No new rule should require the merged carrier to short-haul itself, depriving the carriers of the returns upon which they depend to attract capital, reinvest in their rail networks, and maintain and improve service.

---

[5] Our proposed rule clarifies that the existence of transportation alternatives providing effective competition will be evaluated with respect to the entire movement from origin to destination, which is the transportation service of interest to the shipper. This will avoid the anomalous outcomes that would result were market dominance determinations based on competition for the bottleneck segment only, for example where intermodal competition between origin and destination provides a competitive constraint on rail rates but does not exist at a remote rail gateway where there is no reason at all for competition to exist. See, e.g., STB Docket No. 42038, Minnesota Power, Inc. v. Duluth, Missabe & Iron Range Ry., Decision served July 8, 1999 (ignoring rail-truck alternative between coal mine and utility because there was no evidence of transportation competition at interchange point).

[6] Docket No. 41242, Central Power & Light Co. v. Southern Pac. Transp. Co., Decision served Dec. 31, 1996, pp. 4-11.

Our rule is also far superior to the long-discredited "DT&I" conditions. Those conditions imposed draconian and inefficient requirements to allow routing over all possible gateways and required rate and service parity regardless of the relative efficiencies of various routes. Any such requirement would create significant impediments to efficiency.

UP's proposed rule would supplement existing precedent governing Board analysis of the potential vertical competitive effects of proposed rail combinations. The Board has not established a hard-and-fast rule that end-to-end combinations can never have anticompetitive effects. Rather, the Board's so-called "one-lump" theory establishes a presumption that end-to-end mergers do not have such effects. The presumption can be rebutted, and shippers can seek additional remedies. See, e.g., Finance Docket No. 32549, BN/Santa Fe, Decision No. 38, served Aug. 23, 1995, p. 71, aff'd, Western Resources, Inc. v. STB, 109 F.3d 782 (D.C. Cir. 1997).

V. Shortline and Regional Railroad Issues

All of the concerns expressed by shortline (Class III) and regional (Class II) railroads (collectively, "smaller railroads") can be addressed by the Board's general rules addressing competition and service issues. The service and bottleneck rate protections set forth in other new rules that UP has proposed would provide significant protections for Class III railroads and the shippers they serve. Additional rules specifically addressing shortline issues are not needed.

In particular, concerns regarding the appropriateness of contractual limits on interchange (sometimes called "paper barriers") are not the proper subject of general merger rules. The underlying contractual obligations did not arise from mergers and often are unaffected by mergers, particularly on UP. Issues relating to such contractual provisions were addressed in Ex Parte No. 575, Review of Rail Access and Competition Issues, and

they are the subject of a comprehensive industry agreement negotiated between the Association of American Railroads ("AAR"), on behalf of Class I railroads, and the American Short Line and Regional Railroad Association, on behalf of smaller railroads. AAR has formally invited ASLRA to negotiate regarding that agreement. These issues have also been addressed in individual merger cases on a case-by-case basis.[7]

VI. Employee Issues

UP joins in the Comments of the National Railway Labor Conference.

VII. "Three-to-Two" Issues

UP disfavors any hard-and-fast assumption that anticompetitive effects arise only when the number of rail carrier alternatives drops from two to one. UP believes that the Board should clarify that it will not constrain its analysis of the competitive effects of future transactions in this manner. In past cases, the Board has recognized the potential competitive effects of proposed combinations that reduce the number of rail carrier alternatives from three to two, such as where the combination involves the shippers' two most efficient alternatives.[8] The Board can assess the competitive effects of any proposed transaction only by considering the individual circumstances of each situation.

The Board should therefore consider the following new rule, which could be inserted at the end of 49 C.F.R. § 1180.1(c)(2)(i):

---

[7] See also Finance Docket No. 33388, CSX/NS/Conrail, Decision No. 89, served July 23, 1998, p. 77.

[8] See, e.g., Finance Docket No. 32760, UP/SP, Decision No. 63, served Dec. 4, 1996 (explaining the need for conditions to preserve competitive options for shippers at Lake Charles, Louisiana, served pre-merger by UP, SP and KCS, because of circuity in KCS's route structure).

> The Board will evaluate on a case-by-case basis all claims that a proposed transaction would adversely affect competition by reducing the number of rail carrier alternatives serving an individual shipping point, an origin-destination corridor, or some other properly-defined transportation market. In evaluating such claims, the Board will not apply any rigid numerical standard based on the number of rail carriers serving the market before and after the transaction. Rather, the Board will examine all of the circumstances relevant to the competitive effects of the transaction, including such factors as the nature of the transportation service at issue; the effectiveness of the competition provided by each of the rail carriers serving the corridor, point or market; constraints on rail rates from intermodal, geographic or product competition; and the transaction's effects on the strength of competition among the serving rail carriers.

VIII. Merger-Related Public Interest Benefits

UP recommends that the Board establish a higher threshold for claims of merger benefits. The Board's existing rules indicate that it will "consider whether the benefits claimed by the applicants could be realized by means other than the proposed consolidation that would result in less potential harm to the public." 49 C.F.R. § 1180.1(c). In practice, however, the Board has been reluctant to find that particular claimed merger benefits could be achieved by means other than merger.[9] Recent changes in the structure of Class I railroads, advances in technology, and various innovations in cooperative relationships among rail carriers have made it much more likely that categories of public benefits historically associated with railroad combinations can be achieved via other means. These include:

- Alliances among connecting carriers, such as the KCS-CN-IC alliance;

---

[9] See, e.g., Finance Docket No. 33556, CN/IC, Decision No. 37, served May 25, 1999, pp. 46-49; Finance Docket No. 32760, UP/SP, Decision No. 44, served Aug. 12, 1996, pp. 109-13.

- Industry initiatives, such as AAR's "Interline Service Management" program, which expects to resolve remaining data exchange issues this summer;
- Operational coordinations, such as CN and CP's recent agreement on directional running in British Columbia and the efforts currently underway to streamline operations in the congested Chicago terminal;
- Service initiatives, such as the recently announced NS-BNSF transcontinental intermodal trains; and
- Potentially revolutionary changes in railroading as a result of "business-to-business" e-commerce.

All hold the potential for achieving many of the types of public benefits that historically have been associated with railroad combinations.

Mergers should not be credited with benefits that are practicably achievable through other means that would not cause irreversible changes in the structure of the railroad industry. Indeed, mergers may impair benefits achievable through alternative arrangements. For example, the KCS-CN-IC alliance probably will be lost if BNSF and CN merge.[10] Accordingly, the Board should modify its rules to clarify that it will treat as public benefits only those benefits that can practicably be achieved only through mergers.

UP proposes replacing the last sentence of 49 C.F.R. § 1180.1(c), immediately preceding sub-part (1), with the following:

> The Board will treat as public benefits only those improvements in cost, efficiency, service, competitiveness, or other benefits that applicants demonstrate are incremental to the benefits that could practicably be achieved through means other than a major transaction. The Board will also consider whether, as a result of the applicants' pursuit of the proposed transaction, any improvements in cost, efficiency, service,

---

[10] At the Ex Parte No. 582 hearing, Michael R. Haverty, President and Chief Executive Officer of the Kansas City Southern Railway predicted that, if BNSF and CN combine, "We do not feel that long term the CN-IC-KCS marketing alliance is going to survive."

> competitiveness, or other benefits that would likely be achieved without the transaction would be reduced or lost as a result of the proposed transaction.

IX. Cross-Border Issues

UP believes that the Board should clarify two aspects of its rules as they relate to potential combinations involving non-U.S. carriers.

First, the Board's rules should explicitly acknowledge the extensive relationships among all aspects of the North American rail network by requiring, in the case of a proposed combination involving a carrier within the Board's jurisdiction that has foreign operations, that applicants submit with their application the same information for the foreign service as would be required if the participating carriers operated wholly within the United States. The Board cannot effectively carry out its obligation to evaluate whether a proposed Class I combination is in the national public interest unless it is able to evaluate all aspects of a transaction that affect the United States.

Because of the network characteristics of the railroad industry, changes brought about by a combination that directly affect one part of a railroad system can have significant indirect effects on other parts of the system or, indeed, on the entire North American rail network. This interrelationship was borne out clearly in connection with UP's 1997-1998 service difficulties, when congestion in the Houston area led "to a lengthy and damaging service breakdown dramatically affecting rail transport throughout the West."[11]

---

[11] Finance Docket No. 32760 (Sub-No. 26), UP/SP Houston/Gulf Coast Oversight, Decision No. 10, served Dec. 21, 1998, p. 6.

The same is true with respect to the competitive impacts of a proposed transaction. Because huge volumes of Canadian-originating rail traffic move into the U.S.,[12] transactions that affect competitive alternatives in one part of the continent – in one province of Canada, for example – may have an impact on U.S. interests.

Given these interrelationships among all parts of the North American rail network, the Board and other interested parties participating in a merger proceeding cannot be assured of having access to all the information needed to protect the public interest unless the applicants treat their proposed transaction, for purposes of the analysis to be performed by the Board, as if it were occurring entirely within the United States. Applicants should be required to submit to the Board a system-wide operating plan and a system-wide implementation plan. Applicants should similarly be required to address in their application all the competitive effects of their proposed combination, including effects that might seemingly involve competition outside the United States. Applicants should also address the potential effects of public policies in the foreign jurisdiction on U.S. rail service and viability.[13]

UP recommends that the Board's rules be clarified by adding the following new subsection 1180.6(d):

> In major transactions involving carriers with foreign operations, the information required to be included in the application by this section and sections 1180.7, 1180.8, and 1180.9 shall address the entire transaction and all of its

---

[12] For example, more than 80 percent of British Columbia Railway's traffic flows into the United States.

[13] For example, the Canadian government recently ordered CN and CP to reduce grain rates by 18 percent. If applied to all traffic, such policies could impair the viability of the Canadian portion of a combined rail system.

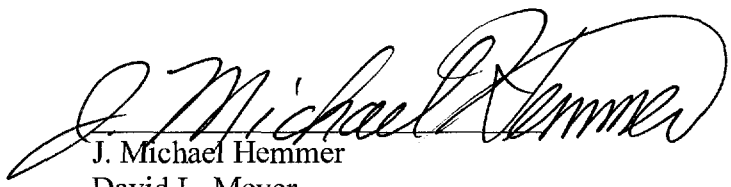
> impacts, including competitive impacts, operating changes and financial effects outside the United States.

Second, it is well established that the Board has broad power to impose conditions designed to mitigate adverse effects of the proposed transaction by indirect means if necessary. For example, the Board can require applicants to enter into agreements with third parties that remedy adverse consequences of their proposed transaction even where the Board itself could not impose upon the applicants the relief embodied in the agreement.[14] The Board's rules should make clear that the Board will impose conditions to remedy potential adverse consequences of transactions involving foreign operations, even where jurisdictional limits on the Board's authority may preclude the Board from granting relief directly. If necessary to make such conditions enforceable by the Board, the Board could require that applicants consent to Board jurisdiction with respect to disputes concerning compensation or other aspects of the conditions the Board imposes.[15]

UP proposes that the Board clarify its rules in this regard by adding the following language to the end of section 1180.1(d)(1):

> In *major* transactions involving carriers with foreign operations, the Board may impose conditions to ameliorate potential adverse effects arising outside the United States. The Board may, for example, as a condition to approving the application, require applicants to enter into legally enforceable private agreements that would remedy potential harms.

---



[14] See, e.g., Finance Docket No. 32760, UP/SP, Decision No. 44, served Aug. 12, 1996, p.146 (requiring UP, as condition of consummating proposed acquisition of SP, to modify contracts with shippers at 2-to-1 points to allow BNSF access to at least 50% of volume).

[15] Agreements entered into to carry out conditions imposed by the Board are routinely enforced by the Board notwithstanding that similar agreements among carriers that do not stem from Board-imposed conditions would be outside the Board's jurisdiction. Canadian Pac. Ltd. v. United States, 379 F. Supp. 128, 133 n.12 (D.D.C. 1974).

CONCLUSION

UP believes that this proceeding is among the most important to come before the Board since the Staggers Act. The rules and policies established here will shape the future structure of the railroad industry and may determine whether the industry grows or atrophies. UP will continue to participate with those high stakes in mind.

Finance Docket No. 34342

KANSAS CITY SOUTHERN
– CONTROL –
THE KANSAS CITY SOUTHERN RAILWAY COMPANY, GATEWAY EASTERN RAILWAY COMPANY, AND THE TEXAS MEXICAN RAILWAY COMPANY

UNION PACIFIC RAILROAD COMPANY'S COMMENTS

Union Pacific Railroad Company ("UP") submits these comments on Kansas City Southern's ("KCS's") proposed common control of the Texas Mexican Railway ("Tex Mex"), Kansas City Southern Railway ("KCSR"), and Gateway Eastern Railroad (collectively "Applicants"), as well as its control of Transportación Ferroviaria Mexicana ("TFM"). In a separate volume, UP is submitting the verified statements of John T. Gray, UP's Vice President-Interline; Stephen R. Barkley, UP's Regional Vice President-Southern Region; Jerry Hausman, an MIT professor and leading industrial organization economist; and Francisco Fuentes Ostos, UP's Mexican counsel.

I. INTRODUCTION AND SUMMARY OF POSITION

KCS proposes to acquire control of the entire TFM rail system. The Board's conclusions here will determine the structure, routing, competitiveness, and vitality of rail-borne international trade between the U.S. and Mexico far into the future, probably for as long as railroads survive. In addition, the Board's handling of the international components of this transaction will affect the structure and course of all future transnational rail proceedings.

UP is not concerned about actions taken in Mexico. It is concerned about decisions that will be made and actions taken in the headquarters of KCS in Kansas City, Missouri, where KCS will exercise its control of Tex Mex and TFM. We ask the Board to consider the effects of this international transaction in the United States, not Mexico.

The Board should not doubt its authority and responsibility to review all potential effects of this transaction on international transportation affecting U.S. shippers. The NAFTA Rail proponents recently broke TFM's rail system into segments – for no reason that we can discern other than to restrict the Board's review of the transaction. But TFM before then had controlled a rail system stretching from Lázaro Cárdenas, Mexico, on the Pacific Ocean to Beaumont, Texas, hundreds of miles into the United States. If UP or BNSF sought to acquire control of CN or CP, and employed a similar device of splitting the Canadian railroad's U.S. operations into a separate transaction, the Board surely would not blindfold itself to the competitive effects in the United States of combining two of North America's major railroads. The Board should be equally vigilant here.

Although we are filing an extensive submission to satisfy the Board's call for substantial evidence, UP's position is simple. The Board should require Applicants to honor their commitments in a meaningful and enforceable way, and that requirement should be a condition of Board approval. Applicants have made several commitments to reassure the Board and the shipping community that NAFTA Rail will not harm competition for international rail traffic. KCS has agreed in writing to accept a condition requiring non-discrimination at the Laredo Bridge, and during the Board's July 31 hearing said it expects the Board to impose conditions requiring it to keep the Laredo Gateway open commercially as well. We agree with KCS that those commitments, if honored meaningfully, will prevent

adverse impacts on competition in the United States. As it has in all recent consolidation proceedings, the Board should hold the Applicants to their promises.

As we will show, relying on NAFTA Rail voluntarism to honor these commitments in the years and decades to come carries too much risk. NAFTA Rail's rational economic incentives will lure it away from those promises. Moreover, the risks to competition are real, while offsetting public benefits of the transaction are modest at best.

Public Benefits. KCS disavows most of the traditional public benefits of end-to-end consolidations. It claims no improvements in train service, no new run-through trains, no new blocking, and no cost reductions through consolidated facilities or functions. KCS, Tex Mex, and TFM rightfully brag that they already provide "seamless service." KCS makes much of its plans to extend its computerized operating system to Tex Mex and TFM, but KCS announced this step long ago and independently of this transaction.

KCS argues that this transaction will strengthen it financially, but that is doubtful, unless it uses the leverage from its new control over Tex Mex and TFM to shift substantial UP traffic to its lines and raise shippers' rates. To effect the transaction, KCS must take on hundreds of millions of dollars of additional debt. Its financial position is already weak, and the debt will not help. We assume that KCS's ultimate goal is to position itself for acquisition by another carrier.

Competitive Effects. If the Board were to accept KCS's recent statements at face value, the TFM transaction would have no effect whatsoever. KCS asserts that not a single shipper will reroute its traffic from UP routes to KCS's routes. Those assertions are not credible. Indeed, KCS has told the Board one story but given Wall Street another. KCS has told the financial community that it will use control over TFM to reroute U.S.-Mexico

traffic over its lines. Of course it will. NAFTA Rail may and should pursue its private interests using pro-competitive means, by improving rail service across the border and eliminating inefficiencies.

At the same time, however, NAFTA Rail will have the power to act anti-competitively. It could increase costs for its competitors, reduce the quality of service provided to competitors, and increase prices or reduce value to customers. NAFTA Rail will enjoy market power over significant flows of international traffic. The market power NAFTA Rail will possess arises in part from its control of the Laredo Gateway. A "gateway" is both a physical place and a set of commercial relationships, and NAFTA Rail will have a stranglehold on both.[1] It will have the power to control all movements over the International Bridge at Laredo, the physical gateway. And through TFM it will control the price and quality of all international traffic flows between Mexico and the United States via Laredo, the commercial gateway. With TFM, NAFTA Rail's "share" of traffic moving via Laredo will be 100 percent. No traffic will be able to flow in either direction over that gateway without TFM's cooperation on the total price and the quality of the international service.

This Board's precedents establish that competition via the Laredo Gateway must be preserved and that other gateways and modes do not provide effective alternatives. The Board granted Tex Mex the right to connect with KCS over UP's tracks on the basis of precisely this determination. Thus, NAFTA Rail's very existence is founded on the essential

---

[1] As the map set forth as Exhibit A to Mr. Gray's Verified Statement ("V.S.") shows, and as Mr. Barkley and Mr. Gray explain, international traffic flows via Laredo must traverse *both* Tex Mex's trackage across the Laredo Bridge and TFM's network that serves the points in Mexico to/from which shippers need rail transportation.

competitive role of the Laredo Gateway. In the six years since the Board found the Laredo Gateway to be "of separate and surpassing importance to U.S.-Mexico rail transportation" and acted to avoid any reduction in competition there,[2] the Laredo Gateway has assumed even greater importance for NAFTA trade between Mexico and the rest of North America.

KCS claims that NAFTA Rail's economic interests will compel it to cooperate with UP and BNSF. That is so for those traffic flows for which KCS/Tex Mex cannot compete, such as movements to and from points served only by UP. The opposite is true for the majority of Laredo rail traffic, which KCS/Tex Mex could carry in the United States. *See* Gray V.S., Exh. J. NAFTA Rail will want to push traffic to its own routes unless the benefits of a competitor's route are compelling.

NAFTA Rail also will enjoy market power because of the continuing inability of Mexico to carry out the goals of rail privatization, initiated in 1997. Six years later, the two private railroads in the northern part of Mexico, TFM and Ferromex, continue to litigate rather than compete as foreseen by the privatization plan. As UP's Mexican counsel explains, the regulatory and legal structures in Mexico are unable to bring these conflicts to a close. More than twenty injunctions ("*amparos*") block regulatory decisions. Critically, the trackage rights fees for Ferromex to operate over TFM (and vice versa) are more than twice those used in similar situations in the U.S., and are commercially non-viable for almost all traffic. While the Board can do nothing to change that, it should

---

[2] *UP/SP*, 1 S.T.B. 233, 448 (1996). In that case, one of the Applicants here, Tex Mex, argued to the Board that U.S. policy regarding NAFTA required that the Board "give heightened scrutiny to transactions within its jurisdiction that present a danger of diminishing competition for transportation of U.S.-Mexican traffic." *UP/SP*, Brief of the Texas Mexican Ry. (TM-39) (June 3, 1996) at 17 (Exhibit 1).

understand that it cannot rely on competition within Mexico to alleviate the anticompetitive threat posed by this transaction in the United States.

One of America's leading economists, Professor Jerry Hausman, evaluates NAFTA Rail's economic power and its ability to use that power to harm the public interest. He asks the right question: not whether UP will be hurt (it will), but whether shippers would be hurt. He concludes that NAFTA Rail will have the incentive and the opportunity to extract higher prices and reduce the quality of service to shippers, unless KCS abides by the commitments it has made in the course of this proceeding.

KCS offers no analysis whatsoever of these competitive effects. Its economist declined to consider the vertical aspects of the NAFTA Rail transaction. However, his prior analysis of the same traffic flows confirmed that substantial amounts of U.S.-Mexico rail traffic are not subject to effective competition by other modes or gateways. In discovery, other parties sought information regarding competitive effects, including data in the possession of TFM (which KCS had a contractual right to procure). But KCS refused to provide such information, limiting UP's and others' ability to explore the most important issues in this proceeding. KCS should not now be allowed to remedy its failure and present evidence of competitive effects of the TFM transaction.

KCS's own commitments, if meaningfully enforced, would prevent the competitive harms likely to arise from the NAFTA Rail transaction. KCS commitments are as follows:

- To administer the International Bridge in a non-discriminatory manner.[3]
- To continue to support international service with BNSF and UP via the Laredo Gateway by providing blocking, run-through trains, car supply, competitive service, and prompt rate quotes.[4]
- To "keep the Laredo Gateway open on commercially reasonable terms."[5] If this means anything, it means that NAFTA Rail will ensure that TFM continues to offer commercially viable connecting rates for UP traffic moving via Laredo.[6]

---

[3] Specifically, Applicants have committed to (a) "work cooperatively with UP toward efficient utilization of the Laredo Bridge" and (b) negotiate "in good faith with UP to develop new dispatching protocols." Supplement to Application (KCS-11/TM-11) ("Supplement") at 4, 26-27 & Davies V.S. at 15-16; *see also* Letter from William A. Mullins, Esq., to David L. Meyer, Esq., dated July 21, 2003 (filed with Board and served on all parties of record) ("Applicants' July 21 Letter") (Exhibit 2). Applicants have stated that they are willing to make their commitment "a condition of common control of Tex Mex." Applicants' July 21 Letter, p. 2.

[4] Specifically, Applicants have committed to use KCS's control of TFM to (a) ensure that "UP and BNSF are provided the same level of service they have experienced in the past, and to making improvements on that level of service where possible;" (b) "require TFM to cooperate with both UP and BNSF on pre-blocking rail cars, improving automated customs pre-clearance procedures, supplying cars for shipment, accommodating run-through train service, providing excellent service and promptly quote rates;" and (c) "work with UP and BNSF on development of a methodology for measuring service standard, and to develop a method by which such standards could be enforced," as to all traffic handled by TFM via the Laredo Gateway. Applicants' July 21 Letter, p. 2 (Exhibit 2); Supplement at 4, 24-25 & Davies V.S. at 14-15.

[5] Applicants' July 21 Letter, p. 2 (Exhibit 2); Supplement at 4 & Davies V.S. at 15.

[6] Keeping a gateway open means more than simply preventing physical impediments to the interchange of freight from one railroad to another at the point of interchange. It means ensuring that one railroad's (here KCS's) acquisition of another railroad on the other side of the gateway (here TFM) does not lead the acquired railroad to discontinue cooperating with other connecting carriers (here UP) on all of the commercial terms that go into competitive interline service offerings to shippers whose freight is moving across the gateway. Otherwise, the merged carrier can close the gateway "commercially," making it

(footnote continued ...)

UP urges the Board to require KCS to honor these commitments in a meaningful and enforceable manner.[7]

We recommend a procedure under which interested parties would have 90 days to negotiate implementing agreements with KCS. If negotiations fail, the Board could resolve disputes, providing an unbiased final decision on any unresolved issues. KCS cannot complain about unfairness in being required to live up to its own promises, if hose promises were honestly made.

Requiring KCS to abide by its commitments would not curtail the potential benefits of NAFTA Rail or NAFTA Rail's ability to compete. Non-discriminatory management of the International Bridge can only benefit the shipping public and international trade. Continued support of TFM routings with UP can only benefit competition and, again, promote trade. If NAFTA Rail can improve service and efficiency, it can attract new customers to its better service, or lower rates.

This is not a Mexican matter, as Applicants have suggested. The traffic at issue here is international cross-border traffic, and the benefit of that competition for shippers occurs primarily in the United States. The Board has consistently acted to protect U.S. shippers in precisely these circumstances. Lest there be a doubt about the appropriateness of Board action here, Applicants acknowledge that keeping this gateway

---

(... footnote continued from previous page)
impossible for the other connecting carriers' transportation options (here, UP-TFM options) to compete effectively for traffic moving via the gateway.

[7] UP has heard from many of its shippers that they were less inclined to voice concerns about KCS's acquisition of Tex Mex and TFM in light of Applicants' commitments.

open is a matter of interest to "all affected parties."[8] And they have made their commitments – including commitments respecting KCS's use of its control over TFM – in this U.S. proceeding.

Finally, Mexican sovereignty would be unaffected by enforcing KCS's commitments. Mexican law, although difficult to enforce, is fully consistent with KCS's promises. It requires non-discriminatory service and rates to all customers, including connecting carriers. Requiring NAFTA Rail management in the United States to honor its commitments with respect to TFM cross-border movements will not affect any regulatory power within Mexico.

Only this agency has the opportunity to evaluate and address the effects of this transaction on international rail commerce in the United States. Mexico's Competition Commission acted on an ex parte basis and considered only effects within Mexico. This Board's authority and remedial powers are much broader than those of the U.S. Department of Justice.

When the Board adopted new rules for Class I mergers, it fundamentally changed merger policy. Supported by UP and KCS, it decided that traffic flows over major, efficient gateways should be preserved. It also stressed the U.S. interest in ensuring that international transactions do not undermine rail competition for U.S. shippers. While those rules do not apply directly here, KCS's commitments in this proceeding are faithful to those principles. The Board should require NAFTA Rail to stand behind these commitments.

---

[8] Applicants' July 21 Letter at 2 (Exhibit 2).

II. THE BOARD SHOULD CONSIDER THE EFFECTS IN THE UNITED STATES OF THE ENTIRE KCS/TFM/TEX MEX TRANSACTION

Consistent with its past practice, the Board should analyze the competitive effects in the United States of the entire KCS/Tex Mex/TFM transaction. To the extent the transaction threatens to produce anticompetitive effects in the United States, the Board should impose conditions that will mitigate those effects.[9] Any other outcome would undermine the Board's authority to respond to future international rail consolidations, including mergers of U.S. and Canadian railroads.

Applicants have artificially segregated KCS's acquisition of control of Tex Mex for the Board's approval. The Board should not be deterred from exercising its full authority to review the effects of the entire transaction by KCS's strategy of segregating its acquisitions of Tex Mex and TFM. Before KCS's strategic use of a purchase and voting trust to temporarily insulate it from Tex Mex, TFM controlled Tex Mex. As the indirect owner of a railroad operating in the United States, TFM would be before the Board (as an applicant, with KCS) seeking approval for a KCS/Tex Mex/TFM transaction. The Board should reject any effort to limit its exercise of authority to review transactions in which carriers seek to acquire both U.S. and foreign rail assets through a strategy of restructuring corporate relationships.

Contrary to Applicants' assertions, considering the effects of the entire transaction and imposing conditions to mitigate any adverse effects are entirely consistent with Board precedent and principles of jurisdiction and comity. The Board plainly has

---

[9] The governing legal standard, set forth in 49 U.S.C. § 11324(d), and in the Board's broad conditioning power under Section 11324(c), is discussed at pages 88-90, below.

jurisdiction to address effects on transportation *within the United States*, including international transportation. Imposing conditions to address any adverse effects on U.S. transportation would not intrude on the sovereignty of Mexico.

A. KCS's Acquisition of Control of Tex Mex and TFM Constitutes a Single Transaction

From its inception, the KCS/ Tex Mex/TFM transaction has been a cohesive transaction that will have significant impacts in the United States. Although TFM is a Mexican railroad, in March 2002 it acquired 100 percent of Mexrail. Mexrail is the holding company for Tex Mex, a railroad located entirely within the United States.[10] Thus, KCS's acquisition of control of TFM, the indirect 100 percent owner of a railroad providing transportation in the United States, would normally be subject to the Board's jurisdiction.

However, just a few days before it filed the Application, KCS acquired 51 percent of TFM's Mexrail shares and placed them into a voting trust. In this manner, it removed TFM's controlling link with Tex Mex temporarily (until KCS could complete its acquisition of both, reuniting TFM with its 100 percent of Tex Mex).[11] KCS then insisted that only its acquisition of control of Tex Mex was subject to Board approval, since TFM no longer controlled a subsidiary that provided transportation in the United States. This was clearly an effort to evade Board jurisdiction by artificially breaking a single corporate family into separate segments, insulating TFM from its Tex Mex operations in the United States.

---

[10] As the Application portrays, under TFM's "existing structure" (*i.e.*, prior to KCS purchasing 51% of Mexrail from TFM), TFM owned 100 percent of Mexrail and through it Tex Mex. Application at 13.

[11] TFM today continues to hold a 49% interest in Mexrail and Tex Mex.

While this purchase and voting trust strategy may have technically avoided the need for KCS and TFM to seek Board approval of the acquisition of TFM, it cannot oust the Board's authority to examine the effects of the entire KCS/Tex Mex/TFM transaction. Nor does it preclude the Board from fashioning conditions that would address any adverse effects on competition of KCS's acquisition of control of both TFM and Tex Mex. Nothing in the KCS purchase of Mexrail and placement of the shares in a voting trust changes the competitive impact of the entire transaction. It is simply an intermediate restructuring of corporate relationships. The effects of the transaction will be the same as if TFM still owned Tex Mex (indirectly through Mexrail).

It is inconceivable that the Board would permit any other U.S. Class 1 railroad to avoid agency review through the sort of maneuver KCS has engaged in here. If UP of BNSF were to announce plans to acquire control of CN or CP, parties would raise concerns about the effect of such a combination on competition both north and south of the border, as well as at the border. There would be questions about whether the merger partners would continue to offer commercially reasonable terms to connecting railroads or would attempt to foreclose competition through withdrawal of reasonable rate factors offered to connecting carriers at significant gateways. If UP or BNSF were to attempt to evade examination of such concerns about competition at international border gateways by carving off and acquiring the U.S. assets of its merger partner, then placing those assets in a voting trust, there would surely be vehement protests from both shippers and other railroads.

If the Board were to conclude here that KCS's purchase/voting trust strategy deprived the agency of the ability to consider the effects of the KCS acquisition of TFM in conjunction with its acquisition of Tex Mex, the result would be highly detrimental. The

message would be that parties to a transaction may evade Board jurisdiction by creative shuffling of assets and use of a voting trust. With the increasing NAFTA ties among the United States, Canada, and Mexico, there likely will be more cross-border transactions in the future. When that occurs, the parties will follow the road map laid out by KCS here. As a result, the Board would never again have the opportunity to review all the aspects of a transnational rail consolidation.

Despite the transparency of KCS's effort to artificially remove TFM from the Board's purview, Applicants assert that the KCS acquisition of control of Tex Mex is independent of its acquisition of control of TFM, and that either of the two "transactions" could occur independently of the other.[12] In fact, the KCS/Tex Mex/TFM combination was {{

}} and it was announced and explained to the public and the investor community as a single event.[13]

KCS's business people, and their financial advisers, have consistently described and analyzed KCS's acquisition of control of TFM and Tex Mex (through Tex Mex's parent Mexrail) as a {{

---

[12] *See* Reply to the Petition of Canadian National Railway Company to Reopen Decision No. 2 and to Reject Application (KCS-16/Tex Mex-16) at 14-15.

[13] *See* KCS-Grupo TMM Press Release, April 21, 2003 (Exhibit 3).

}} KCS and Grupo TMM have consistently presented a single "NAFTA Rail Transaction" to the public, stressing that NAFTA Rail will be a single, seamless rail system.[16]

Given that Tex Mex is the critical link that connects the KCS and TFM systems,[17] it is hard to imagine that KCS would embark upon the TFM acquisition as a stand-alone transaction without acquiring control of Tex Mex. Even if it did choose to delay acquisition of Tex Mex by divesting the 51 percent of Mexrail shares held in a voting trust, KCS might well gain effective control of both entities as soon as it completed its acquisition of TFM. KCS would own 100 percent of both KCS and TFM, the two connections on which Tex Mex depends the most, and through TFM 49 percent of Tex Mex. In these circumstances, even if KCS were to divest the Mexrail shares it has placed in a voting trust,

---

14 *See* Exhibit 4, p. 5. {{

}} *Id.* at 40.

15 For example, the {{

}}

16 KCS's website (www.kcsi.com) includes various documents that consistently describe the "NAFTA Rail Transaction" as a single transaction. *See, e.g.*, "NAFTA Rail Transaction Summary" (available at <www.kcsi.com/pdf/nafta_rail.pdf>) (describing the series of agreements as a single "transaction" and analyzing the financial effects of a combination with "Grupo TFM consolidated") (Exhibit 6).

17 *See* Exhibit 7 (KCS presentation characterizing Tex Mex as "a key link to the NAFTA Railway").

the 49 percent indirect ownership of Tex Mex that it would acquire by virtue of its ownership of TFM likely would give it effective control of that carrier, thereby reuniting TFM and Tex Mex.[18]

The notion that the TFM and Tex Mex acquisitions are independent appears confined to the pleadings filed by KCS and Tex Mex in this proceeding. The Board was clearly correct when it concluded in Decision No. 2 that, "[n]otwithstanding that the two transactions nominally are separate and independent of each other, in reality they are two components of a single, larger transaction with broader implications in the U.S." Decision No. 2, p. 11. KCS's attempt artificially to separate TFM from Tex Mex operations for the duration of this proceeding and its characterization in its pleadings is no basis for the Board now to disregard those broader implications. Rather, the Board should analyze the effects of the entire transaction in the United States and develop conditions that are appropriate to remedy any adverse effects.

B. The Board Has Consistently Evaluated the Full Range of Effects in the United States from Proposed Transactions and Related Non-Jurisdictional Events

Because the KCS acquisition of control of Tex Mex is part of the larger KCS/Tex Mex/TFM transaction, the Board must examine the full range of effects of that larger transaction in the United States. There is no basis for segmenting the analysis and examining only one component of the overall transaction at a time.

---

[18] *See Union Pacific Corp., Union Pacific R.R. & Missouri Pacific R.R. – Control – Chicago & North Western Holdings Corp. & Chicago & North Western Transportation Co.*, 9 I.C.C.2d 939, 947-48 (1993) ("*UP/CNW-Control*").

In the past, the Board and its predecessor, the ICC, have examined effects associated with transnational mergers, so long as those effects relate to transportation in the United States.[19] In one such transaction,[20] two Canadian carriers, Canadian National ("CN") and Canadian Pacific ("CP"), sought ICC approval to purchase Conrail's interests in three separate companies. The principal acquisition was of Canada Southern Railway Co. ("Canada Southern"), a Canadian carrier whose assets (a line from Windsor to Niagara Falls, Ontario, and various branch lines) were located entirely in Canada. The other two companies were the Detroit River Tunnel Company, which owned a tunnel at the Detroit/Windsor gateway that extended a very short distance into the United States, and the Niagara River Bridge Company, which owned a bridge at the Niagara Falls gateway that also extended a short distance into the United States. Despite the fact that one component of the transaction involved assets located entirely outside the United States, the applicants submitted the entire transaction for ICC approval.

The ICC concluded that, because the tunnel and the bridge extended for a short distance into the United States, it had jurisdiction "to the extent transportation in this country is involved." *Canada Southern* at 8. The agency proceeded to analyze all aspects of the transaction, including claims involving the movement of international traffic on the Canada Southern lines in Canada. Among other things, it examined whether sale of the Canadian line would reduce competition in the Detroit-Niagara Falls/Buffalo corridor (for

---

[19] Under 49 U.S.C. § 10501(a)(2), the Board's statutory jurisdiction is defined in terms of "transportation in the United States."

[20] *Canadian National Ry. & Canadian Pacific, Ltd. – Acquisition – Interests of Consolidated Rail Corp.,* ICC Finance Docket No. 30387 (ICC served Aug. 29, 1984) ("*Canada Southern*").

which one route passed through Canada) and whether control of the Detroit and Niagara Falls/Buffalo gateways by CN and CP would adversely affect competition for U.S.-Canada traffic flowing across those gateways. The analysis included an inquiry into whether control of Canadian Southern would permit CN to discriminate against U.S. carriers by diverting traffic to its preferred gateway. *Id.* at 8-11. Ultimately, the agency approved the acquisition because it concluded that the *overall transaction* – including its Canadian components – would not have anticompetitive effects in the United States. *Id.* at 11.

Applicants point out that in *Canada Southern* the ICC declined to require CN and CP to enter into agreements with U.S. rail carriers because "'the interchange practices of Canadian carriers in Canada are beyond our jurisdiction.'" KCS-16/TM-16 at 14 (quoting *Canada Southern* at 7). However, the specific claim the ICC was addressing involved alleged refusal of Canadian carriers to enter into agreements with U.S. carriers for container traffic *between two Canadian points*, supposedly "forcing" the traffic to U.S. ramps. *Canada Southern* at 7. The Commission concluded that the claim was directed to problems that were "not related to this transaction." *Id.* at 11. Moreover, the claim plainly related to competition in Canadian markets, not competition in the United States. Had the Commission found that the challenged practices were related to the transaction and had an adverse effect on transportation in the United States (not just in Canada), it likely would have come to a different conclusion regarding jurisdiction.

The Board also had no hesitation in considering the overall effects of a transnational merger in another proceeding involving a Canadian carrier.[21] In its *CN/WC* decision, the Board considered the effect of a reduction from two shippers to one at Oba, Ontario (served by WC's subsidiary Algoma Central Railway, Inc., which operated only in Canada), and concluded that no U.S. shippers would face a merger-related reduction in competition for rail movements to or from Oba. *CN/WC* at 11 n.19. The Board considered aspects of the transaction in Canada to be relevant to the extent a reduction in competition might affect the United States.

In their Supplement, Applicants try to distinguish cases involving Canadian railroads. They argue that TFM is different because CN and CP have long operated under Board jurisdiction within the United States, whereas "TFM has never operated in the U.S."[22] Applicants have very short memories. As noted above, until May 9, 2003, when KCS acquired 51 percent of the Mexrail shares and placed them into a voting trust as a part of this transaction, TFM's system extended into the United States through its 100 percent control of

---

21 *See Canadian National Ry, Grand Trunk Corp., & WC Merger Sub, Inc. – Control – Wisconsin Central Transportation Corp., Wisconsin Central Ltd., Fox Valley & Western Ltd, Sault Ste. Marie Bridge Co., & Wisconsin Chicago Link Ltd*, STB Finance Docket No. 34000 (STB served Sept. 7, 2001) ("*CN/WC*").

22 Supplement at 6.

Tex Mex.[23] Thus, just as CN and CP historically operated in the United States through their various U.S. subsidiaries, TFM has been operating in the U.S. through Tex Mex.[24]

Applicants also attempt to invoke the older "one merger at a time" decisions (*see* KCS-16/TM-16 at 16-17). However, these cases are inapposite. They address whether the Board, when reviewing separate mergers involving *different sets of parties,* should consider the effects of one speculative merger while reviewing another.[25] The KCS/TFM transaction is clearly not some "speculative" event that may or may not happen. Indeed, Applicants have acknowledged that that transaction may already be consummated by the time the Board renders its decision in this proceeding.[26] More importantly, none of the cases Applicants cite comes close to addressing the question presented here: should two parties to

---

[23] In fact, Tex Mex has been a U.S. subsidiary of Mexican railroads since the early 1900s, when its stock was indirectly owned by Ferrocarriles Nacionales de Mexico. *See Mexrail, Inc. v. Union Pacific R.R.*, STB Finance Docket No. 32980 (STB served July 13, 2000) at 2 n.4.

[24] TFM has acknowledged that it participates in international traffic moving in the United States by virtue of participation in a car pooling agreement, and it has applied for and obtained authorization from the Board for its participation in that agreement. *See Transportation Ferroviaria Mexicana – Pooling of Car Service Regarding Multilevel Cars,* STB Finance Docket No. 29653 (Sub-No. 7) (STB served Sept. 28, 1999). Under 49 U.S.C. § 11322, the Board could have granted such approval only upon a finding that TFM was a carrier providing transportation within the Board's jurisdiction.

[25] *See, e.g., Burlington Northern Inc. & Burlington Northern R.R. – Control & Merger Santa Fe Pacific Corp. & Atchison, Topeka & Santa Fe Ry.,* ICC Finance Docket No. 32549 (STB served Sept. 21, 1995) at 6. Moreover, KCS ignores that fact that the Board more recently has recognized that it is appropriate to depart from its "one merger at a time" principle in some circumstances. *See Major Rail Consolidation Procedures,* STB Ex Parte No. 582 (Sub-No. 1) (STB issued June 25, 2001) at 46. Here the Board properly called for Applicants to provide information about the TFM acquisition on the ground that the broader KCS/Tex Mex/TFM transaction could be very significant and that the role TFM plays in the U.S.-Mexico corridor is significant. *See* Decision No. 2, p. 10.

[26] *See* KCS-16/TM-16 at 14-15.

a transaction be permitted to avoid consideration of the overall effect of an international transaction by artificially bifurcating the jurisdictional and non-jurisdictional components?

In fact, the Board's consideration of aspects of an international transaction that involve transportation in the United States is simply a reflection of its regular practice of examining matters that, while they may not require approval, are nevertheless "related" to a transaction before the agency. For example, in the proceeding to approve the CN/Illinois Central ("CN/IC") control transaction, the Board considered the effects of an Alliance Agreement entered into by the applicants and KCS. It concluded that the agreement did not require regulatory approval, but, because it was "an important settlement agreement related to this merger, . . . it is appropriate for us to scrutinize carefully all of the issues relating to it that have been raised in this proceeding."[27]

The Board made it clear in *CN/IC* that, even if a loss of competition arises from a non-jurisdictional arrangement related to the transaction formally under review, it is appropriate to consider those effects in connection with the transaction. Three shippers complained that another CN/KCS settlement agreement (the "Access Agreement") negotiated in connection with the control proceeding would result in loss of build-in/build-out opportunities.[28] The agency examined this allegation, noting that loss of such an option may "constitute a significant loss of competition."[29] The Board explicitly rejected CN's argument that the Board could not consider such a loss because it resulted

---

27 *See Canadian National Ry., Grand Trunk Corp., & Grand Trunk R.R. – Control – Illinois Central Corp., Illinois Central R.R., Chicago, Central & Pacific R.R., & Cedar River R.R.*, STB Finance Docket No. 33556 (STB served May 25, 1999) ("*CN/IC*") at 25.

28 *Id.* at 33.

29 *Id.*

from a non-jurisdictional settlement agreement, explaining that the agreement was "clearly merger-related."[30]

Applicants recently invoked a decision involving UP and Chicago & North Western ("CNW")[31] for the proposition that the Board will look only to the "specific" transaction at issue. *See* KCS-16/TM-16 at 16-17. However, in evaluating UP's agreement to purchase a sufficient amount of stock to gain effective control, the ICC stated that it would confine its consideration of the application "to the specific stock transaction *and related events*."[32] The Commission went on to make clear that other scenarios UP had presented were relevant to the analysis because they were indications of "what UP intend[ed] to do," provided the basis for findings on the competition and public benefits issues, and therefore "must be considered" as part of the applicant's operating plan.[33]

The precedents discussed above make it clear that the Board's longstanding practice has been to investigate transnational aspects of a transaction, including where pertinent activities that physically occur outside the United States, that may have an effect on transportation in the United States, and to examine matters "related to" a merger when analyzing effects of the merger. KCS's acquisition of control of TFM has effects on transportation in the United States and is related to KCS's acquisition of control of Tex Mex. The Board should have no hesitation in considering the effects of the entire KCS//Tex Mex/TFM transaction in the United States as part of this proceeding.

C. The Board May Fashion Remedies Addressing the Effects of the KCS/Tex Mex/TFM Transaction in the United States, Including Effects Arising from Its International Aspects

The Board may properly impose conditions that address any adverse effects of the KCS/Tex Mex/TFM transaction on transportation in the United States. This is particularly appropriate in the circumstances of this case, in which important NAFTA traffic flows are at stake. Moreover, Applicants have already made commitments involving TFM in recognition of effects that TFM's conduct will have on competition in the United States, and KCS's Mr. Davies stated at the July 31 hearing that Applicants expect that the Board will impose conditions in connection with those commitments.

The Board's precedents fully support the conclusion that the agency may impose conditions that address effects of a transnational transaction in the United States, even when those conditions will affect non-U.S. carriers and conduct outside the United States. For example, in the *CN/IC* proceeding, the Board imposed a merger condition in an effort to protect international traffic flows, despite the fact that its condition affected an Ontario partnership, owner of the Detroit River Tunnel Company. The Board considered a claim by CP and another party that, due to CN's new investment in IC, CN would be less inclined to allow needed improvements to the Detroit River Tunnel ("DRT"). Their argument was that CN would have a stronger incentive to impede the flow of CP's cross-border traffic in order to shift traffic to CN lines in Canada and the United States.[34] The Board concluded that the protesting parties had failed to demonstrate a significant causal link between the transaction and the pre-existing DRT situation. It nevertheless imposed a

---

[34] *CN/IC* at 34-35.

condition holding applicants to their representation that they would not use their control of the Detroit River Tunnel Company – through the Ontario partnership – to frustrate necessary improvements to the tunnel, "because of the importance of the DRT to international trade."[35]

In the *CN/WC* proceeding, which involved a minor transaction, the Board declined to impose the terms of an agreement between CN and the National Industrial Transportation League ("NITL") as a condition to approval of the transaction because doing so did not appear necessary to remedy adverse consequences of the transaction.[36] However, the Board did state that it would hold applicants to representations they had made about the meaning and reach of the agreement.[37] The NITL/CN agreement included interchange protection provisions that included, among other things, a commitment by CN/WC to establish and maintain "commercially reasonable contract through rates and charges" for traffic originating in or destined to points on the Wisconsin Central system over any existing interchange between Wisconsin Central and another carrier.[38] This commitment covered all of the North American rail carrier subsidiaries of Wisconsin Central Transportation Corporation, including Algoma Central, which operated only in Canada.[39] Thus, the Board held the applicants to a commitment regarding rates they would charge for transportation that occurred in part within Canada.

---

35 *Id.* at 35.

36 *CN/WC* at 12.

37 *Id.*

38 *Id.* at 34.

39 *Id.* at 3 n.3; *see also* NIT League-CN Settlement Agreement (Exhibit 8).

Of course, the rate context is one in which the Board has long awarded relief that extends across national boundaries. It is well established that the Board may assess the reasonableness of joint rates involving a domestic carrier and a foreign carrier, even though its remedial powers do not extend directly to the foreign carrier. In such cases, the Board orders relief for an unreasonable international through rate against the United States carrier participating in the route, even though the agency lacks jurisdiction over the foreign segment of the through route and rate.[40] The Board "remains free to take corrective action such as assessing reparations from domestic U.S. carriers participating in such rates."[41]

In this case, requiring KCS, as a condition to Board approval of the Tex Mex transaction, to agree to use its control of all NAFTA Rail carriers (including TFM) to cause TFM to refrain from certain practices that would have anticompetitive effects in the United States would be entirely appropriate and consistent with past practice. The Board has previously emphasized the importance of protecting NAFTA flows.[42] The conditions UP proposes – aimed at fair treatment for U.S. carriers using the Laredo Bridge and keeping the

---

40 *See, e.g., Great Northern Ry. v. Sullivan,* 294 U.S. 458 (1935); *Canada Packers, Ltd. v. Atchison, Topeka & Santa Fe Ry.,* 385 U.S. 182, 183-84 (1966).

41 *Canadian Pacific Ltd. v. United States*, 379 F. Supp. 128, 134 (D.D.C. 1974).

42 For example, in *UP/SP*, 1 S.T.B. at 421, the Board stated:

> "We are particularly sensitive to our responsibility to ensure that this merger will foster the goal of North American economic integration embodied in NAFTA. After all, our regulatory powers are derived from the "Commerce Clause" of our nation's constitution, which, in a very real sense, has resulted in the creation of a "free trade zone" within these United States, leading to our emergence in this century as an economic superpower."

Laredo Gateway open – are all directed at preserving competition and efficiency for NAFTA traffic flows. They would not pertain to TFM's transportation of rail traffic solely between points within Mexico. As explained in later sections, in order to preserve competition at the vital Laredo Gateway and to avoid anticompetitive effects north of the border for U.S.-Mexico traffic movements, BNSF and UP require cooperation from TFM on international interline shipments on commercially reasonable terms, as KCS has promised.

Remedying effects arising out of KCS's acquisition of control of TFM (in combination with its acquisition of control of Tex Mex) is particularly appropriate here. Applicants have already made commitments to the Board and to other parties in this proceeding regarding their intention to treat other carriers fairly in operation of the Laredo Bridge, to keep the Laredo Gateway open on commercially reasonable terms, and to avoid discrimination against connecting carriers.[43] In testifying at the Board's hearing on July 31, 2003, in this proceeding, Mr. Davies of KCS stated specifically that KCS expects that the Board will impose a condition involving preservation of commercially reasonable access to the Laredo Gateway. Because Applicants have already conceded the appropriateness of such commitments, there should be no objection to the Board's imposition of conditions ensuring the enforceability of those commitments.[44]

---

[43] Applicants' July 21 Letter (Exhibit 2).

[44] *See, e.g.*, *CN/WC* at 8, 12 (Board will "hold applicants to representations they have made in this record about the meaning and reach of [the applicants' settlement agreement], including applicants' pledge not to "engage in vertical foreclosure by closing efficient gateways").

D. Imposing Conditions to Remedy Adverse Effects of the KCS/Tex Mex/TFM Transaction on Transportation in the United States Would Not Violate Principles of Jurisdiction or Comity

Applicants have suggested that imposing conditions relating to effects of KCS control of TFM and Tex Mex would somehow exceed the Board's jurisdiction and violate principles of comity. This is not the case.

UP is not asking the Board to assert "extraterritorial jurisdiction." We anticipate that the Board would impose any condition not to TFM or any other Mexican entity, but on a U.S. entity – KCS – over which the Board clearly has jurisdiction. Such conditions would be directed at NAFTA Rail management decisions made in the United States, in Kansas City, Missouri. Most importantly, the conditions would affect movements into and out of the United States and commercial arrangements relating to those movements (*e.g.*, establishment of origin-to-destination rates for U.S.-Mexico cross-border shipments). UP is concerned with any effects of the entire transaction on transportation *in the United States*, *i.e.,* on competition north of the border. The Board would order KCS, a U.S. Applicant, to negotiate with other parties and ultimately to exercise its control over TFM to cause it to refrain from conduct that would adversely affect competition north of the border.[45]

---

[45] Of course, it is well established that U.S. law can apply to foreign economic actors to the extent that the effects of their conduct are felt in the United States. For example, in *Hartford Fire Ins. Co. v. California*, 509 U.S. 764, 796 (1993), the Supreme Court upheld the applicability of the U.S. laws to London-based insurance companies and stated that "it is well established by now that the Sherman Act applies to foreign conduct that was meant to produce and did in fact produce some substantial effect in the United States." Based on this "effects test," the U.S. antitrust agencies routinely review proposed mergers involving foreign companies, and routinely impose conditions on such mergers. *See, e.g.,* FTC Press Release, "FTC Accord in Ciba Geigy/Sandoz Merger to Prevent Slowdown in Gene Therapy

(footnote continued ...)

Nothing in the conditions UP seeks would violate Mexican sovereignty in any way. No Mexican agency has the power to redress anticompetitive effects in the United States. No Mexican agency has even looked at that subject. What UP is proposing here is merely prescription of concrete steps to accomplish broad commitments that KCS has already made. These steps – negotiation of dispatching protocols requiring fair treatment of carriers using the Laredo Bridge, avoiding discrimination against UP on matters of service, and providing commercially reasonable terms for through movements over the Laredo Gateway – would not require KCS to order TFM to violate any Mexican law or regulation. *See* Fuentes V.S. at 9-10.

Applicants have also suggested that the Board should refrain from considering the overall effects of KCS's acquisition of TFM and Tex Mex because other regulatory bodies have some role in reviewing the TFM portion of the transaction. KCS-16/TM-16 at 11-12. The Board should reject this suggestion. The issue in this proceeding is the effects of the transaction on highly significant rail traffic flows into and out of the United States at the most important rail gateway on the U.S./Mexico border. The fact that other agencies are also reviewing the transaction (or have already reviewed it) does not suggest that the Board should relinquish its authority to examine effects of the transaction in the United States. No Mexican body will be concerned with competition north of the border. The fact that other agencies with different responsibilities review this transaction should not

---

(... footnote continued from previous page)
Development & Preserve Competition in Corn Herbicides, Flea-Control Markets" (Dec. 17, 1996) (<http://www3.ftc.gov/opa/1996/12/ciba.htm>) (describing settlement agreement requiring two Swiss pharmaceutical companies to undertake substantial divestitures of foreign assets).

deter the Board from taking appropriate action to safeguard competition in the United States. Certainly no Mexican agency is in a position to regulate in this area. Fuentes V.S. at 7-9.[46]

We briefly review the status of the three investigations Applicants to which Applicants have alluded.

Mexican Competition Commission

As Applicants report, the Mexican Competition Commission (the Commission Federal de Competencia ("CFC")) decided not to block KCS's acquisition of TFM under Mexico's competition law. However, this action does not indicate that the transaction will have no anticompetitive effects on U.S.-Mexico cross-border traffic or within the United States. CFC expressly limited its analysis to the competitive situation *within* Mexico. It considered only an intra-Mexico market, defined as {

} CFC apparently viewed the transaction as {

} The CFC decision included no analysis of effects on international transportation, or effects of NAFTA Rail control of TFM on competition within the United States. Thus, the decision has no bearing on the issues that this Board must determine.

---

[46] The Board has recognized that Canadian and Mexican authorities will be reviewing proposed transnational railroad combinations simultaneously with the Board's review. *See* 49 C.F.R. § 1180.1(k)(2).

[47] *See* Fuentes V.S., Exh. A (KCS-C-0188).

[48] *Id.* at KCS-C-0189.

Moreover, CFC's review was performed on an *ex parte* basis, without allowing participation by parties other than KCS/TFM. The CFC rejected Ferromex's comments, apparently based on a belief that Mexican law precluded it from considering the views of other parties.[49] Even after limiting its analysis, CFC voted to approve the transaction on a tie vote (2-to-2). Under CFC procedures, the vote of a commissioner who supported the transaction was counted as the tie-breaking vote. Fuentes V.S. at 7-8.

U.S. Department of Justice

UP understands that KCS and/or Grupo TMM made Hart-Scott-Rodino notifications pertaining to KCS's acquisition of TFM, and that the statutory waiting period has expired. However, the agency that would have reviewed the transaction was aware that the Board is conducting its own review of the transaction, and that the Board (in Decision No. 2) has expressed its intention to consider the competitive effects of KCS's acquisition of both TFM and Tex Mex. Given DOJ's limited enforcement resources, its limited enforcement options relative to the Board's broad remedial authority,[50] and its awareness of the Board's pending proceeding, it should not be too surprising that DOJ did not take action regarding the TFM acquisition. Whatever action the Board chooses to take in this case will not create a conflict with DOJ's disposition of the matter.

---

[49] UP attempted to participate in the CFC proceeding, but, pursuant to the CFC's standard operating practices, it refused to consider submissions by parties other than KS/TFM. Fuentes V.S. at 8.

[50] Unlike the Board, DOJ has no power to impose competition-preserving conditions. It must secure the parties' agreement to a consent decree or sue in federal court to enjoin the transaction.

Mexican Foreign Investment Commission

As Applicants note, KCS's acquisition of TFM is also subject to review by Mexico's Foreign Investment Commission ("FIC"). FIC is charged with considering whether control of TFM "would contribute to increasing the competitiveness of Mexican industry and promoting regional and technological development, and protect the sovereign integrity of the Nation. The primary focus of this inquiry is on "internal Mexican economic matters." Fuentes V.S. at 8. FIC's review is ongoing, and the precise scope of its inquiry remains unclear. Whatever the outcome of that review, however, it will not involve any evaluation of the effects of KCS control on competition in the United States.

* * *

Thus, there is no jurisdictional bar and no principle based on comity that precludes the Board from analyzing the effects of the entire KCS/Tex Mex/TFM transaction in the United States or from imposing conditions to remedy any adverse effects. The Board is the only agency that is in a position to address the effects of the overall transaction on transportation in the United States. It should proceed with this analysis and, on that basis, impose conditions that will make concrete and effective the commitments Applicants have previously stated in this proceeding.

III. UNCONDITIONED KCS CONTROL OF TEX MEX AND TFM WOULD RESULT IN SUBSTANTIAL LESSENING OF COMPETITION IN THE UNITED STATES

Under 49 U.S.C. § 11324(d), the Board's focus in this case is on competition. UP recognizes that the Board must "approve the transaction" unless it finds there is a likelihood that it will cause a "substantial lessening of competition" that cannot be overcome through conditions without sacrificing public interest benefits stemming from the

transaction.[51] This transaction likely will have such an effect, unless the Board exercises its broad power under 49 U.S.C. § 11324(c) to impose conditions that protect competition. As we explain below, the Laredo Gateway plays a uniquely important role in U.S.-Mexico rail transportation, for which competition among U.S. carriers north of the border provides significant benefits. KCS control of Tex Mex and TFM will give it control of all U.S.-Mexico traffic moving across this vital gateway. Unless Applicants' conditions are implemented by the Board in meaningful and enforceable ways, KCS will use its control to cause anticompetitive shifts of traffic from UP-TFM routes to KCS/Tex Mex routes, degrading services provided to shippers and raising rates.

A. The Laredo Gateway Is Vitally Important to U.S.-Mexico Rail Transportation

The gateway at Laredo, Texas, where Tex Mex and TFM connect, is at the center of this case. The Board has long recognized the vital importance of the Laredo Gateway for competition in the United States.

1. The Board's Grant of Trackage Rights to Tex Mex in *UP/SP* Was Predicated on a Finding that Rail Competition Via the Laredo Gateway Must Be Protected

In 1996, the Board concluded that Laredo was "the most important U.S.-Mexican rail gateway,"[52] occupying a position of "separate and surpassing economic

---

51 *See Kansas City Southern Industries, Inc., KCS Transportation Co. & The Kansas City Southern Ry. – Control – Gateway Western Ry. & Gateway Eastern Ry.,* STB Finance Docket No. 33311 (STB served May 1, 1997) at 4 (if the transaction is likely to cause a substantial lessening of competition, Board may approve the transaction only "if the public interest benefit outweighs any anticompetitive impact that cannot be mitigated through conditions").

52 *UP/SP*, 1 S.T.B. at 422.

significance" in U.S.-Mexico commerce.[53] These conclusions were based in significant part on Tex Mex's representations to the Board that:

> "Laredo is the principal gateway for rail traffic between the United States and Mexico. A majority of all rail traffic moving between the United States and Mexico moves over this gateway. Of all the U.S.-Mexico rail border crossings, it is supported by the strongest infrastructure of customs brokers and provides an effective routing in Mexico to the major Mexican destinations."[54]

Based on these representations and the Board's own findings, the Board granted extensive trackage rights to Tex Mex in order to ensure that there was no reduction in rail competition for rail traffic moving via Laredo.

The Board justified this grant based on the need to "ensure the continuation of an effective competitive alternative to UP's routing into the border crossing at Laredo." 1 S.T.B. at 424.[55] The Board defended its action in the Court of Appeals on the same basis, explaining that it was "undisputed that the merger without conditions would have resulted in significant competitive harm south of Houston, particularly in the U.S.-Mexico trade over the important Laredo gateway, which is used only by UP and Tex Mex."[56] Unless the Board

---

[53] *Id.* The Board also found that that Laredo was "the premier Eastern Mexico gateway," in part because it was the "most efficient Mexican rail gateway" and in part because of its "excellent infrastructure and customs facilities." *Id.* at 565, 566.

[54] *UP/SP*, Responsive Application of The Texas Mexican Ry. (TM-23) (Mar. 29, 1996) at 8-9 (Exhibit 9). Similarly, in this case, Applicants acknowledge that Laredo's importance is "due to [its] superior infrastructure, such as customs brokers, and its location on the shortest route between major Mexican industrial and population centers and the Midwest and Eastern U.S." Application, Grimm V.S. at 84.

[55] *See also UP/SP, Houston/Gulf Coast Oversight*, Decision No. 10 (STB served Dec. 21, 1998) at 10 (noting that Tex Mex's trackage rights over UP were designed to address "the potential loss of competition at Laredo").

[56] *Western Coal Traffic League v. STB,* No. 96-1373, Brief of Respondent STB (Dec. 1997) at 46 (Exhibit 10). The Board defended the grant of Tex Mex's trackage rights as

(footnote continued ...)

were to conclude in this case that there have been "substantially changed circumstances"[57] – in which case the justification for a continuation of Tex Mex's trackage rights would evaporate – it would be impossible for the Board to find there are sufficient alternatives to rail transportation via Laredo (*e.g.*, alternative gateways or modes) to put aside the concern for protecting rail competition at this vital gateway.

2. U.S.-Mexico Rail Shippers Overwhelmingly Prefer Routes Via Laredo

As important as Laredo was in 1996, it is even more important today. The volume of traffic moving across the Laredo Gateway has more than doubled since 1995, as shown in Exhibit F to Mr. Gray's verified statement.[58] Strengthened by the Board's grant of trackage rights in *UP/SP*, Tex Mex has increased its own Laredo Gateway volumes three-and-a-half fold since 1995. *Id.*[59]

Laredo's importance relative to other border gateways is striking. More than 75 percent of all U.S.-Mexico rail traffic (by dollar value) crosses the border at Laredo. Gray V.S. at 10. Laredo's share of aggregate U.S.-Mexico rail commerce understates its importance. Basic geography makes the three gateways in western Mexico – Calexico, Nogales and El Paso – unacceptable alternatives to Laredo for most of the rail traffic flowing between the central and eastern United States (and Canada) and the most populous

---

(... footnote continued from previous page)
"preserv[ing] a limited role for Tex Mex in providing part of an alternate route for shipments moving to and from Mexico." *Id.* at 46-47.

58 *See* Gray V.S. at 12 & Exh. F.

59 *See also* Gray V.S. at 12.

and industrialized regions of Mexico. Those gateways are for the most part limited to handling traffic moving between the western United States and points in western Mexico. *Id.*

Of the three eastern Mexico gateways – Laredo, Eagle Pass/Piedras Negras, and Brownsville/Matamoros – Laredo's share is by far the largest. In 2002, Laredo handled over 75 percent of the rail traffic (by dollar value), and over 50 percent of the rail carloads, that crossed the border at these three gateways.[60] The principal alternative to Laredo is Eagle Pass/Piedras Negras, where UP and BNSF connect with Ferromex.[61] Laredo handles more than three times the volume of traffic crossed at Eagle Pass, and Laredo's share continues to grow.[62]

Perhaps even more telling is the share of *UP's* traffic moving via Laredo. Despite having acquired a 26 percent equity interest in Ferromex in 1997, UP's cross-border traffic has shifted increasingly *toward the Laredo Gateway*, because shippers demand the benefits that Laredo offers. In 1995, Eagle Pass accounted for { } percent of UP's (and

---

60 Gray V.S., Exh. D.

61 Brownsville/Matamoros is of very limited importance. Because of geography, inferior infrastructure and other factors, Brownsville is used principally for traffic moving between the United States and Mexican points just across the border from Brownsville, and for the routing of empties to relieve congestion at Laredo. It does not offer an effective substitute for routes via Laredo. In any event, Brownsville provides a connection only with TFM and no competitive alternative. Gray V.S. at 11.

62 In 1995, Laredo accounted for { } percent of the total cross-border rail traffic at these two gateways. By 2002, Laredo's share had grown to { } percent. *See* Gray V.S. at 12 & Exh. F.

SP's) total cross-border traffic at the Laredo and Eagle Pass gateways.[63] By 2002, Eagle Pass's share of UP's traffic moving via these two gateways had fallen to only { } percent.[64]

Even these impressive statistics mask the true importance of the Laredo Gateway, because they focus on aggregate U.S.-Mexico flows. Examining individual state-to-state flows reveals even more clearly shippers' overwhelming preference for Laredo. For movements between the central and eastern portions of the United States and Canada, on the one hand, and the Mexican states in the industrialized heartland of northeastern and central Mexico that are served by TFM's superior route network, on the other hand, the share of traffic moving via Laredo is in many cases well in excess of { } percent. *See* Gray V.S. at 11-12; Hausman V.S. at 7 & Exh. B.

3. The Laredo Gateway Offers Important Advantages for Shippers

As John Gray, UP's Vice President-Interline, explains in detail, Laredo has several attributes that account for its preeminent role in cross-border rail transportation:

First, as a result of extensive investments over many years by the railroads serving Laredo and by governmental agencies and third parties, Laredo has unparalleled infrastructure devoted to the handling of cross-border shipments. Laredo has uniquely well-developed capabilities for handling the customs, agricultural, immigration, narcotics and (increasingly in the post 9/11 world) security-related inspections required at an international

---

[63] In 1995, UP handled { } loads via Laredo; SP handled { } via Laredo in conjunction with Tex Mex; and SP handled { } loads via Eagle Pass. Gray V.S. at 12 n.13 & Exh. F.

[64] *See* Gray V.S. at 12 & Exh. F.

border. Laredo also has an unmatched community of brokers, freight forwarders and other third parties who assist shippers with customs and other aspects of the border crossing process. Gray V.S. at 14-15; Barkley V.S. at 3.[65] In significant part, these advantages are associated with the large volume of rail and truck traffic that moves through Laredo. Laredo's volume is more than twice that at the next largest U.S./Mexico crossing point (El Paso). Eagle Pass is a distant eighth, with barely eight percent of Laredo's volume. Gray V.S. at 15 & Exh. D.

The railroads serving Laredo also have made extensive investments to make it a uniquely efficient point for interchanging large volumes of cross-border rail shipments. UP has spent tens of millions on extensive yard facilities, mainline capacity, railcar inspection facilities, and other infrastructure needed to make Laredo work as a high volume rail border crossing point. Tex Mex and TFM have also made significant investments. Gray V.S. at 15-16; Barkley V.S. at 3. No other gateway has the basic infrastructure in place to handle the volumes of traffic that move via Laredo, much less to do it efficiently. Gray V.S. at 15-16; Barkley V.S. at 12-13.

Second, the Laredo Gateway provides the only efficient connection with TFM's Mexican rail network, which KCS regards as Mexico's "crown jewel system."[66] KCS understands that TFM is the Mexican railroad {{

---

[65] Applicants and the Board recognize these advantages, as noted above (at notes 53 & 54)

[66] Transcript of KCS Presentation to Analysts, April 29, 2003, Tr. at 13 (Exhibit 11).

}} TFM serves many important points in Mexico exclusively – such as Toluca, San Luis Potosí and much of Monterrey – and it has more efficient routes between the U.S. border and many other important Mexican points – including Monterrey and the industrialized areas in and around Mexico City. Gray V.S. at 18.

Two of TFM's significant advantages stem from failures in the Mexican privatization process that created both TFM and Ferromex. Under the privatization plan, Ferromex was to have received extensive access to TFM-served industries in the Monterrey area in order to create two-railroad competition there. However, TFM has taken advantage of the vagaries of Mexico's legal and regulatory systems to block Ferromex's access to Monterrey. *See* Fuentes V.S. at 6-7; Gray V.S. at 18-19.

In addition, Ferromex's Concession included a grant of hundreds of miles of trackage rights over TFM's Laredo-Mexico City mainline – between Ramos Arizpe (a point near Saltillo) and Querétaro – in order to give Ferromex an efficient route between the U.S. border and central Mexico (especially the so-called "Valle de Mexico" region encompassing Mexico City).[68] Ferromex's own route from Eagle Pass to Mexico City is 57 percent (407 miles) longer than TFM's route from Laredo. Ferromex's trackage rights over TFM reduce this disadvantage to only 48 miles, but they do not provide Ferromex with a useful or cost-effective alternative. Gray V.S. at 17-18. TFM has successfully imposed strict limitations on the traffic Ferromex can handle using these rights, and the limited traffic TFM allows

---

[67] *See* {{
}} (Exhibit 4); *see also* note 54, above.

[68] These rights are shown on the map set forth in Exhibit A to the Gray Verified Statement.

Ferromex to carry incurs extraordinarily high trackage rights fees. Ferromex must pay TFM the equivalent of $0.71 per car-mile to use these rights, which is more than twice what BNSF and Tex Mex pay to use their extensive trackage rights over UP in the United States. *See* Gray V.S. at 17 & Exh. H. UP estimates that Ferromex's variable costs via these trackage rights are approximately 75 percent higher than TFM's costs for movements between the border and Mexico City. A large portion of this gap is accounted for by the unreasonably high fees. Gray V.S. at 18.[69]

Finally, as Mr. Gray explains, shippers also benefit from the uniquely efficient and well-developed rail transportation service offerings via Laredo. TFM has cooperated extensively with both UP and Tex Mex (and its interchange partners KCS and BNSF) to develop highly efficient operating practices (such as pre-blocking), joint service offerings, and customs pre-clearance processes. *See id.* at 19-20.

B. Unconditioned KCS Control of Tex Mex and TFM Threatens to Undermine Competition Via the Laredo Gateway

In the *UP/SP* case, the Board recognized the importance of preserving effective two-railroad competition for international traffic moving via the Laredo Gateway. Concerned that the second railroad serving Laredo from the north – Tex Mex – would be threatened by diversion of SP-Tex Mex traffic to UP single-line routes, the Board granted

---

[69] KCS is well aware of the crippling competitive disadvantages these fees impose on Ferromex. In discussions with Ferromex and Mexican regulatory agencies in connection with the TFM acquisition, KCS has steadfastly refused to consider any material reduction in the level of those fees. *See* Fuentes V.S. at 9. KCS has insisted that any method for establishing fees take into account the $1.4 billion price paid by KCS and Grupo TMM to acquire the TFM Concession in 1996, which underlay the calculation on which the current fee level was based. *Id.* KCS defends this position in a white paper provided to shippers and others in Mexico, *see* Gray V.S., Exh. K, but the fact remains that Ferromex's viability as a competitive alternative is severely hampered by the high fees.

Tex Mex hundreds of miles of trackage rights over UP to forge a direct connection with KCS at Beaumont, Texas. The Board understood not only that Laredo was a vitally important gateway for growing NAFTA trade, but also that competition between U.S. railroads north of the border must be protected.

KCS's proposal to acquire control of Tex Mex and TFM calls for the Board to protect that competition once again.

1. Shippers Benefit from Competition Between UP and KCS/Tex Mex Routes for Traffic Moving Via Laredo

Today, as in 1996, Laredo is served by a single Mexican railroad. Before 1996 that railroad was Mexico's government-owned railroad system, the Ferrocarriles Nacionales de Mexico ("FNM"). Since 1996 that railroad has been TFM, which is controlled by Grupo TMM. TFM (like FNM before it) has interacted with its U.S. connections in an equitable and even-handed manner. TFM has sought to attract traffic to its system in Mexico without regard to which U.S carrier handles the traffic north of the border. TFM has cooperated extensively with both UP and Tex Mex to develop highly efficient cross-border transportation options. Gray V.S. at 19-20. And, consistent with the requirements of Mexican railroad law and TFM's Concession, TFM has charged the same rate factors for its portion of the movement, regardless of which carrier it is working with. *Id.*; *see also* Fuentes V.S. at 4-5.

TFM's equitable behavior has created an environment in which competition between TFM's connections north of the border provides significant benefits for cross-border rail shippers. In *UP/SP*, Tex Mex described this competitive dynamic to the Board: "Because FNM [TFM's predecessor] sets its rates for the Mexican portion of international traffic without regard to the rates for the U.S. portion, the vigorous competition that now

exists between U.S. railroads for that traffic directly benefits the shippers, and any reduction in that competition will harm them."[70]

Consistent with the Board's objective in *UP/SP*, Tex Mex – in close cooperation with both KCS and BNSF – has provided strong competition for UP-TFM routes via Laredo. KCS/Tex Mex routes compete for traffic moving between Mexico and the territory served directly by KCS's system[71] as well as all points in the East, Midwest and Canada reached via KCS's connections with Eastern and Canadian railroads. KCS has important alliances with Canadian National, with which it connects at Jackson, Mississippi; with Norfolk Southern, with which it connects at Meridian, Mississippi; and with DM&E/IC&E, which provides KCS with access to Chicago and also allows KCS to tap grain traffic from IC&E's territory in northern Iowa.[72]

Even before KCS announced this transaction the KCS and Tex Mex have worked together to develop "seamless" services that compete against UP-TFM routes for traffic moving via Laredo. In 2002, KCS touted the fact that "KCS with its partners, TM

---

70 *UP/SP*, Responsive Application of the Texas Mexican Ry. (TM-23) (Mar. 29, 1996), Ellebracht V.S. at 79 (Exhibit 9).

71 Among the important traffic points served by KCSR's system are chemical plants in Baton Rouge, Lake Charles, and elsewhere along the Gulf Coast, forest products shippers on KCSR's former-Midsouth lines in Mississippi, industrial shippers in the Kansas City area, and grain origination points in Iowa and Nebraska reached via KCSR's haulage rights north of Kansas City. Gray V.S. at 24.

72 *See id.* As KCS itself recognizes, one of the strengths of its system is that its {{ }}. *See* {{ }} (Exhibit 4).

and TFM, are second to none in servicing markets in Mexico."[73] UP and KCS/Tex Mex are frequent rivals in bidding for shippers' traffic, as Mr. Gray explains.

In addition, Tex Mex competes for traffic to and from points throughout the West (including western Canada) in conjunction with BNSF. Although KCS's plans for Tex Mex appear to be creating frictions in the Tex Mex-BNSF relationship, Tex Mex cooperates very closely with BNSF on substantial volumes of traffic moving via Laredo.[74]

2. KCS Will Have Incentives and Opportunities to Use Its Control of Tex Mex and TFM to Deprive Shippers of the Price and Service Benefits of UP-TFM Routings

Until now, TFM has not skewed the competitive playing field to favor KCS/Tex Mex routes via Laredo. Instead, although KCS/Tex Mex have cooperated closely with TFM to develop efficient cross-border transportation services, they have faced stiff and often successful competition from efficient UP-TFM services.

Armed with control of both Tex Mex and TFM, however, KCS will have the incentive and ability to manipulate competitive outcomes to favor routes in which its U.S. railroads (KCS and Tex Mex) participate. The incentives to do so will be extreme. KCS has strong incentives to increase its profits by capturing more traffic north of the border, in part to capture the margins on that traffic (Hausman V.S. at 10; Gray V.S. at 23-24) and in part to pay off the substantial debt it will be taking on when it acquires TFM. Substantial volumes of Laredo Gateway traffic will be available to KCS if it can impede UP-TFM

---

[73] KCS NEWS, *"Despacho Previo Process Clarified,"* March 5, 2002 (available on www.kcsi.com) (Exhibit 12).

[74] The fact that BNSF moves so much joint-line traffic across the Laredo gateway with Tex Mex – despite having its own single-line route to Eagle Pass – underscores the importance of the Laredo Gateway.

competition. As shown in Gray Exhibit J, only a small portion of the traffic now moving across the Laredo Gateway – { } percent – is not subject to handling by KCS and/or Tex Mex.

For this portion of UP TFM traffic, KCS may well have incentives to permit TFM to continue its cooperation with UP. However, the balance of the Laredo Gateway traffic – { } percent – is either handled by KCS/Tex Mex today or would be available to them were KCS to implement strategies aimed at degrading the transportation services available from UP via the Laredo Gateway. Gray V.S. at 25.

Applicants have told the Board that they do not anticipate any diversions of traffic resulting from KCS's control of TFM beyond the very modest decreases expected from the Tex Mex acquisition.[75] However, it is clear that KCS will be eager to seize every available opportunity to shift traffic from UP-TFM routes to KCS-Tex Mex-TFM (or BNSF-Tex Mex-TFM) routes. It would behave that way to lengthen hauls on the "NAFTA Rail" system and thereby earn greater profits.

And KCS has told Wall Street that it plans to do exactly that. Soon after KCS announced its plan to acquire control of Tex Mex and TFM, KCS's Chairman and CEO Michael Haverty told securities analysts that acquiring control of TFM will allow KCS to shift TFM's U.S.-Mexico traffic to Tex Mex/KCS routes, because the combined KCS/Tex Mex/TFM system would have "a lot of influence o[n] traffic that moves between Mexico

---

[75] Mr. Mutén forecasts that KCS control of Tex Mex alone – on the assumption that TFM would still be controlled by Grupo TMM – would lead to diversions to KCS/Tex Mex routes totaling 6,313 carloads annually. *See* Application, Mutén V.S. at 124. Applicants say they will seek this traffic because it will bring "additional revenues" to the combined system. Application, Haverty V.S. at 65.

and the United States," and would thereby "draw more traffic to the combined system."[76] He made clear that KCS will be "looking to lengthen the [existing TFM] haul" for "as much traffic . . . as we can."[77] Similarly, KCS's website describes the "strategic rationale" of the KCS/Tex Mex/TFM transaction as including the aim of "lengthen[ing] hauls through an 'across-the-border' view."[78] KCS's recent decision to tell the Board the opposite of this "strategic rationale" should be viewed with healthy skepticism.

Were this transaction to enable KCS/Tex Mex to attract additional traffic to their lines north of Laredo solely by improving services or lowering rates, those effects would be procompetitive rather than anticompetitive. Although UP might lose traffic, shippers would not be harmed and UP would not favor Board intervention.

In this case, however, KCS control of Tex Mex and TFM poses serious threats to the competitive process by undermining the transportation options available to shippers at the Laredo Gateway. And it will do so without promising any significant improvements in KCS/Tex Mex/TFM offerings. See pages 58-63, below. KCS emphasizes that it is acquiring *only* control, but control is all it needs to disrupt the competitive process by degrading UP-TFM competitive options and forcing traffic to KCS/Tex Mex lines. Competition for U.S.-Mexico cross-border traffic depends on efficient access to the Laredo

---

76 KCS Presentation to Analysts, April 29, 2003, Tr. at 12, 20 (Exhibit 11).

77 *Id.* at 10. Mr. Haverty declined to identify "just exactly what the revenue synergies are" – *i.e.*, the traffic diversions and increases in revenue on existing traffic that KCS expects – because KCS had based its initial financial analysis of the transaction on a static analysis. *Id.* at 20; *see also* Supplement at 9. Nevertheless, Mr. Haverty made quite clear that KCS in fact did anticipate traffic shifts stemming from its control of TFM.

78 *See* KCS PowerPoint Presentation regarding NAFTA Rail transaction (available at www.kcsi.com/pdf/nafta_rail.pdf) at 4 (excerpts at Exhibit 6).

Bridge and effective cooperation from TFM, which is an indispensable link in all traffic moving across the border at Laredo. With control of both Tex Mex and TFM, KCS will have effective control of 100 percent of the Laredo Gateway traffic. KCS control of TFM will also allow NAFTA Rail to circumvent – in the United States – the non-discrimination requirements imposed by Mexican law and TFM's Concession so as to extract additional profits from those cross-border shippers that are most dependent on rail. These strategies will not merely shift traffic away from UP-TFM routes, they will do so in *anticompetitive* ways by forcing shippers to pay more and accept poorer service.

KCS control threatens competition in three ways, as explained by economist Jerry Hausman and UP's John Gray and Stephen Barkley.

a) KCS Can Use Its Control of TFM to Degrade UP-TFM Options

When KCS controls both Tex Mex and TFM, it will be in a position to make UP-TFM transportation options less attractive to shippers. It could use its control to cause TFM to discontinue cooperation with UP on operational or service matters, which would degrade the service available to customers from UP-TFM routes and increase shipper costs. KCS could, among many potential steps, cause TFM to cease pre-blocking traffic for UP, to withdraw from participation in efficient customs pre-clearance processes for UP traffic, to delay placement of empty equipment for UP shipments, or to increase transit times on shipments destined for or received from UP. Alternatively, KCS could cause TFM to stop working with UP to *improve* UP-TFM service offerings. Gray V.S. at 31-33. Any of these actions would not merely harm UP, but would deprive shippers of valuable competitive transportation options and thereby disrupt the competitive process. Hausman V.S. at 9-11; Gray V.S. at 33.

An even more serious threat to competition is the prospect that KCS would use its control of TFM to increase TFM rate factors in order to disable competition from UP-TFM offerings.[79] TFM's rate factors are perhaps the single most important aspect of TFM cooperation for U.S.-Mexico traffic. UP could have routes north of the border that were clearly the most efficient, UP services north of the border could be preferred hands-down over those offered by KCS-Tex Mex and BNSF-Tex Mex, and UP could have unrestricted use of the Laredo Bridge to cross its trains. But if TFM's rate factors were too high, shippers would lose the benefit of UP competition. Gray V.S. at 26. For the past six years, TFM has fostered effective competition among U.S. carriers by quoting comparable rates to both of its U.S. connections. TFM has done this in part because its parent, Grupo TMM, has no economic interest in favoring KCS routes over UP routes, and in part because of Mexican legal requirements. *Id.*; Fuentes V.S. at 4-5.

When it acquires control of TFM, however, KCS will have the power to manipulate TFM's rate factors to make UP-TFM services more expensive for shippers, causing them to pay more, and in some cases forcing them to switch to inferior KCS/Tex Mex/TFM offerings. KCS could accomplish this objective without refusing to quote TFM rate factors to UP, and even without discriminating between UP and KCS/Tex Mex in the rate factors it does quote. All that KCS needs to do is cause TFM to raise its rates in relation to KCS rates north of the border which Mexican non-discrimination rules would allow. Gray V.S. at 27; Fuentes V.S. at 4.

---

[79] This especially significant if the Board holds Applicants to their commitment to work with UP to develop methodologies for measuring and enforcing service standards for UP-TFM traffic via the Laredo Gateway.

A simple numerical example (spelled out in Table 1 below) helps illustrate how such a strategy might work. Assume that before KCS gains control of TFM, TFM has provided both UP and KCS/Tex Mex a rate factor of $100 for traffic to an eastern gateway (these numbers are purely illustrative), and that UP and KCS compete to handle the traffic north of Laredo. Assume that UP has the more efficient route and also charges a rate factor of $100. KCS's rate factor is $105. In today's fair competitive process, the shipper will chose the UP-TFM option and pay $200. This outcome is shown in the left-hand portion of the bottom row of Table 1.

After KCS acquires control of Tex Mex and TFM, it can change this result to the disadvantage of shippers. All it needs to do is instruct TFM to raise its rate factor by at least six dollars, as shown in Example 1 in the table. If it did that, the combination UP-TFM rate would now be $206, while KCS/TFM could charge $205 and win the business. KCS would collect this total amount by lowering its own factor to $99, a step it could take because it will get those dollars back through its ownership of TFM. The combined KCS/Tex Mex/TFM would make more money (and more profit, because KCS's previous $105 factor included some return), but the shipper would pay more and lose its preferred route north of the border. *See* Gray V.S. at 27; Hausman V.S. at 9-11.

TABLE 1			
	BEFORE KCS/TFM CONTROL	AFTER KCS/TFM CONTROL	
		Example 1	Example 2
UP Factor	**$100**	**$100**	**$100**
KCS Factor	**$105**	**$99**	**$95**
TFM Factor	**$100**	**$106**	**$120**
UP-TFM Rate	**$200**	**$206**	**$220**
KCS-TFM Rate	**$205**	**$205**	**$215**
Outcome	**UP wins; shipper pays $200**	**KCS wins; shipper pays $205**	**KCS wins; shipper pays $215**

As Mr. Gray explains, KCS could use a similar strategy to increase its profits to shippers' detriment where service rather than rates had led shippers to prefer UP-TFM routings in the pre-transaction period. Alter the above example to assume that UP and KCS/Tex Mex had offered to handle traffic from Laredo to an eastern gateway at comparable $100 rate levels, taking advantage of TFM's non-discriminatory ($100) rate factor, but that the shipper had chosen the UP route because it offered consistently faster transit times. After the transaction, TFM could increase its rate factor by $5 to both UP and KCS/Tex Mex, with KCS/Tex Mex lowering its factor by $5 to offset TFM's increase. To avoid a rate increase (from $200 to $205) the shipper would be forced to use the less attractive KCS/Tex Mex route north of Laredo. Alternatively, the shipper may conclude that it has a sufficiently strong preference for UP service that it is willing to pay $5 more to use it (a fact TFM likely would not have known until KCS/TFM attempted this strategy). Either way, KCS/Tex Mex/TFM would earn additional profits and the shipper would lose. Gray V.S. at 28.

KCS would have a great deal of latitude to manipulate TFM's rates even more than shown in the example, thereby making it even more difficult for UP-TFM service offerings to remain price-competitive. There are no effective Mexican regulatory limits on the level of TFM's rates for transportation within Mexico, as Mr. Fuentes explains. Fuentes V.S. at 3-4, 6. KCS could cause TFM to increase its rate factors as much as necessary to assure that UP was effectively disabled from competing, with KCS reducing its portion of the through rate enough to win the business and increase profits, but not so much that the traffic would dry up. The right-hand portion of Table 1 (Example 2) demonstrates the effect of a 20 percent increase in TFM's factor, which would allow KCS/TFM to win the business while simultaneously increasing the customer's rates significantly. *See* Gray V.S. at 28-29.

As Professor Hausman and Mr. Gray explain, KCS's implementation of such a strategy would hurt shippers and competition, not just UP. For a number of reasons, TFM does not extract from each piece of traffic moving via Laredo the last dollar of revenue that might conceivably be available by virtue of TFM's market power. Most rates are quoted to customers on a "Rule 11" basis, which involves each railroad charging the customer its own, separate rate to the U.S./Mexico border, typically without any agreement by the carriers about what the overall origin-to-destination price should be. This limits the degree to which TFM can differentiate among customers based on their specific circumstances and demand factors. For many shippers, moreover, TFM quotes one rate to the Mexican receiver (or shipper), while the U.S. carrier quotes its rate to a separate entity (either the shipper or receiver) in the United States. TFM's practice of quoting non-discriminatory rates also limits the extent to which it can effectively charge the highest rate that each piece of traffic can bear. *See* Gray V.S. at 29; *see also* Hausman V.S. at 11-12.

Meanwhile, north of the border, for traffic that is competitive between UP and KCS/Tex Mex (and its connections), competition between the U.S. railroads keeps rates competitive today – preventing either U.S carrier from picking up the dollars TFM leaves on the table. Because of this competition, UP would not have significant room to reduce its own revenue requirement in order to offset any higher TFM factors imposed by KCS. As a result, when such strategies extinguish competition from UP north of the border, they will remove constraints on KCS's rates, causing rate increases and reductions in the level of rail service for shippers. Hausman V.S. at 10-11; Gray V.S. at 30.

KCS likely would conclude that this strategy would not work to the same extent for all shippers. For those shippers with relatively better access to other transportation options (such as truck or barge) or more elastic demand for other reasons, KCS could offer lower rates by reducing its factor north of the border by somewhat more. For traffic that UP could efficiently route via Eagle Pass in conjunction with Ferromex, KCS might chose to maintain the status quo so that TFM could keep its existing Mexican portion of the revenues. But for significant amounts of existing Laredo traffic (both UP-TFM and Tex Mex-TFM), rates will increase and service will suffer. Gray V.S. at 30.

This strategy would be even easier for KCS/TFM to implement if Mexican law did not require TFM to offer its U.S. connections comparable rate factors for comparable traffic. If TFM could discriminate overtly against UP, KCS could simply cause TFM to raise its revenue requirements to UP but not to Tex Mex and/or KCS, and the result would be the same: UP's costs effectively would go up, KCS could win the business despite charging higher rates, and shippers would lose. *Id.*

b) KCS Control Will Create New Opportunities for KCS/TFM to Exploit TFM's Market Power By Selectively Raising Rates on Cross-Border Traffic

In addition to disabling a substantial amount of UP competition north of the border, KCS control of TFM would enable NAFTA Rail to increase rates where that TFM alone could not. As Applicants point out, Mexican law and TFM's Concession impose limits on the degree to which TFM can discriminate with respect to rates among similarly situated shippers or TFM's U.S. connections.[80] As Professor Hausman explains, to the extent these non-discrimination rules constrain TFM's ability to differentiate freely among shipments based on their transportation alternatives or other factors affecting their demand elasticity, TFM cannot exploit the full measure of its market power within Mexico. Hausman V.S. at 12; *see also* Gray V.S. at 29. In effect, TFM's rate factors are constrained by the competitive options of the *most elastic* shipments, causing it to charge lower rates than it otherwise would if it had perfect freedom and perfect knowledge. *Id.* Consumers benefit from this situation. The lower TFM rates get passed along to cross-border shippers, because the U.S. carriers' rates are constrained by rail-to-rail competition north of the border.

KCS control of TFM will change this environment by giving the commonly-controlled company will have the ability to price discriminate freely. KCS could simply cause TFM to raise its rate factors to levels that extract the full measure of TFM's market power for its least-elastic shipments. These shippers would suffer rate increases, even if they continued to use UP-TFM routings. Meanwhile, by manipulating the KCS/Tex Mex

---

80 Supplement at 30; *see also* Fuentes V.S. at 4-5.

rate factor north of the border, KCS could hold rates constant for traffic that could least sustain a rate increase. An illustrative example is given in Table 2 below. *See* Hausman V.S. at 11-15.

TABLE 2

	Before KCS/TFM Control		**After KCS/TFM Control**	
	Elastic Traffic	Inelastic Traffic	Elastic Traffic	Inelastic Traffic
TFM Factor for Elastic Traffic	$100	$100	$120	$120
KCS/Tex Mex Factor	$100	$100	$80	$100
UP Factor	$100	$100	$100	$100
Outcome	Shipper pays $200 (Traffic moves UP-TFM or KCS-TM-TFM)	Shipper pays $200 (Traffic moves UP-TFM or KCS-TM-TFM)	Shipper pays $200 (Traffic moves KCS-TM-TFM)	Shipper pays $220 (Traffic moves UP-TFM or KCS-TM-TFM)

The overall effect would be rate increases for significant numbers of shippers.

c) KCS Control Will Create New Incentives and Opportunities for Tex Mex and TFM to Manipulate Operations at the Laredo Bridge

A further immediate threat to competition involves operation of the Laredo Bridge. This crucial connection between the United States and Mexico is controlled by Tex Mex and TFM, which own the track structure on the northern and southern halves of the Bridge, respectively. Barkley V.S. at 2. TFM interchanges with both UP and Tex Mex at Laredo, with UP-TFM movements constituting approximately 75-80 percent of the freight moving across the gateway. *Id.* at 3. Operations over the Bridge are governed by a 1951 agreement between UP and Tex Mex, but that agreement leaves open the potential for Tex Mex to manipulate operations to favor its own trains even while claiming that UP is

receiving "equal" treatment. As long as Tex Mex was controlled by an independent TFM, Tex Mex's incentives to restrict UP's use of the Bridge have been held in check. Once Tex Mex is under KCS control, Tex Mex and TFM will have greater incentives to prefer Tex Mex-TFM traffic over UP-TFM traffic. Preferential treatment would reduce service levels for UP customers and inefficiently divert traffic to Tex Mex-TFM routes.

TFM's increased incentive to give preferential treatment to Tex Mex at Laredo Bridge presents a serious concern. As explained by Stephen R. Barkley, UP's Regional Vice President - Southern Region, it is highly important for UP and its customers to have an operation at Laredo that is efficient and that provides even-handed treatment for UP trains. Movements over the single-track Laredo Bridge involve a delicate operational balance. Barkley V.S. at 4. Like all international border crossings, crossings at Laredo take extra time due to government paperwork and inspections. *Id.* With two railroads north of the border connecting with one railroad south of the border, interchanges must be carefully coordinated. It is essential to stage trains carefully, so that they are ready to move onto the Bridge quickly as soon as the previous interchange is complete. *Id.* at 5. To maximize Bridge capacity, the railroads have set aside alternating six-hour "windows" for northbound and southbound traffic. *Id.* at 6.

When there are more trains waiting than can be moved across the Bridge during a window, the priority in which trains are given access to the bridge becomes very important. Mr. Barkley explains that, in recent years, the Border Superintendent (a TFM employee since 2001) has been generally even-handed in his treatment of UP and Tex Mex trains, providing priority to each railroad in the approximate proportion of its traffic over Laredo. Barkley V.S. at 7, 8-9. Thus, TFM, which today has an interest in maximizing its

traffic volumes without regard to the identity of its partner north of the border, has overridden Tex Mex's impulses to favor Tex Mex-TFM traffic. However, when the economic interests of TFM and Tex Mex become more closely aligned due to common control, the Border Superintendent is more likely to find subtle (or not so subtle) ways to give preference to Tex Mex trains. In particular, the Border Superintendent may accept an argument that Tex Mex personnel have pressed in the past – that each railroad should receive 50 percent of the available Bridge slots, even though Tex Mex carries only 20 to 25 percent of the freight that moves through Laredo. *See id.* at 9, 10-11. Such a 50-50 allocation would leave UP trains at the end of the queue, unable to cross when there were more trains waiting than could move across the Bridge during a window.

Applicants deny that the Laredo Bridge operations will change under common control. They point out that Bridge operations are governed by written agreements and that UP could enforce Tex Mex's contractual obligations.[81] However, the written agreements they cite speak in very general and perhaps conflicting terms. The 1951 agreement between Tex Mex and a UP predecessor provides that "Joint Switching Service" shall be "performed impartially" and that "no preference shall be given to movement of cars of one of the parties."[82] The agreement does not specify what these words mean, how the obligations apply in the context of today's operations (which differ from those described in the 1951 agreement in significant ways), or just how impartial treatment is to be accomplished.

---

81 *See, e.g.,* Reply to UP's Petition For Declaratory Order (KCS-11/TM-11) (June 23, 2003) at 7-10; Supplement at 27.

82 1951 Agreement, § 4(III) (Barkley V.S., Exh. B).

The 1951 Agreement is not enough to protect against the changed incentives created by common control. There must be more specific guidance addressing how the "no preference" requirement is to be implemented. Otherwise, Tex Mex and TFM could argue that a one-for-one priority system is acceptable because it gives "no preference" to either carrier, even though UP's shippers, which today account for the great majority of traffic at Laredo, would be shortchanged under such an allocation. *See* Barkley V.S. at 13-14.

In view of the competitive threat presented by Tex Mex's increased incentives to give preference to Tex Mex trains at Laredo, it is appropriate for the Board to impose conditions that will constrain the ability of the railroads to act in this manner. . And, in light of Applicants' assertion that the NAFTA Rail carriers would not and could not change operations at Laredo Bridge following acquisition of common control,[83] they should have no serious objection to imposition of conditions that will provide greater assurances on this point. As discussed in Section IV, below, UP urges the Board to impose a narrow condition requiring Applicants to negotiate a new protocol governing Bridge operations that will effectively avoid any potential competitive abuse and ensure that the Bridge will continue to be operated in an efficient and fair way.

3. The Lack of Procompetitive Benefits Elevates the Threat to Competition

In many rail merger cases, the Board must weigh the potential anti-competitive harms against the pro-competitive efficiencies that might flow from the transaction. The applicants typically will anticipate significant traffic and revenue gains

---

[83] *See* KCS-11/TM-11 at 7-10.

stemming from their transaction, and the Board must assess the extent to which those private gains are the result of *pro-competitive* improvements in rates and service, rather than the product of anticompetitive actions made possible by the transaction. In this case, however, there is no need to engage in such an analysis. Combining KCS, Tex Mex, and TFM under common control will not achieve any significant efficiencies that could not be accomplished without KCS control.[84] The *only* effect of this transaction will be to transfer control of Tex Mex and TFM from Grupo TMM to KCS. *See* KCS-16/TM-16. As the Applicants have made abundantly clear, KCS, Tex Mex, and TFM have already aligned their operations closely, and they are planning to keep the three carriers intact and separate.[85] But control is all that KCS needs to accomplish the anticompetitive harms described above. Control will enhance KCS's profits, but it will do so at the cost of higher rates and poorer service.

Common control will not strengthen KCS/Tex Mex/TFM as a competitive alternative to UP-TFM: the KCS/Tex Mex/TFM alliance known today as the "NAFTA Railway" already provides that alternative, and nothing about KCS control will make it stronger, except financially by forcing anticompetitive shifts in U.S.-Mexico traffic flows. Importantly, however, if UP has overlooked important benefits stemming from common

---

[84] It is well established that benefits are "merger-related" only if they would not – or could not – be achieved without the transaction. The Board's new major merger rules codified the principle that "when evaluating the public interest, the Board will consider whether the benefits claimed by Applicants could be realized by means other than the proposed consolidation." *See Major Rail Consolidation Procedures* at 16, 21 (discussing 49 C.F.R. § 1180.1(c)).

[85] The Application does claim that some efficiencies will be created through elimination of duplicative Tex Mex administrative functions. Application, Riney V.S. at 62. However, given Tex Mex's size compared to KCS and TFM, those savings will be relatively small in the context of the combined NAFTA Rail. No such efficiencies are claimed as to TFM.

control – such that shippers might in the future choose to route via KCS/Tex Mex routes because of service or rate improvements that this transaction makes possible – the conditions UP is asking the Board to impose to prevent anticompetitive harms would not stand in the way of those benefits.

a) Existing KCS Coordination with TFM and Tex Mex

Since at least 1999, KCS has sought to integrate its operations with both Tex Mex and TFM – as part of their extant "NAFTA Railway" alliance – to provide the efficiencies associated with single-line service. These railroads have already put in place numerous coordinations that have nothing to do with KCS control, including:

- pre-blocking of trains moving to and from Mexico over KCS, Tex Mex, and TFM;[86]
- consolidation of KCS and Tex Mex dispatching, crew calling, and timekeeping;[87]
- transfer of Tex Mex's operations center to KCS's operations center;[88] and

---

[86] Last July, KCS reported on progress achieved by a joint KCS/Tex Mex/TFM team responsible for achieving improved coordination among these carriers: "[e]ach week, the team covers service performance related to KCS' new pre-blocking plan for traffic going southbound into Mexico, despacho previo and clearances that will help expedite traffic." KCS also reported that the partners were working on an initiative "to create a similar plan for operational efficiency going northbound, to include the possibility of TFM pre-blocking traffic to save handling and transit time on traffic moving from Mexico to US Markets." KCS NEWS, "*NAFTA Railway Partners Reflect and Pursue New Opportunities*," July 9, 2002 (available on www.kcsi.com) (Exhibit 12); *see also* Application, Riney V.S. at 136 ("KCSR, Tex Mex and TFM implemented a plan to pre-block trains moving to and from Mexico").

[87] As KCS has reported, the NAFTA Alliance partners have already put into effect "the consolidation of KCS and Tex Mex dispatching, crew calling and timekeeping to KCS's System Transportation Center in Shreveport." KCS NEWS, "*Nafta Railway Partners Reflect and Pursue New Opportunities,*" July 9, 2002 (Exhibit 12).

- participation by KCS in Tex Mex capital improvement projects, including applications for federal funding of Tex Mex investments.[89]

KCS has repeatedly touted these and other coordinations with Tex Mex and TFM as having allowed these railroads to provide "seamless, one stop service" for U.S.-Mexico traffic.[90] According to KCS, together with its partners Tex Mex and TFM it is "second to none in servicing markets in Mexico."[91]

Applicants emphasize that the fact they are already so closely coordinated will facilitate the transition to common control, rather than that control will bring major benefits.[92] The one operational improvement that Applicants claim is in fact already in progress and is not dependent on approval of the transaction. Applicants assert that KCS control of Tex Mex and TFM will enhance rail safety because both Tex Mex and TFM will implement KCS's Management Control System ("MCS").[93] However, long before KCS announced its acquisition of Tex Mex and TFM, KCS announced that it was installing MCS

(... footnote continued from previous page)

88 *See* Application, Haverty V.S. at 62 ("Tex Mex's operations center has been transferred to KCSR's operation center and KCSR pre-blocks trains for Tex Mex. KCSR also handles Tex Mex's dispatching.").

89 *See* Application at 15 (KCS *already* assisting Tex Mex in applying for funding); *id.*, Riney V.S. at 135-39; KCS NEWS, "*NAFTA Railway Partners Reflect and Pursue New Opportunities*, July 9, 2002 (available on www.kcsi.com); KCS NEWS, "*State of the Railroad: From the Desk of Michael R. Haverty, Chairman, President and CEO,*" Dec. 17, 2002 (available on www.kcsi.com) (Exhibit 12) (explaining that that KCS was seeking funding for several projects, including Tex Mex projects).

90 KCS NEWS, "*NAFTA Railway Partners Reflect and Pursue New Opportunities*," July 9, 2002 (available on www.kcsi.com) (Exhibit 12). Applicants' Environmental Appendix (KCS-13/TM-13) similarly emphasizes that KCSR and Tex Mex already "have achieved near seamless operation." *See id.,* Safety Implementation Plan at 3.

91 KCS News, "*Despacho Previo Process Clarified,*" March 5, 2002 (Exhibit 12).

92 *E.g.,* Application, Riney V.S. at 135.

93 Application, Riney V.S. at 140; Supplement at 32.

on Tex Mex.[94] Likewise, prior to KCS's proposal to acquire TFM, KCS and TFM personnel were meeting to "formulate a business case for implementing the [MCS system] on TFM." That meeting was one of "many steps toward a projected implementation of MCS on TFM in the first quarter of 2004" and, according to KCS, marked "another important step toward creating a more seamless NAFTA Railway operation."[95]

b) No Further Coordinations Are Planned

Aside from implementing MCS on TFM, the Applicants do not plan any further operational improvements following either the Tex Mex or TFM acquisitions. The Application explicitly disclaims operational changes on either railroad:

- "The TFM transaction will not alter the basic structure or operations of TFM." (Supplement at 25).
- "Even though KCSR will become affiliated with TFM, the two carriers are not merging nor is TFM acquiring or taking control of KCSR. TFM will continue to be operated from Mexico City, with separate officers and boards of directors from KCS and KCSR." (Supplement at 7).
- The transaction will result in "no significant changes . . . to operations" because KCS and Tex Mex already "have achieved near seamless operation." (Environmental Appendix, Safety Implementation Plan at 3).

---

[94] More than a year ago KCS reported that the NAFTA partners planned to implement MCS on both KCS and Tex Mex. KCS NEWS, "*NAFTA Railway Partners Reflect and Pursue New Opportunities*," July 9, 2002 (available on www.kcsi.com) ("another key topic was that of future projects like the implementation of MCS on KCS this summer and on Tex Mex later this year"). Mr. Haverty indicated in December 2002 – still long before KCS proposed to acquire control of Tex Mex – that KCS intended to implement MCS on Tex Mex in 2003. KCS NEWS, "*State of the Railroad: From the Desk of Michael R. Haverty, Chairman, President and CEO,*" Dec. 17, 2002 (available on www.kcsi.com) (Exhibit 12). In fact, KCS and Tex Mex are proceeding with these plans without regard to Board approval of the Application. Applicants' Safety Implementation Plan reports that, "[i]n the 3d and 4th quarters of 2003, MCS will be implemented on Tex Mex." Environmental Appendix (KCS-13/TM-13), Safety Implementation Plan at 11.

[95] KCS NEWS, "*KCS, TFM Move Toward More Seamless Operation*," July 9, 2002 (available on www.kcsi.com) (Exhibit 12).

- "Operations of Tex Mex and KCS have become closely coordinated in a number of areas as the volume of traffic moving over Tex Mex's trackage rights has increased. Because of this existing coordination, bringing [KCS] and [Tex Mex] under control of the same holding company should not result in any disruption of service because no fundamental changes in service patterns will occur." (Application, Riney V.S. at 136).

- "KCSR and Tex Mex train and yard operations will not change significantly as a result of the transaction," and "it is not anticipated that bringing the two companies under common control will have a significant effect on traffic levels or other basic operating indicators." (Application, Hefley V.S. at 150.)[96]

Absent significant efficiencies – of which there are none – KCS control of all aspects of Tex Mex and TFM actions, from marketing and pricing to the day-to-day operational matters upon which connecting railroads such as UP depend, will pose uniquely severe threats to competition. The Board can avoid that harm through simple conditions that embody promises Applicants have already made and preserve the ability of KCS/Tex Mex/TFM to become more efficient under common control if new opportunities present themselves.

4. Many Shippers Have Expressed Concerns About the Competitive Impacts of the Proposed Transaction

UP is not alone in expressing concerns about the adverse impacts that KCS's control of Tex Mex and TFM would have if KCS's commitments are not implemented in an effective and enforceable manner through Board conditions. UP is providing, at Exhibit 13, a compilation of more than 20 letters and statements from shippers who have called upon the Board to ensure that competition via the Laredo Gateway is protected.

---

[96] *See also id.* at 153 (transaction "will not perceptibly change day-to-day train or yard operation of the two companies").

For example:

- AK Steel, which ships rolled steel from the Midwest to Mexico over the Laredo Gateway, writes:

  "AK Steel is concerned that once the formation of the NAFTA Railway is completed, TFM will favor traffic that originates on its affiliated companies, i.e., KCS and TexMex, over interchange traffic received from UP or [BNSF]. If such discriminatory practices occur, there were be a detrimental impact on cycle times, which would greatly impact AK Steel's ability to obtain reliable and efficient transportation service into Mexico.

  "In addition, AK Steel is concerned that the formation of the NAFTA Railway could impact on the ability of competing carriers to provide service to Mexico on commercially reasonable terms. . . . The combination of KCS/TexMex/TFM . . . presents an incentive for TFM to favor KCS/TexMex to the detriment of other carriers, like UP and BNSF, that connect with TFM at the Laredo Bridge. . . . Such practices would greatly limit UP's and BNSF'a ability to provide competitive priced service for AK Steel's transportation needs to the Mexican gateway."

- Badger Mining, which ships silica sand from Wisconsin mines to TFM-served foundries in Monterrey and Saltillo, writes:

  "We are concerned that the proposed NAFTA Rail transaction might affect the rates and service that UP can offer for our shipments moving over the Laredo Gateway. Our Mexico traffic moves over the Chicago Gateway, so it is susceptible to routings involving KCS. If the NAFTA Rail transaction improves those routings, we would welcome the additional competitive options. However, Mexico is an important growth market for Badger Mining, and we want to ensure that the transaction does not interfere with our ability to use the existing, efficient UP-TFM service.

  ". . . . It is our experience in the railroad business that there are many subtle ways to discriminate against competition, so clear, enforceable standards are important."

  Chicago Sweeteners, which ships manufactured food products to and from Mexico over the Laredo Gateway, explains that "[a]nything that would discriminate against Union Pacific

would be a direct discrimination against all that use is lines to ship to and from Mexico."

- General Chemical, which is a member of an export cooperative that ships soda ash to Mexico over the Laredo Gateway, explains that "UP has coordinated service with the TFM set up via Laredo, TX, including several daily run-through trains with pre-blocking of railcars," and that "UP has spent significant capital to improve border facilities and to automate customs activities to help the flow of international shipments between the U.S. and Mexico." It asks the Board to impose conditions "to ensure continued competitive and efficient rail service via the Laredo gateway for customers using the current UP-TFM rail routing."

- Hub Group, which wrote the Board in support of the Application, subsequently filed an additional letter to state that it "strongly supports conditions that will guarantee continued competitive and efficient UP/TFM rail service via the Laredo gateway."

- International Paper, which shipped more than 186,000 tons of paper products over the Laredo Gateway, states that it has "a number of concerns about the possibility of potential discrimination against either UP or BNSF traffic at the International Bridge at Laredo and, through its affiliation with TFM, in Mexico." It explains that the "cooperation of interlining railroads in establishing equitable and efficient car supply and car hire agreements, compatible train schedules and fair divisions of interline freight revenues."[97]

- Reagent Chemical & Research, which exports hydrochloric acid to Mexico via the Laredo Gateway, states that it has "concerns that the ownership of the International Bridge at Laredo be [sic] under the sole control of the NAFTA Rail carries, and that those controlling the bridge continue to offer the UP complete and uninhibited access to the bridge crossing."

- Unimin, which ships ball clay from Texas and Tennessee plants to the Monterrey area over the Laredo Gateway writes:

  "Until now, TFM had no reason to favor ball clay shipments that originate in Tennessee over shipments that originate in Texas, or vice versa. Following the proposed transaction, TFM will have reason to favor KCS, because they will be under common ownership. If the combined entity raises the price of transporting Unimin's Troup, Texas ball clay from Laredo to Monterrey or uses

---

[97] International Paper's letter was filed directly with the Board and is not included at Exhibit 13.

> its control over the Laredo Bridge to make UP's service slower or less predictable, Mexican tile and sanitaryware producers may shift to the Tennessee producers. This will benefit KCS because KCS can carry Gleason, Tennessee ball clay from New Orleans, Louisiana (where CSX connects to KCS) to Laredo. ...
>
> "We respectfully request that the Board impose detailed conditions of neutrality and non-discrimination in order to preserve competition among rail carriers and to enable Unimin to compete fairly for sales to Mexican customers. The Laredo Bridge cannot be duplicated by competitors, and the other rail crossings from Texas into Mexico are far inferior to it. This Board should not allow control of Laredo Bridge to confer a competitive advantage on the combined KCS-TFM."

- Weyerhaeuser Company, which has packaging plants and distribution facilities for its forest products across the United States, Canada, and Mexico, asks the Board to address several concerns, including concerns that Applicants "must insure that all existing gateways will remain open" and that they "must provide the Board with assurances and process, which can be monitored to insure the impartiality of [their] Mexican partner in dealings with other railroads."

In all, a broad cross-section of more than twenty shippers of products ranging from chemicals, to grain, to forest products, to intermodal, to steel – and including shippers that also filed comments expressing support for the transaction – have asked the Board to impose conditions to make concrete and enforceable KCS's commitments to preserve competition for traffic moving over the Laredo Gateway. Even DuPont, which did not ask the Board to impose conditions on the transaction, nonetheless considered "significant" the "KCS commitment to abide by all existing agreements governing operations of over the Laredo Bridge and to keep the Laredo gateway open on commercially reasonable terms."[98] Other shippers have no doubt refrained from participating actively in this case based on their

---

[98] *See* Prepared Remarks by E.I. DuPont de Nemours, STB Finance Docket No. 34342, filed July 29, 2002 at 3.

expectation that the Board will act – as it has done in every other recent case – to hold Applicants to their well-publicized commitments. [99]

5. Professor Grimm's Competitive Analysis Ignores the Anticompetitive Effects of KCS Control

Applicants' analysis of the effects of their proposed transaction fails to consider the potential that an end-to-end (or "vertical") transaction can have anticompetitive effects. Applicants' competition witness – Professor Curtis Grimm – explicitly limited his analyses to potential "horizontal" competitive effects for 2-to-1 or 3-to-2 shippers,[100] and thus ignored the potential harms from this vertical transaction. *See* Hausman V.S. at 20-21. Professor Grimm applied the federal antitrust agencies' 1992 "Horizontal Merger Guidelines," which on their face apply only to "horizontal merger[s]."[101] As explained in the joint agency statement announcing those Guidelines, they "do not include a discussion of horizontal effects from non-horizontal mergers (*e.g.*, elimination of specific potential entrants and competitive problems from vertical mergers)."[102]

Based on Professor Grimm's unduly narrow analysis – and the observation that TFM is an indispensable link in every cross-border movement via Laredo and is thus a part of every "independent railroad routing"[103] – Applicants assert that their transaction cannot possibly have anticompetitive effects. Instead, they characterize the effects of which

---

103 KCS-14/TM-14 at 13-14 (KCS/Tex Mex responses to Interrogatories 3, 5) (excerpts at Exhibit 15).

UP and others complain as impacts solely on competing carriers rather than impacts on competition.

As Professor Hausman explains, however, Applicants are wrong. It is well recognized that vertical transactions *can* have significant anticompetitive effects. Although many vertical mergers are often not anticompetitive, this transaction poses unique competitive dangers. Applicants' analytical approach sweeps under the rug the unique dynamic of competition for U.S.-Mexico traffic moving via the Laredo Gateway. TFM's incentives (commercial and regulatory) to behave equitably via-à-vis UP and Tex Mex at the Laredo Gateway have created an environment in which competition north of the border has flourished and in which TFM has not fully exploited its market power with respect to U.S.-Mexico cross-border movements. Although this transaction is "end-to-end," KCS control of Tex Mex and TFM will nevertheless adversely affect the existing two-carrier competition for traffic moving via Laredo. Gray V.S. at 20-33; Hausman V.S. at 9-18.

Professor Hausman explains that vertical mergers can produce anticompetitive effects when the merged entity can decrease the service quality or increase the costs of its rivals. Hausman V.S. at 21. By discriminating against a competitor and causing its service quality to be lower, a firm can increase its own demand and often charge higher prices. *Id.* As Professor Hausman explains, the risk is more than theoretical in the circumstances of this case, because for many shippers, neither other U.S.-Mexican gateways nor intermodal competition significantly constrains a "hypothetical monopolist" from increasing price. *Id.* at 6-7.

This is precisely the risk that Mr. Gray describes. Gray V.S. at 31-33. For example, if KCS/Tex Mex/TFM increase UP's costs by interfering with operations at the

Laredo Bridge or by declining to participate in blocking or run-through trains or through other tactics, UP will be forced to raise its rates (or shippers suffering service reductions will feel as if their costs have increased), thereby allowing KCS/Tex Mex/TFM to capture the traffic of those shippers despite offering higher prices or lower service levels. Hausman V.S. at 10. This result is not merely a shift in traffic from UP to KCS, but a genuine loss of competition and harm to shippers. *Id.* at 11.

Professor Hausman also describes a second type of anticompetitive effect that might flow from the end-to-end transaction in this case. He explains that vertical mergers can lead to evasion of regulation and allow the combined firm to better price discriminate. *Id.* at 22.[104] As Professor Hausman explains, to the extent that Mexican law requires TFM to charge the same price for similar movements to and from Laredo for similar commodities, TFM is constrained in the prices it can charge. *Id.* at 12. If TFM attempted to increase the price it charges between Laredo and a given point in Mexico, the increased revenues from less-price-elastic customers would be offset by revenue losses from relatively more price-elastic customers who switch to alternative transportation modes or gateways. *Id.* Thus, TFM's prices to less-elastic customers are lower than they would be if TFM could price discriminate freely. *Id.* Moreover, competition among U.S. railroads north of Laredo prevents TFM's connecting carriers from capturing the extra revenue. *Id.* The proposed transaction will change this dynamic by allowing KCS/Tex Mex/TFM to increase prices to

---

[104] "Evasion" does not refer to any act that would violate Mexican law, but to conduct that TFM could not accomplish today but which a combined KCS/TFM could undertake. Hausman V.S. at 13 n.16.

less-elastic customers while maintaining prices to more-elastic customers at existing levels in order to retain TFM's existing traffic. *Id.* at 13.

Once again, the risk of anticompetitive harm is present in the circumstances of this case. Mr. Fuentes concludes that Mexican regulation would likely not prevent a commonly-controlled KCS/Tex Mex/TFM from engaging in such tactics as long as TFM continued to offer "non-discriminatory" rates for the Mexican portion of the movement. Fuentes V.S. at 3. Mr. Hausman examined the amount of traffic on which KCS/Tex Mex/TFM could potentially employ the rebate strategy and concluded that it is considerably more than needed to result in significant price increases to shippers. Hausman V.S. at 16.

C. Applicants' Arguments Do Not Overcome the Likely Anticompetitive Effects

In its filings in this proceeding and in other public comments about the proposed KCS/Tex Mex/TFM transaction, Applicants have argued that the Board and other interested parties should not be concerned about potential adverse competitive effects of KCS acquiring control of Tex Mex and TFM for four reasons. First, Applicants assert that there is "pervasive truck and barge competition for the U.S./Mexico trade." Supplement at 25; *see also id.* at 13-19. Second, they point out that approximately three-fourths of TFM's interchange traffic at Laredo is with UP, which they assert gives UP substantial "bargaining leverage over a combined KCSR/Tex Mex/TFM System." Supplement at 25. Applicants contend that TFM would have no choice but to continue working with UP, lest UP otherwise shift its traffic "away from the Laredo gateway and away from TFM."[105] Third, Applicants

---

105 Supplement at 24.

argue that UP has a "chokehold" over KCS/Tex Mex's ability to compete that would prevent KCS/Tex Mex from gaining traffic from UP-TFM routes. Fourth, Applicants emphasize that the commitments they have made in this proceeding will successfully avoid anticompetitive harm.

None of these arguments has merit. We address the first three here and turn to the fourth in Section IV.

1. Other Transportation Alternatives Will Not Prevent Anticompetitive Effects

Applicants' suggestion that intermodal competition is "pervasive" for U.S.-Mexico traffic flows is a significant overstatement, directly contradicted by the evidence and Applicants' own representations made in the course of securing Tex Mex's trackage rights over UP. To be sure, there are competitive options for *some* of the rail traffic that Tex Mex and UP interchange with TFM at Laredo. Some could be moved by truck, some could be moved to the border by rail and transloaded into trucks for final delivery, and some could be moved by water between points in the United States near ports and points in Mexico readily accessible to Mexican ports, such as Veracruz. The views of the handful of shippers that appeared at the July 31 hearing no doubt reflect the existence of alternatives for *some* shippers.

However, as Mr. Gray explains, these competitive options are by no means "pervasive." Gray V.S. at 35-38. If they were, the Board would not have had a valid basis for imposing conditions in *UP/SP* designed to protect *railroad* competition at the

Gateway.[106] The Board has regarded competitive rail transportation for NAFTA trade as vitally important precisely because much of the traffic that flows in the corridors anchored by the Laredo Gateway could not move *economically* via other modes.[107]

In *UP/SP*, KCS and Tex Mex both emphasized the importance of rail as the only viable means of transportation for many shippers engaged in U.S.-Mexico trade. Tex Mex stressed to the Board that, "[a]lthough most of the transportation of freight between the United States and Mexico is carried by truck, truck and water transportation are not practical alternatives for almost all of the shipments now transported by rail."[108] Tex Mex contended that the merger "would likely cause a substantial lessening of competition for rail transportation of goods between the United States and Mexico," because "this is not traffic that can feasibly move by other modes."[109] Testifying on behalf of Tex Mex, Professor Grimm (who is Applicants' competition witness in this case) testified that, "[a]lthough truck and water play an important role in transportation of goods between the U.S. and Mexico,

---

106 *See* pages 35-37, *supra.*

107 As Tex Mex explained to the Board in 1996, "Tex Mex's arguments and evidence concerning competition [in *UP/SP*] focused primarily on the importance of preserving competition in the market for rail services between the United States and Mexico, because that is the market in which Tex Mex is currently an important participant and because preserving competition in that market is vital to the policies of both countries as reflected in the North American Free Trade Agreement." *UP/SP*, Tex Mex Petition to Reopen (TM-44) (Sept. 3, 1996) at 4 (Exhibit 16).

108 *UP/SP*, Responsive Application of Texas Mexican Ry. (TM-23) (March 29, 1996), Verified Statement of Larry Fields at 44 (Exhibit 9). Similarly, Tex Mex's brief represented that "[s]ignificant volumes of grain and other agricultural products, minerals, woodpulp, paper products, automobiles and automobile parts, and other metals flow through the Laredo gateway. Much of this is bulk traffic that moves long distances and for which truck transport is not a viable alternative." *UP/SP*, Brief of the Texas Mexican Ry. (TM-39) (June 3, 1996) at 10 (Exhibit 1).

109 *UP/SP*, Responsive Application of Texas Mexican Ry (TM-23) at 14 (Exhibit 9).

many shippers of many commodities are dependent upon rail competition for competitive transportation options."[110] Similarly, Mr. Grimm explained that "[g]rain is the most important commodity, and there is well-established evidence as to the ineffectiveness for trucks for the long-haul movements of this commodity."[111] Another Tex Mex witness opined: "Truck and water competition are not sufficient to constrain significantly rates for rail transportation between the U.S. and Mexico."[112]

KCS (also relying on testimony of Professor Grimm) emphasized the same point in *UP/SP*: "Although truck competition can supplement inadequate intramodal competition for some products and markets, it is not an effective substitute for rail to rail competition . . . . Other modes cannot provide an adequate counterbalance for diminution of rail competition in the proposed transaction."[113]

The Applicants' assertions in this case – echoed with respect to grain by USDA – reach the opposite conclusion only by focusing on highly aggregated data. In essence, they emphasize that much freight moves by truck and water. But examining the traffic flows in particular origin-to-destination markets tells a different story.

---

110 *Id.*, Verified Statement of Curtis Grimm at 128 (Exhibit 9).

111 *Id.* at 129. This view was echoed by the Department of Agriculture in *UP/SP*: "rail is also an important mode of transportation of grain exported overland to Mexico." *UP/SP*, Comments of the USDA (March 29, 1996) at 3.

112 *UP/SP*, Rebuttal of Texas Mexican Ry. (TM-34), Verified Statement of Joseph Ellebracht (May 10, 1996) at 3 (Exhibit 17); *see also UP/SP*, Responsive Application of Texas Mexican Ry. (TM-23), Ellebracht V.S. at 93 ("Truck competition will not be an effective constraint on rail prices in the absence of effective rail-to-rail competition . . . . Water competition will not be a effective constraint on rail prices in the absence of effective rail-to-rail competition") (Exhibit 9).

113 *UP/SP*, KCSR Comments and Request for Conditions, Volume I (KCS-33) (March 29, 1996), Grimm V.S. at 208 (Exhibit 18).

As Mr. Gray explains, for most shippers that use rail today, truck and water alternatives are not available. For example, there are no efficient intermodal alternatives available to shippers of bulk commodities – such as Unimin, Badger Mining, and others – whose facilities and customers are not located adjacent to ports. Trucks may offer a theoretical alternative for some shippers. However, as Mr. Gray describes, for most of the major flows of U.S.-Mexico traffic that move by rail today, railroad transportation offers significant and growing cost advantages relative to available truck and water alternatives. Gray V.S. at 35-37.[114]

Indeed, the fact that so much traffic moved by rail before the privatization of Mexico's railroads in the late 1990's, *despite* the horrible inefficiency of the Mexican rail network at the time (*see* Gray V.S. at 8-9), is a stark reminder of how dependent much traffic is on rail movement. The advantages of rail transportation have only increased with the significant improvements in the efficiency of the Mexican rail system over the past six years. *Id.* at 9. One reflection of this improvement is the drop in TFM's operating ratio, from 93.6 in 1997 to 76.2 in 2002. *Id.*

2. UP's Supposed "Bargaining Leverage" Will Not Prevent KCS Control of Tex Mex and TFM from Having Anticompetitive Effects

Applicants also claim that TFM would not act to adversely affect UP-TFM options because it faces the threat that UP would respond by shifting traffic to another of its Mexican gateways – such as Eagle Pass, served by Ferromex. KCS-16/TM-16 at 20-21.

---

[114] The truck and water alternatives available to some shippers will not protect those who lack equally economical non-rail options. KCS would target its anticompetitive strategies at other UP-TFM traffic. Gray V.S. at 38.

However, as Mr. Gray and Mr. Barkley explain, UP is not in a position to shift large amounts of traffic to gateways served by Ferromex. Laredo is the preeminent gateway for many reasons. *See* pages 35-42, above. Some traffic would be impossible to move via Eagle Pass because it is dependent on TFM's rail network within Mexico, in substantial part due to Ferromex's inferior routes, high trackage rights fees and lack of access to important Mexican points, such as San Luis Potosí, Toluca and much of Monterrey. Gray V.S. at 17-18. For other traffic, UP-TFM routes via Laredo offer important cost and service advantages. Switching gateways would result in a lower level of service for UP's customers. Given UP's 26 percent equity investment in Ferromex since 1997,[115] it is reasonable to expect that UP has already shifted to Eagle Pass the traffic that would move most efficiently via that gateway. In recent years, however, UP-TFM traffic via Laredo has grown much faster than UP-Ferromex traffic via Eagle Pass, providing a telling indication of Laredo's advantages. Gray V.S. at 12. For most shippers, other gateways are simply less efficient than Laredo.

Moreover, alternative gateways do not have significant excess capacity. Eagle Pass could not accommodate a substantial amount of new traffic. It would take many years to build up significant infrastructure and develop enough capacity for Eagle Pass to present a serious threat to TFM's traffic volumes at Laredo. Massive investments in new rail capacity and border crossing infrastructure would be needed at Eagle Pass before significant volumes of Laredo traffic could move via Eagle Pass. Many of the decisions

---

[115] By contrast, nether TFM nor its parent Grupo TMM has any equity interest in KCS that would give TFM incentives (absent the control by KCS achieved through this transaction) to favor KCS routings.

about additional investments at Eagle Pass would be in the hands of government and third parties, and there would be considerable uncertainty whether those investments would be made. In addition, a significant shift of traffic to Eagle Pass would strand tens of millions of dollars of investments UP made at Laredo to support efficient UP-TFM cross-border commerce. Gray V.S. at 13-16; Barkley V.S. at 3.

Finally, the fact that UP could divert *some* traffic from Laredo to Eagle Pass when KCS acquires control of TFM would not deter KCS/TFM from implementing strategies aimed at selectively disabling UP-TFM competitive options. KCS will be able to target its strategies against that traffic which is most dependent on the advantages of Laredo and/or TFM. Moreover, having chosen to bring TFM under the control of a UP competitor, KCS rationally will already have accepted the prospect that UP might do what it could to shift traffic to Eagle Pass in order to remove it from potential interference by KCS. There would be no reason for KCS to expect that its strategies would cause additional, incremental shifts of traffic away from Laredo and TFM. Thus, it would be irrational for KCS to pass up opportunities to use control over TFM to raise rates and shift profitable traffic to KCS and Tex Mex routes. Gray V.S. at 38-39.

Applicants' suggestion that they would be deterred from implementing anticompetitive strategies out of fear that UP (or BNSF) traffic would be diverted to other gateways – and thus "away from TFM" – is also belied by evidence that KCS *already has undertaken or plans to undertake* actions that would adversely affect competition. KCS has announced that it plans to increase the rate factors that Tex Mex has quoted to BNSF for international traffic moving via BNSF-Tex Mex-TFM routes. KCS says that it views those rates as "too low" and "inappropriately" priced. The Application explains that the problem

with Tex Mex's rates is that they were set by TFM and Tex Mex – which until now had no incentives to favor KCS – rather than by KCS:

> "Because KCSR has been a minority investor in Tex Mex and because TFM and Tex Mex have been responsible for their own pricing and marketing arrangements, there may be some agreements that would not provide adequate revenues to a combined KCSR/Tex Mex system. ... [A]ny agreement that does not provide adequate revenues will be reviewed and, if necessary, cancelled pursuant to the terms of that agreement."

Application at 26 n.19.

KCS is obviously undeterred by hypothetical diversions of BNSF-Tex Mex traffic to Eagle Pass or to other modes. Its intention to increase the Tex Mex rate factors available to BNSF for movements via Laredo offers a chilling preview of KCS's strategies using its control of TFM. Increases in the TFM factors available to UP would reap even greater profits for a combined KCS/Tex Mex/TFM system, while having much more severe adverse impacts on the transportation options available to shippers.

3. UP Does Not Have a "Chokehold" Over KCS and Tex Mex

In several of Applicants' filings, they claim that KCS and TFM could not give preference to Tex Mex and KCS traffic because UP has a "chokehold" on lines Tex Mex uses.[116] Applicants are referring to Tex Mex's operations over UP's track between

---

[116] Applicants' Rebuttal to Comments Filed in Reply to Applicant's [sic] Petition to Establish Procedural Schedule (KCS-6/TM-6) (June 9, 2003) at 28 n.20; *see also* Applicants' Reply to UP's Petition For Declaratory Order (KCS-11/TM-11) (June 23, 2003), at 9 n.5. Applicants similarly claim that UP holds a "trump card" because Tex Mex operates over UP trackage. Supplement at 22.

Beaumont, Texas, and Robstown/Corpus Christi, Texas, under trackage rights the Board granted in *UP/SP*. There is no basis for Applicants' claim.[117]

Trackage Rights Operations and Dispatching

Tex Mex first blithely suggests that UP "unfairly dispatches Tex Mex trains."[118] UP has not discriminated against Tex Mex operations in the past, nor could it do so in the future. The Tex Mex trackage rights operations are subject to extensive protections – including Board oversight – that ensure that UP does not discriminate against Tex Mex trains.

Tex Mex's trackage rights are governed by a detailed set of terms, including a protocol governing UP's dispatching of Tex Mex trains negotiated by UP and Tex Mex personnel in 1996. That protocol is substantially the same as the dispatching protocol governing BNSF's trackage rights granted in the *UP/SP* case, which the Board concluded would ensure that the tenant's service was not "subject to dispatching discrimination by applicants." 1 S.T.B. at 403.

Under the protocol, UP must issue written instructions to its dispatchers that Tex Mex trains are to be dispatched "exactly as if they were trains of the same class of [UP] and given equal treatment with trains of [UP]."[119] In evaluating performance of its

---

117 However, Applicants' recognition that fair and nondiscriminatory use of UP's trackage north of Robstown is important to competition *does* underscore the need for the Board to impose conditions in this case that are no less effective in protecting UP's use of the Laredo Bridge and UP's commercial access to TFM's network via the Laredo Gateway than the trackage rights protocols that guarantee Tex Mex fair and nondiscriminatory use of UP's trackage between Beaumont and Robstown.

118 KCS-6/TM-6 at 28 n.20.

119 Dispatching Protocols, § 3 (Barkley V.S., Exh. C).

dispatchers, UP must consider performance of the Tex Mex trains and effectiveness in cooperating with Tex Mex personnel and meeting Tex Mex service requirements.[120] Tex Mex has the right to request meetings with UP personnel to discuss any disagreement about compliance with the protocol and to present such disagreements to a Joint Service Committee comprised of the chief transportation officers of UP and Tex Mex.[121] Tex Mex may submit any disagreement to binding arbitration before a neutral official if it is not satisfied with the Joint Service Committee's action.[122] Ultimately, Tex Mex would be entitled to return to the Board to seek relief if it were dissatisfied with UP's administration of the trackage rights.

UP has never violated the protocol governing movement of Tex Mex trains on UP track or otherwise taken action to disadvantage Tex Mex's trains vis-à-vis UP trains. Barkley V.S. at 19-20. As Mr. Barkley explains, from time to time, the sorts of operational problems common to all railroads (*e.g.*, maintenance curfews) have contributed to slow velocities on the track, but these problems have not been specific to Tex Mex. Rather, they have occasionally slowed the movement of both UP trains and Tex Mex trains using the tracks. *Id.* at 19. Contrary to Tex Mex's assertions, however, the impact of delays on these lines falls much more heavily on UP than Tex Mex, in part because UP operates many more trains than Tex Mex over these lines. *See* Barkley V.S. at 21-22 & Exh. D.

Tex Mex has invoked its right to convene the Joint Service Committee only once, in early 2003. At that time, Mr. Barkley met with a KCS official to discuss concerns

---

120 *Id.* at § 12.

121 *Id.* at § 13.

122 *Id.*

about delays Tex Mex trains had experienced while using UP's tracks. Barkley V.S. at 19-20. In addition, in recent months, UP personnel have met with Tex Mex representatives weekly to discuss concerns about individual trains. In each case in which Tex Mex identified a train delay, UP personnel investigated and explained the relevant circumstances to Tex Mex personnel. After reviewing the information provided to them, Tex Mex personnel have not identified any UP violation of the dispatching protocol.[123]

Operating statistics confirm that Tex Mex trains suffer fewer delays than UP trains in this part of Texas. Mr. Barkley reports that in November 2002 the Spring Dispatching Center (which Tex Mex has been invited to join, but has declined) conducted a four-day study of trains operating on UP's Angleton and Brownsville Subdivisions, parts of which are used by Tex Mex trains operating via trackage rights. This study showed that on average, as among UP, BNSF, and Tex Mex trains, UP trains suffered the most minutes of delay per train, while Tex Mex trains experienced the fewest minutes of delay per train. Barkley V.S. at 21 & Exhibit D.

There is no reason to believe that UP would choose to discriminate against Tex Mex in connection with these trackage rights in the future. UP uses the same lines for

---

[123] Barkley V.S. at 20. Mr. Barkley notes that a major factor causing many Tex Mex crews to expire due to hours of service regulations during movements over the trackage rights is that the Tex Mex crew districts are quite long, much longer than UP's crew districts in this area. *Id.* at 20-21.

Mr. Barkley notes that the UP dispatchers probably give Tex Mex trains better treatment than UP trains as a result of this situation. UP's dispatchers generally attempt to give priority to a train when the crew is about to exceed its hours of service. Because of the length of the Tex Mex crew districts, Tex Mex crews are often in danger of exceeding their hours of service. Since UP's crew districts are shorter, UP crews are less likely to be in this situation and thus the UP trains are less likely to receive priority. *Id.* at 21.

its own trains. Any actions UP took to delay Tex Mex trains would increase congestion on the lines, and this would delay UP trains as well. Barkley V.S. at 21-28. Moreover, Tex Mex could control UP's conduct by enforcing rights under the protocol. As noted above, Tex Mex can raise concerns with UP and seek binding arbitration if it believes UP has violated the protocol. *See* Barkley V.S. at 27. Ultimately, it can seek relief from the Board if it believes the 1996 protocol does not give it the necessary protection in connection with the trackage rights.

In addition, Tex Mex is welcome to participate in the Spring Dispatching Center, the joint command center UP and BNSF established at Spring, Texas in the late 1990s.[124] Placing a representative at the Spring Center would give Tex Mex a better opportunity to coordinate with the UP dispatchers and head off delays, where possible. Despite previous invitations, Tex Mex has declined to participate at Spring. Barkley V.S. at 20.

Capacity on the Trackage Rights Lines

In arguing that UP has a "chokehold," Applicants also have asserted that UP has not invested in the lines Tex Mex uses and that there is insufficient capacity on the Tex Mex trackage rights lines for Tex Mex to add even one more train.[125] However, as Mr. Barkley explains, UP's statistics show that there is sufficient capacity on the trackage rights lines and that Tex Mex should be able to add traffic without the need for additional

---

[124] Barkley V.S. at 22; *UP/SP, Houston Gulf Coast Oversight*, Decision No. 10, p. 24.

[125] *See* KCS-6/TM-6 at 28 n.20; KCS Reply to CN Petition to Reopen Decision No. 2 (KCS-16/TM-16) at 22.

investment. *Id.* Indeed, UP's statistics show that the trackage lines are less constrained than UP's line between San Antonio and Laredo, which is UP's route to the Laredo Gateway. *Id.*

In addition, if Tex Mex believes its operations on UP's tracks are limited by a lack of capacity, it could take at least two steps to help alleviate the problem. First, the 1996 trackage rights agreement permits Tex Mex to fund new sidings and other capital improvements on the trackage rights lines, and UP may not veto such proposals. Tex Mex has never invoked this provision, but this continues to be an available option. Barkley V.S. at 23-24. UP sold to Tex Mex the old SP Wharton line, which runs between Victoria and Rosenberg. Tex Mex and KCS view the rehabilitation of this line as the "next major capital project on Tex Mex" and they will use it in place of approximately more than 100 miles of trackage rights on UP.[126] This would shorten Tex Mex's route from Beaumont to Laredo and reduce concerns about delays on the trackage rights lines.[127]

D. Mexico's Regulatory Regime Will Not Prevent KCS Control from Having Anticompetitive Consequences

In their Supplement, Applicants misleadingly suggest that provisions of Mexican law and TFM's Concession will prevent TFM from engaging in the type of discriminatory conduct that would harm shippers who use UP.[128] Francisco Fuentes Ostos, Mexican counsel experienced in rail matters, explains in his verified statement that Mexican law and regulation will not effectively prevent such anticompetitive behavior. As Mr. Fuentes explains, Mexico's rail regulatory regime is still in its infancy, which means that

---

126 Supplement, Riney V.S. at 141.

127 Barkley V.S. at 24.

128 *See* Supplement at 29-30.

courts and regulators have had almost no occasion to interpret or enforce the relevant provisions of Mexican railroad law. It is thus unclear how courts and regulators would respond to complaints of discriminatory treatment following KCS control. The only certainty is that disputes would take years to resolve. Fuentes V.S. at 2.

Moreover, Mexican law would not prevent KCS/Tex Mex/TFM from engaging in one of the key tactics for exploiting common control described by Messrs. Gray and Hausman: raising TFM rates between Laredo and TFM-served points on a non-discriminatory basis, with KCS selectively reducing its rates for its U.S.-Mexico traffic. Mexican law does not place any practical limits on how high TFM could raise its rates within Mexico in order to carry out this strategy. *Id.* at 3.[129] The law does contain various provisions that purport to require TFM to set rates in a non-discriminatory manner. *See id.* at 4. However, as Mr. Fuentes explains, Mexican authorities likely would not address the overall TFM/Tex Mex/KCS rate. They would consider only whether the *TFM portion of the rate* was offered to all shippers in a nondiscriminatory manner. *See id.* Thus, a strategy involving the use of across-the-board rate increases with (partially) offsetting rate reductions in the United States probably would not be actionable. *See id.* at 3.

Mexican law does purport to prohibit discriminatory behavior by TFM. But KCS/Tex Mex/TFM likely will not be deterred by potential enforcement of Mexican regulatory provisions against TFM discrimination as to matters of operations and service. The Mexican Secretary of Communications and Transport ("SCT"), which is charged with

---

[129] As Mr. Fuentes explains, Mexican law contains procedures through which certain parties theoretically could challenge a carrier's maximum rates, but no rate has ever been challenged using those procedures, and there are many questions about how they would apply. *See* Fuentes V.S. at 3-4.

enforcing these laws, has never had occasion to rule on a dispute involving an allegedly discriminatory practice. *Id.* Thus, there are many unanswered questions about how the SCT would interpret the applicable provisions. *Id.* In fact, according to Mr. Fuentes, it is unclear whether the anti-discrimination provisions would even apply to discrimination by TFM between KCS/Tex Mex and other U.S. connecting carriers if TFM came under KCS control. *Id.* at 5.

Even if UP or affected shippers could in theory successfully challenge discriminatory conduct by TFM, the process for obtaining a favorable SCT resolution, and then enforcing it against TFM, would likely involve years of protracted litigation before administrative agencies and courts in Mexico. *See id.* at 6. All resolutions issued by Mexican administrative agencies such as the SCT are subject to complicated appeal and review by Mexican courts – and can be blocked by "*amparos*" (a type of injunction) filed by parties seeking to delay resolution. *Id.* The judicial process can last years longer than in the U.S., especially where untested issues of law are involved. *Id.*

One illustration of the difficulty in obtaining and then enforcing SCT resolutions is Ferromex's attempt to enforce certain provisions of the TFM Concession. As Mr. Fuentes explains, Ferromex's efforts to obtain an SCT ruling enforcing TFM's obligation to grant Ferromex access to certain shippers in Monterrey began on July 4, 2001 after years of unsuccessful negotiation. More than a year later, on August 7, 2002, the SCT issued a resolution requiring that TFM grant access under specified terms and conditions. TFM then obtained a court order that suspended the SCT's resolution and prevented Ferromex from exercising the rights granted to it by the SCT. The suspension still remains in effect. *See id.* at 7. This experience is typical of efforts to enforce TFM's Concession

and applicable railroad regulations. *See id.* Just as TFM has successfully used "*amparos*" to block full realization of Mexico's privatization plan, KCS/TFM likely could delay for years attempts to enforce Mexican law against its discriminatory practices.

Mexican law thus cannot realistically protect U.S. shippers against the anticompetitive effects of KCS control on traffic moving between the United States and TFM-serviced points in Mexico.

IV. THE BOARD SHOULD IMPOSE CONDITIONS AIMED AT PROTECTING COMPETITION VIA THE LAREDO GATEWAY

To ensure that this transaction does not substantially lessen competition, the Board must fashion conditions that will preserve effective competition for traffic moving over the Laredo Gateway. In order for UP to offer competitive service for U.S.-Mexico rail traffic moving through the Laredo Gateway in competition with a consolidated KCS/Tex Mex/TFM, it must have the continued cooperation of TFM in providing shippers with competitively-viable rates between the U.S. and Mexico (*i.e.*, the gateway must remain open on commercially reasonable terms); it must have the continued cooperation of TFM on all the aspects of service that are required to make UP-TFM offerings competitively viable; and UP's cross-border traffic must receive fair treatment at the Laredo Bridge. Each of these elements is interdependent,[130] and each is threatened by KCS control of Tex Mex and TFM.

---

[130] UP's ability to quote competitive rates would mean nothing if it could not promise its customers efficient service on TFM within Mexico or if its trains were hindered by Tex Mex in crossing the Laredo Bridge. Similarly, UP's ability to provide efficient service for U.S.-Mexico cross-border traffic would mean nothing if it could not offer its customers competitive rates within Mexico or assure them that their traffic will receive equal treatment at the Bridge. Finally, UP's access to the Bridge would mean nothing if it could not offer its

(footnote continued ...)

Applicants' three sets of commitments (*see* page 11, above) are the starting point – but only the starting point – for effective remedial measures that would avoid the threat to competition posed by unconditioned KCS control of Tex Mex and TFM. Standing by themselves, however, Applicants' commitments will not suffice. They lack definition in crucial respects, and they would be utterly unenforceable unless imposed as conditions in this case. Without concrete and enforceable agreements, Applicants will act in accord with their powerful incentives to enhance profits by using control of Tex Mex and TFM to interfere with the competition provided by efficient UP-TFM transportation options.

Converting Applicants' commitments into effective remedial measures is not complicated, and the Board has ample authority to achieve this aim. UP is asking the Board to take three simple steps:

1. Require Applicants, as a condition of Board approval of this transaction, to abide by the commitments they have made in this proceeding;

2. Require them to negotiate in good faith with UP (and other interested parties) to develop agreements that would implement their commitments in effective and enforceable ways, as they have said they are willing to do (with Board guidance as to the objectives of such implementing arrangements where appropriate); and

---

(... footnote continued from previous page)
customers competitive rates and efficient service on UP-TFM international routes between the United States and Mexico.

3. Retain jurisdiction to resolve disputes and impose appropriate implementing arrangements should the parties fail to reach agreement within a reasonable period of time, perhaps 90 days.[131]

Each of these steps is consistent with Applicants' own promises, and with the Board's broad remedial authority. Each is also consistent with the need to protect competition without interfering with the Applicants' legitimate interests in pursuing pro-competitive efficiencies and other improvements that may one day stem from their proposed common control. UP proposes specific language that the Board could impose in Exhibit 19.

At the July 31 hearing, KCS's Gerald Davies complained that Board-imposed conditions would require KCS to negotiate agreements implementing its promises with a "gun to its head." But unless KCS does not intend to negotiate in good faith over effective and enforceable measures to implement its commitments, it has nothing to fear from Board oversight. If parties other than KCS make overreaching demands, UP would expect the Board to favor KCS's position rather than that of its opponents.

The alternative to Board involvement is unacceptable. If the Board did not reserve the ability to impose an appropriate implementing arrangement in the event the

---

[131] This is the Board's standard approach. For example, in *Conrail*, the Board required parties to negotiate agreements implementing various conditions and stated that it would initiate a proceeding if the parties failed to reach an agreement. *Conrail*, 3 S.T.B. at 388-89 (Condition No. 28: requiring negotiations over an agreement to grant CP haulage or trackage rights and stating that the Board will initiate a proceeding to address the matter if the parties have not reached an agreement); *id.* at 391 (Condition No. 64: requiring negotiations over an agreement to grant NECR trackage rights and setting a date for the parties to submit final proposals if negotiations are not fully successful). Similarly, in *UP/SP*, the Board required UP and Tex Mex to negotiate agreements implementing the Board's trackage rights condition, and it resolved several disputed issues when the parties failed to reach agreement on every term. *UP/SP*, 1 S.T.B. at 425; *UP/SP*, Decision No. 47, 1 S.T.B. 591 (1996).

parties fail to agree, there likely would be no agreement. KCS's incentives would be to reserve maximum flexibility for itself, requiring shippers and other affected parties to rely on KCS to act against its self-interest and refrain from the anticompetitive actions that common control of Tex Mex and TFM would allow.

A. The Board Has Authority to Impose Conditions to Mitigate Potential Anticompetitive Effects of the Transaction

The Board "has broad authority to place conditions on approval of [railroad control] transactions."[132] That authority is provided by 49 U.S.C. § 11324(c), which grants the Board authority impose conditions that are in the public interest in connection with approval of a transaction.[133] That authority applies to all control cases, including those governed by 49 U.S.C. § 11324(d). In cases under § 11324(d), the Board must grant the application unless there "likely" will be "substantial" adverse competitive impacts.[134] But the Board also has an obligation to mitigate such effects "through conditions" that serve the public interest.[135] In this case, UP's witnesses demonstrate that unconditioned approval likely would pose a substantial threat to competition for international traffic moving via the Laredo Gateway. The imposition of conditions to mitigate those effects is plainly warranted.

134 *CN/WC* at 10.

135 *Kansas City Southern Industries, Inc., KCS Transportation Co. & The Kansas City Southern Ry. – Control – Gateway Western Ry. & Gateway Eastern Ry.*, STB Finance Docket No. 33311 (STB served May 1, 1997) at 4; *see also CN/WC* at 10; *Dakota, Minnesota & Eastern R.R. & Cedar American Rail Holdings, Inc. – Control – Iowa, Chicago & Eastern R.R.*, STB Finance Docket No. 34178 (STB served Feb. 3, 2003) at 13.

There is another basis for imposing conditions in cases such as this one, where Applicants have made commitments on the record designed to forestall competitive concerns. The Board's routine policy is to require that applicants abide by their representations during the course of the proceeding as a condition of approval. For example, in *CN/WC*, another "minor" transaction, the Board imposed as a condition that "Applicants must adhere to all of the representations they made on the record during the course of this proceeding."[136] The Board has specifically required applicants to abide by commitments to keep open gateways on commercially reasonable terms. For example, in *CN/WC*, the Board stated that it would "hold applicants to [their] representation" to "'keep all existing active gateways affected by the Transaction open on commercially reasonable terms.'"[137] In this proceeding, Applicants have made various substantive commitments on the record, and they have also said that they are willing to negotiate agreements to implement those commitments.

UP's proposed conditions are consistent with the Board's criteria. Ameliorative conditions must: (1) be "operationally feasible," (2) "ameliorate or eliminate the harm," and (3) "result in greater benefit to the public than detriment to the transaction." *See Grainbelt Corp. v. STB*, 109 F.3d 794, 796 (D.C. Cir. 1997). As explained further

---

136 *CN/WC* at 28; *see also CN/IC* at 57 ("Applicants must adhere to all of the representations they made on the record during the course of this proceeding . . . ."); *Conrail*, 3 S.T.B. at 387 ("Applicants must adhere to all of the representations they made during the course of this proceeding . . . .").

137 *CN/WC* at 13. The Board also held applicants to their commitment "to work directly with connecting carriers" to establish rates for movements over affected gateways. *Id.*; *see also CN/IC* at 37 ("[W]e will impose a condition holding applicants to their representation to keep [the CP/IC] gateway open and competitive.").

below, UP's proposal that the Board hold Applicants to their commitments in this proceeding meets each of these standards. It allows the Board to achieve an ideal outcome in this case: protecting competition at the vital Laredo Gateway while simultaneously allowing Applicants to pursue whatever pro-competitive efficiency gains common control might create (however unlikely those efficiencies may be, as discussed above).

B. The Board Should Implement Applicants' Commitments by Imposing Narrowly Tailored Conditions

The commitments Applicants have offered during the course of this proceeding reflect their recognition that a consolidated KCS/Tex Mex/TFM will have new incentives and abilities to harm competition for rail traffic moving over the Laredo Gateway. However, the potential for harm will remain unchecked if the Board does not require Applicants to abide by their commitments and implement them through enforceable agreements. UP's proposed framework for implementation will accomplish this aim with respect to each of Applicants' important commitments.

1. Keeping the Laredo Gateway Open on "Commercially Reasonable Terms"

Applicants have pledged "to keep the Laredo gateway open on commercially reasonable terms."[138] They have also stated that they are "willing to enter into private discussions with UP or any other party to discuss this commitment and reach a private agreement to ensure that [they] abide[] by this commitment."[139]

---

138 Supplement at 24.

139 Applicants' July 21 Letter (Exhibit 2).

This is a good start. However, Applicants have never explained how they would define "commercially reasonable terms" or how they would ensure that UP and others that depend on the Laredo Gateway have access to such terms. Nor is there any mechanism for enforcing this crucial promise. Thus, even if it imposes Applicants' basic commitment as a condition, the Board cannot be confident that rail carriers other than KCS and its partners will be able to offer competitive rates for U.S.-Mexico movements via Laredo in conjunction with TFM.

Shippers should not have to rely on Applicants' nebulous commitment to keep the Laredo Gateway open. In addition to requiring Applicants to abide by their basic commitment to keep the Laredo Gateway open on commercially reasonable terms, the Board should require them to negotiate in good faith with UP to develop an agreement that ensures that the gateway will remain open on commercially reasonable terms. In *Major Rail Consolidation Procedures*, the Board concluded that "major existing gateways should be kept open in future mergers."[140] The Board required future applicants to "present an effective plan to keep open major existing gateway" and stated that it would "impose conditions on any transaction that [it] approve[s] to ensure that result."[141] Even if this case does not technically involve a "major" transaction, the Laredo Gateway is plainly a "major existing gateway" worthy of protection.[142] Even in minor cases, and even where it has not formally found any anticompetitive effects, the Board has imposed conditions aimed at

---

140 *Major Rail Consolidation Procedures* at 25.

141 *Id.*

142 *See CN/WC* at 20 (noting that "applicants have provided a Service Assurance Plan, usually required for major transactions").

protecting gateways. The Board should require Applicants to negotiate with UP to develop an agreement that effectively preserves competition for traffic moving over the Laredo Gateway. If a suitable agreement could not be reached within a reasonable period of time (perhaps 90 days), the Board should conduct further proceedings to develop and impose an appropriate condition.[143]

There is no doubt that a workable arrangement could be arrived at if both sides are motivated to negotiate constructively. UP believes that there are only two basic requirements of any implementing agreement:

- First and foremost, the agreement would have to include some mechanism that provided UP (and other carriers) with the ability to offer shippers competitively-viable services in conjunction with TFM, including TFM commercial terms (*e.g.*, rates, rate factors, etc.) that would allow (but not guarantee) UP-TFM rates on cross-border shipments to remain competitive.
- Second, it must ensure that KCS/Tex Mex/TFM have sufficient flexibility to adjust their rates to reflect transaction-related efficiencies.

There may be a variety of mechanisms available to achieve these goals. In *Major Rail Consolidation Procedures*, UP recommended that the goal of preserving gateways be implemented by requiring that combining carriers make available at a shipper's request separately challengeable "bottleneck" rates between exclusively-served facilities on their system and the affected gateway.[144] The ability to challenge the "bottleneck" rates would ensure that rates were reasonable, and applicants would have flexibility to adjust their

---

143 *See, e.g., UP/SP*, 1 S.T.B. at 425.

144 UP's Comments on Proposed Merger Rules in Major Rail Consolidation Procedures, STB Ex Parte No. 582 (Nov. 17, 2000) at 13, 32-34 (Exhibit 20).

rates, subject to reasonableness constraints.[145] However, UP's proposal could not be implemented here, where the Board is not in a position to apply its stand-alone cost methodologies to TFM rates in Mexico, and there is no effective maximum rate regulation in Mexico.[146]

One potentially effective approach may be a form of "proportional rate" agreement modeled on the I-5 Proportional Rate Agreement between UP and BNSF approved by the Board in the *UP/SP* merger.[147] As Mr. Gray explains in his Verified Statement, the I-5 Agreement has a proven track record of preserving competition for traffic moving over the Portland Gateway. Gray V.S. at 43.[148] It was adopted to address a situation very similar to that present here: BNSF was acquiring former-UP trackage that gave it a new single-line route between the BNSF-served points in the Pacific Northwest and points in Southern California and the Southwest. SP had long had its own single-line route between Portland and the Southwest, but relied on joint-line cooperation from BNSF to serve points in Washington, Idaho and western Canada. UP was concerned that BNSF would discontinue cooperation with UP once it acquired its own single-line route, thereby depriving BNSF-served shippers of the benefits of competition from a second carrier. The I-5 Agreement remedied this problem by establishing a matrix of rate factors that UP could use to compete head-to-head with BNSF single-line routes (albeit on a joint-line basis with the continued cooperation of BNSF). *Id.* at 42-43. The I-5 Agreement has allowed UP to

148 The I-5 Agreement is Gray Exhibit M.

compete, while simultaneously allowing BNSF to grow its traffic using its new single-line routes. The Agreement has not frozen the status quo. *Id.* at 43.

An agreement modeled on the I-5 Agreement could effectively implement the goal of preserving the Laredo Gateway on commercially reasonable terms. UP believes that an adaptation of that agreement to the Laredo setting would preserve its essential elements, as set forth in Gray Exhibit C, although these and all other issues would be open for negotiation with Applicants.

Such an agreement would meet the first essential requirement of an effective gateway condition – it would create a mechanism for obtaining reasonable TFM rate factors. The rate factors would be reasonable because they would be derived from rates that are actually moving traffic – that is, TFM-Tex Mex-KCS origin-destination rates for similar traffic.

It would also meet the second essential requirement – it would not prevent Applicants from adjusting their rates to reflect merger efficiencies. In *Major Rail Consolidation Procedures* and other cases,[149] the Board properly expressed concern about imposing "rate equalization" conditions reminiscent of those developed in *DT&I Control*[150] and later repudiated in *Traffic Protective Conditions*.[151] "*DT&I* conditions," which formerly were imposed almost automatically and identically in every merger proceeding, essentially required consolidated railroads to freeze in place the relationships with other railroads that

---

149 *See, e.g., CN/IC* at 37.

150 *Detroit, Toledo & Ironton R.R. Control*, 275 I.C.C. 455 (1950).

151 *Rulemaking Concerning Traffic Protective Conditions in Railroad Consolidation Procedures*, 366 I.C.C. 112 (1982).

existed before the merger at every interchange point on their systems, no matter how inefficient.[152] The ICC interpreted the conditions to require "rate equalization." This meant that a consolidated carrier "was generally prohibited from maintaining rates on its new single-line routings resulting from consolidation below the rates on any competing joint-line routes in which it participated."[153]

The *DT&I* conditions were problematic because they eliminated consolidating carriers' incentives to reduce rates for their new single-line routings by prohibiting them from offering origin-to-destination rates below those available for competing joint-line routes. Consolidating carriers could not reduce rates to reflect merger efficiencies without first negotiating with connecting carriers to ensure that equal rates would be offered over all competing origin-to-destination routes.[154] Consolidating carriers had no choice but to keep rates high enough to cover the costs of less efficient-joint line movements in the event that shippers, who would have no monetary incentive to chose the more efficient route, chose a joint-line option.[155] Moreover, *DT&I* conditions were applied at every interchange point without regard to whether the joint-line relationship being preserved were efficient ones at major gateways or inefficient ones at minor, little-used junctions.[156]

---

152 *See id.* at 112. The ICC had imposed similar traffic protective conditions on mergers since the 1920's. In *Detroit, Toledo & Ironton R.R. – Control*, 275 I.C.C. 455, 492 (1950), these conditions were distilled to a set of six standard conditions.

153 *Id.* at 13.

154 *See Traffic Protective Conditions*, 366 I.C.C. at 121-22.

155 *See id.* at 123.

156 *See id.* at 122.

An agreement modeled on the I-5 Agreement would easily avoid these concerns. It would be narrowly tailored to solving the competitive problems UP has identified without interfering with Applicants' ability to become more efficient and compete with UP. As Mr. Gray explains, it would not involve rate equalization. It would provide a process for developing rate factors that Applicants could not manipulate to disable UP competition, but Applicants would remain free to charge shippers using their own single-system routes whatever they wished without seeking UP's concurrence. UP would never learn what rate Applicants were offering for a particular customer or route, as the rate factors would be based on aggregated and averaged data prepared by a third party. Gray V.S. at 45.

Moreover, Applicants would have strong incentives to realize efficiencies from their transaction in order to reduce rates and compete against UP. The TFM rate factor available to UP would always lag behind changes in the rates that Applicants were offering. UP's proposal contemplates only quarterly adjustments to the TFM rate factor, and the adjusted factor would reflect *all* comparable traffic moving in the previous quarter, not just new movements. Thus, Applicants would always be able to offer shippers a lower rate per-ton-mile than is reflected in the TFM rate factor available to UP, if they continued to reduce costs. There could be no stronger incentive for Applicants to improve their efficiency as a means of competing with UP. *Id.* at 45-46.

Furthermore, there would be no danger that Applicants would be deterred from reducing rates to reflect their own single-line efficiencies out of concern that they will end up subsidizing inefficient interchange operations at inefficient gateways. First, the condition would apply only to the Laredo Gateway, which is plainly an efficient gateway.

Second, UP and TFM already have a highly efficient interchange at Laredo. Third, KCS/Tex Mex and TFM do not expect to achieve any additional operational efficiencies at the Laredo Gateway as a result of the transaction. As we discuss above, they already tout their "seamless" service, and they have stated that KCS control of TFM is not expected to result in any operational changes.

UP has considered the remedial options suggested by other recent transactions, but these approaches would not resolve the competitive issues in this case. For example, in *Conrail*, CSX and NS agreed "to keep open all major interchanges with other carriers as long as they are economically efficient."[157] That type of broad, vague commitment may have sufficed where no party had demonstrated the competitive harms associated with closing a particular efficient gateway, but where specific harms have been identified, an effective plan for addressing that harm is warranted, as the Board concluded in *Major Rail Consolidation Procedures.*[158]

In *CN/WC*, the applicants made a similar open gateway pledge.[159] They also entered into an agreement with NIT League to establish commercially reasonable contract through rates for all active gateways on request and to freeze their portion of common carrier through rates for five years.[160] However, as in *Conrail*, the Board never found that a

---

157 *Conrail*, 3 S.T.B. at 255.

158 *Major Rail Consolidation Procedures* at 25.

159 *CN/WC* at 13.

160 *Id.* at 12.

condition was appropriate to address potential competitive harms; it simply required the applicants to abide by their commitments.[161]

A short-term rate freeze or other short-term remedy would not be effective in this case.[162] In situations where carriers have multiple gateway options, a short-term remedy may be sufficient, because it would allow potentially affected carriers to develop new routes before one of those options is closed. That is not the situation here, where Laredo is and will for the foreseeable future remain indispensable to much U.S.-Mexico rail commerce. A short-term solution would merely postpone temporarily the adverse competitive effects of the transaction.

2. Enforceable Commitments Regarding Non-Rate Forms of TFM Cooperation for Movements Via Laredo.

Applicants have pledged "to continue to work with both UP and BNSF" with respect to traffic moving between the U.S. and Mexico.[163] They have committed "to seeing that UP and BNSF are provided the same level of service that they have experienced in the past, and to making improvements on that level of service where possible."[164] They have also committed to "use [KCS's] control of TFM . . . to require TFM to cooperate with both UP and BNSF on pre-blocking cars, improving automated customers pre-clearance procedures, supplying cars for shipments, accommodating run-through train service,

---

161 *Id.* at 13-14.

162 Applicants' vague promise to keep the gateway open on "commercially reasonable terms" is no more effective than CN's longer-term commitment to provide "commercially reasonable contract through rates" (*id.* at 12). It would leave unresolved the question of what was "commercially reasonable."

163 Supplement at 25.

164 Applicants' July 21, 2003 Letter (Exhibit 2)

providing excellent service, and promptly quoting rates."[165] And they have committed "to work with UP and BNSF on development of a methodology for measuring service standards and to develop a method by which such standards could be enforced."[166]

In making these commitments, Applicants have appropriately recognized that continued strong competition for U.S.-Mexico traffic depends on the ability to UP and other railroads to offer their customers competitive service as well as competitive rates. UP's competitive concerns relating to TFM service would be met if Applicants abided by these commitments. However, until the parties develop a methodology for measuring service standards and develop a method by which such standards could be enforced, neither the parties nor the Board will be able to assess whether Applicants are living up to those commitments.

In addition to requiring Applicants to abide by their various commitments to work with UP to maintain and improve current service levels, the Board should require them to negotiate in good faith to develop a methodology for measuring service standards and to develop a method by which such standards could be enforced. Like the proposed Gateway Condition, this Service Condition would implement Applicants' various service commitments without interfering with any potential benefits arising from KCS control of Tex Mex and TFM. Applicants have repeatedly asserted that they will have "every

---

165 *Id.*

166 *Id.*

incentive to preserve other carriers' access to and efficient operation with TFM."[167] Thus, there is no conceivable harm in holding Applicants to their service commitments.

Moreover, Applicants' efforts to achieve efficiencies would not be hindered by a requirement that they agree upon methodologies for measuring and enforcing service standards. As Mr. Gray explains, UP and BNSF developed effective methodologies for measuring service performance in the context of the *UP/SP* merger. Gray V.S. at 49. The Board has also required post-approval operational monitoring in other recent transactions.[168] The parties should be able to use these examples as the basis for developing methodologies suitable to this transaction. The Board would thus have a firm basis on which to act in the unlikely event that the parties were unable to reach a negotiated agreement within a reasonable period of time. Again, if a suitable agreement could not be reached within a reasonable period of time (perhaps 90 days), the Board should conduct further proceedings to develop and impose an appropriate condition.[169]

3. The Laredo Bridge

Finally, the Board should impose a Bridge Condition as a condition in this case. Applicants have represented that they would accept a condition holding them to their

---

167 Supplement at 25.

168 *See Conrail* at 55; *CN/WC* at 19-22. In *Major Rail Consolidation Procedures*, the Board imposed new requirements that applicants provide service benchmarks and indicated that it will conduct significant post-approval operational monitoring. *Major Rail Consolidation Procedures* at 40, 62-65; 49 C.F.R. §§ 1180.1(h), 1180.10(k).

169 Again, this comports with the Board's standard practice. *See* note 131, *supra*.

commitments respecting the Laredo Bridge, including a requirement to negotiate a new bridge operating protocol.[170]

As Mr. Barkley explains, UP believes that a new Bridge protocol should accomplish three key objectives, and UP urges the Board to provide guidance to the parties that would ensure that their implementing agreement meets these criteria:

- First, it should establish a joint operations center that would control operations on the Laredo Bridge and the trackage approaching the Bridge. Establishing such a center would give UP a formal role in decisions about Bridge operations and priority for movements over the Bridge. Joint dispatching centers have proved to be a highly successful way to administer trackage used by more than one railroad, ensuring neutral treatment of the trains of each railroad. The joint dispatching operations of UP and BNSF for the Houston area and other congested terminals are prime examples of how well such centers have worked. Barkley V.S. at 15-16.[171]

---

[170] *See* Applicants July 21 Letter (Exhibit 2). Applicants had previously suggested that conditions pertaining to the Laredo Bridge were not warranted because operations were governed by pre-existing agreements. Supplement at 26-27. Applicants, however, ignore the effect that KCS control of Tex Mex would have on Tex Mex's incentives to interpret and apply those agreements in a manner that protected competition via the Laredo Bridge. There is precedent supporting the imposition of conditions to address potential effects caused by changes in carriers' incentives with respect to the implementation of pre-existing agreements. *See Union Pacific Corp. – Control – Chicago & North Western Transportation Co.*, Finance Docket No. 32133 (ICC served Mar. 7, 1995) at 90 (imposing condition precluding CNW from withholding consent to potential assignments by Soo Line of its rights to operate over the Polo Line (between Kansas City and Polo, Missouri) under a longstanding trackage rights/ paired track agreement because "common control will broaden the circumstances in which CNW will have reason to exercise its veto power").

[171] The Board has recognized these benefits. *See UP/SP Houston/Gulf Coast Oversight*, Decision No. 10 (STB served Dec. 21, 1998) at 11, 25-26.

In view of the extensive efforts the three railroads have already made to coordinate their operations at the Bridge, establishment of a joint command center should not be a burden for TFM and Tex Mex. In fact, such a condition is likely to yield greater efficiency in Bridge operations and thus more capacity for all three railroads.

- Second, the new protocols should require the railroads to manage Bridge operations in a manner that will achieve non-discriminatory and efficient operation of the Bridge. Such a provision would enable the railroads to invoke a formal obligation ensuring that each continues to participate in practices that maximize the total capacity and operating efficiency of the Bridge and that do not favor any one user.

- Third, the new protocols should establish a methodology for allocating Bridge capacity that is proportionate to each railroad's share of traffic at the Laredo crossing at any given time. As explained above, UP is concerned that the NAFTA Rail carriers will attempt to impose a 50-50 allocation of priority slots for Bridge crossings. Such a one-for-one protocol would guarantee superior treatment for the carrier with less traffic – and in substance impose an anticompetitive market allocation – since it would receive half of the available slots, while the carrier with the majority of the traffic would receive all of the lowest priority slots. As a result, when there are more trains waiting than can be accommodated during a window, the carrier that enjoys greater market demand for its services would always be the one that is unable to cross all of its trains during that window. The result would be to diminish service levels for the railroad that currently has the majority of the traffic, in this case UP. UP recognizes, of course, that this principle would not create any entitlement to any particular share of Bridge capacity: each party's share would fluctuate with its volume of traffic. If Tex Mex-TFM crossings came to exceed those of UP

as a result of legitimate competitive forces, UP would accept that Tex Mex should be entitled to more than half of the available slots. Barkley V.S. at 16-18.

C. The Proposed Conditions Are Consistent With the Board's Policy Towards End-to-End Transactions

Although Applicants have asserted that it would be inappropriate to impose conditions on their end-to-end transaction, UP's requests for conditions are fully in accord with Board policy for at least three reasons.

First, UP has demonstrated that Applicants' transaction is likely to cause a substantial lessening of competition. UP believes that end-to-end consolidations typically present much less risk of harm than parallel consolidations, but they can nonetheless give rise to anticompetitive effects in certain circumstances. In this case, Applicants will have the ability and the incentives to increase the rates shippers pay or reduce the quality of service they receive in order to generate more revenues for KCS/Tex Mex/TFM. The evidence shows that Applicants' control of the Laredo Gateway and their ability to alter the existing relationship between U.S. carriers and TFM will create opportunities for KCS/Tex Mex/TFM to undermine the competitive process and thereby harm shippers. Hausman V.S. at 9-18. The Board has made it clear that in such circumstances it will exercise its broad conditioning authority in order to reduce the risks to competition.

Second, Board policy recognizes the potential for competitive harm that end-to-end transactions create at major gateways and affirmatively seeks to prevent those harms. In most end-to-end transactions in the past, concerns about closing gateways were unwarranted. In most instances, the transaction eliminated only one of many potential connections at a gateway, and it did not affect the many alternative combinations of gateways and connections that were equally able to compete for the same business.

However, as the Board and UP have recognized, as more and more consolidation have occurred, situations now exist in which the commercial closure of a gateway would pose genuine competitive concern. The risk of closure and the potential for anticompetitive harm are as great as in any major transaction, because the transaction involves the only connection on one side of the gateway, and alternative U.S.-Mexico gateways are not adequate substitutes for the Laredo Gateway.[172] Thus, the Board's policy as expressed in *Major Rail Consolidation Procedures* not only recognizes that end-to-end mergers may present competitive concerns, it would require a gateway-preservation condition in this case.

Third, Applicants have made significant, on-the-record commitments not to engage in discriminatory conduct with respect to rates and service for traffic moving over the Laredo Gateway. As we have shown, the Board's uniform practice has been to impose such commitments as conditions. *See* page 89, above. The Board's policy of holding applicants to their commitments is the same for major and minor transactions, whether they are largely parallel or largely end-to-end.

Applicants have tried to suggest that those conditions would be vastly overreaching. They have implied that UP is seeking to equalize rates for movements over the Laredo Gateway, require special treatment for UP's shipments within Mexico, and freeze the competitive conditions at Laredo. However, as UP has always made clear, it wants none of that.[173] UP does not wish to constrain any efforts by Applicants to provide

---

172 *See* Gray V.S. at 12-20.

173 For example, in response to a letter sent by Applicants seeking clarification of UP's position regarding appropriate relief in this case, UP explained in detail why its proposals for implementing Applicants' commitments would allow Applicants to take advantage of

(footnote continued ...)

shippers with more efficient competitive alternatives. Rather, UP is seeking concrete and enforceable conditions that will prevent Applicants from exercising their new, post-consolidation abilities and incentives act anticompetitively to impede effective competition by UP for movements between the U.S. and Mexico. UP is asking for nothing more than a binding set of requirements holding Applicants to the commitments they have already made on the record in this proceeding.[174] Board policy is fully in accord with that request.

V. CONCLUSION

This case will be the Board's only opportunity to ensure the preservation of rail competition for traffic moving to and from the United States over the most important U.S.-Mexico Gateway. Control of Tex Mex is the linchpin in a transaction that will give KCS control of both the Laredo Gateway and the only Mexican railroad that serves that gateway, which until now has cooperated with both U.S. railroads at Laredo on an equitable basis.

The Board plainly has jurisdiction to address competition for rail traffic moving over the Laredo Gateway in this case. In *UP/SP*, the Board imposed remedies for the sole purpose of preserving competition for this traffic. Applicants have asserted that the Board's jurisdiction in this case is confined because they severed Tex Mex from TFM and placed shares in a voting trust before filing their Application. But that maneuver does not

---

(... footnote continued from previous page)
their improved efficiencies, if any, in competing for traffic moving via Laredo. *See* Letter from David L. Meyer to William A. Mullins, dated July 30, 2003 (Exhibit 21).

174 *See id.*

affect the Board's responsibility to consider the impacts of the broader transaction on competition for traffic within the United States

The likely anticompetitive impacts are clear. Unless the Board conditions its approval, this transaction is likely to result in a the substantial lessening of competition for rail service between the United States and Mexico. UP and other railroads depend on Tex Mex and TFM for physical access to the Laredo Bridge and on TFM for commercial access to points in Mexico. However, as UP's witnesses explain, once NAFTA Rail headquarters in Kansas City, Missouri, gains control of both Tex Mex and TFM., it will have incentives and opportunities to disrupt other U.S. railroads' ability to compete for cross-border traffic and thus reduce competition for that traffic within the United States. U.S. shippers will face higher rates and lower service quality, because most of them have no efficient alternative to rail service over the Laredo Gateway.

Applicants have recognized the anticompetitive potential of their transaction. They offer three commitments designed to forestall concerns. They also offer to negotiate agreements to implement their commitments. UP believes that these commitments, if made concrete and specific through negotiated agreements, would adequately address the competitive problems this transaction presents. The conditions would not grant UP special benefits or interfere with Applicants' efforts to obtain whatever efficiencies they can from their transaction. They are fully in accord with the Board's policies of preserving major gateways and holding applicants to their on-the-record representations in control cases.

UP's request for conditions is straightforward: The Board should require Applicants to abide by their commitments, including their promises to negotiate agreements that implement these commitments. Only the Board can make those commitments

enforceable. The Board should direct the Applicants to negotiate appropriate agreements. If those negotiations are not successful, the Board must be prepared to impose reasonable terms that make Applicants' commitments meaningful and enforceable.

Union Pacific Corp., Union Pacific RR. Co. and Missouri Pacific RR Co. -- Control and Merger -- Southern Pacific Rail Corp., Southern Pacific Trans. Co., St. Louis Southwestern Rw. Co., SPCSL Corp. and The Denver and Rio Grande Western Corp.	Finance Docket No. 32760

BRIEF OF THE TEXAS MEXICAN RAILWAY COMPANY

INTRODUCTION AND SUMMARY

The Texas Mexican Railway ("Tex Mex"), chartered in 1875, is one of the oldest railroad companies in the United States. It owns and operates 157 miles of railroad between Corpus Christi, Texas on the Gulf of Mexico and Laredo, Texas on the Rio Grande. Tex Mex and UP are the two U.S. railroads serving Laredo. Laredo is the main rail gateway between the United States and Mexico; in 1994 Laredo handled 55% of the total tonnage moving by rail between the two countries.

Tex Mex connects with SP at Corpus Christi. Tex Mex and SP together provide the only competition to UP for traffic moving through Laredo. Although UP carries most of that traffic, the competition from Tex Mex and SP has been very effective in keeping UP's rates and service reasonable.

Industries, Inc. ("KCSI"), which controls KCS, to bid on rail lines or concessions (e.g., trackage rights) in Mexico that will be sold later this year as part of the privatization of Mexico's rail system, and to operate any lines or concessions acquired. In November, 1995 KCSI also purchased 49 percent of the stock of Mexrail from TMM.

2. Laredo and the Other U.S.-Mexican Rail Gateways

As noted, Tex Mex serves Laredo, where it interchanges traffic with FNM. The only other U.S. railroad serving Laredo is UP, which serves it via a line running south from San Antonio.

Laredo is the principal rail gateway between the United States and Mexico. In 1994, 55 percent of the total tonnage moving by rail through the eight U.S.-Mexico gateways moved through Laredo.[4/] This fact is due to its superior infrastructure and its location on the shortest route between many U.S. and Mexican origins and destinations. TM-34, Ellebracht RVS at 5.

Significant volumes of grain and other agricultural products, minerals, woodpulp, paper products, automobiles and automobile parts, and other metals flow through the Laredo gateway. Ellebracht VS, TM-23 at 91. Much of this is bulk traffic that moves long distances and for which truck transport is not a viable alternative. Id. at 92.

4/ The other seven gateways are: Calexico, Naco, Nogales, El Paso, Presidio, Eagle Pass and Brownsville.

Although UP traditionally has handled most of the freight that moves over the Laredo gateway, the SP-Tex Mex route has accounted for a substantial amount of that traffic and offers "customers an alternative . . . of significant value." Id. at 67-68. In fact, for shipments originating on other railroads not including UP, the SP-Tex Mex route has been the overwhelming choice of those railroads and shippers for traffic moving to Laredo. Id. at 66. As we discuss more fully in the Argument, the Tex Mex-SP route has provided the only competition to UP for traffic through the Laredo gateway and the principal competition for UP for U.S.-Mexican traffic in general.

Although Laredo is the preferred rail gateway to Mexico and has a number of advantages, other gateways also handle a substantial amount of U.S.-Mexican rail traffic, and, as we will discuss further in the Argument, serve as alternative routes for many movements. The significant gateways for rail traffic to and from the industrial centers of Mexico are, in order of volume, Laredo, El Paso, Brownsville and Eagle Pass.[5/] UP currently serves Laredo, El Paso and Brownsville. SP serves Laredo (with Tex Mex), El Paso and Eagle Pass. BNSF serves El Paso; since the

---

5/ Presidio, the fifth Texas gateway, is served by BNSF and the South Orient Railroad. The three non-Texas gateways are all served by SP and will be served by UPSP following the merger. The BNSF Settlement does not grant BNSF access to any non-Texas gateways.

BNSF merger, it also serves Eagle Pass via haulage rights over SP's line and will obtain trackage rights to Eagle Pass and Brownsville under the BNSF settlement. In 1994, UP and SP together accounted for percent of the rail tonnage between the U.S. and Mexico via all gateways. Ellebracht VS, TM-23 at 77, as corrected by TM-28, errata filed April 12, 1996.[6/]

ARGUMENT

I. TEX MEX IS A VITAL LINK IN MAINTAINING COMPETITIVE RAIL SERVICE BETWEEN THE UNITED STATES AND MEXICO.

As noted in the Statement of facts, the SP-Tex Mex route provides the only competition today to UP for rail traffic moving between the United States and Mexico via Laredo and provides the principal competition to UP for U.S.-Mexican traffic moving via all gateways. That competition is substantial and extremely important in keeping the rates for that traffic down and the quality of service up.

As Mr. Ellebracht discusses, although UP has carried most of the freight over the Laredo gateway, for traffic where the shipper at origin has a choice of routings "the SP-Tex Mex route has a respectable market share." Ellebracht VS, TM-23 at 67. Indeed, his analysis of traffic data shows that "neutral origins

---

6/ This percentage figure includes traffic that SP moved to and from Mexico with Tex Mex but does not include traffic that Tex Mex moved to and from Mexico without SP -- i.e., Mexican traffic to or from Tex Mex's local customers, like Corpus Christi Grain Company. This "Tex Mex-only" traffic accounted for percent of the total U.S.-Mexican rail tonnage in 1994 and percent of the U.S.-Mexican rail tonnage moving through Laredo.

Settlement as a competitive remedy reflects Applicants' recognition of that fact. Although the Mexican rail system is currently state owned, Mr. Ellebracht explains that, for many reasons, rates for the Mexican portion of international moves are, in the vast majority of cases, established without regard to the rates established for the U.S. portion of the moves. Rates for most Mexican moves are established according to a distance-based formula, and through international rates are rare. Ellebracht VS, TM-23 at 78-79. Accordingly, he concludes, "the vigorous competition that now exists between U.S. railroads for that traffic directly benefits the shippers, and any reduction in that competition will harm them." Id. at 79. Applicants have not disputed this.

In this regard, it is also important to stress that ensuring the most vigorous competition for the transportation of goods between the United States and Mexico is clearly consistent with the national policies of both nations as reflected in the North American Free Trade Agreement ("NAFTA"). The central purpose of NAFTA is to promote trade between the two countries. Strong competition among transportation providers is a tremendous stimulus to trade, just as lack of competition suppresses it.[8/]

8/ A number of the statements and letters submitted in support of Tex Mex's responsive application have noted that NAFTA provides a great potential for expanding their businesses which they belief would be seriously threatened by the reduction in the number of railroads serving the U.S.-Mexico market. See, e.g., Feldman VS at 1, TM-23 Ex. 24.

For that reason, NAFTA contains provisions specifically designed to increase competition in cross border transportation services.[9/] As former Secretary of Transportation Andrew Card stated, the purpose of these provisions is to "ensure that the increased trade resulting from the agreement can be carried across the border efficiently and competitively."[10/] The same policy, Tex Mex submits, requires this Board to give heightened scrutiny to transactions within its jurisdiction that present a danger of diminishing competition for transportation of U.S.-Mexican traffic. Cf. McAllen, TX Commercial Zone -- Passenger Operations, Ex Parte No. MC-37 (Sub No. 43) (served Oct. 24, 1995) (ICC should exercise its discretion consistently with the policies of NAFTA).[11/]

9/ Section 1202 of NAFTA and Annex II- Mexico. While most of these pertain to motor carriers, according to the Department of Transportation NAFTA also "opens the Mexican market for U.S. railroads and intermodal companies" and

> "affirms the market-oriented reforms already undertaken by the Mexican government which allow U.S. railroads and intermodal companies to:
> -- Market their services directly to customers;
> -- Carry cargoes directly to Mexican destinations using their own equipment;
> -- Own and operate terminals and other facilities; and
> -- Finance the building of tracks and other rail infrastructure."

DOT News Release 71-92, "Transportation Facts," p. 2 (August 12, 1992).

10/ Remarks of Secretary Card as reported in DOT Release 71-92, issued August 12, 1992.

11/ As we discuss in Part V, below, granting the rights sought by Tex Mex will provide a strong competitive alternative to a merged UPSP and to BNSF for U.S.-Mexican traffic by linking Tex Mex with the KCS system and with KCS's eastern railroad

$19.92 million in the absence of the UP/SP merger. With the UP/SP merger and the BNSF Settlement, he concludes that Tex Mex's revenues would be $13.24 million, or 34 percent less. Ellebracht VS, TM-23 at 98-106.

Based on Mr. Ellebracht's traffic and revenue projections, Tex Mex witness Patrick Krick conducted a financial analysis of the impact of the merger, both as conditioned by the BNSF Settlement and as conditioned by the BNSF Settlement and the rights Tex Mex requests, on Tex Mex's net income. Mr. Krick's analysis shows that a post-merger Tex Mex would immediately go from profitability to unacceptably heavy losses, and he quite simply concludes that Tex Mex "would not survive the UP/SP merger if it is not conditioned by the rights [Tex Mex] requests in its responsive application." Krick VS, TM-23 at 190. On the other hand, Mr. Krick concludes that if Tex Mex is granted the trackage rights it seeks, Tex Mex would remain a viable railroad. Id. at 193.

If Tex Mex did not survive, many of its shippers would lose essential rail service for which they have no feasible transportation alternatives. As described in the Statement of Facts, Tex Mex local shippers like Barr Iron and Metal Co., Corpus Christi Grain Co., and Global Grain Co. have shown that they depend on Tex Mex to transport their products to their markets and that neither trucks nor other railroads are practical alternatives. For example, to ship grain from Corpus Christi to Mexico City or other points in central Mexico, trucks are

obviously not feasible and any rail routing other than Tex Mex would have to go through San Antonio, at least doubling the distance to Laredo and drastically increasing the costs. Furthermore, UP and SP have shown no interest in providing reasonable or reliable service to those shippers. See statements of William E. Bailey and Abel Gonzalez, Jr., TM-23, Ex. 24.

Applicants' chief response to Tex Mex's "loss of essential services" showing is to dispute Mr. Ellebracht's diversion study and claim that Tex Mex will be healthier, rather than gravely damaged, by the merger and Applicants' settlement with BNSF. Applicants do not address or refute Mr. Krick's showing that Tex Mex cannot sustain operations with the loss of traffic that Mr. Ellebracht projects that the merger will cause to Tex Mex.

The criticisms of Mr. Ellebracht's traffic study by Applicants' traffic witness, Richard Peterson, are completely unfounded. First, as Mr. Ellebracht shows in his rebuttal statement, Mr. Peterson's very rosy forecasts about the additional traffic BNSF will supposedly bring to Tex Mex at Robstown are highly improbable on their face. Since Tex Mex already gets 73% of the traffic originated by BNSF destined for Laredo and 99% of the Laredo-bound traffic originated by SP, even if BNSF post merger funneled <u>all</u> of its remaining traffic to Tex Mex, that would not nearly make up for the SP traffic Tex Mex is almost certain to lose. TM-34, Ellebracht RVS at 26-27. Furthermore, it is highly unlikely that BNSF will funnel all of its remaining traffic to Tex Mex after the merger. Indeed, since

the BNSF Settlement will give BNSF trackage rights to Eagle Pass in place of BNSF's current haulage rights and since Eagle Pass is a shorter route for many BNSF moves from western origins than a BN-Tex Mex-Laredo route, it is quite likely that Tex Mex will lose much of the traffic it could expect to receive from BNSF origins in the absence of the merger. Id. at 27.

Mr. Peterson also disparages some of the adjustments Mr. Ellebracht made to Tex Mex's 1994 traffic based on the BNSF merger and other developments since 1994 as "inventing" traffic. Such adjustments, however, are inherent in the methodology used by both Mr. Peterson and Mr. Ellebracht and are common in traffic studies. Mr. Ellebracht's adjustments are no more "invention" than the many adjustments Mr. Peterson made in his traffic study, such as his projections of additional traffic for UP and SP as a result of the UP/CNW and BNSF mergers. Furthermore, Mr. Ellebracht explains in detail why the assailed adjustments are "well founded and entirely reasonable." Id. at 28-29.

In contrast, some of the major assumptions Mr. Peterson made about Tex Mex's post merger traffic are patently unrealistic. Of particular note is Mr. Peterson's assumption that half of the traffic from SP origins that are now routed SP-Tex Mex will continue to be routed to Tex Mex after the merger. This is fanciful. As Mr. Ellebracht noted in his verified statement: "Today there is a tiny trickle of UP-Tex Mex traffic through Robstown to Laredo for which there is a competing UP direct route through San Antonio to Laredo." Ellebracht VS, TM-23 at 105-106.

possible, and transportation between the United States and Mexico would be dominated entirely by a merged UPSP.

The trackage rights sought by Tex Mex will also ensure that Tex Mex and its shippers will not be completely dependent on a connection with BNSF which, for the reasons discussed, is extremely doubtful. As shown by Mr. Ellebracht and Mr. Krick, these rights are likely to generate sufficient traffic and revenues to permit Tex Mex to remain viable and thus to continue providing essential rail services to its shippers.

CONCLUSION

The Board should grant the responsive application and the application for terminal trackage rights of the Texas Mexican Railway Company in this proceeding.

RE: Your Letter of June 30 Regarding Kansas City Southern's Application For Authority to Control The Texas Mexican Railway Company, STB Finance Docket No. 34342

Dear David:

As you know, Kansas City Southern ("KCS") and Union Pacific Railroad Company ("UP") are currently in private discussions regarding UP's concerns over KCS's plans to acquire control of The Texas Mexican Railway Company ("Tex Mex") and TFM, S.A. de C.V. ("TFM"), along with other commercial issues impacting the two companies. You also know that KCS and UP have a confidentiality agreement governing those discussions. Given that background, your July 16 letter asking KCS to respond to your June 30th letter, both of which you served on all parties of record, seems more of an effort by UP to gain some sort of perceived leverage in those negotiations rather than an honest attempt to resolve UP's concerns over the two transactions. Bringing these issues into the public arena, while at the same time negotiating in private, leads one to question UP's motives and its willingness to truly negotiate in good faith.

KCS realizes that there may be other parties, in particular shippers and shipper associations, who would like some clarification of KCS's commitments made in the Application and the Supplement. KCS is talking to these parties. If it is true as you state in your letter that there are other parties unbeknownst to KCS who share UP's concerns, KCS, as always, remains willing to discuss those concerns with these parties in private. Nonetheless, if there are parties who need further clarification on the public record, KCS offers the following:

Laredo Bridge

KCS of course expects that Tex Mex and TFM will continue to cooperate with UP regarding the utilization of the International Bridge across the Rio Grande River at Laredo. As you know, operations over the International Bridge are governed by a series of

agreements dating back to 1951. KCS will honor all existing agreements governing operations over the bridge. In addition, KCS is willing to work cooperatively with UP toward efficient utilization of the bridge and will work in good faith with UP to develop dispatching protocols acceptable to both parties. KCS is confident that it can reach agreement with UP over such dispatching protocols as part of its private discussions with UP. Nonetheless, KCS would be willing to make its commitment to negotiate in good faith new dispatching protocols a condition of its common control of Tex Mex.

Working With UP and BNSF

As KCS has said publicly on many occasions, regardless of whether KCS obtains additional ownership in TFM, it will continue to be in TFM's best interest to work cooperatively with UP and BNSF. KCS remains committed to seeing that UP and BNSF are provided the same level of service they have experienced in the past, and to making improvements on that level of service where possible. KCS further commits that it will use its control of TFM (assuming this transaction is consummated) to require TFM to cooperate with both UP and BNSF on pre-blocking rail cars, improving automated customs pre-clearance procedures, supplying cars for shipments, accommodating run-through train service, providing excellent service, and promptly quoting rates. KCS is also willing to work with UP and BNSF on development of a methodology for measuring service standards and to develop a method by which such standards could be enforced.

Keeping the Laredo Gateway Open

KCS believes that all affected parties are interested in keeping the Laredo Gateway open on commercially reasonable terms. KCS is willing to enter into private discussions with UP or any other party to discuss this commitment and reach a private agreement to ensure that KCS abides by this commitment.

Existing Tex Mex and TFM Agreements

In conjunction with this commitment, KCS will abide by all existing agreements between TFM and Tex Mex and any other carrier, including any agreements providing for rates and divisions at the Laredo gateway, until the termination date set forth in those agreements. KCS, however, is not willing to simply renew or indefinitely extend all agreements under the old terms without undertaking a good faith negotiation. KCS would not expect UP and BNSF to do so either, and does not believe that either did so in their most recent mergers. KCS is not willing to agree to an anticompetitive "freezing" of existing rates or divisions.

General Issues

Depending on the exact form any final agreement would take with respect to settlement of the foregoing issues, KCS expects to be able to agree to the imposition of its commitments on the Laredo Bridge and on working with UP and BNSF (particularly on operational monitoring) as conditions upon the STB's order approving the KCS-Tex Mex

transaction. However, because the Board has no jurisdiction to impose conditions on TFM, any agreements relating to TFM would have to remain a matter of contract between the parties.

UP's Commitments Regarding the Trackage Rights Lines

As you know, over the past three years, UP and Tex Mex officers have been discussing the congestion problems on UP's lines over which Tex Mex operates under trackage rights, and when UP was going to take promised steps to alleviate those problems. UP made commitments in its 1998 Infrastructure Plan, as well as contractual commitments, to maintain adequate infrastructure to prevent deterioration of service over the trackage rights lines. KCS and others do not believe UP has lived up to these commitments. So in response to your questions, KCS asks when UP is going to meet the contractual and public commitments regarding maintaining the infrastructure and transit times on the UP lines used by Tex Mex, particularly the Brownsville Subdivision?

Sincerely,

William A. Mullins

KCS and TMM Announce Agreements Placing TFM, Texas Mexican Railway and The Kansas City Southern Railway Under Common Control

Kansas City Southern (KCS) (NYSE: KSU) and Grupo TMM, S.A. (Grupo TMM) (NYSE: TMM) today announced a series of agreements that have been approved by their respective boards of directors, that will, following shareholder and regulatory approval, place The Kansas City Southern Railway Company (KCSR), the Texas Mexican Railway Company(Tex-Mex), and TFM, S.A., de C.V. (TFM) under the common control of a single transportation holding company, NAFTA Rail, to be headquartered in Kansas City, Missouri. As part of the transaction, KCS will change its name to NAFTA Rail, which will trade on the New York Stock Exchange (NYSE).

The common control of The Kansas City Southern Railway Company and the Texas Mexican Railway under NAFTA Rail, would require approval of the Surface Transportation Board in the United States. Additionally, the acquisition of Grupo TFM shares by NAFTA Rail would require the approval of the Competition Commission and the Foreign Investment Commission in Mexico.

"Common control of these three railroads, which are already physically linked in an end-to-end configuration, will enhance competition and give shippers in the NAFTA trade corridor a strong transportation alternative as they make their decisions to move goods between the United States, Mexico and Canada," said Michael R. Haverty, chairman, president, and chief executive officer of KCS. "KCS already owns KCSR and has significant investments in Tex-Mex and TFM, so these agreements are just a natural business progression offering KCS and Grupo TMM shareholders greater value through the operating efficiencies that will come from common ownership and control."

Jose Serrano, chairman and chief executive officer of Grupo TMM, said, "These transactions will be pro-competitive and allow Mexico to strengthen its position in the North American economy. NAFTA Rail will provide a viable rail alternative, while still preserving existing competitive gateways at the border between Mexico and the United States."

"I am very pleased that we have been able to complete these agreements and that they have been approved by the boards of both companies. We believe that the shareholders of both companies will benefit from bringing these three companies under common ownership," said Serrano. "Both NAFTA Rail and Grupo TMM will continue to work closely together in the future and have agreed to enter into a marketing agreement to further our shared goals of providing end-to-end transportation for our customers."

Mr. Haverty will serve as chairman, president, and chief executive officer of NAFTA Rail. Mr. Serrano will serve as vice chairman of NAFTA Rail and chairman of TFM, while also joining the NAFTA Rail

-more-

board of directors along with Javier Segovia, president of Grupo TMM. The remainder of the 10-person board will be made up of existing KCS directors. Mario Mohar will remain as chief executive officer of TFM.

Under the Grupo TFM acquisition agreement, TMM Mulitimodal, a subsidiary of Grupo TMM, will receive 18 million shares of NAFTA Rail representing approximately 22 percent (20% voting, 2% subject to voting restrictions) of the company, $200 million in cash and a potential incentive payment of between $100 million and $180 million based on the resolution of certain future contingencies.

Grupo TFM owns 80 percent of the common stock of TFM and all the shares entitled to full voting rights. The Mexican Government owns the remaining 20% of TFM. TFM holds the concession to operate Mexico's Northeast Rail Lines for 50 years ending June 2047, and has the option to extend the concession for an additional 50 years. The TFM rail network consists of more than 2,600 miles of main track.

KCSR will remain headquartered in Kansas City, Missouri; Tex-Mex in Laredo, Texas; and TFM in Mexico City.

KCS is a transportation holding company that has railroad investments in the United States, Mexico, and Panama. Its primary holding is The Kansas City Southern Railway Company. Headquartered in Kansas City, Missouri, KCS serves customers in the central and south central regions of the U.S. KCS's rail holdings and investments are primary components of a NAFTA Railway system that links the commercial and industrial centers of the United States, Canada, and Mexico

Headquartered in Mexico City, Grupo TMM is the premier Mexican multimodal transportation company and logistics provider. Through its branch offices and network of subsidiary companies, Grupo TMM provides a dynamic combination of ocean and land transportation services within Mexico. Grupo TMM also has the controlling interest in TFM, which operates Mexico's Northeast Rail Lines and carries over 40 percent of the country's rail cargo.

In connection with the proposed transaction, Kansas City Southern will file relevant materials with the Securities and Exchange Commission ("SEC"), including a proxy statement soliciting shareholder approval of the transaction. Shareholders are urged to read the proxy statement, as well as any amendments and supplements to the proxy statement (if and when they become available) and any other relevant documents filed with the SEC, because they will contain important information about the transaction. Shareholders may obtain the proxy statement and any other relevant documents free of charge at the SEC's Internet web site at www.sec.gov. The proxy statement and any other relevant documents may also be obtained free of charge by contacting the office of the Corporate Secretary at Kansas City Southern's principal executive offices at (816) 983-1538. Written requests should be mailed to P.O. Box 219335, Kansas City, Missouri 64121-9335 (or if by federal express or other form of express delivery to 427 West 12th Street, Kansas City, Missouri 64105).

Media/Analysts Conference Call Notice:
There will be a 10:00 A.M. Central Daylight Time (11:00 A.M. Eastern Daylight Time) conference call today, April 21st, discussing the proposed common control agreement hosted by Michael Haverty, Jose Serrano, and Ronald Russ, KCS executive vice president and chief financial officer. The call will be to discuss the NAFTA Rail transaction. Questions relating to TMM and its financial statement will be handled separately by TMM. A discussion of the transaction is available at the KCS website at www.kcsi.com. Those interested in participating are invited to call 1-800/955-1795 (U.S. and Canada) or 1-706/643-0096 or 001-800-514-7616 (International).

Press Release
April 21, 2003

Participants should call at least five minutes before the conference call begins. A replay of the discussion will be available for one week after the conference call. Replay numbers are 1-800/642-1687 (U.S. & Canada) or 1-706/645-9291 (International).

Included in this press release are certain forward-looking statements within the meaning of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended. Such forward-looking statements are based on the beliefs of the Companies' managements as well as on assumptions made. Actual results could differ materially from those included in such forward-looking statements. Readers are cautioned that all forward-looking statements involve risks and uncertainty. The following factors could cause actual results to differ materially from such forward-looking statements: global, US and Mexican economic and social conditions; the effect of the North American Free Trade Agreement on the level of US-Mexico trade; the condition of the world shipping market; the success of the Companies' investment in TFM, S.A. de C.V. and other new business risks. These risk factors and additional information are included in Grupo TMM's and KCS' reports on file with the Securities and Exchange Commission.

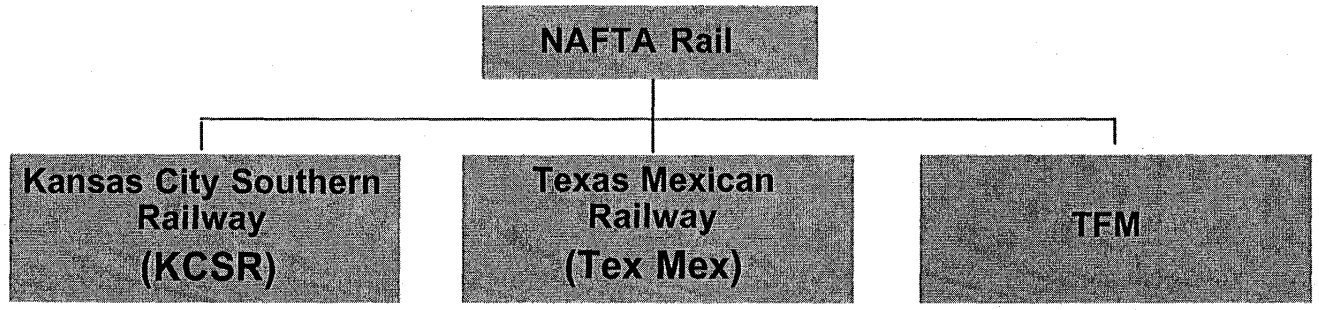
NAFTA Rail

transaction summary



NAFTA
Rail

KCSR, Tex Mex, TFM
Operating Under Common Control

NAFTA Rail

Common Control

- **NAFTA Rail will be a U.S. corporation, headquartered in Kansas City, with three separate railroad companies that connect end to end and operate under integrated management**
  - **KCS and Tex Mex are U.S. corporations**
  - **TFM is a Mexican corporation**
- **Surface Transportation Board approval of the common control of KCSR and Tex Mex is required**
- **Mexico's Foreign Investment Commission will review the foreign control of TFM**
- **Mexico's Competition Commission will review the transaction for competitive effects**

NAFTA Rail

Strategic Rationale for NAFTA Rail

- Enhance shareholder value by achieving consolidation of rapidly expanding TFM affiliate in Mexico, with U.S. ownership
- Accretive from day one
- Improve Tex Mex infrastructure and operations to better link the Kansas City Southern Railway with TFM
- Strengthen KCSR/Tex Mex/TFM as the "NAFTA Railroad" in North America
- Increase EPS contribution from faster-growing rail operations in Mexico
- Lengthen hauls through an "across-the-border" view

NAFTA Rail

Enhanced Competition

- **Three railroad companies connecting end to end to end**
  - Maintain the unique culture of each company
  - Operating under integrated management
  - Only *enhances* competition–no reduction of competitors in any market
    - No "2 to 1 points"
    - No overlaps
- **Common operating platform, MCS: planned implementation on Tex Mex in September 2003, and on TFM in Q1 2004**
  - MCS now operating smoothly at KCSR
  - Common customer access
  - Pro-active service management
- **Tightly managed service across U.S.-Mexico border**
- **Seamless service**
  - Southern Mexico to the heart of the U.S.
  - Integrated operating system
  - Integrated customer service

NAFTA Rail

Enhanced Competition (continued)

- **Combined resources lead to enhanced product offerings**
  - 965 locomotives
  - 25,206 freight cars
  - 140 transload/reload locations
  - 14 intermodal ramps
  - 13 ports
  - 181 interchange points with other railroads

NAFTA Rail

NAFTA RAIL Governance and Management

- **Board of Directors, initially ten members:**
  - Mike Haverty, Chairman
  - Pepe Serrano, Vice-Chairman
  - Seven (in addition to Mike Haverty) current KCS Board members; plus Javier Segovia, President of TMM
- **Management of NAFTA RAIL**
  - Chairman, President & CEO: Mike Haverty
- **Management of Kansas City Southern Railway**
  - Chairman, President & CEO: Mike Haverty
- **Management of TFM**
  - Chairman: Pepe Serrano
  - CEO: Mario Mohar

NAFTA Rail

Transaction Summary

- **To NAFTA RAIL from GTMM**
  - 38.8% of effective ownership of TFM
- **To GTMM from NAFTA RAIL**
  - 18 million shares of NAFTA RAIL
  - $200 million cash
  - Potential incentive payment of $100 million-$180 million based on a resolution of certain contingencies
- **51.0% of Mexrail acquired by NAFTA RAIL for $32 million**

NAFTA Rail

Financial Summary

Income statement data *

(US$mm)

	KCS consolidated	Grupo TFM consolidated	combined
2002 Revenue	$ 566	$ 712	$ 1,278
growth vs. '01	(1.9 %)	6.6%	2.7%
2002 EBITDA	$ 109	$ 259	$ 368
margin	19.3%	36.4%	28.8%
2002 EBIT	$ 48	$ 176	$ 224
margin	8.5%	24.7%	17.5%

* NOTES:

KCS consolidated 2002 EDITDA and EBIT exclude KCS' equity in earnings of Grupo TFM, resulting from existing 37.3% of effective ownership in TFM.

Combined amounts are presented only to demonstrate the relative size of NAFTA Rail if the transaction is consummated. The combined amounts do not reflect the impacts of the application of purchase accounting and do not purport to reflect *pro forma* financial results as if the transaction had been consummated at the beginning of 2002.

Combined amounts are presented only to demonstrate the relative size of NAFTA Rail if the transaction is consummated. The amounts do not reflect the impacts of the application of purchase accounting and do not purport to reflect *pro forma* balance sheet data as if the transaction had been consummated at December 31, 2002.

NAFTA Rail

Value Added Tax (VAT) Update

- TFM filed a lawsuit against the Mexican Government in 1997 alleging that the Government failed to make a value added tax refund in the amount of $206 million
- October 11, 2002: the Mexican Magistrates Court (the appellate court) unanimously ruled in favor of TFM and ordered the lower Fiscal Court to issue a new ruling consistent with the appellate court's opinion
- December 10, 2002: the lower Fiscal Court issued a ruling denying TFM the right to receive the VAT refund
- TFM appealed the December 10th ruling to the Mexican Magistrates Court on January 29,2003

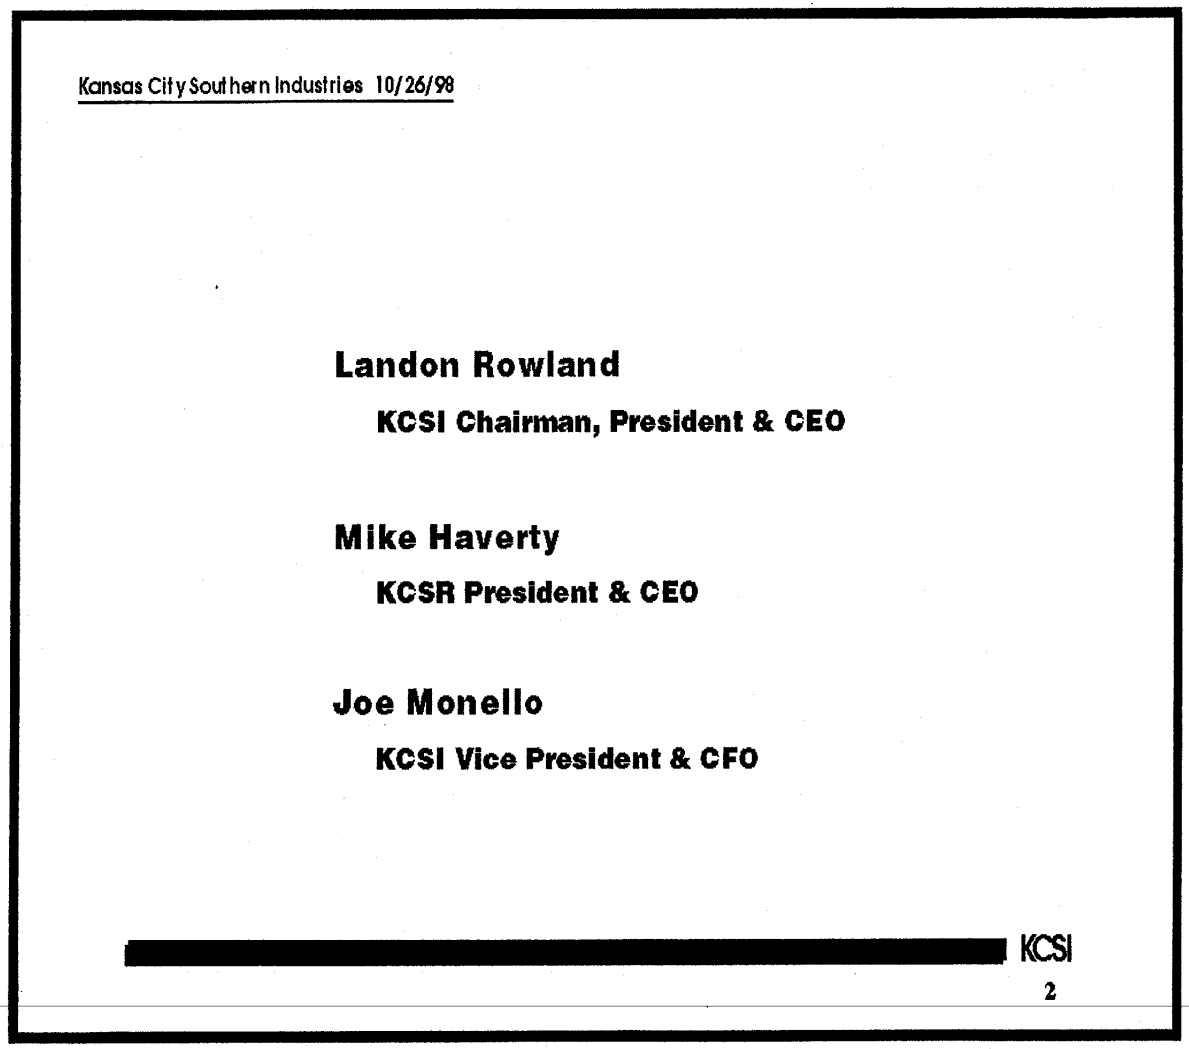
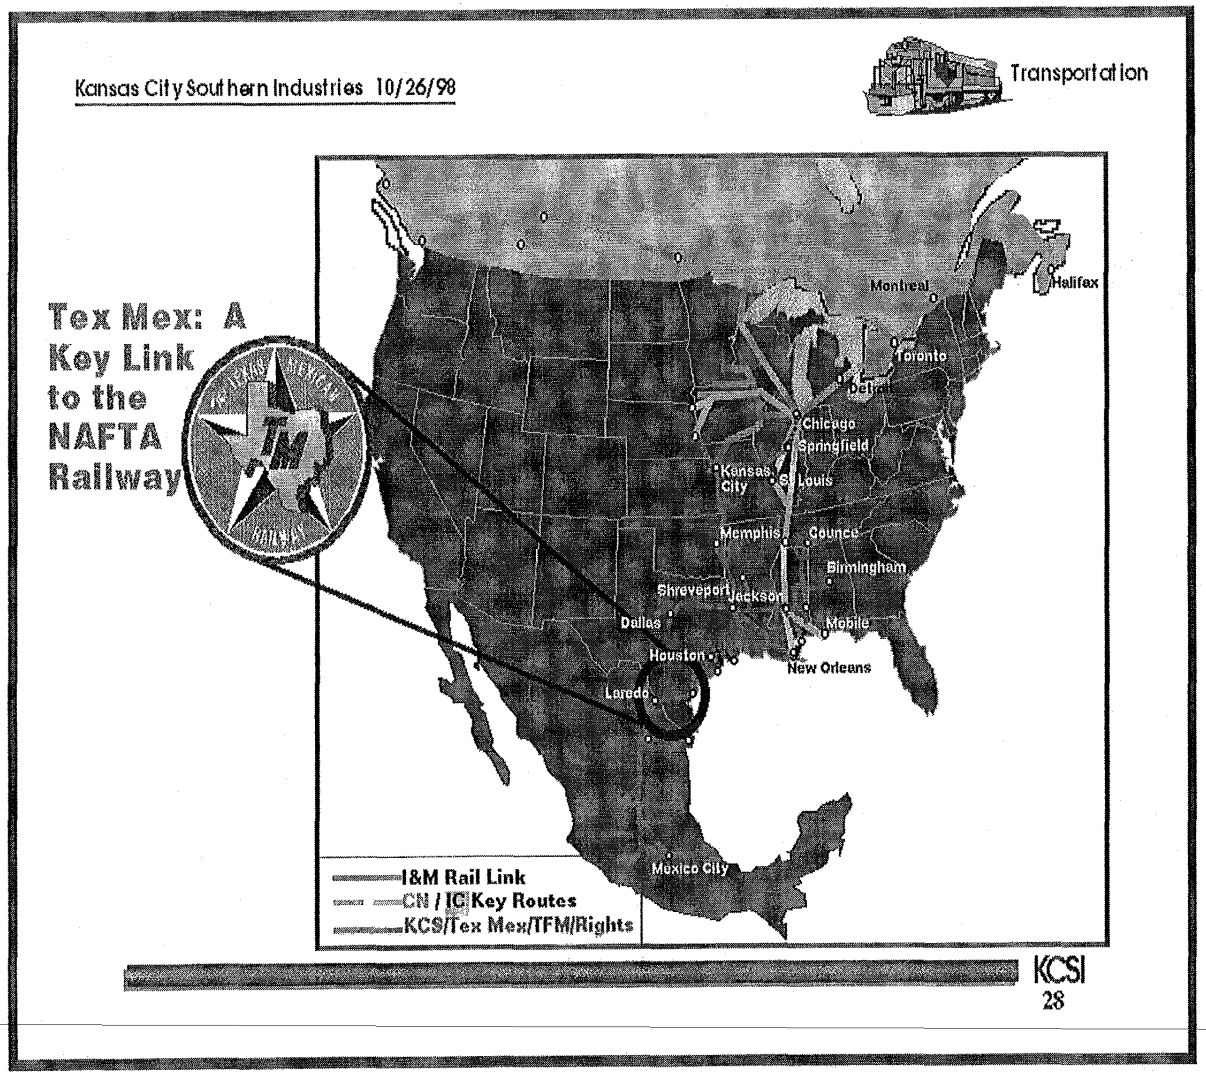
KCSI

Welcome to the Monday, October 26, 1998 Third Quarter Presentation. An audio replay of the presentation is available for the next several days at 888-203-1112 or 719-457-0820. Reference meeting #542111. Subsequently the replay will be available on this web site if there is interest.



Please **WAIT** now for all the slides to load before advancing to the next slide; your "browser" software (preferably Netscape ver 4+, but any browser will do) will indicate when it has finished loading. No special software is needed. Once all the slides have loaded, it is no longer necessary for you to maintain an internet connection to watch the slide program on most computers. You may disconnect. Disconnecting from the audio is not advised, as there is much wisdom here, not to be missed.

If your browser software has finished and all is well you can skip reading this long boring section and click "next" below to advance to the next slide. Reports on how long loading the slides takes vary from a couple of seconds on a very fast fast system (cable modem) to about 2-3 minutes on a typical 28.8 system and even 2X, 3X longer with a 14.4 modem on an older computer and/or a marginal quality phone-line connection. The worst-case we have observed in a properly operating but slow modem setup was about 10 minutes. If your browser is still actively loading much beyond that, you may want to reconsider. Please note that there are issues involved with choices of particular platforms/hardware/operating systems/browser software conbinations that can make internet access speed problematical. There are bad modems and there are bad T1 implementations.



If you do not wait for the entire show to load now, you may encounter some "empty" slide frames as you advance through the program. You may be able to see these slides by clicking on the picture "icon" in the empty slide frame to load that individual slide. A "restart" option is available if all else fails. Depending on your installed software & settings, you may have to scroll to see the entire slide and the "next" prompt. Some very old software "browsers" will not scale the slides properly (the unscaled originals are very large).

Finally, these are screen images and will not print well.

Agreement between the National Industrial Transportation League
And
The Canadian National Railway Company

This Agreement is made this 27th day of April 2001 between The National Industrial Transportation League ("League"), and the Canadian National Railway Company and its affiliated rail carriers ("CN").

Whereas,

CN and Wisconsin Central Transportation Corporation ("WC") (together, "Rail Carriers"), have filed an Application before the Surface Transportation Board ("STB") seeking the STB's approval of the acquisition of control of WC by CN ("Transaction");

The League and CN desire to record the terms on which the League, having reviewed the Application, has agreed to support the Transaction and the treatment of the Transaction before the STB as a "minor transaction;" and

The League and CN desire to record the promises given by CN to the League for the benefit of the members of the shipping public in exchange for the League's support,

Now, therefore, in consideration of the mutual covenants contained herein, CN and the League agree as follows:

1) **League Support.** The League agrees to support STB approval of the Transaction. Within a reasonable time after the execution of this Agreement and no later than April 27, 2001, the League will submit a statement to the STB supporting the Transaction and the treatment by the STB of the Rail Carriers' Application for approval of the Transaction as one for approval of a "minor transaction" as that term is used in 49 C.F.R. §1180.2(c).

2) **Service Protection Agreements.** Upon the request of any shipper or receiver of property on CN and/or WC ("Shipper"), the Rail Carriers shall make a good faith offer to enter into an agreement with that Shipper with respect to that Shipper's traffic affected by the Transaction that, at a minimum:

a) Identifies that Shipper's base service level as the average transit time during each base period for each of the commodities shipped or received by that Shipper between each pertinent origin/destination pair affected by the Transaction. The base periods will be the twelve calendar months preceding the month in which the Transaction is consummated, or such other specific time periods agreed to by the Rail Carriers and that Shipper.

b) Assures that average transit-time at the base service level will not be adversely affected by the Transaction.

c) Provides for (i) Shipper notice to CN if that Shipper's average transit-time for any calendar month after consummation of the Transaction is adversely affected relative to that Shipper's average transit for the corresponding base period calendar month and (ii) a period of not more than 30 days after the date of receipt of such Shipper notice for CN to bring the average transit-time for the movement or movements in question up to the base service level for the corresponding base calendar month..

d) Provides remedies if that Shipper's average monthly transit-time continues to be adversely affected by the Transaction for more than 30 days after the date of such notice. Such remedies, to be applied during the period of degraded service, will include, at a minimum, on-the-ground management flexibility and top-level backing with whatever resources are necessary to effect a complete and timely resolution. The Shipper and Rail Carriers may agree to remedies for service level declines in addition to or in lieu of the remedies provided for in this Agreement. During the two year period after consummation of the Transaction, if a Shipper's average transit time calculated over a calendar month for a particular movement exceeds that for the corresponding base period calendar month, the Rail Carriers shall have the burden of showing that the adverse effect was not a result of the Transaction.

e) The Shipper and Rail Carriers may agree to provide for a sliding scale of charges based on the Rail Carrier's performance for that Shipper after the Transaction relative to that Shipper's base service levels.

f) Unless otherwise agreed to by the Shipper and the Rail Carriers, any agreement made pursuant to this section 2 shall expire five years after the consummation of the Transaction.

3) **Interchange Protection.**

a) At the request of a Shipper, subject to any necessary concurrence of Rail Carriers' connections, Rail Carriers will establish and maintain in effect commercially reasonable contract through rates and charges that are applicable to the transportation of property for that Shipper originating on or destined to points on WC over any existing interchange between WC and any other rail carrier that was active during the 12 months prior to the date of this Agreement.

b) Within the five year period subsequent to the consummation of the Transaction, Rail Carriers, except as provided below, will not increase their portion of common carrier through rates that are in effect upon the date of the consummation of the Transaction and that are applicable to the transportation of property via interchanges to or from origin or destination points on WC and have been used to ship the commodity in question in the prior 12 months. The Rail Carriers' portion of such existing common carrier through rates may be

increased by no more than the change, if any, in the Unadjusted Rail Cost Adjustment Factor ("RCAF-U") or, if the Rail Carriers so choose, the change in the RCAF-U minus any fuel cost element of the RCAF-U plus any cost-based fuel surcharge applied by the Rail Carriers.

c) After the expiration of the five-year period subsequent to the consummation of the Transaction, Rail Carriers will not close, by any commercially unreasonable means, any interchange between WC and any other rail carrier then in active use.

4) **Applicability of this Agreement.** This Agreement was negotiated on the expectation that CN will consummate the acquisition of control of WC. Other than the League's obligations under paragraph 1 hereof, the rights and obligations set forth in this Agreement are contingent upon and will become effective only on the date of such consummation. This Agreement will have no continuing force or effect if the STB does not authorize or CN does not consummate the Transaction. However, if CN does consummate the transaction, then any individual Shipper over CN or WC affected by any of the provisions of this Agreement shall be a third-party beneficiary of this Agreement. No party other than such a Shipper, the League and the Rail Carriers shall be a beneficiary of this Agreement.

5) **Dispute Resolution.** If a dispute arises under this Agreement or any agreement formed pursuant to this Agreement, the exclusive means by which any party to or beneficiary of this Agreement or any agreement formed pursuant to this Agreement may unilaterally seek third party dispute resolution shall be arbitration as provided in an agreement between a Shipper and the Rail Carriers or, if no such provision has been made, under the Commercial Arbitration Rules administered by the American Arbitration Association. In any case, arbitration shall be decided no more than 90 days from the selection of the arbitrator.

6) **Governing Law.** This agreement will be governed by the law of the District of Columbia, without regard to rules pertaining to choice of law.

Canadian National Railway Company

April 25, 2001

Mr. Edward M. Emmett
President
The National Industrial Transportation League
1700 N. Moore Street, Suite 1900
Arlington, VA
22209-1904

Dear Ed,

This will confirm that, upon the execution of the NITL/CN Agreement regarding NITL's support for the CN/WC Transaction and the acceptance by the Surface Transportation Board of the CN/WC Application as one for STB approval of a minor transaction, CN will request that the STB impose a condition on the approval of the Transaction that Applicants will adhere to the following representation made in their Application:

Applicants will also waive any defenses they might otherwise have as a result of the Transaction, under the Board's general rule that it does not separately regulate bottleneck rates, in circumstances where a shipper prior to the Transaction would have been entitled to regulation of a bottleneck rate under the Board's "contract exception" to the general rule.

Sincerely,

James Foote
Executive Vice President Sales and Marketing

RESPONSIVE APPLICATION OF
THE TEXAS MEXICAN RAILWAY COMPANY

The Texas Mexican Railway Company ("Tex Mex"), hereby applies under 49 U.S.C. §§ 11343-45[1/] and the Board's Railroad Consolidation Procedures, 49 C.F.R. part 1180, for the grant of conditions upon the merger transaction proposed by the Union Pacific Corporation, Union Pacific Railroad Company, Missouri Pacific Railroad Company,

---

1/ The ICC Termination Act of 1995, Pub. L. No. 104-88, 109 Stat. 803 (the "Act"), enacted on December 29, 1995 and effective January 1, 1996, abolished the Interstate Commerce Commission ("ICC") and transferred certain functions and proceedings to the Surface Transportation Board ("Board"). Section 204(b)(1) of the Act provides, in general, that proceedings pending before the ICC on the effective date of that legislation shall be decided under the law in effect prior to January 1, 1996, insofar as they involve functions retained by the Act. This responsive application relates to a proceeding that was pending with the ICC prior to January 1, 1996, and to functions that are subject to the Board's jurisdiction pursuant to Sections 11323 through 11325 of the Act. Therefore, this responsive application is submitted pursuant to the law as it was in effect prior to the Act, and citations are to the former sections of the statute and regulations, unless otherwise indicated.

SECTION 1180.6(a)(1)(iii)
PURPOSE

On November 30, 1995, the Applicants filed an application for the merger of the Union Pacific and the Southern Pacific railroad systems. Tex Mex has analyzed the Applicants' Railroad Merger Application in light of the Board's Railroad Consolidation Procedures and General Policy Statement (49 C.F.R. § 1180.1). As set forth in more detail below and in the verified statements of its witnesses, Tex Mex has determined that both potential harms to the public identified in the Board's regulations at 49 C.F.R. § 1180.1(c)(2) (reduction in competition and harm to essential services) will result from the proposed railroad consolidation.

Applicants entered into an agreement with the Burlington Northern Railroad Company and the Atchison, Topeka and Santa Fe Railway Company which the Applicants claim addresses these competitive concerns. Analysis of the effects of the agreement conducted by Tex Mex witnesses Larry Fields, Brad Skinner, Curtis Grimm, and Joseph Ellebracht indicate, however, that the BN/Santa Fe Agreement falls far short of remedying the serious anticompetitive effects and threat to essential services of the merger, particularly as to U.S.-Mexico rail traffic moving through the Laredo rail gateway. The purpose of this responsive application is to address the competitive problems and loss of essential services that will result from the proposed merger and that are not remedied by the BN/Santa Fe Agreement.

The Southern Texas-Mexico Railroads and the Laredo Gateway:

Laredo is the principal gateway for rail traffic between the United States and Mexico. A majority of all rail traffic moving between the United States and Mexico moves over this

gateway. Of all the U.S.-Mexico rail border crossings, it is supported by the strongest infrastructure of customs brokers and provides an effective routing in Mexico to the major Mexican destinations.

Laredo is served by two railroads: Tex Mex and the UP. Tex Mex is a Class II railroad that has been providing rail service since 1875 over its 157-mile line of railroad from Laredo, Texas on the U.S.-Mexico border to Robstown, Texas, where it meets up with UP, and on to Corpus Christi, Texas on the Gulf of Mexico where it meets up with a branch line of UP.

UP is a Class I railroad that stretches the length and breadth of the Western United States. In South Texas, UP has a line that runs from San Antonio, Texas to Laredo. UP also has a line that runs along the Gulf of Mexico from Algoa, Texas (located just south of Houston) to Brownsville, Texas on the U.S.-Mexico border (the "Brownsville Line"). Tex Mex connects with UP's Brownsville Line at Robstown. Tex Mex also connects with UP at Corpus Christi which is on a branch off the Brownsville Line.

The Southern Pacific Transportation Company ("SP") has trackage rights over portions of UP's Brownsville Line and its Corpus Christi branch line that permit it to interchange traffic there with Tex Mex. Although Tex Mex meets both UP and SP in Corpus Christi, nearly all of traffic that it has interchanged at Corpus Christi has been with SP. For many years Tex Mex and SP have provided the competitive alternative to the UP's San Antonio-Laredo service for U.S.-Mexican rail traffic through the Laredo U.S.-Mexico gateway.

urge the Surface Transportation Board to condition any approval of the merger at least upon granting the rights that Tex Mex seeks in this responsive application.

SECTION 1180.6(a)(2)(i)
EFFECTS ON COMPETITION

Each of the witnesses who present verified statements for Tex Mex addresses the effects of the proposed merger, as conditioned by the BN/Santa Fe Agreement, and as further conditioned by the rights requested herein. This section summarizes the more detailed analysis presented in those statements.

1. Effects On Competition of the Proposed Merger and the BN/Santa Fe Agreement Without the Rights Sought Here.

The general conclusion of Tex Mex's witnesses is that the proposed merger would reduce competition in the markets served by Tex Mex -- especially the market for the transportation of goods between the United States and Mexico -- to a serious and unacceptable degree. They also conclude that the BN/Santa Fe Agreement would do little to restore the competition that would otherwise be lost, for two principal reasons.

First, even if the agreement enabled BN/Santa Fe to function as a perfect competitive substitute for an independent SP, the merger would still result in an unacceptable loss of competition in the markets served by Tex Mex because it would eliminate one of the three major U.S. railroads serving U.S.-Mexican gateways and would thus leave many shippers throughout the United States with only two railroads competing for their business where now they have three. Curtis M. Grimm, Professor of Transportation, Business and Public Policy at the College of Business and Management, University of Maryland, explains in his verified

statement how this loss of one of the three competitors in the market for transportation of goods between the United States and Mexico will cause a very substantial loss of competition. Professor Grimm's conclusions about the general anticompetitive effects of reducing the competitors in a market from three to two are supported by empirical studies and are reflected in the Department of Justice's merger guidelines. Larry Fields, Tex Mex's president, and transportation consultant Joseph Ellebracht, also testify on the basis of their many years experience in the railroad industry, including Mr. Ellebracht's 14 years marketing rail services for SP, that shippers benefit significantly in rates and service from having three railroads rather than two competing for their business.

Furthermore, BN/Santa Fe's probable share of the market for U.S.-Mexico traffic is likely to be too small compared to a merged UP/SP's share to induce it to devote the resources needed to compete effectively for the traffic. Consequently, a merged UP/SP will dominate the market so substantially, that BN/Santa Fe's capacity to constrain UP/SP's pricing for most shippers will be minimal. For most shippers, therefore, the reduction in carriers will effectively be from two to one.

Second, the agreement will not enable BN/Santa Fe to function as a perfect, or even acceptable, competitive substitute for an independent SP -- certainly not in the markets served by Tex Mex, in any event. As both Mr. Ellebracht and Allen Haley explain, in place of SP's current operations over its own tracks, the agreement proffers as a substitute BN/Santa Fe operations via trackage or haulage rights, subject to UP/SP's traffic control, over a UP line that is substantially more congested and, for much of the traffic, more circuitous than SP's lines. Mr. Fields and Brad Skinner, a director of Tex Mex, and

Director of Multimodal Operations for Tex Mex's ultimate parent, Transportacion Maritima Mexicana ("TMM"), also describe a number of specific reasons to believe that BN/Santa Fe will have little interest in devoting the resources and efforts necessary to be an effective competitor to a merged UP/SP for this traffic, and that is why the Applicants gave BN/Santa Fe these rights and refused to give Tex Mex the rights it seeks.

Accordingly, if the proposed merger with the BN/Santa Fe agreement were approved, it would very likely cause a substantial lessening of competition for rail transportation of goods between the United States and Mexico. Professor Grimm and Mr. Ellebracht show that this is not traffic that can feasibly move by other modes. More than 80 shippers who depend on Tex Mex have also submitted statements expressing their concerns about the expected loss of competitive alternatives and their support for the rights Tex Mex seeks.

As Brad Skinner discusses, the result of this lessening of competition will seriously undermine the benefits that the United States, Mexico and Canada expect to derive from the North American Free Trade Agreement. It is also likely to undermine Mexico's present efforts to bring new efficiency and competition to the Mexican rail system through privatization. It will also frustrate the efforts that TMM is making, in partnership with Kansas City Southern Industries, Inc. ("KCSI"), to create a rail network between central Mexico and the central United States that will provide a strong competitive alternative to a merged UPSP system for rail transportation between Mexico and the United States and between Mexico and Canada.

SECTION 1180.6(a)(2)(iv)
EFFECT ON ADEQUACY OF TRANSPORTATION

Tex Mex believes that granting the rights sought in this responsive application is necessary to preserve adequate rail transportation services to the public in two respects:

First, it is necessary to prevent an unacceptable loss of competition in the markets served by Tex Mex for the reasons previously summarized in Section 1180.6(a)(2)(i).

Second, in light of Mr. Krick's conclusion that the merger without these rights is likely to result in Tex Mex's going out of business, granting the requested rights is necessary to prevent a loss of all Tex Mex's rail service. As shown by their supporting statements, a number of Tex Mex shippers are very dependent on Tex Mex for their transportation needs and cannot practically use other modes of transport. Corpus Christi Grain Company, for example, depends entirely on Tex Mex to transport its grain to Mexican customers; neither trucks nor any other railroad is a feasible alternative for that traffic. Indeed one shipper, Barr Iron and Metal Company in Alice, Texas states that it "would probably have to close our operations down" if Tex Mex went out of business. Accordingly, without the requested conditions, the merger will cause the loss of essential rail services as well as an unacceptable reduction in competition.

SECTION 1180.6(a)(2)(v)
EFFECT ON EMPLOYEES

Imposing the conditions Tex Mex requests will not result in the abolition or transfer of any Tex Mex employee position. On the contrary, Tex Mex anticipates that it will need to hire between 30 and 40 employees to operate the traffic anticipated from the rights Tex

VERIFIED STATEMENT

OF

LARRY FIELDS

My name is Larry Fields. I am the President of the Texas Mexican Railway Company ("Tex Mex"), headquartered at 1200 Washington St, Laredo, Texas 78042. I am submitting this statement in support of the responsive application being filed by Tex Mex in Finance Docket 32760 seeking trackage rights over UP and SP lines between Robstown, TX and Beaumont, TX.

I have worked in the railroad industry since going to work for the Kansas City Southern Railroad's ("KCS") maintenance of way department in 1965. I worked for KCS in various capacities between 1965 and 1991; my last position was Vice President Operations. From 1991 to 1993 I consulted on rail operations and privatization of lines in Africa and Russia. In 1993 and 1994 I was general manager of a short line railroad. I became president of the Tex Mex on December 1, 1994. I have a bachelor of science degree from Kansas State Teachers College and a masters of business administration degree from Rockhurst College.

INTRODUCTION AND SUMMARY

Currently, the Southern Pacific ("SP"), in conjunction with Tex Mex, provides the only effective competition to the Union Pacific Railroad ("UP") over a vital rail corridor that accounts for a majority of the railroad traffic between the United States and Mexico. In my opinion, it is absolutely critical to

successful, those efforts will enable TMM, KCS and Tex Mex together to provide rail service in both Mexico and the United States that could, in the right circumstances, compete very effectively with a merged UPSP for rail traffic between the United States and Mexico. They will not be able to provide truly competitive service, however, unless Tex Mex connects directly with KCS at Beaumont, TX. In my opinion, UP and SP know this to be true, and that is why they refused KCS's and Tex Mex's request for trackage rights that would provide such a connection and instead granted the rights to BNSF.

II. IMPACT OF THE UP/SP MERGER ON COMPETITION IN MARKETS SERVED BY TEX MEX

As discussed in greater detail in the verified statements of Professor Grimm and Mr. Ellebracht, unless it is properly conditioned, merger of the UP and SP would effectively eliminate rail competition in transportation markets served by Tex Mex. The most important such market is for the transportation of goods between the United States and Mexico. Without conditions, the merger would give the merged UPSP complete control over the all-important Laredo gateway. In 1994 that gateway handled 57% of the rail traffic between the two countries.

An unconditioned merger would also give the merged UPSP compete control of the Brownsville gateway and substantial control of the gateway at Eagle Pass, TX which is currently served by SP's line and access to which BNSF has only via haulage rights. Laredo, Brownsville and Eagle Pass together accounted for 80% of the rail traffic between the U.S. and Mexico and

virtually all of the traffic between the U.S. and Mexico's industrial centers in central and eastern Mexico. Ellebracht V.S. at 17.

That loss of rail competition will have an extremely adverse affect on rail shippers, who have no feasible transportation alternatives. Although most of the transportation of freight between the U.S. and Mexico is carried by truck, truck and water transportation are not practical alternatives for almost all of the shipments now transported by rail. Ellebracht V.S. at 31-34; Professor Grimm concurs in this conclusion and cites supporting evidence provided by many of Tex Mex's shippers.

UP and SP are well aware that an unconditioned merger would eliminate rail competition in the market for U.S.-Mexico rail transportation. That is why they have proposed to give trackage rights and haulage rights to BNSF over the UP line from Algoa, just south of Houston, to Robstown (where BNSF may connect with Tex Mex) and continuing to Brownsville (where BNSF may connect with Ferrocarriles Nacionale de Mexico ("FNM")), and also to give BNSF trackage rights over SP's line to Eagle Pass (to replace BNSF's current haulage rights.) UP and SP claim that those rights will preserve the competition that would otherwise be lost, and they would certainly never have granted such rights unless they recognized that an unconditioned merger would result in an unacceptable loss of competition in this market.

The problem with the solution that UP and SP have proposed is that there is a very high likelihood that BNSF will <u>not</u> be an

adequate substitute for an independent SP in this market, for many reasons which are summarized below. It is, of course, not possible to predict the impact of future events and future competitive behavior with absolute certainty, but that is a risk that the United States and Mexico cannot afford to take.[2/]

III. WHY BNSF WILL NOT BE AN ADEQUATE COMPETITIVE SUBSTITUTE FOR AN INDEPENDENT SP.

Professor Grimm, Mr. Ellebracht and Mr. Haley discuss in detail the reasons why BNSF will not be an adequate competitive substitute for an independent SP for U.S.-Mexican traffic under the terms of BNSF's agreement with UP and SP. The first, and perhaps most important, is the simple fact that today there are three major Class I railroads with access to Mexican gateways. After the merger, even as conditioned on the BNSF settlement agreement, there will be only two major railroads with access to Mexican gateways -- UPSP and BNSF. As Professor Grimm explains, the evidence is compelling that the reduction of the number of railroads serving a market from three to two will cause a significant loss of competition that is likely to result in substantial increases in rates.

[2/] If I am correct that BNSF will not be as effective a competitor for traffic between the U.S. and Mexico, particularly through Laredo, the result would not only be an unacceptable loss of competition for that traffic but would also probably put Tex Mex out of business, as shown by the traffic study performed by Mr. Ellebracht and the financial pro formas developed by Patrick Krick. That event would cause a number of shippers that are now dependent on Tex Mex for transportation to lose essential rail services, as I discuss below.

VERIFICATION

I, **Larry D. Fields**, certify under penalty of perjury the foregoing is true and correct. Executed on March 25, 1996.

LARRY D. FIELDS

VERIFIED STATEMENT

OF

JOSEPH F. ELLEBRACHT

My name is Joseph F. Ellebracht. I am an independent railroad transportation consultant. My office is at 1015 Jackson Avenue, River Forest, Illinois 60305.

Qualifications and Experience

Before establishing my consulting practice in March of 1993, I was employed for nineteen years in the railroad industry in a variety of marketing positions. My most recent railroad employer was the Southern Pacific Transportation Company, where I worked for fourteen years, and before that I worked for the Chicago, Rock Island and Pacific Railroad. I hold a B.A. degree from Washington University and a M.B.A. from the University of Missouri.

During my railroad employment I worked with dozens of railroads, hundreds of railroad customers and thousands of railroad marketing and operating personnel. This experience provided me with knowledge of what buyers and sellers of rail transportation want, and also of the means employed to achieve those wants. During my employment at SP, and after, as a consultant, I participated in a number of railroad acquisition cases as well as other proceedings before the Interstate Commerce

the Mexico-U.S. gateways. BNSF may make minor gains at Eagle Pass, Brownsville and Laredo from the trackage rights granted, but in every case BNSF has been given an inferior route to these gateways compared to that of SP, and an even more inferior route compared to that of UPSP. If the merger is approved as proposed, UPSP will handle nearly all of the traffic to and from Mexico.

The elimination of SP as an independent competitor for U.S-Mexican traffic and the resulting control that UPSP will have over virtually all of that traffic will cause a very substantial loss of competition and will create the climate for a significant increase in rail rates.

While it is true that there is currently only one railroad in Mexico, FNM, the state-owned railroad, that fact has not diminished the benefits shippers have enjoyed to date from the competition among U.S. railroads for that traffic. For a number of reasons, including FNM's ratemaking practices, the different currencies used by the two countries, the unpredictable fluctuations in the exchange rates and the normal transition of ownership of the freight at the border, nearly all U.S. rail rates for traffic to or from Mexico are established only for the U.S. portion of the move. Similarly, FNM rates cover only the Mexican portion. Few rates are established with FNM on a through or joint-rate basis. In my years of marketing for SP, I was directly involved in a few efforts to establish through rates for selected traffic. Such rates, however, have not generally been encouraged by FNM, entail significant administrative and

potential tax burdens, and are requested by very few customers. The vast majority of international rates are made by combining the rate within Mexico and the rate within the United States.

Furthermore, FNM's rates are generally set on a distance basis and, in my experience, have rarely been set in consideration of the rates charged by U.S. railroads for the U.S. portion. As a recent study of U.S.-Mexico traffic by the University of Texas states: "FNM continues to set its rates using the old fixed-rate system. Under this fixed rate system, prices are set according to a distance-based tariff. FNM gives each commodity a class number. Prices are then determined by cross-referencing the class number with the distance to be travelled. The distance factor is set independent of any other variables such as geography and accessibility."[7/]

Because FNM sets its rates for the Mexican portion of international traffic without regard to the rates for the U.S. portion, the vigorous competition that now exists between U.S. railroads for that traffic directly benefits the shippers, and any reduction in that competition will harm them. UP, SP and their witnesses have not disputed this fact. Indeed, the Applicants' settlement agreement with BNSF, which Applicants argue will preserve that competition, clearly reflects their recognition of the serious anticompetitive effect that an

---

7/ Lyndon Johnson, School of Public Affairs, the University of Texas at Austin, U.S.-Mexico Trade and Transportation: Corridors, Logistics Practices and Multimedia Partnerships, Policy Research Project Report Number 113 (Austin, Texas: 1995).

unconditioned merger would have on competition for U.S.-Mexico rail transportation. Unfortunately, as I discuss later, Applicants are wrong that the settlement agreement will preserve the competition that now exists for that traffic.[8/]

B. The Elimination of SP As An Independent Competitor For U.S.-Mexico Traffic Will Cause A Substantial Reduction in Competition.

Contrary to Applicants' claims, BNSF trackage rights or, more likely, haulage rights operations between Houston, Corpus Christi and Brownsville will provide a significantly inferior level of competition to UP for traffic through Laredo than UP now faces from SP in conjunction with Tex Mex or than UPSP would face from Tex Mex if Tex Mex could connect directly in Houston and Beaumont with railroads serving those points. This is true for several reasons that I discuss more fully in the following Section 4.C.

A more fundamental, threshold problem with the proposed UP/SP merger and the BNSF settlement, however, is that, even if one assumed that BNSF would be just as effective a competitor using its trackage and haulage rights as SP is now operating over its own lines, the fact remains that today there are three major

---

[8/] As I have discussed, because FNM sets its rates without regard to the rates charged by U.S. railroad's, FNM's monopoly over the Mexican portion of international moves has not prevented the benefits of competition among U.S. railroads from flowing through to the shippers. As I discuss in Section 4.E, below, the converse situation cannot be expected to hold true. If Mexico establishes a significant degree of competition in its rail system, as is expected, the benefits of that competition would not be likely to flow through to shippers if the U.S. portion of the transportation becomes noncompetitive.

conjunction with KCS, intends to bid for both of those divisions. UP, in conjunction with its Mexican partner, is expected to be another major bidder. TMM expects that the Mexican government will require the purchaser of the first, and perhaps the second, division to provide trackage rights to another carrier to ensure competition over those lines. The process is expected to be completed before the end of the year.

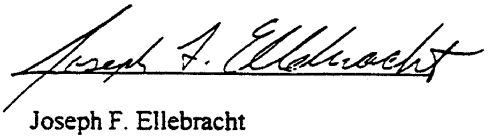
Mexico's efforts to bring competition and efficiency to its rail system, however, would be largely undermined if competition is lost on the U.S. side of the border. UP, SP and BNSF are all very sophisticated in setting rates to maximize profits. Each of them, including a merged UPSP, can be expected to set rates as high as competitive constraints will permit them. To the extent that UPSP and BNSF, both individually or together, will control gateways and routes within the U.S., they can be expected to use that control to the fullest to maximize their revenues on U.S.-Mexico traffic. If competition among Mexican carriers reduces rates for the Mexican portion of such moves, U.S. carriers with control over the U.S. portion can be expected to appropriate those reductions for their own benefit, not the shippers' benefit.

F. Intermodal Competition Alone Is Not Enough to Constrain Rail Prices on Shipments to and from Mexico via Laredo

The table below shows the major commodities handled via Laredo by rail in 1994.

Truck competition will not be an effective constraint on rail prices in the absence of effective rail-to-rail competition.

The inland location of Mexico's major industrial and population centers reduces the attractiveness of water service for the commodities listed in the above table. Generally, for the traffic handled via Laredo, a water-borne shipment would require a relatively long inland leg in both the United States and Mexico. Mexico City is 419 kilometers from the major port of Veracruz. Monterrey is approximately 160 kilometers from the coast. Guadalajara is 313 kilometers from the port of Manzanillo, which is a Pacific port, and would require a long water voyage in addition to a land leg for most of the shipments that are transported through Laredo. Water competition will not be an effective constraint on rail prices in the absence of effective rail-to-rail competition.



G. There Are Serious Risks Associated with the UP/SP-BNSF Settlement Agreement

BNSF may simply fail to exercise its trackage rights. BNSF is under no obligation to fully exercise its trackage/haulage rights to Corpus Christi. Traffic that SP found attractive, with SP's more direct route, may be unattractive to BNSF, which has been relegated to a less direct route. BNSF's bids to shippers will reflect its more circuitous route, as well as the more variable level of its payments for track and maintenance. As a result, BN's bids are likely to be higher than those made by SP, allowing UP to also raise its bids. As a result, the customers will pay more, either to BNSF or to UPSP. BNSF will pursue only

VERIFIED STATEMENT

OF

CURTIS M. GRIMM

I. INTRODUCTION AND SUMMARY

My name is Curtis M. Grimm, and I am Professor and Chair of Transportation, Business and Public Policy, College of Business and Management, University of Maryland at College Park. I have been a member of this College since 1983. I received my B.A. in economics from the University of Wisconsin-Madison in 1975 and my Ph.D. in economics from the University of California-Berkeley in 1983. My Ph.D. dissertation investigated competitive impacts of railroad mergers.

My background includes extensive exposure to public policy issues regarding transportation, including Interstate Commerce Commission ("ICC") merger adjudication. I have previously been employed by the Wisconsin Department of Transportation, the ICC, and the Australian Bureau of Transport and Communication Economics, and I have provided consulting services to several other government agencies and private firms regarding transportation issues. I served as Assistant to the Chief of Intercity Transport Development, Planning Division, Wisconsin Department of Transportation on two separate occasions between 1975 and 1978, with a focus on rail policy issues such as abandonments and the creation of shortline railroads. I also worked on a consolidation involved competing bids from Burlington

provided our company with competitive rates and service. In the near future we would like to begin moving product from various points in the U.S. to Laredo for transfer from rail to truck for delivery into Mexico. This would open up the possibility of backhauling our cars from Laredo to the Eastern U.S. Obviously, we are looking for optimum utilization of our equipment and would like to continue to have several railroads competing for our business. (Cascade Warehouse Company)

Our company plans to extends its reach into Mexico. Within six to twelve months, we plan to begin moving Mexican pine from points within Mexico into the U.S. We believe that the Mexican pine can be marketed in the Midwestern and Southeastern U.S. Although we currently do not ship via rail from Mexico (we have conducted one test shipment via truck), we believe that rail could be a less expensive option versus trucks in this market. (Idaho Timber Corporation)

Much of our traffic moves from warehouse to warehouse and thus is particularly sensitive to transit times. We believe that the logical and economical way to move our business should be on the railroads. (Hudson Foods, Inc.-Turkey Division)

The Mexico market provides great potential for the expansion of Procter and Gamble's products. Again, the reduction in available carriers into and out of Mexico does not fit with this emerging opportunity. We therefore recommend the Surface Transportation Board reject the Union Pacific's acquisition request stated in Docket #32760. (Procter and Gamble)

IV. FOR THE COMMODITIES AT ISSUE HERE, TRUCK AND WATER WILL BE INEFFECTIVE ALTERNATIVES FOR MANY SHIPPERS

Although truck and water play an important role overall in transportation of goods between U.S. and Mexico, many shippers of many commodities are dependent upon rail competition for

competitive transportation options. In his statement, Mr. Ellebracht shows the 23 largest commodities by volume handled by rail through Laredo and the average distance for each commodity shipped between Laredo and the U.S. origin or destination. For the types of commodities involved and the distances involved (which do not even include the Mexican portion of the moves), I fully agree with Mr. Ellebracht that neither truck nor water carriage are alternatives that would provide for most shippers an effective restraint on rail prices in the absence of rail-to-rail competition.

Grain is the most important commodity, and there is well-established evidence as to the ineffectiveness of trucks for the long-haul movements of this commodity, as indicated by the recent Klindworth and Mortinsen report for USDA, cited earlier:

> In the United States, semi-tractor trailer combinations are typically used for relatively short-distance movements of bulk grain from the first collection point to processing plants and subterminal and terminal markets. Occasionally, trucks are also used for the movement of grain from nearby producing areas to U.S. ports for export. (p. 29)
>
> Overland truck delivery is a viable alternative for the movement of U.S. grain into Mexico under two general circumstances: (1) where U.S. production areas are near the border and the Mexican demand is composed of a large number of smaller firms without rail service, and (2) where a Mexican grain demand exists immediately across the border and border rail facilities are either not present or are inadequate. (p. 30)

While water is an option for many shippers, that option also has limitations, as noted in the same USDA report:

> Between 1990 and 1994 51% of U.S. grain exports to Mexico were via water. This number varies significantly by commodity. Most of this traffic has been via Gulf Ports, although Mexico's Pacific Coast ports have superior vessel draft and natural harbors. (p. 49)
>
> Due to the draft limitations and to the short distances from the U.S. Gulf grain export elevators, the vessels servicing the Mexican Gulf ports tend to be small ...built in the early 1970's or before. Normally, these bulk carriers do not have the efficient discharge gear (cranes) of the later class of larger bulk carriers, and discharge rates for these vessels are low... (p. 51)
>
> Other than the discharge capabilities at port, inland distribution is perhaps the most critical component of moving grain into Mexico via maritime routes. While maritime vessel is generally the lowest cost mode of transporting bulk commodities, the efficiencies of maritime transportation can be lost by the slow discharge at port or by the lack of adequate inland transport capacity. ...especially ...where several ports rely entirely on truck for inland distribution and where the national rail system is capacity-constrained. (p. 56)

Two studies by James M. McDonald contain significant evidence as to the harmful impact on rail rates for agricultural commodities from reduction in rail competition.[2/] One study, using 1983 data for shipments of corn, soybeans and wheat, performs regressions to ascertain the relationship between rates and rail competition. A second study draws on data from 1981-1985 regarding grain shipments. MacDonald has provided a statement in this case thoroughly and completely rebutting the

---

2/ McDonald, James M., "Competition and Rail Rates for the Shipment of Corn, Soybeans, and Wheat," *Rand Journal of Economics*, Vol. 18, 1987; and McDonald, James M., "Railroad Deregulation, Innovation, and Competition: Effects of the Staggers Act on Grain Transportation," *Journal of Law and Economics*, Vol. 32, April 1989, pp. 63-95.

criticisms of his work by Applicant's witness Willig. His statement includes the following comments:

> In his statement, Professor Willig (pp. 570-572) argues that my finding of a strong connection between the Herfindahl index of railroad concentration and railroad prices probably reflects the influence of monopoly: "Of course it might be the case that concentration does matter positively for price, but the finding of the statistical correlation would not reliably prove it, because the correlation would be in evidence just from the monopoly effect, regardless of the behavior of the three to two cases" (p. 571).
>
> However, I specifically considered Professor Willig's question in my 1991 publication (4). The late professor Leonard Weiss asked me to summarize my 1987 article, and add several new bits of information, for the well-known book that he edited, Concentration and Price (MIT Press, 1991). One of the things that Professor Weiss asked me to do was to reestimate my equations without observations from monopoly districts. His letter explained that he wanted to know whether the results were driven by monopoly, or also held as one moved from three to two sellers; that is, he had precisely the same question in mind as Professor Willig. In my article for that book ("Concentration and Railroad Pricing"), I summarize the distribution of estimated Herfindahl indexes and railroad numbers across districts, and report the effects of dropping observations from monopoly districts. I quote from that article (p210): "The regressions were remarkably similar to the old. Coefficient values and significance levels showed hardly any change at all. In particular the coefficients on rail competition in the corn and wheat samples each increased imperceptibly, to -.283 in corn and -.111 in wheat (or changes of 0.001 and 0.002). The degree of oligopoly appears to matter, as does the transition to monopoly." That article showed that the rail results were not driven by the monopoly results, and that the results of the analysis remain the same, even when we exclude those least competitive markets. (Pages 11-13).

In addition to grain, there are many other commodities involved in U.S.-Mexico rail traffic. My statement for KCS discusses the abundant evidence showing the limitations of truck

and water in competing with rail for many of these commodities. Tex Mex's shippers transport a broad range of commodities, and their statements reflect their dependence on rail to move those commodities. For example:

> Eagle Picher is a manufacturer of Diatomaceous Earth products which are primarily used in the filtration, filler, and absorbent markets. We have been a significant railroad customer for nearly 50 years, shipping approximately 1250 cars per year and generating an annual revenue of over $6,000,000 to the SP and UP combined. (Eagle-Picher Minerals Inc.)
>
> Our company is in the business of exporting U.S. feed grain commodities by rail to Mexico. (Global Grain Co.)
>
> Skill is an advisor to the Kansas Shippers Association which is comprised of the UP-MP, SFE and SSW Shippers Groups. A total of 38 companies are involved in these groups. The individual companies are shippers/receivers of agricultural products, lumber, cement, and plastics. (Skill Transportation Consulting, Inc.)
>
> Badger Mining operates three mines in Wisconsin, which produce silica sand, a specialty sand used in the oil, gas, foundry, glass, abrasive, and water filtration industries. Badger Mining's three Wisconsin mines produce and ship by rail in excess of 600,000 tons of silica sand annually to points throughout the United States, Canada, Mexico, South America, and the Far East. Badger Mining pays more than $6,000,000 per year in rail freight charges. (Badger Mining Corporation)
>
> L. B. Foster Company manufactures, fabricates and distributes steel pipe and tabular products, railway track rails and trackwork, structural steel, and construction and highway products, with both national and international markets.(L.B. Foster)
>
> I am the Traffic Manager of Kreher Steel Co. and have held that position for the past two years,. I am responsible for the movement of 50,000 net tons of steel bars and billets annually by rail, truck, and water transport. (Kreher Steel Co.)
>
> Faremount Minerals ships via rail to south Texas and Mexico primarily from Wedron (silica sand) and Troy Grove (coated sand), IL. We move the sand to Laredo for export from Wedron via BN-Kansas City-UP and from Troy

> Grove via UP direct. We also ship sand to two rail-to-truck transfer points located at Laredo and Alice, TX on the TexMex Railroad. (Fairmount Minerals, Ltd.)
>
> The company's major products are lumber, cedar fencing, trusses, laminates, treated lumber, hardwoods, specialty boards and lumber-related products. These products ship from our ten remanufacturing facilities and from various mills to all states in the contiguous U.S. (Idaho Timber Corporation)
>
> BHP manufactures copper rods and cathode at several facilities in Nevada and Arizona. (BHP Copper Company)

Many of these shippers provide specific details regarding the ineffectiveness of other modes for their particular shipping needs:

> Trucks cannot compete with the railroads for much of our business. We ship bulk loads over a distance that the railroads can handle at a significantly lower cost. Therefore, we cannot depend on truck competition to replace the SP/TexMex on our business moving into Mexico. (Wilbur-Ellis Company)
>
> Fundamental to maintaining and growing business, International Paper Company depends on reliable rail transportation service at competitive prices. Because the distance from many of our facilities to our customers in mexico exceeds 1,000 miles, rail transportation is the only viable mode of transportation that can be used to competitively place our products in this market. (International Paper Company)
>
> Overall, we find rail shipments to be more cost effective than trucks, especially over long distances. Therefore, trucks are not the best option from a price standpoint for our shipments moving from the Laredo gateway into the U.S. (Cascade Warehouse Company)

V. THE BNSF TRACKAGE RIGHTS WILL NOT BE AN EFFECTIVE ALTERNATIVE FOR THIS LOST COMPETITION.

VERIFICATION

I, Curtis M. Grimm, certify under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this verified statement on behalf of The Texas Mexican Railway Company. Executed on this 25th day of March, 1996.

to grant access to others. The Board has consistently approved such procompetitive, voluntary agreements as in the public interest. Moreover, the Board has imposed procompetitive agreements as conditions consistent with the public interest at the request of applicants and settlement parties, even if it would not have imposed such conditions absent the agreement. But the Board has consistently refused to require the parties to such agreements to extend them to other shippers. *See, e.g.*, BNSF, slip op. at 99, rejecting similar arguments of Bunge Corporation, and Decision No. 44, at 183 rejecting similar arguments of various Montana interests.[42] Enterprise has not shown that the agency's longstanding approach, which fosters pro-competitive settlement agreements, is arbitrary and capricious.

IV

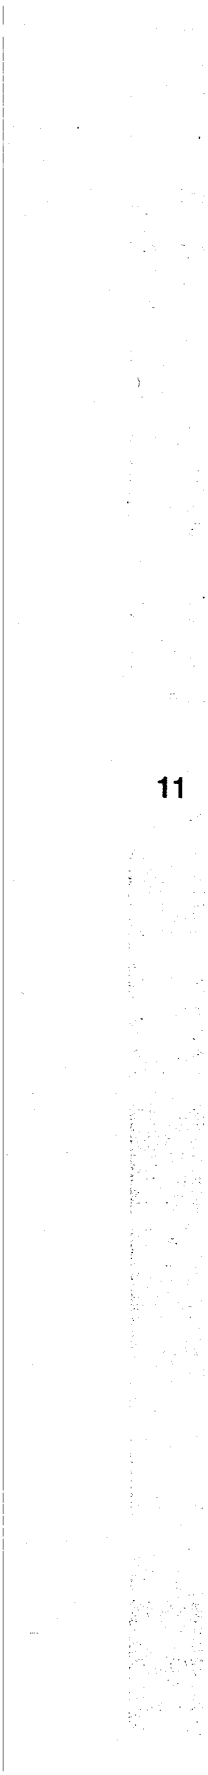
THE BOARD PROPERLY GRANTED TEX MEX TRACKAGE RIGHTS OVER BNSF'S OBJECTIONS

BNSF obtained a voluntary settlement agreement, which, with numerous modifications mostly favorable to BNSF, was imposed by the Board as a merger condition. As a result, BNSF obtained access to hundreds of new shippers and the right to use new, more efficient routes for any of its traffic over thousands of miles of new lines as a result of this merger. Yet BNSF is not

---

[42] In any event, Enterprise stands in somewhat of a different position than Chevron, Amoco, and Exxon, since they supported UP's application to build the Mt. Belvieu branch, and made contractual commitments to use it. Enterprise provided no support and made no commitments.

satisfied. Apparently, BNSF believes that the Board has infringed upon its exclusive proprietary right to use these new trackage rights by permitting Tex Mex to overlap them over a tiny, 50-mile segment. BNSF has this situation exactly backwards. BNSF is only operating over these lines as a result of the Board's approval of this merger, and its approval (and imposition as conditions) of various related settlement agreements as in the public interest. With the merger or without it, BNSF would have needed the approval of the STB under section 11343 to obtain such trackage rights.



It is well settled that the Board has broad discretion in determining what conditions are necessary in a merger proceeding. It is also undisputed that the merger without conditions would have resulted in significant competitive harm south of Houston, particularly in the U.S.-Mexico trade over the important Laredo gateway, which is served only by UP and Tex Mex. The Board had a wide range of options available to it to preserve competition; by no means was the Board constrained to choose the solution proposed by the applicants, total reliance on BNSF. The Board could have declined to approve or permit this portion of BNSF's trackage rights, and could have given Kansas City Southern Railway Company, Tex Mex, or some other carrier exclusive trackage rights over UP to replace the service formerly provided by SP. Instead of choosing either of these exclusive options, the Board chose an option that preserved a limited role for Tex Mex in providing a part of an alternative route for shipments

moving to and from Mexico. At the same time, the Board also approved BNSF's trackage rights service under the BNSF settlement agreement to preserve access to the extensive BNSF system for shippers.

It is true that the Board has a policy of not imposing protective conditions in a merger proceeding except where necessary to preserve essential services or to prevent significant competitive harm. As BNSF correctly points out, the ICC and the Board have generally subjected parties seeking such relief to an exacting standard of proof. The situation here is unusual in that the potential harm to Tex Mex, and in turn to this important alternative Laredo routing, would be caused not just by the merger itself, but also by the settlement agreement, which gave BNSF a new role in this region.

The settlement agreement was a voluntarily negotiated merger condition that for the most part was procompetitive and in the public interest. Indeed, without the settlement agreement, it would have been impossible to approve this merger. But that does not mean that the Board was required to endorse or permit every part of the agreement and impose it alone as a condition. The Board properly declined to impose conditions giving exclusive access south of Houston to BNSF, conditions that could have resulted in Tex Mex being forced out of the market, and its assets being sold to some other carrier, most likely BNSF.

It is not clear to us how BNSF was harmed by the Board's remedy other than by the fact that it has lost the ability to use

Q1 2003 Kansas City Southern Earnings Conference Call

Boston, Apr 30, 2003 (CCBN StreetEvents) -- Event Transcript of Kansas City Southern conference call, 29-Apr-03 1:00pm ET.

THIS CCBN STREETEVENTS TRANSCRIPT IS AVAILABLE AS PART OF A FREE TRIAL UNTIL APRIL 30TH. TO ACCESS THIS CONTENT AFTER THAT DATE, YOU NEED TO BE A STREETEVENTS SUBSCRIBER. FOR ADDITIONAL INFORMATION PLEASE TYPE CCBN <GO>, CALL 617-603-7969 OR EMAIL STREETEVENTS@CCBN.COM.

Corporate Participants

* Michael Haverty
  Kansas City Southern - Chairman President and Chief Excutive Officer
* Gerald Davies
  Kansas City Southern - Executive Vice President and Chief Operating Officer
* Ronald Russ
  Kansas City Southern - Executive Vice President and Chief Financial Officer
* Jim Jones
  Manatt Phelps and Phillips - Board Member

Conference Call Participants

* Jennifer Ritter
  Lehman Brothers
* Tom Waterditz
  Bear Stearns
* Orlando Mushan
  Great T Capital
* Arthur Shield
  Roosevelt Investment Group

Presentation

Operator [1]

Good afternoon, my name is Amy, and I'll be your conference facilitator today. At this time, I'd like to welcome everyone to the Kansas City Southern 1st quarter earnings conference call. All lines have been placed on mute to prevent any background noise. If you should need assistance during the call, please press star then zero, and an operator will come back on line to assist you.

Thank you, I will now turn the call over to Mr. Michael Haverty, Chairman,

President and CEO of Kansas City Southern. Sir, you may begin.

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [2]

Good afternoon to all of you here in New York and all of you who have joined us on the telephone and welcome to Kansas City Southern's combination 1st quarter 2003 presentation as well as a presentation that we want to talk about that deals with the announcement that we made last week regarding the NAFTA Rail transaction, where we will put Kansas City Southern, Tex-Mex and TFM under a single company.

Joining me today as speakers in the presentation, dealing with the 1st quarter will be Gerald Davies, our Executive Vice President and Chief Operating Officer, and also, Ron Russ our Executive Vice President and Chief Financial Officer.

As we look at the first quarter earnings, there's not really a way to put a good face on this thing. I think very clearly, it's obvious that the quarter was a lousy quarter. When you look at the ongoing earnings per share, 8 cents versus 19 cents a year ago, but there are some things clearly that led to having a poor first quarter.

Let me say, first of all, that the first quarter historically for both Kansas City Southern and TFM is the worst quarter of the four. But this quarter was really exacerbated by two things, number one, the uncertain economy in the United States and Mexico tags onto what goes on in the United States and as a result there were some effects on revenues in Mexico. In addition to that, the peso value in Mexico and half of our revenues coming from pesos, we saw a downturn on the revenues there, I'll talk about that in just a little bit.

But also, in addition to the economy and the peso devaluation, fuel prices clearly affected the company in the U.S., the fuel prices were up about 45%, or about $3.3 million and in Mexico, they were up about $5 million or about 40%. We hedged in the United States, about 32% of our purchases, and in Mexico, we were unhedged or we had not purchased fuel forward as we did in the United States.

So, between the economy and the fuel prices, it clearly affected the earnings negatively in the first quarter. In spite of that, I think there are a lot of good news things that we can talk about in this quarter. First of all, we paid down in a very lousy quarter, just about a million dollars in debt, and we did not draw down on our revolver at the KCS level. We also increased the cash on hand from the end of the 4th quarter of 2002 to the end of this quarter from $19 million to $64 million, a $45 million increase or about a 240% increase in cash on hand.

Also this quarter, the increase of our ownership in group-O TFM that took place in July of last year helped us out on the equity earnings side of TFM where last year at this time we had 36.9% compared to 46.6% of the ownership this year compared to last year. And in the U.S., nearly 60% of the commodity categories

---

showed a year-over-year revenue increase, and four out of five of the business units showed they made the forecast that we had projected for this quarter and so we were on target with four out of the five business units.

Another good news story, is MCS that we implemented during the 3rd quarter of last year, is working. All the congestion we had in the past is a thing of the past, and the railroad is running very smoothly. And when you look at the expense side in the U.S., in spite of a 3% wage increase and in spite of increases in health and welfare benefits that were about 5%, and if you exclude the $3.3 million expense of the fuel cost increase, KCS held the line, and in Mexico, we actually would have reduced expenses had it not been for the fuel increase, the fuel increase there, as I said, was about $5.5 million and they only ended up being above on expenses a year ago of $1.5 million. So in reality, without the fuel, they actually reduced the expenses.

So, in spite of a performance that we do not certainly think was good this quarter, there were some good things that happened. And I think we've got some projections looking forward that are going to be positive, and as we talk about our transaction later on in this meeting, I think you'll find that there are some very, very positive opportunities for our shareholders in that transaction.

With that, I'm going to turn it over to Gerald Davies and let Gerald take the presentation and talk about some of the revenues.

Gerald Davies, Kansas City Southern - Executive Vice President and Chief Operating Officer [3]

Thanks, Mike and good afternoon, it's good to be here this afternoon. I'm going to be relatively brief this afternoon, because we're going to spend a good deal of our time this afternoon talking about the transaction, so I'm going to go through this relatively quickly.

As Mike has already said, despite weak revenue results for the 1st quarter of this year, there have been a number of signs that are very positive for our company. We talked about most of the revenue shortfalls that we expect to see this quarter in our prior meetings, especially the last two. We have three sizable revenue hurdles in each of three business units, one customer in each. We expected in the 1st quarter that we would have been able to offset those revenue declines, but we didn't get much help from the economy, frankly.

In addition, the war as it broke out, which normally helps the railroads, did help us much. Most of our military traffic is related to training exercises. With the war going on, you don't need to move military equipment around for training exercises, so we have far fewer military movements in the 1st quarter of this year than either we had expected or is normally the case.

We track normally 42 individual commodity groups and watch their performance and see what's happening during the course of, frankly, each day. Through the 1st quarter, the majority of those lines of business registered increases and

---

even though those that didn't, the increases were relatively small, which as I said, the three exceptions. Four of the five business units as Mike said, registered revenue growth that was ahead of our plan for the year. We had a lot of initiatives that were in place that brought on new customers that expanded the services rendered to existing customers, and brought in additional market share from those existing customers that showed some dramatic improvement in sectors of the business which I'll talk more about in a minute.

Overall, we began the year with a real challenge, as I said. The three areas that we have problems with were coal, plastics and automotive, I have talked about each of these before with you. Coal performed very well, despite the regular decline. The quarter-over-quarter result is skewed by two things, first of all, as I reported before, we had a contract that ended just about a year ago, and, of course, it was not there in the 1st quarter of this year.

In addition, in the 1st quarter of 2002, there were substantial inventory building going on at the utilities we served. This year we didn't have that. Nonetheless, we offset a substantial portion of the revenue decline from the loss of the contract and that inventory loss. If we hadn't had an unexpectedly long maintenance outage, we would have come closer to offsetting it. In the process, we also registered about a 4.5% yield increase in our coal business, that also helped us a lot.

Plastics also performed relatively well, especially given the fact that we had one customer that had a build-in where we lost roughly $2 million a quarter in revenue for that building. With the growth in business at the other plastics customers and other new customers, we were able to offset roughly half of that loss in the 1st quarter, and we'll continue to work on that growth as we go forward to fully offset it.

The automotive losses that we talked about continue to plague us through this quarter. The contract that we lost in the 2nd quarter of last year, was a major one for us. I continue to believe that we have the service quality and the assets in place to be a major player with the automobile industry. I believe and continue to believe that will happen overtime, we continue to work on it constantly.

With the economic recovery being pretty spotty, as Mike already talked about. We had to be pretty nimble in looking for opportunities to gain business. Our gains in the pulp and paper business really exemplified what went on in the business units in Kansas City Southern in the 1st quarter. The pulp and paper business saw a gain of a quarter of a point in production. This is an ongoing saga for almost three years now in the pulp and paper industry. Nonetheless, the pulp and paper business on KCS increased 14% year over year in the quarter. Pretty sizable gain.

Now, part of that was due to a yield increase. We had about a 3% yield increase in the quarter for paper. So we saw market share gain and a yield increase simultaneously that helped us a great deal. Our intermodal including the college business also grew, about 10% in the quarter, and we saw about a $900,000

revenue gain for that line of business in the quarter over a year ago period. The other groups generated relatively small gains, but none--or small decreases, but together, as a whole, they were positive in the smaller sections.

As we worked through the first quarter, we kind of look forward to the rest of the year, we see the second quarter promising slightly higher revenue gains year-over-year, and the 3rd and 4th quarter similarly. Part of that in the 3rd and 4th quarter, will be due to the impact we saw from our MCS implementation last year, we talked about -- we expect to see year-over-year gains from the revenue side as we go through.

Finally, on the revenue side, our Mexico traffic continues to grow. In the 1st quarter of this year, that traffic to and from Mexico over the KCS was up 17%, so it continues its double-digit growth year-over-year.

On the comp side of our equation, we also had two key elements that drove our cost performance. The first is fuel. Mike has already talked a bit about it. The fuel cost increases represent more than 80% of our cost increase year over year in the 1st quarter. Fuel prices were up about 43% over the prior year quarter and our cost increase, 34%, the actual expense that we incurred. That means we had a dramatic increase or improvement in our fuel utilization rates. We had a decline of about 6% in our fuel usage and that is far bigger than the roughly 3% decline than the units handled year-over-year period.

So, we demonstrated the ability to more efficiently use our power building train size and controlling train size, and the production team at KCS performed very well in managing the fuel used in the 1st quarter. Purchase services also saw an increase in expenses. There's a lot of items in purchase services and point to any one as a key driver, there isn't one that really stands out much, except I think there's a major story here in terms of what we pay others to repair our freight cars and locomotives. That price went up relatively sharply, but it really is part of what is a good news story.

Let me explain here. Car hire expenses really have two elements to them. The first is what we pay others for the use of their cars on our system. And the second is what others pay us for our cars on our system and on theirs. In the 1st quarter of this year, we saw the amount that we pay others for the use of their cars drop 8%. That's pretty impressive improvement. We also saw the amounts that others paid us for the use of our cars increase 43%, a huge increase in the 1st quarter. That is the demonstration of the power of MTS in the hands of our managers. They're able much more effectively to target the management of our operations to clearly see what they need to do in the performance.

But there's a bit of a negative on that, when our cars and locomotives are off on other railroad's lines and they do repair for pieces of equipment, they bill us back, so it's an increase in purchase services, which is car repairs and locomotive repairs done by others, because we did a better job at managing our fleet and had it offline a higher portion of the time. That offset some of the gain here but of the 3.4 million saved in car hire, about 2.5 million of that

was due to the benefits of MTS.

On the smaller increases, wages were up about 1.5%, which I think is a good news story, given that our labor costs increased about 3% in our labor agreement. Fringe benefits were up 4.5%, but a gain with health care costs going up nearly 20%, period over period, there's some good news represented in that too.

Let me talk a little more about fuel. Since it was such a large piece of our cost increase for the quarter. Our fuel usage for the quarter decreased 6%, as I said, that's far greater than the 3% decline in units handled for the period. The growth, as a growth indicator, the fuel consumed dropped per carload handled about 3% period over period. That's a major increase, especially since this is the third year we had to focus on fuel utilization and fuel usage. We continue to see major benefits from it. A gain or indicator of MTS to help us.

Our hedging and over price management activities in the fuel side also helped us. We're about 32% hedged or forward bought in the 1st quarter, which helped us control expenses. In fact, if we hadn't done that, we estimate that our fuel prices -- or fuel costs would have been about 4 1/2 million higher than they were. So the bottom line, the fuel increase of 3.3 million was a result to a good deal of management efforts and control.

Let me summarize real quickly here, as Mike said, we've been through the MTS start-up. That's behind us, we're now in the phase of gaining benefits from MTS. Benefits both for the management of our operations and for the service that we're delivering to our customers. The investment is showing results, and I've given you an example here in the car hire and in the fuel savings.

Our performance measures continue to improve and there's some examples of those at the end of the presentation. I won't take the time to go through them today. But we continue to improve things like train speed on the railroad, but I don't have a bullet on this chart.

I also want to mention safety. In the 1st quarter we had 1.49 incidence for 200,000 hours worked. In the rail car industry, that would put us at 2nd place, the first place carrier has an incidence rate of 1.19 for 200,000 hours of work. So our safety performance continues to improve and we continue our intense focus on the safety of our people, the goods we carry and the communities that we serve.

With that, let me turn this over to Ron Russ, our CFO.

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [4]

Thanks, Gerald and good afternoon. It was a very difficult quarter, to reiterate what Mike said. I'll be very brief.

Ignoring the SFAS 143 benefit, ongoing EPS was 8 cents for the quarter, 3 cents from U.S. rail operations and 5 cents from international rail operations. The retirement benefit was from SFAS 143 was about 14 cents a share. On a consolidated basis,KCS operating revenues declined about 2.6% or $3.7 million. Operating income which Mike and Russ have talked at length about was down about $6.6 million from the prior year and that is comparable to a situation where we had $4.4 million of gain last year for the sale of Tex-Mex to TFM in the first quarter of 2002. All in all, KCS earned about 4.7 million down from 9 million on an adjusted basis from the prior year.

Next slide is the pictorial of how we got from 2002 to 2003, in terms of operating profit, I guess again the highlights here, we had good cost controls in a very tough environment, we want you to note the minor increases in labor costs that Mike and Gerald have highlighted, improved equipment utilization from MCS, that gave us a very major upside benefit for the quarter and a disciplined approach on purchasing and cap ex kept us in line on that side. Higher fuel costs and the loss of the coal contract really are the bullet points of the pain that was suffered in the 1st quarter here, ending up at $6.8 million for the quarter.

On the next slide, it is just for informational purposes, I think Gerald explained quite efficiently the benefits we did get from hedging. Going forward this quarter, we're 40% hedged, 21% hedged going into Q3 and 16% hedged in Q4. Our price for the quarter was about 90 cents a gallon and that compares unfavorably with 63 cents a gallon the prior year.

On the next slide I want to emphasize -- I guess this is some of the pleasing aspects of our report this quarter, even in a difficult operating environment in this 1st quarter, our credit measures continue to improve. The debt reduction program began following the 3rd quarter of 2001 continued with focusing on monetizing surplus assets, accelerating collections, basic blocking impacts and running the business. We've held off paying off debt in view of the proposed transaction, and our cash balances are now at the end of March, are $64 million.

A brief word about debt to total cap ratio, there has been some commentary about NAFTA Rail's future debt to total cap post consummation. Our preliminary efforts on a proforma consolidation, pre-acquisition financing utilizing12/31/2002, is nowhere near close to the 70% numbers. TFM results for the quarter were impacted heavily by the devaluation in two ways, one is on the operating side they were impacted not only in person on materials and goods, but also that the revenue line was impacted heavily by the paying customers about $13 million year over year. The operating ratio for the company on a U.S. cap basis was 83.5%, given this economic environment, is still comparable with that experienced by all the North American railroads this year.

Finally, a brief note about the preferred taxes, once again KCS has benefited from the inflation rates in Mexico, which are running at a 4.5% per annum basis right now, and the peso exchange rate is about 10.8 for the quarter, though it has strengthened in the last couple weeks, it's now at about 10.37 pesos to the U.S. dollar. All in, for the first quarter, the net benefit deferred taxes from

the devaluation of the peso and inflation was $6.7 million.

In terms of guidance the quarter, we are cautious in our view for the 2nd quarter and are monitoring the situation. But as usual, we are caveated that TFM's numbers are a bit of a wild card given the swings created by the peso and inflation on the deferred tax line.

We are cautiously optimistic about the 2nd half, with FCS fully imbedded and with good cost controls in the system, and with new movements of traffic coming online, there is potential to see improvement in our U.S. operations in the second half. With that, I'll throw it over to Mike.

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [5]

Well, now, we'll turn to the second part of our presentation, and one of the things I forgot to do at the beginning of the first presentation was read the safe harbor message that I'm supposed to read at both of these, so I'll just combine the safe harbor for both.

These presentations include statements concerning potential future events involving the company which could materially differ from events that actually occur. The difference could be caused by a number of factors, including those factors identified in a current report of form 8K dated 12/11/ 2000, one filed by the company with the S.E.C., file number 1-4717. The company will not update any forward looking statements in the presentation to reflect future events or developments.

This presentation will cover our NAFTA Rail transaction. I will obviously be a speaker, Ron Russ will also cover part of this, and a little bit later in the program, we are going to ask Jim Jones, who is the former U.S. Ambassador to Mexico and a member of the Kansas City Southern Board to join us on the telephone from Mexico at the end of the presentation to give us his view on where we stand on the value added tax dispute that is ongoing in Mexico. So, he'll be on in just a few minutes.

Before I get started talking about the transaction, let me just say that we view this as a very, very exciting transaction, not only Kansas City Southern, but also for TMM. We cannot think of any strategic move that we could make at this point in time that would create more value for both the Kansas City Southern shareholders and the TMM shareholders. We have had a vision of a NAFTA Rail system for many, many years, and this is an opportunity to put this system together.

And as you hear in the presentation, you will understand that Mexico is clearly the greatest revenue producing opportunity in North America. It's proven to be that in the past, and we believe it's proved to be that in the future. We want to capitalize on that opportunity for both the shareholders of Kansas City Southern and TMM.

So, as we talk about the transaction, first of all, I think everyone understands that NAFTA Rail will replace the holding company name of Kansas City Southern. NAFTA Rail will purchase from group-O TMM 38.8% their ownership of TMM. In exchange for that, NAFTA rail will give to group OTMM 18 billion shares of NAFTA Rail stock, $200 million in cash, plus, there's a potential incentive payment for TMM for $100 to $180 million dollars based on a favorable resolution of the tax dispute that is ongoing at this point in time in Mexico. And then, we will immediately pay to TFM $32.7 million for its 51% of MEX-Rail, and we will put that in a blind trust pending approval of the Surface Transportation Board in the United States.

You cannot commonly control two railroads in the United States without Surface Transportation Board's approval, but we will move quickly to carry this transaction out and we will put in a blind trust. The structure of the company's next bill is pretty simple, as I said, NAFTA Rail will replace the Kansas City Southern Holding Company, and it will own all of Kansas City Southern Railway, it will own all of Tex-Mex Railway, and it will own about 86%, excuse me, 76% of TFM, the Mexican Government still owns about 24%. You can look at the map here and see Kansas City Southern and Tex-Mex and TFM on the map, and you can understand how they link together on an end-to-end-to-end type configuration.

We will keep the railroads independent, and the reason that we want to keep the companies independent is that we respect the rights of TFM to operate in Mexico, with Mexican employees and Mexican management manage the company on a day-to-day basis. The holding company will provide guidance, clearly on marketing aspects and utilization, financial advice, information technology and so on, but we understand that because of cultural differences and language differences it's important that we not try to put these companies together.

We also respect the historical significance of the Texas Mexican Tailway that's been headquartered in Texas for well over 100 years, and we will keep that company independent and, of course, Kansas City Southern, that's been around since 1887 will be independent, but the entire network will work together as a single network cooperating very closely together.

The corporate governance and management of the company, I will be the Chairman of NAFTA Rail, Pepe Serrano, TFM, will be the Vice Chairman, and he will continue to be the Chairman of the TFM. The seven current Kansas City Southern Board members will be on the new NAFTA Rail board and also joining the Board will be the President of TMM, Javier Segovias. I will also be President and CEO of NAFTA Rail and at least for the time being, President and CEO of Kansas City Southern Railway, managed by TFM, Mario Mohar, who has been the CEO since the start of the company, will continue to be President and CEO of TFM.

The next slide, the strategic rational for why we are doing what we're doing. Clearly, it is to enhance shareholder value by achieving consolidation of the rapidly expanding TFM affiliate in Mexico with the U.S. ownership. Not only do we have the growth in Mexico, but also, the opportunity to flow more traffic over the combined system which is going to add to the value of the new company.

Also, we've got an increase in earnings per share that will result with the faster growing rail operations in Mexico, and I think it's important to understand -- and Ron will talk about this a little more, that this transaction is accretive from day one. It's a good move for our shareholders. Also, we intend to improve the Tex-Mex infrastructure and operations, that is the critical link between Kansas City Southern and TFM, we will work on that to improve that.

We want to strengthen the three railroads as the NAFTA railroads, we referred to ourselves for some time as the NAFTA railroads, we want to give the shippers that as they use the NAFTA trade corridor, a stronger transportation alternative, we'll be better as a single company, stronger as a single company than we were as three independent companies. And then also we are looking to lengthen the haul through across the border view. Instead of looking from Meridian to Beaumont and from Beaumont to Laredo, we'll be looking from Mexico City to Meridian, and Mexico City to Kansas City and different connections on the Kansas City Southern that lengthen the haul of as much traffic and improve service as we can through competitive service and rates.

Next, as we look at what it's going to take to complete the transaction, bank group consent to consummated, we announced last night that we have gotten that consent from our bank group, headed by J.P. Morgan and the approval was 93%. We also need the approval of TMM bond holders, we need approval of the share holders of both Kansas City Southern and TMM. In order to control two U.S. railroads as I said earlier, Tex-Mex and KCS, we have to have the U.S Surface Transportation Board Approval. Tex-Mex is a class II railroad, Kansas City Southern is a class I.

Ordinarily a transaction like this would not be considered a significant transaction. Clearly the transaction is end-to-end. There are no points on the railroad where you're going to go from two competitors to one, or even three competitors to two. It's clearly end to end and there's no overlap at all. So we feel that this will be approved and we hope that it's approved in an expedited manner.

We also need the approval of Mexico's competition commission. That's kind of like, as you may view in the United States, the Antitrust Division of the Department of Justice. And again, we don't see any competitive problems here. We think if anything, this will strengthen competition for Mexico so that there's not as much dominance as there is today.

Mexico's Foreign Investment Commission must also approve it under Mexican law, Mexican Company or Mexican National has to own controlling interest of the company, but over the last few years, there have been waivers to that law that have been pretty consistently given, Citibank taking over BaniMex is probably one of the primary examples, and there are many others, telecom companies taking control. There's several examples and we don't see a problem with this, there will still be 20% voting control in the hands of a Mexican company, and you'll have additional ownership beyond that, so there's going to be a significant

position by Mexican shareholders in this company, and we intend to, as I say, operate TFM independently, so we don't see that this will be a major problem.

Next slide, why are we so excited about this opportunity, well, we were excited when we invested in Mexico back in 1997. We saw the opportunity for NAFTA coming, and it was not nearly as clear in 1996 as it was today. This shows that the U.S. trade with Mexico exceeds $260 billion a year. It's four times what it was 10 years ago. Seventy-seven percent of the trade of Mexico goes to the United States and a few weeks ago if it's in Mexico, with a small meeting of businessmen with President Fox, and he talked about how Mexico purchases more from the United States than from England, France, Germany, Italy and Spain combined and Mexico will surpass Canada as the number one U.S. trade partner in the next eight years if we follow the current trends.

Eighty-five percent of Mexico's imports from the U.S. today are manufactured goods, in the past, that was primarily petroleum products and agricultural products. Now you have automobiles and may other types of manufacturing that is done, you have steel and so on moving into the United States, and Mexico is also developing from a low-cost assembly manufacturing area to a value added manufacturing area.

In the past I think some people looked at Mexico as just a low cost manufacturing point. I have talked to representatives of all three of the U.S. manufacturers of automobiles and they tell us that not only are their lowest cost vehicles produced in their entire worldwide network in Mexico, but also their highest quality, Mexican workers do an outstanding job, so it has a value-added aspect to it. Also, we think that Mexico is positioned because of its geographic location and its far-reaching free trade agreements could be an international manufacturing hub, not only from North America to the western hemisphere, but also for the world.

So, anybody that thinks that NAFTA has not been successful only needs to look at some of these numbers, and when you think about the opportunities going forward, this is a great railroad transportation opportunity and that is why we forward, this is a great railroad transportation opportunity and that is why we want to put these three companies together.

Now, do we have to go down to the United States, excuse me, down to Mexico and improve the railroads? No, that has already been done, since 1996 really we started operating in '97 although we began preparing for capital improvements as far back as 1996, we have put into the Mexican railroad all the things that you will find in the United States, centralized traffic control, the communication systems, the technology where we detect defects along the track, smaller crews, like you find in the United States, and so on.

In addition to that, the main railroad routes have been improved, we have installed welded rail, we have improved the car capacity over the Laredo bridge by three times by better operating practices, there have been over 150 new locomotives purchase for that railroad, 75 from G.E. and 75 from E.M.B., we put in new capacity and siding, there are 7 intermodal facilities down there to

date, 5 of which are brand new and 70 transload facilities with 12 new facilities planned.

The next slide, if you just look at the revenue growth and just for clarification, '97 was only a five month period of when we took the railroad over, but you can see the kind of revenue growth and clearly there has been some of the flattening from 2000 through 2002, but that is because, again the U.S. economy has been sluggish and as a result of that, I showed you what the trade is between the two countries which clearly is going to affect Mexico.

But, if you look at the next slide, and you look at the revenue increases that have been enjoyed by the Mexican railroad compared to all of the U.S. class one railroads combined, between 1998 and 2000, clearly, TFM is the fastest growing revenue opportunity in North America.

The next slide shows what Kansas City Southern's growth has been since the investment back in 1997 in terms of the volume of traffic that is moving between Mexico and the United States and in the first quarter of this year we have experienced a 17% increase in the number of units going to or from Mexico compared to last year and obviously, when the three railroads are put together, we expect that number to go up substantially as we put more focus on taking advantage of better service and a better opportunity for single pricing from Mexico to the United States and vice versa, that will increase substantially.

The next slide, from an operations and marketing perspective, the three railroad companies will connect end to end so what we will do is design a system that looks not at the three individually, but we will schedule trains from origin to destination from Mexico to the United States and from the United States to Mexico. We will use a common computer system, our MCS system that we are planning on putting on Tex-Mex in September and then 1st quarter of next year, Mexico, and we will closely watch the movement across the border, we think we can improve that, we have already made a lot of improvement.

It will be seamless service, as I said, from Mexico to the heartland of the United States, we will have a common transportation service plan and schedules in place for cars that go from one country to another. The integrated customer service will be easier for customers to communicate with all companies in both countries and we will have through rates between Mexico and the United States and the United States to Mexico that will be easier for customers to understand. And you can see here that the combined resources will be much greater, 965 locomotives, 25,000 cars, and you can see some of the other things, also, we will have about $1.3 billion in revenues which will make this company a stronger company.

True, we are still going to be the smallest company but we are going to have a lot of influence of traffic that moves between Mexico and the United States and we will certainly improve our financial situation longer term and continue to build our revenue base and become stronger per long term.

Now, TFM recently did a study in Mexico with 200 customers, 134 are those that

represented 70% of their current volume in revenue and then 66 potential customers and as you can see here, existing customers identified potential shift in business to TFM that could add as much as 40% to TFM's total volume over the next two years and the potential customers, the 66 identified conversion potentials that would add nearly 10% to TFM. And most of that, as you can see here in this pie chart, comes from trucking, about 73% of the total traffic, I think, shows that it would come from trucking.

Some of those that have been invested in us for some time or in TMM or TFM or KCS bonds may remember that we talked about the opportunities to convert from truck to rail at the time when we made the investment back in 1997. At that time, the railroad had gone down to 11% of the inner city market in Mexico and today, we are up at around 15 or 16%, but are objective was to get back to only 20%, if we felt we could get back to 20% of the inner city market we could justify our investment.

Well, as it's turned out, we have really justified our investment with far less market share and we have not converted over the last five years as much intermodal traffic from truck to rail as we had anticipated because what we did is concentrated on traditional rail traffic such as automobiles, auto parts, grains, steel, cement, appliances and different things. We intend to concentrate much more so on intermodal in the future and we are going to be able to provide certainly truck competitive service, we have got 7 intermodal facilities now, 5 of them are almost brand new and that is going to give us the opportunity to move forward in this truck conversion.

So, this map here just shows the location of these intermodal facilities, and as I said, 5 of those are brand new, if you look at the next map then, you can see how Kansas City Southern fits into the entire rail network in North America and I think you can see where Kansas City Southern, soon to be NAFTA Rail, will fit into the North American scheme.

So, from a strategic standpoint, this combined company could not be better positioned than it is right now, and I think all of us have recognized for a long time that the crown jewel system in Mexico has been Laredo to Mexico City. With that, I am now going to turn the call over to Ron Russ, and then we are going to ask Ambassador Jones to come on the phone here.

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [6]

Thanks again, Mike. I just want to take a moment to expand on a few points we made last week on our conference call and also bring everyone up to speed on where we are.

As Mike mentioned earlier, I want to focus a bit more on the process and approvals needed to complete the transaction. Mike showed a slide earlier of the approvals and the key constituents, now let us address each one in more detail. First, you saw our announcement last night, we have made good progress with our

---

banks. The bank group has consented to consummate the transaction, to acquite group-O TFM shares and to our consent to acquire 51% of Mex-Rail shares. By the way, that approval was at 93% of our bank group.

The bank group also consented to the use of KCS cash on hand to acquire the 51% interest in Mex-Rail for $32.7 million. Again, cash on hand at the end of the quarter, $64 million, up from 19 at the end of the year.

After other approval, let's take a look at TMM bond holders. Their F-4 has been amended and that went effective yesterday, the offer is to exchange their notes due on May 15, 2003 and in 2006. The new notes maturity is May 15, 2004, there is a interest rate coupon improvement to 12% per annum, and the exchange offer expires on May 12th of this year. Both groups of shareholders need to approve the transaction and we will be moving forward with that shortly, we expect that to take place within the next 90 days.

From a regulatory perspective, the U.S. Surface Transportation Board gets involved with the Mex-Rail transaction. NAFTA Rail acquired 51% for $32.7 million, the Mex-Rail shares will be placed in a voting trust while the S.T.D. reviews the application for common control. The application will be filed shortly, and we consider it to be a minor transaction.

Mexico's regulators will also review the transaction, first, Mexico's Competition Commission. We believe that common control of the three railroads is pro-competitive. The estimated time line for the approval is within 120 days.

Mexico's Foreign Investment Commission will also review the transaction. Again, as Mike said earlier, we believe that there are precidents in the marketplace Citibank Group and BaniMex, Anheuser Busch and Modelo, Wal-Mart, et cetera, just to name a few. Again, the estimated time line there, we anticipate this to be completed within 120 days.

Now let's spend a few moments talking about VAT, keep in mind that we view VAT and the VAT lawsuit as an asset even before the magistrate's court decision. TFM filed this suit in 1997 alleging that the government failed to make a value added tax refund to the tune of $206 million. On October 11th of this past year, the Mexican magistrate's court unanimously ruled in the favor of TFM and ordered the lower fiscal court to issue a new ruling consistent with their decision. On October 10th, the lower fiscal court issued a ruling denying TFM the right to receive that refund. TFM has appealed the October 10th ruling on January 29, 2003

With respect to the government, a lot happens before they turn to us. First, there is the decision to proceed with the public quote and that decision takes place prior to October 31, 2003. Second, the 20% interest is put to first group-O TFM, they will have 60 days in which to make a decision. Finally, the 20% interest, if group-O TFM decides not to take up on the put is then put to NAFTA Rail, ie. Kansas City Southern and group-O TMM, the time frame for this is January to February 2004.

Again, this is the end of February, it is nine months but the primary objective of this transaction is to close first, to better deal with the put on a rolled up basis. As perspective, we think about the VAT put issue in the context of probabilities. First, we believe that the probability of VAT being equal to or greater than the put is high based on the high court's decision of this past fall.

Second, no event recovery is a very remote probability, third, we believe Mexico will not execute the put without knowing the resolution of the VAT dispute. It just makes basic common sense, you are looking at $485 million not knowing if you have a potential obligation downstream of better than $800 million.

Now let's turn to the transaction details and financing, first let's spend a moment on the consideration to be paid. The consideration paid for group-O TMM for group o-TFM shares is 18 million shares of NAFTA rail plus $200 million cash. Or at NAFTA Rail's option, NAFTA Rail could pay $120 million cash, plus $80 million worth of NAFTA Rail's shares, approximately 6.4 million shares in total. Finally, the separate transaction of 51% of Mex-Rail for $32.7 million.

Now, let's talk about where we are, at least $120 million is the consideration we're focused on. We're very confident this will be done very quickly. The bank group has consented, we believe $120 million will be raised. You have seen these pages before on the next slides. I just wanted to give everyone a sense of the financial scale of the combined entity.

No VAT, no put case is a very conservative case. The valuation portrayed on this next slide is based on yesterday's close, a valuation of $406 million. Again the multiples, 2.9 times the revenue, 7.9 times EBITDA, and 11.6 times of EBIT, that's the lowest multiple that's been seen in any transaction except for th BNCN, a deal that never went through.

In terms of earnings impact, again, this slide displays our view, that is it's accretive from day one, even if it is entirely equity financed. It's again, the lowest multiple paid for any major rail transaction in recent history that's been concluded, and accretive even without synergy even when financed with all equities

We're very excited about this proposition. I'm excited about the opportunity of getting $360 million of EBIDTA. In that regard I'll throw it over to Mike Haverty.

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [7]

Before we entertain questions here, I'd like to ask if Ambassador Jim Jones is on the telephone and could maybe give us his views on the value added tax dispute in Mexico. Are you there, Jim?

Jim Jones, Manatt Phelps and Phillips - Board Member [8]

Yeah, I'm here, Mike. I'm here in Mexico city at another meeting, but I heard most of your presentation -- recently on the value added tax issue, perhaps everyone there is familiar with it, very briefly, and simply, this is a question as to who issued the valued tax refund. Who filed for that refund, who was entitled to file for that refund even who received that refund back in 1997, which at that time was roughly -- a little over $200 million.

When TFM brought its case before the fiscal court, which is called the tax court also, the tax court is, to put it in context, is a division of the ministry of finance. To speak anecdotally, when U.S. firms had some difficulties before the tax quarter or disputes on tax issues and it came to us for some assistance, I found that the tax court, without exception, ruled on what the ministry of finance position was and, if justice was to be done, it was done at the appellate level. That's where the appellate court overruled the tax court, and remanded it back to the tax court with the instruction to vacate its prior judgment, to weigh the evidence again and issue a new ruling that is consistent with the appellate court's interpretation.

In January of this year, when TFM was notified that the tax court again ruled against it, it appears that most of that decision or that opinion was based on an article in a new law. A new fiscal code that was passed by the Mexican Congress in 2001, four years after this event was in dispute. And so when TFM appealed again at the end of January of this year to the appellate court, it cited several violations of TFM's protection under the Mexican constitution. I might add the case is in front of the same panel that saw the case before and it seems the same lead judge is in charge of the case.

Now, in trying to predict what's going to happen, it's even more difficult in a Latin country that has the civil code because it's substantially different from the English common law. It's hard to tell what the decision is going to be made because the concept of legal precedence that we have in English common law is not the same.

However, having said that, we first look to the attorneys that are representing TFM and how they look at the case, and particularlyry relying on Dr. Herbert Bettincourt, who is the lead attorney for TFM and one of the most respected constitutional lawyers in Mexico, from the beginning of filing this case a few years ago, he has been very confident on the outcome, based upon the constitutional protections for TFM. And short enough, on appeal, he was proven correct.

The attorneys are still very, very positive about the outcome of the case, and as you know, under NAFTA, there's been several reforms, political and economic reforms and the legal and judicial reforms are in the process of taking place. But particularly, at the appellate levels of the Mexican judicial system, the quality and transparency of the judges and the decision has significantly improved.

So I would agree with Ron, that based upon the constitutional basis, that the TFM should be able to prevail on the law and on the constitution. Now, what will that mean in terms of dollar amount? Well, the original claim was for 200-plus million dollars, and then when you add the interest and the other items, it could be in the 8-900 million range, but clearly, by almost any measure, you would believe that it would be equal to or in excess of the value added tax refund.

With the put not having to be exercised for clearly until February of next year -- I think that those two events clearly can take place. Then the question is, of how that refund will be applied. Will it be applied to pay for the put or in what other manner. And that is how I see the case now and as I say, I think we're quite positive on the outcome. Thank you very much, Ambassador and thank you for joining us from Mexico..

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [9]

With that, we will open it up to questions here in the room here in New York. This young lady right here. First of all, I think we need to, Bill, individually identify themselves and the company that they're with over one of these microphones.

==========

Questions and Answers

Jennifer Ritter, Lehman Brothers [1]

Jennifer Ritter with Lehman Brothers, a couple questions on Mexico. First in the quarter, first quarter results, did I hear you say, Ron, that if we -- there was $13 million kind of delta due to the peso devaluation, if we were to try to get an apples to apples comparison, we would add $13 million to the Mexican, or toTFM's revenue?

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [2]

That's correct, Jennifer, the peso devaluation has impacted the Mexican peso customer base, paying base, which is something in the order of 47% of the customer base of TFM and that was the order of $13 million year-over-year in the 1st quarter.

Jennifer Ritter, Lehman Brothers [3]

So revenues, in fact, did grow in TFM?

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [4]

Yes, that's correct.

Jennifer Ritter, Lehman Brothers [5]

And then just to be ultra clear on the put and how it works, the second step is 20% interest put to group OTFM, they can refuse to make good on that put and then it goes to KSU and GTMM?

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [6]

That's correct, that is the original bargain and how it was structured. If the group OTFM passes, then it goes to the two consortium partners in the original concession, Group OTMM and Kansas City Southern. Their obligations are joining several, if one of the partners declines under the old arrangement, the entire obligation fell on the other partner. In this instance, the rollup of the three companies, NAFTA Rail, it will become the payer of that put.

Jennifer Ritter, Lehman Brothers [7]

So really, because NAFTA Rail is going to earn 95% of group OTFM. You're making the decision for group OTFM as well in many ways?

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [8]

To be clear, if we were to acquire the interest in the put, there would still be that interest or group OTFM held by its subsidiary, TFM. So there still would be residual interest, but we would be control of the situation, and we would more than likely influence the way the decision was made.

Jennifer Ritter, Lehman Brothers [9]

Thanks for your time.

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [10]

I think I may follow-up on that, the importance of what Ron has talked about, and the question you asked, Jennifer, is I think there's been kind of a misconception in the financing of this transaction that we raised the $200 million, and then "bang" all of a sudden, we have to come up with $500 million.

The fact is, as Ron as pointed out, you have until next February to come up with this. The VAT is still outstanding and does the Mexican government really want to exercise the put with this issue that's still outstanding. And I think that's an important issue.

So, anybody that has the misconception that is like "bang bang" we really have to raise $700 million right away, that's not the case. We're taking it one step at a time. The 200 million first of which we already targeted really, the number is 120 that we have to raise, we can use stock for the other 80 million if we need to. The cash needs are not there hitting us in the face immediately. Next question, Tom?

Tom Waterditz, Bear Stearns [11]

Hi, it's Tom Waterditz from Bear Stearns. I have one question for you, Michael and two for Jim. Can you give us a sense of your view of how much political influence there is on this foreign investment commission, how much room there is for I guess meddling from other parties that might want to cause trouble. Just your opinion on that?

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [12]

Jim, are you still on here? He may have had to go, he was actually down there for an Anheuser-Busch board meeting, and he may have had to go.

You know, I certainly don't have the expertise on that, I think our partner in Mexico has a lot of experience with that, and we depend upon his advice and I think what we can say best here, Tom, is that we have found the competition commission to be very fair, and not to be politically motivated. They look at a situation, and this is what our partners told us, and they determined whether or not they think it is competitive or anti-competitive, and they rule accordingly, and that it is not greatly politically influenced.

Tom Waterditz, Bear Stearns [13]

Okay. Maybe if I can -- two more for you, Michael, one of the opportunities seems to be taking some of the traffic away at Laredo that goes to either primarily UP, but also to Burlington, I guess Burlington would be through El Paso or Eagle Pass.

But to get some of that business, can you give us a sense of how you're going

---

to do that, given that UP does have a route structure advantage to say Chicago or other places, and maybe the magnitude of the revenue that you really think you can take from other railroads?

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [14]

Let me clarify one thing. B&S does not go to Laredo and TFM does not go to El Paso. Where TFM interchanges with B&S is at Brownsville, which goes across the border point, and then also at Robbs town, which is located on Tex-Mex at the east end near Corpus Christi, and then UP operates at Laredo, but clearly UP is the dominant carrier through Laredo, and that's why we think that this offers one of the opportunities for shippers to look at more equally of spreading traffic between competitors ad I know the railroad business well. We clearly are a competitor in certain markets with the UP.

I can give you an example of -- we were handling Volkswagen automobiles going to Nova Scotia, and competing with the UP in and transit time via Canadian national through Jackson was four days faster, so there are ways you can structure trains, schedules, planning and so on that can make our system competitive.

Are we going to close the gateways at Laredo and Brownsville? Absolutely not. Are UP and B&S, that's still going to be important connections, and U.S. partners for TFM, we plan for that to happen. And what we think is that over time with the new service that we can provide, when it's much more competitive, that we could draw more traffic to the combined system. And we will add more focus on pricing over the combined system.

But does that mean that we're going to take everybody else's business? Absolutely not. That's not going to happen. And I'm not going to identify at this point in time just exactly what the revenue synergies are, because what we've done is we've based this transaction not looking at synergies, and we are saying that it's accretive without synergies.

Tom Waterditz, Bear Stearns [15]

Second question? If I can sneak one last one in here. Can you give us a sense of what the basket is right now in terms of what can be paid dividends from TFM and over what time horizon do you think you can really begin to meaningfully exact cash, because they have a great operating ratio, great tax dividends, do you think at some point you could have a cash payout out of that or pay down debt?

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [16]

I think right now it's pretty premature to think in dividends. Our number one objective is going to be to pay debt down in Mexico. And also, to make capital investments and remember, you can also put capital investments into equipment, and equipment can flow between the different systems, we're a long way, I think, away from worrying about extracting cash out of Mexico.

I have one other thing I might add that I don't think Ron touched on this, but one of the advantages, we think, of rolling these companies together is then having it as a U.S.-based company, as we go to the markets out here,debt markets and so on, that we think we can have a better opportunity to get some better financing opportunities and strengthen the balance sheet and recapitalize longer term, and that's one of the things that we're going to be clearly focusing on, but we did not intend to be paying any dividends or taking any cash out. We're going to be focusing on debt reduction.

Tom Waterditz, Bear Stearns [17]

Congratulations on the transaction, thanks for the time.

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [18]

Thank you.

Orlando Mushan, Great T Capital [19]

Orlando Mushan Great T Capital, how long do you think it will take you to have financing in place, and are you looking at a bond issue or are you going to borrow more from the banks?

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [20]

Okay. Ron, I'm going to let you answer that question.

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [21]

Yeah, thanks, Mike. We're right now in the process of working with our financial advisers, we expect a very near term resolution on this, with the door opening with the consensus yesterday, that gave us the ability to conclude a transaction. So we'll be working with our financial advisers and coming up with a near term plan shortly.

As to the type of instrument, capital raising, we're going to follow right now,

---

I'm not at liberty to say. We thought in the past of debt and equity, and we're pursuing both of those.

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [22]

I might also comment that one of the things we've seen in -- from the publications is that KCS has a 70 debt total cap ratio. And we're not sure where that number comes from, if you look at without leases it's 43% with leases it's been about 58.

If you combined the two systems and took all the debt and equity and figured this out between the two companies, it still comes out to about 58, so we're not sure where the 70 was calculated, but that's a number that keeps showing up. In many publications, and that's where I think people think this company is going to be 70% leveraged, and that's not the case.

Orlando Mushan, Great T Capital [23]

And the second question is regarding the VAT ruling. Is this going to be a final ruling, or can the decision be appealed? And let's say that instead of getting cash, you get to offset the put from the government, does TMM still get an incentive payment or not?

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [24]

I can answer that, Mike.

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [25]

Okay.

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [26]

First off, in terms of the appeal, it is our understanding from our legal advisers that this will be a final decision. It more than likely will be directed to the governments to pay the certificate -- to give the certificate directly to TFM.

Your second part of this question was with regards to, I believe, the incentive payments to TMM. Those incentive payments are not payable unless the VAT is

---

equal to the put. And that begins the mechanism of payment output to TMM.

Orlando Mushan, Great T Capital [27]

What if the payment is not in cash?

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [28]

It is my -- our understanding from our financial -- our legal advisers in Mexico, that if the certificate is received, we have to hold it, and there's been discussion whether we hold it for 60 days or six months, there's some interesting discussion on that, but leave it to be said, once received in hand, it's held and not utilized for payment of taxes, it converts to cash in the six month or sixty day time frame. That's what generates the cash, which we hope is logically offset to the put, and potentially funds to TFM.

Arthur Shield, Roosevelt Investment Group [29]

Yes, Arthur Shield, Roosevelt Investment Group. First of all, congratulations, I think it's a terrific transaction. Three short questions, if I can, first one, is the amount in question on the VAT, in other words, if, in fact, you win, do you win the full amount, including interest and so on, or is that a separate issue that will be addressed?

Michael Haverty, Kansas City Southern - Chairman President and Chief Excutive Officer [30]

I think I can probably address that, the legal counsel that we have in Mexico says that you go back to 1997 when this was first filed and then the value of the VAT at that time was $206 million. And then overtime, this escalates, I think as Ambassador Jones said, that we calculate that value today to be somewhere between 800 and $900 million.

Now, the value of the put, I think last time we looked was about $485 million based on the value of the peso at that time. So, you know, do you end up settling it and getting cash, or do you end up settling it and getting a wash on the settlement. Or just how it works out if that is what works out, we'll see.

But the thing that we're concentrating on at this point in time is the legal process, and the VAT decision. And that's what I think Ambassador Jones was saying that based on his indication, that hopefully in the next 60 days we would have a decision that would come out of Mexico.

Arthur Shield, Roosevelt Investment Group [31]

Okay. And two related questions, looking at your bullet points on the approval process, did I understand it correctly that the TMM bond holders could negate this transaction?

Ronald Russ, Kansas City Southern - Executive Vice President and Chief Financial Officer [32]

That is correct. They do have the ability to not want to exchange their notes. We believe that they now have incentive to be paid in full as a result of the transaction entered between KCS and Group-O TMM. So we're very confident that they will look at TMM being in the position of receiving $200 million in consideration immediately, and being able to use that to take care of their obligations.

Arthur Shield, Roosevelt Investment Group [33]

Thank you. And finally, is the number of shares that TMM will get in this transaction with the stand still agreement, or could they, if they had the wherewithal, buy more stock?

Michael Haverty, Kansas City Southern - Chairman President and Chief Executive Officer [34]

There is a -- if you heard the conference call a week ago, Pepi Serrano was on and talked a bit about the stand still, I will just go over that again, there was a stand still for about six months, at which time he is freed, but he has to sell his shares in a perscribed fashion. TMM has entered into a registration statement which will allow for various disbursements into the public marketplace overtime. He is constrained from selling the controlling block to any interest of strategic or investment -- potential financial investors. Any more questions? Okay, it lasted a little longer than we anticipated. Thank you very much for joining us today. Thank you.

March 5, 2002

Despacho Previo Process Clarified

Previous Article / Next Article / KCS News Menu

KCS with its partners, TM and TFM are second to none in servicing markets in Mexico. At times, the process of clearing southbound cars at the border is confusing. However, as representatives of the NAFTA Railway, it is important for KCS employees to understand this process, which is known as, "despacho previo".

From a transportation standpoint, despacho previo serves two main functions. The first is to notify the broker when cars are billed to Mexico. The second is to release the cars for movement into Mexico when all paperwork between the forwarder, broker and customs is complete. For KCS, notification to the broker begins when a car is billed for movement to Mexico, regardless of origin carrier. When TM receives the waybill transmission, an email notification or "despacho previo notice" is automatically generated to the broker (freight forwarder). This notification begins a flow of paperwork, which when done properly, ensures the car will move transborder without delay.

The following steps occur when pre-clearing a railroad car moving from the U.S. into Mexico:
1. The origin shipper documents the car with the origin railroad carrier and provides the information to the U.S. freight forwarder.
2. The U.S. railroad at the border issues a despacho previo notice.
3. The U.S. freight forwarder furnishes the necessary documentation for an export movement into Mexico (including copies of the waybill) to the Mexican Customs broker.
4. The customer establishes how export duties or other dues will be paid with the U.S. freight forwarder. The Mexican Customs broker pays the import duties.
5. The Mexican Customs broker pre-documents the shipment with Mexican Customs.
6. The Mexican Customs broker pre-documents the shipment with TFM.
7. The Mexican Customs broker delivers the pre-filed documentation to the U.S. freight forwarder.
8. The U.S. freight forwarder delivers copies of all documents to the U.S. connecting railroad at the border, and pays any document delay or demurrage/per diem, if applicable.
9. Finally, the U.S. railroad pre-notifies the car to cross into Mexico.

With despacho previo, cars cross into Mexico for final delivery without being detained at the border. The exception to this process is when Mexican authorities (Hacienda = Treasury) randomly check cars at Nuevo Laredo. Once the car is cleared for Mexico and TM receives the necessary information from the forwarder, a release is entered into their computer system, which automatically updates the KCS system and allows KCS operating personnel to move the car to Mexico.

While the steps for clearing a car into Mexico are clearly defined, the process can be delayed when documents and payments are not received in a timely manner. Long ago, KCS determined that it would not allow uncleared cars to move to TM, so KCS holds all uncleared cars at its Beaumont Yard. This is to prevent congestion on TM, to promote the free flow of traffic to and from the border, and to facilitate the movement of cars held for document delay. KCS has the ability to switch cars from a hold track and to move them toward Mexico within 24 hours after release. Cars delayed at Beaumont are almost always delayed due to clearance problems.

KCS offers a number of other services of which customers may not be aware. Unlike other railroads, KCS and TM offer free time of 72 hours, or the time needed for the car to reach Beaumont, depending on which is greater. Since KCS generates notification at the time of billing, this can add many days free time to the clearance process. KCS' Customer Service Center also proactively monitors the cars being held for clearance into Mexico and will even

provide interface between the shipper and forwarder to ensure paperwork problems are held to a minimum. Document delay charges on TM are significantly less than other railroads.

An upcoming issue of the *KCS News* will outline the process for moving cars northbound from Mexico to the United Sates and the Automated Manifest System, which was implemented in 2001.

NAFTA Railway Partners Reflect and Pursue New Opportunities

Previous Article / Next Article / KCS News Menu

On July 28th, NAFTA Railway alliance partners KCS, TFM and Tex Mex met in Houston for a quarterly meeting to pursue new opportunities for NAFTA Railway growth. Operating, marketing and customer service representatives were present to discuss, among other topics, freight traffic opportunities both north and southbound. All partners agreed that there are tremendous opportunities to grow the business and improve service, especially in conjunction with the recent alliance with BNSF, as well as more established alliances such as those with CN, NS and IMRL.

Recently, the synergies of the three partners have again proven successful with the operational improvements seen on Tex Mex since March. The three groups reported on efficiencies already in effect, such as the consolidation of KCS and Tex Mex dispatching, crew calling and timekeeping to KCS' System Transportation Center in Shreveport.

Since the consolidation, customer service representatives from all three partners, talk weekly about the joint operation. "The team has developed a seamless, one-stop customer service approach for moving traffic in and out of Mexico on the NAFTA Railway," said Jan McNeal, KCS' AVP customer service. "Each week, the team covers service performance related to KCS' new pre-blocking plan for traffic going southbound into Mexico, despacho previo and clearances that will help expedite traffic, technology updates such as Electronic Data Interchange (EDI) performance and billing, as well as current customer issues. The team will continue to resolve issues and provide regular updates to senior leadership."

Since the meeting, KCS and Tex Mex have begun working on an initiative with TFM to create a similar plan for operational efficiency going northbound, to include the possibility of TFM pre-blocking traffic to save handling and transit time on traffic moving from Mexico to the US Markets.

In a final note regarding the NAFTA Railway Alliance meeting, another key topic was that of future projects like the implementation of MCS on KCS this summer and on Tex Mex later this year. The shared computer system will help KCS and Tex Mex to provide more accurate and timely information to customers, and further improve the convenience of doing business on the NAFTA Railway.

State of the Railroad: From the Desk of Michael R. Haverty, Chairman, President and CEO

Previous Article / Next Article / KCS News Menu

As we near the end of 2002, I would like to share with you my thoughts on the state of the railroad, and where I believe we need to be headed next year.

This year is best described as a pivotal turning point. In 2002, we set out to strengthen our balance sheet by increasing revenue, decreasing expenses and paying down debt. A variety of initiatives targeted at meeting these objectives were implemented and significant progress was made. In 2003, we must seize this opportunity to build on our progress, especially taking advantage of the tools now available to us and moving full speed ahead.

In the transportation industry, freight scheduling technology is the greatest opportunity to improve customer service and decrease operating costs. On a technology scale of one to ten, KCS instantaneously went from a one to a ten with the cutover from the Legacy System to the state-of-the-art, operating system, MCS. We are long past the point of implementation. Now, with a comprehensive understanding of our customers' needs, we must utilize the more accurate and timely information provided by MCS to plan and then execute with discipline, in order to meet our customers' requirements. More timely and reliable service gives us the ability to simultaneously grow our revenue and reduce our costs. This spring, MCS will be implemented on Tex-Mex, and on TFM in the fall, further extending the power of information for creating seamless interchange among our family of railroads.

For the customer, MCS offers the greatest benefits to the most service sensitive traffic. The largest growth potential for this type of traffic is over the Meridian to Dallas and Meridian/Jackson to Laredo corridors. In the year ahead, enhancements to the Meridian Speedway, such as added capacity and sidings, will provide a turning point toward improving transit times to better serve existing customers, as well as to support new business, such as the Nissan plant in Canton, Miss. By the second quarter, 12 power-assisted switches will be installed in dark territory on the Vicksburg and Meridian Subdivisions, allowing train crews to control the switches within their authority from the lead locomotive on their train instead of on the ground. New tracks will be added through and to the west end of Jackson's High Oak Yard to facilitate traffic flow between the yard and the transload facility, which will also be expanded. The Jackson transload facility is one of the most significant revenue-generating links in KCS' Transload Center (TLC) network.

KCS continues to reap the benefits of its investment in Mexico, as traffic continues to grow at 15 percent a year. Our working relationship with TFM has become very close in 2002, and we expect to further strengthen and build this relationship in 2003. With the reauthorization of the Transportation Equity Act for the 21st century (TEA-21) legislation and other legislative efforts, KCS could seek public participation in several projects, including Tex-Mex projects that would benefit both the public and KCS.

KCS' alliance with CN remains advantageous for both partners - a relationship that will celebrate its fifth anniversary in early 2003. Our alliance with IC&E has already seen huge gains in grain

traffic, while our alliance with BNSF is just beginning to pick up steam. These strategic alliances continue to strengthen our position as the NAFTA Railway, and when fully realized will promote greater industry cooperation, increase revenue and extend market reach.

In 2003, BELTPACK will be one of the most effective tools for KCS reducing yard incidents and providing productivity gains. We will have 57 jobs in 21 yards operating BELTPACK locomotive remote control systems. KCS must fully utilize BELTPACK to remain competitive.

Everyday, we build for the future, a culture in which safety is a value, not a priority subject to change. In 2002, attentions were diverted and individual safety performance suffered as a result. However, progress is already being made with extensive training in all craft areas and enhancement of the operations testing process. The derailment prevention initiative that began this year demonstrated a 50 percent cost reduction for reportable derailments. Practice of Responsible Care codes is 85 percent in place, and as of November, crossing collisions have decreased year over year by 16 percent. KCS further extends outreach efforts into the community with education, training and local coordination. The combined efforts of all employees will help KCS to achieve our safety vision of becoming the safest railway in North America.

Finally, in the first half of 2003, KCS will implement Enterprise Workforce Management (EWM), a computerized system to increase payroll accuracy and timeliness, and provide daily operations expense reports to improve the management of the railroad. In scope and investment, EWM is second only to MCS. This state-of-the-art system will play a major role in assuring that each paycheck is right and on time.

While these investments provide tremendous opportunities to improve service to customers and increase shareholder value, KCS like the rest of the industry and North America face some daunting challenges. For yet another year, the economy remains uncertain, as does the potential for acts of terrorism. In response, we will continue to tighten our belts and tighten the reins on security. Our industry has been repeatedly complimented for the security measures taken, but we must not let down our guard. The key is cooperation between shippers and carriers to certify a shipment at origin and ensure its security throughout the trip to its ultimate destination.

The steps we must take to succeed in 2003 are clear. Every KCS employee must understand how his/her role affects both revenue and expenses. We must focus on understanding and serving our customers' needs and meeting their requirements consistently. By doing so, we will move in the right direction toward critical measures, such as improving safety performance, decreasing dwell time, completing work orders promptly and improving on-time origins and departures. By working together, communicating and utilizing the technology available to us, we will at the close of 2003, be able to say that we have accomplished much.

On behalf of our board of directors and senior management, I would like to express our heartfelt thanks to KCS' employees and friends who have donated financial resources, as well as to those who have tirelessly volunteered their time to ensuring the success of the 2002 Holiday Express. This project generates tremendous goodwill in many of the communities KCS serves and provides assistance to families in need during the holiday season through contributions to The Salvation Army. Your efforts are important to our Company and to the greater community.

As stated on the back of the 2003 KCS calendar, the men and women of the NAFTA Railway are the heart, soul and backbone of our operation and our most valuable resource. I want to take this opportunity to salute your efforts, thank you for your dedication to our customers and wish you a safe and happy holiday season. Right now is the turning point toward a more successful future for our railroad.

KCS, TFM move toward more seamless operation

Previous Article / Next Article / KCS News Menu

This week marks another important step toward creating a more seamless NAFTA Railway operation. TFM officials, Manuel Zulaica, chief transportation officer, Federico Diaz, director fleet management and transportation support, and Steve Radney, project leader, are at KCS' corporate headquarters in Kansas City, Mo., working with Scott Arvidson, KCS chief information officer, and others to formulate a business case for implementing the Management Control System (MCS) on TFM.

Although MCS is a state-of-the art computer operating system that has been successful on KCS, TFM has different opportunities for cost reduction and improved business value that must be considered in the planning stages. The two companies are establishing templates for various components of the project plan, including system integration, change management and training. For each component, effort, expenses and benefits are analyzed. This meeting is one of many steps toward a projected implementation of MCS on TFM in first quarter of 2004.

Re: Kansas City Southern/NAFTA Rail,
Finance Docket No. 34342

Dear Secretary Williams:

I am Logistics Manager for Agriliance, LLC. We are involved in regular rail trade of fertilizer products to destinations in Mexico.

Agriliance is the agronomy marketing joint venture owned by Land O'Lakes, Inc., Arden Hills, MN; CHS Cooperatives, Inc., St. Paul, MN; and Farmland Industries, Kansas City, MO. Agriliance markets crop nutrients, crop protection products, seed (through Croplan Genetics) and related agronomy services to farmers and ranchers through local cooperatives and independent dealers in all 50 states, Canada and Mexico.

A large percentage of our traffic to Mexico originates on the Union Pacific Railroad.

Agriliance is very much in support of the creation of NAFTA Rail provided the NAFTA Rail carriers agree not to discriminate against traffic originating on the Union Pacific and if TFM continues to support competitive UP-TFM services and rates.

Agriliance is concerned however, that the NAFTA Rail carriers will have opportunities and incentives to undermine competing service on TFM-UP routes. We believe that NAFTA Rail carriers should be willing to back their commitments regarding competitive issues with enforceable conditions or agreements which will insure that the NAFTA Rail carriers will not discriminate against Union Pacific traffic and that TFM will continue to support competitive UP-TFM services and rates.

Provided the board can appropriately secure the competitive structure described, Agriliance supports of the creation of NAFTA Rail.

I, Tracy Mack, declare under penalty of perjury that the foregoing is true and correct. Further I certify that I am qualified and authorized to file this verified statement. Executed on July 22, 2003

July 25, 2003

The Honorable Vernon A. Williams
Secretary
Surface Transportation Board
1925 K Street, N.W.
Washington, D.C. 20423

Re: Finance Docket No. 34342, *Kansas City Southern/NAFTA Rail*

Dear Secretary Williams:

This letter is being submitted in response to the Board's request for comments relating to the July 31, 2003 public hearing on Kansas City Southern's ("KCS") plans to acquire control of Texas Mexican Railway ("TexMex") and the Transportacion Ferrovaria Mexicana ("TFM"). As explained below, AK Steel does not oppose this transaction, provided that the Board assures that the approval of the transaction will not result in any service or competitive harms to our service.

AK Steel is engaged in the production of flat-rolled carbon, stainless and electrical steels for use in automotive, appliance construction and manufacturing markets. AK Steel employs approximately 11,500 men and women at major steel-working plants and offices in Indiana, Kentucky, Ohio and Pennsylvania. These plants include AK Steel's manufacturing facilities at Rockport, Indiana, Middletown Works and Zanesville, Ohio, and Butler, Pennsylvania. AK Steel relies on railroad transportation to deliver its steel products to end-users located throughout the United States and Mexico. This transportation includes AK Steel shipments of approximately 120,000 tons of rolled steel per year to Mexico.

Currently, AK Steel transports its products to Mexico pursuant to a rail transportation agreement under which CSX Transportation, Inc. ("CSXT") originates steel products from the Middletown Works and Rockport Plants and transports them to Salem, Illinois, where the steel is interchanged to the Union Pacific Railroad Company ("UP"). UP then transports the steel to Laredo, Texas, where it is interchanged with TFM at the International Bridge for final delivery to various manufacturing concerns in Mexico, including General Motors. AK Steel has several alternative routings that are available to move its product to the

Mexican gateway, including routes that involve originations on the Norfolk Southern Railway ("NS"), and/or joint-line movements involving BNSF or KCS.

One of AK Steel's primary concerns in transporting steel products to Mexico is transit time. The transit time of these shipments is affected by a variety of factors, most notably including the amount of time taken to interchange with TFM at the International Bridge at Laredo. AK Steel is concerned that once the formation of the NAFTA Railway is completed, TFM will favor traffic that originates on its affiliated companies, i.e., KCS and TexMex, over interchange traffic received from UP or The Burlington Northern & Santa Fe Railway Company ("BNSF"). If such discriminatory practices occur, there would be a detrimental impact on cycle times, which in turn would greatly impact AK Steel's ability to obtain reliable and efficient transportation service into Mexico.

In addition, AK Steel is concerned that the formation of the NAFTA Railway could impact on the ability of competing carriers to provide service to Mexico on commercially reasonable terms. As noted above, AK Steel currently has a variety of alternative transportation routings that it can use to transport its products to Mexico. The combination of KCS/TexMex/TFM, however, presents an incentive for TFM to favor KCS/TexMex to the detriment of other carriers, like UP and BNSF, that connect with TFM at the Laredo Bridge. In so doing, TFM can exercise bottleneck control to assure that AK Steel's only transportation options will be those involving the NAFTA Railway. Such practices would greatly limit UP's and BNSF's ability to provide competitively priced service for AK Steel's transportation needs to the Mexican gateway.

At various times in this proceeding, KCS has represented that it would not "make any changes in the way the Laredo Bridge is dispatched and operated," and that it would "keep the Laredo gateway open on commercially reasonable terms." AK Steel believes that each of these commitments is critical to assuring that the creation of the NAFTA Railway does not harm AK Steel's ability to move its products into Mexico efficiently and at competitively priced transportation rates.

Accordingly, AK Steel hereby requests that the STB condition any approval of the KCS' acquisition of control of TexMex and TFM to protect shippers like AK Steel from potential discriminatory service and pricing practices relating to the Mexican gateway. AK Steel specifically requests that the Board

impose conditions that assure that all carriers interchanging traffic at the Laredo bridge be treated fairly by TFM. In addition, AK Steel requests that the Board impose a condition that prevents TFM from exercising bottleneck control. There are currently three carriers that can be used to reach the Mexican gateway at Laredo. Any approval of the acquisition of control sought by KCS must assure that all of these carriers can continue to provide service at commercially reasonable terms.

Thank you for your consideration and attention to this matter.

Sincerely,

Gary L. Kidwell /gk

Honorable Vernon A. Williams
Secretary
Surface Transportation Board
1925 K Street, N.W.
Washington, D.C. 20423

Re: Kansas City Southern/NAFTA Rail,
Finance Docket No. 34342

Dear Secretary Williams:

My name is Robert Bartol. I am the Manager of Transportation Services for Badger Mining Corporation.

Badger Mining is a privately held international corporation that manufactures industrial silica sand, limestone, zeolite, and other aggregates. Our primary industrial markets include hydraulic fracturing, gravel packing, foundry core and molding applications, industrial and construction fillers, boiler sand, wet grinding media, and fluxing agents. Our products are also used for environmental purposes, such as water filtration, sewage treatment, monitoring wells, remediation wells, and odor control.

Badger Mining ships approximately 40-50 cars per week to Mexico. Our Mexico business consists primarily of silica sand moving to foundries served by TFM in Monterrey and Saltillo. The sand is used in castings to make engine parts for the auto industry. This traffic moves most efficiently from our Fairwater Plant in Wisconsin via the Chicago and Laredo gateways.

We are concerned that the proposed NAFTA Rail transaction might affect the rates and service that UP can offer for our shipments moving over the Laredo Gateway. Our Mexico traffic moves over the Chicago Gateway, so it is susceptible to routings involving KCS. If the NAFTA Rail transaction improves those routings, we would welcome the additional competitive options. However, Mexico is an important growth market for Badger Mining, and we want to ensure that the transaction does not interfere with our ability to use the existing, efficient UP-TFM service.

We understand that KCS has offered several commitments to preserve efficient UP-TFM service over the Laredo Gateway and in Mexico. We appreciate those commitments, but we believe that the Board should make those commitments solid and enforceable. It is our experience in the railroad business that there are many subtle ways to discriminate against competition, so clear,

Our mission is to become the quality leader in the industrial minerals industry with a team of people committed to excellence and a passion for satisfying our customers.

enforceable standards are important. KCS and its partners should be required to provide UP with a fair share of the capacity at Laredo Bridge, continue to cooperate with UP with respect to the service that TFM provides in Mexico and not discriminate against UP routings in terms of service, and provide UP with competitive rate factors for UP-TFM routings via the Laredo Gateway. The Board should solidify these requirements by making them enforceable conditions to its approval of the KCS Application.

Thank you for considering our views.

I, Robert Bartol, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this ~~verified statement~~.
Executed ~~on July 29~~, 2003.

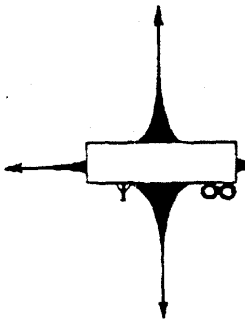
June 27,2003

Dear Sir:



Chicago Sweeteners, Inc is the parent company of Batory De Mexico, which is a manufacturer of food products located in Matamoras MX. We have been a steady shipper of manufactured food products to and from Mexico since 1997. In doing so Batory De Mexico has relied on the Union Pacific and TFM rail systems for an important segment of its logistics network.

Batory De Mexico has learned that the Kansas City Southern Railroad has recently proposed a transaction that would result in its acquisition of Transportacion Ferroviaria Mexicana and the Texas Mexican Railway, and the operation of the three railroads as **NAFTA Rail**. While Batory De Mexico is not opposed to mergers and acquisitions we are opposed strongly to unfair practices in the logistics of border crossings via Union Pacific Railroad. Anything that would discriminate against Union Pacific would be a direct discrimination against all that use its lines to ship to and from Mexico.

Batory De Mexico feels very strongly that any approval of the merger of the KCS, TFM, and the Tex-Mex must be conditioned upon the binding commitment of NAFTA Rail that it will not engage in **unfair practices** to those of us who use Union Pacific to reach Mexican markets or the U.S.. Free trade between our company and companies in Mexico and the U.S. is very important. Unfair practices at the border crossing would greatly impair that business. The service that we have enjoyed over the last 4 years via the existing rail lines has been very efficient. We ask that whatever ventures are allowed in the future that you keep the efficiencies and competitiveness in place for all rail lines.

Sincerely,

Robert V. Tinkham

Re: Kansas City Southern/NAFTA Rail,
Finance Docket No. 34342

Dear Secretary Williams:

My name is Stephen Shaw, and I am the Sales Manager here at Concannon Lumber. We do significant business with Mexico currently and expect that component of our business to do nothing but grow. I expect the proposed NAFTA rail transaction, which will result in KCS acquiring control of Tex Mex and TFM, will affect rail transportation between the United States and Mexico. As a result, we are taking this opportunity to communicate our views to the Surface Transportation Board.

We support all efforts to guarantee that there will be competitive and efficient rail service via the Laredo Gateway. Any restrictions on access to the Gateway will have a negative impact on our business as well as that of our suppliers and receivers. UP today provides U.S.-Mexico service with TFM via Laredo. I understand that KCS has given assurances to the STB that it will work with UP so that UP-TFM service via the Laredo gateway will be handled fairly, efficiently and without discrimination. Therefore, we ask the STB to impose conditions on approval of the transaction. Those conditions will ensure that we continue to receive efficient UP-TFM service offerings. In short, we ask that the STB require the KCS and its partners to commit in concrete and enforceable terms to competitive rail service between the U.S. and Mexico.

We ask that the STB require NAFTA Rail to abide by KCS's promises to provide the following:

- Fair Treatment and Efficient Operations at the Laredo Bridge
- Non-Discrimination for Service in Mexico
- Equitable and Competitive Rate Factors for UP-TFM Routings via the Laredo Gateway

I appreciate the Board's consideration of these views.

Sincerely,

Stephen Shaw, Sales Manager

FMC

July 17, 2003

Honorable Vernon A. Williams
Secretary
Surface Transportation Board
1925 K Street, N.W.
Washington, D.C. 20423

Dear Secretary Williams:

This is in reference to Kansas City Southern/NAFTA Rail Finance Docket No. 34342.

My name is John L. Abbott, Distribution Strategy Manager for FMC Corporation, which is located at 1735 Market Street in Philadelphia, PA 19103. FMC is the world's largest producer of natural soda ash (sodium carbonate; STCC 2812322) and is the market leader in North America. We manage one of the industry's largest and private covered hopper car fleets to transport this commodity from our mines in Westvaco, WY to domestic and international markets. FMC is a member of ANSAC (American Natural Soda Ash Corporation), which markets soda ash to worldwide markets. These exports move in trainload quantities from Wyoming to ports located on the west coast and in the Gulf. FMC also moves over 100,000 tons a year via the Laredo, TX interchange to markets located in Mexico.

FMC supports the creation of the NAFTA rail system as long as it does not discriminate nor disadvantage the UP at the International Bridge at Laredo. The Surface Transportation Board needs to ensure shippers such as FMC that the UP-TFM services and rates remain competitive with NAFTA Rail.

I, John L. Abbott, declare under penalty of perjury that the foregoing is true and correct. Further I certify that I am qualified and authorized to file this verified statement executed on July 17, 2003.

Re: Kansas City Southern/NAFTA Rail
Finance Docket No. 34342

Dear Secretary Williams:

My name and position title is Karl L. Shetler, General Manager-Transportation for General Chemical Industrial Products, Inc., 90 East Halsey Road, Parsippany, NJ 07054. I have been the General Manager-Transportation for 17 years, responsible for finished product and raw material transportation costs and service.

General Chemical Industrial Products is a leading producer of soda ash and calcium chloride in North America. Soda ash is used in the manufacture of glass, sodium-based chemicals including baking soda, detergents, paper and many familiar consumer products. Calcium chloride is used primarily in highway and road maintenance for dust control and roadbed stabilization during the summer and for de-icing during the winter.

The Company's active soda ash facility is located in Green River, WY. This location is the third largest soda ash facility in North America with an annual production capacity of 2,800,000 NT. Our primary mode of shipment is via rail in private cover hopper cars. In 2002 we shipped in excess of 20,000 railcars from our Green River, WY location which is serviced by the Union Pacific Railroad (UP). The Company is a member of ANSAC, a soda ash export cooperative organized in 1984 under the Webb-Pommerene Act. Through ANSAC a portion of our Wyoming shipments are directed to Mexico via the Laredo, TX rail gateway.

The purpose of this letter is to provide our comments regarding the impact of the Kansas City Southern's (KCS) proposed acquisition of the Transportacion Ferroviaria Mexicana (TFM) and The Texas Mexican Railway (TexMex). Finance Docket No. 34342 considers approval by the Surface Transportation Board of the application by the KCS for this new entity to be called "NAFTA Rail".

The UP currently has coordinated service with the TFM set up via Laredo, TX, including several daily run-through trains with pre-blocking of railcars. The UP has spent significant capital to improve border facilities and to automate customs activities to help the flow of international shipments between the U.S. and Mexico. There is significant automotive, grain and intermodal traffic shipped via the UP-TFM route through Laredo. Our ANSAC shipments to Mexico are routed in this same manner.

Our Company requests that the Surface Transportation Board impose specific conditions on the approval of this application by the KCS to ensure continued competitive and efficient rail service via the Laredo gateway for customers using the current UP-TFM rail routing.

Sincerely yours,

General Chemical Industrial Products, Inc.

Karl L. Shetler

Karl L. Shetler

Global Motors

Honorable Vernon A. Williams
Secretary
Surface Transportation Board
1925 K Street, N.W.
Washington, D.C. 20423

July 21, 2003

Re: Kansas City Southern/NAFTA Rail,
Finance Docket No. 34342

Dear Secretary Williams:

I am Peter Rafael Rodriguez. Our company, Global Motors S.A. de C.V., has an established and growing business with Mexico. I expect the proposed NAFTA rail transaction, which will result in KCS acquiring control of Tex Mex and TFM, will affect rail transportation between the United States and Mexico. As a result, we are taking this opportunity to communicate our views to the Surface Transportation Board.

We support all efforts to guarantee that there will be competitive and efficient rail service via the Laredo Gateway. Any restrictions on access to the Gateway will have a negative impact on our business as well as that of our suppliers and receivers. UP today provides U.S.-Mexico service with TFM via Laredo. I understand that KCS has given assurances to the STB that it will work with UP so that UP-TFM service via the Laredo gateway will be handled fairly, efficiently and without discrimination. Therefore, we ask the STB to impose conditions on approval of the transaction. Those conditions will ensure that we continue to receive efficient UP-TFM service offerings. In short, we ask that the STB require the KCS and its partners to commit in concrete and enforceable terms to competitive rail service between the U.S. and Mexico.

We ask that the STB require NAFTA Rail to abide by KCS's promises to provide the following:

- Fair Treatment and Efficient Operations at the Laredo Bridge
- Non-Discrimination for Rates and Service in Mexico
- Equitable and Competitive Rate Factors for UP-TFM Routings via the Laredo Gateway

I appreciate the Board's consideration of these views.

Sincerely,

Rafael Rodriguez

Re: Kansas City Southern/NAFTA Rail
Finance Docket No. 34342

Dear Secretary Williams,

I am Mike Gilbert and I am Senior Product Manager for Griffin Industries in Cold Spring, KY. My company is manufacturer of animal proteins and fat. We ship approximately three to four hundred railcars per year to Mexico. Most all of this routed over the Union Pacific Railroad.

We have some concern over the proposed NAFTA RAIL. Specifically, we do not want to be put in a situation where rates will increase sharply and make it more difficult to do business. We wish to state our support for conditions that will guarantee continued competitive, efficient UP-TFM rail service via the Laredo gateway and that NFTA Rail will abide by KCS's promises. If this is done, we are then in support of the proposal.

I, Mike Gilbert, declare under penalty of perjury that the foregoing is true and correct. Further I certify that I am qualified and authorized to file this verified statement. Executed on July 14, 2003

RE: *Kansas City Southern -- Control -- The Kansas City Southern Railway Company, Gateway Eastern Railway Company, And The Texas Mexican Railway Company* (STB Finance Docket No. 34342)

Dear Mr. Williams:

This is to further supplement my earlier letter to you dated April 28, 2003 (copy attached) whereby Hub Group has registered its support for the KCS control application.

This is to further clarify our position whereby Hub Group also strongly supports conditions that will guarantee continued competitive and efficient UP/TFM rail service via the Laredo gateway. We believe the UP connection at Laredo must be preserved, as it is vitally important to the continued success of NAFTA.

Please consider our views.

Re: Kansas City Southern/NAFTA Rail,
Finance Docket No. 34342

Dear Secretary Williams:

I am William J. McGinn, Director of Distribution for IMC Chemicals Inc. IMC Chemicals Inc. operates a chemical manufacturing facility in Trona California and its cooperate office is located in Overland Park Kansas. Our facility in Trona California manufactures approximately 1,700,000 tons of chemicals including sodium carbonate, sodium sulfate and various sodium borates. Our products are shipped through out North America and to 30 countries around the world.

IMC shipments to Mexico of sodium sulfate and sodium borates total approximately 20,000 tons annually. All shipments are made via the Union Pacific Railroad and the Laredo Texas gateway is used exclusively.

While IMC supports the proposed NAFTA rail transaction, IMC is very concerned about the effect of the merger on UP customers using the Laredo Texas gateway. IMC hopes the Surface Transportation Board proposes conditions that ensure that NAFTA Rail lives up to the stated Kansas City Southern Railway Company commitments.

I, William J. McGinn, declare under penalty of perjury that the foregoing is true and correct. Further I certify that I am qualified and authorized to file this verified statement.

Secretary
Surface Transportation Board
1925 K Street, N.W.
Washington, D.C. 20423

Re: Kansas City Southern / NAFTA Rail,
Finance docket No. 34342

Dear Secretary Williams:

My name is William Knichel, and I am President and CEO of Knichel Logistics, LP, a transportation company based in western Pennsylvania.

We are active in arranging for the transportation of goods to and from Mexico for a major shipper and manufacturer of power tools via the gateway of Laredo, Texas. Currently we are quoting on potential rail volumes of 20-50 shipments per day. In the past we have moved various other commodities to include furniture, chemicals and other finished goods.

My concern is regarding the recent proposed NAFTA rail transactions that may affect the competitive impacts of rail service via the Laredo gateway. It is of the utmost importance that their be clearly defined controls regulating the fair handling of traffic between the Union Pacific Railroad and the NAFTA Rail. Otherwise our customers will be held captive to a monopoly of rates and services that can undermine the current benefits of utilizing the Laredo gateway.

In order to protect our interest as well as the interests of our manufacturing partners in Mexico, we request that their be enforceable terms established for the fair handling of service between the KCS-TFM option that the NAFTA Rail transaction might bring and the UP TFM for service between Mexico and the U.S. via the Laredo bridge.

I, William Knichel, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this verified statement. Executed on July 24, 2003.

RE: Kansas City Southern/Nafta Rail
Finance Docket No. 34342

Dear Secretary Williams:

My name is Edwin E. Vigneaux, Traffic Manager for Reagent Chemical & Research, Inc., responsible for rail transportation.

Reagent Chemical is a distributor of Hydrochloric Acid (HCL), doing business in North America. We are currently exporting approximately 5,000 tons of HCL to Mexico and occasionally importing small amounts of HCL from Mexico. The HCL we ship to and from Mexico is routed via UP-TFM or KCS-TFM, via the Laredo gateway.

This letter concerns the announced plans of the Kansas City Southern (KCS) to acquire control of the Transportacion Ferrovaria Mexicana (TFM) and The Texas Mexican Railway (Tex-Mex), thereby operating all three railroads as "NAFTA Rail". Reagent Chemical is not opposed to this acquisition. We believe the joining of these three railroads will offer competitive and safe transportation of our product between the United States and Mexico.

However, we do have concerns that the ownership of the International Bridge at Laredo be under the sole control of the NAFTA Rail carriers, and that those controlling the bridge continue to offer the UP complete and uninhibited access to the bridge crossing. In order for our company to receive the most economical and consistent transportation of our product to Mexico, we must have open competition between the UP and the NAFTA rail carriers. We believe the only way to achieve this is for the NAFTA carriers to keep this gateway open on commercially reasonable terms.

Reagent Chemical & Research, Inc.
Registered to ISO 9002
File # A6831

We understand that the current KCS management has promised the UP neutrality and non-discrimination of current and future traffic flows. We would prefer that the KCS make these promises concrete and enforceable through private agreements or through conditions prescribed by the STB. If the KCS agrees to make these conditions enforceable, then shippers like Reagent would be assured of having the UP-TFM option that is in place today, as well as whatever improved KCS-TFM option the NAFTA rail transaction might bring. We at Reagent Chemical urge the STB to ask the KCS and its partners to commit to concrete and enforceable terms and that current service between the U.S. and Mexico be preserved by preventing discrimination against the UP at the International Bridge in Laredo.

I, Edwin E. Vigneaux, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this verified statement. Executed on July 10, 2003.

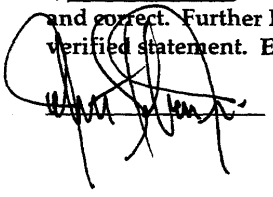
Re: Kansas City Southern/NAFTA Rail,
Finance Docket No. 34342

Dear Secretary Williams:



I am John Staben, Jr., Distribution Specialist at Solvay Engineered Polymers. We are a plastics manufacturer.

We ship railcars to Mexico City and Monterrey to support our Automotive customers. Our business consists of plastics to Mexico from the Midwest. Our shipments move via the Laredo gateway into Mexico.

I understand that Kansas City Southern (KCS) is asking for approval to acquire control of the The Texas Mexican Railway (Tex-Mex) as well as the International Bridge at Laredo and the Mexican railroad that also serves the Laredo gateway, the TFM. My company is not opposed to this transaction, if there are firm and enforceable conditions established by the STB which will require KCS to operate the Laredo bridge and the connection with TFM fairly and without discrimination so the current service offered by UP-TFM over this gateway can continue to be offered efficiently and without interference.

The major concern for us is the potential congestion at the border in Laredo, Texas. Our shipments must be delivered in a timely manner so that our customers continue to buy product from us. We rely on efficient transportation over the gateway. We expect KCS to agree to conditions that will preserve and improve the efficient use of the Laredo Bridge.

I, John Staben, Jr., declare under penalty of perjury that the foregoing is true and correct. Further I certify that I am qualified and authorized to file this verified statement. Executed on July 23, 2003 .

Re: Finance Docket No. 34342

Dear Secretary Williams:

I am Vice President/Distribution of Unimin Corporation. Unimin is one of the nation's largest suppliers of industrial minerals. We mine industrial minerals from over forty locations in the United States. Our products include, among other things, a wide variety of industrial sand, ball clay, feldspar, kaolin, high purity quartz, olivine, bentonite and dolomite. I am writing because we are concerned that Kansas City Southern's (KCS") proposed acquisition of Transportación Ferroviaria Mexicana ("TFM") could raise the cost of shipping industrial minerals to Mexico, which in turn would adversely affect Unimin's business.

Ball Clay

Ball clay is used to make ceramic tile and sanitaryware (toilets, sinks, tubs, etc.). Much of North America's production of ceramic tile and sanitaryware used to be in the Midwestern United States. Over the last 10 years or so, many manufacturers have moved these operations to Mexico, especially the Monterrey area.

Unimin produces ball clay at Gleason, Tennessee, as do three competitors, K-T Clay Corporation, Old Hickory Clay Company, and H.C. Spinks Clay Company. All four Gleason, Tennessee producers are on the CSX line. That line connects to various other carriers, including KCS. In addition, Unimin produces ball clay at Troup, Texas; our plant there is on the Union Pacific ("UP") line.

Our Troup, Texas plant has a transportation advantage over the Tennessee producers for shipments into Mexico by reason of its relative proximity. Accordingly, in 2002, approximately 59 percent of the Troup plant's revenues were from sales to customers in Mexico. About 47 percent of the Troup plant's revenues are from sales to a single customer –

Dal-Tile in Monterrey. Our customers in Mexico purchase f.o.b. our plant and arrange their own freight. Freight costs for customers in the Monterrey area are almost as much as the cost of the ball clay itself. Truck transportation is not a viable option for these customers, because it is approximately twice as expensive as rail.

Ball clay from the Gleason, Tennessee area is still an excellent substitute for ball clay from our Troup, Texas plant, however. The Tennessee deposits are of a higher quality, and the Tennessee producers enjoy certain efficiencies that allow them to sell at a lower price. Accordingly, a very small change in delivered prices (about half of which are freight) would induce Dal-Tile and other Mexican customers to switch their purchases from our Troup plant to one of the Tennessee plants.

Shipments from our Troup plant to the Monterrey area travel on the UP to Laredo, Texas, and then to Monterrey on the TFM. This is a well-traveled route with consistent service, particularly because UP has invested heavily in the infrastructure at Laredo.

Until now, TFM has had no reason to favor ball clay shipments that originate in Tennessee over shipments that originate in Texas, or vice versa. Following the proposed transaction, TFM will have reason to favor KCS, because they will be under common ownership. If the combined entity raises the price of transporting Unimin's Troup, Texas ball clay from Laredo to Monterrey or uses its control over the Laredo Bridge to make UP's service slower or less predictable, Mexican tile and sanitaryware producers may shift to the Tennessee producers. This will benefit KCS because KCS can carry Gleason, Tennessee ball clay from New Orleans, Louisiana (where CSX connects to KCS) to Laredo. Similarly, TFM and KCS could offer preferential traffic packages to Tennessee customers to enable KCS to carry Gleason, Tennessee ball clay from New Orleans to Laredo.

If Dal-Tile, which is by far the Troup plant's largest customer, were to shift to another supplier, the Troup plant likely would not be viable, and twenty-six Unimin jobs in Troup, Texas would be lost. If this were to happen, TFM would still be shipping the same volume of ball clay into Mexico, but KCS would be shipping more than it currently ships.

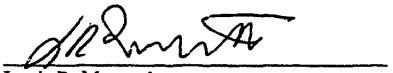
We note that UP could carry ball clay from Troup to Eagle Pass, and connect to Ferrocarril Mexicano ("FXE"), which could then haul it to the Monterrey area. However, this FXE routing has several significant disadvantages. First, it is more circuitous, which means that shipments will take longer and cost more. Second, shipments from the United States move much more quickly through Laredo than through Eagle Pass (or Brownsville, for that matter) because there has been much more investment at Laredo. In this business, time is money, and slower service is a significant disadvantage. Similarly, because ball clay moves in carloads instead of unit trains, the less frequent service on the Eagle Pass-FXE route is also a disadvantage. Since the Eagle Pass-FXE route is used much less intensively than the

Laredo Bridge, it takes longer on the FXE routing to assemble a trainload of empty cars to return from Mexico to the United States, thus further slowing the cycle time and increasing costs.

Fracturing Sand

Fracturing sand, sometimes known as frac sand, is a type of industrial sand. Fracturing sand is used in secondary recovery for oil and gas wells. Unimin is the largest supplier of fracturing sand in the United States. About 10 percent of the fracturing sand revenues at Unimin's principal fracturing sand plants, located in Kasota and Ottawa, Minnesota, is for shipments to Mexico. Those plants are on the UP. Unimin's main competitor in this area, Badger Mining Corporation in Taylor, Wisconsin, is served by the Canadian National ("CN"), which now owns the former Illinois Central, from which it connects to KCS. The CN and KCS are parties to a marketing agreement.

Again, the entity created by the proposed transaction could discriminate against shipments of Unimin products on the UP, which could shift purchases to Unimin's major competitor that utilizes KCS.



Protecting Competition

We respectfully request that the Board impose detailed conditions of neutrality and non-discrimination in order to preserve competition among rail carriers and to enable Unimin to compete fairly for sales to Mexican customers. The Laredo Bridge cannot be duplicated by competitors, and the other rail crossings from Texas into Mexico are far inferior to it. This Board should not allow control of the Laredo Bridge to confer a competitive advantage on the combined KCS-TFM.

Unimin does not oppose the proposed transaction as long as the Board imposes conditions that will protect competition among KCS, UP, and other carriers. Specifically, the Board should insure that (i) the Laredo Bridge will not be used to discriminate against UP traffic, and (ii) TFM will not discriminate against connecting traffic from carriers other than KCS. This non-discrimination obligation must apply to both price and service to be effective. Indeed, unless the Board makes sure that all aspects of service are covered – including transit times, switching service, and car supply – its remedy will be ineffective.

I, Louis R. Mastandrea, declare under penalty of perjury that the foregoing is true and correct. I further certify that I am qualified and authorized to file this verified statement.

Executed on July 23rd, 2003.

RE: Kansas City Southern/NAFTA Rail.
Finance Docket No. 34342

Dear Secretary Williams:

I am Dave Reinders, General Manager at United Farmers Cooperative, George, Iowa.

Our Cooperative is a 100 car-rail shuttle grain shipper. We export via rail approximately 16 million bushels of corn and 4 million bushels of soybeans annually. Many of these trains especially the soybean are shipped to the Mexico market.

I am very concerned about the NAFTA Rail, however it is going to be of the utmost importance that NAFTA Rail lives up to KCS's commitments. I am also concerned about the effect of the proposed transaction on U.P. – TFM service and the treatment of the Union Pacific customer at the Laredo bridge.

Please give these maters your thoughtful consideration

Thank You & Sincerely,
Dave Reinders
General Manager

July 25, 2003

Honorable Vernon A. Williams
Secretary
Surface Transportation Board
1925 K Street, N.W.
Washington, D.C. 20423

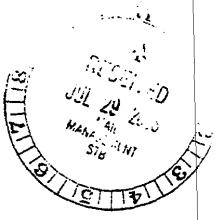
Re: Kansas City Southern/NAFTA Rail,
Finance Docket No. 34342

Dear Secretary Williams:

I am Steve Fitzgerald, Mexico & US Pulp Fiber Logistics Manager. Our company, Westwood Forest Products, Inc., has an established and growing business with Mexico. I expect the proposed NAFTA rail transaction, which will result in KCS acquiring control of Tex Mex and TFM, will affect rail transportation between the United States and Mexico. As a result, we are taking this opportunity to communicate our views to the Surface Transportation Board.

We support all efforts to guarantee that there will be competitive and efficient rail service via the Laredo Gateway. Any restrictions on access to the Gateway will have a negative impact on our business as well as that of our suppliers and receivers. UP today provides U.S.-Mexico service with TFM via Laredo. I understand that KCS has given assurances to the STB that it will work with UP so that UP-TFM service via the Laredo gateway will be handled fairly, efficiently and without discrimination. Therefore, we ask the STB to impose conditions on approval of the transaction. Those conditions will ensure that we continue to receive efficient UP-TFM service offerings. In short, we ask that the STB require the KCS and its partners to commit in concrete and enforceable terms to competitive rail service between the U.S. and Mexico.

We ask that the STB require NAFTA Rail to abide by KCS's promises to provide the following:



- Fair Treatment and Efficient Operations at the Laredo Bridge
- Non-Discrimination for Service in Mexico
- Equitable and Competitive Rate Factors for UP-TFM Routings via the Laredo Gateway

I appreciate the Board's consideration of these views.

Sincerely,
Steve Fitzgerald

Pulp Fiber Logistics Manager

BEFORE THE
SURFACE TRANSPORTATION BOARD
UNITED STATES DEPARTMENT OF TRANSPORTATION

Finance Docket No. 34342

KANSAS CITY SOUTHERN

-- CONTROL --

THE KANSAS CITY SOUTHERN RAILWAY COMPANY,
GATEWAY EASTERN RAILWAY COMPANY
and
THE TEXAS MEXICAN RAILWAY COMPANY

SUBMISSION OF
WEYERHAEUSER COMPANY

Introduction:

My name is John B. Ficker. I am employed by Weyerhaeuser Company as its Logistics Development Manager. My business address is: Weyerhaeuser Company, PO Box 9777 Federal Way, WA 98063-9777. I am familiar with all of Weyerhaeuser's facilities and its transportation requirements. I have worked in the transportation industry for thirty years. I have worked for Weyerhaeuser since 1986. For the first four years of my employment, I was Southern Transportation Manager. In that position, I was responsible for transportation from and to eleven (11) Weyerhaeuser manufacturing facilities and forty (40) distribution centers east of the Rocky Mountains. In 1990, I assumed my current responsibilities, which include reviewing Weyerhaeuser's transportation agreements, determining whether they comply with applicable regulations and statutes, and representing Weyerhaeuser before regulatory agencies. I am a registered practitioner before the Surface Transportation Board and am authorized to represent Weyerhaeuser before federal and state regulatory bodies and present this statement on behalf of Weyerhaeuser.

Background -- Weverhaeuser is a large user of rail:

Weyerhaeuser is a multi-plant forest products company with facilities across North America. Our 2002 annual sales were over $18 billion. We manufacture, distribute, and sell logs, woodchips, lumber, plywood, particleboard, hardboard, oriented strandboard, woodpulp, paper, pulpboard, shipping containers, chemicals, and related products. We own and operate large mill complexes in Alabama, Georgia, Mississippi, Kentucky, West Virginia, North & South Carolina, Oklahoma, Oregon, Washington, Louisiana, Tennessee, Pennsylvania, and Wisconsin, and the Canadian provinces of British Columbia, Alberta, Saskatchewan, Ontario, and New Brunswick. We have numerous packaging plants and distribution facilities across the United States, Mexico, and Canada. We also own and operate five Class III shortline common carrier railroads. Weyerhaeuser is a significant user of rail transportation services in both the United States, Canada and Mexico.

Comments on the Proposed Transaction:

Weyerhaeuser believes that the proposed transaction will have a positive impact on the rail environment in both the United States and Mexico, and as such we support the transaction. Weyerhaeuser has some concerns, which we believe the Board should address in this case. The commonly controlled railroad must insure that all existing gateways will remain open and it will not provide undue preference to any gateway. The commonly controlled railroad must continue to offer competitive rates to and from other connecting railroads.

Weyerhaeuser's major concern is the need for the commonly controlled railroad to provide a 'firewall' between its marketing effort and that of the Mexican carrier TFM who will become a partner in the new NAFTA railway. Without such protection, the KCS/TM will have an unfair advantage over the other connecting railroads. The commonly controlled carrier must provide the Board with assurances and process, which can be monitored to insure the impartiality of its Mexican partner in its dealings with other railroads.

Summary:

Weyerhaeuser supports the proposed transaction with the provision that a verifiable 'firewall' can be developed between the Mexican partner and its US partners.

1992 HORIZONTAL MERGER GUIDELINES
[WITH APRIL 8, 1997, REVISIONS TO SECTION 4 ON EFFICIENCIES]

The U.S. Department of Justice ("Department") and Federal Trade Commission ("Commission") today jointly issued Horizontal Merger Guidelines revising the Department's 1984 Merger Guidelines and the Commission's 1982 Statement Concerning Horizontal Merger Guidelines. The release marks the first time that the two federal agencies that share antitrust enforcement jurisdiction have issued joint guidelines.

Central to the 1992 Department of Justice and Federal Trade Commission Horizontal Merger Guidelines is a recognition that sound merger enforcement is an essential component of our free enterprise system benefitting the competitiveness of American firms and the welfare of American consumers. Sound merger enforcement must prevent anticompetitive mergers yet avoid deterring the larger universe of procompetitive or competitively neutral mergers. The 1992 Horizontal Merger Guidelines implement this objective by describing the analytical foundations of merger enforcement and providing guidance enabling the business community to avoid antitrust problems when planning mergers. The Department first released Merger Guidelines in 1968 in order to inform the business community of the analysis applied by the Department to mergers under the federal antitrust laws. The 1968 Merger Guidelines eventually fell into disuse, both internally and externally, as they were eclipsed by developments in legal and economic thinking about mergers.

In 1982, the Department released revised Merger Guidelines which, reflecting those developments, departed dramatically from the 1968 version. Relative to the Department;s actual practice, however, the 1982 Merger Guidelines represented an evolutionary not revolutionary change. On the same date, the Commission released its Statement Concerning Horizontal Mergers highlighting the principal considerations guiding the Commission's horizontal merger enforcement and noting the "considerable weight" given by the Commission to the Department's 1982 Merger Guidelines.

The Department's current Merger Guidelines, released in 1984, refined and clarified the analytical framework of the 1982 Merger Guidelines. Although the agencies' experience with the 1982 Merger Guidelines reaffirmed the soundness of its underlying principles, the Department concluded that there remained room for improvement.

The revisions embodied in the 1992 Horizontal Merger Guidelines reflect the next logical step in the development of the agencies' analysis of mergers. They reflect the Department's experience in applying the 1982 and 1984 Merger Guidelines as well as the Commission's experience in applying those guidelines and the Commission's 1982 Statement. Both the Department and the Commission believed that their respective Guidelines and Statement presented sound frameworks for antitrust analysis of mergers, but that improvements could be made to reflect advances in legal and economic thinking. The 1992 Horizontal Merger Guidelines accomplish this objective and also clarify certain aspects of the Merger Guidelines that proved to be ambiguous or were interpreted by observers in ways that were inconsistent with the actual policy of the agencies.

The 1992 Horizontal Merger Guidelines do not include a discussion of horizontal effects

from non-horizontal mergers (e.g., elimination of specific potential entrants and competitive problems from vertical mergers). Neither agency has changed its policy with respect to non-horizontal mergers. Specific guidance on non-horizontal mergers is provided in Section 4 of the Department's 1984 Merger Guidelines, read in the context of today's revisions to the treatment of horizontal mergers.

A number of today's revisions are largely technical or stylistic. One major objective of the revisions is to strengthen the document as an analytical road map for the evaluation of mergers. The language, therefore, is intended to be burden-neutral, without altering the burdens of proof or burdens of coming forward as those standards have been established by the courts. In addition, the revisions principally address two areas.

The most significant revision to the Merger Guidelines is to explain more clearly how mergers may lead to adverse competitive effects and how particular market factors relate to the analysis of those effects. These revisions are found in Section 2 of the Horizonal Merger Guidelines. The second principal revision is to sharpen the distinction between the treatment of various types of supply responses and to articulate the framework for analyzing the timeliness, likelihood and sufficiency of entry. These revisions are found in Sections 1.3 and 3.

The new Horizontal Merger Guidelines observe, as did the 1984 Guidelines, that because the specific standards they set out must be applied in widely varied factual circumstances, mechanical application of those standards could produce misleading results. Thus, the Guidelines state that the agencies will apply those standards reasonably and flexibly to the particular facts and circumstances of each proposed merger.

0. PURPOSE, UNDERLYING POLICY ASSUMPTIONS AND OVERVIEW

These Guidelines outline the present enforcement policy of the Department of Justice and the Federal Trade Commission (the "Agency") concerning horizontal acquisitions and mergers ("mergers") subject to section 7 of the Clayton Act,[1]

to section 1 of the Sherman Act,[2]

or to section 5 of the FTC Act.[3] They describe the analytical framework and specific standards normally used by the Agency in analyzing mergers.[4] By stating its policy as simply and clearly as possible, the Agency hopes to reduce the uncertainty associated with enforcement of the antitrust laws in this area.

Although the Guidelines should improve the predictability of the Agency's merger enforcement policy, it is not possible to remove the exercise of judgment from the evaluation of mergers under the antitrust laws. Because the specific standards set forth in the Guidelines must be applied to a broad range of possible factual circumstances, mechanical application of those standards may provide misleading answers to the economic questions raised under the antitrust laws. Moreover, information is often incomplete and the picture of competitive conditions that develops from historical evidence may provide an incomplete answer to the forward-looking inquiry of the Guidelines. Therefore, the Agency will apply the standards of the Guidelines reasonably and flexibly to the particular facts and circumstances of each proposed merger.

0.1 Purpose and Underlying Policy Assumptions of the Guidelines

The Guidelines are designed primarily to articulate the analytical framework the Agency applies in determining whether a merger is likely substantially to lessen competition, not to describe how the Agency will conduct the litigation of cases that it decides to bring. Although relevant in the latter context, the factors contemplated in the Guidelines neither dictate nor exhaust the range of evidence that the Agency must or may introduce in litigation. Consistent with their objective, the Guidelines do not attempt to assign the burden of proof, or the burden of coming forward with evidence, on any particular issue. Nor do the Guidelines attempt to adjust or reapportion burdens of proof or burdens of coming forward as those standards have been established by the courts.(5) Instead, the Guidelines set forth a methodology for analyzing issues once the necessary facts are available. The necessary facts may be derived from the documents and statements of both the merging firms and other sources.

Throughout the Guidelines, the analysis is focused on whether consumers or producers "likely would" take certain actions, that is, whether the action is in the actor's economic interest. References to the profitability of certain actions focus on economic profits rather than accounting profits. Economic profits may be defined as the excess of revenues over costs where costs include the opportunity cost of invested capital.

Mergers are motivated by the prospect of financial gains. The possible sources of the financial gains from mergers are many, and the Guidelines do not attempt to identify all possible sources of gain in every merger. Instead, the Guidelines focus on the one potential source of gain that is of concern under the antitrust laws: market power.

The unifying theme of the Guidelines is that mergers should not be permitted to create or enhance market power or to facilitate its exercise. Market power to a seller is the ability profitably to maintain prices above competitive levels for a significant period of time.(6) In some circumstances, a sole seller (a "monopolist") of a product with no good substitutes can maintain a selling price that is above the level that would prevail if the market were competitive. Similarly, in some circumstances, where only a few firms account for most of the sales of a product, those firms can exercise market power, perhaps even approximating the performance of a monopolist, by either explicitly or implicitly coordinating their actions. Circumstances also may permit a single firm, not a monopolist, to exercise market power through unilateral or non-coordinated conduct--conduct the success of which does not rely on the concurrence of other firms in the market or on coordinated responses by those firms. In any case, the result of the exercise of market power is a transfer of wealth from buyers to sellers or a misallocation of resources.

Market power also encompasses the ability of a single buyer (a "monopsonist"), a coordinating group of buyers, or a single buyer, not a monopsonist, to depress the price paid for a product to a level that is below the competitive price and thereby depress output. The exercise of market power by buyers ("monopsony power") has adverse effects comparable to those associated with the exercise of market power by sellers. In order to assess potential monopsony concerns, the Agency will apply an analytical framework analogous to the framework of these Guidelines.

While challenging competitively harmful mergers, the Agency seeks to avoid

unnecessary interference with the larger universe of mergers that are either competitively beneficial or neutral. In implementing this objective, however, the Guidelines reflect the congressional intent that merger enforcement should interdict competitive problems in their incipiency.

0.2 Overview

The Guidelines describe the analytical process that the Agency will employ in determining whether to challenge a horizontal merger. First, the Agency assesses whether the merger would significantly increase concentration and result in a concentrated market, properly defined and measured. Second, the Agency assesses whether the merger, in light of market concentration and other factors that characterize the market, raises concern about potential adverse competitive effects. Third, the Agency assesses whether entry would be timely, likely and sufficient either to deter or to counteract the competitive effects of concern. Fourth, the Agency assesses any efficiency gains that reasonably cannot be achieved by the parties through other means. Finally the Agency assesses whether, but for the merger, either party to the transaction would be likely to fail, causing its assets to exit the market. The process of assessing market concentration, potential adverse competitive effects, entry, efficiency and failure is a tool that allows the Agency to answer the ultimate inquiry in merger analysis: whether the merger is likely to create or enhance market power or to facilitate its exercise.

1. MARKET DEFINITION, MEASUREMENT AND CONCENTRATION

1.0 Overview

A merger is unlikely to create or enhance market power or to facilitate its exercise unless it significantly increases concentration and results in a concentrated market, properly defined and measured. Mergers that either do not significantly increase concentration or do not result in a concentrated market ordinarily require no further analysis.

The analytic process described in this section ensures that the Agency evaluates the likely competitive impact of a merger within the context of economically meaningful markets--i.e., markets that could be subject to the exercise of market power. Accordingly, for each product or service (hereafter "product") of each merging firm, the Agency seeks to define a market in which firms could effectively exercise market power if they were able to coordinate their actions.

Market definition focuses solely on demand substitution factors--i.e., possible consumer responses. Supply substitution factors--i.e., possible production responses--are considered elsewhere in the Guidelines in the identification of firms that participate in the relevant market and the analysis of entry. See Sections 1.3 and 3. A market is defined as a product or group of products and a geographic area in which it is produced or sold such that a hypothetical profit-maximizing firm, not subject to price regulation, that was the only present and future producer or seller of those products in that area likely would impose at least a "small but significant and nontransitory" increase in price, assuming the terms of sale of all other products are held constant. A relevant market is a group of products and a geographic area that is no bigger than necessary to satisfy this test. The "small but significant and non-transitory" increase in price is employed solely as a methodological tool for the analysis of mergers: it is not a tolerance level for price

KANSAS CITY SOUTHERN
– CONTROL –
THE KANSAS CITY SOUTHERN RAILWAY COMPANY, GATEWAY EASTERN RAILWAY COMPANY, AND THE TEXAS MEXICAN RAILWAY COMPANY

THE KANSAS CITY SOUTHERN RAILWAY COMPANY'S AND THE TEXAS MEXICAN RAILWAY COMPANY'S RESPONSES AND OBJECTIONS TO CANADIAN NATIONAL RAILWAY COMPANY'S FIRST SET OF DOCUMENT PRODUCTION REQUESTS AND INTERROGATORIES TO APPLICANTS

Pursuant to 49 C.F.R. §§ 1114.21-.31, Kansas City Southern, The Kansas City Southern Railway Company, Gateway Eastern Railway Company, The Texas Mexican Railway Company, and Mexrail, Inc. (collectively "Respondents") respond to the discovery requests served by Canadian National Railway Company ("CN") on June 17, 2003 (the "Requests") as follows:

GENERAL RESPONSES

Respondents hereby provide the following general objections to the June 17, 2003 discovery requests served by CN:

1. The use of "KCS" in these responses shall include Kansas City Southern, The Kansas City Southern Railway Company and Gateway Eastern Railway Company.

2. The use of "Tex Mex" in these response shall mean The Texas Mexican Railway Company and Mexrail, Inc.

reduction of source competition." Produce all documents considered by Mr. Grimm in connection with this presumption.

RESPONSE: The "strong presumption" referenced by Dr. Grimm arises from a review of the systems referred to in his statement. The fact that the Mexican and U.S. systems connect at the Laredo Bridge (and KCS and Tex Mex connect at Beaumont) with no overlapping routes serves as the bases for the presumption.

2. State whether Curtis Grimm considers source competition to be a form of horizontal competition or some other type of competition, and, if some other type of competition, identify the type and explain why it is not a form of horizontal competition.

RESPONSE: Source competition, as Dr. Grimm defines it in his two verified statements, involves a reduction in independent railroad routings and could be considered a form of horizontal competition.

3. State whether Curtis Grimm examined the possibility and extent of competition between (a) movements of a commodity originating in Mexico, moving over TFM, and terminating at U.S. destinations, on the one hand, and, on the other, (b) movements of the same or a substitutable commodity originating on or otherwise moving over KCS or Tex Mex and terminating at the same U.S. destinations. If the answer is affirmative, describe the results of the examination and produce all documents considered in connection with the examination. If the answer is negative, explain why Mr. Grimm did not examine the possibility and produce all documents considered by Mr. Grimm in connection with the answer.

RESPONSE: Dr. Grimm did not consider the possibility referenced in Interrogatory No. 3 because it would not result in a reduction of independent railroad routings.

4. Does Curtis Grimm contend that there are no imports to the U.S. from Mexico that move by rail over TFM and compete with U.S.-originated products that move by rail over KCS or Tex Mex and terminate at the same U.S. destinations as the imports from Mexico? Please explain the answer and produce all documents considered by Mr. Grimm in connection with the answer.

RESPONSE: Dr. Grimm makes no such contention.

5. State whether Curtis Grimm examined the possibility and extent of competition between (a) movements of a commodity originating in Mexico and terminating on TFM, on the one hand, and, on the other, (b) movements of the same or a substitutable commodity originating on or otherwise moving over KCS or Tex Mex and terminating at the same TFM destinations. If

the answer is affirmative, describe the results of the examination and produce all documents considered in connection with that examination. If the answer is negative, explain why Mr. Grimm did not examine the possibility and produce all documents considered by Mr. Grimm in connection with the answer.

RESPONSE: Dr. Grimm did not consider the possibility referenced in Interrogatory No. 5 because it would not result in a reduction of independent railroad routings.

6. Does Curtis Grimm contend that there are no exports from the U.S. to Mexico that move by rail over KCS or Tex Mex and compete with Mexican-originated products that terminate at the same Mexican destinations and that move by rail over TFM? Please explain the answer and produce all documents considered in connection with the answer.

RESPONSE: Dr. Grimm makes no such contention.

7. State TFM's stated reasons for desiring, and KCS's reasons for agreeing to, Article VII of the Stock Purchase Agreement.

RESPONSE: Respondents object to Interrogatory No. 7 on the grounds that it seeks information that is neither relevant nor reasonably calculated to lead to the discovery of admissible evidence. Without waiver of these objections, to the best of Respondents' recollection, TFM did not state any reason for desiring Article VII of the Stock Purchase Agreement. KCS proposed the call right by TFM so that if the Tex Mex transaction were rejected by regulators, TFM could regain possession of Tex Mex (or at least control its disposition). In addition, if the conditions placed on KCS's control of Tex Mex are too onerous that it damages TFM's access to improved competitiveness, the call right allows TFM to repurchase Tex Mex, returning the situation to the status quo.

8. Explain whether and how Article VII of the Stock Purchase Agreement will, during the period prior to termination of the repurchase right, affect KCS's incentives to maintain and invest in Tex Mex, or enhance Tex Mex service, and why Article VII is consistent with the public interest.

Respectfully submitted,

Union Pacific Corp., Union Pacific RR. Co. and Missouri Pacific RR Co. -- Control and Merger -- Southern Pacific Rail Corp., Southern Pacific Trans. Co., St. Louis Southwestern Rw. Co., SPCSL Corp. and The Denver and Rio Grande Western Corp.	**Finance Docket No. 32760**

THE TEXAS MEXICAN RAILWAY COMPANY'S
PETITION TO REOPEN DECISION NO. 44

Pursuant to 49 C.F.R. § 1115.3, the Texas Mexican Railway Company ("Tex Mex") files this petition to reopen the Board's Decision No. 44 in this proceeding.

Introduction and Summary

By this petition, Tex Mex requests the Board to remove the limitation imposed in that decision on the trackage rights granted to Tex Mex in Sub-Nos. 13 and 14 restricting Tex Mex's use of such rights to "the transportation of freight having a prior or subsequent movement on [Tex Mex's] Laredo-Robstown-Corpus Christi line." That limitation will have a relatively minor effect on Applicants' traffic but will have a major adverse effect on Tex

as a viable competitor to a merged UPSP. The evidence of Tex Mex's witnesses showed that granting unrestricted rights will produce $822,000 more in revenues and $250,000 more in net income to Tex Mex in the first year of operation that granting rights limited to traffic having a prior or subsequent movement on Tex Mex's line. In fact, the evidence showed that granting limited rights would leave Tex Mex with only $19,000 in net income in the first year of operation (instead of $269,000 with unrestricted rights). That income, though not negative, provides Tex Mex with little margin for weathering business cycles and, more importantly, competing aggressively for traffic.

These errors in the Board's decision are discussed more fully below and in the attached verified statements of Tex Mex's economic witnesses, Dr. Curtis Grimm and Joseph Ellebracht.[2/]

STATEMENT OF FACTS

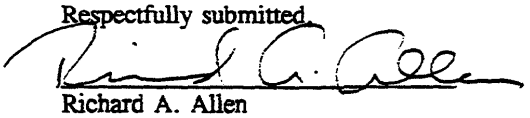
On March 29, 1996, Tex Mex filed a responsive application seeking trackage rights over SP and UP lines from Robstown and Corpus Christi, Texas through Houston to a connection with KCS at Beaumont, Texas (Finance Docket No. 32760, Sub-No. 13) together with an application for terminal trackage rights over lines of the HB&T in Houston (Finance Docket No. 32760, Sub-No. 14). In those applications (contained in TM-23), Tex Mex stated:

[2/] This petition for reopening is based on material error and, to the extent the attached verified statements present new evidence, on new evidence. 49 C.F.R. § 1115.3(b). These statements appear as Appendices A and B hereto.

> Tex Mex seeks rights over those lines to permit it to carry overhead traffic and to serve all local shippers currently capable of receiving service from both the Union Pacific Railroad ("UP") and the Southern Pacific Transportation Company ("SP"), directly or through reciprocal switching, with full rights to interchange traffic with UP, SP and any other railroad at any interchange point on such lines.

TM-23 at 3. See also TM-23 at 158-174 (Operating Plan).

Tex Mex contended that the foregoing trackage rights were needed to preserve competition that would otherwise be lost as a result of the merger. Tex Mex also contended that they were needed to keep Tex Mex viable and thereby preserve essential rail services provided by Tex Mex for which there are no other transportation alternatives. Tex Mex's arguments and evidence concerning competition focused primarily on the importance of preserving competition in the market for rail services between the United States and Mexico, because that is a market in which Tex Mex is currently an important participant and because preserving competition in that market is vital to the policies of both countries as reflected in the North American Free Trade Agreement.



Tex Mex's arguments and evidence, however, were not limited to just that market. By seeking the right to use the trackage rights to serve all shippers currently capable of receiving service from both UP and SP and by seeking full interchange rights with all other railroads at any point on the lines, such as HB&T and the Port Terminal Railway Association ("PTRA") in Houston, Tex Mex's applications served to preserve the existing level of competition for all shippers on the lines in question with respect to <u>all</u> their traffic, not just that moving to and from Mexico or to and from points on Tex Mex's current line. Thus, the traffic and revenue projections in Tex Mex's traffic study, performed by Joseph Ellebracht,

Although Tex Mex correctly stated in its rebuttal statement that it could survive without this traffic, it should be apparent that its survival will be extremely tenuous under the limitation imposed by the Board.[7/] Its marginal income will hardly be sufficient to permit it to weather adverse business cycles of any substantial duration, and will make it very difficult to compete aggressively against UPSP and BNSF with its trackage rights.

CONCLUSION

The Board should reopen Decision No. 44 in this proceeding and remove the routing restriction on the trackage rights granted to Tex Mex in Sub-No. 13 and Sub-No. 14.

Respectfully submitted,

Richard A. Allen

Dated: September 3, 1996

7/ As noted earlier, Tex Mex's submission of evidence showing that it could survive without this traffic was not to suggest that the traffic was unimportant but was for the purpose of ensuring that the Board would not reject is applications in their entirety if it concluded, contrary to Tex Mex's contention, that the right to carry it had not been justified.

REBUTTAL VERIFIED STATEMENT

OF

JOSEPH F. ELLEBRACHT

1. INTRODUCTION

My name is Joseph F. Ellebracht. I am an independent transportation consultant, and I previously submitted a verified statement in support of Tex Mex's responsive application, in TM-23. Two errata statements were also filed in connection with that verified statement. In this statement I will respond to some of the comments made about my verified statement and the Tex Mex responsive application.

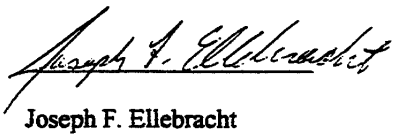
2. SUMMARY OF MY PREVIOUS STATEMENT.

My previous statement in TM-23 included the following principal findings and conclusions:

Tex Mex and SP, operating together, have been effective and aggressive competitors to UP for rail traffic to and from Mexico. Shippers of that traffic have benefitted from this competition among U.S. railroads notwithstanding the current state ownership of the rail system in Mexico.

SP has been essential to Tex Mex's ability to serve its international and local markets. Also, the impact of the recent BNSF merger will likely be positive for SP-Tex Mex service, absent a UP/SP merger.

3. UNREBUTTED TESTIMONY



While many comments were made by various parties about my testimony, none of Applicants' witnesses or BNSF's witnesses took issue with the following conclusions that I reached:

- The SP-Tex Mex route has been an effective competitor to UP for traffic through Laredo.
- SP has made extraordinary efforts to develop the Mexican market with Tex Mex, by maintaining a substantial sales force in Mexico, by establishing a special marketing group to eliminate barriers to using the SP-Tex Mex route, and by making substantial investments to help the Mexican railway system develop its capabilities.
- Truck and water competition are not sufficient to constrain significantly rates for rail transportation between the U.S. and Mexico.
- Shippers of goods by rail between the United States and Mexico have benefitted from competition between U.S. railroads despite the state ownership of the Mexican rail system.
- Railroad marketing personnel know that there is generally a range of prices that *may* be charged for rail transportation, due to modal and geographic competition, but the price that *will* be charged is a function of the amount and character of rail-to-rail competition. Railroad marketing personnel are acutely aware of the rail-to-rail competition they face when bidding on significant traffic flows. (The testimony of SP's Mr. Gazzetta, in UP-SP - 231, Volume 2, Part A, shows this awareness very clearly.)

VERIFICATION

I, Joseph F. Ellebracht, certify under penalty of perjury the foregoing is true and correct. Further I certify that I am qualified and authorized to file this verified statement.

Executed on May 10, 1996.

Joseph F. Ellebracht

VERIFIED STATEMENT

OF

CURTIS M. GRIMM

FINANCE DOCKET NO. 32760

UNION PACIFIC CORPORATION, UNION PACIFIC RAILROAD COMPANY AND MISSOURI PACIFIC RAILROAD COMPANY --CONTROL AND MERGER -- SOUTHERN PACIFIC RAIL CORPORATION, SOUTHERN PACIFIC TRANSPORTATION COMPANY, ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, SPCSL CORP. AND THE DENVER AND RIO GRANDE WESTERN RAILROAD COMPANY

I. INTRODUCTION

My name is Curtis M. Grimm, and I am Professor and Chair of Transportation, Business and Public Policy, College of Business and Management, University of Maryland at College Park. I have been a member of this College since 1983. I received my B.A. in economics from the University of Wisconsin-Madison in 1975 and my Ph.D. in economics from the University of California-Berkeley in 1983. My Ph.D. dissertation investigated competitive impacts of railroad mergers.

My background includes extensive exposure to public policy issues regarding transportation, including Interstate Commerce Commission ("ICC") merger adjudication. I have previously been employed by the Wisconsin Department of Transportation, the ICC, and the Australian Bureau of Transport and Communication Economics, and I have provided consulting services to several other government agencies and private firms regarding

> In short, Baumol and the others have documented that, with very easy entry and exit, a natural monopoly has almost all the attractive characteristics of a competitive market, eliminating the need for regulation. They appropriately call such a natural monopoly a 'contestable' natural monopoly.

VI. RAIL IS THE APPROPRIATE PRODUCT MARKET

In my academic writings and previous ICC testimony, I have consistently argued that rail is the appropriate product market, and that we should reject a market definition that includes other modes within the product market. In determining whether or not a shipper received access to BNSF, Applicants did not consider the type of commodity shipped or the distance the commodity was shipped to the receiver. All 2-to-1 shippers, as defined by Applicants, received BNSF access whether or not the commodity in question may also be easily transported by truck, barge, or air. In other words, Applicants have accepted the notion that the relevant product market was the transportation of products by rail, *i.e.*, reduction of intramodal competition.[61]

Focusing on whether or not there is a reduction in intramodal competition, *i.e.*, competition between rail carriers, is entirely consistent with Commission precedent. *SFSP*, 2 I.C.C. 2d 709, 758 (1986)("[T]he relevant product market here is railroad freight transportation. Equally as clear is the necessity . . . for this Commission to assure the continuation of adequate levels of rail intramodal competition."); *BNSF*, slip op. at 59 ("We rest this conclusion primarily upon continued intramodal competition."). *See also* the *UP/MP/WP* case basing the decision largely on econometric estimates of low cross-elasticity

[61] It would be fundamentally unfair to apply a different standard of what constitutes the relevant product market to KCS while at the same time imposing Applicants' proposed conditions which rely on a completely different definition of the relevant product market.

of demand between rail and truck;[62] and *Chicago, Milwaukee, St. Paul, and Pacific Railroad Company-Reorganization-Acquisition by Grand Trunk Corporation*, 2 I.C.C.2d 161, 224-225 (1984)("*MILW-GTW*")(defining the relevant product market as the transportation of freight by rail).

While the Commission has examined whether or not freight transportation by other modes should be included in the same product market as rail freight transportation for the purpose of determining the competitive effects of a proposed transaction,[63] the focus of most, if not all, prior merger cases has been the reduction of transportation in the intramodal market. Even in the *UP/MKT* proceeding, where the Commission did consider intermodal and intramodal transportation in defining the relevant product market, the Commission's ultimate conclusion rested on the continued presence of intramodal competition as an effective constraint on rates.[64] Accordingly, in defining the relevant product market, focusing primarily on intramodal competition is appropriate. The Commission has supported

---

[62] *Union Pacific Corporation, Pacific Rail System, Inc. and Union Pacific Railroad Company -- Control -- Missouri Pacific Corporation and Missouri Pacific Railroad Company, Finance Docket No. 30,000*, 366 I.C.C. 459, Appendix E, at 673 (1982) ("*UP\MP\WP*").

[63] *Union Pacific Corporation, Union Pacific Railroad Company and Missouri Pacific Railroad Company -- Control -- Missouri-Kansas-Texas Railroad Company*, 4 I.C.C.2d 409 (1988) ("*UP/MKT*").

[64] "We conclude that, post-merger, ample transportation competition will remain throughout the MKT service territory. We rest this conclusion primarily upon continued intramodal competition." *Union Pacific Corporation, Union Pacific Railroad Company and Missouri Pacific Railroad Company -- Control -- Missouri-Kansas-Texas Railroad Company, et al.* 4 I.C.C.2d 409 (1988) ("*UP/MKT*").

this position in important rail merger cases by rejecting efforts to include motor carrier and barge in its definition of relevant markets.

Although truck competition can supplement inadequate intramodal competition for some products and markets, it is not an effective substitute for rail to rail competition. The relative costs of truck and rail, and thus the extent to which motor carriers are competitive with rail in a particular market, depend on the commodity being transported and the distance between origin and destination.[65] For longer distances and for movements of bulk products, rail usually has a significant cost advantage. The nature of products, volume and commercial value are factors present that would tend to limit intermodal applications. Furthermore, given that railroads set prices to a large degree individually on a movement-by-movement basis, the fact that some shippers may have truck or source alternatives to a monopoly rail firm for some movements does not help other shippers -- or even those same shippers, for their movements where no competitive alternatives exist.

As will be discussed in more detail below, other modes cannot provide an adequate counterbalance for the diminution of rail competition in the proposed transaction.

VII. TRUCKS WILL NOT PROVIDE AN EFFECTIVE ALTERNATE MODE OF TRANSPORTATION FOR MOST OF THE COMMODITIES INVOLVED IN THE 2-TO-1 AND 3-TO-2 MARKETS

A careful assessment of the record confirms that truck competition is not as pervasive as UP suggests and does not provide a discipline on rail rates for the vast majority of all

UNION PACIFIC'S CONDITION PROPOSALS

If the Board approves KCS control of Tex Mex, it should impose the following conditions on the Applicants:

1. Applicants must adhere to all of the representations they made during the course of this proceeding, whether or not such representations are specifically referenced in this decision.

2. Applicants must adhere to their commitments in this proceeding that KCS will:

   a. work cooperatively with UP toward efficient utilization of the Laredo Bridge;

   b. negotiate in good faith with UP to develop new dispatching protocols for the Laredo Bridge;

   c. use its control over TFM to ensure that UP and BNSF are provided the same level of service they have experienced in the past and to making improvements to that level of service where possible;

   d. use its control over TFM to require TFM to cooperate with UP and BNSF on pre-blocking rail cars, improving automated customs pre-clearance procedures, supplying cars for shipments, accommodating run-through train service, providing excellent service, and promptly quoting rates;

   e. work with UP and BNSF to develop a methodology for measuring and enforcing service standards for traffic handled by TFM via the Laredo Gateway; and

   f. keep the Laredo Gateway open on commercially reasonable terms.

   Each of these commitments will be enforceable as if it were a condition imposed directly by the Board.

3. To implement the commitment set forth in Condition 2(b), Applicants must negotiate in good faith with UP to develop new dispatching protocols for the Laredo Bridge. Unless the parties agree otherwise, such protocols should provide for (i) a jointly staffed operations center responsible for Laredo Bridge operations, (ii) an express obligation to manage Bridge operations in a manner that is nondiscriminatory and that will achieve maximum efficiency in operation of the Bridge, and (iii) a mechanism for assuring that each U.S. carrier serving the Laredo Gateway has, at any given time, access to Bridge capacity commensurate with the percentage of traffic for which customers have selected that carrier for the movement north of the Laredo Gateway. Applicants shall submit agreed protocols for the Laredo Bridge to the Board within 90 days of the effective date of this Decision. If they have not reached an agreement within that period (or jointly with UP sought additional time for further negotiations), the Board will initiate a proceeding to develop terms that will implement this condition.

4. To implement the commitments set forth in Conditions 2(c)-(e), which will remain enforceable independent of this condition, Applicants must negotiate in good faith with UP to develop an agreement establishing methods for measuring compliance by Applicants with the commitments regarding TFM service and mechanisms for enforcing compliance with those commitments. Applicants shall submit their agreement to the Board within 90 days of the effective date of this Decision. If they have not reached an agreement within that period (or jointly with UP sought additional time for further negotiations), the Board will initiate a proceeding to develop terms that will implement this condition.

5. To implement the commitments set forth in Conditions 2(f), which will remain enforceable independent of this condition, Applicants must negotiate in good faith with UP to develop an agreement to ensure that the Laredo Gateway remains open on commercially reasonable terms. The parties should consider implementing this commitment through an agreement having the in accord with an agreement having the attributes outlined in Appendix C to the Verified Statement of John T. Gray. Applicants shall submit their agreement to the Board within 90 days of the effective date of this Decision. If they have not reached an agreement within that period (or jointly with UP sought additional time for further negotiations), the Board will initiate a proceeding to develop terms that will implement this condition.

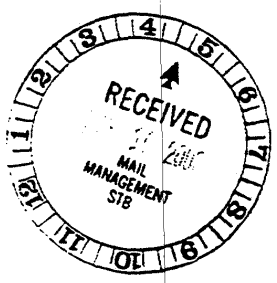
The Board should give merger applicants credit for all proposals that enhance competition. Applicants usually identify enhancements to competition in their applications, and some of those improvements are broader than remedies for competitive harms. For example, UP's agreement with BNSF in the UP/SP proceeding to create two competing rail routes in the West Coast's Interstate 5 Corridor created competition that had never before existed. The Board should not, however, impose new competition on a merger. If competitive harms cannot be addressed and are not offset by sufficient public benefits, the Board should reject the merger.

b. Open gateways



UP agrees with the thrust of the Board's proposal but believes that it does not provide sufficient guidance to potential applicants about what constitutes an "effective plan" for preserving established routes. The Board's proposed rules instead defer developing substantive standards for this rule until the next merger case. UP recommends that the Board consider establishing specific protection for gateways along the lines proposed by UP in Appendix A, pp. 33-34.

V. Shortline and Regional Railroad Issues

UP argued that all of the concerns expressed by shortline and regional railroads could be addressed in the Board's general rules addressing competition and service issues. Appendix A, pp. 36-37. UP notes that the Board's proposed rules appear to adopt this approach. UP also joins AAR's comments addressing shortline and regional issues.

VI. Three-to-Two Issues

UP's Initial Comments. UP asked the Board to affirm that the Board will evaluate on a case-by-case basis the effects of transactions that reduce the number of rail carrier alternatives from three to two. Appendix A, pp. 37-38.

(4) If the Board grants temporary access and the railroads cannot agree on compensation, the Board will apply compensation standards under 49 U.S.C. §§ 11102 and 11123.

(5) The entity obtaining access must be a rail carrier with operating authority from the Board, and the Board must determine that such carrier can operate safely to address the service problem.

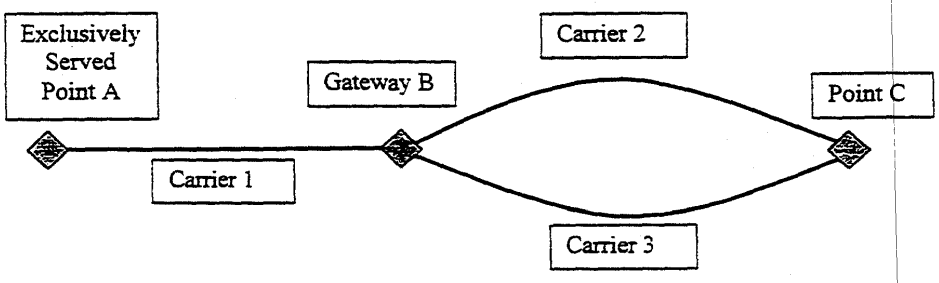
(6) Remedies are available only to shippers lacking existing rail alternatives; provided, however, that the complainant may seek compensation if it can show that the other serving carriers are disabled by the merger-related service problem.

(7) If necessary to effectuate the temporary access remedy, the Board may temporarily suspend a shipper's contractual duty to ship specified volumes of traffic under rail service contracts with the consolidated carrier. The suspension would apply only for the time period necessary to alleviate the service problem.

IV. Promoting and Enhancing Competition

The Board seeks comment on various mechanisms by which rail merger policy might be used to promote and enhance, rather than simply preserve, competition. Most of these mechanisms address the effects of railroad mergers on so-called "bottleneck segments," which are rail segments that connect shipper facilities exclusively served by one carrier with gateways where that carrier connects with other carriers.[4]

UP does not favor using the Board's jurisdiction over rail mergers to alter the competitive structure of the rail industry other than to address the effects of a merger. UP recognizes, however, that most shippers do not want railroad mergers to affect their



---

[4] As the Board's March 31, 2000 decision notes, it is well established that the ICCTA generally does not require rail carriers to establish separately challengeable rates for bottleneck segments. The Board's so-called "Bottleneck" rate decisions clarify the specific circumstances under which carriers may be required to establish, and shippers permitted to challenge, bottleneck rates. See Docket No. 41242, Central Power & Light Co. v. Southern Pac. Transp. Co., Decision served Dec. 31, 1996, clarified in Decision served Apr. 30, 1997, aff'd sub nom. MidAmerican Energy Co. v. STB, 169 F.3d 1099 (8th Cir.), cert. denied, 120 S. Ct. 372 (1999); Union Pacific R.R. v. STB, 202 F.3d 337 (D.C. Cir., 2000).

future opportunities to use established interline routing options. Shippers also do not want mergers either to create new bottlenecks or expand existing bottlenecks. Some shippers are concerned that combinations may eliminate competitive routing options that were previously available for the portion of the overall movement between the gateway and either the origin or destination of the traffic – in effect extending the bottleneck segment. Some shippers are also concerned that, where carriers have established separately challengeable bottleneck rates, a combination with another carrier capable of completing the movement could extinguish the shipper's ability to challenge the bottleneck rate.

UP does not share the view of many shippers that end-to-end mergers generally have anticompetitive vertical effects, and the Board must retain the basic economic and legal principles that guided its Bottleneck decisions. Nevertheless, if the nation's rail system is to be restructured into two transcontinental systems, the Board should take action to keep traditional gateways open. Vague assurances that gateways will stay open are not sufficient because there are too many ways to close them commercially.

UP proposes that the Board modify its rules to require combining carriers to make available at a shipper's request separately challengeable bottleneck rates between exclusively served facilities on their system and the predominant pre-merger gateway for the applicable traffic from those facilities. In the classic "rat-tail" diagram set forth below, if

Carriers 1 and 2 combined, they would be obligated, at the shipper's request, to establish a rate for the "bottleneck" segment between exclusively served Point A and Gateway B. This would preserve the shipper's pre-merger options, because the shipper could combine the A-to-B rate with rates offered by Carrier 3 to complete the movement from origin (Point A) to destination (Point C) and, if necessary, challenge the reasonableness of the A-to-B rate. In fact, such a condition would go somewhat beyond merely preserving the exclusively served shipper's routing options. In some cases, as where the traffic is now moving under joint or proportional rates, the reasonableness of the rate between Point A and Gateway B is not separately challengeable today.

The following specific language for a new section in Part 1180 would implement the proposal outlined above:

1180.__ Preservation of gateways and rate challenge options.

(a) A Class I rail carrier participating as a Primary Applicant in a *major* transaction approved by the Board (a "Participating Carrier") shall, upon request of an affected shipper, establish a rate for transportation (a "Segment Rate") applicable to traffic as to which no Participating Carrier served both the origin and destination of the traffic prior to consummation of the transaction (the "Subject Traffic"), between:

(1) any Exclusively Served Shipper Facility, which means any shipper facility (i) other than an automotive distribution ramp, intermodal facility, or transload facility (ii) that is located at any point on the carrier's system served exclusively by that carrier and no other rail carrier (either directly or via reciprocal switching, joint facility or other service arrangement) (iii) where traffic originated or terminated during the twelve months preceding the pre-filing notice under 49 C.F.R. § 1180.4(b) pertaining to the transaction; and

(2) the Pre-Transaction Gateway, which means the point of interchange, if one exists, that during the twelve months preceding the pre-filing notice under 49 C.F.R. § 1180.4(b) pertaining to the transaction, was (i) an actual interchange between the Participating Carrier and two or more other rail carriers, one of which was another Class I carrier participating in the transaction as a Primary Applicant, (ii) the interchange point most frequently used to move the Subject Traffic (or comparable traffic if the rate

would apply to new traffic) between the Exclusively Served Shipper Facility and the origin or destination of the traffic, and (iii) used by at least 100 cars of traffic originating or terminating at the Exclusively Served Shipper Facility.

(b) The shipper at whose request a Segment Rate is established pursuant to this rule shall be entitled to combine the Segment Rate with a rate or rates offered by a carrier other than the Participating Carrier for movement between the Pre-Transaction Gateway and the origin or destination of the Subject Traffic.

(c) The shipper at whose request a Segment Rate is established pursuant to this rule shall be entitled to challenge the Segment Rate as unreasonably high to the same extent and under the same standards as applicable to rate reasonableness challenges under 49 U.S.C. §§ 10701 and 10707. In determining whether the Participating Carrier is "market dominant," the Board will examine whether there is an absence of effective competition on the entire origin-to-destination route, rather than on the segment between the Exclusively Served Shipper Facility and the Pre-Transaction Gateway.

(d) A shipper facility served exclusively by a Class III rail carrier that is incapable of interchanging traffic with any carrier other than the Participating Carrier, or that is obligated by contract to interchange the majority of its traffic with the Participating Carrier, shall be treated as a facility served exclusively by the Participating Carrier for purposes of this rule. If the Participating Carrier lacks authority to establish a Segment Rate between the Exclusively Served Shipper Facility and the Pre-Transaction Gateway, it shall instead establish a Segment Rate between the point of interchange with the Class III carrier and the Pre-Transaction Gateway.

(e) The obligation to establish a Segment Rate shall also apply to any rail carrier (a "Trackage Rights Carrier") that receives trackage rights or other access to the lines of a Participating Carrier as a result of settlement agreements with the Primary Applicants or conditions imposed on the Primary Applicants by the Board. The Trackage Rights Carrier shall be obligated to establish a Segment Rate pursuant to subparts (a)-(d) above only (1) for traffic capable of being handled using the rights or other access granted to the Trackage Rights Carrier and (2) between Exclusively Served Shipper Facilities located on the Trackage Rights Carrier's system as it existed prior to the transaction and the applicable Pre-Transaction Gateway, if any, where such traffic was interchanged, during the twelve months preceding the pre-filing notice under 49 C.F.R. § 1180.4(b) pertaining to the transaction, with the Participating Carrier over whose lines access was granted.

Such a rule would preserve shippers' pre-merger routing and rate challenge options in a straightforward manner that would not unduly constrain the ability of the combined carrier to achieve efficiencies associated with the combination. Because it would

make use of existing mechanisms for challenging rates, the merging carriers would be able to estimate the costs of this condition in advance. And the condition would ensure that the major pre-transaction gateways would remain open.[5]

This approach is preferable to the options suggested by the Board:

- The Board's contract option would require the shipper to carry the burden of negotiating an agreement with the non-merging carrier on rates and all other attributes of the transportation. That commercial agreement might not be reached.
- The Board's through route alternative would require the merged carrier and connecting carriers to agree. Again, they might not reach agreement.
- The Board's reciprocal switching and trackage rights proposals would run afoul of the fundamental policy basis for the Board's Bottleneck decisions, which affirmed bottleneck carriers' traditional routing discretion and statutorily-recognized right to select their long-hauls.[6] Those proposals would go far beyond what is needed to offset effects of the merger.

No new rule should require the merged carrier to short-haul itself, depriving the carriers of the returns upon which they depend to attract capital, reinvest in their rail networks, and maintain and improve service.

---

[5] Our proposed rule clarifies that the existence of transportation alternatives providing effective competition will be evaluated with respect to the entire movement from origin to destination, which is the transportation service of interest to the shipper. This will avoid the anomalous outcomes that would result were market dominance determinations based on competition for the bottleneck segment only, for example where intermodal competition between origin and destination provides a competitive constraint on rail rates but does not exist at a remote rail gateway where there is no reason at all for competition to exist. See, e.g., STB Docket No. 42038, Minnesota Power, Inc. v. Duluth, Missabe & Iron Range Ry., Decision served July 8, 1999 (ignoring rail-truck alternative between coal mine and utility because there was no evidence of transportation competition at interchange point).

[6] Docket No. 41242, Central Power & Light Co. v. Southern Pac. Transp. Co., Decision served Dec. 31, 1996, pp. 4-11.

Our rule is also far superior to the long-discredited "DT&I" conditions. Those conditions imposed draconian and inefficient requirements to allow routing over all possible gateways and required rate and service parity regardless of the relative efficiencies of various routes. Any such requirement would create significant impediments to efficiency.

UP's proposed rule would supplement existing precedent governing Board analysis of the potential vertical competitive effects of proposed rail combinations. The Board has not established a hard-and-fast rule that end-to-end combinations can never have anticompetitive effects. Rather, the Board's so-called "one-lump" theory establishes a presumption that end-to-end mergers do not have such effects. The presumption can be rebutted, and shippers can seek additional remedies. See, e.g., Finance Docket No. 32549, BN/Santa Fe, Decision No. 38, served Aug. 23, 1995, p. 71, aff'd, Western Resources, Inc. v. STB, 109 F.3d 782 (D.C. Cir. 1997).

V. Shortline and Regional Railroad Issues

All of the concerns expressed by shortline (Class III) and regional (Class II) railroads (collectively, "smaller railroads") can be addressed by the Board's general rules addressing competition and service issues. The service and bottleneck rate protections set forth in other new rules that UP has proposed would provide significant protections for Class III railroads and the shippers they serve. Additional rules specifically addressing shortline issues are not needed.

In particular, concerns regarding the appropriateness of contractual limits on interchange (sometimes called "paper barriers") are not the proper subject of general merger rules. The underlying contractual obligations did not arise from mergers and often are unaffected by mergers, particularly on UP. Issues relating to such contractual provisions were addressed in Ex Parte No. 575, Review of Rail Access and Competition Issues, and

Dear Bill:

This letter responds to questions regarding UP's position raised in your July 21 letter.

First, you ask what UP means when it says that it does not oppose the creation of NAFTA Rail "if the NAFTA Rail carriers agree not to discriminate against UP traffic at the International Bridge at Laredo, and if TFM continues to support competitive UP-TFM service and rates." I believe that UP has made its position clear in a number of settings, but I am happy to respond to your specific questions:

a. "What do you mean by 'not discriminate?'"

UP's Response: By seeking protections to ensure that NAFTA Rail carriers "not discriminate," UP refers to any step that Tex Mex or TFM might take that would inappropriately favor TFM-Tex Mex traffic over UP-TFM traffic at the Laredo Bridge. One example of such discrimination would be efforts by Tex Mex and TFM to limit UP to 50 percent of the Bridge's capacity when more than 50 percent of Laredo traffic volumes were moving on UP routes north of Laredo.

b. "As you know, operations as the Bridge are governed by a series of agreements dating back to 1951 and KCS has committed to abide by such agreements. Does UP contend that such agreements currently "discriminate" against UP?"

UP's Response: UP believes that existing agreements may be open to multiple interpretations, but since TFM's creation have not been applied in a discriminatory way. However, those agreements contain inadequate protections against potential discriminatory

behavior by Tex Mex and TFM once their incentives change due to KCS's acquisition of control of Tex Mex and TFM.

c. "If UP believes the agreements discriminate against it, why has UP not sought to enforce its rights under those agreements, rather than seek STB intervention over purely private contacts?

UP's Response: As noted above, the problem is not existing discrimination, but the change in incentives caused by KCS's acquisition of control. In the past, when Tex Mex was controlled by TFM rather than KCS (and when TFM was controlled by Grupo TMM rather than KCS), Tex Mex carried out TFM's interest in maximizing rail traffic moving via Laredo regardless of which U.S. carrier handled it north of the border. KCS, by contrast, will have incentives to discriminate against UP-TFM traffic.

d. "What does UP mean by 'competitive UP-TFM service and rates?'

UP's Response: "Competitive UP-TFM service and rates" refers to UP-TFM rates and service offerings that reflect continued cooperation from TFM rather than efforts by TFM (under KCS control) to tilt the competitive playing field in favor of KCS/Tex Mex by causing UP-TFM options to become less attractive to customers.

e. "By 'competitive UP-TFM service and rates,' does UP believe that TFM should give UP the exact same divisions as it would give KCS and Tex Mex?"

UP's Response: No, UP does not propose that TFM should be required to give UP the exact same divisions as it would give KCS and Tex Mex. In fact, a requirement of equal divisions would not protect competition following KCS's acquisition of control because Nafta Rail could manipulate upward the TFM portion of its origin-to-destination rates, thereby rendering UP-TFM service offerings unattractive to shippers, while lowering the KCS/Tex Mex portion.

Applicants have committed in this case to keep the Laredo Gateway open on "commercially reasonable terms," but they have not provided any explanation of what terms they would regard as "commercially reasonable" or how their commitment would otherwise be implemented. UP believes the concept of "commercially reasonable terms" requires definition, and UP would be open to a number of potential ways of ensuring that shippers continue to have access to reasonably-priced UP-TFM services.

Second, you inquire about UP's position that UP and its customers should receive a share of Laredo Bridge capacity "commensurate with their share of the rail traffic crossing the Bridge:"

a. "By this suggestion, is UP claiming that if, for example, it currently has 80% of the market share for U.S./Mexico traffic at Laredo that it should be guaranteed the right to use the Bridge 80% of the time?"

UP's Response: No. UP is not seeking to lock in its current share of traffic moving via Laredo. If UP's share of traffic declines because Tex Mex wins more business, UP's allocation of Laredo Bridge capacity should decline commensurately. UP's position is that, at any given point in time, it should be allotted a share of Laredo bridge capacity equivalent to whatever share of traffic is moving in UP-TFM service via Laredo. Tex Mex and TFM should not be in a position to impose artificial constraints on UP's access to Laredo Bridge capacity by, for example, insisting that UP receive only 50 percent of the Bridge's capacity at a time when its share of traffic exceeds 50 percent. UP is prepared to discuss how best this principle could be implemented.

b. "If KCS were to guarantee UP's use of the Bridge based upon UP's current market share usage over the Bridge, how would KCS ever be able to increase its market share for U.S./Mexico traffic?"

UP's Response: The question misstates UP's position. As explained above (in response to item 2(a)), if KCS increased its market share, it would be entitled to a larger share of Laredo Bridge capacity.

c. "Under this suggestions [sic], wouldn't UP have 'locked-in' the Bridge's capacity so as to prevent NAFTA Rail from increasing their use and from being able to effectively compete against UP?"

UP's Response: There would be no "lock-in," for the reasons explained in 2(a) above.

Third, you ask what UP means when it says that TFM should not "discriminate against" UP connecting traffic in favor of Nafta Rail carriers with respect to service.

a. "What does UP mean by the word 'discriminate?'"

UP's Response: UP believes that this concept is quite straightforward. Under KCS control, TFM should cooperate with UP in providing existing levels of service on UP-TFM movements and working to improve those services, to the same extent that it cooperates with its Nafta Rail partners, unless circumstances (such as the relative volume of traffic) warrant different treatment. UP desires to impose no limitations on the degree to which TFM could cooperate with its Nafta Rail partners.

Fourth, you ask about UP's statement that KCS should use its control of TFM to cause TFM to continue providing UP with "equitable TFM rate factors."

a. "Please confirm that UP is requesting that TFM provide it with rates/divisions from or to the Laredo Gateway for only the TFM portion of the entire rail move."

UP's Response: There may be many ways to implement Applicants' commitment to keep the Laredo Gateway open "on commercially reasonable terms," not all of which would necessarily involve TFM rates or divisions. If Nafta Rail were to elect to keep the gateway open by making enforceable commitments regarding TFM's rates or divisions, UP confirms that the TFM rates or divisions would necessarily cover the portion of the movement on TFM's system, *i.e.*, between Laredo and the Mexican point served by TFM or its connections within Mexico.

b. "Please confirm that even if a rail movement could originate and terminate on NAFTA Rail (meaning a commonly controlled KCSR, Tex Mex, and TFM) that UP is still requesting that NAFTA Rail provide it with a rate/divisions requirement for only the TFM portion of the movement?"

UP's Response: See my response to item 4(a), above. If Nafta Rail were to agree with UP to keep the gateway open by making enforceable commitments regarding TFM's rates or divisions, UP believes that it would be especially important that such commitments apply to TFM rates or divisions for movements as to which UP and KCS/Tex Mex compete. If such commitments did not apply in those situations, competition would be extinguished.

c. "If a UP-TFM routing competes against a KCSR/Tex Mex/TFM routing, would UP consider the TFM portion of the route to be the 'bottleneck segment?'"

UP's Response:

UP is uncertain what meaning you intend by your use of the phrase "bottleneck segment," which has been used in different ways in different contexts by various parties. UP does believe that for a large portion of the traffic moving between the United States and Mexico via the Laredo gateway, the TFM portion of the route is an indispensable element of any competitive origin-to-destination transportation service offering, in part due to excessive trackage rights charges in Mexico.

d. "Is UP requesting KCS to provide UP with the same or 'equal' rates over the TFM bottleneck segment that KCS would provide itself over TFM?"

UP's Response: Not necessarily. See my response to item 1(e), above.

e. "Please confirm that if KCS is required to provide UP with 'equitable' rates at Laredo for the TFM portion of an entire origin/destination through route to/from the U.S. to Mexico that such a requirement would prevent NAFTA Rail from providing long haul pricing and instead would require NAFTA Rail to 'short haul' itself for the TFM portion of the move?"

UP's Response: UP is not seeking to prevent KCS from offering "long haul pricing." KCS should be free to price KCSR-Tex Mex-TFM movements as it wishes to attract traffic to its Nafta Rail system, and to lower those rates to reflect any efficiencies that KCS control might achieve. However, KCS should not force shippers to use less efficient long hauls on the Nafta Rail system by extinguishing competition provided by UP-TFM options, such as by establishing non-competitive TFM rate factors.

f. "For any location where UP currently has the ability to interchange with KCSR or Tex Mex, but interchanges with other carriers instead, is UP willing to give KCS the same rates/divisions that it gives to other carriers at that location?"

UP's Response: No, just as UP is not proposing that KCSR or Tex Mex provide UP with the same rates/divisions that it gives other carriers.

Also, your question is not germane to the competitive concerns raised by KCS's acquisition of control of Tex Mex and TFM. Applicants have made a commitment in this case to keep the Laredo Gateway open on commercially reasonable terms. As discussed above, implementing that commitment may or may not involve commitments respecting TFM's rates or divisions. But the need for some form of concrete and enforceable commitment arises in this case – but does not arise with respect to other existing interchange situations – because KCS control will adversely affect competition via the Laredo Gateway. .

Fifth, you ask several questions about the concept of "neutrality and non-discrimination."

a. "When UP speaks of 'neutrality' are they talking about neutral TFM rates (divisions) at the Laredo Gateway?"

b. "Does 'neutral' TFM rates mean 'equal' TFM rates – equal as being between UP and KCSR/TFM?"

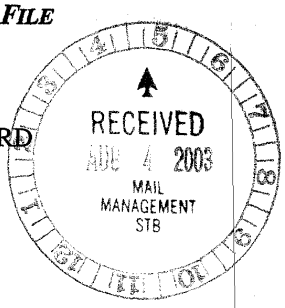
UP's Response to (a) and (b): No. See my response to item 1(e), above.

c. "If UP does not mean neutral TFM rates between KCSR/Tex Mex and UP, then what commitment of 'neutrality' is UP referring to?"

d. "What 'non-discrimination' commitment is UP referring to in this section?"

UP's Response to (c) and (d): UP is referring to neutrality and non-discrimination with respect to the operation of the Laredo Bridge and the entire array of TFM cooperative steps on matters of interline service that have heretofore provided shippers with attractive UP-TFM transportation options via the Laredo Gateway, and which would continue to do so absent KCS's acquisition of control of Tex Mex and TFM. UP's concept of non-discrimination is described further in my response to item 3(a), above.

Finally, you suggest that UP's positions appear contrary to previous positions UP has taken before the Board and Congress. UP disagrees, as our comments in the Board's Class 1 merger rules proceeding confirm. UP will be explaining in its August 4 Comments in this proceeding why its request for Board conditions in this case is supported by existing Board precedent and Congress' rail transportation policies.



Sincerely,

David L. Meyer

VERIFIED STATEMENT

OF

JOHN T. GRAY

My name is John T. Gray. I am Executive Director, Interline for Union Pacific Railroad Company ("UP"). In this capacity I am responsible for analysis of strategic issues and interline relationships with other Class I railroads and short lines. Previously, I was UP's Vice President and General Manager, Business Development. In this position I was responsible for interline management, and industrial development, as well as UP's Mexico business group. Prior to that I was Vice President and General Manager of UP's Industrial Products Business Unit with responsibilities for a business line with approximately $2 billion in annual revenue.

I came to Union Pacific in 1996 as a result of the UP/SP merger. Prior to the merger, I served as SP's Vice President-Network and Corporate Development. In that position I was responsible for SP's Service Design and Planning group, Joint Facilities and Operating Contracts, Strategic Analysis and Capital Planning. During 1995 and 1996 I managed SP's activities associated with the merger of SP and UP.

After earning a Bachelor's degree in Civil Engineering and a Master's degree in Civil Engineering from Tulane University, I served in the Army as executive officer of a transportation unit. I then took Ph.D. courses in transportation systems analysis and developed railroad cost models as a Research Assistant in the Transportation Center at Northwestern University. As Assistant Professor of Transportation at the University of Alaska, I subsequently taught transportation courses and developed transportation analysis tools.

I began my railroading career as Manager-Marketing and Sales for The Alaska Railroad. I later became the Director of Transportation for ARCO Alaska, Inc. I then spent five years at BN, first as Director-Marketing and Business Analysis and later as Assistant Vice President-Chemicals. I moved to SP in 1992 as Managing Director-Yield Management. I was promoted to Vice President-Network and Corporate Development in 1994.

I. INTRODUCTION AND SUMMARY

I explain in this statement why Kansas City Southern's ("KCS's") proposed control of The Texas Mexican Railway ("Tex Mex"), in conjunction with its acquisition of control of the most important Mexican railroad, Transportación Ferroviaria Mexicana ("TFM"), poses serious threats to competition for U.S.-Mexico rail shipments. Unless appropriately conditioned by the Board, KCS's proposed transaction will impair the competitive options available to shippers at the vital Laredo Gateway.

In 1996, the Board recognized that "Laredo is the principal rail gateway between the United States and Mexico,"[1] and it imposed conditions aimed at preserving effective two-railroad competition north of the border for U.S.-Mexico rail traffic moving via Laredo.[2] Laredo's importance is even greater today. International rail traffic via Laredo has more than doubled since 1995, far outpacing growth at other eastern Mexico rail gateways.

The Board's vision of effective two-carrier competition at Laredo has been achieved. TFM has worked closely with both UP and Tex Mex to develop highly efficient cross-border rail transportation services. Although shippers have chosen efficient UP-TFM

---

2 The Board granted Tex Mex extensive trackage rights over UP, allowing Tex Mex to connect with KCS at Beaumont. *See id.* at 422-25.

routes for the great majority of traffic flowing across the border via Laredo, by working with both KCS and BNSF, Tex Mex has increased its international traffic by almost { } percent since 1995.

Effective competition for rail traffic moving via Laredo depends on the cooperation of *both* Tex Mex and TFM. First, Tex Mex (with its parent Mexrail) controls the northern half of the Laredo International Bridge, which is the critical facility that all international rail traffic must use to cross the Rio Grande River at Laredo.[3] Second, TFM is the only Mexican carrier serving the Laredo gateway. KCS regards TFM and its Laredo-Mexico City main stem as the "the crown jewel system in Mexico."[4] The only way for UP to offer interline transportation services over the Laredo gateway – and thus the only way for the Laredo Gateway to be "open" – is with the cooperation of TFM.[5]

UP does not oppose efforts by KCS to become a more effective competitor and in the process attract additional U.S.-Mexico traffic via the Laredo Gateway. UP is not participating in this case out of a concern that KCS might become more efficient. Based on Applicants' statements about their plans for TFM – which involve KCS's acquisition of control but no operational changes – the prospect of significant improvements seems unlikely. To the extent the proposed KCS-Tex Mex-TFM transaction makes "NAFTA Rail" routes (or TFM-Tex Mex-BNSF routes) more efficient, UP would regard those changes as

---

[3] As Mr. Barkley explains, UP can only reach the Mexican border by using trackage rights over Tex Mex.

[4] KCS Conference Call with Analysts (April 29, 2003) (included as an Exhibit to UP's Comments).

[5] A map of the proposed KCS-Tex Mex-TFM system, which depicts the lines of TFM and other railroads within Mexico, is Exhibit A hereto.

procompetitive, even if UP loses traffic and revenues in the process. In any event, none of the relief UP is seeking in this case would interfere with KCS's ability to achieve efficiencies by combining KCS, Tex Mex and TFM into a single, commonly controlled system.

The reason UP is participating in this case is because, in the unique circumstances present here, unconditioned KCS control of Tex Mex and TFM poses serious dangers to competition. When KCS gains control of Tex Mex and TFM, these carriers will have new incentives and new abilities to distort the competitive playing field for traffic moving via the Laredo Gateway between TFM-served points and points in the United States and Canada. KCS actions based on those incentives are likely to eliminate rather than enhance competition. As I will explain, KCS will have incentives to increase the collective profits of its controlled entities by raising rates to shippers and rendering the efficient UP-TFM options that many shippers now prefer more costly, less efficient and thus less attractive.

Applicants have made three commitments on the record in this proceeding. They represent that: (1) KCS will treat UP fairly at the Laredo Bridge; (2) KCS's TFM subsidiary will continue to work with UP for movements via Laredo; and (3) KCS will keep the Laredo Gateway open on commercially reasonable terms. These commitments reflect a proper recognition of the Board's role in safeguarding rail competition via the Laredo Gateway. At the very least, the Board should impose KCS's commitments as conditions in this case. However, KCS's commitments by themselves do not offer sufficient protection. Although aimed at the right problems, Applicants' promises are not sufficiently concrete or enforceable.

UP therefore asks the Board to implement KCS's three commitments by doing three simple things:

1. The Laredo Bridge: Impose a condition requiring KCS to work with UP to reach an agreement respecting new protocols governing operation of the Bridge (as it has already committed to do). The need for such a condition is discussed in the verified statement of Stephen R. Barkley.

2. TFM Service: Impose a condition requiring KCS to develop an agreement that establishes methods for measuring compliance by Applicants with their commitments regarding TFM service and methods for enforcing those commitments. This is also something that Applicants have already committed to do, but it should be done under Board auspices for the reasons I explain below.

3. Keeping the Laredo Gateway Open Commercially: Impose a condition requiring KCS to develop an agreement with UP to ensure that Applicants live up to their commitment to "keep the Laredo Gateway open on commercially reasonable terms." The critical feature of any such agreement would be a mechanism for assuring that the commercial terms of TFM's participation in international rail service offerings (*e.g.*, rates, rate factors, etc.) would allow joint UP-TFM international rail services to remain competitive. There may be many ways to implement this condition effectively, as I explain below.

UP's proposed conditions are carefully tailored to permit KCS, Tex Mex and TFM to develop and capitalize on their potential single-system efficiencies, while preserving the effective competition for U.S.-Mexico traffic among U.S. railroads north of the border that shippers enjoy today.

II. KCS CONTROL OF TFM AND TEX MEX THREATENS TO UNDERMINE EFFECTIVE COMPETITION FOR U.S.-MEXICO RAIL TRAFFIC

As explained below, KCS control of TFM and Tex Mex is likely to undermine effective competition for U.S.-Mexico rail traffic.

A. Rail Transportation Plays a Vital Role in Trade between Mexico and Its NAFTA Trading Partners

As a result of the North American Free Trade Agreement and the privatization of Mexico's rail system, U.S.-Mexico rail traffic has grown dramatically. Since 1994, total cross-border rail traffic has increased by 158 percent to account for nearly $31 billion in

international trade between the U.S. and Mexico.[6] Privatization of the antiquated, government-owned system brought massive investment in Mexico's rail infrastructure, tremendous improvement in the operating efficiency of Mexico's railroads, and increasingly effective cooperation between those railroads and their U.S. interchange partners north of the border. For example, since 1996 TFM has spent $1 billion on capital improvements, completely overhauling its mainline and building five completely new intermodal facilities. It has shed thousands of workers and invested in over 150 efficient new locomotives. TFM revamped its operations, and has begun offering innovative services. Among other things, TFM now cooperates with its U.S. connections to operate efficient 100-car unit "shuttle trains" that move grain from U.S. producers to major Mexican receiving points, replacing the former system of handling this traffic one car at a time at a much higher cost. As a result of such steps, TFM has lowered its operating ratio from 93.6 percent when it began operations in 1997 to 76.1 percent in 2002.[7]

Because of improvements like these, rail transportation has become the mode of choice for growing numbers of companies engaged in trade between Mexico and the rest of North America. Rail increasingly offers those shippers significant cost and/or service advantages relative to other transportation options. For many rail shippers of bulk commodities to or from points not served by water, of course, rail has been and remains effectively the only option.

[7] *See* Post-Effective Amendment No. 2 to Form F-4, Registration Statement under the Securities Act of 1933, Grupo TMM, S.A. and TMM Holdings, S.A. de C.V., Apr. 23, 2003, at 95 (excerpts are Exhibit C hereto).

B. The Laredo Gateway Is Increasingly Vital to U.S.-Mexico Rail Traffic

In the arena of U.S.-Mexico rail traffic, the Laredo gateway has unique importance for rail traffic between Mexico and the United States (and Canada). In 1996, when the Board acted to preserve effective two-railroad competition via Laredo, it recognized Laredo's important role in cross-border rail commerce. Laredo has become even more important in the past six years.

1. Shippers' Routing Choices Reflect Laredo's Importance

The clearest indication of the vital role the Laredo gateway plays in U.S.-Mexico trade is the vast amount of rail traffic handled there. Rail traffic moving via Laredo accounts for approximately 75 percent (by dollar value) of all rail traffic between the United States and Mexico.[8] However, even this figure greatly understates Laredo's importance. Geography plays an important role in limiting most shippers' gateway options. For example, movements between UP's points in the western United States and points in western Mexico naturally flow via the three gateways in western Mexico: Calexico, Nogales and El Paso. Traffic between points in the central and eastern United States (and Canada) and points in eastern and central Mexico cannot effectively use these western gateways.

Of the three gateways in eastern Mexico – Laredo/Nuevo Laredo, Eagle Pass/Piedras Negras and Brownsville/Matamoros – Laredo is preferred by the vast majority of shippers. Laredo accounted for 86 percent of the rail traffic (by value) moving via these three

---

[8] The figure is based on 2001 Bureau of Trade Statistics data on the value of shipments moving between the United States and Mexico. *See* Bureau of Transportation Statistics, U.S. International Trade and Freight Transportation Trends 2003, "Table 24: Top 10 U.S. Land Ports by Value of U.S.-NAFTA Surface Trade: 2000 and 2001" (available at http://www.bts.gov/publications/us_international_trade_and_freight_transportation_trends/2003/html/table_24.html) (Exhibit D hereto).

gateways.[9] Data on the carloads crossed at these gateway tells the same story. In 2002, Laredo accounted for more than { } of all traffic moving via these gateways, as shown in Exhibit E. Eagle Pass, where UP and BNSF connect with Ferromex, handled only { } percent of the loads crossing the border in eastern Mexico.[10] Brownsville, where UP and BNSF connect with TFM, handled only { } percent of the loads. Brownsville's role is quite limited, because it is deficient in all of the attributes that make Laredo important. For example, Brownsville has few brokers and weak border infrastructure. Routes via Brownsville are quite circuitous for shipments to most of the central and eastern Mexico and the capacity of TFM's secondary line from Matamoros to the south is quite limited as is the capacity of UP's line south of Robstown, Texas. For these reasons, most of the traffic moving via Brownsville is traffic to and from *maquiladora* plants near Matamoros and other points just across the border from Brownsville in the Mexican states of Tamaulipas and eastern Nuevo Leon, which cannot be reached as efficiently via Laredo or other gateways.[11]

Even these figures understate Laredo's importance. For certain markets such as for traffic moving between the eastern and midwestern United States and eastern Canada and the industrialized regions of central and eastern Mexico, UP's data indicates that Laredo accounts for even higher shares of all rail traffic, frequently well above { } percent. For example, Laredo handles over { } percent of all UP movements from origins in Michigan

---

9 *Id*.

10 I discuss the reasons for Eagle Pass' limited role at pages at page 16, below.

11 *See* Map at Exhibit A. In addition, as noted below, UP and TFM use Brownville for empties that would ordinarily move via Laredo in order to maximize the efficiency of both gateways.

and Illinois (the two largest origins for Mexican rail traffic) to destinations in Mexico Distrito Federal (Mexico City) and the industrialized Mexican states of Puebla and Querétaro.

Another useful perspective is the rate of growth in rail traffic via Laredo. The volume of traffic moving across the Laredo Gateway has more than { } since 1995, as shown in Exhibit F. Tex Mex, strengthened by the Board's grant of trackage rights in the *UP/SP* case, has increased its volume of Laredo traffic nearly { } fold. *Id.*

At the same time, Laredo has also grown in importance relative to the other border crossing gateways. In 1995, as today, the principal alternative to Laredo was Eagle Pass/Piedras Negras. In 1995, Laredo accounted for { } percent of the total cross-border loads at these two gateways. By 2002, Laredo's share had grown to { } percent.[12]

Laredo's growing importance is perhaps best reflected in the fact that UP has seen its greatest growth occur at Laredo despite having acquired a 26 percent ownership interest in Ferromex, the sole Mexican railroad serving Eagle Pass. In 1995, Eagle Pass accounted for { } percent of UP's and SP's total cross-border loads at the Laredo and Eagle Pass gateways.[13] In 2002, Eagle Pass's share of UP's loads via these two gateways had fallen to { } percent.[14]

2. Laredo Has Significant Advantages Over Other U.S.-Mexico Gateways

Laredo's importance stems from several factors. In part Laredo's advantages are due to the relative efficiency of the U.S. rail routes serving Laredo from the north. But

---

[12] *See* Exhibit F.

[13] In 1995, UP handled { } loads via Laredo; SP handled { } loads via Laredo in conjunction with Tex Mex and { } via Eagle Pass.

[14] In 2002, UP handled { } loads via Laredo and { } via Eagle Pass. (BNSF handled { } loads).

that is a relatively small factor. Laredo's principal advantages over other Mexico gateways are three:

(1) Laredo has a uniquely well-developed international border crossing infrastructure – including well-developed facilities and procedures for customs and other governmental services, a strong broker community, and an extensive rail infrastructure that supports the special requirements of efficient international rail border crossings;

(2) TFM's network serving Laredo from the south offers significant advantages. These include TFM's highly-efficient direct route between the border and the industrial centers of San Luis Potosí and Toluca, which it serves exclusively, as well as Monterrey, Querétaro, Mexico City and other points in the industrialized heartland of northeastern and central Mexico; and

(3) TFM offers well developed and very efficient rail transportation services in close cooperation with both of its interline partners, UP and Tex Mex.

a) Laredo's Extensive Border Infrastructure

As a result of its central role in U.S.-Mexico cross-border trade, Laredo now has a uniquely well-developed infrastructure to accommodate the efficient handling of large volumes of international rail traffic. This infrastructure is the result of many years of planning and investment by the U.S. and Mexican governments, by the railroads serving Laredo, and by third party brokers, warehousing firms, and others that have located at Laredo. These investments were made not just because of Laredo's important role in cross-border rail

transportation, but because of its importance for truck transportation as well. Laredo is by far the leading crossing point for U.S.-Mexico trade by all surface modes.[15]

At any high-volume international crossing point, a well-developed infrastructure is essential to accommodate the need for customs, agricultural, narcotics and immigration inspections. The number of inspections has grown significantly with heightened scrutiny at international border crossings since 9/11. As a result of investments by governments and railroads, Laredo has unusually efficient inspection processes. While still time consuming, these processes have helped to expedite clearance at the border and significantly improve the fluidity of train movements between the United States and Mexico.

Customs, agricultural and other inspection forces of both countries are on duty 24 hours a day at Laredo to facilitate prompt movement of rail traffic. In 1999, UP installed a state-of-the-art, $1.5 million federal customs inspection facility at its Port Laredo yard. The UP facility has a support building for offices of Customs, USDA, and other federal agencies. It also contains a secure location for federal agency personnel to inspect up to sixteen rail cars and eight over-the-road trailers at a time. UP has installed facilities that allow it to switch out cars for inspection while minimizing delays to other movements. U.S. Customs has also invested in facilities for x-raying railcars, the high-tech Vehicle and Cargo Inspection System ("VACIS"), to facilitate detection of illegal immigrants and, especially since 9/11, to assist U.S. government anti-terrorism efforts. Tex Mex also invested a quarter of a million dollars

---

[15] In 2001, Laredo accounted for over $79 billion of U.S.-Mexico surface trade (both highway and rail). Eagle Pass was a distant eighth, with $6.7 billion of total cross-border commerce. *See* Bureau of Transportation Statistics, U.S. International Trade and Freight Transportation Trends 2003, "Table 24: Top 10 U.S. Land Ports by Value of U.S.-NAFTA Surface Trade: 2000 and 2001" (available at http://www.bts. gov/publications/us_international_trade_and_freight_transportation_trends/2003/html/table_24.html) (Exhibit D hereto).

to support this system. TFM has recently opened a SAGAR (the Mexican equivalent of USDA) post at its Sanchez Yard in Nuevo Laredo.

Cross-border shippers (rail and truck) also require extensive support from brokers and other third parties, such as freight forwarders, in dealing with the customs clearance process. Customs brokers and freight forwarders assist shippers in preparing customs forms for the U.S. and Mexican authorities. They utilize electronic pre-clearance procedures that have been implemented by customs agencies on both sides of the border. Laredo has a uniquely well developed broker community, in large part because it is also a very important crossing point for international highway traffic. Compared to other rail crossings, Laredo has a far greater concentration of brokers and freight forwarders. For example, Eagle Pass has only 15 U.S. brokers and 40 freight forwarders, whereas Laredo has 160 U.S. brokers and 500 freight forwarders.

The railroad infrastructure in the vicinity of Laredo is equally important. Although the railroads' pre-cleared run-through services at Laredo are relatively efficient, the railroads still must have extensive rail infrastructure for staging trains and railcars as they await inspection and customs clearances and access to the International Bridge. As a result of millions of dollars of investment by UP, TFM and Tex Mex, Laredo is uniquely positioned to handle high volumes of cross-border rail traffic. Mr. Barkley describes some of the changes UP and the other railroads have made in recent years to facilitate the efficient operation of the Laredo Bridge. All three railroads have built and expanded rail yards to support the growth of traffic moving through Laredo and to maintain the fluidity of the Laredo Bridge operation. At UP's Port Laredo facility, for example, UP has implemented nine phases of expansion since 1990, including the addition of sixteen classification tracks and an intermodal yard. UP and

TFM have also added to mainline track capacity in order to support Laredo crossing operations. For example, UP recently spent ${ } installing an additional siding on its line between Port Laredo and the Laredo Bridge.

UP estimates that the rail infrastructure at Laredo is currently capable of handling approximately { } trains per day across the border. At Eagle Pass, by contrast, UP estimates that there is sufficient capacity to cross only { } trains per day. Significant investments in both railroad and customs-related infrastructure would have to occur for Eagle Pass to be capable of handling volumes of traffic that approach those currently moved via Laredo. In the recent past the Eagle Pass gateway has operated close to capacity. Furthermore, the Mexican customs office at Eagle Pass has limited weekend hours, and Eagle Pass lacks the extensive supporting infrastructure the railroads have developed at Laredo. Regulatory constraints also make it difficult to put in place the required customs support services at Eagle Pass. Mexican law limits customs brokers to no more than four locations. Thus, many brokers that would open a new outlet at Eagle Pass may be required to close an existing location at another border crossing.

b) TFM's Routes South of Laredo Offer Significant Advantages

Another significant advantage favoring the Laredo Gateway is the fact that, unlike Eagle Pass, it provides access to TFM's route network. FXE and TFM were formed following the Mexican government's decision to privatize its national rail system in the mid-1990's. FXE operates primarily in western Mexico, while TFM holds what was referred to at the time of privatization as the "Northeast Concession." *See* Map at Exhibit A. TFM lines run from the Laredo and Brownsville gateways south into the most populous and industrialized regions of Mexico. TFM directly serves leading rail freight centers in Mexico,

including: Monterrey, Saltillo, San Luis Potosí, Querétaro, Mexico City, and Veracruz. *See* Exhibit A, and TFM's System map (Exhibit G hereto).[16]

FXE's lines are predominantly in the western part of Mexico. While FXE and TFM both serve a number of the same Mexican points, TFM's route has geographic advantages for movements between eastern Mexico gateways and much of eastern and central Mexico. A comparison of the TFM and FXE routes between the border and the area surrounding Mexico City, Mexico's largest population and consumption center, is illustrative. FXE's route between Eagle Pass and Mexico City is approximately 407 miles longer than the TFM route between Laredo and Mexico City.[17] Using trackage rights over TFM (between a point near Saltillo and Querétaro, as shown on the map), FXE can narrow that differential to 48 miles, but FXE's trackage rights have serious shortcomings. First, TFM has, to date, enforced strict limitations on the origins and destinations of the traffic FXE can handle using these rights. Second, FXE must pay onerous trackage rights fees to use the rights. FXE's trackage rights carry a rate of $0.71 per car-mile, or more than double the rate BNSF pays to use its trackage rights over UP in the United States.[18] Tex Mex pays UP similarly low fees –

---

[16] TFM's system is also shown in more detail on the "NAFTA Railway" map submitted with the Application.

[17] TFM's route from Laredo to Mexico City is 709 miles. FXE's route from Eagle Pass to Mexico City is 1,116 miles. *See* Map at Exhibit A.

[18] BNSF pays UP the equivalent of $0.27 per car-mile for the trackage rights it obtained in the *UP/SP* merger. In the *UP/SP* case, various parties challenged the trackage rights fees to be paid by BNSF as unduly high. *See UP/SP,* 1 S.T.B. at 413-17. FXE's rates are far higher, create a much greater cost disadvantage, and come close to consuming the entirety of the revenue available to FXE from rail movements using these rights.

only $0.31 per car mile – for its trackage rights between Robstown and Beaumont it obtained in the UP/SP merger.[19] Not surprisingly, FXE has used these trackage rights very sparingly.

Many points in Mexico that in theory could be served by both TFM and FXE are in reality not competitive, due to these inherent cost differentials. As shown in Exhibit H, the high trackage rights fees impose a serious cost disadvantage – on the order of 75 percent – relative to TFM for traffic moving between the United States and Mexico City and points south.[20] FXE can reduce this differential by using its own route, but at the cost of significant service penalties, and FXE's costs still are significantly higher – on the order of 57 percent – than TFM's.

Moreover, a significant portion of current international traffic through Laredo is moving to or from points in Mexico served solely by TFM. For example, TFM has the only access to eighty percent of the shippers in the industrialized region surrounding Monterrey, and it provides the only service to the industrial centers of San Luis Potosí and Toluca. Although FXE, in theory, obtained access to TFM-served shippers in Monterrey as part of the privatization process, to date, TFM has successfully blocked FXE from implementing that access. As Mr. Fuentes explains, Mexican legal and regulatory processes do not yet allow for prompt resolution of disputes involving railroads.[21] TFM's legal challenges have forestalled

---

[19] BNSF and Tex Mex rates are based on application of the gross-ton-mile rates they pay to a 30-ton railcar loaded with 100 tons of freight moved one mile (and averaged for the loaded and empty mile). Lighter weight intermodal and automotive movements incur even lower charges in the United States.

[20] The chart on the right side of Exhibit H compares FXE's costs with TFM's costs, using uniform assumptions about the two railroads' operating costs per mile.

[21] For example, TFM was able to obtain a court order staying an August 2002 regulatory decision that would have given FXE access to shippers in Monterrey as anticipated by the Mexican privatization plan. Fuentes V.S. at 7.

FXE competition in the Monterrey area for several years, with no end in sight. In large part because of intractable regulatory processes, the Mexican privatization process has not yet secured the degree of competition originally envisioned.

c) TFM Has Cooperated Extensively With UP and Tex Mex to Develop Efficient Cross-Border Transportation Via Laredo

Finally, a key to the effectiveness of the Laredo Gateway stems from the extensive cooperative steps that TFM has undertaken with both of its connections at Laredo. Since privatization, TFM – controlled by its Mexican parent Grupo TMM – has cooperated extensively with both UP and Tex Mex to develop efficient cross-border rail transportation offerings. TFM has also worked with Tex Mex, KCS, and BNSF to ensure that Laredo is an efficient and cost-effective gateway for shipping goods to and from Mexico.

TFM's cooperation with UP has taken a myriad of forms that benefit shippers both north and south of the border. TFM has provided UP with reasonable rates and rate factors to enable effective competition between UP-TFM routes and those involving KCS-Tex Mex and BNSF-Tex Mex. In addition, TFM has worked with UP on a wide array of operational issues, including pre-blocking of rail cars, directional handling of empties, and cooperation at Laredo Bridge. The two railroads have coordinated on border crossing issues, such as data exchange for blocking and customs purposes. And TFM has helped UP support customer requirements through the supply of railcars and related services. The cooperation between the two railroads has extended into marketing, including TFM's provision of rapid and responsive rate quotes and UP's one-stop customer service offering known as "MexDirect." I discuss this cooperation in more detail below, at page 22.

TFM has cooperated with Tex Mex and its U.S. connections, KCS and BNSF, as well. KCS and TFM, for example, pre-block traffic for one another, which "relieves Tex

Mex of the cost and responsibility for switching cars and trains, and allows more rapid movement of freight to and from Mexico."[22] Moreover, TFM has taken many of the same cooperative steps for BNSF traffic moving via Tex Mex. Taken together, these steps have made Laredo into an efficient and low-cost rail gateway for U.S.-Mexico trade.

C. Unconditioned KCS Control of Tex Mex and TFM Will Harm Competition

Many railroad consolidations have created improved transportation options for rail shippers and had generally pro-competitive effects. UP has extensive experience with such consolidations, having implemented the UP/MP/WP merger, the UP/MKT merger, the UP/CNW merger and most recently the UP/SP merger. All of those transactions, as conditioned by the Board, allowed the merged company to offer new, more efficient single-line services in competition with single-line routes of its rivals.

If the proposed transaction enables KCS/Tex Mex/TFM to offer improved single-system services, it too may have procompetitive effects. However, there are important differences between this transaction and other end-to-end transactions of the past. Those differences create unusually high risks that, unless subject to effective conditions, the transaction will cause significant harm to competition for traffic moving via the Laredo gateway. The unusual threats posed by this transaction stem from the following factors:

- The transaction would give a single U.S. carrier control over the only Mexican railroad serving the vital Laredo Gateway as well as the vital Laredo Bridge. Until now, U.S. carriers have competed vigorously with one another north of the border, relying on TFM (and TFM's subsidiary, Tex Mex) to cooperate with each of them in a neutral and

---

[22] Application (KCS-3/TM-3), Riney V.S. at 136.

efficient manner. Mexican law has required that TFM cooperate neutrally with both Tex Mex and UP, and with TFM under Grupo TMM control that requirement has coincided with TFM's self-interest.

- Shifting control over TFM from its Mexico parent (Grupo TMM) to a U.S. carrier (KCS) will extinguish TFM's cooperation with UP in situations where UP-TFM services compete with KCS/Tex Mex services. KCS will gain effective control over competition between UP and KCS/Tex Mex in the United States. Shippers have in the past indicated strong preferences for UP-TFM routes via Laredo. KCS will be able to disrupt UP-TFM services by using its control over TFM and Tex Mex, and many shippers relying upon UP-TFM services will face higher costs and poorer service from KCS's unconditioned control of Tex Mex and TFM.

- It appears unlikely that the transaction will produce significant pro-competitive benefits to offset anticipated effects. KCS/Tex Mex/TFM already regard their "NAFTA Alliance" as providing seamless service and do not anticipate any changes in operations as a result of KCS control. Any gains to KCS will stem not from meaningful steps to improve TFM/Tex Mex/KCS offerings, but from anticompetitive efforts to make UP-TFM services less attractive to customers.

1. TFM Has Acted Neutrally Under TMM Control, Allowing for Effective Competition by U.S. Carriers North of the Border

Since privatization in 1996, TFM has been controlled by Grupo TMM, a large Mexican conglomerate. The U.S. carriers that participate with TFM in international rail movements – UP, KCS (via Tex Mex) and BNSF (also via Tex Mex and to a limited extent via the Brownsville gateway) – have competed against one another north of the border, while

relying on TFM's neutral cooperation with respect to the Mexican portion of international movements.

a) TFM has Cooperated Extensively with UP to Develop Efficient and Attractive UP-TFM Rail Transportation Offerings

TFM's neutral role as the sole Mexican carrier serving the vital Laredo Gateway is reflected in the extensive cooperation between UP and TFM to improve UP-TFM services. Just as TFM and Tex Mex (with KCS) have cooperated to expand Tex Mex's international traffic, TFM and UP have built an effective partnership that has brought important benefits to U.S.-Mexico rail shippers for movements via Laredo. That cooperation has covered the full array of activities associated with developing and improving effective and competitively-priced interline rail services options via the Laredo Gateway. TFM has cooperated by providing UP with reasonable rates and rate factors, cooperating on service design and improvements, streamlining border crossing processes, ensuring prompt car supply for UP's Mexican customers, and numerous other steps. I describe the UP-TFM cooperation in these areas in more detail in Appendix A.[23]

2. KCS Control of both Tex Mex and TFM Will Create New Incentives to Tilt the Competitive Playing Field

The many cooperative measures described above and in Appendix A have allowed the continued improvement of UP-TFM transportation options. These improvements largely explain why UP-TFM traffic via Laredo has almost doubled since 1995. At the same

---

[23] UP and TFM hold frequent meetings on a multitude of issues related to cooperation at Laredo. At the assistant vice president level, the railroads convene process improvement meetings every other month. The railroads also hold quarterly executive sessions at the vice president level. Through such management coordination, UP and TFM have been able to provide customers with better U.S.-Mexico rail service.

time, consistent with the Board's intent in imposing conditions on the UP/SP merger, two-railroad competition north of Laredo has become stronger. TFM has worked cooperatively with Tex Mex and its connections (KCS and BNSF) to improve these carriers' US-Mexico interline services as well. Tex Mex's cross-border traffic (with both BNSF and KCS) has grown by { } percent since 1995. Shippers in the United States and Canada that wish to route U.S.-Mexico traffic through Laredo already have several strong competitive options.

Once it gains control of both Tex Mex and TFM, however, KCS will have new incentives and new abilities to limit shippers' choices by making UP-TFM options less attractive to customers, unless the Board imposes appropriate conditions to implement Applicants' generalized commitments not to undertake such strategies. By themselves, the commitments do not offer sufficient protection. It is essential that the Board impose conditions that make these commitments more definite and enforceable – which can be done without sacrificing any potential efficiencies flowing from KCS control. Otherwise, the interests of shippers and the competitive process will suffer.

KCS's incentives to use its control of Tex Mex and TFM to disrupt the competitive process are obvious. For many U.S.-Mexico rail movements, UP routes compete directly with KCS-Tex Mex-TFM and BNSF-Tex Mex-TFM routes. By increasing the costs of UP-TFM options or making them less attractive from a service perspective (and by discouraging TFM cooperation with UP in pursuing service improvements), KCS will be able to enhance its profits in ways that are detrimental to shippers. In shifting traffic to KCS and Tex Mex, allowing the NAFTA Rail system to earn additional profits north of the border, KCS will (1) deprive shippers of efficient UP-TFM services they enjoy today, and (2) allow

KCS-Tex Mex-TFM to increase rail rates to reflect the cost penalties it has managed to impose on UP.

Although UP today handles the majority of traffic moving via the Laredo Gateway, most of that traffic can be handled via KCS and Tex Mex. KCS/Tex Mex can compete head-to-head with UP-TFM routings for traffic moving to Canada, the Eastern United States, and the U.S. Midwest. KCS has connections with the eastern and Canadian railroads at most of the important mid-continent gateways. It also has its own routes to Kansas City, Chicago and St. Louis and other important traffic points.[24] Moreover, KCS has well-developed "alliance" relationships with many of its connecting carriers that allow it to take advantage of efficient run-through and coordinated train services and joint marketing of KCS-Tex Mex-TFM services.[25]

For example, KCS's alliance with IC&E/DM&E gives it efficient access to Chicago, as well as extensive reach in the grain-gathering regions of Iowa and southern Minnesota. KCS also has very efficient connections with alliance partner Norfolk Southern at Meridian, Mississippi, for traffic moving between Mexico and the East, and with alliance partner CN at Jackson, Mississippi, for traffic moving between Mexico and the upper Midwest and Canada, as well as the U.S. east and Midwest via the Chicago and Memphis gateways. I describe KCS's access to the eastern gateways in more detail in Appendix B.

---

[24] Among the important traffic points served by KCS's system are chemical plants in Baton Rouge, Lake Charles and elsewhere along the Gulf Coast, forest products shippers on KCS's former-Midsouth lines in Mississippi, industrial shippers in the Kansas City area, and grain origination points in Iowa and Nebraska reached via KCS's haulage rights north of Kansas City.

[25] *See generally* KCS's own map of its network of routes and alliance partners. This map shows how KCS serves the major gateways (Exhibit I hereto). The NAFTA Railway map submitted with the Application also depicts most of KCS's alliance routes.

In addition, in conjunction with BNSF and TFM, Tex Mex can participate in traffic moving between Mexico and many of the points served by UP's network in the West. As shown in Exhibit J, more than { } percent of the rail traffic moving via Laredo is subject to competitive movement via KCS/Tex Mex and its connections in the United States, including BNSF.

Shippers have benefited from head-to-head competition between UP and KCS/Tex Mex for participation in U.S.-Mexico traffic via Laredo. In many instances, UP has won the business, reflecting shippers' preferences for highly efficient UP-TFM service offerings. For example, {

} Sometimes KCS/Tex Mex prevails, where these carriers can present rate and service offerings more attractive than UP's offerings. For example, {

} UP competed for this business, but did not prevail. These examples demonstrate the extent to which competition for U.S.-Mexico rail traffic has flourished. In these situations and many others, competition among rail carriers north of the border – all able to compete on a level playing field, because of TFM's neutrality – has led to lower rates and improved service offerings. KCS's acquisition of control of TFM and Tex Mex – unless conditioned – will alter the competitive landscape and extinguish these benefits for many shippers.

3. KCS Will Be Able to Use Its Control of Tex Mex and TFM to Make UP-TFM Options Less Attractive to Customers

The viability of two-railroad competition at Laredo depends on TFM cooperation with both of the U.S. carriers serving that vital gateway. Under Grupo TMM control, TFM's cooperation with both UP and Tex Mex has flourished, because TFM has treated its two connections at Laredo neutrally. After KCS takes control of both Tex Mex and TFM, however, this situation will change. KCS will have powerful incentives to use its control of TFM to render UP-TFM options that compete with KCS/Tex Mex routes less attractive to shippers by raising the costs of those options or unwinding cooperative steps that have led to service improvements.

a) Anticompetitive Rate-Based Strategies

TFM's rates (or rate factors) are perhaps the single most important aspect of TFM cooperation for U.S.-Mexico traffic. UP could have routes north of the border that were clearly the most efficient, UP could have completely unconstrained services to the Laredo Bridge, and shippers could prefer UP services hands-down over those offered by KCS-Tex Mex and BNSF-Tex Mex. However, if the rates TFM charges shippers for UP-TFM movements were too high, shippers would lose the benefits of UP competition.

For the past six years, TFM has fostered effective competition among U.S. carriers by quoting comparable rates and rate factors to both UP and Tex Mex for Laredo traffic. As I explained above, TFM has done this in part because its parent, Grupo TMM, has no economic interest in favoring KCS routes over UP routes, and in part because of Mexican non-discrimination requirements.

When it acquires control of TFM, KCS will have the power to manipulate TFM's rates (or rate factors) to make competing UP-TFM services more expensive for

shippers causing them to pay more, and in some cases forcing them to switch to less desirable KCS/Tex Mex offerings. KCS could accomplish this without causing TFM to refuse outright to quote TFM rates to UP, and even without causing TFM to discriminate between UP and KCS/Tex Mex in the rates it does quote. All KCS would need to do is cause TFM to raise its rates, which Mexican law would allow.

A simple numerical example (spelled out in Table 1 below) helps illustrate how such a strategy might work. (The numbers are purely illustrative.) Assume that before KCS gains control of Tex Mex and TFM, TFM has provided both UP and KCS/Tex Mex a rate factor of $100 for traffic to an eastern gateway, and that UP and KCS/Tex Mex compete to handle the traffic north of Laredo. Assume that UP has the more efficient route and charges a rate factor of $100. KCS's rate factor is $105. In a fair competitive process, UP will win the business, and the shipper will pay a total of $200. This outcome is shown in the left-hand portion of the bottom row of Table 1.

After KCS acquires control of Tex Mex and TFM, it can change this result to the disadvantage of shippers. All it needs to do is instruct TFM to raise its rate factor by at least six dollars, as shown in Example 1 in the table. If it did that, the combination UP-TFM rate would now be $206, while KCS TFM could charge $205 and win the business. KCS would develop the $205 rate by lowering its own factor to $99, a step it could take because it can now get those dollars back through its ownership of TFM. The combined KCS/Tex Mex/TFM would make more money (and more profit, assuming KCS's previous $100 factor included some return), but the shipper would pay more and lose its preferred route north of the border.

TABLE 1			
	BEFORE KCS-TFM CONTROL	AFTER KCS-TFM CONTROL	
		Example 1	Example 2
UP Factor	**$100**	**$100**	**$100**
KCS Factor	**$105**	**$99**	**$95**
TFM Factor	**$100**	**$106**	**$120**
UP-TFM Rate	**$200**	**$206**	**$220**
KCS-TFM Rate	**$205**	**$205**	**$215**
Outcome	**UP wins; shipper pays $200**	**KCS wins; shipper pays $205**	**KCS wins; shipper pays $215**

KCS could use a similar strategy to increase its profits to shippers' detriment where service rather than rates had led shippers to prefer UP-TFM routings prior to KCS's acquisition of control of Tex Mex and TFM. In the above example, assume that UP and KCS/Tex Mex had offered to handle traffic from Laredo to an eastern gateway at comparable $100 rate levels, taking advantage of TFM's non-discriminatory ($100) rate factor, but that the shipper had chosen the UP route because, for example, it offered consistently faster transit times. After the transaction, TFM could increase its rate factor by $5 to both UP and KCS/Tex Mex, with KCS/Tex Mex lowering its factor by $5 to offset TFM's increase. To avoid a rate increase (from $200 to $205) the shipper would be forced to use KCS/Tex Mex's route north of Laredo, which it did not prefer. Alternatively, the shipper may conclude that it has a sufficiently strong preference for UP service that it is willing to pay $5 more to use it (a fact TFM likely would not have known until KCS/TFM attempted this strategy). Either way, KCS/Tex Mex/TFM would earn additional profits and the shipper would lose.

It is my understanding that KCS would have a great deal of latitude to increase TFM's rates even further than suggested by these examples, thereby making it even more

difficult for UP-TFM service offerings to remain price-competitive. Mr. Fuentes explains that there are no effective Mexican regulatory limits on the level of TFM's rates for transportation within Mexico. Within the experience of UP's Mexico Group, statutory rates published by the Mexican government (the so-called "TUCE" rates) are so high as to be unusable. Thus, KCS apparently could cause TFM to increase its rate factors as much as necessary to assure that UP was effectively disabled from competing. KCS would reduce its portion of the through rate enough to win the business and increase its profits, but not so much that the traffic would dry up. The right-hand portion of Table 1 (labeled Example 2) demonstrates the effect of a $20 increase in TFM's factor, which would allow KCS/TFM to win the business while simultaneously increasing the customer's rates significantly.

KCS's implementation of such a strategy would hurt shippers and competition, not just UP. For a number of reasons, TFM does not extract the last dollar of revenue that might conceivably be available by virtue of TFM's market power from each piece of traffic moving via Laredo. Most rates are quoted to customers on a "Rule 11" basis, which involves each railroad charging the customer its own, separate rate to the U.S./Mexico border, typically without any agreement by the carriers about what the overall origin-to-destination price should be. This limits the degree to which TFM can differentiate among customers based on their specific circumstances and demand factors. For many shippers, moreover, TFM quotes one rate to the Mexican receiver (or shipper), while the U.S. carrier quotes its rate to a separate entity (either the shipper or receiver) in the U.S. TFM's practice of quoting non-discriminatory rates also limits the extent to which it can effectively charge the highest rate that each piece of traffic can bear. In UP's experience, TFM's rates generally do not exploit the full measure of TFM's potential market power today.

North of the border, for traffic that is competitive between UP and KCS/Tex Mex (and its connections), competition among the U.S. railroads keeps rates competitive today – preventing either U.S carrier from picking up the dollars TFM leaves on the table. Because of this competition, moreover, UP would not have significant room to reduce its own revenue requirement in order to offset higher TFM factors that KCS could impose. As a result, when KCS's strategies extinguish existing competition from UP north of the border, they will remove constraints on KCS's rates and cause rate increases (and reductions in the level of rail service) available to shippers.

KCS likely would conclude that this strategy would not work the same way or to the same extent for all shippers. For those shippers with better access to other transportation options (such as truck or barge) or that otherwise have more elastic demand, KCS could offer lower rates by reducing its factor north of the border by a greater amount. For traffic that UP could efficiently route via Eagle Pass in conjunction with Ferromex, KCS might choose to maintain the status quo, so that TFM could be certain of retaining the Mexican portion of the revenues. But for significant amounts of existing Laredo traffic (both UP-TFM and Tex Mex-TFM), a profit-maximizing KCS strategy would be to increase rates selectively and deteriorate UP-TFM services overall.

This strategy would be even easier for KCS/Tex Mex/TFM to implement if Mexican law did not limit TFM's ability to provide its U.S. connections different rate factors for comparable traffic. If TFM were permitted to discriminate against UP overtly, KCS could simply cause TFM to raise its revenue requirements to UP but not to KCS/Tex Mex, and the result would be the same: UP's costs effectively would go up, KCS could win the business despite charging higher rates, and shippers would lose.

KCS appears to believe that its acquisition of control of TFM would change the way Mexican law applies, and allow TFM to discriminate overtly in favor of KCS-Tex Mex-TFM routes once KCS acquired control of TFM. In a presentation delivered in Mexico a few weeks ago, KCS disagreed with suggestions that TFM would be required to "provide 'equal' rates to the Mexico/U.S. border" once KCS acquired it. KCS criticized any such requirement as precluding NAFTA Rail from offering, "in the form of lower prices to the Mexican shipping public, the benefits of the long haul on its system."[26] UP has no desire to prevent KCS from offering *lower* rates to shippers to reflect any single-system benefits stemming from the proposed transaction. Based on Applicants' statements to the Board in this case, however, the transaction does not appear likely to achieve any such benefits, as discussed below (at pages 33-34). But if KCS is correct that TFM could discriminate by charging lower rates to favor long-haul KCS routings, it is necessarily also true that it could discriminate by charging *higher rates* to shift traffic away from efficient UP-TFM routings.

b) Anticompetitive Service-Based Strategies

Wholly apart from presenting the opportunity to increase UP-TFM rates by manipulating TFM's rate factors, KCS control of both Tex Mex and TFM provides opportunities for KCS to make UP-TFM transportation offerings less attractive (or more costly) in many other ways. As I explained above, the efficient UP-TFM services available to shippers today depend on many forms of cooperation by TFM. KCS – with very different incentives from today's TFM – could unwind many of those cooperative steps, or implement them with less vigor, in order to make UP-TFM options less attractive to shippers.

---

[26] KCS White Paper, p. 4 (Exhibit K hereto).

The measures available to KCS extend to most of the ways TFM cooperates with UP today. In the area of operations, TFM could discontinue pre-blocking cars south of the border or reduce the movement of empties through Brownsville/Matamoros. Eliminating pre-blocking would result in innumerable delays for UP shippers, causing those using private cars to incur additional car ownership costs and slower transit times. TFM could also give less priority to trains carrying UP traffic, or a lower priority to premium UP-TFM trains relative to KCS/Tex Mex/TFM trains. It could delay spotting empty equipment, setting out loads at customer sidings, or pulling loaded cars when the traffic is coming from or destined for UP at Laredo. Shippers would pay the ultimate price through delays and increased costs.

In addition, KCS could cause TFM to become less cooperative in pursuing commercial and marketing opportunities. For example, KCS could cause TFM to delay in providing revenue requirements to UP or rate quotes to customers using UP north of the border. TFM could also discontinue participation in cooperative arrangements, such as MexDirect, that provide customers with one-stop shopping for movements to and from Mexico. With reduced TFM cooperation, shippers would receive less favorable commercial terms, effectively increasing their costs.

In the vital area of customs processes, which can account for significant delays at the border, TFM could reduce its cooperation with respect to automated customs pre-clearance processes for shipments that are moving to or from UP. Because effective implementation of pre-clearance processes requires proactive efforts by both connecting railroads, even subtle reductions in TFM's cooperation could have significant consequences for the efficiency of UP-TFM cross-border movements and the level of service shippers receive.

Any of these steps would degrade the competitive rail transportation options that shippers enjoy today, or preclude UP from continuing to improve its cross-border services in ways that would otherwise have occurred naturally over time absent KCS control of Tex Mex and TFM. KCS says that it will not take any of these steps, and that it will instead "continue to cooperate" with UP in all of these areas.[27] UP welcomes KCS's commitment. As I discuss below (at pages 40-42 and 47-48), however, KCS's commitment needs to be embodied in a concrete and enforceable condition imposed by the Board in this case.

4. There Are No Meaningful Efficiencies Flowing from the Transaction to Offset the Threat of Anticompetitive Effects

Applicants have indicated in their Application and Supplement that the KCS/Tex Mex/TFM transaction will not result in any significant efficiencies that might offset the potential anticompetitive effects I describe above. To the extent the transaction leads to diversions of traffic to Tex Mex and KCS routes, those diversions will not be the product of procompetitive improvements due to increased efficiency from single-system routes. As the Applicants have repeatedly acknowledged, KCS and its "NAFTA Railway Alliance" partners already cooperate very closely today. As of a year ago, the NAFTA Railway Alliance had "developed a seamless, one-stop customer service approach for moving traffic in and out of Mexico on the NAFTA Railway."[28] Similarly, KCS and Tex Mex had put into effect "the

---

[27] *See* Supplement to Application (KCS-10/TM-10) at 25; Letter from William A. Mullins to David L. Meyer, July 21, 2003 (filed with Board and served on all parties of record) ("Applicants' July 21 Letter"), p. 1 (included as an Exhibit to UP's Comments); KCS White Paper (Exhibit K), p. 2.

[28] KCS NEWS, "*NAFTA Railway Partners Reflect and Pursue New Opportunities*," July 9, 2002 (available on www.kcsi.com) (Exhibit L hereto).

consolidation of KCS and Tex Mex dispatching, crew calling and timekeeping to KCS's System Transportation Center in Shreveport."[29]

The operational efficiencies Applicants acknowledge having already achieved are similar to those UP and TFM have achieved, without common control. KCS does not plan any further integration of TFM beyond what has already occurred: the Application states that "the TFM transaction will not alter the basic structure or operations of TFM."[30] Thus, unlike mergers that promise to reduce administrative expenses or allow for service improvements, KCS control of TFM will not produce any direct synergies.

Nor is it plausible that, in the absence of cost savings or efficiencies arising from the transaction, KCS's control will lead it to lower KCS-Tex Mex-TFM rates to attract traffic. If it wished, it could take this step today. KCS's efforts to "lengthen hauls" by shifting UP-TFM traffic to Tex Mex-TFM and KCS-Tex Mex-TFM routes must inevitably focus on measures that harm shippers and competition. As I described above, this would include efforts to raise the costs of UP-TFM movements or make UP-TFM movements less attractive to shippers by manipulating TFM's rate factor upward or by discontinuing (or freezing in place) TFM cooperative efforts that have helped to produce efficient UP-TFM service offerings.

---

29 *Id.* UP's Comments provide further details on the existing degree of integration among the NAFTA Railway Alliance partners.

30 Supplement at 25.

5. The Availability of UP-FXE Routes Via Eagle Pass or Other Transportation Options Would Not Allow Shippers to Avoid the Transaction's Anticompetitive Effects

Applicants have suggested that KCS could not or would not cause TFM to manipulate the competitive landscape in the manner I describe above because some shippers have other transportation options. Applicants argue that many rail shippers have truck and water transportation options, and that UP could divert traffic from the Laredo Gateway to Ferromex routes via Eagle Pass. These options, Applicants suggest, will deter KCS/TFM from closing the Laredo Gateway or otherwise acting anticompetitively. In addition, Applicants suggest that TFM's dependence on traffic that it currently interchanges with UP for a significant portion of its revenues will deter TFM from taking actions to shift this traffic to Tex Mex and KCS routes. I disagree.

To be sure, there are competitive options for some of the traffic that UP interchanges with TFM at Laredo. Some could be moved by truck, or moved to the border by rail and transloaded into trucks for final delivery. Some could be moved by water to or from the Mexican Gulf ports. And some could be moved by rail via the Eagle Pass gateway. For most shippers, however, these options will not avoid the potential anticompetitive effects of the transaction, for at least three reasons.

First, most shippers using rail transportation via Laredo today do not have equally attractive non-rail options. For them, shifts to alternative modes of transportation would impose additional costs or other disadvantages. As discussed above, rail transportation has distinct advantages over truck or barge movements for important traffic flows at Laredo because of geography (*i.e.*, distance of the shipper from ports and cargo transfer costs at ports, both in the United States and Mexico), cost advantages of rail relative to trucks, and other factors. Competition between railroads in the United States ensures that the cost and other

advantages of rail are passed on to shippers. If that competition were disabled, many shippers likely would sustain increased rates or reduced service levels before choosing an inferior option provided by another mode.

Notwithstanding Applicants' broad assertion that TFM faces substantial intramodal and intermodal competition, there are significant U.S.-Mexico traffic flows for which TFM provides a significant advantage in terms of price and service over the next best alternative. Applicants (and USDA) discuss options available to grain shippers, but their discussion focuses on movements in the aggregate rather than considering the options available for particular origin-to-destination markets. In fact, trucks are used only to transport relatively small quantities of grain produced in the area between Corpus Christi and San Antonio, Texas. Water transport handles larger volumes in the aggregate, but it is an effective option only for locations in the United States efficiently served by the Mississippi River system and then only for shipments destined to points in Mexico that are effectively served by Veracruz and other Mexican ports. For grain moving from most of the U.S. Midwest to large portions of eastern and central Mexico, rail is the only viable option, and for much of that traffic, including large receivers in San Luis Potosí and Querétaro, the only rail service available is provided by TFM.

Applicants also tell only half the story with respect to automobile parts and finished automobiles. For shippers and receivers of relatively small quantities of auto parts – typically parts moving to a third-party supplier in Mexico – truck is often a more attractive option than rail. However, for large volume shipments moving directly between parts manufacturers or consolidation centers in the East and Upper Midwest and automobile manufacturers in Mexico, the economics of boxcar or intermodal service are vastly superior to

truck service. The difference involves a combination of volume and service – when a large receiver such as Chrysler or General Motors pays the freight, they are able to smooth the border clearance process and take advantage of the lower rates rail can offer. Moreover, for some receivers, such as Chrysler's plant in Toluca, TFM is not only the most efficient rail option, it is the only option.

With respect to finished automobiles moving from Mexico to the United States, truck is not a viable option. Water transport is an option for some automobiles manufactured in the Mexico City area, primarily for shipments to the East Coast. For finished automobiles moving from Mexican locations to U.S. points that are not on the coast, rail is the only option. And, as with auto parts, for certain manufacturers, TFM is the only rail option.

Applicants did not even attempt to discuss competition for other significant flows of U.S.-Mexico traffic that move by rail today. Producers of many other commodities also depend heavily on rail transportation to provide seamless, efficient transportation between the U.S., Canada and Mexico. Rail transportation offers many such commodity producers the ability to ship more volume at one time directly to a given location, and often for a lower rate than by truck. For example, shippers such as AK Steel move large volumes of steel (especially coiled steel for auto manufacturing) from U.S. origins to TFM-served industrial facilities in central Mexico. That traffic could not move efficiently via truck or water. Likewise, shippers such as Unimin and Badger Mining move large volumes of specialized minerals (like ball clay and industrial sand, respectively) from U.S. production facilities to TFM-served plants in Mexico. That traffic cannot move by water between inland points and it cannot move economically by truck to large, rail-served receivers.

Second, significant amounts of traffic moving via Laredo could not effectively be shifted to alternative rail routes via Eagle Pass. Laredo is the preeminent gateway for many reasons. *See* pages 10-20. Some traffic (including traffic of shippers served only by TFM) could not be moved via Eagle Pass because it is dependent on TFM's rail network within Mexico. For other traffic, UP-TFM routes via Laredo offer important cost and service advantages, as discussed above. The fact that UP-TFM traffic via Laredo has grown much faster than UP-FXE traffic via Eagle Pass – despite UP's equity interest in FXE – provides a telling indication of Laredo's advantages. *See* Exhibit F.

Equally important, Eagle Pass's existing infrastructure could not accommodate a significant shift of all potential traffic from Laredo. Massive and wasteful investments in new rail capacity and border crossing infrastructure would be needed at Eagle Pass before significant volumes of Laredo traffic could be switched to Eagle Pass. A diversion of traffic to Eagle Pass would also strand tens of millions of dollars of UP investments that have supported efficient UP-TFM cross-border commerce at Laredo.

Third, to the extent some shippers do have readily available and equally attractive transportation operations for their rail movements over the Laredo Gateway, those options would not protect other shippers. NAFTA Rail can identify traffic that could shift gateways or modes and focus their anticompetitive strategies on traffic with less attractive options. They would thereby retain TFM's current revenues on traffic that could shift, while increasing NAFTA Rail's profits on traffic more dependent on rail service over the Laredo Gateway.

In addition, it is highly unlikely that KCS would be deterred from applying these strategies to the UP-TFM traffic that cannot effectively be diverted to Eagle Pass out of

fear that UP might retaliate by diverting some *different* UP-TFM traffic away from TFM. KCS no doubt already expects that – as a result of KCS acquiring control of TFM – UP will attempt to shift traffic to Eagle Pass where possible in order to remove it from potential interference by KCS. Thus KCS would not expect its implementation of anticompetitive strategies to lead to any additional, incremental diversions beyond what UP would be able to accomplish in any event. KCS therefore will not pass up opportunities to use control over TFM to shift profitable traffic to KCS and Tex Mex routes.

III. UP'S PROPOSED LAREDO GATEWAY AND SERVICE CONDITIONS ARE NARROWLY TAILORED TO REMEDY THE ADVERSE COMPETITIVE EFFECTS OF AN UNCONDITIONED TRANSACTION WITHOUT INTERFERING WITH APPLICANTS' EFFORTS TO COMPETE USING NEW SINGLE-SYSTEM ROUTES

The Applicants recognize that there are legitimate concerns about the effect of KCS control of Tex Mex and TFM on competition for U.S.-Mexico traffic, but their proposed solution is insufficient to protect against the potential harms. In an effort to convince the Board and the shipping community that competitive harms will not materialize, Applicants have made three important commitments:

- KCS will use its control of TFM to keep the Laredo gateway open on "commercially reasonable terms";[31]

- KCS will use its control over TFM to (a) ensure that UP and BNSF are provided the same level of service they have experienced in the past and to making improvements to that level of service where possible; (b) require TFM to cooperate with UP and BNSF on pre-blocking rail cars, improving automated customs pre-clearance procedures, supplying cars for shipments, accommodating run-through train service, providing excellent

---

[31] Applicants' July 21 Letter, p. 2; Supplement at 4 & Davies V.S. at 15.

service, and promptly quoting rates; and (c) work with UP and BNSF to develop a methodology for measuring and enforcing service standards for traffic handled by TFM via the Laredo Gateway;[32] and

- Applicants will (a) work cooperatively with UP toward efficient utilization of the Laredo Bridge and (b) negotiate in good faith with UP to develop new dispatching protocols for the Laredo Bridge.[33]

Although Applicants have focused on the right issues, their commitments are too vague to be effective. UP urges the Board to condition its approval in this case on Applicants' adherence to their commitments *and* on Applicants' negotiating in good faith with UP to establish concrete and enforceable agreements to implement those commitments. The Board should establish as a basic guideline that the final agreements should allow Applicants to pursue whatever efficiencies they might accomplish as a result of their transaction, while preserving competition for traffic moving over the Laredo Gateway.

In the sections below, I describe UP's view of how best to implement Applicants' commitments to keep the Laredo Gateway open on commercially reasonable terms and to continue to work with UP on cross-border traffic. In a separate statement, Stephen R. Barkley, UP's Regional Vice President - Southern Region, addresses Applicants' pledge to treat UP fairly at the Laredo Bridge. We offer only the broad outlines of implementing arrangements, because we believe that it would be most desirable for the precise terms to be the product of negotiations between Applicants and UP under the Board's supervision.

32 Applicants' July 21 Letter, p. 2; Supplement at 4, 24-25 & Davies V.S. at 14-15.

33 Applicants' July 21 Letter, pp. 1-2; Supplement at 4, 26-27 & Davies V.S. at 15-16.

A. The Laredo Gateway Condition

Acknowledging that NAFTA Rail will have incentives to preclude competition from competing interline routes via Laredo, Applicants have committed "to keep the Laredo gateway open on commercially reasonable terms." Supp. at 24. The underlying competition-preserving principle is easy to articulate: for the Laredo Gateway to remain open on commercially reasonable terms, TFM must not effectively close off UP-TFM interline movements via the gateway by insisting on rates that are too high for UP-TFM routings to be competitively viable. This commitment is crucial. Even if UP received nondiscriminatory treatment at the Laredo Bridge and nondiscriminatory service for UP-TFM movements, those operating conditions would be irrelevant if UP could not attract any traffic because of high TFM rates for the TFM portion of the movement.

However, Applicants never explain what they consider to be "commercially reasonable terms." Nor do they explain how those terms will be established and made available to shippers who use UP. In short, their commitment is in the right spirit, but it is too vague to ensure the preservation of commercially viable TFM-UP routings in the face of their own strong incentives to force shippers to use NAFTA Rail routings. KCS recognized as much in a July 21, 2003 letter, in which it stated that it was "willing to enter into private discussions with UP or any other party to discuss this commitment and reach a private agreement to ensure that KCS abides by this commitment."[34]

The Board should hold Applicants to their basic commitment to keep the Laredo Gateway open. It should also hold them to their commitment to negotiate with UP to

---

[34] Applicants' July 21 Letter, p.2.

establish a workable agreement to implement their commitment. However, the Board should not regard implementation as a purely private matter. It should be prepared to impose an appropriate solution if the parties fail to reach agreement.

UP believes there may be a variety of mechanisms that would offer a workable means of converting Applicants' vague commitment into an effective and enforceable remedy that preserves for shippers commercially-viable and competitive UP-TFM services, while at the same time allowing NAFTA Rail sufficient flexibility to adjust its rates to reflect merger efficiencies.

One effective approach might be a form of "proportional rate" agreement, perhaps modeled on an agreement reached between UP and BNSF in order to keep the Portland Gateway open on commercially reasonable terms following the UP/SP merger. In that case, the merging carriers and BNSF entered into an agreement that enhanced competition by transferring to BNSF a former-UP line in northern California, thereby creating a new BNSF single-line route between the Canadian border and the U.S. Southwest (the so-called "I-5 Corridor"). However, the railroads recognized that BNSF would no longer have incentives to work with UP on an interline basis via the Portland, Oregon gateway for traffic moving between BNSF-served points north of Portland (including points in Canada reached by BNSF indirectly) and points in UP's territory south of Portland. BNSF and SP had previously cooperated closely on such movements. In order to preserve the UP-BNSF interline option as a competitive alternative to BNSF's new single-line routes, UP and BNSF negotiated a mechanism – the I-5 Proportional Rate Agreement ("I-5 Agreement"). The I-5

Agreement allows UP to quote competitive rates for the full origin-to-destination movement of such traffic without the need for BNSF concurrence.[35]

The I-5 Agreement has been quite successful. UP has been able to compete for traffic originating and terminating at the BNSF-served points subject to the Agreement, providing those shippers with a valuable competitive option. At the same time BNSF has been able to grow its own traffic volumes using its new single-line route. The I-5 Agreement and associated line sale have not frozen the pre-existing situation, but have created a dynamic, competitive environment that has benefited shippers using both UP and BNSF options.

The I-5 Agreement is not a rate equalization agreement. It provides a methodology for developing "BNSF rate factors" for the portion of the movement north of Portland, and UP pays BNSF a division based on those factors. BNSF cannot manipulate those factors to disable UP competition, but at the same time BNSF is free to charge shippers using its single-line route whatever it wishes. UP never learns what BNSF's competitive single-line rates are. In Appendix C I have summarized the basic principles underlying the I-5 Agreement, as they might be adapted to fit the situation presented in this case, where it is vital to keep the Laredo Gateway open for commercially reasonable UP-TFM offerings. Such an arrangement could effectively permit UP to provide shippers with competitive UP-TFM services via Laredo, just as the I-5 Agreement allows UP to offer competitive UP-BNSF services via the Portland gateway notwithstanding BNSF's incentives to inhibit competition with its single-line services.

---

[35] A copy of the I-5 Agreement as filed with the Board in 1997 (excluding the highly confidential rate matrix appendices) is Exhibit M.

UP is not asking the Board to require Applicants to agree to a condition based on the I-5 Agreement or even the basic attributes described in Appendix C. UP recognizes that the parties, through private negotiations, may be able to develop a more appropriate means of protecting competition for traffic moving over the Laredo Gateway. UP offers the example of its I-5 Agreement both as starting points for negotiations and to demonstrate that an effective, pro-competitive agreement is possible.

UP is well aware of concerns that gateway preservation conditions not resurrect the rate equalization requirements of the long-discredited *DT&I* conditions. Those requirements inhibited competition by discouraging consolidating carriers from reducing rates on new single-line routes to capture traffic. Consolidating carriers could not reduce their own rates without negotiating with connecting carriers to ensure that equal rates would be offered over all competing routes. They also had little incentive to attract traffic by reducing rates because they had to make those rates available to competitors before locking up the business. Competitors could thus free-ride on the consolidating carrier's marketing and cost-reduction efforts and "cherry-pick" the attractive business. In fact, consolidating carriers were forced to keep their rates high enough to cover the costs of a less efficient joint-line movement in the event that shippers chose a joint-line routing.

The gateway agreement that UP envisions would not undermine Applicants' incentives to pursue whatever pro-competitive benefits might arise from KCS control of Tex Mex and TFM. An agreement modeled on the I-5 Agreement that reflects the essential attributes in Appendix C would contain four specific features designed to preserve Applicants' pro-competitive incentives:

First, Applicants would be free to change their rates as market conditions allowed. *DT&I* conditions imposed a tremendous burden on any effort to reduce rates because consolidating carriers were required to negotiate with their connections to ensure that equal rates would be offered over all competing routes. Under an arrangement similar to the I-5 Agreement, Applicants would be free to reduce (or increase) their rates for any traffic at any time, without engaging in a separate round of negotiations with UP.

Second, Applicants would not be required to inform UP every time they quote a shipper a new rate for handling competitive business. Unlike *DT&I* conditions, which allowed competing carriers to "cherry pick" attractive business, UP's proposal would not require Applicants to provide lower, equalized rates in advance of moving traffic. UP would be entitled only to the TFM rate factors contained in the rate matrix. It would not be entitled to learn what rates Applicants intend to quote or have quoted a particular shipper. The Applicants could thus target business without revealing their activities to UP, and they could reduce their rates in order to attract that business without making those same reduced rates immediately available to UP.

Third, Applicants would always be able to offer shippers a lower TFM rate factor than the matrix factor available to UP, if they continue to reduce costs. Unlike *DT&I* conditions, which required immediate rate equalization, an arrangement like the I-5 Agreement contemplates only periodic adjustments to the rate matrix. In other words, UP would not be entitled to use a TFM rate factor based on NAFTA Rail's most recent, lowest rates. The TFM rate factor available to UP would always lag behind the rates that NAFTA Rail was offering. The Applicants would thus have strong incentives to improve their efficiency and reduce costs, because such actions would allow them to remain ahead of UP in

their ability to reduce rates and capture traffic moving over the Laredo Gateway.[36] Moreover, Applicants' cost advantage over UP would last far longer than one quarter. As described above, TFM rate factors would reflect aggregated and averaged net revenues and divisions received by NAFTA Rail for *all* comparable traffic moving in the previous quarter, not just new movements. In other words, if Applicants reduced their rates to capture one shipper's business during a particular quarter, but they also moved other traffic under older, higher rates, then the next quarter's rate factor would reflect a blended rate, not just the most recent, lower rate.[37] Applicants would thus have strong incentives to pursue whatever legitimate efficiencies they might accomplish as a result of their transaction.

Fourth, Applicants would have the "first look" at all new business that would create a new matrix cell. Under the I-5 Agreement, if a shipper asks UP to move business with a STCC/car type combination for which there is no pre-existing BNSF rate factor, UP must ask BNSF for a rate factor as if there were no agreement in place. If this practice were applied here, it would preserve NAFTA Rail's incentives to develop new business opportunities that might arise as a result of their transaction.

These four features address valid criticisms of *DT&I* rate equalization conditions that have been offered in past cases. In particular, they address criticisms that *DT&I* conditions reduce pro-competitive incentives because they require consolidating carriers to share efficiencies related to their elimination of interchanges at gateways and thus

---

[36] Of course, UP would remain free to reduce its portion of a joint rate in order to respond to competition for traffic over the Laredo Gateway, just as if there were no Gateway Condition.

[37] The Gateway Condition thus not only allows Applicants to take advantage of any ability to reduce costs, but it also allows them to "cherry pick" certain business without making available the same low rates to UP.

subsidize less efficient connecting carriers. However, even without these features, those concerns would be far less significant in this case, because Applicants do not plan to achieve any efficiencies relating to the operation of the Laredo Gateway. *See* pages 33-34 above. Thus, a gateway condition would not undermine Applicants' incentives to reduce their own rates; it would work only to ensure that they do not unfairly discriminate by raising rates for shippers that use UP.

Moreover, as discussed above, UP and TFM have developed their own highly efficient interline services via the Laredo Gateway. NAFTA Rail carriers are unlikely to develop a more efficient interchange than the UP-TFM interchange, particularly if TFM remains an independent company, and particularly if it continues to cooperate with UP. Thus, this is not a case in which a gateway condition would unfairly subsidize a non-applicant by requiring the sharing of merger benefits. The condition would simply guarantee that the existing, highly efficient UP-TFM interchange at the Laredo Gateway would remain open on commercially reasonable terms.

B. The Service Condition

Just as Applicants have incentives to preclude competition by manipulating TFM rate factors, they have incentives to preclude competition by manipulating TFM service provided as part of interline movements with non-NAFTA Rail carriers. In recognition of these anticompetitive incentives, Applicants have committed to "continue to cooperate with UP" regarding "pre-blocking rail cars, automated customers pre-clearance procedures, supplying cars, accommodating run-through train service, and promptly providing rate

quotes."[38] In its letter of July 21, 2003, KCS also committed "to seeing that UP and BNSF are provided the same level of service they have experienced in the past, and to making improvements on that level of service where possible."[39] It further committed to use its control of TFM "to require TFM to cooperate with both UP and BNSF on pre-blocking rail cars, improving automated customs pre-clearance procedures, supplying cars for shipments, accommodating run-through train service, providing excellent service, and promptly quoting rates."[40] Finally it stated that it was willing "to work with UP and BNSF on development of a methodology for measuring service standards and to develop a method by which such standards could be enforced."[41]

On this issue, UP believes that Applicants' commitments offer an effective solution – especially their commitment to "work with UP and BNSF to develop a methodology for measuring and enforcing service standards for traffic handled by TFM via the Laredo Gateway" – provided they are required to adhere to those commitments as a condition to Board approval. Moreover, as with the Gateway Condition, when the Board requires Applicants to live up to their commitment to negotiate with UP, it should not leave the process solely in private hands. The Board should condition its approval on a requirement that Applicants negotiate in good faith with UP to develop an agreement establishing methods for measuring compliance with their commitments regarding TFM service and mechanisms

---

38 Supplement at 25.

39 Applicants' July 21 Letter, p.2.

40 *Id.*

41 *Id.*

for enforcing compliance with those commitments, and it should be prepared to impose an appropriate solution should the parties fail to reach agreement.

Experience implementing the conditions imposed in the UP/SP merger demonstrates that there would be effective ways to implement mechanisms for measuring and enforcing Applicants' adherence to the Service Condition. In connection with the UP/SP merger, UP and BNSF jointly developed measures for monitoring train performance to ensure non-discriminatory treatment of trackage rights trains moving over each other's lines. The implementation of similar service measurements to monitor the treatment of UP-TFM traffic as compared to traffic moving via TFM-Tex Mex routings would go a long way toward fulfilling Applicants' commitment. UP believes that it would be important for the parties to develop additional measures that address other important aspects of TFM cooperation issues – including, for example, measures to compare train schedules, car supply, switching frequency, and customer service responsiveness – but UP's past positive experience demonstrates that good faith negotiations can produce an appropriate solution.

As I discussed above, active cooperation between UP and TFM has been indispensable in developing efficient U.S.-Mexico rail service. History has shown that active coordination of services and operations, including customs clearance processes, blocking, and run-through service, as well as the level of service TFM provides within Mexico on UP-TFM interline business, is essential to attracting and retaining U.S.-Mexico traffic. If the current level of coordination and cooperation between UP and TFM decreased as a result of the transaction, or if TFM discriminated against UP in working to improve existing services, customers would quickly switch to alternative services provided by Tex Mex and KCS, even if they were more costly or less efficient. The Applicants have repeatedly asserted that they

have every incentive to continue cooperating with UP. UP seeks nothing more than an enforceable condition requiring Applicants to back those assertions with action.

APPENDIX A

EXISTING UP-TFM COOPERATION

Reasonable Rate Factors

- TFM has consistently quoted UP reasonable and non-discriminatory rates and rate factors to facilitate effective competition between UP-TFM routes and routes involving KCS-Tex Mex and BNSF-Tex Mex. For the most part, railroad rates break at Laredo, with the carrier(s) north of the border collecting its freight charges with TFM charging and collecting its own rate. To our knowledge, TFM has provided the same rates to both of its connecting carriers at Laredo, in accord with principles of neutrality established under Mexican law and the Concession that privatized TFM. *See* Fuentes V.S. at 4-5.

Marketing and Service Design

- An important feature for growing any transportation market is the ability to respond quickly and effectively to customer requests for pricing. Railroads must be able to quickly analyze the market environment and develop prices which help our customers participate in the ever changing opportunities they encounter. TFM has always proven to be an effective and aggressive market partner that has quickly responded to these opportunities with prices that are competitive. Similarly, TFM has also been a good partner in developing the service packages needed to attract and retain business.
- TFM and UP have implemented a "one-stop" shipping system called MexDirect that helps to expedite the movement of products across the Mexican border. The railroads offer customers "quick quote" rates between UP-served

origins and destinations in the United States and TFM-served origins and destinations in Mexico. Other important MexDirect features include a single-point-of-contact serving both sides of the border; easily understood information on doing business in the two countries, such as instructions on how to obtain credit, place car orders, create bills of lading and trace cars; a single bill, in U.S. dollars; and multiple warehouse and trans-load options. These services could not be offered without proactive TFM cooperation. This recent program offers our customers dramatic simplification for cross-border commerce.

- TFM and UP hold semi-annual marketing meetings. At these gatherings, executives from both railroads explain the successes resulting from UP-TFM cooperation and discuss on-going interline opportunities. The respective marketing departments can then make actual and potential customers aware of the benefits resulting from UP-TFM cooperation.

Operational Coordinations

- UP and TFM have cooperated to develop efficient pre-blocking for traffic moving via Laredo. Pre-blocking involves the delivery by a connecting railroad of blocks of cars all of which are moving to some intermediate point on the receiving railroad's system. Pre-blocking is an important way for interchange partners to reduce each other's costs and improve service levels, since pre-blocked cars do not need to be reclassified at the border and then reclassified again closer to destination.

- At its San Antonio Yard, UP blocks manifest traffic and intermodal "Z" trains for TFM destinations deep within Mexico, such as Mexico City. In return, TFM prepares northbound "Z" trains, which do not require reclassification on UP's system from the time they leave the Mexico City area until reaching Chicago. TFM also pre-blocks general merchandise trains for UP. For example, TFM prepares blocks for UP's Alton & Southern Yard at East St. Louis and for the Livonia Yard near Baton Rouge.
- Accommodating run-through train service. Run through trains are an important method of improving service to customers by avoiding the disruptions that can be caused by the process of interchanging freight cars between connecting railroads. It is particularly useful in an international situation, such as Laredo, where clearance procedures can further disrupt the free flow of goods. Expedited services are particularly dependent on run through trains if they are to be effective.[42]
- Directional handling of empties. TFM and UP also have implemented a cooperative policy regarding empty cars. The two railroads have agreed to route many empties through Brownsville/Matamoros to the extent possible (although many still go through Laredo). This routing of empties helps to keep the key gateway of Laredo less congested, thereby maximizing the ability of

---

[42] An important part of run-through service is the air testing and inspections that both parties perform before handing off trains to one another. UP tests and inspects cars headed for Mexico, and TFM does the same for UP on northbound cars. Although the FRA has not yet fully accepted the results of the TFM testing on northbound trains, UP nevertheless saves an hour on re-testing north of the border due to the assistance TFM provides. UP and TFM are working closely together to achieve FRA recognition of Mexican testing.

Laredo to move loaded railcars. In order to keep the Laredo Gateway fluid, it is important that this practice continue.

- Cooperation at the Laredo Bridge. At the key crossing of Laredo, TFM has worked closely with UP and Tex Mex to improve the management of the Laredo Bridge, allowing the railroads to increase daily throughput over the Bridge dramatically.

Border Crossing Coordinations

- In addition to the investment in infrastructure at and near Laredo, UP and TFM have engaged in important cooperative efforts aimed at smoothing the border crossing process. The railroads must cooperate extensively in order to facilitate obtaining customs and other pre-clearances while customers are en route to the border to avoid the need for customers to spend days waiting at the border to cross. The same degree of cooperation is needed to coordinate efficient operations. For example, local operations managers from both railroads talk twice daily to prioritize operational issues and to handle any anomalies. UP and TFM also exchange data that identifies the blocks that need to be made.

Car Supply and Related Services

- For northbound shipments, TFM is responsible for arranging to supply empty rail cars for loading by customers. This is critical to efficient satisfaction of customer demand. Also of importance has been TFM's ability to efficiently manage empty cars that have moved loaded onto their railroad southbound.

Their ability to match these cars with the requirements of customers shipping northbound is an important factor in keeping costs under control and permitting both railroads to participate in markets that would otherwise have been unavailable. This is supported by TFM's additional services, including prompt switching of loaded and empty cars from customer sidings and empty car cleaning when necessary.

APPENDIX B

KCS ACCESS TO MAJOR EASTERN GATEWAYS

CHICAGO

KCS trackage does not reach Chicago, but it has several ways of reaching the gateway:

- KCS's primary access to the Chicago gateway is via its Alliance partner CN, via a connection at Jackson, MS. As part of the CN-KCS Alliance, this routing also provides KCS with access to traffic to/from CN-served points in Iowa, Wisconsin, Michigan and Canada.

- KCS also reaches Chicago via Kansas City under a Marketing Agreement with the Iowa, Chicago & Eastern ("IC&E"), which operates between Kansas City and Chicago.

- KCS has haulage rights over UP between Springfield, Illinois (which KCS reaches via Kansas City) and Chicago. This agreement dates to 1989, when SP acquired its St. Louis-Springfield-Chicago line.

ST. LOUIS

KCS serves the St. Louis gateway via Kansas City. (Its route includes the Kansas City-St. Louis line of the former Gateway Western Railroad, which is now an integrated part of KCS.) At East St. Louis, KCS connects with CN, CSX and NS for traffic to/from the East and Southeast.

KANSAS CITY

KCS serves Kansas City directly. At Kansas City, KCS connects with its alliance partner IC&E/DM&E, which provides a direct route to Chicago and also serves grain origin points in Iowa and Minnesota. KCS also connects with NS for traffic to/from other points in the Midwest and East.

MEMPHIS

KCS does not serve Memphis, but can access the major southeastern carriers (CSX and NS) at other gateways, as noted. KCS's primary route for traffic to/from points in the Memphis area is via the CN connection at Jackson, Mississippi.

NEW ORLEANS

KCS serves New Orleans, where it connects with CN, CSX and NS for traffic to and from the east. KCS's primary interchange at New Orleans is with CSX, because most traffic to/from CN and NS is interchanged elsewhere, as noted below.

JACKSON, MS

KCS serves Jackson, Mississippi, which is the primary KCS-CN gateway for traffic to/from much of the CN system, including Canada. The two carriers operate coordinated train service via this gateway.

MERIDIAN, MS

KCS serves Meridian, Mississippi, which is its primary junction with NS for traffic to/from the east. The two carriers operate run-through train service via this gateway.

BIRMINGHAM, AL

KCS serves Birmingham, Alabama, where it can interchange with CSX.

APPENDIX C

ONE EFFECTIVE APPROACH FOR KEEPING THE LAREDO GATEWAY OPEN ON COMMERCIALLY REASONABLE TERMS

Purpose

- The agreement should ensure that UP (and carriers participating with it in joint-line routings) can offer shippers rates that include a commercially reasonable TFM factor for traffic moving via the Laredo Gateway between points in Mexico and points in the United States and Canada.

Scope

- The agreement should provide TFM rate factors that UP and other participating carriers could use for traffic moving between:

  (a) any point in Mexico served by TFM (directly or through interchange with carriers other than FXE), and

  (b) points in the United States and Canada served by UP or through UP via its connections.

- The agreement should cover all commodities (carload, bulk and intermodal).

- The agreement should cover both southbound and northbound movements.

- The agreement should cover shipments moved in railcars owned by railroads and third parties.

TFM Rate Factors

- The agreement should provide a matrix of TFM rate factors, in the form of net ton-mile rates (net of refunds, allowances, rebates, ancillary charges, and transload charges) for different commodities and car types.

- The net ton-mile rates in each cell of the matrix would be applied to the TFM mileage and the associated net tons between points in Mexico and the Laredo Gateway to develop the TFM factor.

- The agreement may provide for separate TFM rate factors applicable to different geographical regions within Mexico or the United States/Canada.

Development of TFM Rate Factors

- The initial rate factors should be determined based on the TFM portion of rates used in conjunction with UP-TFM interline movements (net of refunds, allowances, rebates, ancillary charges, and transload charges) in effect and actually moving business as of some reasonable benchmark prior to the announcement of KCS's acquisition of control of TFM and Tex Mex. A third party, such as a major accounting firm or other established transportation consultant (the "consultant") should be employed to compute rates for the TFM portion of UP-TFM movements.

- The net ton mile rate for each commodity/car type should be a weighted average of the rates applicable to movements of each such commodity/car type between the covered points.

- New rates should be derived each subsequent quarter based on KCS/Tex Mex-TFM and other Tex Mex/TFM rates or TFM rate factors actually moving business during the quarter. For Rule 11 rates, KCS/Tex Mex rate factors and route miles would need to be included for the portion of the movement north of Laredo.

- Once a cell in the matrix was filled, the rate factor should not be removed from the matrix if no traffic moved in a given quarter. Instead, the rate in the matrix should be adjusted to reflect rate changes for comparable traffic.

- The agreement should establish procedures to ensure that in settling interline accounts UP's and KCS/Tex Mex's revenues north of the Laredo Gateway are not disclosed to one other.

Service

- The agreement should provide for KCS to use its control of TFM to require that TFM provide service (including car supply, switching, pre-blocking and other handling) for movements as to which the agreement establishes TFM rate factors as TFM must provide in accordance with the other conditions imposed in this case.

Third Party Consultant

- The third party consultant should be jointly employed by UP and KCS/Tex Mex/TFM. The parties should share equally in the expense of employing the consultant. The parties should have the right to audit the consultant's work. The consultant should be required to remain impartial between UP and KCS/Tex Mex/TFM.

VERIFICATION

STATE OF NEBRASKA)

U.S. Merchandise Trade with Mexico by Rail, April 1993-December 2002

(Value in current U.S. dollars) CSV

Year	U.S. Imports from Mexico by Rail	U.S. Exports to Mexico by Rail	Total US-Mexico Trade by Rail
1993 (Apr-Dec)	$6,222,798,108	$2,103,568,900	$8,326,367,008
1994	$7,769,002,773	$4,192,037,736	$11,961,040,509
1995	$9,137,946,078	$4,694,439,969	$13,832,386,047
1996	$12,297,683,361	$5,119,248,882	$16,992,123,330
1997	$12,646,931,446	$5,648,002,070	$18,294,933,516
1998	$12,029,664,622	$6,188,777,197	$18,218,441,819
1999	$14,693,445,318	$5,710,614,158	$20,404,059,476
2000	$21,056,113,884	$10,495,792,020	$31,551,905,904
2001	$22,056,776,869	$10,389,405,439	$32,446,182,308
2002	$20,790,689,267	$10,143,004,235	$30,933,693,502

Note that data between 1993-1996 include transshipment activity (i.e., shipments which entered or exited the United States by way of a US Customs port on the northern or southern borders but whose origin or final destination was other than Canada or Mexico). Data beginning with January 1997 **do not** include transshipment activity. Users should note these differences before comparing figures for 1993-1996 with 1997 and subsequent year data. Also note that the category "OTHER" was further subdivided into "OTHER" and Foreign Trade Zones (FTZ) beginning with the April 1995 data month.

Our railroad operations consist of TFM and the Tex-Mex Railway.

TFM Railroad

TFM, through 2,641 miles (4,251 km) of main track and 637 miles (1,025 km) of trackage rights, operates the primary corridor of the Mexican railroad system which allows us to participate in the growing freight traffic moving between Mexico, the United States and Canada. TFM's rail lines connect the most populated and industrialized regions of Mexico with the principal border gateway between the United States and Mexico at Laredo-Nuevo Laredo. In addition, TFM's rail system serves three of Mexico's four primary seaports at Veracruz and Tampico on the Gulf of Mexico and Lázaro Cárdenas on the Pacific Ocean. TFM serves 15 Mexican states and the cities of Monterrey and Mexico City, representing approximately 70% of the country's population. TFM also expects to serve Guadalajara, Mexico's third largest city, through trackage rights with rail service to Laredo, Texas, the largest freight exchange point between the United States and Mexico, where TFM provides exclusive access from Mexico and also access from the United States through connections with the Tex-Mex Railway and the Union Pacific Railroad. We believe the Laredo gateway is the most important interchange point for freight between the United States and Mexico. Approximately 82% of TFM's total revenue in 2002 was attributable to international freight. The majority of this international freight was bound to or from the United States and Canada, crossing the U.S.-Mexico border at Nuevo Laredo, and most of the remainder came from overseas, principally through Mexico's seaports.

TFM's route structure enables it to benefit from the growing trade resulting from the increasing integration of the North American economies through NAFTA. Mexican foreign trade increased at an average annual rate of 18.8% from 1992 to 2000, increasing by 15.1% in 1999 from 1998 and by 22.5% in 2000 from 1999. Notwithstanding a decrease of 4.1% in Mexican foreign trade in 2001 from 2000 as a result of the slowdown of the U.S. and global economies, TFM's foreign trade increased 0.77% in 2002 from 2001.

TFM has significantly improved the operations of its rail lines by focusing on providing reliable and comprehensive customer service, implementing U.S. and Canadian railroad operating practices and making capital improvements to its track, systems and equipment designed to reduce costs and increase operating efficiencies. In 2002, TFM's operating ratio was 76.1% (78.5% including Mexrail), compared with an operating ratio of 93.6% for the first six months following commencement of its operations. TFM's operating ratio is better than the average operating ratio for the eight Class I railroads in the United States.* Operating ratio is an industry efficiency measure, which represents a railroad's operating expenses as a percentage of its transportation revenues.

---

* Source: American Association of Railroads

The principal commodities hauled over TFM's rail lines are: industrial products, metals and minerals; agro-industrial products; automotive products; chemical and petrochemical products; and intermodal freight. TFM currently operates intermodal terminals located in Monterrey, Toluca and San Luís Potosí, and has access to intermodal terminals at Querétaro, Guadalajara, Ramos Arizpe and Encantada. In addition, TFM has direct access to Grupo TMM's intermodal facilities at the ports of Tampico, Veracruz and Lázaro Cárdenas and to intermodal terminals in Altamira and Manzanillo (through interline service with Ferromex) and in Mexico City (through the Mexico City Railroad Terminal). TFM also has access to intermodal terminals at Laredo operated by the Tex-Mex Railway and the Union Pacific Railroad, which it is using to develop international intermodal business.

TFM's rail lines serve major automobile and other manufacturing facilities at the intermodal terminals at Monterrey and Ramos Arizpe, important industrial and commercial districts, as well as at the facilities of many major customers.

Mexican Government Interests

In connection with the original formation of Grupo TFM, the Mexican government purchased a 24.6% non-voting interest in Grupo TFM for $198.8 million. The Mexican government also granted the original shareholders of Grupo TFM an option (the "call option") to purchase the government's equity interest in Grupo TFM. On July 29, 2002, TFM purchased all of the call option shares for an aggregate purchase price of $256.1 million. The purchase price for the call option shares was financed through (1) a portion of the proceeds of the issuance of $180.0 million of debt securities by TFM and (2) $85.2 million (based on the applicable exchange rate as of March 31, 2002) payable to TFM by the Mexican government as a result of TFM's recent transfer of a redundant portion of its track to the government, together with cash from TFM's operations. As a result of the acquisition of the call option shares, TFM expects to achieve financial benefits and reduce the Mexican government's involvement in its business. The Mexican government retains a 20% non-voting direct equity interest in TFM.

The Mexican government has the right to sell its 20.0% direct equity interest in TFM by October 31, 2003 in a public offering, subject to the approval of Grupo TMM and KCS. If a public offering of TFM shares does not occur by that date and the Mexican government exercises

its put option, Grupo TFM will have the obligation to purchase the Mexican government's interest in TFM at the original peso purchase price per share paid by Grupo TFM for its 80.0% equity interest in TFM, indexed to Mexican inflation. If Grupo TFM does not purchase the Mexican government's TFM shares, the Mexican government may require Grupo TMM and KCS, or either Grupo TMM or KCS alone, to purchase the TFM shares at such price and release Grupo TFM from its obligation. There is no assurance that Grupo TFM, Grupo TMM or KCS will have sufficient funds to acquire the Mexican government's interest. If the TFM Sale is completed, KCS will assume all of our obligations under the put option and will indemnify us from any losses incurred as a result of the exercise by the Mexican government of the repurchase right.

Following its privatization in 1997, TFM and its shareholders have negotiated with the Mexican government the resolution of certain matters related to the granting of the concession and its acquisition of related railroad assets.

In connection with these negotiations, on February 9, 2001, the Mexican government, through the Ministry of Transportation, issued an official statement pursuant to which TFM and the Mexican government agreed to the transfer by TFM of the redundant *La Griega-Mariscala* portion of its track back to the Mexican government. On February 12, 2001, the Mexican government amended TFM's concession title to reflect the reversion of the *La Griega-Mariscala* line to the Mexican government. The consideration for the transfer of the track was approximately Ps. 653.6 million, plus applicable value added tax, or approximately Ps. 751.6 million (approximately $81.9 million as of December 31, 2001). The Mexican government paid the consideration for the *La Griega-Mariscala* line to TFM, amounting to $85.2 million, in conjunction with the acquisition by TFM of the Mexican government's 24.6% interest in Grupo TFM on

---

July 29, 2002. The *La Griega-Mariscala* track is a redundant 32-kilometer stretch of track which is part of TFM's dual track running between Mexico City and the city of Querétaro. The Mexican government subsequently granted the *La Griega-Mariscala* track to Ferromex to fulfill its obligation to provide Ferromex with a track along this route to facilitate transport by Ferromex through Querétaro.

At the same time, TFM's concession was also amended to relieve TFM from responsibility for the maintenance of the electrified catenary over the portion of its dual line between Huehuetoca and Querétaro and to authorize TFM's dismantling of the catenary over that portion of the line, which TFM completed in 1999. In addition, the amendment requires TFM to complete certain railway improvements which TFM believes will not involve material expenditures.

In addition to the foregoing, after a period of negotiation with Ferromex, TFM's principal Mexican rail competitor, and the Mexican government regarding the terms relating to the trackage rights required to be granted by TFM to Ferromex and by Ferromex to TFM under their respective concessions, TFM and Ferromex were unable to reach an agreement with respect to the fees to be paid by TFM and Ferromex for usage of the other's track. Therefore, in accordance with TFM's rights under the Mexican railroad services law, TFM asked the Ministry of Transportation to set these trackage rights using the applicable criteria under the Mexican railroad services law. In March 2002, the Ministry of Transportation issued its trackage rights ruling, which TFM is now appealing. See "Risk Factors—The rates for trackage rights set by the Ministry of Transportation may not adequately compensate TFM" and "—Legal Proceedings" for more information.

The Concession

TFM holds a 50-year concession title, renewable under certain conditions for an additional 50 years, to provide freight transportation services over its rail lines. This right is exclusive for the first 30 years of TFM's operations, subject to certain trackage rights to be granted to other Mexican rail operators. Under the concession, TFM has the right to use, during the full term of the concession, all rights of way, track, buildings and related maintenance facilities that are necessary for the operation of its rail lines. Under the terms of the concession, TFM is required to pay the government a fee equal to 0.5% of our gross revenues during the first 15 years of the concession period, and 1.25% of such revenues during the remainder of the period.

TFM is required to grant trackage rights along our rail lines to Ferromex, Ferrosur and the Mexico City Terminal Railroad. The Ministry of Transportation has the right to grant exclusive passenger service concessions utilizing TFM's rail lines to a concessionaire other than TFM. Under the concession and the Mexican railroad services law, TFM may freely set its rates unless the Mexican Antitrust Commission determines that there is no effective competition, taking into account alternative rail routes and modes of transportation. If the Mexican Antitrust Commission determines that there is a lack of competition in the railroad system, the Ministry of Transportation will establish the basis for TFM's rates. TFM's rates must be registered and applied in accordance with the Mexican railroad services law and regulations. In applying its rates, TFM must not make cross-subsidies, engage in tied sales or engage in other discriminatory pricing tactics. TFM is required to provide railroad services to all users on a fair and non-discriminatory basis and in accordance with the efficiency and safety standards approved periodically by the Ministry of Transportation. In the event that TFM collects from customers rates higher than the registered rates, it must reimburse those customers with interest.

The concession requires TFM to make investments and undertake capital projects in accordance with a business plan approved by the Mexican government. TFM is also responsible for compliance with efficiency and safety standards set forth in the concession, which are based

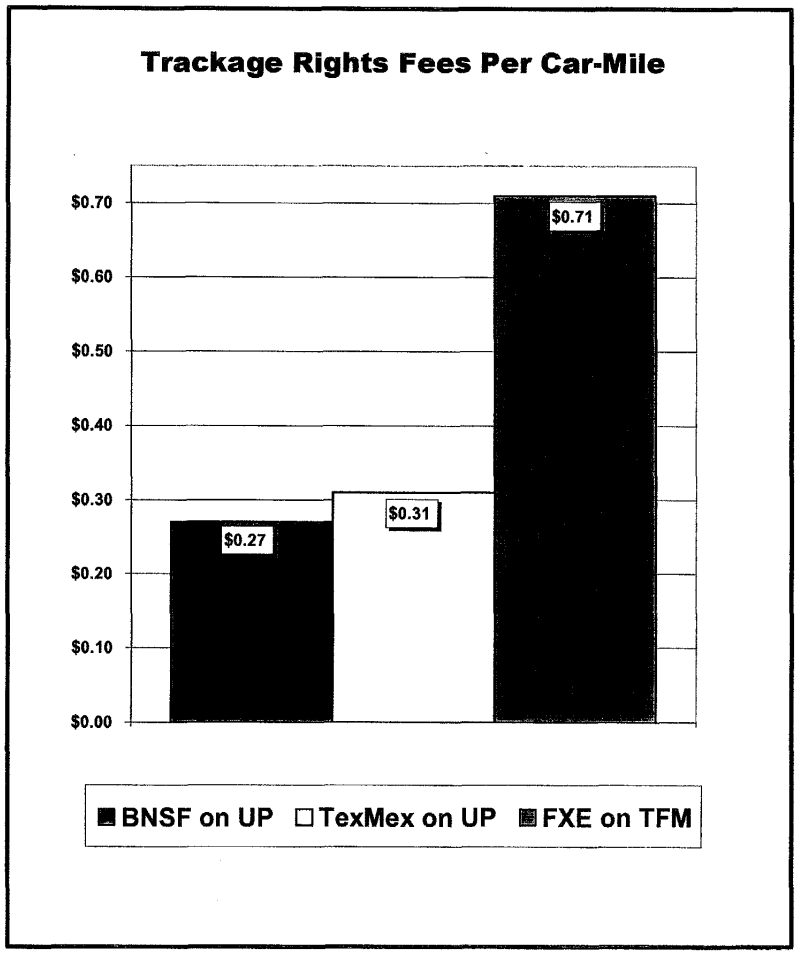
TFM serves Mexico's main industrial districts, including Mexico City, Queretaro, San Luis Potosi, Aguascalientes, Monterrey, Saltillo and Guadalajara, among others, and the ports of Veracruz, Lazaro Cardenas and Tampico/Altamira.



TFM provides the shortest route between major cities in Mexico and the U.S.A., and links up to the North American rail network at the border crossing points of Nuevo Laredo/Laredo and Matamoros/Brownsville, where more than 60% of commercial traffic between Mexico and the USA crosses the border.

NAFTA Rail

NAFTA Rail Will Enhance Mexico/U.S. Rail Competition Providing Shippers A Strong Rail Alternative

The agreements announced between Grupo TMM and Kansas City Southern to create **NAFTA Rail** (a common-control holding company for TFM, The Kansas City Southern Railway, and the Texas Mexican Railway) will enhance Mexican/U.S. rail competition and provide shippers with a strong, new rail alternative in the NAFTA trade corridor.

This is the next step in the effort to develop an effective rail competitor in cross border traffic which was found to be in the public interest by the U.S. Surface Transportation Board in the Union Pacific/Southern Pacific merger in 1996. NAFTA Rail will be that competitor. It will provide seamless, efficient and competitive rail service to shippers in North America and strengthen the ability of the three carriers to invest in their infrastructure, equipment and technology, improving their ability to compete.

NAFTA Shippers Need An Effective Cross Border Rail Competitor; NAFTA Rail Will Be That Competitor

NAFTA Rail is focused on enhancing competition. Because of Union Pacific's dominance of the current Mexico/U.S. rail traffic, shippers need a second rail competitor in this market that is economically viable and able to provide a competitive alternative to UP's dominance. Shippers should have a choice. NAFTA Rail will give shippers a choice.

Today, Union Pacific is the dominant rail carrier between Mexico and the U.S.:

- UP carries 90% of the northbound traffic and 79% of the southbound traffic between Mexico and the U.S. via all six rail gateways;
- At the Laredo, Texas gateway, UP controls 91% of the market share for northbound traffic and 71% of the market share for southbound traffic;
- From Chicago to Laredo, UP controls 98% of the rail traffic;
- From St. Louis to Laredo, UP controls 98% of the rail traffic;
- From Houston to Laredo, UP controls 86% of the rail traffic; and,
- UP currently operates to and from Mexico through all six international gateways.

By comparison:

- At Laredo, BNSF/Tex-Mex has just 5% of the northbound traffic and just 12% of the southbound traffic;
- At Laredo, KCS/Tex-Mex has just 3% of the northbound traffic and just 12% of the southbound traffic;

- BNSF has one direct gateway to Mexico and reaches two more gateways via trackage rights over UP; and,
- KCS/Tex-Mex has only one gateway to Mexico at Laredo, and it depends on trackage rights over approximately 350 miles of UP in Texas to reach this gateway where it competes with UP for Mexican rail traffic.

In addition, Union Pacific has a 26% ownership in Mexico's largest railroad concession, Ferromex, which is TFM's competitor in Mexico. Clearly, Union Pacific dominates rail traffic to and from Mexico.

Trade between Mexico and the United States is the fastest growing trade relationship in the world. Economic growth in both countries relies on this trade and on competitive transportation alternatives to keep it flowing.

Protecting the domination of this vital rail market by one carrier as exists today is not in the shippers' interests nor is it in the public interest. Shippers need an effective cross border rail competitor to provide a viable alternative to the market dominant carrier.

It is in the public's interest to have such a competitor. NAFTA Rail will be that competitor by providing seamless, efficient and competitive rail service to shippers in North America while strengthening the ability of TFM, the Kansas City Southern, and Texas Mexican railroads to invest in their infrastructure, equipment and technology improving their ability to compete.

It's In NAFTA Rail's And Its Customers' Interests To Work With All Carriers In North America

While NAFTA Rail will provide shippers with a competitive alternative to UP in certain markets, NAFTA Rail will also need to cooperate with UP and BNSF in a substantial number of other markets. UP is an important interchange partner with TFM, generating important revenues for its future. UP and BNSF together control approximately 90% of the rail traffic in the United States west of the Mississippi River. Both serve vast territories that NAFTA Rail will not reach. As such, NAFTA Rail will and must continue to cooperate with both carriers on interline services, but also will be a vigorous competitor wherever it can provide alternative rail service to the customer. Working with other carriers is and will be a business necessity for TFM.

UP's chairman, Dick Davidson said recently about TFM, "...we became quite good business partners down there and I would anticipate that would continue." KCS agrees. Under NAFTA Rail, its carriers will continue to cooperate with UP, BNSF and other carriers on:

- Pre-blocking rail cars;
- Improving automated customs pre-clearance procedures;
- Supplying cars for shipments;
- Accommodating run-through train service;
- Providing excellent service: and,

- Promptly quoting rates.

Under NAFTA Rail, the Laredo gateway will be kept open to UP, and Tex-Mex will provide the same fair service to UP at the Laredo bridge as it has in the past. Tex-Mex will also work with BNSF to route traffic via Laredo, even though BNSF has other gateways to Mexico. It is in NAFTA Rail's and its customers' best interests to work with all carriers in North America.

Proposals to Limit Competitive Rail Pricing in Mexican Market Undermine Competitive Rail Service

Rail service pricing in the Mexican market has numerous similarities to the U.S. with the exception that effective competitive options in Mexico are even more available than in the U.S. Consequently, rail pricing in Mexico is very constrained by truck and water competition.

When the Mexican railroads were privatized in 1996-97, their estimated market share was less than 10%. This low market share was driven by the relatively short distance between Mexican freight markets which, in turn, facilitates vigorous truck competition. Easy access to deep water ports on both the Pacific and Gulf Coasts; difficult railroad operating conditions from both Mexican coasts to the interior; and a very inefficient railroad operation with low quality rail service, prior to privatization, also made truck competition successful over rail. As a result, the Mexican economy became and continues to be very dependent on trucks. These were some of the elements that led the Mexican Government to conclude that privatization of the rail system was the right course of action for Mexico.

Since privatization, there have been enormous changes in the rail system. The Mexican rail system was broken up to create three primary rail competitors: TFM, Ferromex, Ferrosur. Competition among the newly privatized rail lines and intensive port and truck competition have led the railroads to rapidly improve service, freight car availability, infrastructure, information systems and customer service. At TFM, for example, more than $1 billion (U.S.) has been invested in freight cars, rail, ties, locomotives and information systems during the last 6 years. The result has been a success for the Mexican shippers and the Mexican public. The rail market share now is estimated to be in the 16% to 17% range. While this gain is significant, rail market share in Mexico is only about one-third of what it is in the U.S. As an indicator of the future growth potential of rail, the border crossing at Nuevo Laredo/Laredo reported the passage of more than one million trucks in 2002.

The current balance between the two largest rail franchises in Mexico – Ferromex and TFM – has produced good results for Mexico. Ferromex is the largest of the rail franchises in Mexico and covers more of the country than does TFM. Ferromex serves four of the six U.S. border crossings while TFM serves only two. Ferromex serves the majority of the grain destinations in Mexico but TFM serves more of the auto parts manufacturers and automobile plants.

Proposals being floated by Union Pacific (UP) would undermine rail competition in Mexico and lead to virtual control of the Mexican rail market by UP. To understand these proposals, it is helpful to remember than UP owns 26% of Ferromex and controls nearly 90% of all the rail traffic between Mexico and the U.S.

In an effort to maintain its control of Mexico-U.S. trade flows, UP has offered two dramatic proposals to protect it from competitive alternatives like NAFTA Rail:

- **Proposal I**

This proposal would give Ferromex additional mandatory trackage rights over TFM so that Ferromex could serve the Laredo gateway directly. Such a broadening of Ferromex was not contemplated by the government's privatization plan nor included in the rail franchises when they were offered for privatization. This expansion of Ferromex would upset the competitive balance achieved in the privatization process and have the effect of allowing Ferromex to serve five of the six routes between Mexico and the U.S. Because UP owns 26% of Ferromex, this would guarantee UP's continued dominance over Mexico-U.S. trade. The Mexican and the U.S. shipping public would, however, be precluded from ever benefiting from competitive rail service.

- **Proposal II**

This proposal is for TFM to provide "equal" rates to the Mexico/U.S. border. Such a proposal would deprive NAFTA Rail of the ability to offer, in the form of lower prices to the Mexican shipping public, the benefits of the long haul on its system from, for example, Mexico City to Meridian, Mississippi or Birmingham, Alabama. In addition, Ferromex is TFM's primary rail competitor. With UP controlling Ferromex's pricing (through its 26% ownership), with enforced "equal" rates as suggested by UP, UP could control the economic viability of both primary rail systems in Mexico and the prices paid by Mexican shippers. In short, "equal" rates give UP a way to control its 90% market share and deprive the Mexican and U.S. shipping public of the benefits of competitive rail service. Moreover, UP's proposal is contrary to Mexican law and regulations which grant each rail carrier in Mexico the right to freely set their own rates in the competitive marketplace.

NAFTA Rail is an effective way to bring a new rail service offering into the NAFTA trade corridor. NAFTA Rail will bring competitive discipline to the NAFTA trade corridor. And, NAFTA Rail will benefit both Mexican and U.S. shippers so NAFTA trade can reach its full potential.

NAFTA Rail Will Remain The Smallest Class I Rail Carrier

Despite strengthening its ability to compete, improving its ability to invest in infrastructure and being the effective rail competitor for cross border traffic that shippers need, NAFTA Rail still will be, by far, the smallest Class I rail carrier in the United States.

In 2002:

- UP had annual revenues of approximately $12.5 billion (U.S.) making it the largest Class I rail carrier in the United States;
- KCS had revenue of under $600 million (U.S.) making it the smallest Class I carrier in the United States;
- If the NAFTA Rail transaction is approved, its combined revenues will be about $1.3 billion (U.S.), just over 10% of UP's 2002 revenues;
- UP has stated that just under 10% of its annual revenues, or about $1 billion (U.S.) is derived from traffic between Mexico and the U.S.; and,
- KCS/Tex-Mex revenues from traffic between Mexico and the U.S. are less than $70 million annually.

Obviously, UP has enormous economic power in the cross border market. NAFTA Rail will enhance Mexico/U.S. rail competition and provide shippers a strong rail alternative in the future.

Questions?

If you have questions about NAFTA Rail or any of these issues, please contact us at 816-983-1500, or send us an e-mail at NAFTA.Rail@kcsr.com and we will respond promptly. NAFTA Rail will be good for shippers, good for competition, and is in the public interest.

NAFTA Railway Partners Reflect and Pursue New Opportunities

Previous Article / Next Article / KCS News Menu

On July 28th, NAFTA Railway alliance partners KCS, TFM and Tex Mex met in Houston for a quarterly meeting to pursue new opportunities for NAFTA Railway growth. Operating, marketing and customer service representatives were present to discuss, among other topics, freight traffic opportunities both north and southbound. All partners agreed that there are tremendous opportunities to grow the business and improve service, especially in conjunction with the recent alliance with BNSF, as well as more established alliances such as those with CN, NS and IMRL.

Recently, the synergies of the three partners have again proven successful with the operational improvements seen on Tex Mex since March. The three groups reported on efficiencies already in effect, such as the consolidation of KCS and Tex Mex dispatching, crew calling and timekeeping to KCS' System Transportation Center in Shreveport.

Since the consolidation, customer service representatives from all three partners, talk weekly about the joint operation. "The team has developed a seamless, one-stop customer service approach for moving traffic in and out of Mexico on the NAFTA Railway," said Jan McNeal, KCS' AVP customer service. "Each week, the team covers service performance related to KCS' new pre-blocking plan for traffic going southbound into Mexico, despacho previo and clearances that will help expedite traffic, technology updates such as Electronic Data Interchange (EDI) performance and billing, as well as current customer issues. The team will continue to resolve issues and provide regular updates to senior leadership."

Since the meeting, KCS and Tex Mex have begun working on an initiative with TFM to create a similar plan for operational efficiency going northbound, to include the possibility of TFM pre-blocking traffic to save handling and transit time on traffic moving from Mexico to the US Markets.

In a final note regarding the NAFTA Railway Alliance meeting, another key topic was that of future projects like the implementation of MCS on KCS this summer and on Tex Mex later this year. The shared computer system will help KCS and Tex Mex to provide more accurate and timely information to customers, and further improve the convenience of doing business on the NAFTA Railway.

PROPORTIONAL RATE AGREEMENT

THIS AGREEMENT made as of this 22 day of May, 1997, between The Burlington Northern and Santa Fe Railway Company, a Delaware corporation and its railroad affiliates (The Burlington Northern and Santa Fe Railway Company and all of its railroad affiliates, and, where appropriate in the context, their predecessors, are hereinafter referred to collectively as "BNSF"), on the one hand, and Union Pacific Railroad Company, a Utah corporation ("UPRR"), and Southern Pacific Transportation Company, a Delaware corporation ("SP") and all of their railroad affiliates (UPRR, SP and all of their railroad affiliates, and, where appropriate in the context, their predecessors, are hereinafter referred to collectively as "UP"), on the other hand.

WITNESSETH:

WHEREAS, BNSF and UP are parties to an agreement dated September 25, 1995, as supplemented by agreements dated November 18, 1995 and June 27, 1996 (the "Settlement Agreement"), and

WHEREAS, pursuant to Section 2c of the Settlement Agreement, BNSF and UP agreed, using the procedures established in Section 9f of the Settlement Agreement, to establish a Proportional Rate Agreement incorporating the terms of the "Term Sheet for UP/SP-BNSF Proportional Rate Agreement Covering I-5 Corridor" attached as Exhibit B to the Settlement Agreement (the "Term Sheet"), and

WHEREAS, by Letter Agreement dated January 8, 1997 (the "Letter Agreement"), BNSF and UP settled certain disputes regarding the terms of the Proportional Rate Agreement.

NOW, THEREFORE, it is mutually agreed by and between the parties:

1. General.

This Agreement allows UP unilaterally to establish rates for all commodities in all car types moving between (a) BNSF-served facilities or interchanges in the Northern Region as shown on the attached Exhibit A and further defined below and (b) UP origins and destinations or interchanges in the Southern Region as shown on Exhibit A and further defined below. For purposes of this Agreement, (i) "BNSF-served facility" shall mean any facility at which rail traffic originates or terminates now or in the future (including, but not limited to, plants, storage facilities, transload facilities, automobile ramps, intermodal facilities, port facilities, and team tracks), served directly or through any switching arrangement (including, but not limited to, reciprocal switching, joint facility switching, and third party switching) by BNSF regardless of whether the facility is served by more than one railroad but excluding (A) those facilities also served by UP directly, through haulage, or through any switching arrangement as described above and (B) intermodal and transload facilities located now or in the future within 75 miles of a UP served intermodal or transload facility, (ii) "origins" and "destinations" shall mean any point (including, but not limited to, plants, storage facilities, transload facilities, automobile ramps, intermodal facilities, port facilities and team tracks) at which rail traffic originates or terminates, regardless of whether such origins and destinations are served by more than one railroad,

and (iii) "interchanges" shall mean any point of interchange between railroad companies regardless of whether more than one railroad interchanges with the connecting railroad or railroads at the interchange in question. All movements under this Agreement shall be handled in interline BNSF-UP service and be interchanged at Portland, Oregon. Rates shall be available under this Agreement regardless of the route used by UP between Portland and the UP origins, destinations or interchanges in the Southern Region. UP may negotiate with the Canadian National Railway Company ("CN") for an agreement under which proportional rates established under this Agreement can be used directly in conjunction with BCRAIL, Ltd. ("BCOL"). BNSF shall provide reasonable assistance to UP in such negotiation. UP may not establish rates under this Agreement for use directly in conjunction with BCOL until UP has first reached such an agreement with CN.

Northern Region - "Northern Region" shall mean and include all (a) BNSF-served facilities for purposes of determining points to and from which UP can establish rates under this Agreement and all BNSF origins and destinations for purposes of identifying movements of traffic used to calculate rate factors under Section 2, whether served now or in the future in British Columbia, in the State of Washington, in the State of Oregon north of Portland (excluding BNSF-served facilities in Portland and including BNSF's Astoria Branch), in the State of Idaho north of an east-west line drawn through the state at the geographic latitude of Portland, Oregon, and in the State of Montana west of a line drawn through Billings and Havre, (b) existing or future interchanges between Canadian railroads and BNSF for traffic originating or terminating in the Provinces of British Columbia, Alberta or Saskatchewan including, but not limited to, interchanges at

Vancouver, North Vancouver, Brownsville, and New Westminster, British Columbia, at Huntingdon, British Columbia/Sumas, Washington and at Coutts, Alberta/Sweet Grass, Montana, (c) existing or future interchanges with railroads except UP that are line haul carriers participating in interline revenue settlements (such as Central Montana Rail, Inc.) in the State of Washington, in the State of Oregon north of Portland, in the State of Idaho north of an east-west line drawn through the state at the geographic latitude of Portland, Oregon, and in the State of Montana west of a line drawn through Billings and Havre, and (d) origins and destinations on connecting railroads that are not line haul carriers participating in revenue settlements (such as Montana Rail Link) in the State of Washington, in the State of Oregon north of Portland, in the State of Idaho north of an east-west line drawn through the state at the geographic latitude of Portland, Oregon, and in the State of Montana west of a line drawn through Billings and Havre.

Southern Region - "Southern Region" shall mean and include (a) all UP origins and destinations whether served now or in the future by UP in the States of Arizona, California, Colorado, New Mexico, Nevada, Oregon (excluding Portland as an origin or destination and excluding any portion of Oregon included in the Northern Region), Utah and Texas west of a line drawn between Monahans and Sanderson, and including, but not limited to, origins and destinations now or in the future served in common by UP and BNSF (and/or any other railroad) as well as origins and destinations now or in the future served exclusively by UP and (b) existing or future interchanges with (i) Mexican railroads and (ii) other railroads in the states listed above.

For purposes of excluding it from the geographic coverage of this Agreement, "Portland" shall be defined as all stations in Multnomah County, Oregon excluding stations designated by UP Freight Station Accounting Codes ("FSAC") 6248 through 6269.

2. Rate Factors.

a. Rate factors to determine BNSF's revenue for rates established under this Agreement shall be developed on a per net ton-mile basis. Except as provided in Section 2g(4)(a), the rate factors shall be listed in matrices developed and maintained by an independent third party consultant employed by the parties pursuant to Section.

The horizontal axis of each matrix shall list all commodities by three digit Standard Transportation Commodity Code ("STCC"). In the event STCC ceases to be used the parties shall agree on an appropriate substitute that most closely matches STCC. The vertical axis of each matrix shall contain listings for each car type shown on the attached Exhibit B which may be amended from time-to-time to reflect the addition or removal from service of car types at the level of commercial distinction reflected in the exhibit, used in the railroad industry. Separate matrices shall cover southbound movements from and northbound movements to (i) BNSF interchanges with Canadian railroads at or in the vicinity of Vancouver, North Vancouver, Brownsville, and New Westminster, British Columbia and Huntingdon, British Columbia/Sumas, Washington; (ii) BNSF-served origins, destinations, and interchanges north of Seattle, Washington and west of the Cascade Mountain Range; (iii) BNSF origins, destinations, and interchanges south of and including Seattle, Washington and west of the Cascade Mountain Range in the State of Washington and in the State of Oregon north of and excluding Portland;

(iv) BNSF origins, destinations, and interchanges in the State of Washington and in the Province of British Columbia east of the Cascade Mountain Range; and (v) BNSF origins, destinations, and interchanges in the State of Idaho and west of Billings and Havre, Montana, including Sweet Grass, Montana/Coutts, Alberta. For each of these ten geographic combinations, separate matrices shall be prepared for trainload and non-trainload traffic, and for "railroad-owned equipment" as defined in Section 2b(1)(f) below and for "private-owned equipment" as defined in Section 2b(1)(g). Trainload traffic shall mean movements of 67 cars or more of one commodity in one car type. The intersection of each STCC and car type in each matrix is referred to herein as a "cell" of the matrix. Rate factors shall be calculated for each cell as specified in this Section 2. An example of a matrix is attached as Exhibit C to this Agreement.

This Agreement applies to all present and future origins, destinations, and interchanges located within the areas described in subsections 2a(i)-(v). The origins, destinations and interchanges presently covered by this Agreement are listed, to the best of the parties' ability to do so, by four position Standard Point Location Code ("SPLC") and/or BNSF FSAC on the attached Exhibit D which may be amended from time to time as necessary to reflect the addition of origins, destinations and interchanges in the areas described in subsections 2a(i)-(v).

b. The following procedures shall govern the development and maintenance of rate factors:

(1) As used in this Agreement, the terms "equipment allowance," "refunds and rebates," "BNSF single-line traffic," "BNSF-UP interline traffic," "UP

proportional rate traffic," "railroad-owned equipment," and "private-owned equipment" shall have the following meanings:

(a) "Equipment allowance" is any consideration including, but not limited to, cash payments and credits, for use of private-owned equipment.

(b) "Refunds and Rebates" shall include (i) all reductions in revenue, except (A) reimbursements to shippers or other parties for the actual cost of services (e.g., weighing) which relieve BNSF of an obligation to perform such service in connection with providing line-haul rail services, (B) liquidated damages for service failures, (C) switching charges absorbed by BNSF, (D) charges by connecting railroads absorbed by BNSF, and (E) funds advanced to BNSF by a shipper for improvements to railroad facilities serving the shipper and repaid to the shipper in the form of an allowance and (ii) the cost to BNSF of providing any service other than line-haul rail services, including, but not limited to transloading, warehousing, waivers of track lease rent, barge charges and drayage charges. No items within the exceptions to clause (i) shall be treated as a refund or rebate pursuant to clause (ii).

(c) "BNSF single-line traffic" is traffic (excluding movements of company materials, movements of BNSF-UP interline traffic and movements of UP proportional rate traffic) that BNSF handles on a through basis between any BNSF origin, destination, or interchange in the Northern Region and any origin, destination, or interchange in the Southern Region including movements between any of BNSF's affiliated railroads regardless of how the movements between the affiliated railroads are billed. For

purposes of this Agreement "BNSF's affiliated railroads" means any railroad controlled by or under common control with BNSF.

(d) "BNSF-UP interline traffic" is traffic (excluding movements of company materials) that moves between a BNSF origin, destination, or interchange in the Northern Region and a UP origin, destination, or interchange in the Southern Region. BNSF-UP interline traffic must move in interline BNSF-UP service and does not include UP proportional rate traffic.

(e) "UP proportional rate traffic" is traffic moving under rates established pursuant to this Agreement.

(f) "Railroad-owned equipment" is equipment owned or controlled by any railroad company including equipment owned by non-carrier third parties, such as TTX Company, which are typically paid for use of their equipment only by the railroad using the equipment.

(g) "Private-owned equipment" is any equipment that is not railroad-owned equipment, including but not limited to, equipment owned by customers and non-carrier third party lessors, where the railroad using the equipment may be obligated to pay equipment allowances for the use of such equipment.

(2) The rate factor to be included in each cell of a matrix shall be an arithmetic average of the rates for all traffic in the following categories: (i) BNSF single-line traffic, (ii) BNSF interline traffic, and (iii) for only the first eight quarterly matrices developed pursuant to this Agreement, UP proportional rate traffic. The rate factors shall be calculated each calendar quarter of the year using the following methodology:

(a) For each movement of traffic in each of the categories listed in the preceding paragraph determine BNSF's revenue for the commodity, car type, and car ownership in question. Revenue shall be net of all refunds and rebates except in the case of revenue for BNSF single-line traffic reaching an exclusively served UP point in the Southern Region via transload and moving on a single bill of lading and for a single rail price which includes transload and drayage charges for delivery to the UP exclusively served point in the Southern Region. In those cases revenue shall include transloading and drayage charges (but no other charges) required for BNSF single-line traffic to reach such exclusively served UP point in the Southern Region. For traffic moving in railroad-owned equipment, car hire paid by BNSF for use of such equipment shall not be deducted from revenue. For traffic moving in private-owned equipment, equipment allowances paid by BNSF for use of such equipment shall be deducted from revenue. The amount of the equipment allowance deducted from BNSF revenue for traffic moving in private-owned equipment shall be the actual equipment allowance paid by BNSF. BNSF shall continue to pay reimbursements, allowances and charges described in Section 2b(1)(b)(A), (C), (D), and (E) (which, as provided in Section 2b(1)(b), are not to be deducted from revenue) on traffic moving under this Agreement on the same terms and conditions as it absorbs those charges for BNSF single-line and BNSF-UP interline traffic. The revenue data (net of all refunds and rebates) included in the computation shall be the most current available single-line and settled interline revenues on a per-car basis for movements in the calendar quarter immediately preceding the calendar month in which the computation is made.

(b) Determine for (i) BNSF single-line traffic, BNSF's official distance between each BNSF origin or interline junction and each BNSF destination or interline junction for the traffic in question as published in BNSF's Mileage Tariff BN 6003 Series or the then current mileage guide ("BNSF's Mileage Tariff"), (ii) BNSF-UP interline traffic, BNSF's official distance between each BNSF origin, destination, or interline junction and the BNSF-UP interline junction for the traffic in question as published in BNSF's Mileage Tariff; and (iii) UP proportional rate traffic, BNSF's official distance between each BNSF origin, destination, or interline junction and Portland, Oregon as published in BNSF's Mileage Tariff. When connecting railroad revenues are included in BNSF's revenue (i.e., BNSF has authority to quote rates for the connecting railroad and the connecting railroad is not a linehaul carrier participating in revenue settlements), the connecting railroad's mileage shall also be included in the BNSF route mileage.

(c) Identify net tons for each move using the lading weight used in calculating freight charges where weight is used for billing purposes or, in the case of traffic moving pursuant to a rate per car, a weight agreed upon by UP and BNSF. If the foregoing measure of lading weight is not available, the actual lading weight shall be used. If the actual lading weight is not available, estimated lading weight shall be used. When estimated lading weights are used they shall be the same estimates as used for other business purposes associated with the traffic in question, e.g., billing, revenue accounting, and operating systems. If none of the foregoing measures are available, net tons shall be measured by the weight capacity of the car or intermodal unit handling the move in question as identified in the Universal Machine Language Equipment Register ("UMLER").

In the event UMLER ceases to be published, the parties shall determine the most appropriate substitute that most closely matches UMLER.

(d) Using the data developed in steps (a) through (c) above calculate the per net ton-mile rate for each movement in each cell. The per net ton-mile rate shall be rounded to a hundredth of a cent. The rounding rule shall be that any fraction less than one half shall be dropped while any fraction equal to or greater than one-half shall be rounded up to the next higher value.

(e) Calculate an arithmetic average of the per net ton-mile rates resulting from step (d) above for each cell.

c. Rate matrices shall become effective two months after the end of the preceding calendar quarter. BNSF and UP agree to provide the third party consultant with the data needed to compute the rate factors in sufficient time to allow the consultant to issue updated rate matrices at least thirty days after the start of the calendar quarter in which such updated rate matrices are to become effective. Once a matrix is issued and until the matrix is updated, UP may use the rate factors in that matrix to establish rates for traffic moving on or after the effective date of the matrix.

d. UP may establish rates under this Agreement in any manner, including, but not limited to, tariffs, contracts, letter quotes, and exempt circulars, provided, however, that UP may not establish rates for handling by BNSF of traffic in the account of a railroad other than UP, and provided further that such tariffs, contracts, letter quotes and exempt circulars shall not, without BNSF's prior consent, impose any obligation on BNSF beyond those established by this Agreement. UP shall have the right to establish rates for

movement in private equipment which may or may not include a mileage allowance, provided that if a rate does include a mileage allowance, UP shall fully defray any mileage payment while the car is on BNSF lines in the Northern Region. The amount paid to BNSF shall be derived (i) for rates established pursuant to contract, from the rate factor in place as of the effective date of the contract and (ii) for rates established pursuant to tariff, letter quote, exempt circular or other mechanism establishing a rate, from the rate factor in place as of the date traffic is tendered (i.e., waybill date) by a customer for movement. The rate factor from which the payment to BNSF is derived for rates established pursuant to contract shall be adjusted in accordance with any adjustment provision included in the contract.

e. If no movements of traffic have taken place for any given cell, the cell shall remain empty until a BNSF single-line or a BNSF-UP interline movement takes place for the commodity and car type creating the cell. However, once a cell has been filled with a rate factor, it shall remain filled. When a rate factor in a cell has not been changed by virtue of a new movement or movements taking place in the preceding quarter, the rate factor in such cell shall be adjusted, using (a) the average rate of change between the preceding and second preceding quarter in the values in the same column of the matrix (i.e., for the same 3-digit STCC code) for which there are new data, or, if this procedure is not applicable because there are no cells in the column with new data, (b) the average rate of change between the preceding and second preceding quarter in the value of all cells in the row of the matrix (i.e., for the same car type) for which there is new data.

f. Should BNSF on its own or at the request of UP establish rates in the future based on factors other than weight, distance, car type or commodity (including but not limited to, the charges for handling by BNSF of traffic in the account of another railroad (i.e., "haulage")), such rates shall be included in the calculation of separate matrices to be used by UP pursuant to this Agreement.

g. (1) Except as provided in Section 2b(2)(c) where estimated weights may be used, this Agreement contemplates that the data used to compute rate factors pursuant to Section 2b(2) shall be actual data. The parties agree that during the Interim Period, as defined below, estimates of rates, equipment allowances, refunds and rebates, mileage, and weights may be used in lieu of actual data. BNSF agrees that the estimates it uses shall be the best estimates available to BNSF and the same estimates that are used for other business purposes at BNSF.

(2) "Interim Period" shall mean the period between (i) the date UP and BNSF close the Keddie-Bieber sale, implement the Chemult-Bend trackage rights, and implement this Agreement as called for in Section 2 of the Settlement Agreement, and (ii) the date BNSF is able to compute rate factors pursuant to Section 2b(2) using actual data.

(3) BNSF agrees to move forward diligently to continue refining the accuracy of its estimating systems used to produce the rate matrix and within 24 months, unless waived by UP, to develop systems necessary to produce a rate matrix derived from actual, rather than estimated data.

(4) During the Interim Period, BNSF shall develop estimated data as described above for the production of rate matrices pursuant to Section 2b(2) and with the following modifications to the procedures in Section 2b(2).

(a) The initial matrix shall be the attached Exhibit E. Updated matrices may be issued by BNSF until the third party consultant is able to begin developing and maintaining the matrices. BNSF and UP agree to provide the third party consultant with the data needed to compute the rate factors for subsequent matrices during the Interim Period in sufficient time to allow the third party consultant to issue updated rate matrices at least 30 days after the start of the calendar quarter in which such updated matrices are to become effective.

(b) New rate matrices shall be developed every quarter during the Interim Period and shall become effective on the later of (i) two months after the end of the preceding calendar quarter or (ii) 15 days (or less, at BNSF's option) after UP substitutes a rate factor or provides additional data as specified in Section 2g(4)(c). The rate matrices shall be derived from data for the calendar quarter immediately preceding the calendar quarter in which the matrix becomes effective. For example, the first updated matrix shall be provided to UP on August 1, 1997 and shall be effective on September 1, 1997. That matrix shall be derived from data for the preceding April, May and June, 1997.

(c) During the first 24 months of the Interim Period, UP shall have the right to substitute a rate factor from the original matrix for a rate factor in the same cell of any subsequent matrix. Any rate factor substituted by UP under the provisions of this Section 2g(4)(c) shall be adjusted in the manner provided in Section 2e.

UP shall also have the right to provide additional rate data which shall be used to recompute the rate factor in any cell of an updated rate matrix based upon UP's additional data and the data used by BNSF. Any substitution of a rate factor or the provision of additional data must be completed no later than 15 days after the rate matrix is issued.

3. Service Standards.

BNSF shall supply and distribute equipment and shall accept, handle, switch and deliver traffic moving under this Agreement without any discrimination whatsoever, including, but not limited to, in promptness, quality of service or efficiency, for both loaded and empty equipment, in favor of comparable traffic moving in BNSF's account. BNSF shall adopt no policies, including but not limited to demurrage and absorption of switching fees or shortline connection fees, that discriminate in any way against traffic moving under this Agreement, provided, however, that BNSF may grant its customers relief from the application of a particular policy on a case-by-case basis if granting such relief is consistent with business practice in the railroad industry and is not used to defeat the requirements of this Agreement not to discriminate against traffic moving under this Agreement. BNSF and UP shall cooperate to establish necessary blocks to provide efficient and competitive service on traffic moving under proportional rates pursuant to this Agreement. To the extent justified by business volumes, BNSF shall continue operating Vancouver, British Columbia-Portland (SPT interchange) trains comparable to BN Nos. 111 and 112 as of September 25, 1995.

4. Equipment Supply.

a. BNSF shall have the same obligation to supply equipment (including, but not limited to, as regards quantity, quality and type) for traffic moving under this Agreement as it has for traffic that does not move under this Agreement.

b. Requests for cars for loading shall be received by BNSF personnel from customers and handled pursuant to the procedures specified in AAR Car Service Rule 15. In the event AAR Car Service Rule 15 ceases to be used the parties shall agree on an appropriate substitute that most closely matches AAR Car Service Rule 15. BNSF shall not require customers to indicate when ordering equipment whether a car shall be used to handle traffic moving under rates established pursuant to this Agreement but may require specific destinations and routing information in accordance with BNSF's customary car ordering procedures. Customers whose traffic moves under this Agreement shall also be permitted to contact UP to order cars. UP shall promptly advise BNSF of the car order and whether it wishes BNSF to fill the car order or whether UP shall provide equipment for such order under the provisions of Section 4c.

c. UP shall have the right, but not the obligation, to provide equipment for any traffic which can move under rates established pursuant to this Agreement. When UP provides equipment, UP shall provide BNSF with information that meets BNSF's car ordering requirements necessary to handle the traffic in question and BNSF agrees to accept the equipment supplied by UP at any interchange between UP and BNSF in response to such orders, provided that the mileage between the interchange in question and the BNSF origin in the Northern Region is no greater than the BNSF mileage between

Portland, Oregon and the origin in question. BNSF shall provide trackage at strategically located car distribution points in the Northern Region to stage UP supplied equipment ordered by customers. Such trackage shall be provided by BNSF at no charge provided, however, that BNSF shall have no obligation to store UP equipment without charge unless such equipment is applied to specific orders for UP supplied equipment.

d. Subject to applicable AAR Car Service Rules, Car Service Directives, and bilateral agreements governing the payment of car hire, the parties shall be responsible for all car hire charges while such cars are on their respective lines.

e. All empty equipment shall be returned by UP or BNSF pursuant to this Agreement, as the case may be, in accordance with applicable AAR Car Service Rules, Car Service Directives and bilateral agreements between UP and BNSF governing the handling of equipment.

f. The parties agree to develop and refine procedures for receiving car orders as necessary to address any inefficiencies that may occur such as duplicate car orders.

5. Billing and Payment.

The parties agree to develop and refine procedures to ensure the efficient processing and exchange of information needed to administer this Agreement. The initial accounting and billing procedures are described on the attached Exhibit F which may be amended from time to time to reflect new and refined procedures developed by the parties as provided in the preceding sentence.

In order to preserve the confidentiality of UP's rates, UP may elect to utilize an agent to handle billing and payment. The agent shall, among other things, issue and receive bills of lading, apply any transportation service contract escalation provisions, issue freight bills to customers, and collect freight payments from customers.

The amount to be paid to BNSF for a particular movement subject to this Agreement shall be derived by multiplying (i) the applicable rate factor by (ii) the net tons shipped by (iii) BNSF's official distance as published in BNSF's Mileage Tariff between the BNSF interline junction, origin or destination on the one hand and Portland, Oregon, on the other hand. Lading weights used to calculate net tons for billing purposes shall be derived in the same manner as specified in Section 2b(2)(c).

Payments to BNSF shall be made by UP or its agent within 15 days after the end of the preceding month. Payment shall cover movements during the preceding month for which UP has received waybills.

6. Third Party Consultant.

The parties may use a third party consultant or consultants to develop and maintain the rate matrices pursuant to this Agreement. The third party consultant shall be jointly employed by BNSF and UP and be required to remain impartial between BNSF and UP. Each party may request the third party to prepare reports using data derived from the rate matrices, provided that (1) such report shall not disclose to UP or BNSF information about the volume of the other's business, (2) the party requesting such report shall be solely responsible for the cost of preparing such report, and (3) such report shall be shared with the other party upon payment by the other party to the party requesting the

report of one half the cost of such report. Within two weeks after being requested by one party to prepare a report, the third party shall give the other party written notice of the request to prepare a report. The third party consultant shall be terminated for any breach of the impartiality requirement of this Section 6 and may also be terminated by mutual agreement of the parties.

7. Right to Audit.

Each party shall have the right to audit, at all reasonable times, so much of the books, accounts and records of the other party as are related to the data required to be supplied by them under the terms of this Agreement. Except as provided below, the expense of any such audit shall be borne by the party undertaking the audit unless errors or information are discovered that have a material adverse effect on the party conducting the audit in which case the party in whose records the errors or information were discovered shall bear the entire expense of the audit.

The right to audit includes the right by either party to require a complete or partial (one or more cells) audit of the rate matrices. The expense of any audit of the rate matrices shall be split evenly between UP and BNSF. When rate factors in a cell or cells of a matrix are found to be in error, the rate factors shall be corrected to reflect accurate data as determined by the audit and the corrected rate factors shall remain in place and unchanged until BNSF or UP, as the case may be, can demonstrate that it has more accurate data to update the rate factor or factors found to be inaccurate. If upon audit, (a) a rate factor derived from BNSF data is found to exceed the rate factor computed using data developed in the audit by 20% or more, or (b) a rate factor derived from UP data is

found to be 20% or more below the rate factor computed using data developed in the audit, then the party whose rate data was inaccurate agrees to reopen to competitive bidding any contracts entered into by such party for the pertinent traffic on the basis of competitive bidding between UP and BNSF while the inaccurate rate factor was in effect, and UP and BNSF may bid on such contract with UP using the corrected rate factor.

BNSF shall have the right to cause an audit by a disinterested third party as provided below, at all reasonable times, of the books, accounts and records of the agent retained by UP to handle billing and payment pursuant to Section 5. BNSF shall bear the expense of any such audit unless material errors are discovered upon audit in which case UP shall bear the entire expense of the audit.

Any audit of the books and records of the third party consultant employed by the parties pursuant to Section 6 of the Agreement shall be a joint audit and the cost of the audit shall be split equally between UP and BNSF.

To the extent any audit requires access to confidential information, the parties agree to enter into an appropriate confidentiality agreement and, if necessary to preserve confidentiality, to use a disinterested third party such as a national accounting firm to conduct such audit. Each party and their agents shall retain, for at least five years, the books, accounts and records used to develop information necessary for the operation of this Agreement.

8. Settlement Agreement.

The terms of the Settlement Agreement, as amended and supplemented from time to time, and to the extent that such terms are not contradictory or inconsistent with the Letter Agreement or this Agreement, shall survive the parties' entry into this Agreement.

9. Arbitration.

All disputes under this Agreement shall be referred to binding arbitration under Section 15 of the Settlement Agreement.

10. Term.

This Agreement shall become effective upon the first day of the Interim Period and shall continue for a term of 99 years and thereafter, subject to renegotiation after 99 years as described below, for so long as BNSF or any other party operates a route between the general vicinity of Bieber and the general vicinity of Stockton wholly within the State of California. After 99 years, the Agreement shall, at the request of either UP or BNSF, be renegotiated to determine terms for continuation of the Agreement in accordance with the purposes of the Agreement and conditions and circumstances at the time of renegotiation, including any then revised conditions of BNSF's operations between Bieber and Stockton. Any disputes over the renegotiation of the terms for continuation of the Agreement shall be submitted to arbitration. This Agreement shall terminate if BNSF shall no longer be able to enter into through rates, haulage or any other transportation arrangement between BNSF points in the Northern Territory and BNSF points in the Southern Territory over a route crossing the Oregon-California border, via either its own lines or those of a railroad other than UP. This Agreement also may be terminated at any

time by (i) mutual consent of the parties or (ii) UP's election to terminate this Agreement by giving one year written revocable notice.

11. Successors and Assignability.

This Agreement shall be binding upon and inure to the benefit of the parties and their respective successors, lessees and assigns. This Agreement is not assignable without written consent of either party, except that either party may assign the Agreement in the event of a sale, assignment, mortgage, or lease of its entire railroad. In the event BNSF sells or leases part or all of its lines in the Northern Territory, BNSF agrees that any such sale or lease shall be subject to this Agreement to the extent BNSF retains the exclusive authority to quote rates for traffic moving subject to this Agreement to and from points on such lines. If BNSF does not retain exclusive authority to quote rates for traffic moving subject to this Agreement to and from points on such lines, BNSF agrees that any such sale or lease shall not be structured in a manner, and that BNSF shall not take any action, that would in any way inhibit or prevent the purchaser or lessee from working with UP to handle in any manner, including on an interline, haulage, proportional rate or any other manner traffic subject to this Agreement originating or terminating on the lines sold.

UP's rights under this Agreement with respect to traffic moving subject to this Agreement to and from points on such a sold or leased line shall be satisfied if (i) proportional rates under this Agreement apply to points on such lines or (ii) UP has direct access or access via interchange (with interchange handled by BNSF for a fee equal to the handling charges called for in haulage agreements entered into between UP and BNSF in connection with implementation of the Settlement Agreement) to the shortline for

traffic covered under this Agreement or (iii) proportional rates under this Agreement apply to the junction with the shortline, and in the case of (ii) or (iii), BNSF has not inhibited or prevented the shortline from working with UP to handle traffic subject to this Agreement in any manner.

12. Miscellaneous.

a. This Agreement may be executed in two or more counterparts, each of which shall be deemed an original, but all of which shall constitute one and the same instrument.

b. When the context requires, singular nouns include the plural and conversely, when plural nouns are used they shall include the singular.

IN WITNESS WHEREOF, the parties have caused this Proportional Rate Agreement to be fully executed as of the date first above written.

EXHIBIT F
ACCOUNTING AND BILLING PROCEDURES

BNSF Proportional Rate Alternatives Selected for Implementation

I ORIGINATING ON BNSF OR TERMINATING ON BNSF IN NORTHERN TERRITORY

A. Procedures for BNSF Proportional Rate Traffic when BNSF, or a BNSF handling carrier, Originates the Shipment in the Northern Territory

Details for Southbound Moves:

1. No BNSF PNW stations need to be adopted by the UP. UP (and connections other than BNSF, if any) establishes through rate by contract, confidential letter quote or tariff via a BNSF-Portland-UP-Destination or Interchange route which stipulates that UP will arrange for service over the BNSF portion of the route; the rate matrix is the BNSF Rule 11 contract rate with UP.
2. Car Orders - to BNSF (subject to Section 4. Equipment Supply in the Agreement)
3. Car Releases - to BNSF
4. Bill of Lading - to BNSF showing I-5 indicator (i.e., reference to UP I-5 rate authority).

   As per AAR Accounting Rule 11 B. (3), BNSF will generate a Rule 11 '417' waybill showing UP as the patron responsible for payment of BNSF's freight charges and the consignee or consignor (as the case may be) as the patron responsible for payment of the through freight charges.

   If customer does not provide the I-5 Indicator, BNSF will generate a revenue waybill for the shipment as an Interline Settlement Movement subject to correction as per AAR Accounting Rule 61. In the event a movement which should have moved under a through rate created under this Agreement is settled between BNSF and UP through interline settlement, BNSF and UP shall settle any discrepancies, including but not limited to duplicate payments, through overcharge claim channels within six months of the waybill date.
5. BNSF creates '417' transportation waybill with the I-5 indicator, a movement route of BNSF to Portland with BNSF flagged as a Rule 11 carrier, and BNSF sends a '417' waybill to other roads in the route.
6. BNSF creates a "parent" Rule 11 '426' waybill and sends it to Central ISS.
7. UP concurs to the "parent" Rule 11 entry in ISS.
8. If UP or a UP "handling" carrier is the destination carrier, UP creates a revenue '426' waybill without BNSF in the revenue route, from Portland to destination showing a prior or true origin as the origin location for the shipment. If another interline carrier terminates the shipment, that

destination carrier creates a revenue '426' "child" waybill with a Rule 11 entry in ISS for the route north of Portland.

9. If the shipment is prepaid, UP creates freight bill and bills the customer the through rate. If the shipment is collect, the destination interline carrier creates freight bill and bills the customer the through rate.
10. BNSF does not bill customer for its Rule 11 portion and does not create a Rule 11 "child" waybill in ISS.
11. UP pays BNSF its proportional rate for its Rule 11 move to Portland. As soon as practicable, payment shall be electronically.
12. If other interline railroads are involved, (e.g., SP/UP) settling carrier pays other roads their divisions or factors as agreed between UP and the connections.
13. BNSF pays car hire for its segment of the move.
14. Freight claims will be handled in accordance with AAR Accounting Rule 116. Any unallocated claims shall be allocated in accordance with the AAR Freight Claim Rules.

B. Procedures for BNSF Proportional Rate Traffic when BNSF, or a BNSF handling carrier, Terminates the Shipment in the Northern Territory and when UP/SP, or a UP/SP handling carrier, Originates the Shipment in the Southern Territory

Details for Northbound Moves:

1. No BNSF PNW stations need to be adopted by the UP. UP establishes through rate by contract, confidential letter quote or tariff via a Origin-UP-Portland-BNSF-Destination route which stipulates that UP will arrange for service over the BNSF portion of the route; the rate matrix is the BNSF Rule 11 contract rate with UP.
2. Car Orders - to UP
3. Car Releases - to UP
4. Bill of Lading - to UP showing I-5 indicator (i.e., UP I-5 rate authority).

As per AAR Accounting Rule 11 B. (3), UP will generate a Rule 11 '417' waybill showing UP as the patron responsible for payment of BNSF's freight charges and the consignee or consignor (as the case may be) as the patron responsible for payment of the through freight charges.

If customer does not provide the I-5 Indicator, and UP does not initially generate a Rule 11 waybill, UP may issue a corrected waybill in accordance with AAR Accounting Rule 61. In the event a movement which should have moved under a through rate created under this Agreement is settled between BNSF and UP through interline settlement, BNSF and UP shall settle any discrepancies, including but not limited to duplicate payments, through overcharge claim channels within six months of the waybill date.

5. UP creates a '417' transportation waybill with the I-5 indicator, a route of UP-Portland-BNSF with BNSF flagged as a Rule 11 carrier, and sends to other roads in the route.
6. UP creates a "parent" Rule 11 '426' waybill and sends it to Central ISS.
7. BNSF concurs to the "parent" Rule 11 entry in ISS.
8. UP creates revenue waybill without BNSF in the revenue route, from the origin to Portland with an ultimate or true destination as the destination location for the shipment; but if UP and SP are both in the route, then UP will create the necessary "child" waybills.
9. UP creates freight bill and bills the customer the through rate.
10. BNSF does not bill the customer for its Rule 11 portion.
11. UP pays BNSF its proportional rate for its Rule 11 move from Portland. As soon as practicable, payment shall be electronically.
12. BNSF pays car hire for its segment of the move.
13. Freight claims will be handled in accordance with AAR Accounting Rule 116. Any unallocated claims shall be allocated in accordance with the AAR Freight Claim Rules.

C. Procedures for BNSF Proportional Rate Traffic when BNSF, or a BNSF handling carrier, Terminates the Shipment in the Northern Territory and when an Interline Carrier Originates the Shipment in the Southern Territory

Details for Northbound Moves:

1. No BNSF PNW stations need to be adopted by the UP. UP and its connections establish through rates by contract, confidential letter quote or tariff via a Origin-Connection-Interchange-UP-Portland-BNSF route which stipulates that UP will arrange for service over the BNSF portion of the route; the rate matrix is the BNSF contract Rule 11 rate with UP.
2. Car Orders - to Origin Interline Carrier
3. Car Releases - to Origin Interline Carrier
4. Bill of Lading - to Origin Interline Carrier showing I-5 indicator (i.e., UP I-5 rate authority)

   As per AAR Accounting Rule 11 B. (3), Origin Interline Carrier will generate a Rule 11 '417' waybill showing UP as the patron responsible for payment of BNSF's freight charges and the consignee or consignor (as the case may be) as the patron responsible for payment of the through freight charges.

   If customer does not provide the I-5 Indicator, Origin Interline Carrier will generate a revenue waybill for the shipment as an Interline Settlement Movement subject to correction as per AAR Accounting Rule 61. In the event a movement which should have moved under a through rate created under this Agreement is settled between BNSF and UP through interline settlement, BNSF and UP shall settle any discrepancies, including but not

limited to duplicate payments, through overcharge claim channels within six months of the waybill date.

5. Interline Origin Carrier creates '417' transportation waybill with the I-5 indicator, and a route of Origin-Interline Origin Carrier-Interchange-UP-Portland-BNSF with BNSF flagged as a Rule 11 carrier, and sends to other roads in the route.
6. Origin Interline Carrier creates a "parent" Rule 11 waybill and sends to Central ISS.
7. BNSF concurs to the "parent" Rule 11 entry in ISS.
8. Origin Interline Carrier creates revenue waybill without BNSF in the revenue route from the origin to Portland with an ultimate or true destination as the destination location for the shipment.
9. If prepaid, the Origin Interline Carrier creates freight bill and bills the customer the through rate. If collect, UP creates the freight bill and bills the customer the through rate.
10. BNSF does not bill the customer for its Rule 11 portion.
11. UP pays BNSF its proportional rate for its Rule 11 move from Portland. As soon as practicable, payment shall be electronically. UP and Origin Interline Carrier settle through interline settlement procedures.
12. BNSF pays car hire for its segment of the move.
13. Freight claims will be handled in accordance with AAR Accounting Rule 116. Any unallocated claims shall be allocated in accordance with the AAR Freight Claim Rules.

II TRAFFIC MOVING OVERHEAD ON BNSF IN NORTHERN TERRITORY

Procedures for BNSF Proportional Rate Traffic if BNSF, or a BNSF handling carrier, bridges traffic through the Northern Territory via Portland

A. Details for Southbound Moves:

1. UP adopts the BNSF interchange stations with the Northern Territory Interchange Carriers (e.g., CN, CM, CP, etc.) Origin Carrier or UP establishes a through rate in contract, letter quote or tariff with a route showing UP as serving the adopted interchange location.
2. Car Order - to Origin Carrier
3. Car Release - to Origin Carrier
4. Bill of Lading - to Origin Carrier showing I-5 indicator (UP I-5 rate authority or adopted junction).

   If customer does not provide the I-5 indicator, any waybills are subject to correction as provided by AAR Accounting Rule 61. In the event a movement which should have moved under a through rate created under this Agreement is settled between BNSF and UP through interline settlement, BNSF and UP shall settle any discrepancies, including but not

limited to duplicate payments, through overcharge claim channels within six months of the waybill date.

5. Origin Carrier creates '417' transportation waybill with the I-5 indicator, an operating route of Origin Carrier-Adopted Interchange-BNSF-Portland-UP with BNSF flagged with an IMA=HM "handling" segment and the R2 BNSF segment flagged as "H", and sends to other roads in the route.
6. Settling carrier (origin if prepaid and destination if collect) creates a revenue waybill without BNSF in the route, UP replaces BNSF in the revenue route.
7. Settling carrier (origin if prepaid and destination if collect) creates a freight bill and bills the customer the through rate.
8. BNSF systems will not expect nor look for a revenue waybill reporting in ISS.
9. UP pays BNSF a proportional rate for its "handling" service in the Northern Territory. As soon as practicable, payment shall be electronically.
10. For the other interline carriers in the route in the '426' waybill, the settling carrier pays the interline carriers their proportion through the normal ISS settlement process.
11. BNSF pays car hire for its segment of the move.
12. Freight claims will be handled in accordance with AAR Accounting Rule 116. Any unallocated claims shall be allocated in accordance with the AAR Freight Claim Rules.

B. Details for Northbound Moves:

1. UP adopts the BNSF interchange stations with the Northern Territory Interchange Carriers (e.g., CN,CM,CP, etc.). Destination Carrier or UP publishes a through rate in contract, letter quote or tariff with UP serving the adopted interchange location.
2. Car Order - to Origin Carrier
3. Car Release - to Origin Carrier
4. Bill of Lading - to Origin Carrier showing I-5 indicator, UP I-5 rate authority or adopted junction.

   If customer does not provide the I-5 indicator, any waybills are subject to correction as provided by AAR Accounting Rule [71]. In the event a movement which should have moved under a through rate created under this Agreement is settled between BNSF and UP through interline settlement, BNSF and UP shall settle any discrepancies, including but not limited to duplicate payments, through overcharge claim channels within six months of the waybill date.
5. Origin Carrier creates '417' transportation waybill with the I-5 indicator, a route of Origin-UP-Portland-BNSF-Adopted Interchange-Destination carrier with BNSF flagged with an IMA=HM segment and the R2 BNSF segment flagged as "H", and sends it to other roads in the route.

6. Settling carrier (origin if prepaid and destination if collect) creates a revenue waybill without BNSF in the route. UP or SP replaces BNSF in the revenue route.
7. Settling carrier (origin if prepaid and destination if collect) creates a freight bill and bills the customer the through rate.
8. BNSF systems will not expect nor look for a revenue waybill reporting in ISS.
9. UP pays BNSF a proportional rate for its "handling" service in the PNW. As soon as practicable, payment shall be electronically.
10. If other interline carriers are in the route, settling carrier pays other roads their proportion through the normal ISS settlement process.
11. BNSF pays car hire for its segment of the move.
12. Freight claims will be handled in accordance with AAR Accounting Rule 116. Any unallocated claims shall be allocated in accordance with the AAR Freight Claim Rules.

In the event AAR Accounting Rules or AAR Freight Claim Rules cease to be used or are modified, the parties shall agree on an appropriate substitute that most closely matches the AAR Accounting Rules, AAR Freight Claim Rules, or particular Rule, as the case may be.

VERIFIED STATEMENT
OF
STEPHEN R. BARKLEY

My name is Stephen R. Barkley. I am Regional Vice President - Southern Region of Union Pacific Railroad Company ("UP"). My office is located at 24125 Aldine Westfield Road, Spring, Texas 77373. I have held my current position since January 1998.

I joined UP from Illinois Central Railroad in 1980. From 1980 to 1989, I held positions in the UP Operating Department, including several trainmaster positions, Director of Train Management, and Manager of Train Operations. In 1989 and 1990, I worked in UP's Marketing and Sales Department, initially as Director of the National Customer Service Center and subsequently as General Director of Service Design. I then returned to the Operating Department, serving as Division Superintendent in Stockton, California and Houston, Texas. From 1994 to 1996, I served as General Manager of the Southern Region. In 1996 and 1997, I was Assistant Vice President in charge of the Harriman Dispatching Center in Omaha.

In my position as Regional Vice President - Southern Region, I am responsible for management of UP's operations in the States of Texas, Oklahoma, and Louisiana. In connection with my duties in my current position and prior positions since 1994, I have become familiar with operations on UP's lines in these states and with operations at UP's border crossings between Texas and Mexico.

Kansas City Southern has recently announced that it intends to create Nafta Rail through acquisition of control of both The Texas Mexican Railway Company ("Tex Mex") and TFM, S.A. de C.V. ("TFM"), a Mexican railroad. I am submitting this

statement to explain UP's concerns about the effect of the proposed Nafta Rail transaction on operations at the International Railroad Bridge, which connects the United States and Mexico at Laredo, Texas, and Nuevo Laredo, Mexico. I suggest how the Board should frame conditions to ensure fair treatment of all railroads at the Bridge. In addition, I address comments Applicants have made about Tex Mex operations over UP lines in Texas under trackage rights granted in connection with approval of the 1996 merger of UP and Southern Pacific Transportation Company ("SP").

I. LAREDO BRIDGE

The International Railroad Bridge at Laredo, Texas ("Laredo Bridge" or "Bridge"), which spans the Rio Grande River, is a crucial link for rail transportation between the United States and Mexico. Of the multiple rail border crossings between the United States and Mexico, the Laredo crossing has the highest volume of rail traffic moving between the two countries. TFM, the successor to the northeast portion of the National Railways of Mexico, owns the southern half of the Laredo Bridge. Tex Mex owns the track on the northern half of the Bridge and the approach track at the north end of the Bridge, while Mexrail (owner of Tex Mex) owns the bridge structure on the northern half. The connection between the U.S. railroads and the TFM system is at the middle of the Bridge. Exhibit A to this statement is a schematic of the Laredo Bridge and nearby tracks.

Importance of Laredo Bridge to UP

UP serves six border crossings between the United States and Mexico. However, the Laredo crossing is by far the most important. UP's principal route between the United States and Mexico runs from San Antonio, Texas to the Mexican border at

Laredo. The Laredo crossing provides the most efficient way for U.S. railroads to serve numerous shippers on TFM's system in the industrialized heartland of northeastern and central Mexico. For most movements between the United States and the regions of Mexico served by TFM, the TFM route to Laredo is much more efficient than the route of Ferrocarril Mexicano ("Ferromex"), which connects to the border crossing at Eagle Pass, Texas. (The TFM route to Laredo is also more efficient than TFM's route to the crossing at Brownsville, Texas.) Moreover, the Laredo crossing has an infrastructure that is unmatched. Over the years, numerous brokers have set up major operations in the Laredo area, and U.S. and Mexican government agencies (including customs, immigration officials, and agricultural and narcotics inspectors) have established significant operations there. The three railroads serving this crossing have built extensive yards, holding tracks, and other facilities in the area. In recent years, UP has invested heavily in facilities at Laredo, Port Laredo (10 miles to the north), and other locations further north of Laredo in order to support the import and export traffic that moves over the Laredo Bridge.

In 2002, UP interchanged 382,723 rail cars (both loads and empties) with TFM at the Laredo Bridge, out of 519,882 rail cars that crossed the Bridge in that year. In the past few years, UP's share of the rail cars that moved over the Laredo Bridge has been in the range of 70 to 75 percent. UP's share of loaded rail cars is between 75 and 80 percent. (UP and TFM have agreed to route many empty UP rail cars over the Brownsville crossing to free up more capacity at Laredo. Thus, UP's share of empties moving over the Bridge is lower than its share of loaded cars.) Tex Mex, which also

interchanges with TFM at the Laredo Bridge, accounts for the remainder of the rail cars that cross at Laredo.

The following table shows UP's share of Laredo Bridge crossings (total loaded and empty rail cars) during the years 1998 through 2002:

Laredo Bridge Crossings
(1998-2002)
(Rail Cars - Loaded and Empty)

	Northbound			Southbound			Northbound and Southbound		
	UP Cars	Total Cars	UP as % of Total	UP Cars	Total Cars	UP as % of Total	UP Cars	Total Cars	UP as% of Total
1998	114,805	168,044	68%	117,408	176,237	67%	232,213	344,281	67%
1999	133,455	201,414	66%	137,055	204,319	67%	270,510	405,733	67%
2000	145,458	187,045	78%	145,310	208,357	70%	290,768	395,402	74%
2001	166,705	237,837	70%	177,575	248,773	71%	344,280	486,610	71%
2002	185,059	253,525	73%	197,664	266,357	74%	382,723	519,882	74%

Bridge Operations

UP and its customers have a keen interest in preserving efficient and fair operations at Laredo Bridge. If Bridge operations do not remain fluid, or if UP trains do not receive even-handed treatment for movements over the Bridge, service levels for UP customers using the Laredo gateway will decline.

Rail operations over the Laredo Bridge present significant operational challenges. As with any border crossing, extra time is required because of the need for government paperwork and inspections. In addition, the Laredo Bridge has only a single track. Thus, trains can operate in only one direction at a time. In order to obtain as much capacity as possible from the Bridge, trains must be carefully staged so that they are

ready to move as soon as the previous train has moved off the Bridge. Interchanges occur while the train is on the Bridge. Thus, crews of the receiving carrier must be prepared to move quickly onto the Bridge, so that the train does not block the Bridge longer than necessary.

Only one railroad -- TFM -- approaches the Bridge from Mexico, but two railroads -- UP and Tex Mex -- approach from the U.S. side. Thus, it is necessary to coordinate the movement of two railroads moving south onto the Bridge. Northbound movements must also be coordinated carefully, since TFM delivers separate trains or blocks of cars to each U.S. carrier. The railroads must time movements so that the receiving railroad's tracks are clear when a train moves off the Bridge. All three railroads must adhere to strict timelines in order to maintain fluid operations over the Bridge.

In recent years, the three railroads that use the Laredo Bridge have made great strides in improving the efficiency of movements over the Bridge. The railroads have worked with brokers and government agencies to expedite customs clearance, agricultural inspections, and inspections for narcotics and illegal aliens. In addition, the railroads have made extensive infrastructure improvements to increase their ability to stage trains crossing the border in an efficient manner and to minimize interference between northbound and southbound trains in the Laredo area. The railroads have also worked to reduce disruption to the local communities by making changes to minimize the number of grade crossings blocked by waiting trains.

In addition, the railroads have made extensive efforts to improve their operating practices, so that movements across the Bridge are as fluid as possible. One

aspect of these operational improvements involves interchange "windows." For many years, the railroads have agreed on particular time periods during which trains will move in a single direction, in order to maximize the available capacity on the Bridge. Certain hours of the day are set aside for northbound movements across the Bridge, and other hours are set aside for southbound movements. Before 1994, there were just two 12-hour windows each day. As a result, traffic often backed up on both sides of the border as trains waited for the window to change. In 1994, after a series of meetings, the railroads agreed to change to four six-hour windows, two in each direction. As a result, yard capacity requirements on both sides of the border were cut in half, traffic moved more efficiently to and from the Bridge, and the railroads were able to coordinate their interchanges more effectively.

In recent years, the railroads have worked hard to coordinate the timing of movements over the Bridge. The three railroads now exchange extensive information on their operating arrangements, so that each railroad can position its trains according to a predictable timeline. This allows each railroad to assemble blocks of cars and position trains so they are ready to move onto the Bridge and be interchanged at the time a railroad on the other side of the border is prepared to receive those blocks. Railroad personnel have also agreed on priorities for certain categories of trains (for example, intermodal and automotive) that should cross ahead of others.

In addition, the railroads have pre-blocked cars for each other, allowing some trains to bypass the yards of the receiving carrier in the Laredo area. For example, UP creates blocks of cars destined for Monterrey and Mexico City, allowing TFM to avoid classifying these cars at its Sanchez Yard. Similarly, TFM creates blocks of UP

cars destined for East St. Louis and Chicago, allowing UP to avoid classifying the cars at Port Laredo. This pre-blocking helps keep train operations more fluid on both sides of the border, which makes the Bridge crossing process more efficient.

Despite carefully developed operating plans, many unexpected events occur in the course of each day. Representatives of the railroads that handle trains crossing the Laredo Bridge hold two conference calls each day to discuss such developments. During these calls, held at 9 a.m. and 6 p.m., the railroad representatives exchange up to date information and negotiate about how to resolve competing demands and respond to unexpected events. Railroad employees also speak with the Border Superintendent (a TFM employee, since mid-2001) at other times during the day to provide updates and discuss the progress of interchange activity. The Border Superintendent acts as the traffic cop, making ultimate decisions about which trains will move across the Bridge and the order in which they will proceed.

The many operational improvements the railroads have made over the years, along with infrastructure additions and improvements in government clearance and inspection procedures, have resulted in major improvements in efficiency. In turn, this has permitted very substantial increases in the amount of traffic that moves over the Bridge. I recall that in 1994, when I first became involved with UP's rail operations to and from Mexico, the largest number of cars that moved across the Bridge in one direction in a 24-hour period was in the range of 300 to 400. Today, between 900 and 1,100 cars move in each direction on the highest volume days. Thus, the various improvements that are now in place have essentially tripled the capacity of the Bridge since 1994.

With current government requirements and operating procedures, the Bridge is operating close to capacity now. Even with the impressive efficiency improvements made in recent years, there are times when more traffic builds up at the border than can be moved across the Bridge in a six-hour window. With the forecasted growth in rail traffic between the United States and Mexico, the Bridge will be at or over its capacity within the next few years.

The current Laredo Bridge operations involve a very delicate balance. While some of the operational improvements that have been made are well established and likely to continue in place (for example, expedited customs procedures), other practices that have helped to expedite operations are highly dependent on the good faith cooperation of the personnel of all three railroads. The advance exchange of operating information, discussion of operating problems on daily conference calls among the railroads, cooperative resolution of differences to maximize efficiency, and even-handed decisions about which trains will receive priority are all dependent on the continuation of a strong spirit of cooperation among the parties.

Sequencing of Trains

Decisions about the order in which trains will move across the Bridge are particularly sensitive. Ultimately, one individual (TFM's Border Superintendent) makes the final decisions about train movements. This individual decides, for example, whether to extend a window to permit an additional train to travel southbound before switching to the northbound window. When trains of more than one railroad are waiting to cross southbound, the Border Superintendent decides which train will move onto the Bridge ahead of the others. Thus, the Border Superintendent exercises a substantial amount of

discretion and is in a position to favor one railroad over another if he should choose to do so.

UP believes that in recent years TFM's Border Superintendent has administered Laredo Bridge operations in an even-handed manner. In general, he has avoided showing favoritism to either one of the U.S. railroads. My perception is that the Border Superintendent has generally made crossing decisions in a manner that has permitted UP to move cars across the Bridge in proportion to its overall percentage of Laredo traffic. In other words, if there are more trains waiting than can cross within a southbound window, the Border Superintendent has cleared UP trains to cross first more than half of the time, reflecting UP's higher percentage of the southbound traffic. The same has been true for northbound TFM blocks intended for UP. As a result, for loaded cars, the allocation of slots for Bridge crossings has approximately reflected the market demand for the UP and Tex Mex services. (This is not the case for empty cars. As I noted above, UP has shifted a large number of empty movements to the Brownsville gateway in order to ease the burden at Laredo.)

However, in the past, when the number of trains waiting to cross was greater than the number that could cross during a six-hour window, Tex Mex has argued that its southbound trains, or blocks of cars TFM is sending northbound to Tex Mex, should receive 50 percent of the available slots. In other words, despite the fact that it currently carries far less than 50 percent of the traffic that moves via the Laredo crossing, Tex Mex has requested a one-for-one allocation, so that when there are more UP and Tex Mex trains waiting than can cross during a window, Tex Mex would receive every other slot. Under such an allocation, UP trains would always be the ones that would have to

wait for the next window (even when they had been in position to cross before the last Tex Mex train arrived).

To date, TFM's Border Superintendent has resisted the Tex Mex arguments. He has continued to give Bridge access to UP and Tex Mex trains in a way that reflects approximately the railroads' relative percentages of Laredo traffic.

Effect of Common Control of TFM and Tex Mex on Bridge Operations

I and other UP personnel are concerned that a transaction that brings TFM and Tex Mex under the common control of Kansas City Southern would upset the efficient and even-handed operation that now exists in connection with Laredo Bridge operations. As a result of common control, the economic interests of TFM, Tex Mex, and Kansas City Southern Railway ("KCSR") will be more closely aligned. Under the control of KCS, Tex Mex and TFM will have greater incentives to take subtle, incremental steps that would disadvantage UP and cause its service to deteriorate. For example, a Border Superintendent who favored Tex Mex based on its Nafta Rail affiliation might decide to extend interchange windows to permit Tex Mex trains to move south over the Bridge, while making no such exceptions for UP trains. Eventually, such incremental steps would have the effect of moving traffic from UP-TFM routings to KCSR-Tex Mex-TFM routings, or to Tex Mex-TFM routings that include The Burlington Northern and Santa Fe Railway Company ("BNSF").

In addition, under common control with Tex Mex, TFM will have less incentive to resist the argument that Tex Mex trains should receive access to the Bridge on a one-for-one basis, *i.e.*, at a rate that exceeds Tex Mex's share of Laredo traffic. A Border Superintendent affiliated with Nafta Rail is much more likely to take the position

that Tex Mex trains should have Bridge access 50 percent of the time, even though Tex Mex currently carries only 25 percent of the traffic to and from the Laredo Bridge. Because the Bridge is operating close to capacity now, this sort of allocation of slots would give special preference to KCSR-Tex Mex-TFM and BNSF-Tex Mex-TFM movements while significantly disadvantaging UP-TFM movements. Whenever there are more cars waiting than can move across the Bridge during a window, the delayed cars (*i.e.*, those at the end of the queue) will be UP cars.

For example, if eight UP trains and two Tex Mex trains were waiting, but only six trains could move across the Bridge during a southbound window, under a 50 percent allocation all of Tex Mex's trains would cross, but only half of UP's trains could cross. The remaining four UP trains would have to wait six more hours, until the next southbound window opened. If train volumes continued to exceed the Bridge capacity, UP trains would continue to be delayed through subsequent windows. As a result, the overall efficiency of UP-TFM movements would decrease, while KCSR-Tex Mex-TFM and BNSF-Tex Mex-TFM movements would become more efficient and thus more attractive to shippers. Eventually some of the UP traffic would shift to Tex Mex in order to continue moving via Laredo.

We have already seen signs that TFM's attitude toward UP is changing. In the past, the relationship between UP personnel and TFM personnel has been highly cordial on a personal level. Since KCS announced its proposed transaction, however, TFM personnel have become more distant and more formal in their relations with us. While at least for now we are able to work with TFM's Border Superintendent to resolve Bridge issues, he has been less accessible than previously.

The Need for a Remedy

If the Nafta Rail transaction is approved, it will be important for the Board to take steps to ensure that UP receives fair treatment for its trains at the Laredo Bridge. If TFM and Tex Mex choose to engage in even subtle discrimination against UP trains at the Bridge (which we expect they will, once under common control by KCS), this will reduce the efficiency of UP-TFM routes and disadvantage UP's customers. There would be significant reductions in the efficiency of the UP-TFM routes if TFM were to shift to a 50-50 allocation of Bridge slots. As described above, though on its face even-handed, such a system would have a disproportionate effect on the carrier that has attracted the majority of the traffic (currently UP).

With a one-for-one allocation of Bridge slots, the majority carrier's trains would always be the ones left to wait until the next window when there were too many trains waiting to cross. (And, as noted above, if more trains arrive to fill up the next window, the delays to the majority carrier's trains continue through additional periods.) By reducing the number of UP trains that could cross during a six-hour window, and thereby artificially reducing the efficiency of UP-TFM movements, the Nafta Rail carriers would be able to shift traffic to what would otherwise be a less efficient KCSR-Tex Mex-TFM or BNSF-Tex Mex-TFM route.

Applicants have claimed that UP could avoid any such discrimination by threatening to move traffic to other border crossings. But UP could not simply shift a large volume of trains to other crossings, as Applicants have suggested. As explained above, other crossing points are much less efficient than Laredo. Moreover, there is far less of the necessary infrastructure at Eagle Pass, and thus much less capacity there. Eagle Pass today has less infrastructure than Laredo had 10 years ago. It would take

many years to build up yard facilities, main track, a large broker community, and government services to a point where Eagle Pass could absorb a large amount of UP's Laredo traffic. The Brownsville crossing has even fewer facilities. Moreover, at Brownsville, UP would depend on TFM's cooperation.

UP also could not avoid the effects of discriminatory treatment by constructing a new bridge at Laredo. Construction of a new bridge and related facilities would be quite expensive (probably close to $100 million) and could not be undertaken without approval from the Mexican government. UP took steps toward construction of a new bridge in the early 1990s, but encountered delays in obtaining approvals from the Mexican government and dropped its plans without having obtained that approval. In my opinion, such approvals would be no easier to obtain today. Moreover, UP operations over a new bridge would still require cooperation from TFM.

Applicants also suggest that the written agreements governing Bridge operations provide UP with sufficient protection. I disagree. A 1951 written agreement between a predecessor of UP and Tex Mex sets out various terms for the joint operations at the Laredo Bridge. Section 4(III) of this agreement provides that "Joint Switching Service" shall be "performed impartially" and that "no preference shall be given to movement of cars of one of the parties." (Exhibit B to this statement shows the relevant provision of the 1951 agreement.) However, the agreement does not specify what this means, how it applies in the context of today's operations (which differ from those described in the 1951 agreement in various ways; for example, the parties no longer perform switching services for each other), or how it is to be accomplished. The agreement does not foreclose Tex Mex's argument that "no preference" means a 50/50

allocation, even when the traffic percentages are not 50/50. I do not believe the 1951 agreement or any of its amendments would be sufficient to ensure even-handed treatment for UP trains once TFM and Tex Mex are under common control.

I am aware that Applicants have stated that they will continue to cooperate with UP regarding utilization of the Laredo Bridge and that they will honor existing agreements governing operations over the Bridge. We welcome these statements. However, Applicants' assurances to date have been stated in very general terms. In order to ensure that all parties receive fair treatment in Bridge operations, there is a need for more clearly defined commitments that would be enforceable. In a letter dated July 21, 2003, counsel for KCS has said it is willing to commit to negotiate in good faith to develop new dispatching protocols for the Bridge and to have this be a condition of its common control of Tex Mex. We believe this is a sensible approach to the Bridge issue. But in order to ensure that all railroads do in fact receive fair treatment, we believe the Board, in imposing such a condition, should set out more specific guidance to the parties and retain jurisdiction to impose an appropriate arrangement if the parties cannot arrive at a consensus solution.

What the Board Should Do

To help ensure that all parties will receive even-handed treatment in connection with operation of the Bridge, the Board should require the parties to adopt new Bridge protocols that adhere to the following principles (unless the parties agree that appropriate protections can be achieved in other ways).

First, UP's role in Bridge operations should be formalized through establishment of a joint operations center responsible for Bridge operations. As

described above, UP personnel currently participate in regular exchanges of operating information and daily conference calls relating to Bridge operations, and UP has had the opportunity to communicate freely with TFM personnel responsible for decisions on Bridge crossing sequence. If the Nafta Rail transaction goes forward, there is a real danger that UP will be shut out of the decisionmaking process and that TFM employees will make unilateral decisions that favor TFM-Tex Mex movements over TFM-UP movements. Prior to mid-2001, when Tex Mex controlled movements over the Bridge, UP faced difficulty in communicating with Tex Mex and having its input considered in management of the Bridge crossing operation. Communication and coordination improved greatly after TFM took control of the Bridge operation. However, UP's perception is that TFM and Tex Mex both regard the Bridge as their "franchise." We believe that, under common control, TFM and Tex Mex will reduce the level of communication and coordination we have seen in recent years and deny UP an influential role in management of the Bridge crossing operation.

The best way to ensure that all three railroads, including UP, continue to have input into decisions about Bridge operations and about whose trains should receive priority when the number of trains waiting exceeds the capacity of a Bridge window is to establish a joint operations center that will control the flow of traffic across the Laredo Bridge. This center should dispatch trackage that extends from UP's Port Laredo Yard to Tex Mex's Serrano Yard, across the Bridge, to TFM's Sanchez Yard.

Joint operations centers are used to coordinate operations when more than one railroad uses the same track and to ensure that all railroads are treated in a neutral manner. In such centers, employees of all railroads sit together in the same dispatching

facility and play a role in the dispatching operation. Dispatchers at a joint operations center have an obligation to act in a neutral manner toward the trains of all participating railroads. The railroads generally agree to structure incentives of these employees to reward the efficient movement of all trains, not just the trains of a particular carrier.

Joint dispatching operations have worked well for trackage in a number of locations, including the Houston area, the Powder River Basin in Wyoming, San Bernadino, California, Kansas City, and the Chicago area. For example, the Spring Dispatching Center in Houston, which is responsible for joint dispatching of jointly owned lines in Houston and between Houston and New Orleans, has been very effective. BNSF, which shares with UP in the joint dispatching, has praised the Spring Center for promoting both efficiency and fairness. (KCS and Tex Mex have been invited to join, but have declined.) Including as part of the condition a requirement that the Nafta Rail carriers and UP negotiate to establish a joint operations center for Bridge movements should not pose a burden. If anything, it should make coordination easier and more effective.

The Board would not need to prescribe the details of a joint operation. Railroads have successfully negotiated these arrangements in the past. At this point, the Board should simply establish the general principle of a joint operations center and allow the parties to work out the operational details.

Second, Applicants should accept an express obligation to manage Bridge operations in a manner that is non-discriminatory and that will achieve maximum efficiency in operation of the Bridge. UP would subscribe to such a commitment. Such an arrangement would allow each carrier to invoke a formal commitment that the others

will continue to participate in practices that maximize the total capacity and operating efficiency of the Bridge, rather than favoring any one user.

Third, the protocols should make clear that, at any given time, Bridge capacity will be allocated in proportion to each railroad's share of traffic at the Laredo crossing. As explained above, UP is concerned that the Nafta Rail carriers will impose a 50-50 allocation of available Bridge slots. Such a one-for-one protocol would guarantee superior treatment for the carrier with less traffic (currently Tex Mex), which would receive half of the slots. When there are more trains waiting than can be accommodated during a window, the carrier that enjoys greater market demand for its services (currently UP) would always be the one that lost the opportunity to cross some of its trains during that window.

Under a fair allocation, when multiple trains are waiting to cross the Bridge in one direction, each railroad should receive slots that would permit it to use the Bridge in accordance with its percentage of the rail traffic that moves via Laredo. Of course, there should be some flexibility in applying a percentage-based formula. It would not be appropriate for the railroads to follow this formula rigidly on a daily basis if doing so would substantially reduce the number of cars moving over the Bridge during a particular day. There should be exceptions for expedited trains (for example, intermodal trains) that need special priority. Moreover, if a railroad could not use all of its allocation, the unused time should be available for the other railroad.

Again, it should not be necessary for the Board to prescribe all of the details of a slot allocation process. Rather, the Board should simply require the parties to negotiate an agreement that would provide slots in proportion to the amount of each

carrier's Laredo traffic. The parties should be able to work out details, such as how to divide capacity into slots. If the parties could not reach agreement, the Board could fashion an appropriate protocol with input from the parties. However, the parties themselves are in the best position to determine how such a system could be implemented, and I believe they will be able to reach agreement following negotiations.

II. TEX MEX TRACKAGE RIGHTS OPERATIONS

I have reviewed certain allegations the Applicants have made in their filings concerning Tex Mex operations over UP track. Applicants claim that UP has a "chokehold" on Tex Mex and could interfere with Tex Mex movements to and from Laredo if it wished to do so. (I assume Applicants are referring to Tex Mex's operations over UP's track between Beaumont, Texas and Robstown/Corpus Christi, Texas, under trackage rights Tex Mex obtained in connection with the Board's 1996 approval of the UP/SP merger.) However, UP has not interfered with Tex Mex operations in the past; moreover, we would not and could not take any such action in the future. The Tex Mex trackage rights operations are subject to extensive protections to ensure that UP does not discriminate against Tex Mex's trains. Ultimately, the trackage rights operations are subject to Board oversight.

The UP-Tex Mex Dispatching Protocol

The Tex Mex trackage rights are governed by a detailed dispatching protocol, negotiated by UP and Tex Mex personnel in 1996 in connection with the Board's award of the trackage rights. A copy of this protocol is attached as Exhibit C to this statement. Under the terms of the protocol, there are numerous specific requirements for administration of the trackage rights.

Under Section 3 of the dispatching protocol, UP dispatchers in this territory must be instructed to treat all trains equally, whether they are UP or Tex Mex trains. Under Section 12 of the protocol, in evaluating performance of its dispatchers, UP must consider performance of Tex Mex trains and effectiveness of meeting Tex Mex service requirements. Under Section 13 of the protocol, Tex Mex has the right to request a meeting with UP personnel to discuss any disagreement about compliance with the protocol and to present such disagreements to a Joint Service Committee comprised of the chief transportation officers of UP and Tex Mex. Tex Mex may submit a disagreement to binding arbitration before a neutral official if it is not satisfied with the Joint Service Committee's action.

I am not aware of a single instance in which UP has violated the protocol governing movement of Tex Mex trains on UP track or otherwise taken action to disadvantage these Tex Mex trains vis-à-vis UP trains. From time to time, various operational problems common to all railroads have contributed to slow velocities on portions of the UP track Tex Mex uses. However, these problems have not been specific to Tex Mex. Rather, they have slowed the movement of all trains (including UP trains) using the tracks.

Tex Mex Delay Claims

Tex Mex has raised concerns about delays its trains have experienced while using UP's tracks. Tex Mex reports that, in a number of cases, the hours of service of a Tex Mex train crew have expired before the train reaches a crew change point, and Tex Mex has had to recrew the train. Earlier this year Tex Mex requested a meeting of the Joint Service Committee established under the UP-Tex Mex dispatching protocol in

order to discuss its concerns about this situation. This was the first time Tex Mex had ever requested such a meeting. In March 2003, I and one of my staff met with Jerry Heavin, Senior Vice President of Operations for KCSR, to review the Tex Mex concerns. We had a productive session in which we discussed these concerns. I advised Mr. Heavin that the velocities of two Tex Mex trains (AJAMXJ and AMXJAX) had improved over the preceding four months. We agreed on steps to follow up on various issues, as well as weekly meetings between UP and Tex Mex personnel for the future. During the March 2003 meeting Mr. Heavin did not identify any respect in which Tex Mex or KCS believed that UP had violated the protocol.

Since the March meeting, UP and Tex Mex personnel have held meetings each Friday to review any concerns about operation of the Tex Mex trains over UP track. In each case in which Tex Mex identified a train delay, UP personnel investigated and explained the relevant circumstances to Tex Mex personnel. Together the UP and Tex Mex personnel identified factors that appear to have been responsible for any delays to the Tex Mex trains. After reviewing the information provided to them, Tex Mex personnel have not identified any UP violation of the protocol.

In my view and that of others at UP, one major factor that causes many Tex Mex crews to expire due to hours of service regulations during movements over the trackage rights is the fact that the Tex Mex crew districts are quite long, much longer than UP's crew districts in the same corridor. Between Houston and Laredo, Tex Mex has just two crew districts -- between Houston and Victoria (216 miles) and between Victoria and Laredo (242 miles). In contrast, most of UP's crew districts in this corridor are between 50 miles and 160 miles in length, and none is as long as the Tex Mex

districts. With such long crew districts, it is not surprising to me that Tex Mex crews frequently expire due to hours of service regulations.

In fact, I believe that the UP dispatchers probably give Tex Mex trains better treatment than UP trains as a result of this situation. UP's dispatchers generally attempt to give priority to a train when the crew is about to expire due to hours of service regulations (in order to allow the train to reach a terminal, rather than tying up mainline capacity). Because of the length of the Tex Mex crew districts, Tex Mex crews are often in danger of exceeding their hours of service. Due to UP's shorter crew districts, UP crews are less likely to be in this situation and thus the UP trains are less likely to receive priority.

Operating statistics UP has collected confirm that Tex Mex trains are suffering fewer delays than UP trains in this part of Texas. In November 2002, the Spring Dispatching Center conducted a four-day study of trains operating on UP's Angleton and Brownsville Subdivisions, parts of which are used by Tex Mex trains operating via trackage rights. This study showed that on average, as among UP, BNSF, and Tex Mex trains, UP trains suffered the most minutes of delay for each train, while Tex Mex trains experienced the fewest minutes of delay per train. Exhibit D to this statement shows the data on minutes of delay per train for UP, BNSF, and Tex Mex trains from the November 2002 study.

There is no reason to believe that UP would choose to discriminate against Tex Mex in connection with these trackage rights in the future. UP uses all of the trackage rights lines for its own trains. Any actions UP took to delay Tex Mex trains would increase congestion on the lines, and this would result in delay to UP trains as

well. In addition to this natural check on any discriminatory conduct, Tex Mex can control UP's conduct by enforcing Tex Mex's rights under the protocol. Tex Mex can monitor performance of its trains, raise its concerns with UP, and seek a binding arbitration award if it cannot obtain a satisfactory resolution through discussions with UP. If it believes the trackage rights are not operating in the manner the STB intended, Tex Mex could seek relief from the Board.

The Board should note that Tex Mex has had opportunities to participate more fully in oversight of the operations on the trackage rights lines, but it has failed to take full advantage of these opportunities. As noted above, under the protocol, Tex Mex has the right to request a Joint Service Committee meeting any time there is a disagreement about compliance with the protocol. As also noted above, Tex Mex has requested only one meeting since it began use of the trackage rights in 1997. Moreover, Tex Mex has never sought binding arbitration of a claim that UP has violated the protocol, although it is entitled to do so under the terms of the protocol.

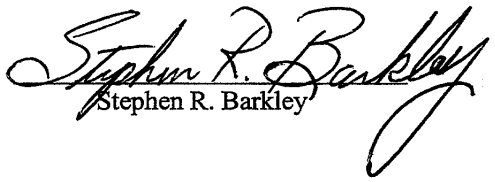
In addition, Tex Mex is free to participate in the Spring Dispatching Center, the joint operations center UP and BNSF operate at Spring, Texas. If Tex Mex agreed to participate in the Spring joint operation, it could have a managerial employee sitting in the same room as the UP and BNSF dispatchers who control train movements on the trackage rights lines. This would facilitate communications and coordination of the Tex Mex train movements over the trackage rights. Despite previous invitations, Tex Mex has declined to participate at Spring. UP and BNSF continue to welcome Tex Mex as a participant in the Spring joint operation.

Capacity Issues

Applicants have also suggested that there is insufficient capacity on the trackage rights lines Tex Mex uses. UP's Network Planning Department, which prepares analyses of line capacity, regularly studies line capacity related to traffic volumes. Based on these analyses, UP has found that there is more than enough capacity to accommodate actual traffic volumes on most of the lines Tex Mex uses. For a portion of the Brownsville Subdivision, Network Planning has concluded that there is sufficient capacity to carry current traffic volumes, although traffic would exceed capacity if several trains per day were added. However, there is enough capacity that Tex Mex could add new traffic to this line without additional investment. Network Planning's analyses also indicate that the trackage rights lines Tex Mex uses are considerably less constrained than the line between San Antonio and Laredo used by UP's trains, where traffic volumes exceed capacity by several trains per day.

Applicants have asserted that UP failed to meet commitments to expand the capacity of the trackage rights lines. In fact, since UP and Tex Mex entered into the trackage rights agreement, UP has spent many millions of dollars on capital projects that benefit lines that Tex Mex uses. If Tex Mex believes that UP has violated that agreement or some other contract by failing to make certain capital investments, it could raise this claim. However, Tex Mex has never informed UP of a capital improvement it believes should have been made on the trackage rights lines.

If it believes its operations on UP's tracks are limited by a lack of capacity, Tex Mex could take at least two steps to help alleviate the situation. First, Section 5 of the 1996 trackage rights agreement gives Tex Mex the right to identify and fund construction of sidings and other capital improvements on the trackage rights lines,



without UP having any veto. Tex Mex has never invoked this provision in the period since it began using the trackage rights, but this continues to be an available option. Second, UP has sold to Tex Mex the old SP Wharton line, which runs between Victoria and Rosenberg. Tex Mex could proceed with plans to rehabilitate this line and use this shorter route in place of approximately 100 miles of trackage rights on UP. This would shorten Tex Mex's route from Houston to Laredo and eliminate any concern about capacity on one portion of the UP lines.

* * *

In summary, there is no realistic prospect that UP could impose a "chokehold" on Tex Mex operations to and from Laredo. UP has not interfered with Tex Mex's operations in the past, and we have no intention of doing so in the future. In any event, Tex Mex can take effective steps to obtain relief if it believes UP is discriminating against Tex Mex trains or otherwise acting in violation of the 1996 dispatching protocol. In addition, Tex Mex has the right to fund capacity additions to the lines it uses. These protections are far more effective than any rights UP could invoke today in connection with the Laredo Bridge operations.

I, Stephen R. Barkley, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on August 1, 2003.

AGREEMENT

between

GUY A. THOMPSON, Trustee,
INTERNATIONAL-GREAT NORTHERN
RAILROAD COMPANY, DEBTOR,
(Herein Called International Trustee)

and

THE TEXAS MEXICAN RAILWAY COMPANY
(Herein Called Tex-Mex Company)

Covering, among other things, the use of certain tracks, improvements and motive power of each International Trustee and Tex-Mex Company, and the performance by certain employes of International Trustee and Tex-Mex Company of certain switching, terminal and other services, incident to the interchange of passenger train cars, and any passengers, baggage, mail and express contained therein, and of freight train cars, and any freight contained therein, between the National Railways of Mexico and each the International Trustee and the Tex-Mex Company at the U. S.-Mexican Boundary Line.

Laredo, Texas.

St. Louis Law Printing Co., 415 North Eighth Street. CEntral 4477.

JAN-18172

(III) Joint Switching Service shall be performed impartially for the account of the parties hereto; and no preference shall be given to movement of cars of one of the parties hereto over cars of the other party hereto.

(IV) Movement of International Trustee's passenger train cars shall have precedence over the movement of freight train cars over Tex-Mex Green Tracks at all times. Subject to foregoing, Joint Switching Service shall have preference over all other movements on Tex-Mex Green Tracks except that Tex-Mex Company shall have preference in the use of Tex-Mex Green Tracks by Tex-Mex Company's sole engine and crew performing sole switching service for Tex-Mex Company on Tex-Mex Company's tracks now or hereafter located near and just easterly of Tex-Mex Green Track No. 1 and intermediate Ventura Street and Lincoln Street, the Tex-Mex Company hereby agreeing to so perform its sole switching service as to not unnecessarily or unreasonably interfere with the movement over Tex-Mex Green Tracks in Joint Switching Service of freight train cars.

Section 5. **Persons Employed In Performing Services Hereunder.**

(A) Each party shall have the right, at such party's sole expense and with such party's sole employes, to handle all papers required by the United States and Mexican governmental authorities for the movement of export and import cars of such party; and shall cause such party's said sole employes to cooperate with the supervisory officer and yard clerks hereinafter referred to in expediting the movement of said export and import cars. Not more than one such sole employe of each party shall be stationed at the Yard Office at the International Bridge at any one time for the purpose aforesaid; and said sole employe may examine only records pertaining to his employer's business.

TERMS FOR TEXAS MEXICAN RAILWAY COMPANY TRACKAGE RIGHTS

The following terms (hereinafter referred to as the "Terms") shall govern rights provided by MISSOURI PACIFIC RAILROAD COMPANY, a Delaware corporation ("MP"), and SOUTHERN PACIFIC TRANSPORTATION COMPANY, a Delaware corporation ("SP"), with MP and SP jointly and severally referred to as "MP/SP" or "Owner," on the one hand, to THE TEXAS MEXICAN RAILWAY COMPANY ("Tex Mex" or "User"), on the other hand, with MP/SP and Tex Mex sometimes referred to collectively as "Parties," pursuant to the decision of the Surface Transportation Board ("STB") in Finance Docket No. 32760 served August 12, 1996 (the "Decision").

RECITALS

A. MP/SP owns lines of railroad consisting of track structure extending between Robstown, Texas and Odem, Texas, and between Corpus Christi, Texas, and Beaumont, Texas, by way of Odem, Texas, identified as follows:

> MP's line between Robstown, Texas, in the vicinity of MP Milepost 141.48 and Placedo, Texas, in the vicinity of MP Milepost 224.2;
>
> MP's line between Corpus Christi, Texas, in the vicinity of MP Milepost 145.59, and Odem, Texas, in the vicinity of MP Milepost 132.2, via Savage Lane to MP's Viola Yard;
>
> SP's line between Placedo, Texas, in the vicinity of SP Milepost 14.2, and West Junction, Texas, in the vicinity of SP Milepost 12.6, via Victoria, Texas, and Flatonia, Texas;
>
> SP's line between West Junction, Texas, in the vicinity of SP Milepost 12.6, and T&NO Junction, Texas, in the vicinity of SP Milepost 4.6;
>
> SP's line from West Junction through Bellaire Junction to Chaney Junction, in the vicinity of SP Milepost 2.8;
>
> SP's line from Chaney Junction, in the vicinity of SP Milepost 2.8, to Tower 26, in the vicinity of SP Milepost 360.7, via the Houston Passenger station;

SP's line from Chaney Junction, in the vicinity of SP Milepost 2.8, to Tower 26, in the vicinity of SP Milepost 360.7, via the Hardy Street yard;

MP's line from Settegast Junction, in the vicinity of MP Milepost 381.61, to the connection with HB&T at Interstate Junction, in the vicinity of MP Milepost 7.60;

SP's line from T&NO Junction, in the vicinity of SP Milepost 4.6, to the connection with PTRA, in the vicinity of Katy Neck (GH&H Junction), in the vicinity of SP Milepost 1.3;

SP's line from SP Milepost 360.7 near Tower 26 to the connection with HB&T at Quitman Street, in the vicinity of SP Milepost 1.45;

MP's line between Gulf Coast Junction, Texas, in the vicinity of MP Milepost 377.98, and Amelia, Texas, in the vicinity of MP Milepost 451.4;

MP's line between Amelia, Texas, in the vicinity of MP Milepost 451.4, and the connection with SP at Langham Road, Texas, in the vicinity of MP Milepost 456.7;

SP's line between Langham Road, Texas, in the vicinity of MP Milepost 456.7, and Tower 74, in the vicinity of MP Milepost 458.8;

MP's line between Tower 74, in the vicinity of MP Milepost 458.8, and (1) the connection with The Kansas City Southern Railway Company ("KCS") at GLC Jct., Texas, in the vicinity of MP Milepost 460.36 (KCS Milepost 766.7), and (2) the connection with KCS at the Neches River Draw Bridge in Beaumont, Texas, in the vicinity of KCS Milepost 766.0;

as shown by bold line on the attached prints dated September 23, 1996 (and identified as Exhibit "A") and further described in Section 1.7 of Exhibit "B," which shall be referred to herein as the "Joint Trackage."

B. The STB in Finance Docket No. 32760 approved the common control and merger of the rail carriers controlled by Union Pacific Corporation ("UPC"), including MP and Union Pacific Railroad Company ("UPRR") (UPC, UPRR and MP are referred to collectively as "UP"), and the rail carriers controlled by Southern Pacific Rail Corporation ("SPR"), including SP, conditioned on, among other things, partial grant of the Responsive Application of Tex Mex, dated March 29, 1996.

C. In order to exercise its authority to acquire control of SPR as granted by the STB in Finance Docket No. 32760, MP/SP is willing to provide Tex Mex with the rights specified in the Decision.

D. Tex Mex desires to receive said rights and desires to conduct operations over said rights. Tex Mex and MP/SP now wish to assist the STB in specifically defining the terms and conditions under which said rights shall be exercised.

E. It is the position of Tex Mex and MP/SP that these Terms do not constitute the acquiescence by either of them in the Decision and shall not preclude either of them from seeking any reopening, reconsideration or judicial review of the Decision.

TERMS

1. General Conditions:

The General Conditions set forth in Exhibit "B" attached hereto are hereby made a part of these Terms. All capitalized Terms used and not otherwise defined in these Terms shall have the meaning ascribed to them in the General Conditions. If any conflict between the General Conditions and these Terms shall arise, the provisions of these Terms shall prevail.

2. Rights of Tex Mex:

(a) Subject to the terms and conditions contained herein, MP/SP shall grant to Tex Mex the nonexclusive right to use the Joint Trackage for the limited operation of Equipment in Tex Mex's account over the Joint Trackage in common with MP/SP and such other railroad company or companies as MP/SP has heretofore admitted or may hereafter at any time in the future admit to the joint use of all or part of the Joint Trackage (provided that such future admittance shall not materially hinder or obstruct the fair and reasonable exercise of the rights granted in these Terms), such other railroad company or companies to be considered MP/SP for the purposes of these Terms, it being understood and agreed that Tex Mex shall not have the right to:

(i) Switch industries upon the Joint Trackage, except as otherwise provided in Section 2(g);

(ii) Set out, pick up or store Equipment upon the Joint Trackage, or any part thereof, except as otherwise provided in Sections 2.11, 2.12 and 2.13 of Exhibit B;

(iii) Serve any industry, team or house track, intermodal or auto facility now existing or hereafter located along the Joint Trackage, except as otherwise provided in Section 2(g);

(iv) Permit or admit any third party to the use of all or any portion of the Joint Trackage, nor, under the guise of doing its own business, contract or make any agreement to handle as its own Equipment over or upon the Joint Trackage, or any portion thereof, the Equipment of any such third party which in the normal course of business would not be considered the Equipment of Tex Mex; provided, however, that the foregoing shall not prevent Tex Mex, pursuant to a run-through agreement with any railroad, from using the locomotives and cabooses of another railroad as its own under these terms;

(v) Connect with or interchange with any other railroad, except as otherwise provided in Section 4; or

(vi) Establish any transload facilities on the Joint Trackage or build into or out from any facility from/to the Joint Trackage.

(b) The rights granted in Section 2 shall be only for rail traffic of all kinds and commodities, both carload and intermodal, in Equipment that meets all applicable specifications established by the Association of American Railroads and the Federal Railroad Administration, provided that all freight handled by Tex Mex pursuant to such rights must have a prior or subsequent movement on Tex Mex's Laredo-Robstown-Corpus Christi Line.

(c) User shall have the right to establish crew change points at points on the Joint Trackage as from time to time may be mutually agreed to in writing by Owner and User. However, User agrees that if sufficient trackage is not available at such locations(s) to facilitate crew changes of User, Owner may require User to construct additional trackage ("Crew Change Facilities") in the vicinity of such location as may be required, in the reasonable judgment of Owner, the cost and expense of which shall be borne solely by User. If User does not agree that such Crew Change Facilities are necessary, the Owner may nevertheless insist that they be constructed, with the question of their necessity, and the User's obligation to bear their cost and expense, to be determined by arbitration pursuant to Section 6 of the General Conditions. In the event such Crew Change Facilities are constructed at the cost and expense of User, and Owner shall choose to use such Crew Change Facilities, Owner shall pay User fifty percent (50%) of the cost of constructing such Crew Change Facilities. Should Owner decline to participate, Owner shall be denied access to such Crew Change Facilities. However, should Owner elect at a later date to use such Crew Change Facilities, such right shall be granted to Owner by User upon payment of fifty percent (50%) of User's initial costs plus per annum interest thereon at a rate equal to the average paid on 90-day Treasury Bills of the United States Government as of the date of completion until the date of use by User commences. Per annum interest shall be adjusted annually on the first day of the twelfth (12th) month following the date of completion and every year thereafter on such date, based on the percentage increase or decrease, in the average yield of 30-year U.S. Treasury Notes for the prior year compared to their average yield in first year of completion of the Improvements. Each annual adjustment shall be subject, however, to a "cap" (up or down) of two percentage points of the prior year's

interest rate (i.e. the adjustment may not exceed an amount equal to two percentage points of the immediately preceding year's interest rate).

In addition, Owner shall lease to User, by separate written agreement at reasonable and customary charges, existing facilities for office, locker, change and lunchroom purposes by User's personnel upon request of User to Owner, and as reasonably available, or property of Owner as reasonably available for User to establish its own facilities.

(d) User agrees that when entering or exiting the Joint Trackage or using the Joint Trackage to set out or pick up ("User's Operations"), it shall do so without unreasonable interference or impairment of the Joint Trackage. However, User agrees that if sufficient trackage is not available at such location(s) to facilitate User's Operations, Owner may require User to construct additional trackage in the vicinity of such location(s) as may be required, in the reasonable judgment of Owner, the cost and expense of which shall be borne solely by User. If User does not agree that such additional trackage is necessary, the Owner may nevertheless insist that it be constructed, with the question of its necessity, and the User's obligation to bear its cost and expense, to be determined by arbitration pursuant to Section 6 of the General Conditions. In the event such trackage is constructed at the cost and expense of User, and Owner shall choose to use such trackage, Owner shall pay User fifty percent (50%) of the cost of constructing such trackage plus interest as calculated pursuant to Section 2(c) above.

(e) User shall have the right to such use of SP's Glidden Yard at Glidden, Texas, as is reasonably necessary to effectuate the rights granted by these Terms and on such terms and conditions (including reasonable compensation terms) as may be agreed to in writing by the parties or determined by arbitration pursuant to Section 6 of the General Conditions if the parties fail to agree; provided, however, that such use by User shall not unreasonably interfere with Owner's operations. Any dispute between User and Owner regarding the reasonableness of User's use of Glidden Yard shall be submitted to arbitration pursuant to Section 6 of the General Conditions.

(f) If Owner implements a directional flow of operations between Houston, Texas, and Beaumont, Texas, Owner will assure that User's operations are not adversely affected thereby.

(g) User shall have the right to serve all shippers that, as of September 10, 1996, were capable of receiving service from both MP and SP and no other railroad, directly or through reciprocal switching.

3. GTM Rate:

(a) In addition to other payments to be made under these Terms, User shall remit to Owner monthly for the use of the Joint Trackage in the operation of its Equipment therealong and thereover, the total amount of 3.84 mills per GTM for all Equipment, which sum per GTM ("GTM Rate") shall be deemed to include ordinary and programmed maintenance of the Joint

Trackage, Changes in and/or Additions to the Joint Trackage (to the extent required by the first sentence of Section 2.2 of the General Conditions), operating expenses, interest rental, depreciation and taxes.

(b) For the purpose of computing the GTM Rate under this Section 3, the distance between the designated points of the Joint Trackage shall be determined by reference to MPRR's EPMS Engineering Mileage Master or SP's Station Pair Master File, whichever is applicable, both of which shall be subject to verification by User.

(c) The GTM Rate set forth in Section 3(a) of these Terms shall be subject to adjustment annually, commencing as of July 1, 1997, as follows:

All trackage rights charges under this Section 3 shall be subject to adjustment annually beginning as of the effective date of these Terms to reflect seventy percent (70%) of increases or decreases in Rail Cost Adjustment Factor, not adjusted for changes in productivity ("RCAF-U") published by the ICC or successor agency or other organizations. In the event the RCAF-U is no longer maintained, the parties shall select a substantially similar index and failing to agree on such an index, the matter shall be referred to binding arbitration.

4. Interchange:

In exercising the rights granted by these Terms, Tex Mex shall have the right to interchange traffic (a) with carriers other than MP/SP at the existing interchange points with those carriers on the Joint Trackage, i.e., (i) at Houston, Texas, with the Port Terminal Railroad Association ("PTRA"), the Houston Belt Terminal Railway Company ("HBT"), The Atchison, Topeka & Santa Fe Railway Company ("ATSF") and Burlington Northern Railroad Company ("BN") (ATSF and BN are referred to collectively as "BNSF"), and (ii) at Beaumont, Texas, with BNSF and The Kansas City Southern Railway Company ("KCS"); (b) with BNSF at Robstown and Corpus Christi and at any new interchange point on the Joint Trackage that may hereafter be established between MP/SP and BNSF; and (c) with MP/SP at Houston, Beaumont and such other points as may mutually be agreed. Any interchange between Tex Mex and PTRA or between Tex Mex and HBT at Houston, Texas, shall be governed by agreements entered into between those parties or terms imposed by the STB.

5. Additions:

(a) Owner and User shall conduct a joint inspection to determine what connections ("Connections") and sidings or siding extensions associated with Connections ("Sidings") are necessary in the reasonable judgment of Owner to implement the rights granted under Section 2 of these Terms. User, at its sole cost and expense, shall pay the cost of such Connections and Sidings. If User does not agree that such Connections and Sidings (other than those described in subsections (i) and (ii), the necessity for which is not in dispute, and to which this sentence does not apply) are necessary, Owner may nevertheless insist that they be constructed, with the question of their necessity, and the User's obligation to bear their cost and expense, to be

determined by arbitration pursuant to Section 6 of the General Conditions. In the event that the User bears the sole cost and expense of any such Connections and Sidings, no other railroad shall have the right to use them except upon terms agreed to by User and such other railroad. In the event Owner shall elect to use such Connections and Sidings, Owner shall pay to User fifty percent (50%) of the cost to User of constructing the Connections and Sidings, plus interest as calculated pursuant to Section 2(c) above, and, having made such payment, Owner may also admit other railroads to the use of such Connections and Sidings. Owner shall maintain the part of any Connection or Siding on its property at its sole cost and expense, and User, at its sole cost and expense, shall maintain the part of any Connection or Siding on its property or property of others. Such necessary Connections and Sidings shall include, but are not necessarily limited to, those described in subsections (i) and (ii) below:

(i) User shall construct a connection to access MP at Robstown, Texas, to include track 8500 feet in length to permit Tex Mex trains to clear the MP main line (the "Robstown Connection"). The design for the Robstown Connection shall be submitted to Owner for its written approval within forty-five (45) days following the effective date of these Terms, which approval shall not be unreasonably withheld, and User's operation thereover shall be subject to Owner's prior written acceptance of the Robstown Connection. User agrees that the Robstown Connection shall be constructed within one hundred eighty (180) days of acquisition of the required property and approval by Owner of its design. Owner grants User the right to use, as daily dispatching conditions reasonably permit, the existing connection between Tex Mex and Owner at Robstown and 8500 feet of Owner's main line south of that connection, for a period of six (6) months following the date of Owner's approval of the design of the Robstown Connection, which connection and trackage shall be deemed part of the Joint Trackage during the period of Tex Mex's usage thereof, including any extensions of the period as provided below. Owner will extend the period of User's use of the existing connection for an additional six (6) months in the event (a) User is unable to complete the Robstown Connection within the time frame specified in the preceding sentence and User is making a bona fide effort to complete the construction of the new connection, and (b) User's continued operations over the existing connection will not, in Owner's judgment, unreasonably interfere with Owner's operations. If BNSF constructs the Robstown Connection, Tex Mex shall have the right to use the Robstown Connection on terms agreed to by Tex Mex and BNSF. If the Robstown Connection is not constructed by BNSF, Tex Mex shall construct the Robstown Connection as provided above.

(ii) User shall also construct a connection to access SP at Flatonia, Texas, to include track parallel to SP's Victoria Subdivision, Port LaVaca Branch, 8500 feet in length to permit Tex Mex trains to clear the SP main line (the "Flatonia Connection"). The design for the Flatonia Connection shall be submitted to Owner for its written approval within forty-five (45) days following the effective date of these Terms, which approval shall not be unreasonably withheld, and

User's operation thereover shall be subject to Owner's prior written acceptance of the Flatonia Connection. User agrees that the Flatonia Connection shall be constructed within one hundred eighty (180) days of acquisition of the required property and approval by Owner of its design. Owner grants User the right to use the existing connection between SP's Victoria Subdivision, Port LaVaca Branch, and SP's Glidden Subdivision at Flatonia and siding south of Owner's main line West of that connection for a period of six (6) months following the date of Owner's approval of the design of the Flatonia Connection, which existing connection and trackage shall be deemed part of the Joint Trackage during the period of Tex Mex's usage thereof.

(b) Except as provided in Section 5(a) above, expenditures for any future Changes in and/or Additions to the Joint Trackage, such as, but not limited to, sidings, Centralized Traffic Control, grade separations, and future connections, shall be handled as follows: (i) if the Change in and/or Addition to the Joint Trackage is for the sole benefit of one party, that party shall be solely responsible for the entire cost and expense thereof; (ii) all other Changes in and/or Additions to the Joint Trackage shall be shared by MP/SP and Tex Mex on the basis that the parties' respective GTM's operated over the Joint Trackage bear to total GTM's operated over the Joint Trackage for the twelve (12) month period immediately prior to the month work on the project is commenced. The use of Joint Trackage by any third party shall be attributed to MP/SP for purposes of computing respective GTM's for purposes of this Section 5(b).

(c) In the event such Changes in and/or Additions to the Joint Trackage are constructed at the sole cost and expense of one party (party of the first part), the other party (party of the second part) shall be denied access to such Change in and/or Addition to the Joint Trackage. If the party of the second part at some future date shall choose to use such Changes in and/or Additions to the Joint Trackage, such right shall be granted to party of the second part by party of the first part upon payment of fifty percent (50%) of party of the first part's initial costs plus per annum interest calculated pursuant to Section 2(c).

6. Notices:

All notices, demands, requests, submissions and other communications which are required or permitted to be given pursuant to these Terms shall be given by either party to the other in writing and shall be deemed properly served if delivered by hand, or mailed by overnight courier or by registered or certified mail, return receipt requested, with postage prepaid, to such other party at the address listed below:

If intended for MP/SP:

Executive Vice President-Operation
Room 1206
1416 Dodge Street
Omaha, Nebraska 68179

With a copy to:

Director Joint Facilities
Room 1200
1416 Dodge Street
Omaha, Nebraska 68179

If intended for Tex Mex:

The Texas Mexican Railway Company
1200 Washington Street
P.O. Box 419
Laredo, Texas 78042

Notice of address change may be given any time pursuant to the provisions of this Section 6.

7. Term:

These Terms shall be effective upon consummation of the control authority granted in the Decision for a term of ninety-nine (99) years. These Terms shall terminate, and all rights conferred pursuant thereto shall be canceled and deemed void ab initio, if, in a Final Order, the application for authority for UP to control SPC has been denied or has been approved on terms unacceptable to the applicants or has been granted on terms that do not require the rights provided herein, provided, however, that if these Terms become effective and are later terminated, any liabilities arising from the exercise of rights under Sections 1 through 5 during the period of its effectiveness shall survive such termination. For purposes of this Section 7, "Final Order" shall mean an order of the Surface Transportation Board, any successor agency, or a court with lawful jurisdiction over the matter which is no longer subject to any further direct judicial review (including a petition for writ of certiorari) and has not been stayed or enjoined.

Approved:

EXHIBIT "B"
GENERAL CONDITIONS

Section 1. DEFINITIONS

1.1 "Annual" shall mean a calendar year.

1.2 "Car" shall mean one (1) rail car; provided, however, that each platform in an articulated rail car of two (2) or more platforms shall be counted as one (1) rail car, subject to modification by mutual agreement of the parties based upon changes in railroad technology.

1.3 "Changes in and/or Additions to" shall mean work projects and retirements, the cost of which is chargeable in whole or in part to Property Accounts during the term of the Terms.

1.4 "Equipment" shall mean trains, locomotives, rail cars (loaded or empty), intermodal units (loaded or empty), cabooses, vehicles, and machinery which are capable of being operated on railroad tracks or on right-of-way for purposes of the maintenance or repair of such railroad tracks.

1.5 "GTM" shall mean gross ton mile which is the weight in tons for Equipment and lading transported over one (1) mile of track included in the Joint Trackage.

1.6 "GTM Handled Proportion" shall mean the GTMs handled over the Joint Trackage by or for a party divided by the total number of GTMs handled by or for all parties using the Joint Trackage, during the same period. For the purpose of computing such GTM's Handled Proportion, Equipment engaged in work service pertaining to construction, maintenance or operation of the Joint Trackage or Changes in and/or Additions to the Joint Trackage shall not be counted and GTMs of third parties shall be attributed to the Owner.

1.7 "Joint Trackage" shall mean the track structure of Owner as described in the Terms including necessary right-of-way and all appurtenances, signals, communications, and facilities of Owner and all Changes in and/or Additions to said track structure now or in the future located as are required or desirable for the operation of the Equipment of the parties hereto.

1.8 "Mill" shall mean one-tenth of a cent ($0.001 US).

1.9 "Owner" shall have the meaning given to it in the Terms.

1.10 "Property Accounts" shall mean accounts so designated under the Uniform System of Accounts for Railroad Companies prescribed by the Interstate Commerce Commission, or any replacement of such system prescribed by the applicable federal regulatory agency, if any, and used by the parties hereto.

1.11 "STB" shall mean the Surface Transportation Board of the United States Department of Transportation or any successor agency.

1.12 "Terms" shall mean those certain Terms for Texas Mexican Railway Company Trackage Rights to which this Exhibit "B" is attached.

1.13 "User" shall have the meaning given to it in the Terms.

Section 2. MAINTENANCE, ADDITIONS, OPERATION, AND CONTROL

2.1 Owner shall have sole charge of the maintenance and repair of the Joint Trackage with its own supervisors, labor, materials and equipment. Owner, from time to time, may make such Changes in and/or Additions to the Joint Trackage as shall be required by any law, rule, regulation or ordinance promulgated by any government body having jurisdiction, or as Owner, in its sole discretion, shall deem necessary, subject to Section 2.2. Such Changes in and/or Additions to the Joint Trackage shall become a part of the Joint Trackage or in the case of retirements shall be excluded from the Joint Trackage.

2.2 Unless otherwise mutually agreed to by the parties in writing, Owner shall, (i) keep and maintain the Joint Trackage on a consistent basis at no less than the track standard designated in the timetable in effect on the date of the Terms, including special instructions for the Joint Trackage as of the date of the Terms, (ii) maintain at least the physical capacity of the Joint Trackage as of the date of the Terms (i.e., number of main tracks, support tracks, signal systems, rail weight, line clearances, etc.), and (iii) be responsible for any Changes in and/or Additions to the Joint Trackage as shall be necessary to accommodate the traffic of Owner and User while maintaining existing service standards (including transit times) in effect on the date of the Terms. In the event that User desires that the Joint Trackage be improved to a condition in excess of the standard set forth in this Section 2.2, or desires that other Changes in and/or Additions to be made to the Joint Trackage, Owner agrees to make such Changes in and/or Additions to the Joint Trackage if funded in advance by User. Thereafter, such Changes in and/or Additions to the Joint Trackage shall become part of the Joint Trackage and shall be maintained by Owner in such improved condition.

2.3 Owner shall employ all persons necessary to construct, operate, maintain, repair and renew the Joint Trackage. Owner shall be bound to use reasonable and customary care, skill and diligence in the construction, operation, maintenance, repair and renewal of the Joint Trackage and in managing of the same. Owner shall make its best effort to ensure that User is given the same advance notice of maintenance plans and schedules as is provided to Owner's personnel.

2.4 The trackage rights granted hereunder shall give User access to and joint use of the Joint Trackage, for such use as is permitted by Section 2 of the Terms, equal to that of Owner. The management, operation (including dispatching) and maintenance of the Joint Trackage shall, at all times, be under the exclusive direction and control of Owner, the movement

of Equipment over and along the Joint Trackage shall at all times be subject to the exclusive direction and control of Owner's authorized representatives and in accordance with such reasonable operating rules as Owner shall from time to time institute, but in the management, operation (including dispatching) and maintenance of the Joint Trackage, Owner and User shall be treated equally. All operating, dispatching and maintenance decisions by Owner affecting the movement of Equipment on the Joint Trackage shall be made pursuant to the Tex Mex-UP SP Dispatching Protocols attached hereto as Attachment 1. User shall, at User's sole cost and expense, obtain, install and maintain necessary communication equipment to allow User's Equipment to communicate with Owner's dispatching and signaling facilities the same as Owner's trains so utilize. Owner shall consult with User prior to the adoption of new communication or signaling systems to be employed on the Joint Trackage, which have not theretofore been generally adopted in the railroad industry.

2.5 A Joint Service Committee ("Committee"), comprised of the chief transportation officers of Owner and User (or their designees) shall be established, and shall be responsible for establishing rules and standards as appropriate to ensure equitable and non-discriminatory treatment, appropriate maintenance and efficient joint use of the Joint Trackage. The Committee shall meet on a regular basis, but not less often than every three (3) months during the first year of operation under the Agreement, and thereafter when any party serves upon the other party thirty (30) days' written notice of its desire to meet to review the overall performance of equipment on the Joint Trackage, conflicts, if any, experienced between Equipment of Owner and Equipment of User, grievances over the handling of particular Equipment or operational events, maintenance of the Joint Trackage, ways in which future conflicts may be minimized, ways of improving operations and maintenance of the Joint Trackage and such other relevant matters as the Committee may decide to consider. The Committee may issue standards or rules to prevent unnecessary interference or impairment of use of the Joint Trackage by either party or otherwise insure fair and equal treatment as between Owner and User. Either party may request a special meeting of the Committee on reasonable notice to the other. Informal telephonic conferences shall be held by the Committee where appropriate to address immediate concerns of either party. It is expected that the work of the Committee shall be undertaken in a spirit of mutual cooperation consistent with the principles expressed in the Terms.

2.6 If the use of the Joint Trackage shall at any time be interrupted or traffic thereon or thereover be delayed for any cause, neither party shall have or make any claim against the other for loss, damage or expense caused by or resulting solely from such interruption or delay.

2.7 Owner may from time to time provide any track or tracks on the Joint Trackage other than those delineated in Exhibit A to the Terms for use by User provided there shall at all times be afforded User a continuous route of equal utility and quality for the operations of its Equipment between the termini of the Joint Trackage. When such tracks which are not part of the Joint Trackage are used as provided herein, the Terms shall govern for purposes of direction and control and liability as if all movement had been made over the Joint Trackage.

2.8 Each party shall be responsible for furnishing, at its sole cost and expense, all labor, fuel and train and other supplies necessary for the operation of its own Equipment over the Joint Trackage. In the event a party does furnish such labor, fuel or train and other supplies to another party, the party receiving the same shall promptly, upon receipt of billing therefor, reimburse the party furnishing the same for its reasonable costs thereof, including customary additives.

2.9 User shall be responsible for the reporting and payment of any mileage, per diem, use or rental charges accruing on Equipment in User's account on the Joint Trackage. Except as may be specifically provided for in the Terms, nothing herein contained is intended to change practices with respect to interchange of traffic between the parties or with other carriers on or along the Joint Trackage.

2.10 Except as otherwise may be provided in the Terms, User shall operate its Equipment over the Joint Trackage with its own employees, but before said employees are assigned or permitted to operate Equipment over the Joint Trackage as herein provided, and from time to time thereafter as and when reasonably requested by Owner, they shall be required to pass the applicable rules examinations required by Owner of its own employees. Owner shall delegate to specified User's officers the conduct of such examinations in the event User chooses to conduct such examinations. If an Owner officer conducts such examinations of employees of User, User shall pay Owner a reasonable fee for each employee so examined, such fee to be mutually agreed upon by the parties from time to time in a separate agreement. Notwithstanding any such examination, User shall be responsible for ensuring that its employees are qualified and have taken all such rules examinations. Upon request of User, Owner shall qualify one or more of User's supervisory officers as pilots and such supervisory officer or officers so qualified shall qualify employees of User engaged in or connected with User's operations on or along the Joint Trackage. At User's request, Owner shall furnish a pilot or pilots, at the expense of User, to assist in operating trains of User over the Joint Trackage.

2.11 If any employee of User shall neglect, refuse or fail to abide by Owner's rules, instructions and restrictions governing the operation on or along the Joint Trackage, such employee shall, upon written request of Owner, be suspended by User from working on the Joint Trackage unless and until requalified to return to work and approved to do so by Owner. If either party shall deem it necessary to hold a formal investigation to establish such neglect, refusal or failure on the part of any employee of User, then upon such notice presented in writing, Owner and User shall promptly hold a joint investigation in which the parties concerned shall participate and bear the expense for their respective officers, counsel, witnesses and employees. Notice of such investigations to User's employees shall be given by User's officers, and such investigation shall be conducted in accordance with the terms and conditions of schedule agreements between User and its employees. If, in the judgment of Owner, the result of such investigation warrants, such employee shall, upon written request by Owner, be withdrawn by User from service on the Joint Trackage, and User shall release and indemnify Owner from and against any and all claims and expenses arising from such withdrawal.

If the disciplinary action is appealed by an employee of User to the National Railroad Adjustment Board or other tribunal lawfully created to adjudicate such cases; and if the decision of such board or tribunal sustains the employee's position, such employee shall not thereafter be barred from service on the Joint Trackage by reason of such disciplinary action.

2.12 If any Equipment of User is bad ordered enroute on the Joint Trackage and (i) it is necessary that it be set out, and (ii) only light repairs to the Equipment are required, such bad ordered Equipment shall be promptly repaired, and, thereafter, be promptly removed from the Joint Trackage by User. Owner may, upon request of User and at User's sole cost and expense, furnish the required labor and material and perform light repairs to make such bad ordered Equipment safe for movement. The employees and Equipment of Owner while in any manner so engaged or while enroute to or returning to Owner's terminal from such an assignment shall be considered Sole Employees (as hereinafter defined) of User and Sole Property (as hereinafter defined) of User. However, should Owner's employees after repairing such bad ordered Equipment for User move directly to perform service for Owner's benefit rather than return to Owner's terminal, then User's exclusive time and liability will end when Owner's employees depart for work to be performed for Owner's benefit. In the case of such repairs by Owner to freight cars in User's account, billing therefor shall be in accordance with the Field and Office Manuals of the Interchange Rules, adopted by the Association of American Railroads ("AAR"), hereinafter called "Interchange Rules", in effect on the date of performance of the repairs. Owner shall then prepare and submit billing directly to and collect from the car owner for car owner responsibility items as determined under said Interchange Rules, and Owner shall prepare and submit billing directly to and collect from User for handling line responsibility items as determined under said Interchange Rules. Owner also shall submit billing to and collect from User any charges for repair to freight cars that are User's car owner responsibility items as determined under said Interchange Rules, should said car owner refuse or otherwise fail to make payment therefor. Repairs to locomotives shall be billed as provided for in Section 3 of these General Conditions.

2.13 If Equipment of User shall become derailed, wrecked, or otherwise disabled while upon the Joint Trackage, it shall be rerailed or cleared by Owner, except that employees of User may rerail User's derailed Equipment on the Joint Trackage whenever use of motorized on or off track equipment is not required; however, in any such case, employees of User shall consult with and be governed by the directions of Owner. Owner reserves the right to rerail Equipment of User when, in the judgment of Owner, Owner deems it advisable to do so to minimize delays and interruptions to train movement. The reasonable costs and expenses of rerailing or clearing derailed, wrecked or disabled Equipment shall be borne by the parties in accordance with Section 5 of these General Conditions. Services provided under this section shall be billed in accordance with Section 3 of these General Conditions.

2.14 In the event Equipment of User shall be forced to stop on the Joint Trackage, and such stoppage is due to insufficient hours of service remaining among User's employees, or due to mechanical failure of User's Equipment (other than bad ordered Equipment subject to light repairs pursuant to Section 2.12), or to any other cause not resulting from an accident or

derailment (including the failure of User to promptly repair and clear bad ordered Equipment pursuant to Section 2.12), and such Equipment is unable to proceed, or if a train of User fails to maintain the speed required by Owner on the Joint Trackage, or if, in emergencies, disabled Equipment is set out of User's trains on the Joint Trackage, Owner shall have the option to furnish motive power or such other assistance (including but not limited to the right to recrew User's train) as may be necessary to haul, help or push such Equipment, or to properly move the disabled Equipment off the Joint Trackage. The reasonable costs and expenses of rendering such assistance shall be borne by User. Services provided under this section shall be billed in accordance with Section 3 of these General Conditions.

2.15 User shall pay to Owner reasonable expenses incurred by Owner in the issuance of timetables made necessary solely by changes in the running time of the trains of User over the Joint Trackage. If changes in running time of trains of Owner or third parties, as well as those of User, require the issuance of timetables, then User shall pay to Owner that proportion of the expenses incurred that one bears to the total number of parties changing the running time of their trains. If changes in running time of trains of Owner or third parties, but not those of User, require the issuance of timetables, then User shall not be required to pay a proportion of the expenses incurred in connection therewith.

2.16 User, at Owner's request, shall be responsible for reporting to Owner the statistical data called for in the Terms, which may include, but is not limited to, the number and type of Equipment and GTMs operated on the Joint Trackage.

Section 3. BILLING

3.1 Billing shall be accomplished on the basis of data contained in a billing form mutually agreed to between the parties. Such billing forms shall contain sufficient detail to permit computation of payments to be made hereunder. Billing shall be prepared according to the rules, additives, and equipment rental rates as published by the Owner. User shall pay to Owner at the Office of the Treasurer of Owner, or at such other location as Owner may from time to time designate in writing, all the compensation and charges of every name and nature which in and by the Terms User is required to pay in lawful money of the United States within sixty (60) days after the rendition of bills therefor. Bills shall contain a statement of the amount due on account of the expenses incurred, properties and facilities provided and services rendered during the billing period.

3.2 Errors or disputed items in any bill shall not be deemed a valid excuse for delaying payment, but shall be paid subject to subsequent adjustment; provided, no exception to any bill shall be honored, recognized or considered if filed after the expiration of three (3) years from the last day of the calendar month during which the bill is rendered and no bill shall be rendered later than three (3) years (i) after the last day of the calendar month in which the expense covered thereby is incurred, or (ii) in the case of claims disputed as to amount or liability, after the amount is settled and/or the liability is established. This provision shall not limit the retroactive

adjustment of billing made pursuant to exception taken to original accounting by or under authority of the STB or retroactive adjustment of wage rates and settlement of wage claims.

3.3 So much of the books, accounts and records of each party hereto as are related to the subject matter of the Terms shall at all reasonable times be open to inspection by the authorized representatives and agents of the parties hereto. All books, accounts, and records shall be maintained to furnish readily full information for each item in accordance with any applicable laws or regulations.

3.4 Should any payment become payable by Owner to User under the Terms, the provisions of Sections 3.1 and 3.2 of these General Conditions shall apply with User as the billing party and Owner as the paying party.

3.5 Either party hereto may assign any receivables due it under the Terms; provided, however, that such assignments shall not relieve the assignor of any rights or obligations under the Terms.

Section 4. COMPLIANCE WITH LAWS

4.1 With respect to operation of Equipment on the Joint Trackage, each party shall comply with all applicable federal, state and local laws, rules, regulations, orders, decisions and ordinances ("Standards"), and if any failure on the part of any party to so comply shall result in a fine, penalty, cost or charge being imposed or assessed on or against another party, such other party shall give prompt notice to the failing party and the failing party shall promptly reimburse and indemnify the other party for such fine, penalty, cost or charge and all expenses and reasonable attorneys' fees incurred in connection therewith, and shall upon request of the other party defend such action free of cost, charge and expense to the other party.

4.2 User agrees to comply fully with all applicable Standards concerning "hazardous waste" and "hazardous substances" ("Hazardous Materials"). Except with Owner's prior consent, User covenants that it shall not treat or dispose of Hazardous Materials on the Joint Trackage. User further agrees to furnish Owner (if requested) with proof, satisfactory to Owner, that User is in such compliance.

In the event any accident, bad ordered Equipment, derailment, vandalism or wreck (for purposes of this Section 4.2 and Section 4.3 hereinafter called collectively "Derailment") involving Equipment of or a train operated by User carrying Hazardous Materials shall occur on any segment of the Joint Trackage, any report required by federal, state or local authorities shall be the responsibility of User. User shall also advise the owner/shipper of the Hazardous Materials involved in the Derailment, and Owner, immediately.

In the event of a Derailment, Owner shall assume responsibility for cleaning up any release of Hazardous Materials from User's Equipment in accordance with all federal, state, or local regulatory requirements. User may have representatives at the scene of the Derailment to

observe and provide information and recommendations concerning the characteristics of Hazardous Materials release and the cleanup effort. Such costs shall be borne in accordance with Section 5 of these General Conditions.

If a Hazardous Materials release caused by a derailment involving Equipment of User, or on a train operated by User, results in contamination of real property or water on the Joint Trackage or on real property or water adjacent to the Joint Trackage (whether such real property or water is owned by Owner or a third party), Owner shall assume responsibility for emergency cleanup conducted to prevent further damage. User shall be responsible for performing cleanup efforts thereafter. Any costs associated with cleaning up real property or water on or adjacent to the Joint Trackage contaminated by Hazardous Materials shall be borne in accordance with Section 5 of these General Conditions.

If Hazardous Materials must be transferred to undamaged Equipment or trucks as a result of a release caused by a derailment involving Equipment of User, or on a train operated by User, User shall perform the transfer; PROVIDED, HOWEVER, that if the Hazardous Materials are in damaged Equipment that is blocking the Joint Trackage, Owner, at its option, may transfer the Hazardous Materials with any costs associated with such transfer borne in accordance with Section 5 of these General Conditions. Transfers of Hazardous Materials by User shall only be conducted after being authorized by Owner.

4.3 The total cost of clearing a Derailment, cleaning up any Hazardous Materials released during such Derailment, and/or repairing the Joint Trackage or any other property damaged thereby shall be borne by the party or parties liable therefor in accordance with Section 5 of these General Conditions.

4.4 In the event of release of Hazardous Materials caused by faulty Equipment or third parties, cleanup will be conducted as stated in Sections 4.2 and 4.3 of these General Conditions.

Section 5. LIABILITY

5.1 General. The provisions of this Section 5 shall apply only as between the parties hereto and are solely for their benefit. Nothing herein is intended to be for the benefit of any person or entity other than the parties hereto. It is the explicit intention of the parties hereto that no person or entity other than the parties hereto is or shall be entitled to bring any action to enforce any provision hereof against any of the parties hereto, and the assumptions, indemnities, covenants, undertakings and agreements set forth herein shall be solely for the benefit of, and shall be enforceable only by, the parties hereto. Notwithstanding anything contained in this Section 5, no provisions hereof shall be deemed to deprive Owner or User of the right to enforce or shall otherwise restrict any remedies to which they would otherwise be entitled under other provisions of the Terms as a result of the other party's failure to perform or observe any other obligation or duty created by the Terms. The provisions of this Section 5 shall apply as between the parties hereto irrespective of the terms of any other agreements between the parties hereto and

other railroads using the Joint Trackage, and the allocation of liabilities provided for herein shall control as between the parties hereto.

5.2 Definitions and Covenants. The parties agree that for the purposes of this Section 5:

(a) The term "Employee(s)" of a party shall mean all officers, agents, employees and contractors of that party. Such Employees shall be treated either as "Sole Employees" or "Joint Employees", as hereinafter specified;

(b) "Sole Employees" and "Sole Property" shall mean one or more Employees, Equipment, tools and other equipment and machinery while engaged in, en route to or from, or otherwise on duty incident to performing service for the exclusive benefit of one party. Pilots furnished by Owner to assist in operating Equipment of User shall be considered the Sole Employees of User while engaged in such operations. Equipment shall be deemed to be the Sole Property of the party receiving the same at such time as deemed interchanged under AAR rules or applicable interchange agreements, or when such party is responsible for the car hire or per diem for the Equipment under agreement between the parties;

(c) "Joint Employee" shall mean one or more Employees while engaged in maintaining, repairing, constructing, renewing, removing, inspecting or managing the Joint Trackage or making Changes in and/or Additions to the Joint Trackage for the benefit of both of the parties hereto, or while preparing to engage in, en route to or from, or otherwise on duty incident to performing such service for the benefit of both parties;

(d) "Joint Property" shall mean the Joint Trackage and all appurtenances thereto, and all Equipment, tools and other equipment and machinery while engaged in maintaining, repairing, constructing, renewing, removing, inspecting, managing or making Changes in and/or Additions to the Joint Trackage for the benefit of both of the parties hereto, or while being prepared to engage in, en route to or from, or otherwise incident to performing such service;

(e) "Loss and/or Damage" shall mean injury to or death of any person, including Employees of the parties hereto, and loss or damage to any property, including property of the partes hereto and property being transported by the parties, which arises out of an incident occurring on, the Joint Trackage and shall include liability for any and all claims, suits, demands, judgments and damages resulting from or arising out of such injury, death, loss or damage, except liability for punitive and exemplary damages. Loss and/or Damage shall include all costs and expenses incidental to any claims, suits, demands and judgments, including attorneys' fees, court costs and other costs of investigation and litigation. Loss and/or Damage shall further include the expense of clearing wrecked or derailed Equipment and the costs of environmental protection, mitigation or clean up necessitated by such wreck or derailment and shall include any liabilities for any third-party claims for personal injury or death, property damage, natural

resource damage, or any penalties, judgments or fines associated with a release of any contaminants resulting from such wreck or derailment;

(f) Operating Employees of Owner whose service may be jointly used by the parties hereto for the movement of trains over the Joint Trackage, including, but not limited to, train dispatchers, train order operators, operator clerks and watchmen shall at the time of performing their services be deemed to be Sole Employees of the party hereto for whose benefit said services may be separately rendered (during the time they are so separately rendered) and be deemed to be Joint Employees of the parties hereto at such time as their services may be rendered for the parties' joint benefit;

(g) All Employees, Equipment, tools and other equipment and machinery other than as described in (b), (c), (d) or (f) above or in Section 5.4, shall be deemed the Sole Employees of the employing party and the Sole Property of the using party;

(h) Any railroad not a party to the Terms heretofore or hereafter admitted to the use of any portion of the Joint Trackage, shall, as between the parties hereto, be regarded in the same light as a third party. Without limiting the generality of the foregoing, neither of the parties hereto assumes any responsibility to the other under the provisions of the Terms for any Loss and/or Damage occasioned by the acts or omissions of any employees of any such other railroad, or for any Loss and/or Damage which such other railroad shall be obligated to assume in whole or in part pursuant to law or any agreement relating to such other railroad's use of any portion of the Joint Trackage;

(i) For the purpose of this Section 5, Equipment of foreign lines being detoured over the Joint Trackage, and all persons other than Joint Employees engaged in moving such Equipment, shall be considered the Equipment and Employees of the party hereto under whose detour agreement or other auspices such movement is being made.

5.3 Reimbursement and Defense. The parties agree that:

(a) Each party hereto shall pay promptly Loss and/or Damage for which such party shall be liable under the provisions of this Section 5, and shall indemnify the other party against such Loss and/or Damage, including reasonable attorneys' fees and costs. If any suit or suits shall be brought against either of the parties hereto and any judgment or judgment shall be recovered which said party is compelled to pay, and the other party shall under the provisions of the Terms be solely liable therefor, then the party which is so liable shall promptly repay on demand to the other party paying the same any monies which it may have been required to pay, whether in the way of Loss and/or Damage, costs, fees or other expenses; and if the Loss and/or Damage in such case or cases is joint or allocated between the parties to the Terms, the party defendant paying the same or any costs, fees or other expenses shall be reimbursed by the other party as allocated pursuant to the Terms;

(b) Each party covenants and agrees with the other party that it will pay for all Loss and/or Damage, both as to persons and property, and related costs which it has herein assumed, or agreed to pay, the judgment of any court in a suit by third party or parties to the contrary notwithstanding, and will forever indemnify and save harmless the other party, its successors and assigns, from and against all liability and claims therefor, or by reason thereof, and will pay, satisfy and discharge all judgments that may be rendered by reason thereof, and all costs, charges and expenses incident thereto;

(c) Each party hereto shall have the sole right to settle, or cause to be settled for it, all claims for Loss and/or Damage for which such party shall be solely liable under the provisions of this Section 5, and the sole right to defend or cause to be defended all suits for the recovery of any such Loss and/or Damage for which such party shall be solely liable under the provisions of this Section 5;

(d) User shall provide written notice to Owner of any accidents or events resulting in Loss and/or Damage within seven (7) days of its discovery or receipt of notification of such occurrence;

(e) In the event both parties hereto may be liable for any Loss and/or Damage under the provisions of this Section 5 ("Co-Liable"), and the same shall be settled by a voluntary payment of money or other valuable consideration by one of the parties Co-Liable therefor, release from liability shall be taken to and in the name of all the parties so liable; however, no such settlement in excess of the sum of One Hundred Thousand Dollars ($100,000) shall be made by or for any party Co-Liable therefor without the written consent of the other parties so liable, but any settlement made by any party in consideration of One Hundred Thousand Dollars ($100,000) or a lesser sum shall be binding upon the other parties and allocated in accordance with Section 5.5; and no party shall unreasonably withhold its consent to a settlement proposed by the other party; provided, however, that failure by a party to secure consent from the other shall not release such other party to the extent the party who failed to obtain such consent demonstrates that the other party was not prejudiced by such failure.

(f) In case a claim or suit shall be commenced against any party hereto for or on account of Loss and/or Damage for which another party hereto is or may be solely liable or Co-Liable under the provisions of this Section 5, the party against whom such claim or suit is commenced shall give to such other party prompt notice in writing of the pendency of such claim or suit, and thereupon such other party shall assume or join in the defense of such claim or suit as follows: If the claim or suit involves Loss and/or Damage to the Sole Employees or Sole Property of a party or its invitee or property in its care, custody or control, that party shall assume and control the investigation and defense of such claim or suit.

if the claim or suit involves Loss and/or Damage to third parties. Joint Employees or the Joint Trackage, the party whose Sole Employees or Equipment were involved in the incident shall investigate and defend such claim or suit: and if such claim or suit involves Loss and/or Damage to third parties. Joint Employees or the Joint Trackage and neither or both party's Equipment and Sole Employees were involved in the incident. Owner shall investigate and defend such claim or suit: provided that the other party also may participate in the defense of any of the foregoing if it may have liability as a result of such incident:

(g) No party hereto shall be conclusively bound by any judgments against the other party, unless the former party shall have had reasonable notice requiring or permitting it to investigate and defend and reasonable opportunity to make such defense. When such notice and opportunity shall have been given, the party so notified and the other party shall be conclusively bound by the judgment as to all matters which could have been litigated in such suit, including without limitation a determination of the relative or comparative fault of each.

5.4 Wrecks and Derailment. The cost and expense of repairing bad ordered Equipment, clearing wrecks or otherwise disabled Equipment or rerailing Equipment (and the costs of repair or renewal of damaged Joint Trackage or adjacent properties) shall be borne by the party whose Equipment was wrecked, disabled, or derailed or caused such damage. All Employees or Equipment, while engaged in, en route to or from, or otherwise incident to operating wrecker or work trains clearing wrecks, disabled Equipment or Derailments or engaged in repair or renewal of the Joint Trackage subsequent to any such wreck, disability or Derailment, shall be deemed to be Sole Employees and/or Sole Property of the party whose Equipment was wrecked, disabled or derailed. However, such Employees or Equipment, while en route from performing such clearing of wrecks, disabled Equipment or Derailments or repairing or renewing the Joint Trackage to perform another type of service, shall not be deemed to be performing service incident to the instant wreck, disability or Derailment.

5.5 Allocation.

(a) Each party shall bear all costs of Loss and/or Damage to its Sole Employees or its Sole Property, or property in its care, custody or control or its invitees without regard to which party was at fault.

(b) Loss and/or Damage to third parties (i.e., any person or entity other than a party hereto, a Sole Employee of either party, a Joint Employee or an invitee of either party) or their property, to Joint Employees or their property or to Joint Property shall be borne by the parties hereto as follows:

(i) If the Loss and/or Damage is attributable to the acts or omissions of only one party hereto, that party shall bear and pay all of such Loss and/or Damage.

(ii) If such Loss and/or Damage is attributable to the acts or omissions of more than one party hereto, such Loss and/or Damage shall be borne and paid by those parties in accordance with a comparative negligence standard, whereby each such party shall bear and pay a portion of the Loss and/or Damage equal to the degree of causative fault or percentage of responsibility for the Loss and/or Damage attributable to that party without regard to laws limiting recovery if one party is more than fifty percent (50%) at fault.

(iii) Loss and/or Damage to third parties or Joint Employees occurring in such a way that it cannot be determined how such Loss and or Damage came about shall be apportioned between Owner, User and any other party(ies) authorized to use the Joint Trackage as a trackage rights tenant, on a usage basis considering each party's gross ton miles over the Joint Trackage for the preceding twelve (12) months or, if such Loss and/or Damage occurs during the first twelve (12) months following the effective date of the Terms, the usage of each party between the occurrence of such Loss and/or Damage and the effective date of the Terms, provided that, without limitation, User shall not bear or incur any liability for claims, suits, demands, judgments, losses or damages resulting from environmental contamination of or hazardous material on or released from the Joint Trackage, except contamination or a release of hazardous materials from User's own Equipment or caused by or arising from the actions or omissions of User or User's Employees, and then only in accordance with the other provisions hereof.

(c) The parties agree that the characterization herein of certain Employees as "Sole Employees" or "Joint Employees" is only for the purpose of allocating Loss and/or Damage suffered by those Employees. Except as specified in subsection (a) of this Section 5.5. (which provides for the allocation of certain Loss and/or Damage between the parties without regard to fault), no party shall be liable for the acts or omissions (negligent or otherwise) of any other party's Employee.

5.6 OWNER AND USER EXPRESSLY INTEND THAT WHERE ONE PARTY IS TO INDEMNIFY THE OTHER PURSUANT TO THE TERMS, SUCH INDEMNITY SHALL INCLUDE (1) INDEMNITY FOR THE NEGLIGENCE OR ALLEGED NEGLIGENCE, WHETHER ACTIVE OR PASSIVE, OF THE INDEMNIFIED PARTY WHERE THAT NEGLIGENCE IS A CAUSE OF THE LOSS OR DAMAGE; (2) INDEMNITY FOR STRICT LIABILITY OF THE INDEMNIFIED PARTY RESULTING FROM A VIOLATION OR ALLEGED VIOLATION OF ANY FEDERAL, STATE OR LOCAL LAW OR REGULATION BY THE INDEMNIFIED PARTY, INCLUDING BUT NOT LIMITED TO THE FEDERAL EMPLOYERS LIABILITY ACT ("FELA"), THE SAFETY APPLIANCE ACT, THE BOILER

INSPECTION ACT, THE OCCUPATIONAL SAFETY AND HEALTH ACT ("OSHA"), THE RESOURCE CONSERVATION AND RECOVERY ACT ("RCRA"), THE COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT ("CERCLA"), THE CLEAN WATER ACT ("CWA"), THE OIL POLLUTION ACT ("OPA"), AND ANY SIMILAR STATE STATUTE IMPOSING OR IMPLEMENTING SIMILAR STANDARDS; AND (3) INDEMNITY FOR ACTS OR ALLEGED ACTS OF GROSS NEGLIGENCE OF THE INDEMNIFIED PARTY, OR OTHER CONDUCT ON THE PART OF THE INDEMNIFIED PARTY FOR WHICH PUNITIVE DAMAGES MIGHT BE SOUGHT.

Section 6. ARBITRATION

6.1 If at any time a question or controversy shall arise between the parties hereto in connection with the Terms upon which the parties cannot agree, such question or controversy shall be submitted to and settled by arbitration. Unless other procedures are agreed to by the parties, arbitration between the parties pursuant to this Section 6 shall be governed by the rules and procedures set forth in this Section 6.

6.2 If the parties to the dispute are able to agree upon a single competent and disinterested arbitrator within twenty (20) days after written notice by one party of its desire for arbitration to the other party, then the question or controversy shall be submitted to and settled by that single arbitrator. Otherwise, any party (the notifying party) may notify the other party (the noticed party) in writing of its request for arbitration and nominating one arbitrator. Within twenty (20) days after receipt of said notice, the noticed party shall appoint an arbitrator and notify the notifying party in writing of such appointment. Should the noticed party fail within twenty (20) days after receipt of such notice to name its arbitrator, said arbitrator may be appointed by the Chief Judge (or acting Chief Judge) of the United States District Court for the District of Columbia upon application by either party after ten (10) days' written notice to the other party. The two arbitrators so chosen shall select one additional arbitrator to complete the board. If the arbitrators so chosen fail to agree upon an additional arbitrator, the same shall, upon application of a party, be appointed by said judge in the manner heretofore stated.

6.3 Upon selection of the arbitrator(s), said arbitrator(s) shall, with reasonable diligence, determine the questions as disclosed in said notice of arbitration, shall give both parties reasonable notice of the time and place (of which the arbitrator(s) shall be the judge) of hearing evidence and argument, may take such evidence as the arbitrator(s) shall deem reasonable or as either party may submit with witnesses required to be sworn, and hear arguments of counsel or others. If an arbitrator declines or fails to act, the party (or parties in the case of a single arbitrator) by whom the arbitrator was chosen or said judge shall appoint another to act in the arbitrator's place.

6.4 After considering all evidence, testimony and arguments, said single arbitrator or the majority of said board of arbitrators shall promptly state such decision or award and the reasoning for such decision or award in writing which shall be final, binding, and conclusive on all parties to the arbitration when delivered to them. The award rendered by the arbitrator(s) may

be entered as a judgment in any court having jurisdiction thereof and enforced as between the parties without further evidentiary proceeding, the same as entered by the court at the conclusion of a judicial proceeding in which no appeal was taken. Until the arbitrator(s) shall issue the first decision or award upon any question submitted for arbitration, performance under the Terms shall continue in the manner and form existing prior to the rise of such question. After delivery of said first decision or award, each party shall forthwith comply with said first decision or award immediately after receiving it.

6.5 Each party to the arbitration shall pay all compensation, costs, and expenses of the arbitrator appointed in its behalf and all fees and expenses of its own witnesses, exhibits, and counsel. The compensation, cost, and expenses of the single arbitrator or the additional arbitrator in the board of arbitrators shall be paid in equal shares by all partes to the arbitration.

6.6 The parties may obtain discovery and offer evidence in accordance with the Federal Rules of Civil Procedure Rules 26 - 37, and Federal Rules of Evidence, as each may be amended from time to time.

6.7 Interest computed annually, at a rate equal to the Prime Rate plus two (2) percentage points, shall be applied to any and all arbitrator's awards requiring the payment of money and shall be calculated from thirty (30) days following the date of the applicable arbitration decision. The term "Prime Rate" shall mean the minimum commercial lending rate charged by banks to their most credit-worthy customers for short-term loans, as published daily in the Wall Street Journal.

Section 7. GOVERNMENTAL APPROVAL AND ABANDONMENT

7.1 Owner and User shall, at their respective cost and expense, initiate by appropriate application or petition and thereafter diligently prosecute proceedings for the procurement of all necessary consent, approval or authority from any governmental agency for the sanction of the Terms and the operations to be carried on or conducted by User thereunder. User and Owner agree to cooperate fully to procure all such necessary consent, approval or authority.

7.2 In the event Owner shall be involuntarily dispossessed, including by threat of condemnation by competent public authority, of the right to operate upon and maintain any portion of its Joint Trackage and Owner fails or declines to replace said Joint Trackage, Owner shall have no obligation hereunder to provide tracks in replacement of such Joint Trackage for User's use, and User shall have and shall make no claim of any kind, legal or otherwise, against Owner for failure to provide such Joint Trackage for User's use.

7.3 To the extent that Owner may lawfully do so, Owner reserves to itself the exclusive right, exercisable at any time during the life of the Terms without concurrence of User, to elect to abandon all or any part of the Joint Trackage by giving six (6) months' prior written notice to User of its intention so to do ("Notice of Abandonment").

Owner shall, concurrent with its Notice of Abandonment, if legally able to do so, give to User the option to purchase the part or parts of the Joint Trackage thereof to be abandoned at the Net Liquidation Value thereof, on the date of said notice; provided, however, it is understood that Burlington Northern Railroad Company and The Atchison, Topeka & Santa Fe Railway Company (collectively, "BNSF") shall be given an option upon the Terms set forth in this Section 7.3, prior to that given User, to purchase the Placedo, Texas to Robstown, Texas segment of the Joint Trackage, subject to User's trackage rights, if BNSF is operating over that segment at the time of its proposed abandonment. "Net Liquidation Value" shall mean fair market value of land and salvage value of track components and other facilities less estimated cost of removal. User shall have three (3) months from the date of receipt of Owner's notice to exercise its option and shall evidence the exercise of its option by giving Owner written notice thereof. Thereafter User shall immediately make appropriate application to secure all necessary governmental authority for such transaction. Within thirty (30) days following the effective date of all requisite governmental approval of the transaction, User shall pay to Owner the amount of money required to purchase said Joint Trackage to be abandoned at the aforesaid Net Liquidation Value. Upon the receipt of payment of such sum, the Terms shall terminate as to the part of the Joint Trackage so purchased by User. Contemporaneously with such payment, by instrument or instruments, Owner shall convey and assign by good and sufficient quit claim deed or deeds, bills of sale or other instruments, all of Owner's right, title, interest and equity, in and to the Joint Trackage so purchased. Owner agrees that it shall promptly take all necessary action to obtain from the trustees of its mortgages all releases or satisfactions covering the same and shall deliver to User such instruments.

If User fails to exercise the option herein granted within the time and in the manner above specified, Owner may forthwith proceed free of all obligation to User to abandon the portion of Joint Trackage or make appropriate application, if necessary, to secure all necessary governmental authority for such abandonment. User agrees that at such time it shall concurrently make application for all necessary governmental authority for abandonment of its right to operate over such Joint Trackage. The Terms shall terminate as to the section of Joint Trackage so abandoned upon the effective date of such approval by governmental authority.

7.4 Owner and User each shall be responsible for and shall bear labor claims, and employee protection payable to, its own respective employees (and employees of its respective affiliated companies) including any amounts that either Owner or User may be required to pay to its own respective employees pursuant to labor protective conditions imposed by the STB.

Section 8. CATASTROPHIC EXPENSE

Catastrophic expense to the Joint Trackage, such as, but not limited to, that arising from flood, earthquake or acts of God, etc., in excess of One Hundred Thousand Dollars ($100,000) for each occurrence shall be billed in addition to the GTM Rates and apportioned on the basis of the parties' GTMs operated over the Joint Trackage for the twelve (12) month period ending immediately prior to the first day of the month of occurrence.

Section 9. TERM

9.1 User shall have the right to terminate the Terms upon twelve (12) months' prior written notice to Owner. Liabilities created under the Terms, if it becomes effective and is later terminated, shall survive such termination.

9.2 Upon termination of the Terms, or any partial termination, as the applicable case may be, however the same may occur, User shall be released from any and all manner of obligations and shall be deemed to have forever relinquished, abandoned, surrendered and renounced any and all right possessed by User to operate over that part of the Joint Trackage to which such termination applied, and as to such part, User shall forever release and discharge Owner of and from any and all manner of obligations, claims, demands, causes of action, or suits which User might have, or which might subsequently accrue to User growing out of or in any manner connected with, directly or indirectly, the contractual obligations of Owner under the Terms, in all events provided, however, the aforesaid relinquishment, abandonment, surrender, renunciation, release and discharge by User shall not in any case affect any of the rights and obligations of either Owner or User which may have accrued, or liabilities accrued or otherwise, which may have arisen prior to such termination or partial termination. Upon any termination, Owner shall remove from Owner's right of way any connecting track, and any exclusive facility of User, at User's expense with salvage to be delivered to and retained by User. Upon any partial termination of the Terms, however the same may occur, the terms and conditions hereof shall continue and remain in full force and effect for the balance of the Joint Trackage.

Section 10. ASSIGNMENT

The Terms and any rights granted hereunder may not be assigned in whole or in part by User without the prior written consent of Owner except (i) as provided in Section 3.5, and (ii) to the purchaser of substantially all of User's rail properties. The Terms may be assigned by Owner without restriction. In the event of an authorized assignment, the Terms and the operating rights hereunder shall be binding upon the successors and assigns of the parties.

Section 11. DEFAULT

11.1 Notwithstanding the provisions of Section 3 of these General Conditions, either party hereto claiming default of any of the provisions of the Terms (including these General Conditions) shall furnish notice and written demand to the other party for performance or compliance with the covenant or condition of the Terms claimed to be in default, which notice shall specify wherein and in what respect such default is claimed to exist and shall specify the particular Section or Sections of the Terms under which such claim of default is made.

11.2 If the default shall continue for an additional period of thirty (30) days after receipt of such written notice and demand, and such default has not been remedied within said thirty (30) day period, or reasonable steps have not been nor continue to be taken to remedy a failure or default which cannot reasonably be remedied within said thirty (30) day period, and such default

relates to the provisions and terms of the Terms, either party shall resort to binding arbitration provided that the arbitrator shall not have the authority to amend, modify or terminate the Terms.

11.3 Failure of a party to claim a default shall not constitute a waiver of such default. Either party hereto entitled to claim default may waive any such default, but no action by such party in waiving such default shall extend to or be taken to affect any subsequent defaults or impair the rights of either party hereto resulting therefrom.

Section 12. OTHER CONSIDERATIONS

12.1 The Terms and each and every provision hereof is for the exclusive benefit of the parties hereto and not for the benefit of any third party. Nothing herein contained shall be taken as creating or increasing any right in any third person to recover by way of damages or otherwise against any of the parties hereto.

12.2 If any covenant or provision of the Terms not material to the right of User to use the Joint Trackage shall be adjudged void, such adjudication shall not affect the validity, obligation or performance of any other covenant or provision which is in itself valid. No controversy concerning any covenant or provision shall delay the performance of any other covenant or provision. Should any covenant or provision of the Terms be adjudged void, the parties shall make such other arrangements as will effect the purposes and intent of the Terms.

12.3 In the event there shall be any conflict between the provisions of these General Conditions and the Terms, the provisions of the Terms shall prevail, except that the definition of Joint Trackage set forth in Section 1.7 of these General Conditions shall prevail.

12.4 All section headings are inserted for convenience only and shall not affect any construction or interpretation of the Terms.

12.5 Reference to any agency or other organization shall include any successor agency or organization, and reference to any index or methodology (e.g., RCAF-U, URCS, etc.), if such index or methodology ceases to exist or is no longer available, shall include any substantially similar index or methodology selected by the parties or, if the parties fail to agree on such, one determined by binding arbitration under Section 6 of these General Conditions.

END OF EXHIBIT "B"

TEX MEX - MP/SP DISPATCHING PROTOCOLS

1. Scope: These protocols apply on all segments of the Joint Trackage.

2. Purpose: To ensure that Tex Mex and MP/SP trains operating on Joint Trackage are given equal dispatch without any discrimination in promptness, quality of service or efficiently and that the competitiveness of Tex Mex operations on the Joint Trackage is not adversely affected by the fact that MP/SP owns the track.

3. General Instructions: MP/SP will issue written instructions to all personnel (including supervisors) responsible for train dispatching on the Joint Trackage that Tex Mex trains are to be dispatched exactly as if they were trains of the same class of MP/SP and given equal treatment with trains of MP/SP. These instructions will be issued at agreed intervals or at the request of Tex Mex.

4. Monitoring Systems: MP/SP will provide Tex Mex with timely and accurate information about the status of Tex Mex trains operating over the Joint Trackage.

5. Train Information: Tex Mex will provide the MP/SP, and regularly update, information about its expected train operations and schedules (including priorities, time commitments, horsepower per trailing ton, etc.) over the Joint Trackage, preferably using electronic data interchange. Tex Mex and MP/SP will establish run time standards by train category based on expected train volumes for Tex Mex. If train volumes are different than expected then adjustments to run time standards will be made by mutual agreement. Tex Mex will provide reliable and current information about trains approaching the Joint Trackage, including train arrival time and train characteristics, preferably by providing at its expense computer terminals, facilities or capabilities showing trains approaching the Joint Trackage, sufficiently in advance to allow dispatchers to plan for them. MP/SP will provide to Tex Mex advance notice of planned maintenance-of-way projects, line closures and train or equipment restrictions. Tex Mex and MP/SP will consult in advance about maintenance-of-way windows resulting from planned maintenance projects so as to minimize disruptions to the operations of both carriers.

6. Specific Instructions: MP/SP will permit Tex Mex to transmit instructions regarding the requirements of specific trains and shipments to designated dispatching center employees responsible for handling those trains.

7. Train Priorities/Run Time Standards: MP/SP will provide to Tex Mex current procedures for assigning dispatching priorities or rankings to trains and information sufficient to show how those procedures are applied to their own trains. Tex Mex will assign priorities or rankings to its trains operating on the Joint Trackage using MP/SP's procedures, and MP/SP will dispatch Tex Mex trains in accordance with those priorities or rankings. It is understood that

technological advances in computer aided dispatching might result in changes to priority assignment methodologies. The parties agree to discuss technological changes which might affect priority assignment methodologies prior to implementation. The Joint Service Committee will be responsible for reviewing these assignments to ensure that they are applied equitably by both railroads.

8. Entry to Joint Trackage: At points where Tex Mex trains enter the Joint Trackage, entry will be provided by MP/SP on a first-come first-served basis, taking into consideration the relative priorities of affected trains and the specific needs and operating characteristics of individual trains of both railroads. If operating circumstances make strict application of this principle difficult or uncertain, Tex Mex and MP/SP may jointly establish standards for determining sequence of entry to Joint Trackage. The parties will communicate daily on any conflicts concerning entry to the Joint Trackage to gain resolution.

9. Communication: MP/SP will provide to Tex Mex, and keep current, lists of dispatching personnel responsible for dispatching the Joint Trackage and contact numbers. Tex Mex and MP/SP will designate more supervisory employees to serve as the day-to-day contacts for communications about operating changes, service requests and concerns. Where feasible and economical, dedicated phone lines or computer links will be established for these communications.

10. Access to Dispatching Center: Appropriate officials of Tex Mex will be admitted at any time to dispatching facilities and personnel responsible for dispatching the Joint Trackage to review the handling of trains on the Joint Trackage (although both railroads will take reasonable steps to prevent disclosure of proprietary information not relevant to the review). It is understood that management and supervision of dispatching operations is the responsibility of MP/SP.

11. Performance Measurement: Tex Mex and MP/SP will cooperate to develop train performance evaluation methods under which train performance of Tex Mex trains on the Joint Trackage can be compared to train performance of MP/SP's trains on the Joint Trackage for the same train category and priority.

12. Personnel Incentives and Evaluation: In evaluating the performance of employees and supervisors responsible for dispatching the Joint Trackage, MP/SP will consider train performance of Tex Mex trains and effectiveness in cooperating with Tex Mex personnel and meeting Tex Mex service requirements in the same manner as such factors are considered with respect to MP/SP's trains, personnel and requirements. If bonuses, raises or salaries of those persons are affected by performance of MP/SP's trains, performance of Tex Mex's trains shall be considered on the same basis to the extent feasible.

13. Disagreements: The designated contact supervisors are expected to raise questions, disagreements, concerns or disputes about compliance with these protocols promptly as and when any such matters arise and to use their best efforts to resolve them. If a matter is not resolved to the satisfaction of both parties, it will be presented to the Joint Service Committee. If a satisfactory resolution cannot be achieved by the Joint Service Committee the matter will be submitted to binding summary arbitration before a neutral experienced railroad operating official within fourteen days. The parties will agree in advance on the sanctions available to the arbitrator to address failures to comply with these protocols.

14. Modifications: As the ultimate objective of these protocols is the equal, flexible and efficient handling of all trains of Tex Mex and MP/SP on the Joint Trackage, these protocols may be modified at any time by mutual agreement, consistent with that objective.

VERIFIED STATEMENT

OF

JERRY A. HAUSMAN

1. I am the MacDonald Professor of Economics at the Massachusetts Institute of Technology ("MIT") in Cambridge, Massachusetts. I graduated from Brown University in 1968. I received a D.Phil. (Ph.D.) in economics from Oxford University in 1973 where I was a Marshall Scholar. I have been at MIT since completing my D.Phil. My academic specialties are econometrics, the application of statistical methods to economic data, and applied microeconomics, the study of behavior by firms and by consumers. I teach a graduate course in applied industrial organization, which is the study of how markets operate. The effect of regulation is a primary topic in the course.

2. I have been an associate editor of *Econometrica*, the leading economics journal, and the *Rand (Bell) Journal of Economics*, the leading journal of applied microeconomics. In December 1985, I received the John Bates Clark Award of the American Economic Association, awarded every other year for the most "significant contributions to economics" by an economist under the age of 40. In 1980, I was awarded the Frisch Medal of the Econometric Society. I have been a member of numerous government advisory committees for both the U.S. government and the Commonwealth of Massachusetts. I have published over 130 academic research papers in leading economic journals including the *American Economic Review*, *Econometrica*, and the *Rand (Bell) Journal of Economics*. I recently published a paper on the effects of

regulation on railroads: "Regulating the U.S. Railroads: The Effects of Sunk Costs and Asymmetric Risk," *Journal of Regulatory Economics*, 2002. My curriculum vitae is attached as Exhibit A.

3. I have submitted declarations to the Board previously. These declarations evaluated the economic effects of the UP/SP merger, the economic principles of dominant carrier regulation, and an economic analysis of conditions that arise in mergers of large railroads.[1] I have extensive experience evaluating the effects of mergers. I have published numerous academic papers discussing the evaluation of the effects of mergers and consulted on over 100 mergers before regulatory agencies including the DOJ, FTC, FCC and numerous foreign countries including the EU, UK, Germany, and Australia.

I. Introduction and Summary of Conclusions

4. I am providing this statement at the request of Union Pacific Railroad Company (UP) in connection with the Surface Transportation Board's review of the proposed acquisition of control of the Texas Mexican Railway Company (Tex Mex) and TFM, S.A. de C.V. (TFM) by Kansas City Southern (KCS).

5. In my economic analysis of the proposed transaction I will use prices charged to shippers and the quality of service to shippers who serve as consumers of railroad services as the basis for my evaluation. If prices to shippers decrease, a transaction is typically pro-competitive. To the contrary, if prices to shippers increase (or if service levels decline) the transaction is typically anticompetitive. I do not consider the

---

[1] *See* Statement of Jerry Hausman submitted in STB Ex Parte, No. 582 Public Views on Major Rail Consolidations; Verified Statement of Prof. Jerry Hausman, submitted in *Union Pac. Corp., et al. – Control – So. Pac. R. Corp., et al.* – Houston/Gulf Coast Oversight, STB Finance Docket, No. 32760 (Sub-No 26).

effects of the transaction on KCS, nor do I consider the effects of the transaction on competitors to KCS, including UP, except as the transaction affects prices (and service levels) provided to shippers.

6. My economic analysis leads to the following conclusions:

A. A significant amount of traffic goes through the Laredo gateway. TFM is the only Mexican railroad that connects to the Laredo gateway. TFM has significant market power for many transportation markets that use the Laredo gateway. TFM's ability to exercise that power today is limited by several factors, one of which is Mexican regulations requiring that TFM offer non-discriminatory pricing between the border and points in Mexico.

B. KCS control of Tex Mex and TFM will have significant anticompetitive effects in the United States and on U.S.-Mexico cross-border commerce for at least two reasons. (1) NAFTA Rail will have the incentive and ability to raise the costs and decrease service levels of competing carriers that interchange with TFM, thereby shifting traffic to less-efficient routes and allowing anticompetitive increases in rates and/or reductions in service quality for U.S. shippers. (2) The transaction may produce higher prices to certain U.S. shippers through evasion of the Mexican regulatory provisions prohibiting price discrimination.

C. In its application KCS has not claimed the presence of any significant efficiencies. Thus, efficiencies will not offset the anticompetitive effects that arise in this transaction.

D. UP's proposed remedies are appropriate for the transaction. The possible remedial approach that UP's Mr. Gray outlines would not be unduly regulatory or interfere with Applicant's ability to compete with other railroads. It also would not lead to decreased competition because of the possibility of increased coordinated interaction among the competing railroads. The approach is similar to a pro-competitive arrangement that the Board has previously approved in the UP/SP merger.

II. Economic Basis for Evaluation of the Transaction

7. Economists judge transactions depending on whether they have pro-competitive or anticompetitive effects. In judging competitive outcomes, we typically consider the effects on consumers. Transactions can affect many economic agents: consumers, merging firms, competing firms, shareholders in these firms, and debt holders in these firms. Often a transaction will favorably affect some groups and disadvantage other groups. However, the DOJ and FTC have determined that consumer welfare should be the objective in evaluating transactions.[2] I agree with this approach. Consumers are harmed when prices increase or product quality decreases. Thus, while a transaction may lead to more efficient and lower cost production, the relevant question is whether consumers will benefit from lower prices.[3] I discuss this viewpoint in my paper, "Efficiencies from the Consumer Viewpoint," *George Mason Law Review* 7 (1999). In the current situation I will use prices charged to shippers and the quality of service to

---

[2] *See, e.g.,* U.S. Department of Justice and Federal Trade Commission Horizontal Merger Guidelines (*Merger Guidelines)*, 1992, ¶ 0.1.

[3] I focus on the price effect of mergers here. Higher quality is similar to a lower price from an economic analysis viewpoint.

shippers who serve as consumers of railroad services to evaluate competitive effects. Typically, if prices to shippers increase, final consumers will pay higher prices for products they purchase.

8. If prices to shippers decrease, a transaction is typically pro-competitive. To the contrary, if prices to shippers increase (or if service levels decline) the transaction is typically anticompetitive. This reasoning holds in the more common situation of horizontal mergers, or in the current situation of a vertical transaction. Thus, I do not consider the effects of the transaction on the KCS, nor do I consider the effects of the transaction on competitors to the KCS, including UP, except as the transaction affects prices (and service levels) provided to shippers.[4]

III. Framework for Economic Analysis

9. I perform my economic analysis within the framework of origin-destination (O-D) markets for a given type of commodity. A shipper will want to ship a commodity from an U.S. origin to a Mexican destination (or vice versa).[5] The shipper typically chooses from a set of alternatives that includes competing railroads that can transport the commodity as well as alternative modes of transportation to the extent they are available - most often trucks and sometimes barges depending on the commodity. The shipper will make the best choice that combines price, shipping time, other service

---

[4] Only in the case of a failing firm (or division) does merger analysis typically consider financial effects on merging firms, *e.g. Merger Guidelines*, ¶ 5.1-5.2. KCS has made no claims regarding a possible failure of the merging firms.

[5] Thus, my analytical approach differs markedly from Applicants' approach, which does not consider O-D markets. *See* Applicants' Supplement pp. 13-19. Instead, it only considers all US-Mexican freight traffic. This approach does not make economic sense because it obscures important competitive differences among different O-D markets.

attributes, and other economic characteristics, such as variability in shipping time, presence of schedules, and possible damage to shipments. O-D markets typically comprise antitrust markets because if all carriers that serve the O-D pair joined together as a "hypothetical monopolist," they could increase prices by at least a "small but significant and nontransitory" amount.[6]

10. The proposed transaction would combine control of one Mexican carrier, TFM, with one of the two U.S. railroads, KCS/Tex Mex (KCS), that interchange traffic with TFM at the U.S.-Mexican border. TFM is the only Mexican carrier that serves the Laredo gateway between the U.S. and Mexico. A substantial proportion of traffic transits the Laredo gateway, approximately 75% of all US-Mexican rail traffic (by value), and (as noted below) much higher shares for many O-D markets.

11. While intermodal competition exists for some movements of some commodities, mainly from trucks, TFM routes via the Laredo gateway have significant cost and service advantages over these other transportation alternatives for many O-D pairs for given commodities. TFM routes have similar advantages over other Mexican gateways, such as Eagle Pass, which TFM does not control. Overall, TFM controls the majority of traffic entering Mexico and has even higher shares of traffic that uses the gateways in eastern Mexico. *See* Gray V.S. pp. 10-12.

12. For numerous O-D pairs for given commodities, the alternative gateways are at a significant cost, distance, and service disadvantage, and rail service via the

---

[6] *See Merger Guidelines* ¶ 1.2. The geographic market definition can expand if competition exists from other origins that limits the ability of the hypothetical monopolist to increase prices. Given the position of the TFM, as I explain below, this consideration is not important in the current transaction.

alternative gateways thus does not effectively constrain the price that TFM can charge. Thus, for many O-D pairs for given commodities, TFM has significant market power. For example, Eagle Pass, an alternative gateway, lacks many of the infrastructure advantages that make Laredo a highly efficient border crossing point.[7] Eagle Pass also has limited capacity. My empirical analysis, attached as Exhibit B, demonstrates that for UP southbound traffic an extremely high share of the traffic to important Mexican destinations uses the Laredo gateway, consistent with TFM having significant market power.[8] For example, { } originates the most southbound traffic, and three of the largest destination states in Mexico are the{ }. Note that over { }% of this O-D traffic uses the Laredo gateway with only very small amounts going over the Eagle Pass gateway. For { }, which originates the second most southbound traffic, over { }% of that traffic to the three largest Mexican destination states uses the Laredo gateway. These shipment data demonstrate the importance of the Laredo gateway and the non-economical alternative that the Eagle Pass gateway yields for this traffic.[9]

---

[7] *See* Gray V.S. pp. 13-16, for a further discussion of the competitive advantages of the Laredo gateway.

[8] A map showing these Mexican destination states and the TFM and FXE route networks is attached as Exhibit C. I limit the analysis to UP data because the data that KCS and BNSF produced in discovery do not indicate the Mexican destinations, so I could not analyze O-D markets. UP's data include destinations within Mexico based on customs information, but that information is only available for southbound shipments.

[9] UP has an economic incentive to use Eagle Pass since it has a 26% ownership interest in FXE, the Mexican railroad that connects at the Eagle Pass gateway.

13. In the current (pre-transaction) situation KCS owns a significant minority stake in TFM.[10] However, TFM is controlled by Grupo TMM. Under Mexican law, TFM faces no effective constraints imposed by maximum rate regulation. However, under Mexican law and the terms of TFM's Concession, TFM must provide non-discriminatory pricing between the border and points in Mexico it serves (or points where it connects with other Mexican carriers, such as Ferrosur), as KCS emphasizes in its application.[11] In addition, under TMM control, TFM has significant economic incentives to cooperate closely with competing U.S. railroads that connect at Laredo. By cooperating with competing railroads at Laredo, the U.S. component of the cost of a rail shipment between a U.S. location and a Mexican location is minimized. Thus, this cooperation keeps the U.S. component of US-Mexican traffic at a minimum price and allows rail traffic to increase through Laredo, providing greater feed to the TFM along with higher revenues and higher profits. Indeed, I understand that TFM has cooperated closely with UP in terms of service levels and price quotes.[12] Further, as Mr. Gray points out, traffic through the Laredo gateway has expanded greatly, largely because of NAFTA and the improved service provided by TFM on the Mexican segment of the traffic.

---

[10] KCS currently has a 49% voting interest in TFM. Because the Mexican government holds a substantial block of shares without voting rights, KCS's direct economic interest in TFM is 36.9%.

[11] *See* Applicants' Supplement p. 30; s*ee also* Memorandum of Kuri Brena et. al. submitted by Applicants, June 19, 2003: "Section 2.15 of the TFM Concession specifically restricts TFM from promoting tie-in or tie-out sales, price discrimination and cross subsidies".

[12] *See* Gray V.S. p. 22.

IV. The Proposed Transaction Will Have Anticompetitive Effects

14. KCS control of Tex Mex and TFM will have anticompetitive effects in the United States for at least two reasons. First, NAFTA Rail will have the incentive and ability to raise the costs and decrease the service levels of competing carriers that interchange with TFM at Laredo, thereby allowing an anticompetitive rate increase in rates or reduction in service levels relating to existing competitive rate levels. Second, the transaction creates the potential for higher prices to certain relatively inelastic shippers through evasion of the Mexican regulatory provisions prohibiting price discrimination. These effects will be felt in the United States, because that is where competition between the carriers north of the border occurs. Because the cooperation of TFM is essential to that competition, control of TFM by one of the two competing U.S. carriers will adversely affect competition for cross-border U.S.-Mexico traffic.

A. Anticompetitive Strategies to Disable UP Competition

15. As a result of the transaction, NAFTA Rail will be able to implement strategies aimed at increasing the costs (and degrading the service quality) of competing carriers that connect with TFM. Those carriers, primarily UP, will then be forced to raise rates, thereby allowing NAFTA Rail to match the increase for shippers who are relatively less price elastic.

16. Shippers currently use UP and KCS/Tex Mex (and its connections, including BNSF) as competitive options for rail movements via Laredo to serve destinations in Mexico. For many O-D markets, as I discussed above, the Laredo gateway is the economical choice. Neither other U.S.-Mexican gateways nor intermodal competition significantly constrains a "hypothetical monopolist" from increasing prices. Thus, economic analysis should focus on these individual O-D markets using Laredo.

Because KCS will control the Laredo gateway if the transaction occurs, NAFTA Rail can increase prices for less-price-elastic shippers using the gateway by disadvantaging UP for shipments that are dependent economically on the use of the Laredo gateway.

17. Currently, TFM has an economic incentive to cooperate fully with all three competing railroads to maximize traffic utilizing the Laredo gateway. The greater the U.S. competition, the higher the service quality and the lower the price for the U.S. segments of a rail movement. Thus, TFM seeks to foster the greatest degree of competition among the U.S. railroads. Conversely, for price-elastic shippers, a deterioration in service or increase in price by TFM would cause some number of the more-price-elastic shippers to send their traffic over other gateways or shift to an alternative transportation mode.

18. However, subsequent to the transaction, the economic incentives for TFM will change. KCS/Tex Mex potentially serves a significant proportion of the UP traffic via Laredo, as I discuss in the next section. To the extent that KCS/TFM can increase the TFM rate factors that are part of the overall price shippers must pay for UP-TFM options, or create a lower level of service quality for UP shipments through the Laredo Gateway, some shippers will choose to shift their traffic from UP to KCS.[13] KCS will increase the profit from its U.S. operations because price exceeds the marginal cost of the additional traffic, given the high level of fixed costs in the railroad industry.

---

[13] The specific means by which NAFTA Rail could facilitate those shifts are explained in the verified statement of John Gray, pp. 26-31. Note that this strategy is distinct from the "raising rivals costs" literature where imposing a cost increase on your competition creates additional costs for the dominant firm. Here no additional costs occur for NAFTA Rail.

19. This strategy will not merely shift incremental margins (profits) from UP to KCS: it will also decrease competition and harm shippers. If UP service levels decrease or its costs increase, competition will decrease and KCS will be able to charge higher prices than currently to less-price-elastic shippers, even though its services were not preferred in the pre-merger environment. That is because UP would have to increase its prices in response to an increase in costs.[14] Thus, less-price-elastic shippers will pay higher prices for the current competition among the U.S. railroads. At the same time, KCS can give rebates (or not charge higher prices) to relatively more-price-elastic shippers who would choose other options if their prices increase. However, for relatively less elastic shippers, KCS will be able to charge a higher price because these shippers do not have alternatives that are closely competitive to shipping via Laredo to many certain Mexican destinations. The anticompetitive result from the transaction is harm to these relatively less elastic shippers.

B. Increases in U.S.-Mexico Rates Through Evasion of Mexican Non-discrimination Regulation

20. Mexican law prohibits TFM from discriminating among customers or among the competing U.S. railroad carriers it connects with at Laredo. Thus, while Mexican railroads face no binding maximum rate regulation, the prohibition on price discrimination today limits the exercise of TFM's market power in connection with U.S.-Mexico cross-border shipments to the extent TFM charges the same price for similar movements to and from Laredo for similar commodities. Shippers who are relatively

---

[14] The strategy thus has similarities to the price discrimination strategy discussed next. KCS only increases prices to less-price-elastic customers, which is similar to increasing all prices and giving rebates to the relatively price-elastic customers.

price elastic, because they have other rail options though alternative gateways or have better intermodal options, constrain the price that TFM can charge to some degree. Today, if TFM attempted to increase the price it charges between Laredo and a given Mexican destination, the increased revenues from less-price-elastic customers, who would continue shipping on the TFM, would be more than offset by revenue losses from relatively more-price-elastic customers who switch to alternative transportation modes.[15] Thus, although TFM would typically try to set the highest price it could to maximize its profits (but could not do so perfectly in light of incomplete information, *etc.*), it does so subject to the constraints limiting its ability to charge different prices for movements between a given point in Mexico and Laredo. These constraints necessarily mean that TFM's prices to less elastic customers are lower than they would be if TFM could price discriminate freely.

21. Competition among U.S. railroads for the traffic north of the Mexican border prevents TFM's connecting carriers from capturing this extra revenue for the less price-elastic customers. If UP attempted to increase prices to less-elastic Mexican traffic on the U.S. segment, BNSF, KCS or another competing railroad would offer a lower price and gain the traffic. Thus, the U.S. component of a given rail movement is set at competitive levels, while the Mexican component for the less price-elastic customers is above the competitive price, given the limited competition that TFM faces south of the

---

[15] In economic terminology the more price-elastic customers are "marginal" customers while the less price-elastic customers are "infra-marginal" customers. Almost all commodities and services have both types of customers.

border, but below the price that TFM could charge if it were not subject to Mexican non-discrimination rules.

22. The proposed transaction changes this situation. The combination of KCS and TFM will be able to increase rates to the less-price-elastic shippers, *i.e.* those who have relatively fewer competitive options, while still maintaining non-discriminatory rates south of the border. NAFTA Rail will be able to increase prices by "evading" Mexican non-discrimination legislation.[16] The following example demonstrates how this price increase could occur. Consider two shippers of the same commodity at two hypothetical origins in the United States who ship to a single destination that TFM serves (exclusively) in Mexico. Call the shippers A and B, from the origins O1 and O2, and to the Mexican destination D. Both ship via the Laredo gateway. Currently, TFM charges the same rate for its portion of each movement, since both go via Laredo to Mexican destination D. U.S. railroads serving the two origins, O1 and O2, compete with each other for the traffic. However, shippers A and B differ in their competitive alternatives. Shipper A can also ship via an alternative mode (or gateway, *e.g.*, Eagle Pass) for only a slightly higher price than by rail via Laredo.[17] Shipper B has no closely competing options, either via an alternative gateway or via intermodal competition. Thus Shipper A is relatively price elastic compared to Shipper B. Mexican regulation constrains TFM

---

[16] By "evasion," I do not refer to illegal conduct. Instead evasion refers to steps that would be possible for a commonly-controlled railroad to take on international shipments because of its U.S. presence that would be impossible for a railroad operating only in Mexico to achieve.

[17] Alternatively, the price could be similar but the quality via Eagle Pass could be slightly lower (*e.g.*, longer shipping time).

from increasing the price to Shipper B, because it would also be required by law to increase the price to Shipper A, and TFM would then lose Shipper A's traffic.

23. However, if KCS gains control of TFM the result will be an increase in price to shipper B, which means in the O2-to-D market prices will increase, and Shipper B (and others) will suffer competitive harm. Thus, an anticompetitive effect will occur to customers in a well-defined (antitrust) market.

24. I now explain how NAFTA Rail will be able to increase the price to Shipper B in a profitable manner after the transaction takes place. When KCS acquires control it could direct TFM to increase its price from Laredo to Mexican destination D for comparable movements of a given commodity, thereby preventing TFM from explicitly engaging in price discrimination from the border to a Mexican origin. Shipper B, who has no economic alternative, will pay the higher price and will suffer competitive harm from the transaction.

25. So as not to lose business from Shipper A, however, KCS will keep shipper A's overall rate constant by rebating to that shipper an amount that offsets the increased price from Laredo to destination D. This option was not available to TFM before the transaction. If TFM had tried to raise rates on cross-border movements, Shipper A would have chosen another transportation option rather than pay a higher price for shipment from the United States to Mexico. While KCS earns less on the U.S. part of the movement, the amount is exactly offset by the increase on the Mexican part of the movement. Thus, Shipper A pays the same overall through price and continues to ship through Laredo. Further, while NAFTA Rail earns the same overall profits from Shipper A, it earns increased profits from Shipper B, who now pays a higher total price since the

Laredo to destination D price has increased, while the price of the U.S. component of the shipment has remained the same. Thus KCS/TFM, *i.e.* NAFTA Rail, earns higher overall profits. NAFTA Rail has the economic incentive and the ability to increase prices in an anticompetitive manner. Shipper B suffers economic harm from this anticompetitive outcome in a well-defined antitrust market.

26. Rail movements for which trucks may be a competitive alternative would also provide opportunities for the same type of anticompetitive price discrimination. For some shipments, trucks may be a viable competitive option, but only for movements where the U.S. point is relatively close to the border. Thus, those shippers have a choice of using an all-rail option via Laredo (and thereby utilizing TFM), or relying on an all-truck route. Assuming the costs of transloading are significant, a shipper from a more distant U.S. point would be restricted to rail based on distance of haul. Thus, in the face of a price increase by TFM, the second shipper would pay the increased price, while KCS could rebate the increase to the shipper having an intermodal option.

27. A limitation of this strategy is that KCS (or Tex Mex) must serve the various "shipper A's" (representing the high-elasticity traffic) so that it can provide the rebate after TFM increases its overall price from Laredo to the Mexican destination. KCS need not serve all such high-elasticity shippers. So long as it serves some of them, prices will increase. The amount of high-elasticity shippers that KCS serves will determine by how much prices will increase, but not the fact of the price increase. Also, note that KCS need not serve the less-elastic shippers (shipper B), because they will pay the higher price and no rebate is necessary.

28. I have investigated the amount of overall traffic that UP carries that KCS could also carry to determine whether KCS could carry a sufficiently large percentage to make the price increase significant. My calculations find that currently approximately 50% of the total traffic via Laredo is directly competitive for KCS using its own facilities. Including interline movements with or trackage rights over BNSF, approximately 75% of existing UP traffic could be served by KCS.[18] *See* Exhibit J to Gray V.S. Thus, the amount of traffic on which KCS could employ the rebate strategy (*i.e.* Shipper A in the hypothetical) is considerably more than needed to make the strategy profitable.

29. One further economic consideration arises in considering the transaction. Mexican regulation also stops TFM from decreasing price to even more price-elastic customers who currently use an alternative gateway or another transportation mode. If TFM decreased prices to these shippers, it would need to decrease prices to all shippers, which would not be a profitable strategy. However, conditions aimed at preventing anticompetitive price increases need not interfere with these beneficial price reductions. In the proposed conditions that I discuss subsequently, TFM could offer lower prices to these shippers who would benefit from the transaction, while not increasing prices to Shipper B.

C. The Overall Anticompetitive Effect is Greater Because of Interaction

30. The two strategies that I have discussed, disabling of UP competition and evasion of Mexican regulation, reinforce each other and enhance the overall

---

[18] It would be incorrect to use the current amount of traffic carried by KCS, UP, and BNSF to make this calculation because currently shippers pay the same price for the Laredo to Mexico component, regardless of which U.S. shipper they use. After the transaction, this situation would change because of the rebate strategy.

anticompetitive effect. Although the two are not interdependent, *i.e.*, either strategy could be implemented and result in anticompetitive harm on it own, the combined ability to increase its rival's costs and to price discriminate without explicitly varying TFM rates to comparably situated shippers increases NAFTA Rail's harms to shippers.

31. Absent the ability to price discriminate, the strategy of disabling UP competition would be less economically attractive because the NAFTA railway would lose traffic when KCS increases its prices. However, the ability of KCS to provide rebates to relatively more elastic shippers increases the return from this strategy because the traffic lost from the price increase can be limited.

32. Similarly, the ability of TFM to extract profits through price discrimination (made possible by using KCS to circumvent Mexican regulation) increases because of the decreased competition from UP. As KCS gains more traffic because of the decreased service levels of UP, NAFTA Rail is able to provide rebates to a larger group of customers, thus making the price discrimination strategy more effective. TFM will be able to increase prices by more than it would in the absence of the ability to disadvantage UP-bound traffic. Thus, the interaction of the two anticompetitive strategies reinforce each other and leads to a larger anticompetitive effect that the sum of the two strategies acting in isolation.

33. UP can divert some of its traffic to other gateways, *e.g.*, Eagle Pass, to avoid the decreased service levels at Laredo. However, this traffic diversion will lead to higher costs and prices and decreased service levels for shippers. Otherwise, if no difference existed for a given O-D movement through Laredo or Eagle Pass, UP would

already be using Eagle Pass.[19] The additional costs incurred from such diversions decreases economic efficiency, without any corresponding increase in production. Shippers will end up paying higher prices and receiving decreased service levels on this diverted traffic. The result is anticompetitive.

34. TFM, in cooperation with the U.S. railroads, has already achieved efficiencies at Laredo. Shippers have demonstrated the high level of efficiencies by choosing to use Laredo as their Mexican gateway. Further, the high level of efficiencies between UP and TFM cannot be re-created with other railroads because no economical replacement exists for either Laredo or TFM for many O-D markets.

V. Efficiencies Will Not Offset the Anticompetitive Effects of the Transaction

35. Efficiencies can sometimes offset anticompetitive effects that arise in a transaction. If cost saving efficiencies are large enough, they can lead to overall decreases in prices, as I discuss in my previous research.[20] The cost savings typically need to be cost savings in variable (marginal) costs to have a decreasing effect on price. Cost savings in overhead and other types of fixed costs typically do not lead to lower prices.

36. In the proposed acquisition neither KCS nor its economist, Professor Grimm, has claimed that any savings will occur, either variable cost savings or fixed cost savings. KCS has explained that the proposed transactions will not achieve any

---

[19] UP owns a 26% share in FXE, which is the Mexican railroad that connects at Eagle Pass.

[20] *See* J. Hausman, "Competitive Analysis with Differentiated Products," *Annales, D'Economie et de Statistique* 34 (1994); "Economic Analysis of Differentiated Products Mergers Using Real World Data," *George Mason Law Review* 5 (1997), and "Efficiencies from the Consumer Viewpoint, " *George Mason Law Review* 7 (1999). The *Merger Guidelines* also discuss the role of efficiencies in Section 4.

operational or service improvements that are not already available through existing cooperation among KCS, Tex Mex, and TFM. KCS, Tex Mex, and TFM already have exceptionally close working relationships and offer what they describe as "seamless service" for traffic moving between the United States and Mexico. They do not anticipate that the NAFTA Rail transaction will allow them to obtain any operational benefits that they are not already pursuing without common control.

37. Some of the public statements by KCS regarding the proposed transaction indicate that efficiencies have already been realized:

- More than a year ago, KCS reported that the "NAFTA Railway Alliance partners KCS, Tex Mex and TFM had "developed a seamless, one-stop customer service approach for moving traffic in and out of Mexico on the NAFTA Railway." KCS explained that "[e]ach week, the team covers service performance related to KCS' new pre-blocking plan for traffic going southbound into Mexico, despacho previo and clearances that will help expedite traffic." KCS also reported that the partners were working on an initiative "to create a similar plan for operational efficiency going northbound, to include the possibility of TFM pre-blocking traffic to save handling and transit time on traffic moving from Mexico to U.S. Markets."[21]

- KCS's CEO Michael R. Haverty reported in December 2002 that, even without common control, KCS's "working relationship with TFM has become very close in 2002, and we expect to further strengthen and build this relationship in 2003."[22]

- The KCS-Tex Mex Control Application reported that, earlier this year, "KCSR, Tex Mex and TFM implemented a plan to pre-block trains moving to and from Mexico."[23]

23 KCS Application, Riney V.S. p. 136.

38. Thus, with no offsetting efficiency effects for the anticompetitive price increases that I discussed earlier, the net result will be price increases in antitrust markets that injure shippers and consumers. Even if there were cost savings, however, the conditions needed to prevent anticompetitive conduct need not interfere with them. The Applicants have claimed that UP and others "do not seem to understand that KCS's transaction with TFM is an acquisition of control, not a merger."[24] The anticompetitive strategies outlined above only require common control, not a full integration of operations. In fact, an outright merger might be preferable from an economics standpoint because it might produce cost savings from reduced overhead. In any event, the continued separate corporate existence of TFM is immaterial to the above analysis, so long as TFM and KCS share a common economic interest in maximizing overall profit, which common control will provide.

VI. Applicants Incorrectly Analyze the Competitive Effects of the Transaction

39. Professor Grimm attempts to analyze the transaction solely on a horizontal basis.[25] His approach is incorrect. The transaction is vertical, not horizontal, since KCS and TFM do not compete for traffic. Instead, TFM is either the upstream or downstream provider of rail transportation from Laredo to Mexican destinations and has market power as the only Mexican railroad serving Laredo. Based on a purely horizontal analysis, I agree with Professor Grimm that no problems arise because no 2-to-1 (or other)

---

[24] KCS Reply to Petition of CN to Reopen Decision No. 2 and to Reject Application (KCS-16), July 21, 2003, p. 19.

[25] Grimm Supplemental V.S. pp. 2-4: "The main body of my initial statement examined the horizontal competitive effects from the transaction....The KCS/Tex Mex/TFM transactions are purely end-to-end with no horizontal anticompetitive effects."

reductions in the number of competing carriers will occur. But the correct analysis is as a vertical merger. While vertical mergers typically do not create the potential for anticompetitive effects in the same way as horizontal mergers, the potential for vertical mergers to lead to anticompetitive outcomes is well recognized, especially when regulation is involved.[26]

A. Vertical Mergers that Facilitate Disadvantaging Competitors

40. The economics literature recognizes that vertical mergers can produce anticompetitive effects where the merged entity can decrease the service quality or increase costs of its rivals.[27] By discriminating against a competitor and causing its service quality to be lower, a firm can increase its own demand and often charge higher prices. For example, prior to the AT&T divestiture, an AT&T long distance customer dialed 10 digits (e.g. 202-368-3543) to make a long distance call while a Sprint or MCI customer typically had to dial a significant amount of extra digits beyond the 10 digits. The extra time and inconvenience of dialing the extra digits decreased Sprint's and MCI's long distance demand. More recently, the U.S. DOJ required a vertical merger party to offer guarantees via a consent decree that it would cooperate with downstream competitors and not degrade the quality of service the combined firm offered to

[26] *See, e.g.*, D. Carlton and J. Perloff, *Modern Industrial Organization*, (Reading, MA, 3rd Ed., 2001, p. 386): "Firms may vertically integrate to evade or avoid government price controls, taxes, and regulations." *See* M. Riordan and S. Salop, "Evaluating Vertical Mergers," *Antitrust Law Journal,* 63, 1995: "A vertical merger also can help a firm to evade statutes or regulations that prohibit price discrimination." (p. 520); *see also*, A. Kahn, *The Economics of Regulation*, (New York, 1971, vol. II, pp. 296-297).

[27] *See, e.g.*, Riordan and Salop, op. cit.

competitors.[28] The recent FTC challenge to the acquisition of two interstate natural gas pipelines by a monopoly gas utility in Michigan provides a further example of the potential for anticompetitive behavior through vertical integration.[29]

B. Vertical Mergers and Regulatory Evasion

41. Regulation attempts to eliminate the exercise of market power, which is defined as the ability to charge prices above the competitive level for a significant period of time. The economics literature recognizes that vertical mergers can lead to the evasion of regulation and to allow the combined firm to better price discriminate.[30] For example, prior to the breakup of AT&T, the U.S. government alleged that AT&T evaded regulation on its monopoly local telephone service by charging higher prices on equipment from its unregulated equipment subsidiary, Western Electric.[31] This regulatory evasion was completely vertical in nature and allegedly led to higher prices to consumers. Similarly, the regulatory evasion by TFM of Mexican regulation will lead to higher prices to relatively less elastic shippers.

---

[28] *See U.S. v. Northrop Grumman & TRW*, 2003-1 TRADE CAS. ¶ 74,057 (D.D.C. 2003).

[29] *See CMS Energy Corp.*, No. 991-0046, 64 FED. REG. 14,725 (1999) (Aid to Public Comment). The FTC alleged that the merged entity would restrict access to its solely served customers in Michigan by non-affiliated pipelines, thereby allowing it to increase rates for gas transportation on its affiliated pipelines into Michigan. The anticompetitive service restrictions of concern to the FTC are analogous to the behavior potentially available to NAFTA Rail. The FTC consent decree imposes service conditions to ensure equal access for non-affiliated pipelines.

[30] See footnote no. 26 for regulatory evasion. For the ability to price discriminate, *see, e.g.*, M.K. Perry, "Vertical Integration: Determinants and Effects," in *Handbook of Industrial Organization*, eds. R. Schmalensee and R. Willig, Amsterdam: North Holland, 1989.

[31] *U.S. v. American Tel. & Telegraph*, 552 F.Supp. 131 (D.D.C. 1982).

42. Vertical mergers can also sometimes have anticompetitive horizontal effects related to regulatory evasion. To the extent that TFM can disable UP and BNSF and make them less competitive with KCS, KCS will be able to increase its prices because UP and BNSF will offer inferior service. Again, one illustration of this problem was the U.S. government's allegation that AT&T used its monopoly over local phone service to discriminate against its long distance rivals such as MCI and Sprint, and these actions allowed AT&T to maintain higher long distance prices. AT&T's actions allegedly occurred despite active regulatory oversight by the FCC and state Public Utility Commissions.[32] Similarly, the DOJ has challenged vertical mergers between natural gas pipelines and electric utilities that could produce anticompetitive effects.[33] Here no active regulatory oversight occurs at the Laredo gateway, so anticompetitive strategies would be more easily implemented.

C. Potential Diversions Do Not Eliminate Anticompetitive Effects

43. The ability for TFM to implement anticompetitive strategies both at the current time and in the future after the transaction is constrained to some extent by intermodal competition and competition from other gateways.[34] But these constraints are already reflected in current prices that limit the amount of market power that TFM can exercise. These competitive constraints will not change with the transaction, so that

---

32 *See id.*

33 *See, e.g., United States v. Enova Corp.,*107 F. Supp. 2d 10 (D.D.C. 2000). In *Enova,* an electric utility was required to divest gas-fired generating plants prior to acquiring a gas utility with monopoly control over a natural gas pipeline into southern California. The competitive concern was that the merged firm would cause higher electric prices by limiting access of its competitors.

34 *See* Applicants' Supplement pp. 13-19; Davies V.S. pp. 7-13.

prices will increase following the transaction as my analysis demonstrates. Also, UP will have the potential to divert some amount of current UP-TFM traffic to UP-FXE routes, such as by using the Eagle Pass gateway.[35] But this traffic diversion will lead to higher costs and prices or lower service quality; otherwise UP would have already implemented this diversion.[36] Thus, to the extent that UP is forced to divert traffic to UP-FXE routes by higher prices or by discrimination, the outcome will be anticompetitive.

VII. Previous STB Merger Policy

44. I understand that the Board has traditionally accepted the "one-lump" doctrine in previous merger cases.[37] My conclusions about the adverse competitive dangers in this case are not inconsistent with the Board's past application of the doctrine. The factual circumstances of this situation are different from those at issue in the usual end-to-end merger case.

45. The distinctions arise from the nature of the Laredo Gateway and the competition north of the border that has occurred because of the neutral and non-discriminatory behavior of TFM south of the border. As an international gateway, Laredo presents a different regulatory context than the usual case. TFM's existing rate levels are subject to different regulation than a domestic gateway in the U.S. In the U.S., dominant carrier regulation remains in place both before and after a merger. Further, in the U.S., where vertical mergers have combined railroads on both sides of major

---

35 *See* Applicants' Supplement pp. 21-24; Davies V.S. pp. 13-14.

36 UP has an economic incentive to use FXE given its 26% ownership interest in FXE.

37 *See Erie-Niagara Steering Committee v. Surface Transportation Board*, 247 F.3d 437, 443 (2d Cir. 2001).

gateways, there typically have been several independent routes for given O-D markets, which limits the ability of the merging railroads to exercise significant market power. Past mergers that formed new single-line routes thus caused other railroads to form similar pairings using the same major gateways (*e.g.,* at Cincinnati, where separate end-to-end mergers formed the CSX and Norfolk Southern systems, both of which operate on both sides of the former-gateway). In the current situation, the traffic data that I discussed above demonstrate the importance of the Laredo Gateway, and only TFM provides rail service on the Mexican side of the Laredo Gateway. Indeed, the Board has recognized that, in an age of declining opportunities to form alternative connections at gateways, it is necessary to impose conditions to keep major existing gateways open.[38]

VIII. The Remedies that UP has Proposed are Appropriate

46. KCS has offered commitments not to engage in anticompetitive strategies.[39] Economists typically believe that firms will engage in anticompetitive activities to increase profits so long as the firms' actions are not illegal. Indeed, many influential management textbooks discuss at length the use of business strategies to disable competitors to increase profits. Thus, most economists are extremely hesitant to take the "word" of merging firms that they will not increase prices after a transaction if they have the ability to do so given the economic incentives to do so. Thus it is important that KCS's commitments be made enforceable.

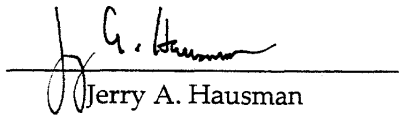
---

[38] *See Major Rail Consolidation Procedures*, STB Ex Parte 582 (Sub-No. 1) (STB served June 11, 2001) at 25.

[39] *See, e.g.*, Applicants' Supplement p. 4, p. 25, p. 26, Davies V.S. pp. 14-16.

47. As Mr. Gray describes, the Board could require KCS to implement its commitments in an effective and enforceable way without posing any risks or hampering competition. Three criteria are relevant in considering proposed regulatory remedies: (1) remedies should be workable and not unduly regulatory; (2) remedies should be designed to affect only the potential adverse consequences; and (3) remedies should not interfere with the Applicants' ability to compete more effectively against other railroads and transportation modes by exploiting possible pro-competitive benefits of the transaction. UP's proposed remedies satisfy each of these criteria.

48. UP has proposed that KCS, as a condition for approval, be required to negotiate an agreement to implement its vague commitment to "keep the Laredo gateway open on commercially reasonable terms." UP has also suggested that one appropriate way that the commitment might be made concrete and enforceable is via a "proportional rate matrix approach" that would attempt to limit anticompetitive price increases by TFM following the transaction. Such an approach would be consistent with the remedial principles described above and has been successfully employed in the "I-5 Proportional Rate Agreement" between UP and BNSF, which the Board approved as part of the UP/SP merger. The agreement would only apply to traffic interchanged between UP and TFM at Laredo so it would not restrict NAFTA Rail's ability to compete for traffic using KCS-Tex Mex routes north of the border. Further, it does not create an increased opportunity for coordinated interaction among the railroads since they gain no knowledge of their competitor's prices. But the proportional rate matrix approach does cause TFM on average to offer UP similar rates to what it "charges itself." The approach is similar to the "imputation approach" used in telecommunications regulation in the similar situation



of a monopoly provider competing in other non-regulated markets.[40] Thus, if NAFTA Rail is more efficient in a given O-D market for a commodity, the proposed regulation will not hinder NAFTA Rail from winning the movement away from UP.

---

[40] I discuss the pro-competitive aspects of imputation in J. Hausman, "Efficient Local Exchange Competition," *Antitrust Bulletin*, 1995

MASSACHUSETTS INSTITUTE OF TECHNOLOGY

1992-	John and Jennie S. MacDonald Professor
1979-	Professor, Department of Economics
1976-79	Associate Professor, Department of Economics
1973-76	Assistant Professor, Department of Economics
1972-73	Visiting Scholar, Department of Economics

VISITING APPOINTMENTS:

1986-87	Visiting Professor, Harvard Business School
1982-83	Visiting Professor, Harvard University Department of Economics
	Visiting Positions: University of Washington, Brigham Young University, Australian National University, Ecole Normale Supérieure, Oxford University, University of Sydney, Wuhan University, Beijing University, University of Western Australia

U.S. ARMY, ANCHORAGE, ALASKA

1968-70	Corps of Engineers

PROFESSIONAL ACTIVITIES:

Associate Editor, Bell Journal of Economics, 1974-1983
Associate Editor, Rand Journal of Economics, 1984-1988
Associate Editor, Econometrica, 1978-1987
Reviewer, Mathematical Reviews, 1978-1980
American Editor, Review of Economic Studies, 1979-82
Associate Editor, Journal of Public Economics, 1982-1998
Associate Editor, Journal of Applied Econometrics, 1985-1993
Advisory Editor, Economics Research Network and Social Science Research , 1998-
Advisory Editor, Journal of Sports Economics, 1999-
Member of MIT Center for Energy and Environmental Policy Research, 1973-
Research Associate, National Bureau of Economic Research, 1979-
Member, American Statistical Association Committee on Energy Statistics, 1981-1984
Special Witness (Master) for the Honorable John R. Bartels, U.S. District Court for the Eastern District of New York in Carter vs. Newsday, Inc., 1981-82
Member of Governor's Advisory Council (Massachusetts) for Revenue and Taxation, 1984-1992
Member, Committee on National Statistics, 1985-1990
Member, National Academy of Social Insurance, 1990-
Member, Committee to Revise U.S. Trade Statistics 1990-1992
Director, MIT Telecommunications Economics Research Program, 1988-
Board of Directors, Theseus Institute, France Telecom University, 1988-1995
Member, Conference on Income and Wealth, National Bureau of Economic Research, 1992-
Member, Committee on the Future of Boston, 1998
Member, GAO Expert Panel to advise USDA on Econometric Models of Cattle Prices, 2001-2
Advisor, China Ministry of Information on Telecommunications Regulation, 2002-

PUBLICATIONS:

I. Econometrics

"Minimum Mean Square Estimators and Robust Regression," Oxford Bulletin of Statistics, April 1974.

VERIFIED STATEMENT

OF

FRANCISCO FUENTES OSTOS

My name is Francisco Fuentes Ostos. I have been a partner in the Mexican law firm of Mijares, Angoitia, Cortés y Fuentes, S.C. since the firm's inception in 1994. I was admitted to practice in Mexico (Escuela Libre de Derecho) in 1990 and obtained a Masters of Law degree from Cambridge University, UK in 1992. I have regularly advised clients on competition issues in Mexico since Mexico's antitrust laws were enacted in 1993. Our firm acted as legal counsel to the financial advisor appointed by the Mexican Federal Government in 1996 for the privatization of the railroad companies, and since then has advised clients on legal issues related to railroad transportation services.

I have acted as the principal competition counsel to the Union Pacific Railroad Company ("UP") with respect to the Mexican issues raised by the proposed acquisition of control by Kansas City Southern ("KCS") of TFM, S.A. de C.V. ("TFM").

UP has asked me to discuss how Mexican law and regulation governing railroads relate to the KCS-TFM transaction. In Section I of this statement, I explain that Mexican law and regulation could not be expected to prevent KCS control of TFM from having adverse effects on competition in the United States for U.S.-Mexico cross-border rail shipments. I note that some of the potential anticompetitive conduct that concerns UP is simply beyond the reach of Mexican law and regulation. I also discuss the fact that the regulatory authorities and courts in Mexico have not implemented the pertinent Mexican railroad regulations, and that it is highly unlikely that a dispute concerning TFM's future compliance with Mexican regulatory requirements could be resolved in an efficient manner.

And I explain how Mexican legal and regulatory processes have for several years allowed TFM to block steps by Ferrocarril Mexicano, S.A. de C.V. ("Ferromex") to enforce rights that it was entitled to under TFM's Concession and Mexican law. In Section II, I describe the Mexican regulatory approval processes applicable to KCS's acquisition of control of TFM and discuss how the relevant Mexican agencies have approached the proposed merger. In Section III, I explain that action by the U.S. Surface Transportation Board ("STB") to enforce commitments made by KCS relating to U.S.-Mexico international rail traffic would not interfere with Mexican law or sovereignty.

I. MEXICAN LAW CANNOT BE RELIED UPON TO PREVENT ANTICOMPETITIVE EFFECTS ON CROSS-BORDER RAIL TRAFFIC

It would not be reasonable to expect that UP or other parties could effectively prevent potential anticompetitive conduct by KCS/TFM by attempting to enforce provisions of Mexican law or TFM's Concession. It is critically important to realize that Mexico's railroad regulatory regime is still in its infancy, which means that Mexican regulators and courts have had almost no occasion to interpret or enforce these provisions.[1] Thus, there is considerable uncertainty regarding how regulators and courts would respond to a complaint of discriminatory treatment. What is certain, however, is that a dispute that raises novel issues of discrimination would likely take years to resolve.

---

[1] Before 1996, the Mexican state owned all railroad assets in the country. In 1995, the Congress amended the constitution in order to allow for private ownership, and then passed a privatization statute. Over the next several years, the various railroad concessions were auctioned off to private investors, with the last sale taking place in 1999.

A. Mexican Law and Regulations Would Not Prevent Across-the Board Increases in TFM Rates

Some of the anticompetitive conduct discussed in UP's Comments is not addressed at all by Mexican railroad law. If the combined KCS/Tex Mex/TFM entity were to engage in the sort of conduct described by Professor Hausman in his verified statement, which would involve TFM raising its rates between Laredo and TFM-served origins and destinations on a non-discriminatory basis (i.e., across-the-board), with KCS selectively granting rebates by lowering its portion of the overall rate on U.S.-Mexico traffic, such conduct would probably not be reviewable under Mexican law.

By statute, there are no practical limits on how high TFM could raise its rates within Mexico. Article 170 of the Railroad Regulations provides that carriers may freely set their rates.[2] Carriers must file their maximum rates with the SCT for each of their routes, and once a maximum rate is registered, the carrier cannot charge more than that rate. There is no limitation, however, on a carrier's ability to return to the SCT and file a higher rate whenever it chooses.

Although rates are freely set by the concession holders, the Authorizing Statute and its regulations contain a procedure through which certain parties can challenge a carrier's registered rates upon having a ruling from the Federal Competition Commission ("CFC") that effective competition does not exist. *See* Authorizing Statute, Article 47; Regulation, Articles 171-73. No rate has ever been challenged pursuant to these provisions.

---

[2] The Regulations were issued in 1996 by the Secretary of Communications and Transport (SCT) pursuant to the terms of the Rail Service Authorizing Statute (*Ley Reglamentaria Del Servicio Ferroviario*) ("Authorizing Statute") that Congress passed as part of the privatization of the Mexican railroad system.

As discussed below, there are numerous questions about how this procedure would be applied.

Mexican authorities likely would have no say about the overall TFM-Tex Mex-KCS rate if the *TFM portion of the rate* was offered in a nondiscriminatory manner to all shippers under equal conditions. Mexican railroad law and TFM's Concession[3] contain various provisions that purport to require TFM to set rates in a non-discriminatory manner. Under Article 170, a carrier's maximum rates "shall be applied in a non-discriminatory manner and shall be the same for users in equal conditions." Carriers are permitted to charge less than their maximum rates as long as they grant such discounts to "users in equal circumstances, in a fair and non-discriminatory manner, in accordance with the specific characteristics of each service, according to the classifications established by this in keeping with the present Regulations."

The TFM Concession also includes several provisions regarding non-discriminatory behavior. Section 2.1 states that TFM "is obligated to provide rail services to requesting users in a permanent and uniform manner and under equitable and nondiscriminatory conditions with respect to opportunity, quality and price, according to the terms laid out in Chapter VII, title three, of the Regulation. Section 2.2 of the TFM Concession requires that TFM "provide terminal and interconnection services at all points connecting with the railroads of other concessionaires or with connecting railroads of other countries under fair and non-discriminatory conditions in regard to timeliness, quality and price." Section 2.2 goes on to say that "[a]ny difference in the timeliness of the service or in

---

3 *See* Supplement to Application (KCS-10/TM-10), Exh. A.

the rates applied must be based on specific circumstances that justify such distinctions being made."

An increase in TFM's rates that was the same for both connections at Laredo, as part of a strategy by KCS/TFM to increase the overall rates on origin-to-destination cross-border shipments, does not appear to be addressed by these provisions.

B. Parties Could Not Rely on the Ability to Enforce Any Provisions of Mexican Railroad Law or TFM's Concession to Prevent Anticompetitive Discrimination By TFM Resulting from KCS Control

The provisions of Mexican law and TFM's Concession noted above do address discriminatory behavior by TFM. However, even if these provisions would in theory apply to the anticompetitive strategies described by UP, efforts to enforce them against TFM would not be effective. To my knowledge, the SCT, which is charged with enforcing the Authorizing Statute and the Regulations, has never had occasion to rule on a dispute involving an allegedly discriminatory practice. Thus, there are numerous open questions regarding, *inter alia*, how the SCT would interpret the applicable nondiscrimination provisions, what sort of relief might be ordered, and what actions TFM might take to delay the enforcement of remedial measures. For example, there is no definitive precedent on whether the anti-discrimination provisions would apply to discrimination by TFM between KCS and other U.S. connecting carriers if KCS and TFM were under common control.

Even if UP or another affected party were successful in challenging TFM's conduct, the process for obtaining a favorable SCT resolution, and then enforcing it against TFM, would involve protracted litigation before multiple administrative agencies and courts in Mexico.

First, the procedures for obtaining a resolution from the SCT can be very time-consuming. Certain types of actions, including challenges to registered maximum rates, require, as mentioned above, that the parties obtain an opinion from the CFC before the SCT will entertain the complaint. For other types of actions, including complaints regarding interconnection services, the parties must first attempt to reach a voluntary agreement within a 90 day period before the SCT will step in. And even then, the parties have the right to challenge in court SCT's decision. Currently the two main railroad companies in Mexico are litigating in federal courts SCT's decision regarding certain trackage rights fees, and that litigation has dragged on for years.

Second, even if UP or another affected party were successful in obtaining a favorable ruling from the SCT, the Mexican legal system would afford TFM various opportunities to challenge the SCT resolution and to block the resolution during the pendency of such challenge. All resolutions issued by administrative agencies such as the SCT are subject to appeal and review by the Mexican courts, and such appeals are typically time-consuming, especially where untested issues of law are involved. Moreover, there are various legal vehicles that TFM could invoke to suspend the effects of the resolution while such appeals are pending. In accordance with the Mexican judicial system, decisions by the SCT could be appealed to the Federal Administrative and Tax Tribunal by TFM and in some instances its decisions could be challenged directly by "*amparo*" proceedings in Federal courts. The writ of "*amparo*" offers federal judicial protection from laws or governmental actions that are asserted to violate individual constitutional rights.

One example of the difficulty in obtaining, and then enforcing, an SCT resolution is the frustrations that Ferromex, a Mexican competitor to TFM, has experienced for six years in seeking to enforce certain provisions of the TFM Concession. As a

condition to the auction of the TFM concession, the SCT sought to ensure competition in the important industrial center of Monterrey by requiring that TFM grant Ferromex access to certain shippers in that city. The fees and conditions associated with this access, however, were not spelled out in TFM Concession. Thus, Ferromex – after failing to reach a voluntary agreement with TFM – sent a letter on July 4, 2001, requesting that the SCT require that TFM make available to Ferromex certain trackage rights and terminal services that are necessary in order to enjoy full access to shippers in Monterrey. Roughly a year later, on August 7, 2002, the SCT issued a resolution granting Ferromex's request and requiring that TFM grant access under specified terms and conditions. Then, TFM obtained a resolution from the Ninth Court of the Federal Administrative and Tax Tribunal which suspends the SCT's resolution and prevents Ferromex from exercising the rights granted to it by the SCT. To my knowledge, this suspension remains in effect. In all, there are more than 20 *amparo* proceedings currently in place between TFM and Ferromex. Experience confirms that efforts to enforce TFM's obligations under its Concession and applicable railroad law and regulations have been ineffective for many years.

II. THE REVIEW OF THE KCS-TFM TRANSACTION BY MEXICAN REGULATORS

The proposed KCS-TFM transaction requires the approval of two Mexican regulatory agencies. The first agency, CFC, approved the transaction without condition in a resolution dated May 19, 2003. KCS produced an English-language translation of the resolution to UP in discovery, which is attached as Exhibit A ("CFC Resolution"). Because the Chairman of the CFC was recused from participating in the proceeding, only four of the

five commissioners voted, and the merger was approved by a vote of 2-2.[4] UP attempted to participate in the CFC proceeding as an interested party, but the CFC rejected its submissions based on its position that third parties are not permitted to participate in CFC processes.

The CFC resolution defined the relevant geographic market as {"

"} Exh. A, KCS – C0188. It held that the merger would not affect competition because the merger would not cause the national railroad system to undergo any changes. Exh. A, KCS – C0189. It did not address any of the vertical issues raised by the transaction or any of the effects that the transaction might have in the United States on U.S.-Mexico cross-border traffic.

The other regulatory agency that needs to approve the proposed merger is the Foreign Investment Commission ("FIC"). To my knowledge, the FIC has not yet issued a decision on the transaction. In accordance with the Foreign Investment Law and the Authorizing Statute, FIC will be examining whether the transaction would contribute to increasing the competitiveness of Mexican industry and promoting regional and technological development, and protect the sovereign integrity of the Nation. The primary focus of this inquiry is on internal Mexican economic matters.

Another Mexican agency that is closely involved in evaluating the potential effects of the proposed merger is the Secretary of Communications and Transportation ("SCT"). SCT is the agency charged with regulation of the railroad industry. Although

---

[4] The tie-breaking vote was cast by one of the participating Commissioners who had been given tie-breaking authority in the temporary absence of the Chairman. *See* CFC Resolution, Exh. A, KCS – C0189. It is questionable whether such tie-breaking vote temporary authority is valid.

KCS and TFM do not need formal SCT approval in order to consummate the TFM acquisition,[5] SCT, as a member of FIC, has been closely involved in helping the FIC evaluate the transaction.

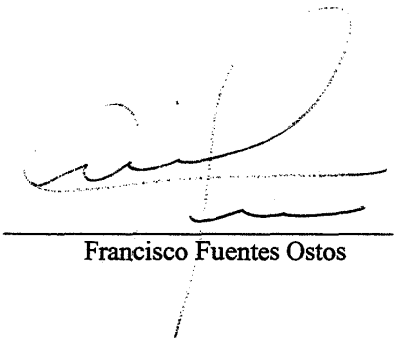
One of the points that various interested parties have discussed with SCT and FIC is the desirability of enhancing the ability of the other Mexican railroad serving the U.S. border – Ferromex – to compete more effectively against TFM (and against other modes of transportation, including trucks) within Mexico, including for the portion of international movements between the U.S. border and points served by TFM in Mexico. One approach would require an elimination of restrictions imposed by TFM on Ferromex's use of trackage rights TFM's important mainline between Ramos Arizpe (near Saltillo) and Querétaro, and a reduction in the high level of fees for those rights. The fees TFM charges Ferromex are high principally because the SCT has determined that the costs upon which such fees are based should include the amortization costs of the high purchase price paid for the TFM Concession. My understanding is that KCS and TFM, in negotiations with the relevant agencies, have refused to consider any proposal that would lead to a meaningful reduction in TFM's high fees.

III. REQUIRING TFM TO NOT DISCRIMINATE WITH RESPECT TO INTERNATIONAL TRAFFIC FLOWS WOULD NOT CONFLICT WITH MEXICAN LAW OR OFFEND MEXICAN NOTIONS OF SOVEREIGNTY.

I understand that UP will be asking the STB to impose conditions on the KCS-Tex Mex acquisition that would require KCS to abide by commitments it is making regarding the Laredo Bridge, and also regarding KCS's use of its control over TFM to

[5] They are required only to file a notice with SCT of the share acquisition by KCS once it is completed.

ensure that TFM continues to work with UP on international cross-border traffic via the Laredo Gateway and continues to provide commercially reasonable rates or rate factors that allow UP-TFM services to remain competitive.



Such action by the STB would not interfere with the role, pursuant to its legal mandate, of any relevant Mexican governmental agency, or involve any conflict or interference with Mexican legal principles, including sovereignty principles. As discussed above in Section II, Mexican railroad law today requires that TFM cooperate with its U.S. connections on an impartial and non-discriminatory basis, including on the rates that it sets and the services it provides, and I understand that TFM has acted in a neutral manner. The commitments KCS has made appear designed to ensure that KCS's control of TFM does not cause an adverse change in the way TFM behaves with respect to its other connections, principally UP, on international traffic flows. Such a commitment is perfectly consistent with Mexican law and regulations.

It would be equally appropriate for the STB to play a role in holding KCS – a U.S. company – to its commitments in an effective way. The Mexican authorities would not question the Board's role in considering and protecting competition for international traffic flows that benefit U.S. customers. As I explained above, no agency of the Mexican government concerns itself with protecting rail competition in the United States that depends on effective cooperation from TFM for the portion of the movement from Laredo south. Steps by the STB that would require KCS to use its new control of TFM to ensure that TFM works with UP on traffic moving across the border at Laredo, and quotes commercially reasonable rates for UP-TFM cross-border interline movements, would not involve any inappropriate interference in internal Mexican affairs or call upon TFM to do anything

inconsistent with other Mexican legal requirements. To the contrary, such steps would be consistent with the principles of non-discrimination and fostering of competition that Mexican law requires Mexican governmental agencies to apply.

I, Francisco Fuentes Ostos, declare under penalty of perjury that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this statement.

Executed on August 1, 2003.

Finance Docket No. 34342

KANSAS CITY SOUTHERN
– CONTROL –
THE KANSAS CITY SOUTHERN RAILWAY COMPANY, GATEWAY EASTERN RAILWAY COMPANY, AND THE TEXAS MEXICAN RAILWAY COMPANY

COMMENTS OF
THE BURLINGTON NORTHERN AND SANTA FE RAILWAY COMPANY

Pursuant to Decision No. 2 in this proceeding, The Burlington Northern and Santa Fe Railway Company ("BNSF") hereby submits its comments on the proposed Kansas City Southern ("KCS")/Texas Mexican Railway Company ("Tex Mex") control transaction.

INTRODUCTION AND SUMMARY

BNSF's interest in the KCS/Tex Mex/NAFTA Rail transaction is to ensure that rail shippers who rely on BNSF to provide them access to south Texas and Mexican markets are not competitively worse off as a result of the transaction. KCS has made a number of pledges and commitments to the Surface Transportation Board ("STB" or "Board") and others which address many of BNSF's concerns – including at the Board's July 31, 2003 public hearing, where KCS stated that it would accept as a condition to the Board's approval of the KCS/Tex Mex transaction a requirement that the Laredo and

Brownsville gateways be kept open on commercially reasonable terms.[1] As a result, BNSF supports the KCS/Tex Mex/NAFTA Rail transaction, subject to clarification of those pledges and commitments and to their inclusion as conditions in the Board's final decision. BNSF believes that the transaction could result in a stronger interline connecting carrier with which BNSF could work to enable it to provide better competition.

The proposed KCS/Tex Mex/NAFTA Rail transaction raises greater competitive issues and policy concerns than would be typical for a primarily end-to-end merger involving a Class II carrier. These concerns arise from the unique and important position that Tex Mex plays in international trade and from the anticipated second-stage acquisition of TFM, S.A. de C.V. ("TFM") by KCS, creating an international single system NAFTA Rail network.

In addition, BNSF plays a special role regarding its customers' traffic moving via Laredo and Brownsville. BNSF obtained access to those gateways in the UP/SP merger proceeding as a replacement for Southern Pacific ("SP") in order to provide a competitive counterweight to Union Pacific ("UP") for U.S.-Mexico traffic. Thus, it is

---

[1] KCS also announced at the hearing that it had reached an agreement with The National Industrial Transportation League ("NIT League") which respect to issues relating to the proposed transaction but did not make details of the agreement public. Accordingly, BNSF has not had an opportunity to review and analyze the agreement, and BNSF will provide its views on the agreement in its September 2, 2003 reply comments.

important that, if the transaction is approved, BNSF's competitive capability to fill that role for its customers continue on an undiminished basis.[2]

In BNSF's view, the key issue for preserving competition for U.S.-Mexican rail traffic is the maintenance of meaningfully open gateways through Laredo and Brownsville including, in BNSF's unique case, its ability to reach Laredo via Tex Mex through Robstown. Otherwise, shippers may be forced to use less efficient and more costly routes, or switch to other transportation modes, for their Mexican traffic as their only alternative to UP. The Board recognized in its revised merger rules in Ex Parte No. 582 (Sub-No. 1)[3] that major existing gateways should be kept open in future mergers, both physically and economically.

The conditions the STB imposed on the UP/SP merger to protect shippers gave BNSF the right to connect with Tex Mex as a neutral bridge carrier, capable of interlining with both BNSF and KCS in competition with UP for traffic to and from the Laredo gateway. BNSF has gained a relatively small percentage of the traffic moving through Laredo, but it helps effectively constrain the rates through that gateway. It is significant to note that KCS reported to the Board in its control application that, small as

---

[2] As KCS has stated in its pleadings to the Board and in various communications to shippers, the Board also provided Tex Mex with trackage rights over UP/SP lines to connect with KCS at Beaumont, TX in order to ensure the continuation of effective competition at Laredo. *Union Pacific Corp. – Control and Merger – Southern Pacific Rail Corp.*, 1 STB 233, 421-426 (1996) (*"Decision No. 44"*). However, as the Board noted, Tex Mex's trackage rights were to be, in Tex Mex's own view, "an addition to [the] competitive safeguards contained in the BNSF agreement, and not . . . a replacement." *Id.* at 147.

[3] *Major Rail Consolidation Procedures* (served June 11, 2001) (*"June 11 Decision"*).

BNSF's share of the Laredo international market is, BNSF nonetheless was Tex Mex's largest interline partner in terms of volume in 2002. While KCS is a vital part of the nation's rail system, it does not have the route structure or market reach to provide the competitive presence that BNSF can and does provide to and from major gateways and throughout the western United States. The diminution of Tex Mex as a neutral non-controlled bridge carrier could weaken the competitive discipline that BNSF provides to UP over the Laredo gateway. BNSF must be able to continue to be a competitive alternative for shippers to UP as a replacement for SP pursuant to the UP/SP merger conditions.

The Board's conditions were also premised on TFM's provision of rates and services over the international gateways of Laredo and Brownsville to and from points in Mexico that permit BNSF to be competitive, and the failure by TFM to do so would similarly adversely affect BNSF's ability to competitively serve shippers.

It is clear that the STB has jurisdiction over the Laredo and Brownsville gateways, within the context of this integrated transaction for control of both Tex Mex and TFM. The STB can exercise its conditioning power to address competitive issues on international traffic over an established international gateway. It does not have direct jurisdiction over TFM's operations within Mexico, but it can require the U.S. controlling company – NAFTA Rail – to ensure commercially reasonable open gateways for international traffic over Laredo and Brownsville.

In statements to the Board on several occasions, KCS has made a series of commitments and pledges and has given reassurances that it would continue to work with BNSF over these international gateways and that it would honor all existing Tex

Mex and TFM marketing and pricing agreements. KCS has also said it will keep the Laredo and Brownsville gateways open on commercially reasonable terms and that all carriers will be treated fairly at the Laredo Bridge. BNSF believes these commitments on service and commercial access need to be made more specific and imposed as conditions for approval of KCS' control of Tex Mex now pending before the Board.

Accordingly, BNSF's support of the NAFTA Rail transaction proposed by KCS and Tex Mex is premised on the Board ensuring through conditions that KCS/Tex Mex will be required to provide commercially reasonable rates and service to BNSF between Laredo and Robstown and that KCS/TFM will be required to provide rates and service for BNSF traffic moving via Laredo and Brownsville to and from Mexico which do not disadvantage shippers who would choose BNSF's offerings in comparison to other routing alternatives.[4]

BNSF does not seek the imposition of something cumbersome or particularly complex. In accord with the kind of condition the STB imposed in the CN/Wisconsin

---

[4] BNSF is not alone in this regard. A number of the shippers who appeared at the Board's July 31st hearing or who have filed written submissions with the Board have noted the importance of requiring KCS to maintain open gateways at Laredo and Brownsville on commercially reasonable terms and/or imposing a condition to that end on the Board's approval of the transaction. These shippers include: AK Steel Corporation; CWS, Incorporated; Dal-Tile; E.I. du Pont de Nemours and Company; Griffin Industries, Inc.; Hub Group, Inc.; Lason Grain Company; Kimberly-Clark de Mexico, S.A. de C.V.; Pacesetter Steel Service, Inc.; Reagent Chemical & Research, Inc.; Unimin Corporation; and Weyerhaeuser Company. Indeed, one of those shippers – Hub Group, Inc. – has recently supplemented its prior April 28, 2003 letter of support to the Board to clarify that it "strongly supports conditions that will guarantee continued competitive and efficient . . . .rail service via the Laredo gateway." Letter from Thomas L. Hardin, Hub Group, Inc., to Secretary Williams, dated July 17, 2003

Central transaction[5] to implement those parties' agreement with NIT League, one tested, workable approach would be for the Applicants to be required to maintain the existing Tex Mex and TFM rates and services presently available for service in conjunction with BNSF at Laredo, Robstown/Corpus Christi and Brownsville for a temporary five-year period, subject to RCAF-U increases, and to provide commercially reasonable rates and services thereafter subject to the jurisdiction of the Board. Such an approach would provide a transitional time period for the development of effective interline routing and commercial relationships in light of the transaction. BNSF does not believe that a condition should preclude the new system from properly exploiting whatever competitive efficiencies and benefits it could bring to the shipping public as a result of its transaction. Thus, if the new system can offer lower rates and better service to rail shippers as a result of its extended system, then it should be free to do so.

Such a condition would reflect the Board's adoption of open gateway requirements in the revised merger rules. It would also be consistent with open gateway agreements in prior merger proceedings and would preserve BNSF's ability to offer effective competition to its customers as a replacement for SP pursuant to the UP/SP merger conditions. Such an approach would also be consistent with the position taken by KCS in Ex Parte No. 582 (Sub-No. 1) that all existing competitive shipper rail options should be preserved in future merger or control transactions.

A measured approach can make the benefits of the proposed NAFTA Rail transaction available to the Applicants and shippers, while preserving competitive

---

[5] *Canadian National Ry. Co. – Control – Wisconsin Central Transp. Corp.*, Finance Docket No. 34000.

alternatives and shipper options, so that ultimately shippers can choose the services they desire.

ARGUMENT

To ensure that there will not be a substantial lessening of competition for traffic moving between the U.S. and Mexico via the Laredo and Brownsville gateways as a result of the proposed KCS/Tex Mex/NAFTA Rail transaction, the Board should condition its approval of the transaction on NAFTA Rail maintaining commercially open gateways at Laredo and Brownsville and maintaining existing rates, subject to RCAF-U adjustments, during a five-year transition period. As shown below and in the Verified Statements of Peter J. Rickershauser ("Rickershauser V.S.") and David Reishus ("Reishus V.S.") submitted herewith, such a condition is necessary to ensure that, in the interim and over the long term, there continues to be effective competition at those two critical international gateways. Such a condition is well within the authority of the Board and is consistent with the Board's past practices and its new rules for mergers. Moreover, because KCS has already agreed and committed to maintain open gateways on commercially reasonable terms at those gateways, such a condition would not adversely affect NAFTA Rail.

I. IT IS CRITICAL TO ENSURE THAT TRAFFIC FLOWS FREELY AND COMPETITIVELY THROUGH LAREDO AND BROWNSVILLE

A. Laredo And Brownsville Are Important Gateways For NAFTA Traffic

Laredo is the most important Mexican gateway, and maintaining an open gateway at Laredo is critical for ensuring the free flow of goods between the U.S. and Mexico. As the Board recognized in the UP/SP merger proceeding, Laredo constitutes a market of "separate and surpassing economic significance" superior to other

gateways. Decision No. 44 at 422. In fact, Laredo accounts for 75% of the value of all rail traffic between the U.S. and Mexico (Reishus V.S. at 4), with overall traffic between the U.S. and Mexico growing over 300% since 1994 (*Id.*, Figure 1).

Laredo is a critical gateway for several key commodities and products. BNSF alone shipped over 13,000 rail cars of grain, 14,000 rail cars of industrial products, 5,000 rail cars of motor vehicles and auto parts, and 3,000 rail cars of intermodal traffic through Laredo in 2002 (Rickershauser V.S., Exhibit 1), and BNSF constitutes only 8% of the total Laredo traffic (Reishus V.S. at 7). Laredo is a key gateway for at least three reasons. First, "Laredo is located on the most direct route between the major population and industrial centers of Mexico City and Monterrey and the central and eastern U.S." Reishus V.S. at 4. Second, the infrastructure that has been built up at Laredo to handle significant traffic volumes on a timely basis makes Laredo one of the most efficient rail gateways to and from Mexico. Third, Laredo is the principal juncture with TFM, which "has exclusive access on the Mexican side of the Northeastern Mexican gateways of Laredo/Nuevo Laredo and Brownsville/Matamoros and reaches the important industrial centers of Mexico City and Monterrey." *Id.*

Brownsville, though carrying less traffic than Laredo, is still a significant gateway for traffic to and from areas of northeastern Mexico it can efficiently serve, particularly for grain processors and other producers near the Mexican border. "BNSF has also increased traffic over its Brownsville route by 250% over the 1996-2002 time period, with over 10,000 cars exchanged at the Brownsville gateway in 2002." Rickershauser V.S. at 4. For example, 60-70% of BNSF's traffic to Brownsville serves a single receiver – Regasa. Rickershauser V.S. at 23. If the Brownsville gateway were to be no longer

open on commercially reasonable terms, Regasa could only receive its soybean shipments through UP, or via barge or truck. *Id.* Such a diversion would nearly eliminate BNSF as a competitor to UP for this traffic, and would likely also mean that the U.S. shippers that served Regasa via BNSF would be replaced by new shippers. *Id.*

B. BNSF Is A Critical Competitor At The Laredo Gateway

Rail traffic to the Laredo gateway is dominated by UP. UP carried 84% of the traffic at Laredo in 2001. Reishus V.S., Figure 3. UP enjoys a more direct route to Laredo; its density on its shipments to Laredo provides it a lower cost structure; and its broad coverage area permits it to serve more customers at that gateway than other carriers. Rickershauser V.S. at 15, Exhibit 2.

The Board conditioned the UP/SP merger on BNSF being granted trackage rights over UP's track to enable BNSF to reach Tex Mex and to serve as an effective competitive replacement to SP for traffic going through Laredo. To further the Board's goals, BNSF has invested heavily to compete for traffic going through Laredo. *See* Rickershauser V.S. at 4. Since the Board's decision in 1996, BNSF has invested over $20 million in marketing BNSF's service to and from Mexico. *Id.* BNSF has added 7-10 additional trains each way per week, it has developed efficient unit grain train services, and it has developed value-added services, such as its Mexi-Modal service and integrated dock-to-dock carload pricing and service. *Id.*

As a result of its efforts, BNSF provides effective competitive discipline to UP. BNSF, operating through an agreement with Tex Mex, accounts for the majority of the non-UP traffic going through Laredo, and in 2002 BNSF shipped 38,800 cars through that gateway. Rickershauser V.S., Exhibit 3. BNSF has increased its traffic through Laredo 87% since 1996, driven largely by growth in grain traffic (258% growth),

industrial traffic (154% growth), and intermodal traffic (156% growth). Rickershauser V.S. at 4-7. In fact, "[d]espite UP's dominant share of traffic over Laredo, BNSF carries over a quarter of the Laredo gateway traffic to and from the tier of grain belt states from Oklahoma to North Dakota." Reishus V.S. at 12 (footnote omitted). BNSF is able to compete for this traffic because of BNSF's broad geographic reach, its ability to offer value-added services, and its reasonably efficient routings to Laredo. Rickershauser V.S. at 8-9. By contrast, KCSR, which provides only 5% of traffic to Laredo, has neither the geographic reach nor the efficient routings that would permit it to pose a competitive threat to UP. *Id.* Because BNSF is the only carrier that can provide full replacement competition against UP at Laredo, maintaining BNSF's access to Laredo at competitively reasonable rates is critical for ensuring effective competition for shippers.

As Mr. Rickershauser states, since the Board's decision in the UP/SP merger:

> BNSF has demonstrated that it can provide effective competitive discipline to UP for traffic destined for the Laredo and Brownsville gateways. Developing that level of competition, though, has required substantial investment on the part of BNSF throughout its network to support Mexican business flows and provide competitive, marketable service offerings for shippers, and has required BNSF to leverage all of its competitive advantages, from its broad geographic reach and extensive interline connections to its dedicated drive to achieving efficiencies and reducing shipping costs. In addition, BNSF's ability to provide effective competition to UP depends on the provision of commercially reasonable rates and services by both the Tex Mex and TFM, and its ability to continue to provide shippers with that competition is dependent on the continuation of such rates and services.

Rickershauser V.S. at 9. Unless BNSF continues to receive commercially reasonable rates and service from both Tex Mex and TFM, the proposed transaction could jeopardize the progress BNSF has made in providing customers relying on it a competitive alternative to UP.

II. ABSENT AN OPEN GATEWAY CONDITION, THE PROPOSED TRANSACTION MAY REDUCE COMPETITIVE OPTIONS AT LAREDO

Absent the imposition of an open gateway condition, the new NAFTA Rail could impose competitive restraints that would reduce competitive options at Laredo and Brownsville. KCS' control over both Tex Mex and TFM would give KCS numerous opportunities to restrict competition through the Laredo gateway, and KCS' comments in this proceeding and its past conduct suggest that the new NAFTA Rail may well avail itself of its options.

First, the new NAFTA Rail will have multiple options for restricting competition through the Laredo gateway. As stated in Mr. Rickershauser's Verified Statement, KCS could discriminate against its competitors in the following ways:

- KCS could raise rates at Robstown for any traffic going over Tex Mex unless it originates from the KCS system or is routed to give KCS its longest haul.
- KCS could raise rates at Laredo for any traffic going over TFM that again does not originate from the KCS/Tex Mex system or does not give the system its longest haul.
- KCS could discriminate against competing carriers on TFM by charging higher bridge fees or by reducing the crossing access that it would charge itself.
- KCS could cause TFM and Tex Mex to discontinue providing value-added services (such as blocking traffic, providing equipment or providing intermodal service) to KCS' competitors, preventing those carriers from offering fully-competitive services.

Rickershauser V.S. at 11.

Second, based on its filings to date and from its past conduct, KCS has effectively acknowledged that it intends to raise rates on BNSF traffic over Tex Mex. In their Application to the Board, the Applicants stated that they may not renew "agreements that would not provide adequate revenues to a combined KCSR/Tex Mex

system." Application at 27, n.19. The BNSF/Tex Mex 1998 interline divisional agreement, which is up for renewal at the end of 2003, appears to be one of the contracts to which the Applicants refer. Further, as KCS stated in response to a discovery request, KCS has told BNSF that it "need[s] to improve the overall revenue/expense ratio for Tex Mex of handling BNSF traffic after expiration of current BNSF-Tex Mex agreements."[6]

KCS' diversion analysis confirms KCS' intent to divert traffic from BNSF, even if that diversion results in inefficient routings of rail traffic. The only way that KCS could achieve such inefficient diversions would be to impose restrictions on BNSF that prevent it from remaining an effective competitor for the traffic. KCS anticipates that its control over Tex Mex alone – without considering the future impact of KCS' control over TFM – will result in the diversion of 4,725 rail cars from BNSF to KCS, which represents almost 10% of BNSF's traffic through Brownsville and Laredo. Rickershauser V.S. at 16. Two-thirds of that traffic will be diverted from a BNSF interchange with Tex Mex at Robstown or Corpus Christi to an interchange with KCSR at Kansas City, and in most cases, the new diverted route is longer than the existing BNSF-Tex Mex route. KCS provides no analysis of which shippers are presumed to choose this new route or on what basis KCS assumed that the traffic would divert to KCS.

Similarly, KCS indicates that it will divert 10% of BNSF's traffic from Brownsville to Laredo, even though the vast majority of that traffic is destined to points just across

---

[6] Supplement to the Kansas City Southern Railway Company's and the Texas Mexican Railway Company's Responses and Objections to Union Pacific Railroad Company's Third Set of Discovery Requests to Applicants, Supplemental Responses, served July 23, 2003, Request No. 26, at p. 2.

the border at Brownsville. Presumably, KCS intends to reroute the traffic through Laredo, south over TFM to Monterrey, and then back north to the border town of Matamoros, Mexico. It is highly unlikely that such inefficient re-routings would result from customer preference, and the only inference must be that KCS intends to impose that rerouting based on discriminatory pricing and service to BNSF.

III. KCS' TRAFFIC DIVERSIONS COULD DRIVE SHIPPERS TO USE LESS EFFICIENT ALTERNATIVE ROUTINGS AND THEREBY REDUCE OVERALL RAIL COMPETITION

Unless properly conditioned, the proposed transaction threatens to injure shippers in two ways. First, because the combined NAFTA Rail will have the ability and incentive to divert traffic to its routes in the U.S., and because of inefficiencies in many of those routes, shippers may be forced to use longer, slower, less efficient service for rail transportation through Laredo and Brownsville. Second, to the extent that NAFTA Rail succeeds in diverting traffic from BNSF and reduces BNSF's long-term competitiveness through Laredo and Brownsville, the transaction may lessen the competitive options open to many shippers who ship goods through those gateways. Such a lessening of competitive options threatens to undo the benefits that resulted from the Board's conditions imposed on the UP/SP merger.

KCS' potential traffic diversions may injure shippers by forcing them to use less efficient alternatives to reach Mexico. As discussed in the Verified Statement of Mr. Rickershauser, the KCS-Tex Mex route to Laredo is less direct than the BNSF-Tex Mex route for at least two reasons. First, "Tex Mex's trackage rights between Houston and Robstown require trains to travel 286 miles. Rather than following the coastline as BNSF's trackage rights do, Tex Mex must travel due west to Flatonia from Houston, before heading south to Robstown through Placedo." Rickershauser V.S. at 12. This

diversion is 23% longer than BNSF's route between Houston and Robstown. *Id.* Second, due to BNSF's diversity of routing options, BNSF offers a more direct route to Laredo from most major interline junction points across the U.S. In fact, KCS' routes from major cities to Laredo are anywhere from 3% to 44% longer than the comparable route for BNSF. *See* Mileage Comparison Chart attached as Exhibit 2 to Mr. Rickershauser's Verified Statement.

Of course, in the delivery of most products, "time is money, and slower service is a significant disadvantage" to shippers. *See* Letter from Louis R. Mastandrea, Unimin Corporation, to Secretary Williams, dated July 23, 2003 ("Mastandrea Letter") at 2. As shippers have made clear in their submissions to the Board, one of their "primary concerns in transporting . . . products to Mexico is transit time." Letter from Gary Kidwell, AK Steel Corporation, to Secretary Williams, dated July 25, 2003 ("Kidwell Letter") at 2.[7] The delays imposed by forced diversions to KCS' lines would likely make KCS' service uncompetitive for much traffic going to Mexico, particularly grain, motor vehicle and auto parts, and intermodal traffic, which collectively account for almost half of BNSF's traffic. Rickershauser V.S. at 5-7.

The forced diversion of traffic to KCS would further injure shippers because KCS cannot offer the range of services that BNSF can offer. While "BNSF moves over 3

---

[7] Mr. Kidwell further explained: "AK Steel is concerned that once the formation of the NAFTA Railway is completed, TFM will favor traffic that originates on its affiliated companies, i.e., KCS and TexMex, over interchange traffic received from UP or The Burlington Northern & Santa Fe Railway Company ("BNSF"). If such discriminatory practices occur, there would be a detrimental impact on cycle times, which in turn would greatly impact AK Steel's ability to obtain reliable and efficient transportation service into Mexico." Kidwell Letter at 2.

million intermodal shipments per year, KCS moves comparatively few." Rickershauser V.S. at 13. KCS' smaller scale results in less equipment availability, which limits KCS' ability to offer credible competitive service to large shippers. *Id.* Further, with only 3,130 route miles of track, KCS is not able to offer the geographic scope of service that BNSF can offer given its 33,000 route miles. This further limits KCS' ability to offer credible service to shippers seeking a comprehensive, single-source provider of rail transportation.

Since the Board's decision in the UP/SP merger granting BNSF trackage rights over UP, BNSF has achieved a toehold as an effective competitor to UP for Mexico traffic. As stated earlier, becoming an effective competitor in the Texas/Mexico corridor through Laredo has required substantial investment on the part of BNSF – over $20 million in marketing alone. It has also required BNSF to aggressively work with Tex Mex and TFM to create value-added services like Mexi-Modal and to improve overall efficiency by blocking of northbound rail traffic and other efficiency improvements. This transaction could threaten to undo BNSF's hard work, reducing the competitive options to shippers.[8]

---

[8] For example, NAFTA Rail's projected traffic diversion threatens to reduce by almost 20% the traffic gains made by BNSF in the six years since the Board's UP/SP decision. That reduction in traffic density "would squeeze BNSF's margins and could force BNSF over time to rationalize the frequency of the train service that it offers." Rickershauser V.S. at 14. Over the long run, faced with competitor control over both Tex Mex and TFM, potentially unable to offer value-added services or to negotiate efficiency-enhancing cooperative agreements, and faced with potentially discriminatory rate-setting for traffic to Mexico, BNSF may be forced to reduce its overall marketing expenditures and customer-driven infrastructure improvements for traffic over the Laredo and Brownsville gateways. *Id.* Such a reduction in service would clearly adversely affect shippers.

KCS will not be able to replace BNSF as the primary competitive alternative to UP. Contrary to assertions recently made by KCS, the Board envisioned BNSF serving as the principal competitive replacement to UP through Laredo. Decision No. 44 at 422. Over the past six years, BNSF *has been* the primary competitive alternative to UP for good reason. First, KCS' routes are longer even than BNSF's routes from most points. Given the difficulty BNSF has competing with UP's more direct routes, KCS would be at an even greater disadvantage. Second, KCS does not offer the same geographic scope of single-line service that BNSF or UP can offer, making KCS less attractive to shippers with multiple origination points. Rickershauser V.S. at 13-14; Reishus V.S. at 12.

Contrary to the assertions of some, other Mexican gateways do not offer a competitive alternative to Laredo and would not be able to ensure competitive discipline on UP if the transaction undermined BNSF's competitiveness at Laredo. First, none of the other gateways (Brownsville, El Paso or Eagle Pass) has the physical infrastructure that is in place at Laredo, and, as a result, dramatically increased shipper volumes moving through these international gateways would strain existing capacity, resulting in delays for existing as well as rerouted traffic. Second, El Paso and Eagle Pass are out of route for most eastern shippers who ship through Laredo, adding further inefficiency at those gateways. Third, because El Paso and Eagle Pass gateways provide interchange with Ferrocarril Mexicano, S.A. de C.V. ("FXE") rather than TFM, any shipment through those gateways for destinations served by TFM would require an extra interchange within Mexico at best, if such a routing would be feasible or available. Moreover, because "in practice, FXE cannot serve most shippers and receivers on

TFM's line," those gateways are ineffective as alternatives to Laredo. *See* Rickershauser V.S. at 18.[9] Finally, besides the fact that BNSF's only connection into Mexico at Brownsville would be over the KCS-controlled TFM, Brownsville cannot serve as a replacement to Laredo because the infrastructure of the track between Matamoros and the TFM main line cannot accommodate the traffic that moves through Laredo, and because that route is longer and slower than a comparable shipment through Laredo for most TFM points. *Id.*[10]

---

[9] Mr. Rickershauser's conclusion is confirmed by Mr. Mastandrea's July 23, 2003 letter to Secretary Williams. There, he notes that a routing via FXE over Eagle Pass has several "significant disadvantages".

> First, it is more circuitous, which means that shipments will take longer and cost more. Second, shipments from the United States move much more quickly through Laredo than through Eagle Pass (or Brownsville, for that matter) because there has been much more investment at Laredo. In this business, time is money, and slower service is a significant disadvantage. Similarly, because ball clay moves in carloads instead of unit trains, the less frequent service on the Eagle Pass-FXE route is also a disadvantage. Since the Eagle Pass-FXE route is used much less intensively than the Laredo Bridge, it takes longer on the FXE routing to assemble a trainload of empty cars to return from Mexico to the United States, thus further slowing the cycle time and increasing costs.

Mastandrea Letter at 2-3.

[10] Truck and water competition also cannot serve as an effective replacement for open rail gateways. Although KCS suggests in its control application (at 27-28) that truck competition obviates the need for conditions, KCS' witness Curtis Grimm took the opposite position in his testimony on behalf of Tex Mex when Tex Mex was seeking trackage rights conditions over UP in 1996. *See* Verified Statement of Curtis M. Grimm, filed March 29, 1996, in Finance Docket No. 32760 (Sub-No. 13) (excerpted at Exhibit 2 to Reishus V.S.). There, he stressed that "[a]lthough truck and water play an important role overall in transportation of goods between U.S. and Mexico, many shippers of many commodities are dependant upon rail competition for competitive transportation (cont'd)

IV. IMPOSITION OF AN OPEN GATEWAY CONDITION IS AN APPROPRIATE REMEDY TO BE IMPOSED BOTH AT ROBSTOWN AND AT BROWNSVILLE AND LAREDO

A. An Open Gateway Condition Is Consistent With The Board's Decision In Ex Parte No. 582 (Sub-No. 1) As Well As KCS' Position In That Proceeding

In Ex Parte No. 582 (Sub-No. 1), the Board recognized that existing major gateways should be kept open in future mergers and that such gateways need to be open both physically and economically. As part of its rationale for so holding, the Board recognized that most inefficient gateways have either been closed or move only minimal traffic, and it noted the broad support expressed for preserving major existing gateways. June 11 Decision at 25-26. Accordingly, the Board stated that it would "require applicants to present an effective plan to keep open major existing gateways" and would "impose conditions on any transaction that [it approves] to ensure that result." *Id.*

Moreover, an open gateway condition is consistent with the position that KCS took in the Ex Parte No. 582 (Sub-No. 1) proceeding, where it insisted that all existing competitive shipper rail options should be preserved in future merger or control

---

(... cont'd)

options." *Id.* at 128-29. The United States Department of Agriculture ("USDA") has suggested here that grain and grain products may be uniquely susceptible to truck and water competition, *see* USDA Comments filed July 25, 2003, but Dr. Grimm in 1996 pointed to the USDA's own reports to demonstrate the ineffectiveness of truck and water alternatives as substitutes for long-haul rail transportation. Reishus V.S. at 15, n.20. Indeed, if the Board had believed that truck and water competition could act as effective replacements for rail competition through Laredo and Brownsville, there would have been no need for it to condition its approval of the UP/SP transaction on access for both BNSF and KCS to Laredo and for BNSF to Brownsville.

transactions.[11] Particularly given that the Board has already acknowledged that the proposed merger between KCS and TFM would fall under the new merger rules but for the fact that TFM is across the Mexican border, application of the open gateway principle is appropriate here as well.

B. An Open Gateway Condition Is Consistent With Conditions Imposed In Other Control Proceedings

In addition to being a part of the new merger process applicable to Class I railroad mergers, the imposition of open gateway requirements has become the norm in rail control transactions to which the new regulations have not applied. In the CN/IC transaction[12] (which preceded the new rules), the Board imposed a condition requiring that the merging parties keep the Chicago gateway between CP and IC open and competitive. This condition was imposed despite the recognition of CN/IC's stated economic incentive and intent to keep that gateway open and competitive.

Similarly, in a 2001 control transaction between a Class I railroad, Canadian National, and a Class II railroad, Wisconsin Central, the Board imposed conditions to "keep all existing active gateways affected by the Transaction open on commercially reasonable terms."[13] The CN/WC transaction, like the one at issue here, was classified

---

[11] *See* "Seven Modest Adjustments Toward Better Balance in Rail Mergers", KCS (Aug. 3, 2000) at 5 ("the Board's guiding principle in any future merger proceeding should be to preserve rail service options available to shippers."). *See also* KCSR ANPR Comments at 14 ("it should be the policy of this Board to preserve the few remaining competitive rail options").

[12] *Canadian National Railway Co. – Control – Illinois Central Corp.*, Finance Docket No. 33556.

[13] *Canadian National Ry. Co. – Control – Wisconsin Central Transp. Corp.*, Finance Docket No. 34000, Decision No. 10 (served September 7, 2001), at 28.

as a "minor transaction". As a mechanism to fulfill the open gateway requirement, CN/WC entered into an agreement with NIT League that required the establishment and maintenance of commercially reasonable contract through rates on all its active gateways; that restricted any increase in their portion of common carrier through rates for five years to a measure of RCAF-U; and that precluded the closure of any active interchange after the five-year period by any commercially unreasonable means.

As Dr. Reishus explains in his Verified Statement, these modern gateway commitments are easily distinguished from the anticompetitive and discredited "DT&I conditions" that the Interstate Commerce Commission routinely imposed in the past.[14] Dr. Reishus explains:

> The DT&I conditions, which rigidly froze in place rates and interchanges as part of merger approval, were imposed on an overly regulated rail industry in desperate need of network rationalization and effectively required that rates be frozen indefinitely over routes and interchanges, no matter how circuitous, insignificant, or inefficient. The DT&I conditions functioned as an anticompetitive barrier to necessary rationalization of the rail industry. By contrast, the current gateway requirements are focused on specific significant gateways, impose specific rate caps for only limited terms (five years) subject to cost-related increases, and require only that the gateway be open on commercially reasonable terms thereafter. The commitments do not preclude procompetitive rate reductions in response to changing marketplace conditions. Rather, these gateway requirements provide a competitive transition for shippers in the face of the loss of a neutral connection and provide a regulatory backstop to actions of the newly merged parties.

Reishus V.S. at 21.

---

[14] *Detroit, Toledo & Ironton R.R. Co. Control*, 275 I.C.C. 455, 492-93 (1950).

C. An Open Gateway Condition Is Necessary To Preserve BNSF's Ability To Offer Effective SP Replacement Competition

At the time of the UP/SP decision, Tex Mex was an independent rail carrier, with barely enough traffic to sustain its own business. "Because of the UP/SP merger agreements and conditions, Tex Mex became a neutral, independent bridge carrier capable of interlining with both BNSF and KCSR in competition with UP for traffic to and from the Laredo gateway." Reishus V.S. at 10. There was no reason to believe that Tex Mex might have an incentive to artificially discriminate between its rail connections. Further, the Mexican railroad network was operated by the Mexican government, and, although privatization was on the horizon, "[i]t was anticipated . . . that the resulting privatized Mexican rail companies would provide neutral, competitive access to shippers in Mexico and for international traffic from the U.S." Reishus V.S. at 17. In fact, the past and current TFM management practice has been one of neutrality generally over the Laredo gateway for U.S. carriers, unless one carrier offered a specific and differentiated market product not provided by the other U.S. carriers which provided benefits to TFM and TFM customers meriting differential treatment. Examples of this neutral, pro-competitive behavior by TFM include:

- TFM has entered into partnerships with all three connecting railroads, UP, BNSF, and KCS, to offer intermodal service between the U.S., Canada and Mexico;

- TFM has collaborated with BNSF (and Tex Mex) to improve service to Mexico, for example, by increasing the efficiency of unit grain trains and by improving through train efficiency;

- TFM has built and subsequently upgraded key facilities to improve the handling of U.S.-Mexico traffic, such as the Sanchez yard at Nuevo Laredo, which benefits all U.S. railroads serving U.S. Mexico traffic.

Reishus V.S. at 18.

With KCS' control over Tex Mex and TFM, this state of neutrality could well change. Because BNSF's ability to compete with UP for Mexico traffic depends on offering its customers door-to-door transportation packages – including competitive rates, service, equipment quality and information exchange – any negative change to Tex Mex's and TFM's neutral stance condition could reduce BNSF's ability to serve as an effective competitor. It bears emphasizing that BNSF's ability to meet customer needs depends on competitive rate and service offerings from both Tex Mex and TFM. UP already has a well-established route to Laredo, with considerable mileage advantage compared to BNSF's route, so BNSF's ability to compete is driven by providing value-added solution services. If Tex Mex and/or TFM are no longer neutral, and do not cooperate in providing value-added services, BNSF's ability to meet its customers' needs and compete with UP will be substantially diminished. Rickershauser V.S. at 16.

Mr. Kidwell of AK Steel expressed this concern in his letter to Secretary Williams.

> In addition, AK Steel is concerned that the formation of the NAFTA Railway could impact on the ability of competing carriers to provide service to Mexico on commercially reasonable terms. As noted above, AK Steel currently has a variety of alternative transportation routings that it can use to transport its products to Mexico. The combination of KCS/TexMex/TFM, however, presents an incentive for TFM to favor KCS/TexMex to the detriment of other carriers, like UP and BNSF, that connect with TFM at the Laredo Bridge. In so doing, TFM can exercise bottleneck control to assure that AK Steel's only transportation options will be those involving the NAFTA Railway. Such practices would greatly limit UP's and BNSF's ability to provide competitively priced service for AK Steel's transportation needs to the Mexican gateway.

Kidwell Letter at 2. *See also* Letter from Jose Robles, Kimberly-Clarke de México, S.A. de C.V., to Secretary Williams, dated July 8, 2003 (the Board should ensure "that NAFTA Rail is prevented to discriminate [sic] against shipments delivered to Laredo by other carriers on both sides of the border"); Letter from Edwin E. Vigneaux, Reagent Chemical & Research, Inc., to Secretary Williams dated July 10, 2003, at 1 ("We believe the only way to achieve [open competition at the Laredo Gateway] is for the NAFTA carriers to keep this gateway open on commercially reasonable terms.").

KCS is not an adequate replacement for BNSF and could not replicate the competition that SP provided to UP before that merger. KCS' network size and scope do not match SP's scope before the merger, and certainly do not match the size and scope of BNSF's network or UP/SP's network after the merger. BNSF's network, on the other hand, closely matches UP's in territorial coverage and connections and is the only network even close to matching UP/SP in combined origin/destination territories. KCS' network is particularly deficient in comparison to BNSF's connectivity to railroads in the eastern and northern United States and Canada. Rickershauser V.S. at 19.

D. An Open Gateway Condition Should Provide For A Transition Period Which Continues Existing Rates

In imposing an open gateway condition on the KCS/Tex Mex transaction, the Board should provide a transition mechanism to ensure that there are no significant market dislocations during the implementation period. Such a transitional time period would permit the development of effective interline routing and commercial relationships in light of the transaction. As Dr. Reishus states in his Verified Statement:

> Application of open gateway conditions on the Laredo and Brownsville gateways that limits increases in rates over a fixed period, such as five years, is a reasonable public policy accommodation to preserve competition and shipper

> options. The interchanges . . . are obviously major, efficient interchanges that experience growing traffic levels; there is no risk that inefficient routings will be preserved in the foreseeable future. As recent merger proceedings prior to this one show, these rate and service restrictions have been offered, negotiated, or imposed by or on the merging parties in a manner that has been acceptable to the parties. These restrictions do not appear to have diminished the efficiency gains that the mergers generate nor do they appear to have deterred the merging parties from completing their transactions and capturing these gains. The Applicants have provided no evidence of any harm that would result from the preservation of existing competitive conditions for a limited period of time that would outweigh the protection that they provide to competition and shippers.

Reishus V.S. at 26-27.

E. The Board Has Jurisdiction to Impose Open Gateway Conditions At Laredo And Brownsville For Cross-Border Traffic

Although KCS agreed at the Board's July 31st hearing to the imposition of open gateway conditions at Laredo and Brownsville, it previously suggested in the Supplement to Application, filed June 23, 2003, that the Board would have no jurisdiction to impose conditions that would implicate its plan to acquire control of TFM. KCS Supplement at 3 n.2. Because open gateway conditions at Laredo and Brownsville would necessarily implicate KCS' plan to acquire control of TFM – indeed, open gateway conditions are required at Laredo and Brownsville precisely because of KCS' plan to acquire control of TFM – KCS' jurisdictional objection to such conditions may now be moot. Nevertheless, to avoid any doubt regarding the Board's authority to impose such conditions, a brief review of the legal basis for that authority is set forth below.

First, no one disputes that the Board has jurisdiction over KCS and Tex Mex or that the Board can impose conditions in the U.S. public interest on KCS' acquisition of

control of Tex Mex. *See* 49 U.S.C. § 11324(c); 49 C.F.R. § 1180.1(d). Furthermore, there is no doubt that the Board's jurisdiction extends not only to domestic rail traffic but also to traffic moving between the U.S. and a foreign country. *See* 49 U.S.C. § 10501(a)(2)(F). In fact, it was specifically because of the Board's concern that competition be maintained for cross-border traffic moving between the U.S. and Mexico through Laredo and Brownsville that the Board in the UP/SP proceeding conditioned that transaction on BNSF's obtaining access to Laredo and Brownsville to act as a competitive counterweight to UP for that traffic. KCS too owes its access to Laredo to the conditions imposed by the Board in that proceeding to maximize competition for U.S.-Mexican traffic.

Second, KCS' plans to acquire control of TFM and integrate it into NAFTA Rail are closely related to its acquisition of control of Tex Mex. This is not a situation, like KCS' acquisition of the Panama Canal Railway Company, where there is no connection between the transaction before the Board and a transaction in another country. KCS' planned TFM acquisition is part and parcel of KCS' NAFTA Rail plan. Most of the traffic that moves over Tex Mex today is bridge traffic that is terminated or originated by TFM. KCS has made clear that it expects to use its integrated NAFTA Rail system to divert traffic that currently moves via BNSF-Tex Mex-TFM or UP-TFM through Laredo and BNSF-TFM or UP-TFM through Brownsville to KCS-Tex Mex-TFM routings. Whether those diversions occur because KCS' integrated system offers better service and rates or because KCS uses its control of Tex Mex and TFM to foreclose BNSF and/or UP depends on whether the Laredo and Brownsville gateways truly remain open, both physically and economically. Arguably, how KCS uses its control of TFM is even more

important than how it uses its control of Tex Mex, because TFM is the only carrier carrying traffic to and from Mexico from both Laredo and Brownville.

The STB need not be concerned that it is being asked to "regulate" in a foreign country. The issue here is not intra-Mexican traffic. The issue here is cross-border traffic moving between the U.S. and Mexico – in which the U.S., its shippers, and its railroads have a vital interest. The Board made clear in Ex Parte No. 582 (Sub-No. 1) that the public interest is served when major gateways remain open in the wake of a merger, and this includes major international gateways. June 11 Decision at 25-26. While Mexican or Canadian law may also have a role to play in keeping those gateways open, the Board must make its own judgment about the conditions that are appropriate to protect U.S. commerce when railroads seeking approval for transactions involves cross-border traffic. Reishus V.S. at 22-25. In fact, in UP/SP, the Board emphatically rejected the suggestion from KCS that cross-border traffic with Mexico involved foreign policy considerations that were beyond the Board's jurisdiction: "We reject KCS' various challenges to our jurisdiction and to the manner in which this proceeding has been conducted. Our jurisdiction extends to rail traffic moving in foreign commerce." Decision No. 44 at 464.

More recently, in Ex Parte No. 582 (Sub-No. 1), the Board rejected arguments that it could not require the submission of information from merger applicants regarding the impact of their foreign operations on U.S. commerce. June 11 Decision at 46-47. In fact, the Board specified in its new merger rules:

> All applicants must submit "full system" competitive analyses and operating plans – incorporating any operations in Canada or Mexico – from which we can determine the competitive, service, employee, safety, and environmental

> impacts of the prospective operations within the United States . . . . [49 C.F.R. § 1180.1(k)]

Thus, there is no doubt that an applicant before the Board can be required to make known its plans for cross-border operations and that the Board can condition the proposed transaction and any affiliated transactions so as to protect U.S. interests.

Third, the Board has jurisdiction to protect its own conditions. In UP/SP, in order to protect U.S. interests in cross-border traffic, the Board imposed as a condition on the transaction that BNSF be given access to Brownville and, via Tex Mex, to Laredo. It also gave KCS access via Tex Mex to Laredo. At the time, both TFM and Tex Mex were independent carriers and could be expected to set reasonably competitive rates in connection with BNSF. There was no apparent need to impose open gateway conditions. Even so, after BNSF had negotiated an agreement with Tex Mex in 1998, it was stymied for some time in obtaining a final agreement. Because of the Board's continuing oversight of the UP/SP transaction, BNSF had an avenue for relief from the Board. If KCS obtains control of both Tex Mex and TFM, it will be in a position potentially to interfere with BNSF's ability to continue to provide efficient cross-border service via Laredo and Brownsville. BNSF would certainly hope to avoid any need to approach the Board to resolve any dispute about gateway closure which became intractable, but if a proceeding became necessary, there can be no doubt that the Board would have jurisdiction to enforce the conditions it imposed in UP/SP and require KCS to permit its controlled affiliates to continue commercially reasonable rates and practices with BNSF.

Finally, it bears emphasizing that the Board's authorization of a control transaction is permissive. If the parties seeking that authorization do not wish to comply

with the conditions that the Board sets in the public interest, they need not consummate the transaction. Thus, if KCS did not expect an open gateway condition to be imposed at Laredo or Brownsville and did not wish to comply with such a condition, it would not have to proceed with its acquisition of control of Tex Mex. In this case, of course, KCS has confirmed that it anticipated such a condition and has already agreed to its imposition. Even were it not estopped from challenging the Board's jurisdiction, however, it could not reasonably complain that it should not be required to comply with open gateway conditions as a prerequisite to the consummation of its NAFTA Rail plans.

CONCLUSION

For the reasons set forth above, BNSF respectfully submits that, should the Board find that the proposed KCS/Tex Mex control transaction is in the public interest and determine to approve the transaction, then it should condition its approval of the transaction by requiring the Applicants to maintain the existing Tex Mex and TFM rates and services presently available for service in conjunction with BNSF for a temporary five-year period, subject to RCAF-U increases, and to provide commercially reasonable rates and services thereafter subject to the jurisdiction of the Board. The imposition of such a condition to maintain open gateways at Robstown, Laredo and Brownsville on a "commercially reasonable" basis would provide shippers and connecting carriers a safety net and regulatory jurisdictional backstop if the market did not function to preserve and permit the use of efficient routings in the future if and when problems

developed. It would do so without unduly affecting the Applicants' ability to offer shippers the benefits of the proposed transaction.

Respectfully submitted,

Jeffrey R. Moreland

CERTIFICATE OF SERVICE

I hereby certify that a copy of the foregoing was served on all parties of record in Finance Docket No. 34342 by first-class mail or a more expeditious manner.

VERIFIED STATEMENT
OF
PETER J. RICKERSHAUSER

My name is Peter J. Rickershauser. I am the Vice President of Network Development for The Burlington Northern and Santa Fe Railway Company ("BNSF"). My business address is 2650 Lou Menk Drive, Fort Worth, TX 76131.

The purpose of this Verified Statement is to set forth BNSF's position on the control transaction proposed by KCS and Tex Mex. BNSF wants to support KCS in its NAFTA Rail transaction. BNSF's interest in the transaction and the overall KCS/Tex Mex/NAFTA Rail transaction is to ensure that rail shippers throughout the United States, Canada and Mexico who rely on BNSF to provide them access to south Texas and Mexico markets and customers are not competitively worse off as a result of the tandem NAFTA Rail transactions. The pledges and other commitments which KCS has made to the Board address many of BNSF's concerns, and, as a result, BNSF supports the proposed transactions subject to the acceptable clarification of KCS' pledges and to their inclusion as conditions on the Board's approval of the transaction in this proceeding.

BNSF believes that, in reviewing the transaction, the Board should address the unique aspects of the transaction by ensuring that KCS, Tex Mex, and TFM maintain open gateways through Laredo and Brownsville and by requiring specificity to KCS' pledges that "it will keep the Laredo gateway open on commercially reasonable terms," that KCS will "continue to cooperate with UP, [and] BNSF . . . on interline services," that "KCS [will] honor the terms of all marketing and pricing agreements involving Tex Mex and TFM . . . to their full term and will not seek to cancel them early," that "[a]ll carriers will be treated fairly at the Laredo bridge," and that "[t]here will not be significant changes in operations and safety will remain a top priority."

Verified Statement of Gerald Davies, Supplement To Application, filed June 23, 2003 ("Davies V.S."), at 14-17.

BNSF is in the unique position of having, unlike UP, to rely on Tex Mex interchange service over Corpus Christi and Robstown, TX to reach the Laredo gateway, thus involving two additional significant interchange points for rail customers in south Texas as well as Mexico to be considered in any discussions involving gateways. BNSF understands KCS' plans to use the NAFTA Rail system to "help secure the financial stability of Tex Mex," bring investment to the Tex Mex system, and generally improve operations and capacity across the Tex Mex network which BNSF and our customers rely on for south Texas and Laredo access. But, while the Applicants have pledged to "keep the Laredo Gateway open on commercially reasonable terms," *Id.* at 15, they have not given the type of detailed, written assurances that are needed to ensure the shipping public that the Applicants will provide commercially reasonable rates to BNSF between Laredo and Robstown, and that the new NAFTA Rail will provide competitive rates and service for BNSF traffic moving via Laredo and Brownsville to and from customers and points accessed by TFM in Mexico. Such commitments are needed in this case to ensure that shippers relying on BNSF to access markets in south Texas served by Tex Mex and Mexico served by TFM are not injured and to ensure that BNSF can continue to serve as an effective competitive replacement for SP vis-à-vis UP, as envisioned under the UP/SP merger conditions.

BACKGROUND AND QUALIFICATIONS

I joined BNSF in October 1996, as Vice President, Marketing, UP/SP Lines. Subsequently, I served as Vice President, Marketing for the UP/SP Lines and the Mexico Business Unit. In those positions, I was responsible for, among other things, coordinating the marketing and implementing of the new service opportunities that BNSF offers to shippers as a

result of the merger of UP and SP, and for coordinating the marketing and service offer for BNSF's Mexico service. Because of my experience in those positions, I am intimately familiar with the market and competitive conditions affecting rail transportation in southern Texas and Mexico.

Prior to joining BNSF, I was Vice President, Sales, with SP in Denver, Colorado, where I directed SP's field carload sales force in the United States and Canada. From 1991 to 1995, I was Managing Director, Regional Sales-Midwest, in Lisle, Illinois, for SP. Prior to that, I spent nine years in various sales and marketing management positions with Norfolk Southern Corporation, seven years in various sales management positions with Norfolk & Western Railway Company, and three years in track maintenance and transportation assignments with several predecessors of Conrail. As a result of my extensive sales, marketing, and transportation experience, I have gained detailed knowledge of the needs of customers and how railroads can meet those needs.

In my current position as Vice President of Network Development, I focus on developing BNSF's rail network to better meet the needs of BNSF's shipper customers. In this capacity, I have acquired substantial knowledge of the strengths and weaknesses of BNSF's rail network and of the networks of our connecting carriers and competitors.

I. BNSF'S COMPETITIVE SERVICE OFFERING IN SOUTHERN TEXAS AND MEXICO

Since the Board's decision in the UP/SP merger proceeding granting BNSF trackage and haulage rights to reach Mexican markets via border crossings points including those in Brownsville and Laredo, TX, effective in September, 1996, BNSF has worked aggressively to expand our Mexican commercial presence on both sides of the international border and to develop an effective competitive offering for customers' traffic bound to or from Mexico

through the Laredo and Brownsville, as well as other gateways. In the past six years, BNSF has invested over $20 million marketing BNSF's service to and from Mexico. Since 1996, BNSF has:

- Increased its annual marketing expenditures for Mexican traffic by over 1000%;
- Identified over 2,000 Mexican rail customers for which BNSF can provide connecting international rail transportation;
- Added 7-10 additional trains each way per week over the BNSF-Tex Mex line compared to what BNSF previously routed via SP-Tex Mex;
- Developed value-added services, such as Mexi-Modal (a door-to-door intermodal service including CN and CSX railroads) and Mexi-Rail (an integrated dock-to-dock carload service);
- Developed efficient unit grain train services in partnership with TFM by focusing on total cycle times for rail cars;
- Helped Mexican customers finance and build track expansions at their facilities on TFM to encourage business to shift to rail;
- Partnered with Tex Mex and TFM to improve through train efficiency by managing the "Despacho Previo" (border customs clearance) process, as well as participating in train pre-blocking to reduce handlings northbound and southbound on BNSF, Tex Mex and TFM;
- In coordination with other carriers and service providers, developed the ability to deliver "one-stop shop" products and services.

Through BNSF's aggressive marketing, its increased service, and its value-added offerings, BNSF increased its Laredo traffic by 87% from 1996 to 2002, making it, as validated by KCS in its control application (at 77), "Tex Mex's primary interchange partner, with 35,000 carloads of forwarded and 10,000 cars of received traffic in 2001." In 2002, BNSF carried almost 40,000 cars of traffic to and from the Laredo gateway. *See* Exhibit 3. BNSF has also increased traffic over its Brownsville route by 250% over the 1996-2002 time period, with over 10,000 cars exchanged at the Brownsville gateway in 2002. This competition by BNSF has

imposed a competitive discipline on UP, which is reflected by the fact that UP's average rate over Laredo did not increase at all during the period 1997 to 2001. UP Fifth Annual Oversight Report in F.D. No. 32760 (Sub-No. 21) (UP/SP 384) (July 2, 2001) ("2001 Oversight Report"), at 111.

The significance for rail freight transportation service providers to reach and maintain access to the Laredo gateway for NAFTA flows cannot be understated. For 2001, fully 75% of all rail shipments between the U.S. and Canada to and from Mexico passed through the Laredo gateway over either UP or Tex Mex. As KCS stated in its control application, "Laredo has long been the principal rail gateway between the U.S. and Mexico. This fact is due to Laredo's superior infrastructure, such as customs brokers, and its location on the shortest route between many U.S. and Mexican origins and destinations, particularly between major Mexican industrial and population centers and the Midwest and Eastern U.S." Application, filed May 13, 2003 at 84.

As detailed in Exhibit 1, BNSF's traffic through Laredo and Brownsville is primarily in four commodity categories of traffic: agricultural goods, industrial materials, motor vehicles and auto parts, and intermodal traffic. A brief description of that traffic follows.

Agricultural Products. Over a third of BNSF's Laredo traffic is grain traffic and over 80% of BNSF's Brownsville traffic consists of grain and grain products, much of which is consumed by customers in Matamoros, directly adjacent to Brownsville. Because grain is a commodity product, customers are particularly sensitive to changes in shipping costs. BNSF's customers include both grain suppliers in the U.S. that need the least-cost/highest service/most efficient route for distributing their grain, and Mexican grain purchasers that need access to a broad number of U.S. grain suppliers to ensure competitive grain delivery economics.

Competition for this business includes other railroad combinations, other commodities and geographic areas, and, to an extent, other transportation modes, including water-borne and truck. BNSF has addressed competitive issues in a number of ways, including extending our high service and efficient 110 car grain shuttle network in partnership with Tex Mex and Mexican rail carriers to a growing number of new and expanded shuttle facilities within Mexico. Because of BNSF's efficient routes, extensive interline connections, added services, and broad geographic reach in grain production areas across the western United States, BNSF has been able to increase its agricultural traffic to Mexico via Laredo by 258% since 1996.

Industrial Products. Traffic in industrial products carried to and from the Laredo gateway by BNSF has grown 154% since 1996, and this traffic now constitutes over a third of BNSF's Laredo traffic. This traffic consists of a variety of different products from scrap paper and cement to aluminum and steel products. Shippers of these goods, and other products such as chemicals, are often either small or operating at widely-dispersed locations, and buyers will often seek to single-source contract with rail carriers that can give them broad access to those shippers. BNSF's broad western U.S. geographic reach and connections to carriers servicing other areas in the eastern U.S. and Canada has allowed it to compete effectively for those customers' business and thus increase its traffic.

Motor Vehicle and Auto Parts. BNSF's motor vehicle and auto parts traffic constitutes 13% of its Laredo traffic, with over 5100 cars shipped annually. Although BNSF has been more successful in serving this traffic via its western Mexican gateways (due to the location of traditional BNSF auto partners' manufacturing locations on the rail networks within Mexico), its ability to provide competitive pricing at the Laredo gateway and its ability to provide reliable and timely service have nonetheless imposed competitive discipline on UP. For example, as a

result of BNSF's competition with UP, UP reduced its overall cost of service to DaimlerChrysler by 25-30% for traffic between the U.S. and Mexico. Consequently, while BNSF's overall share of automotive traffic to and from Mexico is small, our ability to continue to compete (and hopefully secure) more of that traffic in the future depends on the interline service offerings and cost parameters BNSF receives from NAFTA Rail to move via Tex Mex and TFM.

Intermodal. BNSF has invested heavily to attract intermodal traffic to BNSF's network. While intermodal traffic constituted only 8% of BNSF's traffic through Laredo in 2002, that traffic has increased 156% since inception in 1997, and BNSF expects the traffic to continue to grow at double digit rates over the next three years. Intermodal shippers are some of the most time-sensitive customers for BNSF because they carry both inputs to manufacturing, as well as finished goods to distributors for ultimate consumers. BNSF has grown this business in part through the development of its Mexi-Modal service, which is a unique product offering of door-to-door service between the U.S., Canada and Mexico. In addition, BNSF has worked with Tex Mex in developing joint intermodal services in conjunction with Tex Mex's new intermodal facility at Serrano Yard (Milepost 9) on Tex Mex directly east of Laredo. BNSF also worked with Tex Mex and TFM to develop coordinated in-bond U.S. and Canadian products for service to and from points within Mexico. Indeed, without accessing and exploiting BNSF's extensive intermodal network on an interline basis, Tex Mex has a geographically-constricted intermodal service offering for shippers and receivers at Laredo with which to compete with UP's nearby extensive Port Laredo facility, leaving most of the western U.S. without alternative competitive intermodal product offerings.

NAFTA Traffic. In addition to its service to U.S. shippers, BNSF also carries significant NAFTA traffic via its connections with Canadian carriers. BNSF's direct north-south routing

and extensive connections with both CP and CN make BNSF an attractive shipping partner for Canadian traffic, a significant portion of which moves to or from Mexico. For example, in 2002, BNSF carried over 6,800 rail cars from Canada to Mexico, which alone equals almost a quarter of *all* traffic carried by KCS over Tex Mex.

A major operational and marketing initiative being undertaken by BNSF and our partner connecting carriers calls for redesigning interline flows to focus interline carload traffic over fewer gateways with improved service consistency and shipment velocity. A key component of these initiatives, and part of our "Ease Of Doing Business" initiative directed at rail shippers and seeking to make rail more competitive with motor carriers for additional traffic, is pricing simplification to provide competitive through rates on a timely basis. An initial focus of this initiative with both major eastern railroads involves service improvements over the New Orleans, LA gateway, with new carload services in place with CSX and under design with NS. Given BNSF's more direct route between many major eastern gateways and Laredo in conjunction with Tex Mex (for example, as shown on Exhibit 2, the BNSF-Tex Mex route between Laredo and New Orleans is 738 miles, compared with UP's still shorter 724 mile route and with KCS' 1,043 mile route), these initiatives have the opportunity to attract more business to rail from alternative modes, provided BNSF retains the ability to handle this traffic competitively with Tex Mex and TFM for Mexican customers and markets.

Overall, during the past six years, BNSF has demonstrated that it can provide effective competitive discipline to UP for traffic destined for the Laredo and Brownsville gateways. Developing that level of competition, though, has required substantial investment on the part of BNSF throughout its network to support Mexican business flows and provide competitive, marketable service offerings for shippers, and has required BNSF to leverage all of its

competitive advantages, from its broad geographic reach and extensive interline connections to its dedicated drive to provide shippers with improved and additional transportation service options and to achieve efficiencies and reduce shipping costs. In addition, BNSF's ability to provide effective competition to UP depends on the provision of commercially reasonable rates and services by both the Tex Mex and TFM, and its ability to continue to provide shippers with that competition is dependent on the continuation of such rates and services. Thus, the transaction proposed by KCS and Tex Mex could jeopardize BNSF's progress to date and thereby reduce the competitive offerings available to shippers, unless BNSF continues to receive commercially reasonable rates and service from both the Tex Mex and TFM components of the new NAFTA Rail.

II. ABSENT EFFECTIVE OPEN GATEWAY CONDITIONS, KCS COULD FORCE SHIPPERS TO DIVERT TRAFFIC TO KCS

One of the key elements to BNSF's ability to provide competitive service has been its ability to strike reasonable and stable interline pricing and contract terms with Tex Mex and TFM that provide for competitive rates and for BNSF to work cooperatively with Tex Mex and TFM to ensure efficient service for traffic traveling over those lines. While KCS has made a number of helpful "pledges" to the Board on terms and commitments under which NAFTA Rail will work with BNSF (and UP) over the Laredo and Brownsville gateways, many of the pledges lack necessary specificity. Absent continuation of existing interline working relationships with Tex Mex and TFM, perhaps through agreement on enforceable terms of open gateway agreements and their imposition as conditions, KCS has indicated that it will impose new terms and conditions for traffic traveling over Tex Mex and TFM that may restrict BNSF's access to Mexico, and thereby may prevent BNSF from providing an effective competitive alternative to UP.

Specifically, KCS stated in its Application that NAFTA Rail may not renew some pricing and marketing agreements that do not provide "adequate" revenues for a combined KCS/Tex Mex system. Application at 26-27 n.19. The BNSF/Tex Mex 1998 Laredo-Robstown interline division agreement, which covers most commodities moving between BNSF and Tex Mex for the Laredo gateway, and which is up for renewal at the end of this year, appears to be one of the contracts to which KCS refers. Further, as KCS stated in a discovery response in this proceeding, KCS has told BNSF that it "need[s] to improve the overall revenue/expense ratio for Tex Mex of handling BNSF traffic after expiration of current BNSF-Tex Mex agreements."[1] This uncertainty is already impacting BNSF and, potentially, shippers relying on BNSF to reach south Texas and Mexico markets via Laredo and Tex Mex. For example, for customers wanting long term (beyond the end of 2003) rates in conjunction with BNSF and Tex Mex to access Laredo, BNSF cannot offer firm rates and commitments to offer customers in response to many of their inquiries. As the end of 2003 draws closer, customers' abilities to obtain the kind of commitments they need to route their freight to and from Laredo from BNSF in conjunction with Tex Mex will grow more difficult, causing them to look to other carriers, other modes or other markets to handle their Mexico transportation and distribution needs. Waiting for the rates to expire before considering renewal, extension, or renegotiation, as suggested by KCS' Gerald Davies' at the July 31, 2003 Board hearing on the proposed transaction, is not responsive to shippers' needs in this critical competitive corridor. Additionally, resolution of this issue is not of concern to UP or its customers, as UP has its own Laredo access, bypassing Tex Mex.

[1] Supplement to the Kansas City Southern Railway Company's and the Texas Mexican Railway Company's Responses and Objections to Union Pacific Railroad Company's Third Set of Discovery Requests to Applicants, Supplemental Responses, served July 23, 2003, Request No. 26, at page 2.

Moreover, in its diversion analysis, KCS has projected that it will divert 4,725 cars from BNSF to KCS, which represents almost 10% of BNSF's traffic through Brownsville and Laredo.[2] While KCS has not specifically explained how it would achieve those diversions, given its other comments, KCS could achieve that end by raising BNSF's rates over Tex Mex and TFM such that BNSF is not able to compete against KCS for shippers that are served by both railways.

Because KCS has not submitted an operating plan to the Board, its exact operating intentions are unclear. But, there are a number of steps that KCS could take to divert traffic to the KCS system:

- First, KCS could raise rates at Robstown for any traffic going over Tex Mex unless it originates from the KCS system or is routed to give KCS its longest haul. This would artificially increase other carriers' costs, giving KCS a competitive advantage. For example, as stated in KCS' control application, "the other most significant shift comes from traffic that BNSF currently interchanges with Tex Mex at Robstown/Corpus Christi being interchanged instead with KCSR in Kansas City and moving via the commonly-controlled KCSR/Tex Mex to Laredo from that point." (Application, at 122)

- Second, KCS could raise rates at Laredo for any traffic going over TFM that again does not originate from the KCS/Tex Mex system or does not give the system its longest haul.

- Third, KCS could discriminate against competing carriers on TFM by charging higher bridge fees or by reducing the crossing access that it would charge itself. While KCS' "pledges" appear to address the first issue, the second remains – and could impact BNSF-Tex Mex traffic as compared to KCS-Tex Mex traffic.

- Fourth, KCS could cause TFM and Tex Mex to discontinue providing value-added services (such as blocking traffic, providing equipment or providing intermodal service) to KCS' competitors, preventing those carriers from offering fully-competitive services.

---

[2] This projection assumes a static state with respect to KCS' transaction with TFM. Thus, diversions are significantly understated since they do not take any potential anticompetitive steps on TFM into account.

KCS has not disclosed its actual pricing and service intentions for traffic going through Robstown or Laredo. While KCS has made a vague promise many times to keep the Laredo and Brownsville gateways "open on commercially reasonable terms," KCS has refused to give any specific assurances as to what that will mean, beyond a statement "This is the same commitment that was made in the CN/WC and CSX/NS/Conrail merger cases and KCS will live by those commitments." Davies V.S., at 15. Absent a firm and well-defined open gateway commitment by KCS, or the imposition of a condition by the Board, KCS will be free to divert traffic to its own system without regard to the efficiency of such diversions.

As Mr. Davies reported to the Board at the July 31, 2003 hearing, KCS has reached an agreement on the NAFTA transactions with NIT League. BNSF is anxious to review and understand the terms of that agreement, but is hopeful that it will further provide the specificity on the open gateway commitment by KCS to shippers and permit this issue to be resolved.

III. TRAFFIC DIVERSION TO KCS COULD INJURE SHIPPERS

Because of several inadequacies of the KCS/Tex Mex route compared to the BNSF/Tex Mex route, the economic diversion of traffic from BNSF to KCS would in many cases reduce the quality of service available to shippers and negatively impact competition.

First, because the KCS/Tex Mex connection between Houston and Robstown is circuitous compared to BNSF's route, a diversion of traffic to NAFTA Rail from BNSF would add to the shipping time for traffic going to Laredo. Tex Mex's trackage rights between Houston and Robstown require trains to travel 286 miles. Rather than following the coastline as BNSF's route, which includes trackage rights, does, Tex Mex must travel due west to Flatonia from Houston, before heading south to Robstown through Placedo. This diversion is 23% longer than BNSF's route between Houston and Robstown. Further, Tex Mex must go through the Houston

terminal complex, while BNSF skirts around Houston from the northwest on its own line to reach its trackage rights over UP at Algoa to reach Robstown for much of its south Texas and TFM business. In all, Tex Mex's circuity can add an often substantial number of hours of shipping time over a comparable shipment over BNSF track.[3]

In fact, as can be seen on the mileage chart attached as Exhibit 2, the combined KCS/Tex Mex route is longer than the BNSF/Tex Mex route from most major interconnection points across the U.S. to Laredo. For example, from Chicago, KCS/Tex Mex is 1779 miles, while BNSF/Tex Mex is 1660 miles with one less rail carrier in the route (and the dominant rail carrier in the lane, UP, has a route hundreds of miles shorter than BNSF's route). Further, KCS/Tex Mex is 304 miles longer than BNSF (44% longer) from Dallas-Fort Worth to Laredo. BNSF's ability to compete with UP and highway competition is due in part to the more direct north-south route that BNSF enjoys compared to KCS, and in part due to the circuitous nature of the Tex Mex route.

Second, KCS does not offer shippers the range of transportation services and products that BNSF can offer. For example, while BNSF moves over three million intermodal shipments per year, KCS moves comparatively few. This diminishes its ability to compete for double stack intermodal auto parts business due to the overall equipment, infrastructure and capacity requirements. Further, many customers prefer to obtain all rail service requirements from a single-source, even if they have multiple origination locations. BNSF operates one of the largest railroad networks in North America, with 33,000 route miles of track covering 28 states, which allows BNSF to serve as a single-source provider. KCS, by contrast, has less than 10% of

---

[3] Although Tex Mex proposes to reduce this time by relaying track across an 85-mile right of way between Rosenberg and Victoria, Texas, given its projected cost of $60-120 million (depending on a number of factors relating to infrastructure to be installed on this line), the development of that track may be years away.

BNSF's trackage (3,130 track miles), and serves only 11 states. KCS' small network footprint leaves it unable to compete for business from customers seeking a single-source provider without working with partner connections. This recognition on the part of KCS led to its establishing a number of marketing "Alliances" and agreements with connecting carriers having extensive route networks, including BNSF which, as KCS reported in its control application, was inaugurated in 2002 (Application, at 56-57). However, despite KCS' statement that this marketing agreement was entered into "in part to jointly facilitate the development of NAFTA traffic" (*Id.*), traffic to and from Mexico was specifically excluded from the agreement's application at the insistence of KCS, and neither Tex Mex nor TFM are parties to the agreement as a result.

Third, as KCS has pointed out several times, Tex Mex must operate over UP's infrastructure to connect KCSR with TFM, and has over the years and in this proceeding levelled numerous complaints about the handling of Tex Mex trains and line capacity over UP. For example, as KCS pointed out in its control application, "[A]t timetable speeds (which generally have declined since the UP/SP merger), Tex Mex's Robstown-to-Victoria trip could be made in about three hours. However, due to congestion on the Brownsville Subdivision, UP dispatchers often refuse a Tex Mex train entry onto the trackage rights line unless the crew has 5 or even 6 hours of service available" (*Id.*, at 134). Elsewhere in the control application, KCS states "[T]he diversion study also assumes that Tex Mex's operations over UP's lines will be as efficient as if Tex Mex owned those lines. Currently that is not the case. The section of UP's Brownsville Subdivision utilized by Tex Mex is often near gridlock these days . . . These delays significantly increase Tex Mex's train operating costs, including crew costs" (*Id.,* at 149). In its June 23 supplemental filing, KCS further stated "NAFTA Rail's ability to compete against UP at Laredo

depends largely upon the dispatching, maintenance, and investment practices of UP. In the end, NAFTA Rail can remain competitive only if UP is held to its promises, commitments, and agreements to provide neutral treatment to Tex Mex trains, invest in its infrastructure, and maintain service levels on the tracks used by BNSF and Tex Mex to provide a competitive alternative to UP." (Supplement, at 22-23). These claims were repeated at the recent Board hearing. KCS' ability as NAFTA Rail to increase its competitiveness over Tex Mex for TFM traffic could in part depend on its ability to resolve these issues with UP.

IV. TRAFFIC DIVERSION COULD FURTHER INJURE SHIPPERS BY REDUCING BNSF'S ABILITY TO SERVE AS EFFECTIVE COMPETITOR TO UP

The Board's conditions in the UP/SP merger called for BNSF to serve as the competitive replacement for SP to ensure that there is effective competition to UP for traffic to and from southern Texas and Mexico. As discussed earlier, BNSF has invested heavily – over $20 million in marketing costs alone – to offer service that is competitive to UP. BNSF has added additional train service (7-10 additional weekly trains to and from Laredo alone), has developed value-added services such as Mexi-Modal, and has improved its overall efficiency through cooperative agreements with Tex Mex and TFM. As a result, BNSF has increased traffic through Laredo by 87% since 1996, and its competitive presence has disciplined UP, whose prices for traffic through Laredo have remained essentially flat over the same time period. *See* 2001 Oversight Report, at 111.

Despite its success to date, BNSF remains challenged in its ability to compete against UP, which enjoys a network competitive advantage due to its more direct, efficient routings, as shown in the mileage chart in Exhibit 2. As demonstrated in Exhibit 3, BNSF traffic at Laredo declined 14.6% from 2001 to 2002, and BNSF has actually lost market share over that same time period. BNSF's continued ability to serve as an effective competitor will depend on BNSF's

ability to offer long-term competitive and stable interline rates and value-added services, and to maintain sufficient density on its routes.

The competitive steps that KCS may take absent clarity on its open gateway pledge and imposition of those terms as a condition by the Board may erode or eliminate BNSF's ability to remain competitive and thereby deprive shippers of competitive alternatives. For example, decreasing BNSF's traffic density to Brownsville and Laredo by 10% (as projected in KCS' traffic diversion analysis included in its control application) would eliminate almost 20% of BNSF's growth since 1996 and half of BNSF's growth since 1997. That reduction in density would squeeze BNSF's margins and could force BNSF over time to rationalize the frequency of the train service that it offers, making itself uncompetitive for other traffic of existing and potential BNSF customers in this market.

If KCS directed Tex Mex and TFM to cease cooperation with BNSF (*i.e.*, by no longer providing blocking on north-bound traffic, or improved cycle times on unit grain trains, or by no longer providing intermodal service in Mexico), BNSF would be limited in its ability to offer some of the value-added services that have helped it attract traffic.[4] To the extent BNSF is no longer able to grow its Mexican business at historic rates, BNSF may need to reduce its marketing expenditures and reduce or even end the assistance it has provided to shippers to build out their infrastructure to provide value-added services and shift traffic to longhaul rail handling in the U.S. and Mexico. Such responses, while necessary to maintain financial feasibility of the routes, may further erode BNSF's ability to serve as an effective competitor with other carriers and modes for traffic through Laredo. While BNSF would have the option of shifting some

[4] While KCS has stated in a letter to David Meyer dated July 21, 2003, that it will use its control over TFM to ensure that TFM "cooperates" with BNSF in providing services, that commitment should be made express through a condition in this proceeding, so that later, when pinched for competitive leverage, NAFTA Rail does not reduce such services.

portion of its Mexico traffic to TFM's competitor, Ferrocarril Mexicano (FXE), this scenario could nonetheless have a significant impact for rail shippers relying on BNSF, not only within BNSF's western U.S. service territory but on connections, both Class I carriers and shortline and regional rail carriers alike, to reach south Texas and Mexican markets served by Tex Mex and TFM.

BNSF's service through other Mexican gateways is not likely to provide effective competition to UP over the Laredo gateway. For example, BNSF's other direct access to TFM, through Brownsville, could not serve as a competitive replacement to Laredo for at least three reasons. First, the Brownsville gateway does not have the physical infrastructure or support services for handling international traffic that Laredo enjoys. For example, there is no intermodal service provided by any rail carrier in the Brownsville-Matamoros area because there is no facility there. Second, TFM's route between Matamoros and TFM's main north-south line (between Nuevo Laredo and Mexico City) has the characteristics of a lighter-density route, in keeping with the traffic volumes moving over it. Unlike TFM's core, high density/high capacity route south from Laredo, the Matamoros line has not enjoyed the benefit of major capital investments, which limits its ability to carry the volume of traffic, including time-sensitive automotive, intermodal, and other commodities that currently move through Laredo. Third, TFM's line from Matamoros passes through Monterrey to reach TFM's main north-south Laredo line, whereas the Nuevo Laredo route enjoys a bypass around Monterrey, impacting transit time and potentially bringing additional volumes and congestion to Monterrey which is not present now if usage was increased.

While BNSF may divert some traffic to El Paso or Eagle Pass, those gateways would also not provide strong competition to Laredo because (1) they are out of route for most shippers who

would ship through Laredo, (2) they lack the border crossing and yard infrastructure of the Laredo gateway, and (3) FXE may not serve the BNSF shippers' customers located on TFM in Mexico. For example, the El Paso gateway is over 500 miles out of route from Chicago compared to the UP-TFM route via Laredo. While the El Paso route can compete for West Coast traffic, the majority of Mexican intermodal business flows are between the U.S. Upper Midwest region and facilities in Mexico served by TFM. Finally, many customers' traffic is not susceptible to diversion to another gateway or Mexican connecting carrier, potentially harming customers dependent on BNSF to reach customers, markets and locations on TFM.

Moreover, although the TFM and FXE lines are supposed to be open to the other in Mexico, in practice, FXE cannot serve most shippers and receivers on TFM's line, which makes FXE an ineffective alternative for originations or terminations on TFM for other than intermodal and limited transloadable carload traffic. As KCS pointed out in a footnote in its June 23 supplemental filing, even where FXE should be obtaining additional access to TFM lines and customers in common terminal areas, such as Monterrey, that access has largely not been realized due to lengthy negotiations and court actions by both TFM and FXE keeping them from being implemented. Supplement, at 18 n. 7. Moreover, even if FXE could serve TFM points, that service would require an additional interchange, which would be both more expensive and more time consuming. Thus, for shippers such as DeBruce Grain in Creston, Iowa, for example, that ship most of their grain to the San Luis Postosi grain distribution center in Mexico served exclusively by TFM, if BNSF cannot provide efficient service on TFM through Laredo, the only remaining alternative may be for DeBruce Grain to ship its grain to other markets that may provide it a lower total return, reducing market access for this customer compared to his competitors located in other areas and on other transportation providers, including UP.

KCS cannot serve as an effective competitive replacement for SP either. First, as stated above, KCS' routes to reach Tex Mex and TFM are longer even than BNSF's from most joint and interline junction points. Given the difficulty BNSF has competing with UP's more direct routes, KCS will be at an even greater competitive disadvantage. Second, KCS does not offer the same geographic scope of single-line service that BNSF or UP can offer rail customers, making KCS less attractive to shippers with multiple origination points, or who want to single-source their rail commitments. Furthermore, shippers located in the western United States, which have enjoyed the benefit of having BNSF serve as a competitive replacement to SP, would potentially face a reduced competitive landscape. A very real and ironic possibility of KCS' actions in relation to BNSF interline access to Mexican markets could be the diversion of only a small incremental amount of the traffic KCS predicts in its control application to KCS long term, but the surrender of more traffic and future growth to UP, water/barge or truck, and not to KCS/NAFTA Rail.

V. KCS' DIVERSIONS COULD INJURE SHIPPERS IN EVERY COMMODITY GROUP

As explained above, shipping time velocity and consistency along with value added services are important factors for shippers of grain, motor vehicles and auto parts, industrial products, and intermodal traffic. If, due to discriminatory rates or other actions taken by KCS, those shippers are diverted to less efficient KCS' routes, are forced to interchange with KCS in Kansas City, or are forced to pay higher rates to ship over BNSF, those shippers would suffer competitive harm, and may switch their traffic either to UP or to non-rail alternatives. Examples of some of the potential harms faced by BNSF's customers are listed below.

Grain Traffic. Because it is such a widely available commodity, grain traffic is particularly sensitive to even small changes in shipping price and delivered cost. Grain shippers

on BNSF facing modest increases in shipping prices to Mexico, relative to other shippers and other markets, are likely to shift their traffic to other markets where they will be more competitive, or lose the business altogether to other origins, which ripples back to the ultimate producers, the farmers. Further, Mexican grain distribution companies rely on BNSF to provide them with access to a broad number of potential grain providers in the U.S., which ensures efficient grain pricing in Mexico. If BNSF's shipping customers can no longer competitively supply grain over the BNSF route, those Mexican grain distribution companies will lose access to the broad set of suppliers that BNSF was able to provide them, injuring both the Mexican distributor and the U.S. producer. Because KCS' limited reach greatly restricts its ability to originate grain, KCS could not replace the competition that BNSF provided. For example:

- The primary route to Mexico for wheat originating in the Dallas-Fort Worth area is via the Laredo gateway. If KCS were to carry this traffic, the ability for grain suppliers to compete on service and cost could be reduced as the KCS route from the Fort Worth area to Laredo is 304 miles longer than the BNSF route. Even if BNSF had to exchange the traffic with KCS at Houston, the route would still be longer than a BNSF-Tex Mex route.

- Internacional at San Luis Potosi, Mexico is a grain distribution point in Mexico, between Monterrey and Mexico city, served only by TFM. Internacional depends on BNSF to provide it with broad access to grain shippers in the U.S., and ships over 3300 cars on BNSF annually. If, as a result of the NAFTA Rail transaction, BNSF's grain shippers are less competitive shipping grain via the Laredo gateway, Internacional's ability to price shop for grain would be reduced as a result of fewer competitive supply points, and the cost of grain on TFM served points would likely increase. Moreover, Internacional is one of the customers in which BNSF has invested to help upgrade its shipping facilities to receive larger unit train shipments. If BNSF were no longer able to serve customers such as Internacional, it would likely reduce such investments because they would not pay off over time. As a consequence, shippers like Internacional would not only lose access to competitively priced grains but also to financing for infrastructure improvements.

Industrial Products. Industrial products include a wide variety of products from paper and aluminum to cement and metals. The supply points of industrial products are highly

fragmented in the U.S. The Mexican receivers that BNSF serves need to source products from multiple locations and often prefer to do that using a single carrier. Because of its broad geographic network, BNSF is able to provide such services to its Mexican receiver customers. Were KCS to increase the costs of shipping over BNSF, BNSF's Mexican receivers would suffer from the loss of competitive market access, and U.S. shippers would suffer from being denied access to Mexican markets or from a lack of a competitive alternative to UP. For example:

- Pipsamex (Mexico) buys and processes scrap paper from all over the U.S. Pipsamex will, for example, put out for bid a contract for hauling up to 3000 cars of scrap paper annually, and will use the carrier that can give it the best overall rates. Because of BNSF's broad geographic network, BNSF is able to compete against UP for that traffic. If KCS diverted BNSF's traffic to Kansas City or increased BNSF's costs to serve Pipsamex, BNSF may not be able to offer competitive service. Moreover, because KCS does not have as broad a coverage area, it could not provide Pipsamex with access to as many scrap paper shippers. Pipsamex would have to source from only those suppliers on KCS' line or its connections, thereby injuring both Pipsamex and the many scrap paper suppliers who would no longer have access to Pipsamex, or it would have to shift to using UP, thereby further lessening competition for rail traffic through Laredo.

Motor Vehicle and Auto Parts. Because of the need to supply just-in-time inventory systems in Mexico and the U.S., BNSF must provide fast and predictable shipment times to auto manufacturers to compete for motor vehicle and auto parts traffic. Moreover, because motor vehicle manufacturers prefer to contract with a single-source provider that can service most or all of their plants directly or through connections, BNSF and UP are the only effective competitors for those manufacturers. If KCS were to force BNSF to interchange motor vehicle and auto parts traffic in Kansas City rather than Corpus Christi/Robstown, BNSF would lose much of its ability to provide efficient service to Mexico, and UP would be left as the only competitive rail carrier to serve those manufacturers. For example:

- Prior to 2002, Metalsa, a supplier of automobile frames based in Monterrey, Mexico, shipped its products via TFM-UP-ALS-TRRA-BNSF to Fenton, Mo. In 2002, BNSF was able to offer Metalsa a price-competitive rate with a reduced

shipping time because BNSF served the DaimlerChrysler sequencing facility to which Metalsa shipped and was therefore able to reduce the number of traffic interchanges with a route of TFM-TM-BNSF. If KCS were to force that traffic to interchange at Kansas City, Metalsa would lose the benefit of reduced shipping time and would likely also no longer receive a price-competitive rate. The KCS route would be 418 miles longer via GWWR-KCS in comparison to the BNSF route. In such a case, Metalsa would shift back to UP's service. If multiplied over several parts suppliers in Mexico which require optimum transit times, KCS' actions would leave UP virtually without a competitor for rail shipments of automotive parts.

- The DaimlerChrysler double stack auto parts bid exemplifies how BNSF imposes competitive discipline even when it does not win a contract. In 2001, DaimlerChrysler opened for competitive bidding its double-stack auto parts business to Mexico. BNSF was a finalist on the bid, as its bid was considered credible due to the broad geographic scope, efficient delivery times, equipment and infrastructure that would be needed to serve DaimlerChrysler. UP responded by not only reducing its rates on the Mexican route, but also by bundling that traffic with U.S. domestic business and reducing the price on the whole bundle. As a result, DaimlerChrysler received an effective 25-30% reduction in the cost of service to Mexico. Because KCS has neither the geographic scope, the efficient delivery times, nor the required equipment and infrastructure, KCS alone would not have been able to provide such a credible alternative to either UP or highway alternatives.

Intermodal Traffic. Intermodal traffic is one of the most time-sensitive categories of traffic. With BNSF's Mexi-Modal program, which BNSF provides in cooperation with Tex Mex, TFM, CSX and CN, BNSF is able to offer door-to-door service that can significantly reduce transit times for intermodal traffic. If KCS were to force intermodal customers to select its services over Kansas City in lieu of BNSF's more direct and extensive service offerings, or direct Tex Mex or TFM to cease cooperating with BNSF in providing those services, BNSF may be unable to provide shippers that service, and customers may opt for UP or over-the-highway options to meet their customers' transport needs instead. For example:

- Mabe, a GE Company, ships appliances from Toronto, Canada to Mexico City using the Mexi-Modal program. Mabe appliances originate on Canadian National, which interchanges the traffic to BNSF in Chicago. BNSF interchanges that traffic with Tex Mex at Robstown, which performs the necessary work (including in-bond documentation paperwork) to move the traffic through Laredo

to Mexico City on TFM. Once the load clears customs in Mexico City, the TFM Intermodal Team coordinates the final delivery (dray) to the customer's door in the Mexico City area. If BNSF were forced to interchange the traffic at Kansas City or if KCS were to direct Tex Mex or TFM to cease providing that intermodal service, BNSF would be unable to provide Mabe with this attractive service. It is highly possible that KCS would not be able to provide a competitive replacement to Mabe for this service.

Brownsville Traffic. BNSF's Brownsville gateway service primarily serves agricultural processors just across the border in Matamoros, Mexico. If KCS were to divert this traffic to the Laredo gateway, as suggested by its diversion analysis, those Brownsville customers would no longer have competitive rail service available to them. They would be forced to either use UP or to transport the products by other modes of transportation – truck or water, for example. For example:

- Regasa receives 60-70% of BNSF's traffic at Brownsville. Regasa is located in Matamoros, just across from the Brownsville rail border crossing. If KCS were to force BNSF to divert this traffic from Brownsville to Laredo, as suggested in KCS' traffic diversion analysis, the traffic would have to then travel west on Tex Mex 146 miles to Laredo, south on the TFM main line to Monterrey 165 miles, before shipping north and east 208 miles back to Matamoros creating an additional net length of haul of 383 miles. Such a lengthy diversion would probably not be supported economically, and Regasa would likely have no choice but to source its purchases from other locations (potentially outside the U.S.) or find another shipping alternative to BNSF, which would again decrease the competitive options available to shippers.

VI. AN OPEN GATEWAY CONDITION IMPOSED BY THE BOARD COULD PREVENT THESE HARMS TO SHIPPERS

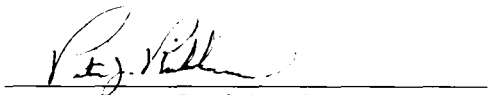
The maintenance of meaningfully open gateways through Laredo and Brownsville would avoid most of the competitive harms outlined above, would not be unduly cumbersome or complex to administer, and would be consistent with the Board's guidelines and past practices. While BNSF has been encouraged that KCS has committed generally to accepting conditions to keep the Laredo and Brownsville gateways open on commercially reasonable terms and to

continuing to provide service at the same levels as the past, those commitments need to be made more specific and enforceable. Specifically, we would suggest an open gateway condition similar to the condition imposed in the CN/Wisconsin Central transaction, which KCS referred to in their June supplemental filing (Davies V.S., at 15). That open gateway commitment and condition spoke to an agreement with NIT League whereby, as applied to the NAFTA Rail transactions, the Applicants would be required to maintain BNSF's existing rates and services with Tex Mex and TFM for a five-year period, subject to RCAF-U increases, and to provide commercially reasonable rates thereafter subject to the jurisdiction of the Board.

Such conditions are not unduly burdensome and pose no threat to KCS' ability to achieve its efficiency gains from the merger. Open gateway conditions should require little ongoing monitoring by the Board, and would be far less intrusive than trackage rights or other remedies. The efficiency of open gateway conditions is apparent by the experiences of the parties following the CN/WC and the CN/IC mergers. In both cases, open gateway conditions were imposed with minimal, if any, impact on the efficiency or operational objectives of the parties.

The imposition of such a condition to maintain open gateways at Robstown, Laredo and Brownsville on a "commercially reasonable" basis would provide shippers and connecting carriers a safety net and regulatory jurisdictional backstop if the market did not function to preserve and permit the use of efficient routings in the future if and when problems developed. It would do so without unduly affecting the Applicants' ability to offer shippers the benefits of the proposed transaction.

Open gateway commitments are also consistent with the Board's guidelines and with past Board practice. In the Board's decision in Ex Parte No. 582 (Sub-No. 1), the Board provided that future major mergers would require the inclusion of open gateway commitments. Given that



the KCS/TFM control proceeding would constitute a major merger if TFM were located in the United States, imposition of the open gateway requirement is appropriate. Further, as mentioned, the Board has imposed open gateway conditions in both the CN/WC and the CN/IC proceedings that are similar, or identical to the open gateway commitments sought here. Given the Board's own precedent, requiring an open gateway commitment at Laredo and Brownsville is a measured approach that can make the benefits of the proposed transaction available to both the shippers and the Applicants.

Finally, imposition of open gateway commitments is consistent with the positions and conduct of KCS. For example, in Ex Parte No. 582 (Sub-No. 1), KCS took the position that all existing competitive shipper rail options should be preserved in future merger or control transactions. Given that position, it would be difficult for KCS to now argue that an open gateway condition is not justified.

VERIFICATION

I, Peter J. Rickershauser, verify under penalty of perjury under the laws of the United States that the foregoing is true and correct. Further, I certify that I am qualified and authorized to file this Verified Statement.

Executed on July 31, 2003.

VERIFIED STATEMENT OF DAVID REISHUS

I. INTRODUCTION

I.A. Qualifications and Purpose

My name is David Reishus. I am a Senior Vice President at Lexecon Inc., and prior to its acquisition by Lexecon in 1999 was President of The Economics Resource Group, Inc. I received my Ph.D. and Master's degrees in economics from Harvard University.

I have specialized in applied microeconomic analysis and have consulted for numerous private and public clients on issues involving the economics of competition, pricing, market access, mergers, and regulation. I have worked extensively in the railroad and energy sectors, and have previously filed testimony before regulatory bodies on the operation of markets and competition. I previously have submitted testimony to the Surface Transportation Board ("STB" or "Board"), including a verified stated previously submitted in this proceeding.[1] My *curriculum vita* is attached as Exhibit 1.

---

[1] Before the Surface Transportation Board, Finance Docket No. 34342, Kansas City Southern -- Control -- The Kansas City Southern Railway Company, Gateway Eastern Railway Company, and The Texas Mexican Railway Company, The Burlington Northern and

I have been asked by The Burlington Northern and Santa Fe Railway Company ("BNSF") to review potential competitive impacts of the proposed common control of The Texas Mexican Railway Company ("Tex Mex") and The Kansas City Southern Railway Company ("KCSR") by Kansas City Southern ("KCS") and to analyze potential remedies or conditions that could mitigate these impacts if the transaction were approved.[2]

I.B. Summary

Three-quarters of the value of U.S.-Mexico trade shipped by rail goes through the Laredo gateway. Laredo and Brownsville, which are the only rail gateways connecting with TFM, S.A. de C.V. ("TFM"), are economically significant and growing more so. BNSF was granted access to the Laredo (via connection with Tex Mex) and Brownsville gateways to replace the competition lost when the rail carriers of Union Pacific Corporation ("UP") and Southern Pacific Rail Corporation ("SP") merged. As part of the conditions imposed on the merger, BNSF received trackage rights to reach Tex Mex at Robstown and Corpus Christi to serve traffic through Laredo. Tex Mex also received trackage rights to Beaumont in order to connect with KCS.

While UP carries a large portion of the Laredo gateway traffic, due to a superior route and the extent of its network, a BNSF-Tex Mex-TFM routing competitively disciplines the rates and service that shippers obtain for traffic through Laredo. Preservation of shippers' competitive alternatives imposed in the UP/SP merger requires that BNSF have continued viable economic and

physical access to the Laredo gateway via interchanges with Tex Mex at Robstown and Corpus Christi and with TFM at Laredo.

A mechanism for ensuring the ongoing competitive discipline in the face of the proposed transactions that would place KCSR, Tex Mex, and TFM under common control is to provide that the gateways are required to remain open on commercially reasonable terms. Requiring that Tex Mex and TFM maintain the Laredo and Brownsville gateways open on a commercially reasonable basis and that a transition for some fixed period of time, such as five years, be in place to limit changes in rates and service conditions would preserve U.S. shipper interests at these U.S.-Mexico gateways.

Imposition of such an open gateway protection is a reasonable and prudent regulatory safety net against a lessening of competition, if the market does not act to provide for efficient outcomes for shippers. Experience in recent mergers demonstrates that such open gateway protections impose little risk of lost efficiencies in the merger as a result of such conditions. From a shipper's perspective, they largely provide stability and continuity over defined important interline gateways. These sorts of conditions have been offered, negotiated, or imposed with no appreciable loss of efficiency. Imposition of such conditions on the Laredo and Brownsville gateways is sound and reasonable public policy.

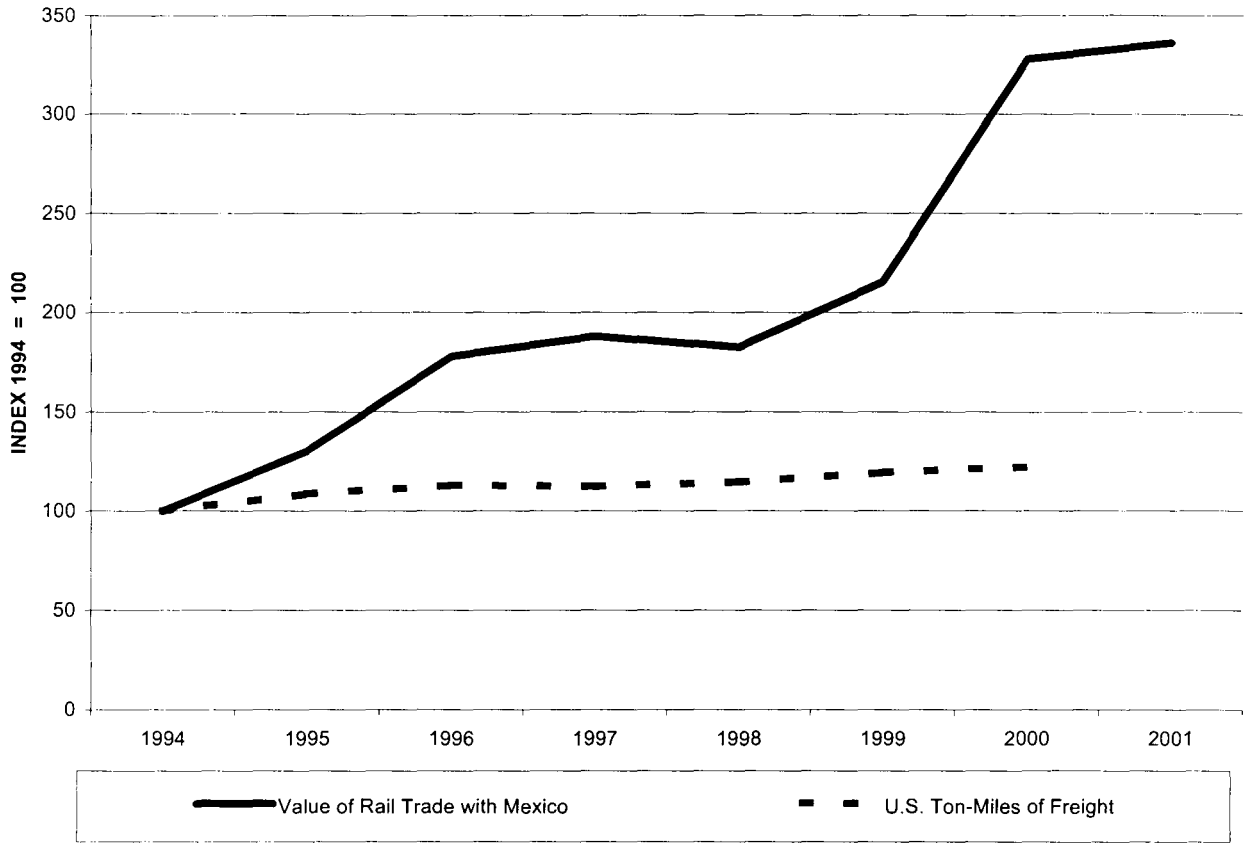
II. THE KCS TRANSACTION AND THE LAREDO GATEWAY

In April 2003, Kansas City Southern announced a series of agreements that would combine KCSR, Tex Mex, and TFM as wholly owned subsidiaries under the common control of KCS, to be renamed NAFTA Rail.[3] The first stage of the proposed combination involves the common control of KCSR and

[3] I will refer to KCS, KCSR, Tex Mex, and The Gateway Eastern Railway Company (a 17-mile short line wholly owned by KCSR) as the "Applicants."

Tex Mex by KCS.[4] The second stage entails exchanging cash and stock so that KCS will control and own all of TFM, which operates the rail lines from Laredo and Brownsville to Monterrey and the Mexico City area, among others.

This transaction raises greater competitive issues and public policy concerns than would be typical for a primarily end-to-end merger between a Class I carrier and a Class II carrier with 157 miles of rail line. These concerns arise, in part, from the unique and important position that Tex Mex plays in international trade and from the anticipated second-stage acquisition of TFM, the connecting Mexican carrier. In addition, continued effective competition to UP for Southeast Texas and Mexico traffic by BNSF as a replacement for SP following the UP/SP merger must be considered and preserved.



The integration of the U.S. and Mexican economies has accelerated since NAFTA went into effect in 1994. Trade between the U.S. and Mexico has grown much faster than growth in either economy. The growth in rail transportation between the two countries reflects that trend; the growth in cross-border rail traffic between the U.S. and Mexico has substantially exceeded the growth in U.S. domestic rail traffic. (See Figure 1.)

Laredo is the dominant gateway for both truck and rail between the U.S. and Mexico. As shown in Figure 2, 75% of the value of rail trade between the U.S. and Mexico passes through Laredo. This is partly a result of geographic happenstance. Laredo is located on the most direct route between the major population and industrial centers of Mexico City and Monterrey and the central and eastern U.S. (See Appendix.) As such, establishment of cross-border business services and investments in the

[4] KCS has already acquired ultimate ownership of Tex Mex (via MexRail) and is seeking approval to exercise control of Tex Mex and dissolve the voting trust into which it has been placed.

6

corresponding physical and organizational infrastructure have been made at Laredo to enable efficient, high-volume cross-border trade and transportation.

Tex Mex's unique significance results from its being the only railroad with U.S. access to the Laredo Mexican gateway besides UP. Tex Mex functions primarily as a bridge carrier connecting the Laredo gateway with the rest of the U.S. rail system; 80% of its traffic is interline traffic to and from Laredo.[5] As shown in Figure 3, UP is the largest U.S. carrier at Laredo, accounting for almost 85% of the units passing through the Laredo gateway in 2001. The remaining traffic travels over the Tex-Mex system, with BNSF-Tex Mex routings having the next largest volume at 8% and KCSR-Tex Mex following with 5%. Thus, joint-line movements with Tex Mex and its upstream carriers are crucial competitive restraints on UP for traffic through the Laredo gateway.

TFM is the most important Mexican railroad for U.S.-Mexican trade. It has exclusive access on the Mexican side to the Northeastern Mexican gateways of Laredo/Nuevo Laredo and Brownsville/Matamoros and reaches the important industrial centers of Mexico City and Monterrey. TFM handles over three-quarters of the U.S.-Mexican rail trade. International freight accounts for 82% of TFM's revenue, most of which passes through Laredo.[6] In fact, TFM enjoys the shortest route from Midwestern and eastern points in

---

[5] 2001 Waybill Sample. Most traffic to and from Mexico is waybilled separately on the U.S. and Mexican side with the U.S.-Mexican border crossing (e.g. Laredo) as the listed destination or origination for traffic that is actually flowing to and from interior points in Mexico. Therefore, it may not be possible from waybill information available to U.S. railroads to identify the destination or origination in Mexico. The amount of local rail traffic to Laredo is small or non-existent, so that all rail traffic identified from waybill information as being to or from Laredo is treated as international traffic flowing through the Laredo gateway.

[6] Grupo TMM, S.A., SEC Form 20-F, 2002, at 27. By contrast, only 30% of traffic on Ferromex, which serves the other U.S.-Mexican rail gateways, is international traffic, reflecting the relative importance of the Laredo and Brownsville gateways. http://www.gmexico.com/gm11000.html, July 29, 2003.

the U.S. to the major industrial and population areas in Mexico.[7] In terms of operating revenue, TFM is the largest railroad in Mexico, with revenues of $670 million in 2001.[8]

The proposed, two-stage control transaction among KCSR, Tex Mex, and TFM is primarily an end-to-end consolidation. End-to-end rail mergers typically result in improved single-line service for some shippers and reduced costs through the capture of economies of scale and scope. Loss of Tex Mex as a neutral, non-controlled bridge carrier, however, threatens the competitive discipline that BNSF provides to UP over the Laredo gateway. Closure of access by a KCS-controlled Tex Mex to Laredo for BNSF traffic or economically inefficient pricing and service by a KCS-controlled Tex Mex would eliminate or weaken the competitive alternative provided by a BNSF-Tex Mex routing.

The risk of reduction in competitive alternatives is enhanced by the proposed second phase of the transaction, as KCS would gain control of the only Mexican railroad serving the Laredo and Brownsville gateways. TFM, currently not controlled by any U.S. carrier, serves as a neutral Mexican carrier for all combinations of traffic crossing at Laredo and Brownsville. While a KCSR-Tex Mex combination alone could effectively foreclose BNSF-source traffic from accessing the Laredo gateway, a combined KCSR-Tex Mex-TFM could additionally foreclose both BNSF and UP through Laredo.

Control of TFM by the Applicants would give KCS complete control over all possible connections through Brownsville and Laredo. With control of TFM, the proposed NAFTA Rail could engage in economically inefficient foreclosure or discrimination against BNSF-sourced traffic at Laredo and/or Brownsville. Thus, to the extent that BNSF provides a competitive discipline

[8] Association of American Railroads, *North American Freight Railroad Statistics*, May 14, 2003, at 1.

to UP at Laredo and Brownsville, this alternative could be lost or reduced if the proposed NAFTA Rail were to inefficiently favor its own traffic through its routing over the Laredo and Brownsville gateways.

III. COMPETITION AT RISK BY KCSR-TEX MEX-TFM TRANSACTION

III.A. UP/SP conditions

The existing set of rail alternatives between the U.S. and Mexico results directly from the UP/Southern Pacific ("SP") combination. Prior to the UP/SP merger, only UP and SP-Tex Mex routings reached the Laredo gateway, and only UP and SP served the Brownsville gateway. As part of a settlement agreement upon which the UP/SP merger was conditioned, BNSF assumed the competitive role of SP so that BNSF would have access to Laredo through connection with Tex Mex and direct access to Brownsville. In addition to the competitive alternative provided by the BNSF-Tex Mex combination to Laredo, the Board granted Tex Mex a connection to KCSR by which KCSR could interchange with Tex Mex to reach Laredo. Because of the UP/SP merger agreements and conditions, Tex Mex became a neutral, independent bridge carrier capable of interlining with both BNSF and KCSR in competition with UP for traffic to and from the Laredo gateway.

The BNSF settlement agreement, on which the UP/SP merger was conditioned, "anticipated that BNSF would replace SP as an independent interline partner for Tex Mex traffic bound to and from Laredo."[9] The Board

[9] Before the Surface Transportation Board, Finance Docket No. 32760, Union Pacific Corporation, Union Pacific Railroad Company, and Missouri Pacific Railroad Company -- Control and Merger -- Southern Pacific Rail Corporation, Southern Pacific Transportation Company, St. Louis Southwestern Railway Company, SPCSL Corp., and the Denver and Rio Grande Western Railroad Company, Decision No. 44, Decided: August 6, 1996, at 148; and Before the Surface Transportation Board, Finance Docket No. 32760, Union Pacific Corporation, Union Pacific Railroad Company, and Missouri Pacific Railroad Company -- Control and Merger -- Southern Pacific Rail Corporation, Southern Pacific Transportation Company, St. Louis Southwestern Railway Company, SPCSL Corp., and the Denver and Rio Grande Western Railroad Company, Decision No. 62, Decided: November 27, 1996, at 7.

also provided Tex Mex limited access to Beaumont, Texas, in order to connect with KCSR. This additional condition was imposed to enhance competition with UP over the Laredo gateway and promote continued service by Tex Mex.

The agreements and conditions imposed in the UP/SP merger have maintained the competitive alternative that would otherwise have been lost. BNSF interlined 45,395 units of traffic with Tex Mex through the Laredo gateway in 2001, compared to 25,345 cars handled by Tex Mex at the gateway from all sources between June 1995 and May 1996.[10] Tex Mex traffic through the Laredo gateway from all sources has more than doubled since the UP/SP merger.[11] BNSF interline traffic currently accounts for more than half of the traffic received by Tex Mex.[12] Concerns that BNSF could not provide Tex Mex sufficient traffic to act as a competitive counterweight to UP have proven to have been unwarranted.

As detailed in the UP/SP oversight proceedings and the Verified Statement of Peter Rickershauser, competition between UP and an independent Tex Mex/BNSF routing for traffic to the Laredo gateway has provided an effective competitive restraint on UP. It has served to suppress rail transportation rate increases from UP over the gateway and has resulted in numerous shippers switching carriers and benefiting from price and service competition between UP and BNSF-Tex Mex for traffic bound to the Laredo gateway.[13] BNSF need not carry the traffic for shippers to benefit from BNSF competition for Laredo gateway traffic; the experience of

Daimler-Chrysler described by Mr. Rickershauser is just one specific, vivid example of how shippers benefit from better service and/or lower rates.

The BNSF-Tex Mex routing provides a unique competitive constraint on UP. BNSF is the only carrier in the west capable of providing competition to UP over the range of its network; KCSR lacks the rail network to provide the competition that BNSF-Tex Mex can provide. For example, approximately a third of BNSF traffic over Laredo and 80% of Brownsville traffic consist of grain and grain by-products delivered to Mexico.[14] Despite UP's dominant share of traffic over Laredo, BNSF carries over a quarter of the Laredo gateway traffic to and from the tier of grain belt states from Oklahoma to North Dakota.[15] KCSR-Tex Mex lacks the network scope to provide an adequate replacement for the competition provided by BNSF-Tex Mex.

A review of the U.S. rail network confirms this conclusion. Figure 4 shows the relative distance from representative originations and interchange locations through the Laredo gateway. As can be seen in each case, a KCSR-Tex Mex routing would increase the length, circuity and, most likely, cost and travel time relative to a BNSF-Tex Mex routing over Laredo. Single-line service created by an end-to-end merger may create service improvements or cost reductions that may be attractive to shippers, despite a somewhat longer haul. Shippers would be harmed, however, if KCS were to force traffic onto itself by inefficiently altering rates and service on Tex Mex (or TFM) for traffic interlined from BNSF. By reducing the competitive discipline that BNSF could provide, such behavior by KCS would reduce the degree of competitive constraint on UP for traffic to Mexico.

---

Chicago	1,660	1,779	7%
DFW (Alliance)	690	994	44%
Houston	377	430	14%
Kansas City	1,230	1,289	5%
New Orleans	738	1,043	41%
St. Louis	1,200	1,618	35%

Source: Verified Statement of Peter J. Rickershauser.

BNSF has made significant investments in expanding its U.S.-Mexico traffic including and especially through the Laredo gateway. As detailed by Mr. Rickershauser, since 1996, BNSF, among other activities, has:[16]

- Increased its annual marketing expenditures for Mexican traffic by over 1000%;
- Added 7-10 additional trains each way per week over the BNSF-Tex Mex line;
- Developed value-added services, such as the Mexi-Modal service, and integrated dock-to-dock carload pricing and service;
- Helped Mexican customers finance and build track expansions at their facilities to facilitate shift to use of rail transportation;
- Developed efficient unit grain train services in partnership with TFM by focusing on cycle times for train cars;
- Partnered with Tex Mex and TFM to improve through-train efficiency by managing the "Despacho Previo" process.

The results of these efforts have been double-digit growth in traffic to Mexico, including over the Laredo and Brownsville gateways.

BNSF-Tex Mex and KCSR-Tex Mex routings through Laredo provide the only *intramodal* competition to UP by which to discipline rates and service UP offers to shippers for traffic to and from Mexico. UP retains a very large share of the rail traffic through Laredo, and viable and active rail alternatives provide a source of competition for some commodities that cannot be matched by other modes of transportation. As previously explained to the Board, rail-on-rail competition between BNSF-Tex Mex and UP has served to reduce rates and improve service to numerous, specific customers

[16] Verified Statement of Peter J. Rickershauser.

for traffic through Laredo.[17] The competitive discipline of the BNSF alternative benefits shippers

For many types of traffic, trucks and other transportation modes could not prevent harm to shippers if BNSF-interline traffic were denied viable rates and service through the Laredo and Brownsville gateways. Trucks are not effective competitors for many types of rail traffic, especially over long distances. Over half of the value of U.S. exports carried by rail through Laredo is destined for Mexico City and the neighboring state of Mexico, a distance of approximately 800 miles from Laredo.[18] While Texas exports more than any other state through the Laredo rail gateway, nearly half of the value of goods exported to Mexico by rail through the Laredo gateway comes from the industrial states of Illinois, Indiana, Ohio, Michigan, and Pennsylvania.[19] A trip from Chicago to Mexico City is approximately 2100 miles, a distance at which railroads hold a competitive advantage over trucks for transportation of many commodities.

Similarly, transportation by ship and barge can provide competition for some shippers and bulk commodities between the U.S. and Mexico, but it cannot provide competitive discipline for all.[20] For example, while rail

[17] Fifth Oversight Report at Confidential Appendix E.

[18] U.S. Department of Transportation, Bureau of Transportation Statistics, Transborder Surface Freight Data; http://www.tfm.com.mx/english/somos/infraestructura.html, July 30, 2003.

[19] U.S. Department of Transportation, Bureau of Transportation Statistics, Transborder Surface Freight Data.

[20] Although KCS argues here that truck alternatives obviate the need for conditions, Dr. Grimm took the position that truck and water competition were insufficient in his testimony on behalf of Tex Mex when Tex Mex was seeking trackage rights conditions over UP in 1996. *See* Verified Statement of Curtis M. Grimm, filed March 29, 1996, in Finance Docket No. 32760 (Sub-No. 13); excerpt attached as Exhibit 2. There, he stated that "[a]lthough truck and water play an important role overall in transportation of goods between U.S. and Mexico, many shippers of many commodities are dependant upon rail competition for competitive transportation options." *Ibid.* at 128-129. The United States Department of Agriculture ("USDA") has suggested that grain and grain products may be highly susceptible to intermodal competition. (USDA Comments filed July 25, 2003.) Dr. Grimm in 1996 pointed to the USDA's reports to explain his conclusion about the ineffectiveness of truck and

accounts for a minority of U.S. grain exports to Mexico, not all Mexican grain receivers are located in places for which delivery from Mexican ports represents competitive alternatives to rail shipments. Also, to the extent that U.S. exporters face higher costs of shipping to Mexico due to actions by the proposed NAFTA Rail at the Laredo and Brownsville interchanges that limit BNSF's ability to compete, these exporters will be forced to accept lower net prices for their product and possibly seek alternative outlets for their products with concomitantly lower netback prices.

The Houston/Gulf service crisis of 1997-98 was a recent, painful episode that demonstrated vividly the limits of intermodal competition and competition provided by alternative Mexican gateways. The service meltdown, among other things, backed up rail exports at Laredo and prevented timely shipments of product through that gateway. A number of shippers turned to trucks, in some cases, to prevent the shutdown of factories, but returned to rail when rail service reverted to normal. If other modes and other gateways were truly effective competition for rail, then the rail service disruption at Laredo would have had little impact on shippers. The very public harm suffered by shippers during the service crisis demonstrates the importance of rail-on-rail competition for U.S.-Mexican traffic across the Laredo gateway.[21]

---

water as an alternative to long-haul rail transportation. Verified Statement of Curtis M. Grimm, March 29, 1996 at 129-130. If the Board had concluded that truck and water competition could act by themselves as a replacement for rail-on-rail competition, there would have been no need to condition the UP/SP merger on the BNSF accessing Laredo and Brownsville (as part of the UP-BNSF Agreement). Moreover, there would have been certainly have been no basis for introducing a third rail access option by connecting Tex Mex with KCS for Laredo traffic.

[21] "Ford, Chrysler Trucks Piling Up: Transport Firms' Merger, Rail Car Shortage Delay Shipping," *The Globe and Mail*, April 28, 1998; "The Western Rail Service Crisis: One Year Later," Economic Research Service/USDA, *Agricultural Outlook*, December 1998.

III.B. TFM and Mexican Railroad Privatization

At the time the UP/SP merger was proposed, the Mexican railroad system was owned by the Mexican government. In May 1995, Mexico's government enacted a new law that paved the way for privatization of Mexico's railways. Privatization involved dividing the state-owned railway company into a number of regional systems and then selling to private investors concessions to operate them. The three main railway systems were the Northeast Railway (connecting the Laredo and Brownsville gateways to Monterrey, Mexico City, and ports on the Pacific and Gulf coasts), the Pacific-North Railway (connecting the Eagle Pass, El Paso, Nogales, and Calexico gateways to Guadalajara, Mexico City, and ports on the Pacific and Gulf coasts), and the Southeast Railway (connecting Mexico City to ports on the Gulf coast).

The Mexican rail privatization imposed barriers to a majority foreign ownership of the new concessions, limiting the risk of control by a U.S. carrier.[22] It was anticipated in 1995 and 1996 that the resulting privatized Mexican rail companies would provide neutral, competitive access to shippers in Mexico and for international traffic from the U.S.[23] In December 1996, after the approval and implementation of the UP/SP merger, the Mexican government announced that TFM, a joint-venture owned 49% by KCS and 51% by Transportacion Maritima Mexicana (TMM), had won the bidding for

---

[22] Mexican railroad privatization explicitly denied majority foreign ownership of any concession. The National Commission on Foreign Investment (CNIE), however, had the authority to override this provision. (*Ley Reglamentaria del Servicio Ferroviario*, Article 17.)

[23] Mexican law states that concessionaires have to provide service in an equitable way (*Ley Reglamentaria del Servicio Ferroviario,* Article 24, May 12, 1995). In addition, Mexico's railway regulations explicitly provide for non-discriminatory treatment of shippers (*Reglamento del Servicio Ferroviario,* Article 170, September 30, 1995). TFM's concession title, awarded in December 1996, further stipulates that TFM must provide terminal and interchange services to interconnecting foreign railroads on an equitable and non-discriminatory basis. It also states that in setting rates, TFM cannot engage in unwarranted price discrimination. (Supplemental Application at 30 and Appendix 1: "Memorandum Summarizing Features of Mexican Law and the TFM Concession Relevant to Issues Arising from Sections 1180.1(K) and 1180.11.") See discussion below regarding implementation.

Northeast Railway concession.[24] At the time when the Northeast Railway concession was awarded to TFM, it accounted for 40% of Mexico's rail cargo, and its network passed through Mexican states composing 69% of Mexico's population and accounting for over 70% of Mexico's gross domestic product.[25]

While U.S. rail interests have maintained minority ownerships in Mexican rail concessionaires, the Mexican railroads have not been controlled by U.S. carriers and have served as neutral interline partners with U.S. railroads over the border. As such, TFM has had the incentive to work with each of the competing U.S. rail connections in a neutral manner to grow and enhance the value of international traffic for itself. Available evidence indicates that TFM has worked with each of the interconnecting U.S. carriers to develop international business. Examples of this neutral, pro-competitive behavior by TFM include:

- TFM has entered into partnerships with all three connecting railroads, UP, BNSF, and KCS, to offer intermodal service between the U.S., Canada, and Mexico[26];

- TFM has collaborated with BNSF (and Tex Mex) to improve service to Mexico, for example, by increasing the efficiency of unit grain trains and by improving through-train efficiency[27];

- TFM has built and subsequently upgraded key facilities to improve the handling of U.S.-Mexico traffic, such as the Sanchez yard at Nuevo Laredo, which benefits all U.S. railroads serving U.S. Mexico traffic.[28]

---

[24] TFM began operation in June 1997. http://www.tfm.com.mx/english/somos/somos.html, July 28, 2003.

[25] Kansas City Southern Industries, SEC Form 10-K, 1997, at 2, 58.

In fact, BNSF officials have stated that "(Kansas City Southern Railway) has a relationship with (Transportacion Ferroviaria Mexicana, a Ferromex competitor) as well, but from our perspective, we're treated fair and equal by TFM and Ferromex management and feel we get a very fair opportunity doing business in Mexico." "Opening El Paso," *Traffic World,* May 20, 2002.

[27] Verified Statement of Peter J. Rickershauser.

Maintenance of the competitive replacement for SP represented by an independent BNSF-Tex Mex routing requires that TFM and Tex Mex both continue to be willing and cooperative partners with BNSF. Preservation of open gateways between Tex Mex and TFM at Laredo and Tex Mex and BNSF at Robstown and Corpus Christi, discussed below in more detail, is a necessary condition for the competitive replacement for SP to be sustained. Moreover, TFM's continued cooperation with BNSF-Tex Mex at Laredo and with BNSF at Brownsville on economically reasonable terms is necessary for BNSF to continue to be an effective competitor with UP.

IV. PRESERVATION OF OPEN GATEWAYS

The preservation of competition for U.S.-Mexican rail traffic requires the preservation of open gateways through Laredo to carriers other than those of the proposed NAFTA Rail. Competition between the UP-TFM and BNSF-Tex Mex-TFM routings requires that the gateways controlled by NAFTA Rail – the combined KCSR, Tex Mex, and TFM – be open at economically efficient rates and service conditions.

IV.A. Public Policy of Open Gateways

In its recently promulgated Major Rail Consolidation Procedures, the Board recognized that "...because most inefficient gateways now have either been closed or move only minimal traffic, major existing gateways should be kept open in future mergers."[29] The Board has acknowledged that gateways need to be open both physically and economically.[30]

---

[29] Surface Transportation Board, Ex Parte No. 582 (Sub-No. 1), Major Rail Consolidation Procedures, June 11, 2001, at 33.

[30] *Ibid.* at 8.

While preservation of existing gateways has become part of the new merger process applicable to Class I railroad mergers, the imposition of open gateway requirements has also become the norm even in rail control transactions to which the new regulations have not applied. In the Canadian National ("CN")-Illinois Central ("IC") transaction, the Board imposed a condition requiring that the merging parties maintain the Canadian Pacific ("CP")-IC gateway in Chicago open and competitive.[31] This condition was imposed despite the recognition of CN/IC's stated economic incentive and intent to keep the gateway open and competitive.

Similarly, in a 2001 control transaction between a Class I railroad, CN, and a Class II railroad, Wisconsin Central ("WC"), the Board imposed conditions to "keep all existing active gateways affected by the Transaction open on commercially reasonable terms."[32] The CN/WC transaction, like the one at issue here, was classified as a "minor transaction."[33] As a mechanism to fulfill this requirement, CN/WC entered into an agreement with The National Industrial Transportation League that required the establishment and maintenance of commercially reasonable contract through-rates on all its active gateways, that restricted any increase in their portion of common carrier through-rates for five years to a measure of railroad cost increases, and that precluded the closure of any active interchange after the five-year period by any commercially unreasonable means.[34]

Marie Bridge Company, and Wisconsin Chicago Link Ltd., Decision No. 10, Decided: September 5, 2001, at 13.

[33] *Ibid* at 3.

[34] *Ibid* at 12-13.

These modern gateway commitments are easily distinguished from the anticompetitive and discredited "DT&I conditions" that the ICC routinely imposed in the past.[35] The DT&I conditions, which rigidly froze in place rates and interchanges as part of merger approval, were imposed on an overly regulated rail industry in desperate need of network rationalization and effectively required that rates be frozen indefinitely over routes and interchanges, no matter how circuitous, insignificant, or inefficient. The DT&I conditions functioned as an anticompetitive barrier to necessary rationalization of the rail industry. By contrast, the current gateway requirements are focused on specific significant gateways, impose specific rate caps for only limited terms (five years) subject to cost-related increases, and require only that the gateway be open on commercially reasonable terms thereafter. The commitments do not preclude procompetitive rate reductions in response to changing marketplace conditions. Rather, these gateway requirements provide a competitive transition for shippers in the face of the loss of a neutral connection and provide a regulatory backstop to actions of the newly merged parties.

IV.B. Tex Mex and the Laredo Gateway

BNSF provides competition to UP through the Laredo gateway by interlining with Tex Mex at its eastern interchanges at Robstown and Corpus Christi.[36] Tex Mex currently provides a neutral bridge movement between these eastern interchanges and Laredo, where it interlines with the currently neutral TFM at the international bridge to reach locations in Mexico. Thus,

[36] The nature of competition at Laredo and BNSF's role in replacing lost alternatives from the merged UP/SP is discussed in more detail in the next section.

the Laredo gateway consists of multiple components. An open Laredo gateway requires that Tex Mex's eastern interchanges at Robstown and Corpus Christi remain open **and** that Tex Mex and TFM maintain the interchange at Laredo open. An open Laredo gateway requires an obligation on both Tex Mex and TFM to preserve the gateway.

Inefficient impediments to interchange at either end of Tex Mex, whether physical or economic, would reduce or eliminate the competitive discipline provided by a BNSF-Tex Mex routing. Thus, any open gateway commitment from Tex Mex must be sure to clarify that the gateways at both the western and the eastern ends of the line remain open.

IV.C. TFM

The two-stage structure of the proposed NAFTA Rail complicates the issue of preserving open gateways. A KCSR-Tex Mex combination may lack the power to bar UP from utilizing the Laredo gateway, but it could exclude or deter BNSF from competing for interline traffic through Laredo. Conditions on Tex Mex that preserve BNSF's competitive ability to reach the Laredo gateway through a BNSF-Tex Mex routing, however, are not sufficient to preserve an open Laredo gateway in light of the proposed second-stage control of TFM. Control of TFM by KCS is sufficient to foreclose BNSF and UP from both the Laredo and the Brownsville gateways, regardless of the conditions imposed on Tex Mex.

Mexican and U.S. rail systems operate under different rules and regulations. Yet, it is necessary to coordinate operations, rates, service and policy to permit an efficient North American rail transportation network. The U.S.-Mexican border acts as a "seam" in the market rules and regulatory oversight, and that "seam" represents a potential source of market inefficiency and regulatory avoidance. Uncoordinated oversight and mismatched market rules at the seams between jurisdictions are common problems in regulated network transportation industries. The opportunity to

game the disparate rules to achieve an anticompetitive outcome may be enhanced by common control of transportation facilities across the regulatory seam by a single market participant. For example, different rules in the U.S. and Mexico may permit a commonly controlled rail entity to take anticompetitive actions on one side of the border that would not be allowed on the other but which would have cross-border effects and which would not be in the interests of shippers. To the extent that regulatory consistency across the seam can be established, pro-competitive impacts of market rules and regulation can be maintained.

Mexican rail concessionaires have exclusive rights to operate over their lines.[37] However, with the objective of giving access to at least two railroads to main cities such as Mexico City, Monterrey, and Guadalajara, the concessions stipulated that the concessionaire must provide trackage rights and access to certain locations to other companies. The government's intention was for the concessionaires to negotiate among themselves the appropriate fees for the mandatory trackage rights specified in the concession titles, but in the event that they were unable to reach an agreement, the Secretariat of Communications and Transportation (SCT) could intervene and set rates.[38] In addition, Mexican law states that mandatory trackage rights should be granted under "equal conditions and in a non-discriminatory way."[39]

The degree of competition and access in the Mexican rail system, however, has not developed as it was anticipated at the time of the UP/SP merger following passage of Mexican rail privatization legislation. In practice, the issue of trackage and hauling rights has been contentious since

---

[37] Concessionaires effectively have exclusive rights during the first thirty years of the concession. J. Campos, "Lessons from railway reforms in Brazil and Mexico," *Transport Policy,* 8 (2001), at 91.

[38] *Ibid.*; *Reglamento del Servicio Ferroviario*, Articles 107, 109.

[39] *Reglamento del Servicio Ferroviario*, Article 109.

the Mexican railroads were privatized. The competition envisioned in the original privatization plan has not been realized. For example, Ferromex has attempted to obtain trackage rights over TFM from Ramos Arizpe (near Monterrey) to Querétaro (near Mexico City), a key north-south route for the automotive industry.[40] Ferromex accused TFM of demanding excessive fees to access Monterrey and in 2001 asked the Federal Competition Commission (CFC) to intervene.[41] The CFC stated that in calculating trackage right fees, the concessionaire ought to act in a non-discriminatory way to avoid undue displacement of the company requesting the trackage rights. The CFC also stated that the exclusive rights granted in the concessions were not intended to result in restrictions to competition.[42]

Despite the Commission's opinion, TFM and Ferromex continued their dispute over trackage rights, and in August 2002 the SCT issued resolutions requiring that TFM grant trackage rights to Ferromex in Monterrey and that Ferromex grant TFM trackage rights in Altamira.[43] Given the inability of TFM and Ferromex to determine acceptable fees, the SCT calculated the fees to be charged by each of the companies, but those have been contested by the parties.[44] In 2002, the SCT issued draft rules governing trackage, haulage, and interconnection rights, but to this date, the terms are still being contested by the railroads, and no final resolution has been reached.[45] In the meantime, in August 2002 the CFC opened an investigation into possible

45 "More LatAm Infrastructure News," *Business News Americas*, October 14, 2002.

anticompetitive, monopolistic behavior by all Mexican railroad companies.[46] This investigation is still in process.[47]

While TFM has provided a neutral connection for U.S. carriers to date, it is unclear whether and to what extent existing Mexican regulatory practice will prevent anticompetitive behavior of a KCS-controlled TFM. Preservation of effective competition for U.S.-Mexican rail traffic requires that TFM maintain the border gateways open physically and economically and that competitive protections provided to shippers on one side of the border for international traffic are not undone by actions on the other side.

IV.D. Proposed Open Gateway Conditions

The KCS Application clearly contemplates that the Robstown, Corpus Christi, and Laredo interchanges will remain economically open to all parties, as the projection of diversions contemplates that BNSF will continue to interchange a significant volume of traffic over the existing gateways. Moreover, the Applicants pledge to "keep the Laredo gateway open on commercially reasonable terms,"[48] and expect and accept that an open gateway requirement will be imposed at the gateways (Laredo and Brownsville) as a condition of the Board's approval of KCS's control of Tex Mex.[49] An open Laredo gateway requires that, first, the BNSF-Tex Mex interchange at Robstown/Corpus Christi remain open; second, the Tex Mex-TFM interchange at Laredo remain open regardless of whom Tex Mex interlines with in the U.S.; and, third, the TFM interchange with UP and Tex Mex remain open regardless of interline movements in the U.S. An open

48 Supplemental Application at 24.

49 Transcript of Testimony of Gerald Davies, COO of KCS, at Public Hearing on Proposed "KCS-Tex Mex"-Railroad Merger, July 31, 2003, at 44-45. He continues that "Those kinds of conditions are conditions that simply will foster the development of that marketplace."

gateway commitment at Laredo and Brownsville is a very modest intervention to preserve existing competitive options.[50]

The Applicants state they intend to "honor the terms of all marketing and pricing agreements involving Tex Mex and TFM" and will "not seek to cancel them early."[51] However, "... KCS is not willing to simply renew such an agreement under the old terms without undertaking a good faith negotiation."[52] Thus, unlike the open gateway commitments that have been made in recent mergers, KCS has indicated an unwillingness to limit rate and division increases for any period beyond the expiration of existing agreements. In the CN/WC transaction, by contrast, limitations to preserve existing competitive gateway rates and conditions were made for five years.

Application of open gateway conditions on the Laredo and Brownsville gateways that limits increases in rates over a fixed period, such as five years, is a reasonable public policy accommodation to preserve competition and shipper options. The interchanges at Laredo are obviously major, efficient interchanges that experience growing traffic levels; there is no risk that inefficient routings will be preserved in the foreseeable future. As recent merger proceedings prior to this one show, these rate and service restrictions have been offered, negotiated, or imposed by or on the merging parties in a manner that has been acceptable to the parties. These restrictions do not appear to have diminished the efficiency gains that the mergers generate nor do they appear to have deterred the merging parties from completing their transactions and capturing these gains. The Applicants have provided no evidence of any harm that would result from the preservation of existing

---

[50] This is recognized by KCS. In discussing the open gateway protections, the KCS COO states, "Those kinds of conditions are conditions that simply will foster the development of that marketplace." *Ibid.* at 45.

[52] *Ibid.*

competitive conditions for a limited period of time that would outweigh the protection that they provide to competition and shippers.

V. PAST AND PRESENT BEHAVIOR OF KCS WITH RESPECT TO TEX MEX-BNSF SERVICE

Past and present behavior of KCS with respect to Tex Mex-BNSF interline service raises heightened concerns about the willingness of KCS to engage in economically efficient and commercially reasonable arrangements with BNSF once it gains control of Tex Mex (and/or TFM). In early 1998, BNSF negotiated a division and marketing agreement with Tex Mex. This agreement was intended to allow BNSF to market BNSF-Tex Mex service more effectively over the Laredo gateway to enhance the competitive alternative anticipated under the UP/SP merger conditions. Only after Tex Mex and BNSF had reached agreement did KCS intervene in an attempt to block Tex-Mex from entering into this pro-competitive agreement with BNSF.[53]

KCS did not reveal to BNSF or the Board the basis on which it claimed the right to intervene until BNSF and Tex Mex had already reached agreement. This disclosure did not come until well after the Board's decision in the UP/SP merger to create a competitive alternative to UP at Laredo through BNSF-Tex Mex and KCSR-Tex Mex routings. No immediate resolution was reached. Instead, filings were made before the Board seeking clarification and relief, and only after several months of wrangling with KCS and the Board's indicated willingness to establish a rate, if necessary, were BNSF and Tex Mex able to enter into the agreements. The agreements, by which BNSF and Tex Mex could effectively set and market contract rates, were and are clearly pro-competitive. BNSF's and Tex Mex's attempts to

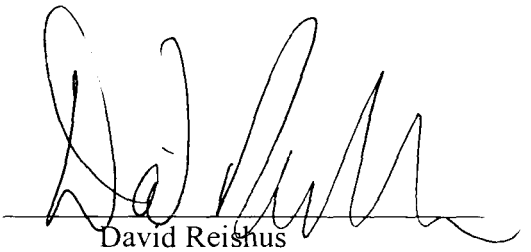
[53] Before the Surface Transportation Board, Finance Docket No. 32760 (Sub-Nos. 26, 30 and 32), BNSF Rebuttal Evidence and Argument in Support of Requests for Additional Remedial Conditions, Verified Statement of Harold F. Weddle, October 16, 1998 (BNSF-10), Tab 2.

complete the agreements indicate that they each thought they were in their own self-interests. Tex Mex, as the bottleneck carrier between BNSF and Laredo, presumably negotiated as successfully as possible to capture the "lump" available to itself (given that it could utilize a competing KCS route to reach U.S. locations). KCS, a minority owner in Tex Mex at that time with no regulatory right of control, exerted itself to prevent this pro-competitive arrangement for BNSF-Tex Mex service to Laredo from taking effect.

The diversion analysis submitted by the Applicants also raises questions about KCS's post-control intentions with respect to rates and service. A detailed look at the predicted diversions from BNSF to KCS, which amount to almost half (47%) of the revenue estimated to be gained by the combined KCS/Tex Mex, indicates that two-thirds of BNSF's lost revenue arises from traffic that is diverted from a BNSF interchange with Tex Mex at Robstown or Corpus Christi to an interchange with KCSR at Kansas City.

Half of the revenue the Applicants predict they will gain from BNSF arises from traffic that originates or terminates at stations closed to KCS or at interchange locations that KCS cannot reach. Again, in most cases, the new diverted route is longer than the existing BNSF-Tex Mex route. The portion of the route from Kansas City itself is longer on KCS than on BNSF to any point located on Tex Mex, including Laredo. (See Figure 4.)

Once KCS were to gain control of Tex Mex, traffic that originates on BNSF would still require one interchange with the commonly controlled KCSR-Tex Mex to reach Laredo, whether it interchanges in Kansas City or Robstown. While the diversion study is premised on continued interchange at Robstown and Corpus Christi, it is unclear what changes KCS intends that would force BNSF to interchange traffic at Kansas City rather than Robstown or Corpus Christi. The predicted diversions would be slower and longer, would have the same number of interchanges as the existing route, and would provide a shorter haul for BNSF which originates the traffic. One



method for achieving that outcome is to raise the divisions at Corpus Christi and Robstown relative to Kansas City so that it is no longer profitable for BNSF to use its more efficient route.

Both past behavior and the projections of the Applicants indicate that modest protective gateway conditions would be prudent public policy to preserve the competitive discipline that a BNSF-Tex Mex routing provides for service to and from Southeast Texas and Mexico.

VERIFICATION

FINAL BRIEF OF DEFENDANT BNSF

Pursuant to the Board's August 8, 2003 Order, BNSF hereby files its final brief.

I. INTRODUCTION

The circumstances leading to this rate reasonableness challenge have become common. Prior to the filing of the complaint, BNSF provided transportation of PRB coal to Xcel's Pawnee electricity generating station in unit trains under a transportation contract. Months before the contract was to expire, the parties began negotiation of a new, replacement contract. BNSF offered new contract rates significantly below the expiring contract rate.[1] Xcel rejected BNSF's offer, requested that BNSF publish a common carrier rate to establish STB jurisdiction for a rate reasonableness challenge, and then initiated this litigation.

This case, like others that have recently been brought against BNSF, is the product of an increasingly widespread view among coal shippers that the Board's regulation of rail rates has become a business opportunity for electric utilities to improve their profits, not a protection against the abuse of market power by regulated common carriers. There was no market failure in this case that justifies Xcel's complaint seeking regulatory intervention. Xcel's transportation costs for the two movements previously bundled under the expiring contract declined. BNSF Op. Nar. at II-76. Xcel had an opportunity to obtain even lower transportation rates through private, market-based negotiations. It passed up that opportunity for the prospect of a regulatory windfall.

While Xcel may have been encouraged to litigate by some Board decisions in the 1990s, it had no valid reason to expect the Board to prescribe rates here that are lower than those that

---

[1] The transportation rate under the expiring contract was { }. Xcel Op. Nar. at II-B-13. BNSF offered to renew the contract at { } a rate { } below the expiring contract rate. *Id.* at II-B-14.

were available to Xcel through contract negotiations. Coal transportation rates have declined over the past two decades, but even Xcel acknowledges that the railroads are under financial pressure to increase coal rates.[2] In exercising its rate reasonableness jurisdiction, the Board cannot and does not ignore these financial concerns. Low rates on coal transportation, resulting in part from shippers' threats to seek unpredictable regulatory action, have contributed to BNSF's continuing revenue inadequacy. BNSF Op. Nar. at II-90-94. The overall R/VC ratio for BNSF's year 2000 coal movements with R/VC ratios over 180 percent was only { } percent, far lower than the revenues that the Board has determined in its RSAM calculations that BNSF needs to generate to become revenue adequate. *Id.* at II-85-86. If regulation further constrains BNSF's coal transportation rates, the prospects for achieving revenue adequacy will be greatly diminished.

Xcel argues that the Board should ignore BNSF's revenue inadequacy in assessing the rates at issue here. Xcel Rep. Nar. at I-3. The statute plainly states the contrary. It expressly instructs the Board to "recogniz[e] the policy . . . that rail carriers shall earn adequate revenues" in determining the reasonableness of rates in individual cases. 49 U.S.C. § 10701(d)(2). This statutory mandate is not satisfied simply by applying the SAC test, as opposed to some other regulatory methodology, to assess rate reasonableness. The SAC test is not a self-executing formula -- not like winding up a clock -- its application in an individual case requires dozens of methodological and evidentiary determinations by the Board. The Board's statutory obligation to take revenue adequacy into account means that the Board must assure itself that the SAC

---

[2] As Xcel states on rebuttal, "Financial analysts and industry observers . . . publicly express their expectation that coal rates generally are on the rise, as the remaining large railroads come under increased investor pressure to grow revenues." Xcel Reb. Nar. at III-A-90.

analysis is being implemented in particular cases consistent with the economic principles and policies that underlie the SAC methodology.

One of the foundations of Constrained Market Pricing is that revenue inadequate railroads must be able to charge higher rates to shippers with inelastic demand. BNSF Op. Nar. at I-6-9. This differential pricing policy is reflected in the Board's RSAM calculations, which indicate that shippers with inelastic demand would have to pay rates that are significantly higher than the 180 percent R/VC jurisdictional threshold if BNSF were to have any hope of achieving revenue adequacy. Xcel is precisely the type of shipper that should be paying high rates because of its inelastic demand for coal transportation service. *Id.* at II-76-90. Xcel does not contest BNSF's evidence on this matter, arguing instead that Xcel's demand elasticity, like BNSF's revenue inadequacy, is irrelevant to the application of the SAC test. But if regulation prevents BNSF from charging a shipper like Xcel rates that significantly exceed the jurisdictional threshold, then the regulatory standard has become an obstacle to revenue adequacy, not a vehicle for achieving financial health as Congress intended.

The policies of promoting differential pricing and revenue adequacy are essential guideposts for the Board's implementation of the SAC test. When forced to resolve questions of SAC methodology in a particular case, the Board needs to consider how its methodological decisions will advance the policies that led to the adoption of the SAC test. It would be irrational to adopt a test for rate reasonableness that was designed to give railroads the opportunity to achieve revenue adequacy through differential pricing but then apply the test in a way that severely constrained railroads' ability to charge higher rates to shippers with inelastic demand.

There are two critical methodological issues in this case that the Board must resolve in light of these policies underlying the SAC test. The first involves traffic grouping. Xcel seeks to

distort the SAC results by assuming that revenues from traffic to Western Resources' Jeffery plant would be available to cover the costs of facilities that the Jeffrey traffic does not use. Xcel's proposed rerouting of the Jeffery movement is a major focus of BNSF's reply and Xcel's rebuttal evidence. As BNSF explains, revenues from the Jeffery movement should not be included in the SAC analysis because those revenues *do not* today offset the cost of facilities that are replicated by the SARR, those revenues *could not* be used by BNSF to offset the cost of those facilities due to binding contractual commitments, and they *would not* be available to offset the cost of SARR facilities in the stand-alone world because of the operating difficulties associated with the proposed revised route.

The second issue involves Xcel's treatment of cross-over traffic. Almost all of the revenue claimed by Xcel's SARR is derived from an arbitrary allocation of revenues on cross-over traffic. Cross-over traffic is subject to manipulation that can distort the results of the SAC test and lead the Board to conclude that rates are unreasonable when in fact they would be found reasonable under a properly performed SAC analysis. Xcel seeks just such an outcome here. Its revenue allocation on cross-over traffic must be rejected.

The Board should also implement the statutory revenue adequacy policy by giving teeth to the requirement that the complainant meet its burden of proof. The Board cannot accept vague or conclusory evidence in support of the complainant's case-in-chief. Therefore, when Xcel assumes operating, personnel and construction costs that are unparalleled in the real world, the Board cannot accept those assumptions based merely on Xcel's assertion that its SARR is assumed to be a least cost, efficient railroad. Xcel must be required to demonstrate with specific evidence how the SARR could achieve unprecedented cost savings. This brief addresses the principal areas of disagreement between the parties on the calculation of SAC costs. As BNSF

explains, Xcel has not carried its burden of proof on the critical cost assumptions underlying its SAC calculations.

When the SAC test is applied in a way that is consistent with the economic principles that led to its adoption and the evidence is evaluated in light of the complainant's burden of proof, the Board must conclude that the challenged rates do not exceed a reasonable maximum.

II. TRAFFIC GROUPING

While the complainant has the right to select the traffic base for its SARR network, there are limitations to this right. As the ICC explained, "[t]he proponent of a particular stand-alone model must . . . be prepared to defend, the assumptions and selections it has made." *Guidelines,* at 544. In several areas, discussed below, BNSF showed that Xcel's assumptions about the traffic and revenues that would be available to the SARR were unsupported and unjustified.

A. Exclusion of Riverside/Highbridge Traffic

Xcel improperly included in its SARR network coal movements to Xcel's own Riverside/Highbridge plants for the full 20 year DCF period. However, the evidence shows that Xcel plans to convert these plants from coal to gas when the existing coal transportation contract with BNSF expires. BNSF Rep. Nar. at III.A-35-36. In fact, in discovery, Xcel told BNSF that those plants would not be included in its SARR network and declined to produce any information about them. *Id.* at III.A-36. It would therefore be unreasonable to assume that the SARR handles any traffic to these plants beyond the amounts required by the existing transportation contract or to include any traffic to these plants after the existing contract expires.

B. Exclusion of Traffic for Consistency with BNSF's 2003 and 2004 Forecasts

For plants other than its own plants, Xcel developed its traffic volumes for the years 2003 and 2004 based upon BNSF's internal forecasts prepared in the ordinary course of business. However, as BNSF explained on reply, Xcel deviated from the BNSF forecast at times, without

justification, and overstated volumes moving to particular shippers. BNSF corrected Xcel's stand-alone traffic volumes to make them consistent with BNSF's internal forecasts that Xcel relied upon for most purposes.[3] These corrections affected the volumes of three shippers – (1) volumes to LCRA's Seymour plant { } consistent with the forecast and the expiration date of the current contract, (2) volumes to LG&E's Ghent plant { } consistent with the forecast and LG&E's obligations under its transportation contract, and (3) volumes to the AEP Rockport plant were { } BNSF Rep. Nar. at III.A-30-34.

On opening, Xcel presented no evidence or explanation supporting its deviation from BNSF's internal forecasts. Xcel merely assumed that "this traffic will continue to move over the WCC after the contracts expire." Xcel Op. Nar. at III-A-9. On rebuttal, Xcel presented for the first time evidence purporting to justify its deviation from the BNSF internal forecasts. Specifically, Xcel claims that publicly available information shows that BNSF's volume forecast relating to the Rockport, Seymour and Ghent plants was inaccurate. This "public information," presented for the first time on rebuttal, is improper. As the Board has repeatedly stated, "[r]ebuttal may not be used in SAC cases as an opportunity to introduce new evidence that could and should have been submitted in the party's case-in-chief."[4] Since Xcel's assumptions

---

[3] The Board has recognized that internal forecasts are a valid basis for forecasting future volumes. *WPL* at 17-18; *WTU* at 662-63. Having chosen to rely on BNSF's forecasts, Xcel should not be able to selectively deviate from them.

[4] *Duke* at 4; *see also Gen. Procedures* at 5; *TMPA* at 138.

represented a departure from the BNSF internal forecasts that Xcel relied on, Xcel should have presented any supporting evidence on opening.[5]

C. Exclusion of Rerouted Jeffrey Traffic

A particularly significant traffic issue in this case involves the non-issue traffic moving annually to Western Resources' Jeffrey plant. As BNSF demonstrated on reply, it was improper for Xcel to include the Jeffrey traffic in the stand-alone shipper group. In the real world, the Jeffrey traffic moves on BNSF from northern PRB mines through Edgemont, SD and Alliance, NB to Northport where it is interchanged with UP. This traffic does not move over the lines replicated by the SARR. As discussed below and in detail in its reply evidence, BNSF showed that the inclusion of the Jeffrey traffic violates both prongs of the two-part test announced by the Board in *TMPA* for assessing a complainant's traffic grouping assumptions. *TMPA* at 19.

As to the first prong of that test, the SARR would not meet the transportation needs of Western Resources because the service provided by the SARR on the Jeffrey movement would be inferior to that provided by the real world BNSF. As to the second prong, the rerouting of the Jeffrey traffic from its real world route would not meet the purposes and objectives of the SAC

---

[5] In any event, a review of the "new evidence" submitted by Xcel does not support Xcel's claim that BNSF's internal forecast was wrong. As to LCRA, Xcel points to the 2002 LCRA Annual Report. However, that Annual Report says nothing about LCRA's coal transportation sources in 2004 and beyond. To the contrary, it merely discussed the current contract that expires on December 31, 2004. BNSF's internal forecast is the only evidence on post-2003 traffic to the Seymour plant. As to Ghent, Xcel points to a Coal Supply Agreement, apparently obtained by Xcel in mid-May 2003, months after its opening evidence, as evidence that LG&E will ship at least 1 million tons of PRB coal in 2004 and 2005. Xcel Reb. Nar. at III-A-34; Xcel Reb. WP at 5554. However, that coal supply agreement does not obligate LG&E to purchase any PRB coal after 2003. LG&E is only obligated to take PRB coal from the supplier after 2003 *if* LG&E and the supplier are able to negotiate a price and other terms. If the parties do not reach an agreement on these terms, the Agreement is terminated. *See* Agreement, § 8.1 at Xcel Reb. WP 5564 to 5565. There is no evidence that an agreement was ever reached on post-2003 PRB coal purchases. BNSF's internal coal forecast remains the best evidence of record on Ghent traffic volumes after 2003.

test. The Board has explained that it is inconsistent with the purposes and objectives of the SAC test for a complainant to rely on non-issue traffic to contribute to the costs of facilities that the non-issue traffic does not use.[6] The Jeffrey traffic does not and would not use the facilities replicated by the SARR so the revenues from that movement should not be included in the SAC analysis.

BNSF has two routes out of the PRB. One route goes south over the Orin Line through Guernsey to Northport. The northern route exits the PRB at Donkey Creek and turns southeast through Edgemont, SD and Alliance, NB. The existence of these two routes allows BNSF efficiently to serve its PRB traffic by routing traffic originating at mines in the northern PRB over the Edgemont/Alliance line and routing the traffic originating at mines in the southern PRB over the southern route. There is no evidence in the record suggesting that BNSF's ownership and operation of these two lines is inefficient or unnecessary. Indeed, shippers, including Western Resources, clearly benefit from the existence of these multiple routes out of the PRB.

Xcel's SARR replicated only the southern BNSF route out of the PRB going through Guernsey. Xcel also assumed, consistent with BNSF's practice in the real world, that this route would handle traffic primarily originating in the southern PRB mines. Nearly 75 percent of the SARR traffic (other than Jeffrey traffic) originates at southern PRB mines, *i.e.* mines south of Cordero. Indeed, where a particular shipper served by the SARR originated coal today at mines

---

[6] *AEPCO* at 2 ("a shipper should not seek to have its rate reduced by shifting any part of the costs of the lines or facilities that it needs onto traffic that does not use those lines or facilities"); *PPL II* at 7 ("revenues from non-issue traffic should not be relied upon to contribute to the costs of line segments or facilities that the non-issue traffic would not use").

in both the northern and southern portions of the PRB, Xcel generally chose to handle only that shipper's southern mine origins.[7]

Xcel departed from this approach with the Jeffrey traffic. That traffic originates at two northern mines in the PRB – Eagle Butte and Belle Ayr – and moves on BNSF today over the Edgemont/Alliance route. {

} BNSF Rep. Nar. at III.A-24, n.16.[8] Several operating conditions also dictate the routing of the Jeffrey traffic over the Edgemont/Alliance line. For example, that route is (1) shorter than the southern route from the PRB, (2) operationally more efficient for coal coming out of the northern Eagle Butte mine where the vast majority of Jeffrey traffic originates, and (3) avoids congestion on the heavily used southern line. *Id.* at III.A-23-24.

Xcel's assumption that the Jeffrey traffic would be rerouted from BNSF's Edgemont/Alliance line to the SARR's southern line is unreasonable and inconsistent with the traffic grouping principles underlying the SAC test. First, under SAC theory, the SARR steps into the shoes of the incumbent. {

} *See WTU* at 658, n.41. A shipper

---

[7] For example, while { } originated coal from many northern mines in 2001 and 2002 (including Cordero, Buckskin, Caballo Rojo and Rawhide), Xcel only selected coal originating from Black Thunder, a southern mine, for inclusion in its traffic base. BNSF Rep. Ex. III.A-3.xls at WS Final Traffic 2002, rows 76-4, 78-9 and SMRT01H2 at rows 128, 177, 186, 197, 325, 337, 355, 385.

[8] Xcel points to a single Jeffrey movement out of the hundreds of Jeffrey movement records produced by BNSF in this case that moved south over the Orin Line through Guernsey. *See* Xcel Reb. Nar. at III-A-19. {

}

cannot have it both ways. It cannot assume the benefits of the incumbent's existing contracts but then avoid the substantive obligations that are part of the contract.

Second, { } it is unreasonable to assume a rerouting of the traffic because the SARR's service would be inferior to the service provided by BNSF today over the Edgemont/Alliance route. As BNSF explained on reply, the disadvantages of the southern route for Jeffrey trains are exemplified by Xcel's own evidence on cycle times. Even though Xcel's string program clearly understates cycle times, Xcel assumed that the cycle times for the Jeffrey trains on the SARR would *exceed* BNSF's cycle times by as much as 17 percent. BNSF Rep. Nar. at III.A-24-27.[9] On rebuttal, Xcel challenged BNSF's cycle times evidence as a apples-to-oranges comparison of average cycle times on the BNSF today to peak cycle times on the SARR. Xcel argued that it is not surprising that the cycle times achieved during the supposed two-week peak period on the SARR are longer than BNSF's average cycle times because one would expect cycle times during peak periods to be longer than average.

The problem with Xcel's argument is that Xcel did not, in fact, model a peak period. As BNSF showed in its Summary Disposition Motion at 10-14, Xcel's opening evidence was based on a modeled week with *below* average traffic volume. In response, Xcel claimed that it inadvertently based its opening evidence on a one-week period from the string program instead of a two-week period. Xcel Rep. to Sum. Disp. Motion, Crowley V.S., 14-15. BNSF then showed in its reply evidence that even the two-week period belatedly selected by Xcel was only an average period on the WCC and still did not qualify as a peak. BNSF Rep. Nar. at III.B-11-

[9] The differences between the cycle times are magnified when the obvious shortcomings in Xcel's string program are considered. *See* BNSF Rep. Nar. at III.B-10-20.

15. On rebuttal, Xcel claimed that it *could* have instructed the string program to model the operations of longer trains with more cars, which would increase the annualized traffic volume based on the two-week period to a level representative of a peak period. Xcel Reb. Nar. at III-B-24-25. But Xcel *did not* model the operations of these longer trains; if it had, the SARR's trains would have been heavier and slower, causing the cycle times to be even longer. [10]

Also on rebuttal, Xcel presented a new string program analysis purporting to show that SARR trains would actually achieve faster cycle times than the trains Xcel modeled on opening. The Board should not give any weight to this new string program analysis. In addition to being improper rebuttal under Board precedent, the string program results generating the supposedly faster trains stemmed in part from an error in the program codes that instructed the model to ignore grades and curves on the SARR. *See* BNSF Surreb. Motion at 15-19. Trains moving over flat, straight track will obviously achieve unrealistically fast transit times. In its response to BNSF's surrebuttal motion, Xcel admits that the new string program contained this error but suggests that yet another change in the program code could fix the error. *See* Xcel Errata to Reb. At this late stage, the Board cannot accept yet another iteration of Xcel's flawed string program or place any reliance at all on operating statistics that might be produced by it.

There are other reasons to believe that the SARR would not be able to provide service as good as the incumbent's on the Jeffrey movement. Use of the Edgemont/Alliance route for the Jeffrey traffic avoids interference with other loaded and empty trains being staged into and out of the southern PRB mines. Since as many as 25 trains a day are assumed to enter and depart the

---

[10] Xcel also claims in its rebuttal that it modeled the "WCC's three busiest weeks" in its string program. Xcel Reb. Nar. at III-A-21. However, Xcel's workpapers show that the traffic volume for this three-week period, when annualized, is equal to Xcel's expected annual volume for the WCC. *See* Xcel Reb. Elec.WP "PEAKTRAINSReb.123."

simplifying assumption that allows shippers to avoid evidentiary burdens as it was in the *Nevada Power* case where the ICC first approved its use. Instead, cross-over traffic has evolved into the 800 pound gorilla of complainants' hypothetical SARRs, completely dominating complainants' traffic groups and effectively determining the outcome of the cases. In a case like this where cross-over traffic dwarfs the issue traffic, the allocation of revenue on cross-over traffic is the most critical input to the SAC analysis, yet that allocation is unavoidably arbitrary, regardless of the allocation method used.

This is a bizarre – and in BNSF's view impermissible – state of affairs. Absent the abuse of cross-over traffic, complainants would have no basis for their rate reasonableness claims.

BNSF's reply evidence explained in detail why reliance on cross-over traffic is inconsistent with SAC principles. Professor Janusz Ordover's extensive testimony on this conceptual aspect of the cross-over issue boils down to three basic propositions: (1) Cross-over traffic violates the cost-causality principle underlying the SAC test. That test is supposed to compare the total revenues generated by the traffic group with the full economic costs of all the facilities needed to serve movements in the group. The use of cross-over traffic (and the splitting of a stand-alone railroad into interline segments) severs the responsibility for cost recovery, necessitating an arbitrary allocation of revenues that, by definition, cannot be attributed to particular segments of the cross-over movement. BNSF Rep. Nar. at III.A.10-13. (2) The allocation of revenue on cross-over traffic can distort the outcome of a properly performed SAC test, resulting in a finding that challenged rates are unreasonably high when, in fact, they would be found to be reasonable under a full SAC analysis. *Id.* at III.A.15-21. The potential for distortion increases as the share of cross-over traffic in the stand-alone traffic group increases.

(3) Complaining shippers, including Xcel, have the incentive to use cross-over traffic as a vehicle for strategic revenue shifting that will produce distorted SAC results. *Id.* at III.A.13-15.

In its rebuttal evidence and argument, Xcel fails to refute any of BNSF's three conceptual propositions. It essentially ducks the first point, suggesting that BNSF's critique of cross-over traffic is an attack on the principal of traffic *grouping*. Xcel Reb. Nar. at I-10-11. But BNSF specifically endorsed the "ICC's decision to allow a shipper to group issue and non issue traffic that was to be carried end-to-end" as "fully consistent with the basic precepts of constrained market pricing." BNSF Rep. Nar. at III.A.9. It is the severing of end-to-end movements and the consequent inability to compare full revenues and full costs that violates SAC principles. Xcel did not even address the severing/arbitrary allocation issue on rebuttal. Nor did Xcel address BNSF's contention that the use of cross-over traffic can distort the outcome of a properly performed SAC analysis. It had no answer to the stick diagram (or "simplified example") set forth in BNSF's reply narrative. *Id.* at III.A-15-21. BNSF has presented unrefuted evidence of the distorting effect of cross-over traffic. Finally, Xcel did not dispute that it has the incentive to manipulate the division of revenues on cross-over traffic so as to engage in strategic revenue shifting.

Given these unrefuted conceptual problems with Xcel's reliance on cross-over traffic, the Board should dismiss Xcel's SAC evidence in its entirety since Xcel's case is built on cross-over traffic. If it does not do so, the Board must accept the evidence of record based on the method for allocating revenue on cross-over traffic that is less arbitrary and less likely to distort the outcome of the SAC analysis.

On the record presented here, the Board's choice of revenue allocation methods is between the modified mileage prorate ("MMP") espoused by Xcel and the density adjusted

revenue allocation method ("DARA") proposed by BNSF. DARA is clearly superior from the perspective of SAC principles because it addresses the ability of the SARR and the residual incumbent to cover both attributable and unattributable costs. It does so by taking account of differing levels of traffic density on the on-SARR and off-SARR portions of cross-over movements. DARA is also superior from an equitable perspective because it produces more even-handed results than MMP, which, as implemented by Xcel, allocates disproportionate revenues to short-haul movements by the SARR as originating carrier.

Xcel attempts to defend MMP not as a matter of economic logic but as a matter of Board precedent. It contends that its use of MMP is based on the Board's "well-established standard that in the absence of actual data on revenue divisions the goal of estimating the revenues that a SARR should earn from cross-over traffic is to estimate what the market-based divisions would be in the 'real world.'" Xcel Reb. Nar. at I-24. Xcel extracts this "well-established standard" from the concurring opinion of Chairman McDonald in the ICC's *Nevada Power* decision.

In fact, the current state of the law is that there is no "well-defined standard" that governs the issue of what method should be used to allocate cross-over traffic revenues in this case. Although the Board and its predecessor have accepted revenue allocations based on MMP in some prior SAC cases, the Board has twice recently addressed the issue of allocation methodology and said that "we have not adopted a single, preferred procedure for developing revenue divisions on cross-over traffic."[14]

As to the Board's supposed preference for allocating revenues by estimating market-based divisions, the state of the law is also different from what Xcel claims it to be. *Nevada*

---

[14] *TMPA* at 31 n.74; *accord PPL I* at 7 n.14.

Power did not constitute an unqualified endorsement of divisions.[15] Numerous other SAC cases, including those most recently decided by the Board, indicate that considerations of cost-coverage are at least as relevant as market considerations in determining how to allocate revenues on cross-over traffic.[16] In *McCarty Farms*, the Board used MMP to allocate revenues on cross-over traffic not because it found MMP to estimate market-based divisions but because it "account[ed] for the non-mileage-based costs incurred when carriers switch freight cars."[17]

The issue regarding cost coverage on cross-over traffic is framed by the Board's recent statement in *TMPA*: "The revenue each carrier receives should cover the attributable costs of the service it provides and make some contribution to its unattributable costs." *TMPA* at 37 n.74. Determining coverage of attributable costs for the SARR and the residual incumbent is relatively straight-forward.[18] The question that is critical to the revenue allocation issue in this case is how the residual revenue available for coverage of unattributable costs should be divided between the SARR and the residual incumbent.

---

[15] *Nevada Power* at 268 ("In the absence of any better evidence, we will prorate the revenues attributable to the cross-over traffic among the SARR and incumbent carriers on a mileage basis. . . . This approach is consistent with the treatment in our staff's preliminary analysis of historically interlined traffic for which actual (market-based) divisions are not available.")

[16] *OPPD* at 136, 138; *PPL I* at 10 n.20; *TMPA* at 31 n.73.

[17] *McCarty Farms* at 9. The Board stated that "[w]e find that the modified mileage proration method is superior to a straight mileage proration, because it takes into consideration differing handling costs." *Id.*

[18] BNSF calculated attributable costs for both the SARR and residual incumbent portions of cross-over movements under its DARA procedure using the most recent URCS for BNSF and employing the Board's Ex Parte No. 399 costing assumptions. BNSF Rep. Nar. at III.A-67. Xcel purported to show that its MMP revenue allocation gives the residual incumbent sufficient revenue to cover attributable costs of off-SARR portions of cross-over movements, but it did not calculate attributable costs correctly. *See* BNSF Rep. Nar. at III.A.-56-57.

Xcel makes no effort to answer this question. BNSF does answer this question, and its answer is that the carrier with relatively lower densities on its segment of a cross-over movement will need a relatively greater portion of the residual revenue on the movement to cover its unattributable costs than the carrier with relatively higher densities. This proposition flows logically from the existence of production economies that characterize the economic structure of the rail industry, and in particular from "the fact that greater use of the fixed plant result in a declining average cost."[19]

BNSF's DARA procedure involves an explicit calculation of attributable costs on both portions of cross-over movements and an allocation of residual revenue in direct proportion to length of haul and in inverse proportion to traffic density.[20] Thus, in the current case, DARA represents a refinement and an improvement over MMP because it provides a principled basis for allocating that portion of revenue on cross-over movements that is available to cover unattributable costs. DARA is designed to be even-handed.[21] In this case, it allows the SARR to benefit from economies of density by receiving additional revenue in excess of attributable costs for each unit of traffic that it carries, while at the same time recognizing that the less dense residual incumbent must also cover unattributable costs over the long term if it is to be able to interchange traffic with the SARR over the long term.

Xcel directs a variety of unfocused criticisms at DARA, the most prominent being that DARA is "contrary to the rule that that estimates of revenue divisions for cross-over traffic must be market-based. . . ." Xcel Reb. Nar. at III-A-63. As discussed above, the decisions of the

---

[19] *Guidelines* at 526; *see also PPL I* at 12 n.21 (referring "to "the declining capital investment needed per unit of output as the rail system is used more intensively").

[20] The procedure for implementing DARA is described at BNSF Rep. Nar. at. III.A.-65-68.

[21] *See* BNSF Rep. Nar. at III.A-71-74 (DARA results and interpretation).

Board and its predecessor regarding cross-over traffic cannot fairly be read to establish such a categorical rule. Xcel also contends that DARA "can lead to anomalous results because it focuses on only a single cost factor – density – and ignores all others." *Id.* at 64. This is simply wrong. In its attributable cost calculation, the DARA procedure takes account of all the cost factors that comprise variable costs. And DARA, like MMP, explicitly accounts for length of haul.

The DARA revenue allocation procedure is the best one available to the Board on the record of this case.

IV. SARR CAPACITY

Xcel's failure to posit a SARR with adequate capacity is a critical flaw in its case-in-chief. Xcel's understatement of capacity resulted in a railroad that would be utterly incapable of providing service at the same level as the incumbent, a flaw that should, on its own, result in dismissal of Xcel's claims. Xcel impermissibly tried to repair the flaws in its capacity assumptions by reconfiguring the SARR on rebuttal, a misuse of rebuttal. In any event, given the deficiencies in the string program, Xcel provided no competent evidence that could be used to assess the new capacity assumptions.[22] The only reliable evidence on SARR capacity in this case is that submitted by BNSF.

[22] As a result, there is no evidence in the record as to the capacity that would be needed to handle the higher traffic volumes assumed by Xcel. The Board cannot logically accept Xcel's traffic assumptions when Xcel has failed to provide competent evidence on the capacity needed to handle that traffic.

A. String Program Flaws

Apart from some general references to the former WRPI line, Xcel's only support for its capacity assumptions is a flawed and unreliable string program analysis.[23] As BNSF explained in BNSF'S Summary Disposition Motion and reply evidence, numerous errors in the string program code as well as in Xcel's application of the string program render it useless in this case as a test for the adequacy of SARR capacity.

First, the string program analysis understates the number of trains that the SARR would need to accommodate in the peak traffic period, thus understating peak period capacity requirements.[24] Second, the string program fails to link empty trains with loaded trains departing from PRB mines, thus ignoring capacity that would be required at the mines or at staging locations in the PRB.[25] Third, the string program fails to detect overloadings of sidings and

---

[23] Xcel claims that its SARR design is based on the former WRPI line. While Xcel's opening SARR had 26% doubletrack compared to 28% doubletrack for the former WRPI line in 1994, the WRPI line in 1994 also carried 30% less traffic than the SARR. BNSF Rep. Nar. at III.B-7. On rebuttal, Xcel claims that UP has expanded its traffic volume on the WRPI line since 1994, but it ignores the fact that UP has also added substantial capacity since 1994 to handle those higher traffic volumes. Xcel Reb. Nar. at III-B-11. By contrast, BNSF's real world Edgemont/Alliance line handles traffic volumes comparable to the SARR and has about 78% doubletrack, more than twice the amount assumed by Xcel, even after Xcel purported to add capacity on rebuttal. BNSF Rep. Nar. at III.B-34.

[24] Xcel's failure to model a peak period is discussed in connection with the Jeffery traffic.

[25] BNSF Sum. Disp. Motion at 15-16 and BNSF Rep. Nar. at III.B-15 to 16. Xcel's string program assumed that some trains would wait for days at mine loading locations but failed to include this time or consider whether there was adequate capacity for these trains at the mines. *Id.* Xcel claims that this problem is the inevitable result of its modeling assumptions, especially its use of actual departure time for individual trains. Xcel Reb. Nar. at III-B-30. But this concession highlights the unreliability of Xcel's string program analysis. Moreover, BNSF showed that it was possible to model a full cycle of SARR trains while they were on the SARR, thus ensuring that SARR capacity in the loading areas would be evaluated. BNSF Rep. Nar. at III.B-25.

yards, a fatal defect in a model designed to test the adequacy of capacity.[26] Fourth, the string program assumes incorrect or impossible train operations, including excessive speeds, flawed acceleration and deceleration, and erratic train movements.[27]

BNSF pointed out these flaws in Xcel's string program in its Summary Disposition Motion, and Xcel claimed, in reply to BNSF's motion, that the errors could be fixed on rebuttal. However, as to the first two categories of errors described above, Xcel did not even attempt on rebuttal to repair the string program.[28] On the question of overloaded yards and sidings, Xcel claims on rebuttal to have addressed this problem by "manually adjust[]" trains. Xcel Reb. Nar. at III-B-33. However, BNSF demonstrated in its Surrebuttal Motion that the new string program, like its many predecessors, still failed to detect overloaded sidings and yards. BNSF Surreb. Motion at 7, 19-20. On the question of erroneous train operations, Xcel claimed that these errors could be corrected by modifying the data used in the string program on SARR grades and curves. Xcel Reb. Nar. at III-B-35. Whether or not this is true, Xcel's rebuttal string program clearly did not fix the problem because the new string program ignored grade and curve

---

[26] BNSF Sum. Disp. Motion at 17; BNSF Rep. Nar. at III.B-17 to 18; BNSF Surreb. Motion at 7, 19-20. These same defects in the string program submitted by complainants in TMPA led the Board to reject its use in that case. *TMPA* at 68 n.112 and 73-74. A related problem is the failure of the string program to detect T-Bone train collisions. BNSF Motion at 16-17 and BNSF Rep. Nar. at III.B-16 to 17.

[27] BNSF Sum. Disp. Motion at 17; BNSF Rep. Nar. at III.B-18 to 20.

[28] Xcel claims that it *could have* modeled a peak period simply by assuming the trains used in the string program were longer and heavier. But the short answer is that Xcel *did not* model the operations of those longer, heavier trains. BNSF Rep. Nar. at III.B-13 n.12. In addition, Xcel did not fix the string program's failure to link loaded and empty trains, which as noted above, is a shortcoming inherent in its model. Xcel Reb. Nar. at III-B-30 to 31.

data altogether.[29] Indeed, this error in the rebuttal string program, which Xcel acknowledges, alone renders it unreliable as a tool for testing capacity in this case.

The Board has seen multiple versions of the string program analysis in recent cases as complainants scramble to address program and implementation errors that are pointed out by defendants. As demonstrated in this case, every time an error in the program is supposedly fixed, other errors are introduced. The string program used here is an unwieldy and unreliable model in each of its iterations and the Board should reject all evidence based on it.

B. Xcel's Understatement of Capacity

There is no dispute that Xcel failed to design a SARR with sufficient capacity to meet the service requirements of its shippers. Xcel's own cycle times evidence showed that SARR trains consistently exceeded BNSF's existing cycle times by large margins.[30] Xcel's failure to posit a SARR that provides service at least as good as that provided by the incumbent justifies dismissal of Xcel's SAC evidence without even considering the many flaws in Xcel's string program. BNSF Rep. Nar. at I-4-9. Indeed, Xcel admitted on rebuttal that the SARR it posited on opening had "certain congestion problems." Xcel Reb. Nar. at III-B-4. It therefore reconfigured the SARR on rebuttal to doubletrack an additional 10% of the SARR. These changes to the SARR design constitute impermissible rebuttal.

The Board permits a complainant to correct inadvertent errors in its opening evidence, but it does not permit the complainant to redesign the SARR to address a design or operating flaw in the complainant's case-in-chief.[31] Xcel's claim that it was merely correcting inadvertent

---

[29] BNSF Surreb. Motion at 6-7, 15-19.

[30] BNSF Rep. Nar. at III.B-8 to 9; III.C-15 to 16.

[31] *Duke* at 4.

string program flaws that BNSF pointed out in its Summary Disposition Motion is patently false. *See* Xcel Reb. Nar. at III-B-3. The revised SARR design presented by Xcel on rebuttal did not simply lengthen sidings to accommodate the multiple trains that the string program erroneously assumed would fit in a siding -- the issue addressed by BNSF in its Motion -- but instead sought to expand capacity to reduce congestion and provide faster cycle times for SARR trains.[32] In effect, Xcel posited a new SARR on rebuttal because it was clear that the SARR posited on opening was inadequate. This is impermissible rebuttal.

In any event, Xcel's rebuttal capacity assumptions cannot be accepted because they cannot be assessed on this record. The flaws in the string program analysis that Xcel used on rebuttal to assess transit times and capacity contain *new* errors. As explained in BNSF's Surrebuttal Motion, Xcel's rebuttal string program analysis mistakenly assumes that SARR trains move over a perfectly flat, straight track, allowing those trains to achieve unrealistic transit times. BNSF Surreb. Motion at 17. Xcel admits that the rebuttal string program contained this error but implausibly suggests that the error is not significant and that it can be corrected by yet another change to the underlying code. It would be improper to consider any evidence based on further iterations of the string program.

C. BNSF's Capacity Model

In contrast to Xcel's made-for-litigation string program, BNSF used the Rail Traffic Controller ("RTC") model developed by Berkeley Simulation Software to develop capacity assumptions for the SARR. The RTC model is sophisticated, reliable and easy to use, and it has become widely accepted among railroads, transit authorities and government agencies. BNSF

---

[32] Indeed, Xcel admits that the changes were addressed to "congestion problems." Xcel Reb. Nar. at III-B-7.

Rep. Nar. at III.B-22. BNSF described in detail on reply the inputs to the RTC model and how that model was used to determine SARR capacity requirements.[33] Using the RTC model, Mr. Wheeler determined that the SARR required an additional 69 miles of mainline track to accommodate BNSF's revised traffic volume.[34]

On rebuttal, Xcel challenged BNSF's use of the RTC model. First, Xcel argued that it would be improper for the Board to accept evidence based on the RTC model because the program code for the model cannot be evaluated. Xcel Reb. Nar. at III-B-38-39. However, the masking of program code is a common feature of commercial computer programs designed to prevent the theft of the underlying intellectual property. The Board should accept evidence based on such programs if the programs are used in commercial applications since acceptance by the industry is sufficient evidence that the model produces reliable results.[35]

Second, Xcel argues that the Board should not accept evidence based on the RTC model because Mr. Wheeler did not respond to requests for detailed information about the specific projects on which the RTC model was used. Xcel Reb. Nar. at III-B-39 to 40. But Mr. Wheeler was not obligated to respond to burdensome and unauthorized discovery requests filed after reply evidence was submitted. Xcel's discovery argument is a red herring intended to distract the

---

[33] BNSF Rep. Nar. at III.B-20-34. BNSF will provide a copy of the RTC model to the Board after final briefs are filed to allow the Board to evaluate BNSF's evidence on capacity. BNSF provided a copy of the model to Xcel after reply evidence was filed.

[34] BNSF Rep. Table III.B-5. Some of the additional capacity in Table III.B-5 is second mainline within SARR yards, and BNSF therefore counted that capacity as yard track in the comparison of track miles in Tables III.B-2 and III.B-3 of its reply evidence.

[35] A more restrictive rule would force the Board to rely on made-for-litigation models that are more easily manipulated. Indeed, it would be irrational for the Board to reject the widely used RTC model and instead rely on a string program developed for litigation purposes whose code is available for review but clearly replete with errors.

Board from the uncontested evidence that the RTC model is in fact used in commercial applications. Xcel presents no evidence whatsoever that the model is unreliable.[36]

Finally, Xcel raises a number of issues related to the implementation and use of the RTC model in this case. It is clear without extensive analysis that Xcel's criticisms are trivial and address minutia, not the overall logic or validity of Mr. Wheeler's RTC application.

In its August 8, 2003 order, the Board instructed the parties to address in their final briefs the development of off-line transit and unloading times used in their respective operating models. BNSF did not independently develop off-line or unloading times but instead accepted Xcel's assumptions as to those times. Xcel never explained its procedure for developing off-line and unloading times, which are set out in an electronic workpaper.[37] It used these off-line times in the following way. It first identified the time that each modeled train was assumed to leave the SARR loaded and then added the off-line time to determine when the train was assumed to return to the SARR empty. BNSF simply accepted Xcel's calculation of the empty return time as the beginning of the cycle of each SARR train that BNSF modeled. There was no reason to question Xcel's calculation of off-line times since those times were not relevant to the determination of SARR capacity or cycle times. Moreover, acceptance of Xcel's calculations eliminated an area of potential dispute.

---

[36] Xcel did criticize the model on grounds that it supposedly does not produce data in a form that can be utilized by an analyst. Xcel Reb. Nar. at III-B-46. Xcel is wrong. The RTC Model can produce output data in spreadsheet format that can be analyzed in either Microsoft Access or Excel.

[37] Xcel Op. Elec. WP "peaktrns.xls" at column AV in the "string_Xcel.zip" file.

D. Yard Capacity

The most significant difference between the parties on the issue of yard capacity relates to the Guernsey Yard, the largest and most important SARR yard. The inadequacy of Xcel's Guernsey yard is evident by comparing it to BNSF's Alliance Yard, which handles a comparable amount and type of traffic as the SARR. BNSF's Alliance Yard has 27 tracks used to process empty trains while Xcel's Guernsey Yard has *six* tracks for empty trains. BNSF Rep. Nar. at III.B-45-46. While Xcel's assumptions inconsistent with the real world, Xcel provides no support for its Guernsey Yard configuration except vague and conclusory assertions that Xcel's experts designed the Guernsey Yard to be comparable to WRPI yards. WRPI, however, handled a substantially lower traffic volume than the SARR is assumed to handle. Moreover, there is no way to verify Xcel's assertions about WRPI because Xcel did not submit a scrap of evidence on the WRPI yard configuration to support its claims.

BNSF performed two independent and complementary analyses of the trackage required for Xcel's Guernsey Yard. First, BNSF's witnesses Messrs. Cebula and Mueller evaluated the actual operations to be carried out at Guernsey. BNSF Rep. Nar. at III.B-46-48, 51. A second analysis was performed by Mr. Wheeler using the RTC model.[38] BNSF Rep. Nar. at III-B-48-49, 51-52. Xcel basically ignored BNSF's RTC model analysis and focused its criticism on Mr. Mueller's analysis of operations needed to be performed at Guernsey.

First, Xcel complained that it was inappropriate for Mr. Mueller to rely on real world experience in assessing the time that empty trains would spend at Guernsey. But Xcel presented no evidence challenging Mr. Mueller's detailed description of the specific steps required or the

[38] Both analyses were performed based on the lower traffic volumes that BNSF assumes will be available to the SARR. Obviously, higher traffic volumes would require substantially more yard capacity.

amount of time required to perform the needed operations, and Xcel likewise presented no evidence to support the 2-hour dwell time for empty trains that Xcel asserts should be used instead.[39] Xcel Reb. Nar. at III-B-52; III-C-19-20. Second, notwithstanding its own designation of the Guernsey yard as the SARR's "principal service/staging yard," Xcel Op. Nar. at III-B-6, Xcel asserts that it was inappropriate to include staging tracks at Guernsey to coordinate access into PRB mines. Xcel Reb. Nar. at III-B-52. But it is beyond serious dispute that any railroad originating unit coal trains in the PRB would need staging facilities to ensure the efficient flow of traffic on high volume lines. BNSF Rep. Nar. at III.B-48. Finally, Xcel challenged BNSF's assumption that southbound loaded trains must enter Guernsey Yard. Xcel Reb. Nar. at III-B-53. But BNSF demonstrated that loaded trains interchanged to BNSF at Pawnee Junction must enter Guernsey Yard for a 1,000-mile inspection. BNSF Rep. Nar. at III.C-24.

V. SARR OPERATING COSTS

It is difficult to compare directly the parties' operating costs because those costs are based on SARRs with significantly different traffic volumes. However, it is clear that the parties are far apart in their calculation of operating costs since Xcel's base year operating costs are 57 percent of BNSF's projected operating costs even though Xcel's SARR supposedly handles 12 percent *more* traffic in the base year.[40] The areas where the parties differ most significantly on operating costs relate to crew, locomotive, G&A, and MOW costs.

---

[39] Mr. Mueller pointed out that his assessment of time was very optimistic when compared to BNSF actuals. BNSF Rep. Nar. at III.C-19 to 24.

[40] *Compare* BNSF Rep. Ex. III-H-1 at 23; Xcel Reb. Ex. III-H-3 at 23; and BNSF Rep. Ex. III.A.8 at 1 and Xcel Reb. Ex. III-A-8 at 1.

A. Crew

Xcel failed to provide the Board with any reliable or usable crew statistics. BNSF pointed out in its Summary Disposition Motion, and Xcel in many cases conceded, the numerous mathematical errors and the failure to comply with federal hours-of-service regulations that led to Xcel's first assumption on opening of 146 T&E employees.[41] In response to BNSF's Motion, Xcel hypothesized that if the errors were corrected, the WCC could require as many as 260 crew personnel in the base year.[42] BNSF demonstrated on reply that the necessary corrections would result in a need for more than 400 crew personnel in the base year.[43] Then on rebuttal, Xcel came up with a new crew number that was lower than its earlier estimate of 260 crew personnel. Xcel's new crew number was based on a "corrected" two week "peak" period and a radically altered string program that purported to show much shorter transit times on SARR trains. As noted previously, the errors in Xcel's rebuttal string program invalidate any statistic, including crew personnel, that was based on the new string output. Moreover, despite its admission that the SARR would be required to comply with hours-of-service regulations, Xcel made no effort to determine whether additional crews would be required because some crews cannot complete their duty tour within the time allowed. Xcel blithely asserts without supporting evidence that "crews would have more than enough time to complete their shifts."[44]

---

[41] *See* BNSF Sum. Disp. Motion, at 18-22; Xcel Rep. to Sum. Disp. Motion, at 5-6; Crowley V.S. at 27.

[42] Xcel Reb. Nar. at III-D-21.

[43] *See* BNSF Rep. Nar. at III.D-38, Table III.D.3-4, and III.D-40 (384 road crew plus 22 switch crew personnel).

[44] Xcel Reb. Nar. at III-D-22. This statement is untrue. Xcel's new (and invalid) string output demonstrates numerous instances where crews would exceed the permitted time.

In addition, Xcel continues to grossly understate the amount it would need to pay its crew personnel. Xcel calculated crew salaries that were below the average salaries paid to BNSF conductors and engineers reflected in Wage Form B, and it also assumed that its employees would work far more than the average BNSF employee despite the smaller annual salary. On reply, BNSF demonstrated that only a very small proportion of BNSF crew personnel works as many shifts as SARR crews would be required to, and that small subset of employees is compensated at much higher levels than the "average" BNSF employee.[45] The labor market would force any railroad to pay higher annual wages to crew expected to work the number of shifts posited by Xcel, especially for unit train coal operations that are unscheduled.[46] Xcel cannot have it both ways. It cannot calculate the number of crew personnel by assuming an extremely high number of crew starts per year and then avoid paying its crew personnel a salary that compensates for that heavy workload.

B. SARR Locomotive Costs

Differences between the parties on the number of locomotives required by the SARR are driven primarily by three factors. First, Xcel's locomotive calculations do not account for peak period requirements. BNSF Rep. Nar. at III.C-33-34. Xcel argues that the SARR does not need worry about peak traffic periods because it could simply borrow locomotives from the residual

---

[45] *See* BNSF Rep. Nar. at III.D-41 to III.D-51.

[46] The low wages cited by Xcel supposedly paid by the ICE are irrelevant. There is no evidence, and no reason to believe, that ICE employees would be expected to perform the same type of work or work anywhere near the number of shifts per year that Xcel assumes for its SARR employees. *See* BNSF Rep. Nar. at III.D-46-48. Indeed, the Board can evaluate the vast differences between the SARR and the ICE by reviewing materials submitted by ICE. *See* Verified Notice of Exemption of Iowa, Chicago & E.R.R. Corp., *Iowa, Chicago & E.R.R. Corp. – Acquisition & Operation Exemption – Lines of I&M Rail Link, LLC*, STB Fin. Docket No. 34177 (filed June 7, 2002).

incumbent under a hypothetical run-through agreement. Xcel Reb. Nar. at III.C-9-10. But Xcel cannot impose on the residual incumbent the burden to incur the costs needed to maintain peak period equipment for the off-SARR *and* on-SARR portions of the movement. As the Board concluded in *TMPA*, it is "a carrier's obligation to have sufficient locomotives to serve its customers during peak periods," *TMPA* at 81, and Xcel failed to do so here.

The parties also disagree on the proper spare margin to use in developing the total locomotive fleet. BNSF showed that Xcel's reliance on a { } in an expired BNSF maintenance contract was misplaced because Xcel misconstrued the scope of that guarantee. BNSF Rep. Nar. at III.C-36. Moreover, BNSF's actual experience with the SD70MAC locomotives used to provide coal transportation service, including those covered by the maintenance agreement, was that they were in the shop and unavailable for use { } of the time. BNSF Rep. Nar. at III.C-37. Since Xcel proposes to use the same types of locomotives for the same type of service, there is no reason to expect that the SARR would experience different availability.

Third, Xcel dramatically reduced its locomotive count on rebuttal based on the output of its rebuttal string program. As discussed above, the output of that string program is flawed and cannot be used to generate reliable operating statistics.[47]

C. G&A

There is not sufficient space to address in this brief the numerous assumptions and calculations needed to produce reliable G&A estimates. However, the Board should evaluate the evidence presented by the parties in light of the real world references that BNSF submitted on

---

[47] Differences between the parties on locomotive operating costs are driven by different assumptions as to rates of fuel consumption. BNSF Rep. Nar. at III.D-9.

reply. BNSF demonstrated that Xcel had posited a SARR that achieved unrealistically low staffing and salary levels that have never been achieved in the past.[48] Given the extreme discrepancies between Xcel's G&A assumptions and real world experience, it was incumbent upon Xcel to submit detailed and verifiable evidence supporting its G&A assumptions. On opening, Xcel failed to provide any support for its G&A assumptions other than the general and conclusory statements of its witnesses. On rebuttal, Xcel purported to submit evidence supporting some of its G&A assumptions. Pursuant to Board precedent described above, this evidence should be excluded as improper rebuttal. The Board should not permit complainants to avoid scrutiny of their cost assumptions by holding back evidence on those assumptions until rebuttal.[49]

A major difference between the parties on G&A costs involves insurance. Xcel assumed the SARR's insurance cost would be a percentage of the SARR operating costs equal to the ratio of BNSF's insurance costs to BNSF's operating costs. Xcel Op. Nar. at III-D-40. However, BNSF demonstrated that its low insurance costs are the result of economies of scale not available to the SARR, and it submitted the only evidence in the record as to the insurance costs that a railroad with the specific characteristics of the SARR would incur. BNSF Rep. Nar. at III.D-95.

---

[48] BNSF Rep. Nar. at III.D-68-69, 79-80, 85-86, 93-95 (staffing levels); *id.* at 99-102 (executive salaries); *id.* at 74-75 (board of directors); *id.* at 87, 94 (outsourcing); *id.* at 62-63 (revenue/employee comparison to Class I railroads); *id.* at 67 (revenue/employee comparison to regional and shortline railroads).

[49] In any event, the rebuttal evidence is inadequate. For example, there are clear inconsistencies between the RailAmerica information offered in Xcel's Reb. Nar. at III-D-42 (noting 500 North American employees) and its workpapers at XCEL.REB.WP.6108 (showing 1300 employees in North America).

D. MOW COSTS

As noted previously, a complainant must design a SARR that provides service at least as good as the service provided by the incumbent. Xcel ignored this requirement in the assessment of SARR capacity and its MOW assumptions suffer from the same flaw. BNSF explained on reply that Xcel's MOW plan would result in delays and degraded service that would be unacceptable to SARR shippers. Xcel's in-house MOW staff would be insufficient to handle even routine day-to-day maintenance and it would be utterly incapable of responding to unexpected maintenance events that could shut down SARR lines. Xcel's arbitrary allocation of 10% of its contract expenditures on program maintenance to supplement the work of its meager in-house MOW staff is patently inadequate.[50] Unsupported allocations are no substitute for competent evidence on the expenditures required to maintain efficient operations of the SARR.

BNSF showed that the level of MOW spending that Xcel assumes for its high-density SARR would be inadequate even for a low density railroad. BNSF presented detailed evidence comparing the MOW staffs for two major shortline railroads, the MRL and the FEC, with Xcel's MOW staff assumptions. As BNSF explained, while both comparison lines had significantly lower traffic density, they had far larger MOW workforces than the SARR.[51] Xcel claims that a better comparison would be with the WRPI line, but it failed to present any competent or verifiable information about the MOW workforce or practices on WRPI.[52]

---

[50] Xcel's 10% assumption comes out of thin air.

[51] *See* BNSF Rep. Nar. at III-D.123, III-D.159, III-D.177. The size of these railroads' operating MOW budget as a percent of total budget was also much greater than assumed by Xcel for its SARR.

[52] The only data presented by Xcel on WRPI was the vague and confusing statement, presented on rebuttal, that "WRPI, with 60 percent higher tonnages than the WCC, averages one person for every 5.8 route miles." Xcel Reb. Nar. at III-D-97. There is no context for this figure. It is

Xcel's MOW assumptions rest on little more than rhetoric about the ability of a SAC complainant to "structure a least-cost, most efficient stand-alone railroad." Xcel Reb. Nar. at III-D-88. But the complainant has the burden of proof and it must present *evidence*, not rhetoric, supporting its cost assumptions. Xcel's opening and rebuttal MOW presentations are totally devoid of substance, analysis or data. The only competent evidence in this case as to the MOW costs for the SARR is that presented by BNSF consisting of a detailed, bottom up evaluation of the specific tasks that would have to be supported by an MOW workforce and the necessary size of that workforce given the specific traffic characteristics and territory to be covered.

VI. ROAD PROPERTY COSTS

The parties differ substantially on the costs to engineer and construct the SARR. Some of the difference results from the parties' different mainline and yard capacity assumptions, discussed previously. Most of the remaining differences are associated with a small number of cost issues that are briefly discussed below.[53]

A. Earthworks In Yards

The single most important area of difference on RPI costs is earthworks, and the most important source of that difference relates to the cost of earthworks required to construct SARR

---

impossible to know whether it is accurate; whether it refers to current UP practice or the old WRPI line; what personnel are included in the number; or what line segment is at issue. Unverifiable evidence such as this is incompetent and cannot be relied upon.

[53] Xcel asserts that the cost/track mile calculated by the Board in *TMPA* ($1.7 million) is a valid benchmark for assessing BNSF's RPI costs in this case ($2.7 million) and Xcel's RPI costs ($1.5 million). Xcel Reb. Nar. at III-F-1. However, a comparison of the TMPA and Xcel SARRs on a cost/track-mile basis is misleading because it does not account for the relative densities of the two railroads. Moreover, any comparison of the evidence here with findings in another case is misplaced because the Board decides SAC cases based on the evidence in the record in each case, not on an independent assessment of costs.

yards.[54] Xcel vastly understated the earthworks costs for SARR yards by assuming that all yards (except the Bill yard) would have an average of one foot of fill. Xcel's reliance on the Board's decision in *WPL* to justify this assumption is misplaced. There, the complainant located SARR yards in the same place they were located when the ICC Engineering Reports were produced. Since the Engineering Reports do not separately identify earthworks for yards and mainline, the complainant allocated the earthworks quantities for a particular valuation section between the yards in the valuation section and the corresponding mainlines assuming one foot of fill for the yards and the remainder for the mainline.[55] Having made this allocation, the Board correctly found that it would be incorrect to assume additional amounts of earthworks for the SARR yards, which would then exceed the total earthworks for the valuation section in the Engineering Reports.

In this case, Xcel chose *not* to locate SARR yards where they were when the Engineering Reports were developed and instead selected locations where earth moving requirements would be substantial. Because earthwork quantities for these new yards are not in the Engineering Report quantities, there is no linkage between yard and mainline earthwork quantities as in *WPL*, and no overstatement or double counting results from using the actual earthwork quantities for these new yards. Indeed, a one-foot-fill assumption dramatically understates the earthworks quantities that would be needed for the SARR yards (except for the yard at Sterling which existed at the time the Engineering Reports were prepared). For example, the Guernsey yard that Xcel chose for its SARR was not built until the late 1970s and its earthworks quantities are not

---

[54] *See* Xcel Reb. Nar. at Tables III-F-6 and III-F-7.

[55] Since the yards were originally located on flat ground, this one foot of fill assumption was reasonable.

reflected in the Engineering Reports. BNSF Rep. Nar. at III.F-46-47. BNSF's witnesses describe the extensive rock formations that had to be excavated in order to create that yard. Xcel's assumption that this yard would require only one foot of fill is clearly wrong.[56] An accurate assessment of earthworks for that yard, as well as the other yards that were placed at locations where yards did not exist when the Engineering Reports were developed, requires an assessment of the specific terrain for the yard, and BNSF has presented the only evidence in this case on that issue.[57]

The second major issue involving earthworks in yards relates to the need to relocate the SARR's Bill yard, which Xcel improperly assumed would be constructed on top of UP's existing Bill yard. Xcel claims that the concept of entry barriers entitles it to build a yard where UP has a yard today since the SARR should not bear costs associated with its later entry into the market. Xcel misinterprets the law relating to entry barriers. As the cases cited by Xcel indicate, an entry barrier is a cost that the new entrant would have that *the incumbent* did not or would not have. Xcel Reb. Nar. at III-B-56, 57. But the existence of UP's yard would be as much an impediment to the incumbent seeking to do business in the manner proposed by Xcel as it is to the SARR.

---

[56] Xcel contends that its method of separating yard quantities in the Engineering Reports from quantities attributable to the mainline overstates mainline earthworks quantities. BNSF disagrees, but that is not a relevant issue since Xcel chose its methodology for separating the respective quantities.

[57] Xcel argues that BNSF should be precluded from relying on commercial software to determine earthworks unless it agrees to produce a copy of the software. It cites the Board's treatment of the RAILS model in *TMPA* as support. But the programs used by BNSF in this case, unlike the proprietary RAILS model, are commonly used by engineering firms and are readily available for purchase. BNSF Rep. Nar. at III.F-44, 146. Xcel would apparently have the Board establish a rule precluding the use of commercial programs, most of which are licensed and cannot be freely produced, so that the parties would be forced to rely on made-for-litigation models that can be more easily manipulated.

The SARR is entitled to assume that its yards are built on top of the incumbent's yards, but it cannot ignore the existence of third party facilities.

B. Earthworks On Line Segments

A SARR must be built to standards that will ensure that it can provide service at least as good as the service provided by the incumbent. Xcel's earthworks calculations for SARR mainline segments violates this principle in two significant ways. First, Xcel assumes that mainline doubletrack segments can be built with only 15 feet between track centers. But as BNSF explained in its reply evidence, BNSF currently has 25-foot track centers on the line segments replicated by the SARR because that track spacing is necessary to maintain efficient traffic flows and to ensure the safety of MOW workers on high volume doubletrack segments. BNSF Rep. Nar. at III.F-24-25. Indeed, FRA regulations require 25-foot track centers unless train speeds are restricted or adjacent tracks are cleared of all maintenance workers and equipment.[58] BNSF has chosen not to sacrifice service quality to its shippers by having narrow track centers that would require speed restrictions and delay. The SARR likewise cannot choose to save costs on the construction of mainline segments that would result in degraded service.[59]

Xcel also failed to include the cost of access roads on certain high traffic portions of the SARR where operating and MOW crews, as well as outside vendors, need to have access to SARR lines without disrupting traffic. Once again, these are facilities that BNSF currently has,

---

[58] 49 C.F.R. 214.7, 214.327(b), 214.335(c). Xcel asserts that the FRA working limits regulation allows the trains to operate at full speed, but the regulation in fact states that movements under working limits "shall be at restricted speed [20 mph] unless a *higher* speed [not necessarily full speed] has been specifically authorized." 49 CFR 214.321(d).

[59] Xcel's assumption of 15-foot track centers is also inconsistent with Xcel's operating plan and string program, neither of which contemplate the effect of maintenance delays. BNSF Rep. Nar. at III.F-26.

and they are critical to BNSF's ability to provide quality service today. The SARR cannot expect to avoid these costs and still provide the same service that BNSF provides. In fact, Xcel does not specifically dispute the need for access roads, but it claims that the earthworks quantities for constructing these roads are already included in the Engineering Reports. Xcel Reb. Nar. at III-F-21. Xcel submits absolutely no evidence to support this assumption and it is implausible on its face. Access roads are required to maintain high volume operations without restricting traffic flows. These concerns were not relevant 100 years ago since the rail lines that were the subject of the Engineering Reports were low density lines. Access roads were built as traffic volumes increased, and there is no reason to believe the Engineering Reports contain any earthworks corresponding to such roads.

C. Engineering Costs

Another major difference between the parties relates to engineering costs. Xcel based its engineering costs entirely on the engineering costs used by the Board in *PPL* and submitted no independent evidence. But reliance on the *PPL* engineering costs is inappropriate. There, the parties agreed on at least two elements of engineering costs (design and subsurface investigation) and the Board accepted *PPL*'s evidence on another cost element (inspection) because it was the only evidence in the record. The Board did not endorse a specific percentage for future cases but merely accepted the evidence before it. Here, BNSF has presented detailed evidence on each specific engineering cost tailored to the circumstances of the SARR at issue in this case. BNSF's evidence on this issue is not only the best evidence as to the engineering costs for the SARR at issue here, it is the *only* evidence.[60]

---

[60] Xcel claims that any costs included in BNSF's engineering estimate associated with the compressed schedule for construction of the SARR are entry barriers that should be excluded

D. Material Transportation

Differences between the parties on material transportation costs relate primarily to three factors. First, Xcel fails to include the cost to transport subballast to the work site. Xcel claims that its subballast costs include transportation, but Xcel's subballast costs are derived from a BNSF AFE that does not include a cost for the transportation of subballast from the quarry. BNSF Rep. Nar. at III.F-95-97. Second, Xcel assumes that subballast will be available from the earthworks preparation of the yard at Guernsey but ignores the fact that the SARR construction schedule specifies that the Guernsey yard would be constructed after the mainlines. *Id.* at III.F-157-158. Third, Xcel assumes the SARR could reduce material transportation costs by using the residual BNSF to transport materials to the work site. *Id.* at III.F-110. This is a distortion of SAC principles. The SAC test allows the complainant to assume the SARR is constructed on top of the existing incumbent's lines. This fiction may be necessary to allow the complainant to choose the most efficient, least cost route, but it cannot be used to ignore real world that any railroad (including the incumbent) would have to incur to construct a new line.

VII. DCF ISSUES

There are two significant areas of dispute between the parties on the implementation of the Board's DCF model. First, BNSF includes a financing fee representing the costs that would be incurred to obtain equity for construction of the SARR. Xcel claims that the Board's cost of capital already includes any flotation costs incurred by the industry. But BNSF showed that while the Board-calculated cost of capital could in theory contain amounts for raising equity, it

---

from the SAC analysis. Once again, Xcel misconstrues the concept of entry barrier. It is an entry barrier to assume a *premium* resulting from labor and equipment shortages that might be associated with an accelerated construction schedule. But BNSF simply included the costs for the additional staffing that would be required to achieve the posited construction schedule.

does not in fact contain such amounts. BNSF Rep. Nar. at III.D-185-86; III.G-1. Since any railroad seeking to raise capital for a significant construction project would incur these costs, it is not an entry barrier to assume those costs in the SAC analysis.

Second, Xcel uses the RCAF-A to index operating costs while BNSF uses the RCAF-U, consistent with the Board's decision in *TMPA*. As BNSF explained, it is inappropriate to assume that a SARR transporting a single commodity would be able to achieve the magnitude of productivity gains possible for an existing Class I railroad. BNSF Rep. Nar. at III.D-184.

VIII. VARIABLE COST CALCULATION

Most of the issues relating to the proper calculation of variable costs are thoroughly addressed in the evidence that has been submitted. It is necessary, however, to address briefly the calculation of road property costs, which account for more than 40% of the difference between the parties' variable cost evidence, because Xcel relies on a new road property analysis submitted for the first time on rebuttal.[61]

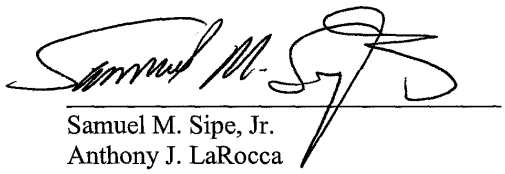
Xcel's new road property evidence purports to rely on the methodology accepted by the Board in *TMPA*. There are three problems with Xcel's reliance on *TMPA*. First, BNSF does not agree with the Board's conclusion in *TMPA* that the reconciliation of FADB and R-1 data at a *system-wide* level confirms the accuracy of the FADB data at the *segment-specific* level. BNSF Op. Nar. at II-49-50; Elliott V.S. at 23-25.[62] Second, even if it were possible to reconcile the

---

[61] Xcel tries to shift the blame to BNSF for its late filed road property evidence, arguing that it should be able to submit a new analysis because BNSF did not provide workpapers to support the Elliott statement until May 6, 2003. But Xcel did not even ask for those workpapers until April 18, 2003, even though it had the Elliott statement since April 2002.

[62] Indeed, Xcel's witness here, Mr. Plaistow, has taken the position in the *AEPCO* case that BNSF's internal road property data do not permit segment-specific calculations. *See* AEPCO Op. Nar. at II-A-37 n. 31 (filed Feb. 7, 2003).

FADB and R-1 data relating to *gross* investment, BNSF showed that the depreciation data used to produce *net* investment are erroneous and overstate depreciation, particularly on high-density lines. BNSF Rep. Nar. at II-20l; Elliott V.S. at 25-29. Third, the Board in *TMPA* specifically left open the question whether a line-specific adjustment could ever be made (even if accurate data were available) without first adjusting the variability factor to account for relative density. BNSF showed that variability does in fact change with density and that the ICC previously acknowledged that relationship. BNSF Op. Nar. at II-52-54; Rep. Nar. at II-22-24; Reb. Nar. at II-36-37. Xcel argues on rebuttal that there is no need to adjust the variability factor because the 50% variability in URCS is already too high. BNSF has not had an opportunity to respond to this assertion, but the short answer is that the ICC already concluded that road property variability most likely ranged between 50% and 90%, i.e., that 50% would be a *floor* for any credible variability analysis.[63]



IX. CONCLUSION

Xcel's SAC evidence is based on fundamental conceptual flaws as well as unsupported and erroneous cost assumptions. When the SAC test is implemented using appropriate cost and revenue assumptions, it is clear that the challenged rate does not exceed a reasonable maximum rate. The Board should dismiss Xcel's complaint.

---

[63] ICC, Bureau of Accounts, Explanation of Rail Cost Finding Procedures and Principles Relating to the Use of Costs, Statement No. 7-63, at 83 (1963). This conclusion is even more applicable today given that changes in railroad accounting result in more MOW expenditures, which are highly variable with density, being treated as capitalized road property costs.

Re: **Major Issues in Rail Rate Cases, STB Ex Parte No. 657 (Sub-No. 1)**
Reply Comments of BNSF Railway Company

Dear Secretary Williams:

BNSF Railway Company ("BNSF") attempted to file a physical copy of the Reply Comments of BNSF Railway Company and related materials with the Board at approximately 3:00 p.m. on May 31, but was unable to complete the filing because the Board's building was closed due to a broken water main. Shortly thereafter, BNSF filed a .pdf version of its Reply Comments using the Board's electronic filing system. Copies of the Reply Comments were served on interested parties on May 31. BNSF is now submitting the paper copy of its filing, as well as CDs containing electronic versions.

Enclosed are the original and twenty copies of the Reply Comments of BNSF Railway Company submitted in response to the Board's Notice of Proposed Rulemaking dated February 27, 2006 in the above-captioned proceeding. Also enclosed are three CDs containing PDF copies of these Reply Comments and three CDs containing electronic versions of BNSF's Reply Comments in Word format.

Please date stamp the extra copy of this letter and return it with our messenger.

Sincerely,

Samuel M. Sipe, Jr.
Counsel for BNSF Railway Company

BEFORE THE
SURFACE TRANSPORTATION BOARD

STB Ex Parte No. 657 (Sub-No. 1)

MAJOR ISSUES IN RAIL RATE CASES

REPLY COMMENTS OF BNSF RAILWAY COMPANY

On May 1, 2006, BNSF Railway Company ("BNSF") submitted comments addressing the rules proposed by the Board in the February 27, 2006 Notice of Proposed Rulemaking in Ex Parte No. 657 (Sub-No. 1), *Major Issues In Rail Rate Cases* ("NPRM"), regarding the application of the SAC test in rail rate cases and the procedures for reopening and vacating existing rate prescriptions. The Board also received comments from other railroads, shippers, shipper associations, and government agencies. BNSF hereby submits its reply comments addressing the opening comments of other parties in this proceeding.

I. INTRODUCTION

More than a quarter of a century after the Staggers Act, shippers and their advocates continue to deny the basic principles that govern the Board's regulation of railroad rates. There is a pervasive sense in the shippers' comments that rate prescriptions should be favored over market-based rates, that railroads should be restrained from setting rates based on market forces, and that differential pricing should be severely restricted because it is unfair to shippers with high demand for rail services. The shippers' emphasis on regulation and disregard for market-based rate setting would turn the statute on its head. In the Staggers Act, Congress sought to *remove* the burdens of regulation that had produced ruinous financial results for the Nation's railroads. Congress expressly instructed the Board to "allow, to the maximum extent possible,

competition and the demand for services to establish reasonable rates for transportation by rail." 49 U.S.C. §10101(1). Congress also instructed the Board to assist railroads to achieve revenue adequacy. 49 U.S.C. §10704(a)(2). There is no dispute that revenue adequacy can only be achieved if railroads are permitted to engage in differential pricing.

The scheme of regulation under the current statute is to give railroads the freedom to set rates based on market forces. Rate regulation is limited to circumstances where there is an abuse of market power. It is not an abuse of market power for a railroad to set differential prices based on perceived demand for service by individual shippers. Differential pricing is critical to the financial viability of the railroad industry and it has been at the heart of regulatory policy since the Staggers Act. Nothing has changed in the railroad industry to make differential pricing any less important now. The Board and its predecessor have repeatedly stated that railroads can recover their substantial joint and common costs only by setting relatively high prices for shippers with high demand for rail service.

Some shippers and their advocates suggest that railroads no longer need to engage in differential pricing because they have already achieved revenue adequacy. *See, e.g.*, Verified Statements of Curtis M. Grimm, at 1-2 ("Grimm Op. VS") and George H. Borts, at 1-2, ("Borts Op. VS"), attached to the Joint Opening Comments of Western Coal Traffic League, Concerned Captive Coal Shippers, Western Fuels Association, Inc, Edison Electric Institute, National Rural Electric Cooperative Association & American Public Power Association (hereinafter "WCTL" or "Coal Shippers"). This claim flies in the face of the Board's own revenue adequacy findings. The Board cannot ignore its calculations showing that the Nation's largest railroads are not consistently earning their cost of capital. If railroads cannot earn their cost of capital on a sustained basis, their ability to provide the services that shippers demand is at risk. The Board's

standards for measuring revenue adequacy are not at issue in this proceeding. If shippers believe that a different revenue adequacy standard should be used, they should seek to convene a separate rulemaking proceeding to address that issue. In the meantime, the Board must be guided by its findings that no Class I railroad has become revenue adequate on a sustained basis.

It is particularly important for the Board carefully to consider the impact of regulatory policy on the adequacy of railroad revenues now, since it is widely agreed that rail capacity needs to be expanded in the face of growing demand. As the Department of Transportation noted in its comments, "[t]he single most critical problem facing railroads today, if not the entire freight transportation industry, is providing the capacity to handle growing demand for transportation." Initial Comments of the United States Department of Transportation at 2 ("DOT Op. Comments"). Railroads can meet this growing demand only if they have revenues that are adequate to fund the costly expansion of their capacity. Regulation that cuts railroad revenues by restricting differential pricing would limit the ability of railroads to make capital investments and therefore would be detrimental to the community of railroad users. The Board regulates railroads in the broad public interest, and the public's interest is in a financially healthy railroad industry that can make the investments necessary to ensure adequate transportation service.

The shippers' comments also assert that the Board has shown a pro-railroad bias in recent coal rate cases. This claim is demonstrably wrong. Where complaints have been dismissed, it has been the result of ill-conceived SAC presentations where the shippers have sought to test the outer limits of the SAC test. The recent upsurge in litigation has not been the result of any market dislocation but rather has resulted from a widespread view that the SAC standard is capable of manipulation, particularly on the issue of cross-over traffic. Rail rate increases have been modest, considering the strong increases in demand. Rail rates have increased far less than

price increases in related energy markets, such as the market for oil, natural gas and coal. *See* Verified Statement of Darius W. Gaskins, Jr. at 9 ("Gaskins Op. VS") attached to the Comments of BNSF Railway Company ("BNSF Op. Comments"). Moreover, where shippers have prevailed in the recent cases, the Board has set rates very low – at or near the jurisdictional threshold.

The commenting shippers also repeat their complaint over the Board's decision to address issues of SAC methodology in a rulemaking proceeding. The shippers' disapproval of rulemakings reflects their hostility toward the economic principles underlying the SAC test. A rulemaking proceeding allows the Board to evaluate and adopt standards based on a broad and careful examination of the economic principles that are supposed to guide the Board's regulation of railroad rates. Shippers have apparently concluded that they can achieve better results when SAC issues are addressed in individual cases, where complex and difficult issues of economic policy may take a back seat to the myriad evidentiary issues that must be decided. It is appropriate for the Board to step back and ask for interested parties' views on broader, recurring issues of SAC methodology.

As BNSF noted in its opening comments, this rulemaking proceeding does not cover all of the issues that BNSF believes should be addressed in a full review of SAC methodology. And the shippers, while opposing the rulemaking, also – inconsistently – ask the Board to expand the scope of the rulemaking to cover additional issues, including the Board's cross-subsidy test, the treatment of debt amortization and the extent to which new SAC methodologies will be considered in the reopening of an existing rate prescription. The Board's rulemaking could have been more comprehensive, but it was not. Given the scope of the Board's initial notice and the fact that the Board has not chosen to expand it, there are limits to the issues that can be addressed

in this proceeding. *See, e.g., Environmental Integrity Project v. EPA*, 425 F.3d 992, 996 (D.C. Cir. 2005). Unless the scope of the rulemaking is expanded by order of the Board and an opportunity is given to all parties to comment on specific new proposals, the Board must limit the scope of this rulemaking to the issues specifically identified in the February 27, 2006 NPRM.

BNSF's reply comments follow the same format as its opening comments. BNSF addresses the opening comments of other parties on each of the Board's six proposals in sections II through VII below. BNSF responds briefly to the Coal Shippers' comments on the cross-subsidy issue in Section VIII. BNSF's reply comments are also supported by verified statements of Professors Kalt and Willig and Messrs. Klick and Baranowski, all of whom presented testimony on BNSF's behalf on opening. In addition, these reply comments are supported by a verified statement of Martin M. Baily, a Senior Fellow at the Institute for International Economics and an Academic Advisor to the Congressional Budget Office, who addresses the economic issues raised by the shippers' comments on the question of productivity that would be experienced by a SARR.

II. MAXIMUM RATE DETERMINATION

A. Railroad Commenters Agree That The Board's Proposals Are Flawed

The most extensive railroad comments on the Board's proposed MCM and MMM approaches to setting a maximum rate were from BNSF. On opening, BNSF and its expert witnesses explained at length why both approaches were fundamentally inconsistent with differential demand-based pricing and the contestable market principles embraced by the *Guidelines*.[1] BNSF showed that the effect of the Board's proposals would be to drive rates on railroads' most demand inelastic traffic down to a common level, in violation of the economic

[1] *Coal Rate Guidelines – Nationwide*, 1 I.C.C.2d 520 (1985)("*Guidelines*").

principles that govern railroad rate regulation, longstanding agency and court decisions, and several explicit provisions of the governing statute. BNSF also showed that the sole rationale for proposing to depart from the percent reduction methodology was an unsupported presumption that railroads will attempt to "game" the results of a SAC analysis in setting a common carrier rate. There is no evidence that would support such a conclusive presumption, which in any event is at odds with a railroad's statutory right to set rates of its own choosing in the first instance.[2]

The joint comments of Norfolk Southern and CSX similarly note that "there is simply no evidence that the hypothetical concern addressed by the Board's proposed alternatives to the [percent reduction methodology] . . . is a real problem that requires abandonment of the fundamentally sound approach that the [percent reduction methodology] takes to allocating excess revenues across the users of a stand-alone railroad system."[3] As to the Board's proposed solution to this nonexistent problem, NS and CSX note that under both of the Board's approaches, the railroads' existing rate structure is destroyed because lower rates do not change while higher rates are forced to a common level.[4] As Norfolk Southern and CSX properly note, the principles of demand-based differential pricing and contestability dictate that any rate reduction methodology should produce lower rates for all movements in a SARR's traffic group when an overcharge has been demonstrated while preserving to the extent possible the existing rate relationships in the railroad's rate structure. UP similarly expresses concern in its comments that MCM and MMM "depart from the concept of differential pricing, which lies at the very core

---

[3] Joint Comments of Norfolk Southern Railway Co. and CSX Transportation Co., at 4 ("NS/CSXT Op. Comments").

[4] *Id.*, at 6.

of the approach the agency has properly taken to rate regulation in the past."[5] UP notes, in addition, that these approaches closely resemble the "ton-mile method" and "ratio method" that the ICC rejected more than 20 years ago.[6]

B. The Shippers Advocate That The Board Should Abandon Percentage Reduction And Adopt No Fixed Approach As A Replacement

The most extensive shipper comments on the rate reduction issue are contained in the Coal Shippers Opening Comments. First, the Coal Shippers support the Board's proposal to discontinue use of the percent reduction methodology. While they refer to the Board's "gaming" rationale for seeking alternatives to the percent reduction methodology, they point to no evidence that such "gaming" has actually occurred. The Coal Shippers discuss the issue briefly in a single paragraph. Indeed, the Coal Shippers make it clear that their real purpose in seeking to eliminate the percent reduction methodology is to eliminate a railroad's ability to engage in differential pricing. This should be troubling to the Board. The Board's proposal was prompted by shippers' repeated claims about the possibility of railroad gaming, and now it is clear that the shippers have in fact been searching for a back door way of eliminating differential pricing, which is a bedrock principle in the *Guidelines*.

The Coal Shippers' tortured argument is that the SARR is, by definition, a revenue *adequate* railroad, while differential pricing is only allowed for revenue *inadequate* railroads. "By continuing to maintain a differential pricing profile attributable to a revenue inadequate incumbent for the revenue adequate SARR, the percent reduction method offends this essential principle of the Guidelines."[7] In other words, once a railroad is found to have charged a rate that

---

[5] Opening Submission of Union Pacific Railroad Co, at 20 ("UP Op. Comments").

[6] The Coal Shippers' comments suggest in passing that MMM and MCM are consistent with Ramsey pricing principles, but make no effort to actually demonstrate such consistency.

[7] Coal Shippers Op. Comments, at 16.

exceeds a reasonable maximum rate, its prices must be set as though it were a revenue adequate SARR that is no longer permitted to price differentially based on shipper demand.

What this argument ignores is that the issue traffic rate is being set for a revenue inadequate railroad. The *Guidelines* unambiguously endorsed demand-based pricing as the "essential principle" governing the Board's regulation of rates for railroads that are revenue inadequate. The ICC acknowledged that a demand-based pricing structure must be preserved if a railroad is to have any chance to achieve revenue adequacy. As the ICC explained in the 1983 Guidelines, "[i]t is only through a demand-based pricing system that the nonattributable costs can be allocated in an efficient manner."[8] The ICC explicitly stated that a railroad's demand-based pricing system must be preserved in the setting of a maximum rate even if the challenged rates are found to exceed a SAC maximum rate: "In considering a rate prescription and/or reparations, we will attempt to provide an effective remedy for the complaining shipper, but in a manner that would not introduce further distortion into the carrier's pricing structure." *Guidelines* at 548. Preservation of the railroad's basic pricing structure, which is accomplished through the percent reduction methodology, was the express goal of the ICC in the *Guidelines*.

Second, the Coal Shippers state that the Board's proposed alternative methodologies are "superior to the percent reduction formula," but they urge the Board not to adopt a single, standard methodology in place of the percent reduction methodology. Instead, they assert that the Board "should consider alternative methodologies that may be developed and proposed in individual proceedings." Coal Shippers Op. Comments at 17. The two shippers with pending cases who filed comments – AEP Texas and Western Fuels/Basin Electric – each advocate that

[8] *Coal Rate Guidelines – Nationwide*, Ex Parte No. 347 (Sub-No.1), slip op. at 9 (Feb. 8, 1983).

the approaches they proposed in their individual cases should be accepted as "appropriate," but non-exclusive, methodologies.

In his attached statement, Professor Kalt explains why the open-ended, results-oriented approach advocated by the shippers is senseless from a regulatory and public policy perspective. The economic principles underlying the *Guidelines* are general and can be applied across the spectrum of cases. They provide a rational framework and add coherence and predictability to the regulatory process. Abandoning the *Guidelines* for a case-by-case approach with no governing principles would undermine the regulatory process and produce negative consequences for the economy as a whole.

The Board's proposed changes to the percent reduction methodology purport to stem from a concern over the possibility of railroad manipulation of the SAC process. But the history of recent cases demonstrates that the real manipulation problem has been created by shippers who construct grotesquely distorted SARRs with huge volumes of cross-over traffic that make minimal use of the SARR but nevertheless generate vast revenue windfalls. The Coal Shippers' proposal that the Board permit complainants to use different rate reduction methods in different cases is an obvious attempt to preserve the ability to manipulate the SAC process. It is an invitation to the Board to unleash wholesale gaming upon rate cases by permitting shippers to choose, without any governing rules, whatever approach results in the lowest rates in a particular case.

C. Alternatives To Percent Reduction Proposed By Shippers Are Flawed

1. AEP Texas

AEP Texas purports to resubmit in this proceeding for adoption "as an acceptable approach to the allocation of rate relief" the General Percent Reduction Methodology ("GPRM") that it advocated in STB Docket No. 41191 (Sub-No. 1). Opening Comments of AEP Texas

North Company, at 8 ("AEP Texas Op. Comments"). AEP Texas promotes GPRM as a modification to the percent reduction methodology that allocates rate relief in proportion to the ratio of price markups over marginal cost. *Id.* at 11. In fact, AEP Texas did not promote a single or consistent GPRM approach in Docket No. 41191. Rather, AEP Texas proposed, on opening, an approach that was described as reducing rates in proportion to mark up over marginal cost but which, as applied, actually set all rates for higher-rated traffic to the same revenue to marginal cost ratio.[9] AEP Texas defended that approach on rebuttal, but then proposed a new allocation method in its brief in violation of the Board's rules governing the scope of final briefs. For purposes of this proceeding, AEP Texas appears to be proposing that the Board adopt the GPRM approach as modified by AEP Texas in its brief. AEP Texas Op. Comments at 13-14.[10]

AEP Texas argues that GPRM is consistent with Ramsey pricing principles because it focuses on the markup over marginal cost rather than absolute rate levels. But two fatal defects render the approach unworkable. First, the markup over marginal cost under Ramsey pricing is related to demand. But GPRM considers the supposed markup over marginal costs only for the cross-over portion of a movement, not for the through movement. There is no shipper demand for a portion of a through movement. The Board's own precedent confirms that it is inappropriate to view the revenue allocated to the SARR for its portion of a movement as a rate

[9] *See* BNSF Reply Nar. at III.G-40 to 41. Such an approach would be similar to the Board's MMM proposal and would suffer from the defects of that proposal as described in the opening statements of Professors Willig and Kalt and Mr. Klick.

[10] Some confusion remains because AEP Texas attaches as an exhibit to its comments Exhibit III-H-1 from its opening evidence in Docket No. 41191. AEP Texas describes the exhibit as "[a]n example of the calculation of the resulting percent markups for each movement." AEP Texas Op. Comments at 13. In fact, the exhibit shows nothing of the kind. Instead, it is the typical DCF exhibit presented in rate cases with an extra column added to Table L to report what purports to be a GPRM SAC rate. That GPRM SAC rate was not calculated using the approach described in AEP Texas' brief, but instead was calculated using the flawed iterative approach that reduced all highly-rated traffic to a common R/VC ratio that AEP Texas appeared to have abandoned by the time it filed its final brief.

that reflects demand for through transportation, or as in any way reflective of shipper demand. In the *Bottleneck*[11] decision, the Board declined to allow shippers to force railroads to establish local rates over bottleneck portions of a through route because, in part, it recognized that a shipper's demand was for origin to destination transportation, not transportation over a specific routing or segment. Quoting *Great Northern Ry. Co. v. Sullivan*, 294 U.S. 458, 463 (1935), the Board affirmed that "[t]he shipper's only interest is that the charge shall be reasonable as a whole." 1 S.T.B. at 1072 (internal quotation marks omitted).

Shipper demand is for a through movement, therefore Ramsey prices would make sense, if they could be calculated, only for the through movement. Mr. Klick explains in his reply verified statement that if it were not for the difficulty in calculating marginal costs – one of the reasons that the ICC concluded that true Ramsey pricing could not be implemented as a regulatory standard – a Ramsey-type rate reduction approach would have to focus on the markup over marginal costs *on the through movement.* Thus, a Ramsey-based approach would first assume that the SAC analysis using cross-over traffic identifies the dollar amount of any overcharge by the incumbent on the movements included in the SARR traffic group. As Mr. Klick explains, this assumption – that the overcharge would not be larger if the SARR were extended – is reasonable in light of the fact that the complainant chose not to build out to include a larger portion of the through movement in the SARR and in light of the incumbent's real world revenue inadequacy. The dollar overcharge thus identified in the cross-over analysis could then be eliminated by applying an equal percentage reduction to the markup over marginal cost on the

[11] *Central Power & Light Co. v. Southern Pacific Transportation Co.*, 1 S.T.B. 1059 (1996), *clarified*, 2 S.T.B. 235 (1997), *aff'd sub nom. MidAmerican Energy Co. v. STB*, 169 F.3d 1099 (8th Cir. 1999).

through movement, thereby preserving the relative demand-based markups (on the through movements) for the group of shippers in the SARR traffic group.

But the second problem with GPRM, relating to the calculation of marginal cost, is insurmountable. An accurate calculation of marginal costs for specific movements is an essential requirement for any Ramsey-based pricing system. GPRM is based on calculating an exceedingly crude URCS-based proxy for marginal cost. BNSF witnesses Kalt, Willig and Klick address in detail the numerous pitfalls involved in attempting to use URCS variable cost calculations as a proxy for true marginal costs.

AEP Texas acknowledges that accurate calculation of marginal costs for each member of a SARR traffic group would be "extremely burdensome." AEP Texas Op. Comments at 11. AEP Texas reasons, however, that it does not matter whether the calculation is accurate, because all that is necessary is to know the relationship between "comparable markups above similarly determined cost levels." *Id.* at 12. That argument is obviously flawed. If marginal costs do not really matter in Ramsey pricing, then why would Ramsey prices focus on the markup over marginal cost? Professor Kalt demonstrates in his reply statement the importance of an accurate calculation of marginal costs in Ramsey pricing. Moreover, as Mr. Klick points out in his reply statement, the ICC recognized that an accurate calculation of marginal costs for particular through movements would be necessary for any Ramsey-based pricing scheme, and that is one of the reasons it did not adopt pure Ramsey pricing as the model for maximum rate regulation.

As an alternative to pure Ramsey pricing, the ICC adopted an approach to maximum rate regulation that allowed railroads to set rates in the first instance based on perceived market demand, and then, if those demand-based prices were shown to generate excessive revenues for a group of shippers, to reduce those demand-based prices to eliminate the overcharge while

preserving the railroad's price structure as much as possible. *See Guidelines* at 548. The Board's percent reduction methodology reflects this regulatory approach and it should continue to be used in SAC cases.

2. Arkansas Electric Cooperative

Arkansas Electric Cooperative, through its witness Michael A. Nelson, proposes that the Board adopt a variant of MMM based on fixed-dollar allocations and train miles.[12] Under the proposed approach, the SARR's costs in excess of variable costs are allocated among shippers on a dollar-per-train-mile basis. The iterative approach proposed by the Board is followed so that no shipper is required to pay more than its existing rate. Mr. Nelson asserts that the approach is reasonable because train-miles are a more accurate measure of the rail capacity used by each shipper and because the approach would encourage shippers to use a smaller number of longer, heavier trains.

Mr. Klick points out in his reply statement that Mr. Nelson's approach suffers from the defects in MMM that were identified in BNSF's opening comments. In addition, selecting train-miles as the measure for allocating unattributable costs is no less arbitrary than ton-miles or car-miles because all of these measures are divorced from the demand elasticities of individual shippers. Ignoring demand does not comply with Ramsey principles. The proposed approach also does not preserve the incumbent's rate structure.

3. Western Fuels/Basin Electric

WFA/Basin ask the Board to adopt as appropriate rate reduction methods the two approaches submitted by them in Docket No. 42088. They label these the Reasonable Allocation Method ("RAM") and the "Reduced Mark-Up." Neither approach is valid.

---

[12] Written Testimony of Michael A. Nelson on Behalf of Arkansas Electric Cooperative Corporation, at 5-8 ("AECC Op. Comments").

a. RAM

WFA/Basin's RAM approach divides a SARR's traffic group into two groups, designated captive and non-captive. All shippers receive revenues sufficient to cover their variable costs. However, responsibility for all unattributable SARR costs is assigned to the so-called captive shippers. The unattributable costs are distributed on a pro-rata ton-mile basis to the shippers labeled captive and then combined with each shipper's variable cost to identify the maximum rate level for each shipper.

WFA/Basins' RAM approach is similar to the Board's MCM approach in that demand for service by individual shippers is utterly ignored. It therefore suffers from the defects of MCM that were pointed out in BNSF's opening comments and the statements of witnesses Willig, Kalt, and Klick. For example, RAM assumes that all shippers designated as captive exhibit identical demand characteristics and that all shippers designated as non-captive exhibit identical demand characteristics. RAM assumes that all captive shippers will pay the same dollar-per-ton mile markup. But as BNSF pointed out in its opening comments, the ICC and the Board have long recognized that demand varies widely among railroad shippers, even among so-called captive shippers. In addition, the statement of Dr. Darius Gaskins submitted by BNSF on opening demonstrates that demand varies widely even among shippers that would be considered captive under RAM. For shippers designated non-captive, RAM assumes that there would be no mark-up over variable cost.

RAM violates the *Guidelines* by imposing on railroads a rate structure that disregards altogether a railroad's demand-based prices. Setting one group of rates (non-captive) equal to variable cost while forcing the other group of rates (captive) to an average rate per ton-mile is completely inconsistent with what would occur if Ramsey principles were applied to reduce rates. As BNSF and its witnesses indicated in their prior filings, if Ramsey principles were

applied, differences in demand elasticity among sole-served shippers would produce different markups, in inverse proportion to demand elasticity, if an overcharge was found. Assuming that a railroad's existing price structure is based on perceived differences in demand elasticity among shippers, application of Ramsey principles would not produce a fundamentally different rate structure, as RAM would do, if overall revenue levels had to be reduced. RAM also distorts the pricing structure because of its treatment of shippers who have more than one rail alternative. It is quite possible that many of these "non-captive" shippers would be willing and able to contribute some amount above their variable costs, but RAM assumes that they cover only their variable costs.

In the attached reply statement, Professor Kalt, who addressed the deficiencies in RAM in Docket No. 42088, further describes the deficiencies in RAM. Professor Kalt explains how RAM is inconsistent with demand-based differential pricing, Ramsey pricing, and contestable market principles.

b. Reduced Mark-Up

WFA/Basin's alternative proposal is the Reduced Mark-Up method. This approach is similar to the GPRM approach advocated by AEP Texas, except that it does not purport to calculate marginal cost. Rather, the "profit contribution" for each shipper – defined as the difference between the SARR's variable cost and revenue – is calculated and reduced in equal proportion to eliminate any excess of SAC over revenues. WFA/Basin continue to assert that RAM is their preferred approach.

The Reduced Mark-Up approach shares with GPRM the obvious defect that it is applied to a cross-over movement where revenues have been arbitrarily assigned to the SARR. The markup, or "profit contribution," that is the focus of this methodology says nothing about shipper

demand for service, because there is no shipper demand for a portion of a through movement. It is simply not possible to apply Ramsey principles to cross-over traffic.

Another major defect in Reduced Mark-Up is its focus on variable cost of the SARR. As discussed previously, variable costs calculated using URCS are not a good measure of marginal cost, which must be identified if Ramsey-based prices are to be constructed. But the Reduced Mark-Up approach distorts the marginal cost calculation even further by using the variable costs of the SARR, which are not the same as that of the incumbent. If the objective of a Ramsey-based approach is to maintain the relative markups in the traffic group based on the incumbent's perception of relative demand elasticity, then the use of a marginal cost calculation based on something other than the incumbent's marginal costs makes no sense at all. The multiple defects in Reduced Mark-Up clearly make it unusable as an approach to determining maximum reasonable rates.

III. REVENUE ALLOCATION FOR CROSS-OVER TRAFFIC

A. Introduction

On opening, BNSF and its expert witnesses supported the Board's proposal to discontinue use of the Modified Straight-Mileage Prorate ("MSP") methodology for allocating revenues on cross-over traffic. As BNSF explained, that methodology has several shortcomings, including its failure to consider the impact of density on cost, that encourage the use of highly contrived SARR configurations dominated by short-haul traffic and that create bias in the SAC results. In lieu of the MSP methodology, BNSF proposed adoption of an approach based on contestability principles to determine the SARR's revenues on cross-over traffic. This approach, which calculates revenues on cross-over traffic based on the incumbent's avoided cost for the portion of a movement handled by the SARR, was described by Professor Kalt in BNSF's opening comments. Union Pacific Railroad Company ("UP") proffered a similar approach based

on the principle of efficient component pricing ("ECP").[13] BNSF also stated that if the Board decides not to base revenues on cross-over traffic on contestable market principles, but rather to allocate through revenues based on relative on-SARR and off-SARR costs, then the Board should adopt the Average Total Cost ("ATC") approach that it proposed in its NOPR. The ATC approach is superior to MSP in that it takes account of the important relationship between density and costs and reduces incentives to game the SAC process by relying on large volumes of very short-haul cross-over traffic that benefits from the 100-mile revenue credit for originating cross-over traffic.

The shippers argue that the Board should reject the ATC approach. Most shippers contend that the Board should continue to use the MSP approach or its predecessor, the Modified Mileage Prorate ("MMP") approach to allocate revenues on cross-over traffic. The primary comments submitted by the shippers on the issue of cross-over traffic revenue allocation are the Coal Shippers Op. Comments. The Coal Shippers Comments on cross-over revenue allocation were also incorporated into the separate comments of several other shippers.[14]

The shippers' support for MSP and MMP is based upon several faulty premises, including the following: (1) the *Guidelines* as properly construed by ICC/STB precedent up to 2003 require that the methodology for allocating revenue to the SARR on cross-over traffic be a market-based approach reflecting real world divisions, and that the MSP/MMP approaches used by the Board are good proxies for real world divisions; (2) a cost-based approach to determining revenue allocations on cross-over traffic is inconsistent with the *Guidelines* and supposedly undermines shippers' entitlement to the use of cross-over traffic, and (3) the specific cost-based

[13] UP Op. Comments at 29-31 and attached Verified Statement of Kevin Neels (hereafter "Neels Op. VS") at 14-17.

[14] Additional Opening Comments of Western Fuels Association, Inc. and Basin Electric Power Cooperative, Inc., at 25 ("WFA/Basin Op. Comments"); AEP Texas Op. Comments at 3.

approach proposed by the Board, the ATC approach, has various flaws, including the flaws that led the Board to reject DARA. As explained below, none of these arguments is supported by the *Guidelines*, ICC/Board precedent or relevant economic theory. BNSF addresses each of these arguments in turn.

Another shipper, Arkansas Electric Cooperative Corporation ("AECC"), proposes an alternative methodology for determining the SARR's revenues on cross-over traffic that would provide the SARR with the full contribution over total variable costs realized by the incumbent on the entire through movement. AECC acknowledges that if its proposed methodology were adopted, rail rates would likely be set at the jurisdictional threshold in SAC cases. As explained below, the Board should reject this proposed methodology because it is inconsistent with principles of contestability.

Finally, a few shippers, WFA/Basin and AEP Texas, submitted comments addressing the issue whether the ATC approach should be applied in pending cases if adopted by the Board. WFA/Basin take the position that it would be manifestly unfair for the Board to apply the ATC approach to the pending WFA/Basin case because doing so would require the submission of a new case. In taking this position, WFA/Basin essentially concede that they used the MSP methodology to "game" the results of the SAC analysis by relying heavily on short-haul cross-over traffic to skew the SAC results in their favor. The Board should not sanction such attempts to manipulate the SAC test by giving the complainant another opportunity to present evidence when its strategy is revealed.

B. Revenue Allocation Based On Real World Divisions Is Not Called For By The *Guidelines*, Economic Theory, Or ICC/Board Precedent

The Coal Shippers argue that the principles endorsed by the *Guidelines*, as construed by ICC/STB precedent up to 2003, require that the Board adopt a market-based approach reflecting

real world divisions as the methodology for allocating revenue on cross-over traffic. *See, e.g.*, Coal Shippers Op. Comments at 26-33, 43-48. Specifically, the shippers argue that use of real-world divisions, or a proxy for real-world divisions like MSP/MMP, conforms to "certain basic principles underlying the *Guidelines*." *Id.* at 27. One such principle, according to the Coal Shippers, is that "the SARR is an independent replacement for the defendant carrier over the involved SARR route." *Id.* The Coal Shippers' theory is that since the SARR replaces the incumbent for a portion of through movements on cross-over traffic, the SARR would have to engage in bi-lateral negotiations with the incumbent to determine the SARR's share of revenue for its portion of the movement. In those negotiations, both parties would use their market power, just as real-world railroads do, to produce results most favorable to them. *Id.* at 27-28; 32-33.

As discussed below, the Coal Shippers' theory is entirely at odds with contestable market theory. Similarly, their claim that the Board impermissibly broke with precedent in rejecting the use of real-world divisions in favor of a cost-based approach is demonstrably inaccurate. *Id.* at 32-33, 38, 43.

1. A Revenue Allocation Methodology Based On Real World Divisions Is Inconsistent With Contestable Market Theory

Contrary to the shippers' claims, contestable market theory does not support a revenue allocation methodology for cross-over traffic based on real-world divisions. As Professor Borts, the Coal Shippers' expert, admits, the most basic principle of contestable markets is that the participants lack market power that is derived from the existence of entry and exit barriers.[15] It would turn contestable market theory on its head to posit SARR revenue divisions based on the outcome of negotiations between real world carriers that use their respective market power to

[15] Borts Op. VS at 3.

influence the results. Indeed, Professor Borts notes that a contestable market "is hardly a realistic description of the railroad industry" given the high entry and high exit barriers in the industry. *Id.*

There is nothing in the *Guidelines* suggesting that a SARR would act as a monopolist simply because it "replaces" the incumbent for a portion of the through movement. To the extent the SARR "replaces" the incumbent for a portion of the through movement, the SARR and the incumbent become partners in an interline movement. Revenues would be established by reference to the principle of contestability that allows either of them to enter or exit without cost and would have nothing to do with the exercise or influence of market power.[16] As Professor Kalt explained, real world market-based divisions are driven by precisely the kind of factors that make them not contestable and, therefore, they cannot be the basis of rates that a SARR would receive in a contestable market. *See* Kalt Reply VS at § IV.A.

Professor Kalt also explained on opening and reiterates in his reply verified statement that it is possible to determine the revenues that would be available to a SARR in a contestable world – *i.e.*, a world with no entry and exit barriers and no market power created by those barriers – in situations where the SARR "replaces" the incumbent for a portion of the through movement. As Professor Kalt explains, in a cross-over scenario the SARR is assumed to have superior efficiency on the portion of the movement for which it replaces the incumbent, which is why, in a contestable market, it would be able to replace the incumbent for that portion of the movement. The SARR would receive as revenues the full avoided cost of the incumbent over

[16] The Coal Shippers' argument that the SARR is entitled to exercise market power in setting revenue divisions because the incumbent exercises market power in the real world to negotiate divisions is similar to its argument that a SARR can rely on internal cross-subsidies to reduce the issue traffic rates because the incumbent relies on cross-subsidies in the real world. In both cases, the shippers' argument ignores the purpose of the SAC test, which is to simulate a competitive market where market power and cross-subsidies would not exist.

that route, thereby realizing the benefit of its superior efficiency.[17] UP's expert, Dr. Neels, presents a similar analysis and proposes a similar calculation methodology based on ECP for setting revenues on cross-over traffic.[18] If the Board uses the principles of contestability to establish revenues on cross-over traffic, it should adopt the avoidable cost theory proposed by Professor Kalt.

2. Neither The ICC/Board Decisions In SAC Cases Prior To 2003 Nor ICC Precedent Outside The SAC Context Require Use Of Real-World Divisions To Allocate Revenues On Cross-Over Traffic

The Coal Shippers Op. Comments mischaracterize precedent in arguing that ICC/Board SAC cases prior to 2003 required the use of real-world divisions to allocate revenues on cross-over traffic to the SARR. In the handful of ICC/Board decisions that addressed the issue of revenue allocation for cross-over traffic prior to 2003, the agency never definitively established that cross-over revenues should be determined on the basis of real-world divisions. The ICC/STB explained that several factors, including costs, should be considered and it repeatedly stated that it did not have a well-established method for allocating revenues on cross-over traffic. There was considerable confusion and uncertainty regarding this issue in the early cases and the ICC/STB made it clear it was searching for guiding principles to govern its selection of a cross-over traffic revenue allocation methodology. In *Duke/NS*, the Board finally settled on the principle that cross-over revenues should be based on an allocation of through revenues in

[17] BNSF Op. Comments at 50-53 and Kalt Op. VS at 37-46; Kalt Reply VS at § IV. When cross-over revenues are determined in this manner, it would be unnecessary and inappropriate to adjust these revenues in any way in the rate reduction phase of the SAC analysis, thus simplifying the SAC test. If SAC revenues were found to exceed SAC costs, only the revenues on through movements would need to be adjusted. BNSF Op. Comments at 51-52.

[18] UP Op. Comments at 29-31 and attached Neels Op. VS at 14-17.

proportion to on-SARR and off-SARR costs.[19] Since then, the Board has been searching for ways to calculate those costs as accurately as possible, and in the NPRM, it settled on ATC.

Contrary to shippers' claims, neither the *Nevada Power*[20] decision nor subsequent SAC cases decided prior to 2003 constituted an unqualified adoption of a standard for cross-over revenues that was based on real-world negotiated divisions. In the 1994 *Nevada Power* decision, which was quoted extensively by shippers, the ICC stated that "[i]n the absence of any better evidence, we will prorate the revenues attributable to the cross-over traffic among the SARR and incumbent carriers on a mileage basis, as proposed by NPC." 10 I.C.C. 2d at 268 (emphasis added). While the ICC referred to market-based divisions as a reference point in calculating cross-over revenues, it also acknowledged the cost-based nature of such divisions. Indeed, Chairman McDonald explained that "market-based divisions result from the interaction of supply considerations (*the relative costs incurred by the carriers in providing the interline movement*) and demand considerations (the relative bargaining power of the two carriers)." 10 I.C.C. 2d at 280 (emphasis added). However, the Chairman also concluded that "with our determination that the SARR is to be a replacement for segments of the incumbent lines, it appears that there are no significant differences in the relative bargaining power of the carriers." *Id.* In other words, the bargaining power factor dropped out of the supposed market-based analysis, leaving only the supply consideration, *i.e.* the relative costs of the carriers. Chairman McDonald then went on to suggest that relative density of on-SARR and off-SARR lines might need to be factored into the allocation of cross-over revenues, a clear recognition of the importance of costs.[21]

---

[19] *Duke Energy Corp. v. Norfolk Southern Railroad Co.*, STB Docket No. 42069 (served Nov. 6, 2003)("*Duke/NS*").

[20] *Bituminous Coal – Hiawatha, Utah to Moapa, Nevada*, 10 I.C.C. 2d 259 (1994).

[21] *Id.* at 281 (". . . mileage-based divisions would not be appropriate approximations of market-based rates for a long-haul, high density SARR, using efficient unit trains, that interlined

Subsequent cases also emphasized the importance of relative on-SARR and off-SARR costs in allocating revenues for cross-over traffic. In *McCarty Farms*, the Board justified its use of the MMP methodology to allocate revenues on cross-over traffic not because it found MMP to estimate market-based divisions but because it "account[ed] for the non-mileage-based costs incurred when carriers switch freight cars."[22] *See also PPL Montana, LLC v. The Burlington Northern and Santa Fe Railway Co.*, STB Docket No. 42054, slip op. at 10 n.20 ("*PPL I*")(served Aug. 19, 2002) "A residual carrier would agree to move the traffic so long as the revenue division would allow it to cover its attributable costs associated with handling the traffic"); *Texas Municipal Power Agency v. The Burlington Northern and Santa Fe Railway Co.*, STB Docket No. 42056, at 31 n. 73 (served Mar. 24, 2003)("*TMPA*")("The revenue each carrier receives should cover the attributable costs of the service it provides and makes some contribution to its unattributable costs. As long as the traffic makes any contribution to a carrier's unattributable cost, the railroad is better off participating in the transportation than not participating in it.").

Several of the SAC cases decided subsequent to *Nevada Power* did not even address the issue of the appropriate revenue division allocation method for cross-over traffic either because the complainant did not include any cross-over traffic in the SARR traffic group, *i.e. WTU/BNSF* and *APS/ATSF*,[23] or the parties agreed to use the MMP method for allocating cross-over

---

with a number of short-haul, light density branch lines that distributed traffic a few cars at a time.").

[22] *McCarty Farms Inc. v. Burlington Northern, Inc.*, 2 S.T.B. 460, 472 (1997). The Board also stated that "[w]e find that the modified mileage proration method is superior to a straight mileage proration, because it takes into consideration differing handling costs." *Id.*

[23] *West Texas Utilities Co. v. Burlington Northern Railroad Co.*, 1 S.T.B. 638 (1996); *Arizona Public Service Co. v. The Atchison, Topeka & Santa Fe Railway Co.*, 2 S.T.B. 367 (1997).

revenues without addressing underlying principles, *i.e. WPL/UP*.[24] In the other pre-2003 cases in which the ICC or Board addressed the issue of the proper revenue allocation methodology, the agency never required the adoption of a market-based approach. In *FMC Wyoming Corp. v Union Pacific* Railroad, STB Docket No. 42022, slip op. at 30-31 (served May 12, 2000), the ICC rejected UP's effort to use actual market-based divisions in favor of the shipper's proposed use of the MMP methodology. In *PPL I* and *TMPA*, the Board continued to use the MMP methodology but acknowledged that "[w]e have not adopted a single preferred procedure for developing revenue divisions on cross-over traffic."[25]

The Coal Shippers also argue that ICC/Board precedent *outside* the SAC context supports the use of a market-based approach reflecting real-world divisions in determining revenue divisions on cross-over traffic. Coal Shippers Op. Comments at 41-42. Specifically, the shippers argue that historically the ICC "routinely . . . consider[ed] evidence of negotiated divisions to determine divisions set under comparable market circumstances." *Id.* at 41. The shippers point to a solitary 1914 ICC decision to establish the existence of this alleged routine practice.[26] In the only other case cited, *Boston and Maine R.R. v. United States*, 208 F. Supp. 661 (D. Mass 1962), the ICC did not (as the shippers suggest) prescribe rate divisions by looking to negotiated divisions on comparable traffic.[27] Rather, the Commission applied a group

---

[24] *Wisconsin Power & Light Co. v. Union Pacific Railroad*, STB Docket No. 42051 (served Sept. 13, 2001).

[25] *PPL I* slip op. at 7, n.14; *TMPA* slip op. at 31, n.75.

[26] *See* Coal Shippers Op. Comments at 41 citing *Rates on Lumber and Other Forest Products from Points in Arkansas* in which the Commission prescribed a common per pound rate for lumber delivered to Northern carriers at East St. Louis.

[27] The language the shippers misleadingly quote from *Boston and Maine* refers to the Commission's ability to establish divisions on a group basis. *See, e.g., The New England Divisions Cases*, 261 U.S. 184 (1923) (affirming as Constitutional the Commission's decision to

divisional scale, developed in a 1953 proceeding, that was roughly designed to allocate revenue based on the joint carriers' respective costs. *Id.* at 676-677.[28]

In fact, the shippers' argument is belied by the case law. Outside the SAC context, the ICC routinely used a cost-based rather than a market-based approach for determining revenue divisions between carriers. In *Trackage Rights - Lehigh Valley Railroad Company*, 342 I.C.C. 793 (1973), the ICC explained that:

> the cost and revenues of moving the issue traffic should be the primary criteria for determining the proper division of through revenue. Indirect as well as direct costs should be included in the cost of service because each segment of traffic should carry its share of this burden. To do otherwise would result in a disproportionate share of these costs being borne by part of the traffic.

Id. at 812.[29]

---

adjust divisions applicable to individual carriers based on group cost and revenue data believed to reflect the similar operating costs and revenue needs of the individual carriers).

[28] In 1965, the Commission re-constructed the divisional scale at issue in *Boston and Maine* "directly from costs" so that it would more accurately reflect each carrier's relative cost of service. *See Chicago & North Western Railway Co. v. Atchison, Topeka, and Santa Fe Railway Co.*, 387 U.S. 326 at 359 (1967), discussing *Official Southern Divisions,* 325 I.C.C. 1, 449 (1965).

[29] This statement is consistent with the ICC's decades-long practice of using a cost-based approach to determine revenue divisions on service provided by interline carriers. *See, e.g., New England Divisions,* 66 I.C.C. 196, 198-199 (1922) ("the relative amount and cost under economical and efficient management of the service rendered is a prime factor in determining the fair and equitable share of joint revenue which each carrier shall receive"); *Divisions of Rates, Official and Southern Territories*, 234 I.C.C. 175 (1939) (allocating more revenue per-mile on joint rates to Southern carriers due to higher relative operating expenses); *Official Southern Divisions,* 325 I.C.C. 1, 449 (1965) (constructing detailed divisional scales based on carriers' relative costs of service); *Baltimore & Ohio Railroad Co. v. Aberdeen and Rockfish,* 393 U.S. 87, 88 (1968)("Commission found that existing divisions violated § 15 (6) because they allocated to Northern lines a lesser share of the revenues than would be warranted by their share of the expenditures made in providing joint service"); *Chicago & Northwestern,* 387 U.S. at 360 ("the Commission's action in this case was based not on revenue needs, but cost of service, and it found that the divisions which it established would produce moderate overall increases in the shares of the Midwestern group, in accord with its costs findings"); *Increases in Freight Rates and Charges of the Long Island Railroad Company*, 346 I.C.C. 305 (1973) (prescribing divisions

3. The Board Explained In *Duke/NS* Why It Adopted A Cost-Based Approach For Allocating Revenues On Cross-Over Traffic

Coal Shippers further argue that the Board's rejection in *Duke/NS* of a market-based approach in favor of a cost-based approach for allocating revenues for cross-over traffic "was made without ever explaining that it was radically departing from longstanding and contrary precedent." *See* Coal Shippers Op. Comments at 34. As explained above, the predicate for this argument – that there was a longstanding precedent inconsistent with use of a cost-based standard – is wrong. In addition, the Board's rationale for adopting a cost-based standard was adequately explained.

The Board's *Duke/NS* decision devotes several pages to its explanation of why it adopted a cost-based revenue allocation methodology. Shippers may not like that explanation, and BNSF disagrees with several points made by the Board in that discussion, but to claim that the Board failed to explain its decision is ludicrous. In that lengthy discussion, the Board "first considered the more general question posed by NS of whether divisions should be based on a market-based or a cost-based inquiry, and concluded that a market-based inquiry is not appropriate for a SAC analysis." *Duke/NS* slip op. at 17. The Board explained that the existence of market power should not factor into the allocation of revenues on cross-over movements, and therefore that "a debate over how much of the revenues from cross-over traffic the hypothetical carrier could negotiate with the residual defendant has no place in the SAC analysis." *Id.* at 19. The Board further explained that real world divisions between NS and other carriers would not "be

---

allocating revenues in proportion to costs); *Expeditious Handling of Divisions of Revenue Cases*, 353 I.C.C. 349 (1981) (requiring detailed production of cost of service information in divisions cases); *Increases in Freight Rates and Charges of the Long Island Railroad Company*, 365 I.C.C. 193 (1981) (having set each carrier's revenue to cost ratio equally in 1973, the Commission refused to readjust the division when it found that Long Island's intervening cost of service increases were due to inefficient operations).

particularly instructive, as those divisions presumably reflect a wide range of commercial considerations across a broad spectrum of traffic and gateways." *Id.* at 20, n. 29.

The Board provided further explanation of why a market-based approach reflecting real world divisions was not an appropriate methodology for allocating revenues to the SARR on cross-over traffic in its recent *Otter Tail* decision.[30] Since *Duke/NS*, the Board has consistently applied a cost-based approach to revenue allocation, although it has continued to search for an appropriate methodology for assessing relative on-SARR and off-SARR costs.[31]

4. A Cost-Based Revenue Allocation Approach Does Not Undermine Shippers' Supposed Entitlement To The Use Of Cross-Over Traffic In A SAC Analysis

As a corollary to their argument that the *Guidelines* require the use of real-world divisions in establishing revenues for cross-over traffic, the Coal Shippers argue that the *Guidelines* do not permit the use of a cost-based revenue allocation procedure because such an approach undermines the right that shippers have to use cross-over traffic in SAC cases. Their argument on this issue is largely incoherent. But the underlying principles they assert and the premises to their argument are clearly wrong.

The Coal Shippers' first premise is that the *Guidelines* explicitly allow complainants in SAC cases to rely on cross-over traffic. *See* Coal Shippers Op. Comments at 25-26. The only support provided for this far-fetched claim is the Coal Shippers' assertion that the *Guidelines* "encourage shippers to augment the issue traffic with other traffic; that is to 'group' traffic in

---

[30] *Otter Tail Power Company v. BNSF Railway Co.*, STB Docket No. 42071, slip op. at 13-15 (served Jan. 27, 2006)("*Otter Tail*").

[31] *See Carolina Power & Light Co. v. Norfolk Southern Railway Co.*, STB Docket No. 42072, slip op. at 20-21 (served Dec. 23, 2003) (" *CPL/NS*"); *Duke Energy Corp. v. CSX Transportation, Inc.*, STB Docket No. 42070, slip op. at 20-21 (served Feb. 4, 2004) ("*Duke/CSX*"); *Public Service Co. of Colorado v. The Burlington Northern and Santa Fe Railway Co.*, STB Docket No. 42057, slip op. at 17 (served June 8, 2004) ("*Xcel/BNSF*").

logical and efficiency-maximizing configurations." *Id.* at 30. Shippers are clearly entitled to group non-issue traffic with issue traffic. However, this cited passage says nothing about whether the "other traffic" can consist of partial movements rather than through movements. There is no indication that the drafters of the *Guidelines* ever contemplated the use of cross-over traffic. Indeed, the *Guidelines'* references to the incumbent's existing rates as the basis for assigning revenues to the SARR make it clear that the ICC assumed that non-issue traffic would be included in a SAC analysis on a through movement basis, since the incumbent's rates exist only for through movements. Indeed, if cross-over traffic had been contemplated in the *Guidelines*, surely the ICC would have said something on the critical issue of revenue allocation that has received so much attention in the SAC cases where cross-over traffic has been used. Cross-over traffic was a foreign concept, never addressed in the *Guidelines*.

Second, the Coal Shippers claim that the use of a cost-based revenue allocation approach in effect requires the complainant to replicate all lines used by its traffic group. *See* Coal Shippers Op. Comments at 35-37. This argument is nonsense. The Board has repeatedly made it clear that the fundamental purpose for allowing complainants to use cross-over traffic in a SAC analysis is to enable complainants to *avoid* having to posit the costs of constructing and operating all of the lines that are used to provide service to the shippers included in the SARR traffic group. *See, e.g., Xcel/BNSF*, slip op. at 14-16; *Otter Tail*, slip op. at 12-13. There is nothing about the use of a cost-based approach that precludes a complainant from using cross-over traffic.

The Coal Shippers' real complaint about a cost-based approach appears to be that it makes the use of cross-over traffic less attractive to complainants because it allocates to the SARR less revenue than their supposed market-based approaches, particularly in cases where

cross-over traffic moves only a short distance on the SARR. Shippers apparently believe that they are entitled to take advantage of economies of density without any responsibility for the costs incurred on low density lines by the incumbent to make those economies of density possible. Such a position is illogical and untenable.

It would be anathema to the statutory revenue adequacy policy for the Board to conclude that a complainant in a SAC case does not need to account in any way for the revenue needs of the incumbent's low density delivery network, without which there would be no partial movements for the SARR to handle. The Board allows a complainant to refrain from building a far-flung delivery network because of the difficulty in presenting SAC evidence relating to the entire network of lines required to provide service to the SARR shippers, not because the high costs associated with BNSF's far-flung delivery network should be borne entirely by the incumbent. *Otter Tail*, slip op. at 12-13. A cost-based revenue allocation approach, when done properly, attempts to ensure that the revenues on through movements are allocated so as to cover the costs associated with different segments of those movements by allocating revenues in proportion to the costs of the various segments. Such an approach does not ensure that there will be revenues to cover the costs of off-SARR portions of a movement, but it can limit the distortions resulting from shippers' decisions not to build low density lines.

C. The Shippers' Claims Regarding The Purported Flaws In The ATC Methodology Proposed By The Board Also Lack Merit

As noted in BNSF's opening comments, BNSF endorses the Board's proposed ATC approach in the event the Board decides not to use contestability principles in establishing revenues on cross-over traffic. It is appropriate for the Board to seek ways to simplify SAC cases, so long as the simplification methodologies do not distort the outcome of the analysis. By taking account of the relative density of on-SARR and off-SARR lines in allocating through

revenues between the SARR and the residual incumbent, the Board's ATC approach is less likely than any cost-based approach used to date in SAC cases to produce distortions. Moreover, under ATC, the results of the SAC analysis are less likely to be driven by the complainant's choice of how much of the incumbent's network should be reproduced by the SARR, thus reducing complainants' incentives to game the SAC test through heavy use of short-haul traffic. The shippers uniformly object to the adoption of the ATC approach but, as explained below, they fail to present any valid basis for rejecting the methodology.

The shippers erroneously assert that the Board should not adopt the ATC methodology because it purportedly contains the same flaws that led the Board to reject the DARA methodology proposed by various railroads. *See* Coal Shippers Op. Comments at 48-52. To the contrary, as shown by Mr. Klick, ATC does achieve a different result than DARA as densities increase and, consequently, does not have the purported flaws in DARA that were identified by the Board. *See* Klick Reply VS at § III. Coal Shippers related claim that by adopting ATC the Board is ignoring its directive from *Duke/NS* that it would need actual line-specific investment data to approximate line-specific fixed costs per mile (Coal Shippers Op. Comments at 52) is based on a misreading of the *Duke/NS* decision and, consequently, has no merit.

Shippers claim that the ATC methodology should be rejected for various other reasons, including that it purportedly creates barriers to entry. *See* Coal Shippers Op. Comments at 39-42). As explained in section IV.B of the reply verified statement of Professor Kalt, the ATC methodology does not create entry barriers. The shippers' argument is based upon an apparent misunderstanding of the economics of barriers to entry. Nor do the other criticisms of the ATC methodology made by Mr. Borts or Mr. Crowley, experts testifying on behalf of the Coal Shippers, have any validity. *See* Klick Reply VS at § III.

Mr. Nelson, an expert retained by the AECC, proposes that the Board adopt a methodology for cross-over traffic that would provide the SARR with the full amount of the contribution that exists on the through movement. Mr. Nelson erroneously asserts that this alternative methodology is consistent with contestable market principles. To the contrary, as explained by Professor Kalt at § IV, the proposed methodology is inconsistent with contestability principles.

D. If The ATC Approach Is Adopted In This Rulemaking, The Board Should Apply It In The Pending Cases

The comments submitted by AEP Texas and WFA/Basin both address the issue whether the Board should apply the ATC methodology in pending cases if the methodology is adopted in this rulemaking proceeding. However, AEP Texas and WFA/Basin take opposite positions on this issue. AEP Texas takes the position that, if adopted, the ATC approach should be mechanically applied to the current record and no new evidence should be allowed in the case. *See* AEP Texas Op. Comments at 5-7. In contrast, WFA/Basin argue that it would be "manifestly unjust" to apply the ATC approach in their pending case because applying it would "require the submission of an essentially new SAC case." *See* WFA/Basin Op. Comments at 25.

WFA/Basin's argument is not based on legal standards governing retroactivity, but on the supposed "unfairness" that would result from application of a cost-based methodology. WFA/Basin essentially admit that they designed their SARR with heavy use of short-haul cross-over traffic to take advantage of the gaming opportunities available by application of the MSP methodology and, consequently, to bias the results in WFA/Basin's favor. WFA/Basin assert that they relied on the MSP approach "as the central building block in determining the LRR's configuration" and that the ATC approach "is a significantly different divisions procedure that MSP, since it, among other things, eliminates the MSP origin and destination revenue blocks and

does not allocate the remaining revenues on a straight mileage prorate." *Id.* at 26. WFA/Basin state that if they had known that the Board would apply the ATC methodology when their evidence was being developed, they "would have most likely configured a SARR that was significantly longer and carried significantly more tons." *Id.* at 27.

WFA/Basin would not be treated unfairly if the Board were to apply a methodology other than MSP to calculate cross-over revenues. The Board had made it abundantly clear before WFA/Basin presented evidence that it would apply a cost-based methodology to allocate revenues between the SARR and the residual incumbent on cross-over traffic. The Board also made it clear that it was concerned about the impact of relative density on costs and that it was open to adopting a new methodology that correctly takes account of economies of density. *See, e.g., Duke/CSX* slip op. at 20 (while it rejected CSX' proposed methodology intended to account for economies of density, the Board noted that it "has not foreclosed an approach that would incorporate relative densities, as densities could affect the defendant carrier's relative costs of providing service over the relevant segments.").

WFA/Basin effectively admit that they were seeking to game the results of the SAC analysis by positing a SARR that relied heavily on short-haul traffic. They either knew or should have known that any cost-based approach that considered relative density of on-SARR and off-SARR lines would have produced a dramatically different allocation of revenues, but they chose to take the chance that the distortions produced by MSP would continue to be available to them. The Board should not sanction WFA/Basin's attempt to manipulate the SAC outcome by positing a short-haul SARR that was profitable only because of the distortions produced by the revenue allocation methodology that had previously been used. WFA/Basin should not get

another opportunity to present SAC evidence. If ATC is adopted, the Board should apply it in the pending cases.

IV. INDEXING OPERATING EXPENSES

The Board's NPRM seeks to resolve a conflict over whether SAC operating costs should be indexed by the RCAF-U (unadjusted for productivity) or the RCAF-A (adjusted for productivity) by proposing a mix of the two indices. The hybrid index would phase in the RCAF-A beginning with 5% in year two and increasing incrementally to 100% in year 20. The railroads universally oppose the Board's proposal. As SAC theory already assumes that the hypothetical SARR is the most efficient, most technologically advanced railroad from its inception, it is unrealistic to also assume that the SARR would achieve any productivity at all in its initial years of operation.[32] The railroads contend that the Board should establish a presumption of no productivity for the first ten years, unless there is compelling evidence of specific improvements the SARR purports to make, including the timing, costs, and anticipated benefits of implementing such improvements.[33] The railroads further contend that adopting the Board's proposed 10-year DCF period would moot the issue, as there clearly would be no need to address productivity on the SARR during that period.

Shippers also object to the Board's proposal. They advocate an aggressive phase-in of the RCAF-A beginning with 50% in year one and increasing incrementally to 100% in year ten.

---

[32] UP Op. Comments at 31-35 and attached Verified Statement of Thomas C Haley ("Haley Op. VS"); BNSF Op. Comments at 55-59; Comments of Canadian Pacific Railway Company, at 3-5 ("CP Op. Comments"); NS/CSXT Op. Comments at 8-11.

[33] BNSF offered as an alternative applying RCAF-A starting in year 11 to those items of operating costs where productivity gains are most likely to occur. Verified Statement of Michael R. Baranowski, at 20-21 ("Baranowski Op. VS"), included with BNSF Op. Comments.

Coal Shippers Op. Comments at 70.[34] They argue that the SARR would achieve significant productivity *even in the first year* from technological advancements, particularly improvements brought about through advances in information technology (IT) and through "learning by doing."

The shippers' position rests heavily on "strawman" arguments that have no merit. First, the Coal Shippers assert, without any support, that the Board's proposal "does not go far enough to eliminate the illogical and unsupported disparity between the manner in which the Board indexes operating expenses and the manner in which the Board forecasts SARR revenues." Coal Shippers Op. Comments at 69. They imply that their proposed mix is the solution to a "problem" that must be fixed, but they offer no evidence that a problem actually exists or that their solution would cure it. As BNSF witness Michael R. Baranowski explains in his reply verified statement, because the three indices used in the DCF – one for revenues, one for operating costs, and one for construction costs – are designed to forecast different elements that are in no way related, there is no disparity between the ways revenues and operating costs are indexed. The revenue index reflects revenues available to a SARR that replaces the incumbent. Those revenues are compared to the operating (and other) costs of an efficient SARR to determine whether, on a present value basis, the revenues exceed costs that need to be covered. The indices are *suppose* to measure different future trends. Moreover, to the extent that productivity is reflected in the forecasts for revenues, that productivity reflects the future efforts

[34] AECC and WFA suggest alternative methodologies. AECC proposes using the anticipated productivity on heavy haul operations rather than the RCAF to phase in productivity on the SARR (AECC Op. Comments at 17-19), but its proposal is based on the same flawed assumptions implicit in Coal Shippers' witness Caves' statement supporting the Coal Shippers' methodology, which is addressed *infra*. WFA reasserts by reference the arguments and proposed index submitted in its pending rate case. AEP Texas, on the other hand, endorses the Coal Shippers' approach rather than the approach it advocated in its pending rate case. Consultants Snavely King & Moros agree with the Board's phase-in proposal, but suggest that under a 10-year DCF scenario, the percentages should be adjusted.

of the industry to achieve the efficient operations that are already captured in the base year SARR operating expenses.

The Coal Shippers' second argument is that the Board's proposal is improperly based on the assumption that most productivity comes from asset replacement. Coal Shippers Op. Comments at 73. The Coal Shippers attack this strawman by pointing to potential productivity gains unrelated to asset replacement (*e.g.*, increased train size, heavier car loadings, updated IT software, improved MOW practices, and labor productivity) which could begin "even in the first year." The shippers' argument, however, is based on a false premise. The Board has not assumed that productivity comes only from asset replacement. The Board simply gave one indisputable example relating to the SARR's assets showing why the SARR would not have the same opportunities to achieve productivity in the early years as real-world railroads. It is a quantum leap to go from that simple, obvious example to the assertion that the Board ignored all other forms of productivity.[35]

Even if the sources of productivity were related to operations rather than assets, that still would not justify productivity for a SARR in the early years of operation. As Mr. Baranowski explains in his attached reply statement, the benefits from many of the technological advances cited by the shippers have already been incorporated into the SARR from the beginning.[36] In

---

[35] Based on this reading of the Board's decision, the Coal Shippers' witness William J. Brennan constructed an elaborate exercise attempting to justify the shippers' proposed 50/50 mix of RCAF-A and RCAF-U in year one. Brennan Op. VS. at 13-14. As Mr. Baranowski shows in his statement, the analysis of the percentage of Class I railroads' system-wide operating costs "associated with assets" has no rational connection with SARR operating costs, and clearly provides no basis for determining the percentage of system-wide productivity reflected in the RCAF-A that would be available to the SARR.

[36] In his opening statement, Mr. Baranowski discussed at length how many potential improvements require substantial outlays of capital beyond what would be reasonable for the SARR to incur in the early years, while others, such as one-man crews, are far too speculative to

effect, the SARR's operations already include the benefit of productivity that it will take many years for real-world railroads to achieve. It would double-count those productivity benefits to reflect future productivity improvements in SARR operations that are already vastly more efficient than real-world operations.

Mr. Baranowski explains that there are many reasons that the SARR would not be able to achieve claimed productivity gains. For example: (1) the SARR is assumed to be optimally sized from a network perspective from day one – shippers build it to the peak year traffic levels, so there cannot be any improvement through additional investment in the right of way; (2) the process used by the Board to adjust operating expenses year-to-year automatically adjusts the rolling stock and operating labor to fit the level of the traffic handled in each year; (3) the G&A expenses are bare-bones from day one, so the concept of management efficiency is moot; (4) the traffic is assumed to be handled from the beginning in the most efficient manner possible – long unit trains for coal, which is the major if not exclusive commodity on a SARR, and hook-and-haul operations for any limited volumes of intermodal or general merchandise that the SARR might carry; and (5) the SARR starts from day one with the most efficient models of rolling

---

assume they would be available in the near future to either the industry or the SARR.

In his reply statement, Mr. Baranowski points out that the technologies cited, or the investments needed to support them, often have been spurned by SARR proponents. For example, while they now claim heavier-loading cars as a potential productivity improvement, they rejected the use of concrete ties and heavier rail required for such loadings, claiming they were unnecessary, either because the SARR would not have the same tonnage as the incumbent or because a least-cost railroad would not incur the added expense. *See e.g.,* Docket No. 42088, WFA/Basin Reb. Nar. at III-F-96 (September 30, 2005). Thus, they avoided the costs for such investments, yet assume productivity benefits from operational changes dependent on those investments. Similarly, they cut operating costs by assuming an exceptionally streamlined staff with unprecedented labor productivity from day one (significantly greater than any achieved by a real-world railroad), yet assume future labor productivity comparable to that of industry participants through learning by doing. *See e.g.,* Docket No. 42088, WFA/Basin Reb. Nar. at III-D-48 through 49 (September 30, 2005).

stock (cars and locomotives), which are almost exclusively under lease by the SARR at an expense that reflects the lowest dollar level the incumbent has been able to negotiate – both for the actual units and, usually, for maintenance. Because of these efficiencies, the SARR would have nothing to gain from technological advances in the early years. They already have the benefits available from existing technologies. And as to future technologies, the FRA points out in its March 2002 strategic plan that technologies currently under development may not be available for implementation for more than five years and the benefits not seen for at least ten years.[37]

In addition to productivity from technological advances, the Coal Shippers and their witnesses Dr. Caves et al (Caves) also claim early benefits through replacement of assets "when economically feasible to do so" regardless of asset lives.[38] They attempt to bolster their argument through reference to an exhibit submitted by AEP Texas in its rate case purportedly showing that the average age of Class I rail assets is seven years, and thus not that different from the SARR's assets. Mr. Baranowski explains that the asset lives calculated from the R-1, which reflect purchase accounting adjustments following recent rail mergers, bear no relationship to the actual physical age of the assets. For example, as part of the purchase accounting adjustment, the accumulated depreciation for assets is written down to zero. Under the shippers' calculations, such assets would have a useful life equal to their remaining life, and as such, would have an age of zero, even though they had been in service for many years. These

[37] *Five Year Strategic Plan for Railroad Research, Development, and Demonstrations, March 2002,* Federal Railroad Administration, at ES-8.

[38] Mr. Baranowski pointed out in his opening statement that for railroad assets the point at which it becomes economically feasible to replace the assets is highly unlikely to occur anytime within the first ten years.

adjustments for newly acquired assets made for accounting purposes do not reflect the actual age of the assets.

The Coal Shippers' third argument is that the complex interconnections between various sources of productivity gains makes it "futile" to examine specific evidence related to the specific sources of process improvements that would impact productivity on the SARR. For this reason, the Coal Shippers claim that the Board should merely assume that the SARR is just like a real-world railroad except where the SARR uses technologies that have not been used by real-world railroads. This argument, presented by Caves, should be a non-starter for use in a SAC case, where the burden of proof is on the complainant. If there is no concrete evidence supporting a productivity adjustment, then there would be no basis for the Board even to consider the question further. In any event, BNSF's expert Dr. Martin N. Baily rejects both the rationale and the assumptions underlying Caves' analysis. He points out that far from being "futile," looking at the specific sources of productivity in the railroad industry and determining whether they *would* or *would not* affect a SARR is the only valid way to address the issue, and the fact that the sources of productivity are interconnected does not preclude their being identified and their likelihood and timing evaluated. He then demonstrates that the underlying assumptions about the SARR's productivity in relation to that of the industry are wrong.

Dr. Baily explains that in assessing the potential productivity for a SARR, Caves overemphasizes the impact that IT improvements would have on the SARR. Research shows that productivity improvements are engendered from IT investments *only* when specific process improvements are *enabled* by these investments. Such process improvements are much more likely in complex networks with large volumes of heterogeneous transactions such as those of

the real-world railroads, than in the simple network of homogeneous traffic, limited activities, and a defined client base characteristic of a hypothetical SARR.

Dr. Baily likewise refutes two of Caves' other arguments that seek to put the SARR on equal footing with real-world railroads with respect to productivity. Caves argues that the SARR would achieve benefits from improving its management practices, as would any other railroad. However, research shows that the most significant gain in productivity comes from companies implementing the best practices of the leading company, and that they most often achieve that goal through opening new best-practices establishments rather than improving best practices themselves. As the SARR is already assumed to be the industry leader – the most efficient railroad that is feasible – the productivity that can be expected from the industry seeking to attain that level would not be available to the SARR. Dr. Baily further notes that Caves' and witness Brennan's reliance on "learning by doing," to the extent it might be considered relevant in a SAC analysis, actually cuts the other way. If the SARR workforce is capable of "learning by doing," then it is a workforce that would – like any other real-world workforce – have *less* efficient operations at the beginning of operations while it "learned the ropes." But the SAC test allows the SARR to achieve all the benefits available from "learning by doing" from day one.

Dr. Baily also rejects Caves' argument that the convergence of rail industry productivity and productivity in the economy as a whole leads to the conclusion that the SARR will experience the same level of productivity as real-world railroads from day one. Whether the railroad industry and the economy as a whole converge is irrelevant to the question of whether the SARR and the rail industry will have the same productivity growth in the SARR's first years of operation. As Dr. Baily explains, the substantial advantage that the SARR has over real-world

railroads leads to the opposite conclusion – that it is reasonable to assume that the SARR will achieve *no* additional productivity in the early years of its operations.

Dr. Baily emphasizes that there is no evidence linking the qualitative arguments in Caves' testimony with the quantitative solution that it supports. Rather, the evidence shows that it is unreasonable to *assume* any productivity for the SARR in the early years of its operation. Therefore, the Board should adopt a presumption of no productivity and apply the RCAF-U for the first ten years of the SARR's operations, unless productivity improvements advocated by the proponents of a SARR can be tied to a specific source of productivity increase that can be identified and evaluated on the evidence.

V. USE OF URCS SYSTEM-AVERAGE COSTS IN RAIL RATE CASES

A. The Board's Proposal Would Simplify SAC Litigation

Class I railroads generally support the Board's proposal to rely more heavily on system-average URCS costs in SAC cases.[39] The Board's proposal addresses three basic problems with the current approach to calculating variable costs for purposes of determining the jurisdictional threshold. First, as BNSF explained in its opening comments, litigation over movement-specific adjustments to URCS system-average costs is burdensome, complex and seldom justified.[40] Second, use of movement-specific adjustments raises complex and difficult issues relating to the variability percentages used in URCS. Third, the current practice promotes uncertainty as to the jurisdictional threshold and encourages unnecessary litigation, thereby undermining one of Congress's objectives in requiring the Board to establish a simple and clear variable costs standard for use in assessing the statutory jurisdictional threshold.

---

[39] Of the railroad commenters, only CP, a carrier that has not litigated a SAC rate case before the Board, objected to the Board's proposal. CP Op. Comments at 5-9.

[40] BNSF Op. Comments at 61-64.

BNSF suggested modest changes to the Board's proposal that would realize the benefits of simplification that the Board is attempting to achieve through its proposal while preserving some role for movement-specific adjustments where consideration of movement-specific adjustments to URCS might actually have an impact on rates. Specifically, BNSF proposed that the Board (1) include in its calculation of URCS system-average costs the payments that railroads make to third parties for providing some portion of the transportation service; and (2) address movement-specific adjustments at the end of a SAC case if it can be shown by clear and convincing evidence that the adjustments are justified and that they would affect the level of a prescribed rate.[41] BNSF anticipates that such adjustments would include the use of additional, easily ascertainable, operating characteristic inputs such as tare weights, empty miles and number of locomotives.[42]

CSX, NS and UP also agree with the Board's objective to increase reliance on system-average costs in an effort to simplify SAC litigation and to avoid complex disputes over issues that may not need to be litigated in every case. They also propose modest changes that would promote simplification while preserving the ability to consider movement-specific adjustments in appropriate circumstances. Like BNSF, CSX, NS and UP advocate that payments made to third parties for providing a portion of the transportation service be included in the variable cost calculation.[43] They also propose that the Board take into account additional operating characteristic inputs, including some of the same operating characteristics identified by BNSF.

[42] *Id.* at 66-67.

[43] NS/CSXT Op. Comments, at 17; UP Op. Comments at 37-40. *See also* Comments of Snavely King Majors O'Connor & Lee, Inc., at 2-3.

CSX/NS make an additional proposal: that the carrier be permitted to elect at the outset of a case whether to contest quantitative market dominance. If the carrier elects not to contest market dominance, the parties would conduct discovery and present evidence regarding only the SAC portion of the case. If the Board then determines that a rate exceeds a maximum reasonableness level, a party could then elect to present variable cost evidence including movement-specific adjustments.[44]

B. Shippers' Objections Are Unfounded

The Coal Shippers flatly oppose the Board's proposal.[45] They urge the Board to continue to accept movement-specific URCS adjustments and to allow full litigation over such adjustments under the same open-ended procedures that have been followed in the past. In some respects, they ask the Board to expand the scope and expense of litigation over variable costs. Only Arkansas Electric Cooperative Corporation expressed qualified support for the Board's proposal.[46]

The Coal Shippers' primary concern appears to be that reliance on unadjusted URCS system-average costs will "raise the jurisdictional threshold rate level and rate prescription floor."[47] There are two problems with this contention. First, there is no reason to believe that the actual variable costs of unit coal train service are below BNSF's system-average variable costs. In fact, there is evidence that suggests that unit coal train variable costs may be higher than system-average variable costs. Second, the Coal Shippers completely disregard the Board's

[44] NS/CSXT Op. Comments at 15.

[45] Coal Shippers Op. Comments at 89-101.

[46] AECC Op. Comments at 20-22.

[47] Coal Shippers Op. Comments at 92.

cost/benefit analysis and its conclusion that the benefits of simplification outweigh the complexities and costs of dealing with variable cost issues from the start in all cases.

The premise of the Coal Shippers' concern that reliance on unadjusted URCS system-average costs will result in an increase in the jurisdictional threshold is their assertion that "adjustments are called for to reflect the economies and efficiencies of unit train service."[48] While there are undoubted efficiencies in unit coal train service, this does not necessarily translate into variable costs that are below a carrier's system-average costs. For example, there is credible evidence that BNSF's current unit coal train operations are more costly in some respects than other types of traffic on BNSF's system. In its opening comments, BNSF identified two examples of costs – locomotives and fuel – that are demonstrably higher for BNSF's unit coal train operations than for other services.[49]

Moreover, even if concerns about the relative efficiency of unit train operations were valid in the past, they do not carry weight today. System-average costs, at least for western railroads, are substantially more reflective of unit train costs today than they were when URCS was developed in the 1980s. Over time, unit trains have accounted for an increasing proportion of the total car miles on western railroads, rising from approximately 25 percent in the early

---

[48] *Id.* at 90.

[49] BNSF Op. Comments at 60 nn. 46, 47. The Coal Shippers' argument presupposes the accuracy of the movement-specific adjustments for which complainants typically advocate, in particular the adjustments to road property costs which, in BNSF's experience, typically account for more than half of the difference between the parties' variable cost estimates. However, BNSF has demonstrated, and the Board has now acknowledged, that there is a significant problem with the road property adjustment. NPRM at 24-25. Specifically, the use of the system-average variability factor to calculate a movement-specific road property adjustment substantially understates the variable road property costs on high density lines. BNSF has also identified problems with the shippers' improper use of data that are not maintained by the railroad for the purpose of making movement-specific cost estimates, which further distorts shipper sponsored adjustments. *See e.g. AEP Texas,* BNSF Reply Evidence, II-36 to II-38 and Exhibit II.A-4 (filed May 24, 2004).

1980s to 43 percent in 2004.[50] Consequently, a significant portion of current system-average costs for the western railroads are based on unit train operations.

As to the Board's cost/benefit analysis, shippers are dismissive of the Board's concern that the limited benefits of allowing movement-specific adjustments outweigh the costs. According to the Coal Shippers, "movement specific adjustments are not the driving factor behind the expense of maximum rate cases."[51] The Coal Shippers miss the point. Regardless of whether the calculation of variable costs is the "driving factor," behind rate case complexity, it is undeniably a significant expense, particularly in light of the fact that each party to a rate case typically files three rounds of evidence on variable cost issues, more than on any other issue in a SAC case. It also should be an unnecessary expense in most cases. Indeed, shippers identify just one case out of the nine coal rate cases that the Board has decided since 2000 in which the jurisdictional threshold was implicated.[52] In light of these facts, it is difficult to comprehend the Coal Shippers' flat-out rejection of the Board's proposal to eliminate from SAC litigation an expense that yields little or no demonstrable benefit.

C. Shippers' Proposals Would Increase Expense, Complexity And Uncertainty Of The Jurisdictional Determination

Coal Shippers suggest that there are other ways besides using system-average costs to deal with the concerns that underlie the Board's proposal to do away with movement-specific adjustments, particularly the Board's concern that data are insufficient to produce reliable movement-specific adjustments. They make three proposals to address perceived problems with railroad recordkeeping: (1) Where adequate data on which to calculate a reliable movement-

---

[50] *Compare* Analysis of Class I Railroads, AAR (1984) *with* Analysis of Class I Railroads, AAR (2004).

[51] Coal Shippers Op. Comments at 91.

[52] *Id.* at 97 (citing *Wisconsin Power & Light*).

specific adjustment are unavailable, the Board should give "deference" to adjustments advocated by the shipper; (2) The Board should permit discovery and use of railroad internal management costs; and (3) The Board should direct railroad defendants to perform special studies, i.e., create evidence at a shipper's request.[53] Each of the shippers' proposals defies the concerns over efficiency, simplification and certainty that the Board is trying to address in this proceeding. Each proposal is also directly at odds with Congress's effort to reduce carriers' regulatory recordkeeping burden.

The Coal Shippers' proposal that the Board show deference to shipper-sponsored movement-specific adjustments effectively asks the Board to relax its long-standing requirement that a proponent of an adjustment show that it is "demonstrably superior" to unadjusted URCS system-average variable costs.[54] Particularly since recordkeeping requirements have been relaxed as part of the deregulatory thrust of the Staggers Act, shippers' proposal opens the door to massive gaming of the URCS calculations on grounds that the railroad's data are supposedly insufficient. This proposal would also substantially increase the uncertainty surrounding the determination of the jurisdictional threshold.

As to the Coal Shippers' proposal that the Board allow discovery and use of internal management costs, the Board has already soundly and repeatedly rejected use of internal management cost data in rate cases on the grounds that "costs in Board proceedings are to be

---

[53] *Id.* at 93-95.

[54] *Potomac Electric Power Co. v. CSX Trans. Inc.*, STB Docket No. 41295, slip op. at 2 n.10 (served May, 27, 1997) citing *Adoption of the Uniform Rail Costing System As a General Purpose Costing System for All Regulatory Costing Purposes*, Ex Parte No. 431 (Sub-No. 1), 5 I.C.C. 2d 894, 899 n. 12 (1989).

determined using . . . URCS," while internal management data are not based on URCS standards.[55]

The Coal Shippers' proposal that carriers should be forced to create new evidence for shippers by conducting special studies would impose new and significant burdens on the carriers. It would also create complex evidentiary issues, and undoubtedly would lead to additional discovery disputes between the parties to a rate case, imposing additional burdens on the Board and the parties.

In its separately filed comments, Arkansas Electric Cooperative Corporation, through its witness, Michael A. Nelson, proposes using SARR operations simulations "to verify or refute the accuracy of the aggregate results of the URCS analysis."[56] Apart from being vague, the problem with AECC's proposal is that the costs of providing service on a least cost, most efficient, hypothetical, stand-alone railroad bear little relationship to the incumbent's real world costs of serving the issue traffic. Accordingly, a simulation of SARR operations would be completely irrelevant to the variable cost calculations.

D. No Movement Specific Adjustments Are Appropriate Unless They Properly Account For The Relationship Between Variability And Density

The Coal Shippers address one substantive issue: the use of the same variability percentage that is used to calculate system-average road property variable costs to calculate a movement-specific adjustment to those costs. The Coal Shippers and their witness, Joseph

[56] AECC Op. Comments at 21.

Plaistow, incorrectly argue that the ICC long ago settled this issue in the shippers' favor.[57] Shippers have made this argument, as well as the others set forth in Mr. Plaistow's statement, in recent rate cases. With one exception that BNSF addresses below, BNSF has explained in prior rate cases why each of Mr. Plaistow's arguments is wrong, and BNSF does not repeat those discussions here.[58] BNSF showed, and the Board acknowledged in the NPRM, that use of the wrong variability percentage causes substantial distortions. Unless and until a method is found to account for the relationship between variability and density, no movement-specific adjustment is appropriate.

Mr. Plaistow raises one new argument. Mr. Plaistow claims that "depreciation rates [that the Board] has approved for application to each Class I railroad already reflect higher costs for higher traffic densities."[59] He does not explain, however, how this fact, even if true, supports the use of the system-average variability factor regardless of density. Indeed, the very fact that depreciation rates are higher on high density lines makes it all the more important to deal with the variability percentage if a movement-specific adjustment is made. Mr. Plaistow appears to

---

[57] Coal Shippers Op. Comments at 96 and Verified Statement of Joseph J. Plaistow attached thereto (Plaistow Op. VS).

[58] In *AEP Texas,* BNSF Rebuttal Evidence, at I-3 to I-33 (filed July 27, 2004), BNSF presented a comprehensive summary of its experts' evidence demonstrating that substantial distortions result from complainant's calculation of movement-specific adjustments to road property costs using the same variability factor that is used to calculate system-average road property variable costs. BNSF also explained that the Board has never addressed the issue of whether it is proper to use the system-average variability factor to make a movement-specific adjustment. BNSF also presented in Exhibit II.A-4 to that rebuttal an econometric analysis that demonstrates that there is a strong relationship between density and the variability of road property investment costs, and that the average variability of road property investments on BNSF's system is 58 percent – higher than the 50 percent variability percentage assumed by URCS. *See also OTP*, BNSF Rebuttal Evidence, at II-9 to II-20, (filed April 29, 2004) (explaining that changes in railroad accounting practices since the adoption of URCS is another factor underlying the strong relationship between variability of road property investment and density).

[59] Plaistow Op. VS at 11.

concede this point, noting that "[a]ny alteration to the variability factor applying to road property return and depreciation costs must take this depreciation rate-density relationship into account."[60] However, Mr. Plaistow never proposes how this could be done.[61]

E. Other Comments

BP Amoco objects to the Board's proposal as it applies to large rate cases but supports it as it applies to small shipper rate cases, i.e., rate cases brought under the *Simplified Guidelines*.[62] As to large rate cases, BP Amoco objects to the Board's proposal because it is "conceivable that a complainant . . . may file a complaint and allege that a rate close to or at the jurisdictional threshold should be prescribed."[63] However, the possibility that variable costs might be a factor in a case is not a legitimate basis for imposing the extensive burdens on the parties associated with litigating movement-specific adjustments. Like the Coal Shippers, BP Amoco ignores the simplification objective that underlies the Board's proposal and presents no evidence suggesting that system-average URCS costs are an unreasonable measure of variable costs for large scale unit coal movements for purposes of determining whether the Board has jurisdiction to entertain a rate complaint.

As to cases brought under the *Simplified Guidelines,* BP Amoco supports the Board's proposal and urges the Board to disallow any adjustments whatsoever to unadjusted URCS system-average variable cost estimates.[64] As BNSF stated in its opening comments, BNSF

---

[60] Plaistow Op. VS at 11-12.

[61] Mr. Plaistow also completely ignores the unreliability of the depreciation data that complainants have tried to use in recent cases to make a purported movement-specific road property and depreciation costs adjustment. *See e.g. AEP Texas,* BNSF Reply Evidence, II-36 to II-38 and Exhibit II.A-4 (filed May 24, 2004).

[62] Initial Comments of BP Amoco Chemical Co. at 2-3.

[63] *Id.*

[64] *Id.*

agrees with the thrust of the Board's proposal to rely principally on a system-average calculation of URCS costs in small-shipper cases, but urges the Board to apply this approach with flexibility given the lack of significant experience in small shipper cases.[65] BP Amoco provides no valid reason for adopting an inflexible rule that adjustments to system-average costs should be disallowed in all cases.

VI. DCF PERIOD

The parties commenting on the Board's proposal to shorten the SAC analysis period from the usual 20 years to ten years expressed qualified acceptance of the proposal. BNSF and UP do not oppose the Board's proposal, even though they recognize that the truncated analysis period could negatively impact the railroads, particularly in cases where the SAC analysis shows over-recovery of SAC costs in the outer years that offset under-recovery in the earlier years. They agree with the Board that a shortened DCF analysis period reduces reliance on speculative forecasts, adequately reflects the business cycles, and that an accompanying limitation on the rate prescription would reduce the need for reopening to vacate or modify existing rate prescriptions that have become obsolete due to changed circumstances. BNSF also supports the use of a shorter DCF period because it allows the Board to avoid grappling with the difficult and speculative issue of SARR productivity, since any productivity that would be experienced by a SARR would only occur in the later years of a SARR's life. NS/CSXT agree generally that a shorter DCF period makes sense, but they propose that the Board establish only a presumptive length of analysis period, allowing the parties to present evidence for different length periods based on the specific circumstances of the case.

[65] BNSF Op. Comments at 68-69.

Commenting shippers had mixed views. Albemarle contends that the Board should not mandate a 10-year DCF period, but instead should address the issue on a case-by-case basis. Comments of Albemarle Corporation, at 8 ("Albemarle Op. Comments"). AECC contends that a 10-year DCF period would impede the SARR's ability to benefit from outer year growth (AECC Op. Comments at 24), and that the Board's proposed procedures for reopening would eliminate any need to shorten the DCF analysis period.[66] *Id.* at 22. The Coal Shippers support the shortened DCF period so long as (1) the Board modifies the DCF model to incorporate a new methodology for amortizing debt, and (2) the rate prescription is allowed to extend indefinitely until the railroad can prove on reopening that there are changed circumstances that justify termination. Coal Shippers Op. Comments at 102-103.

BNSF opposes the Coal Shippers' conditions. The proposed modification to the debt amortization schedule has no place in this proceeding. The treatment of debt amortization is unrelated to the DCF period. The length of the debt amortization period is not a function of the DCF analysis period. As discussed by Mr. Baranowski in the attached verified statement, changes can be made to the DCF period without any need to address the debt amortization period. Indeed, shippers have sought changes in the debt amortization schedule in pending cases without seeking any change in the DCF period.[67] The two issues are separate.

It would therefore be inappropriate even to consider the Coal Shippers' proposal in this proceeding. The NPRM sought comments on the proposed shortening of the DCF period and "how the electronic spreadsheets used in these cases should be modified to make this change [in

---

[66] AECC's argument is rather circular as the Board proposes to shorten the DCF period and the length of the rate prescription precisely to make such reopenings unnecessary.

[67] See BNSF discussion of complainants' attempts in Docket No. 42088, BNSF Reply Nar. at III.G-19 to 20 (July 20, 2005) and in Docket No. 41191 (Sub-No. 1), BNSF Reply Nar. at III.G-23 (May 24, 2005).

the DCF period] if adopted." NPRM at 31. The Board did not seek comments on substantive changes to other economic assumptions used in the DCF analysis and it would be inappropriate to do so now. Moreover, any change to the Board's longstanding practices relating to the debt amortization period would require the evaluation of substantial evidence relating to railroad practices, interest rate assumptions, and the Board's cost of capital determinations, as explained by Mr. Baranowski. This rulemaking proceeding is not the proper forum to consider such a fact-specific inquiry.[68]

The shippers' second request that a rate prescription be allowed to extend beyond the 10-year DCF period and that the railroad be burdened with justifying its termination defeats the purpose of shortening the SAC analysis period. The Board was correct in recognizing that long-term rate prescriptions often becomes obsolete because they are based on projections and assumptions about the future that are inherently speculative. The purpose of the Board's proposal is to reduce the impact of those speculative future projections on rate prescriptions and thereby reduce the litigation burdens that result from reopening proceedings that assess the continued validity of those projections. The shippers' proposal to continue the prescription indefinitely and force the railroad to seek reopening based on changed circumstances undermines the purpose of reducing the DCF period in the first place.

Finally, all parties agree that changes to the DCF analysis period should not be applied to pending rate cases in which the evidentiary period is closed so as to avoid needless complication of those cases. Coal Shippers Op. Comments at 103.

---

[68] In the pending WFA/Basin case (Docket No. 42088), the complainant also sought to have the Board change its treatment of the debt amortization period without any consideration of evidence by burying its proposal in a workpaper on opening. Docket No. 42088, BNSF Brief at 22-23 (December 6, 2005). If complainants want to have a serious discussion of this issue, they must raise it properly in their opening evidence with supporting evidence so that the railroad defendant has an opportunity to address the issue on the merits.

VII. STANDARD FOR REOPENING, VACATING AND FILING A NEW CASE

The Board's NPRM proposes to amend the rules governing the reopening of Board decisions to implement the ruling of the D.C. Circuit in *BNSF v. STB,* 403 F.3d 771 (D.C. Cir. 2005), that railroads and shippers should be treated in the same way when they seek to reopen and vacate an existing rate prescription. Any party seeking to vacate an existing rate prescription – whether a shipper or a railroad – must establish that material error, new evidence or substantially changed circumstances justify reopening and vacatur. The railroad commenters, including BNSF, support the Board's proposed rule change. One shipper urges the Board to continue to apply disparate standards to shippers and railroads, although the largest group of shipper commenters – the Coal Shippers – accepts the Board's conclusion that "a common standard will be applied to all prescription reopening/vacation petitions." Coal Shippers Op. Comments at 105.

In addition, the Board's NPRM sets out a proposed "multi-tier" procedure for addressing requests to reopen and vacate existing rate prescriptions. Under that approach, the Board will lift the prescriptive effect of the prescription upon finding that there is sufficient evidence of changed circumstances to call the validity of the existing prescription into question, and then either call for additional evidence or vacate the prescription and allow the filing of a new rate complaint. The Coal Shippers object to this proposal and instead favor a single evidentiary hearing in which the parties are allowed to present evidence beyond the scope of the original SAC assumptions, including selection of a new traffic group and revision of the SARR configuration. Coal Shippers Op. Comments at 109-14. While the hearing is pending, the rate prescription would remain in effect. Finally, the Coal Shippers argue that the Board should not allow the new standards emerging from this rule making to be used as a basis for reopening

Board decisions with respect to existing rate prescriptions. *Id.* at 115-17. BNSF addresses each these positions below.

A. The Board Correctly Interpreted The Court's Decision In *BNSF* As Mandating Similar Treatment For Railroads And Shippers Seeking *Vacatur* Of A Rate Prescription

Xcel takes issue with the Board's conclusion that any party seeking to reopen and vacate an existing rate prescription must show, to the satisfaction of the Board, that material error, new evidence or substantially changed circumstances justify reopening. Xcel argues that the court's decision in *BNSF* does not mandate identical standards for railroads and shippers, but only requires that the Board provide a well-articulated reason for treating them differently. Xcel further claims that disparate treatment of shippers and railroads could be justified by the supposedly disparate effect of vacatur on shippers and railroads. According to Xcel, "*vacatur* of a rate prescription enables the railroad to regain complete rate-setting autonomy to charge a new rate pending the new case, and imposes on the complainant the high burden of preparing and submitting a new SAC analysis." Comments of Xcel Energy, at 6 ("Xcel Op. Comments").

This argument is a rehashed version of the same argument that was presented to the D.C. Circuit in support of disparate treatment in *BNSF v. STB* and rejected by the court in that case. The D.C. Circuit noted that one of the Board's justifications for disparate treatment was that "vacation of the rate prescription affords the carrier rate-making freedom while the shipper bears a substantial burden to show a new rate is unreasonable." *BNSF* at 777. Thus, the Board's rationale in *BNSF v. STB* was essentially the same rationale that Xcel now asks that the Board resuscitate and use in support of disparate treatment of shippers and railroads. But the D.C. Circuit found that "the Board's *Decision* is arbitrary and capricious," *Id.* at 778, and specifically concluded that "the Board's justification in the *Decision* for disparate treatment is flawed." *Id.* at

777. Thus, the shippers' "better rationale" has already been considered and rejected by the court.

B. Interim Suspension Of A Prescribed Rate Is Within The Board's Authority

The Coal Shippers object to the Board's proposal for an interim suspension of a rate prescription where the party seeking vacatur has demonstrated that there are sufficient grounds for questioning the continued validity of the rate prescription. They claim that the Board lacks the authority to take such an action, arguing that a rate prescription must remain in effect until the Board eliminates it altogether after a full hearing on the merits. Coal Shippers Op. Comments at 106. While BNSF agrees that an existing rate prescription must remain in effect until the Board has made a finding that material error, new evidence or substantially changed circumstances calls the validity of the rate prescription into question, such a finding could support a prospective lifting or suspension of the rate prescription while additional evidence is considered.

The Board is authorized under 49 USC 722(b) to "change, suspend, or set aside" a prior action by the Board. The conditions under which the Board may suspend a prior action under Section 722(b) are specified in Section 722(c), which states that the "Board may, at any time on its own initiative because of material error, new evidence or substantially changed circumstances - (1) reopen a proceeding; (2) grant rehearing, reargument, or reconsideration of an action of the Board; or (3) *change* an action of the Board." (emphasis added). So long as the Board makes specific findings of material error, new evidence or substantially changed circumstances, it may "change" the rate prescription by suspending it while additional evidence is considered. There is nothing in the statute that requires the Board to conduct a full evidentiary hearing before taking action under Section 722(b).

The Coal Shippers contend that lifting the prescriptive effect of a rate prescription is indistinguishable from a *vacatur* and is therefore unlawful absent a full evidentiary hearing. Coal Shippers Op. Comments at 107. But lifting the prescriptive effect is not a final determination on the prescribed rate; it is only a temporary action pending further investigation. As such, it is a "suspension," not a "vacation" of the prescription. "Suspension" is temporary by nature. "Suspend" means "to set aside or make temporarily inoperative," to "stop temporarily," or to "hold in an undetermined or undecided state awaiting further information." *Merriam Webster's Collegiate Dictionary* 1187 (10th ed. 1993). *Vacatur*, on the other hand, implies permanence. "Vacate" means to "make legally void," or to "annul." *Id.* at 1303. The Board's objective in the proposed standard for reopening is not to void the prescription permanently when it lifts the prescriptive effect, but to put the rate prescription on temporary hold pending further investigation. As the prescription may or may not be vacated after consideration of further evidence, the shippers' contention that lifting the prescriptive effect is the equivalent of *vacatur* is incorrect.

The Coal Shippers also contend that under *Arizona Grocery*[69] it is unlawful for the Board to lift the prescriptive effect of a rate prescription prior to a full evidentiary hearing. Coal Shippers Op. Comments at 101-109. But *Arizona Grocery* does not address the scope of the Board's authority under Section 722(b). It is clearly unlawful under *Arizona Grocery* to lift or eliminate the prescriptive effect of a rate prescription at any time prior to a specific finding by the Board that changed circumstances affect the continued validity of the prescription. But *Arizona Grocery* does not preclude the suspension of a rate prescription after such a finding is

[69] *Arizona Grocery Co. v. Atchison, Topeka & Santa Fe Rwy. Co.*, 284 U.S. 370 (1932).

made to enable the Board fully to assess evidence on the question whether to modify the rate prescription, eliminate it altogether, or keep it in place.

C. The Board's Proposed Limits On The Scope Of A Reopening Are Appropriate

The Coal Shippers also complain that any limits on the scope of the reopening proceeding would unduly constrain the hearing that must be carried out before a rate prescription may be vacated. But the shippers misunderstand the question that is at issue in a reopening of an existing rate prescription. The question is not whether *any* rate prescription would be appropriate, but whether the specific rate prescription imposed on the basis of specific SAC assumptions remains valid. For example, since the original rate prescription is typically based on assumptions about future events, it is appropriate to consider whether key assumptions have turned out, over the passage of time, to be accurate. It is not appropriate to relitigate the basic assumptions about the configuration of the SARR or the composition of the SARR traffic group. New evidence relating to a SARR that is different from the SARR in the original SAC analysis would say nothing about the continued validity of the original rate prescription. It would merely indicate that different results could be obtained by changing the underlying SAC assumptions.

Shippers are not prejudiced by the proposed rule. After a rate prescription is vacated, the ratemaking initiative returns to the railroad. If the railroad then establishes a new rate that the shipper believes is unreasonable, the Board's proposed rule would allow the shipper to challenge that rate in a new SAC proceeding.

D. The Board Should Not Adopt A Rule Addressing The Extent To Which Changes In SAC Methodology Will Be Considered In Reopening Proceedings

The Coal Shippers ask the Board to declare that no changes in SAC methodology that result from this rulemaking proceeding can be the basis, standing alone, for a decision to reopen an existing rate prescription. Coal Shippers Op. Comments at 115-16. It would not be

appropriate for the Board to issue such a rule in this proceeding since the issue was not raised in the Board's NPRM. In any event, the question of whether a new standard or methodology constitutes or contributes to "substantially changed circumstances" that would justify reopening cannot be determined in the abstract. It must be decided on a case-by-case basis. The Coal Shippers' concerns over administrative finality and the importance of changes in the factual assumptions underlying the rate prescription would need to be considered in any request to reopen an existing rate prescription. But there is no reason to issue a rule that prohibits the Board from considering changes in SAC methodology in deciding whether to reopen a rate prescription.

VIII. OTHER ISSUES – TESTING FOR CROSS-SUBSIDY

The Coal Shippers argue that the Board's cross-subsidy test, as applied in *PPL* and *Otter Tail*, is inconsistent with the *Guidelines* and constrained market pricing, and must therefore be abandoned. Coal Shippers Op. Comments at 55. The Coal Shippers argue that the *Guidelines* are concerned only with the question whether a *complainant* is cross-subsidizing other traffic, not whether other traffic in a proposed SARR is cross-subsidizing the complainant. The Coal Shippers assert that it is therefore inappropriate to test whether other traffic in the SARR cross-subsidizes the issue traffic and that preventing such cross-subsidies is, in fact, inconsistent with the complainant's prerogative to group traffic in a beneficial manner. *See, e.g.,* Coal Shippers Op. Comments at 65-66. In essence, the Coal Shippers argue that a complainant is entitled to create a SARR in which the issue traffic is cross-subsidized by other shippers and the cross-subsidy that the issue traffic receives from other shippers can be used to reduce the issue traffic rate.

As a preliminary matter, it is clear that the Board's cross-subsidy rules are not part of this proceeding. The cross-subsidy rules did not form a part of the NOPR, and the Board has not

issued any subsequent order that would expand the rulemaking to include new issues. It was therefore inappropriate for the joint shippers to submit detailed comments on this issue, and the Board should disregard those comments.

Moreover, the Board's cross-subsidy rules are economically sound, grounded in rational application of the cross-subsidy principles set out in the *Guidelines*, and judicially approved. When it adopted the cross-subsidy test, the Board explained that the elimination of the effects of cross-subsidies was a "fundamental principle" of constrained market pricing. *PPL Montana, LLC v. Burlington Northern & Santa Fe Railway Co.*, STB Docket No. 42054, slip op. at 6 (served Mar. 24, 2003). Rejecting the same arguments made here, the Board reasoned that "[i]t would turn the CMP principle against cross-subsidization on its head to protect a captive shipper from subsidizing other traffic, while at the same time allowing that shipper's rates to be subsidized by other traffic." *Id.*

The Board's cross-subsidy test was affirmed by the D.C. Circuit in *PPL Montana, LLC v. Surface Transportation Board*, 437 F.3d 1240 (D.C. Cir. 2006). PPL made the same argument to the Court that the Coal Shippers make here. As the Court noted, "PPL suggested the SAC test only prevented the complaining shipper from being forced to subsidize other traffic, and that the complaining shipper was free to design a SARR in which other traffic subsidized the complaining shipper." *Id.* at 1243. But the Court agreed with the Board that "the primary purpose of the SAC test . . . is to guard against 'both cross-subsidization by and cross-subsidization of the captive issue traffic' when determining the reasonableness of the issue traffic's rates." *Id.* at 1245 (quoting the Board's August 2002 decision). As the court recognized, SAC is grounded in competitive market principles, and cross-subsidies would not exist in competitive markets. Moreover, the Court agreed with the Board's obvious conclusion

that a rate cannot be unreasonably high if it does not generate enough revenues, along with revenues from other shippers using the same facilities, to cover the costs of the facilities used by the issue traffic: "[T]he Board's decision advances the reasonable proposition that the captive issue traffic cannot be improperly subsidizing other traffic if the issue traffic cannot even cover its own attributable costs; in other words, it is difficult to steal from a penniless Peter to pay Paul." *Id.* at 1245-46.

The Board's extension of the cross-subsidy rule in *Otter Tail* to the rate reduction phase was a logical application of the same principles articulated by the Board in *PPL* and confirmed by the D.C. Circuit. As the Board explained, if it were to allow shippers to rely on cross-subsidies in the presentation of SAC evidence, a "test designed to root out costs associated with cross-subsidization would be transformed into one where captive shippers seek out cross-subsidies to pay for the facilities needed to serve them." *Otter Tail*, slip op. at 25. Shippers should not be able to use cross-subsidies to create the appearance that a challenged rate is unreasonably high, and they should not be able to use cross-subsidies to produce unwarranted rate reductions.

Professor Willig explains in his reply statement that it is entirely appropriate for the Board to apply its cross-subsidy test both initially and as a check to the level of the prescribed rate. It is undesirable for the regulatory process itself to introduce or exacerbate inefficiencies in the incumbent's rate structure. The Board's cross-subsidy test guards against such problems. Moreover, the concern that the cross-subsidy test will unnecessarily complicate SAC proceedings is based on a misperception of what the test actually requires. The cross-subsidy test does not require a complainant to posit an optimal SARR, it merely requires that the SARR posited by complainant should be free of cross-subsidy.

Mr. Klick explains in his reply statement that Professor Borts' discussion of cross-subsidy is in error because Professor Borts does not recognize how the Board's cross-subsidy test treats different kinds of costs. Contrary to Professor Borts' contention, and the example he uses, the Board's treatment of costs ensures that the test for cross-subsidy is conservative and will not show a cross-subsidy except in fairly extreme cases.

Respectfully submitted

MAJOR ISSUES IN RAIL RATE CASES

Verified Reply Statement of

Joseph P. Kalt, Ph.D.

On Behalf of BNSF Railway Company

May 31, 2006

I. INTRODUCTION

A. Witness Background and Qualifications

My name is Joseph P. Kalt. I am the Ford Foundation Professor of International Political Economy at the John F. Kennedy School of Government, Harvard University. The Kennedy School is Harvard's graduate school of public policy and public administration. In addition to my work at the Kennedy School, I am also a Senior Economist at Lexecon, an economics consulting firm and a division of FTI Consulting. I hold B.A., M.A., and Ph.D. degrees in economics and am a specialist in the economics of competition, antitrust, and regulation, with particular emphasis on the energy, natural resource, and transportation sectors. Throughout my professional career I have conducted research, published, taught, and testified extensively on the economics of competition and regulation, with a particular emphasis on regulated industries. I have studied extensively the economics and regulation of the railroad industry and have presented expert testimony before the Surface Transportation Board (STB or Board) on numerous occasions, most recently in *WFA*.

I previously filed a Verified Statement in this proceeding, *EP 657: Major Issues in Rail Rate Cases* (Opening V.S.). In this Reply Verified Statement (Reply V.S.), I have been asked by BNSF Railway Company (BNSF) to comment specifically on the submissions of the Western Coal Traffic League (WCTL); AEP Texas North Company (AEPTX); Western Fuels Association, Inc., and Basin Electric Cooperative, Inc. (WFA); and Arkansas Electric Cooperative Corporation (AECC). In each case, I consider the economic and policy implications of these submissions' analyses and recommendations relative to two primary issues raised by the Board in *EP 657*: (1) the appropriate rate prescription methodology, and (2) the appropriate principles of revenue allocation for cross-over traffic under the Stand-Alone Cost (SAC) test for rate reasonableness originally set forth in the *Coal Rate Guidelines* (*Guidelines*).[1]

[1] *Coal Rate Guidelines*, Nationwide, 1 ICC 2d 520C (August 8, 1985) (hereinafter, *Guidelines*).

B. Summary of Findings

Rate Reduction Methodology: In my Opening V.S., I compared the two proposals (plus variants) for rate reduction methodology set out by the Board in *EP 657* – Maximum Contribution Methodology (MCM) and Maximum Markup Methodology (MMM) – to the Board's longstanding Percentage Reduction Method (PRM). As I explained therein, the PRM approach to rate prescription recognizes that pre-reduction pricing by the commercially rational incumbent can be presumed to reflect Ramsey principles of differential pricing under which customers with less elastic demand exhibit generally higher rates and higher percentage mark-ups over marginal cost. I noted that these basic relative rate relationships must be maintained, even if rate prescriptions are imposed, if a rate prescription methodology is to be consistent with Ramsey pricing and contestable market theory – the two principles the Interstate Commerce Commission (ICC) cited in the *Guidelines* as underpinning Constrained Market Pricing (CMP) and the SAC test.

Compared to PRM, both MCM and MMM are markedly inconsistent with the simulated competition of contestability and the Ramsey principles that are clearly articulated in the *Guidelines*. Although described as "demand-based" in the *EP 657* rulemaking decision, both MCM and MMM are, at their core, fully distributed cost methodologies that attempt to focus on equal distribution of costs among shippers without regard for the differences in value (i.e., demand elasticities) that individual shippers place on rail transportation. By embracing cost-based methodologies, MCM and MMM fly in the face of the *Guidelines*, which were highly critical of the arbitrariness of establishing rail rates based on cost allocation.[2]

Rate Reduction Methodology (Reply): In this Reply V.S., I apply the economics of Ramsey pricing principles and contestability to evaluate alternatives to the PRM methodology that have been proposed by intervening parties. WCTL, in particular, is aggressive in asserting that rate reduction should be determined in both methodology

---

[2] *Guidelines* at 523, 526.

and magnitude on a case-by-case basis.[3] This is a recommendation for no generalizable methodology. But the principles of Ramsey pricing and the economics of contestability do not vary from case to case. They are generalizable frameworks; that is why the *Guidelines* could be built upon them. The Board's rate reduction methodology should be consistent across cases with the economics of contestability and Ramsey pricing principles.

AEPTX proposes, with WCTL's endorsement, that the Board adopt the General Percent Reduction Method (GPRM) proposed by AEPTX in *Docket No. 41191 (Sub-No. 1)* (AEP Texas). Relative to the Board's current PRM methodology, GPRM is decidedly inferior. GPRM's purported goal is to make the Board's rate reduction methodology consistent with Ramsey principles and to eliminate purported incentives for carriers to "game" the SAC process by establishing rates above commercially reasonable levels in the hope that SAC tests will not lower such rates to below the level carriers' desire. GPRM fails in meeting both of its stated objectives. The proposed rate reduction method requires measurement of the true marginal costs of serving all of the shippers contained in the Stand-Alone Railroad's (SARR's) proposed traffic group. GPRM's proposal to employ the Uniform Railroad Costing System (URCS) as a proxy for economic marginal cost represents a vain hope of achieving the impossible. This is not a matter of whether URCS cost proxies could be "good enough." Rather, as I discuss below, the use of URCS proxies for marginal cost would introduce distinct biases into GPRM – biases that would point in the direction of systematically lowering rail rates below Ramsey levels for services such as rail transportation of coal.

WFA proposes that the Board adopt WFA's so-called Reasonable Allocation Method (RAM) or, in the alternative, WFA's Reduced Mark-Up Method as these have been advanced by WFA in its pending rate case challenging certain rates of BNSF (i.e., Docket No. 42088 (Western Fuels). The RAM approach to rate reduction in SAC

---

[3] See, e.g., Joint Opening Comments of Western Coal Traffic League, Concerned Captive Shippers, Western Fuels Association, Inc., Edison Electric Institute, National Rural Electric Cooperative Association and American Public Power Association, Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases, (hereinafter WCTL Opening) at 13; Verified Statement of Thomas D. Crowley, on behalf of Western Coal Traffic League et al, Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases (hereinafter, Crowley Opening V.S.) at 3.

analyses would be starkly inconsistent with Ramsey principles and, even on its own terms, would require wholly unrealistic assumptions regarding shippers' demands and demand elasticities. From a public policy perspective, the Percentage Reduction Method that the Board has repeatedly employed is clearly preferable to RAM. WFA's Reduced Mark-Up Method is similarly dominated from a public policy perspective by the Board's extant Percent Reduction Methodology.[4]

Revenue Allocations for Cross-Over Traffic: In my Opening V.S., I noted that the Board has recognized that its current system of cross-over allocation creates strong incentives for shippers to design grossly inefficient and biased SARRs. A complainant can selectively choose highly rated (i.e., high revenue and low cost) traffic on the SARR and use rules-based revenue divisions to "game" the process by designing a SARR to capitalize on divisions that reward small SARRs with very large amounts of revenue from highly rated cross-over traffic.[5] With the overwhelming majority of a SARR's revenues coming from cross-over traffic, the challenged traffic is required to provide proportionately less of the revenue burden needed to ensure that overall SARR revenues just cover its stand-alone costs. This increases the likelihood that the incumbent's challenged rates will be found to exceed the rates that would exist in a contestable market.

In *EP 657*, the Board suggests an alternative to its current Modified Straight-Mileage Prorate (MSP) method of allocating revenues to SARRs' cross-over traffic. Under the alternative, the Board would employ a measure of Average Total Cost (ATC) to create a proxy for what the Board refers to as a "full" SAC analysis of a full SARR that would compete to replace all of incumbent carrier's facilities and operations utilized by the SARR's traffic groups.[6] As I showed in my V.S., there is no need to turn to a

4 Although vague, Arkansas Electric Cooperative Corporation appears to endorse the MCM or MMM methodologies. (See Written Testimony of Michael A. Nelson on behalf of Arkansas Electric Cooperative Corporation, Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases (hereinafter "AECC Opening"). I have addressed these options in detail in my V.S. in this proceeding. My analyses there apply to AECC's comments.

5 STB Docket No. 42072, Carolina Power & Light Company v. Norfolk Southern Railway Company, Decision (December 22, 2003) (hereinafter *CP&L/NS Decision*) at 31-32.

6 Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases; Docket No 41191, West Texas Utilities Company v. BNSF Railway Company; STB Docket 41191 (Sub no. 1), AEP Texas North

proxy approach in order to properly incorporate cross-over traffic. The economics of contestability readily yield cross-over allocations for SARR's actually proposed by shippers. Specifically, these economics yield cross-over revenues equal to the incumbent's avoided costs on cross-over traffic, and doing so provides shippers with proper incentives to design efficient SARRs.

Revenue Allocations for Cross-Over Traffic (Reply): Shipper intervenors in this proceeding vociferously oppose changes to the MSP approach. If the MSP approach is to be abandoned, WCTL would prefer to determine cross-over revenue allocation via empirical estimation of "real world" rate divisions. As discussed in my Opening V.S., the MSP approach is wholly inconsistent with the economics of contestability embraced by the *Guidelines*. WCTL's alternative of "actual market divisions" is similarly inconsistent with these economics. The SARRs actually proposed by shippers are properly allocated revenues in accord with incumbents' avoided fixed and variable costs when a SARR replaces the incumbent on system segments that carry the SARR's cross-over traffic. As explained in my Opening V.S., for SARRs that choose to compete for non-issue traffic as *partial* SARRs competing to attract cross-over traffic, this avoided cost standard for determining cross-over revenues follows directly from the economics of contestability. However, if the Board determines that SAC analysis should proceed as if "full" SARRs are competing to replace the incumbent in serving Complainants' traffic groups, the ATC method for allocating revenues to cross-over traffic, set out by the Board in *EP 657*, would represent a sound starting point.

Finally, the treatment of cross-over traffic in SAC analysis must be harmonized with whatever rate reduction methodology is applied when an incumbent's rates are found to generate SARR revenues which exceed the stand-alone cost of a Complainant's SARR. Specifically, whatever rate reduction approach is applied in such cases must be applied to the *through* rates associated with cross-over traffic carried by the SARR. The Ramsey pricing principles and the economics of contestable markets are unambiguous in

---

Company v. BNSF Railway Company; STB Docket No. 42088, Western Fuels Association Inc., & Basin Electric Power Cooperative v. BNSF Railway Company; STB Docket No. 42095, Kansas City Power and Light Company v. Union Pacific Railroad Company, Decision (February 27, 2006) at 7 (hereinafter *EP 657: Major Issues in Rail Rate Cases*) at 17.

indicating: (1) that Ramsey prices and principles only apply to the through rates that interact with shippers' demand elasticities to determine the volume of rail service shippers purchase; and (2) that, in the simulated competition of contestable markets that is the heart of SAC analysis, a "full" SARR would put downward pressure on all of the incumbent's *through* rates.[7] For rate reduction in SAC cases to be coherently consistent with the principles of Ramsey pricing and contestable markets, this means that reduction or mark-up percentages emanating from PRM, MCM, MMM, GPRM, RAM or whatever method the Board adopts must be applied to through rates.

II. RATE PRESCRIPTION AND THE ECONOMICS OF THE COAL RATE *GUIDELINES*

A. Shipper Proposals for a "Case-by-Case" Standard

With respect to the matter of rate prescription methodologies in SAC cases, WCTL and other shippers filing comments in this proceeding advocate no outcome at all, arguing that the appropriate method for resolving rate disputes be decided on a "case-by-case" basis.[8] This approach, however, would leave rate prescription in SAC cases unguided by any overarching, generalized framework grounded in sound application of the economics the *Guidelines* rely upon for why SAC analyses should be done in the first place. Those economics – of contestability and Ramsey prices – have their roots deep in concepts of the public interest and designs of regulatory mechanisms that serve the public interest.[9]

In fact, it is telling in a context such as this when one side of the private interests at stake seeks to avoid adoption of guidelines and principles of sound policy and, instead, invokes a claimed need for case-by-case determinations on a recurring issue. Such a strategy asks for a move away from regulatory policymaking according to coherent frameworks and rules, and toward regulatory policy more susceptible to political forces and pressures. While such a move may be desirable from the perspective of a private

---

[7] As discussed at length in my Opening V.S., in a contestable market, a partial SARR would realize the incumbent's avoided fixed and variable costs on partial (i.e., cross-over) traffic moves.

[8] See, e.g., Crowley Opening V.S. at 3; WCTL Opening at 13 and 22-25.

[9] Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases, Verified Statement of Joseph P. Kalt, Ph.D. on behalf of BNSF Railway Company, (hereinafter Kalt Opening V.S.), at 11-13.

party that fares better wielding political influence than wielding applicable rules and principles, considerable research tells us that, in the realm of governmental policy, stable and coherent rules of the game are critical to satisfying the public's interest in a healthy economy.[10] It is wholly appropriate that an agency such as the Surface Transportation Board undertake, as it is doing here, to build regulatory systems on firm principles that point its decisions toward service of the public interest. Adoption of such principles and procedures will provide information to future participants in rate cases; provide the basis around which parties might enter into independent agreements to resolve rate disputes; and remove the temptation that one party or the other may perceive in taking unfair advantage of a regulatory vacuum by advancing results-oriented methodologies designed to yield the best results for that party in a given case.

B. Guiding Economic Principles

For these reasons, it is appropriate and necessary to develop a framework for rate prescription that is grounded in the basic economic principles of the rail industry. As I noted in my Opening V.S., [11] the *Guidelines* appropriately employed such a framework. The policies implemented under the *Guidelines* are intended to set maximum rates for coal transportation in the face of a tension between railroads' need for differential pricing and concerns over potential railroad market dominance. The *Guidelines* approach this tension by relying upon the results of simulated competition to establish maximum rates on coal (and other traffic) over which a carrier may be found to be market dominant. This is accomplished by invoking the principles of contestable markets and Ramsey-based differential pricing.

Contestability: Under the *Guidelines*' Constrained Market Pricing, the total revenue needed by a rail system or subset of a rail system to ensure that it is able to cover its costs plus a reasonable rate of return is determined using the principles of contestability. A market is contestable when it is free of barriers to entry and exit that can otherwise impede competitors from entering the market to compete as a supplier of

---

[10] A classic in this regard is by Nobel Laureate Douglass C. North, *Institutions, Institutional Change, and Economic Performance* (Cambridge, UK: Cambridge University Press, 1990).

[11] Kalt Opening V.S. at 4-13.

customers' needs. Under such conditions of free entry and exit, even if the market is served at lowest cost by a single large firm that maximizes economies of scale and scope, that single large firm will not be able to extract monopoly prices and profits. This is because if it tries to do so, it is immediately subject to entry and attack by freely entering (and freely exiting) competitors. Under contestable market conditions, surviving suppliers can realize only their costs plus a reasonable (i.e., competitive) rate of return.[12] The real world of the railroad industry obviously is not actually contestable – if it were, there would be no need at all for railroad rate regulation. SAC analysis is designed to simulate the results of contestability. The hypothetical entrant envisioned in the SAC analysis must charge rates sufficient to permit long-term viability, but can earn revenues no higher than those required for long-term viability (i.e., by covering costs plus a reasonable return to reflect the cost of capital).

Ramsey Pricing: The *Guidelines* also invoke the principles of Ramsey pricing.[13] As discussed in my Opening V.S. and the Opening V.S. of Prof. Robert Willig,[14] Ramsey pricing describes a set of rules that simultaneously address the paired challenges of (1) limiting the total revenues of a firm to no more than its total costs (including a reasonable return to cover the cost of capital), and (2) minimizing the distortions to efficiency and the associated public interest in an economy that maximizes consumers' well-being when some of this distortion is unavoidable because the existence of joint and common costs requires differential mark-ups on each movement above its attributable costs.[15] Indeed, the Ramsey pricing rules are derived mathematically in economics by maximizing the benefit to the public of a sector such as railroading. This means limiting the system to no more total revenue than needed to attract and hold investors, and differential pricing that sets rates relative to costs highest for those movements with the highest valuation of their

---

12 *Guidelines* at 528, *EP 657* at 5.

13 *Guidelines* at 526-528.

14 Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases Verified Statement of Robert D. Willig, on behalf of BNSF Railway Company (hereinafter Willig Opening V.S.) at 5-11 and 13-15.

15 This minimization of the loss to consumer well-being that arises because first-best pricing at variable cost is not achievable causes Ramsey pricing to be labeled "second-best" pricing. In other words, the best we can do in the real world in which differential pricing is unavoidable.

rail service in the sense that demands are least discouraged (least elastic) in the face of higher prices. The mathematics of this exercise yields the Ramsey pricing rule:

$$[(P_1 - MC_1)/P_1] \div [(P_2 - MC_2)/P_2] = \varepsilon_2/\varepsilon_1 ;$$

for any two shippers, 1 and 2, with elasticities of demand ε_1 and ε_2.

Thus, under Ramsey pricing, prices across different shippers are set such that each movement's relative mark-up above marginal costs[16] per unit of service varies inversely with its elasticity of demand, and relative mark-ups of any two moves are inversely proportional to the ratio of those movement's relative demand elasticities. The implication is that for, say, non-captive traffic where a shipper might turn relatively easily to, for example, another railroad or another transport mode, elasticities of demand can be expected to be relatively high, and corresponding Ramsey-derived prices would be marked up relatively little (albeit, generally not by zero) compared to marginal cost. Shippers with low elasticities of demand – reflecting more limited alternatives, inelastic ultimate consumer demand, and the like – would see higher relative mark-ups of prices over marginal costs. The evident tight dependency of mark-ups on elasticities of demand is what it means for the *Guidelines* to refer to proper (Ramsey) pricing of rail service as "demand-based."[17]

C. Implications for SAC Analysis

As discussed in my Opening V.S., the basic Ramsey pricing rule with respect to price mark-ups is, to a first approximation, applicable to an unregulated, profit-maximizing firm. The difference between Ramsey pricing applied to the regulated firm and the unregulated firm is that, in the former case, the sum of all revenues –the portions covering both marginal costs and mark-ups – is set equal to cost plus a reasonable return. The unregulated firm charges higher relative mark-ups to less elastic customers in order to maximize *unconstrained* profit. In the contestable setting of SAC analysis, the SARR is attempting to do the same thing, but conditions of free entry mean that the SARR

---

[16] I.e., expressing mark-up of price above marginal cost as a percent of price.

[17] *Guidelines* at 526-527.

cannot realize excess profits (i.e., revenues in excess of costs plus a competitive return to capital). The SARR is appropriately treated in the simulated competition of SAC analysis as being economically compelled to offer the shippers whose business the SARR is chasing prices which are simultaneously sufficient to allow the SARR to break even, and which generate maximum benefit for shippers being served. These are the Ramsey prices. If the SARR doesn't offer them, the SARR does not "win" in the contestable market because the conditions of free entry implicate other competitors able to offer shippers more benefit.

The observation that the incumbent railroad that has not had its rates rolled back by regulation would rationally set relative mark-ups inversely proportional to demand elasticities means that, upon coming into a contestable market against the incumbent, the "winning" SARR will put downward pressure on all rates by following the formula above, reducing mark-ups so as to preserve the Ramsey formula, but pulling down total revenues so that SARR realizes only its costs plus a competitive return. As discussed at length in my Opening V.S., the MCM and MMM methodologies proposed by the Board in *EP 657* for rate reduction in SAC cases would both fail, as a general matter, to exhibit this basic attribute of the contestability foundations of the *Guidelines*.[18] In the same spirit, let us now examine intervening shippers' additional proposals for rate reduction methodologies.

III. SHIPPER PROPOSALS RE: RATE REDUCTION METHODOLOGIES

A. AEPTX's/WCTL's GPRM Proposal

In AEP Texas, AEPTX proposed what it terms a General Percentage Reduction Method (GPRM). AEPTX, along with WCTL, now suggests to the Board that, if this rulemaking is to yield a general rule for rate reduction, that rule should be GPRM. GPRM is purported by AEPTX (and, implicitly, WCTL) as a more consistent with the

[18] Testimony submitted in this proceeding by Michael Nelson as an expert on behalf of AECC proposes an iterative allocation of a SARR's stand-alone revenue requirement. Like the MCM and MMM approaches, Mr. Nelson's proposed rate reduction methodology results in rate compression and rate equalization across select shippers. (See AECC Opening at 6.) As discussed at length in my Opening V.S., this is wholly inconsistent with Ramsey pricing and the economics of contestable markets.

Ramsey pricing rules and as overcoming the purported "gaming" of initial rates by carriers.[19] As I show here, neither of these claims withstands scrutiny.

GPRM attempts to invoke the Ramsey formula set out above. According to AEPTX's Opening submission in this rulemaking, GPRM would proceed by calculating relative mark-ups, $(P_i - MC_i)/P_i$, for all traffic for which the SARR sets itself up to compete in the contestable market. Based on the Ramsey formula set out above, "[t]he estimated mark-ups are used to infer the relative demand elasticities"[20] (i.e., $\varepsilon_2/\varepsilon_1$). This gives GPRM its target: Reduce all rates so as to leave relative mark-ups equal to original relative demand elasticities. To be meaningful, the attempt to "infer" the Ramsey value, $\varepsilon_2/\varepsilon_1$, could only be made with respect to prices and elasticities of demand for *through* moves. For purposes of the Ramsey pricing rule set out above, nether prices nor elasticities are even defined over, for example, sub-portions (e.g., cross-over portions) of a through move. For this reason, as I discuss below in the context of harmonizing cross-over revenue allocation with SAC rate reduction, any coherent rate reduction methodology must be applied to through rates under which cross-over traffic moves.

In implementing PRM, the rates paid by individual movements, P_i, would apparently be based on extant rates at the time of calculation for purposes of the SAC analysis.[21] Marginal cost, MC_i, of serving each individual movement would be estimated using Phase III URCS variable cost items, adjusted for individual movements. Each individual movement's total contribution of mark-up revenues, M_i, would then be

---

19 Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases, Opening Comments of AEP Texas North Company (hereinafter AEPTX Opening) at 15-16.

20 AEPTX Opening at 12.

21 AEPTX refers to the prices to be used as starting points under GPRM as the "original rates[s]." See AEPTX Opening at 13. My analysis in the text treats these as referring to the rates in place at the time of a rate challenge (i.e., with the challenged rate being the P_i of the issue traffic). If, as applied to the challenged rate, "original rate" were to refer to the rate in place for the issue traffic *before* a rate increase occasioning the rate challenge, GPRM would be rendered logically incoherent on its own terms. GPRM relies on rates prevailing in the market to provide Ramsey-relevant information on mark-ups and (implicitly) elasticities of demand. Such an approach requires, at a minimum (i.e., ignoring, for the sake of argument, the method's infeasible reliance on true marginal costs) that the P_i of the issue and non-issue traffic be the rates that the rational, unconstrained carrier sets absent the rate challenge in light of the carrier's perceptions of elasticities of demand and marginal costs. Pre-increase rates on the issue traffic are out of step with these market-driven rates; that is why issue traffic rates get raised.

calculated as the product of (P_i - MC_i) per ton of movement i traffic times the volume, Q_i, in tons of movement i traffic. In the event a SAC analysis found that extant rates of the incumbent applied to the SARR's traffic group yielded an overage of revenues for the SARR relative to the SARR's break-even total costs, rates for issue and non-issue movements would be reduced by subtracting from each movement's total mark-up contribution a share of the overage equal to that movement's share of the total mark-up revenues of all of the issue and non-issue traffic.[22]

The foregoing formulas and calculations are offered by AEPTX as means of purportedly making SAC rate reductions "consistent with Ramsey pricing principles."[23] In fact, GPRM is subject to a number of shortcomings and irresolvable questions of calculational feasibility that render this claim unsupportable. Consider, for example, the underlying premise of GPRM – that it allocates rate reductions across all issue and non-issue traffic in a manner which preserves pre-challenge ratios of relative mark-ups (*per* the Ramsey formula above) and, hence, results in ratios of relative mark-ups at post-reduction rates that continue to equate to pre-reduction ratios of elasticities, $\varepsilon_2/\varepsilon_1$. The very premise is unsupportable: There is, in fact, no basis for asserting that the Ramsey ratio of $\varepsilon_2/\varepsilon_1$ "should" remain constant when an incumbent's extant rates are subject to substantial reduction of the type routinely requested by Complainants in SAC cases. Let us examine why.

---

22 As originally proposed by AEP Texas in AEP Texas v. The Burlington Northern Santa Fe Railway Company, GPRM would employ an iterative approach similar to MMM and MCM. I have discussed the infirmities of such an approach in my Opening V.S. See, also, STB Docket No. 41191 (Sub-No. 1), AEP Texas North Company v. The Burlington Northern and Santa Fe Railway Company, Reply Evidence of The Burlington Northern and Santa Fe Railway Company (May 24, 2004) (hereinafter "BNSF Reply, AEP Texas v. BNSF") at III-G-40-41. AEPTX now appears to have abandoned this approach.

23 AEPTX Opening at 10. See, also, AEPTX Opening at 9, 15, 16. AEPTX also asserts (at 15) that GPRM "eliminates the risk of gaming," referring to the Board's description of such "risk" in *EP 657*. (*EP 657: Major Issues in Rail Rate Cases* at 7-9) The Board sees these risks as arising when the challenged carrier can establish the challenged rate as the starting point for a rate reduction calculation. In so far as AEPTX intends the GPRM to employ the carrier's challenged rate (see note 21 above) in determining an applicable rate reduction, GPRM does not eliminate the asserted "risk." As I discuss in my Opening V.S., the "risk" the Board perceives is properly addressed as an evidentiary matter, rather than through manipulation of rate reduction calculations such as are contained in MCM and MMM.

GPRM's Treatment of Demand Elasticities: AEPTX's proposed GPRM methodology is built on assumptions and calculations regarding both demand elasticities and marginal costs. The *Guidelines* note with force, however, that (at 257):

> We did not consider it to be practical to impose pure Ramsey pricing as a regulatory requirement for across the board application in all cases. Ramsey pricing is based on a mathematical formula that requires both the marginal cost and the elasticity of demand to be quantified for every movement in the carrier's system. Thus, the amount of data and degree of analysis required seemed overwhelming. We concluded that while formal Ramsey pricing is useful as a theoretical guideline, it is too difficult and burdensome for universal application.

With respect to demand elasticities, the underlying premises of GPRM are that the ratio of elasticities, $\varepsilon_2/\varepsilon_1$, can be "inferred" from the original ratios of relative mark-ups; and that this inferred ratio of demand elasticities can then be employed by GPRM as the target at which SAC rate reduction should aim.[24] This approach, however, presumes constancy in relative elasticities of demand as rates are reduced via GPRM. Yet, there is no foundation for believing that, as volumes demanded by shippers change in response to a change in rates, elasticities of demand are constant.

Indeed, demands of constant elasticity have a particular, even peculiar, logarithmic mathematical form which is but one form from among an infinite possible number of forms of mathematical representations of demand. Moreover, nature – or human nature – is not so cooperative as to provide meaningful guidance as to how demand elasticities may change as prices change. Thus, for example, if a shipper's alternatives to a carrier's rail service only become attractive when rail rates are quite high, the carrier's unregulated rates might well be pushed toward those high levels – where the availability of alternatives can start to make demand for the carrier's service more elastic. Lowering rates (e.g., in the simulated competition of SAC analysis) can then move rates into ranges of less elastic demand. On the other hand, if pushing rates to higher levels doesn't call practical alternatives into play, but does squeeze out less urgent

---

[24] Even on its own terms (including the implicit assumption that volumes of traffic are not affected by rates), GPRM's calculations do not (except in mathematically peculiar settings) produce relative rates and mark-ups that "hit" the presumed target of the pre-reduction $\varepsilon_2/\varepsilon_1$. The direction of bias in failing to hit this target can go in either direction for any individual shipper.

ranges of rail use, shippers may well exhibit lower elasticity of demand at higher rates, and higher elasticity of demand at lower rates. Moreover, the permutations and magnitudes of these types of problems only escalate when we wish to know how much demand elasticities change over large ranges of price movements – such as the movements that complaining shippers understandably hope for in SAC analyses.

The "anything could happen" character of this discussion of changes in demand elasticity as one moves over the range of price and volume combinations that describe shipper demands is not empty speculation or quibbling. It is why the *Guidelines* are correct in concluding that credibly quantifying and employing demand elasticities to justify rates would require an "overwhelming" "amount of data and degree of analysis."[25] This conclusion of the *Guidelines* applies with equal force to claims that GPRM is an implementation of Ramsey pricing or can be concluded to be consistent with the Ramsey pricing formula.

GPRM's Treatment of Marginal Costs: Even more profound difficulties for GPRM lie in its treatment of the other primary component of the Ramsey pricing rules – marginal cost. GPRM cannot proceed without calculation of marginal cost, since it is the ratio of percentage mark-ups, $(P_i - MC_i)/P_i$, that is used in GPRM to "infer" and set the target value of $\varepsilon_2/\varepsilon_1$ from the Ramsey pricing rule. As noted, in order to calculate marginal cost, AEPTX proposes to use Phase III URCS costing procedures, presumably employing such URCS cost components as seem to represent variable costs. AEPTX proposes to approximate marginal cost for use in the GPRM calculations with URCS proxies for "system average marginal costs," adjusted for distance.[26] In AEP Texas, the proposed adjustment for distance employed URCS Phase III costing procedures, including the *Ex Parte 270* trainload adjustments, to generate "marginal costs" for movements of 300, 600, 900, and 1200 miles. For GPRM purposes, URCS variable unit costs were modified to eliminate overhead rates, to eliminate various supervision and superintendence costs, to eliminate fixed plant depreciation and lease rentals, to eliminate

---

[25] *Guidelines* at 527.

[26] AEPTX Opening at 12.

returns to fixed plant, to eliminate certain CLOR costs not associated with coal service, and to add certain replacement costs for track.[27]

GPRM's proposed calculations and use of URCS costs would be inconsistent with Ramsey pricing and the *Guidelines*. As the *Guidelines* note (at 532, n. 31):

> Ramsey pricing requires the use of *economic* costs rather than accounting costs. Although Rail Form A or URCS might be useful as a rough indicator of economic costs, we recognize that local factors and circumstances may cause the economic costs to differ greatly from accounting estimates. Such local factors might include, for example, where the movement is a backhaul or off-peak movement or whether the facilities are congested.

The emphasis on *economic* marginal costs is critical in this context. The overriding goals of Ramsey pricing are protection and promotion of the public interest. As discussed in my Opening V.S., Ramsey pricing pursues these public interest objectives by setting prices above marginal costs so as to allow the firm under analysis to cover its costs, while minimizing the distortion to the efficient use of society's resources that comes from pricing above marginal cost.[28] The true, economic marginal cost of providing a good or service (such as rail transportation) to any particular use and customer consists of the value of the resources used up or otherwise forgone by devoting resources to that use and customer, relative to other uses to which those resources might be put (including using the rail service to serve other shippers, or using the associated fuel, labor, and other inputs employed in rail service in some other sector of the economy).

As a general matter and as the *Guidelines* note, true, economic marginal cost differs from accounting costs (including URCS-based accounting costs). Nevertheless, it is tempting to think of, and proxy, marginal cost with accounting measures of unit (average) variable cost. After all, marginal cost is the change in – variation in – the total resource cost of providing a good or service as the volume of output of that service is

---

[27] See STB Docket No. 42088, Western Fuels Association Inc., & Basin Electric Power Cooperative v. BNSF Railway Company, Reply Evidence of BNSF Railway Company, (hereinafter *BNSF Reply Evidence, WFA et al. v. BNSF*), at III-G-37 for further discussion.

[28] Kalt Opening V.S. at 7-9. See, also, Willig Opening V.S. at 12-15.

varied. In terms of average variable costs, however, true marginal cost can be properly conceived of as including both average variable cost *plus or minus* any output-induced changes in average variable cost.[29] Unit variable cost only equates to marginal cost under the special case where unit variable costs are the same no matter what level of output is produced. When marginal cost is, say, above average variable cost, it is pulling that average up (since marginal additions to output add variable costs at the margin which exceed average variable costs up to that point).[30]

As a general matter, accounting costs do not capture marginal cost, even if accounting techniques can measure unit variable cost. Instead, marginal cost is the province of careful and sophisticated statistical estimation techniques of the "burdensome" kind suggested in the *Guidelines*. Moreover, as a general matter, accounting measures of variable cost do not and commonly cannot recognize the kind of "local factors and circumstances" the Guidelines correctly identify as influencing economic marginal cost. Such factors include movement-specific contractual terms, movement- and/or contractually specific risks, movement-specific handling and logistics necessities, and degrees of congestion encountered in serving particular movements and/or line segments. Thus, for example, a rail carrier would be expected to incur higher marginal costs to serve customers with whom it has agreed to particular performance standards or particular handling and logistics techniques. Similarly, where non-performance or operational risks are differentially present, a carrier can be expected to take actions and incur costs that minimize those risks and add to the marginal cost of service.

Of particular relevance to today's coal transportation sector, true economic marginal costs of serving particular shippers are subject to costs attributable to system congestion. In key respects, these costs are inherently outside of the scope of accounting

---

[29] Note, again, the difficulty arising from GPRM's contradictory holding of volume constant in the face of the rate reductions in generates. With volumes held constant, no changes in variable cost are induced. Yet, as explained here, marginal costs are intimately tied to how variable cost changes as volume changes.

[30] Like adding a person who is six feet tall to a group of people that otherwise average five feet six inches tall: The six footer pulls the average of the group up.

measures of cost. Congestion occasions the need for carriers to incur costs to relieve that congestion and, during periods of congestion, ration away that congestion by making decisions on where to allocate resources and whom to serve (or whom to serve first or with the highest quality). Indeed, basic economic principles recognize that under conditions of congestion, one of the components of true economic marginal cost is the cost of having to "bump" certain customers off the system (or "bump" them to the back of the queue in terms of service timing and quality).[31] This forgone service (or quality of service) is a cost of serving those who do not get "bumped" – because the forgone service reflects society's having to forgo the value of the service that is adversely affected by congestion. As the Board and the public have experienced in instances of congestion, such as the service problem following the merger of the Union Pacific and Southern Pacific rail systems, the economic values destroyed and forgone when a rail system is congested are very real costs to the economy.

Congestion arises when market supply conditions tighten relative to demand. Under such supply and demand conditions, well-functioning markets exhibit rising prices: Congestion implies higher true economic marginal costs, and prices in well-functioning, but congested, markets move up with marginal cost and bring supply and demand back into balance. Such supply and demand forces are at work in current coal transportation and, with world energy markets forecasted to remain strong,[32] can be expected to continue into the indefinite future. The Department of Energy's Energy Information Administration estimates that Powder River Basin (PRB) coal production will grow from a level of 398 million tons per year in 2004 to 615 million tons annually in 2024.[33]

As described in detail in BNSF's Opening Narrative in Western Fuels, growing

33 U.S. Energy Information Administration, *Annual Energy Outlook* 2005, Supplemental Table 111 (hereinafter EIA AEO Table 111), included in BNSF's Rebuttal electronic workpapers as "EIA, Annual Energy Outlook (2005) Supplemental Table 111.pdf."

demand is creating tight rail capacity for PRB coal.[34] Market demand for PRB coal is strong and is expected to continue to grow as, for example, utilities in midwestern and eastern states increasingly have been switching to low-sulfur coal produced in the PRB. This comes in response to Clean Air Act Amendments with more stringent emissions requirements that went into effect in 2000. Much of PRB coal moves out of the Basin on track over which Union Pacific Railroad (UP) and BNSF operate jointly. In the last 20 years, coal produced in mines in the southern PRB along this track has increased by a factor of four, while track miles have increased by less than a factor of two.[35] From January 2003 to December 2004, alone, the number of coal trainsets hauling PRB coal increased *over 40%*.[36] Despite investments in tracks, terminal capacity, train sets, and locomotives, track expansion has not been able to keep pace with the very rapid growth in demand for PRB coal. As a result, capacity in the PRB has become considerably tighter in recent years and scheduling conflicts have arisen.[37] Between 2003 and the present, the coal trade press has routinely reported to the effect that "rail capacity on the Southern PRB's Joint Line, operated by both UP and Burlington Northern Santa Fe, is at or very near maximum."[38]

The tightness in PRB rail capacity for moving coal has direct implications for the rates that carriers charge to move coal through the PRB. Higher prices reflect higher marginal costs as shippers seeking PRB transportation "bump" each other off the system or to lower quality, back-of-the-queue service, and as they call more of society's

---

34 For a more detailed discussion, see STB Docket No. 42088, Western Fuels Association Inc., & Basin Electric Power Cooperative v. BNSF Railway Company, Opening Evidence of BNSF Railway Company, (hereinafter *BNSF Opening Evidence, WFA et al. v. BNSF*), Narrative and Exhibits, Volume I of I at II-28 – II-30.

35 In 1984, there were 181 running track miles on the Orin line. By 2004, this had increased to 304.

36 The average trainsets increased from 270 in January 2003 to 390 in December 2004, a 44% increase. Ex Parte 657, *Rail Rate Challenges Under the Stand-Alone Cost Methodology*, Statement of John Lanigan (April 26, 2005) (hereinafter Lanigan Statement).

37 *See*, for example, Energy Information Administration, *Annual Coal Report 2001*, at 34; "Capacity Issues and Trends in the PRB," *Platts Coal Outlook*, November 17, 2003; "PRB Demand Boosts Railroad Outlooks, Pressures on Train Capacity," *Platts Coal Outlook*, February 28, 2005; and "Grand River Dam Authority," *Platts Coal Outlook*, November 8, 2004.

38 "Coal Market Reaching Fever Pitch as Prices, OTC Volumes Soar," *Platts Coal Outlook* (December 8, 2003). See also "KFx Project Raises Possibility of Arch Reviving Coal Creek Mine," *Platts Coal*

resources – from new and/or upgraded tracks needed to carry heavier trains and additional sidings to accommodate more trains, to more advanced signaling equipment, purchasing additional locomotives, etc.[39] – into PRB service. From the perspective of the public interest, it is desirable that rail rates rise in response to these kinds of upward pressure on marginal costs. It is the role of prices to bring supply and demand back into balance. They do so in two ways. First, higher prices dampen demand and allow the customers who value the transportation of PRB coal the most to use the network's constrained capacity. Second, higher prices provide railroads with the means to make additional capital investments in PRB infrastructure and thereby expand the ability of the rail network to carry additional traffic.

In short, matters such as rail congestion imply true economic marginal costs that differ materially from accounting measures of variable costs. They also imply material and substantial deviations between true economic marginal costs and the kind of proxy for "system average marginal cost" that AEPTX proposes to build from URCS costing procedures and apply under its GPRM proposal. Indeed, with true economic marginal costs driven above GPRM's measures of URCS-proxied marginal cost by, for example, congestion, contract performance clauses, and the like, any pretext that GPRM is an approximation of, or is consistent with, Ramsey pricing collapses.

Consider, for example, the simple cases of Tables 1 and 2. Table 1 employs an URCS-proxy for marginal cost. The Table shows a straightforward case in which the Complainant shipper is paying a rate of $12 per ton on 10 tons of issue traffic, while the Other Shipper (or Shippers) in the SARR's traffic group is paying a rate of $10 per ton on 10 tons of non-issue traffic movement. The respective URCS-proxied "marginal costs" of serving these issue and non-issue movements are taken to be $5/ton and $3/ton for the purposes of this illustration. The SARR's total costs are assumed to be $150. In Table 1, however, extant pre-reduction rates yield total revenues of $225. Thus, the incumbent's rates generate $75 in excess of SAC revenues. GPRM allocates this $75 reduction in

---

Outlook (March 29, 2004), and "Shippers, Railroads Need Joint Solutions to Problems," *Platts Coal Outlook* (March 21, 2005).

[39] *See* June 23, 2004 letter to The Honorable Roger Nober from Matt Rose.

proportion to each shipper's contribution to total mark-up, and reduces rates for the Complainant shipper to $8.50/ton, while the Other Shipper(s)' rates are reduced to $6.50/ton. (See Table1) Assuming that traffic volume is not stimulated by the reduction in rates,[40] these rates generate total revenues of $150 – i.e., the revenues needed by the SARR to "stand alone" (i.e., break even).

Table 1

	Original Rate (P)	URCS-Proxy Marginal Cost (MC)	Original (P-MC) ÷ P	Tons (Q)	Mark-Up Contrib. (P-MC)*Q	Share of Mark-Up Contrib.	GPRM SAC Rate	GPRM (P-MC) ÷ P
Complainant	$12	$5	.58	10	$70	.5	$8.50	.41
Other Shipper	$10	$3	.70	10	$70	.5	$6.50	.54

In Table 1, marginal costs to be used by GPRM are proxied by URCS-based variable costs. What if true economic marginal costs differed from these URCS-proxies?. Table 2 addresses this question. In Table 2, Table 1 has been modified by assuming for purposes of illustration that the true economic marginal cost of serving the Complainant's movements is actually $10 per ton (as compared to the URCS-proxied "marginal cost" of $5 per ton in Table 1). For sake of illustration, the economic marginal cost and the URCS-proxied "marginal cost" of serving the Other Shipper is taken to be $3 per ton in both tables. SARR costs are assumed to continue to be $150.

Table 2

	Original Rate (P)	Economic Marginal Cost (MC)	Original (P-MC) ÷ P	Tons (Q)	Mark-Up Contrib. (P-MC)*Q	Share of Mark-Up Contrib.	GPRM SAC Rate	GPRM (P-MC) ÷ P
Complainant	$12	$10	.17	10	$20	.22	$10.44	.04
Other Shipper	$10	$3	.70	10	$70	.78	$4.56	.34

As indicated in Table 2, if GPRM were applied to true economic marginal cost, the resulting SAC rate for the Complainant's movement would be $10.44 – fully 23%

[40] Albeit, inconsistent with the very notion of elasticity of demand. As discussed above, this represents a source of deep conflict with basic economic principles inherent in the GPRM rate reduction proposal.

higher than the $8.50 rate that AEPTX's URCS-based GPRM yields in Table 1. In fact, these results and implications of the inability of GPRM to capture and employ economic marginal cost belie assertions by AEPTX to the effect that: "The use of [URCS] system average costs is sufficient" for the purpose of inferring the relative demand elasticities employed as the target in GPRM.[41] Indeed, the source of the gross error introduced by GPRM in Table 1 is the fact that the use of URCS-proxied marginal costs yields the GPRM's relative elasticity target of $\varepsilon_2/\varepsilon_1 = .58/.70 = .83$. On GPRM's own terms, the target GPRM should be aiming for is for the ratio of *post*-reduction relative mark-ups, $(P_i - MC_i)/P_i)$, to equate to $\varepsilon_2/\varepsilon_1 = .17/.70 = .24$ in Table 2. All else equal, the inability of URCS-proxied accounting costs to reflect marginal cost drivers such as congestion, when congestion is a reality of western coal transportation, imparts a systematic bias toward excessive coal rate reduction under GPRM.

By the same token, AEPTX is wrong in claiming that "there is no need to compute the actual marginal costs of a particular movement with specificity [since] the goal [of GPRM] is to measure the mark-up of the rate over a determined cost level *relative* to comparable mark-ups above similarly determined cost levels on other rates in the traffic group."[42] Clearly, Tables 1 and 2 demonstrate that it matters a great deal under GPRM whether the *levels* of economic marginal costs are measured accurately and, hence, whether pre-reduction ratios of the $(P_i - MC_i)/P_i$ are measured accurately. Moreover, there is no basis for assuming that the errors between AEPTX's URCS-proxied "system average cost" and true economic marginal cost would be proportionately the same for all shippers and all movements (such that it might be claimed that the ratios of the $(P_i - MC_i)/P_i$ are not distorted). In terms of Tables 1 and 2, for example, there is no reason to maintain that both the Complainant's movement and the Other Shipper's movement are subject to the marginal cost impacts of congestion, or the same proportionate marginal cost impacts of congestion – just as there is no foundation for asserting that a Complainant moving Powder River Basin coal is subject to the same congestion as all other shippers in a SARR's traffic group.

---

41 AEPTX Opening at 12.

42 AEPTX Opening at 11-12 (emphasis in the original).

Finally, note that Tables 1 and 2 make it clear that, while AEPTX would interpret the (apparently) relatively high mark-up of the pre-reduction rate paid by the Complainant to relatively inelastic demand on the part of the Complainant, the foregoing makes it clear that what appears to be a high mark-up over URCS-proxied marginal cost can well be due to the inaccuracy of the URCS proxy. In Table 2, the mark-up of the rate paid by the Complainant relative to true economic marginal cost is, in fact, relatively low. The erroneously large rate reduction that GPRM would impose on the challenged rate (*per* Table 1) arises because GPRM cannot accurately measure economic marginal costs – as GPRM's invocation of Ramsey principles requires. More generally, claims to the effect that GPRM yields the greatest percent reduction to the shippers with the least elastic demand and that this means that GPRM "conforms to Ramsey pricing principles" are rendered empty by the inability of GPRM to measure true mark-ups of rates relative to true marginal costs.

Summary re: GPRM: The *Guidelines* sagely recognized that credible quantification of the ingredients needed for explicit implementation of Ramsey pricing rules – particularly demand elasticities and marginal costs – was a hopeless task for real world regulatory practices before the Board. The fact that GPRM falls on these same rocks simply serves to reinforce the useful insight of the *Guidelines*. The kinds of internal contradictions and contradictions of Ramsey pricing rules (and, hence, of the public interest) that systems such as GPRM (and MCM and MMM) introduce in their attempts to get more formulaic and complicated in their focus on mark-ups above costs recommend eschewing them in favor of the Board's longstanding PRM methodology of rate prescription in SAC cases.

The PRM method, too, does not purport to achieve the impossible goal of explicit Ramsey pricing. But it does invoke the basic Ramsey result, discussed above, that the introduction of contestability into rail markets would imply downward movement of all rates if an incumbent's rates generated greater than stand-alone costs for an efficient SARR; and it does so without the pretext that manipulations of accounting-measured

mark-ups are manipulations of mark-ups required by Ramsey pricing.[43] As we have seen, such manipulations can readily move us directly away from the Ramsey principles of the *Guidelines* and, in so doing, away from protection of the public interest.

B. WFA's RAM and "Reduced Mark-Up Method" Approaches to SAC Rate Reduction

In Western Fuels, WFA has proposed that the Board adopt WFA's so-called Reasonable Allocation Method (RAM) or, in the alternative, WFA's Reduced Mark-Up Method as the method of rate reduction to be applied in SAC cases. WFA reiterates these recommendations here. I have previously addressed these methodologies in the course of filings made on behalf of BNSF in Western Fuels.[44] I here briefly summarize my findings.

WFA's RAM Methodology: RAM would allocate joint and common SAC costs (that is, SAC costs above the asserted variable cost of each movement) across different groups of traffic based on methods that the WFA asserts are consistent with Ramsey pricing. Specifically, after dividing the SARR traffic's shippers into two groupings ("competitive" and "captive"), RAM *assumes* that the price elasticities of demand are identical within each group of shippers.[45] In setting the rates, the "competitive" group would pay only variable costs, making no contribution at all to joint and common costs. All of the joint and common costs would be allocated – on the basis of ton-miles – to the shippers in the "captive" group. The rates for each "captive" movement under this method would be the sum of the movement's variable costs and its allocated share of joint and common costs.[46]

---

[43] In fact, as shown in BNSF's Reply Evidence in AEP Texas v. BNSF at III-G-1-13 (Declaration of Richard S. Higgins and Fred S. McChesney), GPRM's noted assumption that traffic volumes are invariant with respect to GPRM's rate reductions actually yield PRM as the GPRM result.

[44] STB Docket No. 42088, Western Fuels Association Inc., & Basin Electric Power Cooperative v. BNSF Railway Company, Reply Statement of Joseph P. Kalt, Ph.D. at 39-45 (hereinafter Kalt WFA *Reply Statement*).

[45] To the extent that any of the shippers are incorrectly classified in the captive group, this would decrease the allocation to the issue traffic by spreading joint and common costs over a larger group of shippers. The RAM method can be quite sensitive to how shippers are classified.

[46] Subject to an imposed constraint on the allocation of joint and common costs to ensure that the rate assigned to each plant does not exceed its actual rate.

The WFA's RAM recommendation suffers from the fact that ton-miles are an arbitrary mechanism for allocating joint and common costs to individual movements. Such allocation is inherently arbitrary because it does not recognize that demand elasticities vary across shippers, including across shippers that RAM might designate as "captive." RAM's ton-miles allocation of joint and common costs would preclude meaningful, Ramsey-consistent demand-based differential pricing. In fact, in part for this reason, the Board has rejected allocating costs on the basis of ton-miles in a number of prior rulings.[47] As recognized in the *Guidelines,* "non-demand-based cost apportionment methods do not necessarily reflect the carrier's ability (or inability) to impose the assigned allocations and cover its costs."[48] Allocation according to ton-miles is just such a non-demand-based method of cost apportionment.

For such an allocation to be non-arbitrary and consistent with the demand-based principles of Ramsey pricing, it would have to be the case (1) that all of the shippers in the group that RAM would label as "captive" would have the same elasticity of demand; and (2) that all of the shippers in the group labeled "competitive" would have the same, infinitely elastic demands.[49] Such requirements of RAM are not remotely plausible. Certainly, an assumption of equal elasticity for all of the shippers that RAM might label as "captive" in a particular group cannot be based on a simple-minded notion[50] that being, say, solely served by a railroad (and, hence, putatively "captive") gives all such shippers the same demand responsiveness, irrespective of such matters as: individual shippers' access to other modes of transportation; their other alternatives for sourcing the product at issue; the profit margins they might realize – or not – from shipping their

47 ICC Docket No. 38301S, Coal Trading Corporation, et al., v. The Baltimore and Ohio Railroad Company, et al. (January 17, 1990) (hereinafter *Coal Trading*) at ¶39-40; CP*&L/NS Decision* at 33.

48 *Guidelines* at 526.

49 Infinitely elastic demand has the characteristic that even a very small increase in price causes buyers demand to evaporate, as those buyers turn to perfect substitutes (for example). Under Ramsey pricing, the only customers bearing no mark-up above marginal cost would be customers with infinitely elastic demand. Trying to recover contribution to the coverage of joint and common costs from such customers is necessarily unsuccessful, since raising price above marginal cost drives those customers completely away.

50 See, for example, STB Docket Number 42088, Western Fuels Association, Inc. and Basin Electric Power Cooperative, Inc. v. The Burlington Northern and Santa Fe Railway Company, Opening Evidence of Western Fuels Association, (hereinafter, "WFA Opening Evidence, WFA v. BNSF") at III-H-23, III-H-25 to III-H-28.

products by rail at a given level of rail rates; the ability of shippers to pass on higher rail rates in the form of higher prices charged to the shippers' respective and different customers; and so on.

Even if RAM's designated group of "captive" shippers were to consist solely of, say, coal-fired electric generation utilities, an assumption of equality of elasticities of demand across those shippers vastly oversimplifies the complexities of electric generation. Individual utilities have their own set of reasonable alternatives available to them for meeting the demands of their customers, and the presence of these alternatives affects how elastic the demand of any particular utility is. A railroad could readily find itself facing multiple sources and degrees of "product" or "geographic" competition on the margin for one shipper, and another set of such factors in the case of the next shipper. Thus, for example, other fuels, a utility's other plants, the technical suitability of alternative coals from alternative mines, and a utility's ability to buy electricity from others on the electricity grid, all provide differential sources and degrees of alternatives to the services of a coal-shipping railroad making deliveries from an array of mines to an array of coal-burning power plants. Such sources and degrees of alternatives significantly affect a plant's elasticity of demand for a railroad's coal transportation services, and they can vary substantially from plant to plant and buyer to buyer.

The assumption of homogeneous and infinitely elastic demands among the group of shippers that RAM would label as "competitive" is similarly unsupportable. First, the case of infinitely elastic demand – and, hence, no mark-up under Ramsey pricing or rational unconstrained pricing by a railroad – is an extremity that is belied by the fact that actual railroads set actual prices differentially, with wide variations in mark-ups across a wide variety of customers (including customers that RAM would undoubtedly label as "competitive"). As noted, such differential pricing is rational for profit-seeking railroads because of cross-shipper differences in demand elasticity, ranging from the very elastic to the very inelastic.

Second, just as the converse is the case for "captive" shippers," having access to multiple railroads might, indeed, make that shipper rail-competitive, but that is not the same as making all multiple-served shippers have the same elasticity of demand. For one

shipper, having access to rail may be nice, but trucking may be the particularly preferred alternative. For another shipper, demands of its marketplace may place a premium on quality of rail service relative to price. Another shipper may need a portfolio of rail alternatives to manage risks in its business, making it less able to play one railroad off against another on the basis of price. One shipper may find it easy to pass rail rates onto downstream customers, while another finds rail rates to be the make-or-break determinant of its profitability. For one shipper, the rail freight charges it bears may be but tiny portions of its overall costs of production, making that shipper relatively price-insensitive (inelastic); another shipper may be extremely price-sensitive because rail costs make up very large portions of its overall costs of doing business in its markets. And so on.

Third, if RAM is to assert any Ramsey-like attributes, RAM's assumption that all "competitive" traffic has infinitely elastic demand must underlie RAM's allocation of *no* mark-up above variable cost to the rates for "competitive" traffic served by a SARR. Yet, if "competitive" traffic generates no revenues in excess of variable costs, it is unclear why any railroad – SARR or incumbent – would service such traffic or invest in needed replacement facilities over time to service such traffic over the long run. The assumption of infinitely elastic demand and RAM's allocation of no mark-up above variable cost are patently unrealistic.

In short, RAM's implicit assumptions (1) that the shippers it would designate as "competitive" would share the same, infinitely elastic demands, and (2) that the shippers it would label as "captive" would thereby all have the same less-than-infinite demand elasticities are untenable. RAM is, in fact, an attack on the differential pricing that the *Guidelines* recognize is necessary for both the health and survival of railroads and the protection of the public interest via Ramsey pricing principles.

WFA's "Reduced Mark-Up Method": As a "fallback" to RAM, WFA proposes an alternative method for adjusting rates. In contrast to RAM, the Reduced Mark-Up Method assumes that there is a wide spectrum of demand elasticities within a SARR's traffic group, and that each movement is capable of providing some contribution to the SARR's joint and common costs. Akin to AEPTX's GPRM methodology discussed above, WFA's Reduced Mark-up Method would utilize accounting estimates of the

variable cost of serving each SARR shipper and the incumbent's extant rates to calculate a mark-up and contribution of price above variable cost for each movement. If a SAC analysis found excess revenues relative to the SARR's stand-alone cost, each shipper's estimated dollar contribution of price above variable cost would be reduced *pro rata* until SARR revenues equal SARR costs.[51]

From the discussion of GPRM, it is clear that WFA's Reduced Mark-up Method suffers from similar incapacitating infirmities. While its precept is that preservation upon rate reduction of the relative size of mark-ups above cost would, in some sense, hearken to Ramsey principles, it does not go the step, as does GPRM, of tying this reasoning to the Ramsey pricing formula set out above. Rather than targeting relative mark-ups expressed as $(P_i - MC_i)/P_i$ (*per* the Ramsey pricing rule), the Reduced Mark-up Method expresses mark-ups as price minus variable cost (i.e., $P_i - VC_i$) and targets the maintenance of proportionate shares of such margin contribution (i.e., $P_i - VC_i) \times Q_i$). Not only does this methodology not target a Ramsey price; as we have seen, the use of accounting measures of variable costs cannot be relied upon for the task at hand as a "good enough" proxy for true economic marginal costs. Accordingly, the Reduced Mark-up Method is subject to creating direct contradictions between itself and Ramsey principles and, hence, between itself and the public interest. It does not qualify as viable method for use in SAC analyses and rate reductions.

C. The Board's Current PRM Approach Is the Feasible, Ramsey-Consistent Rate Reduction Methodology

A finding under SAC analysis that a complainant's candidate SARR would earn excess profits if it charged extant incumbent rates provides justification under CMP for lowering the challenged rate. Since the ICC's *Coal Trading* decision in 1990,[52] challenged rates that are found to be excessive under the SAC analysis have been subject to a Percent Reduction Methodology for bringing such rates into compliance with the *Guidelines*. Under PRM, the challenged rate is reduced by the percentage by which

---

[51] Additional Opening Comments of Western Fuels Association, Inc. and Basin Electric Power Cooperative, Inc., Ex Parte No. 657 (Sub-No. 1), Major Issues in Rail Rate Cases, (hereinafter WFA Opening) at 17.

[52] *Coal Trading* at ¶184.

calculated SARR revenues at extant rates exceed the SARR's stand-alone costs.[53] This is consistent with the economics of contestability and the economics of Ramsey pricing insofar as it recognizes that the opening up of a rail market to contestability would put downward pressure on all rates and, as a general matter, preserve the ranking of rates.

As noted above, the *Guidelines'* recognition that it is not feasible to implement or test for perfect Ramsey pricing applies to PRM.[54] Yet, upon adopting the PRM rate reduction procedure in *Coal Trading*, the ICC appropriately observed that "[t]he rate structure exhibited by the defendants over the complaint period is the necessary consequence of differential pricing and cost of service. Any revision to rates due to the imposition of rate prescriptions should, to the extent possible, retain the underlying relationships. Thus, overcharges must be distributed to the SARR traffic group in a manner which will not substantially change rate relationships and, thus, disrupt the existing pattern of differential pricing unless it is demonstrated that the pattern is seriously flawed."[55] As we have seen, the alternative methodologies that have been introduced in this proceeding – MCM, MMM, GPRM, RAM, Reduced Mark-up – attempt to justify themselves as moving rate reduction closer to Ramsey principles. In each case, however, these methodologies either directly violate Ramsey principles (e.g., as when MCM compresses challenged rates to equality with otherwise different rates on non-issue traffic[56]) or ask too much of the data (e.g., on economic marginal cost) and end up introducing stark distortions of Ramsey principles.

---

53 The ambiguity in the calculation of this percentage that is introduced when candidate SARRs involve cross-over traffic is discussed at length below.

54 Owing to the informational burdens that would be engendered by attempting to figure out each shipper's or shipper type's demand elasticity and the marginal costs of serving each shipper. See *Guidelines* at 527.

56 See Kalt Opening V.S. at 19-22.

IV. REVENUE ALLOCATION ON CROSS-OVER TRAFFIC

Current practice with respect to the allocation of revenues to cross-over traffic carried by the SARR has introduced biases and distortions to the SAC process. Under the Board's standard approach, cross-over revenues have been based on the so-called Modified Straight-Mileage Prorate methodology. Under MSP, revenue is allocated based on the mileage hauled over the SARR relative to the mileage the traffic in question travels on the residual incumbent, with an additional 100-mile block credited for originating or termination the traffic. This MSP approach lacks grounding in the economics of contestability that properly should guide our determinations as to the revenues a SARR electing to compete with the incumbent for only portions of moves carried in the real world by the incumbent would receive.[57] Moreover, the approach provides strong incentives for Complainants in SAC cases to "game" the process by designing manifestly inefficient SARRs to capitalize on divisions that reward small SARRs with very large amounts of revenue from highly rated cross-over traffic.[58] The more such traffic a Complainant can claim, the less the revenue burden to be carried in a SAC analysis by the issue traffic for which Complainants seek rate reductions.

In my Opening V.S., I examined the economics of contestability that underlie SAC analyses. I reported that those economics clearly demonstrate that a contestant SARR seeking to capture cross-over traffic in a contestable market would find itself in competition with an incumbent for provision of facilities and services to the cross-over portions of certain moves. In such a competition, the SARR would "win" by offering rates on its cross-over moves that could "beat" the incumbent's fixed and variable-type expenditures that the incumbent would avoid if it did not carry the cross-over portions at issue principles.[59]

---

57 See Kalt Opening V.S. at 34-37.

58 *CP&L/NS Decision* at 31-32.

59 Kalt Opening V.S. at 37-46. I note that Mr. Nelson opines on behalf of AECC that a partial SARR should be allocated revenues on cross-over traffic such that the SARR captures the margin otherwise realized by the incumbent. (AECC Opening at 9-10.) This is inconsistent with the applicable economics of partial SARRs in contestable markets. These economics yield partial SARRs cross-over revenues no greater than the partially-replaced incumbent's avoidable costs on the partial segments that SARRs typically propose.

A. "Actual Market Divisions" v. Contestable Market Revenue Allocation for Cross-Over Traffic

Albeit indirectly, a number of shipper interests – most vociferously, WCTL – have challenged the conclusions that follow from the economics of contestable markets. Citing the decision by the Interstate Commerce Commission (ICC) in *Nevada Power*,[60] these shippers argue that revenues should be "allocated on the basis of market principles."[61] They argue further that this objective can be accomplished by use of statistical data on "actual market divisions" that arise when two (or more) carriers participate in a move.[62] These "actual market divisions" are represented as being "market-based" and, therefore, consistent with the *Guidelines* and contestable market theory.[63] This representation of proposed "actual market divisions" as consistent the *Guidelines* and contestable market theory is wrong. In fact, it turns contestability on its head.

It is clearly the shippers' view that the term "market principles" is synonymous with the use of real world, "actual market" arrangements between a defendant railroad and its real world connections. Yet, clearly, real world divisions do not plausibly reflect the "market principles" of a contestable market. Real world rail markets are not contestable. In particular, they are subject to fixed and sunk costs that, as a result of being sunk, constitute barriers to entry and exit. Moreover, real world divisions are arrived at by real world railroads, subject to the array of barriers to entry and exit that keep rail markets from being contestable. Consequently, the typical case of two railroads implicitly or explicitly negotiating over divisions on a through move fits what economics refers to as a setting of bilateral bargaining power.[64] Divisions that result in such settings are driven first and foremost by precisely the kinds of factors that make real world rail

61 WCTL at 26.

62 WCTL at 33.

63 WCTL further argues that, in the event the Board does not adopt shippers' "actual market divisions" approach to cross-over revenue allocation, the Board should continue use of MSP (or the original Modified Mileage Prorate, or MMP), rather than an ATC methodology. WCTL Opening at 47-49 and Crowley Opening V.S. at 8.

markets *not* contestable – i.e., which railroad has the most market power, which railroad has the most irretrievably sunk costs, which railroad has most credible threat of surmounting entry barriers and building out to replace the counterparty's facilities and operations, and the like.

In a contestable market (including the simulated contestable market of SAC analysis), on the other hand, both the prospectively entering SARR and the incumbent being challenged compete on "completely symmetric terms."[65] This symmetry means that both the SARR and the incumbent are free of barriers to entry. As a result, when the SARR "wins" the contestability contest, it replaces those services and facilities of the incumbent that it "beats": Because the incumbent faces no barriers to exit, upon losing the contest, the incumbent simply takes its assets and deploys them in some other use at full, fair market value. Furthermore, because the contestable market is free of barriers to entry and exit, the contestable market produces the results of competitive markets.[66] A competitive market drives pricing – including divisions applicable to cross-over traffic – to the level at which the efficient firm can just break even as a stand-alone enterprise.

As Prof. Willig and the other authors of the contestable market framework note, there are two ways to generate the conclusion that contestable markets will yield SAC revenue recovery: "either the absence of sunk costs or the prevention of post-entry responses by incumbents."[67] The absence of sunk costs means that, even if the contest is restricted to solely the SARR and the incumbent, competition to be the "winner" of the traffic will continue, with revenues (including divisions on cross-over traffic) being driven downward until they reach the level of stand-alone costs of efficient carriage. From the perspective of the incumbent, being symmetrically situated vis-à-vis the SARR means that the incumbent, like the SARR, is free of entry and exit barriers. In particular,

66 *Guidelines* at 528.

67 Baumol, Panzar and Willig, Contestable Markets and the Theory of Industry Structure, Harcourt Brace Jovanovich, Inc., 1982 at 301.

sunk costs are not a barrier to entry or exit; hence, the incumbent has every incentive to stay in the competition until revenues are driven to stand-alone competition. If and when the incumbent loses, it can take its resources and redeploy them at full market value.

Alternatively, a market is made contestable when there are no barriers to entry and exit for SARRs and the incumbent is taken to be unable to make its own price responses to the appearance of SARRs. The conditions of free entry and exit mean that any SARR that enters the contest to serve a selected traffic group cannot sustain prices and associated revenues (including the divisions on cross-over traffic) that exceed the stand-alone costs of an efficient SARR. If, for example, a first SARR to enter and price all movements at but one cent below the incumbent's extant rates (including taking cross-over revenue divisions at one cent below the divisions the incumbent grants to other carriers in "actual" market divisions), *and* if resulting revenues exceed the SARR's stand-alone costs, the conditions of free entry guarantee that some other SARR will come in and drive rates and divisions lower. Indeed, this is what the condition of free entry means. If SAC analysis were performed as if the first SARR were protected by barriers to entry and the incumbent was presumed to be unable to respond to that SARR's competition, SAC analysis would not reproduce the results of competition as envisioned by the *Guidelines* and would not satisfy the criterion set out by the authors of the contestability framework, to the effect that regulatory intervention to set rates "should be governed by the performance perfect contestability can be expected to produce."[68] Rather, the SARR would be able to reproduce the results – less one cent – of a market that is decidedly not contestable and subject to the pricing of the incumbent, with its presumed elements of market dominance and associated monopoly power on the part of the incumbent.

As the foregoing suggests, the treatment of sunk costs plays a particularly important role in the economics of contestability. Specifically, sunk costs are a barrier to entry. As such, they can destroy contestability if an incumbent can employ sunk costs to its advantage. It might do so in the face of threatened entry by a SARR, for example, by

---

[68] Baumol, Panzar and Willig, Contestable Markets and the Theory of Industry Structure, Harcourt Brace Jovanovich, Inc., 1982 at 479.

responding to the threat with retaliatory pricing in which the incumbent moves its prices below its own stand-alone costs – since it would be rational for an incumbent with sunk costs to protect itself by ignoring those sunk costs when pricing to deter a new entrant, if necessary. Under such circumstances, the SARR, needing to cover its variable and not-yet-sunk fixed costs, could be precluded from entering, leaving the market uncontested and uncontestable. As the ICC observed in Nevada Power:

> Because of the prevalence of "sunk costs" in railroading, however, post-entry competition between a SARR and an incumbent will not mirror contestable outcomes. That is because an incumbent could remain in the market even if it were to offer rates that do not cover costs that are already sunk.[69]

Interestingly, in subtle but important ways, WCTL shippers in this proceeding do not accept the conclusion that the contestable market framework yields the results of a competitive marketplace. In support of its contention that cross-over revenue allocations should be made based on "actual market divisions," WCTL's version of SAC analysis allows the SARR is protected by barriers to entry by other SARRs,[70] and is competing against an incumbent who cannot respond in any fashion. In the view of WCTL (at 45 and citing to the Opening V.S. of Grimm): "If a new SARR is viewed as a competitor to the existing SARR, and the entrant can take away the existing SARR's revenues before the existing SARR can recoup its costs, then the latter will shun the market. Stated another way, the "no retaliation" applies equally to any market participant, whether it is the incumbent or a prospective new SARR." Given this premise, the SARR in a SAC analysis can actually earn excess revenues (i.e., excess profits). According to WCTL (at 47):

> If the SARR can provide rail service at a profit relative to the incumbent's exiting price for the same service by operating more efficiently, the SARR will enter the market, and set its rate a level below the incumbent's price. How low the SARR sets its rate is dependent upon its overall costs, but in a contestable market, how high the SARR sets its rate is a function of the incumbent's existing price. The SARR's overall costs act as a floor for the SARR's pricing structure, not a cap

---

69 10 I.C.C.2d at 266-267.

70 WCTL Opening at 45.

From the perspective of basic economic principles, WCTL's reasoning is incredible. Under its version of contestability, contestability does not yield what the *Guidelines* seek in SAC analysis: "The stand-alone cost, as we define it here, approximates the full economic costs, including a normal profit, that need to be met for an efficient producer to provide service to the shipper(s) identified. This cost calculation provides a simulated competitive price standard against which actual rates can be compared."[71] And contrary to the *Guidelines*' observation that "contestable markets have competitive characteristics which preclude monopoly pricing,"[72] WCTL's novel version of such markets does not result in the *sine qua non* of competitive markets recognized by the *Guidelines* – i.e., profits in excess of costs, with costs including a reasonable return.[73] Instead, in WCTL's version of "contestability," the SARR can realize excess profits since it need only price at a level below the incumbent's prices; its costs are only a "floor." Indeed, under WCTL's conception, the SARR does not engage in the simulated competition of SAC analysis. Rather, the Complainant's proposed SARR is a monopolist: subject to no threat of entry by other possible SARRs; subject to no threat of even non-retaliatory, competitive responses by incumbents; and subject only to a cap at the existing rates and revenues of the incumbent.

The value to shippers of this is obvious: If the SARR's costs are only a revenue "floor" and the Complainant's SARR can earn revenues in the WCTL version of the contestable market at the level of the incumbent's revenues (less one cent, in order to "beat" the otherwise unresponsive incumbent) irrespective of the SARR's costs, any and all excess of revenues on non-issue traffic relative to competitive market outcomes will leave less revenue for the issue traffic to bear in order for total revenues to add up to total costs. Indeed, WCTL's "SARR costs are only a floor" can readily imply that, since non-issue revenues are capped at the incumbent's existing revenues on such traffic (less one cent), such traffic can generate sufficient revenues in WCTL's version of SAC analysis to render it unnecessary to collect any revenue from the issue traffic.

---

71 *Guidelines* at 529.

72 *Guidelines* at 528.

73 *Guidelines* at 529.

While this is a wonderful result from the short-term, narrow self-interest perspective of complaining shippers, it is a ludicrous result economically and from the perspective of the public interest. Indeed, the fact that contestability implies rates to SARRs which, in the aggregate, just cover the SARR's stand-alone costs is the reason SAC analysis employs rate reduction methods (by precedent, PRM) that apply to all of the SARR's traffic. That is, the very idea of some form of SARR traffic-wide rate reduction methodology is an invocation of the principle that serves as the basis of the *Guidelines* – i.e., that contestable markets put downward pressure on issue and non-issue traffic rates until rates available in the contestable market are no greater than needed to allow the SARR to stand alone (i.e., cover its total costs).

Of course, carriers might prefer WCTL's framework: Taken to its logical conclusion, WCTL's notions that a Complainant SARR would be protected from competitive response by the incumbent *and* from entry by other SARRs. As a result, the Complainant SARR could price up to the level of the existing rates and rate divisions of the incumbent; the Complainant SARR would have no reason to set rates on issue traffic at more than one cent below the challenged rates of the incumbent carrier. Such are the implications of WCTL's unique version of contestability under SAC analysis.

The chains of reasoning by which WCTL reaches its conclusions regarding contestability are remarkably convoluted and (apparently) reflect a notable lack of basic economic understanding. Consider, for example, WCTL's assertion that the Complainant's SARR can price up to the level of the incumbent's existing rates and revenue divisions. According to WCTL, any price response by the incumbent to the appearance of a SARR is impermissible "retaliation"[74] and constitutes a barrier to entry by the SARR.[75] Yet, it is clear from our discussion of sunk costs above that price responses by incumbents that represent "retaliatory" pricing and barriers to entry are price responses by incumbents which push incumbent prices below recovery of the incumbent's full, SAC costs. In the presence of sunk costs, this prospect arises because

[74] WCTL Opening at 45.

[75] WCTL Opening at 41.

incumbents could rationally ignore those costs and reduce prices all the way to variable costs if necessary to discourage entry by a SARR that has not yet sunk its costs.[76]

> [W]here truly sunk costs constitute a high proportion of the incumbent's expenses, entrants should expect incumbents to respond to entry with sharp price reductions, even if they will preclude recovery of investment. Responsive pricing patterns, and rational threats of such behavior, may then effectively prevent replacement of the incumbent.[77]

On the other hand, pricing by an incumbent down to the level of its full costs is not a retaliatory response or barrier to SARR entry; it is a competitive response in a contestable market.

WCTL's reasoning regarding why, in its view, contestable market theory requires that the Complainant's SARR be protected from competition by possible subsequent SARR's is similarly confused. As noted, in WCTL's view, such protection is necessary because without it, "the entrant [SARR] can take away the existing SARR's revenues before the existing SARR can recoup its costs, [and] the latter will shun the market."[78] But the very premise of SAC analysis is that the Complainant's SARR is efficient, or should only "win" in the contestable market if it is efficient. This means that a subsequently entering SARR, by assumption, is not more efficient than the Complainant's "existing SARR" and cannot afford to, and would not rationally, price below the prices and rate divisions the Complainant SARR needs to "recoup" its efficient costs. Moreover, because under contestability, the Complainant SARR is free of barriers to entry and exit, and sunk costs are a barrier to both, the Complainant SARR doesn't need time to "recoup" its costs. If another SARR were to come along and displace it (which could only happen under contestability if this subsequent SARR were more efficient than the Complainant's SARR), the Complainant SARR in SAC analysis can

---

[76] William J. Baumol and Robert D. Willig "Fixed Costs, Sunk Costs, Entry Barriers, and Sustainability of Monopoly," The Quarterly Journal of Economics, August 1981.

[78] WCTL Opening at 45.

freely exit and redeploy its assets and resources to other uses that also yield it a competitive, reasonable rate of return (i.e., its cost of capital).[79]

WCTL is struggling mightily to justify Complainants' SARRs capturing prices on and rate divisions on non-issue traffic that do not reflect competitive market outcomes, but instead reflect "actual market" outcomes and the ready prospect of excess profits for Complainant SARRs. In the process, however, WCTL has created the antithesis of contestability in the markets where the SARR and the incumbent meet under SAC analysis. Notwithstanding the confused and flatly wrong economics employed by WCTL, the bottom line is that allocation of cross-over traffic revenues to the SARR must be based on the way market principles would be applied *in a contestable market*. In my Opening V.S. in this proceeding, I demonstrated that if the SAC proponent chooses to compete in the contestable market with a SARR that depends heavily on cross-over traffic, then application of market principles, *as they would be applied in a contestable market*, would generate cross-over revenue allocations equal to the fixed and variable costs that the incumbent avoids by having the SARR replace it for the SARR's portion of cross-over movements. Applying this principle of "contestability pricing" is not only consistent with the economics of contestability as invoked by the *Guidelines*, it also would give Complainant shippers the incentive to design truly efficient systems that can legitimately "beat" incumbents.

B. "Full" SAC Analysis and ATC-Based Cross-Over Revenue Allocation

In *EP 657*, the Board suggests that rather than incenting Complainants to propose efficient SARRs, efficient SARRs may be so large as to create an undue burden on rate cases and may require the introduction of "simplified" short-cuts to approximate the "full" SARRs that may be maximally efficient and, hence, competitive.[80] Thus, the Board proposes an alternative to its current MSP method of allocating revenues to SARRs' cross-over traffic. Under the alternative, the Board would employ a measure of Average Total Cost (ATC) to create a proxy for what the Board refers to as a "full" SAC

---

[79] In fact, this ability to redeploy assets without suffering any losses from not having enough time to "recoup" costs is what freedom of exit technically means in economics.

[80] *EP 657: Major Issues in Rail Rate Cases*, at 17.

analysis of a full SARR that would compete to replace all of incumbent carrier's facilities and operations utilized by the SARR's traffic groups.[81]

The Board reasons, in essence, that if a full SARR were to be designed to replace the entirety of the incumbent's facilities from which the SARR's traffic group benefits, the resulting SARR would be far more extensive than the actual SARRs Complainants have come to routinely propose. Such full SARRs would not rely on cross-over traffic; they would propose the facilities to serve such traffic as through traffic. As such, full SARRs would have to cover the total costs of associated facilities, suggesting the use of ATC in allocating revenues to actual proposed SARRs' cross-over traffic. As I showed in my Opening V.S., however, there is no need to turn to such a proxy approach in order to properly incorporate cross-over traffic. The economics of contestability readily yield cross-over allocations for SARRs actually proposed by shippers. Specifically, these economics yield cross-over revenues equal to the incumbent's avoided costs on cross-over traffic, and doing so provides shippers with proper incentives to design efficient SARRs.

It is telling that WCTL, representing shipper interests, adamantly opposes the Board's introduction of the notion of a "full" SAC analysis for a "full" SARR.[82] Clearly, garnering "actual market divisions" on non-issue cross-over traffic, with those divisions' values set in decidedly *not* contestable settings, is preferable to shippers interested in depressing rates on issue traffic. In fact, WCTL asserts that the use of ATC to determine SARR cross-over revenues is tantamount to imposing "construction" and "productive technique" barriers to entry on SARRs by implicitly imagining SARRs "building" "full" systems when they might prefer to build "partial" SARRs.[83] In keeping with its treatment of contestability, however, WCTL has erred in its apparent understanding of the economics of barriers to entry.

---

81 *EP 657: Major Issues in Rail Rate Cases* at 17.

82 WCTL Opening at 25, 35-36, 39, 42; Crowley Opening V.S. at 7.

83 WCTL Opening at 39-42.

In the context at hand, a barrier to entry by a SARR would have to consist of a cost borne (albeit, hypothetically in SAC analysis) by a SARR that is not borne by an incumbent and that imparts a competitive advantage to the incumbent in the sense of allowing an otherwise symmetrically situated incumbent to be able to survive as a stand-alone enterprise at lower total revenues than an efficient SARR. Such is not the case with the Board's concept of a "full" SARR.

First, consider the implication that Complainants might have to incur additional litigation costs (e.g., in the form of additional need for analysis and consultants) if Complainants were unable to rely on cross-over traffic and were, instead, required to actually propose "full" SARRs that could replace the entirety of an incumbent's system that serves the SARR's selected traffic group. Such a cost to Complainants *as litigants*, however, would not be a barrier to entry for Complainants' SARRs *as railroads* as these SARRs enter the hypothetical "contests" created by SAC analysis. Not only is the Board's proposed ATC approach to "full" SAC analysis a short-cut to considering "full" SARRs in SAC cases; it is a short-cut intended to avoid the imposition of additional litigation costs on Complainants and carriers. Moreover, such costs are ignored in the simulated market competition of SAC analysis. SARRs *as railroads* (rather than litigants) compete in SAC analyses free of such costs.

Second, implicitly imagining (through the Board's proposed ATC short-cut) "full" SARRs as the competitors in SAC analyses would imply more expensive SARRs than Complainants have been routinely proposing. But such increased expense is not a "construction," "productive technique," or any other kind of barrier to entry. Rather, the "full" SARR would be presumed to be able to freely redeploy fixed assets and realize full market value on those assets if exit proved necessary. The absence of barriers to exit in the contestable setting guarantees this. Furthermore, the costs of "building" "full" facilities would be assumed in "full" SAC analysis to be borne symmetrically by the incumbent.[84] That is, the costs of "full" facilities would not provide incumbents with any

[84] This also follows from the contestability precept of no barriers to exit. In the absence to barriers to exit, the going-forward costs of even an already-built incumbent system include the opportunity costs of not redeploying the incumbent's assets at full market value to other uses. Accordingly, the rational

competitive advantage that otherwise might serve as a barrier to entry. Indeed, Complainants routinely assert that their SARRs – whether large or small – are more efficient than the incumbent's relevant systems. Thus, SAC analysis of either "full" or partial SARRs essentially entails the arguable assumption that SARRs start out in the SAC "contest" on no worse than equal footing with incumbents.

The Board's proposal in *EP 657* is to allocate cross-over traffic revenues to a SARR in the proportion that the average total cost of the proposed SARR's partial move (adjusted as appropriate for mileage and density) bears to the average total cost of the movement on- and off-SARR.[85] As noted above and in my Opening V.S., while the proposal would constitute a short-cut and an approximation, it properly recognizes the principle that, if a "full" SARR were in the "contest" of the simulated competition of SAC analysis, its willingness and ability to stand alone as a successful competitor for the full movement of the traffic would depend on its ability to realize revenues sufficient to cover the total costs of "full" operations.

At the same time, because the proposed ATC approach would be a short-cut and an approximation, it is appropriate to heed Prof. Willig's admonition in his Opening V.S.: If an approximation is to be used to estimate revenues to be allocated to cross-over traffic, both shippers and carriers *must* be afforded the opportunity in SAC cases to demonstrate that the ATC approximation is biased.[86] Without such an opportunity, the ATC short-cut could readily result in short-cuts to conclusions that are inconsistent with the concepts of contestability and stand-alone survival that undergird Constrained Market Pricing in the *Guidelines*.

C. Harmonizing Cross-Over Revenue Allocation and Rate Reduction Methodologies

Finally, it is important that an adoption of the Board's proposed ATC approach to allocation of cross-over traffic revenues be coherently integrated with the accompanying

---

incumbent has to treat its already-built system as not sunk and, hence, price and compete on a symmetrical basis with SARRs.

85 *EP 657: Major Issues in Rail Rate Cases* at 19.

86 Willig Opening V.S. at 30.

rate reduction methodology. In particular, as indicated above, the introduction of "full" SAC analysis via the proposed ATC approach to cross-over revenues would entail the concept of "full" SARRs competing with incumbents for through moves of what would otherwise be cross-over traffic. This implies a shift in focus from the question of rate divisions in contestable markets to price competition on through moves in such markets. This leads us back to Ramsey pricing principles.

Specifically, competition in contestable markets between partial SARRs and incumbents for the carriage of cross-over, as opposed to through, traffic leads to the result reported in my Opening V.S. Namely, such competition would yield the partial SARR divisions of cross-over revenues no greater than the incumbent's avoidable costs of serving the partial move of cross-over traffic. Competition for cross-over portions of through traffic between a partial SARR and an incumbent is not competition over the through rates that are relevant to customer's demand choices and to which Ramsey principles apply.[87] Rather, such partial competition is competition for an incumbent's "make or buy" choice with respect to the partial segment serving what the SARR proposes should be cross-over movements. The incumbent "buys" from the SARR when the SARR accepts rate divisions that are more attractive than the avoidable costs the incumbent would incur to handle the cross-over portions of moves.

On the other hand, competition by "full" SARRs for the full movement of what otherwise would be interchanged as the cross-over traffic of a partial SARR represents competition over the rates paid for through movements by customers. These rates are the rates to which Ramsey principles apply. As such, simulated competition from full SARRs in the contestable market of SAC analysis would be expected to put downward pressure on the through moves sought by a "full" SARR. Thus, to be coherent, rate reduction in SAC analyses that allocate revenues to cross-over traffic via the short-cut of an ATC methodology would apply the rate reduction percentages (e.g., under PRM) to the through revenues associated with cross-over traffic. It is these revenues that "full" SARRs would put under competitive pressure in "full" SAC analyses.

REPLY VERIFIED STATEMENT

OF

ROBERT D. WILLIG

I. INTRODUCTION

My name is Robert D. Willig. I filed an Opening Verified Statement in this proceeding on May 1, 2006, and a copy of my CV was attached as Exhibit No.__(RDW-1) to that statement.

In this Reply Verified Statement, I have been asked by BNSF Railway Company ("BNSF") to address three issues raised by testimony that accompanies the *Pro-Shipper Opening Comments*, filed on May 1, 2006.[1] First, I have been asked to address the shippers' discussions of the cross-subsidy tests that the Surface Transportation Board ("STB" or "Board") applied in the recent *PPL* and *Otter Tail* proceedings – which are set forth in the verified statements filed by Curtis M. Grimm and George H. Borts. Second, I address certain issues raised by two rate reduction proposals made in filings by Western Fuels Association, Inc. and Basin Electric Power Cooperative, Inc. ("WFA"), and one proposal in the Opening Comments of AEP Texas North Company ("AEP Texas"). The first of these issues relates to the view, implicit in both proposals, that one can infer Ramsey price-to-marginal cost relationships for movements in the stand-alone traffic group from rate-to-URCS variable cost relationships. The second issue I address relates to how the use of cross-over traffic affects the way in which rate reductions are actually calculated.

As background for my discussion, it is useful to put the Constrained Market Pricing ("CMP") and the stand-alone cost ("SAC") test into their larger regulatory context. As I noted in

[1] *See Joint Opening Comments of Western Coal Traffic League, Concerned Captive Shippers, Western Fuels Association, Inc., Edison Electric Institute, National Rural Electric Cooperative Association, and American Public Power Association.*

my Opening Verified Statement, where there is effective competition for rail services, there is no need for regulatory intervention, since the effects of competition would lead to prices that maximize the utilization of railroad facilities, while ensuring that shippers need not pay the forward-looking costs of facilities and services from which they derive no benefit. In short, effective competition for rail services will lead to prices that are economically and socially efficient. Furthermore, I noted that when a railroad is revenue inadequate, it has every incentive to price its services in accordance with Ramsey Pricing principles, because doing so will maximize the contribution all services, combined, can make to the coverage of fixed, joint and common costs.

Guidelines recognized, however, that certain *real world* rail markets may not be competitive or contestable, due to the existence of significant barriers to competitive entry into and exit from those markets. When a shipper contends that its rate is unreasonably high, it is in essence asserting that real world entry/exit barriers have rendered the market for its services not effectively competitive, creating an opportunity for the incumbent railroad to charge rates that exceed levels that would exist if the market were contestable, even though consistent with the shippers' real world market demands. The regulatory process embodied in CMP, and the SAC test on which it relies, is therefore designed to assist the Board in determining the economically appropriate level of unattributable costs that should be charged to the shippers that use the railroad (or a delineated subset of the railroad), along with the distribution of those unattributble costs in a manner consistent with Ramsey Pricing principles. *Guidelines* describes this process this way:

> Although we have described the constraints in CMP separately, they are necessarily interrelated. They represent different means of approaching the same basic issue, i.e., the extent

> of unattributable costs to be covered through differential pricing and the portion that can be charged to the shipper involved.
>
> The revenue adequacy constraint is a limit on the total revenues a carrier can collect. The adjustments to eliminate plant and operational inefficiencies reduce the costs which may be covered by differential pricing. The adjustments to account for revenues lost through inefficient pricing practices also reduce the allowable differential pricing. Through these steps, the total amount of permissible differential pricing is determined. The pricing efficiency constraint directs that the resulting pool of unattributable costs be allocated among the carrier's shippers in accordance with Ramsey principles (i.e., on the basis of relative demand elasticities), recognizing that contract solutions may be superior to Ramsey prescriptions.
>
> Alternatively, the pool of unattributable costs to which the shipper must contribute may be determined through a stand-alone cost analysis. This permits the shipper to avoid contributing to the costs of facilities and services from which it does not benefit. Again, the pricing efficiency constraint directs that the unattributable costs of the SAC system be allocated among the users of the SAC system on the basis of the demand elasticities.
>
> Thus, the various constraints contained in CMP may be used individually or in combination to analyze whether the rate at issue is unreasonably high, i.e., set at a level greater than necessary to collect the portion of unattributable costs that can properly be charged to that shipper. If we determine that a rate has been set at an unreasonably high level, we will take whatever action is appropriate, based upon the nature and extent of the violation shown, to afford relief to the complaining shipper and to promote proper pricing by the carrier. In considering a rate prescription and/or reparations, we will attempt to provide an effective remedy for the complaining shipper, but in a manner that would not introduce further distortions into the carrier's pricing structure. *Guidelines* at 1 I.C.C.2d 547-548, (footnotes deleted).

Thus, Guidelines views CMP and SAC as appropriate tools for adjusting railroad rates in those limited circumstances in which market forces are deemed inadequate, not as *carte* blanche for wholesale revision of the incumbent's rate structure. At the end of the day, in other words, application of CMP and the SAC test – where appropriate – should result in a real world rate structure for the real world incumbent that is closer to what would be observed if the market for

all rail services were contestable. Any regulatory action that would distort the incumbent's rate structure by rendering it *less* consistent with what would be observed if real world markets were actually competitive or contestable would be inconsistent with *Guidelines*.

With this background in mind, I now turn my attention to each of the three issues I have been asked to address.

II. TEST FOR CROSS-SUBSIDY

The Board's cross-subsidy test, initially applied in *PPL*, and discussed more fully in *Otter Tail*, comes into play when the proponent of a given stand-alone railroad ("SARR") seeks to make it appear that the issue traffic rates are too high by designing a system that is composed of two essentially separate parts that do not extensively overlap – a lighter-density segment (or group of segments) that is utilized by the issue traffic and certain other non-issue traffic, and a heavier-density segment (or group of segments) that is used relatively little or not at all by the issue traffic (and, therefore, is used exclusively, or primarily, by non-issue traffic).[2] In *PPL*, the Board found that if the attributable forward-looking costs of the lighter-density segment used by the issue traffic are higher than the revenues that would be generated by this traffic, then the proponent of the particular SARR configuration is deemed to have failed in its effort to

[2] As explained in the Reply Verified Statement of John C. Klick, the Board addresses the potential complexity introduced when traffic that predominantly uses the lighter-density segment also makes minor use of the heavier-density segment by excluding – from the attributable costs of the lighter-density segment – *all* of the construction costs associated with the overlapping portion of the SARR network, and *all* of the operating costs associated with non-issue traffic that does not utilize the lighter-density segment, and including all of the revenues generated by the traffic that uses the lighter-density segment. In terms of the schematic set forth at page 11 of the Grimm V.S., the Board would include in the attributable forward-looking costs of the Shipper 1 and Shipper 2 traffic *only* the construction and operating costs for the B-to-A segment (used by both Shipper 1 and Shipper 2), and only the Shipper 2 operating costs for the C-to-B segment (used by both Shipper 2 and Shipper 3) – and it would compare these attributable costs to all of the revenues generated by Shippers 1 and 2. If the revenues from Shippers 1 and 2 are not sufficient to offset these forward-looking costs, a railroad operating in the contestable market envisioned by the SAC test would exit the market because the costs it would save would be greater than the revenues it would lose.

demonstrate that the issue traffic rates are unreasonably high. In upholding the Board's decision in *PPL*, the United States Court of Appeals for the District of Columbia Circuit found in part:

> *Guidelines* explains the SAC test is a means of assuring that a "captive shipper should not bear the costs of any facilities or services from which it derives no benefit." 1 I.C.C.2d at 523. The Board reasonably extrapolated from this that a basic principle of *Guidelines*, and the primary purpose of the SAC test, is to guard against "both cross-subsidization by and cross-subsidization of the captive issue traffic" when determining the reasonableness of the issue traffic's rates. *Decision I*, 2002 WL 1905118 at *5. As previously described, the SAC test, rooted in the concept of contestable markets, "is used to compute the rate a competitor in the market-place would need to charge in serving a captive shipper or a group of shippers who benefit from sharing joint and common costs." *Guidelines*, 1 I.C.C.2d at 528. In a contestable market, a competitor would always enter the market to compete for, and charge a lower price for, any traffic that is subsidizing other traffic on the line. Therefore, just as a "captive shipper should not bear the costs of any facilities or services from which it derives no benefit," *id.* at 523, it was not unreasonable for the Board to require the captive shipper in this case to hypothesize its SARR in accordance with the same standard—i.e., the viability of the western segment (including the issue traffic) could not depend on a cross-subsidy. Faced with PPL's SARR, the Board's decision advances the reasonable proposition that the captive issue traffic cannot be improperly subsidizing other traffic if the issue traffic cannot even cover its own attributable costs; in other words, it is difficult to steal from a penniless Peter to pay Paul.[3]

The Board's February 27, 2006 decision in the instant proceeding did not seek comment on the cross-subsidy issue, which is not surprising, given the D.C. Circuit's endorsement of the logic of the Board's cross-subsidy test. Nevertheless, both Grimm and Borts seek to inject the issue into this proceeding, and BNSF has asked that I therefore briefly address some of the obvious errors in their analyses in this Reply Verified Statement.

Dr. Grimm makes three arguments in opposition to the Board's test. First, he argues that the cross-subsidy test originally envisioned in the *Guidelines* was meant to ensure that the issue

[3] *See* D.C. Circuit No. 04-1369 at 9.

(and other "grouped) traffic was not cross-subsidizing other traffic that does not use the issue traffic facilities, *not* the other way around. Grimm Opening V.S. at 4-5. Second, he argues that contestability theory "posits" that "if *any* SARR can be constructed which generates excess profits, the challenged rates are too high," even if that SARR incorporates a cross-subsidy of the issue traffic by non-issue traffic that does not share facilities with the issue traffic. Grimm Opening V.S. at 6-8.[4] Here, Dr. Grimm raises a "doomsday scenario," interpreting the "sustainability" argument made by the Board in defending its cross-subsidy test as potentially leading "toward a requirement that the complainant devise a SARR which represents the lowest cost, optimum system for any member of the SARR group located anywhere along the SARR route." Finally, Dr. Grimm suggests that the Board's cross-subsidy test must be flawed because BNSF has not yet abandoned the "west line" used by the PPL issue traffic, even though it has "for the past 25-30 years had the ability to abandon unprofitable line segments." Grimm Opening V.S. at 8-9.

What the cross-subsidy test tells us is that if the shipper has indeed posited a SARR that reflects the contribution available from the defendant's traffic selected for inclusion in the traffic group, the real world rates on the lighter-density portion of the network are not yielding revenues that would be generated in a hypothetical contestable market, that is, revenues sufficient to cover the collective attributable cost of handling the traffic over the light density lines in the long term.[5] The implication of this conclusion is that the only appropriate adjustment to the rates on the lighter-density segment, including the issue traffic rates, would be to increase the rates to

[4] This point is the essence of Dr. Borts's criticism of the Board's cross-subsidy test as well. I understand that Dr. Borts has mischaracterized the nature of the Board's cross-subsidy test, which is addressed in Mr. Klick's Reply V.S.

[5] The inclusion of allocated revenues from cross-over traffic movements makes it impossible to know for certain that the revenues generated by the SARR accurately reflect the contribution of the defendant's real world traffic.

levels at which they would cover their traffic's collective attributable costs, assuming that shipper demand for the services involved were sufficient to permit such an increase.[6] The result sought by the complaining shipper, i.e. a *reduction* in the issue traffic rates because contribution can be claimed from other traffic that does not share the lighter-density lines, would yield precisely the opposite result from the rate increase that would occur in a contestable market and would introduce inefficiency into the defendant's real world pricing structure. Because proper rate regulation should always serve to increase the economic efficiency of the incumbent's rate structure, not to introduce new or exacerbate existing departures from contestable-market behavior, the cross-subsidy test is clearly appropriate. This is the essence of the D.C. Circuit's observation, in the above quote, that "the Board's decision advances the reasonable proposition that the captive issue traffic cannot be improperly subsidizing other traffic if the issue traffic cannot even cover its own attributable costs; in other words, it is difficult to steal from a penniless Peter to pay Paul."[7]

The test promulgated in *PPL* relied upon a finding that an internal cross-subsidy existed at the *current* level of revenues allocated to the SARR. In *Otter Tail*, the Board took the next logical step -- concluding that even if no cross-subsidy exists at the current level of revenues allocated to the SARR, rate reductions that are indicated by a finding that current revenue levels exceed SAC could not be significant enough, on the light-density portion of the SARR, to create

[6] If demand is not sufficient to permit rates that recover long-run collective attributable costs, the real world defendant whose costs in the lighter-density lines are sunk, will nonetheless appropriately continue to handle the traffic as long as it recovers collective short-term attributable costs.

[7] Note that while Dr. Grimm suggests that in a "more typical context" cross-subsidy analyses are performed with respect to "estimates of incremental, marginal, or variable costs," which he describes as "more tractable," his discussion at pages 9 and 10 makes clear that he agrees with the commonly-held view of economists that the proper way to assess whether cross subsidy exists is to determine whether the portion of the rail system under study is "a viable component of a presumptively efficient, de novo railroad system," *i.e.*, that the right way to assess whether a cross-subsidy exists *in the real world* is to compare revenues to the forward-looking costs of efficiently constructing and operating the portion of the rail system under study – precisely what the Board's cross-subsidy test does.

a cross-subsidy – *after* the rate reduction – where one does not exist today. The conclusion that the cross-subsidy test properly acts as a constraint on the size of the rate reduction that can be imposed on traffic that moves over the light-density segment also is logical. If one is going to establish reasonable rates by asking what rates would exist on the issue and non-issue traffic in a contestable market, it makes no sense to assume rate levels on the light-density portion of a network that could exist only if a cross-subsidy from the heavier-density portion of the network were available. Over the long run, this approach would merely and unnecessarily replace one distortion (*i.e.*, rates above a reasonable level) with another (*i.e.*, a cross-subsidy of the lighter-density segment by the heavier-density segment). The right approach is the one advocated by the Board, *i.e.*, to reduce rates on the lighter-density segment only until they just cover the forward-looking attributable costs of that segment.

One other brief comment is in order. One can certainly conceive of a process that would result in identifying an "optimal" stand-alone configuration for each combination of traffic movements over an incumbent railroad's system, but nothing in the Board's adoption of the cross-subsidy test forces shippers to take on this burden. All that is required is that the complainant posit a SARR that does not depend upon a cross-subsidy to make the facilities used by the issue traffic look more profitable than they are. To paraphrase Dr. Grimm, identification of *any* low-cost, hypothetical SARR serving the issue traffic and a logical shipper group that is earning excess profits system-wide based upon existing SARR rate levels, *without simultaneously cross-subsidizing the issue traffic rate*, would establish that the complaining shipper's rates are excessive. Just as clearly, as discussed above, it would not be good regulatory policy intentionally to increase the level of distortion in the incumbent's rate structure by means

of an issue traffic rate reduction in excess of one that would exist in a competitive or contestable market.

Dr. Grimm suggests that BNSF's continued operation – over an extended period of time – of the light-density line at issue in *PPL* indicates that the line *does*, in fact, cover its forward-looking costs. As an initial matter, this is tantamount to claiming that the Board significantly overstated the attributable forward-looking costs that it calculated for the "west leg" of the *PPL* SARR. The time is long past for making this claim, but I note that the Board's decision is explicit that it calculated these costs in a manner that would tend to *understate* these costs, not overstate them.[8] In addition, the fact that the stand-alone rail systems relied upon by shippers in *PPL* and *Otter Tail* make such extensive use of cross-over traffic renders it difficult to draw *any* conclusion about the real world incumbent's rail lines.

More fundamentally, the fact that BNSF has continued to operate this line for years is not inconsistent with the Board's conclusion that revenues fail to cover forward-looking attributable cost. Many significant railroad assets, such as grading, tunnels and bridges, have useful lives much longer than the 25 years that have passed since the Staggers Rail Act of 1980 made abandonment of unprofitable rights-of-way by carriers more feasible. As the I.C.C. recognized repeatedly in *Guidelines*, it is economically rational and socially efficient for a railroad to operate segments of railroad that do not cover their long-run incremental costs as long as they are covering the costs that they incur in the short run. *See*, for example, *Guidelines* at 1 I.C.C.2d at 537-538.

[8] *PPL Montana, LLC, v. BNSF*, STB Docket No. 42054, slip op. at 10 (served August 20,2002)

III. ADDITIONAL RATE PRESCRIPTION METHODOLOGIES PROPOSED BY SHIPPERS

In addition to commenting on the Board's rate prescription proposals, Western Fuels Association, Inc. and Basin Electric Power Cooperative ("WFA") proposed two alternatives to the Percent Reduction Methodology, *i.e.*, a "Reasonable Allocation Methodology," or "RAM," and a "Reduced Mark-Up Method." Further, AEP Texas North Company ("AEP Texas") proposed what it calls a "Generalized Percent Reduction Method," or "GPRM." I understand that other BNSF witnesses are addressing these proposals in detail. I limit my focus to implications that exist in both of these filings that the marginal costs relied upon in calculations for both the Reduced Mark-Up method and GPRM are somehow consistent with marginal costs as that term is construed in Ramsey Pricing theory, and that reliance on either of these two methods to establish reduced rates on the issue traffic would therefore somehow be "consistent with" Ramsey pricing.

As WFA explains in its pleading, under the Reduced Mark-Up method, "contribution" on each stand-alone movement is calculated as the difference between "the revenues paid by each [SARR] shipper and the variable costs the [SARR] incurs to provide that shipper with service." While it is not explained in detail in the May 1, 2006 filing, I understand that the following are features of the Reduced Mark-Up method:

1. "variable costs" are based on an effort to put the operating and capital costs of the SARR into an URCS variable cost format,[9] and

2. the term "revenues paid by each [SARR] shipper," when applied to cross-over traffic movements, is in fact a reference to the portion of the BNSF's actual

[9] As an economic matter, it is the marginal costs of the incumbent, not the SARR, that should be used in any rate reduction methodology based on "Ramsey Pricing" principles. Afterall, the aim of the application of regulation to reduce rates is to improve the economic performance of the actual prices with respect to the real world railroads and their actual demands. This is the function of the principles of Ramsey Pricing, and avoidance of cross-subsidy as well. As such, it is the real world marginal costs of the real railroad incumbents that should inform the setting of rates.

> revenues that is allocated to the SARR for providing only a portion of the service provided by BNSF on each movement, *i.e.*, it is based on a formulaic allocation of through revenues.

AEP Texas ties GPRM more directly to the concept of Ramsey pricing (*see* the equation set forth on page 11 of its Opening Comments), and specifically states in its discussion of marginal costs:

> As a practical matter, coal rate proceedings do not readily permit the specific calculation of marginal service costs for each member of the SARR traffic group. Such a showing would be extremely burdensome. This limitation should not affect the use of GPRM, however, as there is no need to compute the actual marginal costs of a particular movement with specificity. Instead, the goal is to measure the markup of the rate over a determined cost level *relative* to the comparable markups above similarly determined cost levels on other rates in the traffic group. As long as the rates are measured against a consistent cost standard, the relative markups can be determined in order to allocate the excess SARR revenues over SAC. AEP Texas Rebuttal at III-G-46 to 47. The average marginal costs for a movement can be determined using publicly available Phase III URCS data for the defendant railroad in the base year of the SAC analysis. AEP Texas Opening at III-G-32 to 33. . . . The calculation of system average marginal costs in this manner has come under attack as not determining shipper-specific marginal costs with certainty. BNSF Reply at III-G-36 to 40. However the Board and ICC each have recognized that complex precision must be tempered with practicality when determining a workable regulatory formula. The marginal cost calculations in this instance are used to estimate the percentage markup for each movement. The estimated markups are used to infer the relative demand elasticities. The use of system average costs is sufficient for such a purpose. AEP Texas Rebuttal at III-G-46 to 47. AEP Texas Opening Comments at 11-12.

Again, although it is not clear from this description, I understand that certain categories of expense have been eliminated from BNSF's URCS to create what AEP Texas calls "marginal costs," and that the revenues and revenue markups calculated for cross-over movements reflect only the portion of the BNSF's actual revenues that is allocated to the SARR, *i.e.*, GPRM also relies upon a formulaic allocation of BNSF's total revenues to the SARR's portion of each cross-

over traffic movement. These features of the reduced mark-up method and the GPRM have implications for several aspects of the rate prescription issue that the Board has raised in this proceeding.

First and foremost, it is something akin to an economic "twilight zone" for shippers to be talking about Ramsey pricing while at the same time relying so extensively on cross-over traffic movements that ignore the revenues and "marginal costs" for the *full service* that is provided on each cross-over traffic movement by BNSF today. Relative elasticities of demand for individual shippers are reflected only in the end-to-end rates they pay, and it is an indefensible leap of faith to *assume*, as WFA and AEP Texas do, that the revenues allocated to the SARR for its portion of each cross-over traffic movement – using MSP, ATC or some other cost-based approximation – could somehow reflect each movement's elasticity of demand.

While I understand the Board's desire to simplify the SAC process through the cross-over traffic convention, there is a real danger in individual rate proceedings that formulaic approximations can bias the results that would be obtained under a "full SAC" analysis that would explicitly reflect each shipper's demand-based rates. The way to address this problem in the rate reduction context was suggested by BNSF in recent rate proceedings, and is alluded to in the Opening V.S. submitted by John Klick in this proceeding, *i.e.*, to apply the rate reduction procedure in a manner that ensures that whatever excess of revenues over SAC results from applying the SAC test is eliminated by reducing the *full* rates on the stand-alone traffic movements, or the *full* contribution generated by this traffic. While this approach does not entirely address the implications of focusing only on the SARR's allocated revenues and "marginal costs," it is a significant step in the right direction.[10]

[10] As I read Mr. Klick's statement, evidence submitted in the *Laramie River* proceeding demonstrates that this approach would *overstate* the reduction required because, as the system is

Second, one cannot expect that URCS-based variable costs – whether for the incumbent railroad or the SARR, un-diluted, or with the sorts of modifications made by AEP Texas – would reflect the marginal costs that are consistent with Ramsey pricing principles. This is so because system-average costs, based on embedded book values, do not accurately reflect marginal costs for individual movements.

In *Guidelines*, the ICC found that:

> Rail Form A and the Uniform Railroad Costing System (URCS) are both cost accounting systems which transform reported railroad expense and activity data into estimates of the intermediate- to long-run variable cost of providing rail service. URCS offers a number of refinements to Rail Form A designed to increase both its flexibility and accuracy. Adoption of URCS is being considered in Ex Parte No. 431.
>
> However, both these systems yield cost estimates which are based largely on system-wide averages. Ramsey pricing requires the use of economic costs rather than accounting costs. Although Rail Form A or URCS might be useful as a rough indicator of economic costs, we recognize that local factors and circumstances may cause the economic costs to differ greatly from accounting estimates. Such local factors might include, for example, whether the movement is a backhaul or off-peak movement or whether the facilities involved are congested. Parties presenting cost estimates should be prepared to show that they have taken account of relevant local factors.[11]

These observations apply with full force to the supposed development of marginal costs reflected in the WFA and AEP Texas proposals. As Mr. Klick explains in more detail, for example, AEP Texas started with standard URCS variable unit costs, and modified those costs to eliminate

---

expanded to look more and more like a "full SAC" analysis, the excess of revenues over SAC declines (not surprising, given the revenue inadequate status of the major railroads). By assuming that the "overage" that is calculated for the "short SARR" (relying on cross-over traffic) would be the same if a "full SAC" were conducted – which is functionally what Mr. Klick's proposal assumes, this method overstates the average reduction required from each member of the stand-alone traffic group, including the issue traffic, *whatever* method is used to develop the rate prescription.

[11] *Guidelines*, 1 I.C.C.2d at 532 n.31.

general overhead and supervisory expenses, depreciation and "return" on fixed assets, added the current year's capital investment in track assets, and eliminated certain carload billing expenses that were deemed inapplicable to coal unit train service. I understand that these modified "system-average marginal costs" were used to generate a series of "cost factors" that AEP Texas alleges can be used to "approximate" movement costs for other lengths of haul (and differences in other shipment characteristics, such as termination vs. interchange and car ownership).

The outcome of such an approach would seem to be an implicit assumption that all movements with identical operating parameters (*e.g.*, the same length of haul, same class of traffic and same car ownership characteristics) would exhibit the same marginal cost. Such an assumption is inconsistent with a basic premise of Ramsey pricing, which requires that the marginal costs used for each individual movement must reflect all of the relevant forward-looking economic costs associated with that particular movement.

If a movement uses a portion of the railroad that is particularly congested, its marginal costs must reflect the costs of this congestion (*i.e.*, either the slower transit times and higher probability of crews outlawing on congested routes, or the investment costs that will be required to eliminate this congestion). On the other hand, if the movement uses a portion of the railroad where there is considerable available capacity, the costs of such capacity would not be part of the marginal costs used in a proper implementation of Ramsey pricing.

Similarly, properly-developed marginal costs would reflect differences in the "risk-profile" of individual movements. Movements under contract are more certain than movements under common carrier rates; movements from or to solely-served locations are more certain than movements between competitively-served locations. As a result, investments in locomotives, freight cars and rights-of-way to handle some movements carry less risk than similar investments

associated with other traffic. Furthermore, while contracts tend to improve certainty, the obligations associated with individual contracts differ, and these differences can impose costs that vary significantly for movements of the same length of haul. Some contracts impose service standards on railroads, while others do not; some impose obligations on railroads to provide railroad-owned equipment or to move additional trainsets of coal at the shipper's request, while others do not. These sorts of requirements affect a railroad's marginal cost of handling these movements, but are not reflected in the URCS-based marginal costs developed for BNSF by AEP Texas.

AEP Texas attempts to down play this long-held view that URCS is not a suitable surrogate for the marginal costs required to implement Ramsey Pricing by arguing that it is only the *relative* costs that are important, not the absolute level of marginal costs. This statement is wrong for two reasons. First, as I have already noted, is the fact that URCS system-average costs are not sensitive to a host of factors that can radically change relative costs, such as diverse contract terms and extent to which certain movements do or do not move over capacity-constrained facilities. As a result, it is a false hope that they get the "relative costs" right. However, even if the *relative* costs were accurate, the absolute level of cost does matter for Ramsey Pricing calculations. If costs are overstated on average, even if the relative level of costs for each movement were accurate, this would lead to a different pattern of rate reductions across the movements in the stand-alone traffic group than if the lower, more accurate marginal costs were employed.[12]

[12] A simple way to illustrate this is to assume that all marginal costs were overstated – by the same amount across the board to maintain the proper *relative* cost levels touted by AEP Texas – and that this overstatement was sufficient to generate costs for certain movements that equaled or exceeded their existing rate levels. Under such circumstances, if a reduction in the amount of unattributable cost that needs to be recovered is indicated by a SAC test, these movements would incur none of this reduction, which would not be the case if the proper marginal costs had been employed.

Reliance on the sort of "system-average" approach to developing marginal costs that is advocated by WFA and AEP Texas also obviously distorts the rate/marginal cost relationships that it relies upon to infer relative demand elasticities. For example, all other things being equal, one would expect BNSF to charge a higher rate per ton for a movement on which it has agreed to a service performance standard (with penalties when it fails to perform) than on one where it has no such obligation. The higher rate reflects the higher risk and, therefore, higher marginal cost to BNSF of handling this movement. Yet the "system-average" approach would calculate identical marginal costs for both movements and infer that the movement that involved the service performance standard is more demand inelastic than the movement that does not because the contribution ratio is higher. Similarly, when a movement makes substantial use of congested BNSF facilities, one would expect BNSF to assess a higher rate per ton – all other things being equal – to offset the costs associated with the congestion (or, alternatively, the costs of eliminating this congestion). Once again, the "system-average" approach to calculating marginal costs would pick up the higher rate per ton, but fail to account for the higher costs, and lead it to conclude, generally, that movements over congested facilities are more demand inelastic than they are.

This discussion highlights a second, critically important flaw introduced by using URCS system average costs as the basis for calculating marginal costs for use in rate reduction methodologies that are allegedly based on Ramsey Pricing principles. I understand that significant network congestion is a real world factor on each of the major railroads that filed opening comments in this proceeding – particularly on lines used by traffic that has been part of stand-alone traffic groups in prior rate cases – yet stand-alone railroads are presumably constructed with sufficient network capacity to handle the traffic included in the stand-alone

traffic group during peak time periods. It obviously makes no economic sense in the real world to *reduce* rates for traffic that makes extensive use of rail facilities that are congested, because this will only encourage more demand for facilities whose capacity is already over-subscribed. But it is certainly possible that a properly-conducted SAC test of these same movements could demonstrate that revenues exceed the long-run forward-looking costs developed to construct and operate the SARR. In these circumstances, how should the Board reconcile the real world "state of play" with the results of a SAC analysis that relies upon a hypothetical efficient service provider?

The answer to this apparent conundrum lies in the principle set forth at the outset of this statement, *i.e.*, that the SAC test is merely a starting point for determining how to modify real world rates to eliminate distortions caused by barriers to entry and exit, and to be more economically and socially efficient in the long-run (it is obviously not efficient to encourage expanded use of facilities that are operating at or above capacity). Traffic that utilizes congested facilities experience very high marginal costs – costs that include a *pro rata* share of the full, forward-looking costs of expanding the network capacity to eliminate the congestion that these movements help to cause. In Ramsey Pricing terms, these very high marginal costs result in relatively small (or even negative) margins on the traffic moving over congested facilities, which in turn suggests that while facilities used by the issue traffic remain congested, minimal or no rate reductions would be warranted, *even if revenues seem to exceed SAC.*[13]

[13] As SAC is routinely calculated, depreciation is annuitized to reflect level conditions of deployment and utilization of capital facilities. However, where traffic is growing fast, or is subject to significant variations over time, facilities will sometimes be congested and sometimes be slack. Optimally, under the dynamics of Ramsey Pricing principles, depreciation should be relatively high when congestion makes contemporaneous marginal costs high, and depreciation should be relatively low when capital facilities are uncongested or even temporarily underutilized, and short-run marginal costs are correspondingly low. With such time-varying depreciation, revenues need not necessarily exceed SAC during times of congestion when optimal prices are high, because depreciation should be high as well.

In short, as the ICC recognized long ago, URCS-based system average variable costs – or variants on these costs – are not sufficiently movement-specific and network-specific to generate rate-to-cost ratios from which one can infer relative demand elasticities – and if marginal costs are not calculated in a manner that properly reflects what the I.C.C. termed "local factors" such as congestion and/or specific contract terms, economically and socially inefficient rate reductions could result.

Under such a dynamic pattern however, prices should fall to reflect the easing of congestion, as depreciation is backed down as well. Here, over time, the overall depreciation should average out (in appropriate discounted values) to the annuitized level, and revenues should be compared to SAC over the full cycle of congestion, capacity enlargement and congestion alleviation.

I declare under penalty of perjury that the foregoing is true and correct.

STB Ex Parte No. 657 (Sub-No. 1)

MAJOR ISSUES IN RAIL RATE CASES

REPLY VERIFIED STATEMENT

OF

JOHN C. KLICK

May 31, 2006

I. INTRODUCTION

My name is John C. Klick. I am a Senior Managing Director in FTI Consulting Inc.'s economic practice. My office is located at 1201 I Street, NW, Suite 400, Washington, D.C., 20005. A statement of my qualifications is attached as Exhibit No. __ JCK-1 to the Opening Verified Statement I filed in this proceeding on May 1, 2006.

I have been asked by BNSF Railway Company ("BNSF") to address certain issues raised in the WCTL Comments,[1] the *Additional Opening Comments of Western Fuels Association, Inc. and Basin Electric Power Cooperative, Inc.* ("WFA"), *Opening Comments of AEP Texas North Company* ("AEP Texas"), and *Comments of Arkansas Electric Cooperative Corporation* ("AECC"). The specific areas I have been asked to address are summarized below:

Rate Reduction

- The reduced mark-up methodology proposed by WFA, and the Generalized Percent Reduction Methodology ("GPRM") proposed by AEP Texas
- The train-mile allocation approach proposed by AECC witness Nelson

Revenue Allocation

- Criticisms of the Average Total Cost ("ATC") proposal, and the market based approach to revenue allocation, made in WCTL Comments

Cross-Subsidy

- Discussion of the cross-subsidy issue set forth in the Borts and Grimm Verified Statements attached to the WCTL Comments

[1] *Joint Opening Comments of Western Coal Traffic League, Concerned Captive Coal Shippers, Western Fuels Association, Inc., Edison Electric Institute, National Rural Electric Cooperative Association, and American Public Power Association* ("WCTL Comments").

II. RATE REDUCTION ISSUES

A. AEP Texas's Generalized Percentage Reduction Method Does Not Implement Ramsey Principles

In its Opening Comments, AEP Texas North Company (AEP Texas) identifies significant flaws in both MCM and MMM, and proposes that the Board adopt instead the Generalized Percentage Reduction Method ("GPRM") that it first proposed in STB Docket No. 41191 (Sub-No.1).[2] AEP Texas states that GPRM "modifies the Board's [percentage reduction] methodology to be consistent with Ramsey pricing principles," and contends that it "allocates rate relief based on the maintenance of the ratios of price markups over marginal cost." AEP Texas's suggestion that its rate reduction approach is consistent with the principles of Ramsey pricing is wrong for several reasons.

As several witnesses for BNSF noted on Opening, in formulating the *Guidelines*[3] the ICC was guided by the economic principles underlying Ramsey pricing. The ICC found it to be impractical to impose pure Ramsey pricing as the mechanism for determining rate reasonableness, because doing so "requires both the marginal cost and the elasticity of demand to be quantified for every movement in the carrier's system. Thus, the amount of data and degree of analysis required seemed overwhelming."[4] The ICC determined to rely upon "formal" Ramsey pricing only as a theoretical *guideline*, and adopted Constrained Market Pricing ("CMP") and the stand-alone cost ("SAC") test as practical alternatives for assessing rate reasonableness that it anticipated would promote Ramsey prices in the freight rail industry.[5]

In advocating GPRM, AEP Texas effectively claims to have found a shortcut that eliminates all of the difficulties and burdens of calculating true Ramsey prices that the ICC

[5] *Id.* at 534.

identified during the *Guidelines* proceeding.[6] As a logical matter, if calculation of Ramsey prices is not practical because it is too complex, the likelihood that Ramsey prices could be closely approximated using GPRM is highly implausible.[7] Although GPRM does exhibit some superficial consistency with Ramsey pricing principles, it suffers from two fundamental problems – neither the revenues nor the marginal costs used in the GPRM rate reduction calculations are meaningful for calculating demand elasticity.

1. AEP Texas's Opening Comments Do Not Clearly Identify Which Version of GPRM It is Proposing in this Proceeding

In Docket No. 41191 (Sub-No.1) – in response to criticisms of its Opening evidence made by BNSF – AEP Texas changed the way it performed its GPRM calculations when it filed its brief in that proceeding. The confusion in this proceeding arises because AEP Texas's Opening Comments do not acknowledge the change that was made in its Docket No. 41191 (Sub-No. 1) pleadings, and it includes documents from the rate case that both precede and succeed the change made on brief as attachments to its GPRM discussion in this proceeding.

---

[6] Specifically, AEP Texas states:

> As a practical matter, coal rate proceedings do not readily permit the specific calculation of marginal service costs for each member of the SARR traffic group. Such a showing would be extremely burdensome. This limitation should not affect the use of GPRM, however, as there is no need to compute the actual marginal costs of a particular movement with specificity. Instead, the goal is to measure the markups above similarly determined cost levels on other rates in the traffic group. As long as the rates are measured against a consistent cost standard, the relative markups can be determined in order to allocate the excess SARR revenues over SAC. AEP Texas Rebuttal at III-G-46 to 47. The average marginal costs for a movement can be determined using publicly available Phase III URCS data for the defendant railroad in the base year of the SAC analysis. AEP Texas Opening at III-G-32 to 33. The SARR revenue per ton attributable to each member of the traffic group then can be compared to the appropriate marginal cost figure, based upon distance, to arrive at the relative markups. *Id.* at 32 to 33. AEP Texas Opening Comments at 11-12.

[7] If it were appropriate to determine the Ramsey optimal prices for the subset of the defendant's system represented by the stand-alone shipper group, the way to determine them would be to calculate the revenue need for the stand-alone railroad (configured to handle the historical and projected volumes of the shipper group) and then set the rates for the shippers in the group based on their demand elasticity and marginal cost. The ICC's discussion of difficulties in implementing pure Ramsey pricing suggests that these calculations cannot be feasibly made, and if this is so it is not likely that one could "back into" reliable Ramsey prices for the subset of the defendant's system in the manner proposed by AEP Texas.

At page III-G-30 of its Opening Narrative in Docket No. 41191 (sub-No. 1), AEP Texas states:

> Following Ramsey principles, a rate reduction or rate relief allocation methodology should attempt to maintain price mark up ratios across the market in question. Herein, AEP Texas proposes and applies an alternative formula -- called the "generalized percentage reduction" rule -- that allocates relief *based on the maintenance of the ratios of price markups over marginal cost.*[8]

A very similar claim is made for GPRM in this proceeding.[9] Note, too, that these claims support BNSF's view – expressed in its Opening Comments by Professors Willig and Kalt, that any acceptable rate reduction methodology must (1) reduce rates for *all* members of the stand-alone traffic group, and (2) maintain the existing rate/cost relationships that are established by the incumbent railroad based on its assessment of market demand.

In Docket No. 41191 (Sub-No. 1), however, examination of the workpapers in which AEP Texas had actually implemented its GPRM calculations revealed that AEP Texas had not in fact maintained the ratios of price markups over marginal cost.[10] Instead, the way AEP Texas computed the rate reduction for the movements in its stand-alone traffic group, including the issue traffic, was to employ the following iterative process for each quarter of the DCF period:

1. Rank order the SARR traffic movements in each quarter by revenue-to-"marginal cost" ratios, highest to lowest.[11]

2. Determine the amount by which TNR revenues in the quarter must be reduced to ensure that overall stand-alone revenues are equal to overall stand-alone costs across the DCF period.

---

[8] AEP Opening Nar. at III-G-30, emphasis supplied.

[9] "The goal of GPRM is to allocate excess revenues over SAC in a manner which simultaneously provides reductions to all shippers in a group whose contributions exceed marginal costs, and closely maintains the relative relationship of each shipper's respective demand elasticity to every other shipper's." AEP Texas Opening Comments at 13.

[10] AEP Texas's application of the "generalized percentage reduction" rule to the TNR is reflected in AEP Texas's Opening electronic workpapers "2000-Q2 AARM.xls" through "2020-AARM.xls," and "Alternative Rate Reduction Rev Ton and Mile Inputs1.xls," "Final SAC Netting and Index.xls," and "AARM Template.xls."

[11] Marginal costs are those developed by the process that I critiqued earlier in this verified statement.

3. Begin the iterative process by reducing revenues for the movement with the highest revenue-to-"marginal cost" ratio until its revenue-to-"marginal cost" ratio just equals the revenue-to-"marginal cost" ratio for the movement rank ordered just below (*i.e.*, the movement with the second highest revenue-to-"marginal cost" ratio).

4. Check to see whether the resulting revenue reduction is sufficient to completely eliminate the quarter's excess revenues, as identified in step 2. If yes, go to step 7; if not, proceed to step 5.

5. Sequentially reduce the revenues for the movements with the highest *two* revenue-to-"marginal cost" ratios until their revenue-to-"marginal cost" ratios just equal the revenue-to-"marginal cost" ratio of the movement rank ordered 3.

6. Repeat steps 4 and 5, sequentially reducing the revenue-to-"marginal cost" ratios for each move above the iteration cut-off point down to the revenue-to-"marginal cost" ratio of the rank ordered move just below the iteration cut-off point until the cumulative revenue reductions are sufficient to eliminate the quarter's excess revenues, as identified in step 2.

7. The prescribed rate for the issue traffic is the revenue per ton shown for the issue traffic movement at the end of the *prior* iteration.

This approach does not come close to "maintaining the ratios of price markups over marginal costs," as AEP Texas claimed it intended. Instead, all of the movements above the iteration cut-off point end up exhibiting *identical* ratios of revenue to "marginal costs," while *none* of the movements below the iteration cut-off point experience any rate reduction at all. Thus, the prescribed rates that AEP Texas calculated in its opening evidence in Docket No. 41191 (sub-No. 1) were characterized by flaws similar to those BNSF identified for MCM and MMM in its Opening Comments in this proceeding, and thus bore no resemblance at all to an outcome consistent with Ramsey pricing principles.

On brief in the Docket No. 41191 (Sub-No. 1) proceeding, AEP Texas modified the way it applied GPRM to be more Ramsey-like, *i.e.*, it modified GPRM to develop rate reductions for each movement in the stand-alone traffic group as described at pages 13 and 14 in its Opening Comments. If revenues exceed SAC, the *corrected* GPRM approach does in fact reduce revenue

levels for each and every movement in the stand-alone traffic group (assuming revenues generated by a movement exceed its "marginal costs"), and does leave each movement's revenue-to-"marginal cost" rank-ordering unchanged.

The witnesses that developed GPRM for AEP Texas in Docket No. 41191 (Sub-No. 1) – Douglas Caves, Kelly Eakin and Mark Meitzen – showed in Exhibit III-G-11 to the opening evidence in the rate proceeding that GPRM was intended to reduce rates for all traffic movements in the stand-alone traffic group, and maintain the relative revenue-to-"marginal cost" rank order of each movement (*see* pages 4 through 5 of Exhibit III-G-11, attached as Exhibit A to the AEP Texas Opening Comments). This, coupled with the fact that on brief AEP Texas conformed *application* of GPRM in the way it was described by its witnesses, strongly supports the criticisms of MCM and MMM made by BNSF in its Opening Comments in this proceeding.

Nevertheless, because it relies upon marginal cost calculations that are fatally flawed, even the corrected GPRM approach is inferior to the Board's traditional percentage reduction method ("PRM"), which does not require marginal cost calculations, but does reduce each issue traffic rate, and does maintain each movement's revenue-to-"marginal cost" rank order.

2. AEP Texas's Calculations Do Not Use Prices that Reflect Demand for Through Service

The contribution margins that Ramsey pricing calculations would rely upon, if they could be done properly, are presumably an indicator of how valuable rail service is to each individual customer of the incumbent. However, when the vast majority of movements in a stand-alone traffic group are cross-over movements – as has been the case in virtually all of the recent SAC proceedings before the Board – the revenues that GPRM uses to develop its markup ratios do not reflect the prices set in the real world for the end-to-end transportation service provided by the incumbent for each cross-over movement, but are allocations of end-to-end revenues derived

using MSP, ATC or some other formulaic methodology. Thus, the revenues used by AEP Texas in its GPRM are not prices for through service and, as a result, cannot possibly reflect the value of rail service to each shipper, because there is no shipper demand for only a portion of an end-to-end movement, and no way of determining the shipper's willingness to pay for transportation to an imaginary interchange point. Thus, any "Ramsey-based" rate reduction would have to be calculated in light of the rate for the *through* movement.

As I suggested in my Opening V.S., this can be done without altering the fundamental nature of SAC presentations. The first step is to assume that the dollar amount of the overcharge developed from a SAC study, using cross-over traffic, would be no larger if a "full SAC" study were conducted.[12] This overage can then be eliminated by applying an equal percentage reduction to the mark-ups over marginal costs developed for the *through* movements of each movement in the stand-alone traffic group, including each cross-over traffic movement (information that is easily developed from data routinely available in SAC cases). This approach preserves the relative demand-based markups across all *through* movements, consistent with Ramsey pricing principles.

3. AEP Texas Has Not Determined Marginal Costs in the Manner Necessary for Proper Calculation of Ramsey Prices

AEP Texas's proxy for demand elasticities requires a calculation of marginal costs. In Docket No. 41191 (sub-No. 1), AEP Texas's witness Whitehurst calculated marginal costs based on BNSF URCS costs. As the ICC recognized long ago, and as Professors Willig and Kalt

[12]This is a reasonable assumption, because if building a full SAC would substantially increase the amount by which revenue exceeds SAC, complainants have every incentive to do so. In fact however – consistent with this logic and with the overall revenue inadequacy of railroads – the "serial build out" analysis conducted by BNSF in *Laramie River* demonstrates that a "full SAC" analysis is most likely to exhibit a lower excess of revenue over SAC. Reply Evidence and Argument of BNSF Railway Company, STB Docket No. 42088, *Western Fuels Association, Inc. and Basin Electric Power Cooperative, Inc. v. BNSF Railway Company* ("*Laramie River*"), Narrative, Volume I of II, at III.A-14.

explain in their Reply Verified Statements, use of URCS (or modifications of URCS) for this purpose does not yield proper Ramsey prices. In *Guidelines*, the ICC stated that both Rail Form A and URCS costs:

> yield cost estimates which are based largely on system-wide averages. Ramsey pricing requires the use of economic costs rather than accounting costs. Although Rail Form A or URCS might be useful as a rough indicator of economic costs, we recognize that local factors and circumstances may cause the economic costs to differ greatly from accounting estimates. Such local factors might include, for example, where the movement is a backhaul or off-peak movement or whether the facilities involved are congested.[13]

The ICC's observations apply with equal force to AEP Texas's supposed development of "marginal costs" for use in GPRM.

In its Opening Exhibit III-G-12, from Docket No. 41191 (sub-No. 1), AEP Texas explained how W. W. Whitehurst & Associates, Inc. supposedly calculated "marginal costs for standard BNSF system-average unit coal train movements based on the Board's URCS costs for the year 2001" for the purpose of applying the GPRM. As described therein, AEP Texas started with standard URCS variable unit costs, and modified those costs by:

- eliminating the URCS general overhead rates;
- eliminating supervision and superintendence for maintenance-of-way ("MOW"), maintenance of equipment ("MOE") and transportation;
- eliminating fixed plant depreciation and lease rentals ("DLR") and fixed plant ("ROI");
- adding current year replacement costs for track structure to maintenance-of-way operating expenses (i.e., the URCS gross ton-mile Table D1 unit costs); and
- eliminating certain CLOR costs that are not associated with coal unit train service.

[13] *Guidelines*, 1 I.C.C.2d at 532 n.31.

These modified "system-average marginal costs" were then applied, using the URCS Phase III costing procedures, employing the Ex Parte No. 270 trainload adjustments, to generate costs for movements of 300, 600, 900 and 1200 miles. These costs, in turn, were used to develop a series of "cost factors" that AEP Texas alleges can be used to "approximate" movement costs for other lengths of haul (and differences in other shipment characteristics, such as termination vs. interchange and car ownership). This approach to developing marginal costs is inappropriate for the purpose of developing Ramsey prices for two primary reasons.

First, the basic assumption of AEP Texas's approach – *i.e.*, that all movements with the same length of haul, same class of traffic and same car ownership characteristics will exhibit the same marginal cost – is not sufficiently movement-specific to yield meaningful Ramsey prices. As explained in the Reply Verified Statements of Professors Kalt and Willig, economic theory requires that the marginal costs used in applying Ramsey prices use costs calculations that reflect, with precision, the specific characteristics of each movement. If a movement uses a portion of the railroad that is particularly congested, its marginal costs must reflect the costs of this congestion (*i.e.*, either the slower transit times and higher probability of crews outlawing on congested routes, and/or the investment costs that will be required to eliminate this congestion). On the other hand, if the movement uses a portion of the railroad where there is excess capacity, such costs would not be part of the marginal costs required to properly implement Ramsey pricing. Similarly, properly-developed marginal costs should reflect differences in the "risk-profile" of individual movements. Movements under contract are more certain than movements under common carrier rates; movements from or to solely-served locations are more certain than movements between competitively-served locations. As a result, investments in locomotives,

freight cars and rights-of-way to handle some movements carry less risk than similar investments associated with other traffic.

More mundane examples exist of the sorts of movement-specific detail that should be reflected in Ramsey prices. In Docket No. 41191 (Sub-No. 1), AEP Texas's application of GPRM assumed that all movements would load to 111 tons per car, move in trains of 110 cars, and require a system-average consist of system-average locomotives to move a system-average number of miles per day. The reality is, however, that these characteristics for individual coal unit train movements exhibit considerable variation.

Contract obligations differ from movement to movement and can impose significantly different costs on BNSF for otherwise similar movements. Some contracts impose service standards on BNSF, while others do not; some impose obligations on BNSF to provide railroad-owned equipment or to move additional trainsets of coal at the shipper's request, while others do not. These sorts of requirements affect BNSF's marginal cost of handling these movements, but are not reflected in the URCS-based marginal costs developed by AEP Texas.

AEP Texas's "system-average" approach to developing marginal costs for GPRM therefore distorts the rate/marginal cost relationships from which GPRM infers relative demand elasticities.[14] For example, all other things being equal, one would expect BNSF to charge a higher rate per ton for a movement where it has agreed to a service performance standard (with penalties when it fails to perform) than where it has no such obligation. The higher rate reflects the higher risk and, therefore, higher marginal cost to BNSF of handling this movement. Yet AEP Texas would calculate identical marginal costs for each movement and infer that the

[14] *See* AEP Texas Opening Comments at 12: "The marginal cost calculations in this instance are used to estimate the percentage markup for each movement. The estimated markups are used to infer the relative demand elasticities."

movement that involved the service performance standard is more demand inelastic than the movement that does not because the contribution ratio is higher.

Similarly, when a movement makes substantial use of congested BNSF facilities, one would expect BNSF to assess a higher rate per ton – all other things being equal – to offset the increase in marginal costs that is associated with operating a railroad at or above capacity. GPRM would pick up the higher rate per ton, but fail to account for the higher marginal costs, leading to the result that movements over congested facilities generally are more demand inelastic and subject to relatively high rate reductions in the event revenues are found to exceed SAC.

The second flaw implicit in the GPRM approach to developing marginal costs is somewhat theoretical, since it is overshadowed by the lack of precision inherent in GPRM's use of system-average URCS costs as the basis for its estimates of marginal costs. It is important, however, because AEP Texas's reliance on this view implies that precision in calculating marginal costs is not so critical (and, implicitly, suggests that the ICC had it wrong long ago when it concluded that Ramsey prices could not feasibly be calculated). This flaw is AEP Texas's contention, highlighted in the quotation cited above in footnote 6, that the absolute level of marginal cost for each individual movement does not need to be calculated accurately as long as the relative marginal costs for the movements in the stand-alone traffic group is approximated accurately. As Professor Willig explains, this assertion is simply wrong. Even if AEP Texas could demonstrate that the URCS-based procedure it uses to calculate marginal costs accurately reflected relative differences in "true" marginal cost – a demonstration that cannot in fact be made, since the URCS-based procedure cannot take differences in utilization of congested and un-congested facilities, differences in third party payments, differences in contract terms, and

other operational differences into account – departures from "true" marginal cost distort the allegedly "Ramsey-based" rate reductions from those that would be calculated if "true" marginal costs were used.

In summary, even if one could infer relative demand elasticities from existing revenue/marginal cost relationships (and, because of the extensive use of cross-over traffic and the consequent revenue allocation, one cannot), the system-average approach to calculating marginal costs employed by AEP Texas would render the numbers unreliable for purposes of a Ramsey-based analysis. For all of these reasons, the rate/marginal cost relationships relied upon by AEP Texas cannot accurately reflect "true" relative demand elasticities and, therefore, cannot produce "Ramsey-like" reductions in rates when revenues are found to exceed SAC for a given SARR.

B. WFA's Reduced Mark-Up Method Suffers from the Same Core Deficiencies as GPRM, and Exhibits an Additional Inconsistency with Proper Use of Ramsey pricing Principles to Calculate Rate Reductions When SAC Exceeds Stand-Alone Revenues

WFA also has a rate case pending at the STB in Docket No. 42088. In *Laramie River*, WFA proposed two alternatives to PRM to be applied if revenues were found to exceed SAC, the "Reasonable Allocation Method," or "RAM" (which is addressed in Professor Kalt's Reply V.S.) and the "Reduced Mark-Up Method."

The Reduced Mark-Up Method is similar to corrected GPRM. It relies upon URCS-based costs as "estimates" of marginal cost, and it reflects only the portion of the incumbent's end-to-end revenues that are allocated to the SARR. In this respect, it also suffers from the two fatal flaws of corrected GPRM. Like corrected GPRM, the Reduced Mark-Up Method generates rate reductions for all members of the stand-alone traffic group that exhibit contribution above

marginal costs, and as a result it preserves each movement's revenue-to-"marginal cost" rank order. Thus, it too highlights the shortcomings of MMM and MCM, and is also inferior to PRM.

In developing its URCS-based estimates of "marginal cost," however, the Reduced Mark-Up Method does not rely upon BNSF's URCS costs as a starting point, as does GPRM. Instead, it tries to "force" the costs developed for the SARR into an URCS format, and then uses these "unit costs" to develop its marginal cost estimates. As Professors Kalt and Willig explain, it is the marginal costs of the incumbent railroad that would be appropriate for any "Ramsey-based" rate reduction procedure (of course, as noted above, URCS-based estimates of "marginal costs" are not sufficiently precise for this purpose), not the marginal costs of the hypothetical competitor.

C. The Ton-Mile Alternative to MMM Proposed by Mr. Nelson Also Suffers from the Flaws Identified in BNSF's Opening Evidence

In the *Decision*, the Board suggested an alternative to the Maximum Mark-Up Methodology ("MMM") procedure that would apply a "fixed dollar" markup above variable costs, for each movement, to account for the excess of SAC over total variable costs for all movements in the stand-alone traffic group. *Decision* at 15-16. As I noted in my Opening V.S. in this proceeding, it is unclear whether the Board is proposing a fixed dollar mark-up per ton, per ton-mile, or per car-mile. Klick Opening V.S. at 9, fn 10.

In an Opening V.S. filed on behalf of Arkansas Electric Cooperative Corporation ("AECC"), Michael A. Nelson suggests yet another version of this "alternative formulation" of MMM that would use train-miles, as opposed to ton-miles or car-miles, to attribute the excess of SAC over total variable costs. Specifically, Mr. Nelson suggests a rate prescription procedure that would (1) first ensure that each movement covers its on-SARR variable costs, and then (2)

attribute the difference between SAC and the sum of all on-SARR variable costs (*i.e.*, the "contribution") to each individual movement on the basis of train-miles.

As an initial matter, whether the alternative formulation of MMM relies upon ton-miles, car-miles or train-miles, the fact remains that this particular methodology is fatally flawed for the same reasons I discussed in my Opening V.S. Klick V.S. at 9-23. Mr. Nelson' version of MMM also would create rate compression in railroad rate structures by ensuring that the highest-contribution movements in the stand-alone traffic group will all have their margins above variable cost driven to an identical amount per train-mile, and that the lowest-contribution movements will experience no rate reduction at all. This destroys the existing railroad pricing structure (contrary to the intent of *Guidelines*) and is inconsistent with the outcomes that would result from proper application of the principles of Ramsey pricing and contestability. Significantly, Mr. Nelson makes no effort to explain how his suggested approach might be deemed consistent with the economic principles of demand-based Ramsey pricing and contestable market theory that underpin the *Guidelines*.

Mr. Nelson is critical of "ton- and car-based measures" for allocating the excess of SAC over variable cost because, in his view, they are too "heterogeneous" to be reliable. Nelson Opening V.S. at 5. Instead, he asks the Board to "address this heterogeneity" by taking into account his view that "achievable capacity throughput for any given rail line is primarily governed by train movements rather than by more specific measures of commodity volume (i.e., cars or tonnage)." This effort to convince the Board that train-miles are more suitable than are ton-miles or car-miles, for allocation of SAC "contribution" to individual movements, serves to underscore that *all* rate prescription proposals that ignore individual shipper demand are

inherently arbitrary and, thus, inconsistent with the basic economic precepts relied upon by the ICC in *Guidelines*.

As experience with the RTC model in various rate proceedings has demonstrated, train-miles are not the homogeneous building block of railroad operations that Mr. Nelson suggests. High-speed train-miles associated with Intermodal trains are not the equivalent of train-miles generated by long, heavy unit coal trains, or unit grain trains, or general merchandise trains; and train-miles on congested main lines are not the equivalent of train-miles generated on underutilized branch lines. Furthermore, a *mix* of different train types can require more capacity than the same number of trains that are all essentially identical. And main line capacity requirements can be significantly affected by circumstances hundreds of miles away, as evidenced by the siding track capacity required on BNSF and UP mainlines and yards to stage unit coal trains into the capacity constrained PRB.

At bottom, Mr. Nelson's recommended approach suffers from *both* of the primary flaws that characterize all of the alternatives to PRM that have been proposed in this proceeding, *i.e.*, it (1) ignores the outcomes that Ramsey pricing principles would dictate – by creating rate compression at the highest-contribution end of the spectrum of stand-alone traffic and generating no rate reduction at all at the lowest-contribution end of the spectrum – and (2) relies upon URCS-based variable costs (or variations thereof) as a surrogate for the movement-specific marginal cost determination required for proper application of Ramsey pricing principles.

III. REVENUE ALLOCATION ISSUES

Shippers universally attack the Average Total Cost ("ATC") procedure that the Board proposed in its *Decision*. Instead, they argue that divisions should be "market based," and recommend as an alternative to "market based" divisions, continued use of MSP in allocating the

incumbent's end-to-end revenues to the SARR for its portion of each cross-over movement.[15] Most shippers also attack the Board's view that the outcome of a "full SAC" is the proper standard for evaluating bias – effectively confirming the railroads' long-held view that their use of cross-over traffic to-date has permitted them to achieve a better result than they could have obtained had they built all of the railroad required to replicate the incumbent's service for the movements in the stand-alone traffic group.[16] Professor Kalt addresses most of these arguments, but BNSF has asked that I address a couple of specific points.

As a threshold matter, it is important to recognize that real world divisions are not relevant to a SAC analysis. As Professor Kalt explains in his Reply V.S., the relevant "market-based" inquiry is what market behavior *in a contestable market* would dictate. Because real world railroad operations are by definition not contestable, real world divisions cannot be relevant to how revenues on cross-over traffic would be allocated in the contestable market environment that the Board seeks to replicate by applying the SAC test.

Evidence filed by the complainant in the *Otter Tail* proceeding makes it obvious why shippers seek to utilize real world divisions data, even though it is so clearly irrelevant to the SAC inquiry – it provides such fertile ground for manipulation of the SAC test.[17] WCTL's witness Crowley acknowledges as much in his Opening V.S. when he states:

---

[15] Some shipper witnesses do embrace "full SAC" as the proper standard. AECC's witness Nelson does so by effectively embracing the "willing" *and* "able" standard articulated by Professor Willig's Opening V.S. He is critical of all of the methods for revenue allocation that are under discussion in this proceeding because "none of the methods limit the off-SARR allocation of revenues to the level that ensures the revenue adequacy of off-SARR segments." Nelson Opening V.S. at 10. Of course, Mr. Nelson's concern is that railroads may be earning unreasonably high profits on cross-over traffic that might be allocated to the off-SARR portions of cross-over movements – a circumstance that is unlikely given railroad revenue inadequacy. I note that if this were the case, however, shippers can (and would) "take credit "for these high earnings, regardless of what revenue allocation procedure is adopted, by presenting a "full SAC" study – so no particular change is required in current SAC procedures to prevent Mr. Nelson's concern from being realized. As Professor Kalt explains, Mr. Nelson's proposed solution, in contrast, is inconsistent with contestable market principles.

[16] *See* Nelson Opening V.S. at 9-10.

[17] STB Docket No. 42071, *Otter Tail Power Company v. BNSF* Railway Company ("*Otter Tail*"). In that proceeding, the complaining shipper employed data produced by BNSF on unit train coal divisions to conduct

> Obviously, no complainant wants to have to redo an entire stand-alone case because the STB changed the method for calculating divisions on cross-over traffic but that is exactly what could happen. Stated differently, as the ATC divisions approach produces different revenues than does the MSP approach promulgated by the STB in recent proceedings, the traffic group selected using MSP will not necessarily maximize profitable traffic when using the ATC approach. The ATC approach will force a complainant to evaluate and include longer haul traffic in the stand-alone group. Therefore the complainant in proceedings where the traffic group was selected using the MSP approach will be forced to reevaluate the selection of the traffic group if the ATC approach is adopted. Crowley Opening V.S. at 10.

The sentiment so candidly expressed by Mr. Crowley explains why shippers oppose so vehemently the Board's view, which is clearly correct, that use of cross-over traffic should not create a SAC result that is radically different from the outcome that would be achieved if a "full SAC" study were conducted; and it explains why they argue so strenuously for real-world "market-based" divisions for cross-over traffic – which clearly are irrelevant to the contestable market environment that informs the SAC test – instead of addressing substantively the evidence that Professor Kalt has presented on what *contestable market behavior* would establish as the appropriate allocation of cross-over traffic revenue to the SARR. Finally, it underscores the importance of Professor Willig's view that if the Board is going to use an approximation such as MSP or ATC to establish cross-over traffic revenues attributable to the SARR in the first

---

regression analyses (using revenue divisions as the dependent variable, and shipment distance as the independent variable). These regression results were then used to estimate the SARR revenue allocation for the cross-over movements. Otter Tail used this regression approach to argue that its SARR was entitled to a significant division of revenues even when it performed minimal or *no* line haul service. Had the Board accepted this approach, it would have created even more incentive for shippers to reduce, as much as possible, the on-SARR distances traveled by cross-over traffic.

In response, to Otter Tail's evidence, BNSF argued that real world divisions were irrelevant to the SAC test, *and* demonstrated that Otter Tail's analysis was rife with statistical errors, the most significant of which was a "relevant range" problem created by the fact that the shortest real world length of haul for which real world divisions were available was substantially longer than the on-SARR lengths of haul for the vast majority of the cross-over traffic movements, rendering the real world divisions of no statistical value in analyzing the cross-over traffic movements. In addition, BNSF identified a host of other statistical problems with the conclusions drawn by Otter Tail that rendered its analysis unusable. In its decision, the Board rejected the market-based approach in favor of a cost-based approach. *Otter Tail* decision at 13-15.

instance, it is critical that the parties be provided an opportunity to demonstrate potential bias, vis a vis a "full SAC" presentation.

A second attack shippers have launched against ATC is to suggest that there is no mathematical difference in the way DARA and ATC work. Borts Opening V.S. at 19. As a result, they argue, the Board's prior rejection of DARA because "the DARA formula did not actually factor in economies of density" should apply with equal force to ATC.[18] There are two responses to this criticism. First, as the table below demonstrates, ATC does in fact treat economies of density differently than does DARA as densities increase.

[18] As the Board states in *Otter Tail*, DARA was rejected because "as the relative economies of density changed (reflected in changes in average total costs) DARA would not adjust the portion of the revenues allocated to each segment, and thus would not achieve its stated objective . . . The defining feature of industries with strong economies of density is decreasing average total cost with output." *Otter Tail* decision at 16, citing *Public Serv. Co. of Colo. d/b/a Xcel Energy v. Burlington N. & S.F. Ry.*, STB Docket No. 42057 ("*Xcel*"), slip op. at 11 (STB served Jan. 19, 2005.

Table 1 Demonstration that ATC and DARA Perform Differently As Densities Increase				
	ATC		DARA	
	SARR	Residual Incumbent	SARR	Residual Incumbent
Mileage	500	500	500	500
Variable Cost Per Ton	$5.00	$5.00	$5.00	$5.00
Fixed Costs Per Mile	$160,000	$160,000	$160,000	$160,000
End-to-End Rate	$20.00	$20.00	$20.00	$20.00
First Hypothetical				
Density (Millions of Tons)	50	25	50	25
Fixed Costs Per Ton-Mile	$.0032	$.0064	xxx	xxx
Fixed Costs Per Ton	$1.60	$3.20	xxx	xxx
Variable Costs Per Ton	$5.00	$5.00	$5.00	$5.00
Total Cost Per Ton	$6.60	$8.20	xxx	xxx
DARA Allocation of Contribution	xxx	xxx	$3.33	$6.67
DARA Total Revenue Allocation	xxx	xxx	$8.33	$11.67
Division of End-to-End Rate	44.6%	55.4%	41.7%	58.3%
Second Hypothetical				
Density (Millions of Tons)	100	50	100	50
Fixed Costs Per Ton-Mile	$.0016	$.0032	xxx	xxx
Fixed Costs Per Ton	$0.80	$1.60	xxx	xxx
Variable Costs Per Ton	$5.00	$5.00	$5.00	$5.00
Total Cost Per Ton	$5.80	$6.60	xxx	xxx
DARA Allocation of Contribution	xxx	xxx	$3.33	$6.67
DARA Total Revenue Allocation	xxx	xxx	$8.33	$11.67
Division of End-to-End Rate	46.8%	53.2%	41.7%	58.3%

Table 1 compares results for ATC and DARA under two hypothetical examples in which, in each case, densities on the SARR are twice as high as densities off the SARR. In the second hypothetical, however, densities on- and off-SARR are twice as high as they are in the first hypothetical. Table 1 demonstrates that as overall densities increase – even though the relationship *between* on-SARR and off-SARR densities remains in proportion – the ATC-based divisions get systematically closer to the 50/50 split that would exist if there were no economies

of density, as is assumed for example by MSP.[19] In contrast, DARA would generate the same division *regardless* of densities, as long as the relationship between on-SARR and off-SARR densities remains in proportion. In short, while both ATC and DARA take economies of density into account – which is clearly a failing of MSP – Table 1 demonstrates that under ATC those effects decline as overall densities increase. This is fully consistent with the Board's view that at higher densities, economies of density become less pronounced. In contrast, the DARA result is unaffected by increases in overall line density, as the Board noted in *Otter Tail* and *Xcel*.

Professor Borts's criticisms also exhibit a fundamental misunderstanding of URCS. For example, he states that:

> It is reasonable to allocate the variable cost of a particular movement on a route mile basis, because variable costs do increase with the length of haul among other indicia of rail output. But there is no rationale for allocating fixed costs on the same basis. For if fixed costs did vary with length of haul they would not be measure as fixed. Borts Opening V.S. at 19.

As the Board recognizes, URCS employs measures of both output and capacity as independent variables in its regressions. When URCS uses the term "variable," it is describing costs that change over the medium to long run as changes in *output* occur, given a specified level of railroad capacity. Thus, the "percent variable," in URCS parlance, is calculated as the ratio of total variable expenses (output coefficient multiplied by total units of output) divided by the total variable costs *plus* total "fixed costs" (in which "fixed costs" are calculated by multiplying the capacity coefficient by total units of capacity). Because URCS itself calculates a cost per unit of capacity (*e.g.*, each mile of road), it is obvious that total capacity costs will increase as the size of

[19] At page 9 of his Opening V.S., Mr. Crowley states ". . . ATC also fails because the STB's proposal intends to rely on system average variable costs as determined by the URCS Phase III calculation and an allocation of fixed costs based on route miles. The application of these system factors to movement-specific rates will in no way recognize the economies of scale, scope and density which the STB is seeking." I do not understand the point Mr. Crowley seeks to make here, but Table 1 clearly demonstrates that his conclusion is wrong – ATC obviously does reflect economies of density.

the railroad increases, but that does not change the fact that these costs are a fixed cost for a given plant size across *all* levels of output.

Both WCTL witnesses Borts and Crowley also criticize ATC as a form of fully-allocated pricing. Borts, for example, states that:

> There is no theoretical justification for allocating fixed costs. Indeed, if such a justification did exist we wouldn't need a SAC approach to the determination of freight rates on captive movements. We would just allocate all of the fixed costs of the railroad's traffic on a route mileage basis." *Id.* at 19-20.

Clearly, fully-allocated costs are not an appropriate basis for setting prices, for all of the reasons articulated in *Guidelines*. But here, we are seeking to allocate the incumbent's end-to-end revenues on cross-over traffic to the SARR – for providing only a portion of the incumbent's end-to-end service – in a manner that "reflects, to the extent practicable, the defendant carrier's relative average costs of providing service over the two segments" *Decision* at 18. Clearly, significant differences in the utilization of fixed plant facilities on-SARR as compared to off-SARR affect the relative average costs – and ATC incorporates those differences. If a "full SAC" analysis were undertaken, different levels of fixed plant utilization experienced in providing end-to-end service would automatically be incorporated into the analysis; the Board has designed its ATC revenue allocation mechanism to reflect this reality in the context of a "partial SAC" analysis that relies heavily on cross-over traffic. *Otter Tail* decision at 14.

In summary, the Board is right in finding that economies of density need to be taken into account in developing a cost-based alternative of cross-over traffic revenues to the SARR, and it is obvious that MSP does not do so. *Decision* at 18. The Board is also correct in observing that the outcome of a "full SAC" is conceptually the right standard for evaluating whether a given cross-over revenue allocation mechanism constitutes a reasonable "approximation." ATC is

clearly superior to other cost-based mechanisms that have been suggested in this proceeding, because it takes economies of density into account (as is implicitly the case in a "full SAC" analysis).[20]

IV. BORTS'S CRITIQUE OF THE *PPL* CROSS-SUBSIDY ANALYSIS REFLECTS A SERIOUS MISUNDERSTANDING OF THE BOARD'S PROCEDURES

In his Reply V.S., Professor Willig addresses the conceptual issues raised by the views expressed by WCTL's witnesses Grimm and Borts in arguing that the Board should cease applying the cross-subsidy test proposed by the Board in *PPL*[21] and *Otter Tail*. BNSF has asked me to focus on the schematic displayed at page 12 of the Borts Opening V.S., and the conclusions that Dr. Borts draws from that schematic at pages 12 through 15. For the Board's convenience, I reproduce the schematic below:

Shippers 1 and 2		**Cordero**		**Rochelle**		**Shipper 3**
A←	**$70**	**→B←**	**$30**	**→C←**	**$10**	**→D**

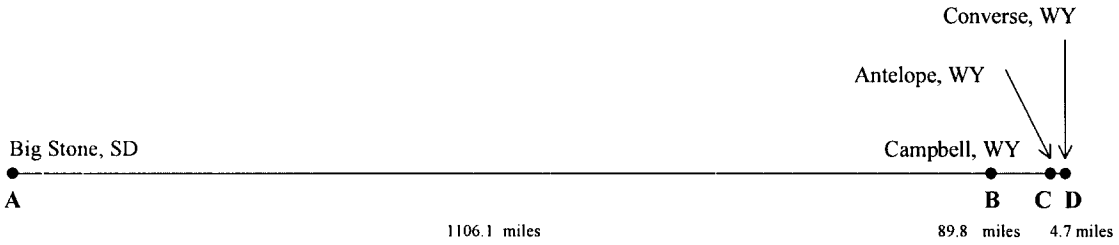
As a threshold matter, the Borts schematic is misleading in two respects. First, it suggests that the "BC Segment" over which there is some "overlap" between the traffic that utilizes the lighter-density route required by the issue traffic (Shippers 1 and 2 in the Borts example) and the traffic that uses the heavier-density segment (Shipper 3) is relatively long. Second, the schematic in the *Otter Tail* decision is a hypothetical illustration of how a "second-

[20] Because a "full SAC" analysis would rely upon efficient, forward-looking costs for various assets and operations required to handle the cross-over traffic end-to-end, while ATC relies upon URCS (which reflects an embedded investment base for the incumbent's assets), there are differences between ATC and a "full SAC" analysis that could render ATC inconsistent with the outcome of a "full SAC" analysis. For this reason, the recommendation made by Professor Willig in his Opening V.S. that ATC be used as an approximation for the purposes of allocating cross-over revenues to the SARR, and that parties be provided with an opportunity to demonstrate in the context of a specific case that it creates a biased result, is sound regulatory policy.

[21] STB Docket No. 42054, *PPL Montana, LLC v. The Burlington Northern and Santa Fe Railway Company.*

order" cross-subsidy test would be conducted, not an illustration of the way the Board actually applied the cross-subsidy test in either *Otter Tail* or *PPL*.

Borts implies that the existence of a BC segment, in which there is an overlap between the traffic that uses the lighter-density AB segment and the traffic that uses the heavier-density CD segment, is a significant problem for the Board's cross-subsidy approach because neither of the two groups of traffic is "solely responsible for the . . . cost of the BC segment." Specifically., Borts states:



> Under a correct application of the PPL test, Shippers 1 and 2 must cover the $70 cost of the AB segment, but they alone are not responsible for the $30 cost of the BC segment. That cost will be shared with Shipper 3. There is no reason why Shipper 3 should be permitted to use the SARR's BC segment for nothing. The only truly attributable costs are those that would disappear if the shipper's traffic disappeared. If Shippers 1 and 2 disappeared, Shipper 3 would still have to cover the cost of the BC segment. Borts Opening V.S. at13.

This statement is clearly correct – and the Board's cross-subsidy test does nothing that is inconsistent with it. What Borts either fails to recognize, or chooses to ignore, is that the Board's application of the cross-subsidy test explicitly addresses this problem by distinguishing between "right-of-way" costs and "operating" costs, and properly considering whether or not these should be included in the attributable costs of the lighter-density segment.

In applying the cross-subsidy test, the Board includes *all* of the revenues generated by Shippers 1 and 2, but explicitly *excludes* all of the right-of-way costs of the BC segment from the attributable costs it calculates for Shippers 1 and 2. It also explicitly *excludes* all of the operating costs incurred on the BC segment by Shipper 3. As a result, the only BC segment costs that the Board's cross-subsidy test includes in the attributable costs calculated for Shippers 1 and 2 would be the operating costs incurred by Shipper 2 (since Shipper 1 does not traverse the BC

segment) – which (to use Borts's formulation) clearly would disappear if Shipper 2 disappeared.[22]

I noted above that the Borts schematic is misleading, because it does not reflect the fact that in the STB's real world applications of the cross-subsidy test, the equivalents of the BC segment have been relatively small in comparison to the real world equivalent of the AB segment. To be more realistic, I produce below a schematic of the actual *Otter Tail* cross-subsidy analysis.

In *Otter Tail*, the equivalent of the BC segment – where there is some overlap between the traffic using the lighter-density segment and the traffic using the heavier-density segment – is only 90 miles long, or 7.5 percent of the total SARR route mileage. The AB segment is over 1,100 miles long.

While the validity of the Board's approach is not a function of the relative lengths of these segments, the likelihood that a cross-subsidy will be found to exist increases when the BC segment is relatively short. Note that if the BC segment were relatively long in relation to the AB and CD Segments – implying that Shippers 1, 2 and 3 shared a significant portion of total SARR facilities – the Board's approach of including the full Shipper 1 and 2 revenues, but

[22] It is on this point that the Borts example goes awry. He asserts that the "cost" of the BC segment is $30, without distinguishing between right-of-way and operating costs. Because the Board's process would include only Shipper 2's *operating* costs in the attributable costs of Shippers 1 and 2, the $30 is clearly attributable to Shipper 2. But Borts treats the $30 as though it were entirely right-of-way cost that would remain to be covered by Shipper 3, even if Shipper 2 disappeared – which is clearly not consistent with the way the Board applies the test.

excluding all of the right-of-way costs for the BC segment, would make it more difficult to show the existence of a cross-subsidy of Shippers 1 and 2, because most of the construction costs of the SARR would be eliminated from the attributable costs of Shippers 1 and 2.

Because the Board's cross-subsidy test assumes that Shippers 1 and 2 (the potentially subsidized traffic) incur *none* of the right-of-way costs of the BC segment, the only BC segment costs that the Board attributes to Shippers 1 and 2 are the operating costs for Shippers 1 and 2, which clearly are attributable to this traffic; and by assuming that Shipper 3 will cover no more than the full right-of-way costs of the BC segment plus its own operating costs, the Board's cross-subsidy test prevents Shipper 3 from paying for any facilities or services that it does not use. In short, the Board's continued application of the cross-subsidy test is appropriate and, as Professor Willig explains, fully consistent with the principles set forth in *Guidelines*.

I declare under penalty of perjury that the foregoing is true and correct.

Baranowski

REPLY VERIFIED STATEMENT

OF

MICHAEL R. BARANOWSKI

I. INTRODUCTION

My name is Michael R. Baranowski. I am the same Michael R. Baranowski who filed a verified statement in this proceeding on behalf of BNSF on May 1, 2006. A statement of my qualifications is attached as Exhibit No. __ MRB-1 to that statement.

In my opening statement, I addressed two of the issues for which the Board sought comments in its February 27, 2006 Decision in Ex Parte No. 657 (Sub-No. 1), *Major Issues in Rail Rate Cases* ("X-657 Decision") -- the Board's proposal to reflect productivity in indexing operating costs and its proposal to shorten the DCF period to ten years. Specifically, I (1) explained why it was unrealistic to assume that the SARR would achieve any productivity in the first ten years of its operations, (2) examined the extent to which future productivity improvements should be reflected in forecasts of stand-alone operating expenses beyond year 10 of a SARR's life; and (3) offered a proposal to reflect future productivity gains that is consistent with the manner in which SARR operating expenses are determined beginning in year 11 of the DCF period. I also addressed the advisability of shortening the DCF period used in SAC studies from 20 to 10 years and explained the relatively minor changes that would be required to the Board's DCF process to implement such a proposal.

BNSF has now asked me to address certain of the opening comments made by parties relating to these two topics. In Section II of my testimony, I address shippers'

comments related to adjustments to SARR operating expenses to reflect the benefits of future productivity, and in particular, I address the following points:

- I discuss the fallacy of shippers' claims that forecasts of future productivity need to be reflected in SARR operating expenses to avoid a disparity between the treatment of SARR operating costs and revenues.
- I explain that the vast majority of the potential productivity improvements identified by shippers (1) are already captured in the SARR operating expenses, (2) are unavailable to a SARR entrant, or (3) would not be realized within the first ten years of SARR operations.
- I explain why shippers' assertion that Class I railroad assets average only seven years in age is wrong.
- I explain why shippers' proposals for determining SARR productivity, which align future SARR productivity with the productivity that will be experienced by the railroad industry as a whole, overstate SARR productivity.

In Section III of my testimony, I address the shippers' unfounded assertion that a change in the DCF period from 20 to 10 years necessitates a change to the SARR debt amortization period.

II. EVALUATION OF THE PARTIES' PRODUCTIVITY COMMENTS

In the Joint Opening Comments of Western Coal Traffic League, et al. ("WCTL" or "Coal Shippers"), WCTL, not surprisingly, lauds the Board's efforts to introduce a productivity adjustment that begins with the second year of SARR operations, but argues that the Board has not gone far enough to eliminate what it describes as the "illogical and unsupported disparity between the manner in which the Board indexes operating expenses and the manner in which the Board forecasts SARR revenues".[1] WCTL further

[1] Joint Opening Comments of Western Coal Traffic League, Concerned Captive Coal Shippers, Western Fuels Association, Inc., Edison Electric Institute, National Rural Electric Cooperative Association and American Public Power Association, May 1, 2006 at 69.

complains that the Board has erred by assuming that a SARR will not enjoy the benefits of any productivity enhancements in its first year of operations and that it is wrong to assume that a SARR's ability to benefit from productivity enhancements in a manner that is comparable to the rail industry as a whole will only be achieved after the twentieth year of SARR operations. WCTL at 69. In place of the Board's proposal, WCTL opines that the Board should adopt an index that is weighted 50 percent RCAF unadjusted for productivity ("RCAF-U") and 50 percent RCAF adjusted for productivity ("RCAF-A") for the first year of SARR operations and transition to 100 percent of the RCAF-A by the tenth year of operations. *Id.* at 70. This proposal is more aggressive in shippers' favor than any of the shipper productivity alternatives currently before the Board.

While WCTL devotes substantial verbiage to potential sources of future productivity, nowhere in its submission does it (1) acknowledge the substantial productivity already reflected in the SARR base year operating expenses, (2) recognize the difference between the limited SARR customer base and the myriad of customers served and commodities moved by the railroad industry as a whole, or (3) explain how anticipated industry-wide productivity is in any way relevant to a SARR. In the remainder of this section, I explain why the shippers' logic is misguided and why its alternative proposal overstates grossly the level of productivity a SARR could achieve – particularly in the early years of its existence.

1. There Is No Disparity Between the Manner In Which the Board Indexes Operating Expenses and the Manner In Which It Forecasts SARR Revenues

The shippers' alleged need for a productivity adjustment to SARR operating expenses, although hotly contested, is a relatively recent argument that was borne from an assertion by complainants in large coal rate proceedings of a conceptual inconsistency

between the index used to adjust revenues for the SARR and the index used to adjust operating expenses. In this proceeding, Dr. Brennan, in testimony sponsored by the Western Coal Traffic League of Concerned Captive Shippers ("WCTL"), echoes that unfounded logic and asserts that the forecast used to project SARR revenues into the future "implicitly" includes a productivity component while the RCAF used for projecting operating expenses does not.[2] From this he concludes that if the forecast of rates being used in the DCF analysis includes productivity, then consistency requires that a productivity adjustment must also be included in the operating expense forecast in the SAC calculations in the DCF analysis.

Dr. Brennan's assessment is wide of the mark for two key reasons. First, any perceived link between the index used to predict SARR revenues and the index used to inflate stand-alone operating expenses is merely a made-for-litigation figment of shippers' imagination. The Board's SAC test is comprised of three independent analyses that are brought together in the discounted cash flow model. Based on the traffic and network configuration posited by a shipper in a SAC rate proceeding, the Board seeks to determine the following:

- The tonnages that need to be moved and the associated revenues that will be available to the SARR entrant over the DCF period.
- The operating expenses that will be incurred in moving the posited traffic over the DCF period.
- The network configuration and cost of building the facilities needed to move the projected traffic volumes, which is converted to an annual capital recovery requirement.

[2] Comments of William J. Brennan, Ph.D. (Brennan) at 5, footnote 5. "This position is also consistent with the Board's preference that forecasts, to the maximum extent possible, come from the same source. To the extent that future revenue streams implicitly include a productivity adjustment, so too should the expense stream."

The DCF model combines the annual operating expense with the annual capital recovery and compares the sum to the annual revenue forecast for each year of the DCF period. Forecasts for each component are derived independently and are not linked in any way. For example, the revenue forecast looks at the forecasted trend in rates that will be charged by the incumbent railroads. These rates will reflect market conditions (including competition), costs, capacity and other relevant factors considered by the incumbent railroads in pricing their services and have nothing whatsoever to do with the projected cost structure of a SARR. Similarly, the forecast applied to SARR operating expenses is focused on the specific inflation anticipated for each of the SARR operating expense categories and is unrelated to cost trends for the incumbent railroad. Because the inflation indexes are designed to forecast different elements that are in no way related, Dr. Brennan is wrong in asserting they should be linked.

Second, Dr. Brennan's argument disregards the significant level of productivity beyond that of the incumbent that is already captured in the base year SARR operating expenses. Because the SARR is more efficient than the residual incumbent, it has already captured all of the productivity that it will take the incumbent years to achieve and to pass along to its shippers. As such, to the extent there is any productivity reflected in the index used to forecast future revenues, that productivity reflects the efforts of the incumbent railroads to catch up to the productivity levels enjoyed by a SARR from the first day of its operation. In other words, the SARR receives as a revenue windfall the difference between the productivity reflected in its base year operations and the productivity that the incumbent railroads have yet to achieve and pass along to their customers through reduced rates.

2. WCTL's Argument that the SARR Will Begin to Achieve Additional Productivity at the Outset of Operations is Wrong

WCTL identifies three principal reasons why it believes the Board is wrong to assume that a SARR would not enjoy productivity benefits at the outset of its operations. First, WCTL argues that there are significant sources of productivity that are not asset related and which could be implemented in the first year of operations. Second, the shippers contend that a SARR would upgrade assets when it would improve efficiency and lower costs, which, the shippers allege, could occur immediately after operations start. And, third, they allege that the SARR would be better situated than the industry as a whole to improve its operation beginning as early as the first year. WCTL at 73-74. None of WCTL's assertions ring true when evaluated in the context of the way in which SARR operating expenses are developed and the substantial productivity above that of the incumbent that a SARR enjoys.

a. Productivity Benefits Unrelated to Asset Replacement

In its opening comments, WCTL attempts to separate potential SARR productivity between that associated with the replacement of assets and productivity derived from non-asset related sources. It argues that there are a number of areas in which productivity gains that are unrelated to asset replacement will be available to the SARR even in its first year of operations and lists seven categories of potential improvement. *Id.* at 74-82. As explained below, all of the potential productivity sources identified by WCTL are either unavailable to a SARR or the full benefits of such productivity are already enjoyed by the SARR. I address each category individually.

1. More Efficient Train Sizes. WCTL asserts that, like incumbent railroads, a SARR will increase its train sizes "when it is economically and technically feasible to do so." It offers no timetable, nor is there any suggestion that such a change would or could occur in the first year of SARR operations. WCTL argues that trains are

sized as the incumbents operate them today, but that the history of unit coal train operations in the west has shown a pattern of increasing train sizes. In fact, train sizes have increased historically, but this trend has leveled off in recent years, suggesting that further increases, particularly in the short term, are unlikely. More importantly, however, a SARR is typically designed at inception to accommodate efficiently the train sizes assumed in the operating plan. In this regard, mine leads, storage tracks, yards, passing sidings, interchange tracks and other SARR facilities are sized for the planned train lengths. Further, the facilities of the residual incumbent and those of the originating mine and terminating shipper are also appropriately sized. As such, any change in SARR train size would likely require additional investment to cover the substantial reconfiguration of on-SARR and off-SARR facilities. To date, no party has included in the SAC costs any provision for such incremental investment, and without those investments, the productivity benefits of longer trains could not accrue to a SARR. Indeed, if the proponents of a SARR consider longer trains a substantial benefit, they have the opportunity in developing the peak year operating plan to incorporate the efficiencies of longer trains, provided, however, that they also include the costs of all incremental investment required to effect such a change, both on and off the SARR.

2. More Efficient Train Operating Systems. In this category, WCTL lists ongoing industry research and development initiatives such as new management systems that will dynamically track locomotive performance and alert users to pending maintenance problems, leading to a decrease in costly unplanned locomotive maintenance. While such an initiative will likely benefit existing railroads, it will have absolutely no benefit to a SARR for two reasons. First, the cost of these and other types of cutting edge systems are typically rejected by complainants in SAC cases as unnecessary. Since they find them unnecessary for cost purposes, complainants should not be allowed to assume future benefits from such investments. Second, SARR operating expenses, to date, have not included any additional costs for unscheduled locomotive maintenance. In the SARR world, locomotive maintenance costs are predictable and scheduled. Thus, complainants are not entitled to the benefits of improvements that would lower costs that were never even included in the SAC operating costs.

   WCTL also cites developments in positive train control and GPS tracking systems as ways to improve system usage and run more trains over particular routes. Here again, these developments will certainly help existing, capacity constrained railroads improve efficiency, but the SARR track configuration is designed to accommodate peak period demand. As such, the SARR has no need for, and thus cannot benefit from, techniques designed to increase capacity.

3. More Efficient Maintenance Procedures. WCTL describes several initiatives under development at the AAR that may improve future maintenance practices and reduce costs. Each of the items identified – Rail Profile Maintenance Software to identify areas of high stress, performance-based track geometry

inspection procedures, and rail flaw and broken rail inspection systems – if implemented, appear to trade increased maintenance of way operating expenditures in the form of preventative maintenance in the short term for lower capital expenditures down the road. Because these additional preventative maintenance expenditures are not included in SARR maintenance of way expenses, the SARR is ineligible for these benefits. In addition, unlike real-world railroads, a SARR typically does not incur any research and development expenditures for these new technologies, and, as it is not a member of the AAR and does not explicitly pay AAR dues, would not be in a position to claim the same benefits as dues-paying, cost-sharing members.

4. Increased Labor Productivity. WCTL, with support from witness Caves et al, argues that productivity improvements will be derived from enterprising workers who will somehow find ways to increase system productivity. But, according to complainants in recent cases, the staff of the SARR is already more efficient than real-world railroads. Indeed, WFA, in its recent rebuttal, claimed that any "peer group" comparisons "lead down a false path because the LRR has no peer group to which it can be compared. Unlike any real-world railroads . . . , the LRR is a single-commodity railroad that operates only unit coal trains in high-volume service . . ."[3] Although the SARR is apparently "peerless" when it comes to G&A staffing costs, exhibiting employee productivity far beyond that ever achieved by any Class I railroad, shippers nonetheless assume that the SARR would share again in the productivity that will render incumbent railroads more efficient, effectively double counting productivity.

   WCTL also argues that there will be substantial over capacity in the early years of SARR operations which will lead to increases in system velocity and, according to WCTL, reduce system unit costs. Notably, WCTL does not identify the costs that would be saved. In reality, from a cost perspective increased velocity on the coal-only SARR will result in increases to SARR fuel consumption and, because heavy unit coal trains moving at higher speeds will inflict exponentially more damage on the track structure, substantially increased maintenance costs. As such, higher train speeds will translate into higher, not lower, costs.

5. Traffic-Based Efficiencies. Here WCTL argues that because the costs for train operating personnel and locomotive related costs move up in lock-step with SARR tonnage increases, complainants are missing out on the traffic based productivity improvements that typically occur when changes in outputs increase faster than changes in inputs. In fact, just the opposite occurs in the Board's SAC process. The operating plan for a SARR is developed based on peak year traffic levels, thus capturing all traffic-based efficiencies. Peak year operating statistics are then ratcheted down to base year levels on a pro-rata basis with tonnage. As a result, the SARR enjoys, in the base year, all of the traffic based efficiencies that would not otherwise be achieved until the peak year volumes are met.

[3] Docket No. 42088, WFA/Basin Reb. Nar. at III-D-48.

6. Information Technology ("IT") System Improvements. WCTL claims that IT systems will generate productivity as older systems are replaced with even more efficient systems, as these systems become available. Unfortunately, WCTL misses the mark. Over the years, improvements in IT have resulted in the substitution of technology for human capital. A SARR, however, is staffed with the bare minimum of personnel (and is more likely understaffed), so there is little opportunity for traditional benefits attributable to IT improvements. In addition, IT comprises a very small portion of annual stand-alone costs – typically around one percent. As such, any cost savings or productivity driven by the substitution of more efficient systems is likely to be minute. Finally, it is extremely unlikely that a SARR would begin replacing its IT systems beginning in the first year of operations.

7. Track-Related Efficiencies. WTCL cites a number of studies the AAR is performing to reduce stress on, and increase the operating life of, track and roadbed structure. The initiatives raised by WCTL, like those associated with improved maintenance practices discussed above, would require more in the way of up-front SARR construction cost that is typically spurned by SAC complainants. If a SARR does not invest in the cutting-edge technology required to improve efficiency, it cannot turn around and claim the associated productivity benefits.

b. The Asset Replacement Criteria Set Forth By Shippers Cannot Be Met By A SARR, Particularly in the Early Years of Operation

In its comments, WCTL maintains that a SARR will replace its assets at any time necessary to improve its efficiency, assuming that a net cost savings can be realized. Witness Caves et al expand this argument, stating, "[g]enerally, a firm will invest in new assets if the expected total cost of producing with the new assets is less than the variable costs of producing with existing assets, regardless of the remaining life of the existing assets."[4] While conceptually accurate, from a practical perspective, there are no SARR assets that could satisfy this test, particularly in the early years of SARR operations. If more efficient assets existed, they would be part of the SARR investment cost. If they do

[4] Joint Verified Statement of Douglas W. Caves, Ph.D., B. Kelley Eakin, Ph.D., Mark E. Meitzen, Ph.D., and Philip E. Schoech, Ph.D. (Caves) at 9.

not yet exist, because of the long lead times for research and development of new railroad products, it is extremely unlikely that these new products could be invented and deployed in time to achieve any productivity in the first 10 years of SARR operations.

c. Because It Has Achieved Productivity Greater Than The Railroad Industry as a Whole, A SARR Is Poorly Situated For Additional Productivity Gains

WCTL argues that productivity improvements could occur as early as the first year of SARR operations due to over-capacity in its network produced by sizing the infrastructure to accommodate their peak year traffic. It claims that as a result the SARR would have the flexibility to improve its operations relative to real-world carriers. As I explained previously, the operating plan for a SARR is developed based on peak year traffic levels, thus capturing all traffic based efficiencies. Those efficiencies are carried back to the base year. Excess capacity in the early years of SARR operations will not produce cost saving efficiencies. Because under SAC theory, the SARR's traffic base is defined, and the labor and equipment scaled in each year to match the actual traffic load for that year, there would be no way that it could productively use its overcapacity. A SARR cannot fill the excess capacity with additional traffic, it cannot further reduce staffing or equipment in any year, and it certainly cannot downsize its plant to remove extra capacity as it will need that capacity in the peak year.

3. Shipper Claims That The Average Age of Class I Railroad Assets in Service as of 2002 Was Seven Years is Wrong

In an effort to dispute the Board's conclusion that a SARR will not reach comparability with the railroad industry in terms of productivity until year 20, WCTL asserts that the SARR is much more closely aligned with the railroad industry than the Board allows. To support that argument, it includes an analysis that AEP Texas

submitted in its rate case purportedly showing that, based on R-1 data, the average age of Class I railroad assets in service as of 2002 was only seven years. Caves at 8-9.

The shippers' reliance on R-1 annual report data to develop the average age of existing railroad assets is critically flawed, and produces an average age that is well below the actual physical life of the assets. Shippers calculate the average age of assets from the R-1 by dividing the accumulated depreciation balance for each roadway account by the annual depreciation recorded for each account. In a simplistic world, such a calculation might yield a reasonable estimate of the average asset age. However, railroads are more complex. Changes in annual depreciation rates produced by increased traffic volumes can distort the analysis. In addition, as shippers' experts should be aware, the accounting for recent railroad mergers and changes in the treatment of removal costs have further distorted the relationship between accumulated and annual depreciation charges, rendering efforts to calculate the average age of assets in place from these data sources futile. For example, as part of the purchase accounting adjustment for mergers, the accumulated depreciation for assets acquired is written down to zero. Under the shippers' calculations, such assets would have a useful life equal to their remaining life and would, as such, have an age of zero, even though the assets have been in service for many years.

4. Shippers' Proposal to Align SARR Productivity With The Productivity Anticipated For the Railroad Industry as a Whole Overstates Dramatically The Productivity That Could Be Achieved By a SARR

In their discussion of potential productivity for the SARR, shippers assert that a SARR is very similar to the real world railroad and, as such, should be expected to enjoy the future productivity benefits predicted for the industry. On this basis, WCTL proposes

that the Board should adopt an index that is weighted 50 percent RCAF-U and 50 percent RCAF-A for the first year of SARR operations and transition to 100 percent of the RCAF-A by the tenth year of operations. As I explained in detail in the prior sections of my Verified Statement, because of the manner in which SARR operating expenses are developed, a SARR is vastly more productive than the railroad industry as a whole. There is thus no basis to assume that a SARR would achieve any additional productivity in the early years of its operation, and likely will not achieve any measurable productivity until after year 10 as new technologies emerge and the SARR begins the process of replacing certain of its assets.

In fact, shippers' claims are belied by their prior submissions. In its recent rebuttal evidence, WFA / Basin noted that, "...no currently operating real-world railroad is comparable to a SARR that handles a single commodity exclusively in unit train service."[5] Single commodity unit train service is the most efficient type of movement made by real world railroads. As such, a SARR that handles only unit train operations has already achieved a level of productivity that real world railroads could only dream of.

WCTL offers another alternative for why it believes it is appropriate to begin with an inflation index that is weighted 50 percent RCAF-A. WCTL witness Brennan asserts that the Board has inappropriately used 100% RCAF-U in year one to index operating expenses and that this, "denies a SARR the benefit of *any* productivity improvements in labor, existing capital or purchased services."[6]

Dr. Brennan begins his analysis on the unfounded presumption that the Board concludes that a SARR will not achieve any additional productivity gains in its first year

[5] Docket No. 42088, WFA/Basin Reb. Nar. at I-31.

[6] Brennan at 11.

of operation simply because a SARR cannot be expected to further increase the productivity attributable to its new capital assets. From this erroneous start,[7] he leaps to the bizarre conclusion that SARR operating expenses can somehow be separated between those associated with the railroad's capital base (including fuel consumption) and those that are not, and that the SARR is eligible to share in productivity benefits for those operating expenses he deems to be not associated with the railroad's capital base. He then embarks on an exercise, using R-1 data, to calculate the percentage of *incumbent railroad* operating expenses associated with capital expenditures and materials and supplies. From this he concludes that more than half of railroad operating expenses are not related to capital assets and could be expected to capture normal productivity gains, rendering shippers' proposal to begin with a 50/50 split of RCAF-U, RCAF-A conservative.

As I describe in more detail, Dr. Brennan's "analysis" suffers innumerable flaws which render his conclusion meaningless. Listed below are just a few of the fatal flaws:

- The gist of Dr. Brennan's analysis is that all Class I railroad operating expenses relating to labor, general expenses and purchased services can benefit from improvements in efficiency. While this certainly may be true for real-world Class I carriers because of the myriad of services they provide, the same does not hold true for a SARR, regardless of the expense category, because as discussed above a SARR already captures all available productivity.

- All of the SARR operating expenses are associated either directly or indirectly with the SARR assets, so any attempt to segregate them is meaningless. For example, Dr. Brennan's approach, if translated to a SARR, would suggest that all train and enginemen labor is unrelated to a SARR's assets. Yet, SARR train and

[7] The Board did not assume, as WCTL claims, that all productivity gains come from asset replacement, but simply noted the SARR would not have equal opportunities for productivity gains as real-world railroads, and it gave as an example the fact that the SARR, with its new assets, would have less opportunity to achieve productivity gains from asset replacement than would real-world railroad with a mix of old and new assets.

enginemen productivity are tied directly to the SARR's locomotive assets and track facilities.

- The cost structures of the incumbent railroads are vastly different from those of a SARR. A Class I railroad's system-wide operating expenses will include, among other things, costs for significantly more complex yard operations, switching operations, varied types of transactions and services for multiple heterogeneous customers, and significantly greater marketing costs than those associated with operating the relatively simple SARR network. As there is no rational nexus between the system-wide operating costs of a Class I railroad and those of the much simpler SARR, there is certainly no logical ground for assuming that the percentage of operating expenses associated with assets (as Dr. Brennan calculates them) will be the same on a Class I railroad and on the SARR.

As such, Dr. Brennan's analysis does not in any way support the shippers' assertion that a 50/50 split of RCAF-U and RCAF-A is the appropriate starting point for indexing SARR operating expenses.

III. CHANGING THE DCF PERIOD DOES NOT REQUIRE A CHANGE IN THE PERIOD OVER WHICH DEBT IS AMORTIZED

In his opening Verified Statement, WCTL witness Thomas D. Crowley discusses what he describes as a problem with the Board's proposal to shorten the DCF period from 20 to 10 years. According to Mr. Crowley, the period over which the stand-alone debt is amortized is the same as the DCF period and, if the Board shortens the DCF period, it must also shorten the amortization period for the SARR debt. As an alternative, Mr. Crowley proposes an approach that has been rejected numerous times by this Board and its predecessor the ICC, which is to amortize the SARR debt over the life of the SARR assets. Crowley at 13-14.

There are a number of problems with Mr. Crowley's proposal. The first is that his starting premise – that the debt amortization period is the same as the DCF period – is wrong. As I explained in my opening comments, the DCF period is simply the time period over which the Board compares stand-alone costs to stand-alone revenues in

determining whether or not a challenged rate is reasonable. Other inputs to the DCF, such as the assumed asset lives, the replacement of assets as they are anticipated to wear out, the calculation of Federal and state income taxes, and the amortization of the debt are not tied to the DCF period and, as such, any consideration of substantive changes to such inputs, including the amortization period, are beyond the scope of this proceeding. Moreover, it is clear that this issue is not one "necessitated" by the change in the DCF period, as WCTL asks the Board to make this change in the amortization period *regardless of whether it uses a 10 or 20 year DCF period.* WCTL at 103. Rather, Mr. Crowley's proposal is a rehash of shippers' continued attempts to have the Board change the economically sound and long-accepted practice of amortizing debt over a 20 year period.

The second problem with Mr. Crowley's argument against the current practice is that the 20 year debt amortization period, although coincidentally the same as the 20 year DCF period, was actually the result of a compromise by the ICC as articulated by the ICC Bureau of Economics staff in a September 9, 1991 memo from Howard K. Face, Director, Office of Economics to David M. Konschnik, Director, Office of Proceedings in ICC Docket Nos. 37063 and 38025S *Dayton Power and Light v. Louisville and Nashville Railroad Company.* In that memo, the staff explained that Complainants Dayton Power and Light had argued to lock in the SARR cost of debt at the weighted average of the cost of debt during the SARR construction period, weighted by the amount of investment assumed to occur in each year. In that proceeding, complainants also advocated that the debt be amortized over the expected life of the SARR assets. In addressing the issue, the staff accepted the Complainants' argument that the cost of debt be locked in at the

average of the cost of debt during the construction period, but rejected the argument that the debt be amortized over the life of the asset and instead chose a 20 year debt amortization period. The staff explained that locking in debt would be consistent with an assumption of a 20 year bond with a fixed interest coupon and that Complainants' proposal to amortize debt over the asset life failed to consider the increased risk and higher yield that would be required if the maturity of the debt instruments were extended from 20 years to the average life of the assets. As the staff explains, it is well established that the longer term a bond or debenture has, the higher the risk premium, and, thus, the yield.

Ironically, the same is true of Mr. Crowley's current proposal. Amortization over the life of the assets would result in long term debt with terms exceeding 50 years, which would clearly elicit concerns over the costs associated with greater risk that were addressed by the ICC in *Dayton Power & Light.* In addition, any change to the Board's longstanding practices relating to the debt amortization period would require the evaluation of substantial evidence relating to railroad debt financing practices, the appropriate interest rate assumption, and the relevance of the Board's cost of capital determinations in SAC proceedings.

Third, Mr. Crowley appears to have inadvertently misspoken in his Verified Statement. At page 20 of his statement, Mr. Crowley states that "In order for the STB's proposed 10-year model to produce the same answer as the current 20-year model produces, the STB has to amortize the Table E debt over the life of the asset and not over the life of the model. With this one adjustment, the two models will produce the same answer(assuming all other inputs are the same)." In fact, the only way for the 10-year

model to produce the same answer as the 20-year model produces (for the first 10 years) is for the debt to continue to be amortized over 20 years. The proposed changes to the DCF model set forth in my opening statement will accomplish this, without any need to change the amortization period.

I declare under penalty of perjury that the foregoing is true and correct.

REPLY VERIFIED STATEMENT

OF

MARTIN N. BAILY

I. INTRODUCTION

My name is Martin N. Baily. I am a Senior Fellow at the Institute for International Economics, a position I have held since March, 2001. In addition, I am a Senior Advisor to the McKinsey Global Institute, the economics think-tank of McKinsey & Company, and I am an Academic Advisor to the Congressional Budget Office. Between October, 1994 and August, 1996, I was a member of the President's Council of Economic Advisors; from August 1999 to January 2001, I was Chairman of the Council of Economic Advisors and a member of the President's Cabinet.

My main field of expertise is productivity. I have conducted academic research projects over the course of over 25 years in this field, looking at the sources of productivity growth in the overall economy, in individual industries, and in individual manufacturing establishments. I co-authored *Innovation and the Productivity Crisis,* published by The Brookings Institution in 1988 and I have written numerous journal articles in the field, before and since—see for example articles in the *Review of Economics and Statistics 2001, Brookings Papers on Economic Activity various issues, Journal of Economic Perspectives 2001, 2002, International Productivity Monitor 2006,* in the attached curriculum vitae.

As well as this academic work, I have also been an advisor to a series of studies of U.S. and overseas productivity performance that examine the behavior of individual companies and industries. Most recently, I presented the results of a study of productivity growth in the U.S.

auto industry at the Chicago Federal Reserve's auto conference in Detroit, in April 2006.[1] The focus of my current work is on the revival of U.S. productivity growth, and the effect of the strong dollar on the U.S. economy. In the early 1990s, I participated in two commercial arbitrations in which I studied the causes of improved productivity on the Burlington Northern Railroad Company. My CV is attached as Exhibit__(MNB__1).[2]

I have been asked by BNSF Railway Company ("BNSF") to address the testimony of Caves, et al.[3] Where relevant to the issues I address in *Caves*, I also discuss the comments of William J. Brennan.[4]

Caves concludes

> that "the Coal Shipper's proposal to attribute 50% of RCAF-A productivity gains to the SARR in the first year of the DCF period (i.e., 50% RCAF-A and 50% RCAF-U) and increase this incrementally to 100% of RCAF-A productivity gains after the tenth year is a reasonable proposal. It is based on the structure of the Board's proposal. However, in contrast to the Board's proposal, the Coal Shipper's proposal more accurately reflects the productivity gains the SARR is likely to enjoy immediately as well as the path of the SARR's gains over time." *Caves* at 3.

A close reading of *Caves* reveals that this conclusion does not actually follow from the discussion of productivity contained in the statement. More fundamentally, for the reasons I describe in detail below, I believe these witnesses have substantially overstated the importance of future improvements in productivity in assessing operating costs for a stand-alone railroad

[4] *See Comments of William J. Brennan, Ph.D.*, attached to the *Joint Opening Comments of Western Coal Traffic League, Concerned Captive Coal Shippers, Western Fuels Association, Inc., Edison Electric Institute, National Rural electric Cooperative Association, and American Public Power Association* in Ex Parte No. 657 (sub-No. 1), dated May 1, 2006 ("*Brennan*").

("SARR") over a multi-year discounted cash flow ("DCF") period. An efficient firm entering the market with new assets, the technology tailored to its operational requirements, and an operating plan reflecting the industry's best practices would begin to experience productivity improvements at some point in the future. But, given its starting point, it is unlikely that that the SARR would experience *any* productivity improvement in the early years of its existence. I understand that the Board is considering the possibility of reducing the DCF period used in its SAC analysis from 20 years to 10. In either case, it would be appropriate to assume that the SARR experiences no productivity improvement during its first 10 years *unless* such improvements can be tied to a specific source of productivity increase that can be identified and evaluated on the evidence.

Caves makes three principal points in an effort to support its conclusions. First it implies that it is futile to try to identify *specific* sources of process improvements that would improve productivity on the SARR (*Caves* at 6-7). Instead, *Caves* suggests that it would be "a more useful exercise" to (1) identify how the SARR differs from the railroad industry generally, (2) examine "qualitatively" whether these differences result from technology that is available to the SARR but not to the industry as a whole, and (3) quantify how much of future productivity gain in industry productivity improvement would be driven by adopting this new technology. *Caves* asserts that all other productivity improvement would be enjoyed by *both* the SARR and the industry. Note that this paradigm *assumes*, without any evidence, (1) that there would be no circumstance in which the SARR would benefit *less* from technological improvements than the real-world industry participants, and (2) that productivity improvements that are not technologically driven would apply equally to both the SARR and the real-world industry participants. As I explain below, both of these implicit assumptions are incorrect.

Second, *Caves* argues that the SARR will have the same access as do real-world railroads to the same pool of human capital and, therefore, can expect to experience the same levels of productivity gain from "the latest innovation and management techniques," which they recognize will lead to productivity improvements in "operations, management practices [and] learning by doing." *Caves* at 8-11.

Third, *Caves* presents evidence to the effect that railroad productivity – which had significantly exceeded economy-wide productivity throughout the 1982 to 2000 time period – seems to be "trending" toward levels that are comparable to those experienced overall in the U.S. economy. *Caves* suggests that this means the railroads have "largely exhausted the productivity gains resulting from deregulation," and asserts as a result that "current railroad productivity is more reflective of economy-wide productivity than of gains from past deregulation." From this line of argument, *Caves* leaps to conclude that "near-future productivity gains by an efficient SARR would also be more reflective of the economy productivity and therefore not much different from gains experienced by an incumbent railroad, or the industry overall." *Caves* at 13-14.

I address each of these three arguments below and show that they do not support the position that a SARR would experience productivity improvement in the early years of its life. Furthermore, it is worth emphasizing that apart from my disagreement with the arguments made by *Caves*, those arguments do not support a conclusion that applying a 50/50 mix of RCAF-A and RCAF-U in Year 1 of a SARR's life, and increasing this mix steadily, year-by-year, to 100% of the RCAF-A by Year 10 of a SARR's life, is appropriate. There is no evidence linking the qualitative comments in *Caves* to the quantitative solution that it advocates.

As a threshold matter, I disagree with the implication in *Caves* that these issues are not amenable to analysis based on evidence. It is important to look at specific sources of potential productivity improvement and to determine whether they would or would not affect a SARR – there is no other valid approach to addressing the issue. It is true, as *Caves* suggests, that these sources of productivity may well be interconnected, but the sources can often be identified and their likelihood and timing evaluated. It is incumbent on those who argue that the SARR would achieve productivity growth in the future to identify the specific sources of productivity improvement, *especially in the early years of a SARR's existence*. In this regard, there is a considerable body of research that bears on these issues (which *Caves* ignores) that demonstrates how unlikely it is that the SARR would achieve significant productivity gains in the early years of its life.

As noted above, *Caves* emphasizes the productivity that would be brought about by advances in information technology ("IT"), citing Board cases that it characterizes as concluding that "there should be no difference between the SARR and incumbent railroads." *Caves* at 106. But this emphasis on the impact of IT on future SARR productivity is overstated. As many companies have found in recent years, merely investing in IT does not guarantee productivity improvements. For example, the U.S. banking industry found that its practice, in the 1990s, of installing high-powered terminals on the desks of bank tellers did nothing to improve the productivity of those tellers.[5] A seminal study on the subject demonstrates that productivity improvements are engendered from IT investments *only* when companies specifically identify process improvements that are *enabled* by these investments.[6]

[5] McKinsey Global Institute, *US Productivity Growth,* McKinsey & Company, Washington DC, 2001.
[6] McKinsey Global Institute, *How It Enables Productivity Growth,* McKinsey & Company, San Francisco, 2002.

In the railroad industry, such process (*i.e.*, best practice) improvements are most likely in complex networks – in which large volumes of heterogeneous transactions must be managed. But it is my understanding that recent SARRs have been relatively simple networks with a defined customer base. The traffic is largely homogeneous – large volume movements of coal to utility plant customers that are handled in continuously cycling unit trains – and much of the complexity of switching, staging and other "hub" operations is left to the incumbent railroad through the use of "cross-over" traffic.[7] In a relatively simple network such as this, the effect of IT investments on productivity improvement is likely to be negligible, even over the longer run. In contrast, if properly implemented, the effect of IT investments on the much more complex networks represented by real-world railroads can be significant, even in the relatively short run where the mix of assets may not be optimal given the mix of traffic.[8]

Of course, technological developments will undoubtedly occur in the future, and the productivity-enhancing benefits of some of those developments will be available to the SARR. But here, too, the evidence strongly suggests that it will take years for new technological developments to have an effect on a SARR that is hypothesized as entering the market *de novo today.*[9] In an example directly on point, the Federal Railroad Administration ("FRA") has noted

---

[7] See, for example, *Opening Evidence of Complainants Western Fuels Association, Inc. and Basin Electric Power Cooperative, Inc.* Narrative Volume 1 of 2 (Public Version) at III-D-49 and III-D-50 ("The LRR's IT staff is smaller than the IT staffs of most railroads because the LRR is unique. It handles only trainload movements, which reduces the complexity of computer and communications systems required to support its operations. The computer system requirements of a Class I railroad are very complex due to the large number of customers served, large number of different commodities handled, large number of different origin and destination pairs, different types of railcars required extensive yard operations, and service commitments to most customers on an individual car basis. The LRR has only one local customer, five interchange points, service measurements entirely by train rather than by individual railcars, and trainload billing with the RMI Revenue system used to allocate revenues."). I also understand that where shippers have hypothesized SARRs that handle multiple commodities, the SARR is assured to receive high-speed trains from the incumbent, moves the train directly across the SARR network and hands the train back to the incumbent for subsequent loading. *See*, for example, *Complainant Arizona Electric Power Cooperative, Inc.'s Rebuttal Evidence*, STB Docket No. 42058, Narrative (Public Version) at III-A-20 through III-A-23.

[8] *See* Opening V.S. of Thomas C. Haley, attached to Union Pacific's Opening Comments.

[9] I understand that SARR's do not normally spend money on research and development, nor do they pay the dues required to belong to industry trade associations that are engaged in research and development efforts on behalf of

that only a portion of the technological improvements under consideration will ever be implemented, and that it will take even longer for improvements that are implemented to show up as efficiency gains in the rail industry's operations.[10] The FRA estimates that, overall, it will take 10 years for technology innovations under active consideration today to begin to generate operational efficiencies.[11]

Research has demonstrated that the most significant source of productivity is from existing firms' efforts to implement the best practices of leading firms in their industries. In the automobile industry, for example, the most important source of productivity improvement over the 15-year period from 1987 to 2002 was the adoption of "lean manufacturing" techniques by the "Big Three" U.S. auto makers – a production process developed over many years by Toyota and introduced into the US industry in the early 1980s.[12] Academic research, using U.S. Census data, confirms this for a study of productivity in retailing, which found that *virtually all* of the productivity growth in that industry arose from opening best-practices establishments and closing older ones, rather than from any improvement in best practices themselves.[13]

---

their members. As a result, the SARR's postulated by shippers are likely to be late adopters of improved technology. *See* Reply V.S. of Mike Baranowski.

[10] In addressing its on-going R.D&D projects (including efforts with Distributed Power and Positive Train Control) FRA states:

> At best, implementation of the results of only a small portion of the projects described herein will have begun five years from now. Effects of the projects...will begin to show up in railroad safety and efficiency statistics in earnest *ten years from now*. (emphasis added).

[11] Many service companies introduced customer relations software believing it would payoff in productivity and profitability. Only now are they seeing positive results, approximately ten years after early introduction.

[12] James P. Womack, Daniel T. Jones and Daniel Roos, *The Machine that Changed the World: The Story of Lean Production,* New York, Rawson Associates, 1990. McKinsey Global Institute, *Increasing Global Competition and Labor Productivity: Lessons from the US Automotive Industry*, McKinsey & Company, San Francisco, November 2005. General Motors and Toyota formed a joint venture called NUMMI to produce small cars in a former GM plant in Fremont CA. The planning for this venture started in 1982. Ford formed a partnership with Mazda in 1979, when it started to learn about lean manufacturing.

[13] Lucia Foster, John C. Haltiwanger and C.J. Krizan, "The Link Between Aggregate and Micro Productivity Growth: Evidence from Retail Trade," *Working Paper, No. 9120,* National Bureau of Economic Research, Cambridge, MA, August 2002.

The implications of this research for the question at hand are obvious. By definition, the SARR embodies – at its inception – a new state-of-the-art physical plant, current technologies, and a best practice operating plan that are collectively tailored to the traffic that is hypothesized to move over the hypothetical railroad. As a result, productivity improvements that can be expected in the rest of the industry – as it seeks to achieve this level of efficiency today – will not be available to the SARR; and efficiency improvements from changes in technology and/or best practices will take years to emerge before they will "move the dial" on the level of SARR productivity.

Caves makes a passing reference to "learning by doing," and this seems to be the central point of *Brennan.* But a detailed study by the staff of the Bureau of Labor Statistics of railroad productivity growth did not mention learning by doing as a source of growth in the industry in the years between 1958 and 1989.[14] This accords with my own experience studying a variety of industries in different countries, where learning by doing has not been found to be an important source of sustained productivity improvement. Furthermore, to the extent learning by doing might be considered relevant in a SAC analysis, it would seem to cut in a direction inconsistent with that advocated by the shippers. As I understand it, the SARR is hypothesized by shippers to operate efficiently from day one, using the current technology. In practice, of course, any start-up railroad – even if it were employing entirely experienced railroad personnel – would experience a significant "ramp up" period before it would be operating optimally. Thus, if one wants to hypothesize a workforce that is capable of achieving productivity improvements from "learning by doing," one must also accept that such a workforce would have *less* efficient operations in the short term while the SARR personnel "learn the ropes." But the SAC test

[14] John Duke, Diane Litz and Lisa Usher "Multifactor Productivity in Railroad Transportation, *Monthly Labor Review,* August 1992.

allows the complainant to assume the most efficient workforce from the first day of SARR operations. The SARR has already "learned by doing," and the benefits are already reflected in the efficient operations of the SARR from the start. It would double count the productivity that would be available from any "learning by doing" to give additional productivity benefits to a SARR through a productivity adjustment to operating cost inflation.

Finally, the discussion in *Caves* to the effect that the level of railroad productivity improvement seems to be converging on the level of productivity improvement in the U.S. economy as a whole – and the conclusion that, therefore, it would be appropriate to assume this level of productivity improvement for the SARR from day one – seems entirely irrelevant to the question of SARR productivity improvement. Even if the level of productivity in the U.S. rail industry seems recently to have converged on the level of productivity improvement economy wide, there is no reason to expect that these two measures would continue to track in the future. But more fundamentally, given the special circumstances that are embodied in the SARR concept – state-of-the-art assets and a best-practices operating plan tailored to a relatively simple network operation – there is simply no reason to expect that the SARR would experience productivity improvements similar to other, real-world railroads or to the economy as a whole in the first 10 years of its life.

Instead, given that the SARR is assumed to already have the most appropriate technologies operated and managed by best-practice personnel, it is reasonable to assume that there would be no additional productivity improvement in the first 10 years of its life. Those who disagree with this view should bear the burden of identifying the operating changes the SARR would make in its early years, changes that would be considered economically rational.

The quantitative impact on productivity of any such process improvements should also be demonstrated.

I declare under penalty of perjury that the foregoing is true and correct.

Martin N. Baily

Exhibit_(MNB)_1

Martin Neil Baily

Résumé, May 2006

Institute for International Economics
1750 Massachusetts Avenue NW, Washington DC 20036-1207
(202) 328-9000.

At McKinsey & Company 202-662-4332 (asst. 202-662-1121)

Date of Birth: January 13, 1945 Citizenship: U.S. Citizen

Married, four children E-mail: mbaily@iie.com and martin_baily@mckinsey.com

Education:

Cambridge University; majored in economics with a minor in natural sciences. Received first class honors. B.A. 1966 M.A. 1970

Simon Fraser University in Canada; majored in economics and econometrics. M.A. 1968.

Massachusetts Institute of Technology, Ph.D. in economics, 1972.

Principal Positions:

Senior Fellow, Institute for International Economics March 2001-present.

Senior Advisor, McKinsey Global Institute, McKinsey & Company, January 2002-present.

Board of Directors, The Phoenix Companies, Hartford CT, April 2005-present

Academic Advisor, Congressional Budget Office, Spring 2006 to the present.

Associate Editor, *Journal of Economic Perspectives,* December 2005 to the present.

Chairman, President's Council of Economic Advisers, member of President Clinton's Cabinet, August 1999-January 2001.

Principal, McKinsey & Company, Inc., September 1996-August 1999.

External Senior Fellow at the Brookings Institution, 1996-1999.

Member, President's Council of Economic Advisers, October 1994-August 1996.

Professor of Economics at the University of Maryland, 1989 to 1996.

Senior Fellow at the Brookings Institution in Washington, D.C. 1979-89.

Research Associate or Affiliate of the National Bureau of Economic Research, 1978-1998.

Co-Editor of the *Brookings Papers on Economic Activity, Microeconomics*, 1989 to 1999.

Lecturer, University of Nairobi, 1972; Assistant Professor MIT, 1972-73; Assistant and Associate Professor, Yale University, 1973-79; Visiting Professor, Universidad de los Andes, Colombia, 1975.

Other Positions:

Vice-Chairman, panel of the National Research Council/National Academy of Sciences convened to assess the contribution of information technology to performance in service activities, 1991-1993.

Member of a panel convened by the Office of Technology Assessment to evaluate pharmaceutical prices, 1991.

Member of the Brookings Panel on Macroeconomics and Senior Adviser to this panel since 1976.

Research Support:

Research has been funded by The National Science Foundation, The Sloan Foundation and The Ford Foundation, as well as numerous corporate supporters.

Consulting Activities:

Prepared economic analysis for numerous companies, including studies of the tax treatment of R&D for the Council on Research and Technology, a consortium of corporations and universities. Testified as an expert witness in D.C. Superior Court and in arbitration hearings. Worked with McKinsey client teams to provide economic counseling to CEOs and senior management.

Summary of Research Interests:

Developed a theory of implicit labor contracts, an analysis of why wage inflation responds so sluggishly to excess supply in the labor market. Evaluated the impact of unemployment insurance, policies to reduce structural unemployment and the role of monetary and fiscal policy in the stability of the U.S. economy. Since 1979 worked on productivity and innovation in the US and other countries. The impact of labor quality, energy and capital, measurement problems, innovation, the electronics revolution and management quality on U.S. economic performance have been assessed. Completed several studies of individual manufacturing plants. Participated as co-author and member of the leadership team of McKinsey Global Institute studies of service

sector and manufacturing productivity and the employment performance and in a series of country studies. Participated in studies of the globalization of the capital market and of health care. Current work assesses the revival of US productivity growth, and the impact of the strong dollar on the US economy. Completed a book on European reform in September 2004.

Dated: April 12, 2011

In this section, the Interested Parties discuss these areas of law and respond to the questions asked by the Board, including pre-Staggers Act practice, the effect of Staggers, and the issue of whether there are statutory or other legal constraints on the Board's ability to change its policy. These areas of law will be dealt with under the following three headings: (a) Reciprocal Switching Agreements under 49 U.S.C. § 11102(c); (b) Terminal Facilities Access under 49 U.S.C. § 11102(a); and (c) Bottleneck Rates. The Interested Parties believe that, in each case, the Board has wide discretion under the statute to change its policies, and that there are no statutory or other legal constraints that would prevent the Board from changing its current rules and policies.

Of course, even new more pro-competitive policies cannot prevent all abuses of market power because some shippers are too far from a competing railroad to benefit from competitive remedies, and because railroads that could compete do not always do so effectively. For such shippers, the Board must continue, and strengthen, its regulation of unreasonable rail rates and practices.

A. THE BOARD HAS BROAD DISCRETION TO REVISE ITS POLICIES TO ENCOURAGE THE USE OF RECIPROCAL SWITCHING

Current § 11102(c) on reciprocal switching, which was added by section 223 of the Staggers Act,[36] provides that the Board "may require rail carriers to enter into reciprocal switching agreements, where it finds such agreements to be practicable and in the public interest, or where such agreements are necessary to provide competitive rail service." The language and legislative history of this section indicate that Congress, through this provision, substantially *broadened* the agency's power to establish reciprocal switching arrangements in order to

[36] Section 223 of the Staggers Act added this section as 49 U.S.C. §11103(c). ICC Termination Act of 1995 revised the number to 49 U.S.C. § 11102(c). Unless the context otherwise requires, the statutory provision in 49 U.S.C. added by Section 223 of the Staggers Act will be referred to by its current numbering as 49 U.S.C. § 11102(c).

encourage the development of such arrangements. Ironically, the agency's current rules and precedent, far from advancing that policy and encouraging reciprocal switching, have instead erected insuperable barriers to the use of section 11102(c). Indeed, the Board's policies and precedent are so unfavorable to shippers, that not a single shipper has even *filed* a request for reciprocal switching under the statute since the Board's last pronouncement regarding the standards that it will apply to establish reciprocal switching agreements under section 11102(c), fifteen years ago.

Fortunately, however, the Board is free to change its current policy and practice, since the statutory wording, legislative history and precedent involving § 11102(c) all indicate that the Board has very substantial discretion to determine the conditions under which reciprocal switching may be established. General court precedent also gives agencies, including the Board, substantial discretion to interpret their statute in light of changed conditions and new policies. Moreover, Congress' passage of the ICC Termination Act of 1995 ("ICCTA") does not constrain the agency's discretion. Although the Board need not rely on changes in the transportation market in order to initiate a revision of its policies and precedent in the area of reciprocal switching, in addition to the matters discussed in Sections II and III of these Joint Comments, there have in fact been changed circumstances related specifically to reciprocal switching that warrant a revision to the Board's rules and precedent. Finally, the Interested Parties strongly believe that the broad "practicable and in the public interest" standard cannot and should not be constrained by the "where . . . necessary to provide competitive rail service" standard. In other words, the two standards are independent, alternative tests.

1. The statutory language and legislative history of § 11102(c) indicate that Congress intended the agency to broaden the use of reciprocal switching and that congress gave the agency wide discretion to do so

Prior to the Staggers Act of 1980, the authority of the Interstate Commerce Commission ("ICC") to impose reciprocal switching arrangements upon carriers or to decide the terms and conditions of reciprocal switching arrangements was not clear.[37] In adding a provision on reciprocal switching to the legislation that eventually became the Staggers Act, Congress indicated that reciprocal switching was to be a *pro-competitive* benefit for shippers. The Staggers Act Senate Report noted, for example, that "[i]n areas where reciprocal switching is feasible, it provides an avenue of relief for shippers served by only one railroad where service is inadequate."[38] This same language was repeated by the Staggers Act Conference Committee Report.[39]

The Congress, in clarifying the agency's authority to prescribe reciprocal switching, fully expected the agency to utilize its new power in a pro-competitive manner. The Staggers Act House Report, for example, noted that "[t]he Committee *intends for the Commission to permit and encourage reciprocal switching as a way to encourage greater competition.*"[40] Accordingly, the Conference Committee accepted the slightly broader version of the provision adopted by the House in incorporating section 223 in the bill that eventually became the Staggers Act. Indeed, the Staggers Act Conference Committee Report *specifically* noted that the reciprocal switching agreement provision in the Act, among others, was "included to foster greater competition."[41]

[39] H.R. Rep. No. 96-1430, at 116 (1980) (Conf. Rep.).
[40] H.R. Rep. No. 96-1035, at 67 (1980) (emphasis added).
[41] H.R. Rep. No. 96-1430, at 80 (1980) (Conf. Rep.). *See also, Central States Enters., Inc. v. ICC*, 780 F.2d 664, 679 (7th Cir. 1985) ("The purpose of the Staggers Act was to encourage, under the appropriate circumstances, but not require, the Commission to approve railroad switching agreements.").

On its face, the wording of the statutory provision gives the agency wide discretion to determine how to provide for broadened reciprocal switching. The language of the provision indicates that the Board "may" require carriers to enter into reciprocal switching arrangements under two standards: (a) where the agency "finds" such agreements to be "practicable and in the public interest"; or (b) where the agency finds that such agreements are "necessary to provide competitive rail service." All of this wording underscores the Board's discretion: the use of the discretionary term "may"; the broad requirement for "findings" determined solely by the Board; the use of the broad "public interest" standard as one alternative to establishing reciprocal switching; and an alternative standard in which the Board could find simply that it is "necessary" to provide competitive rail service.

Congress used the word "may" in this statute to indicate the Board has broad discretion to require reciprocal switching agreements. Courts have noted that the words of section 11102(c) give the agency wide discretion. In *Midtec Paper Corp. v. United States*, 857 F.2d 1487 (D.C. Cir. 1988) ("*Midtec Court Review Decision*"), the court noted the "permissive" language of the reciprocal switching provision as embodied in the use of the word "may," and indicated that the statute "was cast in discretionary terms."[42] More generally, the United States Supreme Court has noted that the use of the term "may" "usually implies some degree of discretion."[43]

Here, the legislative intent behind § 11103(c)(2) and the statutory landscape support the implication that the Board has discretion. First, Congress intended to broaden the Board's regulatory power with § 11102(c)(2), clarifying the Commission's authority to order reciprocal switching[44] and expanding the Commission's ability to "permit and *encourage* reciprocal

switching as a way to encourage greater competition."[45] Second, the broader purpose of the statutes governing rail transportation — to achieve the goals of the national rail transportation policy[46] — suggests that Board has discretion because it requires the Board to weigh multiple, competing factors when regulating the railroad industry.

Similarly, the "public interest" standard of § 11102(c)(2) invites the Board to use its discretion. Congress did not define "public interest," leaving the definition to the Board. In situations like this — where a statute is silent or ambiguous — the Board has broad discretion to resolve the ambiguity.[47] The only limit on this discretion is that it must "represent[] a reasonable accomodation of the conflicting policies that were committed to the agency's care by the statute."[48] Thus, the D.C. Circuit has upheld Commission determinations of public interest under § 11102(c)(2) that were reasonable in light of the national rail transportation policy.[49] Accordingly, the Board's discretion is reviewed under the broad standard of reasonableness.

Likewise, the same broad standard confines the Board's discretion to determine what is "necessary to provide competitive rail service." Congress directed the Board to determine necessity but did not provide clear guidance. To resolve the ambiguity, the Board may construe the provision in any manner that is reasonable.[50]

The wording of §11102(c) gives no indication beyond the broad "public interest/practicable" and "necessary to provide competitive rail service" standards as to how the reciprocal switching provision is to be construed, nor does the legislative history of §11102(c) give any firm direction. The matter is up to the agency's discretion, within the confines,

however, of the pro-competitive purpose of the provision. The Staggers Act Senate Report simply noted that the "practicable and in the public interest" standard was the "same standard the Commission has applied for many years in considering whether to order the joint use of terminal facilities" under current 49 U.S.C. § 11102(a) (then 49 U.S.C. § 11103(a)). As discussed further in Section IV.B. of these Joint Comments, a review of the precedent under the joint use of terminal provisions reveals that the agency's standard had for many years been a broad one.

2. In its decision in *D & H Railway Company*[51] just after the Staggers Act, the Board established reciprocal switching under a broad reading of the statutory provisions, indicating that the Board's current restrictive rules and precedent can be changed

Just six months after the passage of the Staggers Act, the Delaware and Hudson Railway Company ("D&H") filed a petition under the newly-enacted reciprocal switching provisions of 49 U.S.C. 11103(c), seeking the imposition of a reciprocal switching agreement between the D&H and Consolidated Rail Corporation ("Conrail") covering rail service within the city of Philadelphia.[52] In its decision, the ICC noted that relief could be granted under either the "practicable/public interest" test or the "necessary to provide competitive rail service" test.[53]

In determining what is "practicable and in the public interest," the Board noted the broad standard that it had relied on in *Jamestown, N.Y. C. of C. v. Jamestown, W & N. R. R. Co.*, 195 I.C.C.289, 292 (1933) ("*Jamestown*"), and affirmed a finding by the Commission's Review Board that there are four broad criteria for determining whether the proposed switching service is "practicable and in the public interest": (1) the interchange and switching must be feasible; (2) the terminal facilities must be able to accommodate the traffic of both competing carriers; (3) the presence of reciprocal switching must not unduly hamper the ability of either carrier to serve its

[52] *Id.*
[53] *Id.* at 720.

shippers; and (4) the benefits to shippers from improved service or reduced rates must outweigh detriments, if any, to either carrier. In *D&H*, the agency found that each of these four tests were met.[54] Significantly, the carrier did not dispute the propriety of the agency's criteria, only the application of the criteria. In determining the "public interest," the agency noted that "[a]dditional rail competition is a clear public benefit from the proposed operation, one which is endorsed by rail transportation policy announced in the Staggers Act."[55]

In finding that the petition met the second alternative test of "necessary to provide competitive rail service," the agency considered only intramodal rail competition in making that determination. In doing so, it rejected Conrail's arguments that the Review Board erred in failing to consider other types of competition in determining whether reciprocal switching was "necessary to provide competitive rail service." Conrail argued that the Review Board's standard would lead to the "unreasonable result that a competing carrier will be able to impose a reciprocal switching agreement on serving carriers in every instance where a particular shipper or group of shippers has access to only one carrier."[56] In rejecting the railroad's argument, the ICC declared:

> We affirm the review board's interpretation of the intramodal analysis under the "necessary competitive rail service" test. The clear language and legislative history of section 11103(c) show that it was Congress' intent that we focus on rail-to-rail competition in determining whether reciprocal switching agreements are necessary to provide competitive rail service. As noted by the [review] board in the prior decision, 366 I.C.C. at p. 854, the Senate Report (S. Rept. 96-470, 96th Cong. 1st sess. (1979) accompanying section 203(b) of Senate Bill S. 1946, the forerunner of what ultimately added section 11103(c), states that:
>
> > The new railroad transportation policy established by this bill emphasizes the need for increased intramodal and intermodal

[54] *Id.* at 721-725.
[55] *Id.* at 723 (citing the Staggers Act policy to encourage competition).
[56] *Id.* at 727.

> competition and section 203 deals with intramodal competition among railroads.
>
> The [review] board's decision is consistent with the legislative history of section 11103(c).[57]

The ICC further noted that "[t]he reciprocal switching section is concerned with *increasing rail competition by authorizing an increase in the absolute number of rail carriers serving a particular market.* The legislative mandate of section 11103(c) thus requires a narrower (intramodal) focus in determining whether reciprocal switching is necessary to provide 'competitive rail service.'"[58] The agency concluded its analysis in the *D&H* decision by noting that "rail carriers have been given a great deal of flexibility to adjust their rates under the Staggers Act" and the agency was "convinced that Congress' aim in creating section 11103(c) of the Staggers Act was to *provide a competitive counterbalance* to this broadened rate freedom."[59] It buttressed this conviction by quoting the Conference Committee Report on the Staggers Act that "[a] number of provisions are included [in the Staggers Act] *to foster greater competition* by simplifying coordination, minor merger procedures, entry and *reciprocal switching agreements.*"[60]

Thus, three things are abundantly clear in examining the very first decision rendered by the ICC construing its new authority to order reciprocal switching under current § 11102(c): (1) the agency read the language and statutory history of the provision as requiring the agency to *encourage and facilitate* intramodal rail competition through the increased use of reciprocal switching; (2) the agency believed that an extremely broad test – one that would permit

[58] *Id.* at 728 (emphasis added).
[59] *Id.* at 729 (emphasis added).
[60] *Id.* (first emphasis added and second emphasis in original) (citing H.R. Rept. 96-1430, at 80 (1980)). D&H subsequently sued Conrail under the antitrust laws for monopolization. *See Delaware & Hudson Ry. Co. v. Consolidated Rail Corp.*, 902 F.2d 174 (2d Cir. 1990) (reversing a trial court's grant of summary judgment in favor of Conrail).

reciprocal switching to be established in *every* case where a shipper was served by a single rail carrier – was consistent with the words and purpose of the statute; and, (3) the agency has broad authority and discretion to interpret § 11102(c). Thus, the *D&H* decision make abundantly clear that the Board has the authority *now* to change its current rules and precedent — rules and precedent that make it virtually impossible for any shipper to obtain reciprocal switching under the statute. It is to that subject that we now turn.

3. Board precedent construing its Ex Parte No. 445 competitive access rules with respect to reciprocal switching have effectively eliminated the possibility of establishing reciprocal switching under section 11102(c), a result inconsistent with the purpose of section 11102(c)

In the Staggers Act, shippers understood that regulation of railroads was to be curtailed, and instead, to the maximum extent possible, competition was to ensure that rail rates were reasonable. As discussed above, as a partial counterweight to the reduction in the regulatory regime, Congress decided that there should be a broadening of competitive access remedies by inserting new authority for the agency to establish reciprocal switching.

The Board's competitive access rules were promulgated in 1985.[61] Under the Board's rules in Ex Parte No. 445, the Board will establish a reciprocal switching arrangement only where necessary to remedy or prevent acts that are "contrary to the competition policies" of the statute or "otherwise anticompetitive."[62] One year later, the agency issued the first decision construing those rules in response to a request for reciprocal switching, in the case of *Midtec Paper Corp. v. Chicago & North Western Transportation Company*, 3 I.C.C.2d 171 (1986) [herinafter *Midtec*], *aff'd, Midtec Paper Corp. v. United States*, 857 F.2d 1487 (D.C. Cir. 1988) (herinafter *Midtec Court Review Decision*). Between 1986 and 1996 the agency issued four

decisions construing the agency's competitive access rules in response to requests for reciprocal switching or terminal trackage rights: (1) *Midtec*, including the *Midtec Court Review Decision*; (2) *Vista Chemical Co. v. Atchison, Topeka & Santa Fe Railway*, 5 I.C.C.2d 331 (1989); (3) *Shenango, Inc. v. Pittsburgh, C & Y Railway*, 5 I.C.C.2d 995 (1989), *aff'd sub nom. Shenango, Inc. v. ICC*, 904 F.2d 696 (3d Cir. 1990); and, (4) *Golden Cat Division of Ralston Purina Co. v. St. Louis Southwestern Railway*, ICC Docket No. 41550 (served Apr. 25, 1996) ("*Golden Cat*"). In each of these decisions, the agency refused to establish reciprocal switching or terminal trackage rights. More importantly, the precedents set by these decisions have for all practical purposes *eliminated* the availability of relief. Following is a brief review of only some of the statements and principles that have been stated in these decisions, that can be argued to govern reciprocal switching cases.

- The agency's competitive access rules are only intended to correct competitive abuse, only to prevent anticompetitive acts, and not to introduce additional competitive carrier service.[63] Relief is available only where there has been a demonstration of actual or threatened harm.[64]

- Whether or not "abuse" has occurred involves an antitrust-type inquiry.[65] The agency's competitive access rules narrow the agency's discretion under the statute to grant competitive remedies.[66]

- Under the statute, the agency must consider intramodal, intermodal and geographic competition.[67]

- Where the claim is that the carrier's rates are too high, a finding of market dominance is required, and there needs to be an inquiry into rate unreasonableness.[68] However, a finding of market dominance is not sufficient to justify a grant of competitive access.[69]

[69] *Shenango, Inc. v. Pittsburgh, C & Y Railway*, 5 I.C.C.2d 995, 1001 (1989).

- A complete analysis of rates and costs is required to determine the relative efficiency of a carrier's route.[70]

- Even the charging of rates above Stand-Alone Cost is not a sufficient basis for the grant of competitive trackage rights.[71]

- The determination of whether a "terminal area" exists (a prerequisite to the grant of reciprocal switching or trackage rights) requires a full inquiry into the nature and use of the facility, including switching or classification activities, the activities of other shippers, and other facts.[72]

- To obtain competitive access on the basis of poor service, the fact that the carrier's service is not to the shipper's satisfaction is not enough; service failures have to be severe. The shipper must also demonstrate that the accessing carrier would not interfere with the landlord carrier's ability to handle its own business.[73]

The fact of the matter is that the above precedents currently present insuperable obstacles to a grant of competitive access relief through reciprocal switching. It can be argued that a shipper seeking such relief has to present evidence on: (1) likely or actual antitrust-type competitive abuse, such as market foreclosure, price squeezes, refusal to deal, or monopolization or predation; (2) market dominance, including intermodal, intramodal and geographic competition; (3) rate unreasonableness, including an inquiry into the carrier's costs and SAC; (4) the nature of the carrier's operations in the area to establish that there is a terminal area; and/or (5) severe service failures coupled with a showing that the operations of the carrier against whom relief is sought will not be impaired. Just the discovery requirements to adduce evidence to prove these elements are daunting. And because there has never been a successful case, no shipper can be sure of what, if any, evidence would ever satisfy the standards. In the face of all of this, shippers have been effectively deterred from even attempting to invoke the statutory

[70] *Vista Chemical*, 5 I.C.C.2d at 341.

[73] *Id.* at 9.

remedies. In the past fifteen years, there has not been even a single shipper application for reciprocal switching under § 11102(c).[74]

Although the ICC may have believed at the time that it published the Ex Parte No. 445 (Sub-No. 1) rules that it was simply "narrowing" the availability of relief under 49 U.S.C. § 11102(c), a review of all of the precedent reveals that the agency has, by erecting numerous legal and evidentiary barriers, in fact *foreclosed* any relief whatsoever. This result is fundamentally inconsistent with the purpose of the Congress in promulgating its new reciprocal switching remedy for shippers, and is fundamentally unfair. The Board can and should use the wide discretion given it to change its current rules on reciprocal switching.

4. Court review of the Board's decisions in Ex Parte No.445 and *Midtec* indicate that the Board has wide discretion in the area of reciprocal switching

The Interstate Commerce Commission's decisions in Ex Parte No. 445, *Intramodal Rail Competition,* and in *Midtec* were both appealed to the courts, the former in *BG&E* and the latter in the *Midtec Court Review Decision.* In both cases, the court affirmed the agency's decision. However, in both cases the court made clear that it was affirming the agency's decision *not* because the agency's interpretation was the only one permissible under the statute, but rather because the statute gave the agency discretion, and the agency's exercise of that discretion in the case at hand was properly explained. Thus, the court reviews of the agency's decisions make clear that the agency retains wide discretion under the statute, and that the agency's current policies are not the only ones possible.

In *BG&E*, the petitioner challenged as inconsistent with the statute the agency's decision to establish reciprocal switching arrangements *only* to remedy or prevent "anticompetitive" acts,

[74] Over ten years ago, the U.S. Court of Appeals for the Eighth Circuit noted that "invoking [the competitive access] rules has proved difficult for shippers . . . ." *MidAmerican Energy Co. v. STB*, 169 F.3d 1099, 1108 (8th Cir. 1999).

as the ICC's Ex Parte No. 445 rules prescribed. The court noted that while BG&E's position might be a reasonable interpretation of the statute (a question the court did not decide), it was not the *only* reasonable interpretation because "the statutory directives under which the ICC operates do not all point in the same direction . . . Our task thus is only to determine whether the ICC has arrived at a reasonable accommodation of the conflicting policies set out in its governing statute . . . ."[75] In coming to that conclusion, the court noted "the Staggers Act's strong emphasis on preserving and enhancing competition . . . ." *Id.* Thus, the court was clear that, while the agency's interpretation of the statute set forth in its Ex Parte No. 445 rules was permissible, the agency might also come to some other permissible interpretation.

The same was true in the *Midtec Court Review Decision.* In that decision, the court noted the "permissive" language and "discretionary terms" of the statute. The court also noted that it would review the agency's "exercise of discretion" by examining whether it had provided a "reasoned analysis that is not manifestly contrary to the purposes of the legislation it administers."[76] The court found only that the agency's interpretation of the statute was a "reasonable accommodation" of the fifteen different and not-entirely-consistent goals of the national rail transportation policy set out in the Staggers Act, and saw "no basis in the text of the statute or in its legislative history for concluding that the Commission acted unreasonably. . . ."[77] Thus, it is abundantly clear that the court in the *Midtec Court Review Decision*, like the court in *BG&E*, recognized that §11102(c) did not mandate one result, but rather gave the agency wide discretion to interpret the provision in light of current circumstances and the need to weigh and balance the policies of the Act at a particular time. Thus, it is also abundantly clear from these court decisions specifically reviewing the agency's authority under §11102(c) that any future

[75] *Baltimore Gas & Elec. Co. v. United States*, 817 F.2d 108, 115 (D.C. Cir. 1987).
[76] *Midtec Paper Corp. v. United States*, 857 F.2d 1487, 1500 (D.C. Cir. 1988)
[77] *Id.* at 1501.

court, in reviewing any future change to the agency's rules and precedent on reciprocal switching, would review any such action under the same broad parameters.

5. In Ex Parte No. 575, the Board recognized that it had discretion to change its rules

As the Board's Notice indicates, Ex Parte No. 705 is not the first time that the Board has reviewed these issues. Specifically, the Board took extensive testimony and oral comments thirteen years ago, in Ex Parte No. 575, *Review of Rail Access in Competition Issues,* 3 S.T.B. 92 (1998) ("*Ex Parte No. 575 Decision*"). At the end of the proceeding, the Board noted that

> [T]he railroads have not satisfactorily addressed the shippers' basic complaints: that the rail industry has changed dramatically since 1980 as a result of significant railroad consolidations, system rationalizations, and greater carrier pricing flexibility and routing discretion. Although these changes have contributed to the efficiencies, cost savings, and improved earnings necessary to sustain the industry, cumulative the result has been a significantly more consolidated industry in which competitive options for rail-dependent shippers have not been expanded. This increasing consolidation within the industry, combined with the difficulties that many shippers perceive in obtaining relief through the regulatory system, leave too many shippers feeling that they have no leverage and no avenue of relief.[78]

Although ultimately the Board did not take action on the competitive access issues outlined in Ex Parte No. 575 (alternative through routes and bottlenecks, reciprocal switching, and terminal trackage rights),[79] the Board's observations about the negative effects of consolidation and constraints on competition are, for all of the reasons already mentioned, of more pressing concern today than they were thirteen years ago.

The Board's decision in Ex Parte No. 575 made clear that the Board believed that it had discretion to change its rules. The Board, for example, gave *no* indication that it believed that it was constrained by the statute from changing its policies in the three competitive access areas

[78] *Ex Parte No. 575 Decision*, 3 S.T.B. at 95.
[79] *See Ex Parte No. 575 Decision*, 3 S.T.B. at 97

that it discussed. On the contrary, the Board indicated that, "[t]o ensure that our procedures are effective in addressing needed service improvements, we will expeditiously begin a rulemaking proceeding to consider revisions to the competitive access regulations to address quality of service issues."[80] In addition, the Board indicated that "[g]iven the changes that have taken place in the rail industry since 1980, we will also consider whether to revise the competitive access rules with respect to competitive issues not related to quality of service."[81] The Board directed the railroads to arrange meetings with a broad range of shipper interests to explore the issue and see if the parties can mutually identify appropriate modifications to the non-service related component of the Board's competitive access standards that would "facilitate greater access where needed." The Board gave *no* indication that the statute would constrain changes in Board rules or policies or that the "meetings" would thus be restricted to statutory changes — indeed, the direct implication was that the Board would itself directly consider any changes recommended. Though nothing came of these discussions and the Board declined to go forward,[82] it was clear that the Board believed in 1998 that it had discretion to change its rules and policies.

6. Changed circumstance particularly warrant a revision to the Board's rules and precedent on reciprocal switching

As noted above, thirteen years ago, in Ex Parte No. 575, the Board declared that the railroads "have not satisfactorily addressed the shippers' basic complaints: that the rail industry has changed dramatically since 1980 as a result of significant railroad consolidations, system

[80] *Id.* at 98.
[81] *Id.*
[82] In a December 1998 letter to Congress, the STB reviewed its efforts in Ex Parte No. 575 and indicated that it would not reopen its competitive access rules because it believed that such a policy shift should be initiated by Congress rather than the agency. However, the agency's decision not to reopen was clearly made not because it believed that it did not have the statutory power to do so, but for reasons of comity and national policy.

rationalizations, and greater carrier pricing and routing discretion."[83] In the thirteen years since the Board's decision in 1998, there have been further changes in the industry, many of which have been discussed in Section II and III of these comments and which the Board has already noted in its Notice initiating this proceeding.[84] In addition, a few other changed circumstances should be discussed, pertaining specifically to reciprocal switching. Together with the changes already mentioned, such circumstances clearly warrant a revision to the Board's rules on reciprocal switching.

a. Capacity constraints in the rail industry particularly justify a reexamination of the Board's rules on reciprocal switching

There have been increasing concerns that the U.S. rail system is becoming or will soon become increasingly congested and may find it increasingly difficult to handle substantially increased volumes of traffic in the future, at least assuming that traffic rebounds from recession-induced volume reductions. According to the Department of Transportation, between 2010 and 2035, the U.S. transportation system will experience a 22 percent increase in the total tonnage that it moves, a result of population growth.[85] There is no question that traffic density on the U.S. rail system has increased very substantially since passage of the Staggers Act. According to the AAR, revenue ton-miles per owned mile of track has more than tripled since 1980, from 3.40 million ton-miles per owned mile of track to 11.06 million ton-miles per owned mile of track in

[83] *Ex Parte No. 575 Decision*, 3 S.T.B. at 95.
[84] *Competition in the Railroad Industry*, STB Ex Parte No. 705 at 3 (served Jan. 11., 2011).
[85] FRA, Dep't of Transp., *National Rail Plan* 6 (2010). It should be noted, however, that the Board-requested "Supplemental Report to the U.S. Surface Transportation Board on Capacity and Infrastructure Investment – Final Report," by Laurits R. Christensen Associates, Inc., March 2009 ["Christensen Capacity Report"], cautions that such long-term forecasts "should not be viewed as having a high degree of precision." *Id.*, at ES-4. Moreover, the Christensen Capacity Report cautions that DOT forecasts very high demand growth compared to current production forecasts from the Department of Energy and the Department of Agriculture for coal, petroleum products and grains, which are key components of the railroads' traffic mix. *See*, Christensen Capacity Report, at 5-1.

2008.[86] A recent study by RAND Supply Chain Policy Center ("Rand Study"), noted that "[r]ail traffic density may continue to increase, allowing for further productivity improvements, but recent indications that rates are rising suggest that it is possible that, at least in the near future, rail volumes may be approaching capacity."[87] The RAND Study also noted that current research from the finance industry suggests that rail rates have begun to increase by as much as 30 percent for some customers,[88] and indicated that several recent studies "strongly support the hypothesis that railroad prices are increasing rapidly."[89] As previously noted, DOT itself has indicated that between 2001 and 2008, rail rates increased over 25% in inflation-adjusted terms.[90] The RAND Study suggested that rail traffic density may now have increased to a level that could indicate that the rail industry, which is "clearly a natural monopoly," is facing capacity constraints.[91] The RAND Study also indicated that publicly available data suggests that decade-long improvements in rail speed and reliability "may be slowing or reversing,"[92] and that one study has noted that rail productivity metrics indicate that the rate of productivity increases in the rail industry began to decline in 2004.[93]

To the extent that the rail system is experiencing or will soon experience certain capacity constraints, particularly those constraints resulting from operations at specific choke points in the rail system, the increased use of reciprocal switching could provide additional efficiencies. Under the current system, if a shipper is served by a single rail carrier, even if another rail carrier is close by with an equally or even more-efficient routing from origin to destination, the shipper

[93] *Id.* at 38.

is effectively unable to access the other rail carrier because of the extremely high barriers erected as a result of the agency's precedent. However, under a broader reciprocal switching regime, the shipper would be able to access a choice of carriers. If the incumbent's route were the more efficient of the two overall, competition would presumably permit the incumbent to retain the traffic, to the benefit of overall system efficiency and productivity. But in a broader reciprocal switching regime, if the competitive rail carrier's route were the more efficient, competition (assuming a competitive reciprocal switching charge) would permit the shipper to access the more efficient route. Under such a regime, system capacity would be maximized.

b. The Christensen Report confirms that a broadening of reciprocal switching would not harm the railroads' financial health

In its Notice in this proceeding, the Board took note that it had recently commissioned Christensen Associates, Inc. to perform an independent study to examine competitive access issues ("Christensen Competition Report").[94] The Christensen Competition Report noted that, for open-access policies to produce an overall gain in economic welfare, "the effects of lower prices to shippers, increased output, and/or increased service quality due to competitive pressures must outweigh any increase in railroad costs. Furthermore, . . . the economic assessment of the likely effects of these proposals must include the impacts on railroad profitability and investment incentives."[95] The Christensen Competition Report went on to present a summary of the likely economic effects of various competitive access proposals, including reciprocal switching.[96] The Christensen Competition Report noted:

> Of the various open-access policies proposed in recent legislation, those policies that propose incremental changes – *e.g., reciprocal*

[94] See, Lauritis R. Christensen Associates, Inc., *A Study of Competition in the U.S. Freight Railroad Industry and Analysis of Proposals That Might Enhance Competition* (2009), http://www.lrca.com/projects/railroadstudy/ [hereinafter *Christensen Competition Report*].

[96] *Id.* at 22-13.

> *switching and terminal agreements – will be the least costly in terms of loss of economic efficiency and, in our opinion, the most likely to produce competitive responses by railroads.* The losses of economies of density and vertical integration, and the likely negative impact on incumbent investment incentives, are among the economic efficiency costs that must be weighed against any potential gains. Of course, to the extent that competitive responses result and traffic increases, static efficiency losses may be overcome – e.g., there would be a likely gain in economies of density if volumes increase.
>
> . . . .
>
> *[I]ncremental policies such as reciprocal switching . . . are most likely to produce an outcome of increased railroad competition as length-of-haul economies are least affected by end-point open access.*[97]

Table 22-1 summarized the Christensen Competition Report's conclusions by indicating that, reciprocal switching would likely result in "potential gains" with respect to economies of density; would produce only "small losses" or "small effects" with respect to length of haul economies, investment incentives, railroad profitability, and coordination costs; would "most likely" result in competitive responses by carriers; and would "most likely" produce shipper gains. The Report's overall conclusions on reciprocal switching were significant: "[w]e believe that incremental policies such as reciprocal switching and terminal agreements *have a lower potential of leading to adverse changes to industry structure, costs, and operations, and additionally have greater likelihoods of resolving shipper concerns via competitive market responses.*"[98]

7. Under general court precedent, the Board has the broad discretion and wide legal authority to revise its rules on reciprocal switching

As the Board well knows, the law does not require regulations and precedent to remain set in concrete forever. Administrative agencies are permitted to change their policies and reverse prior conclusions as long as the statute permits such discretion and as long as the

[97] *Id.* (emphasis added).
[98] *Id.* at 22-14 (emphasis added).

agencies explain themselves adequately.[99] Indeed, an agency's view of what is in the public interest may change, with or without a change in circumstances.[100] But the agency must supply a reasoned analysis to support its change. *Id.*

As noted by the Supreme Court in *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 863 (1984), an agency interpretation "is not instantly carved in stone." The Board may change its policies, to the extent that the Interstate Commerce Act permits, so long as it acknowledges its prior policy and provides a reasoned basis for the changed policy.[101] Thus, if the STB concludes that circumstances now require a different accommodation of the conflicting goals of the National Transportation Policy, that new interpretation will also enjoy the deference of the courts under the *Chevron* doctrine, as long as the new interpretation is also a reasonable reading of the statute and the agency adequately explains the reason for its change.

The fact that the Congress passed ICCTA in 1995 does not change this conclusion. ICCTA was intended not to make substantive changes to the Interstate Commerce Act (with a few explicit exceptions). The Board should not be dissuaded from amending its policies because of changed circumstances or because it believes that a different policy response is required. Indeed, the Board has changed pre-ICCTA policies after ICCTA, despite the passage of the Act. For example, when the Board concluded in 1999 that it should alter its "market dominance" rules to exclude "product and geographic competition" in most circumstances, it did so despite the fact that its prior decision including product and geographic competition long pre-dated ICCTA, and

---

[99] *Motor Vehicle Mfr's Ass'n v. State Farm*, 463 U.S. 29, 42, 57 (1983).

[100] *Id.* at 58; *see also, BNSF Railway v. STB*, 526 F.3d 770, 779-80 (D.C. Cir. 2008) (holding that the STB may change how it implements it statutory duties with or without a change in circumstances).

[101] See, *e.g.*, *FCC v. Fox*, 129 S. Ct. 1800, 1811 (2009) (holding that to change its position, an agency must show that: (1) the new policy is permissible under the statute; (2) good reasons exist for the policy; and (3) the agency believes the new policy is better); *Greater Boston Television Corp. v. FCC*, 444 F.2d 841, 852 (D.C. Cir. 1970), *cert. denied*, 403 U.S. 923 (1971) ("An agency changing its course must supply a reasoned analysis indicating that prior policies and standards are being deliberately changed, not casually ignored.").

its new policy post-dated ICCTA.[102] This decision was affirmed by the D.C. Circuit, which analyzed the decision under the familiar deferential standard of *Chevron*.[103] The same principle applies here: regardless of the passage of ICCTA, the Board has wide discretion to interpret the standards under which it will establish reciprocal switching under 49 U.S.C. § 11102(c).

8. It would be unlawful and contrary to Congressional intent to constrain the "practicable and in the public interest" standard by the "necessary to provide competitive rail service" standard

In its Notice directed to 49 U.S.C. § 11102(c), the Board asked the parties in particular to address "whether the broad 'practicable and in the public interest' standard in the statute should be constrained by the provision permitting relief "where . . . necessary to provide competitive rail service." The Interested Parties believe that the statute is clear, that these are alternative and independent tests, and that it would be unlawful to constrain the former by the latter.

At the outset, it should be noted that it is not at all clear that the "necessary" test is narrower than the "practicable/public interest" test. Indeed, it could be argued that the latter is broader (i.e., more permissive) than the former. But without getting into a metaphysical discussion as to which test is "broader," it is very clear from both the wording of the statute and the Board's own precedent that these are *alternative* and *independent* tests. The statutory wording is clearly in the alternative: "[t]he Board may require rail carriers to enter into reciprocal switching agreements, where it finds such agreements to be practicable and in the public interest, *or* where such agreements are necessary to provide competitive rail service."[104] If Congress had

[102] *See Mkt. Dominance Determinations – Prod. & Geographic Competition*, 3 S.T.B. 937 (1998).
[103] *Ass'n of Am. R.Rs. v. STB*, 306 F.3d 1108 (D.C. Cir. 2002).
[104] 49 U.S.C. § 11102(c) (emphasis added).

intended the former to be constrained by the latter, it would have chosen statutory language to indicate such an intent.[105]

Moreover, the legislative history also makes clear that these are alternative and independent tests. As noted in Section IV.A.1 and 2, above, the Staggers Act Senate Report noted that the "practicable and in the public interest" standard was the "same standard the Commission [had] applied for many years in considering whether to order the joint use of terminal facilities" under current 49 U.S.C. § 11102(a) (then 49 U.S.C. § 11103(a)). The addition of the "necessary" standard was new, and was clearly intended to provide an alternative to the traditional "practicable/public interest" test that had previously been applied by the agency in the terminal trackage rights context. For the Board to condition the one by the other would therefore violate both the statutory wording and the Congressional intent.

B. THE BOARD HAS WIDE DISCRETION TO ESTABLISH TERMINAL TRACKAGE RIGHTS UNDER SECTION 11102(a)

For many of the same reasons discussed at length in the previous section — the use of the word "may," the need for the Board to issue findings determined solely by it; the use of the broad "practical/public interest" standard, and the general broad standard used by the courts in reviewing agency actions — the Board has wide discretion to establish terminal trackage rights under 49 U.S.C. § 11102(a). Admittedly, the statutory provision granting the Board the authority to order terminal trackage rights is more demanding than the statutory provision authorizing the Board to order reciprocal switching. Under the terminal trackage rights provision of § 11102(a), the agency is required to find not only that the trackage rights are "practicable and in the public

[105] For example, the statute could have used the word "and" in place of the "or"; or could have been worded to permit the Board to require rail carriers to enter into reciprocal switching agreements where it finds such agreements to be practicable and in the public interest, but *provided that* the Board finds that such agreements were necessary to provide competitive rail service. But wording such as "provided," "unless," "on the condition that," etc., were *not* chosen, indicating clearly that Congress intended the tests to be alternative and independent.

interest," but that the trackage rights would not "substantially impair[] the ability of the rail carrier owning the facilities or entitled to use the facilities to handle its own business." This reflects the more invasive nature of trackage rights compared to reciprocal switching.

Nevertheless, a review of precedent under the joint use of terminal provisions confirms that the agency's standard had for many years been a broad one, giving the agency wide discretion. For example, in *Jamestown*, the agency exercised its authority to order joint use of terminal facilities when it found that such use would be in the public interest, would be practicable, and would not substantially impair the carrier owning or entitled to enjoyment of the facilities to handle its own business. [106] In cases before the Staggers Act, the Commission identified the components of the public interest standard for ordering the joint use of terminal facilities. When making a public interest determination, the agency considered the interest of the shippers involved, carriers, and the general public.[107] Two prerequisites existed to finding public interest. First, there needed to be an actual necessity or compelling reason for the joint terminal use.[108] Mere desirability or convenience was insufficient.[109] Second, existing service needed to be inadequate.[110] In addition, the Commission identified a number of factors that would inform a public interest determination, such as: (1) the financial consequence to the carriers involved;[111] (2) the disparity between the traffic gained by the carrier gaining the use and the traffic lost by the carrier providing the use; and (3) the inconveniences that may result to the shipping and traveling public in general.[112] However, these factors were themselves extremely general, and

[106] *Jamestown, N.Y. C. of C. v. Jamestown, W & N. R. R. Co.*, 195 I.C.C. 289, 292 (1933).
[107] *Id.*
[108] *Id.*

[111] *Hastings Commercial Club v. Chicago, Milwaukee & St. Paul Rwy.*, 107 I.C.C. 208, 216 (1926)
[112] *Id.*

gave the agency wide discretion in interpreting them. It is clear, then, the agency exercised considerable discretion in making a public interest determination under 49 U.S.C. § 11102(a).

C. THE BOARD HAS BROAD DISCRETION TO CHANGE ITS POLICIES WITH RESPECT TO BOTTLENECK RATES

For the same reasons that adopting revised policies on reciprocal switching and use of terminal facilities is well within the Board's statutory authority, the Board also has broad discretion to revise its outdated bottleneck rate policy. Indeed, ICCTA entitles a shipper to a common carrier rate upon reasonable request. But, in the so-called "Bottleneck Decisions," the Board permitted a railroad to refuse to quote a bottleneck segment rate, even if a bottleneck rate would facilitate rail-to-rail competition for most of the distance between the origin and destination.[113]

The Board's "Bottleneck Decisions" facilitate conscious parallelism and should be reversed by the Board to allow for additional rail–to-rail competition. A shipper seeking a bottleneck rate from an origin to a destination served by the same carrier will almost always be rebuffed or have the quoted rate limited to a local movement with no combination rate beyond allowed. The purpose of such a refusal is obvious; the carrier forecloses the possible competition offered by a connecting carrier at the interchange point. Today, where there are so few competitive choices, the ability of a railroad to refuse to quote a bottleneck rate to an interchange point makes rail-to-rail competition virtually impossible. The current bottleneck doctrine is an anachronism that would not be tolerated in any other industry. (See Section VII, below, for a discussion of how reasonable access is maintained in telecommunications deregulation.)

It is clearly reasonable, in general, for a shipper to request a common carrier bottleneck rate to a point of interchange that would lead to a routing that, because of the non-bottleneck

[113] *Cent. Power & Light Co. v. S. Pac. R.R.*, 1 S.T.B. 1059 (1996), *clarified by Cent. Power & Light Co. v. S. Pac. R.R.*, 2 S.T.B. 235 (1997), *aff'd in part, MidAmerican Energy Co. v. STB*, 169 F.3d 1099 (8th Cir. 1999).

carrier, is more efficient or otherwise more commercially advantageous to the shipper.[114] It defies common sense, and the pro-competitive purposes of the Staggers Act, to say that a carrier's common carrier obligation does not apply when it would require the carrier to compete with another carrier.[115]

The Supreme Court's decision in *Great Northern Railway v. Sullivan*, 294 U.S. 458 (1935), is not an obstacle to overturning the Board's "Bottleneck Decisions" for three reasons. First, *Great Northern* did not involve a request for a "bottleneck rate," but rather an effort at challenging the "divisions" between two railroads participating in the same joint rate. Second, the Staggers Act was enacted long after *Great Northern* was decided, and adopted a "pro-competitive" rail transportation policy. The "bottleneck" rule prevents, rather than promotes, rail-to-rail competition, and so is inconsistent with the Staggers Act. Third, the Eighth Circuit's decision affirming the Board's "Bottleneck Decisions" held that the existing statute was ambiguous, and deferred to the STB's reasonable interpretation of the statute. The Court's language implied that it would have affirmed a contrary reading, *i.e.*, that the existing statute requires railroads to quote "bottleneck rates."[116]

The lack of a "bottleneck" rate deprives shippers of the ability to benefit from competition where it already exists, and it also deprives them in many cases of the most efficient routes. Instead, shippers are forced to rely heavily upon regulation to ensure reasonable rates for the entire movement from origin to destination, including the competitive segments, or to forego any regulatory constraint at all due to the cost and complexity of bringing such extensive rate

[114] Exceptional situations, in which there is a dispute whether the shipper's chosen point of interchange is feasible or otherwise reasonable, can be dealt with on a case-by-case basis.

[115] 49 U.S.C. § 10705(a)(2), the "long-haul, short-haul" provision, which the Board cited in its "bottleneck rate" decision, is not to the contrary. It clearly provides the Board with discretion to require railroads to participate in through rates (or, as the railroads are fond of putting, to "short-haul themselves."). *See supra* note 45.

[116] *MidAmerican Energy Co. v. STB*, 169 F.3d 1099, 1107 (8th Cir.) ("Regardless of how we would resolve the tension in the Act if we were to independently rule on the utilities' claims, we cannot say that the Board's interpretation was incorrect."), *cert. denied*, 528 U.S. 950 (1999).

cases. Shippers should be entitled to competition, because that was the promise of the Staggers Act. And shippers should certainly be entitled to efficient transportation; that has been the law since 1887.[117]

It follows that the Board should overturn its "bottleneck" rate rule, and may do so as a reasonable interpretation of the existing statute, based on the Eighth Circuit's determination that the statute is ambiguous and because the Board is entitled to deference in construing such provisions.[118]

V. CHANGES TO THE BOARD'S COMPETITION RULES AND PRECEDENT WOULD ASSIST THE U.S. ECONOMY

The Board should consider of the utmost importance the question whether railroad rates and other charges have been increased to such an extent that they are now clearly harming the U.S. economy, in any number of ways. Set out below are examples of the widespread harm to the U.S. economy that high rail rates and poor railroad service cause.

Competition with Foreign Interests. U.S. railroads do not compete with railroads in China, India, Europe, or any other part of the world economy — but most of their customers, especially grain, chemical, clay, and other manufacturing interests, compete with grain, chemical, clay and manufacturing interests in those countries. Therefore, almost every time a rail customer is charged an excessive rate, it hurts American industry's ability to compete with China and other foreign countries and the industries in those countries. Even where rail customers, such as electricity generators, do not compete with foreign entities,[119] American

[117] *E.g., Consolidated Rail Corp. v. United States,* 646 F.2d 642 (D.C. Cir.), *cert. denied,* 454 U.S. 1047 (1981); *Akron, Canton & Youngstown R.R. v. ICC,* 611 F.2d 1162 (6th Cir. 1979), *cert. denied,* 449 U.S. 830 (1980).
[118] *Chevron U.S.A. Inc. v. Natural Res. Def. Council, Inc.*, 467 U.S. 837, 842-43 (1984).
[119] There is a limited amount of electricity that moves across the U.S.-Canadian border, depending on availability and price. Similarly, there is a limited amount of competition between U.S. and Canadian railroads. Neither circumstance is significant enough to affect the overall picture in most markets, given that rail lines and electricity transmission lines are typically not located in ways that promote competition between the United States and Canada.

RECIPROCAL SWITCHING

U.S. WHEAT ASSOCIATES TESTIMONY

U.S. Wheat Associates ("USWA") respectfully submits its testimony in the above-captioned proceeding in accordance with the Surface Transportation Board ("STB" or "Board") Notice of Public Hearing ("Notice") served on December 28, 2021. The Board provided the opportunity for interested parties to provide testimony to update the record in this proceeding regarding its proposed new regulations under which the Board would exercise its statutory authority to require rail carriers to establish reciprocal switching arrangements under certain circumstances. USWA thanks the Board for this opportunity to voice its strong support for these proposed new rules for reciprocal switching made even more necessary now by the changes in the rail industry since early 2017.

USWA INTEREST IN THE PROPOSED RULES

USWA is the export market development organization for the U.S. wheat industry. USWA promotes the reliability, quality, and value of all six U.S. wheat classes to wheat buyers, millers, bakers, food processors, and government officials in more than 100 countries around the

world. Its mission is to "develop, maintain, and expand international markets to enhance wheat's profitability for U.S. wheat producers and its value for their customers." Funding is made possible through checkoff dollars, goods and services from 17 state wheat commissions, and cost-share grants from the U.S. Department of Agriculture's Foreign Agricultural Service.

USWA created an internal Transportation Working Group ("TWG") in 2018 after the realization that increasing rail rates were having a large impact on the wheat industry's export competitiveness. TWG is a working group with USWA that examines rail and other transportation issues on behalf of these member Commissions. Wheat is heavily reliant first on exports, exporting on average half of all US production, and second on rail transportation to move this commodity across the U.S. to feed the world. Rail rates have a disparate impact on wheat shippers vis a vis other bulk US commodities due to the large percentage of production that is exported and the major growing regions that are not generally adjacent to the Mississippi waterways. Distances from the central and northern plains wheat producing areas are far too great to truck wheat to export facilities, making railroads a crucial and irreplaceable link in the wheat export logistics chain.

The results of this increased dependance on rail for the movement of wheat exports have been clear. Over the last decade, rail rates have increased exponentially, and wheat continues to be charged higher rates than other commodities with similar handling characteristics – even for identical hauls. In work conducted by the TWG in 2020, quotes for rail service were collected from grain shippers for major US grain crops. These price indications were for the same origin/destination pairings and for the same dates of service. They documented a premium of between 22% and 39% for wheat movements compared to corn in four major regions. These

results were corroborated by a June 2017 study by the U.S. Department of Agriculture's Agricultural Marketing Service which was able to find no underlying cause driving the increases in wheat rates. These premiums relative to these other commodities clearly demonstrate the current market power of the Class I railroads and the lack of any serious competition afforded to wheat shippers.

That unchecked market power has had serious implications for U.S. wheat's competitive position vis a vis other major world exporters, such as Canada. The Canadian comparison is particularly telling as the two spring wheat and durum growing regions are similarly positioned in the interior of each country, with nearly identical distances to traverse to export facilities in each country, with differing government rail policies (including more favorable terms for reciprocal switching) being one of the only large differences in market position. However, despite the similarities, work collected by one of USWA's member states showed similar origin to export point rail moves in Canada were 30% below the US moves at the time.

As has been demonstrated, wheat rail shippers have been adversely impacted by the lack of any options to obtain competitive rail access. Under the current process for the reciprocal switching remedy, wheat shippers do not bring forward cases and are often forced to modify operations to their detriment because no other viable options are present. This results in negative impacts throughout the supply chain ultimately impacting not only wheat shippers, but their customers and consumers. With extensive coverage by multiple Class I railroads of the largest wheat growing areas in the U.S. and a limited number of export facilities capable of handling bulk grain exports, the US wheat industry is particularly well-positioned to benefit from policies better enabling competitive switching.

USWA appreciates that the STB has an important oversight role in looking at the impact of freight rail policies on rail shippers and is encouraged the STB is seeking ways to improve the reciprocal switching remedy in line with the intent of Congress. USWA urges the Board to breathe life into this remedy that has been essentially dormant for decades and to provide a method to counter the Class I railroads' unabated market power over wheat shippers.

BACKGROUND OF THE PROCEEDING AND THE PUBLIC HEARING

The Board opened this proceeding by issuing a Notice of Proposed Rulemaking ("2016 NPRM") on reciprocal switching on July 27, 2016. *Reciprocal Switching ("NPRM"),* STB Ex Parte 711 (Sub-No. 1) (STB served July 27, 2016). Parties filed opening comments and reply comments on the 2016 NPRM in late 2016 and early 2017. Following these comments, the proceeding did not move forward except for ex parte meetings and has remained essentially dormant since that time.

The 2016 NPRM grew out of the Ex Parte No. 711 proceeding, which was initiated by a July 7, 2011 petition for rulemaking by the National Industrial Transportation League. Petition for Rulemaking of the National Industrial Transportation League, *Petition for Rulemaking to Adopt Revised Competitive Switching Rules*, STB Ex Parte 711 (filed July 7, 2011). That proceeding involved comments filed in 2013 and a public hearing in March 2014.

On December 28, 2021, the Board issued the Notice stating its intent to "hold a public hearing on March 15 and 16, 2022, concerning the reciprocal switching regulations it proposed" through the 2016 NPRM. *Reciprocal Switching*, STB Ex Parte 711 (Sub-No. 1), slip op. at 1 (STB served Dec. 28, 2021). The Board's stated intent for holding a public hearing and inviting comments is "[t]o allow interested persons to submit testimony to update the record," and "[t]o

ensure a full and updated record in this proceeding." *Id.* at 2, 6. Thus, the Notice specifically invites comments addressing certain topics, including:

- "[A]dditional or modified views on the effects and/or need for the proposed regulations" in light of "significant operational changes in and affecting the freight rail industry" in the time "[s]ince the issuance of the NPRM";
- "[N]ew developments (i.e., developments that have occurred since the Board previously invited comments in this proceeding) that a commenter finds are relevant to a final decision in this matter and address any change or significant development in a commenter's views since the previous round of comments"; and
- "[T]opics that were discussed in ex parte communications that have taken place since October 25, 2016, in this proceeding."

Id. at 6.

LAW AND LEGISLATIVE HISTORY REGARDING RECIPROCAL SWITCHING

Reciprocal switching can occur as part of a voluntary arrangement between carriers, or it may be ordered by the Board. The Board may require the establishment of a switching arrangement when it finds that the arrangement either (1) is practicable and in the public interest, or (2) is necessary to provide competitive rail service. 49 U.S.C. § 11102(c)(1). Section 11102(c)(1) authorizes the Board to establish the conditions of and compensation for switching service if the affected carriers cannot reach agreement on those matters within a reasonable period. The Board's implementation of § 11102 is guided by the rail transportation policy set forth in 49 U.S.C. § 10101. *See NPRM*, EP 711 (Sub-No. 1) et al., slip op. at 16.

The Board's current regulations governing reciprocal switching were promulgated in 1985 by the Board's predecessor, the Interstate Commerce Commission ("ICC"), *see Intramodal Rail Competition,* 1 I.C.C.2d 822 (1985), *aff'd sub nom. Balt. Gas & Elec. v. United States,* 817 F.2d 108 (D.C. Cir. 1987), and are codified at 49 C.F.R. § 1144. The regulations provide that reciprocal switching would only be prescribed if the agency determines that it "is necessary to remedy or prevent an act that is contrary to the competition policies of 49 U.S.C. [§] 10101 or is otherwise anticompetitive," and "otherwise satisfies the criteria of . . . [§] 11102(c)." 49 C.F.R. § 1144.2(a)(1). The Board's regulations also provide relevant factors that the agency shall consider in determining whether to prescribe competitive access, along with a "standing" requirement. 49 C.F.R. § 1144.2(a)(1)-(2). The regulations do not address how the Board should establish compensation for Board-ordered switching when the carriers cannot reach agreement within a reasonable period.

In *Midtec Paper Corp. v. Chicago & North Western Transportation Co. ("Midtec"),* 3 I.C.C.2d 171 (1986), the first case where the ICC applied 49 C.F.R. § 1144.2, the ICC explained that the key issue under its then-new regulations was whether the incumbent railroad "has engaged in or is likely to engage in conduct that is contrary to the rail transportation policy or is otherwise anticompetitive." *Id*. at 181. The ICC further explained that it would find anticompetitive behavior only when an incumbent carrier had "used its market power to extract unreasonable terms on through movements" or "because of its monopoly position . . . shown a disregard for the shipper's needs by rendering inadequate service." *Id.* The agency's competitive access regulations have not changed substantively since 1985 and few requests for reciprocal switching have been filed since then. In other words, *Midtec* caused the use of the reciprocal switching remedy to go dormant because rail shippers did not believe this standard could be met.

Under the Board's proposed regulations, there would be no need to show anticompetitive conduct, as had been required in the ICC's *Midtec* decision. Rather, under the Board's proposed regulations, the Board would require the establishment of a switching arrangement when the switching arrangement either was practicable and in the public interest or was necessary to provide competitive rail service. *NPRM,* EP 711 (Sub-No. 1) et al., slip op. at 16. This approach would simply apply the language in the statute as written by Congress.

In assessing whether a switching arrangement would be practicable and in the public interest under the proposed regulations, the Board would consider whether the benefits of a proposed arrangement would outweigh its potential detriments. In making that determination, the Board would consider all relevant factors, such as (1) whether the arrangement would further the rail transportation policies in 49 U.S.C. § 10101; (2) the efficiency of the proposed route; (3) whether the arrangement would allow access to new markets; (4) the impacts, if any, of the arrangement on capital investment, quality of service, and employees; (5) the amount of traffic that would be moved under the arrangement; and (6) the impact, if any, of the arrangement on the rail transportation network. *NPRM*, EP 711 (Sub-No. 1) et al., slip op. at 18.

In assessing whether a reciprocal switching arrangement would be necessary to provide competitive rail service, the Board would consider whether intermodal and intramodal competition were effective with respect to the movements for which the switching arrangement was sought. The Board would evaluate the effectiveness of competition using quantitative and qualitative factors that the Board has developed in the context of assessing market dominance in rate challenges, but it would not consider product competition or geographic competition. *Id.* at 27.

The Board's proposed regulations also state that reciprocal switching would not be ordered, even if one or both of the foregoing standards were met, if the switching was not feasible, would be unsafe, or would unduly hamper a carrier's ability to serve its customers. As additional limitations, the Board would require the establishment of a switching arrangement only when (1) the shipper or receiver was served by a single Class I carrier; and (2) there was or could be, within a reasonable distance of the shipper or receiver's facilities, a working interchange between the incumbent carrier and another Class I rail carrier. *Id.* at 19-21.

The 2016 NPRM sought comments on two alternatives regarding the compensation the Board could impose for switching service if the carriers could not agree within a reasonable time. Under the first alternative, compensation would be based on factors such as: (1) the geography where the proposed switch would occur; (2) the distance between the shipper/receiver and the proposed interchange; (3) the cost of the service; (4) the capacity of the interchange facility; and (5) other case-specific factors. The 2016 NPRM asked for comment on whether the agency should also consider what have been referred to as the incumbent carrier's lost contribution or opportunity costs. Under the second alternative, compensation would be based on the cost of providing the service plus a fair and reasonable return on the capital that was used to provide the service, analogous to the rental income that applies when the Board orders a carrier to provide trackage rights to another carrier (the Board's "SSW methodology"). *Id.* at 25-26; *see, e.g., New England Cent. R.R.—Trackage Rts. Ord.—Pan Am S. LLC*, FD 35842 (STB served Oct. 31, 2017); *St. Louis Sw. Ry.—Trackage Rts. over Mo. Pac. R.R.—Kan. City to St. Louis,* 4 I.C.C.2d 668 (1987); *St. Louis Sw. Ry.—Trackage Rts. over Mo. Pac. R.R.— Kan. City to St. Louis,* 1 I.C.C.2d 776 (1984).

The rail transportation policy established by the Staggers Rail Act of 1980 ("Staggers") places great importance on the promotion of competition in the rail industry: "[i]n regulating the rail industry, it is the policy of the United States government…to allow, to the **maximum extent possible, competition and demand for services to establish reasonable rates for transportation by rail**." 49 U.S.C. § 10101 (1) (emphasis added). Congress emphasized the importance of competition in four additional sections setting out the policy underlying Staggers. *Id.* at (4), (5), (6), and (12). These provisions leave little doubt that Staggers intended to introduce competition as an alternative to regulation of rates and service. These proposed rules follow this rail transportation policy by making competitive access available to rail shippers who have had no real ability to obtain this remedy since *Midtec.*

The new proposed rules in the 2016 NPRM are exactly what Congress intended when it enacted the reciprocal switching remedy in Staggers. Not only do these proposed rules conform with their statutory basis, but they also use the exact language of the statute as noted. Consequently, the proposal would replace the Board's outdated regulations with ones that more closely adhere to Congress' deregulatory vision for the freight rail industry. The legislative history regarding this competitive access remedy makes that extremely clear.

Title II of Staggers is the section which includes the reciprocal switching provision and "is related to the key areas of the Interstate Commerce Act which involve railroad rates and inter-carrier practices. In general, the title assures railroads substantially more rate freedom than [was] afforded them under existing law" at that time. H.R. Rept. 96-1430, 96th Cong. 2d sess. 80 (1980). To balance this new-found ratemaking freedom, "[a] number of provisions are included

to foster greater competition by simplifying coordination, minor mergers procedures, entry and reciprocal switching agreements." *Id.*

The Conference Committee Report on Staggers ("Committee Report") provided in relevant part as follows:

> Consistent with the new rail transportation policy of this Act, the conferees intend that competition be recognized as the best control on the ability of railroads to raise rates. The purpose of this legislation is to reverse the decline of the railroad industry, which has been caused, in part, by excessive government regulation. The conferees believe that **by allowing the forces of the marketplace to regulate railroad rates wherever possible** the financial health of the railroad industry will be improved and will benefit all parts of the economy, including shippers, consumers, and rail employees.

Id. at 89 (emphasis added). Undoubtedly, Congress intended competition to be the most effective and desirable way to protect shippers.

With respect to the way Congress intended for competition to be used remedially, the Committee Report stated:

> The Senate authorized the Commission to require railroads to enter into reciprocal switching where it finds such agreements to be practicable and in the public interest. In many parts of the country, reciprocal switching agreements are in effect where carriers pick up and deliver traffic for other railroads. In areas where reciprocal switching is feasible, it provides an avenue of relief for shippers where

> only one railroad provides service and it is inadequate. The standard "practicable and in the public interest" is the same standard the Commission has applied in considering whether to order joint use of terminal facilities.

Id. at 116. *See also* S. Rept. 96-470, Cong. 1st sess. 41-42 (1979) (same).

Similarly, the discussion of reciprocal switching in the Report of the House Committee on Interstate and Foreign Commerce stated:

> This section empowers the Commission to approve reciprocal switching agreements and joint service agreements upon the request of a carrier or shipper. In geographic areas where reciprocal switching is feasible, it provides competition to the benefit of shippers served. While the Commission now has the power to order the joint use of terminal facilities, its power to order reciprocal switching is less clear. In particular, reciprocal switching has been limited to situations where competition between rail carriers is not threatened. **The Committee intends for the Commission to permit and encourage greater competition.** Likewise joint service agreements should be encouraged in order to improve shipper service and efficiency.
>
> The standard the Commission should use in approving agreements under this section should be where the requested action is "practicable and in the public interest."

H. Rept. 96-1035, 96th Cong. 2nd sess. 67 (1980) (emphasis added).

The Senate Committee on Commerce, Science and Transportation Report emphasized the importance of enhanced competition:

> The new railroad transportation policy established by this bill emphasizes the need for increased intramodal and intermodal competition, and section 203 [the Senate reciprocal switching provision] deals with intramodal competition among railroads… As the Government moves toward significantly less regulation of the services offered by railroads, the Government should encourage, rather than discourage, competition among railroads. **Competition among railroads, or at least the realistic threat of competition, can serve as an important safeguard against inadequate service or unreasonably high prices.**

S. Rept. 96-470, at 41 (1979) (emphasis added). *See also* 126 Cong. Rec. H10079-87, 99 (daily ed. Sept. 30, 1980) (statement of Rep. Eckhardt) ("inclusion of provisions relating to entry and reciprocal switching which provide increased rail-to-rail competition"); 126 Cong. Rec. H5899-5914, 549 (daily ed. June 30,1980) (statement of Rep. Madigan) (reciprocal switching "will introduce additional competition between railroads. Under reciprocal switching, one railroad is given the opportunity to have access to another railroad's operating territory, thereby providing many shippers with competition in rail service that they presently do not enjoy."). The point of this legislation is "to encourage intramodal competition." S. Rept. 96-470, at 38.

The STB in the 2106 NPRM followed this broad two-part model set forth in the statute in creating the proposed rules for reciprocal switching. Instead of the narrow standard in place today, the Board followed the statutory language, the transportation policy, and the legislative

intent by proposing to introduce greater competition into rail markets. The legislative language and history in Staggers urged the ICC to do exactly what the STB has done here.

NEW REASONS WHY THE PROPOSED RULES ARE NEEDED

1. The Historic Rail Industry Change to PSR since 2017 Makes these Proposed Rules Even More Necessary Now to Provide Shippers with a Remedy to Protect Them from this Dysfunctional Operating Model.

The developments regarding Precision Scheduled Railroading ("PSR") since the Board last sought comments in this proceeding clearly provide more justification than ever for the approval of these proposed rules on reciprocal switching. Implementation of PSR by nearly all the Class I railroads[1] (except for BNSF Railway) shortly after this last round of comments has made the need for this competitive access remedy even more compelling now than in early 2017. This widespread implementation and now use of PSR as the railroad operating model has caused a sea change in the way the rail network works and has resulted in generally poorer service and higher rates for rail shippers over the last 5 years.

The railroads claim "Precision" in PSR "refers to highly precise planning, examining, and fine-tuning of all processes related to the movement of rail cars, combined with disciplined, synchronized execution of the processes."[2] There are several elements to many of the PSR operating strategies claimed to be followed by the Class I railroads in the US. The first element is to "restructure local service" by "better utilize[ing] crews and locomotives, while asking more of

[1] Canadian Pacific Railway and Canadian National Railway Company had already implemented PSR before 2017.

[2] [2] "*The Operational Nuts and Bolts of Precision Scheduled Railroading",* Carl Van Dyke, FHWA Webinar PowerPoint, at 6, March 2020, https://www.fhwa.dot.gov/Planning/freight_planning/talking_freight/march_2020/talkingfreight3_18_20cvd.pdf

customers and local crews." *Id.* at 8. The second element is to "increase car velocity" by "reduc[ing] switching, while using block swaps more and providing multiple outlets for traffic - focus on plan adherence and elimination of blocking (switching), connection, and train make-up errors." *Id.* The third element is to "minimize train miles and road locomotive and crew needs" by "run[ning] fewer, longer, more generic trains on a balanced network and filling out the trains to their maximum capacity, while focusing on crew and locomotive cycling." *Id.* The fourth element is to "change customer services" by "eliminat[ing] 'boutique' operating plan elements (blocks and trains) and standardizing product offerings." *Id.* In its purest form, this operating strategy should "bring[] together many core principles that should arguably be widely supported by both railroads and customers, driving to better asset velocity, overall efficiency, shipment speed, and reliability." *Id.* at 7.

Unfortunately, PSR has not been used in its purest form as the railroads have professed and has been widely opposed by rail shippers due to its adverse effects on their service and costs. As stated by Chair of the House Committee on Transportation and Infrastructure Peter DeFazio: "In recent years, numerous stakeholders have raised concerns about the railroad management strategy known as precision scheduled railroading (PSR). Using variations of this strategy, it appears that Class I railroads have streamlined operations and otherwise cut costs in pursuit of lower operating ratios for short-term revenue gains. Stakeholders are concerned that the rise of the PSR model has come at the expense of long-term capital investments, reduced rail infrastructure, affected service for some shippers, and caused dramatic workforce cuts and safety

concerns."[3] Chair DeFazio was so concerned by this problematic use of PSR that a study by the U.S. General Accountability Office ("GAO") was passed by the House in his surface transportation reauthorization bill, the INVEST in America Act, to help find ways to address the impacts this railroad management strategy has had on workers, freight shippers, passenger railroads, and rail safety.

The facts clearly demonstrate that Chair DeFazio's impression of PSR is the accurate one. First and foremost, rail service has plummeted since this historical change in how railroads operate. In March 2017, CSX Transportation, Inc. ("CSXT") implemented PSR as its rail operating plan. This implementation led to countless service issues across its network almost immediately. Part of CSXT's PSR plan involved cutting a large number of jobs across its system. By July, the Board had taken a number of actions in response to the service problems resulting from CSXT's ongoing implementation of this new operating plan. The Board began closely monitoring CSXT's performance, including requesting that CSXT's senior management participate in weekly calls with the Board's Rail Customer and Public Assistance staff and that CSXT submit weekly specific service performance data to facilitate these calls.

On October 11, 2017, service on CSXT had become so unreliable that the Board ordered executive-level officials from CSXT to appear at a listening session at the STB to discuss their ongoing and future efforts to improve service and to provide an estimated timeline for recovery of normal service levels. The Board also asked impacted shippers to appear at the public listening session to discuss their service concerns and comment on the railroad's service recovery efforts.

[3] May 12, 2021 Letter from Chair DeFazio to U.S. Government Accountability Office, https://transportation.house.gov/news/press-releases/chairs-defazio-and-payne-jr-request-gao-study-on-the-impacts-of-precision-scheduled-railroading-on-workers-safety-and-shippers

On March 18, 2018, STB Chairman Ann Begeman individually wrote the Class I railroads about service issues across the US rail system. She stated that the Board had been closely monitoring freight rail service across the US and had become increasingly concerned about its overall state based on the weekly data collected under 49 C.F.R. pt. 1250. The data was indicating that service was deteriorating based on decreasing system average train speeds and increasing terminal dwell time. Other key metrics were also trending in a negative direction. The STB began holding weekly calls with the railroads and asked them to provide certain information with respect to their rail service.

Despite these monumental service issues on CSXT, most of the other Class I railroads, who were not already operating under PSR, also adopted this rail operating plan, including Norfolk Southern Railway ("NSR") in July 2019, Kansas City Southern Railway in January 2019, and Union Pacific Railroad ("UP") in October 2018. These changes led to further disruptions across the US rail network. Massive job cuts, like on CSXT, occurred on NS and UP as part of this plan, leading many to believe that any uptick in the need for rail service would leave them woefully unprepared. This eventually proved to be the case.

On August 24, 2020, the STB Chairman, as well as the Federal Railroad Administration Administrator, wrote the Class I railroads about both of their rail service concerns. These leaders of the rail regulatory agencies explained that they had been made aware of service issues, including missed industrial switches and excessively late or annulled trains due to crew availability issues. They noted that with both increasing intermodal and carload volumes and a projected robust harvest fast approaching, railroad employee availability, together with sufficient equipment resourcing, was essential for safe, fluid rail service in support of the nation's economic recovery from COVID-19. Given the challenges related to changing demand patterns

and operating conditions, they stated that increased communication and transparency with rail shippers had become especially important to ensure they have the information needed to plan their businesses and meet their own customers' needs. They emphasized that it was their expectation that there would be heightened emphasis on improving employee availability, equipment resources, and robust communication to quickly resolve service issues as they arose and to prevent them from becoming widespread. The Class I railroads did not heed this warning as service issues became more rampant.

On May 27, 2021, the new Chairman of the STB, Martin Oberman, also felt compelled to write to the Class I railroads again about rail service issues. He explained that the Board had received concerning reports from a meaningful number of rail customers of subpar performance, including missed switches, railcars delayed at intermediate yards or interchanges, extended out-of-route movements, and prolonged dwell at origin for some unit train traffic. Additionally, he noted that the STB had been made aware of instances of significant congestion at various intermodal facilities, which has resulted in delayed train arrivals and disruptions to container availability. He recognized that these rail service challenges, at least to some extent, had been related to workforce reductions resulting from COVID-19 cases, quarantines, and furloughs based on the temporary decline in demand and the resultant adjustments made by railroads in nearly every facet of their businesses. **But he also expressed his concern about the extent to which these service issues may be related to or exacerbated by a broader trend of rail labor reductions that have been occurring over the past several years. He stated that a lack of personnel, including reserve personnel, has made it more difficult to scale-up operations to respond to increases in demand and to maintain reliable service in the face of unanticipated external events that disrupt ordinary operations or business expectations.** He said labor

shortages could also delay or prolong the recovery period when such network disruptions inevitably occur.

As stated in previous STB letters, he said it is vital that freight railroads continue frequent, proactive communication with the Board and customers on their ability to meet demands for service as the economy recovers from the pandemic. He requested an updated and detailed description of the railroads' preparedness to meet anticipated future demand, including (1) the availability of train crew, yard, and maintenance employees (active, reserve, and furloughed workers) and their plans and time frames for employees to return to work and any re-training, if necessary, and (2) the availability of equipment resources (active and short-term / long-term stored locomotives and rail cars). **As part of this update, he specifically requested that the railroads also address whether they have any long-term plans, including their hiring plans for 2021 and 2022, to reverse any of the diminishing workforce levels which have resulted from their strategies in recent years.** He also asked them to identify any regions of their networks where they were experiencing or anticipating workforce challenges, and their plans to overcome these challenges.

Shortly thereafter, on July 22, 2021, STB Chairman Oberman again wrote the Class I railroads about significant disruptions within the international intermodal supply chain that involve the freight rail network. He stated that he was particularly concerned about significant increases in container congestion at key U.S. terminals, and substantial charges being levied by the railroads for container storage at these terminals. Specifically, in recent months, he asserted that the Board had received numerous reports related to the length of time that containers were being held in rail yards, and the sizeable storage fees some customers had been required to pay in order to obtain release of containers bearing their shipments. He said that he was particularly

troubled about reports that Class I railroads were continuing to impose these charges even in circumstances when the receivers, as a practical matter, had no means to facilitate the release of their containers. Under these circumstances, he noted that demurrage fails to provide any constructive incentives, and perversely results in massive charges that can exceed the commercial value of the shipment. In order to better understand the magnitude of the current container congestion and the framework for the associated demurrage fees, he asked for information from each of the Class I railroads regarding policies and practices with respect to the assessment of demurrage fees on intermodal containers.

On October 18, 2021, Chairman Oberman focused on service issues on CSXT which again caused great concern to the Board, thereby precipitating a letter to the carrier seeking rail service performance information. He stated his reason for this information request was that over the past several months, the Board had continued to receive a steady stream of complaints about the adequacy of rail service provided by CSXT. In both private meetings and public settings, he said CSXT customers have relayed examples of substandard performance, including missed switches, extended transit times for both manifest and bulk shipments, unfilled car orders, and the inability to contact customer service and operating personnel. He stated that customers have also reported that service problems are sometimes resolved, only to recur weeks or months later. Taken together, he noted these complaints were of grave concern as it appeared that CSXT resources were surged to assist one customer, only to have problems arise with another. And, as a result of these problems, he explained that customers incurred premium freight costs, idled production, lost sales and damaged commercial relationships, typically without meaningful recourse from CSXT. In addition to anecdotal incidents, he noted CSXT's rail service performance data reported under STB Docket No. EP 724 tended to support that CSXT's

network was underperforming compared to the benchmarks set in 2019. **He also noted that CSXT has approximately 1,000 fewer "transportation" employees for August 2021 compared to August 2019 (6,577 versus 7,543), as reported on STB Form C.**

This was followed with a similar letter to NS on November 23, 2021, emphasizing the railroad's deteriorating key operating metrics reported pursuant to EP 724. **He compared these numbers with the fact that NSR's number of "transportation" employees had continued to decline over the prior three months (8,281, 8,269, and 8,207, respectively), as reported on STB Form C.** Coinciding with the marked deterioration in NSR's performance metrics, he said the Board had received an increasing number of complaints from NSR's customers about poor performance, including missed switches, cars stranded at intermediate yards, longer transit times, operating plan changes without notice, and a lack of communication from customer service**. For these reasons, he requested that NSR provide the Board with a review of the current state of its network, and assessment of what factors are affecting NSR's ability to achieve past levels of fluidity and consistent service, and in particular the impact on customer service of previous headcount reductions for train, yard, and maintenance employees. He noted it would be most helpful if NSR could provide this review as a follow up to its June 18, 2021, letter, in which a "program of targeted hiring" to meet workforce needs, referenced measures to attract and retain operating employees was outlined. In light of the declining employee headcount since June as shown by the data supplied to the STB, he asserted this program does not appear to have succeeded in obtaining a workforce level sufficient to avoid the service challenges described above.**

As some of these STB communications seem to express, this massive decline in rail service since 2017 can clearly be tied to the use of PSR across the US rail network and the

resulting job cuts that made the railroads incapable of providing adequate service and handling upticks in the need for service. CSX had 23,988 total employees and 9262 train and engine service employees in February 2017. CSX had 17,250 total employees and 6795 train and engine service employees in December 2021. UP had 44,652 total employees and 18,612 train and engine service employees in October 2018. UP had 32,494 total employees and 14,079 train and engine service employees in December 2021. NS had 24,594 total employees and 10,243 train and engine service employees in July 2019. NS had 18,011 total employees and 7521 train and engine service employees in December 2021. (These numbers were obtained from the STB Form C information on the STB website.) Job cuts of this magnitude can only result in one outcome which is poor service as the above-recounted facts clearly demonstrate.

Moreover, the operating ratios for these railroads continue to decline. UP has gone from an operating ratio of 63.7% in 2016 to 57.2 in 2021. CSX has gone from 69.2% in 2016 to 56.3% in 2021. NS has gone from 69.6% in 2016 to 60.1% in 2021.

While service has declined, rail rates have continued to rise. In a recent report published by the Rail Customer Coalition[4], evidence of skyrocketing rates and less competitive traffic is clear. The report finds:

- From 2004 to 2019, **real rates (adjusted for inflation) for all rail shippers increased 43%.**
- During the same period, real **railroad costs rose only 8%.**
- Rates for the largest U.S. railroads have jumped **more than twice as fast as inflation and rates for long-haul trucking**.

[4] Escalation Consultants, "*Economic Analysis: Consolidation and Increasing Freight Rail Rates*," June 2021. https://www.freightrailreform.com/new-report-finds-rail-customers-paying-a-steep-price-for-consolidation-and-dwindling-competition/

- **For major commodity groups, revenue from potentially non-competitive rates increased 230%**, while revenue from competitive rates increased only 24%.
- **In 2019, half of railroad revenue was generated from potentially non-competitive rates**, up from 27% in 2004.
- For significantly impacted sectors and commodities, the share of total rail revenue derived from non-competitive rates increased as follows**:**

Agriculture

Commodity	2004	2019
Food Products	15%	39%
Farm Products	34%	56%

Building & Construction

Commodity	2004	2019
Wood Products	8%	31%

Metal Products	17%	45%
Stone & Glass Products	36%	64%

Transportation & Infrastructure

Commodity	2004	2019
Transportation Equipment	13%	33%

- In a troubling indicator of the railroads' ever-growing market dominance and pricing power, **the average revenue-to-variable-cost (RVC) ratio increased from 135% to 167% for shipments of these commodities.**

Id.

Obviously, the implementation of PSR by the railroads since 2016 has made the need for these proposed rules more evident. In fact, before BNSF Executive Chairman Matt Rose retired, he predicted that "PSR, reducing service, and demarketing some types of traffic in pursuit of higher profits" would result in increased scrutiny by the STB. He stated that railroads "have this common carrier obligation to provide freight service to all customers in all markets. And what we're doing in PSR is redefining what we're willing to accept in the freight railroad industry on certain lanes. And I really do believe we're going to get in a lot of trouble by doing that." He

added that "[w]hen you start redefining markets, I think the federal policy makers will look at this, and quite frankly, they will not be happy with us."[5]

As Chairman Oberman recently noted, "railroads' emphasis has not been on growth. Rather, the emphasis has been on cutting in pursuit of the almighty [operating ratio] down to below 60%." He added that '[i]t is clear that as a whole, railroads have foregone many kinds of carloads that they could carry profitably, only not at O.R.s as low as 55%, and instead have focused on only the most profitable traffic. No one is asking the railroads to focus on traffic that would only be carried at a loss. But surely it is not asking too much for railroads to actively seek profitable traffic, even if not as profitable as others."[6]

In other words, PSR railroads have resorted to only choosing rail traffic which fits within the PSR model to continue to drive down operating ratios. This practice leaves certain rail shippers out in the cold even though rail is their best transportation option. This practice is even more disruptive today when truck capacity due to a shortage of drivers is extremely limited. As a result, some rail shippers have nowhere to turn.

The effects of this new rail operating strategy have devastated the rail workforce and resulted in correspondingly poor rail service and sometimes no service at all. While the railroads will assumedly argue that the pandemic is the cause of their service issues over the last two years, this claim is obviously only a part of the story. USWA does not dispute that the pandemic has had a historic impact on the world's supply chain. However, the railroads by slashing jobs have

[5] Trains, *Analysis: Former BNSF Executive Matt Rose's Warning Comes True,* July 22, 2021. https://www.trains.com/trn/news-reviews/news-wire/former-bnsf-executive-matt-roses-2019-warning-comes-true/

[6] Trains, *Top Regulator Urges Railroads to Focus on Growth,* September 9, 2021. https://www.trains.com/trn/news-reviews/news-wire/top-regulator-urges-railroads-to-focus-on-growth/

directly caused the situation to be much worse by making them incapable of adjusting to upticks in the need for rail service. As a result, many rail shippers, especially captive ones, have suffered from plant shutdowns and slowdowns and other adverse impacts that have damaged their businesses despite paying higher and higher rates. These shippers have little recourse except through informal channels to hold these railroads accountable for the harms they suffer at the hands of the railroads. If the new proposed rules are adopted by the Board, some rail shippers would finally have a path to remedy some of these problems. In sum, there never has been a time since the enactment of Staggers where Congress's intent to introduce competition through reciprocal switching was more needed.

2. Increased Use of Reciprocal Switching Arrangements Will Lead to Increased Revenues for the Class I Railroads.

Railroads claim that reciprocal switching will not allow them to properly invest in their infrastructure and would deter them from investing where reciprocal switching allowed another carrier access to its captive customers. However, with the proposed rules, new rail shippers and an overall increase in contribution to overhead could be attracted with the prospect of competitive linehaul service and stable switching service. In other words, railroads could be the financial beneficiaries from reciprocal switching because it may make rail more attractive to shippers who can get better rates and service due to the new competition.

As discussed in the previous section, railroads have slashed jobs and expenses under the guise of PSR. Continuing down this path will eventually lead to the complete destruction of rail service in the US. In other words, cutting expenses can only go so far. At some point, railroads will have to begin to look to other ways to impress Wall Street besides cost cutting because there will be nothing left to cut. The only other way to do this would be to increase revenues. Despite

the railroads total opposition to any change to the reciprocal switching remedy as proposed in this proceeding, this view is shortsighted when one considers the benefits of reciprocal switching to an industry that has recently lost one of its main sources of revenue in coal.

Railroads like to emphasize how capital intensive its industry is and how much money it invests in its infrastructure. This claim is certainly a main talking point by the railroads and undisputedly warrants careful examination because proper investment in the rail network is essential to provide this crucial service to the nation. However, concerning the general state of capital investment by Class I railroads, capital investment claimed by the seven Class I railroads during the decade 2010-to-2019 is approximately $152.1 billion, $26.6 billion of which represents the portion of those capital expenditures that was discretionary and spent in order to increase the railroad's rate of return, where the $125.5 billion difference is comprised of non-discretionary items that would not increase the railroad's rate of return and would not be classified as capital expenditures in other industries[7]:

- $85.4 billion spent on track and bridges, primarily replacements in kind;
- $30.9 billion spent on locomotives and freight cars, again almost entirely replacements in kind, where locomotives were not new Tier 4 environmentally compliant, but re-built lower Tier motive power and where locomotive work, as measured by gross ton-miles of freight moved, was flat[8] during the decade, and where replaced cars did not keep up with retired cars—railroad-controlled car fleets decreasing 24% from 2010 to 2019[9]; and

[7] Comments of Rail Cents Enterprises, Inc., EP 711 (Sub-No. 1), at 6 (filed February 1, 2022).
[8] Freight ton-miles moved by the seven Class I's was basically flat from 2010 (2.21 trillion) to 2019 (2.29 trillion).
[9] Freight cars owned and leased by Class I's decreased 24% from 461,849 in 2010 to 351,032 in 2019.

- $9.2 billion spent on Positive Train Control, a safety technology mandated by Congress in 2008,

Id.

While these numbers touted by the railroads appear impressive on their face, they are not as substantial as claimed. The question then becomes what are the railroads doing with all the monies that they are earning from these massive cuts in expenses. Distributions to shareholders by the seven Class I railroads during the same decade, 2010-to-2019, was approximately $164.2 billion. That is, the Class I's returned over six times[10] as much money to shareholders during the decade before the Covid-19 crises as they spent on projects to increase their rates of return. *Id.* "Implication: senior management at the Class I's has had great difficulty in finding investments with returns in excess of their cost of capital, hinting that a new strategy based on carload traffic growth could open up new vistas of franchise growth." *Id.* Reciprocal switching could make this strategy more obtainable by introducing competition, thereby creating better service and lower rates.

Railroads have been accused of demarketing certain types of traffic as discussed in the previous section, since the advent of the PSR revolution, that do not fit within this model. Many shippers have sought new rail service or sought to continue rail service only to have the railroads express little interest in their business. Railroads can easily deter shippers from using rail by quoting extremely high rates or offering limited service. While railroads know that rates are required to be reasonable by statute, they also know that the STB rate case process provides little hope to the shippers who would like to challenge these rates as the Board has admitted in recent

[10] $164.2 billion divided by $26.6 billion is 6.2, which changes very little (to 6.1) if all numbers for the decade are converted into constant dollars in order to erase the effects of inflation.

proceedings. Therefore, if rail traffic does not fit within the PSR model, railroads can easily sidestep their common carrier obligation by offering these unreasonable take it or leave it rates to shippers.

However, at some point, railroads will have to change their shortsighted path in order to make Wall Street happy by increasing revenues as this present strategy is unsustainable in the long run. An increase in reciprocal switching could help to make this inevitable path more of a reality. For example, railroads may only provide a shipper facility with three days of switching service per week. However, the shipper may want to increase the number of days of service to move more of its product by rail. If an interchange with another railroad is within a reasonable distance, that competing railroad could fill in that void and provide service on those additional days. The result would be more rail business. Moreover, by offering more competitive rates, railroads could obtain more business that presently moves by other modes of transportation.

With the recent loss of revenue from the large decrease in coal traffic, Class I railroads will have to turn to new markets to increase revenue. That market could easily be carload traffic. As a result, while this proposed change to the reciprocal switching rules may be strongly opposed by the rail industry now, it may eventually lead to increases in business brought on my better rates and improved service, thereby making this a win-win situation for all involved.

3. During this Historic Disruption of the Global and U.S. Supply Chains Brought on by the Pandemic, the Need for More Efficient and Flexible Rail Service Has Never Been More Evident which these Proposed Rules Will Allow to Happen.

As the Board is aware, the global supply chain has been completely disrupted by the pandemic that has changed the world as we know it over the last two years. This supply chain crisis has wreaked havoc across all forms of transportation including maritime, trucking, and rail. The unpredictability of the demand for goods and the workforce supply, among other things, has

brought on events in the supply chain never seen in the past. Unfortunately, there is no certain time when this disruptive situation will end.

Obviously, railroads are crucial to the supply chain in the U.S. and North America. An efficient rail system is extremely important now to help solve these supply chain issues. However, with the pandemic and corresponding difficulties in keeping the workforce fully staffed brought on by devastating illness and quarantine requirements across the U.S., the railroads have had an extremely difficult time providing adequate service to rail shippers in dire need of their services during these unprecedented times. These workforce difficulties were compounded by the large job cuts described above that made the railroads woefully unprepared for these challenges brought on by the pandemic. Moreover, the railroads seemed reluctant to bring back workers as the numbers quoted by Chairman Oberman in his letters to CSX and NS last year demonstrate.

Reciprocal switching could certainly be a cure for some of these troubles when a railroad is understaffed and cannot adequately provide service to its customers. First, when an incumbent railroad serving a captive shipper is not prepared for a surge in business due to job cuts, a competing railroad with a nearby interchange may have the resources to provide this service. The proposed new rules could allow the captive shipper to obtain this service through a reciprocal switching arrangement. At present, it is highly unlikely that the incumbent would allow the competing railroad access to its captive customer. As a result, the captive customer would have no other choice but to rely on the unprepared railroad and receive inadequate service.

Second, in some instances, the incumbent railroad may not have access to the most efficient rail route for its captive customer. Therefore, when rail service crises occur, the captive shipper would be required to rely on the incumbent carrier's less efficient route even though a

competing railroad with a nearby interchange can provide better service. The inefficiency of this result would only be compounded if the incumbent railroad was suffering from service issues across its network brought on by its unpreparedness for a surge in business.

While railroads do at times have a difficult balancing act when trying to determine the resources they need to be prepared for changes in business, examples of major rail service problems have been common over the last decade despite the financial health of the industry. In 2013 and 2014, the rail network struggled mightily with the upsurge in business in North Dakota brought on by fracking and crude by rail. *See United States Rail Service Issues, et al,* EP 724 (STB served Aug. 18, 2014). These issues became even worse with poor weather in Chicago and a strong harvest that had to compete for service with the crude oil traffic. *Id.* As noted, CSX had severe service problems as it implemented PSR on its network in 2017 which continue to this day. *See Public Listening Session Regarding CSX Transportation, Inc.'s Rail Service Issues, et al,* EP 742 (STB served Aug. 24, 2017). The implementation of the proposed rules might not have been able to eliminate all these issues over the years, but it certainly could have helped in certain situations by allowing rail customers to use a better prepared or suited railroad that might not have been available because of the lack of this competitive access remedy.

Generally, the implementation of these proposed rules will make the rail network more efficient by allowing captive shippers within a reasonable distance of a competing railroad to obtain better routes or better service as discussed above. It also would create competition which would require railroads to provide better service to rail shippers or risk losing business. There never has been a time since the passage of Staggers that this remedy has been more needed. The railroads have decided to implement PSR and make cuts to their workforces and other needs that have generally left them unprepared to provide adequate rail service. The railroads have not been

responsive to the Board's inquiries and warnings about their hiring issues. As a result, rail shippers have suffered from poor service resulting in plant shutdowns and slowdowns on an unprecedented basis. This use of reciprocal switching on an increased basis will make the rail system more efficient and hopefully compel the railroads to provide better service and to be more prepared by introducing more competition into the rail industry.

CONCLUSION

Based on the foregoing discussion, USWA strongly urges the Board to adopt the proposed rules for reciprocal switching. The case for the implementation of these rules has never been stronger than now.

Respectfully submitted,

/s/ Daniel R. Elliott

Public Record

BEFORE THE
SURFACE TRANSPORTATION BOARD

Docket No. EP 711 (Sub-No. 1)

RECIPROCAL SWITCHING

INDUSTRIAL MINERALS ASSOCIATION–NORTH AMERICA TESTIMONY

The Industrial Minerals Association–North America ("IMA") respectfully submits its testimony in the above-captioned proceeding in accordance with the Surface Transportation Board ("STB" or "Board") Notice of Public Hearing ("Notice") served on December 28, 2021. The Board provided the opportunity for interested parties to provide testimony to update the record in this proceeding regarding its proposed new regulations under which the Board would exercise its statutory authority to require rail carriers to establish reciprocal switching arrangements under certain circumstances. IMA thanks the Board for this opportunity to voice its strong support for these proposed new rules for reciprocal switching made even more necessary now by the changes in the rail industry since early 2017.

IMA INTEREST IN THE PROPOSED RULES

IMA is a trade association that represents companies that mine, process, and sell industrial minerals throughout North America. IMA represents a diverse set of member companies engaged in mining and processing of ball clay, barite, bentonite, borates, calcium carbonate,

diatomite, feldspar, industrial sand, kaolin, lithium, mica, perlite, potash, quartz, salt, soda ash, sodium bicarbonate, talc, and wollastonite, and other minerals across North America. The industrial minerals produced by IMA member companies are the raw material feedstock that are incorporated into a broad range of products, including among other things, container, food products, flat and specialty glasses, paint and coatings, ceramics, and a broad range of building products. Additionally, industrial minerals are used to make foundry molds and cores, which are in turn used to make metal shapes used to manufacture automobiles, SUVs and trucks, rail cars and almost all other items that have metal castings. The demand for many of these minerals from manufacturers is global, and the continued pressure member companies are feeling from the railroads in the form of unreliable service and higher rates is making it more difficult to compete in that global market. This poor service by the railroads is having a negative overall impact on the U.S. economy, and issues could get worse if they are not held accountable.

Industrial minerals are low margin, high volume products. Member companies are heavily dependent upon a reliable and cost-effective transportation network, especially rail, and are major shippers with the major rails. To help highlight that, in 2014, the nonmetallic minerals except fuels category, made up $1.5 Billion in total freight rail premiums.

IMA member companies have been adversely impacted by the lack of any options to obtain competitive rail access. Under the current process for the reciprocal switching remedy, IMA members do not bring forward reciprocal switching cases and are often forced to modify operations to their detriment because no other viable options are present. This results in negative impacts throughout the supply chain ultimately impacting not only IMA member companies, but their customers and consumers.

IMA appreciates that the STB has an important oversight role in looking at the impact of freight rail policies on rail shippers and is encouraged the STB is seeking ways to improve the reciprocal switching remedy in line with the intent of Congress. IMA urges the Board to breathe life into this remedy that has been essentially dormant for decades and to provide a method to counter the Class I railroads' unabated market power over its member companies.

BACKGROUND OF THE PROCEEDING AND THE PUBLIC HEARING

The Board opened this proceeding by issuing a Notice of Proposed Rulemaking ("2016 NPRM") on reciprocal switching on July 27, 2016. *Reciprocal Switching ("NPRM"),* STB Ex Parte 711 (Sub-No. 1) (STB served July 27, 2016). Parties filed opening comments and reply comments on the 2016 NPRM in late 2016 and early 2017. Following these comments, the proceeding did not move forward except for ex parte meetings and has remained essentially dormant since that time.

The 2016 NPRM grew out of the Ex Parte No. 711 proceeding, which was initiated by a July 7, 2011 petition for rulemaking by the National Industrial Transportation League. Petition for Rulemaking of the National Industrial Transportation League, *Petition for Rulemaking to Adopt Revised Competitive Switching Rules,* STB Ex Parte 711 (served July 7, 2011). That proceeding involved comments filed in 2013 and a public hearing in March 2014.

On December 28, 2021, the Board issued the Notice stating its intent to "hold a public hearing on March 15 and 16, 2022, concerning the reciprocal switching regulations it proposed" through the 2016 NPRM. *Reciprocal Switching*, STB Ex Parte 711 (Sub-No. 1), slip op. at 1 (STB served Dec. 28, 2021). The Board's stated intent for holding a public hearing and inviting comments is "[t]o allow interested persons to submit testimony to update the record," and "[t]o

ensure a full and updated record in this proceeding." *Id.* at 2, 6. Thus, the Notice specifically invites comments addressing certain topics, including:

- "[A]dditional or modified views on the effects and/or need for the proposed regulations" in light of "significant operational changes in and affecting the freight rail industry" in the time "[s]ince the issuance of the NPRM";
- "[N]ew developments (i.e., developments that have occurred since the Board previously invited comments in this proceeding) that a commenter finds are relevant to a final decision in this matter and address any change or significant development in a commenter's views since the previous round of comments"; and
- "[T]opics that were discussed in ex parte communications that have taken place since October 25, 2016, in this proceeding."

Id. at 6.

LAW AND LEGISLATIVE HISTORY REGARDING RECIPROCAL SWITCHING

Reciprocal switching can occur as part of a voluntary arrangement between carriers, or it may be ordered by the Board. The Board may require the establishment of a switching arrangement when it finds that the arrangement either (1) is practicable and in the public interest, or (2) is necessary to provide competitive rail service. 49 U.S.C. § 11102(c)(1). Section 11102(c)(1) authorizes the Board to establish the conditions of and compensation for switching service if the affected carriers cannot reach agreement on those matters within a reasonable period. The Board's implementation of § 11102 is guided by the rail transportation policy set forth in 49 U.S.C. § 10101. *See NPRM*, EP 711 (Sub-No. 1) et al., slip op. at 16.

The Board's current regulations governing reciprocal switching were promulgated in 1985 by the Board's predecessor, the Interstate Commerce Commission ("ICC"), *see Intramodal Rail Competition,* 1 I.C.C.2d 822 (1985), *aff'd sub nom. Balt. Gas & Elec. v. United States,* 817 F.2d 108 (D.C. Cir. 1987), and are codified at 49 C.F.R. § 1144. The regulations provide that reciprocal switching would only be prescribed if the agency determines that it "is necessary to remedy or prevent an act that is contrary to the competition policies of 49 U.S.C. [§] 10101 or is otherwise anticompetitive," and "otherwise satisfies the criteria of . . . [§] 11102(c)." 49 C.F.R. § 1144.2(a)(1). The Board's regulations also provide relevant factors that the agency shall consider in determining whether to prescribe competitive access, along with a "standing" requirement. 49 C.F.R. § 1144.2(a)(1)-(2). The regulations do not address how the Board should establish compensation for Board-ordered switching when the carriers cannot reach agreement within a reasonable period.

In *Midtec Paper Corp. v. Chicago & North Western Transportation Co. ("Midtec"),* 3 I.C.C.2d 171 (1986), the first case where the ICC applied 49 C.F.R. § 1144.2, the ICC explained that the key issue under its then-new regulations was whether the incumbent railroad "has engaged in or is likely to engage in conduct that is contrary to the rail transportation policy or is otherwise anticompetitive." *Id*. at 181. The ICC further explained that it would find anticompetitive behavior only when an incumbent carrier had "used its market power to extract unreasonable terms on through movements" or "because of its monopoly position . . . shown a disregard for the shipper's needs by rendering inadequate service." *Id.* The agency's competitive access regulations have not changed substantively since 1985 and few requests for reciprocal switching have been filed since then. In other words, *Midtec* caused the use of the reciprocal switching remedy to go dormant because rail shippers did not believe this standard could be met.

Under the Board's proposed regulations, there would be no need to show anticompetitive conduct, as had been required in the ICC's *Midtec* decision. Rather, under the Board's proposed regulations, the Board would require the establishment of a switching arrangement when the switching arrangement either was practicable and in the public interest or was necessary to provide competitive rail service. *NPRM,* EP 711 (Sub-No. 1) et al., slip op. at 16. This approach would simply apply the language in the statute as written by Congress.

In assessing whether a switching arrangement would be practicable and in the public interest under the proposed regulations, the Board would consider whether the benefits of a proposed arrangement would outweigh its potential detriments. In making that determination, the Board would consider all relevant factors, such as (1) whether the arrangement would further the rail transportation policies in 49 U.S.C. § 10101; (2) the efficiency of the proposed route; (3) whether the arrangement would allow access to new markets; (4) the impacts, if any, of the arrangement on capital investment, quality of service, and employees; (5) the amount of traffic that would be moved under the arrangement; and (6) the impact, if any, of the arrangement on the rail transportation network. *NPRM*, EP 711 (Sub-No. 1) et al., slip op. at 18.

In assessing whether a reciprocal switching arrangement would be necessary to provide competitive rail service, the Board would consider whether intermodal and intramodal competition were effective with respect to the movements for which the switching arrangement was sought. The Board would evaluate the effectiveness of competition using quantitative and qualitative factors that the Board has developed in the context of assessing market dominance in rate challenges, but it would not consider product competition or geographic competition. *Id.* at 27.

The Board's proposed regulations also state that reciprocal switching would not be ordered, even if one or both of the foregoing standards were met, if the switching was not feasible, would be unsafe, or would unduly hamper a carrier's ability to serve its customers. As additional limitations, the Board would require the establishment of a switching arrangement only when (1) the shipper or receiver was served by a single Class I carrier; and (2) there was or could be, within a reasonable distance of the shipper or receiver's facilities, a working interchange between the incumbent carrier and another Class I rail carrier. *Id.* at 19-21.

The 2016 NPRM sought comments on two alternatives regarding the compensation the Board could impose for switching service if the carriers could not agree within a reasonable time. Under the first alternative, compensation would be based on factors such as: (1) the geography where the proposed switch would occur; (2) the distance between the shipper/receiver and the proposed interchange; (3) the cost of the service; (4) the capacity of the interchange facility; and (5) other case-specific factors. The 2016 NPRM asked for comment on whether the agency should also consider what have been referred to as the incumbent carrier's lost contribution or opportunity costs. Under the second alternative, compensation would be based on the cost of providing the service plus a fair and reasonable return on the capital that was used to provide the service, analogous to the rental income that applies when the Board orders a carrier to provide trackage rights to another carrier (the Board's "SSW methodology"). *Id.* at 25-26; *see, e.g., New England Cent. R.R.—Trackage Rts. Ord.—Pan Am S. LLC*, FD 35842 (STB served Oct. 31, 2017); *St. Louis Sw. Ry.—Trackage Rts. over Mo. Pac. R.R.—Kan. City to St. Louis,* 4 I.C.C.2d 668 (1987); *St. Louis Sw. Ry.—Trackage Rts. over Mo. Pac. R.R.— Kan. City to St. Louis,* 1 I.C.C.2d 776 (1984).

The rail transportation policy established by the Staggers Rail Act of 1980 ("Staggers") places great importance on the promotion of competition in the rail industry: "[i]n regulating the rail industry, it is the policy of the United States government…to allow, to the **maximum extent possible**, competition and demand for services to establish reasonable rates for transportation by rail." 49 U.S.C. § 10101 (1) (emphasis added). Congress emphasized the importance of competition in four additional sections setting out the policy underlying Staggers. *Id.* at (4), (5), (6), and (12). These provisions leave little doubt that Staggers intended to introduce competition as an alternative to regulation of rates and service. These proposed rules follow this rail transportation policy by making competitive access available to rail shippers who have had no real ability to obtain this remedy since *Midtec.*

The new proposed rules in the 2016 NPRM are exactly what Congress intended when it enacted the reciprocal switching remedy in Staggers. Not only do these proposed rules conform with their statutory basis, but they also use the exact language of the statute as noted. Consequently, the proposal would replace the Board's outdated regulations with ones that more closely adhere to Congress' deregulatory vision for the freight rail industry. The legislative history regarding this competitive access remedy makes that extremely clear.

Title II of Staggers is the section which includes the reciprocal switching provision and "is related to the key areas of the Interstate Commerce Act which involve railroad rates and inter-carrier practices. In general, the title assures railroads substantially more rate freedom than [was] afforded them under existing law" at that time. H.R. Rept. 96-1430, 96th Cong. 2d sess. 80 (1980). To balance this new-found ratemaking freedom, "[a] number of provisions are included

to foster greater competition by simplifying coordination, minor mergers procedures, entry and reciprocal switching agreements." *Id.*

The Conference Committee Report on Staggers ("Committee Report") provided in relevant part as follows:

> Consistent with the new rail transportation policy of this Act, the conferees intend that competition be recognized as the best control on the ability of railroads to raise rates. The purpose of this legislation is to reverse the decline of the railroad industry, which has been caused, in part, by excessive government regulation. The conferees believe that **by allowing the forces of the marketplace to regulate railroad rates wherever possible** the financial health of the railroad industry will be improved and will benefit all parts of the economy, including shippers, consumers, and rail employees.

Id. at 89 (emphasis added). Undoubtedly, Congress intended competition to be the most effective and desirable way to protect shippers.

With respect to the way Congress intended for competition to be used remedially, the Committee Report stated:

> The Senate authorized the Commission to require railroads to enter into reciprocal switching where it finds such agreements to be practicable and in the public interest. In many parts of the country, reciprocal switching agreements are in effect where carriers pick up and deliver traffic for other railroads. In areas where reciprocal switching is feasible, it provides an avenue of relief for shippers where

> only one railroad provides service and it is inadequate. The standard "practicable and in the public interest" is the same standard the Commission has applied in considering whether to order joint use of terminal facilities.

Id. at 116. *See also* S. Rept. 96-470, Cong. 1st sess. 41-42 (1979) (same).

Similarly, the discussion of reciprocal switching in the Report of the House Committee on Interstate and Foreign Commerce stated:

> This section empowers the Commission to approve reciprocal switching agreements and joint service agreements upon the request of a carrier or shipper. In geographic areas where reciprocal switching is feasible, it provides competition to the benefit of shippers served. While the Commission now has the power to order the joint use of terminal facilities, its power to order reciprocal switching is less clear. In particular,reciprocal switching has been limited to situations where competition between rail carriers is not threatened. **The Committee intends for the Commission to permit and encourage greater competition.** Likewise joint service agreements should be encouraged in order to improve shipper service and efficiency.
>
> The standard the Commission should use in approving agreements under this section should be where the requested action is "practicable and in the public interest."

H. Rept. 96-1035, 96th Cong. 2nd sess. 67 (1980) (emphasis added).

The Senate Committee on Commerce, Science and Transportation Report emphasized the importance of enhanced competition:

> The new railroad transportation policy established by this bill emphasizes the need for increased intramodal and intermodal competition, and section 203 [the Senate reciprocal switching provision] deals with intramodal competition among railroads… As the Government moves toward significantly less regulation of the services offered by railroads, the Government should encourage, rather than discourage, competition among railroads. **Competition among railroads, or at least the realistic threat of competition, can serve as an important safeguard against inadequate service or unreasonably high prices.**

S. Rept. 96-470, at 41 (1979) (emphasis added). *See also* 126 Cong. Rec. H10079-87, 99 (daily ed. Sept. 30, 1980) (statement of Rep. Eckhardt) ("inclusion of provisions relating to entry and reciprocal switching which provide increased rail-to-rail competition"); 126 Cong. Rec. H5899-5914, 549 (daily ed. June 30,1980) (statement of Rep. Madigan) (reciprocal switching "will introduce additional competition between railroads. Under reciprocal switching, one railroad is given the opportunity to have access to another railroad's operating territory, thereby providing many shippers with competition in rail service that they presently do not enjoy."). The point of this legislation is "to encourage intramodal competition." S. Rept. 96-470, at 38.

The STB in the 2106 NPRM followed this broad two-part model set forth in the statute in creating the proposed rules for reciprocal switching. Instead of the narrow standard in place today, the Board followed the statutory language, the transportation policy, and the legislative

intent by proposing to introduce greater competition into rail markets. The legislative language and history in Staggers urged the ICC to do exactly what the STB has done here.

NEW REASONS WHY THE PROPOSED RULES ARE NEEDED

1. The Historic Rail Industry Change to PSR since 2017 Makes these Proposed Rules Even More Necessary Now to Provide Shippers with a Remedy to Protect Them from this Dysfunctional Operating Model.

The developments regarding Precision Scheduled Railroading ("PSR") since the Board last sought comments in this proceeding clearly provide more justification than ever for the approval of these proposed rules on reciprocal switching. Implementation of PSR by nearly all the Class I railroads[1] (except for BNSF Railway) shortly after this last round of comments has made the need for this competitive access remedy even more compelling now than in early 2017. This widespread implementation and now use of PSR as the railroad operating model has caused a sea change in the way the rail network works and has resulted in generally poorer service and higher rates for rail shippers over the last 5 years.

The railroads claim "Precision" in PSR "refers to highly precise planning, examining, and fine-tuning of all processes related to the movement of rail cars, combined with disciplined, synchronized execution of the processes."[2] There are several elements to many of the PSR operating strategies claimed to be followed by the Class I railroads in the US. The first element is to "restructure local service" by "better utilize[ing] crews and locomotives, while asking more of

[1] Canadian Pacific Railway and Canadian National Railway Company had already implemented PSR before 2017.

[2] [2] "*The Operational Nuts and Bolts of Precision Scheduled Railroading",* Carl Van Dyke, FHWA Webinar PowerPoint, at 6, March 2020, https://www.fhwa.dot.gov/Planning/freight_planning/talking_freight/march_2020/talkingfreight3_18_20cvd.pdf

customers and local crews." *Id.* at 8. The second element is to "increase car velocity" by "reduc[ing] switching, while using block swaps more and providing multiple outlets for traffic - focus on plan adherence and elimination of blocking (switching), connection, and train make-up errors." *Id.* The third element is to "minimize train miles and road locomotive and crew needs" by "run[ning] fewer, longer, more generic trains on a balanced network and filling out the trains to their maximum capacity, while focusing on crew and locomotive cycling." *Id.* The fourth element is to "change customer services" by "eliminat[ing] 'boutique' operating plan elements (blocks and trains) and standardizing product offerings." *Id.* In its purest form, this operating strategy should "bring[] together many core principles that should arguably be widely supported by both railroads and customers, driving to better asset velocity, overall efficiency, shipment speed, and reliability." *Id.* at 7.

Unfortunately, PSR has not been used in its purest form as the railroads have professed and has been widely opposed by rail shippers due to its adverse effects on their service and costs. As stated by Chair of the House Committee on Transportation and Infrastructure Peter DeFazio: "In recent years, numerous stakeholders have raised concerns about the railroad management strategy known as precision scheduled railroading (PSR). Using variations of this strategy, it appears that Class I railroads have streamlined operations and otherwise cut costs in pursuit of lower operating ratios for short-term revenue gains. Stakeholders are concerned that the rise of the PSR model has come at the expense of long-term capital investments, reduced rail infrastructure, affected service for some shippers, and caused dramatic workforce cuts and safety

concerns."[3] Chair DeFazio was so concerned by this problematic use of PSR that a study by General Accountability Office ("GAO") was passed by the House in his surface transportation reauthorization bill, the INVEST in America Act, to help find ways to address the impacts this railroad management strategy has had on workers, freight shippers, passenger railroads, and rail safety.

The facts clearly demonstrate that Chair DeFazio's impression of PSR is the accurate one. First and foremost, rail service has plummeted since this historical change in how railroads operate. In March 2017, CSX Transportation, Inc. ("CSXT") implemented PSR as its rail operating plan. This implementation led to countless service issues across its network almost immediately. Part of CSXT's PSR plan involved cutting a large number of jobs across its system. By July, the Board had taken a number of actions in response to the service problems resulting from CSXT's ongoing implementation of this new operating plan. The Board began closely monitoring CSXT's performance, including requesting that CSXT's senior management participate in weekly calls with the Board's Rail Customer and Public Assistance staff and that CSXT submit weekly specific service performance data to facilitate these calls.

On October 11, 2017, service on CSXT had become so unreliable that the Board ordered executive-level officials from CSXT to appear at a listening session at the STB to discuss their ongoing and future efforts to improve service and to provide an estimated timeline for recovery of normal service levels. The Board also asked impacted shippers to appear at the public

[3] May 12, 2021 Letter from Chair DeFazio to U.S. Government Accountability Office, https://transportation.house.gov/news/press-releases/chairs-defazio-and-payne-jr-request-gao-study-on-the-impacts-of-precision-scheduled-railroading-on-workers-safety-and-shippers

listening session to discuss their service concerns and comment on the railroad's service recovery efforts.

On March 18, 2018, STB Chairman Ann Begeman individually wrote the Class I railroads about service issues across the US rail system. She stated that the Board had been closely monitoring freight rail service across the US and had become increasingly concerned about its overall state based on the weekly data collected under 49 C.F.R. pt. 1250. The data was indicating that service was deteriorating based on decreasing system average train speeds and increasing terminal dwell time. Other key metrics were also trending in a negative direction. The STB began holding weekly calls with the railroads and asked them to provide certain information with respect to their rail service.

Despite these monumental service issues on CSXT, most of the other Class I railroads, who were not already operating under PSR, also adopted this rail operating plan, including Norfolk Southern Railway ("NSR") in July 2019, Kansas City Southern Railway in January 2019, and Union Pacific Railroad ("UP") in October 2018. These changes led to further disruptions across the US rail network. Massive job cuts, like on CSXT, occurred on NS and UP as part of this plan, leading many to believe that any uptick in the need for rail service would leave them woefully unprepared. This eventually proved to be the case.

On August 24, 2020, the STB Chairman, as well as the Federal Railroad Administration Administrator, wrote the Class I railroads about both of their rail service concerns. These leaders of the rail regulatory agencies explained that they had been made aware of service issues, including missed industrial switches and excessively late or annulled trains due to crew availability issues. They noted that with both increasing intermodal and carload volumes and a projected robust harvest fast approaching, railroad employee availability, together with sufficient

equipment resourcing, was essential for safe, fluid rail service in support of the nation's economic recovery from COVID-19. Given the challenges related to changing demand patterns and operating conditions, they stated that increased communication and transparency with rail shippers had become especially important to ensure they have the information needed to plan their businesses and meet their own customers' needs. They emphasized that it was their expectation that there would be heightened emphasis on improving employee availability, equipment resources, and robust communication to quickly resolve service issues as they arose and to prevent them from becoming widespread. The Class I railroads did not heed this warning as service issues became more rampant.

On May 27, 2021, the new Chairman of the STB, Martin Oberman, also felt compelled to write to the Class I railroads again about rail service issues. He explained that the Board had received concerning reports from a meaningful number of rail customers of subpar performance, including missed switches, railcars delayed at intermediate yards or interchanges, extended out-of-route movements, and prolonged dwell at origin for some unit train traffic. Additionally, he noted that the STB had been made aware of instances of significant congestion at various intermodal facilities, which has resulted in delayed train arrivals and disruptions to container availability. He recognized that these rail service challenges, at least to some extent, had been related to workforce reductions resulting from COVID-19 cases, quarantines, and furloughs based on the temporary decline in demand and the resultant adjustments made by railroads in nearly every facet of their businesses. **But he also expressed his concern about the extent to which these service issues may be related to or exacerbated by a broader trend of rail labor reductions that have been occurring over the past several years. He stated that a lack of personnel, including reserve personnel, has made it more difficult to scale-up operations to**

respond to increases in demand and to maintain reliable service in the face of unanticipated external events that disrupt ordinary operations or business expectations. He said labor shortages could also delay or prolong the recovery period when such network disruptions inevitably occur.

As stated in previous STB letters, he said it is vital that freight railroads continue frequent, proactive communication with the Board and customers on their ability to meet demands for service as the economy recovers from the pandemic. He requested an updated and detailed description of the railroads' preparedness to meet anticipated future demand, including (1) the availability of train crew, yard, and maintenance employees (active, reserve, and furloughed workers) and their plans and time frames for employees to return to work and any re-training, if necessary, and (2) the availability of equipment resources (active and short-term / long-term stored locomotives and rail cars). **As part of this update, he specifically requested that the railroads also address whether they have any long-term plans, including their hiring plans for 2021 and 2022, to reverse any of the diminishing workforce levels which have resulted from their strategies in recent years.** He also asked them to identify any regions of their networks where they were experiencing or anticipating workforce challenges, and their plans to overcome these challenges.

Shortly thereafter, on July 22, 2021, STB Chairman Oberman again wrote the Class I railroads about significant disruptions within the international intermodal supply chain that involve the freight rail network. He stated that he was particularly concerned about significant increases in container congestion at key U.S. terminals, and substantial charges being levied by the railroads for container storage at these terminals. Specifically, in recent months, he asserted that the Board had received numerous reports related to the length of time that containers were

being held in rail yards, and the sizeable storage fees some customers had been required to pay in order to obtain release of containers bearing their shipments. He said that he was particularly troubled about reports that Class I railroads were continuing to impose these charges even in circumstances when the receivers, as a practical matter, had no means to facilitate the release of their containers. Under these circumstances, he noted that demurrage fails to provide any constructive incentives, and perversely results in massive charges that can exceed the commercial value of the shipment. In order to better understand the magnitude of the current container congestion and the framework for the associated demurrage fees, he asked for information from each of the Class I railroads regarding policies and practices with respect to the assessment of demurrage fees on intermodal containers.

On October 18, 2021, Chairman Oberman focused on service issues on CSXT which again caused great concern to the Board, thereby precipitating a letter to the carrier seeking rail service performance information. He stated his reason for this information request was that over the past several months, the Board had continued to receive a steady stream of complaints about the adequacy of rail service provided by CSXT. In both private meetings and public settings, he said CSXT customers have relayed examples of substandard performance, including missed switches, extended transit times for both manifest and bulk shipments, unfilled car orders, and the inability to contact customer service and operating personnel. He stated that customers have also reported that service problems are sometimes resolved, only to recur weeks or months later. Taken together, he noted these complaints were of grave concern as it appeared that CSXT resources were surged to assist one customer, only to have problems arise with another. And, as a result of these problems, he explained that customers incurred premium freight costs, idled production, lost sales and damaged commercial relationships, typically without meaningful

recourse from CSXT. In addition to anecdotal incidents, he noted CSXT's rail service performance data reported under STB Docket No. EP 724 tended to support that CSXT's network was underperforming compared to the benchmarks set in 2019. **He also noted that CSXT has approximately 1,000 fewer "transportation" employees for August 2021 compared to August 2019 (6,577 versus 7,543), as reported on STB Form C.**

This was followed with a similar letter to NS on November 23, 2021, emphasizing the railroad's deteriorating key operating metrics reported pursuant to EP 724. **He compared these numbers with the fact that NSR's number of "transportation" employees had continued to decline over the prior three months (8,281, 8,269, and 8,207, respectively), as reported on STB Form C.** Coinciding with the marked deterioration in NSR's performance metrics, he said the Board had received an increasing number of complaints from NSR's customers about poor performance, including missed switches, cars stranded at intermediate yards, longer transit times, operating plan changes without notice, and a lack of communication from customer service**. For these reasons, he requested that NSR provide the Board with a review of the current state of its network, and assessment of what factors are affecting NSR's ability to achieve past levels of fluidity and consistent service, and in particular the impact on customer service of previous headcount reductions for train, yard, and maintenance employees. He noted it would be most helpful if NSR could provide this review as a follow up to its June 18, 2021, letter, in which a "program of targeted hiring" to meet workforce needs, referenced measures to attract and retain operating employees was outlined. In light of the declining employee headcount since June as shown by the data supplied to the STB, he asserted this program does not appear to have succeeded in obtaining a workforce level sufficient to avoid the service challenges described above.**

As some of these STB communications seem to express, this massive decline in rail service since 2017 can clearly be tied to the use of PSR across the US rail network and the resulting job cuts that made the railroads incapable of providing adequate service and handling upticks in the need for service. CSX had 23,988 total employees and 9262 train and engine service employees in February 2017. CSX had 17,250 total employees and 6795 train and engine service employees in December 2021. UP had 44,652 total employees and 18,612 train and engine service employees in October 2018. UP had 32,494 total employees and 14,079 train and engine service employees in December 2021. NS had 24,594 total employees and 10,243 train and engine service employees in July 2019. NS had 18,011 total employees and 7521 train and engine service employees in December 2021. (These numbers were obtained from the STB Form C information on the STB website.) Job cuts of this magnitude can only result in one outcome which is poor service as the above-recounted facts clearly demonstrate.

Moreover, the operating ratios for these railroads continue to decline. UP has gone from an operating ratio of 63.7% in 2016 to 57.2 in 2021. CSX has gone from 69.2% in 2016 to 56.3% in 2021. NS has gone from 69.6% in 2016 to 60.1% in 2021.

While service has declined, rail rates have continued to rise. In a recent report published by the Rail Customer Coalition[4], evidence of skyrocketing rates and less competitive traffic is clear. The report finds:

- From 2004 to 2019, **real rates (adjusted for inflation) for all rail shippers increased 43%.**

[4] Escalation Consultants, "*Economic Analysis: Consolidation and Increasing Freight Rail Rates*," June 2021. https://www.freightrailreform.com/new-report-finds-rail-customers-paying-a-steep-price-for-consolidation-and-dwindling-competition/

- During the same period, real **railroad costs rose only 8%.**
- Rates for the largest U.S. railroads have jumped **more than twice as fast as inflation and rates for long-haul trucking**.
- **For major commodity groups, revenue from potentially non-competitive rates increased 230%**, while revenue from competitive rates increased only 24%.
- **In 2019, half of railroad revenue was generated from potentially non-competitive rates**, up from 27% in 2004.
- For significantly impacted sectors and commodities, the share of total rail revenue derived from non-competitive rates increased as follows**:**

Agriculture

Commodity	2004	2019
Food Products	15%	39%
Farm Products	34%	56%

Building & Construction

Commodity	2004	2019

Wood Products	8%	31%
Metal Products	17%	45%
Stone & Glass Products	36%	64%

Transportation & Infrastructure

Commodity	2004	2019
Transportation Equipment	13%	33%

- In a troubling indicator of the railroads' ever-growing market dominance and pricing power, **the average revenue-to-variable-cost (RVC) ratio increased from 135% to 167% for shipments of these commodities.**

Id.

Obviously, the implementation of PSR by the railroads since 2016 has made the need for these proposed rules more evident. In fact, before BNSF Executive Chairman Matt Rose retired, he predicted that "PSR, reducing service, and demarketing some types of traffic in pursuit of higher profits" would result in increased scrutiny by the STB. He stated that railroads "have this common carrier obligation to provide freight service to all customers in all markets. And what we're doing in PSR is redefining what we're willing to accept in the freight railroad industry on

certain lanes. And I really do believe we're going to get in a lot of trouble by doing that." He added that "[w]hen you start redefining markets, I think the federal policy makers will look at this, and quite frankly, they will not be happy with us."[5]

As Chairman Oberman recently noted, "railroads' emphasis has not been on growth. Rather, the emphasis has been on cutting in pursuit of the almighty [operating ratio] down to below 60%." He added that '[i]t is clear that as a whole, railroads have foregone many kinds of carloads that they could carry profitably, only not at O.R.s as low as 55%, and instead have focused on only the most profitable traffic. No one is asking the railroads to focus on traffic that would only be carried at a loss. But surely it is not asking too much for railroads to actively seek profitable traffic, even if not as profitable as others."[6]

In other words, PSR railroads have resorted to only choosing rail traffic which fits within the PSR model to continue to drive down operating ratios. This practice leaves certain rail shippers out in the cold even though rail is their best transportation option. This practice is even more disruptive today when truck capacity due to a shortage of drivers is extremely limited. As a result, some rail shippers have nowhere to turn.

The effects of this new rail operating strategy have devastated the rail workforce and resulted in correspondingly poor rail service and sometimes no service at all. While the railroads will assumedly argue that the pandemic is the cause of their service issues over the last two years, this claim is obviously only a part of the story. IMA does not dispute that the pandemic has had a

[5] Trains, *Analysis: Former BNSF Executive Matt Rose's Warning Comes True,* July 22, 2021. https://www.trains.com/trn/news-reviews/news-wire/former-bnsf-executive-matt-roses-2019-warning-comes-true/

[6] Trains, *Top Regulator Urges Railroads to Focus on Growth,* September 9, 2021. https://www.trains.com/trn/news-reviews/news-wire/top-regulator-urges-railroads-to-focus-on-growth/

historic impact on the world's supply chain. However, the railroads by slashing jobs have directly caused the situation to be much worse by making them incapable of adjusting to upticks in the need for rail service. As a result, many rail shippers, especially captive ones, have suffered from plant shutdowns and slowdowns and other adverse impacts that have damaged their businesses despite paying higher and higher rates. These shippers have little recourse except through informal channels to hold these railroads accountable for the harms they suffer at the hands of the railroads. If the new proposed rules are adopted by the Board, some rail shippers would finally have a path to remedy some of these problems. In sum, there never has been a time since the enactment of Staggers where Congress's intent to introduce competition through reciprocal switching was more needed.

2. Increased Use of Reciprocal Switching Arrangements Will Lead to Increased Revenues for the Class I Railroads.

Railroads claim that reciprocal switching will not allow them to properly invest in their infrastructure and would deter them from investing where reciprocal switching allowed another carrier access to its captive customers. An alternative speculation is that new rail shippers and an overall increase in contribution to overhead could be attracted with the prospect of competitive linehaul service and stable switching service, both of which are promulgated by reciprocal switching. In other words, railroads could be the financial beneficiaries from reciprocal switching because it may make rail more attractive to shippers who can get better rates and service due to the new competition.

As discussed in the previous section, railroads have slashed jobs and expenses under the guise of PSR. Continuing down this path will eventually lead to the complete destruction of rail service in the US. In other words, cutting expenses can only go so far. At some point, railroads

will have to begin to look to other ways to impress Wall Street besides cost cutting because there will be nothing left to cut. The only other way to do this would be to increase revenues. Despite the railroads total opposition to any change to the reciprocal switching remedy as proposed in this proceeding, this view is shortsighted when one considers the benefits of reciprocal switching to an industry that has recently lost one of its main sources of revenue in coal.

Railroads like to emphasize how capital intensive its industry is and how much money it invests in its infrastructure. This claim is certainly a main talking point by the railroads and undisputedly warrants careful examination because proper investment in the rail network is essential to provide this crucial service to the nation. However, concerning the general state of capital investment by Class I railroads, capital investment claimed by the seven Class I railroads during the decade 2010-to-2019 is approximately $152.1 billion, $26.6 billion of which represents the portion of those capital expenditures that was discretionary and spent in order to increase the railroad's rate of return, where the $125.5 billion difference is comprised of non-discretionary items that would not increase the railroad's rate of return and would not be classified as capital expenditures in other industries[7]:

- $85.4 billion spent on track and bridges, primarily replacements in kind;
- $30.9 billion spent on locomotives and freight cars, again almost entirely replacements in kind, where locomotives were not new Tier 4 environmentally compliant, but re-built lower Tier motive power and where locomotive work, as measured by gross ton-miles of

[7] Comments of Rail Cents Enterprises, Inc., EP 711 (Sub-No. 1), at 6 (filed February 1, 2022).

freight moved, was flat[8] during the decade, and where replaced cars did not keep up with retired cars—railroad-controlled car fleets decreasing 24% from 2010 to 2019[9]; and

- $9.2 billion spent on Positive Train Control, a safety technology mandated by Congress in 2008,

Id.

While these numbers touted by the railroads appear impressive on their face, they are not as substantial as claimed. The question then becomes what are the railroads doing with all the monies that they are earning from these massive cuts in expenses. Distributions to shareholders by the seven Class I railroads during the same decade, 2010-to-2019, was approximately $164.2 billion. That is, the Class I's returned over six times[10] as much money to shareholders during the decade before the Covid-19 crises as they spent on projects to increase their rates of return. *Id.* "Implication: senior management at the Class I's has had great difficulty in finding investments with returns in excess of their cost of capital, hinting that a new strategy based on carload traffic growth could open up new vistas of franchise growth." *Id.* Reciprocal switching could make this strategy more obtainable by introducing competition, thereby creating better service and lower rates.

Railroads have been accused of demarketing certain types of traffic as discussed in the previous section, since the advent of the PSR revolution, that do not fit within this model. Many shippers have sought new rail service or sought to continue rail service only to have the railroads

[8] Freight ton-miles moved by the seven Class I's was basically flat from 2010 (2.21 trillion) to 2019 (2.29 trillion).
[9] Freight cars owned and leased by Class I's decreased 24% from 461,849 in 2010 to 351,032 in 2019.
[10] $164.2 billion divided by $26.6 billion is 6.2, which changes very little (to 6.1) if all numbers for the decade are converted into constant dollars in order to erase the effects of inflation.

express little interest in their business. Railroads can easily deter shippers from using rail by quoting extremely high rates or offering limited service. While railroads know that rates are required to be reasonable by statute, they also know that the STB rate case process provides little hope to the shippers who would like to challenge these rates as the Board has admitted in recent proceedings. Therefore, if rail traffic does not fit within the PSR model, railroads can easily sidestep their common carrier obligation by offering these unreasonable take it or leave it rates to shippers.

However, at some point, railroads will have to change their shortsighted path in order to make Wall Street happy by increasing revenues as this present strategy is unsustainable in the long run. An increase in reciprocal switching could help to make this inevitable path more of a reality. For example, railroads may only provide a shipper facility with three days of switching service per week. However, the shipper may want to increase the number of days of service to move more of its product by rail. If an interchange with another railroad is within a reasonable distance, that competing railroad could fill in that void and provide service on those additional days. The result would be more rail business. Moreover, by offering more competitive rates, railroads could obtain more business that presently moves by other modes of transportation.

With the recent loss of revenue from the large decrease in coal traffic, Class I railroads will have to turn to new markets to increase revenue. That market could easily be carload traffic. As a result, while this proposed change to the reciprocal switching rules may be strongly opposed by the rail industry now, it may eventually lead to increases in business brought on my better rates and improved service, thereby making this a win-win situation for all involved.

3. During this Historic Disruption of the Global and U.S. Supply Chains Brought on by the Pandemic, the Need for More Efficient and Flexible Rail Service Has Never Been More Evident which these Proposed Rules Will Allow to Happen.

As the Board is aware, the global supply chain has been completely disrupted by the pandemic that has changed the world as we know it over the last two years. This supply chain crisis has wreaked havoc across all forms of transportation including maritime, trucking, and rail. The unpredictability of the demand for goods and the workforce supply, among other things, has brought on events in the supply chain never seen in the past. Unfortunately, there is no certain time when this disruptive situation will end.

Obviously, railroads are crucial to the supply chain in the U.S. and North America. An efficient rail system is extremely important now to help solve these supply chain issues. However, with the pandemic and corresponding difficulties in keeping the workforce fully staffed brought on by devastating illness and quarantine requirements across the U.S., the railroads have had an extremely difficult time providing adequate service to rail shippers in dire need of their services during these unprecedented times. These workforce difficulties were compounded by the large job cuts described above that made the railroads woefully unprepared for these challenges brought on by the pandemic. Moreover, the railroads seemed reluctant to bring back workers as the numbers quoted by Chairman Oberman in his letters to CSX and NS last year demonstrate.

Reciprocal switching could certainly be a cure for some of these troubles when a railroad is understaffed and cannot adequately provide service to its customers. First, when an incumbent railroad serving a captive shipper is not prepared for a surge in business due to job cuts, a competing railroad with a nearby interchange may have the resources to provide this service. The proposed new rules could allow the captive shipper to obtain this service through a reciprocal switching arrangement. At present, it is highly unlikely that the incumbent would allow the

competing railroad access to its captive customer. As a result, the captive customer would have no other choice but to rely on the unprepared railroad and receive inadequate service.

Second, in some instances, the incumbent railroad may not have access to the most efficient rail route for its captive customer. Therefore, when rail service crises occur, the captive shipper would be required to rely on the incumbent carrier's less efficient route even though a competing railroad with a nearby interchange can provide better service. The inefficiency of this result would only be compounded if the incumbent railroad was suffering from service issues across its network brought on by its unpreparedness for a surge in business.

While railroads do at times have a difficult balancing act when trying to determine the resources they need to be prepared for changes in business, examples of major rail service problems have been common over the last decade despite the financial health of the industry. In 2013 and 2014, the rail network struggled mightily with the upsurge in business in North Dakota brought on by fracking and crude by rail. *See United States Rail Service Issues, et al,* EP 724 (STB served Aug. 18, 2014). These issues became even worse with poor weather in Chicago and a strong harvest that had to compete for service with the crude oil traffic. *Id.* As noted, CSX had severe service problems as it implemented PSR on its network in 2017 which continue to this day. *See Public Listening Session Regarding CSX Transportation, Inc.'s Rail Service Issues, et al,* EP 742 (STB served Aug. 24, 2017). The implementation of the proposed rules might not have been able to eliminate all these issues over the years, but it certainly could have helped in certain situations by allowing rail customers to use a better prepared or suited railroad that might not have been available because of the lack of this competitive access remedy.

Generally, the implementation of these proposed rules will make the rail network more efficient by allowing captive shippers within a reasonable distance of a competing railroad to

obtain better routes or better service as discussed above. It also would create competition which would require railroads to provide better service to rail shippers or risk losing business. There never has been a time since the passage of Staggers that this remedy has been more needed. The railroads have decided to implement PSR and make cuts to their workforces and other needs that have generally left them unprepared to provide adequate rail service. The railroads have not been responsive to the Board's inquiries and warnings about their hiring issues. As a result, rail shippers have suffered from poor service resulting in plant shutdowns and slowdowns on an unprecedented basis. This use of reciprocal switching on an increased basis will make the rail system more efficient and hopefully compel the railroads to provide better service and to be more prepared by introducing more competition into the rail industry.

IMA TESTIMONY ABOUT INTERCHANGE DISTANCE

One of the requirements in the proposed rules is that "[t]he party seeking such switching shows that there is or can be a working interchange between the Class I carrier servicing the party seeking switching and another Class I rail carrier within a reasonable distance of the facilities of the party seeking switching." IMA is concerned about how the term "reasonable distance" will be interpreted in future decisions at the Board. IMA urges the Board to liberally interpret this language, or many IMA member companies may not have access to this crucial reciprocal switching remedy.

Many IMA member companies are located in remote, rural areas where only one Class I railroad is in the immediate area. These member companies are captive to this railroad and have no other options to move their bulk product to their customers or ports. These member companies are large rail shippers and spend over $1 billion in rail service each year. However, if the Board limits a "reasonable distance" to 30 miles in these remote areas, many of the IMA

member companies will not be able to use the proposed rules because of their long distance to an interchange with another Class I railroad. Many member companies find themselves in this position because the nature of their business makes it more likely that they will be located in these more remote areas. This is also the case for many rail shippers in other industries like agriculture and coal. Therefore, this is an extremely important issue for many rail shippers who are captive in remote locations.

Moreover, IMA member companies that are captive to a Class I railroad in these remote areas presently feel helpless to push for reasonable rates and service. First, as the Board has noted, the competitive access remedies have proven to be unworkable for captive shippers over the past several decades since the *Midtec* decision. In essence, these remedies, including reciprocal switching, cannot be used successfully by IMA member companies. Second, the stand alone cost test rate case process for large rate cases has proven to be broken to a large extent. The process has been shown to be overly expensive, incredibly complex, unpredictable, and unusable depending on the circumstances. Finally, most IMA member companies have little flexibility regarding the locations of their facilities. They must be located where they are because that is where the industrial minerals are located. As a result, these member companies cannot choose to place their facilities at locations that are served by more than one railroad.

The Board has acknowledged the ineffectiveness of these remedies and has begun to take action for which the IMA commends the Board and urges it to move swiftly in this proceeding. Also, the Board reviewed the broken rate case process in its rate case report and has moved forward with the Final Offer Rate Review process for small rate cases. While IMA is very supportive of these actions, its member companies could still find themselves in the same position after all is said and done. FORR does little to help these large rail shippers with its 2

years / $4 million cap. As mentioned, many IMA member companies are large rail shippers who would need an improved large rate case process for an effective remedy for unreasonable rates. Moreover, if the term "reasonable distance" is strictly interpreted to only apply to interchanges within a 30-mile radius, many of these member companies would not be able to use this remedy. As a result, they would find themselves in the same position that they are in right now which is without any accessible remedy before the Board when they are captive. This result seems inherently wrong and counter to the intentions of Congress.

Therefore, IMA respectfully asks the Board to apply the term "reasonable distance" with the location in mind. If the facility is in a remote location, the Board should permit this distance to be at least 300 miles to make it usable by these captive rail shippers. Longer distance interchange points are not unheard of in rail regulation. In Canada, the 2018 amendments to the Canada Transportation Act provide for Long Haul Interswitching, which provides for reciprocal switching in circumstances where the nearest interchange is much farther than 300 miles.

If the Board does not interpret "reasonable distance" this way, the result would eliminate the benefits of the proposed rules to a large sector of captive rail shippers. Moreover, it is clearly in the public interest because these rail shippers presently feel as if they have no access to the Board when they are captive, and a shorter distance limitation would make them feel as if nothing has changed.

CONCLUSION

Based on the foregoing discussion, IMA strongly urges the Board to adopt the proposed rules for reciprocal switching with this one recommendation regarding "reasonable distance" in mind. The case for the implementation of these rules has never been stronger than now.

Respectfully submitted,

Re: STB Docket No. EP 711 (Sub - No. 1) – *Reciprocal Switching*

Dear Ms. Brown:

Pursuant to the decision served in the captioned proceeding on December 28, 2021, the National Grain and Feed Association ("NGFA") hereby submits its written comments on the topics discussed in the decision. The NGFA also submits the written testimony of Mr. Max Fisher, its Chief Economist. Mr. Fisher will be in attendance for NGFA at the hearing scheduled on March 15-16, accompanied by its undersigned counsel. The NGFA has requested 10 minutes be allotted for its remarks.

Please do not hesitate to call me if you have any questions.

Sincerely,

Thomas W. Wilcox

Docket No. EP 711 (Sub- No.1)

RECIPROCAL SWITCHING

COMMENTS OF THE NATIONAL GRAIN AND FEED ASSOCIATION

The National Grain and Feed Association ("NGFA") is very appreciative of the opportunity to supplement its prior comments in this proceeding,[1] and the NGFA commends the Surface Transportation Board ("Board" or "STB") for resuming its consideration of revising the current rules and regulations implementing 49 U.S.C. §11102(c)(1) to facilitate reciprocal switching for the purposes of potentially increasing rail-to-rail competition for the benefit of agricultural shippers and for society at large. Many of the NGFA's members are captive to one railroad for service. While the alternative of truck transportation for most agricultural commodities

[1] On October 26, 2016 the NGFA submitted Opening Comments in response to the Notice of Proposed Rulemaking ("NPRM") issued in this Docket on July 26, 2016. On January 13, 2017, the NGFA submitted Reply Comments on the NPRM. The NGFA also participated in a joint filing in this and other dockets submitted on July 29, 2021 by a group of agricultural trade associations called the Agricultural Working Group in response to the July 9, 2021 Executive Order issued by President Biden which in part encouraged the Board to adopt initiatives such as reciprocal switching to encourage competition in the railroad industry. NGFA incorporates those prior filings by reference in these comments.

theoretically exists nearly everywhere, it is not an effective competitor to long haul shipments that predominate rail transportation. Thus, a revision of the rules governing Board-directed reciprocal switching arrangements to more closely adhere to the statutory language is not only long overdue, it would potentially provide relief for NGFA's members that is not currently available under existing rules and agency precedent.

I. Identity and Interests of NGFA

The NGFA, established in 1896, consists of more than 1,000 grain, feed, processing, exporting and other grain-related companies that operate more than 8,000 facilities handling U.S. grains and oilseeds. Its membership includes grain elevators; feed and feed ingredient manufacturers; biofuels companies; grain and oilseed processors and millers; exporters; livestock and poultry integrators; and associated firms that provide goods and services to the nation's grain, feed, and processing industry. The NGFA also consists of 27 affiliated State and Regional Grain and Feed Associations and is co-located and has a strategic alliance with the North American Export Grain Association, and a strategic alliance with the Pet Food Institute.

II. Comments in Response to the December 27, 2021 Decision

A. New Developments in the Agricultural Industry Relevant to a Final Decision

Since 2017, when the written comment period on the NPRM closed, the amount of grain transported by rail has been relatively steady and the long running trend of shuttering smaller train loading facilities and building larger facilities has continued. This combination of steady grain volumes and fewer, but larger facilities, is in part the outcome of the Class I railroads' changes to their operating plans caused by adopting the principles of so-called "precision scheduled

railroading." This change in the agricultural commodity transportation market has created an even greater need for reciprocal switching and makes the industry more conducive to trying to create rail competition through reciprocal switching.

Meanwhile, the need for increased rail-on-rail competition remains. The number and makeup of grain handling facilities is evolving, but the ability remains low to locate or move facilities to more favorable locations to try and obtain rail-to-rail competition. For example, grain origin facilities must stay reasonably close to farms to keep truck freight costs manageable for the first movement from field to storage. This means grain handlers often must build in areas that are captive to a single railroad.

In summary, agriculture's suitability for reciprocal switching has improved and its need for rail-to-rail competition remains.

B. Comments on Topics Discussed in *Ex Parte* Meetings

The NGFA does not have any comments on topics that were discussed in *ex parte* meetings with the Board members and staff on reciprocal switching issues.

C. Other Matters Relevant to This Proceeding

The NGFA continues to maintain that final revised rules governing the Board's establishment of reciprocal switching arrangements should have several primary objectives. The first objective is to reaffirm the Board's conclusion in the NPRM that the "anticompetitive act" standard applied in the Interstate Commerce Commission's rules in *Intramodal Rail Competition*[2] and in *Midtec Paper Corp. v. Chicago & North Western Transportation Co*[3] should be reversed for the reasons discussed in the NPRM.[4]

[2] 1 I.C.C.2d 822 (1985), *aff'd sub nom Balt. Gas & Elec. v. United States*, 817 F.2d 108 (D.C. Cir. 1987).
[3] 3 I.C.C.2d 171 (1986).
[4] NPRM at 8-10.

Second, the final revised rules should be as streamlined as possible so decisions on whether a reciprocal switch arrangement should be established can be made without lengthy and costly administrative proceedings, while still fulfilling the statutory directives of §11102(c)(1) and principles of due process. The NGFA has previously commented that the final rules should be more explicit about the procedures for resolving reciprocal switching disputes. The NGFA also believes that the Board should reconsider its prior rejection of the concepts of rebuttable presumptions that was a key component of the original proposal of the National Industrial Transportation League in 2011. For example, the Board could establish a presumption that carriers should establish a reciprocal switching arrangement for shippers located within a defined distance of an established interchange, thus placing the onus on the incumbent rail carrier to demonstrate that a reciprocal switching arrangement was neither in the public interest nor necessary to provide competitive rail service. In such cases, evidence could include the extent to which the incumbent's investment in power, crews and track can create capacity that would overcome alleged switching challenges.

Third, the NGFA continues to urge the Board to be adaptable in determining qualifications for determining whether there "can be" a working interchange from which reciprocal switching can occur.[5] The final rules should take into account that new interchanges can be established, and former interchanges rehabilitated and restored to service. The NGFA also recommends that the Board accompany the final rules with a public process whereby existing and potential new interchanges eligible for reciprocal switching arrangements would be identified starting from an appropriate baseline date preceding the effective date of the final rules.

Fourth, the NPRM chose to leave the determination of whether there is a working

[5] The NGFA has previously commented it does not object to the NPRM's proposed identification of existing interchanges.

interchange "within a reasonable distance of the facilities of the party seeking switching" to be made on a case-by-case basis.[6] The NGFA recently surveyed its membership and now more than one-half of its members' rail origin and destination facilities that are located on a Class I railway are located within 100 miles of a second Class I railway. Consequently, a determination in the final rules that 100 miles is "within a reasonable distance" could potentially lead to increased rail-to-rail competition for a significant portion of grain shippers, and the NGFA reiterates its support for such a determination.

Grain shippers and receivers that are beyond a "reasonable distance" from an interchange would be relegated to trying to control their rail transportation costs through efforts to have the Board determine the maximum reasonable rate the railroad could charge under the law. For this reason, the NGFA is very pleased that the Board is simultaneously working to promulgate revisions to its rate reasonableness procedures and standards that are applicable to disputes that involve relatively small damage amounts.

Finally, the NGFA continues to encourage the Board to be vigilant in fashioning workable and effective rules governing the compensation to be paid incumbent carriers in Board-directed reciprocal switching arrangements. As the NGFA has explained in its prior comments in this proceeding, the Board's rules should apply to both cases where (1) the Board directs a reciprocal switch arrangement and the carriers cannot reach agreement on the conditions and compensation applicable to the agreement; and (2) the Board directs an arrangement and the carriers do reach agreement but the shipper(s) benefitting from the arrangement believe the agreed upon amount is unreasonably high. The NGFA continues to be concerned that in today's concentrated railroad industry the possibility exists that such fees and terms almost certainly will be set at levels that

[6] Proposed Section 1145.2(a)(1)(ii).

maintain the *status quo* at a particular location instead of creating effective competition. In such cases, which the NGFA believes will be common despite the pro-competitive intent of §11102(c), shippers must have a clearly defined and efficient means to challenge the agreed-upon reciprocal switching fee at this Board. The most efficient and reasonable approach to address this issue would be for the final rules to establish that the standards for determining whether compensation agreed to by railroads under §11102(c) is appropriate shall be the same as the standards to be applied when they *cannot* agree.

NGFA continues to be in favor of an "access pricing" methodology (compensation determined on a case-by-case basis reviewing a specific set of factors - i.e., geography, distance, cost of service, capacity of interchange facility, etc.) – as proposed in the NRPM. By developing and then consistently applying an appropriate "access pricing" methodology, the Board would place all incumbent rail carriers on a level playing field to compete for business through reciprocal switching arrangements.

III. Conclusion

The NGFA encourages the Board to maximize this opportunity to facilitate rail-to-rail competition and allow both origin and destination rail customers to attempt to obtain alternative rail service via reciprocal switching arrangements. In a highly consolidated and largely captive industry, this may be the best opportunity to create some semblance of effective rail-to-rail competition. The NGFA accordingly urges the Board to act with all deliberate speed to promulgate final regulations in this proceeding.

Respectfully submitted,

Sincerely,

Michael C. Seyfert

Docket No. EP 711 (Sub- No.1)

RECIPROCAL SWITCHING

TESTIMONY OF THE NATIONAL GRAIN AND FEED ASSOCIATION

Good morning, my name is Max Fisher, and I am the Chief Economist for the National Grain and Feed Association. The NGFA consists of more than 1,000 grain, feed, processing, exporting and other grain-related companies that operate more than 8,000 facilities.

I would like to begin by commending the Board for resuming its work in this proceeding for the purpose of increasing rail-to-rail competition through reciprocal switching arrangements. Many of NGFA's members are captive to one railroad and have little bargaining power in the absence of rail-to-rail competition.

Since 2017, when NGFA submitted its last set of comments on the NRPM, the amount of grain transported by rail has been relatively steady, and the long running trend of shuttering smaller train loading facilities and building larger facilities has continued. This combination of steady grain volumes and fewer, but larger facilities is in part the outcome of the Class I railroads' changes

to their operating plans caused by adopting the principles of so-called "precision scheduled railroading."

Meanwhile, the need for increased rail-to-rail competition remains. The number and makeup of grain handling facilities is evolving, but the ability remains low to locate facilities in places where more than one railroad can provide service. For example, grain origin facilities must stay reasonably close to farms to keep truck freight costs manageable for the first movement from field to storage. This means grain handlers often must build in areas that are captive to a single railroad.

To summarize these trends, agriculture's suitability for alternative rail service through reciprocal switching has improved and its need for rail-to-rail competition remains.

With respect to the 2016 NPRM, the NGFA maintains that several primary objectives should be reflected in the final rules the Board issues. The first objective is to reaffirm the Board's conclusion in the proposed rule that the "anticompetitive act" standard applied by the Interstate Commerce Commission in the MidTec case and other decisions should be reversed.

Second, the procedures contained in the final rules should be as streamlined as possible so decisions on the establishment of reciprocal switching arrangements can be made without lengthy and costly administrative proceedings.

Third, the NGFA continues to urge the Board to be adaptable and take into account that interchanges conducive to reciprocal switching can be established or reconstructed. The NGFA also recommends that the Board accompany the final rules with a public process whereby existing and potential new interchanges eligible for reciprocal switching arrangements would be identified.

Fourth, the NGFA recently surveyed its membership and now more than one-half of its members' rail origin and destination facilities are located on a Class I railway that is within 100

miles of a second Class I railway. Consequently, a determination in the final rules that 100 miles is "within a reasonable distance" of an interchange could potentially lead to increased rail-to-rail competition for a significant portion of grain shippers.

In any case, the NGFA is very pleased that the Board is simultaneously working to promulgate revisions to its rate reasonableness procedures for shippers and receivers that would be too far from an interchange to participate in reciprocal switching.

Finally, the NGFA encourages the Board to fashion workable and effective rules governing the compensation to be paid incumbent carriers in Board-directed reciprocal switching arrangements. These rules should apply to cases where the Board directs a reciprocal switch arrangement but the carriers cannot reach agreement on the conditions and compensation; and also cases where the Board directs an arrangement and the carriers do reach agreement but the shipper(s) benefitting from the arrangement believe the agreed upon amount is unreasonably high.

The NGFA is remains in favor of the "access pricing" methodology in the proposed rule. By developing and consistently applying an appropriate "access pricing" methodology, the Board should be able to place rail carriers on a relatively level playing field to compete for business through reciprocal switching arrangements.

In conclusion, the NGFA encourages the Board to maximize this opportunity to facilitate rail-to-rail competition and allow both origin and destination rail customers to attempt to obtain alternative rail service via reciprocal switching arrangements. In a highly consolidated and largely captive industry, this may be the best opportunity to create some semblance of rail-to-rail competition. The NGFA accordingly urges the Board to act with all deliberate speed to promulgate final regulations in this proceeding.

HYNES V.S. EXHIBIT 40

EX PARTE NO. 711 (SUB-NO. 1), PRIVATE RAILCAR FOOD AND BEVERAGE ASSOCIATION TESTIMONY (FILED FEB. 14, 2022)

303902
ENTERED
Office of Proceedings
February 14, 2022
Part of
Public Record

BEFORE THE

SURFACE TRANSPORTATION BOARD

Docket No. EP 711 (Sub-No. 1)

RECIPROCAL SWITCHING

PRIVATE RAILCAR FOOD AND BEVERAGE ASSOCIATION TESTIMONY

Private Railcar Food and Beverage Association ("PRFBA") respectfully submits its testimony in the above-captioned proceeding in accordance with the Surface Transportation Board ("STB" or "Board") Notice of Public Hearing ("Notice") served on December 28, 2021. The Board provided the opportunity for interested parties to provide testimony to update the record in this proceeding regarding its proposed new regulations under which the Board would exercise its statutory authority to require rail carriers to establish reciprocal switching arrangements under certain circumstances. PRFBA thanks the Board for this opportunity to voice its strong support for these proposed new rules for reciprocal switching made even more necessary now by the changes in the rail industry since early 2017.

PRFBA INTEREST IN THE PROPOSED RULES

PRFBA is comprised of 18 global food and beverage companies and manufacturers headquartered in North America. These members include PepsiCo, Inc., Molson Coors Beverage

Company, KraftHeinz Food Company, General Mills, Inc. ("GMI"), McCain Foods USA, Inc, Sysco Corporation, Bonduelle America, Boardman Foods, Inc., G3 Enterprises, Inc., JD Irving/Cavendish Farms, The Martin-Brower Corporation, Lamb Weston Holdings, Inc., Univar Solutions, Darigold, Inc., Kellogg Company, Land O' Lakes, Inc., National Sugar Marketing, LLC, and Laprino Foods. They are major rail shippers that rely on the railroads to produce and distribute their food and beverage products that are vital to the health and welfare of our nation. These companies are responsible for feeding the citizens of this nation. Without adequate rail service, their food and beverages will not be on store shelves in the US.

PRFBA members meet regularly to discuss opportunities and solutions to their "similar" challenges with railcar service. The membership collaborates with other trade associations with regard to industry changes and proposed legislation and regulations that directly impact the association's food and beverage transportation needs. PRFBA meets with the Class I North American railroads where group discussions are held on rail service issues unique to its membership. PRFBA provides its members with a forum to work together to harness the railroad service challenges ultimately providing a better industry foundation for private railcar food and beverage shippers in North America.

PRFBA members continue to be adversely impacted by the lack of any options to obtain competitive rail access. Under the current process for the reciprocal switching remedy, PRFBA members do not bring forward reciprocal switching cases and are often forced to modify operations to their detriment because no other viable options are present. This results in negative impacts throughout the supply chain ultimately impacting not only PRFBA members, but their customers and then their consumers.

PRFBA appreciates that the STB has an important oversight role in looking at the impact of freight rail policies on rail shippers and is encouraged the STB is seeking ways to improve the reciprocal switching remedy in line with the intent of Congress. PRFBA urges the Board to breathe life into this remedy that has been essentially dormant for decades and to provide a method to counter the Class I railroads' unabated market power over its members.

BACKGROUND OF THE PROCEEDING AND THE PUBLIC HEARING

The Board opened this proceeding by issuing a Notice of Proposed Rulemaking ("2016 NPRM") on reciprocal switching on July 27, 2016. *Reciprocal Switching ("NPRM"),* STB Ex Parte 711 (Sub-No. 1) (STB served July 27, 2016). Parties filed opening comments and reply comments on the 2016 NPRM in late 2016 and early 2017. Following these comments, the proceeding did not move forward except for ex parte meetings and has remained essentially dormant since that time.

The 2016 NPRM grew out of the Ex Parte No. 711 proceeding, which was initiated by a July 7, 2011 petition for rulemaking by the National Industrial Transportation League. Petition for Rulemaking of the National Industrial Transportation League, *Petition for Rulemaking to Adopt Revised Competitive Switching Rules*, STB Ex Parte 711 (served July 7, 2011). That proceeding involved comments filed in 2013 and a public hearing in March 2014.

On December 28, 2021, the Board issued the Notice stating its intent to "hold a public hearing on March 15 and 16, 2022, concerning the reciprocal switching regulations it proposed" through the 2016 NPRM. *Reciprocal Switching*, STB Ex Parte 711 (Sub-No. 1), slip op. at 1 (STB served Dec. 28, 2021). The Board's stated intent for holding a public hearing and inviting comments is "[t]o allow interested persons to submit testimony to update the record," and "[t]o

ensure a full and updated record in this proceeding." *Id.* at 2, 6. Thus, the Notice specifically invites comments addressing certain topics, including:

- "[A]dditional or modified views on the effects and/or need for the proposed regulations" in light of "significant operational changes in and affecting the freight rail industry" in the time "[s]ince the issuance of the NPRM";
- "[N]ew developments (i.e., developments that have occurred since the Board previously invited comments in this proceeding) that a commenter finds are relevant to a final decision in this matter and address any change or significant development in a commenter's views since the previous round of comments"; and
- "[T]opics that were discussed in ex parte communications that have taken place since October 25, 2016, in this proceeding."

Id. at 6.

LAW AND LEGISLATIVE HISTORY REGARDING RECIPROCAL SWITCHING

Reciprocal switching can occur as part of a voluntary arrangement between carriers, or it may be ordered by the Board. The Board may require the establishment of a switching arrangement when it finds that the arrangement either (1) is practicable and in the public interest, or (2) is necessary to provide competitive rail service. 49 U.S.C. § 11102(c)(1). Section 11102(c)(1) authorizes the Board to establish the conditions of and compensation for switching service if the affected carriers cannot reach agreement on those matters within a reasonable period. The Board's implementation of § 11102 is guided by the rail transportation policy set forth in 49 U.S.C. § 10101. *See NPRM*, EP 711 (Sub-No. 1) et al., slip op. at 16.

The Board's current regulations governing reciprocal switching were promulgated in 1985 by the Board's predecessor, the Interstate Commerce Commission ("ICC"), *see Intramodal Rail Competition,* 1 I.C.C.2d 822 (1985), *aff'd sub nom. Balt. Gas & Elec. v. United States,* 817 F.2d 108 (D.C. Cir. 1987), and are codified at 49 C.F.R. § 1144. The regulations provide that reciprocal switching would only be prescribed if the agency determines that it "is necessary to remedy or prevent an act that is contrary to the competition policies of 49 U.S.C. [§] 10101 or is otherwise anticompetitive," and "otherwise satisfies the criteria of . . . [§] 11102(c)." 49 C.F.R. § 1144.2(a)(1). The Board's regulations also provide relevant factors that the agency shall consider in determining whether to prescribe competitive access, along with a "standing" requirement. 49 C.F.R. § 1144.2(a)(1)-(2). The regulations do not address how the Board should establish compensation for Board-ordered switching when the carriers cannot reach agreement within a reasonable period.

In *Midtec Paper Corp. v. Chicago & North Western Transportation Co. ("Midtec"),* 3 I.C.C.2d 171 (1986), the first case where the ICC applied 49 C.F.R. § 1144.2, the ICC explained that the key issue under its then-new regulations was whether the incumbent railroad "has engaged in or is likely to engage in conduct that is contrary to the rail transportation policy or is otherwise anticompetitive." *Id*. at 181. The ICC further explained that it would find anticompetitive behavior only when an incumbent carrier had "used its market power to extract unreasonable terms on through movements" or "because of its monopoly position . . . shown a disregard for the shipper's needs by rendering inadequate service." *Id.* The agency's competitive access regulations have not changed substantively since 1985 and few requests for reciprocal switching have been filed since then. In other words, *Midtec* caused the use of the reciprocal switching remedy to go dormant because rail shippers did not believe this standard could be met.

Under the Board's proposed regulations, there would be no need to show anticompetitive conduct, as had been required in the ICC's *Midtec* decision. Rather, under the Board's proposed regulations, the Board would require the establishment of a switching arrangement when the switching arrangement either was practicable and in the public interest or was necessary to provide competitive rail service. *NPRM,* EP 711 (Sub-No. 1) et al., slip op. at 16. This approach would simply apply the language in the statute as written by Congress.

In assessing whether a switching arrangement would be practicable and in the public interest under the proposed regulations, the Board would consider whether the benefits of a proposed arrangement would outweigh its potential detriments. In making that determination, the Board would consider all relevant factors, such as (1) whether the arrangement would further the rail transportation policies in 49 U.S.C. § 10101; (2) the efficiency of the proposed route; (3) whether the arrangement would allow access to new markets; (4) the impacts, if any, of the arrangement on capital investment, quality of service, and employees; (5) the amount of traffic that would be moved under the arrangement; and (6) the impact, if any, of the arrangement on the rail transportation network. *NPRM*, EP 711 (Sub-No. 1) et al., slip op. at 18.

In assessing whether a reciprocal switching arrangement would be necessary to provide competitive rail service, the Board would consider whether intermodal and intramodal competition were effective with respect to the movements for which the switching arrangement was sought. The Board would evaluate the effectiveness of competition using quantitative and qualitative factors that the Board has developed in the context of assessing market dominance in rate challenges, but it would not consider product competition or geographic competition. *Id.* at 27.

The Board's proposed regulations also state that reciprocal switching would not be ordered, even if one or both of the foregoing standards were met, if the switching was not feasible, would be unsafe, or would unduly hamper a carrier's ability to serve its customers. As additional limitations, the Board would require the establishment of a switching arrangement only when (1) the shipper or receiver was served by a single Class I carrier; and (2) there was or could be, within a reasonable distance of the shipper or receiver's facilities, a working interchange between the incumbent carrier and another Class I rail carrier. *Id.* at 19-21.

The 2016 NPRM sought comments on two alternatives regarding the compensation the Board could impose for switching service if the carriers could not agree within a reasonable time. Under the first alternative, compensation would be based on factors such as: (1) the geography where the proposed switch would occur; (2) the distance between the shipper/receiver and the proposed interchange; (3) the cost of the service; (4) the capacity of the interchange facility; and (5) other case-specific factors. The 2016 NPRM asked for comment on whether the agency should also consider what have been referred to as the incumbent carrier's lost contribution or opportunity costs. Under the second alternative, compensation would be based on the cost of providing the service plus a fair and reasonable return on the capital that was used to provide the service, analogous to the rental income that applies when the Board orders a carrier to provide trackage rights to another carrier (the Board's "SSW methodology"). *Id.* at 25-26; *see, e.g., New England Cent. R.R.—Trackage Rts. Ord.—Pan Am S. LLC*, FD 35842 (STB served Oct. 31, 2017); *St. Louis Sw. Ry.—Trackage Rts. over Mo. Pac. R.R.—Kan. City to St. Louis,* 4 I.C.C.2d 668 (1987); *St. Louis Sw. Ry.—Trackage Rts. over Mo. Pac. R.R.— Kan. City to St. Louis,* 1 I.C.C.2d 776 (1984).

The rail transportation policy established by the Staggers Rail Act of 1980 ("Staggers") places great importance on the promotion of competition in the rail industry: "[i]n regulating the rail industry, it is the policy of the United States government…to allow, to the **maximum extent possible**, competition and demand for services to establish reasonable rates for transportation by rail." 49 U.S.C. § 10101 (1) (emphasis added). Congress emphasized the importance of competition in four additional sections setting out the policy underlying Staggers. *Id.* at (4), (5), (6), and (12). These provisions leave little doubt that Staggers intended to introduce competition as an alternative to regulation of rates and service. These proposed rules follow this rail transportation policy by making competitive access available to rail shippers who have had no real ability to obtain this remedy since *Midtec.*

The new proposed rules in the 2016 NPRM are exactly what Congress intended when it enacted the reciprocal switching remedy in Staggers. Not only do these proposed rules conform with their statutory basis, but they also use the exact language of the statute as noted. Consequently, the proposal would replace the Board's outdated regulations with ones that more closely adhere to Congress' deregulatory vision for the freight rail industry. The legislative history regarding this competitive access remedy makes that extremely clear.

Title II of Staggers is the section which includes the reciprocal switching provision and "is related to the key areas of the Interstate Commerce Act which involve railroad rates and inter-carrier practices. In general, the title assures railroads substantially more rate freedom than [was] afforded them under existing law" at that time. H.R. Rept. 96-1430, 96th Cong. 2d sess. 80 (1980). To balance this new-found ratemaking freedom, "[a] number of provisions are included

to foster greater competition by simplifying coordination, minor mergers procedures, entry and reciprocal switching agreements." *Id.*

The Conference Committee Report on Staggers ("Committee Report") provided in relevant part as follows:

> Consistent with the new rail transportation policy of this Act, the conferees intend that competition be recognized as the best control on the ability of railroads to raise rates. The purpose of this legislation is to reverse the decline of the railroad industry, which has been caused, in part, by excessive government regulation. The conferees believe that **by allowing the forces of the marketplace to regulate railroad rates wherever possible** the financial health of the railroad industry will be improved and will benefit all parts of the economy, including shippers, consumers, and rail employees.

Id. at 89 (emphasis added). Undoubtedly, Congress intended competition to be the most effective and desirable way to protect shippers.

With respect to the way Congress intended for competition to be used remedially, the Committee Report stated:

> The Senate authorized the Commission to require railroads to enter into reciprocal switching where it finds such agreements to be practicable and in the public interest. In many parts of the country, reciprocal switching agreements are in effect where carriers pick up and deliver traffic for other railroads. In areas where reciprocal switching is feasible, it provides an avenue of relief for shippers where

> only one railroad provides service and it is inadequate. The standard "practicable and in the public interest" is the same standard the Commission has applied in considering whether to order joint use of terminal facilities.

Id. at 116. *See also* S. Rept. 96-470, Cong. 1st sess. 41-42 (1979) (same).

Similarly, the discussion of reciprocal switching in the Report of the House Committee on Interstate and Foreign Commerce stated:

> This section empowers the Commission to approve reciprocal switching agreements and joint service agreements upon the request of a carrier or shipper. In geographic areas where reciprocal switching is feasible, it provides competition to the benefit of shippers served. While the Commission now has the power to order the joint use of terminal facilities, its power to order reciprocal switching is less clear. In particular,reciprocal switching has been limited to situations where competition between rail carriers is not threatened. **The Committee intends for the Commission to permit and encourage greater competition.** Likewise joint service agreements should be encouraged in order to improve shipper service and efficiency.
>
> The standard the Commission should use in approving agreements under this section should be where the requested action is "practicable and in the public interest."

H. Rept. 96-1035, 96th Cong. 2nd sess. 67 (1980) (emphasis added).

The Senate Committee on Commerce, Science and Transportation Report emphasized the importance of enhanced competition:

> The new railroad transportation policy established by this bill emphasizes the need for increased intramodal and intermodal competition, and section 203 [the Senate reciprocal switching provision] deals with intramodal competition among railroads… As the Government moves toward significantly less regulation of the services offered by railroads, the Government should encourage, rather than discourage, competition among railroads. **Competition among railroads, or at least the realistic threat of competition, can serve as an important safeguard against inadequate service or unreasonably high prices.**

S. Rept. 96-470, at 41 (1979) (emphasis added). *See also* 126 Cong. Rec. H10079-87, 99 (daily ed. Sept. 30, 1980) (statement of Rep. Eckhardt) ("inclusion of provisions relating to entry and reciprocal switching which provide increased rail-to-rail competition"); 126 Cong. Rec. H5899-5914, 549 (daily ed. June 30,1980) (statement of Rep. Madigan) (reciprocal switching "will introduce additional competition between railroads. Under reciprocal switching, one railroad is given the opportunity to have access to another railroad's operating territory, thereby providing many shippers with competition in rail service that they presently do not enjoy."). The point of this legislation is "to encourage intramodal competition." S. Rept. 96-470, at 38.

The STB in the 2106 NPRM followed this broad two-part model set forth in the statute in creating the proposed rules for reciprocal switching. Instead of the narrow standard in place today, the Board followed the statutory language, the transportation policy, and the legislative

intent by proposing to introduce greater competition into rail markets. The legislative language and history in Staggers urged the ICC to do exactly what the STB has done here.

NEW REASONS WHY THE PROPOSED RULES ARE NEEDED

1. The Historic Rail Industry Change to PSR since 2017 Makes these Proposed Rules Even More Necessary Now to Provide Shippers with a Remedy to Protect Them from this Dysfunctional Operating Model.

The developments regarding Precision Scheduled Railroading ("PSR") since the Board last sought comments in this proceeding clearly provide more justification than ever for the approval of these proposed rules on reciprocal switching. Implementation of PSR by nearly all the Class I railroads[1] (except for BNSF Railway) shortly after this last round of comments has made the need for this competitive access remedy even more compelling now than in early 2017. This widespread implementation and now use of PSR as the railroad operating model has caused a sea change in the way the rail network works and has resulted in generally poorer service and higher rates for rail shippers over the last 5 years.

The railroads claim "Precision" in PSR "refers to highly precise planning, examining, and fine-tuning of all processes related to the movement of rail cars, combined with disciplined, synchronized execution of the processes."[2] There are several elements to many of the PSR operating strategies claimed to be followed by the Class I railroads in the US. The first element is to "restructure local service" by "better utiliz[ing] crews and locomotives, while asking more of

[1] Canadian Pacific Railway and Canadian National Railway Company had already implemented PSR before 2017.

[2] "*The Operational Nuts and Bolts of Precision Scheduled Railroading",* Carl Van Dyke, FHWA Webinar PowerPoint, at 6, March 2020, https://www.fhwa.dot.gov/Planning/freight_planning/talking_freight/march_2020/talkingfreight3_18_20cvd.pdf

customers and local crews." *Id.* at 8. The second element is to "increase car velocity" by "reduc[ing] switching, while using block swaps more and providing multiple outlets for traffic - focus on plan adherence and elimination of blocking (switching), connection, and train make-up errors." *Id.* The third element is to "minimize train miles and road locomotive and crew needs" by "run[ning] fewer, longer, more generic trains on a balanced network and filling out the trains to their maximum capacity, while focusing on crew and locomotive cycling." *Id.* The fourth element is to "change customer services" by "eliminat[ing] 'boutique' operating plan elements (blocks and trains) and standardizing product offerings." *Id.* In its purest form, this operating strategy should "bring[] together many core principles that should arguably be widely supported by both railroads and customers, driving to better asset velocity, overall efficiency, shipment speed, and reliability." *Id.* at 7.

Unfortunately, PSR has not been used in its purest form as the railroads have professed and has been widely opposed by rail shippers due to its adverse effects on their service and costs. As stated by Chair of the House Committee on Transportation and Infrastructure Peter DeFazio: "In recent years, numerous stakeholders have raised concerns about the railroad management strategy known as precision scheduled railroading (PSR). Using variations of this strategy, it appears that Class I railroads have streamlined operations and otherwise cut costs in pursuit of lower operating ratios for short-term revenue gains. Stakeholders are concerned that the rise of the PSR model has come at the expense of long-term capital investments, reduced rail infrastructure, affected service for some shippers, and caused dramatic workforce cuts and safety

concerns."[3] Chair DeFazio was so concerned by this problematic use of PSR that a study by the General Accountability Office ("GAO") was passed by the House in his surface transportation reauthorization bill, the INVEST in America Act, to help find ways to address the impacts this railroad management strategy has had on workers, freight shippers, passenger railroads, and rail safety. Since the House passage of the INVEST Act, and upon the direct request of Chairman DeFazio and Chairman of the House Railroads, Pipelines, and Hazardous Materials Subcommittee Chairman Donald Payne, the GAO began conducting this study late last year.

The facts clearly demonstrate that Chair DeFazio's impression of PSR is the accurate one. First and foremost, rail service has plummeted since this historical change in how railroads operate. In March 2017, CSX Transportation, Inc. ("CSXT") implemented PSR as its rail operating plan. This implementation led to countless service issues across its network almost immediately. Part of CSXT's PSR plan involved cutting a large number of jobs across its system. By July, the Board had taken a number of actions in response to the service problems resulting from CSXT's ongoing implementation of this new operating plan. The Board began closely monitoring CSXT's performance, including requesting that CSXT's senior management participate in weekly calls with the Board's Rail Customer and Public Assistance staff and that CSXT submit weekly specific service performance data to facilitate these calls.

On October 11, 2017, service on CSXT had become so unreliable that the Board ordered executive-level officials from CSXT to appear at a listening session at the STB to discuss their ongoing and future efforts to improve service and to provide an estimated timeline for recovery

[3] May 12, 2021 Letter from Chair DeFazio to U.S. Government Accountability Office, https://transportation.house.gov/news/press-releases/chairs-defazio-and-payne-jr-request-gao-study-on-the-impacts-of-precision-scheduled-railroading-on-workers-safety-and-shippers

of normal service levels. The Board also asked impacted shippers to appear at the public listening session to discuss their service concerns and comment on the railroad's service recovery efforts.

On March 18, 2018, STB Chairman Ann Begeman individually wrote the Class I railroads about service issues across the US rail system. She stated that the Board had been closely monitoring freight rail service across the US and had become increasingly concerned about its overall state based on the weekly data collected under 49 C.F.R. pt. 1250. The data was indicating that service was deteriorating based on decreasing system average train speeds and increasing terminal dwell time. Other key metrics were also trending in a negative direction. The STB began holding weekly calls with the railroads and asked them to provide certain information with respect to their rail service.

Despite these monumental service issues on CSXT, most of the other Class I railroads, who were not already operating under PSR, also adopted this rail operating plan, including Norfolk Southern Railway ("NSR") in July 2019, Kansas City Southern Railway in January 2019, and Union Pacific Railroad ("UP") in October 2018. These changes led to further disruptions across the US rail network. Massive job cuts, like on CSXT, occurred on NS and UP as part of this plan, leading many to believe that any uptick in the need for rail service would leave them woefully unprepared. This eventually proved to be the case.

On August 24, 2020, the STB Chairman, as well as the Federal Railroad Administration Administrator, wrote the Class I railroads about both of their rail service concerns. These leaders of the rail regulatory agencies explained that they had been made aware of service issues, including missed industrial switches and excessively late or annulled trains due to crew availability issues. They noted that with both increasing intermodal and carload volumes and a

projected robust harvest fast approaching, railroad employee availability, together with sufficient equipment resourcing, was essential for safe, fluid rail service in support of the nation's economic recovery from COVID-19. Given the challenges related to changing demand patterns and operating conditions, they stated that increased communication and transparency with rail shippers had become especially important to ensure they have the information needed to plan their businesses and meet their own customers' needs. They emphasized that it was their expectation that there would be heightened emphasis on improving employee availability, equipment resources, and robust communication to quickly resolve service issues as they arose and to prevent them from becoming widespread. The Class I railroads did not heed this warning as service issues became more rampant.

On May 27, 2021, the new Chairman of the STB, Martin Oberman, also felt compelled to write to the Class I railroads again about rail service issues. He explained that the Board had received concerning reports from a meaningful number of rail customers of subpar performance, including missed switches, railcars delayed at intermediate yards or interchanges, extended out-of-route movements, and prolonged dwell at origin for some unit train traffic. Additionally, he noted that the STB had been made aware of instances of significant congestion at various intermodal facilities, which has resulted in delayed train arrivals and disruptions to container availability. He recognized that these rail service challenges, at least to some extent, had been related to workforce reductions resulting from COVID-19 cases, quarantines, and furloughs based on the temporary decline in demand and the resultant adjustments made by railroads in nearly every facet of their businesses. **But he also expressed his concern about the extent to which these service issues may be related to or exacerbated by a broader trend of rail labor reductions that have been occurring over the past several years. He stated that a lack of**

personnel, including reserve personnel, has made it more difficult to scale-up operations to respond to increases in demand and to maintain reliable service in the face of unanticipated external events that disrupt ordinary operations or business expectations. He said labor shortages could also delay or prolong the recovery period when such network disruptions inevitably occur.

As stated in previous STB letters, he said it is vital that freight railroads continue frequent, proactive communication with the Board and customers on their ability to meet demands for service as the economy recovers from the pandemic. He requested an updated and detailed description of the railroads' preparedness to meet anticipated future demand, including (1) the availability of train crew, yard, and maintenance employees (active, reserve, and furloughed workers) and their plans and time frames for employees to return to work and any re-training, if necessary, and (2) the availability of equipment resources (active and short-term / long-term stored locomotives and rail cars). **As part of this update, he specifically requested that the railroads also address whether they have any long-term plans, including their hiring plans for 2021 and 2022, to reverse any of the diminishing workforce levels which have resulted from their strategies in recent years.** He also asked them to identify any regions of their networks where they were experiencing or anticipating workforce challenges, and their plans to overcome these challenges.

Shortly thereafter, on July 22, 2021, STB Chairman Oberman again wrote the Class I railroads about significant disruptions within the international intermodal supply chain that involve the freight rail network. He stated that he was particularly concerned about significant increases in container congestion at key U.S. terminals, and substantial charges being levied by the railroads for container storage at these terminals. Specifically, in recent months, he asserted

that the Board had received numerous reports related to the length of time that containers were being held in rail yards, and the sizeable storage fees some customers had been required to pay in order to obtain release of containers bearing their shipments. He said that he was particularly troubled about reports that Class I railroads were continuing to impose these charges even in circumstances when the receivers, as a practical matter, had no means to facilitate the release of their containers. Under these circumstances, he noted that demurrage fails to provide any constructive incentives, and perversely results in massive charges that can exceed the commercial value of the shipment. In order to better understand the magnitude of the current container congestion and the framework for the associated demurrage fees, he asked for information from each of the Class I railroads regarding policies and practices with respect to the assessment of demurrage fees on intermodal containers.

On October 18, 2021, Chairman Oberman focused on service issues on CSXT which again caused great concern to the Board, thereby precipitating a letter to the carrier seeking rail service performance information. He stated his reason for this information request was that over the past several months, the Board had continued to receive a steady stream of complaints about the adequacy of rail service provided by CSXT. In both private meetings and public settings, he said CSXT customers have relayed examples of substandard performance, including missed switches, extended transit times for both manifest and bulk shipments, unfilled car orders, and the inability to contact customer service and operating personnel. He stated that customers have also reported that service problems are sometimes resolved, only to recur weeks or months later. Taken together, he noted these complaints were of grave concern as it appeared that CSXT resources were surged to assist one customer, only to have problems arise with another. And, as a result of these problems, he explained that customers incurred premium freight costs, idled

production, lost sales and damaged commercial relationships, typically without meaningful recourse from CSXT. In addition to anecdotal incidents, he noted CSXT's rail service performance data reported under STB Docket No. EP 724 tended to support that CSXT's network was underperforming compared to the benchmarks set in 2019. **He also noted that CSXT has approximately 1,000 fewer "transportation" employees for August 2021 compared to August 2019 (6,577 versus 7,543), as reported on STB Form C.**

This was followed with a similar letter to NS on November 23, 2021, emphasizing the railroad's deteriorating key operating metrics reported pursuant to EP 724. **He compared these numbers with the fact that NSR's number of "transportation" employees had continued to decline over the prior three months (8,281, 8,269, and 8,207, respectively), as reported on STB Form C.** Coinciding with the marked deterioration in NSR's performance metrics, he said the Board had received an increasing number of complaints from NSR's customers about poor performance, including missed switches, cars stranded at intermediate yards, longer transit times, operating plan changes without notice, and a lack of communication from customer service**. For these reasons, he requested that NSR provide the Board with a review of the current state of its network, and assessment of what factors are affecting NSR's ability to achieve past levels of fluidity and consistent service, and in particular the impact on customer service of previous headcount reductions for train, yard, and maintenance employees. He noted it would be most helpful if NSR could provide this review as a follow up to its June 18, 2021, letter, in which a "program of targeted hiring" to meet workforce needs, referenced measures to attract and retain operating employees was outlined. In light of the declining employee headcount since June as shown by the data supplied to the STB, he asserted this**

program does not appear to have succeeded in obtaining a workforce level sufficient to avoid the service challenges described above.

As some of these STB communications seem to express, this massive decline in rail service since 2017 can clearly be tied to the use of PSR across the US rail network and the resulting job cuts that made the railroads incapable of providing adequate service and handling upticks in the need for service. CSX had 23,988 total employees and 9262 train and engine service employees in February 2017. CSX had 17,250 total employees and 6795 train and engine service employees in December 2021. UP had 44,652 total employees and 18,612 train and engine service employees in October 2018. UP had 32,494 total employees and 14,079 train and engine service employees in December 2021. NS had 24,594 total employees and 10,243 train and engine service employees in July 2019. NS had 18,011 total employees and 7521 train and engine service employees in December 2021. (These numbers were obtained from the STB Form C information on the STB website.) Job cuts of this magnitude can only result in one outcome which is poor service as the above-recounted facts clearly demonstrate.

Moreover, the operating ratios for these railroads continue to decline. UP has gone from an operating ratio of 63.7% in 2016 to 57.2 in 2021. CSX has gone from 69.2% in 2016 to 56.3% in 2021. NS has gone from 69.6% in 2016 to 60.1% in 2021.

While service has declined, rail rates have continued to rise. In a recent report published by the Rail Customer Coalition[4], evidence of skyrocketing rates and less competitive traffic is clear. The report finds:

[4] Escalation Consultants, "*Economic Analysis: Consolidation and Increasing Freight Rail Rates*," June 2021. https://www.freightrailreform.com/new-report-finds-rail-customers-paying-a-steep-price-for-consolidation-and-dwindling-competition/

- From 2004 to 2019, **real rates (adjusted for inflation) for all rail shippers increased 43%.**
- During the same period, real **railroad costs rose only 8%.**
- Rates for the largest U.S. railroads have jumped **more than twice as fast as inflation and rates for long-haul trucking**.
- **For major commodity groups, revenue from potentially non-competitive rates increased 230%**, while revenue from competitive rates increased only 24%.
- **In 2019, half of railroad revenue was generated from potentially non-competitive rates**, up from 27% in 2004.
- For significantly impacted sectors and commodities, the share of total rail revenue derived from non-competitive rates increased as follows**:**

Agriculture

Commodity	2004	2019
Food Products	15%	39%
Farm Products	34%	56%

Building & Construction

Commodity	2004	2019
Wood Products	8%	31%
Metal Products	17%	45%
Stone & Glass Products	36%	64%

Transportation & Infrastructure

Commodity	2004	2019
Transportation Equipment	13%	33%

- In a troubling indicator of the railroads' ever-growing market dominance and pricing power, **the average revenue-to-variable-cost (RVC) ratio increased from 135% to 167% for shipments of these commodities.**

Id.

Obviously, the implementation of PSR by the railroads since 2016 has made the need for these proposed rules more evident. In fact, before BNSF Executive Chairman Matt Rose retired, he predicted that "PSR, reducing service, and demarketing some types of traffic in pursuit of

higher profits" would result in increased scrutiny by the STB. He stated that railroads "have this common carrier obligation to provide freight service to all customers in all markets. And what we're doing in PSR is redefining what we're willing to accept in the freight railroad industry on certain lanes. And I really do believe we're going to get in a lot of trouble by doing that." He added that "[w]hen you start redefining markets, I think the federal policy makers will look at this, and quite frankly, they will not be happy with us."[5]

As Chairman Oberman recently noted, "railroads' emphasis has not been on growth. Rather, the emphasis has been on cutting in pursuit of the almighty [operating ratio] down to below 60%." He added that '[i]t is clear that as a whole, railroads have foregone many kinds of carloads that they could carry profitably, only not at O.R.s as low as 55%, and instead have focused on only the most profitable traffic. No one is asking the railroads to focus on traffic that would only be carried at a loss. But surely it is not asking too much for railroads to actively seek profitable traffic, even if not as profitable as others."[6]

In other words, PSR railroads have resorted to only choosing rail traffic which fits within the PSR model to continue to drive down operating ratios. This practice leaves certain rail shippers out in the cold even though rail is their best transportation option. This practice is even more disruptive today when truck capacity due to a shortage of drivers is extremely limited. As a result, some rail shippers have nowhere to turn.

---

[5] Trains, *Analysis: Former BNSF Executive Matt Rose's Warning Comes True,* July 22, 2021. https://www.trains.com/trn/news-reviews/news-wire/former-bnsf-executive-matt-roses-2019-warning-comes-true/

[6] Trains, *Top Regulator Urges Railroads to Focus on Growth,* September 9, 2021. https://www.trains.com/trn/news-reviews/news-wire/top-regulator-urges-railroads-to-focus-on-growth/

The effects of this new rail operating strategy have devastated the rail workforce and resulted in correspondingly poor rail service and sometimes no service at all. While the railroads will assumedly argue that the pandemic is the cause of their service issues over the last two years, this claim is obviously only a part of the story. PRFBA does not dispute that the pandemic has had a historic impact on the world's supply chain. However, the railroads by slashing jobs have directly caused the situation to be much worse by making them incapable of adjusting to upticks in the need for rail service. As a result, many rail shippers, especially captive ones, have suffered from plant shutdowns and slowdowns and other adverse impacts that have damaged their businesses despite paying higher and higher rates. These shippers have little recourse except through informal channels to hold these railroads accountable for the harms they suffer at the hands of the railroads. If the new proposed rules are adopted by the Board, some rail shippers would finally have a path to remedy some of these problems. In sum, there never has been a time since the enactment of Staggers where Congress's intent to introduce competition through reciprocal switching was more needed.

2. Increased Use of Reciprocal Switching Arrangements Will Lead to Increased Revenues for the Class I Railroads.

Railroads claim that reciprocal switching will not allow them to properly invest in their infrastructure and would deter them from investing where reciprocal switching allowed another carrier access to its captive customers. An alternative speculation is that new rail shippers and an overall increase in contribution to overhead could be attracted with the prospect of competitive linehaul service and stable switching service, both of which are promulgated by reciprocal switching. In other words, railroads could be the financial beneficiaries from reciprocal

switching because it may make rail more attractive to shippers who can get better rates and service due to the new competition.

As discussed in the previous section, railroads have slashed jobs and expenses under the guise of PSR. Continuing down this path will eventually lead to the complete destruction of rail service in the US. In other words, cutting expenses can only go so far. At some point, railroads will have to begin to look to other ways to impress Wall Street besides cost cutting because there will be nothing left to cut. The only other way to do this would be to increase revenues. Despite the railroads total opposition to any change to the reciprocal switching remedy as proposed in this proceeding, this view is shortsighted when one considers the benefits of reciprocal switching to an industry that has recently lost one of its main sources of revenue in coal.

Railroads like to emphasize how capital intensive its industry is and how much money it invests in its infrastructure. This claim is certainly a main talking point by the railroads and undisputedly warrants careful examination because proper investment in the rail network is essential to provide this crucial service to the nation. However, concerning the general state of capital investment by Class I railroads, capital investment claimed by the seven Class I railroads during the decade 2010-to-2019 is approximately $152.1 billion, $26.6 billion of which represents the portion of those capital expenditures that was discretionary and spent in order to increase the railroad's rate of return, where the $125.5 billion difference is comprised of non-discretionary items that would not increase the railroad's rate of return and would not be classified as capital expenditures in other industries[7]:

- $85.4 billion spent on track and bridges, primarily replacements in kind;

[7] Comments of Rail Cents Enterprises, Inc., EP 711 (Sub-No. 1), at 6 (filed February 1, 2022).

- $30.9 billion spent on locomotives and freight cars, again almost entirely replacements in kind, where locomotives were not new Tier 4 environmentally compliant, but re-built lower Tier motive power and where locomotive work, as measured by gross ton-miles of freight moved, was flat[8] during the decade, and where replaced cars did not keep up with retired cars—railroad-controlled car fleets decreasing 24% from 2010 to 2019[9]; and
- $9.2 billion spent on Positive Train Control, a safety technology mandated by Congress in 2008,

Id.

While these numbers touted by the railroads appear impressive on their face, they are not as substantial as claimed. The question then becomes what are the railroads doing with all the monies that they are earning from these massive cuts in expenses. Distributions to shareholders by the seven Class I railroads during the same decade, 2010-to-2019, was approximately $164.2 billion. That is, the Class I's returned over six times[10] as much money to shareholders during the decade before the Covid-19 crises as they spent on projects to increase their rates of return. *Id.* "Implication: senior management at the Class I's has had great difficulty in finding investments with returns in excess of their cost of capital, hinting that a new strategy based on carload traffic growth could open up new vistas of franchise growth." *Id.* Reciprocal switching could make this strategy more obtainable by introducing competition, thereby creating better service and lower rates.

[8] Freight ton-miles moved by the seven Class I's was basically flat from 2010 (2.21 trillion) to 2019 (2.29 trillion).
[9] Freight cars owned and leased by Class I's decreased 24% from 461,849 in 2010 to 351,032 in 2019.
[10] $164.2 billion divided by $26.6 billion is 6.2, which changes very little (to 6.1) if all numbers for the decade are converted into constant dollars in order to erase the effects of inflation.

Railroads have been accused of demarketing certain types of traffic as discussed in the previous section, since the advent of the PSR revolution, that do not fit within this model. Many shippers have sought new rail service or sought to continue rail service only to have the railroads express little interest in their business. Railroads can easily deter shippers from using rail by quoting extremely high rates or offering limited service. While railroads know that rates are required to be reasonable by statute, they also know that the STB rate case process provides little hope to the shippers who would like to challenge these rates as the Board has admitted in recent proceedings. Therefore, if rail traffic does not fit within the PSR model, railroads can easily sidestep their common carrier obligation by offering these unreasonable take it or leave it rates to shippers.

However, at some point, railroads will have to change their shortsighted path in order to make Wall Street happy by increasing revenues as this present strategy is unsustainable in the long run. An increase in reciprocal switching could help to make this inevitable path more of a reality. For example, railroads may only provide a shipper facility with three days of switching service per week. However, the shipper may want to increase the number of days of service to move more of its product by rail. If an interchange with another railroad is within a reasonable distance, that competing railroad could fill in that void and provide service on those additional days. The result would be more rail business. Moreover, by offering more competitive rates, railroads could obtain more business that presently moves by other modes of transportation.

With the recent loss of revenue from the large decrease in coal traffic, Class I railroads will have to turn to new markets to increase revenue. That market could easily be carload traffic. As a result, while this proposed change to the reciprocal switching rules may be strongly opposed by

the rail industry now, it may eventually lead to increases in business brought on my better rates and improved service, thereby making this a win-win situation for all involved.

3. During this Historic Disruption of the Global and U.S. Supply Chains Brought on by the Pandemic, the Need for More Efficient and Flexible Rail Service Has Never Been More Evident which these Proposed Rules Will Allow to Happen.

As the Board is aware, the global supply chain has been completely disrupted by the pandemic that has changed the world as we know it over the last two years. This supply chain crisis has wreaked havoc across all forms of transportation including maritime, trucking, and rail. The unpredictability of the demand for goods and the workforce supply, among other things, has brought on events in the supply chain never seen in the past. Unfortunately, there is no certain time when this disruptive situation will end.

Obviously, railroads are crucial to the supply chain in the U.S. and North America. An efficient rail system is extremely important now to help solve these supply chain issues. However, with the pandemic and corresponding difficulties in keeping the workforce fully staffed brought on by devastating illness and quarantine requirements across the U.S., the railroads have had an extremely difficult time providing adequate service to rail shippers in dire need of their services during these unprecedented times. These workforce difficulties were compounded by the large job cuts described above that made the railroads woefully unprepared for these challenges brought on by the pandemic. Moreover, the railroads seemed reluctant to bring back workers as the numbers quoted by Chairman Oberman in his letters to CSX and NS last year demonstrate.

Reciprocal switching could certainly be a cure for some of these troubles when a railroad is understaffed and cannot adequately provide service to its customers. First, when an incumbent railroad serving a captive shipper is not prepared for a surge in business due to job cuts, a

competing railroad with a nearby interchange may have the resources to provide this service. The proposed new rules could allow the captive shipper to obtain this service through a reciprocal switching arrangement. At present, it is highly unlikely that the incumbent would allow the competing railroad access to its captive customer. As a result, the captive customer would have no other choice but to rely on the unprepared railroad and receive inadequate service.

Second, in some instances, the incumbent railroad may not have access to the most efficient rail route for its captive customer. Therefore, when rail service crises occur, the captive shipper would be required to rely on the incumbent carrier's less efficient route even though a competing railroad with a nearby interchange can provide better service. The inefficiency of this result would only be compounded if the incumbent railroad was suffering from service issues across its network brought on by its unpreparedness for a surge in business.

While railroads do at times have a difficult balancing act when trying to determine the resources they need to be prepared for changes in business, examples of major rail service problems have been common over the last decade despite the financial health of the industry. In 2013 and 2014, the rail network struggled mightily with the upsurge in business in North Dakota brought on by fracking and crude by rail. *See United States Rail Service Issues, et al,* EP 724 (STB served Aug. 18, 2014). These issues became even worse with poor weather in Chicago and a strong harvest that had to compete for service with the crude oil traffic. *Id.* As noted, CSX had severe service problems as it implemented PSR on its network in 2017 which continue to this day. *See Public Listening Session Regarding CSX Transportation, Inc.'s Rail Service Issues, et al,* EP 742 (STB served Aug. 24, 2017). The implementation of the proposed rules might not have been able to eliminate all these issues over the years, but it certainly could have helped in

certain situations by allowing rail customers to use a better prepared or suited railroad that might not have been available because of the lack of this competitive access remedy.

Generally, the implementation of these proposed rules will make the rail network more efficient by allowing captive shippers within a reasonable distance of a competing railroad to obtain better routes or better service as discussed above. It also would create competition which would require railroads to provide better service to rail shippers or risk losing business. There never has been a time since the passage of Staggers that this remedy has been more needed. The railroads have decided to implement PSR and make cuts to their workforces and other needs that have generally left them unprepared to provide adequate rail service. The railroads have not been responsive to the Board's inquiries and warnings about their hiring issues. As a result, rail shippers have suffered from poor service resulting in plant shutdowns and slowdowns on an unprecedented basis. This use of reciprocal switching on an increased basis will make the rail system more efficient and hopefully compel the railroads to provide better service and to be more prepared by introducing more competition into the rail industry.

PRFBA TESTIMONY PROVIDING SPECIFIC EXAMPLES OF RECENT INCREASE IN NEED FOR THE PROPOSED RULES

As noted, PRFBA members are major food and beverage companies that rely on rail service to feed the world. Without adequate rail service, these companies will not be able to get their products to their customers. Since 2017 with the advent of PSR across the US rail system, PRFBA members have noticed a greater need and reason for the proposed rules on reciprocal switching because their rail service has become much more unreliable, and the railroads seem less responsive to their needs. Members have suffered from plant shutdowns, more inefficient routes, and outrageous price increases unrelated to the actual cost of shipping the goods.

For example, KraftHeinz has a facility in North Florida that is single served by a Class I railroad with another Class I railroad nearby. The railroad was unable to serve this facility adequately causing it to shut down production on at least one occasion which prevented KraftHeinz from meeting its production-scheduled demands. If reciprocal switching had been a possibility, it likely would have been able to prevent its plant from being shut down by using the other nearby Class I railroad.

Moreover, another member was recently given a proposal by its Class I railroad to increase one of its rates. This increase would have resulted in a revenue to variable cost of over 600% for this captive route. When asked what the reason for the rate increase was, the railroad told this member that it was because a competing railroad had won the member's rail business for certain unrelated competitive traffic in a bidding contest for the work with this railroad. As a result, the railroad said it was raising this member's rate in response.

Also, this same member is captive at another one of its production facilities and was looking to grow its rail shipments. At one time in the discussions with its railroad, two railroads came together for a competitive rate compared to truck (before the current market conditions). Then, the discussion shifted to the railroad that serves the origin taking the loads the entire movement. This increased the rate, mileage, and transit time. If reciprocal switching would have been an option, this member would have gotten a lower rate and better transit times. This member also had an opportunity on this given lane to share a carpool with another shipper who had empty cars going back that this member could have filled, but this shipper wanted to keep its cars on another rail line that did not switch this member's facility. Thus, this member had to source more railcars which increased costs and stunted rail growth despite a plan for rail expansion.

In other words, the examples of where the proposed rules for member companies would help to eliminate adverse service situations, make routes more efficient, and deter unreasonable rate increases are many. Unfortunately, this need for the proposed rules has become more and more vital to PRFBA members' use of rail since 2017 because of the adoption of PSR by more railroads. Without these proposed rules, members will continue to suffer from unreliable service and other difficulties that captive rail shippers must endure at present. Without this change, PRFBA members will move away from rail more and more.

CONCLUSION

Based on the foregoing discussion, PRFBA strongly urges the Board to adopt the proposed rules for reciprocal switching. The case for the implementation of these rules has never been stronger than now.

Respectfully submitted,

/s/ Daniel R. Elliott

HEARING ON REVENUE ADEQUACY

STB Docket EP 722

RAILROAD REVENUE ADEQUACY

SUPPLEMENTAL SUBMISSION OF THE NATIONAL GRAIN AND FEED ASSOCIATION

On December 12-13, 2019, the Surface Transportation Board ("Board," "STB" or "Agency) conducted a public hearing in these proceedings. Representatives of the National Grain and Feed Association ("NGFA") appeared and provided testimony on December 13, 2019. On December 16, 2019, the Board served a Decision that held the hearing record open until February 13, 2020 to allow hearing participants to supplement their oral testimony. Pursuant to that Decision, the NGFA hereby supplements its oral testimony to address certain issues and questions that arose during the hearing.

A. The Legal Viability of the Revenue-Adequacy Constraint

The Notice of Hearing issued on September 12, 2019 stated that the hearing's purpose was to receive public input on several recommendations made by the Rail Rate Reform Task Force ("RRTF") on how to incorporate a railroad's revenue-adequate status into maximum reasonable rate determinations. Devising ways to take a railroads' revenue-adequate status into account when determining maximum reasonable rates is not new. Such efforts have been part of the statutory directives to the Interstate Commerce Commission ("ICC") and the Board's charge for more than 40 years. *See, e.g., Standards and Procedures for the Establishment of Adequate Railroad Revenues*, 358 I.C.C. 844 (1978)("*Standards*"). In *Standards*, the ICC adopted standards and procedures for implementing Section 15a(4) of the Interstate Commerce Act, the predecessor to 49 U.S.C. §10704. In contemplating the overall purpose of the annual revenue-adequacy determination it was directed to make for Class I railroads, the ICC concluded that while this statute focused attention on the criteria for determining revenue adequacy, "it is evident that more than a mere determination is contemplated." *Id*. at 847. Moreover,

> it is clear that Congress did not intend for our mandate to be simply one of promoting railroad revenues. *Consideration of shipper and public interests requires that revenue adequacy be taken not only as a goal but also a limitation*. *In other words, to the extent possible, we are to assist railroads in attaining revenue adequacy, and to protect the public from having to provide revenues that exceed an adequate level*. *Id.* at 848 (emphasis added).

On the question of how to factor a railroad's revenue adequacy into an individual rate proceeding, railroad parties participating in *Standards* recognized that Section 15a(4) created some type of cap on railroad revenues. The ICC summarized its contention to be "that a specific increase proposed by an individual railroad should be approved so long as that railroad's overall revenue does not exceed an adequate level." *Id*. at 853. The ICC

concluded in *Standards* that "revenue adequacy should be a consideration in individual rate proceedings," *id*. and "[a] proponent carrier's revenue adequacy status can and should influence the determination as to how high its rate for a particular service may be reasonably set." *Id*. at 854. Thus, the ICC clearly concluded that a railroad's revenue-adequate status limited the extent to which it could increase its rates. This statutory interpretation in *Standards* was not judicially challenged by any Class I railroad.

The ICC carried over its interpretation of Section 15a(4) when its language was folded into the Staggers Rail Act of 1980 (Staggers Act) and became 49 U.S.C. §10704(a). First, the ICC modified its formula for determining revenue adequacy in *Standards* without modifying or retracting any of its statements regarding how a railroad's revenue-adequate status would constrain its ability to raise its rates. *Standards for Railroad Revenue Adequacy*, 364 I.C.C. 803 (1981). Soon thereafter, the ICC promulgated *Coal Rate Guidelines Nationwide*, 1 I.C.C. 520 (1985), in which the ICC reaffirmed its interpretation of the statutory language, stating:

> Our revenue adequacy standard represents a reasonable level of profitability for a healthy carrier. It fairly rewards the rail company's investors and assures shippers that the carrier will be able to meet their service needs for the long term. Carriers do not need greater revenues than this standard permits, and we believe that, in a regulated setting, they are not entitled to any higher revenues. Therefore, the logical first constraint on a carrier's pricing is that its rates not be designed to earn greater revenues than needed to achieve and maintain this "revenue adequacy" level. In other words, captive shippers should not be required to continue to pay differentially higher rates than other shippers when some or all of that differential is no longer necessary to ensure a financially sound carrier capable of meeting its current and future service needs. *Id*. at 535-36.

The ICC further clarified that "A railroad seeking to earn revenues that would provide it, over the long term, a return on investment above the cost of capital would have to demonstrate with particularity: (1) a need for the higher revenues; (2) the harm it would suffer if it could not collect them; and (3) why the captive shippers should provide them." *Id*. at footnote 36. Elsewhere in

Coal Rate Guidelines, the ICC stated, "the revenue adequacy constraint is a limit on the total revenues a carrier can collect." *Id*. at 547.

The revenue-adequacy constraint in *Coal Rate Guidelines* was affirmed explicitly by the U.S. Court of Appeals for the Third Circuit in 1987. *Consolidated Rail Corp. v. U.S.*, 812 F.2d 1444 (3rd Cir. 1987). In that case, in which both railroads and shippers participated, the court held that the four constraints in the Final Guidelines were consistent with the 4R Act and the Staggers Act. As to the revenue-adequacy constraint specifically, the court stated that *"[b]y imposing revenue adequacy as a ceiling*, the ICC intends to ensure that a captive shipper will 'not be required to continue to pay differentially higher rates than other shippers when some or all of that differential is no longer necessary to ensure a financially sound carrier capable of meeting the current and future service needs." *Id*. at 1450 (emphasis supplied), *Citing* 1 ICC 2d 520, 535-46. The court also said that the revenue-adequacy constraint and the other three constraints in *Coal Rate Guidelines* are "designed to protect captive shippers from paying rates that are unnecessary to achieve revenue adequacy and which reflect inefficiencies." *Id*. at 1444. The revenue-adequacy constraint, although seldom used, subsequently has been part of the Board's rate reasonableness rules and policies for more than 35 years.

Notwithstanding this long, clear line of agency and court precedent (and the lack of any railroad formally challenging the legality of the agency's statutory interpretation) the Association of American Railroads (AAR) inexplicably alleged during the hearing proceeding that the revenue-adequacy constraint somehow "came out of the blue and was untethered from the statute, prior precedent, sound economic concepts or support of commentators…." Comments of the AAR at 33. This collateral attack on the legality of the revenue-adequacy constraint in this proceeding is utterly meritless.

B. Economic Profit Under §10704

One issue that arose during the hearing proceeding involved the question of how to define the term "economic profit" in 49 U.S.C. §10704(a)(2), which states in relevant part that railroads are entitled to earn a "reasonable and economic profit or return (or both) on capital employed in the business." Economic profit typically is defined as the profitability measurement that calculates the amount that revenues exceed the opportunity costs a company experiences from using resources to make and sell these products. Opportunity cost is the cost of an opportunity foregone, *i.e.*, given up so as to pursue another one. Consequently, economic profit is excess money a company earned from one course of action over another had it chosen differently. When the opportunity costs exceed the revenues received, then the outcome is economic loss. Economic profit is different than "accounting profit," which simply measures the difference between revenues and costs of production, without taking into account opportunity costs. Notwithstanding the foregoing, the AAR in this proceeding asserts "Economic profit equals ROI minus COC." AAR Comments at 17, note 17.

There appears to be a dearth of legislative history explaining the meaning of "economic profit" in §10704(a)(2). Nevertheless, the railroads' view of the provision immediately after passage of the Staggers Act is instructive. For example, in 1987 an amendment was proposed by shipper interests to delete the term "economic profit" from §10704. In Congressional testimony opposing the amendment, the then-President of the AAR stated:

> The statutory requirement that an adequate revenue for railroads include "a reasonable and economic profit or return (or both) on capital employed in the business" originated with the 4-R Act. The legislative history of that Act sheds no clear light on Congressional intent in employing the term. Economists use the term "economic profit" to refer to profits in excess of costs including returns to shareholders. The Congress would not intend that railroads generally be allowed excessive profits. It would be fair to infer, however, an intention to allow railroads like all other competitive industries to earn above normal profits (returns) in some

> years to compensate for years in which inadequate profits (returns) were realized. Such averaging would be necessary if the railroads were to earn adequate returns over the long run. The deletion of the phrase "economic profit" could be construed as an intentional action to prohibit such averaging.
>
> The word "economic" modified the word "return" as well as the word "profit." An "economic return" means, to an economist, a return equal to the cost of capital – and that is the standard the ICC has adopted.
>
> Upon deleting the words "and economic profit" the law would provide only for "a reasonable return." This change gives effect to the other amendments in this section of the bill (discussed below) which, in the aggregate, would preclude the railroads from every (sic) earning the cost of capital and which would, therefore, be a prescription for disinvestment in the railroad industry.

Rail Industry/Staggers Act Oversight: Hearings before the Senate Committee on Commerce, Science and Transportation, Subcommittee on Surface Transportation, June 9, 1987, at 521, Statement of William H. Dempsey, President, Association of American Railroads.

The AAR's statement that "[e]conomists use the term 'economic profit' to refer to profits in excess of costs including returns to shareholders," is confirmation that in 1987, the AAR believed that economic profit included all profits in excess of costs, which included returns to shareholders and, it logically follows profits that are used to buy back shares of the company's stock. Moreover, the "profit-averaging" concept advanced by AAR may have had some facial appeal in the years immediately following passage of the Staggers Act when some railroads still were struggling financially. However, it has absolutely no application to the modern railroad industry, when comparable years of "inadequate profits" do not occur. Finally, the AAR's testimony confirmed that the AAR at that time interpreted "economic return" to mean a return equal to the railroad's cost of capital.

C. The Board Should Encourage Actual Competition to Establish Market-Based Rates – Role of Reciprocal Switching and Bottleneck Rules

1. The best way to account for railroad revenue adequacy in rate-setting is to create actual rail-to-rail competition

It is beyond dispute that the Staggers Act was enacted in large part to allow and encourage competition between railroads to establish rates and terms for service. This plainly is evident within the National Rail Transportation Policy, which unequivocally states that "In regulating the railroad industry, it is the policy of the United States Government…(1) to allow, to the maximum extent possible, competition and the demand for services to establish reasonable rates for transportation by rail." 49 U.S.C. §10101(1). *See also* §10101(4) (policy is to "ensure the development and continuation of a sound rail transportation system with effective competition among rail carriers and with other modes, to meet the needs of the public and the national defense"); §10101(5)("to ensure effective competition and coordination between rail carriers and other modes). Competition between railroads has been encouraged in areas such as rail construction under §10901, where the ICC and the STB have adopted longstanding policies that liberally approve rail buildouts and associated rail crossings to establish competition at captive shipper locations.[1]

In their written submissions and testimony in this proceeding, the Class I railroads assert that they exist in a market where their rates purportedly are set through vigorous competition. However, the carriers' claims of competition are not based on any evidence of actual head-to-head competition with other railroads. Instead "competition" is defined artificially by carriers in terms of whether the rates they charge are less than the 180 percent jurisdictional threshold under 49 U.S.C. §10707. For example, less than one-third of BNSF's traffic exceeds 180 percent of

[1] See e.g. Docket No. FD 36186, *Texas Railway Exchange – Construction and Operation Exemption – Galveston County, Tex* (served January 17, 2020); STB Finance Docket No. 34210, *Sunflower Rail Company – Construction and Operation Exemption – Finney County, KS* (served March 28, 2003)

variable costs. So, BNSF asserts, *ipso facto*, that the remainder of its rates are established via market-based competition.

The carriers' reliance on the jurisdictional threshold as a surrogate for the real competition envisioned by the framers of the Staggers Act is inaccurate, misleading and obscures the fact that there is very little actual, effective competition in the railroad industry any longer. The reality of the situation today is that carriers typically increase rates to the maximum extent they can. In other cases, carriers "demarket" rail movements they no longer wish to transport by either assessing exorbitant rates that make the movements economically uncompetitive, or imposing restrictive service terms and conditions that make rail unattractive to shippers or receivers (e.g., unilaterally shifting previous unit-train traffic to more costly and less-timely manifest service). These trends have become more prevalent under the so-called "precision scheduled railroad" operating model implemented by most Class I carriers.

Whenever the policy discussion turns to fulfilling the Staggers Act's policy and goal of allowing, "*to the maximum extent possible*, competition and the demand for services to establish reasonable rates for transportation," the railroads vehemently resist any attempts by the Board to increase the opportunities for Class I railroads to compete with one another and to gain market share. As noted by Vice Chairman Oberman in the hearing proceeding, "But it seems to be difficult for us – for the railroads to come in here and say 'let competition set the rates, but where there is a chance to have more competition, don't make us do it.' And I share (Board Chairman Ann Begeman's) sentiment, we've seen at least two concrete situations that I'm aware of where railroads, there's some evidence that they have a chance for competition and they are consciously avoiding it." Tr. At 343.

Typically heard Class I railroad laments of the horrors of actually competing for business with one another like other industries do on a daily basis are that if a railroad actually had to reduce its rates because of competition, this would (1) retard future investment in their system; and (2) create network "inefficiencies," which usually boils down to the inconvenience of altering operating plans to keep or seek new business. These laments are obviously time-worn by now[2], but they were repeated in this hearing proceeding. *See* Tr. At 310 (where a witness for Norfolk Southern Railway asserted that creating competition through either bottleneck rule changes or reciprocal switching would "introduce a level of inefficiency and risk into the system that's not present now. And both provide a disincentive to investment, a likelihood of causing congestion or other operational disruption."). The NGFA finds the Board's frustration with such positions both totally justified and encouraging, such as the comment of Chairman Begeman to a railroad representative at Tr. At 339 ("But I'm not hearing anything about the fact that you also could be receiving, you know, service, or you know, customers from the other bottleneck carriers that might want to be in the same situation where someone wants to go to you and leave them…it seems like it would be an opportunity should the carrier want to take it and, as Frank just said, and actually do some competition."), to which the response was, "the concern we have [presumably with actually competing] is that what may be good for one particular shipper is bad for the network.") *Id*. at 341. *See also id*. at 345, where the railroad representative stated that when faced with the choice of lowering a rate to keep traffic "I don't want to – if we lowered the rate because I want to avoid it, that means there's less chance of investment there, less new capacity, less solution for

[2] Such assertions have become a familiar refrain from the Class I railroads. Attached hereto are NGFA's reply comments in Docket No. EP 711 (Sub – No. 1), *Reciprocal Switching*, filed January 13, 2017, which responds to nearly identical arguments made by railroad parties in that proceeding

operational issues." The NGFA concurs with Vice Chairman Oberman's response, which was, "[y]ou are arguing for monopolistic pricing, so you could have more money. I mean you're either going to have competition set the rates or you're not." *Id.* at 346.

One of the salutary purposes of the public hearing was to explore whether the RRTF's proposals to suspend or overrule the "Bottleneck Rules" for Long-Term Revenue Adequate Railroads potentially would create opportunities for Class I railroads to compete for new business and market share. Also revisited as part of that general discussion were the policy implications and issues surrounding an effort by the Board to revise the rules and policies implementing 49 U.S.C. §11102(c), which state in part "The Board may require rail carriers to enter into reciprocal switching agreements, where it finds such agreements to be practicable and in the public interest, *or where such agreements are necessary to provide competitive rail service*." (emphasis supplied). Right on cue, the Class I railroads uniformly criticized the Board for even considering taking steps that would increase competition in the railroad industry and in part provide them with increased business opportunities and traffic volumes.

The notion that facilitating actual competition between railroads would be harmful and bad policy is not only contrary to the express language of the statute and its legislative history, it is patently absurd, particularly in today's duopolistic rail industry. The NGFA again strongly urges the Board to reject the Class I railroad's overwrought claims that requiring them to actually compete with each other in accordance with the clear intent of Congress in the Staggers Act would harm them and their systems. Hereafter, the NGFA provides additional comments on the bottleneck proposals and the reciprocal switching discussion.

2. **The Board has the authority to implement the RRTF proposal on bottleneck rules**.

The NGFA reiterates its support for the RRTF's proposal that so-called "bottleneck rule" protections should be suspended or overruled for railroads determined to be long-term revenue adequate. In doing so, the NGFA presumes the RRFT means that a bottleneck railroad that serves the same origin or destination as an alternative railroad would be required to provide a rate for transportation over its bottleneck segment without (1) the shipper having to make a case for "competitive access" under 49 CFR Part 1144 and applicable precedent, and (2) without having to first enter into a contract for the non-bottleneck portions of the overall movement. The latter point is helpful to agricultural shippers because many do not ship by contract. NGFA does not interpret the RRTF's recommendation to mean that shippers could pick and choose interchanges and routings as the AAR and other parties asserted during the hearing. The NGFA believes that the Board should remain the ultimate authority for such determinations under 49 U.S.C. §10742 and other applicable statutes.

The NGFA agrees there is no policy basis for erecting the barrier of the competitive-access rules to protect a long-term-revenue-adequate railroad's desire for long-haul revenues, and the Board clearly has discretionary authority to implement that recommendation. Carriers do not have a statutory absolute right to either the long haul or a short haul. Specifically, 49 U.S.C. §10705(a) provides that the STB must "give reasonable preference, subject to this subsection" to the carrier originating the traffic when prescribing a joint through route. In addition, the Board's obligations to uphold a railroad's routing preferences are qualified further by 49 U.S.C. §10705(a)(2)(A) – (C). Subparagraph (C) provides that the Board does not have to defer to a railroad's preference for its long haul if the Board "decides that the proposed through route is needed to provide adequate, and more efficient or economic, transportation." This provision gives the Board broad

discretion to allow competition between Class I railroads when a bottleneck railroad has been determined to be long-term revenue adequate. Indeed, 49 U.S.C. 10101(1) commands the Board to allow such competition "to the maximum extent possible." *See also* STB Docket NOR 42131, *Canexus Chemicals v. BNSF* (served February 8, 2012)(where the STB found in part that BNSF's preference for a particular route and interchange point with the Union Pacific Railway was unreasonable under §10705(a) and contrary to the public interest).

The Board also clearly has the discretionary administrative authority to amend its competitive access rules under 49 CFR Part 1144 and decide to terminate their application to bottleneck rate situations involving long-term-revenue-adequate railroads. The authority to change the competitive access rules administratively was briefed extensively by the NGFA and other parties in their submissions in Docket No. EP 711 (Sub-No.1), *Reciprocal Switching*, where the Board in 2017 proposed to overturn 30-year-old agency precedent and regulations implementing 49 U.S.C. §11102(c), which have stifled shippers' ability to obtain competitive rates through reciprocal switching from interchange points served by railroads other than their incumbent carrier.

Finally, the NGFA repeats below the three additional elements it believes would be appropriate for suspending the bottleneck rules as applied to shipments of agricultural products.

- First, in cases where the bottleneck railroad and alternative railroads regularly have utilized an interchange, there should be a rebuttable presumption that the interchange is physically and operationally feasible and safe. The railroad – not the shipper – should bear the burden to rebut this presumption.

- Second, suspending the bottleneck rules should not lead to a conclusion that "effective competition" is present for the non-bottleneck segments of through movements. Whether the bottleneck rate results in the competition the RRTF envisions actually occurs – or occurs at all – should be determined on a case-by-case basis pursuant to the Board's rules governing determinations of market dominance.

- Third, as noted previously by NGFA, to the extent a long-term-revenue-adequate railroad responds to a request for a rate over a bottleneck segment by establishing a charge to switch the trains of the alternative railroad, there should be clear standards that prevent such charges from becoming an economic barrier to using an alternative railroad. NGFA previously has suggested a rebuttable-presumption, cost-based approach that the railroad must justify if the switch charge is challenged.

Distilled to its essence, the railroads' collective objection to the RRTF's bottleneck recommendation is that they do not want to be put in a position of competing with another railroad to keep business they currently have from a captive rail shipper to which they can charge monopoly rates. This is flatly contrary to the statutory charge to the Board to allow rail-to-rail competition "*to the maximum extent possible*." The RRTF's proposals, on the other hand, are entirely consistent with the statutory directive.

3. The Board also has the authority to liberalize the reciprocal switching rules, which also may prove to be a very effective way to foster rail-to-rail competition

The railroads' reaction to the RRTF's bottleneck rule proposals is consistent with the theme the Class I railroads advanced in Docket No. EP 711 (Sub-No. 1), *Reciprocal Switching*, in which they objected strongly to the Board's proposal to reverse the onerous standards for permitting reciprocal switching pursuant to 49 U.S.C. §11102(c), an action that would have benefitted all Class I railroads by increasing their opportunities to compete for market share.

Amending the reciprocal switching rules remains a potentially effective way to increase competition in the railroad industry. As discussed in this hearing proceeding, there is an interplay between requiring a bottleneck railroad to short-haul itself under §10705 and §11102(c) because under §10705, the Board may require a bottleneck railroad to short-haul itself and permit competition with a non-bottleneck railroad by requiring the bottleneck railroad to provide

reciprocal switching pursuant to §11102(c). Thus, a reciprocal switching order under §11102 is an express exception to the statutory provisions that favor the railroads' preference for their long haul. The NGFA believes that amending the reciprocal switching rules to place more appropriate emphasis on implementing the congressional intent of directing railroads to enter into reciprocal switching agreements "where such agreements are necessary to provide competitive rail service" is warranted.

D. The NGFA Supports Rate Rules that Compare Rates if Properly Formulated and Procedurally Efficient

The NGFA continues to believe the Board's Three-Benchmark methodology could be improved to make it a more accessible, workable and cost-effective process for challenging unreasonable rail rates. For this reason, in its Opening and Reply Comments in the Final Offer Rate Review (FORR) proposed rule (EP 755), NGFA respectfully recommended that the Board not close the docket in *Expanding Access to Rate Relief*, EP 665 (Sub-No. 2), and instead continue work toward issuing final rules that modify its initial proposal in response to the comments received from NGFA and other stakeholders, as well as the recommendations of its RRTF. In particular, the NGFA supported the following recommendations made by the RRTF to improve the "smallest rate cases" methodology proposal in EP 665 (Sub-No. 2):

1. Allow the traffic comparison group to include similar traffic with R/VC ratios below 180 percent, so long as they exceed the carrier's RSAM figure;

2. Set the revenue need adjustment factor at 1 when the carrier is "long-term revenue adequate," as defined by the Board;

3. Eliminate the so-called "common-carrier adjustment," which was used in a single case with virtually no evidentiary support;

4. Eliminate the "revenue-per-ton-mile screen;"

5. Eliminate the "other-relevant-factors" component, which has been shown to be subject to abuse and litigation gamesmanship by defendant railroads;

6. Eliminate the confidence interval; and

7. Adopt more streamlined procedural rules and timelines.

As noted in its previous filings on the FORR rulemaking, the NGFA does not agree with the RRTF's recommendation to establish a $500,000 cap for relief for cases utilizing the three-benchmark methodology. This is far too low for reasons the NGFA has explained in its prior comments to that docket.

However, the NGFA continues to believe that rate review methodologies that utilize a rate-comparison approach, such as the Board's "smallest rate cases" proposal and the current Three-Benchmark Methodology (as modified by recommendations from the RRTF, NGFA and other stakeholders), can be useful and improve the process, and we encourage the Board to continue its efforts in this regard. NGFA's support for the comparison-traffic-based approach also is one reason it conditionally supported the Board's proposal to amend its Waybill Sample regulations to simplify and increase the sampling rates required to be reported by Class I railroads of non-intermodal carload shipments. The RRTF correctly has pointed out that this additional data would provide a greater number of potentially comparable movements and relevant comparability factors from which shippers could create comparison group proposals, thereby rectifying the paucity of data that currently too often exists.

E. The NGFA Continues to Believe Rate Disputes Could be Resolved Through its Arbitration Process

The NGFA continues to believe rate-related disputes between its member companies and rail carriers could be resolved successfully through the NGFA's Rail Arbitration System, which

has been in place since 1998 and has operated extremely well. In fact, there is nothing now preventing a shipper and railroad from arbitrating a rate dispute through NGFA, even though such arbitration currently is ***not*** compulsory under NGFA's Rail Arbitration Rules.

However, doing so requires a willing partner. Thus far, Class I carriers have rejected repeated approaches from NGFA to create a framework for compulsory arbitration of rate-related disputes. To its credit, the BNSF Railway approached NGFA on two occasions for exploratory discussions – first with NGFA's Executive Committee on January 12, 2015, and followed by an initial working discussion on October 27, 2016 between two BNSF executives with a delegation representing NGFA's Rail Shipper/Receiver Committee to explore potential approaches. However, no follow-up discussions have been conducted with BNSF after it indicated that agreement by one or more additional Class I carriers would be a prerequisite for its participation. Despite several approaches by NGFA to other Class I railroads since 2016, none has expressed a willingness to even explore such discussions, which NGFA attributes in large part to the current lack of an accessible, timely, workable and cost-effective rate-challenge process at the Board. Further, no Class I railroad yet has agreed to arbitrate a rate complaint involving an individual shipper through NGFA's system.

NGFA believes fervently in alternative-dispute resolution, including its own, which provide impartial, transparent, cost-effective and timely resolution of disputes, with decisions rendered by disinterested experts knowledgeable about the type of dispute involved in the case. Cases filed under NGFA's Rail Arbitration System are adjudicated by a panel of three arbitrators comprised of both rail carriers and rail users, with written decisions published and made available publicly, in which the arbitrators' names are listed to further enhance transparency and accountability.

NGFA believes strongly that having a streamlined, workable, timely and cost-effective rate-challenge process available through the Board – such as the proposed FORR and an updated and improved Three-Benchmark methodology along the lines NGFA has suggested – would be an important development to "incentivize" thus far recalcitrant Class I carriers to consider alternative dispute resolution as a means of resolving shipper-railroad disputes involving freight rail rates and other matters, including demurrage and accessorial practices that rail customers may believe are commercially unfair, commercially unachievable and non-reciprocal.

Conclusion

The NGFA appreciates the Board's willingness to provide an opportunity for stakeholders to provide supplemental comments following the public hearing, and thanks the Board in advance for its consideration of its comments.

Surface Transportation Board

Docket No. EP 738
Regulatory Reform Task Force
July 25, 2017

Written Statement of The Fertilizer Institute

The Fertilizer Institute ("TFI") submits these comments for the record of the July 25, 2017 Regulatory Reform Task Force ("RRTF") Listening Session announced in a decision served in this docket on June 20, 2017.

TFI represents the nation's fertilizer industry including producers, importers, retailers, wholesalers and companies that provide services to the fertilizer industry. TFI's members play a key role in producing and distributing vital crop nutrients, such as nitrogen, phosphorus and potassium, which facilitate the production of healthy and abundant supplies of food, fiber and fuel. Fertilizers make it possible for farmers to grow enough food to feed the world's more than 7 billion people. TFI members rely heavily upon rail transportation to produce fertilizers and transport them to farms. TFI's full-time staff, based in Washington, D.C., serves its members through legislative, educational, technical, and economic information and public communication programs.

TFI supports the RRTF mission to identify rules and practices that are burdensome, unnecessary, or outdated, and to recommend how they should be addressed. Through these comments, TFI brings to the RRTF's attention certain existing regulations that are outdated, unnecessary and burdensome, resulting in collateral burdens and consequences in other regulatory areas also within the Board's jurisdiction. Those rules pertain to reciprocal switching and rate regulation.

In EP 711, *Reciprocal Switching*, the Board is considering repealing and replacing its existing regulations for prescribing reciprocal switching. Those rules, currently codified at 49 C.F.R. Part 1144, were originally adopted in Ex Parte No. 445 (Sub-No. 1), *Intramodal Rail Competition*, 1 I.C.C. 2d 822 (1985), which was prior to most of the rail mergers that have consolidated the rail industry into eastern and western duopolies. Moreover, the Board has applied those rules to set an unattainable bar for obtaining reciprocal switching by requiring a showing that is equivalent to establishing a violation of the antitrust laws. *E.g., Midtec Paper Corp. v. Chicago and N.W. Transp. Co.*, 3 I.C.C. 2d 171 (1986). This unattainable bar allows rail carriers with relatively short distance origin or destination bottlenecks to foreclose existing competitive options over non-bottleneck portions of their routes. Due to industry consolidation, the distances over which such competition is foreclosed has grown vastly longer than they were in 1985.

Setting a reasonable and attainable standard for reciprocal switching by replacing the current rules, as proposed in EP 711, will have significant deregulatory effects. Currently, captive rail shippers with rate and/or service problems must rely upon Board regulation to address those problems. Such regulation involves the Board in prescribing rates and directing alternative rail service. These regulatory remedies themselves are expensive and difficult to

pursue in a timely and cost-effective manner, which effectively leaves most captive shippers without any remedies at all. Reciprocal switching would alleviate the need for regulation of rates and service at all by allowing competition in the marketplace to resolve those issues where such competition already exists but is foreclosed by the incumbent rail carrier's short distance bottleneck.

Even in situations where the need for regulation is not completely eliminated, reciprocal switching still can significantly reduce the scope of such regulation. For example, in the absence of reciprocal switching, a bottleneck origin rail carrier is entitled to its long haul. If the actual bottleneck distance is just 30 miles out of a 500 mile movement on that rail carrier, and competition exists for the remaining 470 miles, the Board still must regulate the rate over the entire 500 mile route to protect the captive shipper from market power. In contrast, reciprocal switching at the origin would reduce the need for rate regulation to just the 30 mile bottleneck segment, allowing competition to determine a rate for the other 470 miles.

Although reducing the burdens of the current reciprocal switching rules would have a substantial deregulatory effect, such action will not completely eliminate the need for regulation. The Board's existing standards for ensuring reasonable rail rates are particularly cumbersome, time-consuming and expensive. The heart of the problem is the Board's use of stand-alone costs ("SAC") to measure rate reasonableness, which requires a shipper to design, construct, and operate a hypothetical alternative to the incumbent's rail service. The SAC process was created 30 years ago for unit train coal traffic and a very different rail industry and marketplace. Moreover, the Board has required shippers to present SAC evidence for the incumbent's entire route instead of just the truly captive bottleneck segments, which often are much shorter. As a consequence of this burdensome process, many captive shippers are without a truly effective means to redress unreasonable rates.

TFI, therefore, urges the RRTF to consider how replacing the outdated and burdensome reciprocal switching rules with new rules that reflect today's rail markets can have a positive deregulatory impact simply by allowing competition to function where it already exists. In addition, TFI supports efforts to develop alternatives to SAC that better reflect today's rail markets and are less arcane, costly and lengthy.

STB Docket No. EP 722
Railroad Revenue Adequacy

WRITTEN SUBMISSION OF THE NATIONAL INDUSTRIAL TRANSPORTATION LEAGUE

The National Industrial Transportation League ("NITL" or "League") hereby submits its written submission on the revenue adequacy issues raised in the Notice of Public Hearing ("Notice") served by the Surface Transportation Board ("STB" or "Board") on September 12, 2019 in the above-noted proceedings.

The League represents a broad cross-section of American business, united in their need for reliable, efficient and competitive transportation services. Our rail members ship chemicals, petroleum, agricultural products, paper and forest products, and many other commodities using all modes of transportation, including rail. Our members have developed complex supply chains to support their operations. Efficient and competitive rail service, and fair rules and practices related to such service, are critical to maintaining the supply of goods required to meet the demand of American businesses and consumers and to compete effectively with producers around the world.

The Notice indicates that the Board will hold a public hearing on December 12, 2019 on revenue adequacy issues that were raised in the report issued by the Board's Rate Review Task Force ("RRTF"). The RRTF was established in January 2018 to recommend improvements to the existing rate review processes and to propose new rate review methodologies that would be more attuned to the realities of the current transportation world.[1] The RRTF's Report, issued to the Board on April 25, 2019, dealt with a variety of railroad rate review matters. Among them were matters dealing with railroad revenue adequacy, including proposals dealing with the definition of long-term railroad revenue adequacy; a proposed possible rate increase constraint; a proposed change to the Board's bottleneck rules; and a proposed change to the Board's Simplified Stand-Alone Cost Rules for revenue adequate carriers.[2]

In its September 12 Notice, the Board invited interested persons to provide input on the RRTF's recommendations regarding revenue adequacy. Based on the current financial strength of the freight rail industry, including the large number of Class I railroads who recently and currently have been determined by the Board to be revenue adequate, it is entirely appropriate for the Board to evaluate possible new rate review procedures that would apply to revenue adequate carriers. The League thanks the Board for issuing its Notice of Public Hearing and provides its written submission on each of the RRTF's revenue adequacy proposals below.

A. Definition of Long-Term Revenue Adequacy

In its Report, the RRTF noted that the Board has been directed by statute to assist rail carriers in achieving revenue adequacy, and is required to determine which rail carriers are earning adequate revenues.[3] The Report further noted that the Board's annual revenue adequacy

[1] RRTF Report, p. 1.

[2] RRTF Report, pp. 32-41.

[3] RRTF Report, p. 32.

determination is simply a one-year snapshot, and was never intended to identify whether rate relief was available under the long-term revenue adequacy constraint announced in *Coal Rate Guidelines.*[4] In that decision, the agency noted that revenue adequacy is a "long term" concept, not a single-year snapshot.

With this background, the RRTF indicated that the Board has never announced a working definition of what it means to be long-term revenue adequate, and stated that "the time is ripe for the Board to pronounce a working definition of long-term revenue adequacy. . . ."[5] The RRTF recommended that the Board measure long-term revenue adequacy "over the length of an entire business cycle," in order to include the negative effects of a recession. The Task Force's specific recommendation was to look at the "**shortest period of time, not less than five years, that includes both a year in which a recession began and a year that follows a year in which a recession began."**[6] The RRTF Report then set forth the long-term revenue adequacy status of each of the nation's Class I carriers for each relevant period per year from 2002 through 2017. The data set forth in the RRTF Report thus covered two recessionary periods in 2001 and 2008-2009.

The League believes that the long-term revenue adequacy standard recommended in the RRTF Report is extremely conservative, tending to emphasize the effects of recessions on the finances of the nation's rail carriers. The RRTF indeed concedes this point, noting that its recommendation "emphasize[s] the significance of recessions. . . ."[7] The RRTF methodology does this by requiring both the year in which a recession began and a year following a year in

[4] *Coal Rate Guideline, Nationwide*, 1 I.C.C.2d 520, 536 (1985), *aff'd sub nom. Consol. Rail Corp. v. United States*, 812 F.2d 1444 (3d Cir. 1987).

[5] RRTF Report, p. 33.

[6] *Id.* (emphasis in original).

[7] *Id.*, p. 35.

which a recession began to be included in the analysis (which second year could itself be part of the recessionary period, as it was in 2007-2008), and by focusing on the "shortest" period of time, not less than five years, in which those events occur. Use of the "shortest" period of time again emphasizes the effects of a recession on the finances of the nation's rail carriers by limiting the years considered. The RRTF indicates that these features will add a "confidence factor" that railroads will achieve and maintain long-term revenue adequacy by emphasizing the effect of recessions on the nation's rail carriers.[8] Therefore, if a rail carrier achieves long-term revenue adequacy under the RRTF's proposed definition, the Board can be certain that a rail carrier is financially sound over the long-term.

Particularly given the conservative nature of the recommended definition of long-term revenue adequacy, the figures in the RRTF Report for the long-term revenue adequacy status of each of the nation's Class I rail carriers are significant; indeed, eye-opening. Though the average cost of capital in each of these periods from 1998 to 2017 has remained fairly stable,[9] the average return on investment of all of the nation's Class I rail has climbed significantly over this period. UP's average long-term return over this nineteen-year period has more than doubled, from 6.56% to 13.01%. NS' and BNSF's average long-term return have increased by about 40% over this period. Even carriers that have not achieved long-term revenue adequacy under the RRTF's definition have seen a major increase in their returns: CP's average long-term return has doubled, and CSX's average long-term return has nearly doubled. Accordingly, the long-term revenue adequacy data included in the RRTF report fully supports the use of a variety of rate and market constraints on such carriers.

[8] *Id.*

[9] The average cost of capital in each revenue adequacy test period has ranged from a low of 10.23% (from 1999-2003) to a high of 11.22 % (in 2007-2013).

In addition, it is significant that, once a carrier has achieved long-term revenue adequacy even under the conservative definition proposed by the RRTF, the carrier remains long-term revenue adequate over time. Thus, NS achieved long-term revenue adequacy in 2006, and has remained long-term revenue adequate every single test period since then, through 2017, the most recent year for which data is available. UP and BNSF achieved long-term revenue adequacy in 2012 and 2013 respectively, and they also have maintained that status for every period since then.

The data in the RRTF Report thus indicates two things of major significance. First, the rail industry that the Board oversees in 2019 is night-and-day different from the rail industry that the Congress and the agency faced in 1980 at the time of the Staggers Act and even the industry existing at the time of the ICC Termination Act of 1995. Specifically, the freight rail industry has experienced a financial renaissance since that time and is currently very financially strong. Thus, it is entirely appropriate for the Board to develop new rate review rules that reflect the existing financial state of the Class I railroads, including the achievement by the vast majority of revenue adequacy. Second, the financial trends in the industry and the tendency for carriers to remain long-term revenue adequate after they have achieved that status, strongly indicates that the Board can place constraints on long-term revenue adequate carriers without fearing that the financial status of these carriers will be compromised.

B. Rate Increase Constraint

In its Report, the RRTF described a possible rate increase constraint (RIC) applicable to carriers that are long-term revenue adequate. The proposed constraint identifies the point at which the existing application of differential pricing is enough: carriers at or above that point would be forbidden from increasing non-contract, non-exempt rates by more than the rate of inflation. If a rate is below the threshold, a carrier could raise that rate to the threshold, but not

beyond. The RIC threshold would be determined by calculating an average annual real surplus beyond long-term revenue adequacy and that surplus would be allocated to various commodities. At that point, an increase in differential pricing beyond the RIC threshold would be subject to challenge. A shipper would have to file a complaint, prove that the railroad is market-dominant with respect to the challenged movement(s) and show that the issue movement is non-exempt and non-contract.[10] The rate increase constraint proposed by the RRTF would provide benefits to shippers and would not be unfair to carriers. Certainly, if a carrier is long-term revenue adequate and is market dominant as to a particular movement, there is no reason why that carrier should be permitted to increase such captive rates any further. Indeed, the Rate Increase Constraints identified in the RRTF Report are still financially profitable to carriers, sometimes in the extreme. Specifically, the RRTF Report indicates that, depending upon the commodity, the RIC would apply beginning at no less than a revenue to variable cost ratio of 180% for certain commodities, and for some commodities on certain railroads a constraint would not apply until the revenue to variable cost ratio for a movement would exceed over 600%.[11]

Although existing rates could not be reduced under this constraint, at least further rate increases would be limited solely to increases in a railroad's cost of service. Under the proposal, it would be relatively simple for a shipper to determine whether its rate was below, at, or above the RIC level, by simply calculating an R/VC for the movement. And, while a shipper would have to file a complaint, the litigation would basically be limited to a determination of market dominance. Thus, while the proposed RIC would not have huge benefits to shippers, since it would only limit future rate increases, shippers would benefit from not have huge litigation or

[10] RRTF Report, pp. 36-37.

[11] RRTF Report, p. 38 (R/VC Constraint for chlorine for NS would be 639%).

other costs either. The League believes that the adoption of the proposal by the Board is legally supportable and would offer benefits to some companies in the shipper community.

C. Bottleneck Changes

The third topic for comment set forth in the Board's Ex Parte 761 Notice of Public Hearing was the RRTF's recommendation for suspension of the Board's Bottleneck protections as applied to long-term revenue adequate carriers.[12] In its Report, the RRTF first noted the agency's decisions in its "Bottleneck" cases[13] which restrict bottleneck relief only to situations where a shipper has made a full-blown competitive access case (which relief has rarely been granted) or where the shipper has obtained a rail contract for the non-bottleneck segment in cases where the origin carrier does not also serve the destination.[14] The RRTF indicated that a change in the Board's policy for long-term revenue adequate carriers could be an "effective" competitive remedy, since it would make it easier to require such carriers to perform a short-haul in order to promote competition for a portion of the movement.[15] In discussing its recommendation, the RRTF analyzed the statutory and legal basis for the Board's Bottleneck decisions, and the legal basis for making a change to that policy for long-term revenue adequate carriers. The League has examined the RRFT's legal analysis and agrees that the Board would be well within its discretion to make such a change. First, the statute on its face provides the Board with a legal basis for limiting a carrier's general routing prerogatives and its long-haul in particular. Specifically, 49 U.S.C. §10705(a)(2)(C) states that "[t]he Board may require a rail carrier to

[12] Ex Parte 761 Notice, p. 3; RRTF Report, pp. 39-41.

[13] *Central Power & Light Co. v. S. Pac. Transportation Co.*, 1 S.T.B. 1059 (1996), *clarified*, 2 S.T.B. 235 (1997), *aff'd sub nom. MidAmerican Energy Co. v. STB*, 169 F.3d 1099 (8th Cir. 1999).

[14] RRTF Report, p. 40.

[15] *Id.*

include in a through route substantially less than the entire length of its railroad when…the Board decides that the proposed through route is needed to provide adequate, and more efficient or economic, transportation…." Elimination of the Board's Bottleneck restrictions in the case of long-term revenue adequate carriers would permit shippers to access rail-to-rail competition for at least a portion of the through route, thus obtaining more "economic" transportation. Shippers would not pursue the alternative routing using a bottleneck rate if the more competitive transportation did not also provide "adequate" service. Thus, removal of Bottleneck restrictions for long-term revenue adequate carriers would meet the express terms of Section 10705(a)(2)(C), by resulting in "adequate" and "economic" rail transportation.

Moreover, the elimination of Bottleneck restrictions for long-term revenue adequate carriers would be consistent with the purpose of the statute and the changes in circumstances underlying the Board's 1990s Bottleneck decisions. In reviewing the agency's Bottleneck Decisions, the Eighth Circuit noted that the Board had "grappled with the tension between two competing policies expressed in the Interstate Commerce Act," namely, the carriers' broad discretion in setting rates and routes, and regulation of a railroad's monopoly power.[16] The court also noted that:

> the Act protects both shippers and carriers. It guarantees that shippers will receive service at reasonable rates, and it allows carriers to provide service in a manner that achieves revenue adequacy.[17]

The court then noted that "in the present case, the Board determined that exploiting bottlenecks by refusing to provide separately challengeable bottleneck rates also assists carriers in achieving revenue adequacy."[18]

---

[16] *MidAmerican,* 169 F.3d at 1104.

[17] *Id.* at 1106.

[18] *Id.* at 1107.

But the force of this key rationale underlying the Board's Bottleneck decisions and the Eighth Circuit's review of them disappears in the case of long-term revenue adequate carriers. Indeed, in that case, there is no "tension" between the carriers' need for revenue adequacy and the shippers' need for service at competitive rates because the carrier has already achieved revenue adequacy over at least a five-year period (and in the present cases, much more). Thus, the Board is well within its discretion in opening up bottleneck relief for such carriers.

The League strongly supports the RRTF's recommendation for a change in the Board's Bottleneck rules in the case of long-term revenue adequate carriers. In the current situation, the change would allow a shipper to obtain competition over a non-bottleneck segment and would also allow a shipper to challenge a bottleneck rate, at least for three of the nation's seven Class I railroads. Based on present circumstances, this would introduce greater rail competition at least for these three carriers. Of course, if the bottleneck carrier offers an excessive rate over the bottleneck segment, the shipper would still have to challenge that rate before the Board and be able to show that the bottleneck rate is unreasonable. The potential need to litigate the reasonableness of the bottleneck rate is a difficult task that by itself would limit the practical application of the new rule. Yet, by permitting competition over the non-bottleneck segment and by permitting a shipper to bring a reasonableness complaint against a bottleneck rate, fairer and more competitive rates are likely to result, either through negotiation with the bottleneck carrier or through rate reasonableness litigation before the Board.

In supporting the adoption of the RRTF bottleneck recommendation by the Board, the League recognizes that there is a significant limitation to that recommendation: namely, bottleneck relief would apply only to long-term revenue adequate carriers. Currently only three of the nation's seven Class I carriers would qualify as long-term revenue adequate. This leaves

shippers served by nearly sixty percent of the nation's carriers without this competitive access relief. Accordingly, even if the Board were to open up bottleneck rates as recommended by the RRTF, there is still a need for the Board to adopt its proposed competitive switching rules which would apply to all Class I railroads.

On July 27, 2016, the Board granted in part a petition by the League to adopt revised reciprocal switching regulations that had been proposed by the League. The Board proposed its own regulations that would allow a party to seek a reciprocal switching prescription that is either practicable and in the public interest or necessary to provide competitive rail service. See, Ex Parte 711 (Sub-No. 1), *Reciprocal Switching*, decision served July 27, 2016. Interested parties filed comments on the Board's proposal on October 26, 2016 and Reply Comments on January 13, 2017. No action has been taken in Ex Parte 711 (Sub-No 1) since then, although the Board has authorized ex parte meetings with Board members and has yet to set a date to close the record in that docket.

The League strongly urges the Board to take action as recommended by the League in its opening and reply comments submitted in EP 711, in order to provide at least some measure of competitive relief to all of the nation's shippers, whether or not they are served by long-term revenue adequate carriers. The League sees no reason for continued inaction in the reciprocal switching proceeding which has been the subject of extensive briefing and expert testimony, has been pending for more than three years, and was constituted from earlier proceedings that began in 2011.[19] Between 2002 and 2017, the average rate of return for each revenue adequacy test

[19] The Board first initiated a hearing on the state of competition in the railroad industry, and possible policy changes, in June 2011 in its Ex Parte 705 proceeding. The League actively participated in the hearing and subsequently filed its Petition for Rulemaking to Adopt Revised Reciprocal Switching Rules soon after that hearing on July 7, 2011.

period for all of the nation's Class I rail carriers has increased from 6.87% to 10.24%.[20] No Class I rail carrier had an average return on investment in the most recent revenue adequacy test period of less than 8.28%.[21] Clearly, the railroad industry as a whole is financially viable and stable. Accordingly, increasing competitive access through broadened reciprocal switching rules for all Class I carriers is in the public interest.

D. Simplified Stand-Alone Cost (Simplified-SAC) Changes

The final RRTF revenue adequacy recommendation involved a proposed change to Simplified–SAC for long-term revenue adequate carriers. Specifically, the RRTF recommended that the Board reinstate the simplification of Road Property Investment from Simplified-SAC for such carriers, to make the Simplified-SAC process quicker and easier. The RRTF also recommended that Simplified-SAC be eliminated for non-long-term-revenue inadequate carriers, since the process has never been used.

The League believes that the Board should not pursue this recommendation. As pointed out by the RRTF, the Simplified-SAC process has never been used, and the League believes that the proposed change will not cure the problems with Simplified-SAC. The time of the Board

[20] RRTF Report, p. 35: 2002 (Revenue Adequacy Test Period 1998-2002): BNSF= 8.30%, CN=8.46%, CP=4.92%, CSX=5.06%, KCS=7.06%, NS=7.72%, UP=6.56%. Average of all equals 6.87%. 2017 (Revenue Adequacy Test Period 2007-2017): BNSF=11.44%, CN=9.49%, CP=8.86%, CSX=9.46%, KCS=8.28%, NS =11.12%, UP=13.01%. Average of all equals 10.24%.

[21] KCS' return on investment in 2017 (2007-2017 test period) was 8.28%. *See* footnote 5.

and its staff can be better spent on other recommendations by the RRTF, and in other proceedings.

HEARING ON REVENUE ADEQUACY

Docket No. EP 722

RAILROAD REVENUE ADEQUACY

INDUSTRIAL MINERALS ASSOCIATION- NORTH AMERICA COMMENTS

Industrial Minerals Association ("IMA-NA") respectfully submits its comments for the Hearing on Revenue Adequacy. On September 12, 2019, the Surface Transportation Board ("STB" or "Board") issued a Notice of Public Hearing ("Notice") for December 12, 2019 on revenue adequacy issues raised in the report issued by the Board's Rate Reform Task Force ("RRTF"). IMA-NA sincerely thanks the Board for having this hearing on a matter that is extremely important to us. Presently, IMA-NA feels its members have no recourse when a rate is unreasonable and commends the Board for attempting to find better ways to challenge a rate in this proceeding and in the Final Offer Rate Review and Market Dominance Streamlined Approach proceedings.

In January 2018, the Board established the RRTF with the objectives of developing recommendations to reform and streamline the Board's rate review process for large cases and determining how to best provide a rate review process for smaller cases. After holding informal meetings throughout 2018, the RRTF issued a report on April 25, 2019 (RRTF Report). The

RRTF Report recommended, among other things, that the Board consider policy changes regarding revenue adequacy. RRTF Report 12-13, 32-42.

In the Notice, the Board asked interested persons to provide input on the RRTF's recommendations regarding railroad revenue adequacy. The Board specifically asked participants to address the following RRTF recommendations in their written testimony at the hearing:

- Definition of long-term revenue adequacy: The RRTF recommended determining long-term revenue adequacy by looking at the annual determinations over "the shortest period of time, not less than five years, that includes both a year in which a recession began and a year that follows a year in which a recession began." RRTF Report 13, 33.

- Rate increase constraint: The RRTF recommended considering a rate increase constraint for long-term revenue-adequate carriers, which would identify a point beyond which further application of differential pricing would be unwarranted. See RRTF Report 13, 36-39.

- Bottleneck changes: The RRTF recommended considering suspension of the Board's Bottleneck protections as applied to long-term revenue-adequate carriers. See RRTF Report 13, 39-41.

- Simplified Stand-Alone Cost (Simplified-SAC) changes: For purposes of considering whether a long-term revenue-adequate carrier's rate is reasonable under Simplified-SAC, the RRTF recommended reinstating the simplification of the Road Property Investment analysis. See RRTF Report 13, 41-42, & app. B.

IMA-NA will address each of these points in the order presented by the Board.

IDENTITY AND INTEREST

The IMA-NA is a trade association that represents companies that mine, process and sell industrial minerals throughout North America. IMA-NA represents a wide variety of minerals in North America, including: ball clay, barite bentonite, borates, calcium carbonate, diatomite, feldspar, industrial sand, kaolin, soda ash, talc, wollastonite and other minerals. The industrial minerals produced by IMA-NA member companies are the raw material feedstock that are incorporated into a broad range of products, including among other things, containers, flat and specialty glasses, paint and coatings, ceramics, and a broad range of building products. Additionally, industrial minerals are used to make foundry molds and cores, which are in turn

utilized to make metal shapes for the manufacturing of automobiles, SUVs and trucks, rail cars and almost all other items that have metal castings. The demand for many of these minerals from manufacturers is global, and the continued pressure its member companies are feeling from the railroads in the form of constant rate increases is making it more difficult to compete in that global market.

In this global market, IMA-NA has seen with certain minerals that it is now cheaper for its members' global competitors to ship via vessel from Europe and elsewhere to portions of the United States than it is for IMA-NA members to ship via rail in the United States with the skyrocketing rail rates. These unchecked rates imposed by the railroads are having a negative overall impact on the U.S. economy, and matters could get even worse if they are not held accountable.

Industrial minerals are low margin, high volume products. IMA-NA member companies are heavily dependent upon a reliable and cost-effective transportation network, especially rail, and are major shippers with the Class I rails. To help highlight that, in 2014, the nonmetallic minerals, except fuels category, made up $1.5 billion in total freight rail premiums.

As a result, IMA-NA has a very strong interest in having the Board provide a revenue adequacy constraint process and in the market dominance streamlined process in EP 756 and in final offer rate review process in EP 755. IMA-NA commends the Board for taking an interest in promoting policies that remove barriers to accessing regulatory protection remedies and is extremely pleased that the Board is having this discussion about the revenue adequacy constraint.

DEFINITION OF LONG-TERM REVENUE ADEQUACY

The first recommendation the Board asks IMA-NA to address is the definition of long-term revenue adequacy. As noted, the RRTF recommended determining long-term revenue adequacy by looking at the annual determinations over "the shortest period of time, not less than five years, that includes both a year in which a recession began and a year that follows a year in which a recession began." RRTF Report 13, 33. Generally, IMA-NA is supportive of this approach but suggests broadening it to ensure it captures all revenue adequate carriers that are financially healthy by adding the right to submit additional probative evidence on revenue

adequacy and an STB-determined range around the cost of capital calculation that would take into account the inexact nature of the process.

Under 49 U.S.C. § 10701(d)(2), when determining whether a rate is reasonable, the Board is directed to give due consideration to three factors, recognizing the policy that "rail carriers shall earn adequate revenues." The Board is required to "annually determine which rail carriers are earning adequate revenues." 49 U.S.C. § 10704(a)(3); see, e.g., R.R. Revenue Adequacy—2017 Determination, EP 552 (Sub-No. 22) (STB served Dec. 21, 2018). This annual determination is distinct from long-term revenue adequacy, which "calls for a company, *over time*, to average return on investment equal to its cost of capital." Coal Rate Guidelines, Nationwide, 1 I.C.C.2d 520, 536 (1985).

Each year, the Board determines the railroad industry's cost of capital and then uses this figure in a variety of regulatory proceedings, including the annual determination of railroad revenue adequacy. The Board calculates the cost of capital as the weighted average of the cost of debt and the cost of equity. See Methodology to be Employed in Determining the R.R. Indus.'s Cost of Capital, EP 664, slip op. at 3 (STB served Jan. 17, 2008). While the cost of debt is observable and readily available, **the cost of equity (the expected return that equity investors require) can only be estimated.** Id. Thus, "estimating the cost of equity requires relying on appropriate finance models." Pet. of the W. Coal Traffic League to Inst. a Rulemaking Proceeding to Abolish the Use of the Multi-Stage Discounted Cash Flow Model in Determining the R.R. Indus.'s Cost of Equity Capital, EP 664 (Sub-No. 2), slip op. at 2 (STB served Oct. 31, 2016).

As the Board has stated previously, **there is no single simple or correct way to estimate the cost of equity for the railroad industry**, and many model options are available. Use of a Multi-Stage Discounted Cash Flow Model, EP 664 (Sub-No. 1), slip op. at 15; see also Pet. of the W. Coal Traffic League, EP 664 (Sub-No. 2), slip op. at 2, 20 (STB served Oct. 31, 2016). The Board has acknowledged that "by using multiple models that are based on different perspectives and rely on different inputs, the Board benefits because anomalies affecting one model are less likely to affect the other." Pet. of the W. Coal Traffic League, EP 664 (Sub-No. 2), slip op. at 3 (STB served Apr. 28, 2017). The Board has previously determined that a

methodology that uses multiple models is more robust than a methodology that utilizes only one model, not because one model is "conceptually or pragmatically superior to the other," but rather because each has different strengths and weaknesses. Pet. of the W. Coal Traffic League, EP 664 (Sub-No. 2), slip op. at 11 (STB served Oct. 31, 2016). Since 2009, the Board has found that the simple average of the Capital Asset Pricing Model ("CAPM") and the Morningstar/Ibbotson Multi-Stage Discounted Cash Flow Model ("MSDCF") has produced a reasonable estimate of the cost of equity used to gauge the financial health of the railroad industry.

This annual cost of capital determination has been the subject of much controversy and debate over the years, including various challenges and changes to the process. In fact, the Board presently has a proceeding pending before it in EP 664 (Sub-No. 4), Revisions to the Board's Methodology for Determining the Railroad Industry's Cost of Capital, regarding a proposal to incorporate an additional model, called the "Step MSDCF" to complement its use of the CAPM and Morningstar/Ibbotson MSDCF approaches. IMA-NA is supportive of the proposed rule in this proceeding but urges the Board to have some additional flexibility in its approach when determining long-term revenue adequacy instead of closely following these annual determinations that the Board concedes are not exact because the cost of equity determination is merely an estimate.

In making a decision on long-term revenue adequacy, the Board should consider that most economists and financial analysts presently do not consider any Class I railroad to be revenue inadequate. In a congressionally mandated report, a distinguished committee of economists put together by the Transportation Research Board declared their belief that the rail industry is now revenue adequate. Nat'l Acads. Of Sciences, Eng'g, and Med., Modernizing Freight Rail Regulation (2015) ("TRB Committee Report"). It even recommended that the STB discontinue issuing annual reports on the revenue adequacy of individual railroads and replace them with periodic studies of economic and competitive conditions in the rail industry. Id. Moreover, the U.S. Senate Commerce Committee issued a report, The Current Financial State of the Class I Freight Rail Industry, in 2010, that found the railroad industry to be revenue adequate and extremely financially healthy.

In fact, CSX in May of this year had its stock price top 80, increasing from a price of 14 in December of 2007. Moreover, CSX's operating ratio in 2018 reached an all-time low of 58.7%. However, the Board recently in a revenue adequacy constraint rate case found CSX not to be revenue adequate despite this obvious good health. Consumers Energy Company v. CSX Transportation, Inc., NOR 42142, slip op. at 21 (STB served Jan. 11, 2018 and updated Mar. 14, 2018). While CSX was close to being revenue adequate in the Board's annual determinations during the present business cycle, it never achieved that standard which resulted in this confusing finding of revenue inadequacy despite the railroad's skyrocketing stock price and record low operating ratio.

Now, as noted, the Board proposes to define long-term revenue adequacy by looking at these annual determinations over "the shortest period of time, not less than five years, that includes both a year in which a recession began and a year that follows a year in which a recession began." RRTF Report 13, 33. While this approach is compelling in its straightforwardness and simplicity, CSX still would not have been found to be revenue adequate if the Board had used this approach in Consumers. Obviously, this result seems irrational and needs to be fixed in some fashion.

Consequently, IMA-NA urges the Board to use its proposed test, but it should add in two additional parts. First, IMA-NA suggests that the Board also permit additional probative evidence of revenue adequacy or inadequacy to be submitted by the parties in these cases. This suggestion follows the existing precedent in these types of proceedings regarding revenue adequacy which permits this type of evidence. See Consumers, slip op. at 5-6. However, the Board should reevaluate how it could possibly find a company like CSX to be revenue inadequate despite receiving ample additional evidence of its extremely good financial health. Otherwise, the revenue adequacy constraint may lie fallow like the Stand-Alone Cost constraint presently does.

One way to ensure that railroads are considered to be revenue adequate when they are earning a return just below the cost of capital standard is to create a range around this number of two percentage points. Therefore, if the Board determined the cost of capital to be 12% over a business cycle, a railroad that earned 10.5% would still be considered long-term revenue

adequate. This approach is justifiable because the cost of capital determination is merely an estimate. This proposed range would have resulted in the correct finding in Consumers and would fix a clear flaw in the process.

IMA-NA again commends the Board for having this discussion about a standard for when a railroad is considered to be long-term revenue adequate. However, it urges the Board to consider all probative and competent evidence when reaching this result and to provide some flexibility in making this determination by establishing some type of cost of capital range when deciding whether a railroad earned its cost of capital over a business cycle.

RATE INCREASE CONSTRAINT

As noted, the RRTF recommended considering a rate increase constraint for long-term revenue-adequate carriers, which would identify a point beyond which further application of differential pricing would be unwarranted. See RRTF Report 13, 36-39. The RRTF reasoned that "the purpose of this proposal is 'to maintain reasonable rates where there is an absence of effective competition and where rail rates provide revenues which exceed the amount necessary to maintain the rail system and to attract capital.'" RRTF Report 36 (quoting 49 U.S.C. § 10101(6)); see also Coal Rate Guidelines, 1 I.C.C.2d at 535-36 ("the logical first constraint on a carrier's pricing is that its rates not be designed to earn greater revenues than needed to achieve and maintain this 'revenue adequacy' level. In other words, captive shippers should not be required to continue to pay differentially higher rates than other shippers when some or all of that differential is no longer necessary to ensure a financially sound carrier capable of meeting its current and future service needs.") IMA-NA again thanks the Board for this opportunity to discuss this recommendation which provides a form of relief for rail shippers when long-term revenue adequacy is found.

The RRTF explained that this constraint is an identification of the point at which the existing application of differential pricing is enough. However, in applying this constraint, the Board would not rebate any money to shippers and would not reduce the rates shippers are currently paying beyond the level identified. Moreover, carriers could continue to charge their existing rates to their existing customers; the constraint would impose no change on their existing rate structure. For shippers whose rates exceed the rate increase constraint, carriers

would be forbidden from raising non-contract, non-exempt rates by more than the rate of inflation (as measured by RCAF-U). Long-term revenue adequate carriers would be free to raise non-contract, non-exempt rates below the threshold, but only up to the threshold, not beyond it. No constraint would be enforced as to commodities or services that are exempt or pursuant to a contract as described in 49 U.S.C. § 10709(a). The threshold level would vary based on the category of transportation and would rise and fall each year as the carrier's revenue above the long-term revenue adequacy threshold rises or falls. RRTF Report 36-37.

In other words, the Board would prospectively constrain long-term revenue adequate railroads from raising rates but would not provide a shipper any relief from an existing unreasonable rate prospectively or retrospectively. While this constraint would be an extremely useful tool for shippers to help them control the unreasonable rate increases which seem to have become a matter of course in the rail industry, it would not solve the existing or past problem of an unreasonable rate. As a result, IMA-NA urges the Board to adopt this constraint and also to make competitive access more available to shippers as discussed in the following section.

BOTTLENECK CHANGES

As noted, the RRTF recommended considering suspension of the Board's Bottleneck protections as applied to long-term revenue-adequate carriers. See RRTF Report 13, 39-41. IMA-NA applauds this proposal and only asks the Board to take one further step by also making reciprocal switching available to shippers by using a more lenient standard as applied to long-term revenue adequate carriers.1

As background, "competitive access" refers to inter-railroad cooperative arrangements under which railroads participate in "through routes" with other railroads, offer shippers "joint rates" on such routes, use other railroads' terminal trackage facilities, and "switch" cars in the service of other railroads to and from track sidings where shippers are located. A through route is an arrangement under which a shipment is transported to its ultimate destination by two or more railroads in succession.

1 IMA-NA continues to support the Board's reciprocal switching proposal in Reciprocal Switching, EP 711 (Sub-No. 1). However, it makes this suggestion for reciprocal switching here based on its uncertainty about how that matter will proceed.

After the enactment of the Staggers Rail Act of 1980, the Interstate Commerce Commission ("ICC") adopted regulations regarding competitive access substantially similar to a proposal submitted by joint agreement between certain shippers and railroads. Intramodal Rail Competition, EP 445 (Sub-No. 1) (served Oct. 31, 1985). These regulations set out the standards the ICC and now the Board would thereafter use in determining whether to prescribe through routes and joint rates, and establish switching arrangements: the ICC will step in only where necessary to remedy or prevent acts that are "contrary to the competition policies of 49 U.S.C. [Sec.] 10101a or [are] otherwise anticompetitive." 49 C.F.R. Sec. 1144.5(a)(1)(i) (1986). Since the enactment of this regulatory standard, shippers have rarely utilized this remedy because it was believed to be unattainable by most and has proven to be so.

As mentioned above, one means of competitive access that is available to a shipper and is at issue in this recommendation is a through route under 49 U.S.C. § 10705, which is subject to the Bottleneck protections. This remedy can be used when a rail bottleneck arises. The RRTF explained that a rail bottleneck arises when more than one railroad may be involved in providing service from an origin to a destination, but only one—the bottleneck carrier—can serve either the origin or the destination. In the late 1990s, the Board handled the three Bottleneck cases, see Cent. Power & Light Co. v. S. Pac. Transp. Co., 1 S.T.B. 1059 (1996), clarified, 2 S.T.B. 235 (1997), aff'd sub nom. MidAmerican Energy Co. v. STB, 169 F.3d 1099 (8th Cir. 1999). in which a utility company sought to require the bottleneck carrier to establish a "local rate" for the segment of the through movement that was served by that carrier so that the utility could combine that local rate with a rate for the remainder of the movement by another carrier. The idea was that, rather than having to challenge the full origin-to-destination rate in its entirety, as generally required by Great Northern Railway v. Sullivan, 294 U.S. 458, 463 (1935), the utility could create competition for the bulk of the movement and separately challenge the reasonableness of the local (bottleneck) rate, presumably resulting in lower charges overall.

In its decisions, the Board found that a shipper cannot force a bottleneck carrier to use a routing over the line of the non-bottleneck carrier without making a full-blown "competitive access" case subject to the strict regulatory test established in Intramodal Rail Competition, even if such a routing could result in lower rates. Otherwise, the Board found that a shipper could direct a bottleneck carrier that could provide origin-to-destination rail service to "shorthaul"

itself by routing traffic over the lines of the non-bottleneck carrier if it obtained a rail contract under 49 U.S.C. § 10709 for the non-bottleneck segment. The Board's decisions were affirmed in MidAmerican.

Concluding that they reflected a "permissible" reading of the statute, the MidAmerican court found that the Board's Bottleneck decisions "grappled with the tension between two competing policies expressed in the Interstate Commerce Act": carrier discretion in setting rates and routing traffic (49 U.S.C. § 10701(c)) so that railroads could "achieve revenue adequacy by competing on a free-market basis," on the one hand; and the requirement that market-dominant carriers charge only reasonable rates (49 U.S.C. § 10701(d)), on the other. 169 F.3d at 1104-05. The reviewing court's decision was based in part on the Board's conclusion that permitting the maximum differential pricing at bottlenecks would "assist[] carriers in achieving revenue adequacy." Id. at 1107. Indeed, the MidAmerican court found that permitting the maximum differential pricing at bottlenecks would assist carriers in "achiev[ing] revenue adequacy by competing on a free-market basis." See 169 F.3d at 1105-07.

The RRTF stated that this rationale in the Bottleneck cases loses its force for carriers that have already achieved long-term revenue adequacy and for a part of an industry that is viewed as quite profitable. RRTF Report 41. The RRTF explained that given the significant improvement in the rail industry's finances, a change making it easier to require revenue-adequate carriers to short-haul to promote competition for a portion of a movement might well be another permissible reading of the statute. RRTF Report 40.

IMA-NA believes this recommendation to make a through route more available when a carrier is found to be long-term revenue adequate is indisputably within the Board's statutory power as explained in the RRTF Report. 40-41. Also, because the rail industry is clearly revenue adequate, the suspension of the Bottleneck decisions (that have essentially stopped the through route remedy to this point) makes complete sense. The vibrant and healthy rail industry today and the ailing and stagnant rail industry in the 80s are completely different animals. Therefore, due to this change in the state of the industry, the Board should implement this new standard making through routes more available by suspending the Bottleneck protections under these circumstances.

However, the Board should not stop there. Changing the standard for bottleneck situations alone would be a great first step; however, this remedy would not be as useful for some shippers as it would be for others. As the Board noted, if a shipper obtained this access, it would still have to bring a rate case to obtain relief on the shorter captive portion of the route against the incumbent carrier. Of course, the hope would be that the shipper would now have more negotiating power due to the availability of this remedy, but as the Board knows and is the point of the RRTF Report, bringing a rate case is not a simple matter and might render this proposal less effective. As a result, IMA-NA also believes the Board should reverse its decisions to use the existing competitive access standard discussed above to obtain the reciprocal switching remedy, thereby giving shippers another option when a railroad is found to be long-term revenue adequate.

Under reciprocal switching, or as it is sometimes called, "competitive switching," an incumbent carrier transports a shipper's traffic to an interchange point, where it switches the cars over to the competing carrier. The competing carrier pays the incumbent carrier a switching fee for bringing or taking the cars from the shipper's facility to the interchange point, or vice versa, which is incorporated into the competing carrier's total rate to the shipper. Reciprocal switching thus enables a competing carrier to offer its own single-line rate to compete with the incumbent carrier's single-line rate, even if the competing carrier's lines do not physically reach a shipper's facility.

Reciprocal switching can occur as part of a voluntary arrangement between carriers, or it may be ordered by the Board. The statutory provision governing the Board's authority to order reciprocal switching arrangements was first enacted by Congress in the Staggers Rail Act of 1980, Pub. L. 96-448, 94 Stat. 1895. That provision now states as follows:

> The Board may require rail carriers to enter into reciprocal switching agreements <u>where it finds such agreements to be practicable and in the public interest, or where such agreements are necessary to provide competitive rail service.</u> The rail carriers entering into such an agreement shall establish the conditions and compensation applicable to such agreement, but, if the rail carriers cannot agree upon such conditions and compensation within a reasonable period of time, the Board may establish such conditions and compensation.

49 U.S.C. § 11102(c)(1) (emphasis added) (previously codified at 49 U.S.C. § 11103(c) (1980)).

In 1986, the ICC decided its first reciprocal switching case under the strict competitive access regulations discussed above. In Midtec Paper Corp. v. Chicago & North Western Transportation Co., 3 I.C.C.2d 171 (1986), the ICC denied a shipper's petition for competitive access either via terminal trackage rights or reciprocal switching. In so doing, the ICC elaborated on the rules it adopted in Intramodal Rail Competition and their relation to the statute:

> (W)e think it correct to view the Staggers (Act) changes as directed to situations where some competitive failure occurs. There is a vast difference between using the Commission's regulatory power to correct abuses that result from insufficient intramodal competition and using that power to initiate an open-ended restructuring of service to and within terminal areas solely to introduce additional carrier service.

Id. at 174. Thus, although "(u)nder (§ 11102(c)), awarding reciprocal switching is discretionary," the ICC explained that the key issue under its then-new regulations was whether the incumbent railroad "has engaged or is likely to engage in conduct that is contrary to the rail transportation policy or is otherwise anticompetitive." Id. at 181.

Since adoption of the agency's stringent competitive access regulations in 1985 discussed above, the regulations have not changed substantively. Few requests for reciprocal switching have been filed with the agency since then, and in none of those cases has the Board granted a request for reciprocal switching. See, e.g., Midtec Paper Corp, 3 I.C.C.2d 171; Vista Chem. Co. v. Atchison, Topeka & Santa Fe Ry., 5 I.C.C.2d 331 (1989). Therefore, like with the Bottleneck cases, this competitive access remedy has been rendered somewhat useless to captive shippers since Intramodal Rail Competition and Midtec Paper Corp.

As noted, the health of the rail industry has improved substantially since these competitive access policies were imposed in 1985. In the 80s, the rail industry was barely alive due to decades of inefficiencies and bankruptcies. In the TRB Committee Report, it was noted that "[t]he U.S. freight rail industry has undergone a remarkable transformation since the enactment of the Staggers Rail Act of 1980," and exclaimed that "the industry has evolved and the railroads' financial viability has drastically improved." 1-2. Therefore, for the same reasons the RRTF suggested suspending the Bottleneck decisions when a carrier is found to be long-term

revenue adequate, the Board should also apply that rationale to reciprocal switching. The Board should suspend the use of a single anticompetitive standard for reciprocal switching cases when a railroad is found to be long-term revenue adequate and a less stringent standard like the one proposed in EP 711 (Sub-No. 1) or used in Canada should be applied.

Moreover, reciprocal switching is commonly viewed as the least intrusive of the competitive access remedies available to the Board. The less intrusive nature of this remedy, the great improvement to the health of the rail industry since the 80s, and the complexities of a bottleneck case make the addition of this remedy a perfect fit for the Board's intent to make the regulatory process more effective for captive shippers who now have no options available.

IMA-NA assumes the Class I railroads will argue that making these competitive access remedies available upon a finding of long-term revenue adequacy will be a financial and operational disaster for them. However, one must merely look to our north in Canada to see that the use of these remedies will have very little effect on the financial and operational health of large railroads. In Canada, "competitive line haul rates" and "interswitching" have proven to be successful policies for the protection of shippers and have had no adverse effect financially, operationally, or otherwise on the rail industry. In fact, the Canadian rail industry has long been a favorite of financial analysts with operating ratios in 2018 below 60%, generally better than their U.S. counterparts, except ironically for CSX.

Consequently, IMA-NA asks the Board to add this additional competitive access change to the Bottleneck cases recommendation in the event of long-term revenue adequacy by a railroad. This addition would make the Board's recommendation more effective and would provide captive shippers with the protection they need from rail market dominance. When the ICC imposed the stringent competitive harm standard for these access remedies, it did so to protect an industry that was reeling from bankruptcies and inefficient operations. Now, the rail industry has strongly recovered and these policies of the past are no longer necessary. In fact, the pendulum has completely swung to the other side with shippers having nearly no access to rate relief or competitive access remedies that Congress intended to be used for their protection. As a result, these changes making bottleneck relief and reciprocal switching more available are

crucial to a regulatory scheme that seemingly has lost its way during the rail renaissance over the past few decades.

SIMPLIFIED STAND-ALONE COST CHANGES

As noted, the Board also asked for testimony on the RRTF recommendation reinstating the simplification of the Road Property Investment Analysis for purposes of considering whether a long-term revenue adequate carrier's rate is reasonable under Simplified-SAC. While IMA-NA is more interested in having these other recommendations discussed above being imposed, it fully supports this proposed change to Simplified-SAC which could possibly result in this process being used in the future. As mentioned in the RRTF Report, Simplified-SAC has never been litigated to a final decision. Therefore, any mechanism that might breathe some life into this process would be welcomed.

CONCLUSION

IMA-NA once again thanks the Board for taking this important step to define when a railroad is considered to be long-term revenue adequate and to determine what regulatory action should then occur. As discussed herein, IMA-NA supports the recommendations by RRTF listed in the Notice but also seeks a slight broadening of the proposed long-term revenue adequacy standard and the addition of reciprocal switching to the Bottleneck protections change. With the imposition of these recommendations for a revenue adequacy constraint and the rules proposed in Final Offer Rate Review and Market Dominance Streamlined Approach, IMA-NA believes the Board will be able to regulate the railroad industry in the manner Congress intended. As a result, IMA-NA asks the Board to take these needed steps and bring back some balance to a regulatory scheme that has been less effective than necessary to protect railroad shippers.

SUMMARY OF CP DELAY EVENTS 2016-2021

REDACTED PUBLIC RECORD VERSION

DATE	TRAIN	PEAK	LOCATION	TYPE	MIN	DESCRIPTION	Exhibit A-2 PAGE #	DOC ID	BACKGROUND
1/11/2016	2221		Spaulding	DELAY	22	Dispatcher failed to move Metra train around CP grinding equipment	10	8201	1. Metra 2221 was delayed 22 minutes following CP Rail Grinding equipment which was operating on Track and Time. Primary delay occurred at Spaulding. Opportunity to have 2221 run on #2 MT from Roselle West to Spaulding around rail grinder was not taken. Lengthy delay carried over to delays to Peak Period trains 2244 (9 minutes) and 2243 both of which turn from 2221.
1/11/2016	2244	PEAK		DELAY	9	Cascading delay	10	8201	CASCADE
1/11/2016	2243	PEAK		DELAY		Cascading delay	10	8201	CASCADE
1/11/2016	2248		Bensenville	DELAY	14	Two freights dispatched out of yard at once, forcing one into peak period	10	8201	1. CP 473 was allowed to depart Bensenville behind 2221 at the same time that CP 472 (8500 feet) on short time was ['allowed to leave Genoa as the evening Metra rush approached. This created a "hostage railroading" situation whereby it became necessary to run 472 in the midst of the rush in order to get 473 out of the way. 472 wound up stopping on the plant at B17 from 1830 to 1850 delaying Metra 2248 who caught up with 472 at Wooddale. 2248 was 14 minutes late arriving Chicago which turned into similar delays to "flips" 2249, 2254, and 2255.
1/11/2016	2249		Bensenville	DELAY		Cascading delay	10	8201	CASCADE
1/11/2016	2254		Bensenville	DELAY		Cascading delay	10	8201	CASCADE
1/11/2016	2255		Bensenville	DELAY		Cascading delay	10	8201	CASCADE
1/15/2016	2250		B17	DELAY	20	Waiting for inbound freight	2	8450	Inbound train #2250, scheduled to arrive Chicago Union Station at 8:29 PM, is 15 to 20 minutes behind schedule dfreight train interference. 680-704 was released into Bensenville yard but did not have a route when they arrived which resulted in the train trailing out of the yard onto the main track.
1/15/2016	2251			DELAY		Cascading delay	2	8450	
1/15/2016	2256			DELAY		Cascading delay	2	8450	
2/9/2016	2256		B12	DELAY	25	Dispatched freight train slow to enter yard	34	7904	Please see delay to Metra 2256 (MWDW) last night - 25 minutes freight interference. What were the circumstances? Was running 2256 on #2 Mail and loading/unloading at crosswalks an option? It looks like 287-09 departed Gale wood at 2231 which should have been sufficient time to get the train in the clear at Bensenville. Appears the train was stopped in the plant at B12 attempting to line frozen switches into the yard. I don't believe running 2256 on Main 2 would have been an option for loading/ unloading due to 287-09 blocking the crosswalks. We had CCF do a replay. 287 came #2 main from Galewood and crossed to 3-lead so that #2 main, as you point out, was not an option. Please re-emphasize with all of the dispatchers that when trains are released to go into the yard, either at B 17 or B12, that there is a commitment from the yard that the route will be lined (or if not, what switches the freight crew will need to line before they can be clear) and a conversation with the crew that they will in fact be able to clear given the information received from the yard.
2/16/2016	2256		Spaulding	DELAY	20	Following freight train	21	8013	Metra 2256 delayed 20 MINUTES last night behind CP 472 working at Spaulding. 2256 then followed 472 to Tower B17 arriving Chicago minutes late. I thought we had agreed that trains working at Spaulding would Only occupy the block between TowelSffitilding allowing Metra traffic to run around on #1 Main between B35 and Spaulding. In this case, 472 could also have been held to follow 2256 from Almoi hold the main as 2256 is the last Metra inbound of the night. Please advise why neither ofthese provisions were chosen.
2/16/2016	2256		B17	DELAY		Freight train dispatched ahead of Metra train	21	8013	Yesterday afternoon, CP-473 departed Tower B17 1513 hrs, right ahead of Metra 2221 who is due there at 1503, but was running late due to picking up passengers from our stalled 2219 from an earlier Engine failure. 473 actually had a 10 minute lead on 2221 who went by B17 at 1523. Normally this would have worked out okay, however 473 was told to stop around Schaumburg when it was discovered that there was an additional car in the train without paperwork. When stopped, 473 was actually almost 10 miles out of Bensenville. Having gone that far already, we asked that 473 be allowed to continue West to clear Metra territory at Randall Road and resolve the paperwork issue up there. Train was, nevertheless, held until a radio waybill could be composed and issued, necessitating having 2221 stop at Roselle West while the Operator at B17 timed out the signal, then running on #2 Main to Tower B35. This situation would have resulted in a substantial Metra delay except for the fact that Metra 2242 had been annulled due to the earlier engine failure on 2219.
2/16/2016	2221		B17	DELAY		Cascading delay	21	8013	CASCADE
2/17/2016	2255		Bensenville	ALT TRACK		Dispatcher dispatched freight train ahead of Metra train	21	8013	Yesterday evening, there was a lengthy CP-484 that had run East via A5 stopped on #1 MT at Galewood East awaiting release from Bensenville Yard. Metra 2255 was lined up to run #3 MT from Tower 66 to Galewood East around 484. This would have been fine since 2255 has no scheduled passenger stops between 66 and Galewood East. 2255 also has a scheduled meet with inbound 2256 in the Mont Clare-Elmwood Park area, half-way between Galewood East and Tower B12. Had 2255 crossed back over to #1 MT at Galewood East ahead of 484, 2255 would have been on the correct track for his station work, and 2256 would have been able to proceed East on his correct #3 MT from B12 without any delay. Apparently, while 2255 was approaching B6, the Elgin Dispatcher received the release from Bensenville for 484. Rather than wait the additional 5 minutes (10 tops) for 2255 to come around, 484 was lined up to immediately proceed West on #1 MT from Galewood East. Doing this necessitated running 2255 West all the way to B12 on #3 Main which created two problems: 1) 2256 would have to wait at 612 @ 20 minutes for 2255 to clear (This is the same train, and for the most part the same passengers, that had to endure a 20 minute delay the previous evening for the 472 incident above). 2) 484 running West on #1 MT was now operating on the normal loading side for 2255, separating any boarding passengers from crossing to #3 Main where 2255 was running. Nothing was gained for 484 by doing this, since when 484 got to B12, they still had to wait for 2255 (as well as the badly delayed 2256) to clear the interlocking. In addition, with 484 stopped on #1 MT at B12, both River Grove Depot, as well as the heavily trafficked Thatcher Avenue, were blocked by 484. At least one individual wound up crawling underneath 484 in order to get to the opposite platform to board 2255 at River Grove. This may have been before 484 stopped.
2/17/2016	2256		Bensenville	DELAY	20	Cascading delay	21	8013	CASCADE
3/8/2016	2251		B17	DELAY		Dispatcher error	11	8169	Train #2 2 5 1, Scheduled to Arrive Big Timber Rd at 10:01 PM - Stopped. Train #2 2 5 1, scheduled to arrive Big Timber Rd at 10:01 PM, is stopped near Bensenville due to switch problems. duration ofthis delay is unknown. Metra will update this site as information becomes available. Had to hand line route at B17. Spoke with Delia at B17. She said she had indications on the switches but could not display a signal. Even though she had indications on the switches, she told the crew to "check their route". Crew took that as instructions to hand line. Niki, please remind operators that when they have proper switch indications for the needed route, they should not tell crews to check their route.

3/10/2016	2244	PEAK	Spaulding	DELAY	24	Dispatched too many freights at once near peak period	12	8168	This evening, during the 45 minute scheduled gap between Metra #2242 (Spaulding 1535) and #2244 (Spaulding 1620) CP G-35 was allowed to triple up a train from the CN interchange at Spaulding out on to Metra #2 MT while holding the interlocking at Spaulding. #2244 wound up sitting at Spaulding while G35 completed their triple, then followed G35 to Bensenville. Having already delayed 2244 @ 10 minutes, we were assured that G35 would have a "straight shot" into Bensenville yard, but in spite of this, G35 stopped 3 times going into the yard before the rear of the 7700 foot train cleared B17 interlocking. #2244 was delayed over 30 minutes in the process, and arrived CUS at 1801, 24 minutes behind schedule. While delays of this magnitude to our service are never acceptable, this was particularly bad because: ·2244 with a scheduled arrival at CUS at 1737 was operating in the peak of our evening rush hour, and is considered a "peak period" train. ·2244's late operation necessitated numerous modifications to our normal rush hour operation including altering crew and equipment turns so that #2243, our 1746 departure from Chicago who normally turns from #2244, and is one of our most heavily patronized trains, could still depart on time. Track utilization changes between Tower B6 and Tower B12 also had to be arranged in order to accommodate the late running 2244. The practice of having G35 come out at Spaulding and triple up on the main line during the narrow windows between scheduled Metra trains is one that was quite common at one time, and was a chronic cause of Metra delays. It has come to our attention that this practice has occurred several time of late, and while up until tonight, no major delays have occurred because of it, the risks are there every time this plan is implemented. We have discussed this practice in the past and came up with the following possible solutions to avoid delays to our service: 1.Schedule G35 to do Spaulding work so as to come out on #2 MT AFTER #2256, our last inbound train to Chicago, passes Spaulding at 2223 hrs. Virtually unlimited time on the main is then available. 2.If necessary to make these moves while Metra trains are still running, have G35 assemble their train COMPLETELY WEST of the Spaulding interlocking on #2 MT so that EWD Metra trains can run on #1 MT from Tower B35 to Spaulding and cross back over to #2 MT AT SPAULDING. Our schedules will support this operation without causing delays to our service, but EWD Metr, trains must cross back at SPAULDING, not Roselle West. I know it's a bit awkward assembling West of Spaulding due to road crossings, but it can and has been done. 3.Do not try and triple up between trains while holding the plant. It is in many ways just as quick -- and much simpler -- to take one or two cuts into Bensenville, then return with light power for the remaining cut(s). All of these ideas have been discussed in the past, and to my knowledge, had been adhered to until just recently. I would appreciate your cooperation in insuring that the Spaulding operation does not again become a source of delays to our service and customers. As always, thanks for your help and assistance. If there are any questions, or if I can assist in any way, please let me know.
4/7/2016			Fox Lake	CALLBOX		Call box not working	30	7667	The box with the direct line to the C&M Dispatcher at Fox Lake has been out for a week now. It has been extremely difficult logistically to get movement authorities to our trains so that they can leave Fox Lake. WE have had late trains on occasion because of this. Can we please put our heads together and come up with a solution? If we can't get AT&T interested in fixing the problem, we will need to look for a different carrier. This has got to be fixed.
4/11/2016			Fox Lake	CALLBOX		Call box not working	30	7667	Fox Lake box is still out. Now Grayslake is out again as well. We have had 3 Metra delays today due to this situation. We need to come up with a solution now.
4/11/2016			Grayslake	CALLBOX		Call box not working	30	7667	Fox Lake box is still out. Now Grayslake is out again as well. We have had 3 Metra delays today due to this situation. We need to come up with a solution now.
5/13/2016	2254		TOW	DELAY	12	Waiting for freight to clear	9	8255	Metra 2254 shows delay of12 minutes at TOW waiting for freight train to clear. Please advise circumstances.
7/26/2016	2231	PEAK	Itsaca and Wooddale	DELAY	11	Dispatching error compounding one blocked mainline, causing slowdown	16	8135	On Monday, July 25, 2016 while travelling EWD on #2 MT following Metra 2244 at approximately 1700 hrs., CP 472-24 with 87-42-12700, 8350 feet experienced an emergency brake application between Itasca and Wooddale. After Conductor walked almost the entire length of the train, it was reported that there was a knuckle and/or drawbar failure about 5 cars from the rear of the train. CP dispatched personnel stationed at Bensenville Yard from both their transportation and mechanical departments to assist the crew, and a Metra Signal Maintainer, who was in the area, also helped in expediting the clearing of #2 Main once the problems were identified. Arrangements were made to have CP-472 take the head portion of the train (up to the break) into Bensenville yard, and a crew that went on duty at Bensenville at 1800 hrs was promptly positioned with light power in order to retrieve the rear 5 cars once the head end cleared Tower B17. We are grateful for the prompt response to the situation by all involved, and appreciate the effort put forth to clear up our Main Tracks to salvage as much of the evening rush hour as possible. Unfortunately, because this train was operating during Metra's Peak Period, the logistics of single-tracking around the stalled train (8 miles from Tower B17 to Roselle West with 5 intermediate passenger stations and a dense WWD peak period schedule) had a devastating effect on our Operation, both during the peak period itself, and, because of crew and equipment turns, afterward. In review, it appears that the delays to 2233 through 2239 (as well as to subsequent trains since 2246 waited at Roselle West for 2239 to clear and 2243 waited at B17 for 2246 to clear) might have been significantly reduced, since, per Rule 6.23, once 2231 passed by the disabled train at restricted speed and determined that #1 Main was, in fact, not obstructed, the following trains should have been allowed to proceed through the area at track speed rather than at restricted speed as the trains in question were instructed.

7/28/2016	2256		B35	DELAY	7	Dispatching Metra train on the wrong track for passengers to alight	28	7686	Metra 2256 last night delayed 7 minutes due to using #1 MT Tower B35 to Roselle West around G35 and waiting on passengers on wrong side to cross overlincluding substantial delay at Bartlett due to split platforms and lengthy walk involved to get to the #1 platform. #2253 delayed 14 minutes at Roselle West waiting for 2256 to clear #1 main. In discussions sometime ago, it was agreed to call G35 to follow Metra 2253 out of B17 at 2212 and then crossover to #2 MT at Roselle West behind #2256 who is the last Metra inbound of the night so as to preclude the possibility of G35 disrupting Metra schedules. Can we please look into resuming this practice?

7/28/2016	2160		Fox Lake	CALLBOX		Call box not working	29	7685	2160 left Fox Lake 5 minutes late again. Conductor wrote, "late departure of 2160 due to CP Dispatcher not answering call box at Fox Lake". LMM working again last night. This is 3rd time with same problem recently.
8/1/2016	2227	PEAK		DELAY	11	Equipment error compounded by close to peak	15	8135	The scenario encountered on Monday, July 25, 2016 (described below) repeated itself almost identically on Friday, July 29, 2016. 472-29 was operating in the same slot as the train on Monday, following 2244 and ahead of 2246 out of Elgin. This time the train had 99-39-11000, 9396 feet long. In essentially the same location as Monday, this train also got a broken knuckle and drawbar, this time about 84 cars back. We were able to alleviate some of the delays encountered on Monday by operating only the first train by, 2227, at restricted speed and allowing the balance to go by at track speed. Nevertheless, the delays were devastating to our rush hour service, as well as to our customers, many of whom were personally assured following Monday's meltdown that we at Metra had taken appropriate steps with our counterparts at CP Rail to insure that this would not happen again. The situation was further hampered on Friday due to the broken drawbar becoming wedged underneath the car behind (and had we been made aware of this, we would have dispatched appropriate engineering or mechanical personnel from Metra to assist), which ultimately resulted in our single tracking around 472's rear end until almost 2200 hrs, over 5 hours after the initial break.

4/28/2017	2200		B17	DELAY	15	Freight train stopped several times while pulling into the yard with rear end blocking Metra Main Line at Tower B17	48	8043	Metra 2200 delayed about 15 minutes this morning behind CP-472 who apparently stopped several times while pulling into the yard with rear end blocking Metra Main Line at Tower B17.
4/28/2017	2200		B12	ALT TRACK		Metra train forced to use alternate track at station due to CP-143 on #3 MT with rear end blocking B12.	48	8043	After that, 2200 delayed additionally using #1 MT Tower B12 to Galewood waiting for passengers to walk across from the normal #3 Main platform. This was due to CP-143 on #3 MT with rear end blocking B12. Please advise why these trains were released without a clear route into the yard so as to clear Main Tracks in sufficient time to avoid delay to Metra scheduled operations. Delay to 2200 will carry over to flips 2201 and 2222.
4/28/2017	2201			DELAY		Cascading delay	48	8043	CASCADE
4/28/2017	2222			DELAY		Cascading delay	48	8043	CASCADE
6/26/2017	2158		Rondout	DELAY	4	Metra train held at Rondout @ 4 minutes to follow CP-384-251	45	8178	Metra 2158 last night delayed @ 12 minutes. They were held at Rondout @ 4 minutes to follow CP-384-251, then lost @ another 7 minutes following 384-251 to Tower A20. This also caused delays to 2151 who meets 2158 at Rondout, and 2155 who turns at Chicago from 2158. I interviewed the student that was in the office and was advised that they were intending to stack the route for Metra 2158 and inadvertently stacked the route for 384. They noticed just as the signal came in for 384. They thought that knocking the signal down and waiting for it to run time would take longer and result in a larger delay to Metra 2158 than just running the train. I will address with the dispatcher as well and have already addressed with the student. As part of the education process, student should be advised that in this case, if the mistake was noticed right away, it would have been considerably faster to contact 384 for permission to take the signal down, run time, and then line up 2158. Thanks for the follow up.

7/10/2017	2208	PEAK	B12	ALT TRACK		NS 17V was dispatched from Cicero West to Tower B12 Westward on #3 MT behind #2202 and ahead of #2208	56	7608	During this morning's AM peak period operation, NS 17V was dispatched from Cicero West to Tower B12 Westward on #3 MT behind #2202 and ahead of #2208. #2208 is supposed to operate on #3 MT because it has scheduled stops at Elmwood Park, Mont Clare, Mars and Galewood where there are no passenger loading platforms on #2 MT, and there is opposing traffic scheduled on #1 MT. 17V was unable to clear Tower B12 prior to Metra 2208's arrival, so it became necessary to run #2208 on #2 MT from Tower B12 to Galewood East. This entailed loading and unloading passengers at crosswalks and/or road crossings at the four stations listed. While this is never a good operating practice, loading and unloading passengers in this manner was that much more problematic this morning because all of this was taking place during a heavy rainstorm, and passengers were unable to remain under platform shelters and still board the train. #2208 arrived Chicago at 7:26 AM, 6 minutes late. Moving NS-17V in this manner interfered with Metra's operation of peak period train 2208 in contradiction to terms set forth in the Metra-CP Operating agreement.
7/10/2017	2208	PEAK		DELAY	6	Alternative track use caused delays	56	7608	
7/10/2017	2208	PEAK	B12	ALT TRACK		NS 17-V dispatched to run West on #3 MT forcing Metra trains to use alternate track at stations	56	7608	Reference e-mail sent last Monday, July 10, 2017 (below) relative to Metra peak-period train #2208 scheduled to make local stops at Elmwood Park, Mont Clare, Mars, and Galewood being routed down #2 MT where there are no passenger platforms instead of running on #3 MT as they are supposed to due to NS 17-V operating WWD on #3 MT. This same scenario was repeated this morning, MONDAY JULY 17, 2017 except this morning BOTH #2208 and #2212 who both make those same 4 local stops were run on #2 MT so that NS 17-V could run West on #3 MT. In this case, not only did passengers have to load and unload on crosswalks and road crossings instead of using boarding platforms, but also had to dodge 17-V who on #3 MT would have been between the loading platforms and the Metra train(s).
7/10/2017	2212	PEAK	B12	ALT TRACK		NS 17-V dispatched to run West on #3 MT forcing Metra trains to use alternate track at stations	56	7608	
9/13/2017			B12	DELAY		Dispatcher dispatched NS crew that was not lined up correctly during peak period	40	8483	NS 17v received the lineup at B12 at 53-5lined 2main-3main— 3 lead. It accepted the signal at 5:39:57. If you listen to the attached recordings, the crew appears not to kril their territory. When the B12 Dispatcher asks why theytopped, they stated they wererit lined the correct way. I reviewed the replay and they were indeed properly lin NS2204 had to be rerouted to track 1 @b17 causing' alellay. NS 17V finally cleared B12 @628a. NS crews on 17v are notoriously slow. Today they stopped at B12 even though properly lined for 3-lead resulting in a substantial delay to Metra 2204 who had to meet 2201 at B17 in order to run around 17v. Is there any way to work with NS crews so they don't tie up the railroad so long? Otherwise we should not chance running them during rush hours.
11/3/2017	2256		Spaulding	DELAY	15	Waiting for freight train to clear plant	51	7985	Metra 2256 delayed at Spaulding 15 minutes for G-65 to clear plant. Please advise circumstances for this.lengthy delay.
12/6/2017	2256		Bensenville	DELAY	14	Waiting for freight train coming from Bryn Mawr and pulling Bensenville Yard	38	8498	Metra 2256 Wednesday December 6. 2017 held at 1317 14 minutes for inbound lie ight train coming olicut-oliti•om Bryn Mawr and pulling Bensenville Yard. Please advise circumstances.
12/26/2017	2204	PEAK	Big Timber Road	DELAY	25	Equipment problem compounded by planned crewing at Randall Road just before peak period	41	8355	Compounded by ongoing signal problems at Tower B35 caused by a relay house fire over the past weekend, a CP-473 was allowed to leave Bensenville at 0330 heading West on the Elgin Sub. The train was being operated by a Chicago Terminal crew who was not qualified to run past Randall Road (MP 40.26), the intention being that a crew cabbing from Nahant or Savanna would meet the train at Randall Road and take over. Bear in mind that Metra's first EWD train of the morning rush hour departs Elgin at 0417 which means that an 0330 departure from Bensenville is doable, but iffy, under the best of circumstances. It was a known fact that due to the relay house fire, CP 473 would need to stop at both Spaulding and Tower B35 to get verbal authority past stop signals and would then be proceeding at restricted speed. The temperatures on this date and time were below zero which means that freight operations can typically be problematic and/or slower, and that Metra customers waiting for their trains are standing out in the cold at several locations. The fact that 473 was going to be re-crewed was not communicated, and when 473 stopped with the head end at Randall Road for the re-crew, the rear end of the train was blocking our Big Timber Road depot, as well as the crossovers at the Almora Control Point. The equipment for Metra 2204 (due out of Big Timber 0527) was allowed to follow 473 out of Elgin, but could not get to the depot to pick up passengers. 2206's eqpt went up #2 MT from Elgin depot to Big Timber but passengers at that depot were blocked by 473 could not get to the train. We wound up running 2206's equipment as 2204 25 minutes late, and 2204's equipment as 2206 (34 minutes late). Both trains originated at Elgin Depot. The first train capable of picking up passengers at Big Timber Road was 2210 due out of Big Timber 0612. The late departures wound up creating a domino effect on our operations causing 18 delays and 2 annulments. All of these trains are considered to be "Peak Period trains" which, according to the Metra-CP operating agreement, are not be interfered with.

12/26/2017	2230		B35	DELAY	40	CP-472 was dispatched in a narrow window between scheduled Metra trains and wound up getting a broken drawbar just short of Tower B35	41	8355	Later that morning, CP-472 was dispatched in a narrow window between scheduled Metra trains and wound up getting a broken drawbar just short of Tower B35. Metra 2230 was directly behind 472 when this occurred, had to back up to Almora to use the other main around 472 resulting in a 40 minute delay to 2230 as well as a 17 minute delay to following 2232.

12/28/2017	2244	PEAK	B12	ALT TRACK		Freight train released at peak of rush hour in tight window between Metra trains	41	8355	During the heart of the evening rush hour, a 67X was released at Cicero West to run to Tower B12 on #3 MT and into the yard via 6-lead, directly behind 2242 who cleared Cicero West at 1639. This left less than 20 minutes for 67X to clear B12 before Metra 2244 was due at 1657. 67X did not clear B12 until 1720 necessitating running 2244 down #2 MT where there are no station platforms at 4 stops (Elmwood Park, Mont Clare, Mars, and Galewood). Passenger loading and unloading then needed to take place using a single coach vestibule spotted at crosswalks or road crossings, a time consuming process. 2244 arrived Chicago 12 minutes late resulting in Peak Period train 2243 departing Chicago 7 minutes late. Minor delays were also experienced by Peak Period trains 2231, 2233, NCS 111 and NCS 113 which all had to operate on #1 MT due to 2244 occupying #2 MT, instead of the established operation which has some WWD rush hour trains running on #1 MT and some on #2 MT. While in most cases, CP Dispatchers have been cooperative and work with us to insure that our scheduled operation is protected, the succession of delays experienced this week has not only been a cause for increased customer complaints, but a cause for concern among those of us involved in Metra's Operations. Moving forward, we ask that Dispatchers use extra discretion in moving freight traffic close to scheduled Metra operations, and avoid close moves when possible. It is strongly suggested that prior to releasing trains for Bensenville yard, Dispatchers ascertain from Bensenville Yardmasters the total number of hand throw switches the crew will need to line prior to clearing at B12 or B17, and then pass along this information to the crew onboard the freight train, asking if they will be able to clear in sufficient time to avoid a delay to the next scheduled Metra train. We know that winter weather presents challenges to all of us, and hope that we will be able to work together to protect our respective operations. As always, your assistance is greatly appreciated. If I can be of any help, please let me know.

3/10/2018	2256			DELAY		Cascading delay	73	8395	
3/13/2018	2254		B17	DELAY		CP 280 train left on Metra #2 MT for a re-crew, occupying for over 5 hours, activated automatic warning device at crossings	73	8395	Last night (Tue Mar 13-Wed Mar 14) a CP 280 train departed Tower B17 @ 2100 and was left on Metra #2 MT, presumably for a re-crew. Train did not clear B12 until 0228 this morning, thus occupying #2 MT for over 5 hours. Also, it appears that 280's inbound crew may have pulled down too close to Scott Street, since we wound up with Automatic Warning Device activations at Scott St., Rose St. Calwagner and Ruby Streets. Metra 2254 was delayed copying mandatory directives for the crossings and lost time running around 280 on #1 MT and complying with the crossing restrictions; 2255 was delayed further when Police left lighted fusees at the crossings.
3/13/2018	2255		B17	DELAY		Cascading delay	73	8395	
3/14/2018	2202		Bensenville	DELAY	20	CP-G52 with 7400 feet was dispatched from Bensenville Yard ahead of Metra train	73	8395	This morning, (Wed. Mar 14) a CP-G52 was dispatched from Bensenville Yard on #3 MT ahead of Metra 2202. G52 with 7400 feet had to line switches at both ends of the Galewood receiving yard before being able to clear #3 Main. Metra 2202 wound up sitting behind 2202 for close to 20 minutes waiting for G52 to pull in the clear.
