RAIL SAFETY ANALYSIS

C.1 Background

The Canadian National Railway Company and Grand Trunk Corporation (collectively, CN or the Applicants) are seeking authorization from the Surface Transportation Board (Board) to acquire control of EJ&E West Company, a wholly owned non-carrier subsidiary of Elgin, Joliet and Eastern Railway Company (EJ&E). In this Appendix the Board's Section of Environmental Analysis (SEA) outlines the approach used to evaluate the safety impacts that may result from CN's proposed acquisition of EJ&E and presents the results of these analyses. In general, SEA compared pre-acquisition data with anticipated post-acquisition conditions to assess how the proposed acquisition would affect safety.

The Applicants are proposing to use the EJ&E rail line to connect all five of CN's rail lines in Chicago (the Proposed Action). The SEA evaluated the potential effects of the Proposed Action and other alternatives on rail safety at highway/rail at-grade crossings. The following components are discussed herein:

- Applicable Board, Federal Highway Administration (FHWA), Federal Railroad Administration (FRA), and state highway/rail regulations that SEA used for impact analysis
- Sources and types of data that SEA obtained
- Methods SEA used to analyze impacts
- Rail operations for freight and passenger trains
- Highway injuries and fatalities avoided as freight diverts from highway to rail
- Hazardous materials transport safety at rail yards and on mainline rail line segments
- Vehicle traffic safety at highway/rail at-grade crossings

C.2 Rail Safety Methodology

The Proposed Action would impact a number of highway/rail at-grade crossings. Construction activities associated with the Proposed Action include new rail connections, extensions of existing sidings, installation of a second track (double-tracking), and modifications to existing rail yard facilities. These impacts would occur primarily along four types of rail line segments. SEA focused their impact analysis on the following areas:

- EJ&E main tracks between Leithton, Illinois, and Kirk Yard. Existing highway/rail at-grade crossings located along 102 miles of the EJ&E main track would incur additional train traffic as described in the Applicants' operating plan. FRA highway/rail at-grade crossing inventory includes 99 public and 15 private highway/rail at-grade crossings and five pedestrian at-grade crossings. Some are low-volume roads with passive warning devices and others are major arterial roadways with advanced active warning devices including automatic gates. This segment analysis also included additional tracks proposed to intersect existing roadways as a result of the proposed siding extensions and double-track.

- CN main tracks immediately in advance of the proposed CN/EJ&E connections. CN has five rail lines that would serve as entrance and divergence points for CN trains crossing EJ&E lines between Leithton and Kirk Yard. SEA analyzed the Applicants' operating plan to determine if there would be an increase or a reduction in the number of trains operating upon these segments. In addition, the efficiency, or speed, of the connections would have an impact upon the frequency and time of duration that highway/rail at-grade crossings along these segments may be blocked by trains. SEA limited the distance of impact along these segments to the distance that trains would be accelerating or decelerating between normal operating speeds and the speeds necessary to operate through the connections. This line segment distance was limited to five miles.
- CN main tracks inside the EJ&E. CN lines that are within the arc of the EJ&E lines would likely experience a reduction in the number of trains operating on these segments. SEA analyzed the Applicants' operating plan to determine the decrease (or increase) in the number of trains expected to operate on these segments.
- EJ&E tracks other than the main track. This group of segments includes existing EJ&E tracks that are not described above but would be included in the Proposed Action. These segments are not expected to experience substantial changes; however, SEA analyzed the Applicants' operating plan to verify this.

C.2.1 Applicable Regulations and Guidance

- 49 Code of Federal Regulations (CFR) 1105.7(e)(2) and (7)
- 49 CFR 200 through 240
- Railroad Grade Crossing Handbook – Revised 2nd Edition – 8/2007

SEA conducted an analysis in compliance with 49 CFR 1105.7 (e)(2) and (7), which requires a description of the safety effects of the Proposed Action and vehicle delay times at railroad crossings. FRA is the Federal agency with authority over railroad safety. FRA has regulatory and enforcement powers found in 49 CFR 200 through 240.

C.2.2 Data Sources

To evaluate the safety implications of rail safety as a result of the Proposed Action, SEA used the following data sources:

- FRA database on rail grade crossings
- FRA historical accident history
- Applicants' track charts
- Applicants' operating plan
- Vehicular traffic average daily traffic (ADT) counts, to be obtained from the roadway authorities with jurisdiction over the roadways
- FRA Highway-Rail Crossing Web Accident Prediction System (WBAPS)
- *Summary of the DOT Rail-Highway Crossing Resource Allocation Procedure-Revised*, (FRA Report No. DOT/FRA/OS-87/05 Final Report, June 1987)
- Field verification of type of warning devices, number of tracks and travel lanes, and posted roadway speeds

C.2.3 Screening Process

SEA reviewed all rail line segments within the study area for the Proposed Action. This included 176 highway/rail public at-grade crossings on the EJ&E line segments and 155 highway/rail public at-grade crossings on the CN line segments

C.2.4 Analytical Methods

Along the EJ&E rail line segments SEA field verified critical highway/rail at-grade crossing information that the accident prediction formula includes as well as other items not contained within the FRA data that are germane to the task. Field verification is not expected to be required for the CN lines located within the EJ&E arc. SEA acquired traffic volume estimates for each road crossed within the analyzed rail line segments from the FRA database and other public agencies having jurisdiction over these roadways. SEA obtained historic and projected train volumes from the Applicants.

SEA estimated the vehicle/rail accident rates for the public and private highway/rail at-grade crossings for each of the four rail line segment types within the Study Area.

SEA compiled historical accident data from the most recent 5-year period and highway and rail characteristics for highway/rail at-grade crossings within the Study Area.

For the purpose of this analysis, SEA assumes an increase, or decrease, of at least 0.05 accidents per year (or 1.00 additional accident every 20 years) will be significant.

SEA calculated the risk of accidents at highway/rail at-grade crossings using a standard method developed by the FRA. This method is described in a report, *Summary of the DOT Rail-Highway Crossing Resource Allocation Procedure-Revised*, referenced in Section 1.3, Data Sources. The method calculates the risk of an accident at a highway/rail at-grade crossing based upon the characteristics of the crossing and statistical information on historic accident experience. The historic data is based on FRA records of accidents, along with the inventory of physical and functional crossing characteristics. The method uses three formulas:

$$a = K \times EI \times DT \times MS \times MT \times HP \times HL$$

$$B = \frac{T_o}{T_o + T} (a) + \frac{T}{T_o + T} (N/T) \text{ where } T_o = 1/(0.05 + a)$$

$$\begin{aligned} A &= 0.6768 \times B \text{ (for crossings protected by passive devices only)} \\ &= 0.4605 \times B \text{ (for crossings protected by flashing lights only)} \\ &= 0.6039 \times B \text{ (for crossings protected by gates and flashing lights)}^1 \end{aligned}$$

where:

$$\begin{aligned} a &= \text{Initial predicted accidents per year} \\ K &= \text{Basic accident prediction formula constant} \\ EI &= \text{Exposure index factor based on the product of the roadway vehicles and trains per day} \\ DT &= \text{Factor for the number of through trains per day during daylight} \end{aligned}$$

¹ Reference: "Accident Prediction and Resource Allocation Procedure Normalizing Constants 2007" FRA website under Safety.

<i>MS</i>	=	Factor for maximum timetable speed
<i>MT</i>	=	Factor for number of main tracks
<i>HP</i>	=	Factor for paved roadway
<i>HL</i>	=	Factor for number of roadway lanes
<i>B</i>	=	Weighted average of predicted accident rate and actual accident history
<i>T</i>	=	Years of recorded accident history
<i>T_o</i>	=	Weighting factor in the DOT accident prediction formula
<i>N</i>	=	Accidents recorded for a crossing in <i>T</i> years
<i>A</i>	=	Final predicted accidents per year

The first formula is the result of a multiple regression analysis of the data from the FRA databases. Because the FRA data cannot describe the precise characteristics of each crossing, such as sight distances, the calculation of predicted accident rates is improved by the addition of actual accident experience at a highway/rail at-grade crossing. The results of the first formula serve as an input to the second formula, which averages the initial predicted accident rates for a highway/rail at-grade crossing with the actual experience.

The second and third formulas apply a constant that adjusts for the level of protection that the warning device at the highway/rail at-grade crossing would provide. The values shown in the third formula are from the earlier cited Accident Prediction and Resource Allocation Procedure Normalizing Constants – 2007 provided by FRA. The FRA database served as the source of information for train traffic and accident history at similar highway/rail at-grade crossings.

C.3 Hazardous Materials Transport Methodology

SEA evaluated the potential safety impacts associated with hazardous materials transport resulting from the Proposed Action. SEA does not expect the Proposed Action would result in a net increase in hazardous materials transported to and from industrial facilities within the Study Area, but would shift additional volumes of hazardous materials currently being transported on CN routes to proposed EJ&E routes.

Most shipments to and from industrial facilities within the Study Area consist of non-hazardous materials. However, the industrial entities in the area do ship and receive hazardous materials. Some of these materials that are currently being shipped on CN routes would be transferred to the EJ&E routes. Analysis will include identification of key routes. SEA defines key routes as accommodating 10,000 or more carloads of hazardous materials annually.

C.3.1 Hazardous Materials Methodology

- SEA verified the historical data provided by CN and EJ&E on hazardous materials shipments. In addition, SEA analyzed potential safety impacts of the proposed rail operations related to hazardous materials transport within the Study Area.
- SEA evaluated the safety effects of transporting hazardous wastes and materials by rail along the proposed routes associated with the Proposed Action using the following data sources:
 - o Federal Railroad Administration (FRA) databases of railroad accident/incident reports and bulletins

- o Associate of American Railroads (AAR) fact book
- o AAR Analysis of Class I Railroads
- o U.S. Department of Defense (DOD) Hazardous Materials Incident Reporting System (HMIRS)
- o Inter-Industry Rail Safety Task Force Risk Assessment for the Transportation of Hazardous Materials by Rail reference manual
- o Supplementary Report: Railroad Accident Rate and Risk Reduction Option Effectiveness Analysis and Data²
- o Information provided by the Applicants
- o The Applicants' operating plan
- SEA evaluated historical releases of hazardous materials by CN and EJ&E (system-wide) and other rail shippers in the Study Area. Railroads are required to report to the U.S. Department of Transportation (DOT) on Form 5800.1 any unintentional release of hazardous materials that meets the criteria set forth in 49 Code of Federal Regulations (CFR) 171.16. DOT compiles the forms to create the HMIRS database, which includes the following information: 1) when and where a hazardous materials release occurred, 2) the substances and quantities released, and 3) the source of the release. The HMIRS database includes incidents that do not meet FRA reporting criteria (that is, the database includes all releases, not just those in which damage to equipment, signals, and track exceeded \$6,500).
- SEA reviewed the HMIRS database for entries involving CN and EJ&E within the Study Area for the most recent 5-year period and summarized that information in tabular form.
- SEA made a preliminary determination of routes that would be designated key routes and these are included in the analysis. If proposed routes would not warrant key route designation (defined in AAR's Circular OT-55-B Criterion as 10,000 annual carloads), no further analysis will be conducted.

C.3.2 Applicable Regulations and Guidance

- 49 CFR 1105.7
- 49 CFR 200 through 240

SEA conducted the analyses in accordance with the Board's regulation at 49 CFR 1105.7 (e)(7), which requires a description of the effects of the Proposed Action on public health and safety. Because the Proposed Action would result in the transport of hazardous materials, this regulation requires the Applicants to provide the following information to the Board:

- Hazardous materials types and quantities
- Frequency of service
- Chemicals being transported that, if mixed, could react to form more hazardous compounds or conditions
- Safety practices (including any speed restrictions)
- Applicant safety record on derailments, accidents, and hazardous materials spills
- Contingency plans to address accidental hazardous materials releases
- Likelihood of an accidental release of hazardous materials
- Ozone-depleting chemicals

² Report prepared by Arthur D. Little for the Inter-Industry Rail Safety Task Force, "Supplementary Report: Railroad Accident Rate and Risk Reduction Option Effectiveness Analysis and Data" (2nd Revision), April 1996.

FRA is the Federal agency with authority over railroad safety. FRA's regulatory and enforcement powers are found within 49 CFR 200 through 240.

Other regulations that pertain to hazardous wastes and materials transported by rail include the following: 1) those promulgated pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (40 CFR 305 and 306); 2) those promulgated pursuant to the Resource Conservation and Recovery Act of 1976 (40 CFR 264 and 265); and 3) DOT regulations found in 49 CFR 171, 172, 173, 178, 179, 180, and 185.

C.3.3 Data Sources

To evaluate the safety effects of transporting hazardous wastes and materials by rail as a result of the Proposed Action, SEA verified that the Applicants used the following data sources:

- FRA databases of railroad accident/incident reports and bulletins
- AAR fact book
- *AAR Analysis of Class I Railroads*
- DOD Hazardous Materials Incident Reporting System (HMIRS)
- Inter-Industry Rail Safety Task Force Risk Assessment for the Transportation of Hazardous Materials by Rail reference manual
- Supplementary Report: Railroad Accident Rate and Risk Reduction Option Effectiveness Analysis and Data
- Applicants' operating plan
- Data on hazardous materials transported by CN and EJ&E
- Data on hazardous material spills along similar, low-speed tracks operated by CN
- Data on hazardous materials shipped and received by area manufacturing companies

C.3.4 Screening Process

SEA evaluated all rail lines potentially controlled by EJ&E to identify those rail line segments and rail yards that would experience an increase in the volume of hazardous materials transported as a result of the Proposed Action. The analysis is focused only on those rail line segments and rail yards that meet the screening threshold for analysis.

C.3.5 Analytical Methods

C.3.5.1 Historical Hazardous Materials Releases

Railroads must report to DOT on Form 5800.1 any unintentional release of hazardous materials that meets the criteria set forth in 49 CFR 171.16. DOT compiles the forms to create the HMIRS database, which includes the following information: 1) when and where a hazardous materials release occurred, 2) the substance and quantity released, and 3) the source of the release.

SEA reviewed a list of the HMIRS database for entries involving CN and EJ&E, including any U.S. operating subsidiaries, for the most recent 5-year period and summarized that information in tabular form.

SEA also prepared a list of and assessed the hazardous materials being transported. If the proposed route warrants key route status, or if requested to do so by the Board, SEA performed several hazardous materials transport calculations as follows:

C.3.5.2 Annual Hazardous Materials Car Miles

The annual hazardous materials car-miles for the routes associated with the Proposed Action were obtained by multiplying annual hazardous materials carloads transported by the length of the connection segment.

$$\text{AHMATSEG} = \text{AHMAT} \times \text{SLENGTH}$$

where:

AHMATSEG = Annual hazardous materials car-miles per rail line segment

AHMAT = Annual hazardous materials carloads per rail line segment

SLENGTH = Rail line segment length (miles)

C.3.5.3 System Wide Average for Derailments

SEA calculated a system-wide (CN and EJ&E) average for derailments per car-mile for the most recent 3-year period on similar, low-speed tracks.

$$\text{DAVE} = \text{TCAR} / \text{TLCM}$$

where:

DAVE = Average derailment rate per car-mile

TCAR = Total carloads derailed

TLCM = Total loaded car-miles

C.3.5.4 Annual Hazardous Materials Car Derailments

SEA calculated the projected annual hazardous materials car derailments for the Proposed Action by multiplying annual hazardous materials car-miles per rail line segment (if appropriate) by the derailment rate per car-mile.

$$\text{AHMATDSEG} = \text{AHMATSEG} \times \text{DAVE}$$

where:

AHMATDSEG = Annual hazardous materials car derailments per rail line segment

AHMATSEG = Annual hazardous materials car-miles per rail line segment

DAVE = Derailment rate per car-mile

C.3.5.5 Annual Hazardous Materials Car Releases

SEA calculated the projected annual hazardous materials car releases for the Proposed Action by multiplying annual hazardous materials car derailments per rail line segment by the probability of a release from a derailed hazardous materials car.

$$\text{AHMATR} = \text{AHMATDSEG} \times \text{PROBR}$$

where:

AHMATR = Annual hazardous materials car releases per rail line segment

AHMATDSEG = Annual hazardous materials car derailments per rail line segment

PROBR = Probability of a release from a derailed hazardous materials car

C.3.5.6 Annual Hazardous Materials Car Releases / Mile

SEA calculated the projected number of annual hazardous materials car releases per mile by dividing the annual hazardous materials car releases per rail line segment by the rail line segment length.

$$\text{AHMATRM} = \text{AHMATR} / \text{SLENGTH}$$

where:

AHMATRM = Annual hazardous materials car releases per mile

AHMATR = Annual hazardous materials car releases per rail line segment

SLENGTH = Segment length (miles)

C.3.5.7 Release Rates / Mile

SEA calculated the release rates, or the expected interval (in years) between consecutive releases per mile, for the rail line segment by taking the reciprocal of the annual hazardous materials car releases per mile.

$$\text{RR} = 1 / \text{AHMATRM}$$

where:

RR = Release rate; expected interval between consecutive releases per mile

AHMATRM = Annual hazardous materials car releases per mile

C.3.5.8 Hazardous Materials Spills

SEA evaluated the potential of hazardous materials spills occurring in the EJ&E rail yards as a result of an increase in volume (that is, the number of rail cars) of hazardous materials switched as a result of the Proposed Action.

C.3.5.9 Hazardous Materials Release Rates

SEA calculated the hazardous materials release rates before and after the Proposed Action would become operational. To do this, SEA used the following process/equations:

$$\text{NDPSE} = \text{ND} / \text{SE}$$

where:

NDPSE = Number of derailments per million switching events

ND = Number of derailments

SE = Annual number of loaded car switching events

C.3.5.10 Hazardous Materials Cars Switched

SEA calculated the number of hazardous materials cars switched per year at the EJ&E rail yards by determining the sum of the annual number of cars switched in a traditional manner and the annual number of cars block-swapped and multiplying by the fraction of cars that carry hazardous materials.

$$\text{NHMATCSPY} = [\text{CST} + (\text{CSBS} \times 0.33)] \times \text{F}$$

where:

NHMATCSPY = Number of hazardous materials cars switched per year

CST	= Annual number of cars switched in a traditional manner
CSBS	= Annual number of cars block-swapped (0.33 is a factor applied to convert CSBS to an equivalent number of cars switched)
F	= Fraction of cars that carry hazardous materials

C.3.5.11 Car Derailment Frequency

SEA calculated the projected car derailment frequency by multiplying the number of derailments per million switching events by the number of hazardous materials cars switched per year.

$$\text{DFREQ} = \text{NDPSE} \times \text{NHMATCSPY}$$

where:

DFREQ = Estimated number of hazardous materials car derailments per year

NDPSE = Number of derailments per million switching events

NHMATCSPY = Number of hazardous materials cars switched each year

C.3.5.12 Releases / Year

SEA estimated the number of releases per year by multiplying the estimated number of hazardous materials car derailments per year by 0.038 (a factor which represents hazardous materials releases per rail yard derailment).

$$\text{AR} = \text{DFREQ} \times 0.038$$

where:

AR = Annual releases

DFREQ = Estimated number of hazardous materials car derailments per year

C.3.5.13 Consecutive Release Rates

SEA calculated the release rates, or the expected interval (in years) between consecutive releases, for the EJ&E rail yards.

$$\text{RRRY} = 1/\text{AR}$$

where:

RRRY = Release rate for the rail yard

AR = Annual releases

C.4 Reference Sources

The following emergency action, response and safety documents were reviewed and evaluated as part of the SEA's safety analysis:

- CN's Emergency Response Plan, November 9, 2005 provides the framework for emergency response operations. It was prepared to allow CN's operators to safely and effectively respond to emergencies consisting of an accident, incident or act of nature outside of regular CN operations that may represent a potential hazard to people, property and the environment. This plan serves as the Emergency Response Assistance Plan (ERP 2-0120) filed with Transport Canada and developed in a manner to satisfy U.S.

Occupational Safety and Health Administration's requirements. The Plan was developed to prevent injuries, save lives, minimize environmental damage, minimize property damage, and provide for the continuity of rail service.

- The United States Hazardous Materials Instructions for Rail, October 2, 2002, was developed for the purpose of creating uniform standards for employees of multiple companies that inspect or transport hazardous materials by rail. By applying a standard set of rules, CN and other railroads seek to handle hazardous material shipments securely and efficiently and thereby enhance the safety of the employees and the communities through which the railroads operate.
- The EJ&E Emergency Action Plan, 2005, was prepared to provide a plan with specialized instructions for a prompt response and effective handling of emergencies involving hazardous materials. The documents objectives are to save lives, prevent injury, limit the loss of property and protect the environment. It presents an emergency evacuation plan, hazardous material training status, emergency contacts and hazardous waste storage and spill plan. References used in the plan include the DOT Guide for Preparing Hazardous Materials Incidents Reports, January 2004, EPA List of Lists, October 2001, and the FEMA Guide for All-Hazards Emergency Operations Planning, April 2001.
- CN's Emergency Response Incident Command Logbook, November 2005, serves as a supplement to CN's Emergency Response Plan and is intended to be used in the event of significant emergencies that involve setting up an incident command post. It is design to assist in organizing activities, record keeping, and tracking throughout emergency response. For smaller scale emergencies, CN's Emergency Response-Supervisor Logbook is used.
- The List of Emergency Response Contractors, provides the names, addresses and phone numbers of contractors that are equipped to assist with CN's emergency response activities.
- A 2008 STCC Code inventory of hazardous materials that were shipped along the CN/EJ&E routes.

Quiet Zone Tables 3-4 through 3-12

Attachment C3

Quiet Zone Tables 3-4 through 3-12

4.2.4 Vehicle Safety

Note: Analysis used in zones described in Tables 3-4 through 3-12, on the following tables, included the use of the FRA model and Quiet Zone Calculator with assumed 2015 ADT volumes and 2015 train volumes. Though the NSRT is anticipated to fluctuate on a regular basis to and through 2015, the current value was used to estimate quiet zone compliance in this analysis.

Details on incident 2004081023

RPTNO	SEQ	REM
2004081023	1	CN CONDUCTOR REPORTED BEING SPLASHED WITH PRODUCT FROM TANK CAR DOWX7171
2004081023	2	(L/SODIUM HYDROXIDE, SOLUTION) DURING NORMALS SWITCHING OPERATIONS IN THE
2004081023	3	CN GLENN YARD, CHICAGO. ALL APPROPRIATE DEPARTMENTS NOTIFIED. EMPLOYEE
2004081023	4	TAKEN TO LOCAL HOSPITAL, TREATED AND RELEASED. CN HAZMAT TEAM, LOCAL FIRE
2004081023	5	DEPARTMENT AND SHIPPER'S RESPONSE TEAM RESPONDED. THREE MANWAY COVER BOLTS
2004081023	6	FOUND LESS THAN TOOL TIGHT AND GASKET MISALIGNED. MANWAY PROPERLY SECURED
2004081023	7	AND TANK CAR RELEASED FOR MOVEMENT.
