumb convention that an interchange adds 24 hours.[48] UP and KCSM car event data {{[redacted]}} for the UP-KCSM interchange at Laredo, where it takes on average {{[redacted]}} between when a car arrives on KCSM at Laredo, TX and when it departs on a UP train from Port Laredo, TX.[49] UP's witness Mr. Haley provides a useful reference in his estimate that UP's route would take 32.8 hours between Laredo to Chicago while the existing KCS/CP interline route would take 47.4 hours.[50] In this case, the 14.6-hour additional pure running time from Laredo to Chicago on CP/KCS cited by Mr. Haley could be overcome on saved interchange time alone.

38. Other factors may also explain situations where the longer route provides a faster transit time. For instance, a route that is five percent longer with average train speed that was five percent faster would have the same transit time as the other route. Based on publicly reported service data in the STB's EP 724 docket, CP and KCS average train velocities are

---

[48] For instance, this convention was referenced by CSX's Executive Vice President of Operations Jamie Boychuk at the Board's January 13, 2022 hearing on the CSX/Pan Am Merger: CSXT/Pan Am, Finance Docket No. 36472, Hearing Tr. (Jan 13, 2022) at 139, lines 8-10 (incl. in workpapers). *See* workpaper "Hearing Transcript.pdf."

[49] *See* workpaper "Transit Time Analysis.xlsx." For intermodal, while interchange times are expected to be faster, it still takes on average {{[redacted]}} between when a unit arrives on KCSM at Laredo, TX and when it departs on a UP train from Port Laredo, TX.

[50] *See* Haley V.S. at 21. This analysis effectively represents the pure running time and accounts for no time for yard dwell, line congestion, actual train speeds, crew change availability, or any other variety of items that influence actual transit time.

between 5 to 7 percent higher on average than UP since 2019.[51] In addition, increasing the frequency of when the railroad provides switching service to pick up or deliver carloads to the customer's facilities could overcome a difference in transit time. For example, providing switching service at the origin and destination three times a week instead of two would eliminate the end-to-end transit time difference.[52] This process of establishing the appropriate frequency of origin and destination switching services in calculating the required end-to-end transit times is discussed in the amended operating plan.[53]

39. Actual relationships between route length and transit time are not linear, which is at odds with the view that CPKC would not be able to provide competitive service levels due to relatively longer routes. Using UP's car event data and waybill data, we surveyed how route miles compared to transit time for movements across UP's system that moved through Laredo.[54] The results of this analysis show that transit times vary widely regardless of route length, and it is frequently the case that longer routes have shorter transit times.

---

51 *See* workpaper "Historical Train Speed Reporting.xlsx," at tab "Summary."

52 Seven days in a week divided by two industry switch visits per week implies 3.5 days between switches, meaning a car on average is waiting 1.75 days for pickup from the time it is released, or placement from the time it reaches the serving yard. This same figure is 1.16 days under a scenario with 3 industry switch pick-ups per week, which implies more than a 1-day savings of adding one industry switch visit per week at the origin and destination. 7/(2*2)=1.75, 7/(3x2)=1.16, and (1.75-1.16)x2=1.16 day transit time reduction.

53 *See* Elphick/Orr amended operating plan verified statement at ¶ 162. ("As CPKC integrates the two networks, in-depth reviews of local service levels may reveal opportunities to adjust local assignments to provide further improvements in the service provided to customers. CP plans to approach this process – referred to as "white-boarding" – on a customer-specific basis to design services that consider end-to-end customer transit time along with the service timing and frequency that meets the customer's needs.")

54 We defined the transit start time based on "IR" and "RL" events and transit end time based on "ID", "AP", and "OD" events.

FIGURE 2[55]
UP FY2019 TRANSIT TIMES AND ROUTE LENGTH FOR CARLOAD SHIPMENTS THROUGH LAREDO

{{ }}

40. The distribution in the scatter plot in Figure 2 above illustrates that there is {{ }} even when focusing on a single railroad's network, and that shipments traveling longer distances frequently have shorter transit times. In particular, movements {{ }}.

41. This poses both challenges and opportunities for each railroad contending to provide the ideal service parameters demanded by shippers in a myriad of individual circumstances. Many elements of CPKC's operating plan, including train schedules, line

[55] *See* workpaper "Transit Time Analysis.xlsx."

capacity and velocity, planned maintenance outages, switching frequency, and intermediate handlings, will affect the transit times and service levels CPKC is able to provide to customers. It is unfounded to discount CPKC's opportunities to compete on the narrow basis of relative route length, or that one of its routes is simulated to have a running time that is {{[redacted]}}

42. Critiques about relative route length and transit time also overlook the importance of service reliability. As the above scatter plot in Figure 2 shows, typical shipments through Laredo may spend anywhere between {{[redacted]}} travelling on UP's system and frequently have {{[redacted]}}.[56] Regarding the paramount importance of service reliability, Adriene Bailey, a partner at Oliver Wyman, stated at the recent RailTrends 2021 conference: "Variability is the root of all evil."[57] Our initial statement emphasized how the focused, repetitive train movements on the CPKC main north-south corridor would be conducive to such reliability. We also understand CP/KCS planned operations will emphasize the use of daily scheduled trains to minimize the possibility of service disruptions and coordination breakdowns.[58]

43. To illustrate such variation in a situation directly relevant to diversion traffic CPKC would compete to attract, the below chart shows transit time in days from when

---

56 *See* workpaper "Transit Time Analysis.xlsx."

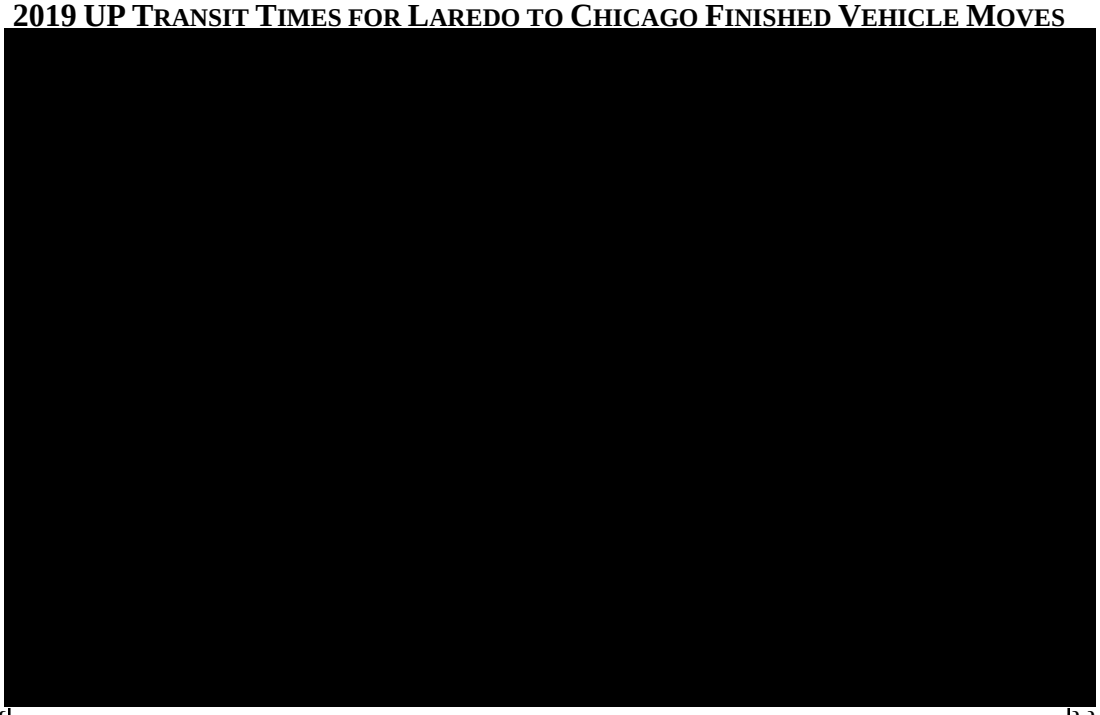
57 *See* workpaper "Wyman Variability Article.pdf."

58 *See* CP's May 13, 2022 Amended Operating Plan at ¶ 139. "Based on CP's long experience with PSR, it is understood that daily service for all lines of business in all directions creates a predictable daily schedule that encourages the railroad and its customers to collaborate to achieve predictable and reliable operations… This experience informed the approach to designing a consolidated plan for the CP/KCS system that took advantage of its greater scope and density with both efficiency and service reliability as the primary objectives."

containers were received by UP from KCSM at Laredo to when they were released at UP's Yard Center intermodal terminal in Chicago.

FIGURE 3[59]
2019 UP-KCSM TRANSIT TIMES FOR
LAREDO TO CHICAGO INTERMODAL MOVES

{{ [redacted] }}



44. Figure 3 shows that UP's intermodal shipment times typically vary between {{ [redacted] }} days in this lane. In this context, assertions, like those made by UP's witnesses, that CPKC would be unable to provide a reliable service within these time parameters because the simulated running time of its route is 14-hours longer are clearly unfounded.

45. Similarly, the below figure shows the transit time in days from when automotive shipments were received by UP from KCSM at Laredo, Mexico to when they were placed at UP's automotive facility in Chicago.

---

[59] *See* workpaper "Transit Time Analysis.xlsx."

FIGURE 4[60]
2019 UP TRANSIT TIMES FOR LAREDO TO CHICAGO FINISHED VEHICLE MOVES

{{ }}

46. Figure 4 shows that shipment times typically vary between {{ }}, though at times, it takes longer. It would again be wrong to conclude CPKC would be unable to provide competitive service levels due to having a route simulated to have a running time that was 14 hours longer than UP's. Instances where CPKC can narrow the standard deviation with improved reliability, even assuming for the sake of argument overall average transit times are slightly longer, would likely result in the ability to offer the most attractive service option to many shippers.

47. The notion that longer routes may be unable to attract traffic is also at odds with UP's experience competing against BNSF for intermodal traffic moving from the Laredo gateway to Chicago. According to Mr. Haley, UP's route is 1,420 miles and BNSF's route is

[60] *See* workpaper "Transit Time Analysis.xlsx."

1,708 miles. He also estimates BNSF's simulated running time is about 7 hours longer than UP's.[61] Despite this difference, BNSF was able to attract {{{[redacted]}}} of intermodal volumes on this corridor in 2019 and {{{[redacted]}}} in 2020.[62] The below charts show BNSF transit time typically varying between {{[redacted]}} days from Laredo to Chicago, compared to UP's transit time varying between {{[redacted]}}. It also illustrates how much actual transit times differ from the simulated running times estimated by Mr. Haley.

61 *See* Haley V.S. at 21

62 *See* workpaper "Recent Laredo to Chicago IM Shares.xlsx," at tab "Summary Figures."

FIGURE 5[63]
2019 BNSF AND UP 10-DAY ROLLING AVERAGE TRANSIT TIMES FOR LAREDO TO CHICAGO INTERMODAL MOVES COMPARED TO MR. HALEY'S SIMULATED RUNNING TIME {{

{{

}}

63 *See* workpaper "Transit Time Analysis.xlsx."

As shown in Figure 5, while UP tends to have {{[redacted]}}, this is not always the case. Moreover, even though {{{[redacted]}}}. In line with this result, it is reasonable to expect that CPKC, whose route is nearly identical in length to BNSF's as identified by Mr. Haley, would also be able to {{{[redacted]}}} of traffic in this corridor.

48. Figure 5 also plots Mr. Haley's simulated running times for the BNSF and UP routes. For each railroad, the gap between Mr. Haley's theoretical figures and actual performance is measured in {{[redacted]}} demonstrating that the alleged seven extra hours required on a CPKC route (according to Mr. Haley's modeling) would not remotely be disqualifying. Indeed, the seven-hour gap between Mr. Haley's modeled BNSF running time and CPKC's running time corresponds quite closely to the gap between UP and BNSF, and {{[redacted]}}.[64]

49. It should also be recognized that longer routes do not lead to higher rates as some other railroad witnesses have suggested, without any support.[65] To demonstrate this, we examined the pricing for movements of comparable types of traffic between county-to-county pairs in our initial traffic distribution analysis.[66] For example, Figure B1 in our Appendix B included 524 individual county-to-county carload traffic flows of at least 1,000 miles in length

---

64 Mr. Haley claims that BNSF's route is seven hours faster than the CP/KCS route in terms of running time, but it is unreasonable to think that the reason that BNSF could attract significant shares of traffic on this lane and CP/KCS could not is simply a function of this seven hour difference. *See* Workpaper "Recent Laredo to Chicago IM Shares.xlsx," at tab "Summary Figures." {{[redacted]}}

65 *See* Rocker/Turner V.S. at 11-12.

66 Our analysis controlled for specific traffic characteristics that impact rates, including 7-digit STCC, Car Ownership, and Shipment Size.

for which two Class 1 carriers offered single-line routes that were used between 2015 and 2019. There are 521 unique lanes within these county-to-county pairs where two Class 1 carriers each move the same traffic type. As shown in Figure 6 below, 55% of the time the carrier with the longer route offered the lower rate.

FIGURE 6[67]
RELATIVE RATE LEVELS (X-AXIS) AND RELATIVE ROUTE MILES (Y-AXIS) FOR EQUIVALENT CARLOAD MOVEMENTS BETWEEN COUNTY-TO-COUNTY PAIRS SERVED BY TWO SINGLE-LINE CARRIERS IN 2015-2019 (CWS DATA)

{{{ }}}

50. A similar story is also observed for the 33 county-to-county pairs in Figure B2 of our Appendix B analysis where two Class 1 railroads offer single-line intermodal service.[68] As seen in Figure 7 below, 61% of the identified lanes are instances where the carrier with the longer route offers the lower rate.

{{{  }}}

51. The outcomes observed in the above charts – showing the railroad with the longer routes often offering the lower rate – are aligned with basic knowledge of how railroad carriers operate and compete. As referenced in our initial statement, the nature of differential pricing permits railroads to remain competitive and often offer lower rates even assuming, for sake of demonstration, their variable costs were modestly higher.[70]

52. In summary, it should not be expected that CPKC would *always win* on service, transit time, rate, or any number of other factors that a given shipper values any more than it

---

69 *See* workpaper "Rate and Distance Analysis.xlsx," at tabs "Summary Charts" and "Summary Figures."

70 *See* Brown/Zebrowski O.V.S. at fn.16.

should be proposed that any other *competing railroad would always prevail* on these factors. Because of the multiple factors that shippers consider, basing diversion percentages on average expected traffic shares historically achieved among carriers competing across many different lanes is appropriate. This context is important to understanding the findings from our analysis showing that relative route distance does not heavily influence traffic shares within modest distances where the alternative routes are no more than 50 percent different in length. With all these factors in mind, we identified traffic that fit within reasonable mileage thresholds, and CP's operating team analyzed our choices in depth to determine whether CPKC would be capable of providing effective service.

3. The Levels of Shifting Traffic We Estimate Are Those That Would Occur Without Changes in Relative Rate Levels and Do Not Depend on "Foreclosure" of Other Options

53. As discussed above, our percentages of traffic likely to shift to CPKC are supported by actual historical distributions of traffic in similar competitive situations. Accordingly, they represent the most reasonable estimates of what would have occurred under the status quo in 2019 had CP and KCS functioned as a combined railroad, holding other factors equal. In light of comments made by various railroad witnesses[71], it should be emphasized that, as we explained in our initial statement, our estimate of traffic that would move to CPKC are those that would occur absent any hypothesized anti-competitive conduct such as foreclosure. [72] Our estimates also do not assume or depend on changes in rate levels. Rather, they represent how traffic would tend to divide among carriers and their associated route options based on existing traffic distribution patterns in the freight railroad industry.

---

71 *See* Carey/Bremser V.S. at 31-35, Rocker/Turner V.S. at 13, and Hunt V.S. at 9.

72 *See* Brown/Zebrowski O.V.S. at ¶ 33.

54. ***Our Traffic Gain Estimates Assume No "Foreclosure."*** The amount of traffic we estimate CPKC would attract from existing routes is based on traffic share distributions for competitive transportation lanes without any hypothetical route foreclosure occurring. For each county-to-county geography we consider, there are multiple active route options used by shippers, which is contrary to a situation where traffic would only travel on a given route because all of the other options were foreclosed. As such, our analysis shows that CPKC is already anticipated to attract substantial amounts of new traffic from competing in the marketplace without using hypothetical foreclosure strategies, which supports the conclusion that CPKC *would not* engage in such strategies.

55. The traffic distributions we rely on that are most relevant to illustrating this point are for so-called "dependent interline" situations, i.e., where a railroad that solely serves one end of the movement could theoretically try to disincentivize traffic from travelling on available interline route options, so as to keep the traffic on its single-line route all the way to the other end. As with all of our estimates, we based our analyses of these situations on actual data points reflecting shipper routing choices. In situations where single-line and dependent interline routes could be used for rail service between a given county-to-county pair, the data showed that dependent interline routes were available and actually chosen by many shippers. These are situations where foreclosure is by definition not occurring despite the *theoretical ability* of the railroad with sole access at one end to engage in foreclosure strategies.[73] In other words, the

[73] There is no reason to believe that foreclosure is occurring in other lanes where the single-line route is exclusively preferred by shippers over a dependent interline. This presumably reflects the shipper's preference for single-line service in many if not all instances. While accounting for such single-line only lanes could arguably justify using higher diversion percentages, we focus on those situations with an active dependent interline route specifically to ensure there is no possibility of route foreclosure implied in our diversion estimate.

amount of traffic we estimate CPKC would attract is based on average traffic shares that single-line routes have historically attracted while making interline route options available as well.[74] The data thus demonstrate in these situations that shippers tend to favor the single-line route option, but at least one interline route also remains an option that is chosen at least some of the time, and on which the single-line carrier willingly participates.[75] As a result, the amount of traffic we estimate shifting as a result of the Transaction represents what CPKC would attract without engaging in any hypothetical foreclosure strategies.

56. ***Our Traffic Gain Estimates Are Not Dependent on Rate Level Changes.*** Our analysis of traffic share distributions, which feed into our diversion percentages, do not assume changes to existing rate levels. The traffic shares we observe have already been established, presumably based on factors including various rate levels offered among the competing railroads. As such, it would not be appropriate to adjust the assumed rate levels underlying these traffic distributions without also considering whether traffic distributions should be adjusted as well. For example, consider a shipper that was indifferent between two carriers in all regards except rate: were we to assume that one carrier reduced its rate, and the other did not, this would justify higher levels of traffic moving on the carrier with the lower rate than estimated by our

---

[75] It is reasonable to assume continued participation of other Class 1 railroads on dependent diversion lanes for a variety of reasons, including the possibility of them already offering favorable service and rates in some cases, being willing to compete on rate and improve their service in other cases, and having the ability to make competitive responses leveraging their franchise strength were CPKC to try to force a shipper to choose a routing alternative it does not voluntarily prefer. Specifically, given that other Class 1 railroads participate in {{[redacted]}}, it is reasonable to assume that any attempts to remove another Class 1 railroad's participation in a dependent interline route forcibly against a shipper's wish could result in KCSM losing existing business it has with that shipper both on the lane in question to an FXE-routing and to many other locations where the CPKC system could not reach without interlining. *See* workpaper "KCSM Crossborder Traffic Summary.xlsx," at tab "Summary Figures."

diversion percentages, which are rate-neutral.[76] We recognize that the CP/KCS combination is reasonably expected to increase competition and lead to rate reductions (or reductions to future rate increases that would otherwise occur) both arising from CPKC's own improved efficiency or competitive responses, or both, and this enhanced competition is among the principal benefits of a CP/KCS combination.[77] The key point here is that for the purpose of estimating traffic shifts, we appropriately used existing rate levels so that rates among carriers are the same relative to each other, regardless of whether or how much overall rate levels may change in the future, which we do not attempt to predict. Instead, as determined through the bidding process, CPKC would sometimes win and sometimes lose a particular piece of business based on how the shipper weighs – both from price and service perspectives – the transportation offers available to it at the time from railroads competing for the traffic. This rate-neutral approach is typical to rail traffic diversion studies.

C. We Accurately Estimate the Revenue Levels CPKC Will Earn for Diverted Traffic on a Pro Forma 2019 Basis

57. To estimate incremental revenues for traffic attracted to CPKC, we used actual 2019 revenues when available, and when not available we estimated prevailing rate levels for individual diversion lanes, calculated from available revenue information for comparable movements. Such estimates were only required for "extended haul" diversions where the waybill record for the existing interline move is rebilled and does not report end-to-end revenues. In these cases, we examined the data in two ways: by looking at the average end-to-end

---

[76] We note the reason we applied a 5% reduction to the limited subset of traffic shifting from other single-line traffic to CPKC was because we recognized CP would need to differentiate its service in some regard from the existing service, which would typically involve relatively shorter routes, in particular for intermodal moves on the Dallas-Chicago corridor which constitutes over 80% of the traffic at issue. *See* Wahba and Naatz O.V.S. at ¶ 52.

[77] *See* Brown/Zebrowski O.V.S. at ¶¶ 32 and 89.

revenues for the most comparable set of traffic moving in the same end-to-end corridor less existing CP and KCS divisions (the "end to end approach"), and by looking at the segment revenues for the most comparable set of traffic moving over the same segment where CP or KCS would extend the haul under the diversion (the "segment approach"). Where one of the two approaches yields a "poor" set of comparable traffic (usually because the geography of the most comparable shipments are only detailed at the freight region or country level), and the other approach does not, we default to the approach that has the better match. In these cases, the "segment approach" typically has a more precise match than the "end to end approach," and accordingly we default to the "segment approach" in the limited instances where both approaches have matches that are not "poor."

58. Mr. Hunt's claim that we significantly overstated revenues is based on his apparent failure to understand how our revenue estimating process works, i.e., what he characterizes as discrepancies between actual revenue levels and those we estimated, are actually differences between two estimated levels, which we then review to determine which is most appropriate to use.[78] He claims we wrongfully selected the "segment approach" to estimate revenue for 52,927 units, but he not only fails to articulate if one approach is preferable and why, he also overlooks that over 90% of these units (47,421 to be exact) are cases where the "segment approach" had a match that is not "poor," and the "end to end approach" had a match that is "poor."[79] Thus, even if we had defaulted to the "end to end" approach where both approaches had matches that were not "poor," revenues for this traffic would not have differed substantially because the "segment approach" would still have been selected in most cases, as is logically

---

[78] *See* Hunt Comments V.S. at 15-19.

[79] *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Segment Revenue Reconciliation."

appropriate, due to having the better match. We note that Mr. Hunt does not dispute the appropriateness of choosing the more precise match; he instead erroneously believes that our logic "defaults" to the segment approach at this stage in the process, when actually it "defaults" to the more precise match. For the minimal amount of the traffic where both approaches had non-poor matches and it may have been justifiable to use either approach, we believe defaulting to the "segment approach" was the better option due to the observation that the segment approach generally yielded the more precise match. Defaulting to the "end to end approach," however, would have resulted in revenues only approximately $3.6 million lower overall – a trivial impact on our results.[80] In this light, Mr. Hunt's allegation that we overstated revenues by nearly $50 million is simply a function of his inaccurate understanding of our process, and should be dismissed.

59. Mr. Hunt makes two other similarly erroneous claims that also appear to be a function of his inaccurate understanding of our process for estimating revenues. First, he incorrectly suggests that we use revenues that are sometimes higher than known actual revenues. The one example he cites to try to substantiate this claim is for a rebilled move.[81] However, because this was a rebilled moved, we did not have complete end-to-end revenues and had to estimate the revenues. His comparison between partial revenue amounts for the rebilled move and estimated revenues for the complete end-to-end moves is an irrelevant apples-to-oranges comparison.

---

[80] *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Segment Revenue Reconciliation."

[81] *See* Hunt Comments V.S. at 20. *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Calculations," Column A (Row ID) = 2693, Column T (Rebill Code) = 3.

60. Second, Mr. Hunt also cites to an example where a column in our calculation spreadsheet shows a negative revenue amount for non-CP/KCS revenues on a certain movement.[82] His suggestion that this is indicative of an error in our process is misleading, since, as our workpapers clearly show, these amounts have no bearing on our revenue calculations. As is the case for all of the limited instances where there are negative revenues in this column for diversion traffic, this move is rebilled, which means that non-CP/KCS revenue amounts listed in this column are incomplete and should not be used to develop revenue levels for the complete end to end route(which is why we had to estimate revenues instead).

61. Mr. Hunt identifies a minor coding error in our conversion of Canadian dollars to U.S. Dollars.[83] This affects a total of 21 units of traffic, and would impact total revenues by less than 0.01%.[84] We deem it unnecessary to make a correction given the minimal impact.

62. CSX witnesses Carey/Bremser also make certain claims about our process for estimating incremental revenues that should be addressed.[85] First, they fault us for not basing incremental revenues on rates for single-line movements.[86] This claim ignores that we use existing rate levels whenever they are available, and these largely consist of single-line movements.[87] Second, they wrongfully assert that we overstate revenues by using masked CWS

---

82 *See* Hunt Comments V.S. at 20. *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Calculations," Column A (Row ID) = 11797, Column T (Rebill Code) = 1.

83 *See* Hunt Comments V.S. at 23-24 and workpaper "HC- Currency Conversion Error.txt."

84 *See* workpaper "8 - Diversion Identification Reconciliation.xlsx," at tab "Canadian Revenue Reconciliation."

85 Their primary concern, related to the alleged need to model the effect of future competition on existing rate levels, is addressed above.

86 *See* Carey/Bremser V.S. at 34.

87 *See* our O.V.S. workpapers "6a - Revenue Matching.sql" and "6b - Revenue Matching.xlsx."

revenues. [88] This is factually incorrect. We use the same unmasked CWS data that they presumably also obtained access to per the terms of the CWS approval agreement they signed.[89]

D. Our Rail-to-Rail Diversion Estimates Are Complementary to, and Do Not Conflict with, the Other Anticipated Traffic Gains Identified by Other Applicant Witnesses

63. CN's witness Mr. Hunt also alleges that we "missed" certain diversion traffic which was then included in the growth traffic estimate by Mr. Wahba. As a threshold issue, his claim is self-contradictory because after saying we "missed" the traffic, which implies it exists and can be attracted to CPKC, he proceeds to remove this traffic from his restatement of diversions, presumably because he believes it does not exist or is not divertible. Putting this aside, the traffic he references is appropriately not covered in our work because it did not move in 2019, and is appropriately included in the work of Mr. Wahba because it would move in the case of the CP/KCS combination. The scope of our rail diversion estimate, traffic that would have been attracted to CPKC had it existed in 2019, and how our study relates to the growth traffic of Mr. Wahba, is described in detail in our initial estimate[90], so it is unclear why Mr. Hunt would claim this exclusion is either "unusual" or "unexplained."

64. Nonetheless, we provide the details of the specific instances he cites to explain why they are complementary. The LPG growth traffic included in Mr. Wahba's statement are new volumes gained by CP after 2019, so, by definition, they are not included in our estimate

---

88 *See* Carey/Bremser V.S. at 35.

89 *See* STB 07/08/2021 Waybill Agreement WB21-37 filing 302693, at 8.

90 *See* Brown/Zebrowski O.V.S. at 4. ("We examine whether the traffic moving between individual origins and destinations in 2019 would have moved differently were CP and KCS functioning as a combined system." *See* also Footnote 1. ("Our analysis based on 2019 traffic data does not consider other potentially significant traffic opportunities that would arise from (a) post-merger changes in traffic patterns (except for grain); (b) investments by CPKC in growth opportunities unlocked by a combined CP/KCS network; or (c) diversions to CPKC intermodal offerings from the highways (so-called truck-to-rail diversions)").

based on 2019 traffic. The soybean and DDG growth traffic are also not included in our rail-to-rail diversion estimate. Mr. Wahba explains how each is based on focused business initiatives targeting specific receivers in Monterrey, NL. The only soybean diversions we include are based on the five percent market share increase estimated by Mr. Wahba, which by design was developed separately from diversion amounts under this specific initiative. Moreover, we do not include any DDG traffic in our estimate involving the receivers in Monterrey that are part of his growth traffic estimate (specifically, {{[redacted]}}), so there is no possibility for a double-count for this group of traffic.[91]

III. THE RAIL TRAFFIC DIVERSION ESTIMATES OFFERED IN SUPPORT OF CN'S RESPONSIVE APPLICATION ARE FLAWED

65. We have been asked by counsel for CP and KCS to evaluate Mr. Hunt's estimate of the amount of rail traffic that would shift to CN as a result of CN's proposed acquisition of KCS's Kanas City-Springfield/St. Louis line (the "Springfield Transaction"). For the reasons discussed below, we believe his estimate is flawed and produces unrealistic and invalid results.

A. Mr. Hunt's Diversion Percentages Are Effectively Random

66. As discussed above, Mr. Hunt's method for estimating diversion percentages is deeply flawed. To summarize, he bases estimates on models that use coefficients that are statistically insignificant and produce diversion percentages that contradict real-world expectations (for example, by diverting more traffic as relative route length becomes longer).

67. The thoroughly arbitrary nature of his approach is shown by comparing what his diversion model predicts regarding the allocation of rail traffic among alternative routes with

---

[91] In fact, we only include {{[redacted]}} total diversion carloads of DDGs (STCC codes 2085940 and 2082330) to the entire Mexican state of Nueva Leon. None of these are to {{[redacted]}}. *See* workpaper "DDG Traffic Detail.xlsx".

how that traffic actually is distributed. Mr. Hunt's predictions are determinative of every diversion percentage he applies, yet as the chart in Figure 8 shows, they entirely fail to accurately predict any actual traffic shares.[92]

FIGURE 8[93]
MR. HUNT'S REGRESSION MODEL PREDICTS TRAFFIC SHARES THAT BEAR NO RESEMBLANCE TO ACTUAL TRAFFIC SHARES{{

{{{  }}}

68. The black diagonal line in Figure 8 depicts Mr. Hunt's predicted traffic shares and the red dots represent the actual traffic shares he is trying to predict. Were his model a sound

---

92 This shows results for his grain/other regression model, but similar results are also produced in his automotive and intermodal regression models.

93 *See* workpaper "Diversion Percentage Analysis.xlsx," at tab "Final Charts," at Columns D-N.

representation of reality, the red dots would be expected to track fairly closely to the black line. The chart clearly shows the two have nothing in common.

69. As a result of modelling predicted traffic shares that bear no resemblance to actual traffic shares, and then using these as the basis for determining the amount of traffic that would divert as a result of the Springfield Transaction, Mr. Hunt's approach also produces diversion percentages that are illogical and obviously flawed in terms of how they relate to one another. Mr. Hunt's approach differs from previous diversion studies both by using coefficients that are not statistically significant and basing his estimates purely on theoretically modelled pre-transaction traffic shares not related to actual traffic shares.[94]

70. The consequences of this flawed approach are apparent in the results generated by his process. For example, his diversion percentages are nearly identical whether a new CN single line route would be competing against an existing single-line route or against an existing interline route. A new CN-Springfield route in a market where CN currently handles no traffic would attract 39.2% of the traffic whether the existing route is single-line or interline.[95] This is illogical. As his own assignment of junction impedance indicates, all else equal, a single-line

---

[94] *See* CN/IC-7, Woodward V.S. at II-26: "The traffic allocation process uses a complex set of rules that compares the market share estimate of the eligible route to the pre-transaction market shares of the railroads in the eligible route. The eligible route will replace pre-transaction routes involving railroads in the eligible route up to the level of the eligible route market share or the pre-transaction market share, whichever is greater." Although the exact process cannot be precisely determined from available information, it appears diversion percentages under the Woodward approach are based on the difference between actual pre-transaction market shares (as opposed to modelled) and predicted post-transaction market shares, rather than based on differences in two purely hypothetical predicted market shares as done by Mr. Hunt. *See also BN/*SF-7, Hornung V.S. (BN/ATSF rail-to-rail diversion study) at II-46 to II-47 ("the potential amount of diversion equals the estimated market share on the post-BN/Santa Fe consolidate route, minus the market share in base 1993 on routes involving both BN and Santa Fe").

[95] This example assumes all routes are 1,000 miles in length. This analysis shows results for his grain/other model, but similar results are also produced for his automotive and intermodal models. *See* workpaper "Diversion Percentage Analysis.xlsx," at tab "Summary Figures."

route should be more preferable to an interline route than to another a single-line route, and thus attract a higher relative share of traffic from the interline route. As another example, his diversion percentages are also illogically higher when a new single line route competes against two existing interline routes instead of one. For example, a new CN-Springfield route in a market where CN currently handles no traffic would attract 47.2 percent of the traffic when competing against two existing interline routes, compared to the 39.2 percent of traffic that would be attracted when competing against only one interline route.[96] This finding contradicts expectations because competing against two routes instead of one should not result in gaining a higher share of the total traffic available. In summary, his diversion percentages are not supported by any valid data analysis nor are internally consistent, and represent figures that are effectively random.

B. The Majority of Diversion Volumes Mr. Hunt Identifies Are Based on Unfounded Premises

71. Even putting aside his deeply flawed process for determining the portion of traffic that will shift to CN, the base traffic he identifies as eligible for diversion is beset by problems. First, nearly one-third of Mr. Hunt's total diversions consist of NS traffic moving between Kansas City and St. Louis, on one end, and Detroit, on the other end, in specialized RoadRailer service, which is jointly and exclusively offered by NS and its subsidiary Triple Crown.[97] Despite characterizing this as the "primary" diversion opportunity in his study, Mr. Hunt does not explain how CN would attract this traffic (in fact, the only place he acknowledges this is

---

96 *See* Workpaper "Diversion Percentage Analysis.xlsx," at tab "Summary Figures."

97 All traffic he identifies moving between Detroit and Kansas City, as well as some between St. Louis and Detroit, is in RoadRailer service. This traffic is identified as RoadRailer based on the "Intermodal Equipment Flag" field in the CWS. *See* workpaper "CN Diversion Analysis.xlsx," at tabs "Summary Figures" and "2019 CWS RoadRailer Summary."

RoadRailer traffic is in his workpapers where he unsuccessfully attempts to adjust their shipment weights as will be explained later in this statement).[98] RoadRailer is a specialized service only offered domestically by NS and Triple Crown in this one corridor since 2016. [99] As seen in the images in Figure 9 below, RoadRailer service uses a unique type of equipment where the chassis has both rubber and steel wheels, and a special operation that moves the chassis directly between rail and road, without lifting a container between the road and railroad flat car as done for other intermodal service.

FIGURE 9
NORFOLK SOUTHERN'S UNIQUE ROADRAILER EQUIPMENT

98 "The primary rail-to-rail diversion opportunity for a CN acquisition of the Springfield Line will be intermodal shipments between Detroit and Kansas City." *See* Hunt Application V.S. at 14.

99 *See* workpaper "Triple Crown Article.pdf."

72. Nowhere in its Responsive Application has CN indicated that it intends to make the necessary investments to offer this service, nor does Mr. Hunt explain why customers using the current service would convert to a different type of CN intermodal service between Kansas City and St. Louis. When asked in discovery to provide all documents related to this estimate, CN acknowledged that the reason it was included was merely because it was identified as intermodal traffic in the CWS data.[100] This is an insufficient explanation to justify why this service would be attracted to CN, which presumably does not even possess the right type and amount of rail equipment to handle these RoadRailer volumes, or explain why customers would be interested in converting away from RoadRailer service to another type of intermodal service. Simply put, this group of traffic should not be viewed as realistically moving to CN.

73. Second, there is a fundamental disconnect between how Mr. Hunt describes the benefits to CN of acquiring the Springfield Line related to traffic originating or terminating in the St. Louis area, and how he estimates diversions for this traffic. At the beginning of his statement, he describes how CN – which already serves St. Louis – would reduce its existing single-line route between St. Louis and points north by approximately 50 miles as a result of acquiring the Springfield Line.[101] However, he does not calculate diversions associated with the effect of this single-line route improvement, but instead calculates diversions based on the notion that the transaction would convert an *interline CN route to* a single-line route via Springfield.[102]

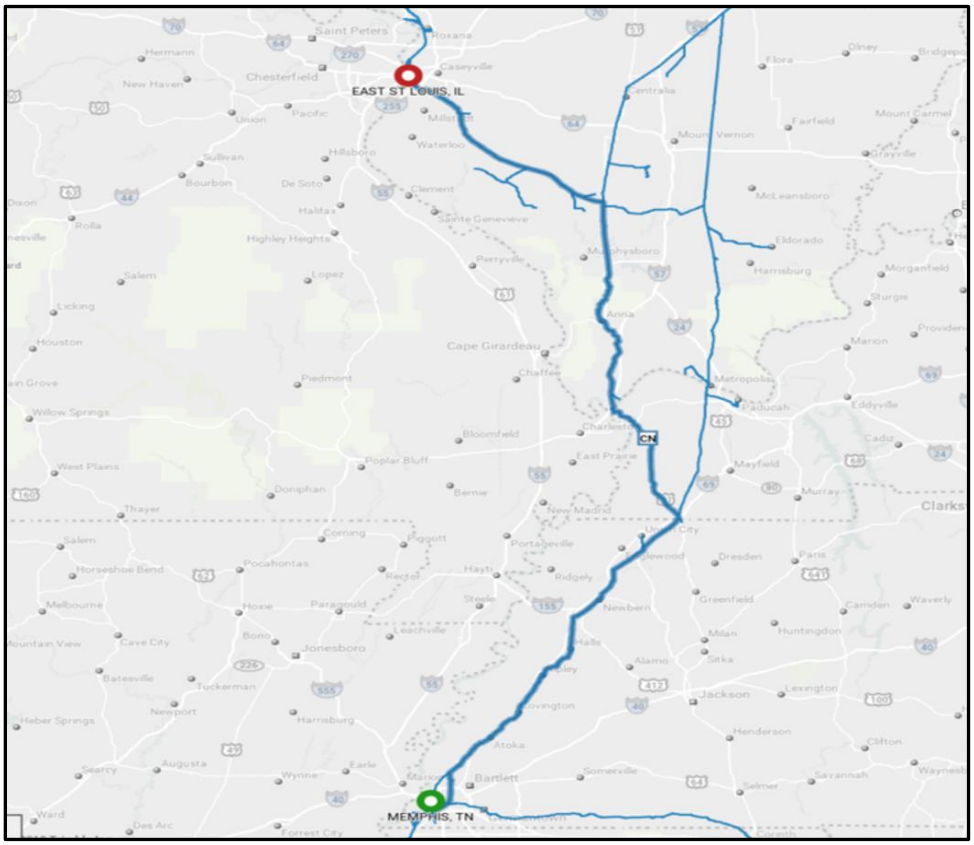
---

100 *See* CN's response to CP's Fourth Set of discovery requests at request number 6. "CN responds that RoadRailer traffic was reported as intermodal in the STB Carload Waybill Sample. It was therefore included in the Springfield Line intermodal rail-to-rail diversion study." *See* workpaper "CN Response to CP Fourth Discovery.pdf."

101 *See* Hunt Application V.S. at 6.

102 For example, *see* workpaper "CN Diversion Analysis.xlsx," at tab "New2Existing – Auto", at row 21. This shows the effect of switching from a 547-mile route with one junction to a 547-route with no junctions as originally calculated by Mr. Hunt. In reality, the impact of the Springfield Transaction is

This construct is artificial. As Mr. Hunt recognizes, CN already has a single-line route via Du Quoin, IL.[103] Nonetheless, Mr. Hunt diverts traffic assuming the impact of CN acquiring the Springfield line was CN switching from an interline route to a single-line route, rather than switching from one single-line route it already uses to another single-line route that is 50 miles shorter.



74. Third, the remainder of Mr. Hunt's division estimates involving St. Louis incorrectly assume that acquiring the Springfield Line would have any modelled impact on CN's ability to attract traffic moving between St. Louis and the south. Similar to above, he calculates diversion amounts associated with removing a junction at East St. Louis for such traffic, but such movements do not and would not use this junction either before or after the transaction.[104] To illustrate, the map in Figure 10 below depicts one auto movement Mr. Hunt diverts to a CN route between East St. Louis and Memphis. In this case, CN's existing route has no junction, so a junction would not be eliminated were CN to acquire the Springfield line, contrary to Mr. Hunt's assumption in his calculations.

switching from the existing single-line route, to a new single-line route that is 50-miles shorter, which is corrected in workpaper "CN Diversion Analysis.xlsx," at tab "New2Existing – Auto Corrected," Cells P22, Q22, and Z22.Under his process this correction would result in {{{[redacted]}}} carloads diverting instead of the {{{[redacted]}}} that he originally estimated. *See* workpaper "CN Diversion Analysis.xlsx," at tabs "New2Existing – Auto Corrected" and "Existing2New – Auto Corrected" for further examples.

[103] *See* Hunt Responsive Application V.S. at 5.

[104] For example, *see* workpaper "CN Diversion Analysis.xlsx," at tab "New2Existing – Auto" where Column B (Mkt) = 4. This shows the effect of switching from a 714-mile route with one junction to a 714-route with no junctions as originally calculated by Mr. Hunt. In reality, the impact of the Springfield Transaction is switching from the existing single-line route, to a new single-line route that is the same length, which is corrected in workpaper "CN Diversion Analysis.xlsx," at "New2Existing – Auto Corrected," cells P16, Q16, and Z16. Under his process this correction would result in {{{[redacted]}}} carloads diverting instead of the {{{[redacted]}}} that he originally estimated. *See* workpaper "CN Diversion Analysis.xlsx.," at tabs "New2Existing – Auto Corrected" and "Existing2New – Auto Corrected" for further examples.

FIGURE 10
EXAMPLE MOVEMENT BETWEEN EAST ST. LOUIS AND MEMPHIS WHERE MR. HUNT'S DIVERSION CALCULATIONS MISTAKENLY ASSUME THERE WOULD BE A CHANGE IN THE NUMBER OF JUNCTIONS[105]

75. Applying his process correctly to account for the actual impact of the proposed acquisition for shipments involving Saint Louis, would have a dramatic impact on his results, where instead of the {{{[redacted]}}} units Mr. Hunt estimates, his own methodology would properly have found only {{{[redacted]}}}.[106]

105 Generated using PC Miler 27 using the "Practical Route" setting.

106 *See* workpaper "CN Diversion Analysis.xlsx," at tab "Summary Figures."

76. While there may be valid reasons for why traffic not impacted by route synergies could move to CN due to effects of a proposed transaction, it is inappropriate to, without any explanation, estimate these diversions by forcing the model to generate diversion percentages based on changes in routes that would not occur as a result of the Springfield Transaction.[107]

77. Fourth, Mr. Hunt provides no explanation for how he quantifies the level of diversions involving shifts from other East Coast ports to the Port of Montreal, which comprise over 20 percent of his diversion traffic (and a majority of the traffic not already flawed for the reasons explained above). He simply assumes {{[redacted]}} estimated containers (which is roughly 15 percent) moving between locations he characterizes as "Eastern Ports" and Kansas City and St. Louis will divert to CN. He neither examines the current modal shares, or carrier shares among the portion that is moving by rail. His 15 percent assumed diversion percentage appears only as raw and unfounded assumption. He neither claims to have obtained this figure from knowledgeable CN personnel, performed any analysis to justify it, nor provided any explanation for why he views it as reasonable.

To illustrate the significance of the flaws we have described, the chart in Figure 11 below summarizes his different buckets of diversion traffic in light of the four specific problems discussed above. Figure 11 shows that approximately two-thirds of the rail-to-rail diversion volumes calculated in his study are unrealistic.

---

[107] It may be possible that Mr. Hunt is trying to reflect that CN does not have local access to certain KCS-served customers within the Saint Louis area, and that he believes by acquiring the Springfield Line, CN would gain local access and thus eliminate a junction. However, concluding that such diversions were likely would require reviewing the individual customers' access options within the St. Louis terminal to make such determinations, which Mr. Hunt does not appear to do. To the extent CN is attempting to acquire the Springfield line to gain additional access to customers in the St. Louis terminal area, rather than address alleged competitive dynamics of the proposed CP/KCS combination, it would presumably be required to explain why such an intervention by the STB would be appropriate or relevant to the proposed CP/KCS combination.

FIGURE 11[108]
SUMMARY OF DIFFERENT GROUPS OF TRAFFIC IN MR. HUNT'S RAIL DIVERSION STUDY FOR CN'S PROPOSED SPRINGFIELD LINE ACQUISITION

{{{  }}}

78. There are also methodological problems related to how he determines what traffic to consider for diversions in the first place that further add to the unreliability of his study. As a result of a lack of documentation showing what logic he used to select traffic for further review that is potentially divertible,[109] and apparent inconsistencies in the traffic he did select, there is no clear way to discern how he screened for divertible traffic. It follows there is no way to evaluate whether his approach was justifiable. Notably, anomalies abound in the hard-coded results he did provide, making it difficult to determine the exact criteria he used when applying the "geographic filters" he says he did.

---

[108] *See* workpaper "CN Diversion Analysis.xlsx," at tab "Summary Chart."

[109] *See* Hunt Application V.S. at 36. "Geographic filters were applied to select traffic between CN currently served regions and the proposed new terminals in Kansas City and East St. Louis and areas served by these new terminals." CP asked direct and detailed questions about how the traffic he selected was identified, which appear only as hard-coded figures in his workpapers, but CN's only response was to cite CP back to the hard-coded figures asked about in the first place. This is insufficient, because the question is not what traffic was selected, but what methodology was used to select it.

79. For instance, he describes the geographic selection criteria for "in-scope" intermodal traffic as the "areas served by" the newly planned terminals at East St. Louis and Kansas City,[110] which he defines for intermodal movements as "traffic within the same BEA or neighboring BEA at both the origin and destination." However, he identifies a significant amount of intermodal traffic terminating at Omaha, which is not a neighboring BEA and is over 160 miles away from Kansas City.[111] There is no discussion in his statement of what treatment he intends for Omaha-related intermodal diversions or why. The only context he provides related to Omaha is in his workpapers, where he notes that auto traffic is "unlikely to truck to Omaha" and removes it from his diversion estimate. This serves to raise further questions about why he includes thousands of potentially divertible intermodal units to or from Omaha in his diversion model workpapers. In many cases, it appears that any consistent set of logic used would have captured two similar lanes of traffic, although he only selected one. For example:

- He diverts traffic on the Montreal to Kansas City auto lane, but not on a Saint-Luc to Kansas City auto lane. Saint-Luc is in Montreal and served by CN.[112]

---

110 *See* Hunt Application V.S. at 36. "[T]raffic within the same BEA or neighboring BEA at both the origin and destination was considered to be competitive."

111 *See* Hunt Application workpaper "HC-2022January_R2R_Intermodal_v4.xlsx," at tab "Existing2New," at Rows 18-20. While perhaps he intended to use the "catchment" areas from his truck-to-rail diversion study instead of "neighboring BEAs," were this to be the case, it is not clear why he only looked at the Omaha BEA but not other BEAs such as Lincoln, Springfield, and Joplin that are also listed. *See* Hunt Application V.S. at 26. Similar anomalies in the areas he selects can be seen in other instances. For example, although he says he is selecting grain at the BEA level, he also selects, and then cuts from his diversions, traffic from BEAs not touching the Springfield Line such as Des Moines. *See* Hunt Application workpaper "HC-2022January_R2R_Grain_v4.xlsx," at tab "Raw-CN," Rows 174-176, and at tab "Raw-STB," Rows 5-6, 9, 11, 13-16, 18, 24, 28-29, 70-80.

112 *See* Hunt Application workpaper "HC-2022January_R2R_Auto_v4.xlsx," at Tab "Raw-CN," at Row 55. *See also* workpaper "Missed Diversion Traffic Analysis.xlsx," at tab "Kansas City to St. Luc Autos."

- He diverts traffic on the Kansas City, MO to New Westminster auto lane, but not on the Fairfax, KS to Vancouver auto lane. New Westminster is in Vancouver and served by CN.[113]
- He diverts traffic on the Kansas City to Joffre auto lane, but not on the Kansas City to Quebec City lane. Joffre is only 15-miles from Quebec and both are served by CN.[114]

80. If there is any logic that explains such apparent discrepancies, Mr. Hunt should have provided it. Absent such an explanation, the study's methodology and results cannot be viewed as coherent, much less reliable.

81. There are additional problems affecting the traffic that was selected stemming from the portion that was "cut." For example, Mr. Hunt states that Memphis to Omaha automotive traffic is "unlikely to compete with [a] UP direct route" and thus eliminates it, but he diverts a significant amount of Memphis to Omaha intermodal traffic from UP.[115] Since intermodal traffic is generally the most time-sensitive traffic railroads handle, it is unclear why CN could compete on intermodal but not on automotive between the same geographies. In a similar case, he excludes grain movements from St. Louis to the south because he states there is no route improvement, but includes auto movements in these same corridors that likewise have

113 *See* Hunt Application workpaper "HC-2022January_R2R_Auto_v4.xlsx," at Tab "Raw-CN," at Rows 52. *See also* workpaper "Missed Diversion Traffic Analysis.xlsx," at tab "Kansas City to NWM Autos."

114 *See* Hunt Application workpaper "HC-2022January_R2R_Auto_v4.xlsx," at Tab "Raw-CN," at Rows 56. *See* also workpaper "Missed Diversion Traffic Analysis.xlsx," at tab "Kansas City to Quebec Autos."

115 *See* Hunt Application workpaper "HC- 2022January_R2R_Intermodal_v4.xlsx," at tab "Existing2New," at Rows 18-20. *See also* Hunt Application workpaper "HC-2022January_R2R_Auto_v4.xlsx," at tab "Raw-STB" at Row 72.

no route improvement.[116] To reiterate, while there may be explanations for these seeming contradictions, but Mr. Hunt provided none in his statement or in discovery.[117]

82. Moreover, while Mr. Hunt states CN's commercial team provided guidance on "geographic regions they viewed as opportunities for traffic gain," his estimate does not always conform to their stated views and he does not explain why. For example, Mr. Przednowek's Verified Statement notes that "a CN-owned Springfield Line would increase transportation competition for grain customers on CN's lines in the Midwest by offering a revived competitive option to the East St. Louis barge market,"[118] but Mr. Hunt excluded grain traffic to St. Louis from the Midwest, citing in his workpapers that there is "no advantage for grain to St. Louis."[119]

C. Mr. Hunt's Revenue Estimates Are Methodologically Unsound and Overstated

83. Mr. Hunt's revenue estimates suffer from serious issues as well. First, where actual revenues are unavailable, his estimates boil down to assuming CN will either earn {{{[redacted]}}} per incremental car mile, depending on commodity group, as derived from CWS system-wide averages for GTW. Such a level of extreme simplicity is not typical in rail-to-rail diversion study and conflicts with prevailing rate levels on the traffic lanes he diverts, which is why we opted for a more precise and sophisticated approach when

---

116 *See* Hunt Application workpaper "HC- 2022January_R2R_Auto_v4.xlsx," at tab "New2Existing," at Rows 4-13 and 20-22. *See also* Hunt Application workpaper "HC-2022January_R2R_Grain _v4.xlsx," at tab "Raw-CN" at Rows 90-91 and at tab "Raw-STB," at Rows 60, 64, and 66-69.

117 CP asked direct and detailed questions about how the traffic he selected was identified, which appear only as hard-coded figures in his workpapers, but CN's only response was to cite CP back to the very same hard-coded figures.

118 *See* Przednowek Responsive Application V.S, at 4.

119 *See* Hunt Application workpaper "HC- 2022January_R2R_Grain_v4.xlsx," at tab "Raw-CN," Rows 44, 48, and 50, at tab "Raw-CPKCS," Rows 34-36 and 43-45, and at tab "Raw-STB," Rows 34-36, 39, 42, and 44, where it states "<- cut - no advantage for grain to St Louis" in the Column labeled "Cuts."

calculating lane specific prevailing rate levels, taking into account movement characteristics such as STCC, Car Type, and Car Ownership, since such factors impact rate levels as well.

84. We analyzed Mr. Hunt's diversions where actual revenues are unavailable and found many cases where prevailing rate levels are substantially lower than the system-wide averages he uses. For example, we were able to precisely match to moves in the 2015-2019 CWS for two automotive lanes from Ontario to Kansas City and Kansas City to Ontario, in terms of Origin/Destination SPLC, First Digit AAR Car Type, 4-Digit STCC, and Car Ownership, with prevailing rate levels of {{{[redacted]}}} on each lane respectively. This represents 34% and 41% reductions (after accounting for his 5% reduction) respectively from the revenue levels Mr. Hunt developed using system-wide revenue per car mile estimates for these diversions.

85. Mr. Hunt's process of relying on average revenues per car mile instead of prevailing rate levels is also illogical – and contrary to market-based rate-making – because this results in CN earning more incremental revenues than the incumbent carrier simply because it has the longer route.[120] For example, on an Automobile lane diverted from Kansas City, MO to Regina, SK, CN's proposed route is about 280 miles longer than the current route on CP. As a result, CN calculates a revenue per car of {{[redacted]}}, whereas the revenue per car mile that Mr. Hunt's approach would have developed based on the current, shorter route mileage would by {{[redacted]}}, which amounts to a 20% increase in CN's calculated rate simply because CN has the longer route.[121]

---

[120] *See* workpaper "CN Revenue Analysis.xlsx," at tab "Main," where Column W (Revenue Grouping) = "No Historical Revenue - Rev/Car Approach Used and Shorter Relative Route" or "No Historical Revenue - Rev/Car Approach Used and Longer Relative Route."

[121] *See* workpaper "CN Revenue Analysis.xlsx," at tabs "Summary Figures" and "Main," at Rows 136 and 137

86. Mr. Hunt also makes a technical error that significantly overstates revenues for his "primary" category of diversions. Specifically, as noted in his workpapers, he intended to proportionally reduce his revenue estimate to account for the relative lower weight of Triple Crown RoadRailer shipments compared to other intermodal shipments, but he instead increased revenues by multiplying by "12.86/9.5" rather than by "9.5/12.86." Due to this error on top of his otherwise inaccurate process, the end result of his calculation is that CWS data shows intermodal units moving between Detroit and Kansas City have revenues of {{{[redacted]}}} per unit, while Mr. Hunt estimated CN would earn {{{[redacted]}}} for each diverted unit.[122]

87. For all the reasons Mr. Hunt articulates in his criticisms of our diversion study – which, as we explain above, is reasonable and reliable – his estimates of diversion traffic truly are flawed and random, and as a result render all downstream operational, environmental, financial and other analyses required to evaluate CN's application to acquire the Springfield line meaningless.

IV. TRAFFIC DATA SHOW THAT KCS-CN ROUTES VIA SPRINGFIELD PLAY NO MEANINGFUL COMPETITIVE ROLE

88. At the request of counsel for Applicants, we also provide an overview of traffic using KCS's Springfield Line by movement category (overhead, locally served, and CN-KCS interchanged), as well as an analysis of historical traffic patterns over corridors where KCS's Springfield Line could theoretically be used as part of an interline route. Our analysis of current traffic uses 2019 Combined CP/KCS traffic tape data as was submitted in our O.V.S.

---

122 *See* workpaper "CN Revenue Analysis.xlsx," at tab "Summary Figures." It should also be noted that Mr. Hunt does not even apply the Triple Crown adjustment to all Triple Crown traffic. *See* Hunt workpaper "HC- 20220208 Rev Adjustment v03.xlsx," at tab "Main," where at Cells U4 and U13 are blank but should include the same Triple Crown Adjustment as Cells U6 and U15.

89. Using 2019 Combined CP/KCS 100-percent traffic tape data, we summarized the amount of traffic moving in the following buckets: overhead, local, and CN-KCS traffic interchanged at Springfield. This is depicted in Table 3 below.

TABLE 3[123]
2019 TRAFFIC ON KCS SPRINGFIELD LINE BY MOVEMENT CATEGORY

Movement Category	2019 Units	Percent
Traffic Locally Served on Springfield Line	{{{[redacted]}}}	{{{[redacted]}}}
Overhead Traffic on Springfield Line	{{{[redacted]}}}	{{{[redacted]}}}
CN-KCS Springfield Interchange Traffic	{{{[redacted]}}}	{{{[redacted]}}}
Total 2019 KCS Springfield Line Traffic	**{{{[redacted]}}}**	**100.0%**

90. Table 3 shows that the CN-KCS interchange traffic at Springfield is an {{{[redacted]}}} component of KCS's use and operation of the Springfield Line, which {{{[redacted]}}}

91. We further analyzed available data to assess the role that the Springfield Line plays in various rail traffic corridors of potential interest, particularly where CN says that the line competes with CP's route between Kansas City and Chicago. Our analysis of historical traffic patterns uses primarily 2015-2020 CWS data, as well as 2019 CN and Combined CP/KCS traffic tape data for Toronto movements.

92. The results of this analysis show that practically no traffic moving over the following corridors has used KCS's Springfield Line.

- Between Kansas City and Chicago
- Between Kansas City and Detroit

---

123 *See* workpaper "2019 Springfield Line Traffic Summary.xlsx," at tab "Summary Table." Figures include originations/terminations at St. Louis but not Kansas City (which KCS may still be able to serve without using the Springfield Line).

- Between Kansas City and Toronto
- Between Mexico and Chicago
- Between Mexico and Detroit
- Between Mexico and Toronto

93. Specifically, an {{{[redacted]}}} of total traffic moving over these corridors used the CN-KCS interchange at Springfield in the past five years (or the past one year for Toronto corridors). Figure 12 below table summarizes these results.

FIGURE 12[124]
HISTORICAL ROUTES USED IN CORRIDORS RELEVANT TO KCS'S SPRINGFIELD LINE BETWEEN 2015 AND 2020

{{{[redacted]}}}

[124] Source: STB Carload Waybill Sample. Carloads on corridors including Toronto reflect 2019 traffic flows from CN and Combined CP/KCS traffic tape data. Mexico corridors include traffic rebilled at the Mexican border. Intermodal containers are converted to carloads at a containers-to-carloads ratio of 5-to-1. *See* workpaper "Historical Springfield Line Analysis.xlsx," at tab "Chart."

APPENDIX A

In Appendix A of our O.V.S, we described the processed used to generate 100-percent traffic tapes for the combined CP and KCS systems. At request of counsel, we have supplemented this data table is certain ways described below using 2019 traffic tape data produced by BNSF, UP, NS and CSXT.

First, we added records to the data table from BNSF and UP traffic tape data for loaded interline shipments with FXE, and loaded CN shipments between the United States and Canada (interline and local). Prior to adding records, we first removed limited internal duplicates from the data based on unique combinations of waybill date and car/container initial and number. We did not add records where CP, KCS, or KCSM participated on the route to the extent these were already covered by existing records for the same movement in the base data table. We also only added a single copy of a movement that was in multiple of the additional carriers' traffic tapes, e.g., for a FXE-BNSF-UP movement, we only added the record from the BNSF traffic tapes to the extent it was also included in UP traffic tapes. Where certain variables in the additional carriers' traffic tapes were confirmed to align with variables already in the base data table, we structured them in the same field, and otherwise appended fields onto the original data table layout containing these variables.

Second, we appended revenue and routing fields for interline records onto the updated data table from the traffic tapes of all available carriers participating on the route. Specifically, for all records involving CN, CP, and KCS interline movements, as well as for BNSF-FXE and UP-FXE interline movements, we appended available revenue and routing fields from each of the carriers' respective traffic tape data onto the base record for the movement in the data table, e.g., for a KCSM-UP movement, we appended revenue and routing fields from the UP record

onto the base KCSM record for the same movement in the data table. Movements from different carriers' traffic tapes were matched together based on unique combinations of waybill date and car/container initial and number.

Third, we applied logic to develop standardized routing location and railroad fields for each interline movement (e.g., for a CP-BNSF movement, SPLC 1, SPLC 2, SPLC 3, RR1, RR2, RR3, etc. as derived from CP traffic tapes; SPLC 1, SPLC 2, SPLC 3, RR1, RR2, RR3, etc. as derived from BNSF traffic tapes). Using this standardized information, we developed PC Miler miles for each segment of the route, e.g., Miles 1, Miles 2, Miles 3, etc. PC Miler miles were developed in PC Miler Version 27 using the "practical" route option.

The below table summarizes the records we added and appended based on this process. Details our provided in our workpapers.

REPLY VERIFIED STATEMENT
OF
MICHAEL R. BARANOWSKI

1. My name is Michael R. Baranowski. I am a Senior Managing Director of FTI Consulting, Inc. which is located at 8251 Greensboro Drive, McLean, VA 22102, and leader of the firm's Network Industries Strategies ("NIS") practice. I submitted a Verified Statement on behalf of Applicants Canadian Pacific ("CP") and Kansas City Southern ("KCS") in this proceeding on October 29, 2021 (which I refer to as my "V.S."). A detailed statement of my qualifications is attached as Exhibit No. 1 to my V.S.

2. In my V.S., I developed the total savings in operating expenses that would result from the Transaction. I also calculated the costs (and net revenues) associated with the incremental Transaction-related traffic that other Applicant witnesses (Jonathan Wahba and Mike Naatz, Richard Brown and Nathan Zebrowski, and Bengt Mutén) anticipated the combined CPKC system would attract as a result of the Transaction, using a Uniform Rail Costing System ("URCS") application for 2019 that I constructed for the consolidated CPKC system. Those estimates were not affected by any of the changes reflected in the Amended Operating Plan filed in May.

3. Table 1 below summarizes the savings the combined CPKC system will achieve over the first three years of combined operations.

TABLE 1[1]
CPKC CUMULATIVE OPERATING SAVINGS SUMMARY
(IN USD, EXCLUDES SAVINGS RELATED TO MERGER-RELATED TRAFFIC ADDITIONS)

Item	Year 1	Year 2	Year 3
Operating Metrics	52.59M	52.59M	52.59M
Fuel Savings	26.57M	28.19M	29.79M
Locomotive Depreciation and Lease	10.15M	10.15M	10.15M
Freight Car	0.00M	1.79M	2.60M
Procurement	4.18M	12.05M	20.54M
Total	**93.5M**	**104.8M**	**115.7M**

4. Table 2 below summarizes the net revenues that the combined CPKC system will generate from incremental Transaction-related traffic gains.

TABLE 2[2]
SUMMARY OF CPKC MERGER BENEFITS

	Year 1 (2023)	Year 2 (2024)	Year 3 (2025)
Diverted Carloads/Units	195,093	351,620	509,490
Incremental Revenues	$418.0M	$726.7M	$1021.9M
Incremental Costs by Category:			
Engineering – Maintenance of Way	$18.1M	$28.6M	$38.8M
Mechanical	$10.2M	$17.1M	$23.4M
Transportation	$91.1M	$148.6M	$204.8M
Equipment Requirements and Utilization	$1.3M	$6.5M	$13.6M
Intermodal Operations	$8.6M	$17.0M	$25.7M
Total Incremental Costs	$129.2M	$217.8M	$306.3M
Net Merger Benefits	**$288.9M**	**$508.8M**	**$715.6M**

5. I have been asked by Applicants to respond to a variety of criticisms of my development of Transaction-related savings and net revenue from incremental traffic attracted to CPKC as a result of the Transaction raised in the comments of a number of Class 1 carriers in this proceeding ("Opposition Carriers"). I have reviewed those criticisms and conclude that they

[1] CP-25/KCS-13, Verified Statement of Michael Baranowksi (filed October 28, 2021) ("Baranowski V.S.") at 11.

[2] Baranowski V.S. at 26.

are without merit. The substantial benefits to this Transaction from the savings and net benefits that I have estimated are real opportunities on which CPKC will capitalize. The criticisms of my estimates are not well-founded and do not undermine my confidence in my methodology or my estimates for reasons discussed below.

6. In large part they are purely anecdotal, merely observing that the approach that I have taken here is different from the approaches taken by other witnesses in prior merger proceedings and speculating that the merger savings that I calculated cannot be achieved in the timeframe contemplated. None of them question the fact that my approach was reasonable and appropriate for purposes of analyzing this Transaction.

7. Opposition Carrier witnesses also opine that the costs that I develop to handle the additional carload and intermodal volumes that will be attracted to the combined CPKC system are lower as a percentage of revenues than what they have observed in prior mergers. To the extent that they compare my results to other benchmarks, those comparisons are based on manipulations of data that clearly produce wrong results. In addition, they ignore that these prior mergers involved railroads that had not adopted the efficiency components of operations like those underpinning precision scheduled railroading as adopted by CP, KCS, and the future CPKC.

8. While certain Opposition Carrier witnesses discuss specific cost components they believe are not accurately reflected by my analysis, no witness has presented an alternative set of results.

9. I have also been asked to summarize revenue to variable cost ratios for BNSF and UP intermodal and carload shipments to and from Mexico via Laredo, TX.

10. In Section I of this Reply Verified Statement (R.V.S.), I address the relatively minor criticisms of my estimate of the operating expense savings that will be generated by the combination of CP and KCS. In Section II, I refute the criticisms of my estimates of the costs required to handle CPKC's anticipated Transaction-related traffic gains. In Section III, I summarize BNSF and UP revenue to variable cost ratios for intermodal and carload shipments to and from Mexico via Laredo, TX.

I. THE CLASS 1 CRITICISMS OF MY ESTIMATES OF TRANSACTION-RELATED OPERATING COST SAVINGS ARE NOT WELL FOUNDED

A. There Is No Basis for Assertions that the Operating Savings I Estimated Cannot Be Achieved in the Proposed Timeframe

11. My analysis of the timing of cost reductions is based on the pace of Transaction implementation set forth in the Application. Given CP's and KCS's strong operational track record and history of effective merger implementation and the extensive planning that was already well underway for the post-control integration of CP and KCS at the time of my statement and that has continued during this proceeding, my assumptions and estimates continue to be reasonable.

B. My Savings Estimates Are Based on Valid and Verifiable Calculations Drawing from Data Customarily Relied Upon in the Railroad Industry

12. CN witness Mark E. Zmijewski opines that my calculations of Transaction-related operating expense savings are not verifiable.[3] This criticism is inaccurate. I provided ample workpapers from which my calculations could be verified. Table 3 below summarizes the workpapers provided in support of my merger-related operating expenses savings in my V.S.

[3] CN-13, Verified Statement of Mark Zmijewski (filed February 28, 2022) ("Zmijewski Comments V.S.") at 58.

TABLE 3
SUMMARY OF WORKPAPERS PRODUCED IN SUPPORT OF TRANSACTION-RELATED SAVINGS

FILENAME	DESCRIPTION
Base to Optimized Fuel Savings Summary.xlsx	Transaction-related synergy fuel-related savings calculations
Base to Optimized Operating Plan Summary.xlsx	Transaction-related savings calculations applicable to operating metric differences between base and optimized operating plans
CPKCS Procurement Synergies Study.xlsx	Transaction-related procurement savings calculations and assumptions
Freight Car Savings.xlsx	Summary of Transaction-related freight car savings

13. Not only is my analysis reliable and verifiable, it is also consistent with approaches to rail costing used both in Board proceedings and by railroads in the ordinary course. For example, as explained in my V.S., fuel savings attributable to CPKC are aligned with CP's internal projections while procurement savings are based on real opportunities for increased volume-related price adjustments and best practices.

II. THE CLASS 1 CRITICISMS OF MY ESTIMATES OF CPKC'S COSTS TO HANDLE TRANSACTION-RELATED TRAFFIC GAINS ARE NOT WELL FOUNDED

14. The criticisms of my development of the costs attributable to the shipments that would be attracted to the CPKC system as a result of the Transaction ("Attracted Shipments") can be grouped into five categories. First, CN witness Hugh Randall[4] and UP witness Thomas C. Haley[5] suggest that certain costs are missing from my analysis, and that based on their observations, my operating expenses are too low. Second, Mr. Randall asserts that the operating expense methodology I use differs from the methodology used by applicants in prior mergers.[6]

---

[4] CN-13, Verified Statement of Hugh Randall (filed February 28, 2022) ("Randall Comments V.S.") at 32.

[5] UP-10, Verified Statement of Thomas Haley (filed February 25, 2022) ("Haley Comments V.S.") at 10.

[6] Randall Comments V.S. at 33.

Third, Mr. Randall[7] and CN witness Carl Van Dyke[8] suggest that my development of operating expenses attributable to the Attracted Shipments is untethered to the Operating Plan or the MultiRail tool used to develop the Operating Plan for scheduled train service. Fourth, Dr. Zmijewski opines that my operating costs are not verifiable.[9] And fifth, CSX witnesses Julie M. Carey and Alfred W. Bresmer[10] and BNSF witness Benton V. Fisher[11] suggest that my cost estimates do not include the actual joint facility costs that will be triggered by the Attracted Shipments. I address each of these categories in the remainder of this section.

A. My Estimates Did Not Omit Categories of Expenses

15. A number of Opposition Carrier witnesses complain that I omitted certain cost elements associated with the Attracted Shipments or that the costs I attributed are too low.

16. First, my estimates included the relevant costs. I explained clearly in my V.S. that the buildup of costs that I attributed to the Attracted Shipments reflect the following two categories:

- URCS cost components that are affected directly by the Attracted Shipments; and
- Costs that are not accounted for in other analyses undertaken by CP.

17. The only categories of costs that I omitted from my estimates were (a) those calculated and presented by other Applicant witnesses and (b) those that would not be affected by the addition of the Attracted Shipments. My critics simply ignore the fact that my analysis

---

7 *Id.*

8 CN-13, Verified Statement of Carl Van Dyke (filed February 28, 2022) ("Van Dyke Comments V.S.") at 29.

9 Zmijewski Comments V.S. at 60.

10 CSX-8, Verified Statement of Julie Carey and Albert Bremser (filed February 28, 2022) ("Carey & Bremser Comments V.S.") at 37.

11 BNSF-9, Verified Statement of Benton Fisher (filed February 28, 2022) ("Fisher Comments V.S.") at 38.

had to both avoid double counting costs that other witnesses estimated and adding costs unaffected by incremental traffic gains.

18. As my V.S. explained, I took account of the cost analysis of these other witnesses by making the following adjustments to standard URCS costing procedures:

- Elimination of all overhead expenses. The merger-related changes to general overhead and administrative expenses are addressed in the Verified Statement of Dean Vargas;
- Elimination of all overhead expenses attributed directly to the maintenance of way, mechanical, and transportation departments. The merger-related changes to these departments are addressed in the Amended Operating Plan. Further, departmental overheads are not affected by the addition of the Attracted Shipments;
- Elimination of all carload clerical costs. These costs are largely IT related and changes to IT as a result of the merger are addressed in the Verified Statement of James Clements; and
- Elimination of all road and equipment ownership costs, with the exception of a portion of depreciation and lease costs associated with additional locomotives and freight car equipment required to accommodate the Attracted Shipments as set forth in the Amended Operating Plan. To be clear, ownership costs in URCS include both depreciation expenses, which represent the return of investment and return on investment. Additional capital requirements needed to accommodate the Attracted Shipments are addressed in the Operating Plan. Adding depreciation expenses from URCS would result in a double count of those capital ownership costs.

19. My estimates, together with estimates presented by other Applicant witnesses, thus encompassed all of the costs that would arise from the incremental Transaction-related traffic, without double-counting. Because the costs my analysis attributed to the Attracted Shipments meet my stated criteria of being affected by the addition of the diverted traffic shipments and not addressed elsewhere in the CP Application, any observations related to cost elements not included as part of my analysis are invalid.

20. Second, claims by a number of Opposition Carrier witnesses that my cost estimates are too low are incorrect. They make this allegation based on their observations of an

"operating ratio" attributable to the incremental new shipments of 30%.[12] Relatedly, Mr. Van Dyke argues that the projected incremental traffic, which is sizeable, would not move from truck or other railroads at the variable cost-to-revenue ratio levels reflected in my statement.[13]

21. These allegations are incorrect for reasons similar to those discussed above. Both of these Opposition Carrier witnesses' concerns fail to consider that the costs I attribute to the incremental shipments are only the URCS unit costs that are affected directly by those shipments,[14] a subset of total costs, whereas reported operating ratios *include* all such costs. As an example, in my analysis I did not identify any additional maintenance of way overhead costs directly. Under a standard URCS application, a portion of maintenance of way overhead cost would be attributed to the Attracted Shipments. Specifically, the service units for the Attracted Shipments would be added to the service units generated by the existing CP and KCS shipments and the cost for maintenance of way overhead spread over the larger combined shipment volumes. Because my analysis focused only on the incremental cost to the combined CPKC of handing the Attracted Shipments, I did not find it necessary to redistribute costs not directly affected by the additional volumes to those volumes. Therefore, a comparison to an operating ratio is a comparison of apples and oranges.

22. Equally important, comparing the 30 percent figure to typical railroad operating ratios is invalid. Reported operating ratios are based on aggregate revenues and costs for enterprise-wide bodies of traffic. Thus, instead of looking at only the costs and revenues specific

---

[12] Randall Comments V.S. at 27.

[13] Van Dyke Comments V.S. at 16.

[14] Again, costs evaluated by other witnesses are not included in my estimates because they are addressed elsewhere in the Application. Incremental costs in the categories of depreciation, general and administration, and other cost elements that are addressed elsewhere in the Application or are otherwise not affected by the addition of the Attracted Shipments are excluded from my analysis, as they should be.

to the *incremental* traffic, comparisons of the revenue-to-cost relationship for the combined CPKC should be considered in assessing, from a top-down perspective, the overall reasonableness of the results. Table 4 below compares the combined CPKC pro forma 2019 operating ratio for the U.S. portion of the system, including the revenues and costs attributable to the Attracted Shipments, with the actual 2021 U.S. operating ratios for CP, KCS, and pro forma CPKC combined for the U.S. network.

TABLE 4
CPKC'S PRO FORMA OPERATING RATIO VALIDATES MY COST ESTIMATES[15]

Comparison of 2019 CPKC U.S. Operating Ratio Including U.S. Portion of Transaction-Related Traffic Increases (Revenue and Cost to CP and KCS 2021 Operating Ratio)				
Description	**CP 2019 (Soo)**	**KCSR 2019**	**Incremental Traffic (U.S. Portion)**	**Total**
2019 Overview				
Revenue ($000s)	1,581,634	1,484,821	775,117	3,841,572
Expenses ($000s)	1,075,661	1,147,854	232,359	2,455,874
Operating Ratio	0.68	0.77	0.30	0.64
2021 Overview				
Revenue ($000s)	1,575,619	1,572,087	n/a	3,147,706
Expenses ($000s)	970,660	1,117,264	n/a	2,087,924
Operating Ratio	0.62	0.71	n/a	0.66

23. Table 4 shows that the pro forma 2019 operating ratio for the U.S. portion of the combined CPKC is 0.64, which unsurprisingly is two points higher than the 2021 CP U.S. operating ratio of 0.62 and two points below the 2021 combined CPKC operating ratio of 0.66. Put another way, the combined operating ratio for the U.S. portion of the combined CPKC included in the Application is in line with the operating ratios achieved by the CP's and KCS's U.S. operations in 2021, despite the lower "variable cost-to-incremental-revenue ratio" that

[15] *See* workpaper "Operating Ratio Calculations.xlsx," at tab "Summary Table."

Opposition Carrier witnesses misleadingly cite to suggest that my cost estimates were unrealistically low.

24. Mr. Randall further asserts that the combined CPKC operating expenses for the first three years of consolidated operations are understated by nearly $2.47 billion dollars. He bases this alleged shortfall by comparing the historical cost per gross ton mile from 2015 to 2019 for CP and KCS with the projected average cost per gross ton mile for the combined CPKC during the first three years of operation derived from the Application income statement ("CPKC Projected Average Cost"). Mr. Randall's assertion is that the CPKC Projected Average Costs are understated because the CPKC Projected Average Cost of $0.0126 is below the historical 2015–2019 average cost per thousand gross ton miles that he observed for CP-U.S. and KCS-U.S. combined and separately for BNSF, CSX, NS, and UP combined.

25. Mr. Randall provides no explanation of why the observed historical average operating expense for what he describes as the "Big Four" is at all relevant to the combined CPKC network.[16] The arbitrary nature of his finding becomes apparent by changing only one assumption from his analysis. Specifically, by using the historical average cost per thousand gross ton miles for BNSF over the 2015 to 2019 timeframe instead, the combined CPKC operating expenses would appear overstated – not understated – by approximately $1.82 billion.[17] This confirms that my estimates are in a reasonable range.

26. Mr. Randall's analysis also does not consider the efficiencies of the combined CPKC system as outlined in the Amended Operating Plan. As Mr. Elphick explains, upon

---

[16] Randall Comments V.S. at 26.

[17] *See* workpaper "Oliver Wyman OPEX Worksheet – Restated.xlsx," at tab "Summary for OPEX VS - BNSF Only," at Cell D181.

authorization of control, CPKC would begin to make changes to improve service and efficiency on the combined network through new train services and longer-distance train profiles and longer-distance blocking. The practical effects of these efficiencies would be to lower operating expenses per thousand gross ton miles to below the historical levels observed for the independent CP and KCS over the 2015 to 2019 timeframe.

B. Differences from the Precise Approach Taken in Other Merger Cases Do Not Undermine the Validity of My Estimates

27. CN witness Randall argues that the approach I developed for costing the Attracted Shipments differs from the approach taken in prior mergers.[18] It is important to note that nowhere does Mr. Randall indicate that the approach that I have taken is wrong. It is only that in his view, the approach I have taken is different.

28. The heart of Mr. Randall's criticism seems to be that in prior mergers, applicants' approaches were organized differently and included what he describes as a "system model" to derive operating statistics from the operating plan, and that those operating statistics were then input into a "costing model" where they were converted into projected operating expenses based on the historic relationship of each category of operating expense with projected changes in operating activity as represented by projected changes in GTMs.[19] The results of the costing model are then inputs into the "financial model."

29. While my analysis may not follow a structure that Mr. Randall views as familiar or routine, all of the required steps he outlines are included. To the extent that there is any meaningful deviation, it relates to the CP and KCS combination being a truly end-to-end merger.

---

[18] Randall Comments V.S. at 30.

[19] *Id.* at 29.

Specifically, economies associated with internal network re-routing or network rationalization that may have been available to applicants in mergers with more overlapping routes – potentially leading to more efficient routing alternatives and a reduction in train miles, car miles and gross ton miles – are not present here. As such, there is no need for a so-called "system model" to recompute operating statistics here. It is most important to identify the incremental costs that the combined CPKC will incur to handle the Attracted Shipments, which I have done.

30. The "financial model" Mr. Randall believes is necessary for this analysis – i.e., the tool used to develop the pro forma financial statements – *was* used by Applicants and described in the Verified Statement of Dean Vargas. The end-to-end nature of the CP and KCS consolidation produces a financial model that is straightforward, beginning by adding together the financial results of the independent CP and KCS systems. The only pieces that then need to be added to comport with Mr. Randall's view are the revenue and operating expense estimates associated with the Attracted Shipments, which *is precisely what my analysis did*. Specifically, my approach:

- Created a consolidated set of URCS inputs;
- Adjusted the consolidated URCS costs for improved efficiencies generated by the Operating Plan;
- Identified the specific cost URCS cost components affected by the Attracted Shipments;
- Developed URCS-related operating statistic inputs specific to the Attracted Shipments;
- Multiplied the diverted shipment operating statistics by the relevant URCS unit costs to determine incremental operating expenses;
- Aggregated incremental operating expenses by diverted shipment traffic category and operating expense grouping consistent with the requirements of the financial model; and
- Provided results to Mr. Vargas.

C. My Operating Expense Estimates Are Tethered Directly to the Operating Plan (and Amended Operating Plan)

31. In a similar criticism, Mr. Van Dyke criticizes my development of the operating expenses attributable to the Attracted Shipments because I did not use MultiRail as the basis for my operating expenses, which he believes are untethered to the Operating Plan.[20] Mr. Van Dyke's critique is incorrect and meritless.

32. First, the Attracted Shipments included in my costing analysis were provided by Messrs. Brown and Zebrowski (and included the estimates of incremental traffic gains forecasted by Applicant witnesses Jonathan Wahba and Michael Naatz, and Bengt Mutén). Those same shipments were provided to the Operating Plan team for processing in the development of the Operating Plan. In other words, the Operating Plan and my cost analysis rely on exactly the same set of Attracted Shipments.[21]

33. Second, my costing of the Attracted Shipments did incorporate the applicable efficiency adjustments generated from the MultiRail process within the Operating Plan for scheduled train movements which, for purposes of reporting consolidated system-wide effects, were combined with bulk train shipments not addressed within MultiRail. Specifically, my analysis incorporated the following costing adjustment produced by the operating plan MultiRail process:

- Improved fuel consumption efficiency by 2.0%, 1.8% and 1.7% in years 1, 2 and 3 respectively;
- Reduced locomotive units per train by 4.0%, 2.0% and 2.4% in years 1, 2 and 3, respectively;

---

[20] Van Dyke Comments V.S. at 28.

[21] The Attracted Shipments for which I developed CPKC handling costs generate approximately 196.5 million gross ton miles per day.

- Increased trailing tons per train by 3.5%, 3.4% and 3.3% in years 1, 2 and 3, respectively; and
- Increased average crew miles per train by 0.7% in years 1 through 3.

34. Mr. Van Dyke also suggests that I failed to consider the effects of growth-related traffic in the Operating Plan in my development of costs.[22] Consistent with the development of the pro forma financial results showing the effects of the proposed consolidation on base year 2019 financials, my costing of Attracted Shipments focused only on the incremental cost of handling those shipments. Accounting for productivity from the efficiency gains attributable to organic growth traffic as suggested by Mr. Van Dyke would have resulted in even lower incremental costs for the Attracted Shipments.

35. Last, Mr. Van Dyke asserts that costs attributable to block swaps and other intermediate switching and intermodal lifts required to handle the Attracted Shipments are not included in costs I developed.[23] Again Mr. Van Dyke is wrong. The costs I developed for the Attracted Shipments include inter and intra-train ("I&I") switching cost at the standard URCS switching intervals for carload and intermodal shipments. I&I switches include block swaps and intermediate switching of freight cars from one train to another. Accordingly, the costs I developed *do* include these allegedly missing costs, for all intermodal Attracted Shipments.[24]

23 Van Dyke Comments V.S. at 33.

24 *See* Baranowski V.S. workpaper "URCS Phase III Calculation For Growth Traffic.xlsx," tab "Phase III Calculation" rows 154 and 256.

D. My Cost Estimates Are Based on Valid and Verifiable Calculations Drawing from Data Customarily Relied Upon in the Railroad Industry

36. As he did with my development of operating expense savings attributable to the Transaction, Dr. Zmijewski, relying in part on the testimony of Mr. Randall, expresses that he is "aware of no facts, calculations, or detailed methodology for the Baranowski VS's calculation of incremental cost per diverted unit" and goes on to conclude that my development of the cost attributable to the Attracted Shipments is not verifiable.[25] It is not clear to me the scope of the analysis – if any – conducted by Dr. Zmijewski in making his assertion, but in addition to my V.S., in which I explained the methodology that I used to determine the costs attributable to the Attracted Shipments, I included the workpapers in Table 5 pertaining exclusively to that analysis.

[25] Zmijewski Comments V.S. at 59.

37. Dr. Zmijewski further asserts that many of the claimed efficiencies engendered by the merger are not verifiable or merger-specific under a framework typically employed by the DOJ/FTC known as the *Merger Guidelines.*[26] Yet, this framework, by Dr. Zmijewski's own admission, is not applicable to the acquisition of KCS by CP, nor does it prescribe specific standards, methods, or tests, to verify claims of efficiency.[27]

38. As I explained above, my approach is fully consistent with the approach used routinely in the railroad industry, both for the purposes of Board proceedings and ordinary

[26] Zmijewski Comments V.S. at 35.

[27] *Id.*

course railroad costing. Further, based on conversations with CP, the incremental costs of handling the Attracted Shipments that I develop are in line with both CP's experience and expectations related to the efficiencies available from the combined system and the costs of handling additional volumes. In sum, the efficiencies achieved by this Transaction have been estimated in the same way the railroads approach such matters in the ordinary course and in regulatory proceedings and should not be rejected for failing to meet Dr. Zmijewski's own self-imputed litigation-style standards.

E. The Specific Manner in Which Joint Facility Costs Are Considered Does Not Materially Affect My Estimates

39. CSX witnesses Drs. Carey and Bresmer observe correctly that the costs that I developed and attributed to the Attracted Shipments rely on system-average URCS costs instead of lane-specific costs to cover the economic costs associated with haulage agreements or trackage rights agreements. Though they acknowledge that I included these costs, they nevertheless assert that URCS system-average costs may understate the fees attributable to a specific route.[28] In contrast to Drs. Carey and Bremer, who acknowledge that I included costs to cover haulage and trackage rights agreements, BNSF witness Mr. Fisher observes that the costs that I attribute to these Attracted Shipments do not include the URCS line item costs that are specifically related to joint facilities expenses.[29]

40. I disagree that joint facility costs are not considered properly in my analysis. Consistent with Drs. Carey's and Bresmer's view, my analyses include an estimate of the CPKC economic costs attributable to haulage or trackage rights for the Attracted Shipments.

---

[28] Carey & Bremser Comments V.S. at 35, fn.151.

[29] Fisher Comments V.S. at 38.

Specifically as I explained in my V.S., the URCS running track costs include maintenance of way, maintenance of way administration, joint facility costs and other costs related to operating and maintaining right of way from which I identified those specific line items affected by the Attracted Shipments. Although my analysis did not identify the specific URCS joint facility-related unit cost elements as directly affected by the Attracted Shipments, my analysis does include the operating mileages over the trackage rights segments and the full URCS related variable costs for tie, rail, OTM and ballast maintenance costs. Ties, rail, OTM and ballast maintenance costs are typically a significant component of joint facility compensation. Further, unlike for fuel, crew, and locomotive costs discussed above, I did not make any efficiency adjustments to the unit costs for components relating to the below-the-rail cost associated with trackage rights segments. As such, my costs for the Attracted Shipments include appropriate consideration for trackage rights-related costs associated with Attracted Traffic including KCS's trackage rights over UP-owned lines in Texas.

41. Although I disagree with the critiques about my methodology and resulting cost levels, I performed a sensitivity analysis after reading these critiques. If I were instead to add URCS "joint facility" costs to my analysis on top of the maintenance-related costs already included in my analysis, the costs attributable to the Transaction-related shipments would increase by only $7.1 million, from $306.3 million to $313.5[30] million, before determining how to adjust the costs that I included in my analysis. In short, my methodology included costs for the haulage and trackage rights segments, was reasonable, and produced valid and reasonable results.

---

[30] *See* workpaper "URCS Phase III Calculation For Growth Traffic with Joint Facility Costs.xlsm," at tab "Final Summary," at cells F13 and G13.

III. CALCULATIONS OF BNSF AND UP REVENUE TO VARIABLE COST RATIOS

42. I have been asked to provide revenue to variable cost ("RVC") ratios for BNSF and UP intermodal and carload shipments moving to and from Mexico via Laredo, TX. I identified from the Board's 2019 Confidential Carload Waybill Sample ("CWS") the BNSF and UP shipments moving through the Laredo, TX gateway based on the following criteria:

- All BNSF shipments with reported on or off junctions at Robstown or Corpus Christi and originating or terminating in Mexico.
- All UP shipments with a reported on or off junction at Laredo and originating or terminating in Mexico.

43. To develop the RVC ratios and average revenue above variable costs, I used the variable cost developed by the Board and reported in the CWS, and identified the actual BNSF and UP shipment revenue from the BNSF and UP waybill data produced in discovery. My results are summarized in Table 6 below and details of my calculations are set forth in my work papers.[31]

TABLE 6
BNSF AND UP AVERAGE RVC RATIOS AND AVERAGE REVENUE ABOVE VARIABLE COST FOR SHIPMENTS MOVING THROUGH LAREDO

REPLY VERIFIED STATEMENT OF BENGT MUTÉN

TABLE OF CONTENTS

I. CRITICISMS OF MY ANALYSIS ARE INCORRECT 2

II. MY ANALYSIS DOES NOT UNDERMINE THE TESTIMONY OF OTHER APPLICANT WITNESSES 4

III. MR. HUNT'S PROJECTIONS OF FUTURE INTERMODAL TRAFFIC ON THE SPRINGFIELD LINE APPEAR IMPLAUSIBLE BECAUSE OF FLAWS IN HIS METHODOLOGY 6

1. My name is Bengt Mutén, and I am a Consulting Principal with S&P Global in its Economics and Country Risk practice. My office is located at One Financial Center, Suite 1900, Boston, Massachusetts 02111. I submitted a Verified Statement supporting the Application filed on October 29, 2021. I am submitting this Reply Verified Statement, first, to respond to certain criticisms of my truck-to-rail diversion analysis and Applicants' rail-to-rail diversion estimates; and second, to address flaws in the Verified Statement of David T. Hunt, submitted by Canadian National Railway Company ("CN").

I. CRITICISMS OF MY ANALYSIS ARE INCORRECT

2. In my analysis of truck-to-rail diversions, I set an upper limit of 70.9 percent for the rail intermodal share of traffic in any particular corridor. BNSF witness Benton Fisher criticizes this ceiling as "a broad assessment" that results in inappropriately understated diversion estimates.[1] This ceiling, however, was entirely appropriate.

3. As I explained in my Verified Statement, this ceiling allowed me to remove potentially unreliable outliers in the data and avoid overestimating potential diversions. In line with the standard practice of expert transportation analysts, I reviewed the rail intermodal traffic and lane shares to remove outlier data that would have an unreliable impact on the outcome of the analysis. To remove unreliable outliers in the data, I sorted all the BEA-to-BEA flows sequentially in order of intermodal share, and then excluded the top 20 percent of flows. The maximum intermodal share among the remaining flows was 70.9 percent. Excluding the top 20 percent of flows is a safeguard that is particularly useful when considering potential diversions across a large geographic area and a broad range of commodities, as the breadth of information

[1] BNSF-9, Verified Statement of Benton Fisher ("Fisher V.S.") at 15.

tends to produce unreliable outliers. Thus, given the substantial scope of the CP-KCS transaction, I removed outliers to produce a more reliable dataset and applied the resulting 70.9 percent ceiling.

4. While there were instances where actual rail intermodal share in certain corridors, compared to total dry van and refrigerated traffic, exceeded the upper limit I set for my analysis, I found those instances to be unrepresentative exceptions that would be inappropriate to rely upon in reaching conclusions about the likely body of truck traffic susceptible to being attracted by new CPKC intermodal services. It is possible that some number of these exceptional corridors were among those subject to diversion in my analysis. However, I did not have the ability to identify the specific reasons why rail intermodal share might have exceeded the limit in a particular corridor. To illustrate, for example, in the Norfolk BEA to Chicago BEA lane, Transearch data showed 1,395 moves in dry van or refrigerated trucks, while the expanded Confidential Waybill Sample ("CWS") showed {{{[redacted]}}} trailers or containers, for a rail intermodal share of {{{[redacted]}}} percent. But it would be inappropriate to apply this figure more generally, because it is likely that intermodal share in this lane is driven by import container flows arriving at the Hampton Roads and moving inland by rail. This would not be a useful model for most of the flows considered for CP-KCS. There may be other reasons that explain the outlier observation in other lanes. However, even had I wanted to exclude just import containers from my analysis, it would not have been possible to do so, because the CWS import/export flag in most cases is "9," representing unknown status.

5. Mr. Fisher makes another misguided critique when he notes: "[a] third source of understatement of the likely level of rail and truck traffic diversions involves the source of the data," as the "Board's Carload Waybill Sample does not fully represent transborder shipments,

especially rail traffic volumes moving to/from Mexico."[2] First, my analysis did not rely solely on CWS data. I used CWS data in conjunction with Transearch data and 100-percent data from KCS, KCSM, and CP actual waybills, which produced a reliable and accurate data source, as shown by the fact that the count of cross border rail traffic from those sources matches the count of cross border rail traffic in the Bureau of Transportation Statistics.

6. Second, the CWS does include essentially all cross border traffic to and from Mexico. A significant share is shown as rebill traffic received or forwarded at the border crossing, but by using CWS data in conjunction with Transearch rail volumes, I was able to estimate the Mexico origins and destinations.

7. Third, even if there was an undercount of rail flows, which there was not, this would have led to an overstatement – not an understatement – of diversions, since Transearch starts with total overland trade, and truck volumes are presumed to be *the remainder* after rail and pipeline flows are netted out.

II. MY ANALYSIS DOES NOT UNDERMINE THE TESTIMONY OF OTHER APPLICANT WITNESSES

8. CN witness David Hunt also errs in his criticism of Applicants' projected rail-to-rail traffic shifts when he erroneously applies my analysis to facts to which it does not apply. For example, Mr. Hunt inaccurately relies on my Verified Statement to criticize FTI's analysis regarding rail-to-rail diversion to longer routes.[3] In broad terms, it is true that a shipper's freight

---

[2] BNSF-9, Fisher V.S. at 16.

[3] Mr. Hunt states: "[t]he relationship between route length and route choice is a well-established concept in transportation modeling. This idea is both simple and intuitive: the least-cost route between an origin and a destination is likely to capture the greatest share of traffic, where cost is a function of distance. The traffic diversion models used in prior Class I railroad merger cases have consistently recognized this principle. Indeed, Applicants' own witness, Bengt Mutén, testifies that 'distance between end points' was found by his former colleagues at Reebie Associates to be one of 'the primary drivers of intermodal market share.' CP witness Mutén's truck-to-rail diversion model includes two parameters

mode choice is typically a trade-off between time (whether absolute or relative) and the cost and other options avalable to the shipper. (Even here, however, Mr. Hunt's criticism based on route length is an oversimplification, in that route length is only one of many factors that determine transit time.)

9. What Mr. Hunt most crucially overlooks, however, is that FTI was undertaking a fundamentally different analysis, involving fundamentally different service parameters, than my analysis. Distance directly impacts both time and cost for truck shipments, whereas that is not necessarily true for rail shipments. In other words, distance is a far better proxy for time and cost in truck shipping than in rail shipping. It is therefore to be expected that a truck-to-rail diversion study would be more sensitive to route circuity than a rail-to-rail traffic analysis.

10. In addition, Mr. Hunt fails to properly apply my analysis to the facts when he criticizes Messrs. Wahba's and Naatz's perishable diversion estimates.[4] Mr. Hunt

based on route distance, overall truck distance and the difference between truck and rail distances." CN-13, Verified Statement of David Hunt ("Hunt V.S.") at 8.

Mr. Hunt also notes "[i]t appears that witnesses Brown and Zebrowski initially recognized the importance of distance in rail market share. They conducted a statistical analysis comparing the relationship between rail carriers' length-of-haul and their historical market share. But the results of their analysis – which purported to find 'a weak correlation between the relative shares of traffic among the available routing options and the movement mileage for those options' – are utterly inconsistent with both prior traffic diversion modeling and witness Mutén's truck-to-rail diversion analysis." *Id.* at 9.

[4] "Witnesses Wahba and Naatz also project that CPKC will earn an additional $54.4 million in incremental revenues from perishables truck-to-rail diversions. Specifically, they divert to the CPKC network 24,748 units of perishables in 53-foot refrigerated containers that move by truck from Michoacán/Veracruz, Mexico to Chicago, the Twin Cities, and Kansas City. Applicants' own truck-to-rail diversion expert Mutén concluded that only a much smaller volume of this perishable traffic would be divertible: 374 units, with associated revenues of just $0.06 million. Witness Mutén explained why he did not include the 24,748 units diverted by witnesses Wahba and Naatz: 'Most of these volumes flow out of Mexico to intermediate destinations [sic] in border states and later move to the Midwest.' Witnesses Wahba's and Naatz's 'analysis' of this 'additional opportunity' appears to consist of (i) estimating that five million tons of produce moved from Mexico to wholesaler markets in border states, (ii) assuming that CPKC could capture ten percent of such traffic, and (iii) diverting that ten percent from truck to CPKC. Applications do not explain why these shipments are divertible, or why witness Mutén (who clearly was aware of the movements) did not judge them to be divertible." *Id.* at 34-35.

misunderstands the relationship between my analysis and Messrs. Wahba's and Naatz's analysis. Their analysis assesses the potential of new CPKC single-line rail service connecting origins in Mexico with destination markets in the United States to attract perishables traffic that is moving by truck today, but not via the same path. Because the new CPKC service represents a route that does not exist today, I was not able to incorporate it into my analysis using my methodology. The underlying truck flows of perishables from Mexico to the United States, however, do show up in the data. To the extent my analysis identified diversions of perishable traffic from truck to rail, I manually removed those moves from my analysis to avoid double-counting those diversions.[5]

11. To be more specific, the Transearch database shows movements of perishables from Mexico to the Upper Midwest as they currently occur, primarily in two distinct flows: first, perishables flow to distribution centers in Texas, and then, the perishables flow from those distribution centers to their final destinations, such as Chicago. Messrs. Wahba and Naatz identified flows from origin to final destination for which a direct, single-line CPKC service could be competitive by replacing those two moves with a single-rail intermodal move. In my diversion analysis, I initially found a small amount of likely diversions of perishables on the existing legs. Because Messrs. Wahba and Naatz were forecasting both legs to be replaced by new flows (that do not yet exist), I manually and correctly removed those potential diversions to avoid double-counting the same freight.

III. MR. HUNT'S PROJECTIONS OF FUTURE INTERMODAL TRAFFIC ON THE SPRINGFIELD LINE APPEAR IMPLAUSIBLE BECAUSE OF FLAWS IN HIS METHODOLOGY

12. CN witness Mr. Hunt forecasts huge shifts in truck traffic from highways to CN's

[5] *See* Application, Mutén V.S. at 22.

proposed new route between Kansas City and Chicago if CN is permitted to acquire KCS's Kansas City-Springfield Line. These predictions are implausible for several reasons.

13. First, Mr. Hunt's model is flawed, as it completely ignores important factors influencing shipper choice. The most serious omission is that Mr. Hunt's model does not take shipment time or the variability of shipment time into account at all. The mode choice in Mr. Hunt's model is driven by comparing Uniform Rail Costing System costs for the rail portion (with modeled truck operator costs added for the drays), with modeled truck operator costs for the existing highway flow. Changes in relative costs drive his results.

14. In reality, however, shippers' choices between trucks and rail intermodal service *are not solely based on relative out-of-pocket costs* (*i.e.*, *transportation charges*), but on a much broader array of logistics costs that are affected by service levels and service reliability – including the inventory costs associated with shipment time and the cost of safety stock needed in case of delays. Those other costs are typically higher for rail flows (including intermodal) than for truckload flows because of longer shipment time and greater variability, but Mr. Hunt's model does not account for those additional costs at all.[6]

15. Second, Mr. Hunt inappropriately included in his analysis several lanes with well-developed and efficient direct intermodal service, and he diverted substantial volumes of truck traffic in those lanes to CN's theoretical new service. For example, in 2019 Norfolk Southern carried {{{[redacted]}}} units between Kansas City and Detroit and {{{[redacted]}}} units between St. Louis and Detroit, and BNSF carried {{{[redacted]}}} units between Kansas City and Chicago. In effect, Mr. Hunt's analysis incorrectly treated these lanes as if there was not any existing rail

[6] Mr. Hunt's workpapers show only the URCS rail costs and modelled truck costs. There is no mention of shippers' indirect costs.

intermodal service today, and asked, if rail costs are lower that truck costs with rail attract trucks off the highway. Mr. Hunt's analysis improperly ignored that the remaining pool of truck traffic in these lanes reflects choices by shippers who, for whatever reason, have *already rejected* the intermodal option. While a second competing option over a somewhat more circuitous CN available route might attract some of this portion of this traffic, it certainly would not divert the same share that a brand new service would attract, as Mr. Hunt's analysis inappropriately assumes.[7]

16. Third, Mr. Hunt wrongly forecasts diversions to CN's hypothetical rail intermodal service despite the fact that in many lanes the service would require significant drays *away from the destination* to the origin ramp, *back towards the origin* from the destination ramp, *or both*. While intermodal service can be competitive despite meaningful drayage distances when the drays are *in the ultimate direction of travel*, other drays that are contrary to the flow of traffic are unlikely to be cost effective. Mr. Hunt's analysis nonetheless predicts (incorrectly in my view) significant diversions that would require inefficient drays. For example, Mr. Hunt predicts diversions of truck flows between Evansville, IN and Detroit, despite the need for the origin dray to drive approximately 535 miles away from Detroit to reach CN's planned St. Louis ramp and be loaded on a train that would head back towards Detroit. To the extent this traffic is susceptible to intermodal diversion at all, it likely would be from a ramp in Chicago. Although Chicago is 129 miles farther from Evansville than St. Louis, Chicago is much closer to the ultimate rail destination. Similarly, it is unlikely that the drays from Springfield, MO, Columbia, MO, and Joplin, MO first going west to Kansas City before starting their journey east (or vice versa) will create diversions. The number of highway miles needed to reach Kansas City would

---

[7] CN-13, Hunt V.S. at 9.

have the shipment much closer to its ultimate destination (or a ramp in Chicago closer to the destination). Thus, it is unlikely that this traffic will convert given that these movements involve drays that will not be cost effective.

17. Fourth, as illustrated by the Evansville-St. Louis drayage example, many of Mr. Hunt's diversions involve shipments that would not need to use KCS's Kansas City-Springfield Line. Mr. Hunt's model of estimated future intermodal traffic on the Springfield Line assumes diversions to and from a proposed CN intermodal ramp in St. Louis. Diversions attributable to this ramp account for 22.8 percent of the intermodal diversions in Mr. Hunt's model. But St. Louis is already served by CN, and a route between St. Louis and Chicago via KCS trackage would be only 50 miles shorter than CN's existing, parallel rail route. CN is and has been free to build this St. Louis ramp without the requested divestiture of the Springfield Line – thus, these gains Mr. Hunt's analysis predicts are unrelated to CN's Responsive Application and should not be considered as diversions stemming from the requested diversion. Even if properly treated as related to CN's proposed transaction, Mr. Hunt's analysis overestimates the extent of potential diversions, as it fails to account for the new route's insignificant impact on route distance and the limited cost savings it will create. Using Mr. Hunt's own cost model, the route would only create a savings of 1.4 percent, or $173,000, annually.[8]

[8] *See* CN-13, Hunt V.S. at 28.

RE: STB Finance Docket No. 36500

ATTN: Surface Transportation Board

My name is Darren Loewen, Director of Intermodal at Bison Transport ("Bison"). My business address is 1001 Sherwin Rd, Winnipeg, MB R3H 0T8.

Bison is a North American transportation company that specializes in full truckload, intermodal, logistics & less-than-truckload. Bison moves goods between Canada, the USA, and Mexico and believes that the CP-KCS merger will create efficiencies for our transportation network. Because of that, we are writing to express our support for the merger.

As a transportation provider moving goods between Mexico, the USA and Canada, we can see the benefit of a single-line rail option to serve all three markets. A single carrier to move our rail intermodal shipments will allow for a much simpler process with:

- Less need for trucks to move containers between interline partner rail terminals.
- Less complex routings that will create more competitive alternatives for Bison and its customers.
- The ability to compete with over-the-road transport and allow for new truck-to-rail conversions that are not possible today.

We have worked with both CP and KCS for many years and have been pleased with both of their commitments to on time delivery and safety. We fully expect CPKC to meet or exceed those same standards.

Certain parties in this matter have filed comments with the Board proposing conditions on the merger. Having reviewed those proposals, we see no benefits stemming from the proposed conditions. We also believe the proposed conditions present a serious risk of inhibiting the new, combined railroad's ability to effectively compete in the market. Because competition in the rail transportation market is good for Bison and good for our customers, we urge the Board to approve the Merger without conditions.

Sincerely,

Darren Loewen

Director of Intermodal

Bison Transport

REPLY VERIFIED STATEMENT OF CENTRAL MISSOURI AGRI-SERVICE, LLC

CENTRAL MISSOURI
AGRIService LLC

211 N. Lyon Ave. • Marshall, MO 65340 • (660) 886-6976

Verified Statement of John Fletcher

1. I am John Fletcher, General Manager of Central Missouri Agri-Service, LLC (CMAS), and I am submitting this verified statement to oppose the responsive application filed by Canadian National (CN) in STB Finance Docket 36500. We support of the Canadian Pacific (CP)-Kansas City Southern (KCS) Transaction and urge the Board to approve it without granting the CN responsive application.

2. CMAS was formed and began operations on September 1, 1999. CMAS is a joint venture of Fletcher Grain Company, MFA Incorporated, and Cooperative Association Number 1 of Slater, Missouri.

    a. Fletcher Grain Company began operations in Marshall, Missouri in the 1910s, selling seed and feed to farmers and purchasing produce from farmers in the Marshall and surrounding areas. In the last half of the century the company experienced concentrated growth in the areas of grain handling, fertilizer and crop protection products, seeds, and livestock feed.

    b. MFA Incorporated is a state-wide cooperative; organized in 1914 in a schoolhouse near Brunswick MO. MFA operates agricultural related businesses throughout the state of Missouri and in surrounding states.

    c. Cooperative Association Number 1 was founded in 1919. It was the first local cooperative founded under the 1919 state law providing for farmer owned cooperatives.

3. Our facility is located at Marshall, Missouri, and is served by KCS. It is located on the line from Kansas City to Springfield, Illinois, that CN asks the Surface Transportation Board to force KCS to divest to it. CN claims that it will grant haulage rights to CPKC if the line is divested to it.

4. We opened the Marshall facility in 2015 after investing about $25 million in it. It includes loop tracks to build in efficiencies.

5. Of the more than 5,000 cars we shipped in 2021, fewer than 10 percent move East.

6. The economics of our single-line hauls with KCS to serve customers to the south and west would be undermined if the line were divested to CN. We are also concerned that haulage is not a real solution to allow us to continue to efficiently move our grain to our customers. Added interchanges between CN to CPKC would not be as efficient as our single-line haul on the KCS system.

7. Moreover, most of our shipments – indeed about 80% -- move to Mexico. We ship a substantial percentage of our volume to Mexico via KCS-KCSM. This is our route of choice, which we use because it is best for us -- and not as some allege because we are coerced to do so.

8. The line in question has been treated as a stepchild for as long as I can remember prior to KCS acquiring it. This has occurred because either the owner didn't care, or because the owner was a short line and couldn't afford to be competitive. Since KCS acquired this line, it has been significantly upgraded, traffic has increased, and the service level has greatly increased. I would hate to see the improvements of the last twenty years abandoned in favor of an unknown quantity.

VERIFICATION AND CERTIFICATION

I, John Fletcher, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified und authorized to file this verified statement. I also certify that I have this day served a copy of the foregoing Verified Statement upon all other parties of record by depositing a copy in the U.S. mail in a properly addressed envelope with adequate first-class postage thereon prepaid, or by other, more expeditious means.

5500 Cenex Drive
Inver Grove Heights, MN 55077-1721

Creating connections to empower agriculture

Reply Verified Statement of Kevin Hall in STB Finance Docket 36500

1. My name is Kevin Hall. I am Vice President, Supply Chain & Continuous Improvement, Agriculture for CHS Inc. ("CHS").
2. CHS is a diversified global agribusiness cooperative owned by farmers and local cooperatives across the United States. First organized in 1929, CHS employs more than 10,000 dedicated people around the globe who provide our owners and customers with a strong, efficient supply chain, access to global markets, and products and services for agricultural businesses and rural communities.
3. As stated in CHS' April 2021 letter, CHS supports the approval of the CP-KCS merger. CHS continues to support the CP-KCS merger, because we believe it will create new, single routes that will be more efficient than existing interline routes and will benefit farmers.
4. The increased efficiencies and market access created by the CP-KCS merger would be an impetus for rail-using companies, such as CHS, to make the most of those benefits by considering making new investments in supply chain infrastructure to be served by CPKC. Without the CP-KCS merger and the aforementioned benefits, such investments would be unlikely to provide a strategic rationale or rate of return sufficient to justify the capital investment.

VERIFICATION AND CERTIFICATION

I, Kevin Hall declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified und authorized to file this verified statement. I also certify that I have this day served a copy of the foregoing Verified Statement upon all other parties of record by depositing a copy in the U S mail in a properly addressed envelope with adequate first-class postage thereon prepaid, or by other, more expeditious means.

REPLY VERIFIED STATEMENT OF HAPAG-LLOYD (AMERICA) LLC

Hapag-Lloyd

Surface Transportation Board

Finance Docket No. 36500

Reply Verified Statement of Uffe Ostergaard

1. My name is Uffe Ostergaard. I am President for Hapag-Lloyd (America) LLC.

2. Hapag-Lloyd (America) LLC previously wrote in support of the CP-KCS Transaction in March 2021. We submit this Verified Statement to further express our views on one specific benefit we expect the Transaction to generate efficient and effective intermodal service between the port of Lazaro Cardenas and destinations in the United States and Canada.

3. Much ocean freight from Asia bound for the United States and Canada flows through various Canadian and United States ports, including Los Angeles and Long Beach. While it is undeniable that those ports will continue to be lynchpins in the global supply chain, it is also evident that the volumes shipping through most ports often strain their capacity, creating delays.

4. The port of Lazaro Cardenas could handle some of this ocean freight from Asia to the United States and Canada, reducing the strain on other key gateways.

5. The lack of efficient single-line intermodal service from the port of Lazaro Cardenas to major distribution hubs in the United States and Canada, however, has limited the potential of Lazaro Cardenas to serve this function. Currently, KCS serves Lazaro Cardenas, but only reaches as far as Kansas City. Intermodal service from Lazaro to places like Chicago, Detroit, and Toronto is thus necessarily interline service.

6. The combined CP-KCS network, however, will create efficient, single-line service from Lazaro Cardenas to those U.S. and Canadian population centers, making Lazaro a valuable relief valve for freight that would otherwise further clog other ports.

7. We understand that some commenters have called into question whether intermodal service on CPKC from Lazaro to the U.S. Midwest is really an option shippers would choose. We believe that it will be. Reliable, efficient rail service will make Lazaro a reasonable alternative to overcrowded Southern California ports.

8. While the combined rail-water distance from some Asian ports to key Midwest and Canadian destination markets via the Port Lazaro Cardenas is somewhat farther than for other U.S. West Coast ports, the extra distance is not a major handicap in providing reliable service to reach end-markets. The key is reliability and efficiency, and the Port of Lazaro Cardenas, couples with efficient CPKC single-line rail service, will offer a very attractive alternative for companies like Hapag and our many intermodal customers. We are so excited about this new option that we have embarked on trial shipments through Lazaro Cardenas in recent months with a number of beneficial cargo owners ("BCOs") that are looking for alternatives and flexibility. Providing more options to U.S. shippers must be a priority and this solution will bring a larger part of the rail network to the intermodal market and support competition as well.

9. We believe this strengthening of Lazaro Cardenas and thus of the global supply chain is a very likely outcome of the CP-KCS Transaction. For this reason, and the reasons expressed in our earlier letter, we support the CP-KCS Transaction.

VERIFICATION AND CERTIFICATION

I, Uffe Ostergaard, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified und authorized to file this verified statement. I also certify that I have this day served a copy of the foregoing Verified Statement upon all other parties of record by depositing a copy in the U S mail in a properly addressed envelope with adequate first-class postage thereon prepaid, or by other, more expeditious means.

REPLY VERIFIED STATEMENT OF HARDISTY ENERGY TERMINAL

USD GROUP

HARDISTY ENERGY TERMINAL

STB Finance Docket No. 36500

My name is Josh Ruple and I am Executive Vice President, Chief Operating Officer of US Development Group, LLC ("USDG") and a member of the Board of Directors at Hardisty Energy Terminal GP Ltd., the General Partner of the Hardisty Energy Terminal Limited Partnership ("HET"). In March 2021, HET wrote to the Board to express our support for the Proposed Merger of Canadian Pacific ("CP") and Kansas City Southern Railway ("KCS"). Both USDG and HET continue to support the Proposed Merger based on our belief that it will benefit our joint customers.

I write to emphasize the importance of this merger to the future growth in our DRUbit™ by Rail™ Network. As we explained in the March 2021 letter, HET is a partnership between USDG and Gibson Energy ULC formed for the purpose of building and operating a Diluent Recovery Unit ("DRU") to create DRUbit™, a safer and more efficient shipment of heavy Canadian crude oil to markets outside of Canada. Historically, Canadian heavy crude is shipped by pipeline in the form of "Dilbit," which is bitumen with diluent blended to lower viscosity, making it more suitable for pipeline transportation. For destinations not reached by pipeline, rail offers the only viable means of transportation, and traditionally crude shipped by rail has been in the same "Dilbit" form. This is despite the fact that for crude-by-rail shipments the diluent serves no further purpose and has certain drawbacks in that it adds weight and volume to the shipment; it increases the risk of transportation handling; and adds to the flammability of the blended product.

HET's DRU facilities remove the diluent just prior to loading the bitumen onto a railcar, creating a product we call DRUbit™. DRUbit™ is a safer, and more economical, way to ship Canadian heavy crude by rail. DRUbit™ ships by rail as a non-hazardous and non-flammable commodity and with approximately 20% -30% less CO_2e emissions than currently available rail and pipeline alternatives, respectively. Replacing Dilbit rail shipments with movements on our DRUbit™ by Rail™ Network is very much in the public interest. And switching from dilbit to DRUbit™ requires further infrastructure investments at both origin and destination, respectively. Some of those infrastructure projects are already in progress and/or are completed, including at our Hardisty and Port Arthur facilities which opened in August 2021 and were fully operational in December 2021.

I understand that certain commenters have asserted that, because our DRUbit™ by Rail™ Network is already operational, the proposed CP/KCS combination cannot be responsible for forecasted increases in DRUbit™ shipping. In our estimation, this assertion isn't fully supported. We have plans to invest in additional capacity through future DRUbit™ by Rail™ Network expansions. This additional capacity is currently planned in additive DRU infrastructure in Hardisty, coverting additional existing Dilbit rail shipments into safer DRUbit™ shipments and capacity increases at our Port Arthur rail destination to connect our joint customers to the Gulf Coast refining market. This additional capacity, market access

811 MAIN STREET, SUITE 2800 HOUSTON, TX 77002 | P 281.291.0510 | F 281.291.0321

and resulting investments are largely dependent on efficient rail transportation from Canada to the Gulf Coast. We believe the CP/KCS combination will create new, efficient, single-line connections relevant to our DRUbit™ by Rail™ Network, served at origin by CP's network, and many of our customers in the Gulf, served by KCS at destination. The efficiencies created by the transaction, including improved cycle times and more reliable service, will enhance the DRUbit™ by Rail™ Network value proposition for our joint customers, which will in turn allow us to commercialize the increased volumes needed to justify further capacity investment. Put simply, we believe that our goal of additive Dilbit to DRUbit™ shipment transition is substantially more likely to increase in a world with CPKC than in one without.

For these reasons, and for the reasons expressed in the March 2021 letter, we respectfully urge the Board to approve the Proposed Merger as soon as possible.

Respectfully,

Josh Ruple
Executive Vice President, Chief Operating Officer – US Development Group LLC
Member of the Board of Directors – Hardisty Energy Terminal GP Ltd.

VERIFICATION

I, Josh Ruple, declare under penalty of perjury that the foregoing is true and correct, to the best of my knowledge. Further, I certify that I am qualified und authorized to file this verified statement.

NEW COOPERATIVE INC.
2626 1st Ave. South | P.O. Box 818 | Fort Dodge, IA 50501

Reply Verified Statement of NEW Cooperative, Inc.
STB Finance Docket 36500

I am Dan Dix, General Manager at NEW Cooperative Inc. ("NEW Coop"). I have been General Manager since 2015.

I write on behalf of NEW Cooperative Inc, a coop owned by Iowa farmers.

As we wrote in our March 2021 letter, we support the CP-KCS combination. We believe that the combined CPKC network will provide substantial benefits to our 8,000 member owners. We believe that those benefits will enable us to make an investment that we otherwise could not.

I write today to advise the STB of a potential investment that is contingent on the approval of the CP-KCS combination. This combination provides us the possibility to build a greenfield grain elevator to ship corn and soybeans in Northern Iowa, to capitalize on new, efficient single-line routes on CP-KC from Iowa to grain destinations on the KCS, including Mexico. We estimate that this project will cost $30,000,000. We believe this investment will bring further benefits to our members and the supply chain as a whole, but is only viable in light of opportunities created by the CP-KCS combination. We again urge the STB to approve the combination.

VERIFICATION AND CERTIFICATION

I, Dan Dix, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified und authorized to file this verified statement. I also certify that I have this day served a copy of the foregoing Verified Statement upon all other parties of record by depositing a copy in the U S mail in a properly addressed envelope with adequate first-class postage thereon prepaid, or by other, more expeditious means.

REPLY VERIFIED STATEMENT OF RAY-CARROLL COUNTY GRAIN GROWERS, INC.

REDACTED PUBLIC RECORD VERSION

RAY-CARROLL COUNTY GRAIN GROWERS, INC.

post office box 158 / richmond, missouri 64085

816-776-2291

STB Finance Docket 36500

Verified Statement of Ray Carroll County Grain Growers, Inc

Dear Surface Transportation Board Members:

I am Beau Hepler, General Manager of Ray Carroll County Grain Growers ("Ray Carroll"). Ray Carroll strongly opposes the Inconsistent Application filed by Canadian National ("CN") in this proceeding.

Farmers are experts in making things grow. As a full-service cooperative, Ray-Carroll County Grain Growers provides the services and technical expertise to help our local producers thrive. We've been proud to serve our member-owners since 1931.

Customers count on us for grain, agronomy, precision agriculture, insurance, energy, and feed solutions. There is a reason why Ray-Carroll has continued to grow since local farmers formed the cooperative more than 80 years ago. Guided by an 11-member board of directors, Ray-Carroll is focused on providing members and customers with high-quality products and services as we move forward together.

We are pleased to support the CP-KC transaction and believe that it opens up more possibilities for us. In fact, we anticipate making new investments in this corridor in the foreseeable future. If this transaction is approved it will open new business opportunities for us.

We have been moving forward thanks to the options we have for our grain. In 2004, we purchased the elevator in Slater, MO, from Farmland Industries. In 2013, we constructed a new shuttle loading elevator in Corder, MO, that we continue to upgrade and expand. We have invested heavily in the expansion of our Corder, MO facility. We have spent this money as we see the opportunity to continue gaining efficiencies and the ability to grow our market share in the region. Both of our elevators at Coder and Slater, MO, are located on the KCS line between Kansas City and Springfield, Illinois. This is the line that CN has asked the Surface Transportation Board to force divesture to the CN, while granting haulage rights back to KCS.

PRINTED WITH SOY INK
Environmentally Friendlier
Locally Grown!

We oppose CN's Inconsistent Application and request for divestiture of this line. The markets that we serve are Mexico and other points reached via KCS's line via Kansas City to the west of our facility. In fact, in 2021, we shipped nearly 6,500 cars, of which 94% of our shipments moved West and to Mexico while only 6% moved East. With 5,270 of those cars (or 81% of our cars) terminating in Mexico, you can see that the vast majority of our product is shipped to Mexican markets via KCS-KCSM. That route is efficient. We have chosen to because they are the best option available to us on the merits.

If the line were divested to CN, we believe that the options for our grain would be constrained. Moreover, granting CPKC haulage rights over the line is not a solution to our lost options. Haulage, which would require CN to take our railcars toward Kansas City for interchange with CPKC, is a much less efficient process than we have today with single-line service from KCS.

Ray Carroll supports the CPKC Transaction and urges the Board to approve it without granting CN's Inconsistent Application.

VERIFICATION AND CERTIFICATION

I, Beau Hepler, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified und authorized to file this verified statement. I also certify that I have this day served a copy of the foregoing Verified Statement upon all other parties of record by depositing a copy in the U S mail in a properly addressed envelope with adequate first-class postage thereon prepaid, or by other, more expeditious means.

REPLY VERIFIED STATEMENT OF RICHARDSON INTERNATIONAL LIMITED

RICHARDSON

STB Finance Docket 36500

Verified Statement of Robert Bielik

My name is Robert Bielik and I am Vice-President, Transportation, of Richardson International Limited ("Richardson").

I and Richardson are aware of, and support the CP-KC Transaction and encourage the Surface Transportation Board to confirm its approval.

Richardson recently acquired St. Louis-based Italgrani USA, Inc., the largest durum miller in North America. The transaction assets included a milling facility in St. Louis that specializes in semolina and durum flour products, along with grain storage and crop inputs facilities situated at Tolley, Powers Lake, and Benedict (North Dakota); and a commodity trading office in Minneapolis.

Richardson has reviewed the CP-KC Transaction and believes it opens new markets to our company. More specifically, we expect to be able to access new markets for our grain handling facilities located in North Dakota to ship grain to the Gulf area as well as Mexico. Additionally, the CP-KC network resulting from the Transaction will also allow Richardson to source durum for milling at its KCS-served St. Louis durum milling facility from its extensive CP-served network in southern Saskatchewan and from its newly-acquired elevators in North Dakota over new CP-KC single-line routes. Furthermore, the CP-KC Transaction would result in the connection of the St. Louis durum milling facility to important markets in the West and in Mexico over an existing KCS single-line route, which is very important to our business plan. The Springfield Line is an important part of that single-line route.

It is our understanding that Canadian National has asked the Board to order the KCS rail line between Springfield, Illinois, and Kansas City to be divested to it, while granting haulage operating rights back to KCS. We oppose Canadian National's request that the Board divest the Springfield Line to it because it would eliminate single-line service—both on routes that currently exist and routes that will become available as a result of the CP-KC Transaction—that are important to us. Retaining the rail line into St. Louis via the Springfield Line as part of the CPKC network is important to achieving the benefits of a single-line haul over those new routes.

REPLY VERIFIED STATEMENT OF SPARX LOGISTICS INC.

SPARX logistics

1. SPARX logistics Inc. ("SPARX") submits this verified statement in support of the CP-KCS Transaction.
2. SPARX is a leading global logistics provider.
3. SPARX recently introduced a new ocean service from China to the port of Lazaro Cardenas in Mexico, specifically targeting customers with final destinations in the central United States.
4. We believe this service will alleviate some of the congestion, and associated delays, the ports of Los Angeles and Long Beach, creating a valuable option for our customers. Considering the congestion on the USWC the routing via LZC improves the overall transit times into the Midwest of the USA.
5. KCS's reliable intermodal service is a key component of the success of this enterprise. However, the fact that the KCS network does not reach beyond Kansas City requires that some customers must use less efficient interline routings to reach Chicago and points beyond.
6. The CP-KCS Transaction promises to substantially increase the value of routings through the port of Lazaro Cardenas by extending efficient, single-line intermodal service to Chicago, New York, Toronto, and other important destinations. We would like to extend this service into ATL/SAV/NJ and Columbus,OH.
7. We understand that some commenters in this proceeding have questioned whether the market will realistically support a route from Asia through Lazaro to the U.S. Midwest. We clearly believe it can.
8. We have proven through our actions that we believe ocean shipping from Asia to Lazaro Cardenas is a viable way to reach destinations in the Central and Eastern United States. We believe that the CP-KCS Transaction can only strengthen this exciting new option, making it better for our shippers and their customers.
9. For these reasons, SPARX supports the CP-KCS Transaction.

VERIFICATION AND CERTIFICATION

I, Markus Heinken, confirm that the foregoing is true and correct .

Re: Verified Statement FD 36500, Canadian National Railway Company, Grand Trunk Corporation, and CN's Rail Operating Subsidiaries—Control—Kansas City Southern, the Kansas City Southern Railway Company, Gateway Eastern Railway Company, and the Texas Mexican Railway Company.

Dear Ms. Brown:

My name is Adrián Estrada Montemayor, and I serve as General Counsel and Institutional Affairs VP of Ternium México, S.A. de C.V. ("Ternium"). I reach out to you in order to confirm our previous communication dated June 25, 2021, in support to the Canadian Pacific - Kansas City Southern merger ("CPKC Transaction").

As I mentioned before, Ternium is one of the largest railway service users in Mexico and has a long-standing strategic commercial relationship with Kansas City Southern México, S.A. de C.V. ("KCSM"); using railway infrastructure, Ternium ships (i) slabs from Port of Brownsville and Lázaro Cárdenas, Michoacán to our industrial facilities in Nuevo León, (ii) scrap and direct reduced iron (DRI) to our facilities in Nuevo León and Puebla and (iii) all kinds of steel products from our industrial facilities in Mexico to serve our customers in the region. With KCSM´s railway service, our most relevant manufacturing footprint is covered.

Railway competition is paramount for large rail users like us, therefore we trust that the CPKC Transaction would enhance competition, bring efficiencies and generate flexibility for all rail users in the North American market. Moreover, we expect that the CPKC Transaction will boost the existing rail network and provide new routing and interchange options for rail users, generating competition with other large rail and truck carriers.

Given the foregoing, Ternium supports the CPKC Transaction and respectfully urges the STB to approve it under its current merger guidelines, so the companies can be fully integrated to unlock the benefits of the strategic combination.

Should you have any question or comment on the above, please feel free to contact me.

Sincerely,

Ternium México S.A. de C.V.
Adrián Estrada Montemayor
General Counsel and Institutional Affairs VP

REPLY VERIFIED STATEMENT OF BRAD SANDERS, USD GROUP

USD GROUP

STB Finance Docket No. 36500

Reply Verified Statement of Brad Sanders

1. My name is Brad Sanders and my business address is 811 Main St, Suite 2800, Houston, TX 77002. I am Executive Vice President, Chief Commercial Officer of US Development Group, LLC ("USDG"). In my role, I am responsible for developing the commercial strategies and the proper execution of them for USDG.

2. USDG has previously submitted to the Board letters supporting approval of the proposed CP/KCS combination. As expressed in our previous letters, USDG supports swift approval of the CP/KCS combination because of the significant benefits we and our customers expect to realize from this transaction. We believe the single-line benefits and new investments made possible by the CP/KCS transaction will provide the improved rail efficiency and economics necessary to support further investment in our DRUbit™ by Rail™ Network.

3. USDG and its partners operate the Hardisty Energy Terminal. In 2021 we began shipping DRUbit™ from our DRU (diluent recovery unit) near Hardisty, Alberta to the Port Arthur Terminal on the U.S. Gulf Coast for sale to numerous refining customers in the United States and international locations by pipe and vessel. Our joint customer chose CP and KCS to provide rail transportation on an interline basis.

USD GROUP

4. Canadian bitumen shipped as DRUbit™ uniquely ships by rail in the United States and Canada as non-hazardous and non-flammable, and with approximately 20% -30% less CO2e emissions than currently available rail and pipeline alternatives, respectively.

5. Switching from dilbit to DRUbit™ requires substantial infrastructure investment. At origin, diluent recovery units are required to transform dilbit to DRUbit™. At destination, additional, specialized infrastructure is required to remove DRUbit™ from railcars for final delivery to refineries. Some of those infrastructure projects are already in progress and/or are completed, including at our Hardisty and Port Arthur facilities. We are proud of the success of our Phase I DRUbit™ Hardisty operation. However, given the volatility in the crude market, additional investments to expand the capacity of the Hardisty facility – what we call Hardisty DRUbit™ Phases II and III – and counterpart unloading facilities are not assured.

6. We believe the CP-KCS Transaction will provide compelling support for additional investments, and in the process enable crude moving by rail as dilbit (sometimes through the crowded Chicago gateway) to be converted to DRUbit™ moving on new CPKC routes. Our Hardisty facility is on the CP network, and many of the refineries to which we ship can ben accessed on the KCS network. The CP-KCS Transaction will connect those origins and destinations in efficient, single line routes that do not exist today, resulting in improved cycle times and reliability. We believe the efficiencies unlocked by the CP-KCS Transaction will make further investments in DRUbit™ more economically viable.

USD GROUP

7. We understand that some comments have questioned whether increased DRUbit™ traffic on CPKC can fairly be attributed to the efficiencies of the CP/KCS Transaction. We answer that question in the affirmative. We believe the Transaction will create more efficient, new single line routes from origins near the Alberta oil sands, on CP's network, to destination refineries on KCS's network, without which new DRUbit™ traffic is much less likely to arise. We understand that CPKC will support new investment in capacity (longer sidings, etc.) on the CP-KCS North-South route connecting Canada with the Gulf Coast, enabling improved cycle times and reliability and the ability to move more product on the same number of trains, which impacts cost, efficiency, and capacity. These efficient new routes promise to incentivize further investment in DRUbit™ infrastructure, thereby speeding up the transition to more efficient, safer DRUbit™.

8. For the reasons stated above and drawing specific attention to the significant additional sustainability benefits that we believe the DBR™ Network will create with the CP-KCS combination, USDG urges the Board to approve the CP-KCS proposed combination as expeditiously as possible. We look forward to seeing the new CPKC as a stronger competitor in the industry.

Respectfully,

Brad Sanders
Executive Vice President, Chief Commercial Officer
USD Group LLC

VERIFICATION

I, Brad Sanders, declare under penalty of perjury that the foregoing is true and correct, to the best of my knowledge. Further, I certify that I am qualified und authorized to file this verified statement.

MAJOR RAIL CONSOLIDATION PROCEDURES

VERIFIED STATEMENT OF RICHARD J. PIERCE, JR.

My name is Richard J. Pierce, Jr. I am the Lyle T. Alverson Research Professor of Law at George Washington University, 720 20th Street, N.W., Washington, D.C. 20052. I have been asked by The Burlington Northern and Santa Fe Railway Company (BNSF) to provide my opinions on the new rail merger policy the Surface Transportation Board (STB or Board) proposed in Ex Parte No. 582 (Sub-No. 1). I will begin by describing my background and experience relevant to that task. I then will summarize the history of economic regulation, deregulation, and regulatory reform in the U.S. over the last three decades. I will follow that with a description of the merger policies currently implemented by other agencies, with emphasis on the current policy of the Federal Energy Regulatory Commission (FERC), an agency that, like the STB, applies a public interest standard, rather than pure antitrust review. After that, I will identify the characteristics of the STB's proposed policy that I believe to be inappropriate, counterproductive, and a major step backward from the regulatory reform efforts that have produced outstanding results in numerous markets, including the rail market, over the past 30 years.

I conclude that any final rules adopted by the STB should: (i) result in timely review of mergers; (ii) eliminate the presumption that future rail mergers will not produce efficiencies; and

(iii) eliminate the presumptions that future rail mergers will produce competitive harms and service disruptions. The STB should not require merger applicants to propose "competitive enhancements" to offset presumed harms, and the scope of post-merger review should be limited to the efficacy of competitive conditions adopted in the merger and the temporary remedy of any merger-related service disruptions.

BACKGROUND AND EXPERIENCE

I have been a law professor for 23 years. The courses I regularly teach include Regulated Industries, Antitrust Law, and Administrative Law. My research and scholarly writings correspond with the subjects I teach. I have written a dozen books and over 80 articles. I have attached a copy of my resume, including a list of my publications, as Appendix A to this report. My central interest in teaching, research, and writing is the effects of various forms of government intervention – including economic regulation and antitrust law – on the performance of markets. My writings have been relied upon by numerous agencies and courts, and are found in many opinions of the U.S. Supreme Court. I have played an active role in the process of restructuring, and reforming the regulation of, many markets in North America, Europe, Asia, and Australia. In addition, I have provided consulting services to a wide variety of private and governmental participants in those processes of restructuring and regulatory reform, including the General Accounting Office, the U.S. Agency for International Development, the Organization for Economic Coordination and Development, and The World Bank.

THE RECENT HISTORY OF ECONOMIC REGULATION

In the early 1970's, the U.S. relied primarily on economic regulation to govern the performance of many markets, including rail, trucking, air travel, financial services, natural gas, electricity, oil and petroleum products, and telecommunications. Regulatory agencies used a

combination of rate regulation and regulatory restrictions on market entry and exit to implement a system of central planning. All of those regulated markets performed poorly.

The U.S. responded by deregulating the markets that were not characterized by natural monopoly conditions – specifically, trucking, airlines, oil and petroleum products, and financial services. The results were so socially beneficial that the U.S. turned its attention to markets with more complicated characteristics. The natural gas, telecommunications, and electricity markets include many functions that are susceptible to performance in an unregulated, structurally competitive market, but they also include some functions, like transmission of electricity, that continue to be natural monopolies. In each of these markets, the U.S. has reduced significantly the role of government regulation as a governance mechanism, and has increased its reliance on unregulated competitive market forces to obtain socially beneficial changes in the performance of the markets. Generally, the U.S. has separated the natural monopoly functions from the functions that are susceptible to governance by competitive markets, deregulated the functions that are susceptible to performance in a competitive market, and switched to new methods of regulating the residual natural monopoly functions that are compatible with, and supportive of, the newly deregulated market-based functions.

The results have been impressive. Each of these markets performs much better today than it did when we attempted to rely on central planning and pervasive regulation to govern it. As scholars from the Brookings Institution and George Mason University concluded in an important study published in 1997, consumers have obtained scores of billions of dollars in annual benefits as a result of this movement toward deregulation and regulatory reform. Robert Crandall & Jerry Ellig, Economic Deregulation and Consumer Choice (1997). I have described this process and its many socially beneficial results at greater length and in greater detail elsewhere. See, e.g.,

Richard J. Pierce, Jr. & Ernest Gellhorn, Regulated Industries (4th ed. 1999); Richard J. Pierce, Jr., Economic Regulation (1994); Richard J. Pierce, Jr., Reconstituting the Natural Gas Industry from Wellhead to Burnertip, 9 Energy L. J. 1 (1988).

The extraordinary success of the U.S. deregulation and regulatory reform process, combined with the enviable performance of the U.S. economy and the collapse of the centrally planned Soviet economy, has inspired nations on every continent to emulate the U.S. approach. Almost every country is in some stage of attempting to apply the lessons of the U.S. movement toward deregulation and regulatory reform, with the same kind of resulting substantial improvements in market performance that the U.S. has experienced.

As the Board well knows, the history of the U.S. rail industry is similar to the history of the other industries that have been the subject of deregulation and regulatory reform. In the early 1970s, the U.S. rail market was on the verge of total collapse. Most railroads were either bankrupt or nearly so. The cause was easy to identify. Implementation of a central planning approach to the market through application of rate regulation and regulatory restrictions on market entry and exit had nearly destroyed the market. The rail regulatory regime that was being implemented at the time cost the U.S. economy between $9.7 and $16.2 billion per year. C. Barnekov & A. Kleit, The Costs of Railroad Regulation (1988).

Congress responded by enacting the 4R Act and the Staggers Act. As they were ultimately implemented by first the ICC and then the STB, those statutes went a great distance toward replacing central planning with reliance on markets to determine prices, terms and conditions of service, and market entry and exit. Those statutes were predicated on the well-supported belief that railroads confront effective competition in most markets from a combination of other railroads and other modes of transportation. The STB continues to perform

some important regulatory roles, e.g., regulation of rates charged where a railroad has "market dominance." Even in those narrow contexts, however, the STB has come increasingly to rely on regulatory methods that reflect market forces, e.g., differential or Ramsey pricing, rather than traditional cost-of-service regulation. As a result, the rail market is much healthier than it was prior to the regulatory changes mandated by Congress. By any conceivable measure, shippers and the U.S. economy have experienced significant benefits attributable to the movement from primary reliance on regulation to primary reliance on market forces to govern the rail market.

The Board's revised merger policy should reflect these general and rail-specific directions in economic regulation.

MERGER POLICY

Any country needs a merger policy that accomplishes two goals. First, it should enable an agency to identify, and potentially to block, proposed mergers that would have the potential to create unacceptable anticompetitive effects. Second, it should enable all other proposed mergers to be reviewed and approved quickly and easily. We often tend to emphasize the first goal in talking about merger policy, but the second goal is even more important than the first. Only a small fraction of proposed mergers pose any plausible threat of harm to the performance of any market. The vast bulk pose no such threat. In an economy as diverse and dynamic as the U.S. economy, it is essential that firms be able to order, and to reorder, their structures and relationships quickly and easily in response to constantly changing marketplaces.

The U.S. legal regime applicable to most mergers furthers both goals admirably. In most areas, the Department of Justice and the Federal Trade Commission (DOJ/FTC) share responsibility to determine whether a proposed merger is likely to have intolerable anticompetitive effects and to attempt to block any such merger that they so identify. They fulfill

those responsibilities in a highly pragmatic manner that has helped to give the U.S. the best performing economy in the world. A high proportion of proposed mergers do not even meet the threshold criteria that trigger a duty to notify the DOJ/FTC of the merger. Of those that do, the DOJ/FTC attempt to block only a handful of proposed mergers each year. A high proportion of the proposed mergers that do meet those criteria elicit only a quick review by the DOJ/FTC that is sufficient to allow them to conclude that the merger poses no plausible threat to harm the performance of any market. The DOJ/FTC identify only a small fraction of proposed mergers that raise plausible concerns sufficient to justify detailed scrutiny. Even within that small class of proposed mergers, in most cases the DOJ/FTC ultimately conclude either that the proposed merger does not, in fact, threaten competitive harm or that any such threat can be mitigated adequately through undertakings that the firms are willing to make as conditions on the DOJ/FTC's acquiescence in the proposed merger. Through this process, the vast majority of proposed mergers in the U.S. are completed quickly and inexpensively. In most cases, the DOJ/FTC complete the process of reviewing a proposed merger within sixty days. Thus, as it is designed and implemented, U.S. merger policy reflects a presumption that most mergers are socially beneficial. That presumption can be rebutted only by demonstrating that a proposed merger has the clear potential to harm the performance of a market.

It is even more important to have a merger policy that allows mergers to be completed quickly and inexpensively in the context of a previously regulated market that is undergoing a transition to greater reliance on market forces. Regulation always distorts firms' decisionmaking and induces firms to choose inefficient structures. It also distorts their decisionmaking in many other contexts, e.g., it induces them to make poor investment decisions, to invest in the wrong kinds of assets in the wrong places, to hire the wrong numbers and types of personnel, and to

make other decisions based on regulation, rather than economic efficiency. When previously regulated firms are freed from regulatory restraints and subjected instead to competitive market forces, they invariably conclude that they must make major changes in order to be efficient enough to survive and prosper in their new environment. Many discover that they must make major structural changes through mergers and acquisitions. Any agency that is responsible for considering proposed mergers in that context must adopt a merger policy that will both allow it to identify, and to block, the occasional proposed merger that poses intolerable risks of harm to the performance of markets, and, even more important, allow the quick and inexpensive consummation of the many mergers that do not pose such risks.

Of course, regulatory agencies review mergers under a "public interest" standard that is not necessarily the same as the antitrust analysis performed by the DOJ/FTC. However, even in this area, regulators have, over time, narrowed the scope of their review considerably.

For example, FERC has jurisdiction over mergers in the electric utility industry, an industry that is undergoing a transition from pervasive regulation to primary reliance on competitive market forces. FERC originally used a six-factor test for merger review: (1) the effect of the proposed merger on competition; (2) the effect of the proposed merger on the applicants' operating costs and rate levels; (3) the reasonableness of the purchase price; (4) the degree of coercion, if any, the acquiring utility has applied to the to-be-acquired utility to accept the merger; (5) the impact of the merger on state and federal regulation; and (6) the contemplated accounting treatment. In a high proportion of cases, FERC applied that policy through the use of lengthy oral adjudicatory hearings.

However, in 1996, FERC concluded that its policy was no longer appropriate for application to an industry that was undergoing a transition to primary reliance on market forces,

and announced a new policy that was designed to fit the new environment. See FERC Order No. 592, Docket No. RM96-6-000 (Dec. 18, 1996) (policy statement) and Order No. 592-A, Docket No. RM96-6-001 (June 2, 1997) (order on reconsideration); FERC Order No. 642, 93 F.E.R.C. ¶61.164 (November 15, 2000). See also Richard J. Pierce, Jr., Antitrust Policy in the New Electricity Industry, 17 Energy L. J. 29 (1996).

In justifying its changed policy, FERC identified several major defects in its old policy, each of which also is relevant to the Board's proposed revisions to its merger policy. First, many of the factors it considered were not appropriate for consideration by an agency that was reviewing mergers proposed by firms that are subject to market forces. Second, FERC concluded that its old policy was too unpredictable in its outcome, imposed undue burdens, and required far too much time to implement in many cases. FERC recognized that most proposed mergers are socially beneficial, and that a policy that is difficult to predict, burdensome, and slow deters many firms from even attempting to enter into socially beneficial mergers. Third, FERC recognized that its old policy was highly susceptible to abuse by badly motivated protestors and intervenors. Those included competitors who wanted to stop, or at least to delay, a transaction that would create a more formidable competitor, and rent seekers who used their ability to protest, or to demand a costly hearing, as a source of leverage to extract from the merging firms a variety of special interest concessions on issues unrelated to the proposed merger. Fourth, FERC recognized that its old policy tended to discount and to submerge the issue that should dominate its merger policy in the new environment – whether a proposed merger is likely to cause serious harm to the performance of any market.

To remedy these problems, FERC's new policy reduced to three the factors that FERC will consider in acting on a proposed merger: (1) effects on competition; (2) effects on rates;

and (3) effects on regulation. As a practical matter, FERC places almost exclusive emphasis on effects on competition in most cases. In applying the first factor – effects on competition – FERC has largely adopted the DOJ/FTC Merger Guidelines. This enables FERC to screen proposed mergers, so that mergers that do not raise significant competitive issues can be handled on an expedited basis. The second factor – effects on rates – is unique to FERC's method of ratemaking. It usually can be satisfied simply by applicants agreeing not to file for rate increases directly attributable to the merger. The third factor – effects on regulation – reflects potential jurisdictional problems that sometimes are raised by a merger as a result of some judicial interpretations of the Public Utility Holding Company Act. Those opinions suggest that some utility mergers can have the effect of precluding both FERC and state regulators from regulating transactions among corporate affiliates. That factor usually can be satisfied simply by applicants agreeing not to use the merger as a vehicle to avoid state or FERC regulation of matters that were subject to state or FERC regulation before the merger.

FERC's revised policy had positive results. FERC has applied its new policy to 42 proposed mergers in the last four years, excluding the few merger applications that were filed and withdrawn when the applicants changed their minds about the desirability of the proposed merger. See List of Mergers Filed with the Commission Since 1995, available at http://www.ferc.fed.us./electric/mergers/mgrpag.htm (last updated July 31, 2000). FERC approved each of these mergers, though it approved some on the condition that the parties adopt mitigating measures. FERC completed its review and approval process in less than six months in 37 of the 42 cases, and its average processing for merger applications has been 117 days since it revised its policy. It completed the process in less than a year in all but one of the cases. That case raised extremely difficult and unprecedented issues. Even in those cases where competition

issues were raised, FERC has been able to resolve most mergers on the basis of the filing submitted by the merger applicants, pleadings filed by interested parties, and supplemental data requests from its staff. Most mergers handled by FERC do not result in formal discovery by the parties and are resolved through "paper hearings," without the use of formal discovery or evidentiary hearings. Courts have repeatedly upheld and often applauded this type of decisionmaking procedure by agencies that are acting under broader statutory standards in cases in which the dominant issues are economic. See, e.g., Louisiana Energy and Power Authority v. FERC, 141 F.3d 364 (D.C. Cir. 1998); Union Pacific Fuels v. FERC, 129 F.3d 157 (D.C.Cir. 1997); SBC Communications v. FCC, 56 F.3d 1484 (D.C. Cir. 1995). See generally Kenneth Culp Davis & Richard J. Pierce, Jr., Administrative Law Treatise § 8.2 (3d ed. 1994 and annual supplements). The advantages of this procedure are obvious and substantial. It permits the agency to make decisions on the basis of high quality data and analysis with limited consumption of agency resources. It expedites the decisionmaking process. It also reduces the ability of third parties to abuse the merger review process by using it to block or to delay a competitor's merger or to extract special interest benefits by threatening to try to block the merger or to delay the proceeding.

FERC's policy has, over time, moved toward the focused approach used by the DOJ/FTC and other agencies that are engaged solely in antitrust review. Under this approach, the agency first defines the appropriate markets and the effects on those markets of the proposed merger. If the agency identifies a market in which it fears that the merger creates an undue risk of harming the performance of the market, it works with the applicants to identify an effective means of mitigating the potential harm it has identified. In a high proportion of the relatively few cases that reach this stage of the decisionmaking process, the agency is able to identify effective

mitigation measures that the firm is willing to implement as a condition on the completion of its merger, e.g., divestiture of assets in a market in which the merged firm otherwise would have an unduly high share of the market. If the agency identifies a market in which the merger poses a significant risk of anticompetitive behavior that is not amenable to effective mitigation, the agency looks at the potential social benefits of the merger to determine whether they are sufficient to justify its approval notwithstanding the existence of some risk that the merger might harm the performance of some market. These are the relatively rare hard cases that sometimes elicit an order disapproving a proposed merger.

One characteristic of this decisionmaking process is particularly noteworthy. Each step is contingent on the results of the prior step. Thus, for instance, the agency does not engage in detailed economic analysis unless and until it has applied some simple screens to see whether such an analysis is necessary. It does not look for mitigation measures unless and until it has concluded that the merger would pose an undue risk to the performance of a market in the absence of mitigation measures. It does not look for social benefits of a merger unless and until it concludes that the merger poses otherwise unacceptable and unmitigatable risks to the performance of a market.

This clear, simple, contingent, and sequential approach has many advantages. It conserves the resources of the agency and the parties. It minimizes the amount of time required to review a proposed merger. Finally, it permits any firm that is considering a potential transaction to perform its own analysis early in its own decisionmaking process and to make a reasonably reliable prediction of the likely results of the agency's decisionmaking process.

Following this general trend, the Board's final merger rules should focus principally on competitive issues, with additional review of issues that are unique to the rail industry, such as

service issues. A narrow scope of review, coupled with expedited review, would be consistent with the Board's application of a broad "public interest" standard.

THE STB'S PROPOSED POLICY

The STB is wise to reconsider its merger policy to determine whether conditions have changed in the past twenty years in ways that justify a change in policy and to reflect the general trends in the area of economic regulation. The proposed new policy is severely flawed in a number of respects, however. Before I discuss each of the elements of the proposed policy that are inappropriate and counterproductive, I will describe the problems that would be created by adoption of the policy as a whole.

The proposed policy would require the STB to apply at least four factors in addition to the potential adverse effect on competition in evaluating a proposed merger: (1) the adequacy of the firms' plan to improve service; (2) the adequacy of the firms' plan to enhance competition; (3) the adequacy of the firms' plan to minimize service disruptions during the post-merger transition period; and (4) the adequacy of the firms' attempt to anticipate and then to evaluate the likely responses of the firms' competitors to the proposed merger, including additional mergers that might be proposed as a competitive response to the proposed merger. The inclusion of "enhanced competition" and downstream effects in this analysis would impose extraordinarily heavy burdens on both the applicants and the STB's staff. It would produce long, expensive, and complicated proceedings. It would maximize the opportunities for competitors and other third parties to abuse the merger approval process by using it to stop or to delay a pro-competitive merger or to use it as a means to extract special favors unrelated to the proposed merger. It would require the STB to select winners and losers if it adopts remedies or conditions that are not specifically designed to offset identified harms. Finally, the use of such factors in reviewing

mergers would render prediction of the likely results of the merger review process nearly impossible. Through each of those effects, the proposed policy would deter firms from even attempting to identify, negotiate, and propose socially beneficial mergers.

The factors beyond competitive and service effects that the STB has proposed also represent a major step back to the bad old days in which agencies acted on the assumption that agency-implemented central planning will yield better results than primary reliance on market forces to determine the most efficient structure of a market. As stated in the recently released "Final Report of The International Competition Policy Advisory Committee to the Attorney General and Assistant Attorney General for Antitrust" (2000) [hereinafter Attorney General's Advisory Committee, available at www.usdoj.gov.atr/icpac/icpac.htm]:

> As a best practice or discipline, with limited exceptions (such as national security), noncompetition factors should not be applied in antitrust merger review. If a jurisdiction's law recognizes noncompetition factors (such as preservation of jobs, promotion of exports, or international comparative advantage), such factors should be applied transparently and in a manner narrowly tailored to achieve their ends. *Executive Summary*, Attorney General's Advisory Committee.

While the Board reviews mergers under a public interest standard, the analysis of merger-related competitive effects should, for reasons discussed above, be the core of that analysis. Moreover, the Board's proposed policy would reduce the transparency of its decisions and expand the scope of its review and remedies.

I will now discuss each of the factors the STB proposes to apply in reviewing proposed mergers.

Presumption That All of the Efficiency Enhancing Mergers Have Been Completed

The Board's proposed "paradigm" shift in merger policy review is premised on the unprecedented and unsupported presumption that the rationalization of the nation's rail system

and the elimination of excess capacity have been completed. Specifically, the Board cites substantial reductions in excess capacity and improvements in efficiency that have resulted from the prior rail mergers that rationalized the nation's rail system, and then concludes that "this process has now largely been completed, and [] the efficiencies and service improvements to be realized from further downsizing of rail route systems are limited." Comments to Proposed § 1180.1(a), Notice of Proposed Rulemaking (NPR) at 11.

To my knowledge, no agency has ever announced a merger policy that presumes that future mergers are unlikely to improve the performance of a market. The STB reasons that, since prior mergers yielded large efficiency gains, future mergers are unlikely to produce significant further improvements. That is a classic non sequitur. The STB provides no support for its belief, and it is hard to imagine how any agency could support such a belief. It is highly unlikely that any market in history has been characterized by optimal structural efficiency. If any market ever reached that state of structural euphoria, that state would exist only for a very short time. The U.S. economy is extraordinarily dynamic. Firms in every market must engage in a continuous process of reevaluating their structure to determine whether it continues to allow them to participate in constantly changing markets in an efficient manner.

The Presumption of Anticompetitive Effects

The Board has also proposed to adopt a presumption that any proposed merger of Class I railroads would have anticompetitive effects. Thus, the Board says that "[a]ny railroad combination entails a risk that the merged carrier will acquire and exploit increased market power." Proposed § 1180.1(c)(2)(i), NPR at 15. In another place, the Board says that it "expects that any merger of Class I carriers will create some anticompetitive effects . . . ." Proposed § 1180.1(d), NPR at 16. That presumption seems to drive many of the other elements of the

Board's proposed policy. Thus, for instance, because mergers would have anticompetitive effects, the Board says that it "does not favor consolidations . . . unless there are substantial and demonstrable public benefits to the transaction that cannot otherwise be achieved." Comments to Proposed § 1180.1(a), NPR at 11.

A presumption that an entire class of potential mergers will have anticompetitive effects is again unprecedented and unsupportable. There are over 120 merger policies currently in effect around the world. To the best of my knowledge, none of those policies includes a presumption that an entire class of mergers will have anticompetitive effects. The Board has provided no support for this presumption.

Some proposed mergers pose significant risks that they will impair the performance of one or more markets. Others do not. The only way to distinguish among them is to apply standard tools of economic analysis to each market that is potentially affected by a specific proposed merger. The Board can fulfill its responsibilities in the merger review process only by identifying each product and geographic market that is potentially affected by a proposed merger and evaluating the potential effects of the merger on the performance of each of those markets.

Presumption of Significant Service Disruptions

The Board discusses at length its concerns about potential service disruptions during the period following a merger. It then adopts a presumption that rail mergers will necessarily create substantial service disruptions. It says: "Our recent experience has shown that, even with substantial advance planning, implementing large rail mergers may cause substantial service disruptions that delay or outweigh expected efficiency gains that should flow to the public. Under our proposed rule, these potential harms would be included in our balancing test." Comments to Proposed § 1180.1(c), NPR at 13.

However, only some of the most recent consolidations produced those unfortunate results. Two cases are not sufficient to support a sweeping generalization, particularly when those two cases involved unusual factors and when there are numerous cases in which mergers did not yield serious service disruptions. There is no justification for a presumption that rail mergers will cause substantial service disruptions, particularly when the Board also is proposing that merger applicants address their transitional plans with a new level of detail and that a heightened regime of post-merger monitoring of service be implemented.

Moreover, merger applicants will have every incentive to minimize service disruptions in the future. Markets punish firms severely for service disruptions. The financial performance of UP during the period in which it experienced severe service problems illustrates the point. During its service crisis, UP's quarterly earnings per share dropped from $0.96 in September 1997 to a low of a loss of $1.70 per share in June, 1998. UP's earnings did not recover until the second half of 1999. UP was hit with several lawsuits, and the STB imposed emergency service orders on UP during the depths of its crisis. UP's experience serves as an effective object lesson to other firms that might otherwise be tempted to try to implement a merger with inadequate planning.

Because the Board believes that the risk of service disruptions is serious enough to warrant consideration in merger review proceedings, it clearly can require applicants to submit their plans to avoid those problems for the Board's review, as the Board has proposed. (I understand that BNSF supports this requirement.) However, the Board should then limit its consideration of the proposed plan to avoid service disruptions to a simple yes or no determination with respect to the adequacy of the plan. It should not attempt to assign a value to the risk of service disruptions that must then be offset with unrelated enhancements. That is the

antithesis of the "transparent" and "narrowly tailored" consideration of noncompetition factors recommended by the Attorney General's Advisory Committee.

Mandatory "Enhanced Competition" Conditions

The Board proposes "to require applicants to incorporate proposals for enhanced competition . . . ." Comments to Proposed § 1180.1(c), NPR at 13. The Board refers to an "equal access" rule as an example of such a mandatory proposal. It also says that inclusion of such a proposal is "likely to be extremely important to us in determining whether to approve a particular application." Id. at 14. This is a bad idea for at least four reasons.

First, if the Board is convinced that some major change in its regulatory policy, like an equal access requirement, would yield significant public benefits, the efficacy of that policy change will depend primarily on its scope. It would make little sense, and do little good, to impose it selectively on railroads that propose to merge. Instead, the agency should consider whether to apply the new approach to all railroads.

Second, adopting a policy of approving mergers only if the applicants agree to adopt a major change in their methods of operation that they consider highly undesirable is much more likely to discourage railroads from proposing socially beneficial mergers than to produce a legal regime in which many railroads agree to the change as a condition of approval of a merger.

Third, the policy would require the Board to determine what level of enhancements are necessary to offset possible harms and then allocate those enhancements to shippers who are not, by definition, directly affected by the potential harm. The unfairness inherent in providing benefits to one class of shippers, rather than another, is a key reason why remedies should be designed to offset specified harms to specific groups.

Fourth, and most important, no agency should consider adopting a major change in its regulatory policy, like an equal access rule, without considering carefully and in detail all of the implications and effects of adopting the new policy. That cannot be done as an add-on to a merger review proceeding. It requires instead a separate rulemaking in which the agency addresses with care the scores of important issues that are raised by such a proposed policy change.

Requiring only one participant in a market to allow its competitors to use its assets is a radical step. In the vast majority of circumstances, this would be a terrible idea, whether or not open access or similar regimes would be beneficial if implemented on a broad basis.

Mandatory Post-Merger Oversight

The Board proposes to establish an elaborate "formal oversight process" applicable to all mergers. Proposed § 1180.1(g), NPR at 19; see also Proposed § 1180.1(i), NPR at 20. Because the Board's review extends beyond the efficacy of any competition-related merger conditions and merger-related service problems to include unforeseen circumstances, subsequent mergers, and conditions related to the achievement of all projected benefits exactly when projected, this proposal would undercut the transparency and finality that is required in merger proceedings. Indeed, unless the scope of post-merger review is properly limited to the efficacy of the competitive remedies adopted in the merger and the identification and resolution of merger-related service problems, I cannot imagine any firm that would be willing to propose a merger that would be subject to such an extraordinary, open-ended post-merger oversight process and subject to the risk of after-the-fact imposition of new, impossible-to-predict conditions.

The Board's proposal would vastly expand the scope of post-merger review beyond that undertaken by other agencies. Agencies sometimes approve mergers subject to mitigation

conditions, e.g., divest fifty percent of your retail gasoline outlets in Los Angeles. Agencies act in that manner when they conclude that a proposed merger would have unacceptable effects on the performance of a market in the absence of the mitigation condition. When an agency approves a merger subject to a mitigation condition, it retains the power to enforce the condition, or even to dissolve the merger, if the merged firm fails to comply with the condition. All merger applicants understand and accept the need for an agency to retain that power. The applicants know what the mitigation conditions on approval are before they merge. If they conclude that the conditions are unacceptable, they simply decline to merge. I have never heard of any agency attempting to retain an open-ended power to impose new conditions on a previously approved and completed merger based on the agency's determination that the merger has not produced exactly the results that the applicants expected or that the agency later prefers.

First, as I noted earlier, under the proper scope of review in today's economy, the Board should not require submission of evidence that a merger will produce benefits unless it concludes that the merger poses a significant risk of adversely affecting the performance of a market and that risk cannot be effectively mitigated. However, I understand that this is an accepted practice in the rail industry, even without the expansion the Board is currently providing. Nonetheless, an agency certainly should not attempt to engage in post-merger oversight to ensure that the merger produced precisely the benefits the applicants projected.

Second, it would be extremely difficult to determine whether any "shortfall" in benefits is a result of the problems relating to the merger. The performance of any firm depends on a myriad variables, many of which are beyond the firm's control. If a merged firm's performance falls short of its expectations and those of the Board, the Board would have to determine the extent to which its performance is attributable to the merger versus the extent to which it is

attributable to any number of other potential sources, e.g., an economic downturn, the responses of competitors, an increase in fuel or labor costs, or a tightening of capital markets.

Third, no transaction ever goes exactly as planned or as the parties anticipated that it would. That basic truth certainly applies to all mergers. I doubt that any merger in history has produced exactly the results the firm expected. The results of a merger depend on how it interacts with numerous other factors, including changes in market conditions, responses of competitors, and changes in general economic conditions. Sometimes a merger produces benefits that differ significantly from the firm's expectations. Thus, for instance, a firm might project large savings in labor costs, but unexpected increases in demand for the firm's services might persuade it to retain its original workforce and to reassign many of its employees in ways that permit it to meet the increased demand efficiently and effectively. Would the Board consider that a failure to fulfill the firm's benefit projections? Would it order the firm to fire enough employees to fulfill its original projected labor cost savings? Some mergers produce disappointing results – results that fall well short of the firm's expectations. Agencies do not approve mergers because they expect all mergers to be successful. Such an expectation would be absurd. It is contradicted by history. Some mergers yield spectacular results; some yield terrible results. Agencies approve mergers that do not have anticompetitive effects because they know that many will yield good results and because they know that the firms that propose to merge are in a much better position than any agency to predict the results of the merger.

Fourth, and most important, unless the scope of post-merger is properly limited, I cannot imagine any firm that would be willing to merge, or even to consider a merger, under conditions in which an agency can impose unknown and unknowable conditions on the merged firm years after the merger is approved and implemented.

Requirement to Anticipate and to Analyze Responses of Competitors

The proposed policy would require merger applicants to predict the responses of their competitors, including any mergers their competitors might propose in an effort to remain competitive with the merged firm, and to evaluate the effects of those potential responses. The Board would then hold the applicants responsible for the effects of their competitors' responses by denying the application if the Board concludes that the competitors' responses would have unacceptable effects.

The Board should not adopt this policy. First, it is extremely difficult for a firm to predict the actions of its competitors with any degree of confidence and accuracy. Of course, firms attempt to do this all of the time, but they can never do better than to predict a relatively wide range of potential responses. Second, any firm is understandably reluctant to disclose to its competitors its evaluation of the likely effects of the range of actions it believes that its competitors might take. No agency should compel any firm to disclose that information. Markets do not perform well when competitors are required to share with each other their predictions and evaluations of their competitors' potential actions. Third, this requirement will force applicants to speculate and will make merger proceedings unmanageable. That is why the STB wisely refrained from imposing such a requirement in the past. Those reasons remain valid and persuasive today. Fourth, this requirement would provide competitors of merger applicants an ideal vehicle to abuse the merger review process by blocking a socially beneficial merger. The competitor would need only to allege that it would respond to the merger by proposing a patently outrageous merger in order to block approval of the proposed merger. Fifth, it makes no sense to disapprove an otherwise socially beneficial merger because it might induce a competitor to

propose a socially destructive merger. If that happens, the Board should simply disapprove the second proposed merger.

CONCLUSION

The Board should not adopt those proposed changes in its merger policy that would expand the scope of its merger review or create new presumptions against mergers. Such changes would return the Board to a central planning role, threaten the transparency and predictability of Board review, and result in a mismatch of actual harms and actual remedies. The Board should maintain the approach that is clearly reflected in the 4R Act and the Staggers Act and that has produced excellent results in so many other markets. It should rely primarily on market forces to produce good results, and it should rely on regulation only in those few contexts in which market forces alone are unlikely to produce good results.

Therefore, any final rules adopted by the Board should: (i) eliminate the presumption that rail mergers will no longer produce public benefits; (ii) eliminate the presumptions that future rail mergers will cause competitive and service harms; and (iii) eliminate the requirement that merger applicants propose "competitive enhancements" to offset these presumed harms. Final rules also should not require applicants to "guarantee" the projected benefits of mergers or to forecast the responsive actions of their competitors. The Board's rule also should limit the scope of post-merger review to the efficacy of competition conditions adopted as part of the merger and the temporary remedy of merger-related service problems. Most importantly, any final merger rules should contain an expedited schedule and provide railroads and interested parties with transparency and finality in Board actions.

RICHARD J. PIERCE, JR.
122 Madison Place
Alexandria, Virginia 22314

Birthdate: July 15, 1943
Married: Jill Birdwhistell Pierce
Children: Gabriel, 1974; Danielle, 1976

PRESENT POSITION: Lyle T. Alverson Research Professor of Law
George Washington University Law School
720 20th Street, N.W.
Washington, D.C. 20052
(202) 994-1549

COURSES:

Administrative Law, Antitrust Law, Regulated Industries, Energy Law, Oil and Gas Law, Energy Tax Policy, Evidence, Torts, Conflicts, Economic Analysis of Law

EMPLOYMENT:

June 1989 - June 1995 - Paul J. Kellner Professor of Law
Columbia University School of Law
435 West 116th Street
New York, NY 10027-7297

June 1986 - June 1989 - George W. Hutchison Professor of Energy Law
Southern Methodist University School of Law
Dallas, TX 75275

July 1984 - June 1986 - Dean and Professor of Law
University of Pittsburgh School of Law
3900 Forbes Avenue
Pittsburgh, PA 15260

July 1981 - June 1984 - W. R. Irby Professor of Law
and Director, Energy Law Program
Tulane University School of Law
New Orleans, LA 70118

August 1980 - June 1981 - Visiting Professor of Law
University of Virginia School of Law
Charlottesville, VA 22901

August 1977 - August 1981 - Professor of Law
University of Kansas School of Law
Lawrence, KS 66045
(Associate Professor until June 1980)

June 1972 - August 1977 - Sutherland, Asbill & Brennan
1666 K Street, N. W.
Washington, D. C. 20006

May 1969 to Sept. 1969- Instructor, United States Coast Guard
Reserve Training Center
Yorktown, VA 23690

May 1968 to May 1969 - Assistant Chief, Aids to Navigation Branch
U.S. Coast Guard District Headquarters
1520 Market Street
St. Louis, MO 63103

June 1966 to May 1968 - Operations Officer
United States Coast Guard
Cutter Sedge
Cordova, AK 99501

February 1966 to June 1966 Officer Candidate School
United States Coast Guard
Reserve Training Center
Yorktown, VA 23960

June 1965 to February 1966 Financial Management Trainee
General Electric Company
Switchgear Department
6901 Elmwood Avenue
Philadelphia, PA 19142

EDUCATION:

September 1969 to June 1972 - University of Virginia School of Law
Charlottesville, VA 22901
J. D.: 1972
Managing Editor, Virginia Law Review
Order of the Coif
Michie Legal Writing Award
Student Assistant to Prof. Richard Merrill

September 1961 to June 1965 - Lehigh University
Bethlehem, PA 18017

COMPETITION IN THE RAILROAD INDUSTRY

REPLY COMMENTS OF BNSF RAILWAY COMPANY

BNSF Railway Company submits these reply comments pursuant to the Board's decisions served January 11 and February 4, 2011, in this proceeding. Attached in support of these comments is the verified statement of John P. Lanigan, Executive Vice President and Chief Marketing Officer for BNSF.

INTRODUCTION

Since the Staggers Rail Act of 1980, Pub. L. No. 96-448, 94 Stat. 1895 ("Staggers Act"), the railroad industry has made significant investment in infrastructure and equipment to the immense benefit of its customers and the nation at large. As implemented by the Interstate Commerce Commission ("ICC"), the market-based regulatory model mandated in the Staggers Act was so successful that Congress reinforced that mandate when it passed the mantle to the Surface Transportation Board ("STB") in the ICC Termination Act of 1995, Pub. L. No. 104-88, 109 Stat. 803 ("ICCTA"). In the post-Staggers era, the STB has adopted regulatory policies aimed at preserving a careful balance between reliance on market forces to establish reasonable rates and protecting shippers from abuse of market power.

Under the current regulatory regime, competitive access remedies are reserved for demonstrated abuses of market power. Commenting parties seeking more intrusive regulation

bear a heavy burden of showing why changes to the existing regime, which already provides ample recourse for shippers claiming abuse of market power through its existing rate reasonableness and competitive access mechanisms, are necessary and represent good public policy.

The commenters in this proceeding arguing for more access regulation have not met that heavy burden. Most of their arguments simply reprise claims that have been made to the ICC, the STB, and the courts for over two decades. Somewhat distinctively here, many of the commenters rely on unsupported claims of "duopoly power" arising from rail mergers, "parallel pricing," and railroads awash in excess profits.[1] These claims, however, are equally unavailing. The rail mergers of the 1990s made the industry *more* competitive, not less. The efficiency and productivity of the industry produced both lower prices and better service. As Mr. Lanigan explains in his verified statement, BNSF competes daily with other railroads, trucking companies, and barge companies by providing competitive, high-value service. The real focus of most of the shipper commenters appears to be the *level* of the rates they are charged for this service—as they have been for most of the three decades since the passage of the Staggers Act. They point to recent rate increases and urge the Board to adopt changes under the rubric of access as a means of obtaining lower rail rates than what the Board's existing rate regulation would prescribe. In fact, as described herein, after falling steadily for over two decades, rail prices began to increase in the mid-2000s because demand and costs increased, not because of a

[1] *See, e.g.,* Comments of Concerned Captive Coal Shippers ("CCCS Comments"); Comments of The Fertilizer Institute ("TFI Comments"); Comments Submitted by Olin Corporation ("Olin Comments"); Comments of Omaha Public Power District, Et Al. ("OPPD Comments"); Comments of Western Coal Traffic League ("WCTL Comments"); Initial Comments of Arkansas Electric Cooperative Corporation ("AECC Comments"); Initial Comments of Westlake Chemical Corporation ("Westlake Comments"); Joint Comments of Alliance for Rail Competition, Et Al. ("Alliance Comments").

lack of competition between railroads. Rail prices are still far below their levels in 1980 in real terms, and the shipping public has benefited enormously from the reinvestment made possible by the industry's improved financial condition.

Further, the fact that railroads have become more profitable and better able to attract investment capital today does *not* mean that they have achieved the kind of sustained profitability that will enable them to replace their assets in the long run. Depriving railroads of revenues simply because they have more revenues and are closer to a self-sustaining financial *future* is the surest way of preventing that future from being reached.

In sum, calls for reopening mergers and imposing new regulatory requirements that would siphon revenues from efficient operations are misguided and contrary to the interests of the majority of BNSF's shippers. There is ample regulation in place to protect shippers against unreasonable rates, poor service, or other abuses. Comments filed in this proceeding have not shown why the STB should abandon its current, more balanced regulatory regime and adopt an uncertain radical new approach to access regulation.

I. THE ROLE OF ECONOMIC REGULATION OF RAILROADS

As the Board is well aware, the nation learned the hard way in the 1960s and 1970s that railroads operate in largely competitive markets and that regulation that attempted to mandate non-market-based pricing or operations would, over time, bankrupt the industry. A significant number of major railroads in the Northeast and Midwest in fact went bankrupt, and most others were in poor financial condition. *See* S. Rep. No. 609, 93rd Cong., 1st Sess. 5-13 (1973). Congress found that the crisis had been caused in substantial part by a pervasive, inflexible regulatory scheme administered by the ICC, which promoted equalized rates and "open routing" and hindered the efforts of individual railroads to achieve greater efficiency and compete

successfully with other transportation modes. *See, e.g.*, S. Rep. No. 499, 94th Cong., 1st Sess. 10-11 (1975) ("[T]he present regulatory system has sapped the ability of railroads to respond, compete, innovate, and develop their full service capacity."); H.R. Rep. No. 1430, 96th Cong., 2nd Sess. 111 (1980). *See generally* T. Keeler, *Railroads, Freight and Public Policy*, 24-32 (1980).

Congress made the first effort to free up the regulatory stranglehold on the industry in the Railroad Revitalization and Regulatory Reform Act of 1976, Pub. L. No. 94-210, 90 Stat. 31 ("4R Act"), but the ICC was slow to react to the imperative for reduced regulation. Frustrated with the ICC's lack of progress and the continuing financial crisis in the rail industry, Congress four years later enacted the Staggers Act, which mandated much more extensive deregulation of the industry. This time the ICC responded appropriately to Congress's mandate. The ICC in the ensuing years adopted and implemented rules and exemptions that generally adhered to the principle that the markets for rail service would be allowed to operate freely, and regulation would be applied only in situations where it was proven necessary to protect a shipper against a demonstrated abuse of market power.[2]

---

[2] *See, e.g., Western Railroads Agreement*, 364 I.C.C. 635 (1981) (rejecting prior regime of "equalized rates" and "open routing"); *Rulemaking Concerning Traffic Protective Conditions in Railroad Consolidation Proceedings*, 366 I.C.C. 112 (1982) (same), *rev'd on other grounds sub nom. Detroit, Toledo & Ironton Ry. v. ICC*, 725 F.2d 47 (1984); *Standards for Intramodal Rail Competition*, STB Ex Parte No. 445 (served July 7, 1983) (encouraging independent rate and route actions, and reserving regulatory intervention for anticompetitive conduct); *Coal Rate Guidelines—Nationwide*, 1 I.C.C.2d 520 (1985) (adopting rate reasonableness standards recognizing the necessity for market-based, differential pricing), *aff'd sub nom. Consolidated Rail Corp. v. United States*, 812 F.2d 1444 (3d Cir. 1987); *Exemption from Regulation—Boxcar Traffic*, 367 I.C.C. 424 (1983) (exempting traffic from regulation where abuse of market power unlikely), *aff'd in relevant part sub nom. Brae Corp v. ICC*, 740 F.2d 1023 (D.C. Cir. 1984); *Intramodal Rail Competition*, 1 I.C.C.2d 822 (1985) (adopting rules for addressing allegations of anticompetitive conduct in individual cases) (served Oct. 31, 1985), *aff'd sub nom. Baltimore Gas & Electric v. United States*, 817 F.2d 108 (D.C. Cir. 1987); *Midtec Paper Corp. v. Chicago & North Western Transp. Co.*, 3 I.C.C.2d 171 (1986) (restricting application of competitive access rules to situations where anticompetitive abuse occurs), *aff'd sub nom. Midtec Paper Corp. v. United States*, 857 F.2d 1487 (D.C. Cir. 1988).

So successful was that approach that when Congress passed ICCTA in 1995, it reduced regulation still further, and reinforced the mandate that, "to the maximum extent permissible by law," regulation should be applied only to protect against market abuse. *See* 49 U.S.C. § 10502(a); H.R. Rep. No. 104-311, 104th Cong., 1st Sess. 91 (1995), at 96. Consistent with that statutory mandate, the STB adhered to the market-based regulatory policy of the Staggers Act and ICCTA and declined invitations to impose blanket "interchange," "bottleneck," or "access" regulation. *See Central Power & Light Co. v. Southern Pac. Transp. Co.*, 1 S.T.B. 1059 (1996), 2 S.T.B. 235 (1997), *aff'd sub nom. MidAmerican Energy Co. v. STB*, 169 F.3d 1099 (8th Cir. 1999).

The results demonstrate the wisdom of that adherence to the principles of the 4R and Staggers Acts. A freight rail industry that was almost moribund in the late 1970s slowly crept back to life. Freed to set demand-based rates, railroads reacted by pricing their services to meet the requirements of the individual markets in which they operated. They withdrew from rate bureaus and began independently pricing their portions of through movements as well as their single-line rates. Market-based prices encouraged market-based investment, and investment capital began to return to the industry. With the demise of the old "open routing" regulatory regime, railroads had greater assurance that their investments in efficient routes and facilities would be rewarded, and they were able to build greater density on their main lines and justify upgrades to key yards. As Congress concluded in passing the ICCTA, the deregulatory approach of the Staggers Act "produced a renaissance in the railroad industry." H.R. Rep. No. 104-311, at 91.

Many Class I railroads combined, largely end-to-end, to enhance their ability to provide single-line service over major routes and consolidate facilities. At the same time, the number of

regional and shortline railroads dramatically increased as they took advantage of their lower cost structures to maintain and grow local gathering networks.[3] The productivity of the industry surged, and much of that productivity was passed on to shippers in the form of lower rates. Lanigan VS at 5, 10. Today, rail rates across the country are significantly lower in real terms than they were when the Staggers Act was passed. *Id.* at 10 And the railroads are on much firmer financial footing. None of the Class I railroads has achieved long-term revenue adequacy, but they have made substantial progress toward that vital financial and statutory goal. *See Railroad Revenue Adequacy—2009 Determination,* STB Docket No. EP 552 (Sub-No. 14) (served Nov. 10, 2010).

In the face of this clear validation of the deregulatory mandate of the Staggers Act and ICCTA—and clear vindication of the ICC's and STB's implementation of that mandate—some of the shipper interests in this proceeding claim that they do not seek to have the Board impose more regulation on the railroads, but only to impose more "competition." *See, e.g.,* Alliance Comments at 4-5. However, the Board's imposition of routing or rate requirements on railroads, however denominated, is the very definition of regulation. Such regulation can be justified in situations where a railroad has demonstrably abused its market power—as the STB's rules currently provide (*see* 49 C.F.R. Part 1144)—but the shipper interests seeking more "competitive access" do not want to restrict it to abusive situations. Even where traffic is moving efficiently, they want the STB to micro-manage the railroads' routes and rates, harkening back to the kind of "open routing" philosophy that helped bring the industry to its knees before the modern era of

[3] A study of rail competition undertaken by Christensen Associates at the STB's request concluded that the total number of railroads in the country increased from around 490 in the mid-1980s to 559 in 2009. Laurits R. Christensen Assoc., Inc., *A Study of Competition in the U.S. Freight Railroad Industry and Analysis of Proposals That Might Enhance Competition: Revised Final Report* (2009) ("*Christensen Report*"), at ES-8.

rail deregulation. *See, e.g., Western Railroads—Agreement*, 364 I.C.C. at 648-49 (holding that independent, market-based rate and route decisions would promote "a sound, economic, and efficient rail system" and that "[t]he elimination of costly, circuitous and inefficient routes will benefit the industry as well as its customers.")

Some of the commenters claim that they do not want to return to an "open routing" regime, but only to have the STB intervene when a railroad's rates exceed certain R/VC ratios. *See, e.g.,* CCCS Comments at 75-82. They do not claim that rates set at those R/VC ratios are unreasonably high, or demonstrate that the traffic is moving inefficiently, or that the shipper is otherwise receiving poor service. For all intents and purposes, therefore, they want to use access remedies to curtail differential pricing. As the Board well knows, however, demand-based differential pricing is the cornerstone of the railroads' ability to cover their fixed and common costs. *See, e.g., Coal Rate Guidelines—Nationwide*, 1 I.C.C.2d at 526-27 (explaining that "the cost structure of the railroad industry necessitates differential pricing of rail services" and endorsing market-based pricing). If a shipper believes that it is being charged an unreasonably high rate for the through service it receives, then its remedy lies in the Board's rate reasonableness standards. If it is receiving efficient service at a reasonable rate, however, it should not be permitted to use "access" regulation as a back-door method to undermine the railroad's rates.

A few commenters make a frontal assault on the STB's market dominance and rate reasonableness rules. They claim that the railroads have "duopolies" in the West and East that make access remedies of questionable utility. *See, e.g.,* WCTL Comments at 23-30. Some even suggest that the STB should reopen the Class I rail mergers of the 1990s to impose unarticulated regulatory conditions. *See, e.g.,* Olin Comments at 18-22. They also claim that the industry is

currently awash in excess profits that the STB should curtail. *See, e.g.,* AECC Comments at 4. While these claims are far afield from the access issues framed by the STB in this proceeding, we address these attacks on the structure and financial progress of the industry in the remainder of these reply comments and in the attached verified statement of Mr. Lanigan.

II. THE STRUCTURE OF THE RAIL INDUSTRY

Contrary to the suggestion of some shipper interests, there are considerably more railroads operating in the United States today than at the time the Staggers Act was passed. While there are fewer Class I railroads, there are many more regional and shortline railroads, and together they provide much more competitive service than was possible under the old structure. Among the regulatory reforms that Congress mandated in the Staggers Act were provisions that encouraged rail mergers, so that Class I railroads could capitalize on economies of scale and single-line service on major routes, as well as consolidate redundant facilities. Staggers Act, Section 228 (amending 49 U.S.C. §§ 11344 and 11345). At the same time, Congress made it easier for Class I railroads to spin off rail lines to regional and shortline carriers with lower costs and a local focus that helped retain and grow traffic on lower density lines. The resulting restructuring of the rail industry was one of the key drivers of the post-Staggers productivity improvements that benefited the shipping public as well as the rail industry. Lanigan VS at 4-5.

Some of the shipper commenters, however, suggest that the rail mergers of the 1990s created "duopolies" that have facilitated deleterious "parallel pricing" or "conscious parallelism" by the railroads, and they suggest that new regulatory requirements are necessary to ameliorate this allegedly anticompetitive state of affairs. *See* Olin Comments at 18-19. Arguments for the post hoc imposition of blanket merger conditions are far beyond the scope of this proceeding, and are unfounded from both a legal and practical perspective. There is no precedent for the

long reach back that the shippers seek and no way that retroactive conditions could be imposed without disrupting the settled interests and expectations of numerous parties and unraveling scores of existing commercial relationships for shippers and railroads alike.

In any event, the suggestion that shippers have suffered increased rates as a result of Class I rail mergers in the 1990s is wrong. First, the idea that those mergers increased the railroads' market power rests on a misperception about rail markets. "Captive" shippers generally do not become more captive when two railroads combine end-to-end, and most of the mergers in the 1990s were end-to-end. As the STB found in approving those mergers, the suggestion that "captive" shippers require special regulatory protections simply because two railroads have combined end-to-end to become one railroad is incorrect. *See, e.g., Burlington Northern, Et Al.—Merger—Santa Fe Pacific, Et Al.*, 10 I.C.C.2d 661, 725 (1995). In the instances where a non-captive shipper became captive as a result of a merger, the STB imposed conditions to remedy that effect; but the STB properly avoided any unnecessary additional regulation. *See, e.g., id.* at 761-62. The result, as the STB predicted, was *enhanced* competition from the merged railroads.

The 1995 merger of the Burlington Northern Railroad ("BN") and The Atchison, Topeka and Santa Fe Railway Company ("ATSF") exemplifies this phenomenon. The ability of the combined railroads to provide more efficient single-line service, to internally reroute traffic to achieve greater traffic densities, to combine their car and locomotive fleets for greater efficiencies, to reduce their overhead costs, and to avoid duplicative capital expenditures benefited both the railroads and their customers. Lanigan VS at 2-5. BNSF expanded the overall volume of service the two railroads had provided while dramatically improving the efficiency of its operations and its service quality. *Id.* It managed to pour billions of dollars into plant and

equipment to sustain and enhance its system while significantly improving its financial condition. *Id.* at 6.

WCTL focuses on coal traffic from the Powder River Basin ("PRB") as indicative of the alleged deleterious effects of the Class I rail mergers of the 1990s. *See* WCTL Comments, Richards VS at 7-19. But in fact the PRB provides a good example of how the mergers of the 1990s *enhanced* rather than diminished competition. BN and the Chicago and Northwestern Transportation Company ("CNW") were the original railroads serving the PRB. When Union Pacific Railroad ("UP") acquired CNW, it did not diminish competition in the PRB, but in fact enhanced competition by replacing CNW with a railroad that had much greater financial resources and the largest rail network in the country. BN's merger with ATSF further enhanced competition for PRB traffic by extending BNSF's single-line reach and enabling it to consolidate facilities for greater efficiency. Lanigan VS at 4. Furthermore, conditions were imposed in the BN/ATSF and UP/SP mergers that ameliorated any shipper captivity that resulted from those mergers. Thus, the suggestion that competition for PRB traffic was diminished by the BN/ATSF or the UP/CNW and UP/SP mergers is simply groundless.

Yet WCTL argues that the fact the rail prices began to increase around 2004, after they had steadily declined for over two decades, shows that the railroads have "duopoly power" as a result of the mergers that should be remedied by the Board. *See* WCTL Comments, Richards VS at 16-19. This argument, which is echoed by non-PRB shipper interests as well, is without merit. *See, e.g.,* Alliance Comments at 15-16. When rates generally increase across all traffic categories, the explanation lies not in unsubstantiated conspiracy theories but in the simple fact, as the STB's own Christensen study found, that costs began to increase in 2004, which alone can account for much of the rates increases to date. Christensen Report, at ES-5, ES-16; *see also*

Laurits R. Christensen Assoc., Inc, *An Update to the Study of Competition in the U.S. Freight Railroad Industry: Final Report* (2010) ("*Christensen Update*"), at i (railroads' "marginal cost has been increasing at a faster average annual rate than railroad revenue per ton-mile"). At the same time, after years of enormous productivity growth, the industry's ability to wring more cost savings from consolidation and technology began to slow, and the railroads began to pour even more money into maintaining and enhancing their capacity to meet the demand for their services. Lanigan VS at 9-11.

Moreover, demand for rail service surged across most traffic categories as the nation's economy expanded in the mid-2000s and railroads priced their services accordingly. *Id.* The increase in their profitability finally began to put the railroads on the kind of sound financial footing that Congress envisioned in the Staggers Act, but the railroads still did not earn, and have not earned, sustained revenues sufficient in the long run to replace the assets required to meet shipper demand. Rates in real terms still remain below their level when the Staggers Act was passed. *Id.* at 10. In short, shipper complaints about abuse of market power arising from rate increases in the 2000s are not supported by the facts.

WCTL opines that rate increases on PRB coal traffic are attributable to BNSF's and UP's issuance of published tariffs applicable to that traffic in 2003 and 2004. WCTL Comments, Richards VS at 13-15. There are several reasons why this argument is wrong. As described above, increases in rates on PRB coal traffic coincided with increases in rates on all traffic nationwide in the same time period as a result of increased costs and market demand. BNSF certainly does not agree that the issuance of published tariffs is suspect. A great deal of traffic in the rail industry moves under published tariffs—tariffs covering the movement of agricultural products are a good example—and many shippers prefer them. But the question is moot with

respect to PRB coal movements, because those published tariffs have not supplanted confidential contracts, which have been and continue to be the dominant mode of pricing those movements. Lanigan VS at 12. Not only does WCTL concede this, but WCTL also complains about the confidentiality of those contracts. WCTL Comments, Richards VS at 15, 18. Finally, as Mr. Lanigan states in his verified statement, assertions that BNSF and UP do not compete for the business of coal shippers, or non-coal shippers, are without any factual basis. BNSF competes hard with UP for shippers' business, and both loses and gains traffic, including coal traffic, in the process. *Id.* at 12-13.

The bottom line is that the restructuring of the rail industry after passage of the Staggers Act, including the mergers of the 1990s, enhanced competition in the rail industry. Rates went down while service improved and reinvestment in the industry grew. The fact that rates went up as demand and costs increased in the 2000s, after decades of rate reductions, reflects exactly the kind of price adjustment that occurs in every competitive industry where demand and costs fluctuate. And the fact that railroads' financial situation continued to improve reflects exactly the progress toward revenue adequacy that Congress, the ICC, and the STB intended.

III. THE FINANCIAL CONDITION OF THE RAIL INDUSTRY

Many of the shipper interests commenting in this proceeding assert that the railroad industry is highly profitable and, accordingly, railroads can afford to have revenues siphoned off to some shippers by various forms of new access regulation. *See, e.g.,* Alliance Comments at 16. Of course, these shippers do not demonstrate that their proposals for new access regulation are necessary to address abuses of market power at particular locations. Instead, they suggest that the STB need not concern itself with the railroads' loss of revenue under new access regulation,

because a number of different indicators of railroad profitability show that the industry is earning supra-competitive returns. *See, e.g.,* WCTL Comments at 31-35.

With respect to BNSF, several shipper commenters point to an observation by Warren Buffett that its investment in BNSF had yielded good returns. *See, e.g.,* Alliance Comments at 19-20. But none of these commenters show that any railroad, including BNSF, has reached a sustained level of earnings that will permit it to replace its productive assets in the long term. All of the measures of profitability and financial health cited by these commenters are measure of *short-term* financial strength. Whether BNSF or any other railroad has attained a level of earnings sufficient to meet demand and replace its system in the long run depends on a *long-term* measure of revenue adequacy. BNSF will be required to make many billions of dollars in capital investment in the future to have the capacity to meet shipper demand. Lanigan VS at 6, 13. Whether that investment will make economic sense for BNSF depends on whether, over the long term, the potential return outweighs the risks—including the risk from changes in regulatory policy. *Id.* at 13-14.

None of the shipper commenters attempts an economic demonstration that the various financial ratios they propose are suitable measures of long-term revenue adequacy in the rail industry. The STB need only refer to the ICC's own extensive deliberations on the subject to refute the idea that the kinds of financial ratios proposed by these commenters are good indicators of revenue adequacy. Prior to passage of the Staggers Act, the ICC experimented with a variety of different indicators of financial health—including return on shareholders' equity, fixed charge coverage ratios, proportion of debt in the capital structure, ratio of market value of common stock to book value, "funds flow" analyses, operating ratios, and throw-off-to-debt ratios. *See, e.g., Standards and Procedures for the Establishment of Adequate Railroad Revenue*

Levels (Ex Parte No. 338), 358 I.C.C. 844 (1978); *Adequacy of Railroad Revenue—1978 Determination (Ex Parte No. 352),* 362 I.C.C. 199 (1979). The ICC found, among other things, that even the Pittsburgh and Lake Erie Railroad, which subsequently filed for bankruptcy, could be deemed revenue adequate because it had a low operating ratio, a low debt ratio, and a sizable investment program. 362 I.C.C. at 327-28.

After the Staggers Act was passed, the ICC revisited its standards for revenue adequacy and determined that the financial ratios and "funds flow" approaches it had briefly sanctioned "were and are appropriate as indicators only of the short-term viability of railroads." *Standards for Railroad Revenue Adequacy (Ex Parte No. 393)*, 364 I.C.C. 803, 808 (1981). The ICC explained further:

> If we adopted the Ex Parte No. 353 minimum or short-term standard for use here, we would likely in the next few years find ourselves denying a railroad the pricing flexibility necessary to obtain long-term revenue adequacy simply because that railroad was making some progress toward achieving that goal. In short, we would be assigning the railroads the Sisyphean task of working toward revenue adequacy, and every time it came close robbing it of the very means it had used to get there. We do not believe this is desirable nor do we believe it was intended by Congress. [*Id.*]

Accordingly, the STB adopted a rate of return on investment equal to the current cost of capital as the standard of revenue adequacy. As the ICC observed, "[s]uch a standard is widely agreed to be the minimum necessary to attract and maintain capital in the railroad, or any other, industry." *Id.* at 809. Furthermore, it is the only standard that meets the statutory definition of revenue adequacy at 49 U.S.C. § 10704(a)(2):

> The Board shall maintain and revise as necessary standards and procedures for establishing revenue levels for rail carriers providing transportation subject to its jurisdiction under this part that are adequate, under honest, economical, and efficient management, to cover total operating expenses, including depreciation and obsolescence, *plus a reasonable and economic*

> *profit or return (or both) on capital employed in the business.*
> [Emphasis added]

As noted earlier, the railroad industry was in poor financial condition when the Staggers Act was passed, and it has taken three decades for the industry to progress financially to the point where there is a realistic prospect of achieving revenue adequacy. The industry demonstrably has not reached that goal, even when measured by a single year, much less the Board's long-term standards. *See Railroad Revenue Adequacy—2009 Determination,* STB Docket No. EP 552 (Sub-No. 14) (served Nov. 10, 2010).

Finally, one shipper commenter, NRG Energy, Inc., claims that the STB should not only revise its methodology for calculating revenue adequacy but also change its use of generally accepted accounting principles ("GAAP") to value a railroad's assets after a merger or acquisition. NRG claims that where the purchase price of the assets exceeds their book value, including the "acquisition premium" in the railroad's rate base "distorts the true financial health of the railroad," and points to Berkshire's acquisition of BNSF as an example. NRG Comments at 2. Not only is this "acquisition premium" claim well outside the scope of this proceeding about competitive access, but it has been thoroughly litigated and repeatedly rejected by this agency and the courts.[4] NRG complains that the use of acquisition cost could "skew" the STB's revenue adequacy and variable cost calculations, but the STB has specifically addressed both issues and concluded the opposite. *See, e.g., Conrail,* 3 S.T.B. at 262-65. The STB stressed there that acquisition cost "represents by far the best evidence of the current market value of

[4] *See Major Railroad Consolidation Procedures,* STB Ex Parte No. 582 (Sub-No. 1), slip op. at 28, 2001 WL 648944, *18 (served June 11, 2001); *CSX Corp.—Control—Conrail, Inc.,* 3 S.T.B. 196, 262-65 (1998) ("*Conrail*"), *aff'd sub nom. Assoc. of Amer. RR's v. ICC,* 978 F.2d 737, 741-43 (D.C. Cir. 1992); *Railroad Revenue Adequacy—1988 Determination,* 6 I.C.C.2d 933, 935-42 (1990), *aff'd sub nom. Erie-Niagara Rail Steering Comm. v. STB,* 247 F.3d 437, 442-43 (2d Cir. 2001).

[railroad] properties." *Id.* at 265. Virtually every Class I railroad merger or acquisition that has taken place in the past two decades has involved an "acquisition premium," and in every instance the acquisition cost has been booked by the ICC and the STB using GAAP accounting. NRG has offered no reason why Berkshire's acquisition of BNSF should be an exception.

CONCLUSION

The Board should not permit this proceeding about access issues to be used to mount a collateral attack on the economic model underpinning our freight railroad industry. As discussed in BNSF's initial comments, there is ample regulation in place to protect shippers against unreasonable rates, poor service, or other abuses. None of the commenters proposing alternative access standards has demonstrated why legitimate shipper concerns cannot be met under the Board's existing regulatory rate or service frameworks. The kind of intrusive access regulation being promoted by a subset of shippers may give them short-term benefits, but it is not only the railroads that will suffer. The shipping community as a whole will also pay for the diminution in investment and operational inefficiency that would result. It has taken BNSF and its predecessors over three decades since the passage of the Staggers Act to optimize the combined railroad network, and altering the Board's access policies to move back toward an open routing regime would significantly jeopardize the efficiency of the network's operations. The deregulatory approach taken by Congress in the Staggers Act and ICCTA, and implemented by

the ICC and the STB, has been a demonstrable success and the Board should refrain from instituting radical new access regulation that jeopardizes these hard-won successes.

SURFACE TRANSPORTATION BOARD

EX PARTE NO. 705

COMPETITION IN THE RAILROAD INDUSTRY

VERIFIED STATEMENT OF
JOHN P. LANIGAN

My name is John P. Lanigan. I am Executive Vice President and Chief Marketing Officer for BNSF Railway Company. I have been in this position since 2003 and have responsibility for BNSF's sales, marketing, customer service, and economic development. I lead the activities of the four business groups within our Marketing Department: Agricultural Products, Coal, Consumer Products, and Industrial Products. Prior to joining BNSF, I spent over sixteen years with Schneider National, Inc., one of the largest truckload motor carriers in the United States.

I understand that the STB in this proceeding has sought comments regarding the possibility of altering its longstanding "access" doctrines. In addition to commenting on the existing access doctrines, several shipper interests have submitted comments in this proceeding claiming that new regulation is justified because, they assert, the intensity of competition among railroads, in particular western railroads, has diminished in recent years, largely as a result of Class I railroad mergers in the 1990s, including the merger of Burlington Northern Railroad ("BN") and The Atchison, Topeka and Santa Fe Railway ("ATSF") in 1995. I am submitting this statement to respond to those filings.

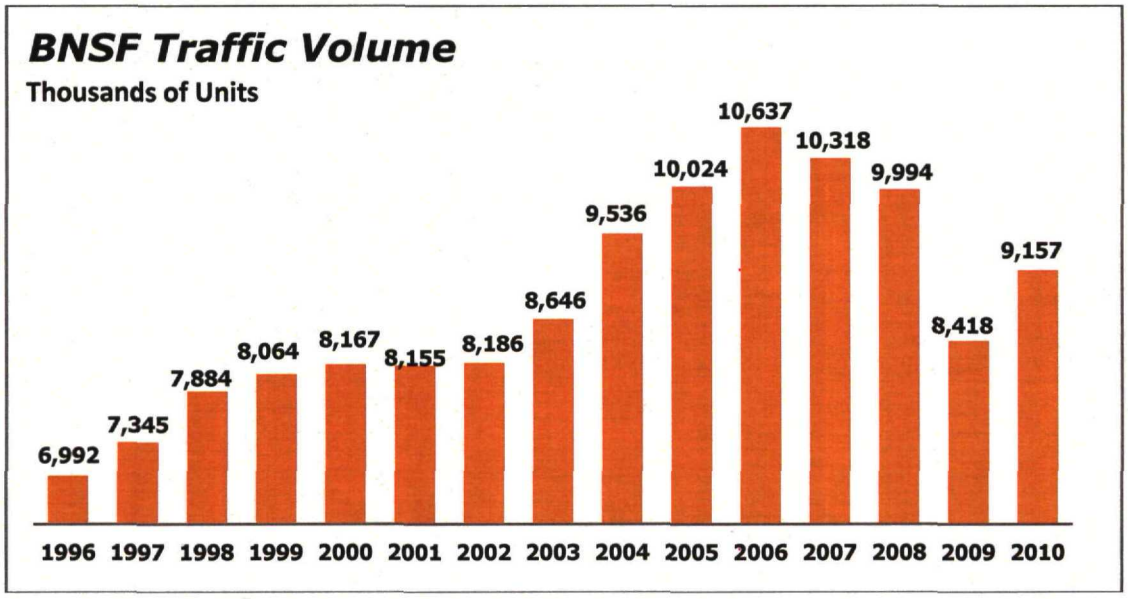
As I explain below, BNSF competes for traffic in every commodity group. We compete hard for business at BNSF, as we did at Schneider. At Schneider, we competed not only with other trucking companies, but with railroads as well. At BNSF, we compete with other railroads, trucking companies, and barge companies on a daily basis. Our goal is to provide our customers with competitive, high-value service that will cause them to choose BNSF over our rail competitors or other modes of freight transportation. Our corporate vision is to realize the tremendous potential of BNSF by providing transportation services that consistently meet our customers' expectations, and that vision extends to every customer, every day, in every customer circumstance.

The BN/ATSF merger contributed substantially to BNSF's competitive capacity and significantly improved BNSF's ability to compete in the marketplace for transportation services. Shippers have benefitted from the enhanced service BNSF has been able to provide, as well as the enormous investment BNSF has made improving our system. BNSF's continued ability and readiness to reinvest in our system and further expand our service offerings depends on the continued opportunity to earn a reasonable return.

In their filings, some shippers or shipper trade associations assert that the BN/ATSF merger led to a reduction in competition. Distilling all of the arguments to their core, these commenters point to recent rate increases for rail service as evidence. I strongly disagree with these assertions. Rate increases over the past eight years are not evidence of a reduction in competition among railroads flowing from the rail mergers of the 1990s. Coming out of the manufacturing-led recession of the early 2000s, consumer demand and housing starts soared to all-time record levels. This demand led to rapid growth in rail loadings, culminating in record rail demand in 2006. I know from extensive experience in the transportation industry that prices

often increase even where there is vigorous competition, particularly when demand exceeds capacity and costs increase. BNSF's rate increases in recent years resulted directly from cost increases and increases in demand for service on increasingly constrained rail capacity coupled with rising costs, not from the BN/ATSF merger or any subsequent reduction in the intensity with which BNSF competes for business.

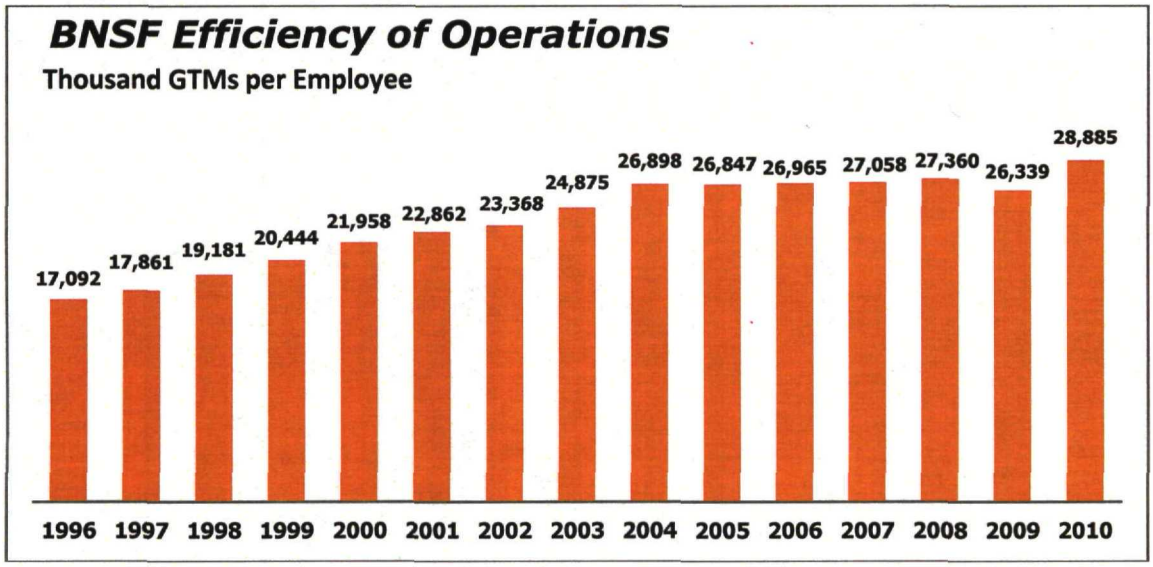
There can be no dispute that BNSF's costs have increased, particularly for our two largest expense categories, fuel and wages. For example, in 1996, the total cost of diesel fuel for BNSF was $727 million. In 2010, our cost of fuel had increased to $3,016 million. We have also seen increases in our personnel costs over that time. Similarly, there can be no dispute that volumes have increased on BNSF. In 1996 the railroad hauled 6,992 thousand units of freight; by 2006 that number had increased to 10,637 thousand, and even after the recent recession the number of units hauled in 2010 stood at 9,157 thousand units. Finally, since 1996 BNSF made $39 billion in capital investments in our network. All of these are costs and expenses that must be reflected in our rates.



I interact every day with our customers, and they are frank and open about their expectations of the railroad in terms of service and rate levels, and I believe that the negative filings before the STB in this proceeding represent a vocal but small minority of the almost ten thousand companies with which we do business. Rail rates are determined by market forces as the Staggers Act envisioned. The critical shippers appear to be complaining about the level of their rates. But the STB's existing rate reasonableness regime already provides shippers with several options for seeking appropriate rate relief. BNSF also has mechanisms outside the STB's procedures, like the Montana Alternative Dispute Resolution program for rate level challenges by Montana grain shippers as a supplement to the rate reasonableness challenge rights shippers

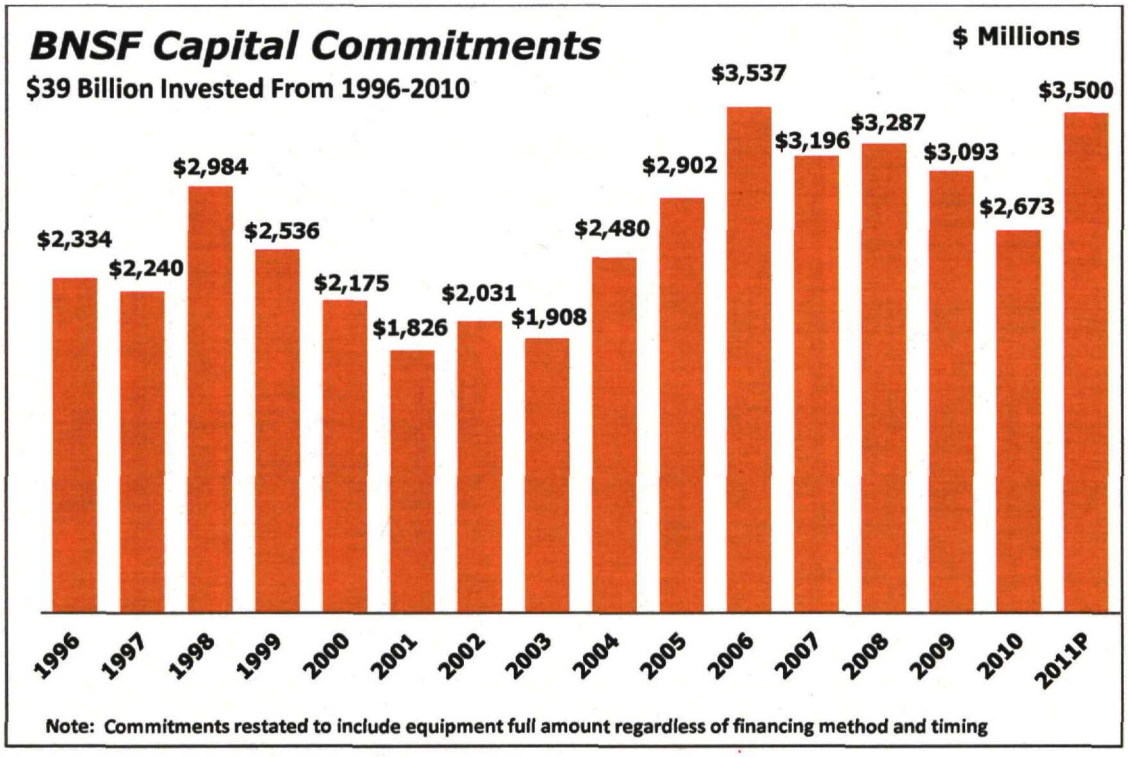
enjoy before the Board. The STB should refrain from imposing unnecessary new regulations that micro-manage railroads' operations, artificially depress rates, and jeopardize BNSF's ability to invest in our network to meet current and future transportation demand.

1. The Competitive Benefits of the BN/ATSF Merger.



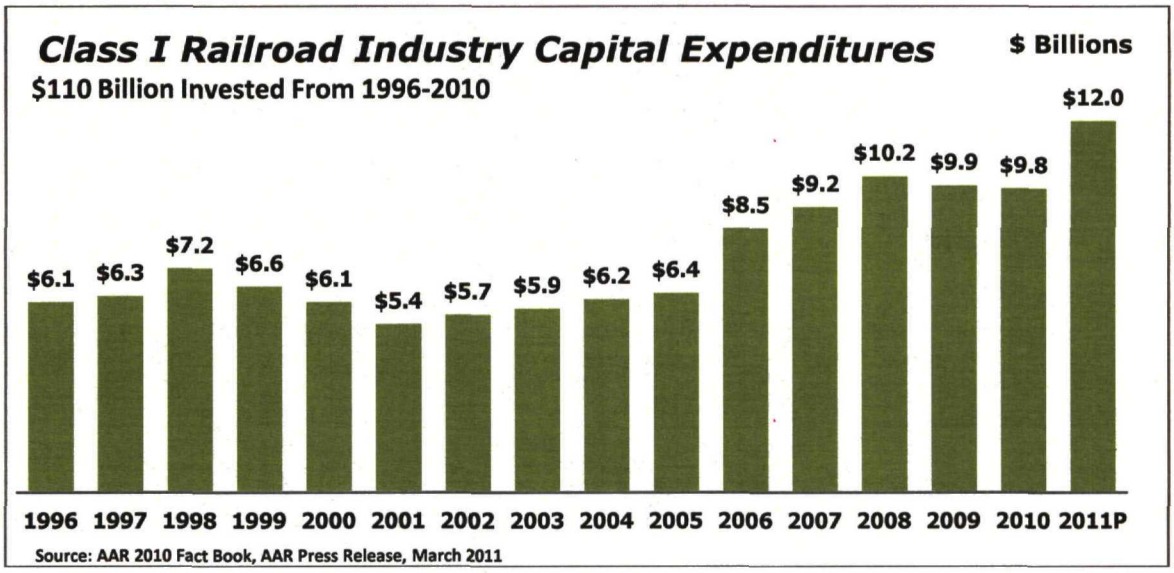
I was not at BNSF at the time of the BN/ATSF merger, but I can personally attest to the competitive benefits that resulted from the marketing reach, diversity of traffic, and operating efficiencies produced by the merger. The BN/ATSF merger integrated two rail networks with little overlap. It created an expanded rail system that could provide new single-line service from points on BN's system to points on ATSF's system. It significantly diversified the traffic bases of the two railroads, balancing BN's strength in coal and grain with ATSF's strength in intermodal traffic. Among other things, it enabled the two railroads to internally reroute traffic to achieve greater traffic densities, to integrate the productive facilities of the railroads, to combine car and locomotive fleets for greater efficiency, to reduce overhead costs, and to target capital expenditures to projects yielding the greatest benefits to the combined system and our customers.

The result was exactly as the two railroads predicted. The merger created a stronger railroad with the size and scale to compete more effectively for domestic and international business, including our intermodal business, and to move significant volumes of traffic off the highways and on to rail. Over time, the new BNSF system significantly expanded both the volume of rail services it provided and the efficiency of those services. Between 1996 and 2006, BNSF's total volume of traffic increased over 50%. The recession beginning in 2007 took a heavy toll on BNSF's business, but in 2010 our volume was still over 30% higher than in 1996.



BNSF's traffic increased in every major product group between 1996 and 2006. We grew our consumer products traffic by 76%, our agricultural products traffic by 66%, our coal traffic by 33%, and our industrial products traffic by 19%. Even with the effects of the recession, in 2010 our volume in every commodity group except industrial products was substantially higher than in 1996.

The efficiency of BNSF's operations also improved dramatically.



Not only was our employee productivity higher, but our locomotive utilization was much better and we carried more tonnage per gallon of fuel.

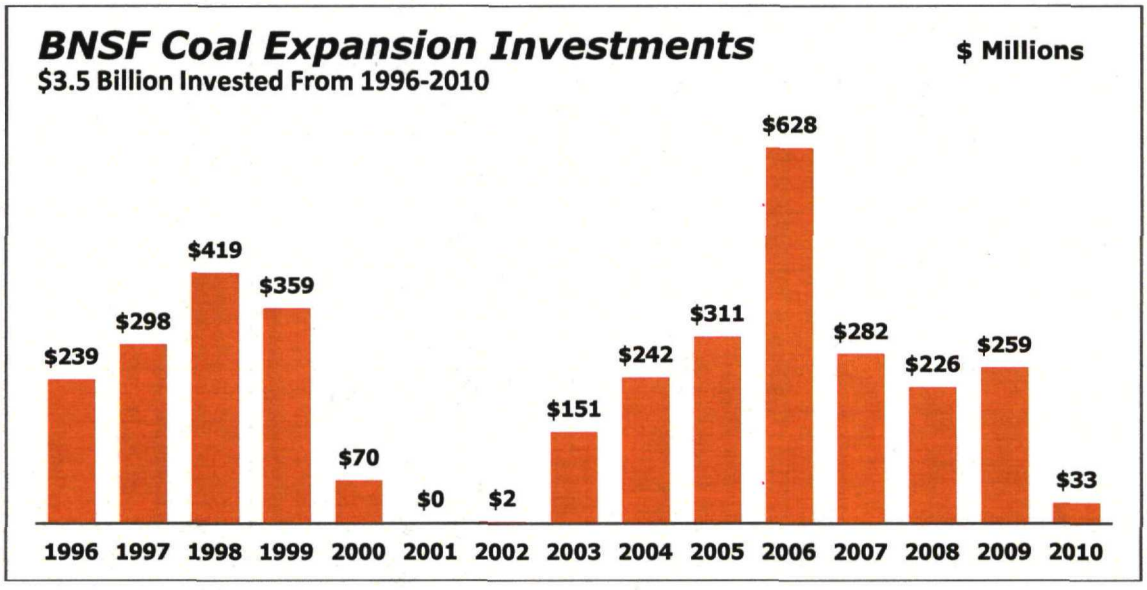
All of these improvements required billions of dollars in capital investment. Between 1996 and 2010, BNSF poured over $39 billion into the network to both maintain and expand our plant, equipment and technology. We estimate that in 2011 we will spend another $3.5 billion to sustain and enhance our capacity.

BNSF was not alone. The other railroads also invested billions of dollars into improving their rail systems and aggressively competed for business.

These benefits would be at risk if the STB were to adopt new regulation that would artificially reduce rates for a minority of shippers while substantially increasing the operational complexities and costs of providing service to *all* shippers. Many of the proposals advanced by commenting shippers in their opening submissions seem to be aimed at returning the railroads to a Pre-Staggers Act open interchange regime. Such an approach would significantly disrupt the substantial progress we have made over the last two decades by interfering with the cost efficiency of our current network, compromising network velocity, and making it harder for BNSF to meaningfully compete for business.

2. The Claims of "Parallel Pricing" and Excess Profits

Despite the fact that the BN/ATSF merger delivered exactly what was predicted, some of the shipper interests in this proceeding claim that the Class I mergers of the 1990s, including the BN/ATSF merger, have somehow led to a reduction in competition among railroads. As evidence, they point to alleged "parallel pricing" by BNSF and other Class I railroads, to so called "conscious parallelism" between BNSF and the other large Western railroad, Union Pacific ("UP"), and to excess profits by the four largest railroads. As remedies, they suggest that



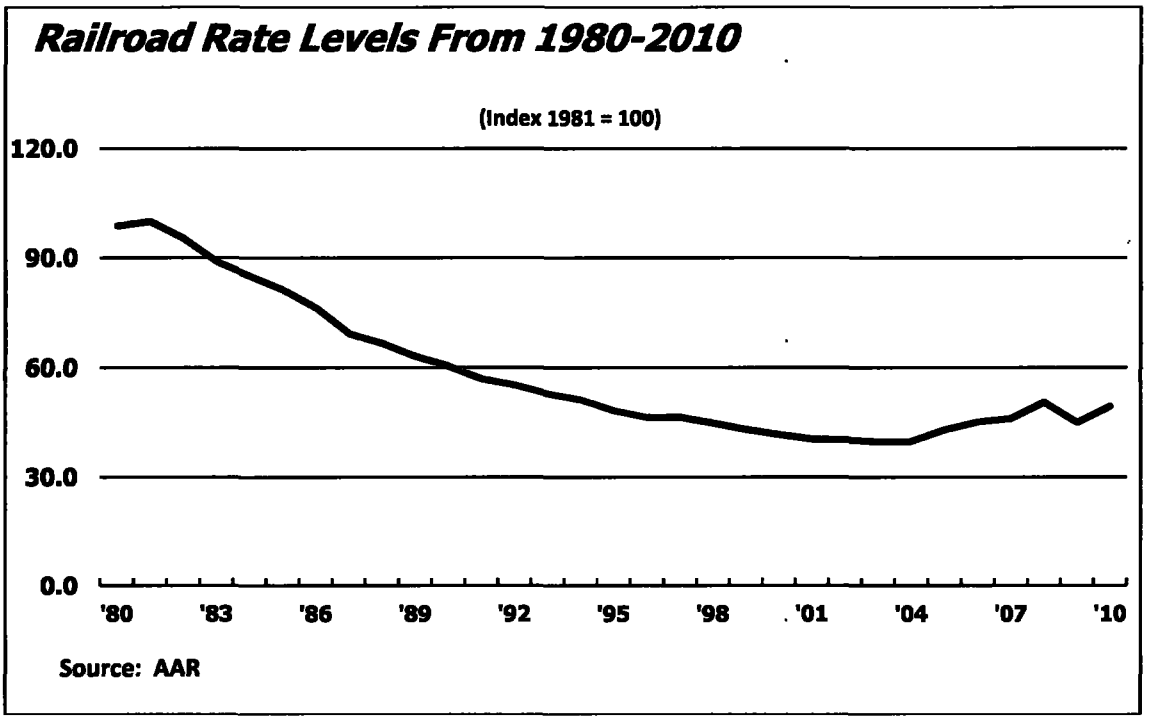
the mergers of the 1990s should be reopened to impose new access conditions, or that the STB should otherwise impose new access or rate reasonableness regulations. The justifications used by these commenting shippers for more regulation are wrong on several levels.

In the first place, they rest on mistaken assumptions about the markets for rail transportation. When two railroads combine end-to-end, that does not diminish the number of railroads serving the origin or the number of railroads serving the destination. And, of course, it does not diminish the competition from other transportation modes, like trucks and barges. The claim of some shippers that competition was reduced as a result of certain end-to-end mergers ignores the vast diversity of market conditions and competitive options in different transportation markets. Those shippers also ignore the benefits produced by those mergers that have allowed railroads to compete more effectively for business. As I discussed above, railroads combining end-to-end, like BN and ATSF, do have the opportunity to create more efficient networks, and compete more effectively for long-haul service. And that is exactly what transpired as a result of the BN/ATSF merger. BNSF was able to improve its service and grow the combined railroads' business in every major traffic category.

Some of the coal shipper interests make much of the so-called "duopoly" that BNSF and UP have for coal service to and from the Powder River Basin ("PRB"), but the suggestion that the rail mergers of the 1990s created a PRB "duopoly" or in any way diminished competition could not be more wrong. The PRB has never been served by more than two railroads—first, BN and the Chicago and North Western Transportation Company ("CNW"), and then BNSF and UP (as a result of the BN/ATSF merger and the UP/CNW merger). There is no question that UP's acquisition of the financially troubled CNW actually enhanced competition in the PRB. BNSF and UP were able to offer more single-line service to and from the PRB and they had

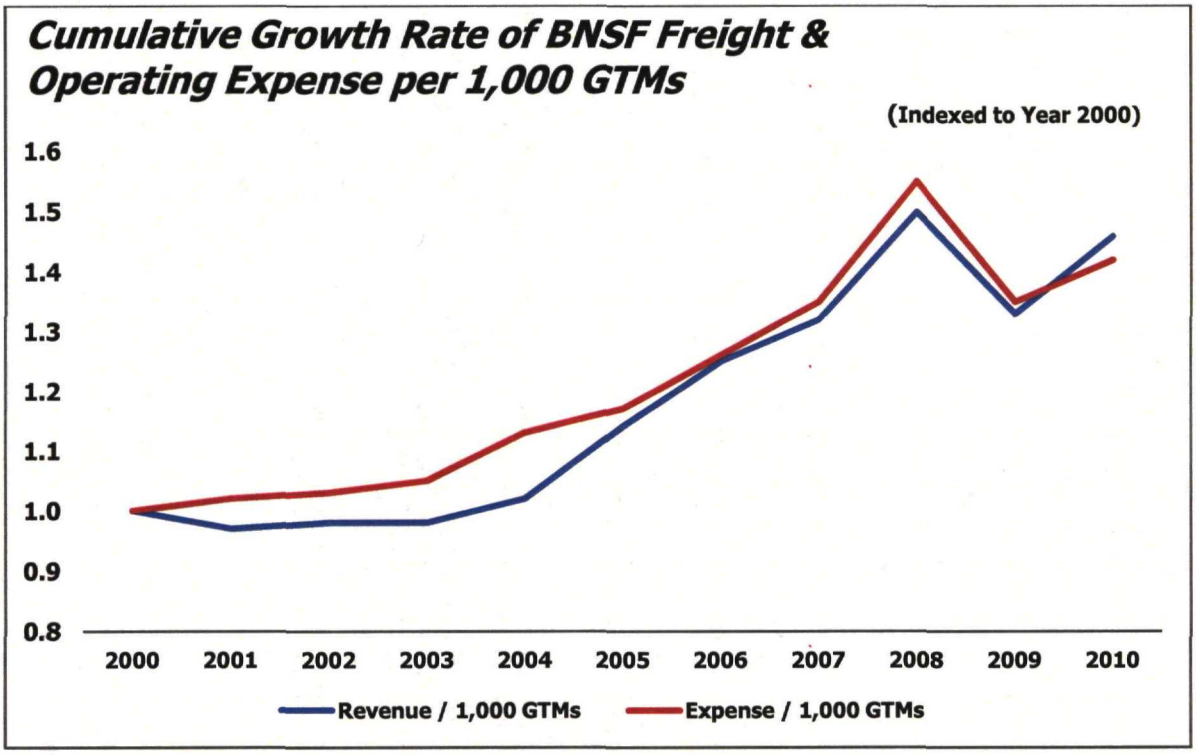
greater financial resources to invest in coal service. The resulting service improvements have made PRB coal more competitive in eastern U.S. markets and in export markets, which can be served by both BNSF and UP.

Indeed, since the mergers, BNSF has invested enormous amounts into the Joint Line that serves the PRB, as well as other facilities and equipment dedicated to coal service. In 1985, the Joint Line handled 19 million tons of coal. Volume grew steadily and by 2005 the Joint Line capacity had grown to handle a record 325 million tons. BNSF and UP agreed to add a third and fourth mainline, which enabled the Joint Line to handle in excess of 400 million tons. Of course, BNSF's investment in coal service covered more than the Joint Line. As the chart below shows, BNSF invested over $3.5 billion between 1996 and 2010 to expand its capacity to handle increased coal traffic. This does not include the substantial on-going investment required to maintain and replace our existing coal infrastructure.



BNSF's investment in its competitive capacity has by no means been limited to coal. BNSF has also made substantial capital investments in infrastructure across our network that

benefits many other types of traffic. Growth in one area contributes to growth in another by expanding the base of traffic that shares the common costs of the network.



In short, shippers cannot make any serious claim that competition was reduced by the structural changes in the rail network that resulted from the combination of BN and ATSF. Those changes have been uniformly positive. Some shipper interests, however, argue that pricing competition must have been reduced, because, after over two decades of steady decline, BNSF's and other railroads' prices began to rise around 2004.

One major problem with this argument as it applies to western railroads is that the BN/ATSF and the UP/SP mergers took place in the mid-1990s, but the increases in prices did not take place until many years later. As the chart below demonstrates, rail prices in fact continued to trend downward in real terms after the mergers.

The rate increases in the mid-2000s were attributable to market forces. An enormous increase in demand from the shipping public for rail service coincided with a substantial increase

in costs, at the same time that the productivity gains that had characterized the industry since the passage of the Staggers Act began to slow. BNSF, like other railroads, was stretched to meet that demand and cover its costs, and we set prices accordingly. For many years, the increase in our revenues did not keep pace with the increase in our costs.

My experience in the trucking industry involved similar dynamics—when costs and demand went up, particularly in a capacity constrained environment, rates increased; when demand no longer exceeded capacity and costs fell, so did rates. Anyone familiar with transportation markets knows that prices can rise even where there is competition among the providers of service. When costs increase and demand increases, rates will inevitably rise. These were the factors that led to rate increases in recent years, not any reduction in competition.

In addition, BNSF saw in this period the expiration of a large number of long-term contracts that contained below-market rates. While some shippers faced significantly higher rates than they had enjoyed under their old contracts, those higher rates were in line with market

based rates that BNSF negotiated with similarly situated shippers. BNSF also poured even more investment into plant, equipment and technology in an effort to provide the best service it could to as many shippers as possible. BNSF's price increases were a direct response to demand, capacity and cost conditions in the mid-2000s, not to any structural after effects of the rail mergers in the mid-1990s or any diminution of competition.

A couple of coal interests assert that BNSF's and UP's prices increased for PRB coal movements because in 2003 and 2004 BNSF and UP introduced published coal tariffs. As the STB well knows, published tariffs are common in the rail industry, and many of our shippers prefer them. Agricultural products, for example, move almost entirely under tariff rates. Moreover, increased BNSF rates for PRB coal transportation were entirely consistent with the increases in rates across all commodity groups, and, as described above, were driven by increased demand and constrained capacity. In any event, UP's coal tariff rates were never made public and BNSF's were public only for a limited period of time. Additionally, the coal shipper interests acknowledge that the vast majority of PRB coal continues to move under private, confidential contracts as it has since the inception of vigorous rail competition for PRB movements in the early 1980s.

Some shipper commenters, including some coal shipper interests, assert that they cannot always get the type of bids that they want for their business. Obviously, neither BNSF nor any other freight transportation company in any mode can meet every shipper's desired price or service. Demand and costs differ greatly among different types of traffic and among different shippers. But any suggestion that we do not compete for business everywhere we can is simply wrong. Other railroads, trucks, and barges also compete with us, and we cannot always retain the business we have. With respect to UP, every year since I have been at BNSF we have

competed with UP for new and existing business. We win some and we lose some. In some instances, our business losses are quite public, such as when intermodal industry leader Hub Group shifted the majority of its business away from BNSF, representing a major loss in revenue and volume to UP. Many other examples of business losses and gains are less public, though they are equally impactful. The assertions of some coal shippers that BNSF does not compete for their business and that after 2004 no coal business has shifted between BNSF and UP are categorically false.

Finally, some shippers assert that Class I railroads, including BNSF, should be subjected to more regulation because we are awash in excess revenues. Several point to a statement made by Berkshire Hathaway's Chairman, Warren Buffett, that Berkshire Hathaway's acquisition of BNSF has been profitable. But asserting that this means that BNSF has reached revenue adequacy confuses the short-term profitability of Berkshire Hathaway's investment with the long-term ability of BNSF to sustain and replace its system. There is no doubt that BNSF's financial condition has improved significantly, as has the financial condition of the other Class I railroads in the United States since the passage of the Staggers Act. But there is equally no doubt that BNSF has not yet achieved the sustained level of earnings necessary to cover its long-term costs.

Railroad assets are very long-lived. BNSF, like every other railroad, must make decisions about whether to invest in new assets or replace old assets on the basis of its expectations about whether it will have a reasonable opportunity to cover the costs of that investment in the long run. BNSF is committed to maintaining and expanding our network to enable us to better serve our existing customers and to compete for new customers, but we must be able earn a return over the long term that justifies those investments. For decades, our

customers implored us to invest to improve capacity and efficiency. It takes a profitable return to make these record investments that benefit our customers. The United States needs a strong and growing freight rail industry to compete in an increasingly global economy. Our national freight rail network, of which BNSF is the largest in terms of units and revenues, is a critical competitive advantage for our economy. Now that BNSF and other railroads, after 30 years, have finally begun to approach the level of earnings that might sustain and grow their operations in the long run, the STB should not lightly entertain proposals in this proceeding to impose new merger conditions or other regulations that jeopardize the ability and incentive of railroads to make future investments in the rail freight system.

RAILROAD CONTROL APPLICATION (CN/WC-2)
(STB Finance Docket No. 34000)

Dear Mr. Williams:

Enclosed for filing in the above-captioned docket please find an original and 25 copies of volumes 1 and 2 of the above-captioned railroad control application, which is designated as "CN/WC-2." We are including with the application a filing fee in the amount of $5,500.00, pursuant to 49 C.F.R. § 1002.2(f)(38)(iii). Also enclosed are three diskettes, each containing sections of the text of this document in WordPerfect 6/7/8/9 format.

Very truly yours,

Paul A. Cunningham

VERIFIED STATEMENT
OF
PAUL M. TELLIER

I am Paul M. Tellier, President and Chief Executive Officer and a director of Canadian National Railway Company. My professional background is outlined in Attachment A to this statement.

SUMMARY OF STATEMENT

Combining CN and the Wisconsin Central Transportation Corporation will be good for shippers, employees and shareholders. This end-to-end Transaction will contribute to the public interest in meeting the growing transportation needs of the NAFTA marketplace and will deliver significant public benefits. It will be particularly beneficial to WC shippers.

Our Transaction will have no anticompetitive effects:

- There are no 2-1 or 3-2 shippers.
- There will be no reduction in geographic competition.
- There will be no increase in the market power of CN or WC.
- We will keep active gateways affected by the Transaction open on commercially reasonable terms.

By increasing efficiency and building upon WC's tradition as a service-oriented carrier, the CN/WC merger will be entirely procompetitive:

- WC shippers will benefit from the large system resources and market reach that the CN/WC merger will bring.
- Customers of both CN and WC will benefit from shortened car transit times, increased reliability and other service improvements and operating efficiencies fostered by the merger.

And, the Transaction will offer employees their best long-term opportunity on the WC:

- Merger implementation will be carried out safely and incrementally, like the CN/IC merger, and will entail only minor workforce reductions.

- CN will remain financially strong after the WC acquisition, able to maintain the integrated CN/WC system in top condition and highly competitive in the marketplace.

We are confident that implementation of the CN/WC merger will proceed smoothly and will result in meaningful service improvements. We plan to operate WC as the sixth division of the CN system in order to preserve WC's local characteristics and the value of its employee's experience as much as possible while securing the benefits of system integration. Among other things, this will assure that customers on WC's relatively low-density lines will continue to receive the quality of service they have come to expect from WC. We have provided a Service Assurance Plan that we are confident will assure customers that service levels for each of them will be as good as or better than current levels.

What we need to do now is get on with the process of building a strong CN/WC that will promote competition in the rail industry. Because the Transaction will cause no harm to competition but will instead bring enhanced competition and other public benefits, I respectfully urge this Board to review the CN/WC Transaction under the Board's procedures for minor transactions. And, for these same reasons, I urge you to approve it without delay.

A NEW BEGINNING FOR WC

WC has made impressive progress in improving service on its lines. However, it is now at the stage, according to its own board of directors and management, where it cannot

go further on its own. Opportunities to improve WC's competitive position are not economically feasible absent the scale and scope of a much larger system. The recognition that these circumstances do not bode well for WC's shareholders, customers and employees led to WC's decision to seek to merge with CN.

CN is ready, willing and able to complete this Transaction successfully. WC is already an efficient regional carrier. We believe that we can make WC even better for both its customers and its employees. CN has shown in the recent past that it can increase efficiency and offer new and improved services through an effective merger with another railroad. The CN/IC Transaction was implemented with real gains in efficiency and, we are proud to say, without any significant service quality problems. Since 1998, we have reduced our system operating ratio from 75.1% to 69.6%. The process of becoming more efficient has continued throughout the implementation of the CN/IC transaction. Our operating ratio was 73.4% in the first half of 1999, 72% in all of 1999, and 69.6% in 2000.

SECURING CN's NAFTA ROUTE

North-South Trade Flows

Our acquisition of IC and our Alliance with KCS reflect our emphasis on serving the rapidly growing market for cross-border NAFTA traffic. WC already plays an important role in our ability to serve these transportation needs. Primarily through the CN/WC haulage agreements, approximately 20% of WC's freight revenue derives from CN, while 25% of CN's cross-border traffic moves over WC's Superior-to-Chicago line.

By acquiring WC, we now seek to secure and to increase to the maximum extent possible the efficiency of our important NAFTA route connecting western Canada and the

central U.S. In fact, securing the WC portion of this route is CN's principal motivation for this Transaction. WC was put up for sale by its board of directors. We responded quickly, as we saw ourselves as the logical and most capable owner of this important link in our system.

The CN/IC merger in 1999 enhanced the potential for CN traffic to move in either direction over WC between Superior and Chicago and underscored the importance of the WC connection to CN. However, the efficacy of the WC haulage arrangements faced a threat when WC decided late last year to pursue a sale of its U.S. operations to a major railroad. This created a risk that CN's crucial Superior-Chicago connection via WC could come under control of another Class I railroad competitor, which might result in less cooperative service and ultimately non-renewal of the haulage agreements, which, in contrast to trackage rights, are not subject to continuation by the Board. The CN/WC Transaction would secure permanently CN's control of the vital WC connection between Superior and Chicago.

The North American economy is integrating and shippers are demanding better integrated rail service. NAFTA customers are causing trade flows between Canada and the U.S. to grow at a rate of approximately 10% per year. Trade flows between Canada and Mexico, and between the U.S. and Mexico, are each growing at a rate of about 15% per year. With its enhanced single-line service, the CN/WC merger will help us meet the expanding cross-border transportation needs of customers across the merged system. Several important examples of the greater operating efficiencies that will result from the merged system are outlined in our Operating Plan.

Shipper Benefits

Expanded single-line service and other large network advantages, including the availability of a larger supply of well-maintained locomotives and rail cars, will benefit WC customers. New market opportunities, both inbound and outbound, will be opened to them through their post-merger access to the full scale, scope, and operating efficiencies of CN's rail network. CN's customers will benefit, too, from more efficient access to origins and destinations on WC's lines.

We believe, for example, that shippers of metals and minerals, forest products, chemicals, and agricultural products will be special beneficiaries of the expanded single-line network and improved equipment supply that will be made available to them by the CN/WC merger. As a result, we expect to gain new business in the transportation of these commodities following the CN/WC merger.

Additional Benefits

Together, our two systems will yield as a result of the Transaction important cost-saving benefits that do not depend on large labor force reductions, or on a wholesale restructuring of rail facilities. These benefits are estimated at approximately $55 million in recurring annual operating savings, which we expect to be attained incrementally over an estimated three-year implementation period. We will achieve these savings mainly through increasing asset productivity, consolidating general and administrative functions, and joint procurement of equipment, supplies and other needs. Cost savings, as well as service improvements, will also result from the use of CN's state-of-the-art information technology system to manage WC's rail network.

These cost efficiencies will strengthen our financial ability to improve the quality of CN/WC service. Service improvements represent increased value to customers and to the economy as a whole, which has long been recognized in principle as an important public benefit.

In addition to improving customer service, safety will continue to be a top priority throughout and after the implementation process. Our Safety Integration Plan will detail the steps we will take to ensure that the implementation of this Transaction will emphasize maintaining and improving safety throughout our merged system.

Labor impacts from the consolidation will be relatively small. Some workforce reductions will be handled through normal attrition. Others will be mitigated by our strong commitment to retraining and relocation. WC employees will benefit, too, from being part of a larger, stronger, better-positioned system in an industry where customers' transportation needs are rapidly evolving.

Implementing the CN/WC Transaction will be comparatively straight-forward. Only one facility will be consolidated: we will combine yard operations in Superior at CN's Pokegama Yard. Merger implementation will be facilitated by the absence of any need to deal with network overlap or line abandonments. More important, we will not be undertaking any significant rerouting of traffic. Operating changes, on balance, will be minor. In fact, the overall level of changes will be insignificant when compared with those occasioned by other major railroads' recent efforts to integrate or divide substantially overlapping rail operations.

Finally, the integrated CN/WC system will be financially strong. While we will in the first instance borrow under CN's revolving credit facility the $800 million in cash needed to complete the merger, we expect post-merger to reduce CN's overall debt substantially within a relatively short period using retained earnings and the proceeds from the eventual disposition of WC's overseas holdings. Even with the added debt from the WC acquisition, our balance sheet will remain strong. Our financial capacity to pursue opportunities to improve our rail system will be, if anything, enhanced by the CN/WC Transaction.

Improving Service

We have every expectation that merger implementation will proceed smoothly, deliberately and, above all, safely. Even the hint of a service or safety problem will receive the prompt attention of the merged system's top managers. The principles, policies and procedures set forth in our Service Assurance Plan, and in our Safety Integration Plan -- both of which we will continue to develop during the period before approval and implementation -- are intended to guide and focus our efforts to eliminate problems before they happen.

We are not, of course, blind to the fact that problems can arise, despite our best intentions and our most careful precautions. If a problem does occur suddenly, it will be met with on-the-ground management flexibility, with top-level backing, and with whatever resources are necessary to effect a complete and timely resolution. Bolstering our confidence in our ability to do just that are two critical factors. First, our two rail systems are in fine shape, both structurally and operationally. Because we are going to operate WC as the sixth CN Division, we anticipate little change in its local operations. The CN/WC system will have ample line and facility capacity, well-functioning car and locomotive fleets, and a

carefully integrated information system. And, we will have the financial wherewithal to maintain and, where appropriate, to improve the operational capabilities of the merged system.

Second, CN and WC already work well together. The proposed merger will simply add the benefits of unitary control to maximize the opportunities of both systems together. Integrating our railroads' operations at their two points of connection in the U.S. – where they are already working closely to maximize the benefits of the CN/WC haulage agreements – thus should not be a major challenge. Our highly talented personnel have experience in successfully implementing the CN/IC transaction, have witnessed first hand through interline portals or otherwise the troubled implementations of other transactions, and have directed our two railroads' efforts in helping resolve the problems that arose in their wake.

We will not fail in the implementation of our Transaction. We recognize, however, that many shippers, particularly those who had bad experiences following transactions not involving CN, may worry about the potential for declining service during the period of merger implementation. Our successful implementation of the CN/IC transaction, we believe, was a favorable experience for shippers. We fully expect that the CN/WC transaction will be accomplished in the same way. Indeed, we are assuring all of our customers that their rail service will be as good as – or better than – the service they now receive from our two railroads.

FAIRNESS TO SHAREHOLDERS

In approving and recommending the proposed CN/WC merger, CN's board of directors received and relied upon, among other things, the opinion of its financial advisor,

Salomon Smith Barney Inc., to the effect that, as of January 29, 2001 (the date of CN's merger agreement with WC) the cash consideration to be paid by CN to WC shareholders upon the merger closing was fair, from a financial point of view, to CN. A copy of Salomon Smith Barney's fairness opinion is provided as Attachment B to this statement.

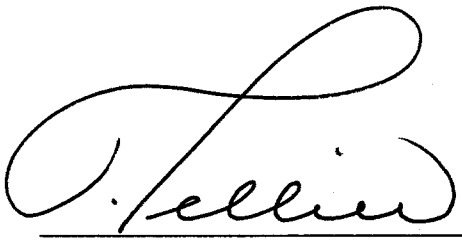
CONCLUSION

A natural fit for both companies, the CN/WC Transaction will infuse WC with greater financial strength and other resources necessary to ensure that WC's prior successes in safely providing high quality service to customers can continue. The Transaction will also make CN's NAFTA route secure and incrementally better without any appreciable risk of service deterioration. Shippers, especially those on CN 's and WC's lines, will benefit further from expanded single-line service and other easily implemented service improvements.

Relatively few operational changes will be made in implementing the merger, and those that are made will be managed carefully. We will phase in implementation, just as we did in integrating the CN and IC systems. We fully expect the CN/WC implementation process to be successful, but if there are problems, we will fix them promptly. While this may be a minor transaction from a regulatory perspective, it will still be a matter of importance to our shippers. We therefore will give it our full attention in order to make it another success story like CN/IC.

This Transaction will improve our customers' ability to participate in fast-growing NAFTA markets. It will introduce added efficiency that will be a procompetitive plus for the North American transportation system. There is, in our view, no competitive downside to the merger.

For WC and its customers, the Transaction will provide new opportunities and greater efficiencies through single-line access to markets served by CN's network, and through the addition of CN's resources and operational strengths.



For CN, the Transaction will permanently secure a crucial element of its rail network that is now bridged by term-limited haulage agreements with WC for CN traffic over WC's high-capacity main line connecting Superior and Chicago.

This is a good transaction. I respectfully urge its prompt review and approval by the Board.

VERIFICATION

I, Paul M. Tellier, verify under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this Verified Statement.

Executed on April 6, 2001.

Personal Background of Paul M. Tellier

I have occupied my current positions since 1992. Prior to that, I served for seven years as clerk of the Privy Council and secretary to the Cabinet of the Government of Canada. I have also served in other positions in the Government of Canada, including Deputy Minister of Indian Affairs and Northern Development (1979) and as Deputy Minister of Energy, Mines and Resources (1982). I am a graduate of the Universities of Ottawa, Canada and Oxford, England. I was admitted to the Quebec Bar in 1963 and was appointed Queen's Counsel in 1981.

SALOMON SMITH BARNEY

A member of citigroup

CONFIDENTIAL

January 29, 2001

The Board of Directors
Canadian National Railway Company
935 de La Gauchenere Street West
Montreal, Quebec H3B 2M9
Canada

Members of the Board:

You have requested our opinion as to the fairness, from a financial point of view, to Canadian National Railway Company ("CNR") of the Merger Consideration (as defined below) to be paid by CNR pursuant to the terms and subject to the conditions set forth in the Agreement and Plan of Merger, dated as of January 29, 2001 (the "Merger Agreement"), among Wisconsin Central Transportation Corporation ("Wisconsin Central"), CNR and WC Merger Sub, Inc., an indirect wholly owned subsidiary of CNR ("Merger Sub"). As more fully described in the Merger Agreement, (i) Merger Sub will merge with and into Wisconsin Central (the "Merger") and (ii) each outstanding share of the common stock, par value $0.01 per share, of Wisconsin Central ("Wisconsin Central Common Stock") will be converted into the right to receive $17.15 in cash, without interest (the "Merger Consideration").

In arriving at our opinion, we reviewed the Merger Agreement and held discussions with certain senior officers, directors and other representatives and advisors of CNR and certain senior officers and other representatives and advisors of Wisconsin Central and certain of its affiliates concerning the business, operations and prospects of Wisconsin Central. We examined certain publicly available business and financial information relating to Wisconsin Central as well as certain financial forecasts and other information and data relating to CNR and Wisconsin Central which were provided to or otherwise discussed with us by the managements of CNR and Wisconsin Central and certain of its affiliates, including certain information relating to the potential strategic implications and operational benefits anticipated by the management of CNR to result from the Merger. We reviewed the financial terms of the Merger as set forth in the Merger Agreement in relation to, among other things: current and historical market prices and trading volumes of Wisconsin Central Common Stock; the financial condition and historical and projected earnings and other operating data of Wisconsin Central; and the capitalization of Wisconsin Central. We considered, to the extent publicly available, the financial terms of other transactions recently effected which we considered relevant in evaluating the Merger and analyzed certain financial, stock market and other publicly available information relating to the businesses of other companies whose operations we considered relevant in evaluating those of Wisconsin Central. We also evaluated the potential pro forma financial impact of the Merger on CNR. In addition to the foregoing, we conducted such other analyses and examinations and considered such other financial, economic and market criteria as we deemed appropriate in arriving at our opinion.

In rendering our opinion, we have assumed and relied, without independent verification, upon the accuracy and completeness of all financial and other information and data publicly available or furnished to or otherwise reviewed by or discussed with us. With respect to financial forecasts and other

SALOMON SMITH BARNEY
A member of citigroup

information and data provided to or otherwise reviewed by or discussed with us, we have been advised by the managements of CNR and Wisconsin Central and certain of its affiliates that such forecasts and other information and data (including adjustments to the forecasts and other information and data relating to Wisconsin Central prepared by the management of CNR) were reasonably prepared on bases reflecting the best currently available estimates and judgments of the respective managements of CNR and Wisconsin Central and certain of its affiliates as to the future financial performance of CNR and Wisconsin Central and the best currently available estimates and judgments of the management of CNR as to the strategic implications and operational benefits (including the amount, timing and achievability thereof) anticipated to result from the Merger. We have assumed with your consent that, in the course of obtaining the necessary regulatory and third party approvals or consents for the Merger, no delay, limitation, restriction or condition will be imposed that would have a material adverse effect on Wisconsin Central or the contemplated benefits to CNR of the Merger. We have not made or been provided with an independent evaluation or appraisal of the assets or liabilities (contingent or otherwise) of Wisconsin Central nor have we made any physical inspection of the properties or assets of Wisconsin Central. Our opinion does not address, and we express no view as to, the relative merits of the Merger as compared to any alternative business strategies that might exist for CNR or the effect of any other transaction in which CNR might engage. Our opinion is necessarily based upon information available to us, and financial, stock market and other conditions and circumstances existing and disclosed to us, as of the date hereof.

Salomon Smith Barney Inc. has acted as financial advisor to CNR in connection with the proposed Merger and will receive a fee for such services, a significant portion of which is payable upon the consummation of the Merger. We in the past have provided services to CNR unrelated to the proposed Merger, and may participate in the financing for the Merger, for which services we have received and would receive compensation. In the ordinary course of our business, we and our affiliates may actively trade or hold the securities of CNR and Wisconsin Central for our own account or for the account of our customers and, accordingly, may at any time hold a long or short position in such securities. In addition, we and our affiliates (including Citigroup Inc. and its affiliates) may maintain relationships with CNR, Wisconsin Central and their respective affiliates.

Our advisory services and the opinion expressed herein are provided for the information of the Board of Directors of CNR in its evaluation of the proposed Merger, and may not be relied upon by any third party or used for any other purpose. Our opinion may not be published or otherwise used or referred to, nor shall any public reference to Salomon Smith Barney Inc. be made, without our prior written consent.

Based upon and subject to the foregoing, our experience as investment bankers, our work as described above and other factors we deemed relevant, we are of the opinion that, as of the date hereof, the Merger Consideration to be paid by CNR pursuant to the Merger Agreement is fair, from a financial point of view, to CNR.

Very truly yours,

Salomon Smith Barney Inc.

Synopsis

Background: Federal Trade Commission (**FTC**) brought action against coal producers that sought to form joint venture, seeking injunction under Federal Trade Commission Act (FTCA) to prevent joint venture from moving forward until **FTC** could conduct an administrative hearing to determine whether joint venture would violate Section 7 of the Clayton Act.

Holdings: The District Court, Sarah E. Pitlyk, J., held that:

[1] relevant product market was the market for coal from the specific geographical region in which proposed venture's coal was mined;

[2] relevant geographic market was the specific river basin from which the coal was mined;

[3] **FTC** established prima facie case that proposed joint venture would result in a significant market share and an undue increase in concentration in the relevant market, warranting presumption that venture would substantially lessen competition;

[4] coal producers failed to rebut presumption of anticompetitive effects;

[5] coal producers' claim that joint venture would generate significant efficiencies was insufficient to rebut **FTC's** prima facie showing of anticompetitive effects of the venture; and

[6] preliminary injunction was in the public interest.

Motion granted.

Procedural Posture(s): Motion for Preliminary Injunction.

West Headnotes (49)

[1] Antitrust and Trade Regulation Preliminary

The standard for a preliminary injunction described in Section 13(b) of the FTCA differs from the more familiar preliminary injunction standard applied in other contexts: a preliminary injunction may be granted in an antitrust case if the Federal Trade Commission shows that weighing the equities and considering the Commission's likelihood of ultimate success, such action would be in the public interest. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[2] Antitrust and Trade Regulation Preliminary

In order to demonstrate a likelihood of ultimate success in an antitrust case, as required for a preliminary injunction under the FTCA, the Federal Trade Commission (**FTC**) must raise questions going to the merits so serious, substantial, difficult and doubtful as to make them fair ground for thorough investigation, study, deliberation and determination by the **FTC** in the first instance and ultimately by the Court of Appeals. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

[3] **Antitrust and Trade Regulation** Injunction

A showing of a fair or tenable chance of success on the merits will not suffice for injunctive relief under FTCA. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[4] **Antitrust and Trade Regulation** Presumptions and burden of proof

Antitrust and Trade Regulation Preliminary

Under the burden-shifting framework for evaluating Federal Trade Commission's (**FTC**) likelihood of success on the merits of a Clayton Act claim, as required for a preliminary injunction under the FTCA, the **FTC** must first present a prima facie case that the merger will result in an undue market concentration for a particular product or service in a particular geographic area, which creates a presumption that the merger will substantially lessen competition; the burden of production then shifts to defendants to rebut the presumption, and, on a sufficient showing, back to the **FTC** to present additional evidence of anticompetitive effects. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[5] **Antitrust and Trade Regulation** Presumptions and burden of proof

Antitrust and Trade Regulation Preliminary

On a motion for a preliminary injunction under FTCA, the ultimate burden of persuasion remains at all times with the Federal Trade Commission. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[6] **Antitrust and Trade Regulation** Presumptions and burden of proof

Antitrust and Trade Regulation Preliminary

The more compelling the prima facie case on a motion for preliminary injunction under the FTCA, the more evidence the defendant must present to rebut it successfully. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[7] **Antitrust and Trade Regulation** Presumptions and burden of proof

Antitrust and Trade Regulation Preliminary

On a motion for a preliminary injunction under FTCA, a defendant can make the required showing to rebut a prima facie case that a merger will result in undue market concentration by affirmatively showing why a given transaction is unlikely to substantially lessen competition, or by discrediting the data underlying the initial presumption in the government's favor. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[8] **Antitrust and Trade Regulation** Preliminary

A failure of proof in any respect on a motion for preliminary injunction under FTCA will mean the transaction at issue should not be enjoined. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[9] **Antitrust and Trade Regulation** Preliminary

On a motion for preliminary injunction under the FTCA, the court must also weigh the equities, but if the Federal Trade Commission is unable to demonstrate a likelihood of success, the equities

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

alone cannot justify an injunction. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[10] **Antitrust and Trade Regulation** Relevant market in general

Antitrust and Trade Regulation Preliminary

The Federal Trade Commission's initial burden on a motion for preliminary injunction under FTCA is to demonstrate that there is a relevant market in which the proposed merger is likely to harm competition relative to the but-for world in which there is no merger. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[11] **Antitrust and Trade Regulation** Product market

Antitrust and Trade Regulation Geographic market

A "relevant market" for purpose of an antitrust action consists of two separate components: a product market and a geographic market.

[12] **Antitrust and Trade Regulation** Product market

The "relevant product market" for purpose of antitrust action identifies the product and services with which the defendants' products compete.

[13] **Antitrust and Trade Regulation** Geographic market

The "relevant geographic market" for purpose of an antitrust action identifies the geographic area in which the defendant competes in marketing its products or service.

[14] **Antitrust and Trade Regulation** Elasticity of supply and demand

Antitrust and Trade Regulation Product market

For purpose of an antitrust action, a product market is defined by the reasonable interchangeability of use or the cross-elasticity of demand between the product itself and substitutes for it.

[15] **Antitrust and Trade Regulation** Product market; line of commerce

For purpose of an antitrust action, a properly defined product market includes the functionally similar products to which customers could turn if merger attempted to impose a post-closing price increase.

[16] **Antitrust and Trade Regulation** Product market

A relevant product market in an antitrust action need not be defined around a single product.

[17] **Antitrust and Trade Regulation** Product market

The mere fact that a firm may be termed a competitor in the overall marketplace does not necessarily require that it be included in the relevant product market for antitrust purposes; rather, the critical question is whether two products can be used for the same purpose, and if so, whether and to what extent purchasers are willing to substitute one for the other.

[18] **Antitrust and Trade Regulation** Relevant market in general

If two commercial entities seeking to merge compete in multiple product markets, the merger will be illegal under the Clayton Act if it causes substantial competitive harm in any of those markets. Clayton Act § 7, 15 U.S.C.A. § 18.

[19] **Antitrust and Trade Regulation** Relevant market in general

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

Because competitive harm in any relevant product market is enough to make out a prima facie case for violation of the Clayton Act, and because potential harms to competition will likely be less apparent in a broader, less concentrated market than in a narrower included market, the court's task in an antitrust action is to identify the narrowest market within which the defendant companies compete that qualifies as a relevant product market. Clayton Act § 7, 15 U.S.C.A. § 18.

[20] **Antitrust and Trade Regulation** Product market; line of commerce

The hypothetical monopolist test is an analytical method for determining the relevant product market in a Clayton Act antitrust action, which asks whether a hypothetical monopolist who has control over the products in an alleged market could profitably raise prices on those products.

[21] **Antitrust and Trade Regulation** Product market; line of commerce

Under the hypothetical monopolist test, an analytical method for determining the relevant product market in a Clayton Act antitrust action, if a firm with a monopoly over the products in a candidate market could profitably impose a small but significant non-transitory increase in price, then that market constitutes a relevant product market.

[22] **Antitrust and Trade Regulation** Product market; line of commerce

In determining a relevant product market for purpose of a Clayton Act antitrust action, courts also often consider whether a candidate market is characterized by certain practical indicia, known as the *Brown Shoe*, 82 S.Ct. 1502, factors, including industry or public recognition of the market as a separate economic entity, the product's peculiar characteristics and uses, unique production facilities, distinct consumers, distinct prices, sensitivity to price changes, and specialized vendors.

[23] **Antitrust and Trade Regulation** Product market; line of commerce

The *Brown Shoe*, 82 S.Ct. 1502, factors for determining a relevant product market for purpose of a Clayton Act antitrust action are not rigidly applied.

[24] **Antitrust and Trade Regulation** Relevant market in general

Ultimately, the determination of the relevant market for purpose of a Clayton Act antitrust action is a matter of business reality – of how the market is perceived by those who strive for profit in it.

[25] **Antitrust and Trade Regulation** Product market; line of commerce

The first *Brown Shoe*, 82 S.Ct. 1502, factor for determining a relevant product market for purpose of a Clayton Act antitrust action evaluates how industry participants recognize competitive realities; the industry or public recognition of the submarket as a separate economic unit matters because courts assume that economic actors usually have accurate perceptions of economic realities.

[26] **Antitrust and Trade Regulation** Product market; line of commerce

Market definition for purpose of a Clayton Act antitrust action is not a zero-sum game; each proposed relevant product market stands or falls on its own merits, and the narrowest market principle determines which of the qualifying markets a court should use for the rest of its merger analysis.

[27] **Antitrust and Trade Regulation** Oil, gas, and mining

Antitrust and Trade Regulation Preliminary

Relevant product market for purpose of Federal Trade Commission's (**FTC**) motion for preliminary injunction under FTCA to prevent two coal producers from forming joint venture pending **FTC's** review of whether venture would violate Clayton Act was the market for coal from the specific geographical region in which proposed venture's coal was mined; although coal competed with natural gas and renewable **energy** sources in a broader **energy** market, hypothetical monopolist test demonstrated that customers of coal from region were likely to continue to purchase it in the face of small price increases, industry actors treated the region's coal as a distinct submarket, price of region's coal was set through market-specific competitive interactions among suppliers, only utilities with plants designed specifically for region's coal could buy and use it, and region's coal had distinct properties that made it more desirable for customers. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b); Clayton Act § 7, 15 U.S.C.A. § 18.

[28] **Antitrust and Trade Regulation** Geographical market; section of country

The proper question to be asked in determining the relevant geographic market for a Clayton Act antitrust action is where, within the area of competitive overlap, the effect of the merger on competition will be direct and immediate.

[29] **Antitrust and Trade Regulation** Geographical market; section of country

The relevant geographic market for purpose of a Clayton Act antitrust action must correspond to the commercial realities of the industry and be economically significant.

[30] **Antitrust and Trade Regulation** Oil, gas, and mining

Antitrust and Trade Regulation Preliminary

Relevant geographic market for purpose of Federal Trade Commission's (**FTC**) motion for preliminary injunction under FTCA to prevent two coal producers from forming joint venture pending **FTC's** review of whether venture would violate Clayton Act was the specific river basin from which the coal was mined, as type of coal from that river basin could not be mined outside of the basin. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b); Clayton Act § 7, 15 U.S.C.A. § 18.

[31] **Antitrust and Trade Regulation** Relevant market in general

Market concentration, for purpose of determining if a merger will cause anticompetitive effects, is a function of the number of firms in a market and their respective market shares.

[32] **Antitrust and Trade Regulation** Relevant market in general

A common tool used to measure changes in market concentration is the Herfindahl–Hirschmann Index (HHI), which is calculated by summing the squares of an individual firms' market shares, a calculation that gives proportionately greater weight to the larger market shares; sufficiently large HHI figures establish the Federal Trade Commission's prima facie case that a merger is anticompetitive, as required for preliminary injunction under FTCA.

Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[33] **Antitrust and Trade Regulation** Presumptions and burden of proof

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

Antitrust and Trade Regulation Mergers and acquisitions

Federal Trade Commission (**FTC**) established prima facie case that proposed joint venture between two coal producers would result in a significant market share and an undue increase in concentration in the relevant market, warranting presumption that venture would substantially lessen competition, as required for preliminary injunction baring creation of the venture pending **FTC** hearing to determine whether venture would violate Section 7 of the Clayton Act, unless producers could rebut presumption of anticompetitive effects; relevant market was already highly concentrated and calculations demonstrated that venture would make it far more concentrated, customers benefited from head-to-head competition between producers that would be eliminated, customers would not be able to resist five to ten percent price increases, and producers were focused on generating higher margins for investors, giving them incentive to raise prices. Clayton Act § 7, 15 U.S.C.A. § 18; Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[34] **Antitrust and Trade Regulation** Mergers and Acquisitions

Antitrust and Trade Regulation Preliminary

For purpose of establishing a prima facie case of the likelihood of anticompetitive effects from a merger, as required for preliminary injunction under FTCA, a merger that eliminates head-to-head competition between close competitors is likely to have unilateral anticompetitive effect if the acquiring firm will have the incentive to raise prices or reduce quality after the acquisition, independent of competitive responses from other firms. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[35] **Antitrust and Trade Regulation** Preliminary

Ultimately, the court need not decisively sift through various models and theories to determine, on a motion for preliminary injunction under FTCA, whether a proposed merger would have anticompetitive effects; the court's task is to determine whether the Federal Trade Commission (**FTC**) has raised questions going to the merits so serious, substantial, difficult and doubtful as to make them fair ground for thorough investigation, study, deliberation and determination by the **FTC** in the first instance and ultimately by the Court of Appeals. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[36] **Antitrust and Trade Regulation** Presumptions and burden of proof

Antitrust and Trade Regulation Preliminary

On a motion for preliminary injunction under FTCA, the presumption that a merger will substantially lessen competition is rebuttable; defendants can either discredit the data underlying the initial presumption in the government's favor, or affirmatively show why the merger is unlikely to substantially lessen competition. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[37] **Antitrust and Trade Regulation** Oil, gas, and mining

Antitrust and Trade Regulation Mergers and acquisitions

Coal producers that sought to form joint venture failed to rebut presumption of anticompetitive effects created by Federal Trade Commission's (**FTC**) showing that creation of venture would have resulted in significant market share and an undue increase in competition in the relevant market, and thus **FTC** established a likelihood of success on the merits, as required to enjoin creation of venture pending **FTC** hearings on whether it violated Section 7 of the Clayton Act; although there was competition from other

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

fuels and other suppliers of coal from relevant market, there was no prospect for new coal mines to open in relevant market or for existing mines to expand, and energy producers could not easily change to other fuel sources. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b); Clayton Act § 7, 15 U.S.C.A. § 18.

[38] **Antitrust and Trade Regulation** Mergers and acquisitions

Antitrust and Trade Regulation Preliminary

Where a court finds high market concentration levels, defendants must present proof of extraordinary efficiencies to rebut the government's prima facie case of anticompetitive effects of a merger, on a motion for a preliminary injunction under FTCA. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[39] **Antitrust and Trade Regulation** Mergers and acquisitions

Antitrust and Trade Regulation Preliminary

On a motion for preliminary injunction under FTCA, even if evidence of efficiencies gained by a merger alone is insufficient to rebut the government's prima facie case of anticompetitive effects of the merger, such evidence may nevertheless be relevant to the competitive effects analysis of the market required to determine whether the proposed transaction will substantially lessen competition. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[40] **Antitrust and Trade Regulation** Mergers and Acquisitions

Antitrust and Trade Regulation Preliminary

In evaluating a defendant's claim that a merger will promote efficiencies, offered to rebut the government's prima facie case of anticompetitive effects of the merger made on a motion for preliminary injunction under FTCA, the court must undertake a rigorous analysis of the kinds of efficiencies being urged by the parties in order to ensure that those efficiencies represent more than mere speculation and promises about post-merger behavior. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[41] **Antitrust and Trade Regulation** Mergers and Acquisitions

Antitrust and Trade Regulation Preliminary

In evaluating a defendant's claim that a merger will promote efficiencies, offered to rebut the government's prima facie case of anticompetitive effects of the merger made on a motion for preliminary injunction under FTCA, the court must determine whether the efficiencies are merger-specific, meaning they represent a type of cost saving that could not be achieved without the merger, and verifiable, meaning the estimate of the predicted saving must be reasonably verifiable by an independent party. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[42] **Antitrust and Trade Regulation** Mergers and acquisitions

Antitrust and Trade Regulation Preliminary

In evaluating a defendant's claim that a merger will promote efficiencies, offered to rebut the government's prima facie case of anticompetitive effects of the merger made on a motion for preliminary injunction under FTCA, defendants bear the burden of demonstrating that their claimed efficiencies are merger-specific, which requires demonstrating that the efficiencies cannot be achieved by either company alone because, if they can, the merger's asserted benefits can be achieved without the concomitant loss of a competitor. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

[43] **Antitrust and Trade Regulation** Mergers and acquisitions

Antitrust and Trade Regulation Preliminary

In evaluating a defendant's claim that a merger will promote efficiencies, offered to rebut the government's prima facie case of anticompetitive effects of the merger made on a motion for preliminary injunction under FTCA, defendants must also demonstrate that their claimed efficiencies would benefit customers. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[44] **Antitrust and Trade Regulation** Oil, gas, and mining

Antitrust and Trade Regulation Mergers and acquisitions

Coal producers' claim that creation of joint venture between two companies would generate significant efficiencies by optimizing production across mines that were currently operated separately was insufficient to rebut the Federal Trade Commission's (**FTC**) prima facie showing of anticompetitive effects of the joint venture, on **FTC's** motion for preliminary injunction under FTCA; although producers were able to demonstrate some verifiable efficiencies from venture, many of the efficiencies shown were unverifiable because they were grounded in the business judgment of producers' employees, producers used 20-year horizon for forecasting efficiencies, which was less accurate than the typical five-year horizon used, not all of the anticipated efficiencies were merger-specific, and all claimed efficiencies together were insufficient to offset likely competitive harm to customers from the venture. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[45] **Antitrust and Trade Regulation** Presumptions and burden of proof

Antitrust and Trade Regulation Preliminary

Even once a presumption in favor of a preliminary injunction under FTCA is established, the public interest standard still requires the court to weigh the public and private equities of enjoining the merger. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[46] **Antitrust and Trade Regulation** Oil, gas, and mining

Antitrust and Trade Regulation Preliminary

Preliminary injunction under FTCA enjoining creation of joint venture between two coal producers pending full administrative hearing on the merits of the merger under the Clayton Act was in the public interest; although venture would generate efficiencies that would be delayed or lost if venture was blocked and preventing the venture from proceeding was likely to lead to unforeseen abrupt mine closures, bankruptcies, and layoffs, creation of venture between two largest coal producers in region would cause harm to customers from lost competition that likely could not be undone if creation of venture was permitted to proceed. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b); Clayton Act § 7, 15 U.S.C.A. § 18.

[47] **Antitrust and Trade Regulation** Preliminary

The principal equitable consideration weighing in favor of a preliminary injunction under FTCA pending a Federal Trade Commission (**FTC**) hearing on whether a proposed merger would violate Section 7 of the Clayton Act is the strong public interest in effective enforcement of the antitrust laws and in the **FTC** having the ability to order effective relief if it succeeds in an administrative proceeding. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b); Clayton Act § 7, 15 U.S.C.A. § 18.

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

[48] Antitrust and Trade Regulation Preliminary

Allowing a proposed merger to proceed and then later "unscrambling the eggs" upon a finding of illegality under the Clayton Act by the Federal Trade Commission (**FTC**) is a daunting and potentially impossible task, which supports the issuance of an injunction under FTCA pending **FTC** hearing on the matter. Clayton Act § 7, 15 U.S.C.A. § 18; Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b).

[49] Antitrust and Trade Regulation Preliminary

The parties' stated intention to abandon a proposed merger prior to the Federal Trade Commission's (**FTC**) merits proceeding under Clayton Act if an FTCA injunction is granted pending resolution of the **FTC** proceedings is a private equity, and cannot on its own overcome the public equities that favor granting the injunction. Federal Trade Commission Act § 13, 15 U.S.C.A. § 53(b); Clayton Act § 7, 15 U.S.C.A. § 18.

MEMORANDUM OPINION

SARAH E. PITLYK, UNITED STATES DISTRICT JUDGE

Flipping a light switch is the culmination of a long and convoluted process. The electricity needed to turn on that light—indeed, the electricity needed for any purpose, be it residential, commercial, or industrial—is generated at power plants owned by investor- or publicly-owned utilities and cooperatives, independent power producers, or the government. Joint Stipulation of Uncontested Facts ("JSUF") (Doc. [301-1]) ¶ 4. Each power plant consists of one or more electricity generating units ("EGUs"). *Id.* ¶ 5. Each EGU uses one of a wide range of generating technologies to transform the **energy** in a specific fuel—e.g., uranium, coal, oil, natural gas, sunshine, wind, water—into electricity. *Id.* ¶ 6. The typical user of electrical power is indifferent to the method used to generate that power; to most of us, a megawatt is a megawatt is a megawatt. *Id.* ¶ 8. But to **energy** companies, utilities, policymakers, regulators, and investors (to name just a few), the process by which certain fuels are selected—or not—for use in electricity generation is a matter of momentous consequence. This case is about that process.

One of the most important fuels for electricity generation is thermal coal. Though it has steadily ceded ground to natural gas and renewables over the past twenty years, coal still provides 20 percent of our nation's electricity, and it is ***874** projected to remain an important fuel source for decades to come. Defendants **Peabody Energy** Company ("**Peabody**") and Arch Resources, Inc., ("Arch") are the two largest coal producers in the United States. **Peabody Energy Corp**.'s Answer & Affirmative Defenses (Doc. [54]) ("**Peabody** Answer") ¶¶ 15-16. **Peabody** and Arch propose to mitigate the effects of the coal industry's overall decline on their employees and investors by combining some of their thermal coal operations in a joint venture (the "JV"). JSUF ¶ 30. Defendants announced their intention to form the JV on June 19, 2019. *Id.*

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

Eight months later, three days before the JV was to be consummated, the Federal Trade Commission ("**FTC**") filed suit in this Court seeking an immediate injunction under Section 13(b) of the Federal Trade Commission Act to prevent the proposed JV from moving forward until the **FTC** could conduct an administrative hearing to determine whether it would violate Section 7 of the Clayton Act. Defendants stipulated to a temporary restraining order pending this Court's hearing on the **FTC's** Motion for Preliminary Injunction (Doc. [137]). After two COVID-19-related delays, that hearing took place in mid-July 2020, less than 5 months after the **FTC's** initial filing. In the interim, the parties worked furiously to exchange written discovery, take dozens of depositions, and prepare hundreds of pages of briefing and thousands of exhibits—all within the extraordinary constraints imposed by a global pandemic.

In considering the Motion, the Court has been the beneficiary of those herculean efforts, as both sides ably distilled their complex arguments into coherent, comprehensible presentations over the course of a nine-day evidentiary hearing, followed by proposed findings of fact and conclusions of law and closing arguments. Having carefully considered all of those submissions, the Court finds that the **FTC** has met its burden under Section 13(b) of the Federal Trade Commission Act for a preliminary injunction; accordingly, its Motion for Preliminary Injunction (Doc. [137]) is granted.

BACKGROUND

I. Factual Background

A. SPRB coal mining and transportation

The case is principally concerned with one of the several fuels that can be used for **energy** production: thermal coal. JSUF ¶¶ 13-14. It is even more narrowly focused, in fact, on thermal coal that is mined in one specific geographical region, the Southern Powder River Basin ("SPRB"), located in northeastern Wyoming, near the town of Gillette. *Id.* ¶¶ 16-17.

Unlike some mines in other parts of the country, SPRB mines are surface mines, meaning they are not underground. Tr. Vol. 2A (Jones) 5:20-21. Mining SPRB coal therefore requires removing "overburden," the material covering the coal. *Id.* at 5:22-23. The number of cubic yards of dirt that must be removed to access one ton of coal is the "strip ratio." Tr. Vol. 5A (Lang) 110:13-17. As an example, if a mine has a strip ratio of 4, that means that, on average, 4 cubic yards of dirt must be removed to access one ton of coal. *Id.* at 110:17-18. An SPRB coal mine's cost structure is primarily a function of the how difficult it is to access the coal, which is most succinctly captured by a mine's strip ratio. Tr. Vol. 5A (Kellow) at 64:22-65:2.

Coal companies design mines to minimize the cost of extracting coal, which involves optimizing the use of equipment used to remove overburden. There are three ways to move overburden. Tr. Vol. 5A (Lang) at 109:1-3. The most cost-effective ***875** method is explosives, whereby mining companies blast the overburden over the top of the pit and land it in another pit, revealing the material below what was blasted. *Id.* at 109:3-9. These can be massive explosions. Paul Lang, Arch's CEO and himself an experienced coal miner, stated that he has detonated as much as approximately 8.5 million pounds of explosives at a time. *Id.*

The second cheapest way to move large volumes of material is a dragline. *Id.* at 109:9-11. A dragline is an order of magnitude more expensive than explosives, but it is still very efficient. *Id.* Draglines are some of the largest earth-moving equipment in the world, with buckets that can scoop as much as 165 cubic yards at a time. *Id.* at 108:18-21. However, because of their size and the way they function, there are limitations on what they can do and where they can do it. *Id.* at 109:13-18.

The third way to move material is truck shovels, which are two to three times more expensive than a dragline. *Id.* at 109:19-22. When a company designs a coal mine, it optimizes the mine plan for the less expensive technologies, explosives and draglines. *Id.* at 109:23-25. As coal is extracted from a mine, the cost of extracting the marginal ton of coal increases as explosives and draglines become less feasible, and expensive shovel trucks are eventually needed for an increasing share of overburden removal. *Id.* at 110:24-111:17.

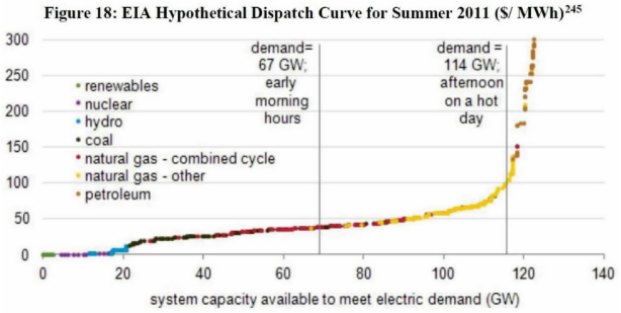
Once accessed, the coal is trucked out of the pit in six-foot chunks and run through a crusher, which breaks it up into two-inch-long pieces that customers can put into their boilers. Tr. Vol. 5B (Lang) 11:24-12:7. The crushed coal is loaded onto conveyor belts, which transport it to loadouts, where it is loaded onto train cars. *Id.* at 11:12-24.

Coal customers buy and take possession of the coal when it is loaded onto railcars in the SPRB. Tr. Vol. 1B (Meyer) 22:24-25. Hence, the price paid for the coal is sometimes

called the "mine-mouth" price. [Redacted] That commodity price is only a fraction of the coal's total delivered cost because customers also pay to transport the coal from the SPRB to wherever it will be used. *Id.* at 23:1-12. The transportation costs are substantial, sometimes up to more than half of the total delivered cost of the SPRB coal. *See, e.g.*, *id.*

All SPRB mines are along a rail line. The portion of the rail line south of the town of Gillette, Wyoming, is referred to as the "joint line" because it is owned by both the Burlington Northern Santa Fe ("BNSF") and Union Pacific railroads. [Redacted] The joint line is quadruple track through the SPRB coal mines, making it an efficient means of transporting coal out of the SPRB. *Id.* Mines north of Gillette are generally on a BNSF line only, which affects available prices and destinations for coal from that area. *Id.*; Tr. Vol. 3B (Sandlin) 81:19-82:1 (mines not along the joint line are "a bit more limited" in what power plants they can serve). The Buckskin, Rawhide, Eagle Butte, Dry Fork, and Wyodak mines are all north of Gillette and are served only by the BNSF line, while the Caballo, Belle Ayr, Cordero Rojo, Coal Creek, Black Thunder, NARM, and Antelope mines are all south of Gillette and served by the joint line. PX8001 (Hill Report) Fig. 2. [1] The lack of rail competition for mines north of the joint line has led to higher prices for transportation for coal from these mines, making such coal somewhat less attractive relative to ***876** mines served by the joint line. *See, e.g.*, [Redacted] does not solicit SPRB coal suppliers with only mines north of the joint line because they are "not competitive from a transportation standpoint"); [Redacted] only solicits SPRB coal suppliers with mines on the joint line); Tr. Vol. 5B (Stuchal) 93:9-12 (NPPD purchases SPRB coal from all producers on the joint line and none on the BNSF-only line).

B. ISOs and RTOs



When coal arrives at a power plant, it is not yet determined how frequently the plant will burn the coal or how much it will burn. Many utilities do not make these decisions themselves. Rather, the majority of all U.S.-generated electricity is managed through seven regional electricity markets known as Independent System Operators ("ISOs") or Regional Transmission Organizations ("RTOs"). [2] JSUF ¶ 9; PX8001 (Hill Report) ¶ 62. The Southwest Power Pool ("SPP"), the Midcontinent Independent System Operator ("MISO"), the **Energy** Reliability Council of Texas ("ERCOT"), and the Pennsylvania, Jersey, Maryland Power Pool ("PJM") together account for nearly 75% of all SPRB coal consumed in the United States. DX4005 (Carey Report) ¶ 19, Fig. 6. These organizations conduct daily auctions to match regional electricity demand as projected by providers, such as utility companies, with electricity supply offers from generators to maintain reliable and cost-effective electricity service in their geographic areas. DX4005 (Carey Report) ¶¶ 13, 27-32. These auctions are conducted on both day-ahead and real-time bases. *Id.* ¶ 27.

ISOs, and not the electricity generators, ultimately determine which EGUs "dispatch"—i.e., generate electricity and provide it to the grid—at every moment of every day. Tr. Vol. 6A (Carey) 24:13-16. The ISOs determine which EGUs dispatch on a "least-cost basis," meaning that those EGUs that can supply the anticipated electricity demand at the lowest cost will be instructed to run by the ISO. DX4005 (Carey Report) ¶ 28. EGUs in an ISO must make a confidential bid, based on the variable cost to supply a unit of production. *Id.* ¶¶ 30, 32. Based on the anticipated amount of **energy** (for the day-ahead market) or the actual amount of **energy** being demanded (for the real-time market), each ISO sets a market-clearing price—that is, the price at which the bid of the marginal unit of supply meets demand. *Id.* ¶ 31. If an EGU's bid is less than the market-clearing price, the ISO will instruct that EGU to generate, and the EGU's operator will be paid the market-clearing price for its power—even if its bid was less than the market-clearing price. *Id.*; DX4001 (Bailey Report) ¶ 13; Tr. Vol. 6A (Carey) 30:5-19. When this happens, the EGU is described as "in the money." DX4005 (Carey Report) ¶ 31. If, by contrast, an EGU's bid is greater than the market-clearing price, the ISO will not instruct that EGU to generate, and the EGU's operator will not be paid for that unit, putting the EGU "out of the money." *Id.*

This process—referred to as "merit-order dispatch" or "least-cost dispatch"—results in the lowest cost electricity dispatching (i.e., on a "least-cost basis"), regardless of the method by which the electricity is generated. *Id.* ¶ 28. In the dispatch process, then, EGUs within an ISO compete against all EGUs of all fuel types within that same ISO to generate electricity. DX4001 (Bailey Report) ¶ 13; Tr. Vol. 3B ***877** (Trushenski) 40:2-19. While certain areas of the country are not covered by an ISO, vertically integrated electrical utilities in those areas, such as the Tennessee Valley Authority ("TVA") and Southern Company, rely on merit-order dispatch to ensure cost-effectiveness. *See, e.g.,* Tr. Vol. 7B (Fuller) 9:10-10:10. [3]

C. Electricity dispatch curves

The mechanism by which merit-order dispatch occurs is the electricity dispatch curve, sometimes referred to as a dispatch "stack." DX4001 (Bailey Report) ¶¶ 13-14.

DX4005 (Carey Report) Fig. 18. Generally speaking, different EGU types occupy different parts of the dispatch curve. Some units—typically renewables such as wind, solar, and hydroelectric—generate power at close to no marginal cost because they have no fuel costs. Such EGUs are therefore bid into the market at low cost and typically are the first to run when available and needed to fulfill anticipated **energy** demand. DX4005 (Carey Report) ¶ 84. Nuclear-powered EGUs are typically next on the dispatch curve, as these units also have low marginal costs and are dispatchable.[4] Tr. Vol. 1B (Meyer) 11:19-22. EGUs that generate electricity from fossil fuels—e.g., coal, natural gas, and oil—have higher variable costs, primarily because of their fuel costs. Tr. Vol. 7B (Fuller) 10:2-5. These EGUs are typically bid in at their variable costs, appearing further up and to the right of the dispatch curve. DX4005 (Carey Report) ¶ 99; Tr. Vol. 5B (Stuchal) 99:11-17 (NPPD submits its nuclear plant as a must-run generating facility, followed by wind generation, then other renewables ***878** including hydro, and finally coal and natural gas).

As described above, an EGU is typically dispatched only when its bid is at or below the market-clearing price. The more low-cost bids are submitted by renewable- and nuclear-powered EGUs, the further fossil fuels, including coal, are pushed to the right on the dispatch curve, because the marginal cost of generating an additional megawatt from renewables or nuclear is virtually always lower than the marginal cost of generating that megawatt from coal. DX4005 (Carey Report) ¶ 99. Whatever the market-clearing price, then, increasing renewable generation likely means that fewer fossil fuel-powered EGUs will be called to run. Tr. Vol. 6A (Carey) 46:14-19.

Whether because of market-order dispatch, planned or unplanned maintenance, or other reasons, an EGU does not run at its maximum capacity at every moment of every day of every year. Tr. Vol. 1B (Meyer) 10:2-16. An EGU's "capacity factor," or "utilization rate," measures how often a unit runs as a fraction of its total capability. Tr. Vol. 2A (Peterson) 39:25-40:1. A lower capacity factor means that a unit runs less often; a higher capacity factor means that it runs more often. The higher a unit's capacity factor, the more economical it is to operate. Vol. 1B (Meyer) 10:3-12.

D. Recent trends in energy generation

The most recent major antitrust proceeding in the coal industry took place in 2004. *F.T.C. v. Arch Coal, Inc.*, 329 F. Supp. 2d 109 (D.D.C. 2004). The commercial circumstances of coal companies have changed significantly in the intervening sixteen years. The three most important changes for this case's purposes are the significantly lower price of natural gas; the substantial increase in renewable generation; and the steep decline in coal generation. The confluence of those trends has led to a significant decrease in coal consumption since 2004.

1. Declining natural gas prices

Technological advancements such as hydraulic fracturing, sometimes referred to as "fracking," as well as the discovery of vast reserves of natural gas in shale rock formations throughout the United States, have precipitated a remarkable decline in the cost of producing natural gas. DX4001 (Bailey Report) ¶ 17. Since 2008, the price of natural gas has fallen by more than 75%, from over $8/mmBTU to under $2/mmBTU. *Id.* These developments have made the United States the world's largest natural gas producer. DX4003 (Israel Report) ¶ 50. At the same time, new and highly efficient combined cycle gas turbines ("CCGTs") have made natural gas EGUs much more efficient at converting the **energy** stored within natural gas into electricity. DX4001 (Bailey Report) ¶ 17; [Redacted]

The combination of cheap natural gas and efficient CCGTs has made electricity generation from natural gas more cost-effective than in the past, causing many utilities to construct natural gas-powered EGUs that compete with coal-powered EGUs to dispatch. DX4005 (Carey Report) ¶¶ 75-77. As a result, average capacity factors within MISO, SPP, and ERCOT for natural gas-powered EGUs have risen from approximately 30-40% to 50-60% from 2010 to 2019, while

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

average capacity factors for coal-powered EGUs have fallen from approximately 70% to 40% over that same time period. *Id.* ¶¶ 93-94 & Figs. 13-14.

2. Increasing renewable generation

Over the last several decades, governmental authorities have introduced subsidies ***879** and other policies designed to encourage investment in renewable **energy** generation, and electricity generators have directed their capital investments accordingly. Tr. Vol. 1B (Meyer) 16:13-15 ("We are adding renewables right now ... to meet compliance with Missouri's renewable **energy** standard."). Accordingly, electricity generation from wind and solar has doubled since 2010. Tr. Vol. 6A (Carey) 45:3-45:8.

Solar and wind power are intermittent and "non-dispatchable" **energy** sources, meaning they only generate **energy** when the wind is blowing or the sun is shining, which is out of the utility company's control. Tr. Vol. 6A (Galli) 113:5-8; Tr. Vol. 7B (Fuller) 18:22-19:8. That constraint makes renewable fuels imperfect replacements for fossil fuels like coal. When they do run, however, renewables are the lowest-cost generation options on the dispatch curve, shifting SPRB coal generation to the right, and decreasing the likelihood that an SPRB coal-fired unit will be dispatched. *See* Section I.C, *supra.* As such, increased use of renewables has contributed to an erosion in demand for coal. [Redacted]

3. Declining coal generation

In addition to plummeting natural gas prices and pro-renewable policies, some witnesses pointed to environmental regulations as a factor increasing the cost of operating coal-fired EGUs in recent years. [Redacted] plans to retire certain coal-fired EGUs because "there would be significant capital investments that would be required in those units to extend the life and to operate and meet environmental standards"); *see also* [Redacted] Whatever the causes, the operational costs of coal-fired generation have increased over the past 16 years, relative to other fuel sources. DX4001 (Bailey Report) ¶¶ 18-20. In response to these increasing costs, electricity generators have shifted away from coal by investing in new renewable and natural gas-powered EGUs and idling or permanently retiring their coal EGUs. *Id.*

Between 2010 and the first quarter of 2019, U.S. power companies announced the retirement of at least 546 coal-powered EGUs totaling about 102 gigawatts (GW) of generating capacity. DX8009-001. Plant owners intend to retire another 17 GW of coal-fired capacity by 2025. *Id.* Strikingly, not a single megawatt of coal generating capacity is currently being built or planned in the entire United States. Tr. Vol. 6A (Carey) 46:20-21.

In addition, some plants that are not being retired are being relegated to seasonal operations. For instance, [Redacted] has retired, idled, or converted to natural gas [Redacted] coal-fired EGUs, and it is considering retiring its [Redacted] remaining coal-fired EGUs or shifting to seasonal operations. [Redacted]

4. Cumulative impact on the coal industry

As a result of these developments, coal is no longer uniformly regarded as the "baseload" generation source that it was when *Arch Coal* was decided. DX4001 (Bailey Report) ¶ 31 (collecting statements from various utilities). Coal-fired EGUs are increasingly "load-following," meaning that they may or may not dispatch depending on day-to-day changes in the ISO dispatch market. *Id.*

In 2004, coal, including but not limited to SPRB coal, comprised almost 50% of net electricity generation in the United States, while nuclear provided about 20%, natural gas provided about 18%, hydro provided about 7%, and other renewables, including wind and solar, provided about 2%. *Id.* at Ex. 8. In 2019, as a result of the three trends described above, coal's share of net electricity generation in the United States had fallen to about 23%, while natural gas ***880** generation had leapt to about 38% of net generation and other renewables had climbed from 2% to about 10%. *Id.* Meanwhile, the country's annual net electricity consumption has stayed relatively flat, increasing by less than 15% over that same time period. *Id.* at Ex. 9. These trends represent a clear structural shift away from coal to other fuels, and no party has suggested that coal will ever again be the primary fuel used to generate electricity in the United States.

The overall decline in electricity generation from coal is reflected in SPRB coal production. From a peak of 452 million tons of SPRB coal mined in 2008, aggregate SPRB coal production decreased by over 40% to 267 million tons in 2019. *Id.* ¶ 21. Between 2011 and 2019, **Peabody's**

production at its three SPRB mines (NARM, Caballo, and Rawhide) declined by nearly 30%, from 148 million tons to 108 million tons. *Id.* Likewise, Arch's production at its two SPRB mines (Black Thunder and Coal Creek) declined by 41%, from 128 million tons to 75 million tons. *Id.* These declines can also be seen in customers' SPRB coal deliveries. *Id.* ¶ 22.

As the costs of production have increased and demand has decreased, the price of SPRB coal has declined from $20 per ton in 2006 to approximately $12 per ton in 2020. Tr. Vol. 3B (Sandlin) 101:24-102:3. Higher costs of production combined with lower prices have caused profit margins to fall. Arch's profit margin for Black Thunder coal fell from [Redacted] in 2004 to [Redacted] in 2019. DX4001 (Bailey Report) ¶ 23. Arch's SPRB margins were negative in each of the first two quarters of 2020. Tr. Vol. 5A (Lang) 77:15-24, 81:20-83:18. **Peabody's** profits margin for NARM coal declined from [Redacted] in 2007 to [Redacted] in 2019. DX4001 (Bailey Report) ¶ 23. **Peabody's** overall SPRB margins in the first quarter of 2020 were 10%. Tr. Vol. 5A (Kellow) 32:21-24.

The combination of low natural gas prices, increasing use of renewables, structural decline in SPRB coal production, and falling margins has caused numerous SPRB coal producers to declare bankruptcy over the last ten years. JSUF ¶¶ 27-29. In order to cut costs, mining companies have laid off significant fractions of workforces at all SPRB mines in recent years, including in the last several months. DX8698-001; Tr. Vol. 5A (Kellow) 13:14-14:10 (describing recent **Peabody** layoffs); Tr. Vol. 5A (Lang) 69:8-12 (Arch has gone from 39 coal mines and over 8,000 employees in 2011 to 8 coal mines and 3,400 employees today). One of the witnesses at the hearing had himself retired early as part of **Peabody's** ongoing force reduction efforts. Tr. Vol. 6A (Galli) 105:16-24.

Given the pace of retirements of coal-powered units and the lack of any plans for new coal-powered units, coal companies perceive any retirement of a coal-powered EGU to be a permanent loss in demand. Tr. Vol. 5A (Kellow) 6:19-7:6 (once a customer decides to retire a coal plant, the associated demand is "lost to coal forever" because "we are not seeing new generation of coal units coming online"). Coal companies therefore have an incentive to work with customers to try to prevent such retirements. Tr. Vol. 6B (Galli) 42:19-45:3 (regarding [Redacted]); DX4003 (Israel Report) ¶ 123 (collecting examples of Defendants adjusting pricing to forestall coal EGU retirements).

II. The Proposed Joint Venture

Peabody is a publicly traded mining company headquartered in St. Louis, Missouri. JSUF ¶ 2. **Peabody** describes itself as "the leading global pure-play coal company, serving power and steel customers in more than 25 countries on six continents." ***881** PX9010-002. It is the largest producer and supplier of coal from the SPRB. **Peabody** Answer ¶ 16; PX8001 (Hill Report) ¶ 30. **Peabody** operates three mines in the SPRB: North Antelope Rochelle ("NARM"), Rawhide, and Caballo. JSUF ¶ 20. NARM is the largest coal mine in the world, powering approximately 4.5% of total U.S. electricity generation. PX9010-002. In 2019, **Peabody** sold approximately 108 million tons of SPRB coal: 85.3 million tons from NARM, 12.6 million tons from Caballo, and 10.1 million tons from Rawhide. PX9063-061.

Arch is also a publicly traded mining company headquartered in St. Louis, Missouri. JSUF ¶ 3. Arch also operates two thermal coal mines in the SPRB: Black Thunder and Coal Creek. JSUF ¶ 19. In 2019, Arch sold 72 million tons of SPRB coal from Black Thunder and 2.6 million tons from Coal Creek. PX9055-015. According to the U.S. **Energy** Information Administration ("EIA"), which defines itself as the "premier source for **energy** information" in the United States, JSUF ¶ 11, and whose data and reports on power generation both parties cite extensively, Black Thunder is the second most productive mine in the United States, after **Peabody's** NARM. PX9041-034.

In addition to **Peabody** and Arch, five other companies produce coal in the SPRB from seven mines. JSUF ¶ 21. Navajo Transitional **Energy** Co. ("NTEC") operates the Antelope and Cordero Rojo mines. *Id.* ¶ 22. [5] Eagle Specialty Minerals ("Eagle"), an affiliate of FM Coal, operates the Eagle Butte and Belle Ayr mines. *Id.* ¶ 23. [6] Peter Kiewit Sons, Inc., ("Kiewit") operates the Buckskin mine. *Id.* ¶ 24. Black Hills Corporation operates the Wyodak mine. *Id.* ¶ 25. The Western Fuels Association ("WFA") operates the Dry Fork mine. *Id.* ¶ 26.

Defendants announced the proposed joint venture on June 19, 2019. *Id.* ¶ 30. If consummated, the JV would combine **Peabody** and Arch's PRB and Colorado mining assets. *Id.* The JV would be 66.5% owned by **Peabody** and 33.5% owned by Arch, *id.* ¶ 31, and **Peabody** would serve as the JV operator and handle coal marketing for the JV. PX1564-004. The JV would control approximately 65-70% of all SPRB coal

produced, PX8001 Fig. 22, and would operate five of the top ten most productive mines in the United States. PX1564-005.

Defendants contend that the JV will combine their Colorado and SPRB mining assets in a "highly synergistic joint venture aimed at strengthening coal's competitiveness against natural gas and renewables, while creating substantial value for customers and shareholders." Defendants' Proposed Findings of Fact and Conclusions of Law ("DPFFCL") (Doc. [404]) ¶ 50; DX8696-001. The JV would join **Peabody's** NARM mine with Arch's Black Thunder mine into a single mining complex. DPFFCL ¶ 50; DX8696-002. Currently, the two mines neighbor one another but are separated by a seven-mile property line. *Id.*

III. The FTC's Challenge and Procedural History

On February 25, 2020, the **FTC** initiated an administrative proceeding challenging the JV under Section 7 of the Clayton Act ***882** and Section 5 of the **FTC** Act. JSUF ¶ 32. The following day, the **FTC** initiated this litigation, filing a complaint seeking a temporary restraining order ("TRO") and preliminary injunction blocking the JV pursuant to Section 13(b) of the **FTC** Act. *Id.* ¶ 33. On February 28th, the **FTC** and Defendants stipulated to, and this Court ordered, a TRO blocking Defendants from consummating the JV pending this Court's adjudication of the **FTC's** motion for a preliminary injunction. *Id.* ¶ 34.

The parties originally intended to conduct a preliminary injunction hearing in June 2020. Because of delays caused by the ongoing COVID-19 pandemic, that schedule was amended twice, giving the parties more time to adjust to rapidly evolving health guidelines and public safety risks and to conduct heroic amounts of written discovery and scores of depositions.

Even with those delays, this case was litigated at breakneck speed. Less than five months after the **FTC's** initial filing in this Court in late February, the parties conducted a nine-day preliminary injunction hearing from July 14th through the 24th, during which the parties admitted hundreds of exhibits and presented testimony from dozens of witnesses.[7] On August 3rd, the parties filed proposed findings of fact and conclusions of law, and on August 10th, the parties presented their closing arguments to the Court.

LEGAL STANDARD

Section 7 of the Clayton Act prohibits mergers or acquisitions "the effect of [which] may be substantially to lessen competition, or to tend to create a monopoly" in "any line of commerce or in any activity affecting commerce in any section of the country." 15 U.S.C. § 18. When the **FTC** has "reason to believe that a corporation is violating, or is about to violate, Section 7 of the Clayton Act," it may seek a preliminary injunction under Section 13(b) of the **FTC** Act to "prevent a merger pending the Commission's administrative adjudication of the merger's legality." *F.T.C. v. Staples, Inc.*, 970 F. Supp. 1066, 1070 (D.D.C. 1997) ("*Staples I*") (citing 15 U.S.C. § 53(b)).[8]

[1] [2] [3] The standard for a preliminary injunction described in Section 13(b) of the **FTC** Act differs from the more familiar preliminary injunction standard applied in other contexts. *F.T.C. v. Sysco **Corp.***, 113 F. Supp. 3d 1, 22 (D.D.C. 2015). A preliminary injunction may be granted in an antitrust case if the **FTC** shows that "weighing the equities and considering the Commission's likelihood of ultimate success, such ***883** action would be in the public interest." *F.T.C. v. Tenet Health Care **Corp.***, 186 F.3d 1045, 1051 (8th Cir. 1999) (quoting 15 U.S.C. § 53(b)). In order to demonstrate such a likelihood of ultimate success, "the **FTC** must raise questions going to the merits so serious, substantial, difficult and doubtful as to make them fair ground for thorough investigation, study, deliberation and determination by the **FTC** in the first instance and ultimately by the Court of Appeals." *F.T.C. v. Freeman Hosp.*, 69 F.3d 260, 267 (8th Cir. 1995) (quotation omitted). "A showing of a fair or tenable chance of success on the merits will not suffice for injunctive relief." *Tenet Health*, 186 F.3d at 1051 (citing *Freeman Hosp.*, 69 F.3d at 267).

[4] [5] [6] [7] [8] [9] In *United States v. Baker Hughes, Inc.*, 908 F.2d 981, 982–83 (D.C. Cir. 1990), the D.C. Circuit established a burden-shifting framework for evaluating the **FTC's** likelihood of success on the merits. The Eighth Circuit has analyzed, endorsed, and applied the *Baker Hughes* burden-shifting framework in the context of an alleged Clayton Act violation. *See F.T.C. v. Sanford Health*,

926 F.3d 959 (8th Cir. 2019). The Eighth Circuit described the framework:

> Under this approach, the [**FTC**] must first present a prima facie case that the merger will result in an undue market concentration for a particular product or service in a particular geographic area. That showing creates a presumption that the merger will substantially lessen competition. The burden of production then shifts to the defendant[s] to rebut the presumption, and, on a sufficient showing, back to the [**FTC**] to present additional evidence of anticompetitive effects. The ultimate burden of persuasion remains at all times with the [**FTC**].

Id. at 962-63. "The more compelling the prima facie case, the more evidence the defendant must present to rebut it successfully." *Baker Hughes*, 908 F.2d at 991. "A defendant can make the required showing by affirmatively showing why a given transaction is unlikely to substantially lessen competition, or by discrediting the data underlying the initial presumption in the government's favor." *Id.* "[A] failure of proof in any respect will mean the transaction should not be enjoined." *F.T.C. v. Arch Coal*, 329 F. Supp. 2d 109, 116 (D.D.C. 2004). The court must also weigh the equities, but if the **FTC** is unable to demonstrate a likelihood of success, the equities alone cannot justify an injunction. *Id.*

DISCUSSION

I. Market Definition

[10] The **FTC's** initial burden, then, is to demonstrate that there is a relevant market in which the proposed JV is likely to harm competition relative to the "but-for" world in which there is no JV. *See* *Brown Shoe Co. v. United States*, 370 U.S. 294, 325, 82 S.Ct. 1502, 8 L.Ed.2d 510 (1962); *Sanford*, 926 F.3d at 962-63 (describing market definition and burden-shifting framework); Horizontal Merger Guidelines [9] ("Guidelines") § 1 (merger analysis normally requires "an assessment of what will likely happen if a merger proceeds as compared to what will likely happen if it does not"); *F.T.C. v. Nat'l Tea Co.*, 603 F.2d 694, 700 (8th Cir. 1979) ("[W]hen examining a merger, a court must necessarily compare what may happen ***884** if the merger occurs with what may happen if the merger does not occur.").

This initial step is mission-critical for all **FTC** merger challenges. *United States v. Marine Bancorp.*, 418 U.S. 602, 618, 94 S.Ct. 2856, 41 L.Ed.2d 978 (1974) (Market definition is " 'a necessary predicate' to deciding whether a merger contravenes the Clayton Act.") (quoting *United States v. E.I. du Pont De Nemours & Co.*, 353 U.S. 586, 593, 77 S.Ct. 872, 1 L.Ed.2d 1057 (1957)); *Tenet Health*, 186 F.3d at 1051 ("Without a well-defined relevant market, a merger's effect on competition cannot be evaluated. It is thus essential that the **FTC** identify a credible relevant market before a preliminary injunction may properly issue.") (citation omitted); *Freeman Hosp.*, 69 F.3d at 268 ("Without a well-defined relevant market, an examination of a transaction's competitive effects is without context or meaning."). This case is no exception. If the **FTC** does not produce sufficient evidence for its proposed market definition —and satisfactorily address Defendants' objections thereto— it will be very difficult to justify its request for a preliminary injunction against the JV. *See, e.g.*, *F.T.C. v. RAG-Stiftung et al.*, 436 F.Supp.3d 278, 287 (D.D.C. 2020) (The **FTC's** failure "to properly define a market in terms of both product and geography ... all but precludes the Court from siding with it.").

[11] **[12]** **[13]** "A relevant market consists of two separate components: a product market and a geographic market." *Freeman Hosp.*, 69 F.3d at 268. "First, the 'relevant product market' identifies the product and services with which the defendants' products compete. Second, the 'relevant geographic market' identifies the geographic area in which the defendant competes in marketing its products or service." *Arch Coal, Inc.*, 329 F. Supp. 2d at 119; *see also* *F.T.C. v. CCC Holdings Inc.*, 605 F. Supp. 2d 26, 37 (D.D.C. 2009) (same). In this case, the principal question in the market definition phase is the relevant product market. If the **FTC** succeeds in defining the product market as SPRB coal, the geographic market follows rather uncontroversially from that conclusion. Therefore, the Court will focus first on the parties' positions on the relevant product market.

A. Relevant product market

[14] **[15]** A product market is defined by "the reasonable interchangeability of use or the cross-elasticity of demand between the product itself and substitutes for it." *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502. *See also Process Controls Int'l, Inc. v. Emerson Process Mgmt.*, Case No. 4:10-cv-645-CDP, 2011 WL 403121, at *2 (E.D. Mo. Feb. 1, 2011) ("[T]he relevant product market includes all reasonably interchangeable products."). In other words, a properly defined product market includes the functionally similar products to which customers could turn if the JV attempted to impose a post-closing price increase. *See Little Rock Cardiology Clinic PA v. Baptist Health*, 591 F.3d 591, 596 (8th Cir. 2009) (noting focus is whether "consumers will shift from one product to the other in response to changes in their relative costs"); *F.T.C. v. R.R. Donnelley & Sons Co.*, Case No. 90-1619-SSH, 1990 WL 193674, at *2 (D.D.C. Aug. 27, 1990) ("If customers are able to substitute one product or service in response to a nontrivial increase in the price of another, these products or services must fall within the same product market.").

[16] **[17]** A relevant product market need not be defined around a *single* product. *See United States v. Grinnell Corp.*, 384 U.S. 563, 572, 86 S.Ct. 1698, 16 L.Ed.2d 778 (1966) ("We see no barrier to combining in a single market a number of different products or services where that ***885** combination reflects commercial realities."); *Sysco*, 113 F. Supp. 3d at 26 ("The 'product' that comprises the market need not be a discrete good for sale."); *see, e.g.*, *United States v. Phila. Nat'l Bank*, 374 U.S. 321, 356, 83 S.Ct. 1715, 10 L.Ed.2d 915 (1963). Also, "the mere fact that a firm may be termed a competitor in the overall marketplace does not necessarily require that it be included in the relevant product market for antitrust purposes." *Staples I*, 970 F. Supp. at 1075. Rather, the critical question is "whether two products can be used for the same purpose, and if so, whether and to what extent purchasers are willing to substitute one for the other." *Id.* at 1074 (quotation omitted); *see also Sysco*, 113 F. Supp. 3d at 26 ("[M]arket definition hinges on whether consumers view the products as reasonable substitutes.") (internal quotation marks and citation omitted).

Here, the **FTC** insists that the market for SPRB coal satisfies all applicable criteria for a relevant product market. Defendants counter that the electricity industry is so complex and dynamic that the JV cannot reasonably be evaluated in the context of the market for SPRB coal alone. Instead, they urge this Court to define the relevant product market for evaluation of the JV more broadly, to include not only other kinds of coal but also other fuels that compete with coal in the electricity generation market. Resolution of this critical question has been complicated by a recurring theme of this litigation: "There is no industry like the electricity industry." Tr. Vol. 6A (Carey) 24:8-9. The parties took great pains to educate the Court about the idiosyncrasies of that industry, though, and the Court has done its best to take them into account in its evaluation of their proposed relevant product markets.

Courts have various tools with which to determine whether to adopt the **FTC's** proposed relevant product market, including quantitative approaches, such as the hypothetical monopolist test ("HMT"), and qualitative approaches, such as the factors laid out in *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502. The parties here have discussed both the HMT and *Brown Shoe*. And both sides have made compelling points in favor of their preferred product markets, as outlined below. Considering all of the evidence, though, both quantitative and qualitative, the Court finds that SPRB coal is the relevant product market in which to evaluate the competitive effects of the proposed JV.

[18] Crucial to the Court's conclusion is the "narrowest market principle." A broad product market (e.g., American electricity production) may contain smaller markets (e.g., the markets for each of the individual sources of fuel or markets consisting of power producers in a certain region) which themselves "constitute [relevant] product markets for antitrust purposes." *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502. If **Peabody** and Arch compete in multiple product markets, the JV will be illegal under the Clayton Act if it causes substantial competitive harm in *any* of those markets. *United States v. Cont'l Can Co.*, 378 U.S. 441, 458, 84 S.Ct. 1738, 12 L.Ed.2d 953 (1964); *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502 ("Because [Section 7] of the Clayton Act prohibits any merger which may substantially lessen competition 'in any line of commerce,' it is necessary to examine the effects of a merger in each such economically significant submarket to determine if there is a reasonable probability that the merger will substantially lessen competition.") (internal citations omitted).

[19] Because competitive harm in *any* relevant product market is enough to make out a prima facie case for violation of the Clayton Act, and because potential ***886** harms to competition will likely be less apparent in a broader, less concentrated market than in a narrower included market, this Court's task is to identify the narrowest market within which the defendant companies compete that qualifies as a relevant product market. *See* *Times-Picayune Publ'g Co. v. United States*, 345 U.S. 594, 612 n.31, 73 S.Ct. 872, 97 L.Ed. 1277 (1953) ("The circle must be drawn narrowly to exclude any other product to which, within reasonable variations in price, only a limited number of buyers will turn."); *United States v. H&R Block, Inc.*, 833 F. Supp. 2d 36, 58-60 (D.D.C. 2011) (explaining "the principle that the relevant product market should ordinarily be defined as the smallest product market that will satisfy the hypothetical monopolist test"). The prospective merger's likely competitive effects on *that* market will determine its legality. *See* Guidelines § 4.1.1; *Sysco*, 113 F. Supp. 3d at 26-27; *Arch Coal*, 329 F. Supp. 2d at 120; *Tronox*, 332 F. Supp. 3d at 201-02.

It is indisputable on the record in this case that coal competes with natural gas and renewables in a broader **energy** market. Still, the **FTC** has presented more than sufficient evidence that there is *also* a distinct competitive market among SPRB coal producers that satisfies the applicable criteria for market definition. Because the SPRB coal market satisfies the relevant criteria and is narrower than the **energy** market writ large, that is the market within which the Court must evaluate the legality of the proposed JV. *Cont'l Can Co.*, 378 U.S. at 458, 84 S.Ct. 1738; *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502.

In determining the relevant product market for analysis of the proposed JV, the Court has considered the **FTC's** application of the HMT, the parties' criticisms and defenses thereof, and each of the *Brown Shoe* practical indicia. The Court will address each of these considerations in turn.

1. Hypothetical Monopolist Test

The **FTC** argues that the HMT, which is "commonly used in antitrust actions to define the relevant market," *Sanford*, 926 F.3d at 963, demonstrates that the relevant product market here is the market for SPRB coal. PPCL ¶¶ 19-21; *see also* Guidelines § 4.1.1 (The **FTC** "employ[s] the hypothetical monopolist test to evaluate whether groups of products in candidate markets are sufficiently broad to constitute relevant antitrust markets.").

[20] **[21]** The HMT is an analytical method that asks "whether a hypothetical monopolist who has control over the products in an alleged market could profitably raise prices on those products." *F.T.C. v. Staples, Inc.*, 190 F. Supp. 3d 100, 121 (D.D.C. 2016) ("*Staples II*"). If a firm with a monopoly over the products in a candidate market could profitably impose a small but significant non-transitory increase in price ("SSNIP"), then that market constitutes a relevant product market for antitrust purposes. Guidelines § 4.1.1. Federal agencies, including the **FTC**, usually use a SSNIP of 5% of prices absent the merger in their analyses of prospective mergers. *Id.* § 4.1.2. Neither party has argued that 5% is an inappropriate SSNIP to use in the Court's application of the HMT to the JV.

a. The **FTC's** HMT analysis

Dr. Nicholas Hill, an antitrust economist, gave expert testimony on behalf of the **FTC** regarding implementation of the HMT to assess whether SPRB coal is properly defined as the relevant product market for evaluation of the proposed JV. Plaintiff's Proposed Findings of Fact ("PPFF") (Doc. [395]) ¶¶ 38-40; PX8001 (Hill Report) ¶¶ 80-84. Dr. Hill implemented the HMT using the critical elasticity ***887** method, Tr. Vol. 4A (Hill) 25:10-13, which he testified is a long-established and well accepted method, Tr. Vol. 9B (Hill) 82:21-83:10. To apply the method, Mr. Hill first calculated the critical elasticity, which is based on industry margins and a 5% SSNIP. PX8001 (Hill Report) ¶ 115; Tr. Vol. 4A (Hill) 26:6-17, 27:2-28:13. Next, Dr. Hill calculated the actual price elasticity of demand for SPRB coal, using standard econometric techniques on real-world data sources. PX8001 (Hill Report) ¶ 114; Tr. Vol. 4A (Hill) 26:18-23, 28:14-25. Finally, Dr. Hill compared the critical elasticity to the actual elasticity: If the actual price elasticity of demand is lower than the critical elasticity, the HMT is satisfied, and the group of products is a properly defined relevant product market for antitrust purposes. PX8001 (Hill Report) ¶ 113; Tr. Vol. 4A (Hill) 29:3-9.

In order to calculate critical elasticity, one must use an industry margin. The parties gave very different estimates of industry SPRB coal margins at the hearing, ranging from negative margins (*i.e.*, Defendants lost money on SPRB coal sales) to margins in excess of 30%. Dr. Hill relied on the average industry variable cost margin based on Defendants' own accounting data. PX8001 (Hill Report) ¶ 250. Dr. Mark Israel, one of Defendants' experts, presented a different margin based on a different categorization of certain costs as variable, decreasing the margin. Tr. Vol. 9B (Israel) 29:16-20. The **FTC** argues that Dr. Hill's margin calculations apply a more consistent methodology than Dr. Israel's. PPFF ¶ 45. The Court feels no need to resolve that dispute, because Dr. Hill explained that his methodology, which resulted in a *higher* margin, made the HMT *more* stringent and *more* difficult for the proposed relevant product market to satisfy. Tr. Vol. 4A (Hill) 132:15-133:6. Thus, the use of Dr. Israel's lower margin with the HMT would presumably have yielded results even more strongly supportive of the **FTC's** proposed market. Moreover, Defendants never argued that a different set of margins would have led to a different outcome on the HMT, so choosing between Dr. Hill's and Dr. Israel's margin calculations would be an academic exercise.

The actual price elasticity of demand is an economic metric for how many sales a product (here, SPRB coal) would lose in response to a small change in price. PX8001 (Hill Report) ¶ 107. It is another signifier of how closely potential substitutes, such as natural gas or other fuels, compete with SPRB coal, in that a higher price elasticity of demand suggests that customers can easily switch to an alternative, whereas a lower elasticity means that customers cannot. *See id.* ¶ 149. Dr. Hill estimated the actual price elasticity of demand for SPRB coal using five different data sets drawn from real-world market sources. *Id.* Fig. 21; PX8006 (Hill Rebuttal Report) Fig. 73; Tr. Vol. 4A (Hill) 30:19-48:8. In all of Dr. Hill's elasticity estimates, the actual price elasticity of demand for SPRB coal was relatively low. PX8001 (Hill Report) ¶ 117. According to the **FTC**, this finding, which takes into account the competitive pressures from potential substitutes like natural gas, means that customers of SPRB coal, viewed in the aggregate, are likely to continue purchasing SPRB coal in the face of a small increase in price. *Id.* ¶¶ 149-50; Tr. Vol. 4A (Hill) 47:21-49:14. None of Defendants' experts calculated an alternate value for the price elasticity of demand for SPRB coal. Tr. Vol. 9B (Hill) 52:3-11. Thus, according to the **FTC**, Dr. Hill' analysis proves that SPRB coal satisfies the HMT and constitutes the relevant product market in which to consider the legality of the proposed JV.

b. Defendants' response to the HMT

Defendants assert three objections to Dr. Hill's analysis of the relevant product ***888** market based on the HMT: Dr. Hill's HMT fails to incorporate the effects of dynamic competition; it contradicts real-world facts; and it is inconsistent with the realities of merit-order dispatch.

i. Dynamic versus static competition

First, Defendants argue that Dr. Hill's HMT analysis is fundamentally flawed because "[t]he electricity generation marketplace is uniquely complex and subject to multiple levels of dynamic competition." DPFFCL ¶ 182. They contend that "dynamic competition and the ever-present risk of coal EGU retirements and resulting permanent loss of SPRB coal demand" would prevent a hypothetical SPRB coal monopolist from increasing SPRB coal prices, thereby risking a permanent reduction in future coal demand. *Id.* ¶ 183.

According to Defendants, "[a] hypothetical SPRB coal monopolist considering a price increase must account not just for short-term potential lost sales volume to other fuels, but also for the coal demand that will be lost due to longer-term changes in generation strategies, including the permanent loss of demand when coal EGUs are retired." *Id.* ¶ 185. As Defendants' expert, Dr. Elizabeth Bailey, an antitrust economist at NERA Economic Consulting, explained at the hearing, "if the price of SPRB coal were to go up by a small amount ... in the short run, that has an effect on utilization or dispatch. And then in the medium and longer run, that has an effect on dynamic substitution, these changes in generation strategies." Tr. Vol. 7A (Bailey) 29:23-30:3.

In a world with dynamic competition, Defendants argue, competition from natural gas and renewables triggers two types of "bad news" for SPRB coal producers and consumers: (1) declining utilization of coal-powered generation, as ISOs dispatch fewer coal-fired EGUs as a result of relatively cheaper alternative sources of **energy**; and (2) a decline in wholesale electricity prices, causing all EGUs to be paid a lower market-clearing price when they run. Tr. Vol. 7A (Bailey) 46:18-48:11. These forces mean that if a hypothetical monopolist attempted to increase SPRB coal prices, both short-run and longer-run demand would fall, driving dynamic substitution away from SPRB coal. *Id.*;

DPFFCL ¶ 187. As described in Section I(D)3, above, such dynamic substitution can take multiple forms: a shift to seasonal operations; entering into power purchase agreements with other electricity generators; accelerating investments in alternative generation sources; accelerating retirement decisions; or retiring a unit immediately and permanently. Tr. Vol. 7A (Bailey) 31:23-32:17. This combination of static and dynamic substitution affects all SPRB coal-powered EGUs, regardless of efficiency. Thus, Defendants claim, even relatively efficient coal-powered EGUs "have made dynamic changes in generation strategy in response to competition from other fuel sources." DPFFCL ¶ 190 (citing Tr. Vol. 7A (Bailey) 50:15-52:7).

As an example of how this dynamic substitution occurs, Defendants point to [Redacted] DPFFCL ¶ 189. [Redacted] but as competition from natural gas and subsidized renewables increased, [Redacted] Tr. Vol. 7A (Bailey) 34:19-35:3 [Redacted] evaluated a range of options, from buying **energy** off the grid through power purchase agreements, shifting to seasonal operations, temporarily idling or "mothballing" the plant, and then finally retiring the plant. *Id.* at 35:4-36:1; DX1055-0004 [Redacted] operating environment has changed drastically over the last several years, transitioning from base load operations to load following, and now reconsidering reserve shut down scenarios. This is largely driven by falling natural gas prices which drive down ERCOT wholesale market ***889** prices, ample generation capacity in ERCOT, and the continued growth of renewables in the ERCOT market."). Arch [Redacted] to try to make [Redacted] more competitive with *other* ***energy*** *sources*—critically, not in an attempt to undercut competing SPRB coal suppliers or as a result of an RFP. [Redacted] While Arch was ultimately unsuccessful and [Redacted] Defendants argue that this example shows that they are in close competition with other sources of **energy**, perhaps even closer competition than they are in with other SPRB coal producers, and that they are highly sensitive to dynamic competition.

Dr. Israel explained that this dynamic competition affects how a rational, profit-maximizing coal producer will operate. DX4003 (Israel Report) ¶¶ 84-130. In a counterfactual coal-only world with only static competition, if the JV raised prices and found that its lost sales rendered the price increase unprofitable, it could lower its prices to regain the market share lost by the earlier price increase. *Id.* ¶ 85. However, in a world with competition from other fuel sources, SPRB coal producers must consider the risk that raising prices would induce customers to accelerate coal EGU retirements, permanently reducing demand and making it impossible to return to the pre-price-increase world simply by lowering prices. *Id.* ¶¶ 86-87. According to Defendants, Dr. Hill's HMT estimates only the immediate, static substitution caused by shifts in the dispatch curve, which misses longer-term dynamic risks and therefore cannot explain decisions like those made by [Redacted] in regard to its [Redacted] plant and by Arch in trying to [Redacted]. DPFFCL ¶ 193. Customers, on the other hand, recognize the reality of dynamic competition, and use the threat of dynamic substitution to obtain more competitive pricing in RFPs. *Id.*; [Redacted] (acknowledging that [Redacted] uses the threat of coal plant retirements or seasonal shutdowns to get better pricing from SPRB coal suppliers).

In rebuttal, Dr. Hill notes that his application of the HMT does capture dynamic substitution of the sort described by Defendants' experts, such as the risk of plant retirement, in his calculation of the price elasticity of demand. Tr. Vol. 9B (Hill) 50:8-13. One of Dr. Hill's estimates of this elasticity was explicitly based on plant closures, *i.e.*, the relationship between SPRB coal prices and the probability of closures of SPRB coal plants. *Id.* at 50:15-18. Dr. Hill concluded that SPRB prices have only a modest impact on plant closures and, therefore, on SPRB demand. PX8006 (Hill Rebuttal Report) ¶¶ 93-94, 174.

Dr. Israel argued that Dr. Hill's plant closure elasticity was flawed because it looked at only the likelihood of retirement in the next year, and the elasticity should be increased (possibly by as much as a factor of 10) to account for the long-run effect of plant closures. Tr. Vol. 9A (Israel) 51:15-52:5. As Dr. Hill explained, however, if there is a price increase in year one, any plants that close are likely to be plants that were already marginal economically, perhaps because of their old age or small size. Tr. Vol. 9B (Hill) 50:22-51:13. If a plant survives the price increase in year one, and the price increase persists, then the surviving plant is relatively unlikely to close in the following years because the fact of its survival in the first year suggests it is a relatively healthier plant. *Id.* Therefore, Dr. Hill contended, multiplying his elasticity based on the prospect of plant closures by a factor of 10 would not yield a more accurate result.

ii. Real-world facts

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

Defendants also argue that, in addition to failing to account for dynamic competition, Dr. Hill's HMT contradicts real-world ***890** facts. DPFFCL ¶ 194. Dr. Bailey explained that key economic indicators for SPRB coal producers, such as margins, prices, and production, belie the **FTC's** theory of an oligopoly with increasing concentration. Tr. Vol. 7A (Bailey) 53:5-55:1; DX4001 (Bailey Report) Exs. 11, 19, 23, 43. For instance, her analysis shows that, as production in the SPRB has become more concentrated and the overall number of SPRB coal producers has stayed constant, margins have *fallen.* Tr. Vol. 7A (Bailey) 53:21-54:13; DX4002 (Bailey Rebuttal Report) Exs. 2, 3. According to Dr. Bailey, this means that "the decline that we're seeing in the profit margins is not being driven by entry or a change in the number of suppliers or what that market structure looks like." Tr. Vol. 7A (Bailey) 55:20-56:1. Instead, she hypothesizes that the changing price of natural gas can explain these real-world facts. *Id.* at 55:2-19.

Dr. Hill denies that his application of the HMT is in tension with real-world facts. He levels two criticisms at Dr. Bailey's analysis, both based on the underlying fact that Dr. Bailey's comparison of SPRB coal margins and the price of natural gas between 2010-2011 (the "high gas price" period) and 2017-2019 (the "low gas price" period) is labeled an "event study" but is in fact not based on any event at all. Tr. Vol. 9B (Hill) 61:8-62:4. First, he argues that the comparison cannot show what caused declining SPRB coal margins. *Id.* For example, between those two time periods, strip ratios increased and new environmental regulations were implemented, both of which would be expected to diminish margins. *Id.* at 62:5-19. Dr. Bailey's study, which is not centered around any event, offers no insight into what drove down SPRB coal margins during the time periods she selected; rather, it simply shows that SPRB coal margins did in fact decline. In the absence of further evidence, new environmental regulations and increasing strip ratios—both acknowledged by Defendants at the hearing—explain decreasing SPRB coal margins as convincingly as declining natural gas prices.

This conclusion is bolstered by Dr. Hill's second criticism of Dr. Bailey's analysis: Because the "event" study lacks an event, there is nothing constraining the analysis to 2010-2011 as a control period for high gas prices. In his rebuttal report, Dr. Hill showed that Dr. Bailey's purported findings evaporate when her analysis is performed with 2013-2014 as a control period, rather than 2010-2011—even though gas prices were very similar in both years. *Id.* at 62:20-65:3; PX8006 (Hill Rebuttal Report) ¶¶ 121, 124. [10] Meanwhile, between those two time periods, major environmental regulations had begun being implemented, providing a plausible alternative explanation for declining margins. Tr. Vol. 9B (Hill) 64:10-65:3. Rather than conduct a regression analysis to determine how natural gas prices affect SPRB coal margins, Defendants rely on a flawed "event" study that fails to prove that Dr. Hill's HMT analysis diverges from real-world facts.

iii. Merit-order dispatch

Finally, Defendants' argue that Dr. Hill's HMT is inconsistent with the reality of merit-order dispatch. A hypothetical monopolist, they argue, could not successfully impose a SSNIP because ISOs apply merit-order dispatch to decide which ***891** EGUs run. Any increase in SPRB coal prices relative to other fuels will result in coal EGUs bidding into the ISO at higher prices and dispatching less frequently. DPFFCL ¶ 200. Therefore, a SSNIP would cause utilities, who want their EGUs to dispatch and therefore get paid, to switch from coal to other fuels—both in the short term by reducing coal burn and purchases and in the long term by shifting electricity generation resources away from coal EGUs toward EGUs powered by other fuels that are likely to be dispatched more frequently. *Id.* Defendants called six witnesses responsible for procuring coal (on behalf of Entergy, NIPSCO, NPPD, AEP, Southern Company, and DTE **Energy**) who testified that they would switch to other fuels if SPRB coal prices increased. *See, e.g.*, Tr. Vol. 7B (Fuller) 23:22-24:16 (explaining how capacity factors at Southern's various plants affect the company's fossil fuel procurement strategy).

Against Defendants' witnesses claiming that they would switch fuel sources if SPRB coal prices rose, the **FTC** presented seven witnesses stating the opposite. *See, e.g.*, [Redacted] purchasing of SPRB coal would not be affected by a 5 percent increase in SPRB coal prices because natural gas still would not be competitive). While the **FTC** cannot meet its burden by offering evidence from a limited subset of customers, *see R.R. Donnelley*, 1990 WL 193674, at *2 ("Isolated segments with isolated customers do not make for a separate product market."), Defendants have not substantiated their claim that the subset of customers who testified for the **FTC** "are not representative of the market." *U.S. v. Engelhard*, 126 F.3d 1302, 1306 (11th Cir. 1997). Customers representing almost 90% of all SPRB coal sales

were subpoenaed in this action, and customers representing over 75% of all SPRB coal sales were deposed. PX8001 (Hill Report) Fig. 42. Customers called by the **FTC**, including such Fortune 500 heavyweights as Ameren and Xcel, account for about 33% of SPRB coal sales. Tr. Vol. 1A (**FTC** Opening) 54:22-55:15. Defendants cannot reasonably maintain that the **FTC** has to call every SPRB coal consumer or prove that not a single one of Defendants' customers will desert them in the event of a SSNIP. And they provide the Court with no reason to regard the customers called by the **FTC** as any less representative than the witnesses called by Defendant—or the coal customers whom neither party called, for that matter.

In addition, the **FTC** has presented factual evidence that customers will accept, and in fact have accepted, price increases in the range of a SSNIP without decreasing their coal purchases. As will be discussed in greater depth in Section II.C, below, the Black Lung Excise Tax ("BLET"), which is a tax paid by coal suppliers but not suppliers of other fuels, increased at the beginning of 2020. [Redacted] Tr. Vol. 3A (Smith) 16:16-18:1, PX6046 (Galli) 132:23-136:21. Five customers testified that they did not reduce coal burn or consider reducing their future projected coal purchases as a result. PPFF ¶ 141 (collecting testimony). The reason is simple: Utilities "still need the coal to fuel [their] power generating units to supply electricity for [their] customers." [Redacted]

This last observation also undermines Defendants' reliance on *U.S. v. Sabre* ***Corp***., 452 F.Supp.3d 97, 126 (D. Del. 2020), as an example of a court finding an economic expert's SSNIP test unpersuasive where the expert relied on an inaccurate assumption that ignored industry realities. *See* DPFFCL ¶ 199. That expert's SSNIP tests "assume[d] that an airline confronted with a hypothetical price increase has only two choices: pay the increase or walk away." ***892** *Sabre*, 452 F.Supp.3d at 126. The court held that that assumption ignored the fact that "airlines also have the ability to withhold consent or not reach a deal" with the hypothetical monopolist and instead try to steer business to other places. *Id.* (internal quotation and citation omitted). The industry in *Sabre* (the airline travel industry) differs from the electricity industry in a critical way: Utilities are *legally obligated* to provide electricity to their customers. *See*, [Redacted] They cannot simply choose to "not reach a deal," *Sabre*, 452 F.Supp.3d at 126, but rather must generate electricity—including from SPRB coal, if their EGUs are designed to burn it—in order to meet those obligations. SPRB coal customers are, to that extent, different from customers in many other industries. The Court will not rely on arguments that "ignore[ ] industry realities." *Sabre*, 452 F.Supp.3d at 144.

c. Conclusion of HMT analysis

The **FTC** has presented substantial legal authority supporting the use of the HMT for questions of market definition that are relevantly similar to the one faced by this Court. *See Sanford*, 926 F.3d at 963-64; *Tronox*, 332 F. Supp. 3d at 204; *Sysco*, 113 F. Supp. 3d at 33-34; *H & R Block*, 833 F. Supp. 2d at 51-52. Every industry has its idiosyncrasies. Defendants have not persuaded the Court that the **energy** industry is so different from all other industries that a standard, well-accepted analytical tool like the HMT must be discounted entirely, or that the Court should favor Defendants' less scientific approach to market definition. Dr. Hill cogently explained his execution of the HMT and persuasively rebutted Defendants' criticisms of it. And those (ultimately unsuccessful) criticisms of Dr. Hill's analysis did nothing to undercut the HMT's usefulness as an analytical tool for determining how to define the relevant product market. *See Sanford*, 926 F.3d at 963 (the HMT "is commonly used in antitrust actions to define the relevant market.") (citing *Saint Alphonsus Med. Ctr.-Nampa Inc. v. St. Luke's Health Sys., Ltd.*, 778 F.3d 775, 784 (9th Cir. 2015)).

2. *Brown Shoe* factors

[22] **[23]** **[24]** The HMT is not the only method for determining a relevant product market, however. Following the Supreme Court's decision in *Brown Shoe*, courts also often consider whether a candidate market is characterized by certain "practical indicia," including "industry or public recognition of the [market] as a separate economic entity, the product's peculiar characteristics and uses, unique production facilities, distinct consumers, distinct prices, sensitivity to price changes, and specialized vendors." 370 U.S. at 325, 82 S.Ct. 1502. These factors are not rigidly applied.[11] *See Se. Mo. Hosp. v. C.R. Bard, Inc.*, 642 F.3d 608, 614 (8th Cir. 2011) ("[T]he presence of some [indicia], and absence of others, is not dispositive."). Ultimately, "the determination

of the relevant market ... is 'a matter of business reality – [ ] of how the market is perceived by those who strive for profit in it.' " *Cardinal Health*, 12 F. Supp. 2d at 46 (quoting *F.T.C. v. Coca–Cola Co.*, 641 F.Supp. 1128, 1132 (D.D.C. 1986), *vacated as moot*, 829 F.2d 191 (D.C. Cir. 1987)).

Both sides have argued persuasively that certain *Brown Shoe* factors support ***893** the Court's use of their preferred market. Specifically, Defendants have established that there is robust industry and public recognition of interfuel competition and that the prices for SPRB coal are affected by the prices of other fuels. The **FTC**, meanwhile, has demonstrated industry recognition of an SPRB coal market, plus it has established that SPRB coal has distinct customers, distinct and desirable characteristics, and unique production facilities. The **FTC** has even shown that SPRB coal prices are sufficiently distinct to satisfy *Brown Shoe*. On the whole, therefore, although Defendants again remind the Court of the competition between SPRB coal and other fuel sources, they do not undermine the **FTC's** argument that the SPRB coal market has the "practical indicia" of a relevant product market. The fact that Defendants' proposed product market might also satisfy certain *Brown Shoe* factors does nothing to counter the evidence—both quantitative and qualitative—that SPRB coal qualifies as a relevant product market within which to evaluate the effects of the proposed JV.

a. Industry or public recognition

[25] The first *Brown Shoe* factor evaluates how industry participants recognize competitive realities. "The industry or public recognition of the submarket as a separate economic unit matters because we assume that economic actors usually have accurate perceptions of economic realities." *Rothery Storage & Van Co. v. Atlas Van Lines, Inc.*, 792 F.2d 210, 218 n.4 (D.C. Cir. 1986) (quotation marks omitted). Defendants focused exhaustively on this factor, presenting voluminous evidence reflecting industry assessments that coal is in competition with rival fuels in an expansive **energy** market. *See* DPFFCL ¶¶ 77-100. The **FTC** countered with evidence of industry acknowledgment that SPRB coal companies compete principally against each other. *See* PPFF ¶¶ 11-15. Unfortunately for Defendants, the industry recognition arguments presented by the two sides are not mutually exclusive. The Court finds both sides' narratives to be true.

Defendants provided evidence from four sources showing industry recognition of interfuel competition: the EIA; SPRB coal customers; coal producers; and industry analysts. First, they point out that the EIA has recognized competition among fuels used to generate electricity, explaining that "[t]he competition of coal and natural gas for electricity generation plays an important role in setting wholesale electricity prices." DX8007-0002; *see also* DX8746-0001 ("The primary driver of [2016] low wholesale electricity prices was the sustained low cost of natural gas, which is the fuel that often determines the marginal generation cost in most power markets."). The EIA has observed that the increase in natural-gas fired generation has come "largely at the expense of coal-fired generation," DX8746-0001, and that the "primary driver" in the decline in coal-fired generation is "increased output from natural gas-fired plants and wind turbines." DX8012-0001. The EIA confirms what Drs. Bailey and Israel explained: A decline in utilization "leads to a decline in revenues at a plant, which generally translates to lower operating margins, less ability to cover costs, and in many cases, retiring that capacity." DX8743-0002. Moreover, the EIA predicts that this interfuel competition will continue. *Id.* ("Because of more competitive natural gas prices, more advanced natural gas combined-cycle generators, and the increasing efficiency of the natural gas generator fleet, the EIA expects more coal-fired generators to retire, especially within the next decade.").

Second, Defendants point to statements from their customers acknowledging competition ***894** between SPRB coal and other electricity generation sources. [Redacted] testified that "[c]oal generation competes against gas every hour of every day." [Redacted] stated that "[t]he decline in coal-fired generation, the decline in coal production, the decline in coal prices have been caused by the **energy** market, not caused by competition between the coal producers." [Redacted] testified the "primary source of competition" facing SPRB coal today is "the overall **energy** market," including "lower cost alternatives like wind and natural gas, solar, nuclear and hydro." [Redacted] And [Redacted] agreed that "[n]atural gas is by the far the biggest threat to coal demand." [Redacted] Defendants were even able to cite testimony from more than half a dozen customers who were called as witnesses by the **FTC**, acknowledging the competition between natural gas and coal. DPFFCL ¶ 84 (collecting testimony). These statements accord with the reality of merit-order dispatch

within ISOs. *See, e.g.,* [Redacted] (describing how MISO compares EGUs "based on the operating costs of that unit," regardless of fuel source); *see also* DPFFCL ¶¶ 85-86 (collecting witness statements on the effects of ISO/RTOs on interfuel competition).

In addition to customer testimony, Defendants cite customers' ordinary course documents as evidence that SPRB coal customers recognize the significance of interfuel competition. *See* DPFFCL ¶ 87. For example, NIPSCO's 2018 Integrated Resource Plan ("IRP") states:

> The market is currently undergoing change as coal capacity retires and the generation mix shifts toward renewables and natural gas. In recent years, low natural gas prices have resulted in efficient natural gas plants displacing coal-fired generation in the dispatch stack. This dynamic has altered **energy** prices and has negatively impacted the economics of coal plants.

DX1012-0019. An economic consultant for [Redacted] stated that one of the "key drivers" of its coal demand forecast was "how the relationship between natural gas and coal commodity prices influences fuel-switching between coal and natural gas." DX2061-0009; *see also* [Redacted] (discussing DX2061). And in an internal email, an employee of [Redacted] an SPRB coal customer, stated, "the play here is not coal to coal competition, but really coal versus [natural gas], solar, etc." DX7015-0001; *see also* DX6071 ("I can certainly understand how this gas market is impacting Powder River Basin. We will end the year with surplus inventories at all of our power plants since our plans did not see this low of gas prices in the forecast.").

Third, Defendants cite evidence of coal producers' own recognition of the reality of interfuel competition. *See* DPFFCL ¶ 89. Virtually every employee of Arch or **Peabody** to testify at the hearing spoke to this competition. *See, e.g.*, Tr. Vol. 3A (Smith) 58:25-59:9; 67:20-68:25; Tr. Vol. 5A (Kellow) 14:15-21. And Defendants submitted evidence that other coal producers, [Redacted], likewise recognize the significance of competition from other fuel sources, particularly natural gas. *See* DPFFCL ¶¶ 91-93.

The Court recognizes the risk of relying on such testimony, particularly when it comes from Defendants' employees. However, these opinions do not appear to have been concocted for the purposes of this hearing. They are reflected pervasively in Defendants' ordinary course documents, which "courts often pay close attention to" when determining the relevant product market. *H & R Block*, 833 F. Supp. 2d at 52; *see* DPFFCL ¶ 94. Defendants' ordinary course documents support their testimony that coal producers view other fuels ***895** to be their competitors, as well as other SPRB coal producers. *See, e.g.*, DX5004-0007 ("We are also focused on developing creative contract structures to increase burn and to provide our customers cost competitive coal to compete against other alternatives."); DX6023-0049 [Redacted] DX6089-0020 [Redacted]; DX6191 [Redacted] DX6078 [Redacted] DX5022 ("The forward gas curves are so low, that [Redacted] plans to wait for 2023 purchases."); DX6073 [Redacted] DX6081 [Redacted] DX1040-0001 [Redacted]

Taken together, these ordinary course documents make abundantly clear that SPRB coal producers, including Defendants, take themselves to be competing in the **energy** marketplace with other fuels, especially natural gas. *Contrast United States v. Aetna*, 240 F. Supp. 3d 1, 44-45 (D.D.C. 2017) (regular course documents showed that each merging party viewed the other as their greatest competition); *H & R Block*, 833 F. Supp. 2d at 52-54 (same).

Finally, Defendants point to the fact that industry analysts recognize that other fuels used to generate electricity are a competitive constraint on SPRB coal. *See* DPFFCL ¶¶ 95-100. One industry observer, [Redacted] found that "PRB coal is ... greatly challenged by wind and natural gas competition," and that "[n]atural gas is by far the biggest threat to coal demand" and "has displaced hundreds of millions of [tons of] annual coal demand," DX1501-0009,-0018. [Redacted] further reported that it was "seeing a tight relation to coal burn and natgas prices. Even the small pickup in natgas pricing last week resulted in a pickup in coal burn. Therefore, the dismal outlook is very much predicated on natural gas prices. Any lift in natgas prices would temper this, but that does not appear likely." DX1001-0002. And numerous other industry observers have made similar observations. DX8003 (IHS Markit); [Redacted] DX8033 (PA Consulting); DX1002 (S&P Global Platts); DX5146 (S&P Global Market Intelligence).

The **FTC** spills somewhat less ink on the "industry recognition" prong of the *Brown Shoe* analysis, but the Commission still points to ample evidence that industry actors treat the SPRB coal market as a distinct submarket. For example, the **FTC** demonstrates that Defendants themselves study and analyze SPRB coal as a distinct commodity, citing high-level documents tracking and discussing SPRB production, supply and demand, and market shares separately from other coal sources and other **energy** sources. *See* PPFF ¶ 11 (collecting sources). They point out that Defendants track SPRB sales opportunities and SPRB RFPs separately from other non-coal fuels and fuel basins. *Id.* ¶¶ 12-13 (collecting sources). And the **FTC** points to examples of industry analysts and the EIA discussing SPRB-specific market dynamics and price predictions. *Id.* ¶¶ 14-15 (collecting sources).

[26] The **FTC's** lower-key approach to this factor reflects an aspect of market definition that is easy to forget in the point-counterpoint of litigation—that the **FTC** does not have to *disprove* Defendants' theory of the relevant product market. It has to show only that the SPRB coal market satisfies the criteria for a relevant product market. *See* *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502. There may also be *other* product markets in which the JV's effects would be less harmful or even innocuous; that would not undermine the viability of SPRB coal as a relevant product market for the purpose of antitrust analysis, particularly if the SPRB coal market is narrower than those rival candidates. *See* *H & R Block*, 833 F. Supp. 2d at 58-60. In other words, market definition is not a zero-sum game; each proposed relevant ***896** product market stands or falls on its own merits, and the narrowest market principle determines which of the qualifying markets a court should use for the rest of its merger analysis. *See* *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502. Therefore, the **FTC** does not have to be concerned (at least at the market definition phase) with disproving Defendants' claim that SPRB coal competes with natural gas and other fuels in a broader **energy** market. True or not, it does not affect whether the market for SPRB coal qualifies as a relevant product market under applicable standards and precedents.

Based on the evidence of industry recognition produced by both sides, there is little doubt that SPRB coal providers compete *both* among themselves in a market for SPRB coal *and* against other fuels in a broader market for electricity generation. Therefore, both sides' proposed market definitions satisfy the industry recognition prong of the *Brown Shoe* analysis.

b. Distinct prices

Defendants have provided compelling anecdotal and statistical evidence that SPRB coal prices are closely related to the price of other fuels, and particularly natural gas. On the other hand, the **FTC's** economic analysis of the SPRB market, discussed above, demonstrates that demand for SPRB coal is relatively inelastic, and that SPRB coal-reliant power producers are relatively insensitive to price increases. Thus, again, both sides invoke this factor in support of their positions. Unlike the industry recognition prong, though, the strength of Defendants' argument here does actually detract from the strength of the **FTC's**. Still, the **FTC** has produced sufficient evidence that its proposed relevant product market, SPRB coal, satisfies this prong.

Supporting Defendants' view, the Court heard uncontested testimony that Defendants set the prices that form the basis of their RFP negotiations, in part, based on natural gas prices. **Peabody's** price-setting process includes a Market and Pricing Committee ("MPC") that recommends SPRB coal price changes based in large part on the forecasted price of natural gas. *See* DPFFCL ¶¶ 36-37; Tr. Vol. 6B (Galli) 14:23-16:10, 17:6-20; 18:2-14; 19:14-25; 21:12-23:15. Defense witness Bryan Galli, who had sat on **Peabody's** Market and Pricing Steering Committee ("MPSC"), which reviews the MPC's recommendations, testified that that body analyzes natural gas prices and forwards in every meeting. Tr. Vol. 6B (Galli) 21:22-22:2. He gave two examples from the past year alone—in September 2019 and March 2020—when **Peabody** reduced its SPRB coal prices in response to falling natural gas prices. *Id.* at 17:6-18:1; 21:12-23:15.

Similarly, the Court heard evidence that "two main things" Arch considers in pricing its SPRB coal are [Redacted] Tr. Vol. 5A (Lang) 103:17-24; *see also* Tr. Vol. 3A (Smith) 58:25-59:9 (testifying that the natural gas price is "the very first thing" in Arch's weekly Domestic Thermal Updates because [Redacted]

SPRB coal consumers recognize that low natural gas prices affect SPRB coal demand and prices. Defendants cite a cavalcade of customers who admit to considering other fuel prices, including natural gas prices, when determining how

much coal to purchase and when to issue a coal RFP. *See* DPFFCL ¶ 112; Tr. Vol. 1B (Meyer) 32:25-33:20; [Redacted] Tr. Vol. 7B (Fuller) 22:3-23:3. Defendants also elicited testimony from both suppliers and customers of SPRB coal showing that they evaluate coal prices in direct comparison to natural gas prices, informing fuel purchasing decisions and resource planning. *See, e.g.*, [Redacted]

***897** The **FTC** counters with evidence that SPRB coal's prices are distinct from the prices of other fuels. First, it points to industry reports that track SPRB coal prices separately from prices of other types of coal and other non-coal fuel sources. *See* PX9026-002; PX4775-0130-31, Fig. 8-11 (study projecting PRB coal pricing less than half of other coals as far out as 2040); PX8001 (Hill Report) ¶ 91; *see also* *Tronox*, 332 F. Supp. 3d at 200-01 (distinct prices and consistent market share for chloride titanium dioxide relative to sulfate titanium dioxide supported a finding of a separate market). It also notes that SPRB coal has different production costs and different supply and demand influences from non-coal fuels. In reference to natural gas in particular, the **FTC** points out that "natural gas is a byproduct of crude oil extraction, so oil market dynamics impact significant amounts of supply," and "[n]atural gas prices are also influenced by demand for natural gas used to heat homes in winter." PX8001 (Hill Report) ¶ 91 (relying on EIA publications); PX9188; PX9189; PX6006 (Kellow) IH Tr. 165:1-167:1.

The **FTC** also argues that the relationship between natural gas price assumptions and MPC prices is not as tight as Defendants would have the Court believe. Although Mr. Galli's testimony was compelling, it paints an incomplete picture. Dr. Hill plotted the relationship between **Peabody's** natural gas price assumptions and MPC prices from May 2015 through November 2019 based on data provided by **Peabody** through Dr. Israel. PX8006 (Hill Rebuttal Report) Fig. 63. While the two figures tracked each other closely from May 2015 through approximately January 2016, they then began to diverge, with natural gas continuing to fall roughly another 20% from its January 2016 levels, while MPC prices fell only slightly. *Id.* There was intense competition with natural gas throughout that time period, and as described above, **Peabody** ended up cutting MPC prices twice within the last year. Still, the fact that **Peabody** was willing and able to hold the line on prices for three years, despite ever-lower natural gas prices, suggests that the relationship between natural gas prices and MPC prices—and therefore the relationship between natural gas prices and SPRB coal prices—is not as tight as Defendants have characterized it.

But the core of the **FTC's** argument—a refrain that the **FTC** has sounded over and over throughout the litigation—is that SPRB coal prices are set through *SPRB-specific* competitive interactions among *SPRB suppliers*. *See, e.g.*, PPFF ¶¶ 17-18. The Court heard a great deal of testimony from SPRB coal customers about the RFP and contracting process, by which SPRB coal is usually procured. *See* [Redacted] PPFF ¶ 18 (collecting customer testimony). The **FTC** cites customer testimony that only SPRB suppliers are invited to participate in RFPs for SPRB coal. *See* PPFF ¶ 20. And it points out, based on Defendants' own documents and testimony, that when Defendants analyze their competition for bids to SPRB customers, they compare their own bids to other SPRB suppliers—without reference to natural gas suppliers or other non-coal suppliers. *Id.* ¶ 21. Finally, the **FTC** attests that SPRB coal suppliers recognize that, when they receive an RFP for SPRB coal, they are competing against other SPRB coal suppliers. [Redacted] The **FTC** argues that this RFP process, and not the price of natural gas, determines coal prices. *See, e.g.*, *Staples II*, 190 F. Supp. 3d at 119 (RFPs for multi-year contracts supports finding of distinct prices).

This question—i.e., what determines the price that customers pay for SPRB coal—has been the most hotly contested issue in ***898** this litigation. As described above, **Peabody's** witnesses persuasively testified that the MPC and MPSC [Redacted] taking into account, among other things, the price of natural gas, and that [Redacted] Tr. Vol. 6B (Galli) 16:22-17:20, 23:16-23, 26:6-20, 27:20-28:13. Yet, the **FTC** presented droves of documents and testimony suggesting that the RFP process puts SPRB coal suppliers—and most often, Arch and **Peabody**—into head-to-head competition with one another. That is the competition they contend would be lost if the JV goes forward.

Once again, both parties' narratives ring true. The fact that a significant amount of the price variation for SPRB coal over the past several years is attributable to rapidly changing gas prices does not rule out the possibility that some remaining amount of price variation is attributable to head-to-head competition among coal providers. It also does not rule out the possibility that the loss of that remaining variation could constitute a cognizable harm to competition in a relevant product market. In fact, the price of natural gas could be the most powerful driver of coal prices by a wide margin, and it could still be the case that there is enough head-to-head competition between SPRB coal producers for those producers to constitute a distinct product market. Thus, while

Defendants effectively presented their case, they did not refute the **FTC's**—especially given the evidence that a 5% increase in the price of SPRB coal would not drive customers to purchase an alternative fuel source and [Redacted] *See* Section II.C, *infra.* This Court therefore finds that, however powerful the effect of natural gas prices on the prices of SPRB coal, the evidence suggests that there is still room for enough non-natural-gas-related variation to characterize SPRB coal prices as "distinct."

c. Distinct customers

The parties take differing approaches to this factor. Defendants point out that no SPRB coal customers who participated in this proceeding generate electricity exclusively from SPRB coal. Instead, the record shows that customers who purchase SPRB coal also procure other fuels to generate electricity. DPFFCL ¶ 104; DX2049-0003 ("Southern Company Fuel Diversity: 'All Arrows in the Quiver' "); Tr. Vol. 3B (Sandlin) 110:8-17 (agreeing that WFA believes all generation resources are important). In addition to purchasing other fuels to generate power, utilities also have the option to purchase power from electricity markets if it is more cost-effective than generating power themselves. *See, e.g.,* Tr. Vol. 2B (Ruhl) 85:10-86:2, 86:23-87:11 (OPPD has purchased power from the market when it was more economic to do so); Tr. Vol. 7B (Fuller) 10:11-20 (Southern purchases electricity on wholesale power market when it is cheaper than to generate it itself); [Redacted] DPFFCL ¶ 106.

The **FTC** counters that SPRB coal has distinct customers with distinct needs because it is bought by utilities with SPRB-fueled power plants, which are long-lived, expensive, and configured for SPRB coal's distinct characteristics (discussed further below). *See* PPFF ¶ 35. Virtually no one other than an owner of an SPRB coal-fired power plant buys SPRB coal, and conversely, an owner of an SPRB coal-fired EGU can only buy SPRB coal for that unit. Such plants cannot easily switch to using other types of coal or other non-fuel coal sources without costly modifications, higher costs, or inefficiencies. *Id.* (collecting statements).

The **FTC's** interpretation is the correct one. The fact that SPRB coal customers also purchase resources other than SPRB coal to generate electricity does not mean that SPRB coal companies do not have ***899** *distinct* customers; it means that they don't have *exclusive* customers, which is not at issue. By Defendants' logic, markets would have to be incomprehensibly large to qualify as relevant product markets for antitrust analysis, which would in turn defeat the whole enterprise. All humans eat more than one type of food, but that does not mean that no particular kind of food has a distinct customer base. Put differently, the customer base for tofu burgers is no less distinct because the same customers also eat kale. And "all food" would not be a useful market for antitrust analysis. *See* *H & R Block*, 833 F. Supp. 2d at 59 (rejecting a proposed market of all methods of tax preparation because it left "no conceivable alternatives besides going to jail, fleeing to Canada, or not earning any taxable income," which would cause "the usual tools of antitrust analysis—such as the hypothetical monopolist test—[to] cease being useful because it is self-evident that a monopolist ... in that situation could essentially name any price since taxpayers would have no alternative but to pay it").

SPRB coal-fired EGUs are distinctive power plants with very specific requirements. PX7011 ¶ 11 ("[Redacted] has explored the use of coals from basins outside the PRB, such as Illinois Basin coal, but the operational and environmental compliance risks, the major permit amendment requirements, and the potentially higher cost of coal and railroad transportation make the use of Illinois Basin coal uneconomic."); Tr. Vol. 2A (Peterson) 42:25-43:10 (Evergy estimated that it would cost over $100 million and require up to four years to convert one of its generating stations from coal to natural gas); *see also* *Aetna*, 240 F. Supp. 3d at 26-28 (evidence showing customers have "durable preference" for one product and are unlikely to switch supports finding of distinct customers). Short of shutting down a plant (which is not an immediate option for utilities with load-carrying obligations), utilities with SPRB coal plants require a distinct input—controlled overwhelmingly by Defendants—in order to operate. *See Whole Foods*, 543 F.3d at 1039 (a core group of "particularly dedicated" customers may support a finding of a relevant market when "particular circumstances dictate that a product 'is the only realistic choice' ") (quoting *SuperTurf, Inc. v. Monsanto Co.*, 660 F.2d 1275, 1278 (8th Cir. 1981)). At the same time, no entity *other than* an electricity-generating utility with a SPRB-coal-fired EGU would have any use for SPRB coal. Therefore, there are distinct customers for SPRB coal.

d. Distinct characteristics

The **FTC** has presented extensive evidence that SPRB coal has distinct and desirable properties relative to other coals and other fuels more generally. *See generally* PPFF ¶¶ 24-34. Because SPRB coal sits in thick beds close to the surface of the earth, SPRB mines are more cost effective than mines in other U.S. coal basins. PX2758-013; PX9168-001. SPRB coal also has low sulfur, sodium, and ash contents relative to other coals. PPFF ¶¶ 25-27; PX9038-001; Tr. Vol. 1B (Meyer) 20:1-19 (Ameren solicits bids for what it calls "ultra-low sulfur" coals to remain compliant with emissions standards); [Redacted] PX8001 (Hill Report) ¶ 94 n.227. SPRB coal also has a specific heat content, typically in the 8,400-8,800 Btu range. PPFF ¶ 29; PX8001 (Hill Report) ¶ 96.

SPRB coal customers consistently testified that they value SPRB coal because of its distinctive properties. *See* PPFF ¶ 28; *see, e.g.*, [Redacted] values ultra-low sulfur coal and has even rejected the lowest-price bid from Eagle Butte in favor of higher priced offerings that met its sulfur needs); Tr. Vol. 2B (Romer) 96:4-7 (Xcel sources ***900** SPRB coal to generate power because "our boilers were designed for [SPRB coal]"); [Redacted] plants burn only SPRB coal because SPRB coal "has the characteristics that the units were designed for."); [Redacted] coal-fired units are designed to burn low sulfur PRB coal); Tr. Vol. 2A (Peterson) 34:10-35:6 (SPRB coal works best in Evergy's coal-fired generating units because of its sulfur dioxide, sodium and ash content); [Redacted] does not purchase coal from the Illinois basin because of its higher sulfur and sodium). Failure to use SPRB coal can result in operational issues and harm to boilers. Tr. Vol. 8A (Benham) 72:19-73:8 (SPRB coal is important to Minnesota Power's generation because higher sodium content in NPRB coal can plug boilers); Tr. Vol. 2B (Ruhl) 20:3-11 (SPRB coal is typically between 8,300 to 8,900 Btu, which OPPD can burn in its coal-fired units).

SPRB customers also testified that they see the ability to stockpile SPRB coal as an advantage over alternative fuels. PPFF ¶ 30; Tr. Vol. 3B (Sandlin) 125:9-126:4 (the ability to stockpile and "survive off [ ] inventory piles for a while" is an advantage of coal); *see also* Tr. Vol. 2B (Romer) 96:4-7 (describing ready availability as a reason why Xcel sources SPRB coal to generate power). Natural gas cannot be stockpiled, leaving power producers at risk of interruptions due to frozen pipelines or capacity constraints during periods of high demand. *See* [Redacted] (the ability to stockpile is an advantage of coal over natural gas); [Redacted] ("Natural gas has restrictions on delivery in winter, capacity restrictions in winter months, like the recent polar vortex, and therefore, the natural gas could not get delivered to our —our combined-cycle gas plants. With coal, we store coal on the ground, so we always know we're reliable. That's the backbone of our reliability to our customers and to the market because we already have the **energy** on-site, ready to be used."). Renewable **energy** sources also cannot be stockpiled and are subject to natural fluctuations in sunlight, wind, or precipitation. *See* Tr. Vol. 3B (Sandlin) 93:23-94:18 (power plants fueled by wind were unable to run during the polar vortex while coal plants were able to run and supply electricity); Tr. Vol. 1B (Jones) 81:12-24 (SPRB coal-fired capacity is more valuable than the same amount of wind capacity because coal is reliable and wind is intermittent). And transmission constraints affect the availability of wind **energy**. Tr. Vol. 2A (Peterson) 43:13-44:6 (testifying that wind is not a reliable source of **energy** for Evergy because the wind does not always blow, and transmission can become constrained).

Defendants made little effort to dispute the plain fact that SPRB coal has the above distinct characteristics. Therefore, the Court has no trouble finding that the SPRB coal market satisfies this factor of the *Brown Shoe* analysis.

e. Unique production facilities

It is even easier for the **FTC** to satisfy the "unique production facilities" prong of *Brown Shoe*. Only coal suppliers operating in the SPRB produce SPRB coal. JSUF ¶¶ 17-21. SPRB coal suppliers' production facilities—i.e., coal mines and related processing facilities—are entirely different from facilities related to the production of natural gas or other fuels. *Compare* PX6031 (Gurgenli) 42:4-23 (describing surface coal mining), *and* PX9168-0001-03 (EIA article on mining and transportation of coal) *and* PX8001 (Hill Report) ¶¶ 24-26, *with* PX8001 (Hill Report) ¶ 71 (describing production and transportation of natural gas). Defendants do not deny these obvious facts.

f. Conclusion of *Brown Shoe* analysis

Defendants have established that there is industry and public recognition of a ***901** broader **energy** market and that SPRB coal prices are, to some extent, related to natural gas prices. But their success does not entail the **FTC's** failure. On the contrary, the **FTC** has established not just industry

recognition of a distinct SPRB coal market, but also that SPRB coal has distinct and desirable characteristics, distinct customers, and unique production facilities. And while the strength of Defendants' showing of the relationship between the prices for natural gas and SPRB coal does weaken somewhat the **FTC's** claim that SPRB coal has "distinct prices," the Court finds that the **FTC** produced enough evidence to satisfy that *Brown Shoe* factor as well.

3. Conclusion: SPRB coal is a relevant product market.

[27] The **FTC** has presented both economic analysis (in the form of the HMT) and practical evidence that the SPRB is a relevant product market under traditional antitrust analytical methods and precedents. That is all they needed to do to justify the Court analyzing the effects of the proposed JV in that market, and they accomplished it. *See* *Cont'l Can Co.*, 378 U.S. at 458, 84 S.Ct. 1738.

The Court is persuaded that there is meaningful competition between SPRB coal and other sources of fuel used to generate electricity, and that the cost of natural gas influences the price of SPRB coal. Ultimately, though, Defendants' arguments do not cohere into a powerful enough case to persuade the Court to ignore both the narrowest market principle and the standard analytical and economic tools provided by the **FTC**, which overwhelmingly support the existence of a distinct market for SPRB coal in which consumers likely would be forced to accept a SSNIP.

For the foregoing reasons, the Court finds that there is an "economically significant submarket" of SPRB coal only. *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502. The Court will conduct the remainder of its analysis of the proposed JV in the context of that market.

B. Relevant geographic market

[28] **[29]** The second half of market definition is to determine the relevant geographic market. *Sysco*, 113 F. Supp. 3d at 48. The Supreme Court has stated that, for Section 7 of the Clayton Act, the relevant geographic market is "the area in which the goods or services at issue are marketed to a significant degree by the acquired firm." *Marine Bancorp.*, 418 U.S. at 620-21, 94 S.Ct. 2856. Stated differently, "[t]he proper question to be asked ... [is] where, within the area of competitive overlap, the effect of the merger on competition will be direct and immediate." *Phila. Nat'l Bank*, 374 U.S. at 357, 83 S.Ct. 1715; *see also* *Cardinal Health*, 12 F. Supp. 2d at 49 (citation omitted) (internal quotation marks omitted) (stating that the relevant geographic market is "the area to which consumers can practically turn for alternative sources of the product and in which the antitrust defendants face competition"). Like the product market, the geographic market must "correspond to the commercial realities of the industry and be economically significant." *Brown Shoe*, 370 U.S. at 336-37, 82 S.Ct. 1502 (footnote omitted) (internal quotation marks omitted).

[30] SPRB coal supplier mines are located exclusively within the Southern Powder River Basin near Gillette, Wyoming. PX8001 (Hill Report) Fig. 2. SPRB coal cannot be mined outside the SPRB, *id.* ¶ 87, and customers cannot purchase SPRB coal from any mines outside of the SPRB. [Redacted] Tr. Vol. 2B (Ruhl) 10:14-17. By finding the SPRB coal market to be the relevant product market, then, ***902** the Court has effectively also defined the relevant geographic market. Defendants have not argued otherwise. Accordingly, the Court finds that the SPRB is the relevant geographic market.

II. FTC's Prima Facie Case for Likelihood of Anticompetitive Effects

Having found that the **FTC** has carried its burden of establishing a relevant market for SPRB coal, the Court turns next to "the likely effects of the proposed [JV] on competition within that market." *F.T.C. v. Swedish Match,* 131 F. Supp. 2d 151, 166 (D.D.C. 2000). "If the **FTC** can make a prima facie showing that the [JV] will result in a significant market share and an undue increase in concentration" in the relevant market, then "a presumption is established that [the JV] will substantially lessen competition." *Id.*; *see also* *Phila. Nat'l Bank*, 374 U.S. at 363, 83 S.Ct. 1715 ("[A] merger which produces a firm controlling an undue percentage share of the relevant market, and results in a significant increase in the concentration of firms in that market is so inherently likely to lessen competition substantially that it must be enjoined in the absence of evidence clearly showing that the merger is not likely to have such anticompetitive effects.").

[31] **[32]** "Market concentration is a function of the number of firms in a market and their respective market shares."

Arch Coal, 329 F. Supp. 2d at 123. A common tool used to measure changes in market concentration is the Herfindahl–Hirschmann Index (HHI). *F.T.C. v. H. J. Heinz,* 246 F.3d 708, 716 (D.C. Cir. 2001); *see also* Guidelines § 5.3. HHI figures are "calculated by summing the squares of the individual firms' market shares," a calculation that "gives proportionately greater weight to the larger market shares." Guidelines § 5.3. "Sufficiently large HHI figures establish the **FTC's** prima facie case that a merger is anticompetitive." *Heinz,* 246 F.3d at 716.

[33] In support of its prima facie case, the **FTC** makes a market share argument based on the HHI, which it then supports with evidence of head-to-head competition between **Peabody** and Arch; evidence that SPRB coal customers would not be able to protect themselves from a price increase; and an argument that just such a price increase is likely from the proposed JV.

A. Market share calculation

The Merger Guidelines, which provide "a useful illustration of the application of HHI," *F.T.C. v. PPG Indus., Inc.,* 798 F.2d 1500, 1503 n.4 (D.C. Cir. 1986), state that a market with an HHI above 2,500 is considered "highly concentrated"; a market with an HHI between 1,500 and 2,500 is considered "moderately concentrated"; and a market with an HHI below 1,500 is considered "unconcentrated," Guidelines § 5.3. Also according to the Guidelines, mergers that result in "highly concentrated markets that involve an increase in the HHI of more than 200 points will be presumed to be likely to enhance market power." *Id.* In *Heinz,* for example, the D.C. Circuit held that an increase in HHI by 510 points "creates, by a wide margin, a presumption that the merger will lessen competition." 246 F.3d at 716.

Dr. Hill calculated that **Peabody** and Arch have a combined market share of 68% when measured by production volumes. PX8001 (Hill Report) Fig. 22. Dr. Hill's calculation is consistent with **Peabody's** ordinary-course documents, *see, e.g.,* PX1681-007; PX1141-004, and documents from third parties, *see* PX5536-001; PX3021-001; PX5535-001. Dr. Hill calculated market shares and the HHI using 2019 mine production data, and he found that the JV will increase the SPRB coal market's ***903** HHI by 2,258 points, from 2,707 to 4,965. PX8001 (Hill Report) Fig. 22, ¶¶ 155, 158. In other words, the JV would take an already "highly concentrated" market—at 2,707—and make it *far* more concentrated by *nearly doubling* its HHI—to 4,965. The increase of 2,258 points is fully *four times* the increase that the D.C. Circuit deemed to have created a presumption of anti-competitive effects "by a wide margin." *Heinz,* 246 F.3d at 716. Dr. Hill performed the same calculations based on HHI figures in all years from 2008 to present, and the JV would have been presumptively illegal in every one of those years. PX8001 (Hill Report) ¶ 160 and Fig. 24.

Tellingly, Defendants' experts do not contest the accuracy of Dr. Hill's calculations of market share or market concentration. PPFF ¶ 65. Even more here than in *Heinz,* then, the HHI calculation "creates, by a wide margin, a presumption that the merger will lessen competition." 246 F.3d at 716.

B. Head-to-head competition

[34] "Courts have recognized that a merger that eliminates head-to-head competition between close competitors can result in a substantial lessening of competition." *Sysco,* 113 F. Supp. 3d at 61; *see also* *Heinz,* 246 F.3d at 717-19 (holding that elimination of competition between second-and third-largest jarred baby food manufacturers would weaken competition); *Swedish Match,* 131 F. Supp. 2d at 169 (finding a likelihood of unilateral price increase where merger would eliminate one of Swedish Match's "primary direct competitors"); *Staples I,* 970 F. Supp. at 1083 (finding anticompetitive effects where the "merger would eliminate significant head-to-head competition between the two lowest cost and lowest priced firms in the ... market."); Guidelines § 6 ("The elimination of competition between two firms that results from their merger may alone constitute a substantial lessening of competition."). In such circumstances, a merger "is likely to have unilateral anticompetitive effect if the acquiring firm will have the incentive to raise prices or reduce quality after the acquisition, independent of competitive responses from other firms." *H & R Block,* 833 F. Supp. 2d at 81.

There is extensive evidence in the record that SPRB coal customers benefit from head-to-head competition between **Peabody** and Arch. *See* PPFF ¶¶ 70-71; PX2376-001 [Redacted] The parties' own bidding databases, as well as shipment data maintained by the EIA, show [Redacted]

See PX8001 (Hill Report) ¶¶ 169-78, Figs. 25-28. Those lost business opportunities are reflected in the parties' ordinary course documents describing customer negotiations in response to competing bids from each other. *See* PPFF ¶¶ 76-77 (collecting sources).

Some of this head-to-head competition manifests as competitive bidding through the RFP process. Tr. Vol. 5B (Lang) 17:8-11 (agreeing that, "in general," "the price that Arch receives for SPRB coal is determined by negotiations between Arch and its customers"). At the hearing, Mr. David James, a **Peabody** Director of Sales & Marketing, and Mr. Rowdy Smith, Arch's Senior Vice President of Domestic Thermal Coal, discussed several examples in which the offers provided by competing SPRB coal suppliers, including from **Peabody** and Arch, affected negotiations with potential buyers of their SPRB coal. PPFF ¶¶ 79-81. Similarly, customers called by both sides testified to specific instances where they benefited from competition through the RFP process and secured more advantageous pricing. *Id.* ¶¶ 82-87, 89, 91-92 (collecting testimony from representatives of [Redacted] Other customers ***904** did not testify to specific instances of competition but spoke more generally from their business experience of the value they perceive from a competitive bidding process. *Id.* ¶¶ 88, 93-97 (collecting testimony from representatives of [Redacted] Other evidence shows that customers benefit on non-price terms (*e.g.*, volume flexibility, which allows a customer to bring forward or push back SPRB coal deliveries based on expected versus actual demand) because of head-to-head competition between **Peabody** and Arch. *Id.* ¶¶ 98-101.

C. Customers' inability to protect themselves from a price increase

A number of **FTC's** SPRB coal customer witnesses testified that they could not protect themselves against an SPRB coal price increase. For instance, a representative of [Redacted] testified that it would continue buying SPRB coal for its coal units even if the mine-mouth price for SPRB coal increased by 10 percent because its units would still be profitable, but the higher prices for SPRB coal would mean that ratepayers would ultimately pay a higher price. PPFF ¶ 102; [Redacted] A representative of [Redacted] testified that it would not stop purchasing SPRB coal if prices increased by 5 percent because it lacks enough generating capacity from all other forms of power to meet its obligations without SPRB coal. PPFF ¶ 103; [Redacted] A representative of [Redacted] testified that it would not switch to fuels other than SPRB coal if prices increased by 5 percent because its EGUs are designed to burn SPRB coal. PPFF ¶ 104; [Redacted] Other customers provided similar testimony. PPFF ¶¶ 105-09.

In response to the **FTC's** impressive showing, Defendants point to the testimony of one customer who reluctantly conceded counsel's assertion that "there is some negotiating power in the hands of the coal consumers," [Redacted] and one letter from an economic consultant containing a single sentence to the effect that, due to [Redacted] Based on that evidence alone, Defendants ask the Court to find that coal purchasers are sufficiently sophisticated entities to resist a price increase, even from an entity that controls a two-thirds share of the SPRB coal market. *See* DPFFCL ¶ 233 (quoting *Gen. Dynamics*, 341 F. Supp. at 559 ("sophisticated, knowledgeable purchasers wield[ ] great economic power and hav[e] formidable bargaining strength")). Considering the volume of documents, testimony, and analysis produced in this matter, that is a slender reed.

In addition to a lopsided evidentiary showing, the Court has the benefit of a real-world event study to facilitate the evaluation of the parties' competing arguments: the recent increase in the Black Lung Excise Tax ("BLET"). The BLET, which is imposed by Congress, increased at the beginning of 2020. PX6046 (Galli) 134:18-135:6. [Redacted] *See* Tr. Vol. 3A (Smith) 16:16-17:11. [Redacted] PPFF ¶ 141—despite the supposed downward pressure exerted by low natural gas prices and the risk of coal plant retirements. *See* Section I.A.1.b.*iii, supra.* And the **FTC** presented testimony from five different customers that they did not reduce their coal burn or consider reducing the amount of coal they will buy in 2020 as a result of that increase. PPFF ¶ 141. While the BLET increase was not quite as large as what economists use to represent a SSNIP (typically 5 percent), this recent, real-world example nonetheless provides corroborating evidence that some customers will indeed be unable to avoid a non-negligible price increase.

Counsel for **Peabody** suggested during closing arguments that, as a matter of contract, it has always been the case that ***905** the BLET, along with any other government surcharge, is passed through to the customer, and the parties do not know in advance when such a surcharge will be imposed, so it is not an apt comparison to other types of price increases. Closing Arguments (Hassi) at 94:12-96:9. Counsel further pointed out that Dr. Hill's analysis was of contracts entered into in 2019, arguing that the **FTC** did not show whether the early 2020 increase has had an effect in the market because the market participants are now aware of the price increase. *Id.* As a

 © 2022 Thomson Reuters. No claim to original U.S. Government Works.

result, he described the BLET as a "red herring" with respect to determining customers' ability to protect themselves from an SPRB price increase. *Id.*

Counsel's arguments have merit. It is true that Dr. Hill did not perform a systematic analysis of the effect on coal purchaser behavior of the early 2020 BLET surcharge. But the case study is more than a red herring for two reasons. First, the Court heard testimonial evidence from five utilities that the BLET pass-through did not affect their SPRB coal procurement or burn behavior. While an economic analysis of the BLET's effects would have been welcome, the testimonial evidence allows the Court to discern that at least some of Defendants' customers must absorb price increases. Moreover, Defendants could have produced evidence to the contrary in the form of customer testimony or sales data, but they did not. Therefore, those customers' testimony stands unrebutted.

Second, the fact that such pass-through language is a standard part of coal contracts does not lessen the BLET's relevance. If the cost of SPRB coal went up 3% and customers did not change their coal burns or purchasing plans, that is relevant no matter the cause of the increase. If customers could readily switch to burning natural gas or use negotiating power to avoid a price increase, they would, whether the increase was caused by taxes or something else. SPRB coal customers' responses (or lack thereof) to the BLET, together with the related testimony elicited by the **FTC**, suggest that they cannot.

D. Likelihood of price increases

Currently, Defendants are both pursuing business strategies that focus explicitly on reducing output from their SPRB mines. **Peabody's** President and CEO stated in a Q4 2018 earnings call that its thermal operations, including in the SPRB, "continue to emphasize value over volume in the face of reduced coal demand" to generate higher margins for investors. PX9104-007. At that time—less than a year before the JV was announced—he stated that **Peabody** intended to reduce production at NARM by 10 million tons because they "[were] not generating margins [they found] acceptable for [their] investors." *Id.* The year before, **Peabody's** CFO and Executive Vice President stated that "new **Peabody** isn't about volumes but about margins and return." PX9098-004. Meanwhile, Arch's strategy is "to harvest the remaining cash flows [from its SPRB mines] and use the proceeds to invest in [non-SPRB] assets or return capital to shareholders." PX2628-002.

Defendants argue that this Court cannot simply assume, based on the **FTC's** showing of "increased concentration in a narrowly defined market" that the JV will have anticompetitive effects. DPFFCL ¶ 223. Such effects are the result of "purposeful business choices made by the corporation's management calculated, affirmatively or by effect, to achieve those ends." *Deutsche Telekom*, 439 F. Supp. 3d at 245. According to Defendants, they have presented evidence showing that it would be self-defeating for the JV to raise prices, while the **FTC** has produced "no evidence ***906** that Defendants intend to raise prices" post-JV. DPFFCL ¶¶ 223-24. In light of the above statements of corporate strategy, the argument that "coal producers have no incentive to raise prices and further erode future coal demand," DPFFCL ¶ 222, is not well-taken.

That finding is bolstered by Dr. Hill's Cournot model, which economists use to predict the effect of changes in concentration in a market, especially in concentrated markets with a relatively homogenous product like SPRB coal. PX8001 (Hill Report) ¶ 180. In order to make the analysis more favorable to Defendants, Dr. Hill assumed that Defendants would achieve and pass through the 5.5 percent marginal cost efficiencies that they claim will result from the JV and that they would follow through on a pledge to implement a 15-cent discount on all contracted tons between the date the JV closes and the end of 2022. *Id.* ¶ 179. He also included the price elasticity of demand, which captures competition with other fuels. Tr. Vol. 4A (Hill) 76:1-5.

Dr. Hill implemented two versions of the Cournot model. The first "baseline" model assumes that demand for SPRB coal remains constant over time. PX8001 (Hill Report) ¶ 191. That version predicts that the JV will lead to significantly higher prices for SPRB coal in every year from 2021 to 2030, causing total harm to consumers with a net present value of almost $1.7 billion. *Id.* ¶¶ 195-96, Figs. 31-32. The second version of the Cournot model assumes an annual decline in demand for SPRB coal of [Redacted] per year from 2021 to 2030, [Redacted] *Id.* ¶ 198; PX1621-034. This model still predicts significantly higher prices for SPRB coal over the next ten years, causing total harm with a net present value of over $1 billion. PX8001 (Hill Report) Figs. 33-34. According to Dr. Hill, "[t]hese results show that neither the parties' 15-cent discount nor their claimed marginal cost efficiencies will likely prevent the joint venture from substantially reducing competition, raising prices, and harming customers." *Id.* ¶ 197.

Defendants object to Dr. Hill's applications of the Cournot model on a number of grounds, most notably that they fail to incorporate dynamic risks such as coal plant closures, the growth of renewables, or the effect of SPRB coal prices on demand, and that his model's predicted margins do not match observed margins. DPFFCL ¶¶ 227-28. Defendants argue that Dr. Hill's hypothesized harm falls away when dynamic effects are incorporated

Dr. Hill's analysis stands up to Defendants' critiques. His margins are based on Defendants' own accounting data. Tr. Vol. 9B (Hill) 52:12-53:2; PX8001 (Hill Report) ¶ 250 and Fig. 52 (citing PX2755 and PX1614). And he does not ignore dynamic competition, as Defendants argue. In his declining demand version of the Cournot model, he used **Peabody's** own projections of SPRB coal production volumes, which, according to Mr. Galli, take dynamic competition from other fuels into account. PX8001 (Hill Report) ¶ 198 (citing PX1621-031); Tr. Vol. 6B (Galli) 7:10-19 (**Peabody** considers natural gas prices to be the "biggest factor" affecting their SPRB coal forecasts). In his report, Dr. Hill also calculated the total harm to consumers using faster and slower decline rates of demand for SPRB coal, as well as a variable decline rate based on **Peabody's** exact annual projections formulated earlier this year. *Id.* ¶ 256. No matter which figures Dr. Hill used, the Cournot model predicted substantial harm to consumers. *Id*. at Fig. 56.

Dr. Hill also explained the underlying logic for these results: The JV's anticompetitive effect "is rooted in the fact that it combines the two SPRB coal suppliers that ***907** own the largest, most important mines in the SPRB. It puts in one set of hands assets that would otherwise compete vigorously with one another, even as demand fell and other mines ceased to produce." *Id.* ¶ 202. According to [Redacted] another SPRB coal producer, the JV will "have enough 8800 production capacity and market share to control the 8800 market pricing which will set the market for 8400" and will "have the production capacity to take over the entire PRB forecasted demand from 2021 on." PX3021-001.

E. Conclusion: FTC has established a presumption of anticompetitive effects.

[35] "Ultimately, this Court need not decisively sift through various models and theories." *Tronox*, 332 F. Supp. 3d at 212; *see also* *Sysco*, 113 F. Supp. 3d at 36-37 (noting that the court "hesitates to rely on" an expert's precise calculations where such calculations are subject to valid criticism, and concluding that "when evaluated against the record as a whole, [the expert's] conclusions are more consistent with the business realities" of the relevant market). The Court's task is to determine whether the **FTC** "has raised questions going to the merits so serious, substantial, difficult and doubtful as to make them fair ground for thorough investigation, study, deliberation and determination by the **FTC** in the first instance and ultimately by the Court of Appeals." *Heinz*, 246 F.3d at 714-15 (internal quotation omitted); *see also* *Tronox*, 332 F. Supp. 3d at 212. The **FTC** has cleared that bar.

The **FTC's** HHI analysis created a "presumption ... that [the JV] will substantially lessen competition" by "showing that the [JV] will result in a significant market share and an undue increase in concentration" in the SPRB coal market. *Swedish Match,* 131 F. Supp. 2d at 166. The **FTC** then reinforced that presumption with evidence that the JV would eliminate head-to-head competition between Defendants and increase Defendants' already-existing incentives to engage in strategic output withholding, to the detriment of its customers. The **FTC** therefore has firmly established a presumption that the proposed JV will have anticompetitive effects in violation of the Clayton Act.

III. Defendants' Case Against Likelihood of Anticompetitive Effects

[36] The presumption that the JV will substantially lessen competition is rebuttable. Defendants can either "discredit[ ] the data underlying the initial presumption in the government's favor," or "affirmatively show[ ] why [the JV] is unlikely to substantially lessen competition." *Baker Hughes*, 908 F.2d at 991. "The more compelling the [**FTC's**] prima facie case, the more evidence [Defendants] must present to rebut it successfully," though, and here the **FTC's** case is quite compelling. *Id.*

The proposed JV involves the two biggest producers of the relevant product in an already concentrated market, and it would create a single entity with 68% market share. That share far exceeds what the Supreme Court has held to be a concerning level of concentration. *See* *Phila. Nat'l Bank*, 374 U.S. at 364–65, 83 S.Ct. 1715 (a merger resulting in a single firm controlling at least 30% of the relevant market was sufficient to "raise an inference that the effect

of the contemplated merger ... may be substantially to lessen competition"); *Continental Can*, 378 U.S. at 461, 84 S.Ct. 1738 (a merger resulting in a company with 25% market share "falls squarely within the principle that where there has been a history of tendency toward concentration in the industry[,] tendencies toward further concentration are to be curbed in their incipiency.").

***908** Some courts have found market share to be too crude and have preferred a focus on HHI. *F.T.C. v. PPG Indus., Inc.*, 798 F.2d at 1503 ("The **FTC** and the Department of Justice, as well as most economists, consider [HHI] superior to such cruder measures as the four- or eight-firm concentration ratios which merely sum up the market shares of the largest four or eight firms."). The result in this case is the same. An increase of over 2,000 in the HHI index is more than ten times the threshold for a presumption of enhanced market power. Guidelines § 5.3; *Heinz*, 246 F.3d at 716. And the **FTC** has produced substantial evidence that the JV would eliminate head-to-head competition; that SPRB coal customers would have trouble resisting a price increase; and that such an increase is likely. Thus, Defendants have an uphill climb to rebut the resulting presumption that the JV will harm competition.

To that end, Defendants argue that customers have multiple strategies available for resisting a potential price increase. They contend that customers will continue to substitute other fuels for coal because of changes in relative prices, thereby constraining the JV in both the short term—by reducing coal burn, deferring deliveries and purchasing less coal—and in the long term—by retiring their coal EGUs. DPFFCL ¶ 234. Defendants also argue that the JV will face competitive constraints from other SPRB coal producers, including through possible expansion by other SPRB coal producers at their mines. *Id.* ¶ 235.

[37] None of Defendants' arguments can defeat the presumption of anticompetitive effects created by the **FTC's** showing.

A. Competition from other fuels and other SPRB coal suppliers

Defendants argue that, "[e]ven if other fuels are not a substantial enough constraint to be included in the relevant product market, customers will continue to substitute (through generation or purchasing) other fuels for coal due to relative changes in price and thereby constrain the Joint Venture in both the short term, by reducing coal burn, deferring deliveries and purchasing less coal, and the longer term, by retiring their coal EGUs." DPFFCL ¶ 234. Additionally, they argue that the JV "will also continue to face critical competitive constraints from other coal producers." *Id.* ¶ 235.

As discussed in Section I.A.1.a, above, Dr. Hill's actual elasticity of demand calculation incorporates competition from other fuels. Tr. Vol. 4A (Hill) 47:21-49:14. There is no dispute that natural gas and renewables impose some amount of competitive pressure on SPRB coal producers; the key question is whether such competition is likely to constrain the JV from harming competition, and Dr. Hill's HMT analysis strongly suggests that it is not.

In addition, multiple SPRB coal customers testified about the challenges of switching from SPRB coal to another fuel source. Renewables are not dispatchable baseload units; they are intermittent fuel sources that are difficult to store. Customers cannot replace baseload units with non-dispatchable, intermittent resources. PPFF ¶ 144 (collecting witness testimony). Natural gas prices are projected to rise relative to SPRB coal prices in coming years, making them a less effective constraint moving forward. *Id.* ¶ 145. And even at current low prices, natural gas generation is still more expensive than SPRB coal for many customers. *Id.* ¶¶ 146-47 (collecting witness testimony).

Professor Julie Carey, Managing Director at National Economic Research Associates, Inc., argued that Defendants would not want to raise SPRB coal prices ***909** if it meant that coal units would dispatch less power because their bids would exceed the market-clearing price. She determined that a 5 percent SPRB coal price increase translated to a $0.28/MwH increase in the cost of generating power for an average SPRB coal plant. Tr. Vol. 6A (Carey) 85:18-24. She then applied the price increase to several dispatch stacks, comparing the generating costs of SPRB coal units supplied by Defendants to the costs of the next units in the dispatch stacks that are not also supplied by Defendants, *id.* at 91:8-23, finding that even small cost differences affect the likelihood of an EGU bidding below the market-clearing price and being dispatched. *Id.* at 51:3-53:9

Surely it is true that the lower the price of coal, the lower a unit costs to operate, the lower the utility can bid into the ISO, making that unit marginally more likely to dispatch.

And so, all other things being equal, a modest increase in the cost of coal, translated directly into an increase in a utility's bid for its coal EGU, could move the unit up the dispatch stack, reducing its odds of dispatching. But all other things are not equal. Tr. Vol. 6A (Carey) 73:25-74:5 ("In the real world, the sale of electricity and the competition that exists is highly complicated.") Professor Carey's analysis tells us nothing about *how much* any particular unit's odds of dispatching would be impacted by the hypothesized price increase, which would depend on not just the commodity cost of coal but also many other factors, starting with where the unit's original bid was situated relative to the market-clearing price. If it started out well below the market-clearing price, a modest increase in its bid would be unlikely to affect whether it dispatches. [12] Also relevant would be all of the other factors that go into the utility's *bid* for that unit, as ISOs make dispatch decisions based on utilities' bids, rather than their costs. PX6029 (Kimm) 30:18-25 (units dispatch "based on their offer ... not necessarily their cost"). Witnesses testified that the factors affecting bids are manifold. Tr. Vol. 1B (Meyer) 42:11-43:2 (bids into MISO account for a "whole host of other parameters" beyond cost to operate EGUs); Tr. Vol. 6A (Carey) 79:6-25 (EGUs in ISOs employ multiple bidding strategies). Plus there are various considerations that might cause a unit to be dispatched out of order or self-committed. [13] *See, e.g.*, Tr. Vol. 1B (Meyer) 40:11-42:2 (coal units may self-commit because the RTO day-ahead market does not capture the costs associated with starting and stopping a coal-fired generating unit); [Redacted] (ISOs may pick a higher cost generating unit over a lower cost generating unit if the higher cost unit provides another benefit such as reliability or alleviation of transmission constraints); [Redacted] (same).

In sum, the dispatch of generation units in wholesale electricity markets is complex and involves many interrelated factors. PPFF ¶¶ 155-165. It seems unlikely that ***910** an increase in the mine-mouth price of coal would translate neatly into a single effect over all units bid in by all utilities into all ISOs. But even if it did, it would be impossible to know how much of a deterrent it might be to increasing coal prices without knowing how such an increase would affect the ability of coal EGUs to *dispatch.* Tr. Vol. 6A (Carey) 74:19-75:24 (an EGU's variable cost is not the sole determinant of whether that unit generates electricity).

The **FTC** also points out that ISOs already operate today, so SPRB coal buyers are presumably already exercising any leverage they may have in their negotiations with SPRB coal suppliers based on the fact of inter-fuel competition in the ISO market. PPFF ¶¶ 153-54. Moreover, as discussed in Section II.C, above, the BLET pass-through illustrates that a price increase of a similar magnitude to that which was considered by Professor Carey is unlikely to have a meaningful effect on coal purchases, suggesting that it is unlikely to meaningfully affect coal dispatch. Professor Carey's analysis does not suggest anything to the contrary.

And as will be described at greater length in Section III.C, below, it is unlikely that the other SPRB coal producers, which collectively control about 32% of SPRB coal production, will be able to expand output sufficiently to impose a meaningful competitive constraint on the JV. A representative from NTEC, the third-largest SPRB coal producer and the owner of the Antelope mine, [Redacted] PX6009 (Tipton) 166:12-167:3. Kiewit, another SPRB coal producer, believes that the JV will [Redacted] PX3021-001.

B. Arch's diminished competitiveness in the but-for world

The Eighth Circuit has instructed that "when examining a merger, a court must necessarily compare what may happen if the merger occurs with what may happen if the merger does not occur." *Nat'l Tea Co.*, 603 F.2d at 700. And Defendants argue that Arch, in particular, will struggle if the JV is enjoined. *See also* *Arch Coal*, 329 F. Supp. 2d at 153 ("A weak financial condition, or limited reserves, may mean that a company will be a far less significant competitor than current market share, or production statistics, appear to indicate.").

Arch argues that it will become a far less important SPRB coal supplier and [Redacted] DPFFCL ¶ 232. Arch recently has operated at a loss in the SPRB, with losses in the second quarter of 2020 of [Redacted] cents per ton. Tr. Vol. 5A (Lang) 82:4-13. The company claims that, absent the JV, it will [Redacted] which would allow Arch to focus on its most profitable operations in the hopes of earning positive margins and [Redacted] *Id.* at 100:8-25.

First, the Court notes that Arch's underlying logic—[Redacted]—supports the Court's finding that the parties have the incentive and intention to maximize profits by cutting output.

Second, Defendants explicitly disclaim any reliance on the "failing firm" defense; rather, they draw the Court's

attention to "the industry's struggles and the impact they have on Defendants' employees and local economies and communities when assessing the balance of equities." DPFFCL ¶ 256. The Court certainly does take note of all of those circumstances. But no matter the outcome of this proceeding, Arch "[has] made [its] decision" to "pivot[ ] away" from SPRB coal production. Tr. Vol. 5A (Lang) 102:8-15. In other words, while Arch and the State of Wyoming believe that the JV may help avoid unplanned job losses, Arch ultimately intends to [Redacted] with or without the JV. [Redacted] *Id.* at 100:8-25. To the extent that these realities ***911** affect the balance of equities, the Court will consider those arguments at the proper time. They do not alter the Court's analysis of the JV's likely competitive effects.

C. Expansion by other SPRB coal producers

Lastly, Defendants argue that other SPRB coal producers will expand to offset any decrease in production caused by the JV.

As an initial matter, **Peabody** and Arch agree that greenfield entry into the SPRB coal market is "unlikely." PPFF ¶ 181. The financial and regulatory barriers to entering the SPRB or obtaining licenses to expand into new areas within the SPRB are immense, and Dr. Hill testified, without rebuttal from Defendants, that it would take "a very long time" for a competitor to enter the market or expand existing mines. *Id.* ¶¶ 182-184. In light of this uncontroverted testimony, together with the facts that coal plants are retiring and no new coal plants are being built, the Court finds that it is unlikely that any new coal mines will open in the SPRB or existing mines will obtain regulatory approval for an expansion into new areas within the SPRB.

Undeterred, Defendants argue that the JV will face competition from other coal producers who can expand output at their existing mines without need for regulatory approval or substantial up-front expense. DPFFCL ¶¶ 235-38. Dr. Bailey estimated that SPRB coal producers other than **Peabody** and Arch had at least 70.5 million tons of excess capacity in 2019, which roughly equals Black Thunder's annual output. DX4001 (Bailey Report) ¶ 91. Defendants contend that this excess capacity will only grow as demand continues to decline due to additional coal EGU retirements and shifts towards natural gas and renewables. DPFFCL ¶ 236. They point to Kiewit and NTEC in particular, [Redacted]. ¶ 238. They also note that other SPRB coal suppliers "compete and frequently win business in RFPs against Defendants today, and there is no reason to believe they would not continue doing so." *Id.* ¶ 237.

Citing testimony from industry participants, the **FTC** counters that "existing firms are unlikely to invest capital in increasing output in hopes of capturing share from a massive JV with a dominant position." PPFF ¶ 185. NTEC's Antelope mine, the closest rival to Black Thunder and NARM, is [Redacted] *Id.* ¶ 186. [Redacted] Tr. Vol. 2B (Romer) 101:17-102:17. That testimony aligns with the deposition testimony of Mr. Harry Tipton, NTEC's Chief Marketing and Operating Officer, who stated that [Redacted] PX6009 (Tipton) 127:15-128:6.

FM Coal's mines are smaller and produce lower-heat and higher-sulfur coal that is a poor substitute for coal from NARM or Black Thunder. PPFF ¶ 135. Kiewit plans to [Redacted] PX3022-009. No one contends that Blacks Hills or WFA, which both own much smaller mines that produce lower-heat and higher-sulfur coal, could replace any meaningful portion of the coal currently supplied by NARM and Black Thunder. PPFF ¶ 189.[14] Additionally, some customers do not even solicit bids from suppliers other than Defendants because of the design of their EGUs. *Id.* ¶ 191.

Dr. Bailey's argument about possible expansion by Defendants' competitors rests on an assumption that every one of them could expand their annual production to their maximum annual delivered tons from ***912** 2010 through 2019. DX4001 (Bailey Report) Fig. 60. While that measure may describe what is geologically *possible* (although her methodology is debatable), it is not the relevant measure for antitrust analysis. *F.T.C. v. ProMedica Health Sys., Inc.*, No. 3:11 CV 47, 2011 WL 1219281, at *57 (N.D. Ohio Mar. 29, 2011) ("Defendants must show both that entry is *likely*—meaning both technically possible [ ] and economically feasible—and that it will *replace* the competition that existed prior to the merger.") (citing *Cardinal Health*, 12 F. Supp. 2d at 56) (emphasis in original). Dr. Bailey has not provided the Court with what is economically and geologically *feasible* in the next several years. On the other hand, the **FTC** has presented ordinary course business documents and statements from decision-makers at rival SPRB coal producers that clearly indicate that no other producer has the desire or wherewithal to expand production to an extent that would meaningfully reduce the likely anticompetitive effects of the JV.

Lastly, the Court notes that Defendants' argument that SPRB coal suppliers would provide meaningful competition with

the JV through the RFP process is in tension with their broader argument that the RFP process plays a comparatively insignificant role in constraining the cost of SPRB coal. Moreover, as noted above, Defendants' ordinary course documents show that the individual Defendants are more likely to lose bids to one another, as opposed to other SPRB coal producers.

Accordingly, the Court concludes that expansion of rival SPRB coal producers is unlikely to offset the likely anticompetitive effects of the proposed JV.

D. Conclusion: Defendants fail to rebut evidence of likely anticompetitive effects.

Based on all of the evidence presented, the Court finds that, "because the proposed [JV] would eliminate head-to-head competition between the number one and number two competitors in the market for [SPRB coal]," the JV is likely to lead to anticompetitive effects in that market. *Sysco*, 113 F. Supp. 3d at 65. Evidence of probable unilateral effects strengthens the **FTC's** prima facie case that the merger will lessen competition in the national customer market. *See Heinz*, 246 F.3d at 717 (footnote omitted) (finding that "the **FTC's** market concentration statistics are bolstered by the indisputable fact that the merger will eliminate competition between the two merging parties"); *Whole Foods*, 548 F.3d at 1043 (Tatel, J., concurring) (citation omitted) (internal quotation marks omitted) ("[T]here can be little doubt that the acquisition of the second largest firm in the market by the largest firm in the market will tend to harm competition in that market."). This finding is bolstered by both Defendants' stated goal to restrain production in order to increase margins.

Defendants present several rebuttal arguments, but they are unavailing. While there is evidence that SPRB suppliers compete with each other and with other non-coal fuel sources, many customers testified that they cannot resist a price increase or substitute to other fuels in response to one, and their experience with the BLET validates those claims. Arch is evidently [Redacted] whether or not this Court enjoins the proposed JV, and any other discussion of Arch's competitive position in the but-for world is more appropriate for the balancing of the equities. There is no prospect for new SPRB coal mines to open, and existing SPRB coal suppliers are unlikely to expand their mines to make up for any reduction in SPRB coal supply by the JV. Thus, Defendants have failed to rebut **FTC's** showing that the proposed JV ***913** is likely to have anticompetitive effects in the SPRB coal industry.

IV. Defendants' Claimed Efficiencies

Defendants' other response to the **FTC's** prima facie case is that the JV will achieve significant efficiencies that are likely to enhance competition, rather than hinder it.

[38] The Supreme Court has not sanctioned an "efficiencies" defense in a case brought under Section 7 of the Clayton Act. *See F.T.C. v. Procter & Gamble Co.*, 386 U.S. 568, 580, 87 S.Ct. 1224, 18 L.Ed.2d 303 (1967) ("Possible economies cannot be used as a defense to illegality. Congress was aware that some mergers which lessen competition may also result in economies but it struck the balance in favor of protecting competition."). However, appellate courts and the Horizontal Merger Guidelines recognize that, in some instances, efficiencies resulting from the merger may be considered in rebutting the government's prima facie case. *Heinz*, 246 F.3d at 720 (citations omitted). Where, as in this case, a court finds high market concentration levels, defendants must present "proof of extraordinary efficiencies" to rebut the government's prima facie case. *Id.* (citations omitted) (requiring "extraordinary" efficiencies to rebut an increase in HHI of 510 points); *see also Sysco*, 113 F. Supp. 3d at 81-82.

[39] The Court is not aware of any case, and Defendants have cited none, where the merging parties have successfully rebutted the government's prima facie case on the strength of the efficiencies. *See CCC Holdings*, 605 F. Supp. 2d at 72 (stating that "courts have rarely, if ever, denied a preliminary injunction solely based on the likely efficiencies"). Yet even if evidence of efficiencies alone is insufficient to rebut the government's prima facie case, such evidence may nevertheless be "relevant to the competitive effects analysis of the market required to determine whether the proposed transaction will substantially lessen competition." *Arch Coal*, 329 F. Supp. 2d at 151 (citations omitted).

[40] **[41]** The Court must "undertake a rigorous analysis of the kinds of efficiencies being urged by the parties in order to ensure that those 'efficiencies' represent more than mere speculation and promises about post-merger behavior." *Heinz*, 246 F.3d at 721. Specifically, the Court must determine whether the efficiencies are "merger-specific"—

meaning they represent "a type of cost saving that could not be achieved without the merger"—and "verifiable"—meaning "the estimate of the predicted saving must be reasonably verifiable by an independent party." *H & R Block*, 833 F. Supp. 2d at 89 (internal quotation marks omitted) (citing Guidelines § 10); *Cardinal Health*, 12 F. Supp. 2d at 62 ("In light of the anti-competitive concerns that mergers raise, efficiencies, no matter how great, should not be considered if they could also be accomplished without a merger.").

[42] **[43]** Defendants bear the burden of demonstrating that their claimed efficiencies are merger-specific, *H & R Block*, 833 F. Supp. 2d at 90, which requires demonstrating that the efficiencies "cannot be achieved by either company alone because, if they can, the merger's asserted benefits can be achieved without the concomitant loss of a competitor." *Heinz*, 246 F.3d at 722. Defendants must also demonstrate that their claimed efficiencies would benefit customers. *CCC Holdings*, 605 F. Supp. 2d at 74; *see also* Guidelines § 10 ("Cognizable efficiencies have the potential to reverse competitive harm only if they are likely to be "passed through to customers."); *id.* ("It "is incumbent upon the ***914** merging firms to substantiate efficiency claims.").

[44] Defendants claim that the JV will generate significant efficiencies by optimizing production across mines that are currently operated separately, thereby reducing the cost of operations and increasing the output of coal. DPFFCL ¶ 240. Dr. Israel estimated that the JV will achieve $337.4 to $495.1 million in variable cost savings through the end of the mines' lives and $164.4 to $277.8 million in variable cost savings in its first five years. *Id.* Defendants argue that these "[s]ignificant variable cost reductions are most likely to encourage further coal production, reduce coal prices, and to be pro-competitive." *Id.* ¶ 241. As a result, the JV "will result in lower prices than would prevail in the but-for world, and will thereby enhance competition and benefit customers." *Id.* ¶ 242. Further, the JV will better position Defendants to compete in today's **energy** marketplace, ensuring that their mines will continue to operate and providing customers "access to a stable and reliable supply of SPRB coal in the future." *Id.* ¶ 243.

A. Verifiability

Defendants argue that their claimed efficiencies are verifiable because the "bulk" of them "result from joining Arch and **Peabody's** contiguous SPRB mines and reducing incremental production costs." *Id.* ¶ 245. Mr. Brock Haas, **Peabody's** Vice President of Mine Finance, testified about the "Clean Team" process used by Defendants, which involved professionals from both companies with experience in mining and incorporating contiguous mine operations in developing a joint mine plan, comparing that joint mine plan to Defendants' stand-alone plans, and estimating the JV's efficiencies. Tr. Vol. 8B (Haas) 30:2-39:16. Mr. Haas described the projected efficiencies that would result from combining formerly separate production operations to reduce incremental production costs by using more efficient mining methods, better utilizing mining equipment, reducing mine reclamation costs, and reducing purchasing costs. *Id.* at 40:3-46:24. Mr. Lang also testified about these efficiencies, describing how the combination of adjoining mines would enable more efficient mining. Tr. Vol. 6B (Lang) 8:25-14:15.

Defendants argue that their projected efficiency figures are credible because they have achieved—in fact, exceeded—similar efficiencies in similar transactions in which they integrated contiguous mines into Black Thunder. DPFFCL ¶ 246. In 2004, Arch acquired the North Rochelle mine from Triton, dissolving more than five miles of common boundary, and in 2009, Arch acquired the Jacobs Ranch mine from Rio Tinto and dissolved a six-mile boundary. *Id.* ¶ 59. In both acquisitions, Arch projected significant cost-saving efficiencies due to removing the common boundaries and integrating the stand-alone mines. *Id.* ¶ 60. Mr. Lang, who was integrally involved in both of those previous transactions, testified that Arch exceeded the projected efficiencies in both transactions. *Id.* ¶ 61; Tr. Vol. 5A (Lang) 114:9-118:25; DX8845-0019. For instance, at closing of the Jacobs Ranch transaction in 2009, Arch projected roughly [Redacted] million in lifetime cost savings; in 2014, after achieving substantial returns in the first few years after the transaction, Arch projected total savings at roughly [Redacted] million. DPFFCL ¶ 61; DX6029. [15]

***915** The **FTC** argues that Defendants' efficiencies are not verifiable because the mine plans that form the basis of the efficiencies calculations are long-term forecasts based on assumptions that change over time, and they are a "closed box". PPFF ¶¶ 197-99. In particular, the JV mine plan is not an ordinary course document, and Defendants did not disclose the assumptions and factual foundations that would allow the individual claimed efficiencies to be verified. *Id.* ¶ 200. Dr. Israel accepted these assumptions and used them in his calculations, *id.* ¶ 204, but Dr. Mark Zmijewski, the

FTC's efficiencies expert, found that many of the numbers in the spreadsheets underlying Dr. Israel's calculations were hard-coded, meaning that the cells contained digits with no references to other figures or calculations, rendering them impossible to verify without more explanation. *Id.* ¶ 202.

The **FTC** provided several examples of the problems that result from Defendants' reliance on such assumptions. For instance, the JV mine plan includes hard-coded numbers related to equipment productivity, which measures the amount of dirt a machine can move in a given pit. Productivity estimates are based on the judgment and expertise of one of **Peabody's** engineers. PX6031 (Gurgenli) 165:14-173:17. Dr. Zmijewski complains that he cannot verify such as assumption without the historical data used to determine equipment productivity or an explanation why the equipment productivity would change by the specified amount if the JV were consummated. Tr. Vol. 9B (Zmijewski) 140:23-141:3.

The **FTC** also criticizes the "unfounded assumptions" in Defendants' calculations. PPFF ¶ 204. As an example, the **FTC** points to Defendants' assumption that, [Redacted] PX1048-004. [Redacted] PX7013 ¶ 6.

Also problematic, according to the **FTC**, is Defendants' assumption that increasing volume in purchasing will lead to an additional [Redacted] discount across suppliers. PPFF ¶ 205. Defendants base the [Redacted] figure on the responses they received from a subset of suppliers who provided nonbinding responses to Defendants' inquiries; they have not verified that the informal predictions of suppliers would materialize if the JV were consummated. Tr. Vol. 9B (Zmijewski) 153:5-155:19.

Additionally, the **FTC** argues that Dr. Israel did not verify the efficiencies because he failed to independently identify the assumptions, factual foundations, and calculations underpinning the JV mine plan, and his reliance on the parties' business judgment and private conversations renders his analysis unverifiable. PPFF ¶ 206. Also, Dr. Israel claimed to test the efficiencies with a "sensitivities" analysis, but his analysis was less rigorous than **Peabody's** ordinary course standards. *Id.* ¶ 208.

Finally, the **FTC** rejects the notion that evidence from Arch's past transactions substantiates their claimed efficiencies, because verification of current claimed efficiencies with past-achieved efficiencies requires a mapping of the individual claims. *Id.* ¶¶ 213-14. As an example of efficiencies from the Triton transaction that do not map onto the efficiency claims in this case, the **FTC** points to the fuel efficiency in the ***916** Triton transaction, which concerned more efficient routes that consumed less fuel, while the [Redacted] efficiency in this transaction is based on [Redacted] *Id.* ¶ 214.

Defendants respond that the JV mine plan is, by definition, outside the current ordinary course of Defendants' business. DPFFCL ¶ 247. They point out, however, that they used the same ordinary course methodologies and processes that they use in their stand-alone mine planning. Tr. Vol. 8B (Haas) 35:9-36:3.

The bulk of the JV's efficiencies derive from the physical reality that the seven-mile boundary separating Black Thunder from NARM is geologically arbitrary and the operational reality that operating as one mine instead of two will make for a more efficient operation. A customer witness suggested that the possible efficiencies were apparent to anyone who had visited the mines and seen the manner in which they are separated. [Redacted] Based on testimony from Defendants' employees and several customers, as well as the results of previous analogous mergers undertaken by Arch, it seems clear that the projected efficiencies are more than a mirage. While Dr. Zmijewski's testimony identified several flaws with Defendants' process, and the Court commends his rigor, the Court also has no doubt that there is truth to Defendants' claim that the JV is likely to achieve significant efficiencies.

The Court is, of course, concerned about the fundamental unverifiability of efficiencies that are grounded in the business judgments of Defendants' employees. Also, as the **FTC's** examples make clear, some portion of Defendants' projected efficiencies are unrealistic or oversimplified. But Defendants have shown that they used a process substantially similar to that used in the ordinary course of business to determine the anticipated efficiencies arising from this transaction, and they have supported their claims with evidence from past transactions. Thus, the issues identified by the **FTC** do not render Defendants' efficiencies wholly unverifiable.

B. Specificity

In addition to being verifiable, claimed efficiencies must also be specific to the JV. Efficiencies are merger-specific if they "cannot be achieved by either company alone." *F.T.C. v. H.J. Heinz Co.*, 246 F.3d 708, 722 (D.C. Cir. 2001); *see*

also Guidelines § 10 (agencies "credit only those efficiencies likely to be accomplished with the proposed merger and unlikely to be accomplished in [its] absence").

Most of Defendants' projected efficiencies result from combining Defendants' contiguous NARM and Black Thunder mines and optimizing them under a joint mine plan. DPFFCL ¶ 251. Mr. Haas testified that neither **Peabody** nor Arch alone could achieve the synergies offered by the JV because it "would just be impractical .... By getting rid of the border, it allows you to unlock all these synergies." Tr. Vol. 8B (Haas) 38:19-39:16. Defendants also point to their bankruptcy filings within the last five years as evidence that they have done everything they can to make their separate operations as efficient as possible. DPFFCL ¶ 250. They claim to have very limited scope to continue cutting costs as separate entities. *Id.*

The **FTC** counters that it is incorrect to assume that any differences between the standalone and JV mine plans are attainable only through the JV. One significant component of the claimed efficiencies is [Redacted] and Arch has bought and sold used draglines, at least one of which is involved in the projected efficiencies in this case. Tr. Vol. 5B (Lang) 19:5-22. While the parties may prefer not to [Redacted] Defendants have not shown that such a sale could not be accomplished in the absence of the JV. Similarly, the **FTC** points out ***917** that [Redacted] is not merger-specific because Arch could learn **Peabody's** best practices through means other than the JV. PPFF ¶ 220; PX8002 (Zmijewski Report) ¶¶ 160-62.

The **FTC** also argues that Defendants incorrectly assume that any current differences between Arch and **Peabody's** pricing today derives from differences in purchasing volumes, which is belied by evidence showing that certain pricing differences reflect different preferences and tradeoffs during negotiations. PPFF ¶¶ 221-23. Per the **FTC**, "Arch and **Peabody** do not need the JV to make different contracting choices." *Id.* ¶ 222 (citing PX8002 (Zmijewski Report) ¶¶ 133-41).

The Court agrees with the **FTC** that some portion of Defendants' claimed efficiencies are probably achievable without the JV. *See generally* PX8002 (Zmijewski Expert Report) ¶¶ 131-72. Still, the underlying logic of the JV is undeniable. While some of the anticipated efficiencies may not be merger-specific, operating the mines jointly will clearly make possible substantial efficiencies.

C. Other considerations

The **FTC** raises several other objections to Defendants' efficiencies calculations. The first, and most compelling, objection is that Defendants' forecasts use, on average a 20-year horizon. Tr. Vol. 9B (Zmijewski) 125:5-19. All forecasts, including financial forecasts, become less accurate as the time horizon lengthens. *Id.* For that reason, the Merger Guidelines are skeptical of claimed efficiencies in the distant future, Guidelines § 10 n.15, and parties presenting efficiencies claims commonly limit the claims to five years or less, Tr. Vol. 9B (Zmijewski) 125:20-127:13, as Arch did in the Triton merger. PX2760; PPFF ¶ 211. It is therefore noteworthy that Defendants present their claimed efficiencies here over the life of the mine, rather than over a five-year time horizon. This longer time horizon increases the net present value of the variable cost savings from [Redacted] (over five years) to [Redacted] (over the life of the mine). DX4003 (Israel Report) ¶ 138. [16]

The **FTC** also argues that the JV has not demonstrated that it will share efficiencies with customers because the price forecast included in Defendants' claimed efficiency analysis shows [Redacted] PPFF ¶ 224. It points to Defendants' own price forecast, as well as statements from customers who reported that Defendants told them frankly that they did not expect the price of SPRB coal fall as a result of the JV. *Id.* at ¶¶ 224-25.

That argument is intuitive but unavailing. The Court's objective is to determine the JV's likely effect on competition compared to the but-for world in which the JV is not allowed. *Nat'l Tea Co.*, 603 F.2d at 700 ("[W]hen examining a merger, a court must necessarily compare what may happen if the merger occurs with what may happen if the merger does not occur."). The fact that the world with the JV does not have lower prices than the present is not, in itself, dispositive. Defendants told at least one customer that the JV will forestall price increases. [Redacted] In other words, Defendants stated that prices would rise faster in the but-for world without the JV. If true, then the JV's forestalling of price increases is a cognizable benefit to Defendants' customers.

D. Conclusion: Even with efficiencies, Defendants do not rebut presumption of likely anticompetitive effects.

"Even if the savings are neither as great as defendants have claimed nor capable of ***918** precise quantification based on the evidence presented by defendants," the Court is convinced that combining the adjacent Black Thunder and

North Antelope Rochelle mines "will inevitably allow [the JV] to achieve some measure of lower costs and higher productivity." *Arch Coal*, 329 F. Supp. 2d at 153. These efficiencies, therefore, are "relevant to an assessment" of the likely state of competition in the post-JV SPRB coal market and provide "some limited additional evidence to rebut the claim of post-merger anticompetitive effects." *Id.*

That said, even granting Defendants every dollar of their claimed efficiencies (which, based on the foregoing, is not wholly justified) and making the implausible assumption that they would pass every penny of those efficiencies on to their customers, Defendants' claimed efficiencies still would not offset the likely competitive harm to those same customers predicted by the more conservative version of Dr. Hill's Cournot model. *See* Section II.D, *supra.* Therefore, the Defendants' claimed efficiencies add little to the Defendants' effort to rebut the **FTC's** case that the proposed JV would likely have anticompetitive effects in the SPRB coal market.

Even giving Defendants the full benefit of the doubt as to efficiencies, then, they still have failed to "produce evidence showing that the **FTC's** *prima facie* case 'inaccurately predicts the relevant transaction's probable effect on future competition.' " *Sanford Health*, 926 F.3d at 962-63 (quoting *Baker Hughes*, 908 F.2d at 991). The **FTC** has succeeded in showing that JV is likely to lead to anticompetitive effects in the SPRB coal market and is thus likely to succeed on the merits of its challenge under Section 7 of the Clayton Act. 15 U.S.C. §§ 18, 53(b).

V. The Equities

[45] **[46]** The Court's finding that the **FTC** has established a likelihood of success on the merits creates a presumption in favor of a preliminary injunction. *Swedish Match*, 131 F. Supp. 2d at 172. Despite this presumption, "Section 13(b)'s 'public interest' standard still requires the court to weigh the public and private equities of enjoining the [JV]." *Sysco*, 113 F. Supp. 3d at 86 (citing *Heinz*, 246 F.3d at 726). In conducting that analysis, the Court is mindful that "no court has denied a Section 13(b) motion for a preliminary injunction based on weight of the equities" where the **FTC** has demonstrated a likelihood of success on the merits. *Sanford*, 2017 WL 10810016, at *31.

[47] **[48]** The principal equitable consideration weighing in favor of a preliminary injunction is the "strong public interest in effective enforcement of the antitrust laws and in the **FTC** having the ability to order effective relief if it succeeds in an administrative proceeding." *Id.* "[C]ompetition is our fundamental national economic policy, offering as it does the only alternative to the cartelization or governmental regimentation of large portions of the economy." *Phila. Nat'l Bank*, 374 U.S. at 372, 83 S.Ct. 1715. The purpose of the preliminary injunction is to preserve the **FTC's** ability to obtain effective relief if the JV is ultimately found to violate Section 7 of the Clayton Act. Allowing the transaction to proceed and then later " 'unscrambling' the eggs" upon a finding of illegality by the **FTC** is a "daunting and potentially impossible task," *Sysco*, 113 F. Supp. 3d at 87, which supports the issuance of an injunction.

[49] On the other side of the ledger, the Court is convinced that the JV will generate substantial efficiencies, and blocking the transaction will prevent those synergies from being realized before the ***919** completion of the **FTC's** administrative proceeding. [17] Also, according to the State of Wyoming in its amicus brief, unforeseen abrupt mine closures and bankruptcies could result in immediate layoffs affecting the entire state of Wyoming. Doc. [273-1] at 14. The way the State sees it, the Court's choice is between a haphazard consolidation via bankruptcies and "[t]he thoughtful planned consolidation of coal mines in Wyoming ...." *Id.* Similarly, although Defendants do not make a "failing firm" defense, DPFFCL ¶ 256, they did present evidence that Arch faces an uncertain future in the SPRB if the JV is enjoined. Tr. Vol. 5A (Lang) 101:1-4 (stating "full **energy** ... has been on this JV" and that "it is best not only for our customers but especially for our employees"); Tr. Vol. 3A (Smith) 65:20-22 [Redacted]

The Eighth Circuit has instructed that a court "ought to exercise extreme caution" when considering a request for a preliminary injunction, especially "in an industry ... experiencing significant and profound changes." *Tenet Health*, 186 F.3d at 1055. SPRB coal, as well as the **energy** industry more broadly, is certainly such an industry. Yet the Court cannot conclude, on this record, that the JV's likely benefits—which are not insubstantial, including significant efficiencies for Defendants and some mitigation of the decline of Arch and other entities in the Wyoming coal industry—will outweigh the potential harm to consumers from the lost competition between the two largest producers in the SPRB. PX8001 (Hill Report) Figs. 31-34 (finding net present value

of predicted harm to customers from 2021-2030 of between $1.092 billion and $1.946 billion). At the very least, the record in this case "rais[es] questions going to the merits so serious, substantial, difficult and doubtful as to make them fair ground for thorough investigation, study, deliberation and determination by the **FTC** in the first instance ...." *Tenet Health*, 186 F.3d at 1051 (internal quotations omitted). Accordingly, upon weighing the relevant equities, the Court finds that a preliminary injunction enjoining the JV pending a full administrative hearing on the merits is in the public interest.

CONCLUSION

Having considered all of the evidence presented in this case, the Court cannot help but return to Judge Tatel's observation in *Whole Foods*: "[T]here can be little doubt that the acquisition of the second largest firm in the market by the largest firm in the market will tend to harm competition in that market." *Whole Foods*, 548 F.3d at 1043 (Tatel, J., concurring) (citation omitted) (internal quotation marks omitted). The **FTC** has satisfied its burden of showing a "reasonable probability" that a JV between the two largest SPRB coal suppliers would harm competition in the SPRB coal market. *Brown Shoe*, 370 U.S. at 325, 82 S.Ct. 1502. The JV is likely to cause unduly high market concentration in the market for SPRB coal, which, despite the headwinds facing the coal industry, is projected to continue supplying a significant portion of the fuel for electricity generation in the United States for decades to ***920** come.[18] The evidence offered by Defendants to rebut the **FTC's** prima facie case makes clear that there is meaningful competition between SPRB coal and other fuels, but it does not rebut the **FTC's** central claim that there is meaningful coal-on-coal competition that would be lost if the parties were allowed to consummate the JV. The equities also favor granting a preliminary injunction.

The **FTC** has thus succeeded in showing that, "weighing the equities and considering the Commission's likelihood of ultimate success, [the preliminary injunction] would be in the public interest." *Tenet Health*, 186 F.3d at 1051 (quoting 15 U.S.C. § 53(b)). Accordingly, the Court grants the **FTC's** Motion for Preliminary Injunction (Doc. [137]). A separate order accompanies this Memorandum Opinion.

5 Cloud Peak **Energy**, Inc., ("Cloud Peak") previously operated the Antelope and Cordero Rojo mines prior to filing for bankruptcy protection in May 2019. *Id.* ¶ 27. NTEC acquired those mines during Cloud Peak's bankruptcy proceedings.

6 Blackjewel, LLC ("Blackjewel") previously operated the Eagle Butte and Belle Ayr mines. *Id.* ¶ 28. Blackjewel filed for bankruptcy protection in July 2019, resulting in a temporary shutdown of its two mines. *Id.* ¶ 29.

7 Due to late-breaking coronavirus-related developments, the preliminary injunction hearing—which involved dozens of attorneys, 24 live witnesses, plus security, Clerk's Office, and chambers staff over nine court days—nearly had to be held entirely via video conferencing technology. At the eleventh hour, the Eastern District of Missouri Clerk's Office devised a way to hold it safely with a dozen attorneys and most witnesses appearing in person (scrupulously socially-distanced and masked); several examining attorneys and witnesses appearing by video conference; many more attorneys connected via a secure audio line; and the general public listening in by telephone. It was a staggering logistical and technological challenge, and the Court commends all involved—including attorneys, paralegals, support staff, and courthouse personnel—for their flexibility, resourcefulness, and professionalism.

8 A hearing before an administrative law judge is scheduled to begin on December 1, 2020. Counsel for Defendants has represented to the Court that the administrative hearing will never happen, and that **Peabody** and Arch will abandon the JV if the Court grants a preliminary injunction. The Court has no reason to doubt Counsel's representation, but Defendants' intentions do not affect the legal standard that this Court must apply.

9 Both parties cite to the Guidelines, published by the U.S. Department of Justice and the Federal Trade Commission, extensively in their briefing. Although they are not binding, the Guidelines "have [ ] been repeatedly relied on by the courts" in evaluating merger challenges. *F.T.C. v. Tronox Ltd.*, 332 F. Supp. 3d 187, 206 (D.D.C. 2018).

10 Dr. Hill points out in his rebuttal report that Dr. Bailey changed her "Before" and "After" time periods for this analysis between the **FTC's** pre-complaint investigatory proceeding and her expert report in this case. PX8006 (Hill Rebuttal Report) ¶¶ 122-23. That shift supports Dr. Hill's argument that, within a certain range, the time period selected by Dr. Bailey is essentially arbitrary, which casts further doubt on the helpfulness of an event study without an underlying event.

11 The *Brown Shoe* approach to market definition has been criticized as "free-wheeling," and out of step with "modern merger practice." *F.T.C. v. Whole Foods Market, Inc.*, 548 F.3d 1028, 1058-59 (D.C. Cir. 2008) (Kavanaugh, J., dissenting). Nevertheless, it remains good law and is still regularly invoked in antitrust challenges. *See, e.g.*, *RAG-Stiftung*, 436 F. Supp. 3d at 293 n.3 (quoting *Sysco*, 113 F. Supp. 3d at 27 n.2) ("*Brown Shoe* remains the law, and this court cannot ignore its dictates.")

12 One utility representative testified that its coal units are so far "in the money" that an increase of 50% in the cost of coal would not cause them not to run: "[T]he units still run, it's just that that margin that they were making shrinks and shrinks and shrinks as the coal gets more expensive, and all that means is that my customer rates ultimately are higher and higher and higher." [Redacted]

13 Self-commitment is an exception to the "least-cost dispatch" rule: when certain EGUs are bid into ISOs as "self-committed" or "must run," the utility is directing the ISO to operate the unit regardless of its variable costs. Tr. Vol. 6A (Carey) 80:1-5; [Redacted] In most circumstances, self-committed units dispatch economically,

PX9191-001; Tr. Vol. 6A (Carey) 81:17-82:1, and uneconomic self-commits are highly discouraged by ISOs and regulatory authorities, as they are inconsistent with least-cost dispatch. Tr. Vol. 6A (Carey) 33:9-33:14.

14 Dr. Bailey argues that these mines are competitively meaningful because any coal purchased from these two mines would free up coal at rival mines. DX4001 (Bailey Report) ¶ 90. However, she discusses magnitudes of several hundred thousand tons per year, *id.*, which is around one percent of the annual production of Black Thunder alone.

15 Defendants argue that Arch's customers benefited from both prior transactions because North Rochelle and Jacobs Ranch were both struggling as stand-alone assets, and the combination allowed Arch to increase production and lower costs relative to the prior owners' stand-alone plans. DPFFCL ¶ 63; PX9065-002. While the **FTC** argues that these transactions did not benefit customers because SPRB coal prices increased following these acquisitions, PPFF ¶ 216, the record does not support the **FTC's** claim. There is a critical distinction between lower prices in absolute terms and lower prices relative to those that would have prevailed absent the acquisition, and the **FTC** has not shown that Arch's prices were higher post-merger than they would have been absent the merger.

16 The very fact that Dr. Israel calculated and included a five-year efficiencies calculation suggests that he was aware of the difficulty of projecting savings over the life of the mine.

17 The Court notes again that counsel for Defendants has indicated that they will not litigate an administrative proceeding and will instead abandon the JV if this Court issues a preliminary injunction. As a result, the practical effect of granting an injunction will be to terminate the JV. However, "the parties' stated intention to abandon the transaction prior to the merits proceeding is a private equity, and cannot on its own overcome the public equities that favor the **FTC**." *F.T.C. v. Wilh. Wilhelmsen Holding ASA*, 341 F. Supp. 3d 27, 74 (D.D.C. 2018) (citing *Heinz*, 246 F.3d at 727, and *Sysco*, 113 F. Supp. 3d at 87).

18 *See* EIA Annual **Energy** Outlook 2020, Table 66, *available at* https://www.eia.gov/outlooks/aeo/tables_ref.php (projecting that almost 200 million tons of SPRB coal will be consumed in 2030, and that annual consumption will remain around 150 million tons per year through 2050).

MAJOR RAIL CONSOLIDATION PROCEDURES

COMMENTS OF THE BURLINGTON NORTHERN
AND SANTA FE RAILWAY COMPANY

The Burlington Northern and Santa Fe Railway Company ("BNSF") hereby files its comments, including the verified statements of Robert D. Krebs, Professors José A. Gómez-Ibáñez and Joseph P. Kalt, Professor Richard J. Pierce, Jr., and Professor Bradford Cornell, in response to the "Notice of Proposed Rulemaking" ("NPR") issued by the Surface Transportation Board ("Board") on October 3, 2000. In the NPR, the Board has requested comments on proposed changes in its merger rules that would significantly raise the bar for future mergers of Class I railroads.

I. EXECUTIVE SUMMARY

BNSF supports those narrow changes proposed by the NPR that would refine the Board's current pro-merger policy to address the precise concerns raised by recent mergers. Specifically, BNSF supports the requirements that future merger applications include (i) detailed service assurance plans, and (ii) proposals for maintaining competition through an open major gateway policy and the preservation of the "contract exception" right for shippers affected by a merger.

However, BNSF strongly opposes the unduly prolonged schedule proposed by the Board for handling Class I railroad mergers, which could stretch to 19 months or longer.

Such a schedule is not consistent with the demands of the economy in general or of shippers, other carriers and ports. It could adversely affect the access of railroads to capital markets, reduce the benefits generated by rail mergers, and place merger applicants in a state of regulatory limbo that would be harmful to shippers and the railroad industry. Therefore, BNSF proposes herein a maximum review period of one year from the date of the pre-filing notification. Moreover, given the end-to-end nature of likely future Class I transactions, there is no reason why the Board cannot process mergers within even shorter periods, using the same simplified procedures as other agencies do in reviewing mergers of comparable scope and size, much as the Board's predecessor itself suggested in 1995.

Further, BNSF strongly opposes those provisions of the NPR that would reverse the statutory presumption in favor of mergers and require all merger applicants to propose "competitive enhancements" to offset unrelated and ill-defined presumed harms supposedly arising from irremediable reductions in geographic and product competition and unavoidable transitional service problems. BNSF also believes that the Board must carefully limit the categories of "downstream" and "crossover" effects it will review in merger cases to those that are sufficiently concrete to be suitable for analysis and are related directly to the actual merger pending before the Board. Furthermore, the Board's oversight of a consummated merger should be limited to policing the efficacy of competitive remedies adopted in that merger proceeding and addressing merger-related service problems. The Board should not penalize a merged railroad, or impose new conditions on a merger, merely because all projected benefits of the merger are not realized on schedule or because a future merger produces some new, unanticipated harm.

Taken together, the provisions of the NPR opposed by BNSF would impose unacceptable delay in merger review, remove predictability and finality from Board review of mergers, and signal a return by the Board to discredited interventionist policies that would result in significant harm to the rail industry and to rail shippers. As a result, the NPR could prevent the proposal or consummation of beneficial mergers and encourage the flight of capital from the rail industry at precisely the time when the industry must invest to expand its capacity and improve its competitive position and services.

Therefore, in any final rule, the Board should: (i) adopt procedural rules that will result in final Board action no later than one year after the pre-filing notification of a merger; (ii) require merger applicants to submit a detailed service assurance plan and proposals (such as open gateways, contract exception rights, and protection for 2-to-1 shippers) that would preserve effective competitive alternatives for those shippers who now have them; (iii) eliminate the presumption that mergers can no longer produce significant public benefits; (iv) eliminate the presumption that future mergers will cause competitive or service harms that must be offset by unrelated competitive enhancements; (v) limit the scope of Board review of downstream and crossover effects; and (vi) avoid post-merger review of issues other than the efficacy of competitive remedies adopted as conditions of the merger and the need for temporary remedies for any merger-related service failures.

If so revised, the final rules would protect shippers against the repetition of past service problems and preserve effective competitive rail options, while still giving railroads the tools and ability to attract the capital necessary to meet the service and competitive challenges of the new century. Such rules also would provide the timely, predictable and final action that capital markets, railroads, shippers and other interested parties require.

II. INTRODUCTION

The U.S. rail industry has made significant progress in the last twenty years, rationalizing capacity, increasing productivity and decreasing real rates for shippers. Mergers have been a critical tool in attaining these benefits for the Nation.

The rail industry now faces different problems from those of the past. Although a primary focus of mergers once was the elimination of excess capacity, many industry participants agree that the industry now requires new capacity, new services and improved efficiency in order to meet the requirements of its customers and respond to pressures from competitors.

To meet the needs of the industry and its customers, railroads must have the ability to move quickly. However, the proposed rules would impose a lengthy procedural schedule that is incompatible with the requirements of today's economy, particularly those of capital markets. In contrast, mergers of major companies in other industries, including regulated industries, routinely are reviewed by other government agencies in a matter of months. *See* Attachment 2 to these comments. A prolonged schedule for rail mergers would impose unnecessary direct and indirect costs on merging railroads, shippers, other carriers and ports. An extended procedural schedule would expand the uncertainty that capital markets abhor, deny shippers the timely benefits of rail mergers, and limit the ability of railroads and shippers to respond to changed circumstances and new opportunities during the review period. By deferring merger benefits and creating uncertainty, the unnecessarily protracted proposed schedule for handling merger applications could, in and of itself, result in a "good" merger becoming a "bad" merger. This would be unsound and destructive

public policy.[1] The Board, therefore, should complete its review of future merger applications no later than one year after the filing of the pre-filing notification.

The Board's merger policy should continue to favor mergers because mergers can still produce public benefits. Mergers can help the rail industry quickly, inexpensively and effectively expand capacity through the more efficient use of existing capital assets. Mergers also can enable railroads to reduce their costs. They can encourage new investment, as evidenced by the investments triggered by recent mergers in the industry, and enable enhanced services to be offered to shippers. By expanding the scope of networks, mergers can help railroads meet a greater range of shippers' transportation needs, thereby attracting new business and improving their overall competitive position in the national transportation market. The ability to pursue mergers, when warranted, can reassure investors about the future of a rail industry that today is not earning its cost of capital. Accordingly, both public policy and a clear Congressional mandate require that the Board continue to favor and approve efficiency-producing mergers.

However, by creating unfounded substantive and procedural obstacles to future mergers, the proposed rules would deepen the capital problems of the rail industry and impede railroads' efforts to create new capacity and improve their competitive positions. Adoption of the proposed rules also would raise fears that the Board is returning to the intrusive and failed policies of the past. While merger applicants today understand what issues they must address when contemplating and then pursuing a merger, the proposed

[1] "Markets do not stand still while the Board is deliberating. The longer the Board takes, the longer the merging parties are caught in limbo. Investors and stockholders are well aware of the adverse effects that can have on profitability, and their perception of the risk will be reflected both in the value of the railroad's stock and in their decisions to invest in the industry." Verified Statement of Bradford Cornell ("V.S. Cornell") at 10.

rules would remove the essential element of predictability required for sound business planning and regulatory policy. Furthermore, because the Board's proposed rules contemplate the imposition of additional conditions during an extended oversight period and require merged railroads to guarantee projected benefits, the parties will lack the finality, closure and certainty the regulatory process should provide.[2]

Key elements of the proposed merger rules are based on unsound economic analysis and regulatory policy, and are contrary to law. For example, even though the proposed rules would create new requirements (the maintenance of open major gateways and contract exception rights) that supplement the Board's traditional approach to competitive issues, the rules would presume, perhaps irrebuttably, that competitive harms would be produced by any future merger of Class I railroads. This presumption cannot be justified. The Board has adequate tools to define and then address with narrowly crafted remedies the actual extent of competitive harms that might be produced by any specific merger proposal, particularly with respect to the end-to-end mergers of the future. Furthermore, even under its proposed rules, the Board would have to engage in a detailed analysis of the presumed competitive harms in order to determine what level of competitive enhancements would be required to offset those presumed harms.

Even though the proposed merger rules would require the submission of extremely detailed service assurance and transition plans and provide for extensive post-approval

---

[2] "Investors have choices. If the long-term prospects of the railroad industry are significantly clouded by regulatory restrictions and regulatory uncertainty, investors will be reluctant to risk their funds in the industry. This, in turn, may reduce the industry's access to funds in the capital markets and raises their cost of capital. This higher cost of capital translates into a reduced stock price, which hurts the firm's shareholders and further discourages new investment." V.S. Cornell at 9.

operational monitoring by the Board, the NPR presumes that significant transitional service problems will nevertheless accompany all future mergers. In so doing, the NPR does not properly recognize that the unique transitional service problems of the UP/SP and CSX/NS/Conrail transactions are unlikely to be repeated. UP acquired a railroad that had underinvested for years, and CSX and NS divided an existing carrier's assets in a manner unprecedented in the past and unlikely to be repeated in the future. The NPR also does not recognize that the end-to-end mergers of the future are far less likely to raise significant service issues. Finally, railroads face powerful financial incentives not to repeat past service problems, which led to sharply reduced earnings, litigation, and damaged relations with customers.

The proposed rules also underestimate or, perhaps, do not value at all the intermodal competition that mergers produce, the evidence that intramodal competition has remained strong after prior mergers (as demonstrated by real rate reductions for all classes of shippers), and the investments that merged railroads have made in improving service and hence their competitive positions. Moreover, the NPR would require the Board to speculate whether the benefits projected for a specific merger could be replicated through an alliance or joint marketing effort that no one has actually proposed.[3] However, given the

[3] "It would be irrational for two railroads to propose an end-to-end merger unless they believed that the merger would generate cost savings and service improvements that they could not gain by other means. The cost, delay, and uncertainty of the merger process give railroads strong incentives to seek their ends by other means. The fact that railroads continue to pursue end-to-end mergers is thus strong evidence that mergers can provide benefits that are unavailable via other types of transactions. Railroads' preference in many cases to achieve integration through merger rather than alternative contractual arrangements is driven by the underlying economics of the rail industry. In order to move traffic from origin to destination while meeting the service needs of shippers, railroads must solve a technical coordination problem. Railroads allocate resources and coordinate decision-making regarding scheduling, routing, allocating locomotives, prioritizing car

additional costs of a merger, including the substantial expense of preparing the environmental review and the risk that unacceptable competitive and service conditions will be imposed or the merger rejected, the Board can assume that merger applicants have reviewed their alternatives thoroughly before subjecting themselves to the merger review process.

By presuming harms that have not been shown to be either likely or significant and then requiring merger applicants to offset these hypothetical harms with unrelated competitive enhancements, the proposed rules would make it impossible for future merger applicants reasonably to forecast Board action. Furthermore, the rules would encourage interested parties to seek "rents" by demanding non-merger-related benefits, based on a claim that these benefits would compensate for the unidentified and unquantified harms caused by the merger. Because the remedies would be unrelated to the posited harms, the Board would have no predictable or reasoned basis for selecting among competing remedies, deciding what cumulative level of remedies is necessary, or determining which shippers should receive such windfall benefits.[4] The lack of predictability would impede

---

switching, moving trains through congested yards, etc. These decisions interact in ways that can affect numerous portions of a railroad's operations and the shippers who use that system. As a result, railroads establish complex operations, procedures, and protocols that attempt to balance the needs of all of their shippers, and rail managers are constantly deciding in real time which trains should have priority and what actions to take when unplanned contingencies occur." Verified Statement of José Gómez-Ibáñez and Joseph P. Kalt ("V.S. Gómez-Ibáñez/Kalt") at 23.

[4] "In the absence of a clear standard, it will be difficult [for the Board] to limit or constrain the requests for favors and difficult to prevent arbitrary outcomes based on the success of shippers' bargaining." V.S. Gómez-Ibáñez/Kalt at 18. "The unfairness inherent in providing benefits to one class of shippers, rather than another, is a key reason why remedies should be designed to offset specific harms to specific groups." Verified Statement of Richard J. Pierce, Jr. ("V.S. Pierce") at 17.

beneficial change and harm the ability of the rail industry to raise necessary capital, and therefore is strongly undesirable from a public policy perspective.[5]

The NPR's proposal on the analysis of "crossover" and "downstream" effects also is far too broad. Merging railroads should be required to demonstrate that their merger will not produce adverse crossover effects by creating service problems for other railroads.[6] However, with respect to downstream effects, it would be speculative for any merger applicant to forecast the actions of its competitors. Such speculation would invite meaningless debate and abuse of the merger review process, as competitors and other interested parties posit downstream responses that somehow require the rejection or conditioning of the merger actually before the Board.[7] Furthermore, it would be inappropriate policy and contrary to the statute to remedy competitive or other problems arising from a potential (or a future) merger with new conditions on an already

---

[5] "[B]y adopting a presumption that future mergers are inherently harmful and making it more difficult to justify future mergers, the proposed new merger policy signals investors that the Board is satisfied with the status quo of rail sector financial performance and capital investment." Verified Statement of Robert D. Krebs ("V.S. Krebs") at 3.

[6] "While a railroad has the clear economic incentive to prevent disruption of its own system, it can rationally ignore the effects of its disruptions on *other* railroads' service, revenue, and profits. . . . Of course, the foregoing does not mean that merging railroads will always under-protect against service disruption. Recent mergers, such as those between BN and the ATSF and the Canadian National/Illinois Central transactions, provide counterexamples that make it clear that the generalized disruption of the rail network is not an inevitable consequence of mergers. It is clear that the presence of service disruption is directly related to the method by which a merger is implemented. . . . [and] the Board has a legitimate role in protecting the public against merger-related service disruptions." V.S. Gómez-Ibáñez/Kalt at 13.

[7] "[P]roposed mergers should not be impeded by a proposal that imposes substantial new burdens on applicants, elevates speculation to the role of evidence, and opens a Pandora's box of political pressures and temptations while adding nothing of value to the merger review process." V.S. Gómez-Ibáñez/Kalt at 29.

consummated merger. Therefore, the middle ground proposed by BNSF in response to the ANPR remains the only feasible proposal – if a second rail merger is announced and notice of it is filed with the Securities and Exchange Commission ("SEC") by the date that initial comments are due with respect to the first merger, the parties to the first merger proceeding should address whether any new competitive problems would be created by the two mergers.

Finally, the Board should limit its post-merger oversight to a review of whether the conditions imposed to maintain shippers' competitive options have worked; whether service assurance plans have been followed and updated to maintain service integrity for rail shippers, shortlines and regional carriers and ports; and whether temporary remedies are required to alleviate any temporary merger-related service problems that may have developed. A merged railroad should not be subject to the post-merger imposition of conditions in response to unforeseen circumstances or a future merger.[8] Further, a merged railroad cannot be the guarantor of merger benefits in today's dynamic economy. Indeed, such a policy would encourage a merged railroad to make bad decisions – such as laying off employees, making unnecessary capital investments, or rushing implementation instead of proceeding with step-by-step caution – only to satisfy the post-merger review. Moreover, a merged railroad might not achieve all projected benefits precisely because the merger triggered competitive responses by intra- and intermodal competitors. Thus, it is not clear how the Board could – or why it should – unscramble a merger or impose significant new

[8] "I cannot imagine any firm that would be willing to merge, or even to consider a merger, under conditions in which an agency can impose unknown and unknowable conditions on the merged firm years after the merger is approved and implemented." V.S. Pierce at 20.

conditions if all projected benefits were not achieved on precisely the schedule originally forecast.

If the proposed rules are adopted without significant changes, good mergers – those that create public and private benefits, maintain effective competitive options for shippers who now have them, preserve and improve the quality of service, and create the efficiencies and attract the new traffic necessary to justify further investment in the rail industry – would be discouraged, if not prohibited. Indeed, good mergers may not even be proposed because railroads may conclude that the procedural and substantive bars to mergers have been raised too high to be satisfied at a fair cost. Even if the rules do not discourage railroads from initiating mergers, the policy could result in the rejection of a good merger without any showing that the merger would produce an irremediable concrete harm. This is not sound economic or regulatory policy; it is bad law, and it would undermine the progress of the last two decades.

Regulators across the United States and around the world have recognized that regulation should be crafted as narrowly as possible, aimed at only those issues that cannot be better handled through competition in the marketplace. In particular, there is broad consensus among economists, regulators and legislators that merger policy should focus on the specific competitive effects of a proposed merger.[9] Therefore, absent

[9] "[I]n non-regulated industries, where the harm to competition and the risk of the exercise of market power is the primary focus of merger policy." V.S. Gómez-Ibáñez/Kalt at 4 (citing Horizontal Merger Guidelines, U.S. Dept. of Justice and Federal Trade Commission, April 12, 1997, as amended April 18, 1997). Even regulated industries have moved in this direction. For example, the Federal Energy Regulatory Commission ("FERC") has streamlined its merger approval process over time to focus almost exclusively on the effects on competition. V.S. Pierce at 7-11 (describing FERC's regulatory procedures).

significant irremediable effects, market-driven mergers should be permitted to go forward. Merger policy should not encourage unaffected parties to seek rents or conditions unrelated to the merger, nor should it be used as a blunt instrument for regulators to force the restructuring of an entire industry. Merger policy should defer to market forces except when identified competitive and service harms are threatened. Merger policy should recognize the high costs of regulatory delay and the need to provide industry participants with clear guidance that can be used reasonably to project regulatory outcomes.

Until the start of the Ex Parte No. 582 process, the Board seemed committed to the same kind of market-driven merger policies that guide other U.S. antitrust and regulatory authorities. Yet by expanding the scope of Board review and increasing the uncertainty of Board actions, the NPR would move the Board in the opposite direction from general regulatory policy in the United States. This would lead to underinvestment in the railroad industry, a loss of inter- and intramodal competition, and a return to the problems of the past.

Therefore, the Board's revised merger policy statement should not disfavor mergers, but instead should maintain the pro-merger policy prescribed by Congress. The Board's merger policy should call for a balanced review, based on concrete and widely understood standards, to determine whether the proposed merger would result in the elimination of effective competitive alternatives for those shippers who currently have such alternatives or produce transitional or permanent service problems. If a merger is likely to produce public benefits, and identified competitive and service harms are avoided or appropriately mitigated, the Board's merger policy should result in the timely review and approval of that merger – without injecting presumptions of harms, the need to counterbalance such

hypothetical harms with unrelated competitive enhancements, or the ability of third parties to extract rents as the price of approval. Accordingly, the Board should adopt the focused, but meaningful, changes in its merger policies proposed by BNSF in response to the ANPR, accelerate its review of rail mergers so that all mergers are reviewed within one year of the pre-filing notification, and otherwise leave intact its current general approach to rail mergers.

III. DISCUSSION

A. It Is Vital That Merger Proceedings Be Handled Expeditiously, Within Periods Consistent with the Requirements of the Economy and Capital Markets. The NPR proposed that evidentiary proceedings be completed within one year after an application is filed, with a Board decision to be issued within 90 days after closure of the evidentiary proceeding. Proposed 49 C.F.R. § 1180.4(e), NPR at 27. With a prefiling period of 90 to 180 days, this could result in merger reviews taking almost 2 years to complete, a period that is simply too long given the financial realities of today's economy. The deadline for Board action on a merger application should be reduced to a maximum of one year, including the pre-filing period and a six-month period for any required evidentiary proceedings.

The unwarranted regulatory delay proposed by the NPR would create significant harm for the rail industry and shippers. In his Verified Statement, Robert Krebs states that:

> First, there is no reason to delay the benefits of a good merger for shippers. Yet, extended procedural schedules defer those benefits for shippers and can even lead to the complete loss of those benefits because good mergers are either not proposed or are undone by the delay and uncertainty of the review process. Second, during the period when a merger is pending before the Board, the applicants and other parties are placed in a regulatory limbo, unsure how to plan for the future or how to respond to other opportunities.

> Regulatory limitations on a railroad's use of its assets and uncertainty about future limitations act not only as disincentives for the railroads to invest in particular projects but also as disincentives for outside investors to invest in the railroad . . . . Investors have choices. If the long-term prospects of the rail industry are significantly clouded by regulatory restrictions, investors will be reluctant to risk their funds in the industry. This, in turn, may reduce the industry's access to funds in the capital markets and raises their cost of capital. V.S. Cornell at 8-9.

Professor Cornell further explains that:

> Each of these regulatory taxes diminishes the prospective benefits of possible merger transactions. It is quite conceivable that a merger that otherwise promised to make the merging railroads more efficient, improve their services, and help them cover their cost of capital – with no unremedied competitive harms – would effectively be defeated by such taxes. That is not in the railroads' interest, it is not in their customers' interest, and it is not in the public interest. *Id.* at 13.

The BN/SF and UP/SP mergers demonstrated the positive benefits that mergers can produce. In both cases, competitive options were retained for those shippers who had such options prior to the mergers. Post-merger, BNSF and UP made significant investments in infrastructure improvements, new locomotives, and additional or advanced rolling stock. Both BNSF and UP offered new services to their shippers, including efficient and competitive services that finally delivered the unfulfilled promises of earlier joint ventures. The Board should not turn its back on the benefits that future mergers can produce, such as the benefits that the proposed combination of BNSF and CN would have produced. V.S. Krebs at 7 - 8.

Furthermore, any "paradigm shift" in the current pro-merger policy reflected in the Board's current regulations must come from Congress. Congress established the pro-merger statutory policy, and only Congress can reverse that policy. Even if the proposed rules did not incorporate an overt anti-merger bias, but rather only adopted a neutral stance

hypothetical harms with unrelated competitive enhancements, or the ability of third parties to extract rents as the price of approval. Accordingly, the Board should adopt the focused, but meaningful, changes in its merger policies proposed by BNSF in response to the ANPR, accelerate its review of rail mergers so that all mergers are reviewed within one year of the pre-filing notification, and otherwise leave intact its current general approach to rail mergers.

III. DISCUSSION

A. It Is Vital That Merger Proceedings Be Handled Expeditiously, Within Periods Consistent with the Requirements of the Economy and Capital Markets. The NPR proposed that evidentiary proceedings be completed within one year after an application is filed, with a Board decision to be issued within 90 days after closure of the evidentiary proceeding. Proposed 49 C.F.R. § 1180.4(e), NPR at 27. With a prefiling period of 90 to 180 days, this could result in merger reviews taking almost 2 years to complete, a period that is simply too long given the financial realities of today's economy. The deadline for Board action on a merger application should be reduced to a maximum of one year, including the pre-filing period and a six-month period for any required evidentiary proceedings.

The unwarranted regulatory delay proposed by the NPR would create significant harm for the rail industry and shippers. In his Verified Statement, Robert Krebs states that:

> First, there is no reason to delay the benefits of a good merger for shippers. Yet, extended procedural schedules defer those benefits for shippers and can even lead to the complete loss of those benefits because good mergers are either not proposed or are undone by the delay and uncertainty of the review process. Second, during the period when a merger is pending before the Board, the applicants and other parties are placed in a regulatory limbo, unsure how to plan for the future or how to respond to other opportunities.

> Third, capital markets cannot tolerate uncertainty or delay. The mere threat of an extended regulatory proceeding would cause capital to seek other investment opportunities and place downward pressure on railroad stocks. V.S. Krebs at 3-4.[10]

In the rail industry, capital markets see a review process that takes much longer than that of other industries. The markets also remember that the Board already has imposed an effective 34-month moratorium[11] on rail mergers, ostensibly so that it could more effectively – not in a more cumbersome way – process merger applications. Finally, as the Board has implicitly recognized in its proposal to discount future benefits, there is a time value of money, so the length of the review process can, by delaying the realization of merger benefits, turn a "good" merger into a "bad" merger or lead railroads to choose not to pursue good mergers.

---

[10] Robert Krebs further states that "[T]he bottom line is that shareholders and shippers alike suffer when they must defer enjoyment of the benefits accruing from a beneficial rail merger until the conclusion of the lengthy STB review process." V.S. Krebs at 6. This position is supported by Professor Cornell in his verified statement, where he states "[d]elay in the approval process is particularly insidious from a financial standpoint. Not only does it delay the cash benefits of the merger, thereby significantly reducing the present value of the transaction, but it prevents the railroads that plan to merge from determining their optimal capital expenditure levels and allocation of assets while they are enmeshed in regulatory limbo." V.S. Cornell at 4.

Professor Cornell further explains that "[A] 19-month delay imposes a serious tax on the finances of any combination. In effect, it would set back by nearly two years the merging railroads' ability to begin to realize the benefits of the transaction. Moreover, it would make it impossible during that time period for either of the merging parties to determine their optimal capital expenditure levels and allocation of assets. . . . Investors and stockholders are well aware of the adverse effect this can have on profitability, and their perception of the risk will be reflected in both the value of the railroads' stock and in their decisions to invest in the industry." V.S. Cornell at 10.

[11] On March 17, 2000, the Board announced a moratorium on the filing of merger applications until its new merger rules are issued in June 2001. Because any future merger would be subject to at least a 3-month pre-filing notification period and the proposed 16-month review period, the result would be an effective moratorium of 34 months.

There is no reason for merger review to take as long as the NPR proposes. Given the additional detailed information that the NPR would require to be part of any application, the express requirement that many procedural and case management issues be handled during the pre-filing period, and the end-to-end nature of the mergers likely to be proposed in the future, any final rule adopted by the Board should significantly accelerate the merger review process.

BNSF has reviewed the time taken for mergers to be processed in both regulated and unregulated industries; the results are shown in Attachment 2 to these comments. Of 48 mergers of large corporations that were subject to review by the Federal Trade Commission ("FTC") or the Department of Justice ("DOJ"), including large telecommunications mergers in which the Federal Communications Commission had a significant role, 34 were resolved in six months or less. Similarly, between 1995 and the present, the Federal Energy Regulatory Commission ("FERC") was able to resolve 29 of 49 merger proposals in less than six months, including several mergers that created new utility giants.[12] FERC was able to improve its merger processing time significantly when it narrowed the scope of its merger review and defined more precisely for applicants what issues must be addressed in any application. FERC also has been able to process most mergers without the need to supplement the initial filings of the parties with third-party discovery, depositions or other evidentiary proceedings. The Board should do the same.[13]

---

[12] *See* V.S. Pierce at 7-11 for a discussion of FERC procedures.

[13] Even if the Board determines that discovery is required, the Interstate Commerce Commission showed in the BN/SF merger proceeding that the merger review process can be completed in less than one year. In that proceeding, the applicants' notice of intent was filed on July 8, 1994. The proceeding was suspended for a period of 3 months from December 5, 1994, to March 9, 1995. The Commission's final decision was issued on

Furthermore, the mere size of a merger should not dictate the time it takes to analyze the merger. In fact, large mergers that do not raise difficult competitive issues often are handled by DOJ/FTC and other agencies in only a few months. Many agencies are able to process mergers without significant evidentiary proceedings, relying instead on paper hearings without discovery. The Board should adopt this approach, so that rail mergers that do not raise competitive or other complicated issues are handled on an expedited basis.

For these reasons, BNSF requests that the Board adopt the procedural schedule for Class I mergers set forth in Attachment 1. This schedule would result in final Board action on merger applications within 270 days of the filing of a complete merger application, or approximately one year from the date that the pre-filing notification is submitted to the Board. This schedule is closer to the timetables for final review in other industries with which the rail sector competes for capital and, equally important, this schedule is consistent with schedules that the Board's predecessor itself has stated are ample to ensure full review of a merger application.

In a notice of proposed rulemaking, the Interstate Commerce Commission proposed to complete its merger proceedings within 180 days after the filing of a Class I merger application. Ex Parte No. 282 (Sub-No. 19), New Procedures in Rail Acquisitions, Mergers and Consolidations (served January 26, 1995). The Commission concluded that such a time frame would fully preserve the opportunity for effective participation by affected persons and the public at large, would provide for reasoned consideration of the arguments

---

August 23, 1995. The proceeding thus encompassed 10 months, excluding the period of suspension.

for and against a proposed application, and would permit consideration of competing applications, proposed conditions and amendments offered by the applicants to meet objections to a proposed transaction.[14] The schedule proposed by BNSF would do likewise and, in fact, would add 90 days to the Commission's 1995 proposed schedule.

A review period of one year for Class I mergers also would accommodate the environmental review required under the National Environmental Policy Act ("NEPA") and the Board's existing environmental regulations. The Board, in cooperation with the applicants, could initiate many of the steps involved in the NEPA process as soon as applicants filed the pre-filing notification, instead of waiting for the filing of the application. These steps could include publication in the Federal Register of the notice of intent to prepare an Environmental Impact Statement ("EIS") (should the decision be made that an EIS is required), selection of the third party contractor, coordination with other federal and state agencies, and initiation of the scoping process.

Even if the Board were to decide not to initiate one or more of these steps in a given proceeding until after an application was filed, BNSF's proposed procedural schedule still provides ample time for completion of the environmental review in advance of final action by the Board. For example, under BNSF's proposed schedule, the notice of intent to prepare an EIS and request for comments on the scope of the EIS would be issued 7 days

[14] In fact, a variant of the Commission's proposed 180-day schedule was applied to the then pending BN/SF merger proceeding, and, excluding the period when the proceeding was suspended, the Commission completed the evidentiary portion of the proceeding in approximately 6 months. *See* Burlington Northern Inc., et al. – Control and Merger – Santa Fe Pacific Corp., et al., Finance Docket No. 32549, Decision No. 10 (ICC March 7, 1995). The time allotted for briefing, oral argument and the Commission's decision was substantially less than BNSF has proposed here, and the Commission was nonetheless fully able to review the issues raised by the proposed merger, identify necessary conditions, and complete the environmental review process.

after the filing of the application, and the final notice concerning the scope of an EIS would be issued 45 days after the filing of the application. A Draft EIS would be published 110 days after the application was filed,[15] with comments on the Draft EIS due 155 days after the application was filed. The Final EIS would be issued 205 days after the application was filed, making it available to the Board 5 days in advance of oral argument and 15 days before the voting conference.

BNSF's proposed environmental schedule is not significantly shorter than those adopted by the Board in recent rail merger proceedings[16] and would clearly meet the key time periods established under the Council of Environmental Quality NEPA requirements for conducting an EIS. They require that the comment period on the Draft EIS be a minimum of 45 days and that the final agency action cannot occur sooner than 90 days after the Draft EIS or 30 days after the Final EIS. 40 C.F.R. § 1506.10.

Therefore, the Board should adopt a procedural schedule that requires review of a proposed merger to be completed within one year of the pre-filing notification. Such a

---

[15] To facilitate a timely environmental review process, parties contemplating the filing of inconsistent or responsive applications should be required to file any responsive environmental reports 20 days prior to the filing of such applications (or 70 days after filing of the primary application), unless the responsive applicant can certify that the transaction proposed in such responsive application would fall within the exception criteria of 49 C.F.R. § 1105.6 (c)(2).

[16] In all of the recent merger cases, with the exception of the Conrail acquisition, an Environmental Assessment was completed within 270 days. Although the EIS in Conrail was completed in slightly less than 11 months, the schedule included 45 days for the development of a Safety Integration Plan, a requirement that was established by the Board after the application was filed and therefore was not envisioned in the original environmental schedule. *See* CSX Corporation, et al. – Control and Operating Leases/Agreement – Conrail Inc., et al., Finance Docket No. 33388 ("Conrail"), Decision No. 89 (STB July 20, 1998) at 155.

schedule would recognize the need of all parties for timely Board action and ample time for any necessary environmental review.

B. The Presumptions Underlying the Proposed Rules Are Wrong. The NPR is premised on the view that the primary virtue of rail mergers is the elimination of excess capacity, a process the Board believes is essentially complete. *See* NPR at 10. The NPR, therefore, concludes that national policy should no longer favor mergers. Proposed 49 C.F.R. § 1180.1(a), NPR at 11. The NPR further presumes, apparently irrebuttably, that future mergers will produce competitive and service harms. *See* Proposed 49 C.F.R. § 1180.1(c), NPR at 12. As a result, the NPR requires that any merger must include "competitive enhancements" to offset these harms, effectively creating a presumption against mergers. Proposed 49 C.F.R. § 1180.1(d), NPR at 16.

Each of the NPR's premises is wrong. Furthermore, the Board lacks the authority to conclude that Congress' pro-merger policy is no longer justified and, therefore, could be reversed by the Board. Only Congress can reverse that policy.

1. There Is No Basis for the Presumption That Future Rail Mergers Will Not Produce Significant Public Benefits, and Any Such Presumption Would Violate Congressional Intent. The NPR presumes that mergers should no longer be favored because the past problem of excess capacity and the need to rationalize the rail industry have been resolved. This presumption is wrong.[17]

[17] Concerns about reducing excess capacity hardly register at all in the legislative history of the Interstate Commerce Commission Termination Act of 1995 ("ICCTA") (Pub. L. No. 104-88, 109 Stat. 803). In fact, in defending the continuation of the existing pro-merger standard, Senator Pressler barely referred to excess capacity issues at all. Instead, to the extent that excess capacity concerns figured in his position, they were subordinate to other concerns that continue to justify a pro-merger policy in the present day: "Mergers and consolidations allow the rail industry to maximize the use of its tracks, cut down on

The rail industry continues to face four significant and interrelated problems: (1) the need to add capacity; (2) the need to become more efficient in its operations; (3) the need to improve service to shippers; and (4) the need to earn a return that is adequate to attract the capital necessary to resolve the first three problems. Contrary to the assumptions of the NPR, mergers can play a crucial role in solving these problems, but only if artificial regulatory barriers to good mergers are not erected.

First, the most efficient and timely way to increase capacity is to better utilize existing assets. Mergers can expand capacity at the least possible cost. A merged railroad will have a better ability to manage its assets to maximize capacity than two railroads acting separately or through an alliance or joint venture, because it will be able to make decisions based upon the requirements of its entire network, rather than on a compromise between the competing self-interests of two allied partners.[18]

---

interchange points, get the most out of switching yards, consolidate terminals, and, in short, provide better service to its customers at lower cost." 141 Cong. Rec. S17,588 (Nov. 28, 1995). Similarly, the ICC Chair, Gail McDonald, noted that the driving forces behind the anticipated future railroad mergers were the industry's desire to "become more efficient and offer 'seamless service.'" Disposition of the Railroad Authority of the Interstate Commerce Commission: Hearings before the Subcommittee on Railroads of the Committee on Transportation and Intrastructure, House of Representatives, 104th Cong., 1st Sess. 106 (1995).

[18] "The fact that railroads continue to pursue end-to-end mergers is thus strong evidence that mergers can provide benefits that are unavailable via other types of transactions." V.S. Gómez-Ibáñez/Kalt at 23.

Second, a merged railroad can be more efficient in its operations.[19] A merged railroad can combine many functions, such as information technology and accounting. A merged railroad also can achieve purchasing efficiencies that, because they require a centralized approach to asset management, can be attained only by a unified entity. A merged railroad can reduce the inputs required to achieve a given level of output, thereby producing public and private benefits. Through economies of scope and scale and the ability to make decisions based on optimizing system performance, a merged railroad can do more with less.

Third, single-line service can offer shippers more reliable service, while enabling railroads to craft new services that can attract traffic from competitors and other transportation modes. An expanded, integrated rail network can provide shippers with access to new markets. A merged railroad also can benefit from the different commodity and product expertise of the pre-merger railroads. If a merged railroad becomes a better competitor and shippers gain access to new markets and services, there will be beneficial effects for the railroad, shippers and the Nation.[20]

---

[19] For example, "[s]ingle-line service enhances efficiency by eliminating costs and uncertainty associated with making and managing interline movements. In addition, expansion of single-line service typically represents a dramatic improvement in the quality of service a railroad offers its shippers. As railroads expand their offerings of single-line service, they can increase the speed of their service, make service more reliable, reduce damage and loss, and reduce capital requirements by making more efficient use of rail (and shipper) facilities." V.S. Gómez-Ibáñez/Kalt at 10.

[20] "The revitalization of the rail industry is one of the success stories of U.S. public policy over the last 25 years. Beginning with major regulatory reforms in the 1970s and culminating with the passage of the Staggers Act of 1980, the U.S. railroad industry has improved its performance substantially. Greater rate flexibility, deregulation of rates in certain markets, and opportunities for negotiated, tailored service offerings are among the factors that have brought railroads under the discipline of the marketplace. Regulatory reform has also allowed market forces to shape the ownership structure of railroad assets.

Fourth, a regulatory policy that continues to favor mergers will enable railroads to attract capital by reassuring investors that railroads will be free to pursue their preferred business strategies, as long as they will not eliminate competition for 2-to-1 shippers[21] or threaten shippers with service problems. Industries that depend upon capital investment in long-lived assets require the assurance that regulators will not restrict their ability to respond to market requirements unless, and then only to the extent, necessary to prevent identifiable and cognizable harms to the public interest. Capital will not be freely available to an industry in which regulators assert the right to reject one merger combination because regulators prefer a different, but unproposed outcome.

In his Verified Statement, Professor Bradford Cornell explains that:

> Limitations on a railroad's (or any other business's) use of its assets function as a tax. They reduce the assets' expected return by restricting the ways that the assets can be utilized. An investment that might otherwise have a positive net present value will not be undertaken if regulatory limitations so tax the expected stream of revenues that the value turns negative vis-a-vis the costs. The deterrent to investment is obvious when we know exactly what the regulatory limitations are, but the tax can be substantially compounded by delay and by an uncertain regulatory environment. When the amount of the regulatory tax cannot be established, railroads may choose not to make the investment at all. Alternatively, they may require a much higher return to cover the regulatory risk. Either way, the regulatory tax can kill an investment, or re-investment, that otherwise would have made good economic sense.

Increased freedom to abandon low-density, unprofitable service and to consolidate rail systems in order to exploit network economies has contributed to improvements in the industry. The result has been a dramatic improvement in the nation's rail system. While there have been bumps in the road at times, these benefits have been shared both by the nation's railroads, who have improved their financial health, and by the nation's shippers, who have access to a railroad system that is more cost-effective, can provide quality service, and has shown rates that have trended clearly downward." V.S. Gómez-Ibáñez/Kalt at 8.

[21] The effect of a merger on any 3-to-2 shippers would continue to be reviewed on a case-by-case basis.

> Regulatory limitations on a railroad's use of its assets and uncertainty about future limitations act not only as disincentives for the railroads to invest in particular projects but also as disincentives for outside investors to invest in the railroad . . . . Investors have choices. If the long-term prospects of the rail industry are significantly clouded by regulatory restrictions, investors will be reluctant to risk their funds in the industry. This, in turn, may reduce the industry's access to funds in the capital markets and raises their cost of capital. V.S. Cornell at 8-9.

Professor Cornell further explains that:

> Each of these regulatory taxes diminishes the prospective benefits of possible merger transactions. It is quite conceivable that a merger that otherwise promised to make the merging railroads more efficient, improve their services, and help them cover their cost of capital – with no unremedied competitive harms – would effectively be defeated by such taxes. That is not in the railroads' interest, it is not in their customers' interest, and it is not in the public interest. *Id.* at 13.

The BN/SF and UP/SP mergers demonstrated the positive benefits that mergers can produce. In both cases, competitive options were retained for those shippers who had such options prior to the mergers. Post-merger, BNSF and UP made significant investments in infrastructure improvements, new locomotives, and additional or advanced rolling stock. Both BNSF and UP offered new services to their shippers, including efficient and competitive services that finally delivered the unfulfilled promises of earlier joint ventures. The Board should not turn its back on the benefits that future mergers can produce, such as the benefits that the proposed combination of BNSF and CN would have produced. V.S. Krebs at 7 - 8.

Furthermore, any "paradigm shift" in the current pro-merger policy reflected in the Board's current regulations must come from Congress. Congress established the pro-merger statutory policy, and only Congress can reverse that policy. Even if the proposed rules did not incorporate an overt anti-merger bias, but rather only adopted a neutral stance

toward rail mergers and increased the regulation of such mergers, the rules would be inconsistent with the Board's statutory authority.[22]

---

[22] If the Board actually intended to bar any future mergers, such an animus against mergers would contravene the unambiguous language of the Board's authorizing statute, as well as the clear intent of Congress. The ICCTA states that the STB "shall approve and authorize a transaction under this section when it finds the transaction is consistent with the public interest." 49 U.S.C. § 11324(c) (emphasis added); *see also* 49 U.S.C. §§ 11323-11325 (provisions relating to merger approval procedures and standards). This Congressional directive would be undermined by rules that preclude or discourage mergers that are in the public interest.

By the same token, the Board does not have the authority to institute a presumption that the benefits of mergers are outweighed by their disadvantages. The ICCTA clearly contemplates that the public interest may be served by (at least some) railroad mergers and that the relative benefits and harms of mergers are to be determined on a case-by-case basis. For instance, section 11324(b) states that:

> In a proceeding under this section * * * the Board shall consider at least * * *
>
> (1) the effect of the proposed transaction on the adequacy of transportation to the public;
>
> (2) the effect on the public interest of including, or failing to include, other rail carriers in the area involved in the proposed transaction; [and]
>
> * * * *
>
> (5) whether the proposed transaction would have an adverse effect on competition. * * * *

49 U.S.C. § 11324(b) (emphasis added). *See also id.* § 11324(c) (directing the Board to approve "a transaction" upon a finding that "the transaction" is in the public interest). These ICCTA provisions, which make clear that "each proposed transaction" is to be judged on its own merits, are inconsistent with a categorical presumption, such as the Board has proposed in its rules, that mergers are contrary to the public interest. Accordingly, the Board does not have the statutory authority to adopt rules that would preclude or discourage mergers, or that it would incorporate a presumption that mergers are contrary to the public interest.

Moreover, even if Congress had been silent on the issue of whether mergers could be precluded altogether by the Board, the Board would not have the authority to promulgate anti-merger rules, such as the ones it now proposes. After all, railroad merger policy is of fundamental importance both to national transportation policy and the economy more generally. Thus, it would be completely implausible, and highly improper, to assume that Congress intended to delegate to the agency, sub silentio, the authority to promulgate

Existing law clearly favors mergers that increase efficiency. Both the 4R Act of 1976 (Pub. L. No. 94-210, 90 Stat. 31) and the Staggers Rail Act of 1980 (Pub. L. No. 96-448, 94 Stat. 1895) reflected "Congress' endorsement of mergers that enhance railroad efficiency." Lamoille Valley R.R. Co. v. ICC, 711 F.2d 295, 302 (D.C. 1983). The ICCTA was intended to continue this pro-merger policy.

In enacting the ICCTA, Congress knew that the Class I railroads were entering a "new round of consolidation." 141 Cong. Rec. H12,253 (daily ed. Nov. 14, 1995) (statement of Rep. Shuster). Congress assumed that, as a result of such consolidations, "thousands of miles of track, whether we like or not, are going to be abandoned." *Ibid.* Notwithstanding Congress's knowledge of the very factors that the Board now invokes to justify replacing the existing Congressional merger policy, Congress, in the ICCTA, elected to continue the existing merger policy. *See, e.g., id.* at S17,588 (daily ed. Nov. 28, 1995) (statement of Sen. Pressler) ("Absent some compelling reason for change, which has yet to appear, the current process should stand."); *id.* at S17,821 (daily ed. Nov. 29, 1995) (corrected version of Senator Pressler's remarks); *id.* at S17,590 (daily ed. Nov. 28, 1995) (statement of Sen. Hutchison) (noting concerns about railroad mergers, but stating that "[w]e have the ability to judge the issues under the standards we have had before"); *see also* Disposition of the Railroad Authority of the Interstate Commerce Commission: Hearings before the Subcommittee on Railroads of the Committee on Transportation and

---

rules forbidding private restructuring initiatives. As the Supreme Court noted in a similar context, "Congress could not have intended to delegate a decision of such economic and political significance in so cryptic a fashion." FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 120 S. Ct. 1291, 1315 (2000).

Infrastructure, House of Representatives, 104th Cong., 1st Sess. 106 (1995) (testimony c. Gail C. McDonald, Chair of the ICC, stating that "[a]nother round of major rail consolidations is anticipated as the railroad industry strives to become even more efficient and offer 'seamless service'").

In fact, the Senate rejected a proposal to respond to increasing rail industry concentration by subjecting merger proposals to an antitrust analysis that would have been more rigorous than the existing public interest analysis used by the ICC. *See* 41 Cong. Rec. S17,585-17,590 (daily ed. Nov. 28, 1995) (debate among Sens. Dorgan, Bond, Pressler, and Hutchison). In arguing against the proposal, Senator Pressler noted that, although "[i]n the last 15 years, there have been roughly a dozen rail mergers, a tremendous increase in concentration when just measured by the number of railroads," the public interest standard used by the ICC should not be changed. *Id.* at S17,588; *see also id.* at S17,820 (daily ed. Nov. 29, 1995) (corrected version of Senator Pressler's remarks). In the course of the debate on the proposal, Senator Pressler pointed out that "many rail efficiencies can be achieved only through mergers." *Ibid.*

The Board's proposed rules, however, would undermine Congress' considered decision to maintain the then-existing pro-merger policy in the ICCTA. Accordingly, promulgation of these rules would contravene the Board's statutory authority.

The proposed rules also would be invalid because they are inconsistent with Congress's expressed intent that the ICCTA continue and advance a policy of deregulation of the railroad industry. The ICCTA was intended to reduce the regulation of railroads, not expand it. *See, e.g.*, ICCTA, § 10101(2), Pub. L. 104-88 (articulating U.S. policy "to minimize the need for Federal regulatory control over the rail transportation system"); H.R.

Rep. No. 104-311, at 82, 1995 U.S.C.C.A.N. 793, 793 ("The bill substantially deregulates the rail and motor carrier industries."); *see also* Ex Parte No. 529, Class Exemption for Acquisition or Operation of Rail Lines by Class III Rail Carriers Under 49 U.S.C. 10902, 1996 WL 339192, at *17 (served June 21, 1996) (Morgan, Chair, commenting) (referring to "deregulatory direction" of the ICCTA).

Congress's intent to continue its existing deregulatory policy was and is one of the most important features of the ICCTA. As noted, in deciding to stay the deregulatory course, Congress acted with full knowledge that the industry was likely to become more concentrated in the future. *See* 141 Cong. Rec. S17,579 (daily ed. Nov. 28, 1995) (statement of Sen. Pressler) (rejecting argument that increasing concentration in the industry required "reregulation," noting that "I am not convinced a return to a pre-Staggers approach is the answer"); *see also id.* at H12,253 (daily ed. Nov. 14, 1995) (statement of Rep. Shuster) ("[T]he rail part of this legislation repeals and reduces numerous regulatory requirements."); *ibid.* (statement of Rep. Shuster) ("The bill continues the basic structure of the Staggers Act under which the freight railroad industry has seen remarkable recovery, primarily due to the benefits of deregulation."); *id.* at S17,579 (daily ed. Nov. 28, 1995) (statement of Sen. Pressler) ("As a general principle, S. 1396 continues the deregulation theme of the past 15 years by providing further regulatory reductions in the surface transportation industries."); *id.* at S17,581 (statement of Sen. Exon) ("This legislation represents the latest chapter in a thoughtful and deliberate effort to reform and deregulate America's great transportation sector. The more we can deregulate it, the better it will be and the more service it will provide."); *id.* at H15,600 (daily ed. Dec. 22, 1995) (statement of Rep. Shuster) (["The conference report] continues the basic structure of the Staggers

Act, under which the railroad industry has seen a remarkable recovery primarily due to the benefits of deregulation.").

The Board's proposed rules, however, would greatly expand the regulatory burdens facing potential merging railroads and would upset the "careful balance," *id.* at S17,580 (daily ed. Nov. 28, 1995) (statement of Sen. Pressler), that Congress struck with respect to the appropriate level of regulation. Accordingly, the proposed rules clearly violate the expressed intent of Congress.

The proposed rules cannot be salvaged by pointing to the need to address the growing concentration of the industry or by arguing that there no longer is a need to reduce excess capacity. As noted above, Congress was well aware that the industry would likely experience further concentration in the coming years, but nevertheless opted for a continuation of the pro-merger policy. If Congress determines that mergers are no longer in the public interest, it – but only it – can establish such a paradigm shift by revising the statutes that define the proper scope of Board review.

2. <u>There Is No Basis for the Presumption That Mergers Will Produce Generalized Competitive Harms</u>. There is no basis for the broad presumption that any future merger will necessarily cause generalized competitive harms. *See* Proposed 49 C.F.R. § 1180.1(a), NPR at 11.

The Board's current policies already require that a merger plan preserve competitive options for 2-to-1 shippers, 2-to-1 shortlines and regionals, build-in and build-out

opportunities, and transloads. Thus, any merger applicants already know, even without the NPR, that they must mitigate any such competitive harms.[23]

Despite these precedents, the Board apparently is concerned about the potential loss of more generalized competition, such as product and geographic competition. However, it is not clear how geographic and product competition would be adversely affected by the end-to-end mergers that are likely to be proposed in the future, particularly given the open gateway and contract exception proposals contained in the NPR.[24]

Furthermore, if these concerns are legitimate, there is no reason why the Board cannot consider, as it has in the past, whether geographic and product competition would be reduced, under the facts of an actual merger, in specific markets and, if so, what specific remedies are required to offset any identified harms.[25] A focused review of geographic and

[23] "[A]s railroads have consolidated, the Board (and its predecessor, the ICC) has been vigilant in protecting the rail options of shippers. In the context of merger policy, the Board has established a strong precedent to preserve options for a shipper who had access to two rail options prior to a proposed merger. Indeed, merging parties no longer appear before the Board without . . . first ensuring that their transaction preserves access to at least two rail options. This bespeaks clear and forceful policy aimed at protecting competition and the public interest." V.S. Gómez-Ibáñez /Kalt at 12-13.

[24] "For the loss of geographic competition to be a significant issue in a merger proceeding, one needs to show that geographic competition was, prior to the merger, the constraining factor on the potential for the exercise of market power, and that the merger would eliminate such competition.

"Previous mergers have involved extensive evidentiary findings regarding the process of competition—inter-modal, intra-modal, and geographic—and the likely effect of the merger. Evidence and previous Board rulings indicate that most proposed mergers have not presented significant risks of competitive harm, once competition-preserving conditions have been granted. . . . The Board's ability to obtain similar evidence and perform similar analyses are unaffected by previous rail consolidation." V.S. Gómez-Ibáñez /Kalt at 16-17.

[25] "The Board has successfully obtained and evaluated evidence on the prospective competitive harm that a merger could pose. . . . There is no reason that the Board will be unable to make similar evaluations in the future." V.S. Gómez-Ibáñez/Kalt at 17. *See, e.g.*,

product competition issues also would ensure that any relief is directed at the shippers who otherwise would suffer a loss of competitive pressure on rail rates, rather than providing a windfall to competitors or other unaffected shippers. (Ironically, if the NPR is adopted, Board policy would irrebuttably presume that geographic and product competition would be harmed by any merger, while the Board's policies on shipper rate challenges would presume that geographic and product competition do not constrain the rates charged by railroads.)

Finally, mergers produce competitive benefits by increasing intermodal competition, encouraging railroads to invest in infrastructure and provide new service, and providing shippers with access to new markets. The general decline in real rail rates also demonstrates that mergers have maintained or enhanced intramodal competition. Therefore, the Board's presumption is based on an unwarranted projection of non-remediable competitive harm and a dismissal of the general competitive benefits that rail mergers can continue to produce in the future.

3. There Is No Basis for the Presumption That Mergers Will Cause Transitional Service Harms. There is no basis for the presumption that a merger will necessarily cause transitional service problems. *See* Proposed 49 C.F.R. § 1180.1(c)(2), NPR at 15.

First, the problems of the UP/SP and NS/CSX/Conrail transactions were truly unique. UP acquired a railroad that had under-invested for years and then, as UP has

---

Union Pacific Corporation, et al. – Control and Merger – Southern Pacific Rail Corporation, et al., Finance Docket No. 32760 ("UP/SP") Decision No. 44 (STB August 12, 1996) at 124-32 (geographic competition), 146 (transloads and build-in/build-outs); Conrail, Decision No. 89 at 61-62 (build-in/build-outs and transloads).

acknowledged, there were some transitional personnel and operating problems. NS/CSX/Conrail involved an unprecedented – and unlikely to be repeated in the foreseeable future – division of the assets of an existing railroad. Neither of these facts is likely to recur in a future end-to-end merger.[26]

Second, the detailed service assurance plans and post-merger monitoring proposed by the NPR – and supported fully by BNSF – will ensure that merging railroads engage in a more detailed analysis of potential service problems and that interested parties have the ability to probe those plans. Proposed 49 C.F.R. § 1180.1(h), NPR at 20. The proposed rules build on the experiences of the past and require merger applicants to address in detail those areas that have led to problems in past mergers. Given the detail of these plans and the high level of review and monitoring the plans will receive from shippers and the Board, the final plans approved by the Board should minimize any such service problems.

In addition, BNSF proposed, in response to the ANPR and in public statements about the BNSF/CN combination, that merging railroads negotiate meaningful service guarantees with their shippers. BNSF also proposed that merger applicants provide evidence that their post-merger plans will generate the capital to support the infrastructure improvements necessary for the benefits of the proposed merger to be realized. Both elements would further lessen the likelihood of future major service disruptions.[27]

---

[26] The Board itself has recognized that despite the difficulties associated with the implementation, the UP/SP merger remains in the public interest. *See* UP/SP, Decision No. 15 (STB Nov. 29, 1999) at 5-6.

[27] *See* V.S. Gómez-Ibáñez/Kalt at § IV for a discussion of appropriate methods for minimizing service disruptions.

Third, merged railroads will have every incentive to maintain service quality and to learn from the problems of the past. UP, CSX and NS paid a very high price, in lost revenues, damages, and credibility with their shippers, for their service problems. No railroad will want to repeat that experience.

Fourth, the NPR proposes to offset potential and transitory service harms with concrete and permanent competitive conditions. Proposed 49 C.F.R. § 1180.1(d), NPR at 16. This is not an appropriate matching of problems with remedies. Instead, any remedies should provide shippers with alternate access during any period in which the merged railroad is experiencing merger-related service problems.

In sum, the NPR already contains the appropriate approach to any service problems of the future – the filing of detailed service assurance plans, aggressive post-merger monitoring, and prompt service relief (including temporary access to other carriers) for adversely affected shippers. With these strategies and potential remedies in place, it is not appropriate to presume that more regulatory intervention is required. Accordingly, the final rule should not include this presumption.

C. Imposing a Substantially Heavier Burden, Including the Requirement of Unrelated Competitive Enhancements, on Future Railroad Mergers Would Be Bad Policy and Law. Because rail mergers can be structured to mitigate identified competitive harms, there is no basis for a presumption that generalized competitive harms must somehow be offset. Proposed 49 C.F.R. § 1180.1(d), NPR at 16. As Professors Jose Gómez-Ibáñez and Joseph Kalt explain in their Verified Statement:

> Previous experience and the recent evolution of the railroad industry do not suggest that future mergers will reduce competition in ways that cannot be identified or mitigated. . . . [P]ast mergers do not appear to have

> reduced the competitive pressures on the railroads. Competition has been preserved in part because railroads are subject to many sources of competition that are usually not affected by mergers. Railroads compete intensely with trucks and barges for many commodities and shipments, for example, and this inter-modal competition is not reduced by rail mergers. . . .
>
> The Board has also played an important role in preserving competition by insisting that merger applicants offer trackage rights or other remedies that insure that any shipper served by two or more railroads before the merger still has a choice of at least two railroads after. Substantial evidence over the past several years and mergers indicates that Board-imposed and/or privately negotiated trackage, haulage and other conditions to preserve competition have been effective. V.S. Gómez-Ibáñez/Kalt at 14-15.

Similarly, for reasons discussed above, a presumption should not be adopted that rail mergers invariably produce service failures affecting rail customers, communities, or employees. Therefore, there is no basis for requiring merging railroads to offer unrelated "competitive enhancements" that could deter future mergers that would serve the public interest.

BNSF has supported the concept of raising the bar for mergers in the specific areas that have been identified as problems in recent mergers, including transitional service problems and the problems that might be created by transcontinental mergers, such as open gateways. However, that process should not become a means to alter the statutory basis of determining the public interest or a vehicle to reject the benefits of good mergers. There is a fundamental difference between raising the bar, as BNSF has proposed, and creating potentially insurmountable barriers, as the NPR proposes.

It is not appropriate to require that rail mergers enhance competition.[28] If a merger would maintain effective intramodal competition for those shippers who now have it (as, for example, Board policy requires that it must for all 2-to-1 shippers) and would offer significant public benefits, it would be a mistake to deny the public and the railroads the benefits of the merger. That policy would harm shippers and adversely affect the ability of railroads to attract the capital necessary to invest in infrastructure. Therefore, applicants should not be burdened with the requirement that they offset abstract presumed losses in competition with unrelated competitive enhancements.

Although the Board has disavowed a blanket "open access" requirement, merger applicants would appear to be compelled to make at least limited access concessions in order to meet the requirement for competitive enhancements. In his Verified Statement, Professor Richard J. Pierce explains why the Board's proposal to require applicants to incorporate proposals for enhanced competition is a bad idea.

> First, if the Board is convinced that some major change in its regulatory policy, like an equal access requirement, would yield significant public benefits, the efficacy of that policy change will depend primarily on its scope. It would make little sense, and do little good, to impose it selectively on railroads that propose to merge. Instead, the agency should consider whether to apply the new approach to all railroads.
>
> Second, adopting a policy of approving mergers only if the applicants agree to adopt a major change in their methods of operation that they consider highly undesirable is much more likely to discourage railroads from proposing socially beneficial mergers than to produce a legal regime in which many railroads agree to the change as a condition on approval of a merger.

---

[28] The NPR appears to ignore the pro-competitive aspects of rail mergers, which often result in increased inter- and intramodal competition. V.S. Krebs at 6-7. "This new presumption ignores the fact that modern rail mergers have made railroads more effective competitors thereby improving the competitive marketplace served by all modes of transportation." *Id.* at 7.

> Third, the policy would require the Board to determine what level of enhancements are necessary to offset possible harms and then allocate those enhancements to shippers who are not, by definition, directly affected by the potential harm. The unfairness inherent in providing benefits to one class of shippers, rather than another, is a key reason why remedies should be designed to offset specified harms to specific groups.
>
> Fourth, and most important, no agency should consider adopting a major change in its regulatory policy, like an equal access rule, without considering carefully and in detail all of the implications and effects of adopting the new policy. That cannot be done as an add-on to a merger review proceeding. It requires instead a separate rulemaking in which the agency addresses with care the scores of important issues that are raised by such a proposed policy change. V.S. Pierce at 17-18.

Further, if some shippers would suffer cognizable competitive harms as a result of a proposed merger, relief should be crafted to address those specific harms. The pursuit of broader remedies would be unfair to the harmed shippers and would raise very significant questions about the future regulatory structure of the rail industry.

For example, as the Board stated, one potential competitive enhancement could be the adoption of a limited system of open access or the elimination of paper and steel barriers for Class II and III railroads. NPR at 16-17 (discussion of Board's authority under Proposed § 1180.1(d)). However, unless such remedies were imposed on a uniform national basis, the merged railroad would be placed at a significant competitive disadvantage. The Board also could expect to hear pleas for relief from shippers and Class II and III railroads who would not benefit from the specific enhancements proposed in a merger proceeding.[29] Again, any such structural changes should be imposed only on a uniform basis.

---

[29] "The problem of rent-seeking will be exacerbated by shippers seeking relief before the Board and the Board needing to decide which shippers will get what kind of benefit from 'enhanced competition' and in what form this condition will occur." V.S. Gómez-Ibáñez /Kalt at 19.

The NPR also would create barriers to future mergers by allowing the Board to decide whether the claimed benefits of any merger could be achieved through means short of merger, such as alliances and marketing arrangements, that no party has actually proposed. Proposed 49 C.F.R. § 1180.1(c), NPR at 12-13. However, there are sound economic reasons to believe that mergers will be more efficient in the long-run than joint ventures.[30] Furthermore, proper market incentives exist for management to choose the

[30] "We can imagine a hypothetical rail network in which each successive mile of track is owned by a different railroad. In such a situation, . . . decisions . . . would need to be coordinated through negotiations or complex contracts involving multiple parties that set out as many foreseeable contingencies as possible, perhaps simplifying or ignoring certain economic interactions. Since there are significant costs associated with writing complex contracts or engaging in ongoing negotiations, we do not see the foregoing ownership structure in railroading. Rather, we observe integrated railroads with significant geographic scope to their ownership and operations. . . .

"Contractual relationships often require parties to bear large transaction costs, particularly when agreements must be closely monitored to ensure compliance. Real world negotiations include a high level of uncertainty and differences in expectation about both the current state of the world (e.g., the ability of coordinated service to attract new business immediately) and the future (e.g., how the agreement will evolve). This makes it difficult to reach, monitor, and enforce mutually beneficial marketplace agreements. When parties have different information, different expectations, and different alternative opportunities, they will also tend to value the benefits of a relationship differently. . . .

"Even when firms can agree on the benefits, they tend to have their own financial interests and priorities. Under such circumstances, writing sufficiently complex contracts to incorporate the myriad details and contingencies needed for successful integration is quite difficult. . . . [F]irms behave reasonably and tend to protect their individual interests, insisting on their individual priorities and strategies. This can make full coordination infeasible. Customers' needs go unserved and 'money is left on the table' . . . . Capturing such business provides the lure to mergers that improve network coordination by bringing the problems and incentives under the control of single ownership.

"The problem of inducing mutually beneficial arm's-length arrangements is doubly hard when durable capital needs to be sunk and shared to realize the benefits of economic success. Issues related to how to apportion capital expenditures across parties are especially difficult when the benefits that accrue from such an investment will be distributed across the network. . . . These factors act to limit independent firms' willingness to commit necessary capital to investments that an integrated firm would readily undertake. Under such circumstances, customers' needs can go under-served and, to capitalize on the business opportunities this creates, efficient marketplace forces push companies to bring

more efficient alternative as between mergers or joint ventures in each particular instance, and there is no reason to believe that the Board would make better decisions by second-guessing management.[31] Thus, it would be bad public policy for the Board to reject a merger that creates no concrete harm and promises public benefits merely because the Board prefers alliances to mergers.

In addition, the NPR would create barriers to future mergers by adopting rules that are unacceptably vague. Under the current rules and precedents, merger applicants know precisely what competitive harms they must mitigate, and the Board can review whether each such harm is adequately mitigated by proposed conditions. However, the NPR requires that merger applicants propose competitive enhancements to offset unrelated presumed competitive and transitional service harms. Proposed 49 C.F.R. § 1180.1(d), NPR at 16. It would be impossible for merger applicants to propose offsets to harms that cannot be precisely identified or quantified. Neither the Board nor interested parties would have any meaningful guidelines for identifying the type or extent of enhancements required to offset harms that the parties may be unable to identify or assess.[32]

---

operations that need to be coordinated over the use of long-lived, sunk capital under the roof of one firm." V.S. Gómez-Ibáñez/Kalt at 23-25.

[31] In fact, Board-imposed "conditions are likely to be more unwieldy, arbitrary, and inefficient than arrangements reached through private two-party negotiation." V.S. Gómez-Ibáñez/Kalt at 19.

[32] Moreover, the Board's proposed rules are so vague that they would render merger review virtually standardless. For instance, the proposed rules make merger approval contingent on whether some undefined quantum of "competitive enhancements" will outweigh some unspecified level of harm that is presumed to result from any and all railroad mergers. Such criteria for determining whether to approve a merger are devoid of any "intelligible principle" to cabin the agency's exercise of its discretion. J. W. Hampton & Co. v. United States, 276 U.S. 394, 409 (1928). Accordingly, the Board's proposed rules, if promulgated, would constitute an unconstitutional delegation of legislative authority,

Finally, the proposed rules would encourage abuse of the regulatory process by interested parties.[33] For example, a competing railroad could propose enhancements in its competitive position (or, more subtly, encourage shippers, shortlines or communities to propose such enhancements) to offset the hypothetical problems of its competitors' proposed merger. Shippers could seek new options to offset presumed losses of geographic competition that do not even affect them. The Board would have no reasoned basis for weighing these requests, and the regulatory process would be held hostage by parties who would be encouraged to use any merger proceeding as an opportunity for regulatory blackmail. Further, the proposed rules also would place the Board in the unprecedented and unjustified position of picking winners and losers in the general economy by deciding which shippers or sectors of the economy will be the beneficiaries of any enhanced competition conditions. The Board, for example, would have to decide which chemical shippers receive additional competitive benefits or, instead, whether coal shippers will be targeted for benefits, rather than agricultural shippers. This is not a role the Board should fill, and the problem of selecting winners and losers demonstrates why the Board

---

particularly since, as the Board itself has acknowledged, railroad mergers and merger policy affect the entire economy. *See* American Trucking Ass'ns v. EPA, 175 F.3d 1027, 1034-37, modified on reh'g, 195 F.3d 4 (D.C. Cir. 1999), cert. granted, 120 S. Ct. 2003 & 120 S. Ct. 2193 (2000); International Union, UAW v. OSHA, 938 F.2d 1310, 1317-1318 (D.C. Cir. 1991); STB Ex Parte No. 582, Public Views on Major Rail Consolidations, slip op. at 2 (served March 7, 2000) (rail merger policy and potential disruptions caused by mergers may affect "the national economy and defense").

[33] "Any and all shippers, regardless of the merit of their position, will have the incentive to seek conditions that grant them more than they currently have." V.S. Gómez-Ibáñez/Kalt at 18. The proposed rule "would maximize the opportunities for competitors and other third parties to abuse the merger approval process by using it to stop or to delay a pro-competitive merger or to use it as means to extract special favors unrelated to the proposed merger." V.S. Pierce at 12.

should limit its review to imposing specific conditions designed to offset or remedy specific merger-related harms.

D. Applicants Should Be Required to Address Only Concrete Downstream and Crossover Effects of a Proposed Merger. The NPR would require that merger applicants address the downstream and crossover effects of the proposed merger. Proposed 49 C.F.R. § 1180.1(i), NPR at 21. In its comments on the ANPR, BNSF proposed that merger applicants (i) demonstrate that they will not create crossover effects by exporting service problems to other railroads, and (ii) assess any new competitive problems with their merger that would be created by any subsequent merger that is filed with the SEC by the time that the first round of intervenor comments is due under the procedural schedule.

The Board's concern with downstream effects runs directly contrary to its presumption that future mergers will not produce competitive and other public benefits. After all, a "responsive" merger would be "necessary" only if the first merger creates new competitive pressures. If a merger did not produce a more efficient competitor, there would not be a responsive merger.

Furthermore, it is not clear what the Board would or could do with these projections. If a pending merger would produce public benefits, the Board should not reject the merger because a potential responsive merger might be harmful to the public interest. Instead, the Board should reject or condition the responsive merger if it is actually filed. It would be inappropriate for the Board to cure any potential deficiencies in a subsequent merger by imposing conditions on a prior merger.

Injecting these issues, without appropriate limits, into the merger review process would inevitably result in an abuse and prolongation of the regulatory process. Contesting

railroads and shippers would have the incentive to posit responses and problems simply to delay, complicate and defeat a pending merger proposal. Furthermore, it would be impossible and speculative for any railroad to present a case on all the potential strategic reactions to its proposed transaction, and the Board would have no reasoned basis to select among various hypotheticals announced by the parties.

The NPR could be read to suggest that the Board has preferred outcomes in any further consolidation of the rail industry. However, experience teaches that the selection of merger partners is best left to the forces of the market, subject to the protection of competition. Furthermore, if the Board, quite improperly, rejects a proposed merger because it favors another combination, the Board would lack the authority to force unwilling partners to combine, and it would be bad policy for it to attempt to do so.

The NPR also could be read to suggest that the Board favors a "competitive balance," one in which railroads compete at the margins but are guaranteed a basic market share. While the Board's governing statutes call for the preservation of essential services to shippers, the reforms of the 4R Act and the Staggers Act were explicitly intended to end the days when regulators allocated markets.

The broad downstream effects analysis proposed by the Board could lead to perverse results. For example, suppose that Merger 1 would be considered to be in the public interest, under whatever standards the Board adopts, except that Merger 1 might provoke the filing of Merger 2, a merger that the Board believes would not be in the public interest. The Board should not reject Merger 1 based on the speculation that Merger 2 might be filed in response and might have bad results. Merger 2 can be dealt with on its

own merits. In no event should the Board impose conditions on Merger 1 to remedy problems that are created by, and internal to, Merger 2.[34]

Similarly, suppose that Merger 1 is a surprise to the Board, either because of the timing or the identity of the parties. This does not mean that the Board should refuse to approve Merger 1 because it prefers a different pairing. Congress has rejected this command-and-control approach to regulation of railroads. Further, if the Board has views on the appropriate regulatory structure of the industry, such as open access issues, those views should, to the extent allowed by statute, be addressed through a rulemaking of general applicability.

However, there are legitimate downstream and crossover issues for the Board to consider, as BNSF noted in its comments on the ANPR. These issues are tied directly to the appropriate scope of Board review of mergers – competitive and service issues. Thus, it would be appropriate for the Board to review whether an actual responsive merger somehow vitiated the effectiveness of remedies imposed to protect 2-to-1 shippers. Similarly, the Board should assure that a merger will not result in the export of service problems to other railroads. Of course, both of these concerns are already covered in other areas of the NPR.

---

[34] "Even if it were possible to predict future mergers with accuracy, it would be inappropriate to use such predictions to block a proposed merger. Each application should be judged on its own merits, according to the principles of sound merger policy. The 'looming possibility' of subsequent merger applications is no reason to prevent a proposed combination that meets traditional merger policy criteria. . . .

"The goals of sound merger policy would be better served by a more limited measure that would require a merger applicant to consider the effect of any concurrent merger application." V.S. Gómez-Ibáñez/Kalt at 29.

E. Applicants Should Not Be Subject to the Future Imposition of Conditions to Their Mergers or Required to Guarantee the Specific Projected Benefits of a Merger. Merger applicants and other parties require assurances that Board action with respect to any merger will be final, except as necessary to remedy any transitional service problems or any competitive conditions that prove to be inadequate. The use of the Board's post-merger conditioning power to remedy these narrow categories of merger-related problems could be appropriate, in some circumstances, because it would be crafted to preserve the service and competitive results promised by the merger applicants and approved by the Board. However, the NPR proposes to reserve to the Board the authority to impose post-merger conditions under a much wider variety of circumstances.

The NPR proposes that the Board will retain the right to impose new conditions on a merger in response to unforeseen circumstances or subsequent mergers. The "unforseen circumstances" test is so broad that a merged railroad always would be subject to the risk that the Board would impose conditions that would not have been acceptable as an original precondition to the merger. The industry requires certainty, but this proposal removes it entirely. Furthermore, if a subsequent merger takes place, any problems created by the second merger should be remedied only through conditions imposed on that merger, without requiring a previously merged railroad to contribute to the resolution of service or competitive problems that were created by the second merger.

The NPR also states that merger applicants must propose how they would be held accountable for the benefits and service improvements they claim. Proposed 49 C.F.R. § 1180.1(c)(1), NPR at 14. The Board's proposal is overly broad, mixing areas where continued Board oversight is necessary and appropriate with areas where continued Board

oversight would be harmful and contrary to sound public policy. The proposal would deny merging railroads the ability to weigh a complete set of conditions in deciding whether to proceed with their merger after receiving Board approval.[35] The threat to impose additional conditions if projected public benefits are not met is bad public policy.[36]

Oversight by the Board of implementation of competitive conditions is appropriate. If remedies for 2-to-1 shippers or the new open gateway policies do not work, for example, it would be appropriate for the Board to act, using its conditioning powers. The Board has done so in the past.

The Board also should monitor service implementation with a readiness to use its service order power to address service breakdowns, as it has done in the past. In fact, the Board has clarified and expanded its procedures, as a result of the UP/SP and Conrail problems.

---

[35] As the Board itself has recognized, once a merger has been consummated and the applicants can no longer walk away from it, the "imposition of disproportionate new conditions becomes increasingly inconsistent with notions of commercial certainty and fairness." Union Pacific Corp., et al. – Control and Merger – Southern Pacific Rail Corp., et al. [Houston/Gulf Coast Oversight], Finance Docket No. 32760 (Sub-No. 26), Decision No. 10 (STB Dec. 21, 1998), at 3.

[36] "This proposal completely misses the point of a dynamic marketplace – shippers can benefit from competitive responses to mergers that may deprive the merging parties of the expected traffic, but which in fact produce lower rates or better service for shippers. Such a result cannot be considered harmful to the public interest, and no intervention from the Board should be needed to address the failure of merging carriers to gain as much new traffic as they had hoped to gain." V.S. Krebs at 10–11. "The estimated public benefits of a merger are inevitably based on forecasts of many uncertain variables. . . . Actual benefits may diverge from projected because of events that are unexpected and completely outside the control of the merger applicants. Everything from changes in the overall economy or the weather could result in forecasts being inaccurate – in either direction – after the fact." V.S. Gómez-Ibáñez/Kalt at 30-31.

However, beyond that, it is not clear what role government appropriately can have to ensure "accountability" for the claimed improvements. It is manifestly in the applicants' best interest to do all they can to make the service improvements and implement the efficiencies of the transaction as seamlessly as possible. But the applicants cannot be held responsible for unforeseen developments in their shippers' businesses, in the competitive dynamics of the industry, or in the economy as a whole that may adversely affect their projections.[37]

For example, the NPR could be read to suggest that, somehow, a merged railroad could be subject to the imposition of additional conditions if the results of traffic diversion studies were not realized. However, a merged railroad might not capture projected traffic precisely because of the competitive ("downstream") responses of other railroads, trucks and barges, with the result that shippers receive even more benefits than the merging parties suggested. Similarly, a merged railroad might not achieve projected labor savings because of unanticipated success in attracting new traffic or because it decides to be more cautious in implementing future personnel reductions in the interest of service integrity, again to the benefit of shippers. This is why the current Board merger policy – focused on the competitive and service effects of a merger – is both the correct policy and the only policy that can be enforced with any logic or reason.

---

[37] "Some mergers produce disappointing results – results that fall well short of the firm's expectations. Agencies do not approve mergers because they expect all mergers to be successful. Such an expectation would be absurd. It is contradicted by history. Some mergers yield spectacular results; some yield terrible results. Agencies approve mergers that do not have anticompetitive effects because they know that many will yield good results and because they know that the firms that propose to merge are in a much better position than any agency to predict the results of the merger." V.S. Pierce at 20.

Finally, the proposed accountability standard could have the result of discouraging the merged railroad from rethinking its plans in light of changing circumstances. The proposed review would encourage railroads to take unwise actions solely in order to reach regulatory benchmarks, rather than to achieve competitive and service results. The review also could force a merged railroad to proceed to the next step of its integration plan, even if problems have been identified and remain unresolved. These are not desirable results.

In summary, the Board's current policy is the correct one. The Board should act to protect shippers when competition-related conditions prove to be ineffective. The Board should act to provide shippers with relief when service is disrupted due to merger-related problems. However, there is not a broader post-merger role for the Board to play.

F. The Board Should Not Dictate the Structure of Future Business Relationships. The NPR states that, in assessing whether a merger is in the public interest, the Board will consider whether the claimed benefits could be realized in other ways, such as joint marketing ventures, alliances and other mechanisms. Proposed 49 C.F.R. § 1180.1(c), NPR at 12-13. However, railroads recognize the extensive time and effort that mergers require. When they choose mergers over alliances and other types of voluntary coordination agreements, they do so because mergers are more likely to achieve the efficiencies they need.[38] A merged entity will be better positioned to respond to future problems, including natural disasters, because of its ability to make decisions that reflect the balancing of the requirements of the entire system, rather than that part of the system served by each railroad in an alliance.

---

[38] *See* § VI of V.S. Gómez-Ibáñez/Kalt for a discussion of non-merger transactions.

Railroads will choose among alliances, other forms of voluntary cooperation, and mergers based upon their assessment of which form will produce the greatest benefits. These decisions will be made with a full awareness of the requirements that the Board will impose on any merger. Indeed, given the burdens imposed on merger applicants, if alliances and joint ventures are an efficient means of increasing efficiencies and becoming competitive, railroads will continue to pursue them. However, in the final analysis, sound economic and regulatory policy requires that the Board defer to the decisions by capital markets on the best way to structure business enterprises, unless those decisions would result in identifiable harms that cannot be mitigated.[39]

G. The Board Should Require Merger Applicants to File Service Assurance Plans and Should Monitor Post-Merger Implementation. The NPR proposes that merger applicants prepare an extensive service assurance plan to address the risks of service problems and implementation. Proposed 49 C.F.R. § 1180.1(h), NPR at 20. BNSF has already endorsed the concept of service integration plans and would continue to support "service assurance plans" as an addition by rule to the requirements of an application, as suggested in our comments in the ANPR phase. The plans would involve protection of service integrity for shippers during the merger implementation process, and include plans made in conjunction with connecting rail carriers, including Class II and Class III carriers, as well as ports. However, as discussed above, the filing and testing of a service assurance plan should negate any presumption that a merger will produce transitional

[39] "Regulatory limitations on a railroad's use of its assets and uncertainty about future limitations act not only as disincentives for the railroads to invest in particular projects but also as disincentives for outside investors to invest in the railroad." V.S. Cornell at 9.

service problems that must be weighed against the merger as part of the public interest balancing.

The NPR also proposes that the Board conduct extensive post-approval operational monitoring to help ensure that service levels after a merger are reasonable and adequate. Proposed 49 C.F.R. § 1180.1(h), NPR at 20. BNSF supports this proposal. The merging carriers should propose the relevant datapoints to be monitored, the specific metrics to be provided to the Board and others, and the processes to be used to conduct the post-approval operational monitoring.

H. The Board Should Require That Affected Major Gateways Remain Open, 2-to-1 Situations Be Remedied, Including Build-In/Build-Out and Transload Opportunities, and "Contract Exception" Rights Be Retained. In proposed Section 1180.6(b)(10), the NPR proposes that merger applicants must demonstrate how the use of major gateways will be preserved. BNSF supports adoption of a requirement that applicants demonstrate how access to markets and viable service offerings through major open gateways would be maintained operationally and financially. However, this requirement should apply only to points directly affected by the merger; there is no merger-related policy basis for extending this requirement to gateways not affected by a merger.

The NPR proposes that merger applicants must demonstrate how build-in/build-out and transload options would be preserved. Proposed 49 C.F.R. § 1180.6(b)(10), NPR at 31. To the extent that a shipper would lose such options, such a demonstration would be appropriate with respect to 2-to-1 situations, along the lines of the CMA Agreement and the conditions adopted in UP/SP.[40]

[40] *See*, UP/SP, Decision No. 44, at 18.

The NPR proposes that merger applicants must demonstrate how they would preserve the bottleneck contract exception. Proposed 49 C.F.R. § 1180.6(b)(10), NPR at 31. To the extent a shipper would lose a remedy as a result of a proposed merger, BNSF agrees that preservation of the contract exception would be appropriate.

I. Other Issues Raised by the NPR.

1. Transnational Transactions. The NPR proposes that a full-system competitive analysis and operating plan must be provided in cases involving Canadian or Mexican railroads. Proposed 49 C.F.R. § 1180.1(k), NPR at 21-22. BNSF does not oppose reasonable requirements in this area relating to railroads operating in Canada and Mexico as well as the U.S., particularly as they relate to North American Free Trade Agreement ("NAFTA") traffic and influences on each country's international trade abilities and commitments, issues of safety requiring involvement or cooperation with the Federal Railroad Administration, issues of conflicting economic regulation in Canada and/or Mexico as they affect the operation of the free market in the United States, or issues relating to national defense.

However, the Board should not presume transnational transactions to be contrary to the public interest, and should not discriminate against them. For example, it would not be appropriate for the Board to attempt to forestall the traffic shifts that might result from shippers' responses to the creation of a rail network that is more efficient and has a broader geographic scope.

2. Labor Issues. The NPR proposes that merger applicants must file additional employee impact information, including cross-border data for transnational

mergers. *See* Proposed 49 C.F.R. § 1180.1(e), NPR at 21-22. BNSF supports this position.

The NPR also states that contract override of labor agreements ("cramdown preemption") is to be very narrowly applied, and it states that the Board may impose additional labor conditions if appropriate. Proposed 49 C.F.R. § 1180.1(e), NPR at 17. However, Congress has defined when cramdown conditions are to be used and the scope of such conditions. Any change in this area should come from Congress.

While BNSF does not believe that the Board can ignore the statutory mandates when voluntary efforts fail, BNSF supports direct negotiations between unions and the merger candidates as the best mechanism for resolving labor issues. BNSF was successful in reaching agreements with labor when it was pursuing its combination with CN, and it would hope for similar success in connection with any future combination proposals. Furthermore, if such negotiations are to succeed, the Board need not and should not involve itself in reviewing or approving voluntary labor implementation agreements.

3. Market Data in Support of a Merger Application. The NPR proposes that an application include expanded market data, including detailed market share data that previously has not been furnished in merger cases. *See* Proposed 49 C.F.R. § 1180.7, NPR at 33-34. BNSF would not oppose reasonable requirements in this area, but the requirements should reflect what is practical from a data standpoint and recognize intermodal competition and the Board's precedents on the types of competitive effects that need to be remedied as part of the merger review process.

For example, proposed Section 1180.7(a)(3) appears to require actual and projected market share data by origin/destination area and major commodity group for individual transportation modes. Such data may not be available for trucks and barges at the level of specificity that the proposed rule may contemplate. Similarly, such detailed data may be unavailable, for example, in Mexico for any mode. The Board should make clear that its data requirements are not hard and fast, but are tempered by what is practical to obtain.

The Board also should ask whether the added burden of collecting and analyzing this data is justified. Because of its unique operating characteristics, traditional market share analysis is not appropriate in the rail industry, where a large number of shippers have always been sole-served and where many markets are subject to competition, but served by a single carrier due to long-term contracts. Instead, Board review has looked to the loss of existing competitive alternatives, not changes in market shares.

More fundamentally, the Board should reject any implication that it will use market data to ensure that a merger does not affect the market shares of other railroads. The competition created by mergers is good for the general public and shippers, and no railroad should be insulated from the changes in market shares that such competition brings.

4. Upstream Effects. The NPR specifically addresses "downstream" effects, although, as discussed above, the proposal is far too broad. There also is an issue concerning "upstream" effects – that is, the effects on conditions imposed on a prior merger when that merged railroad is itself an applicant in a subsequent merger.[41]

[41] As noted above, it would be contrary to statute and bad policy for the Board to remedy the problems associated with a proposed merger by imposing conditions (including the reopening of old conditions) on other parties.

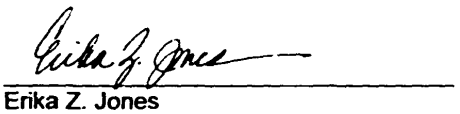
BNSF believes that it is appropriate for the Board to take such "upstream effects" into account, provided that the emphasis remains on protecting the competitive interests of shippers and not the competitive position of railroads. For example, if a condition was imposed to protect a 2-to-1 shipper in a prior merger involving one of the merger applicants, it would be appropriate to review whether the condition would remain viable after the merger.

5. Technical Changes. The NPR proposes various technical revisions to the existing merger rules to codify a number of the Board's current practices and to conform the rules to the waivers and clarifications that the Board has granted in recent merger proceedings. BNSF is in agreement with the proposed revisions and notes that their adoption should enable the Board to process and complete its review of a proposed merger transaction within the maximum review period of one year from the date of the pre-filing notification which BNSF has proposed above.

IV. CONCLUSION

BNSF supports those specific elements of the NPR that would require merger applicants to file an application that addresses how the merged railroad will implement the merger, whether 2-to-1 shippers will retain effective competitive options after the merger, and whether the merged railroad will have an open gateway policy and preserve "contract exception" rights for affected shippers.

However, the Board must expedite its merger review process to meet the demands of capital markets and shippers. No merger review should take longer than one year, and some mergers can and should be handled in even less time. Further, the Board should not – and cannot legally – presume that mergers have no further role to play in improving the



existing railroad system, in creating new efficiencies, or in providing the capacity and services necessary to provide shippers with the services they need in the modern economy. The Board should not presume that future mergers will create competitive and service problems that must be offset by unrelated competitive enhancements. Instead, the Board should review closely the details of each merger proposal, identify any probable competitive or service harms, and review the adequacy of the applicants' proposals for preventing those harms on the record in that case. The Board's review should be specific, not presumptive, and remedies should focus on correcting identified problems, not offsetting presumed, unidentified harms.

The Board should not require merger applicants to address purely hypothetical responsive mergers, nor should the Board reject a merger because it does not fit into the Board's preconceived notions of what shape the final North American rail system should take. The Board should adopt rules that allow all parties to make reasonable predictions about Board action, and the Board should not construct a system which encourages opportunistic parties to seek self-serving conditions to "offset" unspecified, unquantified, hypothetical but presumed harms.

These actions will ensure that future mergers serve the public interest; that Board policy does not discourage mergers that would produce public and private benefits; and that the Board acts in a timely fashion, given the demands of today's economy. These actions will raise the bar in an appropriate fashion, without creating presumptions that are contrary to sound economic and regulatory policy and in violation of law. These actions also will provide the signal of regulatory stability that is essential if the railroad industry is

to attract and retain the capital necessary to meet the Nation's requirements for a competitive and reliable rail sector.

PROPOSED PROCEDURAL SCHEDULE

(The term "F" designates the date of filing of the application and "F+n" means "n" days following that date.)

F	Primary application and any related applications filed.
F+7	Notice of intent to prepare an EIS and request for comments on proposed EIS scope published in the Federal Register.
F+15	Board notice of acceptance of primary application (and any related applications) published in the Federal Register.
F+30	Safety Integration Plan due.
F+45	Draft of final EIS scoping.
F+60	Notification of intent to participate in proceeding due. Description of anticipated inconsistent and responsive applications due; petitions for waiver or clarification due with respect to such applications.
F+90	Inconsistent and responsive applications due. All comments, protests, requests for conditions, and any other evidence and argument in opposition to the primary application due. Comments by U.S. Department of Justice ("DOJ") and U.S. Department of Transportation ("DOT") due.
F+105	Notice of acceptance (if required) of inconsistent and responsive applications published in the Federal Register.
F+110	Date of draft EIS.
F+120	Response to inconsistent and responsive applications due. Response to comments, protests, requested conditions, and other opposition due. Rebuttal in support of primary application and related applications due.
F+150	Rebuttal in support of inconsistent and responsive applications due.
F+155	Comments on draft EIS due.
F+180	Briefs due, all parties (not to exceed 60 pages for applicants and not to exceed 30 pages for others).
F+205	Date of final EIS.
F+210	Oral argument (close of evidentiary record).
F+220	Voting conference (at Board's discretion).
F+270	Date of service of final decision.

Attachment 2

Merger Summary/Timeline (1997-2000)

No.	Principal Merging Entities	Market Value (approximate)	Announcement Date	Completion Date	Total Time	Procedural History & Relevant Factors
1	AirTouch Communications Inc./ Vodafone Group Plc	$62 billion transaction value	January 15, 1999	June 30, 1999	5+ months	• FTC grants early termination of HSR Act waiting period March 3, 1999; • EC conditional approval May 24, 1999; • Shareholder approval June 1, 1999; • FCC approval June 23, 1999.
2	American Stores Company/ Albertson's, Inc.	$11.7 billion transaction value	August 3, 1998	June 2[illegible], 1999	10+ months	• FTC files HSR Act request for additional information October 2, 1998; • Stockholder approval 11/12/98; • Divestiture agreement with FTC clears merger June 22, 1999.
3	Ameritech Corp./ SBC Communications Inc.	$62 billion transaction value; $146 billion combined assets	May 11, 1998	October 8, 1999	16+ months	• EC & other European entities approval July 23, 1998; • Application filed with FCC July 24, 1998; • Divestiture agreement with DOJ clears merger March 23, 1999; • State entities approval August 9 through September 23, 1999; • FCC conditional approval October 8, 1999.
4	Amoco/ BP	$55 billion transaction value	August 11, 1998	December 31, 1998	4+ months	• EC approval December 14, 1998; • Divestiture agreement with FTC clears merger December 30, 1998.
5	AMP Inc./ Tyco International Ltd.	$12.22 billion transaction value	November 23, 1998	April 2, 1999	4+ months	
6	Asda Group plc/ Wal-Mart Stores, Inc.	$10.8 billion transaction value	June 14, 1999	July 27, 1999	1+ month	• EC approval July 26, 1999.

CERTIFICATE OF SERVICE

I do hereby certify that copies of The Burlington Northern and Santa Fe Railway Company's Comments are being served on all parties of record this 17th day of November, 2000.

David I. Bloom

BEFORE THE
SURFACE TRANSPORTATION BOARD

EX PARTE NO. 582 (SUB-NO. 1)

MAJOR RAIL CONSOLIDATION PROCEDURES

VERIFIED STATEMENT
OF
ROBERT D. KREBS

I am Robert D. Krebs, Chairman and Chief Executive Officer of Burlington Northern Santa Fe Corporation, which owns and operates The Burlington Northern and Santa Fe Railway Company ("BNSF"). A summary of my background is attached as an appendix to this statement.

The Board has proposed numerous changes to its rail merger policies. Many of these changes make sense in today's environment, and I have addressed many of the sensible proposals in previous statements and testimony in this and related proceedings. In this statement, I want to address several major issues raised by the proposed rules that could adversely affect the rail sector's ability to attract investment capital.

In an earlier decision in a related proceeding, the Board concluded:

> "Looking forward, the key problem faced by railroads — how to improve profitability through enhancing the service provided to their customers — is ***linked to adding to insufficient infrastructure***, not to eliminating excess capacity." STB Ex Parte No. 582 Decision (March 17, 2000), page 6. (Emphasis added).

The Board was correct in this observation. I believe that the greatest challenges facing the railroad industry and its customers today are (1) the challenge of improving service to rail shippers and (2) the challenge of attracting the capital

investment needed to obtain efficiencies from the existing rail infrastructure and, where necessary, to construct new infrastructure to support improved rail service offerings. Given the fact that the rail sector lags behind other industry sectors in growth and return on invested capital, it is already challenging to attract investment capital to the rail sector. Moreover, investor focus on short-term profits does not reward companies that make investments in the long-term infrastructure improvements that will be needed to improve service and handle additional capacity. Therefore, if the Board is serious about encouraging improvements in rail service, it should ensure that its policies do not discourage private investment in the rail sector and that its policies affirmatively encourage adequate revenues for rail businesses.

A vitally important factor to investors in today's economic climate is the speed with which they will see an appropriate return on their investments. When regulatory approvals are required for transactions, investors need predictable and expeditious outcomes. To avoid discouraging investment in the rail sector, the Board must accelerate its merger review process to reach quickly the core issues that need to be addressed in a rail merger. The lengthy proceedings permitted (but not required) under the statute, coupled with the vague new standards identified in the proposed rules, could chill a good merger proposal from even being made. To prevent that result, and to assure investors that the Board is sensitive to the need for expeditious decisionmaking, the Board should adopt a pro forma procedural schedule that permits full public participation and environmental review, yet results in a final Board decision within one year of the parties' filing of a notice of intent.

As I noted above, the proposed new merger policy appropriately addresses many of the needs of today's transportation market. For example, the proposal to

require the preparation of detailed Service Assurance Plans to accompany future merger applications is an excellent idea that should aid the agency and the public in reviewing whether the merger applicants will be able to deliver adequate service in the post-merger environment. I also support the Board's proposal to ensure that major gateways remain open following a merger, that the "contract exception" right is maintained, and that build-in and transload opportunities are preserved for shippers.

In many other respects, however, the proposed new merger policy introduces serious new risks of delay and uncertainty into the regulatory process, signaling investors that the rail sector may be an unpredictable market in the foreseeable future. On a related point, by adopting a presumption that future mergers are inherently harmful and making it more difficult to justify future mergers, the proposed new merger policy signals investors that the Board is satisfied with the status quo of rail sector financial performance and capital investment.

I am not satisfied with the status quo of rail sector financial performance. I believe that there are substantial opportunities for growth in the rail sector. These opportunities will not come to pass, however, if the industry cannot improve its ability to attract investment capital. Unfortunately, the proposed new merger policy is a step in the wrong direction, and will make it harder, rather than easier, for the rail industry to attract the capital it needs to fulfill the Board's vision of improved service to rail shippers.

I therefore intend to address the following points in detail in this statement.

First, there is no reason to delay the benefits of a good merger for shippers. Yet, extended procedural schedules defer those benefits for shippers and can even lead to the complete loss of those benefits because good mergers are either not

proposed or are undone by the delay and uncertainty of the review process. Second, during the period when a merger is pending before the Board, the applicants and other parties are placed in a regulatory limbo, unsure how to plan for the future or how to respond to other opportunities. Third, capital markets cannot tolerate uncertainty or delay. The mere threat of an extended regulatory proceeding would cause capital to seek other investment opportunities and place downward pressure on railroad stocks. I believe that the proposed new merger policy statement does not adequately consider this issue, and I will urge that the Board adopt a policy committing to an expeditious review of any proposed rail merger in the future.

I also will suggest that the new policy inappropriately presumes that future rail merger proposals are inherently harmful, a presumption that will strongly discourage future investment in the rail sector. I will urge the Board to revisit this presumption, as well.

The Public Interest Requires More Expeditious Consideration of Railroad Merger Applications

In citing some of the tenets of the Rail Transportation Policy in support of its proposed new merger policy, the Board overlooked one provision of the Policy that is extremely important to investors: the Rail Transportation Policy's call for "fair and expeditious regulatory decisions."

Delay is the enemy of capital investment. Investors are not ordinarily willing to park their investment dollars awaiting lengthy regulatory approvals of a transaction. Investors make an exception when they perceive that a transaction will add value to the investment in the long run, but only when the regulatory process is expeditious and predictable. In connection with our recent proposal to combine with the Canadian National Railway Company ("CN"), our investors made it clear to

us that they could not tolerate the additional delay that was introduced by the Board's moratorium, coupled with the already lengthy regulatory review process. Because our two companies could not risk the flight of investment capital that would likely have resulted from waiting for the moratorium and approval process to run their courses, we jointly terminated the transaction this summer, notwithstanding the significant shipper benefits that could have resulted from that proposed combination.

There is no other U.S. industry that must routinely endure merger approval processes that are as lengthy and expensive as the Board's merger review process. To be sure, there are isolated examples of transactions that have become embroiled in lengthy regulatory reviews, but these are rare. Far more commonly, federal regulatory clearances for major mergers — including transactions far larger in value than any modern rail merger — occur in a matter of a few months. And, it would be parochial (and wrong) to presume that mergers in other industries have less significant effects on the U.S. economy than end-to-end rail mergers. Recent consolidations in the banking, telecommunications and energy sectors have dwarfed recent rail mergers, and have reshaped markets in many industrial sectors.

There is simply no public policy justification for stretching out railroad merger reviews to nineteen months (or longer). Mergers in other industries do not require protracted evidentiary proceedings, depositions or environmental reviews. While I understand that the Board could not eliminate all of the procedures now required, there are many steps (such as interrogatories and depositions) that are not required by the statute and add substantial delay and expense to the process. The Board could retain each of the rail merger procedural steps mandated by the statute, as well as complete an environmental review, and still complete the evidentiary portion of the case within six months after an application is filed. BNSF's comments contain

a template for a 270-day procedural schedule that provides ample opportunities for public participation, environmental review and Board consideration, allowing a decision to be rendered within nine months of the filing of an application. There is simply no reason why the entire merger review process could not be completed by the Board quickly enough to permit closing of an approved transaction within one year of the parties' filing their notice of intent to apply for merger approval.

The bottom line is that shareholders and shippers alike suffer when they must defer enjoyment of the benefits accruing from a beneficial rail merger until the conclusion of the lengthy STB review process. The delays inherent in the current process are a severe deterrent to investors and deprive shippers of the improved services, transit times and other benefits that can accompany end-to-end rail mergers. The Board should reexamine its procedural rules, eliminate unnecessary steps and commit publicly to a streamlined, expedited review of future rail merger proposals in order to remove a significant obstacle to investment in the rail sector.

It is Wrong to Presume that All Remaining Potential Mergers in the Rail Sector Are Inherently Harmful

The Notice of Proposed Rulemaking proposes to create a new presumption that any future rail mergers will be inherently harmful to competition and rail service (at least temporarily) and proposes to require future merger applicants to come up with a plan to "enhance" competition as a way of mitigating against these perceived harms.

This new presumption ignores the fact that modern rail mergers have made railroads more effective competitors, thereby improving the competitive marketplace served by all modes of transportation. Shippers have benefitted from this improved competitive market through lower rates, better service and innovative service offerings.

If we had been allowed to file our application for review of the proposed combination of BNSF and CN, it would have shown how the combination would have advanced the public interest in many ways. These included offering shippers improved routing options, faster transit times on major routes, bypassing congested urban areas and providing unprecedented gateway and service guarantees. Our proposed combination would have produced improved asset utilization, thus increasing the capacity of the combined system without the need for additional equipment and infrastructure investment. The combination would also have yielded substantial economic synergies, freeing capital for infrastructure investment where that investment may be needed; and it would have substantially advanced the interests of North American trade as embodied in the North American Free Trade Agreement ("NAFTA"). We believe we would have shown that these public interest benefits were achievable without introducing competitive harm, without adverse effects on employee or public safety, and with only minimal effects on employment or the environment.

The application would have described estimated total merger benefits of approximately $800 million annually, including over $300 million in additional net revenue from traffic gains, a substantial portion of which came from attracting business back to the rail system. We also projected approximately $500 million in operating synergies per year, of which $400 million would have been reduced operating costs and $100 million in avoided capital expenditures. These savings would have made the combined railroads even stronger financially, better able to compete for new business and make infrastructure investments. Even more important, the new system would have provided owners with returns in excess of the company's cost of capital. Unless and until we can earn our cost of capital, BNSF's

ability to make infrastructure and equipment investments is questionable. Indeed, we may find that further consolidation is necessary to assure the rail industry's financial health for the benefit of its customers, employees and the country.

Therefore, there is absolutely no basis for the proposed new presumption and no reason to saddle future mergers with the substantial costs of "enhancing" competition. What it means to "enhance" competition is not precisely spelled out, but the proffered examples all have one thing in common: the merging carriers would have to open up some amount of business to new competition without receiving any counterpart access to new customers from the other rail carriers. Unlike existing merger policy, which ensures the preservation of two carrier service for shippers that enjoyed that competition before the merger, the new presumption and remedy proposal would bestow new competition on shippers that do not now have any rail-to-rail competition.

I know of no other U.S. industry that is expected to give away its customers without compensation as a condition of obtaining federal approval to merge. This proposal is particularly ill-advised, because the "enhanced" competition is not required to be related to the specific alleged harm and there is therefore no way for an applicant to know what level of enhancements will be required by the Board as a condition of approval. The net effect of this new presumption of harm, and mandated remedy is to increase the costs of future mergers, while providing a windfall to the rail carriers that are not among the first to merge under the new policy. This will make it much more difficult to persuade investors to support future mergers, and will likely result in deterring beneficial mergers that would have passed muster under the existing merger policy. Shippers will suffer the loss of merger-related efficiencies and benefits that they would have enjoyed from mergers that are

discouraged by the proposed new policy.

The Board's proposal cannot be reconciled with the public interest. Notwithstanding the serious service disruptions that followed the Union Pacific/Southern Pacific merger, no one could seriously suggest that rail shippers would be better served today with an independent (but financially crippled) Southern Pacific. Yet, it is unlikely that any carrier would have been willing to take on the problems and expense of rebuilding the Southern Pacific franchise if it also had to "enhance" competition as a price of obtaining federal approval to merge.

Moreover, this proposal puts the Board in the role of central planner for the railroad industry, by deciding which shippers will benefit from enhanced competition and which will not. This proposal is a giant step toward reregulation that itself will discourage future investment in the rail sector, as the Board was clearly told at its public hearings in March 2000 in a proceeding related to this rulemaking.

I also want to comment on the proposal to require applicants to prove during the oversight proceedings that they have actually achieved the projected benefits of the merger. This proposal completely misses the point of a dynamic marketplace — shippers can benefit from competitive responses to mergers that may deprive the merging parties of the expected traffic, but which in fact produce lower rates or better service for shippers. Such a result cannot be considered harmful to the public interest, and no intervention from the Board should be needed to address the failure of merging carriers to gain as much new traffic as they had hoped to gain. Moreover, it is unclear what remedies are available to the Board in such a circumstance.

Finally, I want to comment on the proposal to require applicants to accept the possibility of indeterminate conditions that may be imposed years after the merger

in order to address some perceived harm arising from a ***future*** consolidation. Such a new requirement would impose unacceptable uncertainty on the first carriers to merge under the new policy. Investors could not possibly evaluate the economics of a transaction that has no finality and that could be converted, retroactively, from a beneficial transaction to an economically unattractive one. This concept is anathema to investors and will seriously harm the industry's ability to attract investment capital in the future.

Conclusion

If the Board wants rail service improvements, it must establish policies that encourage, rather than discourage, investment in the rail sector to finance those improvements. The Board's proposed new merger policy sends the wrong signals to the capital markets about the likelihood of damaging reregulation. Moreover, the proposed policy would increase the costs of mergers, perhaps to the point of making them economically infeasible, sending yet another negative signal to the capital markets. Finally, the proposed policy misses the opportunity to streamline and expedite the rail merger approval process, an essential step if railroads are to compete effectively for investment capital with other industries that enjoy much swifter reviews of their merger proposals.

ROBERT D. KREBS
CHAIRMAN AND CHIEF EXECUTIVE OFFICER

A native of Sacramento, California, Mr. Krebs began his career in the railroad industry when he joined the Southern Pacific Company in June of 1966 on special duty in the operating departments of Southern Pacific Transportation Company ("SPT") and the St. Louis Southwestern Railway Company, becoming Vice President-Operations of SPT in 1980; a Director of SPT in 1981; President of SPT and St. Louis Southwestern Railway Company in 1982; President and Chief Operating Officer of Santa Fe Southern Pacific Corporation ("SFSP") in 1983; President and Chief Executive Officer of SFSP in 1987; Chairman, President and Chief Executive Officer of SFSP on May 24, 1988; Chairman and Chief Executive Officer of The Atchison, Topeka and Santa Fe Railway Company ("ATSF") on June 1, 1989; and Chairman, President and Chief Executive Officer of ATSF on June 4, 1991.

On September 22, 1995, he was named President and Chief Executive Officer of Burlington Northern Santa Fe Corporation. On April 17, 1997, he was named Chairman, President and Chief Executive Officer of Burlington Northern Santa Fe Corporation. On June 1, 1999, he was named Chairman and Chief Executive Officer of Burlington Northern Santa Fe Corporation and Chairman and Chief Executive Officer of The Burlington Northern and Santa Fe Railway Company.

Mr. Krebs earned a Bachelor of Arts degree at Stanford University in 1964. He graduated with distinction and was elected to Phi Beta Kappa. He earned a Master of Business Administration at the Harvard Graduate School of Business in 1966.

VERIFICATION

I, Robert D. Krebs, verify under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this Verified Statement.

Executed on November 16, 2000.

Robert D. Krebs

BEFORE THE
SURFACE TRANSPORTATION BOARD

STB EX PARTE NO. 582 (Sub-No. 1)
PUBLIC VIEWS ON MAJOR RAIL CONSOLIDATIONS

VERIFIED STATEMENT OF

JOSÉ A. GÓMEZ-IBÁÑEZ
AND
JOSEPH P. KALT[1]

I. INTRODUCTION

The railroad industry is a vital part of the modern US economy, fulfilling a critical role in keeping the nation's logistics system efficient and competitive in today's global economy. Accordingly, the public has an important stake in ensuring that the industry is structured and regulated in ways that provide the benefits of a well-functioning rail sector. The restructuring of the rail sector and the framework of governmental oversight employed over the last twenty-five years have helped to bring the sector to the point where it is now clearly a strong contributor to, rather than an anachronistic drag on, the nation's business. Mergers and related ownership restructurings have played significant and, on net, positive roles in the industry's turnaround.

Given the stake that the public has in a healthy and efficient rail system, and given problems of service disruptions that have followed on the heels of some recent consolidations, it is appropriate that policymakers now address the questions of whether and how merger policy might be /improved. The current proposals of the Surface Transportation Board provide the opportunity to appropriately focus public discussion. The Board has solicited comments on the need for policy changes and received voluminous responses from

In addition, Gómez-Ibáñez has served as a consultant to governments and international lending agencies on infrastructure privatization and regulation. Joseph P. Kalt is the Ford Foundation Professor of International Political Economy at the John F. Kennedy School of Government at Harvard University in Cambridge, Massachusetts. At the Kennedy School, he has served as chair of the economics and quantitative methods cluster, faculty chair and Academic Dean for Research, chair of degree programs, and chair of the Ph.D. program. In addition, he works as a senior economist with Lexecon Inc. Attachment 1 provides information on the authors' professional and academic backgrounds.

railroads, shippers, and other interested parties. In our view, the resulting proposed rules constitute a mixed picture, holding promise for improving merger policy in key dimensions, but risking harm to the nation's economic health in others.

On the promising side, the Board's efforts to protect against merger-related service disruptions in its proposed rules are both well-timed and consistent with principles of sound public policy. Until the recent UP/SP merger, the railroad industry and its regulators arguably had underestimated the transitional problems that mergers could pose. The UP/SP experiences, followed by implementation difficulties attendant to the breakup of Conrail, have driven home the lesson that mergers, consolidations, and restructurings can adversely affect service not only on the merging carriers' systems, but on connecting carriers as well. Consequently, rail industry stakeholders nationwide—including the Board, the railroads, shippers, and the general public—have a vital interest in ensuring that such service disruptions do not recur. The present proceeding provides the Board with a valuable opportunity to make substantive improvements to its merger policy so as to minimize the prospects of future merger-related service disruptions.

On the dangerous side, the analysis of the competitive implications of mergers and consolidations in the proposed rules oversteps the traditional and appropriate role of merger review and opens unnecessarily a Pandora's box of political temptations and difficulties. In particular, we are troubled by the proposals to require (1) that a proposed merger not only protect, but enhance, competition, (2) that merging railroads demonstrate that the benefits they seek can not be achieved by any other means short of consolidation, (3) that merging parties analyze the effects of future consolidations that the merger in question might provoke, and (4) that they provide specific guarantees of the benefits that consolidation will provide.

As the Board notes, these features of its proposed new rules constitute a "paradigm shift" in merger policy. Stated bluntly, the Board appears to have concluded that future railroad mergers are unlikely to be in the public interest, and, based on this conclusion, the Board has proposed a set of rules that would do much to discourage future rail mergers. Indeed, it is notable that these proposed rules are not just more restrictive than the rules the Board has applied to railroads in the past, but are far more restrictive than the tests that anti-trust regulators generally apply to other industries.

While the Board's concern with service disruptions is warranted, we believe that the competition-related elements of the proposed rules will effectively act as an unnecessary and harmful "tax" on efficient merger transactions, raising risks and other costs faced by future merger applicants. The proposed requirement that mergers enhance competition is a clear example of this. The test commonly applied by the Board to prior railroad mergers (and by other regulators to their industries) has evolved into a standard of "do no harm to competition." Where there is a risk of reduced competition, Board precedent now clearly compels merger applicants to pre-condition their transaction with remedies if a consolidation is to have any chance of being approved by the Board. In practice, this is a strict test in that it does not admit to the possibility that even small reductions in competition might be tolerable if a merger's benefits (in improved railroad efficiency or service) were sufficiently large. Effectively, current policy holds that mergers are disallowed unless competition is protected, regardless of the other benefits that might be achieved. To now go further and require that a merger enhance competition would result in the discouragement and denial of mergers that do not harm competition and do provide other public benefits. Worse, the requirement to enhance competition is so open ended that it will empower intervenors to "hold up" merger applicants for concessions that are completely unrelated to the specific competitive or other concerns a merger raises. In short, it is an invitation to politicize the merger review process.

Indeed, we fear that some of the proposed rules have less to do with the evaluation of whether a proposed merger is in the public interest than with an effort to overturn the reforms to railroad regulation ushered in under the Staggers Act of 1980. The Staggers Act led to a dramatic revival of the railroad industry that benefits both railroads and shippers alike. After decades of minimal returns and decaying service, railroad profitability finally improved to the point where major new investments could be financed from private capital markets. Improvements in railroad efficiency made possible dramatic reductions in average railroad rates, enhanced service reliability, and a resurgence in railroad traffic. Mergers and consolidations were key tools the industry used to reduce costs and improve service in the Staggers era. Effective merger policies should not now be abandoned in misguided attempts to respond to shifting political winds. Merger policy should be improved where it has failed to adequately protect the ***public*** interest.

II. THE LOGIC OF CURRENT MERGER POLICY

II.A The Board's Current Merger Policy

In its current merger policy, as implemented in recent merger reviews, the Board has focused the bulk of its resources on addressing the protection of competition. In particular, the Board has required that merger applicants identify every case where a merger would cause a shipper to lose a meaningful competitive option and take steps to remedy that loss.

The Board's current merger policy is, in fact, more restrictive than seems to be required under the Staggers Act. The Staggers Act provides that the Board apply a "net public benefits" test. That is, the Board is to weigh the possible benefits of a merger against its potential costs, and to determine whether the public would be, on the whole, better off with the merger or not. The benefits might include reductions in railroad costs or improvements in railroad service, while the costs might include reduced competition and service disruptions during the transition. In practice, however, the merger review process devotes relatively little attention to merger benefits, in effect applying a test that a merger must impose little or no costs, regardless of its benefits. [2]

II.B The Focus on Protecting Competition

The Board's vigilant attention to protecting competition puts it in the "mainstream" of merger and antitrust policy as it is practiced in other industries. Mergers, like most business conduct in a private enterprise economy, are motivated by private gain to the decision-making parties. Such gain can result from all sorts of causes, many of which generate public benefits. Of course, one source of potential private gain not in the public interest arises if a merger might create or enhance the use of market power. For this reason, while our economic system properly gives wide berth to private incentives, merger policy, broadly applied, is properly concerned with protecting competition. This holds even in non-regulated industries, where the harm to competition and the risk of the exercise of market power is the primary focus of merger policy.[3]

---

[2] The Staggers Act calls for the Board to consider a number of factors, such as the effect on labor and the environment as part of the merger review process.

[3] See *Horizontal Merger Guidelines*, U.S. Department of Justice and the Federal Trade Commission, April 2, 1992 as amended April 8, 1997.

Economic analysis provides the tools for analyzing competition and the risk that a merger will enhance market power. Market power, either unilateral or in conjunction with other firms, is the ability to maintain prices above competitive levels. When firms that compete in a market merge, the merger reduces the number of competitors in that market. Depending on the facts and circumstances of the merger, this reduction in competitive rivalry between the merging parties may reduce competition and present a significant risk of competitive harm through the prospective use of market power. Factors such as concentration, entry, and ease of engaging in coordinated anticompetitive action need to be evaluated.

By focusing primarily on preventing harm to competition, traditional merger policy recognizes that it is important to establish appropriate boundaries between private and public decision making. The government has a legitimate role in ensuring that mergers do not harm the public, primarily through the loss of competition. But there is a concomitant need to ensure that regulatory policy does not kill off private incentives to seek efficient and high quality business strategies. Individual companies are in a much better position than the government to understand the intricacies of the industry and customer needs so as to efficiently organize business activities and capital investment.

In short, sound merger policy, as has been generally implemented across other industries, is properly focussed on ensuring specific public policy interests are preserved—such as the protection from the exercise of market power. To the extent these policy objectives are met, private companies are properly free to risk their capital and make their investments as they see fit. Failure to heed these principles is a recipe for counter-productive policies when it comes to serving the public interest.

II.C The Application of Merger Policy to Railroads

This standard approach of protecting competition has been applied to the railroad industry in a fairly straightforward way by the Surface Transportation Board in the past. The Board has examined proposed mergers on a case-by-case basis, using the tools of economic analysis to assess the risk of competitive harm. In many, many situations in the railroad industry, a merger poses no threat to competition because it does not even alter the number of railroads that particular shippers have access to at their particular shipping points. Moreover, even where a rail merger might reduce the number of rail alternatives, intermodal, geographic and source competition all can serve to limit the potential exercise of market power. Applying these tests to a particular proposed rail merger depends on the facts and circumstances of that merger and the specific markets in which the merging railroads are found to compete. The de facto standard that has emerged from recent merger cases is that the evidence presented to the Board must demonstrate that a merger will not reduce the number of independent rail options serving a shipper to less than two, regardless of the extent of alternative competitive options from other sources.[4] Where a merger would reduce the number of rail alternatives, for example, from three to two, additional factual inquiry appropriately ensues.

One difference between the railroads and most other industries, however, is that merger oversight is not the only protection against railroad market power. Unlike most of the U.S. economy, the rail industry is subject to economic regulation. This arises, in part, because some shippers are served by a single railroad. As a result of the economies of density, scale and scope in the rail industry, most rail shippers will not have (and never have had) a choice of numerous independent rail transportation alternatives. And while much rail traffic is subject to intense competition from trucks, barges or other sources, some shippers will have few if any competitive alternatives to the one railroad serving them. The existing regulatory structure incorporates this reality and provides protections to captive shippers through oversight and capping of rates, while at the same time providing the possibility (but

[4] The Board has applied the same standard to potential rail competition in the form of preserving build-in and build-out opportunities.

not the assurance) of railroads being able to earn a sufficient return to support the fixed and common costs of the rail infrastructure.

Over the years, the system of economic regulation has had to learn the importance of striking an appropriate balance between protecting captive shippers and railroad financial health. Railroads typically have fixed and network costs that are very high while their variable costs for moving any particular shipment are often very low. One of the chronic problems of the railroad industry is that services that are subject to intense intra- or intermodal competition seldom make any significant contributions to those high fixed or variable costs. If the railroad is to avoid bankruptcy, it must raise these contributions from those services where competition is not as intense. The Staggers Act of 1980 explicitly recognized this problem by granting the railroads the right to charge different shippers different prices but within specified limits. In doing so it both protected captive shippers (by capping their prices) and the railroads' viability (by allowing them rate flexibility).

The Staggers Act does not conflict with the traditional merger policy of protecting against competitive harm. Indeed, the Act supplements merger review by providing an additional layer of protection for shippers who have few competitive options. But the wisdom of the Staggers Act is that it recognizes the reality that competition is unlikely to be extremely intense on every service, and that if it ever were the railroad industry would be forced into financial decline or required to seek public subsidy. In other words, maintaining some modest market power and differential pricing, within strictly regulated limits, is in the long-term interests of shippers.

A second difference between the railroads and most other industries is that harm to competition is not the only major potential public cost of mergers. In particular, railroads connect with one another and exchange traffic, so that service disruptions caused by the merger of two carriers can affect other carriers in the industry. The merging carriers may not consider the costs of the disruptions caused on other parts of the rail network, so the Board has a legitimate role in protecting third parties from this harm. The Board has gradually strengthened its review of the risk of service disruptions from mergers, and the proposed rules are an additional step in this direction. In effect, the Board is adding "no harm through service disruption" to its traditional standard of "no harm through lost competition."

III. THE EFFECTS OF MERGERS ON THE RAILROAD INDUSTRY

The Board's mainstream approach to merger policy has served shippers, railroads, and the public well. While it is difficult to isolate precisely the share that mergers have contributed to the dramatic benefits of the past two decades of regulatory reform in the rail sector, there can be no doubt that mergers have played a significant role. Clearly, the nation's rail network would not be a better network if we had foregone the elimination of outmoded facilities, the end-to-end joining of previously balkanized systems into more seamless networks, and the additions of service and capital that mergers have permitted. Critics of rail mergers sometimes lament the declining number of Class 1 railroads, but it is not credible to maintain that railroads, shippers, or the U.S. economy would be better off if today's Class 1 railroads were split up into thirty separate systems, and the systems restored to their pre-merger configurations.

III.A Revitalization of the Rail Industry in the Staggers Era

The revitalization of the rail industry is one of the success stories of U.S. public policy over the last 25 years. Beginning with major regulatory reforms in the 1970s and culminating with the passage of the Staggers Act of 1980, the U.S. railroad industry has improved its performance substantially. Greater rate flexibility, deregulation of rates in certain markets, and opportunities for negotiated, tailored service offerings are among the factors that have brought railroads under the discipline of the marketplace. Regulatory reform has also allowed market forces to shape the ownership structure of railroad assets. Increased freedom to abandon low-density, unprofitable service and to consolidate rail systems in order to exploit network economies has contributed to improvements in the industry. The result has been a dramatic improvement in the nation's rail system. While there have been bumps in the road at times, these benefits have been shared both by the nation's railroads, who have improved their financial health, and by the nation's shippers, who have access to a railroad system that is more cost-effective, can provide quality service, and has shown rates that have trended clearly downward.

In response to opportunities provided by reformed regulation, the railroad industry has:

- Reduced average rates in nominal and real (inflation-adjusted) terms;

- Improved productivity of labor and capital;
- Increased capital expenditures on infrastructure; and
- Improved financial health for the railroads.

Some of these results are summarized in Figure 1. Nearly all measures available demonstrate that the improvements in the rail industry have benefited shippers, railroads, and the economy. As a result, this efficient rail system has become a key component in supporting the flow of goods and materials in an internationally competitive economy.

III.B The Role of Mergers in Industry Revitalization

Ownership restructurings have had an important role in the revitalization of the U.S. rail system. In the pre-Staggers era, the boundaries between rail systems were dictated more by history and politics than by the logic and incentives of the marketplace. The result was a rail network with boundaries between railroads that were largely economically arbitrary. The industry's declining physical condition was evidence that capital markets did not and would not invest in rail systems that could not realize efficiencies because of historically imposed structures and ownership patterns.

Many of the earliest mergers in the Staggers era involved railroads whose lines ran parallel to one another. The principal benefits from these parallel mergers were the elimination of lightly-used duplicative main lines and yards and improvements in traffic density. Later mergers have tended to be of railroads that meet end-to-end. The primary motive for end-to-end mergers has been to reduce the delays, unreliability, and transactions costs caused when traffic is handed from one railroad to another. The resulting increases in single-line service and longer hauls have not only increased speed and reliability of service for shippers, but also reduced railroad costs by improving the productivity of equipment and train crews. Research confirms that the post-Staggers mergers contributed substantially to increased efficiency in the rail sector—and to lower costs for shippers.[5]

While not disputing that past mergers have been beneficial, the Board asserts in its proposed rules that future mergers and other corporate restructurings are unlikely to produce

---

[5] Research shows that the mergers of the 1980s significantly reduced railroad costs; see, for example, Vellturo, Christopher, et al., "Deregulation, Mergers, and Cost Savings in Class I U.S. Railroads, 1974-1986," Journal of Economics and Management Strategy (Summer 1992), 339-369.

public benefits through further rationalization of rail networks.[6] In making this assertion, the Board overemphasizes the role that capacity reduction has played as a source of merger benefits and discounts the other ways mergers generate benefits, such as reducing operating costs and improving service quality. As an example of merger-related cost savings, BNSF's operating ratio declined from 84.4 in 1994 to 75.4 in 1999—a decline of over 10% and a savings of approximately $800 million in 1999.[7] Over the same time period, operating ratios for other Class 1 railroads *increased* almost 5%, from 82.5 to 86.5.[8]

The Board's current overemphasis on capacity reduction overlooks the public benefits that mergers generate by enabling railroads to improve the service they offer their shippers. In particular, recent end-to-end mergers have been targeted at enhancing efficiency and output through the extension of single-line service offerings. Indeed, railroads that have participated in major mergers in the 1990s have increased their average length of haul by 21% (UP, SP, and CNW) and 23% (BN and ATSF) from 1994 to 1999, compared to a 6% increase in average length of haul for other, non-merging railroads.[9]

Single-line service enhances efficiency by eliminating costs and uncertainty associated with making and managing interline movements. In addition, expansion of single-line service typically represents a dramatic improvement in the quality of service a railroad offers its shippers. As railroads expand their offerings of single-line service, they can increase the speed of their service, make service more reliable, reduce damage and loss, and reduce capital requirements by making more efficient use of rail (and shipper) facilities. In the past, the Board has recognized that single-line service is a major source of public (and shipper) benefits:

---

6 "[O]ur proposed revision to the rules would recognize that this process [of rationalizing the nation's rail system and eliminating excess capacity] has now largely been completed, and that the efficiencies and service improvements to be realized from further downsizing of rail route systems are limited." Surface Transportation Board Decision, STB Ex Parte No. 582 (Sub-No. 1), Major Rail Consolidation Procedures, Notice of Proposed Rulemaking , October 3, 2000, at 11.

7 *Quarterly Progress Report of the Burlington Northern and Santa Fe Railway Company*, Finance Docket No. 32760, January 18, 2000, at 80.

8 *Analysis of Class I Railroads*, American Association of Railroads, 1994-1999.

9 *Analysis of Class I Railroads*, 1993-1999.

> Single-line service is important to shipper logistics strategies. Interchange between railroads can be costly... As a result of the new single-line service capability of the combined BNSF/Santa Fe, shippers will likely see decreases in working capital requirements as base inventories shrink due to improved transit times, and as safety stocks of inventory are reduced because the combined system can eliminate the uncertainty of interchange. The transaction costs shippers incur in initial rate negotiations, in arranging equipment supply, tracking shipments, and in billing and payment procedures, will likely be reduced.[10]

The Board's view that extension of single-line service is an important source of benefit is confirmed by experience. Evidence reviewed below indicates that railroads have been notably successful in attracting substantial volumes of traffic to expanded single-line service options following merger. This demonstrates eloquently that shippers benefit from these services.

In sum, the available evidence does not suggest that the benefits from network integration have been exhausted. Figure 1 shows steady improvement in the performance of the industry through the mergers of the 1980s and the 1990s. Simple inspection of a map of the North American rail systems, moreover, shows that there are still opportunities to achieve integration of existing networks through end-to-end mergers. The most discussed opportunities, of course, are mergers that would form two transcontinental railroads in the United States.

III.C The Effects of Mergers on Competition

Critics of the post-Staggers merger policy argue that Staggers-era mergers have harmed shippers by significantly reducing the number of railroads. In particular, critics often cite the fact that the number of Class I railroads declined from approximately 30 in 1980 to fewer than 10 in 2000, largely as a result of mergers.[11] This statistic is extremely misleading and its use is demagogic.

---

[10] Decision No. 38 of the Interstate Commerce Commission, Burlington Northern and Santa Fe Pacific, August 16, 1995, Finance Docket No. 32549, at 65.

[11] The other main reason the number of Class I railroads declined was because the Federal Railroad Administration increased the minimum size a railroad had to be to be classified as Class I. Six railroads operating today as independent regionals or shortlines were classified as Class I railroads in 1980.

In the first place, the total number of railroads in the nation as a whole is not a measure of the number of railroads individual shippers have to choose from. Since long before the Staggers Act, the vast majority of rail shipping points have been served by only one, or at most two or three, railroads. Moreover, the number of railroads serving a particular point is a misleading measure of competition. It is with good reason that merger policy admonishes that simple measures of market structure—including counting firms and measuring the concentration of their shares via such devices as HHIs[12]—are but a "starting point" for assessing marketplace competitiveness.[13]

In the case of railroads, competition from other modes, especially trucks and barges, is often very significant. The nature and potency of competition also depends on competition from other geographic locations and products. A steam coal mine might be served by only one railroad, for example, but that railroad will be constrained in raising its rates by the fact that the delivered price of the mine's coal must be competitive with the delivered price of coal from other mines and with the costs of alternative energy sources such as oil, natural gas, or hydro power. Indeed, the Staggers Act greatly increased the potential for geographic and product competition by making it possible for railroads and their customers to sign confidential long-term contracts. Under such contracts, the railroads have strong incentives to agree to reasonable rates because otherwise shippers will invest over time in other places and/or lines of business.

The fact that average rail rates have continued to decline even though the frequency of direct railroad to railroad contact has been relatively low is consistent with potent competitive forces from such sources as other modes, geographic locations and products. Despite the fact that most shippers served directly by a railroad continue to be served by only one railroad, average rail rates continued to decline in real terms during the 1990s.

Finally, as railroads have consolidated, the Board (and its predecessor, the ICC) has been vigilant in protecting the rail options of shippers. In the context of merger policy, the Board has established a strong precedent to preserve options for a shipper who had access

---

[13] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, 1997, Section 2.0, "Overview."

to two rail options prior to a proposed merger. Indeed, merging parties no longer appear before the Board without first ensuring that their transaction preserves access to at least two rail options. There is no evidence that rail mergers have increased the number of solely-served shippers; the opposite is true. This bespeaks clear and forceful policy aimed at protecting competition and the public interest.

IV. APPROPRIATE PROTECTION AGAINST MERGER-RELATED SERVICE DISRUPTIONS

By their nature as networks, railroad systems are vulnerable to disruptions that can spread throughout the network. Vulnerability to these spillover effects was most dramatically demonstrated when disruption on the UP/SP system around Houston quickly backed up and disrupted the operations not only of other parts of UP but even completely separate systems. While a railroad has the clear economic incentive to prevent disruption of its own system, it can rationally ignore the effects of its disruption on *other* railroads' service, revenue, and profits. This implies an inefficiently weak effort to prevent disruption.

Of course, the foregoing does not mean that merging railroads will always under-protect against service disruption. Recent mergers, such as those between BN and the ATSF and the Canadian National/Illinois Central transaction, provide counterexamples that make it clear that the generalized disruption of the rail network is not an inevitable consequence of mergers. It is clear that the presence of service disruption is directly related to the method by which a merger is implemented.

In any case, as noted earlier, the Board has a legitimate role in protecting the public against merger-related service disruptions. In this respect, railroad mergers differ significantly from those in most other industries, where network externalities are not a significant factor. Further, the Board is correct in finding in this proceeding that its current policies are insufficient to protect against such disruptions, and to take the present opportunity to introduce policies that can provide necessary protection in the event of future mergers.

Such protection does not imply either a ban on mergers or the imposition of merger conditions that would discourage mergers by raising costs and risks to merging parties. Instead, we believe it is appropriate that the Board adopt mechanisms appropriately targeted

at addressing its concerns about prospective merger-caused service quality degradation. Such mechanisms would reasonably include:

- A financial plan, endorsed by an independent expert, that demonstrates that the merger applicants have the wherewithal to undertake both those investments that are foreseen as necessary to achieve the planned merger of the parties' rail systems, as well as those investments whose need is unforeseen but that might be necessitated by service disruptions that arise unexpectedly.
- A thorough operating plan, including contingencies for possible service disruptions, that enables the Board and potentially affected parties to identify the ways service on other rail systems might be adversely affected by the merger.
- Post-merger quality-of-service guarantees that compel the merging parties to internalize the costs to their own and other railroads' systems and customers in the event of disruption that can be clearly attributed to a merger.

V. PROTECTING COMPETITION VERSUS "ENHANCING" COMPETITION

In a dramatic break from its current policy the Board now proposes to require merger applicants not just to protect competition that would otherwise be lost as a result of the merger, but to *enhance* competition:

> Applicants are expected to propose measures to mitigate and offset merger harms. These conditions should not simply preserve, but also enhance, competition. (p. 31)

This proposal assumes that future mergers will harm competition in ways that cannot be anticipated, so that competition must be enhanced by other means to compensate. But the presumption of competitive harm seems unwarranted, and the proposed remedy is of doubtful practicality and opens the door for political pressures and interference.

V.A The Presumption Of Competitive Harm From Future Mergers Is Unjustified

Previous experience and the recent evolution of the railroad industry do not suggest that future mergers will reduce competition in ways that cannot be identified or mitigated. As noted earlier, past mergers do not appear to have reduced the competitive pressures on the railroads. Competition has been preserved in part because railroads are subject to many sources of competition that are usually not affected by mergers. Railroads compete intensely with trucks and barges for many commodities and shipments, for example, and this inter-

modal competition is not reduced by rail mergers. Railroads also face competition from other geographic areas and products, and the extent of geographic and product competition was greatly enhanced when the Staggers Act made it legal for shippers to sign long-term contracts with railroads.

The Board has also played an important role in preserving competition by insisting that merger applicants offer trackage rights or other remedies that insure that any shipper served by two or more railroads before the merger still has a choice of at least two railroads after. Substantial evidence over the past several years and mergers indicates that Board-imposed and/or privately negotiated trackage, haulage and other conditions to preserve competition have been effective. For example, the I-5 agreement in the UP-SP merger and the Shared Asset Areas in the Conrail Transaction have increased the number of shippers that have had access to two or more railroads. The pro-competitive outcomes from rail mergers have typically occurred as a result of private negotiations to rationalize the operation of the rail network rather than a regulatorily imposed transaction cost on the merging process. The UP/SP oversight process has demonstrated the general effectiveness of these conditions. The rights granted to BNSF in this transaction gave competitive rail options to many shippers on the UP and SP systems. BNSF attracted over 340,000 loaded units of traffic in 1999 on the routes to which it was granted rights as part of the UP/SP merger.[14]

Most recent railroad mergers involve railroads whose route networks connect end-to-end rather than running parallel to one another. Economic analysis indicates that end-to-end mergers are unlikely to cause competitive harm. Unlike parallel mergers, end-to-end mergers do not involve significant network overlaps, so that few or no shippers face a potential reduction in the number of railroads that serve them. Moreover, end-to-end mergers are the equivalent to vertically integrating the various routes served by railroads, and the overall impact of integrating and rationalizing the ownership of the rail network is pro-competitive through reduced costs and improved overall service. Indeed, the ability to reduce costs by making the most of economies of scale and scope and offering improved single-line service has motivated recent mergers.

---

[14] *Quarterly Progress Report of the Burlington Northern and Santa Fe Railway Company*, Finance Docket No. 32760, January 18, 2000.

The Board appears to recognize that future mergers are also likely to be end-to-end, and thus that threats to multiple rail access are likely to be less of an issue in the future than they have been in the past. The proposed BN-CN transaction that was withdrawn following the STB merger moratorium, for example, involved little network overlap and little loss of multiple rail access prior to the granting of conditions. And the most plausible remaining opportunities would involve end-to-end mergers to create transcontinental carriers.

Instead, the Board has identified potential reductions in geographic and product competition as a major concern and the primary reason why future merger applicants should be required to enhance competition. Geographic competition occurs when a product is available from many locations, so that transportation rates are constrained by the need to meet the delivered prices from elsewhere.[15] Similar forces work in the origin markets. Geographic competition is typically most effective in the case of relatively fungible commodities, such as grains, coal, or other raw materials that are available from a variety of sources and have numerous customer outlets.

It is puzzling why the Board appears to believe that potential reductions in geographic competition cannot be identified and mitigated in the same ways that potential reductions in multiple railroad access have been dealt with in the past. Potential losses in geographic competition have been raised in previous rail mergers, and the steps for assessing those losses are relatively straightforward. For the loss of geographic competition to be a significant issue in a merger proceeding, one needs to show that geographic competition was, prior to the merger, the constraining factor on the potential for the exercise of market power, and that the merger would eliminate such competition. Such a demonstration would involve identifying an economically relevant product and set of shipments for which intramodal, intermodal and product competition were ineffective competition, for which the merging railroads were competing in delivering those shipments to the same general locations, and for which the combination of the two rail carriers altered the process of geographic competition with the other carriers delivering the product so that there was a significant risk for the creation and use of market power.

[15] Product competition works in a similar manner via other similar products that satisfy customers' needs that serve to restrain delivered pricing.

Similarly, the steps to mitigate any threatened reduction in geographic competition seem equally straightforward. The merger applicants would be expected to offer trackage rights or similar remedies to preserve geographic competition, much as they have been expected to offer trackage rights to preserve shipper access to multiple railroads. And if the applicants did not volunteer a satisfactory remedy, the Board would be free to impose a remedy as a condition for the approval of the merger.

The Board's concerns are also hard to understand because future mergers are unlikely to pose serious threats to geographic competition. When the issue has been raised in previous rail mergers, the evidence has not supported a finding of competitive harm through the loss of geographic competition. Moreover, the factors that contribute to the loss of geographic competition are less likely to be in evidence in future mergers than they were in the past. Several of the major mergers in the 1990s, while predominantly end-to-end, at least involved railroads operating in the same broad geographic areas, such as the BN/SF, the UP/SP, and the Conrail transaction. In a proposed merger of one of the western and eastern railroads, for example, the railroads would not for the most part serve the same regions for most of the traffic. Thus, unlike the case of the western railroads that transported similar products (e.g. grain) that originated over the region for delivery to similar locations (e.g. the Gulf Coast ports), a merger between one of the western and one of the eastern railroads is likely to have greater differences in product and geographic overlap than in previous mergers.

Previous mergers have involved extensive evidentiary findings regarding the process of competition—inter-modal, intra-modal, and geographic—and the likely effect of the merger. Evidence and previous Board rulings indicate that most proposed mergers have not presented significant risks of competitive harm, once competition-preserving conditions have been granted. The Board has successfully obtained and evaluated evidence on the prospective competitive harm that a merger could pose. The Board's ability to obtain similar evidence and perform similar analyses are unaffected by previous rail consolidation. There is no reason that the Board will be unable to make similar evaluations in the future.

V.B "Enhanced" Competition and Rent-Seeking

The requirement to "enhance" competition—through whatever means the Board decides would meet its new standard—would undoubtedly encourage rent-seeking by intervenors. The Board proposes no clear standard for how and how much competition must

be enhanced. This vagueness stands in sharp contrast to the clear and traditional merger standard of identifying and protecting against specific likely harms to competition. This vagueness creates uncertainty and will encourage intervention and rent-seeking by all comers who could benefit from a regulatorily imposed condition as part of a merger. Any and all shippers, regardless of the merit of their position, will have the incentive to seek conditions that grant them more than they currently have.

Rent-seeking occurs when there are benefits being bestowed whose value exceeds their price. In the situation established by the proposed rule, the Board would bestow access to enhanced competitive conditions on shippers that are otherwise not harmed by the merger. These conditions could, for example through the introduction of trackage rights, provide a shipper that possessed ample competitive options with access to new single-line service on a non-merging railroad. To the extent that the conditions being offered or imposed have value to shippers, shippers will have the incentive to negotiate directly with the railroad, intervene in the proceeding, and/or appeal to the Board to impose conditions. Every shipper will have the incentive to seek as much of the available "rent" for itself as possible.

Administrative rent-seeking wastes society's resources. The need to "buy off" intervenors will likely result in expensive and inefficient outcomes that dissipate benefits from further vertical integration in the rail industry. These "payments," expressed in terms of "enhanced competition conditions" or other concessions to shippers, are likely to be expensive to the railroad. In the absence of a clear standard, it will be difficult to limit or constrain the requests for favors and difficult to prevent arbitrary outcomes based on the success of shippers' bargaining. While the railroads have the incentive to meet the enhanced competition rule in as efficient a method as possible, the dispensation of favors is likely to reflect the perceived effectiveness of different shippers in proceedings before the Board. Indeed, in this type of negotiated process with no clear standard, the railroad may need to make private concessions to shippers that have nothing to do with enhancing competition. Instead they will represent a bribe to prevent further intervention and delay in the rail proceeding.

While the free-for-all between shippers and merging railroads to dispense favors is wasteful, inserting the Board deeply into the process is likely to make it worse. Unlike the railroad negotiating with its customers, the Board generally will lack the information (e.g., knowledge of traffic patterns) to establish sets of conditions that have value to the shipper

and can be provided efficiently. The problem of rent-seeking will be exacerbated by shippers seeking relief before the Board and the Board needing to decide which shippers will get what kind of benefit from "enhanced competition" and in what form this condition will occur. To the extent the Board imposes enhanced competition as a merger standard, these imposed conditions are likely to be more unwieldy, arbitrary, and inefficient than arrangements reached through private two-party negotiation.

V.C Problems of Implementation

While the Board calls for enhanced competition, it does not specify what that means beyond providing a list of alternatives. At the very least, the Board seems to want to expand the trackage, haulage, third-party access, and other forms of organization that have occasionally been introduced in previous mergers. In the future, however, these measures would not be limited to situations where they were needed to mitigate potential competitive harm due to the loss of a rail competitor. Instead, they would be applied more widely.

The widespread introduction of trackage rights and similar measures would transform the rail industry by essentially dividing train operations and infrastructure maintenance into separate companies. The typical railroad might still both operate trains and maintain track, signals, way, yards and other infrastructure. Increasingly, however, the trains it operated would run on other railroads' tracks while the tracks it maintained would be used by other railroads' trains.

While trackage rights and similar measures have been effective when used selectively to mitigate specific competitive harms, their generalized application would pose serious difficulties. All forms of access—whether trackage, haulage, joint access areas, or mandated access—require the resolution of complex coordination problems between the railroad granting the access and the railroad using it. Although successful, the BNSF/UPSP agreement, for example, has been the subject of ongoing dispute and review by the Board regarding operations and infrastructure investment.[16] The service problems in the East following the Conrail transaction have, at least in part, resulted from the difficulty of solving

[16] For examples, see STB Finance Docket 32760 Decision No. 61 (November 19, 1996); Decision No. 81 (September 30, 1998); Decision No. 86 (July 9, 1999); and Decision No. 89 (May 31, 2000).

the coordination problem in the shared areas.[17] Indeed, the history of disputes over shared assets goes back to the earliest days of the rail industry.[18] These agreements permit the sharing of expensive network resources, but also involve disputes, inefficiencies and, sometimes, third-party intervention by the Board to resolve disputes over coordination issues such as the need to share tight capacity.

The coordination problems introduced by separating train operations from infrastructure are similar to those that occur when two railroads interline traffic. Indeed, as we have noted, a primary driver of recent mergers in the railroad industry has been the need to solve the coordination problems of interlining so as to improve service to customers.[19] The problem of interchanges is one of coordination: how are priorities met?; what investment needs to be made?; which train gets priority to scarce yard capacity? When infrastructure capacity is slack, the problem of prioritizing activities is less difficult. When capacity is tighter and more valuable, the problem of coordinating access to that capacity in a shared environment becomes more difficult. The integrated firm can make these decisions internally with a common incentive to maximize profits through meeting customers' demands. When assets are shared and incentives are misaligned, negotiations must take place and agreement is not assured.

There are strong reasons for believing that the coordination problems created by mandated access or other arm's-length approaches to "enhancing" competition are more serious in railroads than in other network industries such as electricity, natural gas, and telecommunications. Unlike electricity and natural gas, for example, rail freight service is not fungible—freight must travel between a particular origin and destination, and the terms of service, cost, speed and provision of reliability vary among shippers and products.[20]

[18] See, e.g., Atchison, Topeka & Santa Fe Ry. Co.—Operating Agreement, 331 I.C.C. 367 (1967); Atchison, Topeka & Santa Fe Ry. Co.—Operating Agreement, 8 I.C.C.2d 297 (1992).

[19] See the discussion in section VI regarding the success of the arm's-length negotiated Avard agreement compared to a vertically-integrated merged railroad as an example.

[20] José A. Gómez-Ibáñez, "Regulating Coordination: The Promise and Problems of Vertically Unbundling Private Infrastructure," Discussion Paper, John F. Kennedy School of Government, Harvard University, December 1999.

Excess (and often relatively low cost) capacity reduce the problems of coordination in telecomm systems. On the other hand, the interdependence of different geographic portions of congested rail networks and between operations and necessary investments in track, signaling, and other infrastructure facilities are significant. Similarly, the fixed and sunk costs of the common infrastructure are high relative to the value of the service provided and require returns over very long lifetimes. Each of these factors raises the bar to cooperative, negotiated outcomes. The incentive to share expensive, congestible infrastructure capital and improve service is high; the fact that railroads have had difficulty doing this effectively demonstrates the difficulty of achieving these gains through arm's-length negotiations.

The experiences of the few countries that have attempted to enhance competition by effectively de-merging portions of the rail sector (e.g., through mandated access) confirm the difficulties of across-firm coordination. The case of mandated access on the rail network in Great Britain, for example, has been well-studied and is illustrative.[21] The problems of negotiating shared access to the infrastructure as it reaches capacity limits and, especially, investments to expand capacity and improve infrastructure have been large. Negotiations frequently are three-way—two private parties and the rail Regulator. While simple and obviously valuable projects do get approved and implemented, high transaction and negotiation costs and delay discourage many worthwhile projects that would otherwise be undertaken by a vertically integrated railroad.

Experience in the U.S. and abroad confirms the significant risks that a policy of extensive and imposed "enhanced" competition brings. Focussed and small scale arrangements that enhance competition where the interests of the parties sharing access are similar can be effective. The broader and more intrusive these conditions become, and the more they are imposed by third-parties, the greater the coordination costs become. Indeed, these types of arrangements can ultimately become a bar to efficient investment and service, when incentives diverge.

---

[21] See the discussion in Section IV of Gómez-Ibáñez, "Regulating Coordination: The Promise and Problems of Vertically Unbundling Private Infrastructure," Discussion Paper, John F. Kennedy School of Government, Harvard University, December 1999.

V.D Competition "Enhancement" and the Regulatory Paradigm

The requirement of enhanced competition, in whatever form, also threatens to undo, in the context of merger policy, the underlying structure of post-Staggers rate regulation. Thus, the Board's proposed rule represents a "paradigm shift" not only in merger policy, but in the fundamental principles of rail regulation as it is practiced in the Staggers era. Such a comprehensive change should not be introduced without careful consideration of all of its effects.

Existing regulatory policy recognizes that the rail industry is a network industry with high fixed costs that serves different shippers with different competitive alternatives. Differential pricing, in which railroads can charge some shippers more than other shippers that may have better competitive options, subject to regulatory protections on the higher rates, provides the mechanism by which railroads have the possibility of obtaining a return on capital adequate to support past and future investments. This policy, for the most part, has worked well for both railroads and shippers. In the absence of differential pricing, there is no source for revenue to maintain the shared costs of the rail network.

The imposition of enhanced competition as a condition of merger will hamper the railroads' ability to engage in differential pricing and reduce their revenue in a manner unrelated to cost reductions the merger might bring. In effect the requirement to enhance competition is a tax on the merging parties. This tax would not only discourage mergers that would be in the public interest, but also exacerbate the problem of providing a sufficient return to railroad investment. Without an adequate return the railroads will be unable to attract capital for maintenance of the existing networks and for future infrastructure expansion.

The imposition of its proposed competition enhancement standard may have other impacts that the Board either has not foreseen or has not sufficiently considered. Such dramatic policy changes require a level of analysis and debate far more comprehensive than the current proceeding—focused on *merger* policy—has provided.

VI. NON-MERGER ALTERNATIVES

The Board proposes to introduce a new standard for the quantification of the net benefits of a proposed merger. In quantifying net public benefits of the proposed

transaction, the Board would apparently include only those benefits that can be shown affirmatively to be unachievable by non-merger alternatives:

> [T]he Board will also consider whether the benefits claimed by applicants could be realized by means other than the proposed consolidation. The Board believes that other private sector initiatives, such as joint marketing agreements and interline partnerships, can produce many of the efficiencies of a merger while risking less potential harm to the public. (p. 44)

Implementation of this new net benefits standard would substitute the regulator's judgment, mediated through contentious litigation, for the demonstrated judgment of the market players who put their capital at risk when deciding on the efficiency of merger and non-merger coordination transactions.

It would be irrational for two railroads to propose an end-to-end merger unless they believed that the merger would generate cost savings and service improvements that they could not gain by other means. The cost, delay, and uncertainty of the merger process give railroads strong incentives to seek their ends by other means. The fact that railroads continue to pursue end-to-end mergers is thus strong evidence that mergers can provide benefits that are unavailable via other types of transactions. Railroads' preference in many cases to achieve integration through merger rather than alternative contractual arrangements is driven by the underlying economics of the rail industry. In order to move traffic from origin to destination while meeting the service needs of shippers, railroads must solve a technical coordination problem. Railroads allocate resources and coordinate decision-making regarding scheduling, routing, allocating locomotives, prioritizing car switching, moving trains through congested yards, etc. These decisions interact in ways that can affect numerous portions of a railroad's operations and the shippers who use that system. As a result, railroads establish complex operations, procedures, and protocols that attempt to balance the needs of all of their shippers, and rail managers are constantly deciding in real time which trains should have priority and what actions to take when unplanned contingencies occur.

We can imagine a hypothetical rail network in which each successive mile of track is owned by a different railroad. In such a situation, the types of decisions described above would need to be coordinated through negotiations or complex contracts involving multiple parties that set out as many foreseeable contingencies as possible, perhaps simplifying or ignoring certain economic interactions. Since there are significant costs associated with

writing complex contracts or engaging in ongoing negotiations, we do not see the foregoing ownership structure in railroading. Rather, we observe integrated railroads with significant geographic scope to their ownership and operations. The extent of a railroad's system provides the reach over which key capital and operating decisions can be resolved more efficiently and at a lower cost by managerial discretion rather than through the use of contracts or other coordination mechanisms between separately owned firms. Operations within a single firm allow management to coordinate operations and to align operational and marketing priorities. When it is recognized that the use of arm's-length mechanisms is hardly costless and efficient in the face of the challenges of running a network, making judgment calls about these priorities is properly placed inside firms, not out on the market between firms.[22]

Contractual relationships often require parties to bear large transaction costs, particularly when agreements must be closely monitored to ensure compliance. Real world negotiations include a high level of uncertainty and differences in expectation about both the current state of the world (e.g., the ability of coordinated service to attract new business immediately) and the future (e.g., how the agreement will evolve). This makes it difficult to reach, monitor, and enforce mutually beneficial marketplace agreements.[23] When parties have different information, different expectations, and different alternative opportunities, they will also tend to value the benefits of a relationship differently. For example, railroads may have differing infrastructure capacities, equipment needs, costs of providing service, and/or marketing priorities. It can be difficult and costly for parties to reach and implement an agreement when they cannot even agree on the benefits that they will share.

Even when firms can agree on the benefits, they tend to have their own financial interests and priorities. Under such circumstances, writing sufficiently complex contracts to incorporate the myriad details and contingencies needed for successful integration is quite difficult. Since many of the benefits are shared over the network as a whole, independent firms must properly concern themselves with how those benefits will be divided between them. As a result, firms behave reasonably and tend to protect their individual interests,

---

[22] This is the Coasian explanation for the existence of firms. See Coase, R.H., "The Nature of the Firm," *Economica*, November 1937, at 386-405.

[23] Williamson, O. E., ***Markets and Hierarchies: Analysis and Antitrust Implications, A Study in the Economics of Internal Organization***, 1975, at 234-247.

insisting on their individual priorities and strategies. This can make full coordination infeasible. Customers' needs go unserved and "money is left on the table"—i.e., business that could be gained through more efficiently organized and coordinated operations. Capturing such business provides the lure to mergers that improve network coordination by bringing the problems and incentives under the control of single ownership.

The problem of inducing mutually beneficial arm's-length arrangements is doubly hard when durable capital needs to be sunk and shared to realize the benefits of economic success.[24] Issues related to how to apportion capital expenditures across parties are especially difficult when the benefits that accrue from such an investment will be distributed across the network. Indeed, basic economic reasoning indicates that there may exist no equilibrium set of arm's-length contractual relationships by which to decide efficiently who should pay what share of costs and who should receive what share of revenues under conditions in which network assets are jointly used by independent parties.[25] Moreover, it is often infeasible for contract duration to be as long as the useful life of investments in an industry with such long-lived, sunk capital as railroading. These factors act to limit independent firms' willingness to commit necessary capital to investments that an integrated firm would readily undertake. Under such circumstances, customers' needs can go under-served and, to capitalize on the business opportunities this creates, efficient marketplace forces push companies to bring operations that need to be coordinated over the use of long-lived, sunk capital under the roof of one firm.

Therefore, combinations are driven by the desire and need of the industry to invest in infrastructure and capacity. Therein lie the pressures that have been driving railroads to rationalize previously balkanized ownership boundaries by building and consolidating integrated rail networks in the post-Staggers era. Second guessing these pressures by opening up proposed mergers to intervention by third parties able to garner private benefits from merger approval proceedings is poor policy.

These implications from economics are supported by recent railroad industry experience. The consolidation of the Burlington Northern (BN) and the Atchison, Topeka & Santa Fe (Santa Fe) provides a clear "natural experiment" by which to compare inter-railroad contractual coordination as a substitute for merger. In the early 1990s, several years before their merger, BN and Santa Fe instituted a cooperative marketing agreement to move intermodal traffic over Avard, Oklahoma, via a haulage agreement. The railroads were particularly interested in high priority intermodal service between the West Coast, served by Santa Fe, and the Southeast, served by BN to Memphis and beyond. Because of differing management priorities, however, the agreement did not work as effectively as might have been hoped. The issue that impeded the cooperative effort was primarily that operating departments could not coordinate sufficiently to get one intermodal train in each direction to run consistently on time. Without a high degree of reliability, the service was not attractive to the high priority customers that it was targeting.

In 1995, BN and Santa Fe consummated their merger, and operating decisions have since been coordinated within a single firm, rather than through contractual relationship. Tellingly, since the merger, intermodal traffic has increased sharply. As shown in Figure 2, and notwithstanding strong pre-merger incentives and concerted effort to find non-merger mechanisms for capturing new business available through coordination, these increases have been seen at multiple points in the BNSF nexus. Traffic through Memphis, for example, has increased by 68%. As a point of comparison, intermodal traffic for the US as a whole increased 14% from 1995 to 1999. The results realized post-merger by BNSF dwarf this figure. This is true not only for the Memphis traffic, but holds in such areas as Texas to California (up 56%), Chicago to California (up 49%), Chicago to the Pacific Northwest (up 40%), and between Minnesota and California, Arizona, and New Mexico (up 170%). This burst in performance is clearly merger-related: Prior to their merger, BNSF had no incentive to ignore this business if there had been viable non-merger alternatives for chasing it.

BNSF's post-merger success in increasing its movements of Midwestern agricultural products provides further evidence that coordinating operations within a single firm can enable railroads to improve service and attract customers. Prior to the merger, Santa Fe had very few corn origins and transported relatively small amounts of corn to the livestock destinations it served. By combining BN's corn origins with Santa Fe's livestock destinations, the merger has enabled BNSF to increase its share of corn delivery to these

destinations. For example, pre-merger Santa Fe transported less than 20% of the corn delivered to feedlots in the Texas Panhandle. After the merger, BNSF was able to attract the construction of two high capacity unloading facilities in the Hereford, Texas area, and BNSF now transports 50% of the corn delivered to Texas Panhandle feedlots. BNSF has had similar success in shipping corn from the Midwest to dairy, poultry, and feedlot facilities in California. The former Santa Fe transported only 10% of the corn delivered to these markets. After the merger, BNSF was able to attract the construction of four high capacity unloading facilities in the central California area and BNSF now transports 40% of the corn delivered to these markets.

VII. CUMULATIVE IMPACTS AND CROSSOVER EFFECTS

The Board proposes to require that merger applicants predict whether their merger will provoke other mergers in the future and then analyze the "cumulative impacts and crossover effects" of their proposed merger and the subsequent mergers they think most likely. This requirement stems from a fear that otherwise the Board will be reviewing individual mergers in isolation, without any understanding of their subsequent or wider implications. While the Board's concern is perhaps understandable, the proposed remedy is flawed and the concern seems exaggerated or misplaced.

The Board's proposal is flawed in so far as it is extremely difficult to predict the future configuration of the railroad industry with much accuracy. As noted earlier, the industry's incentives continue to push it toward efficient rationalization of ownership boundaries through end-to-end consolidation. However, statements about which companies will merge with others and when, if ever, in response to those incentives are necessarily highly speculative. The few economic analyses that have sought to predict mergers among firms are plagued by thorny methodological issues and generate results that relate acquisition likelihood to general firm characteristics (such as to firm size and R&D intensity), rather than providing the predictions of specific merger pairs that the Board appears to be seeking.[26] Moreover, the record of past accurate predictions is relatively poor. Figure 3 delineates the tumultuous events that resulted in the Conrail transaction. Figure 4 shows that the path to merger for Burlington Northern and Santa Fe was similarly tortuous. A review of the contemporaneous trade press shows that the course of events surrounding these highly

[26] See, for example, "Estimation of the Probability of Acquisition in an Equilibrium Setting" by Hall, Bronwyn H., University of California at Berkeley Working Paper in Economics: 8887, August 1988.

contested mergers was generally unforeseen. Thus, there is a real danger that applicants and the Board will waste time analyzing combinations that may never come to pass and still end up being surprised by actual events.

Equally important, the fear that a merger can not be assessed unless all of its future implications are known seems exaggerated. The concern seems to be that the Board's approval of one merger might compel other railroads to merge defensively, and that the cumulative effects of all these mergers might not be in the public interest. But why would other railroads be forced into defensive mergers? It could not be because the merged railroad had gained more market power over "captive shippers" since the current Board policy requires that the options of shippers not be reduced by the merger; and a merger that somehow enhanced market power would improve the lot of other railroads who are thereby made more attractive to customers. If one consolidation triggers a "defensive" merger by other parties it will be because the merged railroad has gained some service or cost advantage over other railroads by virtue of its merger—i.e., the merged entity is more efficient and better able to meet customers' needs. And if that is the motive that is compelling the defensive mergers, then the defensive mergers must logically be in the public interest too.

In this context, there is no sound economic reason to believe that the case-by-case approach that the Board (and the regulators of other industries) has traditionally followed is inappropriate. As long as the Board continues to approve only mergers that protect competition and prevent service disruptions, mergers which occur will enhance efficiency and performance. The pressure this may put on other railroads is precisely the result policy should seek. There is no reason to think that the Board will be "forced" by the results of a current merger to approve future mergers that are not in the public interest.

Indeed, the proposed requirement to consider cumulative and crossover effects could well be expected to have the undesirable effect of increasing the political pressures on the Board to step in and manage the structure and timing of railroad consolidations. The temptations for the Board to try to manage the industry structure are strong—its predecessor, the ICC, attempted to do so many times, most notably with its consolidation plans in the 1920s and 1970s. But pre-planning of the industry structure oversteps the regulator's proper role of protecting competition. Moreover, such planning is bound to increase the number of intervenors in merger cases and intensify the political pressures on the Board simply

because this type of planning necessarily creates winners and losers. The Board is unlikely to be able to second-guess the industry as to which combinations are likely to offer the greatest gains in efficiency and service quality. Worse, faced with so many pressures, the process will be pushed to abandon difficult and careful analysis and instead fashion a plan that simply attempts to compromise or balance all the claims and issues raised by the many parties. The historical experience of the rail industry under the previous regulatory regime shows the deleterious effects of the political system's involvement in the micro-management of business decisions and industry structure.

In short, even if it were possible to predict future mergers with accuracy, it would be inappropriate to use such predictions to block a proposed merger. Each application should be judged on its own merits, according to the principles of sound merger policy. The "looming possibility" of subsequent merger applications is no reason to prevent a proposed combination that meets traditional merger policy criteria. And proposed mergers should not be impeded by a proposal that imposes substantial new burdens on applicants, elevates speculation to the role of evidence, and opens a Pandora's box of political pressures and temptations while adding nothing of value to the merger review process. The goals of sound merger policy would be better served by a more limited measure that would require a merger applicant to consider the effect of any concurrent merger application. While burdensome, such a requirement would be consistent with a desire to analyze predictable (as opposed to unpredictable) competitive effects.

VIII. BENEFIT GUARANTEES

The Board proposes that future merger applications should include mechanisms to guarantee the achievement of forecast public benefits:

> [A]pplicants must suggest additional measures that the Board might take if the anticipated public benefits identified by applicants fail to materialize in a timely manner. (p. 32)

This rule appears to be designed to offset any incentives that merger applicants might have to overstate merger benefits. The rule would hold the applicants' feet to the fire by punishing railroads that failed to achieve the benefits they projected in their application. The Board does not discuss specific mechanisms that might be used for this purpose.

The Board's presumption that applicants have incentives to overstate merger benefits is plausible. The Board currently does not apply sanctions if projected benefits do not materialize, so there is little reason for applicants not to present benefits optimistically. Nevertheless, the Board's remedy appears both unnecessary and impractical. It is unnecessary from a public policy perspective as long as the Board continues its current policy of approving mergers only when it is convinced that the merger will cause no competitive or other harms. If a merger causes no harm, then it will still be in the public interest no matter how small the benefits ultimately prove to be. This is why mainstream merger policy as practiced in other industries—and as reflected in the Board's current policy—presumes that regulators need not overly concern themselves with merger benefits.

Moreover, mergers are properly seen as promising significant benefits because it would be irrational for applicants to propose one that did not. As explained above, mergers impose substantial risks and costs on the applicants and would not rationally be proposed unless they promised efficiency and service gains that could not be achieved by other means. Thus, even if we assume that applicants present benefits optimistically, they also have powerful incentives to invest in only those prospective mergers that they expect will produce substantial benefits.

Additionally, railroads have clear and powerful incentives to try to realize the benefits they expect once the merger is approved. The estimated public benefits—such as cost savings and better service (leading to increased volumes and revenues)—are also the main source of private benefits to the shareholders. If the public benefits fail to materialize, shareholders suffer directly and immediately through lower profits and falling stock prices. As a result, railroads have strong internal incentives to implement a merger skillfully so that the benefits they had hoped for actually materialize.

Finally, there are serious practical problems with implementing a rule to guarantee the achievement of estimated benefits. Such a rule presumably would be designed to punish merging parties only for those after-the-fact benefit shortfalls that resulted from the applicants' before-the-fact exaggerations. The estimated public benefits of a merger are inevitably based on forecasts of many uncertain variables, however, such as the rates of growth of the economy, of specific regions and industries, and of freight shipments along particular corridors. Actual benefits may diverge from projected because of events that are unexpected and completely outside the control of the merger applicants. Everything from

changes in the overall economy or the weather could result in forecasts being inaccurate—in either direction—after the fact. Drawing an analytically and procedurally robust line between shortfalls that result from supposed exaggeration and other shortfalls (or overruns, for that matter) would be problematic, procedurally expensive, and politicized, to say the least. This is not consistent with sound regulatory approaches to ensuring serving the public's interest.

Attachment 1

José A. Gómez-Ibáñez

José A. Gómez-Ibáñez is the Derek C. Bok Professor of Public Policy and Urban Planning at Harvard University, where he holds a joint appointment at the John F. Kennedy School of Government and the Graduate School of Design. He teaches courses in economics, policy analysis, infrastructure and transportation policy in both schools.

Professor Gómez-Ibáñez has published numerous articles on transportation policy and regulation and is co-author of several books including *Essays in Transportation Economics and Policy: A Handbook in Honor of John R. Meyer* (with William Tye and Clifford Winston; Brookings, 1999); *Going Private: The International Experience with Transport Privatization* (with John R. Meyer; Brookings, 1993); *Regulation for Revenue: The Political Economy of Land Use Exactions* (with Alan Altshuler; Brookings, 1993); *Autos, Transit and Cities* (with John R. Meyer; Harvard, 1981); and *Cases in Microeconomics* (with Joseph Kalt; Prentice-Hall, 1990).

At the University, Gómez-Ibáñez currently serves as the faculty chair of the Masters in Urban Planning Program at the Design School and the faculty co-chair (with Henry Lee) of the Infrastructure in a Market Economy executive program at the Kennedy School. In the past he has served as the chairman of the Masters in Public Policy program at the Kennedy School, and as Chair of the Department of Urban Planning and Design and of doctoral programs at the Graduate School of Design.

In addition, Professor Gómez-Ibáñez has served as a consultant and advisor on transportation policy and regulation issues to government agencies both here and abroad. He served as senior staff economist to the President's Council of Economic Advisors (1980-81), where he was responsible for regulation, transportation and environmental issues. He has chaired the Mayor's Transportation Advisory Committee in Boston (1985-86) and has been consultant to the governments of Singapore, Indonesia, Guatemala, Bolivia, Chile, Argentina, Spain and other countries. He is a member of the American Economic Association, the American Planning Association, and the Transportation Research Forum.

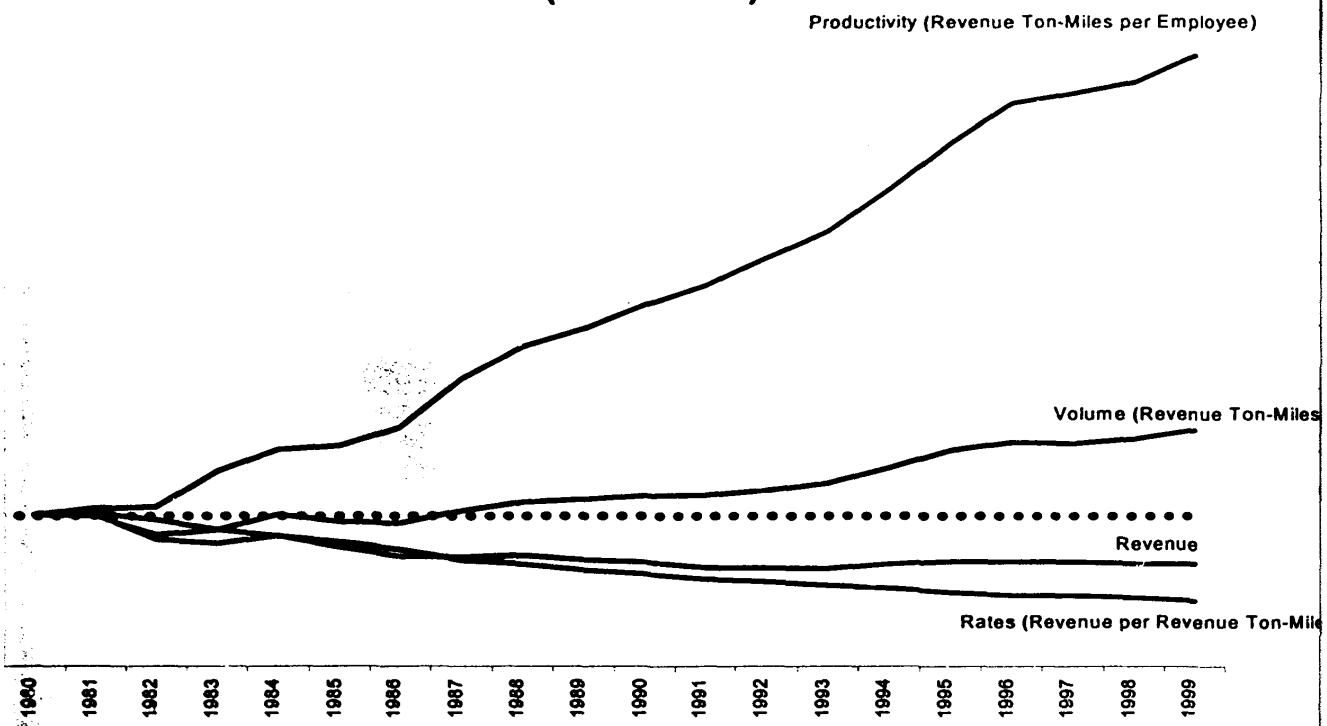
Joseph P. Kalt

Joseph P. Kalt is the Ford Foundation Professor of International Political Economy and chair of the Economics and Quantitative Methods Cluster at the John F. Kennedy School of Government at Harvard University. Professor Kalt is a specialist in the economics of antitrust and regulation, with particular emphasis on the natural resource and transportation sectors. His publications in the area include: *The Economics and Politics of Oil Price Regulation*; *Drawing the Line on Natural Gas Regulation* (with Frank C. Schuler); *Petroleum Price Regulation: Should We Decontrol?* (with Kenneth Arrow); and *New Horizons in Natural Gas Deregulation* (with Jerome Ellig). Professor Kalt has testified frequently before the U.S. Congress, federal and state regulatory commissions, and in state and federal legal proceedings on matters of competition policy, mergers, and industry regulation.



Professor Kalt is also co-director with Stephen Cornell and Manley Begay of The Harvard Project on American Indian Economic Development and the National Executive Education Program for Native American Leadership. In addition, he is the co-editor with Stephen Cornell of *What Can Tribes Do? Strategies and Institutions in American Indian Economic Development.* Since 1987, the Harvard Project has worked for and with tribes and tribal organizations, providing research, advisory services, and education on issues of nation-building in Indian Country.

Professor Kalt has served as the Kennedy School's Academic Dean for Research, chair of degree programs, and chair of Ph.D. programs. He is also a member of the Board of Trustees of the Fort Apache Heritage Foundation of the White Mountain Apache Tribe (Arizona), the Board of Trustees of the Foundation for American Communications, and the Faculty Advisory Board of the Harvard University Native American Program. He served as advisor to the Royal Commission on Aboriginal Peoples, a commissioner on the President's Commission on Aviation Safety, and on the Steering Committee of the National Park Service's *National Parks for the 21st Century.*

BEFORE THE SURFACE TRANSPORTATION BOARD

EX PARTE 582 (SUB-NO. 1)

MAJOR RAIL CONSOLIDATION PROCEDURES

VERIFIED STATEMENT OF RICHARD J. PIERCE, JR.

My name is Richard J. Pierce, Jr. I am the Lyle T. Alverson Research Professor of Law at George Washington University, 720 20th Street, N.W., Washington, D.C. 20052. I have been asked by The Burlington Northern and Santa Fe Railway Company (BNSF) to provide my opinions on the new rail merger policy the Surface Transportation Board (STB or Board) proposed in Ex Parte No. 582 (Sub-No. 1). I will begin by describing my background and experience relevant to that task. I then will summarize the history of economic regulation, deregulation, and regulatory reform in the U.S. over the last three decades. I will follow that with a description of the merger policies currently implemented by other agencies, with emphasis on the current policy of the Federal Energy Regulatory Commission (FERC), an agency that, like the STB, applies a public interest standard, rather than pure antitrust review. After that, I will identify the characteristics of the STB's proposed policy that I believe to be inappropriate, counterproductive, and a major step backward from the regulatory reform efforts that have produced outstanding results in numerous markets, including the rail market, over the past 30 years.

I conclude that any final rules adopted by the STB should: (i) result in timely review of mergers; (ii) eliminate the presumption that future rail mergers will not produce efficiencies; and

(iii) eliminate the presumptions that future rail mergers will produce competitive harms and service disruptions. The STB should not require merger applicants to propose "competitive enhancements" to offset presumed harms, and the scope of post-merger review should be limited to the efficacy of competitive conditions adopted in the merger and the temporary remedy of any merger-related service disruptions.

BACKGROUND AND EXPERIENCE

I have been a law professor for 23 years. The courses I regularly teach include Regulated Industries, Antitrust Law, and Administrative Law. My research and scholarly writings correspond with the subjects I teach. I have written a dozen books and over 80 articles. I have attached a copy of my resume, including a list of my publications, as Appendix A to this report. My central interest in teaching, research, and writing is the effects of various forms of government intervention – including economic regulation and antitrust law – on the performance of markets. My writings have been relied upon by numerous agencies and courts, and are found in many opinions of the U.S. Supreme Court. I have played an active role in the process of restructuring, and reforming the regulation of, many markets in North America, Europe, Asia, and Australia. In addition, I have provided consulting services to a wide variety of private and governmental participants in those processes of restructuring and regulatory reform, including the General Accounting Office, the U.S. Agency for International Development, the Organization for Economic Coordination and Development, and The World Bank.

THE RECENT HISTORY OF ECONOMIC REGULATION

In the early 1970's, the U.S. relied primarily on economic regulation to govern the performance of many markets, including rail, trucking, air travel, financial services, natural gas, electricity, oil and petroleum products, and telecommunications. Regulatory agencies used a

combination of rate regulation and regulatory restrictions on market entry and exit to implement a system of central planning. All of those regulated markets performed poorly.

The U.S. responded by deregulating the markets that were not characterized by natural monopoly conditions – specifically, trucking, airlines, oil and petroleum products, and financial services. The results were so socially beneficial that the U.S. turned its attention to markets with more complicated characteristics. The natural gas, telecommunications, and electricity markets include many functions that are susceptible to performance in an unregulated, structurally competitive market, but they also include some functions, like transmission of electricity, that continue to be natural monopolies. In each of these markets, the U.S. has reduced significantly the role of government regulation as a governance mechanism, and has increased its reliance on unregulated competitive market forces to obtain socially beneficial changes in the performance of the markets. Generally, the U.S. has separated the natural monopoly functions from the functions that are susceptible to governance by competitive markets, deregulated the functions that are susceptible to performance in a competitive market, and switched to new methods of regulating the residual natural monopoly functions that are compatible with, and supportive of, the newly deregulated market-based functions.

The results have been impressive. Each of these markets performs much better today than it did when we attempted to rely on central planning and pervasive regulation to govern it. As scholars from the Brookings Institution and George Mason University concluded in an important study published in 1997, consumers have obtained scores of billions of dollars in annual benefits as a result of this movement toward deregulation and regulatory reform. Robert Crandall & Jerry Ellig, Economic Deregulation and Consumer Choice (1997). I have described this process and its many socially beneficial results at greater length and in greater detail elsewhere. See, e.g.,

Richard J. Pierce, Jr. & Ernest Gellhorn, Regulated Industries (4th ed. 1999); Richard J. Pierce, Jr., Economic Regulation (1994); Richard J. Pierce, Jr., Reconstituting the Natural Gas Industry from Wellhead to Burnertip, 9 Energy L. J. 1 (1988).

The extraordinary success of the U.S. deregulation and regulatory reform process, combined with the enviable performance of the U.S. economy and the collapse of the centrally planned Soviet economy, has inspired nations on every continent to emulate the U.S. approach. Almost every country is in some stage of attempting to apply the lessons of the U.S. movement toward deregulation and regulatory reform, with the same kind of resulting substantial improvements in market performance that the U.S. has experienced.

As the Board well knows, the history of the U.S. rail industry is similar to the history of the other industries that have been the subject of deregulation and regulatory reform. In the early 1970s, the U.S. rail market was on the verge of total collapse. Most railroads were either bankrupt or nearly so. The cause was easy to identify. Implementation of a central planning approach to the market through application of rate regulation and regulatory restrictions on market entry and exit had nearly destroyed the market. The rail regulatory regime that was being implemented at the time cost the U.S. economy between $9.7 and $16.2 billion per year. C. Barnekov & A. Kleit, The Costs of Railroad Regulation (1988).

Congress responded by enacting the 4R Act and the Staggers Act. As they were ultimately implemented by first the ICC and then the STB, those statutes went a great distance toward replacing central planning with reliance on markets to determine prices, terms and conditions of service, and market entry and exit. Those statutes were predicated on the well-supported belief that railroads confront effective competition in most markets from a combination of other railroads and other modes of transportation. The STB continues to perform

some important regulatory roles, e.g., regulation of rates charged where a railroad has "market dominance." Even in those narrow contexts, however, the STB has come increasingly to rely on regulatory methods that reflect market forces, e.g., differential or Ramsey pricing, rather than traditional cost-of-service regulation. As a result, the rail market is much healthier than it was prior to the regulatory changes mandated by Congress. By any conceivable measure, shippers and the U.S. economy have experienced significant benefits attributable to the movement from primary reliance on regulation to primary reliance on market forces to govern the rail market.

The Board's revised merger policy should reflect these general and rail-specific directions in economic regulation.

MERGER POLICY

Any country needs a merger policy that accomplishes two goals. First, it should enable an agency to identify, and potentially to block, proposed mergers that would have the potential to create unacceptable anticompetitive effects. Second, it should enable all other proposed mergers to be reviewed and approved quickly and easily. We often tend to emphasize the first goal in talking about merger policy, but the second goal is even more important than the first. Only a small fraction of proposed mergers pose any plausible threat of harm to the performance of any market. The vast bulk pose no such threat. In an economy as diverse and dynamic as the U.S. economy, it is essential that firms be able to order, and to reorder, their structures and relationships quickly and easily in response to constantly changing marketplaces.

The U.S. legal regime applicable to most mergers furthers both goals admirably. In most areas, the Department of Justice and the Federal Trade Commission (DOJ/FTC) share responsibility to determine whether a proposed merger is likely to have intolerable anticompetitive effects and to attempt to block any such merger that they so identify. They fulfill

those responsibilities in a highly pragmatic manner that has helped to give the U.S. the best performing economy in the world. A high proportion of proposed mergers do not even meet the threshold criteria that trigger a duty to notify the DOJ/FTC of the merger. Of those that do, the DOJ/FTC attempt to block only a handful of proposed mergers each year. A high proportion of the proposed mergers that do meet those criteria elicit only a quick review by the DOJ/FTC that is sufficient to allow them to conclude that the merger poses no plausible threat to harm the performance of any market. The DOJ/FTC identify only a small fraction of proposed mergers that raise plausible concerns sufficient to justify detailed scrutiny. Even within that small class of proposed mergers, in most cases the DOJ/FTC ultimately conclude either that the proposed merger does not, in fact, threaten competitive harm or that any such threat can be mitigated adequately through undertakings that the firms are willing to make as conditions on the DOJ/FTC's acquiescence in the proposed merger. Through this process, the vast majority of proposed mergers in the U.S. are completed quickly and inexpensively. In most cases, the DOJ/FTC complete the process of reviewing a proposed merger within sixty days. Thus, as it is designed and implemented, U.S. merger policy reflects a presumption that most mergers are socially beneficial. That presumption can be rebutted only by demonstrating that a proposed merger has the clear potential to harm the performance of a market.

It is even more important to have a merger policy that allows mergers to be completed quickly and inexpensively in the context of a previously regulated market that is undergoing a transition to greater reliance on market forces. Regulation always distorts firms' decisionmaking and induces firms to choose inefficient structures. It also distorts their decisionmaking in many other contexts, e.g., it induces them to make poor investment decisions, to invest in the wrong kinds of assets in the wrong places, to hire the wrong numbers and types of personnel, and to

make other decisions based on regulation, rather than economic efficiency. When previously regulated firms are freed from regulatory restraints and subjected instead to competitive market forces, they invariably conclude that they must make major changes in order to be efficient enough to survive and prosper in their new environment. Many discover that they must make major structural changes through mergers and acquisitions. Any agency that is responsible for considering proposed mergers in that context must adopt a merger policy that will both allow it to identify, and to block, the occasional proposed merger that poses intolerable risks of harm to the performance of markets, and, even more important, allow the quick and inexpensive consummation of the many mergers that do not pose such risks.

Of course, regulatory agencies review mergers under a "public interest" standard that is not necessarily the same as the antitrust analysis performed by the DOJ/FTC. However, even in this area, regulators have, over time, narrowed the scope of their review considerably.

For example, FERC has jurisdiction over mergers in the electric utility industry, an industry that is undergoing a transition from pervasive regulation to primary reliance on competitive market forces. FERC originally used a six-factor test for merger review: (1) the effect of the proposed merger on competition; (2) the effect of the proposed merger on the applicants' operating costs and rate levels; (3) the reasonableness of the purchase price; (4) the degree of coercion, if any, the acquiring utility has applied to the to-be-acquired utility to accept the merger; (5) the impact of the merger on state and federal regulation; and (6) the contemplated accounting treatment. In a high proportion of cases, FERC applied that policy through the use of lengthy oral adjudicatory hearings.

However, in 1996, FERC concluded that its policy was no longer appropriate for application to an industry that was undergoing a transition to primary reliance on market forces,

and announced a new policy that was designed to fit the new environment. See FERC Order No. 592, Docket No. RM96-6-000 (Dec. 18, 1996) (policy statement) and Order No. 592-A, Docket No. RM96-6-001 (June 2, 1997) (order on reconsideration); FERC Order No. 642, 93 F.E.R.C. ¶61.164 (November 15, 2000). See also Richard J. Pierce, Jr., Antitrust Policy in the New Electricity Industry, 17 Energy L. J. 29 (1996).

In justifying its changed policy, FERC identified several major defects in its old policy, each of which also is relevant to the Board's proposed revisions to its merger policy. First, many of the factors it considered were not appropriate for consideration by an agency that was reviewing mergers proposed by firms that are subject to market forces. Second, FERC concluded that its old policy was too unpredictable in its outcome, imposed undue burdens, and required far too much time to implement in many cases. FERC recognized that most proposed mergers are socially beneficial, and that a policy that is difficult to predict, burdensome, and slow deters many firms from even attempting to enter into socially beneficial mergers. Third, FERC recognized that its old policy was highly susceptible to abuse by badly motivated protestors and intervenors. Those included competitors who wanted to stop, or at least to delay, a transaction that would create a more formidable competitor, and rent seekers who used their ability to protest, or to demand a costly hearing, as a source of leverage to extract from the merging firms a variety of special interest concessions on issues unrelated to the proposed merger. Fourth, FERC recognized that its old policy tended to discount and to submerge the issue that should dominate its merger policy in the new environment – whether a proposed merger is likely to cause serious harm to the performance of any market.

To remedy these problems, FERC's new policy reduced to three the factors that FERC will consider in acting on a proposed merger: (1) effects on competition; (2) effects on rates;

and (3) effects on regulation. As a practical matter, FERC places almost exclusive emphasis on effects on competition in most cases. In applying the first factor – effects on competition – FERC has largely adopted the DOJ/FTC Merger Guidelines. This enables FERC to screen proposed mergers, so that mergers that do not raise significant competitive issues can be handled on an expedited basis. The second factor – effects on rates – is unique to FERC's method of ratemaking. It usually can be satisfied simply by applicants agreeing not to file for rate increases directly attributable to the merger. The third factor – effects on regulation – reflects potential jurisdictional problems that sometimes are raised by a merger as a result of some judicial interpretations of the Public Utility Holding Company Act. Those opinions suggest that some utility mergers can have the effect of precluding both FERC and state regulators from regulating transactions among corporate affiliates. That factor usually can be satisfied simply by applicants agreeing not to use the merger as a vehicle to avoid state or FERC regulation of matters that were subject to state or FERC regulation before the merger.

FERC's revised policy had positive results. FERC has applied its new policy to 42 proposed mergers in the last four years, excluding the few merger applications that were filed and withdrawn when the applicants changed their minds about the desirability of the proposed merger. See List of Mergers Filed with the Commission Since 1995, available at http://www.ferc.fed.us./electric/mergers/mgrpag.htm (last updated July 31, 2000). FERC approved each of these mergers, though it approved some on the condition that the parties adopt mitigating measures. FERC completed its review and approval process in less than six months in 37 of the 42 cases, and its average processing for merger applications has been 117 days since it revised its policy. It completed the process in less than a year in all but one of the cases. That case raised extremely difficult and unprecedented issues. Even in those cases where competition

issues were raised, FERC has been able to resolve most mergers on the basis of the filing submitted by the merger applicants, pleadings filed by interested parties, and supplemental data requests from its staff. Most mergers handled by FERC do not result in formal discovery by the parties and are resolved through "paper hearings," without the use of formal discovery or evidentiary hearings. Courts have repeatedly upheld and often applauded this type of decisionmaking procedure by agencies that are acting under broader statutory standards in cases in which the dominant issues are economic. See, e.g., Louisiana Energy and Power Authority v. FERC, 141 F.3d 364 (D.C. Cir. 1998); Union Pacific Fuels v. FERC, 129 F.3d 157 (D.C.Cir. 1997); SBC Communications v. FCC, 56 F.3d 1484 (D.C. Cir. 1995). See generally Kenneth Culp Davis & Richard J. Pierce, Jr., Administrative Law Treatise § 8.2 (3d ed. 1994 and annual supplements). The advantages of this procedure are obvious and substantial. It permits the agency to make decisions on the basis of high quality data and analysis with limited consumption of agency resources. It expedites the decisionmaking process. It also reduces the ability of third parties to abuse the merger review process by using it to block or to delay a competitor's merger or to extract special interest benefits by threatening to try to block the merger or to delay the proceeding.

FERC's policy has, over time, moved toward the focused approach used by the DOJ/FTC and other agencies that are engaged solely in antitrust review. Under this approach, the agency first defines the appropriate markets and the effects on those markets of the proposed merger. If the agency identifies a market in which it fears that the merger creates an undue risk of harming the performance of the market, it works with the applicants to identify an effective means of mitigating the potential harm it has identified. In a high proportion of the relatively few cases that reach this stage of the decisionmaking process, the agency is able to identify effective

mitigation measures that the firm is willing to implement as a condition on the completion of its merger, e.g., divestiture of assets in a market in which the merged firm otherwise would have an unduly high share of the market. If the agency identifies a market in which the merger poses a significant risk of anticompetitive behavior that is not amenable to effective mitigation, the agency looks at the potential social benefits of the merger to determine whether they are sufficient to justify its approval notwithstanding the existence of some risk that the merger might harm the performance of some market. These are the relatively rare hard cases that sometimes elicit an order disapproving a proposed merger.

One characteristic of this decisionmaking process is particularly noteworthy. Each step is contingent on the results of the prior step. Thus, for instance, the agency does not engage in detailed economic analysis unless and until it has applied some simple screens to see whether such an analysis is necessary. It does not look for mitigation measures unless and until it has concluded that the merger would pose an undue risk to the performance of a market in the absence of mitigation measures. It does not look for social benefits of a merger unless and until it concludes that the merger poses otherwise unacceptable and unmitigatable risks to the performance of a market.

This clear, simple, contingent, and sequential approach has many advantages. It conserves the resources of the agency and the parties. It minimizes the amount of time required to review a proposed merger. Finally, it permits any firm that is considering a potential transaction to perform its own analysis early in its own decisionmaking process and to make a reasonably reliable prediction of the likely results of the agency's decisionmaking process.

Following this general trend, the Board's final merger rules should focus principally on competitive issues, with additional review of issues that are unique to the rail industry, such as

service issues. A narrow scope of review, coupled with expedited review, would be consistent with the Board's application of a broad "public interest" standard.

THE STB'S PROPOSED POLICY

The STB is wise to reconsider its merger policy to determine whether conditions have changed in the past twenty years in ways that justify a change in policy and to reflect the general trends in the area of economic regulation. The proposed new policy is severely flawed in a number of respects, however. Before I discuss each of the elements of the proposed policy that are inappropriate and counterproductive, I will describe the problems that would be created by adoption of the policy as a whole.

The proposed policy would require the STB to apply at least four factors in addition to the potential adverse effect on competition in evaluating a proposed merger: (1) the adequacy of the firms' plan to improve service; (2) the adequacy of the firms' plan to enhance competition; (3) the adequacy of the firms' plan to minimize service disruptions during the post-merger transition period; and (4) the adequacy of the firms' attempt to anticipate and then to evaluate the likely responses of the firms' competitors to the proposed merger, including additional mergers that might be proposed as a competitive response to the proposed merger. The inclusion of "enhanced competition" and downstream effects in this analysis would impose extraordinarily heavy burdens on both the applicants and the STB's staff. It would produce long, expensive, and complicated proceedings. It would maximize the opportunities for competitors and other third parties to abuse the merger approval process by using it to stop or to delay a pro-competitive merger or to use it as a means to extract special favors unrelated to the proposed merger. It would require the STB to select winners and losers if it adopts remedies or conditions that are not specifically designed to offset identified harms. Finally, the use of such factors in reviewing

mergers would render prediction of the likely results of the merger review process nearly impossible. Through each of those effects, the proposed policy would deter firms from even attempting to identify, negotiate, and propose socially beneficial mergers.

The factors beyond competitive and service effects that the STB has proposed also represent a major step back to the bad old days in which agencies acted on the assumption that agency-implemented central planning will yield better results than primary reliance on market forces to determine the most efficient structure of a market. As stated in the recently released "Final Report of The International Competition Policy Advisory Committee to the Attorney General and Assistant Attorney General for Antitrust" (2000) [hereinafter Attorney General's Advisory Committee, available at www.usdoj.gov.atr/icpac/icpac.htm]:

> As a best practice or discipline, with limited exceptions (such as national security), noncompetition factors should not be applied in antitrust merger review. If a jurisdiction's law recognizes noncompetition factors (such as preservation of jobs, promotion of exports, or international comparative advantage), such factors should be applied transparently and in a manner narrowly tailored to achieve their ends. *Executive Summary*, Attorney General's Advisory Committee.

While the Board reviews mergers under a public interest standard, the analysis of merger-related competitive effects should, for reasons discussed above, be the core of that analysis. Moreover, the Board's proposed policy would reduce the transparency of its decisions and expand the scope of its review and remedies.

I will now discuss each of the factors the STB proposes to apply in reviewing proposed mergers.

Presumption That All of the Efficiency Enhancing Mergers Have Been Completed

The Board's proposed "paradigm" shift in merger policy review is premised on the unprecedented and unsupported presumption that the rationalization of the nation's rail system

and the elimination of excess capacity have been completed. Specifically, the Board cites substantial reductions in excess capacity and improvements in efficiency that have resulted from the prior rail mergers that rationalized the nation's rail system, and then concludes that "this process has now largely been completed, and [] the efficiencies and service improvements to be realized from further downsizing of rail route systems are limited." Comments to Proposed § 1180.1(a), Notice of Proposed Rulemaking (NPR) at 11.

To my knowledge, no agency has ever announced a merger policy that presumes that future mergers are unlikely to improve the performance of a market. The STB reasons that, since prior mergers yielded large efficiency gains, future mergers are unlikely to produce significant further improvements. That is a classic non sequitur. The STB provides no support for its belief, and it is hard to imagine how any agency could support such a belief. It is highly unlikely that any market in history has been characterized by optimal structural efficiency. If any market ever reached that state of structural euphoria, that state would exist only for a very short time. The U.S. economy is extraordinarily dynamic. Firms in every market must engage in a continuous process of reevaluating their structure to determine whether it continues to allow them to participate in constantly changing markets in an efficient manner.

The Presumption of Anticompetitive Effects

The Board has also proposed to adopt a presumption that any proposed merger of Class I railroads would have anticompetitive effects. Thus, the Board says that "[a]ny railroad combination entails a risk that the merged carrier will acquire and exploit increased market power." Proposed § 1180.1(c)(2)(i), NPR at 15. In another place, the Board says that it "expects that any merger of Class I carriers will create some anticompetitive effects . . . ." Proposed § 1180.1(d), NPR at 16. That presumption seems to drive many of the other elements of the

Board's proposed policy. Thus, for instance, because mergers would have anticompetitive effects, the Board says that it "does not favor consolidations . . . unless there are substantial and demonstrable public benefits to the transaction that cannot otherwise be achieved." Comments to Proposed § 1180.1(a), NPR at 11.

A presumption that an entire class of potential mergers will have anticompetitive effects is again unprecedented and unsupportable. There are over 120 merger policies currently in effect around the world. To the best of my knowledge, none of those policies includes a presumption that an entire class of mergers will have anticompetitive effects. The Board has provided no support for this presumption.

Some proposed mergers pose significant risks that they will impair the performance of one or more markets. Others do not. The only way to distinguish among them is to apply standard tools of economic analysis to each market that is potentially affected by a specific proposed merger. The Board can fulfill its responsibilities in the merger review process only by identifying each product and geographic market that is potentially affected by a proposed merger and evaluating the potential effects of the merger on the performance of each of those markets.

Presumption of Significant Service Disruptions

The Board discusses at length its concerns about potential service disruptions during the period following a merger. It then adopts a presumption that rail mergers will necessarily create substantial service disruptions. It says: "Our recent experience has shown that, even with substantial advance planning, implementing large rail mergers may cause substantial service disruptions that delay or outweigh expected efficiency gains that should flow to the public. Under our proposed rule, these potential harms would be included in our balancing test." Comments to Proposed § 1180.1(c), NPR at 13.

However, only some of the most recent consolidations produced those unfortunate results. Two cases are not sufficient to support a sweeping generalization, particularly when those two cases involved unusual factors and when there are numerous cases in which mergers did not yield serious service disruptions. There is no justification for a presumption that rail mergers will cause substantial service disruptions, particularly when the Board also is proposing that merger applicants address their transitional plans with a new level of detail and that a heightened regime of post-merger monitoring of service be implemented.

Moreover, merger applicants will have every incentive to minimize service disruptions in the future. Markets punish firms severely for service disruptions. The financial performance of UP during the period in which it experienced severe service problems illustrates the point. During its service crisis, UP's quarterly earnings per share dropped from $0.96 in September 1997 to a low of a loss of $1.70 per share in June, 1998. UP's earnings did not recover until the second half of 1999. UP was hit with several lawsuits, and the STB imposed emergency service orders on UP during the depths of its crisis. UP's experience serves as an effective object lesson to other firms that might otherwise be tempted to try to implement a merger with inadequate planning.

Because the Board believes that the risk of service disruptions is serious enough to warrant consideration in merger review proceedings, it clearly can require applicants to submit their plans to avoid those problems for the Board's review, as the Board has proposed. (I understand that BNSF supports this requirement.) However, the Board should then limit its consideration of the proposed plan to avoid service disruptions to a simple yes or no determination with respect to the adequacy of the plan. It should not attempt to assign a value to the risk of service disruptions that must then be offset with unrelated enhancements. That is the

antithesis of the "transparent" and "narrowly tailored" consideration of noncompetition factors recommended by the Attorney General's Advisory Committee.

Mandatory "Enhanced Competition" Conditions

The Board proposes "to require applicants to incorporate proposals for enhanced competition . . . ." Comments to Proposed § 1180.1(c), NPR at 13. The Board refers to an "equal access" rule as an example of such a mandatory proposal. It also says that inclusion of such a proposal is "likely to be extremely important to us in determining whether to approve a particular application." Id. at 14. This is a bad idea for at least four reasons.

First, if the Board is convinced that some major change in its regulatory policy, like an equal access requirement, would yield significant public benefits, the efficacy of that policy change will depend primarily on its scope. It would make little sense, and do little good, to impose it selectively on railroads that propose to merge. Instead, the agency should consider whether to apply the new approach to all railroads.

Second, adopting a policy of approving mergers only if the applicants agree to adopt a major change in their methods of operation that they consider highly undesirable is much more likely to discourage railroads from proposing socially beneficial mergers than to produce a legal regime in which many railroads agree to the change as a condition of approval of a merger.

Third, the policy would require the Board to determine what level of enhancements are necessary to offset possible harms and then allocate those enhancements to shippers who are not, by definition, directly affected by the potential harm. The unfairness inherent in providing benefits to one class of shippers, rather than another, is a key reason why remedies should be designed to offset specified harms to specific groups.

Fourth, and most important, no agency should consider adopting a major change in its regulatory policy, like an equal access rule, without considering carefully and in detail all of the implications and effects of adopting the new policy. That cannot be done as an add-on to a merger review proceeding. It requires instead a separate rulemaking in which the agency addresses with care the scores of important issues that are raised by such a proposed policy change.

Requiring only one participant in a market to allow its competitors to use its assets is a radical step. In the vast majority of circumstances, this would be a terrible idea, whether or not open access or similar regimes would be beneficial if implemented on a broad basis.

Mandatory Post-Merger Oversight

The Board proposes to establish an elaborate "formal oversight process" applicable to all mergers. Proposed § 1180.1(g), NPR at 19; see also Proposed § 1180.1(i), NPR at 20. Because the Board's review extends beyond the efficacy of any competition-related merger conditions and merger-related service problems to include unforeseen circumstances, subsequent mergers, and conditions related to the achievement of all projected benefits exactly when projected, this proposal would undercut the transparency and finality that is required in merger proceedings. Indeed, unless the scope of post-merger review is properly limited to the efficacy of the competitive remedies adopted in the merger and the identification and resolution of merger-related service problems, I cannot imagine any firm that would be willing to propose a merger that would be subject to such an extraordinary, open-ended post-merger oversight process and subject to the risk of after-the-fact imposition of new, impossible-to-predict conditions.

The Board's proposal would vastly expand the scope of post-merger review beyond that undertaken by other agencies. Agencies sometimes approve mergers subject to mitigation

conditions, e.g., divest fifty percent of your retail gasoline outlets in Los Angeles. Agencies act in that manner when they conclude that a proposed merger would have unacceptable effects on the performance of a market in the absence of the mitigation condition. When an agency approves a merger subject to a mitigation condition, it retains the power to enforce the condition, or even to dissolve the merger, if the merged firm fails to comply with the condition. All merger applicants understand and accept the need for an agency to retain that power. The applicants know what the mitigation conditions on approval are before they merge. If they conclude that the conditions are unacceptable, they simply decline to merge. I have never heard of any agency attempting to retain an open-ended power to impose new conditions on a previously approved and completed merger based on the agency's determination that the merger has not produced exactly the results that the applicants expected or that the agency later prefers.

First, as I noted earlier, under the proper scope of review in today's economy, the Board should not require submission of evidence that a merger will produce benefits unless it concludes that the merger poses a significant risk of adversely affecting the performance of a market and that risk cannot be effectively mitigated. However, I understand that this is an accepted practice in the rail industry, even without the expansion the Board is currently providing. Nonetheless, an agency certainly should not attempt to engage in post-merger oversight to ensure that the merger produced precisely the benefits the applicants projected.

Second, it would be extremely difficult to determine whether any "shortfall" in benefits is a result of the problems relating to the merger. The performance of any firm depends on a myriad variables, many of which are beyond the firm's control. If a merged firm's performance falls short of its expectations and those of the Board, the Board would have to determine the extent to which its performance is attributable to the merger versus the extent to which it is

attributable to any number of other potential sources, e.g., an economic downturn, the responses of competitors, an increase in fuel or labor costs, or a tightening of capital markets.

Third, no transaction ever goes exactly as planned or as the parties anticipated that it would. That basic truth certainly applies to all mergers. I doubt that any merger in history has produced exactly the results the firm expected. The results of a merger depend on how it interacts with numerous other factors, including changes in market conditions, responses of competitors, and changes in general economic conditions. Sometimes a merger produces benefits that differ significantly from the firm's expectations. Thus, for instance, a firm might project large savings in labor costs, but unexpected increases in demand for the firm's services might persuade it to retain its original workforce and to reassign many of its employees in ways that permit it to meet the increased demand efficiently and effectively. Would the Board consider that a failure to fulfill the firm's benefit projections? Would it order the firm to fire enough employees to fulfill its original projected labor cost savings? Some mergers produce disappointing results – results that fall well short of the firm's expectations. Agencies do not approve mergers because they expect all mergers to be successful. Such an expectation would be absurd. It is contradicted by history. Some mergers yield spectacular results; some yield terrible results. Agencies approve mergers that do not have anticompetitive effects because they know that many will yield good results and because they know that the firms that propose to merge are in a much better position than any agency to predict the results of the merger.

Fourth, and most important, unless the scope of post-merger is properly limited, I cannot imagine any firm that would be willing to merge, or even to consider a merger, under conditions in which an agency can impose unknown and unknowable conditions on the merged firm years after the merger is approved and implemented.

Requirement to Anticipate and to Analyze Responses of Competitors

The proposed policy would require merger applicants to predict the responses of their competitors, including any mergers their competitors might propose in an effort to remain competitive with the merged firm, and to evaluate the effects of those potential responses. The Board would then hold the applicants responsible for the effects of their competitors' responses by denying the application if the Board concludes that the competitors' responses would have unacceptable effects.

The Board should not adopt this policy. First, it is extremely difficult for a firm to predict the actions of its competitors with any degree of confidence and accuracy. Of course, firms attempt to do this all of the time, but they can never do better than to predict a relatively wide range of potential responses. Second, any firm is understandably reluctant to disclose to its competitors its evaluation of the likely effects of the range of actions it believes that its competitors might take. No agency should compel any firm to disclose that information. Markets do not perform well when competitors are required to share with each other their predictions and evaluations of their competitors' potential actions. Third, this requirement will force applicants to speculate and will make merger proceedings unmanageable. That is why the STB wisely refrained from imposing such a requirement in the past. Those reasons remain valid and persuasive today. Fourth, this requirement would provide competitors of merger applicants an ideal vehicle to abuse the merger review process by blocking a socially beneficial merger. The competitor would need only to allege that it would respond to the merger by proposing a patently outrageous merger in order to block approval of the proposed merger. Fifth, it makes no sense to disapprove an otherwise socially beneficial merger because it might induce a competitor to

propose a socially destructive merger. If that happens, the Board should simply disapprove the second proposed merger.

CONCLUSION

The Board should not adopt those proposed changes in its merger policy that would expand the scope of its merger review or create new presumptions against mergers. Such changes would return the Board to a central planning role, threaten the transparency and predictability of Board review, and result in a mismatch of actual harms and actual remedies. The Board should maintain the approach that is clearly reflected in the 4R Act and the Staggers Act and that has produced excellent results in so many other markets. It should rely primarily on market forces to produce good results, and it should rely on regulation only in those few contexts in which market forces alone are unlikely to produce good results.

Therefore, any final rules adopted by the Board should: (i) eliminate the presumption that rail mergers will no longer produce public benefits; (ii) eliminate the presumptions that future rail mergers will cause competitive and service harms; and (iii) eliminate the requirement that merger applicants propose "competitive enhancements" to offset these presumed harms. Final rules also should not require applicants to "guarantee" the projected benefits of mergers or to forecast the responsive actions of their competitors. The Board's rule also should limit the scope of post-merger review to the efficacy of competition conditions adopted as part of the merger and the temporary remedy of merger-related service problems. Most importantly, any final merger rules should contain an expedited schedule and provide railroads and interested parties with transparency and finality in Board actions.

RICHARD J. PIERCE, JR.
122 Madison Place
Alexandria, Virginia 22314

Birthdate: July 15, 1943
Married: Jill Birdwhistell Pierce
Children: Gabriel, 1974; Danielle, 1976

PRESENT POSITION: Lyle T. Alverson Research Professor of Law
George Washington University Law School
720 20th Street, N.W.
Washington, D.C. 20052
(202) 994-1549

COURSES:

Administrative Law, Antitrust Law, Regulated Industries, Energy Law, Oil and Gas Law, Energy Tax Policy, Evidence, Torts, Conflicts, Economic Analysis of Law

EMPLOYMENT:

June 1989 - June 1995 - Paul J. Kellner Professor of Law
Columbia University School of Law
435 West 116th Street
New York, NY 10027-7297

June 1986 - June 1989 - George W. Hutchison Professor of Energy Law
Southern Methodist University School of Law
Dallas, TX 75275

July 1984 - June 1986 - Dean and Professor of Law
University of Pittsburgh School of Law
3900 Forbes Avenue
Pittsburgh, PA 15260

July 1981 - June 1984 - W. R. Irby Professor of Law
and Director, Energy Law Program
Tulane University School of Law
New Orleans, LA 70118

August 1980 - June 1981 - Visiting Professor of Law
University of Virginia School of Law
Charlottesville, VA 22901

August 1977 - August 1981 - Professor of Law
University of Kansas School of Law
Lawrence, KS 66045
(Associate Professor until June 1980)

June 1972 - August 1977 - Sutherland, Asbill & Brennan
1666 K Street, N. W.
Washington, D. C. 20006

May 1969 to Sept. 1969- Instructor, United States Coast Guard
Reserve Training Center
Yorktown, VA 23690

May 1968 to May 1969 - Assistant Chief, Aids to Navigation Branch
U.S. Coast Guard District Headquarters
1520 Market Street
St. Louis, MO 63103

June 1966 to May 1968 - Operations Officer
United States Coast Guard
Cutter Sedge
Cordova, AK 99501

February 1966 to June 1966 Officer Candidate School
United States Coast Guard
Reserve Training Center
Yorktown, VA 23960

June 1965 to February 1966 Financial Management Trainee
General Electric Company
Switchgear Department
6901 Elmwood Avenue
Philadelphia, PA 19142

EDUCATION:

September 1969 to June 1972 - University of Virginia School of Law
Charlottesville, VA 22901
J. D.: 1972
Managing Editor, Virginia Law Review
Order of the Coif
Michie Legal Writing Award
Student Assistant to Prof. Richard Merrill

September 1961 to June 1965 - Lehigh University
Bethlehem, PA 18017

SURFACE TRANSPORTATION BOARD

EX PARTE NO. 582 (SUB-NO. 1)

MAJOR RAIL CONSOLIDATION PROCEDURES

VERIFIED STATEMENT OF BRADFORD CORNELL

Background and Qualifications

I am a Professor of Finance and Director of the Bank of America Research Center at the Anderson Graduate School of Management at the University of California, Los Angeles (UCLA). I earned my doctorate in Financial Economics from Stanford in 1975, and have held positions as a finance professor at the University of Arizona, University of Southern California, California Institute of Technology, and UCLA. At UCLA, I have twice served as Vice-Chairman of the Anderson School and have twice served as chairman of the finance department. I am a past Vice-President of the Western Finance Association. I am also a past director of both the American Finance Association and the Western Finance Association.

I have written more than 70 articles and two books on finance and securities, including *Corporate Valuation: Tools for Effective Appraisal and Decision-Making,* published by McGraw-Hill, and *The Equity Risk Premium and the Long-run Future of the Stock Market,* published by John Wiley. I have also served as an associate editor of numerous professional journals – including *The Journal of Finance, the Journal of Futures Markets,*

The Journal of Financial Research and The Journal of International Business Studies – and I have served as a reviewer for nearly a dozen other professional journals. I have received prizes and grants for my research from the Chicago Board of Trade, the Chicago Mercantile Exchange and the Institute for Quantitative Research in Finance.

My background is described more fully in my *curriculum vitae*, which is attached hereto as Exhibit 1.

Factual Background

On October 3, 2000, the Surface Transportation Board ("Board") announced proposed modifications to its regulations at 49 CFR part 1180 governing proposals for major rail consolidations. According to the summary disseminated by the Board:

> These proposed new rules would substantially increase the burden on applicants to demonstrate that a proposed transaction is in the public interest, requiring them, among other things, to demonstrate that the transaction would enhance competition as an offset to negative impacts resulting from service disruptions and competitive harms likely to be caused by the merger.[1]

The Board is seeking public comment on these proposed modifications before they are codified. I have been asked by The Burlington Northern and Santa Fe Railway Company ("BNSF") to comment on these modifications with respect to the railroad industry's ability to invest in and maintain its operating assets while earning a sufficient return on those assets to cover its economic cost of capital over the long term.

[1] STB Ex Parte No. 582 (Sub-No. 1), Major Rail Consolidation Procedures (served October 3, 2000) ("NPR"), p. 1.

In the text of proposed 49 CFR 1180.1(a)-(d), the Board appears to presume that any merger between Class I railroad companies results in harm in the form of reduced competition and disruption in service. The merging parties must show that, as an offset to the presumptive harm caused by reduced competition and service disruption, the proposed merger offers "competitive enhancements." Furthermore, the Board would require the merging parties to project the public benefits of the proposed merger and suggest possible remedial steps for the Board to take if those benefits are not realized.[2] The merging parties would also be required to anticipate additional Class I merger applications that might be filed in response to their own application, to measure their benefits in light of the anticipated downstream mergers, and to discuss how conditions imposed in their proposed merger would have to be altered, or new conditions imposed, if any future consolidation(s) were approved.[3] Before the proposed merger would be allowed to proceed, there would be a lengthy review process: (i) a minimum notice period of three months, (ii) an application acceptance period of one month, (iii) an evidentiary proceeding lasting a year, and (iv) a final decision period of three months.[4] Thus, a proposed combination between two Class I railroad companies may be delayed for up to 19 months.

Discussion

As a general matter, anything that creates additional investor uncertainty and/or limits the ability of a firm's managers to utilize its assets in a manner that it feels is consistent with the interest of the stockholders adversely affects the firm's stock price and its cost of capital. The Board's proposed merger rules could have significant adverse effects on railroad investment incentives and the terms on which outside investors will continue to provide funds to the industry. The business of railroading is highly capital-intensive and requires billions in annual investment of private capital. Despite the important financial strides the industry has made under deregulation, it has yet to earn a sufficient return on its investment, according to accounting data published by the Board itself.

Regulatory limitations on the railroads' use of their assets effectively function as a tax, reducing the expected return on the assets. Delay in the approval process is particularly insidious from a financial standpoint. Not only does it delay the cash benefits of the merger, thereby significantly reducing the present value of the transaction, but it prevents the railroads that plan to merge from determining their optimal capital expenditure levels and allocation of assets while they are enmeshed in regulatory limbo. Investors do not look kindly on such delay, and they will lower their earnings expectations commensurately. The fundamental question that the Board must answer is whether the proposed changes will, in fact, add delay and increase uncertainty. If they do either, then the value of railroad assets will fall and the incentive to invest in railroad assets will decrease.

Even when mergers offer railroads the opportunity to use their assets more efficiently and do not diminish competition, the proposed merger rules require that the merging parties offer "competitive enhancements," which can significantly reduce the return promised by the merger. If, as here, the rules create significant uncertainty – not only about the level of "competitive enhancements" required, but also about whether new or revised conditions may be imposed in the future, and "measures" may be taken if all public benefits are not realized – the perceived risk significantly increases the cost of capital for the merging parties. Prospective investors will recognize that a railroad's ability to take advantage of merger opportunities that could help it cover its system costs is significantly diminished.

A rational response to such a regulatory tax, in order to protect shareholder value, is to shelve promising merger plans and scale back to projects, if any, that can be expected to earn the cost of capital. If the existing rail system as a whole does not hold out the promise of such returns, the railroads cannot be expected to continue making investments designed to maintain their overall capacity. They can be expected to make targeted investments in lines and services that offer the necessary returns and, over time, disinvest in the rest.

Railroad Industry Performance Under Deregulation. Freight railroads in this country are like other private businesses in that they must offer a competitive return on investment in order to attract and retain capital. It was largely because of the railroads'

inability to attract and retain capital under regulation, with returns falling well below the returns of other U.S. corporations, that the industry was substantially deregulated in the late 1970's and early 1980's.[5] One of the most significant aspects of the regulatory reforms instituted by Congress and implemented by the Interstate Commerce Commission in the late 1970's and early 1980's was the express recognition that railroads must be permitted to cover their capital costs if a sound transportation system was to be preserved in this country.[6] The railroad industry is very capital-intensive. In 1998 alone, Class I railroads invested $7.2 billion, or 21.7 percent of their revenues, in plant and equipment. Over the past ten years, their capital expenditures have totaled $49 billion.[7]

The railroads' willingness to pour money back into the industry is largely attributable to the prospect that deregulation opened up for competitive financial returns in the industry. In the wake of Congress's passage of the Staggers Rail Act of 1980, the railroads abandoned a third of their track, reduced crew sizes, and used contracts to customize services and align their prices to the requirements of individual shippers. Aided by mergers, which were encouraged by the ICC and the Board, railroads streamlined their systems, diminished interchange costs, and made more effective use

of their assets. Their real operating costs per ton-mile fell 60% between 1980 and 1998.[8] Rail traffic grew from a low of 19.5 million originating carloads in 1985 to 25.7 million in 1998.[9]

All of these factors helped boost the railroad's profitability. But the industry's financial improvement has not yet resulted in long-term accounting returns on investment at or near the levels calculated by the ICC and the Board as indicative of revenue adequacy for the industry. Railroads cannot simply raise rates to achieve greater profitability. Deregulation has unleashed cost reductions and productivity improvements for the railroads. At the same time, real rail rates to shippers have declined by half on average.[10] As shown in Exhibit 2 to this statement, in every year from 1978 through 1999, the industry's composite accounting return on investment has been less, and often substantially less, than its cost of capital as determined by the ICC and the Board. While the methods used by the Board and its predecessors to perform this calculation have been much debated, the figures in Exhibit 2 are so dramatic that it is unlikely,

regardless of adjustments, that anyone could argue that the railroads' returns on investment have consistently exceeded their economic cost of capital.

The performance of railroad stocks indicates that railroads are having a difficult time earning their cost of capital. Exhibit 3 shows indexed monthly price change data for the Dow Jones Railroad Index–America plotted against the Standard & Poor's 500 Stock Index, an established proxy for the general market. From January 1995 onward, that railroad index substantially underperforms the S&P 500 and remains relatively stagnant over the period. When the comparison is made with the Standard & Poor's Railroad Index – which includes only the four largest railroads, BNSF, UP, Norfolk Southern, and CSX – the result is the same, as shown in Exhibit 4. Such a sustained period of stagnation during a raging bull market suggests considerable question in the investment community about the railroads' ability to cover the costs of their current systems over the long term. The last thing the Board should do under these circumstances is to enact ill-advised regulations that would reduce the railroads' long-term prospects for covering their capital costs.

Regulatory Risk and Railroad Investment Incentives. Limitations on a railroad's (or any other business's) use of its assets function as a tax. They reduce the assets' expected return by restricting the ways that the assets can be utilized. An investment that might otherwise have a positive net present value will not be undertaken if regulatory limitations so tax the expected stream of revenues that the value turns

negative vis-a-vis the costs. The deterrent to investment is obvious when we know exactly what the regulatory limitations are, but the tax can be substantially compounded by delay and by an uncertain regulatory environment. When the amount of the regulatory tax cannot be established, railroads may choose not to make the investment at all. Alternatively, they may require a much higher return to cover the regulatory risk. Either way, the regulatory tax can kill an investment, or re-investment, that otherwise would have made good economic sense.[11]

Regulatory limitations on a railroad's use of its assets and uncertainty about future limitations act not only as disincentives for the railroads to invest in particular projects but also as disincentives for outside investors to invest in the railroad. Every year, railroads make large investments in track, rolling stock, and other related facilities to maintain their infrastructure and handle increased traffic. Many of these investments are fixed and sunk, and the assets involved have very long lives.[12] Investors have choices. If the long-term prospects of the rail industry are significantly clouded by regulatory restrictions and regulatory uncertainty, investors will be reluctant to risk their funds in the industry. This, in turn, may reduce the industry's access to funds in the capital markets and raises their cost of capital. This higher cost of capital translates into a reduced stock price, which hurts the firm's shareholders and further discourages new investment.

---

[11] I recognize that in some cases, the Board may choose to block a merger that increases shareholders' wealth if there is a greater cost to the public interest. This should be examined on a case-by-case basis.

[12] For a list of the types of long-lived assets involved, see 49 CFR Part 1201, Subpart A (Uniform System of Accounts).

The provisions of the Board's proposed rules indisputably serve to limit railroad companies' use of assets. If the Board uses the full 19-month period allowed,[13] it would significantly delay any proposed merger transaction between Class I railroads when compared with BNSF's proposed 12-month review period.[14] As BNSF has represented in its comments, mergers of major companies in other regulated industries can be accomplished in a matter of months.[15] A 19-month delay imposes a serious tax on the finances of any combination. In effect, it would set back by nearly two years the merging railroads' ability to begin to realize the benefits of the transaction. Moreover, it would make it impossible during that time period for either of the merging parties to determine their optimal capital expenditure levels and allocation of assets. Markets do not stand still while the Board is deliberating. The longer the Board takes, the longer the merging parties are caught in limbo. Investors and stockholders are well aware of the adverse effects this can have on profitability, and their perception of the risk will be reflected in both the value of the railroads' stock and in their decisions to invest in the industry.

The substantive criteria the Board proposes to use to assess Class I mergers also would impose a significant tax on the finances of proposed transactions. The justification the Board states for requiring merging parties to offer "competitive enhancements" is that

---

[13] Proposed 49 CFR 1180.4(e)(2)-(3), NPR p. 27; 49 CFR 1180.4(b)(1) and (c)(7).

[14] BNSF in its Comments is proposing that the Board limit its merger review and decision time to one year, which would be a significant improvement from the standpoint of regulatory delay over a permitted 19-month schedule.

[15] BNSF Comments, Section III.A.

such enhancements are necessary to offset the presumed deleterious effects a merger will have on geographic and product competition and customer service.[16] But, as Professors Gómez-Ibáñez and Kalt explore in some detail in their verified statement on behalf of BNSF, the Board nowhere explains why those deleterious effects must be presumed or why conditions could not be fashioned that address any demonstrated deleterious effects directly. The result of setting up a hurdle of presumed but undefined and unquantified adverse merger effects, which must be overcome with unrelated "competitive enhancements," is that neither the railroads nor their investors can know with reasonable certainty what amount of "enhancements" will be required to overcome the presumed adverse effects. This makes it difficult to determine whether the transaction as planned will be approved or, if it is approved, whether the "enhancements" required will so diminish the benefits to the merging parties as to make the transaction uneconomic.

This uncertainty is compounded by proposals like those the Board makes, if it approves a merger, to closely monitor the public benefits that the merging railroads estimated would result from the merger and to seek "measures" to impose if those public benefits are not realized.[17] Merging railroads have every incentive to work to realize all of the benefits they have projected, and more, but railroads and their investors are acutely aware that they cannot control the markets for transportation services or the responses

---

[16] Proposed 49 CFR 1180.1(c)-(d), NPR pp. 12-16.

[17] Proposed 49 CFR 1180.1(c)(1), NPR p. 14.

of the railroads' competitors. As it is currently worded, the Board's proposal provides a disincentive for railroads to contemplate combinations, even if they feel that they are the most profitable and efficient use of their assets, for fear of retributive behavior on the part of the Board. This possibility of retributive behavior acts as an uncertain tax upon the railroad companies' assets, which lowers the expected return to be earned on those assets. To threaten that undefined "measures" will be taken if the merging railroads fall short of their goals sets up another disincentive to merge at all. At the least, it requires that a further risk premium be assigned to the return that the railroads and their investors will require even to propose a merger transaction.

Similarly troubling from a financial standpoint is the proposed requirement that railroads anticipate possible responsive mergers, measure their benefits in light of those possible mergers, and discuss how conditions that may be imposed in their proposed merger would have to be altered, or new conditions imposed, if any future mergers were approved.[18] It would be hard enough to have to anticipate even in general terms what, if any, mergers might be proposed in reaction to a present merger proposal, without having to quantify the effects of the various possibilities on the benefits of the present proposal. The suggestion that the Board's approval of a future merger could result in new or altered conditions being imposed on a present merger further exacerbates the uncertainty for railroads and their investors in attempting to determine whether the

[18] Proposed 49 CFR 1180.1(i), NPR pp. 20-21.

present value of the flow of net revenues from the transaction will cover the capital costs.

Each of these regulatory taxes diminishes the prospective benefits of possible merger transactions. It is quite conceivable that a merger that otherwise promised to make the merging railroads more efficient, improve their services, and help them cover their cost of capital – with no unremedied competitive harms – would effectively be defeated by such taxes. That is not in the railroads' interest, it is not in their customers' interest, and it is not in the public interest.

Adverse Financial Effects of Burdensome Merger Regulation. The adverse effects of burdensome regulation are no secret in the rail industry. There is widespread agreement that much of the blame for the poor financial condition of the industry in the 1970's can be laid at the feet of overly restrictive regulation.[19] Investors cannot be compelled to invest their money in an industry that is constrained from covering its costs. When Congress passed the Staggers Act in 1980, it estimated that capital shortfall in the industry would grow to $16-20 billion by 1985 unless regulatory reforms were enacted.[20]

---

[19] *See, e.g.,* General Accounting Office, *Railroad Regulation: Economic and Financial Impacts of the Staggers Rail Act of 1980* (1990), *Changes in Railroad Rates and Service Quality Since 1990* (1999); Braeutigam, R., "Consequences of Regulatory Reform in the American Railroad Industry," *Southern Econ. J.* 468 (Jan. 1993) ("Although regulatory reform has occurred in many American industries in the past two decades, in few of these industries was the need for reform as clear and urgent as in the domestic railroad industry during the 1970's").

[20] P.L. 96-448, Section 2(7).

As discussed earlier, the reforms that were enacted, including a policy that promoted efficient mergers, had the desired effect of reversing the railroads' decline and encouraging new investment in the industry. But the railroads' past improved performance cannot justify renewed investment in their overall systems unless it holds out the promise of enabling them to cover their overall costs.

Mergers, and the prospect of mergers, are one of the ways that the industry can justify reinvestment in systems that have not historically covered their cost of capital. If mergers provide the means to improve operating efficiency and build markets by offering new and improved rail services, then railroads may have reason to maintain and upgrade their systems in anticipation of future combinations that can meet the financial requirements of the market. If, on the other hand, the kinds of regulatory taxes contained in the Board's proposed merger rules overly burden mergers that make good economic and competitive sense, then those mergers either will not happen, or their benefits will be significantly reduced. The predictable result will be a reduced expected return for the railroads' assets, a reduction in capital spending, a higher cost of capital, harm to shareholders, and, ultimately, harm to shippers if the services they want cannot be supported.

Research Evaluation

Project reviewer for the National Science Foundation: 1979-Present
Program committee for the Western Finance Association: 1982-1988

Selected Board and Committee Memberships

Chairman, Mayor Riordan's Blue Ribbon Commission on Los Angeles' Municipal Investments
Pension Policy Board, The Aerospace Corporation: 1985-Present
Forms Engineering Corporation: 1976-1997
Trustee, Kellow Trust: 1982-1991

Selected Consulting Clients

Merrill Lynch (obtained futures broker's license, owned a seat on the International Monetary Market of the Chicago Mercantile Exchange)
Chase Manhattan Bank
Thrifty Corporation
Wynn Oil
Resorts International

Expert Witness

Numerous cases involving the application of financial economics

Media Experience

Occasional contributor to *The Wall Street Journal* and *The Los Angeles Times*
Occasional commentator for local television and radio stations
Lecturer on valuation theory, appraisal practice, and securities pricing

APPLICANTS' BRIEF

The common control, consolidation and merger of BN and Santa Fe will yield substantial – and undisputed – public benefits by creating an integrated rail network that will give shippers efficient new single-line rail service to virtually all key domestic and export gateways in the Western United States. Because this is predominantly an end-to-end combination, situations in which there might be a potential reduction in competition have been limited from the outset. Competitive options have been preserved in all of those situations under the settlement agreements Applicants have entered into with SP and UP.[1/] Equally important, the combination of BN and Santa Fe will enhance competition, both between rail carriers and between rail and truck transportation. All other criteria for Commission approval are satisfied, and the Commission should accordingly authorize the common control, consolidation and merger that Applicants propose.

In doing so, the Commission should deny the requests for conditions and responsive applications that have been filed by certain utilities, short line railroads and other parties. As detailed below, none of the relief those parties seek is necessary to remedy any adverse effect of this transaction. Indeed, many of those requests seek relief unrelated to this transaction and seek to place their proponents in a better competitive position than they are in today. They consequently offer no valid basis to grant such relief.

[1/] A map showing the proposed Burlington Northern and Santa Fe Railway is provided in Appendix A, and a map showing it in relation to SP, UP and the rights named in Section 1 of the NIT League Stipulation is provided in Appendix B. A list of the abbreviations, acronyms and short forms for citations to decisions and pleadings used in this brief is provided in Appendix C.

I. THE PRIMARY APPLICATION SHOULD BE APPROVED

The "single and essential standard of approval is that the Commission find the [transaction] to be consistent with the public interest" under 49 U.S.C. § 11344(c). UP/CNW at 53 (internal quotation marks omitted). The statute defines five public interest factors to be considered in reviewing a transaction, such as this, that involves two or more Class I railroads:

> (A) the effect of the proposed transaction on the adequacy of transportation to the public; (B) the effect on the public interest of including, or failing to include, other rail carriers in the area involved in the proposed transaction; (C) the total fixed charges that result from the proposed transaction; (D) the interest of carrier employees affected by the proposed transaction; and (E) whether the proposed transaction would have an adverse effect on competition among rail carriers in the affected region.

UP/CNW at 53 (citing 49 U.S.C. § 11344(b)(1)).

In assessing effects on the adequacy of transportation, the Commission examines the public benefits that will result from the transaction. UP/CNW at 53. Those benefits include efficiency gains from cost reductions, service improvements, the ability to provide rail service with fewer resources and "economies of scale, scope, and density." Id. Public benefits may also flow from "marketing opportunities that can make the consolidated carrier financially stronger and, therefore, a better competitor that can more easily provide adequate service on demand," as well as from the "elimination of duplicative facilities and the use of more direct routings." Id. at 56 (citing 49 C.F.R. § 1180.1(c)(1)).

In assessing effects on competition, the Commission looks both to the Rail Transportation Policy set forth at section 10101a, which emphasizes "reliance on competitive forces, not government regulation, to modernize railroad actions and to promote efficiency," and to the "policies embodied in the antitrust laws." UP/CNW at 54. The Commission

> must estimate the scope and appraise the effects of the curtailment of competition which will result from the proposed consolidation and consider

> them along with the advantages of improved service, safer operations, lower costs, etc., to determine whether the consolidation will assist in effectuating the overall transportation policy. . . .

Id. (quoting McLean Trucking Co. v. United States, 321 U.S. 67, 87-88 (1944)). The Commission does not "sit as an antitrust court," but rather balances any anticompetitive effects of the transaction against its anticipated benefits. UP/CNW at 55. "In essence," the Commission performs "a balancing test weighing 'the potential benefits to applicants and the public against the potential harm to the public.'" Id. at 55-56 (quoting 49 C.F.R. § 1180.1(c)).

The other considerations set forth in section 11344 are "Special Public Interest Factors" as to which the Commission makes "special, narrowly focused public interest findings." UP/CNW at 55. These include the effect of the transaction on the applicants' railroad employees. See id. at 94-95. In addition, the Commission reviews the financial terms of the transaction and their fairness to shareholders. See Schwabacher at 198, 201; see also UP/MKT at 515-16; UP/MP/WP at 635. Finally, the environmental laws, as implemented through the Commission's environmental regulations, require the Commission to consider "the effects of the transaction on the environment." UP/CNW at 55.

A. The Consolidation Will Result in Substantial Public Benefits

The proposed transaction is consistent with the public interest and should be approved because it promises public benefits that far outweigh any potential harm. "Public benefits may be defined as efficiency gains which may or may not be shared with shippers and which include both cost reductions and service improvements." Id. at 53. Applicants' showing of extensive service improvements and substantial cost reductions from the proposed transaction is essentially undisputed.

Shippers and the consuming public will benefit from the enhanced single-line service provided by the consolidated carriers. The Commission has emphasized that "[t]here are substantial efficiencies in single-line service compared to joint-line service." Id. at 66-67. Indeed, the public benefits of single-line service are a recurrent theme in Commission merger decisions. RGI/SP at 877-78; CSX Control at 552; BN/Frisco at 935-40. Applicants' evidence establishes that the combined BN/Santa Fe will be able to provide extensive new single-line service, including but not limited to service (1) between points in California and the Southwest served by Santa Fe and points in the Southeast served by BN; (2) between points in the Northern Tier states served by BN and points in the Southwest and California served by Santa Fe; and (3) between Canada and Mexico. Krebs V.S., BN/SF-7 at 151-54; Lewis V.S., BN/SF-7 at 220-41.

Single-line service benefits shippers by improving transit times and eliminating the uncertainties associated with interchanging traffic, thereby permitting shippers to reduce their inventory costs. Marlier V.S., BN/SF-7 at 179; Lewis V.S., BN/SF-7 at 246. By dealing with one carrier rather than two, shippers also can reduce transaction costs for activities such as negotiating rates, arranging equipment supply, tracking shipments and making payments. Id.

Single-line service will also benefit the public interest and the consolidated railroads themselves by allowing the combined BN/Santa Fe to compete more effectively against other rail carriers and trucks. Marlier V.S., BN/SF-7 at 172-80; Kalt V.S., BN/SF-7 at 453; Cane V.S., BN/SF-7 at 352-55. The Commission has found that enhanced competition is a public benefit because it leads to improved service or reduced rates. UP/CNW at 64. The extended single-line hauls and diversions from other carriers projected by Applicants' traffic studies reflect enhanced competitive strength that will result in increased traffic for the BN/Santa Fe system. Kalt V.S., BN/SF-7 at 490-91. The proposed consolidation is the only way that these projected benefits can be fully realized: Applicants' evidence demonstrates that efforts to improve service

and enhance competitiveness through other cooperative arrangements have fallen short of producing the benefits of actual single-line service. Krebs V.S., BN/SF-7 at 153-54; Kalt V.S., BN/SF-7 at 53-55; Cane V.S., BN/SF-7 at 363-73.

Two aspects of the enhanced competitive strength of the combined BN/Santa Fe system warrant special mention because of the public benefits they offer.

The first is the expanded network coverage that will allow Applicants to compete more effectively against the other major western railroads – UP and SP – and to reach all key West Coast export and mid-continent gateways. Grinstein V.S., BN/SF-7 at 141-42; Kalt V.S., BN/SF-7 at 453-69. Neither BN nor Santa Fe currently possesses network coverage as extensive as that of UP or SP. BN lacks direct access to Central and Southern California, the Southwest, and Mexico. BN's West Coast port coverage is limited to the Pacific Northwest. Santa Fe does not reach the Pacific Northwest, the Upper Midwest or Canada. The combination of BN and Santa Fe will overcome these limitations. Expanded access to West Coast and Gulf Coast ports will permit Applicants to serve the needs of U.S. shippers better in the increasingly competitive global marketplace. Grinstein V.S., BN/SF-7 at 142. The ability to provide single-line service between Canada and Mexico will also enable the combined railroad to assist American industry in realizing the opportunities created by NAFTA. Lewis V.S., BN/SF-7 at 226-41.

A second major benefit of Applicants' enhanced competitive strength will be their ability to divert truck traffic from the overcrowded highways to the safer and more energy-efficient rail system. Marlier V.S., BN/SF-7 at 179; Stone V.S., BN/SF-7 at 682; Roberts V.S., BN/SF-7 at 724-25. The projected movement of additional containers and trailers on Applicants' trains will further the intermodal partnerships that Santa Fe has been at the forefront of developing. Krebs V.S., BN/SF-7 at 154-56; Marlier V.S., BN/SF-7 at 170. The public will

benefit from a more efficient use of the national transportation infrastructure, from reduced energy consumption and from improved air quality.

The combination of BN and Santa Fe will produce quantifiable benefits that are projected to exceed $560 million annually. Applicants project total cost savings of $453 million annually. Ice V.S., BN/SF-7 at 336. The increased traffic Applicants expect to realize through extended hauls, diversions from other rail carriers and diversions from trucks are projected to yield gross annual revenues of $306 million, with a net revenue gain to Applicants of $107 million. Id. Together, the net revenue gain and the cost savings yield projected benefits in excess of $560 million annually.

The vast majority of the $560 million in projected benefits constitute public benefits. "Cost reductions, regardless of whether they are passed on to shippers, are public benefits because they permit a railroad to provide the same level of rail services with fewer resources or a greater level of rail services with the same resources." UP/CNW at 53. Professor Kalt examined the $453 million in projected cost savings and concluded that "the overwhelming portion of the cost savings identified by the merging companies constitutes reduced use of resources and thus qualifies as public benefits." Kalt V.S., BN/SF-7 at 482; see also Schmalensee R.V.S. at 26-27.

The Operating Plan shows that the consolidation will result in annual operating savings of nearly $107 million. Operating Plan, BN/SF-8 at 135. The operating efficiency benefits include, among others, improved equipment utilization due to integrated dispatching and scheduling, consolidation and specialization of system mechanical shops, more efficient utilization of personnel, lower equipment maintenance and maintenance of way costs, integrated train operations and consolidation of duplicative yard and terminal functions. Ice V.S., BN/SF-7 at

331-32; Robinson V.S., BN/SF-8 at 295-306; Operating Plan, BN/SF-8 at 113-29. Applicants' Operating Plan

> projects that the combined system could offer shippers single-line service with internal reroutes that, in the aggregate, would have moved the base 1993 traffic with reductions of 37 million car miles, 2.67 billion gross ton miles, and 1.8 million locomotive unit miles compared to operations over the separate railroads. These reductions in route miles will also result in a savings of 4 million gallons of fuel per year.

Ice V.S., BN/SF-7 at 332 (as corrected by Errata submitted Nov. 7, 1994); see also Robinson V.S., BN/SF-8 at 296. Such savings from more efficient train operations are clearly public benefits. See, e.g., RGI/SP at 879-80; BN/Frisco at 935-37; NS Control at 203.

Extensive savings will be realized from the reduction of duplicative general administrative and support functions – $346 million annually. These savings, which are a key element of the public benefits of this transaction, will be achieved by operating the combined company with unified executive offices, an integrated and consolidated management information system, a centralized customer support function and just-in-time inventory practices, as well as through rationalization and specialization in various support and clerical areas. Ice V.S., BN/SF-7 at 333; Hund/Snyder V.S., BN/SF-8 at 339-50; Robinson R.V.S. at 3-6.

The additional traffic Applicants expect to carry after the consolidation will result from the provision of higher quality rail service, which, as Professor Kalt explains, is a public benefit. Kalt V.S., BN/SF-7 at 483. However, the annual net revenue gain of $107 million that Applicants project is not the measure of the net benefits of service improvements to the shipping public. Id.; see also UP/CNW at 67 ("[O]nly the service improvements and cost savings associated with traffic diversions can be counted as public benefits."). Because of data limitations, the public benefits associated with improved service – e.g., reduced inventory costs and reduced transaction costs for shippers – are difficult to quantify. Nonetheless, such public benefits are

likely to be substantial given the magnitude of traffic gains projected by Applicants. Kalt V.S., BN/SF-7 at 482-83, 488-90; Schmalensee R.V.S. at 10-14, 27-28.

The public benefits identified by Applicants are essentially unchallenged. Although a number of parties are participating in this proceeding in an opportunistic attempt to obtain conditions, Applicants' showing of public benefits is essentially unchallenged.[2/] As DOJ acknowledges, "[i]t is likely a merger of two railroads having combined revenues of $7 billion would create significant efficiencies." Woodward V.S., DOJ-2 at 1 n.1.

The extensive support for the consolidation by shippers and government officials further attests to the public benefits of the transaction. Some 600 shippers and more than 60 governmental entities have filed statements or letters supporting the proposed consolidation. See BN/SF-10, 11, 21, 34. This broad-based and enthusiastic support for the transaction confirms the substantial public benefits that will flow from the combination of BN and Santa Fe. A list of statements supporting the proposed transaction is provided in Appendix D.

B. The Proposed Transaction Will Not Have an Adverse Effect On Competition

In evaluating "whether the proposed transaction would have an adverse effect on competition among rail carriers in the affected region," 49 U.S.C. § 11344(b)(1)(E), the Commission does not limit its consideration of competition to the number of rail carriers alone, but rather determines whether the consolidated carrier in fact will have market power.[3/] At the out-

---

[2/] Dr. Christensen, a witness for certain utility interests, contends that the proposed transaction would not create scale economies. However, the Commission has recognized that there are substantial efficiencies associated with single-line service. See UP/CNW at 66-67. Moreover, Dr. Christensen does not dispute that the vast preponderance of the $453 million in cost savings projected by Applicants are public benefits.

[3/] See UP/MP/WP at 516 n.46 (defining market power as the "ability profitably to sustain higher prices or lower service quality"); accord UP/MKT at 433; Central Vermont at 335.

set, the Commission generally examines a consolidation's effects on the existing railroad network, with particular attention to whether the consolidation is primarily parallel – combining routes between the same points – or end-to-end – combining routes that may serve some of the same points but generally serve separate, if neighboring, parts of the country. The Commission has recognized that "consolidations of end-to-end railroads rarely raise competitive concerns." UP/CNW at 70; see also Schmalensee R.V.S. at 16-23.

The BN/Santa Fe consolidation is predominantly end-to-end. Kalt R.V.S. at 5. There is no overlap between BN and Santa Fe in the three major transcontinental corridors. BN's principal transcontinental route is over the Northern Corridor, whereas Santa Fe operates over the Southern Corridor; neither carrier has a through route in the Central Corridor. With very few exceptions, the small number of routes where BN and Santa Fe do overlap are served by one or more additional railroads. Moreover, BN and Santa Fe are complementary not only in their route structure, but also in the commodities they carry, in that BN's principal strength is in coal and grain transportation and Santa Fe's in intermodal movements. Kalt V.S., BN/SF-7 at 451-53.

In fact, the BN/Santa Fe consolidation will be affirmatively procompetitive because it creates a strong carrier to compete with UP's and SP's long-haul options. Id. at 519-20; see also NS Control at 229 (benefits of competition between NS and CSX). Not only are the procompetitive effects of this consolidation prominent, but, as Professor Kalt explains, it presents only narrow issues of horizontal competition; the vertical combination of BN and Santa Fe "does not pose a threat of competitive harm to shippers." Kalt R.V.S. at 100.[4/]

[4/] The vertical foreclosure claims that have been raised lack merit for the reasons explained in Commission precedents (e.g., UP/CNW at 72-76, 87-89; UP/MP/WP at 537-43), in Kalt R.V.S. at 42-100 and Schmalensee R.V.S. at 28-44, and in the discussions of particular claims, infra.

In contrast to the substantial benefits of this transaction, only a few localized claims of reduced rail competition have been raised. Such alleged reductions do not equate to actual competitive harm, particularly in light of the settlements reached in this proceeding. In its competition analysis, the Commission – because of its pragmatic focus on "meaningful reduction[s] in . . . transportation competition" that result from actual market power (UP/CNW at 64) – may give "dominant weight" to factors other than intramodal competition. Central Vermont at 336. This is because the Commission begins its analysis of the competitive impact of a consolidation by defining the relevant markets that would be affected. RGI/SP at 885. "A relevant market is the area of effective competition" – the zone of modes, products, sources, and destinations within which "consumers shift their consumption in response to a change in relative price or quality." UP/CNW at 57 (emphasis added).[5/]

For some long-haul movements of dense bulk commodities, the relevant market may consist only of rail transportation. For shorter movements, or movements of other commodities, transportation by truck, barge, pipeline, or electrical transmission may be substituted for rail transportation if prices increase too much. Different products, different sources or, for multi-plant shippers, different destinations may be substituted in some cases.

Fuel for the generation of electricity is an example: electricity is fungible, most purchasers use a variety of fuels delivered by a variety of rail carriers and other modes, and all purchasers may substitute competitively priced power generated by other plants or other utilities for power that is supracompetitively priced because of high rail transportation costs. For these reasons, the Commission has recognized that competition from other modes, other sources or

---

[5/] USDA contends that the consolidation of BN and Santa Fe will reduce competition for the transportation of wheat, but fails to define the market for such transportation in economically meaningful terms and ignores source competition. Kalt R.V.S. at 31-34.

other products may force a carrier to price competitively even if it does not compete directly with another railroad. E.g., UP/MKT at 433, 477; Milwaukee I at 227-28; Spine Line at 930-32.

Applying this analytic framework to the markets that BN and Santa Fe serve, the significant anticompetitive effects of the proposed consolidation have been few and far between from the outset. Moreover, Applicants have taken steps to address the limited problem areas through the settlement agreements discussed below.[6/] Applicants' stipulation with NIT League, which represents a broad range of shipper interests, identifies the areas of competitive concern and provides assurance that the settlements will be implemented. See BN/SF-33.[7/] Adoption of the NIT League Stipulation as a condition to the Commission's approval of the transaction will resolve any genuine competitive problems. Kalt R.V.S. at 4, 7; Ice R.V.S. at 17-26.

With respect to the first location named in the NIT League Stipulation, Applicants have agreed to give UP overhead trackage rights between Superior, NE and Abilene, KS, with access to all shippers served by both BN and Santa Fe in Superior. Kalt R.V.S. at 2-3; Ice R.V.S.

[6/] In addition to the agreements related to the competitive effects of the consolidation, Applicants have entered into several agreements that actively enhance rail competition in areas where the consolidation would not otherwise affect competition. Kalt R.V.S. at 6, 16, 21; Ice R.V.S. at 3-16; see also BN/SF-32 & BN/SF-33 (settlement agreements).

[7/] In their stipulation with NIT League (BN/SF-33, Stip. ¶ 1), Applicants have agreed to grant the following to unaffiliated Class I carriers:

> (1) overhead trackage rights between Abilene, KS, and Superior, NE, with access to all facilities at Superior that are served by both BN and Santa Fe;
>
> (2) overhead trackage rights over Santa Fe's lines between Pueblo, CO, and Stratford, TX, and over BN's lines between Dalhart and Fort Worth, TX, along with access to all industries served by either BN or Santa Fe at Amarillo, Lubbock, and Plainview, TX, and access to SWGR;
>
> (3) access to TPW at Bushnell, IL; and
>
> (4) access to all industries served by either BN or Santa Fe at Ft. Madison, IA, and Galesburg, IL.

at 18-19. The agreement ensures that every Superior shipper that has access to two railroads at the time of the consolidation will continue to be served by two railroads after the consolidation (Ice R.V.S. at 18-19), and actually increases competition over the present level. Only Santa Fe now has a route leading south from Superior, but after the consolidation UP will compete for this traffic for the first time. Kalt R.V.S. at 10-11. It is therefore unsurprising that the single Superior shipper to comment on the consolidation supports it in the wake of the UP agreement (see Ice R.V.S. at 19; Kalt R.V.S. at 14), and that DOJ also recognizes that, assuming proper trackage rights compensation terms, the UP agreement solves any competitive problems at Superior (Woodward V.S., DOJ-3 at 11-12).

Applicants' agreement with SP preserves and indeed enhances two-carrier competition in the other areas where concerns about transaction-related reductions in rail competition might arise. Applicants will provide SP with trackage rights that, when combined with SP's existing line between Stratford and Dalhart, TX, will give SP the ability to carry overhead traffic from Pueblo, CO to Fort Worth, TX. Ice R.V.S. at 9-10, 19. Moreover, SP will have direct access to all shippers in Amarillo, with haulage rights providing access to all shippers in Lubbock and Plainview. Id. at 19-23. The haulage rights to Lubbock also allow SP to interchange traffic with SWGR in Lubbock – without paying the switching charge now applicable to BN-SWGR interchanges. As Mr. Ice and Professor Kalt point out, those haulage rights provide SP with more efficient and thus more competitive access to shippers in Plainview and Lubbock, because SP need not attract enough volume to justify running entire trains of its own over the short haul to Amarillo. See id. at 18; Kalt R.V.S. at 12-13. Moreover, the Amarillo-Lubbock-Plainview arrangement will increase the options for shippers in those locations. They will continue to have single-line service to the entire range of destinations now served by BN and Santa Fe, and they will gain new single-line service to SP destinations as well – including competing single-line service

to California and the Southwest. Ice R.V.S. at 21-22; Kalt R.V.S. at 10-11. DOJ recognizes that the SP agreement will solve its competitive concerns in this area, assuming proper compensation terms. Woodward V.S., DOJ-3 at 12-13.

Finally, Applicants' agreement with SP addresses the potential diminution of competition in southeastern Iowa and the adjoining portion of Illinois. SP now has trackage rights over a BN line from Kansas City to Chicago through Galesburg, IL and Bushnell, IL (but without access at those points). Under the agreement, SP will have the right to interchange traffic with TPW at Bushnell, along with the ability to serve all shippers in Galesburg. SP also will receive haulage rights to serve all shippers in Ft. Madison, IA. Ice R.V.S. at 23-26.

These arrangements will give shippers in southeastern Iowa and neighboring portions of Illinois an improved range of westbound shipping options. Whereas Keokuk, IA shippers previously could either interchange directly with BN, or send traffic over a KJRY-TPW-Santa Fe routing – often only to connect with SP to reach their shipping destinations (see id. at 25) – they now will have single-line service from Keokuk to all destinations served by either BN or Santa Fe, and will have SP destinations available over a KJRY-TPW-SP routing. As DOJ recognizes, this addresses all legitimate competitive concerns at Keokuk. Woodward V.S., DOJ-3 at 13 & n.16; see also Kalt R.V.S. at 20. Ft. Madison and Galesburg shippers will gain direct access to SP, in addition to their existing access to BN and Santa Fe, preserving two-carrier competition in those locations.

Various parties to this proceeding recognize that the UP and SP settlement agreements solve any competitive problems in the areas where they apply but ask the Commission to impose them as conditions to its approval of the transaction. Imposition of the agreements as conditions is inappropriate and unnecessary. In their stipulation with NIT League, Applicants have agreed to submit to the Commission implementing agreements to carry out all trackage

rights granted in the settlement agreements described above no later than 180 days from the date of the stipulation, and to implement haulage rights identified in the NIT League Stipulation promptly after receiving approval for the consolidation. BN-SF 33, Stip. ¶ 2.

In addition, Applicants and NIT League have agreed to ask the Commission to impose their stipulation as a condition to approval of this transaction (id. ¶ 4), which Applicants hereby request. Imposing the stipulation as a condition makes it unnecessary to impose any other conditions to preserve competition; compliance with the stipulation will sufficiently protect competitive alternatives without further regulatory involvement.

The settlement agreements result from arm's-length negotiations between sophisticated commercial entities. For that reason, the Commission can be confident that the agreements are workable. See Kalt R.V.S. at 22-23 (the "contextual tailoring that is obtained through business negotiations of trackage and haulage agreements" make the agreements "work effectively"); see also Schmalensee R.V.S. at 44-51. Moreover, the accord with NIT League ensures that the results of inter-carrier negotiations will benefit shippers as well as the carriers themselves.

Applicants thus have fashioned appropriate remedies to the potential harms to competition resulting from the consolidation. The substantial efficiencies that will be achieved manifestly outweigh the minimal and scattered potential competitive harm alleged here. See UP/MP/WP at 564; Kalt V.S., BN/SF-7 at 515-19; see also Schmalensee R.V.S. at 9-15. Precedent and sound policy fully justify approval of this transaction.

C. All Criteria For Authorization Are Satisfied

All applicable criteria for authorization of the common control, consolidation and merger of BN and Santa Fe, the associated securities and financial matters, and Applicants' related petitions for exemption in Sub-Nos. 1-12 have been fully satisfied.

Section 11344: The consolidation of BN and Santa Fe will substantially enhance competition and, as Applicants demonstrate, will have no "adverse effect on competition among rail carriers." Moreover, the substantial and unchallenged public benefits Applicants have shown will greatly improve the "adequacy of transportation to the public." The only allegations of potential adverse effects on such service are very limited and wholly unfounded. As detailed below, claims by Amtrak and SCRRA that the transaction will adversely affect certain passenger and commuter operations are speculative and ignore existing contractual arrangements. Moreover, while KJRY, GNBC and SWGR loosely refer to "essential services," they plainly fail to show that essential rail services would be lost under applicable Commission standards.[8/]

The effects of the transaction on employees are detailed in Applicants' evidence.[9/] Any effects are adequately addressed by the already extensive statutory labor protection. See Northrup R.V.S. at 25-28.

[8/] The Commission requires proof that a railroad "will incur revenue losses that threaten its ability to provide service throughout its system," and that "the threatened services are essential, rather than peripheral," considering "the public need for the services" and whether alternative service is currently available or would likely be provided by other carriers if necessary. UP/MP/WP at 546. KJRY, GNBC and SWGR do not even purport to meet those tests, and Applicants show that no essential services in fact are threatened. See BN/SF-35&36, Overview at 104-05, 110; infra pages 42-45.

[9/] See Labor Impact Exh., BN/SF-8 at 425; Hund-Snyder V.S., BN/SF-8 at 335-51; Hund-Speaker V.S., BN/SF-8 at 433-37; Robinson R.V.S. at 1-6; BN/SF-35&36, Overview at 119-20.

The BNI-SFP merger and the common control, consolidation and merger of BN and Santa Fe will not increase total fixed charges. See Hund-Snyder Supp. V.S. at 3, 4. No other rail carrier has sought inclusion in the transaction.

Securities: Applicants have requested authorization under 49 U.S.C. § 11301 to the extent it may apply to BN's succession to Santa Fe obligations. See BN/SF-7 at 7, 57. Any such assumption of liabilities fully satisfies the standards for approval, as it will be for the purpose of implementing a transaction the Commission will have found to be consistent with the public interest and will not impair the merged carrier's ability to provide service. See id. at 7; Hund-Snyder Supp. V.S. at 4-5 & Exhibits. No party has contested Applicants' request for section 11301 approval.

Financial Terms: The financial terms of the transaction, including the stock exchange ratio, were agreed to on an arm's-length basis, and their fairness to stockholders has been confirmed by the parties' expert financial advisors. See BN/SF-25, SEC Form S4, Post-Effective Amendment No. 4 at 42-49 & Apps. C&D. The final terms reflect the market's determination of a fair exchange ratio and provide a premium for SFP shareholders. See id. at 12; UP/CNW Financial Terms at 3.[10/] The merger was overwhelmingly approved by the shareholders of both BNI and SFP, and no party has challenged the exchange ratio or any other financial term. The Commission should accordingly find those terms to be just, fair and reasonable.

Related Petitions for Exemption: The related petitions for exemption in Sub-Nos. 1-12 seek authorization for the control of WUTR and for eleven minor construction projects designed to achieve efficiencies described in the Operating Plan. No party has contested any

---

[10/] Those terms are summarized in BN/SF-25 and set forth in detail in the accompanying SEC filings. As explained in BN/SF-25 at 2-4 & n.2, they include an alternative merger structure that would involve an additional holding company entity, BNSF Corporation, and two subsidiaries it would create for that purpose. Applicants have asked the Commission to join all of those entities as additional Applicants in this proceeding. Id. at 3 n.2.

of those petitions, and the requirements for exemption under 49 U.S.C. § 10505 have been met in each case. Regulation of the underlying transactions is not necessary to carry out the rail transportation policy or to protect shippers from abuse of market power, and each transaction is limited in scope. The exemptions accordingly should be granted.

Environmental Matters: Both the draft EA served June 6, 1995 and Applicants' environmental evidence (BN/SF-14) conclude that the Application and the construction in Sub-Nos. 2-12 will not result in any significant adverse environmental effects. In fact, the substantial, uncontested truck-to-rail diversions projected (see BN/SF-14 at 107-12, 144-46) will yield significant environmental benefits in improved air quality and reduced energy consumption.

II. THE REQUESTS FOR CONDITIONS AND RESPONSIVE APPLICATIONS SHOULD BE DENIED

Applicants have agreed that compliance with the NIT League Stipulation should be made a condition of Commission approval. No other conditions are justified.

A. The Commission's Strict Standards Require That the Requests for Conditions and Responsive Applications Be Denied

The Commission imposes conditions sparingly because they tend to reduce the benefits of a consolidation for both the carriers and the public. UP/CNW at 56; 49 C.F.R. § 1180.1(d)(1). Thus, a condition will not be imposed unless the Commission finds

> that the consolidation may produce effects harmful to the public interest (such as an anticompetitive reduction of competition in an affected market), that the conditions to be imposed will ameliorate or eliminate the harmful effects, that the conditions will be operationally feasible, and that the conditions will produce public benefits (through reduction or elimination of the possible harm) outweighing any reduction to the public benefits produced by the merger.

UP/MP/WP at 565. In light of the settlements, none of the requests for conditions or responsive applications in this proceeding meets these tests.

To be granted, a condition must first address an effect of the transaction. The Commission will not impose conditions "to ameliorate longstanding problems which were not created by the merger," nor will it impose conditions that "are in no way related either directly or indirectly to the involved merger." BN/Frisco at 952 (footnote omitted); see also UP/CNW at 97.

While showing that a condition addresses effects of the transaction is necessary, it is by no means sufficient. The condition must also be narrowly tailored to remedy those effects. The Commission will not use its conditioning power "to make consolidation proceedings vehicles for rail system restructuring," UP/MP/WP at 564, and will not impose a condition that would put its proponent in a better position than it occupied before the consolidation. UP/CNW at 97; Milwaukee II at 455. If, for example, the harm to be remedied consists of the loss of a rail option, any conditions should be confined to restoring that option and should not extend to creating new options that did not exist before consolidation. E.g., Milwaukee II at 455; Wisconsin Central at 233; UP/MP/WP at 564. Moreover, conditions are not warranted to offset revenue losses by competitors as a result of the transaction. BN/Frisco at 951.

Operational feasibility is another key factor. For example, in evaluating requests for trackage rights, the Commission considers the capacity of the line involved to handle the increased traffic the trackage rights would add (UP/MP/WP at 572, 587), the risk of congestion at yards and terminal facilities (id. at 571), the potential for disrupting the operations of the landlord or other connecting carriers and downgrading service to shippers (id. at 584), and the workability of the responsive applicant's operating plan (id.).

Even if those tests are satisfied, the Commission will not impose a condition whose ameliorative benefits are outweighed by the harm it would inflict on the consolidation itself. For example, the Commission has long found that traffic protective conditions, and the artificial constraints on divisions and routings they entail, are anticompetitive and should not be imposed, because they inhibit the efficient pricing of divisions and routing of traffic in accordance with market forces.[11/]

The Commission also will not impose conditions to address potential problems for which adequate remedies are already provided by law. Traffic protective conditions again provide a good example: the Commission has held that a merger proceeding is not the appropriate forum to address concerns over potential cancellations of joint rates or through routes because adequate protection against such cancellations exists under 49 U.S.C. § 10705(e) and 49 C.F.R. § 1144. See RGI/SP at 932; CSX Control at 579; Seaboard I at 603. The same reasoning applies to conditions seeking the prescription of rates or rate levels, such as the "parity" conditions that have been sought by certain parties here. The Interstate Commerce Act contains detailed standards that must be applied in reviewing the reasonableness of filed rates and prescribing maximum reasonable rates. See 49 U.S.C. §§ 10701a, 10704, 10707, 10707a, 10709. Those provisions of the statute are the exclusive remedies on rate matters, making rate-related conditions both unnecessary and inappropriate.[12/]

[11/] See, e.g., Seaboard II at 5; N&W/DTI at 527; Traffic Protective Conditions at 114; Milwaukee I at 263. Notwithstanding this precedent, two parties have asked the Commission to resuscitate the long-interred "DT&I" traffic protective conditions by requesting that Applicants be required to set divisions on the basis of mileage or a "mileage equivalency" rule. See IC-12 at 4; AEPC-5 at 3 & Crowley V.S. at 6.

[12/] See UP/MKT at 477 (rate reasonableness proceeding, rather than merger proceeding, is appropriate forum for rate challenge); see also 49 U.S.C. § 10707a(h); National Grain & Feed at 432; Union Pac. R.R., 867 F.2d at 649.

These Commission standards dispose of a number of the requests for conditions made in this case without any need to address specific facts. The responsive applications of HL&P (Sub-No. 13) and SPS (Sub-No. 14) and the requests for conditions granting trackage rights to carriers that have not filed responsive applications themselves, such as those of WRI and OG&E, should be denied because they fail to present sufficient information for evaluation of the operational feasibility of such trackage rights and their impact on Applicants' own operations. The Commission cannot adequately evaluate such operational matters without concrete evidence regarding the proposed operations of the carrier that would use the trackage rights. The requests by IC and AEPCO for traffic protective conditions should also be denied, based on the Commission precedent set forth above and because they would undermine the public benefits of this transaction. See Kalt R.V.S. at 105. Similarly, the requests by AEPCO, Chaco, CP&L, WCTL and MWBC for rate "parity" conditions or rate caps (see AEPC-5 at 3 & Crowley V.S. at 7; CEC-1 at 1, 5; CP&L-7 at 9-10; WCTL-4 at 15; MWBC Comments at 8-9) should be rejected because such rate matters cannot properly be addressed by means of conditions on a consolidation.

B. The Commission Should Not Modify Negotiated Trackage Rights Compensation Terms

DOJ, UP and various shippers request conditions that would modify terms of negotiated trackage rights agreements. Those requests should be denied.

The Commission has made clear that it will not modify the terms of privately negotiated trackage rights agreements to address competitive concerns raised by a consolidation. In UP/MKT, the Commission rejected DOJ's argument for such modifications, holding that:

> where the opposing parties have reached a voluntary agreement on trackage rights in a rail consolidation proceeding, our role ... is a limited one. In this context, "we will approve any reasonable terms agreed to by the parties."

UP/MKT at 468 (quoting UP/MP/WP at 589). That holding is consistent with the Commission's well-established preference for trackage rights compensation to be set by private agreement rather than by regulatory fiat – as well as its policy of favoring negotiated solutions, in both control cases and other proceedings. See UP/MP/WP at 589; UP/MKT at 417; NS Control at 182 & n.21; BN/Frisco at 953; A&M I at 620; RGI/CMW at 982.

As Professor Kalt confirms, negotiated settlements are preferable to terms imposed by a regulator because they are more likely to reflect the parties' efficiency considerations and independent business goals. Kalt R.V.S. at 7-8. Moreover, Applicants' evidence establishes that the compensation terms of these arm's-length agreements are set at levels customary in the industry, eliminating any concern that they will not permit competition between tenant and landlord. Ice R.V.S. at 3, 16; see also UP-7 at 3-4; SP-39 at 2.

DOJ's argument in support of modifying the compensation terms is substantially the same as that rejected in UP/MKT. While acknowledging that "in several of the markets of competitive concern identified by [DOJ] in its Comments, trackage or haulage rights granted to UP or SP may solve the competitive problems," DOJ speculates that those rights might not be an effective remedy if their compensation terms are so high that they would result in higher post-merger rates for shippers. DOJ-3 at 3. DOJ asks the Commission to modify the settlement agreements by imposing "cost-based" rates in place of those negotiated by the parties, endorsing at least in part an approach presented by NIT League witness Crowley before NIT League abandoned that request. Woodward V.S., DOJ-3 at 7-10. However, DOJ offers no evidence to suggest that the negotiated compensation terms are in any way unreasonable or would not in fact permit vigorous competition between the landlord and tenant railroads. In contrast, both UP and SP have stated that the terms of their respective agreements are commercially reasonable

and that they intend to compete vigorously pursuant to those rights. UP-7 at 3-4; SP-39 at 2, 8-10.

Even if the Commission had occasion to set trackage rights compensation, the approach advocated by Mr. Crowley would run afoul of the Commission's methodology for setting reasonable compensation failing agreement by the parties. To derive such compensation, the Commission adds to the landlord's variable costs and proportional maintenance and operation expenses an interest rental component based on the value of the line involved, multiplied by the pre-tax equivalent of the railroad industry cost of capital and prorated by a usage measure.[13/] The compensation levels produced by Mr. Crowley's original cost approach would be only a fraction of those produced by the Commission's methodology.

In fact, it is not clear that DOJ's endorsement of Mr. Crowley's approach extends to his reliance upon original cost. DOJ's witness Woodward states that "any trackage rights fees should allow the landlord a return on its track investment sufficient to maintain the track at pre-merger levels. ... [T]he landlord should receive a payment equal to the opportunity cost of the funds needed to maintain the track." Woodward V.S., DOJ-3 at 8. If the landlord is to remain in business over the long term, it will need to earn funds sufficient to replace the track. Thus, to the extent that Dr. Woodward implicitly recognizes the appropriateness of replacement costs, his endorsement of Mr. Crowley's approach is qualified.

Separately, UP asks the Commission to delete a negotiated provision from Applicants' agreement with SP that provides for the reopening and adjustment of compensation

---

[13/] See, e.g., SSW I at 779-80; SSW II at 682-83, 687. To value the line, the Commission uses either the Capitalized Earnings or the Reproduction Cost New Less Depreciation approach – both of which are designed to produce a current value for the property. See SSW I at 786; ATSF III at 5; ATSF II at 305. The Commission has explicitly rejected the sort of "original cost," "historical cost" or "book value" approach advocated by Mr. Crowley. Compare ATSF I at 376, 379; SSW II at 674 with Crowley V.S., NITL-8 at 11.

terms in the event that UP were to acquire control of SP. Contrary to UP's suggestion, this provision is neither unreasonable nor anticompetitive. Reopening and adjustment of compensation terms is a logical consequence of the changed circumstances if both UP and SP were to operate over Applicants' lines between Pueblo and Fort Worth. Today UP has its own line serving this corridor. If UP were to control SP, it could route significant overhead traffic over Applicants' lines. A change in compensation could be required to defray increased operating and capital costs, including costs attributable to congestion on Applicants' lines. Recognizing the significant and predictable volume of coal traffic in the Pueblo-to-Fort Worth corridor and the possibility that a combined UP/SP could tax the capacity of Applicants' lines by shifting significant coal volumes to those lines, Applicants and SP negotiated a charge to apply in the event of UP control of SP that would compensate for the potential impact of such a shift.

C. No Party Has Satisfied the Commission's Requirements for Imposing Conditions

1. Utility Interests

Various utility interests claim that the proposed consolidation would reduce actual or potential competition. All seek to expand – not simply preserve – their competitive options through regulatory "hand-outs." None has satisfied the Commission's strict standards for imposing merger-related conditions.

The predominant complaint of the utility interests is alleged vertical foreclosure: because the merger will combine a single destination carrier with a formerly independent origin carrier, the utility interests claim that the benefits of origin competition will be lost. The Commission has rejected this "neutrality" argument whenever it has been raised by utilities or carriers seeking to serve them. In UP/MP/WP, the Commission rejected BN's request for trackage rights to serve utilities served solely by MP at destination, reasoning that prior to a merger

> A carrier with a destination monopoly will likely push the through rate as high as possible and keep the monopoly profits to itself by playing off competing connecting carriers against one another in setting divisions ....
>
> Therefore, the market power faced by an existing utility is not created, or increased, by consolidation of a monopoly destination carrier with an origin carrier . . . .

UP/MP/WP at 538-39.

In two subsequent cases, Milwaukee II and UP/MKT, the Commission described what the record "must clearly show" in order for a non-merging carrier even to "qualify" for trackage rights to a utility served by a single destination carrier:

> First, it must show that prior to the merger the benefits of origin competition flowed through to the utility and were not captured by the destination monopoly carrier . . . .
>
> Second . . . there must be an additional showing that such a competitive flow-through will be significantly curtailed by the merger.
>
> Thus, a mere showing that a grant of trackage rights to [a non-merging carrier] would enhance competition is not sufficient to warrant our approval.

Milwaukee II at 455 (emphasis added); see also UP/MKT at 476.[14/] A party seeking relief must satisfy both the first and second prongs of this "Milwaukee/MKT" test.

Furthermore, the Commission has rejected the assumption that merged carriers that can provide through service will engage in vertical foreclosure by refusing to submit bids with unaffiliated railroads, recently reiterating "that merged railroads ... have the incentive to encourage full use of the most efficient routing, even when it entails a joint-line alternative to a single system route." Seaboard II at 5; see also Traffic Protective Conditions at 126.

The utility interests seek to make their vertical foreclosure case by alleging that any decline in their rates was due exclusively to origin competition and by asserting that the

---

[14/] While a party might "qualify" for a condition under this standard, the condition should not be granted unless it satisfies the Commission's general standards for granting conditions, including the requirement that the trackage rights sought be operationally feasible.

combined entity will no longer bid with unaffiliated origin carriers or pass on future rate declines. Such "evidence" fails to meet the Commission's test for conditions in three critical respects. It does not "clearly show," as the Milwaukee/MKT test requires, (1) that any particular declines in rates were caused by "origin competition"; (2) that the benefits of origin competition were not "captured by the destination monopoly carrier"; or (3) that any pre-merger "competitive flow-through" would be curtailed significantly post-merger.

By contrast, Professor Kalt demonstrates that the general decline in rates from the PRB since the mid-1980s – which occurred without regard to the number of origin carriers – resulted in part from competition from alternative fuels; that a profit-maximizing destination carrier rationally reduces through rates when upstream rates fall and nonetheless captures its full "lump" of profits; and that BN/Santa Fe will in the future, as each does today, jointly bid with other carriers, so long as it is efficient to do so. Kalt R.V.S. at 49-52, 54-62, 66-75. This latter point has been reaffirmed repeatedly throughout this proceeding by witnesses from both BN and Santa Fe. OG&E Comments, Carter Dep. at 38-40; Quilici R.V.S. at 6 & n.2; Shalah R.V.S. at 22 & n.3.

Although vertical arguments predominate, some utilities also complain that horizontal competition will decline after the merger because BN and Santa Fe will no longer compete for origin, destination or bridge traffic. In analyzing such complaints, the Commission requires convincing evidence that such competition had a beneficial impact before the consolidation, and that afterward there would be a lessening of competition. See 49 C.F.R. § 1180.1(c). As is demonstrated below, the utilities fail this test as well.

In deciding whether conditions are warranted in either the vertical or horizontal context, the Commission has considered whether other competitive forces might discipline rail pricing post-merger. In UP/MKT, it stated that "resort to product competition and the threat to

build out[] have been, and will continue to be, an effective competitive force." UP/MKT at 477 (footnote omitted). Moreover, the Commission long has recognized that a utility's "ability to interchange power among utilities and plants" may prevent it from being "captive" to a single railroad at a single generating station. Salt River II at 687. Thus, a utility's fuel and transportation options must be viewed on a "systemwide" basis, not plant by plant in isolation. Id. at 687-88.

Despite these clear Commission precedents, the utility interests have consistently ignored or underplayed the extent to which alternative fuels and alternative sources of power provide a competitive option to rail transportation. Dr. Avera has described the ever-increasing competitive options enjoyed by utilities. While utilities once were run as geographically isolated, stand-alone entities dependent on their own generating capacity, they now operate across transmission grids, routinely buying and selling power among themselves and from a growing number of non-utility generators. And, although utilities once looked to coal as the fuel of choice, natural gas has emerged to challenge the continued use of coal in existing generating plants and frequently to replace it as the primary fuel in new facilities. Today utilities can choose whether to generate or purchase power and whether to use coal or natural gas, and these choices provide competitive leverage that offsets any potential diminution of intramodal rail competition. Avera R.V.S. at 3-4.

No utility interest has satisfied the strict tests required to justify conditions.

HL&P, whose Parish plant near Houston is served by Santa Fe, contends that the proposed consolidation will foreclose origin competition between BN and UP for movements from the PRB because BN/Santa Fe allegedly would be unwilling to interchange with UP. HLP-10 at 16-17. As a remedy for this alleged loss of origin competition, HL&P asks the Commission

to create destination competition by granting trackage rights to UP or SP for the movement of coal trains over Santa Fe's line to Parish. Id. at 19.

In an attempt to meet the Milwaukee/MKT test, HL&P asserts that it obtained the benefits of origin competition between BN and UP beginning in 1990, by soliciting bids for movements of incremental tonnage. However, the evidence

Redacted Material

Despite HL&P's efforts to dismiss these factors, it remains undisputed that they were the principal influences on BN. In light of this evidence, HL&P has not "clearly shown" that it obtained benefits from origin competition, as opposed to other competitive forces – forces that will not be affected by the proposed consolidation.

Redacted Material

Its ability to pursue this construction will be totally unaffected by this transaction.

Moreover, as Dr. Avera notes and HL&P confirms, HL&P is committed to gas-fired generation. Avera R.V.S. at 38-40; Brackeen R.V.S. at 9, 15, 18, 19. It has announced that its new units will be fueled by gas, and its current gas-fired capacity is nearly four times greater than the generating capacity at Parish and substantially underutilized. Avera R.V.S. at 38-40. And in its own words, HL&P is "one of the largest purchasers of cogenerated power in the world." Brackeen R.V.S. at 25.

Commission precedent precludes HL&P from using this proceeding to expand destination competition when its competitive situation post-merger will be identical to its current situation.

Redacted Material

CP&L, which has an SP-served generating facility near Corpus Christi, TX, contends that the proposed merger will eliminate competition between BN and Santa Fe for the bridge portion of coal movements from an SP-served mine at Colowyo, CO to its plant. It asks the Commission to require SP – a non-applicant – to quote proportional rates for the origin and destination segments of the haul. CP&L-7 at 9-10.

CP&L's request should be rejected. First, the Commission's authority to impose conditions on a non-applicant is limited to the extraordinary relief permitted by 49 U.S.C. § 11103, and does not extend to rate prescription. See UP/MP/WP at 574-75. Second, CP&L admits that bridge competition has "had no tempering effect on SP's dominance over coal deliveries," thus conceding the absence of any benefit from competition between BN and Santa Fe prior to the consolidation. CP&L-7 at 3-4. Third, as a result of the Applicants' grant of trackage rights to SP between Pueblo and Fort Worth – precisely the relief sought by CP&L in this proceeding less than three months ago (CP&L-2 at 2) – CP&L will continue to have two rail carriers

capable of handling the bridge segment of the Colowyo movement. Fourth, CP&L has publicly stated its intention to shift a substantial portion of its coal purchases to PRB mines this year, giving it a new competitive option of moving coal via UP-SP. Shalah R.V.S., Exh. 20. Finally, CP&L has considerable negotiating leverage stemming from the fact that it is part of the Central and South West Corporation integrated utility system, which has coal, natural gas and nuclear capabilities with a total capacity more than 20 times that of the CP&L facility in question. Avera R.V.S. at 46-47. Having thus failed to make any showing of pre-merger benefit or post-merger harm, CP&L has no factual or legal basis for its extraordinary request. See UP/MKT at 476.

SPS operates two coal-fired generating stations: Harrington Station in Amarillo, TX, which is served by both BN and Santa Fe, and Tolk Station, southwest of Amarillo, which is served only by Santa Fe. Its concern with a loss of horizontal competition between BN and Santa Fe at its Harrington Station is fully addressed by Applicants' agreement with SP, which enables SP to serve Harrington directly.

With respect to its Tolk Station, SPS contends that the proposed consolidation would foreclose origin competition between BN and UP due to the loss of a neutral connection with Santa Fe. As a remedy, SPS seeks the imposition of trackage rights to permit another carrier to serve Tolk.

SPS has failed to satisfy either part of the Milwaukee/MKT test.

Redacted Material

Redacted Material

Moreover, Professor Kalt shows that coal transportation rates from the PRB have steadily declined since 1984 due to several factors, including a general "softening" in demand, and that reduced rates are evident without regard to the number of origin carriers. As Professor Kalt also testifies, the mere fact that rates have been reduced does not mean that the full lump of profits was not, in the Commission's language, "captured by the destination monopoly carrier." Milwaukee II at 455; see also Kalt R.V.S. at 54-62, 67-75. In fact, Professor Kalt cites evidence of Santa Fe's bids to the SPS coal plants confirming that Santa Fe sought to capture its full lump of profit at Tolk. Id. at 85-88.

Beyond this, SPS concedes that fuel alternatives have constrained rail rates at Tolk.

Redacted Material

SPS admits that the rate reductions it has obtained from BN and Santa Fe on these volumes have not been caused by "[i]ntramodal competition" but are the "result of product competition (gas) or end-use competition (wholesale power market conditions)." SPST-10 at 16 n.5. Both types of competition "have been, and will continue to be, an effective competitive force." UP/MKT at 477.

Nor can SPS seriously contend that it will be disadvantaged at Tolk. SP's ability to serve the Harrington Station will give SPS significant bargaining power at the Tolk Station, permitting SPS to shift Harrington tonnage away from BN/Santa Fe if its rates for Tolk are not competitive. Additional leverage will result from the ability to shift some of Tolk's coal generation to natural gas generation and wholesale power purchases. Avera R.V.S. at 43. SPS's substantially underutilized gas-fired capacity exceeds the coal-fired capacity at Tolk by more than 70%,

and SPS is currently selling wholesale power in 15 states, from Mississippi to Washington. Id. at 44-45; see also UP/MKT at 477.

WRI focuses on two small, old plants – its Lawrence and Tecumseh Energy Centers – located near Topeka, KS, and now exclusively served by Santa Fe. According to WRI, the proposed transaction will result in the vertical foreclosure of competition from UP-served mines in the Hanna Basin of Wyoming and SP-served mines in Colorado, because a combined BN/Santa Fe would favor BN-served PRB origins. As a remedy for the alleged loss of origin competition, WRI requests that the Commission create new destination competition by granting SP and/or UP trackage rights to the two plants, at Commission-prescribed rates.

The proposed consolidation will have no impact on origin competition between UP and SP. Redacted Material there is no basis for WRI's assertion that BN/Santa Fe could divert traffic to PRB origins. Further, even though Santa Fe today can offer single-line service to Lawrence and Tecumseh, Redacted Material This confirms Professor Kalt's analysis and the Commission's prior holdings that it is not in the self-interest of vertically integrated destination monopolists to preclude unaffiliated carriers from upstream moves. Kalt R.V.S. at 51; Seaboard I at 5; Traffic Protective Conditions at 126. In short, if the proposed consolidation is approved, WRI will still have the same two competing sources of coal supplies – Colorado and Wyoming – and the same two competing origin carriers – SP and UP.

In addition, WRI will continue to be able to exert competitive leverage in negotiating rates for Lawrence and Tecumseh.

Redacted Material BN/SF-39&40, Counsel Exh. C23. It could shift generation from these facilities to its larger, more modern, coal-fired Jeffrey Energy

Center. And it could use the leverage of substantial excess gas-fired capacity and participation in two major regional power pools. Avera R.V.S. at 32-36; see also UP/MKT at 477. In light of all these options, the Commission should reject WRI's effort to use this proceeding to "enhance competition" by expanding the number of carriers serving its facilities. See Milwaukee II at 455.

WFA contends that the proposed consolidation will foreclose potential origin competition between BN and UP for PRB coal movements to the Holcomb, KS plant of its member utility, Sunflower, which is now served solely by Santa Fe. It requests trackage rights for a WFA affiliate – WFSC – to operate as a Class III carrier over the jointly operated SP-Santa Fe line from Denver to Holcomb. WFA Comments at 2.

Although it asserts that there "presently [is] origin competition" from UP for these PRB movements, WFSCAPP at 5, WFA does not cite a single instance in which UP has competed for the origin portion of this move. Indeed, WFA states that it "would not dispute that the carriers currently capture monopoly rent by virtue of [Santa Fe's] destination monopoly." Id. at 8-9 n.4. By conceding there were no pre-transaction benefits of origin competition, WFA also concedes that it cannot meet the Commission's test for imposing conditions. Further,

Redacted Material

The Commission should not make WFA's post-merger situation better than its situation pre-merger. See Milwaukee II at 455. In any event, WFA's proposed condition would require SP's consent to operations over the jointly-owned Denver-Pueblo line – consent that non-applicant SP has not granted. See SP-39 at 11-12; BNSF-39&40, Counsel Exh. C24.

OG&E operates two coal-fired plants: Sooner Station near Red Rock, OK is served solely by Santa Fe, and Muskogee Station at Fort Gibson, OK is served solely by UP. OG&E

contends that the proposed transaction will eliminate horizontal competition at Sooner between Santa Fe – which serves the plant now – and BN – which OG&E claims could serve the plant if a spur were built. OG&E requests that the Commission grant UP trackage rights to Sooner over Santa Fe's line and prescribe compensation.[15/]

The requested relief is unwarranted and vastly disproportionate to any harm to OG&E that could possibly result from this transaction. To begin with,

Redacted Material

[16/]

Redacted Material

[15/] To Applicants' knowledge, the Commission has never granted a condition in response to a build-out threat. The only instance in which the Commission even hinted a condition might be appropriate involved a shipper that located its plant "expressly to ensure availability of service by both [merging] railroads and control by neither." See SFSP at 803. Here, however, OG&E has not argued that it relied on destination competition in locating its Sooner plant and apparently did not even consider the possibility of a second rail spur until eleven years after the Sooner plant came on line. See OG&E Comments at 8 & Holloway V.S. at 6.

[16/] OG&E also argues that it faces a risk of vertical foreclosure at Sooner. Not only are OG&E's arguments unavailing for all the reasons set forth in the rebuttal statements of Professors Kalt and Schmalensee (e.g., Kalt R.V.S. at 51-53, 68-69; Schmalensee R.V.S. at 28-39),

Redacted Material

Redacted Material

17/

Redacted Material

As a matter of policy, the Commission should not attempt to fashion relief for OG&E that is based only on a remote possibility of harm thirteen years in the future. This is especially so because OG&E will continue to have significant leverage in negotiating with the consolidated company. The Commission has long understood that a utility's ability "to inter-change power among . . . plants" may prevent it from being "captive" to a destination carrier at a single generating station. Salt River II at 687. OG&E already has the ability to shift coal volumes from its Sooner plant to its larger plant at Muskogee (Shalah R.V.S. at 28-29); Muskogee

17/

Redacted Material

has 50% more capacity than Sooner and has been operating at less than two-thirds of capacity (Avera R.V.S. at 28-29). A shift of even a portion of the Sooner burn to Muskogee would cost BN/Santa Fe millions of dollars in revenue, presenting a powerful constraint on rates. See, e.g., Salt River II at 691; Aluminum Ass'n at 489.

Redacted Material

Factors other than rail competition will provide further constraints. OG&E can exert leverage as a result of its ability to burn natural gas and to purchase power from other utilities. OG&E's gas-fired capacity is three times the capacity of Sooner. The unused capacity at its gas-fired Seminole plant alone could produce all the electricity Sooner generated in 1994. Avera R.V.S. at 29-30. In addition, OG&E plans to increase its gas-fired generation from 18% to 28% by 1998, and has demonstrated its commitment to gas by maintaining a gas production, processing, transportation and marketing subsidiary. Id. at 30. OG&E also will be able to take advantage of the growing opportunities to purchase or sell wholesale power as the electricity grid moves to an open access regulatory regime. Id. at 31-32. OG&E's "flexibility in determining how much power it will produce . . . at which plants" and with which fuels – as well as whether and how much power to buy from or sell to other utilities – further protects it from any exercise of market power by BN/Santa Fe. Salt River II at 689.

In terms of rail competition, the consolidation improves OG&E's situation. OG&E now has joint-line service from UP/Santa Fe with a speculative prospect of competing single-line BN service – if a $15 million spur were constructed. After the consolidation, without any conditions, OG&E will have actual single-line service available from BN/ Santa Fe, as well as the continuing possibility of joint-line service between BN/Santa Fe and UP. OG&E wants this already

improved situation to be enhanced further by adding a second single-line option through trackage rights for UP.

The conditions that OG&E seeks would be excessive even if this transaction did have some adverse competitive effect at Sooner. If OG&E had been seeking to preserve the potential competition that it alleges, then logically it would have asked that another carrier be granted trackage rights on the BN line, with the right to operate over a prospective rail spur that would serve the Sooner Station. For example, overhead trackage rights to enable KCS to operate from Neosho, MO to the vicinity of Perry, OK, or to enable UP to operate to the vicinity of Perry from UP's own line in Tulsa – with the opportunity for a build-out – would replicate or even enhance OG&E's pre-transaction competitive options.

When faced with a choice between approving a consolidation that may have minimal anticompetitive effects, and imposing an ill-fitting condition, the Commission should approve the transaction without the condition. See UP/MP/WP at 564. Even if it believes that OG&E has raised a bona fide competitive issue, the Commission should adhere to that course and approve this transaction without imposing conditions wholly disproportionate to the harm they purport to address. Milwaukee II at 449-50; Kalt R.V.S. at 39-40.

TEP and AEPCO[18/] both contend that the proposed transaction will eliminate potential competition between Santa Fe – which currently serves as origin carrier for their New Mexico coal – and BN – which could provide bridge service between Pueblo, CO and Dalhart, TX for SP-originated and SP-delivered Colorado coal. TEP Comments at 22-23; AEPC-5 at 3. Any legitimate concern these utilities might have is fully satisfied by the SP settlement, which

---

[18/] TEP's claims involve its SP-served Irvington station in Tucson, AZ. AEPCO's Apache generating station near Tucson is also served by SP.

gives SP access to this bridge segment. Their remaining requests for prescription of trackage rights compensation or proportional rates should be rejected. See supra pages 11-12.[19/]

APS also burns New Mexico coal, but the entire 114-mile movement to its Cholla Station near Joseph City, AZ is handled by Santa Fe – a fact that will not be changed by this transaction. Its claim that BN/Santa Fe would foreclose potential source competition for PRB coal movements when its current contract expires in 2001 (APS-1 at 5, 10-11) fails the first element of the Milwaukee/MKT test: APS cannot establish that it benefited from pre-merger rail competition **Redacted Material**

[20/]

WCTL, an association primarily of Western utilities, requests either a network of trackage rights over Santa Fe lines in Colorado, Texas and New Mexico or prescription of a rate cap on new BN/Santa Fe coal traffic originating in the San Juan and Raton Basins. Its request is based on the premise that the proposed transaction will reduce the number of carriers serving the Western "market" from four to three, resulting in a "dangerous concentration" of market power. Borts V.S., WCTL-4 at 5-6.

WCTL's market concentration arguments are premised on a gerrymandered definition of the market for Western coal and pure speculation regarding anticipated rate increases.

[19/] AEPCO's claims that it has benefited from competition between BN and Santa Fe are greatly exaggerated: since 1986 BN has made only one unsuccessful bid and participated in a handful of isolated spot moves. Quilici R.V.S. at 9. Moreover, post-merger, AEPCO will continue to have a variety of source and railroad options, including Colorado coal via SP single-line, New Mexico coal via BN/Santa Fe-Deming-SP and PRB coal via BN/Santa Fe-Denver-SP or UP-Denver-SP.

[20/] APS's real complaint is that it has no competitive alternative to its current routing and that its current rates are allegedly too high. APS-1 at 4, 5. APS is already pursuing this complaint, which pre-dates and is entirely unrelated to the proposed transaction, in a pending rate case. See Arizona Public Serv. Co. & PacifiCorp v. Atchison, Topeka and Santa Fe Ry., Docket No. 41185 (complaint filed Jan. 3, 1994). As the Commission has noted, if a utility "has remedies before this Commission and is pursuing them," the imposition of a condition is not warranted. UP/MKT at 477.

Kalt R.V.S. at 26-28. WCTL does not identify any shipper that would be served by its proposed trackage rights and makes no effort to establish their operational feasibility. It fails to recognize that the same rail carriers will continue to compete for transportation from the various coal fields in the same relative competitive positions after the consolidation and ignores the competitive impact of alternative fuels and purchased power. Quilici R.V.S. at 16, 19. Accordingly, the Commission should reject both WCTL's request for trackage rights and its proposed rate cap.

Finally, **Chaco**, which owns coal deposits in the San Juan Basin (CEC-1 at 2), alleges that the proposed transaction will place BN/Santa Fe in control of multiple coal origins and surmises that the combined company will either deny Chaco service or provide service at discriminatory rates. Chaco asks that the Commission impose a rate cap for coal traffic moving on BN/Santa Fe from the San Juan Basin.

The Commission summarily rejected a similar contention in RGI/SP (at 933) and should also do so here. Chaco's coal reserves are undeveloped, its coal customers are not yet identified, and the rail line that will serve the reserves is incomplete. BN/SF-35&36, Overview at 74-75. Its contentions are all fully addressed by its existing contracts and regulatory remedies. Id.; Ice R.V.S. at 37-38. Chaco's requested rate cap would modify the rate provisions of its contracts with Santa Fe – a result that is both inappropriate and unnecessary.

2. Phillips Petroleum

Phillips' refinery in Borger, TX is currently served only by a Panhandle Northern line that connects with Santa Fe. It nonetheless seeks a trackage rights condition, claiming that this transaction will reduce potential horizontal competition at Borger by removing a purported BN build-out possibility and will lead to vertical foreclosure of competition as well.

The 25- to 30-mile build-out from Borger to the BN line was and remains infeasible given its $28-35 million cost and the relatively small amount of traffic available there. Fisher R.V.S. at 6-7, 11; Carter R.V.S. at 4-5. Phillips quibbles with the exact mileage and cost (Watson R.V.S., PPC-10 at 3-4), but does not challenge two critical facts. First, Santa Fe never considered the possibility of such a build-out in its pricing decisions for Borger traffic. Carter R.V.S. at 3-5. Second, Phillips never tried to use the build-out "threat" to gain rate concessions from Santa Fe. BN/SF-39&40, Counsel Exh. C35. Given this undisputed evidence, the build-out possibility could not have had any competitive effect. Kalt R.V.S. at 40-41.[21/]

Phillips' trackage rights request is further undermined by the fact – disclosed in discovery – that Redacted Material of its "rail-competitive" Borger traffic moves by pipeline. BN/SF-35&36, Overview at 77 & n.32; Kalt R.V.S., Exh. 13; BN/SF-39&40, Counsel Exh. C34. Phillips' own data thus refute its assertion that no effective intermodal competition exists for Borger traffic. PPC Comments at 32-34. Moreover, Phillips does not dispute that source competition is a significant constraint on rail rates to Borger. See Carter R.V.S. at 2-3, 9-10.[22/] And even apart from the lack of any factual basis for Phillips' proposed condition, it is plainly disproportionate to the competitive harm alleged. In short, Phillips' request lacks any competitive justification and should be rejected.

[21/] Phillips' attempt to undermine BN's cost estimate on rebuttal does nothing to change this conclusion. Phillips is wrong in asserting, with no support, that the grading is substantially in place along most of the build-out route, and in any event there is no basis for its claim that BN should have used a lower track construction cost estimate. Given the hazardous nature of all of Phillips' Borger traffic, it is absurd to suggest that Phillips' six-year old internal estimate of $400,000 per mile to construct limited use "above-the-grade" rail spurs has any relevance to the major construction the build-out would have required. Phillips also ignores the existence of buildings and other competing uses along the right-of-way for the proposed spur. See Fisher R.V.S. at 10.

[22/] Phillips' vertical foreclosure claims are based on erroneous factual premises (see Carter R.V.S. at 6-9) and suffer from the same failings as those of several utilities (Kalt R.V.S. at 44 n.29). In fact, this transaction will increase competitive options for Borger shippers, not reduce them – as recognized in the statement of support filed by Sid Richardson Carbon Co., a prominent Borger shipper.

3. Other Shippers

Although some 600 shippers have submitted testimony supporting the proposed transaction (see BN/SF-10, 11, 21, 34), a small number of shippers, shipper groups and government agencies seek to burden the consolidation with trackage or haulage rights, rate caps, routing restraints, car access guarantees and a series of other conditions that are designed to improve only the economic position of a particular private interest, while detracting from the public benefits and efficiencies that the consolidation would produce.[23/] The record evidence shows that none of these shippers will lose competitive options as a result of the transaction. Lewis R.V.S. at 40-49; Ice R.V.S. at 35-43; BN/SF-35&36, Overview at 82-92. Instead, the requested conditions are designed to enhance existing competitive options, address operational or other non-merger-related concerns, respond to settlements or maintain competitive relations between shippers and their competitors – none of which offers any valid basis for imposing conditions. See UP/CNW at 64, 71; UP/MKT at 469, 477 & n.68.

4. Other Railroads

Each of the railroad parties seeking protective conditions – IC, KJRY, FMRC/GNBC and SWGR – is obviously prompted by a perceived opportunity to enhance its commercial interests at Applicants' expense. None of them has met the burden of demonstrating that the condi-

---

[23/] These shippers and other entities include Montana Wheat and Barley Committee (rate cap condition); Bunge Corporation (trackage rights); Chaparral Steel (trackage access); Public Utilities Commission of California (trackage rights); Arkansas City Businesses (trackage rights); American Maize-Products Company (haulage rights); Kansas Department of Transportation and Kansas Shippers Ass'n (competitive access, line sale, car access and other conditions); "K" Line America, Inc. (trackage rights and operational guarantees); Universal Forest Products (competitive access); Society of the Plastics Industry, Inc. and Cargill, Inc. (mandated interchange of traffic, prohibitions against certain route closures and more); and Chicago Board of Trade (trackage rights). In addition, Gore's Feed and Fertilizer, Farmland Industries, Occidental Chemical Corporation and Owens-Corning sought conditions that have been addressed in the Cen-Tex settlements (see CTSO-3 at 2-3) or the NIT League Stipulation.

tions sought are justified by a threatened reduction in competition or loss of essential services stemming from the proposed transaction. See UP/CNW at 56-57; UP/MKT at 437; BN/Frisco at 951-52.

IC seeks a 15-year condition requiring Commission-prescribed mileage-prorated rates or divisions designed to equalize Applicants' per-mile revenue regardless of the point of interchange for traffic moving between IC points in three southeastern states and BN/Santa Fe points in ten midwestern and northwestern states. Alternatively, IC requests haulage rights for 15 years in those ten states at a similarly fixed rate.

IC seeks sweeping rate equalization conditions notwithstanding undisputed evidence that this transaction will hardly affect IC's traffic and will have no detrimental effects on movements in which IC participates. BN and Santa Fe do not significantly compete today for origin or destination hauls interchanged with IC. Lewis R.V.S. at 2-4. Further, IC will see only a minuscule loss from diversions of about 0.1% in its very healthy operating revenues. Id. at 22.

IC's requests, supported by only one shipper, are based entirely on speculation that the combined BN/Santa Fe will close efficient routes to maximize its long haul, even when doing so would not constitute rational profit-maximizing behavior. Mohan V.S. at 4-9. This is based on IC's claims that BN engages in this practice today. Id. The evidence shows, however, that the market dictates present BN-IC routings, contradicting IC's claims that BN has "promoted" its own long hauls at IC's expense and closed gateways regardless of efficiency considerations. Lewis R.V.S. at 4-14; BN/SF-35&36, Overview at 95-96. IC's allegation that the consolidated railroads will act contrary to their own economic self-interest by routing traffic inefficiently is also unsupported by economic logic. Schmalensee R.V.S. at 40-44.

Granting IC's requested conditions would effectively reverse more than 15 years of Commission precedent rejecting DT&I-type conditions. Rate equalization is not required in merger cases because the free market – not regulatory intervention – is the best guarantor of efficiency. See Seaboard II at 15-16; N&W/DTI at 527; CSX Control at 578-79; Kalt R.V.S. at 105. Here, IC proposes conditions more regressive than DT&I, asking the Commission to prescribe new divisions and rates, a result entirely at odds with sound economic policy and Commission precedent.

This proceeding is not the right forum for addressing IC's unsubstantiated concerns about the cancellation of joint rates and through routes or the commercial closure of gateways. IC has other avenues for addressing the former issue, and has failed to demonstrate the likelihood of the closing of any gateways.

KJRY persists in contending that conditions are needed to improve competition in Keokuk, IA, even though DOJ recognizes that Applicants' agreement with SP solves any competitive problem there. See DOJ-3 at 13 & n.16. Asserting that the consolidation will have anti-competitive consequences for rail services in the markets served by its 33-mile line, KJRY asks for trackage rights to connect with SP and NS lines at West Quincy and Hannibal, MO, which would more than double the scope of its operations, increase the number of railroads with which it now connects and allow it to serve shippers now served only by BN.[24/]

KJRY shippers, however, will continue to experience vigorous competition post-merger because Applicants' settlement with SP opens a new KJRY-TPW-SP routing (replacing a KJRY-TPW-Santa Fe routing) that fully replaces the competition between BN and Santa Fe. Ice

---

[24/] KJRY claims that it will not exercise its right to interchange with NS provided that TPW offers satisfactory service. See KJRY-4 at 3. On rebuttal, KJRY abandoned its request for trackage rights to Louisiana, MO for interchange with GWWR. Id.

R.V.S. at 24-25; Hatzenbuhler R.V.S. at 6-10; Kalt R.V.S. at 19-20.[25/] KJRY's concerns about the length of this new routing for westbound traffic are misplaced. Applicants have shown that any added mileage is de minimis relative to this traffic's overall length of haul, and that operational efficiencies will be realized. Hatzenbuhler R.V.S. at 5-6; Ice R.V.S. at 24-25. Its criticism of the Bushnell interchange between TPW and SP is likewise unwarranted. Hatzenbuhler R.V.S. at 9-10; see also SP-39 at 8-10 & Hord V.S. at 1-2; TPW-1 at 14-15 & Wyss V.S. at 5-6; BN/SF-35&36, Overview at 101-02. KJRY's trackage rights request is thus unjustified, as is its request for reciprocal switching at Quincy, IL, a point that warrants no Commission attention because Quincy will see no post-merger reduction in competition. See UP/CNW at 64, 71; UP/MKT at 440, 448, 451-52.

KJRY concedes that its unprecedented request that BN be forced to sell its Keokuk yard – which is worth more than $3 million – is intended only to offset, at Applicants' expense, revenue losses predicted by KJRY. See BN/SF-35&36, Overview at 103. KJRY admits that the sale would in fact produce a windfall of over $1 million a year for KJRY. Id. at 104. Moreover, it is not required to address any impact of the proposed transaction. See UP/MKT at 458; BN/Frisco at 951-52. Finally, KJRY has failed to sustain its half-hearted "essential services" claim, which its own President admitted was not really serious (BN/SF-39&40, Counsel Exh. C44 at 75-76; KJRY-4, Warfield V.S. at 4), because it has not adduced convincing evidence that its viability is at risk or that any shipper will lose transportation options. See Hatzenbuhler R.V.S. at 16-17; Kalt R.V.S. at 16-21; see also UP/CNW at 91, 94; UP/MKT at 474-75; UP/MP/WP at 546.

FMRC/GNBC, two commonly owned short lines, initially requested a condition eliminating from the 1987 BN/GNBC line sale agreement a provision that requires the payment

---

[25/] KJRY improperly raises for the first time on rebuttal a claim that Santa Fe controls TPW and that any routing over TPW therefore would be of illusory competitive value. No evidence has been offered that could sustain KJRY's unfounded control claim, which in any event has no merit.

of compensating charges to BN when GNBC interchanges with other railroads traffic BN can transport at origin or destination (see Keck R.V.S. at 4-6) – a requirement the Commission has held does not reduce competition. Montana Rail Link at 20.[26] Applicants have explained that the consolidation would have no impact on this provision, because it will not be interpreted by Applicants to apply to traffic moving to or from current Santa Fe stations not presently served by BN. Keck R.V.S. at 11; BN/SF-39&40, Counsel Exh. C40. GNBC concedes on rebuttal that Applicants thereby "allay[ed] GNBC's concern" (Betke R.V.S., GNBC-5 at 4), and its request that the Commission impose that interpretation as a condition is wholly unjustified.

FMRC/GNBC also seek a condition amending an existing trackage rights agreement between BN and GNBC to allow GNBC to connect with FMRC at Altus, OK, to serve industries at Altus, and to connect with SP at Quanah, TX, where GNBC has only recently exercised its long-held trackage rights to connect with BN. The mere prospect that FMRC/GNBC might experience modest diversion losses of $86,000 annually, the primary justification offered for these additional rights, does not justify a condition. Keck R.V.S. at 13-15; BN/Frisco at 951. The additional justification originally advanced for the connection with SP – to provide a new competitive option for southbound shipments – also fails because the existing competitive options for such shipments, BN and UP (which connects with FMRC through WTJ, a UP short line at Altus), will remain unaffected by the transaction. Keck R.V.S. at 14-15; Kalt R.V.S. at 35; UP/CNW at 97; BN/Frisco at 951.[27]

---

[26] Such charges maintain BN's participation in GNBC traffic and thereby allowed BN to sell the line at a lower price. Keck R.V.S. at 4-6. Other BN agreements with short lines are similar, but GNBC is the only BN short line that has not fully supported this transaction. Id. at 6.

[27] On rebuttal, FMRC/GNBC criticize Professor Kalt's conclusions about post-consolidation competitive options for certain wheat shipments, claiming that SP is not a viable competitor for the traffic they handle. Professor Kalt never claimed that SP was a viable competitor for the traffic of these particular short lines, only that it serves certain points also served by UP, which does compete for (continued...)

On rebuttal, GNBC presents an altogether new "justification" for expanded trackage rights, i.e., the claimed loss of competition for Altus traffic. GNBC ignores the fact that UP provides a competitive option at Altus through WTJ. The imposition of a condition that would restructure GNBC's operations, particularly where Altus traffic will retain rail (BN and UP) and truck competition, thus is entirely unwarranted. UP/MKT at 461-63; UP/MP/WP at 564.

SWGR, a Lubbock-area short line, seeks 67 miles of trackage rights to connect with UP. SWGR has failed to show that those rights are in any way justified by this transaction. The settlement with SP maintains the current level of competition by providing for interchange between SP and SWGR with no reciprocal switch fee. Ice R.V.S. at 21-23; Kalt R.V.S. at 12-13. This solves any possible competitive problem.

The other conditions SWGR seeks address non-merger-related commercial arrangements with BN and Santa Fe with respect to divisions, car supply and other matters. Ice R.V.S. at 22-23. On their face, these conditions do not address any legitimate public interest concerns arising from the consolidation of BN and Santa Fe. See UP/CNW at 56-57; UP/MKT at 437; BN/Frisco at 951-52; see also Kalt R.V.S. at 12-13. SWGR's vague suggestion that essential services are at risk is likewise completely unsupported. See UP/MP/WP at 546.

5. Amtrak and SCRRA

Amtrak and **SCRRA** ask the Commission to modify certain existing contractual relationships with BN and Santa Fe and to impose conditions that would significantly alter – for the sole benefit of Amtrak and SCRRA – the bargained-for terms of those contracts. Amtrak asks the Commission to impose an 80% on-time performance requirement for the operation of its

---

27/ (...continued)
FMRC/GNBC traffic. Kalt R.V.S. at 33-34; BN/SF-39&40, Counsel Exh. C39. Further, FMRC and GNBC acknowledge that some 40% of the wheat shipped from Western Oklahoma is transported by truck. Kalt R.V.S. at 34.

trains over Applicants' lines and to require Applicants to pay certain potential future line upgrading costs. SCRRA also seeks conditions regarding performance and future investments.

Applicants have projected no detrimental effects on either passenger or commuter services as a result of the consolidation, and neither Amtrak nor SCRRA has produced evidence demonstrating the contrary. See Ice R.V.S. at 30-35; Jackson R.V.S. at 9-12, 15-19; Mitchell R.V.S. at 5-6; Operating Plan, BN/SF-8 at 112. Amtrak and SCRRA are attempting to use this proceeding to have the Commission reform the terms of their private contracts with Applicants – a type of request the Commission has consistently rejected. See Guilford at 413 (Commission declined to "intervene to adjust contractual relationships"); BN/Frisco at 953, 956-57 (same). Both Amtrak and SCRRA already have significant protections and remedies – through statutes and/or existing contractual provisions – to address the specific concerns they have raised with the Commission. See, e.g., Ice R.V.S. at 32; Mitchell R.V.S. at 2-5. Aside from its contracts with Applicants, both of which expire in April 1996, Amtrak has extensive remedies under the Rail Passenger Service Act – including requirements that its trains have preference over freight traffic and that its contracts with rail carriers "shall include a penalty for untimely performance" – which provide adequate alternatives to its requested conditions. See 49 U.S.C. § 24308(a); see also id. §§ 24308(c), 24309. SCRRA already has comprehensive agreements with Santa Fe that address the issues it seeks to raise here. See Ice R.V.S. at 34-35; see also Jackson R.V.S. at 3-12.[28/]

[28/] In any event, SCRRA's operations are purely intrastate and thus not subject to Commission jurisdiction. See 49 U.S.C. § 10501(b); Durango & Silverton Narrow Gauge R.R. at 2; Staten Island Rap. Transp. Op. Auth. at 2; Magner-O'Hara Scenic Ry. at 2. Even if SCRRA's requests manifested a sufficient nexus to interstate transportation, those requests would necessarily interject the Commission into the day-to-day functions (e.g., funding, dispatching and oversight of traffic flows) of an intrastate commuter service, an area clearly beyond the scope of the Commission's jurisdiction.

6. Labor

Several labor organizations, employee representatives and an individual have asked for protective conditions in excess of those required by statute – currently New York Dock.[29/] They seek attrition conditions and alternatively request various enhancements of the New York Dock conditions. They also seek rulings as to the continuing effect, post-consolidation, of certain provisions in collective bargaining agreements and prior protective arrangements. The Commission has denied similar requests in other cases, and should do so here as well. See, e.g., UP/CNW at 95-96.

Attrition conditions impose enormous costs and inefficiencies on the merging railroads. See Northrup R.V.S. at 11-20. Since New York Dock was first adopted, the Commission has never imposed attrition conditions. See CSX Control at 589; see also UP/MP/WP at 620. As the Commission has recently held, "[a]ttrition-type conditions are calculated to preserve unnecessary jobs, and unduly restrict a carrier's ability to establish economical operations." UP/CNW at 96; see also Northrup R.V.S. at 11-20. Their imposition would seriously undermine the public benefits of this transaction and would place BN/Santa Fe at a substantial disadvantage compared to its principal competitor – UP – which has not been subjected to attrition conditions in any of its mergers. See Northrup R.V.S. at 17. Finally, nothing in the unions' evidence even begins to show the "unusual circumstances" required in order to justify imposing more than the statutory conditions. See UP/CNW at 95-96 and cases cited therein; 49 C.F.R. § 1180.1(f); BN/SF-35&36, Overview at 121-22 & n.62.

Enhancements of New York Dock should also be denied. The statutory conditions stand on their own; there is no basis for specially imposing portions of them. Equally important,

---

[29/] Comments were filed by ARU, BLE, IAM, TCU, UTU, Patrick W. Simmons, John D. Fitzgerald and William Stinson Purdy.

the Commission should not through that device be drawn into making anticipatory rulings as to the preemptive effect, under 49 U.S.C. § 11341, of its approval on existing agreements and arrangements. The Commission recently affirmed that it

> has never required applicants to identify all anticipated changes that might impact on [collective bargaining agreements] or [Railway Labor Act] rights. Such a requirement could negate many benefits from changes that only become apparent after consummation. Moreover, there is no legal requirement for identification, since section 11341(a) is "self-executing," that is, its exemptive power is effective when necessary to permit the carrying out of a project. Put another way, the exemption does not depend on a Commission finding that it is applicable. We will not limit the use of section 11341(a) by declaring that it is available only in circumstances identified prior to approval. Cf. American Train Dispatchers Ass'n v. ICC, 26 F.3d 1157 (D.C. Cir. 1994).

UP/CNW at 101. For those reasons, the unions' requests for rulings as to the "necessity" of specific actions set forth in the Operating Plan, or the preemptive effect of any other actions, should be denied. See id.

In any event, the actions on which the unions seek such rulings are not merely necessary but integral to achieving the transportation benefits of this consolidation. See BN/SF-35&36, Overview at 120. Applicants' ability to efficiently utilize its combined workforces, such as by transferring employees to the locations at which the work will be performed – even though such transfers may be between BN and Santa Fe, across existing seniority districts, beyond existing residence locations or beyond what would otherwise be possible under existing agreements and arrangements – is essential "to realize the full potential of the consolidation for improved service, operating economies and reduced investment." Operating Plan, BN/SF-8 at 43; see also id. at 44, 130; Hund-Snyder V.S., BN/SF-8 at 348; Robinson R.V.S. at 1-6.[30/]

[30/] The need for that flexibility in order to achieve the transportation benefits of this transaction also means that the union requests for the Commission to impose as conditions provisions of certain existing agreements should also be denied.

The miscellaneous conditions sought by rail labor, including the effort to extend labor protection to GWWR employees, should also be denied. As Applicants have demonstrated, Santa Fe does not control GWWR, nor are GWWR's personnel "joint employees" of Santa Fe. See BN/SF-35&36, Overview at 119-21 & n.61; Ice R.V.S. at 26-29. In order to obtain the substantial public benefits that will flow from achieving the efficiencies this transaction offers, the Commission should impose no more than the minimum conditions mandated by statute. See BN/SF-35&36, Overview at 122-23.[31/]

[31/] ARU also contends that certain recent Santa Fe layoffs are attributable to merger-related debt, but in fact they are not. See BN/SF-39&40, Counsel Exh. C43 (McInnes Dep.).

CONCLUSION

The Application should be approved, Applicants' related petitions for exemption in Sub-Nos. 1-12 should be granted, the responsive applications in Sub-Nos. 13-18 should be denied, and the only conditions imposed should be compliance with the NIT League Stipulation and the minimum labor protective conditions required by statute. Applicants' proposed findings and order are provided in Appendix E.

Respectfully submitted,

Jeffrey R. Moreland
Richard E. Weicher

APPENDIX E

APPLICANTS' PROPOSED FINDINGS AND ORDER

APPLICANTS' PROPOSED FINDINGS AND ORDER

FINDINGS

In Finance Docket No. 32549, we find: (a) that the common control, consolidation and merger of Burlington Northern Railroad Company ("BN") and The Atchison, Topeka and Santa Fe Railway Company ("Santa Fe") through the proposed transaction is within the scope of 49 U.S.C. § 11343 and is consistent with the public interest; (b) that the transaction will not adversely affect the adequacy of transportation to the public; (c) that no other railroad in the area involved in the transaction has requested inclusion in the transaction, and that failure to include such railroads will not adversely affect the public interest; (d) that the transaction will not result in any guarantee or assumption of payment of dividends or any increase in fixed charges; (e) that interests of employees affected by the proposed transaction will be adequately addressed by the conditions imposed herein; (f) that the transaction will not significantly reduce rail competition in any market; and (g) that the terms of the transaction, including all issuances of securities incident thereto, are just, fair and reasonable. We further find that good cause has been demonstrated to join as applicants BNSF Corporation and its contemplated subsidiaries to be formed in order to effect the alternative merger structure, and to waive the requirements of 49 C.F.R. §§ 1180.4 - 1180.9 with respect to them. We further find that the proposed assumptions of liabilities and securities obligations: (a) are consistent with the proper performance of transportation by the carriers to be controlled by BNI and BNSF Corporation; (b) will not impair the ability of the controlled carriers to provide public transportation; (c) are otherwise consistent with the public interest; and (d) are for objects within the lawful corporate purposes of the applicants involved and reasonably appropriate for those purposes. We further find that any rail employees of the primary applicants affected by the transaction authorized in Finance Docket No. 32549

should be protected by the minimum conditions required by 49 U.S.C. § 11347 (New York Dock, 360 I.C.C. 60, 84-90 (1979)) unless different conditions are provided for in a labor agreement entered into subsequent to this decision and prior to consolidation, in which case protection shall be at the negotiated level, subject to our review to assure fair and equitable treatment of affected employees.

In Finance Docket No. 32549 (Sub-No. 1), we find that the acquisition and exercise of control of the Wichita Union Terminal Railway Company by the merged company is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 2), we find that the proposed construction of a 3,134 foot connection between the Santa Fe main line and the Southwestern Public Service Company power plant near Amarillo, Texas is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 3), we find that the proposed construction of a 930 foot connection between the BN and Santa Fe rail lines in Amarillo, Texas is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 4), we find that the proposed construction of a 1,100 foot connection in the southeast quadrant of the intersection between BN and Santa Fe rail lines in Dobbin, Texas is exempt from prior Commission review and approval pursuant

to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 5), we find that the proposed construction of a 2,970 foot connection between BN and Santa Fe rail lines in Dobbin, Texas is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 6), we find that the proposed construction of a 4,165 foot connecting track with a proposed wye track which is 2,390 feet long connecting BN and Santa Fe rail lines near Cameron, Illinois is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 7), we find that the proposed construction of a 7,000 foot connection between BN and Santa Fe rail lines at Enid, Oklahoma is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 8), we find that the proposed construction of a 468 foot connection between the BN and Santa Fe rail lines at Fairmont, Oklahoma is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the

transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 9), we find that the proposed construction of a 1,268 foot connection between BN and Santa Fe rail lines at Perry, Oklahoma is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 10), we find that the proposed construction of a 1,090 foot connection between BN and Santa Fe rail lines in Perry, Oklahoma is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 11), we find that the proposed construction of a 1,255 foot connection between BN and Santa Fe rail lines in Saginaw, Texas is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 12), we find that the proposed construction of a 6,142 foot connection between BN and Santa Fe rail lines in Saginaw, Texas is exempt from prior Commission review and approval pursuant to 49 U.S.C. § 10505(a) because the proposed construction is limited in scope and such review is unnecessary to carry out the

transportation policy of 49 U.S.C. § 10101a or to protect shippers from the abuse of market power.

In Finance Docket No. 32549 (Sub-No. 13), we find that the application filed by Houston Lighting and Power Company for trackage rights is not consistent with the public interest.

In Finance Docket No. 32549 (Sub-No. 14), we find that the application filed by Southwestern Public Service Company and Tuco Inc. for trackage rights is not consistent with the public interest.

In Finance Docket No. 32549 (Sub-No. 15), we find that the application filed by Grainbelt Corporation for trackage rights is not consistent with the public interest.

In Finance Docket No. 32549 (Sub-No. 16), we find that the application filed by Western Fuels Service Corporation for trackage rights is not consistent with the public interest.

In Finance Docket No. 32549 (Sub-No. 17), we find that the application filed by Keokuk Junction Railway for trackage rights and terminal access is not consistent with the public interest.

In Finance Docket No. 32549 (Sub-No. 18), we find that the application filed by the Seagraves, Whiteface and Lubbock Railroad Company for trackage rights and other conditions is not consistent with the public interest.

We find that requiring Applicants to comply with the NIT League Stipulation, as provided in ¶ 4 thereof, is consistent with the public interest.

We find that all other conditions requested by any party to this proceeding are not consistent with the public interest.

We find that this action will not significantly affect the quality of the human environment or the conservation of energy resources.

ORDER

It is ordered:

1. In Finance Docket No. 32549, BNSF Corporation and its contemplated subsidiaries to be formed in order to effect the alternative merger structure are joined as applicants, the requirements of 49 C.F.R. §§ 1180.4 - 1180.9 are waived with respect to them, the application is approved (subject to the condition that the applicants comply with the requirements of their May 26, 1995 Stipulation with NIT League) and the assumptions of liabilities and securities obligations incident thereto are approved.

2. If the applicants consummate the approved transaction, they shall confirm in writing to the Commission, within 15 days after consummation, the date of consummation. Where appropriate, applicants shall submit to the Commission three copies of the journal entries recording consummation of the transaction.

3. All notices to the Commission as a result of any authorization shall refer to this decision by date and docket number.

4. No change or modification shall be made in the terms and conditions approved in the authorized application without the prior approval of the Commission.

5. In Finance Docket No. 32549 (Sub-No. 1), the petition for exemption is granted.

6. In Finance Docket No. 32549 (Sub-No. 2), the petition for exemption is granted.

7. In Finance Docket No. 32549 (Sub-No. 3), the petition for exemption is granted.

8. In Finance Docket No. 32549 (Sub-No. 4), the petition for exemption is granted.

9. In Finance Docket No. 32549 (Sub-No. 5), the petition for exemption is granted.

10. In Finance Docket No. 32549 (Sub-No. 6), the petition for exemption is granted.

11. In Finance Docket No. 32549 (Sub-No. 7), the petition for exemption is granted.

12. In Finance Docket No. 32549 (Sub-No. 8), the petition for exemption is granted.

13. In Finance Docket No. 32549 (Sub-No. 9), the petition for exemption is granted.

14. In Finance Docket No. 32549 (Sub-No. 10), the petition for exemption is granted.

15. In Finance Docket No. 32549 (Sub-No. 11), the petition for exemption is granted.

16. In Finance Docket No. 32549 (Sub-No. 12), the petition for exemption is granted.

17. In Finance Docket No. 32549 (Sub-No. 13), the application filed by Houston Lighting and Power Company for trackage rights is denied.

18. In Finance Docket No. 32549 (Sub-No. 14), the application filed by South-western Public Service Company and Tuco Inc. for trackage rights is denied.

19. In Finance Docket No. 32549 (Sub-No. 15), the application filed by Grainbelt Corporation for trackage rights is denied.

20. In Finance Docket No. 32549 (Sub-No. 16), the application filed by Western Fuels Service Corporation for trackage rights is denied.

21. In Finance Docket No. 32549 (Sub-No. 17), the application filed by Keokuk Junction Railway for trackage rights and terminal access is denied.

22. In Finance Docket No. 32549 (Sub-No. 18), the application filed by the Seagraves, Whiteface and Lubbock Railroad Company for trackage rights and other conditions is denied.

23. The authority granted in Finance Docket No. 32549 and Finance Docket No. 32549 (Sub-No. 1) is subject to the minimum labor protective conditions required by 49 U.S.C. § 11347 (New York Dock Ry. – Control – Brooklyn Eastern Dist., 360 I.C.C. 60, 84-90 (1979)).

24. All other conditions requested by any party to this proceeding are denied.

25. This decision shall be effective thirty days from the date of service.

26. The requirement of an initial decision is waived pursuant to 49 U.S.C § 11345(f). The decisions embraced herein are final decisions within the meaning of 49 U.S.C. § 10327. Any administrative appeal will be entertained only under 49 U.S.C. § 10327(g), which permits appeal only on the basis of material error, new evidence, or substantially changed circumstances.

Re: Ex Parte No. 582 (Sub-No. 1), *Major Rail Consolidation Procedures*

Dear Mr. Williams:

Enclosed for filing on behalf of Norfolk Southern Corporation and Norfolk Southern Railway Company in the above-referenced docket are a signed original and 25 copies of the "Comments of Norfolk Southern in Response to Advance Notice of Proposed Rulemaking." Also enclosed is a computer disk containing a copy of this filing in WordPerfect 7/8/9 format.

Please acknowledge receipt of these papers for filing by date-stamping the enclosed duplicate copy and returning it with our messenger. Thank you for your attention to this matter.

Very truly yours,

Vincent F. Prada

G. Paul Moates

CONCLUSION 69

ATTACHMENT A -- Verified Statement of James W. McClellan

E. Competitive Effects

In assessing proposed major rail consolidations under the statutory public interest test, the Board and the ICC have always given careful, if not primary, consideration to the effects of the proposed transaction on competition. The governing statute directs the Board to consider impacts on rail competition, and the Board's existing merger policy statement similarly emphasizes impacts on competition as a key consideration in reviewing rail merger proposals.[21]

The Board and ICC have long recognized, however, that railroad mergers can have both positive and negative impacts on competition. By reducing existing competitive transportation alternatives available to shippers, rail consolidations (particularly parallel transactions) may increase the ability of the merged system to exercise undue market power by charging higher rates and/or providing degraded service. Such effects are correctly treated as transaction-related public harms and, unless remediable through conditions, weigh against approval of a proposed combination. But railroad mergers may also enhance or increase competition -- both between railroads and, importantly, between railroads and other transportation modes -- by enabling the merged system to offer improved service, reduce costs, achieve operating efficiencies and, generally, enhance the long-term financial viability that alone permits the railroad to maintain, replace and expand its infrastructure and provide safe, reliable and efficient service. This principle reflects the need for railroads (like any business) to earn adequate revenues and cover their full

UP/SP merger decision in order to impose open switching within the Houston terminal area. *See* STB Finance Docket No. 32760 (Sub-No. 26), *Union Pacific Corp. -- Control & Merger -- Southern Pacific Rail Corp. [Houston/Gulf Coast Oversight]*, Decision No. 10 (served Dec. 21, 1998) ("*Houston/Gulf Coast Oversight*").

[21] *See* 49 U.S.C. § 11324(b)(5); 49 C.F.R. § 1180.1.

costs of service if the competition they provide is to be sustainable. A significant issue in every railroad merger proceeding has been how to weigh these various effects to promote competitive, sustainable rail transportation.

In assessing the impacts of proposed rail consolidations on competition between rail carriers, the Board and ICC have long adhered to the principle that merger review should be focused on the preservation of pre-existing rail-to-rail competition and the imposition of conditions only to ameliorate merger-related reductions in rail-to-rail competition. The agency has also looked with favor on voluntary proposals by rail merger applicants to expand direct rail-to-rail competition, such as the Shared Assets Areas that were created in the recent Conrail transaction,[22] just as it has welcomed competition-enhancing projects (such as rail line "build-outs" and other rail line construction projects) that are fostered by the market. But the agency has steadfastly resisted efforts to use the merger review process (much less regulation generally) as a vehicle for expanding or injecting, through various types of involuntary "open" access measures, rail-to-rail competition that the marketplace itself has not fostered.[23]

The Board reaffirmed this rule less than two years ago when it rejected the requests of various parties to impose an "open access" merger condition that would have required Union Pacific to open up all solely served shippers within the entire Houston terminal switching district to access by other railroads.

---

[22] *See Conrail*, Decision No. 89 (served July 23, 1998), at 133; McClellan VS at 15-16.

[23] *See, e.g., Conrail*, Decision No. 89 (served July 23, 1998), at 70-71 (rejecting requests by various shippers served solely by Conrail prior to the proposed joint CSXT/NS/Conrail transaction to receive post-transaction service from both CSXT and NS).

> Well-established transportation law recognizes that some shippers are served by a single railroad. It also recognizes that such "captive shippers" may pay higher rates under "demand-based differential pricing" legal principles that govern the railroad industry, to reflect the economies of the railroad industry and the fact that some rail traffic is more captive and some more competitive. Because the railroad industry is not an open access industry, and because some shippers may pay more than others under the law that we administer, merger proceedings are not used as vehicles to equalize the competitive positions of shippers generally. The Board does adopt competitive conditions to ensure that a merger does not put shippers into a worse position than they were in before . . . . But a well-established principle of rail merger law is that the conditions the Board imposes in a merger proceeding are designed to ameliorate specific merger-related harm, not to simply add more competitors.

Houston/Gulf Coast Oversight, *supra*, at 2-3.

The Board also emphasized in that case that, because the requested "open access" condition (dubbed the "Consensus Plan" by its proponents) was unrelated to any actual merger-related harm, there was no principled basis for limiting the relief to the Houston terminal area. "The Consensus Plan is premised on the idea that shippers should, wherever possible, be served by more than one railroad . . . . If we adopt the Consensus Plan, then there is no basis on which we could refuse to provide for open access throughout the rail system." *Id.* at 2. The Board properly recognized that such a regime of open access could prevent the railroads from using differential pricing to recover their large fixed and common costs and undermine their ability to invest in needed plant and facilities. For this reason, the Board concluded that the requested "open access regulatory scheme" is "not provided for in the statute the Board currently administers, and thus, in our view, is a matter more appropriately debated in Congress." *Id.*

Notwithstanding these findings, the Board has now declared in its ANPR that "we believe that the time has come to consider whether we should alter our rail merger policy to place a greater emphasis on enhancing, rather than simply preserving, competition." ANPR at 7. The

Board outlined various proposals for such forced access conditions, and invited comment on these or any other proposals to use merger conditions to "promote and enhance competition in the rail industry." *Id.*

Norfolk Southern respectfully suggests that the radical change in rail merger policy raised in the ANPR would be unlawful for the reasons the Board itself articulated in *Houston/Gulf Coast Oversight*, unnecessary in light of competitive market forces and fundamentally bad public policy in any event. The Board's competitive-effects analysis of proposed major rail consolidations should continue to be focused on preserving rail-to-rail competition, not using regulation in a misguided attempt to manufacture an artificial, and ultimately unsustainable, form of rail-to-rail competition. Norfolk Southern recommends a number of changes in the way the Board assesses and remedies genuine merger-related competitive harms, but the reregulatory forced access proposals outlined in the ANPR should be rejected.

1. Preserving Rail-to-Rail Competition

In previous rail consolidation proceedings, the analysis of rail-to-rail competitive effects and of appropriate conditions to ameliorate merger-related competitive harms has tended to focus on several recurring issues, including (a) "two-to-one" issues, (b) "three-to-two" issues, (c) the "one-lump" doctrine, and (d) other vertical effects issues such as the maintenance of efficient gateways. The Board's ANPR invited comment on how some of these issues should be treated in revised merger rules. ANPR at 7-8.

(a) "2-to-1" Issues

Although all of the major rail mergers approved by the Board and ICC over the past 20 years have been largely end-to-end combinations, with little horizontal overlap in the merging carriers' lines, most transactions have involved some number of rail shippers that were directly served before the merger by both of the combining carriers and that, as a result of the proposed combination, would experience a reduction in the number of direct rail options from two to one. The Board and ICC have consistently concluded that such "2-to-1" shippers would suffer merger-related competitive harm and that such harm warranted remedial relief in the form of a merger condition granting an independent rail carrier the right to serve the affected shippers by means of trackage rights, reciprocal switching or other measure. This practice has become so common that most recent merger applicants have proactively identified such "2-to-1" shippers in their application and have proposed or even voluntarily negotiated a competitive remedy at or sometime after the filing of their railroad consolidation application.

In light of this consistent practice, Norfolk Southern suggests that the Board codify its recent practice by providing in its revised merger policy statement that, absent unusual circumstances, a major rail consolidation proposal should include voluntary arrangements (subject to Board prescription of reasonable terms in the event of disagreement) for trackage rights, switching or other appropriate access by an independent carrier to replicate two-carrier rail service for those individual shipper facilities whose direct rail alternatives would be reduced from two to one as a result of the proposed transaction. The Board's merger policy should require such a remedy whenever it is practicable, and should in any event impose a burden on the

applicant carriers to identify affected "2-to-1" shippers and attempt to come up with an appropriate plan to remedy merger-related competitive h to these shippers.

(b) "3-to-2" Issues

In recent major rail consolidation proceedings, the Board and ICC have generally concluded that a merger-related reduction from three to two in the number of independent railroads serving a particular shipper facility does not result in a significant diminution in competition sufficient to warrant the imposition of conditions.[24] The agency has concluded that the remaining two-carrier rail competition was sufficient to prevent increased exercise of market power in the setting of rates and services and, in the case of the UP/SP merger, that the combination of two of the three serving railroads would actually enhance competition by strengthening the combining railroads' systems and long-term financial viability.

The Board's ANPR invites comment on how the proposed new merger policy should address such "3-to-2" shippers. ANPR at 9. Norfolk Southern believes that this issue should best be left to case-by-case examination based on the individual circumstances of each case. Few rail markets can support viable three-carrier rail service, while experience (including NS's experience in competing head-to-head with CSXT in numerous markets) teaches that two-carrier rail service will normally preserve effective, robust competition. In the relatively few situations where three-carrier service remains, the issue whether a merger-related reduction from three to two direct serving rail carriers causes harm to competition is likely to turn on the character of the particular services involved and the condition of the serving railroads. These

---

[24] *See* STB Finance Docket No. 32760, *Union Pacific Corp. -- Control & Merger -- Southern Pacific Rail Corp.* ("*UP/SP*"), Decision No. 44 (served Aug. 12, 1996), at 119-21.

issues are best left for case-by-case adjudication, especially because the specific infrastructure available will greatly determine whether a reduction in the number of carriers serving the market enhances or reduces rail service options.

(c) "One-Lump" Doctrine

The Board has invited comment on whether it should consider proposals to revise "the application of the 'one-lump' theory to rail mergers" by requiring that trackage rights be granted to another carrier when a railroad that exclusively serves a shipper merges with one of several connecting carriers. The argument is that, although the Board and reviewing courts have accepted the validity of expert economic evidence demonstrating that the exclusively served shipper in such situations does not suffer a reduction in competition for its traffic,[25] the Board should nonetheless impose a condition mandating trackage rights for another carrier to access the exclusively served shipper's facilities in order to promote or enhance competition.

In short, proponents of this "remedy" simply seek to use the fact of an end-to-end consolidation transaction as a convenient opportunity to force two-carrier rail access to exclusively served shippers whose situations would not change at all as a result of the transaction. In addition to consistently rejecting the economic theory on which these claims are based, the Board and ICC have found that the relief that shippers have sought in order to address this phantom competitive harm -- a grant of trackage rights over the lines of the carrier that provided exclusive

---

[25] *See, e.g., Conrail*, Decision No. 89 (served July 23, 1998), at 67-70, 78; ICC Finance Docket No. 32549, *Burlington Northern Inc. -- Control & Merger -- Santa Fe Pacific Corp.* ("*BN/Santa Fe*"), Decision No. 38 (served Aug. 23, 1995), *aff'd sub nom. Western Resources, Inc. v. STB*, 109 F.3d 782 (D.C. Cir. 1997).

rail service before the proposed consolidation -- would be enormously overbroad and would go far beyond simply restoring pre-merger rail competitive options.

The "one-lump" doctrine is not an immutable principle foreclosing all opportunity for relief to exclusively served shippers which claim that the merger of their serving railroad with a connecting carrier would cause competitive harm. The doctrine erects only a presumption, which is rebuttable in individual cases, that such end-to-end mergers do not harm competition. Shippers have the opportunity to rebut the theory and its applicability in individual cases. That rule should be continued. But there is no proper basis on which to declare the theory essentially "null and void" simply by ignoring what it demonstrates.

(d) Maintenance of Efficient Gateways

During the post-Staggers period, the ICC and Board have consistently found that vertical, or end-to-end, railroad consolidations generally have no adverse effects on competition but, to the contrary, strengthen competition by expanding single-line service opportunities and allowing railroads to provide better, more efficient service in competition with other rail carriers and other modes. Consistent with the agency's treatment of vertical effects claims subject to the "one-lump" doctrine, the Board and ICC have uniformly rejected arguments that an end-to-end rail merger would reduce competition through the foreclosure of independent connecting railroads. Specifically, the agency has rejected claims that railroads would have an incentive to close efficient interchanges with other carriers and favor the extended single-line routes created by an end-to-end merger over more efficient joint-line routes.[26]

---

[26] *See, e.g., Rulemaking Concerning Traffic Protective Conditions in Railroad Consolidation Proceedings*, 366 I.C.C. 112 (1982), *aff'd sub nom. Detroit, Toledo & Ironton Railroad Co.*

(continued...)

Despite these consistent rulings, various shipper interests continue to raise concerns about the potential effects of an end-to-end railroad merger in closing efficient gateways and requiring shippers to utilize a merged system's long-haul single-line routes in preference to other efficient interline routes. These concerns have assumed increased significance as consolidations have reduced the number of major railroad systems and as the railroad industry faces the imminent prospect of mergers creating the first transcontinental rail systems. For example, if one of the western carriers were to propose a combination with Norfolk Southern, shippers that are today exclusively served at origin by that western carrier and that could utilize either NS or CSXT to complete their freight shipments in the eastern U.S. (through an interchange at a gateway such as Chicago) might be concerned that, as a result of this hypothetical merger, they would be foreclosed from using CSXT on an interline basis with the merging western carrier and would be forced instead to use single-line NS service. This concern is sometimes expressed in terms of an end-to-end merger extending a "bottleneck" line segment.

Norfolk Southern believes that, although railroads have no incentives to close efficient gateways and interchanges, concerns about the merger-related closure of major gateways has assumed such significance in the light of the current structure of the railroad industry that it would be appropriate for the Board to include in its revised merger policy a provision to preserve,

---

[26](...continued)
v. ICC, 725 F.2d 47 (6th Cir. 1984); ICC Finance Docket No. 21215 (Sub-No. 5), *Seaboard Air Line Railroad Co. -- Merger -- Atlantic Coast Line Railroad Co. -- Petition to Remove Traffic Protective Conditions* (March 27, 1995); *Guilford Transportation Industries, Inc. -- Control -- Boston & Maine Corp.*, 5 I.C.C.2d 202, 218 (1988); ICC Docket No. 39176 (Sub-No. 1), *Pittsburgh & Lake Erie Railroad Co. v. Consolidated Rail Corp.* (decided April 3, 1985), *aff'd sub nom. Pittsburgh & Lake Erie Railroad Co. v. ICC*, 796 F.2d 1534 (D.C. Cir. 1986); *CSX Corp. -- Control -- American Commercial Lines, Inc.*, 2 I.C.C.2d 490, 528 (1984), *aff'd sub nom. Crounse Corp. v. ICC*, 781 F.2d 1176 (6th Cir.), *cert. denied*, 479 U.S. 890 (1986).

for solely served interline rail shippers that today have rail alternatives for a portion of their freight movements, the post-merger availability of efficient pre-merger gateways that have actually handled the interchange of significant amounts of freight traffic. This measure would allay concerns about the potential adverse end-to-end effects of a possible future transcontinental rail merger and claims that such transactions may serve to extend "bottlenecks" to the competitive disadvantage of "captive" rail shippers.

The serious challenge in fashioning such a new rule to safeguard major efficient gateways, however, is to avoid unwittingly resurrecting the discredited *DT&I* traffic protective conditions of the past. Under those conditions, the ICC required as a condition to approval of railroad mergers that the combining railroads maintain, and keep commercially open, *all* pre-merger interchanges with other railroads. The concern about having too many interchange points is even more valid today. Then, the issue was too much capacity and too many expensive, low-volume points. Today's reality is that the infrastructure to support low-volume interchange points does not exist. And the increased switching which results from having more interchange points can cause deterioration in service for many other customers that use the rail network of the affected carriers. As the ICC long ago recognized, these gateway protection conditions had the effect of freezing inefficient gateways, insulating connecting railroads from competition from new, expanded single-line service offerings of the merged railroads and destroying the ability of the railroads to consolidate traffic on higher-density longer-haul routes and thereby to improve service and reduce costs.[27] The gateway protection conditions also had the anti-competitive effect

---

[27] *See, e.g., Rulemaking Concerning Traffic Protective Conditions in Railroad Consolidation Proceedings*, 366 I.C.C. 112 (1982); *Seaboard Air Line*, *supra*.

of freezing railroad rates over competing routes because the conditions locked railroads into maintaining all existing joint-line routes and adoption of market-based rates at different levels for different routes could be challenged as a "commercial closing" of the frozen interchanges.

For this reason, any measure to protect efficient gateways must take care to insure that it does not result in a requirement that every pre-merger interchange point, regardless of the level of its actual use and regardless of its relative efficiency, be kept open and frozen for all time. That would simply handcuff the railroads in modifying their traffic routing practices to take account of market conditions and, perversely, would retard rate and service competition between alternative single-line and joint-line routes. Rather, the new policy NS is suggesting should be focused on requiring the maintenance of truly important, major, operationally feasible and efficient gateways for those exclusively served shippers who could credibly claim that an end-to-end merger would extend a "bottleneck" and reduce the competitive rail alternatives they enjoyed pre-merger. As an initial proposal, Norfolk Southern suggests that, for possible future east-west U.S. transcontinental consolidations, such a gateway protection measure could appropriately apply to the major Midwestern and Mississippi River gateways of Chicago, Kansas City, St. Louis, Memphis and New Orleans. For other particular transactions, it could be extended to comparable major gateways that handle significant traffic volumes. Because this measure would be focused on *preserving* the competitive routing options that existed prior to a proposed major rail consolidation, moreover, the protection should be afforded only to individual shippers that are exclusively served at origin or destination by one of the combining railroads, that prior to the proposed merger could complete their freight shipment only through an interchange at a gateway served by another one of the railroads and at least one other independent railroad, and that

actually used the covered gateway for a significant volume of freight traffic prior to the proposed railroad consolidation.[28]

Norfolk Southern suggests that this proposed gateway protection policy be implemented by requiring major rail consolidation applicants to establish, upon reasonable request by eligible solely served rail shippers, a common carrier or contract rate to apply to the movement of the shipper's traffic over the merged carriers' lines to/from a covered interchange point for use in conjunction with another railroad not involved in the proposed consolidation. The shipper would then be free to interchange its traffic with another connecting rail carrier at that connection and to use interline transportation service to complete the shipment. If the affected shipper were dissatisfied with the rate offered by the merged system, the shipper could bring a complaint seeking prescription of a reasonable rate to apply to the movement. This mechanism would have the effect of preserving the competitive routing options that existed pre-merger, and preventing the merger from extending the scope of the "bottleneck." To illustrate using the hypothetical example discussed previously, if a western rail carrier and Norfolk Southern merged, and a particular shipper that is solely served by the western carrier prior to the merger had used interline service via the western carrier and CSXT over Chicago for a significant volume of freight traffic, the gateway preservation provision would require the merged NS system to offer the shipper a common carrier or contract rate to apply over the former western carrier's lines to or via Chicago for use in conjunction with CSXT to complete the shipment. In this way, the shipper's pre-merger alternative of using either NS or CSXT service would be preserved, and it would do so

[28] Because the purpose of this measure would be to prevent reductions in competition resulting from a merger, it would be inappropriate to extend it to exempt traffic (such as intermodal and automotive traffic) that, by definition, is subject to effective competition.

without requiring (as the old *DT&I* conditions did) railroads to freeze or equalize their rates over competing routes or embroiling the parties (or the Board) in disputes over the establishment of joint rates and divisions.

Norfolk Southern believes that a provision, along these lines, to preserve major, efficient gateways would go a long way toward meeting the concerns of shipper interests that another major rail consolidation -- and especially a transaction that creates the first U.S. transcontinental rail system -- would reduce competitive routing options for shippers. At the same time, by confining the measure to the most important, heavily used (and unquestionably efficient) interchanges, the proposal strikes an appropriate balance between maintaining competitive routing options and the opportunity for efficient long-hauls for all involved carriers and avoiding the recreation of the disastrous mandated open-routing policies of the past.

2. Attempting to Inject New Rail-to-Rail Competition Through Forced Access

As noted above, the Board has announced that, contrary to its longstanding and consistent interpretation of rail merger standards, it may wish to consider in this rulemaking the imposition of various forced or open access, "bottleneck" rate or other reregulatory requirements designed to inject new rail-to-rail competition as a condition to approval of future major rail consolidation transactions. ANPR at 7-8. Such attempts to "remedy" perceived or claimed competitive imbalances that are not generated by a particular transaction would be unsound, both because they would work to discourage what might otherwise be meritorious transactions and because they are inherently suspect in terms of their legal and economic rationale. Forcing additional competition for the sake of competition, without appropriate consideration of the

BEFORE THE
SURFACE TRANSPORTATION BOARD

STB Ex Parte No. 582 (Sub-No. 1)

MAJOR RAIL CONSOLIDATION PROCEDURES

UNION PACIFIC'S
COMMENTS AND INITIAL PROPOSALS

Union Pacific Corporation and Union Pacific Railroad Company (collectively "UP") appreciate the opportunity to offer comments in response to the Board's Advance Notice of Proposed Rulemaking served March 31, 2000 (the "ANPR").

As the comments in Public Views on Major Rail Consolidations establish, the Board's policies and rules regarding Class I rail mergers[1] must be revised. The Board's current rules are based on the outdated assumption that the railroad industry suffers from excess capacity -- a condition that no longer exists.[2] The shipping community's broad hostility toward additional mergers under current policies and regulations underscores the need for this revision.

UP questions whether additional Class I consolidations will ever be in the public interest, even though mergers have provided important benefits in the past.

---

[1] We use the term "merger" to refer to mergers and other forms of consolidation and changes of control involving Class I rail carriers that are treated as "major transactions" under the Board's merger rules.

[2] As UP urged in its Comments in Ex Parte No. 582, the Board should strike from its rules the outdated first two sentences of 49 U.S.C. § 1180.1(a).

They helped eliminate the excess capacity that pre-Staggers Act regulation had forced the railroads to maintain. They combined traffic flows onto fewer routes and via fewer interchanges, allowing railroads to take advantage of economies of density. They helped the railroads achieve major productivity gains, many of which were passed along to shippers in the form of lower rates. And they provided homes for financially weak railroads that had little or no prospect of remaining viable on their own, including the Western Pacific, M-K-T, and Southern Pacific railroads.

Today the Board and stakeholders in rail transportation confront new realities that require a paradigm shift in the way we think about these mergers. The process of eliminating large-scale excess capacity in the rail industry is mostly complete. With far fewer railroads interacting, the opportunities for cooperation to achieve benefits traditionally ascribed to mergers are brighter than ever. For example, studies suggest that alliances are both increasing popular in American business and provide better returns on investment than mergers. Technology is about to alter this 165-year-old industry. More than one railroad has said publicly that e-commerce will "revolutionize" the railroad industry. Most important, additional Class I mergers would likely result in only two major railroads north of the Mexican border.

UP encourages the Board to develop policies and rules that are appropriate for considering merger proposals in this new environment. The Board should evaluate the impact of and need for any additional Class I mergers on the assumption that any such merger is part of an "end game" resulting in transcontinental mergers and only two major railroads in North America. It should condition any mergers it approves in a manner that

protects the public interest and shipper interests under that industry structure. Only by adopting this perspective can the Board develop realistic and consistent public policies.

UP will propose and discuss several potential rule changes designed to respond to some of the concerns its customers voiced in the Ex Parte No. 582 proceeding and to adapt the Board's rules to the prospect of transcontinental and trans-border mergers. Our proposals are detailed but should be considered as only initial concepts for further discussion. We expect to revise or reconsider them in response to comments from other parties.

UP discusses its proposals in the order of the topics listed in the ANPR, not in order of their importance.

I. Downstream Effects

When Burlington Northern Santa Fe and Canadian National notified the Board of their consolidation plans, the Board quickly recognized that their transaction would lead to "downstream" effects, including responsive merger applications likely to yield only two remaining North American rail systems. It promptly suspended the "one case at a time" rule set forth in 49 C.F.R. § 1180.1(g). Under the Board's ruling, parties in a BNSF/CN proceeding would have been expected to consider downstream effects.

UP believes the Board acted wisely, and it encourages the Board to impose the same requirements on all proposed Class I merger proposals. Any combination among the six largest remaining railroads in North America would be part of and would drive what many parties at the Board's public hearing described as the "end game" in rail consolidations. Before approving any additional Class I merger, the Board should consider whether the "end game" is in the public interest. This is the overriding public policy question before the Board.

UP offers two specific proposals. First, although we believe that there are still too many possible permutations to expect parties to address every imaginable combination of Class I carriers and that such an exercise would involve too much speculation, it is not too early to require parties to address in future applications whether a two-railroad North American rail system would be in the public interest. For example, applicants and other parties should address whether a single railroad serving Florida, the Northeast, Western Canada, and California would be manageable and responsive to its shippers. Second, to provide a more realistic analysis of proposals that reach the Board in the same time frame, the Board should announce now that it may consider such proposals in a single, combined proceeding.

UP recommends that the Board replace 49 C.F.R. 1180.1(g) with the following provisions:

> (g) *Downstream effects.*
>
> (1) Applicants proposing a major transaction must evaluate the effects on competition and the public interest of combining all Class I railroads in the United States and Canada into two North American Class I railroads. Applicants need not identify specific combinations, but should evaluate the implications of an industry structure consisting of two major railroads.
>
> (2) The Board may, on its own motion or on request of an interested party, consolidate for hearing and decision any application proposing a major transaction filed before the date set for the filing of inconsistent applications in another pending proceeding arising out of another application proposing a major transaction.

II. Maintaining Safe Operations

UP is satisfied that current safety requirements in connection with Class I mergers adequately protect the public interest. The Board's safety compliance programs,

developed in conjunction with the Federal Railroad Administration, appear to be effective in ensuring that mergers are implemented safely. The Board should take equal care to ensure that any conditions applied to future Class I mergers can be implemented with similar attention to safety.

III. Safeguarding Rail Service

Service failures following recent major mergers are a primary cause of shipper disaffection with railroads and rail mergers. The Ex Parte No. 582 record rings with shipper complaints about promises unfulfilled and service that declined after mergers. We expect all railroads to propose more stringent measures to prevent future mergers from causing service to decline. Like other railroads, UP proposes more comprehensive implementation planning.

UP believes that railroads proposing future mergers should also accept greater responsibility for effects of their mergers by providing remedies for any significant service deterioration. We believe that the Board has the power to condition mergers in the public interest by establishing an expedited procedure for customers to obtain either temporary substitute service or recovery of substitute transportation costs. Following its 1997-98 service crisis, UP paid hundreds of millions of dollars in such costs to its customers, well beyond its likely liability in the courts.

Remedies must be based on quantifiable and detailed performance data that measure railroad performance in a way that is meaningful to individual shippers. Shippers and the railroads that serve them should be able to compare service before and after a

consolidation using consistent measurements.[3] UP proposes that applicants create and maintain databases showing both on-line transit times and on-line cycle times for individual shipments, as well as the extent of variability in each measurement.

UP would also be interested in developing performance measurements for car supply, but we have not been able to identify a way to solve several problems. During car shortages, when the parties most need accurate data, some shippers order more cars than they need to protect their minimum requirements, thereby distorting the railroad's performance. Also, a railroad's ability to satisfy a car order depends on how far in advance the shipper orders the car. Railroads will more frequently fail to fill requests for cars on the same day than requests for cars in three days. UP would be interested in suggestions regarding this performance measurement.

The applicants should be required to develop these data for the base year used in their merger application and compile comparable data throughout the merger implementation period. They should retain all such data throughout the implementation period.

UP proposes an expedited Board procedure to provide effective remedies if, despite all reasonable precautions, service declines significantly after a merger. Customers could request either access by another carrier during the service failure or compensation for reasonable additional transportation costs, such as the cost of moving products by truck.

UP proposes the following addition to 49 C.F.R. § 1180.8:

---

[3] During its service crisis, UP encountered great difficulty in reconciling its performance data with shipper records. Our proposal solves that problem by requiring comparable data for pre-merger and post-merger periods.

(c) (1) For *major* transactions, provide a detailed implementation plan (exhibit __) explaining how the consolidated entity will perform all of the important actions necessary to implement the consolidation and how it will provide adequate capacity for post-consolidation service. These actions should include at least the following:

(i) labor agreement consolidations;
(ii) computer-system integration;
(iii) significant personnel reductions;
(iv) major reroutes and extended hauls;
(v) capacity expansions and track upgrades;
(vi) acquisition of locomotives and freight cars; and
(vii) facility consolidations and expansions.

Applicants should state the major assumptions underlying the implementation plan. The implementation plan should also set forth the schedule on which public benefits will be achieved. Unlike the operating plan, which is based only on the incremental effects of the consolidation, the implementation plan should accommodate reasonably expected changes in traffic volume that would occur without the consolidation during the implementation period.

(2) The implementation plan should give shippers warning of critical time periods during which service might be affected by major changes, such as computer-system integration. For each major change, the applicants should describe contingency plans and procedures to recover from any service problems that might arise. After consolidation, the combined carrier must update the implementation plan, including the timing of the actions listed in (c)(1)(i)-(vii) above, in quarterly reports to the Board until all of the important implementation actions have been completed. The combined carrier must also transmit notices to potentially affected shippers and other carriers not less than 30 days in advance of implementation actions that might cause disruption, unless circumstances prevent issuing such notices.

UP also proposes the following new section of Part 1180:

1180._ Remedies for service deterioration as a result of consolidation

(a) For the base year, applicants in a *major* transaction must prepare and maintain a database from which it is possible to obtain pre-consolidation (1) transit times and variability of transit times for all shipments; (2) cycle times and variability of cycle times for all applicable shipments; and (3) [supply of empty cars] (collectively, "Service Measurements"). If the consolidation is approved, the combined carrier must maintain this database for five years after the effective date of the Board's decision approving the consolidation, and provide Service Measurements to affected shippers or Class III rail carriers that have a legitimate need for the information in order to demonstrate service deterioration.

(b) The following provisions apply for a period of five years after the effective date of the Board's decision approving the consolidation:

(1) If a shipper (not a third-party beneficiary) or Class III rail carrier that has shipped more than 100 cars over 12 months in a corridor can show that a Service Measurement for its traffic has deteriorated by an average of more than 50 percent from pre-consolidation levels for more than 60 consecutive days, it may give the consolidated carrier written notice asking the railroad to cure service within 60 days from the date of receipt of the notice and to provide historical and current Service Measurements for the affected traffic.

(2) If the carrier is unable to restore service to the 50 percent level by the end of the 60-day cure period, the shipper or Class III rail carrier may file a service complaint with the Board seeking a remedy for inadequate service. To file a service complaint, the shipper or Class III rail carrier must show that the carrier's service, as measured by any of the Service Measurements, deteriorated by an average of more than 50 percent from the base period for 120 or more consecutive days (through the cure period), that it cooperated with the carrier in efforts to restore service, and that it has incurred increased transportation costs as a result of the deteriorated service. Unless the carrier can establish in a reply to be filed within ten days after receipt of the service complaint (x) that the service decline is attributable to factors other than implementation of the consolidation or (y) that the complaining party did not reasonably cooperate with remediation efforts, the Board may grant either of the following remedies within 30 days after the complaint is filed:

(i) temporary access by reciprocal switching or trackage rights (including, if necessary, temporary trackage rights over other carriers) to the complainant's facility, if the Board concludes that access will result in improved service to the shipper and will not adversely affect service to other shippers or further degrade the operations of the consolidated carrier; or

(ii) reimbursement of incremental transportation costs that could not reasonably be mitigated and that were incurred by the complainant or, if complainant is a Class III rail carrier, by shippers located on that carrier.

(3) Pursuant to 49 U.S.C. § 11123, the Board will reconsider the need for the service remedy after 30 days, and the service remedy will automatically expire, if not previously terminated, after 270 days. The consolidated railroad may at any time petition for termination of a service remedy on the ground that service has been restored to the 50 percent level.

(4) If the Board grants temporary access and the railroads cannot agree on compensation, the Board will apply compensation standards under 49 U.S.C. §§ 11102 and 11123.

(5) The entity obtaining access must be a rail carrier with operating authority from the Board, and the Board must determine that such carrier can operate safely to address the service problem.

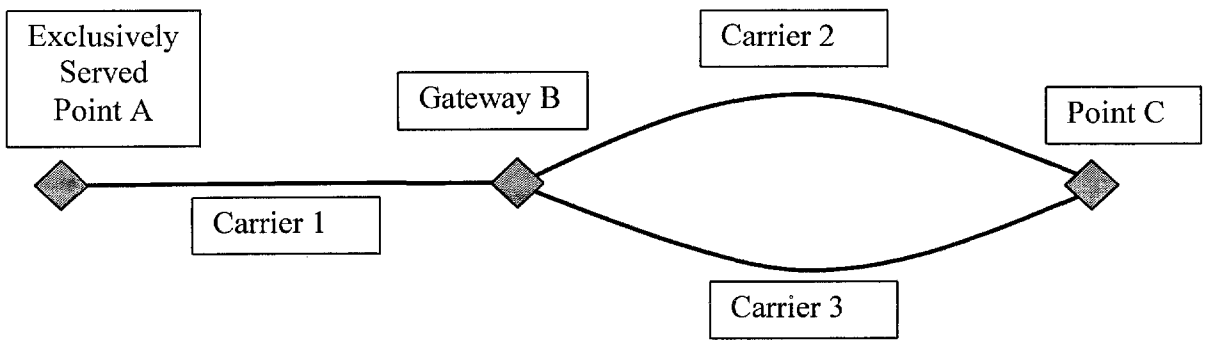
(6) Remedies are available only to shippers lacking existing rail alternatives; provided, however, that the complainant may seek compensation if it can show that the other serving carriers are disabled by the merger-related service problem.

(7) If necessary to effectuate the temporary access remedy, the Board may temporarily suspend a shipper's contractual duty to ship specified volumes of traffic under rail service contracts with the consolidated carrier. The suspension would apply only for the time period necessary to alleviate the service problem.

IV. Promoting and Enhancing Competition

The Board seeks comment on various mechanisms by which rail merger policy might be used to promote and enhance, rather than simply preserve, competition. Most of these mechanisms address the effects of railroad mergers on so-called "bottleneck segments," which are rail segments that connect shipper facilities exclusively served by one carrier with gateways where that carrier connects with other carriers.[4]

UP does not favor using the Board's jurisdiction over rail mergers to alter the competitive structure of the rail industry other than to address the effects of a merger. UP recognizes, however, that most shippers do not want railroad mergers to affect their



---

[4] As the Board's March 31, 2000 decision notes, it is well established that the ICCTA generally does not require rail carriers to establish separately challengeable rates for bottleneck segments. The Board's so-called "Bottleneck" rate decisions clarify the specific circumstances under which carriers may be required to establish, and shippers permitted to challenge, bottleneck rates. See Docket No. 41242, Central Power & Light Co. v. Southern Pac. Transp. Co., Decision served Dec. 31, 1996, clarified in Decision served Apr. 30, 1997, aff'd sub nom. MidAmerican Energy Co. v. STB, 169 F.3d 1099 (8th Cir.), cert. denied, 120 S. Ct. 372 (1999); Union Pacific R.R. v. STB, 202 F.3d 337 (D.C. Cir., 2000).

future opportunities to use established interline routing options. Shippers also do not want mergers either to create new bottlenecks or expand existing bottlenecks. Some shippers are concerned that combinations may eliminate competitive routing options that were previously available for the portion of the overall movement between the gateway and either the origin or destination of the traffic – in effect extending the bottleneck segment. Some shippers are also concerned that, where carriers have established separately challengeable bottleneck rates, a combination with another carrier capable of completing the movement could extinguish the shipper's ability to challenge the bottleneck rate.

UP does not share the view of many shippers that end-to-end mergers generally have anticompetitive vertical effects, and the Board must retain the basic economic and legal principles that guided its Bottleneck decisions. Nevertheless, if the nation's rail system is to be restructured into two transcontinental systems, the Board should take action to keep traditional gateways open. Vague assurances that gateways will stay open are not sufficient because there are too many ways to close them commercially.

UP proposes that the Board modify its rules to require combining carriers to make available at a shipper's request separately challengeable bottleneck rates between exclusively served facilities on their system and the predominant pre-merger gateway for the applicable traffic from those facilities. In the classic "rat-tail" diagram set forth below, if

Carriers 1 and 2 combined, they would be obligated, at the shipper's request, to establish a rate for the "bottleneck" segment between exclusively served Point A and Gateway B. This would preserve the shipper's pre-merger options, because the shipper could combine the A-to-B rate with rates offered by Carrier 3 to complete the movement from origin (Point A) to destination (Point C) and, if necessary, challenge the reasonableness of the A-to-B rate. In fact, such a condition would go somewhat beyond merely preserving the exclusively served shipper's routing options. In some cases, as where the traffic is now moving under joint or proportional rates, the reasonableness of the rate between Point A and Gateway B is not separately challengeable today.

The following specific language for a new section in Part 1180 would implement the proposal outlined above:

1180.__ Preservation of gateways and rate challenge options.

(a) A Class I rail carrier participating as a Primary Applicant in a *major* transaction approved by the Board (a "Participating Carrier") shall, upon request of an affected shipper, establish a rate for transportation (a "Segment Rate") applicable to traffic as to which no Participating Carrier served both the origin and destination of the traffic prior to consummation of the transaction (the "Subject Traffic"), between:

(1) any Exclusively Served Shipper Facility, which means any shipper facility (i) other than an automotive distribution ramp, intermodal facility, or transload facility (ii) that is located at any point on the carrier's system served exclusively by that carrier and no other rail carrier (either directly or via reciprocal switching, joint facility or other service arrangement) (iii) where traffic originated or terminated during the twelve months preceding the pre-filing notice under 49 C.F.R. § 1180.4(b) pertaining to the transaction; and

(2) the Pre-Transaction Gateway, which means the point of interchange, if one exists, that during the twelve months preceding the pre-filing notice under 49 C.F.R. § 1180.4(b) pertaining to the transaction, was (i) an actual interchange between the Participating Carrier and two or more other rail carriers, one of which was another Class I carrier participating in the transaction as a Primary Applicant, (ii) the interchange point most frequently used to move the Subject Traffic (or comparable traffic if the rate

would apply to new traffic) between the Exclusively Served Shipper Facility and the origin or destination of the traffic, and (iii) used by at least 100 cars of traffic originating or terminating at the Exclusively Served Shipper Facility.

(b) The shipper at whose request a Segment Rate is established pursuant to this rule shall be entitled to combine the Segment Rate with a rate or rates offered by a carrier other than the Participating Carrier for movement between the Pre-Transaction Gateway and the origin or destination of the Subject Traffic.

(c) The shipper at whose request a Segment Rate is established pursuant to this rule shall be entitled to challenge the Segment Rate as unreasonably high to the same extent and under the same standards as applicable to rate reasonableness challenges under 49 U.S.C. §§ 10701 and 10707. In determining whether the Participating Carrier is "market dominant," the Board will examine whether there is an absence of effective competition on the entire origin-to-destination route, rather than on the segment between the Exclusively Served Shipper Facility and the Pre-Transaction Gateway.

(d) A shipper facility served exclusively by a Class III rail carrier that is incapable of interchanging traffic with any carrier other than the Participating Carrier, or that is obligated by contract to interchange the majority of its traffic with the Participating Carrier, shall be treated as a facility served exclusively by the Participating Carrier for purposes of this rule. If the Participating Carrier lacks authority to establish a Segment Rate between the Exclusively Served Shipper Facility and the Pre-Transaction Gateway, it shall instead establish a Segment Rate between the point of interchange with the Class III carrier and the Pre-Transaction Gateway.

(e) The obligation to establish a Segment Rate shall also apply to any rail carrier (a "Trackage Rights Carrier") that receives trackage rights or other access to the lines of a Participating Carrier as a result of settlement agreements with the Primary Applicants or conditions imposed on the Primary Applicants by the Board. The Trackage Rights Carrier shall be obligated to establish a Segment Rate pursuant to subparts (a)-(d) above only (1) for traffic capable of being handled using the rights or other access granted to the Trackage Rights Carrier and (2) between Exclusively Served Shipper Facilities located on the Trackage Rights Carrier's system as it existed prior to the transaction and the applicable Pre-Transaction Gateway, if any, where such traffic was interchanged, during the twelve months preceding the pre-filing notice under 49 C.F.R. § 1180.4(b) pertaining to the transaction, with the Participating Carrier over whose lines access was granted.

Such a rule would preserve shippers' pre-merger routing and rate challenge options in a straightforward manner that would not unduly constrain the ability of the combined carrier to achieve efficiencies associated with the combination. Because it would

make use of existing mechanisms for challenging rates, the merging carriers would be able to estimate the costs of this condition in advance. And the condition would ensure that the major pre-transaction gateways would remain open.[5]

This approach is preferable to the options suggested by the Board:

- The Board's contract option would require the shipper to carry the burden of negotiating an agreement with the non-merging carrier on rates and all other attributes of the transportation. That commercial agreement might not be reached.

- The Board's through route alternative would require the merged carrier and connecting carriers to agree. Again, they might not reach agreement.

- The Board's reciprocal switching and trackage rights proposals would run afoul of the fundamental policy basis for the Board's Bottleneck decisions, which affirmed bottleneck carriers' traditional routing discretion and statutorily-recognized right to select their long-hauls.[6] Those proposals would go far beyond what is needed to offset effects of the merger.
