For the EIS on the proposed CN-EJ&E acquisition, SEA held 14 scoping open house meetings in 7 locations in January 2008. In addition to the public scoping meetings, SEA held agency scoping meetings with Federal, state, and local agencies in Illinois and Indiana. At the Illinois agency scoping meeting, a number of agencies asked for a greater role in development of the Draft EIS. In response, SEA established 5 stakeholder focus area groups which reviewed the methodologies and data sources used in the analysis for the Draft EIS, offered comments and suggestions, and provided additional data.

Throughout the EIS process SEA has consulted extensively with appropriate agencies, including the United States EPA and the US Fish and Wildlife Service.

In addition, SEA identified 28 communities with minority or low-income populations potentially affected by the proposed acquisition. SEA then conducted targeted and specific outreach efforts to engage these communities in the environmental review process, including direct calls to elected officials regarding the environmental review process, public scoping meetings, and meetings with local representatives.

The Board is publishing the Draft EIS and is making it available for public review and comment. SEA is also scheduling open houses/public meetings at 8 locations in the Chicago area to give people an opportunity to learn about the Proposed Action and to present their views. SEA will continue to consult with Federal, state, and local agencies, tribes, affected communities, and all interested parties to gather and disseminate information about the proposed acquisition. (Back to top)

How would the CN-EJ&E acquisition affect me and my community?
If the Board were to approve the CN-EJ&E acquisition, CN would redirect its trains from its 5 rail lines in Chicago to the EJ&E rail line, thereby increasing the volume of freight rail traffic

along the EJ&E rail line, with a corresponding decrease in the volume of freight rail traffic along the CN rail lines. The increase in rail traffic along the EJ&E rail line would or could result in increases in:

- Delays at highway/rail at-grade crossings, including delays of school buses and emergency vehicles
- Levels of noise and vibration
- Risk of train accidents
- Air pollutant emissions
- Energy use

Although the risk is still very low, people along the EJ&E rail line would also have an increased risk of exposure to hazardous materials should an accident occur resulting in a release of such materials. Property values could decrease somewhat for residences adjacent to the EJ&E rail line. No impacts to land use and biological, water, and cultural resources or changes to population, housing, and public services are expected. Some of the potential environmental impacts could be reduced or eliminated with mitigation.

The decrease in freight rail traffic along the 5 CN rail lines would result in corresponding benefits (decreases in existing adverse impacts) to the communities along those rail lines. In addition, the proposed redirection of freight rail traffic along the EJ&E line is expected to reduce freight rail delays and rail traffic congestion within the Chicago rail system. (Back to top)

Would the STB impose mitigation to reduce the adverse impacts if the CN-EJ&E acquisition were approved?
As it has in other cases, the Board is very likely to impose mitigation if it were to approve the CN-EJ&E acquisition. Based on the information available to date, consultations with appropriate agencies, and extensive environmental analysis, SEA has developed recommended preliminary environmental mitigation measures to address the identified adverse environmental impacts. These measures include requiring CN to take actions to reduce emergency vehicle delays, levels of noise and vibration, and the risk of accidents, including accidents involving hazardous materials. In addition, CN has submitted 76 voluntary mitigation measures.

As an alternative to the mitigation that the Board might unilaterally impose upon applicants, SEA encourages applicants to negotiate mutually acceptable agreements with affected communities to address potential environmental impacts. Negotiated agreements can be with neighborhoods, communities, cities, counties, regional coalitions, states, or other entities. If negotiated agreements are submitted to the Board, the Board's practice is to include a condition in any final decision approval of the proposed transaction requiring applicants to comply with the terms of the negotiated agreement. (Back to top)

What is the Board's authority to impose mitigation?
As a government agency, the Board can only impose conditions that are consistent with its statutory authority. Any conditions the Board imposes must relate directly to the transaction before it, must be reasonable, and must be supported by the record before the Board. The Board typically does not require mitigation for existing environmental conditions, such as the

effects of current railroad operations, or for land development in the vicinity of the railroads. (Back to top)

Will the STB consider safety issues?
Yes. Although ensuring freight rail safety is the primary responsibility of the Federal Railroad Administration, the STB also takes safety concerns into consideration in its decisionmaking. This includes vehicle safety, passenger rail safety, freight rail safety, pedestrian safety, bicycle safety, emergency vehicle response and hazardous material transportation. Safety concerns are usually raised and addressed in the STB's environmental review process. (Back to top)

In the future, could CN run more trains over the EJ&E rail line?
Because of physical and operational constraints on the EJ&E rail line, SEA concluded that, under the CN proposed operating plan, the EJ&E rail line would be operated at or very near to capacity. In other words, it is unlikely that the number of trains using the EJ&E rail line would be higher than that estimated by CN in the proposed operating plan. SEA conducted numerous independent rail capacity and constraint analyses before reaching this conclusion. (Back to top)

Has the Board ever denied a request for approval of a railroad acquisition?
Yes. The Board and its predecessor agency, the Interstate Commerce Commission, have denied some rail merger and acquisition proposals. Each case is unique, however, and the Board makes a decision in each case before it based on the full record of the transportation merits and the potential environmental impacts. Only after considering the full record does the Board make a decision to grant, to deny, or to grant with mitigating conditions. (Back to top)

If the Board denies the acquisition application, can CN use the EJ&E line anyway?
Yes. CN currently has trackage rights to the EJ&E rail line, giving it the right to use the EJ&E line, and could shift an increased number of trains onto the EJ&E rail line. CN would not need Board approval to exercise its existing trackage rights on the EJ&E. (Back to top)

Where can I get more information on the pending CN-EJ&E acquisition case or other proposals currently before the STB?
Please visit the STB's website at http://www.stb.dot.gov. The STB maintains an electronic public docket and information system designed to permit prompt and easy public access to all filings and comments submitted to the STB and decisions issued by the agency. Information about the pending CN-EJ&E acquisition case can be found by referencing STB Finance Docket No. 35087, *Canadian National Railway Company and Grand Trunk Corporation Control-EJ&E West Company*.

SEA also maintains a project specific website at http://www.stbfinancedocket35087.com. (Back to top)

How can I submit comments on the Draft EIS?
SEA encourages all interested parties to submit written comments on any aspect of the Draft EIS. SEA will consider all comments in preparing the Final EIS, which will include responses to

all substantive comments, SEA's final conclusions on potential impacts, and SEA's final recommendations.

Comments on the Draft EIS may be submitted by mail, by e-file, or by telephone. All correspondence should refer to STB Finance Docket No. 35087. The deadline for comments on the Draft EIS is **September 30, 2008**.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

Written comments should be mailed to:

Phillis Johnson-Ball
STB Finance Docket No. 35087
Surface Transportation Board
395 E Street, S.W.
Washington, DC 20423-0001

Environmental comments can also be filed electronically on the Board's web site, http://www.stb.dot.gov, by clicking on the "E-FILING" link. Comments are accepted at the toll-free project information line at 1-800-347-0689. A Spanish language option is available.

SEA will also hold 8 open house/public meetings to present the conclusions in the Draft EIS and invite interested parties to make oral comments. The dates, times, and locations of these public meetings are shown on the Public Involvement page. (Back to top)

The following abbreviations are used throughout this website:

- **Board** - Surface Transportation Board
- **CN** - Canadian National Railway Company and Grand Trunk Corporation
- **EIS** - Environmental Impact Statement
- **EJ&E** - Elgin, Joliet and Eastern Railway Company

Comments on the Draft EIS can be submitted in several ways:

- Written Comments
- Recorded Comments
- Electronic Comments

Written Comments: Comment forms will be provided at the public meetings and will be accepted on site or by mail. Additionally, comment forms or written letters may be **postmarked by September 30, 2008**, to:

Phillis Johnson-Ball
Surface Transportation Board
395 E Street, SW
Washington, DC 20423
Ref: STB Finance Docket No. 35087

Recorded Comments: Court reporters will be available at the public meetings for those who wish to dictate their comments in a more informal setting. Comments may also be recorded at any time during the comment period on the project hotline: **1-800-347-0689**.

Electronic Comments: Comments may be filed electronically on the Board's website, www.stb.dot.gov, by clicking on the **E-FILING** link. Please refer to STB Finance Docket No. 35087.

All comments received - written, E-filed, or oral - will carry equal weight in helping to finalize the EIS and guide the Board in its decision making on this matter.

Please refer to STB Finance Docket No. 35087 in all correspondence addressed to the Board. The comment period for the Draft EIS is July 25, 2008 to September 30, 2008.

Submitting a comment will also add your name to the SEA mailing list for notice of the distribution of the Final EIS. This mailing list will also be used to distribute any other important information regarding the project. You can be added to the mailing list without submitting a comment by using the same contact information listed above. In addition, your name can

be added to the distribution list by signing in at any public meeting.

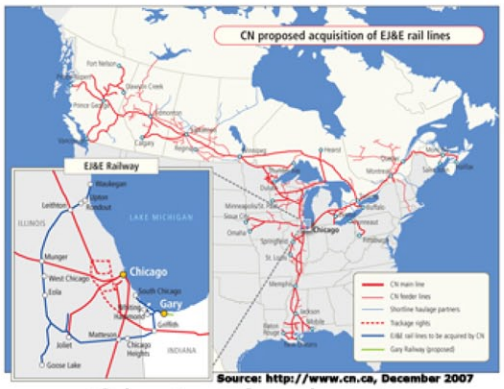
The Draft EIS has been released! See the Draft EIS tab on the left to review the document and the Contact Information tab for information on how to submit comments. Comments must be submitted by September 30, 2008.

Speakers at Previous Meetings

Welcome!

Welcome to the website for information regarding the Surface Transportation Board's environmental review of the proposed Canadian National Railway Company acquisition of the Elgin, Joliet and Eastern Railway Company.



Use the navigation buttons to the left to view information about the environmental study currently underway.

Project Overview

On October 30, 2007, Canadian National Railway Company (CN) (along with its U.S. subsidiary, Grand Trunk Corporation), filed an application with the Surface Transportation Board (Board) seeking to acquire EJ&E West Company, a wholly owned noncarrier subsidiary of Elgin, Joliet and Eastern Railway Company (EJ&E).

CN is one of Canada's two major railroads. It extends from Halifax, Nova Scotia, to Vancouver and Prince Rupert, British Columbia. EJ&E is a Class II railroad that currently operates over

200 miles of track in northeastern Illinois and northwestern Indiana, consisting primarily of an arc around Chicago, Illinois. This arc extends from Waukegan, Illinois, southward to Joliet, Illinois, then eastward to Gary, Indiana, and then northwest to South Chicago, Illinois, along Lake Michigan, as shown in the inset image. EJ&E provides rail service to approximately 100 customers, including steel mills, coal utilities, plastics and chemical producers, steel processors, distribution centers, and scrap processors.

Click on image for a closer view.

CN's proposed acquisition of EJ&E would shift rail traffic currently moving over CN's rail lines inside the EJ&E arc in Chicago to EJ&E rail lines, which traverse the suburbs generally to the west and south of Chicago. Rail traffic on CN lines inside the EJ&E arc would generally decrease. The decreases in rail traffic would be offset by increases in the number of trains operating on the EJ&E rail line outside of Chicago (approximately 15 to 27 more trains would operate on various segments of the EJ&E rail lines).

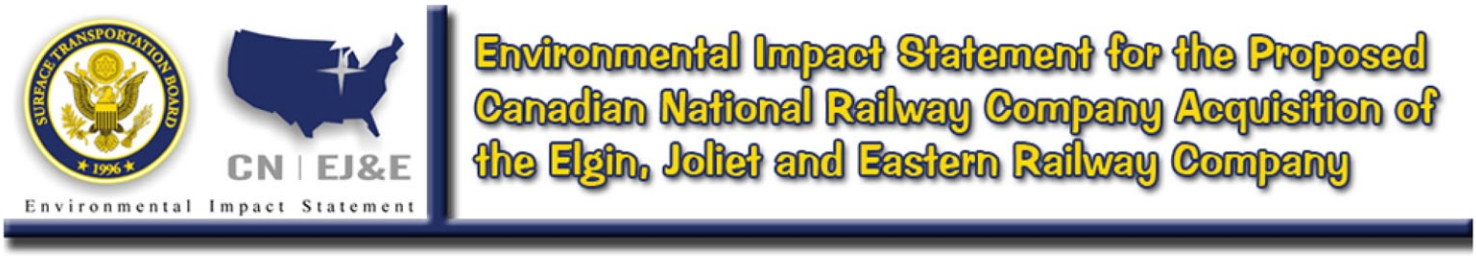
CN plans to construct six new rail-to-rail connections between existing rail lines and the newly acquired EJ&E line at the following locations:

1. Munger, Illinois
2. Joliet, Illinois
3. Matteson, Illinois
4. Griffith, Indiana
5. Ivanhoe, Indiana
6. Kirk Yard (Gary), Indiana

In addition to the six new rail-to-rail connections, CN plans to construct 19 miles of new sidings and double tracking at the following Illinois locations:

1. Leithton (near Libertyville)
2. Between East Siding/Eola and Walker
3. Between East Joliet and Frankfort

Applicants state three primary purposes for pursuing the Control Transaction. First, they believe the Control Transaction would improve their operations in and beyond the Chicago area by providing CN with a continuous rail route around Chicago, under applicants' ownership, that would connect the five CN lines that presently radiate from Chicago. Second, acquiring EJ&E's rail assets would make available to applicants EJ&E's Kirk Yard--an automated classification facility in Gary--as well as smaller facilities in Joliet and Whiting, IN, thus enabling applicants to consolidate car classification work at Kirk and East Joliet Yards and to reduce use of the Belt Railway Company of Chicago's (BRC) Clearing Yard. Lastly, applicants state that their system would benefit from the fact that EJ&E provides an important supply line for North American steel, chemical, and petrochemical industries, as well as for Chicago area utilities and others, which would allow applicants to develop closer and more extensive relationships



with companies in and serving those industries.

To thoroughly assess the potential environmental impacts that may result from the proposed acquisition, the Board through its Section of Environmental Analysis (SEA), will prepare an Environmental Impact Statement (EIS). Learn more about the EIS process on the Environmental Review Process page.

Environmental Review Process

The National Environmental Policy Act (NEPA) process is intended to assist the Board and the public in identifying and assessing the potential environmental consequences of a proposed action before a decision on that proposed action is made. SEA is responsible for ensuring that the Board complies with NEPA and related environmental statues.

Steps of the Environmental Review Process are as follows:

- Notice of Intent
- Draft Scope of Study
- Public Scoping Meetings
- Final Scope of Study
- Draft EIS
- Public Comment
- Final EIS
- Decision

Notice of Intent

The Notice of Intent (NOI) is a document prepared by the Board that states the intent to prepare an EIS. It is mailed to all parties on the environmental distribution list and is posted on the Board's website. The NOI provides information about the next steps of the environmental review process, including the draft Scope of Study, and public scoping meetings. The NOI was published on December 21, 2007, and is available on the News & Information page.

Draft Scope of Study

A draft Scope of Study was developed for the EIS and published in the Federal Register on December 21, 2007. Public comments on the draft Scope of Study were accepted until February 15, 2008. The draft Scope of Study incorporated the environmental issues and concerns with regard to aspect's of the environmental review process. The draft Scope of Study is available on the News & Information page.

Public Scoping Meetings

Scoping is an open process to determine the range of issues that should be examined and assessed in the EIS. The scoping process included a number of public open house scoping meetings held in the affected area in mid-to late January 2008. At the meetings, members of the public had the opportunity to discuss their interests and concerns with SEA staff. Click here for information regarding the Scoping Period meetings and comment period.

Final Scope of Study

A final Scope of Study for the EIS was prepared based on the comments received on the draft Scope of Study. The final Scope of Study was published in the Federal Register on Friday, April 25 and is available on the News and Information page.

Draft EIS

SEA prepared a Draft EIS for the project. The Draft EIS addressed required environmental subjects as well as those environmental issues and concerns identified during the scoping process. The Draft EIS was served on July 25, 2008, and is available on the Draft EIS page. It contains SEA's preliminary recommendations for environmental mitigation measures.

Public Comment

The public, agencies, elected officials, and communities have the opportunity to actively participate and comment on the environmental review process. The Board invites these stakeholders to review the Draft EIS, attend public meetings, and submit comments. Comments on the Draft EIS must be **postmarked by September 30, 2008**, and can be submitted as described on the Contact Information page.

Final EIS

SEA will then prepare a Final EIS that will address the comments on the Draft EIS from the public and agencies.

Decision

The Board will review the Final EIS and then issue a decision on the proposed project. In reaching its decision in this case, the Board will take into account the Draft EIS, the Final EIS, public comments, and the environmental analysis and recommendations, including any environmental mitigation proposed by SEA.

The following abbreviations are used throughout this website:

- **Board** - Surface Transportation Board
- **CN** - Canadian National Railway Company and Grand Trunk Corporation
- **EIS** - Environmental Impact Statement
- **EJ&E** - Elgin, Joliet and Eastern Railway Company

July 25, 2008

Re: STB Finance Docket No. 35087, Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company; Issuance of Draft Environmental Impact Statement

Dear Reader:

The Section of Environmental Analysis (SEA) is pleased to provide you with your copy of the Draft Environmental Impact Statement (EIS) on the proposed acquisition of the Elgin, Joliet & Eastern Railroad by Canadian National Railway and Grand Trunk Corporation (Applicants). This Draft EIS analyzes the environmental impacts that might occur if the Applicants were to acquire and operate trains over the EJ&E Railroad, an approximately 200-mile long railroad that forms an arc from the northwest to the southeast suburbs of Chicago, approximately 40 miles outside the city. The potential environmental impacts to both the human and the natural environments that could result from the proposed acquisition are compared to the environmental impacts of continuing rail operations on the EJ&E rail line and the five CN rail lines that feed into Chicago.

The Draft EIS also sets forth SEA's preliminary recommended mitigation, Applicants' voluntary mitigation measures, and encourages mutually acceptable negotiated agreements to mitigate adverse environmental impacts should the Board approve this acquisition. The Draft EIS reflects the active participation – more than 5000 comments submitted to date – of members of the public in the Chicagoland area and beyond.

SEA invites public comment on all aspects of the Draft EIS and is providing a 60-day public comment period, which begins upon the U.S. Environmental Protection Agency's issuance of a notice of availability in the Federal Register on August 1, 2008. Comments on the Draft EIS must be postmarked by September 30, 2008. Instructions on how to submit comments, and a list of the location, dates, and times of the open house/public meetings to be held in the Chicagoland area, are attached to this letter in a separate Fact Sheet. After your review of the Draft EIS, we appreciate your comments on ways to improve our analyses, make corrections and supplement what you feel needs further work. The more specific your comments are, the better we will be able to respond to them.

After the close of the public comment period on the Draft EIS, SEA will prepare a Final EIS in response to comments on the Draft EIS. The Board will then issue a final decision, based on the entire environmental record, including the record on the transportation merits, the Draft EIS, the Final EIS, and all public and agency comments received. The Board then will decide whether to approve the proposed acquisition, deny it, or approve it with mitigating conditions, including environmental conditions.

The Draft EIS is also available for viewing and downloading via the Board's Web site at http://www.stb.dot.gov, under "E-Library," then under "Decisions & Notices," beneath the date "7/25/08."

For further information on the proceeding, please visit the project web site at www.stbfinancedocket35087.com or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

SEA has distributed the Draft EIS widely for public review and comment. Approximately 5,000 copies of the Draft EIS on compact discs have been distributed to all parties on SEA's environmental distribution list, which includes interested Federally recognized tribes, key governmental agencies, elected officials, and persons expressing an interest in receiving a copy of the Draft EIS or participating in the environmental review process for this proceeding. SEA has also distributed the Draft EIS to all parties of record (official participants), as well as making additional print copies of the Draft EIS available for review in 49 libraries throughout the Study Area.

SEA appreciates the efforts of all interested parties who have participated in this environmental review to date. We look forward to receiving your comments.

Sincerely,

Victoria J. Rutson
Chief
Section of Environmental Analysis

Public Involvement

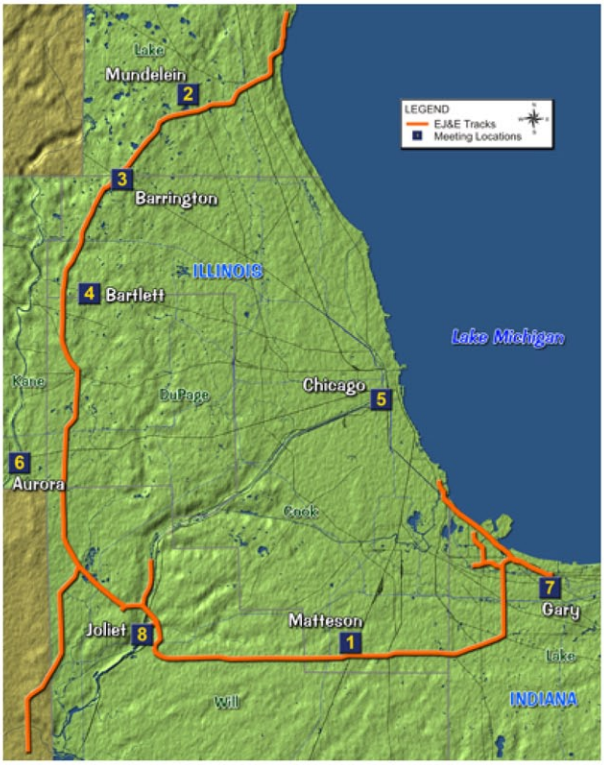
YOUR INPUT IS IMPORTANT!

Comments provided by the public helps the Board complete the Final EIS. Comments are due September 30, 2008, see the Contact Information page for ways to submit comments on the Draft EIS.

What is the purpose of this website?

This website is intended to provide necessary information to the public and to encourage all interested parties to participate in the EIS process. This website also provides guidance on how to submit comments (see the Contact Information page).

When can I get involved?



SEA appreciates and desires the public to be actively involved in the environmental review process. SEA has conducted public meetings at two different points in the environmental review process. In January, SEA hosted a series of public meetings and received public comments during the Scoping Period. Click here for information regarding the scoping period meetings and comment period. With the release of the Draft EIS, SEA once again soliciting public comment and hosted public meetings. Information available during the Draft EIS public meetings is presented here.

When were the Draft EIS public meetings held?

Beginning on August 25, 2008, SEA hosted **eight public meetings** throughout the Chicagoland area to present the findings of the Draft EIS and receive public comments. Each public meeting consisted of an informal open house segment from 4:00 to 6:00 PM, followed by a formal public meeting from 6:00 to 9:00 PM. At the beginning of each formal public meeting segment, SEA gave a brief overview of its findings in the Draft EIS and then invited interested parties to make oral comments and/or submit written comments. SEA had a transcriber present to record the oral comments in either English or Spanish. The dates and locations of the public meetings are shown below:

Ref No.	Date	Location
1	Monday August 25, 2008	Holiday Inn Hotel 500 Holiday Plaza Drive Matteson, IL 60443
2	Tuesday August 26, 2008	Crowne Plaza Chicago North Shore 510 E Route 83 Mundelein, IL 60060
3	Wednesday August 27, 2008	Barrington High School 616 W Main Street Barrington, IL 60010
4	Thursday August 28, 2008	Bartlett High School 701 Schick Road Bartlett, IL 60103
5	Monday September 8, 2008	Loyola University Rubloff Auditorium 25 E Pearson Chicago, IL 60611
6	Tuesday September 9, 2008	West Aurora High School 1201 W New York Street Aurora, IL 60506
7	Wednesday September 10, 2008	Indiana University Northwest Auditorium 3400 Broadway Gary, IN 46408
8	Thursday September 11, 2008	Holiday Inn Hotel 411 S Larkin Avenue Joliet, IL 60436

Click on a number for a detailed map.

Those that attended the public meeting were given a public meeting guide with important project information.

Information on this study was presented on a series of boards (30" x 40"). These boards are available for viewing (click on links below) and include:

- Board 1 - Welcome
- Board 2 - Purpose of this Meeting
- Board 3 - Purpose of the Acquisition
- Board 4 - Project Location Map
- Board 5 - Anticipated Changes
- Board 6 - Rail Traffic Volume Changes

- Board 7 - How Do I Submit Comments
- Board 8 - Key Transportation Findings (1)
- Board 9 - Key Transportation Findings (2)
- Board 10 - Key Transportation Findings Map
- Board 11 - Key Emergency Service Findings
- Board 12 - Public Meeting Ground Rules
- Board 13 - Public Meeting Guidelines

The presentation that SEA gave is available here (ZIP 5MB).

Information Request

SEA has made several information requests from the applicants in regard to the proposed Canadian National Railway Company acquisition of the Elgin, Joliet and Eastern Railway Company. This information will assist SEA in conducting the environmental review of the proposed acquisition required by the National Environmental Policy Act. As the review proceeds, further information requests may be necessary to ensure the study is conducted thoroughly. These information requests and the responses from the applicants are available below.

To download the file (PDF or ZIP), right mouse click on the link and choose Save Target As..., then save the file to your computer.

The Board and SEA

For more information on the Board and SEA, please click here (PDF 31KB).

Find information requested of the applicants from the Board on the Information Request Page.

Announcements and News Releases

July 25, 2008 - The Board released the Draft EIS. This document is available on the Draft EIS page. The comment period for the Draft EIS will close September 30, 2008. To help inform stakeholders of the contents of the Draft EIS, eight public meetings were held during the comment period. See the Public Involvement page for information regarding public meetings and the Contact Information page for information regarding submitting comments on the Draft EIS.

April 25, 2008 - The Board released the Final Scope of Study. This document was published in the Federal Register and incorporates comments received on the Draft Scope of Study. The Board issued a clarification to the Final Scope of Study on Monday, April 28, 2008. View the addendum to the Final Scope of Study here (PDF 35KB) and the new version of the Final Scope of Study here (PDF 88KB).

April 23, 2008 - The Board released Decision No. 9 (PDF 72KB) regarding the six proposed connections. Illustrations of the proposed track improvements are available on the Scoping Period Meetings and Comment Summary page.

February 15, 2008 - The deadline for comments on the draft Scope of Study has closed. The next opportunity for public review and comment will occur after the release of the Draft EIS.

January 27, 2008 - The Board extended the comment period of the draft Scope of Study for the EIS to February 15, 2008. See the postcard that announced the extension.

December 12, 2007 - This press release (PDF 18KB) from the Board is regarding public

involvement and the review process for the project. This document contains information about what procedures will be followed for reviewing the impacts of the proposed acquisition and how public input will play a role in that process.

Project Information

On January 8, 9, 10, 15, 16, 17, and 22, 2008, public open house meetings were conducted in Mundelein, Barrington, Joliet, Matteson, Gary, West Chicago, and Chicago (see map to the left for meeting locations). Over 2,000 interested citizens attended the meetings. A project fact sheet (PDF 31KB) prepared for the public scoping meetings provided a quick overview of the proposed acquisition and explained how to submit comments.

On December 21, 2007, the Board issued a Notice of Intent (NOI) (PDF 52KB) to prepare an EIS and a draft Scope of Study for the project, which gives general project information and information about the first set of public meetings as well as outlines the process that will be followed in the environmental review. The NOI also includes information about the environmental aspects that will be considered in the EIS. The public meetings will present general information about the project and allow the public to submit comments on the study that will be incorporated in the final Scope of Study for the project. You can submit comments on the draft Scope of Study by using the Contact Information page.

On November 27, 2007, the Board issued Decision No. 2: Notice of Acceptance of Primary Application and Related Filings; Issuance of Procedural Schedule (PDF 129KB), in which

the Board accepts CN's application for acquisition and adopts a procedural schedule for consideration of the application.

The above documents are in PDF format. If you need Adobe Reader, click here to download for free.

Scoping Period Meetings and Comment Summary

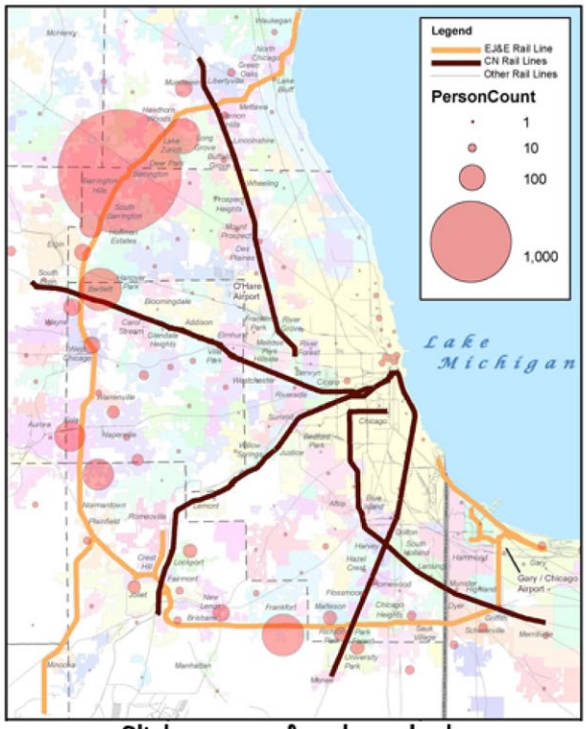
When were the scoping meetings held?

Scoping meetings were held January 8, 9, 10, 15, 16, 17, and 22, 2008, in Mundelein, Barrington, Joliet, Matteson, Gary, West Chicago, and Chicago respectively. All scoping meetings were held in an open house format, with the same information presented during each meeting.

In keeping with the open house format of the scoping meetings, there were no formal presentations made by agency representatives. Rather, SEA staff was available to answer questions and receive comments individually. Interested persons asked questions about the proposed acquisition and the Board's environmental review process, and discussed the potential environmental effects of the proposed acquisition with project team members.

Information on this study was presented on a series of boards (30" x 40"). These boards are available for viewing (click on links below) and include:

- Welcome
- What is the Purpose of This Open House Scoping Meeting?
- Who is Hosting This Meeting?
- What is the Proposed Acquisition?/What is the Purpose of the Acquisition?
- Project Location Map
- What Changes are Anticipated from the Acquisition?
- Communities Along Affected Rail Line Segments
- Anticipated Changes to Rail Traffic Volumes
- What Process Will SEA Follow?
- What Issues did the Draft Scope of Study Identify?
- How Do I Submit Comments?



A series of flip charts were used to illustrate proposed track improvements at six locations along the EJ&E rail line. These charts are available for viewing (click on links below) and include:

- Project Track Improvements - Proposed Rail Connection on EJ&E Locations

- Project Track Improvements - Munger, IL
- Project Track Improvements - Joliet, IL
- Project Track Improvements - Matteson, IL
- Project Track Improvements - Griffith, IN
- Project Track Improvements - Ivanhoe, IN
- Project Track Improvements - Kirk Yard, IN

What comments were received during the Scoping Period?

3,683 comments on the Draft Scope of Study were submitted from members of the public, government officials, businesses, and other interested stakeholders. The map below shows the distribution of comments received within the Chicago metro area. Additionally, comment summary reports for some of the larger distributions of comments are provided.

Click on map for closer look.

Frequently Asked Questions

On October 30, 2007, Canadian National Railway Company and Grand Trunk Corporation (CN) filed an application with the Surface Transportation Board seeking the Board's approval to acquire control of EJ&E West Company and to use the EJ&E main rail line to connect all 5 of CN's rail lines in the Chicago, Illinois Metropolitan Area. The EJ&E main line, located in northeastern Illinois and northwestern Indiana, extends in an arc around Chicago, Illinois. The following addresses frequently asked questions about the STB, its decision-making process and authority, and the proposed acquisition.

- What is the Surface Transportation Board (STB or Board)?
- What is the STB's process for authorizing railroad consolidations and acquisitions of control?
- What does NEPA require?
- What is the role of SEA in the NEPA process?
- What is the STB's NEPA process in a railroad acquisition case?
- What is the public's role in the NEPA process?
- How would the CN-EJ&E acquisition affect me and my community?
- Would the STB impose mitigation to reduce the adverse impacts if the CN-EJ&E acquisition were approved?
- What is the Board's authority to impose mitigation?
- Will the STB consider safety issues?
- In the future, could CN run more trains over the EJ&E rail line?
- Has the Board ever denied a request for approval of a railroad acquisition?
- If the Board denies the acquisition application, can CN use the EJ&E line anyway?
- Where can I get more information on the pending CN-EJ&E acquisition case or other proposals currently before the STB?
- How can I submit comments on the Draft EIS?

What is the Surface Transportation Board (STB or Board)?
The STB was created by the ICC Termination Act of 1995 as a successor to the Interstate Commerce Commission, and is responsible for the economic regulation of freight railroads under the Interstate Commerce Act, pursuant to 49 U.S.C. 701-727 and 10101-16106. Among its various duties, the STB reviews railroad proposals to construct and operate new rail lines, abandon unneeded rail lines, or acquire and operate other lines or other railroads.

The Board itself is a bipartisan body with 3 members who are appointed by the President and confirmed by the Senate for staggered 5-year terms. Currently (as of July 2008), Charles D. Nottingham is the Chairman of the STB, Francis P. Mulvey is the Vice Chairman, and W. Douglas Buttrey is the third member.

Within the STB, the Section of Environmental Analysis (SEA) is responsible for directing the environmental review process for matters that come before the Board, conducting independent analysis of all environmental data, and making environmental recommendations to the Board.

Overall, the STB has a staff of approximately 140 people, consisting of attorneys, economists, transportation industry analysts, engineers, auditors, environmental specialists, and support staff. Although the STB is organizationally within DOT, it operates as an independent regulatory agency. (Back to top)

What is the STB's process for authorizing railroad consolidations and acquisitions of control?

When 2 or more rail carriers seek to consolidate – whether through merger or common control – they must obtain prior STB approval under 49 U.S.C. 11323-25 and 49 CFR Part 1180. In the case of the proposed acquisition of the Elgin, Joliet and Eastern Railway Company (EJ&E) (a Class II railroad) by the Canadian National Railway Company and Grand Trunk Corporation (CN) (a Class I railroad), the STB must approve the acquisition unless it finds (1) as a result of the transaction, there is likely to be substantial lessening of competition, creation of a monopoly, or restraint of trade in freight surface transportation in any region of the United States, and (2) the anti-competitive effects of the transaction outweigh the public interest in meeting significant transportation needs (49 U.S.C. 11324(d)).

After an application for STB approval is filed, the STB sets a procedural schedule that gives interested parties time to submit information on any transportation issues and for the applicant to reply. The STB also prepares environmental analyses and documentation to meet its obligations under environmental laws. The STB then considers the entire record (including all comments received on environmental or transportation issues), in deciding whether to authorize the acquisition application as proposed, deny the proposal, or approve the proposal with conditions imposed to mitigate likely competitive adverse effects or potential safety or environmental concerns.

There are statutory time limits for the STB's processing of merger/control applications. Because the Board determined that the CN-EJ&E acquisition is a minor transaction, the STB's decision normally would be due within six months of the filing of the application (49 U.S.C. 11325(d)). However, the STB must also comply with the National Environmental Policy Act (NEPA), 42 U.S.C. 4321 *et seq*., in its decisionmaking and must complete the necessary environmental review process before making a final decision. Therefore, a final decision here will be issued as soon as possible after completion of the environmental review process. (Back to top)

What does NEPA require?
NEPA requires Federal agencies to examine the potential environmental impacts of their proposed actions, to inform the public concerning those impacts, and to consider the impacts in their decisionmaking. The purpose of NEPA is to focus the attention of the agency and the public on the likely environmental consequences of a proposed action in order to minimize or avoid potential adverse environmental impacts. However, NEPA does not mandate a particular result. Once the adverse environmental impacts have been adequately identified and evaluated, the agency can conclude that other benefits outweigh the environmental costs.

The STB's environmental review process must comply with the requirements of the President's Council on Environmental Quality NEPA regulations (40 CFR Parts 1500-1508) and with its own NEPA-implementing regulations (49 CFR Part 1105). In the case of the proposed CN-EJ&E acquisition, the STB determined that these regulations require the preparation of a full Environmental Impact Statement (EIS) -- the environmental documentation prepared in cases that have potentially significant environmental impacts. (Back to top)

What is the role of SEA in the NEPA process?
Under NEPA, the STB must consider the potential environmental impacts of its action before deciding whether to approve an application. SEA is the office within the STB that gathers and analyzes the environmental record in a case, prepares the NEPA documentation, and provides technical advice and recommendations to the Board on environmental matters. SEA has trained legal and environmental specialists, headed by the Chief of the Section of Environmental Analysis, Victoria Rutson.

SEA often uses "third-party contracting" to help prepare environmental documentation. Third-party contracting is a voluntary arrangement in which the applicant pays for a contractor to assist SEA by developing the environmental analyses necessary for compliance with NEPA and related environmental laws, under SEA's direction, control, and supervision. The Board's environmental rules at 49 CFR 1105.10(d) as well as the CEQ regulations at 40 Code of Federal Regulations [CFR] 1500 – 1508, specifically permit the use of third-party contractors approved by SEA.

The third-party contracting process provides an effective means to prepare an independent, comprehensive environmental analysis that meets the requirements of NEPA and related environmental laws. The contractors function as an extension of SEA's staff. They work under SEA's direction to collect and verify environmental information from the railroads, consulting agencies, other interested parties, and the general public; conduct unbiased environmental analysis; develop appropriate environmental criteria and methodologies for analyzing particular environmental issue areas; and prepare environmental documentation and mitigation options. SEA makes its own evaluation of the environmental issues and is responsible for the scope and content of the NEPA document. (Back to top)

What is the STB's NEPA process in a railroad acquisition case?
If an EIS is prepared, SEA first issues a notice of intent to prepare an EIS and determines the scope of work for the EIS, after providing opportunities for public participation and consultation with appropriate Federal, state, and local agencies and other government entities. SEA

then prepares a Draft EIS that analyzes in detail the potential environmental impacts of the proposed acquisition, considers reasonable and feasible alternatives to the applicant's proposal, and makes recommendations for environmental mitigation. By regulation, the public has at least 45 days to comment on a Draft EIS.

SEA then issues a Final EIS that responds to the public comments, presents the results of any further environmental analysis, and incorporates final environmental mitigation recommendations. The Board then considers both the environmental record (the Draft and Final EISs and all comments received) and the record on the transportation issues to decide whether to authorize the acquisition as proposed, deny the proposal, or approve it with conditions, including environmental conditions (see 49 CFR 1105.10(a) and (f)). (Back to top)

What is the public's role in the NEPA process?
There are ample opportunities for public input during the NEPA process, particularly during scoping (to determine what issues should be addressed in an EIS) and in commenting on a Draft EIS. The public can submit written comments directly to the agency and/or participate in hearings or public meetings. In preparing the Final EIS, the Federal agency must take into consideration, and respond to, the comments received from the public and other parties.

For the EIS on the proposed CN-EJ&E acquisition, SEA held 14 scoping open house meetings in 7 locations in January 2008. In addition to the public scoping meetings, SEA held agency scoping meetings with Federal, state, and local agencies in Illinois and Indiana. At the Illinois agency scoping meeting, a number of agencies asked for a greater role in development of the Draft EIS. In response, SEA established 5 stakeholder focus area groups which reviewed the methodologies and data sources used in the analysis for the Draft EIS, offered comments and suggestions, and provided additional data.

Throughout the EIS process SEA has consulted extensively with appropriate agencies, including the United States EPA and the US Fish and Wildlife Service.

In addition, SEA identified 28 communities with minority or low-income populations potentially affected by the proposed acquisition. SEA then conducted targeted and specific outreach efforts to engage these communities in the environmental review process, including direct calls to elected officials regarding the environmental review process, public scoping meetings, and meetings with local representatives.

The Board is publishing the Draft EIS and is making it available for public review and comment. SEA is also scheduling open houses/public meetings at 8 locations in the Chicago area to give people an opportunity to learn about the Proposed Action and to present their views. SEA will continue to consult with Federal, state, and local agencies, tribes, affected communities, and all interested parties to gather and disseminate information about the proposed acquisition. (Back to top)

How would the CN-EJ&E acquisition affect me and my community?
If the Board were to approve the CN-EJ&E acquisition, CN would redirect its trains from its 5 rail lines in Chicago to the EJ&E rail line, thereby increasing the volume of freight rail traffic

along the EJ&E rail line, with a corresponding decrease in the volume of freight rail traffic along the CN rail lines. The increase in rail traffic along the EJ&E rail line would or could result in increases in:

- Delays at highway/rail at-grade crossings, including delays of school buses and emergency vehicles
- Levels of noise and vibration
- Risk of train accidents
- Air pollutant emissions
- Energy use

Although the risk is still very low, people along the EJ&E rail line would also have an increased risk of exposure to hazardous materials should an accident occur resulting in a release of such materials. Property values could decrease somewhat for residences adjacent to the EJ&E rail line. No impacts to land use and biological, water, and cultural resources or changes to population, housing, and public services are expected. Some of the potential environmental impacts could be reduced or eliminated with mitigation.

The decrease in freight rail traffic along the 5 CN rail lines would result in corresponding benefits (decreases in existing adverse impacts) to the communities along those rail lines. In addition, the proposed redirection of freight rail traffic along the EJ&E line is expected to reduce freight rail delays and rail traffic congestion within the Chicago rail system. (Back to top)

Would the STB impose mitigation to reduce the adverse impacts if the CN-EJ&E acquisition were approved?
As it has in other cases, the Board is very likely to impose mitigation if it were to approve the CN-EJ&E acquisition. Based on the information available to date, consultations with appropriate agencies, and extensive environmental analysis, SEA has developed recommended preliminary environmental mitigation measures to address the identified adverse environmental impacts. These measures include requiring CN to take actions to reduce emergency vehicle delays, levels of noise and vibration, and the risk of accidents, including accidents involving hazardous materials. In addition, CN has submitted 76 voluntary mitigation measures.

As an alternative to the mitigation that the Board might unilaterally impose upon applicants, SEA encourages applicants to negotiate mutually acceptable agreements with affected communities to address potential environmental impacts. Negotiated agreements can be with neighborhoods, communities, cities, counties, regional coalitions, states, or other entities. If negotiated agreements are submitted to the Board, the Board's practice is to include a condition in any final decision approval of the proposed transaction requiring applicants to comply with the terms of the negotiated agreement. (Back to top)

What is the Board's authority to impose mitigation?
As a government agency, the Board can only impose conditions that are consistent with its statutory authority. Any conditions the Board imposes must relate directly to the transaction before it, must be reasonable, and must be supported by the record before the Board. The Board typically does not require mitigation for existing environmental conditions, such as the

effects of current railroad operations, or for land development in the vicinity of the railroads. (Back to top)

Will the STB consider safety issues?
Yes. Although ensuring freight rail safety is the primary responsibility of the Federal Railroad Administration, the STB also takes safety concerns into consideration in its decisionmaking. This includes vehicle safety, passenger rail safety, freight rail safety, pedestrian safety, bicycle safety, emergency vehicle response and hazardous material transportation. Safety concerns are usually raised and addressed in the STB's environmental review process. (Back to top)

In the future, could CN run more trains over the EJ&E rail line?
Because of physical and operational constraints on the EJ&E rail line, SEA concluded that, under the CN proposed operating plan, the EJ&E rail line would be operated at or very near to capacity. In other words, it is unlikely that the number of trains using the EJ&E rail line would be higher than that estimated by CN in the proposed operating plan. SEA conducted numerous independent rail capacity and constraint analyses before reaching this conclusion. (Back to top)

Has the Board ever denied a request for approval of a railroad acquisition?
Yes. The Board and its predecessor agency, the Interstate Commerce Commission, have denied some rail merger and acquisition proposals. Each case is unique, however, and the Board makes a decision in each case before it based on the full record of the transportation merits and the potential environmental impacts. Only after considering the full record does the Board make a decision to grant, to deny, or to grant with mitigating conditions. (Back to top)

If the Board denies the acquisition application, can CN use the EJ&E line anyway?
Yes. CN currently has trackage rights to the EJ&E rail line, giving it the right to use the EJ&E line, and could shift an increased number of trains onto the EJ&E rail line. CN would not need Board approval to exercise its existing trackage rights on the EJ&E. (Back to top)

Where can I get more information on the pending CN-EJ&E acquisition case or other proposals currently before the STB?
Please visit the STB's website at http://www.stb.dot.gov. The STB maintains an electronic public docket and information system designed to permit prompt and easy public access to all filings and comments submitted to the STB and decisions issued by the agency. Information about the pending CN-EJ&E acquisition case can be found by referencing STB Finance Docket No. 35087, *Canadian National Railway Company and Grand Trunk Corporation Control-EJ&E West Company*.

SEA also maintains a project specific website at http://www.stbfinancedocket35087.com. (Back to top)

How can I submit comments on the Draft EIS?
SEA encourages all interested parties to submit written comments on any aspect of the Draft EIS. SEA will consider all comments in preparing the Final EIS, which will include responses to

all substantive comments, SEA's final conclusions on potential impacts, and SEA's final recommendations.

Comments on the Draft EIS may be submitted by mail, by e-file, or by telephone. All correspondence should refer to STB Finance Docket No. 35087. The deadline for comments on the Draft EIS is **September 30, 2008**.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

Written comments should be mailed to:

Phillis Johnson-Ball
STB Finance Docket No. 35087
Surface Transportation Board
395 E Street, S.W.
Washington, DC 20423-0001

Environmental comments can also be filed electronically on the Board's web site, http://www.stb.dot.gov, by clicking on the "E-FILING" link. Comments are accepted at the toll-free project information line at 1-800-347-0689. A Spanish language option is available.

SEA will also hold 8 open house/public meetings to present the conclusions in the Draft EIS and invite interested parties to make oral comments. The dates, times, and locations of these public meetings are shown on the Public Involvement page. (Back to top)

Comments on the Draft EIS can be submitted in several ways:

- Written Comments
- Recorded Comments
- Electronic Comments

Written Comments: Written letters must be **postmarked by September 30, 2008**, to:

Phillis Johnson-Ball
Surface Transportation Board
395 E Street, SW
Washington, DC 20423
Ref: STB Finance Docket No. 35087

Recorded Comments: Comments may be recorded at any time during the comment period on the project hotline: **1-800-347-0689**.

Electronic Comments: Comments may be filed electronically on the Board's website, www.stb.dot.gov, by clicking on the **E-FILING** link. Please refer to STB Finance Docket No. 35087.

All comments received - written, E-filed, or oral - will carry equal weight in helping to finalize the EIS and guide the Board in its decision making on this matter.

Please refer to STB Finance Docket No. 35087 in all correspondence addressed to the Board. The comment period for the Draft EIS is July 25, 2008 to September 30, 2008.

Submitting a comment will also add your name to the SEA mailing list for notice of the distribution of the Final EIS. This mailing list will also be used to distribute any other important information regarding the project. You can be added to the mailing list without submitting a comment by using the same contact information listed above.

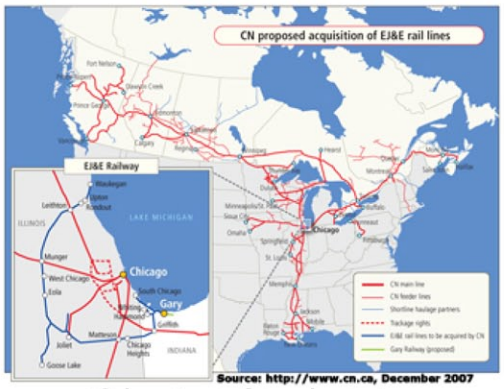
The comment period on the Draft EIS closed September 30, 2008. The Board is currently reviewing and incorporating all comments submitted within the comment period in the Final EIS.

Speakers at Previous Meetings

Welcome!

Welcome to the website for information regarding the Surface Transportation Board's environmental review of the proposed Canadian National Railway Company acquisition of the Elgin, Joliet and Eastern Railway Company.



Use the navigation buttons to the left to view information about the environmental study currently underway.

Project Overview

On October 30, 2007, Canadian National Railway Company (CN) (along with its U.S. subsidiary, Grand Trunk Corporation), filed an application with the Surface Transportation Board (Board) seeking to acquire EJ&E West Company, a wholly owned noncarrier subsidiary of Elgin, Joliet and Eastern Railway Company (EJ&E).

CN is one of Canada's two major railroads. It extends from Halifax, Nova Scotia, to Vancouver and Prince Rupert, British Columbia. EJ&E is a Class II railroad that currently operates over

200 miles of track in northeastern Illinois and northwestern Indiana, consisting primarily of an arc around Chicago, Illinois. This arc extends from Waukegan, Illinois, southward to Joliet, Illinois, then eastward to Gary, Indiana, and then northwest to South Chicago, Illinois, along Lake Michigan, as shown in the inset image. EJ&E provides rail service to approximately 100 customers, including steel mills, coal utilities, plastics and chemical producers, steel processors, distribution centers, and scrap processors.

Click on image for a closer view.

CN's proposed acquisition of EJ&E would shift rail traffic currently moving over CN's rail lines inside the EJ&E arc in Chicago to EJ&E rail lines, which traverse the suburbs generally to the west and south of Chicago. Rail traffic on CN lines inside the EJ&E arc would generally decrease. The decreases in rail traffic would be offset by increases in the number of trains operating on the EJ&E rail line outside of Chicago (approximately 15 to 27 more trains would operate on various segments of the EJ&E rail lines).

CN plans to construct six new rail-to-rail connections between existing rail lines and the newly acquired EJ&E line at the following locations:

1. Munger, Illinois
2. Joliet, Illinois
3. Matteson, Illinois
4. Griffith, Indiana
5. Ivanhoe, Indiana
6. Kirk Yard (Gary), Indiana

In addition to the six new rail-to-rail connections, CN plans to construct 19 miles of new sidings and double tracking at the following Illinois locations:

1. Leithton (near Libertyville)
2. Between East Siding/Eola and Walker
3. Between East Joliet and Frankfort

Applicants state three primary purposes for pursuing the Control Transaction. First, they believe the Control Transaction would improve their operations in and beyond the Chicago area by providing CN with a continuous rail route around Chicago, under applicants' ownership, that would connect the five CN lines that presently radiate from Chicago. Second, acquiring EJ&E's rail assets would make available to applicants EJ&E's Kirk Yard--an automated classification facility in Gary--as well as smaller facilities in Joliet and Whiting, IN, thus enabling applicants to consolidate car classification work at Kirk and East Joliet Yards and to reduce use of the Belt Railway Company of Chicago's (BRC) Clearing Yard. Lastly, applicants state that their system would benefit from the fact that EJ&E provides an important supply line for North American steel, chemical, and petrochemical industries, as well as for Chicago area utilities and others, which would allow applicants to develop closer and more extensive relationships

with companies in and serving those industries.

To thoroughly assess the potential environmental impacts that may result from the proposed acquisition, the Board through its Section of Environmental Analysis (SEA), will prepare an Environmental Impact Statement (EIS). Learn more about the EIS process on the Environmental Review Process page.

The following abbreviations are used throughout this website:

Environmental Review Process

The National Environmental Policy Act (NEPA) process is intended to assist the Board and the public in identifying and assessing the potential environmental consequences of a proposed action before a decision on that proposed action is made. SEA is responsible for ensuring that the Board complies with NEPA and related environmental statues.

Steps of the Environmental Review Process are as follows:

- Notice of Intent
- Draft Scope of Study
- Public Scoping Meetings
- Final Scope of Study
- Draft EIS
- Public Comment
- Final EIS
- Decision

Notice of Intent

The Notice of Intent (NOI) is a document prepared by the Board that states the intent to prepare an EIS. It is mailed to all parties on the environmental distribution list and is posted on the Board's website. The NOI provides information about the next steps of the environmental review process, including the draft Scope of Study, and public scoping meetings. The NOI was published on December 21, 2007, and is available on the News & Information page.

Draft Scope of Study

A draft Scope of Study was developed for the EIS and published in the Federal Register on December 21, 2007. Public comments on the draft Scope of Study were accepted until February 15, 2008. The draft Scope of Study incorporated the environmental issues and concerns with regard to aspect's of the environmental review process. The draft Scope of Study is available on the News & Information page.

Public Scoping Meetings

Scoping is an open process to determine the range of issues that should be examined and assessed in the EIS. The scoping process included a number of public open house scoping meetings held in the affected area in mid-to late January 2008. At the meetings, members of the public had the opportunity to discuss their interests and concerns with SEA staff. Click here for information regarding the Scoping Period meetings and comment period.

Final Scope of Study

A final Scope of Study for the EIS was prepared based on the comments received on the draft Scope of Study. The final Scope of Study was published in the Federal Register on Friday, April 25 and is available on the News and Information page.

Draft EIS

SEA prepared a Draft EIS for the project. The Draft EIS addressed required environmental subjects as well as those environmental issues and concerns identified during the scoping process. The Draft EIS was served on July 25, 2008, and is available on the Draft EIS page. It contains SEA's preliminary recommendations for environmental mitigation measures.

Public Comment

The public, agencies, elected officials, and communities have the opportunity to actively participate and comment on the environmental review process. The Board invited these stakeholders to review the Draft EIS, attend public meetings, and submit comments. The comment period on the Draft EIS was open July 25th through September 30, 2008. Comments were accepted in several ways:

- Written Comments - Comment forms submitted at the public meeting or written letters to the board.
- Electronic Comments - E-filings on the Board's website.
- Recorded Comments - Voicemail messages on the project hotline, oral comments with a court reporter at a public meeting, or providing a 3-minute oral comment during the public meeting.

Final EIS

SEA is currently preparing the Final EIS that will address the comments on the Draft EIS from the public and agencies.

Decision

The Board will review the Final EIS and then issue a decision on the proposed project. In reaching its decision in this case, the Board will take into account the Draft EIS, the Final EIS, public comments, and the environmental analysis and recommendations, including any environmental mitigation proposed by SEA.

The following abbreviations are used throughout this website:

- **Board** - Surface Transportation Board
- **CN** - Canadian National Railway Company and Grand Trunk Corporation
- **EIS** - Environmental Impact Statement
- **EJ&E** - Elgin, Joliet and Eastern Railway Company

Section of Environmental Analysis

July 25, 2008

Re: STB Finance Docket No. 35087, Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company; Issuance of Draft Environmental Impact Statement

Dear Reader:

The Section of Environmental Analysis (SEA) is pleased to provide you with your copy of the Draft Environmental Impact Statement (EIS) on the proposed acquisition of the Elgin, Joliet & Eastern Railroad by Canadian National Railway and Grand Trunk Corporation (Applicants). This Draft EIS analyzes the environmental impacts that might occur if the Applicants were to acquire and operate trains over the EJ&E Railroad, an approximately 200-mile long railroad that forms an arc from the northwest to the southeast suburbs of Chicago, approximately 40 miles outside the city. The potential environmental impacts to both the human and the natural environments that could result from the proposed acquisition are compared to the environmental impacts of continuing rail operations on the EJ&E rail line and the five CN rail lines that feed into Chicago.

The Draft EIS also sets forth SEA's preliminary recommended mitigation, Applicants' voluntary mitigation measures, and encourages mutually acceptable negotiated agreements to mitigate adverse environmental impacts should the Board approve this acquisition. The Draft EIS reflects the active participation – more than 5000 comments submitted to date – of members of the public in the Chicagoland area and beyond.

SEA invites public comment on all aspects of the Draft EIS and is providing a 60-day public comment period, which begins upon the U.S. Environmental Protection Agency's issuance of a notice of availability in the Federal Register on August 1, 2008. Comments on the Draft EIS must be postmarked by September 30, 2008. Instructions on how to submit comments, and a list of the location, dates, and times of the open house/public meetings to be held in the Chicagoland area, are attached to this letter in a separate Fact Sheet. After your review of the Draft EIS, we appreciate your comments on ways to improve our analyses, make corrections and supplement what you feel needs further work. The more specific your comments are, the better we will be able to respond to them.

After the close of the public comment period on the Draft EIS, SEA will prepare a Final EIS in response to comments on the Draft EIS. The Board will then issue a final decision, based on the entire environmental record, including the record on the transportation merits, the Draft EIS, the Final EIS, and all public and agency comments received. The Board then will decide whether to approve the proposed acquisition, deny it, or approve it with mitigating conditions, including environmental conditions.

The Draft EIS is also available for viewing and downloading via the Board's Web site at http://www.stb.dot.gov, under "E-Library," then under "Decisions & Notices," beneath the date "7/25/08."

For further information on the proceeding, please visit the project web site at www.stbfinancedocket35087.com or call the toll-free information line at 1-800-347-0689. You may also visit the Board's website (www.stb.dot.gov) and look for Key Cases under Environmental Matters.

SEA has distributed the Draft EIS widely for public review and comment. Approximately 5,000 copies of the Draft EIS on compact discs have been distributed to all parties on SEA's environmental distribution list, which includes interested Federally recognized tribes, key governmental agencies, elected officials, and persons expressing an interest in receiving a copy of the Draft EIS or participating in the environmental review process for this proceeding. SEA has also distributed the Draft EIS to all parties of record (official participants), as well as making additional print copies of the Draft EIS available for review in 49 libraries throughout the Study Area.

SEA appreciates the efforts of all interested parties who have participated in this environmental review to date. We look forward to receiving your comments.

Sincerely,

Victoria J. Rutson
Chief
Section of Environmental Analysis

Public Involvement

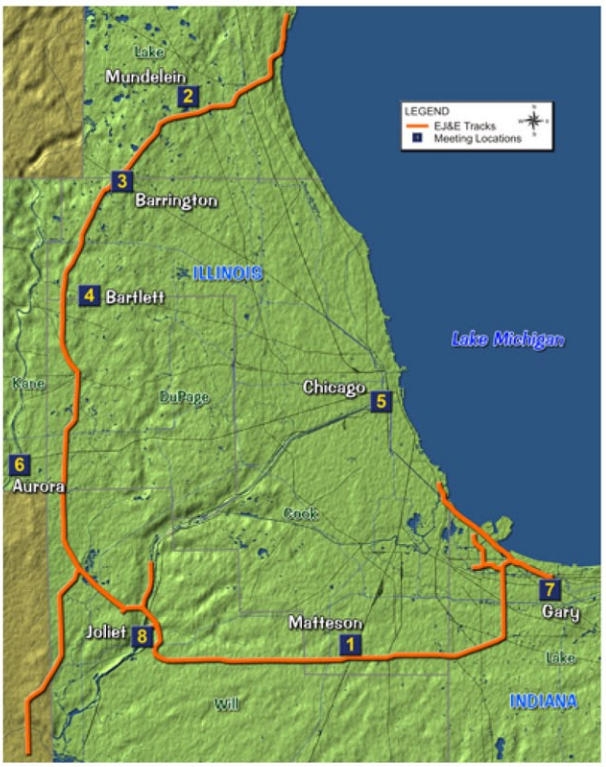
What is the purpose of this website?

This website is intended to provide necessary information to the public and to encourage all interested parties to participate in the EIS process. This website also provides guidance on how to submit comments (see the Contact Information page).

When can I get involved?

SEA appreciates and desires the public to be actively involved in the environmental review process. SEA has conducted public meetings at two different points in the environmental review process. In January, SEA hosted a series of public meetings and received public comments during the Scoping Period. Click here for information regarding the scoping period meetings and comment period. With the release of the Draft EIS, SEA once again soliciting public comment and hosted public meetings. Information available during the Draft EIS public meetings is presented here.



When were the Draft EIS public meetings held?

Beginning on August 25, 2008, SEA hosted **eight public meetings** throughout the Chicagoland area to present the findings of the Draft EIS and receive public comments. Each public meeting consisted of an informal open house segment from 4:00 to 6:00 PM, followed by a formal public meeting from 6:00 to 9:00 PM. At the beginning of each formal public meeting segment, SEA gave a brief overview of its findings in the Draft EIS and then invited interested parties to make oral comments and/or submit written comments. SEA had a transcriber present to record the oral comments in either English or Spanish. The dates and locations of the public meetings are shown below:

Ref No.	Date	Location
1	Monday August 25, 2008	Holiday Inn Hotel 500 Holiday Plaza Drive Matteson, IL 60443

Click on a number for a detailed map.

2	Tuesday August 26, 2008	Crowne Plaza Chicago North Shore 510 E Route 83 Mundelein, IL 60060
3	Wednesday August 27, 2008	Barrington High School 616 W Main Street Barrington, IL 60010
4	Thursday August 28, 2008	Bartlett High School 701 Schick Road Bartlett, IL 60103
5	Monday September 8, 2008	Loyola University Rubloff Auditorium 25 E Pearson Chicago, IL 60611
6	Tuesday September 9, 2008	West Aurora High School 1201 W New York Street Aurora, IL 60506
7	Wednesday September 10, 2008	Indiana University Northwest Auditorium 3400 Broadway Gary, IN 46408
8	Thursday September 11, 2008	Holiday Inn Hotel 411 S Larkin Avenue Joliet, IL 60436

Those that attended the public meeting were given a public meeting guide with important project information.

Information on this study was presented on a series of boards (30" x 40"). These boards are available for viewing (click on links below) and include:

- Board 1 - Welcome
- Board 2 - Purpose of this Meeting
- Board 3 - Purpose of the Acquisition
- Board 4 - Project Location Map

Scoping Period Meetings and Comment Summary

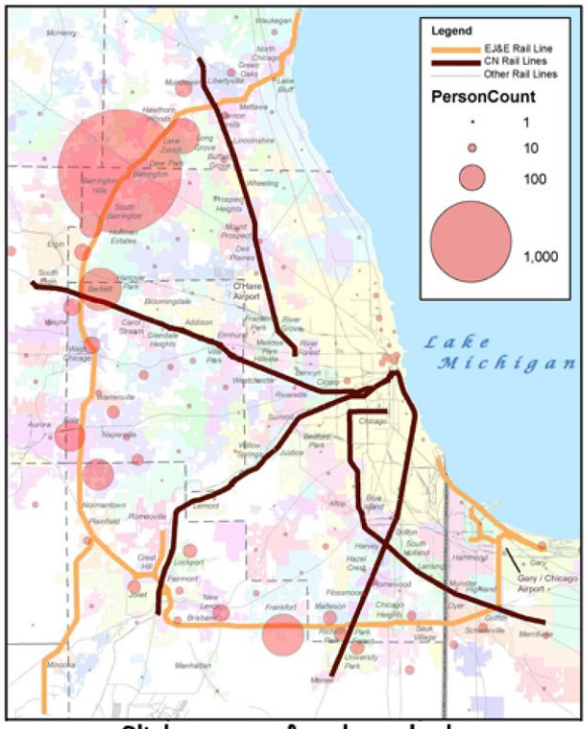
When were the scoping meetings held?

Scoping meetings were held January 8, 9, 10, 15, 16, 17, and 22, 2008, in Mundelein, Barrington, Joliet, Matteson, Gary, West Chicago, and Chicago respectively. All scoping meetings were held in an open house format, with the same information presented during each meeting.

In keeping with the open house format of the scoping meetings, there were no formal presentations made by agency representatives. Rather, SEA staff was available to answer questions and receive comments individually. Interested persons asked questions about the proposed acquisition and the Board's environmental review process, and discussed the potential environmental effects of the proposed acquisition with project team members.

Information on this study was presented on a series of boards (30" x 40"). These boards are available for viewing (click on links below) and include:

- Welcome
- What is the Purpose of This Open House Scoping Meeting?
- Who is Hosting This Meeting?
- What is the Proposed Acquisition?/What is the Purpose of the Acquisition?
- Project Location Map
- What Changes are Anticipated from the Acquisition?
- Communities Along Affected Rail Line Segments
- Anticipated Changes to Rail Traffic Volumes
- What Process Will SEA Follow?
- What Issues did the Draft Scope of Study Identify?
- How Do I Submit Comments?



A series of flip charts were used to illustrate proposed track improvements at six locations along the EJ&E rail line. These charts are available for viewing (click on links below) and include:

- Project Track Improvements - Proposed Rail Connection on EJ&E Locations

- Project Track Improvements - Munger, IL
- Project Track Improvements - Joliet, IL
- Project Track Improvements - Matteson, IL
- Project Track Improvements - Griffith, IN
- Project Track Improvements - Ivanhoe, IN
- Project Track Improvements - Kirk Yard, IN

What comments were received during the Scoping Period?

3,683 comments on the Draft Scope of Study were submitted from members of the public, government officials, businesses, and other interested stakeholders. The map below shows the distribution of comments received within the Chicago metro area. Additionally, comment summary reports for some of the larger distributions of comments are provided.

Click on map for closer look.

Information Request

SEA has made several information requests from the applicants in regard to the proposed Canadian National Railway Company acquisition of the Elgin, Joliet and Eastern Railway Company. This information will assist SEA in conducting the environmental review of the proposed acquisition required by the National Environmental Policy Act. As the review proceeds, further information requests may be necessary to ensure the study is conducted thoroughly. These information requests and the responses from the applicants are available below.

News and Information

The Board and SEA

For more information on the Board and SEA, please click here (PDF 31KB).

Find information requested of the applicants from the Board on the Information Request Page.

Announcements and News Releases

July 25, 2008 - The Board released the Draft EIS. This document is available on the Draft EIS page. The comment period for the Draft EIS closed September 30, 2008. To help inform stakeholders of the contents of the Draft EIS, eight public meetings were held during the comment period. See the Public Involvement page for information regarding public meetings.

April 25, 2008 - The Board released the Final Scope of Study. This document was published in the Federal Register and incorporates comments received on the Draft Scope of Study. The Board issued a clarification to the Final Scope of Study on Monday, April 28, 2008. View the addendum to the Final Scope of Study here (PDF 35KB) and the new version of the Final Scope of Study here (PDF 88KB).

April 23, 2008 - The Board released Decision No. 9 (PDF 72KB) regarding the six proposed connections. Illustrations of the proposed track improvements are available on the Scoping Period Meetings and Comment Summary page.

February 15, 2008 - The deadline for comments on the draft Scope of Study has closed. The next opportunity for public review and comment will occur after the release of the Draft EIS.

January 27, 2008 - The Board extended the comment period of the draft Scope of Study for the EIS to February 15, 2008. See the postcard that announced the extension.

December 12, 2007 - This press release (PDF 18KB) from the Board is regarding public involvement and the review process for the project. This document contains information about

what procedures will be followed for reviewing the impacts of the proposed acquisition and how public input will play a role in that process.

Project Information

On January 8, 9, 10, 15, 16, 17, and 22, 2008, public open house meetings were conducted in Mundelein, Barrington, Joliet, Matteson, Gary, West Chicago, and Chicago (see map to the left for meeting locations). Over 2,000 interested citizens attended the meetings. A project fact sheet (PDF 31KB) prepared for the public scoping meetings provided a quick overview of the proposed acquisition and explained how to submit comments.

On December 21, 2007, the Board issued a Notice of Intent (NOI) (PDF 52KB) to prepare an EIS and a draft Scope of Study for the project, which gives general project information and information about the first set of public meetings as well as outlines the process that will be followed in the environmental review. The NOI also includes information about the environmental aspects that will be considered in the EIS. The public meetings will present general information about the project and allow the public to submit comments on the study that will be incorporated in the final Scope of Study for the project. You can submit comments on the draft Scope of Study by using the Contact Information page.

On November 27, 2007, the Board issued Decision No. 2: Notice of Acceptance of Primary Application and Related Filings; Issuance of Procedural Schedule (PDF 129KB), in which the Board accepts CN's application for acquisition and adopts a procedural schedule for

consideration of the application.

The above documents are in PDF format. If you need Adobe Reader, click here to download for free.

Frequently Asked Questions

On October 30, 2007, Canadian National Railway Company and Grand Trunk Corporation (CN) filed an application with the Surface Transportation Board seeking the Board's approval to acquire control of EJ&E West Company and to use the EJ&E main rail line to connect all 5 of CN's rail lines in the Chicago, Illinois Metropolitan Area. The EJ&E main line, located in northeastern Illinois and northwestern Indiana, extends in an arc around Chicago, Illinois. The following addresses frequently asked questions about the STB, its decision-making process and authority, and the proposed acquisition.

- What is the Surface Transportation Board (STB or Board)?
- What is the STB's process for authorizing railroad consolidations and acquisitions of control?
- What does NEPA require?
- What is the role of SEA in the NEPA process?
- What is the STB's NEPA process in a railroad acquisition case?
- What is the public's role in the NEPA process?
- How would the CN-EJ&E acquisition affect me and my community?
- Would the STB impose mitigation to reduce the adverse impacts if the CN-EJ&E acquisition were approved?
- What is the Board's authority to impose mitigation?
- Will the STB consider safety issues?
- In the future, could CN run more trains over the EJ&E rail line?
- Has the Board ever denied a request for approval of a railroad acquisition?
- If the Board denies the acquisition application, can CN use the EJ&E line anyway?
- Where can I get more information on the pending CN-EJ&E acquisition case or other proposals currently before the STB?
- How can I submit comments on the Draft EIS?

What is the Surface Transportation Board (STB or Board)?
The STB was created by the ICC Termination Act of 1995 as a successor to the Interstate Commerce Commission, and is responsible for the economic regulation of freight railroads under the Interstate Commerce Act, pursuant to 49 U.S.C. 701-727 and 10101-16106. Among its various duties, the STB reviews railroad proposals to construct and operate new rail lines, abandon unneeded rail lines, or acquire and operate other lines or other railroads.

The Board itself is a bipartisan body with 3 members who are appointed by the President and confirmed by the Senate for staggered 5-year terms. Currently (as of July 2008), Charles D. Nottingham is the Chairman of the STB, Francis P. Mulvey is the Vice Chairman, and W. Douglas Buttrey is the third member.

Within the STB, the Section of Environmental Analysis (SEA) is responsible for directing the environmental review process for matters that come before the Board, conducting independent analysis of all environmental data, and making environmental recommendations to the Board.

Overall, the STB has a staff of approximately 140 people, consisting of attorneys, economists, transportation industry analysts, engineers, auditors, environmental specialists, and support staff. Although the STB is organizationally within DOT, it operates as an independent regulatory agency. (Back to top)

What is the STB's process for authorizing railroad consolidations and acquisitions of control?

When 2 or more rail carriers seek to consolidate – whether through merger or common control – they must obtain prior STB approval under 49 U.S.C. 11323-25 and 49 CFR Part 1180. In the case of the proposed acquisition of the Elgin, Joliet and Eastern Railway Company (EJ&E) (a Class II railroad) by the Canadian National Railway Company and Grand Trunk Corporation (CN) (a Class I railroad), the STB must approve the acquisition unless it finds (1) as a result of the transaction, there is likely to be substantial lessening of competition, creation of a monopoly, or restraint of trade in freight surface transportation in any region of the United States, and (2) the anti-competitive effects of the transaction outweigh the public interest in meeting significant transportation needs (49 U.S.C. 11324(d)).

After an application for STB approval is filed, the STB sets a procedural schedule that gives interested parties time to submit information on any transportation issues and for the applicant to reply. The STB also prepares environmental analyses and documentation to meet its obligations under environmental laws. The STB then considers the entire record (including all comments received on environmental or transportation issues), in deciding whether to authorize the acquisition application as proposed, deny the proposal, or approve the proposal with conditions imposed to mitigate likely competitive adverse effects or potential safety or environmental concerns.

There are statutory time limits for the STB's processing of merger/control applications. Because the Board determined that the CN-EJ&E acquisition is a minor transaction, the STB's decision normally would be due within six months of the filing of the application (49 U.S.C. 11325(d)). However, the STB must also comply with the National Environmental Policy Act (NEPA), 42 U.S.C. 4321 *et seq*., in its decisionmaking and must complete the necessary environmental review process before making a final decision. Therefore, a final decision here will be issued as soon as possible after completion of the environmental review process. (Back to top)

What does NEPA require?
NEPA requires Federal agencies to examine the potential environmental impacts of their proposed actions, to inform the public concerning those impacts, and to consider the impacts in their decisionmaking. The purpose of NEPA is to focus the attention of the agency and the public on the likely environmental consequences of a proposed action in order to minimize or avoid potential adverse environmental impacts. However, NEPA does not mandate a particular result. Once the adverse environmental impacts have been adequately identified and evaluated, the agency can conclude that other benefits outweigh the environmental costs.

The STB's environmental review process must comply with the requirements of the President's Council on Environmental Quality NEPA regulations (40 CFR Parts 1500-1508) and with its own NEPA-implementing regulations (49 CFR Part 1105). In the case of the proposed CN-EJ&E acquisition, the STB determined that these regulations require the preparation of a full Environmental Impact Statement (EIS) -- the environmental documentation prepared in cases that have potentially significant environmental impacts. (Back to top)

What is the role of SEA in the NEPA process?
Under NEPA, the STB must consider the potential environmental impacts of its action before deciding whether to approve an application. SEA is the office within the STB that gathers and analyzes the environmental record in a case, prepares the NEPA documentation, and provides technical advice and recommendations to the Board on environmental matters. SEA has trained legal and environmental specialists, headed by the Chief of the Section of Environmental Analysis, Victoria Rutson.

SEA often uses "third-party contracting" to help prepare environmental documentation. Third-party contracting is a voluntary arrangement in which the applicant pays for a contractor to assist SEA by developing the environmental analyses necessary for compliance with NEPA and related environmental laws, under SEA's direction, control, and supervision. The Board's environmental rules at 49 CFR 1105.10(d) as well as the CEQ regulations at 40 Code of Federal Regulations [CFR] 1500 – 1508, specifically permit the use of third-party contractors approved by SEA.

The third-party contracting process provides an effective means to prepare an independent, comprehensive environmental analysis that meets the requirements of NEPA and related environmental laws. The contractors function as an extension of SEA's staff. They work under SEA's direction to collect and verify environmental information from the railroads, consulting agencies, other interested parties, and the general public; conduct unbiased environmental analysis; develop appropriate environmental criteria and methodologies for analyzing particular environmental issue areas; and prepare environmental documentation and mitigation options. SEA makes its own evaluation of the environmental issues and is responsible for the scope and content of the NEPA document. (Back to top)

What is the STB's NEPA process in a railroad acquisition case?
If an EIS is prepared, SEA first issues a notice of intent to prepare an EIS and determines the scope of work for the EIS, after providing opportunities for public participation and consultation with appropriate Federal, state, and local agencies and other government entities. SEA

then prepares a Draft EIS that analyzes in detail the potential environmental impacts of the proposed acquisition, considers reasonable and feasible alternatives to the applicant's proposal, and makes recommendations for environmental mitigation. By regulation, the public has at least 45 days to comment on a Draft EIS.

SEA then issues a Final EIS that responds to the public comments, presents the results of any further environmental analysis, and incorporates final environmental mitigation recommendations. The Board then considers both the environmental record (the Draft and Final EISs and all comments received) and the record on the transportation issues to decide whether to authorize the acquisition as proposed, deny the proposal, or approve it with conditions, including environmental conditions (see 49 CFR 1105.10(a) and (f)). (Back to top)

What is the public's role in the NEPA process?
There are ample opportunities for public input during the NEPA process, particularly during scoping (to determine what issues should be addressed in an EIS) and in commenting on a Draft EIS. The public can submit written comments directly to the agency and/or participate in hearings or public meetings. In preparing the Final EIS, the Federal agency must take into consideration, and respond to, the comments received from the public and other parties.

For the EIS on the proposed CN-EJ&E acquisition, SEA held 14 scoping open house meetings in 7 locations in January 2008. In addition to the public scoping meetings, SEA held agency scoping meetings with Federal, state, and local agencies in Illinois and Indiana. At the Illinois agency scoping meeting, a number of agencies asked for a greater role in development of the Draft EIS. In response, SEA established 5 stakeholder focus area groups which reviewed the methodologies and data sources used in the analysis for the Draft EIS, offered comments and suggestions, and provided additional data.

Throughout the EIS process SEA has consulted extensively with appropriate agencies, including the United States EPA and the US Fish and Wildlife Service.

In addition, SEA identified 28 communities with minority or low-income populations potentially affected by the proposed acquisition. SEA then conducted targeted and specific outreach efforts to engage these communities in the environmental review process, including direct calls to elected officials regarding the environmental review process, public scoping meetings, and meetings with local representatives.

The Board is publishing the Draft EIS and is making it available for public review and comment. SEA is also scheduling open houses/public meetings at 8 locations in the Chicago area to give people an opportunity to learn about the Proposed Action and to present their views. SEA will continue to consult with Federal, state, and local agencies, tribes, affected communities, and all interested parties to gather and disseminate information about the proposed acquisition. (Back to top)

How would the CN-EJ&E acquisition affect me and my community?
If the Board were to approve the CN-EJ&E acquisition, CN would redirect its trains from its 5 rail lines in Chicago to the EJ&E rail line, thereby increasing the volume of freight rail traffic

along the EJ&E rail line, with a corresponding decrease in the volume of freight rail traffic along the CN rail lines. The increase in rail traffic along the EJ&E rail line would or could result in increases in:

- Delays at highway/rail at-grade crossings, including delays of school buses and emergency vehicles
- Levels of noise and vibration
- Risk of train accidents
- Air pollutant emissions
- Energy use

Although the risk is still very low, people along the EJ&E rail line would also have an increased risk of exposure to hazardous materials should an accident occur resulting in a release of such materials. Property values could decrease somewhat for residences adjacent to the EJ&E rail line. No impacts to land use and biological, water, and cultural resources or changes to population, housing, and public services are expected. Some of the potential environmental impacts could be reduced or eliminated with mitigation.

The decrease in freight rail traffic along the 5 CN rail lines would result in corresponding benefits (decreases in existing adverse impacts) to the communities along those rail lines. In addition, the proposed redirection of freight rail traffic along the EJ&E line is expected to reduce freight rail delays and rail traffic congestion within the Chicago rail system. (Back to top)

Would the STB impose mitigation to reduce the adverse impacts if the CN-EJ&E acquisition were approved?
As it has in other cases, the Board is very likely to impose mitigation if it were to approve the CN-EJ&E acquisition. Based on the information available to date, consultations with appropriate agencies, and extensive environmental analysis, SEA has developed recommended preliminary environmental mitigation measures to address the identified adverse environmental impacts. These measures include requiring CN to take actions to reduce emergency vehicle delays, levels of noise and vibration, and the risk of accidents, including accidents involving hazardous materials. In addition, CN has submitted 76 voluntary mitigation measures.

As an alternative to the mitigation that the Board might unilaterally impose upon applicants, SEA encourages applicants to negotiate mutually acceptable agreements with affected communities to address potential environmental impacts. Negotiated agreements can be with neighborhoods, communities, cities, counties, regional coalitions, states, or other entities. If negotiated agreements are submitted to the Board, the Board's practice is to include a condition in any final decision approval of the proposed transaction requiring applicants to comply with the terms of the negotiated agreement. (Back to top)

What is the Board's authority to impose mitigation?
As a government agency, the Board can only impose conditions that are consistent with its statutory authority. Any conditions the Board imposes must relate directly to the transaction before it, must be reasonable, and must be supported by the record before the Board. The Board typically does not require mitigation for existing environmental conditions, such as the

effects of current railroad operations, or for land development in the vicinity of the railroads. (Back to top)

Will the STB consider safety issues?
Yes. Although ensuring freight rail safety is the primary responsibility of the Federal Railroad Administration, the STB also takes safety concerns into consideration in its decisionmaking. This includes vehicle safety, passenger rail safety, freight rail safety, pedestrian safety, bicycle safety, emergency vehicle response and hazardous material transportation. Safety concerns are usually raised and addressed in the STB's environmental review process. (Back to top)

In the future, could CN run more trains over the EJ&E rail line?
Because of physical and operational constraints on the EJ&E rail line, SEA concluded that, under the CN proposed operating plan, the EJ&E rail line would be operated at or very near to capacity. In other words, it is unlikely that the number of trains using the EJ&E rail line would be higher than that estimated by CN in the proposed operating plan. SEA conducted numerous independent rail capacity and constraint analyses before reaching this conclusion. (Back to top)

Has the Board ever denied a request for approval of a railroad acquisition?
Yes. The Board and its predecessor agency, the Interstate Commerce Commission, have denied some rail merger and acquisition proposals. Each case is unique, however, and the Board makes a decision in each case before it based on the full record of the transportation merits and the potential environmental impacts. Only after considering the full record does the Board make a decision to grant, to deny, or to grant with mitigating conditions. (Back to top)

If the Board denies the acquisition application, can CN use the EJ&E line anyway?
Yes. CN currently has trackage rights to the EJ&E rail line, giving it the right to use the EJ&E line, and could shift an increased number of trains onto the EJ&E rail line. CN would not need Board approval to exercise its existing trackage rights on the EJ&E. (Back to top)

Where can I get more information on the pending CN-EJ&E acquisition case or other proposals currently before the STB?
Please visit the STB's website at http://www.stb.dot.gov. The STB maintains an electronic public docket and information system designed to permit prompt and easy public access to all filings and comments submitted to the STB and decisions issued by the agency. Information about the pending CN-EJ&E acquisition case can be found by referencing STB Finance Docket No. 35087, *Canadian National Railway Company and Grand Trunk Corporation Control-EJ&E West Company*.

SEA also maintains a project specific website at http://www.stbfinancedocket35087.com. (Back to top)

How can I submit comments on the Draft EIS?
The comment period on the Draft EIS closed September 30, 2008. The Board appreciates all comments submitted on the Draft EIS and will incorporate these comments into the Final

EIS. (Back to top)

JUNTA DE TRANSPORTE DE SUPERFICIE
EXHIBICIÓN PÚBLICA/JUNTAS PÚBLICAS

En el 25 de julio, 2008, la Junta de Transporte de Superficie (Junta) distribuyo el Borrador de la Declaración de las Consecuencias para el Medioambiente (Borrador de la EIS) para la adquisición propuesta por el ferrocarril Canadian National del ferrocarril Elgin, Joliet and Eastern. Como parte del proceso del EIS, la Sección de Análisis Medioambiental (SEA) de la Junta tendrá ocho juntas públicas para presentar sus conclusiones del Borrador de la EIS y para dar la oportunidad para comentario público sobre el documento.

SEA tendrá las juntas públicas en las siguientes fechas y en las siguientes ubicaciones:

1 lunes, 25 de agosto, 2008
Holiday Inn
500 Holiday Plaza Dr.
Matteson, IL 60443

2 martes, 26 de agosto, 2008
Crowne Plaza Hotel
510 E. Route 83
Mundelein, IL 60060

3 miércoles, 27 de agosto, 2008
Barrington High School Gym
616 W. Main St.
Barrington, IL 60010

4 jueves, 28 de agosto, 2008
Bartlett High School Auditorium
701 W. Schick Rd.
Bartlett, IL 60103

5 lunes, 8 de septiembre, 2008
Loyola University of Chicago
Rubloff Auditorium
25 E. Pearson St.
Chicago, IL 60611

6 martes, 9 de septiembre, 2008
West Aurora High School Auditorium
1201 W. New York St.
Aurora, IL 60506

7 miércoles, 10 de septiembre, 2008
Indiana University Northwest
Savannah Center
3400 Broadway
Gary, IN 46408

8 jueves, 11 de septiembre, 2008
Holiday Inn
411 S. Larkin Ave.
Joliet, IL 60436

Las instalaciones de las juntas estan en concordancia con el Acto de Americanos con Desabilidades. Personas que necesitan ajustes especiales adicionales deben llamar al 800-347-0689, 48 horas antes de la junta pública

La misma información será presentada en cada junta y seguirá el horario delineado abajo:

Exhibición Pública– 4:00 PM – 6:00 PM

SEA y su consultante, HDR, Inc. estarán disponible para contestar preguntas y ayudar a los miembros del público revisar los mapas del proyecto y otras conclusiones del análisis del Borrador de la EIS.

Junta Pública – 6:00 PM – 9:00 PM

SEA hará una presentación corta al público y luego estará disponible para recibir comentario formal sobre el Borrado de la EIS. Esta porción de la junta se llevará a cabo para el propósito de recibir comentario. Esto no está intentado para ser una sesión de preguntas y respuestas.

Registración de hablantes será determinado por orden de llegada llamando a la línea de teléfono de información para preregistrarse en avance o por registrarse en las mesas de entrada el día de la junta pública. Registración por teléfono se acabará a las 6 PM el día antes de la junta. Cada hablante tendrá hasta 3 minutos para presentar su comentario.

Por favor de mandar todo comentario por escrito a: Phillis Johnson-Ball, Surface Transportation Board, 395 E Street, SW, Washington, DC 20423; Attention: Environmental Filing, STB Finance Docket No. 35087. Someter comentario electrónico visitando al sitio de Web de la Junta, www.stb.dot.gov, bajo el encabezamiento E-Filing. Por favor de referir al STB Finance Docket No. 35087. Reporteros judiciales estarán disponibles en la junta para aquellos que desean dictar su comentario en vez de presentarlos públicamente. Comentario también puede ser grabado cualquier tiempo durante el periodo de comentario en la línea de teléfono de información: 1-800-347-0689.

Todo comentario recibido tendrá el mismo impacto en ayudar a finalizar el EIS y guiar la Junta en su proceso de tomar decisiones en este asunto. ***El periodo de comentario sobre el Borrador del EIS se acabará el 30 de septiembre, 2008.***

Para más información sobre este procedimiento, por favor visite el sitio de Web del proyecto en www.stbfinancedocket35087.com, o llame a la línea de teléfono gratuito de información al 1-800-347-0689. También puede visitar al sitio de Web de la Junta (www.stb.dot.gov) y busque a Key Cases bajo Environmental Matters.

para el Borrador de la Declaración de las Consecuencias para el Medioambiente en relación a la adquisición propuesta por Canadian National Railway de Elgin, Joliet & Eastern Railway Company

Horario de Esta Noche

4 - 6 PM **Exhibición Abierta**
No habrá presentación formal, sólo discusiones informales

6 - 9 PM **Junta Pública**
Corta presentación seguida por comentarios orales

Visión General de la Solicitud

Acción Propuesta

El 30 de Octubre del 2007, Canadian National (CN) presentó una solicitud ante la Junta de Transporte de Superficie (Junta) buscando su aprobación para la adquisición de Elgin, Joliet & Eastern Railway Company (EJ&E). Con la Acción Propuesta se anticipan los siguientes cambios:

- •Seis conexiones nuevas riel-a-riel entre líneas existentes.
- Adición de 19 millas de extensión de apartadero y doble vías
- Aumento del uso de Kirk Yard y East Joliet Yard
- Aumento del tráfico ferroviario por aproximadamente 15 a 24 trenes por día en la línea ferroviaria de EJ&E entre Libertyville, IL, y Gary, IN
- Disminución del tráfico ferroviario en la línea ferroviaria de CN dentro del arco de EJ&E
- Eliminación del tráfico ferroviario en la línea ferroviaria de CN desde St. Charles Air Line cerca de McCormick Place

Propósito y Necesidad

Según CN, los tres propósitos principales de la Acción Propuesta son:

1. Mejorar las operación dentro y fuera del área de Chicago proveyendo una ruta ferroviaria continua alrededor de la Ciudad que enlace a las cinco líneas ferroviarias de CN radiando de Chicago
2. Consolidar todo trabajo de clasificación de vagones en los astilleros pertenecientes a CN para reducir el uso de los servicios de Belt Railway Company de Chicago Clearing Yards
3. Proveer acceso a los clientes localizados en EJ&E, incluyendo las industrias de acero, químicos, petroquímicos y servicios

Palabras Claves y Abreviaciones

Las siguientes son palabras claves o abreviaciones usadas en esta Guía de la Junta Pública.

Solicitantes:	Canadian National Railway Company y Grand Trunk Corporation (CN)
Acción Propuesta:	La adquisición propuesta por los Solicitantes para controlar Elgin, Joliet & Eastern West Company (EJ&E), usar la línea de ferroviaria de EJ&E para conectar las cinco líneas ferroviarias de CN en Chicago y la desviación de algunos trenes de operar dentro del arco de EJ&E a la línea ferroviaria de EJ&E
Junta:	Junta de Transporte de Superficie (STB)
SEA:	Sección de Análisis Medioambiental (una oficina dentro de la Junta responsable de conducir la revisión medioambiental)

Fechas y Ubicaciones de las Juntas Públicas:

SEA ofrecerá 8 exhibiciones abiertas/juntas públicas para presentar los resultados del Borrador de la Declaración de las Consecuencias Medioambiental (Borrador de la EIS) e invitará a las partes interesadas hacer comentarios orales. Las fechas, horas, y ubicaciones de las juntas públicas son las siguientes:

1 **Lunes, 25 de agosto del 2008**
Holiday Inn
500 Holiday Plaza Dr.
Matteson, IL 60443

2 **Martes, 26 de agosto del 2008**
Crowne Plaza Hotel
510 E. Route 83
Mundelein, IL 60060

3 **Miércoles, 27 de agosto del 2008**
Barrington High School Gym
616 W. Main St.
Barrington, IL 60010

4 **Jueves, 28 de agosto del 2008**
Bartlett High School Auditorium
701 W. Schick Rd.
Bartlett, IL 60103

5 **Lunes, 8 de septiembre del 2008**
Loyola University of Chicago
Rubloff Auditorium
25 E. Pearson St.
Chicago, IL 60611

6 **Martes, 9 de septiembre del 2008**

8 **Jueves, 11 de septiembre del 2008**
Holiday Inn
411 S. Larkin Ave.
Joliet, IL 60436

Formato y Reglas Básicas de las Juntas Públicas

Todas las juntas consistirán de una exhibición abierta seguida por una junta pública. La misma información se presentará en cada junta pública y se regirá al horario indicado abajo.

EXHIBICIÓN ABIERTA 4:00 PM – 6:00 PM

Empleados de la Junta y de HDR, Inc., estarán disponibles para contestar preguntas y para ayudar a los miembros del público a revisar los mapas del proyecto y otros resultados del Borrador de la EIS y el análisis.

JUNTA PÚBLICA 6:00 PM – 9:00 PM

Empleados de la Junta y de HDR, Inc., harán una presentación corta al público y luego estarán disponibles para recibir los comentarios formales sobre el Borrador de la EIS. Esta parte de la reunión se llevara a cabo con el propósito de recibir comentarios. No es una sesión de preguntas y respuestas.

A partir del 25 de julio del 2008, la registración de hablantes se determinará por orden de inscripción al llamar a la línea telefónica de información para registrarse de antemano (1-800-347-0689) o al registrarse en las mesas de inscripción el día de la junta pública. A cada hablante se le permitirá hasta 3 minutos para presentar sus comentarios

El respeto mutuo, la cortesía y la paciencia son los principios fundamentales de la junta. Para mantener una ambiente en donde todos se sientan cómodos y bienvenidos, le rogamos que siga las siguientes reglas básicas:

- No se permite el uso de letreros, carteles o dispositivos visuales en el salón de la junta.
- Favor de no interrumpir a los hablantes mientras estén hablando.
- Favor de mantenerse callado mientras esté en la audiencia para que el reportero judicial pueda escuchar y registrar los comentarios correctamente.
- Cuando esté hablando, favor de no dirigirse a la audiencia ni buscar la participación de la audiencia.
- Favor de apagar celulares y beepers o prográmelos para que vibren..

Directrices de las Juntas Públicas

Los procedimientos para la inscripción y participación de los hablantes están listados a continuación. El moderador tiene la autoridad de apartarse de estos procedimientos si es necesario.

1. Todos los hablantes están requeridos a registrarse llamando de antemano a la línea de información de esta junta (1-800-347-0689) o registrándose en la Mesa de Inscripción para Hablantes de esta junta.
2. Una lista con los hablantes registrados será entregada al moderador y al reportero judicial al inicio de la junta pública. Hablantes serán llamados basados en la orden en que fueron registrados. Los oficiales Federalmente electos serán puestos al principio de la lista de hablantes.
3. Para poder acomodar el mayor número de hablantes posibles, individuos que ya hayan hablado en otra junta pública para este procedimiento serán puestos al final de la lista de hablantes.
4. A cada hablante se le brindará un máximo de 3 minutos para presentar sus comentarios. Un controlador del tiempo alertará al hablante a los 2 minutos, a los 2 minutos y medio y al cumplirse los 3 minutos.
5. Se les recomienda a los hablantes resumir los comentarios escritos en vez de leerlos en su totalidad.
6. Para permitir iguales oportunidades a todos, y para acomodar al número de personas que quieran hablar, no se permitirá el ceder el tiempo a otra persona.
7. No se permitirá la presencia de manifestantes ni en la exhibición abierta y en la junta pública.
8. Réplicas de las juntas públicas estarán disponibles en el sitio de Web de Junta (*http://www.stb.dot.gov*) aproximadamente dos semanas después de las juntas públicas.

En adición al hablar en las juntas públicas, comentarios detallados escritos u orales sobre el Borrador de la EIS pueden ser sometidos por otros métodos que están descritos en la página 16 de esta guía. Todos los comentarios recibidos tendrán el mismo peso en el proceso y recibirán el mismo nivel de atención. La fecha límite para los comentarios sobre el Borrador de la EIS es el **30 de septiembre del 2008.**

PREGUNTAS QUE SE HACEN CON FRECUENCIA

El 30 de octubre de 2007, la Canadian National Railway Company y la Grand Trunk Corporation (CN) presentaron una aplicación a la Junta de Transporte de Superficie con el propósito de recibir la aprobación de la Junta para adquirir control sobre la EJ&E West Company y de usar la vía principal de la EJ&E para conectar todos las 5 líneas férreas de CN en el Área Metropolitana de Chicago, Illinois. La línea principal de EJ&E, situada en Illinois del noreste e Indiana del noreste, extiende en un arco alrededor de Chicago, Illinois. A continuación se consideran las preguntas que se hacen con más frecuencia acerca de la STB, su proceso de toma de decisiones y autoridad, y de la adquisición propuesta.

¿Qué es la Junta de Transporte (STB o la Junta)?

El STB fue creado por el ICC Termination Act de 1995 como sucesor de la Interstate Commerce Commission, y es responsable por la regulación económica de las líneas férreas de carga bajo el Interstate Commerce Act, en conformidad con 49 U.S.C. 701-727 y 10101-16106. Entre sus varias responsabilidades, la STB revisa propuestas para las líneas férreas ya sea para construir u operar nuevas líneas férreas, abandona vías férreas que ya no se necesitan, o adquiere y opera otras líneas u otras vías férreas.

La Junta en sí es un cuerpo de dos partes con 3 miembros que son elegidos por El Presidente y confirmados por el Senado por 5 años de términos escalonados. Actualmente (a julio del 2008), Charles D. Nottinghan es el Presidente de la STB, Francis P. Mulvey es el Vice-Presidente y W. Douglas Buttrey es el tercer miembro.

Dentro de la STB, la Sección de Análisis Medioambiental (SEA) es responsable por la dirección del proceso de revisión medioambiental de los asuntos que son presentados a la Junta, conduce análisis independientes de todos los datos del medioambiente, y hace recomendaciones en cuanto al medioambiente a la Junta.

Sobre todo, la STB tiene un personal de aproximadamente 140 personas, que consiste de abogados, economistas, analistas de transporte industrial, ingenieros, auditores, especialistas del medioambiente, y personal asistente. Aunque la STB en su organización está dentro del DOT, funciona como una agencia reguladora independiente.

¿Cuál es el proceso que sigue la STB para la autorización de las consolidaciones y adquisiciones del control de una línea férrea?

Cuando 2 o más líneas férreas quieren consolidarse –ya sea a través de un fusión o por control común- antes tendrán que obtener la aprobación de la STB bajo la 49U.S.C. 11323-25 y 49 CFR Parte 1180. En el caso de la adquisición propuesta de la Elgin, Joliet y Eastern Railway Company (EJ&E) (una línea de ferrocarril Clase II) por la Canadian National Railway Company y Grand Trunk Corporation (CN) (una línea de ferrocarril Clase I), la STB debe aprobar la adquisición a menos que ésta encuentre que: (1) como resultado de la transacción, haya la probabilidad de una reducción de competencia, la creación de un monopolio, o la restricción del comercio en el transporte de carga de superficie en cualquier región de los Estados Unidos, y (2) los efectos anti-competitivos de la transacción sobrepasan los intereses del público en la satisfacción de la necesidad significativa de transporte (49 U.S.C. 11324(d)).

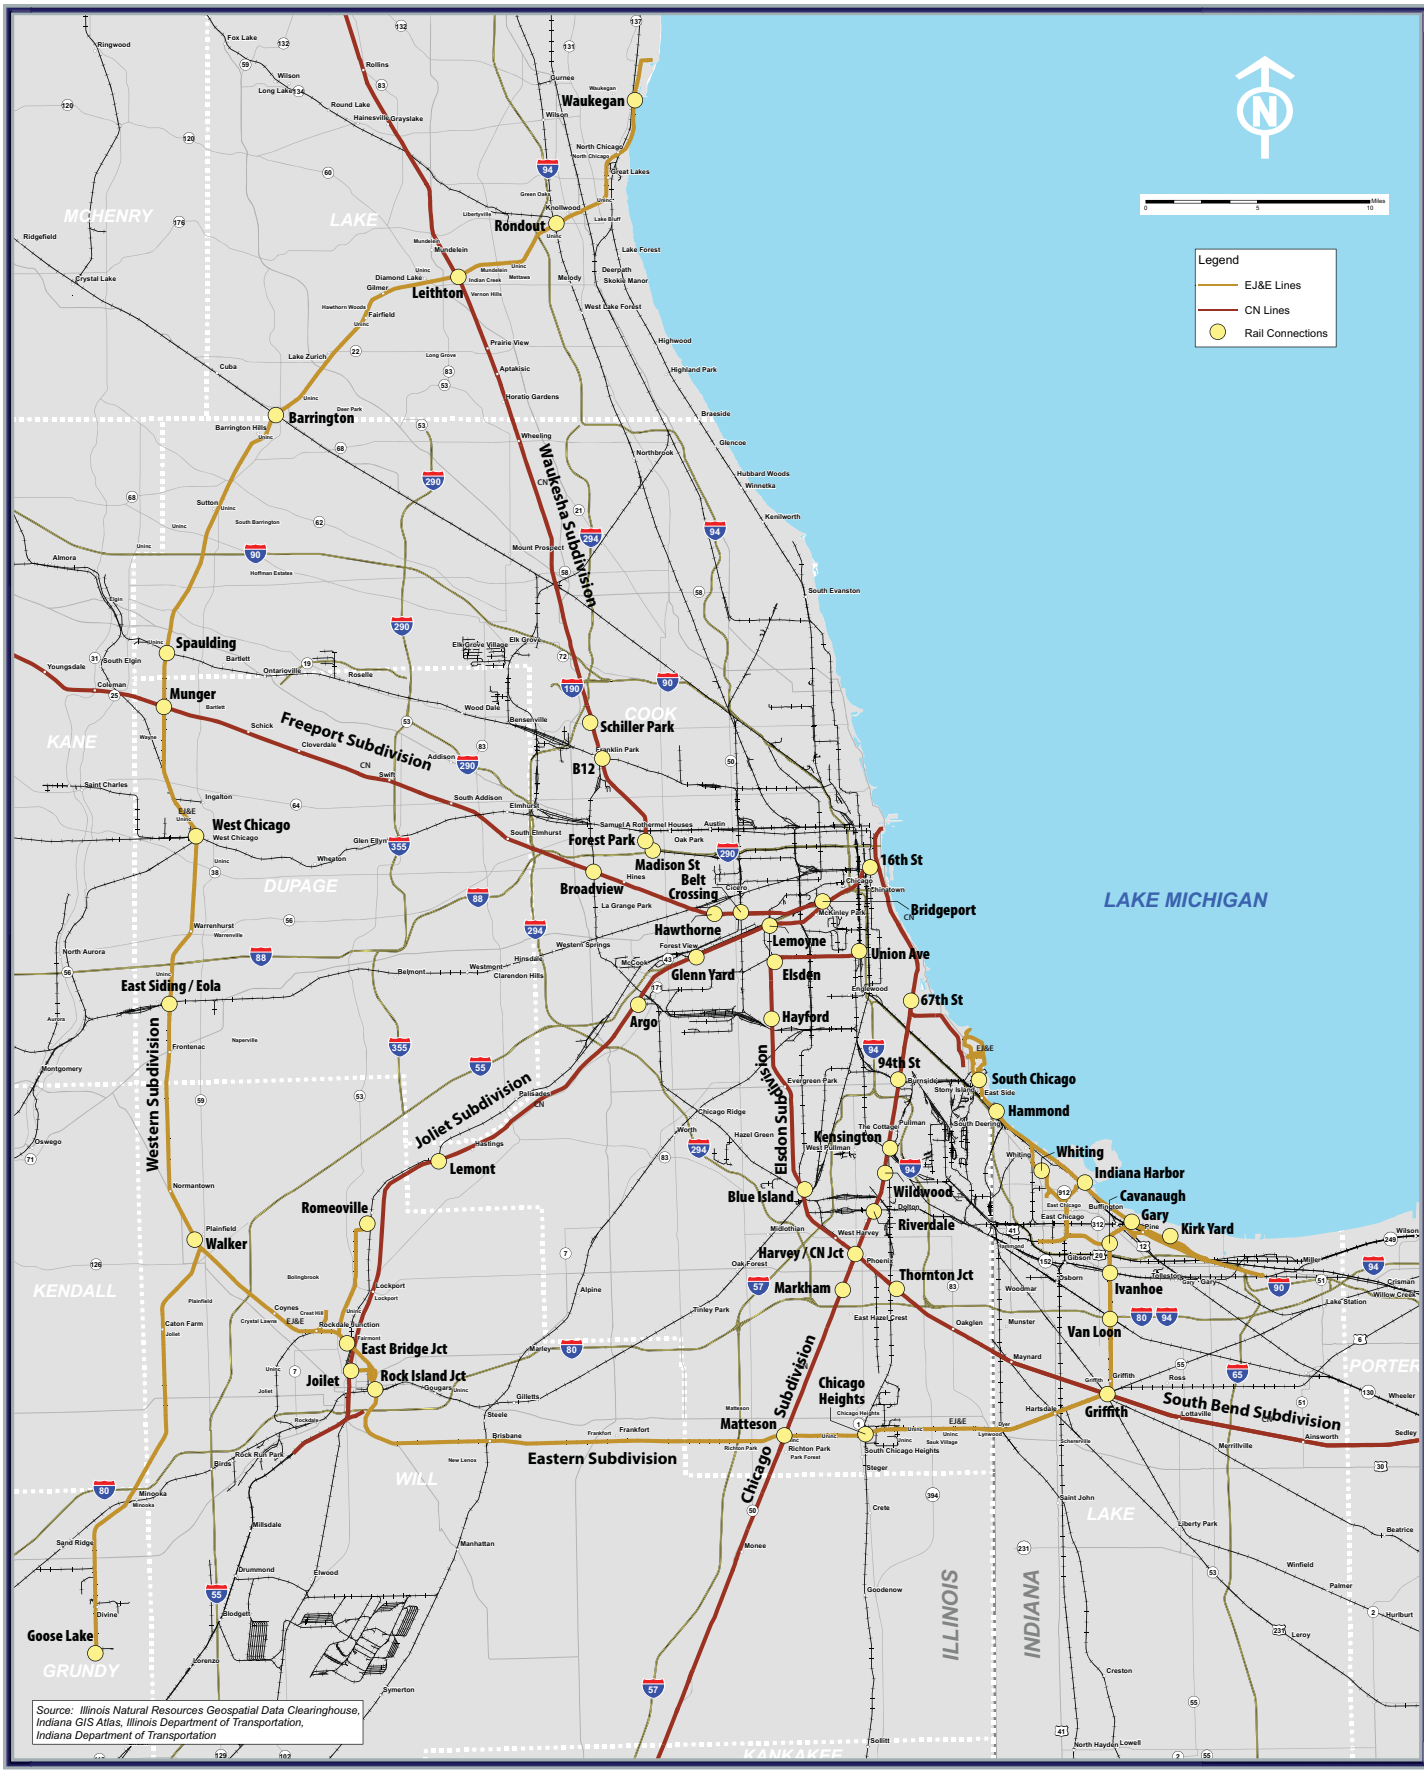
Después que se presenta una aplicación a la STB para ser aprobada, la STB establece un horario de procedimientos que da tiempo a las partes interesadas de someter información respecto a cualquier tipo de problemas de transporte y asimismo le da tiempo al solicitante para responder. La STB también prepara análisis del medioambiente y la documentación para cumplir con sus obligaciones bajo las leyes del medioambiente. Entonces la STB considera el registro completo (incluyendo todos los comentarios recibidos respecto a los problemas del medioambiente o de transporte), al decidir si autorizar la aplicación propuesta de adquisición, si niega la propuesta, o si aprueba la propuesta con condiciones impuestas para atenuar las preocupaciones de seguridad o medioambientales.

Existen obligaciones legales con respecto a límites de tiempo que controlan el proceso de fusión/control de las aplicaciones. Porque la Junta determinó que la adquisición de CN-EJ&E es una transacción de menor, la decisión del STB sería normalmente debida en el plazo de seis meses después de la presentación de la aplicación (49 U.S.C. 11325(d)).

Sin embargo, la STB también debe cumplir con el Acta de la Política Medioambiental Nacional (NEPA), 42 U.S.C. 4321 *et seq*., al hacer su decisión y debe completar el proceso de revisión medioambiental necesario antes de hacer una decisión final. Por lo tanto, una decisión final aquí será publicada cuanto antes después de completar el proceso de revisión medioambiental.

¿Qué requiere la NEPA?

La NEPA requiere que las agencias federales examinen el potencial de impacto al medioambiente en cuanto a las acciones propuestas, para informar al público de esos impactos, y de considerar ese impacto al tomar la decisión. El propósito de la NEPA es el de enfocar la atención de la agencia y del público de las posibles consecuencias de una acción propuesta para minimizar o evitar impactos potenciales adversos en contra el medioambiente. Sin embargo, la NEPA no autoriza un resultado en particular. Cuando el impacto al medioambiente ha sido adecuadamente identificado y evaluado, la agencia puede concluir que otros beneficios sobrepasan los costos medioambientales.



El proceso de revisión de la STB debe cumplir con los requisitos del Consejo de Calidad Medioambiental del Presidente, regulaciones de la NEPA (40 CFR Parte 1500-1508) y con su propia NEPA- implementando regulaciones (49 CFR Parte 1105). En el caso propuesto de la adquisición de la CN-EJ&E, la STB determinó que estas regulaciones requieren la preparación de una Declaración de Impacto Medioambiental (EIS) Final – la documentación respecto al medioambiente preparada en casos que tienen un potencial significativo de impacto medioambiental.

¿Cuál es el rol del SEA en el proceso de la NEPA?

Bajo NEPA, el STB debe considerar el potencial de impactos medioambiental de su acción antes de decidir si aprobar o no una aplicación. El SEA es la oficina dentro de la STB que recoge y analiza los records medioambientales en el caso, prepara la documentación NEPA, y provee asesoramiento técnico y recomendaciones a la Junta de asuntos medioambientales. SEA ha entrenado a especialistas legales y del medioambiente, liderados por la Líder de la Sección de Análisis Medioambiental, Victoria Rutson.

El SEA a menudo usa “contratos con terceras partes” para que ayuden a preparar la documentación medioambiental. Esta tercera parte contratada es un arreglo voluntario en el cual el solicitante paga a una contratista para que ayude al SEA mediante el desarrollo de un análisis medioambiental necesario para cumplir con la NEPA y las leyes medioambientales relacionadas, bajo la dirección, el control y la supervisión del SEA. Las leyes medioambientales de la Junta en 49 CFR 1105.10(d), así como las regulaciones CEQ en Code of Federal Regulations 40 [CFR] 1500 – 1508,

Location Map

especialmente permite el uso de contratistas como tercera parte aprobado por el SEA.

El proceso de contratación de esa tercera parte provee de un medio efectivo para preparar un análisis medioambiental independiente, comprensivo que cumple con los requisitos de la NEPA y de las leyes medioambientales relacionadas. Los contratistas funcionan como una extensión del personal de la SEA. Estos trabajan bajo la dirección del SEA para recoger y verificar la información medioambiental de las líneas férreas, las agencias consultoras, de otras partes interesadas y del público en general; conducen análisis medioambientales imparciales; desarrollan un criterio medioambiental apropiado y metodologías para el análisis de áreas con problemas medioambientales específicos; y preparan documentación medioambiental y opciones atenuantes.

El SEA hace su propia evaluación de los problemas medioambientales y es responsable de la asignación del alcance y el contenido del documento de la NEPA.

¿Qué es el proceso NEPA de STB en un caso de adquisición?

Si se prepara un EIS, el SEA primero emite una declaración de intención para preparar un EIS y determina el alcance de trabajo para el EIS, después de proveerle al público de la oportunidad de participación y consulta con la presencia de las agencias federales, estatales y locales apropiadas y otras entidades del gobierno. Entonces SEA prepara un Borrador de la EIS que analiza en detalle el potencial de impacto medioambiental de la adquisición propuesta, considera alternativas razonables y factibles a la propuesta del Solicitante, y hace recomendaciones para atenuantes medioambientales. Por ley el público tiene por lo menos 45 días para comentar respecto al Borrador de la EIS.

Entonces, el SEA emite una EIS final que responde a los comentarios del público, presenta el resultado de cualquier análisis medioambiental adicional, e incorpora recomendaciones atenuantes finales en cuanto al medioambiente. Luego la Junta considera tanto el record medioambiental (el Borrador y el EIS Final y todos los comentarios recibidos) y el record de los problemas de transporte para decidir si autorizar la adquisición tal como ha sido propuesta, si negar la proposición, o si aprobarla bajo ciertas condiciones, incluyendo condiciones medioambientales (véase 49 CFR1105.10(a) y (f)).

¿Cuál es el rol del público en el proceso NEPA?

Hay grandes oportunidades de participación del público durante el proceso NEPA, particularmente durante la determinación del alcance (para determinar que problemas deberían ser tratados en un EIS) y cuando se puede comentar respecto al Borrador de la EIS. El público puede someter comentarios escritos hechos directamente a la agencia y/o participar en audiencias o reuniones públicas. Cuando está preparando el EIS Final, la agencia federal debe tomar en consideración, y responder a, los comentarios recibidos del público y de otras partes.

Para EIS en la propuesta adquisición de CN-EJ&E, el SEA realizó 14 reuniones de casa abierta en 7 lugares en enero del 2008. Adicionalmente a estas reuniones, el SEA realizó estas reuniones de alcance con agencias federales y locales en Illinois e Indiana. En la reunión de alcance de la agencia de Illinois, un número de agencias pidió tener un papel más amplio en el desarrollo del Borrador de la EIS. En respuesta, el SEA estableció 5 grupos de enfoque interesados en la gestión de proyectos que revisaron la metodología y las fuentes de datos usados en el análisis para el Borrador de la EIS, ofrecieron comentarios, sugerencias y proveyeron datos adicionales.

A través del proceso EIS el SEA ha consultado extensivamente con las agencias apropiadas, incluyendo la EPA de los Estados Unidos y del U.S. Fish and Wildlife Service.

Adicionalmente, el SEA identificó 28 comunidades con la minoría o las poblaciones de ingreso bajo que tienen la potencia de ser afectadas por la adquisición propuesta. Entonces, el SEA conduce esfuerzos de alcance social específicos para integrar a las comunidades en el proceso de revisión medioambiental, incluyendo llamadas directas a oficiales electos respecto al proceso de revisión medioambiental, reuniones de asignación de alcance, y reuniones con representantes locales.

La Junta está publicando el Borrador de la EIS y haciéndolo disponible para la revisión y comentarios del público. El SEA también está planeando casas abiertas/reuniones públicas en 8 lugares en el área de Chicago para dar una oportunidad a la gente enterarse de la Acción Propuesta y para que presenten sus impresiones al respecto. El SEA continuará consultando con agencias federales, estatales y locales, tribus, comunidades afectadas, y a todas las partes interesadas para recolectar y diseminar información acerca de la adquisición propuesta.

¿Cómo me afectará la adquisición de la CN-EJ&E a mí y a mi comunidad?

Si fuese que la Junta debería aprobar la adquisición de la CN-EJ&E, la CN redirigirá sus trenes, de sus vías de 5 rieles en Chicago a la línea férrea EJ&E, incrementando de esa manera el volumen de tráfico de carga pesada a lo largo de la línea férrea EJ&E, con una disminución correspondiente en el volumen de tráfico de carga pesada a lo largo de las línea férrea CN. El incremento en el tráfico a lo largo de la línea férrea EJ&E puede o podría resultar en incrementos de:

- Demoras en los cruces a nivel de las vías del ferrocarril en la carretera, incluyendo las demoras de buses de escuela y vehículos de emergencia
- Niveles de ruido y vibración
- Riesgo de accidentes de tren
- Emisiones Contaminantes
- Uso de energía

Sin embargo que el riesgo es todavía muy bajo, la gente a lo largo de la línea férrea también tendrá un riesgo más grande de exposición a materiales peligrosos si ocurriese un accidente, resultando en una fuga de dichos materiales. El valor de la propiedad podría bajar de alguna manera para las residencias adyacentes a la línea férrea EJ&E. No se espera ningún tipo de impacto en el uso de tierras, ni impacto biológico, ni en el agua, ni en los recursos culturales, ni en cambios en la población, ni en la vivienda, y ni en el servicio público. Algunos de los impactos potenciales para el medioambiente podrían ser reducidos o eliminados con atenuantes.

La reducción en tráfico de carga pesada a lo largo de las 5 líneas férreas CN resultaría en beneficios correspondientes (disminuciones en impacto adverso ya existente) para las comunidades a lo largo de aquellas líneas férreas. Adicionalmente, se espera que la propuesta de redirección de tráfico de carga pesada a lo largo de la línea EJ&E reduzca las demoras en el tráfico de carga pesada y congestión de tráfico férreo en el sistema férreo de Chicago.

¿Impondría STB atenuantes para reducir impactos adversos si la adquisición CNEJ&E fuese aprobada?

Como ha ocurrido en otros casos, es muy probable que la Junta imponga atenuantes si esto aprobase la adquisición CN-EJ&E. Basada en la información disponible hoy en día, las consultas con las agencias apropiadas y un análisis medioambiental extenso, el SEA ha desarrollado

medidas preliminares atenuantes recomendadas para tratar el impacto identificado como adverso en contra del medioambiente. Estas medidas incluyen el requerir que la CN tome acción para reducir las demoras de los vehículos de emergencia, los niveles de ruido y vibración, y el riesgo de accidentes, incluyendo accidentes que implican materiales peligrosos. Adicionalmente, la CN ha sometido 76 medidas atenuantes voluntarias.

Como alternativa a la atenuante que la Junta posiblemente haya impuesto unilateralmente sobre los solicitantes, el SEA fomenta a que los solicitantes realicen acuerdos que sean mutuamente aceptables con las comunidades afectadas para tratar temas de impacto medioambiental. Los acuerdos negociados pueden ser con las vecindades, las comunidades, las ciudades, los condados, las coaliciones regionales, los estados, u otras entidades. Si los acuerdos negociados son sometidos a la Junta, lo que hace la Junta normalmente es incluir una condición en cualquier decisión final de aprobación de la transacción propuesta, demandando que los solicitantes cumplan con los términos de los acuerdos negociados.

¿Cuál es la autoridad de la Junta para imponer atenuantes?

Como agencia del gobierno, la Junta solamente puede imponer condiciones que están de acuerdo con su autoridad jurídica. Cualquier condición que impone la Junta debe estar directamente relacionada con la transacción presentada, debe ser razonable, y debe estar basada en la documentación presentada a la Junta. La Junta normalmente no requiere de atenuantes para condiciones medioambientales existentes, como son los efectos de operaciones férreas actuales, o el desarrollo de la tierra en la vecindad de las vías férreas.

¿Considerara la STB asuntos de seguridad?

Sí. Sin embargo que la seguridad de los trenes de carga es la responsabilidad principal de la Federal Railroad Administration, la STB también toma en consideración los asuntos de seguridad dentro del proceso de toma de decisiones. Esto incluye seguridad de vehículo, trenes de pasajeros, trenes de carga, peatones, bicicletas, vehículos de respuesta a emergencias y de transporte de materiales peligrosos. Las preocupaciones en cuanto a la seguridad son generalmente mencionadas y tratadas en el proceso de revisión medioambiental de la STB.

¿En el futuro, puede la CN enviar más trenes a la línea férrea EJ&E?

Debido a restricciones físicas y operacionales en la línea férrea EJ&E dándole la derecha de utilizar la línea de EJ&E, SEA concluyo que, bajo

del plan operacional propuesto, la línea férrea EJ&E será operada en su máxima capacidad o casi a máxima capacidad. En otras palabras, no es muy probable que el número de trenes que están usando la línea férrea EJ&E vaya a ser mayor a lo estimado por la CN en el plan operativo propuesto. El SEA condujo numerosos análisis respecto a la capacidad y las restricciones de las vías, antes de llegar a esta conclusión.

¿Ha negado La Junta la aprobación de una petición o adquisición alguna vez?

Sí. La Junta y sus agencias predecesoras, la Interstate Commerce Commission han negado algunas fusiones férreas y propuestas de adquisición. Sin embargo cada caso es único, y La Junta hace su decisión en cada caso basado en el record completo de los meritos del transporte y del impacto medioambiental. Solamente después de considerar todos los records es cuando La Junta hace la decisión de otorgar, negar, o de otorgar con atenuantes.

Si la Junta niega la aplicación de adquisición. ¿Puede de todas maneras la CN usar las líneas férreas de la EJ&E?

Sí. CN actualmente tiene derecho a vías férreas en la línea férrea EJ&E, dándole la derecha de utilizar la línea de EJ&E, y podría enviar un numero más grande de trenes hacia la línea férrea EJ&E. CN no necesitara la aprobación de la Junta para el uso del derecho a las vías existentes de la EJ&E.

¿En dónde puedo obtener más información del caso de adquisición pendiente CN-EJ&E o de la propuesta que actualmente se ha presentado a la STB?

Por favor visite el sitio de Web de la STB en: *http://www.stb.dot.gov*. La STB mantiene una bitácora electrónica pública y un sistema de información designado a permitir acceso al público de una manera rápida y fácil, acceso a todos los archivos y comentarios sometidos ante la STB y las decisiones emitidas por la agencia. La información acerca de la adquisición pendiente CN-EJ&E se encuentra mediante la referencia a la STB Finance Docket No. 35087, *Canadian National Railway Company y Grand Trunk Corporation Control-EJ&E West Company.*

El SEA también mantiene un sitio de Web que es específico de acuerdo al proyecto en el siguiente sitio de Web:

http://www.stbfinancedocket35087.com.

Revisión del Borrador de la EIS

El Borrador de la EIS puede ser revisado en la red en *http://www.stbfinancedocket35087.com*. Copias impresas del documento están disponibles en las siguientes ubicaciones:

¿Cómo Puedo Someter Comentarios Sobre el Borrador de la EIS?

SEA anima a los partidos interesados a someter comentarios escritos sobre cualquier aspecto del Borrador de la EIS. SEA tomará en cuenta todos los comentarios al preparar la EIS Final que incluirá respuestas a todos los comentarios substanciales, las conclusiones finales de SEA sobre posibles impactos y las recomendaciones finales de SEA.

Es importante para SEA escuchar comentarios sobre los siguientes puntos:

1. Una alternativa, evaluación de impacto y/o borrador de mitigación particular.
2. Cualquier información incompleta o incorrecta.
3. Cómo la acción propuesta le afectará a usted.

Los comentarios sobre el Borrador de la EIS pueden ser enviados por correo, por archivo-electrónico o por teléfono. Toda la correspondencia deberá hacer referencia a STB Finance Docket No. 35087. La fecha límite para los comentarios sobre el Borrador de la EIS es el 30 de septiembre del 2008.

Al enviar sus comentarios, por favor sea lo más específico posible y substancie sus preocupaciones y recomendaciones.

Los comentarios escritos deben ser enviados por correo a:

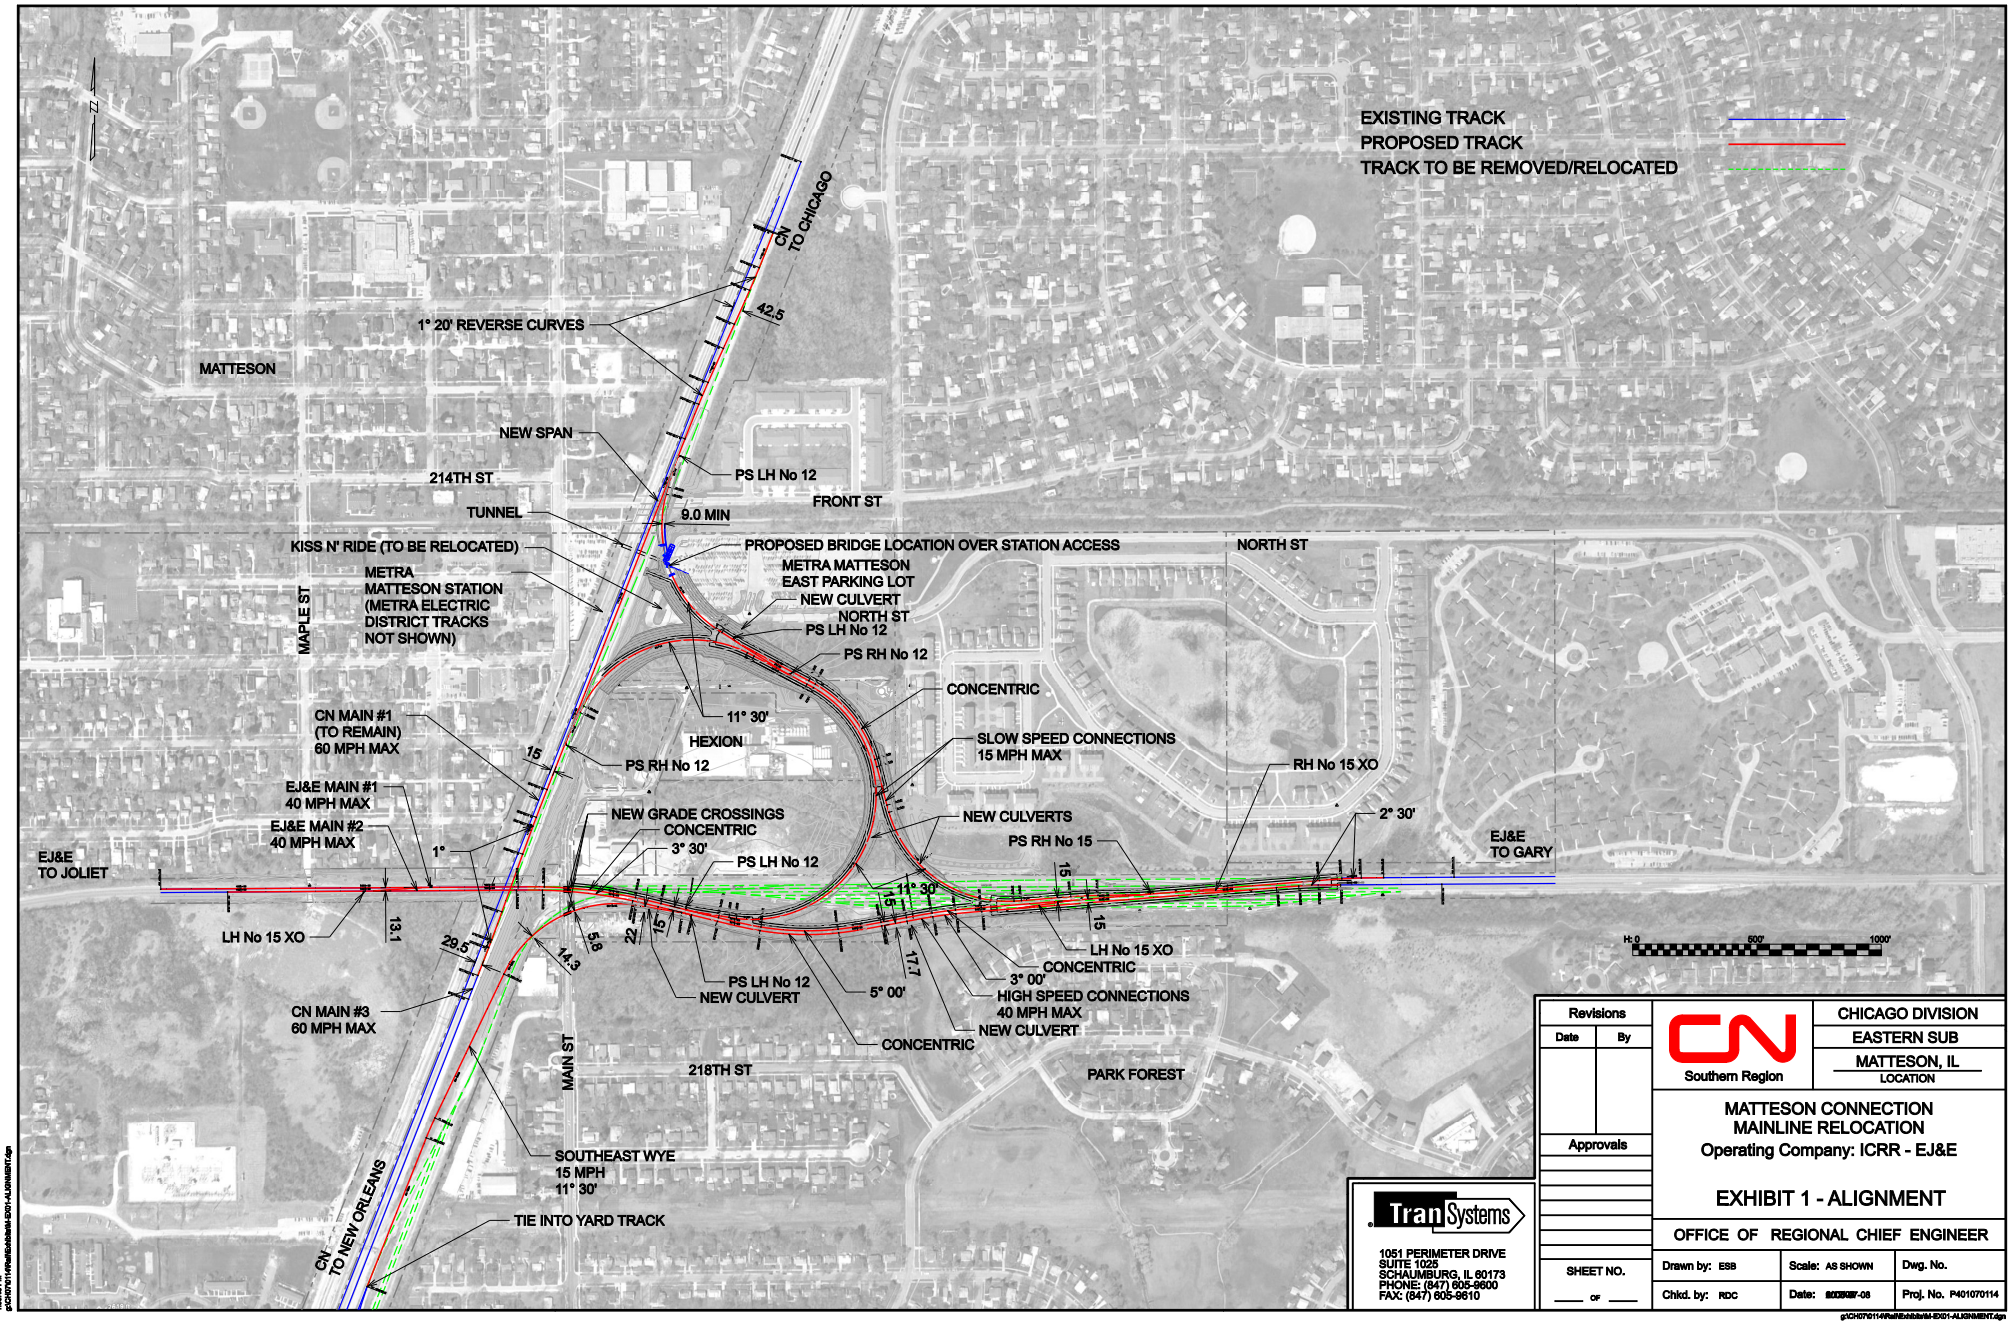
Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

On behalf of Canadian National Railway Company and Grand Trunk Corporation (together with their rail carrier subsidiaries, "CN"), I am submitting the following supplement to my previous response to Item No. 7 of SEA's Data and Information Request #2:

7. Please provide any analysis or discussion of alternatives that may have been evaluated for any of the connections. If information does not exist, please discuss potential alternatives, specifically the connections at Munger and Matteson.



Since submission of its responses to Data and Information Request #2, CN has modified the design of the proposed connection between the CN and EJ&E rail lines at Matteson to permit trains operating on the EJ&E main line to move at speeds up to 40 miles per hour. The PDF file on the enclosed CD contains CN's current design for this connection, which would permit operations at that speed.

Very truly yours,

Paul A. Cunningham
Counsel for Canadian National Railway Company
and Grand Trunk Corporation

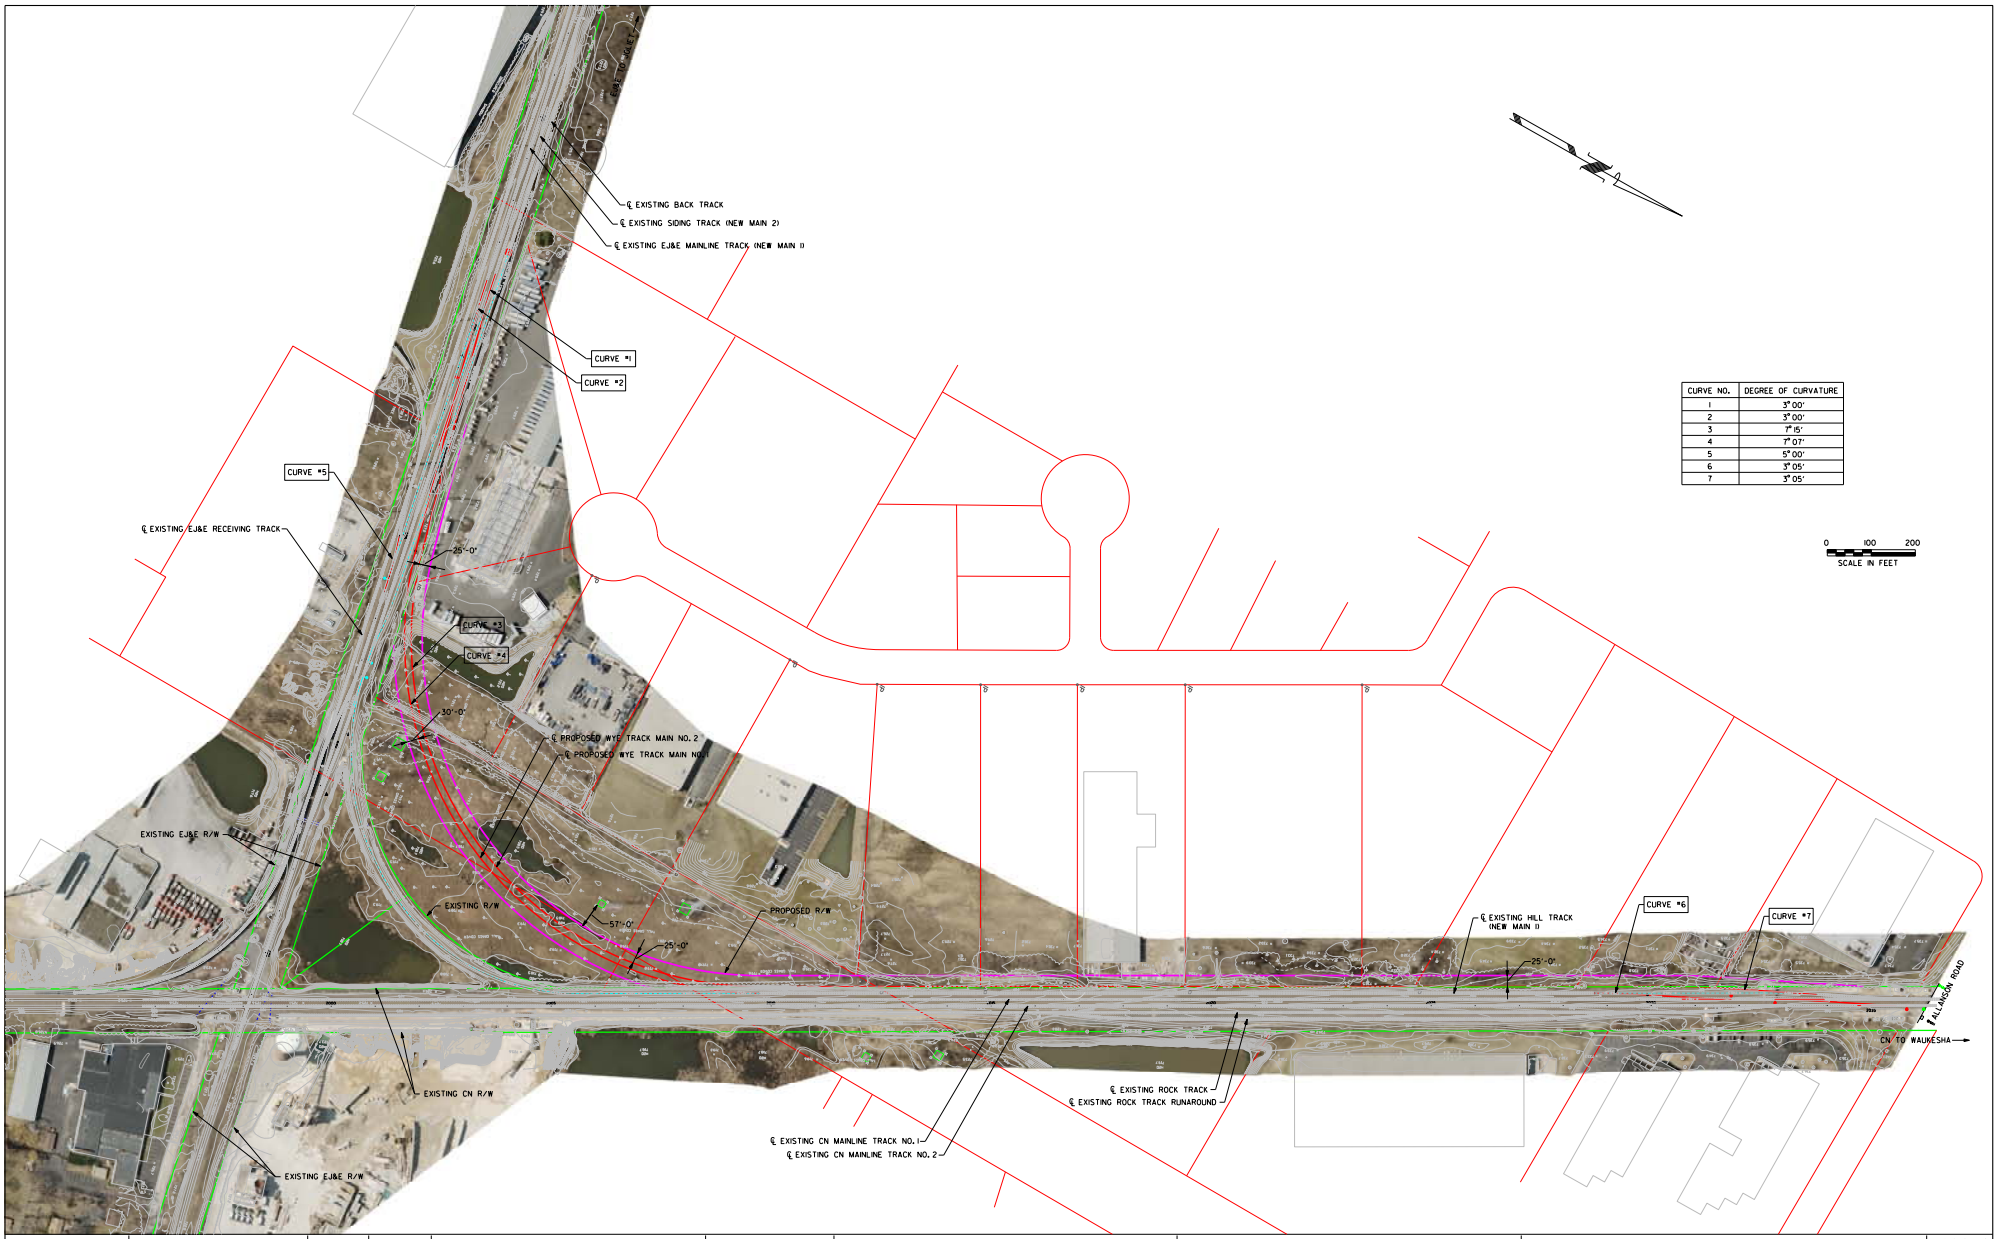
Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

On behalf of Canadian National Railway Company and Grand Trunk Corporation (together with their rail carrier subsidiaries, "CN"), I am submitting the following further supplement to my previous response to Item No. 7 of SEA's Data and Information Request #2:



7. Please provide any analysis or discussion of alternatives that may have been evaluated for any of the connections. If information does not exist, please discuss potential alternatives, specifically the connections at Munger and Matteson.

Since submission of its responses to Data and Information Request #2, CN has modified the design of the improved connection that it proposes to build between the CN and EJ&E rail lines at Leithton. CN now intends to construct the connection according to the design found on the enclosed CD, which would require CN to obtain additional land and permits, but would permit trains operating between CN's Waukesha Subdivision north of the connection and the EJ&E main line west of the connection to move at speeds up to 30 miles per hour.

Very truly yours,

Paul A. Cunningham
Counsel for Canadian National Railway Company
and Grand Trunk Corporation

Re: STB Finance Docket No. 35087, Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company

Dear Mr. Pellerin:

Pursuant to 40 C.F.R. § 1506.5(a), the Section of Environmental Analysis requests additional information in connection with the on-going environmental review of the above-referenced proceeding. Attached are several extracts from comments received on the Draft EIS expressing concern about whether CN's train traffic projections have appropriately accounted for possible freight traffic from the future expansion (phase 2) of the Prince Rupert Container Terminal. Based on CN's April 21, 2008 response to SEA's information request number 3, SEA's understanding is that CN's operating plan accounts for the full development of Prince Rupert Container Terminal Phase 1. The operating plan does not include any other rail traffic from possible expansion of the Prince Rupert facility, because "(n)o other phase of that development has received necessary environmental approval or funding."

SEA requests that CN review the attached comments on the inclusion of rail traffic from future Prince Rupert expansion and expand on CN's rationale for either including or not including Prince Rupert expansion beyond phase 1 into the rail traffic projections.

Thank you for your continued assistance. Please provide a copy of your response as soon as possible and no later than October 8, 2008, to Phillis Johnson-Ball of my staff and to our independent third-party consultant, John Morton, at HDR, 8404 Indian Hills Drive, Omaha, Nebraska, 68114-4098.

Sincerely

Victoria J. Rutson

Information Request #6

Additional Information on CN's Projected Train Counts

Background

SEA's Information Request Number 3, dated March 25, 2008, and CN's response dated April 21, 2008, were part of SEA's effort to verify the reasonably foreseeable train traffic that should be used by SEA in the EIS. In addition the Draft EIS evaluated in detail CN's train traffic projection and concluded that the estimate of train traffic provided by CN in the operating plan provided a reasonable estimate of future train traffic should the Board approve the transaction. A number of commentors on the Draft EIS express concerned that the train traffic numbers used in the Draft EIS should include possible future train traffic from phase 2 of the Prince Rupert Container Terminal development.

Comments Received on the DEIS

SEA has received over 3300 comments thus far on the Draft Environmental Impact Statement (EIS). Several comments question CN's train traffic predictions. Here are some excerpts of from these comments:

> *The CN ships out of the western Canadian Port of Prince Rupert. According to that port's own website, an expansion project is scheduled to begin in 2009 and to be completed in 2013, a time period outside this draft Environmental impact statement, is to due to be completed. That expansion of Prince Rupert would quadruple the port's capacity and enable it to handle 96 billion pounds of cargo a year. There are also plans to expand the cargo freight or the container facility, increase its container capacity by 300 percent, up to 240 billion pounds a year. With the surging Asian trade and so-called "Best Port in North America," where do you think the increased amount of cargo is going to go? I'll tell you, right through the 9th ward and when track fills up, right through the city of Chicago. How can the members of the STB determine the long-term cumulative effect that this sale will have on the residents when they don't even have the basic data needed to make those determinations? It is not surprising that CN has refused to provide the SEA with the projected increase in freight traffic. Does anyone believe for one moment that they don't exactly know what the increased freight is going to be? You don't invest in a port expansion not knowing what will happen. What is surprising is that the SEA did not demand the data and went as far as to make excuses in the draft Environmental Impact study as to why it is difficult to predict that data. The draft EIS is flawed and must be redone using the projected freight data extending at least ten years past the year 2013.*
>
> *CN's unwillingness to provide freight traffic projections beyond three years (a cut off that precedes the Phase 2 expansion of the major new port served by CN - the Port of Prince Rupert in western Canada. CN needs to provide capacity data and*

operational projections to 2020, at the very least. If the American Association of Railroads can demand taxpayer investments in rail infrastructure to accommodate a projected growth in rail freight of 88% by 2035, it is inconceivable that the CN cannot quantify its own long-range business projections involving the EJ&E.

The CN seasonality of their customer's cargo and resulting peak seasonality impact along within the Chicago Mega Region. An example is 28 average trains per day past specific mile post along the "J" communities is quite different than the peak trains moving past that exact mile post. The data suggests that CN has understated the peak trains volumes by a factor of 3 to 4 times. Week 33 shows 95,474 tons vs Week 1 at 19,751 tons. The Port of Prince Rupert portion of these numbers is easily determined. http ://www.cn .ca/productsservices/e n index.shtml

Questions

In light of these and similar comments, I ask that you respond to the best of your ability to the following questions: Is Prince Rupert Container Terminal Phase 2 (or later phases) reasonably foreseeable and does the train traffic identified in CN's operating plan appropriately account for traffic from the Prince Rupert development?

Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

I am writing, on behalf of Applicants Canadian National Railway Company and Grand Trunk Corporation (together, "Applicants"; together with their rail carrier subsidiaries, "CN"), to provide you and HDR Engineering, Inc. ("HDR"), in response to the inquiry you made in your letter of September 30, 2008, to Normand Pellerin of CN, regarding "possible freight traffic from the future expansion (phase 2) of the Prince Rupert Container Terminal."

As you are probably aware, CN provided information responsive to that inquiry on pages 36 through 40 of its Comments on the Draft Environmental Impact Statement, which were submitted to your office on September 30, 2008. For your convenience and that of SEA's third-party consultants, the relevant language from CN's Comments is set forth below:

> **A.3 The rail traffic volumes reported in CN's Operating Plan are a reasonable basis for SEA's analysis of the environmental impacts of the Transaction.**
>
> Some commenters, however, have argued that the traffic accounted for in the Operating Plan is too low to serve as a basis for SEA's environmental review because it fails to include traffic moving through the Port of Prince Rupert after completion of the proposed Phase 2 of the Port's Fairview Container Terminal. If that expansion were completed, it is argued, then the capacity of the Port would rise from 500,000 [twenty-foot]-equivalent units ("TEUs") to 2 million TEUs, causing a proportionate increase in Prince Rupert intermodal traffic on CN lines through Chicago, and the environmental analysis of the Transaction should therefore extend to impacts of this additional traffic.

But construction of Phase 2 is not reasonably foreseeable at present, and SEA was right to exclude it from its examination of impacts [of] the proposed Transaction.

Phase 1 of the Fairview Terminal began operations in October 2007. It currently handles 300,000 TEUs per year, which require five weekly trains in each direction. If the Terminal were to operate at the full capacity of Phase 1 (500,000 TEUs), it would require 10 trains a week (one train a day in each direction). CN assumed that Phase 1 would in fact eventually operate at capacity, and it factored the potentially resulting train traffic into its Operating Plan, which SEA relied on as the basis for its analysis of the impacts of the Transaction.

Although the Prince Rupert Port Authority has discussed expanding the Terminal beyond Phase 1, no decision to undertake that expansion has been made. The Port Authority does not have the funds necessary for the proposed expansion, and neither the federal nor provincial government [have] indicated that it would provide them. Thus, if the Terminal is to be expanded into Phase 2, that decision must be made by RREEF Infrastructure, the new owner of Maher Terminals, which operates the Terminal.[29] RREEF is facing substantial uncertainty – even apart from the current financial uncertainties in the U.S. and elsewhere – as to whether to invest in the expansion for several reasons, including the following:

1. Demand for trans-Pacific intermodal traffic is lower than previously expected. Growth in that traffic is now projected to grow at levels of 5 to 7% between 2010 and 2020, rather than between 10 and 20% as previously forecast.

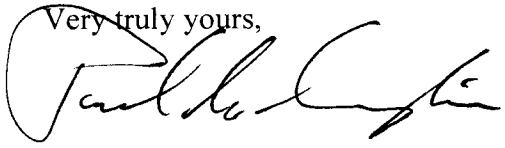
2. West Coast ports at Vancouver, Tacoma, and Los Angeles, which compete with Prince Rupert, are expected to expand their capacity by up to 5.4 million TEUs between now and 2020, making demand for transportation through Prince Rupert even weaker. In addition, a new container facility has been proposed for construction in Mexico at Punta Colonet, with a capacity of 2 million TEUs per year. As these projects are completed, the demand for expansion at Prince Rupert could readily change.

3. Expansion beyond Phase I would require negotiations with the Canadian Department of Oceans and Fisheries for environmental permitting, because of possible negative impacts on fish and wildlife habitat. A satisfactory outcome of those negotiations is by no means assured.

---

[29] *See RREEF Infrastructure Completes Maher Terminals Acquisition*, Bus. Wire, July 5, 2007; RREEF, Infrastructure, Business Overview, https://www.rreef.com/cps/rde/xchg/infr_en/hs.xsl/692.html.

1700 K Street, N.W.
Suite 400
Washington, D.C. 20006-3804



Telephone 202.973.7600
Facsimile 202.973.7610

4. The expansion would require deposit of fill on land and water to which First Nations (Canadian Native Americans) have asserted claims. Before construction could begin, those claims would need to be resolved, through a process of negotiating with five First Nations bands that have inconsistent positions regarding appropriate compensation. These negotiations are likely to be more complex than comparable negotiations with First Nations in connection with Phase 1 of the Terminal, which, unlike Phase 2, involved construction on the site of an existing terminal rather than . . . on undeveloped property.

For these reasons, CN believes that any statements by the Prince Rupert Port Authority regarding early commencement and completion of Phase 2, however optimistic, offer little basis for anyone to conclude that Phase 2 is reasonably foreseeable. In the end, it is not the Authority that will determine to spend the money needed for the expansion. RREEF, which would be making the investment, has not yet determined to do so.

If you have any further questions regarding traffic that CN expects to transport from Prince Rupert, please let me know, and I will provide you with whatever information I can.

Very truly yours,

Paul A. Cunningham

Re: STB Finance Docket No. 35087, Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company

Dear Mr. Pellerin:

Pursuant to 40 C.F.R. § 1506.5(a), I am sending our seventh request for information needed for the purposes of the Section of Environmental Analysis' environmental review in connection with the above-referenced proceeding. As we have discussed, there is information that we need to conduct the technical analysis and prepare the Draft Environmental Impact Statement. This information specifically relates to the proposed transaction and associated rail improvements.

Please clarify the pre-transaction and post- transaction train traffic on the CN Joliet subdivision. We need to know whether there is actually a change or not.

Thank you for your continued assistance. Please provide a copy of your response as soon as possible to Phillis Johnson-Ball of my staff and to our independent third-party consultant, John Morton, at HDR, 8404 Indian Hills Drive, Omaha, Nebraska, 68114-4098.

Sincerely

Victoria J. Rutson

Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

I am writing, on behalf of Applicants Canadian National Railway Company and Grand Trunk Corporation (together, "Applicants"; together with their rail carrier subsidiaries, "CN"), to provide you and HDR Engineering, Inc. ("HDR"), with the response to your seventh request for information in this proceeding, as made in your letter of October 23, 2008, to Normand Pellerin of CN.

> Please clarify the pre-transaction and post-transaction train traffic on the CN Joliet subdivision. We need to know whether there is actually a change or not.

CN's Joliet Subdivision includes CN segments 14 (between Bridgeport and Lemoyne), 15 (between Lemoyne and Glenn Yard), 16 (between Glenn Yard and Argo), 17 (between Argo and Lemont), and 18 (between Lemont and Joliet), as identified in the Operating Plan. At present, an average of 10 Amtrak trains per day (5 trains daily in each direction) and 4.3 Metra trains per day (3 trains Monday through Friday in each direction) are scheduled to operate over the Joliet Subdivision. In addition, BNSF has trackage rights on the Joliet Subdivision between Joliet and Glenn Yard (segments 16 and 17), and it operates two trains per day (one in each direction) over those segments. In addition, CN operates a number of unscheduled local trains out of Glenn Yard to serve industries on the Joliet Subdivision.

The train counts reported for these segments in Attachment A.1 to CN's Operating Plan, as filed with the Application and corrected by CN-14 (filed January 2, 2008), did

not include Amtrak or Metra passenger trains, or any CN local freight trains, because operations of those trains were not expected to change as a result of the Transaction.

Information about pre-Transaction freight traffic (reported in the "Base" column under "Freight – Trains/Day" in Attachment A.1) was based on actual traffic data from 2006, the last year for which complete data were available at the time the Operating Plan was prepared. Those data indicated that BNSF operated an average of 1.8 trains per day between Joliet and Glenn Yard (*i.e.*, on CN segments 16, 17, and 18), where they would be interchanged to or from CN. (Since 2006, BNSF traffic has increased sufficiently that the railroad now regularly operates two trains per day over segments 16, 17, and 18 (one train in each direction), as reported earlier.) Attachment A.1 indicates that, in addition to the 1.8 BNSF trains per day, an average of 4.0 CN trains per day operates over segment 16 between Argo (where they move to or from the IHB line) and Glenn Yard. (If the train counts in the "Base" column of Attachment A.1 were revised to reflect the change in BNSF's operations since 2006, it should show 6.0 trains per day on segment 16, and 2.0 trains per day on segments 17 and 18.)

CN expects that, after implementation of the proposed Transaction, the BNSF trains now operating between Joliet and Glen Yard would instead be interchanged with CN at Eola, and thus would not move on the Joliet Subdivision at all. CN also expects that the 4.0 trains now moving between Glenn Yard and Argo would not longer do so, because CN would route those trains over the EJ&EW line instead of via IHB. On the other hand, CN expects that it would operate two trains a day between East Joliet Yard (which would become available to CN as a result of the Transaction) and Glenn Yard. (These 2.0 trains per day are reported in the "Total" column for segments 16, 17, and 18 under "Freight – Trains/Day" in Attachment A.1. If the "Change" column under "Freight – Trains/Day" is revised to reflect the change in BNSF's operations, it would show a decrease of 4.0 trains per day on segment 16, and a net change of 0.0 trains per day on segments 17 and 18.)

North of Glenn Yard, Attachment A.1 indicates that an average of 2.1 trains per day currently operate over segments 15 (between Glenn Yard and Lemoyne) and 14 (between Lemoyne and Bridgeport). At Bridgeport, CN's Freeport Subdivision meets the Joliet Subdivision, and the train count on CN segment 9 (between Bridgeport and 16th Street) therefore includes, not only the 2.1 trains per day that operate between Glenn Yard and Bridgeport, but also 2.5 trains a day that move to or from the Freeport Subdivision, for a total of 4.6 trains per day. These numbers are reported in the "Base" column under "Freight – Trains/Day" on Attachment A.1. These numbers do not include local trains, which would not be affected by the Transaction.

Following implementation of the Transaction, CN expects that all the trains shown on Attachment A.1 as moving on segments 9, 14, and 15 would be rerouted to operate

over the EJ&EW line. The post-Transaction train counts for segments 9 and 14 are therefore shown as 0.0 trains per day in the "Total" column under "Freight - Trains/Day" on Attachment A.1. The "Total" column for segment 15, however, erroneously shows 2.0 trains per day. This number represents a BRC "puller," which operates once a day in each direction between Lemoyne (where it moves to and from the BRC line) and Glenn Yard. This train was omitted from the pre-Transaction train counts reported in the "Base" column, and should therefore have been omitted from the post-Transaction train counts in the "Total" column. If the post-Transaction train count for segment 15 is corrected to 0.0 trains per day, then the "Change" from pre-Transaction to post-Transaction train volumes would be a decrease of 4.6 trains per day on segment 9, and a decrease of 2.1 trains per day on segments 14 and 15.

To summarize, the train counts on the Joliet Subdivision, as shown in Attachment A.1 but revised to reflect the corrections explained above, are as follows:

Rail Line Segment Description				Freight - Trains/Day		
Road	Segment Number	From Station	To Station	Base (pre-Transaction)	Change	Total (post-Transaction)
CN	9	16thSt	Bridgeport	4.6	(4.6)	0.0
CN	14	Bridgeport	Lemoyne	2.1	(2.1)	0.0
CN	15	Lemoyne	Glenn Yard	2.1	(2.1)	0.0
CN	16	Glenn Yard	Argo	6.0	(4.0)	2.0
CN	17	Argo	Lemont	2.0	0.0	2.0
CN	18	Lemont	Joliet	2.0	0.0	2.0

As you can see from this table, the Transaction is expected to result in no net change in the number of trains moving on CN segments 17 and 18, and to result in a decrease in the number of trains moving on CN segments 9, 14, 15, and 16.

If you need any further explanation of CN's calculations of pre-Transaction and post-Transaction train numbers, please let me know, and I will provide you whatever additional information I can.

Very truly yours,

Paul A. Cunningham /jmg

Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

In examining the information previously provided to you in response to your first Data and Information Request of December 18, 2007, we have determined that Exhibit A to my letter to you of March 12, 2008, incorrectly identifies the EJ&E rail segments crossed by seven highways. (The error occurred because the rail segments were defined by the milepost numbers, as indicated in the EJ&E timetable, of the endpoints for each segment, and the grade crossings were assigned to particular segments on the basis of which segment, as so defined, contained the mileposts for the individual crossings. It appears that, in some instances, the timetable milepost numbers do not correspond to the location of the rail crossings that are the actual endpoints for the rail segments.)

This error appears to have had minor effects on the grade-crossing delay information reported, in Exhibit C to my letter of March 12, 2008, for six of the seven crossings.[1] For three of the crossings (135th Street (Western Subdivision MP 11.43), Van Dyke Road (Western Subdivision MP 10.68), and 143rd Street (Western Subdivision MP 10.33), all of which are in Segment 10), the number of pre-Transaction and post-Transaction trains was affected, but there is no change in the number of additional trains following the Transaction (column FQ on the "EJE Crossings" tab on Exhibit C), and thus no change in the increase in

[1] For one of the crossings (Spaulding Road, at Western Subdivision MP 37.60), none of the data were affected, because the road lies north of the connection between EJ&E Segment 14 and CPRS Segment 2, so that the number of trains crossing Spaulding Road is the same as the number moving over Segment 14.

delay at the crossings. For the remaining three crossings (Main Street (Eastern Subdivision MP 21.61, in Segment 6), East End Avenue (Eastern Subdivision MP 25.19, in Segment 5), and Broad Street (Eastern Subdivision MP 36.33, in Segment 4)), using the train counts for the correct segments causes the increase in the number of trains to increase by 1.0, 1.1, and 0.9 trains per day, respectively. As a result of these adjustments, as well as other corrections described in previous correspondence with you,[2] there is a slightly lower increase in delay at grade crossings on the EJ&E rail segments than previously reported (1069 hours of delay per day rather than 1152 hours). These adjustments have no impact on the information previously reported regarding fuel consumption and emission of air pollutants by locomotives.

The enclosed CD contains a corrected version of Exhibit C. In addition to reflecting corrections to the location of grade crossings on EJ&E rail segments, the data on this CD reflect corrections, as noted in the correspondence cited above, to CN's assumptions regarding routing of trains before and after implementation of the Transaction.

Very truly yours,

Paul A. Cunningham
Counsel for Canadian National Railway Company
and Grand Trunk Corporation

Enclosure

cc: Phillis Johnson-Ball

Section of Environmental Analysis
Surface Transportation Board
395 E Street, S.W.
Washington, D.C. 20423-0001

Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

By letters to you dated August 21 and September 17, 2008, I informed you that Canadian National Railway Company and Grand Trunk Corporation (together with their rail carrier subsidiaries, "CN") had modified the designs of the improved connections that they would plan on constructing at Matteson and Leithton if the proposed CN/EJ&EW Transaction were approved and implemented. As I explained in those letters, the new designs of those connections would permit trains moving on the main line near Matteson to operate at speeds of 40 mph, and trains moving over the connection between CN's Waukesha Subdivision north of the connection at Leithton and the EJ&E line west of that connection to operate at speeds of 30 mph.

The new track speeds made possible by these new designs would not, however, necessarily be the average speed of trains actually moving on the tracks following implementation of the Transaction. CN therefore recalculated the expected average train speeds, using the same Train Performance Calculator ("TPC") model used to calculate the speeds that reported to you in Exhibit A to my letter to you of March 13, 2008 (in which I provided a supplemental response to Item No. 8 of SEA's first Information and Data Request).

CN used the TPC to model the performance of the typical CN, EJ&E, and other trains on EJ&E to North State Line, Wisconsin, on CN's Waukesha Subdivision, via the connection at Leithton, and then back again to Kirk Yard. For each train type, CN ran the model four times. Two runs assumed that the trains would run over the lines as currently configured. The first of these assumed a scenario under which the train would operate without any

impedances. The second run assumed a scenario under which the train would be impeded at conflict points (meets and crossing diamonds) throughout its journey. (The model assumed that in case of conflict, the train would move into sidings that would not leave the train blocking any rail-highway at-grade crossing.)

For the second two runs, CN modified the inputs into the model to reflect CN's plans for modifications of the lines (including the connections and track configuration at Matteson and Leithton) following implementation of the Transactions. Again, one of these runs assumed a scenario under which the train would operate unimpeded, and the second assumed that the train would be impeded at each conflict point.

The TPC was thus used to model performance of an unimpeded and an impeded run, westbound and eastbound, pre-Transaction and post-Transaction, for each train type (CN, EJ&E, and other). At each grade crossing on the EJ&E line, for each run of each train type, the train speed was calculated by averaging the speeds of the train as its front end, its midpoint, and its tail end would pass over the crossing. For each train type, CN averaged the four speeds (impeded and unimpeded, westbound and eastbound) at each grade crossing, then averaged the speeds of the three train types, weighted by frequency of operation of each train type, to determine the average train speed at the crossing.[1] (As noted in my February 15, 2008, letter, it was CN's judgment that trains operating on the EJ&E line are likely to be impeded at conflict points less than half the time, and that averaging the speeds of the unimpeded and impeded trains would therefore be a conservative approach that would tend to understate the train speeds.)

In the same way, CN used the TPC to model the performance of the Transaction, of the typical CN trains moving on the Waukesha Subdivision, before and after implementation of the from Schiller Park to North State Line and back. In order to calculate pre-Transaction and post-Transaction train speeds on CN Segment 29 (the Waukesha Subdivision between Grays Lake and Leithton), CN used the average, weighted by train frequency, of the CN trains that would run on the Waukesha Subdivision on both sides of Leithton and those that would move between the Waukesha Subdivision north of Leithton and the EJ&E line west of Leithton.

---

[1] EJ&E trains do not operate over the Waukesha Subdivision, so these trains were given a weight of zero in the computation of train speeds over the crossings on that subdivision. Approximately 0.6 "other" trains are interchanged with CN at Leithton and move over the Waukesha Subdivision north of that point. They are operated by CN on the Waukesha Subdivision, but on Exhibit A they are counted in the "other" column for the Waukesha Subdivision crossings, because CN used TPC to model their performance on the Waukesha Subdivision to and from the EJ&E line.

CN observed that the planned connection at Matteson is particularly complex, with a substantial proportion of the trains on EJ&E Segments 6 and 7 expected to move to or from the CN line over the connections at Matteson rather than passing from one EJ&E segment to the adjacent one, and because many of the trains moving over those connections would cross Main Street at grade substantially more slowly than trains on the main line, while other trains moving over those connections would not cross Main Street at all. Accordingly, CN calculated the speeds of the trains on all alternative connections at Matteson,[2] as well as on the main line, and averaged the speeds of trains (weighted by frequency) over the different tracks crossing Main Street to determine the average train speeds of trains crossing that highway.

This procedure for calculating post-Transaction train speeds is largely identical to the procedure used to calculate the speeds reported earlier in Exhibit C of my letter to you of February 15, 2008, and Exhibit A of my letter to you of March 13, 2008, with these differences:

1. The track configuration incorporated into the model included the modified designs of the connection at Leithton and of the connection and adjacent main track at Matteson.

2. For trains moving on the EJ&E line, the TPC was used to model train runs between Kirk Yard and North State Line, rather than between Kirk Yard and Leithton as in the earlier calculations. For trains operating on CN Segment 22 within the EJ&E arc, the TPC was used to model the performance of trains running between Schiller Park and North State Line, rather than between Schiller Park and Leithton.

3. Instead of simply reporting the speed of the midpoint of the train at each grade crossing, as was done in the calculations reported previously, CN calculated the train speed at each crossing as the average of the speeds as the head end, the midpoint, and the tail end of the train passed over the crossing, and reported the train speed as the average of those three speeds.

4. CN determined that it had made an error in its earlier calculation of the weighted average of the CN, EJ&E, and other train speeds on the EJ&E line, so that

---

[2] As with the speed of trains on the main line, CN used TPC to calculate the speed of trains operating over each alternative connection (EJE Segment 6-CN Segment 1; EJE Segment 6-CN Segment 32; EJE Segment 7-CN Segment 32). In each case, CN modeled the run of a typical CN train between Kirk Yard and North State Line, but substituted the track speed of the relevant connection for the track speed of the main line at and near the crossing, so that the performance of the hypothetical trains moving over the crossing at the reduced speeds would serve as proxies for the performance of the trains over the connections themselves.

excessive weight had been given to the "other" (*i.e.*, non-CN, non-EJ&E) trains. This error, which affected both pre-Transaction and post-Transaction speeds, was corrected in the latest calculations.

The train speeds as calculated at each grade crossing are reported in Exhibit A to this letter, which is an Excel file (Exhibit_A_Outside_the_arc_train_speeds-revised_20080925.xls) included in the enclosed CD.

We would note that the revised train speed calculations reported in Exhibit A indicate that trains after implementation of the Transaction would operate at 31 mph over Western Avenue (EJ&E Eastern Subdivision MP 23.12), 29 mph over Main Street (EJ&E Eastern Subdivision MP 21.61), 38 mph over Cicero Avenue (EJ&E Eastern Subdivision MP 20.06), 40 mph over Ridgeland Avenue (EJ&E Eastern Subdivision MP 18.07), 33 mph over Illinois Route 60/83 (EJ&E Western Subdivision MP 59.02), 33 mph over Diamond Lake Road (EJ&E Western Subdivision MP 59.13), and 33 mph over Allanson Road (CN Waukesha Subdivision MP 38.65).

After these train speeds were calculated, CN updated its calculations of vehicular delay at grade crossings to reflect the updated speeds. Those calculations are reported on Exhibit B to this letter, which is an Excel file (Exhibit_B_CN-EJE_Grade_Crossing_Analysis-revised_20080925.xls) included in the enclosed CD. (This file is an updated version of Exhibit C to my letter to you of March 12, 2008, as previously corrected by the file transmitted to you as an enclosure to my letter to you of August 8, 2008.)[3]

We would note too that these updated delay calculations indicate that total vehicular delay on the EJ&E line and on the Waukesha Subdivision between Leithton and Grays Lake would increase by 1080 hours per day (compared to 1069 hours per day according to the calculations reported to you in my letter of August 5, 2008). As previously calculated, however, total vehicular delay on rail lines used by CN within the EJ&E arc would be expected to decrease by 1309 hours per day, for a net decrease of 228 hours per day across the Chicago region (compared to 240 hours per day as reported in my letter of August 5, 2008). (These calculations do not reflect decreases in delay that would be made possible by increased train speeds in and near Joliet, as a result of track improvements that CN has committed to make in accordance with its settlement agreement of August 25, 2008, with the City of Joliet.) I would appreciate it if

[3] The speeds reported on Exhibit A for trains operating over the EJ&E line before implementation of the Transaction have been recalculated to correct the error, described above, that CN previously made in computing the weighted average of the speeds of the CN, EJ&E, and other trains.

SEA could take these revised calculations into account in the Final Environmental Impact Statement now being prepared.

Very truly yours,

Paul A. Cunningham
Counsel for Canadian National Railway
Company and Grand Trunk Corporation

Enclosure (CD containing Exhibits A and B)

AND HAND DELIVERY

Ms. Victoria J. Rutson, Chief
Section of Environmental Analysis
Surface Transportation Board
395 E Street, S.W.
Washington, D.C. 20423-0001

Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

Following on discussions with your office and with the U.S. Fish and Wildlife Service ("USFWS"), I am submitting the enclosed Additional Voluntary Mitigation Measures, as a supplement to Applicants Voluntary Mitigation Proposal, which was submitted to your office on June 26, 2008, and modified in Applicants' Comments on the Draft Environmental Statement (filed September 30, 2008). These additional measures are submitted in order to address concerns raised by USFWS regarding potential impacts of the Transaction proposed by Applicants in this proceeding.

As you will note, we have placed the second of the listed measures in brackets. If, in your judgment, this measure is necessary to address USFWS's concerns fully, we request that SEA recommend that the Board require adherence to this measure as a condition to its approval of the proposed Transaction. Applicants would consent to imposition of the remaining listed measures as conditions on that approval.

Very truly yours,

Paul A. Cunningham
Counsel for Applicants Canadian National Railway Company and Grand Trunk Corporation

Enclosure

cc: Phillis Johnson-Ball
John H. Morton
Theodore K. Kalick
Normand Pellerin

ADDITIONAL VOLUNTARY MITIGATION MEASURES
REGARDING ISSUES RAISED BY U.S. FISH AND WILDLIFE SERVICE

VM xx Applicants shall cooperate with Midwest Generation, LLC ("MWG"), to identify locations on Applicants' property, or available to Applicants, on which loaded coal trains could be staged while awaiting delivery to MWG's Will County Generating Station and Joliet Generating Station and which would make unnecessary the construction of additional train storage capacity on MWG property that would adversely affect the Hine's emerald dragonfly or its habitat. If no adequate existing train storage locations can be identified, Applicants shall make reasonable efforts to acquire or construct, at MWG's expense, new train storage capacity, at locations where construction would not have adverse impacts on the Hine's emerald dragonfly or its habitat, and which would make construction of additional storage capacity on MWG's property unnecessary, and shall make that capacity available as needed for staging of coal trains destined for Will County and Joliet Stations.

[VM xx Pending identification of appropriate storage locations for MWG coal trains, Applicants shall work with railroads delivering coal trains to the EJ&EW line to ensure that coal trains destined for delivery to Midwest Generation's Will County and Joliet Stations are metered so that they do not come upon the EJ&E line unless there is sufficient storage capacity to receive those trains, and Applicants' dispatchers shall not permit coal trains to move onto the EJ&EW line from the lines of other railroads without first receiving confirmation that space will be available on MWG's existing tracks, or on available facilities on the EJ&EW line, to receive those trains.]

VM xx In consultation with the U.S. Fish and Wildlife Service (USFWS) and relevant natural resource stakeholders, Applicants shall participate in the development of a Habitat Conservation Plan for the Hine's emerald dragonfly or necessary work plans applicable to State and Federally listed threatened and endangered species and take the necessary measures to ensure that rail operations do not cause undue impact to those species.

VM xx [Migratory Birds] Where warranted, Applicants shall work with relevant natural resource stakeholder groups, Forest Preserve Districts, the Indiana office of The Nature Conservancy (TNC), Illinois Department of Natural Resources (IDNR), Indiana Department of Natural Resources (INDNR), and USFWS to support the creation or enhancement of migratory bird habitat away from those segments of the EJ&E rail line on which Applicants project Transaction-related increases in rail traffic, and where there is proposed Transaction-related construction of double-track and new or improved connections.

VM xx [Rare and Listed Turtles] In consultation with USFWS, Applicants shall construct and maintain adequate passages (that is, pipes or culverts) for turtles to cross through the track bed in areas on the EJ&E rail line between Leithton and Gary on which Applicants expect to increase rail traffic and where habitat for rare and/or listed turtle species (that is, Blanding's or spotted turtle) exists on both sides of the rail line.

VM xx [Karner Blue Butterfly] In consultation with USFWS, Applicants shall identify areas of suitable habitat of the Karner blue butterfly within Kirk Yard and in the vicinity of all planned Transaction-related construction of double track and new or improved connections within the State of Indiana for potential habitat protection and/or enhancement. Applicants shall contact TNC about participation in the Safe Harbor Agreement for the Karner blue butterfly.

VM xx [Indiana Dune and Swale] In consultation with appropriate Federal and State natural resource stakeholders, including USFWS, INDNR and TNC, Applicants shall designate EJ&EW-owned areas of prime prairie and dune swale habitat for potential land management agreement and/or conservation easement. Should modifications to Kirk Yard be proposed in the future, Applicants shall review proposed plans for upgrading and expansion of Kirk Yard in order to avoid construction in identified dune swale areas. In the event that unavoidable impacts are identified, the Applicants shall work with TNC to develop a plan for mitigation of those impacts and improvement of the quality of remaining dune swale areas.

VM xx [Eastern prairie fringed orchid] Prior to any ground disturbing activities, Applicants shall hire a qualified biologist to survey for the Eastern prairie fringed orchid (*Platanthera leucophaea)* in areas containing suitable habitat. Applicants shall survey each area on at least three non-consecutive days between June 28 and July 11, as this is when the orchid typically flowers and is most identifiable. If the Applicants' biologist finds orchids, Applicants shall not conduct any construction activities in that area and Applicants shall notify USFWS and the Board immediately. The Board shall reinitiate consultation with USFWS. Applicants shall work with the Board and USFWS to determine appropriate measures to offset impacts, most likely providing funding for an ongoing hand pollination project, or providing funding to be used to enhance another orchid site (that is, brush cutting, prescribed burning).

Appendix D
Oral Comments Received on the Draft Environmental Impact Statement

SEA held eight public meetings on the Draft EIS. The meetings were held:

- Monday, August 25, 2008: Matteson, Illinois
- Tuesday, August 26, 2008: Mundelein, Illinois
- Wednesday, August 27, 2008: Barrington, Illinois
- Thursday, August 28, 2008: Bartlett, Illinois
- Monday, September 8, 2008: Chicago, Illinois
- Tuesday, September 9, 2008: Aurora, Illinois
- Wednesday, September 10, 2008: Gary, Indiana
- Thursday, September 11, 2008: Joliet, Illinois

A total of 305 oral comments were received at the eight meetings (33 comments at the Matteson meeting, 35 comments at the Mundelein meeting, 69 comments at the Barrington meeting, 38 comments at the Bartlett meeting, 21 comments at the Chicago meeting, 55 comments at the Aurora meeting, 19 comments at the Gary meeting, 35 comments at the Joliet meeting). The transcripts from the public meetings are contained in this Appendix.

Each oral comment was assigned a comment number. The August 25 transcript contains comments from comment document #12137, the August 26 transcript contains comments from comment document #12376, the August 27 transcript contains comments from comment document #12377, the August 28 transcript contains comments from comment document #12136, the September 8 transcript contains comments from comment document #12535, the September 9 transcript contains comments from comment document #12711, the September 10 transcript contains comments from comment document #12875, and the September 11 transcript contains comments from comment document #13001. Table D-1, on the next page, organizes the oral comments on the Draft EIS alphabetically within the following categories:

- Elected Officials (Federal, state, and local)
- Agencies (Federal, state, tribal, and local)
- Passenger/Rail Service Providers
- Organizations
- Applicant
- Citizens

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET AND EASTERN RAILWAY COMPANY

PUBLIC HEARING

AUGUST 25, 2008

6:00 P.M.

Conducted by:

Tina Marie Adams, Meeting Facilitator - MWW Group Public Relations

Victoria Rutson, Section Chief - Surface Transportation Board, Section of Environmental Analysis

John Morton, Project Manager - HDR Engineering

MS. ADAMS: We're going to go ahead and get started.

I'm sorry? Did I hear

something from the crowd? Everyone can hear okay? You can hear okay in the back? Okay.

Good evening, ladies and gentlemen. Thank you for attending tonight's meeting. We are here tonight to hear your comments on the Draft Environmental Impact Statement that was released on July 25th regarding Canadian National Railway's proposed acquisition of the EJ&E Railroad.

My name is Tina Marie Adams, and I work for a firm called MWW Group Public Relations. We are part of a third-party contracting team that supports the Surface Transportation Board and its Section of Environmental Analysis. I will be facilitating the meeting tonight.

Before we get started, I'd like to take this opportunity to review some of

4

the protocol for tonight's meeting. In a moment I will introduce those presiding over the meeting, and there will be a short presentation on the findings from the Draft Environmental Impact Statement.

Immediately following this, we will hear your comments. Each commenter

will be given up to 3 minutes to speak. A time clock will be displayed on this screen to my right, and a yellow card will be shown at 2 minutes 30 seconds, with a red card at 3 minutes.

A list of speakers will also be displayed on the screen here to my right. I will also call forward the next two speakers in line after that person so we can be as efficient as possible tonight.

There's one microphone set up here in the center aisle. There are still some speaking spots available tonight, so if you're interested in speaking, you can still proceed to the registration table that's in the open house area or see a staff member who can assist you.

5

Alternatively, we want to remind you that you can submit your comments to the Surface Transportation Board through 1) a toll-free number, 2) website, 3) the mailing address, all of which are in the program that you received tonight, or you can get an extra copy, again, in the open house area.

There are also comment forms and drop boxes located in the open house area

and court reporters located throughout the venue. You may record your comments with them throughout the meeting.

Please recognize that all methods of comment received by September 30th will be taken into consideration and weighed equally.

Also, a quick housekeeping note. I just want to note that there are three exits here to my right, as well as three exits to my left.

Tonight we are here to listen to your comments on the Draft EIS. This is not a question-and-answer session. The

meeting will conclude at 9:00 p.m., with an announcement at 8:30 noting that we have 30 minutes that remain.

We appreciate your courtesy as we work to create an environment where everyone can be heard tonight.

In the event that anyone is in need of a Spanish translator, Beatriz is here tonight to assist.

If you have any questions, we have a number of staff available to assist you. Staff are identified with their name tags, as you see on me, and are located

throughout the venue.

In addition, our open house will remain open during the evening where additional court reporters are available for those of you wishing to provide comments in a more private setting.

At this time I'd now like to introduce the people with me on the stage. Victoria Rutson, who is chief of the Section of Environmental Analysis for the Surface Transportation Board, and John

Morton, the project manager from HDR Engineering, who is a third-party consultant supporting the Surface Transportation Board's Section of Environmental Analysis.

Victoria Rutson will now make some remarks about the Draft EIS.

MS. RUTSON: Thank you, Tina Marie.

Can everyone hear me?

AUDIENCE MEMBERS: Yes.

MS. RUTSON: Good evening, and thank you so much for coming here tonight. As Tina Marie told you, my name is Vicki Rutson. I'm with the Surface Transportation Board's Section of Environmental Analysis. We're here tonight

to hear your comments.

We know that this proposed acquisition has generated many questions in the Chicagoland area, and we know that Matteson in particular is going through a period of loss and mourning. We are particularly glad then that we have such a good showing tonight. We're looking

forward to hearing your neighbors' comments and your opportunity to have your voice heard.

As Tina Marie said, there are many ways to submit public comments. You're more than welcome to speak tonight. If you don't feel comfortable speaking in public, you can submit a comment in writing, you can submit an electronic comment on the board's website, and you can call our toll-free environmental hotline number and leave a recorded comment message.

All the instructions on how to follow those various methods of submitting comments are in the booklet that you picked up when you came to the meeting tonight.

Comments are due September 30th. If you're writing a letter, it means that

it must be postmarked by September 30th. Otherwise, a recorded message or an e-filing must be received on September 30th.

Once we get all the comments,

the team will be busy preparing what's called a Final Environmental Impact Statement. That document will review the comments, will consider them, and will respond to them. It will also contain our recommendations to the decision-maker in this proceeding.

The decision-maker is the Surface Transportation Board, a three-member board in Washington, D.C. The three gentlemen who comprise the board will be making the decision on this transaction, but only after the full record is closed, which means all your comments, our responses, any additional environmental analysis that we must do, and, very importantly, our recommended environmental mitigation.

The board is an independent federal agency located in Washington, D.C. It's neither a proponent or an opponent of this proposal. It is a neutral

adjudicatory decision-making agency.
My job is to make sure that the

Surface Transportation Board complies with the National Environmental Policy Act, and the Act is actually rather simple. It says that before an agency makes a decision, it must take a hard look at the environmental impacts of that decision. That's the first tenet of NEPA.

The second is that there must be an opportunity for public involvement. And that's why we're so pleased to have a good turnout tonight, and we look forward to your comments in whatever medium you choose to submit them.

Every comment will be treated equally, whether you give it orally through the hotline, by a letter or an e-filing, or speak privately to a court reporter this evening. Every comment will be treated equally.

The next step in the process, as I said, is the issuance of the Final Environmental Impact Statement. The board has said that that document will come out sometime between December 1st and

January 31st.

After, and only after, that Final EIS is issued will there be a final decision on this proposal, and that decision will either be to approve the transaction, to deny the transaction, or to approve the transaction but only with the imposition of environmental and other mitigating conditions. Those are the three choices that the board has.

With that, I'd like to turn the microphone over to John Morton, who is going to give you a summary of the findings in the Draft EIS.

John?

MR. MORTON: Thank you, Vicki.

I'd like to kind of briefly go through the -- some of the findings in the Draft EIS. First, discuss a little bit about the applicant. CN is a Class I railroad with operations --

I'm sorry. Is there a question?

AUDIENCE MEMBER: No.

MR. BRYANT: Oh, okay.

AUDIENCE MEMBER: Someone trying to find where I am.

MR. MORTON: Oh. She's up here in front.

(Continuing) -- with operations in Canada and United States. Canadian National has five rail lines that converge in the Chicago area. You can see the five dark lines are the rail lines that converge in the Chicago area, and they operate about 150 miles of rail lines in Chicago.

EJ&E is a regional railroad that operates in an arc around Chicago. It starts up at Waukegan, comes around to Joliet and across to Griffith and then up to Gary. It's about -- has about 200 miles of rail line, and it's got three major yards, including a major classification yard in Gary, Indiana: The Kirk Yard.

As Vicki mentioned, the applicants have identified three primary purposes for acquiring the EJ&E. First is to increase Canadian National's flexibility in routing by getting a route around the

city. It's to make EJ&E's Kirk Yard available to the Canadian National. And it's to allow the CN to develop a more extensive relationship with the shippers on the EJ&E.

There are several things that the transaction -- what happened, there are some changes in rail operations and yard operations I'll talk about in a minute. There's also -- CN proposes six new connections. They're listed up here. We have a chart back in the open house section if you wanted to look at those six connections. And there's -- they're proposing 19 miles of siding extensions and double tracking.

The Draft EIS included --

Yes, please.

AUDIENCE MEMBER: What is meant by a siding extension?

MR. MORTON: It's essentially putting in a second track where there is one track now. In some cases we identified it as extending where they have a siding,

just running -- extending that siding, that second track. In some cases it's a double track or actually adding a second main line.

The EIS identified a number of

resource areas and talks about the issues in each one of those resource areas, and I want to cover just a few tonight.

Rail operations. This is a density diagram, and hopefully folks in the room can see it. But generally, this is the EJ&E arc on the outside, and these are the CN rail lines coming down the inside. The light blue color is the current train track, again, in terms of number of trains per day. The darker color is the proposed train numbers in terms of trains per day should the transaction be approved.

And as you can see, what -- there's fair -- most of the tracking that would be coming down today would be diverted and come around the EJ&E arc, and so you can see the shift in traffic levels.

The EIS looked at the operations

and had concluded that essentially the EJ&E would be near or at its capacity, its practical train volume capacity, in a number of areas. As a result of that, the EIS concluded that it would be unlikely that the number of trains identified in CN's operating plan would be exceeded or be higher.

It also identified that in certain areas where Metra crosses the EJ&E that in order to maintain the high on-time performance of Metra that CN and Metra would need to work together.

In the safety, because of the increased number of train miles, the probability of a train accident on the EJ&E arc would likely increase. You know, by the same token, because of the reduced number of train miles, the probability of a train accident on the CN rail line inside the EJ&E arc would likely decrease.

AUDIENCE MEMBER: For how long?

MR. MORTON: The potential for a highway-rail accident on the EJ&E rail line

would also likely increase, and consequently, because of the reduction, the potential for a highway-rail accident on the CN rail line would likely decrease.

Woodruff Road in Joliet and Lake and Miller Street in Griffith, Indiana, the EIS identified those as experiencing a substantial increase in the potential for an accident. The EIS concluded that there really wouldn't no -- be no impact on passenger safety because passenger rail

doesn't operate on the EJ&E rail line, but you would have an improvement on the CN rail lines because of the reduction in the freight traffic.

In addition, because of the change in freight operations, there would be a -- a number -- more hazardous materials transported on the EJ&E route, and many of the segments along the EJ&E rail line would be major key routes, or that would be more than 20,000 carloads of hazardous material transported on them per year.

We evaluated 155 highway-rail at-grade crossings on the Canadian National rail lines within the arc. 125 of those would benefit from the proposed action.

Of the 112 highway-rail at-grade crossings on the EJ&E, 87 of them did meet the board's threshold for environmental analysis. On that -- of that analysis, existing congestion within the EJ&E corridor makes -- we had some mitigation suggestions in the EIS.

Without mitigation, there are 15 highway-rail at-grade crossings that we've identified, and they're listed up there,

and they're on the board out in the public -- or in the open house session that would be substantially affected by the proposed action.

From an air quality standpoint, because of the longer train route, the emissions would increase. But because of the more efficient route and the less delay, the result is that the increase in emissions would be below the de minimis

thresholds for general conformity in this area.

We looked at all the emergency services providers -- the police, the hospitals, and the fire stations -- and identified that there are eleven, nine fire and two hospitals that are located near the EJ&E that would potentially experience effects without mitigation.

We identified in the Draft EIS about 3,000 noise-sensitive receptors. Those are homes and businesses and facilities that are sensitive to noise that would be within the 65 dBA. That's a measurement of noise along the EJ&E. There would be about 2,700 receptors that would actually benefit on the CN rail line

segments from the reduced traffic.

Because of the safety requirements, the quiet zone in Barrington would actually no longer qualify as a quiet zone without mitigation.

There were a number of mitigation measures listed in the Draft

EIS. Canadian National has 76 voluntary mitigation measures in these areas. In addition to those 76, CN is proposing 72 mitigation measures in those areas. And those are all listed in both the Executive Summary and also in the Draft EIS.

And with that, I'd like to turn it back over to Tina Marie for the comments.

MS. ADAMS: I'd actually like to start by acknowledging that there were a couple questions folks had during John's presentation. I would invite you to go to the open house portion where there are still engineering staff that are there to answer your question because we want to reserve this time for people to make their public comments. So thank you for that.

AUDIENCE MEMBER: One question. Why is this all being based on the environment

and nothing else?

MS. ADAMS: Again, I would invite you to go to the open house portion, and that's where we're going to address

questions that people have. During this period, this is strictly the public comment period.

But, again, there are staff back there, and if you are someone who is commenting, before or after you comment, again, please feel free to move to the open house area to have questions answered.

Okay. With that, we will begin the public comment portion of our meeting. I want to remind you that we're going to adhere to that 3-minute rule. And we want to also get our first commenters up and ready here.

I understand Rick Bryant, representing Congressman Jesse Jackson's office, is here first up to speak at the microphone -- there you are. Okay -- and then followed by Judith Bird and Michael Lazich.

As people are making their way to the microphone, I just want to remind you if you could please state your name,

who you represent or the town that you're

from. And if you could also please spell your last name for the benefit of the court reporter, who will be taking down all the comments made here today.

We have the microphone here at the center aisle.

MR. BRYANT: Oh, okay.

Hi, my name is Rick Bryant. I'm the District Administrator for Congressman Jesse Jackson, Jr. The Congressman's district, for those of you who don't know, starts at the Museum of Science and Industry, comes down the lakefront all the way down the Indiana line to the Cook County border, across over to University Park, and then kind of back up I-57, so it's a large district.

This issue that brings us here today is a complicated and perplexing one for Congressman Jackson. That's because one-third of his district, the northern part that I just described, strongly favors this transaction because it will significantly reduce train traffic for

them.

Another third of the district, the southern third, strongly opposes this transaction because it will significantly increase train traffic in their communities.

And the middle third of the district will see little impact from the proposed transaction and, therefore, they remain largely ambivalent to the issue.

And then, finally, there's Homewood, the U.S. corporate headquarters for Canadian National Railway, which, as you know, was formerly the Illinois Central Railroad. Homewood favors the sale because local officials there fear that without this transaction, Canadian National will move a significant number of its current and future freight operations and its local jobs from the Chicago area to Memphis, Tennessee.

So where does the Congressman stand? He supports the sale, but his support is conditional. He has asked the

Surface Transportation Board, twice in

writing, to ensure that the terms of the sale include specific mitigation requirements in the communities between Matteson and the Indiana state line.

That mitigation includes underpasses or overpasses at the four locations identified in the charts out here, which is Cicero Avenue in Matteson, Western Avenue in Park Forest, Chicago Road in Chicago Heights, and Lincoln Highway in Lynwood.

These viaducts will guarantee uninterrupted north-south automobile traffic flow on these major thoroughfares, and these viaducts will also prevent potential problems for local emergency vehicles who need around-the-clock access between local communities and the St. James Hospitals in Chicago Heights and Olympia Fields.

There's one other condition that the Congressman is demanding. Not only must the STB require these underpasses, but

including CN, the federal government, and/or the state government.

As the Congressman stated in his letters to the Surface Transportation Board, the local communities cannot afford the underpasses, and they should not be required to pay for those.

Eleven Chicagoland communities -- the eleven communities identified in the study that need mitigation, of those eleven, Chicago Heights has the lowest annual household income, Park Forest has the third lowest, and Lynwood and Matteson are also below the average.

In closing, the Congressman wrote that he believes that the acquisition of EJ&E Railroad by Canadian National will greatly improve overall rail service and efficiencies throughout the Chicago area,

as well as reduce overall rail congestion.

However, he emphasized that those overall regional railroad benefits should not outweigh or override the specific local negative impacts of rerouting trains that will certainly create headaches in other communities.

the STB must be responsible for identifying funding for them as well. Funding should not come from -- and the funding should come from a combination of sources,

"In the end," Jackson has told the board, "I am counting on the board to work with me and all interested parties to appropriately find funding for these highlighted mitigation projects."

Thank you very much.

MS. ADAMS: Okay. We have Judith Bird --

MR. BRYANT: We also have copies of the letters the Congressman has sent to STB and the statement over on the side table.

MS. ADAMS: We have Judith Bird speaking next -- again, I would remind you if you could please say your full name and spell that, your last name, who you represent or the town that you're from -- followed by Michael Lazich and Julian

Alexander.

MS. BIRD: My name is Judith Bird, J-U-D-I-T-H, B-I-R-D. I'm a resident of Frankfort, Illinois. I felt that the -- the Draft EIS study seems to be based on traffic projections only up to the year 2015, and that's only seven years away.

The Northwestern Planning Commission estimates then Frankfort's population will be up to 55,000 by the year

2030. This study should be based on much higher population numbers; otherwise, the study is flawed from the beginning.

The Draft EIS is based on the belief that trains will travel at 45 miles per hour through Frankfort; thus, the wait times around grade crossings will be very short. My own personal observation just simply being stuck at trains periodically is that trains are not running that fast. 15 to 20 miles per hour is a more realistic estimate.

The EIS authors must look at the reality of the train speeds and consider

the impact of blocked intersections in our communities.

If you've ever waited for an ambulance for any reason, a minute can seem like an hour. Should your home be on the wrong side of the tracks anywhere within this whole area, the times will increase enormously, and it's simply not -- I don't feel the DEIS adequately addresses this type of issue.

Part of the requirements for this purchase absolutely must include a requirement for CN to fund additional fire

stations, as well as provide HAZMAT training and equipment to our local communities.

Thank you.

MS. ADAMS: Thank you.

We have Michael Lazich and Julian Alexander and Mayor Jim Holland following that.

MR. LAZICH: My name is Michael C. Lazich, L-A-Z-I-C-H. I live in Frankfort, Illinois, in the Sandalwood Estates. I

live at 11560 Tea Tree Lane. It's a four-block area, runs parallel to the railroad tracks. The homes are in the range from 400,000 to $600,000 homes.

I would question that 65 decibel because I can go out on my patio, and some of the trains -- not all of them -- and I can literally watch my windows vibrate. So I would question that 65 decibel number.

Now, my neighbors -- I've lived there four years. It's a brand-new home, bought it in '04. My neighbors, who -- on each side, east and west, because the -- runs east and west. Neighbors on both sides are moving, and the one across the street, strictly because of CN Railroad

moving in. They understand the impact of running all these trains through our neighborhood, the impact it's going to have on the neighborhood.

And another question I have is the hazardous waste, especially chlorine gas. Now they're running coal cars through there and tankers with chlorine gas. It's

very deadly.

If it should overturn like they had a deadly accident in Tennessee, not only my four-block area, but literally for miles the chlorine gas could seep through the neighborhoods and everything and be very deadly to the neighborhood.

And these are just some of my concerns. Thank you.

MR. ADAMS: Julian Alexander followed by Mayor Holland and Mike

MR. ALEXANDER: My name is Julian Alexander A-L-E-X-A-N-D-E-R. I'm president of the Meadow Lakes Homeowner's Association, which our subdivision sits directly adjacent to the tracks.

We look at this as a major impact on our community. Pollution would increase from 28 to 38 trains, there is

more pollution. So I disagree with your numbers there.

Hazmat. We have no hazmat teams in our community, nor had our fire department ever been trained for any type

of emergency like this, nor do they have response vehicles like that.

The traffic increase of train traffic on those tracks. The more trains we all know, the more accidents. You can't tell me that you put one train on a track, you have less accidents. If you put 30 on a track, you are going to have more accidents.

The noise pollution. We live there now, you have four, five trains coming through there, all times of night and just as the gentleman before me, we can literally see our windows shake.

Our schools and hospitals. We happen to be on that list of one of the eleven hospitals. If there's an emergency in our community, once we leave our community, we use Cicero Avenue. If there's no under or overpass there, we are stuck. We cannot use Governor's Highway all the time because it floods. We cannot

go to I-57.

Life and death here. Stroke,

heart attack victim. We are talking seconds, not minutes.

The value of our homes would definitely decrease. The safety on the tracks as far as kids playing on those tracks without a berm, I think is just terrible to put our kids in jeopardy like this.

Our health issues. The health issues of pollution from the tracks is definitely a major concern and we all know that the trains do put out a lot more pollution than a car.

The over and underpass. We have not heard of the railroad talking about that in any form or fashion or saying anything like that. They have not given us the respect to even talk that way although they are saying what their trains could do.

We know that these trains go up and down these tracks and the freight trains could be there for hours. We have seen them coming and going in both directions and we think that's a major

32

concern.
Also, the last thing, the pollution part of it. We are definitely concerned about that. As far as trains sitting there with engines just idling, winter or summer, we are definitely concerned about that. Thank you.
MS. ADAMS: Mayor Holland, Mike Stevens and Mike Mohan.
MR. HIGGINS: Vicki, we certainly compliment you on your well-organized event.
My name is Jim Holland H-O-L-L-A-N-D. I am the Mayor of the Village of Frankfort and the Village of Frankfort will make a comment in writing later and after our engineers have a chance to review the environmental impact statement that's been drafted.
Tonight I'm going to make some comments about four concerns that I have personally found in the draft environmental impact statement. The environmental impact statement needs to take a hard look at

33

suggestions from organizations such as CREATE that have made proposals to alleviate rail congestion in Chicago.
These suggestions would benefit all railroads in Chicago, not just the CN. The draft environmental impact statement needs to -- seems to just dismiss the CREATE suggestions. The final EIS should seriously consider CREATE alternatives.
The draft EIS suggests the CN should pay only a portion of the cost of mitigation for such items as grade separations. The draft EIS suggests that government should pay the rest. Key Illinois state agencies, IDOT and the ICC have stated that they do not have funds for grade separations and other mitigation.
The draft EIS fails to take a hard look at the likelihood that the Federal, state and local governments can or will fund those costs. CN's profit will benefit from this transaction. They should pay for all mitigation required.

34

The final EIS should identify this realistic source for funding

mitigation even if it is precedent setting. The draft EIS states that bicycle and pedestrian safely will be addressed after the publication of the EIS. These issues need to be addressed in the EIS.
Bicycle and pedestrian trails are very important to residents of Frankfort. Several bicycle trails already cross the tracks in Frankfort and our plans call for them at nearly every rail highway intersection.
The EIS needs to take a hard look at bicycle and pedestrian crossings and the EIS should order the CN to provide proper crossings for bicycles and pedestrians where local plans show them.
Appendix L suggests that there will be a significant sound impact to the people of Frankfort. The EIS should require the CN to pay for the four-way gates and other improvements necessary to qualify Frankfort six at-grade crossings

35

for a long-term Federal Railroad Administration approved quiet zone.
In addition, the EIS should direct CN to pay the cost for berms and landscaping and other mitigation items to

help mitigate sound in residential areas in Frankfort.
We certainly thank you for the opportunity to speak tonight.
MS. ADAMS: Mike Stevens, Mike Mohan and Joe Sweiderman.
MR. HIGGINS: Good evening. My name is Mike Stevens S-T-E-V-E-N-S. I live in Frankfort and I'm also a village trustee in Frankfort and I wish I didn't have to follow Mayor Holland.
I'm opposed to the sale and there are a number of reasons why. First of all, is the increase in train traffic from six to 28 a day. I don't know how anyone can say that's a good thing for Frankfort.
This will negatively impact our fire and police emergency response time. I

36

read over the weekend an article in the paper where Mayor Balderman in New Lenox talked about a situation where he was a policeman there and got caught in a situation where the ambulance couldn't get across the track and a young child lost its life. And we don't want that to happen anywhere.

I'm concerned about the school buses that they have to cross the tracks a number of times a day. And we've got a situation at 116th Avenue where we don't even have crossing gates coming down. They are not even there.

I believe that what we are doing is moving a regional transportation problem further west and we are not addressing this problem as it exists.

People who currently live in the area today where the trains are running have dealt with this issue for many years. Their property values reflect already the high volume of train traffic.

Who is going to pay our

homeowners because of their home values being reduced because of these trains coming through?

The cost of mitigation. The cost is staggering yet the CN only proposes to contribute 40 million dollars. This from a company that made over 2 billion dollars in profit last year.

The CN is a foreign company expecting the US taxpayers to foot the bill so that they can become more profitable.

This sale if it goes through will be a huge win for CN and a huge loss for the American taxpayer.

And my town, my town of Frankfort will be a less desirable place to live. Thank you so much.

MS. ADAMS: Mike Mohan and then we have Joe Sweiderman and Terry LaPlasta.

MR. HIGGINS: My name is Michael Mohan M-O-H-A-N and I am CN's Vice President of Service. Thank you for the opportunity to speak this evening about CN's goals in this transaction and our

commitment to the environmental review process in this proceeding.

CN is the fifth largest railroad in North America, measured in terms of revenues, and we work closely with all our rail colleagues as part of an integrated network.

In addition to our transcontinental operations across Canada, we operate in sixteen states in the United States. CN has a particularly strong heritage in Illinois.

A key portion of our US network is the former Illinois Central Railroad,

which CN acquired in 1999, and which has operated for more than 150 years. In addition, CN's US headquarters is located in Homewood, Illinois and we are proud to have more that 1500 employees located in this state.

CN prides itself on running a precision railroad. Our President and Chief Executive Officer, Hunter Harrison, pioneered the concept, which enables CN to

conduct safe and efficient operations while providing the best possible service to our customers.

Our proposed acquisition of the major portion of the Elgin, Joliet & Eastern Railway Company is intended to help address the severe rail congestion plaguing the Chicago region. This transaction would enable CN to divert most of our trains that currently operate through downtown Chicago onto the underutilized EJ&E line on the periphery of the city.

By doing so, this transaction would streamline CN's operations while also providing a privately funded partial remedy to the costly and inefficient rail congestion in Chicago. Importantly,

roughly 60 communities inside the EJ&E also would benefit from reduced train traffic as a result of the transaction.

CN understands the concerns about increased train traffic that have been raised by communities along the EJ&E line. We have been engaged on environmental

issues in two major areas.

First, CN has been an active participant in the Section of Environmental Analysis environment review process and CN has done everything possible to help facilitate this process.

CN has provided all of the data requested by SEA and its consultants for their analysis and we participated in the SEA's scoping meetings conducted earlier this year by being available at each meeting to talk with community residents and officials and respond to their questions.

In addition, consistent with STB practice under which the applicants in a transaction are responsible for reimbursing the charges incurred by the third-party consultants assisting SEA in the environmental review process, under SEA's

direction, CN has already paid the
independent environment consultants who are
assisting SEA more that $10.5 million, and
we expect to pay at $7.5 million more

41

through the end of this year.
In addition, we have hired our
own in dependent environmental consultants
who have conducted extensive environmental
analyses in order to both answer SEA's
factual inquiries and to develop mitigation
plans. Our consultants were also
instrumental in developing CN's proposed
voluntary mitigation options, which were
included in the Draft Environmental Impact
Statement issued on July 25 by SEA.
Second, CN has undertaken an
extensive community outreach effort,
starting first with briefings on the
transaction with individual community
leaders, civic organizations, and other
groups when we announced this transaction.
At the conclusion of SEA's
scoping meetings, CN launched an extensive
community outreach initiative with the goal
of developing voluntary mitigation
agreements with communities located along
the EJ&E lines to address their concerns

about the impact of increased train traffic

42

along the line.
My colleague, Eric Jakubowski
and I have met with every community located
along the EJ&E line willing to meet with
us, including Matteson. We have been
successful in reaching an agreement with
the City of Joliet that addresses their
environment concerns, and we have
productive discussions ongoing with a
number of other communities. CN is fully
committed to these mitigation efforts.
I know there has been interest
and concerns expressed about CN's august 14
filing in which we asked the Board to
divide this proceeding so that the
transaction can close on the transportation
merits before the end of 2008.
The need for our filing arose
because the board's July 25, 2008 decision
projected a timetable for a final decision
in this proceeding that likely extends into
2009, but with no certain end date.
At the same time, the Stock
Purchase Agreement between CN and EJ&E, an

43

indicted subsidiary of United States Steel
Corporation presents the risk that EJ&E
could terminate the transaction if it were
not approved by the STB and closed by
December 31, 2008.
CN contacted US steel and
requested modification of the SPA or other
action that would assure that the
transaction could still be closed if
approved after December 312008. Earlier
this month, however, US Steel declined our
request. Facing the very real prospect
that we would not be able to close on the
transaction by year-end, we filed our
August 14 petition.
There is no dispute about the
transportation benefits of the transaction
and the lack of serious competitive issues.
What I want to emphasize this evening is
that our petition would not in any way
change SEA's environmental review process.
The environmental review process would
continue as outlined in the Boards July 25
decision setting forth time limits in this

44

proceeding.

Of particular importance, during
the time between the Board's approval of
our transaction and completion of the
environmental review process, CN would not
be allowed to make any transaction-related
operational changes that would create
adverse impacts on communities located
along the EJ&E line.
We fully understand the need for
a thorough environmental review and we are
not seeking to deprive any community or
interested part of its opportunity to
participate in this process.
Thank you again for the
opportunity to provide CN's perspective on
this transaction.
MS. ADAMS: We now have Joe
Schwieterman, Terry LaMastas up and Kurt
Zollener.
MR. SCHWIETERMAN: Good evening, I'm
Joe Schwieterman, Professor at DePaul
University and Director of the Chatting
Institute at DePaul.

45

MS. ADAMS: Could you state your
name, please?
MR. SCHWIETERMAN:
s-C-H-W-I-E-T-E-R-M-A-N. I'm here speaking

on my personal views and not those of my employer.

I appreciated the draft EIS as the region has a lot of trouble making choices on transportation infrastructure from highway expansion to airports to rail, it's been a frustrating ten years. And part of the problem is lack of adequate state support for grade crossing improvement in this case.

Part of our failure is to adequately create, thus the rail problems continue to grow worse and communities everywhere are feeling the pinch. I think the draft EIS captures those problems well.

On one hand, it shows there are significant transportation benefits to the acquisition. It shows that CN can take steps to mitigate some of the problems but it shows that the problems are indeed very

real.

I think the costs do not rise to the level where they offset the benefits of this transaction for the region. And the volume of traffic will grow in this region, making more traffic on the EJ&E inevitable regardless of what occurs but the regional

benefits are fairly compelling.

I think the assumption on traffic flow are reasonable in the EIS. In the same time, I think some of the numbers on traffic volume for all the lines in the region may indeed change dramatically when you look out ten or fifteen years which may assess the need for additional improvements to insure that train speed remains at the level CAS anticipates.

The EJ&E was built of the bypass I think with proper mitigation can be an efficient bypass. I think our region is wise to debate these issues carefully but I think as a region, the benefits are indeed fairly compelling. Thank you.

MS. ADAMS: Terry LoMastis, followed

by Kurt Zollener and Jorge Perez.

MR. HIGGINS: My name is Terry Lomastis. I'm Vice Chair of Economic Development For Chicago South Chamber of Commerce.

This is a vast reach in the south side of Chicago. It represents about 86 communities and about 2.5 million residents. We house several national and regional organizations and one of the

largest logistics centers in the United States.

All work together to coordinate the operations in the south suburbs. The Chicago Chamber of Commerce is a steward of economic vitality for our region and believes that the acquisition will help move freight traffic more effectively and create jobs and open up new economic development opportunities for all.

As freight traffic is expected to increase over the coming years and the need to improve and expand our rail system and to accommodate a growing flow of

commercial -- with commerce throughout the region is apparent.

That the Canadian National Rail Company whose corporate headquarters are in South Cook County is offering to investigate in our region -- is offering to invest in our region which will result in strengthening our economy.

We expect that Canadian National will also work with local communities and governments to help address the need for the infrastructure changes that will occur.

We are asking the Surface

Transportation Board to look favorably upon the benefits to be derived from this transaction and to look to minimize any negative impact on communities along the EJ&E by supporting both public and privately long-term funding and issues to provide infrastructure needed to support the necessary changes that will impact our communities.

Thank you very much for having us.

MS. ADAMS: Kurt Zoellner followed by Jorge Perez and Representative Al Riley.

MR. HIGGINS: Yes. My name is Kurt Zollener Z-O-E-L-L-N-E-R representing the Village of Mokena. I'd like to give a couple comments.

First talk about some broad issues and then some more specific. First of all, in our opinion, the final EIS needs to broadly address the thought plane.

First review alternatives for relieving rail congestion in the Chicagoland area. Other than CN's proposed shift of huge volumes of rail traffic from existing tracks to the EJ&E.

More specifically, we believe

that EIS should reconsider the CREATE alternative as a comprehensive solution to the problem.

Secondly, assess realistically the ability of taxpayers to fund the mitigation recommendations contained in the DEIS, as well as other mitigation measures. Citizens throughout the region made demands

should CN's proposal ultimately be approved.

We believe the environmental impact of proposed transaction on the regional will be far greater than implied in the DEIS, given the scarcity of federal, state and local government dollars to enact mitigation measures.

Finally re-evaluate the list of substantially affected crossings included in the DEIS. The limited time length projection of ATT counts in DEIS on these roads crossing the EJ&E at grade level, in our opinion, fails to adequately consider the probable prospect of both increased vehicular traffic on the roads and increased freight traffic on the EJ&e over the next 20 years given current population growth patterns and every increasing

volumes of freight traffic on the rails.

On a more specific basis we would ask the STB to do the following and the final EIS. First take a harder look at specific impact of noise on residential

homes located along the EJ&E that might be associated with larger and much more frequent freight traffic.

Secondly, require CN to pay for the installation of berms or noise walls in areas which EJ&E trackage lies within the 65 d/b/a projected contour line for residential areas as condition of approval for CN's acquisition of the EJ&E.

Such noise barriers are necessary to help protect the property values of these residential areas. We believe it is unfair to ask the residents of homes near the EJ&E to simply absorb the negative physical and economic impacts that will be imposed on them if this is ultimately approved.

Third, to take a harder look at the negative impacts on safety and traffic congestion at grade crossings that would be associated with a quadrupling of freight traffic on the EJ&E.

And finally, require CN to pay for necessary crossing improvements

including grade separations for either quad gates or barrier median test conditions for approval for the acquisition.

With specific respect to our community and its crossing of Wolf Road, we will need the installation of barrier medians to be the minimum acceptable crossing improvement. Thank you.

MS. ADAMS: Jorge Perez followed by Al Riley and Doug Whitley.

MR. PEREZ: Good evening. My name is Jorge Perez and I'm from South Chicago. The representatives of Surface Transportation Board, I'm President of the Calumet Area Industrial Commission, an organization representing businesses and industry on the south side of Chicago and in the southern suburbs.

I come before you today to urge the Surface Transportation Board to include the positive economic impact that the Canadian National Railroad's acquisition of the EJ&E Railroad will have in its environmental impact statement.

The purchase of the EJ&E by Canadian National holds the promise of economic revitalization for the portion of the EJ&E Railroad that runs to the southeast side of Chicago.

The EJ&E Railroad will link the Port of Chicago on the southeast side of Chicago with an international shipping network. Companies can unload their product in the Port of Chicago onto the Canadian National Railroad and ship them transcontinental to West Coast ports and destinations across the globe.

This increases the value of the port of Chicago and will lead to further investment in jobs in the shipping industry.

In addition to the economic benefits of the south and southeast side of the city and suburban industry, the acquisition will be good for the economy and the Chicago Metropolitan region.

Rail congestion slows the transport of goods to and from Chicago

businesses, increasing costs to those products. This same congestion adds to shipping costs of businesses across the country as trains passing from the east to the West Coast face delays as they pass through Chicago.

If the rail congestion in Chicago is not addressed soon, shippers will find alternative means of shipping resulting in a loss of revenue and jobs for the Chicago region.

In closing, the south side and southern suburbs of Chicago need the economic development and jobs that link the EJ&E Railway to the Canadian National, International Shipping network will provide.

On behalf of the Calumet Area Board of Directors, I urge the Surface Transportation Board to approve the proposed acquisition of the EJ&E Railway. Thank you.

MS. ADAMS: I understand that -- please be respectful of everyone. We

appreciate that.

I understand that you are

representing Representative Al Riley.

If you could please state your name and spell your name.

MS. PERALES: My name is Martha Perales and I'm here representing State Representative Al Riley. Last name is spelled P-E-R-A-L-E-S.

State Representative Riley represents the 38th District. The 38th District includes all and or portions of Country Club Hills, Flossmoor, Harvey, Hazel Crest, Markham, Matteson, Oak Forrest, Olympia Fields, Park Forest, Richton Park and Tinley Park.

I'm here in opposition to the proposed EJ&E purchase. I don't think that CN has been neighborly in their whole approach and that is why I am against the purchase in its present form. There has been little discussion from CN to mitigate the congestion being caused by more and longer trains.

This is about mitigating congestion around the Chicago area. We are also being viewed as an inter land in this deal. I don't believe if CN really listened to the critical mass of the

residents, the counsel of governments and municipalities in the metropolitan area.

The whole issue of congestion and mitigation and prospective of these long trains and its impact our or region has not been fully addressed at this time. If CN believes this this is a good deal for the Chicago area, then additional discussions need to be made between CN and the municipalities.

My main argument is the lack of access and inconvenience to our residents. Our region has been historically left behind when it comes to creating access, whether it be by airports, commercial rail or long overdue energy considerations for our regions.

There are currently a couple bottlenecks on Western Avenue and Main

Street between the Village of Matteson and the Village of Park Forest, just to name a few.

There has to be some kind of tangible evidence that moving more freight in this instance has some kind of economic impact for our region. It's all theoretical at this time.

It's sort of an abstract concept. Most people perceive that this is a business deal, an acquisition. Conceptually, I am for moving more freight but we have to turn this precept of yes, it is good and show it's something tangible.

It is like trickle-down economics. And with a very effect of public policy, people have to have faith in it and wait and it never happened. When there's a cause and effect that has yet to be tested, municipalities must be tried in their effort to make sure their quality of this life is not diminished in this business deal.

Ladies and gentlemen, there

appears to be a fallacy -- there appear to be some fallacies in their arguments in this business deal.

Respectfully submitted, State Representative Al Riley.

MS. ADAMS: I would again just like to remind the crowd to please be respectful of the speakers regardless of their position.

Your silence would be a great response to that as an option. Now we have

Doug Whitley. Following him is Timothy Kasien and Rick Reinbold.

MR. HIGGINS: Good evening. I'm Doug Whitley, President of the Illinois Chamber of Commerce.

I speak tonight on behalf of employers and employees in this region. Transportation is one of the cornerstones of the Illinois economy and specifically here in the Chicago region.

We have numerous transportation issues that must be addressed and this EJ&E acquisition by CN is only one of multiple

activities that should take place in the future.

One of the components of our mission is to promote the infrastructure investment in this community and in this state. Businesses depend upon it.

Infrastructure is the engine of our economy. I'd like to quote from the Transportation Commission report delivered earlier this year to the United States Congress.

It says quote: It is an overstatement to say the nation's potential for the creation of wealth will depend in great part on the success of freight efficiency.

This report talked about choke points in our nation's system of transportation threatening this regional economy and the nation's economy. Chicago is one of the most critical choke points that begs to be addressed.

CN's proposal to acquire the EJ&E will ease the choke point enabling

more efficient flow of goods to and through the region providing and protecting jobs. It is a proactive start by the private sector to begin an important long-term improvement process. Much more needs to be done and it will take many years to do all that needs to be done, but it is a start. And that's why I'm here today.

Freight congestion poses a threat to the Illinois economy. It's time to remove the uncertainty about the timeliness of transportation supply chain in the Chicago Metropolitan area.

Not long ago, Chicago region was the third largest intermodal freight hub in the nation. Today we are fifth, largely because of areas like Kansas City and Memphis doing more to provide more and reliable efficient rail service.

Two-thirds of the nation's cargo containers moves through Illinois, most of which moves right through the Chicago regional area. The rail industry employs many people and thousands more depend upon

the distribution of goods and services that move through Chicago.

Efficient Chicago area rail and truck networks are critical to the nation's economy, not just Chicago's. The CN acquisition is but one of many positive steps that must follow.

It is in the state's interest to insure that Northeastern Illinois remains the transportation hub of North America.

In my opinion, the State of Illinois has been sorely absent and silent when it comes to being extremely helpful in giving and providing comfort to these communities that there will be construction projects, solutions and comfort to these communities that have the greatest concerns about the future of rail freight traffic in Illinois.

Mitigation is appropriate and necessary but it will take time and cooperation on the part of many, including the municipalities, the state, and the Federal Government and yes, the CN.

MS. ADAMS: You are at time. I'm sorry.

MR. WHITLEY: But every one of us is dependent upon increased jobs and increased economic in our state.

MS. ADAMS: Thank you. Just to remind everyone, we do have the strict three minute limit. If you have more comments, we do invite you to go to the open house to extend your comments.

Okay. We have Timothy Kocian followed by Rick Reinbold and Cynthia Corso-Heath.

MR. KOCIAN: Good evening. My name is Tim Kocian and I'm here representing the homeowners on Aberdeen Road in Frankfort.

THE COURT: Could you spell your last name, please?

MR. KOCIAN: My name is spelled K-O-C-I-A-N. To let you understand where we are situated in this, Aberdeen Road is on the north side of the railroad tracks and there are houses on the south side of

Aberdeen Road on the north side.

The entrance to Aberdeen Road is a couple hundred feet from the crossing of Harlem Avenue. When the train stops, the traffic on Harlem Avenue, you cannot get in or out of Aberdeen Road and if you have an emergency, you are going to be lucky if the cars aren't blocking it.

And there's only one way to get in and out. And people are going to be in jeopardy if you don't do something about that crossing.

I understand that Cook County is not interested in doing something about that crossing because nobody who is affected by that crossing lives in Cook County. They all live in Will County.

Cook County owns the crossing but they do not have any people that are living off of it. If you come to Aberdeen Road, I will show you that -- you'll be surprised how close the train runs to people's back yards.

It's up on a fifteen foot embankment and as the train goes through,

you can feel the vibrations. And they'll wake you up at night even across the street where we live, which is 300 feet away from the track.

I have measured the current trains from our front porch which is on your 65 d/b/a and I measure them 70-74 d/b/a sustained on the current, let alone what's going to be proposed.

That could be waking you up six to eight times a night. And I think everyone realizes what the effect on people is if they are going to be sleep deprived by being woken up in the night six to eight times.

The railroad, I understand, has argued that the EJ&E has been there for a hundred years, so people get over it. You've had a railroad there, you knew that when you moved in.

Well, we knew the character of the railroad and the way we look at it, the character has been sustained and has set a precedent for the last hundred years.

Because of that precedent,

because of the character of the railroad, communities have grown up around the railroad that are consistent with that character. It's too late to change the character of the railroad now.

The time to make it into a super highway for transit is long past. Thank you.

MS. ADAMS: Rick Reinbold followed by Cynthia Corso-Heath and Robert Ukokian, if I'm saying that correctly. Do we have Rick Reinbold? If not, Cynthia Corso Heath followed by Robert Ukockis and Julie Furgason.

MS. CORSO HEATH: Okay. Thank you to the STB for allowing us to speak tonight. My name is Cynthia Corso Heath. That's C O R S O, H E A T H. I'm a long-time resident of Frankfort and the southern suburbs. I am currently serving as a village trustee in Frankfort. I am also on the board of the Lincolnway Public Safety Communications Center which

dispatches police, fire, and other emergency 911 calls.

The draft EIS confirmed what we knew, that the proposed acquisition of the

EJ&E line by this Canadian company will have severe impacts on our quality of life. Air pollution impacts on the quality of life in our community. Not only will this harm the home values of our nearby residents, but it will greatly disrupt the flow of traffic and commerce.

The CN is already projecting a 400 percent increase in rail traffic across our Frankfort crossings. Buses will not be able to get children to schools on a timely basis. This may disrupt school schedules and could result in increased school costs to purchase more buses. Emergency vehicles will not reach fires or medical cases quickly. Police dispatched to emergencies will be hampered by delays at all of these train crossings. Dozens of cars will sit waiting for trains to pass, burning costly gasoline and spewing exhaust fumes into the

air. The risk of accidents will increase significantly.

Mitigating this impact will cost hundreds of millions of dollars. But why should U.S. taxpayers have this burden when only the Canadian National railroad is benefiting? I understand the need to

improve transportation in the area. I've observed years of analysis over the potential impact to residents and the environment of a third Chicago airport near Peotone. Before I-355 was constructed, there was also much study and work to mitigate negative consequences of these significant transportation benefits and was all part of the planning and mitigated.

It amazes me now that this Canadian company's acquisition of railroad tracks with its resulting dire consequences for Illinois residents might be approved without requiring them to pay for relief for the affected residents. This is in stark contrast to the requirements which were placed upon those other transportation

improvements.

I'm also not personally comfortable with the CN record of communicating with and cooperating with the public. The Canadian government itself has raised concerns about safety issues. All we're doing is relocating this problem from one part of the area to another. They are a profitable public corporation, and I don't expect them to assist with any of

these improvements without being forced by the federal government. Thank you.

MS. ADAMS: Robert Ukockis, followed by Julie Furgason and Sam Dendrinos. Is Robert here? Julie Furguson.

MS. FURGASON: My name is Julie Furgason. That's F U R G A S O N. And I speak as a lifelong Park Forest resident and as an educator in the area.

As much as I'm concerned about the pollution and noise changes involved with the proposed acquisition, I am even more concerned with access to safe and quick passage of emergency and medical

vehicles that will most likely be halted by the proposed acquisition specifically over already assessed critical at-grade crossings at Cicero in Matteson and Western Avenue in Park Forest and Chicago Heights.

If this acquisition is approved, I hope the board and the surrounding affected towns and Canadian National have a plan implemented before increased rail traffic occurs. This plan should include updating railway crossings to include facilities for emergency vehicles to cross during a train's passing at at-grade

crossings. This plan should include grade separations for vehicle transportation.

My understanding is that Canadian National wants this acquisition approved within the year. This acquisition should not be approved until emergency vehicle access plans are implemented for the safety of all towns involved.

It frustrates me that CN will gain revenue from this acquisition but is willing to pay only 5 to 50 percent of the

cost to improve crossings.

In addition to the concerns for emergency vehicle access, this acquisition will also stifle economic growth in the south suburbs. And, once again, it seems only beneficial to Canadian National's interests without considering the thousands of citizens adversely affected.

MS. ADAMS: Sam Dendrinos followed by Vicky Urban and Conrad Urban.

MR. DENDRINOS: Hi. My name is Sam Dendrinos, D E N D R I N O S. I'm a resident of Frankfort, and my family and I reside about a mile south of the EJ&E train track.

I had a chance to review the

environment draft impact statement, and I do have concerns about the amount of volume of rail traffic and the length of trains that will be coming through our community.

You know, I don't live exactly on the tracks. My house does not vibrate. My glass doesn't shake, but I can hear the train in the background. But my biggest

concern is, it splits our town in half. We have six crossings in Frankfort; one is only above grade. I think the congestion problem that's going to occur from this is going to be a much -- much more detrimental than the benefit of what's happening.

If you look at the statement that Canadian National put in its application for acquiring the EJ&E, they talked about alleviating the congestion in Chicago. Well, the key word there is "congestion." They are just moving one existing problem from one area of the Chicago area to another area. And I think what needs to be done is a hard look needs to be taken at moving the rail further out to some of the more rural areas.

What we have in this country is kind of an antiquated rail system that was

put in place years ago to deal with a much smaller population. There has been community suburbs that have grown around the rail tracks. And I think -- Again, I know there have been people here tonight

for the railroad; and I understand the economic benefit. I'm all for that.

But I think again we're not solving the issue. We're just moving the burden to other communities. And I will say the burden or the congestion that CN faces in Chicago for a couple-day delay in commerce has a far less impact than people's quality of lives in some of these communities this train is going to go through. Thank you.

MS. ADAMS: Vicky Urban followed by Conrad Urban and then Gary Kopycinski.

MS. URBAN: Hi, I'm Vicky Urban. I live in Frankfort, Illinois.

So far this year, according to our news media, there have been four children killed by CN or EJ&E trains going through our suburban residential neighborhoods. That is with only four to six short trains a day, which we can pretty much anticipate when they will be coming.

Two are late at night. What might we expect with the amount of trains that

they're planning for our community? Where would we call if we see a child on the tracks? Would they even answer?

These tracks were never meant to carry huge amounts of freight even before the area was heavily settled. It was meant to be used as a commuter train and a few short trains from U.S. Steel.

Three days ago, there was a derailment in Oklahoma of a freight train carrying oil products. It immediately engulfed the area in a huge fireball. If that happened in our backyard, I would not be here speaking to you tonight. And all the children at Camp Manitoqua, at the grade school across Sauk Trail, or anyone at St. Anthony's Church as well as my neighborhood would probably be dead.

MS. ADAMS: Conrad Urban followed by Gary Kopycinski and then Richard Smeaton.

MR. URBAN: I'm Conrad Urban, a resident of Frankfort, a former railroad surgeon, and I address the problem of safety of our community.

I spent many years of my career training emergency medical responders, and I know that time is of the essence. Due to the present location of the EJ&E track and the proposed length of trains, there will be a large segment of our community, including children at Camp Manitoqua and two schools on Sauk Trail as well as the residents along Aberdeen, my street, who will be denied access by emergency vehicles unless great separations are constructed.

Furthermore, if there is a derailment in this area, access by fire equipment or haz-mat teams will be virtually impossible except by a very circuitous route. The above could be solved by overpasses or underpasses at Harlem and Sauk Trail. But Canadian National has already made it clear that mitigation of this sort would fall on the backs of the tax-burdened citizens of Illinois.

Obviously with our home values plummeting, our tax base will deteriorate.

Is it reasonable to have taxpayers subsidize the profits of large foreign corporations? One might argue that increase in rail traffic in our area will reduce rail traffic in other areas. However, the mitigation necessary to ensure the safety of the citizens is already in place in those areas and would have to be added at the expense of taxpayers for our area.

MS. ADAMS: Gary Kopycinski, followed by Richard Smeaton and then Nancy Labb.

MR. KOPYCINSKI: Hi. I'm Gary Kopycinski, K O P Y C I N S K I. I'm a village trustee in Park Forest. And I'm here to say that this sale is not good at all for Park Forest. We are concerned about congestion, noise, the impact on our economic development. We are concerned about public safety. We're concerned about a 400 percent increase in rail traffic.

It's not uncommon now for cars to wait 20 minutes, 20 minutes while those

gates are down. In the interim, I understand from a representative from CN

today that they're not planning on using the switchyard that causes these delays. I wish I could believe that. At this point, I have doubts.

I heard from a CN representative today about $2 billion in profits, 75 percent of which is supposed to go towards capital. I can tell you where they can put that 75 percent. We need it down here.

We are concerned about a shopping plaza which we are working right now to redevelop. We are concerned about school bus traffic. We are concerned about ambulances. We are concerned about our police making it to the north end of town. When those gates are down, the only way to get from the north end or to the south end of Park Forest is under a viaduct. If that viaduct floods, you do the math. We're lost. Thank you.

MS. ADAMS: Richard Smeaton followed

by Nancy Labb and Bill Goodwin.

MR. SMEATON: Hi. I'm Richard Smeaton. I'm community development director for the Village of Matteson. S M E A T O N.

I'd just like to begin my statements by saying the Village of Matteson will be submitting written comments in the future. I would also like to echo the concerns of the Village of Frankfort and many others. Emergency response times are paramount concerns to the Village of Matteson, our police department, our fire department, our public works department. We need to see grade separations at the regional arterials and have funding to construct them.

Another concern that's unique to the Village of Matteson is the spur line that will be constructed in our historic downtown area. This proposed spur line will connect the Canadian National line that's existing and the EJ&E line. This proposed alignment will interfere with the

Matteson Metra station. They'll be building over the eastern entrance to the station and also interfering with the parking lot that's there.

There will be -- This spur line would remove and severely hinder any operations for the existing Kiss-N-Ride, would reduce proposed potential development

and property surrounded by the spur, and this would also severely affect the quality of life and the property that will be a hundred percent off this spur line at a second-story level for the existing Holden Park subdivision. Thank you.

MS. ADAMS: Nancy Labb followed by Bill Goodwin and Virginia Goodwin.

MS. LABB: My name is Nancy Labb, L A B B. I am a resident of Park Forest, and I have resided in the Village of Park Forest for 37 years. We have one major roadway which cuts through our village. This is Western Avenue. It is a route by which our police and fire departments reach various people in the community. It is a

route where our commuters go home, and it is the hub of our economic development.

It would be devastating to increase the railroad traffic crossing this street by the proposed 400 percent, which would mean, I believe, 32 trains per day. Some people already avoid this route due to the present eight trains per day. This means that people will just basically circumvent our village.

But more -- I understand that

there is some realization of the hardship that this will cause Park Forest, but I want to underline and say bravo to representative Jesse Jackson Junior and his proposal that you find the money before you go through with this sale rather than having this sale and then having money, which we just don't have available.

The other thing that has concerned me is that I did read that CNN, or CN, is pushing for the sale in October. And then somebody told me no, it's September before this impact study has gone

through. I just can't believe that this is the way that we do business and are going to improve transportation when it's not thought through thoroughly before its enacted upon.

The other thing, of course, I think there were a lot of us that were looking forward to the Star Line train coming through, commuter train coming through. And, of course, that will knock that out. And that's been something that's been in the planning here for years. I wish we could just all get together and then seriously all consider the true

impact. Thank you.

MS. ADAMS: Bill Goodwin, Virginia Goodwin, and then Evelyn Summick.

MR. GOODWIN: Good evening. My name is Bill Goodwin, G O O D W I N. I live in Aberdeen on Aberdeen Road in Frankfort.

Mr. Cozzi and Mr. Urban have already spoken eloquently about the noise, the congestion, and the possible safety problems that will ensue if we continue to

have an at-grade crossing at the train crossing at Harlem Avenue, which is very, very close to our street. There's only one way in and one way out, and that's the intersection at Harlem.

They've spoken eloquently about the vibration. I won't dwell on that any further. What I will add as a postscript is the train horn. We live close enough to Harlem that we hear every one of them coming and going. It's an unintended, unplanned alarm clock for me. It happens now a couple times a night. If the proposed acquisition goes through, it will be maybe a dozen or more times a night. So for me, it will be sleepless in Frankfort.

Final comment, I want to

reinforce what Mayor Holland has said, that we need to take a harder look, especially when it comes to mitigation. I think the completeness of the environmental report would be greatly enhanced if that section of the report was looked at again, especially when it comes to the at-grade

crossings.

If I understand correctly, only 15 at-grade crossings were recommended for grade separation out of 133. To me, this doesn't pass the common-sense test. I'm no expert, but it just doesn't seem right.

The second point has to do with the fact that we will be suffering from financial difficulty, taxpayers locally and in the county and in the state, unless some pretty stern, hard-and-fast rules are laid down by the board about the financing. Many people have commented on the unfairness of having the company profit at the taxpayer expense, and I think eventually that will be the bottom line. Thank you.

MS. ADAMS: Virginia Goodwin followed by Evelyn Summick and then Regan Stockstell, if I'm pronouncing those

correctly.

MS. GOODWIN: Hello. My name is Virginia Goodwin, G O O D W I N. I echo what he says. I live in the same house.

He will not like that alarm clock, the unattended alarm clock.

My additional concerns have to deal with at-grade crossings in Frankfort, which there are six -- none of which are recommended for mitigation in the current plan. At the rate of 28 trains per day up from eight per day and trains two miles long and trains that need one mile to stop, an unintended emergency could still not be averted for one mile, which means three at-grade crossings would be covered in Frankfort before that train stopped. I find that unacceptable. I think for the safety of our citizens, it ought not be allowed to pass the STB's scrutiny.

I find it appalling that the CN has offered only 40 million for mitigation. That's nowhere near the cost of mitigating what needs to be done. So I would appreciate your efforts to get a firm deal for more funding for mitigation from CN before its approved. Thank you.

MS. ADAMS: Evelyn Summick, Regan

Stockstell, and Jim Nolting.

MS. SUMMICK: Hello. My name is Evelyn Summick. I'm a resident of Park Forest. Every since I first heard about this railroad acquisition proposition coming through and reading the articles in the newspaper, one of the things that struck me was the fact that the Canadian National, according to the statistics that were printed, never pays for more than 5 percent, 5 to 10 percent of mitigation of the grade crossings, yet they are making billions of dollars. And this to me just does not sound right, along with all the other problems that would be happening that everyone else has already commented on today that I won't go through.

But what I'm asking the board to do is what these other people have just mentioned. If the Board allows the sale, I am asking you -- indeed, I am begging you -- to please force the Canadian National to have all the funding for mitigation in place before the first train

85

comes down the EJ&E because you know as well as I do that once that train starts coming down the track, it will be too late to say to them, "Oh, by the way, you owe us a few more millions."

Please get it in writing first. Have all the money in place because we, these towns out here -- Cook County already has the highest tax rate in the country. The State of Illinois has no money to hand out. Please, we are begging you, make them pay for all the improvements.

MS. ADAMS: Regan Stockstell, Jim Nolting, and Jared Weiland.

MR. STOCKSTELL: Regan Stockstell, S T O C K S T E L L, representing the Village of Richton Park. I'd just like to echo many of the comments that have been given tonight. It is the Village of Richton Park's position we oppose the proposed acquisition of the EJ&E rail for many of the same reasons -- obvious impacts on quality of life.

One in particular we feel that

86

the Surface Transportation Board needs to

pay closer attention to, you identified in your report that there are two separated grade crossings in Richton Park. That makes me -- leads me to believe that you're considering also the I-57 overpass. If not, then there's indeed only one separated grade crossing in the village and that would be Governors Highway.

And to that point, Governors Highway being the main grade -- separated grade crossing for emergency services, that not only services Richton Park emergency services but many of our neighboring communities. Park Forest, Frankfort, University Park, and several others all utilize Governors Highway to access St. James Hospital.

What I did see in the report regarding mitigation and as was mentioned earlier by one neighboring communities is the fact that we have flooding issues with regard to the underpass at Governors Highway. In order to take trains a day to

87

32 will obviously increase the number of trains we have in the community on a daily basis, that would obviously impact traffic that if a situation occurs where there are

storms, which we are seeing that storms are increasing these days, the road's closed. And we're now talking, you know, we've heard talk about the impact on response times. But based on that impact on response times, we're now talking possible loss of lives. And I don't think that the profit of companies such as Canadian National should be valued higher than that of human life.

So I'm saying that once again the Village of Park Forest does oppose the acquisition. But if it is to occur, we would strongly encourage the STB to look further at a second or third separated grade crossing at Cicero Avenue. This is shared by both communities of Richton Park and Matteson.

Once again, we'd like to echo that I don't think it could be stated any

88

more emphatically; but absolutely if this is to go through, the recommended mitigation should be highly funded by Canadian National and not the federal government, local, or state. They should pay for their profit. Thank you.

MS. ADAMS: Jim Nolting, followed by

Jared Weiland, and Mark Steinman.

MR. NOLTING: My name is Jim Nolting, N O L T I N G. I'm a resident of Frankfort, and I'd like to talk about the economic impact. I'd like to preface my comment by saying that I'm a very -- proponent of free trade. I have no problem with a Canadian railroad purchasing American assets.

However, I do strongly disagree with taxpayers subsidizing the purchase. You're talking about enhancements for roads, safety, sound abatement that will exceed a billion dollars. And most likely -- and this is going to have to come from some sort of revenue source: federal, state, local. It's either going to be

89

additional taxes, or it's going to be taken out of an existing fund. And so I just don't think that that's an appropriate expenditure of taxpayer dollars to help subsidize a foreign acquisition.

Also on the economic impact front is values of homes. I know my -- I moved to Frankfort about six years ago, and my value of my house is the same as it was six years ago. Now, if the train goes

through there, I know the value of my house is going to decline. And you multiply that impact by the thousands of homes that run up and down that line and, again, you're talking about something that is, again, going to be a considerable amount of money.

So I do hope the STB definitely takes into account the economic impact issues because, again, I think it's going to be to the billions of dollars. And this is taxpayers footing the bill for a takeover by a private company. Thank you.

MS. ADAMS: Jered Wieland, followed by Marc Steinman and Kevin

Burns.

MR. WIELAND: Jered Wieland, W-I-E-L-A-N-D. I'm also a resident of Frankfort.

The only reason I'm here is because the railway that I moved in close to used to have a small number of trains. I would not have bought the house where it is if it wasn't for the historic use of the tracks as they were. When they were first built, they were in cornfields, I'm sure, a hundred years ago.

Things have changed in Chicago

in the last hundred years. It's a little different story now. You've got communities all around the tracks, all the way up and down the 198 miles or whatever it is.

So if they were going to use the railroad the way it was originally built and intended, I wouldn't be here. Nobody would care. There would be six trains coming by my house like there currently is. I would sleep fine.

My house backs up to the tracks. Luckily, I'm not a light sleeper. My wife is. It's going to be detrimental for her. She's currently fighting cancer. It's not the best thing to have trains rumbling through your backyard when you need to get a good night's sleep as part of your health.

The other point I wanted to make was Mr. Jackson's rep was conflicted because a third and a third and a third. Supposedly a third of the people in that district are going to benefit.

That benefit, from what CN has said, is going to dissipate within two years and be totally gone. The benefit

inside the arc is going to be backfilled within less than two years, if I'm correct, as admitted by CN.

So they are basically going to screw us out in the suburbs along the track to have a temporary gain inside the loop, and then that's going to be gone. And then where are we going to be?

So as Mayor Holland mentioned, we need to look long term instead of short term. We need to get back out into the cornfields with new infrastructure is what the answer needs to be.

The only positive thing I've heard tonight about this transaction happening was -- I believe his name was Jorge from the Southeast Side -- said that it was going to have a positive environmental impact.

The only environmental impact I heard was it was going to cut 289 jobs. But if he's accurate, that is the only benefit I've heard of this whole thing. So please consider that.

Everything else that's been brought up is negative. There's going to be an 800 percent increase for me

personally at my house in train traffic and pollution and vibration. And yes, my windows do shake.

The fact that CN has been brought up by the Canadian government as

having a very poor safety record, not even on the charts, and they're going to increase by 572 percent the amount of toxic/hazardous material coming within a couple hundred feet of my house is ridiculous, and there's no mitigation for anything.

That grade crossing at Harlem, yes. I cannot get into Aberdeen if there's a train. And neither can the ambulance, neither can -- a neighbor just died not too long ago. Thankfully it wasn't due to a train, but it very well could have been.

And I'm okay with the sale if they mitigate everything, but it shouldn't be me losing a hundred thousand dollars' value on my home that I've saved 13 years to buy my first home and then turn around and take my tax dollars to fix everything that only happens because CN changes the characteristics of the track.

Thank you.

MS. ADAMS: Marc Steinman, followed by Kevin Burns and Father John

Siemianowski.

MR. STEINMAN: Hi. I'm Marc Steinman. That's S-T-E-I-N-M-A-N. I'm a resident of Aberdeen Road in Frankfort.

Well, if nothing else, CN and the Surface Transportation Board now realize one thing. In the absence of direct communication on CN's part, common sense and ethics, people will stand up for their rights.

But as always, the facts of this issue aren't really that complicated. First, this is a railroad, as many -- as many have said before, that was put together over a hundred years ago and operated as a Class II operation. The growth and encroachment of suburbia during that time has been permitted by municipalities and accepted by adjoining residents based upon that fact.

We're now faced with a Class I operation: Not what we signed up for, pure and simple.

And I'd like to know -- I know

it's not a question-and-answer period. I'd like to know how many times has the Surface Transportation Board been faced with the transition of a Class II operation to a Class I operation of this magnitude through this much of suburbia?

Second, we're only dealing with this issue in this particular manner because CN is taking advantage of the federal government's lack of forethought in providing adequate protection of its taxpayers and citizens by providing the appropriate representation.

Surface Transportation Board, when I first heard what your cause was, you're not the people that should do it. After all, if this were an aviation matter, the response to this potential change in operation would be quite different as it's now occurring in Chicago.

Changes in traffic patterns dictate the entire shutdown and elimination of neighborhoods. This is no different.

The Surface Transportation

Safety -- or Surface Transportation Board's noise projections are flawed. As was pointed out by one of my neighbors, he measured 70 decibels in excess on the north side of Aberdeen. People living on the south side are going to see in excess of 80 decibels every time a train goes by, 28 times a day. That means nobody sleeps on Aberdeen.

And fourth, I'd like to keep things very, very simple. And, finally, transferring problems of railroad-citizen interface from one area to another doesn't solve anything; it only helps CN.

If this railroad didn't exist today and CN wanted to build a loop around Chicago, they couldn't permit this rail line in the area that we're talking. That in and of itself is saying something. It just -- (applause).

Thank you.

MS. ADAMS: Kevin Burns, followed by Father John and Gregg Markmann.

MR. BURNS: Kevin Burns, B-U-R-N-S.

I'd like to speak on two components, one locally. When this all

started almost about a year ago, there was discussion at the kitchen tables of my neighbors.

I live in Frankfort. I moved in about three years ago. I'm a licensed Realtor and a licensed appraiser. I grew up the first eight years of my life in Riverdale. I lived directly behind a switchyard. So for me to purchase a house near the railroad tracks, I was fully understanding what I was purchasing.

Many planning boards in all these communities that are affected have passed and looked at the environmental components of putting houses next to these tracks, and they've all been vetted.

What you have here, I feel, is you have a neighbor, the train tracks, who, you know, you have a good relationship with your neighbor. When the neighbor changes and the use changes, that could have a dramatic effect on how your neighbor is

treated and how the environment is impacted.

Just to put it in some commonsense terms, I had my daughter, my six-year-old daughter, get off the bus, and

she started talking about the train because there was one going by as we were walking back. And she said, "Daddy, Daddy. My girlfriend Katie lives over -- one subdivision over, and she" -- they live near the tracks. And she said, "When she sits on the toilet, the water splashes up when the engine goes by."

So that is your environmental impact that I'd like to add based on all the studies you have.

Speaking from a regional standpoint -- because this is really not a NIMBY-Frankfort issue; this is really a regional problem. And when you look at the impact of an 8 billion sales company, 2 billion -- what's to say -- they've been very straightforward about the profitability of hauling more HAZMAT

materials and items around.

And, you know, we've already experienced more tax money spent. We just had to move up a firehouse that's being built south of our tracks because we don't have any fire stations. And so Station 5 is now being built, and Station 4 hasn't been built yet because of the anticipation

of the environmental and safety issues.

This company -- and my wife's Canadian. This company is very profitable. They're -- they seem to have a rush to judgment on this. What's to say that vertically integration, a Chinese company or someone else comes along and buys them after this? And what type of control do we have on the environment, environmental impact?

So I would just like to add that to the component in your thought process.

Thank you.

MS. ADAMS: Father John followed by Gregg Markmann.

FATHER SIEMIANOWSKI: Good evening.

My name is Father John Siemianowski, S-I-E-M-I-A-N-O-W-S-K-I, and I'm pastor of St. Agnes and St. Paul's Catholic Churches in Chicago Heights, one on the south side of the tracks, one on the north side of the tracks. I presently for the past 12 years have lived on Chicago Road four blocks north of the tracks.

As has been stated before, all major health care facilities in the area are located on the north of the EJ&E

railroad tracks: St. James, Chicago Heights; St. James, Olympia Fields; Ingalls, Harvey; Advocate, Hazel Crest. For all people who live south of the tracks, this becomes a health and safety issue.

The closest facility if stopped by a train is to either send them to Indiana, Margaret Mercy, or to St. Mary or one of the other, Riverside in Kankakee.

All railroad crossings in Chicago Heights are at grade level, except there's one underpass. It's an old

one-lane road walkway into the steel mills east of East End Avenue at Butler. But you take your life into your hands riding on the road prior to getting to the one-lane bridge that's falling down, but it does get you under.

Another concern about schools besides safety of ambulance or emergency is that if you operate a school near the tracks, which we do, the purchase affects tardiness of teachers and students.

For students, tardiness is an excuse for failure. For teachers, if you have a room of 20 or 25 students

unsupervised waiting for a teacher on the other side of the tracks, it also can be a disaster. So I think that's very important for anyone with -- all of us with schools around there.

Response time for fire and police, as has been said, is affected. It concerns where major equipment is staged, and in a town like Chicago Heights, we have some equipment on both sides, but it sounds

like some of the towns don't have equipment on both sides of the tracks.

Chicago Road, Route 1, is presently a major north-south connecting the south suburbs and into Chicago. Presently, when the ten trains go by, there's usually a half-mile backup when the gates go up. Add to that the prefab homes that use Chicago Road as their journey, and then they turn onto Route 30 going west. It adds miles of congestion and traffic.

And I live on Chicago Road, 8 feet off the road, so I can tell you.

Finally, negative effect on local economy. Last night I waited five minutes for a parked train on Chicago Road, turned around and went to a different town

to eat my dinner. It affects the local economy, local restaurants and tax base.

Thank you.

MS. ADAMS: Gregg Markmann, followed by Sakhawat Hussain.

MR. MARKMANN: My name is Gregg Markmann. That's M-A-R-K-M-A-N-N. I'm a

resident of Frankfort.

And as a resident of Frankfort, I want to express my grave concern over the proposed purchase of the EJ&E by CN. You're aware of the many, many concerns of my town, along with a large coalition of dozens of other towns united in our opposition to this life-packing event.

As for the effects on Frankfort alone, the increase in rail traffic will literally cut my town in half, with almost no viable passage from one side of town to the other. We have one small, antiquated underpass, which is in near disrepair. There's no other access corridors for many miles around. Frankfort's neighboring towns on either side have no underpass at all.

In addition to this isolation effect, our town's future growth will be

permanently stunted as both business and resident alike will be effectively cut off from each other. This will have a very true and real Berlin Wall effect on my town

as well as other towns, with economic and tax-generating consequences from businesses and homeowners alike due to the permanent isolation we will suffer on each side of these tracks.

This will also have negative growth repercussions throughout the entire Southland region, which is currently in many respects undeveloped. And it's -- but it's also one of the most promising areas for development in the entire Chicagoland area. This acquisition will kill much of that development, in my estimation.

I respectfully urge you to take this potential economic disaster through unintended consequences into consideration, not to mention the safety and environmental issues for which I'm sure you're being made aware of by myself and countless other opposers of this tragic potential purchase.

MS. ADAMS: Sakhawat Hussain.

DR. HUSSAIN: My name is Dr. Hussain, H-U-S-S-A-I-N. And I'm very

grateful to the railroad company for giving

me the training. I was trained at Illinois Circle Hospital.

This was one of the best hospital because of the accidents. The railroad would bring all the patients there, and they would unload those patient. This was the best surgery training program ever there was. The president of the American Medical Association four years in a row was in that hospital, and we got some very good training.

But, on the other hand, coming back to the real perspective, we are being railroaded right here. And there is nobody -- (applause).

Let me tell you what Aberdeen Road is. I moved there in 1980, 28 years ago. I've been living in the same house. When I moved there, the Frankfort was a town that we could not buy a bread of loaf. We used to go to Matteson. There was not a White Hen Pantry. There were not nothing. There was just a restaurant, La Posada, which got burned.

And my daughter was born in that house, then graduated from the school. There was one high school that exploded. The class went to 1200. My other son, four years behind, went to a different school. When he graduated, the class exploded. We have a third school now.

When we send instruction to our friends how to come to Aberdeen Road, we write down it is sandwiched between the crossing sign and the actual tracks. This is how close we live. So if you hit the tracks, you have gone too far. It's 2 mile long. There are houses on each side of the road, and there are houses on each side of the track.

A 2-mile-long train, there is no way in the world the 1.1 million people who die in this country every year because of heart attack, and half of them die in their houses -- this is a fact -- because they cannot get immediate attention and ambulances.

One minute is too much. 30

second is too much. Every second count to

save a life. We are trading profits for the lives of the residents of Frankfort and southwest suburbs. This must stop.

And I have news for you. If -- in 1980 when I moved, the area codes were only (312) and (815). There was no (708), (630), (847). The population has exploded. The people at risk are thousand and thousand and thousands die more right now, and we need to take care of them.

There are children. There are schools. There are hospital that will be totally cut off. There were two railroad tracks when I moved, not one. One of them is a -- is now a plank on which we can ride the bike. If Canadian National want to do it, they should turn into a bike path, not into a disaster -- (applause).

MS. ADAMS: First of all, we want to thank you for your comments, everyone who had comments tonight.

This concludes the public comment portion of our meeting. The open

house will continue until 9:00 where Vicki and John, as well as other engineers and representatives, will be there to ask -- answer questions that you might have.

Thank you. Thank you very much.

(Proceedings concluded at 7:48 p.m.)

1

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET, AND EASTER RAILWAY COMPANY

PUBLIC HEARING

August 26, 2008

6:00 P.M.

Conducted by:

Heather Tarczan, Meeting Facilitator - MWW Group Public Relations

Victoria Rutson, Section Chief - Surface Transportation Board, Section of Environmental Analysis

John Morton, Project Manager - HDR Engineering

CROWNE PLAZA CHICAGO NORTH SHORE
510 EAST ROUTE 83
MUNDELEIN, ILLINOIS

CHIMNIAK REPORTING & VIDEO
312-781-9111

REPORTED BY: TINA ALFARO, CSR No. 084-004220
ELSIE DELAVICH

2

MS. TARCZAN: Good evening, ladies and gentlemen. For those of you standing, if you'd like to take a seat, please feel free to do so at this point.

Thank you for attending tonight's meeting. We're here tonight to hear your comments on the Draft Environmental Impact Statement that was released on July 25th regarding Canadian National Railway's proposed acquisition of the EJ&E Railroad.

My name is Heather Tarczan, and I work for a firm called MWW Group Public Relations. We are part of a third-party contracting team that supports the Surface Transportation Board and its section of environmental analysis. I will be facilitating this meeting.

Before we get started I would like to take this opportunity to review some protocol for tonight's meeting. In a moment I will introduce those presiding over the meeting, and there will be a short presentation on the findings from the Draft Environmental Impact Statement.

3

Immediately following this we will hear your comments.

Each commenter will be given up to 3 minutes to speak. The time clock will be displayed on the screen, and a yellow card will be shown at 2 minutes and 30 seconds, a red card at 3 minutes. A list of speakers in their speaking order will be displayed on the screen. Also, I will call forward the next two speakers in line after each speaker so we may be as efficient as possible. There is one microphone set up in the middle of the aisle.

There are still some speaking spots available tonight. If you are interested in speaking, please proceed to the registration table or see a staff member who can assist you. Alternatively, you may submit comments to the Surface Transportation Board through a toll free number, Web site, or mailing address, all of which are in the program you received tonight. There are also comment forms and drop boxes located in the lobby and court

4

reporters located throughout the venue. You may record your comments with them throughout tonight's meeting. Please recognize that all methods of comment received by September 30th will be taken into consideration and weighed equally.

Tonight we are here to listen to your comments on the draft EIS. This is not a question and answer session. The meeting will conclude at 9:00 p.m. with an announcement at 8:30, noting 30 minutes remaining. We appreciate your courtesy as we work to create an environment where everyone can be heard.

In the event that anyone is in need of a Spanish translator, Beatrice is here tonight.

If you have any questions, we have a number of staff available to assist you. Staff are identified with nametags and are located throughout the venue. Our open house will remain open during the evening where additional court reporters are available for those of you wishing to

5

provide comments in a more private setting.

One housekeeping note, emergency exits are located behind you.

I'd now like to introduce the people with me on stage. Victoria Rutson, chief of the section of environmental analysis for the Surface Transportation Board; John Morton, project manager from HDR Engineering, who is a third-party consultant supporting the Surface

Transportation Board's section of environmental analysis.

Victoria Rutson will now make some remarks on the draft EIS.

MS. RUTSON: Thank you, Heather. I was going to come down closer. It seems like an intimate group, and I'd feel more comfortable down there talking to you rather than up here talking at you.

Again. My name is Vicky Rutson; I'm with the Surface Transportation Board's section of environmental analysis. I'm very pleased to be with you all here tonight. We're here for one purpose, and

that is to hear what you have to tell us, what you have to say about the Draft Environmental Impact Statement that my office produced on July 25th.

As Heather said, there are a number of ways of submitting public comments. You may feel uncomfortable speaking in public. I certainly understand that. If you do feel that way, please understand you can go talk to one of the court reporters who are in the other room, you may call the toll free environmental hotline, and the number is in the materials

you've been given, you may submit your comment by E-filing through the Board's Web address, or you may simply send us a letter, the conventional way. Again, all the instructions for how to submit those various forms of comments are in the materials. Written comments, letters, need to be postmarked by September 30th. The E-filing or hotline number comments must be received by September 30th.

What are we going to do when

we've received all of your comments? This is what happens next. We'll take all of the comments that we receive, oral, written, court reporter, E-filed, every comment we receive, and we will read, review, consider, and respond to each comment in a final Environmental Impact Statement. Comments that raise similar issues will be grouped and responded to. The final EIS will contain my shop's recommendations to the Surface Transportation Board on mitigation and on environmental impact.

Potential environmental impacts can be both adverse and beneficial, and it's my office's job to make sure that we

reveal both the potential adverse and beneficial impacts of Canadian National's proposal.

I'm going to take just a minute to talk about the Surface Transportation Board. I'm sure one of the many questions you've been asking yourselves during this process is who is the Surface

Transportation Board and what do they do.

The Surface Transportation Board is a federal agency located in Washington D.C. Congress created the Board in order to ensure a strong national rail transportation system, but the Board also must comply with the National Environmental Policy Act Or NEPA, and it's under NEPA that we prepared the Draft Environmental Impact Statement.

This essentially requires two things. First, that an agency truly understand the potential adverse and beneficial impacts of any decision it makes before it makes that decision, and, second, NEPA requires that the public have a full opportunity to participate in the process. That's why it's so important that we hear what you have to say tonight.

I'll wind up quickly because I know right now it seems like I'm doing all the talking.

The process that remains, we'll issue the final Environmental Impact

Statement sometime between December 1st and January 31st. That's the procedural schedule to date. It is only after that final Environmental Impact Statement is issued that the Board may make its final decision on CN's proposal to acquire the EJ&E rail line.

When the Board makes that decision, it has three choices. It can choose to approve the proposed acquisition, to deny the proposed acquisition, or to approve the proposed acquisition but only with the addition of certain mitigating conditions.

Again, I'm very pleased that you're with us tonight. I have one note based on our meeting last night. Again, we had excellent participation. We did have one speaker who was not accorded the respect that I believe all speakers are entitled. I understand completely that this transaction, this process has raised

many questions. I know too that by coming to this meeting you're exhibiting your

responsibility as public citizens, and I ask you just to remember -- and I know you know this well -- to be respectful and kind to the other speakers. It's not easy getting up to speaking, especially if you're saying something that is not going over well. People have different opinions, and we're blessed in this country to have the freedom to express those.

So I'll stop nagging, I'll thank you for being here, and I'll turn the microphone over to John Morton.

MR. MORTON: Thank you, Vicky.

I'd like to quickly go through some of the findings of the draft EIS, and I know that I'm covering these very rapidly in that there's a lot more information behind these findings. I know people have questions. We've left the open house open and the staff is over there. So if you have any questions, anything that you'd like to discuss, you know, get better explanation on, feel free to talk to the staff that will be manning the open house

session.

CN is a class 1 railroad that is a major shipper of domestic freights and imports and exports and it has five rail lines converging on the City of Chicago. And you can see the rail lines, the five CN rail lines are in the dark color there on the map. They operate about 150 miles of rail lines in the Chicago area.

EJ&E is a regional railroad. It operates essentially in an arch starting at Waukegan on the top side of the screen. It's the lighter colored route that comes basically south to Joliet and then across to Gary. I hope people in the back can see the slide. If not, we do have these maps over in the open house.

EJ&E operates about 200 miles of rail line around the arch. They have several yards, including two major yards, one east Joliet yard in Joliet, Illinois and the Kirk yard in Gary, Indiana.

According to the Canadian National their purpose in acquiring the

EJ&E is to, one, increase CN's operational flexibility by providing a continuous route around the city. They also want to make use of Kirk yard and they want to develop a closer relationship with the shippers on the EJ&E.

The draft EIS, you know, evaluated a number of areas, and we did it by resources. These are the resources that are generally talked about in the draft EIS, and I just want to cover just a couple of those resources.

First, you know, the application does include certain changes in rail operations. I'll talk about those in a minute. In addition to that their proposal included six connections, and those are rail lines, for rail line connections. It also included 19 miles of new parallel second track, and that is either a siding extension or a double track in some areas, and those areas will listed on the screen.

This is an output from some of our studies. It's a density map. It

essentially is a schematic of the EJ&E along the outside and then the CN rail

lines converging on the inside. So I know it's a little bit confusing, but it's a graphic that sort of helps show what the proposed traffic changes are. The light blue color is the current day traffic in terms of trains per day. We have the actual numbers available, but the width of the bar sort of represents the number of trains per day. The dark color represents the proposed traffic in terms of trains per day. So you can see essentially the plan is to shift some of the traffic from the current CN rail lines through town to the EJ&E.

As a result of that the EIS reached a couple conclusions. One is that in some areas on the EJ&E they're reaching their practical capacity, and, as a result, the EIS concluded that it's really unlikely that the traffic levels would be higher than the numbers that CN estimated in their application. In addition, because of the

crossings, the EIS indicated that Metra on-time performance, you know, there needs to be -- can be maintained with an effective working relationship with CN.

EIS evaluated a number of safety

issues, and in general, because of the increase in train miles on the EJ&E rail line itself, there is an increased probability of train accidents and an increased probability of highway/rail accidents. By the same token, on the CN rail lines, because of the reduction in freight rail traffic, there is a corresponding decrease in the probability of a rail accident and a probability of a highway accident. In addition, there are three roads, Woodruff Road, Lake Street, and Miller Street in Griffith, Indiana that would experience a substantial increase in risk.

The EIS evaluated passenger rail and hazardous material. There is no passenger rail operating of the EJ&E. Consequently, there is no effect on

passenger rail safety on the EJ&E. There is passenger rail operated on the CN line segments within the arch, and because of the reduction in the rail traffic there, there would be an improvement in passenger rail safety there. There would be a substantial increase in the amount of hazardous material that's shipped on the

EJ&E and a corresponding decrease, of course, on the CN rail line segments.

The EIS evaluated 125 highway/rail at-grade crossings on the Canadian National out of a total -- there's a total of 155. 125 of those actually improve on the CN rail line. Of the 112 on the EJ&E 87 of those trip the threshold for analysis in the EIS. As a result, the EIS identified 15 highway/rail at-grade crossings that would be substantially impacted, and those are the blue diamonds that you see around there. Once again, the list is on a board on the outside if you wanted to find out the specific crossings.

The EIS evaluated air quality,

and because of the longer EJ&E route there would be an increase in fuel use and an increase in emissions, but because of the more efficient movement, the overall air quality emissions, you know, changes in 2015 would not exceed the current regulations or impact the region's air quality compliance.

The EIS looked at emergency service providers and identified 11 emergency service providers, nine fire

departments, two hospitals, that would be impacted by the proposed transaction.

In addition, the EIS identified about 3,000 residences on the EJ&E that would be within the 65 DBA noise contour. It identified about 2,700 residences on the CN rail lines that are currently within that where noise would decrease. In addition, in the Barrington quiet zone, because of the increased freight traffic, without mitigation would lose its quiet zone designation.

The EIS also looked at mitigation

for these impacts. Canadian National submitted a set of voluntary mitigation measures covering the areas that we identified up there. They had 76 mitigation measures. In addition to that, the CN included 72 recommended mitigation measures to cover other impacts that either weren't covered by the voluntary ones or to augment the voluntary mitigation measures.

And with that I'd like to turn it back over to Heather to start the comment phase of this. Thank you.

MS. TARCZAN: One important note we want to make sure that is understood is

that the Surface Transportation Board and its representatives here tonight are a neutral third party who are responsible for evaluating and putting together the Environmental Impact Statement.

We will now begin the comment portion of our meeting. Let me remind you again that we will adhere to the 3-minute rule.

I would now like to ask the first

commenter, Congresswoman Melissa Bean, to please come forward and begin your remarks. Al Engberg and Keith Petropoulos, your turns are next, and you may take the position behind the microphone.

When you are coming up to speak, please state your name, spell your last name, and indicate who you represent or which town you are from.

REPRESENTATIVE BEAN: I'm going to turn so I can kind of talk to you and the people who are here.

I'm Melissa Bean, and I have the honor of representing the Illinois State District in the U.S. Congress and many of you who are here tonight. I did ask for a little extra time and was granted that early. Particularly representing many people who wanted to be here but couldn't be here. So summarizing much of what I've heard from so many of you already.

I'm not just speaking on behalf of constituents I serve in Congress, but also as a mother of two who has to cross the EJ&E regularly in our daily lives to get to school, to get to the hospital, to get to the grocery store, basically to get anywhere where crossing the EJ&E.

This is an issue that doesn't

just affect the Barrington area where I happen to live, but it also effects many communities in the 8th District, Mundelein, Bartlett, Hawthorn Woods, Lake Zurich,

Hawthorn Estates, just to name a few outside of my district, and the reason there is strong Congressional support on a bipartisan basis -- I should say opposition to this deal from members Rosco, Biggert, Manzulo, Foster and Bisclosky is because it also effects or Illinois communities like Naperville, Aurora, Plainfield, West Chicago, Frankfort, and even gets into northwest Indiana as far as the over 40 communities throughout the region who would experience up to a 400 percent increase or more in freight train traffic if this proposed acquisition of the EJ&E by CN is approved.

Last November I requested the environmental impact study, which you recently did provide the draft to. Unlike the standard review performed by the STB, the EIS gives local residents a forum to raise their concerns, and over the last several months the level of involvement from thousands of residents has displayed

in unprecedented level of communication by

all parties involved.

The intent of an Environmental Impact Study should be to provide balanced perspective with the challenges we're facing from a transportation perspective looking for sufficient solutions, but balancing those issues of commerce and efficiency with the concerns of community and taypayers. So our taypayers are expecting the Surface Transportation Board to represent them when they're making these decisions.

Regrettably the draft EIS which was issued a month ago didn't really do that. Instead it seemed to endorse much of what you've just seen from the earlier proposal. They're allowing a private foreign company to destroy local communities' quality of life, their safety, their economies while expecting those same communities to pick up the tab.

Some specifics. First of all, in the draft it fails to provide other options to consider to relieve congestion in those

areas that have been severely already impacted by freight traffic. It also fails to review existing alternatives and places, again, an egregious and unwanted tax burden on local communities by expecting them to fund the vast majority, roughly 90 to 95 percent, of the mitigation costs for a project that they don't want and would not benefit from in any way.

For instance, IDOT testified at a hearing we had in Chicago recently and talked about 133 crossings on average, and you heard earlier those grade crossing separations could cost on average $50 million each. So the $40 million of proposed mitigation costs from CN is laughable in that there's over a billion dollars in mitigation costs at a minimum to make this work.

So instead of solving a problem what we have here is a private company saying they're solving other people's problems when they're really, as they should be, serving their shareholders.

That's their job. It's my job to serve my

constituents and to serve Illinois' efficiency. We should be looking at not moving a problem, but solving it.

In the draft EIS there was identified at-grade crossings where police, fire, and emergency medical service providers would be cut off from the consumers that they serve. There's no solutions offered. It identifies that. It doesn't offer any solutions or recommendations on how do we ensure the safeties of our communities, some of whom have no overpasses, no underpasses to get people to the emergency services that they need.

Highway and rail accident rates, which you already identified, are already predicted to increase by 28 percent on the EJ&E. Now, let's note this is Canadian National whose parliament did a study in Canada and they came out dead last in safety. There's also already been recent deaths on the EJ&E right here in my

district. So safety concerns should be one of our most paramount considerations, and I'm sure the STB will be considering that as you move forward.

It also refuses to evaluate the impact that this proposed acquisition would have on the planned Metra Star line. Actually, what it says is because CN says it will just be fine, they're accepting that. Again, Phil Pagano (phonetic) from Metra, who testified recently at the hearing we had in Chicago, clearly communicated that there has been zero commitment in writing or in any form from CN to actually say how, in fact, you could add this additional freight traffic to the same tracks that we were going to put this suburban rail transportation on.

In doing the suburban transportation which is something that was planned by so many of our local municipalities it would have reduced utilization and costs of our highways while also reducing emissions. That would be

entirely thrown out because of this transaction. It disregards the severe impact that the 400 percent increase in freight traffic would have on our communities, including deadlock traffic, increased emissions and pollution, noise levels, very dangerous safety concerns.

Thousands of our children standing in the freezing cold Chicago winters while 2-mile trains stop them from crossing their tracks just on the way to school, and that's not even considering the economic issues of businesses that will go away, property values that will go down, and the economic burden of increased and egregious taxes.

Local planning organizations and elected officials have been entirely circumvented from doing what they're supposed to do, which is to plan and act, and worse, the so-called benefits are clearly a sham.

My office has communicated with CN from the very beginning of this proposed

transaction trying to get them to make commitments to those communities, and some of you I know are in those communities who support this because you believe you'll see a reduction in traffic. There's no such guarantee that there would be, particularly beyond the three years of recommended accountability by the STB.

If you look at given the high gas prices and how freight traffic is going

to increase, the stronger likelihood if this goes through as it's proposed is we'll reduce it a little over here, we'll increase it a little over there, and then we'll go right back as soon as the three years is up and just increase it right back to where it was in those other communities, and that's if, given how the timing works out, those short-term reductions ever happen.

We've tried to get commitments in writing. We've gotten absolutely nothing because they're trying to jam this through without the real planning that should be

happening.

As I stand before you, I really urge you, the STB, to reject this proposed acquisition, and also suggest that if you don't, that you would at least require that CN fund and complete all the needed mitigation that's been identified by our communities before they increase any freight traffic in these areas.

This transaction, everyone needs to be reminded, has been initiated by and for the benefit of this private, foreign entity and their shareholders, and their

shareholder upside should not be paid for my American taypayers.

I come from the private sector, and in the private sector usually process, planning, performance measurement are the criteria around which decisions are made. That's not what's happening here. The STB when it was created was created for the purpose of insuring the viability of the railroad industry and community concerns have not historically been considered, and

if we don't change the process, they won't be in the future. It's one of the reasons with bipartisan support we introduced legislation in Washington to change their scope and require that all of these considerations be included before any of these types of decisions be made in the future so we can balance the interests of commerce with the interests of American taypayers.

On that note, I thank you all for weighing in. I hope you'll continue to weigh in so we can give the STB all the information they need so that they can serve us best. Thank you for being here.

MS. TARCZAN: Al Engberg please step

to the microphone.

MR. ENGBERG: My name is Al Engberg, E-N-G-B-E-R-G. I'm from Mt. Prospect.

This transportation will negatively affect this area. How easy should we state the obvious? But that's not the single focus of this board. Its job is to assess the impact across the

entire region. On the existing CN right-of-way there are more grade crossings, more motorists, more school busses, more ambulances, and more hospitals than all of EJ&E. Within a short distance of my house alone there are five major highways across the CN, 12, 14, 58, 62, and 68. All the well- organized, well-funded motion-based opposition cannot alter these facts.

Then there is Metra. For the EJ&E there is a proposed but not funded expansion commonly referred to as the Star line, but the only significant addition to Metra in the last 20 years is the North Central that was put on the CN right-of-way. In order to operate both there was an improvement on the CN right-of-way including additional trackage.

Most other Metra lines share the right-of-way with freight. In short, freight traffic can and does coexist with Metra lines. To use the Star line as a means to block this purchase is deceptive

and not supported by the facts.

The task given this board is to evaluate the facts of the proposal and arrive at a decision in an environment that's free of political and localized pressure. Probably the most disturbing aspect of this process is the new legislative effort proposed by politicians pandering to local pressure groups and by no means in the best interests of the entire region. I have no problem with new legislation that will apply to future requests but should not apply to applications currently under view.

In fact, from Senator Durbin's own Web site, his statement on the proposed CN (inaudible) says, and I quote, "CN must think they are playing a weak hand because it seems they are making every attempt to change the rules of the game."

I agree, no change in the rules of the game. Therefore I call upon the

Senator to follow through on his statement and to use his position as majority whip to

oppose any retroactive provision in new legislation.

Being a resident of Mt. Prospect, I have a bias in this proceeding. Those along the EJ&E also cannot be taken as objective. So I look for studies that can be ascribed to impartial parties. I believe no one can characterize the Transportation Center of Northwestern University as being in the pocket of either side and has earned credibility of regional transportation issues.

A presentation of this purchase was presented at Northwestern in February of this year and considered all aspects of the proposal and included in the approval of the purchase was in the best interest of the entire region. And I quote, "The negative impacts on a relative basis will be less than the negative impact currently existing or being felt every day on the other areas of the region." I have the URL if anybody wants it.

32

Communities used to encourage railroads because of the transportation as a key part of the economic vitality of the region, not an inconvenience of our daily lives. This new antirail attitude can be attributed in part to a growing service economy, but those who believe our economy can grow are resisting the industries that provide the framework for our prosperity are sadly misguided.

MS. TARCZAN: Thank you. Your 3 minutes are over.

MR. ENGBERG: Can I have a few more seconds?

MS. TARCZAN: I'm sorry, sir. We're going to try to keep us on time tonight.

So I'd like to call Keith Petropoulos to the microphone, followed by David Heyden, who will be followed by John Tolomei.

I'd like to remind everybody too that you can also submit comments over to the court reporter located in the room next to us.

33

MR. PETROPOULOS: My name's Keith Petropoulos, P-E-T-R-O-P-O-U-L-O-S. I represent my family that I moved a year ago. I've got five kids. We moved from Algonquin, Illinois -- Oh, my time has started already. I haven't even started my speech yet. Can I start my time over?

MS. TARCZAN: No, sir. Please keep going.

MR. PETROPOULOS: Well, anyway, here we go.

I'm speaking to appeal to your core values, not as analysts of the STB, but as citizens of this deserving country.

During the Marshall Plan the United States made sacrifices to numerous overseas countries and basically gave away our industry and our resources to help create a peaceful means to defeat communism. In the '80s foreign labor accelerated the export of our wealth-making ability and the invention of the containerized movement of freight increased the number of imports to the United States

34

and reduced our industrial capacity. This process keeps continuing at reducing

America's wealth- making ability where our country gets poorer and poorer and other countries like China become more wealthy and more wealthy.

This transaction is basically run by two partners, a greedy Canadian railroad company that wants an advantage in the import freight business so it can compete with the Burlington National and the American railroads and the Union Pacific to bypass American ports to bring crappy Chinese goods to America from Canada.

So this entire transaction is being brought so -- and try and remember who the Canadian's partner is. It's Costco. Costco is the Canadian National steamship line, a steamship line that's completely subsidized on the backs of the poor peasants of China. This is the same government that murdered 30 million of its own people since 1950. The butchers of

35

China are going to bring their junk to this country on a Canadian railroad through my beautiful town.

You've got to stop and think, think of what you're doing, think about

what you're bringing to this country. You're bringing a further demise of our country and you're only speeding the destruction of our industrial capacity. The whole process, the whole plan is preposterous and ludicrous. It is practically almost treasonist to approve of this plan.

I really need you to think about the interests of your family, the interests of your neighbors in this entire transaction and stop worrying about dotting the Is and crossing the Ts and how many decibels, what goes on with the railroad, how many intersections you're going to affect, and you've got to stop and think about what you're truly working on. Look in your hearts.

MS. TARCZAN: David Heyden please

36

come to the microphone, followed by John Tolomei, followed by Mayor Keith Hunt.

MR. TOLOMEI: Point of order before you start my time. Dave Heyden had reserved his time for an opportunity to speak tomorrow, night. So he expects to be speaking tomorrow night, I know he called for that time, and I was told that I could

use his time since he isn't here since he expected to be speaking -- he expected to be speaking tomorrow night.

MS. TARCZAN: Sir, at this point we're not able to take substitutes for the folks that are not here. So I do apologize for that.

To that end I will be calling John Tolomei.

MR. TOLOMEI: John Tolomei, Village President of Lake Zurich. Thank you for the opportunity to speak tonight.

The draft EIS severely underestimates the impact of the acquisition on homes and businesses. The report references the presence of the EJ&E line since 1891 but fails to realistically evaluate the impact or, more importantly, the lack of impact from decades of the EJ&E operating with minor freight volumes.

Failure to recognize the minor impact of the present EJ&E operations leads to defective conclusions in the EIS such as that at 4.6.4 where it states, "The effects on community facilities would be minimal because the communities have grown around the EJ&E and adapted to its presence."

In fact, what the communities did grow accustomed to is a railroad that has virtually no impact on daily life. For at least four decades the EJ&E operated their rail line with next to no traffic and fostered an environment of a virtually

nonexistent rail line. Accordingly, the communities through which it passes grew without any reason to provide accommodation for its trains. Our communities were lulled into normal suburban development by an innocuous short-haul rail operation. We are not equipped to handle its overnight conversion into a major trunk line and lack the infrastructure for it.

I agree wholeheartedly with the statement of the report at 4.6-6 that "Homes and businesses are often the biggest investment people have and anything that might affect the value of these investments

is a serious concern." As a result of decades of minimal EJ&E operations communities developed, good businesses grew, and many people built high-quality homes since rail traffic imposed no appreciable burden.

Homeowners and local proprietors had no reasons to expect such a drastic change in EJ&E operations and built close to the tracks that will now bring day and

night noise, vibration, and delays. This acquisition gives us the entire burden of a major freight line with no benefits such as public transportation that other communities that want to lose trains still have and will retain at our expense.

Thus, the real depression in values to housing and businesses is closest to the case of building a freight only rail line where none existed before. Any finding that the past presence of EJ&E lessens the impact of the CN acquisition plan completely ignores the EJ&E operations over the last decades when all major growth in our communities took place. Property values will drop precipitously with the acquisition since the change it will bring

is not incremental but a dramatic step change that completely alters the nature of our communities.

Thank you.

MS. TARCZAN: I'd like to remind everybody tonight that there are other methods to make comments. You can use our

Web site, our toll free number, as well as our mailing address. I'd also like to remind the speakers who are speaking tonight that the second they come to the microphone and begin speaking your time is counted.

To that end, I'd like to call Mayor Keith Hunt, to be followed by Eric Jakubowski, followed by Mayor Tony Arredia.

Mayor.

41

MR. HUNT: Good evening. I'm Keith Hunt. I'm the mayor of Hawthorn Woods.

The draft EIS fails to adequately address the impacts to our community in critical areas including noise levels, transportation of hazardous materials, traffic delays, safety risks, and, most importantly, impacts the emergency services.

We have -- you have a chart in your executive summary that identifies 11 different emergency response units in Illinois and Indiana that are, in your words, likely to be seriously affected. Two of those serve our community.

The draft EIS fails to consider the local and regional planning that has gone on in this area for decades. Our community and the others around it have worked together cooperatively to plan the entire Route 12 corridor and other areas. We have a plan for a complete downtown area

along Midlothian Road, which runs

42

immediately next to the EJ&E line. Those economic hopes and that planning will all be for naught and will be dashed if this proposal is allowed to go forward and if those types of considerations are not seriously addressed.

We've tried to meet with CN, we asked for commitments, and we were told why would we agree to that, why would we commit to that, why would we give you that kind of commitment. Failing those types of iron clad commitments, this deal has to be vetoed. It's not good for the region. There's been, as Congresswoman Bean pointed out, very, very poor level of planning that's gone in, and many of the local factors simply have not been considered.

One of our local fire chiefs from the Lake Zurich Fire Department has been asking for months to get information from CN about the nature of the hazardous materials. They won't give it to him. Why is that? Why can't we get basic information so that we can plan for our

43

community?

Speaking of planning for our community, we're a small community of 8,000 people. We have a budget of roughly $3 million a year, and as the Congresswoman pointed out, just one of these grade separation crossings is going to cost about $50 million. We need two. That represents the next 30 years of our budget. And yet CN is not willing to make any commitment in writing to our community, just like they're not willing to make any commitment in writing to any of the communities who they tout as a three-year beneficiary of this plan but with no forward commitment in terms of what's going to happen in the future. We need to hold people -- honorable people honor their commitments. We need to make these people honor, but we need to make them honor their commitments.

We need to make sure that we have adequate investigation given considerations for local planning and local impacts here, and the draft EIS statement simply doesn't

44

go nearly far enough.

Thank you.

MS. TARCZAN: Eric Jakubowski, Tony Arredia, James Johnson.

I'd also like to remind people that you are cutting into time with clapping or any other method of showing your approval or disapproval.

45

MR. JAKUBOWSKI: My name is Eric Jakubowski. I'm a director for CN based here in Chicago, and this evening I would like to describe the formal community

outreach process that CN has been undertaking for the past several months.

The SEA encouraged CN to propose voluntary mitigation and to negotiate mutually acceptable agreements with affected communities to address potential environmental impacts related to this transaction. CN is working diligently to this end. We are taking very seriously the concerns of communities along the EJ&E line. The DEIS also confirms our view that the transaction and environmental impacts can be reasonably mitigated.

Following the SEA scoping meetings earlier this year my colleague, Mike Molene, (phonetic) and I sought meetings with all 34 communities on the EJ&E and 32 agreed to meet with CN. Our approach to these meetings has been deliberate and professional. We have

undertaken a thorough analysis of traffic flows, the locations of hospitals, schools and police stations, and other characteristics of each community along the line. Our very first meeting with each community focused on listening to specific concerns and answering questions about our

plan.

Once the community leaders and CN agreed upon issues that may require mitigation, we scheduled a joint field investigation to discuss options. It is not CN's intention to try to impose solutions, but rather to construct arrangements that will be responsive to community concerns long lasting and beneficial.

Our discussions focused on the following: Safety, CN is reviewing locations where schools and parks are adjacent to railroad property for possible safety fencing. We reviewed these locations with local communities to clarify limits and specific fencing types to

prevent trespassing.

Operations, CN's committed to making improvements to railroad plans to minimize various noise and train delay in pass. This includes remote powering of railroad switches to minimize stopping and curb loop indicators to reduce possible wheel screws. Where the usual standards are exceeded CN is also working with several communities to construct traffic

facilities that will expedite train movements and reduce the delay on nearby grade crossings.

With respect to grade crossings, CN remains concerned that the DEIS does not adhere to the criteria previously used by the STB for measuring crossing impacts and applies federal guidelines designed for other purposes as the basis for mitigation analysis. The DEIS also builds on future traffic projections and does not appropriately take into account the nature and implications of existing conditions at crossings. Nevertheless, we are making

every effort to address legitimate community concerns and reach reasonable agreements.

Noise mitigation, our analysis indicates that portions of some communities may witness increased noise exposure, and we are discussing options such as home sound producing, berms, vegetation, or sound walls.

Quiet zones, CN's involvement in funding improvements required for quiet zones are unprecedented, but we believe this is the greatest concern of many

neighbors.

Training and emergency communication protocol, CN will commit to training their community's emergency response folks, and we are discussing coordination efforts to ensure that emergency dispatchers have realtime access to train movement information and that we can establish a reliable protocol that is customized for each community.

Thank you.

MS. TARCZAN: Mayor Tony Arredia please step to the microphone, followed by James Johnson, and John Gohmann.

Mayor Arredia?

James Johnson?

MR. JOHNSON: Jim Johnson, village trustee, Lake Zurich.

We have only hit the tip of the iceberg in the acquisition process. Yet the CN is yelling at the captain, the STB, to damn the icebergs and go full speed ahead. The partial environmental impact study has gaps, lacks data to substantiate a number of claims, invites more questions than it answers. It alludes to economic consequences. Why ask the STB to slow down

and listen to and actually study the concerns and then fully investigate?

It is the goal of the CN to get a monopoly. A North American train from Asia by developing in stages a mega port of Prince Rupert freight will come via the shortest water route through a super highway through our community. The Star

line, a vital commuter link from Chicago and connecting communities will be lost for all time.

Our West Coast ports will suffer and Americans will lose jobs, lost hours waiting for trains, pollution damage from waiting vehicles, thousands of homes along the track losing value is, again, only the tip of the iceberg.

This is the time for the STB to step up. You're not bound to follow 50-year-old precedents. This is the time to set a new course and to get out of the iceberg's way. Railroads are no longer the poor step-children of transportation. They're big business in every sense of the word. They do not need to be subsidized.

When trains first crossed the country railroads got incredible benefits

because ultimately it directly benefited our citizens and our country's development. Now a foreign national giant wants to benefit by taking advantage of our laws to subsidize their effort to put a super

highway from Prince Rupert to Memphis and on to Europe.

STB, I ask you to use the authority you already have to make them pay. Mitigation should not be a token payment left up to the CN. They have not negotiated in good faith. In fact, they have tried to divide and conquer using parts of their original 40-million- dollar offer. They are relying on past STB precedent to determine what they must be forced to pay. I say the hell with precedent, set a new course.

I implore the STB, do not do the expected thing, do the right thing. To do that you must not let the CN bully you. You're not paper pushers or puppets on a string. You must take the time to gather all the data that is needed, including a full economic impact study. If it takes 18 months or two years, the railroad line will still be there and so will the CN. Please

avoid the iceberg, stand up for every taxpayer, defend our citizen's rights, and

represent the best interests of America

Thank you.

MS. TARCZAN: John Gohmann, Malcolm Holec, John Lobaito.

I'd also like to ask everybody to please form a line once your name is called behind the speaker in front of you.

MR. GOHMANN: Good evening. I'm chairman of the Minnesota Commercial Railroad in St. Paul --

MS. TARCZAN: Sir, can you please state your name.

MR. GOHMANN: John Gohmann, G-O-H-M-A-N-N. I'm chairman and founder of the railroad in Minnesota and truck line and I'm also president of the Small Railroad Business Owners of America, and I'm basically here to suggest -- I've heard lot of emotion. I've heard about big old Canadian National Railroad Company. About 60 percent of the shareholders of CN are American. They have about 8,000 American employees, all who have jobs and families like the rest of the people here.

The Canadian National -- I have put a press kit together and I have several copies, I'll give the Board one, with a lot of facts and background so you'll have a copy of it. It's a matter of the record.

But everything you talk about, Prince Rupert, Prince Rupert is a new port

to serve North America, not the Canadian National. Prince Rupert is going to relieve congestion to move grain for export from America from the farmers. It's going to open up another network for boats.

Everybody in this room, if I asked you to take out any clothes that you have that were not made in China, anything in your house or in your car that wasn't made in China, folks, they're here. They're here and they've been here for 20 years. The bottom line is that we have to make more jobs in America.

Let me tell you some of the stuff the CN moves. I served as a consultant to help form the Wisconsin Central, which became the CN. Grain from Iowa, Wisconsin; coal from the Powder River Basin for power plants; automobiles from Michigan, Wisconsin, Minnesota, southern states; paper to the Chicago Tribune, 15 to 20 car loads a day of paper comes out of Northern Minnesota; fertilizer, hundreds of cars a year for agriculture, thousands of cars a

year; steel from northwest Indiana to steel-producing facilities all over the

country.

Right now it takes the EJ&E four days to get one car of steel from Gary, Indiana to Leafland and it's forcing all this business to move on truck over the highway. How do I know? It comes to my warehouse. It takes another three days to get it to St. Paul. The bottom line is there's already congestion here.

This book explains how a series of railroad mergers forced by bankruptcies in the '60s and '70s caused the rationalization of plants and railroad yards over Chicago. The system accommodated what it was at the time, but for the last five or six years Chicago has been grid locked. I have photographs of trains being parked all over Chicago waiting to get through the Chicago terminal on the CN, CP, other railroads. It happens, and it happens east and west. We move about 25 percent of all United States

freight through Chicago. There's an unprecedented demand.

Lastly, I would only suggest that people here who have a problem go down and look at the BNSF main line, they look at

the UP main line, they look at the CP main line over here. The CP main line has 110 trains a day. It's all documented.

MS. TARCZAN: Ladies and gentlemen, I would like to ask all of you tonight who are cutting in to other people's comments, we will have to alert security, which is already in the room. Those of you who do make these comments will be removed.

Thank you, sir.

MR. GOHMANN: It's all in the record. I will submit it to you later.

MS. TARCZAN: Thank you.

Malcolm Holec, John Lobaito, Jeff Steingart.

MR. HOLEC: Malcolm Holec, H-O-L-E-C. I live in Mt. Prospect.

Our family has lived within 150 feet of the existing Northline of the Canadian National track for almost 40 years. We had some rough times. We had the Sioux line, Milwaukee Road, Wisconsin Central, all railroads with limited

resources and a lot of noise and a lot of problems.

Since the Canadian National took over things have vastly improved. We now have more trains, we've got about 22 freight trains, and we've got 22 North Central line commuter trains. So we've got about 44 trains going through. The Canadian National has made such dramatic improvements all the way along. Better track, they replace track constantly. I think they maintain their wheels. We don't any clickity clack that we had for many years. Until they took over we had the clickity clack all the time. They've done a remarkable job.

They've improved -- talking about environment. They've improved our environment I think dramatically.

I think it's very important that the process -- I think what should happen is each town should work with the Canadian National. I think they should be working together. Obviously a lot of people are working against them. I think it's important. I think they can do a wonderful job.

I'm concerned that if the Canadian National doesn't do this, because of the congestion and the congestion is not going to go away, it's going to end up with some American railroad that's going to have to be subsidized by taypayers.

I think we're fortunate that Canadian National is doing this in a way because I think it's going to have to be done. The congestion around the Chicago area is certainly affecting the whole country, perhaps the whole world, and if they don't do it, somebody I firmly believe

is going to have to do it. I think they're doing it, and from my experience with the Canadian National, they're a reliable private firm and I truly believe we should support -- I think that each community should be working with them, and I hope they would do -- I hear they're not as cooperative as they should be.

They've got to be made to realize too and I think the Board should spend more time in getting parties together, getting the Canadian National and the towns together -- some towns obviously are very resistant and Canadian National

seems to be a bit resistant. That's where I see the duty of the board is, to get these parties together.

I think that's where the problem is right now. I think it's very obvious at this meeting that that's the problem. There's nobody getting them coordinated, and that's where I think this board should be serving. I just get the feeling they're not, and I think that's the reason there's

all this turmoil. They're not doing the job that I think should be done, and I think it's important because I think it's going to cost the taypayers if this falls through.

Thank you.

MS. TARCZAN: John Lobaito, Jeff Steingart, Tim Sashko.

MR. LOBAITO: John Lobaito, Village of Mundelein, L-O-B-A-I-T-O.

Mundelein is central to this transaction because of the connection between Canadian National line and the EJ&E line. Mundelein will see the greatest diversion of train from one line to the other and that slow speed connection will block crossings both on the CN and the EJ&E line. We believe Mundelein will be impacted more than any other community as the Draft Environmental Impact Statement shows.

We have been negotiating with the CN and have made some progress, with an emphasis on some, on reaching a voluntary agreement and mitigating the impact that we will see in our community.

We have made no agreement on addressing major issues and the proposed

transaction will have on traffic and our provision of delivering emergency services. Mundelein's fire and emergency services providers are potentially seriously

affected. Additionally, Allanson Road on the CN line blocked by trains transferring to the EJ&E line is listed as one of the 15 crossings that, and I quote, "Require mitigation due to effects under the proposed action."

Furthermore, we believe that the SEA erred in it's not including Route 60/83 in the top 15 lists of severely impacted crossings because it meets two of the criteria that SEA has established for inclusion. The impacts on Route 60/83 include over 40 hours of delay per day and the queue will block a major roadway. Moverover, that route is critical to emergency services over a large area because Mundelein Fire Department is closely partnered with Countryside Fire Protection District that provides emergency service response in Mundelein.

We're asking the CN for these three things: One, as in interim step until a grade separation can be built at

Route 60/83 for CN to finance three

additional firemen, paramedics per shift. Mundelein will match that by providing $4 million worth of equipment and facilities. By adding staffing we hope to alleviate the drop in our response time caused by the proposed action. We estimate this cost to be $750,000 per year.

Upfront engineering costs of a million dollars for a grade separation at 60/83. We're also asking them to pay 50 percent of the cost of the grade separation at 60/83 and 50 percent of the cost of the grade separation at Allanson Road. To date they have not offered on these two crossings anything except to increase train speed in that connection. We don't believe that's going to be enough. We do not believe that an engineer would attempt that sharp curve at anything more than 25 miles an hour.

Another open issue we have that happens to begin with the date the board approval and the date that the higher speed connection between the CN and the EJ&E is

built. By building this connection this will take at least two years. Given that the wetlands and the land was acquired -- the land that needs to be acquired, this is an optimistic time frame. We ask that some condition be imposed on the proposed action either delaying any rerouting until the new connection is built or limiting allowable train lanes until it is built.

We understand the significant transportation benefits of the proposed action. We trust that the board will understand the significant environmental impacts on Mundelein and take those into account.

MS. TARCZAN: Thank you, sir. Your time has ended.

Jeff Steingart, Tim Sashko, Peter Crouch.

Please state your name, spelling your last name, please.

MR. STEINGART: Jeff Steingart,

S-T-E-I-N-G-A-R-T, the fire chief of Countryside Fire Protection District serving Vernon Hills, Unincorporated Lake County area, portions of Hawthorn Woods, Long Grove. Also with me is Chief Tim Sashko with the Mundelein Fire Department.

As Mr. Lobaito stated, we work very closely in protecting the 33.2 square miles between our two agencies through a very comprehensive intergovernmental agreement responding to over 7,500 emergencies a year in the affected area.

With the shift of the 15 trains to the EJ&E it simply shifts the problem to an area within that protection zone, as we'll call it, to an area that is lacking water supply, has extended response times due to long rural roads, and is farther away from hospitals when we're transporting patients to the emergency room. This provides much greater vulnerability in providing emergency service to the area that we serve collectively through four

fire stations.

It's adding two new grade crossings that will seriously hamper our response times to a scene and then also

backing each other up for when we have multiple incidents in that 33 square miles.

Split change on the curve in the effected area of Route 60/83 near Diamond lake Are what concerns us the most.

MS. TARCZAN: Thank you, sir.

Tim Sashko, Peter Crouch, Robin Meier.

MR. SASHKO: Thank you. Tim Sashko, S-A-S-H-K-O, fire chief, Village of Mundelein.

Three things that the EIS report doesn't address that we think are critical and following with Chief Steingart's comments. Number one is code of federal

regulation 1910134 which is an OSHA law. It is something that we are judged by as far as fire ground operations and our ability to have two in and two out on fire ground operations. It's a requirement by law that we have firefighters outside of a building that match what is inside a building both in voice and visual contact.

With the delays that we anticipate because specifically of the 60/83 grade crossing, we will lose the ability to provide that level of service because of delays that occur, and we cannot enact fire ground operations without having that standard in place. And it is measurable. It's a law. It's something we cannot hide from.

Second to that is the National Fire Protection Association Standard 1710 that also creates minimum requirements and time elements for what we need on the fire ground in resources in order to be able to fight a fire. Both of these being violated jeopardizes law enforcement officers who are faced with the need to potentially react and go into a burning building where they don't belong, as well as firefighters

and certainly the lives and property of the people we serve.

Another thing the EIS does not address, the third point, emergency medical services. There is nothing in there about clinical death, which is four minutes, and biological death, which is six minutes. Any grade crossing delays that we have will definitely affect the ability for us to provide services with EMS and be able to provide patient care so we get people to the hospital in a timely matter. Our only hospital that we serve in this area on a regular basis is Condell in Libertyville.

We have to go through 60/83 in order to effectively deliver patients.

The EIS does identify the possibility of erecting another fire station. In our conversations with the CN this is not feasible and it's, frankly, a waste of money. It's a resource we don't need and we have that in place. As Mr. Lobaito stated, we need manpower. We've openly had discussions with the CN on a model that can possibly resolve a lot of the mitigating factors that prevent us from being able to provide emergency services.

Thank you.

MS. TARCZAN: Peter Crouch, Robin Meier, Representative Elaine Nekritz.

Again I ask that you please form a line behind the speaker who is speaking so that we do not lose time.

Peter Crouch, Robin Meier.

MS. MEIER: Robin Meier, M-E-I-E-R, Mundelein.

I would like to mention that I hope to see the Metra Star line become a reality sometime in the future. However, tonight I want to focus on the transitional curve from the CN to the EJ&E line located between Allanson Road and Route 60 in Mundelein.

This is a relatively sharp curve in a limited space. There is potential for a freight train accident involving hazardous waste and dangerous chemicals at this curve even if this curve is redesigned. Speed, the condition, and maintenance of the track will directly

impact ongoing safety.

In a train accident on August 22, 2008 in Luther, Oklahoma traffic was blocked in a 3-mile radius as a precaution against toxic chemicals that could be spread by the wind. The Oklahoma accident involved crude oil and ethanol and was located in a remote area.

The section of the Mundelein track is located near an industrial area. However, a 3-mile radius includes approximately 31 public or private schools and 21 parks, not to mention local business or residential areas. Do our residents, parents, business, or government leaders have an accurate list or knowledge of the chemicals and toxic material that's traveling on this rail line through our communities? We should all be concerned about the hazardous material traveling through our towns.

A direct quote from the executive summary of the EIS statement, page 13 under Safety, "Based on the historic data maintained by the FRA for annual hazardous materials release, the likelihood of a release of hazardous materials would still

be remote, less than once every year."

Trains managing even a redesigned curve will be an accident waiting to happen. The likelihood of an accident or potential release of hazardous

material less than once every year should not be acceptable. Please consider the safety, health, and wellbeing of our residents and children.

Thank you.

MS. TARCZAN: Representative Nekritz, Dr. Brian Knutson, Dale Perrin.

REPRESENTATIVE NEKRITZ: I'm State Representative Elaine Nekritz, N-E-K-R-I-T-Z. I represent parts of Des Plaines, Mt. Prospect, and Prospect Heights, all of which are home to the existing CN line.

My constituents know all too well the impacts of the freight rail, which is why we would very much welcome the relief that the proposed acquisition could provide even for a few years. CN is projecting that their existing line would see a reduction in trains from 19 to 2 per day in those suburbs. Yet the draft EIS gives short trip to the positive community and environmental impacts along the existing CN line.

For example, it seems that the wait time for vehicles stopped at grade crossings along the CN line are completely ignored in the calculation of energy use and air quality and climate in the executive summary.

Furthermore, over the last ten

years communities along all freight lines have experienced dramatic increases in traffic. The freights already own these lines. They did not seek permission to increase the number of trains, nor did they provide any mitigation. In Des Plaines, a community of almost 60,000, there are 32 at-grade crossings and only two grade separations.

So while I support mitigation, I find it difficult to justify that communities which would just now feel the impact of more trains would go to the front of the line to receive mitigation while those who have been dealing with this issue for decades continue to wait.

I also serve as chair of the Illinois House Rail Committee, and, as such, I would like to point out there is a regional economic perspective to this potential acquisition that is significant. Chicagoland is the world's fifth largest intermodal freight hub. The movement of freight is a huge economic engine in our

regional economy. The rail industry alone employs almost 9,000 people in northern Illinois and many thousands more are employed in the warehousing distribution and logistics sectors. Unfortunately investment in the necessary transportation infrastructure has lagged to the point where rail and truck traffic congestion is intolerable. Companies are being lured away by Kansas City, Memphis, and others.

The Chicago Department of Transportation, the Illinois Department of Transportation, and the six class 1 railroads came together a few years ago to work on a plan to relieve congestion. The result was create a 1.5-billion-dollar public/private partnership. In the last Federal transportation bill we received a fraction of that money, and the State has yet to come up with any.

While we haggle over taxpayer funding for critical congestion relief, the CN is offering a purely private sector solution. All manner of consumer goods

from shoes to food to cars are transported by train. It is the most economically and

environmentally efficient form of transportation. In the global economy, which is dependent upon transporting goods quickly and reliably, freight trains are a fact of life.

The CN proposal deserves a fair review that considers all factors, including the positive regional and economic benefits.

MS. TARCZAN: Dr. Brian Knutson, Dale Perrin, James Tarbet.

MR. KNUTSON: I'm Brian Knutson, K-N-U-T-S-O-N, superintendent of Community Unit School District 95 in Lake Zurich and surrounding villages.

The wellbeing of students, staff, and residents is always at the forefront of both our short- and long-term plan. I'm here this evening to speak in opposition to the proposed acquisition of the EJ&E rail line by Canadian National Railway Company.

If approved, this acquisition will significantly impact the day-to-day functionality of our nine schools, more than 7,000 students in public and private schools in our area, and nearly a thousand staff members in Community Unit School District and our private schools within District 95.

School District 95 serves a combined population of more than 6,400 students and staff from a service area of approximately 20 square miles. Our transportation fleet travels around 500,000 miles annually to and from school and for

school trips. Our private transportation contractors travel another 350,000 miles for our special education programs. One-third of our transportation fleet is located approximately 50 feet from the railroad tracks in the center of our village. Should there be any incident in that proximity, a derailment, train stalls, or slow-downs, our equipment would be vulnerable to damage and delays.

Significant delays and safety situations will occur throughout our district as buses cross the EJ&E line more than 230 times per day to deliver students to and from our schools. In addition to the location of our fleet, the hub of our district-wide technology infrastructure is located within 50 feet of the railroad tracks.

The EJ&E rail line intersects several major thoroughfares in our school district. There are only two elevated crossings in the entire district with all other crossings at grade. This increased

freight traffic will dramatically affect the commute times of staff, students, and parents, which could jeopardize their safety and the safety of the area's children as they travel to and from school.

Lake Zurich High School and May Whitney Elementary School are located immediately adjacent to the EJ&E tracks raising critical environmental and safety concerns in the wake of increased freight traffic. There is currently no fence or barrier separating the schools from the tracks. We know in spite of repeated warnings that students use the tracks as a cut-through to get to school. More than 500 of the high school's 2,200 students either walk or transport themselves to school each day. We can expect hurried and impulsive behavior causing more concerns.

In addition to these dangerous conditions, increased rail traffic will result in significant transportation disruptions, delayed emergency response times, and add significant cost to our

schools and taypayers to mitigate the issues cited above.

The proposed EJ&E acquisition if approved will adversely affect the welfare of students and staff. I implore you to think seriously about the safety and welfare of our students.

MS. TARCZAN: Dale Perrin, James Tarbet, Steve Riess.

MR. PERRIN: Dale Perrin, P-e-r-r-i-n.

As a resident of Lake Zurich and the executive director of the Lake Zurich Area Chamber of Commerce, I'd like to state my strong opposition to this acquisition.

This purchase will ruin the economy of our local community, and the State of Illinois and the Chicago metropolitan area can ill afford the negative consequences of this transaction. CN should not be allowed to expediate the approval and acquisition in advance of the upcoming presidential inauguration. This matter has such long-term effects that it should be reviewed by the newly appointed STB members who will be in office to face

the consequences of their decision.

The Chamber of Commerce strongly opposes this transaction for the following reasons: Disruption to current businesses, negative impact on property values, and hesitancy to build will strongly impair the realization of current and future plans

within Lake Zurich's downtown and Hawthorn Woods, Midlothian developments.

Additional delays from 400 percent increase in train traffic will negatively impact public, vehicular, and pedestrian safety.

Average train lengths of 10,000 feet or more will block all of our at-grade crossings bringing traffic to downtown to a standstill. The added delays will increase emergency response times resulting in unnecessary loss of life.

This transaction will also seriously jeopardize the proposed Star line's viability to relieve the region's traffic congestion and improve air quality.

The STB must require CN to be a hundred percent financially accountable to mitigate all of the adverse public safety and environmental impacts that will be

imposed upon effective communities such as the 400 percent increase in traffic -- freight traffic will make areas planned or approved for residential and

other uses no longer viable projects, plus the current road infrastructure cannot handle the vehicular traffic congestion that will be created by this large traffic increase.

Greater train frequency through our town will increase the probability of rail- related accidents. The installation of barrier walls as well as pedestrian crossing bridges and controlled access points should be provided at no cost to Lake Zurich.

Oakwood emergency service responses must receive a detailed manifest of all hazardous materials being transported. Response training, evacuation planning, and recovery resources as relates to the hazardous materials being transported should be provided at no cost to Lake Zurich.

CN should fund construction of overpasses and/or underpasses to minimize traffic backups throughout town.

In closing I'd like to recommend

that the STB reject CN's proposal to acquire the EJ&E rail line given the catastrophic impacts it will have on Lake Zurich and all the affected communities.

MS. TARCZAN: James Tarbet, Steven Riess, Marty Moylan.

85

MR. TARBET: My name is Jim Tarbet, T-A-R-B-E-T. I'm a resident of Lake Zurich, and I'm ferroequinologist. A ferroequinologist is a fancy term for a rail fan. I am also an analytical reader. If this was about railroading, I'd be all for it.

In reviewing the information I keep hearing strains of the Shirelles, will you still love me tomorrow. Due to the time limitation I will be submitting my comments in writing and extending my remarks at a later time.

The basic problem in the analysis is it's based upon a short-term impact. Unfortunately CN's documentation truly projects a long-term impact that will severely be detrimental to the quality of lives throughout the area.

I want to make a couple points perfectly clear. There are always comments about nimbees (phonetic). I strongly believe that people have to ask the question, if not in my backyard, why in

86

yours?

I'm not affected by the traffic issues that concern people. Literally, I walk everywhere. Comments about welfare sometimes a little bit obsurd. Most areas affected in Lake Zurich are the lower income people within our community. They're not a bunch of snobs.

I've heard also that certain issues are not to be addressed within the STB findings. I hope that STB in doing so will find that these issues are outside of their scope of control and that they need to be addressed in the final findings. I also understand that the STB will only address concerns about CN's operation in the U.S. I certainly hope and respectfully request that the STB reconsider this point. Prior corporate conduct should be considered in this.

Ask any police officer, the first prime suspect in a crime is the person with means, opportunity and motive, and a record of prior conduct. CN right

87

now is under investigation and study by the government of Canada both for their safety problems and for their service problems.

I have read through all the

information that has been provided, and I find that there are some extreme conflicts throughout between what CN has told you and what CN is promoting on their own end in Canada along with the Canadian government.

Thank you.

MS. TARCZAN: Steve Riess, Marty Moylan, Robert Sherman.

88

MR. RIESS: My name is Steve Riess. I'm with the Village of Hawthorn Woods. Last name spelled R-I-E-S-S.

I caution you guys, the STB should pay attention. This is not the last time you will face this issue. This issue will come up again in other communities

around the country. It's going to take place in Los Angeles, in Phoenix, Arizona, and Atlanta, and the decisions you make here will govern how it will be treated in the future. There will be precedent setting.

As many of you on this board might know, much of the law governing operations and land rights of railroads are very old, dating back to a time when this country was in its youth, with vast regions of unpopulated areas. Unprecedented rights-of-way, land grants, and even the right to change the course of rivers was granted to the railroads. Railroads were the vehicles of the American dream and prosperity came to America on those rails.

89

Congress had great foresight when they granted sweeping powers and authorities to those corporations, but America has changed, and I have little doubt that they could not possibly have perceived the impact your decisions have in our world today.

In fact, it is these very laws that bring us here today. Businesses in the U.S. are pretty much responsible for

its own performance and wellbeing. Occasionally the government comes to the aid of corporations. If American Honda, a highly profitable corporation, were to come to the government and ask permission to block 120 intersections for up to 10 hours a day, every government body would reply with a resounding no and Honda would have no alternative, they would be required to spend the money out of their own pockets to build the bridges and build the under passes.

So I ask you now why is it you are asking the American people to pay for

the bridges and underpasses to maximize the profits of a foreign corporation, a foreign corporation that is already highly profitable, a foreign corporation that showed a 2-billion- dollar profit in 2007.

I don't oppose CN acquiring EJ&E. I do oppose asking the American people to bear the burden of creating the profit for CN by not requiring them to pay for this same things that every other corporation in the United States would be required to pay. We cannot often see what the future will hold, but I'll tell you what the wrong

decision here will hold for the American people. America is about to get hit by a train.

Thank you.

MS. TARCZAN: Marty Moylan, Robert Sherman, Bogdan Vitas.

Last call for Marty Moylan.

Robert Sherman, Bodgan Vitas, Vijay Gadde.

MR. SHERMAN: Good evening, Heather, Vicky, John. I can tell from watching you that you're taking everybody's comments very seriously, and I thank you for that.

I'm Rob Sherman, S-H-E-R-M-A-N, the green party candidate for state rep for the Buffalo Grove area.

This fabulous proposal should be approved because success for our region depends on us fully utilizing all of our transportation resources rather than overburdening one set of resources and underutilizing another.

I've heard the objectors raise their hysteria about safety and emergency services. Hey, that, as my people like to

say, is why God prevented mutual aid. I'm sure the mutual aid arrangements already exist because we already have train service on the EJ&E line and on the other train lines in the area.

I hear a lot of hysteria about traffic and traffic interference. I'm in Buffalo Grove and I travel into Wheeling

where the CN line is located. In two or three minutes the train is gone and you go on through. It's just like a long traffic light.

The reality is that -- ladies and gentlemen, the reality is that the objectors are hypocrites. If the trains were so unsafe, then they would want it banned everywhere and not just in their community. If mitigation is so important, they would be asking for mitigation everywhere where the line is now instead of just in their community. So the only time that mitigation and safety is a problem is when they are inconvenienced.

The people in the arch communities, the EJ&E arch communities, they enjoy all the benefits that rail brings. They enjoy the TVs and the air

conditioners and the refrigerators that are brought in. They just don't want the burden of the freight rails that bring those things to the community. They want somebody else stuck with the burden while

they get the benefit.

If more trains are burdensome, then we could always reduce the number of Metra trains that are in their communities now and then the number of trains would remain the same.

So in conclusion, this proposal should be approved because it better utilizes our limited transportation resources and balances the load while providing a proper balance of the burden

Thank you for your time.

MS. TARCZAN: Bogdan Vitas, Vijay Gadde, Bill Medcalf.

Bogdan Vitas.

MR. VITAS: My name is Bob Vitas, V-I-T-A-S, and I'm the village administrator of the Village of Lake Zurich, Illinois.

First of all, thank you for allowing me the opportunity to speak on the issue of Canadian National Railway Company acquisition of the EJ&E rail line that traverses through the exact center of our community.

In other testimony the Village President, John Tolomei, and Village Trustee, James Johnson, along with the Village department heads, will address various shortcomings of the Draft Environmental Impact Statement. The focus of my testimony will relate to the negative financial impacts the Village of Lake Zurich can expect to sustain should the Surface Transportation Board approve the acquisition over the outpouring of local objections.

In the Draft Environmental Impact Statement the section on

socioeconomics fails to clearly identify the fiscal impacts in each of the affected communities. Why? Because the breadth of the analysis has been limited from the beginning when the STB predetermined that the acquisition was a minor transaction and did not require a full blown Economic Impact Analysis. In my professional opinion, that is entirely flawed from the outset. You cannot separate the economics of a transaction of this magnitude from the environmental impacts and vice versa.

This being said, let me now turn my attention to the direct economic impact that this acquisition and dramatic increase in proposed operations the Canadian National will have on Lake Zurich.

As I stated a moment ago, the EJ&E rail line divides Lake Zurich in half and the community is fully developed along both sides of the rail line. This includes adjoining the residential, commercial, industrial, and institutional properties planned and developed on the basis that the

EJ&E has historically been and is a local industry servicing single- track short-line operation and not a rail superhighway the likes of which the CN is planning to operate.

If approved by the STB, the acquisition will have devastating impacts on all properties located within 250 to 500 feet of the rail line. The de-valuation of these properties in a community that is fully developed will have grave consequences for all the local taxing bodies. We will be forced to either reduce services and employees or increase the property tax burden, all for a private foreign company with no direct or indirect benefit for Lake Zurich. Simply put, this is not equitable for anyone.

As part of my presentation I would like to enter into my testimony Exhibit 1, which was prepared by the Engineering Department of Lake Zurich. The aerial map depicted in the exhibit clearly identifies the impact zone referred to in

the Draft Environmental Impact Statement. Altogether there are 364 residential

properties within 500 feet of the rail line depicted by the white dashed line, of which 114 residential properties are located within the Village's tax increment finance district as depicted in the map insert. For purposes of this analysis, I am not calling out the number of commercial and industrial properties or the institutional properties owned by Community Unit School District No. 95.

The total fair market value of the affected residential properties is $110 million and the equalized assessed value for tax purposes is about $37 million. A detailed report of these figures was prepared by the Village finance department and is on the table in front of you.

Based on the Environmental Impact Study Table 4.6-3, Property Value Effects From Increased Trains On A Nearby Existing Rail Line, we can fully expect to

suffer significant negative adjustments to all property values within 500 feet of the rail line. In accordance with published documentation by the STB and data from other sources, the loss in taxable values

can range anywhere from 5 percent to 15 percent depending on the proximity.

That being said, let me just close because this is going to go on longer than I thought, there's only one correct decision for the STB, and that is to reject the acquisition now or be held accountable and responsible for the worst transportation decision in the history of the United States.

Thank you.

MS. TARCZAN: Vijay Gadde, Bill Medcalf, Susan Rein.

MR. GADDE: Vijay Gadde, G-A-D-D-E, Village of Lake Zurich.

This is in response to the STB's release of the draft EIS regarding the expected environmental effects on the proposed CN acquisition of the EJ&E line which bisects the entire community of Lake Zurich and specifically its downtown

redevelopment area, which has been struggling to revitalize.

My comments are focused on noise, vibration, and quiet zones. EJ&E tracks abut quiet residential neighborhoods and school properties that will be impacted negatively by the increased sound, noise, and vibrations caused by the increase in train traffic. While the DEIS acknowledges that this can be intrusive and annoying to the occupants, the report focused only on the potential perception of vibrations and interference with vibration-sensitive equipment.

The DEIS provides a broad range of mitigation measures without clearly

indicating which measures the STB would like to impose on CN for specific levels of impact. The LDN of 70 DBA is an unsubstantiated threshold for mitigation for noise impacts. This methodology is too generalized and could result in an inaccurate inclusion or exclusion of impacted homes that could require mitigation for noise impacts.

The DEIS also identified a Lake Zurich monitoring location, 437 Elm Place.

We do not have such an address in Lake Zurich. We also have questions about the location and validity of the vibration test performed in the Carolyn Court subdivision where the equipment malfunctioned after two trains because of subzero temperatures.

The mitigation measures identified -- the DEIS concludes that the noise wall in the propagation path could potentially help with the noise level, but it does not identify the mitigation measures at all.

Also, the DEIS abdicates its

responsibility to address for noise impacts by encouraging CN to negotiate with affected municipalities rather than taking a hard look at the mitigation itself. The DEIS mentions noise walls and suggests the CN determine their feasibility.

With undercounted ADTs, short train lengths, and the overly optimistic data regarding train speeds, the region cannot accept the DEIS conclusions on delay calculations that led to an undercounting of the number of grade crossings that are in need of mitigation.

Once again, the affected

communities are left to their own devices to negotiate with CN without any indication of what specific mitigation the STB could impose on CN. Without this specific information, how can these communities even begin to negotiate with CN?

While the DEIS acknowledges both existed and planned quiet zones, at a meeting with the village on March 5, 2008 CN officials made a commitment to help

maintain the quiet zones.

So in conclusion we ask the STB to disapprove the proposed transaction in whole or approve it with the conditions that we submitted earlier.

MS. TARCZAN: Bill Medcalf, Suzy Rein, Daniel Peterson.

MR. MEDCALF: Good evening. My name is Bill Medcalf, M-E-D-C-A-L-F. I'm here tonight to speak for myself and for the 52 members of the Whiteley Village Townhome Condominium Association. At present those two positions are not in full agreement.

Initially I had conditional support for the concept of CN's purchase of the EJ&E West. Routing rail traffic around Chicago would, I thought, reduce start/stop idle and acceleration/deceleration cycles and reduce rail transit time with the expected result of saving fuel and reducing emissions to the Chicago air shed. My concerns were primarily with grade crossing effects on emergency service response time and the noise and vibration affects on the students at Lake Zurich High School. As you've already heard, the EJ&E right-of-way abuts the school property.

After reading through the DEIS Executive Summary I now find that I'm beginning to lean to opposition of the sale. It seems that CN's acquisition of

the EJ&E West property will benefit CN greatly and some Chicago neighborhoods to a lesser extent and that the communities along the EJ&E will suffer.

To wit, the DEIS makes it clear that those will be -- that there will be adverse impact on the air quality and on fuel consumption, both diesel and gasoline. Furthermore, in several residential areas near me, but not mine, emergency response time can be severely affected unless there is effective mitigation.

Finally, in the event of hazardous material spills in some locations, remote though that possibility may be, certain municipal water supplies can be very severely affected. The Whiteley Village Townhome Condominium Association, much of which is approximately 500 feet from the EJ&E right-of-way between old McHenry and Oakwood, is opposed to the proposed acquisition principally because of the increased noise, the effects on vehicle

traffic patterns, and emergency services

response time that will result from the increased rail traffic.

Thank you for the opportunity.

MS. TARCZAN: Susan Rein, Daniel Peterson, Ken Grooms.

MS. REIN: My name is Suzy Rein, R-E-I-N. I'm speaking to you tonight as a 13-year resident of the Village of Hawthorn Woods and as a former Village board trustee and as the current chairperson of the Plan Commission and Zoning Board of Appeals of the Village of Hawthorn Woods.

I strongly oppose any action that would allow Canadian National to control the EJ&E railway for several reasons. I, along with many others, moved to this community and made time to shepard its development for the same reason, that it is a unique in the Chicagoland area, a place that is currently defined by many as a quiet rural atmosphere. Many consider it a kind of sanctuary to which residents can retreat after a day of heavy traffic, noise, and hassle experienced elsewhere.

Our peaceful rural and natural environment would be significantly altered if numerous long freight trains are rerouted through our village on the EJ&E tracks. Increases in noise, traffic,

pollution, danger, and frustration would be

our new normal. That's not what we came here for.

Many of us have been working for years towards the fulfillment of a comprehensive plan which guides the thoughtful and careful development of this community. It has taken a long time to arrange for the necessary infrastructure and resources like sewer and water which are essential to support nonresidential development and an additional tax base. These resources are finally in place or are coming into being.

As a result, we are just getting under way with attracting retail and other business to our community, businesses which would improve the quality of life for our residents, while producing much needed tax revenues for our village coffers. The EJ&E tracks run right along this business corridor, and I'm concerned that if you approve the acquisition, the impacts will significantly impede or derail many of our

business development opportunities.

The negative impact on property values has been addressed by some others here this evening, as has the fact that this train track bisects our village and that long Canadian National freight trains would block two of our main roads at once making it impossible for emergency services to reach people or property in time when minutes matter.

Finally, I want to add that if after hearing all of the testimony against the acquisition you decide to support it anyway, I urge you to demand that Canadian National use its own financial resources to mitigate the negative public safety and environmental impacts that will result. Street and track rate changes, barrier walls, and the like will all be needed, and villages like ours do not have the money to pay for these safeguards. I encourage you to make a thoughtful, thorough decision that weighs all the evidence and protects the people, property, development

opportunities, and the environment in the place that we call home.

Thank you.

MS. TARCZAN: Daniel Peterson, Ken Grooms, Chris Grooms.

MR. PETERSON: Daniel Peterson, P-E-T-E-R-S-O-N, director of building and zoning for the Village of Lake Zurich.

I'm here to tonight to talk about land use, socioeconomics, and community cohesion. The mythology used to evaluate the effects of the proposed action are flawed due to the lack of evaluation of the impact of the increase in train traffic on existing or future land use plans specifically stated in the report. None of the existing or future land use plans reviewed assumes that the EJ&E rail corridor would be removed. We're not arguing that it would be removed. However, in land use plans the Village of Lake Zurich and the communities around us and on the whole corridor plan for the usage that has been for decades, a single-track service rail. We did not plan for 400 percent additional freight traffic.

To show the impact on land use I'd like to read a letter that we received. We've been recruiting a senior living

center to come in and build a property adjacent to the E.

"I regret to inform you that Pathway Senior Living has elected not to pursue this project at the current location. I appreciate the support the project received at the Village's courtesy review. As you know, the project would add 120 assisted living units at a total development cost of approximately $22 million and operationally would employ 40 to 45 full-time employees. Unfortunately the site backed up to the

EJ&E railroad. We belatedly learned of the potential sale to the CN and the significant increase in rail traffic they proposed. While the limited current use of the line could be accommodated with sufficient sound insulation, we believe the increased use is incompatible with residential use."

This specifically addresses and it limits our use of land within the corridor. The Environmental Impact

Statement did not account for that.

Secondly, job loss. The Environmental Impact Statement states that 280 jobs would be lost indirectly or directly related to this transaction. We lost 45 new jobs with this one transaction alone. Now multiply that across 36 communities or across the corridor. I feel the report failed to account for this job loss and socioeconomics in the region.

Finally, we've been asked just to accept this because it's always been there. I think that's the wrong perception. The villages and communities in the region need to be heard and taken a look at all the impacts that negatively affect us.

In conclusion, I ask that the STB take the time to thoroughly evaluate the environmental impacts that the proposed purchase would have on our community. I'd also ask that the adverse economic burden caused by this transaction and the loss of property value, tax base for businesses, job loss be fully mitigated prior to

consideration.

Thank you.

MS. TARCZAN: Ken Grooms, Chris Grooms, Vanessa Griffin.

MR. GROOMS: My name is Ken Grooms, Jr., It's G-R-O-O-M-S, and I want to thank you for allowing us to speak to you this evening.

I have several concerns regarding the EIS as submitted. The first of which is the impact on the proposed Star line, the Amtrak lines, and the Metra lines in the area.

For example, with the proposed Star line, while it is not currently an operating commuter service, many of the municipalities along this line have spent millions of dollars in preparation for this line. For example, the City of Naperville

has spent in excess of $8 million in acquiring 45 acres of land for the proposed Star line train stations.

We also believe that the EIS scope needs to look at the additional costs

local governments will incur in providing future grade separations between the railroad lines. We also believe that the EIS scope needs to be expanded to look at the economic and quality of life losses that will result from not only the impact of this increased train traffic, but also the possible loss of the Star line. If the CN has projected that another -- an additional line be put in alongside the EJ&E line for the Star line, that the CN be responsible for the cost for that and not pass it on to Metra, which is already struggling.

Another thing is the CN has stated that their trains will be traveling at a higher rate of speed than the current EJ&E trains. If that is so, that would create an additional hazard for the people trying to cross the tracks and for the people, vehicles, and pedestrians trying to cross the tracks.

In specific, a couple of the sections of the report that I'd like to

comment on, section 1-A states that consideration for at-grade crossings be given for all crossings of 2,500 or more. I would propose that that be for all proposed and future grade crossings that CN have a financial commitment to.

One comment that was made as to earlier in conclusion that the State of Illinois is losing jobs. Well, part of the reason we're losing jobs is the dysfunction of our state legislature and not the congestion in Chicago.

So I highly recommend that you take a serious look at the mitigation problems that this will create and that you reject this.

Thank you.

MS. TARCZAN: Chris Grooms, Vanessa Griffin, Gregory Schaeffer.

116

MS. GROOMS: My name is Chris Grooms, G-R-O-O-M-S, resident of Lake Zurich.

I strongly oppose this purchase. My main concern with this purchase is the public and school safety issues. 14 locations on the EJ&E line will see an increase between 15 to 26 trains per day. According to local emergency room officials, for every extra minute of delay for a heart attack patient the chance of survival is reduced by 10 percent. Freight trains can take 4 to 6 minutes to pass a crossing. A 6-minute delay leads to an even greater reduced chance of survival. Any delay in beginning fire suppression will result in significantly greater damage to the structure involved plus increases of threat to the lives of occupants of that structure. Also, each year in Illinois at least 50 people are killed and another 50 are injured in rail crossing collisions.

I would ask that you reject this proposal as these are real life statistics

117

and life and death time issues, and they should always supersede the interests of a for-profit organization.

Thank you for listening to all our concerns.

MS. TARCZAN: Vanessa Griffin, Gregory Schaefer, James Bateman.

Vanessa Griffin.

Gregory Schaeffer.

James Bateman please take your queue.

Michael Fisher please take your queue.

118

Mr. SCHAEFFER: My name is Gregory Schaefer, S-C-H-A-E-F-E-R. I'm one of

those hysterical people that Robert Sherman talked about. Let me tell you why.

December 1999 a petroleum products train that links an oil refinery to the people in Montreal exploded when it collided with a freight train. The train derailed on a switch frog that broke under the stress. According to many train crews, this spot was known to be defective, but even after repeated reports, management refused to effect any repairs.

May 14, 2003 a trestle collapsed under the weight of a freight train near McBride killing both crew members. Both men had been disciplined earlier for refusing to take the train on the same bridge claiming the bridge was unsafe. Subsequent inquiry revealed as far back as 1999 the bridge components had been reported as rotten, yet no repairs had been ordered by management.

Residents of Wabamun Lake and

119

Alberta staged a blockade of CN tracks in August 2005 when they were unsatisfied with CN's response to a fuel oil spill in the lake from the derailed freight train.

On August 5, 2005 a CN train had

nine cars derail on a bridge over the Cheakamus River causing 11,000 U.S. gallons of caustic soda to spill into the river. The CBC has stated that it could take the river as long as 50 years to recover from the toxic pollution.

Transport Canada has restricted CN to trains not exceeding 80 cars in length because of the multiple derailments on the former BCR line. CN had allegedly been running trains in excess of 150 cars.

A further derailment at Moran, 20 miles north of Lillooet, on June 30, 2006 has raised more concerns about CN's safety policies. Two more derailments days apart near Lytton in August 2006 have continued criticism. In the first case 20 coal cars of a train using the CN bridge derailed dumping 12 cars of coal into the Thompson

120

River.

Two CN trains collided on August 4, 2007 on the banks of the Fraser River. Several cars carrying gasoline, diesel, and lumber burst into flames. Water bombers were needed to help put out the fire, but the fuel still seeped into the Fraser River.

On December 4, 2007 a CN train derailed near Edmonton. Of the 28 cars that derailed thank God most of them were empty. The minister of Canadian Transport talks about the safety program of the CN and says "It seems to be blame and punishment instead of educate and correct. Frequently employees involved in accidents are blamed for errors without follow-up or root cause investigation. They are then punished without any other corrective action taking place on the part of the railroad to prevent recurrences.".

These guys can't get it right up there. The Canadian government knows it. They can't get it right down here.

MS. TARCZAN: James Bateman, Michael Fisher, Michelle Oehlerking (phonetic).

MR. BATEMAN: My name is James Bateman. I'm a resident of Barrington.

I've been a resident of Barrington for the last three decades. During that time on five separate occasions members of my family have required emergency medical treatment, and in three of those cases they required transport by the Barrington Fire Department to Good Shepherd Hospital. In three of those cases the ambulance route required crossing of the EJ&E railroad tracks.

In at least one of those cases timely intervention by doctors at Good

Shepherd Hospital Cardiac Center was essential in order to prevent heart damage, which would have certainly occurred had the treatment been delayed. Northwest Community Hospital, Sherman Hospital, Northern Illinois Medical Center, St. Alexus Hospital are not acceptable in terms of an alternative for the timely cardiac care.

It's bizarre to think that the

requirements of a Canadian corporation would dictate that an ambulance has to turn around a mile or a mile and a half from Good Shepherd Hospital and go to a hospital seven or ten miles away in order to get emergency medical care.

Building more fire or police stations will never address the grid lock that this proposal will create. Duplicating hospitals is an insane possibility that will never occur. This proposal will rip apart the fabric of a community that I've lived in for many, many years. It will as a practical matter as has already been discussed this evening prevent timely access not only for emergency medical care, but it will disrupt

the education of students due to delays caused by increased freight train traffic who may not arrive at school in a timely manner, and it will cause massive interference with the ability of residents to just obtain the other essential services required for their lives.

The mitigation efforts required by DEIS are woefully inadequate. Recommended, that is, not required. The environmental costs of CN's proposed purchase vastly exceed the proposed purchase price. In fact, just one line item in that environmental cost, that being a conservative estimate for the cost of grade separations, will exceed by many times the reported purchase price.

I believe that the draft EIS terribly underestimates the substantially affected grade crossings, particularly in the Barrington area. To leave out Route 14 and Lake Cook Road crossings is obsurd. One freight train with a 10,000-foot length will block all four crossings in the Village of Barrington.

I ask you to reject this proposal and prevent the highest price

being paid in that being the death or injury to residents of the areas where emergency services will be affected.

Thank you.

MS. TARCZAN: Michael Fisher, Michelle Oehlerking, Marshall Lau.

MR. FISHER: My name is Michael Fisher, F-I-S-H-E-R, and I have lived in the Mundelein area for most of my life.

I do not believe that the proposed expansion of Canadian National's freight traffic through Illinois will benefit anyone but Canadian National. They have suggested that shifting rail traffic will have benefits for some communities and drawbacks for others, but I believe all of Illinois will suffer.

Turning the EJ&E rail line into a freight train superhighway will decimate the dozens of cities it currently runs through. Housing values will fall, tax bases will decrease, businesses will close or move, and traffic will increase.

At the same time there will still be rail lines in these other, quote, benefit communities, and I doubt that these will remain idle. As freight increases, these lines will surely be returned to their current high level of utilization.

Canadian National is just a

business, a corporation, and, as such, it has no mandate other than to increase revenues. They have a deplorable record of working with communities, of dealing with the negative impact of their business. The schools, private homes, and businesses that currently reside alongside of the EJ&E will quickly become hostages to the goodwill of a corporation that has shown it has no goodwill. When trains derail, when traffic fatalities occur, when hazardous materials are spilled Canadian National has shown itself to be magnificently unhelpful to the people, communities, and environments that are affected.

Change takes time. I repeat, change takes time. Our city have been built around a certain level of rail traffic. To change overnight from a few trains a day to greater than 20 trains a day is to blatantly disregard the rights of people in favor of corporate profit. A gradual increase in traffic is acceptable and allows cities to gradually restructure

themselves. An overnight increase of the

magnitude that is being proposed here today is a recipe for disaster. To permit that much rail traffic before any system is in place to handle it is unimaginable.

Canadian National would like this process to be quick and dirty. Just increase the trains and let the towns sort out the problems later as best they can. Remember that the communities Canadian National currently runs trains through have had many decades in which to adjust themselves to their current level of rail traffic. Houses, schools, and businesses have been located with an eye to the railroad tracks. Underpasses and overpasses have been planned and gradually constructed. And even with all this they find the rail traffic intolerable. They are overjoyed at the prospect of fewer trains.

If the impact in our area will be as minor as Canadian National claims, then why are these other towns so desperate

to see them leave?

Thank you.

MS. TARCZAN: Michelle Oehlerking, Marshall Law, Richard Walke.

MR. WALKE: My name is Richard Walke, spelled W-A-L-K-E. I'm a resident of Hawthorn Woods on the east side of the tracks, and I'm speaking on behalf of myself.

Like many others here tonight, I'm adamantly opposed to the proposal for

the expansion of the rail services on the EJ&E tracks through the area. My opposition is based on a number of reasons that have already been expressed here tonight. So there's probably no point in me standing up here and saying me too. So I'd like to speak to it from the perspective of my expertise, that being fire protection.

I'm a fire protection engineer and right off the bat fire protection engineers cringe when we hear the word single family home or one or two family homes. Typically these structures are constructed of wood, obviously them being combustible. Beyond that they lack the modern active and passive fire protection

features that are built into larger structures built in accordance with the International Building Code, items such as fire sprinklers and the monitored fire alarm systems, for example. As a result, the National Fire Protection Association estimates that approximately 83 percent of all fire deaths in America occur in the home. That's approximately 3,000 people annually.

Now, why are these numbers so staggering? Well, even in a modern code-compliant single or multifamily home escape time is measured in minutes. I have a chart here which I'll leave with the court reporter from the National Fire Protection Association which states after 3.5 minutes without fire sprinklers odds of escaping decrease significantly.

3.5 minutes is nothing. It's just a very small segment in time. Even under the best of circumstances in a fire situation the fire services will be arriving basically at the conclusion of

that window of opportunity for escape. If the route is obstructed by a freight train, they will have no window of opportunity. They won't be able to mount their search and rescue operations for the residents of the homes. The residents will be left on their own accord to escape from that structure.

Beyond that, if one family member does escape, human nature being what it is, another member doesn't escape, they're going to run back into the building to try to protect or save their spouse or

kids. And I'm sure the two fire chiefs that were here earlier would suggest that's probably not what we should all be doing, but that's what we will all do unfortunately. If their crews are stuck out on Old McHenry Road in a traffic jam as a result of a freight train, the residents will be left on their own accord and very likely the result will be tragedy. That's not what we want for the residents of the Village of Hawthorn Woods and the other

surrounding communities.

So in summary, I strongly suggest the STB oppose or reject this proposal. Thank you.

MS. TARCZAN: Michael Talbett, Ken Deja, Susan Branding.

MR. TALBETT: Good evening. My name is Michael Talbett, that's spelled T-A-L-B-E-T-T, and I am a resident of Lake Zurich. I also serve as the vice chairman of the Lake County board and I'm a member of the Lake County Forest Preserve District, and the district I represent has approximately 22,000 people.

On their behalf I'm urging the Surface Transportation Board to find simply

that the costs of this merger far outweigh the benefits. Some of those environmental costs have already been identified here tonight, but they're worth repeating.

The increase in particulate matter that will come from the trains that pass by, the increased pollution from the cars that are idling is something that has

to be considered. The disturbance of sensitive green spaces in our community has to be considered in the environmental impact. Forest preserves in Lake County will be disturbed and adversely affected by this merger.

The exposure of many sensitive residents in this district are adversely impacted by this merger. We've heard the school superintendent talk about the number of children that are in proximity to the railroad lines and will be present as trains pass. Our library has an outdoor children's area very close to the railroad tracks. So these have to be considered as well.

I think the various representatives of the emergency responders that were here tonight clearly made the

point that lives will be lost because of increased response times. What price do we put on those?

If the Surface Transportation Board is to allow this, they have to

provide and order the CN to do the mitigation that's needed to ameliorate some of these costs.

The point has already been made that in the past preference has been given the railroads at different times in our history because the United States has a policy of wanting to promote the opening of the west. Well, those days are long gone and railroad companies are not entitled to such preferences and they should pay their way.

Increased noise has a cost. Increased pollution has a cost. Increased environmental disturbance and degradation has a cost. Increased response time has a cost in human life. All these costs outweigh the benefits, and the few benefits that do -- that may be present don't occur in this region. The net effect of this merger is a loss to this area, and that is not what this fact finding is about. The

costs outweigh the benefits by far.

MS. TARCZAN: Kenneth Deja, Suzanne

Branding, Phillip LaGro.

MR. DEJA: My name is Kenneth Deja, D-E-J-A.

I find it curious that Mr. Gohmann came down from Minnesota on his own dime to promote CN. I seriously doubt Mr. Gohmann has toured the affected areas and really is an expert to comment on what is going to happen if and when we go through this transaction.

It's reported that 1.5 million people live among the EJ&E line. According to the U.S. Census in 2007, that's the same number of people equal to the sixth largest state in the United States. This line does not run through commercial corridors and is mostly -- is not mostly in rural areas or on the outskirts of town. It runs through primarily residential areas.

I find it sad that Representative Nekritz and Robert Marshall are for the EJ&E purchase because it removes trains from the communities and

shifts them to others. That's really not a reason to be for it.

I hear about moving goods and services in a cost effective manner. I really don't think anyone is again rail traffic or interstate commerce, but there a smart way to move goods and irresponsibly move goods. I believe this is an irresponsible way to move goods.

There are other train lines that are west of this area that are mostly in rural areas. Doesn't mean people won't be affected, but they affect very few people in comparison to this proposed transaction.

Currently there are three to five trains a day running along the EJ&E, one around 11:00 p.m., one around 3:00 in the morning, one around mid morning, and one in the afternoon. Rarely do these occur during rush-hour traffic. Our highways are not equipped to handle this increase in traffic.

Even this lack of current traffic, someone 60 plus years ago had the

foresight to build an underpass under Route 12 in Lake Zurich so that car traffic, truck traffic, and train traffic could all coexist. Right now none of these communities have the infrastructure to coexist with a train. That infrastructure will take years if not decades to put in place.

Please do not approve this transaction. Thank you.

MS. TARCZAN: Suzanne Branding, Phillip LaGro.

SUZANNE BRANDING: We thank you for the opportunity to be able to speak this evening. My name is Suzanne Branding. I am a village trustee of the Village of Lake Zurich, and I came tonight without the intention really of speaking, but I have to say something.

We are all aware of the safety issues that are involved; the ambulances, the police cars not being able to get through. We are concerned about the environmental security, sound pollution,

vibration, air pollution. I want to bring up these safety and environmental issues on

Let me just say something on a very personal note. I have a daughter who is a foreign service officer with the State Department. I am very proud of her. She has been with our Federal government for six years. I am lucky to see her once or twice a year. She happens to be home right now. Part of her job is keeping us safe. And what is happening with allowing these trains to come through is to open a door, a little bit at our airports to let people come in and with the security on our borders, but we are taking the walls down. We don't know what is coming in here. How are you going to keep us safe?

PHIL LAGRO: Good evening, ladies and gentlemen of the board and staff. I thank you very much for letting all of us have an opportunity to speak with you tonight.

I am a long-time resident of Hawthorn Woods, Illinois. I am a plan commissioner on the Plan Commission Zoning

a larger scale. We have dealt with them locally, but let's deal with them regionally and even nationally.

What we are considering doing here is allowing a foreign company to buy our infrastructure and allow any country, company, entity who has the money to ship things right in the heart of our country, right through our country? What has Homeland Security said about this? How is Homeland Security going to be checking these cars and this freight? And the things that are coming in?

We have all been at airports. I am sure some of you have flown to get here today. You have been through security. You know what it is like. Imagine thousands of train cars coming through your community. How is that going to be checked? How can you assure us we are going to be safe with what is coming through our community? We have already had

various things coming in from halfway around the world. How can we be sure more of this is not going to be happening with the freight that is coming into our country?

Board of Appeals, and I am also a member of TRACK (phonetic), the coalition of communities opposing the potential acquisition of EJ&E by CN.

CN is a large, successful, incredibly efficient company. They are arguably already the Number 1 railroad in the world. And my reading of the 2007 annual report to shareholders gives me every indication that their aspirations are, in fact, to become the Number 1 transportation company in the world. This includes potentially ocean-going involvement, certainly railroading, vast scale and expanding, and also trucking.

Their may be trucking removed

from the roadways as part of the proposed transaction, but in the efficient flow of goods by shipping, by rail, and then to the end point customer for CN trucking provides an essential final link in getting the goods to the ultimate customer, whoever that is.

In fact, semi tractor trailers are featured photographically in the CN annual report. I won't begin to try and repeat all of the many eloquent, emotional

comments that have come before me tonight. I would just point out that the negative impacts that you have heard so many people talk about are not imagined. They are very real. And they are impacts that potentially will affect hundreds of thousands of US Citizens, taxpayers, families. People just like us. People just like you. And I would say to the board, please do not approve this transaction.

As we tell our kids with respect to drugs, just say no.

TERRY BARNETT: My name is Terry Barnett. I live at 4 Sandpiper Lane in Hawthorn Woods. I am the president of the Underground Contractors Association of Illinois. I sit on the Board of Directors of Illinois Road and Transportation Authority. And I meet with Senator Oberstar at least two, three, four times a year. I know Senator Oberstar is kind of Chairman of this whole thing. So I kind of know your boss.

These are his numbers from the last meeting that I had with the senator. The transportation system in Lake County is

one of the worst in the state. It is already burdened with poorly-constructed roads. The arteries are already clogged. 53 hasn't been brought through, and we are getting ready to burden it with additional traffic through the railway system.

Senator Oberstar made the comment at his last meeting with half a dozen of us that when General Mills trucks drive on our highways, for every mile per

hour under the posted speed limit costs that company a million dollars. For every mile per hour under the posted speed limit that UPS goes -- and UPS has a huge hub around in here -- every mile per hour under the posted speed limit costs that company $5,000. That is from the senator's mouth.

This transportation system in Lake County is in disrepair. It is not adequate and you are fixing to burden the heck out of it. We will receive benefit and take the brunt of the pain. So the answer is unequivocally a no.

Thank you.

MS. TARCZAN: Thank you all for the comments provided tonight. The next public meeting is in Barrington tomorrow from 4:00

to 9:00 p.m.

The final environmental impact statement will be available sometime between December 1st and January 31st.

The court reporter will remain in the venue tonight until 9:00 p.m. Feel free, again, to make your comments with one

of our court reporters, through our website, by writing a letter, by calling our toll free hotline. Thank you.

1

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET, AND EASTERN RAILWAY COMPANY

PUBLIC HEARING

August 27, 2008

6:00 P.M.

Conducted by:

Tina-Marie Adams, Meeting Facilitator - MWW Group Public Relations

Victoria Rutson, Section Chief - Surface Transportation Board, Section of Environmental Analysis

John Morton, Project Manager - HDR Engineering

BARRINGTON HIGH SCHOOL
616 WEST MAIN STREET
BARRINGTON, ILLINOIS

CHIMNIAK REPORTING & VIDEO
312-781-9111

REPORTED BY: TINA ALFARO, SHARON STUCKLY, CHERYL SANDECKI, NICOLE BREYTSPRAAK, JOANNE BROGAN, JAMIE FRIEL, LAURA RENKE

2

MS. ADAMS: We're now going to begin the public meeting portion of tonight's meeting. If everyone would please take your seats.

Good evening, ladies and gentlemen. Thank you for attending tonight's meeting. We are here tonight to hear your comments on the Draft Environmental Impact Statement that was released July 25 regarding Canadian National Railway's proposed acquisition of the EJ&E railroad.

My name is Tina-Marie Adams, and I work for a firm called MWW Group Public Relations. We are part of a third-party contracting team that supports the Surface Transportation Board and its section of the environmental analysis. I will be facilitating the meeting tonight.

Before we get started I'd like to take this opportunity to review some protocol for tonight's meeting. For starters, I would ask that everyone please turn off your cell phones and please

3

refrain from interrupting any speakers or commenters. In a moment I will introduce those presiding over the meeting and there will be a short presentation on the findings from the Draft Environmental Impact Statement.

Immediately following this we will hear your comments. Each commenter will be given up to three minutes to speak. There will be a time clock displayed on the screens to my right and left, and the time clock will display 3 minutes and count down. A yellow card will be shown at 2 minutes and 30 seconds and a red card will be shown at 3 minutes. A list of speakers in order will be displayed on the screen. Also, I will call forward the next two speakers in line after each speaker so we can be as efficient as possible.

There is one microphone set up at the head of each aisle here on the floor. Though many of you have signed up to speak tonight, due to our time constraints and the number of people who have signed up we

4

may not be able to list all commenters. However, we want to ensure you that all methods of comment received by September 30th will be taken into consideration and weighed equally.

Included in the programming you received tonight there's a toll free number, Web site, and mailing address to submit comments to the Surface Transportation Board. There are also comment forms and drop boxes located at the far end of the gym and court reporters located throughout the venue. You may record your comments with them throughout the meeting.

Tonight we are here to listen to your comments on the draft EIS. This is not a question and answer session, but we invite you to return to the open house area at the far end if you have questions or comments that you would like to provide. Also, you can provide comments in a more private setting with a court reporter located there. The meeting will conclude

5

at 9:00 p.m.

We appreciate your courtesy as we work to create an environment where everyone can be heard. If you disagree with the speaker, we ask that you not express your disagreement out loud. Likewise, please note that applause for a speaker during his or her comments gives that person less time to speak and ultimately limits the time for everyone

else to speak.

In the event that anyone needs a Spanish translator, Beatrice is here to assist. Beatrice will be here.

If you have any questions, we have a number of staff available to assist you. Staff are identified with nametags like the one I'm wearing and are located throughout the venue.

One quick housekeeping matter, there are four emergency exits, two located at the front of the gymnasium where we are standing to my right and left as well as at the far end of the gym.

I'd like to now introduce the people with me here on the stage. Victoria Rutson is a chief of the section of environmental analysis for the Surface Transportation Board. John Morton is a project manager from HDR Engineering, who is a third-party consultant supporting the Surface Transportation Board's section of environmental analysis.

With that, Victoria Rutson will now make some comments about the draft EIS.

MS. RUTSON: Thank you, Tina-Marie. Can everyone hear me? If you have trouble

understanding what I'm saying, please just raise your hand, and I'll try to move to the other mick or speak more slowly or make a little bit more sense even for an attorney.

My name is Vicky Rutson. I'm the chief of the section of environmental analysis at the Surface Transportation Board. I'm very pleased to be with you here tonight.

I understand and everyone on our

team understands how many questions this proposed acquisition has raised in the communities around Chicagoland. The purpose of the meeting here is to listen to your comments on the Draft Environmental Impact Statement. I want to remind you that there are many ways to submit comments, and each way of submitting a comment counts equally.

Sometimes people don't feel comfortable speaking in public. For those people please feel free to submit letters. They must be postmarked by September 30th, and the information about where to send your letters is in the information booklet that you've been provided with tonight.

You may also E-file using the board's Web site. You may also call our toll free environmental hotline and leave a recorded message.

Again, as Tina-Marie said, you may go back to the far end of the gym and speak privately to one of the court reporters who will carefully record your

comments, and the tables will continue to be set up in the back with the comment sheets that you can fill out, leave here, or take home to mail in. Again, each means of submitting a comment are treated equally.

Now, what are we going to do with all these comments? When the comment period closes on September 30th, the team will carefully read, review, consider, and respond to the comments in a document known as a Final Environmental Impact Statement. That Final Environmental Impact Statement should be coming out sometime between December 1st and January 31st.

That document will set forth my team's recommendations to the decision maker in this case. The decision maker is the Surface Transportation Board. Let me

speak for just a couple minutes about who is the Surface Transportation Board.

The board is an agency in Washington D.C. charged with Congress to ensure a strong rail freight transportation

system in the United States. The board is composed of three members. They're appointed by the president and confirmed by the senate. The names of the three board members are in your materials. They will be making a decision on whether to approve, deny, or approve with conditions the proposal by Canadian National to acquire the EJ&E railroad.

The board complies with its own government statute, the Interstate Commerce Act, but it must also comply with another statute called the National Environmental Policy Act, and it's under that law that we're all here tonight. That law requires all federal agencies to take a hard look at environmental impacts of their decisions before making a final decision. Therefore, the board must take a hard look at the environmental impacts both beneficial and adverse of CN's proposed acquisition before rendering a final decision.

If we put the final EIS out sometime between December and the end of

January, then the board cannot act with a final decision until after that final EIS is out.

The board is a neutral party. It is neither a proponent nor an opponent of the file that it is considering. It must neutrally and carefully consider the full record before making a decision.

Again, that full record includes all the comments that we'll be gathering from members of the public. We're going to be listening very carefully to everything you say tonight. We're going to be looking very carefully at everything you submit orally and in writing.

I thank you so much for being here, and I thank you in advance for treating each speaker with courtesy and respect. It's difficult to get up in front of a crowd and speak, and it's very difficulty to do that when you know your position may not be going over well. So please, even though you may not agree at all with what someone may be saying, I do

ask that you treat them with the courtesy and respect that I know that you have shown me and my team throughout this very difficult process.

Thank you so much for being here tonight, and now I'm turning the microphone over to John Morton.

MR. MORTON: Thank you, Vicky.

For those over in the entranceway, please feel free to come on in. There are seats available up in the bleachers on both sides. You know, I know we have a venue where you're going to have some commotion over there. Just kind of bear with that.

What I'd like to do is speak a little bit about what the EIS found. First, CN is a class 1 railroad, a major shipper of domestic and foreign freight. It operates five rail lines converging into Chicago. They're shown in the dark on the maps up there. I know that the people in back may not be able to see them too well, but they converge on Chicago and they

operate about 150 miles in Chicago.

The EJ&E is a regional railroad that operates in an arch around the City of Chicago. It starts in the dark part in Waukegan. That's at the far upper corner of the map up there. EJ&E is shown in the orange color. I know it's a little light. It comes pretty much due south to the Joliet and then straight east across Illinois and into Indiana and then up to Gary, Indiana. EJ&E operates two major rail yards, one the Joliet yard in Joliet, Illinois and Kirk yard in Gary, Indiana.

According to the applicant, Canadian National, the purpose for acquiring the EJ&E rail line is, one, to increase CN's operational flexibility by combining their five rail lines in one continuous group around Chicago; the second one is to make Kirk yard available to the CN; and the third is to allow CN to provide a more -- develop more extensive relationships with the shippers on the EJ&E rail line.

The draft EIS, which I notice a number of you have, is a very voluminous

document and it covers a number of subjects, and I've listed the subjects up there. I just want to briefly go through just a few of the findings so that we provide enough time for everybody to provide comments. If you have questions -- and I know you will -- the open house session is still open and there's staff back there. Feel free to go back at any time and ask your questions of the staff and they can explain what the EIS is covering in a little bit more detail than I'm going to go through tonight.

First, the proposal results in some operational changes which I'm going to talk about in a few minutes. It also includes the construction of six connections, and that is a connection between the EJ&E and another rail line. Those are listed and we have a map in the back that shows where each one of those connections are proposed.

We also operate 19 miles -- or they also propose to construct 19 miles of new parallel rail line, and those are the locations that they're proposing and, once again, we have a map in the back if you

want to see specifically where those -- that new parallel main line would be constructed.

This is a density chart that comes out of the analysis. I know it's a little bit confusing, but it basically attempts to show the changes in trains and that's trains per day is the way it's represented. The light blue lines -- the light blue color is the existing number of trains per day. The dark color is the proposed number of trains per day. So you can see where the traffic is proposed to be shifted. Generally speaking, what happens is the CN rail lines on the inside of the arch will show a reduction in rail traffic. The line on the EJ&E arch itself will show an increase in rail traffic.

One of the conclusions that the

EIS reaches from that is that as a result of traffic changes EJ&E would be near or at its practical traffic volume capacity. As a result, the EIS concludes that it's unlikely that the track levels on the EJ&E would be higher than those estimated by CN in their operations plan. In addition, the other conclusion is that Metra's on-time

performance can be maintained with effective cooperation between CN and Metra.

There's a number of -- the draft EIS evaluates training and roadway safety issues, and there's a number of conclusions. In general on the EJ&E arch itself there's a -- because of the increased amount of freight trains, there will be an increase in the probability of a train accident and also an increase in the probability of highway/rail accidents. By the same token, on the CN rail lines because of the reduction in the number of trains there will be a corresponding decrease in the probability of a rail accident on those CN rail lines and a

reduction in the probability of highway accident.

The EIS has identified three at-grade crossings that would experience substantial increase in accident risk, and that is Woodruff Road in Joliet, Illinois and Lake and Miller Streets in Griffith, Indiana.

Passenger rail line and hazmat -- you know, transportation were also evaluated in the EIS. There is no passenger rail operated on the EJ&E. So

therefore there would not be a change or effect on passenger safety on the EJ&E rail line. There is passenger rail operated on the CN rail line segments, and therefore taking the traffic off would have a corresponding benefit or improved passenger rail safety.

There will be a substantial increase in the amount of hazardous material shipped on the EJ&E rail line and a corresponding decrease on the CN line segments inside the arch.

On transportation system -- and

this is basically talking about traffic delay -- there are 155 highway at-grade crossings evaluated on the CN rail line -- I'm sorry -- 155 of which 125 would show a reduced delay improvement because of reduced traffic. Of the 112 highway/rail at-grade crossings on the EJ&E there would be 87 of them that met the board's threshold for analysis, and of those 87 there would be 15 that without mitigation wouldn't have a substantial adverse effect. And those are listed, once again -- they're shown in the blue diamonds on the graphic up there, and we have the listing of them

and specifically the locations back on the tables back in the open house section if you want to take a look at those.

From an air quality standpoint the EJ&E is a longer route. Therefore, there would be an increase in fuel and an increase in air emissions, but there also would be a corresponding increase in efficiency and the net result is that the air emission changes in 2015 would not

exceed any current regulations or impact the region's air quality compliance.

The EIS evaluated all the emergency service providers along the arch and concluded that without mitigation 11 emergency service providers, that's nine fire stations and two medical facilities, would experience substantial effects, and those, once again, are shown on the graphic up there and they're listed specifically and located on the maps back in the back.

Noise, there would be about 3,000 residences that would now be within the 65 DB contour on the EJ&E arch. There would be about 2,700 on the CN rail lines that would see a reduction in noise. One of the conclusions specifically applicable to this

area is that the Barrington quiet zone -- and I believe that's a quiet zone that starts at Huff Street and goes to the southwest -- would lose its status because of the increased train activity.

The EIS also identified a number of mitigation measures or proposed

mitigation measures. CN provided a set of voluntary mitigation measures, 76 of which, and they're listed in the various categories showing the areas that they would mitigate. In addition to that the EIS has 72 additional mitigation. That's above and beyond the 76, and, once again, the categories are there.

The executive summary of the EIS lists all 76 and all 72, if you happen to have that, and we have lists back in the back or you can find people back there if you have specific questions on what's recommended in the draft EIS.

With that I'd like to turn it back over to Tina-Marie.

MS. ADAMS: We will now begin the comment portion of our meeting, and we'll begin with Congresswoman Melissa Bean and Congressman Don Manzullo.

REPRESENTATIVE BEAN: I'm going to turn myself to the group while I am addressing the STB.

Good evening. I'm Melissa Bean, and I have the honor of representing the Illinois 8th District in the U.S. Congress and many of you that are here tonight. I'm speaking to you not just on behalf of those that I serve in this district, but as a mom in the community. In fact, I just missed both of my daughters. So like many of you I have to cross the EJ&E tracks to go to the grocery store, to go to school, to get to the hospital, and it effects us on a personal level as well.

But this just isn't a Barrington area issue as some have tried to portray. There are well over 40 communities along the EJ&E not just in my district like Mundelein, Hawthorn Woods, Lake Zurich, but also outside of this district, Bartlett, Naperville, Aurora,

Plainfield, West Chicago, Frankfort,

Northwest Indiana. These communities will experience a 400 to 900 percent increase in freight traffic if you include the lengths of the trains. That's why there's bipartisan opposition to this deal in our Illinois delegation in Indiana including our Senators Durbin and Obama, Reps. Manzullo, Roskam, Foster, Biggert, and Visclosky.

Last November I requested the Environmental Impact Statement and the STB did prepare it and I appreciate that. Unlike the standard review performed by the STB, the EIS process made this forum possible so many of you here today could raise your concerns. Over the last several months thousands of residents have brought out unprecedented levels of opposition, and I appreciate your involvement.

The intent of the EIS should be to balance priorities between the issues of commerce and transportation concerns with the safety, quality of life

and the economies of our communities, and I know that my constituents here tonight are counting on you, the STB, a federal agency paid for by their tax dollars, to serve their interests.

Regrettably the recent Draft Environmental Impact Statement seems to endorse allowing a private company to destroy local communities' quality of life, safety, and economies while expecting those same communities to pick up the tab. Specifically, it fails in scope and solutions. It fails the public by placing an egregious tax burden on local communities by expecting them to fund the vast majority of mitigation costs for a project they don't want and won't benefit from. CN's 40 million towards mitigation is laughable considering the projected costs just for 15 to 20 grade crossings would be over a billion dollars. It fails to provide other options or even review existing alternatives, whether that is create or a band rail system. They're not

even being considered.

What we're essentially doing here is talking about moving a problem and adding additional problems, not solving a problem. It identifies 15 at-grade crossings where there are many more, over 133 that need improvements. It identifies 11 communities that would be cut off from their police, their fire, and their EMS providers who serve them while offering no solutions or recommendations to ensure the safety of our communities.

On safety -- I've been hearing from so many parents on this issue. Safety is our number one concern, as you can imagine. Highway rail accident rates are predicted to increase by 28 percent on the EJ&E, and that's assuming that CN even adheres to their very nebulous projections of what those actual increases in traffic would be.

It refuses to evaluate the impact this transaction would have on the Metra Star line, which has wide

bipartisan support because in addition to providing a commuter rail, it also would reduce utilization and costs of our highways in decreasing emissions.

Phil Pagano from Metra testified at our Chicago hearing and specifically rejected CN's claim that they would make this plan work on the Star line because it would essentially require the same rail, and CN has refused to give Metra any firm commitments in that regard

It disregards the severe impact of 400 to 900 percent increase that freight traffic would have on the quality of life in our neighborhoods due to deadlock traffic, increased emissions and pollution, noise levels, safety casualties, thousands of children standing in the freezing winters of Chicago while waiting for 2-mile trains to go by so they can cross the tracks to get to school, lost businesses, lost property value, lost tax revenue. Specifically, the municipality's revenues will decrease while their tax burden

increases given the high fuel costs that are likely to go much higher than what's being projected as well as misstatements about Amtrak and Star line services.

Worse, the so-called benefits to other communities are not certain as the draft EIS only suggests a 3-year enforcement period, which means CN is not accountable to maintain any reductions in freight traffic in other communities or prohibited from increasing traffic in all of our communities. That's no firm commitments from CN.

I urge the STB to reject this proposed acquisition outright. If, however, you choose to allow it to move forward, you should require CN to fund and

complete all needed mitigation as identified by our communities before any increase in freight traffic is allowed. As this transaction has been initiated by and for the benefit of a private foreign entity, their shareholder upside should not be paid for by American taypayers.

The current process puts the interests of industries over those of American families and taypayers. In September I'll be working to improve legislation to change this process in order to better reflect the American values by protecting the rights of our constituents and our communities. The STB has an opportunity to show America, the federal agency they pay for, can and will put the American taxpayer first. Please do.

Before my colleague Congressman Manzullo speaks, I just want to add one final comment. I've heard from many people tonight that they came here to speak, and because of the time constraints some will not be able to speak. I know they're

having requests for additional hearings, and I want to make that request again tonight that I hope you'll consider their opportunity to speak.

Thanks so much.

MR. MANZULLO: I'm Congressman Don Manzullo representing most of McHenry County with the exception of the northeast corner which is represented by Mrs. Bean. And I cannot tell you how disappointed I am with the poor scholarship by the STB on the environmental impact statement. And I say that -- I say that -- I say that because as I read this, you do not show the impact on the people.

The people I represent in McHenry County, tens of thousands of them, each day come through the areas that are impacted, but I want to show you what you concentrated on. On page 3-11-30, on the

horned bladderwort, you took that into consideration. And on page 3-11-10, the yellow-bellied sapsucker.

Now these are legitimate issues that should be determined by environmental impact, but because you never insisted on knowing the length of the trains or the number of trains, your statement, your

conclusions are faulty because you don't have the evidence because the CN never squared with you. They never squared with us. That's the problem.

And I do not see how you can make this conclusion. In fact the introduction, the 25 minutes that you took should be given back to the people to give them the opportunity. And I would ask unanimous consent that 25 minutes be added to the clock to end at 9:30.

Do we have that? Do we have that from you? Would you add 25 minutes back to the clock for the people to be heard because the people have never been heard on this.

Three weeks ago, four members of congress held a hearing in downtown Chicago and the president of CN Railroad personally

told Senator Durbin he would appear anywhere, anyplace anytime. And when he refused to show up the next day, we got a press release threatening to sue. We introduced the legislation. A week later

he puts out a press release asking you to expedite the process so you can bypass what could possibly happen in congress.

Now why are these people upset? Why are they upset? They've never been treated fairly. And what's at stake? 400 crossings of school busses on those tracks. What's at stake is what you never analyzed. What's not in here is the impact on the back up of traffic. You never took a look at that. You never did your job.

And my question to you is did you prepare this report or did CN? Who prepared the report? I want to know. Would you like to know who prepared it? Who prepared the report? Can you answer me? Did you prepare this report or did CN prepare it?

MS. ADAMS: I want to remind you this is a public comment period.

MR. MANZULLO: I'm a member of congress and I want answers from you. We

have been blown off by CN Railroad. We want a simple answer. Who paid and who

prepared this report?

MS. ADAMS: We would invite you and any other member of the public --

MR. MANZULLO: Answer the question. Answer the question. I'm not going to sit down until you answer the question, Ma'am.

I can tell -- I can tell the poor had nothing to do with this report. Absolutely nothing. It goes to show -- it goes to show -- it gives new meaning to the word railroad when you were trying to force down the throats of the people who are impacted and you yourselves probably had nothing to do with this report because you made a blatant statement that the safety of the people would not be impaired when you don't even know the number of trains or the length of the trains.

I'm going to ask you again, did you prepare this report or did CN prepare the report?

MS. ADAMS: I'm going to remind you again this is a public comment --

MR. MANZULLO: You don't have to

32

remind me of anything. I want an answer.
MS. ADAMS: If you have any questions, we invite you to --
MR. MANZULLO: You don't understand. You don't blow off these people. You don't -- you prepared it? Did you have anything to do with it personally?.
MS. RUTSON: Yes.
MR. MANZULLO: Did you ask any of the people out here about the impact?
MS. RUTSON: During scoping.
MR. MANZULLO: Did you?
MS. RUTSON: That's what we --
MR. MANZULLO: Did you ask the people? Did you ask the people for input on this report?
MS. RUTSON: We tried, but we want more now.
MR. MANZULLO: You tried? You should have gotten it before you prepared this report. I was told this report cost 10 million dollars. Is that correct? Is that correct?
MS. RUTSON: We don't know.

33

MR. MANZULLO: You don't know what it costs. You should. So what you do is you come up with this hurried report. It's faulty preparation, it's faulty conclusion, and you are telling these people you want input on the report that's already printed. That doesn't make sense. And that's why we're here. And that's why we're upset. You could cut off the opposition to the people. You can come into this area and say they know (inaudible). You could never quiet the voice of American people and they will not go away.
MS. ADAMS: We're going to continue with the public comment portion. Let me remind you that we're going to adhere to a three-minute rule which begins as soon as you start speaking.
If three minutes is not enough time for you, please feel free to speak with the reporter in the open house area to the back of the room to complete your remarks.
We also advise you to submit

34

your full written remarks to the court reporters located here at the front of the

room.
We have Mayor Karen Darch who will be speaking first, then Maggie Bosley and James Wallace will be next.
Again we invite you to the microphone that's closest to where you are sitting.

35

MS. DARCH: Thank you. Good evening. I'm Karen Darch, president of the village of Barrington. And I thank you for returning to Barrington to again hear from a community which will be forever changed

if CN is allowed to acquire the EJ&E and turn it into an international freight superhighway.
You will hear from other village officials tonight and we will submit more extensive written comments by September 30th, but for tonight, I want to focus on the disconnect between what is reality and some of what is or is not in the DEIS.
Here's what's real. CN has a route through Chicago and a way to get its goods where they need to go. CN says it wants to purchase EJ&E to gain efficiency. It is not about getting from the Port of Prince Rupert to CN's Memphis distribution center. It's about getting there faster with what reliable forecasters predict will be exponentially growing freight traffic.

36

What price efficiency? Also real is the CREATE program, the agreed to, approved, partly-funded plan for freight decongestion through Chicago helping all 6 Class 1 railroads and the communities with existing rail lines.
The DEIS accepts CN's contention of long delays through Chicago with no

analysis. It accepts that there is an overall regional benefit in getting CN's goods to market faster with no real analysis. It will not look beyond 2015 for what this deal will really bring to communities along the EJ&E and along what will be the backfilled tracks where CN currently runs. And there is no review of CREATE or even CN's, Central Corridor, part of the CREATE or any other alternative. Because they do not exactly fit CN's overly narrow purpose and need statement which the DEIS accepted wholesale. Reality is that SEA can under NEPA review alternatives even if they are outside of SEA's jurisdiction.

The DEIS suggests mitigation

possibilities and working out deals with CN. The reality is CN is offering no real money to solve the problems it creates and is banking on the STB to hold to precedent which has railroads pay virtually nothing for mitigation. And the reality is the communities and state and federal governments do not have the money to fix the problems even if they wanted to fix these CN-created problems. Talk is cheap. Solutions along the J are not.

The reality is approval of this deal will be a huge victory for CN's bottom line, a potential death sentence for Barrington and a nightmare for the entire region's taxpayers and commuters.

MS. ADAMS: Maggie Bosley, James Wallace and Steven Miller.

MS. BOSLEY: Hello. My name is Maggie Bosley and I am the director of community and financial services for the village of Barrington.

As the chief financial person on staff for the village of Barrington, my top priority is the physical health of our community.

I am very concerned with the misrepresentations and omissions in the draft environmental impact study regarding the negative financial impacts to Barrington if the CN acquisition is approved.

First the DEIS said that there are 15 grade crossings in the region that will be affected due to the effects of this possible CN acquisition and only one of them was a Barrington. We are a confident that there are actually three grade crossings that will be -- will be substantially impacted in Barrington if this acquisition is approved.

Providing grade separation at

each of these crossings is estimated to cost upwards of $80 million each which means that Barrington would have to have $240 million in funding for grade separations.

The DEIS reports state that CN would be obligated to pay between 5 and 50 percent of those costs. In our case, where would the other 120 to $228 million come from? The DEIS did not investigate whether there will be federal, state or local funding to contribute towards the shortfall.

The State of Illinois agencies have clearly stated after this DEIS report was issued that Illinois is not in a position to fund any grade crossings that

would result out of this transaction.

As for local funding, I am here to let you know that the village simply does not have this funding available. By state statute, we have a legal debt limit and the maximum amount we can lawfully borrow is only a minute fraction of that

120 to $228 million that we would need.

Furthermore why should the taxpayers of Barrington be responsible to cover the costs that are incurred due to private railroad pursuing profit.

The draft statement included only the possibility of federal, state or local funding without taking government fiscal realities into account is nothing more than an empty promise to the communities that will be impacted.

Second, the sales tax base will be negatively impacted if the CN transaction is approved. And this affect was not addressed in the draft statement.

If the transaction is approved, the congestion caused by the rail traffic increases consumers will be unable to get to their local establishments which will erode the business activity in Barrington

and all along the EJ&E. This impact will be significant to Barrington in that 30 to 40 percent of the general fund relies on sales tax revenues.

Third, the DEIS did not adequately address the negative impact to the property values if the transaction is approved. I implore you to not approve this transaction.

MS. ADAMS: James Wallace followed by Steven Miller and Kathleen Leitner.

MR. WALLACE: Good evening. Thank you for giving those of us who will be affected by this proposed acquisition the opportunity to share with you our concerns over the draft environmental impact statement.

My name is Jim Wallace. I'm the deputy village manager for the village of Barrington. And as someone who has reviewed many developmental proposals over the years, I respectfully request that the STB review the impacts of this proposal from what I consider to be a fair and balanced perspective.

When the village reviews proposed developments of existing facilities, we attempt to anticipate the problems that will arise and the adverse impacts that will occur as a result of that. We simply either do not allow the development to occur or we require appropriate mitigation.

Mitigation by a developer is required when they have to counteract

direct affects of their development or when their development will result based on accumulative affects over time in the reaching of certain milestones that will require additional offsite work.

For example, often is the case that developers are required to add roadway turns and provide capital improvements, pay for intersection improvements and the like and dedicate land for public use.

When developers are unable or unwilling to mitigate their adverse affects, we don't approve their developments.

One thing that everyone agrees on in this matter is if this acquisition is approved there will be significant impacts on the vehicular traffic.

The village of Barrington is undertaking studies on three of the four places where CN intersects major roadways in our village. That's US Highway 14, State Route 59 and Lake Cook Road.

We expect to find and will be

submitting documentation of this that the

impacts of the increased freight traffic will result in significant affect and substantial affect on these three intersections.

We believe it's only fair that CN will be required to bear the cost of mitigation for these affects. It is only their development that is causing the need for grade separation therefore they should be required to bear the responsibility for it.

We believe -- we believe that the environmental impact study should duly recognize these three substantially affected intersections as well as the other negative impacts that will occur in the village of Barrington and up and down the line. We respectfully request you do not approve this acquisition. Thank you.

MS. ADAMS: We have Steven Miller and Kathleen Leitner and Tom Leonard.

MR. MILLER: Good evening. The DEIS states the threat of additional trains past the 2015 estimates seem unlikely, yet all the information we received from the US

Department of Transportation have estimates that exceed 75 percent growth of projected rail traffic. With that additional pressure and demand, if approved, I feel the DEIS should take this into consideration along the whole line an accurate estimate of the impact on our communities and others.

Also a community that depends 100 percent on water from shallow aquifers, it would seem that the environmental impact study would have extensively looked at the effect of the hazmat spill and its effects on the water supplies of communities that depend upon this water source and have no other infrastructure to deliver drinking water.

Not only that, concern is layered with the poor safety record that CN has exhibited in Canada and also in the US.

I don't understand ignoring of this safety record. It is to me like saying ignore the man behind the curtain. I feel we need analysis and knowledge of ground water and aquifer vulnerability.

I would ask that the environmental impact study be much more

extensive and study hazardous materials.

Thirdly our community is most concerned about safety reaction time to life and death situations. While we have a response system on both sides of the tracks, our hospital is located on one side. Assuming our paramedic, fire and police equipment are not caught, and that's a big assumption, in a gridlock, the other hospitals are at minimum of five to seven additional minutes to get critical care.

As a trustee, I have the privilege, believe it or not, of exercising public safety. And any statistical analysis doesn't speak to reality when it comes to public safety. I can attest to the fact that an hour can go by without a

single emergency, followed by two or three in a 15-minute period of time.

When this occurs, we need personnel from both sides of the tracks to get to one side or the other as quick as possible.

As a trustee, I am asked to make decisions that affect commerce and personal lives. So are you. I appreciate very much the conflict you are dealing with, but I

must ask that what we ask of our business partners and that is for a win-win.

At this time, all we see is pulling trains from areas that have substantial infrastructure and placing them through communities that have little or none so one company can benefit.

Thank you for your consideration.

MS. ADAMS: Kathleen Leitner, followed by Tom Leonard and Greg Summers.

MS. LEITNER: Good evening. Good evening. My name is Kathleen Leitner. I am the village president for Village of Tower Lakes, a small village six miles to the north of Barrington.

Tower Lakes children attend Barrington schools including the two middle schools and the high school all of which are located in the village of Barrington. In addition, most of our residents travel through Barrington utilizing Route 59, Route 14 and Lake Cook Road on their commute to work. We share these roads with

residents from communities as far away as Algonquin, Crystal Lake, McHenry, and the Fox Lake region. All of us funnel into Barrington making our way to the interstate highways and the Chicago area.

My comments this evening are directed to the three factors employed in the DEIS delay calculation and how those calculations need to be corrected as applied to Route 59, Route 14 and the Lake Cook Road at grade crossings.

First, the basic variable employed by SEA in determining potential vehicular delays at grade crossings is the projected average daily traffic or ADT count. It appears that the ADT count used by the SEA are vastly underrepresentative since the SEA projected 2015 figures are far below the current numbers counted by Barrington itself.

If the 2015 projections for increased traffic are today's counts, clearly the ADT calculation demands further scrutiny. Such scrutiny would indicate greater traffic counts at Route 14 and Lake Cook EJ&J crossings, clarifying that Route 59 is not the only EJ&E crossing in

Barrington bearing heavy traffic and in need for mitigation.

Second, trains lengths used by the SEA in its delayed calculations incorporate figures provided by CN but do not reflect statements made by CN regarding length of trains they hope to run of up to 12,000 feet, and that's from the June 4,

2008, Terrace Standard. The DEIS delay calculation of train length needs to incorporate CN's stated train length. Considering these longer lengths will show that in the Barrington area more than one major intersection will be blocked at a time, often these three major intersections at once.

Third, trains speeds provided by CN for use in the delay calculation do not reflect current actual speeds which are substantially slower than speeds used in the DEIS calculation. It is highly questionable that the higher speeds projected by CN can be achieved when freight trains on this line will have to be integrated with commuter train traffic, other freight traffic and highway traffic. Using current speeds, projected delay times

will easily double at each grade crossing.

With undercounted ADT's, artificially short trains length and unrealistic trains speeds used in its delay calculations, we in this area cannot accept

the DEIS conclusions which result in an undercounting of the number of grade crossings in need of mitigation in the Barrington area.

We respectfully request the SEA to conclude that far more mitigation is required of CN in the Barrington area or the transaction cannot be approved.

MS. ADAMS: Tom Leonard followed by Greg Summers.

MR. LEONARD: Hello. By name is Tom Leonard and I am the superintendent of Barrington School District 220. I'm here to speak on behalf of the children in this area.

We are a school district of over 9,200 students and 1,000 employees. Our district covers 72 square miles encompassing all or parts of 12 villages. The EJ&E tracks cut through the heart of Barrington 220 School District. We are deeply concerned about adding freight traffic on this line for three main reasons. Safety, efficiency and cost.

First safety. Many of our children walk to their neighborhood schools. This high school of over 3,000 students is 600 feet from the EJ&E tracks. The main walking route for this high school must pass over the EJ&E lines causing hundreds of students to cross the tracks twice daily. Statistically this will undoubtedly increase the risk of accidents. Emergency response times to our school will

compromise our ability to meet the medical and security needs of the children.

Second, efficiency. Our bus transportation complex is located in the center of this village to provide the most efficient and economical transportation routes. Since the EJ&E lines cut through the heart of the district, we are also right on those train lines.

Our busses cross EJ&E lines over 840 times per day. An additional 5.3 minute delay every time a train comes through this area will have a ripple effect, resulting in delays to the start of school and added travel times. Decreased efficiency will compound throughout our daily schedule to create situations no amount of mitigation will make acceptable.

Costs. My third point. Added busses along the routes increase transportation costs will all need to be borne by the school district. If that is the choice, then the residents of this school district will need to make hard

decisions about investing in and maintaining quality of education versus the amount of gas we pour into fuel tanks as we reconfigure bus routes or the idle time at railroad crossings.

Requiring taxpayers to favor freight trains and fuel costs over classroom needs or to chose between locomotive and learning is not fair to them or to the nearly 10,000 children in our community.

My conclusion. The EJ&E acquisition by Canadian National, if it becomes a reality, will adversely affect the welfare of students, staff and residents in the Barrington 220 community, particularly in safety, efficiency and cost.

We appreciate your consideration of these concerns. And I thank you for your time.

MS. ADAMS: We next have Greg Summers followed by Eugene Dawson and James Daluga. I remind everyone please state

your name and who you represent or the town that you are from.

MR. SUMMERS: Greg Summers, and I am the director of engineering and building for the Village of Barrington.

In the few brief minutes I have available, I would just like to point out a

few material flaws in the draft DEIS and some additional details not contained in the document.

The DEIS, as drafted, fails to properly review the alternatives to the proposed EJ&J. At a minimum, the analysis should have addressed CREATE as a viable alternative to the ultimate goal of moving freight through the region. The DEIS excludes consideration of exploring possibility of utilizing routes through less populated areas.

The CN proposal, if approved, can have a detrimental impact on the EJ&E Quiet Zone, which was long pursued by the village and zoning communities in the region, especially including the crossing at Route 59 that is not currently included in the EJ&J Quiet Zone.

While the DEIS recommends that the CN bear the costs associated with maintaining the Quiet Zone throughout Barrington in the present day, it does nothing to address other communities nor does it address effect. These zones are reviewed every three years.

Volume of traffic is one of the

many considerations taken into that process. Increased trains would inevitably lead to increased traffic and pedestrian conflicts, which will increase the safety demands, ultimately result in a loss of Quiet Zone status or prevent quiet zones such as the Route 59 crossing.

I recently had an opportunity to meet with representatives of the Canadian National here in the community and view the areas that would be currently. Proposals by the CN for mitigation were minimal at best and wholly inadequate for addressing the impacts of their proposal. These proposals consisted of sound walls, which are both impractical and unsightly. And

representatives went so for as to point out in installing the sound walls, they would remove all the existing green growing on their right-of-way. So actually residents can gain an unsightly wall and lose the trees that buffer the existing rail track.

Several other questions proposed to the CN at this meeting and were met with a lack of appropriate answers. When asked about the noise level of the CN trains and the ambient level of EJ&J trains, they

stated that they weren't sure, but their trains were newer and probably quieter than EJ&J trains.

When asked how that compared with a proposal doubling the speed from 22 to 45 miles an hour would they still be quieter, they were completely unable to answer the question.

When asked about public vibration levels from a faster, longer train with double stacked cargo would compare, they changed the subject.

In conclusion, CN has proven it

does not have a handle on the real burdens imposed on the communities that it intends to pressure its way through.

While the STB document does not go far enough to identify all of the consequences and externalities of the picture, it does go far enough to reveal that this solution is wholly inadequate and should be denied in its entirety.

MS. ADAMS: James Daluga, David F. Nelson, Denise Pieroni.

MR. DAWSON: I am Eugene Dawson. I am the supervisor of Barrington Township. I would like to address three points. The first of which are medical emergencies. Let me begin by stating that we service the area of five hospitals, Advocate Good Shepherd in Barrington, Sherman Hospital in Elgin, St. Joe's in Elgin, St. Alexis in Hoffman Estates and Northwest Community Hospital in Arlington Heights.

With the projected length of trains from 6,000 feet to 10,000 feet that be passing through Barrington, the potential of shutting off the ability to cross the tracks will negate three hospitals, three. Which means that during the golden hour, that time which a person

needs to have the time to get to the proper care and proper substance to keep them going, it will not be there because of the distance, that the folks will have to go to St. Alexis in Hoffman Estates and also Northwest Community in Arlington Heights.

Keep in mind, however, that when

we talk about these hospitals, those are the ones that can care for the folks immediately.

In that golden hour, if you do not get there on time, it's not the Canadian National that's out of luck, it's you that's out of luck, the patient.

The safety record, public safety, the safety record of Canadian National leaves a lot to be desired. In their country, Canadian National remains under scrutiny and heavy pressure. In 2005, the government of Canada found 54 percent of locomotives, 50 percent of train brakes and 26 percent of crossings defective.

A 2007 report by the Canadian Parliament found a disconnect on safety issues on management and front-line workers. That report also highlighted what

company employees call a culture of fear when it comes to reporting safety-related problems.

There are approximately 800 bus

crossings a day. You heard superintendents speak about that. But let me make mention to that study of rail accidents back to 2001. It is apparent that some of these trains were carrying hazardous materials either in liquid or powder form that can lead to an exposure that does not have to exist. A train crossing at Geschulte and Main -- I might say Geschulte and Main are right over here. So if you had a tanker car go bad, all of us, including you folks, would be at risk.

National security, since 9/11, the United States has been on high alert to protect this country and its people at all costs. Keep in mind Canadian National is an $8 billion profit company. They are offering $40 million for 133 crossings.

I would like to conclude by saying when reviewing this information, please keep in mind that this could happen to you, your family, your neighbors and friends. This is not a not-my-backyard

24 situation, but another imposition of big

1 business on the backs of the little guys.
2 Thank you.
3 MS. ADAMS: James Daluga and David
4 Nelson and Denise Pieroni.

1 MR. DALUGA: I am Jim Daluga. I am
2 a trustee in the village and chair and
3 finance committees for the Village of
4 Barrington. I would like to address two
5 major flaws in the draft DEIS. The first
6 is regarding the local tax base. For the
7 Village of Barrington, our fiscal health is
8 dependent on revenues derived from property
9 and sales tax. That revenue is used to
10 support school districts and obtain first
11 responder capabilities. The failure of the
12 DEIS to calculate the ripple effect harms
13 from a reduction in local business activity
14 and property values and then assess how
15 that will affect the tax base for the
16 Village of Barrington makes the DEIS wholly
17 inadequate in this regard.
18 There is also a total failure to
19 assess the ability of taxpayers to invest
20 in mitigation and an incorrect assumption
21 that communities have any negotiating power
22 with Canadian National. The DEIS states
23 there are 15 grade crossings in the study
24 area that require mitigation and provides a

1 range of mitigation options for

2 consideration. Even if we accept the point
3 of these 15 required mitigation, grade
4 separations are the only realistic option.
5 All the Quiet Zone will do is to assure a
6 patient lying in the back of an ambulance
7 that, while the 12,000-foot CN train is
8 passing, they might die in some relative
9 piece and quiet.
10 You heard from Maggie Bosley how
11 much it is going to cost to mitigate the
12 problems that CN is going to cause. You
13 also heard from Mr. Wallace about what the
14 Village of Barrington does when it comes to
15 private entities that promote a project in
16 the Village of Barrington. I can assure
17 you any project that is done in the Village
18 of Barrington will cause many adverse
19 effects.
20 We require the party presenting
21 the project to pay 100 percent of the
22 mitigation costs. They said they won't pay
23 the mitigating costs created by the
24 project. Why isn't CN required to do the

1 same thing? The CN has suggested a
2 possible reason. The CN has stated the
3 municipalities should bear the brunt of
4 mitigation cost because a grade separation

5 would benefit the municipalities, not CN.
6 That's like saying to me, Jim, we are going
7 to allow CN to beat you about the head with
8 a baseball bat 24 times a day, we know it
9 will hurt and probably cause permanent
10 damage, so you should probably get a
11 helmet, but we expect to you pay for the
12 helmet because it benefits you, not CN.
13 That is the most ridiculous thing I have
14 ever heard.
15 All I am asking is that if you
16 do approve this transaction, you do it
17 right then and make Canadian National, a
18 multi-billion dollar corporation and the
19 only one that will truly benefit from this
20 action, pay for the infrastructure needed
21 to keep them from destroying our town.
22 MS. ADAMS: Dave Nelson, Denise
23 Pieroni, Peggy Blanchard.
24

1 MR. NELSON: My name is David
2 Nelson. I am presently the Cuba Township
3 Supervisor, having served in that capacity
4 for years. I formerly served on the board
5 of trustees of the Village of Barrington
6 for 12 years, the last four of which I was
7 village president.

I work on Main Street in downtown Barrington. Most importantly, I am a 35-year resident of Barrington. I know how important safety and quality of life mean to our citizens.

First thanks to the great turnout, Barrington. We really appreciate it.

In Barrington we are concerned with many aspects of the purchase of the EJ&J by Canadian National. In our township alone there are four grade crossings where traffic will stop for an additional 15 to 20 trains each day. One revised grade crossing at Route 59 will not be enough to allow traffic to flow through our community. And who is going to pay for the

changes to the crossings?

It is my mind-boggling to contemplate the costs to recreate those intersections, not to mention the loss of time and business during the construction process.

The draft environmental impact statement does not adequately address this issue. Where will we get these hundreds of millions of dollars through taxes? What is

a realistic answer for this?

Barrington is the community that sees the big picture. We are a train community. The Village of Barrington was settled along the train lines. It is ridiculous for anyone to suggest we don't want trains in our backyard. We have 65 Metra trains and a number of EJ&J trains coming through our backyards every single day, with the possibility of 11 more Metra trains promised in the near future. And we have lived in cooperation with trains since the village was founded.

We have no problems with trains.

But we do, however, have a problem with an unrealistic number of trains that will breathe life as we know it to, say, a screeching halt. Many of the DEIS arguments are flawed and confusing. If the report can't keep its own facts straight, how are we to be confident that the information is anything near the truth?

By increasing the number of trains dramatically and all side effects of that change, most families largest investment, their homes, will be negatively impacted in a huge way, affecting safety,

schools, the environment and the day-to-day result of life.

The environmental impact statement view that only homes within 250 feet of the tracks will be adversely affected is unsubstantiated and unrealistic.

In Barrington we are not unreasonable people. We do not think we are special. But we do know right from wrong and fair from unjust. We do know a

bad idea when we see it. We do know with the price of a gallon of gasoline, more commuter trains would serve us better than more congestion and more idling cars burning gas while waiting for trains to pass. And we do know that family and homes are more important than the profits of a Canadian corporation.

Here is what keeps us awake at nights, the vision of the ambulances not being able to get to the hospital, toxic spills, detained fire equipment, derailments.

Homeland Security issues that are not addressed in overland transit, worsening air quality, noise pollution, all

in order to move freight a day faster. Please don't throw this wonderful American community under the train.

MS. ADAMS: Denise Pieroni, Peggy Blanchard.

MS. PIERONI: I would like to thank you for providing me this opportunity to address you. My name is Denise Pieroni and I am the village manager for the Village of Barrington.

Barrington has and continues to stay true to its principles of controlled growth, quality development and providing quality services to its residences and businesses to ensure that Barrington remains a great place to live or play.

During a meeting awhile back with representatives of the CN, a comment was made by one of the representatives that the CN should not be held responsible for correcting the problems created by the development policies of the village. I can assure you that if he had taken even the time to briefly research the village and

its development policies, he would have come to realize that Barrington takes its planning function seriously and is proactive in its approach to mitigation of possible negative impacts of any

development proposed within our corporate limits.

The village expects those wishing to develop a project in our community to accept responsibility for addressing the challenges that may be created by that development. Likewise, if the challenges cannot be addressed, then other alternatives such as developing elsewhere need to be pursued. Why should the CN be held to a different standard?

Even though the DEIS is flawed and deficient in its analysis impacts, it has been and will continue to be apparent by the information presented tonight and which will be presented throughout the comments period. Impacts on emergency medical response, on traffic, on air quality, on noise vibration and on the economy have been identified.

In Barrington these impacts meet the but-for test. But for the CN and their

proposal to increase freight traffic throughout our community, Barrington would

not be facing these challenges. As such, if CN through its own financial resources cannot mitigate these impacts, then CN should be not allowed to increase freight traffic through our community.

Unfortunately, with Barrington and the other communities along the EJ&J, CN is not willing to accept its responsibility to mitigate impacts of its proposed transaction, and just as this $8 billion Canadian corporation chooses not to accept its responsibility for safety as evidenced in recent articles regarding its safety record in Canada and which the DEIS neglected to take into consideration.

As for the claims that congestion across the region will be reduced, even CN admits when pressed that any such decrease in congestion will be temporary.

For argument sake let us assume congestion will improve in certain areas. These benefitting communities have indicated that these aren't concerns if we

know the problems and we have the ability to address them in advance. Shouldn't it be the STB's obligation to the impacted communities and their residents to ensure that these issues are addressed before any further freight traffic is allowed on this line?

In closing, I implore you to hold CN accountable for the impact of its business decisions. They should not be allowed to benefit financially from the definition of our communities.

MS. ADAMS: Peggy Blanchard, Colleen Meg. I would invite you to submit your remarks to the court reporter.

MS. BLANCHARD: Good evening. My name is Peggy Blanchard. I am director of economic and community development with the Village of Barrington. I am here to voice concerns with the DEIS preliminary impact analysis and comment on the economic and quality of life issues that would arise through the CN acquisition of the EJ&J.

Barrington center of commerce is located in the heart of the community surrounded by the EJ&J Railroad, the Union Pacific Railroad and three major road networks. This unique set of circumstances creates both opportunities and challenges for economic growth. Specifically, the major road networks and continued rail system provides opportunities for increasing exposure for businesses and transportation alternatives for our customers and employees.

But the rail and its competing use with the road system, however, creates challenges in terms of traffic congestion within our community. The EJ&J crosses

each of its major road networks. Increasing freight traffic from three to

five trains a day to 20-plus trains will create significant gridlock, thus impacting our local and regional economy resulting in, one, loss of corporate investment. Because of time delays and reduced productivity of its workforce, corporations will seek to relocate out of the community, which will result in loss of real estate tax revenue, decline in property tax revenues and increase in vacancies and increase in sales tax and overall burden on the local economy.

Loss of jobs, a family with jobs in a service and retail sector would be dramatically reduced as businesses seek to open in other areas due to consumers changing shopping patterns as a result of increased traffic congestion.

Will 20 trains rumbling through town everyday and tying up traffic on the major arterials that service our town be convenient for our customers and employees

to get into Barrington? The answer is no.

While grade separation on Route 59 along with Route 14 and Lake-Cook Road is an absolute improved necessity if this transaction is approved, the grade

separation on Route 59 presents significant challenges for the village. It would negatively impact access to existing commercial centers and identified redevelopment sites, making it difficult, if not impossible, to lease existing space and dooming any possibility of retail development in the area.

These impacts have not been thoroughly addressed in the DEIS. If it were effectively analyzed from my perspective, data would have supported the position of no further train traffic on the EJ&J through Barrington.

Based on the negative economic impacts to Barrington and the neighboring communities, along with an entire EJ&J line, this acquisition should not be allowed to go forward.

MS. ADAMS: Colleen Meg, Jim Arie, Dennis Burmeister. If no Colleen Meg, Jim Arie.

MR. ARIE: Good evening, my name is Jim Arie. I am the fire chief of the Barrington Fire Department. Throughout our jurisdiction, residents and commuters depend upon major arterial state highways and county roadways that are intersected by the EJ&E Rail Line. We rely on the same highways and roadways for prompt response to emergency calls and expedient transport of emergency medical patients to hospitals.

In 2007 a response time averaged

for emergency rooms throughout our area was 4 minutes, 16 seconds. Response time average for the same period for emergencies in the Village of Barrington was 3 minutes, 21 seconds. The response time, a vital component of emergency services, is far superior to the national standard of four to six minutes.

The proposed increase in EJ&J will drastically impede our ability to maintain the superior level of response service for the community at large.

Time, special response time has

a great deal to do with our ability to provide critically important emergency services in life and death situations.

My focus is on the second part of our emergency medical response, which is after we've reached the patient and before the patient arrives at the hospital. Eighty-six percent of our patients are taken to Advocate Good Shepherd Hospital, our closest trauma center and cardiac cath lab, which is located less than two miles from the corporate limits of the Village of Barrington. At least a third of those patients would be potentially reverted to

hospitals in other communities due to increased freight train traffic or stopped freight trains, blocking access to Good Shepherd Hospital.

As an example, a patient transporter from the Garlands of Barrington, a continuing care center, to Good Shepherd Hospital with no train blockage at the Route 14 EJ&E crossing will arrive in seven and a half minutes. A

patient being transported from the Garlands crossing at 14 if blocked by a train would not be taken to the closest hospital.

Instead, that patient will be transported to a hospital at Hoffman Estates in 12 minutes or to Arlington Heights in 13 minutes or to a hospital in Elgin in 18 minutes.

For patients with life-threatening trauma emergencies, we need to get our patients quickly to the hospital. If we can, then we give the patients the best chance of survival. We take patients to hospitals that are further away and encounter a domino effect of much longer response times and more coverage areas not protected by the emergency

resources.

Given the direct impact of increased rail traffic on essential local services, blocked rail crossings, especially those crossings on Route 14 and Lake-Cook Road, Route 59, bring about serious life-threatening issues that no

doubt have an adverse impact of the life we protect and serve.

Even if there will be a proposed single grade separation at Route 59, this will not solve the safety problems.

I implore the Surface Transportation Board to require grade separations at three crossings, right 14, Lake-Cook and Hough Street. That intersects eight highways within our community. I request any increase in freight traffic not be allowed until such grade separation is accomplished. Thank you.

MS. ADAMS: Dennis Burmeister, Janet Agnoletti, Steve Roberts.

MR. BURMEISTER: Dennis Burmeister. I am director of public works for the Village of Barrington. I would like to expound on Trustee Miller's comments and those previously commented on and as well as impact comment on public works and our concern relative to response time often in support of public police and fire emergencies.

Our public works department provides typical public works services to over 10,000 residents of Barrington and, through intergovernmental agreements, provides services to residents of both the villages of Inverness and Barrington Hills. One of the most critical services we provide is potable drinking water.

The Village of Barrington, like many other communities along the EJ&J corridor, does not obtain its water from Lake Michigan, but rather draws its potable drinking water from wells located in either the shallow sand and gravel aquifer or from

the shallow limestone aquifer. The Village

of Barrington has wells located in both aquifers.

The DEIS examined the potential effects of the increased freight traffic on water resources, including the effects on groundwater aquifers. DEIS identifies several areas along the EJ&J whether the shallow groundwater aquifers have a high susceptibility of being affected by a hazardous spill.

A risk to the groundwater exists today, albeit small in comparison to the ten-fold increase in the length and numbers of the trains if the sale is allowed to happen.

The DEIS failed to adequately address increased risk of groundwater posed by the increase in the number of trains per day and the increased potential for accidents involving other trains. Increased risk does not take into account the potential increase in the types and amounts of hazardous materials being transported nor in my opinion does it take

85

into account the potential concern regarding CN's commitment to safety.

An article in the July '08 issue of the Canadian Magazine, Canadian National said just a little over a year ago Paul Miller was CN's first chief safety officer. The article also states that this month July transportation minister Lawrence Cannon issued an emergency directive ordering CN to replace faulty wheels which have been linked to several derailments. There are other issues in this and other publications alleging issues of safety.

However, in my opinion these two examples underscore that potential safety concern. If CN had not recently gotten a chief safety officer, how seriously have they been taking the issue of safety? And if there were defective wheels, why did it take an emergency directive ordering CN to replace those wheels?

I point to these two examples under the ten-fold increase in freight traffic as well as the unknown increase in

86

the types and amounts of hazardous material

transported to highlight an increased safety risk to our water resources that this acquisition will have, and more specifically the risk to groundwater resources as reason enough to deny the sale of EJ&J to the CN. Thank you.

MS. ADAMS: Janet Agnoletti, Tim Roberts and Nancy Schumm.

87

MS. AGNOLETTI: Janet Agnoletti, Executive director of the Barrington Area Council of Governments or BACOG. BACOG is a regional planning organization. It's

members are nine local governments. In fact, the Barrington region covers over 80 square miles and represents over 35,000 people.

BACOG opposes the proposed CN transaction. BACOG has submitted a variety, a myriad of comments on this proposal which have received very little consideration in the EIS. The EIS ignores impacts on groundwater. And this is the topic of my comments tonight.

BACOG has conducted extensive research on the shallow aquifers over the past several years. Because BACOG recognizes that groundwater is the only source of water supply to this area, the Village of Barrington has a public supply, but all the other BACOG towns and the BACOG town residents have private wells in their backyards or in their neighbors. All these

88

wells are getting their water from the same interconnected aquifer system. This is the same water source, the shallow aquifer system.

In addition to Barrington's public wells, there is about 800 existing and planned backyard wells within about a

mile of the railroad within just the BACOG boundaries. And in the entire 80 square miles of BACOG, we have about 6 to 8,000 more individual wells sharing the same groundwater, the same source.

Hazardous materials train spills occur with regularity and frequency. The draft EIS acknowledges the potential increase in hazmat spills but states the likelihood of release would be remote, less than once every year, especially for groundwater. One is too many. That's a quote from someone else. One is too many.

The EIS does not consider the Canadian safety record. The Canadian safety record is significantly worse than the U.S. record, and this would elevate

89

that spill potential quite a bit. That Canadian safety record needs to be used in the final EIS.

The wells here are shallow. Our wells are in the range of 50 feet below ground surface to a couple hundred feet below ground surface, most making them particularly vulnerable to contamination. We are concerned with the hazmat spills dropping contaminants which may seep

directly down into the aquifer. We are concerned that storm water carrying contaminants to recharge areas where they can seep into the aquifers.

We are also concerned there is contamination in one part of the aquifer and it can move to other parts of the aquifer because of groundwater flow. If anything happens to our water supply, there is no Lake Michigan water, no river water, no other water. And in our region there is little in the way of infrastructure to distribute water from any other source.

We have submitted in February

and May data and maps about groundwater from our research. We -- your consultants say that the risk is low. Number one, we don't believe that. We don't accept that. And, number two, the consequences are so high to the people of this community that we think it is warranted to do a more comprehensive study of groundwater than has been requested. Thank you.

MR. ROBERTS: My name is Tim Roberts, Village Trustee here in Barrington.

I have four points about the DEIS.

First, there's been no review of the alternatives. There are alternative solutions available to us. It's appalling that we're not going to look into them. In fact, the DEIS completely eliminated grade as a reasonable alternative to this acquisition. Why?

Second, good decisions come from good information. Yet, the DEIS is filled with unsubstantiated claims based on unsourced data. For example, noise and

hazardous materials. The DEIS uses "analysis" and "mitigation thresholds" that are not only unsubstantiated but that have actually been criticized by the Environmental Protection Agency and the Department of Transportation.

Why intentionally use bad information? Why rely on unsubstantiated

and unsourced data?

Third, along the same vein. The DEIS uses contradicted data. Take for example the operational air emissions methodology. The DEIS uses two sets of fuel use estimates. It seems the first set of numbers revealed that the pollution could pose a threat to Chicago's federally required air quality standards. Those numbers were 374 tons per year. That number was too high. So Canadian National gave the STB some new numbers, 95 tons per year. How does Canadian National explain this? Not very well.

Four, the DEIS fails to look broadly at indirect and cumulative effects. This sort of tunnel vision is simply inexcusable, especially in the context and times we live in.

The DEIS dismisses any arguments that prove consequences not immediately adjacent to the EJ&E rail tracks. It says it isn't in their purview but environmental regulations require it. I'm talking about

air quality, I'm talking about Homeland Security. Why does the DEIS refuse to deal with these issues?

Here's the bottom line: Canadian National is all stick and no carrot.

Canadian National is spending money on PR claiming that they will work with communities. Yet, we have been dismissed and put off. We've tried to find solutions and they've shut us down at every turn, and now we're being bullied. Yes, bullied.

Canadian National is a huge profitable foreign company. It has bullied the Village of Barrington and they've clearly bullied the STB, an agency of the United States Congress.

For one, I don't care much for bullies.

Lyndon B. Johnson once remarked that, If you let a bully come in the front

yard, the next day he'll be on your porch.
I say, Enough is enough.

Canadian National is already on our front porch filled with empty promises and fulsome threats. They have demonstrated that their promises mean nothing.
We, the people of Barrington, are not unreasonable people, but there is nothing reasonable about the way Canadian National has bullied us. It is time to knock the bully down. Please do not approve this transaction.
Thank you.

MS. SCHUMM-BURGESS: My name is Nancy Schumm-Burgess. I'm the Executive Director of the Barrington Area Conservation Trust.
Our vision is to preserve the open space rural character and scenic historical, recreational, and national resources of the Barrington area. As a not-for-profit with environmental concerns, we have several reservations and concerns about this EIS.
By its very nature, the EIS is required to address environmental concerns and at the very least comment upon them, but this statement does not and omitted several important material information.
The SEA identified that it received its biological data from several agencies; however, they did not list the Forest Preserve District of Lake County, Illinois as one of their resources or the Flint Creek Water Plant published earlier this year. There's significant data missing for our region with this omission.

The SEA does confirm that the Chicago wilderness area offers refuge to native wildlife that this network of wild spaces contains globally significant natural communities. However, no protection strategy or estimate of the impact to these communities has been clearly identified.
For instance, they recognize that de-fragmentation is one of the largest contributing factors to the habitat degradation for a large number of species. It does not identify the recommended resource protection areas recognized by both the Chicago Wilderness and the Chicago Metropolitan Planning Agency. If they had included this data, they would know that this area is one of seven remaining largest continuous regions of non-fragmented national resources, and, in fact, the only thing that bisects many of these natural resources in this area is the EJ&E line. The increase of rail traffic along these lines will absolutely affect the migration, diversity, population, density, and quality

of life of these natural resources as well as the humans that inhabit them.

The EIS acknowledges that certain wildlife is killed by railcars regularly, but they don't keep any records of animal kills on any of the lines.
The EIS confirms that the condition of these present habitats ranges from low quality to high quality and that certain high quality areas can be negatively impacted by land use changes, and, yet, they do not address the negative impact to these areas that will occur because of our own increase of traffic, vibration, and leaching of materials.
The EIS claims to have confirmed the quality of these areas by limited field investigation, railroad right-of-ways, and a rail trip. Where is the field data for these investigations? How can natural areas be investigated from public roadways? They acknowledge the Illinois Natural Area Inventory areas, including Cuba Marsh Forest Preserve, Crabtree Nature Center,

and Spring Creek do exist in this area, but they never address what measure could be taken to protect them from increased CN Railway use and what impact that increased traffic will have on those areas.

They admit that Barrington had vibrational measures well above the normal, but at the same time they claimed to have equipment malfunctions at all of these sites. Were these actual measured? We would like to know some answers.

99

MS. BRADFORD-WHITE: I'm Mary Bradford-White. I'm the President of the Barrington Area Conservation Trust. I'll finish up with the comments on this report.

EIS identifies Barrington as having unacceptable mobility because of the combinations of a roadway operating at LOS E through F and two rail lines crossing

adjacent to downtown Barrington but offers no solutions.

EIS confirms that groundwater protection is an important issue for consideration. Given that, there's no data that studies the vibrational affects of increased rail traffic or increased haz-mat risks along areas of thin "highly permeable materials" such as important groundwater recharge areas. These areas have been identified in recent studies that are omitted from the report, including but not limited to Flint Creek Watershed Plan of 2008.

How does CN plan on identifying and addressing the impact to these systems?

The EIS identifies surrounding roadways as alternatives during times of high traffic. Do they consider these true alternatives? Have they addressed these issues with individual or metropolitan plan commissions? Have they identified the impact to the communities affected? How do they plan on addressing the impact of increased traffic to smaller roadways designed for lighter traffic?

The EIS claims that it will

address global warming issues like fuel usage or climate change but never really addresses this directly. What will the actual proposed impact be on the local communities, including, but not limited to, increase in traffic wait times at rail crossings, increased heat island profile based on figure 3.9-3?

In conclusion, while this report claims to be an environmental study, there's very little real environmental data that identifies potential problems and potential solutions to those problems.

Increasing rail traffic to semi-rural areas will have real impacts to the local flora, fauna, and quality of life of the residents, both human and animals. This report sorely lacks the information to determine what those impacts may be and how they may be resolved.

MR. LAWLER: Good evening. My name is Jeff Lawler, and I serve as the police chief for the Village of Barrington.

I have spoken with and written to you previously about my concerns regarding the acquisition of the EJ&E Railroad by the Canadian National Railway. Those initial concerns have not been abated in the Draft Environmental Impact Statement.

My Village residents, employees, and our local businesses and visitors will be inaccessible to police services with each passing freight train in the bifurcated community that is being considered. If you call police and need emergency help, a one-minute, two-minute,

or a three-minute delay can be a lifetime, literally. Ask our victims of domestic violence if they have concerns regarding police response time.

When the EJ&E is blocked by a moving train or a stationary train, I have no access to the wrong side of town. My

closest access to grade separation is in the next community to the south to the overpass on Algonquin Road in Barrington Hills. From the center of Barrington to the high school where we're meeting tonight is an 8.6-mile trip on busy, winding, hilly roads. My next closest access to grade separation is via drive through Deer Park, the next community east of Barrington; then Lake Zurich, the next community to the north of Deer Park to an underpass on Grand Road. A trip from the center of town to where we're meeting tonight would be 12 miles.

This is excessive and literally risks lives. The lives of the public the police are responding to help, the lives of the motorists that we endanger on the way to the emergency, and the lives of the first responders driving to or who are

waiting for help themselves involved in situations.

This should be cause enough to deny this acquisition.

But I have additional concerns.

Through twisted logic, the report indicates that there will be a small potential decrease in accidents between CN's current line traffic being moved to the EJ&E. I'm not impressed with the potential increase of main track accidents increasing in my area of responsibility in the order of magnitude of greater than 20 percent.

Statistics can be made to show anything. While citing the potential increase in hazardous material releases on the EJ&E line when managed by CN, the report goes on to say that a release is a remote event and that currently used CN lines will have a substantial decrease in the risk of hazardous material release. That judgment provides me with little comfort when the carloads of hazardous materials through my town increase tenfold in number.

The primary beneficiary of this

acquisition relocating freight traffic from

its current line to EJ&E line is Canadian National Railroad. The public interest is not served by this acquisition, just the interest of the Canadian National Railroad.

MR. ANDERSON: My name is Jeff Anderson and I'm a Village Trustee for the Village of Barrington.

Before I make my remarks, I would just like to thank the residents from this village and community for making their remarks tonight.

I read the executive summary, and I was asking myself this question: After hearing a lot from CN regarding the benefits of what they call the winner communities and the loser communities, those winners being on the yard and the losers being on the inside line, your executive summary has three interesting facts, more noise, more grade crossings, and more fuel. How does that make us winners and -- or us winners and them losers? It's just incredible to think that more noise on this line, more grade crossings on this line, and there's more fuel that's going to be used by the trains on this line to maintain the status quo.

I would also like to make a

comment about the absolute stop. Lake

Zurich Road is at the point where the train potentially would stop if there was a UP line train going through. You mentioned in your executive -- Appendix D of your report that 6,829-foot train could take upwards of eight to nine minutes to clear the Village of Barrington. What happens if it's a 8,000-foot train or a 12,000 foot train? Much has been made about 40 miles an hour speed limit through town of the CN line. How do you explain at a minimum eight to nine minutes on a 7,000-foot train coming through town and listening to all the things that our public safety and school district officials have made tonight?

Thank you.

MS. LAMBERT: Good evening. I'm Karen Lambert, president of this community's medical center, Advocate Good Shepherd Hospital. In the Draft

Environment Impact Statement, the Canadian National contends that the EJ&E acquisition has unquestioned benefits for the public interest, and I'm here tonight to question these benefits.

The draft impact fails to acknowledge the impact that the increased train traffic will have on the accessibility to lifesaving medical care. In fact, in the medical facilities section for the Barrington communities, it devotes just one sentence, No public at-grade crossings are within two miles of the emergency medical facility, Advocate Good Shepherd Hospital. As a result, it didn't study whether the community's of acute care hospital would be accessible or not.

The stated rationale for this two-mile metric is that typically beyond two miles from the tracks, it tends to

diminish the probability that Canadian National train traffic would interfere with emergency medical responders. The two-mile metric is not feasible given Barrington's unique geographic and road configuration. In addition, the inaccessibility to alternate hospitals during critical

life-threatening conditions makes the two-mile metric inappropriate.

Across the five miles of railroad that cuts through Barrington lies five westbound roads to reach the hospital. Five roads in five miles with five at-grade crossings that separate ambulances from delivering patients to our emergency department.

DEIS did analyze our EMS's ability to respond to a patient's call for help, but it ignored the question of the other critical half of the first responder equation: Will emergency services be able to transport and deliver their patients to the community's critical care facility? In our evaluation, the answer is a resounding,

no.

This proposal offers no sound answers to critical public health and safety issues. These are issues that must be urgently and effectively addressed. The proposed action in its current state will cost lives. Patients are transported by ambulance because it's an emergency. Emergencies demand urgency, not delaying treatment for critical patients.

Mortality rates for our communities will increase. Only an acute care hospital can deliver certain life-saving procedures and time measured in minutes is always the enemy of a critical patient.

Overall, this proposed action will negatively impact patient outcomes and overall patient care for thousands of area residents, and that, by any definition, is certainly not in the public interest.

Thank you.

DR. GIANGRASSO: I'm Dr. Joseph Giangrasso, medical director for the emergency department at Good Shepherd Hospital.

I'm here to say if this acquisition goes through, the health and safety of our community would be greatly jeopardized. As I mentioned before at the public hearing the first time, patients lives will be lost. Very simple, if you cannot get the patient to the hospital to get the help and treatment, the patient would suffer. In emergency medicine, that

usually means they die.

Now, when we mentioned this before, CN representative was saying, Take them to another hospital. I'm sorry. That's very critically fought. What's even more disturbing is that DEIS contention and I quote, "The response to the actual scene of an emergency is the most critical action, not the transport to the emergency medical facility."

I'm an emergency medicine

specialist. Yes, emergency medicine is a speciality that now knows that paramedics do a great job. In our community, they do a wonderful job. However, they cannot give indefinite treatment.

I'll give you definite examples why people will die. Take heart attacks, the number one killer in our area. When a person has a heart attack, the blood vessel is blocked and no oxygen can get to their heart. The treatment for that is to take a wire from the leg and go into the heart and open that vessel. That's called a catheter. I'm sorry, the paramedics do not have a cath. Lab in the back of their rig.

Take your trauma patient. If

they're internally bleeding, they need to go to the operating room to find that bleeder and stop it. Again, paramedics are good, but they don't have the operating room on the back of their rig.

If you have a stroke, again, we now have medicine that could stop a stroke; however, certain testing can be done, one

of which is a CAT scan. Again, CAT scans are not in the back of an ambulance.

These patients need to get to the closest hospital, and to say they can go to any hospital is defectively flawed. I'm very disappointed that there was no study done showing that all hospitals are not equal. Our hospital has a cardiac cath. Lab. I don't think all of our hospitals in our area do. So if you need -- not all hospitals have open heart surgery. I'm sorry, if you need open heart surgery and you go to the hospital that does not have it, they're just going to airlift you back to us. All you do is lose time and probably suffer consequences because of it.

All three of the problems I mentioned before, heart attack, strokes,

trauma, they are all time sensitive. What that means is that, as we say in emergency medicine, for a heart attack, time is muscle. The longer it takes to stop the heart attack, the more muscle will die and

the more chance the patient will die. In a stroke, the same thing, time is brain. The longer it takes to stop the stroke, more brain cells die. Again, the more they die, the person will become totally disabled or even die. You personally only have so much blood in your body, so when you bleed internally, when you're out of blood, obviously, you're dead.

So, please, take very careful consideration before you make this acquisition go through. If you do allow this acquisition to go through, make sure that this mitigation is done and overpasses are done before the trains go through or people will die before then.

Thank you.

MS. RASEMAN: Good evening. My name is Beth Raseman. I'm a Trustee with the Village of Barrington. I'm going to focus on some of the issues with the conflict with Metra tonight and the economic value on this transaction.

Unlike many of the towns that the EJ&E intersects, we have a very heavily traveled commuter line. Commuter ridership is up dramatically due to the cost of fuel and road congestion. At the same time that CN's planning to add freight capacity to its lines, Metra is also planning to increase its capacity and expand further to the northwest. Barrington has been asked for support to increase the number of trains from the current 62 passenger trains a day to 73 trains a day. These numbers do not include the freight that is also handled every day on the Metra line.

There are many conflicts in the DEIS because the recommendations in the executive summary, the body of the report, and the appendices regarding the issue of

116

the ability to coordinate these two intersecting lines. There are also many omissions.

In the Bottleneck Analysis that were run to model, the actual coordination of the capacity and the conflict scenarios along the track that included factoring in the longer trains that CN was to use, insight was given into the reality of the conflicts that will exist on the rails. This is to say nothing of the conflicts that will be generated along our roadways. In the report it states that the CN average train length would be 7,623 feet, an increase from the current average length of 2,509 feet. However, the average is not necessarily indicative of the maximum train length, which is moving towards 8- to 10,000 feet. Those are trains that are two miles in length. One of these trains would effectively block every major thoroughfare in Barrington, since the distance from Lake Zurich Road to Lake Cook Road is 1.1 miles long.

117

In the appendices, Rail Operations Analysis states, These scenarios indicate that under some conditions 8- to 10,000 foot trains can operate on the EJ&E track without serious effects on the at-grade crossing for either the highway/rail or the rail/rail conflicts. However, these scenarios are not necessarily indicative of train operations as they would actually occur. The report also states that a train of this length has come to a hard stop at Lake Zurich Road would be 10 to 11 minutes to weave through the morning or afternoon rush hour.

We already know about how bad the traffic congestion will be here for our residents and the commuters who pass through our area. We were disappointed that the report analyzed the net economic impact on the region but said nothing of the impact on the towns along the EJ&E or the people who have to commute to jobs through these towns.

This transaction will have

118

devastating effects on our quality of life but will also directly affect our sales tax

base that supports our infrastructure, roads, sewer, and water. You'll effectively be allowing us to destroy our economy, our neighborhoods, our community.

119

MS. REINHARD: Good evening. My name is Linda Reinhard. I help represent the 1400 residents of Fox Point in Barrington.

I lead a business in China and I

travel there monthly. These goods to be transported on the CN line are exported from the newest, largest, deepest port in the world in China. It has enough output to support all of CN's phase two capacity of 2 million containers plus 28 million more. The impact study cannot stop at 2015 when CN has touted this link as their connection from the Port of Prince Rupert to the Memphis distribution centers.

This so-called Midwest express does not belong in Barrington, it doesn't belong in Chicago. The CN and STB must find a solution for the industrial thoroughfare that does not impose unacceptable safety threats to our children.

The current analysis significantly underestimates the impact to

120

our communities. A meaningful study requires accurate answers to these two questions, One: What is the maximum potential freight over the next 20 years and how will it be carried? CN projects 400 percent growth by 2010. That equates to 82-mile trains. What happens ten years from now? The STB must require that CN

provide a realistic long-term plan which then serves as their freight limit.

What are the true delays? Based on the freight volume plan, an adequate projection must consider how the crossing of the 73 Metra trains and the 20 to 80 freight trains be scheduled. What are the resulting delays if the freight trains have to start from a full stop? Will the car traffic ever flow? A schedule must be created, traffic must be simulated in order to calculated the real delays.

Fox Point residents feel these trains jeopardize the safety of our children. CN's safety record is horrendous with 50 percent defects in their brakes and

26 percent defects in their railroad crossings.

Mark my words: With Barrington school buses crossing 840 times a day, accidents will happen and, yet, this is not even analyzed in your report.

Furthermore, hazardous material accidents cannot be deferred when they've already had a haz-mat accident in Canada and we're on a shallow water supply system.

The impact statement needs to

inform STB, Canadian National, and everyone else who supports this, including Mayor Daley, exactly what the real risk is to our children and our community.

Please take the time to do an accurate analysis. You owe it to our children.

Thank you.

MR. MANGANO: My name is Jeff Mangano. I'm a resident of Lake Zurich, Illinois. I represent approximately 200 residents that abut to the EJ&E.

My issue is loss of home value. If the STB approves this sale, overnight home values of 100,000 homeowners along the EJ&E will plummet; overnight homeowners will lose tens of thousands if not hundreds of thousands of dollars in lost value; overnight your decision will erase decades of appreciation, equity, and home value; overnight your decision will turn tens of thousands, if not hundreds of thousands of

homeowners upside down in their mortgages. Hard working, fiscally responsible homeowners and taxpayers will immediately owe more than what their homes are worth. Put yourself in our shoes for a moment.

The implication of this is catastrophic for many people, especially in a time when the real estate market is currently in shambles and foreclosures are at record levels.

We understand your roles are to promote fair and competitive trade in the real world industry, but you as Americans also have a fiduciary duty to your fellow citizens to make decisions that are not negligent. Approving this purchase can be construed as an act of negligence and most definitely an act of fleecing the American taxpayer.

Thank you.

MS. KEMP: I thank you for this opportunity. The railroad is not in my backyard, but it is -- the railroad is not in my backyard but it is in my community, in my Village, in my state, and my country.

As a citizen, I felt obliged to come here and to learn all that I could about the CN proposal, and I can tell you my conclusion is over months of looking at this, the more I learn, the more I say this can't be allowed. We cannot allow CN to come through our villages.

The proposed trains are not helping our country to grow stronger as much as they help foreign interests. We need our trains and our rails to get people moving, not freight.

From personal experience, I worked downtown for several years. I had a 3 1/2 hour a day round trip commute. I was

grateful for the train because it would have been much worse. That was without all of the congestion just trying to get to the train station. That was before this

125

proposal.

I can't even imagine wanting to take myself, my grandchildren, and my family down there to go to the theater or to enjoy the beautiful City of Chicago.

People from all over, Wisconsin and Indiana, Chicago and all of our Illinois suburbs meet every day in Chicago. We make this a vibrant Midwest. We're not a rest stop. We're a very vibrant community that contributes to the viability of our economy.

We really need investment in light rail that's faster, smoother, and cleaner for people. We do not need CN's trains competing for the routes around our suburbs.

I believe train laws are really outdated, especially reading through your material. If you don't have the criteria of whether this is a competitive situation or not in the United States, that is no criteria for judgment impact in the United

States for a foreign train to come in here

126

and compete for our railroads.

The initial arguments in this country to support trains had to do with helping people and the country's prosper and expand, not helping foreign companies use our rails and roads for international transport.

We cannot be fooled by the rhetoric about reducing local truck traffic or let one community get pitted against another. Chicago loses and we lose if people cannot get to work in Chicago. And, yes, we live in a global economy, but we do not have to destroy ourselves and get down to this potential level of pollution and probable hazardous material spills in our beautiful suburbs to even out the pain of the beautiful big cities that are train transportation hubs. We do not need the never-ending construction of towns along the EJ&E Railroad Lines, and we're not going to have our children be killed because of this.

What do we have to do? Stop

127

them now.

128

MS. OLIVER: I'm Sam Oliver. I'm a

resident of North Barrington. I'm a member of the Barrington 220 School District. I certainly echo what Doctor Leonard presented earlier regarding our school district. I'm also a member of the environmental community in this area, and I want to address four situations that really are potential environmental impacts of the proposed acquisition.

The first is so important that I'm going to repeat it. It's been mentioned, but all residents of the Barrington area depend upon a shallow aquifer system to supply 100 percent of our drinking water. The possibility of a hazardous material spill is of great concern. We have no existing infrastructure to deliver water from an alternate source and no access to Lake Michigan water. I want to a say a little bit more about that.

In this area we have very environmentally sensitive areas that would

129

make a hazardous material spill difficult to clean up. The EJ&E line here is surrounded by wetlands, lakes and Cuba Marsh, which would make it difficult for

cleanup crews to access and operate in much of the area that could potentially be impacted in the event of a spill.

The second point another concern, and we've heard this but it's important, is that the increase in rail freight will result in degradation of our air quality through significant increase of backed up vehicles at crossings as our drivers wait and wait and wait for the trains to pass through.

Point three, the natural and open spaces in the Barrington area are unique features of our lives here. We have an amazing variety of plant and wildlife species in our area. Those species and their habitats have been recognized, valued, protected, celebrated and painstakingly restored here over many years, beginning as far back as 1970,

through the work of hundreds and hundreds of our citizens. There are concerns about disruptions in these habitats that would be caused by increased emissions, vibrations, wind effects and potential contamination.

And finally there is certainly concern that even more nonnative invasive

species could be introduced here through the freight traffic from around the world. As it is, so much of our time, energy and money is spent battling nonnative invasive species here such as buckthorn, garlic mustard, purple loosestrife, Asian longhorned beetles, gypsy moths, and on and on. The potential consequences to sensitive sites that we value such as parks, wetlands, nature preserves and forest preserves, as well as our individual properties must be seriously considered.

MS. QUIGG: I'm Catherine Quigg, and I have lived in Barrington for 42 years. Canadian National presents the most environmentally destructive situation that has ever faced our community.

Barrington depends on shallow groundwater aquifers for drinking water, unlike Chicago and some suburbs which get Lake Michigan water. Any contamination of water in our aquifers would threaten the public health, safety, welfare and ability of families and businesses to survive. There is a life and death difference between a rail spill accident in Chicago and one in our village. No amount of

mitigation will pay for contamination of Barrington's groundwater. No over or underpasses will solve this problem. We have no alternative water supply and virtually no possibility of obtaining water from Lake Michigan. Other northeastern Illinois communities already use the maximum allocation governed by Supreme Court ruling and international treaty.

Liquid hazardous material released from a CN train accident in Barrington could quickly enter our aquifers and permanently destroy our drinking water. Without drinking water Barrington will die.

However, the DEIS does not discuss the issue of precarious drinking water. But it does admit that increases in freight traffic on the EJ&E rail would have a corresponding increase in the risk of hazmat spills which could affect ground water sources.

A CN rail derailment in Canada spilled 194,000 gallons of heavy bunker C fuel oil across five miles of Wabamun Lake. Not until four days later did CN reveal that 185,000 gallons of hazardous, highly toxic chemicals suspected of being

carcinogens had also spilled into the lake. Residents were only belatedly told to stop drinking lake and well water. The provincial government issued an environmental protection order for CN to clean up the spill, and this is only one of numerous CN serious spillage accidents in the U.S. and Canada.

It is not surprising to learn the Canadian rail safety committee gave CN the lowest evaluation possible for safety

systems to offset accidents, noting that safety has not been a high enough priority. Look down the railroad tracks running through Cuba Marsh and our town and imagine the destruction of our drinking water if an accident occurs. Barrington shallow aquifers cannot withstand the same contamination voiced by CN on Wabamun Lake and its residents.

Even the most generous mitigation measures will not offset or balance the public safety. Please deny CN's appeal to take over the EJ&E railroad, for the health and safety of the Barrington area, its drinking water and its people. Thank you.

MR. MASTANDREA: My name is Terry Mastandrea. I'm the director/fire chief of the Lake Zurich Fire Rescue Department that provides emergency services within Lake Zurich, Hawthorne Woods, North Barrington, Lake Barrington, Deer Park, Kildeer and unincorporated Lake County.

The acquisition of the EJ&E by the CN will diminish our long-standing tradition of preserving and protecting the health, safety and welfare of our residents. The purchase provides no benefit and in fact will results in significant negative environmental impact for public safety.

The SEA accurately indicates the CN acquisition will have a significant negative impact on our ability to effectively respond to emergency calls but

does not address, or is flawed, in the following points: Train accidents on the EJ&E rail line are likely to increase by 28 percent but does not address the type, risk factor or local resource impact and

capacity. An increase from 5.3 to 20.3 trains per day with an increased 9.4 hazardous materials cars per train, which equals 141 per day, presents high risk challenges first responders will be mandated to respond to with little to no additional resources.

The SEA is silent and CN has been unresponsive after multiple meetings, emails and phone calls requesting information on proposed types and quantities of hazardous materials that will be transported.

The SEA does not address chemical release as far as spill, plume information for public protection for evacuation planning. Fifteen crossings are defined as being substantially affected. Two of them are within our response area, yet the SAE does not address the delays will have on public safety response times.

Without mitigation 11 fire

emergency medical service providers would potentially experience substantial effects.

The SEA is flawed in only listing Lake Zurich station 3 since the impact at all other stations and departments that respond for and provide support to that station will equally be affected.

Lives may be saved if advanced life support is initiated within four to six minutes. The SEA does not address the impact delayed response will have on the preservation of life.

Fire typically increases in size every minute. The SEA does not address the impact delayed response will have on firefighter safety and property loss to the residents or community tax base.

Major changes on rail lines that require major mitigation to address the significant environmental impact issues must be thoroughly reviewed.

Emergency responders must be unimpeded access across rail lines to ensure effective emergency services can be delivered during life-threatening events. Delays in our business are unacceptable and

mission critical to sustaining life and property and should not be worsened to appease the private sector's mission of simply generating more profit. The STB and applicant must be responsive to the basic public safety needs of a community and must be responsible for all actions, funding and infrastructure, to preserve those services.

138

MS. MEYER: Good evening. My name is Janet Meyer, president of Barrington Chamber of Commerce. Our office is located in the heart of Barrington. We do represent the villages of Barrington which accounts for 15,000 employees, which 5,000 work in the heart of the village that are severely impacted by this.

Since we've heard of this proposed acquisition we have worked behind the scenes to educate a vast number of publics which definitely include the residents as well as the business community. In doing so we have solicited a number of letter-writing campaigns, and we have many members and residents that attempted to speak to you; and unfortunately I do not believe that their concerns have reached you because I have not seen that response in your report. So this evening I'd like to just brush tip on a few of the very significant economic downfalls of this proposal.

Let us remind you again, and I

139

know you have heard this from just about every speaker here this evening, yes, we

have traffic in Barrington already; but we cannot address and certainly live with an increase in -- fourfold increase in traffic of trains. That is not going to work. This increase would cause significant delays already on congested or arterial roads. Emergency responders, and we've heard from all the experts here this evening, cannot reach those with emergencies. So obviously as a Chamber of Commerce, we are very concerned. Here at a time we're trying to plan for disaster preparedness we have to be concerned about this as well. So yes, we cannot deal with a community divided by trains that can be nearly two miles long.

I would like to urge you in behalf of this membership to really once again think here before you take the next step. As I said, almost 5,000 employees right here in the heart that are severely impacted by this decision. Examine the

140

impacts of this transaction in depth, particularly the effect it will have on the livelihood of those already struggling businesses in the area during these economic times. Open up any paper. You

know in the community that you live in as well as Barrington, these are not pleasant times for any business owner.

This chamber represents over 750 members, 85 percent of them have fewer than five employees. They are barely making it in these times. You have added to that complexity and the problem has already begun. Since we have made the announcement businesses have stopped expanding. They are looking for new homes. This is not a good thing.

So, yes, again I will make my comments briefly because you are cutting me off, but at this point you can see this purchase causes real problems for our community. Without your protection we have no way of protecting ourselves so we are depending on you to thoroughly consider

141

this impact. Stop the addition of trains. I don't believe in my heart that you can look in the mirror, make the decision to let this go forward with CN rails and live with that fact. So again thank you again for your time.

MR. LEE: My name is Bob Lee, and I have had the honor and privilege of

being part of this community and raising our family here for the last 29 years, but I'm horrified to think of the future if you allow this transaction to go forward. In your draft CN National railroad contends that their proposal has a substantial and unquestionable benefits to the public interest. I'm here to question those benefits. In light of the facts that you have heard our town will be devastated if you allow this to happen.

What benefit is greater than human life? Within 600 feet of where we're standing now thousands of children go to school every day by bus, by car, walking, with their I-Pods on, their heads down,

142

they're chatting and they're oblivious of what's happening on those railroad tracks. Not to have the grade crossing there, it's unconscionable; and it's unbelievable that you wouldn't have one on Route 14. It just does not make any sense.

And I will guarantee, I'll bet any one of you, that if you do not mandate that those train crossings are -- separations are done and completed before this transaction is finalized and treated

and trains can run, I'll guarantee you in five years they're not done because there's no money to do them. It doesn't make any sense. How can you come up with a program and do this study and have no fiscal responsibility to make it possible? It doesn't make sense.

And I'm not sure if you will hear -- have really read this study, but your impact study is completely amiss this draft about housing and the impact on us as homeowners. Your draft admits that some homes within 250 feet of the rail line with

another one, please. Thank you.

MR. FINLON: Hello, my name is a Patrick Finlon. I'm a deputy of chief of police with the Village of Lake Zurich. I would like to address in my statement the issues that directly affect law enforcement in the village. My statement will address safety, noise and vibration and emergency vehicle response.

The increased number of trains traveling through Lake Zurich would exponentially increase the incidence of conflict between vehicle, pedestrian and bicycle traffic and rail traffic. Currently 5.3 trains travel through Lake Zurich daily, and it is reported that 20.3 trains will travel through the village. Within the corporate limits of the village

of Lake Zurich there are five grade level crossings. Multiplying the crossings by the numbers of trains, currently there are 26.3 incidence of possible conflict with rail traffic and projecting the future amount of train traffic there would be 101.5 incidence of train/traffic conflict.

This is a 300 percent increase. With this increase in conflicts there will be an increase in possible vehicle collisions.

Additionally Lions Park adjacent to the railway is used for a community festival, the Alpinefest. Many individuals attending the event will be parking south of the railway and walking north hopefully at grade crossings. This would increase the number of possible train/pedestrian conflicts. What wasn't addressed in the report was the average time required to investigate a train versus vehicle, pedestrian or bicycle collision and the traffic obstruction that would be encountered. Typically a serious traffic accident requires approximately three hours of investigative time by a team of trained accident investigators.

Traffic queing is also a problem

at the grade level crossings. The crossings on Ela Road has a traffic volume of 16,100 vehicles per day. When a train traverses this crossing, often southbound

traffic backs up to U.S. Route 12. Traffic on U.S. Route 12 is stopped in the eastbound right turn lane and westbound left turn lane. The intersection of U.S. Route 12 and Ela Road has a traffic volume of 43,000 cars per day. The speed limit is 45 miles an hour. With the increased incidence of rail/vehicle conflict, traffic will back up more often and rear-end collisions are likely to occur. The mechanics of such a crash include all vehicles stopped in traffic struck in the rear by a vehicle traveling 45 miles an hour.

I'd like to address noise and vibration in that the Lake Zurich Police Department responded to a complaint April 22nd at 5:32 p.m. The complaint involved a rail work crew performing track maintenance; and engine and crew stayed in the area for 24 hours, and the engine was left running. The officer that responded indicated that there was a strong smell of

fuel exhaust and loud noise in the area.

147

In summary, given the number of factors affecting law enforcement, it is imperative that mitigation of the traffic impact by the CN railway include the strategic improvement of grade crossing allowing for the separation of rail and vehicle traffic to improve traffic safety.

148

MR. STETSON: Hello. My name is Brad Stetson. I'm a Barrington resident. I'm chairman and CEO of Barrington Bank & Trust, and I'm also an executive director of the Barrington Area Chamber of Commerce.

Exactly eight years ago tomorrow at 43 years old I awoke with chest pains. I was having a heart attack. Thankfully due to the response of the Barrington Fire And Rescue Team, Doctor Horcher and the emergency room staff at Good Shepherd Hospital I survived. However, would that have been the case that the ambulance rounded the corner of Route 14 and Northwest Highway only to find a freight train blocking the route for 10, 15, maybe 20 minutes, I don't think I'd care to speculate on that. The fact is a significant number of Barrington area residents south and southeast of Good Shepherd Hospital will have to speculate that each and every time an emergency response is required.

I've prepared several other

149

comments. However, they've been more than

adequately addressed by the many village and public officials before me; and I think they have been credible, logical and well-organized, and I think they were to the point and well addressed.

The fact of the matter is as a local community banker, the economic impact of this proposed transaction will be detriment to the businesses, both retail and commercial. They are already fighting an economic environment that is working against them. This type of transaction will only exacerbate the problem that they currently seek today.

I'm sure that any well-educated individual can come up with a study to illustrate what they would like people to think, and it certainly appears is that the CN Railway has certainly accomplished that with this board. The fact is the business epicenter of Barrington is Route 59 and Main Street, which is Lake-Cook. There are over 200 businesses located within a

150

quarter of a mile of that intersection, and the retail businesses and restaurants survive on people coming from Lake Barrington, North Barrington, Barrington

Hills, Tower Lakes, Deer Park. How are they going to survive when all of a sudden this traffic issue arises that only congests this particular center of town?

As a local businessman I clearly understand the economics and the business model behind the acquisition by the Canadian National Railway, and it appears to be a solid one. However, the economics and the dynamics of the model are clearly one-sided favoring the CN. Today, today is neither practical nor realistic to expect the county, the state or the federal government to assist in the mitigation. They are for all intents and purposes bankrupt. Oh, of course they can raise our taxes.

151

MR. HEYDEN: Good evening. My name is David Heyden. I'm director of Public Works for Lake Zurich. I would like to take this opportunity to bring to your attention a number of inconsistencies present in the DEIS findings that should be clarified.

First the study consistently

refers to -- the study consistently refers to resultant decrease in CN operations along the existing inner arc. Currently it is understood that the existing rail lines on the inner arc are at capacity thereby restricting any further use of these existing lines.

Once the CN has decreased its use on these existing rail lines, which is not guaranteed, this provides the opportunity for other carriers to increase their use on these lines, thereby misrepresenting the reductions on the existing lines as stated in the draft EIS.

Second, on page ES-13 the draft EIS states that the Barrington area currently qualifies as a quiet zone. This

quiet zone is actually in effect from North Chicago to Bartlett. The entire quiet zone corridor should be referenced with proper mitigation included.

Third, page ES-15 under land use, the report states that the construction of connections and double tracks would not affect the current lane use patterns. While this may be true in the areas of expansion Lake Zurich was

informed by the CN that it does not have any intention of preserving existing local rail service to the corridor. Ceasing of this service will likely have a detrimental effect on the land use due to the loss of rail service to the existing users. These cumulative impacts should also be discussed in the study.

Fourth, under water resources. The EIS does mention the potential increase in groundwater contamination, particularly in shallow wells, but does not give and should include specific data regarding the potential impacts of the number of wells

that would be affected as compared to the inner arc areas. The inner arc has lower chance of water supply contamination in the event of a hazardous spill due to being served by Lake Michigan. The inclusion of this data is necessary to understand the full potential of effects of the groundwater.

Fifth, the report also mentions decreases in water quality due to construction runoff but does not address impacts to common storm water runoff. With the passage of the new NPDES Phase II

regulations, the local municipalities are now responsible for the quality of storm water runoff entering their storm sewers and other bodies of water under their jurisdiction.

Contaminated storm water is common from rail corridors or due to trace elements being deposited along the corridor from leaking cars, diesel fuel, grease and heavy metals. Existing storm water quality measurements should be taken as well as the

potential impacts included in this study. The additional number of freight trains and cargo will undoubtedly result in an increase in the amount of these trace contaminants along the railroad corridor further reducing storm water quality.

Storm water quality devices should be included in the mitigation efforts at the points of discharge into sensitive areas such as wetlands and prior to being released into local municipal sewers. It should be required that the applicant perform this mitigation measure as most of the discharge points are located on the railroad property which is under their sole jurisdiction. The final EIS

should address these issues prior to making a final decision. Thank you.

MR. BATTLE: Good evening. My name is Brian Battle. I'm a Barrington resident, and I currently serve our community as the president of our school board. This evening my comments will address some concerns identified certainly about our board, our students, our parents, our staff and all the residents of the community in School District 220. We have been disappointed in our previous identification these issues were not included in the DEIS, but we certainly hope that they will be reflected in the final group.

First in fact, we are unit district providing services prekindergarten through 12. We serve over 9,200 students. We employ over 1,100 staff members making us the largest employer in the Barrington

area. We cover 72 square miles for our residents. We operate 14 buildings; and as you know, the EJ&E crosses intersection within our boundary seven times.

You have heard several people

comment that our school buses cross EJ&E lines on average 840 times a day. That's not including extracurricular activity. That is a staggering number. That causes our board to be very concerned about safety and traffic issues.

We have neighborhood schools that are essentially kindergarten through 5. All of them are neighborhood schools, because very few of our students are in a position to walk within the Illinois guidelines of 1.5 mile walking radius. There are still several traffic safety issues that cause about 90 percent of our students to take buses or drive. So during the morning and the afternoon rush hour there is a lot of traffic that is attributed to our students. We have prekindergarten federally-mandated program. It is a central program that causes people from all over the 72 square miles to have to drive to one location.

We have two middle schools that serve our grades 6 through 8. They are

located on the east side of the EJ&E tracks. We have one high school located on the west side of the EJ&E tracks. As our students work their way through our school system, every one of our students and families are forced to cross those EJ&E lines at some point, oftentimes, many times (inaudible).

The board in our previously approved resolution has indicated our concern on increased traffic that would limit the ability of the police and fire departments and ambulances to reach our schools and our children in emergency situations. In addition increased traffic would add critical minutes to the time it takes an ambulance to transport an injured student or staff member to the nearest hospital; and we have also experienced several recently tragic deaths around train tracks, which is a huge concern to our board and our community. Increased rail traffic would add to that risk.

So our board has asked that the

Surface Transportation Board say no to the proposed acquisition; and if so, we've requested remediation, and the draft EIS only identifies the Hough Street intersection requiring remediation. This board feels very, very strongly that the Route 14 and Lake-Cook intersections also require remediation. Thank you.

MR. TRAFTON: My name is Gordon Trafton. I am Senior Vice President, Southern Region, for CN. From our headquarters in Homewood, I oversee all of CN's operations in the U.S., which spans 16 states and has roughly 6,600 employees. I'm an American, reside in the western suburbs, and live not far from the Elgin, Joliet and Eastern Railway Company, otherwise known as EJ&E.

Chicago is essential to rail operations, but it presents major operational challenges for us. This transaction would improve rail operations on the CN system and the rest of the Chicago rail network by moving CN trains out of the urban core to the underutilized EJ&E line on the outskirts of the Chicago metropolitan area. As a result, it would significantly improve the fluidity of CN's and other rail operations in the region resulting in faster transit times and more reliable service for rail customers and enhancing the competitiveness of businesses

in the region that utilize rail service.

The Board recognized the

transportation benefits of this transaction and the absence of serious competitive and/or transportation issues when it characterized this transaction as minor in November 2007.

However, CN also fully understands the importance of a thorough review of the transaction's environmental impacts. We object, however, to the efforts of some to use the environmental review process to defeat the transaction. CN has been and remains committed to working with the communities to develop comprehensive voluntary mitigation agreements addressing reasonable environmental concerns. I have personally met twice with Barrington officials to discuss this transaction and its impacts.

It's important to recognize that the significant congestion relief the transaction will bring to the Chicago region is reciprocal. For every community

along the EJ&E line that would see increased train traffic, nearly double that number along CN lines would experience a traffic decrease. In terms of the number of residents affected, roughly one million

individuals would have additional trains operating through their communities, but more than two and a half million would have fewer trains.

CN is disappointed that the Draft EIS did not fully identify these benefits or balance them against the effects of increased train traffic along the EJ&E line. It also fails to take into account what would happen -- what would likely happen in Chicago if the transaction not proceed. Absent a quick and massive infusion of government funding for CREATE or some other congestion-reducing initiative, one can expect increased rail congestion in downtown Chicago, increased delays for motorists, increased train idling, and continued high levels of rail operations in more densely-populated

communities and less efficient rail operations to the detriment of users of rail shippers and ultimately consumers.

CN has been active in the environmental review process and, as evidenced by our agreement this week with Joliet, in our ongoing voluntary mitigation efforts with communities. We will continue

our efforts to bring the environmental mitigation process to a successful conclusion with appropriate mitigation for adverse environmental impacts related to train traffic increases. We hope the communities will work with us in this same spirit of cooperation and problem solving.

Thank you for the opportunity to present CN's views to you this evening.

MR. KELLER: Good morning. My name is Kris Keller. I own National Realty Network. We do commercial real estate brokerage. I have four offices located around Chicago, but my headquarters is in downtown Barrington. I employ over 20 agents in my Barrington office. We probably have half of all the commercial listings in town. I am also Chairman of the Board for the North Shore Barrington Association of Realtors and I will also be

a director on two other commercial real estate professional boards, the Illinois Chapter of CCIM and the Northern Illinois Commercial Association of Realtors.

I would like to make clear that no one has asked me to be here or to speak on any particular subject. As a matter of fact, I worked for two different railroads in my career and have a soft place in my heart for them. I am here because I believe that the acquisition of the EJ&E by the Canadian National and the resultant additional train traffic would negatively

change Barrington forever.

I will limit my comments to an area of my expertise: Barrington commercial real estate. The Village of Barrington by itself does not have the demographics to support a vibrant downtown retail environment. Barrington relies upon the surrounding communities, Barrington Hills, South Barrington, North Barrington, Lake Barrington, and others who also think of this as their downtown.

The current train traffic that goes through Barrington is considered to be a nuisance when trying to get into town,

but it is considered to be a manageable nuisance. I can tell you with certainty that with the addition of anywhere near the amount of train traffic that is currently being considered, shoppers from the surrounding communities will no longer come to Barrington's downtown. The incremental train traffic added by the Canadian National will devastate the community businesses.

The initial environmental study does not take into consideration: One, the effect on business owners who have worked a lifetime to develop their business; two, the loss of jobs; three, the loss of property values in the commercial properties in town when they are having difficulty renting them out; four, the subsequent loss of sales tax to this town; five, the change to this community that will no longer have many of the walk-to-town amenities currently enjoyed.

There is no question in my mind that if you approve this acquisition -- there's no question in my mind that if you approve this acquisition, you will be destroying the business community and

forever changing the landscape of Barrington, a change from which its business community will not recover.

MR. PANSCH: My name is Detlev Pansch. I'm the Executive Director of the Barrington Public Library District. As the Public Library District serving the greater Barrington community, the Barrington Area Library draws its patrons from all or part of the 14 communities coming -- covering 72 square miles. The library's entrance drive is approximately 850 feet south of the crossing of the EJ&E line and Route 14.

Last year we had 319,000 visitors making the Barrington Area Library one of the most trafficked public buildings in the Village of Barrington. In addition to those arriving by motor vehicle, many patrons arrive as pedestrians or ride bicycles to our facility.

Part of the library's improvement plan is to expand the building in the near future. Following

construction, the children's wing will be less than 1,000 feet from the rail line. Each summer the library hopes to bring outdoor story times at Citizens Park and

Langendorf Park in the Village of Barrington, both of which are adjacent to the railway. The library is concerned that traffic backup caused by frequent freight trains will prevent patrons from reaching the library's property safely and conveniently.

We are also concerned about the increased pollution that will be generated as a result of increased freight train traffic and that will snarl automobile traffic throughout Barrington. The increase in noise from train whistles and locomotives will adversely affect the library and the use of our facility. The DEIS does not adequately address these concerns which threaten the library's mission and the quality of life for the people of the Barrington community.

Furthermore, the DEIS recommends recommendations for limiting the number of freight trains during rush hour and averting them to other times does not aid

the library. We are open to the public

until 9:00 p.m. Monday through Friday. The library holds numerous programs in the evening after rush hour has ended.

Finally, because our facility draws a large amount of visitors of all ages, medical emergencies do occur. A patron that becomes ill at the library will have the benefit of a quick paramedic response. However, there will be no way to quickly transport a patient from our facility to Good Shepherd Hospital when the train has blocked every intersection in the village. A detour to a hospital much farther south of our community could have deadly consequences and is simply unacceptable.

The library requests the Surface Transportation Board to reconsider the impact of the proposed sale on the Barrington Area Library and the Barrington area as a whole and to amend the environmental impact report to address these concerns and to suggest means for resolving them.

169

MR. BRAITHWAITE: Good evening. My name is Bill Braithwaite. I'm a 52-year resident of Barrington. I think one of the -- There is a lot of people I know.

One of the serious flaws in the draft statement is related to public safety issues. To put that into context, I would like to have you just hold -- have a jump forward with me for say two years. And I am in this particular auditorium watching a basketball game, and I have the unfortunate event of having a heart attack or a stroke.

I know that ordinarily within three minutes -- approximately three minutes I am going to get some help from our wonderful emergency services. Unless this facility -- The CN proposal has been approved, and as I am waiting there, the emergency vehicle comes to railroad crossings just a few hundred feet from here. And one of those almost two-mile trains comes through. As a result, I am waiting, waiting, waiting. How long am I waiting? Four minutes? Five minutes? How

170

long? I'm just waiting. Tell me. I'm

waiting longer and waiting and still waiting, waiting for help. Why can't they come? Why can't it come? Waiting, waiting, still waiting. And the time that I have had here today is only a part of the time that I'm waiting and wondering when will help come, when will help come.

And at the end of this short time I would still be waiting for another two to four minutes. And let's suppose that I expire. That's the polite word for die. Who's responsible for that? Who is responsible?

171

MS. FINLEY: Hello. My name is Rita Finley, and I live -- I have lived in Deer Park for the past 11 years raising a family with three children not far from the

EJ&E. We moved to this area for more open space and less congestion but had to give up the closer access to Lake Michigan, O'Hare, and other amenities that are more accessible to people living east of us.

I have four concerns to talk about now. One is the quantity of rail operations. In your executive summary you state that it is unlikely that the number of trains using the EJ&E would be higher than that estimated by CN's Operating Plan. If you are basing your EIS solely on CN's proposed Operating Plan, then I ask you to mandate the maximum number and length of trains that could ever be allowed to run on the EJ&E. Alternatively, please fully explore the carrying capacity of the line and that impact before making a decision.

Two, the risk of contamination

172

of water resources is very real, is the very difference on the EJ&E versus where the CN's current lines are. You even stated concerns in your summary; and that included domestic wells, which I have on my property. We need you to protect our water quality that is at risk from contamination.

Why? Simply, we have no other viable water source. Train lines that run along the area behind Lake Michigan don't have these risks.

Air quality. Would residents with respiratory problems such as asthma and chronic heart disease or babies and children with respiratory systems developing now have to take extra precaution with increased freight and idling cars? We need assurance from you that this poses no risk. How can we ignore this segment of the population?

Traffic delay mitigation. Please examine traffic patterns of communities of Barrington Metra. I think most need to pass an EJ&E intersection,

173

such as Lake Zurich Road, just to get to the train station. Commuters would have to allow significantly greater time added to an already long commute downtown. It would be unpredictable.

Another traffic issue is without mitigation, cars, trucks will seek a bypass while waiting for the train. This will result in excess wear and tear on subsequent roads for -- Skip some of this.

Finally, I understand new Hazmat regulations are underway. Please examine if this would slow down the allowed train speeds and, therefore, causing longer blocked intersections. Thank you for listening, and I ask you to weigh heavily the unique sensitive environment.

Finally, every silver lining has a cloud. CN's portrayal of the EJ&E being the silver lining to solve freight problems in Chicago creates many new clouds to be well-examined before any decision is made. Thank you.

MR. KELSCH: My name is Joe Kelsch, Sr. I am the Director of the Barrington Area Development Council known as BADC and its immediate past president and a 37-year resident of the community.

The BADC was founded 40 years ago with a mission to foster the development of the civic and service organizations necessary to the quality of life we now enjoy in the greater Barrington community. We played a significant role in establishing BACOG in the late '60s, that being the school district, Good Shepherd

Hospital, and many of the other organizations represented here this evening.

We continue to advocate for those issues that improve the quality of life our residents expect, a quality now threatened by the pending CN acquisition.

We appreciate the role that a railroad plays in the development of Barrington. Without the Northwestern, now Metra, we would not be among the most

desired communities in which to live. However, the CN acquisition would overwhelm our community with increased freight traffic, a condition that if preexisting would have prevented the community from attaining the quality of life we now enjoy, one that is reflected in our home values and the tax base to support our excellent school system.

That is the reality we must give priority to. The Barrington area is in large part what it is today because of its relative freedom from rail congestion.

Although our area contains a number of municipalities, we have developed into a cohesive community in terms of

infrastructures, unit school district, regional government, shared police and fire, area hospital, the civic and service organizations, and church congregations that reach across the entire area.

This cohesiveness would have been impossible without a reasonably efficient road system that connects our

villages and ties them into the Village of Barrington as the commercial and civic hub of the area.

All major area roads converge at the village center and all intersect with EJ&E. Any major increase in freight traffic would not only tie up traffic far beyond what this already heavily burdened road is facing, it would greatly disrupt the cohesiveness and quality of life issues I have just cited.

STB must give primary consideration to the concerns of our residents regarding these quality of life issues. While there may be economic benefits to the greater Chicago area from the proposed acquisition, they would largely accrue to CN at the expense of those communities along the EJ&E.

STB has an ethical and moral responsibility to base its decision on what best serves the public interest, meaning we the people. You face a challenging task. You must be mindful of your responsibility

to the citizens of this community. In doing so, your decision could be fair to all, but only if you require the CN and the Federal government to assume full responsibility for the cost of mitigating the entire...

MR. BEAUBIEN: Thank you for the opportunity to be heard. I will add a different perspective than you heard on the testimony of the report and quality of the report and things that need to be addressed.

As a Representative from the State of Illinois for this district, I wanted you to know that I'm very much opposed to the process of bringing the trains through here, but a couple of additional points.

One, saving the trains is a process called CREATE, which has not been funded yet, partially because CN wouldn't help fund it; but I think we ought to take that into consideration when we are looking to this process because what it does is it addresses the entire region, not just this particular area. We should wait until we have had an opportunity to see what the CREATE report would do.

Secondly, the report infers that somehow or another the State of Illinois is

ChimniakCourtReporting.com
312.781.9111

179

going to be able to help mitigate some of these crossings and problems that these various villages are going to have. As the budget negotiator and a House Republican for the last six years, I can tell you that's not going to happen. This state is broke. We're $3 million in debt as I'm standing here. They say it's two. Believe me, it's three. We have severe financial problems.

In the event -- and I hope it does happen -- we have a capitol bill, the money is really being spoken for by higher ed, K-12, the roads, highways, infrastructure, bridges, and so forth. So there will be very little money. So if anyone thinks that this report can hint or suggest that the state is going to be able to help you, it will not.

Along with all the other things that were talked about here tonight, I just wanted to give that particular perspective. Thank you very much.

MR. MEISER: I'm Joe Meiser. I'm a member of the Village of Barrington Plan Commission and a resident. There's 21 major areas in this Draft Environmental Impact Statement that's flawed, and I'm only going to focus on three of those areas. There are actually over 21 areas.

But No. 1, the vehicle gridlock analysis is flawed. The DEIS utilizes a flawed average daily traffic count. Many of the communities have conducted their own ADT counts and are a much higher count than those in the DEIS where the train links and speeds of the DEIS are flat out wrong. The reality is it's a high ADT. Longer and slower trains are going to cause gridlock at a much worse grade than is projected in the DEIS.

The mitigation promises in the DEIS are empty. The DEIS states that only 15 crossings in this project area are going to require mitigation. That's absolutely an understatement. Anybody that knows the situation here with the crossings can tell

ChimniakCourtReporting.com
312.781.9111

181

you that every single one of them would need -- in this area would need -- in at

least the Village of Barrington, Barrington will need mitigation.

But even if that were true, even if it was just 15, based on an estimate of $35 million per crossing, you're talking about $525 million to mitigate the crossings, those 15 crossings that need mitigation in this study area. And that would mean that $525 million was necessary. But in the draft statement, CN would only be responsible for a small fraction of the cost of that leaving up to $500 million unaccounted for.

We've heard it over and over. We just heard from a state legislator. There is no money to pay for this. There is no state money, no Federal money, no local money. It's obviously an empty promise. It's not going to happen. We're not going to get the mitigation. So why even pretend it's even going to happen? Why even talk about it? There's nothing to

ChimniakCourtReporting.com
312.781.9111

182

talk about.

The life and death first responder analysis is a joke. The DEIS rejects as quote "will not substantially impact communities with EMS facilities on

both sides of the tracks." That's ridiculous. Those facilities were never designed or staffed with contemplation of any significant traffic on the EJ&E; but worse, the DEIS states -- and I quote -- "response to the actual scene of an emergency is the most critical action, not the transport to the emergency medical facility."

How callous is that? Since when has the Surface Transportation Board become an expert on emergency care? I'm sure that whoever wrote that would be speaking a different story if they were sitting in the back of an ambulance after having a heart attack or a stroke idling at a railroad crossing.

Let's have an accurate environmental impact statement. If we do,

this deal is not going forward. Thank you.

MR. KNOOP: My name is Steve Knoop, Trustee of Barrington Hills. Frankly, I take great insult to your map in the STB. The problem with this map is that you fail to show the entire system map of CN and its process through the United States. Many people don't know that CN bought the old IC lines. This train isn't going to Memphis. This train isn't going to New Orleans.

Essentially, let's be clear on

the economic impact of what this transaction is all about. We have a Canadian-owned company transporting Asian goods to Latin America using the EJ&E tracks and the old IC tracks. There is no economic benefit here to Chicago. That analysis is -- There is no economic benefit to the United States. Your draft applies boilerplate logic and parameters to a complex and unique situation which can only be demonstrated by the following misrepresentation of facts, which I'll summarize.

On Page 6-17, which is talked about a lot, certain communities already face traffic congestion at rail crossings and, thus, it would be inappropriate to hold CN responsible for traffic at these grade crossings. This purports that Barrington and the Barrington area communities should have predicted a global economy and known in advance that a major international Class I railroad was about to steamroll through its community with international freight headed to Latin America on a railroad built in 1891.

Going on, Page ES-18 states --

and I quote -- "vibrations by even the heaviest trains rarely cause structural damage or even minor cosmetic damage." My first-grader knows better than that. EJ&E was never meant to be a Class I railroad. You have not done your study of the threat of the EJ&E. It is not appropriate and will not -- And EJ&E does cause vibration, and I have proof.

If you had done your analysis

correctly, which you haven't, you would have gone to the bridge -- the railroad bridge at Hawthorne Lake and Otis Road. This bridge is actually shut down by vibration and is still subject to structuring.

In summary, if the CN merger is approved, the STB and U.S. Rep Lipinski should be held accountable for the destruction and deterioration of property values. I take great issue with Mr. Lipinski as the only Chicago area member of the House Transportation Committee which overseas the STB.

Mr. Lipinski and STB, the Barrington area communities are not for sale. We are not for sale for

stockholders. We are not for sale to Latin America and Asian freight. Thank you.

MS. MAZURKIEWICZ: Hello. My name is Donna Mazurkiewicz, and I'm the President of the Concord Village Condo Association. There are about 250 houses, townhomes, and villas in this four to five block square area. My unit and several others in Concord Village who are in the back, we face the railroad only 50 feet away. How am I to protect myself when these trains derail? We all know that CN does not have a great safety record, and I'm scared of that. Finally, I'm scared to death if anything should happen.

Congestion -- and I'm going to repeat a lot of what some of the other people have said, which it still needs to be said again and again. Congestion is already a problem on Route 12 to get around. We don't have a lot of alternative streets to use. So, therefore, we run late

to work. We run late to get the kids to school. Mainly, it is going to really interfere with our emergency services trying to get to all of our people.

We rely on Barrington and the train station to get the people downtown. As it stands now, Route 12 is also very busy. When you hit Route 12 to Ela Road, to turn left on Ela, the train would be crossing that track. Traffic will also back up onto Route 12, which makes it worse than it is now.

Economics. Mr. Lipinski of the Third District says the economy is going to help us. Who is this going to help? Not us. It's not ours, but big business will. Not in America, though, but Canada and China and other Asian countries who will be transporting major goods on containers and double containers, hazardous materials, et cetera.

CN said that 60 percent of the people are going to get relief from this and the other 40 are going to have to live with this quadruple congestion. Who? We're all equal. I don't see how you can determine that this person is better than

the next person.

Also, when those tracks become available again, if CN is approved here, the tracks to Chicago will certainly be eaten up by another train company. So, therefore, nobody wins.

We the people want to have emergency protection to get to us as soon as possible to save lives of our family, friends, neighbors, and myself. The way the roads are now, this cannot be done.

We the people, for those of us who still have a job and has not lost theirs, like to get to work on time. This is only going to get worse. We have problems now.

Economics again. CN is not going to give us enough money to take care of the infrastructure to make this work. I know counties would pay. I'm already paying enough for taxes. The counties get money for transportation from the state and the State of Illinois. The State of Illinois does not have enough money to take care of all the major problems they have.

Police, regional commuter transportation, the poor, and those who are mentally challenged who are in state homes, which some are facing major problems now getting funding from the state to keep them open.

Help us little people. Don't let business get in the way again and again for their prosperity and not think about the majority of people who make up this country. This is not good economics for Illinois.

MS. ADAMS: Douglas Rees, James Perille, Kurt Marquardt.

MR. REES: My name is Douglas

Rees. I'm the president of American.

I'd like to remind the STB that the Fifth Amendment of the United States Constitution reads: No person shall be deprived of life, liberty, or property without the due process of law.

I'd also like to note that the Fourteenth Amendment states that no state shall deprive any person of life, liberty, or property without, once again, the due process of law.

To me, liberty and property also equates to the right to a safe and productive life. Prior speakers clearly demonstrated the shortfalls of your study and the resulting safety issues.

It seems to me your shortsighted study and upcoming capitulation to Canadian National is clearly a violation of the due process protection afforded to the hundreds of thousands of people who work and live along this line.

That being said, what's the

answer? Stop hiding behind this flawed study and do it live. Pick a date in October and pick a date in November -- not when schools are out, not when people aren't working, but a full day -- and without notice close those crossings all the way up and down the line, reflecting 20 trains a day.

Then let's sit back and see how those results compare to the results that you've put out with a questionable (applause) --

And then once you do that, then you will be able to say, all right. Let's have an honest and true discussion about what this means to that area and stack that up to the benefit that's going to come out in effecting benefits under North American Trade Agreement, et cetera.

That's the only way that you can clearly say that under the oath that you take, and all the politicians behind this, about when they protect and serve the Constitution of the United States. That's

MR. PERILLE: I'm James Perille. I'm a 38-year resident of Fox Point Barrington formerly and now a two-year resident of Lake Barrington Shores. I was the former secretary-chairman of Fox Point. I was also vice president of land use for the North Barrington Area Association, and more recently I was the president of the Barrington Enlightened Taxpayers Association, known as BETA.

The Surface Transportation Board's Draft Environmental Impact Statement fails to give a realistic picture of the damage that the proposed CN purchase of the EJ&E would bring to the outer ring communities on the EJ&E line.

The greater train length and the number of trains per day would increase the train miles per day or traffic impact on the EJ&E by more than ninefold -- that's ninefold -- or 835 percent at each of the eight Barrington area crossings. This is based on the study assumption that the number of trains per day would increase

from 5.3 to 20.3 or by 15 trains. Also the assumption is made that the average train length will increase from 2,590 feet to 6,321 feet.

It is likely that the number of trains per day will eventually increase by 20 rather than 15. Also, over time, the average length of trains could reach 10,000 feet rather than 6,321 feet as now expected. This would mean the implementation of the proposal would result in an 18-fold -- that is 18-fold -- or 1,700 percent increase in EJ&E train miles

per day impacting each of our crossings.
Such horrendous increases are difficult to comprehend in terms of health, safety, welfare of the citizens of the Barrington area.
Barrington is the hub of the total BACOG area and is the center of banking, shopping, commuting, church, library, medical, cultural, and educational activities. Police, fire, and emergency paramedic access would be compromised by

traffic gridlock. Commuters and school buses would experience intolerable delays. The quality of life for our entire community would suffer.
The study only recognizes that the proposal will result in a loss of property value for homes within 250 feet of the rail. I estimate the total value of all property in the BACOG area is at least $15 billion. A loss in value of only 10 percent or 20 percent for the entire BACOG area would represent a conservative estimate and amount to 1.5 billion to 3 billion loss in property value. Contrast this to the CN investment of $300 million for the purchase of the EJ&E.

The CN proposal should be denied.
MS. ADAMS: Kurt Marquardt, Richard McDonald, Rob Sherman.

MR. MARQUARDT: My name is Kurt Marquardt, president of Marquardt Buick, Pontiac, GMC, a business that's been active in the Barrington community for almost 60 years.
This year I've been honored to represent the Barrington area businesses as chairman of the Barrington Area Chamber of Commerce, an organization whose purpose is to serve as an advocate for the greater Barrington businesses in ways that enhance the vibrancy of the business environment and quality of life of our 800 members.
Never before have we as a community been faced with a bigger threat to the viability of our local economy than the proposed acquisition by Canadian National. Many real concerns have been brought up this evening regarding safety,

noise, property values, to name a few.
However, the economic impact of this transaction as proposed would be devastating, forever changing the landscape of our downtown and surrounding areas.

In preparation for this evening, the Chamber of Commerce conducted a survey of our area businesses to measure the forecasted impact of the CN acquisition. Overall, respondents represented almost 1.5 billion in 2007 revenues to our local economy.
Among these Barrington businesses, when forecasting what impact an increase of only five or ten freight trains per day would have on their business revenues, with all economic and environmental conditions remaining the same, the forecasted reduction was over $114 million, an amount, again, that would be devastating to our local economy.
Furthermore, a full 74 percent of respondents expect a decrease in future revenues as a result of this acquisition.
This survey also addressed the likelihood of each of the businesses as to whether they would consider relocating

their place of business. Almost 46 percent of the respondents indicated that they

would strongly consider relocating, while nearly 20 percent indicated that they would, indeed, relocate their place of business. Added together, this means that two-thirds, or 66 percent, of our area businesses will move or strongly consider a move out of town.
If you take this one step further, if the remaining businesses experience that 7½ percent reduction in their revenues, and say only 50 percent of the existing businesses seek relocation, the resulting situation would leave Barrington, as one respondent put it, a ghost town.
I urge the Surface Transportation Board to take the needed actions to prevent this crushing blow to our local economy.
Thank you.
MS. ADAMS: Richard McDonald, Rob Sherman, Brian Deja.

200

MR. McDONALD: My name is Richard McDonald. I'm a retired North Western Railroad --

MS. ADAMS: Could you move closer to the microphone.

MR. McDONALD: I'm Richard McDonald. I'm a retired North Western Railroad transportation officer and a Barrington resident.

Seven years ago, the board approved CN's purchase of the Wisconsin Central Railroad. This extended CN's reach from Canada to the Gulf of Mexico. Apparently it was close to a rubber-stamp deal with very little fanfare. There certainly wasn't much examination of CN's proposed operation, particularly in Chicago, which turned into a nightmare from the start.

Customers began complaining about service. The people in Chicago started complaining about traffic congestion. The other railroads started complaining about rail congestion. Indeed,

201

it was taking CN cars longer to get through the Chicago terminal than it took them to get from Winnipeg to Chicago.

The likes of River Forest, Forest Park, Riverside, Cicero, Riverdale, and the City of Chicago itself complained bitterly. They'd never seen such long trains of Canadian traffic creeping through their residential areas.

So what brought this all about? When CN's predecessor railroad brought its traffic from the Duluth Gateway, these communities weren't complaining. They didn't because they never even saw them. WC's customers weren't complaining about service either. So what did change?

In a nutshell, WC kept the cars sorted by destination, and before they arrived in Chicago. Then, after refining its blocks at Schiller Park Yard, WC delivered its transfer trains directly to the receiving carriers in pre-blocked run-through mode, so their traffic moved swiftly through the terminal.

202

Less than 10 percent of WC's traffic operated through the St. Charles

Air Line and the City of Chicago. There were relatively short -- these were relatively short interchange moves to and from the ICG. The other 90 percent was delivered to connections with other carriers via trackage rights on the IHB. None of it moved through the aforementioned inner suburbs.

Canadian National took over the Wisconsin Central. Instead of pre-blocking and maintaining those blocks upon arrival, it literally dumped its mixed trains into the terminal. First CN maneuvered its lengthy trains through the aforementioned inner suburbs to reach its Glenn Yard. Then it switched and reswitched and then made up other trains to get through the St. Charles Air Line and dragged it down through the City of Chicago.

Now, if the CN-WC merger of 2001 didn't negatively affect rail transportation, what would? CN changed

203

everything WC was doing to provide good service. Or, as the pundits would say, CN did nothing to benefit our national economy.

MS. ADAMS: Rob Sherman --

MR. McDONALD: So what makes you think --

MS. ADAMS: -- Brian Deja, Maureen Roberts.

MR. McDONALD: -- they're going to do it now?

MS. ADAMS: Rob Sherman, Brian Deja, Maureen Roberts.

204

MS. ROBERTS: Thank you. Good evening. My name is Maureen Roberts.

MS. ADAMS: Could you move closer.

MS. ROBERTS: My name is Maureen Roberts, and I live in Barrington.

A few months ago, Harrison Hunter, CEO of CN, said that the folks here

in Barrington are selfish. Well, tonight I want to talk about myself and my family, and tonight I am going to be selfish.

My home is on the crossroads of Route 59, Route 14, Cuba Road, and Lake Zurich Road. If and when a 1- or 2-mile-long freight train comes through Barrington 20 times a day, traffic will stop and back up to my doorstep and beyond.

I will not be able to leave my home to get to my office, to get to my clients, to get to my post office, to get to my library, to get to my grocery store. I will not be able to get to the Metra station here in the village.

My daughter, who is a high

schooler here, has to cross the EJ&E tracks not once, but twice, to get to the school. In addition to that, she also crosses the Metra line. Three railroad crossings that she has to go over to get to school.

And in addition to my not being able to get to destinations which are all in walking distance to me -- the library, the grocery store, my place of business -- the police department, the fire department, and ambulances services will not be able to

get to me if I need them.

A couple of weeks back at the Lake Zurich meeting, I had an opportunity to speak with a CN representative who told me that opponents to this acquisition are afraid of change. And I am here to tell you tonight that I am not afraid of change, but I am afraid of what is coming down those tracks, and I am afraid of the damage that is going to be left in its wake.

Right now the STB holds in its hands all that is vital to myself and my family: My livelihood, my well-being, my

safety, my pursuit of happiness.

I hope that you all on the board keep that in mind when the time comes to decide whether or not 8,000 tons of metal and steel should come rumbling through our small town 20 times a day. Please consider not allowing this purchase that would cause such a hardship on my family.

Thank you.

MS. ADAMS: Paul Hunt, Roger Owens, and Dan Strahan.

MR. HUNT: Good evening. Paul Hunt, trustee of Village of Barrington and also chairman of public safety for the village.

Imagine the audacity of the good people of Barrington to question that the word "benefit" be used in the transferring of their operation from their existing tracks to the EJ&E tracks.

Imagine the audacity of the good people of Barrington, West Chicago, Aurora, and Griffith, Indiana, well-known railroad towns, that their sole existence started with the railroad, be merely dismissed as not-in-my-backyard opponents.

This, as the testimony has been brought out, is something that doesn't

belong anywhere near an urban populated area. Some testimony has suggested that this is a major railroad interfare. This isn't something out west, west of Route 39, perhaps the Mississippi River belt. This is not something that should remotely come close to either our community or any

community in this Northeast Chicago area.

I'm also a recipient of being served by the Barrington police and the fire district when I needed medical help. I'm a graduate of Good Shepherd cardiac open-heart unit, a group of professionals from the beginning to the end that not only preserved my life, but also gave me great comfort in knowing that my community is being served by the best.

The three crossings that have been pointed out in the Village of Barrington, along with the Ela Road crossing at Lake Zurich, are major, major roads, routes to Good Shepherd Hospital.

Despite still having the environmental impact, the noise, just damage to the environment, we need to maintain public safety. That is something we all have the right to, and we as a

community have developed a very capable system.

I implore this board, the staff, to take into account these considerations.

209

It is not worth $300 million. It's not worth a billion dollars. This is something that must be considered, and CN and its operations should go to a more appropriate location.

Thank you.

MS. ADAMS: It is now 9:22. We're going to take a ten-minute break. We'll return at 9:32 according to the gymnasium clock. Thank you.

(Recess taken.)

MS. ADAMS: Roger Owens. Roger Owens, Dan Strahan.

210

MR. STRAHAN: My name is Dan Strahan, assistant village engineer for the Village of Barrington Hills.

While the Draft Environmental Impact Statement identifies several areas in which the proposed transaction would negatively impact the region as a whole, such as air quality, noise, and fuel, the focus of my comments will be three areas of local concern identified in correspondence to the STB during the scoping period, but they were not addressed by the Draft Environmental Impact Statement.

The Village of Barrington Hills provided comments on the draft scope of the EIS in February of this year. This letter identified a key drainage structure located under the current EJ&E tracks that regulates the water level in Hawthorne Lake. This outlet structure was constructed in 1910, and documentation was submitted to illustrate recent structural deficiencies that had begun to surface.

The village requested that this

211

structure be examined to confirm that the increased frequency and magnitude of loading that would result from the proposed transaction would not result in failure of this outlet structure. Such a failure would result in the unrestricted release of a 30-acre impoundment of Flint Creek, similar to the Lake Delton failure in Wisconsin in June of this year.

While the Draft EIS states on page 4.10-15 that vibration by even the heaviest freight trains rarely causes structural damage, in the same section of the report a detailed vibration analysis was, in fact, conducted on the Prestwick Dam in Frankfort, Illinois, an earthen dam more than 1,500 feet away from the EJ&E tracks, for the potential for vibration damage, yet the report failed to consider the impacts to a failing 100-year-old concrete structure located less than 50 feet from the center line of the tracks.

Another area of concern to the village is the intersection of Penny Road

212

and Illinois Route 59. The EJ&E tracks

cross Penny Road approximately 200 feet west of the intersection. As a result, there is a limited amount of vehicle storage between the tracks and the intersection.

This limited storage is of particular concern, as Rose Elementary School is located a short distance east of the intersection, meaning school buses frequently cross this intersection, generally during peak hours.

The nearly 300 percent increase in trains that is projected along with this bus traffic creates a potentially dangerous situation, tragically one that was made very familiar to the Barrington area in October of 1995 when seven students were killed when a Metra train hit a school bus in Fox River Grove.

This illustrates the need to complete detailed studies on at-grade crossings near major intersections.

Thank you.

213

MS. ADAMS: Richard Kuhn, Kathy Pinkus, Jamie Maravich. Richard Kuhn, Kathy Pinkus.

MS. PINKUS: Thank you. My name is Kathy Pinkus, and I speak to you as the past chairman of the North Shore-Barrington Association of Realtors and also as an active Realtor in Barrington and on behalf of the over 400 active Realtors in Barrington, approximately 100 of which have

attended tonight's meeting. And I thank them so very much for attending.

I've spoken to the majority of these agents, and I speak for them. Let me address the following points. We estimate the property values in all of the Barrington area will decrease by approximately 15 percent for those homes that are directly just in the vicinity in the Barrington area, but those homes that are directly in the vicinity of the train will go down in value 20 to 30 percent, and that's going to immediately decrease in value. This will put so many people that were in an appreciation track to immediate decline in their finances.

This reduction of property

values will also decrease far below the tax base, which supports our schools, the infrastructure, and area improvements.

We can't even afford to build a middle school that didn't pass a referendum several years ago, and now we have to -- and we need more elementary schools that are already overcrowded, and now we have to pay for the impact that the CN train will come with us.

This will radiate to so many other aspects of our community, and it will -- and as of right now, possible newcomers to the area, they've chosen other communities because of the possibility of the train. This will kill a town that we know today as the town of open spaces, a little slow moving, yes, but a town that has worked hard to keep its low profile. The train will absolutely ruin that.

Thank you.

MS. ADAMS: Jamie Maravich, Neil Morgan, Valerie Glimp.

MS. MARAVICH: Good evening. My name is Jamie Maravich. I'm a Lake Zurich resident.

Thank you for your time here this evening. I'm going to focus my statements on the Transportation Systems portion of the Executive Summary. I'm one of the multitude of unfortunate people who have been deemed in your study to be substantially impacted by the proposal, not by one of the 15 at-grade crossings that have been identified to be substantially impacted and require mitigation, but by two

of those 15 crossings, along with the -- I will suffer the conflicts on the Metra line which runs in and out of the Barrington train station.

Please don't misunderstand. This is not by any stretch solely a Barrington problem. The Barrington train station serves as a vital transportation hub for hardworking professionals from several surrounding villages, including Lake Zurich and Wauconda.

From just about anywhere in those villages, it is impossible to even reach the train station without crossing at least one EJ&E line. Not only will the commuters have a much more difficult time getting to the train station, but once there, there is a strong likelihood that they will experience delays getting to their next destination because of conflicts that Metra will have with CN trains.

And again, these delays won't be confined to Barrington area residents. They will impact thousands of other commuters along the line with their families. These commuters spend an average of 3 hours a day presently commuting so

that they can support their families and preserve their quality of life that this proposed acquisition so gravely jeopardizes.

The time the families get to spend together before and after work is a most precious and valued commodity. Please don't stand for this proposal that will

take untold hours away.

The communities that currently have to deal with CN have infrastructure to handle that burden. The communities on the EJ&E line do not.

Furthermore, I most respectfully disagree with the board's finding that any mitigation towards the devastating effects resulting from the traffic delays caused by the proposed action should be jointly funded by the applicant and the taxpayers, who will already be paying in many other ways, including increased pollution, increased noise, loss of sales tax revenue, lower property values, increased property taxes, substantially increased danger of health hazards from train accidents, dangers to those who fall prey to the newly tremendous temptation to beat the train,

and, yes, paying with that priceless and precious commodity of time.

In the spirit of compromise, I ask the board to reverse this assessment and require the applicants to fully fund

the design and construction of a minimum of 15 grade-separated highway-rail crossings that this acquisition would require throughout the study area.

In the spirit of the greatest good, I ask that the board reject this acquisition outright.

Thank you.

MS. ADAMS: Neil Morgan, Valerie Glimp, Zina Jacque. Neil Morgan, Valerie Glimp. Valerie Glimp, Zina Jacque. Zina Jacque, Bruce Sauer. Bruce Sauer.

MR. SAUER: Bruce Sauer. Good evening. My name is Bruce Sauer. I'm the village president of North Barrington.

I would like you, if you would, to imagine the EIS report in your hands, and I would like you to imagine writing on the EIS report all of the questions that have been asked by the people tonight, of all the questions that will be asked by the people of all the communities that you're going to review this with over the next few weeks.

I would ask that you write those questions in red ink because I think when you see the amount of red ink on that paper -- and I think it's appropriate that we're in a school. That amount of red ink -- because you failed to answer those questions in anticipation of the needs of the citizens.

I ask not that you make a judgment based on the information you have today, but rather that you extend the amount of information that you're

gathering, that you answer these questions specifically per community, that you answer the questions of real estate value, that you answer the question of business value, that you answer the questions of safety.

Trains have been running in the Chicagoland area for 140 years. The decision that you make today will be probably institute trains running for another 100 years.

I think it would be wise and I think it is appropriate that you take additional months or time of unlimited amount to answer the questions for each of the communities before you make a final decision.

Thank you.

MS. ADAMS: Mike Joyce, Scott Gifford, Terry Jennings.

MR. JOYCE: Hi, I'm Mike Joyce. I had a prepared speech, but something was brought to my attention in the other room when I was talking to some of the folks with white badges in back. I was in the back room talking to some people with the white badges and something came to my attention. I had prepared an exactly 3-minute presentation, but I'm going to change it.

A couple days ago I did some internet research on CN's railway, the big T that cuts across Canada with the bar that goes down to Mexico that runs right through Chicago, and I wanted to look at it from the big picture what they were planning in the future. I ran across -- again, this is on the CN.CA Web site plus some articles written in the industry news publications that were interviews with CN executives.

Their strategy, corporate objective is to capture the growing Asian market. We heard about that a little bit tonight. The West Coast of the U.S. ports

are fairly taxed right now with the amount of commodities coming in. The Prince

Rupert Sound is the project that I'm sure you're aware of. It went on-line in 2007 with phase 1. Phase 1 have a yield of 500,000 TEUs which is -- I just learned this recently. You put about two to four TEUs on an REU, which is basically a rail car.

Their stated plan, their corporate objective called phase 2, which is due in 2010, increases that yield from a capacity of 500,000 TEUs to 2 million TEUs. Nobody over there knew about this, and your paper, your analysis seems to not include this growth, 400 percent growth in phase 2 from the Prince Rupert Sound.

In a video provided by CN.CA available on the internet, on U-Tube, as well as on CN's Web site is a very proud video which talks about the Asian tiger waking up and all these commodities coming over to North America, and their Prince Rupert terminal intends to capture that

market.

So I would hope that you guys would consider phase 2, which falls within your study which increases the through-put by 400 percent. The 500,000

TEUs, when you do the math, you get to the 27 trains per day. So if you look at the increase of 400 percent, we're exceeding a hundred trains per day through Barrington. That's one-way trains. The return trains add up to 200 per day.

Thank you.

MS. ADAMS: Scott Gifford, Terry Jennings, Mary Margaret Olson.

Scott Gifford.

Terry Jennings.

MS. JENNINGS: Good evening. I'm Terry Jennings, the executive director of the Barrington Park District, and next to me is Christine Carrie.

MS. ADAMS: Just one of you is able to speak tonight, and that's you Terry because you're registered.

MS. JENNINGS: Can we share?

MS. ADAMS: No.

MS. JENNINGS: They told us we could.

MS. ADAMS: No, you can't.

MS. JENNINGS: On February 18, 2008 the Barrington Park District Board of Commissioners unanimously passed resolution 2008-1 opposing the Canadian Railroad acquisition of the EJ&E railroad trackage. Here are some of the reasons why.

Fact, the CN remains under fire in Canada. A 2007 report by the Canadian Parliament found a quote saying "Disconnect on safety issues between management and front line workers." That report also highlighted what company

employees called a culture of fear when it comes to reporting safety-related problems. Again, fact, a disconnect on safety issues. Again, fact, a culture of fear by CN employees.

Here we are at Langendorf Park, Barrington's main recreational facility located adjacent to the north boundary of the EJ&E and west of the EJ&E crossing on Northwest Highway, potentially cutting us off from police and fire access

in the event a train comes through blocking both Northwest Highway and Route 59.

Please tell us what happens to the young child who has had a tragic accident in our swimming pool? What do we tell the parents when on-site resuscitation efforts failed and essential transport of this child to the hospital couldn't happen because the ambulance was unable to get through? Whose fault is that?

Then what happens on Monday, every Monday, every month, all year long

when the seniors are at the park, when that senior has a stroke? What do we tell that senior's family when the ambulance can't get to Langendorf Park to administer that time- critical care for that life-changing event?

And what about all the summer long with the hundreds and hundreds of children and adults in our camps, on programs, playgrounds, softball leagues, picnics, skate boarding, just to name a few, when programming is at its height. The line drive that hits a player in the head, the skateboarded who falls off the

ramp, or a child who slips off the top of the playground, timing is of the essence to get them care and our paramedics can't get through.

We can tell you the Park District will make every effort to take care of the injured, we will call 191, and our emergency vehicles can't get through due to a train and it will not be the Park District's fault. CN has to take

responsibility for those issues. CN must be responsible for the people of Barrington and the users of our park.

Please reconsider those real critical safety issues for all of us involved. Thank you.

MS. ADAMS: Mary Margaret Olson, Joyce Palmquist, Karen McCarthy.

MS. PALMQUIST: My name is Joyce Palmquist. I'm the executive director of Barrington Area Council on Aging. We're the primary organization serving senior citizens and their family caregivers in the Barrington area.

My primary concern would be to some extent to those expressed by the hospital and by the police and the fire department. It's really around the ability of emergency responders to be able to help older adults who are in crisis.

You are probably not aware that within a 4-mile radius of downtown Barrington there are six facilities that serve senior citizens or individuals that are disabled. One of them is Alden Estates of Barrington. That's a nursing home that has 110 residents. We have Barrington Horizons, which is a residential facility

which has 59 residents. We have Green Castle of Barrington. It's a subsidized building. It has 103 residents.

We have the Garlands of

Barrington. That's a continuing care retirement community. It has 220 residents and it's expanding. We have a new facility called Sunrise Senior Living. It has a capacity of 59 and currently has about 35 residents. We have Lake Barrington Woods. It's a residential retirement assisted living facility that has 220 residents.

We also have three areas in the village where seniors tend to reside in condos, Shorley Woods on Northwest Highway, the Ela Street Apartments, the Outlooks of Barrington.

When you look at these facilities and where people reside, that's at least 800 individuals who are at high risk of needing some kind of emergency medical care. In addition, 12 percent of the population -- in the Village of Barrington, the population here is about 12,000 people. 12 percent are people that are 65 and over. So some of them are in addition to these individuals. Plus, there

are other people with chronic illness

conditions that cannot get out and about.

For older adults one of the biggest concerns for them is access to medical care, and having the EJ&E and the concern about the ability of emergency responders to be able to assist older adults puts an unnecessary burden on them as they already are anxious about their health concerns.

Terry was talking about the Park District. We have a meal program there, again, with older adults every Monday who are having a meal and may need to have an emergency responder. We deliver Meals on Wheels, which sometimes you will find a person who actually is lying on the floor waiting to get a meal, and if there's an emergency, we may not be able to get to them. When we find them, the responders won't be able to get to them. Plus, the whole delivery is interfered with when we have 3 point rail transportation.

Thank you for listening.

Thank you.

MS. ADAMS: Karen McCarthy, Ed Guntin, Bob Crowther.

MS. McCARTHY: Good evening.

First I'd like to thank the Surface Transportation Board for this opportunity to speak and hopefully be heard on the proposed purchase of the EJ&E railroad by the Canadian National.

With a 3-minute limit I will not repeat the numerous and obvious detrimental effects your approval of this deal would cause the Barrington area and the entire Chicago regional area. Instead I will ask you to consider why Canadian National's right to purchase the EJ&E should take precedence over the structure of American communities.

Why does Chicago need to be one of the major transportation hubs in this country? Do the interests of the Chicago area residents benefit more from this deal than the interests of CN? I say no. If the Chicago area rail lines are so congested it is because they have met their saturation point. Trying to force more train traffic and congestion into this area

solely serves only one interest, that of the railroad industry.

As an agency of the federal government paid by the American taypayers

you have a duty to perform and evaluate a fair and complete environmental impact report. Your evaluation of this report will be grossly incomplete and negligent if it does not include real mitigation solutions and guarantee funding sources to pay for the mitigation solutions before this deal is approved.

My analogy to this deal is a developer going out and buying a large parcel of land with grand ideas what he's going to do with it only to find out after the purchase that it was a really bad idea because the big ideas required improvements that are physically or economically feasible.

However, in this analogy the only people hurt are the developers. In the proposed Canadian National deal Canadian National seems to think they have

the right to demand whatever they want to increase their profits and then pass the destruction and cost onto the taypayers.

You cannot approve this deal without with real engineered and finance mitigation solutions in place. Our communities cannot survive through the

years the planning and funding process will take, if they occur at all. Where do you, the Surface Transportation Board, and Canadian National think the funding is going to come from?

On August 1, 2007 Interstate 35-W collapsed in Minneapolis. If you will please remember the issues that arose after this incident. We the people of the United States, we the taypayers don't have the funding to repair and replace our existing crumbling infrastructure. So please explain how you can justify approving this deal on the backs of the American taxpayers.

Please do not insult my intelligence by stating the overall benefit

to the Chicago area will be greater than the harm done to a few communities, because anyone who believes that train traffic on existing CN rail lines will be reduced in the future must believe in Santa Clause, the Easter Bunny, and the Tooth Fairy. Unless it is in writing in a legal document, it is a worthless rework.

This deal is bad for the Barrington area, the entire Chicago

regional area, and the American taxpayer. Let the freight train traffic move outside of the Chicago metro area where mitigation solutions will be feasible and cost effective and where future appropriate development can occur around them because overpasses and underpasses were designed into the master plan from the beginning.

MS. ADAMS: Ed Guntin, Bob Crowther, Peter Yates.

MR. GUNTIN: Good evening. My name is Ed Guntin, a resident of the Jewel Park community in Barrington. I have three young children who attend Barrington schools. As such, what I can say about the proposed CN transaction would fill volumes. In the short time I have been allotted, however, I will focus on one exclusive topic.

CN and its supporters have argued that those who choose to live near or in any community with freight train traffic should have expected that some

things might change. The essence of the argument is that individuals who come to the nuisance have no rights. For obvious reasons this form of reasoning is ridiculous, and I would expect that you would see the same.

It is one thing for a person to choose to live near the EJ&E tracks with no freight traffic whose presently is three to five trains a day. It's another for CN to propose a 400 percent increase in

freight traffic with no end in sight.

I submit to you that it is CN who is proposing to bring this outrageous business level to Barrington, neighboring communities, and the United States collectively. I implore you to consider the health and welfare of tax-paying U.S. citizens above all you should keep in minds.

The facts summarized by many speakers this evening are clear. As our representatives you must oppose CN's proposed acquisition. There is no other reasonable option. Do not support a foreign national like CN who cares exclusively about their bottom line and not

the welfare of American citizens.

Thank you very much.

MS. ADAMS: Bob Crowther, Peter Yates, Ed Springer. Bob Crowther, Peter Yates, Ed Springer. Bill Palmer, Terry O'Connor. Terry O'Connor, Robert Abboud.

MR. ABBOUD: Good evening. My name is Robert Abboud. I'm the president of the Village of Barrington Hills.

The Village of Barrington Hills has about 6 miles of EJ&E track running essentially north to south from Lake Cook Road to Route 72. The village of Barrington Hills of course opposes this deal. We believe that the deal is bad for the community. We believe it's bad for the region. We believe it will essentially institute a 2-billion-plus-dollar new cost to the taypayers of the State of Illinois just to mitigate the initial impacts. In addition, there will be another $1 billion in long-term mitigation costs that we'll have to deal with.

I should point out that

within the middle of that 6-mile section which is in the Village of Barrington Hills it's a single track. Now, your EIS already describes that you're going to have an increase in accident frequency, you're

going to have an increase in the severity of accidents, and you indicated that you would have a substantial increase in the amount of hazardous materials which would be carried along that track. That track is a single track right there. If you walk it, you'll see that in many cases you're more than 50 feet off the natural grade. So that the ballast, the part that holds the track is more than 50 feet high at that point.

You make the claim in the EIS that the CN and its operating affiliates will be able to properly and safely operate the line and it should be able to respond to any kind of hazardous material accident. I'm an engineer. We do this kind of stuff for a living. When I read the quality of the analysis that was done in the EIS, I was absolutely shocked, in particular because it failed to do a comprehensive analysis that was based on consequence.

You talk about accident frequency. You only need one tank car of

TCE to roll off that track. Based on the accident frequency that you propose, we should expect one of those tank cars to roll off the track in the Village of Barrington Hills every 28 months. We need one event to permanently damage the water supply not just of Barrington Hills, but of the entire Barrington region, which is some 50-square miles. Only one event will do it, because there is no mechanism that you have demonstrated -- that CN has demonstrated, rather, to be able to process and handle that kind of accident.

The last thing I want to mention is all of the data that I saw in the EIS appears to be provided by CN. It doesn't appear that the STB did any of its own independent analysis in terms of getting the data, the underlying data to do the analysis properly. I caution you about that because the President appointed you -- the President of the country appointed you as a fiduciary responsibility to protect the citizens of the United

States. You need your data, not the data from the CN.

Thank you.

MS. ADAMS: Keith Hunt, Richard Burkhart.

MR. BURKHART: Good evening. My name is Richard Burkhart. I'm a retired vice president for Oracle Corporation and a past member of the planning commission for Deer Park and president of the area for about 40 years.

I submitted on the 28th of January a 26-page document that outlined a number of issue that have not been addressed by the STB or the DEIS, nor the HDR people who are paid directly by CN through the STB. So there's a direct conflict of interest by having a consulting company taking data as Bob just mentioned and putting it into the record and then making a decision.

Case in point is if you triangulate the data from Costco, which is the chinese shipping organization who serves the port of Prince Rupert exclusively, it's just recently launched Costco America, that holds 12,500 TEUs and you triangulate the data from Prince Rupert Sound, which is exclusively served by CN,

we determine from the CN.CA Web site that there is a seasonality factor that probably

a hundred percent of the people in this room have experienced that the rush of finished consumer goods occurs in the period as defined by the CN Web site as week 33. There are six days per week out of 53 that they represent.

The traffic in week 1 represents 19 million tons. If you triangulate the data back to the other two sources I mentioned, you can determine easily where that freight is coming from. It shows the class of freight, it shows the intermodal, et cetera.

The net result is that we are at four to five times the number of trains equaling 82 that would be coming through Barrington in the period of August for a period of 16 weeks for that seasonality rush.

The DEIS represents there's a 3-year buildout construction period and traffic would be running at

lower speed and will have to go through the city. So for Mr. Harrison to represent the haves and have nots in this situation, downtown Chicago will continue to have the freight.

What I would like to respectfully request is that the nine-page document that I'm putting into the record tonight will have some standing and it be addressed by the STB, not handed off to HDR. I spoke to six of the HDR representatives. None had read the document that I had presented earlier.

There are social issues that are represented by President Clinton's order of 1994 that represent 211 Latinos that are in four cities, and this is a key part of the under-representation of the social injustice issue.

MS. ADAMS: Bob Vitas, John Tolomei, Bill Medcalf.

MR. VITAS: My name is Bob Vitas, and I'm the administrator for the Village of Lake Zurich. I spoke yesterday. I'm speaking again this evening.

In the Draft Environmental Impact Statement the section on socioeconomics fails to clearly identify the physical impacts in each of the

affected communities. If approved by the STB, the acquisition will have devastating impacts on all properties located within 500 feet of the rail line, not to mention beyond. In Lake Zurich alone there are 364 residential properties within 500 feet of the rail line. The total fair market value of the affected residential properties is slightly over $110 million and the equalized assessed value for tax purposes it's about 37 million.

Based on table 4.6-3 in the Environmental Impact Study, we can fully expect to suffer significant negative adjustments to all property values within 500 feet of the rail line. The loss in

taxable values can range from a low of 5.3 percent to as much as 15 percent depending on the proximity of the property to the rail line.

Using these percentages and applying them to existing known property values at 5 percent of the market value we'd see a reduction down to $105 million or a loss of about 5.5 million. The corresponding equalized value at 5 percent would then be reduced by about $35

million which would result in a loss of about $1.8 million. This would result in a direct minimum loss of revenue to the taxing bodies of Lake Zurich of a quarter million dollars.

On the high side at 15 percent the fair market value would have to be reduced to 93 or 94 million, which would be a loss of about 16.5 million. The corresponding equalized value at 15 percent would then be further reduced by 32 million, which would result in a loss of about 5.3 million. The end result is for

the 15 percent loss scenario an annual loss of close to $680,000.

Today's dollars, not future dollars. The village cannot and will not pass these losses on to the taypayers in the community.

As for the total 40 million suggested by the Canadian National as fair compensation to mitigate the impact of their operations, this figure is both ridiculous and offensive. In Lake Zurich along a total of six at-grade crossing may require grade separation. Only two were identified. The Environmental Impact

Statement specifically calls out that only two of the six should require grade separation.

At an average cost of 50 million the CN would need to invest anywhere from a minimum of 100 million up to 300 million just in Lake Zurich alone and adjoining Hawthorn Woods.

All the adjoining residential areas in the communities and

the School District No. 95 property will require some form of noise barriers and vibration protection measures. Add these costs to grade separation costs just in Lake Zurich alone and there is no question in my mind or anyone else's for that matter that the Canadian National's offer of 40 million is nothing less than an insult to the intelligence of all those affected by these hearings.

Who is going to replace the valuable and needed tax dollars? Will the Canadian National Railroad Company or the U.S. government step up to the plate and make Lake Zurich whole? Highly unlikely. Let me assure you here today, the property owners and local taxpayers of

Lake Zurich will not and cannot afford to bear these losses at the expense of the Canadian National.

MS. ADAMS: John Tolomei, Bill Medcalf, Daniel Peterson.

MR. TOLOMEI: I'm John Tolomei, president of the Village of Lake Zurich. Thank you for the opportunity to speak again.

I don't envy the members of the STB, who stated their three choices: Approve, deny, or approve with required conditions. To approve without conditions or deny presents the dilemma of either denying what many believe to be a needed expansion of freight capacity and a vital reason or significant diminishing the quality of life in many communities over 200 miles of railroad line. There's no point in denying that the acquisition will change life for all communities along the EJ&E. The only question is how bad will it get.

Your agency must decide the complex proposition that creates

winners and looses with high stakes for any parties. Although not in a decision I would welcome, an approval with conditions offers the only way to accommodate both

needs. The question then becomes what conditions and who pays for them.

We know that roads and airports can no longer expand in communities without providing significant mitigation to abate noise and maintain community connectivity. 2-mile-long trains of large containers intrude no less dramatically than cars, trucks, and airplanes. Railroads must be brought into the current age so that the public gets the same protection from new traffic that -- new train traffic that it now gets from other expansion to transportation facilities. Please condition any approval and giving us as much protection as neighborhoods now get with widening expressways or enlarging airports.

Requiring such measures for the CN acquisition will impose high costs. However, we all know that the real solution to Chicago's regional rail needs carry a high price tag. That's why CREATE

requires a 1.5-billion-dollar investment.

Rather than wait for the government to come to a comprehensive solution, the CN wants to approve a quick fix shortcut to CREATE. The problem is CN's solution is it fails to fix reasonable problems with the needed steel and concrete, but instead profits the CN by putting a Band-aid on regional rail problems at the cost of or quality of life.

If you choose to approve this acquisition, at least add all the real costs that deal with requiring extensive mitigation that includes sound barriers, underpasses, and other needed facilities. Sure it may delay the acquisition, but in the long run it will generate a true solution that establishes the policies needed to deal with an expanding railroad industry.

If rail truly carries the freight it touts, then it can pay the full cost for the burdens it imposes, and if CN can't do it on its own, such action will provide time for creative solutions such as freight surcharges or other means

253

to provide the funds for full modern-day mitigation as a condition to the expansion of the operations along the EJ&E.

Thank you.

MS. ADAMS: Bill Medcalf, Daniel Peterson, Vijay Gadde. Daniel Peterson.

254

MR. PETERSON: Good evening. Daniel

Peterson, Village of Lake Zurich, Director of Building and Zoning.

Last night I spoke to you about land use and the flaws in the Draft Environmental Impact Study and how it did not truly address the socioeconomic impacts that each community along the EJ&E will absorb and face if this transaction goes through.

I spoke last night to the fact that you will limit the municipality's ability to control land use along the EJ&E corridor. I highlighted a loss of a 22-million-dollar construction project, a loss of 45 full-time jobs related to that project, and the loss of business in our downtown.

Subsequently going through notes of a discussion we had with CN earlier this year, with the increase in freight traffic there is no guarantee that our industrial park will get the same level of service that passes currently on the E

255

related to goods and services being brought in. One such company could in effect lose 176 employees from our community should they leave town if they lose service there.

So the 280 potential direct or indirectly reduced job losses highlighted in the draft EIS is false. (Inaudible) are calculating 216 potential job losses related to this transaction. Where is that going to be made up? How is that going to affect our community and the jobs.

Again to land use, we will have to readdress our master plan, our comprehensive plan, and our downtown redevelopment at a potential cost estimate right now of over a quarter million dollars. Again, not being addressed through the Environmental Impact Statement.

Now, that's just one community. Multiply that by 36 communities along the EJ&E and that is a substantial impact that has been ignored.

Thank you.

256

MR. GADDE: This is a further expansion on my comments regarding noise and vibration presented on August 27 at the public meeting in Mundelein, Illinois.

The EJ&E tracks primarily abut quiet residential neighborhoods and school properties that will be impacted

negatively by increased sound, noise, and vibrations caused by the increase in train traffic. These areas include: Concord Village, Wicklow Village, Braemar, Carolyn Court, Hillman's, Bruce, Mionske, Prospect Park, and Hefler's subdivisions, The Landings, and Terrace Lane Apartments, School District 95 (Lake Zurich High School, May Whitney), and the entire downtown Lake Zurich redevelopment area.

In the DEIS, the SEA stated that: SEA concludes that requiring mitigation for all of the noise sensitive receptors predicted to experience a Ldn of 70 dBA or greater may unreasonably burden the applicants. The Ldn of 70 dBA is an

257

unsubstantiated threshold for the consideration of mitigation for noise impacts that has no technical basis, which no other agency uses, and that has been roundly criticized by the U.S. Environmental Protection Agency.

The DEIS uses a methodology for generating noise contours and accounting for building shielding that is outdated and was used prior to the advent of high speed

personal computers. This methodology is too generalized and could result in inaccurate inclusion or exclusion of impacted homes that could require mitigation for noise impacts. This threshold is higher than the widely accepted threshold at which impacts are deemed significant. For example, IDOT uses 66 dBA as a base threshold for consideration mitigating measures. Other flaws in the assessment methods include the following: While the DEIS acknowledges that this can be intrusive and annoying to the occupants, the report focused only on

the potential perceptions of vibrations and interference with vibration sensitive equipment.

The DEIS included a Lake Zurich monitoring location, 437 Elm Place. We do not have such an address in Lake Zurich.

We question the location and validity of the vibration test performed in the backyard of a residence in Carolyn Court, where the equipment malfunctioned after the first two trains because of sub-zero temperatures.

In its environmental justice

analysis, the DEIS fails to include a map showing low income and minority homes that would be impacted by noise.

While the DEIS concludes that a noise wall in the propagation path could potentially abate the predicted noise level, the DEIS does not identify any mitigation measures at all.

The public perception of validity for this DEIS must be based on an acceptable level of data validity and

transparency. In this document, these characteristics are spotty at best and the region cannot accept the DEIS conclusions.

The SEA should perform a more detailed noise and vibration analysis as part of their final environmental study and should contact every property owner residing in the subdivisions and adjoining areas noted below, all located within 500 feet of EJ&E tracks to discuss noise walls and additional landscape buffers.

MR. TARBET: My name is Jim Tarbet. I'm a resident of Lake Zurich.

On a professional basis, I dealt with computer systems from all technical aspects. In the field repairing them amounted to friction with laws of engineering. Analytical, yes.

Most last night after the meeting and all day today I sat trying to analyze the comments and information and that was after my questions based upon what I had read in this document.

There are no less than eight areas where real circumstances seem to deviate extremely from the analytical engineering data that you have, which, at best, demonstrates the computers are garbage in, garbage out. Everything from public health safety, welfare, quality of

life, economics, social life regarding our community.

I looked at the circumstances of the track and all of the safety issues related to it, and, quite frankly, I think

that the mayor of Barrington Hills is underestimating things when he said 28 months between major accidents.

U.S. Agency has direct authority over this, yet according to your brochure, you're advocating most of the responsibility that you have to the public. You are responsible for the public health, safety, welfare.

When we get to the point of each of these communities having facilities and having school facilities so close to the railroad tracks and everything else, I wonder what the price of a life is. And I guarantee that Hunter Harrison does not have the desire to go putting things in to protect the public health, safety, welfare, which is your primary responsibility, not the corporate.

I hope you look at your brochure, look at the consequences on that. I hope that you look at your methodology

and the consequences associated with that.
Throw out most of what you have, get back

into the real world with real measurements
and stop dealing with a computer. Your
computer system has failed just as badly as
the FAA failed last time.
Thank you, and good evening.
MS. ADAMS: This concludes the
public comment portion of our meeting
tonight.
We want to thank everyone for
their comments.
The next public meeting is
tomorrow evening in Bartlett with 4:00 to
6:00 p.m. open house followed by public
comment. Thank you.

D.4 Bartlett, Illinois

1

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET AND EASTERN RAILWAY COMPANY

BARTLETT HIGH SCHOOL

701 SCHICK ROAD

HANOVER PARK, IL 60103

CHIMNIAK REPORTING & VIDEO

Telephone: 312-781-9111

REPORTED BY: Dyann L. Berndt, CSR, RPR; Heather Reiva, CSR; Barbara Polke, CSR; Robin Chimniak CSR, RMR

2

MS. ADAMS: If everyone can please take your seats, we're about to begin the public comment portion of the meeting. Good evening, ladies and gentlemen. Thank you for attending tonight's meeting. We are here tonight to hear your comments on the draft Environment -- draft Environmental Impact Statement that was released July 25th regarding Canadian National Railway's proposed acquisition of the EJ&E Railroad. My name is Tina Marie Adams, and I will be facilitating the meeting tonight.

Before we get started, I'd like to take this opportunity to review some protocol for tonight's meeting. For starters, I would ask that everyone please turn off your cell phones and please refrain from interrupting any of the speakers or commenters. In a moment I will introduce those presiding over the meeting, and there will be a short presentation on the findings of the draft Environmental Impact Statement. Immediately following

3

this, we will hear your comments.

Each commenter will be given up to three minutes to speak. The time clock will be displayed on the screen right here in the center of the stage, and a yellow card will be shown and will be right in front of you at the microphone at two minutes and 30 seconds, with a red card shown at three minutes.

You will also see a list of speakers in order displayed on the screen. I will call forward the next two speakers in line after each speaker so we can be as efficient as possible. As you can see, there are two microphones set up in each aisle so move to the one closest to you. If you are interested in speaking and you haven't registered yet, you can still proceed to the registration table in the lobby here outside the auditorium.

Alternatively, I just wanted to remind you that you can submit comments to the Surface Transportation Board through the toll-free number, Web site, or the mailing

4

address, all of which are located in the program of the meeting that you received tonight. There are also comment forms and drop boxes in the lobby, and you can record your comments with the court reporters that are also located in the lobby. Again, just to remind you that all methods of comment are -- that are received by September 30th will be taken into consideration and weighed equally.

Tonight we are here to listen to your comments on the draft EIS. This is not a question and answer session, but we invite you to return to the open house area if you have questions or if you would like to provide your comments in a more private setting with one of the court reporters.

We appreciate your courtesy as we work to create an environment where everyone can be heard tonight. If you disagree with the speaker, we ask that you not express your disagreement out loud. Likewise, we know that interrupting a speaker during his or her remarks would give that person less

5

time to speak, and this is a time for everyone. So please just be considerate of all the speakers in that regard.

If we have anyone needing a Spanish translator, we do have someone here to assist you with that. She'll be available and around the room; but, also, you can look for someone with one of our tags that represents a staff person. In general if you have any questions, we have staff

around the facility to help. One quick housekeeping matter in terms of emergency exits, we have two located to your right and to my left; and we have three emergency exits to the right, to your left.

I'd now like to introduce to you the people on stage with me. Victoria Rutson, chief -- chief of the section of environmental analysis for the Surface Transportation Board, and John Morton, the team leader supporting the Surface Transportation Board's section of the environmental analysis. Victoria Rutson will now make some remarks about the draft

MS. RUTSON: Thank you, Tina Marie. Can everyone understand what I'm saying? If you can't hear me or understand me, please just put your hand up; and I'll try to slow down a bit or be a little more clear.

Thank you so much for coming this evening. It's a pleasure for me to be with you here tonight. As Tina Marie explained, the purpose of tonight's meeting is for us to hear you. We're here to listen, take notes, and carefully understand the comments that you would like to make to us on the draft Environmental Impact Statement.

I am the chief of the section of

environmental analysis at the Surface Transportation Board. Again, my name is Vicki Rutson, R-u-t-s-o-n. I've received letters from thousands and thousands of people in the Chicagoland area, and I'm sure many of you have written to me, as well. I've read the letters, and I understand what you're saying to us. I'm

very eager to hear what you have to say to us tonight.

As Tina Marie explained, there are many ways to submit public comments on the draft EIS. You may speak tonight in public. If you feel less comfortable speaking in public, you may write your comments down and mail them to the Surface Transportation Board. As long as they're postmarked by September 30th, those comments will be considered. You may meet privately with one of the court reporters that are available in the hall area. You may e-file your comments following the directions in the materials that have been provided. You may also call the board's toll-free environmental hot line number and record your message. You may do all of those things all at the same time. If you

think of a comment later on and want to add to what you've said, please don't hesitate to take some extra comment forms home with you to add to what you thought and said earlier.

Now, what are we going to do with all of your comments? Everything that we gather by September 30th or, in the case of letters, that are postmarked by September 30th will be read, reviewed, considered, and responded to in a final Environmental Impact Statement. That final Environmental Impact Statement will be issued sometime between December 1st and January 31st. That document will set forward the recommendations of the environmental staff to the decision-maker in this case.

Who is the decision-maker? It's the three men who comprise the Surface Transportation Board.

The board is an agency located in Washington, DC. The board was created by Congress and given by Congress the job of ensuring a strong national freight rail transportation system. The board members are appointed by the President and confirmed by the Senate for standard

five-year terms. That's explained on page 5 of your materials. The board is a

bipartisan, neutral body that will consider whether to approve this transaction, deny this transaction, or approve this transaction but only with the addition of mitigating conditions. Again, the board is neither an opponent or a proponent of this proposed acquisition. It is a neutral decision-maker. All your comments are very important to us, and each is considered equally. So if you don't feel like speaking tonight, please don't feel bad about that. You may comment in one of the many other ways I've suggested.

With that, I'll turn the microphone over to John Morton, who will talk about the findings of the draft Environmental Impact Statement. Thank you so much for being with us here tonight, and I thank you in advance for your respect and courtesy to other speakers. You have shown courtesy and respect to me throughout this very difficult process, and I am so appreciative to you for that; and I would ask you when people are saying things that you may not

necessarily agree with -- we understand you don't agree with the things that everyone says but please be respectful to those people. It's hard to speak in public, and it's really hard when people are saying things while you're trying to do it. So thank you for your courtesy, and we're so pleased to be here.

MR. MORTON: Thank you, Vicki. If it's okay, I -- I would -- I would just plan on speaking down here on the floor. I wanted to quickly go through some of the findings from the -- the Environmental Impact Statement. It's a -- it's a large document. I know you have a lot of questions. I'm only going to cover a few areas. We've set up some of the tables and the displays that were in the open house and set them up in the -- in the back corridor right behind the auditorium, and the staff that was manning -- maintaining and manning the displays down there are available back there to answer your questions. So I encourage you at any time just to go ahead and -- and ask your questions to the staff that's -- that's back in -- in the back.

First, I'd like to talk briefly about the -- the applicant. CN is a class one railroad, and it -- it basically is a major shipper, both, you know, foreign and -- and domestic freight. They have five rail

lines that -- in the Chicago area that converge on -- oh, I'm sorry -- that

converge on Chicago. And if I can get this -- I'm sorry. My hand does -- it shakes a little bit. But those are the five dark-colored rail lines that -- you know, and they come into Chicago. They operate about 150 miles of rail line in the Chicago area.

EJ&E is a regional rail line that -- that starts up in the north by Waukegan, comes down to the -- the Joliet area pretty much due south, and then across the, you know, southern part of the Chicago area, due east into Indiana and then up to -- to -- to Gary, Indiana. The EJ&E has two major rail yards; that is, the east Joliet rail yard in Joliet, Illinois, and the Kirk yard in -- in Gary, Indiana.

CN has identified three primary purposes for the -- the acquisition. First, they'd like to combine, you know, their five rail lines and -- and improve their operations around the city. Second,

they'd like to acquire the use of EJ&E's Kirk yard; and, third, they'd like to develop a more extensive relationship with the shippers on the -- the EJ&E.

The -- the draft EIS evaluated a lot

of -- of issues, and we did it by -- and we -- we organized it by resource category; and these are the -- these are the areas that are discussed in the draft Environmental Impact Statement. What I'd like to do is briefly go through the findings in a -- in a couple of these areas. Once again, I'm not going to cover everything that's -- that's in the document, and we -- and we do have people if you have questions on anything we talk about, they'll be -- feel free to ask the people back in -- in the hallway.

First, the -- the proposed transaction would have a number of changes. I'm going to talk about the rail line operational changes in just a second. The -- the -- the -- CN also proposes to construct six new connections. One is -- is fairly close

to here at Munger, and they also propose to construct 19 miles of a second parallel track in four specific areas that we've listed here. Once again, you have charts and maps located in the hallway that can show you the specific locations of those connections and where they're going to construct the second track.

From a traffic change standpoint, this is -- this is a density chart; and I know it's a -- it's a little hard to read, and it could be -- what it is is the outer area is -- is the EJ&E ring, you know, or arc. The inner lines are the -- the CN lines. The light blue color is the current traffic levels. The dark blue color is the proposed traffic levels should the transaction be approved.

So you can see that primarily what the -- what the operation plan includes is shifting traffic from the interior of the arc to the arc in -- in -- in coming around the -- the Chicago area. The expected increase on the EJ&E is anywhere from 15

to, you know, 24 trains per day. What that means and -- in -- in what the EIS evaluated is that in some areas the -- the practical capacity of the EJ&E rail line, you know, that will be at or near that practical capacity.

As a result, you know, the EIS indicates that we don't really expect any higher volumes of trains than -- than what was proposed in the Canadian National's operating plan. In addition, Metra does

cross the EJ&E in a number of areas, and coordination between Metra and CN will be required.

We -- the EIS evaluated train and roadway's safety. On -- on the EJ&E rail line itself because of the increased number of trains, the probability of -- of train accidents does increase, and the probability of a highway rail accident also increases. On the CN rail lines inside the arc because of the decreased train traffic, the probability of a freight accident decreases, and the probability of a highway

rail accident -- accident also decreases -- decreases. In addition, the EIS identifies three intersections that -- where there would be a substantial increase in -- in the potential for an accident, and those are Woodruff Road in Julia, Illinois, and then Lake and Miller in Griffith, Indiana.

The EIS also looked at passenger rail and hazmat. There is no passenger rail currently operating on the -- the EJ&E. There is passenger rail operating on the CN rail line segments inside the arc. Because of the reduced number of freight trains, there would be an improvement in passenger

rail safety there. There will be a substantial increase in the movement of hazardous material on the -- the EJ&E arc and a corresponding decrease in the movement of hazardous material on the CN rail lines inside the arc.

The EIS looked at 155 highway crossings on the CN rail line segment. There's -- 125 of those would have reduced freight train -- and then -- you know,

activity and thus a reduced delay at those. The EIS looked at 112 highway at-grade crossings on the EJ&E. Of those, 87 did meet the board's threshold for analysis. In the analysis, the -- the EIS concluded that without mitigation, 15 of those highway rail at-grade crossings would be substantially affected.

And those 15 are shown, once again, in the little diamonds up there; and if you want to know the specific locations, we do have a map, once again, in the back in the hallway. We'd be happy to show you where that is and actually show you where it is on -- on the -- the map that we have back there, too.

The -- the draft EIS looked at air

quality. There would be increased mileage because of the longer route around the arc, but there's increased efficiencies, also. The -- the net result is that the -- overall there would not be -- the -- the air emissions increases it -- by 2015 would not exceed current regulations or

jeopardize the air quality -- the region's air quality compliance.

The -- the draft EIS looked at emergency service providers, evaluated all the emergency service providers in -- in the vicinity of the EJ&E arc and identified that the documentation of level would -- would be substantially affected. That would be nine fire stations and two hospitals. Once again, the locations are shown up there, and the -- and the details on that are in the -- on the maps in the -- in the hallway in the back.

The -- the EIS looked at noise. There would be about 3,000 residences that would experience -- would be now within the 65 db contour on the EJ&E arc. There would be about 2700 that would no longer be within that contour on the CN rail line segments. Also, the Barrington area quiet zone would

-- because of the increase in freight traffic would no longer be able to maintain its quiet zone status without some type of mitigation.

The EIS also looked at mitigation for -- for a number of activities. The CN provides 76 voluntary mitigation measures. They're -- they -- they're shown in the various classes here. They're listed in the -- both the draft EIS and in -- the executive summary to the draft EIS lists all 76 of the measures.

In addition to that above and beyond those 76, CN identified 72 proposed mitigation measures; and it's certainly one of the things that they were hoping for comments on to also address a number of -- of -- of issues there. And, once again, those 72 measures are located in the -- in the executive summary of the EIS and also in the EIS itself.

And with that I'd just like to remind you that, as Vicki mentioned, there's a number of ways to provide comments. We encourage you to use all those forms, and I'd like to turn it over to Tina Marie.

MS. ADAMS: We will now begin the comment portion of our meeting. Let me remind you that we will adhere to the three-minute rule, which begins as soon as you start speaking. If three minutes is not enough time for you, please feel free to speak with a court reporter out in the lobby to complete your remarks.

We'd also invite you, if you have written remarks if you're speaking tonight, to provide those to the court reporter located to my right, to the audience's left, as you complete your speaking. If you speak beyond the three minutes, I will have to announce the next speakers. I would now like to ask the first commenter, Janet Andrew, to approach one of the microphones followed by Catherine Melchert and Michael Blazer. Please state your name and who you represent and the town that you're from.

MS. ANDREW: My name is Janet Andrew. I live at 109 Forest View Drive in Elgin in unincorporated Cook County. I'm an officer of the Rolling Meadows Homeowners Association, and I represent the concerns of 57 homeowners, about half of whom own homes that are within approximately 300 feet of the EJ&E tracks.

Of the many concerns that I would like to comment on --

MS. ADAMS: Would you get a little closer to the microphone? Thank you.

MS. ANDREW: -- there are two specific that I want to talk about right now. My neighbors and I believe that the SEA has made a gross oversight in failing to estimate the loss of property values. Although the study referenced in the draft is stated as recent, it is from 2004 and cites home values in Cuyahoga County, Ohio, where the median home price last year was $154,000. The average age of the homes in the study was 60 years. The study did not address the impact of increased rail

traffic on newer neighborhoods at all.

In contrast, the median home price in Cook County in 2007 was $449,000. We believe it's preposterous to suggest that the study is representative of homes along the EJ&E today. Plus current median home values are shown in the draft for only six of the 60 affected communities, and no estimated counts are provided for how many homes will actually be impacted. The comparison of our homes to this four-year-old study in Ohio is highly questionable.

Since the draft fails to estimate property loss values for any of the impacted areas, we've come up with our own. Using home values in Rolling Knolls as listed on Zillow and Cyberhomes, we estimate the loss of property value in my neighborhood alone to be in the range of three to three-and-a-half million dollars. This comes to about an average of $60,000 per home.

These are seriously large numbers and

considering the shockingly high foreclosure activity we're seeing today, it's a glaring shortfall on the part of the SEA to not have comprehensively addressed the impact on property values. If I can come up with a dollar estimate, surely the SEA should have been able to come up with a dollar estimate.

The safety of our ground water is also a serious concern for my neighbors. None of the 57 homeowners in my neighborhood have access to municipal infrastructure; rather, we rely on private wells for our water. While the draft suggests that the likelihood of a hazardous materials spill is remote, the risk does still exist and, in fact, has occurred on CN rail lines in the past.

Should a hazmat incident occur along our stretch of rail, all of our wells would likely become contaminated.

CN has been shown in recent years to have a deplorable safety record and has proven to be profoundly insufficient in

their response to hazardous spills. The fact that the SEA has not considered the impact of this risk to our private water supply is an egregious omission and should be rectified in the final study. Thank you.

MS. ADAMS: Catherine Melchert, followed by Michael Blazer and Danny Simpson.

MS. MELCHERT: Good evening. My name is Catherine Melchert, and I am the village president of Bartlett. The point has been made by the Canadian National Railroad Company and some communities that this purchase would be good for the region, and that point is false. Creating new problems without fixing the old is neither good for sustainable growth, nor does it do anything to promote regional cooperation.

Had Canadian National and its sister railroad company embraced the concepts of CREATE with full vigor from the beginning, the congestion on existing lines could have been mitigated and could be mitigated; but the problem seems to be that the railroad companies, the CN in this instance, are not looking for long-term solutions to existing problems but, rather, short-term answers to their long-term profits. This purchase will add nothing to the communities along this line. There is no benefit which would improve our communities, only problems; and we know something about these problems.

There is an existing CN line that runs east-west of our community. Although this is one of the lines which will see less traffic, it is because of this line that we have experienced difficulties with this railroad company. This line has caused serious disruption to our community and the travelers on state Route 59 for many years, and until recently there has been no effort to respond to the correction of problems which speak to the issues of air quality, traffic congestion, and quality of life for our residents.

I refer you to the posters that we have in the hallway with information regarding the delays over the period of the last 18 months. Think about this: You have a major highway blocked; the closest north-south arterial in either direction is two miles away; access to police, fire, and ambulance is cut off; police officers taken away from the normal duties to cover major traffic issues; and there is no communication from CN. Equally

frustrating, there is no recourse.

We are afraid that if this purchase is approved without federal regulations prohibiting such practice, it will begin again after the purchase is approved. This cannot be allowed to occur. It seems that regulations or agreements must have strong consequences in order for the railroad to be a good neighbor.

Let me go back once again to regional planning and a topic of which you are well aware. The STAR line, an innovative idea, would be good for the region in many ways, not the least of which is improvement in congestion and air quality. This purchase all but brings the death knell to that

project, and that would be unforgivable. That would be so 19th century.

Sacrifice a modern day, light rail commuter line that daily benefits thousands of the region's commuters, creates less road congestion for thousands more, attracts new businesses and jobs because of these improvements to the quality of life

in our area and for what? A foreign-owned company able to swiftly move foreign goods through our region to be transported to the gulf and on to other foreign countries which in the end results in the loss of business and jobs at our own West Coast ports.

There are far too many unintended consequences to this purchase for it to be quickly approved. There are far too many unintended consequences that need to be mitigated for this purchase to be approved. We need a plan that addresses all the issues, not just for today for this purchase, but for the region and for the future. Thank you.

MS. ADAMS: Michael Blazer followed by Danny Simpson and Michael Airdo. Folks in the back of the auditorium, are you

hearing the speakers okay?

MS. ADAMS: Rob Sherman?

MR. SHERMAN: Good evening, Tina Marie. Good to see you, John. Nice to see you all survived Barrington last night.

I'm Rob Sherman, the green party candidate for state rep in such communities as Buffalo Grove, Wheeling, and Prospect Heights where the Metra north central line runs and where the current freight trains run. I wanted to add five quick points to my comments from Tuesday night.

First, I continue to hear that this proposal is a catastrophe but only if it affects the people along the EJ&E rail. If it affects my communities, then it's okay. So if -- if these trains are a problem, if these trains really weren't that big of a problem, then there would be a problem all over, not just in the EJ&E ring.

Zoning, I want to talk about zoning mitigation meetings and Metra STAR line. Regarding zoning, I go to a lot of Buffalo Grove village board meetings, as well as

village board meetings in other communities, and I hear this all the time

where residents say, hey, I don't want a business to go in in a particular location, or I don't want something built in a particular spot where it's zoned for that. And the municipal officials always say, well, there's nothing we can do because the property owner has the right to use his property for what it's zoned for.

So this sounds basically like a zoning dispute. Ladies and gentlemen, this is zoned for rail; and just because the property owner didn't fully do the license resource, doesn't mean he should be denied the opportunity to fully utilize it now. It -- it's not like they're asking for a zoning variance. It's not like they want to, you know, shoot fireworks off. They're asking to use their property for what it's zoned for. How can you or the communities say that a property owner should be denied the right to use his property for its intended purpose?

Next, in regard to mitigation, the only mitigation that I think is

32

appropriate, the only key piece of mitigation, one, rush hour. Perhaps there can be a moratorium during rush hour so it doesn't mess up, you know, the Metra trains that cross and also the street traffic when people are -- are trying to get through and in a hurry to get to the -- to -- to work or school. But, also, if that kind of moratorium is put in, then in regards to the forest preserve where they want to link somewhere in DuPage County forest preserves, they should be given that option to do that.

Meetings, I've heard a lot about how the meetings are along the EJ&E communities. We should have meetings; and as a procedural question, can we get some meetings along the -- where the line is, not on the freight line?

And the last thing in regards to the Metra STAR line, I hear that 20 freight trains a day would be catastrophic; but 40 Metra trains, that would be okay. And the freight trains, they wouldn't run during

33

rush hour but the Metra trains would. So if -- if 20 freight trains would be catastrophic, 40 Metra trains would be terrible. Thank you for your time.

34

MR. SIMPSON: The first thing I want to talk about is the CN's desire to

short-circuit this entire process. They have filed a petition asking for early approval of the stock purchase agreement with U.S. Steel.

They want you to decide by October 15, only 15 days after the public comment period, and they want you to decide whether you will do that by September 15, before this public comment period is even concluded, and if you don't do it, they say they will take this to the appellate court.

Now, why are they in such a hurry? They say this is a "minor transaction" because any anticompetitive effects of the transaction will clearly be outweighed by the transaction's anticipated contribution to the public interest in meeting significant transportation needs, and they say that there is a risk that U.S. Steel will walk away from the deal if this isn't done by December 31.

Now, I don't know about you, but

35

I haven't heard of a lineup of other buyers for the EJ&E waiting in the wings if this deal falls through.

So what's the real reason? Why do they want a rush to judgment? Because

they have failed to adhere to recognized engineering principles; because they ignore pending projects that dramatically alter the results of their faulty analysis; because the data they've submitted is just plain false.

This is not just theoretical. We are not here opposing just for the sake of opposing. This isn't "minor" to the village of Bartlett. We are dealing with significant life, health and safety issues.

There are two at-grade crossings in Bartlett, as you know, West Bartlett Road and Stearns Road. The current conditions are already untenable. I have here almost 250 pages of police reports in one 12-month period, resulting from extreme delays at the grade crossings in Bartlett, all far in excess of the ten minutes that

36

the CN says should be the standard. They propose a 400 to 500 percent increase in rail traffic at these two crossings, but according to the CN, 22.5 plus 23.4 equals zero.

The CN effectively ignores the Stearns Road Bridge over Fox River, and then there is the new fire station being

built, recognized in the draft EIS (p. ES-44, Table ES-2) as an Emergency Service Provider Potentially Substantially Affected under the Proposed Action.

What does the CN say about such a direct and substantial impact on the residents of Bartlett? They don't put forth a single specific mitigation proposal. Instead, what we get is generalities like VM 21: Applicants shall notify Emergency Services Dispatching Centers for communities along the affected segments of all crossings blocked by trains that are stopped and may be unable to move for a significant period of time.

Now, I suppose that could work

if fires will cooperate and not start while trains are blocking the road, and if accidents won't happen at those times, and if people will also cooperate and have the courtesy to not have heart attacks or strokes at the wrong time.

We are dealing with situations where seconds matter and where minutes can mean the difference between life and death. But to the CN this is a minor matter and they are making a contribution to the

public interest.

Why is the CN doing this, what is, in fact, a conscious effort to avoid, to evade grade separation requirements?

Now, I will close in reminding you of your obligations. What is the STB duty here? That you not be swayed by false and misleading information and that you do your job and not rush to judgment.

Thank you.

MS. ADAMS: Daniel Simpson, followed by Michael Airdo and Brent Coulter

MR. SIMPSON: My name is Danny Simpson. I'm assistant vice president of safety and environmental proceedings. I appreciate the opportunity to present CN's perspective on safety and emergency response issues here this evening.

You probably heard some people raise concerns about CN's corporate culture, saying it would lead to decrease in safety levels if this transaction were approved. These suggestions aren't supported by the facts. Safety is one of CN's core values since CN operates one of the safest railroads in North America

according to the Federal Railroad Administration's statistics.

As required by the Board and FRA regulations, CN prepared a safety information plan, or SIP, with this transaction. Should the board approve this transaction, CN is fully prepared to comply with the terms of the final SIP and to continue to coordinate with the FRA integration into CN's operations.

Unfortunately, despite best efforts, incidents do sometimes occur in the rail industry. However, CN's emergency response plan is designed to allow seamless integration of federal, state and local governments before, during and after emergencies. CN works with communities to ensure a high level of emergency preparedness. In addition, our system protection plan ensures distribution of resources aimed at prevention, preparedness, and emergency response capability.

Training is an important aspect of our efforts. CN's dangerous goods group conducts outreach training programs in communities across the system, resulting in

better trained global responders, working safely and efficiently with CN personnel should emergencies arise.

Some have made much of the findings in the draft relating to increased frequency of train accidents and increased risk of accidents at rail crossings. The

possibility of any accident is a serious matter, but what people seem to forget is in the draft finding the likely number of rail accidents from CN's existing lines, if such changes are made, would decline 77 percent compared to current operations, and the grade crossing accidents in the region overall would decrease by 8 percent.

Also, as the draft pointed out, while the number of major key routes of hazardous material shipments on the EJ&E line would increase from 2 to 14, the number of major key routes on CN's existing lines through downtown Chicago would fall from 23 to 3. The DIS shows the risk of adverse safety impacts along the EJ&E line are more than offset by the safety benefits for the communities located along the CN's existing lines.

CN recognizes the potential

adverse safety impact along the CJ&E must be addressed. CN proposed a number of voluntary mitigation measures relating to ER and haz mat transportation, which were

included in the DIS. In addition, as my colleagues testified earlier this week, CN has been actively engaged in outreach efforts to communities along the EJ&E line in an effort to develop comprehensive voluntary mitigation measures and to address community concerns.

I'm happy to discuss these related issues with any and all communities along the line, and I have already done so with numerous within the community.

Thanks again for the opportunity to speak before you this evening.

MS. ADAMS: Michael Airdo, followed by Brent Coulter and Alan Murphy.

MR. AIRDO: Good evening. Michael Airdo, Bartlett Village Trustee.

There are three concerns that I would like to focus my comments on this evening; safety, air quality and noise. I'm narrowing my comments to these areas because these will have the greatest negative impacts on the residents of Bartlett.

These three issues; safety, air quality and noise, are also the impacts that the draft DIS has provided little hope for meaningful mitigation by CN.

The first issue is safety. With the huge increase in freight volume, as well as an increase in hazardous cargo loads, the risk to safety is very real. The draft DIS indicates the total number of train accidents on the EJ&E will likely increase by 28 percent, and the number of major key routes, key routes being aligned with the trains that carry more than 20,000 car loads per year of hazardous materials, will increase from 2 to 14. A greater

potential of train accidents coupled with a dramatic jump in loads carrying hazardous material is a dangerous combination, that what does the Draft EIS say to communities faced with this increase?

It tells us not to worry, that hazardous material would remain remote because of the regulatory and other safeguards already in place. Such a statement does little to ease the concerns of our residents living along the EJ&E.

This is especially worrisome given CN's deplorable safety record in Canada. In a report released this year by the Canadian Parliament, CN received the lowest grade possible on implementing safety management systems designed to offset accidents and other safety hazards.

But we need not rely on the Canadian Parliament to tell us the priorities of CN when safety is involved. We can look to the company's response to a $130 million hazardous material spill in Canada caused by a defective rail.

According to that account, CN

still faces charges from Alberta's Environment Ministry that it failed to act properly to confine the spill. But those charges don't raise red flags as fast as the fact that within 48 hours the big rail's trains were moving again, while the townspeople had to physically block the tracks to get the attention of CN officials, who would not meet with local citizens impacted by their spill.

The assurance that CN will operate in a safe manner is met with skepticism here in Bartlett, and justifiably so. That the SEA decided not to look at CN's Canadian safety record in developing the Draft EIS is remarkable and needs to be rectified.

The second issue is the increased freight traffic. CN argues the more rail traffic means fewer trucks on the road, improving the local environment. The traffic idling, while waiting for two-mile long trains to pass at grade crossings,

will negatively impact local air quality. The crossings in Bartlett and Route 59 and Munger Road were blocked 120 times.

The final issue is noise. The

CN locomotives have stopped in Bartlett in the past, and we read about it in the Chicago Tribune, from 36 to 48 hours straight, less than a hundred feet from the Woodland Hills subdivision, and CN has done nothing about it and refuses to do anything about it.

MS. ADAMS: Bret Coulter, followed by Alan Murphy and Joseph Fink.

MR. COULTER: Good evening. My name is Brent Coulter. I'm a registered professional engineer in the State of Illinois and hold a national certification as a professional traffic operations engineer.

My testimony tonight is on

behalf of the Village of Bartlett, and I will be following up on the introductory comments of Mr. Blazer earlier.

The CN proposes to increase train traffic fourfold in a section of the EJ&E rail corridor that already experiences excessive at-grade crossing blockage by train activity, and where no alternative highway/rail grade separation exists for a length of nearly seven miles. This action is of great concern to the Village of Bartlett with respect to increased highway delay and queuing, and significantly slower vehicle response times to a large residential and employee population west of the EJ&E.

Equations for delay and queuing

for rail/highway at-grade crossings used in the Draft EIS were developed based on rudimentary concepts borrowed from highway traffic signal theory and reference the nationally recognized Highway Capacity Manual. While I agree with this analogy to highway traffic signal control, the simple equations used in the Draft EIS fail to incorporate many critical factors.

Application of computer models

that implement the full Highway Capacity Manual indicate that both delay and queuing in the Draft EIS are underestimated by 50 percent or more, with both the Stearns Road and West Bartlett Road arterial at-grade crossings exceeding the 40 daily vehicle hours of delay criterion used in the Draft EIS for grade separation consideration.

In the absence of additional lanes crossing the EJ&E on West Bartlett Road, peak hour vehicle queues could exceed 4,000 feet and would block all access points serving nearby residential neighborhoods just east and west of the

crossing, as well as access to Bartlett Fire Protection District Station No. 3.

In addition, the adverse or extra travel distance that fire department vehicles would be forced to travel to access a grade separation or open crossing to serve the area west of the EJ&E ranges from 2.1 miles to over 4.2 miles. That's 3 to 5 times the 3/4-mile threshold that defines a substantial impact used by the Illinois Commerce Commission for at-grade crossing closures in urban areas.

In some cases, projected year

2015 highway traffic volumes used in the draft EIS for evaluation of the proposed action have been significantly underreported. On top of that, use of the seven-year horizon for impact evaluation is unacceptable and out of step with the typical 20-year design horizon mandated by the Illinois Department of Transportation and the Federal Highway Administration.

The draft EIS analysis crossing delay in queuing is based upon assumptions

favorable to the proposed acquisition in terms of train operating speeds, no bunching of train traffic during the highway peak hours, and no excess crossing blockage due to train switching activity. Such an environment is contradicted by a history of extremely long delays and blockages along EJ&E crossings in the Bartlett area.

In conclusion, I believe that the draft DIS method for estimating delay and queuing is flawed, and, in combination with low estimates of future highway usage, significantly underestimates at-grade crossing delay and queuing. The Draft DIS also fails to estimate the adverse travel

distance for police, fire and ambulance vehicles to provide emergency service to the Bartlett area west of the EJ&E railroad when crossings are blocked by trains.

MS. ADAMS: Alan Murphy, followed by Joseph Fink and Karen Wojciechowski.

MR. MURPHY: Good morning. My name is Alan Murphy. I'm here represent the people of the Du Page Group. If you are not familiar with us, we led the fight and defeated the transfer station in West Chicago. We also do other charitable activities in western Du Page.

As you are possibly aware or becoming aware, we provided the signs out in front of the high school tonight, the nice yard signs. Our group is formed to help the local people in western Du Page County, and I think it is a life safety issue, the whole CN proposal.

One of the things you have got to realize is what happens if you have a heart attack and you are on the wrong side of the tracks? What happens if you live west of Bartlett and have a heart attack?

What happens if you live downtown Wayne and there is a UP train and a CN train? Wayne becomes an island. How do you get help to that person? Three minutes, four minutes; how long does it take for you to expire?

People's lives are more important.

West Chicago spent a lot of money on redeveloping its downtown. What will the CN do to West Chicago's traffic patterns? Will it put a stranglehold on our town's development, our time, our money, our citizen's way of life? It will affect everybody along the whole route.

One of the things you must realize is West Chicago is at a junction; the Union Pacific west line, Canadian National, or the EJ&E. This point where the junction meets, if all the proposals go through, will be the busiest train intersection in the United States. With all the projections, there will be over 200 trains a day at that intersection. What is the railroad industry and what is the CN doing to help the community of West Chicago and the residents?

The other thing I would like to address is the Petitioner filed a

1,000-page document, and I'm given, what, three minutes to respond to 1,000 pages?

You know, we teach our kids to say no to drugs. Why doesn't the National Transportation Board take a lesson from that and just say no? Thank you.

MS. ADAMS: Joseph Fink, followed by Karen Wojciechowski and Michael Kwasman.

MR. FINK: My name is Joe Fink. I live at 617 Rose Lane in Bartlett, and I'm just here to speak for me, and not other organizations.

I do appreciate the fact that officials from Bartlett have taken the position that this is not good for our area. I was quite surprised when we came here tonight to find that at a grade crossing about a mile from my house, the number of hazardous car loads would go from 29 to 209. That concerns me, and the name and number of trains at that same grade crossing goes from five to 22.

That grade crossing is very close to the new fire station that has just been built here on West Bartlett Road, and a train, if you try to get across west from there, you would have a very difficult time if the train is going across that crossing.

I can appreciate personally how important it is, when you call for emergency service, you need it. This is a personal thing for me. My wife has needed

54

that a number of times. We had a wonderful response from the Bartlett police and the fire department, and I just think that that would be jeopardized.

The last thing I'm concerned about is the length of the trains. These two-mile trains, possibly two-mile trains, traveling in the Chicago area and in the Bartlett area, it just doesn't make sense to me. Thank you very much.

MS. ADAMS: Karen Wojciechowski, followed by Michael Kwasman and Ruben Pineda.

55

MS. WOJCIECHOWSKI: Hi. I'm Karen Wojciechowski, and I'm a concerned resident

from Bartlett.

If this deal were only about interstate commerce or transportation efficiency, we probably wouldn't be here tonight because there wouldn't be much to talk about; however, there is one very important issue, and that is safety, the seriousness of which is minimized by the study.

I'm not here because I'm worried that I will be late for an appointment to the beauty salon due to a train blocking the road or because I'm annoyed by trains going at all hours. What keeps me awake at night is the risk of being cut off from emergency services, which would be four or five times more likely to happen if this deal goes through.

Like thousands of Bartlett residents, I live west of the EJ&E tracks. Unfortunately, all of the services that my neighbors and I potentially need during an

56

emergency situation are located east of the tracks, including a new fire station, the two existing fire stations, the police station, and the nearest hospitals.

Seconds count in an emergency

situation. The fact of the matter is if your house is on fire, if your husband is having a heart attack, or your baby can't breathe, you don't have time to wait for that fire engine, for that police car, or for that ambulance to turn around and take an alternate route because a freight train is blocking the only path to your house.

The STB study has already identified the impact of the emergency services in Bartlett as a substantial potential problem area, and, with all due respect, approving this deal without having effective mitigation in place would be the height of irresponsibility. I'm aware that a level of risk exists today because of the existing freight traffic, but let me give you an analogy here: Increasing the risk to public safety by allowing freight

57

traffic on the line to quadruple is like dealing with a few drops of spilled milk by dropping the entire pitcher on the floor. It only makes the situation worse.

No one can and no one should attempt to put a price on a human life. The risk to public safety is too serious and can't simply be dismissed for those of

us living along the EJ&E tracks. Public safety is not a game of number crunching, or regional averages, or comparing the number of towns that will and won't be impacted. It is about preserving human life and nothing is more important.

That's why I urge the STB members to imagine themselves in a similar position and truly evaluate the serious safety risks this deal poses.

Thank you.

MS. ADAMS: Michael Kwasman, followed by Ruben Pineda and Jesse Felix.

58

MR. KWASMAN: Good evening. I'm Mike Kwasman, mayor of West Chicago, the community that has its tradition of a railroad town.

However, we were stricken when representatives from the STB came to my community, looked at what we had to offer, and they were a little bit stumped about the train-to-train roadblock. We are not talking just commuters. We are talking the CN versus the UP. You don't think that the

UP would let the CN get an upper hand when it comes to competition? I think not.

So when most trains bottleneck in an area, what are we to do in our town of West Chicago? Miles and miles of stopped trains. Your plan, it wasn't even mentioned in your plan.

Number two, you say, about fire stations, sure, we are building new fire stations in West Chicago, not due to growth. We are building fire stations due to rail traffic.

The CN wants to increase their

capacity. Their capacity is for repayment to their stockholders. Well, my stockholders are the citizens of West Chicago. They have already dug into their pocket and raised their property tax to as far as 25 percent, not due to them, but due to the railroads.

In today's times, how much can we keep asking our constituents to go into their pocket? There has to be some sort of balance between commerce and the safety of our public. Your job is to weigh that balance. We come from the community that is a railroad town. We have no intention

of being enslaved by a railroad.

Thank you.

MS. ADAMS: Ruben Pineda, followed by Jesse Felix and Randy Ramey.

MR. PINEDA: I'm alderman Ruben Pineda from the City of West Chicago, Third Ward. The Third Ward is exactly right where these railroad tracks are. It runs right along the border of the Second and Third Ward. My ward is going to be greatly impacted.

Right now we have five at-grade crossings in West Chicago. With the length of the trains, if this acquisition happens, at any time all five of those grade crossings can be stopped at one time. So nobody would be able to get to the eastside of West Chicago.

I kind of like the eastside of West Chicago, and I would kind of like to be able to visit once in a while. With all

these trains coming through here, five at-grade crossings, we really wouldn't have a chance to get across there.

Right now we have one at-grade crossing that is going to be greatly impacted; it is called Aurora Street, and there that is completely landlocked, and

that is the only way in and out to those four or five homes. We already had one house fire that our fire department was not able to get to in time, and we lost two lives, two small young children. So we have an issue there if there is a train stopped in front of Aurora. There is no way in and out of that little tiny subdivision.

We have got about 300 or 400 students that are on the west side of the tracks in my ward that have to cross three grade crossings there to get to high school, either in a vehicle or walking. There are a large percent of pedestrians that are students and are walking, and of course students, when they start hearing those bells, the first thing they are going to try to do is try to beat that train, and I find that very disturbing because we have

already had one death this year, within the last six months. It was a small child trying to beat the train. If we have more trains running through there, the averages

are going to go way up as far as possible fatalities.

With the impact that these trains could possibly cause, we have only got a couple of options as far as my ward, and that's going out on Tower Road or Pearl Road. Those are two very critical intersections that a lot of people literally don't go that way because, Roosevelt Road, we have got two blind spots there to try to get out on the track. If these trains start coming through, they have no option but to go out there and try to get through there. There is no stoplight. There is nothing there.

So that's a huge concern because of the amount of traffic accidents at that crossing there would be incredible.

This acquisition could literally cut my community in half. The City Council has worked very hard to make it a better community, and it will completely destroy our community, and I would hate to see

something like that happen.

63

Thank you very much.

MS. ADAMS: Jesse Felix followed by Randy Ramey and Hugh Stott.

64

MR. FELIX: My name is Jesse Felix. I am a resident of the Community of Bartlett, and I am the superintendent of parks for the West Chicago Park District. A key factor when one decides to move a corporation or, most important, a family to a community is the quality of life.

Parks, I have always felt, demonstrate community pride and give the residents and visitors a positive impression to what a community has to offer. Active and passive recreation are important factors for the quality of life in a community. They are important factors to remember when considering this proposal, however minor the Board may feel this that transaction may be.

We are very proud of our parks in West Chicago. They are more than just athletic fields and open spaces. Our parks contain plants, animals, and the inanimate.

If I do not object to this proposal, which will bring additional

65

train traffic to the community and

negatively influence the parks, I would be doing a disservice to the community I work for and the community I live in.

Commissioner Buttrey is correct in his concern and assessment that even the most far-reaching mitigation would be enough to offset or balance the environmental detriments that would flow from this proposal.

No one came to West Chicago Park District and asked about our adjacent properties or future plans for development. Reed-Keppler Park has 500,000 visitors annually that use it for recreation and special events. Reed-Keppler Park contains 20 acres of high quality wetlands that run along the EJ&E.

Pioneer Park has a master plan to redevelop the existing park amenities and the land that was acquired by EJ&E. This park will see an increase in usage once the redevelopment has occurred beginning in 2009. Pioneer Park is our hub

66

park for the south side of West Chicago.

One major park that was missed in the report was Manville Oaks Park. Manville Oaks is a 184 park site

that runs along the east side of the EJ&E across from Fermi Lab. This park has a master plan for redevelopment that has recently been completed. We would anticipate at least 250,000 visitors to the park to attend concerts, play disc golf, attend sporting events, or walk, jog, and bike.

Within Manville Oaks is Kress Creek, which was recently cleaned up by the Kerr-McGee Corporation under the watchful eye of the EPA, and please note that Wilson Street was vacated by the Winfield Township and is not the property of the park district.

When the ICC approved the purchase of the Chicago Northwestern by the Union Pacific, no environmental impact statement was ever done.

Vibration by the

67

additional train traffic may have an adverse effect on our building at 157 West Washington Street. The increased train traffic after the purchase has had an adverse effect on our location also.

Chicago landscape planner, Jens Jensen, wrote that, "Everyone

is entitled to a home where the sun, stars, open fields, giant trees, and smiling flowers are free to teach an undisturbed lesson of life."

We have strayed from that vision by not properly planning for expansion, not only in the city, but as far west as you can imagine. Thank you.

MS. ADAMS: Randy Ramey, followed by Hugh Stott and Joe Modrich.

MR. RAMEY: Thank you. I am Randy Ramey. I represent the 110,000 people of District 55 and, specifically, the residents of West Chicago, Wayne, and Bartlett.

I have a brief statement from Senator John Millner, who couldn't be here this evening. He has served as a police officer and leader of many law enforcement organizations for over 30 years and has a complete understanding of life-threatening situations.

Under the current situation with the few trains that move through the communities, we have had situations where the public safety officers could not reach those in need, i.e., choking, heart attacks, serious accidents, et cetera.

If we increase train traffic from 4 trains a day to 20 or more even longer trains, these situations would only multiply.

Our communities are

expected to build additional public safety facilities, hospitals, and other multimillion dollar infrastructure improvements to prevent dangerous and tragic situations from occurring.

I understand the importance of efficiently utilizing our rail lines to move goods throughout our state and country, but if you balance it out, I believe that this sale would cause more harm than good.

The Village of Wayne would -- has a unique situation where a good portion of the community is built between two rail lines. If those additional trains would start to roll, a large part of the community would be trapped between the two trains where police, fire, and ambulances would not be able to attend to those in need until the train has passed.

In West Chicago ambulances are located on one side of the train tracks, and in Bartlett emergency

personnel won't be able to reach the emergency in a timely basis because rail lines run through their major throughways. In a choking or heart attack situation, seconds count, and those situations would statistically be more prevalent than they are today.

Even the STB report concluded that fire and emergency medical service providers near the EJ&E rail line would potentially experience substantial effects as a result of the proposed action. Why would we take such a risk?

Additionally, the traffic congestion would be so onerous that the local economy may be adversely impacted with these additional trains.

I am appealing to you and the officials of the Surface Transportation Board to weigh this decision carefully and urge you to consider concerns of residents and communities on both sides of this issue.

So as you have seen

throughout this evening, a lot of what we are talking about is public safety. I am concerned that the STB predicts a 28-percent increase in accidents along the EJ&E line. My wife just got a job at the Community High School in West Chicago, which runs right by that line. I certainly hope she is not part of the 28-percent increase in accidents. Thank you.

MS. ADAMS: Hugh Stott, Joe Modrich, followed by Vicky Lenahan.

ChimniakCourtReporting.com
312.781.9111

72

MR. STOTT: My name is Hugh Stott. I'm deputy fire chief of the West Chicago Fire Protection District. The West Chicago Fire Protection District protects the lives and properties of approximately 35,000 residents of the towns of West Chicago, Wayne, and Warrenville.

Our population rises during the daytime to approximately 50,000 residents, visitors, and travellers.

The area that we protect is literally divided by the presence of railroad tracks. The Union Pacific right-of-way divides us from east to west. The current EJ&E right-of-way divides us right down the middle from north to south. We are subject to the presence of approximately 68 Metra trains and upwards of the 80 to 100 freight trains on any given day.

As in any movement of freight by rail or truck, a concern in the

ChimniakCourtReporting.com
312.781.9111

73

the potential release and management of hazardous materials.

But, even more importantly, is the increased obstruction of six grade crossings by the potential acquisition of the Canadian National. It was mentioned there were five crossings. Those were within the City of West Chicago. We have one that is outside of the city limits.

At the present rail traffic density, we estimate that on an average, 20 minutes out of each hour results in the most critical downtown grade crossing being obstructed by a train. With the increase from the current 6 EJ&E trains to a potential of 22 or more CN trains, this delay can only increase.

There is only one grade crossing separation that allows us to access that area that is potentially cut off by EJ&E or CN rail traffic. This adds 4.6 miles of travel to our response. This will undoubtedly increase the emergency

ChimniakCourtReporting.com
312.781.9111

74

response times, and as any public safety professional will tell you, response times are critical.

Our community has supported our ability to deliver quality, professional emergency service. The West Chicago Fire District sees the acquisition of the EJ&E and the resulting increased rail traffic as a threat to that ability to deliver those services promptly and with limited delay during critical moments.

I would also like to point out that the charts of the study failed to identify the six grade crossings within the district and the district at all being impacted by this acquisition. Thank you.

MS. ADAMS: Joe Modrich, followed by Vicky Lenahan. Is Joe Modrich here? If not, Vicky Lenahan. Vicky Lenahan? Is Frank Napolitano here? Okay. Frank Napolitano?

Thomas Ashton. We will have Thomas Ashton, followed by Ken

ChimniakCourtReporting.com
312.781.9111

75

Kaczynski and Candice Grace.

ChimniakCourtReporting.com
312.781.9111

76

MR. ASHTON: My name is Thomas Ashton, and I represent myself and

200 other homeowners near me. My home, along with some 200 other homes, is located squarely in what I am calling the Canadian National/UP Triangle. I live in the Village of Wayne, the center of which is bound on the north, south, east, and west by rail lines with five at-grade crossings separated by less than two miles at most and less than half a mile at the closest. We are likely to be trapped on all sides by trains; to the north at the Powis Avenue crossing, to the west at the Army Trail Road crossing, to the east at the other Army Trail Road crossing and at the Smith Road crossing, and to the south at the other Smith Road crossing. Like the infamous Bermuda Triangle, the CN Triangle could make many aspects of my life in my community disappear.

Look at the map and the aerial photos. With 5 at-grade crossings, my family and the 200 other homeowners

trapped by trains are going to suffer real losses. Trapped in the CN Triangle, we will suffer a loss of safety.

Wayne does not have a public water supply, so we do not have fire

hydrants in our community. A house fire can double in size every minute, so every minute counts, especially with no fire hydrant system to put out the fire. With an average of 4 minutes for a train to clear an at-grade crossing, if one of those 200 homes catches fire, the delays from a fivefold increase in freight traffic each day will be devastating.

Likewise, the crossing delays will have catastrophic effects on EMS response times where every minute delay results in greater loss of life.

School safety is also a major concern. Wayne Elementary School, with over 600 grade-school students, is also in the middle of that triangle. From bus delays to classroom interruptions as freight trains barrel past with noise,

smoke, vibration, and hazardous cargo, the exposure is simply unacceptable.

We will suffer financial loss. CN's acquisition of the line will have a huge impact on home values for my family and the 200 others in the triangle.

To add insult to injury, my village of 2700 residents is expected to

help pay to mitigate the impacts it will have on our community. The costs would include not only crossing corrections, but emergency service personnel, school buses, bus drivers, in addition to the incalculable impact on the local environment.

We would have a loss of cultural heritage. The quaint little Village of Wayne where we hear the sound of train whistles numerous times a day, from the 6:00 a.m. train when I get up in the morning to the 11:15 when I go to bed, will now be inundated with freight trains at all hours. The town will be split east and west. It will lose its shared sense of

community.

The move will only invite other rail carriers to fill the void CN leaves in Chicago. Please look at your maps and don't leave me on an island.

MS. ADAMS: Ken Kaczynski, followed by Candice Grace and Jim McCarthy.

MR. KACZYNSKI: Good evening. My name is Ken Kaczynski, and I am the president of the Board of Education of School District U-46, Illinois' second largest school district. Joining me here this evening is Dr. Jose Torres, superintendent of schools.

On behalf of our Board of Education, let me first thank the U.S. Surface Transportation Board for holding this forum in Bartlett High School, which is one of the five high schools in our school district.

The School District U-46

serves many communities, including Bartlett, Wayne, Elgin, Hanover Park, Hoffman Estates, South Elgin, and Streamwood.

As you know, EJ&E Railway runs through the eastern portion of U-46, including the villages of Bartlett and Hoffman Estates.

I am here this evening to express the concerns of School District

U-46 regarding the proposed acquisition of the EJ&E Railway Company by the Canadian National Railway.

First, the anticipated increase of 15 to 24 trains per day will pose a problem for the safety and timely transportation of our students. Our transportation department conducted an analysis that shows there are 4 grade crossings where the EJ&E railroad crosses our bus stops, including West Bartlett Road, Sterns Road, Army Trail Road, and Smith Road.

Last year we had 55 buses that crossed on West Bartlett Road, 16 buses that crossed at Army Trail, 14 on Smith Road, and 4 buses that crossed on

West Sterns Road.

Without question, the anticipated increase in rail traffic during the day will have a negative impact on our ability to safely and timely transport the students on these 89 buses to and from school.

Secondly, the increase in rail traffic could impact the emergency response times of local police, fire, and ambulances to our schools. While local authorities are extremely cooperative and have plans in place to ensure that they are able to respond to an emergency despite any obstacles, the timeliness of their response will be affected by the increase in rail traffic.

What I did not see in your presentation was the impact it might have on mutual-aid responses from surrounding communities.

Finally, we are concerned about the increase in hazardous waste material that may be transported near several of our schools. School District U-46 has four schools that are within one mile of the EJ&E lines, including Wayne

Elementary in Wayne, Nature Ridge in Bartlett, Hilltop Elementary and Timber Trails Elementary School in Hoffman Estates. Another Bartlett school, Liberty

Elementary, is approximately two miles from the rails. Please consider the impact that any spill of hazardous materials could have on nearly 3200 students who are being served in these buildings. Again, thank you for taking the time to hear the concerns of School District U-46.

MS. ADAMS: Candice Grace, followed by Jim McCarthy and Colleen Mulen.

MS. GRACE: Good evening. My name is Candi Grace, and I am a trustee in the Village of Riverside, and I feel very strongly about this issue, the issue before us, which is should the CN Railway be allowed to purchase the EJ&E in order to move freight traffic through our region more efficiently.

I am disappointed that no public hearings were available in the communities that are going to benefit from this acquisition.

In making this important decision, I would hope that the STB would look at the bigger picture for northeastern Illinois and northwest Indiana, not just what municipalities along the EJ&E have said.

Mayor Melchert of Bartlett has been quoted as saying, "We have to find a new approach to traffic congestion," in reference to the STAR line project. The purchase of the EJ&E is part of that answer for us in my village.

85

Mayor Melchert is correct. We do need to find new approaches to address traffic congestion, and the railroads are a solution to meeting the nation's growing freight mobility needs. Railroads can haul a larger volume of goods than trucks while using less fuel. The land needed to haul freight on a railroad versus a road is much less, and improvements to rail are often much cheaper than expanding or building new roadways.

We have capacity challenges and transportation congestion in this region that needs to be moved. The country's economy depends on it as much as our region does.

The goal of this project is to make freight move much more efficiently through or region and to reduce freight congestion in areas that have been impacted for decades.

The draft EIS talks slightly about the benefits to the other communities in the inner ring suburbs. I

86

wish the Environmental Impact Statement had

looked more closely at that.

Riverside has two train lines. We have 150 to 160 trains per day. If this deal goes through, we'll lose 8 to 10. That's not a huge percentage; but in terms of the public safety impact, it's enormous.

The CN trains block our access to Loyola University Medical Center, which is a Level I trauma center in that area, and there is no way around it for miles.

North Riverside, which is just to the north of us, their train station is right next to the tracks. The tracks bisect the town. They require mutual aid from their neighbors to fight fires. If there is a train across the tracks, we deal with it.

I'm running out of time. If I thought the status quo was best for the region, I wouldn't be here speaking tonight; but I think we have to look at

87

this as a regional solution and not just look at the effects on the communities nearby. You will also be hearing us from in written comments, but we wanted to make

sure that the voice of the inner ring suburbs was heard, because we are impacted by this in ways that, while it's negative here, it's also positive for us, and you need to look at those just as closely as you listen to the comments tonight. Thank you.

MS. ADAMS: Jim McCarthy, followed by Colleen Mulen and Jim Plonczynski.

88

MR. McCARTHY: My name is Jim McCarthy. I'm a trustee for the Bartlett Fire Protection District.

My comments this evening are out of concern for our residents living west of the EJ&E tracks along West Bartlett Road. Approximately 11 percent of our

45,000 residents live west of these tracks. As a point of reference, we responded to almost 3300 calls last year.

On October 1st the district will open our third station, which is located on West Bartlett Road less than 1/2 mile east of the EJ&E tracks. The location of this station was based on a very fundamental strategy: Lower the response times to all of our west-side residents.

In the fire service, response time is critical. We are all aware that cardiac tissue begins to die after 4 minutes without blood flow, but did you know that fire doubles in size every minute? In other words, after 4 minutes, a

89

fire is 16 times its original size.

I am very concerned with the drastic increase in the number and overall length of the trains crossing West Bartlett Road.

Additionally, I am concerned with the trains moving through this crossing at a reduced speed and/or stopping as they switch tracks at Randall Road. Both of these scenarios greatly

increase the possibility of these residents being faced with extended emergency response times.

While we have mutual-aid agreements with surrounding communities, these do not meet the critical response times I spoke of earlier.

Assuming the best-case scenario, a blocked grade crossing at West Bartlett Road would likely result in an 8- to 10-minute total response time for a resident living west of the EJ&E line.

After 4 minutes, the chance of survival decreases by 50 percent

for every minute that critical care is delayed.

I appreciate CN's offer of an alerting system to allow our dispatch personnel to know when a train is blocking West Bartlett Road. While this is helpful, it really only provides minimum mitigation towards meeting those critical response times.

I strongly believe the 5,000 residents west of this grade crossing need something more than an at-grade crossing and the lengthy emergency response

times that would go along with it.

They need a commitment from the STB that they will be mindful of the emergency response times that they deserve. Thank you.

MS. ADAMS: Colleen Mulen. Is Colleen Mulen here? If not, Jim Plonczynski. Is Jim Zay here? Okay. We have Jim Zay followed by Eileen Phipps and Representative Mike Fortner.

MR. ZAY: Good evening. My name is Jim Zay. I am a DuPage County Board member, and I represent parts of Bartlett, Wayne, West Chicago, and Warrenville, which is greatly affected by this acquisition.

As a local elected official, when you have to make decisions regarding zoning or development, you have to look at the benefits; but, also, you have to look at the negatives that affect the community and the region. This greatly affects our region and our quality of life, which I don't think EIS has taken a look at.

We have heard many

statements today about public safety. I'm not going to get into this. On the EIS it says that 125 grade crossings will benefit from this. The County of DuPage has recently done studies, which we will be submitting, talking about the 18 grade crossings that are in DuPage County. Through our study, out of those 18, 7 of

those will qualify for grade separations. Of those 7, we estimate the cost at $700 million for this. That is $400 million in the total acquisition of the EJ&E.

The EJ&E was very nice, originally offering $30 million for grade separation. $30 million will not build you a grade separation.

The county did a grade separation on County Farm Road near the complex with Central DuPage Hospital five years ago, and it cost $50 million. That would mitigate the UP and Canadian National running through that area. So $30 million might get you a grade separation of one lane each, so their offer is very short.

The County will be submitting this to you during the process.

When we talk about public safety, U-46 came here tonight. It has not been brought up. You have the second largest school district in the State of Illinois sending kids across these tracks every day. Now you're

increasing that fourfold and putting kids at risk every day, and it's unfortunate, but these accidents do happen. You have to look at that as parents in the neighborhoods.

I would hope that the EIS would not rush to judgment, would take their time and not move this forward, as has been asked by the Canadian National. This needs a full process and needs to be looked at completely while the public hearings are going on and every statement, pro and con, is looked at during the process. Thank you.

MS. ADAMS: Eileen Phipps followed by Representative Mike Fortner and Michael Anastasio.

MS. PHIPPS: Thank you. My name is Eileen Phipps. I have had the honor and the privilege of serving as Mayor of the Village of Wayne since 1995. Wayne is a one-of-a-kind community. It's located in both Kane and DuPage County, and we are approximately 35 miles west of Chicago. Our population is in the range of 2500 people, all of whom strongly support our rich heritage of volunteerism, historic preservation, and equestrian activities.

We are home to the Wayne-DuPage Hunt, and it is a most spectacular sight to see the riders in their scarlet colors, majestic horses riding out of the mist on a Sunday morning following the hounds as they track the scent of a fox.

Our community is home to two National Register of Historic Places: Oak Lawn Farm, which includes the Dunham Castle at Army Trail and Dunham Roads, and our downtown center on Army Trail Road where you will find the Little Home Church

by the Wayside. This historic church, which recently celebrated over 125 years, is the gathering place for large community events as well as our annual Flag Day Parade and Ice Cream Social.

We are extremely fortunate to have Pratt-Wayne Woods Forest Preserve and the newly acquired Dunham Marsh Forest Preserve in our community. Ours is one of the few towns where one can regularly observe nature in all of its abundant glory.

I wanted to take a few moments to give you a feel for our community. We have a small yet very professional police department with five full-time officers and several part timers.

Most of our roads are private and maintained by the homeowners' associations. Every home is on private well and septic. We have no commercial base.

The people that choose to make Wayne their home do so because of

the uniqueness and the character and the peace and tranquility; an oasis, if you will, in the center of urbanity.

Adding an additional 20 trains per day would have a devastating socioeconomic impact on and no benefit to our residents, neighboring towns, or industries. This transaction will not bring new jobs or better lives. It will destroy the quality of life the families that have made Wayne home came out here looking for.

We all know that an increase in traffic translates into an increase in potential accidents. Should there be a hazardous waste spill, with the types of soils we have, our wells would become contaminated. We have absolutely no way to get fresh water to our homes.

What will the STB or Canadian National offer as assurance to our families that a catastrophe of this nature will not happen?

I will cut short my

comments. It is extremely important that the scope of the EIS take into consideration the socioeconomic impacts on our communities. This process must be extended to allow the time necessary to give full and equal weight to our concerns. The decision that you make is one that we will have to live with. Thank you.

MS. ADAMS: Representative Mike Fortner, Michael Anastasio, Jim Morris.

MR. FORTNER: Thank you. I am State Representative Mike Fortner of the 95th District, which includes the communities of West Chicago, Warrenville, Aurora, and Naperville along EJ&E.

I want to address a number of omissions and inconsistencies that I have found in the draft EIS.

I want to reserve those comments about public transit, traffic congestion, and safety to written comments I will be submitting later.

Tonight I'm going to address some of the issues on hazardous material transport. Chapter 4 gives the impression that this is merely a trade-off of hazardous material as it is being carried on lines more towards the center of the city and moving them out to the suburbs. John said as much in his opening comments, that this was a corresponding decrease matching the increase.

Those are not the case,

based on the numeric facts that are in the EIS. For instance, if you look at Figure 4.2-6, up in Lake County where the current Waukesha Subdivision shows a decrease of about 150 hazardous material cars per day, there's an increase right nearby, if this acquisition goes through, of about 165.

The situation gets much worse as you get into western DuPage County. There you see West Chicago rise from about 30 to 315 hazardous material cars per day. That's an increase of almost 300. It gets even worse as you get to Naperville where the increase is 350.

When one goes to look for a decrease, it's not there at that level. There is a decrease, but if I look at all of the north-south entry points on the north side, I can only come up with about a decrease of 220. So it's not a match, and, on top of it, that's multiple lines. You're seeing a concentration of that material along the western DuPage

corridor; much greater risks that will come about not balanced by a decreased risk further in.

The final point I'm going to raise that I think is a glaring omission is the lack of anything in the draft EIS that relates to the requirements of the Congressional Act passed last year that recognizes there may be alternative non-target railroads. What's that? That is about results from the 9/11 Commission

that were enacted by Congress last year that said there must be attempts to move hazardous materials out of the metropolitan areas. Find alternative routes.

The Canadian National has certainly used agreements in the past to route things around Chicago. As recently as 2004 there has been such an agreement. That's been missing in the EIS. It certainly needs to be addressed that this type of traffic needs to get out of the metro area, and moving to the EJ&E does not solve that problem. Thank you. ^^^

MS. ADAMS: Michael Anastasio, followed by Jim Morris, and Alderman James Beifuss.

MR. ANASTASIO: My name is Michael Anastasio. I'm the president of the North Country in Wayne Community Association, which comprises approximately 46 homes and about 150 Wayne residents, including children. And I'm here on their behalf, as well as myself.

We vociferously object to the proposed action and support only the no-action alternative because approval of the proposed action, with or without the proposed mitigation efforts, would be arbitrary, capricious, and illegal and, among other things, place a highly disproportionate and illegitimate adverse impact on our safety, air quality, environment, productivity, and quality of

life.

The three-minute time allotment for comment doesn't allow me sufficient time to point out all the inadequacies and illegalities, but here are some examples.

The study predicts that the proposed action would lead to upwards of

150 percent increase in the annual number of highway/rail accidents in at-grade crossings on the EJ&E rail line. Refer to page 12 of the summary, if you'd like.

It would also increase the risk for pedestrians and bicycles at the railway. Our residents and their children pass over those crossings on a daily basis, and that increase poses an outrageous and unacceptable risk to our community.

Particularly troubling is that the study notes the EJ&E rail line has more public highway/rail at-grade intersections than the current CN lines. It's simply incomprehensible to us how any action that will lead to a more than quadrupling of traffic over at-grade crossings is acceptable, especially when it's clear the number of accidents we experience will increase.

The analysis done by the study relative to hazardous materials releases has absolutely no credibility. The study admits that the report of hazardous

material increases would increase and there would be a large percentage increase in the volume of hazardous materials that would be transported on the EJ&E line. However, the study only focuses conclusorily on the likelihood of an accident being remote and does no analysis whatsoever of the extent of damage, personal injury, and death that have been caused by such a release. A proper risk analysis factors in not only probability, but also the magnitude of damage that could be caused.

By way of example, in 1984 the Union Carbide chemical release in Bhopal, India, that killed nearly 4,000 people. That was a remote likelihood, but the damage was catastrophic.

The study also erroneously relies on historical data while ignoring the added operational safety risks that will arise from the EJ&E line operating at or near capacity. Such operation levels makes useless any historical data.

Further, the study admits that

emergency services response times would experience substantial delays, and these delays were not factored into the risk analysis relative to the damages and harm that can be caused by the releases.

My time has run out. I'll submit the rest of my comments on-line.

MS. ADAMS: Jim Morris, followed by James Beifuss, and Robert Schoen.

MR. MORRIS: My name is Jim Morris, and I am here with my wife, Michelle. We own a home in Wayne, which we are here to protect tonight.

I want to thank these three folks up here -- Vicky, Tina Marie, and John -- for their time they spend here in what has got to be some very trying meetings. But more than that, I want to thank those of you who came here tonight, and certainly those of you who have spoken in opposition to what is trying to be done to us tonight. So thank you.

But this discussion is more than just about safety, the environment, and the other negative aspects of this situation. The discussion is about more than just home values in Wayne or in West Chicago or Bartlett or Barrington. It's about preserving a way of life for which many of us in here have spent time, energy, and love to preserve and to keep, to enjoy now and to pass it down later.

Earlier tonight I was called a

NIMBY. For those of you who are uneducated

in that type of lingo, that means "not in my backyard." That means I don't want it in my backyard. I would rather give it to somebody else. That's not true. I don't want anybody to have this in their backyard.

Now, I was told that we can't stop progress of the CN railroad. Well, I am amazed that a foreign company can come to this country and dictate to us what we're going to do with our property. These proposals offer no benefits to anybody within this region and offers no -- almost nothing to ease the disastrous effects on what their railroad would do.

I am concerned about American bureaucracy endowed with the power to make decisions that ignore and minimize individual investment of the love and the efforts and the treasures that we have in this part of this country.

So my wife and I want to personally thank all of you for showing up

tonight and all of you that hold a stake in the results of these ongoing discussions because only by turning out to make these lively, energetic, and committed comments do we have a chance of winning this battle.

One more comment before I leave. I've got 22 seconds.

My NIMBY guy also said, you know, "The railroad was here first."

You know what? It was here first. The EJ&E was here first. So let's keep it the EJ&E, and kick the CN out.

Thank you.

MS. ADAMS: James Beifuss followed by Robert Schoen and Jerry Nordengren.

MR. BEIFUSS: I am Jim Beifuss, alderman for the City of West Chicago. I'm a 15-year resident for the City of West Chicago and have served on the city council for about 7 years.

I have been a member of our council's infrastructure and development committees and have served as chairman of the infrastructure committee. As such, I have developed a substantial understanding of our transportation needs and challenges and the importance of mitigating adverse impacts in connection with transportation projects.

My interest here is in the health, welfare, and safety of the residents of West Chicago. West Chicago was incorporated more than 150 years ago and has a long history with the railroads. The EJ&E railroad and the Union Pacific lines intersect in the geographic center of our town, in our historic downtown in the middle of Washington Street, the primary ^collector street. Those two rail lines

box off the residents of the southeast corner of town from the main fire station located on Fremont Street directly north of our downtown.

The consequences of track blockage to fire and ambulance response are well known to our first responders and residents. It is notable that the study did not consider the cumulative effect of two intersecting lines in the calculation of total delay hours and the determination of "substantial affected crossings."

We have, during two different administrations, commissioned engineering studies to come up with plans to bridge or go under the tracks to address public safety concerns associated with fire, police, and ambulance response.

The first study came up with various grade separation options on Washington Street that entailed wrecking a substantial portion of downtown and cost about $20 million. This was done years ago.

The second, more-recent study looked at a bypass option a few blocks north of Washington Street. The engineering consultants' design, taking into account all of the main track, spur, and terrain features, entailed a monstrous bypass four lanes wide, about a mile long, most of it elevated about 30 feet high.

The railroad contribution to building such overpasses in either scenario, just 5 percent, the rest of the cost to be borne by the taxpayers.

Given the crippling blockage

caused by the combined traffic of the rail lines, imagine our shock when we read that the Washington Street crossing did not make the list of intersections meriting mitigation.

On the subject of environmental justice, the draft report indicates that the most densely populated areas along the line are West Chicago and Park Forest. The population of West Chicago is 26,000 persons, and approximately 48 percent of

those persons are Hispanic. In West Chicago the EJ&E right-of-way is directly adjacent to dense residential neighborhoods, including many thousands of school children and senior citizens. Those residents will be disproportionately adversely impacted by the 12-fold increase in train traffic along the track.

First, combined with the UP traffic, the increase will effectively wall off a quarter of our town from emergency response and services. This will materially adversely impact their health and welfare, and the impact --

MS. ADAMS: Robert Schoen, followed by Jerry Nordengren, and Elizabeth Regan.

MR. BEIFUSS: Thank you. I have additional comments, which I will provide to the court reporter.

MR. SCHOEN: Thank you. My name is Bob Schoen. I am here with my wife, Debbie. We're residents of Wayne, Illinois.

When we moved to Wayne, we moved to that oasis we thought we had. Now we're stuck on this island, and it's only going to get really bad apparently.

We moved out there because of the parks, because of the prairie path, because of Pratt's Wayne Woods. This is devastating. I feel like I'm in a horror movie right now. I was nervous before -- upset before I got here tonight. Now I'm hearing all the -- all the reality of the CN Railroad, all the problems they're having in Canada.

My house, by the way, our house, is 46 feet -- our property line is 46 feet

from the tracks behind our house. Our pool that we thought we could come and enjoy with our grandkids is 66 feet from the tracks. These four trains a day that we get to come, two of them during the middle

of the night, that's okay. Now we're going to get 24 or more?

There is no way we're going to be able to have any quality of life living in this home, let alone the concerns of, you know, safety, my wife's heart problems, getting to a hospital. It's a lot worse than I even thought it was with this coming to our area.

So we're here simply to voice our opposition of what's going on. It's going to absolutely totally destroy our property values and our way of -- our way of life.

Thank you.

MS. ADAMS: Jerry Nordengren, Elizabeth Regan, Tim Schneider.

MR. NORDENGREN: Thank you. I'm Jerry Nordengren. I'm from West Chicago. I've been there for about 40 years.

Much of what I was going to talk about has already been said, and so I'm not going to be redundant.

But I will say that, oh, about 40 years ago we came in with an emergency, possible emergency. My wife had a very bad heart, and whether or not she could make it when she delivered was another question. But the big thing is living in West Chicago and west of Main Street, well, trying to get to Elmhurst Memorial Hospital at any time of the day could be very difficult because the railroads. And we're lucky, we made it.

But it's extremely risky when you've got a situation like that. And now you have quadruple the situation. It's hard to see. And, again, since I'm one who lived through it, I really dread this happening.

And, again, much of what I was

116

going to say was already said. But to me, I live, let's say, a good Chicago city block from the railroad, and it's enough where it shakes the house. And I feel so bad for those -- like the man in Wayne who lives just -- well, 60 feet away, it's extremely dangerous in a situation like that. And I just can't see how they want to propose this.

I have a question for you people up there. How many of you live within 60 feet of a railroad line? None of you, or you would not be up there.

So you see, it's extremely important for you to consider. We live here. These towns were set up with the railroad to be a part of them. These towns were not set up by the railroads to be us a part of a town with them leading a way. There is a big difference. We really are the town, and you're part of the town. We're not a part of the railroad. That's extremely important.

By the way, I used to work for a

117

railroad, and no one has talked about the money bit, but, you know, you're losing an awful lot of money with those lines in Chicago, where the cars can't get out of there, and you're losing a lot of money, too, because you've got to pay rental on the cars.

Folks, I used to be an accountant with the railroad, and it's something else when you stop and think about the fact that, say, Milwaukee Road was using Canadian -- a hundred cars from them, and Canadian only used 50 of the Milwaukee. Well, that means that they're going to have to pay for 50 cars, the rental. So it's a case of money, folks.

Thank you. Bye now.

MS. ADAMS: Elizabeth Regan, followed by Tim Schneider, and Cathy Scanlon.

118

MS. REGAN: Hello. My name is Elizabeth Regan. I'm a resident of Wayne

and one of the people who will be living in this island that everyone keeps referring to. I'll be brief.

I agree many people have already stated everything I had intended to say tonight, but basically I believe there are two things that every human being fights for; home and country. I deliberately put home first, and I believe myself and everybody here tonight agrees with that.

Homes are supposed to provide security, safety for our families. All of these things will be taken away from all of us with this move.

I think the solution is that the railroad should take that $30 million that they're offering and provide it to the unfortunate people who already have these issues and make their problems better, instead of moving it to a new location and increasing the possibility of destroying many, many lives.

119

Thank you very much.

MS. ADAMS: Tim Schneider, followed by Cathy Scanlon, and Mike Kelly.

120

MR. SCHNEIDER: Good evening. I would first like to thank you for your professionalism this evening.

My name is Tim Schneider, and I'm a resident of Bartlett. I serve as a member of the Cook County Board of Commissioners and represent 325,000 people in the northwest suburbs of Cook County.

We debated this issue at length during the recent Cook County board meeting. At the end of the meeting the board voted in favor of the CN proposal. All of the commissioners who felt they would get relief from rail traffic voted for it, and those suburban commissioners like myself who would get stuck with additional traffic voted against it.

This is absolutely a not-in-my-backyard situation. They don't want it in their backyard, and they're trying to stick it in ours, and I really don't get it.

Even CN has stated that within three years after purchasing EJ&E, the

number of trains running on the Chicago and eastern lines will be back to their previous levels. Mind you, this is freight from China, shipped to a Canadian port, transported by Canadian rail, bypassing Chicago on its way to Memphis, and destined for Europe.

This will create no new jobs. In fact, EJ&E workers will lose their jobs and create devastating effects up and down the EJ&E line.

Residents and Metra riders will suffer, not to mention the proposed STAR line that the local, state, and federal officials have been working on for over ten years. And yes, the quality of our lives will suffer, along with the safety of our family.

I thought I knew what audacity was. Canadian National has elevated it to an art form. They come in and try and tell us what is best for us and for the greater good. And what is best for us? Apparently they want us to believe that poor air

quality and exposure to hazardous waste, longer travel times, and decreased safety conditions are what is best.

And what do they offer? Essentially nothing in the way of mitigation or improvements. They want taxpayers to pay for the infrastructure and residents and commuters to suffer forever.

We've all heard of the audacity of hope. Well, Canadian National needs to understand the audacity of nope, n-o-p-e. But at the end of the day, when Canadian National tries to encroach on our communities, lower safety, environmental,

and quality of life standards and then expect us to foot the bill, the only responsible answer should be of the four-letter variety; nope.

Thank you.

MS. ADAMS: Cathy Scanlon, followed by Mike Kelly, and Terry Witt.

MS. SCANLON: Hi. I'm Cathy Scanlon, and I'm a BRAT, a Bartlett resident against trains.

STB cannot ignore CN's total safety record. Only considering CN's record in the U.S. is half the picture.

Consider the CN derailment in August 2005 in Lake Wabamun, Canada. 700,000 liters of oil spilled into that lake. That's almost 4,700 barrels of oil. Faulty track laid back in 2003, only two years earlier, was the blame.

At the February scoping meeting that was held here in Bartlett, I asked a CN official what happened. Normand Pellerin told me "shit happened" and laughed.

I asked him pointed questions such as what was CN doing about the rest of that faulty track. He explained that there was a five- to seven-year phased replacement plan in progress. I find that time line unacceptable.

Canada charges CN failing to

take all reasonable measures to remedy and confine the spill, $500,000 fee.

I implore the STB to further analyze CN's ambitions to move manufactured goods from Asia, through Canada, into Chicago, through Bartlett, on to Memphis. CN's VP of sales and marketing, James Foote, refers to that as the Midwest Express.

The real capacity and growth that CN is pursuing strategically with shipping these containers from Asia through Canada and through Bartlett, it needs to be analyzed and included more accurately in the scope of this study. Rerouting trains on the EJ&E will create capacity for them to do this, additional capacity beyond what is noted.

Once Phase II of CN's growth strategically -- the Midwest Express part

of it -- is achieved, I would guesstimate more than 100 trains will be coming through Bartlett.

The EJ&E was a regional train

125

line linking Chicago and the Midwest areas. It was not intended nor should it be an international line.

Thank you.

MS. ADAMS: Mike Kelly, Terry Witt, and Matt Fuesting.

126

MR. KELLY: I'm Mike Kelly; Hanover Township supervisor.

Hanover Township north of here has about 76,000 residents; contains Cook County-Bartlett, Cook County-Hanover Park, Cook County-Elgin, all of Streamwood, portions of Schaumburg, and Hoffman Estates.

As the STB knows, our board passed a resolution back in January opposing this acquisition, and rather than read it back in the record, just looking I see No. 35. There is many more to come after me. By my count, I think I'm the 33rd person who has opposed the acquisition here this evening.

I will not attempt to extrapolate on the eloquence of our previous speakers; our mayors, our state representatives, our fire board members, our school board members. Hanover Township stands firmly with all of those individuals to oppose the acquisition, and we urge you to block it.

127

Thank you.

MS. ADAMS: Terry Witt, Matt Fuesting, and Joe Modrich.

128

MR. WITT: My name is Terry Witt.

I'm a 5-year resident of Bartlett, a 27-year resident of Des Plaines before that, one of those towns in favor of this.

I just want to give a little perspective from when I was in business for about 30 years. I did a lot of business with the railroads, and I found them to be firmly entrenched in the 1800s. And I think they're still there. And when they had to expand through the country, that was maybe good.

A couple of examples. We would get sugar from the Dakotas. It took seven days to get a railcar in. We could have put it down to five, but the railroads would not make a switch in Minneapolis, where it was less crowded. So not only did we have longer to wait, we were also having an extra day of unknown on the switch.

We would also get corn syrup. We got it from 15 miles away. It took 7 or 8 days to get that from the railroad; 15 miles.

129

And when we were nine days, one day late, we would call them up real quick, and in 30 minutes we could have a truck.

So I'm a little skeptical about

the railroad and how good they can do business. I think they need to take a great big step back and see what's important for a hundred years from now. They're looking for a "right now," "money right now."

Well, how should we expand this country? How are we going to become energy independent? Let's put a big broad plan together, get them totally out of Chicago.

I agree take them out of that inner ring, but don't just go ten miles. Go a hundred miles, and make the thing work for the whole country.

And then I just have one other -- just a local comment. I noticed on the map you were missing one of the crossings of the EJ&E Railroad. In Pratt's Wayne Woods there is a trail. It's about midway between Army Trail and the Chicago

Central Railroad. And to cross that, you just pick up your bicycle, walk up the berm, cross the tracks, and down the other side. There is no signal, but it's there. It's official, and it should be provided for.

Thank you.

MS. ADAMS: Matt Fuesting, followed by Joe Modrich, and Rob Sherman.

MR. FUESTING: Good evening. I'm Matt Fuesting from the City of West Chicago, on behalf of Nick Dzierzanowski, my co-alderman from the City of West Chicago.

I want to express our displeasure and our opposition to the plan that's possibly being proposed. Our ward is at the intersection of Powis and Smith Road. Norton Creek Elementary School sits

there. Those aren't statistics. They are children. It's within a chip shot of 755 homes and an elementary school. We're vehemently opposed to the plan that's possibly being proposed here.

In addition, I served as chairman of the transportation task force in 2003, 2004 for the City of West Chicago. One of the things we did during this time when I was chairman was to study an at-grade separation and the cost and the engineering situation.

Our county board members talked about the $15 million aspect of what went

on at County Farm in Wheaton. I know about that. That is simplistic in nature comparatively speaking. I know about the studies because I served as chairman.

The other -- to try to reconfigure and do the necessary steps for an at-grade separation in downtown West Chicago would be herculean. It would not cost $20 million. It would be more along the lines of the gross national product of a third-world nation.

Once again, we're dealing with people's lives, people's situations, where

we don't have the aspect of getting from one side of the tracks to the other for purposes of emergency response.

These are not statistics. They're hard-core people, hard-core issues that need to be addressed. They have not been addressed in the mitigation aspect with the study.

One of the things you will not see in that study is the maintenance of an at-grade separation. Who is going to do

that? Who is going to be responsible for that? CN comes in, they take over, it's going to be borne by all of the municipalities, specifically West Chicago.

So I ask you to take that into consideration and consider that when you're making a decision.

Thank you.

MS. ADAMS: Joe Modrich, followed by Rob Sherman.

MR. MODRICH: Good evening. My name is Joe Modrich. I'm a director of the park district in Franklin Park.

From our perspective -- we have four facilities in Franklin Park; two parks, and two -- our community center, and our pool right on the railroad tracks. And in Franklin Park there are as many as 100 to 150 trains a day; commuters and freight.

From our perspective in Franklin Park, the regional rail system in the Chicago area is antiquated and overburdened. In its current state it's not capable of sustaining the area's needs for freight transit, much less for the expected growth.

Over the past several years Franklin Park and many other communities have experienced a significant increase in

train traffic and vehicle congestion.

Many communities have suffered for decades with the pollution caused by idling trains.

The CN acquisition will bring

environmental justice in the area while maintaining Chicago as a major rail hub; fewer idling trains and less traffic delays, as well as decreased fuel emissions.

CN is offering a fair and reasonable solution to the rail congestion in Chicago. While some suburban communities will see an increase in trains, many more will see a decrease.

Motorists and homeowners would see a significant reduction in truck traffic on roads and highways in the Chicago area. Fewer trucks on the road means cleaner air.

Weaknesses in the current rail system affect more than just freight traffic. Metra and Amtrak trains are delayed and disrupted because of jockeying the position with the backlog of freight trains trying to get through the area.

This plan will -- will be funded

mostly by private money. In this day and age, with government shortfalls, this is a

significant benefit.

As a member of the S.T.A.R.T. coalition, I am interested in supporting the goals of the Chicago Region Environment and Transportation Efficiency Program and protecting the Chicago region's status as transportation hub of North America.

It is important to look at the big picture when looking at this proposal. It is the best solution for the entire area.

There is a not-in-my-backyard component to all these things. We experienced it in the park district all the time. No one wants a facility in their neighborhood; for example, a skate park for the children.

In this situation we believe that the region benefits economically from the transport of the rail situations that we have, and the best way to share that is to spread the responsibility of providing the land and the infrastructure for the freight systems.

Thank you.

MS. ADAMS: We have one more speaker, Frank Napolitano.

138

MR. NAPOLITANO: My name's Frank Napolitano. I live at 1048 Webford Road in Bartlett, Illinois. I'm sorry I wasn't able to speak earlier when I was -- I had to duck out for a few minutes, but I'm glad I'm able to speak at this time.

I've heard a -- you know, a lot of things discussed for people that are for it. The last two speakers, they would like to see perhaps the EJ&E line take over this committee, national traffic, because national traffic is in their backyard now. The bottom line is the infrastructure is not here. It's not presently here, and there's no -- nobody willing to take ownership for building the infrastructure to support that, be it building underpasses and things like that.

Clearly, we have a school district that's the second largest school district in the state that straddles this EJ&E line. You have 40,000 students, a good portion of them going east and west across major -- many of these roads here

139

in -- in Bartlett, part of U46. That's a hazard to their health with -- without

having these underpasses built currently and not having the -- anybody taking ownership to build that, the underpasses and things like that.

You have a -- in Bartlett they have a train station that's almost completed that is really close to the -- the -- the tracks, EJ&E line, and obviously this congestion would put major delays. I'm sure you've heard all heard all these things already.

One of the first things we learn in life about making decisions is make a list of the pros and the cons. It's pretty simple. You've got your positives on one side to do something; you've got your negatives on the other. When it outweighs it so significantly one way or the other, that's the decision you make. Clearly, maybe there's one or two pros to the other areas that are affected by the Canadian National at this point; but there are so

140

many negatives in moving this to our community, with our region, that the cons and the negatives totally outweigh this.

It should be a no-brainer to not allow this purchase to go through at this point.

Again, Canadian National, they're not bringing enough to the table. There's no positives for the region for them to move out here. They're not going to add the infrastructure we need to support that, and the negatives are endless.

Obviously, I'm not in favor of this purchase going through, and as I said, I think it's a no-brainer to deny this purchase. Thank you for your time.

MS. ADAMS: Do we have any more registered speakers at this time? We would like to invite any additional commenters to go ahead and register in the lobby. In the meantime, we would invite everyone to return to the open house area if you'd like to review the boards or ask questions. The court reporter and at least one member of the STB team will remain here in the public

141

meeting area to receive additional comments should we have any additional registration during this hour. Thank you for your comments tonight that everyone provided, and the next public meeting is in Chicago, September 8th, from 4:00 to 9:00 p.m.

(Brief pause.)

142

MR. BRUNO: My name's Tom Bruno. I'm a resident of Hoffman Estates. I did not hear Hoffman Estates mentioned in tonight's meeting. Most of the speakers are from West Chicago, Bartlett, those areas. There are at least three to five hundred homes that back up to the EJ&E line. Our house backs up directly to the EJ&E line. We take three to five trains a day. Our property is within 50 feet of the line. We are very -- I'm very, very

concerned about 20 to 25 trains a day.

The biggest concern by far is hazardous waste. We would have absolutely no time to escape if there was a derailment. This line -- this Canadian National, I know they tout a good safety record; but I've done some digging and researching accidents in Canada. They had a lot of accidents in Canada.

They had one in Illinois -- in southern Illinois just three years ago. It was shown to be -- the conclusion of the study was shown to be faulty weld marks or

faulty welding on the rails that caused the derailment. A three-mile area had to be evacuated. That type of accident would wipe us out. Literally we would be -- we could be killed from something like that. The hazardous waste issue very much concerns us, all the residents along that section of the line.

I also want to mention Shoe Factory Road. Shoe Factory Road gets blocked by these trains already, but they are infrequent now. If you let a -- 20 or 25 trains a day and longer trains, Shoe Factory Road will be severely impacted; and

there will be buses that go down that road to the schools that were mentioned tonight.

There's also a bike path that crosses that same intersection, and the bike path is used frequently. I'm one of the users of that bike path. There's absolutely no mention of mitigation in the study that I saw, and that concerns me a lot.

I would love to see Canadian National put forward much better mitigation --

self-mitigation options. We'd be more -- more than willing to entertain that, but they're only willing to put forward 130 million for a few sites. That just absolutely does not work for the infrastructure that we have. We don't have enough infrastructure to accommodate that many trains.

The other thing I want to mention is that we really don't believe that the traffic in the inner city is going to go down. Give it three years. The traffic's going to be back up to where it was, and those people are going to be right back where they started. So thank you for accommodating my comments.

(End of statement.)

MS. CATALANO: I'm Marilyn Catalano. On August 23rd, 1993, my family celebrated a great celebration of the baptism of our grandson. My mother, that night we took her home. She lived in Berwyn, and as soon as I got home to Glen Ellyn we got a call from her, please come back to the house; something's wrong with me. So I called my son who lived upstairs; I said, get down by grandma. He called for an ambulance right away.

Ambulance came within minutes, took her to MacNeal Hospital -- tried to take her to MacNeal Hospital; but because of all the railroads that are there and all the trains that stop through there, they were unable to get her into that hospital for quite awhile until the railroad -- the train passed.

My mother had a massive stroke. It

hit at the base of her brain into both sections of her -- her brain from the base, hit both sides of her brain. She's still alive at the age of 95, paralyzed on the

left side, blind, and unable to swallow. Had we been able to get her there quicker, we would have been able to prevent what took place with her, not the stroke; but she would have had the medical aid that she needed.

As a result of this, it compounds because now my husband and I are just retiring; but we are her caretakers. So now our lives are on hold until God decides to take her. I watch; I look at my mother who had the most beautiful blue-violet eyes you ever wanted to see, and there's no color in her eyes. I want to hear her voice, to be able to talk to me and can't. I want to be able to eat the meals that she made for my family. I want to see her crochet; I want to see her do her artwork. She was a talented woman. She's vegetated because of the railroad, because we couldn't get her into MacNeal Hospital because of a train that was stopped there.

That's all I have to say. That's

reality; that's what can happen. And we

live in Wayne. I am so scared of what's going to happen because I have the same heart problems she has, the blood pressure problems she had; and I don't want to have to leave my house. You know, all our life savings is invested in that house. This is where we wanted to spend our retirement; and it -- nothing's working out, absolutely nothing. This scares the living daylights out of me not being able to get to a hospital if we need it. That's my story. Thank you.

(End of statement.)

MR. KOZIAL: My name is George Kozial, K-o-z-i-a-l. Like so many of my friends and neighbors I'm very concerned about the attempts by the railroad to purchase for a number of reasons. Today five to six trains pass through Bartlett. After the sale 20 to 25 trains will pass through, a potential increase of 400 percent. With the increase comes longer trains. This will create times when it might be impossible to get across either of the two crossings in Bartlett. Trains of two miles in length will make this very difficult.

All in all they may become a serious health and safety issue. Police cannot get to where they need to be while they wait for a train to pass by. This applies east to west and west to east. And heaven forbid somebody's sitting on the other side of the west side of the tracks and they need to -- and they're in an ambulance and they need to get to the east side.

What about the children who are being

bused to and from South Elgin to the

tracks? My community of Walnut Hills, all the children of high school age bused to South Elgin. What happens when the bus sits and this is what causes students to be late? U46 has indicated that as many as 45 to 60 buses will pass this way every day. Just a little logic says more longer trains will lead to more congestion and idling as trains pass.

What happens if a derailment occurs in this area? More trains increase this possibility. I am concerned when a foreign company asks to have the approval process sped up to be completed sometime in October. Why? I do not want discussions about remediation to occur after the sale. If that occurs, we have lost a great amount of leverage to get environmental human and community issues discussed and resolved.

I'm afraid their remediation issues will never be agreed to should CN be allowed to purchase the railroad. Remember, if we rush into and through this

process, we just might miss something very important and make a decision on a very important matter that will affect us, our children, our environment, our health, our

way of life for many, many years. We cannot afford to make the wrong decision. In closing I must say that I must ask that the Surface Transportation Board deny CN's proposal to purchase EJ&E at this time. Thank you for letting me speak tonight.

(End of public meeting speakers.)

D.5 Chicago, Illinois

1

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET AND EASTERN RAILWAY COMPANY

LOYOLA UNIVERSITY

25 EAST PEARSON STREET

CHICAGO, IL

SEPTEMBER 8, 2008

CHIMNIAK REPORTING & VIDEO

Telephone: 312-781-9111

REPORTED BY: Dyann L. Berndt, CSR, RPR

Donna Kazaitis, CSR, RPR, CLV

2

MS. TARCZAN: Good evening, ladies and gentlemen. Can everybody hear me? Thank you all for attending tonight's meeting. We are here tonight to hear your comments on the draft Environmental Impact Statement that was released on July 25th regarding Canadian National Railway's proposed acquisition of the EJ&E Railroad. My name is Heather Tarczan, and I will be facilitating this meeting.

Before we get started, I'd like to take this opportunity to review some protocol for tonight's meeting. For starters, I would like to ask that everybody please turn off your cell phones and please refrain from interrupting any speakers or commenters. In a moment I will introduce those presiding over the meeting, and there will be a short presentation on the findings from the draft Environmental Impact Statement.

Immediately following this we will hear your comments. Each commenter will be given up to three minutes to speak.

3

The time clock will be displayed on the screen, and a yellow card will be held up at two minutes and 30 seconds and a red card at three minutes. A list of speakers in the order will be displayed on the screen. Also, I will call forward the next two speakers in line after each speaker so we can be as efficient as possible. There is one microphone in this aisle.

If you are interested in speaking and haven't registered yet, please proceed to the registration table just outside this venue or see a staff member who's identified with a name tag who can assist you.

Alternatively, included in the program you received tonight you may make comments to the Surface Transportation Board through a toll-free number, Web site, or mailing address, all of which are in the program you received tonight. There also comment forms and drop boxes, as well as court reporters located in the open house area. You may record your comments with

4

them throughout tonight's meeting. Please recognize that all methods of comment received by September 30th will be taken into consideration and weighed equally.

Tonight we are here to listen to your comments on the draft EIS. This is not a question and answer session, though we invite you to return to the open house area if you have any questions or would like to provide your comments in a more private setting with a court reporter there.

We appreciate your courtesy as we work to create an environment where everyone can be heard. If you disagree with a speaker, we ask that you not express your disagreement out loud. Likewise, please note that applause for a speaker during his or her remarks gives that person less time to speak and ultimately limits the time for everyone else to speak. In the event that anyone is in need of a Spanish translator, please let a staff person know. If you have any questions, we

5

have a number of staff available to assist you. Again, staff are identified with name tags and are located throughout the venue; and one quick -- quick housekeeping matter, emergency exits are located behind you.

I'd now like to introduce the people on stage with me. Phillis Johnson-Ball is the deputy chief of the section on environmental analysis for the Surface Transportation Board. John Morton

is the team leader supporting the Surface Transportation Board's section of environmental analysis. Phillis Johnson-Ball will now make some remarks about the draft EIS.

MS. JOHNSON-BALL: Good evening. Thank you all for coming out. I'm glad to see that the weather didn't deter you all from coming to the meeting tonight. I'd like to start by saying I'm Phillis Johnson-Ball. I know many of you have submitted comments, and you're probably very familiar with my name; and we appreciate the comments and the suggestions

authorize carrier actions. We authorize mergers, acquisitions. We authorize abandonments and a host of other activities for minor carriers such as bus, truck, and -- and pipeline.

The board also has an office that resolves carrier disputes. We conduct rule-makings and proceedings. We adjudicate rates. We monitor carrier activity and industry performance. We have an office that deals with enforcement

environmental review process for all actions within the board that requires an environmental review. Our analyses are independent. We provide technical assistance to the board and to the public.

The purpose of the environmental review is not just to advise the Surface Transportation Board's decision-makers

Heather said, the comment period is a 60-day comment period; and the comment period is over September 30th. Your comments, if they're written comments, must be postmarked by -- did I say December? I

Now, people have asked us as part of the -- the process exactly how does

this process work, and what does the -- the board consider? And the -- when Canadian National filed an application with the board, the process began by them simply filing an application. The board then set the procedural schedule in which we consider the transportation or the merits and the environmental issues.

Just to talk a little bit about what does the board consider in terms of -- we look at it in two parallel fashions. The board considers the merits, and the merits consist of economics, competitive issues, and transportation; and the board also considers the environmental impacts, and those things are weighted equally in the process. The board -- our decision-makers do not make any decision until both of those processes have been completed, so they have the full benefit of the entire record.

The board then can take three actions: The board can deny the acquisition; the board can authorize the

acquisition; or the board can authorize the acquisition with conditions. The board can place conditions on the merit section, which is competitive, economic, and transportation; and the board can impose conditions on the environmental part of it.

We also have heard lots of questions about the third-party contractor project -- process and who exactly is HDR and why is HDR working with the board to prepare this document. We are -- we're a very small federal agency. We have approximately 150 people in the entire agency. We have about nine people on the environmental staff. We have about 22 projects that are currently before the board, ten of those are about -- are EISs. So as other small agencies -- federal agencies, we use the third-party contractor process to assist us; and HDR, who has worked with us on many projects, is our third-party contractor.

Now, John Morton is -- who's the project manager, will give you a little

more detail on the project. Thank you. John?

MR. MORTON: Thank you, Phillis. First, I'd -- I'd like to talk a little bit about, you know, kind of who Canadian National is, the -- the applicants, and then talk some about the process that -- that we're going through and there -- and some of the results.

If you have any questions, I -- I would encourage you to -- to talk to one of the team members, look at the maps, look at the information that we have in the open house. The open house portion of this is still going on, and it's still staffed; and so if -- so if -- if -- I know I'm going to go through this rather fast. So if you have questions, you want to, you know, find out a little bit more, feel free to -- to -- to step into the other room and -- and ask one of the staff members back there.

CN is a Class 1 railroad and a major shipper. They -- they operate five rail lines, as you can see in -- in the

dark colors, that -- that radiate out from the Chicago area. They operate about 150

miles of -- of rail line in Chicago.

EJ&E is -- is a regional railroad that operates in generally an arc around the outside of Chicago. EJ&E has two major rail yards, one in -- East Joliet rail yard in Joliet, Illinois, and Kirk yard in Gary, Indiana. CN's purpose for acquiring the EJ&E -- they stated three purposes in their applications: First is to increase their operational flexibility by combining or -- or providing a continuous route connecting their five rail lines.

The -- the second purpose is -- is to make available EJ&E's Kirk yard and East Joliet yard to their operations.

And the third is to -- to develop a more extensive relationship with the shippers on the -- the EJ&E.

The draft EIS analyzed a number of -- of topics and resources. I want to talk about just a few of them tonight. The

rest of them, if you have questions, once again, we have staff members available in the open house that would be more than happy to walk through any -- any of these resource areas with you.

There's some major operational changes resulting from the -- the proposed transaction, and I'll talk about those in a minute. In addition to those changes, the CN proposes to construct six new connections. We've listed them there. We -- we have graphics and -- and displays in the other room if you want to look specifically at those connections, and they also propose to -- to construct about 19 miles of new parallel track along their existing track.

This is an output from -- from some of the modeling and the work that -- that we've done, and I know it's a little difficult to -- to read; but essentially the -- the -- this is a schematic of the -- the EJ&E and CN's five rail lines. The -- the light color, the light blue is the --

represents the current traffic that's on those rail lines today. The dark blue represents the proposed traffic, you know, should CN acquire the EJ&E and -- and change its operations. And so you can see in general they're shifting traffic from the interior of the -- on the CN rail lines inside the arc to outside of the arc. The

-- the -- it -- the expected volume changes is somewhere between 15 and 24 trains per day.

The analysis that was done in the EIS concluded a couple -- three things, basically, on the operations. First, that the EJ&E rail line would be operating at or close to its maximum capacity in -- in several key locations. As a result, the -- the EIS concluded that it would be unlikely that -- that the -- there would be more traffic on the EJ&E than the -- than the traffic levels estimated by CN in their applications.

And, third, that Metra's on-time performance can be maintained through

effective cooperation with CN.

The EIS also evaluated train and roadway safety. On the EJ&E arc because of the increased number of train miles, the -- the probability of a train accident would go up, as would the probability of a highway rail accident. On the CN rail line inside of the arc, the -- there would be a reduction in the train miles and a reduction in the probability of a train accident and the probability of a highway

rail at-grade accident. There were two -- or three roads -- crossings that -- that, you know, we calculated that there would be a substantial increase in risk; and one is Woodruff Road in Joliet, Illinois, and the other two are Lake and Miller Streets in Griffith, Indiana.

The -- the EIS evaluated passenger rail safety; and with respect to that, there is no passenger rail currently operating on the EJ&E there so the transaction would have no effect on passenger rail safety. That if -- there

would be a reduction of freight traffic on the CN rail line segments inside the arc and, consequently, an improvement in passenger rail safety there. There would also be a substantial increase in the shipment of hazardous materials on the -- the EJ&E rail line and a reduction of the shipment of hazardous materials on the CN rail lines within the arc.

The EIS also looked at the -- the transportation systems. The -- the -- evaluated 155 at-grade crossings on the CN rail lines, that's 125 of which would have reduced delays because of the reduction in

the number of trains. They looked at 112 crossings -- highway rail at-grade crossings on the EJ&E rail line. Of those, 87 of them actually met the board's threshold for environmental analysis. Of those 87, there -- that without mitigation, 15 of those grade crossings were identified as being substantially affected by the -- the acquisition; and those 15 are shown on the map here. They're listed on a board on

the outside in the hallway, and -- and they're described on the maps in the open house area if anybody wants to -- to look at any specific railroad highway at-grade crossing.

The EIS also evaluated air quality issues. Because of the longer rail line -- rail route around the city -- around the -- the Chicago area, there would be an increase in fuel use. However, that increase in fuel use would be offset by a -- by a more free-flowing operation and more efficiencies and less trains idling. Therefore, the -- the overall emission changes in 2015 would not exceed, you know, current regulations or would not impact the region's air quality compliance.

The EIS looked at emergency response and concluded that there would be 11 emergency service providers that -- that would be impacted. There would be nine fire stations and two emergency medical facilities that -- that would be potentially substantially affected; and,

once again, those are shown on the -- the graphic here. They're listed on the -- on the board in the -- outside in the hallway, and you're more -- and they're listed and identified specifically on -- on the maps that we have in the open house section.

The EIS evaluated noise. There would be about 3,000 residences along the EJ&E rail line that -- that would see an increase at noise levels above 65dba. In -- on the CN rail line there would be about 2700 residences that would show a reduction in the -- the noise levels. In addition, the -- the Barrington area quiet zone, because of the increased freight traffic without mitigation, it would lose its quiet zone status.

The EIS also identified a number of mitigation measures. CN provided a set of voluntary mitigation measures that are

all listed in the -- the EIS. They -- they provided 76 in these subject areas. In addition to that and on top of that, Steve recommended 72 additional measures in those

topic areas and, once again, be more than happy to -- to talk or show you the -- the specific mitigation measures. I have them in the -- the executive summary and also chapter 6 of the draft EIS.

And with that, I'd like to turn it back over to Heather. Thank you.

MS. TARCZAN: We will now begin the comment portion of our meeting. Let me remind you that we will adhere to the three-minute rule which begins as soon as you start speaking. If three minutes is not enough time for you, please feel free to speak with a court reporter in the open house area to complete your remarks. We also invite you to submit your full written remarks to the court reporter located here.

To be fair and consistent if you speak beyond three minutes, I will begin to announce the next speaker. I would now like to ask that the first speaker, Fred Millar, please step forward and come to the microphone. In the que behind him is Jim

Foote and Christopher Berry. Jim Foote?

Okay. We're going to go ahead and start with Jim LaBelle. Again, once you hear your name, please proceed to the microphone. So we'll go ahead and start with Jim Foote, to be followed by Christopher Berry, followed by Jim LaBelle. So if you can go ahead and take your que, that would be terrific. Go ahead.

MR. FOOTE: Thank you. My name is Jim Foote. I'm executive vice president, sales and marketing, for CN with my primary office here in Chicago. I've worked in the railroad industry for over 35 years and have also lived in Chicago for much of the past 30 years. Thank you for this opportunity to -- to speak with you tonight about the important benefits that the CN-EJ&E transaction will bring to the Chicago region.

Chicago-area rail congestion is well -- is a well-documented problem. Diverting most of our trains that currently operate through downtown Chicago onto the underutilized EJ&E line will streamline CN's operations in the region and reduce regional rail and related vehicular congestion. In fact, roughly 60 communities inside the EJ&E arc will benefit from reduced train traffic as a result of the transaction.

Despite the important benefits this transaction would bring to the city of

Chicago and surrounding communities, there

has been an astounding amount of misinformation disseminated about this transaction. Allow me to focus on the facts.

First, safety overall will improve. The D -- draft EIS project -- projected an overall eight percent reduction in crossing accidents. Further, while the DEIS projected that train accidents on the EJ&E line would increase by 28 percent, it also found that train accidents on the CN lines inside the arc would decline by 77 percent. The net impact is an important and safe -- in -- the net impact is an improvement in safety that could save lives in the Chicago area.

Second, C found that no additional hazardous material accidents are anticipated as traffic shifts from CN's downtown line to the J. The transaction actually addresses an important objective of the federal government, namely, that certain hazardous materials should be

routed away from heavily populated urban corridors such as Chicago to less populated areas whenever possible. CN's line currently runs through the heart of Chicago under McCormick Place and past Soldier Field. CN also has committed to providing full training for municipal first responders and will offer more comprehensive emergency response capabilities than exist along the J today.

We respect the noise impacts. The draft stated that 1,160 so-called sensitive receptors would be affected. CN's voluntary mitigation plan addresses these noise impacts. Notably, however, CN did not -- C did not quantify the significant noise benefits for communities inside the -- the J arc, even though it's safe to assume that these benefits are far greater than the noise impacts from added traffic on the J. With the reduced noise the transaction would bring for millions inside Chicago and CN's commitment to mitigate noise impacts affecting the fewer

people on the J, the transaction can only bring about undeniable benefits for train noise in the Chicago region. Thank you very much.

MS. TARCZAN: Thank you. Christopher Berry, Jim LaBelle, Gordon McCoy.

MR. BERRY: Hi. I'm Chris Berry from the University of Chicago. I'm here today to speak to you not as a professor but as a citizen who has a stake in the outcome here. I live on the near South Side, and I work in Hyde Park, which are two of many neighborhoods in the city that will be affected by this acquisition and will benefit from it. We expect improvements in pollution, noise, safety, congestion, and

also increases in property values; and it seems the benefits to city neighborhoods are being almost entirely ignored in this debate.

Instead, the debate is being framed as one between overall benefits to the region versus community impacts in the suburbs, but this is a false juxtaposition. In fact, the CN's deal can be justified solely on the basis of community impact if the positive impacts in Chicago's neighborhoods are counted.

Suppose we look at the acquisition solely in terms of community

1.25 million people. Moreover, the population density near the tracks in the city is more than twice as high as in the suburbs, meaning that more people will be directly affected.

There are, however, some notable differences between the people in the city who will benefit from the plan and those in the suburbs who would be negatively affected. The suburbs, where rail traffic would increase, have a median income of

$76,000 and are 76 percent white. The city neighborhoods have a median income of $46,000 and are 70 percent minority. Just because the people in the city have less, doesn't mean they should count for less in this process.

Yet, there are some disturbing signs that the people in the city are not being treated equally. Of seven STB scoping meetings, six were held in the suburbs and only one was in Chicago. Of 39 poster locations announcing those meetings, only one was in the city; and it was not even in a neighborhood that would have been affected. Of 22 outreach meetings for minorities, only one was in Chicago; and of

eight public hearings on the draft EIS of which this is one, this is the only one in Chicago, and this is not even in an affected neighborhood.

Yet there are more people in Chicago who would benefit from this plan than would be harmed by -- by it in all the suburbs combined.

If all the affected communities are counted equally, then the acquisition can easily be justified on community impact grounds alone; and I haven't even mentioned the 1.2 million people living in other suburbs where rail traffic would decrease. Factor in the overriding regional and national economic and environmental impact, and the case in favor of this deal is overwhelming.

Now, I am not suggesting that the negative impacts in some suburbs should be ignored. A central tenet of good government is that policies whose benefits outweigh the costs should be approved, and the losers should be compensated. In the present case, the STB, along with state and local governments, have many tools available to mitigate negative impacts in

the suburbs.

Every important policy decision creates winners and losers, but the mere existence of adverse impacts should not derail this deal because if the deal is not

approved, someone will have to explain why the negative impacts for a few outweigh the positive impacts for the many.

MS. TARCZAN: Thank you. Jim LaBelle, Gordon McCoy, Jim Giblin.

MR. LaBELLE: Good evening. My name is Jim LaBelle. I'm vice president of Chicago Metropolis 2020. We're a business-led civic organization that was created in 1999 by the Commercial Club of Chicago to promote sound growth. The -- I just have one main comment, and that's that the draft Environmental Impact Study focuses solely on the direct impacts that were being anticipated from the -- the CN acquisition of the EJ&E; and as it shifts much of its traffic to the EJ&E, the draft EIS does not address the regional or national economic impact of the proposed acquisition.

We believe it's important that the STB, as well as the region's residents, understand how this transaction will affect production, income, and jobs in the region and the nation. Therefore, Chicago Metropolis 2020 is undertaking an analysis of the regional and national economic impacts. We will consider the economic impact of changes that can reasonably be

32

expected in such things as rail operations, shipping time, business investment, and other quantifiable factors. We've retained an economic development research group to assist us in this.

When the economic analysis is completed this fall, we intend to present it to the Surface Transportation Board for consideration in making its decision on the matter. We may have this before the end of September; but if -- if we don't, we'll submit it directly to the Surface Transportation Board for consideration. Thank you.

MS. TARCZAN: Gordon McCoy, Jim Giblin, David Betlejewski.

33

MR. GIBLIN: Jim Giblin.

MS. TARCZAN: Okay. Go ahead.

MR. GIBLIN: Good afternoon. My name is Jim Giblin. I am a transportation consultant that lives and works in Downers Grove, Illinois.

We have approximately 150 freight and passenger trains per day operating through our town on one of the busiest rail main lines in the world with absolutely no grade separations. And I am here to tell you that the quality of life in our town is just fine.

According to a 2002 study by the Illinois Commerce Commission, there are over 1,700 public highway grade crossings in the six counties of northeastern Illinois.

Every weekday approximately half a million motorists are delayed at these crossings for a cumulative total of some 11,000 hours.

Frankly, being surprised at finding railroad grade crossing delays in

34

the Chicago region is like being surprised to find gambling in the back room of Rick's

Cafe in Casablanca.

The projected grade crossing delays along the EJ&E after the CN acquisition would still represent a relatively small portion of the region's overall total.

According to the ICC study in 2002, the region had 30 grade crossing locations, count them, 30, where delays exceeded any of the projected crossing delays on the EJ&E. Thus, one is tempted to ask "What's the big deal?"

Much has been made about the impact of CN/EJ&E on the proposed Star line commuter route. Yet comments made by EJ&E management in the 1999 Metra feasibility study clearly indicate that the future of the Star line has been in serious jeopardy for some time.

Quoting directly from that report: "EJ&E management indicated that specific long-term levels of freight

35

traffic are difficult or impossible to predict at this time, but they will need to retain their existing trackage and other infrastructure to conduct their future business, allowing EJ&E exclusive use of

their present physical plant without interference from Metra commuter operations. EJ&E management reiterated that their existing track capacity would be required for present and future freight operations."

Finally, we would like to remind all parties involved here of the larger issues at stake. According to STB Chairman Charles D. Nottingham, in sworn congressional testimony March 5, 2008, "Given the magnitude of rail infrastructure needs and the lack of alternative sources of funding, Congress and the STB should be very careful to avoid sending signals to the financial market that we do not welcome and encourage investment in the privately-owned rail system. Freight railroads in the U.S. are in reasonably

36

good financial shape and are attracting investors of all types and sizes. The rail industry's ability in future years to continue this trend will largely determine whether the rail sector will have the resources needed to meet growing demand for rail service."

Thank you.

MS. TARCZAN: We do have a number of people who have arrived since we started, and I certainly would like to invite those of you who wish to speak before us tonight to register outside this room. You're welcome to do that.

At this time I'd like to call David Betlejewski, Representative Karen Yarbrough, Village President Harold Wiaduck, Representative Ken Dunkin.

MS. YARBROUGH: Good evening. I'm State Representative Karen Yarbrough. I represent the 7th District and also the Democratic Committeeman for Proviso Township, one of Cook County's largest townships just west of Chicago.

I support the CN/EJ&E transaction.

You already have data from a number of sources about this matter, so my focus is on the bigger picture. And that

is how this transaction impacts the lives of my constituents, the lives of those living along the EJ&E, and how it impacts all of us in the greater Chicago region.

I fully understand why the residents along the EJ&E are resistant to what they perceive is an infringement on their daily lives.

I live in the Village of Maywood which is cut in half by the UP railroad. I have more commuter trains alone passing daily through my village than the total trains the communities on the EJ&E will see

in one day.

We have 59 commuter trains and 40 to 60 freight trains daily. Clearly, I get impatient and frustrated when I'm blocked by a train, but I also realize that those trains are moving people to and from work, moving freight, which is the backbone of our economy, and let's not leave out the jobs.

I have several crossings in my district that will see a reduction in rail traffic including one near the huge Loyola Medical Center that's often blocked by CN.

I am told that this transaction

could result in a net reduction of grade crossing delays of 174 hours per day. I understand the vast majority of those reductions will occur in the City of Chicago and its border towns.

Your task is to measure the environmental impact of this transaction, and I commend that effort. But please don't tell my constituents the disruption to their lives from train congestion is

less important than disruption to the lives of those along the EJ&E. And don't tell them that an improvement for them somehow should not be measured equitably against the inconvenience to others.

It is neither appropriate nor fair to tell the people of my district that because they're used to it, any relief to them is somehow less relevant, when there's a solution out there that begins to address the problem for the entire region.

CN should not be penalized for looking beyond the confines of the City of Chicago and revitalizing an existing, underutilized segment of rail infrastructure that will help unstrangle an urban legend, the Chicago rail hub.

I leave you with the words of Victor Hugo who said, and I quote, "There is nothing more powerful as an idea whose time has come," end of quote.

The time is now and the idea positively makes sense.

Thank you.

MS. TARCZAN: Village President Harold Wiaduck, Representative Ken Dunkin, Reggie Greenwood.

41

MR. WIADUCK: Good evening. My name is Harold Wiaduck. I'm the President of the Village of Riverside, a community of about 9,000 residents located in west suburban Cook County.

I'm the past president of the West Central Municipal Conference, an association that comprises 38 municipalities in western Cook County representing a population of over 500,000.

I am here tonight to express our Village's support for this transaction. The West Central Municipal Conference also supports the purchase.

We in western Cook County are disappointed that our area has been ignored in this process. All of these meetings have been held in areas that will be affected in a negative way.

Only tonight's meeting is in a location where the region will see benefits. This makes it difficult for our

supporters to come and attend and gives an

ChimniakCourtReporting.com
312.781.9111

42

unfair advantage to the opposition.

More than 60 communities throughout the metropolitan area will see freight traffic reduction as a result compared with fewer than 30 communities that will see an increase. Less rail traffic in our communities means less road congestion, freer flow of goods, services, and people within our communities.

The Draft EIS does not discuss in detail the benefits that will be derived from this transaction; however, much attention has been given to the issues raised by those who oppose the transaction.

On the economic side, the recent CREATE feasibility study suggested over $780 billion of output and $217 billion of wages are affected in this area. What happens in our region impacts the entire nation and arguably the entire continent.

Being a transportation hub is a double-edged sword. Congestion is a problem. It takes a long time to get people across this area. In fact, a longer

ChimniakCourtReporting.com
312.781.9111

43

time to get across the City of Chicago than it does to send a train between Winnipeg in western Canada and Chicago.

Without question, when we consider what we have to gain and what we would lose, we cannot afford inaction or a missed opportunity.

Arguments have been made that the corridor needs to be preserved for transit service. The rail lines in our region need to be used to their fullest potential and that means moving people and freight. Our region has a long history of transit operating on freight and rail lines, and we need to continue that tradition.

The Metropolitan Planning Council has estimated that a billion dollars is lost annually by the freight industry due to congested condition. Who pays that cost? The citizens of the region, the nation. The cost of shipping goods is passed on to the consumer. Keeping the cost of goods down is critical

ChimniakCourtReporting.com
312.781.9111

44

if we can find a way to do it, and we must.

Finally, the opposition talks about safety. Safety is important to all of us. In the inner ring it's suggested that 77 percent of, the accidents will go down 77 percent. This is an amazing statistic. I ask that the STB keep these in mind. Thank you.

MS. TARCZAN: Representative Ken Dunkin, Reggie Greenwood, Don Jaburek.

ChimniakCourtReporting.com
312.781.9111

45

MR. GREENWOOD: Thank you. Good evening. My name is Reggie Greenwood. I represent a group called the Chicago Southland Economic Development Corporation,

which is an economic development organization with public and private members promoting economic development in south Cook and east Will Counties.

One of the main economic development activities in our region is branded the I-80 East Logistics Corridor.

We have just completed a comprehensive freight study that identifies our region's unique freight assets for economic development. Two of those key assets are the EJ&E line and the Canadian National line and the Canadian National intermodal site.

These assets are already leading to significant new development in our region such as the five million square feet logistic center in Sauk Village.

There's also a lot of potential now for industrial development in the

inner-ring suburbs of Harvey around the CN intermodal site.

This proposed acquisition of EJ&E by the CN will substantially benefit the industrial development opportunities in our region.

Our region will indeed, however,

be substantially impacted by increased rail traffic at four crossings along the EJ&E.

One of our biggest potential problems of course is access to, as pointed out earlier, fire and hospitals.

Our organization recently had gotten together with several other institutions, for example, the Will County Center for Economic Development and the Will County Intergovernment League, to develop a proposal to take to the State of Illinois so that the new Capital Bill will hopefully include a separate line item for freight investments so that we can encourage and pressure the State to recognize that they have to play a role in funding the mitigation measures for the

crossings in our region.

However, I do want, even though we have these potential, we do have these negative impacts in our region, we must also recognize that our area would greatly benefit from the potential of increased jobs from the industrial/warehouse development that would be spurred by this acquisition. Thank you.

MS. TARCZAN: Don Jaburek, Ethan

Bueno de Mesquita, Patricia Harthun.

MR. JABUREK: Good evening. My name is Donald Jaburek. I'm a resident from the inner area here in Chicago that would be greatly affected by this acquisition.

I live in the area near the St. Charles Airline near 16th and Clark Street or 16th and the Chicago Metra Rock Island line intersection with the current CN line.

I echo many of the other comments that people have made and will make, but I don't want to give a lot of

numbers and so forth.

I want to just give you a little bit of information about a particular area and how it's impacted in terms of air quality.

Westbound trains on the St. Charles Airline of the CN line idle for three to five hours every day while they wait for passage across the Metra line and go south. Every day myself and my neighbors watch and breathe as these

locomotives spew their fumes into the air waiting in this congested bottleneck that currently exists.

The ongoing impact of this air quality in that area is terrible and has many of course immeasurable health negatives to communities such as ours. And this is of course duplicated all across the region.

I would hope that you would take this into consideration, particularly the air quality, in just this one area where these trains sit every day two, three, and four locomotives for three to four hours every day. Sometimes more hours than that, but every day that. That's significant and

it can be alleviated by this acquisition.
Thank you.
MS. TARCZAN: Ethan Bueno de Mesquita, Patricia Harthun, Michael Mini.

MR. BUENO DE MESQUITA: Hi. I'm Ethan Bueno de Mesquita. I'm a professor of public policy at the University of Chicago.

I'm presenting my personal views as a resident of the City of Chicago who lives and works in the neighborhoods that would be positively affected by the CN acquisition.

It's clear from a strict sort of cost benefit perspective that this acquisition is a good idea. As my colleague Christopher Berry already emphasized, the number of people who would benefit far exceeds the number of people who would be inconvenienced. And when you add in the regional benefits, this seems like a no-brainer.

And yet, the merits not withstanding, the regulatory approval process frankly seems to be getting bogged down in a political debate pitting regional interests and regional benefits against the

local and parochial interests of suburban residents who want to avoid an increase in rail traffic in their communities.

In my view the reason that the Service Transportation Board, nonelected federal officials, is making this decision is precisely because your status allows you to be insulated from these local concerns and consider the regional and national benefits and weigh the cost and benefits. With many of the economic and environmental benefits, this is a fairly straight forward exercise.

But in thinking about the impact on communities, you have to assess the impact on people's lives. And it's important that in doing so the quality of life of people in the suburbs and the quality of life of people in the city get equal weight. And it's to this point I want to speak.

My concern is that suburban

interests opposed to the deal seem to be getting significantly more attention than

the city interests in favor of the deal.

My guess is this is the case for two reasons: First, as my colleague Chris already detailed, the STB process for assessing community impact has been seriously biased in favor of soliciting suburban concerns. There has not been a single one of these meetings, including this one, held in an area that's going to be positively affected.

Second, the suburban interests opposed to the acquisition have been better organized and more vocal than the city residents.

You might naturally assume from this that the negative impact on the quality of life in the suburbs must be qualitatively larger than the positive impact of quality of life in the city. I would caution you against reaching that conclusion.

As my colleague described earlier, the demographics of these two communities is quite different.

In particular, suburban communities opposed to the acquisition are on average 65 percent more affluent and have half the number of underrepresented minorities when compared to urban neighborhoods that will benefit from the acquisition.

Like in any American inner city, the residents of the south side of Chicago that stand to benefit from this acquisition have a lot of issues to occupy their attention. Many are concerned about whether their children will return safely from schools, whether those schools will be properly funded, when the next set of foreclosures will hit, and so on and so on. Train traffic may be pretty far down the list of things that they need to solicit their government about.

Meanwhile, in some of the Chicago suburbs the prospect of an increase in rail traffic may actually be the biggest problem their community has faced in quite some time. But this does not mean that the

city residents don't have serious interests at stake.

You should not discount the interests of city residents simply because those citizens have larger issues occupying their attention and as such have not been as vocal on this issue, the turnout tonight notwithstanding.

In conclusion, let me note that this is a rare opportunity for you to support a policy that will both benefit the economy and the region and members of an urban community that have long borne more than their fair share of the cost of our region's economic activity. Thank you.

MS. TARCZAN: Patricia Harthun, Michael Mini, Jacquelyn Paine.

MS. HARTHUN: Hi. My name is Patricia Harthun. I'm here as a citizen of

the south side of Chicago in the Beverly neighborhood, and I am speaking in support of the proposal to allow the Canadian National Railway to use the old Elgin lines.

As many people have already detailed in their numbers, the measure would reduce congestion on the overburdened city rail lines.

Our neighborhood is surrounded by busy rail lines. There's rarely a trip that I take that doesn't result in waiting for a train.

My statistics are on a much more personal level. I plan my routes frequently around whether the train line is open. Oh, 99th Street is open, cross now, because there are so many trains that go through the neighborhood that they congest traffic, people sit with their engines idling and further pollute the air.

There are two sets of tracks

between my house and the grocery store, three on my way to exercise, two between my house and the nearest trauma center.

Obviously, some of these are very personal and somewhat inconsequential

on the overall impact. However, I have seen ambulances sitting, waiting to cross the tracks, to the nearest trauma center.

Christ Hospital is the only trauma center in the area, and there are two rail lines between the east side and Christ Hospital in Oak Lawn.

In addition, the congestion on the city rail lines often causes the trains to stop, and that further delays any type of life-saving measures.

It's understandable that the communities that will be impacted negatively would speak up. These communities have strong voices, but the number of people who may be inconvenienced by the proposal is less than those who will benefit.

I heard a complaint on the news

that school buses have to cross the tracks and that they were afraid of accidents. But if the drivers heed the crossing signals, that shouldn't be an issue.

However, in the city children walk to school, and it's tempting for a child who may be late to school to try and cross through that stopped train. And we

have lost children to rail accidents trying to cross the tracks.

On a larger scale, obviously the increased amount of time the train takes increases transportation costs which are then passed on to the consumers.

I would urge you to consider the greater good rather than the local objections of those few who have enjoyed relatively little train traffic up to this point.

I don't see how the Transportation Board could turn down the proposal that would reduce this freight train congestion.

So please support the measure to

grant access to the Canadian National Railway. Thank you.

MS. TARCZAN: Michael Mini, Jacquelyn Paine, Robert W. Trowther.

MR. MINI: My name is Michael Mini. I'm the Government Relations Director at the Chicagoland Chamber of Commerce.

We represent over 2,600 businesses throughout the Chicagoland region. Our mission is to make Chicagoland the most business-friendly region in America.

Chicagoland Chamber of Commerce strongly supports the CN acquisition of EJ&E Railway.

We believe that this proposed acquisition is key to ensuring the long-term health and well being of our

regional economy. We urge the STB to approve the transaction without further delay.

Industrial and manufacturing businesses in the Chicagoland region depend on good transportation, and freight rail plays a major role in their success. However, quite often the railroads serving our shippers encounter severe congestion that is an adverse impact on our economy.

CN's acquisition of certain EJ&E assets is an important step toward improving that situation.

Without question, our rail shippers will benefit from the streamlined rail operations and reduced congestion resulting overtime as well as the new efficiencies and operating improvements the acquisition will bring to CN's network.

In addition, the acquisition will be another step forward in CN's long-term commitment to reduce costs, improve service, and provide customers with more single-line market opportunities, all of which will benefit the Chicagoland region and our businesses.

Finally, we urge the STB not to

burden this transaction with unrealistic mitigation requirements and approve it as soon as possible so that Chicagoland and regional businesses, as well as the community in general, can begin realizing the benefits of this important transaction. Thank you.

MS. TARCZAN: Jacquelyn Paine, Robert W. Trowther, Bob Crowther.

MS. PAINE: Hello. I'm Jacquelyn Paine, and I live in Riverside, Illinois.

I have 25 years experience in rail transportation with a Class I railroad, CSX, and also as Director of Rail Transportation for a Fortune 500 company.

When I started with CSX, my first day on the job my boss and I flew from Baltimore to Chicago and we visited the CSX bar yard. It was full of cars. The problem was trying to get the cars out and get them to other railroads so they could complete their journeys.

Since then I've been to many, many rail yards, and it's the same problem everywhere here in the Chicago area.

Rail cars don't spend a lot of time moving. They spend a lot of time sitting. We call that the dwell time. In a 24-hour period, typically a car will only move six or eight hours maximum, unless

it's coming from the west coast or

something like that.

The way this impacts us is in several different ways, and I tend to take a more regional look and a more national look than I would had I not worked for a railroad. However, what you want to do is move the cars as quickly as possible.

If you can improve that, you can reduce congestion simply because you don't have as many rail cars sitting in the yard clogging them up making it difficult to move them to their next destination.

I have personally experienced delays of up to three weeks on cars coming into Chicago from a western road trying to get to the CSX yard or perhaps the NS on the other side of Chicago. The reason for lengthy times is weather conditions, flooding, et cetera.

It's not a pleasant thing to have your customer calling you every day hounding you about when they're going to get their rail car. And you're absolutely powerless because it's sitting, it's stuck

maybe in the clearing yard, the yard is full of cars, and the belt railroad just can't get it out.

Do you know who pays for this? All of us here in the room pays for this because those transportation costs are passed onto us through the products we buy.

I am supporting this acquisition because of the economic benefits that it would bring to us personally and also to the manufacturing companies we have in this area.

Manufacturers can reduce the size of their car fleets, which is a huge drain. They can provide better service. And, you know, the productivity wouldn't be bad either because I really got tired of having to call the railroads and beg and plead and scream and yell just to get my cars to move. Thank you.

MS. TARCZAN: Robert W. Trowther, Bob Crowther, A. Johnson.

MR. CROWTHER: I may be No. 17 and

18, but it's Bob Crowther.

I've come from Barrington down here to see, I'm opposed I must say to the railroad increases in our town. We have a ton of them now on the commuter line.

The interesting thing about Barrington is that these tracks cross each over in our town. One train, one freight train, can block all four intersections in our town. So the fact that they mentioned on the chart outside that there's one mitigation point in Barrington isn't really true. There's four.

So anyway, I thought I should come down and see your turnout. We had over five thousand. I counted at best 72 here and even with the nice court reporters, verbatim reporters, and your nice board.

We opposed it for a couple of simple reasons: First of all, our tracks are crossed by school buses 840 times a day

now, okay, without increased train traffic. That's significant.

The other thing is that our 90 square miles of the Barringtons are

serviced by wells, not deep wells, shallow aquifers. So that hauling chemicals and petro chemicals and the like doesn't appeal to us that much, as it doesn't to you I'm sure.

So that's all I basically had to say. I don't like the idea of transferring problems from one area to the other.

I respect the gentlemen from the University of Chicago, but some of the names in Barrington are on those walls at both the hospital and the university, as you know, and they were at this meeting and they don't like it. So we don't think it impacts too much.

U.S. Steel, $300 million is a pittance to them in selling this railway.

We also don't think it's the Service Transportation Board's role to enhance the future profits or whatever of

an international railway.

I want to thank Ms. Ball for her time and you guys, all your patience. I noticed that in the document it says that your board and the previous Interstate Commerce Commission, which was before you, has in the past denied mergers.

I hope you will deny this one. Thank you for your time.

MS. TARCZAN: A. Johnson, John Ehlers, Patrick Spiroff.

MR. JOHNSON: I'm A. Dwight Johnson, and I'm a consultant for Canadian National Railroad. Now I'm retired from Canadian National Railroad. I have 42 years of rail experience, and I did written comments so I don't want to repeat those.

What I want to talk about now is the -- is -- they complain about the other -- the EJ&E acquisition because who's going to pay for overpasses because of additional freight service on the EJ&E? Well, I have a source for their funding, and that is the additional property taxes that Canadian

National's going to pay because when that happens in my experience -- and I've been involved in three different mergers -- and to pay -- the property taxes for the railroad, they will triple immediately. So that will be a definite source of funding for their overpasses that they're all worried about.

Another thing, and I did write this in my written testimony. I want to

mention about Barrington. Barrington has a commuter rail station on Union Pacific. They voluntarily decided to build it downtown, blocking both Route 59 and Lake Cook Road for -- for an average of four minutes every time a train stops. They are crying crocodile tears.

They also -- another thing, when there was a brand new schedule out that Union Pacific put out, one train did not stop in downtown Barrington; and they had service every -- an average of every 15 minutes at that time, and they forced that train to stop there. If they care about

crossings being blocked, they should have not stopped that train at Barrington.

MS. TARCZAN: John Ehlers, Patrick Spiroff, Bill Wendt.

MR. EHLERS: Good evening, everybody, ladies and gentlemen, the Surface Transportation Board, and other interested -- other interested parties. My name is John Ehlers. I'm owner and president of Rail 1 Media. I'm here to put on the public record our extended automatic warning system. Just to clarify, Rail 1 is not part of any news organization, however kindred to outdoor advertising. Both Rail 1 -- but Rail 1 does have -- have multiple divisions that are involved in highway rail safety. Our second division is design and installation.

My company has designed an extended warning system that could be

installed and connected electrically from the grade crossing to an LED lighting system along the road. With the roadside message, both the LED and roadside message are Federal Highway Administration-approved.

The warning system is multifunctional. That is, with a standard

grade crossing vehicles react to the action of the -- to the lights and the gates and in some instances take a gamble, for lack of a better word, to drive around the gates to beat the lights -- beat the lights through the -- through the grade -- through the right-of-way.

On the other hand, there are those that respond to the stop and -- respond and come to a stop at the stop zone. As we go -- as we know, this -- this entire action works around time. We feel that there is a need for transition time. This is where we feel our warning system applies and comes into effect.

How our warning system works is connected at -- to the grade crossing directly when the train shunts the -- the relay through a series of connections and

directly activates the lights -- the LED lights. This with the roadside message when lights are flashing, trains operating through the right-of-way, which would provide the transition time for those

vehicles that are on the roads.

As I said, it's a multifunctional system as a constant reminder, as well as the LED system providing a greater distance of visual contact from the LED lights that a train is operating through the right-of-way. This provides emergency services, police, fire, and EMS to use an alternative route to respond and find a different means to respond to an emergency.

To conclude, I hope that you -- you take a closer look at Rail 1's extended warning system, that the Surface -- Surface Transportation Board determines as a result of these meetings -- determines that as a result of these meetings, provides certain recommendations, as I hope we become one of them. Furthermore, extended warning system -- our extended warning system sheds new light on the Surface Transportation Board and the communities of this acquisition

that it affects.

MS. TARCZAN: Patrick Spiroff, Bill Wendt, Michael Howard.

MR. SPIROFF: I want to thank you for allowing me to come here to speak tonight. I'm just an ordinary citizen. I live in Frankfort, Illinois. The train's going to be running through my backyard. Obviously, I'm not thrilled about that, just, you know, want -- imagine that you moved, and you're living on a small country road; and the next thing you know, it's going to be turned into a superhighway. But, you know, so obviously it's going to affect my property values, those personal issues. But that's not really why I came down here on this rainy Monday night.

In December of 2006, my oldest daughter was diagnosed with type one diabetes. It's also known as juvenile diabetes. And, you know, all the other factors I understand; but I -- I'm just coming here as a concerned father. You see I don't have prepared notes; I'm just kind of winging it.

But what concerns me is, you know, I live at an at-grade crossing, up --

you know, up the street from it; and I'm very concerned that it's going to be blocking emergency vehicles making it to my home. You know, so I'm just here as one individual father speaking out for his daughter.

I'm very -- you know, the -- the impact of type one diabetes is you can suffer a coma due to low blood sugar and so every second would count getting my daughter to an emergency room to bring her back up and have her regain consciousness and not affect, you know, her brain. So, obviously, I'm not going to explain any -- any kind of mitigating factors. It's just kind of well, you know, you lived on a railroad track. You should just have to deal with that.

So I just -- you know, I just want to say here that, you know, with no mitigating factors to take in account that crossing, there's also -- not only just to my home, but there's -- she also lives -- I'm sorry. She goes to school, and there's

a railroad crossing just to the north of her; and this crossing does not even have a

signal or lights or anything, and it's the first crossing right behind the school.

So not only is it going to affect emergency vehicles coming to my home; it will also affect emergency vehicles access to that school; it's Hickory Creek. And that's why I'm here. Thank you very much for your time.

MS. TARCZAN: Just to confirm, it's Patrick Spiroff?

MR. SPIROFF: Yes. Thank you very much.

MS. TARCZAN: Bill Wendt, Michael Howard.

MR. WENDT: Yes, my name is Bill Wendt. I live in the city, and for quite a few years I have thought that the railroads are running too much freight through Chicago when they would have a shorter,

more direct route outside the city; and along the bypasses of Chicago would be the Elgin, Joliet and Eastern. Having said that, it's not like -- my written remarks might -- might seem like I'm more of a friend of thinly populated suburban sprawl than I am, but there are very valid concerns about these emergency vehicles being blocked; and I haven't heard any real mitigation of that concern. And the railroad, I think, is kind of blowing its own credibility on that in not proposing at least something like a dozen separated crossings to alleviate this particular concern.

As far as the STAR line is concerned, now Metra is talking about 20-minute commuter train service, which is incompatible with freight service. I do

think there is a better approach than -- to -- to public transportation needs in that area, and that would be -- well, we've had these van pools for over 20 years, computer-matched van pools. We could have computer-matched bus pools of 50 or more.

And there are about 500,000 people in that area west of O'Hare, working

in that area. It's what -- about the same as downtown Chicago except over at least 10 times the land area. You need rubber tire distribution there anyway, and if you have to have rubber tire distribution, well, there's not much point in running an expensive, disruptive railroad down the middle of an expressway when there is a railroad just a couple miles north of there.

But still, I think the better solution would be a bus rapid transit, and we -- that would be with or without a monorail that could really put the rapid in bus rapid transit, suspend a monorail in which a vehicle is simply a skid that a bus

drives on and drives off and the stations need be little more than a bus turnaround.

It doesn't matter too precisely where they are. But figure the great unemployment center in the southern suburbs is about 35 miles as the crow flies from the great employment center in the northwestern suburbs. And we could have one seat rides in -- in an hour or less between the two with that kind of technology.

I think the Grand Trunk Western lines in the city could be used for Metra commuter trains, save about 400 million in rerouting the Metra southwest service. And I would be opposed to abandoning the rail lines -- these rail lines in the city because with traffic increasing the way it is, we just might need them again before too terribly long.

MS. TARCZAN: Michael Howard, Jim Domiano, Steve Mannos.

MR. HOWARD: Good evening. I'd like to say thank you very much for offering the opportunity for us to come. I represent the community of Fuller Park, 4500 families that are most affected by all the growth and commerce that's been mentioned here tonight. I just want you to know that the impact from all of the profit and all the growth that hasn't -- has happened in the rail system over the last three to four decades has impacted our community to a greater extent than those that are worried about being affected if this acquisition goes forward.

We suffer from the largest asthma population in the city of Chicago due to all of the congested locomotives in those switching yards and those side rails that have been built to -- to handle the increase of traffic through the city itself. Our -- our -- our properties are rattled daily, 24 hours a day, by the banging of those cars being switched from track to track and being loaded and

unloaded. Our children have so much asthma. Our senior citizens have a large increase of respiratory ailments due to all of the diesel and traffic emissions that encompass our community.

We're surrounded on both sides by major hubs. Not only do we get the CN traffic and others. We have the Amtrak, the Metra traffic. All of that has to share the same lines through our neighborhood on both sides of the neighborhood every day. I want you to imagine not being able to open your windows on a -- on a hot summer night because you cannot afford to breathe that heavy diesel fumes that's coming from those 15 engines that are just sitting there waiting to

switch their load through the city.

So, for us, I -- I'm really in support of this move because the mission of our organization -- I'm executive director of Fuller Park Community Development -- is to improve the quality of life for our constituents, and this move to relieve the

congestion through the city of Chicago would indeed improve the quality of life for our constituents. So we would say yes, vote yes for this expansion for our health.

We're not here -- we're not gaining economically. We're not gaining for jobs. We don't have any economic benefit from this pollution that -- that affects our lives daily, but it has ruined the quality of life for many of the seniors that are in this room tonight and then it also affects our children every day, as they can't even open up the school room windows on certain summer days, and even during the coldest day of the year we've had some heavy diesel fumes that float through. They had to -- everyone closed their windows because the children were choking.

So it's matter of life and death

for our community that you approve this plan. Thank you.

MS. TARCZAN: Jim Domiano, Steve Mannos.

MR. DOMIANO: Hi. I'm Jim Domiano, and Michael stole my notes, I think; but I am here to speak as an individual who lives in the near South Loop at 15th and State. I live approximately that far from the rail line, and my situation and my building situation, Dearborn Towers, is aggravated by the fact that we live above this. In our neighborhood you have canyons of concrete, and the noise issues that we're talking about here are significantly exacerbated by the problems with having huge tunnels of buildings that the noise reverberates through.

We moved in in 2001 and during one of the first nights that we stayed there, I was awoken at about 2:30, 3:00 o'clock in the morning by what I thought was someone throwing giant aluminum boxes down a concrete stairwell. I said to my wife, what is that? She said, oh, those are the coal cars. The train just stopped over there where Dan was mentioning earlier

where the crossing is over by Clark and

16th, crashing together 300 times.

I invite any of you to spend some time in my guest bedroom because I'll tell you; I'm still not used to the noise. The vibration is so intense, and I live on the 10th floor, that things will be moved off of shelves. I feel very badly for people who live on the fourth floor, which is about 30 feet above this.

We're a small community of about 315 units, so you're looking at about 600 people; but multiply this by the tens of thousands of people who live along the lines from the south side. And one of the reasons that you don't see some of these people here is because -- I found out about this meeting Thursday, and I'm pleased to see two other members of Dearborn Tower here. But the disenfranchised of those neighborhoods haven't been made known and aware of this particular situation.

They look to you for their assistance and your wisdom and your guidance to look at the situation and say,

85

the needs of more people who will benefit outweigh the needs of some communities. And with proper guidance and proper holding accountable of CN, which I know is part of this plan, we can mitigate the issues that will potentially occur in the suburban areas; and everyone will benefit significantly from situations like this. Part of the challenge in this type of a situation is everyone wants the benefit of this type of arrangement. Everyone wants the benefit of rail traffic and the decrease in costs, but nobody wants it in their backyard.

So I think at the end of the day it is really important about the individual personal stories that we're seeing here; but more so, we need to look at the overall financial impact on the greater area and the impact on the number of families, positively and negatively. Add that up and determine at the end of the day what the best decision is to make. Thank you.

MS. TARCZAN: Steve Mannos, Mike

MR. MANNOS: Good evening. My name is Steve Mannos. I'm president of the Dearborn Tower Condominium Association, along here with Jim and another one of our

residents. I'm here tonight to strongly back the proposal and to give you some reasons why.

Economic, but not -- but more importantly than that, we -- we have a severe problem in our neighborhood with noise and pollution. When those trains idle for three, four hours at a time at State and 16th, the -- the fumes and the pollution are unbelievable. We, therefore, are strongly supporting the -- the railroad's move; and we're also going to do everything we can to notify more people in our neighborhood because we weren't notified until very recently, and it's a travesty that there's only one meeting in the city of Chicago which has a million-and-a-half people. You know, I know Barrington is growing rapidly; but they're nowhere near a million-and-a-half

88

people.

I've also lived -- I have a perspective of living in the suburbs. I lived in LaGrange for several years; and, believe me, waiting for the train an extra four, five minutes is a hell of a lot easier than sitting and listening to

banging and banging for two, three hours at a time. That's all I have to say.

MS. TARCZAN: Mike Joyce, Representative Ken Duncan.

I would like to take this opportunity again to ask anybody who's interested in speaking tonight to please step outside the room and register. We have no more registered speakers at this time. We certainly invite any additional commenters again to register now. In the meantime, we invite everyone to return to the open house area if you would like to review the boards or ask questions. The court reporter and at least one member of the Surface Transportation Board team will remain here in the public meeting area to

89

receive additional comments from newly registered speakers should we have any additional registration before 9:00 p.m. This concludes the public comment portion of the meeting. Thank you all for coming.

(Brief pause.)

(Whereupon the audience took its leave.)

MS. TARCZAN: Representative Ken Dunkin.

MR. DUNKIN: Hi, thank you. I'm Ken Dunkin, Illinois State Representative.

I represent the 5th District where there's a considerable amount of transportation that has been a major issue of concern as voiced to my residents on the southern end of my district, particularly around 39th and Shield and Princeton, that area.

Even before I was elected they had discussed and talked about how the trains often sat idle for a number of hours and sometimes throughout the night over

around 43rd and Princeton, 45th and Normal. They said there were a number of fumes that would be emitted there. Not to mention the rumbling of the engines for quite some time, for some extended period. They believe it was or is sort of a yard where they just had a long freeze or pause.

So I recall that at least almost, wow, over six years ago now when I was actually a candidate, and to have this issue close to being rectified or at least

pushed or moved further away from the community will be a big value add for my constituents over in the 3rd Ward of the 5th District.

Some of the areas that were discussed or issues that I recall, and again, I'm going way back six years now, were issues of possible asthma, environmental racism because it was a predominantly poor, predominantly black community, certainly on one side, and the community just tended to take it for granted that there was nothing anyone could do about it or even consider moving it along.

I believe Michael Howard, who's

a strong voice and advocate against this particular idling of trains, I'm sure he gave voice to this as well.

Just some of the points that I wanted to make. The residents of the 5th District have had to deal with the burden of bottlenecks on rail lines. Chicago's rail line is one of the most important in

the nation but it's in desperate need of improvement.

In fact, dozens of residents from the 5th District will be attending today's hearing just to give voice to their support for CN's proposed acquisition of the EJ&E line and to explain how their communities will benefit greatly from the streamlined rail operations.

Again, we know that St. Louis almost took the place, the center hub of the country of Chicago years ago. But Chicago became that strong hub where there was a lot of interchange, and we appreciate that, but we have to do just mass improvement, as voiced, of trains idling in any particular community for a given time so we can avoid the possible negative affect such as hazardous air quality and

sort of some of the other issues that affect our constituents.

So please give this great consideration. I wish I had more time to discuss this issue. And I'll be supporting

them moving along away from our particular area. Thank you.

MS. TARCZAN: Thank you.

I do want to point out to you if you'd like to make your remarks, continue them with the Court Reporter outside, we can certainly have you do that, or we can also record your remarks on paper through our hotline on our website.

MR. DUNKIN: I can leave something in writing?

MS. TARCZAN: Yes.

(End of statement.)

1

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET AND EASTERN RAILWAY COMPANY

AURORA WEST HIGH SCHOOL
1201 WEST GALENA BOULEVARD
AURORA, ILLINOIS
SEPTEMBER 9, 2008

CHIMNIAK REPORTING & VIDEO
Telephone: 312-781-9111

REPORTED BY: Nicole M. Breytspraak, Janice M. Kocek, Joanne Brogan, Laura Locascio,

2

MS. ADAMS: We will begin the

public comment portion of the meeting in about half a minute if folks would like to take their seats.

Good evening, ladies and gentlemen. Thank you for being here tonight. We are here tonight to hear your comments on the Draft Environmental Impact Statement that was released July 25th regarding Canadian National Railway's proposed acquisition of the EJ&E Railroad.

My name is Tina Marie Adams, and I'll be facilitating the meeting tonight.

Before we get started, I'll review some protocol for tonight's meeting. For starters, I would ask everyone to please turn off their cell phones and please refrain from interrupting any speakers or commenters.

In a moment I'll introduce those presiding, and there will be a short presentation on the findings of the Draft Environmental Impact Statement.

3

Immediately following this, we'll hear your comments. Each commenter will be given up to three minutes to speak. The time clock will be displayed on the screen here behind

me and a yellow card will be shown at two minutes and 30 seconds, as you see right here; a red card will be shown at three minutes. A list of speakers in order will be displayed on the screen. Also, I will call forth the next two speakers in line after each speaker so we can be as efficient as possible. As you can see, there's one microphone set up in each aisle, so you can choose whichever one is closest to you.

If you're interested in speaking and haven't registered yet, please proceed to the registration table that's actually located directly outside past the auditorium past the exit signs and in the hallway there.

Alternatively, included in the programs that you received tonight, you may submit comments to the Surface

4

Transportation Board through a toll free number, website, or mailing address, all of which are also in the programs that you've received. There are also comment forms and drop boxes and court reporters located in the open house area. You may record your comments with them throughout the night.

Please recognize that all methods of comment will be -- received by September 30th will be taken into consideration and weighed equally.

Tonight we're here to listen to your comments on the Draft EIS. This is not a question-and-answer session, but we invite you to return to the open house area if you do have questions. You can also provide your comments in a more private setting there with a court reporter if you'd like to do that.

We appreciate your courtesy as we work to create an environment where everyone can be heard. If you disagree with a speaker, we ask that you not express your disagreement out loud. Likewise,

5

please note that applause for a speaker during his or her remarks gives that person less time to speak and ultimately will limit the time for everyone else.

In the event that you need a Spanish translator, please let a staff person know. We have Beatrice here who can translate. She'll be located toward the back of the auditorium.

If you have questions about

anything, a staff member can assist you. We're identified with these name tags, as you see on me here, and located throughout the venue.

One other quick housekeeping matter. We have ten exits here in the auditorium, four to the back of the auditorium and three each on either side.

With that, I'd now like to introduce the people with me here on stage. Phyllis Johnson-Ball, who is a deputy chief of staff of the section of environmental analysis for the Surface Transportation Board, and John Morton, team leader

supporting the Surface Transportation Board section of environmental analysis.

Phyllis Johnson-Ball will now make her remarks.

MS. JOHNSON-BALL: Good evening. Thank you for coming to our public meeting -- I'm a little shorter than she is.

I'm Phyllis Johnson-Ball, Surface Transportation Board, section of environmental analysis. Many of you probably recognize my name because we received numerous comments and I have read

those comments and I understand what many of your concerns are, and so tonight we're here to give you an opportunity to -- I'm a little too close -- to give you an opportunity to learn a little bit about exactly what is the Surface Transportation Board, what we do. This is your opportunity to talk to us so that we can hear your voice, and it's very important that you provide us with comments because this is all a part of the environmental process and your participation is definitely a critical part of it.

I'd like to begin by talking a little bit about who is the Surface Transportation Board and why there's a Board involved in this process and give you a brief overview of exactly what is the process involved with this proposed acquisition.

The Surface Transportation Board's primary functions are to authorize carrier actions, to resolve carrier disputes, we conduct rule making on proceedings, adjudicate reasonableness of rail rates, we monitor carrier activities and industry performance, we take

enforcement action on carriers, and we also have an office for consumer assistance, and I know many people as part of this process has taken advantage of that particular office by calling in and asking questions and giving us comments.

The Surface Transportation Board is made up of three decision makers, they are appointed by the President and confirmed by the Senate. Our chairman is Charles Nottingham, our vice-chairman is Francis Mulvey, and our commissioner is Douglas Buttrey.

The section of environmental analysis is the environmental arm of the Surface Transportation Board. We, basically, direct the environment review, we conduct independent analysis of all environmental data, we provide technical assistance to the Board and to the public and make recommendations on environmental matters, and we also ensure that our agency complies with the National Environment Policy Act.

The public participation process, which we are engaging in tonight, is one of the most critical components of

NEPA of the environmental process. This is your opportunity for your voice to be heard. This is your opportunity to tell us what we've done well as part of our environmental analysis, what we have done not so well, and what we also need to continue to do. So, please, give us comments. Your comments are due to the Board by September 30th. If you mail them, they must be postmarked by September 30th. If you provide comments tonight or if you provide them in writing, they must be at the Board by the close of business on September 30th.

As we talked about earlier, there's several ways in which you can provide comments to the Board. We have a 1-800 number, which is 1-800-347-0689. You can send us a letter; you can fill out the comment form; you can email us; you can speak tonight publicly, we'll record your comments, we have court reporters here; and you can also talk with one of the court reporters we have out in the office -- excuse me -- out in the hall. All of the comments that you make have equal weight, so whether you do it in writing, whether

you speak tonight, the Board considers all of those comments equally.

We've had questions about what exactly is the acquisition process. The process starts by an applicant, in this case Canadian National, applying to the Surface Transportation Board for authority to acquire the EJ&E. The Board then sets a procedural schedule to consider the merits and the environmental issues. The merits consist of economics, the transportation, and competitive issues. The environmental process consists of things such as air quality, noise, community impacts, environmental justice, historic preservation, biological resources, weapons, all of the physical impacts associated with the proposed acquisition. It also considers transportation, safety, and delay issues, and issues we have heard so much about, congestion.

The Board can take three avenues in response to Canadian National's requests. The Board can deny the transaction, the Board can approve the transaction, the Board can approve the

transaction with conditions, and that's conditions on the merits and the Board can impose environmental conditions.

I'd also like to mention a little bit about the third-party process and who is HDR. The Surface Transportation Board is a very small agency. We have approximately 150 people, nine of them are on the environmental staff, so we often, as other small agencies -- federal agencies do, we engage third-party contractors or outside consultants to assist us in the preparation of our environmental documentation. In this case, HDR is our third-party contractor. So John Morton of HDR is going to give you a brief overview of the results of the Draft Environmental Impact Statement.

Thank you.

MR. MORTON: Thank you, Phyllis.

I briefly want to go through the Draft EIS and some of the conclusions. I know that there's -- it's a very voluminous document, a lot of information is in there.

I want to touch the surface. If you have questions, if you want to explore anything in more detail, we're leaving the open house session open and manned. There's maps back there. There's people that would be more than happy to talk to you about any specific resources or help you better understand, you know, some of the issues that are going to be talked about tonight.

First of all, the applicant, CN is a Class One railroad, a major shipper of domestic and foreign freight. They have five rail lines that converge on Chicago. Those rail lines are shown on the dark color on the map. They operate about 150 miles of rail line in the Chicago area. EJ&E is a regional rail line that operates in an arc around the City of Chicago. They have two main rail yards, and that is East Joliet Yard in Joliet, Illinois and Kirk Yard in Gary, Indiana.

CN indicated that they had three primary purposes for acquiring the EJ&E. First, it provides CN with operational

flexibility by connecting their five lines into a continuous route around the City.

Second, they want to make available the Kirk Yard to the EJ&E -- the EJ&E's Kirk's yard to the CN's operation, and it will allow CN to develop a more extensive relationship with the shippers on the EJ&E.

The Draft EIS covers a number of resources listed here, and I'm only going to touch on just a few. Once again, if I don't mention it, if you have some questions, feel free to talk to anybody that's in the -- that's manning the open house session and look at some of the maps and information that we have there.

First thing is just actually the changes that will take place. There will be changes in train traffic and train operations, which I'll talk about in a second. In addition to that, CN proposes to construct six new connections, and that is a rail connection from one railroad to another railroad and they propose to construct 19 miles of new parallel track

alongside the existing track, and those locations are shown on the slide.

The -- this is a map, and I know it's a little hard to understand, but it's essentially a density diagram and an output

from some of the analysis that was done. The light blue color is -- shows the trains today, the thickness is indicative of the number of trains; the dark blue color shows the proposed trains should the Surface Transportation Board approve the acquisition. So what you can see is that much of the traffic that currently operates inside the EJ&E yard will be shifted to the EJ&E yard. There will be a total change of about 15 to 24 trains.

As a result of those changes, the analysis indicates that the EJ&E rail line in some parts will be at or near existing capacity. As a result, it's unlikely, you know, that there will be more trains operated on the EJ&E than those that were estimated by CN in their application. In addition, one of the conclusions of the

Draft EIS is that Metra's on-time performance can be maintained with effective coordination between Metra and CN.

The EIS looked at roadway and train safety information. On the EJ&E arc because of the proposed increase of the train activities, there will be an increase

in probability of train accidents and also an increased probability of a highway/rail accident.

On the CN rail lines inside the arc because of the reduced number of freight trains, there will be a reduced probability of a train accident and a decreased probability of a highway/rail accident. In addition, the EIS identified three highway/rail at-grade crossings that, you know, would see a substantial increase in accident risk and those would be Woodruff Road in Joliet, Illinois and Lake and Miller Streets in Griffith, Indiana.

The EIS also evaluated passenger rail safety and haz-mat safety. There's no

passenger rail currently operating on the EJ&E. There is passenger rail operating on the CN Rail Line that will show a decrease in freight accident -- or freight train activities, and that's an improvement in passenger rail safety. On the haz-mat side, there would be a substantial increase in the shipment of hazardous materials shipping -- moving from the CN Rail Line inside the arc to the EJ&E rail line.

Transportation findings. The

EIS evaluated 155 highway at-grade crossings on the CN rail line, 125 of those would see a reduced, you know, amount of freight traffic. On the EJ&E rail line, the EIS looked at 112, 87 of which met the Board's threshold for the environmental analysis. Of those 87 without mitigation, 15 would be substantially affected by the proposed acquisition. Those 15 are shown up here, and we list them on the maps and on -- and identify them on the boards that were available in the open house session.

The EIS looked at air quality.

The EJ&E route is a longer route, therefore, there would be increased fuel use. However, because of the efficiencies and the more free-flowing operation, it would be a more efficient operation and, therefore, air emissions in the year 2015 would not exceed current regulations or impact the region's air quality compliance.

The EIS also looked at emergency response. Without mitigation, there would be eleven fire and emergency medical service providers that would be substantially effected. The nine fire and two hospitals are shown on the graphic,

and, once again, they're identified on the boards and shown on the maps in displays there in the open house.

The EIS looked at noise. There's about 3,000 residences that would exceed the 65 dba noise on the EJ&E. About 2700 would show an improvement on the CN Rail Line inside the arc, and one quiet zone, Barrington area quiet zone, because of the increased freight traffic would lose

its quiet zone status.

The EIS also identified possible mitigation or mitigation recommendations. The CN provided or offered 76 voluntary mitigation measures in these resource categories. In addition to those 76, the SEA also identified 72 additional mitigation measures in these resources categories. Once again, those are listed in both the Executive Summary of the Draft EIS and in Chapter 6 of the Draft EIS, and we would have copies of both of those in the open house session if you want to take a look at the mitigation.

And with that, I'd like to turn it back over to Tina Marie.

MS. TINA-MARIE ADAMS: Okay. We'll now begin the public comment portion of our meeting. Let me remind you that we have the three-minute rule, which begins as soon as you begin speaking.

If three minutes is not enough time, please feel free to speak with the court reporter in the open house area to complete your remarks.

We'd also invite you to submit your full written remarks to the court reporter, located here by the stage when you're done as well.

To be fair and consistent, if you speak beyond the three minutes we will go ahead and announce the next speakers.

I would now like to ask for the first commenter, Darlene Senger, followed by Eric Gallt, and then Marcie Schatz.

When you come to the microphone

if you would please state your name and who you represent or the town you're from.

MS. DARLENE SENGER: Good evening, my name is Darlene Senger. I am a councilman in the City of Naperville and Naperville's track representative.

I'd like to give you a little bit of background of how we got here tonight. The cities of Aurora and Naperville, Plainfield have been working together to basically notify people of this hearing tonight. And that population, we represent over a third of a million people in the area.

I'd like to thank West Chicago High School for -- West Aurora High School for hosting us tonight. I'd also like to make the comment that it's a shame that we couldn't have had this at Waubonsie Valley High School because it is closer to those who are affected, and I know for a fact there are citizens and the residents of Naperville and some in Aurora that could not make this meeting tonight because of the fact it was so far away.

I also wanted to say that we

want to thank the STB for listening to our comments and we also want to thank you for the decision you made to -- the other day or today about delaying or denying the October 15th expedition of the Canadian National's request to bifurcate.

We are very pleased you've done that and we do ask you to continue to listen to what we have to say and take all the time you need in order to come up with the right decision.

Tonight we're here to comment on the Draft Environmental Impact Statement, and the keyword in that term is "impact." And you're going to hear a lot tonight about how this impacts our communities and it very much impacts our communities.

It impacts the air we breathe, it impacts our traffic, and public safety, it impacts our property values, it impacts our pocket books.

I'm really concerned about that because I know with the at-grade crossings that need to be mitigated with either an

underpass or overpass, we're talking about possibly hundreds of millions of dollars. And where is the money going to come from?

That concerns me as a representative, it concerns me as a possible state representative, and I would speak on the federal level, too.

A lot of this is not about not in our backyard, but it's not in our pockets.

I'm also going to comment a little bit about specifics with Naperville. One of the things that the draft environmental report fails to talk about is how when an at-grade crossing is now affected that traffic moves into a grade-separated crossing.

Currently in our three communities we have seventeen at-grade crossings and twenty-three total, so those sorts of traffic shifts need to be taken into consideration.

I'd also like to comment on the fact that looking at the amount of traffic

that's calculated in this, IDOT looks out

for twenty years, it is not looking out for twenty years.

Our communities are still in the growth mode. We need to look out longer term to make sure that we take consideration of total cost and total impact on quality of life.

Again, I want to thank you for having us tonight.

MS. TINA-MARIE ADAMS: Eric Gallt, followed by Marcie Schatz and Tom Weisner.

MR. ERIC GALLT: Good evening, I am Eric Gallt with the city of Aurora, staff member and city traffic engineer.

I was requested to speak on behalf of the city of Aurora with regards to some of the impacts on the traffic and some of the evaluations that were made through the Environmental Impact Statement.

It was difficult in doing so in that it was obvious that the EIS was rushed as far as the time frame and the amount of input that went into the Environmental Impact Statement was lacking in some of the depth of investigations.

Just in the city of Aurora I'd like to point out that traffic counts are off as much as 300 percent.

Hafenricter is shown as a 2015 volume under the 2,050. However, in a traffic count done in April of 2008 the traffic volume of 6,250 was observed.

Hafenricter was not even evaluated in the EIS, which given the existing volumes it should be have been

evaluated, and having a 2015 volume significantly above the threshold for investigation.

In addition, Keating was referenced at 2015. In 2015 of having 2,050 and is seen significantly higher on existing traffic counts than are proposed under the EIS.

Secondly, we have significant concerns over the traffic delay methodology and believe it is fundamentally flawed assuming, in essence, the -- the formula assumes a free-flow after the trains have passed the crossing.

In situations like Ogden, we have significant traffic signals, both upstream and downstream. When the train is gone, there is not a free-flow situation, as assumed under the traffic -- under the methodology; and therefore, the methodology itself is way underestimating the delay that is experienced by our community.

And lastly, we did some investigations under the evaluation of what

they're seeing on the EIS with regards to closure times.

We sent several of our employees out to crossings to investigate how long crossings are actually closed.

Under a no-build situation the EIS said that a crossing is actually closed for 1.9 minutes. However, on September 4th we observed three different crossings.

At 7:21 the crossing was closed for 3 minutes and 50 seconds. At 8:08 it was closed for 4 minutes and 27 seconds. And 10:54 for 4 minutes and 10 seconds.

This is well above the 1.9 minutes that was assumed during no action. We believe it is grossly underestimated and, therefore, the results in EIS are not to be taken as truth. Thank you.

MS. TINA-MARIE ADAMS: Marcie Schatz, followed by Tom Weisner and Bill Wiett.

MARCIE SCHATZ: Marcie Schatz, I'm the director of transportation, engineering and development with the city of Naperville.

The STAR Line is the solution to a problem that cannot be solved by merely buildings roads. And this commuter rail service would connect more than 100 communities and link more than 1.6 million residents from northern, southern and western suburbs.

My fear is with this acquisition that the implementation of the STAR Line

becomes fiscally as well as logistically impossible.

Without access to the EJ&E tracks, the plan for the STAR Line is derailed and millions of regional commuters will have no option but to use their cars to travel.

The CN has given us no real assurances that they will accommodate the planned STAR Line operation.

The only commitments made in the

CN's mitigation proposal is a commitment to continuing discussions.

Initial meetings with Canadian National earlier this year when the cities have asked for information about the Star Line and any commitments to the Star Line, the Canadian National's response was that there was nothing in the EJ&E's files as they did their research.

So given that and that sort of comment, you can understand it appears that the sentiment is not there towards working toward a cooperative solution towards the implementation.

With the price of gasoline at an all-time high, the effective use of --

effective use of rail not only for freight but for commuters is critical.

Taxpayers will also pay a high price should the Star Line not be built. Many communities, including Naperville and Plainfield, have already purchased more than 100 acres of land and invested tens of millions of dollars in the Star Line. In

addition, federal funds have been used for STAR Line land.

Naperville and Plainfield have revised zoning, business owners have made business plans and residents have made decisions based on the future of the Star Line.

The implementation of the STAR Line will be far more difficult, and we request the STB to consider these comments and impose some obligation on CN to mitigate the increased costs that the community, the state of Illinois and the Metra will face for its implementation.

MS. TINA-MARIE ADAMS: Mayor Tom Weisner, followed by Bill Wiett, and Lynda Elmore.

MR. TOM WEISNER: Good evening. I'm Tom Weisner, Mayor of the city of Aurora, and I had wanted to start the evening by thanking the STB for holding this hearing in Aurora.

However, your decision to be miles from the affected neighborhoods, frankly, makes such comments disingenuous; however, I do want to thank all of you who are here tonight, and I recognize many of you from the townhall meeting we had just a few weeks ago at which we had 800 to 1,500 people.

And I assure our STB friends that they would see that many people at least tonight had they had the meeting in the vicinity of the affected and impacted area as opposed to seven miles away.

Wading through the EIS it is clear ACR, the firm who conducted the study, failed to conduct research within the communities this EIS covers.

Instead they took shortcuts, accepting CN's estimates at face value and

using data that in some cases is years old.

That may work in areas where the population is stagnant, but Aurora continues to experience rapid population growth, which brings me to my next point.

The DEIS completely discounts the impact on community cohesion because the EJ&E rail line has been in operation since 1891.

Well, I hate to disappoint you, but Aurora has been a community since 1837, long before the railroad laid their first track, and it has grown tremendously in the area of concern over the last 30 years.

The DEIS is also rampant with fuzzy math. On Ogden Avenue, for example, the DEIS suggested although CN is doubling the length of the trains, the average vehicle delay will be only 1.5 minutes when a train passes.

That is a really amazing feat given the fact that right now the actual delay is between 3 and 5 minutes per crossing.

32

It will take pages to detail all the issues we have encountered with the data in the DEIS, so I want to spend the remainder of my time focusing on the most glaring omission of this study, the fact that it fails to identify how to pay for all the mitigation costs that would be required.

In Aurora alone the DEIS identified three grade crossings which would be early candidates for grade separation.

IDOT recently estimated the cost of separation at between $40 million and $60 million, which means the cost to Aurora would be between $120 million and $180 million to mitigate the traffic impacts alone.

The section of the environmental analysis would suggest that CN may be mandated to pay from 5 to 50 percent of these costs.

There is a big difference between 5 and 50 percent, and by the way,

33

who will be paying the other 50 percent?

Would it be STB, the federal government?

IDOT has made it clear that the state of Illinois is in no position to pay these mitigated costs.

At the same time families are hurting, Canadian National CO Hunter Harrison has stated American taxpayers should pay the bulk of mitigation costs.

We are not an anti-business. This is not a not-in-my-backyard issue. It is a not-in-our-back-pocket issue.

If they can't be a good neighbor they shouldn't be a neighbor at all. Thank you.

MS. TINA-MARIE ADAMS: Bill Wiett, followed by Lynda Elmore and Keith Leroy.

34

MS. LYNDA ELMORE: Good evening, my name is Bill Weitt and the I'm chief of

staff for the city of Aurora.

I would like to voice my disappointment with the location of this hearing.

We're not talking about a suburban transit access route known as STAR Line. STAR Line is a 55-mile low-impact commuter rail line and will provide connections between the Chicago suburbs and Joliet to O'Hare Airport.

STAR Line is a part of the federal government's New Starts program, which is a primary financial resource for supporting locally planned, implemented and operated transit guideway capital investments.

The computer rail line would run along the EJ&E Railroad and connect to a new rail line that would run along the northwest corridor next to the Tollway connecting with four existing Metra lines.

Nearly 100 communities would be

35

served, providing a safe, reliable transportation option to 1.6 million residents.

The impact of the STAR Line is not totally considered in this study; and

given the projections to be at capacity on the EJ&E by 2015, it is unlikely the STAR Line would be a priority.

There are zero assurances of mitigation proposed to ensure that STAR Line can move forward.

There have been hundreds of thousands of dollars that have already been spent by communities in anticipation of the STAR Line.

The study ignores the cumulative negative impact on public safety of the STAR Line. By eliminating the STAR Line, congestion will continue to increase, with the corresponding increase in traffic accidents and decrease in air quality, and that was not acknowledged.

So when the study time for the STAR Line takes several years, when the

36

study time for any bridge reconstruction project takes two years, when the study time for any work along the Fox River or any waterway is eighteen months, it is difficult to believe that this study can be concluded by the end of the year when you have to consider scores of forest preserves, rails and scenic corridors,

local parks, water conservation areas, fire and emergency medical providers, and fifteen grade crossings being substantially affected.

There needs to be considerable thought on how this impact is being weighed in the EIS study. Thank you.

MS. TINA-MARIE ADAMS: Lynda Elmore, followed by Keith Leroy and Rick Mervine.

MS. LYNDA ELMORE: Hi, I'm Lynda Elmore. I'm an alderman with the City of Aurora. I represent the far east side where the EJ&E Railroad line runs through or abuts the entire area.

Even before this became an issue, one of the most critical issues that we have on the far east side and that we hear continually is quality of life and traffic.

The EJ&E is going to impact both

of those in a most severe manner. The draft EIS substantially fails to report on the overall community impact of noise, on the community's quality of life, property values or how the impact varies across communities or different types of land uses.

The SEA concluded, and I quote, "Without mitigation noise impact would be high and adverse."

The city of Aurora has already spent hundreds of thousands of dollars making improvements to add a quiet zone

along the EJ&E.

It is finally in the approval stage and the draft EIS failed to acknowledge or even preserve it.

The draft EIS also stated the proposed changes in rail operations would also increase vibrations in nearby buildings which can be intrusive and annoying to occupants.

Those occupants are our families, are our children, are our schools. And the real impact may be worse than what has been stated.

The DEIS uses an analysis and

mitigation thresholds for noise and hazardous materials that are actually unsubstantiated and have been sharply criticized by the United States Environmental Protection Agency and the United States Department of Transportation in the previous environmental impact studies that have been prepared by the SEA.

And the Draft Environmental Statement does not provide a time frame for

when the increase in rail traffic would begin as compared to when the necessary mitigation measures can be implemented if the acquisition is approved.

Lastly, I am concerned about the time frame we have been given to actually review the DEIS.

While the SEA has several months to prepare the analysis with an unlimited team of engineers paid for by Canadian National, towns with far fewer resources have only 60 days in which to respond.

The Illinois Commerce Commission, IDOT and CMAP all have indicated that this is not enough time to do their review.

Thank you for your time. I am

sorry that it's being held on this side of town and not where the residents live.

MS. TINA-MARIE ADAMS: Keith Leroy, followed by Rick Mervine and Rae Keasler.

MR. KEITH LEROY: Good evening, my name is Leroy Keith. I'm the 9th Ward Alderman for the city of Aurora.

The EJ&E tracks go through my ward and split approximately 18,000 people on the east and west side of those tracks.

These are real people not just numbers and certainly not just residents who have homes near railroad tracks. They're husbands wives and children, just like yours, but more importantly they're Americans.

I was originally going to speak about the Canadian National's dismal safety record and the lack of track and train maintenance that has caused many derailments resulting in extensive property, environmental and biological damage, but I didn't have the time to do that justice.

Then I was going to speak about the Canadian government's recent report on CN's lack of a viable safety management system, but again, too much information to

cover in just three minutes.

So I decide to point out that the Surface Transportation Board is required by the National Protection Agency to consider the cumulative effects that the sale of the EJ&E will have on the residents and that the section of environmental analysis is required to provide the STB with all the information that they need to make a well-informed decision regarding those cumulative effects.

The problem is the SEA didn't obtain all the information considering the factors related to the environmental impact or the CN just refused to provide it to them.

So I will use my last few minutes to discuss one important factor that seems to be missing in the draft EIS, a factor that goes right to the core of determining the cumulative environmental impacts, that being number of trains that will operate on the tracks.

The Draft EIS only projects

freight traffic on the EJ&E line for the next three years. The CN ships out of the Western Canadian Port of Prince Rupert.

According to that port's own Website, an expansion project is scheduled to begin in 2009 and to be completed in 2013, a time period outside this draft Environmental Impact statement, is to due to be completed.

That expansion of Prince Rupert would quadruple the port's capacity and enable it to handle 96 billion pounds of cargo a year.

There are also plans to expand the cargo freight or the container facility, increase its container capacity by 300 percent, up to 240 billion pounds a year.

With the surging Asian trade and so-called "Best Port in North America," where do you think the increased amount of cargo is going to go?

I'll tell you, right through the 9th Ward and when track fills up, right

through the city of Chicago.

How can the members of the STB determine the long-term cumulative effect that this sale will have on the residents when they don't even have the basic data needed to make those determinations?

It is not surprising that CN has refused to provide the SEA with the projected increase in freight traffic.

Does anyone believe for one moment that they don't exactly know what the increased freight is going to be?

You don't invest in a port expansion not knowing what will happen.

What is surprising is that the SEA did not demand the data and went as far as to make excuses in the draft Environmental Impact Study as to why it is difficult to predict that data.

The draft EIS is flawed and must be redone using the projected freight data extending at least ten years past the year 2013. Thank you.

MS. TINA-MARIE ADAMS: Rick Mervine,

followed by Rae Keasler and Carrie Anne

Ergo.

MR. RICK MERVINE: Good evening. My name is Rick Mervine. I'm the 8th Ward Alderman, the 8th Ward of the city of Aurora, and just for reference, that is in

the DuPage portion of Aurora.

My 18,00 residents that I represent are bordered up against the EJ&E Railroad tracks and also have as part of that the Ogden Avenue, Illinois Route 34 roadway that was mentioned in the DEIS.

Now, I know you've heard an awful lot up to this point. You're going to hear a lot more, and I could tell you that my residents are very upset about this and that would be exactly correct.

I mean, you should hear the phone calls that I'm getting, the e-mails I'm getting every day. I'm getting volumes from that perspective.

Most of all they're most upset about the fact that they don't believe their federal government is listening to them.

On top of that, a mile away from

these railroad tracks right outside of my ward is a major trauma hospital; and I didn't see that in the DEIS report as well.

I think that needs to be taken into consideration. We've got a road there on Ogden that has 55,000 cars a day passing through it, and it's a grade passing, grade-level pass.

But on top of that, I want to ask a basic business question here. I'm a management consultant by trade. That's what I do for a living.

And I looked at this and I say that no viable business is going to leave a valuable asset unchecked.

If they leave those rail lines in Chicago, they're a valuable asset. They have to be maintained because there are some Amtrak and other tracks -- other trains that need to take place on those tracks.

So in order to keep up the infrastructure you've got to be able to make money on them. If you don't make

money on them, then that's not a good business decision.

Quite honestly, I think what's going to happen here is that they'll move trains out here and then the tracks will fill up again in Chicago.

I might mention if you take a good look at the satellite photos for those tracks in Chicago, the vast majority of those tracks are covered by infrastructure that makes it able for the people to live in those areas to be able to handle it, infrastructure that we don't have, infrastructure in the form of overpasses and underpasses.

All you have to do is look at the satellite photos. It's very, very clear, all right.

I don't make -- it doesn't make any sense to me, doesn't make any sense to my residents to take trains from tracks that have infrastructure and know how to handle it, move it out here where we have a lot of congestion already and no

infrastructure, and not have to be able to deal with that mitigation.

Thank you very much.

MS. TINA-MARIE ADAMS: Rae Keasler, Carrie Anne Ergo and Duncan Russell.

MS. RAE KEASLER: My name is Ray Keasler and I'm a transportation planner for the City of Aurora.

Thank you for providing me and our residents the opportunity to speak on the issues today.

The focus of my testimony is the negative land use and environmental impacts the city will experience should the STB approve the acquisition, despite the overwhelming objections voiced by the affected community.

The DEIS fails to thoroughly analyze how existing land uses will be negatively impacted in the long-range by significant train traffic.

Given the importance and recent trends to approve long-range transportation plans out 15, 20 or even 30 years, we believe the train traffic projections should also be modeled for similarly longer periods of time.

We believe the methodology of anticipating only a 2 percent annual

increase in train traffic is faulty, especially given the rising fuel prices.

In short, we believe this assumption will significantly under-estimate track usage and this in turn will underreport the negative impacts to residential, commercial and parkland.

As for impacts to land uses, it should be noted that approximately one-fifth of the land surrounding this track is single-family residential and one-fifth is zoned parks and open space.

These types of land uses are very sensitive to traffic noise and vibration, and we believe more weight should be given to their impacts, especially since the low train traffic projections were used in the DEIS.

Similarly, we are also concerned

that the effects on natural areas and parks along the EJ&E rail line will be significant.

Of the main impacts, the DEIS indicates that the Rookery on the east side

of the EJ&E will be highly disturbed, as well as the Night Heron Marsh Forest Preserve located on the west side of the tracks and just north of Liberty Street.

The DEIS indicates that a total of four state-listed species along the EJ&E will experience habitat loss, including the Sandhill Crane, the Least Bittern, Yellow Headed Black Bird and Black Crown Night Heron.

In addition, the DEIS indicates that one reptile species, the Blinding Turret, will experience habitat loss and individual mortality in the construction area.

The largest regional trail that we have in Aurora will also be impacted. It is the 62-mile long Illinois Prairie Path, and ironically it lies on the former right of way for the Old Chicago Aurora & Elgin Electric Railroad.

It was the first U.S. rail-to-

trail conversion in the nation in the 1960's.

Thank you for your time and your consideration.

MS. TINA-MARIE ADAMS: Carrie Anne Ergo, followed by Duncan Russell and Richard Furstenau.

MS. ERGO: Hi, my name is Carie Anne Ergo. I'm not only an employee at the city of Aurora, I also have the distinction of living across the street from a home that backs the EJ&E line. So I'm affected both as a resident as well as -- directly affected as a resident as well as I've gotten to learn a lot about this issue from my work with the city, and one of the things in looking at the DEIS that really struck me is I've been in government for over a decade, and there's nowhere in the DEIS that provides a time frame for when the increase in rail traffic would begin in comparison to when the necessary mitigation measurements would be implemented.

So this is obviously a huge concern of mine considering the SEA concluded that without mitigation the noise impact would be highly adverse, and the proposed changes in rail operations would increase vibrations of nearby buildings which can be intrusive and annoying to occupants.

So knowing that I live just a short while from the Ogden Avenue, which is going to experience great traffic, I'm less than a block from the rail line. I'm trying to figure out how the overpass and underpass is going to go up overnight, how the noise is going to be mitigated because everything that has been indicated is CN is trying to push this through before the end of the year. So that is one of my major concerns.

Another concern I have is that the DEIS says that some homes within 250 feet of the rail line with 20 additional trains could experience a decrease in property value. So I'm asking what will be the decrease in my property value because mine is going to be one of those homes, and I couldn't find that anywhere. I couldn't find it anywhere clearly stated in the DEIS what that would look like.

And then I'm wondering, my neighbor that's behind me the other way, when my home value falls, what's their home

value going to look like? I think those things should be studied and looked at

further.

So earlier we heard Mayor Weisner say there was between 120 and $180 million to mitigate the impact in traffic alone here in Aurora, and he asked the question who should pay for it. Well, the state of Illinois through IDOT has made it clear that they're in no position to fund this. Earlier today in fact the congressional budget office estimated that the federal deficit budget will soar above $400 billion before the end of this month.

Here in Aurora we have a hiring freeze because almost every revenue source is down, and just last week we learn unemployment has jumped to a five-year high. My point being is that CN has offered to chip in about $40 million to fund mitigation in improvement in Joliet that also help to increase their profitability. So I kind of wonder how destitute this poor company is that they're

asking for U.S. taxpayers to subsidize their expansion plans, and then found out that last year they posted a net profit in excess of $2 billion.

MS. ADAMS: Duncan Russell,

Richard Furstenau and Keith Creel.

MR. RUSSELL: Good evening. My name is Duncan Russell, and I'm an area resident. I will pose a number of questions. This is abbreviated, but I will pose a number of questions and then suggest answers as an area resident.

First, has CN made a good faith effort to negotiate satisfactory solutions

that mitigate the noise and interchange transitions? The answer is no, they have not. In fact one of the communities I contacted laughed at me when I asked if any negotiations were ongoing with the CN. The CN has no intention of being a good corporate citizen.

As I read your draft, the DEIS, you state the board has not received any of the negotiated agreements for the affected communities. You're not going to. Well, if the CN doesn't reach an agreement with Aurora regarding the affected grade crossings and the board approves this acquisition without satisfactory agreements being in place, what incentive does CN have

to continue to talk to Aurora? None. More, much more must be demanded of the CN before anything is approved.

Third pertains to the quiet zone opportunity. Some towns including Aurora are pursuing a quiet zone status. My question is what good is a quiet zone status if the volume of rail freight increases to the point where whistles become necessary to protect the public? The answer is none. A quiet zone status

becomes redundant.

Last question. In your EIS you state that mitigation at 15 grade crossings would appropriately be funded by a combination of entities and not by the applicant alone. My question is why? Who benefits from this takeover? Is it the public, or is it a private Canadian enterprise? The answer is a private Canadian enterprise. Without mitigation the situation in Aurora with a 600 percent rail freight increase is going to be a nightmare.

Since the CN is causing the nightmare, it's only fair that the CN pay the majority of mitigation expense. In fact the formula I suggest is one-seventh to the local communities and six-sevenths for the CN, and I arrived at that based on the proposed increase in the volume of rail freight over their current levels.

To state, as you have in your EIS, the railroad crossings in Aurora are a preexisting condition misrepresents the condition. Mitigation is not required under certain circumstances in Aurora. An occasional railroad inconvenience is

something we live with. However, after rail freight increases 600 percent, mitigation will be necessary.

This proposed 300 million acquisition by the CN is really not a $300 million project. It's closer to a $2 billion project when all the environmental fixes are included. If the CN had to pay their fair share of the mitigation expenses, about 87 percent, this project

will balloon from 300 million to 1.8 billion, and I submit to you the CN would walk away from this acquisition if they had to pay their fair share. Why should a private enterprise realize a taxpayer subsidy of 90 percent? Let the investment stand on its own merit. Let the CN pay their fair share.

MS. ADAMS: Richard Furstenau, Keith Creel and Jared Ploger.

MR. FURSTENAU: My name is Dick Furstenau. I'm a councilman in the City of Naperville. And let me just tell you as I looked at the view graphs tonight, I was really stunned by the arrogance that this company has as you take a look at especially the graph that showed the thin line and the thick line. I'm telling you, where we stand in this community is that starts at the north part of Aurora and Naperville, and the thickest line is between north Naperville and Aurora and all the way down to Plainfield, and it's not three times. It's five times or six times if you really look at that, scale it out, which I couldn't do as you played it.

So the company has been very arrogant to the community. They were going to do this, and they thought it was going to slide right through. Well, the citizens

have risen up and said that's not the case.

Somebody wants to leave us to our own problems to solve 400, 500, 600 million dollars. I've got news for you,

fellows and folks, it's not going to happen. We don't have that money, I can assure you of that. We'll never have that money. Ogden Avenue alone they say is going to take somewhere between 50 to 55 million dollars to mitigate, so we don't have it, Aurora doesn't have it, and nobody else up and down the line has it; and Naperville is touted to have more money than they know what to do with, and quite frankly we don't, okay.

The way I got this thing looked at we're going to be closing down about 16 lanes of traffic up and down between our communities, and there's going to be left ten open. Four of -- eight of those -- I'm sorry. Six of those ten will be in the middle of that, and the north and the south areas will have nothing, will be blocked off, completely blocked.

And the other thing that I do as a councilman over the last ten years every time that there's something that comes

before us that talks about something in the

community that's on a piece of paper I like to go look at it because I tell you something, it's worth 10 million pages of paper.

You folks cannot leave this town, this area, until you go look at Ogden Avenue; and if you think that you can build this railroad and have the railroad go through and not do anything to Ogden Avenue beforehand, it's -- this thing will die under it's own weight. It will not happen. Traffic will be backed up everywhere that you can imagine. It's not going to work.

The other thing is we've really barricaded the communities. It's a very poor and bad thing to do, but that's what we've done. We're going to barricade the communities. You might as well take the Fox River, run it down that railroad track, put a couple of bridges on it and say have a nice day to the folks because that's what's really going to go on when this thing is done.

The other thing is we cannot let

the railroad lease these tracks. We cannot let them use the tracks and lease them and get around this whole process because what have we gained? Nothing, but that's what they're going to do next. Make sure that doesn't happen. Thank you. Have a nice day. Thank you for your time.

MS. ADAMS: Keith Creel followed by Jared Ploger and John Leick.

MR. CREEL: Good evening. My

name is Keith Creel. I'm the executive vice president of operations for CN. Thank you for the opportunity to discuss the environmental benefits of CN's proposed acquisition of the major portion of EJ&E railway.

Numerous studies have demonstrated that the current rail network overall is insufficient to keep up with freight demand. A 2007 study by Cambridge Systematics prepared for the American Association of Railroads found that if the rail capacity needs are not addressed in the coming years, roughly 16,000 miles of the 52,000 miles of primary rail main lines studied will be carrying traffic volumes greater than the capacity of those lines, resulting in unstable traffic flows and service breakdown conditions.

Most recently the U.S. Chamber of Commerce issued a sobering assessment of the state of the U.S. transportation system noting that, quote: "We are not adequately

maintaining the transportation systems we already have. We are not providing sufficient capacity to meet today's demand, and we're not planning and making

improvements required to support a 21st century economy.

Of course we are all well acquainted with the infrastructures issues and congestion in the Chicago region, which is the nation's rail hub. Several years ago various levels of government, freight railroads, Amtrak and Metra, came together to form a private-public partnership known as CREATE, the goal of which is to increase the efficiencies of the region's rail infrastructure and the quality of life of Chicago residents. CN is a founding member of CREATE and remains supportive of the program. Unfortunately, however, CREATE has received only a small fraction of the government funding required to make the program a reality.

CN's proposed acquisition of the J is intended to start to address the rail

congestion problem in Chicago consistent with the goals of CREATE. Diverting most of our trains that currently operate through downtown Chicago onto the underutilized J line which streamline CN's operations in the region while also reducing regional rail and related

vehicular congestion. In fact more than 60 communities inside the J arc would benefit from reduced train traffic as a result of the transaction.

At the same time communities along the J line will experience greater train traffic as operations are diverted from CN's existing lines to the J. However, there are two important factors to keep in mind. First, this train traffic is moving traffic from one part of the Chicago region to another. This is not an influx of new train traffic in the region. Not only have communities inside the J arc coexisted for decades with this train traffic, but there are numerous thriving communities in the region that have far

more rail traffic on lines of other freight carriers and Metra than post-transaction levels along the J line.

Second, CN is working with the communities along the J line to develop voluntary mitigation agreements to address reasonable environmental concerns. We have reached an agreement with one community, the city of Joliet, and are optimistic that we will be successful in reaching

agreements with others in the near future.

What we need is for all parties to be willing to come together in good faith to recognize the important of the Chicago region of efficient commerce and the important transportation and environmental benefits this transaction would bring to the region and to work constructively to address legitimate environmental concerns along the J line.

Thank you for the opportunity to testify before you this evening.

MS. ADAMS: Jared Ploger followed by John Leick and Michael Reilly.

MEMBER OF THE AUDIENCE: What town do you live in? Not around here.

MS. ADAMS: Jared Ploger. John Leick. Michael Reilly.

MR. LEICK: John Leick.

MS. ADAMS: Oh, John. Okay, John Leick.

MR. LEICK: Should I go ahead?

MS. ADAMS: Yes. Sorry about that.

MR. LEICK: John Leick, citizen of Aurora. I have lived near the crossing of Keating and the EJ&E tracks in Aurora for approximately ten years. Aurora has four crossings along the EJ&E tracks that has substantial population growth over those ten years, and now over 1,000 citizens are affected by the noise and trains passing over these crossings.

Over those ten years I have tried unsuccessfully to get a quiet zone implemented. Over those ten years the Federal Railroad Administration made empty promises to develop reasonable rules to implement quiet zones.

Finally in 2005 after many

iterations the FRA finally issued quiet zones that may allow -- quiet zone rules that may allow us to have a quiet zone. We are still waiting for the installation of additional equipment before we can make a final application.

This STB report is not realistic in mitigating the potential harm and

declining quality of life that this Canadian National purchase will cost. To expect that the Canadian National will work with communities to implement fund mitigation are ridiculous assumptions; and if any effort is put forth, it can take many years for any results.

The train horns are painfully loud. They have awoken myself and my family many, many, many, many nights. This report states that the train traffic will increase to about two trains every hour. To help you understand the harm that you will cause thousands of residents I want you to imagine that you fall asleep at about 10:30 in the evening, and then at 10:45 you'll hear (blowing horn), and then at 11:15 (blowing horn), and then at 11:45 (blowing horn), and then at 12:15. Sorry.

I should have brought a bigger container.

AUDIENCE MEMBER: It's longer than that out in Oswego with all those train crossings.

MR. LEICK: Well, this froze up

on me, but I want you to remember this is what you are going to do to my family every night for as long as we live at this house (blowing horn). Thank you.

MR. REILLY: Good evening to all the appointed elected officials who have taken time to participate in this forum this evening in an effort to make the best decision on the proposed acquisition.

My name is Mike Reilly, a resident of Naperville, Illinois, president of the homeowners' association, which is in both Naperville and Aurora. And I'm director of the Naperville Homeowners' Federation and umbrella organization of 148 homeowner associations in the area.

Thank you for the opportunity to provide testimony on this issue, one that I've been involved in and interested in since it first became public.

Recently while reading an online article on the CN/EJ&E acquisition in the Daily Herald, I wanted to respond to it.

I was struck by one commentary that had NIMBY, NIMBY, NIMBY as its headline. Beyond the repetitive acronym of the title, the commentary didn't dispute the points in the article. He just

basically dismissed them.

And I'm quoting here. The term NIMBY is an acronym for no in my backyard, which was first in used in the Christian Science Modern 1998.

It's usually a policy of opponents of a development in flying that they have narrow, selfish or myopic views. Its use is often pejorative.

Essentially this means merely applying the labels to a viewpoint belittles it or even dismisses it outright. The connotation is that if you're accused of conducting a different position, you're always wrong.

Well, does that prejudgement or prejudice, does that really apply here? Certainly when a brand new development, say a prisoner of a waste treatment plant is looking for a site, if it's near your property, you may very well take a not in my backyard attitude.

Sometimes they'll even go further and take a NIABY position, which is

not in anyone's backyard. A BANANA position, which is build absolutely nothing anywhere near anything. A NOTE position, which is not over there either. Or even a NOPE position, which is not on planet earth.

But if the project is beneficial to the general public, it has to go somewhere. And the hope is that the decision makers will get it to a location to minimize disruption to the citizens.

With Canadian National's support of the EJ&E line, we have a different situation. The rail lines in the Chicago area have been there for generations. Therefore, commercial and residential development have adjusted to the environmental impact to the free market system in building infrastructure I referenced before.

This proposed acquisition would not only just interrupt the quality of life of hundreds of thousands of people in the Western suburbs from Lake County, Illinois

to Lake County, Indiana, but also it wouldn't eliminate the railways.

To the members of the STB, you have a great responsibility to make this decision. I understand the limitations policed on you in the narrow scope of the charter.

I ask that you step back and view it in a broader context, limiting it from just a business point of view, which is just not a good deal for hundreds of thousands of people.

When you commit yourself to a career in public service, I'm sure one of the reasons is that positive impact on the way of life. I suggest you acknowledge the impact of this decision in the broader mission of the STB. So take it up to Congress for denial or, please, just don't approve it.

MR. MILLER: Thank you. I'm Ken Miller, counselman for the City of Naperville and also live within a half mile of EJ&E.

The draft EIS does not adequately speak to the impacts of our community in critical areas such as noise and hazardous materials, traffic delays and safety risk, as well as impacts to emergency service providers, school districts and to our property values.

Prospects of rail traffic growing from 15 trains per day to more than 40 per day with 100 to 125-car trains. Immediately after the acquisition is an action that requires a much more in-depth look at the factors, as well, to some level of examination of what's going to incur in 10 to 20 years.

The CN estimated that CN will incur 337 additional car levels that will travel EJ&E each day if the proposed acquisition is approved. Imagine having that running past your backyard.

How would it impact your daily life? A major attribute of the City of Naperville is its quality of life. The impacts of additional noise and traffic delays from increased trains will have a negative impact on our residents' quality of life, which is not acceptable as a counselman in the City of Naperville.

The noise associated with the proposed increase in train traffic in an area concerns the residents of Naperville. The establishment of quiet zones is important to the quality of life issue. And the city has begun working with our neighboring communities to establish these quiet zones.

It is important then that the city of Naperville and residents who live adjacent to these tracks, that the process to establish quiet zones is not hindered by the CN acquisition of EJ&E.

In addition to the increased noise, it would seem that the potential for a serious public disaster would increase nearly 10-fold due to increased train traffic.

Every community that touches the EJ&E is concerned about the necessary precautions to ensure safety of its residents must be guaranteed if this acquisition is approved.

While a proposed quiet zone is important to address noise and safety along the rail line, the draft must also address potential mitigation and safety enhancements related to schools, pedestrians and bicycle traffic.

A significant area of concern in the draft EIS does not include structured emergency response plans that detail how the CN is going to respond to emergencies and specific hazardous waste.

Even more importantly, the draft EIS does not conform to the 2008 emergency response guide, which recommends an evacuation distance of one mile or more for chemicals such as anhydrous ammonia.

The draft EIS fights that they only identify schools in one-half mile but for around the EJ&E right of way. This needs to be corrected in order to ensure our community safety with this proposed increase in hazardous materials traveling through our community.

Thank you for your consideration.

MR. CHATT: Hello. I'm Charles Chatt. I'm a private citizen in Aurora. It's truly incumbent on this section to release an independent analysis and study without prejudice to one party or another. However, the way in which the material is presented in this study both implicitly and explicitly seem to display a propensity towards supporting the action, a determination which rests with another party. I'll provide some examples.

I'd like to draw your attention to Figure ES-2. This is the map that's shows the rerouting of traffic. Now, while this map depicts where the traffic is being reduced and where the traffic is being added, but it's a fine print in the legend

track that we are closest to today sees an average of 15.7 trains per day. But if the purchase is approved, we'll see 39.5 trains per day. Or an increase of 252 percent.

However, that is only half the story. When we take into account the length of these trains, increasing from approximately 2,600 to 6,300 feet, the same section of track will see an increase of 514 percent. But you'd never know it by looking at the numbers on the map. Showing only these numbers belittles the volume of train traffic proposed by this plan.

Next, I'd like to draw your attention to Section 8.2.3 within the irreversible and irretrievable commitments of resources titled "fuel usage." The third paragraph begins with -- and I quote -- in addition to the proposed action -- in addition, the proposed action

would use 84,239 gallons of gasoline and 8,179 gallons of diesel per year over the nonaction alternative for increasing idle times at highway and railway crossings.

This is how much fuel we're going to burn while we're sitting there watching the trains go by. The study then continues.

At the same time, however, residents of the Chicago region and the United States in general would benefit from the improvement of rail operations in Chicago. The first time that I read that I had to reread it again.

There is no specificity, no data presented to lend credibility to this statement. It's simply conjecture. In a section of the study, it's devoted solely to presenting commitment of resources in terms of fuel usage.

And as I reread it again, it seems to be a biased conclusion statement, rather than a statement of fact. I certainly hope that when the final report is issued, it presents a more complete, more unbiased and more factual review of the environmental impact of this purchase.

Thank you for your time.

MR. MASSA: Hello. My name is Martin Massa. I happen to be a citizen of District 9 down by EJ.

I am not a member of the NIMBY society. And I'm going to become a very unpopular right now. I support this merger. I know I'm going to be unpopular with this.

I do not have anything to gain by my support except a clear conscience that I did something. I apologize Mayor Weisner and Alderman Keith.

You guys have done great things for my neighborhood, Aurora and the area in general. But I disagree with you on this one. And I just have to say that.

My support is a guarded support, because it will be an impact in increased traffic on the railroads along the Naperville border.

I currently work in Lisle. My wife works in Naperville. We go to church in Naperville. We split our shopping in Oswego, Aurora and Naperville.

85

We have to cross the track at least once a day going to and from work and to church. If there's an increase in traffic, guess what, I'll have to leave an extra 10 or 15 minutes early.

I intentionally build time into my schedule for something like this, because you never know when something is going to slow you up. Say an accident on the interstate or just slow traffic in general.

The other thing I hear is concern about safety and pollution. To the pollution, the air pollution isn't really changing much. Trains are there. There's not increase in traffic. No real increase in air pollution.

To the noise pollution, yeah, that's annoying. I understand it. You with your little beeper thing, I lived next door to a crossing for many years. I got used to it. After three or four weeks I started telling time by it. Yes, I did.

And to safety concerns, the

86

crossings here need upgrading now. Ours

need upgrading now. That backs up all the time. Has anybody ever been behind all the buses that pull into the barn at 3:00 at night. You sit there and get caught behind those and you're forever, just because there's a railing road crossing there now. Who cares about any trains running.

As to that claim, the Keating crossing, the company of first suit, the company experts, the bussing company for Oswego districts 308, 203 and 204 have specific rules in place that the public are not allowed to cross at Keating, nor are they allowed to cross Haftenrichter.

And Wolf's crossing because of the state laws stating that a bus is not supposed to cross unless if there's a train -- unless a cop waves them across, there's always a train sitting aside it. Just light we do 80 in a 55 zone on the interstate.

As I started mentioned with NIMBY, just pure and simple, it is a case

87

of NIMBY. The problem is that, in fact, it's already in our backyard people. We're already having the problems. We need work now. Thank you.

88

MR. DASCHNER: Good evening. I feel privileged with all the speakers before me. They have outstanding arguments, outstanding things to say. My name is Stephen Daschner. I'm superintendent of Indian Prairie School District 204, the residents of Aurora and

the half mile from these tracks.

I stand before you to voice some major concerns on behalf of kids and our district. Our school district encompasses more than 46 square miles.

And Prairie is the third largest district in the State of Illinois, which includes 31 schools and enrolls about -- not about, but 29,500 students and employs a little over 3,000 people.

Our school district transportation strategy is of critical importance to the education of our students, teachers and our entire community.

We have 250 buses transporting 17,500 children to school every day. Our

89

buses make more than 1,300 daily routes. And they travel more than 2.6 million miles each year, operating from 6:00 a.m. to 6:00 p.m.

With the expanded use and increased traffic on the EJ&E rail line, we anticipate substantial delays for many of our students as the rail line stretches more than eleven miles through the hearts of our districts.

We have seven schools located within a half mile of the tracks. And if we expand to a full mile on the east and west sides of the tracks, the number of school grows to 15.

Our elementary schools, middle schools and high schools have staggered start times, which allows us to use a cost effective three-tier bussing schedule for our students.

This type of carefully-timed schedule uses the same bus to run first day of high school, then in middle school, and finally an elementary route.

Any delays caused by increased traffic -- train traffic, however small, greatly impacts students' arrival to school on time, as well as their safe and timely return to home.

There are two grade level crossings, a particular concern to us. 164 school buses cross the Odgen Avenue tracks, and 139 school buses cross Montgomery Avenue each day.

There's also an expected increase in train length, which will increase gate closer times up to ten minutes. But the volume of school buses crossing the tracks is clear to see our concerns over anticipated usage.

We have more than 60 percent of our students riding buses. Therefore, it is important that we voice these concerns about this particular issue.

Thank you for your time.

MS. HOLMES: Thank you very much. I'm State Senator Linda Holmes. I represent the 42nd District.

The 42nd District runs from Aurora through Montgomery, Oswego, covers all of Plainfield into Shorewood and parts of Joliet. So, yes, this is an area that's greatly impacted by this.

I'm speaking out today as so many of you have spoken out on behalf of Aurora. And it's great to have you out here. And I want to say a big thank you to everybody who did come out and is speaking out and is taking part of this.

This is an issue that Representative Tom Cross and I were speaking on at the end of 2007, because we knew this would impact our communities to such a major, major level.

What I want to speak about here is Plainfield. Because you see, Plainfield as much as we requested to have a meeting, we don't get a meeting in Plainfield.

Although Plainfield is impacted because they have 17 crossings, 16 at grade.

I think everybody knows just how rapidly Plainfield is growing. And to have this amount of train traffic stopping the traffic that is already busting at the limits in Plainfield is an absolute disaster.

It's going to be a major issue when it comes to safety vehicles and just people getting to and from school, works and throughout their community.

So I want to speak on behalf of Plainfield, because they are also going to experience a devastating impact if this happens.

I understand that this will relieve traffic congestion and traffic -- train traffic in Chicago. That's very nice for Chicago. I don't think we should be doing it on the backs of our outlying communities.

The other major disappointment I had when I spoke with CN in early June and they talked about doing this with the Surface Transportation Board doing this environmental impact study, I said the one thing I want in data is the safety record.

I was told we would get the safety record in this data. But that that safety record would only reflect the safety record in the U.S.

Canadian National has miles of track and operates in Canada. I want to see that safety data. Because if this is going to impact our country, let's see what it's doing in theirs.

Other than that, I just want to say a huge thank you to everybody who came out, who spoke, who has continued to be an advocate for our communities.

I think it's imperative that we continue to do that. So thank you very much for attending tonight.

MS. SMITH: Good evening, I'm Kathleen Smith. I am an environmental attorney. I've been an environmental attorney since 1982 when I graduated from Northern Illinois University. I've been a resident of Aurora for five years. I got my JD in 1991, and I later pursued a Master of Law and environmental law, an LM, and I got that from George Washington University in Washington, D.C. in the year 2000. My thesis dealt with global warming. I served at the Pentagon for nine years. I was an assistant general counselor for the United States Air Force in the environmental divisions from 1991 to 2000. As a matter of fact, I was responsible in drafting the air pollution section in approximately 25 Air Force documents, EIS's that were prepared. I furthermore commented on air pollution and global warming sections on over -- in EIS's on over 50 to 60 documents. So I am very familiar with the requirements of NEPA.

I have been personally impacted

by the current trains. I have been stopped on Liberty traveling east or west between Eola and Route 59. The closest overpass is New York Street, and many cars do turn around and head for that overpass. I've also been impacted in traveling east or west between Eola and Route 59 on Montgomery, which is a residential area in contrast to the first area I mentioned, which is open fields and industrial. In the Montgomery area, I'm not aware of any convenient overpass.

I think that this EIS, and from what I've heard tonight, I certainly haven't heard any contradictory ideas, fails completely to address air pollution and global warming from the perspective of idling cars.

Now, your gentleman up there spoke about a reduction in train idling. How about considering the impacts of the pollution and global warming from all the cars that are going to be there? I fail to see that in your air quality section, and I

think that needs to be addressed.

Furthermore, I would also like to note there's a very short amount of road between Eola and Liberty. The cars will back up there and cause traffic jams on Liberty and on Eola. Liberty is the street that commuters use going to and from the Route 59 Metra station. It's very, very heavily loaded right now when the commuters are leaving to go to work and when they're coming back.

I would like to see all of that addressed. Thank you.

MS. BARRY: Good evening. My name is Clare Barry. I'm an alderman for

the City of Warrenville. I'm here tonight on behalf of hundreds of households that border the EJ&E tracks through Warrenville. Many of those homes have the tracks literally in their backyards.

In addition, one of Warrenville's two elementary schools is within 1200 feet of the tracks and a key park used for baseball and soccer games is within only 300 feet. Hundreds of children are at both of these locations throughout the year. Their safety is of the utmost concern.

Should this transaction be approved, Warrenville residents can expect to experience an increase in train traffic by over 70 percent. Because of the length of track along the segment in Warrenville does not have an at-grade crossing, the EJ&E often idles their trains in the backyards of the border homes for over an hour at a time as they wait for other train

traffic to cross intersecting tracks. With increases in train traffic, this will only become more frequent.

Not only does this disrupt the quality of life of local homeowners because

of noise and vibration, it increases the diesel pollution in the air. More frequent idling will certainly make these homeowners' property values decrease as well.

The Draft EIS references noise and vibration only briefly talking about potential sound barriers and noting that vibration is only a perception and does not really have any type of esthetic or structural impact on households. I invite the STB and CN to visit one of the hundreds of households that border the tracks in three of Warrenville's subdivisions when a train is passing by or idling. Not only does damage occur, but the quality of life is also severely impacted. Conversations have to stop, television and radios can't be heard, and sleep is disrupted. These

households belong to families with children. There are well-established consequences of sleep loss and sleep disruption in children. These consequences include daytime sleepiness and fatigue, reduced alertness, and compromised performance in specific neurobehavioral functioning or other behavioral

characteristics, including mood and emotional regulation.

How does CN plan to mitigate that.

The City of Warrenville has taken a position of formal opposition to the proposed transaction because of its severe negative impact on the property values, safety, and quality of life for thousands of residents who live along the tracks.

Thank you for your time and consideration.

MR. THOMAS: Good evening. I'm Greg Thomas, Chief of Police for the City of Aurora. I appreciate the time given to me to discuss the impact the sale of the EJ&E Railway to Canadian National will have on the Aurora Police Department.

There are a few points to consider from the police department's point of view. With more trains, higher propensity for the vehicle/train collisions, trains carrying hazardous

materials create the possibility of hazardous material spills. Though these are terrible issues to deal with, just as important is the impact on everyday operations.

The EJ&E Railroad tracks cross several roadways in Aurora. These crossings are all in what the Aurora Police Department geographically call Area 3.

About a year ago, the Area 3 commander demonstrated to the rest of the command staff that response times for emergency calls for service was

significantly higher in Area 3 than the rest of the City due to traffic issues. The command staff decided at that time to assign six additional officers to Area 3.

The police department fears that with the additional trains, we'll have difficulty getting to where we are needing. When we're responding to nonemergency calls, waiting on trains is frustrating. However, when we have to get to an emergency call, it's much more than an inconvenience, it's life-threatening.

It's clear there's going to be additional trains. It's clear that trains

pass at grade. Additional trains are going to impact vehicle traffic and it's going to impact our response time. As much as we try our best to locate patrol vehicles strategically throughout the City, we would have to rely on luck that we would be on the correct side of the tracks when an emergency call is dispatched to a squad car.

Neither the police department

nor the victims of these emergency situations want emergency response by police, fire, or ambulance based on luck. These victims want and require emergency personnel get to the scene as quickly as possible. Waiting for trains at crossing is going to impact first responder operations.

Officers merely cannot find an alternative route. That's not an option. A squad car, for example, patrolling in White Eagle Subdivision would have to travel north all the way to McCoy before being able to proceed westbound passed the tracks in order to proceed back southbound in order to get to an emergency at Menard's and the middle school. That trip would

take a considerable amount of time when seconds are critical.

In some cases it may make more sense to just wait for a train to clear the roadway, a very difficult request of our officers when we have to respond to maybe an active assailant or a child choking or a

heart attack victim.

It's obvious that if Canadian National is allowed to purchase the EJ&E Railroad, there would be a significant negative impact on the Aurora Police Department's response time and to the citizens that we serve.

Thank you.

MR. OELKER: Good evening. My name is Tim Oelker, and I'm the fire chief here in the City of Aurora. I will be brief.

From a public safety perspective, more specifically fire and emergency medical response, the outcome of an incident many times is directly related to how quickly we can get to a scene and in the case of a medical emergency, how quickly we can deliver the patient to a place of definitive care or the hospital.

Any interruption or delay in our ability to get to an emergency scene or to get the patient to the hospital could have a devastating result. The proposed increase in train traffic and the resulting delays will have a negative impact on our operations and the people we serve. There's no way it can.

It's impossible to say to what degree. We may be lucky for a while, depending on the location of the call and

the nature of the incident, but eventually

some time in the future, someone's life will be in the balance and the outcome will be affected by the situation. It's not a matter of if it will happen but when.

Thank you.

MR. ASHEIM: Hello. My name is Paul Asheim. I'm the president of Stonebridge Community Association, which is on the east side of Aurora. We have approximately about a thousand homes and townhomes.

As president of Stonebridge, I'm here to add our concern with the prospect of an EJ&E sale and the increase in the freight traffic it would bring to our neighborhood. This concern is not just from, as the CN puts it, Selfless Not In My Backyard People, but, in fact, from citizens that acknowledge the importance of railroad traffic while at the same time also acknowledging the potential problems that may occur with the increased train traffic, environmental impacts, and public safety delays, including longer waits at-grade rail crossings, which will in turn hamper the movements of school buses and emergency vehicles.

In addition, if the EJ&E purchase sets a good economic deal for CN, they should be willing to absorb more of

the infrastructure cost that they've been

willing to absorb until this point in time. Local communities have already had their budgets stretched to the limit and it's not feasible to assume money's available to fund the staggering cost of grade separation that will be necessary.

Thank you.

MR. HETZLER: I'm Richard Hetzler, resident of the opposite side of Aurora near the trains.

When the original public

hearings were held in January, STB gave this entire area no opportunity to express our concerns. Thanks to our mayor, we were made aware of this and many of those adversely affected were able to become involved.

Now the second meeting is being held, and STB has been forced to have a meeting in this area. Despite our mayor's recommendation, it was scheduled here, 10 miles from the nearest affected rail crossing, and in a different county. The result is that many people who would like to participate do not have the time or gas money to come this far. This location selection appears to prove the desire of the STB to minimize public input.

I have come with the fear that the STB has done whatever the railroad asked. The Alaska Oil and Conservation

Commission did whatever the oil companies asked until about five years ago when Sarah Palin became involved. We need another Sarah Palin.

Press released from Canadian National all pretend that the area will exceed three to four times train traffic in

the area. The flood Draft Environmental Impact Study is clear that the train numbers in our area will increase 2 1/2 times and the average length will increase 2 1/2 times. That means that over six times the train cars will go through our residential area as we presently experience.

My main concern is the Ogden at-rail crossing, US IDOT 250560X. The EIS is clear that this at-grade crossing will be -- will have double track constructed. The impact statement is also clear that the crossing will exceed Federal Highway Administration exposure limits for safety. The impact statement is also clear that the exposure will exceed 40 hours of delay per

day. This is obvious -- it is obvious that an overpass must be constructed prior to any train traffic increase, and no approval should be granted until Canadian National has constructed this overpass at their expense.

We live in an area where most train crossings are at grade. If the proposed change is approved, we'll be over six times the number of railcars moving

through the area, we'll have to cross twice the number of tracks we now encounter, and without grade separation prior to Canadian National's start of their profitable operation, local commerce will come to a halt and Federal guidelines for safety will no longer be met.

Thank you.

MS. PIETRZAK: Good evening. Thank you.

My name is Nancy Pietrzak. I am the manager of the emergency department at Rush-Copley Medical Center, which is located on Ogden Avenue, and we are the Community's Level II trauma center. I would like to read a brief statement on behalf of Rush-Copley.

Rush-Copley recognizes that the sale of the EJ&E Railway to Canadian National will significantly increase area freight rail traffic posing transportation

delays for emergency vehicle responders. Rush-Copley cautions those in support of this project to carefully consider the impact it will likely have on patients seeking emergency medical care.

Thank you for your time.

MS. CHURCH: Good evening. My name is Robin Church. I am a resident of Aurora. I also serve as president of the Indian Prairie Parents' Council, an umbrella organization of 31 PTA and PTSA units in Indian Prairie School District 204, the largest school district in Illinois encompassing 46 square miles, including portions of Naperville, Aurora, Bolingbrook, and Plainfield. The PTA members we represent currently number about 19,300. At the heart of the PTA mission is to be a strong advocate for the education and well-being of every child.

On February 21, 2008, at the direction of our council delegates, our

legislative committee sent a letter to the Surface Transportation Board protesting the acquisition of the EJ&E Railroad by Canadian National Railway. In that letter we stated our opposition to this acquisition due to various concerns that will threaten the well-being of our children. Those concerns have not been

abated.

Our primary concern continues to be safety. Train traffic is inherently dangerous to children. The EJ&E tracks run through or immediately adjacent to the borders of 17 of our schools. There are eight at-grade crossings on this line within our district. CN predicts an increase from 15 to 42 trains a day and plans to run them at near track speed, up to 40 to 45 miles per hour. In the draft EIS, the SEA calculated that the total number of train accidents on the EJ&E line is likely to increase by 28 percent. This is unacceptable.

In addition, the proposed increase in hazardous cargo to be transported will put our children at risk in case of an accident or derailment. This

is unacceptable.

Increased traffic over at-grade crossing hinders the ability, as you have heard, of emergency vehicles and personnel to respond to emergency situations. Again,

increasing risk to our children.

According to the Draft EIS, SEA concluded that without mitigation, eleven fire and emergency medical service providers near this rail line would potentially experience substantial effect as a result of the proposed acquisition. You have heard from our superintendent regarding these issues. Traffic delays will most definitely increase.

We respectfully request that you deny this proposed acquisition. Thank you for your time and consideration.

MR. KNIGHTWRIGHT: Thank you. I'm James Knightwright of Aurora, Illinois. I'm chair of Southeast Villages Neighborhood and vice-chair of the Aurora Neighborhood Council.

Southeast Villages is triangular shaped, mounted on the south by Keating Road, on the northwest by Ogden, and on the east by the EJ&E Railroad. We have three at-grade crossings in our neighborhood. At the far western corner is Copley Hospital. We have four schools in our neighborhood and some students attend a fifth school just on the other side of the tracks. Of those five schools, four of them draw students across the tracks every day. We've been working for years to insure the safety of these crossings. However, on Ogden Road there are a couple of crosses in memory of Waubonsee Valley High School students who died there.

I live in a wonderfully diverse neighborhood. In my children's grade school, there is 48 different native

languages spoken. You cannot find a better place to raise global citizens than there. I'm concerned about losing that.

If the sale goes through and the trains increase, I'm concerned of the impact that mitigation will have on my neighborhood. I've seen pocket neighborhoods die while a highway bridge or a bridge was being built. I am worried about the impact that increased train traffic will put my neighborhood into that pocket waiting for mitigation.

As for the flaws in the study, the DES refers to decreases in traffic on lines in the east. Any transportation planner worth their salt would know that if the infrastructure exists, it will get used. That goes for sewers and streets, highways and railroads. Any promised decrease will only be short-term. Any suggestion that the decrease will be long-term is a lie.

If there's a problem with the rail system in the Chicago area, let's

build a real solution, not a temporary short-term one. If Mr. Kriel from Canadian National is interested in working toward a solution, then why is Canadian National trying to rush this process.

I do not believe that the study has adequately looked at the impact on the Route 59 business corridor nor, for that matter, the technology corridor around I-88. These are major -- this is a major economic engine for the eastern part of Aurora and also for most of Naperville.

I think we need -- the study needs to be looked into deeper, and I'd like to thank you for your time and consideration.

MS. TINA-MARIE ADAMS: Michael Grisek, followed by Mary McEntee and Jim Davidson.

Michael Grisek.

Michael Grisek.

Mary McEntee.

Mary McEntee.

Jim Davidson.

Jim Davidson.

Joe Harrington.

MR. JOE HARRINGTON: Hello, I thank you for allowing me to speak.

I'm a resident of Aurora, and I'm going to talk a little bit about -- something a little bit different, and it

sort of compliments what Kathleen Smith said.

She spoke about the pollution of idling cars. I'm going to talk a little bit about the fuel that gets wasted because of these idling cars.

MS. TINA-MARIE ADAMS: I want to make sure you're Joe Harrington.

MR. JOE HARRINGTON: Yes.

MS. TINA-MARIE ADAMS: Good. Keep going. Sorry about that.

MR. JOE HARRINGTON: As a resident of the area that's going to be affected by the changes or increase in rail traffic on rails currently owned and operated by EJ&E Railroad, I'm going to submit a statement on how the sale might affect local transportation fuel usage.

As citizens of the United States

we're all concerned about energy usage and in particular energy waste.

I submit that the sale of the EJ&E to the Canadian National Railroad will lead to significant increases in the amount of fuel wasted by residents and truckers in our region.

A lot of issues have already

been raised regarding negative effects on safety, effects on emergency response, capability, noise, property values, lost time commuting and so on.

What I submit is that there will also be a large negative effect on energy utilization due to forced diesel idling and grade-level crossings.

What I've done is I've gotten kind of technical on this, and I've made some calculations on the amount of fuel that gets wasted per car, per train at each grade-level crossing.

The calculation relates fuel consumed while vehicles wait for a train to pass at a two-lane grade-level crossing.

The Liberty crossing has been mentioned a couple times, and that's one I use daily.

For this calculation I chose a 6-cylinder engine, and this will get a little technical, and I referenced a vehicle, that the gate-down time would be five minutes, and I want to determine how long the vehicle will idle. You know, this wastes gas unless everybody shuts the car off.

I've chosen the number of

waiting vehicles to be fifteen, which is lower than what I normally encounter at that crossing.

With such referenced conditions I calculated the amount of fuel consumed while idling at the crossing to be 0.31 gallons per vehicle per minute, and this is for a vehicle that's actually undersized relative to what one normally uses. This is a small car, not an SUV.

For a two-lane grade-level crossing with fifteen vehicles waiting for five minutes, the amount of fuel wasted is

5 gallons at that particular crossing.

We now consider that this event will occur at each grade level crossing along the EJ&E, which is -- I took, like, 120 crossings. That's, like, close to 600 gallons it wasted.

With this cost -- and this is per train. If you multiply this cost by the number of trains per day, you arrival at a fairly large number of trains.

This is referencing only the EJ&E, and this comes out to about $2,100 worth of fuel wasted per day.

If you take into consideration

the fact that the CN acquisition will increase this by approximately fifteen times, two to three times train length, five times as many trains, you're going to end up with pretty large numbers just in wasted fuel.

I thank you for your attention.

MS. TINA-MARIE ADAMS: Dean Johnson, followed by Steve Keca, Mike Anastasio and Stan Mrizek.

MS. DEAN JOHNSON: Hi, my name is Dean Johnson. I'm chairman of the Big Woods Marmion Neighborhood Association in the city of Aurora.

We've heard some comments about some fuzzy math being used. Some fuzzy math that I found in the draft of the EIS was that the CN would be operating at or near full capacity, yet it also stated that the STAR Line could also be implemented along the same tracks.

This to me just doesn't add up.

I want to try for some unfuzzy math. Increased road traffic plus increased train traffic equals more accidents. That's not fuzzy. That's life and death.

It is time for a new standard in safety requirements. It is time for a new precedent in the financial participation

from the railroads.

Currently EJ&E and CN have recommended that there are two grade separations that should be improved. The

Draft EIS recommended fifteen additional separations to be funded.

In looking at the math then, looking at the counts, I think that standard is too low. I think there are at least ten other grades that need to be separated, Diehl Road being one of them.

The only way to reduce the number of accidents that are going to happen with the increased cars and increased trains intersecting each other is to do these grade separations.

This is something that needs to happen before the trains can be allowed to be increased on those tracks.

The other way to mitigate accidents is to increase the number of quiet zones.

Unfortunately, right now quiet zones are the exception rather than the rule, and that needs to be reversed. Quiet zones need to be the standard.

It's time that the technology

for the safety of railroads be updated to

this century.

The current technology that is being used is so old and antiquated because the railroads have not been required to implement those changes at their expense.

We have made numerous requirements for car safety over the years, including seatbelts, mirrors and other things, it is time that those things get implemented.

One of the reasons that was used for not requiring the railroads to pay more to build is because it was a preexisting condition.

I would put to you the four to six times the amount of trains on the existing tracks does not constitute an existing condition.

We need to make the railroads pay for these things ahead of time. The costs should be known ahead of time and put into an escrow fund so that CN should know what their full financial obligation is before the sale is allowed.

Thank you.

MS. TINA-MARIE ADAMS: We're actually going to pick up someone, Mary McEntee from the back of the auditorium. And then Mary will be followed by Steve Keca and Stan Mrizek.

The audience, if you could turn your attention to the back row there so we can hear Mary McEntee.

MS. MARY McENTEE: I'm a resident of

Centennial, a home for senior citizens, and I have a concern about the emergency transportation.

If the CN goes through the emergency vehicles can't get through to the hospitals or the, or the nursing homes or the rehab.

And also I have concerns for -- we have rights for senior citizens, and they will have a hard time to get through because they have to wait, and sometimes you don't know if it's going to be ten minutes or fifteen minutes or if the train has fifty cars on it and you might have to sit there for a half and hour. And I have a great concern about that.

And it scares me, the thought of it because you can go in there any time, you might see a freight train going and going and you don't know how long you have to sit there.

And somebody has to get to a hospital as a fast as they can, or if they

have to get to a clinic as fast as they can, and it gets mighty frightening. So I hope they do something about it.

MS. TINA-MARIE ADAMS: Steve

Keca, followed by Stan Mrizek and Margaret Daugherty.

MR. STEVE KECA: Hi, thanks for the opportunity. My name is Steve Keca and I represent the Remington Crossing neighborhood, which is on the east side of Aurora in the affected area.

I wanted to speak because I was disturbed about the seeming lack of

consideration of CN's overall safety record when the EIS was published.

And I think the bottom line is that the CN regularly moves hazardous materials across its lines and they do have an extremely poor safety record, especially if you look at Canada.

A couple of the speakers tonight mentioned they didn't have time to go into detail on some of that, but I actually have some of the detail.

So CN received the lowest grade level possible on implementing safety management systems, also called SMS, that are designed to offset accidents and other safety hazards, according to a report released by the Standing Committee on

Transportation, Infrastructure and Communities on Rail Safety in Canada, so their own agency.

The Committee stressed it had "serious concerns regarding both the delays and the manner in which the SMS has been implemented by the railway."

"On a scale of 1 to 5, with 5 being the optimum, CN was at Level 1 or 2. This is not, in our view, acceptable

progress," the report noted.

And I read this and I wondered why exactly did they do the report to begin with. And what I found were a couple interesting news items.

The first one I'll talk about is from August 23rd of this year, and the news item read that, "The effects of the CN rail derailment just over three years ago are still being felt, as there is still evidence of contamination at Lake Wabamun. The oil spill into the lake occurred after 43 cars of a CN rail train derailed due to a faulty track that had many fractures."

"More than 700,000 liters of oil and other chemicals were spilled into the lake, just over 50 kilometers west of Edmonton."

Another news item from July 30th, a CN freight derailment, a freight train derailed in Ontario.

Seven cars from the train went off the tracks. It blocked all the tracks in the area and no traffic could get in and out of Toronto.

Another news item from July 11th, "CN will go on trial in North

Vancouver on April 6th, 2009 over a derailment in 2005 north of Squamish that spilled 40,000 liters of caustic soda."

Other derailments that were listed July 20th, July 16th, July 12th, June 13th, May 5th, March 5th.

It took me five minutes to get this information on the internet, and I only went back to March.

So what I'd like you to do when you think about this and when the other

people read this study is I live about 250 feet away from those tracks and I'm just imagining my kids are playing out in the backyard and one of these trains goes off the tracks.

I mean, have you thought about that?

MS. TINA-MARIE ADAMS: Stan Mrizek, followed by Margaret Daugherty.

ChimniakCourtReporting.com

MR. STAN MRIZEK: Hi. My name is Stan Mrizek, just a resident in Naperville, and I just wanted to share some comments with the Board.

I want to start by thanking the Board for rejecting Canadian National's request to allow the sale before completion of this study and despite their bullying tactics.

And CN's attitude throughout the process seems to me to be one of arrogance and disregard for the impact of the communities in proximity to the tracks they want to purchase.

They somehow believe that improving that profit is more important than the affected people, and I'm one of them.

Moreover they expect that one

level of government or another, the people of the United States should pay for or live with the damage they intend to inflict.

This includes hundreds of millions of dollars for grade separations

ChimniakCourtReporting.com
312.781.9111

135

in order to get reasonable traffic flow, increased risk of crossing accidents, increased risks of hazardous materials spills, increased costs to ensure adequate response time by emergency vehicles, traffic jams, wasted fuel and pollution created by construction of grade separation projects in addition to the trains later on, probably taking several years to complete the grade separation projects.

Noise and vibration pollution, Canadian National has stated that this transaction would benefit the Chicago area. However, when invited to by elected legislatures to a meeting intended to give CN an opportunity to substantiate these benefits, they declined to attend.

I would question whether any part of the Chicago area will benefit from a reduction in rail traffic.

If demand for track time through this area is so great, what studies have

been done to prove that any time relinquished by CN on the existing tracks

ChimniakCourtReporting.com
312.781.9111

136

would not simply be reabsorbed by more CN trains or those of other railroads.

In fact, the only unimpressionable benefactor of this transaction is CN and at an enormous cost to the public.

I urge the Board to deny this transaction. I also request that the Board consider adding a meeting at a site more convenient to the Naperville and Plainfield residents.

MS. TINA-MARIE ADAMS: Margaret Daugherty, followed by Alan Murphy and Mike Anastasio.

MS. DOUGHERTY: I'm Margaret Dougherty and I reside in Georgetown Subdivision in Aurora, which is bounded by Route 34 and Montgomery Road and the railroad tracks and includes two of the crossings that need mitigation.

And from my own personal experience I can tell you that already it's a traffic nightmare there.

I need to cross those crossings

ChimniakCourtReporting.com
312.781.9111

137

every day to go to work. For example, last Friday it took me fifteen minutes to exit my subdivision out onto Route 34 because traffic was so backed up from a minor accident by those tracks. A coworker who lives four miles down Oswego couldn't get out onto Route 34.

I'm already gravely concerned on a daily basis about getting emergency vehicles in or out of there because literally there's no way in or out. You can't get out onto Ogden Avenue.

In addition, the emissions, I think all you have to do is drive down that road and see the dying fir trees to realize those emissions from those cars are already too high, much less adding standing vehicles for long periods of time.

And the air quality, I've lived there for twenty years. I can attest to the decrease in air quality already there.

Also, further comments, as far as the Chicago and the suburbs already being congested, my question is why don't

they mitigate those circumstances. Probably because it's too expensive.

We can't afford the increase in taxes needing to pay for these above-grade crossings.

And I suggest there be a new term for not-in-my-backyard and that term would take care of a backyard that wants to get rid of their problem and put it in someone else's.

And that's exactly what I see happening, and I see this as a sales pitch by the Canadian National Company to get people behind them for this sale.

And I also don't believe, as other people, that there will be a decrease in the future in that traffic. Maybe for a short period of time, and it will go back to increase in Chicago.

In addition, no one's mentioned the high tension wires that run adjacent to those railroad crossings. They're major electrical sources.

I personally can't see how you

could ever put an overpass there without moving those high tension wires, and I

don't see that happening, and I don't see who's going to pay for that as well.

Those are just some of my comments. Thank you.

MS. TINA-MARIE ADAMS: Alan Murphy, followed by Mike Anastasio.

MR. ALAN MURPHY: Good evening, I'm Alan Murphy. I'm from West Chicago.

A resident by the name of Mr. Wego just had a heart attack in West Chicago, but don't be alarmed, the fire

department's been called, help is on its way.

I wish to present to you tonight several resolutions opposing the CN purchase of the EJ&E Railroad.

The first one is from the Village of Wayne, the second resolution is from the West Chicago Fire Protection District, the third is from the West Chicago Park District, the fourth is from Winfield Township, the fifth is from Lake Eleanor Estates Homeowners Association in Wayne, Illinois. The next one is from Churchill of Wayne Homeowners Association, Wayne, Illinois. The next one is from Honey Hill Community Association, Wayne. Illinois.

I'm going to present them and give them to the court reporter here so

that they'll be entered into the record.

I would like to talk to you about noise pollution and the mitigation. There are several residents in my town that are within the 80 decibel noise limit.

What will be done to take care of those homeowners that are going to be afflicted by that?

Are they going to experience the same things as the homeowners around O'Hare Airport?

There are many things that come into play with the Canadian National purchase of the EJ&E.

Life safety issues: Remember, Mr. Wego has had a heart attack.

If the Canadian National goes through with their purchase of the EJ&E, they will institute two-mile long trains.

A two-mile long train in my town will block all five grade crossings forcing the fire department to take a route all the way out to Roosevelt Road. That's a seven-minute route to get to Mr. Wego.

Time is running short. Mr. Wego doesn't have long.

One of the things that's very unique about my community is it's in the top five in the country as far as train and train and train crossing.

I have the Union Pacific West Line coming through my town, Metra, the EJ&E, and now the potential Canadian National Railway.

If everything goes through as

proposed, there will be more than 200 trains crossing through my town a day. That's eight an hour.

Mr. Wego doesn't have long. It takes seven minutes for the fire department to reach him. Funny thing is it's ironic, you gave us three minutes to talk, it takes a person three minutes to die.

Mr. Wego just passed away. Thank you.

MS. ADAMS: Mike Anastasio, Jim Morris and Richard Mikel.

MR. ANASTASIO: Thank you very much. My name is Mike Anastasio, and I'm here on behalf of myself and The North Country in Wayne Community Association, which has over approximately 150 residents and represents over 46 homes in the village of Wayne. We will be directly impacted by this action.

Let me state simply we strongly object to this action. We strongly object to the draft EIS. Frankly, and I say this respectfully, it's an outrage. This is nothing more -- this situation is really nothing more than a rich foreign company trying to increase it's already huge

profits at the expense of our health and safety and our property. And I appeal to you with all my -- with whatever I can, the government to protect us from this and take action and not approve this.

I also want to make a record -- comment for the record for Mr. Creel and everybody else from the Canadian National Railway. We appreciate your concerns over the poor state of our transportation system

in this country, but we don't need your help and we don't want it. I wouldn't have enough time in three days to comment on all the insufficiencies with the draft EIS let alone three minutes, but I'll point out a few.

But before I do I would state that it's our view that the study needs to be restarted from scratch and not paid for by the Canadian National Railroad Company; paid but for by an objective third-party neutral and like the U.S. government and done properly and objectively.

Well, one of the things that EIS did was it eliminated four alternatives that could have avoided this adverse impact on our community. You can look at the

executive summary on page 9. One of the reasons was that it was too expensive. Well, I didn't see any evidence that the government or the study had done a financial analysis of Canadian National Railway.

When I looked at their

financials for the last three fiscal years they had $8 billion in revenue, 3 billion in operating income, and also their CEO had $12 million in compensation last year and held $75 million worth of stock options, and they throw $30 million, $40 million in mitigation measures on the table. That's an outrage.

One of the purposes the CN provides relative to its purpose in wanting to do this is it wants to develop closer relationships with chemical and petrochemical industries and steel companies and other utilities. Who are those companies? What are those chemicals? The EIS doesn't identify the quantities, the identities of these companies. We need to know their records. We need to know the volumes. It needs to be done properly. Please stop this.

MS. ADAMS: Jim Morris, Richard Mikel and Carl Bryant.

MR. MORRIS: I'd like to speak to everybody. My name is Jim Morris, and I'm also from Wayne, as is Mike, and we are here tonight to lend our support and our information we can impart to you and anything to assist in defeating this horrific idea that's come down the pike. Notice it wasn't the railroad.

I am nimbic, only I don't want it in anybody's back yard; and we are here to, as I said, assist you because the draft that we're talking about here tonight is fundamentally flawed, as Mike just stated. For example, the CN stays that by 2015, don't worry about the increase in traffic over and above the plan. There won't be any, because we only call for a 2 percent increase per year in traffic. Well, the U.S. Department of Transportation forecasted that there's going to be a doubling of the rail traffic in the next 20 years. So I think to find out where the discrepancy is you've got to follow the

money and find out who paid for this

147

report, just like Mike stated.

The -- excuse me. I think the key here is what we've got to do is for the people who aren't here tonight, who couldn't make the seven miles, this is your home. These are your businesses. This is your benefit. You're fighting for what you want to maintain as your lifestyle; and if you don't care enough, don't show up, because these people over here are the only gate we have against these people who sit over here who want this railroad. So it's up to you folks.

Now, we have put together in Wayne a website. There's a HR bill No. 6077 that will stop this from happening in the future. There's no reason why a foreign company, a rich foreign company, can walk into this country and dictate what happens to our property and tells us how to enjoy it. That's what we're here for tonight, and you've got to get the word out.

So in order to make that easier

148

yet, Mike Anastasio and our group in Wayne put together a website that all you have to do is click on the website, and it will walk you through contacting everybody to tell them what you feel about this, anything. Just tell them that you don't want it. Now, if you have a piece of paper and a pencil the website's name is stopcnrail.com. It doesn't get easier, you don't have to do anything. It will tell you what to do. It will show you how to send a message, but we have got to have the people that aren't here tonight to get up in arms enough to protect their own interests. It's time.

I'm an American, and I don't like these guys at all. I don't like them coming in here trying to tell us what to do, and we don't have much of a chance because frankly legally they got all the rights in the world because the laws are antiquated and the rail system is antiquated. Follow the money. It's a lot cheaper to come around the western suburbs

149

than it is to improve your infrastructure

to go through Chicago. They're going to take a stop from the western coast of Canada, and they want to take it right to the Gulf Coast of the United States. Stop them.

MS. ADAMS: Richard Mikel followed by Carl Bryant and Marilyn Griffin.

150

MR. MIKEL: Good evening. My name is Richard Mikel. I'm representing the Naperville Fire Department. I'm an assistant fire chief for the city of

Naperville. I thank the board for the opportunity to be able to present to you this evening.

My purpose here this evening is to reaffirm the city of Naperville's opposition to this proposed acquisition. The safest method I have to voice this opposition is to refer to the facts that are contained in this study. According to the information that we have been provided, the CN is considered a major shipper of freight to the rail industry.

One of the three main purposes that's been identified for this proposed acquisition is to develop a more extensive relationship with the chemical shippers along the EJ&E rail line. This brings along with it a substantial increase in hazardous materials that will be shipped along the EJ&E line. Along with these

151

increased trains with the increased amount of hazardous materials being shipped comes the increased probability of train accidents, not only rail accidents themselves but rail and highway collisions as well.

Another fact identified in the

study is that the Aurora crossings will be substantially impacted by the trains that will be now traveling on these tracks. The environmental impact study further reveals that an overall increase in the number of residents that would be exposed to pollution associated with these trains as compared to those who are impacted today.

The concerns of the Naperville Fire Department are simple, concise and based on facts that we've received here. The overall environmental impact to area residents would be negative. The probability not possibility of railroad accidents involving hazardous materials will be greatly increased.

The delay that Naperville

ambulances could incur while transporting patients to emergency medical facilities located in Aurora could cost lives. Based on these facts as presented in the study the Naperville Fire Department on behalf of the residents we serve and protect voices its opposition to this proposed acquisition. The negative impact to the quality of life and the safety of our citizens leaves us no alternative but to

oppose this. Thank you very much.

MS. ADAMS: Carl Bryant followed by Marilyn Griffin and Joan Solms.

MR. BRYANT: My name is Carl Bryant. I'm a lifelong resident of Plainfield, and I am here to oppose this acquisition. As stated by Representative Solms, we have 16 grade crossings in Plainfield. We have a school district that encompasses 50 square miles and it's probably the third or fourth largest in the state.

In 1985 our community was 3,800 in population. Today it's 40,000. You can imagine what our community is like with that number of railroad crossings. It

bisects our community. We are stated to be 110,000 in the future, and the impact on our quality of life and our ability to get around in our community is incalculable; and I think it's a travesty that this proposition is even on the table.

It's been estimated that Chicago derives a billion dollar benefit by having the rail hub in Chicago. Let it stay there.

MS. ADAMS: Marilyn Griffin followed

by Joan Solms and Matt Cipolla.

MS. GRIFFIN: Is this where I stand here? We've heard all the figures, and I'll skip that and talk about our village.

MS. ADAMS: Are you Marilyn Griffin.

MS. GRIFFIN: Yes.

MS. ADAMS: Okay, good.

MS. GRIFFIN: The historic center -- is this right? Okay. The historic center of our village of Wayne is a triangle. The homes are trapped by rails tracks on every side, and we're talking about grade crossings. We have eight in this little, dinky place; EJ&E on the east and north, the Union Pacific on the west, the two close the triangle on the south. You must cross one of these tracks to escape.

We will have unbearable delays

in our lives every day. In a worst case there could be no way out, no way to get rescuers in. When school is in session, there are 600 more children. Our elementary school is in the triangle. 150

homes in the triangle are from 50 feet to a half mile from the tracks, many of us within a couple hundred feet.

If there is a spill, all of Wayne is threatened the loss of fresh water. We all have private wells. CN claims they are safe. Look at their Canadian record and reports from Canadian residents.

Will the trains really be bigger and longer? New ships being built are bigger, bigger to carry up to five times the freight car units. U.S. ports can't handle them so they go to the Port of Prince Rupert. CN plans to increase freight car units, their freight car units, from 500,000 to 3 million. They have ordered 50 new locomotives and 2,000 new rail cars. They expect to make billions moving freight on EJ&E. They offer 40 million in mitigation, not enough for even one overpass. They do not believe

overpasses are needed. I believe that's been -- they stated that.

CN maintains the property for accident -- pardon me. CN maintains the probability for accident is very low. Where is the study for that with quadruple traffic? What does it say in the documents that CN will be held responsible for? What are remedies required or structures built to prevent accident? Where are these required.

To bring up property values, we are wondering if our homes will have any value. We say to each other and we have to say it, I wouldn't buy a house in Wayne. Thank you.

MS. ADAMS: Joan Solms, Matt Cipolla, Lawrence Ladner.

MS. SOLMS: Thank you. I'm Joan Solms, and I'm running for state representative in the 83rd District, and what I want to address is something about the long-term impact this may have on our country, not only what happens here, because what we do and say here may have a long-term impact on our country.

I worked for the railroad. I love the railroad. I get my pension from the railroad, but I have not -- I don't think you can hear me. I have not been shown what financial gains this sale would bring to our taxpayers, to our homeowners or to labor. I was told a few jobs would be gained.

On the other hand, on the other hand, rumor has it that in the future plan by the industrialists, it is to bypass the California ports and bring these ships and their cargoes into Canada across Canada by rail and down through the U.S. Now, we already know that this is in the plans for the southwest where they're building the

Super Highway or they hope to build it where they will bypass our California ports, bring the cargo into Mexico and then up by truck through the United States, one of the big terminals being Kansas City.

Now, we were second punched by the industrialists who -- the world industrialists, I should say, on and a NAFTA. This could be a spitball right between our eyes. If we lose California we're going to lose thousands of jobs through the California ports; and this is at a time in our economy we need more jobs not less, and I just wish there was some labor representative here to address this issue.

And all I could say is I cannot support this sale at this time. We know so little about it. Thank you.

MR. CIPOLLA: Matt Cipolla. I'm a resident and a commuter of Plainfield. And

like Linda Holmes mentioned, they each -- there's going to be 18 trains expanded to 42. And that's just by the tracks closest to me.

I'm going to speak from the transportation industry. I've worked with heavy equipment for over five years. Like the one speaker mentioned, that those numbers that CN is proposing on the increase of traffic, it is skewed. I'm telling you right now.

Freight is down, because of the high diesel prices. And that's the reason why this is getting all proposed, is because of increased freight traffic.

And all the shippers and suppliers, that's where it's going to. That's where they're cutting their costs at. So all that -- all the freight trains coming through, all these services everyone is talking about -- and you're looking at those numbers, I tell you what, double it.

I'm telling you right now. And that's the reason. And that's going to be increased over the next ten years.

We have 16 at grade crossings at Plainfield. Not five, not six. Seven,

eight, nine, ten, eleven, twelve, thirteen, fourteen, fifteen, sixteen. Plainfield will suffer.

And the Board has to understand and have compassion for the commuters and homeowners like everybody else with all the other cities and villages out here. Thank you.

MR. LADNER: I'm Lawrence Ladner. I'm a ten-year resident of the east side of Aurora. I'd like to thank the Board for giving us the opportunity to speak against this acquisition of the EJ&E by CN.

I'm here to talk against the acquisition for a variety of reasons.

Number one is cost. Not the purchase price by CN, but by the cost that will be borne by us, the tax payers and the voters and citizens of the effected communities.

Now, the cost is going to be, what, $300 million for CN to acquire the right of way of the EJ&E.

It will cost the tax payers of the effected communities, what, approximately $1.5 billion in order to build the infrastructure just so we can have overpasses.

I'm a business man. But if I went to the city of Aurora and said I want to spend some money on something, and I

want you to spend five times as much money to facilitate that improvement, they would throw me out the door. And I wouldn't blame them.

Now, even if we can never really account for the amount of money that it's going to cost us as tax payers, we will notice the traffic delays. We can see increased traffic on the rail lines and will increase two and a half to three times. Those trains are going to be twice

as long as they are now.

Now, I live near Liberty Street. And I cross that grade crossing sometimes many times a day. I get struck by the train; I live with it. That's just too bad.

Now, I have to ask who is going to benefit from this? The citizens and the tax payers or a foreign corporation?

If they want to buy EJ&E, if infrastructure upgrades have to be done, they should pay for it. Not 50 percent, but 100 percent.

Now, for benefits, the Star Line would never be built. The Star Line is a rail commuter line that would be of genuine benefit to the people of the effected area.

Me, I'm going to vote for something that's actually going to be a benefit to the people who are here in the area.

And am I to understand that the environmental impact studies have not yet been completed? Well, if they're not substantially completed, read that 80 percent, 90 percent, they're not going to be finished by the end of the year.

And if they're not finished by the end of the year and they're not nearly finished now, they won't be believable. I ask the Board to reject the acquisition of EJ&E by CN.

MR. BOLWIN: My name is Charles Bolwin. I work for the Illinois Department of Transportation. And I feel that the roads are being impacted, and I feel our jobs are in trouble.

And we plow these roads in the winter. Safety is a problem. And traffic backup would be a big problem on these roads, that this would hurt our school system as far as time and our buses that take our children back and forth to schools.

How close are -- our stop-and-go lights are very close and to these railroads. How many blocks or miles can traffic be backed up? I've got to do my job. Firefighters have to do their job.

I plow snow in the winter. Ambulances and hospitals are in Aurora, Naperville, Plainfield area and all of Illinois. What can we do or what do we want as a citizen of the United States of America?

I do not want this railroad in

my backyard and not in the United States. Stay in Canada and build your own railroad there.

How many bridges and more roads would we have to flip for the cost for CN and EJ&E? And at 3:00 in the morning, I hear the train whistle; the train sound go off. And I live on Frontanac and Odgen.

I'm a committeeman. And a certain area there's condos right on the railroad. How many bridges otherwise -- excuse me -- we also have noise. And we have to get some type of soundproofing that are used in all neighborhoods like Bensonville and other areas. This has to do with the airports and our states.

We just don't have the areas -- we do not want you in our backyard. So it's not easy to talk up here to people

that don't understand what we go through living by the railroads.

Thank you.

MR. SELK: Rick Selk. I'm here representing my family. Please don't send me back -- no. I'm Rick Selk.

What benefits will we derive from this sale and the increase in the train traffic? We live approximately a mile away from the train tracks.

The increased traffic -- closest underpasses that we have are five miles to the north and ten miles to the south. All of our emergency and nonemergency medical facilities are on the opposite side of the railroad tracks.

We've been asking for some time for quiet zones for the tracks. And that is not going to be a reality now.

We are actually looking forward to the Star Line so that I could take my kids down to the lake or we could go to the zoo or do something else instead of driving all over the place, because that is a problem in the metropolitan area.

So basically we're moving from

an estimated -- and I'm just going to repeat that again -- an estimated three-fold increase in the number of trains.

And we're also -- you said six. I looked at the figures. And the ones that I looked at said three in my area anyway. We're also looking at the length of the trains to be two and a half times what they currently are. And again, I'm going to repeat estimated, so it could be more or less.

And as I have heard, this report was done by CN, so I'm going to leave it at that.

If you've ever been stuck waiting for a train at Odgen Avenue, you'd understand the impact that this increased train traffic is going to have.

There is a meridian that goes at least a half mile to the west. There is no way to turn around. You are stuck. The longer that you sit -- the longer the trains, the longer you're going to sit

169

there.

And it's not acceptable in a situation where somebody has a medical emergency, and they have to get on the other side.

This leads me into the emissions concerns that I have. If you would, please, look at the fastest growing communities in Illinois.

Aurora and Naperville had had a little friendly competition over the years on who is second in the state. And it's been going on for some time. And all I can say is sorry, Naperville.

Chicagoland has been recognized historically as having high levels of emissions; otherwise, we wouldn't be using reformulated gas.

Where I work, if you take a vehicle, you cannot have it idle anywhere. As a matter of fact, I believe state law says that you can't idle outside of business any longer either. So it seems to me that that would be a problem for idling

170

so many more cars.

And thank you for your time.

171

MR. SANDSCHAFER: My name is Scott Sandschafer. Good evening. And I apologize that I do not have a formal statement, but would like to share some of

my concerns and feelings.

I live in Pagoda Court, Naperville, Illinois, which is only less than 200 yards away from the railroad. I live in between the 111th crossing and 119th. So I'm a neighbor of Plainfield, Aurora, Naperville, Oswego.

And I've only lived in my home for approximately twelve months. I have not and was not aware because the merger was announced, as far as I understand, after I moved.

But, of course, it has a direct impact of my American dream. One, my wife and I had saved and saved for ten years after we've lived in Chicago, built our dream home, understanding that we were going to be close to the railroad, but knowing that it would only be 15 minutes every two hours where we would have some

172

inconvenience in regards to noise.

Of course the quality of life of my family, my children, my four year old, my three year old and my one year old will be directly impacted based on the noise, as well as the concerns that have been mentioned this evening.

Also my other concern is, one, whereas part of a -- our home, there's a new school Peterson, Peterson Grade School, which is less than -- I would say less than 50 feet or extremely close to the railroad where my children will be going to school.

Of course this increased rail traffic, of course, provides an impact not only to the quality of being outside, which is what I enjoyed when I was a kid, but of course the safety concerns that have been mentioned numerous times tonight.

One last point, fortunately I've been able to provide for my family and my wife doesn't have to work now. Of course with the taxes that I pay and I can justify associated to schools, the infrastructure

173

in regards to roads and the libraries, et cetera, living in a great community that we live in, based on the payment that I might have to make based on the new taxes that I will have to pay, we'll have to reconsider how we approach our lifestyle and raise our children.

The other point is, one, I've lived in Chicago for over ten years. Of course I wasn't even aware living in five

different neighborhoods of the freight traffic. So obviously the infrastructure and how they approach the train traffic there is a way that it's not effecting the community.

So I would strongly oppose and I urge -- I urge the people and I look into the camera hoping that I will be heard, as well as the people that are sitting up here taking notes that I strongly oppose this acquisition.

And, please, consider the families and the dreams that people have that will be impacted as part of this

decision.

Thank you very much.

MS. DECKER: Hello. My name is Shirley Decker. I live on Frontanac backing up to the berm and also right by the Montgomery crossing and the Odgen crossing.

I have a couple of concerns tonight. And I'd like to tell you a little bit about what happens to us now.

Currently when -- I work also at a clinic, which is just three miles from me. It now takes us 15 minutes to get just to work, which is down Frontanac and Odgen. And whenever -- that's just one of the issues.

Another issue is where I work, the patients that actually have to wait for

trains currently are delayed already getting to their appointments, because I work for a health facility. And I see that every day in my job.

The other thing I'd like to talk to you about is what happens to me now? I only learned about this meeting today because of a politician's thing that was

mailed to me, one of their mailings. And I did not hear about this meeting at all.

I live -- I'm directly affected; yet I knew nothing about this meeting, other than I got this in the mail. And it wasn't from the Surface Transportation Board. I don't know that that's your obligation.

However, I think it would be important that they do send us some kind of mailing to let us know about these meetings since it so directly effects us.

I'd also like to implore you to, please, take a bus trip, if nothing else, to the intersection of Odgen where that crossing is and just sit there and look at what happens on a daily basis in that area.

I was really involved in a school district in my early years and have

been in District 204. I've been in the area since 1985. And I saw the growth there.

And one of the things from being part of that growth and on some of those

committees is people would tell us how terrible it is. But until we actually went to those areas and we saw them for ourselves and we saw what happens on a daily basis, a picture and a piece of paper doesn't really show you what that's like.

So if you could get mailings out to us and you can visit these sites, it would be greatly appreciated.

Currently also from a tax standpoint, this is a personal note, I pay over $9,000 a year. That has a lot to do with everything in the area. But if you add on to me, as well, this tax burden that this purchase could do to me, I would hope that you would consider that in your decision making.

Thank you very much.

178

MR. SCHOEN: My name is Bob Schoen. I'm a resident of Wayne, Illinois. I'm here with my wife, Debbie, to address the recent couple of issues that concern us in the draft report.

The first one is the environmental impact statement appears to significantly understate the cost of mitigation.

We have heard that there was a study done by a DuPage County board that said the mitigation costs could be as high a $700 million. Tonight I hear it could be as high as $1.5 billion.

And that's probably not the only mitigation costs that have to be addressed. Whose going to pay for these costs? Both IDOT and the ICC have already said they're not able to fund any mitigation costs.

The federal government doesn't have funds to even finish the Sterns Road project. And the amount that CN has proposed to pay for is a joke.

To make things even worse, in

179

addition to the amount offered by CN being a ridiculously low dollar amount, apparently there's no law in place to force CN to ever follow through on these mitigations.

And when is it going to happen? Is it going to happen before they start running ten times the number of train cars that they run now, or is it going to be ten years from now.

Of course based on other comments we've heard, it may be decades before they even consider spending any money on it.

And then apparently even after our home values are going to plummet, we as homeowners are going to be expected to come up with this $700 million plus in mitigation costs to attempt to mitigate the significant health, safety and quality of life issues that this transaction is going to create.

Secondly, the study totally discounts the significant and devastating

180

effects on home values. According to the summary I read, some homes within 250 feet of the railroad could experience a decrease in value.

And by the way, the study goes on to say the effects would be only minor and negligible. The tone of that study makes me sick.

We all know that our entire way of life is going to change if the transaction goes through. Our property value is going to be drastically effected.

A significant factor in determining the value of our homes is the nature of the communities we live in. And our quiet country-like communities will essentially be turned into train yards.

And by the way, I live in the Wayne triangle of death that you heard people talk about earlier. We could be totally cut off with one train that could block any exit or entrance to our home area.

And by the way, I live within 45

181

feet -- my lot line is 45 feet away from the train crossing. So nobody can tell me

this is not going to destroy my property value.

Thank you.

182

MR. DAVIS: My name is Jeff Davis. I live in Naperville, Illinois. I work for a company called Phoenix Closures. I've been there for 14 years. And they're a significant user of the railroad freight.

So we -- and that's critical to our company.

Although this acquisition really has no effect on Phoenix Closures, although there's 250 people that work in manufacturing. And one of the things we haven't heard here tonight is really the whole story.

A lot of what we've heard is what affected us grossly. But on a national basis, the national chamber of commerce has supported this acquisition.

And why do they support the acquisition? Because it's jobs and it's commerce. And it's jobs and commerce on manufacturing.

Manufacturing has lost a lot of jobs. The state chamber of commerce has supported this acquisition. So part of

this story hasn't been completely told. And a lot of people need to understand that.

I'll give you another example. The Burlington Northern presently runs through and has for since -- the Burlington Northern was built to the cities of Aurora and Naperville.

They have a triple line main. I don't know how many trains they run, but it's way, way, way more than the Canadian National. They have hazardous waste. They block crossings. They do all that stuff. We have a great quality of life here.

So do not paint this all the doom and gloom. Before I got with Phoenix Closures -- and again, I've been there for 14 years, I spent seven years from '81 through 1988 with the Chicago Northwestern Railroad.

I was in the sales and marketing department selling railroad freight. I was in

Green Bay, Wisconsin; Pittsburgh,

Pennsylvania; Atlanta, Georgia.

I left there in frustration and disgust and I spent five years with the Canadian National Railroad in Atlanta, Georgia and then in Chicago. I'm a Chicago boy, so I came back home.

But the reason I'm not in the railroad business any more -- and again, I spent 12 years there -- is jobs. The manufacturing jobs left North America. They went to Asia. And we don't need jobs

like what I had when I was a younger man.

So I applaud this public meeting. And I know you will take those other considerations. There's local issues, too.

But what you don't hear tonight is solutions. I know there's other cities that have supported this acquisition. Villages such as Schiller Park, Des Plaines, Vernon Hills, Buffalo Grove.

And there is a lot of things here and not just a local issue. So don't paint this as doom and gloom, because it's

not. It's something that we need more commerce and better commerce. And not fewer. Thank you.

MS. ADAMS: I just want to remind you again that all methods of comment received by September 30th will be taken into equal consideration, and that includes the toll free number, the website, the mailing address, the comment forms here in the lobby and in the open house area as well as the court reporters.

MR. SIMMONS: My name is Rick Simmons. I live over in East Aurora. I'm a civil engineer. I live one mile from the EJ&E track. I live a little over half a mile from the Metra track and the switching yard over in East Aurora.

Everybody has heard a thousand times, right, buyer beware. We moved in, we were quite a bit away from the railroad track; we knew exactly where we were relative to the railroad track. We moved in, it was a nice night, we opened the windows, all night long the trains were blowing their horns, revving up their motors. A mile away you could hear it just like you're in their backyard. Let me assure you, you can when the winds are

right and the atmospheric conditions are right and even when they're wrong, sometimes you can hear all of that. It's very noisy.

Everybody says, buyer beware, right? Okay. Does anybody now have the right to come in here and put five times as

many trains on the track, four times, whatever it is, rev up the motors, blow the horn, diesel smoke blowing. You can smell the stuff three-quarters of a mile, half a mile, or a mile away, you actually can smell the diesel smoke at times.

So I urge the authority, Stop it. Block it. Block it tonight. Don't be a chicken. Do it. Just do it. You heard all of this, just do it.

Thank you.

And then last but not least, I mention the Metra line. The Metra line, EJ&E line is a grade crossing. What are you going to do about that? Going to put an elevated crossing there, a separated crossing? You better, or you're going to be sitting on the Metra line waiting on the 5-, 10-, 15-minute trains. That's got to be done.

What do you really have to do if the authority doesn't do the humanitarian thing, the ethical thing to block this thing, if you don't do that, you have to

have separated crossings all the way from Aurora to Plainfield and anywhere elsewhere you're going to impact life the way it's going to be impacted here. That's got to be done. I strongly urge the authority to take the appropriate action, and I encourage the authority, Don't be chicken, do the right thing.

And someone said earlier that the trains can do what they want, they have the legal authority. Well, they wouldn't have the legal authority if the commission blocks it, right, so I urge the commission to block it.

Last but not least, if someone wants to know how we feel when we're sitting there in the traffic all the time, break these trains up into short trains, let them stop and wait on the traffic during rush hour and stuff. Put a traffic light there and let the trains wait on the traffic, then you'll know how we feel.

And, finally -- I'm out of time,

and I've ran out of stuff to say.

Thank you.

THE AUDIENCE: You've got 30 seconds.

MR. SIMMONS: I forgot what I was going to say.

MR. KIESA: My name is David Kiesa. I'm a West Chicago resident for 25 years, and my wife and I have lived there, again, 25 years. I'm just a couple blocks away from EJ&E and also a couple blocks away from the UP tracks and there's an interlocking, I guess is what's it's called, between those two main lines three blocks away from my house, so I get to see the perfect storm that goes on when you got main line trains going in one of the -- you know, one direction waiting for main line trains in the other direction, the impact that that has on the neighborhoods just from an aspect of getting from one side of the town to the other.

And as I understand it right now, a grade separation at Geneva Road, which is where that interlocking that I'm talking about is near, Geneva Road, apparently, there's not a discussion about a separation there, which is just as well because I think if they put in a grade separation there, it would destroy the

fabric of the community there. We have a

100-year-old community of residences, old homes with children living in those homes, which kind of gets to the next point.

That simple little rail line, which is probably maxed out right now, is suddenly going to be stressed out having many, many more trains there, and I can't imagine the safety of the children, what that would be like with these additional trains.

I'm sure you folks know that the end of May of this year, a little three-year-old girl was struck on the EJ&E tracks, and I'm surprised more hasn't happened in the years past.

I'm sorry I don't have more official information like the other folks do. All this is just purely antidotal from living there 25 years.

I love trains. I grew up next to the Burlington Northern in Downers Grove. I love trains. To see what it does to the train and the traffic in the town

because of those two main lines right next to each other, I can't imagine this getting a hundred times worse.

Thank you very much.

MS. SCHOEN: My name is Debra Schoen. I'm a resident of Wayne.

I object to the proposed action and the EIS. There are many problems with the EIS. Let me describe one. The EIS should illustrate disaster scenarios. In other words, don't just tell us that it is

unlikely that catastrophic train wrecks will occur. Tell us how many people and children in Wayne and any other community will be injured and killed if there is a train derailment and a hazardous chemical release and fire and explosion results.

Of course, you have to account for the fact that emergency services will not be able to respond because, number one, they will be unable to cross over the tracks to help, and, number two, they will not even be available because our community does not have the infrastructure or resources to support emergency services. Don't think this doesn't happen, it does. Just go to www.stopcnrail.com and you can see what a Canadian Railway accident looks

like, and also the destructive force of a railcar explosion.

Finally, tell us who will be responsible for the injury and deaths resulting from accidents that will be caused by this plan.

Thank you.

MR. HEBREARD: My name is Dan Hebreard. I'm a lifelong DuPage County resident, current Aurora resident, and I'm here to talk about Chicagoland, which is approaching 10 million people.

This is going to affect at least 2, possibly up to $3 million people along the line. I'm going to read now from the Public Meeting Guide, page 6, paragraph 3: Because the Board determined that the CN EJ&E acquisition is a minor transaction.

Hundreds of millions of dollars, possibly billions of dollars, 2, maybe

3 million people. The Board decided it's a minor transaction.

You're here to serve the public. You're here to serve the American people. Do your job. Do the right thing.

MR. CASSIOPPI: My name is Gerry Cassioppi. I'm a candidate for DuPage County Board, District Five, which includes the railroad in question. I've also lived in Naperville for 18 years and been a member of the Naperville School District 203 School Board and also Naperville Transportation Advisory Board.

I'm certainly very much aware of the quality of life issues that this proposal would effect in this area. I'm also concerned about the safety and the children issues that this proposal would effect.

But I would look at -- having been on your side and listened to people in

these situations, I would, again, ask you to do your job. These people have done their job coming here tonight. I think you have plenty of information to go back, and I would look at it more not as a NIMBY issue but as a bully issue, and it's time for somebody to stand up to the CN Railroad.

Thank you.

MS. ADAMS: This concludes the public comment portion of our meeting tonight. We want to thank everyone for your comments. The next public meeting is tomorrow night in Gary, Indiana from 4:00 to 9:00 p.m.

Thank you.

THE AUDIENCE: I hope you've listened.

(End of meeting.)

D.7 Gary, Indiana

1

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET AND EASTERN RAILWAY COMPANY

PUBLIC HEARING

September 10, 2008

6:00 P.M.

Conducted by:

Heather Tarczan, Meeting Facilitator - MWW Group Public Relations

Phillis Johnson-Ball, Deputy Chief of Staff, The Section of Environmental Analysis - STB

John Morton, Project Manager - HDR Engineering

INDIANA UNIVERSITY NORTHWEST

3400 BROADWAY

GARY, ILLINOIS

CHIMNIAK REPORTING & VIDEO

Telephone: 312.781.9111

Reported by: Rachel F. Gard, Sharon Stuckly

MS. TARCZAN: Good evening, ladies and gentlemen. Can everybody hear me? Thank you for attending tonight's meeting. We are here tonight to hear your comments on the Draft Environmental Impact Statement that was released July 25th regarding Canadian National Railway's proposed acquisition of the EJ&E Railroad.

My name is Heather Tarczan, and I'll be facilitating the meeting tonight.

Before we get started, I would like to take this opportunity to review some protocol for tonight's meeting. For starters, I would like to ask that everyone please turn off your cell phones and please refrain from interrupting any speaker or commenter. In a moment, I will introduce those presiding over the meeting, and there will be a short presentation on the findings from the Draft Environmental Impact Statement.

Immediately following this, we will hear your comments. Each commenter

will be given up to three minutes to speak. The time clock will be displayed on the screen behind me; and a yellow card will be shown at 2 minutes and 30 seconds and a red card shown at 3 minutes. A list of speakers in the order they will speaking in will be displayed on the screen. Also I will call forward the next two speakers in line after each speaker so that we can be as efficient as possible.

If you are interested in speaking tonight and haven't yet registered, please proceed to the registration table located just outside this venue. A staff person will be able to assist you. Alternatively included in the program you received tonight, you may submit comments to the Surface Transportation Board through a toll-free number, website, or mailing address. There are also comment forms and drop boxes as well as court reporters located throughout the venue.

Please recognize that all

methods of comment received by September 30th will be taken into consideration and weighed equally.

Tonight we are here to listen to your comments on the draft EIS. This is not a question-and-answer session, though we invite you to return to the open house area if you have any questions or you would like to provide your comments in a more private setting with a court reporter there.

We appreciate your courtesy as we work to create an environment where everyone can be heard. If you disagree with a speaker, we ask that you not express your disagreement out loud. Likewise, please know that applause for a speaker may cut into that person's time and ultimately gives everybody less time to speak.

In the event that anyone is in need of a Spanish translator, please let a staff person know.

If you have any questions, we have a number of staff available to assist

you. Staff are identified with name tags and located throughout the venue.

One quick housekeeping matter: Emergency exits are located directly behind you.

I'd now like to introduce the people with me on stage: Phillis Johnson-Ball, deputy chief of the Section of Environmental Analysis for the Surface Transportation Board and John Morton, team

leader supporting the Section of Environmental Analysis.

Phillis Johnson-Ball will now make some remarks about the Draft EIS.

MS. JOHNSON-BALL: Welcome to our public meeting. My name is Phillis Johnson-Ball, and I'm with the Surface Transportation Board's Section of Environmental Analysis. The purpose for our meeting tonight is to receive your comments. This is your opportunity for your voice to be heard. I know many of you have concerns about this proposed transaction, so please use this opportunity

activity and industry performance, to take enforcement actions, and to provide information assisting to the public.

Many of you have already taken advantage of the board's consumer assistance project of office by calling in and asking questions and providing us with information. The Surface Transportation Board is made up of three members. They are appointed by the president, our chairman. And these people are our

say, take this opportunity to tell us what you want us to know. Tell us what we did in the Draft Environmental Impact Statement that was good, if any. Tell us what we did wrong. Tell us what we need to improve, and tell us what is yet to be done.

Responses or comments to the Draft Environmental Impact Statement must

issues. The merits consist of the economics, competitive issues, and transportation issues. Parallel with that process, we consider the environmental impacts of a proposed transaction. These

contractor, will give us a brief overview of the results of the DEIS. Thank you.

MR. MORTON: Thank you, Phillis. I'd like to briefly cover some of the results of the matters listed in the draft environmental statement. I know that the documents is a very voluminous document and there's a lot of information in there. But I'm only going to touch the surface of some of those.

If you have questions, if you want to, you know, look into any of the issues we talk about tonight in more detail, we're leaving the open house portion of it, and the displays and the maps are still out in the lobby. We have staff out there identified by the name tags that would be more than happy to answer any questions that you might have.

First, today is to talk about the applicant. CN is a Class 1 railroad. It is a major shipper of freight, both domestic and foreign. It operates five rail lines that converge in the Chicago area. Those are shown in this map in the dark color. They operate about 150 miles

of rail line in the Chicago area.

EJ&E is a regional rail line that operates in an arc around Chicago. I'm sorry. It's in the orange color around here (indicating). EJ&E has two major yards: The East Joliet Yard in Joliet, Indiana, and -- I'm sorry, Joliet Illinois, and Kirk Yard in Gary, Indiana.

CN has identified three primary purposes for acquiring the EJ&E. One is to connect their five rail lines and provide a continuous route around Chicago. The second one is to get the paying control and get use of Kirk Yard and East Joliet Yard. And the third is to develop a more extensive relationship with the shippers on the East Joliet Yard, EJ&E.

The Draft EIS evaluated a number of issues and information, and these are the resource categories. I'm only going to touch on just a few of those tonight. First, the changes in the operations: I'm going to talk about train traffic changes in just a moment. But in addition to the

train traffic changes, CN also proposes to construct six new connections. Three of those connections are here in Indiana: One at Griffith, one at Ivanhoe, and one at Kirk Yard. They also propose to construct 19 miles of new parallel second track along the existing main line. And actually all of that is going to be constructed in Illinois.

From an operational side, this is a density map, and I know it's a little hard to read. But I'll kind of walk through it. The CN rail lines are the ones converging in the center. This is a schematic of the map I showed you earlier. The light blue color shows the current train traffic levels. You know, it's indicative of the number of trains per day. The dark blue color shows the proposed train traffic. So from the map, it's easy to show that what CN proposes to do is divert some of the traffic moving through the city today to the EJ&E and going around the city. The expected increases are

somewhere between 15 and 24 trains per day.

As a result of the analysis, a couple of conclusions is that in certain areas, the EJ&E rail line would be at or very near its practical capacity. As a result, the EIS concludes that it's very unlikely that CN would operate -- or that more trains or that the train traffic would be higher than that estimated by CN.

The other finding from the EIS is that Metra on-time performance can be maintained with effective coordination.

The EIS evaluated train and roadway safety issues. On the EJ&E arc, because of the increased number of train miles, there would be an increased probability of train accidents and an increased probability of highway accidents. By the same token, on the CN rail lines inside the arc, because of the reduced number of freight trains, there would be a reduced -- a decreased probability of train accidents and highway accidents.

There are three roads or

highways that the EIS identified as having potential safety concerns, two of which are Indiana; and that's Lake Street and Miller Street in Griffith, Indiana.

The EIS evaluated passenger rail

and haz-mat safety. There's no passenger rail operating today on the EJ&E. There is passenger rail operating on the CN rail line segments. And because of the reduced number of freight trains, there would be an improvement or an increase in passenger rail safety. There will be a substantial increase in the amount of hazardous material shipped on the EJ&E rail line.

The EIS looked at transportation systems. It evaluated 155 highway rail at-grade crossings on the CN rail line segments inside the arc. Of those 125 -- Of those 155, 125 would show -- would have a reduced number of trains crossing them.

The EIS evaluated 112 highway at-grade crossings on the EJ&E. And of those 112, 87 of them met the board's threshold for environmental analysis. Of

those, 15 the EIS identified as being substantially affected; and those 15 are shown on the maps. And it includes Broad Street in Griffith, Indiana.

The EIS looked at air quality. The EJ&E rail line is a longer route and, consequently, there would be increase in fuel use. But that increase in fuel use

would be offset by a more efficient route and a freer flowing system. Consequently, the EIS concluded that the air emission changes in 2015 would not exceed current regulations and would not impact the region's air quality compliance.

The EIS also looked at emergency response and identified 11 emergency service providers: nine fire stations and two, you know, medical services providers that would be affected by the transaction; and those are shown on the map behind me. And we also identified them specifically on the boards out in the hallway, if you want to look at them.

The EIS looked at noise. There

would be about 3,000 residences that now would have a noise level above 65 dBA near the EJ&E. There would be about 2700 that would have less noise along the CN rail line segments. In addition, one quiet zone, the Barrington area quiet zone, without mitigation would lose its quiet zone status.

The EIS identified a number of mitigation measures, and these are listed both in the executive summary of the EIS as

well as in Chapter 6 of the Draft EIS. Part of that is that CN provided 76 voluntary mitigation measures. Those are all listed in there. Here are the categories that the mitigation falls in. But in addition to that and on top of that, CN identified 72 additional mitigation measures.

And, once again, those are the categories that those additional mitigation measures fall into. All the mitigation measures are listed in the Draft EIS in Chapter 6 and also in the executive

summary, which is once again available in the open house area in the lobby.

Finally, as Phillis and Heather noted, there's a number of ways to provide comments. And I encourage you all to take advantage of each and every one of those.

With that, I'd like to turn it back over to Heather.

MS. TARCZAN: We will now begin the comment portion of our meeting. Let me remind you that we will adhere to the three-minute rule, which begins as soon as you start speaking. If three minutes is not enough time for you, please feel free

to speak with the court reporter in the open house area to complete your remarks. We also invite you to submit your full written comments to the court reporter located on the left-hand side of the stage.

To be fair and consistent, if you speak beyond three minutes, I will begin to announce the next group of speakers. I would now like to ask the first commenter, Mark Lopez, to please come

to the microphone. Following Mr. Lopez will be Ann Valentine and Senator Karen Tallian.

MR. LOPEZ: On behalf of Congressman Pete Visclosky, I would like to read the following remarks in for the official record: I would like to thank the Surface Transportation Board's Section of Environmental Analysis (SEA) for hosting today's public meeting, and I would like to thank the residents and elected officials of Northwest Indiana for their attendance.

Since CN first announced its intention to acquire the EJ&E which will result in a three-fold increase in train traffic in the fall of 2007, I have sincerely tried to find a silver lining in the transaction for the people of Northwest Indiana. After months of fruitless searching and after reading the Draft Environmental Impact Statement, I have to concede there's not one benefit to be found.

There is no economic benefit to the region. The DEIS states that this transaction will result in a loss of 300 jobs in the region. There's no energy and

environmental benefits. The DEIS states that this transaction will not take trucks off the road and result in more burning of fuel and gasoline and diesel. There's no public safety benefit. The DEIS states this transaction will increase the likelihood of a train accident on the EJ&E line by 28 percent, which our area can ill afford.

While the DEIS identifies some major environmental detriments that will result from this acquisition, it in no way provides matching solutions. The Mitigation section of the 9-inch thick, multiple-volume DEIS is a meager 32 pages and is sorely lacking in detail and real relief for the citizens on the EJ&E line.

CN is quick to state that taxpayers should foot the bill for any necessary mitigation. The taxpayers should not be held financially responsible for mitigation expenses, which in this transaction could be in the hundreds of

millions of dollars.

So as it currently stands, this transaction will have absolutely no positive impacts on the communities on the EJ&E, and we are expected to merely accept that our lives will be dramatically altered for no reason other than it is good for CN's bottom line.

Congressman Visclosky urges the SEA to strengthen the DEIS and impose mitigation conditions on CN that will ensure the quality of life for Northwest Indiana.

In addition, the Congressman requests the SEA to hold an additional hearing in Northwest Indiana and to extend the public comment period an additional 30 days to allow the residents of the region ample opportunity to express their concerns with the impact of this transaction.

To that end, I would like to submit a letter from myself, Senator Lugar, Senator Bayh, Governor Daniels requesting that the STB take these actions. Congressman looks forward to continuing to

work with community leaders in Indiana to hopefully prevent this transaction from occurring and, at the very least, alleviated the burden the affected communities bear.

Thank you again for the opportunity to share my remarks on this very important matter.

MS. TARCZAN: Ann Valentine, Senator Karen Tallian, Mike Mohan. And let me ask everybody to please be sure to state your name, the office that you represent, or the city that you're from. Thank you.

MS. VALENTINE: I'm Ann Valentine,

Policy Director for Transportation with the Office of Indiana Governor Mitch Daniels. The following is the statement of Indiana Governor Mitch Daniels: Thank you for the opportunity to provide comments, and thank you to Congressman Visclosky for his leadership and engagement with the local community on this issue.

As the "Crossroads of America," Indiana has a particular interest in ensuring adequate infrastructure to maintain a vibrant economy. For transportation -- and specifically rail -- this means balancing the need to move people and freight safely and rapidly while ensuring Hoosiers have safe and livable communities.

First, despite the enormous concern about this transaction (unprecedented according to the Surface Transportation Board staff) and its significant impact on Northwest Indiana, I am disappointed the Surface Transportation

Joliet & Eastern Railroad has a significant impact on Northwest Indiana. While the majority of the rail crossings in this transaction are in Illinois, virtually all of the rail traffic will run through Northwest Indiana. Communities such as Griffith, Dyer, and East Chicago will see more trains more frequently and will experience longer delays at crossings. Economic development projects such as the expansion of the Gary Airport and extension of the South Shore Line are also impacted by this transaction.

After reviewing the STB's Draft Environmental Impact Statement, too many questions are left unanswered and significant safety and congestion concerns remain. This morning, I submitted detailed written comments on this matter to the STB. Chief among my concerns is that the DEIS

will rest entirely on affected communities and the State of Indiana.

This is not acceptable to the citizens and communities of Northwest Indiana, nor is it acceptable to me. I commit the expertise and service of the Indiana Department of Transportation to serve as a resource for CN and local communities as they determine appropriate safety improvement measures and congestion mitigation. I ask the STB to require CN to commit to mitigate at its own expense the safety and congestion impacts caused by this transaction. Thank you.

MS. TARCZAN: Senator Karen Tallian, Mike Mohan, Stan Hendricks.

Senator Tallian?

MR. MOHAN: My name is Michael Mohan, and I am CN's vice president of service. Thank you for the opportunity to speak this evening about CN's proposed acquisition of the major portion of the EJ&E.

CN is the fifth largest railroad in North America. In addition to our transcontinental operations across Canada, we operate in 16 states in the United States, including Indiana. CN currently has more than 250 employees in Indiana with an annual payroll of nearly $16 million,

and we spend another roughly $22 million annually in the state.

Our proposed acquisition of the major portions of the EJ&E is intended to help address the severe rail congestion plaguing the Chicago and Northwest Indiana regions. This transaction would enable CN to divert most of our trains that currently operate through downtown Chicago onto the underutilized EJ&E line. By doing so, this transaction would streamline CN's

operations while also providing a privately funded, partial remedy to the costly and inefficient rail congestion in Chicago.

Importantly, roughly 60 communities inside the EJ&E would also benefit from reduced train traffic as a result of the transaction, including the towns of Munster and Highland in Indiana.

In addition, Gary will see millions of dollars in new private investment to upgrade Kirk Yard to a major railcar classification facility. The related employment potential provides new opportunities for Gary and the region.

Finally, since filing our application last year, CN worked closely in

supporting the EJ&E in discussions with the Gary Chicago International Airport and other railroads regarding the airport's expansion plans. Those discussions successfully produced a signed four-party agreement that provides the framework for relocating the EJ&E line so that the airport may fully carry on its plans. Even

though CN was not signatory to the PMU, we will honor the agreement if the transaction is approved.

CN understands the concerns about increased train traffic that have been raised by communities along the EJ&E. CN has been an active participant in the SEA environment review process, and CN had done everything possible to help facilitate this process. CN has also undertaken an extensive community outreach effort with the goal of developing voluntary mitigation agreements with communities along the EJ&E.

My colleague, Eric, and I have met with every community located along the EJ&E line willing to meet with us including Gary, Griffith, Schererville, and Dyer. We have been successful in reaching agreements with other communities like Joliet, and we

have productive discussions ongoing with a number of other communities.

There's no dispute about the transportation benefits of the transaction and the lack of serious competitive issues.

What I want to emphasize this evening is CN's commitment to addressing legitimate environmental concerns related to train traffic increases.

At the same time, we are hopeful that people will recognize the benefits this transaction will bring to the Chicago and Northwest Indiana region generally as an important step to solving the rail congestion that plagues the region and to the more than 60 communities that will see train traffic decreases.

I thank you again for the opportunity to provide CN's perspective on this transaction.

MS. TARCZAN: Stan Hendricks. Fred Millar, Cheryl Satkus.

MR. HENDRICKS: Good evening. My name is Stan Hendricks. My property is located at 1832 Hart Street in Dyer, Indiana.

I've corresponded with this body on several occasions, and I appreciate the opportunity to voice my concern here.

I previously documented some of this information as it appears in the Draft Environmental Impact Statement, and I am here today to state why I feel that statement is flawed.

At the January 16th meeting, I spoke with someone who identified himself as an employee of the HDR Engineering firm. At that time, I verbally granted him access to my property for the purpose of placing vibration and noise-monitoring equipment. The person took my name and address. I was led to believe that this would be done.

Upon reviewing the Draft Environmental Impact Statement, I found that the monitoring equipment was placed nowhere near my building. My building sits

32

10 feet from the center of the rail line, not 200 feet as indicated by the Draft Impact Environmental Statement.

As mentioned in my original documentation, not only is there a major concern with noise and vibration levels but there's added concern with safety. Derailment, which causes an accordion effect, or cars being knocked into my building is a real and serious concern.

The increase in rail traffic will not only negatively impact my building but will also negatively impact the ten people that work at the two companies that occupy that space.

Noise, vibration, and safety are three major issues which should have been addressed in the Draft Impact Statement at the Hart Street location, but they were not. These concerns, and I'm sure there are others, bring into question the reliability and validity of the statement.

Also in recent litigation, it's been found that local governments do not

33

have authority over problems resulting in this type of infrastructure. Only the federal government can take the best interests of individuals such as myself into concern.

Therefore, I would ask that the Surface Transportation Board review the Draft Impact Statement for its validity and deny the Canadian National proposed purchase EJ&E rail line. Thank you.

MS. TARCZAN: Fred Millar, Cheryl Satkus, George Van Til. Fred Millar? Cheryl Satkus.

34

MS. SATKUS: Hi. My name is Cheryl Satkus, and I live at 330 North

Indiana Street in Griffith, Indiana.

I've lived at 330 North Indiana for 23 years. Across the street from my home is Tot Park. Tot, that's T O T, as in kiddie park. For 23 years I've watched small children play in that park. I've seen parents push their little ones in baby swings and watched kids play on the teeter-totters.

Currently, on some afternoons, you can see four-year-olds practicing soccer. Kids of all ages, and older kids too, play basketball at the basketball court there. And I've seen senior citizens come and go at the senior citizen center located just north of the basketball court.

On the other side of the park is the set of EJ&E Railroad tracks. And for 23 years, I've watched as the EJ&E hauled, and continues to haul, all kinds of hazardous materials along these tracks. Just last night at 8:20 p.m. two trains

35

hauling various materials came rolling by at a pretty fast clip -- so fast I could barely read the placards.

I'd like to comment on just two of those hazardous materials that were on

those trains last night. Chlorine, according to the 2008 Emergency Response Guidebook, is placarded at 1017 and is toxic and may be fatal if inhaled. According to this Guidebook, "if tank, rail car, or tank truck is involved in a fire, consider initial evacuation for one-half mile radius."

Butane was another material I observed last night. Butane is placarded as 1075 and has a red placard to indicate a fire hazard. Butane is extremely flammable and can be easily ignited by heat or flames. Evacuation in this case would be a one-mile radius.

Members of the STB, the town of Griffith has a volunteer fire department and is already unprepared to appropriately respond to an incident from a leak or spill

36

or derailment. Now the Canadian National Railroad wants to increase these hazards that are rolling past our parks, our children, and our senior citizens by four times what we already can't handle. With your permission, Canadian National will increase the chances of an incident at Tot Park by 30 percent.

That's -- Please do what's right and moral and deny the Canadian National requests to bring even more hazards and poisons through our residential communities and past our kids. Thank you.

MS. ADAMS: George Van Till. Stan Dobosz. Karen Kroczek.

MR. VAN TIL: My name is George Van Til. I'm a Lake County surveyor. My job involves dealing with quality of life issues for the people of Lake County. But what I'm here for tonight is the fact that my people, my family have been in the area that we're talking about, in the affected area, for more than 100 years and myself more than 50.

I found out tonight earlier that the railroad tracks that I live several

hundred feet away from are going to lose traffic, maybe down to only two or three trains a day. But I don't care. I'm still here because I totally, totally oppose this because of the quality of life that we're talking about.

The booklet says -- the STB says this is a minor transaction. Not for us it's not. Not for tens of thousands of people.

I go to work every day like so many thousands and tens of thousands of people do or come back. That will be

absolutely affected by this. Our recreation, our socialization, so many things will be affected by it.

You talk about the environment. Well, there is a lot of things that have been brought up here. Noise. Air pollution. Safety. What about the wasted time?

We're talking about going from eight or ten trains a day to 28 or 30 or more. That's an incredible amount. It's difficult now. The way that I travel and all the people in the west middle part of the county, we all the time are held up by

trains. I just cannot imagine how bad it will be.

I asked somebody out there before we came here, I said, tell me what positive benefit that can have for our area. And nobody out there could tell me that because there just isn't.

It's going to degrade our property values and our quality of life. There's no question about that.

It's just north and south is enough split up the way it is. You know, I was thinking, and you might -- think about this. Our steel mills are now owned out of England. Our tollway, Spain, Australia. Even our beer, by Belgium. And now we're talking about our good friends in Canada. It's not so much that they're foreign countries, but the farther away that you are from where we are here locally, the more you care about the profit margin instead of the quality of life. It's just human nature.

I beg you. The quality of life that we're talking about is something that would change dramatically, change traumatically in our area.

I believe this is one of the biggest threats that I have ever seen as a citizen or as an elected official for the west middle part of our county. I'm very worried about it. Please stop.

MS. ADAMS: Stan Dobosz. Karen Kroczek. B. Jackson.

MR. DOBOSZ: My name is Stan Dobosz. And I'm a councilman in the town of Griffith. We have filed our comments with the board many months ago, so we need the concerns of our public to be heard.

Also I'd like to thank the STB for rejecting the Canadian National requests to approve pending acquisition of the EJ&E before completing the environmental review process which is required by the National Environmental Policy Act.

Yesterday I was in Washington, D.C., and attended a hearing by the committee on transportation and infrastructure chaired by Chairman James Oberstar. They were hearing testimony on HR 6707 which is taking responsible action for community safety acts. The bill is sponsored also by Pete Visclosky.

The bill requires the STB to reject proposed acquisition if it finds the transactions have adverse impact on affected communities that outweigh the

transportation benefits of the transaction.

What I see now is that they're moving one problem to another problem without a solution.

With the proposed sale, the increased traffic, it appears the town of Griffith will be the most severely impacted community in Northwest Indiana going from nine trains a day to 38.

There are no economic benefits for the town of Griffith with this increased train traffic. The transaction would have an adverse effect on property values.

The environmental impact, noise, vibration, whistle blowing, air quality will be disruptive to those neighborhoods. A derailment would be catastrophic for those residents.

Trains reported to be 8,000 feet long would cut our town in two. In an emergency, the delay response time would double for police and fire department and

ambulance service with the total of these

trains coming from this area.

All three fire stations and police stations in the town of Griffith are located on the west side the tracks. If the crossings are blocked, response time could double.

The town of Griffith to protect their citizens would need to consider building a fire station on the east side of town, hire addition police to cover that side of town, a solution that we cannot afford.

The Broad Street crossing is a major north-south thoroughfare with 25,000 vehicles daily. It has been singled out by the transportation board that it will be seriously impacted by the proposed sale.

Delays at the Broad Street crossing will only aggravate a bad situation adding to a serious air quality situation, causing additional traffic problems for our downtown area which we're trying to revitalize.

Thank you for your time.

MS. ADAMS: Karen Kroczek. B. Jackson. Anne D. Collins.

MS. KROCZEK: Hello. My name is

Karen Kroczek. I'm from Munster, Indiana. I want to thank you for hosting this public hearing and for refusing to approve sale prior to the DEIS report.

I would like first and foremost to say that the human cost does not seem to be reflected in the DEIS report. And I'd like to see more attention paid to the issues of health as a consequence of increased diesel fuel and time spent waiting for the trains. We are going to have health impacts. And I think that that is a very tangible cost which needs to be measured in some positive sense.

Newspapers and periodicals now are talking more about incidents of chronic bronchial problems, cancer, et cetera, in areas on the east and west coast where we've had increased amounts of transportation. That needs to be measured and we need to gauge that down the line somewhere.

We live in cancer alley. From

Joliet through Gary, Indiana, there are higher rates of chronic and awful diseases like cancer than there are in the rest of the state. In our area, we already suffer

from industrial pollution. This is just another nail in our coffin.

I also feel that the hazardous material question needs to be considered very carefully since Canadian National does not have the best track record on that. I understand that they have a lawsuit against them right now in Canada for some area that they have not cleaned up after a hazardous spill. As Mr. Dobosz mentioned, that would be a tragedy in Griffith especially since emergency vehicle response times would be problematic.

Second, I want to emphasize this plan pits one northwestern Indiana community against another. This area is trying to recover from some very serious economic problems over the last 20 years. We need the network opportunity that were envisioned in the Marquette plan and the

Northwest Indiana Regional Planning Council.

This plan works against both of those opportunities. If this area is to thrive, we must work together to create a better economy, not be at loggerheads to snare a few jobs in Gary.

The motley crew of people that are supporting this from Mitch Daniels to Visclosky and Dick Durbin suggest that generally speaking we see no benefit to this program for Northwest Indiana and we really appreciate it if you would at least expand the number of meetings and the amount of time to study the problem.

Thank you very much.

MS. ADAMS: B. Jackson. Anne D. Collins. Steven Kramer.

B. Jackson. Anne D. Collins.

MS. COLLINS: Good evening. I came tonight to point out something that's been a problem in my town and I've learned a lot which I appreciate very much both from the presentation that you have made and from the information provided by Canadian National.

I was inspired to come because I had a problem in Merrillville for the last five years. I do live in Merrillville by

the way. When I go north, we have to go across the Canadian National tracks.

For five years, they were in the most deplorable condition. At times, you had a half mile at least back waiting to cross the tracks because the tracks were in such terrible condition, you had to just ease yourself across.

Merrillville schools, the Merrillville town, the Merrillville fire department and citizens begged for relief. Most of the time when we call the number we found for that, we had a busy signal or just a response that we will look into

that.

And I'm not kidding about the condition of the tracks. They were just absolutely horrible. And I'm not joking about easing across.

We run 78 school busses across that track every day. Some of our schools are on the north side of town and they have to cross those tracks. And needless to say that required a lot of maintenance.

My feeling on this is that if you have a neighbor who doesn't take care of his property, you don't want him buying

up other property in the neighborhood. And this is -- this is a strong feeling I have about this.

If they couldn't maintain the railroad tracks on 53 and 55 in the town of Merrillville which are our main north-south passages through town and also the evacuation route for the cities of Gary, Griffith and Highland, you cannot expect -- you have doubts about their ability to provide for these many, many more crossings

that they will be responsible for.

And I really do mean I appreciated the information from both groups tonight. It's very helpful. I am still against the acquisition because I think the mediation you were talking about and others have spoken to are something you really need to have an absolute guaranteed writing before you allow any acquisition at all.

There should be no question of who pays for what and what needs to be done.

Thank you very much.

MS. ADAMS: Steven Kramer. Joseph Svetanoff. Joseph Gomeztagle.

MR. KRAMER: Good evening. My name is Steve Kramer. I live in Dyer, Indiana. I live at 1622 Magnolia which is right next to the railroad tracks. And I'm here on behalf of the town of Dyer residents, as a tax payer, as a father. I have four kids that live at my house with my wife. They're 17, 18, 19 and 21.

For Dyer, Indiana, the first thing I found strange was nothing was listed in the documentation that I've seen, nothing was listed out in the hallways on all your pamphlets. I talked to one gentleman and he said it's probably buried very deep. Take a look. Well, I'm tired of Dyer being buried very deep.

We have several unique problems in town that have not been addressed. I cannot believe that no one seen the largest

hospital in the area right at State Line and Route 30 just a block or two away from a major intersection.

It's not listed on your emergency response. Neither is the town's

ChimniakCourtReporting.com
312.781.9111

51

fire department or police department. It is within blocks of three different rail crossings.

The other problem is Route 30 is a major alternative route for 80-94. Whenever there's a problem, all of the traffic and all of the truck traffic is directed down Route 30.

I'm not a lawyer. I'm not a speaker I'm just coming here on behalf of the town residents. Our town which if this proposed rail line is coming through is going to bisect it running east and west. We have one east and west artery. That is Route 30. The other is Lake and Hart Street.

What is unique to it is we have the CSX Rail Line that runs north and south parallel. This line crosses the CN -- proposed CN which is the EJ&E right now. It hauls freight and it also hauls the passenger train Amtrak. We have an Amtrak

station in town. That's not listed.

We have school busses that need

ChimniakCourtReporting.com
312.781.9111

52

to cross there, emergency vehicles. We can't possibly be rail locked where there's no emergency availability, no connection to the hospital, nothing.

I don't understand why these things were not addressed in any of your studies. And I see this yellow card coming, so I'm going to tell you our environmental study that we done. Imagine that table shaking. Imagine those glasses banging back and forth. This is in the middle of the night or all day, early morning. In the middle of your sleep, what we hear is ERRRRRRRRRRRRRRR. Thank you.

MS. ADAMS: Joseph Svetanoff. Joseph Gomeztagle. Judi Schoon.

MR. SVETANOFF: Good evening. My name is Joseph Svetanoff. And I'm an attorney with Austgen, Kuiper and Associates here representing the town of Schererville.

First before I begin, I would like to thank both Edmund Malinowski who is the director of planning and building and Joseph Kruzan who is a fire chief within the town of Schererville for accompanying me here tonight to view everything and to hear all the comments that are coming before you.

For nearly one year, the local news media has reported on the potential acquisition of the Elgin, Joliet and Eastern Railway Company by the Canadian National Railway Corporation.

The Canadian National Railway Corporation has continued to represent to the Surface Transportation Board that it contemplates through this acquisition that there will be improved railway operations, more efficient train movements and the

reduction of congestion with favorable economic and environmental impact upon northwest Indiana.

Moreover, the Canadian National has indicated that there will be no anticipated adverse safety impact concerning the potential increase in train traffic.

The town completely disagrees with the above-mentioned claimed benefits presented by the Canadian National and has consistently raised the following concerns regarding this acquisition to the Surface Transportation Board which are as follows: The increase in train traffic upon the safety of the citizens within the town of Schererville. The impact and delay upon transportation systems specifically concerning our most important emergency responders. The increase of noise and vibration. The increase of air pollution. The increase of hazardous waste transport.

And mitigation steps requested of Canadian National Railway by the town

are namely a grade separation of Kennedy Avenue, acquiring a train location

monitoring system for the town and creating a new quiet zone corridor for the 213th Street crossing.

Furthermore, Schererville town officials along with their attorneys have identified definite impacts which will occur affecting the quality of life of the town resident citizens based upon the above-mentioned concerns.

Moreover, the town council has passed two town council resolutions and collected approximately 6,352 signatures of citizens in and around the town which have opposed this acquisition and its negative effects.

Additionally, the town while voicing its concerns directly to the Canadian National has never been approached, contacted or presented any type of mutually-acceptable agreement which was encouraged by the Surface Transportation Board within the DEIS.

In closing, we encourage the Surface Transportation Board to review our environmental response and attached exhibits. Thank you.

MS. ADAMS: Joseph Gomeztagle. Judi

Schoon. Dennis Ruthrauff.

MR. GOMEZTAGLE: Thank you very much for --

MS. ADAMS: Please state your name.

MR. GOMEZTAGLE: Joe Gomeztagle. Just today, September the 10th, a local newspaper announced that Lear, a plant located in Hammond will lay off approximately 121 workers. That's due

November the 3rd.

Several months prior to that, Union Tank located in East Chicago closed its plant laying off approximately 400 employees.

Canadian National Railroad Company provides Lake County with an opportunity we have all been waiting for. The opportunity. On October 30th, we all know that Canadian National Railway Company and Grand Trunk filed application with Surface Transportation which is STB seeking the board's approval to acquire control of the EJ&E.

On July 23rd, STB provided a draft of the environmental impact statement

which is the EIS.

This potential purchase provided Northwest Indiana with an opportunity to first understand what is EIS study. How it affects not only one community in regards to jobs but how it enhances our quality of life. We must learn to collaborate and cooperate, to mediate issues in an effective and efficient method.

America and Indiana is faced with a global economy, a competitive

market. Location, location, location is the most important element in real estate.

Northwest Indiana is in a pivotal position because of its location. We must understand rights and responsibilities to our communities.

To be competitive and provide a future for our children and capitalize on this opportunity, we must make an effort to understand our rights and responsibilities associated with them. We can relate to our rights the right to speak, the right to live in any way we want and the right to

vote. But all too often we forget about our responsibilities.

In this case, our responsibility is to be well informed about EIS, to participate in a dialogue, not discussion. I often see discussions as concussions. To listen and learn about issues that bring an opportunity to the community. A big part of this communication -- a big part of this. Communication. It's important in order to achieve our goal. Complaining does not work as a strategy. We have to work as a community.

Northwest Indiana has an

opportunity to provide awareness about the possibilities that are before us. Thank you very much.

MS. ADAMS: Judi Schoon. Dennis Ruthrauff. Ron Bartnicki.

MS. SCHOON: Hi. My name is Judi Schoon. I live at 304 North Wiggins, Indiana -- Griffith, Indiana. I'd like to thank the board today for giving me the opportunity to speak to you.

After listening to the comments out there and listening to the boards and seeing all the maps and everything, I felt compelled that I really needed to get my comments out to you today.

I come to you today as a concerned mom. I live on Lake Street in Griffith. That is -- you literally -- if these tracks go through, they will literally separate us from the community that we live in.

When I bought my house, we spent

a great deal of time researching the communities, the emergency services and everything that each community had to offer to us. Because at that time I had one child with insulin-dependent diabetes, so making sure that I had emergency services close to me was probably one of the most

important things that I asked for. And the schools. We researched all of this.

If you put those railroad tracks between us, that's going to separate us from the schools, from the emergency services, from everything else.

Shortly after we moved into our house, our second child got insulin-dependent diabetes. Now the emergency services became so vital it was ridiculous.

Shortly after that, our third child then developed juvenile diabetes. Now emergency services are so vital, it's unbelievable.

You asked today when the comments were made what have we missed, what can we do to make this better. The one thing that you missed is how are the emergency services going to get from on

that side of those railroad tracks to on my side. How is my children going to be protected. How are the children that are playing in Tot Park, how are they going to

be protected.

I have literally witnessed where the police officers have had to take children out from underneath the trains that were stopped on those tracks waiting to get in to exchange. These children get bored. They're kids. They're going to play. They literally pulled them from out underneath those trains that are sitting on those tracks. That is not safe.

I disagree. I think our fire department is an extremely, extremely good fire department. But if you separate us from those -- from that fire department, how are our firemen on this side of the tracks supposed to get to those fire stations that are on that side of the tracks. They can't. You're literally dividing our town.

I agree with Congressman Visclosky. This will dramatically affect our lives for no important reason. I beg you today as the board please deny this

petition. Thank you very much.

MS. ADAMS: Dennis Ruthrauff. Ron Bartnicki. Joreen Decker.

MR. RUTHRAUFF: Hello. My name is Dennis Ruthrauff. I live in Schererville, Indiana. My home is located at the Auburn Meadow subdivision at Janice Drive and Deer Creek Drive. This is one quarter mile south of the EJ&E Railroad Line. The only area between my home and the railroad tracks is a wild life area and wetlands.

Since 2002, the train traffic on EJ&E Line has already increased by four times the amount of trains. The noise and vibrations and horn blowing are already a very big nuisance, not to mention the safety issues and the hazardous material concerns.

I cannot imagine these amounts being quadrupled again. The EJ&E make up their trains on this line all day and all night with banging noise and horn blowing.

For these reasons alone, I am against the acquisition of the EJ&E and Canadian National railroad. Please deny this acquisition. Thank you.

MS. ADAMS: Ron Bartnicki. Joreen

Decker. Carolyn Marsh.

MR. BARTNICKI: I'm Ron Bartnicki. I'm the president of the Emergency Medical Services Board of Control for Griffith. I have been in that position for almost 15

years. And never have I come across a more vexing and important issue than this. And like Cheryl Satkus and Judi Schoon before me, I'd like to represent not only the Board of Control's concern but also citizens of Griffith.

There are many issues that I think would affect Griffith if this acquisition went through. Environmental issue would be the No. 1 concern on my part. It would have a critical impact on the emergency ambulance services for Griffith.

Right now currently we only have one dedicated ambulance in our town at any one time. An ambulance is there 7 11. If an ambulance is stopped by a 200-car train, it will entail a delay to get a back-up ambulance from elsewhere to the scene on the other side of the tracks.

Prompt Ambulance has even said that if we wanted to purchase or contract another second ambulance, and it wouldn't be justified because of the volume of calls that we have, it would cost up to $400,000 a year for that second dedicated ambulance in our town.

Now our current contract with our emergency services provider is good for nine more years. It stipulates that Prompt will average less than four minutes for emergency calls to the scene for every month.

This will become impossible in some critical situations if there's a 200-car train going by. And when a patient that needs advanced life support, a heart patient comes and needs help, that ambulance is going to be delayed extra minutes. For every minute that that ambulance is delayed, that person has a 10 percent less chance of survival.

Even though we do not have the call volume to justify that contracting an

additional ambulance in our town, we would be forced to actually renegotiate our contract and add an ambulance at that cost that I mentioned. And still have to remove response time criteria in the contract which is currently at less than four minutes average per month.

Now, the second issue is quality. I know I'm getting -- my time is short, but it will literally cut our town

in half. It will have -- it will increase the noise and vibration by six times because the proposal is for three times the number of trains and they would be double the length.

Safety has been covered substantially by others.

Thank you for the opportunity to express these issues.

MS. ADAMS: Joreen Decker. Carolyn Marsh. Leonard Tomaszewski.

MS. DECKER: Hello. My name is Joreen Decker. And I'm here -- I'd sort of like to represent the south side of town near the South Park. That would definitely be very negatively impacted.

I remember as a child going to Franklin School, and once in a while you'd get held up. And I know there's high school students, the bus comes down there a lot and students I believe probably still walk to Franklin over there. And I just remember being late. A few times you couldn't wait -- back in the days of the

caboose, you couldn't wait to see it because a lot of times it would be quite long.

And I would -- also as everybody has stated today that not only would you have delays for school and work but also for emergencies which would be quite frightening in a lot of situations.

The noise factor of course would be unbearable at that amount of trains being quadrupled like that. I'd hate to

see that. I'd be concerned about like senior citizens and people like that.

Another thing I haven't heard brought up but that I would also be a little frightened of is maybe the possibility of more fatal accidents. As a person, a member of the family -- a member of my family that was killed by a train many years before I was born, but a possibility would definitely increase with having that amount of train traffic. And I certainly wouldn't want another family to have to go through that.

Basically it's just a matter of noise and also environment. I'm sure there would be some kind of pollution coming with

that. And I'm sure that's why most of us are here because we don't want to see, you know, this mass increase in the train traffic.

You know, you'd probably have people maybe trying to go around the train tracks or something like that that of course none of us would like to see. They

might also try to go through other towns or something like that. And I just don't think any of us really want to see this great increase in the amount of train traffic going through our town.

I think it would have nothing but a negative impact and it sounds like they're basically trying to divert the traffic from maybe the Chicago area to Griffith. And I just don't want to see that.

As somebody that grew up around there, went to school there, I just don't want to see that happen to the town. Thank you.

MS. ADAMS: Carolyn Marsh. Leonard Tomaszewski. Thomas Frank.

MS. MARSH: Carolyn Marsh. I live in Whiting, Indiana. And there is an EJ&E spur that runs along the lake front into Chicago, 87th Street, US Steel, the old US Steel plant.

Now, this spur is basically inactive, but it is close to four other major rail lines that run along the Indiana shoreline. I live there. I know what vibrations are. I know what noise is because of these four major lines that run through there. There is a lot of hazardous waste already on these existing lines. I'd like to know how much hazardous waste is also coming from these other rail major rail lines.

In regards to the Marquette plan, I'd like to know why this spur along -- it's called the -- I find out it's called the Lake Shore Line, what exactly does Representative Visclosky -- what is his problem with this CN purchase of the

EJ&E, how it conflicts with the Marquette plan because I see the Marquette plan as a

polluter as something degrading our quality of life.

They want to take away our Whiting Park for a marine. And you have to remember, I live next to British Petroleum. I have not heard any politicians concerned about the pollution coming out of British Petroleum as they are concerned about this acquisition. I find there's some hypocrisy going on here when it comes to pollution. But I really would like to know more what Visclosky -- what his objections are that is going to hurt his Marquette plan because his Marquette plan hurts the communities of East Chicago, Gary, Whiting and Hammond, and it encloses and privatizes that lake shore. So I wonder why it is not in the environmental assessment. They pulled it out because they said it's inactive, but I think that there should be an environment assessment if they make a lake shore drive there instead because there are plans to make -- where they want that moved, that EJ&E line moved so they could put a lake

shore drive there so that there is a way of getting to condos and marinas along the shoreline which is going to add pollution to our communities. It threatens our quality of life.

So I think there's another angle here that people have to consider why Visclosky is opposing this acquisition. It's not just about the quality of life as he claims because he's threatening our quality of life in Whiting, Hammond and the shoreline communities.

MS. ADAMS: Leonard Tomaszewski. Thomas Frank.

MR. TOMASZEWSKI: My name is Leonard Tomaszewski. I'm a resident of Gary, Indiana, for 77 years and two months. This is a long history of an EJ&E and US Steel over the years. It was 59 years ago and four months that I began at US steel. It was a good industry to work for. The EJ&E was owned originally by US Steel.

In 1896, my grandfather lived in South Chicago, Illinois, and come to Gary to help build that slip. And I look at this whole situation. My question is economically how many jobs will this produce. I haven't heard that brought up this evening. If this acquisition would go through, I would like to know how many jobs are they going to produce, and good paying jobs in this community.

We look on the lake front like the lady stated coming from Whiting, East Chicago, Gary and so forth. The long-term plan over the next 25 years, this going to be what they call a gambling mecca. Have you folks been in Vegas? You know what

it's all about. The steel mills are going to close down. They're going to sell those

steel mills. And they're going to let them go. And they're going -- people are going to be bidding for them like on the stock market. You are going to bid for these jobs.

And the people don't know what's going to go on in this community in the next 25 years. I'll be resting over at Calvary, but my grandchildren and my great grandchildren, I'd like to see them have a quality of life.

And if this is in the interest of jobs and also the people in Griffith, the people in Dyer and so forth, the hospital over there, this all has got to be taken into consideration.

I live two blocks away from the railroad tracks and I time it at night. I sleep during the day. Every 20 minutes a train is going by in 24 hours plus in the day time. And all this rail traffic that they went to the government in the last 20

years and had a subsidy because they're going broke. Now they're making million of dollars and they want to come from Canada and buy into the EJ&E Railroad.

Why is EJ&E selling it and for

what price are they asking for that steel and the railroad. What is that railroad worth to them. What is it worth to the community. What is it worth to the people and the quality of life and the children going to the schools and so forth.

Like the lady said, the children are waiting in anticipation to go to the park and going onto that railroad tracks. They got automated systems where they don't have switchmen anymore. They turn around. They switch those cars from track and another track. And I've seen a number of fatalities because of automation. They took these people and they lost their lives because of that.

So I would ask the board to consider this very seriously as to what is being created here. Is this a monopoly or

is this something of interest for the community as a whole. Thank you.

MS. ADAMS: Thomas Frank.

MR. FRANK: Hello. I'm Thomas Frank from East Chicago, Indiana, and I just want to mention that in the last decade Northwest Indiana suffered from enormous amount of economic depression from the industries that have reaped a lot of benefit for the last hundred years.

The challenge for us in Northwest Indiana is to revitalize the region, retread our economy and that means attracting new types of investment,

residential, retail, commercial, office, et cetera, et cetera.

Right now Northwest Indiana is presently home to one of the densest highest volume corridor of freight in the world actually. And yet Northwest Indiana benefits very little from this. We have criss-crossed with enormous amount of rail lines all the way through the region that stops economic development in those communities.

Presently we're engaged and in the last 10 years have been engaged in an

effort to relocate and consolidate numerous number of rail lines off of at-grade crossings to begin to allow for inner city cores to revitalize. Right now if you go through our inner city cores -- let me give you an example. The CSX line that goes through East Chicago east west presently has I believe 56 trains per day. Now the train purchase of this line going through East Chicago will add an additional 39.

The aggregate number of trains that run through the corridor stops economic development in all different areas. And it's a challenge for us as

we're looking to revitalize the area and rationalize this poorly-designed infrastructure that we presently have and we wouldn't want to have CN be committed to this type of infrastructure before we're able to rationalize it. It is a poorly-designed system at present. And we need to alleviate much of that traffic off of the lake front and off of the inner city communities that are presently negatively

impacted enormously.

I want to thank you for this opportunity. Thank you.

MS. ADAMS: We have no more registered speakers at this time. We invite any additional commenters to register now.

In the meantime, we invite everyone to return to the open house area to review the boards and to ask questions.

The court reporter and at least one member of the Surface Transportation Board will remain here in the public area to receive additional comments from newly-registered speakers should we have any before 9:00 p.m. tonight.

Thank you all for your comments.

Our next public meeting and our final public meeting is in Joliet tomorrow from 4:00 to 9:00 p.m.

(WHEREUPON, the meeting adjourned at 7:13 p.m.)

D.8 Joliet, Illinois

1

SCOPING MEETING FOR THE PROPOSED CANADIAN NATIONAL RAILWAY COMPANY ACQUISITION OF THE ELGIN, JOLIET AND EASTERN RAILWAY COMPANY

PUBLIC MEETING

SEPTEMBER 11, 2008

HOLIDAY INN HOTEL & CONFERENCE CENTER
411 SOUTH LARKIN AVENUE
JOLIET, ILLINOIS

Conducted by:

Heather Tarczan, Meeting Facilitator - MWW Group Public Relations

Phillis Johnson-Ball, Deputy Chief of Staff, The Section of Environmental Analysis - STB

John Morton, Project Manager - HDR Engineering

CHIMNIAK REPORTING & VIDEO

Telephone: 312.781.9111

Reported by: Nicole M. Breytspraak, 084-003835

2

MS. TARCZAN: Thank you for

attending tonight's meeting.

We are here tonight to hear your comments on the Draft Environmental Impact Statement that was released on July 25 regarding Canadian National Railway's proposed acquisition of the EJ&E Railroad.

My name is Heather Tarczan, and I will be facilitating tonight's meeting.

Before we get started, I would like to take this opportunity to review some protocol for tonight's meeting. For starters, I would like to ask everyone to please turn off your cell phones and please refrain from interrupting any speakers or commenters.

In a moment I will introduce those presiding over the meeting and there will be a short presentation on the findings from the Draft Environmental Impact Statement. Immediately following this, we will hear your comments. Each commenter will be given up to three minutes

3

to speak. The time clock will be displayed on the screen and a yellow card will be shown at two minutes and 30 seconds and a red card shown at three minutes. A list of

speakers in the order they will be speaking in will be displayed on the screen. I will call forward the next two speakers in line after the speaker so that we may be as efficient as possible.

If you are interested in speaking and haven't registered yet, please proceed to the registration table or see a staff member who can assist you. Alternatively, included in the program you received tonight, you may submit comments to the Surface Transportation Board through a toll-free number, website, or mailing address. There are also comment forms and drop boxes as well as court reporters located in the open house area. Please recognize that all methods of comments received by September 30th will be taken into consideration and weighed equally.

Tonight we are here to listen to

4

your comments on the Draft EIS. This is not a question-and-answer session, though we invite you to return to the open house area if you have any questions or you'd like to provide your comments in a more private setting with a court reporter there.

We appreciate your courtesy as we work to create an environment where everyone can be heard. If you disagree with a speaker, we ask that you not express your disagreement out loud. Likewise, please note that applause for speakers during his or her remarks gives that person less time to speak and, ultimately, limits the time for everyone else to speak.

In the event anyone is in need of a Spanish translator, please let a staff person know.

If you have any questions, we have a number of staff available to assist you. Again, staff are identified with a name tag and they're located throughout our venue.

5

One quick housekeeping note, in an event of an emergency, exits are located on both sides of the room.

I'd now like to introduce the people with me on stage. Phillis Johnson-Ball, deputy chief of the Section of Environmental Analysis for the Surface Transportation Board. John Morton, team leader supporting the Surface Transportation Board's Section of

Environmental Analysis.

Phillis Johnson-Ball will now make some remarks on the Draft EIS.

MS. JOHNSON-BALL: Good evening, and welcome to our public meeting.

My name is Phillis Johnson-Ball, and I'm with the Board's -- Surface Transportation Board's Section of Environmental Analysis.

I know many of you have concerns about this proposed transaction on the community, and we're here to hear your comments and to record them. This is your opportunity to have your voice heard, so

please take the opportunity to sign up, speak tonight, or to leave us written comments.

I'd like to begin by giving a brief overview of the functions of the Surface Transportation Board. The Board authorizes carrier actions, resolves carrier disputes, conducts rule makings, adjudicates reasonableness of rates, monitors motor carrier activity, and it takes performance action, and, importantly, it provides assistance to the public. I know many of you have contacted our office

well, and what we still need to do. So, please, I ask again, take the opportunity to speak with us tonight or to leave comments.

Responses to our Draft Environmental Impact Statement are due to the Board by September 30th. If you mail in your comments, they must be postmarked

of assistance to ask questions and to receive information.

The Board is composed of three bipartisan members that are appointed by the President. The members are Charles Nottingham, who is our chairman; vice-chairman, Frances Mulvey; and Commissioner, Douglas Buttrey. These are our decision makers.

The Section of Environmental Analysis is the environmental arm of the

Board. We direct the Board's environmental review. We conduct independent analysis of all environmental data. We provide technical advice and recommendations to the Board and assistance to the public and information on the various environmental issues. The Section of Environmental Analysis also ensures that the agency complies with the National Environmental Policy Act or NEPA.

Public participation, which is why we're here tonight, is one of the most critical aspects of the process. This is your opportunity to have your voice heard. This is the time that we want you to tell us what we did well, what we did not so

by September 30th. If you provide them by phone, you can dial -- we have a 1-800 number, 1 (800) 347-0689. You can provide a written comment, again, that has to be postmarked by September 30th; you can email them to the Board; you can speak publicly tonight; or you can speak to one of the court reporters out in the hallways.

I'd like to talk a little bit about the acquisition process, what happens and how does this process get started. First, an application is received by the Board, it's received at the Board by an applicant. The Board then sets a procedural schedule where the Board considers the merits and the environmental issues.

The merits consist of competitive issues, economic issues, and

transportation. In a parallel, the Board considers the environmental impacts of the proposed transaction. So the Board is looking at the transaction from the merits and the environmental process at exactly

the same time. The Board cannot issue a decision until the process for analyzing the merits and the environmental process has been completed.

The Board, after reviewing all of the information from the merits and the environmental process can take three actions. The Board can deny the process, the Board can approve the transaction, or the Board can approve the transaction with conditions on the merits or conditions on the environmental part of it.

The Board -- we've had a lot of comments about the third-party process and exactly who is HDR. The Surface Transportation Board is composed of approximately 150 people, nine of those people work on the environmental staff. So the Board, like other small Federal agencies use the third-party process to assist us in the preparation of our environmental documentation. And in this

particular case, HDR is the Board's third-party contractor. The third-party

10

contractor works under the sole supervision and direction of the Surface Transportation Board. They report directly to the Board on all environmental matters.

John Morton, who is with HDR, will give you an overview of the results of the Draft EIS.

Thank you.

MR. MORTON: Thank you, Phillis.

I'd like to talk a little bit about the Draft EIS and the conclusions of the Draft EIS, but before I do that, I would like to let you know that there is a lot of information in the EIS, and I understand that we're only going to touch on just a little bit of it tonight, I would encourage you to if you have questions, if you want to find out more, we're going to leave the open house portion of it back behind the divider there and those staff members will be back there, they'll be more than happy to answer any questions you might have, either as a result of the presentation that I give or as speakers

11

come up tonight, if there are questions that, you know, occur to you, feel free to go back to the open house portion, look at the maps, and talk to any of the staff members, you know, that are wearing a name tag.

We encourage you to move forward if you can't see the slides, and if you, you know, need to have a better view, we do have seats up front.

CN is the applicant. CN is a major shipper of both domestic and foreign freight. They have five rail lines that converge on the Chicago area. Those rail lines are shown in the dark color on these maps. They operate about 150 miles of rail lines in the Chicago area. EJ&E is a regional rail line. They operate a rail line that covers an arc in the lighter brown color that -- around the City. They also operate two main rail yards, one is East Joliet Rail Yard here in Joliet and the other one is Kirk Yard in Gary, Indiana.

12

CN has indicated three primary purposes for acquiring the EJ&E. The first is to increase the CN's operational flexibility by, essentially, providing a, you know, a continuous rail route around the City by connecting their five rail lines. The second reason is to make Kirk Yard and East Joliet Yard available to their operations, and the third is to develop a more extensive relationship with the various shippers on the EJ&E rail line.

The EIS evaluated a number of resource categories and a number of issues. I'm only going to talk about just a few of them tonight. If you have any questions about remaining issues, anything that I don't talk about, feel free, once again, to talk to anybody with a tag and look at the maps and the information back in the open house section.

The application included a number of changes in rail traffic, and I'll talk about those in a second. They also included six new connections, one, you

13

know, is here in Joliet, and it included 19 miles of a second, you know,

construction of a second parallel track along the existing track, and, once again, a portion of that, you know, runs from East Joliet Yard to Frankfort.

From an operations standpoint, the EIS looked at a number of changes in CN's operating plan. This is a schematic, and I know it's a little difficult to read, but it's a schematic output from the analysis. The lines coming in are the five CN rail lines that we showed on the earlier map. The thick line on the outside is the EJ&E arc around the City. The light blue color is the current number of trains operating on those rail lines today. The thickness of the line indicates the number of trains per day. The darker blue color is the proposed changes from the operating plan. It's pretty easy to see that the major change is they're taking traffic that's operating through the City today and putting it on the EJ&E arc on the outside.

14

They're looking at about 15 to 24 trains a day change.

As a result of the analysis that we did, the EIS concluded that in some sections the EJ&E rail line would be at or

near its practical capacity. The result of that is that it's unlikely that CN would operate more trains or that the traffic levels would be higher than estimated by CN in their operating plan. In addition, one of the conclusions is that Metra's on-time performance can be maintained with effective coordination between CN and Metra.

The EIS evaluated train and roadway safety. On the EJ&E arc because of the increased number of train miles operated on the EJ&E arc, there would be an increased probability of train accidents and an increased probability of highway/rail accidents. Conversely, on the CN Rail Line segments inside the arc, there would be a reduction of train miles and a reduction for the potential for train

accidents and highway/rail accidents.

The EIS identified three road crossings that would see a substantial -- potentially have a substantial increase in accident risk. One of them is Woodruff Road here in Joliet.

The EIS also evaluated passenger rail and hazmat safety. There is no

passenger rail that operates on the EJ&E, but there is passenger rail that operates on the CN Rail Lines where the traffic will go down improving passenger rail safety. The transaction would result in a significant increase in hazardous material transportation on the EJ&E Rail Line.

The EIS also looked at transportation systems. It evaluated 155 at-grade crossings on the CN Rail Line segments inside the arc, and of those, 125 would experience reduction in train traffic. It looked at 112 crossings on the EJ&E, of those, 87, you know, met the Board's criteria for analysis. Of those 87, 15 were considered to be, you know,

substantially affected. The 15 crossings are listed on a board back in the open house section, identified on the map in the open house section. I would encourage you that if you wanted to talk to any -- specifically about any of those, they, you know, talk with one of the staff members back in the open house section.

The EIS also looked at air quality findings. Because of the longer rail route used in the EJ&E, there would be

an increase in fuel use, but because of the more free-flowing aspects of it, it would be more efficient and there would be less idling time for locomotives; therefore, the conclusion was that the air emission changes in 2015 would not exceed current regulations or jeopardize the region's air quality compliance.

The EIS also looked at emergency response and emergency response providers and identified 11, you know, emergency service providers that would be affected. There's nine fire stations and two

hospitals that the EIS identified. Once again, those are listed specifically on a board back in the open house section and identified on the maps.

The EIS looked at noise. There would be about 3,000 homes/residences that would be within the 65 dba contour as a result of the transaction. On the EJ&E Rail Line there would be about 2700 on the CN Rail Line segments inside the arc where you would have a reduced noise level. In addition, the one quiet zone, the Barrington area quiet zone, without mitigation would lose its quiet zone status

because of the increased freight activity.

The EIS also identified a number of mitigation measures to offset the impacts identified. The applicant, CN, provided a list, 76 voluntary mitigation measures. Those are identified -- I'm sorry -- identified in the -- by topic there. We -- they are listed in the executive summary of the EIS and they're also listed in Chapter 6 of the EIS if you

wanted to look at any one of those 76. In addition to that and on top of the 76, SEA identified 72 mitigation measures, and, once again, we identified the specific resource category of those 72 measures.

Finally, I, once again, reiterate that there are a number of ways to file comments, and I encourage you to use all of those methods for filing comments.

Thank you.

Heather?

MS. TARCZAN: We will now begin the comment portion of our meeting. Let me remind you that we will adhere to the three-minute rule, which begins as soon as you start speaking. If three minutes is not enough time for you, please feel free to speak with the court reporter in the open-house area to complete your remarks. We also invite you to leave your full, written comments with the court reporter located in the front of the stage.

To be fair and consistent, if you speak beyond the three minutes, I will begin to announce the next speakers.

I would now like to ask that the first speaker, Margie Almanza, please come to the microphone. Margie will be followed by George L. Cutright, Jr., and Lee Ann Goodson. Each commenter should begin by stating their name and who you represent or

the town you are from.

MS. ALMANZA: My name is Margie Almanza, and I am here representing Congressman Jerry Weller. Congressman Weller regrets that he is unable to attend tonight but would just like to offer the following comments: He believes that events like these give representatives and other bodies a sense of public opinion on an issue, and the proposed acquisition of the EJ&E railroad is no different.

He understands that there are many concerns by members of the public that this proposed deal will have, the end result of which will undoubtedly be substantially increased train traffic, and, with it, an increase in traffic gridlock, noise pollution, and a decrease in the overall quality of life for the people living along the EJ&E railroad.

He is also concerned with the unknown environmental risks of this deal. He believes we cannot be too careful in protecting our environment for future

generations.

His desire is for Canadian National to spend quality time with each community affected by their proposal to learn of their negative impacts, and he urges the Surface Transportation Board to be extremely thorough in their review of this deal so that no problem is left on the doorsteps of our communities or our future generations. Thank you.

MS. TARCZAN: Thank you. Again, I would like to ask each speaker who is next in line to please form a line behind each microphone.

George L. Cutright, Jr., Lee Ann Goodson, Alex Harris. Mr. Cutright.

MR. CUTRIGHT: Yes. Good evening. My name is George Cutright, Jr. I appreciate the opportunity to come here tonight and voice my comments.

I have an entire folder here of pros and cons concerning this proposed acquisition. There is much talk about two-mile trains, several other things, who is going to pay for it, much conflict about how this should be done. There are some statements that are being made that, you know, the people who wish to have this go through have not been able to have their voices heard as well, and I'm hopeful that is not the case. I'm hopeful they, too, will be able to speak their side.

I will not take up time or anyone else's possible subject matter, being the second one called, and will speak strictly about the event of September 7th where the Surface Transportation Board was able to explain to Canadian National that they would not agree to go ahead with a final decision without the full impact of

the environmental study to be made

available to the board. I fully agree with that. I'm not talking tonight about the economics. I'm talking about the environment. I live next to a federally protected wetlands. I currently have frogs in my backyard. There's a lot of things that are causing this. The train track is right there. There's been encroachment of -- there's been some people moving in the subdivision.

I am an advocate for the environment. I know that if this goes through, one man says you will lose -- 100,000 homes will lose value. That would be a very difficult thing. I have been in my home for 21 years; but, at the same time, I understand that hopefully some kind of a provision can be made, if it does go through, that enough mitigation is done so that the effects to the environment are actually taken care of.

I do know that Canadian National is an organization that is in the

transportation stocks and is making good money. Their largest shareholder is Bill Gates. I'm not -- I thought he was more interested in the environment.

I am, again, encouraged that we will -- everyone will be able to be heard and that other people other than just myself will talk about the environmental impact. Thank you.

MS. TARCZAN: Lee Ann Goodson, Alex Harris, Eric Jakubowski.

MS. GOODSON: My name is Lee Ann Goodson. I serve as legislative coordinator for House Republican Leader Tom Cross, and I am elected to the Will County Board and serve as a commissioner for the Forest Preserve District of Will County.

My comments will be submitted in

greater detail in a letter from Representative Cross and myself, but I would like to thank you, thank the STB, for taking the time to conduct these hearings. I appreciate your recognition that this is a transaction of major concern for all of the citizens as well as the local county, state, and federal elected officials of this region.

Historically, the rail industry seems to have been given a pass on transparency all in the name of protecting information from competitors.

Now, the price of fuel in the U.S. is rapidly rising, with little relief in sight. As our federal elected officials search for alternative sources of energy,

the demand for cost-efficient methods of transport to transport good across the country has revived the rail industry. Projections show a growing demand for rail transport for the foreseeable future. With that increase in demand on rail services comes greater responsibility to all railroads and the STB to address the big picture.

CN's proposal to redirect some

trains from the densely populated suburbs of Chicago to the densely populated region of the collar counties is short-sighted. Shifting the burden of rail congestion from one community to another falls short of a real long-term solution.

This transaction benefits CN and their customers with faster service and delivery while increasing their bottom line, but it places a major burden on the backs of taxpayers unless CN is responsible for the challenges they create.

The DEIS fails to address the indirect and cumulative impacts of this

transaction, nor does it hold anyone liable for proper mitigation. Communities are encouraged to work with CN, yet CN has stated publicly and privately they will do only what is required of them and will not invest more than the customary 5 to 10 percent of the acquisition.

Costs for mitigation are estimated at several million dollars. CN has been quoted as saying we will have to look to our state and federal government for funds to mitigate. We all know, we are all well-aware of the financial status of

our state and federal government.

While we scramble to get costs and figures to substantiate our concerns, the DEIS provides for just three years of oversight following approval of this transaction. With all of the state and federal mandates on road projects, three years is barely enough time to conduct Phase I and Phase II engineering to split grade crossings.

The application is for the

purchase of approximately 198 miles of track with the capacity to hold two or more rails beside it. After three years of oversight, CN is free to develop these beds as they see fit.

I would encourage a minimum of 5, 10 years or even longer of the STB oversight. While this is not a common practice and demand, the rail transportation -- the demand for rail transportation necessitates the change.

House Republican Leader and I stand as opposed to this transaction and urge the STB to deny its approval without a long-term solution that can be found to mitigate the problems it creates.

MS. TARCZAN: Alex Harris, Eric Jakubowski, James Moustis.

MR. HARRIS: Thank you very much. Alex Harris, the village administrator for the Village of Plainfield, here on behalf of Mayor Waldorf, our trustees, and the 38,000 residents of the Village of Plainfield.

One, we want to thank the STB for coming back to Will County, HDR for their explanation this evening, and encourage you to visit the Village of Plainfield and sit down with us to understand the issues that we will address here this evening.

We were asked to summarize our comments, and we will submit from our Mayor Waldorf formal engineering and concerns regarding traffic counts; but tonight we wanted to, first, highlight the Village of Plainfield, talk about planning and then

the quality-of-life issues.

First, the Village of Plainfield is the oldest as well as the fastest growing community here in Will County. The Village of Plainfield was actually here

prior to the railroad, and it's something that we are very proud about. The fastest growing portion is something that we sincerely hope that the Surface Transportation Board takes a closer look at than just current projections that they have in the draft EIS.

To that end, we want to highlight planning. The Village of Plainfield has its future land-use plan as well as comprehensive plan approved, nearly ten years of how our community will grow. This does not incorporate the current transaction for Canadian National. As a matter of fact, we have looked at rail as recently as this year and addressed how we would handle future growth of rail but not to the degree that Canadian National is looking to represent.

Secondly, the county that we are in, Will County, actually has a transportation plan going out to 2030. In

that, they have not accounted for the Canadian National growth along the EJ&E

and, again, a great concern to us.

Finally, the State that actually has Route 30, Route 59, Route 126, as well as I-55 all through the Village of Plainfield that has not only its five-year plan but its engineering plan in place, all of that we strongly encourage the Surface Transportation Board and its consultants to take a closer look and make sure that, indeed, you are representing the good planning that has happened in this region and how best we address that with the current transaction.

Finally, quality of life. Two quick stories: We had a fire recently in the Village of Plainfield and our fire district, something that's completely separate as a taxing body, could not get to the house because of existing rail.

Then, secondly, we have one of the largest school districts, the fifth largest in the state, and with their 400 buses we feel that is a grave concern of getting kids to school on time and safely.

32

Finally, all of this comes together with H.R. 6707. All of the legislators in this area as well as across the country are looking very closely, including Chairman Oberstar. We strongly support that you look at the support we see on planning, quality of life for the Village of Plainfield and our region. Thank you.

MS. TARCZAN: Eric Jakubowski, James Moustis, Lawrence Walsh.

33

MR. JAKUBOWSKI: Good evening. I am Eric Jakubowski. I am a director with the CN. Thank you for the opportunity to present CN's perspective on the draft EIS.

This evening I would like to focus on CN's commitment to the environmental review process and our efforts with communities along the EJ&E line to reach voluntary mitigation agreements.

As you have heard from CN witnesses throughout these hearings on the draft EIS, CN has been taking very seriously the concerns of communities along EJ&E lines related to increased train traffic. We began meeting last fall with municipal leaders and staff and then launched substantial environmental outreach meetings earlier this year in an effort to construct voluntary mitigation agreements that will be responsive to community concerns now and into the future.

After identifying the unique characteristics and environmental concerns

34

of each community, we have explored with them proposals covering a range of issues,

including safety, noise, rail operations, emergency response training, and coordination of emergency communications.

CN is committed to this effort, and the agreement that we have reached in late August with the City of Joliet is evidence of the fact that community concerns related to increased train traffic can be successfully mitigated.

CN is willing to address legitimate environmental concerns with communities willing to work in good faith with us to meet their needs while enabling this transaction to move forward. Our agreement with Joliet resolves the city's outstanding concerns related to quiet zones, operations, and communications surrounding the transaction and does involve significant investment in track improvements and roadway features along the route through Joliet.

CN is actively working with many

35

other communities now, and we believe this will be the first of many voluntary mitigation agreements between CN and communities along the EJ&E.

CN also is fully committed to

completing this transaction. By acquiring the EJ&E, we are seeking to make CN and the rail system more efficient, easing rail congestion in the critical downtown Chicago gateway and making continued use of fuel-efficient, safe, and environmentally friendly freight rail transportation in this region a viable freight transportation option for the business community.

CN wants the most efficient transportation network possible. We understand the desire for a comprehensive congestion-relief solution for the region, such as CREATE, which we support.

Unfortunately, the government's funding for CREATE has not been forthcoming, and even under the most optimistic scenario, it will take many years before CREATE will produce meaningful

36

congestion relief in the region.

CN's proposed acquisition of the EJ&E offers a private-sector solution to some of Chicago's ills. The more efficient rail operation that will result from this transaction, combined with the relief for 60 communities inside the EJ&E arc that will benefit from the reduced train traffic

are important benefits to the region that should not be overlooked. Thank you for this opportunity.

MS. TARCZAN: James Moustis, Lawrence Walsh, Chris Cartwright.

MR. MOUSTIS: I'm Jim Moustis, chairman of the Will County Board and supervisor of Frankfort Township. I would like to thank the Surface Transportation Board for hosting this event this evening.

The discussion to date, much of it has been on the traffic impacts to our communities that would be caused by the acquisition of the EJ&E by Canadian National Railway. Those are the problems the CN has the ability and resources to

solve, and the STB should absolutely require the CN to do so.

The CN purchase will also greatly increase the threat of hazardous material, threats due to potential accidental or incident -- intentional chemical leaks. The STB's own map shows that the CN acquisition of EJ&E will result in a tenfold increase to haz.mat. cargos on the northern half of the EJ&E line, including many communities in Will, DuPage, Cook and Lake Counties and a sevenfold increase to the southern half of the EJ&E

line.

According to the chlorine industry, the gas cloud from one 90-ton chlorine tank can spread out at a lethal level 15 miles downwind by 4 miles wide. The chemical release from even one railcar in an urban area would be an unprecedented toxic gas disaster for any community, whether the release is accidental or intentional, and the risk is unacceptable.

There are existing, alternative railroads that are well around and outside of the metropolitan Chicago area. Under the National Environmental Protection Act,

the STB should have considered these alternatives instead of limiting the choices of routing to the downtown Chicago line or the EJ&E suburban loop. Such alternatives are already used by major railroads in other regions of the country.

The Draft Environmental Impact Statement summarizes the six scenarios haz.mat. -- six serious haz.mat. railcar events that the CN and EJ&E reported in

Chicago from 2003 through 2007, with only a total of 89 people evacuated.

The draft ignores earlier, more serious local chemical railcar releases, and the EIS discusses further haz.mat. release by concluding that they will be minor.

It appears that the STB's basic stance is that the CN purchase merely will transfer the impacts of rail cargos from downtown Chicago to less-populated suburbs while dismissing other alternative routes because they don't give the CN what it desires. Yet, there is no guarantee from the Canadian National Railway, the STB, or anyone else that the EJ&E purchase will benefit the downtown Chicago lines with a

long-term lessening of rail freight, including haz.mat. cargos, or that either the EJ&E communities or Chicago will be at reduced risk from incidents of hazardous materials released.

MS. TARCZAN: Lawrence Walsh, Chris Cartwright, Karyn Robles.

Lawrence Walsh, Chris Cartwright, Karyn Robles, Allen Persons.

Again, I would like to ask everybody to please form a queue behind the microphones. Chris Cartwright.

41

MR. CARTWRIGHT: Yes. My name is Chris Cartwright. I am the local chairman for the International Association of Machinists and Aerospace Workers. I represent the machinists on the EJ&E in Joliet. I can tell you for a fact in the last thirty days, we have had five delays at crossings. We have had one out at 135th Street out in Plainfield. We have had one at Woodruff Road. We have had one at Briggs Street. Briggs Street, I feel, is more critical than Woodruff as far as the impact. We have also had two at Rowell Avenue, right under I-80. That's the way I take to work. I'm stopped there at least five times a month with delayed trains.

The difficulty is with the Rock Crossing there, the trains coming in a lot of times can't make it in; the same with coming out of the yard.

I feel that with the CN's proposal that they are going to put a run-through track, a main line, right

through the center of our yard, and send it

42

straight through up through the Rock and up into Frankfort. I feel this is not feasible. There is no way that they can do this without being affected by the Rock, as well as coming up the steep grade into Frankfort.

Not only does that endanger the lives of the men that work out in the yard, you have car inspectors looking over cars, you have crews switching, you've got a train going 40 miles an hour as they propose, that's quite a distance of speed, and they can't just stop if a guy is right there in the way or, you know, it could cost people's lives.

As well as I think the impact of the jobs in Joliet I don't think has been addressed either. I understand tonight that the CN wasn't aware that there are 11 locomotive department employees that work in Joliet they didn't know existed. They thought they worked out of Kirk yard. We very much live and work in Joliet. We work and live in this area. We will directly be

43

affected by this. That worries me and my family.

The way I understand it, the CN is going to close the Woodcrest shop. That means all those jobs are going to leave Illinois. That does affect the environment as far as the community goes. If we don't have that money here, those people aren't making those decent-wage jobs, all that money goes over to Indiana.

So I strongly suggest you look into the Joliet issue as far as Briggs Street, as well as I live in Sugar Creek. Half my fire district is on the north side of the tracks. We don't have fire hydrants in our neighborhood. Our pump truck is actually on the north side, so if we have a fire, we have to get the pump truck from the north side, you know. This is something to look into, and I appreciate you giving us this opportunity. Thanks.

MS. TARCZAN: Karyn Robles, Allen Persons, Representative Renee Kosel.

44

MS. ROBLES: Thank you. My name is

Karyn Robles. I am the transportation team leader for the City of Naperville. Thank you for letting us speak tonight.

The City of Naperville and other communities along EJ&E are facing serious impacts which will result from the increase in train traffic if the CN is allowed to move forward with this acquisition. There are major issues that need to be considered because of how they will impact the thousands of residents and businesses around the railroad as well as the many drivers who travel across the EJ&E on a daily basis.

In Naperville, we have three major roadways that cross the EJ&E, Diehl Road, Ogden Avenue, and 111th Street, all of which will see a significant increase in the number of train crossings, which will result in serious delays to our residents and businesses who live and work in our community.

In terms of day-to-day life for

45

our residents, if a commuter who is traveling west along Ogden Avenue each day to get to work gets stopped by a train, this proposal would add an additional nine

minutes to their commute.

If the CN is permitted to acquire the railroad, they are anticipating that our train traffic will triple, which means three times as many people will have an additional nine minutes added on to their commute, one way.

In addition to the increase in commuting time that our residents will experience, the traffic delays caused on the main arterial roadways have a direct impact on the traffic on the surrounding streets as well as the residents and businesses located on them.

The draft EIS does talk about how traffic from the at-grade crossings can shift over to existing grade-separated crossings as people try to avoid the delays. However, there is no analysis done to see if the grade-separated crossings

that we currently have can accommodate this shift in traffic.

The adjacent grade-separated crossings have not been designed to accommodate the influx of traffic that we would experience from this acquisition. The solution cannot be that the vehicles will relocate to other roadways with grade-separated crossings, because those roadways are already congested.

The EIS must evaluate how many vehicles it expects to use an alternative route and calculate the impact those shifts will have on those roads and crossings if we are truly to understand the impacts of this acquisition.

Additionally, the methodologies used don't meet the federally established planning policies that look at impacts for the next 20 years, and we would like to see that further out.

A grade-separated crossing at Ogden Avenue will cost at least $55 million to construct, and Canadian National is

saying they will pay for 5 to 10 percent. Where is the rest of that money going to come from?

The state has said that they don't have it, which puts the burden on the municipalities. We feel that the CN should pay at least 50 percent of that cost due to the impacts that we are going to experience.

This proposed acquisition presents some serious consequences for our community, and we would ask the STB to carefully look at these impacts and either deny the acquisition or ensure that proper mitigation is required to minimize those impacts. Thank you for allowing me time to provide my comments.

MS. TARCZAN: Allen Persons, Representative Renee Kosel, Donald E. Bennett.

MR. PERSONS: My name is Allen Persons. I currently serve the Village of Plainfield as the Director of Public Works. I've served in this position for over ten years now.

I would like to thank the Surface Transportation Board for the opportunity to speak on this important issue. The Village's Public Works Department has serious concerns with specific sections of the Draft EIS, and I will outline a few of these concerns tonight, but we'll submit a whole list before the end of the comment period.

The first is the study indicates that the Village's population is 13,038 people. In fact, we are currently over 38,000 people as Administrator Harris had mentioned earlier. This type of error was common throughout the document. The similar incorrect data was utilize to underestimate current and future traffic demands.

Under the mitigation section

that was on the board here earlier, it recognizes that Plainfield's 135th Street at-grade crossing will need mitigation as it's only 605 feet from U.S. Route 30. If you apply the same type of thinking to other intersections or crossings in town, such as Naperville Road, Route 126, they're both within close proximity to Route 59, and the 127th Street railway crossing is only 45 feet from Route 30. We question why the EIS failed to recognize these other intersections and calculate the delays that would be presented. We believe that the EIS is deficient in this area.

Under the Transportation System Analysis Section, we believe that the

traffic data that was utilized is outdated and incorrect. For example, the EIS failed to recognize the significant traffic pattern changes that occurred within a section of our 143rd Street. Recently, the Illinois Department of Transportation redesignated 143rd Street as U.S. Route 30. At that time or at this time the traffic

volumes have more than doubled than the estimated traffic numbers that were in the EIS. Overall, we believe the EIS is deficient in this area currently as well as projected traffic volumes.

We believe that the EIS failed to address the costs that are needed for the associated grade separated crossings that will be needed in the future, and we can all agree that a grade separated crossing is the safest way and the most -- and the least congestive way to alleviate these problems.

Overall, as the EIS has failed to properly address many issues and is deficient in many areas, we recommend that the STB take the necessary time to complete an accurate study on the real impacts the proposed acquisition will have on our

residents in Plainfield.

Thank you.

MS. TARCZAN: On behalf of State Representative Renee Kosel, Roberta Burmeister; Donald E. Bennett; Fred Millar.

MS. BURMEISTER: My name is Roberta Burmeister, and I am Illinois State Representative Renee Kosel's legislative aide in her district office, which represents the 81st Legislative District.

Thank you for the opportunity to comment on behalf of Representative Kosel, who is in Springfield working on budgetary issues for our state.

As she can't be here tonight, she asked me to deliver this message to you on her behalf.

In the introduction it is mentioned that an Environmental Impact Statement must take a hard look at issues. During my brief time to speak tonight, I will comment on two issues that Representative Kosel believes requires a harder work before the final Environmental Impact Statement can be completed.

The Draft Environmental Impact Statement fails to take a hard look at the

source of funding mitigation costs, such as overpasses and underpasses. The Draft

Environmental Impact Statement suggests that the Canadian National Railway should only pay a small portion of these costs and Federal, State, and local governments should pay the majority of the costs.

Recently key Illinois state agencies, the Illinois Department of Transportation and the Illinois Commerce Commission, stated at a Congressional hearing in Chicago that they do not have funds for grade separations along the EJ&E railway tracks in their budget. The Canadian National's public financial statement shows that the company made over $2 billion last year on revenues of 8 billion. The taxpayers of the United States should not help this exceptionally profitable foreign railroad make even higher profits by subsidizing the mitigation that these actions require. Even if it is precedent setting, the STB should require the Canadian National to pay for all mitigation required. Final Environmental Impact Study should

identified the Canadian National Railway as the realistic source for funding mitigation, not the taxpayers of the State of Illinois.

State Representative Kosel is a former school board member. The Draft Environmental Impact Statement does not take a hard look at the needs of school children who will be required to cross the tracks on a daily basis. The Draft EIS does not mention mitigation measures such as restrictions on time of day for freight train operations to avoid conflicts with school bus traffic. The Environmental Impact Statement needs to direct the Canadian National to work with local school districts to avoid operating trains at highway crossings during peak school bus operating hours.

You may not be aware that our community is building a new high school with property that borders the EJ&E tracks. You may not be aware that the majority of growth from the Lincoln-Way High School

District south of the EJ&E tracks and all four high schools are located north of the EJ&E tracks. The disruption caused to educational programs caused by late buses is dramatic. The Final Environmental Impact Study needs to state how this disruption can be avoided.

She wishes you to take a hard look at the issues. Thank you.

MS. TARCZAN: Donald E. Bennett, Fred Millar, Dino Kapadia.

MR. BENNETT: Good evening. My name is Donald Bennett. I'm the Chief of Police

for the Village of Plainfield.

As chief for the last 23 years of the Village of Plainfield, I can assure you firsthand the real impact that this is going to have on our community. Train traffic through Plainfield will have a detrimental effect on the traffic movement that's already gridlocked, which is not being considered in your Environmental Study that interstate I-55 and its access through Illinois 126 will have a tremendous delay. In fact, the CN's proposal of having the trains come through at 30- to 34-minute intervals will not allow the volume of traffic to regroup before the next train comes through. This, in turn, will back up, which it already does with the current EJ&E when it comes through, the traffic on 126 backs up onto Illinois Route 59 causing delays for north and south movement as well as the east and west

movement on the 126. Having the two-mile train will cause tremendous impact. We do not feel we will be able to recuperate during those times.

An additional issue is that the

train when it comes through in the downtown portion will block all five crossings trapping emergency vehicles on one side of the community from getting to the other. Due to geographic restrictions, such as the rookery and other bodies of water, there is no simple way to get around, and, therefore, having this additional delays will you cause undue hardship for the emergency responsive people in the Village of Plainfield without having an above-grade or some other alternative to get over the tracks.

Second, or thirdly, as you're well aware or probably have, the Illinois Commerce Commission deals with train/vehicle collisions, and approximately 40 percent of all train collisions in the State of Illinois occur within the six

county Metro area. Having said that, the psychological makeup of today's drivers are not favorable to patience and calmness when out on the road and do not deal with unexpected delays well.

Rail studies show and indicate that basic signal improvements at traffic grade crossings have limited impact, and

the fact is in the last five years, more frequent reductions are slim due to the fact that 91 percent of the collisions are due to inattentive driving, people going around the rail crossings, disregarding the flashing lights.

I think the Safety Board needs to take this into consideration in dealing with anything with the City of Plainfield.

Thank you.

MS. TARCZAN: Fred Millar, Dino Kapadia, Marcella DeMauro.

Fred Millar. Dino Kapadia.

MR. KAPADIA: My name is Dino Kapadia and I'm from Frankfort.

These are my comments as a retired senior outlining consequences that I've not seen addressed as of yet. Thousands of people could go postal to Canadian National. Here is why. The Surface Transportation Board is structured to only evaluate changes in the surface environment, not the changes that will occur in the mental environment

of thousands of affected commuters who may go berserk. Why? Because after the purchase, repeatedly and unpredictably and due to absolutely no fault of their own, those innocent family supporters who suddenly find themselves living on the wrong side of the EJ&E tracks, such as myself, could be frequently late going to their work. So, like me, they will be written up and warned three times by their employers and them summarily fired.

About the tardiness fallout. Suppose that about 100,000 commuters in the

EJ&E communities drive daily to work. Now suppose that only 10 percent of them face loss of jobs, as I actually do, but that's over 10,000 drivers all the way from Mundelein to Aurora to Northwest, Indiana. Add to those commuters thousands of unfortunate rail commuters whose trains either share or cross EJ&E or Canadian National tracks, where signalman have long-standing instructions to always give priority to freight trains. Why? Because they pay the freight.

Now further suppose that only a fraction of those feeling confused and

helpless are predisposed to getting berserk, that could still be over a thousand people. What would those thousand people do? Hopefully, just honk their horns and not mimic Mayor Daley who sneakily during the middle of the night on March 30 of 2003, when frustrated with another Federal agency, the FAA, said, To heck with it, and took some very impressionable and illegal actions in

tearing up the landing strip to prevent more and more planes from flying in to downtown Chicago.

Now I'm definitely one of those thousands who will be fired because I deal with parents who have already dropped their kids off at the parking lot at the tutoring center where I work will be forced to come back again and again to take their kids back home.

So, Surface Transportation Board and Canadian National, please do what you can to preserve the status quo. Think of the midnight madness of Mayor Daley and do not cause thousands to go postal on Canadian National.

MS. TARCZAN: Marcella DeMauro,

Annette Bowden, Tim Baldermann.

MS. DeMAURO: Good evening. My name is Marcella DeMauro representing the forest preserve district of Will County.

My comments tonight will highlight some of the concerns that we have about impacts to our forest preserves.

The Forest Preserves District currently owns and manages over 20,000 acres and 100 miles of trails for the enjoyment of Will County residents.

The proposed acquisition of the EJ&E by the CN may affect four forest preserves, three dedicated state nature preserves, three existing recreational trails, and one proposed trail.

In general, the Draft EIS is inadequate by providing minimal detail about how a determination of no environmental impact was made. While

acknowledging there would be longterm impacts to natural resources, the Draft EIS offered no mechanism for monitoring, evaluating, or mitigating for these

acknowledged impacts. The Final EIS needs to provide quantifiable conclusions for impacts to biological resources and appropriate mitigation measures.

With respect to public safety, two of our preserves are transected by the rail line and limited to a single ingress/egress. The public may be trapped by a train during an emergency and be without access to emergency services.

The Draft EIS concludes that there could be an increase in hazardous material spills. Many Will County residents depend upon a shallow aquifer system to supply 100 percent of their drinking water. Some communities have no existing infrastructure to deliver water from an alternative source, like Lake Michigan, and this needs to be addressed.

Many of the areas along the EJ&E are environmentally sensitive preserves that would make a hazardous material spill

difficult to clean up, many of which

provide breeding habitat for documented occurrences of Federal and State endangered and threatened species. With large increases in freight volume and hazardous cargo load, this risk is very real.

The Final EIS needs to address mitigation for hazardous spills, including site cleanup, financial compensation for damages, and preserved closure timelines.

With respect to vibration and noise, the Final EIS needs to address specific vibration impacts to flood control structures and other preserved infrastructure, noise impacts to preserve users and visitors attending on site public programs.

With respect to wildlife, studies cited in the Draft EIS suggest birds at a distance of more than 500 feet will not be affected by additional train traffic. None of the cited studies were specific to the species present in the rookery at Lake Renwick Preserve, and the results are inappropriate generalized to

all avian species. This report does not acknowledge that critical foraging and potential breeding habitat for the rookery exists within the identified 500-foot sensitivity zone.

In closing, today the Forest Preserve Board of Commissioners adopted a resolution opposing the acquisition of the EJ&E by the Canadian National Railway Company. This resolution will be submitted along with my comments this evening.

The Forest Preserve District also intends to submit comprehensive written comments on the Draft EIS by the September 30th deadline.

Thank you.

MS. TARCZAN: Annette Bowden, Tim Baldermann, Brian Horvath.

MS. BOWDEN: As a trustee for the

Village of New Lenox, I represent myself and all of the residents opposing the CN acquisition.

New Lenox has always embraced the various rails that passed through our community. Even our Village seal is that of a locomotive. This seal was designed by a young student many years ago as a symbol of New Lenox. The trains have always been a part of our growing history. It's hard to imagine that CN trains may now become the striking sword splitting us in half.

With five at-grade crossings within a four-mile stretch, the safety, security, and quality of life of our community is now at risk. Silver Cross Hospital is currently building a new facility on the north side of our town. CN trains would make it near impossible to reach the hospital during any emergency situation south of the tracks. If you had a child or grandchild being transported to

Silver Cross and lost that child because you were waiting on train or trains, I'm sure you'll agree, putting as few trains as possible on at-grade crossings would be

considered the only choice.

Village Station, a proposed trans-oriented development of 225 acres, 1,000 residential units with an estimated population of 2500 is located less than one-quarter mile from the EJ&E. This is just one of several large parcels of property with commercial and residential approval that is south of the tracks. We have hundreds of existing homes and a brand new high school proposed to open in fall of '09. They are also within the quarter mile. I am sure you will agree that that is concerning.

Please reconsider the implications that this is for the greater good of the transportation industry. As a Board member, resident, mother, grandmother, I know this acquisition will leave our community of New Lenox, as well

as many others, with an enormous safety and financial burden and impact the quality of life and sense of security that we now have.

I respectfully urge you to look deeply at this acquisition and not compromise the ability to protect and serve

our community. The value of our homes may be in jeopardy just by the economics of our country today.

As a trustee, I cannot justify any reason to support this acquisition without appropriate funds or assurances that protect our community and maintain our quality of life.

Thank you.

MS. TARCZAN: Tim Baldermann, Brian Horvath, John Considine.

MR. BALDERMANN: Good evening. My name is Tim Baldermann. I'm the Mayor of the Village of New Lenox.

When I was first told the Canadian National was looking to acquire the EJ&E, we agreed to sit down with representatives from Canadian National and see exactly what their plan was. Obviously, I was very concerned about the amount of train traffic that was going to

increase through our community but still was willing to sit down and ask them what they were going to do to help us with this situation.

I was very disappointed to find out that even initially they were not open to doing very much. When they talked about at-grade crossings -- and we have five in our community, all of them are at-grade -- they stated that they would contribute, perhaps, 5 to 10 percent of the cost, perhaps, for maybe one or two of the crossings. They said the rest of that funding should come from the State

government or from the Federal government.

What turns out, as you know, in this State and in this country, there is no funding. We have major road projects that are going on in our community. We are about to lose millions of dollars of Federal funding because the State can't pass the Capital Bill and can't match those funds. Therefore, it falls back on the taxpayers of the Village of New Lenox.

What I also find interesting is that when I'm dealing with the Department of Transportation and we're looking at 20

or $30 million worth of roadwork near our mall development sites on the north side of town, they require us to build those roads to the standards set for the year 2030. It's on us to pay for those improvements because there are no state funds. Why is it that this foreign company can come in and not have to look at the projected population up to 2030 in our community?

New Lenox currently has a population of approximately 25,000 people.

It has a projected population in the year 2030 of 100,000. Yet, looking at the Impact, we don't make the grade, according to the Canadian National.

I'll leave you with one other story. I'm not only the Mayor of New Lenox, I'm the chief of police in another community, and I've been in law enforcement for 21 years. On two occasions, I had an issue with trains and safety of citizens. The first one was responding to a nine-month-old baby that wasn't breathing. I happened to make it through the crossing as the gates went down, unfortunately the ambulance was behind me and did not get there. That child did not survive. On

another occasion, I was headed over to a call of someone that was trying to enter into a home, peering through windows and trying to enter into a home. I couldn't get there because the train was stopped. What I ended up doing was walking down the train tracks looking for a dead body that night and never got over to that call. So

public safety is truly an issue as well.

Thank you for your time.

MS. TARCZAN: Brian Horvath, John Considine, Robert Olson.

MR. HORVATH: My name is Brian Horvath. I'm a resident of Mokena, and I am representing a newly developed area called The Bridges of Mokena townhomes, which is just located west of 116th Street, and it runs adjacent to the tracks.

The Bridges consists of 58 townhomes, 125 single-family homes, which is currently halfway through the phase of completion.

Our concern, first and foremost, is the safety of the residents in our community and all the communities that will be impacted by the sale or lease of the tracks to Canadian National. With the estimate of over 400-percent increase in train activity comes the added risk of derailments, pedestrian and vehicle accidents, transportation of hazardous cargo, both noise and air pollution, and the delay in response times of emergency vehicles due to the blocked crossings, not

to mention the daily congestion that this will add to the public for commuting back and forth to work, school, church, and other activities.

The proposed plan will devastate the growth and diminish the quality of life, severely impact the property values, adding the extra threat of disaster and tremendously elevating the risk of accidents.

My wife and I, as well as all of our neighbors, purchased our townhomes within the past two years knowing that the rail nearby was in operation approximately 6 times a day. This proposed plan will increase the numbers to a minimum of 28. That's more than one per hour, a number no community should be burdened with. Like my neighbors, we carefully considered this before we invested our equity and savings of 30-plus years. We purchased our home because we sought a community that would be conducive to retirement living. The railroad tracks did precede our community; however, communities build up knowing the ramifications of Class 2 regional railways,

not Class 1 superhighway trains.

Without any crossing gates, noise-dampening sound barriers, horn restrictions, and with the questionable safety record of Canadian National Rail Company, we have good reason to be concerned, especially with the middle school one-half mile to the south of the tracks and the Old Plank Trail bike trail one-quarter mile to the north.

The Bridges of Mokena presently is a quiet and peaceful community, and now Canadian National wants to destroy our dreams and our aspirations for their financial gain.

So, in closing, I am asking you to help us avoid this tragedy. Thank you.

MS. TARCZAN: John Considine, Robert Olson, Jack Lanigan.

John Considine, Robert Olson, Robert Olson, Jack Lanigan.

MR. LANIGAN: Good evening, ladies and gentlemen. My name is Jack Lanigan. I am the founder and chairman of the board of Mi-Jack Products. I am also on the board of the Southland Development Corporation, promoting businesses to relocate to the south Chicagoland area.

Mi-Jack came to Hazel Crest 35 years ago with 18 employees. Today, worldwide, we have approximately 3,000 employees. In the southland area we have over 1,000 employees from ITS, Mi-Jack, Greenfield Products, QSales and Leasing, and Payton Equipment in Riverdale.

The reason I have outlined our company's affiliations is to illustrate our dedication to the southland area and how vital it is for all of our employees who work in the southland area.

Mi-Jack manufactures and distributes gantry cranes used by the railroads and ports for transloading containers through four regional operation headquarters, five sales offices. We also

operate over 60 intermodal terminals throughout the country.

However, I am here today to talk about the benefits of this transaction and what it will create for the economy through the Chicago regional. Industries served by the CN and other major railroad carriers throughout the region will benefit from the reduction in congestion. Remember that word, "congestion," because pretty soon if we don't clear out the congestion, we won't be able to do anything, not even go to work. So what I'm trying to outline here is the benefits that the CN will no longer be operating some of the tracks that will relieve some of the congestion.

The impact of reducing rail congestion will get our products delivery faster to our customers, get paid faster, and through positive cash flow for maintaining our payroll.

All shippers will benefit from the improved flow of the rail network as well. We ship or receive over 3,600 parts

for manufacture and maintenance each year in our Hazel Crest facility, and transit time on this trip traffic will reduce our regions and will be very, very efficient.

What I'm trying to point out

here is that the probability and the dependability of traffic going from one area to another area will really relieve our managers' inventory, showing faster delivery, and actually put a profit to maintain our manpower.

CN is as much a U.S. company as a Canadian. U.S. financial institutes and shareholders own 50 percent of CN. CN's headquarters is in Homewood. They have a payroll of $97 million, so let's set the record straight.

MS. TARCZAN: Bill Lamb, Robert Donaldson, Bill Lamb.

MR. LAMB: My name is Bill Lamb. I am a trustee for the Village of Plainfield.

My personal review of the draft Environmental Impact Statement is that a serious effort was made to analyze the issues that arise with this particular minor transaction.

Unfortunately, this proposed

acquisition by Canadian National will truly have a major impact on the quality of life of residents. The reason is the very significant increase in the number and length of freight trains rolling along the tracks without any serious commitment by CN to mitigation.

Also seriously impacted are the many commuters who must pass over the various at-grade crossings as they head daily toward the expressways serving the Chicago metropolitan area.

Plainfield and surrounding towns have experienced explosive population growth in recent years. As a result, massive improvements in the regional road

system are already overdue because the infrastructure engineering design takes time, and the funds are just not available to handle all of the sorely needed projects. With so many at-grade EJ&E crossings, 16 alone in Plainfield, any significant decrease in the amount of time cars, school buses, and trucks can move over the tracks compounds an already serious problem.

Considering the current

situation, it is crucial that several important at-grade crossings be converted to above grade to facilitate the efficient movement of residents and emergency response teams throughout the region.

There is considerable information available to project the severity of the problem. For example, a state representative testified earlier this week at a conference in Washington that Des Plaines has three Class 1 railroads passing through town, and most crossings are at grade. She noted that the rail

traffic and at-grade crossings made it practically impossible to move around town. In addition, she indicated that they have been unsuccessfully seeking mitigation help for almost 20 years. My guess is that the towns along the EJ&E line will see the same result if mitigation is not required as part of the acquisition approval.

Looking towards the future, I believe that high fuel costs will ensure that railroads have a bright future in moving people and freight. Thus, it is important that the Chicago area embrace railroad growth. One important step in

this direction would be to have Canadian National make a firm commitment to assist in developing the STAR line along the EJ&E tracks.

To accommodate the often-mentioned growth in freight traffic, we all should support CREATE. From my perspective, this is the only effort so far that has the potential to provide the rail infrastructure that will be needed to move

massive amounts of freight efficiently.

In closing, I believe the Surface Transportation Board needs to make sure the Environmental Impact Statement is based on the best available information and that the STB staff takes the time needed to properly assess the major impact of this proposed acquisition. Thank you.

MS. TARCZAN: Robert Donaldson, John Bauer, Margretta Boersma.

Robert Donaldson, John Bauer, Margretta Boersma.

MS. BOERSMA: Good evening. My comments are more on a personal level.

MS. TARCZAN: I am sorry. Can you state your name and move closer to the mic.

MS. BOERSMA: My name is Margretta Boersma, and I represent the homeowner's association of Gateway Parks at Route 45 at Steger Road in Frankfort Township. We are just a little south of the Town of Frankfort.

As a community, we support and stand behind Mayor Jim Holland and the Town of Frankfort and all of its concerns. We are a community of 450 homes of seniors, 55 and older. Our concerns are the ability of the medical ambulance and so forth to get in and out of our community and get us to hospitals when it's necessary. There's not too many roads that we can either get to St. James in Chicago Heights or Olympia

Fields or in Joliet, Silver Cross.

The other concern we have is in case of an accident on the train tracks, it would be the hazardous materials that could

be in there. The safety of the viaduct at Route 45, north of Laraway, when I go through there sometimes, I look at that trestle and I think I hope there is no train going over it, because it doesn't look like it would hold up very long under a lot of train traffic.

And the other thing is from our area, there are about eight roads that go into the Frankfort area, and Frankfort is really our lifeline from where we live, and out of those eight roads, only Route 45 has a viaduct. Every other road is a grade crossing, a street-level crossing.

Those are the concerns that we have in our community of 450 homes, and I thank you for your time.

MS. TARCZAN: Matt Ciboa, Jeff Valenti, Terri Wintermute.

MR. CIBOA: Hello. My name is Matt Ciboa. I am a concerned homeowner of Plainfield, and it's pretty sad when you hear the name "profit." I guess that's always the point, isn't it? You know, it's getting real tough to live nowadays. With all the issues that Chicago and the suburbs, with everything that's going on, you know, the quality of life is really diminishing, and let me think for a moment. I am going to go off base here, but it's going to lead up to the point I'd like to make. You know, with Chicago ranked third for the worst traffic and construction congestion in the nation, Chicago ranked first in air traffic congestion, Chicago has the highest taxes, Chicago has the highest fuel taxes, and now we are looking at major train increased congestion, it's more than we can fathom.

Nobody can put a number on how much we.

Will lose in home values, fuel consumption, time, the cost of life away

85

from work and our families. This is much more than we are talking about an acquisition here. It goes way beyond this. A year ago, I actually looked at some houses in Oswego, Montgomery, Plainfield, Naperville, and I'll tell you what, there are some houses against tracks, great deals. It was hard to pass up, and it went right into my head, noise, vibrations, whistle blows. I passed.

So the fact is already there. Nobody knows at what point and how much. This goes way beyond anybody's knowledge, studies, predictions on how it's going to affect all these communities. I would say deny any forward movement on this acquisition until further studies. Communities were built with train flow in mind of being acceptable, and now Canadian Railway wants to change that. We are not talking a few trains. We are talking big numbers. I have a solution to this: They expand somewhere else. Thank you.

MS. TARCZAN: Jeff Valenti, Terri

86

Wintermte, John Petrosky.

87

MR. VALENTI: My name is Jeff Valenti, and I am a resident of Plainfield. I thought I would come out today to support the people of my town. You know, I'm new

to this. I didn't know much about this topic, but I sit here and listen to what's being discussed and I hear about toxic railroad products. I hear about pollution. I hear about delays. I hear about injury to people. I hear about officials that are much more knowledgeable about this topic talk about their experiences with being stuck behind a railroad track with an infant that dies.

And every day I see things that I have slip away. I see less money in my pocket. I see less value to my home. I see less value to communities and to the towns and to the shops and to the businesses that were once there, and I think, you know, how much more will it be that the bigger guy gets more and the little person suffers? You know, that's just a feeling that I see every day now,

88

and it seems like this kind of -- this merger would benefit a lot of people at the top, and most of the people in the communities would have devastating effects to their livelihood, to their lives, and I think that when you're taking into consideration the people and their lives

and their livings to go to work and their safety, it's all -- I think you should give more weight to that. You should look at that as being the most important thing is that if you don't have a community that can function, you don't have anything, and that's what I have to say.

MS. TARCZAN: Terri Wintermute, John Petrosky, Ken Miller.

89

MS. WINTERMUTE: Good evening. Thank you for hearing my concerns about the proposed sale to Canadian National. My name is Terri Wintermute.

I live on the far west side of Bolingbrook where it meets the communities of Plainfield and Naperville.

As a retired, tenured member of the Will County Board, where I chaired their land-use committee and was also the

county's representative to the Northeastern Illinois Planning Commission, I have reviewed many land use and transportation plans over the years, and I have quality of life, traffic, and safety concerns about this proposal.

The proposed increase in rail traffic will negatively impact the quality of life in an area where the average one-way commute to work for the average person is already 35 minutes. If you study from the U.S. Census Bureau, you will see that is one of the largest commutes, longest commutes, in the entire United

States. More congestion will not be good for our communities. Our roadway system is already taxed to the max from the years when Will County was the fastest growing county in the State of Illinois and the 14th fastest growing county in the entire United States.

Additionally, the number of at-grade rail crossings and an increase in rail traffic creates an increased safety concern, not to mention the increase in hazardous materials that will be traveling on rail lines through residential areas.

You also need to know that not all first responders in these communities will have the necessary training nor the necessary equipment to prepare them for a haz.mat. emergency that they will have to respond to.

Communities such as Joliet and Plainfield will also find their emergency service facilities and personnel dissected by rail traffic.

This is not a good transaction

for our communities. I urge you to not approve it, and, if you must, there would be severe mitigation that would be required. Thank you.

MS. TARCZAN: John Petrosky, Ken Miller, Dick Furstenau.

MR. PETROSKY: Good evening. My name is John Petrosky. I'm a resident of the Village of New Lenox. I speak, I guess, not only for myself, but my wife and children and also for my in-laws, who are in the audience, but we'll get back to them in a moment.

This, first of all, as you say, is not about Not In My Backyard. The tracks are already there. This is about being a good neighbor.

We understand about the need for railroads. We all use the services that they carry, either directly as consumers or indirectly as they service industries that, in turn, take care of us. That's why we make accommodations. They were there when we moved in, we accommodated them. However, it seems unreasonable that we

should be accommodating a 400 percent increase in traffic on these rails and pay for it ourselves with taxes, especially when the City and surrounding areas already have infrastructure in place to handle this

traffic, even if it means putting the rail traffic through industrial areas and so forth.

At the local level, Zoning Boards and the like regulate growth, which Will County is seeing a lot of. They balance the interests of the public and the individuals. Likewise, it seems to me that that is the responsibility of the STB, to balance the interest of the company that stands to make a lot of money off this deal versus the interest of the individuals that it affects, who get nothing but increased opportunity for death, destruction, and other negative impacts.

On a personal level, I'm making a few examples. The entrance to our subdivision as it stands now is already blocked by traffic from stopped trains. Imagine what would happen when this traffic dramatically increases. Likewise, increase in idling cars just outside of our

neighborhoods where our kids play will undoubtedly effect air quality.

94

As other folks have indicated, the tracks in New Lenox split -- split the community in half but also families. My in-laws live, unfortunately, on the wrong side of the tracks, even though their house is much nicer than mine. I would like to imagine my kids when they get older walking or riding their bike to see grandma and grandpa. Not with a 400 percent increase traffic. I care deeply about them, and I cannot imagine them, their house on fire; an intruder in their house while they wait for emergency services sitting on a train track, and that's why I have to take it to the Board personally.

Why don't you move into our community? It's a great place until the trains come, but you have to live on the south side. And you, sir, your house might be on fire while a fire truck sits at a railroad track. You, ma'am, you may have an intruder in your house, and while the cops sit at the railroad tracks, your intruder becomes an attacker. That's what

95

we have to look forward to while CN reaps the profits.

MS. TARCZAN: Kenn Miller, Dick Furstenau, Kirk Zoellner.

96

MR. MILLER: I'm Ken Miller, councilman for the City of Naperville, and also I live within a half mile of the EJ&E.

Thank you for allowing me to speak. The Draft EIS does not adequately speak to the impacts to our community in critical areas such as noise, hazardous materials, traffic delay, potential demise of the STAR line, and safety risk as well as impacts to emergency service providers, school districts, and to our property values. The prospect of rail traffic growing from 15 trains per day to more than 40 per day with 100- to over a 125-car trains almost immediately after the acquisition is an action that requires a much more in-depth look of these factors as well as some level of examination what might occurred in 10 to 20 years.

A significant area of concerns as well is that the Draft EIS does not include structured emergency response that

97

detail how CN will respond to emergencies involving specific hazardous materials.

Even more importantly, the Draft EIS does not conform to the 2008 emergency response guide, which recommends an evacuation distance of one mile or more for chemicals such as anhydrous ammonia. The Draft EIS cites that they will only identify schools in a one-half mile buffer around the EJ&E right-of-way. This needs to be corrected in order to ensure our community's safety with this proposed increase in hazardous waste materials traveling through our communities.

Additionally, the Suburban Transit Access Route, or STAR line, is a solution to traffic problems that cannot be solved by merely continuing to build roads. The commuter rail service would connect more than 100 communities and link 1.6 million residents from the north, south, and western suburbs of Chicago.

With the price of gasoline at an all-time high, commuters need a cost

98

effective alternative, like the STAR line, to connect their home and workplace. Without access to the EJ&E tracks, the STAR line will be derailed and millions of regional commuters will have no option but

to use their cars to travel from suburb to suburb.

There are serious questions about the financial and logistic feasibility of the STAR line if the CN's acquisition of the EJ&E is approved without STB requiring CN to allow commuter trains to operate on the rail line.

The CN has given us no assurance that it will accommodate the planned STAR line accommodations.

In addition to the negative impact on commuters's pocketbooks, taxpayers will also pay a price should the STAR line not be built. Many communities, including Naperville and Plainfield, have already purchased more than 100 acres of land and invested tens of millions of dollars preparing for the STAR line.

Not only has the City of Naperville invested $8 million but more businesses and residents have made their similar investments based on the future STAR line.

The City of Naperville requests that the STB impose some mitigation to ensure that the financial impacts of the

proposed acquisition to the STAR line are not borne by the communities, State of Illinois, or Metra.

And to answer Mr. Lanigan of Mi-Jack, reducing congestion in Chicago and moving it to the suburbs is no improvement.

Thank you.

MS. TARCZAN: Dick Furstenau, Kirk Zoellner, Ethan Bueno De Mesquita.

Dick Furstenau?

Kirk?

MR. ZOELLNER: Yes.

MR. ZOELLNER: I'm Kirk Zoellner, Village of Mokena -- representing the Village of Mokena.

In our opinion, the Final EIS needs to broadly address the following: First, review alternatives for relieving rail congestion in the Chicagoland area other than CN's proposed shipment of huge volumes of rail traffic from existing trackage to the EJ&E. More specifically, we feel that the EIS should reconsider

the create alternative as a comprehensive solution to the problem.

Secondly, assess realistically the ability of taxpayers to fund the mitigation recommendations contained in the DEIS as well as other mitigation measures citizens throughout the region may demand should CN's proposal ultimately be approved. We believe the environmental impact of the proposed transaction on the region will be far greater than implied in the DEIS, given the scarcity of the Federal, State, and local government

dollars to enact mitigation measures.

Thirdly, reevaluate the list of substantially affected crossings included in the DEIS. The limited time length projection of ADT counts in the DEIS on those roads crossing the EJ&E at grade level, in our opinion, fails to adequately consider the probable prospect of increased vehicle traffic on the roads and increased freight traffic on the EJ&E over the next 20 years, given current population growth patterns and every increasing volumes of freight traffic on the rails.

Now, on a more specific basis,

we'd ask the STB do the following in the Final EIS.

First, take a harder look at specific impacts on noise on residential homes located along the EJ&E that might be associated with larger and much more frequent freight traffic on the line.

Secondly, require CN to pay for the installation of berms or noise walls in areas where EJ&E trackage lies within the

projected 65 dba weighted daily average contour line for residential areas as a condition of approval for CN's acquisition of the EJ&E. Such noise barriers are necessary to help protect the property values of these residential areas. We believe it's unfair to ask Mokena residents with homes near the EJ&E to simply absorb the negative physical and economic impacts that will be imposed on them if this transaction is ultimately approved.

Third, take a harder look of the negative impacts on safety and traffic congestion at at-grade crossings that would be associated with this quadrupling of freight traffic on the EJ&E in our area.

Finally, require CN to pay for

the necessary crossing improvements, including grade separations or either quad gates or barrier medians as a condition of approval for the acquisition. With specific respect to Mokena and its at-grade crossing on Wolf Road, we believe the installation of barrier medians to be the

minimum acceptable crossing improvement.

Thank you.

MS. TARCZAN: Ethan Bueno De Mesquita, Mayor Jim Holland, Senator Linda Holmes.

Ethan Bueno De Mesquita.

Mayor Jim Holland.

MAYOR HOLLAND: Heather and fellows, my name is Jim Holland. I'm the mayor of the Village of Frankfort.

Tonight in the short time I have, I will only bring up one issue for you to consider. I ask this Surface Transportation Board to require the final EIS to take a hard look at the issue of who should pay for mitigation. The Draft EIS suggests STB might require the CN to pay only 5 to 10 percent of the cost of overpasses and underpasses that are needed. The CN expects the United States taxpayers to pick up the bill for the bulk of this cost. Why should the United States taxpayers subsidize this exceptionally profitable railroad?

A hard look at the cost of financing mitigation would show that the logical source of funds is the applicant, the CN, the entity that stands to gain the most from this transaction, and that is what the Final EIS should state.

If the CN had to pay for the

overpasses and underpasses, the CN would find it cheaper to follow the suggestions of the Create organization that has made proposals to correct rail congestion in Chicago.

They would also find it cheaper to build a whole new railroad further from the Chicago suburbs out in the rural areas.

Either of these programs could completely solve the Chicago rail congestion problem for all railroads, not just this one railroad, but, instead, the CN believes it can get the United States taxpayers to subsidize their purchase of the J, and so they proceed with this plan, even though it just moves a problem from Cook County to the collared counties.

It seems almost absurd for the taxpayers to help the CN when we consider the CN's China strategy. The CN recently built a new container port in Prince Rupert, British Columbia. This port is closer to China than ports in the United States. The CN hopes to run 200 car trains

from this port through the suburbs of Chicago to the CN's intermodal terminal in Memphis. Take a hard look at the fact that tax subsidies for items such as overpasses and underpasses will help the CN take jobs away from United States citizens who work for United States ports and for United States railroads.

In addition, these tax subsidies will help reduce the transportation costs and products made in China, making United States manufacturers less competitive. A tax subsidy for the CN is detrimental to United States citizens.

It can be corrected by having the STB order the CN to pay for mitigation such as overpasses and underpasses instead of the United States taxpayers.

Thank you.

MS. TARCZAN: Linda Holmes, Nancy Dye, Pam Helsel Hoffman.

Ladies and gentlemen, please come to order.

Senator Linda Holmes.

Nancy Dye.

MS. DYE: I'm Nancy Dye. Like the greater majority of people hear this evening, I'm opposed to CN. The trains are a-comin', they're multiplying. Emergency

vehicles are waiting. Is a house burning? Is there a child or someone who is deathly ill and needs medical attention?

In New Lenox, trains will increase from 8 to 30 or more trains per day. In addition to the emergency concern that I have, air quality as well as hazmat and noise control also exists.

I have to echo what Mayor Holland just said. Unless CN is going to pay or fund the mitigation for infrastructure changes when it's going to realize revenues, the STB should not approve this acquisition of the EJ&E. With all due respect, it is absolutely ludicrous for CN to expect taxpayers and the State and Federal governments to contribute any funds.

I implore the STB to ask CN for a list of all the funds that they're going

to give to the affected communities before any affirmative decision is made.

Thank you.

MS. TARCZAN: Pam Hoffman, Rick Ryfa, Arthur Reis.

MS. HELSEL HOFFMAN: My name is Pam Helsel Hoffman. I'm president of the Crete Rural Park District, and I'm also a candidate for the Will County Board from District One, which is the extreme easternmost portion of Will County.

How does the acquisition of the EJ&E by Canadian National affect people living in the eastern portion of Will County? Whenever there is a

community on one side of a railroad track with a hospital on the other side, it alters response time of emergency medical service providers.

People living in the Crete and Beecher areas who might normally travel down Route One to reach St. James Hospital in Chicago Heights would be delayed by increased train traffic on the EJ&E tracks in Chicago Heights. Emergency vehicles would need to take longer alternate routes to reach St. James's emergency facilities. Frankfort Village also has six grade crossings in their community that would

pose a similar problem for their emergency vehicles and would affect school bus traffic as well.

Additionally, only 5 to 10 percent of the cost of grade crossing mitigation is traditionally covered by the railroad. Federal, State and local government pays the bulk of the cost for grade crossing separations. Thus, a foreign company will reap profits at the expense of American taxpayers.

Some argue that Canadian National's purchase of the EJ&E tracks

would relieve train traffic congestion into and out of Chicago and that it would benefit the communities near Chicago --

MS. TARCZAN: Try this.

MS. HELSEL HOFFMAN: Should I start over?

Some argue that Canadian National's purchase of the EJ&E tracks would relieve train traffic congestion into and out of Chicago and would benefit those communities near Chicago. However, that

relief would be short lived because other trains would eventually fill the void vacated by Canadian National.

There are many other issues to be considered such as noise, pollution, transportation of hazardous materials, et cetera, but due to time constraints, I cannot go into that.

I thank you for letting us voice our opinions tonight at this public hearing.

Thank you.

MS. TARCZAN: Since we have one microphone down, if the speakers could please use the microphone that's to the right of where you're seated.

Rick Ryfa, Arthur Reis, Thomas Venskus.

MR. RYFA: My name is Rick Ryfa. I am the town council president in Griffith, Indiana. The Town of Griffith will be submitting a comprehensive response to the Environmental Impact Study. Tonight I just want to highlight a few areas where the impact study was deficient, and I am also making a request that the Surface Transportation Board hold additional hearings, one of which will be located in Griffith at a venue provided by the Town of Griffith.

While I agree with the recommendations from the impact study that suggest mitigation is needed at three of our at-grade crossings and two of our fire stations, I feel that the study falls terribly short in fully assessing the damage that will be done to our town if the

proposed merger goes through.

The study fails to mention that the EJ&E tracks traverse through our entire length of town through a very densely populated residential area which, given the

increased length of trains, will essentially cut our town in half.

Griffith will experience a tremendous increase in noise pollution. Hundreds of residents will literally be woken up from their sleep every night with the train whistles.

We see an immediate decrease in property values and an increase in hazardous waste risk at the proposed connecting station.

Broad Street will be gridlocked, as will 45th Avenue.

We have 4 schools within one-quarter mile of the EJ&E railroad tracks, as well as 15 schools and parks within 1.5 miles of the railroad tracks. These issues must be addressed.

The study also stated that our police department would be generally unaffected because they are considered mobile. While, in theory, this sounds

reasonable, locally we have determined that a minimum of one extra police squad would

be required to be on streets at all times to maintain the same level of protection we currently provide our residents. This is another issue that must be addressed.

In closing, I recognize there are benefits the reorganization will bring to many parts of North America; however, the cost of the present proposal will disproportionately burden the Town of Griffith and the communities represented here in such a manner that the gains do not outweigh the injustice of all our communities' losses combined.

MS. TARCZAN: Arthur Reis, Thomas Venskus, Margie Bonuchi.

116

MR. REIS: Good evening. My name is Art Reis, and I am a resident of the Village of New Lenox for the last 25 1/2 years, and I have seen both the -- we have three railroad lines running through town, the Norfolk and Southern and the Chessie Rock Island in addition to the EJ&E.

Unlike most of you, I am not against the merger or the replacement or the acquisition of the rail line by EJ&E, but there are conditions, and many of them have already been raised in this meeting. The mitigation issue is key. It is supreme.

Understand that I don't believe "profit" is a dirty word. However, I do believe in giving back to the communities that you serve, and being that the railroad does make at least a 25-percent profit on what they are doing, according to the figures I've received, and the tax structure, which is beyond the scope of the STB hearing, is very much in favor of the railroad and needs to be mitigated at the

117

state level, do you realize they only pay $4,068 per township for the trackage value that they have. That's less than I pay in my own property taxes. Give you a clue? Start there.

But I believe that the STB must make it a point that the railroad is to mitigate, as many of the speakers have said here, for the improvement which will be needed, and there will be improvements needed in every community that they cross.

Now, every 50 minutes seems like piking to me. I work in Hammond, Indiana, and anybody who is over here from over there knows what the Chessie System line does to Calumet Avenue. They have got a train running through every 15 minutes, which is ridiculous, but it could be mitigated with having the tracks moved up or the streets moved down. Whatever it is, the railroad needs to pay for it.

We don't have the money. The collar counties only get 30¢ back for every dollar they send to Springfield, and in the

118

United States of America we only get 70¢ back for every dollar that the State of

Illinois puts into the federal coffers. Something needs to be done about that, but I think the issue should start with the railroad. They should give back to the communities that they are doing -- I don't think that the railroad is a bad thing. The future of this country is going to be more railroad oriented than you think, and the lifeblood of any community is the ability of them, of the transportation network, to work. That includes roads, railroads, and airports.

We just lost our airport in New Lenox that could have been developed into an economic benefit for the community. The railroad could be, too, with factories coming in, light industry using railroad sidings, hiring workers, local workers, not having to need that much of road.

I understand what happens when a railroad cuts a community in half. I get it; but it's going to have to be mitigated

119

by the railroads and not by us. Thank you.

MS. TARCZAN: Thomas Venskus, Margie Bonuchi, Jason Mottl, and, before we proceed, I would also like to ask if anybody is interested in signing up to

speak tonight, we will still have some spots available.

Thomas.

120

MR. VENSKUS: Good evening. Thank you for the opportunity to express my opinion and documentation regarding the pending sale.

My name is Thomas Venskus. I am a resident of Frankfort. I am here to represent the Prestwick Homeowners Association. I presently reside on

Aberdeen Road, which backs up 100 feet from the elevated train tracks behind my residence.

I, too, am an engineer by trade and have reviewed all of the documentation furnished to date by CNR's environmental engineers, consultants, SEA, and HDR.

I am here tonight to refute that the modeling information presented on the contrast and topo studies is insufficient, incorrect, misleading, outdated, and unequivocally incomplete.

Modeling information indicated 65 decibels. This, in fact, does not represent true actual readings. Quantitative analysis of true, onsite

seismic and decibel readings have not been acquired nor represented truthfully; case in point, decibel readings and seismic studies must be acquired, first and foremost, behind existing homeowners' properties, schools, parks, campgrounds, forest preserves, businesses, et cetera, adjacent to these tracks.

Again, the contract studies represent 65 decibels along the train tracks. This, in fact, is incorrect based

on various supporting documents that can easily be obtained from the Internet. Normal conversation at 2 meters is 60 decibels. A typical freight train is well over 100 decibels at 50 feet.

Based on these simple charts, which show various decibel readings of everyday noise, the charts portrayed by CNR are grossly misleading.

Additionally, these contract studies prepared by CNR purposely do not locate the proximity of residences, businesses, schools, camps, forest

preserves, parks, et cetera, in relationship to the existing EJ&E railroad tracks.

In the Prestwick subdivision, contract sheel L1, sheet 97 of 139, reflects that the residences are omitted as well as locating that the tracks are elevated along this section. The sound and decibel readings of the trains along this stretch of track is at even greater levels since the natural tree buffers cannot mitigate the trains' sounds. During the winter when the ground is frozen and the trees' foliage is not available to absorb

the natural buffer -- to act as a natural buffer to absorb these sounds, the decibel and seismic readings along -- during the season are even greater, probably doubled.

As a result of the aforementioned information, actual field testing and documentation must be taken along the entire length of the tracks to document these conditions.

If CNR trains are three miles in

length and carrying more freight, what do you think the decibel readings will be at that time?

I bet they will be well above the OSHA guidelines for what is considered safe noise.

In conclusion, I ask that further studies and testing be conducted before this sale is even approved, and, further, think about this: Would you want this in your community, behind your own homes? I say no.

MS. TARCZAN: Margie Bonuchi, Jason Mottl.

MS. BONUCHI: Good evening. My name is Margie Bonuchi, and I am a resident of the Village of Plainfield. I have been a resident for approximately 13 years and moved to that community and loved every minute of being there.

I am an active community volunteer, and one of my assignments is a member of the planning commission for the Village of Plainfield.

I am here tonight not with a lot of facts and figures, as many of my other counterparts have, but as a citizen who is coming forward to you as a board to ask you respectfully to please review the facts, consider the issues.

I chose the middle of Plainfield for my home because I wanted to be in the center of everything. We are near the railroad tracks. I grew up near railroad

tracks. This is not a case, as someone else stated, as a NIMBY situation. I'm used to having them there and that's not the issue; but when all of those crossings

are close together the way they are in the center of Plainfield, you're cutting through the heart of the village.

That town has experienced tremendous growth over the last several years because of people coming to Plainfield for the quality of life. They have worked hard for their homes there. Some have businesses there. Others commute a long distance into the city, which is stressful enough the way it is right now.

The way these trains would go through and the volume of trains that would stop any kind of movement in our community would make that commute nearly impossible.

As a member of a board who many times is listening to public comment and public hearings, I sit where you are and I hear people come to me and talk about all the different things, whether a business is going to open that's going to be in a commercial area that backs up to their home, and I have to separate out whether

it's I just don't want that store or

restaurant compared to is this really detrimental? One of the criteria on the planning commission is is this injurious to the quality of life to existing situations that are there, or wording to that effect. This is truly injurious.

The half of the town that I am on will no longer have adequate police or fire protection, which is very, very serious.

I am an administrator with the school district, so as I know someone has shown earlier, Plainfield School District covers 64 square miles with 30,000 students. You can imagine, with 30 buildings existing today, how difficult it is to move those students and traffic and people commuting.

So, as a citizen, I implore you to please look at the facts of this. Do not just settle for the route of the financial gain, because many times we have to take the route of the citizens over the financial gain in the Village of

Plainfield, and I ask that you make those considerations here. Thank you.

MS. TARCZAN: Jason Mottl, Cynthia James.

MR. MOTTL: Good evening. My name is

Jason Mottl. I am the secretary of the Homeowners' Association of Stone Creek, which is a collection of 110 homes on the very most northern part of Joliet. Many of our homes are literally within spitting distance of the tracks.

It's been proposed of an increase of approximately 24 trains just running along the four major grade crossings that run up to our subdivision. There are two to the west and two to the south, which means, literally, that only the 110 homes in my subdivision that I represent but literally the hundreds of other homes in the immediate area, all four of those crossings could be down at the same time, which means I can't go south or I can't go west, literally.

Unless the STB and CN knows of four-dimensional travel where we cannot go south or not go west in certain places, then I'm all for it; but 24 more trains, as estimated, will be blocking these

intersections. That's 24 more times you have to sit there and wait. That's 24 more trains that are blocking your way to school, your way to work, your way to

church. The STB really needs to take a hard look at this.

I lived in Joliet four years. Previously most of my life I lived off of another train rail line that, ironically, would be lessened, or the train traffic would be lessened by this merger, so it's just kind of robbing Peter to pay Paul, so to speak.

The major intersection by my subdivision is Renwick Road, which approximately now has 10,000 cars crossing it each day, which is, if you think about it, is the population of some of the very communities of people who have spoken here today. 10,000 cars in one intersection to have an increase of 24 trains in a 24-hour period is just too much.

I implore the STB to seriously review on your final draft and take into

illustrious senator, CN and the STB can spin this all the way they want, but, in the words of our senator, it's like lipstick on a pig. Thank you.

MS. TARCZAN: Cynthia James, Alan Logsdon.

MS. JAMES: Good evening. My name is Cynthia James. I live in New Lenox Township, and I am a special education teacher for elementary students. I currently live about 900 feet from the railroad tracks that run just south of my home.

In my small subdivision, it's more of a country subdivision than a formed subdivision. It's been there in New Lenox

Township for over 40 years. All of the homes, which are 122, are served by private wells for their private family water supplies. I know this number of 122 very well because last Saturday, my daughter and I hand delivered flyers to our little neighborhood to implore our neighbors to come to this meeting tonight. I had only run off 70 copies, because I didn't really realize how many neighbors I really did have. We all have a private well system.

The concerns that I have in our neighborhood are the fact -- is the fact that the increased train traffic, which

into the ground, it can leech into the soil and contaminate the public water supply.

Now, the special education students that I teach are behaviorally challenged. They are academically challenged and emotionally challenged. How many of those students that I teach every day that throw chairs, spit, and do other variety of unacceptable behaviors perhaps have been contaminated in some way by the toxic pollution that's in our air from

MR. LOGSDON: My name is Alan Logsdon. I am a 40-year resident of Frankfort. I would like to thank the panel here this evening for their patience in listening to all of us.

I didn't come here prepared to speak. I came here to listen and to hear, and some of what I have heard has stirred me to speak.

One of the things that I was not aware of before coming here tonight, and this was pointed out in the very beginning of the presentation, was a parallel rail line from Joliet to Frankfort, and, to me, this gives opportunity, double the opportunity, for backups on the grade rail crossings between Joliet and Frankfort.

There would be two reasons to have a parallel line: One would be to have

two trains running very, very close to each other.

The other would be for one train to pull over and stop while the others are passing. Either way, I see a much

increased delay time for trains or for cars waiting to cross at-grade crossings in that area.

The other reason that I was moved to speak was the other people have spoken very eloquently this evening about what they believe to be deficiencies in the CN plan or in the Environmental Impact Statement that has been presented.

I would like to take the other viewpoint here, and that is we are supposed to be balancing the good with the bad of this proposal, and it appears that the one good of the proposal that is being promoted here is this reduction of train traffic in the inner more areas of Chicago.

Well, I don't have a lot of experience with the railroads, but I do have experience, having lived here for 40 years, with roads in this area, and I think traffic is traffic, and in my time here, Interstate 80 was completed, and I

can tell you that that has not reduced the traffic on Route 30.

I was here when Interstate 57 was completed to give us better access into Chicago. That has not improved my ability to get into Chicago. It hasn't reduced the congestion on the Dan Ryan.

355 has been completed. That has not reduced my congestion and my travel time.

My travel time on Route 45 going up to Orland continues to get worse and worse, in spite of the building of better highways to reduce traffic. So I ask you to take that into consideration, and I thank you for your time.

MS. TARCZAN: We have no more registered speakers at this time. We invite any additional commenters to register now.

In the meantime, we invite everyone to return to the open-house area to review the boards or to ask questions.

The court reporter and at least one member of the STB team will remain here in the public meeting area to receive

additional comments from newly registered speakers, should we have any before 9:00 p.m. Thank you.

(WHEREUPON, the meeting adjourned at 8:04 p.m.)

Appendix E

Comments Received on the Draft Environmental Impact Statement

Attachments:

E.1 Comment Letter from United States Department of the Interior

E.2 Comment Letter from United States Department of Transportation

E.3 Comment Letter from United States Environmental Protection Agency

E.4 Comment Letter from the Applicants

E.5 Comments Received From All Others on the Draft EIS (CD only)

Appendix E
Comments Received on the Draft Environmental Impact Statement

SEA received and fully considered a total of over 9,500 comments on the Draft EIS. Of these comments, over 300 were oral comments received at the public meetings held August 25-28, 2008 and September 8-11, 2008 (See Appendix D) and over 9,200 were written comments that were emailed, faxed, e-filed, mailed to SEA, transcribed from the hotline, or submitted at the public meetings.

Appendix E presents these 9,200 written comments. Copies of comment letters received from the Department of Interior, Department of Transportation, and Environmental Protection Agency are reproduced and attached to this Final EIS in Appendix E, as is the Applicants' comment letter. However, because of the volume of comments received, all other comment letters have been included with Appendix E only with the electronic version of this Final EIS in numerical order. Parties not recieiving the electronic version of Appendix E may request an electronic copy by calling the Project Hotline at 1-800-347-0689.

Tables E-1 and E-2 present the names of those who submitted comments. The tables present the individual's name and title or name of organization, and the comment number of the comment. For private citizens, the tables show the individual's name and comment number. The comment number is needed to identify the individual's comment letter. Each individual's letter has been saved as an electronic file, with a file name that corresponds to its comment number. Tables E-1 and E-2 are organized alphabetically according to the follow categories:

- Elected Officials (Federal, state, and local)
- Agencies (Federal, state, tribal, and local)
- Passenger/Rail Service Providers
- Organizations
- Applicant
- Citizens

Several commenters faxed, or emailed written comments to SEA and then submitted the same comment letter by mail or messenger. When duplicate comments were submitted using different media, Tables E-1 and E-2 list the commenter name only once, but includes the unique comment numbers assigned to each submittal in the "Comment Number" column.

SEA identified over 2,000 distinct form letters submitted in the written comments. SEA is reprinting one copy of each of these form letters. The commenters who submitted form letters are included in Tables E-1 and E-2 with the parenthetical notation (*) to describe the applicable form letter that is printed in this Appendix.

Table E-1. Comments Received on the Draft EIS (inadvertentenly omitted from the Master List)

Commenter Name	Commenter Title/Organization	Comment Number

E.1 Comment Letter from United States Department of the Interior

United States Department of the Interior

OFFICE OF THE SECRETARY
Office of Environmental Policy and Compliance
Custom House, Room 244
200 Chestnut Street
Philadelphia, Pennsylvania 19106-2904

IN REPLY REFER TO:

TAKE PRIDE IN AMERICA

September 29, 2008

ER 08/833

Ms. Phillis Johnson-Ball
Surface Transportation Board
395 E Street, SW
Washington, DC 20423
Ref: STB Finance Docket No. 35087

Dear Ms. Johnson-Ball:

The Department of the Interior (Department) has reviewed the July 2008 Draft Environmental Impact Statement (DEIS) for the proposed Canadian National Railway Company and Grand Trunk Corporation (Applicants) acquisition of the Elgin, Joliet, and Eastern Railway Company (EJ&E). Coordination between the Surface Transportation Board's (STB) Section of Environmental Analysis (SEA) and the U.S. Fish and Wildlife Service (Service) began during the scoping process. With respect to resources or issues for which the Department or its bureaus have jurisdiction or special expertise, we offer the following comments and recommendations for your consideration.

GENERAL COMMENTS

The DEIS provides a considerable amount of general information on issues of concern to the Department, but detailed analysis is often lacking. The proposed action and alternatives, which include the construction of six new connections and the installation of 19 miles of double track, would result in environmental impacts of varying severity depending on the particular location within the project area. All alternatives would result in greater environmental impacts than the no action alternative. The DEIS does not adequately identify adverse impacts to the Service's trust resources (federally listed species and migratory birds) and does not fully disclose impacts to other wildlife. As a result, the DEIS fails to consider and describe appropriate mitigation for these environmental impacts.

There is confusion about which agencies own or manage conservation lands in the two affected States, where conservation lands are located in relation to either the EJ&E or CN tracks, and about lands that have utilized Land and Water Conservation Fund monies, among other issues. A major problem in sections of the DEIS dealing with the Indiana portion of the project is a failure to provide adequate maps and descriptions of the main line and other tracks in the

Gary/Hammond/East Chicago/Whiting area (Lake Front Line, City Track, etc.) so that specific locations of important natural resources areas can be ascertained in relation to the tracks (Figures 2.1-1, 3.1-1, and 3.11-1 are not of sufficient detail to be adequate; Figure E-1, Sheets 29 through 32, provide better detail but do not name the tracks or provide the Segment numbers that are used throughout the text). The text does not clearly distinguish between the EJ&E main line and other EJ&E tracks in the discussion of project impacts. In particular, the proximity of any EJ&E tracks to the Indiana Dunes National Lakeshore is not clearly apparent, other than the Gaylord Tract in Griffith.

The specific comments below address these concerns in more detail and provide recommendations to correct these deficiencies in the final EIS. We also recommend that SEA coordinate further with the Service to resolve differences of opinion concerning project impacts to Service trust resources. If differences remain, SEA should ensure that the opposing views are disclosed and adequately discussed in the final EIS.

SPECIFIC COMMENTS

Proposed Action and Alternatives (Chapter 2)

Section 2.2.1.4, Planned Phased Integration of Applicants' Operating Plan: This section discusses the proposed phased implementation of the CN take-over of the EJ&E system. The Lake Front Line and Whiting Branch are mentioned several times, but no mention is made about the Hammond Branch, City Track, or the other tracks listed on Table 3.3-2 of Appendix E. It is indicated that service would not change on the Whiting Branch, but in Phase 3 there would be longer trains on the Lake Front Line, which essentially borders Lake Michigan through northwestern Gary and northern East Chicago, Whiting, and Hammond, Indiana to South Chicago, Illinois. These longer trains on the Lake Front Line are not discussed in Chapter 4, Environmental Consequences, section of the DEIS, despite the fact that these longer trains could adversely impact other existing and proposed uses of the Lake Michigan shoreline (e.g., the Marquette Plan, including a trail).

It is also not clear which track borders the north side of Clarke and Pine and Pine Station State Nature Preserves, west and east, respectively, of Clark Road in Gary. (Table 3.3-2 in Appendix E lists 2 at-grade crossings of Clark Road using names not found anywhere in the text.) Because these habitats are unique, this track and any changes or lack of changes in operation need to be mentioned here and discussed in Chapter 4, Environmental Consequences.

Section 2.4.1, Rail Connection Alternatives-Munger, Illinois: This section describes all of the alternatives considered for the six proposed rail connections, including the proposed and no-build alternatives. The Service supports the No-build at Munger alternative to avoid direct or indirect impacts (noise) to Service trust resources (migratory birds) that would result from the Munger build alternatives in Pratt's Wayne Woods Forest Preserve (PWWFP). As the DEIS notes in Section 3.11.6.3, PWWFP provides important habitat for state listed, wetland, and grassland birds. If a build alternative is chosen, the Service supports the Applicant's Proposed Munger Connection (Section 2.4.1.2) because changes were made to the Original Munger alternative to avoid PWWFP land (wetlands in particular). The Munger Alternative-UP Connection would also avoid wetland impacts at PWWFP; however, other offsite environmental

impacts (impacts to the southern end of Pratt's Wayne Woods and Brewster Creek Fen Nature Preserve) would result from this alternative.

Section 2.4.2, Rail Connection Alternatives-Joliet, Illinois: The Service supports the No-build at Joliet alternative to avoid direct impacts with the Hine's emerald dragonfly which occupies habitat in the vicinity of this alternative. This issue will be addressed in Section 4.11, Biological Resources and should be addressed in the final EIS.

Table 2-9: This table presents a summary of potential environmental impacts due to changes in rail operations. We disagree with several of the conclusions made by SEA in regard to impacts on biological resources. The conclusions are located in the proposed action column. Specifically, we disagree with SEA's conclusions that the proposed action would not have an adverse effect on plant communities, wildlife, conservation and natural areas, wetlands, federally listed species (including the Hine's emerald dragonfly), state listed species, and water resources. Since land not currently used for railroad purposes will be taken for the proposed rail connections, plant communities and wildlife habitat will be affected and, in some cases, wetlands will be filled. Stating that wetlands would not be affected "as no changes in drainage patterns would occur" is incorrect. The filling of wetlands will adversely affect the wetlands whether or not drainage patterns are modified by the filling. Some conservation lands will be adversely affected by increases in numbers of trains passing them, with resultant noise and air pollution impacts. We disagree with the conclusion that the noise level increase of 65 dBA or greater would not result in adverse effects. These statements in Table 2-9 do not agree with the discussion of project impacts in Chapter 4, Environmental Consequences. These discrepancies should be addressed in the final EIS.

Table 2-10: This table presents a summary of potential environmental impacts for the Munger Connection. We agree with SEA's conclusion that the Proposed Munger Connection would result in "increased noise and indirect loss of habitat, potentially decreasing the breeding activity of marsh birds." However, this conclusion should be made for the Munger-Original Proposal and Munger-Northwest Quadrant alternatives.

We disagree with SEA's conclusion that there would be no effects to federally listed species. This determination cannot be made for the eastern prairie fringed orchid without conducting a habitat assessment or surveys in suitable wetland habitat. The conclusion in the table should be revised in the final EIS. This issue is addressed in greater detail in our comments regarding Section 4.11, Biological Resources.

Table 2-11: This table presents a summary of potential environmental impacts for the Joliet Connection. We disagree with SEA's conclusion that there would be no effects to federally listed species. As noted above, the proposed construction could result in take of the Hine's emerald dragonfly. The conclusion in the table should be revised in the final EIS. This issue is addressed in greater detail in our comments regarding Section 4.11, Biological Resources.

Tables 2-12 and 2-16: These tables present summaries of potential environmental impacts for the Matteson Connection and for proposed double tracking. We disagree with SEA's conclusion that there would be no effects to federally listed species since this determination cannot be made for the eastern prairie fringed orchid without conducting a habitat assessment or surveys in

suitable wetland habitat. The conclusions in the tables should be revised in the final EIS. This issue is addressed in greater detail in our comments on Section 4.11, Biological Resources.

Table 2-13, Summary of Potential Environmental Impacts – Griffith Connection: This table indicates that there would not be an effect on local parks, but in Chapter 4, Environmental Consequences, it is acknowledged that the Griffith Historical Park and Depot Museum may be affected to some extent because it is immediately adjacent to the proposed connection. This table also states that there would be no effect on wildlife, despite the fact that several acres of prairie, woodland, and wetland habitat would be converted to railroad embankments and tracks. Chapter 4, Environmental Consequences, acknowledges that wildlife will be impacted by this connector. These discrepancies should be addressed in the final EIS.

Table 2-14, Summary of Potential Environmental Impacts – Ivanhoe Connection: This table also states that there will be no effect on wildlife. However, birds and small mammals that utilize the existing remnant prairie along the south side of the CSXT tracks will lose habitat. Under Biological Resources, it is indicated that there will be "potential effect on wetlands and dry woodlands species" of State-listed threatened and endangered species, but under Water Resources, it is stated that the project "would not affect wetlands." This inconsistency needs to be addressed.

Table 2-15, Summary of Potential Environmental Impact – Kirk Yard Connection: This table makes similar statements about potentially affecting wetland and prairie species of threatened wildlife, while not affecting wildlife or wetlands. These inconsistencies need to be corrected.

Affected Environment (Chapter 3)

Section 3.1.2.2, Yard Operations: This section states that the Whiting Yard in Indiana is located "just southeast of Kirk Yard," although it is actually about 6 miles northwest of Kirk Yard.

Section 3.3.1, Regional and Local Highway Systems: The discussion in this section, as well as in section 4.3.1, of existing conditions and with-the-project conditions of highway/rail at-grade crossings in Gary, Indiana, does not adequately describe the crossing situation in that community. At this time, the only grade-separated crossing of the EJ&E tracks with a roadway in Gary is Industrial Highway (former US 12) near Gary-Chicago International Airport. Industrial Highway has an at-grade crossing of the CSXT Railroad double main line track a short distance northwest of the EJ&E grade separation. However, Chicago Avenue intersects Industrial Highway in the same general area, parallel to the CSXT tracks, and has an interchange with Cline Avenue/SR912. This configuration will change, however, when the EJ&E tracks are moved around Gary-Chicago International Airport, at which time the grade-separation will be removed and at-grade crossings will be provided at Industrial Highway and Chicago Avenue. At some unknown date, a grade separation will again be provided over Industrial Highway and Chicago Avenue will be closed. However, the airport's ultimate plans, not covered under the 2005 FAA Record of Decision, are to close Industrial Highway entirely in order to lengthen the north-south runway.

Fifth Avenue (US 12-20) is a 4-lane highway that is the main entrance to the west side of Gary and includes an interchange with Cline Avenue about 0.5 mile west of the EJ&E at-grade crossing; it is a Department of Transportation designated heavy truck route that traverses the city

west to east. This highway is not even mentioned on page 3.3-37. Ninth Avenue is a 2-lane city street that crosses the EJ&E at-grade. It does not intersect with Cline Avenue and currently does not proceed into Hammond but connects with a service road parallel to Cline Avenue that connects with 15th Avenue. Therefore, it is not an alternative to either 5th or 15th Avenues. Fifteenth Avenue is a 2-lane city street serving commercial and industrial properties near the EJ&E at-grade crossing and mostly residential properties to the east; 15th Avenue intersects with Cline Avenue. Twenty-fifth Avenue is a 2-lane city street primarily serving residential areas; it does not intersect with Cline Avenue, but does proceed into Hammond. The seven unnamed roadways that have grade separated crossings of some part of the EJ&E tracks in Gary need to be named, and it should be acknowledged that they are not main entrances to the city from the west over the EJ&E double track main line.

Therefore, at this time, only Industrial Highway and Chicago Avenue are available to provide unobstructed access to the west side of Gary from Cline Avenue, which is the main north-south highway connection to Interstate Highways 80-94 and 90, area steel mills, and adjacent communities west of Gary. This unobstructed entrance will be lost during the unknown time period after the initial relocation of the EJ&E tracks around Gary-Chicago International Airport and before the construction of the Industrial Highway grade separation over the EJ&E (even though Industrial Highway may eventually be closed). With increased numbers of trains and longer trains on the EJ&E tracks with the project, access to and from the west side of Gary to Cline Avenue and adjacent communities could be significantly compromised unless another grade separation is provided.

This possible traffic impairment into and out of Gary is of concern to this Department because of the proximity of Ivanhoe Dune and Swale Nature Preserve and Ivanhoe South Dune and Swale to both the EJ&E tracks and 5th Avenue. Since 5th Avenue/US 12-20 is the major highway access for western Gary, it would appear that a grade separation will be needed at this location, regardless of the current and estimate traffic volumes (Level of Service) discussed in the DEIS. Either a grade separation of the EJ&E over 5th Avenue or 5th Avenue over the EJ&E would likely adversely impact the Ivanhoe Dune and Swale natural area complex. These preserves support the federally endangered Karner blue butterfly (*Lycaeides melissa samuelis*) and numerous Indiana-listed species of plants and animals. These dune and swale habitats are recognized as a Globally Imperiled Ecosystem.

Therefore, we request that the Surface Transportation Board provide a detailed discussion of the possible need for a grade separation at 5th Avenue/US 12-20 and the EJ&E Railroad, as well as the environmental consequences of such a separation, in the final EIS. Either grade separation structure would require retaining walls rather than side slopes in order to reduce the footprint of the structure and the impact on the Ivanhoe preserves. We believe that it is necessary for STB to address this issue because a grade separation would not be needed at this location "but for" the proposed project.

The discussions about Hammond, East Chicago, and Whiting need to make clear that the EJ&E lines being addressed are not the main line extending south and west from Kirk Yard into Illinois, which is the line that will experience the increases in numbers and sizes of trains. These cities are instead along lightly used spur lines that apparently would not have increased traffic as a consequence of the project.

Section 3.3.4, Airports: This section, as well as section 4.3.4, needs to discuss the ultimate plans of Gary-Chicago International Airport to close Industrial Highway at some unknown time in the future if the north-south runway is to be extended.

Section 3.5, Land Use: This section describes the land at the proposed Griffith connection between the CN and EJ&E Railroads as "vacant land." This land is apparently not zoned but is just there, unoccupied by a specific use. Based upon the Service's review of the area, it would more naturally be called "open space" since it consists of dry sand prairie, wetland, and savanna/woodland. Several abandoned rail rights-of-way cross the site, but native habitats dominate. Zoned "land use" does not necessarily describe the current land use, as is the case at this site. This same type of distinction can be made at the proposed Ivanhoe connector site, which is apparently zoned "open space" but is primarily industrial land, except for remnant prairie along the south side of the CXST track. "Open space" is the correct designation for the Ivanhoe dune and swale complex north of the proposed Ivanhoe connector.

Section 3.5.5, Public Lands: This section discusses various types of public lands in the project area but leaves the reader very confused about the subject. Both Indiana and Illinois have Nature Preserve systems; Indiana has County Park systems and no Forest Preserve systems; Illinois has Forest Preserve systems and no County Park systems within the counties affected by the proposed project. These distinctions are not made clear in this Public Lands discussion. This section needs to clearly explain the similarities and differences in the public land systems between Indiana and Illinois. For example, Table 3.5-2, Forest Preserves Adjacent to the EJ&E Rail Line, does not make clear that this system exists only in Illinois; all it states is that there are no forest preserves located near the EJ&E rail line in Lake County, Indiana. A reviewer unfamiliar with the distinctions between the two State systems would therefore believe that there are no designated, significant natural habitats along the EJ&E line in Indiana, which is not the case.

Section 3.5.5.6, Nature Preserves, and Table 3.5-3: The information provided in this section is also confusing. Listed lands are described as "south of" or "west of" the EJ& E line, but there is no indication if they are immediately adjacent to the main rail line or one of the spur lines, which is the important issue. Hoosier Prairie in Griffith is, in fact, along both the CN line and the EJ&E line. When the entire site is considered, it is about 600 acres in size, not the 430 acres listed in the table. Ivanhoe Dune and Swale is east, not west, of the EJ&E main line. Clarke and Pine and Pine Station Nature Preserves are along the south side of one of the spur lines of the EJ&E; this line should be named in the table.

Table 3.5-4, Resource-Rich and Protected Areas Adjacent to the EJ&E Rail Line: This table is also very confusing. Apparently, this terminology is used only in Illinois for specific resources; however, this is not made clear either in the discussion or in this Table. The last line of the table states that "No protected areas are located near the EJ&E rail line in Lake County, Indiana." This would lead the reviewer to conclude that there is nothing of importance along the EJ&E Railroad in Indiana, which is clearly not the case. Therefore, it must be made clear that this Resource-Rich and Protected Areas designation refers only to Illinois; any references to Indiana need to be removed.

Table 3.5-9, Trails and Greenways in Lake County, Indiana: This table is incorrect about most of the trails. The Northwest Indiana Regional Planning Commission (NIRPC) does not manage

the trails, although they published the regional trail map and are involved in trail planning. The Little Calumet River Trail is a component of the Little Calumet River Flood Protection and Recreation Project being constructed by the Chicago District, U.S. Army Corps of Engineers, with the Little Calumet River Basin Development Commission (LCRBDC) being the local sponsor and the trail manager, in conjunction with the cities and towns the trail passes through. The trail is located, or will be located, along levees either north or south of the river and crosses the EJ&E min line tracks in Griffith. The Grand Calumet River and Marquette Corridor Trails do not exist, although there is a Marquette Trail on a portion of an abandoned Indiana Harbor Belt (IHB) rail corridor within the Indiana Dunes National Lakeshore (INDU) in Gary. The Marquette Trail is administered by INDU. The plan is for a trail near the Lake Michigan shoreline of Indiana between Illinois and Michigan, not Ohio. The only part presently existing is in the vicinity of Whihala Beach County Park in Whiting, which may mean it is near the EJ&E Lake Front Line. Portions of the Grand Calumet River trail are in the planning stage; it will be constructed on city streets and the river shoreline both north and south of I-90/Indiana Toll Road. The Oak Savanna Trail is along an abandoned railroad grade and is administered by the Lake County Parks and Recreation Department. The Prairie Duneland Trail is also along an abandoned railroad grade and is administered by Portage, Chesterton, and Porter County.

Table 3.5-11, Land and Water Conservation Fund Properties: This table omits Hoosier Prairie and Clarke and Pine Nature Preserves, although both have received funding from the Land and Water Conservation Fund. We acknowledge that the National Park Service Website references (http://waso-lwcf.ncrc.nps.gov/public/index.cfm) do not list these two properties, but information about the funding is available from the Indiana Department of Natural Resources, Divisions of Outdoor Recreation and Nature Preserves.

Section 3.10.2, Existing Conditions: This section describes the existing conditions with respect to noise and vibration. It describes the Kirk Yard as being "between the shore of Lake Michigan to the north, the US Steel Gary Works to the east, an interstate highway to the south, and rail lines to the west." However, Kirk Yard is not along the shoreline of Lake Michigan; it is inland about a mile and the US Steel Gary Works is between it and the Lake.

Section 3.11, Biological Resources: This section describes the biological resources of the Study Area, which is a 1-mile-wide corridor centered on the EJ&E and CN rail lines.

Section 3.11.1, Background, and 3.11.6, Conservation and Natural Areas within the Illinois Study Area: Figure 3.11-1 in section 3.11.1 displays natural areas that would be affected by the proposed action and section 3.11.6 describes the natural areas. We note that the northern portions of MacArthur Woods and Middle Fork Savanna were not highlighted on the figure and were not described in these sections. These forest preserves are located along the EJ&E arch and provide habitat for Service trust resources. Therefore, the final EIS should highlight and describe these natural areas.

Figure 3.11-1 should be revised to designate the rail lines by segment number, since segment numbers are used in the text.

Table 3.11-1, Invasive and Nonnative Plant Species: Spotted knapweed (*Centaurea maculosa*) is another significant nonnative, invasive plant species that should be added to the list in this table and discussed in section 3.11.3.2, particularly since it is prevalent along railroad rights-of-way.

Table 3.11-2, Common Wildlife Species in the Study Area, and Table 3.11-3, Common Migratory Birds in the Study Area: These tables actually list many species that are very uncommon in the area, including those that are Indiana and/or Illinois listed rare species, as shown in Table 3.11-7, State-listed Threatened & Endangered Species Potentially within Illinois and Indiana Study Area. Common species would instead include American robin, blue jay, gray squirrel, white-tailed deer, and similar species that have adapted to living in human-dominated habitats. The rarer species are most often found within the Nature Preserves, Forest Preserves, and other significant habitats. Osprey, black-crowned night heron, and common loon are not "common" migratory birds within the study area (Table 3.11-3). Some of the birds listed migrate through the area but are not known to nest, while others on the list are known nesters.

There is also a large heron rookery in Lake County, Indiana, west of Cline Avenue and south of the Little Calumet River, which is about a mile west of the EJ&E main line. Although the rookery itself is outside of the mile-wide Study Area, the birds feed along the river in the vicinity of the railroad river bridge and numerous other locations along the river and area wetlands. Great blue heron, great egret, green heron, and black-crowned night heron have been known to nest at this rookery.

Section 3.11.7, Conservation and Natural Areas within the Indiana Study Area: This section mentions "county forest preserves," but Indiana does not have a County Forest Preserve system, instead having a County Park system. This section continues the confusing conservation land discussions mentioned previously in our comments and needs clarification. Table 3.11-5 and the discussion in this section need to indicate what community the various lands are located in, particularly since some of them are not shown on Figure 3.11-1. We have no idea if any of the unnamed high quality natural communities discussed include the EJ&E prairie, which is located east of Clark Road at the west end of the Kirk Yard. This sand prairie and wetland complex is a remnant dune and swale habitat not far from Clarke and Pine and Pine Station Nature Preserves and is an area the Indiana natural resources agencies are interested in preserving and enhancing, possibly as mitigation for the impacts of this STB project. This area is discussed further in our comments on Chapter 6, Mitigation.

Except for the Gaylord Butterfly Tract, the Hoosier Prairie State Nature Preserve is owned and managed by the Indiana Division of Nature Preserves, even though it is a component of the Indiana Dunes National Lakeshore and a National Natural Landmark. The Gaylord parcel is south of the main section of Hoosier Prairie and is adjacent to the south side of the EJ&E right-of-way in Segment 5B. Hoosier Prairie also includes an 18-acre parcel adjacent to the south side of the EJ&E main line immediately west of Kennedy Avenue.

The discussion of Clarke and Pine and Pine Station Nature Preserves should identify which EJ&E track is adjacent to the properties. Pine Station is both north and south of the Grand Calumet River and it is both owned and managed by the Indiana Division of Nature Preserves.

It is not clear why the Indiana Dunes National Lakeshore is mentioned, because other than owning the Gaylord Butterfly Tract in Griffith, it appears that INDU is not located along any of the EJ&E tracks. Therefore, the proximity of INDU to any of the EJ&E tracks needs to be clarified.

Section 3.11.8, Threatened, Endangered, and Sensitive Species: This section describes the federally listed species that have the potential to occur in the study area. In reference to the Hine's emerald dragonfly, it is noted that the Service has an agreement with EJ&E rail line for train operations on the Paul Ales Branch and that trains operate between 4 to 6 miles per hour to reduce adult mortality from direct train collisions. Furthermore, the DEIS notes that the reduced speeds minimize impacts to larval Hine's emerald dragonflies from "squishing" ground water from beneath the railbed, releasing sediments into larval habitat next to the railroad embankment. The final EIS should clarify that the speed limits were imposed by the special conditions of the 1996 U.S. Army Corps of Engineers (COE) permit (Permit # 199600211). Additionally, it should be clarified that the there is not an agreement in place between EJ&E and the Service; Commonwealth Edison was the applicant for the 1996 permit. It is our understanding that EJ&E operates trains on the line, the Metropolitan Water Reclamation District owns the land within the right-of-way, and Midwest Generation owns the rail line.

In reference to habitat for the eastern prairie fringed orchid, the EIS should also list wet to mesic prairie and marsh edges as suitable habitats. The DEIS notes two locations where the orchid was last recorded in the vicinity of the EJ&E. However, the orchid could be found in suitable wetland habitat throughout the study area and, as noted above, habitat assessments need to be conducted to determine whether suitable habitat is present.

Concerning the Karner blue butterfly, no critical habitat has been designated for the species anywhere throughout its range, so the Study Area is not the only area with no designated critical habitat. All of the Karner blue's larval stages utilize wild lupine (*Lupinus perennis*) as their sole food source, not just "several" of them.

In its February 12, 2008, letter to STB concerning the Draft Scope of Study for Finance Docket No. 35087, the Service's Bloomington, Indiana, Ecological Services Field Office stated that the proposed project area is within the range of the federally endangered Indiana bat (*Myotis sodalis*). The Service indicated that this species may be found along the floodplain of the Little Calumet River, which is crossed by the EJ&E main line tracks. However, this species is not listed on table 3.11-6 and is not discussed in this section of the DEIS. Based upon knowledge of the species, it is the position of the Service that the Indiana bat is considered to be present in suitable habitat unless proven otherwise. The Little Calumet River floodplain is considered suitable habitat although no studies have been undertaken along the river corridor in Lake County to prove or disprove the presence of the Indiana bat. The species is known along the East Branch of the river in adjacent Porter County. We therefore request that the Indiana bat be addressed in this section of the final EIS, as well as in section 4.11.

Section 3.12, Water Resources: This section discusses the various permits that may be needed by the Applicants because of project impacts to wetlands and/or Waters of the United States or Waters of the States. However, it confuses the Indiana Department of Environmental Management's (IDEM) Section 401 authority with the Federal Consistency Review requirements of the Indiana Department of Natural Resources. These are two separate and distinct reviews done by different agencies. Also, the discussion only addresses use of Nationwide Permits or the Indiana Regional General Permit No. 1, not the procedure if an individual permit is required under Section 404 of the Clean Water Act or Section 10 of the 1899 Rivers and Harbors Act. Both types of permits need to be discussed.

Section 3.12.5, Wetlands: This section notes that the Applicants would be required to conduct wetland delineations as part of Section 404 of the Clean Water Act. The Service recommends that the delineations and habitat assessments (e.g., Floristic Quality Assessments) be conducted during the growing season for greatest accuracy and reliability.

This section also needs to acknowledge publicly owned wetlands along the Little Calumet River in Lake County, Indiana. These wetlands are owned by the LCRBDC as part of the flood control project lands.

Environmental Consequences (Chapter 4)
As stated previously, we believe that a grade separation will likely be needed at 5th Avenue in Gary, Indiana, because it is the main west-side access into and out of the city. Therefore, the consequences of such a structure need to be addressed in this section.

Section 4.2.5, Hazardous Material Transportation Safety: This section needs to indicate whether or not herbicides and pesticides that could impact wildlife will be carried by the trains and may be released in an accident. If such materials spilled near a site containing endangered wildlife, such as the Karner blue butterfly, the population could be decimated before containment and clean-up is achieved. Temporarily restricting use of a water body that has received a spill may help keep humans away, but it will not help the wildlife that utilize the water body and cannot escape it.

Section 4.5, Land Use: This section states that the proposed action would not affect public lands in Indiana (page 4.5-3). We disagree. The Gaylord Butterfly Tract and the Hoosier Prairie 18-acre Kennedy Avenue tract would be affected by proximity effects, such as increased noise, because they are immediately adjacent to the EJ&E main line. The 18-acre Kennedy Avenue tract could also be impacted by any changes to the at-grade crossing at location. As previously noted, both Clarke and Pine and Hoosier Prairie Nature Preserves are Section 6(f) Land and Water Conservation Fund properties.

Construction of the Griffith connector (page 4.5-11) may not impact land use patterns, but it would certainly impact current use at the site, which is undeveloped open space. This is described as 3.25 acres of vacant land, which is actually sand prairie, wetland, and savanna/woodland. Section 4.11, Biological Resources, states that although there are natural habitats in the proposed connection areas, "the affected wildlife habitat is general minor [sic] and wildlife is mobile" so the proposed construction would not affect wildlife. This no-effect is not accurate. Wildlife forced to move from their habitat or die are "affected"; any eggs or immobile individuals will be killed. Wildlife do not necessarily have other habitats to move into because those habitats are already occupied. Wildlife have specific home ranges of certain sizes, and wildlife cannot be "stacked" into remaining habitats. Therefore, all of the wildlife species utilizing the 3.25 acres of natural habitat at the Griffith connector will be adversely affected through loss of habitat. These wildlife include insects, amphibians, reptiles, birds, and mammals. More detailed descriptions of the habitats at the Griffith connector site are necessary (page 4.11-16). The wetland at the Griffith connector site is not just a palustrine emergent seasonal type; it also includes scrub-shrub and forested components (Table 4.12-7, Wetland Effects from Proposed Connections). We agree that a botanical survey is necessary at the Griffith connector site prior to construction. Such a survey is also needed at the Ivanhoe connector site because of the remnant prairie along the south side of the CSXT tracks.

Section 4.10, Noise and Vibration: This section discusses noise impacts from the proposed action and estimates the number of noise-sensitive receptors that would be affected by increased average noise levels (in dBA). However, SEA's analyses only considered noise impacts on humans and did not consider the effects of noise on wildlife (specifically migratory birds), although the effects on wildlife are mentioned in Section 4.11. In this section, SEA determined that noise levels less than 65 dBA are generally not considered adverse to human health and welfare. SEA also determined that the majority of the EJ&E segments would experience noise levels of 65 dBA or greater and that seven of the segments would experience noise levels of 70 dBA or greater. The noise levels for some of these segments could approach 100 dBA since the existing noise levels at some of the monitoring stations in Table 3.10-2 show dBAs currently above 80 dBA and up to 92 dBA. In addition, average sound exposure levels (SEL) for locomotives horns, locomotives, and rail cars along the EJ&E are 104.1 dBA, 93.9 dBA, and 91.7 dBA, respectively.

Section 4.10.1.1 of the DEIS notes that the Board requires an evaluation of potential noise effects as part of an environmental analysis. However, SEA did not evaluate the potential noise effects on a major component of the environment, wildlife. Research exists that indicates thresholds for which adverse effects would be seen in wildlife, particularly in migratory birds. The issue of noise impacts to migratory birds is discussed in more detail in our comments on Section 4.11. Because of the numerous natural areas located adjacent to the EJ&E arch and the potential for adverse effects from the increased noise levels, noise impacts and their effects on wildlife should be considered and discussed in this section of the final EIS.

Sections 4.11.1 and 4.11.3, Biological Resources: These sections present the methodology SEA used to determine potential effects from the proposed action on biological resources and details the potential effects by category. In the summary of findings, we agree with the statement that wildlife and natural areas would experience a higher probability of exposure to hazardous material spills and that bird populations may experience behavioral or physiological effects and masking of communication signals because of increased noise. We also agree that several forest preserves, nature preserves, and state parks would be affected by the increased train traffic. However, we do not agree with the determination that only bird populations within 500 feet of the rail line could be affected. This issue is discussed in greater detail in our comments below on Section 4.11.3.1, Proposed Changes in Rail Line Operations-Wildlife.

We disagree with the finding that only the Hine's emerald dragonfly and Karner blue butterfly could be affected by the proposed action. As noted above, determinations about the eastern prairie fringed orchid cannot be made without surveys or habitat assessments such as a Floristic Quality Assessment. We also disagree with the finding that changes in rail operations would not affect the Hine's emerald dragonfly and that the orchid only has the potential to occur at the Proposed Griffith Connection.

We disagree with several of the conclusions at the end of section 4.11.3, which are:
(1) the risk of hazardous materials spills would increase but the probability is still remote,
(2) the probability of train/animal collisions would increase but would remain low,
(3) the noise effects to wildlife, particularly migratory birds, would increase but effects are expected to remain slight, and
(4) impacts to the Hine's emerald dragonfly from ground vibration are not expected to change.

The final EIS should discuss the benefits of the proposed actions on wildlife, as a result of reduced train activity inside of the EJ&E arch. For example, based on maps provided, existing adverse impacts (e.g., noise, collisions) to wildlife would be reduced on the Freeport Subdivision (south of Schiller Woods Forest Preserve), the Joliet Subdivision (along the Palos Preserves), and the South Bend Subdivision (north of Wampum Lake Woods and Thornton Lansing Road Nature Preserve).

Section 4.11.3.1, Proposed Changes in Rail Line Operations -Wildlife: This section acknowledges that rail line operations would lead to increased noise (see above). Numerous studies investigating the effect of noise on wildlife have been conducted. In this regard, birds have been studied the most (with most of those studies involving the effects of traffic on birds). Very little research has been completed showing the affect of railroad noise on birds. However, a recent study by Waterman et al. (2004) on meadow birds in the Netherlands showed that wetland birds were adversely affected by railroad noise levels ranging from 42 to 49 dBA.

The DEIS notes that several of the highway studies documented lower species diversity and lower breeding densities near roads and highway traffic. However, most of these studies do not conclusively show that noise is the main cause of these effects and that other variables associated with noise (e.g., visual disturbance) are not factors. In a series of studies in the Netherlands, Reijnen et al. (1987, 1995, 1996, 1997), Reijnen and Foppen (1994, 1995), and Foppen and Reijnen (1994) have shown that the number of breeding woodland and grassland birds have declined significantly near roads as a result of noise. The farthest distance for which reductions in the numbers of breeding birds were still observed from the roads was 1500 meters (4,921 feet). These studies also showed that noise levels as low as 50 dBA resulted in an adverse effect on breeding birds (with several studies showing an effect below 60 dBA). In these studies, 33 of 45 investigated woodland bird species were adversely affected by noise and 7 of 12 grassland species were adversely affected. Forman et al. (2002) also showed that several species of grassland birds (especially bobolink and eastern meadowlark) decreased in numbers and breeding densities near roads. Waterman et al. (2004) found adverse effects of railway noise in meadow/wetland bird species within 15 areas along existing railroads. These birds consisted mostly of shorebirds and ducks. The threshold noise level at which bird densities were adversely affected varied little among the species studied and, as noted above, ranged from 42 to 49 dBA.

Although it can be argued that the studies indicating an adverse effect on birds do not clearly isolate noise as an exclusive source of disturbance, it is widely agreed that noise has a negative effect on birds. The reference to the 500-foot distance as a threshold for reduction of adverse effects to birds can be disputed based on other studies showing an effect at longer distances (up to 1500 meters).

The DEIS identifies the numerous natural areas along the EJ&E arch and describes the vast numbers of migratory birds (including state listed species) that frequent these natural areas. Thus, the DEIS highlights the importance of these natural areas as bird concentration areas.

The final EIS should compare the predicted noises levels from the proposed action (including the increased number and frequency of trains) to noise levels and distances that have shown an adverse effect on migratory birds. Based on the studies reviewed by the Service showing adverse effects at greater distances than noted in the DEIS and adverse effects on breeding bird

densities at lower noise levels than noted in the DEIS, the proposed action would adversely affect migratory birds.

This section also notes that wildlife and natural areas would experience a higher probability of exposure to hazardous material spills and train collisions. SEA acknowledges the potential increase in the possibility of hazardous materials releases; however, due to regulatory and other safeguards in place, SEA believes the possibility of hazardous materials releases are remote. We disagree with this conclusion because, as SEA highlights, the increase in hazardous materials releases would increase with the increased amount of train activity. This increased probability would occur regardless of the regulatory safeguards currently in place. SEA evaluated the frequency of release (before and after the proposed action) of hazardous materials based on statistics provided by the Applicants. The results are shown in Table 4.2-23. However, these results and other results fail to support SEA's determination that hazardous releases are remote. The final EIS should provide data that shows the potential frequency of spills with the proposed number of carloads transporting hazardous materials per day (anticipated at up to 500 carloads per day). Table 4.2-23 shows potential intervals between anticipated hazardous material releases in years. The final EIS should also provide data that compares the frequency of spills (with the proposed number of carloads) with other rail lines transporting comparable numbers of cars per day over similar distances. This comparison of data could show whether the possibility of hazardous materials releases is remote.

Section 4.11.3.1, Proposed Changes in Rail Line Operations - Natural Areas: This section identifies four categories of risk to natural areas. Again, the 500-foot distance is provided; however, it is noted that animals in the area already live with daily noise from trains and therefore, noise could only have minor effects on wildlife and natural areas adjacent to the EJ&E arch. These statements do not take into account the increased number of trains proposed to operate on the EJ&E arch and the subsequent increased frequency of disturbance. Although it is acknowledged that some bird species habituate to increased noise levels, this ability to avoid the impacts of noise may be due to the fact that species able to habituate are native generalists or non-native colonizers (Kasloo and Tyson 2004, Slabbekoorn and Ripmeester 2008). Slabbekoorn and Ripmeester (2008) note that several of the native generalists or non-native colonizers are able to adapt to urban noise conditions. Rare and declining bird species along the EJ&E arch that would be subject to the increased number of trains may not be able to habituate to the increased disturbance levels because they are not native generalists, non-native colonizers, or urban species. Several of these species are on the Service's Region 3 Fish and Wildlife Resource Conservation Priorities (RCP) list and have also been identified as focal species by the Service's "Focal Species Strategy for Migratory Birds." In addition, several of these bird species are listed as endangered or threatened species by the state of Illinois.

The DEIS also notes that animals living in and passing along the EJ&E arch may be at higher risk of being struck by trains due to increased traffic. However, the DEIS goes on to state that these animals have adapted to the existing train traffic, and there would not be an effect on animal populations. For both conclusions, the final EIS should use analyses to support these claims, factoring in the increased number of trains and increased frequency of the trains traveling along the EJ&E arch. Lower densities and diversity of wildlife near roadways may be due in part to increased mortality from collisions with vehicles. We would expect to see increased mortality from collisions with trains if there is an increase in the number of trains.

Section 4.11.3.1, Proposed Changes in Rail Line Operations - Federally Listed Species: This section notes that vibration of the tracks causes sediments to be pushed from the rail bed into larval Hine's emerald dragonfly habitat, resulting in adverse impacts to Hine's emerald dragonfly larvae. It is also noted that the proposed action would not change operations on the Paul Ales Branch; therefore, the DEIS concludes that Hine's emerald dragonfly larvae would not be affected beyond current operations.

The DEIS notes the dispersal ability of adults, indicates (in Figure 2.2-1) that 42.3 trains would pass through the area per day, and that the risk of collisions for adults could increase in EJ&E Segment 9B (at the southern most end of designated Critical Habitat). A study in Door County Wisconsin demonstrated Hine's emerald dragonfly mortality that resulted from collisions with vehicles (Soluk and Moss 2003). We believe that Hine's emerald dragonflies would also be vulnerable to passing trains and that more trains would increase this risk. However, SEA concludes that increases in traffic on this segment are not likely to adversely affect the Hine's emerald dragonfly. The Service disagrees with this conclusion and questions how SEA made this determination given the information provided to them. As noted in Section 3.11.8.1, adult Hine's emerald dragonflies were observed in 2004 in the area of Segment 9B. More recent surveys in 2007 also identified adults in this area, which is less than 0.12 miles north of Segment 9B, well within the flight distance of an adult dragonfly.

We do not concur with SEA's conclusion that the proposed action would not adversely affect the Hine's emerald dragonfly. For this reason, we recommend that SEA consider requesting formal consultation as described in section 7 of the Endangered Species Act of 1973, as amended. We recommend that SEA inform the Applicants to consider carrying out actions that would enhance the habitat for Hine's emerald dragonflies, but that would not create an attractive nuisance near railroad tracks. SEA should request formal consultation if its actions would result in adverse effects to the listed species. For example, if SEA's actions would modify train speeds or modify numbers of trains on specific lines, then SEA's actions would directly or indirectly lead to adverse effects on the Hine's emerald dragonfly. SEA and the Applicants should also seriously consider joining in the effort to develop a Habitat Conservation Plan (HCP) in the lower Des Plaines River Valley. At present, the Applicants do not have the permission to take the federally listed species. The Endangered Species Act provides two possible approaches to an applicant to gain permission from the Service to take listed species. That permission may be granted after conducting a review necessary as part of a formal consultation. Permission to take may also be granted following review and approval of an HCP and accompanying section 10(a)(1)(b) permit application.

Table 4.11-2, Potential Effects on Federally Listed Species Along the EJ&E Rail Line Due to Operational Changes: Contrary to the information provided in this table, the Karner blue butterfly is not present in EJ&E Segment 5B.

Section 4.11.3.1, Proposed Changes in Rail Line Operations - State Listed Species: This section discusses the state listed species that occur in the study area. Although this section discusses state listed species, we provide comment because all the grassland, marsh, and rookery bird species listed in Table 4.11-3 are Service trust resources and most of them are listed as rare and declining bird species by the Service. Of the species listed in Table 4.11-3, Henslow's sparrow, short-eared owl, upland sandpiper, and king rail are on the Service's RCP and Focal Species lists. Black tern, common moorhen, least bittern, black-crowned night heron, and American

bittern are on the RCP list. Sandhill crane is on the Focal Species list. All of the birds on the RCP list are listed due to their rare or declining status and, therefore, have a need for special conservation attention. Focal species are those the Service is targeting for a return to healthy and sustainable levels.

Table 4.11-3 needs to include black-crowned night heron and Franklin's ground squirrel in the segment along Clarke and Pine and Pine Station Nature Preserves, since both species are found at these preserves. Henslow's sparrow is listed in the table as likely being present in Segment 4, which is the developed town of Griffith. We strongly doubt that this grassland species is present in the developed community, although it may be present along the CN Segment 33 at Oak Ridge County Park or CN Segment 23A at Hoosier Prairie.

This section also discusses increased Blanding's and spotted turtle mortality due to increased rail traffic. Although we agree with this assessment, we do not agree with SEA's conclusion that only minor effects are expected because habitat structure would not change and both species currently occur in the rail environment. The final EIS should address turtles being trapped between railroad rails and how increased train activity would result in longer periods of being trapped. Research has shown that prolonged periods of being trapped between railroad rails can result in mortality and physiological stress (overheating) on turtles (Kornilev et al. 2006).

Rookery species of birds could be adversely impacted by any activity that adversely impacts the Grand Calumet River and Little Calumet River, because herons and egrets regularly feed along these rivers, including near the EJ&E bridges.

Concerning Dune Invertebrate Species (page 4.11-13), the Gaylord Butterfly Tract and Hoosier Prairie Kennedy Avenue tract are directly adjacent to the EJ&E main line tracks and are not buffered from them by petroleum storage facilities.

Section 4.11.3.2, Proposed New Constructions/Connections - Wildlife: As noted above and in the DEIS, PWWFP is an important bird area and noise would adversely affect birds in the area. In addition to the increased numbers of trains, noise from construction could adversely affect breeding birds during the breeding season. This could be minimized by restricting construction during the breeding season (April – August). This recommendation holds true for all Munger alternatives except for the Munger-UP Connection alternative.

The section also states that "because the affected wildlife habitat is generally minor and wildlife is mobile, SEA determined the construction of the connections would not affect wildlife." We disagree with the determination and again note that the DEIS emphasizes the habitat value and diversity of state listed bird species at the Munger location. The presence of the high number of state listed species does not support the conclusion that the affected habitat is generally minor. Furthermore, no wildlife survey data have been provided for the Matteson alternatives, although the DEIS indicates that wetlands and wetland birds are likely present in the area of this connection. Therefore, based on the lack of supporting information, we cannot concur with SEA's determination. The final EIS should address these issues.

Section 4.11.3.2, Proposed New Constructions/Connections - Natural Areas: Refer to the comments above.

Section 4.11.3.2, Proposed New Constructions/Connections - Federally Listed Species: Figure 2.2-1 indicates that train activity would increase to two trains per day along the Joliet Subdivision, in the area of the Proposed Joliet Connection. Take of adult Hine's emerald dragonflies may be currently occurring on the Joliet Subdivision. An increase in train activity would result in further take. Adult Hine's emerald dragonflies were observed approximately 0.17 miles west of the Joliet Subdivision and approximately 1.10 miles northwest of the Proposed Joliet Connection in 2004. The Service has tried unsuccessfully to address the issue of take with Canadian National in the past (see enclosed letter). Due to the proposed increased train activity within the flight distance of an adult dragonfly, the Service concludes that the proposed action would likely adversely affect the Hine's emerald dragonfly and take could occur.

The DEIS notes that the eastern prairie fringed orchid could occur at the proposed Griffith Connection or wetland margins. As stated above, the orchid could be found in suitable wetland habitat throughout the study area, and surveys or habitat assessments need to be conducted in areas of new construction or double tracking to determine whether suitable habitat is present. Therefore, there is insufficient information to conclude that the orchid is not likely to be adversely affected.

Section 4.11.3.2, Proposed New Constructions/Connections - State Listed Species: Refer to the comments above.

Section 4.11.3.2, Proposed New Constructions/Double Track - Federally Listed Species: The Service agrees with SEA's determination that the orchid, mead's milkweed, and prairie bush clover could be affected by double track construction if suitable habitat is present. In addition to the proposed surveys, wetland delineations and habitat assessments should be conducted in wetland areas.

Section 4.12 and 4.12.3.2, Water Resources: The Service agrees with SEA's findings in this section that increases in rail traffic would result in a corresponding increase in the risk of hazardous spills, which could affect water resources. The DEIS notes that wetlands would be directly impacted during construction of connections and double tracking and that wetland delineations would be conducted as part of the permitting process. The final EIS should also indicate that habitat assessments should be conducted as well to determine if suitable habitat is present for the orchid and to help determine mitigation ratios for proposed wetland impacts.

Table 4.12-1, Potentially Affected Lakes and Preserves: This table lists conservation lands that contain water but fails to include Ivanhoe Dune and Swale and Ivanhoe South. These areas contain water/wetlands in the form of interdunal swales and should be listed on this table and discussed in the text.

Indirect and Cumulative Effects (Chapter 5)

Section 5.3, Potential Indirect Effects of the Proposed Action: In Section 5.3, SEA concludes that the proposed action could result in indirect effects from increased rail activity in the East Joliet and Kirk Yards and general indirect effects throughout the region. Section 5.3.1 discusses the general indirect effects of the project, **but does not** address any potential indirect effects on biological resources. This section does not disclose indirect impacts from the proposed action

and does not address indirect impacts to biological resources in the study area. The final EIS should address indirect effects to all biological resources listed in Chapter 4, or provide substantial documentation if the conclusion is that the proposed action would not result in indirect effects on biological resources.

Section 5.4, Related Projects, and Section 5.5, Site-Specific Cumulative Effects Analysis of Related Projects: These sections discuss past, present, and foreseeable cumulative effects on natural resources from the proposed action and at other areas outside the EJ&E right-of-way which should be considered in the cumulative impacts analysis as described in the National Environmental Policy Act (NEPA). In section 5.5.1, SEA concludes that the interaction between the proposed action impacts and the proposed Metra Star Line could result in minor cumulative impacts. Table 5.5-1 indicates that PWWFP would be affected and effects to biological resources would be minor. We believe that the impacts will be far more substantial than indicated in the DEIS. Departmental comments regarding Chapter 4 describe our concerns with respect to impacts of the proposed project to biological resources, particularly migratory birds. The impacts from the proposed action and the proposed Metra Star Line would occur along the same areas of the EJ&E arch and would adversely impact (specifically via noise) migratory birds in the same natural areas along the EJ&E arch. Furthermore, it is noted that the proposed Metra Star Line could result in a new dedicated track within the EJ&E right-of-way. A new track could have far greater direct construction impacts than the Applicants' proposal. The final EIS should more fully disclose the cumulative effects of the proposed Metra Star Line and the proposed project. The final EIS should address increased noise impacts and the increased probability of collisions with wildlife. Additionally, in the final EIS, Section 5.5.2 should provide figures depicting the locations of the proposed Star Line commuter stations so that determinations could be made about potential adverse impacts to natural areas and wildlife.

Mitigation (Chapter 6)

Section 6.2, Applicants' Voluntary Mitigation Measures: Chapter 6 discusses mitigation, including proposed voluntary mitigation measures offered by the Applicants as described in this section. We believe that a significant number of the Applicants' proposed mitigation measures are, in fact, best management practices that should be automatically required as part of the proposed action. Others, such as VM 64 concerning wetland fills and VM 65 concerning NPDES permits, are actions that are required by law and are not voluntary. Air quality VM 43, concerning switching to locomotives that emit fewer air pollutants, is commendable, but a time table needs to be established and adhered to. As stated, the proposal is open-ended on when it will occur, which could be many years away. The Applicants did not propose any mitigation measures to compensate for unavoidable impacts to biological resources.

Section 6.3, SEA's Preliminary Environmental Mitigation Measures: This section discusses the preliminary recommended environmental mitigation measures that are based on SEA's environmental analysis of the proposed action. SEA proposes mitigation measures to address effects not addressed by the Applicants' voluntary mitigation. We do not understand why adherence to required safety plans, including Occupational Safety and Health Administration (OSHA) requirements, is considered mitigation.

Several of the SEA proposed mitigation measures use terms such as "regularly inspect" or "communicate regularly" with other entities concerning noise and vibration (Nos. 24 and 26),

without defining "regularly". Noise and possibly vibration also affect wildlife, so a clearly defined inspection schedule should be required.

The Department's Recommendations for Additional Mitigation

As noted in our above comments, we believe that the DEIS does not fully disclose all potential project impacts to natural resources. To address these potential impacts, as well as to augment some of SEA's proposed mitigation measures, we offer the recommendations below. These recommendations should be added to the indicated subsections in Chapter 6 in the final EIS.

Section 6.3.10.1, Noise:

- The Applicants should construct noise barriers in all locations where the EJ&E arch crosses through or is adjacent to a natural area that has been identified in the DEIS as an area where birds are concentrated. These areas have been discussed previously and are identified in various places in the DEIS. The noise barriers should be constructed on the outside of the existing or proposed tracks (both sides) and the Applicants should review existing research that discusses the heights, shapes, and materials used to construct the barriers (e.g., use of absorbent material) in order to mitigate noise impacts to birds and wildlife. These should be designed in association with designated wildlife crossings to permit the safe crossing by wildlife. The Service can provide technical assistance in the noise barrier review. The Applicants should construct these barriers to keep the noise levels below 50 dBA in these areas. Noise barriers should also be discussed as a potential mitigation measure in section 6.3.11.2.

Section 6.3.11.3, Federally-Listed and State-Listed Threatened and Endangered Species:

- The Applicants should continue to abide by the special conditions of the 1996 COE Permit # 199600211 for train operations on the Paul Ales Branch in order to minimize further impacts to larval Hine's emerald dragonflies.

- The Applicants should conduct wetland delineations and habitat assessments in all construction areas to determine if suitable habitat is present for the eastern prairie fringed orchid. If suitable habitat is present, the Applicants should conduct orchid searches during the bloom date: June 28 through July 11, with searches conducted a minimum of three non-consecutive days within this time period.

- The Applicants should construct turtle ramps, drop boxes, or other structures that reduce the possibility of turtles becoming trapped within railroad rails, in all locations where the EJ&E arch crosses through or is adjacent to wetland areas. These structures should be placed at regular intervals in identified wetland areas. The Applicants should also construct turtle crossings in areas where turtles are concentrated (e.g., PWWFP). The Service can provide technical assistance in the selection and placement of these structures.

Section 6.3.14.6, Biological Resources:

- We agree with proposed Mitigation 30 concerning the Karner blue butterfly in the West Gary Recovery Unit. However, we do not agree with proposed Mitigation 57 concerning development and implementation of a plan for the restoration of dune and swale in the Ivanhoe connector area.

Based upon experience with attempts to recreate dune and swale habitat, we know that it has not been successful, even in areas not as heavily disturbed as the industrial property that would be affected by most of the connector. Therefore, we request that this proposed mitigation be deleted and replaced with mitigation to require the preservation and enhancement of the EJ&E prairie at the northwest end of the Kirk Yard. As previously mentioned, this area retains many natural qualities and is considered significant habitat for native plants and animals. It also supports wetlands, which likely need enhancement due to the encroachment of invasive species of plants and possibly animals. Therefore, it may be suitable to serve as required mitigation for the loss of wetlands at the Griffith connector, subject to approval by the regulatory agencies. Preservation of this prairie/wetland complex could be through a deed restriction and management agreement with the Indiana Division of Nature Preserves or through gift or sale to that agency.

- As discussed in our comments regarding section 3.3.1, we believe that a grade separation of the EJ&E over 5th Avenue or 5th Avenue over the EJ&E in Gary will likely be needed, resulting in impacts to the Ivanhoe dune and swale preserves. Mitigation measures to avoid, minimize, and offset any impacts need to be developed and included in the final EIS.

- The Applicants should avoid construction at PWWFP during the bird breeding season (April – August) to avoid disturbance of breeding birds in the vicinity.

- The Applicants should construct a hazardous materials containment system at PWWFP to capture hazardous materials in the event an accidental spill in this important wetland and bird habitat.

- We agree that Mitigation 62, concerning clearing of all equipment to reduce or prevent spread of invasive plant species, is necessary and desirable. However, the equipment would also need to be cleaned to remove invasive animal species, many of which are microscopic, such as veligers of invasive mussels that could spread into natural lakes and streams.

Section 6.3.14.7, Water Resources:

- The Applicants should conduct wetland delineations and associated habitat assessments to determine the floristic quality of wetlands that would be impacted by construction activities. The habitat assessments would be useful in determining the wetland mitigation replacement ratios, which could be higher than the 3:1 ratio noted in section 6.3.14.7.

- The Service believes that areas adjacent to the existing rail lines that currently support breeding grassland and wetland birds would become less suitable due to the increased number of trains and associated noise. We recommend that the Applicants consider conducting wetland and habitat restoration at one or more sites more remote from the rail lines to offset any reduced breeding bird productivity. There are a number of publically owned sites near the EJ&E arch that are currently undergoing habitat restoration or may be suitable candidates for restoration where impacts could be adequately offset. If this option is pursued, the Service could provide technical assistance in identifying potential sites.

Short-Term Use versus Long-Term Productivity of the Environment (Chapter 7)

In this chapter, SEA concludes that there would be some short-term construction disturbance which could have some impacts on resources. However, these would be eliminated upon completion of the construction activities. SEA also concludes that there would be no long-term impacts to resources. We disagree with SEA's conclusion that there would be no long-term impacts to resources and that short-term or long-term impacts would only result from disturbance associated with construction.

We believe that noise impacts to birds would be a long-term impact on birds. In addition, mortality of wildlife from train collisions and wildlife being trapped for longer periods between rails would also be long-term impacts. The final EIS should address these impacts on resources.

Section 7.2, Potential Hazardous Material Release: We disagree with SEA's conclusion that there would be no short or long-term impacts resulting from hazardous materials releases in the proposed construction areas. Due to the increased number of trains, the proposed action would create long-term impacts on resources (e.g., at PWWFP). The final EIS should address this issue more thoroughly.

Section 7.3.1, Wetlands: We agree with SEA's statement in section 7.3 that wetland productivity could be affected through permanent losses and adverse impacts to wetland function. However, section 7.3.1 states that long-term productivity would not be affected because the wetlands and wetland functions would be restored or replaced via mitigation. In addition, SEA states that wetlands and wetland functions would be protected by best management practices. We disagree with both conclusions.

Typically, wetland mitigation through section 404 of the Clean Water Act has focused on mitigating direct loss of habitat. However, we have suggested that increased noise would have a long-term impact on breeding bird productivity, which would not likely be considered during permit review, nor is it adequately considered in the DEIS. Offsite bird habitat restoration, as suggested previously in our comments, should be considered as a means of maintaining wetland bird productivity. Similarly, best management practices would offset some water quality and quantity impacts at the area of impact but would not address the impacts to wetland wildlife associated with increased rail noise. The final EIS should address these issues.

Irreversible and Irretrievable Commitments of Resources (Chapter 8)

Section 8.1.3, Protected Species: We disagree with SEA's conclusion that the proposed action would not irreversibly or irretrievably affect any particular animal populations. We believe that there would be ongoing impacts to wildlife that would not be fully mitigated with the mitigation measures presently proposed in the EIS. Our comments include recommendations that could improve the mitigation and lend support to SEA's conclusions.

Appendix M – Biological Resources Analysis

Section M.3.1, Natural Areas with Potential for Impacts: As noted previously, Middlefork Savanna Forest Preserve and MacArthur Woods Forest Preserve should be added to this section

and other applicable sections in the final EIS. Descriptions of these areas and the resources that could be affected should also be included in the final EIS.

For most of the natural areas listed in the section, SEA makes the same determinations that increased noise could only affect animal behavior within 500 feet of the rail line (and these animals already live with daily noise) and that the increased potential for animal/train collisions is not likely to adversely affect any particular animal populations. Again, we disagree with these conclusions. The language in the final EIS should be changed in this section to reflect our other requested changes listed throughout our comment letter.

Section M.3.1.1.9, Lake Renwick Forest Preserve: This section discusses the significance of the Lake Renwick Heron Rookery Nature Preserve. This section also acknowledges that flushing events from trains or train noise have been documented at the rookery. We do not agree with SEA's conclusion that there would not be a measurable impact on birds in the rookery from increased train noise. We also do not agree that SEA's determination that the increased potential for animal/train collisions would not likely adversely affect the rookery. The final EIS should address these issues.

Section M.3.1.1.14, Sauk Trail Woods and Indian Woods Forest Preserve: We disagree with SEA's determination that minimal impacts from increased noise and collisions on wildlife or habitat because this area is not being managed for wildlife or habitat. Just because a natural area is not being managed for wildlife or habitat does not mean wildlife is not present (and could be adversely affected). This language should be changed in the final EIS for this section and any other section for which this determination was made.

Table M.3.2-1, Natural Areas with No Impacts from the Proposed Action: We do not agree with SEA's inclusion in this section of natural areas that provide habitat for migratory birds and which are in close proximity to the EJ&E arch. The final EIS should address these issues.

SUMMARY COMMENTS

The DEIS provides general information on natural resources of concern to the Department, but detailed information and associated analysis is often lacking. Confusing information is presented about which agencies own or manage conservation lands in the two affected States and where conservation lands are located in relation to either the EJ&E or CN tracks. The DEIS inadequately identifies adverse impacts to the Service's trust resources (federally listed species and migratory birds) and does not fully disclose impacts to other wildlife. As a result, the DEIS inadequately identifies appropriate mitigation for these environmental impacts.

We offered numerous recommendations in these comments to address the aforementioned inadequacies of the environmental impact statement and thereby assist the SEA in fully disclosing and appropriately mitigating anticipated adverse environmental impacts.

The Department recommends that SEA coordinate with the appropriate Service field office(s) to discuss the concerns expressed and attempt to resolve the opposing views of the two agencies about anticipated project impacts to Service trust resources and mitigation needed to address the impacts. The results of the coordination, particularly any remaining differences of opinion, should be disclosed and adequately discussed in the final EIS.

The Department looks forward to continued coordination with SEA and the Applicants to ensure that project impacts to resources of concern to the Department are adequately addressed. For matters related to fish and wildlife resources and federally listed threatened and endangered species in the Illinois portion of the study area, please continue to coordinate with Mr. Shawn Cirton, U.S. Fish and Wildlife Service, 1250 South Grove Ave., Suite 103, Barrington, Illinois 60010, phone (847) 381-2253, extension 19, fax (847) 381-2285. For the Indiana portion of the study area, please continue to coordinate with Ms. Elizabeth McCloskey, P.O. Box 2616, Chesterton, Indiana 46304, phone (219) 983-9753, fax: 219-983-9816.

We appreciate the opportunity to review the document and provide comments.

Sincerely,

Michael T. Chezik
Regional Environmental Officer

DOT-6

Before the
Surface Transportation Board
Washington, D.C.

Canadian National Railway Company, and Grand Trunk Corporation -- Control -- EJ&E West Company	)	Finance Docket No. 35087

Comments of the
United States Department of Transportation
On the Draft Environmental Impact Statement

Introduction

The acquisition of the Elgin, Joliet & Eastern Railway Company ("EJ&E") by the Canadian National Railway Company and the Grand Trunk Corporation (collectively, "Applicants" or "CN") would result in the shift of significant amounts of traffic from rail lines that traverse the central urban core of Chicago to lines that run through suburban and exurban communities and other areas in the region. That shift would yield significant benefits as well as burdens, which would fall unevenly over the metropolitan area.

In this portion of the proceeding the Surface Transportation Board ("STB" or "Board") considers the transaction's environmental effects. The National Environmental Policy Act ("NEPA") requires the agency to take a "hard look" at the environmental consequences of the proposed acquisition, but does not demand that environmental values outweigh all others. *Robertson v. Merthow Valley Citizens Council*, 490 U.S. 332, 350-51 (1989). The Board accordingly fulfills its statutory obligations overall by weighing

"the anticipated public benefits against the potential adverse effects to the national transportation system, interstate commerce, and affected regions and communities." Draft Environmental Impact Statement ("DEIS") at 6-2, 6-3; *see* 42 U.S.C. §§ 4321 et seq.; 49 U.S.C. § 11324(d).

The United States Department of Transportation ("DOT" or "Department") has already expressed its view that the transaction warrants approval (subject to fairly minor conditions) pursuant to the underlying regulatory standard. 49 U.S.C. § 11324(d); DOT-4 (filed March 13, 2008). The Section of Environmental Analysis ("SEA") has now prepared a comprehensive analysis of the environmental and related impacts of the proposed acquisition. DOT comments herein only on specified portions of the DEIS, notably the prospects for rail congestion on the EJ&E lines and its consequences. We offer as well recommendations on mitigation efforts and responsibilities appropriate to this case. [1]

Before turning to the DEIS, however, DOT wishes to note a basic apprehension with the potential for processes like this one to impede clearly beneficial transportation projects because of very localized concerns.

The Uses of NEPA

Addressing the environmental concerns arising from this transaction raises a key issue vital to providing the rail capacity needed to meet growing transportation demands in an environmentally benign manner. That issue requires weighing potentially

[1]/ DOT takes no position with respect to matters covered in the DEIS that are not mentioned herein.

significant localized environmental impacts with a project's clear national and local environmental, economic, and other benefits.

Using EJ&E tracks to divert traffic currently passing through downtown Chicago, and investing to expand the capacity of the EJ&E, will provide significant benefits to businesses and consumers throughout the country, as well as to large numbers of residents in the Chicago area. On the other hand, as the DEIS indicates, the significant traffic shifts that make this merger beneficial from a national and regional transportation perspective negatively affect communities along the EJ&E.

The DEIS identifies a great many impacts of varying character and consequence, and lists mitigation options that might be implemented. The task at hand is to identify those impacts that are sufficiently meaningful to warrant mitigation, the most appropriate mitigation measure(s) in each case, and -- for those instances in which mitigation requires a financial (rather than, say, an operational) commitment -- sources of funding.

In commenting on the scope of the EIS earlier in this proceeding, DOT stressed that:

> It is simply not possible as a financial or operational matter to mitigate, for example, all vehicular safety and delay issues by a grade-separation at every crossing, or all noise issues by barring the use of train horns within earshot of homes or offices. Moreover, such a narrow perspective tends to emphasize more parochial concerns at the expense of others who are similarly situated with interests no less legitimate. By contrast, a more inclusive focus allows for a more realistic and efficient approach to mitigate adverse effects in cases, like this one, involving large traffic flows, numerous communities and even more numerous grade crossings, and finite resources.

DOT-3 at 3-4 (filed February 15, 2008).

This broad perspective properly serves the Board and the public interest, and helps to avoid more narrowly based decisionmaking. *See, e.g., CSX Corp., et. al, -- Control -- Conrail Inc,. et al.,* 3 S.T.B. 196, at 356-59 (1998). We urge the Board to adhere to this perspective as it considers possible mitigation measures for impacts that cannot be resolved by agreement among the parties. Delays in approval and/or the imposition of overwhelming mitigation costs on participating carriers could also provide an unintended and unfortunate incentive to railroads to forego otherwise beneficial transactions or seek alternatives that do not require regulatory approval. [2]

In sum, the overarching standard for the STB in this proceeding should be to assure that the transaction has net positive benefits, that significant impacts are fully disclosed and addressed where feasible, and that the Applicants take what steps they can to minimize impacts for which they are responsible. The Department agrees with SEA that it would be unreasonable to impose on the Applicants all the burdens required to mitigate virtually every impact in this case. DEIS, at 6-17. NEPA does not require this, [3] and sound public policy counsels against it, for it would frustrate the rationalization of the rail industry and deprive the public of the manifest benefits of that process -- higher efficiency, lower costs, reduced emissions, etc.

[2]/ For example, most of the traffic currently on the more congested parts of the EJ&E stems not from that carrier's own trains but from Union Pacific ("UP") and BNSF Railway ("BNSF") trains operating via trackage rights. DEIS, at 4.1-9. CN as well as these other railroads could potentially route additional trains over an independent EJ&E without need for STB approval. The impacts of any resulting increases in traffic over the line in that event would be neither studied nor mitigated.

[3]/ *See Robertson*, 490 U.S. at 352 ("There is a fundamental distinction [ ] between a requirement that mitigation be discussed in significant detail to ensure that environmental consequences have been fairly evaluated, on the one hand, and a substantive requirement that a complete mitigation plan be actually formulated and adopted, on the other.")

CN should not be held responsible for mitigation measures that are beyond its authority to implement, nor should it alone bear the costs of mitigating impacts that arise from a combination of the proposed transaction and other sources. The Department sets forth below recommendations on both reasonable mitigation options for the impacts we address, and appropriate funding mechanisms.

The Transaction's Public Benefits

Chicago has long been the nation's single most important railroad center, where all major carriers on the continent come together. It is unfortunately also the country's principal rail bottleneck. Moving traffic through the metropolitan area can add more than one day to transit time, with attendant costs to railroads, shippers, consumers, and the environment. *Id.* at 1.2-5. In recent years major public and private sector stakeholders have joined to form the Chicago Region Environmental and Transportation Efficiency ("CREATE") project, a massive undertaking to enhance transportation efficiency and safety in the area by improving and maximizing use of certain rail corridors, constructing multiple grade separations and rail over- and underpasses, upgrading rail facilities, etc. [4]

A lack of adequate funding has impaired CREATE's progress, but the pending transaction would effectively relieve some of the problems CREATE was meant to resolve. The shift in rail traffic from the CN to the EJ&E would make greater use of and expand existing capacity, reduce rail congestion, increase transportation efficiency, and enhance safety. *See, e.g.,* CN-2 at 23, Operating Plan (Exhibit 15), Verified Statement ("VS") of David L. Novak. Benefits will accrue to CN, of course, but also to shippers in

[4]/ For a fuller explanation, see www.createprogram.org.

the form of faster and more reliable service and lower logistics costs, and eventually to consumers in the form of lower prices. [5]

The transaction also will benefit the public by enhancing safety on a net basis even without any mitigation measures in place. The DEIS finds that both the rate and the number of train accidents overall will decline. DEIS, at 4.2-4; Table 4.2-3. [6] Accidents between motor vehicles and trains at grade crossings would also decrease. *Id.* at 4.2-17. SEA found there would be a substantial reduction in the risk of release of hazardous materials on the CN lines and a potential increase on the EJ&E, but the possibility "would remain remote." *Id.* at 4.2-38. Finally, the number of people exposed to the varied burdens of significant levels of rail traffic -- vehicular delays, risks to safety and air quality, etc. -- will be cut substantially, from more than 900,000 to about 335,000. *Id.* at 4.2-37.

But these benefits are not unalloyed. The shift in rail operations that is the driving force for the transaction often means that a benefit for one localized area entails a detriment for another. Simply put, a reduction in trains on the CN's urban tracks and the addition of trains on the EJ&E's suburban tracks commonly improves the quality of life for the former and decreases it for the latter. *Id.* at ES-12, -14. The significant adverse impacts must be addressed and mitigated to the extent feasible. In these times of strained rail capacity, DOT concentrates on the DEIS's treatment of rail congestion on the EJ&E and its consequences.

[5]/ As it has since the Staggers Act, competition from other railroads and modes of transportation will ensure that much of the benefit will be passed on to consumers.

[6]/ Rail accidents on the pertinent lines would decline by 8%, while accidents in rail yards would increase slightly because of increased switching activity because of the merger. DEIS, at 4.2-7. The SEA proposes mitigation conditions that should reduce the risk of such accidents.

Rail and Vehicular Congestion

The SEA measures the capacity of the EJ&E line to accommodate the train volumes projected by Applicants in their Operating Plan and finds that, even after completion of the proposed capital projects, such traffic levels would put the EJ&E "at or very near to capacity." DEIS, at 4.1-39. On this basis SEA considers that the Applicants' traffic projections "while optimistic, present a reasonable basis on which to conduct the environmental impacts analysis." *Id.* The Department, however, believes that the DEIS finding depends to some degree upon unrealistic assumptions, and thus may understate the likely extent of rail congestion on the EJ&E and its consequences.

The DEIS assesses the capacity of the EJ&E using three different analytical techniques. The first is a "bottleneck analysis" of a line segment over which the capacity to add trains cannot be readily or inexpensively increased. DEIS, at 4.1-21. SEA chose to study an eleven mile segment between Walker (near Plainfield, IL) and Rock Island Junction (near Joliet, IL), which includes the Des Plaines River Bridge, the EJ&E's East Joliet Yard, and other operational and physical constraints. SEA concluded that "the Applicants' Operating Plan would consume all or nearly all of the main line capacity of this bottleneck." *Id.* at 4.1-26.

This statement implies there will be no adverse impacts on the segment, but that will be the case only if pertinent assumptions hold true. However, consideration of just one of the factors included in the study -- the Des Plaines River Bridge -- leads DOT to believe that congestion and its consequences are virtually inevitable on this segment as a practical matter.

The bridge currently opens an average of 17 times a day, and river traffic has the right-of-way; if boats arrive when trains are approaching the bridge, those trains must be held. There are limited locations to hold trains on each side of the river that have sufficient length to park waiting trains without blocking highway grade crossings. *Id.* at 4.1-23. Given the Applicants' plan to operate 42 trains a day over this segment, and the other related problems noted in the DEIS, it is very likely that trains will be delayed, that the above sidings will prove inadequate, and that stopped trains will block roadway grade crossings. *Id.* at 4.1-21, -26

The second analytical technique SEA used to measure the adequacy of the EJ&E to absorb the traffic projected by the Applicants is the Line Occupancy Index ("LOI") Analysis, which compares a rail line's nominal capacity (involving train speed, methods of operation, etc.) with the actual number of trains that will occupy the line. *Id.* at 4.1-27. LOIs "between 70 and 100 indicate that the rail line segment has exceeded its practical capacity, and maintenance activities will likely result in interruption to train traffic, or rerouting of train traffic to other lines, or temporary reductions in rail service levels offered to shippers, or all three." *Id.*

The results of this analysis show a dramatic increase in LOIs with multiple EJ&E segments rising to or well into the 70 to 100 range. Figure 4.1-8. Although SEA again concludes that the Applicants' Operating Plan "would consume nearly all of the main line capacity" of the EJ&E (but only under ideal conditions), the DEIS also finds that the EJ&E "could have insufficient capacity to allow for non-interference with the existing trains of other railroads that cross the EJ&E rail line without incurring delays to Applicants' trains." DEIS, at 4.1-29. Clearly, it will be very difficult to operate the

number of trains CN proposes in a timely manner over these segments without adversely affecting vehicle travel.

The third analytical tool used in the DEIS is the Rail Traffic Controller ("RTC") Model, reportedly industry dispatching software which runs simulations based on a railroad's physical plant, train characteristics, etc. *Id.* at 4.1-32. RTC model results are primarily expressed in "delay ratios," which measure time lost in rail operations as trains wait for a clear track. *Id.* A delay ratio of 20 or higher is generally avoided in the industry. *Id.* [7]

Applying the RTC model to the Applicants' Operating Plan yielded a delay ratio of 28; adding more trains from any source (such as Metra or UP) would multiply the ratio dramatically. *Id.*, Table 4.1-2. Another RTC output ("stringline diagrams") confirmed that implementing the Applicants' Operating Plan would produce "major delays at several locations" on the EJ&E. *Id.* at 4.1-33.

DOT believes even these findings and conclusions to be overly optimistic because of the assumptions employed in the study. For instance, in the RTC exercise SEA assumed: that freight trains crossing the EJ&E main line at grade are given precedence over trains on the EJ&E main line, that these trains are evenly spaced throughout each 24-hour period, that bridge lifts at Joliet operate 20 times per day at equal intervals over 24 hours, and that trains leaving the EJ&E would promptly be accepted by the CN and other railroads. *Id.* at 4.1-32.

[7] "High delay ratios indicate a rail system that is overloaded with trains, or that trains are of excessive length or insufficient horsepower for the system, or all three." DEIS, at 4.1-32. They reflect a system operating close to capacity and thus very vulnerable to factors, like mechanical malfunctions or track maintenance, that commonly hinder trains. *Id.* at 4.1-33.

But such assumptions would make scheduling trains on the EJ&E much simpler than it really is, for they do not reflect the reality of more nearly random train arrivals, inconsistent times between bridge lifts, and delays due to connecting carriers failing to accept trains promptly. In other words, they do not recognize the inevitable clustering of events that would result in trains on the EJ&E main line having to stop for potentially longer periods than planned.

Naturally, the consequences of delayed trains are not limited to the CN. As already noted, a significant number of trains from other railroads (*e.g.,* BNSF, UP) now operate over the EJ&E and would likely feel the effect of operating "at or near capacity." *Id.* at 4.1-3, -27, -33. Moreover, some Amtrak trains and significant numbers of Metra commuter trains cross certain of these potentially congested spots; if rail-to-rail crossings are blocked, passengers may face delays. Finally, there are only a very limited number of sidings with both sufficient length for the longer trains proposed and no highway grade crossings nearby. If major train congestion develops on the line, highway-rail grade crossings may be blocked, with resulting vehicular delays.

The SEA found that 15 at-grade highway crossings and 11 providers of emergency services would experience such considerable traffic delays as a result of the transaction as to be "substantially affected." DEIS, at 4.3-2; Tables 6.3-1 and 6.3-2, at 6-18, -21. [8] The SEA estimated that the proposed merger and incremental growth rates would impose a net increase of 475 vehicle-hour delays per day at these crossings by 2015. *Id.*, Table 4.3-3. It must be remembered that these calculations assume a particular

[8] A crossing is "substantially affected" if the proposed consolidation caused blockage or resulted in more than 40 hours of delay per day, or if the crossing would be at or over capacity. *Id.*

train speed; if trains must proceed more slowly because of congestion or some other factor, total delays will increase. If trains must actually stop when they are not at sidings, crossings may be blocked for more extended periods. Although such blockages can occasionally occur anywhere due to mechanical problems, accidents, or other unavoidable circumstances, it is unacceptable for rail carriers to block crossings routinely due to inadequate system capacity. DOT urges the SEA to ground the final EIS on reasonable operating assumptions and to ensure that it fully address the extent of rail congestion on the EJ&E and its consequences.

Mitigation – Funding

Virtually all rail consolidations entail adverse impacts of one sort or another. Demonstrable reductions in competition are relatively easily identified and resolved; negative environmental consequences on communities are more difficult to mitigate. Very often the best resolutions are those reached by agreements among the parties themselves, and DOT continues to encourage these. But in the absence of such agreements, the STB must choose appropriate conditions.

The Department believes that applicants in rail consolidation cases should adopt operational practices that are sensitive to local conditions, and should participate in the funding required to mitigate other transaction-related impacts. Pre-existing conditions are not the responsibility of such applicants, even though they may add to a merger's effects. That is the case here: there is already traffic congestion at rail crossings in many communities along the EJ&E, by no means all of it caused by EJ&E trains. DEIS, at 6-

17. Thus, remedial measures should be funded only partially by the Applicants and partially by affected communities.

SEA is considering a range of mitigation options for the highway/at-grade rail crossings and emergency service providers it identified as "substantially affected." *Id.* at 6-19, -21. DOT agrees with the DEIS that the identified crossings and emergency service providers each warrant mitigation measures. One of the options listed is a "Traffic Impact Mitigation Fund," which would require the Applicants to work with appropriate public agencies to establish a pool of money (including a one-time contribution from CN) to be administered by interested agencies to redress the delay and safety impacts of the proposed transaction. *Id.*, at 6-20.

The Department supports this option. A regional mitigation fund, with monies from the Applicants and other local, state, and federal sources, could finance those mitigation measures and projects that make the most sense from the proper (broader) perspective. We acknowledge that between the townships, counties, and states involved in this proceeding, developing and implementing such a fund would not be simple, but we share SEA's hope that such an approach offers an attractive opportunity for effective solutions. *Id.* at 6-19. Since most of the environmental benefits from reduced traffic through Chicago occur in the same state as the negative impacts on the suburban counties, one obvious participant in and potential contributor to a Traffic Mitigation Fund would be the Illinois Department of Transportation.

DOT also wishes to suggest a possible means to determine the approximate appropriate size of a fund insofar as it is devoted to vehicular delays. This approach would determine the present monetary value of the annual cost of delays over the

foreseeable future by multiplying the annual cost by an appropriate discounting factor. [9] The Applicants' share of that amount would depend upon the STB's view of the extent to which CN's post-merger operations contributed to the delays.

The Department also suggests imposing a time restriction on the use of Applicants' money in any mandated general mitigation fund. If that money cannot be committed to particular projects within a certain period (*e.g.*, five years), it should revert to the Applicants. Reaching agreement among the various entities on allocating the fund will be difficult. The threat of loss of a significant amount of money will give them an incentive to work cooperatively. It will also assure that the mitigation is provided in a timely manner, as the impacts are felt.

Mitigation – Operational Limits

The Applicants have made the fairly standard representation that they can operate the merged railroads efficiently and without untoward consequences. CN-2 at 209-211, Operating Plan (Exhibit 15). Nonetheless, operational problems have resulted from past mergers, and these can reduce or defer the anticipated public benefits from a given transaction. Moreover, the Department has indicated its expectation that implementation of the Applicants' Operating Plan under current and projected circumstances will produce

[9] We do not advocate any particular value, but simply to illustrate this concept one would accept the DEIS estimate that total net delays would increase by 475 vehicle hours per day by 2015 as a result of the proposed merger and incremental growth. Table 4.3-3. Assuming (1) that each vehicle has one person (the average is probably higher), and (2) that the value of that person's time on an hourly basis is $21.69 (the approximate average wage rate), yields a delay cost of $10,302 per day, or about $3.86 million a year. The present value would of course depend on discount rate used. A ten percent rate over a twenty year period would produce a present delay value of nearly $33 million. Use of 2015 projections in the DEIS (at the request of various parties) supports adjusting the discounting to take into account when delays actually begin and when mitigation measures are funded.

congestion on the EJ&E beyond that forecast by the SEA, and that vehicular delays will increase commensurately.

Applicants in rail consolidation proceedings should generally be held to their representations. But even when they make none, such carriers should not be permitted to implement their mergers in a way that results in persistent roadway blockages or other substantial vehicular delays. In these circumstances, if delays materially in excess of SEA's projections occur with any consistency, DOT proposes that the Board adopt a condition that would require CN to limit its train operations over the EJ&E to the level necessary to redress transaction-related delays. [10]

CN could readily divert trains to its existing lines in the Chicago area to relieve problems beyond those foreseen in the DEIS. The prospect of this sanction and its operational disadvantages vis-à-vis use of the EJ&E line should provide a clear incentive to the Applicants to align traffic shifts more carefully with the capacity available on the EJ&E at any given time.

Mitigation - West Chicago

Departmental personnel visited several of the areas studied in the DEIS and noted that the City of West Chicago in particular is apt to face considerable impacts that may not be easily mitigated. Specifically, the fact that the EJ&E crosses the main line of the UP in West Chicago at grade, where both railroads also cross a number of roadways,

[10] The affected communities could document such instances and petition the Board in the oversight period we have previously recommended to impose this measure. *See Union Pacific/Southern Pacific Merger*, 1 S.T.B. 233, 515-518 (1996), in which the STB did not permit the level of rail operations through the city of Reno, Nevada, called for in the Operating Plan in order to preserve the environmental status quo while studies were underway to determine the precise number and location of grade separations. Here, such a limit would be put in place only after other mitigation measures failed to prevent substantial vehicular delays beyond those estimated in the DEIS.

makes any solution difficult. We urge careful attention to address the complex potential problems at this location when more trains will be using the EJ&E line.

DOT is especially concerned that the pedestrian crossing at West Chicago High School (south of the crossing between UP's main line and the EJ&E) may be blocked by standing trains waiting to proceed across the UP line. Students and others may be tempted to cross under the standing EJ&E trains, a particularly dangerous activity. Yet this crossing is not even mentioned in the DEIS inventory of pedestrian crossings. DEIS, at 4.2.-35. We recommend a specific condition here, such as a lit pedestrian underpass, to avoid a tragedy.

Mitigation – Gary/Chicago International Airport

The EJ&E line is immediately adjacent to the end of the main runway at Gary/Chicago International Airport ("GCIA"). The Federal Aviation Administration has previously studied and agreed to fund an extension of that runway to enable GCIA to meet federal airport safety standards, which project would require the relocation of the EJ&E track. DEIS, at 3.3-94, -96. The SEA observes that the merger would not affect existing operations at GCIA, and that as a result of a Preliminary Memorandum of Understanding ("PMOU") that CN has committed to honor, the transaction would not affect the runway extension project. Id. at 4.3-91.

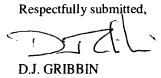
The PMOU was entered into by the airport, EJ&E, and two other rail carriers involved in the relocation (CSX and Norfolk Southern). By its terms it is "non-binding" on the parties (and thus on CN), but it establishes a clear framework leading to "future binding agreements" by which the parties clearly anticipate successful completion of the

runway project and relocation of the EJ&E and related rail facilities. PMOU at 2-7. Through the PMOU the rail carriers have expressed their willingness to accommodate the project so long as their operations and legal interests are not affected and GCIA provides the funding. *E.g., id.* at 13, 16. The FAA has already committed funds to relocate the rail line and issued a letter of intent to reflect its preliminary support for additional financing in the amount of roughly $20 million. DOT-3 at 2. If more is necessary, GCIA is responsible for that funding; it may return to the FAA and/or seek other sources.

Particularly insofar as the Applicants have voluntarily agreed to comply with the PMOU, DOT fully anticipates that CN would use its good faith best efforts in carrying out this undertaking. Although the PMOU does not itself guarantee the completion of the rail line relocation/runway project, with no apparent operational or financial reason for opposition, there would be every reason to expect that the parties could resolve any remaining issues. The Board would of course be available during the oversight period we have recommended to consider documented complaints that the Applicants are not abiding by their representations in this regard.

Metra Star Line

Specific mitigation action at this point with respect to Metra's planned "Star Line" is premature. If that line comes to pass, however, the Department will be concerned with the addition of a substantial number of trains to the EJ&E line during rush hours. They will be running more or less at right angles to the large numbers of existing Metra commuter trains during those same periods. DOT for now will continue



to monitor developments through its directly concerned program offices, the Federal Railroad Administration and the Federal Transit Administration.

Conclusion

The pending transaction promises both substantial public benefits and significant adverse environmental burdens. The Board should consider its overall responsibilities under both applicable regulatory standards and NEPA and approve the consolidation of the CN and EJ&E subject to conditions addressing competitive and environmental impacts.

Those conditions that are appropriate here are familiar. They proceed from a broader rather than a narrower perspective. They also require the Applicants to maintain the status quo and, where that is not feasible (as it is not with respect to certain environmental matters), to work in good faith with affected parties and to contribute financially to mitigate impacts that threaten serious disruptions. If and when these efforts fail to prevent substantial vehicular delays beyond those projected, the train volumes that give rise to such impacts should be reduced.

Respectfully submitted,

D.J. GRIBBIN
General Counsel

Comments:

On behalf of the U.S. EPA we provide the following comments to the DEIS your office published for public and agency comment, regarding the Canadian National Railway Company Acquisition of the Elgin, Joliet & Eastern Railway Company. We appreciate the extension afforded us for obtaining review and concurrence by our Administrator's offices at this time of the federal fiscal year. We look forward to a phone conversation with your office, I believe we settled on 2:00 pm your time, on Monday, October 6, 2008. If that turns out to be a problem, let us know. Thank you for the encouraging working relationship we have established through this project effort.

Re: Comment on the Surface Transportation Board Draft Environmental Impact Statement for the Canadian National Railway Company Proposed Acquisition of the Elgin, Joliet and Eastern Railway.
CEQ #20080290

Dear Ms. Rutson:

In accordance with U.S. Environmental Protection Agency responsibilities under the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act (CAA), we have reviewed the Draft Environmental Impact Statement (DEIS) for the Canadian National Railway Company's (CN) proposed acquisition of the Elgin, Joliet and Eastern Railway Company (EJ&E) ("the proposal"). EJ&E operates approximately 200 miles of railroad that forms an arc around metropolitan Chicago from Waukegan, Illinois to Gary, Indiana.

The proposed acquisition would serve three purposes and needs:
1) improve CN operations in and beyond the Chicago area by providing a continuous rail route around the congested city center, a route that would be under their sole ownership and would connect with CN's five rail lines radiating from Chicago;
2) reduce CN dependency on purchasing use of the Belt Railway Company Clearing Yard in the city center and provide the Kirk (Gary, Indiana) and Joliet Yards and smaller rail facilities for train and railcar classification work and handling; and
3) provide CN a new business relationship with approximately 100 industrial and utility companies serviced by EJ&E, plus additional companies serving those industries.

EPA participated in a number of early public and agency scoping meetings and, on February 15, 2008, submitted comments on the Surface Transportation Board's (STB) Notice of Intent to Prepare an Environmental Impact Statement. EPA project staff toured the project area with STB's consultants in March 2008. We submitted detailed scoping comments on April 24, 2008. Our scoping comments

Recycled/Recyclable - Printed with Vegetable Oil Based Inks on 100% Recycled Paper (50% Postconsumer)

discussed surface waters and stormwater run-off, air quality, environmental justice, railroad and highway crossings, coordination with other freight and passenger rail operations in the Chicago area, and cumulative impacts. Our scoping comments also requested that proposed mitigation actions be presented in the DEIS in detail, including measures to evaluate their success.

The following comments outline our major concerns. These comments are discussed in greater detail in the enclosed Detailed Comments on the Draft Environmental Impact Statement for the Proposed Canadian National Railway Acquisition of the Elgin, Joliet & Eastern Railway (detailed comments), which also comments on other issues, such as noise, climate change science, surface water, wetlands, stormwater run-off, floodplains, threatened and endangered species, invasive species / railway maintenance, cumulative / indirect impacts, and cultural resources. Based on these comments, we have rated the DEIS as "Environmental Concerns – Insufficient Information" (EC-2).

RAIL OPERATIONS

Because the projected level of rail operations will determine the level of all potential impacts, the Final Environmental Impact Statement (FEIS) should provide additional information to support the rail traffic projections put forth in the proposal. We commend the STB for providing three special analyses addressing this concern, i.e., a bottleneck assessment, a maximum capacity analysis, and Rail Traffic Controller modeling. The proposal clearly shows that rail operations on the EJ&E arc will be at capacity immediately if the proposal is implemented, with most of CN's traffic diverted from CN's existing lines. The capacity of the EJ&E arc may change if key bottlenecks are reduced. Future CN traffic growth in the Chicago area would either revert to the existing CN lines and/or be accommodated on the EJ&E arc if bottlenecks are reduced. We acknowledge the difficulty of forecasting long-term changes in traffic. Nonetheless, EPA recommends that the STB project traffic growth on the existing CN lines and on the EJ&E arc if its capacity changes due to bottleneck reductions. Please discuss in the FEIS the direct, indirect, and cumulative impacts of this potential future traffic growth.

The DEIS notes that most hazardous materials transported following this proposal, would move in "key trains" and that all EJ&E segments will be designated as "key routes" under Federal Railroad Administration regulations. These trains will move at mandated reduced speeds. Rail operations, capacity, and efficiency modeling for this proposal should consider these slower speeds in projecting traffic capacity on the EJ&E tracks, and how much traffic might need to remain on the existing CN lines through the City of Chicago and inner ring suburbs.

We recommend the STB include in the FEIS and Record of Decision (ROD) a requirement that if the proposal is approved, CN or its successors would initiate an adaptive management (AM) program. This AM program would stipulate that if any segment of the proposed rail system sustains an increase of some pre-specified number of average daily trains for a pre-designated period of time, then the applicant or its successors would re-evaluate the impacts of that increased traffic volume and provide mitigations as appropriate. These mitigation measures should be acceptable to the STB and compliant with any regulatory requirements applicable to specific impacts, as determined by the relevant regulatory agency. We concur with the STB proposal to establish a public/private mitigation fund, and suggest it be part of the AM with an annual contribution by CN or its successors adequate to sustain needed mitigation measures. This fund would appropriately be managed by a state or regional

planning agency for the project area, and provide for possible receipt of other contributions as might be provided by federal, state, and/or local governments.

Further explanation is needed in the FEIS regarding how existing and future Metra and Amtrak passenger rail services will be accommodated under the proposal. The DEIS contains assurances that the planned Metra STAR line will be accommodated within the parameters of the proposal, but no specifics are provided. This is a concern, given that the EJ&E arc, which would host a portion of the STAR line, will operate at capacity as soon as the proposal is implemented.

The proposal calls for enhancing the existing rail-to-rail connection at Munger in DuPage County, Illinois. The DEIS indicates that this enhancement will provide little operational improvement, but would impact wetlands, biota, and a county forest preserve. We conclude that the hydrological impacts are potentially greater than described in the DEIS. Therefore, we recommend that the Munger connection enhancement component of the proposal be dropped from further consideration in the FEIS.

HAZARDOUS MATERIAL TRANSPORT AND RAIL SAFETY

The DEIS states that the railroad industry has a low risk of accidents and spills, and that should an accident or spill occur, rapid emergency response involving containment and clean-up would follow, led by local governments as first responders. These assurances apply to both public safety and natural resource impacts, including spills to water, when potential impacts could spread quickly. We note that all segments of the proposed project will be designated as hazardous key routes. Both CN and EJ&E have a history of higher incident rates than the railroad industry as a whole. The higher incident records for both railroads involved are not adequately explained in the DEIS. CN's corporate rail safety record, both in the United States and Canada, as well as EJ&E's, warrant further explanation in the FEIS. No installation of containment measures or preventative measures are proposed in the DEIS. We recommend the FEIS include procedures for spill prevention for CN's operations in the Chicago area and installation of containment measures near sensitive water resources (e.g., Cuba Marsh, the heron rookery near Plainfield, the Des Plaines River, and the Grand and Little Calumet Rivers).

The FEIS should provide a list of significant, geographically vulnerable natural areas that need special planning and possible structural measures for spill protection. This should be compiled in consultation with the U.S. Fish and Wildlife Service offices, the Departments of Natural Resources in Illinois and Indiana, and the STB convened Illinois Natural and Water Resources Stakeholder Group. A management plan for responders and any structural mitigation measures should be developed in consultation with hazardous waste programs at EPA, Illinois EPA and the Indiana Department of Environmental Management. This plan should be available for emergency use and incorporated into broader emergency planning at the local and regional levels.

AIR QUALITY

We appreciate that the DEIS includes a general conformity analysis and an air toxics assessment. However, diesel particulates were not included in the air toxics analysis, and should be added in the FEIS. Both the conformity analysis and the air toxics "hot spot" analysis should include

projected emissions for the Kirk and Joliet yards, which will experience significantly increased operations if the proposal is implemented. We recommend that the three at-grade crossings where the hot spot analysis shows that EPA reference levels will be exceeded be considered high priorities for grade separation mitigation. We commend CN for proposing voluntary air mitigation to include diesel emission reduction strategies, such as low-emission switching engines in the yards and anti-idling measures.

ENVIRONMENTAL JUSTICE

EPA recommends that STB provide clearer explanations in the FEIS of the methods used to evaluate potential for disproportionate impacts and use updated census data if available and appropriate. Impacts should be consistently evaluated across the entire project study area, including potential environmental justice communities.

We appreciate the opportunity to comment on the DEIS for this proposal. We welcome the opportunity to work with STB to address our comments prior to issuance of the FEIS. If you have questions regarding these comments, please contact me or my staff member, Norm West by phone at 312-353-5692, or at west.norman@epa.gov.

Sincerely,

Lynn Buhl
Regional Administrator

Enclosures:
1. Summary of Ratings Definitions and Follow-up Actions
2. Detailed Comments on the Draft Environmental Impact Statement for the Proposed Canadian National Railway Acquisition of the Elgin, Joliet & Eastern Railway

SUMMARY OF RATING DEFINITIONS AND FOLLOW UP ACTION*

Environmental Impact of the Action

LO-Lack of Objections
The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC-Environmental Concerns
The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impacts. EPA would like to work with the lead agency to reduce these impacts.

EO-Environmental Objections
The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU-Environmentally Unsatisfactory
The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS sate, this proposal will be recommended for referral to the CEQ.

Adequacy of the Impact Statement

Category 1-Adequate
The EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alterative and those of the alternatives reasonably available to the project or action. No further analysis or data collecting is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2-Insufficient Information
The draft EIS does not contain sufficient information for the EPA to fully assess the environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category 3-Inadequate
EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft FIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft FIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640 Policy and Procedures for the Review of the Federal Actions Impacting the Environment

Detailed Comments on the Draft Environmental Impact Statement for the Proposed Canadian National Railway (CN) Acquisition of the Elgin, Joliet & Elgin Railway (EJ&E)

The following detailed comments are provided by the U.S. Environmental Protection Agency (EPA) on the Surface Transportation Board (STB) draft Environmental Impact Statement (DEIS) published in the Federal Register under CEQ #20080290. We acknowledge the extensive mitigations proposed both voluntarily by the applicant and recommended by STB. Voluntary mitigation (VM) measures referenced in our comments are proposed by CN.

We commend STB for responding to EPA scoping comments on many issues, specifically including:

- Considerations of alternatives to improve train storage and train speed and reduce impacts are incorporated into the DEIS.
- The DEIS evaluates at-grade crossings and identifies crossings for various mitigations.
- The DEIS considers land use impacts and compliance with Indiana's Coastal Zone Management Act.
- The DEIS considers climate change impacts and greenhouse gas emissions.
- Some air quality hot spot analysis is provided, and VM is proposed to refit rail yard locomotives with EPA-recommended idling control systems.
- STB undertook an extensive analysis of existing and proposed project noise. Several VMs address these noise issues, including construction noise, wayside noise, and noise at rail-to-rail crossings and switches. Appropriate assessments for vibration impacts were included.
- VM #31 and VM #68 propose the use of native plant materials to cover construction site disruptions in consultation with local conservation offices.

The following discussion presents our detailed concerns, which should be addressed in the FEIS. These issues include some general observations regarding the DEIS sections on Purpose and Need, Alternatives, and Mitigation, and then specific details concerning hazardous materials transportation, rail and community safety, air emissions, environmental justice, noise, surface waters, wetlands, stormwater run-off, floodplains, threatened and endangered species, invasive species, cumulative and indirect impacts, and cultural resources.

Purpose and Need, Alternatives, and Mitigation

The Purpose and Need section essentially reiterates the proposed action. The FEIS should provide analyses and a clear explanation as to why the alternatives that were dismissed without detailed study fail to meet the purpose and need.

Our avoidance, minimization, and mitigation scoping comments requested delineation of all avoidance and minimization efforts, for the overall project, for project components, and for individual or specific impacts. We acknowledge the mitigation measures proposed; however, the DEIS mainly focuses on proposed mitigation measures and does not provide much explanation of other options for avoidance, minimization and mitigation that may have been considered but not selected. Our scoping

comments requested mitigation measures be presented in detail with follow-up measures for maintaining and evaluating mitigation success. These were typically not provided in the DEIS, and should be addressed in the FEIS.

Hazardous Materials Transport

Please include hazardous materials transport in the Rail Safety section of the FEIS for clearer understanding. The DEIS should be revised to reflect the Federal Railroad Administration's (FRA) June 1, 2008 guidance on "key routes" and "key trains." That guidance supersedes the DEIS statement, "Neither the number of daily trains nor the commodities carried are a factor in establishing the classification of the track." Spill mitigation measures in Section 6, including VM #15, should include adherence to EPA regulations 40 CFR Part 263, and should explicitly include working with EPA, state environmental agencies, and local agencies on spill responses.

The DEIS acknowledges that the proposal increases the potential for yard accidents due to increases in car handling activity. The DEIS only references that CN must prepare a Safety Integration Plan (SIP) and comply with applicable Federal and state regulations. EPA believes that STB should consider additional mitigation and explain that measures beyond the legal minimums may be appropriate to protect the public health and natural resources. We also recommend that the STB consider adding substantive mitigation measures that specifically contribute to spill prevention and strategic containment for the project area, especially near sensitive water bodies.

Recent research indicates that broken rails, particularly at weld points, are the leading cause of major derailments and accidental releases of hazardous materials on U.S. Class I railroads. Ongoing research, such as that being conducted by Professor Christopher Barkan of the Railroad Engineering Program at the University of Illinois, is developing new methods to locate and correct such rail problems. We recommend that these methods be considered for inclusion in the adaptive management program to enhance spill prevention.

The DEIS does not give much detail on potentially impacted vulnerable facilities, such as schools, hospitals, nursing homes, high density housing, and oil/chemical facilities, although it does provide detail regarding environmentally sensitive areas, hazardous waste sites, and regulated chemical handling facilities. We recommend the community sites be more fully addressed in the FEIS regarding hazard analysis and risk assessment.

The DEIS did not provide any detailed information or statement on CN's hazardous materials (HAZMAT) spill response capabilities. CN seems to rely totally on local responders, despite a wide variability of local HAZMAT response capabilities in the area. No CN equipment lists, contractors, or corporate HAZMAT teams are mentioned. The FEIS should provide more detail which would be useful in determining what impacts to human health and the environment might result from a delayed or under-supplied and understaffed response. We note that STB mitigation #10 states that CN will assist in providing training to the affected local community responders, with an option to perhaps offer training in Chicago. We recommend that such training be provided specifically for the Chicago area to maximize participation for all affected response local responders.

Rail and Community Safety

The DEIS identified that some rail-highway at-grade crossings could have a higher potential for vehicles to become trapped on the tracks between the warning devices, due to local conditions. This is a significant safety concern. EPA recommends that all at-grade crossings on the EJ&E are be evaluated for this risk, and that all crossings with a higher potential for such a risk be mitigated.

Air Emissions

The mobile source air toxics (MSAT) analysis was performed at railroad crossings for five air toxic compounds. The FEIS should supplement the MSAT analysis by adding diesel particulate matter (PM), which EPA considers a priority MSAT. However, while EPA considers diesel exhaust a likely human carcinogen, and available evidence supports this conclusion, EPA cannot at this time provide a cancer potency value, i.e., unit risk factor (URF), for diesel PM. However, in EPA's recent final rule setting standards for locomotive and marine diesel engines (73 Federal Register 37096, June 30, 2008), EPA conducted dispersion modeling to assess diesel PM concentrations near ports and rail yards across the nation. In that study, 0.2 and 2 ug/m^3 were employed as levels indicating elevated exposures.[1] For non-cancer effects, EPA has a reference concentration (RfC) of 5 ug/m^3 for diesel PM. These factors could be used to estimate exposures to diesel PM of potential health significance.

Climate Change Science

EPA recommends that the background and context for the climate change discussion in the DEIS be revised to reflect, in brief, the relevant climate change science at http://cpa.gov/climatechange/. EPA's site references reports from the Intergovernmental Panel on Climate Change, and provides links to the U.S. Climate Change Science program. The executive summary of the "Scientific Assessment of the Effects of Global Climate Change on the United States," by the National Science and Technology Council (May 2008), also synthesizes the climate change science.

Environmental Justice

The environmental justice (EJ) analysis should include citations for the "relevant orders and guidelines" and to the "environmental justice criteria" mentioned in the DEIS, and said to have been developed by EPA and STB. The EJ analysis should explain why census block groups were selected as the unit of analysis. This analysis should consider the availability of other demographic data to supplement the 2000 census data, and/or explain the decision not to use such data. EPA's April 1998 "Final Guidance for Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analyses" notes:

[1] ICF International, September 28, 2007. Estimation of diesel particulate matter concentration isopleths for marine harbor areas and rail yards. Memorandum to EPA under Work Assignment Number 0-3, Contract Number EP-C-06-094. This memo is available in Docket EPA-HQ-OAR-2003-0190. This analysis was published in the peer-reviewed proceedings of the Air & Waste Management Association's annual conference in 2008 (Paper #719).

> census data have been shown to be unreliable in some cases, in part because the level of aggregation may not offer a fine enough mesh to identify the existence of such communities. Also, census data are based on self-reporting. These data are not always consistent and are prone to undercounting minority populations and low-income populations due to a perceived reluctance for certain populations to divulge information.

The "Study Area" for the EJ analysis is defined as "census block groups along the EJ&E rail line within 1,500 feet of rail segments where the number of trains would increase by at least eight trains per day and that would be designated as key routes for hazardous material transportation" and "[a]long the CN rail line, …census block groups within 400 feet of rail segments where the number of trains would decrease by at least eight trains per day and the segments would not be designated key routes for hazardous materials transport." The EJ analysis should explain the rationale for this definition of the Study Area.

The FEIS analysis should explain why other types of impacts evaluated elsewhere in the DEIS are not evaluated in the EJ Analysis, or should include an evaluation of such impacts. Where a localized impact is found in the DEIS yet found not to be significant based on comparison to the overall DEIS Study Area, it may still merit evaluation in the EJ analysis. EPA's 1998 NEPA Guidance states:

> …Minority communities and low income communities may comprise a very small percentage of the total population and/or geographical area. Therefore, the assumptions and inputs used in conjunction with traditional analytical tools for studying potential impacts under NEPA, and the results of the analyses, may not fully reflect the impacts that may be borne by these smaller communities or populations. An analysis of disproportionate impacts will develop an understanding of how the total potential impacts vary across individual communities. This allows analysts to identify and understand what portion of the total impacts may be borne by minority or low-income communities, to assess whether they are disproportionately high and adverse, and to develop alternatives and mitigation measures if necessary.

Appendix I should provide additional information to explain the statistical analysis and the conclusion of the EJ analysis. In particular, the following questions are not answered by the provided information:

- How were the marginal probabilities derived?
- What do the different marginal probabilities demonstrate?
- Why are the marginal probabilities in Tables I.2-2 (Actual noise impacts) and I.2-3 (Expected noise impacts) identical?
- Why are there only 2 tables? Shouldn't there be four: minority/actual; minority/expected; low-income/actual; low-income/expected?
- The DEIS states, "Further analysis revealed that the high and adverse train noise impacts are not disproportionately borne by minority or low-income environmental justice populations." What analysis supports that statement?

Noise

Although several sensitive noise receptors, such as Fermi Lab, are identified, we suggest that the noise analysis be expanded to include specific information on any schools, libraries, eldercare facilities, hospitals, and churches that will be exposed to an Ldn of 65 dBA or greater.

EPA requests STB provide justification of its statement that mitigation at the Ldn of 65 dBA is unreasonable. Section 4.10 states that 1,559 noise-sensitive receptors would experience an Ldn of 70 dBA or greater along seven segments of the EJ&E rail line. In Section 4.10.3, there is discussion that states that it is appropriate that the applicant determine where noise walls could provide noise reductions for receptors that are predicted to experience an Ldn of 70 dBA or greater. We believe that the FEIS should provide more detail on the locations of possible noise walls along these segments (such as placing them on Figure L-1). The FEIS should also provide more information on which noise walls are likely to provide benefits and be both reasonable and feasible. We believe it is important that this mitigation be part of the EIS process and not be developed at a later time as currently proposed. The consideration of other options for noise mitigation should be discussed in the FEIS.

Surface Water, Wetlands, and Stormwater Run-off

CN will be responsible for applying for and securing any wetland Clean Water Act (CWA) Section 404 permits, including State water quality certification under CWA Section 401, which may be needed to construct CN's proposed connecting track and double track projects. However, information in the FEIS could support decision-making during the Section 404 permit review process, especially because the applicant must demonstrate compliance with the CWA Section 404(b)(1) Guidelines prior to obtaining an individual Section 404 permit. The Section 404 (b)(1) Guidelines require that projects be evaluated first to avoid and then minimize impacts to waters of the United States (including wetlands). Remaining impacts must then be mitigated. A permit cannot be issued if there is a practicable alternative that would have fewer adverse impacts on the aquatic ecosystem.

EPA recommends that the FEIS should fully discuss all of the alternatives for the proposed connecting track and double track projects. A number of the connecting track alternatives are able to avoid wetlands and waters entirely. Others have varying amounts and types of impacts to wetlands. Several of the preferred alternatives in the DEIS have higher impacts than some of those not preferred. The FEIS should explain the trade-offs of the selection process, especially at Munger and Matteson. Consideration of alternatives is less clear for the double tracking proposals. Please document in the FEIS what has been done to avoid and minimize wetland and water impacts, by refining the major alternatives.

The FEIS should explain how the proposal will comply with state and county wetland regulations. The States of Illinois and Indiana and many counties in the Chicago metropolitan region have developed rules to regulate wetlands that are outside of the Federal jurisdiction. For example, Lake County, Illinois requires buffers for all Federal and county jurisdictional waters. Buffers are areas of predominantly vegetated land adjacent to drainage ways, wetlands, lakes, ponds, or other surface waters, which may or may not be waters of the United States. Buffer width requirements are based on the quality and size of the wetland.

We note that wetlands in the DEIS are described predominantly in terms of their vegetative quality. A description of any other significant ecological services for these wetlands should be included in the FEIS to better inform mitigation.

The DEIS summarizes previous NEPA activities by the Federal Aviation Administration at the Gary International Airport, pertaining to the EIS/ROD on the runway extension and EJ&E track re-routing. That summary is helpful. Subsequent to the NEPA process, the Gary/Chicago International Airport applied for a Clean Water Act (CWA) Section 404 Permit from the Detroit District of the Corps of Engineers, which was published by the Detroit District as Public Notice No. 93-145-126-7 on January 22, 2007 (replacing the original publication of December 28, 2006). We understand that a decision on this permit is still pending. The project as proposed in the Public Notice reflected the wider loop of the final alignment, Alternative 1-D. However, the Public Notice did not indicate whether or not the proposed crossing of the CSX and Norfolk Southern Railroad (NS) rail tracks by the EJ&E tracks would be at grade or grade-separated. It is unclear whether or not the June 27, 2008, preliminary memorandum of understanding between the Gary/Chicago International Airport, EJ&E, CSX and NS would change what was proposed for Section 404 permitting by the Airport. The DEIS indicates that CN will abide by the Section 404 permit conditions if the permit is issued. The FEIS should report the status of these activities.

Aircraft at the Gary/Chicago International Airport cannot use the full length of the existing main runway because of the vertical impediment of the EJ&E tracks, which are elevated on an embankment. The physical location of these tracks further limits extension of the runway and its safety zone. Consequently, the EJ&E tracks currently limit flight operations. However, if the track relocation cannot be resolved, due to grade crossing problems or some other issue, can the operations under CN's proposed EJ&E acquisition (essentially tripling the number of trains traversing this section of track) proceed effectively over the existing track? How will the change in traffic on the EJ&E tracks under CN's proposal impact flight operations at this airport? Please address this scenario in the FEIS.

The DEIS refers to best management practices (BMPs) for construction run-off in special cases. These special cases and BMPs should be fully described in the FEIS. We recommend the FEIS should stipulate that sediment basins and other mitigations be designed for 100-year flood levels.

Floodplains

The DEIS (Table 4.12-3) indicates 28 surface water impacts from double track construction would result in increased flood elevations up to 1 foot, 9 of which are within FEMA floodplains. Nine others would exceed a 1-foot flood level elevation, 3 of which would be in FEMA-mapped floodplains. An additional 11 drainage structures (Table 4.12-4) are indicated as possibly causing moderate increases (5 to 10 feet per second) in hydraulic flow velocity; 18 could cause major increases (greater than 10 feet per second). The FEIS should include additional information for these floodplains, indicating the acreage and stream length of these impacts. The DEIS is unclear whether these figures represent potential impacts prior to avoidance and minimization or, as implied in the mitigation section, they are conditions proposed to be partially mitigated using BMP protection systems. Stream relocations are also indicated as a possibility. The FEIS should provide details for these impacts and

commit the applicant to negotiate with appropriate local jurisdictions and the Illinois Natural and Water Resources Stakeholder Group on these issues.

Threatened and Endangered Species /Wildlife and Habitat / Invasive Species

Based on the STB stakeholder meetings EPA attended with many federal, state and local representatives, we conclude that the DEIS understates the potential for impacts to threatened and endangered species, wildlife, and habitat, and the consequences of invasive species. We recommend that STB consult with this Illinois Natural and Water Resources Stakeholder Group to more fully identify impacts and formulate appropriate mitigation procedures to include both in the FEIS and in the recommended adaptive management program.

We understand that CN plans to follow some Canadian practices using herbicides in right-of-way maintenance. At a minimum, U.S. and state regulatory requirements for pesticide use must be followed. An expanded discussion of right-of-way maintenance practices should cover the entire EJ&E arc, from Gary to Waukegan. The portion of the EJ&E arc from Leithton to Waukegan is not presently included in the project area, but the impacts of right-of-way maintenance to several significant waters, including the Lake Michigan coastal area, should be addressed in the FEIS.

Cumulative and Indirect Impacts

The DEIS includes a section on Indirect and Cumulative Impacts; however, there is little analysis presented for these determinations. The FEIS should describe the accumulation of impacts to different natural resources and present how the proposed project could add to those impacts, or improve the status of those resources through mitigation for the impacts of the proposed project.

Cultural Resources

The DEIS indicates that during scoping, the applicant requested information from the public regarding historic resources that might be impacted by the proposal, and on the basis that no structures were presented, concludes there will be no impacts to these resources. However, a survey of historic resources has apparently not been undertaken by the applicant or STB. STB is responsible for complying with the National Historic Preservation Act, including determining the area of potential effects and evaluating all existing historic and archaeological resources that are listed or may be eligible for listing on the National Register of Historic Places. For example, EJ&E's Joliet Yard, which is proposed to be acquired by CN, contains an historic roundhouse that is currently in disrepair. Please note that vibration can be a source of impacts to historic structures, even if the construction activities are not directly adjacent The FEIS should provide a detailed discussion of STB's and the applicant's assessment of all historic resources and proposed mitigation measures, including coordination with the State Historic Preservation Officers (SHPO) in Illinois and Indiana.

Re: ***Canadian National Railway Company and Grand Trunk Corporation – Control – EJ&E West Company*** **(STB Finance Docket No. 35087)**

Dear Ms. Rutson:

Pursuant to the July 25, 2008, decision of the Surface Transportation Board, Canadian National Railway Company and Grand Trunk Corporation submit the enclosed comments on the scope of the final environmental impact statement to be prepared in this proceeding.

Yours truly,

Paul A. Cunningham

Counsel for Canadian National Railway Company and Grand Trunk Corporation

TABLE OF CONTENTS

Page

Part 1 – Applicants' Voluntary Mitigation Proposal 1

Part 2 – Applicants' Comments on the Draft Environmental Impact Statement 18

I. Preface & Background 18

A. Preface 18

B. SEA's comprehensive assessment of the environmental impacts of the proposed transaction generally satisfies the requirements of NEPA and the Board's environmental regulations. 24

C. CN generally agrees with the factual analysis undertaken by SEA. 25

D. Given the substantial thoroughness of the DEIS and the goals of NEPA, there is no reason SEA cannot complete its environmental review in time to permit a final decision by the Board that would be effective by December 31. 27

II. CN's Outreach & Mitigation Agreements 28

A. CN's outreach efforts 28

A.1 CN has sought to enter into agreements with all other communities on the EJ&E lines to provide reasonable mitigation of adverse environmental impacts potentially resulting from Transaction-related increases in rail traffic. 28

A.2 CN has reached a mutually acceptable agreement that provides reasonable mitigation for the city of Joliet. 29

III. The DEIS correctly identified alternatives to the proposed Transaction. 29

IV. Comments on specific "Environmental Resource Categories" addressed in the DEIS. 33

A. Rail Operations 33

A.1 Metra's proposed STAR Line project is not reasonably foreseeable. 33

A.2 Communities would not be divided by 10,000-foot CN trains after implementation of the Transaction, and in any event CN has proposed a mitigation condition to prevent lengthy blockages of road crossings by CN trains on the affected line. 35

A.3 The rail traffic volumes reported in CN's Operating Plan are a reasonable basis for SEA's analysis of the environmental impacts of the Transaction. 36

B. Freight Rail Safety 40

C. Vehicle Safety 41

D. Hazardous Materials Transportation Safety 42

E. Transportation Systems – Regional and Local Highway Systems 45

E.1. CN has reached an agreement to assure mitigation of the only delay impacts of the Transaction that could reasonably be found to warrant mitigation under the standards previously applied by the Board for this purpose. 47

E.2. SEA has offered no rational basis for the prescription of grade crossing separations where roadway performance is not impaired below levels of service as measured by generally accepted and universally applied roadway performance standards. 48

E.2.a. It would be arbitrary, capricious, and unreasonable for the Board, as suggested by SEA, to abandon its past practice of using LOS as the principal indicator of the need for mitigation due to potential vehicle delay. 49

E.2.b. The hyperbole of local opponents concerning the impacts of delay is starkly contrary to the facts and cannot justify SEA's departure from its prior use of established LOS standards for identifying crossings requiring mitigation 53

E.2.c. SEA has improperly used FHWA guidelines intended as non-binding threshold guidance to

state transportation planners as a principal basis for prescribed mitigation. 59

E.2.d. The unreasonablenesss of prescribing crossing delay mitigation based on FHWA's delay standard is highlighted by the fact that doing so would undermine the public interest in funding of grade separations for vehicle/rail crossings that have significantly greater delay than the crossings at issue here. 66

E.2.e. There can be no basis for requiring grade separation as mitigation for crossings delays without a proper determination that the value of the mitigation is warranted by the cost of the separation and by the relative value of the mitigation at one crossing as opposed to the value of mitigating delay at other crossings. SEA has not conducted that analysis. 68

E.3. SEA did not properly analyze impacts on vehicular traffic and therefore overstated the Transaction's impact on delay at grade crossings. 72

E.3.a. SEA should use the train counts most recently reported by CN. 72

E.3.b. SEA should use updated train speeds. 73

E.3.c. SEA should use the most recent reports of Average Daily Vehicular Traffic ("ADT") information. 74

E.3.d. There is no rational basis for using projected ADTs; SEA should use 2007 ADTs. 76

E.3.e. Even if SEA projects growth in vehicular traffic, any projections should be based on reasonable growth assumptions and not on the arbitrary assumptions contained in the DEIS. 80

E.4. Queue length is not a rational basis to require mitigation, and even if it were indicative of a need for mitigation, it would not require a grade separation. 87

E.4.a. Queue length is not a rational basis for requiring mitigation 88

E.4.b. Even if it were reasonable for SEA to use queue length as a basis for finding a grade crossing to be "potentially substantially affected," the DEIS properly recognizes that solutions other than grade separations are appropriate. 89

E.5. Use of updated data, corrected assumptions, and proper analysis in keeping with past precedent, eliminates all crossings as candidates for mitigation other than Washington Street and Woodruff Road. 90

E.6. Even if there were a rational basis for prescribing grade separations at crossings other than those in Joliet, the allocation of responsibility for such crossing should be that traditionally applied under federal and state law. 92

E.6.a. In considering responsibility for funding grade separations, SEA should take into account reductions in crossing delays. 92

E.6.b. There is no rational basis for imposing on a railroad the cost and burden of mitigation of the impacts of a control Transaction differently from the delay impacts of any other railroad operation. 97

E.6.c. Federal and state grade separation policies would limit the railroad contribution here to no more than 5% of the cost of grade crossing upgrades, including separation. 99

E.6.d. The longstanding federal policy concerning the allocation of the costs of grade improvements should be maintained in this case. 103

E.6.e. The fact that CN is a profitable company incorporated and headquartered in Canada should be irrelevant to the issues before the Board under ICCTA and NEPA 107

F. Transportation Systems – Effects on Emergency Response 108

F.1 The emergency response analysis included in the DEIS failed to accurately quantify impacts to emergency response. 109

F.1.a SEA's simplistic analysis overstates effects on emergency response. 110

F.1.b The DEIS failed to consider in any meaningful way the possibility of coordination between potentially impacted facilities during a response. 112

F.2 SEA should have used a more sophisticated model to estimate impacts on those emergency response providers identified in the DEIS 113

F.3 Any mitigation should be based on actual degradation in response time as estimated by the model created by IEM 115

G. Land Use 116

H. Socioeconomics 116

H.1 The DEIS does not properly assess the labor impacts of the Transaction in the Chicago area; the Transaction would actually have a significant positive impact on employment in both the Chicago region and the national economy 120

H.1.a The DEIS miscalculates the employment impacts of the Transaction. 121

H.1.b The DEIS does not take into account potential positive labor impacts other than those caused by CN's planned construction activity. 125

H.2 The Transaction would have economic benefits, which the DEIS overlooked, from the net reduction in vehicular delays at at-grade highway crossings in the Chicago area. 127

H.3 The Transaction would provide economic benefits to shippers as a result of reduced transit time and increased reliability of train service through Chicago. 130

H.4 There is no basis for any determination that any negative effects of the transaction on property values would be other than minimal and offset by increases by positive impacts of property values where train operations are to be reduced 135

I. **Environmental Justice** 139

J. **Noise & Vibration** 142

K. **Biological Resources** 144

L. **Water Resources** 145

M. **Monitoring & Enforcement** 145

V. **The Requirements of NEPA** 146

A. **NEPA does not require or authorize imposition of any mitigation.** 146

B. **It is unclear whether ICCTA, the Board's governing statute, provides any authority to impose environmental review or mitigation conditions on a "minor" transaction such as the CN/EJ&EW transaction.** 148

C. **NEPA does not require analysis of impacts for which the agency action is not the legally relevant cause.** 150

Part 1 – Applicants' Voluntary Mitigation Proposal

CN submitted a comprehensive Voluntary Mitigation Proposal ("VMP") to SEA on June 26, 2008, detailing the conditions that CN proposed that the Board impose to mitigate adverse environmental impacts both generally and at specific locations. This proposal, discussed in chapter 6 of the DEIS (at 6-3 through 6-12), was intended to cover communities that do not enter into individual mitigation agreements with CN.

Individual mitigation agreements are often preferable to Board-imposed mitigation, because they can cover issues and provide remedies that are outside the Board's authority or that or are not directly related to the Transaction. But for those communities for which CN is unable to reach an agreement, the voluntary mitigation plan serves as a backstop to ensure that adverse impacts are still subject to reasonable mitigation, regardless of whether the Board would have the power to impose those mitigation conditions absent CN's consent. The conditions CN has proposed were based on CN's extensive experience in past control transactions, conditions that were accepted by railroads in previous control proceedings, and conditions that were requested during the scoping process or CN's negotiations with affected communities.

CN's voluntary mitigation proposal is intended to provide for mitigation that meets the standards of relevance, reasonableness, and support set forth by the Board in previous cases: "any conditions the Board imposes must relate directly to the transaction before it, must be reasonable, and must be supported by the record before the Board."[1] Thus, CN's proposal is

[1] Draft Environmental Impact Statement at 6-1, *San Jacinto Rail Ltd. – Constr. & Operation Exemption – Build-Out to the Bayport Loop Near Houston, Harris County, TX*, STB Finance Docket No. 34079 (STB served Dec. 6, 2002) ("*Bayport Loop DEIS*"); Draft Environmental Impact Statement at 5-1, *S.W. Gulf R.R. – Constr. & Operation – In Medina County, TX*, STB Finance Docket No. 34284 (STB served Nov. 5, 2004) ("*SW Gulf DEIS*"). *See also* 1 Draft Environmental Impact Statement at 3-3, *CSX Corp. – Control & Operating Leases/Agreements – Conrail Inc.*, STB Finance Docket No. 33388 (STB served Dec. 12, 1997) ("*Conrail DEIS*") (for an environmental mitigation condition to be imposed without consent it "must be reasonable, must be directly related to the impact caused by the Acquisition, must be appropriate to the scope and degree of the environmental impact, and should not unduly frustrate the ability of the Applicants to realize the anticipated public benefits of the proposed . . . Acquisition.").

intended to provide for mitigation of all relevant environmental impacts which are shown to be likely as a result of the CN/EJ&EW Transaction, and which are significant when measured under the standards applied by the Board in previous cases. CN's voluntary mitigation proposal reasonably addresses the significant impacts of the Transaction, while not jeopardizing CN's ability to realize the public benefits anticipated as a result of the Transaction.

Based on SEA's thorough analysis and recommended mitigation in the DEIS, CN is now submitting a revised voluntary mitigation proposal that would provide further relief to impacted communities. Subject to a limited number of exceptions, CN agrees to almost all of the additional mitigation proposals included in the DEIS even though such extensive mitigation is not required by NEPA, by the Board's governing statute, the ICC Termination Act of 1995 ("ICCTA"), 49 U.S.C. §§ 10101 *et seq*, or by the rules of the Council on Environmental Quality ("CEQ") or the Board.[2] The list of voluntary mitigation measures CN is now agreeing[3] includes 101 discrete elements. CN expects the total cost of this revised program to be roughly $60 million.[4]

[2] CN's proposal may not include all specific items of SEA's proposed additional mitigation that relate to routine compliance with regulatory requirements in connection with implementation of mitigation or of the Transaction. CN intends, nevertheless, to comply fully with any applicable laws and regulations. If greater specificity is desired regarding this commitment, CN would appreciate the opportunity to comment on any further SEA proposals in that regard.

[3] Because CN is voluntarily agreeing to much of the mitigation suggested by SEA, uncertainties regarding the extent of the Board's authority to impose environmental conditions in minor transactions may not need not to be resolved. CN reserves its rights to challenge the Board's authority to impose any unreasonable conditions.

[4] Though CN believes the concerns raised by some of the more vocal local activists are largely overstated or unsupported, it continues to reach out to the affected communities in the hope of reaching some agreements, and has proposed a mitigation budget of $60 million – a full 20% of the acquisition cost of EJ&EW.

APPLICANTS' VOLUNTARY MITIGATION MEASURES

Applicants propose the following voluntary mitigation measures for the Board to consider in issuing its final decision. These measures refine and supplement the 70 voluntary measures Applicants listed on June 26, 2008, and include 32 of the additional measures which SEA, recommended should the Board authorize the Application. DEIS at 6-13—6-31. Applicants plan on implementing the proposed mitigation within the later of three years after approval of the Application or the completion of the capital improvements described in the operating plan.

The individual mitigation measures are organized by the Environmental Impact Categories found in the Corrected Final Scope of Study, served April 28, 2008.

1. SAFETY

Grade Crossings

VM 1. Applicants shall consult with appropriate agencies to determine the final design and other details of the grade crossing protections or rehabilitations on EJ&EW's rail line. Implementation of all grade crossing protections shall be subject to the review and approval of the Federal Railroad Administration ("FRA") and the appropriate state Departments of Transportation.

VM 2 Applicants shall coordinate with the appropriate state departments of transportation, counties, and affected communities along the EJ&E rail line to develop a program for installing temporary notification signs or message boards, where warranted, in railroad right-of-way ("ROW") at highway/rail at-grade crossings, clearly advising motorists of the increase in train traffic on affected rail line segments. The format and lettering of these signs shall comply with the Federal Highway Administration's (FHWA) *Manual on Uniform Traffic Control Devices* (FHWA 2007b) and shall be in place no less than 30 days before and six months after the acquisition by CN of the control of EJ&EW. The Applicants shall conduct a media campaign throughout the affected counties and communities surrounding the EJ&E rail line advising the public of increased operations along the EJ&E rail line. The campaign shall include the use of different media (radio, television, newspaper, Internet). Applicants shall distribute all information in both English and Spanish, where appropriate.

VM 3 Where necessary for implementation of a Quiet Zone, and in consultation with the affected community, FRA, and the appropriate state Department of Transportation, Applicants shall construct or install roadway median barriers to reduce the opportunity for vehicles to maneuver around a lowered gate.

VM 4 Applicants shall cooperate with the municipalities affected to determine which improvements would be necessary for existing Quiet Zone to maintain FRA compliance.

VM 5 Applicants shall cooperate with interested communities for the establishment of Quiet Zones and assist in identifying supplemental or alternative safety measures, practical operational methods, or technologies that may enable the community to establish Quiet Zones.

VM 6 Applicants shall consult with affected communities to improve visibility at highway rail at-grade crossings by clearing vegetation or installing lighting to illuminate passing or stopped trains.

VM 7 Within 6 months of acquisition by CN of the control of EJ&EW, Applicants shall cooperate with the Illinois Department of Transportation, Indiana Department of Transportation and other appropriate local agencies to coordinate a review of corridors surrounding highway/rail at-grade crossings to examine safety and adequacy of the existing warning devices, and identify remedies to improve safety for highway vehicles.

VM 8 Where grade-crossing rehabilitation is agreed to, Applicants shall assure that rehabilitated roadway approaches and rail line crossings meet or exceed the standards of the State Department of Transportation's rules, guidelines, or statutes, and the American Railway Engineering and Maintenance of Way Association ("AREMA") standards, with a goal of eliminating rough or humped crossings to the extent reasonably practicable.

VM 9 For each of the public grade crossings on EJ&EW's rail line, Applicants shall provide and maintain permanent signs prominently displaying both a toll-free telephone number and a unique grade-crossing identification number in compliance with Federal Highway Regulations (23 C.F.R. Part 655). The toll-free number shall enable drivers to report accidents, malfunctioning warning devices, stalled vehicles, or other dangerous conditions and shall be answered 24 hours per day by Applicants' personnel. At crossings where EJ&EW's ROW is close to another rail carrier's crossing, Applicants shall coordinate with the other rail carrier to establish a procedure and share information regarding reported accidents and grade-crossing device malfunctions.

VM 10 Within 6 months of acquisition by CN of the control of EJ&EW, Applicants shall cooperate with school and park districts to provide fencing where schools or parks are within one-quarter mile of the right of way and to identify at-grade crossings where additional pedestrian warning devices may be warranted.

VM11 Applicants shall continue ongoing efforts with community officials to identify elementary, middle, and high schools within 0.5 miles of EJ&EW's ROW and

provide, upon request, informational materials concerning railroad safety to such identified schools.

VM 12 Within 6 months of the effective date of the Board's final decision, Applicants shall initiate review of the locations of designated pedestrian and recreational trail at-grade crossings along the EJ&E rail line that would see an increase in train traffic under the Proposed Action. The Applicants shall cooperate in the review with local agencies and community trail groups to assess the adequacy of the existing warning devices, to ascertain if particular trail uses or issues reduce the effectiveness of these warning devices, and to identify appropriate remedies to improve safety of pedestrian and recreational trail users.

Construction

VM 13 Before starting any construction activities for the proposed connections or installation of double track, Applicants shall develop – in conjunction with the affected communities and local fire and emergency response departments along the EJ&E rail line – an adequate plan for fire prevention and suppression and subsequent land restoration during construction and operation along the EJ&E rail line. Applicants shall submit the plan to local communities and local fire and emergency response departments. Applicants' plan shall ensure that all non-turbocharged locomotives are equipped with functional spark arrestors on exhaust stacks, and carry fire extinguishers suitable for flammable liquid fires, electrical fires, and combustible materials fires, as well as provide for the installation of low-spark brake shoes on all locomotives.

2. HAZARDOUS MATERIALS TRANSPORTATION

VM 14 Applicants shall comply with the current Association of American Railroads ("AAR") "key route" guidelines, found in AAR Circular No. OT-55-I, and any subsequent revisions.

VM 15 Applicants shall comply with the current AAR "key train" guidelines, found in AAR Circular No. OT-55-I, and any subsequent revisions.

VM 16 To the extent permitted and subject to applicable confidentiality limitations, Applicants shall distribute to each local emergency response organization or coordinating body in the communities along the key routes a copy of the Applicants' current Hazardous Materials Emergency Response Plans.

VM 17 Applicants shall incorporate EJ&EW into their existing Hazardous Materials Emergency Response Plan.

VM 18 Applicants shall comply with all hazardous materials regulations of the United States Department of Transportation (including the Federal Railroad Administration and the

United States Pipeline and Hazardous Materials Safety Administration) and Department of Homeland Security (including the Transportation Security Administration). Applicants shall dispose of all materials that cannot be reused in accordance with applicable law

VM 19 Upon request, Applicants shall implement real-time or desktop simulation emergency response drills with the voluntary participation of local emergency response organizations.

VM 20 Applicants shall continue their ongoing efforts with community officials to identify the public emergency response teams located along EJ&EW and shall provide, upon request, hazardous material training.

VM 21 Applicants shall conduct Transportation Community Awareness and Emergency Response Program (TRANSCAER) workshops (training for communities through which dangerous goods are transported) in those communities along the EJ&E rail line that request this training.

VM 22 Applicants shall assist in the hazardous materials training emergency responders for affected communities that express an interest in such training. Applicants shall support through
funding or other means the training of one representative from each of the communities located along the EJ&E rail line segments where the transportation of hazardous materials would increase. Applicants shall complete the training within 3 years from the date that the Applicants initiate operational changes associated with the Proposed Action.

VM 23 Applicants shall develop internal emergency response plans to allow for agencies to be notified in an emergency, and to locate and inventory the appropriate emergency equipment. Applicants shall provide the emergency response plans to the relevant state and local authorities within 6 months of acquisition by CN of the control of EJ&EW.

VM 24 Applicants shall provide dedicated toll-free telephone number to the emergency response organizations or coordinating bodies responsible for communities located along the EJ&E rail line. This telephone number shall provide access to applicant personnel 24 hours per day, seven days a week, enabling local emergency response personnel to obtain and provide information quickly regarding the transport of hazardous materials on a given train and appropriate emergency response procedures should a train accident or hazardous materials release occur.

VM 25 In accordance with their Emergency Response Plan, Applicants shall make the required notifications to the appropriate Federal and state environmental agencies in the event of a reportable hazardous materials release. Applicants shall work with the appropriate agencies such as the United States Fish and Wildlife Service, Illinois Environmental Protection Agency and Indiana Department of Environmental

Management to respond to and remediate hazardous materials releases with the potential to affect wetlands or wildlife habitat(s), particularly those of federally threatened or endangered species.

VM 26 Prior to initiating any Transaction-related construction activities, Applicants shall develop a spill prevention plan for petroleum products or other hazardous materials during construction activities. At a minimum, the spill prevention plan shall address the following:

- Definition of what constitutes a reportable spill;
- Requirements and procedures for reporting spills to appropriate government agencies;
- Methods of containing, recovering, and cleaning up spilled material;
- Equipment available to respond to spills and location of such equipment; and
- List of government agencies and Applicants' management personnel to be contacted in the event of a spill. In the event of a reportable spill, Applicants shall comply with their spill prevention plan and applicable Federal, state, and local regulations pertaining to spill containment and appropriate clean-up.

3. TRANSPORTATION SYSTEMS

Grade Crossing Delay

VM 27 Applicants shall comply with the Voluntary Mitigation Agreement concluded with the City of Joliet, which among other things addresses delay at the public highway/rail at-grade crossings at Woodruff Road and Washington Street.

VM 28 Although Applicants have not identified any grade crossings, other than Woodruff Road and Washington Street, that would require mitigation under SEA's established standards, Applicants shall, upon request, cooperate with municipalities and counties in support of their efforts to secure funding, in conjunction with appropriate state agencies, for grade separations where they may be appropriate under criteria established by relevant state Department of Transportation. Applicants shall contribute their statutorily required amount of funding to the cost of the grade separation.

VM 29 Applicants shall examine train operations for ways of reducing highway/rail at grade crossing blockages,

VM 30 Applicants shall cooperate with the appropriate state and local agencies and municipalities to:

- Evaluate the possibility that one or more roadways listed in Table ES-1 could be closed at the point where it crosses the EJ&E rail line, in order to eliminate the at-grade crossing.

- Improve or identify modifications to roadways that would reduce vehicle delays by improving roadway capacity over the crossing by construction of additional lanes.

- Assist in a survey of highway/rail at-grade crossings for a determination of the adequacy of existing grade crossing signal systems, signage, roadway striping, traffic signaling inter-ties, and curbs and medians.

- Identify conditions and roadway, signal, and warning device configuration may trap vehicles between warning device gates on or near the highway/rail at-grade crossing.

- Cooperate with state and local agencies to develop and implement a plan to grade-separate the highway/rail crossing.

VM 31 Applicants shall install power switches along EJ&EW where Applicants determine that manual switches could cause stopped trains to block grade crossings for excessive periods of time and that power switches would increase the speed of rail traffic and reduce the likelihood of such blockages.

VM 32 In order to minimize the number of trains being stopped by operators at locations that block grade crossings on the EJ&EW system, Applicants shall work with other railroads to establish reasonable and effective policies and procedures to prevent other railroads' trains from interfering with Applicants' trains on EJ&EW.

VM 33 Applicants' design for wayside signaling systems shall be configured and implemented to minimize the length of time that trains or maintenance-of-way vehicles or activities occupy at-grade crossings or unnecessarily activate grade-crossing warning devices.

VM 34 Applicants shall install control signals ("A" block or absolute stop signals) at the ends of sidings, double track sections, crossovers, and other control switch locations (Applicants 2008a).

VM 35 Applicants shall operate under U.S. Operating Rule No. 526 (Public Crossings), which provides that a public crossing must not be blocked longer than 10 minutes unless it cannot be avoided and that, if possible, rail cars, engines, and rail equipment may not stand closer than 200 feet from a highway/rail at-grade crossing when there is an adjacent track (Applicants 2008a). If the blockage is likely to exceed this time frame, then the train shall then be promptly cut to clear the blocked crossing or crossings.

VM 36 Applicants shall develop and submit to SEA a report on frequency and duration of trains delay at crossing for a period covering the first three years of operational changes.

Commuter and passenger rail service

VM 37 Applicants shall abide by the commitment made to Amtrak in a letter dated March 10, 2008 concerning Amtrak's use of the St. Charles Air Line (Air Line). In general, the commitment allows Amtrak to remain indefinitely on the Air Line after CN's trains are re-routed from the Air Line onto the EJ&E rail line should the Proposed Action be approved and implemented, thereby preserving Amtrak's access to Chicago's Union Station and Amtrak's ability to continue to provide service to and from points such as Champaign and Carbondale, Illinois. Applicants shall abide by the commitment to capping the cost to Amtrak for maintaining the Air Line at the current level, indexed for inflation (Applicants 2008p).

VM 38 Applicants shall operate the key interlockings at West Chicago and Barrington, Illinois, according to the current agreements under which EJ&E operates. Those agreements require EJ&E to give priority to passenger trains over either UP or EJ&E freight trains (Applicants 2008k).

VM 39 Applicants shall work with Metra to explore all options for service on the proposed STAR Line, including use of the EJ&E rail line. The timing and implementation of STAR Line service remain subject to numerous variables, including securing government funding, but the Applicants are committed to continuing discussions with Metra on the STAR Line (Applicants 2008j).

VM 40 During and after construction, Applicants shall maintain the pedestrian tunnel from the Metra Park-n-Ride lot to the Metra train station on the east side of the Chicago Subdivision rail line at Matteson (Applicants 2008l).

VM 41 Applicants shall comply with any written and executed curfew agreements that are now in effect regarding operations affecting passenger or commuter train service.

Emergency vehicle delay

VM 42 Applicants shall notify Emergency Services Dispatching Centers for communities along the affected segments of all crossings blocked by trains that are stopped and may be unable to move for a significant period of time Applicants shall work with affected communities to minimize emergency vehicle delay by maintaining facilities for emergency communication with local Emergency Response Centers through a dedicated toll-free telephone number; and providing, upon request, dispatching monitors that allow Emergency Response Center dispatching personnel to see real-time train locations.,

VM 43 Applicants shall make Operation Lifesaver programs available to communities, schools, and other organizations located along the affected segments.

VM 44 For up to 3 years after acquisition by CN of the control of EJ&EW , Applicants shall provide Operation Lifesaver programs in Spanish, upon request.

Construction

VM 45 At least one month prior to initiation of Transaction-related construction activities, Applicants shall provide the information described below regarding Transaction-related construction of sidings, double-tracking, or connections, as well as any additional information, as appropriate, to fire departments and the Local Emergency Planning Commissions ("LEPC") for communities within or adjacent to the construction area:

- The schedule for construction throughout the project area, including the sequence of construction work relating to public grade crossings and approximate schedule for these activities at each crossing;
- A toll-free number to contact Applicants' personnel, to answer questions or attend meetings for the purpose of informing emergency-service providers about the project construction and operations; and
- Revisions to this information, including changes in construction schedule, as appropriate.

VM 46 In undertaking Transaction-related construction activities, Applicants shall use practices recommended by AREMA and recommended standards for track construction in the AREMA Manual for Railway Engineering.

VM 47 During Transaction-related construction concerning at-grade crossings, when reasonably practicable, Applicants shall consult with the appropriate state Department of Transportation regarding detours and associated signage, as appropriate, or maintain at least one open lane of traffic at all times to allow for the quick passage of emergency and other vehicles.

VM 48 Applicants shall minimize temporary road closures during construction activities associated with the connections and double track. Applicants shall manage construction schedules to:
- Minimize highway/rail at-grade crossing closures
- Relay highway/rail at-grade crossing closure schedules to local emergency service providers

4. LAND USE

General Land Use

VM 49 Before beginning construction activity, Applicants shall survey all suitable habitats potentially impacted by the construction activity for Federally- and state-listed threatened or endangered plant species. If any listed plant species are located,

Applicants shall implement a mitigation plan in consultation with the appropriate Federal and state agencies.

VM 50 If identified in the area, Applicants shall coordinate with USFWS-Indiana and The Nature Conservancy (TNC) to monitor effects on the Karner blue butterfly in the West Gary Recovery Unit.

VM 51 Applicants shall continue the existing agreements for Paul Ales Branch operation for the protection of the Federally-listed Hine's emerald dragonfly.

VM 52 Applicants shall identify suitable habitat for Franklin's ground squirrel within construction limits, and minimize mowing along the ROW beyond what is necessary for reasonable railroad maintenance and safety.

VM 53 Land areas that are directly disturbed by Applicants' Transaction-related construction and are not owned by the Applicants (such as access roads, haul roads, and crane pads) shall be restored to their original condition, as may be reasonably practicable, upon completion of Transaction-related construction.

VM 54 During construction, temporary barricades, fencing, and/or flagging shall be used in sensitive habitats to contain construction-related impacts to the area within the construction Right Of Way ("ROW"). Staging areas shall be located in previously disturbed sites and not in sensitive habitat areas.

VM 55 To the extent reasonably practicable, Applicants shall confine construction traffic to a temporary access road within the construction ROW or established public roads. Where traffic cannot be confined to temporary access roads or established public roads, Applicants shall make necessary arrangements with landowners to gain access from private roadways. The temporary access roads shall be used only during project-related construction. Any temporary access roads constructed outside the rail line ROW shall be removed and restored upon completion of construction unless otherwise agreed to with the landowners.

VM 56 During Transaction-related earthmoving activities, Applicants shall remove topsoil and segregate it from subsoil. Applicants shall also stockpile topsoil for later application during reclamation of disturbed areas along the ROW. Applicants shall place the topsoil stockpiles in areas that would minimize the potential for erosion and use appropriate erosion control measures around all stockpiles to prevent erosion.

VM 57 Applicants shall commence reclamation of disturbed areas as soon as reasonably practicable after Transaction-related construction ends along a particular stretch of rail line. The goal of reclamation shall be the rapid and permanent reestablishment of native ground cover on disturbed areas. If weather or season precludes the prompt reestablishment of vegetation, Applicants shall use measures such as mulching or erosion control blankets to prevent erosion until reseeding can be completed.

VM 58 Applicants shall limit ground disturbance to only the areas necessary for Transaction-related construction activities.

VM 59 Applicants shall review the limits of land disturbance prior to construction to determine whether any U.S. Department of Commerce, National Geodetic survey monuments (that is, a government owned permanent survey marker) would be disturbed. If any survey monuments would be disturbed, Applicants shall give a 90-day notification to the U.S. Department of Commerce.

VM 60 Applicants shall consult with the appropriate state, county personnel, Forest Preserve and trail managers prior to construction activities on state land and shall flag the boundaries of the ROW.

VM 61 Applicants shall notify the trail managers of new construction that intersects trails during final design. Where possible, Applicants shall maintain access to all existing trails, greenways, and scenic corridors during construction. If temporary trail closures are required during construction, Applicants shall provide appropriate signage to detour pedestrian and recreational trail users to a safe alternate route.

VM 62 Before construction of the Applicants' Proposed Munger Connection adjacent to the Pratt's Wayne Woods Forest Preserve, Applicants shall flag the boundaries of the CN ROW, the EJ&E ROW, and the portion of the Commonwealth Edison ROW required for construction. Applicant shall remain within the flagged boundaries. Unless agreed by the Forest Preserve Management, no construction shall take place outside of the flagged construction area. Where possible, Applicants shall maintain access during construction activities to all existing roads, trails, and facilities within the Pratt's Wayne Woods Forest Preserve.

VM 63 Applicants shall require contractors to dispose of waste generated during Transaction-related construction activities in accordance with all applicable Federal, State, and local regulations.

Community Outreach

VM 64 Prior to initiation of Transaction-related construction activities, Applicants shall name a Community Liaison to: consult with affected communities, businesses, and agencies; seek to develop cooperative solutions to local concerns regarding construction activities; be available for public meetings; and conduct periodic public outreach regarding Transaction-related construction activities. The Community Liaison shall be available to consult with businesses and agencies until all Transaction-related construction activities are complete. Applicants shall provide the name and phone number of the Community Liaison to mayors and other appropriate local officials in each community where Transaction-related construction activities will occur.

VM 65 Applicants shall continue their ongoing community outreach efforts by maintaining, throughout the period of construction of Transaction-related sidings, double-track, and connections, a website about the construction.

Residential

VM 66 Applicants' Transaction-related construction vehicles, equipment, and workers shall not access work areas by crossing residential properties without the permission of the property owner or occupant.

Business and Industrial

VM 67 Applicants' Transaction-related construction vehicles, equipment, and workers shall not access work areas by crossing business or industrial areas, including parking areas or driveways, without advance notice to the business owner.

VM 68 Applicants shall work with affected businesses or industries to appropriately redress Transaction-related construction activity issues affecting any business or industry.

VM 69 To the extent reasonably practicable, Applicants shall ensure that entrances and exits for businesses are not obstructed by Transaction-related construction activities, except as required to move equipment.

State Lands

VM 70 Applicants shall consult with the General Land Office ("GLO") of Illinois to coordinate an Easement Agreement for crossing State-owned parks to reach Transaction-related construction areas.

Utility Corridors

VM 71 Applicants shall make reasonable efforts to identify all utilities that are reasonably expected to be materially affected by the proposed construction within their existing ROW or that cross their existing ROW. Applicants shall notify the owner of each such utility identified prior to commencing Transaction-related construction activities and coordinate with the owner to minimize damage to utilities. Applicants shall also consult with utility owners to design the rail line so that utilities are reasonably protected during Transaction-related construction activities.

VM 72 Applicants shall use the services of a qualified pipeline engineering firm that is familiar with the project area to assist in the identification of the various pipeline crossings and to assist in the design of crossings as necessary for Transaction-related construction activities.

5. AIR QUALITY

VM 73 Applicants shall accelerate implementation of EPA locomotive emissions reduction efforts by installing idling control systems on their switching locomotives assigned to the Chicago area and shall accelerate replacement of switching locomotives that are excluded from EPA emission standards and are now in service at Chicago-area yards that will experience increased yard activity as a result of the Transaction with locomotives that are compliant with EPA Tier 0 or more stringent emission standards.

VM 74 Applicants, to the extent reasonably practicable, shall adopt efficient fuel saving practices that may include a range of operating practices that will help reduce locomotive emissions, such as shutting down locomotives when not in use and when temperatures are above 40 degrees.

VM 75 To minimize fugitive dust emissions created during Transaction-related construction activities, Applicants shall implement appropriate fugitive dust suppression controls, such as spraying water or other approved measures. Applicants shall also regularly operate water trucks on haul roads to reduce dust.

VM 76 Applicants shall work with their contractors to make sure that construction equipment is properly maintained and that mufflers and other required pollution-control devices are in working condition in order to limit construction-related air emissions.

6. NOISE AND VIBRATION

VM 77 Applicants shall work with affected communities that have sensitive receptors that would experience an increase of at least 5 dBA and reach 70 dBA to mitigate train noise to levels as low as 70 dBA by cost effective means as are agreed to by an affected community and Applicants. In the absence of such an agreement, Applicants shall implement cost effective mitigation that could include such measures as (1) constructing noise control devices such as noise barriers, (2) installing vegetation or berming, or (3) installing, or providing funding for installation of, enhanced warning devices in order to provide the level of warning necessary to allow the community to request a waiver from Federal Railroad Administration (FRA) of the requirement to sound the horn and achieve quiet zone requirements.

VM 78 Applicants shall consult with affected communities and work with their construction contractors to minimize, to the extent reasonably practicable, construction-related noise disturbances near any residential areas.

VM 79 Applicants shall work with their construction contractors to maintain Transaction-related construction and maintenance vehicles in good working order with properly functioning mufflers to control noise.

VM 80 In addition to the development of other noise mitigation measures, Applicants shall consider lubricating curves where doing so would both be consistent with safe and

5. AIR QUALITY

VM 73 Applicants shall accelerate implementation of EPA locomotive emissions reduction efforts by installing idling control systems on their switching locomotives assigned to the Chicago area and shall accelerate replacement of switching locomotives that are excluded from EPA emission standards and are now in service at Chicago-area yards that will experience increased yard activity as a result of the Transaction with locomotives that are compliant with EPA Tier 0 or more stringent emission standards.

VM 74 Applicants, to the extent reasonably practicable, shall adopt efficient fuel saving practices that may include a range of operating practices that will help reduce locomotive emissions, such as shutting down locomotives when not in use and when temperatures are above 40 degrees.

VM 75 To minimize fugitive dust emissions created during Transaction-related construction activities, Applicants shall implement appropriate fugitive dust suppression controls, such as spraying water or other approved measures. Applicants shall also regularly operate water trucks on haul roads to reduce dust.

VM 76 Applicants shall work with their contractors to make sure that construction equipment is properly maintained and that mufflers and other required pollution-control devices are in working condition in order to limit construction-related air emissions.

6. NOISE AND VIBRATION

VM 77 Applicants shall work with affected communities that have sensitive receptors that would experience an increase of at least 5 dBA and reach 70 dBA to mitigate train noise to levels as low as 70 dBA by cost effective means as are agreed to by an affected community and Applicants. In the absence of such an agreement, Applicants shall implement cost effective mitigation that could include such measures as (1) constructing noise control devices such as noise barriers, (2) installing vegetation or berming, or (3) installing, or providing funding for installation of, enhanced warning devices in order to provide the level of warning necessary to allow the community to request a waiver from Federal Railroad Administration (FRA) of the requirement to sound the horn and achieve quiet zone requirements.

VM 78 Applicants shall consult with affected communities and work with their construction contractors to minimize, to the extent reasonably practicable, construction-related noise disturbances near any residential areas.

VM 79 Applicants shall work with their construction contractors to maintain Transaction-related construction and maintenance vehicles in good working order with properly functioning mufflers to control noise.

VM 80 In addition to the development of other noise mitigation measures, Applicants shall consider lubricating curves where doing so would both be consistent with safe and

efficient operating practices and significantly reduce noise for residential or other noise sensitive receptors. Applicants shall also continue to employ safe and efficient operating procedures that, in lieu of, or as complement to, other noise mitigation measures can have the collateral benefit of effectively reducing noise from train operations. Such procedures include:

- inspecting rail car wheels to maintain wheels in good working order and minimize the development of wheel flats;
- inspecting new and existing rail for rough surfaces and, where appropriate, grinding these surfaces to provide a smooth rail surface during operations;
- regularly maintaining locomotives, and keeping mufflers in good working order; and
- removing or consolidating switches determined by Applicants to no longer be needed.

VM 81 To minimize noise and vibration, Applicants shall install and maintain rail and rail beds according to AREMA standards.

VM 82 Applicants shall comply with FRA regulations establishing decibel limits for train operations.

VM 83 Applicants shall install or relocate a Wheel Impact Load Detector (WILD) on the EJ&E rail line within three years of acquisition by CN of the control of EJ&EW.

7. BIOLOGICAL RESOURCES

VM 84 For impacts to non-jurisdictional isolated wetlands habitat along the new line, Applicants shall survey the route to determine if the Hines Emerald Dragonfly is present along the ROW.

VM 85 Upon consultation with U.S. Fish and Wildlife Service, should the Hines Emerald Dragonfly be observed on the site of Transaction-related construction activities, Applicants shall implement appropriate measures prior to and during construction to reduce or eliminate impacts on the Hines Emerald Dragonfly.

VM 86 Prior to initiating Transaction-related construction activities, Applicants shall consult with the local offices of the Natural Resource Conservation Service ("NRCS") to develop an appropriate plan for restoration and re-vegetation of the disturbed areas (including appropriate seed mix specifications).

VM 87 During construction activity, Applicants shall take reasonable steps to ensure contractors use fill material appropriate for the project area.

VM 88 Applicants shall, to the extent reasonably practicable, revegetate the bottom and sides of the drainage ditches using natural recruitment from the native seed sources in the stockpiled topsoil.

8. WATER RESOURCES

VM 89 In the case where there is a potential for a railroad drainage ditch to influence wetland hydrology, Applicants shall construct low permeability clay berms (wetland berms adjacent to the drainage channels that would be proximal to the isolated wetlands). These berms would minimize the impact to surface water drainage from the proposed drainage ditch.

VM 90 Applicants shall compensate in accordance with USACE regulations in both Illinois and Indiana for wetland impacts that cannot be avoided and for impacts that are determined by USACE to be on waters of the U.S. for construction related to the proposed action.

VM 91 Applicants shall maintain drainage ditches as permanent vegetated swales to provide storm water retention and treatment. Removal of accumulated sediments shall be conducted only as necessary to maintain storm water retention capacity and function.

VM 92 To minimize sedimentation into streams and waterways during construction, Applicants shall use best management practices, such as silt fences and straw bale dikes, to minimize soil erosion, sedimentation, runoff, and surface instability during project-related construction activities. Applicants shall seek to disturb the smallest area possible around any streams and shall conduct reseeding efforts to ensure proper revegetation of disturbed areas as soon as reasonably practicable following Transaction-related construction activities.

VM 93 In order to control erosion, Applicants shall establish staging and lay down areas for Transaction-related construction material and equipment at least 300 feet from jurisdictional waters of the United States and in areas that are not environmentally sensitive. Applicants shall not clear any vegetation between the staging area and the waterway or wetlands. To the extent reasonably practicable, areas with non-jurisdictional isolated waters will not be used for staging and lay down and will only be impacted when necessary for construction. When Transaction-related construction activities, such as culvert and bridgework, require work in streambeds, Applicants shall conduct these activities, to the extent reasonably practicable, during low-flow conditions.

VM 94 During Transaction-related construction activities, Applicants shall require all contractors to conduct daily inspections of all equipment for any fuel, lube oil, hydraulic, or antifreeze leaks. If leaks are found, Applicants shall require the contractor to immediately remove the equipment from service and repair or replace it.

VM 95 Applicants shall employ best management practices to control turbidity and disturbance to bottom sediments of surface waters during Transaction-related construction. Applicants shall implement best management practices in wetlands or other waters of the United States to avoid adverse downstream impacts on fish, mussels, and other aquatic biota.

VM 96 Applicants shall implement their current noxious weed control program during construction and operation of Transaction-related sidings, double-track, and connections. All herbicides used by Applicants shall be approved by the U.S. EPA.

VM 97 Applicants shall ensure that any herbicides used in ROW maintenance to control vegetation are approved by the U.S. EPA and are applied by licensed individuals who shall limit application to the extent necessary for rail operations. Herbicides shall be applied so as to prevent or minimize drift off of the ROW onto adjacent areas.

VM 98 During construction, Applicants shall prohibit Transaction-related construction vehicles from driving in or crossing streams at other than established crossing points.

VM 99 Applicants shall, to the extent reasonably practicable, ensure that any fill placed below the ordinary high water line of wetlands and streams is appropriate material selected to minimize impacts to the wetlands and streams. All stream crossing points shall be returned to their pre-construction contours to the extent reasonably practicable and the crossing banks will be reseeded or replanted with native species immediately following project-related construction.

VM 100 Applicants shall obtain a National Pollutant Discharge Elimination System ("NPDES") storm water discharge permit from U.S. EPA or appropriate State agencies for Transaction-related construction activities.

9. MONITORING AND ENFORCEMENT

VM 101 Applicants shall submit quarterly reports to SEA on the progress of, implementation of, and compliance with the mitigation measures for a period covering the first three years of operational changes.

Part 2 – Applicants' Comments on the Draft Environmental Impact Statement

I. Preface & Background

A. Preface

CN welcomes this opportunity to Comment on the DEIS. It offers this preface to put its comments in perspective.

There is no real question that the CN/EJ&EW Transaction[5] would further the public interest in meeting important national and regional transportation needs and improving the economy. The most significant question in this proceeding has become whether the Transaction will "survive" the length of the Board's environmental review.

At the outset, that seemed to be an easy question. The Transaction is a simple one – the acquisition of 158 route miles of operating railroad. It would have two principal sources of environmental impacts: 1) the shifting of trains from CN lines to under-utilized EJ&E lines (a shift that, as railroads respond to Chicago's rail congestion, might occur without the Transaction and without regulatory review); and 2) the construction of facilities not otherwise subject to the Board's jurisdiction to better accommodate those additional trains. And CN entered upon the Transaction ready and willing to mitigate all environmental impacts that might be reasonably attributed to the Transaction under the Board's existing standards for measuring and mitigating such impacts. CN was prepared for serious environmental review.

Thus, when the Board determined to conduct its first EIS for a "minor" transaction, CN agreed, without waiving any rights, to assist and fund the Board's EIS on the very reasonable

[5] Applicants incorporate by reference the short forms and abbreviations set forth in the Table of Abbreviations at CN-2 at 8-11.

assumption that the Board could readily complete the "hard look" it had undertaken with regard to the Transaction in time for CN to consummate the Transaction before the end of 2008. CN therefore saw little risk that the EIS would ultimately threaten termination of the Transaction at year's end under CN's Stock Purchase Agreement with EJ&E.

The Board, however, did not do what was necessary, as required by Congress and Supreme Court precedent, to conduct an expeditious and disciplined review process. Instead, the Board embarked on a review that may, in proportion to the substantive environmental issues presented, be the most time-consuming and expensive in the agency's history. The study is expected to cost $20 million or more just for SEA's consultants; the preparation of the DEIS alone consumed, for every route-mile of railroad being acquired, about $79,000.00 in consultant fees and 422 consultant hours.

In the course of this study, when it became clear that the Transaction might be at risk by virtue of delay, the Board rejected CN's requests for either an expedited process to allow the closing of the Transaction by year's end, or if expedition was beyond the Board's capacity, a bifurcated process that would allow the closing of the Transaction by year's end and the protection of the environmental status quo until the Board completed its environmental review. As a result, there is now a very real risk that the Transaction will be terminated before the Board's has finished its review.

While many legitimate concerns were raised in good faith about the Transaction prior to the DEIS, no one explicitly identified any matters that, in light of the Board's prior experience, could have warranted such an expenditure of money and time. The draft and final scope of study for the EIS took a long time to develop, but both were conventional. They presented no significant issues that had not been encountered by the Board or its consultants in the past. And

they required the consultants working under the Board's supervision to employ no science, methodologies, or technology that were not readily available to professional evaluators of environmental impacts. This was very familiar territory to an agency that had conducted many inquiries into the impacts of train operation and railroad construction on the environment.

With the production of the DEIS, however, it became clear that the extraordinary length and cost of the Board's process was almost entirely attributable to its response to the controversy over the Transaction's potential impacts that had been generated[6] by a number of opposing communities along the EJ&E. And that reaction appears also to have influenced the substance of the DEIS. Where controversy has been greatest, the DEIS appears to reflect more a reaction to that controversy than to an independent, professional environmental review.

Thus, the DEIS departs from established practice and precedent to include certain assessments that have little real basis in science, logic, or economics, that lack reasonable proportion or perspective, and have no predicate in law or generally applicable public policy. This is most obvious with respect to the increased delay at railroad grade crossings that would accompany a shift of trains from other lines to the EJ&EW. There, the DEIS appears to have abandoned rigorous objectivity with respect to the matters warranting study, the vehicle traffic data used to support its analyses, the proper measure of impacts that require mitigation, and the proper allocation of the cost of mitigation, and gives short shrift to the beneficial impacts of the Transaction on the majority of the impacted population in the region. In short, the DEIS's assessment of a few controversial subjects, is unreasonable.

The basis for CN's concerns about the impact of controversy on the DEIS process is well illustrated by the opposition of the Village of Barrington, Illinois, an affluent suburb of some

[6] *See e.g.*, CN-39 at 3.

10,000 residents located along the EJ&E. Barrington has been among the most vocal of the opponents of the Transaction, and its well-funded activism appears to have influenced the Board's approach to the Transaction in ways that are not necessarily in the broad public interest.

The village is traversed by the lines of EJ&E and UP and currently experiences about 60 freight and commuter trains a day on the UP line, and about 5 trains per day on EJ&E. After the Transaction, CN proposes to run an additional 13 trains a day through the village – for a total of approximately 18 trains per day over the EJ&E line. These 13 new trains would be about 17% of the total trains experienced daily by the citizens of Barrington.

From Barrington's reaction to these 13 new trains per day, one would never guess that what is at issue is an average delay of a few seconds a month for the average motorist using a railroad crossing. Yet, in an effort to whip up opposition and influence the Board's adjudicatory process, village leaders have characterized these impacts essentially as threatening to end life as it is now known in Barrington. The village president refers to the proposed Transaction, apparently without any irony, as "the greatest challenge we have ever faced."[7]

These efforts to influence the Board's focus in its environmental review appear to have had a profound impact. For example, the review process paid scant attention to the benefits of the Transaction to the many communities inside the EJ&E arc or to issues of environmental justice.[8]

There are many communities that now experience the trains that CN would like to shift to the EJ&E at traffic levels equivalent to those that communities along the EJ&E would experience

[8] C. Berry and E. Bueno de Mesquita, "Stalemate over Rail Plan Reflects Failure of Political Leadership," *available at* http://media1.dailysouthtown.com/multimedia/berrymesquitacn.pdf_20080911_13_16_26_47.imageContent.

if the Transaction were approved. For example, Harvey, in southern Cook County, has a population of 30,000 with a median income of roughly $32, 000. Harvey has 9 grade crossings on CN's line through the center of its town and CN proposes to reduce train traffic on that line from 15 trains a day to 1 train a day – a reduction almost directly equivalent to the increase in traffic through Barrington. According to calculations submitted to SEA by CN, Harvey will see a reduction in average delay per vehicle which almost exactly matches the average increase in delay per vehicle for Barrington.

Yet, reading the DEIS, one would be hard pressed to find any detailed discussion of this benefit and like benefits to the many citizens who would be positively affected by the Transaction. These citizens number far more than those who would be negatively affected. While the Board sponsored 6 scoping meetings and 7 open houses at communities along EJ&E, it made no attempt to reach out to the people of Harvey and similarly situated communities to solicit their input on the Transaction. Yet the need for such an assessment was obvious, as shown by Exhibit 1.

The lack of perspective in the DEIS concerning reciprocal benefits seems contrary to the purposes of NEPA. NEPA was not intended to be a tool to be used to prevent change that has demonstrable economic, environmental, and social benefits for the region generally and for minorities and other environmental justice communities in particular.

Fortunately, all of this is merely prologue to the next step in the process ordained by the Board. There is no requirement in NEPA or any other law or policy for the Board to continue to bend its standards in the face of controversy. The Board should revert to its prior standards and expeditiously produce an FEIS based on solid law, science, reason, and economics from a balanced perspective, informed by generally applicable public policies. Given the SEA's well-

established professional capacities, and proper Board direction, this should not be a difficult matter.

The good news is that most of the analyses conducted for the DEIS were not distorted by reaction to controversy and are reasonable. CN accordingly has generally endorsed and accepted, as part of its comprehensive Voluntary Mitigation Plan much of the analyses and mitigation recommended in the DEIS.

With respect to matters where the DEIS appears to be most affected by controversy, CN has made an effort to determine, and reflect in this response what a reasonable approach would indicate. It has sought to supply the most accurate data, to take into account the overall environmental impacts, and to use well-established indicators of impact, the need for mitigation, and the proper allocation of the costs of mitigation. On that basis, even though the Transaction will produce environmental impacts that, on a regional basis, are almost entirely positive, CN continues to stand by its commitment to voluntarily provide mitigation of all impacts at levels that would meet or exceed the Board's prior standards for impact analysis, prescription of mitigation, and sharing of mitigation costs.

Contrary to the early judgments of some observers, all of the environmental impacts that the Board has previously required to be mitigated can be reasonably mitigated here, albeit at great expense. This is reflected in CN's new Voluntary Mitigation Program, revised to reflect the DEIS and CN's own revised analyses, which would cost roughly $60 million -- a proportion of the Transaction's cost that is unprecedented in STB history.

Where there are real problems – such as at the two crossings in Joliet where the level of service would have been reduced to what has previously been recognized as an unacceptable level – CN has already agreed to mitigate them. Where other communities would be interested

in a grade separation, CN has already agreed to work with them to identify sources of funding and has committed to paying its fair share as established under long-standing practice and legal requirements. Where noise levels would exceed SEA's established levels for mitigation, and where CN is unable to reach a mitigation agreement with a community, it has agreed to work with the community to implement cost-effective mitigation.

CN cannot reasonably be expected to pay for mitigation imposed in response primarily to controversy. CN, however, fully recognizes that reasonable parties may differ as to the best approach to these matters. It continues to be willing to accept other mitigation proposed by the Board so long as the mitigation is reasonable, in light of sound science, logic and economics, and generally applicable public policies. It looks forward to working with the affected communities to implement all reasonable mitigation imposed by the Board's final EIS.

B. SEA's comprehensive assessment of the environmental impacts of the proposed transaction generally satisfies the requirements of NEPA and the Board's environmental regulations.

In preparing the five-volume Draft Environmental Impact Statement ("DEIS") for the proposed acquisition of EJ&E West Company ("EJ&EW") by Applicants Canadian National Railway Company and Grand Trunk Corporation (together, "CN" or "Applicants"),[9] SEA examined the potential environmental impacts of the Transaction with a level of scrutiny unprecedented in a "minor" control proceeding. As reported in the DEIS, that examination clearly took a "hard look" at the potential environmental impacts of the Transaction, and comprehensively addressed every environmental issue that the Board would be required to

[9] Applicants hereby incorporate by reference the short forms and abbreviations set forth in the Table of Abbreviations at CN-2 at 8-11.

analyze in satisfaction of its obligations under NEPA,[10] assuming it applies.[11] The DEIS accordingly provides a solid basis for expeditious completion of the environmental review, publication of the Final Environmental Impact Statement ("FEIS"), and issuance by the Board of a decision on the merits.

C. CN generally agrees with the factual analysis undertaken by SEA.

The DEIS supports the conclusion that in many respects the Transaction would have minor impacts, and in some cases would produce substantial environmental benefits. For virtually every adverse impact caused by increased train traffic on the EJ&E arc, the Transaction would cause a countervailing benefit from reduction of train traffic on lines used by CN through Chicago. For example, the DEIS recognizes that the Transaction would lead to region-wide decreases in freight rail accidents (8%), DEIS at 4.2-4, and highway/rail at-grade crossing accidents (9%), DEIS at 4.2-17. And because the communities adjacent to the lines with reduced traffic are more densely populated than those on the lines with increased traffic, the number of residents benefited is greater than those who would experience adverse environmental effects. Thus, the Transaction should be regarded as causing a net environmental benefit. This is true even without considering such factors as how increased rail capacity would make it more likely that any increases in freight traffic in the Chicago area would move on trains rather than trucks, which are acknowledged to cause greater environmental harm, because of higher fuel consumption and higher emissions of air pollutants per unit of freight transported.

[10] In fact, it might be argued that the analysis was far more extensive than NEPA would require for this relatively small transaction.

[11] On September 18, 2008, CN filed in the United States Court of Appeals for the D.C. Circuit a petition for a writ of mandamus making a legal challenge to the Board's application of NEPA. *In re Canadian Nat'l Ry.*, No. 08-1303 (D.C. Cir. Sept. 18, 2008). *See also* CN's assessment of the applicability and requirements of NEPA, discussed below in Section V.

Even in cases where the DEIS does not cite environmental benefits, it recognizes that the Transaction would have either no effect or no significant adverse impact (*e.g.*, commuter capacity and passenger rail service (*id.* at 4.1-41—4.1-49); intercity passenger rail service (*id.* at 4.1-50–4.1-51); rail operations (*id.* at 6-12); passenger rail safety (*id.* at 6-15); navigable waterways (*id.* at 6-22); airports (*id.* at 4.3-91); hazardous waste sites (*id.* at 6-23); prime farmland (*id.* at 4.5-1); socioeconomics (*id.* at 6-23); environmental justice (*id.* at 6-23); energy use (*id.* at 4.8-7); air quality (*id.* at 4.9-30); climate (*id.* at 4.9-31); wildlife (*id.* at 6-25); and other biological resources (*id.* at 4.11-26); floodplains and streams (*id.* at 4.12-7, 4.12-8); surface water quality; wetlands (*id.* at 4.12-7); and cultural resources (*id.* at 6-26)). Where the Transaction might lead to significant adverse impacts, the DEIS indicates that effective mitigation is possible. *See*, *e.g.*, *id.* at 4.4-4 (adequate procedures can mitigate impact to hazardous waste sites from construction).

CN agrees with these important conclusions, but believes that in many cases the true benefits of the Transaction – which must be weighed against its adverse impacts – are much greater than indicated in the DEIS. Additionally, CN takes exception to SEA's treatment of a relatively small number of issues, as described in more detail below. It appears that in some cases, portions of the DEIS are based on flawed data or faulty assumptions, thereby over-estimating the potential negative impacts and under estimating the potential positive impacts. In other cases, SEA proposes mitigation that might not be warranted if more accurate or relevant data and assumptions were used.

Subject to the modifications proposed by CN below, the DEIS provides a solid foundation for the Final Environmental Impact Statement ("FEIS"). In preparing the FEIS, SEA should carefully consider what recommendations for mitigation are factually warranted, within

the legal purview of the Board, and consistent with the appropriate balance of public benefits and interests related to this Transaction.

D. Given the substantial thoroughness of the DEIS and the goals of NEPA, SEA should complete its environmental review in time to permit a final decision by the Board that would be effective by December 31.

Despite the substantial and continuing opposition to the Transaction, the DEIS confirms that the impacts are neither unusual nor greater than those in previous railroad control proceedings. Even under some of the unwarranted or questionable assumptions made by SEA (including in some instances unreasonably altering the Board's established standards for mitigation, which are based on defensible criteria), few impacts exceed the established or new thresholds applied by SEA. Given the overall thorough job SEA did in preparing the DEIS and the superficial nature of most of the critical comments offered to date, there is no apparent reason why SEA should not complete its review in time to allow CN to close on the Transaction by the end of the year.

If, however, SEA determines that, despite the thoroughness of the study it has thus far made of the Transaction, yet further analysis of specific environmental effects is needed, then this requirement should not cause action on the Application to be delayed past December 31. The Board should instead act promptly on the Application, and assuming it finds that the Transaction otherwise qualifies for approval, condition that approval on CN's submitting to such additional environmental analysis as may reasonably be required, and to such reasonable further mitigation as the study indicates is necessary.[12]

[12] *Cf. Union Pacific Corp. – Control & Merger – Southern Pacific Rail Corp.*, 1 S.T.B. 233 (1996) (approval of major transaction conditioned on further study to determine appropriate mitigation of localized environmental impacts in Reno and Wichita; applicants required to maintain environmental status quo pending completion of study and determination of mitigation), *aff'd sub nom. Western Coal Traffic League v. STB*, 169 F.3d 775 (D.C. Cir. 1999).

II. CN's Outreach & Mitigation Agreements

A. CN's outreach efforts

CN has reached out to all potentially affected communities along the EJ&E line, and has offered reasonable measures to mitigate adverse environmental impacts of the Transaction. CN has already been able to reach a significant mutually acceptable agreement with one community, and is actively negotiating with others. CN remains willing to negotiate with any community that seeks to do so in good faith.

A.1 CN has sought to enter into agreements with all other communities on the EJ&E lines to provide reasonable mitigation of adverse environmental impacts potentially resulting from Transaction-related increases in rail traffic.

CN's outreach process began when CN and USS announced the Transaction in September 2007. CN contacted officials in communities along the line, offering briefings and other information on the Transaction. Prior to the scoping process, CN held at least 23 meetings with 14 of these communities, as well as with officials from DuPage, Will, Cook, and Lake counties.

Upon completion of the scoping meetings held by SEA earlier this year to receive comments on the scope of study of the proposed environmental impact statement, CN launched its formal community outreach program. A dedicated team of senior CN officers, along with environmental experts retained specifically for this purpose, offered to meet with any community along the EJ&E line to identify their environmental concerns associated with increased train traffic and to negotiate a voluntary mitigation agreement to address those concerns. Since SEA's

scoping meetings, CN officials have met with officials of 31 of the 33 communities[13] along the EJ&E line in connection with this initiative, with more than 80 meetings to date, along with numerous communications by telephone, e-mail, and letter. Discussions with the communities are at varying stages. CN has also held two "emergency response" seminars covering 12 towns in Will and Lake counties.

Any agreements that are signed as a result of this outreach process will be written to take effect upon CN's implementation of the Transaction, pursuant to a Board decision approving CN's application. CN is willing to have the Board's approval of the application be conditioned on CN's adherence to these agreements in lieu of any location-specific environmental conditions which the Board might otherwise impose.

A.2 CN has reached a mutually acceptable agreement that provides reasonable mitigation for the city of Joliet.

CN has successfully negotiated a settlement agreement with the City of Joliet, which was submitted to SEA on August 26, 2008, and which addresses all of Joliet's concerns regarding the environmental impacts of the Transaction, including delay at crossings on Washington Street and Woodruff Road, which the DEIS identified as potential candidates for mitigation. CN requests that the terms of the agreement be imposed as a condition in lieu of other location-specific mitigation SEA may otherwise impose.

III. The DEIS correctly identified alternatives to the proposed Transaction.

SEA identified two alternatives to approval of the Application (described in the DEIS as the "Proposed Action"). The first is approval of the Application with conditions, including

[13] Officials from Long Grove and Deer Park have declined to meet with CN.

environmental mitigation conditions, and the second is the "No-Action" alternative, which CEQ regulations require be examined in any EIS.[14] SEA appropriately omitted other alternatives that were suggested to it in the scoping process.

SEA properly discounted the Chicago Region Environmental And Transportation Efficiency Program ("CREATE") as an alternative to the Transaction, on the grounds that CREATE would not meet the Transaction's purposes of giving CN control of its own route around Chicago, giving CN access to EJ&E's Kirk and East Joliet Yards, and allowing CN to benefit from the supply line provided by EJ&E to various industries it now serves, including the steel, chemical, and petrochemical industries. But the most fundamental reason that CREATE is not an adequate alternative to the Transaction is that the one goal of the Transaction that CREATE has the potential to address – the reduction of congestion that slows down CN's trains (and others) within Chicago – cannot be realized if the elements of CREATE that benefit CN are not financed and implemented.

Its founders originally estimated in 2003 that CREATE would cost approximately $1.53 billion, with the rail participants collectively to contribute $232 million to pay for the estimated railroad benefits of the Project, and the remainder to be funded from federal, state, and local sources to pay for the Project's public benefits, including grade separations.[15] CN was the only railroad participating in CREATE that would be required to relocate its operations through

[14] 40 C.F.R. § 1502.14(d). CEQ has explained that consideration of the No-Action alternative is required even in cases (such as this one, *see* 49 U.S.C. § 11324(d) and discussion in section V.B., below) where "the agency is under a . . . legislative command to act." Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations, 46 Fed. Reg. 18,026, 18,037 (1981) ("Forty Questions").

[15] *See, e.g.*, Joint Statement of Understandings Regarding the Proposed CREATE Project, Section II.6 (June 13, 2003), Chicago Region Environmental And Transportation Efficiency Program, Final Feasibility Plan 25 (Aug. 2005) ("CREATE Feasibility Plan"), *available at* http://www.createprogram.org/pdf/final_feasibility_plan.pdf.

Chicago to a new route to be constructed as part of the CREATE project. CN agreed to contribute $63.4 million toward the rail assets (rail, ties, ballast, and signals) required for the construction of that route, called the Central Corridor.[16] It was understood by the participants in the project that the railroads' financial contributions and their continuing participation were dependent upon full authorization and availability of the public funds required for the project.[17]

In 2005, however, in the SAFETEA-LU legislation,[18] Congress authorized significantly less federal funding for CREATE than its proponents had sought. The lower funding provided would enable only a very limited partial implementation of CREATE in the upcoming years, and, with continued funding uncertainties, leaves realization of the remainder of the project – including construction of a new CN Central Corridor route through Chicago – in serious question.

Thus, the availability of CREATE as an alternative to the Transaction is something that CN – or the Board – cannot count on in the near term or intermediate future, which means it is not presently able to satisfy any of CN's purposes in entering the proposed Transaction. The Transaction, on the other hand, could start meeting those purposes immediately upon approval by the Board.

[16] Under CREATE, the railroads would only be required to pay for those improvements that would actually benefit their operations, and thus the public, not the railroads, would be responsible for paying for grade separations in connection with the project. *See, e.g.*, CREATE Feasibility Plan at 25. This is true even though construction of the Central Corridor would have substantial environmental impacts on the adjacent communities, including the taking and demolition of local residences.

[17] CREATE Feasibility Plan at 9, 15 ("Except as provided in Section IV hereof [regarding $2.5 million to be provided for additional engineering], the Railroad Financial Contribution to the Project shall be contingent upon a binding commitment that establishes the availability, on terms and conditions satisfactory to the Participating Railroads, of all Additional Funding and of third-party properties necessary to complete the entire Project.").

[18] Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA–LU), Pub. L. No. 109-59, § 1301(m), 119 Stat. 1144, 1203 (2005).

Moreover, as neither CN nor the Board is in any position to implement CREATE, NEPA does not require its consideration as an alternative to CN's application. *See Envtl. Law & Policy Ctr. v. Nuclear Regulatory Comm'n*, 470 F.3d 676, 684 (7th Cir. 2006) (reasonable for agency to conclude that NEPA does not require consideration of alternatives that applicant is in no position to implement). And, as CN is a private applicant for a federal license, the Board can "accord substantial weight to the preferences of the applicant" because Congress, in drafting NEPA, "did not expect agencies to determine for the applicant what the goals of the applicant's proposal should be." *City of Grapevine v. Dep't of Transp.*, 17 F.3d 1502, 1506 (D.C. Cir. 1994) (quoting *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190 (D.C. Cir. 1991)) (quotations omitted). Under NEPA, there is therefore no legal requirement for SEA to consider CREATE as an alternative.

SEA also properly rejected the vague suggestions of other commenters that construction of an outer rail bypass at some unspecified location should have been examined as an alternative to the Transaction. As SEA has observed, DEIS at 2-69, construction of a bypass would have much more damaging environmental impacts than the proposed Transaction, because it would require creation of a new right-of-way over potentially hundreds of miles far outside Chicago. Proponents of building a Chicago rail bypass further west have not provided the slightest indication of where it might be built (*i.e.*, in who else's back yard), how long it would be, how disruptive its construction would be, how long it would take before trains could use it, or, significantly, how much it would cost. Wherever it was proposed, the residents, businesses, and landowners in the affected communities could be expected to protest at least as vigorously as the much smaller number of people affected by the construction of DM&E's proposed new rail line into the Powder River Basin.

IV. Comments on specific "Environmental Resource Categories" addressed in the DEIS.

A. Rail Operations

CN generally concurs with SEA's assessment that the Transaction would have limited impacts on freight and passenger rail operations on the affected segments. However, CN wishes to respond to (1) SEA's characterization of the Suburban Transit Access Route ("STAR") Line, now under consideration by Metra, as "reasonably foreseeable" (DEIS at 4.1-39), requiring examination of the potential impacts of the Transaction on that project in connection with CN's proposed rail operations; (2) comments that have been made by opponents to the Transaction, to the effect that local communities would be devastated by the frequent passage of trains of 10,000 feet in length; and (3) comments that CN's traffic projections are unrealistically low.

A.1 Metra's proposed STAR Line project is not reasonably foreseeable.

In past environmental review proceedings, SEA and the Board have evaluated the impacts of proposed transactions on "reasonably foreseeable commuter rail inception or expansion plans (i.e., where capital improvements are planned, approved, and funded)." Notice of Final Scope of Environmental Impact Statement, *CSX Corp. – Control & Operating Leases/Agreements – Conrail Inc.*, STB Finance Docket No. 33388, slip op. at 5 (STB served Oct. 1, 1997). In this proceeding, however, SEA has deviated from its past practice in order to describe the impacts of the Transaction on the STAR Line, but provides no justification for this change in policy.[19] At the same time, however, the DEIS itself provides evidence of how speculative the proposed service is (DEIS at 4.1-45).

[19] *Cf. Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 209-13 (1988) (agency may not retroactively revise rule absent express authority).

The STAR Line is not "reasonably foreseeable" for at least three basic reasons. First, the threshold Alternatives Analysis under the Federal Transit Administration's New Starts program has not been completed, and the STAR Line has thus not yet been determined to be the preferred alternative to carry out the planned service so as to qualify for federal funding. Second, funding for the STAR Line is not complete. Metra's website notes that it is "currently seeking funding under the latest transportation bill" and that "state money will be a necessary component of the overall funding package."[20] Neither the Illinois legislature nor Illinois DOT has taken any steps toward funding the STAR Line. Implementation of the STAR Line, in the absence of the CN/EJ&EW Transaction, is, thus, far from "reasonably foreseeable," and should be regarded by SEA as at best speculative.

In any event, those who have attacked the Transaction as likely to kill the STAR Line are mistaken. As noted above, it is not at all certain that Metra's proposed service would ever come to life, whether or not the Transaction were implemented. In fact, CN's voluntary mitigation plan includes a commitment to "work with Metra to explore all options for service on the proposed STAR Line, including use of the EJ&E rail line" (VM 39) According to Philip Pagano, the executive director of Metra, while it would be easier to implement the STAR Line without CN running on EJ&E, he believes that Metra can "co-exist[] on a rail line with both freight and commuter traffic" and can do so "at a reasonable price."[21] Additionally, Metra has a long history of working cooperatively with freight railroads, including CN, which already shares two of its existing lines (the Joliet and Waukesha subdivisions) with Metra.

[20] *See* Frequently Asked Questions for the STAR Line, http://metraconnects.metrarail.com/faq.php?line=star (last visited Sep. 30, 2008).

[21] *See* Andre Salles, *Illinois Officials Still Think EJ&E Sale A Bad Idea*, Chic. Sun-Times, Aug. 6, 2008, *available at* http://www.ble.org/pr/news/headline.asp?id=23161.

A.2 Communities would not be divided by 10,000-foot CN trains after implementation of the Transaction, and in any event CN has proposed a mitigation condition to prevent lengthy blockages of road crossings by CN trains on the affected line.

Some commenters have raised the spectre of frequent 10,000 foot long CN trains running over the EJ&E line,[22] blocking several road crossings at a time, and potentially cutting a community in two if the train should stop while on those crossings. Such comments fail to recognize that 10,000 feet is the *maximum* length of the intermodal train moving to or from Prince Rupert, British Columbia, that CN expects to move over the Waukesha Subdivision (and, if the CN/EJ&EW Transaction is implemented, on the EJ&E line) once a day after Phase 1 of the Fairview Container Terminal at Prince Rupert is operating at full capacity. At that time, no more than two such trains per day are expected to move over the EJ&E line (one in each direction, with the westbound train (headed toward Price Rupert) largely carrying empty containers), and the average length of all trains moving on that line would be 6,321 feet (as compared to an average length of 6,423 feet for CN trains that would move on lines through Chicago in the absence of the CN/EJ&EW Transaction).[23]

Despite the false alarms raised by some commenters, the prospect of highway crossings being blocked for long periods by stopped 10,000-foot trains is not reasonable. As the DEIS

[22] *See, e.g.*, Kevin P. Cramer, *CN Rail Deal in Danger*, N.W. Herald, July 9, 2008, http://www.nwherald.com/articles/2008/07/09/news/nation_and_world/doc487443ccdb13f10834 2497.txt (Barrington Hills village president quoted as raising prospect of "a 10,000-, 12,000-foot freight train running through every 43 minutes" without citing any source).

[23] *See* Letter from Paul A. Cunningham, Counsel, CN, to Victoria J. Rutson, Chief, SEA, Exhibit A (Feb. 15, 2008), *available at* http://www.stbfinancedocket35087.com/html/inforequest.html; letter from Paul A Cunningham to Victoria J. Rutson, Exhibit A (Feb. 29, 2008), *available at* http://www.stbfinancedocket35087.com/html/inforequest.html.

explains,[24] the EJ&E line provides locations where trains as long as 10,000 feet could be held, without blocking any road crossings. Moreover, under CN's current operating procedures, dispatchers and locomotive engineers are required to follow U.S. Operating Rules No. 526 (Public Crossings),[25] which provides that a public crossing must not be blocked longer than 10 minutes unless it cannot be avoided and that, if possible, rail cars, engines, and equipment may not stand closer than 200 feet from a road crossing when there is an adjacent track. (In cases where a train nonetheless stops in such a way as to block a crossing, the crew would be required to cut the train at the crossing location so that the parts of the train would be clear of the crossing while the train was stopped, and then would have to reattach the cut cars once the train was cleared to proceed.)

In any event, CN has proposed, as part of its VMP, that adherence with U.S. Operating Rule No. 526 (Public Crossings) be imposed as a condition of Board approval of the Transaction (VM 35). If so imposed, it would be enforceable by the Board at the request of individuals or communities affected by blockages in violation of the condition.[26]

A.3 The rail traffic volumes reported in CN's Operating Plan are a reasonable basis for SEA's analysis of the environmental impacts of the Transaction.

Some commenters have challenged SEA's use of the post-Transaction rail traffic data reported in CN's Operating Plan as the basis for its analysis of environmental impacts caused by the Transaction. (It has been suggested, for example, that CN's projection that rail traffic in the

[24] *See* DEIS at 3.1-17 – 3.1-20, Table 3.1-3.

[25] *See* Letter from Paul A. Cunningham, Counsel, CN, to Victoria J. Rutson, Chief, SEA, Exhibit E (Feb. 15, 2008).

[26] Because it would be imposed by a federal agency, such a condition would not be subject to federal preemption, as would state and local laws prohibiting road crossing blockages. *Cf. Vill. of Mundelein v. Wisc. Cent. R.R.*, 882 N.E.2d 544 (Ill. 2008), *petition for cert. filed*, 76 U.S.L.W. 3597 (Apr. 24, 2008) (No. 07-1355).

Frankfort area will rise from 6 to 28 trains per day is "quite conservative," considering that CN could make improvements that would increase the capacity of the line after consummation of the Transaction, without subjecting those improvements to any environmental study.[27])

As CN has already explained to SEA, however, there appear to be no better indicators of the reasonably foreseeable relevant traffic flows than those reflected in the Operating Plan (which are comparable to those used by the Board in past environmental reviews), and any projection of greater flows would be both unreliably speculative and unnecessary for SEA's purposes.[28] While it is true that CN, like any owner of a rail line, can make capacity improvements without regulatory review, limited only by its financial resources and its ability to acquire any land that might be needed to widen its right-of-way, that fact provides little basis for determining how much traffic the railroad would carry. The theoretical ability to enhance capacity gives no reason to believe that the traffic would grow to fill it.

Finally, as CN explained above, and in its April 21 letter, SEA's analysis under NEPA is not required to evaluate impacts from action that the Board cannot, by denying approval of the Application, prevent. *Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752, 767 (2004); *see also* section V.C, below. The traffic figures reported in CN's Operating Plan are, for reasons set forth in the April 21 letter, more than sufficient to provide a basis for analysis of impacts caused by such "but-for" trains.

Some commenters, however, have argued that the traffic accounted for in the Operating Plan is too low to serve as a basis for SEA's environmental review because it fails to include

[27] Susan Lafferty, *Frankfort: EJ&E study 'inadequate,'* Joliet Herald News, Sept. 17, 2008, *available at* http://www.suburbanchicagonews.com/heraldnews/news/1167497,4_1_JO17_FRRAIL_S1.article.

[28] Letter from Paul A. Cunningham, Counsel, CN, to Victoria J. Rutson, Chief, SEA, at 3 (Apr. 21, 2008) ("April 21, 2008 Letter"), *available at* http://www.stbfinancedocket35087.com/html/inforequest.html.

traffic moving through the Port of Prince Rupert after completion of the proposed Phase 2 of the Port's Fairview Container Terminal. If that expansion were completed, it is argued, then the capacity of the Port would rise from 500,000 truck-equivalent units ("TEUs") to 2 million TEUs, causing a proportionate increase in Prince Rupert intermodal traffic on CN lines through Chicago, and the environmental analysis of the Transaction should therefore extend to impacts of this additional traffic. But construction of Phase 2 is not reasonably foreseeable at present, and SEA was right to exclude it from its examination of impacts if the proposed Transaction.

Phase 1 of the Fairview Terminal began operations in October 2007. It currently handles 300,000 TEUs per year, which require five weekly trains in each direction. If the Terminal were to operate at the full capacity of Phase 1 (500,000 TEUs), it would require 10 trains a week (one train a day in each direction). CN assumed that Phase 1 would in fact eventually operate at capacity, and it factored the potentially resulting train traffic into its Operating Plan, which SEA relied on as the basis for its analysis of the impacts of the Transaction.

Although the Prince Rupert Port Authority has discussed expanding the Terminal beyond Phase 1, no decision to undertake that expansion has been made. The Port Authority does not have the funds necessary for the proposed expansion, and neither the federal nor provincial government has indicated that it would provide them. Thus, if the Terminal is to be expanded into Phase 2, that decision that must be made by RREEF Infrastructure, the new owner of Maher Terminals, which operates the Terminal.[29] RREEF is facing substantial uncertainty – even apart from the current financial uncertainties in the U.S. and elsewhere – as to whether to invest in the expansion for several reasons, including the following:

[29] *See RREEF Infrastructure Completes Maher Terminals Acquisition*, Bus. Wire, July 5, 2007; RREEF, Infrastructure, Business Overview, https://www.rreef.com/cps/rde/xchg/infr_en/hs.xsl/692.html.

1. Demand for trans-Pacific intermodal traffic is lower than previously expected. Growth in that traffic is now projected to grow at levels of 5 to 7% between 2010 and 2020, rather than between 10 and 20% as previously forecast.

2. West Coast ports at Vancouver, Tacoma, and Los Angeles, which compete with Prince Rupert, are expected to expand their capacity by up to 5.4 million TEUs between now and 2020, making demand for transportation through Prince Rupert even weaker. In addition, a new container facility has been proposed for construction in Mexico at Punta Colonet, with a capacity of 2 million TEUs per year. As these projects are completed, the demand for expansion at Prince Rupert could readily change.

3. Expansion beyond Phase I would require negotiations with the Canadian Department of Oceans and Fisheries for environmental permitting, because of possible negative impacts on fish and wildlife habitat. A satisfactory outcome of those negotiations is by no means assured.

4. The expansion would require deposit of fill on land and water to which First Nations (Canadian Native Americans) have asserted claims. Before construction could begin, those claims would need to be resolved, through a process of negotiating with five First Nations bands that have inconsistent positions regarding appropriate compensation. These negotiations are likely to be more complex than comparable negotiations with First Nations in connection with Phase 1 of the Terminal, which, unlike Phase 2, involved construction on the site of an existing terminal rather than one on undeveloped property.

For these reasons, CN believes that any statements by the Prince Rupert Port Authority regarding early commencement and completion of Phase 2, however optimistic, offer little basis for anyone to conclude that Phase 2 is reasonably foreseeable. In the end, it is not the Authority

that will determine to spend the money needed for the expansion. RREEF, which would be making the investment, has not yet determined to do so.

B. Freight Rail Safety

CN agrees with SEA's conclusion that there would be an overall system-wide decrease in accidents. DEIS at 4.2-1. As the DEIS makes clear, and the following tables illustrate, CN has a better safety record than EJ&E; consequently, the DEIS appropriately projects that the Transaction would lead to a decrease in number of accidents.

Railroad	Average Accident Rates per Million Train Miles[30]	Average Main Track Accident Rate per Million Train Miles[31]	Average Yard Accident Rate per Million Yard Switching Miles[32]
CN	4.2	1.5	11.7
EJ&E	18.2	3.1	33.3

CN, moreover, has an established history of improving safety and decreasing accidents on a line after assuming control. After CN's acquisition of both Illinois Central and Wisconsin Central, the safety record of each of those systems improved.[33] And to the extent that reduction in rail congestion in Chicago makes shippers less likely to shift from rail transportation to the inherently more unsafe truck transportation, it will enhance overall hazmat safety.

In addition to the thorough analysis provided in the DEIS, CN submitted a detailed Safety Integration Plan ("SIP"), pursuant to STB and FRA regulations, and FRA has declared that it is

[30] Source: DEIS Table 4.2-1

[31] Source: DEIS Table 4.2-2

[32] Source: DEIS Table 4.2-2

[33] Federal Railroad Administration, United States Department of Transportation, 2002 Railroad Safety Statistics: Final Report, Table 1-7, *available at* http://safetydata.fra.dot.gov/OfficeofSafety/publicsite/publications.aspx?itemno=7.05 (train accident rate on IC declined from 7.82 accidents per million train miles in 1998 (the year before its acquisition) to 6.13 in 2000 (the year after acquisition); train accident rate on WC declined from 8.27 in 2000 (the year before acquisition) to 5.21 (the year after acquisition)).

satisfied with the SIP, submitted by CN on June 27, 2008.[34] Some commenters have noted a Canadian Parliamentary report concerning past CN safety matters in Canada. While safety is always a top priority, CN's operations in Canada are subject to a different regulatory regime, and only statistics related to CN operations in the US are relevant for purposes of the DEIS because those are the only ones that can properly be compared with EJ&E.

In its Voluntary Mitigation Plan, CN has adopted (as VM 13), substantially all of SEA's proposed additional mitigation item no. 37 (regarding development of a fire prevention and suppression plan in connection with Transaction-related construction). SEA's proposal, however, is not reasonable to the extent that it would require installation of low-spark brake shoes on railcars in addition to locomotives. CN cannot require shippers and other railroads to install brake shoes on their equipment, yet must haul those cars if interchanged by other railroads or tendered by shippers. And, even as to CN's own cars, requiring retrofitting to install low-spark brake shoes would be prohibitively expensive, and not justified by the expected reduction in incident of accidental fires.

C. Vehicle Safety

CN agrees with SEA's analysis that vehicle safety would improve in the region as a result of the Transaction, DEIS at 4.2-17, and that no crossings would experience a significant increase in the frequency of accidents. DEIS at 4.2-19. SEA's proposed additional mitigation measure no. 4 (regarding a media campaign CN would be required to conduct about increased operations along the EJ&E rail line) is reasonable to the extent that it would require CN to use radio and

[34] Letter from Joseph Boardman, Administrator, FRA to Victoria J. Rutson, Chief, SEA (Sept. 12, 2008), *available at* http://www.stb.dot.gov/ect1/ecorrespondence.nsf/PublicIncomingByDateReceived/2AA0AD5F7FB0E15D852574CC007328E6/$File/13680.BOARDMAN.PDF?OpenElement

newspapers for that campaign, and CN has modified item VM 2 of its VMP to reflect SEA's item no. 4 to that extent.

However, it would be unreasonable to require that CN also hold public meetings to notify the public of increased operations. SEA has already held two rounds of meetings around the EJ&E arc, once in connection with the scope of its environmental review and once to receive comments on the DEIS. Any medium used to inform the communities about the public meetings could just as readily be employed to inform them about the fact of increased traffic volumes. There is no need for residents who have read or heard about those increases to come to a public meeting to hear about them again, nor is there any reason to require CN to bear the expense of setting up such superfluous meetings.

D. Hazardous Materials Transportation Safety

The DEIS determined that while "hazardous material releases have historically been, and should continue to be, extremely rare . . . there would be a potential increase in the possibility of a release because of increased train miles resulting from the longer route, and more carloads of hazardous materials, on the EJ&E rail line." DEIS at 4.2-38. CN agrees that the "possibility of a hazardous materials release would remain remote" both because of the existing regulatory requirements and CN's own safety-focused operating environment. Moreover, to the extent that reduction in rail congestion in Chicago makes shippers less likely to shift from rail transportation to the inherently more unsafe truck transportation, the Transaction would enhance overall hazardous materials safety.

In addition, as the DEIS properly observes, the Transaction would result in the movement of hazardous materials across the Chicago region more quickly than under the No-Action Alternative. DEIS at 4.2-38. Not only would this improve safety, by reducing the time during

which people in the vicinity of CN's lines would be exposed to risk, but it would also improve security, by reducing the time during which hazmat railcars would be vulnerable to vandalism, terrorism, or other malicious activities that could lead to a harmful release.

Moreover, the DEIS overlooked recent federal regulations that suggest that the Transaction may cause less of an increase in the volume of hazardous materials moving on the EJ&E line than assumed in the DEIS. Those regulations may require more of those materials to move on the EJ&E line, even under the No-Action Alternative.

In April 2008, the Pipeline and Hazardous Materials Safety Administration adopted an Interim Final Rule that could require rail carriers to alter their existing routes for hazardous materials in order to avoid dense urban populations. *See Hazardous Materials: Enhancing Rail Transportation Safety and Security for Hazardous Materials Shipments*, 73 Fed. Reg. 20,752, 20,771 (Apr. 16, 2008) (issuing 49 C.F.R. §§ 172.820, 172.822, 49 C.F.R. Part 172 Appendix D; revising 49 C.F.R. § 174.9). The new regulations require every rail carrier of certain hazardous materials to "analyze the safety and security for each route" that handles the materials, "identify practicable alternative routes over which it has the authority to operate," and then use the analysis to select the best route to be used. *Id.* In determining practicable alternative routes, railroads must consider the use of interchange agreements with other carriers. *Id.* at 20,766, 20,771. Because a "primary safety and security concern" addressed by the regulations is "the prevention of catastrophic release or explosion in proximity to densely populated areas, including urban areas," *id.* at 20,760, the regulations could well lead railroads such as CN to select alternatives routings for hazardous materials shipments rather than current ones through the city of Chicago, and to enter interchange agreements that would increase the hazardous materials traffic on EJ&E, even without acquiring EJ&E's lines.

It is thus entirely possible that a much higher volume of hazardous materials traffic would be transported over EJ&E under the No-Action alternative than the DEIS projects. While it may not be presently possible to quantify this potential increase in hazardous materials traffic, SEA's analysis does not appear to take it into account at all and is thus extremely conservative in this regard.

CN has added VM 23 to its Voluntary Mitigation Plan, to reflect the substance of SEA mitigation item no. 11 (regarding emergency response plans), except with regard to two points. Notification of individual residing in a community affected by a hazardous materials emergency is properly the responsibility of appropriate agencies, who are more familiar than the railroad with the community and its inhabitants, and with the best way to inform them in the event of an emergency. Also, it would be unreasonable to require CN to provide response plans to relevant agencies almost immediately (60 days) after the effective date of the Board's final decision, especially given the DEIS's conclusion that the expected interval between hazardous materials releases on the affected EJ&E lines would, at worst, decline to 71 years. VM 23 would therefore instead require CN to develop internal emergency response plans for the notification of agencies, not individuals, in an emergency and to provide its response plans to relevant authorities within six months of CN's acquisition of EJ&EW.

SEA has also proposed additional mitigation measure no. 12 (regarding provision of "toll-free telephone numbers" to the emergency response organizations or coordinating bodies responsible for each community located along the EJ&E rail line). The substance of this proposal has been incorporated into VM 24, in CN's voluntary mitigation plan. It would be unreasonable, however, to obligate CN to establish more than one toll-free number, and equally unreasonable to require CN to establish a Spanish-language option, as SEA proposal no. 12 does.

While official emergency response organizations and coordinating bodies in the United States may have bilingual capabilities, so that they may better serve those of their constituents who are not fluent in English, it would be unreasonable to assume that those organizations and bodies may themselves be unable to communicate in English. It would be even more unreasonable to impose extra costs and burdens on CN on the basis of such an unreasonable assumption.

E. Transportation Systems – Regional and Local Highway Systems

SEA evaluated the effects of the Transaction on the regional and local highway systems by estimating the change in vehicle delay at highway/rail at-grade crossings and then assessing how increased delays could affect regional mobility. SEA concluded that 15 grade crossings[35] would be "Potentially Substantially Affected" by the Transaction, meaning that, according to SEA, traffic congestion at those crossings would likely cause "a serious impact on the overall mobility of the respective communities under the Proposed Action" and that mitigation at those crossings was therefore "appropriate and warranted." DEIS at 6-18, 6-19. SEA did not recommend specific mitigation, but suggested "a menu of mitigation options" up to and including complete grade separation (*i.e.*, construction of an overpass or an underpass for the railroad or the highway), for which CN could be called on to pay up to 25 to 50 percent of the costs. *Id.* at 6-19—6-21.

SEA arrived at its list of 15 grade crossings for potential mitigation by applying not only its established Level of Service ("LOS") standard (under which only two grade crossings would

[35] In addition, two other crossings appear to meet aspects of SEA's standards for mitigation in this case, but were not included on the list of crossings that SEA determined required mitigation. Those two crossings are Diamond Lake Road (which Table 4.3-11 notes exceeds the queue length criterion) and IL 60&83, which table 4.3-4 notes exceeds the total delay criterion). Since those crossings present some common issues with the 15 listed, they are discussed below.

have been considered for grade separation),[36] but also other standards. SEA relied on Federal Highway Administration ("FHWA") guidelines that, according to SEA, "suggest that grade crossings should be considered for grade separation or otherwise eliminated across the railroad right-of-way whenever one or more" of 11 conditions exist. *Id.* at 4.2-14—4.2-15. Of those 11 conditions, SEA ultimately determined that, in application, only three indicated that mitigation might be required: "crossing exposure" (for three crossings); "total delay" (12 crossings), and high expected accident frequency (one crossing). *Id.* at 4.2-17—4.2.-19, 6-18—6-19.[37] In addition to the FHWA guidelines, SEA created a "queue length" standard, which it had not previously applied, under which a crossing was judged to be "seriously affected" if SEA determined, based on its projection of vehicular traffic volumes in 2015, that the queue of vehicles stopped at the crossing for a passing train would be long enough to block a major thoroughfare, *id.* at 6-18—6-19.

As discussed below, SEA's analysis of transportation systems was arbitrary and greatly overstated both the number of locations where mitigation, including grade separations, should be considered and the range of contribution that could reasonably be expected from CN for such grade crossings. There was no basis for SEA to alter the criteria it had previously used to identify grade crossings to be considered for mitigation, especially for grade separation. In

[36] DEIS at 6-18.

[37] The specific FHWA guidelines used are: (1) for vehicle crossing exposure, the product of the number of trains per day and ADT exceeds 1,000,000 in urban areas; (2) for "total delay," "vehicle delay exceeds 40 vehicle hours per day; and (3) for "accident frequency," the expected accident frequency for active devices with gates, as calculated by the USDOT Accident Prediction Formula, including 5-year history, exceeds 0.5. DEIS at 4.2-14—4.2-15; Federal Highway Administration, U.S. Department of Transportation, Railroad-Highway Grade Crossing Handbook 151 (rev. 2d ed. Aug. 2007) ("FHWA Handbook"), *available at* http://safety.fhwa.dot.gov/xings/07010/07010.pdf.

addition, SEA's data and methodology used to analyze traffic volumes were flawed and resulted in greatly overstated average daily vehicular traffic ("ADT"). Finally, it would be unreasonable, beyond the Board's authority, and contrary to good public policy, to require CN to pay more than the maximum fixed by statute and regulations for the railroad's share of grade separation costs or to otherwise apply to CN standards for assessing impacts, determining the need for mitigation, or allocating the cost of mitigation that are not generally applied to railroads causing similar impacts in the states and localities at issue.

E.1. CN has reached an agreement to assure mitigation of the only two vehicular crossing delay impacts of the Transaction that could reasonably be found to warrant grade separation under the standards previously applied by the Board for this purpose.

As discussed below, in past proceedings, SEA and the Board have determined that grade separation to mitigate Transaction-related vehicular delay should be considered at grade crossings where the following three criteria are met:

- Post-Transaction LOS would decrease at least one LOS grade and the Post-Transaction LOS would be at LOS E or F;
- Transaction-related train traffic would increase by at least eight trains per day; and
- Increased train speeds would appear not to be feasible or sufficient to mitigate Transaction-related delay impacts.

Draft Environmental Impact Statement at G-7, *Dakota, M. & E. R.R. Construction into the Powder River Basin*, STB Finance Docket No. 33407 (STB served Sept. 27, 2000) ("*DM&E DEIS*"); *accord*, *Conrail DEIS* at C-15.[38] Under these criteria, the only candidates for grade

[38] LOS is described in section E.2.a, below.

separations would be the crossings at Woodruff Road and Washington Street in Joliet.[39] CN has successfully negotiated a settlement agreement with the City of Joliet, which was submitted to SEA on August 26, 2008, and which addresses all of Joliet's concerns regarding the environmental impacts of the Transaction, including delay at the Woodruff Road and Washington Street crossings. CN requests that the terms of the agreement be imposed as a condition in lieu of other location-specific mitigation SEA may otherwise impose at these crossings.

E.2. SEA has offered no rational basis for the prescription of grade crossing separations where roadway performance is not impaired below levels of service as measured by generally accepted and roadway performance standards.

In previous environmental reviews, SEA has determined mitigation for vehicle delay at grade crossings based on the degradation in the LOS at the grade crossing. For the reasons discussed below, the LOS criterion is a reasonable and defensible standard for imposing mitigation that leads to predictable and rational results. In the absence of any demonstration that LOS is insufficient as a criterion for determining mitigation, it would be unreasonable to abandon its use and base mitigation on other standards.

[39] At both crossings, the projected number of daily trains would rise by 21.8. CN has determined that the LOS would fall from B to E at Woodruff Road and would fall from A to E at Washington Street. *See* letter from Paul A. Cunningham, Counsel, CN, to Victoria J. Rutson, Chief, SEA, Exhibit B (Sept. 26, 2008), *available at* http://www.stbfinancedocket35087.com/html/inforequest.html. SEA has calculated that LOS would fall to F at both crossings. DEIS, App. E., Att. E at 11. The current configuration of the tracks crossing these highways would not permit the movement of trains at speeds faster than 10 mph.

E.2.a. It would be arbitrary, capricious, and unreasonable for the Board, as suggested by SEA, to abandon its past practice of using LOS as the principal indicator of the need for mitigation due to potential vehicle delay.

LOS has long been used as a measure of operational efficiency for roadways and signalized intersections. The criteria for and descriptions of LOS are provided by the *Highway Capacity Manual*.[40] LOS is a measure of quality, describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience. HCM at 2-2. LOS is expressed as a letter grade ranging from LOS A (free flowing) to F (severely congested) and is measured quantitatively by the average delay for all vehicles. Each LOS designation is also intended to reflect and describe qualitatively the user's perception of the operational conditions within the traffic stream. *Id.* at 2-3. Thus, LOS encompasses both quantitative and qualitative elements.

Because of similarities between a signalized intersection and a railroad/highway at-grade crossing, SEA adopted the LOS methodology in the *Conrail* proceeding and applied it in its environmental review in that case. *Conrail DEIS* at C-14. SEA also incorporated the LOS methodology into its criteria for determining when grade separations could be warranted. *Id.* at C-15. Basing mitigation initially, if not conclusively, on a decline in LOS is reasonable because the LOS standard is heavily studied, well understood, and widely used. Most important, the LOS criterion takes into account the change in the overall performance of vehicular traffic at the crossing, as opposed to the exceedance of a single delay criterion, which may or may not indicate degradation in roadway performance that warrants mitigation. As SEA stated in *Conrail*, it chose the criterion to "identify grade crossings where there would be a significant *degradation* in

[40] Transportation Research Board, Highway Capacity Manual (2000) ("HCM"). According to SEA, each state uses the HCM for capacity-related analysis, which governs the functional facility parameters needed to meet specified levels of performance. DM&E DEIS at G-4.

level of service as a result of . . . significant increases in proposed train traffic." *Id.* at C-15 (emphasis added). While the LOS criterion used in the HCM may not be completely representative of the conditions at highway/rail at-grade crossings, SEA's use of it was logical because a decline to an LOS of E or F represents a level at which existing infrastructure is no longer sufficient to effectively handle both vehicles and trains and where delay becomes significantly noticeable to most people.

The LOS criterion has been used by SEA since *Conrail*, where it was the basis for the only grade separation ordered as part of that proceeding.[41] Only a few months before issuing the DEIS in this proceeding, in an Environmental Assessment ("EA"), SEA used the LOS criterion as the sole determinant of whether mitigation for vehicle delay was required.[42]

LOS is based on the level of delay experienced by each vehicle that passes through the crossing – including vehicles delayed and not delayed by a train – and is calculated by dividing the total amount of time vehicles are delayed at a crossing by the total number of vehicles that travel through the crossing in a 24-hour period.[43] In other words, it is a measure of the average

[41] Compare 6B Final Environmental Impact Statement, App. G, at G1, *CSX Corp. – Control & Operating Leases/Agreements – Conrail Inc.*, STB Finance Docket No. 33388 (STB served May 29, 1998) ("*Conrail FEIS*") (listing Randolph Street in Dekalb County, Indiana as the only crossing with a post-acquisition LOS of F) with 5 *Conrail FEIS* at 7-31 (imposing as a condition that CSX "continue negotiations . . . for the expeditious implementation of a grade separation at CSX's Randolph Street highway/rail at-grade crossing.").

[42] *See Ariz. E. Ry. – Constr. & Operation – In Graham County, AZ*, STB Finance Docket No. 34836, Draft Environmental Assessment at 4-8 & Appendix F (STB served Feb. 25, 2008) ("Traffic/transportation impacts would be considered significant if the Proposed Action resulted in excessive delay as characterized by an exceedance of LOS standards established in the Highway Capacity Manual." *Id.* at 4-8. The EA found that traffic would operate at a LOS of B or C at two relevant crossings, and that "LOS B and LOS C are considered acceptable levels of service for roads of this type. SEA has determined that no mitigation would be required." *Id.* at 4-10.)

[43] When calculating the average delay for all vehicles (on which LOS is based), SEA also multiplied the amount of time vehicles are delayed by 2 to produce "a conservative estimate of delay." DEIS, Appendix E, Attachment E1 at E-8—E-9.

amount of time a vehicle can reasonably be expected to be delayed each time it crosses a rail line. Some days a driver may not be delayed at all, while on others that same driver may be the first to arrive at a crossing as the gates are lowered. But over time, a driver will be delayed by a certain amount of average time each time he or she crosses that crossing.

The following table shows the LOS criteria used in the *HCM*:[44]

LOS	Average Delay per Vehicle Using the Crossing[45] (seconds/vehicle)
A	≤ 10
B	≥ 10-20
C	≥ 20-35
D	≥ 35-55
E	≥ 55-80
F	≥ 80

The following table shows the post-Transaction delay per vehicle using the crossing, as calculated by SEA and reported in the DEIS, and the corresponding LOS for each of the crossings identified by SEA as potentially requiring mitigation:

[44] *See also id.* at E-9, Table E.2-3.

[45] Delay per vehicle is the estimated average delay experienced for all vehicles at an affected grade crossing including vehicles not delayed by train traffic. It is most easily defined as the aggregate delay incurred by vehicles divided by total traffic at the crossing.

Post-Transaction Delay and Level of Service Calculations for Crossings Determined by SEA to Require Mitigation, as Reported in the DEIS[46]

Crossing	Post-Transaction Average Delay per Vehicle[47] (seconds/vehicle)	Level of Service
Allanson Road	19.4	B
Diamond Lake Road	13.2	B
IL 60 & 83	12.0	B
Old McHenry Road	9.6	A
Ela Road	7.8	A
Hough Street (IL 59 & 63)	6.6	A
Liberty Street	18.0	B
Ogden Avenue (US 34)	12.0	B
Montgomery Road/83rd Street	12.0	B
135th Street	12.0	B
Woodruff Road	108.0	F
Washington Street	102.0	F
Cicero Avenue	12.0	B
Western Avenue	12.0	B
Chicago Road	24.0	C
Lincoln Highway (US 30)	12.0	B
Broad Street (IN)	18.0	B

This table shows SEA's determination of post-Acquisition average delay as of 2015, and not merely the change attributable to the Transaction. The table shows that only two crossings, with a post-Transaction LOS of F, exceed SEA's established threshold for grade separations; performance is not even close to being substantially impaired for any other crossings. As discussed above, CN has already reached a negotiated agreement regarding these two crossings

[46] *See* Table E1.2-1, in Attachment E1 of Appendix E. These figures do not take into account the several ways, discussed below, in which the DEIS overestimates delay at grade crossings. As noted in footnote 34, Diamond Lake Road and IL 60&83 are included in this table and discussion although neither is listed in Table 6.3-1.

[47] Delay per vehicle is the estimated average delay experienced for all vehicles at an affected grade crossing including vehicles not delayed by train traffic. It is most easily defined as the aggregate delay incurred by vehicles divided by total traffic at the crossing

(Washington Street and Woodruff Road in Joliet), which are the only crossings that meet SEA's established LOS criteria of significance for consideration of mitigation.

E.2.b. The hyperbole of local opponents concerning the impacts of delay is starkly contrary to the facts and cannot justify SEA's departure from its prior use of established LOS standards for identifying crossings requiring mitigation.

Citing substantial percentage increases in traffic, rather than focusing on the more relevant absolute levels of traffic that are commonly found throughout the region, many Transaction opponents have argued that their communities would be virtually destroyed by vehicle delays at grade crossings absent multiple grade separations. To them, any analytic methodology used by the Board that does not justify grade separations for their communities is necessarily flawed. As discussed in this section, however, the facts are very different. When the impacts of vehicular delay are brought down to the level of specific impacts on individual drivers it becomes evident that grade separations beyond those that would be found using the Board's customary LOS criteria are unnecessary and cannot possibly be justified on the basis of costs and benefits. Opponents' hyperbolic descriptions of delay impacts provide no basis for the Board to deviate from its LOS standard by applying new and different standards for the identification of crossings potentially warranting mitigation.

The Village of Barrington provides one case on point. At SEA's open house in the Village of Barrington, its director of community and financial services said "there are actually three grade crossings that will be substantially impacted in Barrington if this acquisition is approved. Providing grade separations at each of these crossings is estimated to cost upwards of $80 million each which means that Barrington would have to have $240 million in funding for

grade separations."[48] All of this for a community that has only some 10,000 residents, many of whom are not old enough to drive.

The following table shows that in fact there would be minimal impacts attributable to the Transaction on the three crossings that Barrington believes will be "substantially impacted":

Delay Calculations for Three At-Grade Crossings in Barrington, as Reported in the DEIS[49]

	Northwest Highway	Hough Street	Lake/Cook Road
Total post-acquisition average delay for every vehicle that passes through the crossing (seconds per day)	6.6	6.6	6.6
Total post-acquisition average delay per vehicle delayed by a train (minutes per day)	1.6	1.6	1.6
Change in total time gates are down at crossing (minutes per day)	43.5	43.4	43.4
Change in the percent of the day gates are down at a crossing	3.0%	3.0%	3.0%
Total number of vehicles delayed per day	1,182	844	499
Total number of vehicles over the crossing per day	33,662	24,056	14,222

The average vehicle passing over these crossings would be delayed by a total of 6.6 seconds each time it passed over the crossing – or about the amount of time it takes to read this sentence. For each vehicle using the crossings, that is equivalent to an additional 40 minutes a year, assuming one crossing a day. The crossing itself would be blocked only an extra 44 minutes a day – equal to 3% of the day.

Thus, according to the calculations in the DEIS, a vehicle would be delayed at the three Barrington crossings because of a train once every 28.5 days, or 13 times a year – a little more

[48] Transcript of Scoping Meeting for the proposed Canadian National Railway Company Acquisition of the Elgin, Joliet & Eastern Railway Company (Aug. 27, 2008), *available at* http://www.stb.dot.gov/ect1/ecorrespondence.nsf/PublicIncomingByDateReceived/43533F042EC11BD8852574BB0042B1DB/$File/12377.BEAN.PDF?OpenElement. A subsequent speaker identified those three crossings as US Highway 14 (Northwest Highway), State Road 59 (Hough Street), and Lake Cook Road. *Id.* at 44. No one has identified the basis for the $80 million estimate.

[49] All numbers come from the DEIS, which overstates by 2 the number of trains (18.3) that would operate over EJ&E does not use updated train speeds, and projects ADT to 2015. The actual impacts upon implementation of the Transaction would therefore be even less.

than once a month.[50] When delayed by a train, a driver's trip would be delayed, on average, by 1.6 minutes. In other words, the "substantial impacts" that Barrington believes warrant $240 million in mitigation, would amount to a total of 1.6 minutes of delay every 4 weeks for each driver using those crossings.

To put that cost in perspective, the DEIS estimates that a total of 2,525 vehicles a day (3.5% of the total vehicles that cross on a given day) would be delayed at those three crossings. Across all three Barrington crossings, vehicles would experience a total increase of 3,721 minutes of delay a day,[51] or a total of 62 hours a day, or 22,630 hours per year, or about 678,900 hours in the 30 years over which the cost of the grade separation could be expected to be amortized. Given that Barrington believes it would be necessary to spend $240 million to mitigate the 30-year impact of 678,900 hours, in order to justify the mitigation cost on the basis of a cost benefit/benefit analysis, SEA would need to find that the opportunity cost of the time of the average vehicle occupant using the crossings in Barrington is at least $353 an hour.[52]

This is just one example of the how opponents of the Transaction have often grossly overstated the impacts the Transaction would have at crossings for communities along the EJ&E line. Minimal impacts are projected for most such crossings; daily delay per vehicle is projected to be a matter of seconds. The following table shows in detail (using DEIS data that, as is

[50] For example, at the Northwest Highway, SEA estimates an ADT of 33,662, with 1,182 drivers delayed per day. Assuming a different 1,182 drivers are delayed on day 2 than day 1 means that a single driver will be delayed every 33,662 / 1,182 = 28.5 days. Conversely, if it is the same 1,182 drivers that are delayed every day, then every other driver would not be delayed at all. Reality will likely be somewhere in the middle, with some drivers being delayed more frequently than others. But the average driver would be delayed every 28.5 days.

[51] *See* DEIS at 4.3-11—4.4-15 (Table 4.3-4) (difference between Proposed Action and No-Action alternatives at Northwest Highway equal to a total of 1,744 minutes of delay a day; at Hough Street, 1,243 minutes; and at Lake/Cook Road, 735 minutes).

[52] $240,000,000 divided by 678,900 hours equals $353 dollars/hour.

demonstrated below, overstates delay) the impacts of the Transaction on drivers using crossings in various jurisdictions on EJ&EW:

Selected Post-Transaction Delay Calculations, as Reported in the DEIS, for Jurisdictions Along EJ&E

	Weighted Average Delay per Vehicle[53] (seconds)	Weighted Average Delay per Delayed Vehicle[54] (minutes)	Average Gate Down Time[55] (% of a 24 hour period)
Overall	13.64	1.8	6.0%
By State			
Illinois	14.17	1.8	6.1%
Indiana	11.18	1.7	5.4%
By County			
Lake (IL)	8.92	1.8	4.0%
NW Cook (IL)	6.79	1.6	3.6%
Dupage (IL)	12.56	1.7	6.1%
Will (IL)	19.55	1.9	6.9%
SE Cook (IL)	16.14	2.0	7.1%
Lake (IN)	11.18	1.7	5.4%
By Community			
Libertyville (Lake)	13.20	2.3	4.9%
Mundelein (Lake)	12.00	2.1	4.6%

Elgin (Cook)	6.55	1.5	3.4%

[53] Delay per vehicle is the estimated average delay experienced for all vehicles at an affected grade crossing. In other words, it is the aggregate delay divided by total traffic at the crossing. This column shows the weighted average of delay per vehicle for all crossings in the listed jurisdiction.

[54] Average delay per delayed vehicle is the average amount of time that a driver would be delayed at a grade crossing as a result of a single train event, assuming uniform vehicle arrival. This column shows the weighted average of delay per delayed vehicle for all crossings in the listed jurisdiction.

[55] Average gate down time as a percentage of a 24 hour period measures the total time the crossing is blocked during a 24 hour period. Total gate down time is the product of the blocked crossing time per train and the number of trains per day. This column expresses that result as a percentage of a 24 hour period.

Selected Post-Transaction Delay Calculations, as Reported in the DEIS, for Jurisdictions Along EJ&E

	Weighted Average Delay per Vehicle[53] (seconds)	Weighted Average Delay per Delayed Vehicle[54] (minutes)	Average Gate Down Time[55] (% of a 24 hour period)
Bartlett (Dupage)	6.60	1.5	3.7%
Wayne (Dupage)	7.80	1.6	4.0%
West Chicago (Dupage)	15.08	2.0	6.5%
Naperville (Dupage)	12.00	1.6	5.4%
Aurora (Dupage)	13.30	1.6	6.8%
Plainfield (Will)	11.98	1.5	6.6%
Crest Hill (Will)	12.50	1.5	7.2%
Joliet (Will)	56.89	3.3	9.7%
New Lenox (Will)	12.00	1.7	5.2%
Frankfort (Will)	10.26	1.7	5.2%
Matteson (Cook)	13.05	2.0	5.9%
Park Forest (Cook)	12.00	1.9	6.3%
Chicago Heights (Cook)	24.58	2.4	8.2%
Sauk Village (Cook)	6.00	1.4	5.1%
Lynwood (Cook)	12.00	1.7	6.1%
Dyer (Lake, IN)	12.00	1.6	6.0%
Schererville (Lake, IN)	12.00	1.5	5.4%
Griffith (Lake, IN)	14.05	1.8	5.6%
Gary (Lake, IN)	6.00	1.5	4.7%

This table shows that, overall, vehicles using the crossings would, on average, experience less than 14 seconds of delay. When a vehicle is stopped at a crossing, the average wait time would be less than 2 minutes. Overall, gates would be down for an average of 6.0% of the day, for a total average of 86 minutes a day.[56]

[56] This analysis comes from the DEIS, which as discussed elsewhere, substantially overstates the impact of the Transaction on vehicle delay. Under CN's analysis, which was submitted to SEA on September 26, 2008, overall average delay per vehicle would be 5.9 seconds; average delay per delayed vehicle would be 1.7 minutes; and blocked crossing time per day would be 5.4%.

Such delays are not unusual for the region, as many communities see more traffic than CN proposes to route via EJ&E. The following chart compares the traffic on main lines of three of CN's competitors into Chicago:

Comparison of Major Rail Lines in the Chicago Region

Railroad (line)	Length of Line (miles)	Average Number of Trains (Freight & Commuter)	Number of Communities Impacted	Total Number of Public Grade Crossings	Total Number of Grade Separations
EJ&E Post-Transaction (Leithton to Gary)	105	20-40	33	99	42
BNSF (Eola to IHB)	19.5	142	9	23	15
UP West (West Chicago to Proviso)	15.9	107	8	28	8
UP North (Barrington to Mayfair)	24.3	67	8	33	7
CP (Mayfair to Roundout)	23.2	82	10	21	9

In sum, given the potential impacts of the proposed Transaction, there is no basis for concluding that the Board's LOS analysis fails to identify all grade crossing locations potentially warranting mitigation due to potential vehicle crossing delay. Accordingly, and for the reasons discussed further below, SEA's application of FHWA guideline criteria and use of a novel queue length analysis as an additional means of identifying crossing locations requiring mitigation (including possible grade separation) due to potential vehicle delay is unnecessary and unreasonable.

E.2.c. SEA has improperly used FHWA guidelines intended as non-binding threshold guidance to state transportation planners as a principal basis for prescribed mitigation.

SEA initially introduced the use of FHWA guidelines for the DEIS as relevant to its determination of whether the transaction "would significantly affect traffic safety." DEIS at 4.2-14.[57] It stated that the "guidelines suggest that grade crossings should be considered for grade separation or otherwise eliminated across the railroad right-of-way whenever one or more" of the eleven conditions listed by SEA exist. *Id.* Later in its analysis, it extended its use of FHWA guidelines to act as an independent basis for finding that mitigation is required on the basis of vehicle delay. *Id.* at 4.3-9.

SEA ultimately used three of the conditions from the FHWA guidelines – vehicular crossing exposure, vehicle delay in excess of 40 vehicle-hours per day, and "high incidence of predicted accidents" – as a basis to determine that a current grade crossing would be "substantially affected" by the Transaction and thus require mitigation, including possible grade separation. DEIS at 4.2-15. The one clearly safety-based crossing condition – high incidence of predicted accidents – was found by SEA to justify mitigation at only Woodruff Road in Joliet, which, as discussed above, already exceeded the established LOS criterion and is the subject of a settlement agreement.[58] By contrast, SEA's use of its FHWA-based "vehicle delay" guideline

[57] Similarly, in the *Bayport Loop* construction case, while SEA stated that it "conducted its grade crossings analysis in accordance with USDOT's Federal Highway Administration guidelines," Final Environmental Impact Statement at 4-23, *San Jacinto Rail Ltd. – Constr. & Operation Exemption – Build-Out to the Bayport Loop Near Houston, Harris County, TX*, STB Finance Docket No. 34079 (STB served May 2, 2003) ("*Bayport Loop FEIS*"), an examination of SEA's methodology shows that the FHWA guidelines were used in its analysis of safety impacts of the proposed new rail line, but not in evaluating delay. Instead, in assessing delay, SEA continued to rely exclusively on the LOS standard. *Compare Bayport Loop DEIS* at F-1—F-6 (grade crossing delay methodology) *with id.* at F-7 (traffic safety methodology, applying FHWA criteria).

[58] Although it should not be at issue due to the settlement, the STB should note that, in accordance with FHWA's own guidelines, Woodruff Road would not qualify as a candidate for

became the sole basis for including 7 crossings in the Board's list of 15 crossings requiring mitigation and, in combination with the volume-based "vehicle exposure" guideline, was responsible for the addition to that list of 2 more crossings. Thus, of the 13 crossings listed by SEA for mitigation that are not subject to a settlement agreement, 9 were added by SEA through its FHWA-based analysis.

This use of the FHWA guidelines was unprecedented, unwarranted, and based on a misapprehension of the purpose of the guidelines. The FHWA guidelines were neither developed nor intended to be used for the mandatory prescription of mitigation conditions, are ill-suited to that application, and were certainly not intended to be used as an independent justification for mitigation on the basis of traffic volumes or delay that would otherwise fail to meet the requirements for mitigation under the Board's LOS analysis.

The guidelines come from the FHWA Handbook. That handbook includes a list of conditions that highway planners may wish to use as guidelines when deciding whether and where to invest in traffic control devices or other measures at a highway-rail grade crossing. The conditions themselves are contained in a guidance document prepared by a Technical Working Group ("TWG") established by U.S. DOT.[59] The FHWA Handbook makes clear that

> [t]he TWG document is intended to provide guidance to assist engineers in the selection of traffic control devices or other measures at highway-rail grade crossings. It is not to be interpreted as policy or standards and is not mandatory. . . . A number of measures are included that may not have been supported by

mitigation based on high accident frequency. DEIS at 6-18. The FHWA guidelines suggest that a crossing should be considered for grade separation if "[t]he expected accident frequency for active devices with gates, as calculated by the USDOT Accident Prediction Formula, including 5-year history, exceeds 0.5." DEIS at 4.2-15; *see also* FHWA Handbook at 151. Yet according to the DEIS, the predicted frequency of accidents at Woodruff Road would be only 0.21359, or less than half the threshold that, under the FHWA guidelines, would call for consideration of grade separation.

[59] The TWG is led by representatives from FHWA, FRA, FTA, and NHTSA. The STB was not involved in the TWG.

> quantitative research but are being used by states and local agencies. These are included to inform practitioners of the array of tools being used or explored.

FHWA Handbook at 145. (Emphasis added.) The FHWA guidelines are essentially screening tools developed to provide a quick and easy means of ranking crossings so that a state can best focus its attention on crossings that could meet each state's criteria for separation. Use of these guidelines is only the first step in a multi-factor review process, which includes a benefit/cost analysis. For example, the FHWA Handbook notes that even using exposure as a "screening method should be [done] with caution and should be calibrated for values appropriate for the particular jurisdiction." FHWA Handbook at 77. Another report concludes that the exposure index is "insufficiently accurate to serve as a decision tool to provide a particular grade separation without further technical and administrative investigation."[60] While some states (but neither Illinois nor Indiana) do rely on the exposure index to rank crossings, no state uses it as an independently sufficient determinant to require a grade separation.[61]

Similarly, there is no basis for the unadulterated use of the 40-hours-of-delay guideline as a threshold for mitigation, especially since that guideline appears to be based on a "rule of thumb" that is unsupported by any quantitative analysis. The FHWA Handbook cites the *Guidance on Traffic Control Devices at Highway-Rail Grade Crossings*, Nov. 2002, (available at http://safety.fhwa.dot.gov/media/twgreport.htm) as the source of this criterion. That document, in turn, cites a San Gabriel Valley Grade Crossings Study, Final Report (1997), which was

[60] TransTech Group, Inc., A Procedure for the Provision of Highway-Railroad Grade Separations 26 (Apr. 2001), ("TransTech Report") *available at* http://www.transtechgroupinc.com/Full_Report_042008.doc. *See also* NCHRP 288, Evaluating Grade-Separated Rail and Highway Crossing Alternatives, Transp. Res. Board (1987) ("while few states have established warrants for crossing protection based on an exposure index, this approach is not recommended because an exposure index does not accurately reflect safety conditions at crossings, and, consequently, does not provide an adequate basis for decision-making").

[61] TransTech Report at 15-16 (reporting results of 50 state survey).

prepared for the San Gabriel Valley Council of Governments by Korve Engineering in connection with the Alameda Corridor project.[62] Part of the report describes a "literature search to identify criteria for grade separation." *Id.* This search indicated that there was "a variety of considerations for grade separation but few standards." *Id.* One of those considerations was a "rule of thumb" that 40 to 50 vehicle hours of delay per day is a threshold for separation. *Id.* Based on that "rule of thumb," the designers of the Alameda Corridor apparently chose the 40-hour threshold to determine when grade separations would be constructed. *Id.* This, in turn, was adopted by the TWG and included in the FHWA Handbook as one of the measures used by states and local agencies, included merely "to inform practitioners of the array of tools being used or explored."[63] No analysis or quantitative basis for this threshold appears to have been established. So far as CN is aware, the guideline has not been adopted by any state or federal agency as a primary determinant of whether a crossing should be grade-separated.

Moreover, SEA should not use the particular conditions under the FHWA guidelines relating to vehicle exposure and delay conditions as a basis for determining that mitigation is required where use of the Board's LOS criteria indicate otherwise. Those FHWA conditions are a crude means of considering the potential impacts of traffic volumes and delay. Those matters are encompassed within the more sophisticated and appropriate LOS criteria, which take into account both the existing conditions of the crossing and the future conditions.[64]

[62] *See* Brent Ogden, Engineering the Alameda Corridor – East Project (July 14, 2003), *available at* http://www.arema.org/eseries/scriptcontent/custom/e_arema/library/2003_Conference_Proceedings/0023.pdf

[63] FHWA Handbook at 145.

[64] As an example of this failing of the FHWA standards, consider total vehicle delay at Illinois Route 60&83 and Montgomery Road. Using the updated train counts supplied by CN, but holding all other aspects of SEA's analysis constant (even those which CN disputes, such as projected ADT), the calculated delay would be 43.2 hours at Illinois Route 60/83 and 41.6 hours

Further, requiring mitigation based on these conditions could misdirect the proper environmental focus – which, under NEPA is on changes to the environment caused by approval of CN's Application – to pre-existing conditions. This is because the traffic delays on which the DEIS's demand for mitigation focus are largely the product of past under-investment in local highway infrastructure, and/or in some instances community determinations to avoid or decline solutions. Some local officials are now seeking to use this proceeding as an opportunity to have someone else pay to resolve their pre-existing local problems.

For example, according to the Chief of Police for the Village of Plainfield, the population of the Village has increased from 5,000 to 40,000 in fifteen years.[65] However, investment in infrastructure has not kept pace with demand, to the point where "current vehicular traffic volumes far exceed their initial design capacity" making residents "unhappy with daily congestion within the community." *Id.* (emphasis added). Delay in this community is clearly a preexisting condition, and not something that CN would be creating. Indeed, the DEIS recognizes that CN would be causing at most, minimal impacts. See Table at section E.2.b, above, indicating that Plainfield drivers would on average experience 12 seconds of delay at

at Montgomery Road. Based on misapplication of the FHWA guidelines, both crossings would be candidates for grade separation. However, increasing train speeds at both crossings just 2 mph over the speeds SEA assumed (to 30 and 40 mph, respectively) would reduce delay at each crossing to 38.8 and 39.9 hours, respectively. This would remove both crossings as candidates for mitigation under the FHWA delay guideline. The Board need not rely on such a crude analysis in which a 2 mph difference in train speed is the difference between no imposed mitigation and a grade crossing costing potentially millions of dollars. By focusing on the change in service of the crossing, instead of an arbitrary threshold, the LOS mitigation standard avoids this problem.

[65] Letter from Donald E. Bennett, Chief of Police, Village of Plainfield, to Phillis Johnson-Ball, Deputy Chief, SEA, Sep. 8, 2008, *available at* http://www.stb.dot.gov/ect1/ecorrespondence.nsf/PublicIncomingByDateReceived/52CFC053256F5EEC852574C80047AAE6/$File/13332.BENNETT.PDF?OpenElement

crossings in their community. Nor is traffic congestion a particularly recent problem for most communities along EJ&E.[66]

Similarly, Hough Street in Barrington (identified by the DEIS as requiring mitigation) has long been plagued by traffic delays.[67] As long ago as 2000, traffic on the street has been operating well above capacity,[68] but Barrington has long opposed IDOT's preferred solution of widening the road from 2 to 4 lanes.[69] If Hough Street were a 4 lane road today, it would not have a queue length problem and therefore would not even be on SEA's list of crossings requiring mitigation.

Interestingly, Barrington has previously downplayed the effects of traffic congestion, with one member of the Barrington Area Council of Governments ("BACOG") stating that Barrington is "so unique that the level of traffic doesn't really compromise the quality of life;" and "you learn to live with the small area [of town] that backs up." *Id.* Moreover, Barrington subsequently (and unanimously) rejected a variety of bypass options that would take traffic off

[66] Kevin Barrett, *Local Leaders Gather to Press State for More Transportation Funding*, Chi. Daily Herald, July 29, 1999, at D3 (noting that Naperville city officials "warned that area roadways will not support exploding business and residential growth").

[67] Virginia Groark, *Barrington Committee Offers Ideas on Traffic; Hough Congestion a Longtime Problem*, Chi. Trib., Aug. 16, 2000 at Metro Northwest 1.

[68] *Id.* (noting that, in 2000, ADT on Hough was 22,000, or about 7,000 more than the ideal maximum of 15,000.)

[69] *See* http://www.ci.barrington.il.us/DocumentsAndForms/Documents/PDFs/Comp%20Plan/Chapter%208.pdf, 2000 Official Comprehensive Plan of the Village of Barrington, Ch. 8 Transportation, at 24. Widening Hough Street would have reduced delays by 24 seconds. Dennis Rodkin, *Barrington Continues to Sing Illinois 59 Traffic Blues*, Chicago Tribune, June 19, 2002, at 60. Conversely, CN's acquisition of EJ&E would increase delay in Barrington by approximately 6 seconds.

Hough Street and recommended that IDOT's "consideration of bypass options be limited to outside the BACOG area."[70]

LOS is also a better standard for determining the impacts on vehicle delay that are attributable to the increase in rail traffic that would result from the Transaction because it relates more closely to the actual experience of a driver waiting at or passing through the crossing. For example, a highway with high traffic volumes (such as Ogden Avenue) may reach the 40 hour threshold even though each individual driver is inconvenienced with only a minor delay. If tens of thousands of drivers are each delayed by a few seconds, a crossing could quickly reach the 40 hour threshold, even though each individual driver may not notice any difference in the functioning of the roadway.

Finally, to the extent there might be a safety element to the exposure criteria that is not fully encompassed by the LOS criteria, it would be adequately encompassed by the separate FHWA condition relating to frequency of accidents.[71] Thus, there is no need and no basis to use the additional FHWA conditions for exposure or delay where the Board has already applied its criteria based the frequency of accidents and LOS.

[70] http://www.ci.barrington.il.us/DocumentsAndForms/Documents/PDFs/Comp%20Plan/3rd_Amendment_(Traffic)_Ord_03-3095.pdf, Ordinance No. 03-3095, An Ordinance Amending the Official Comprehensive Plan of the Village of Barrington, Oct. 13, 2003.

[71] In fact, SEA's safety analysis in this case showed that no grade crossing would experience a substantial increase in accident frequency, and that the overall number of rail-highway accidents per year would decrease by 9% year. DEIS at 4.2-17—4.2-18.

E.2.d. The unreasonablenesss of prescribing crossing delay mitigation based on FHWA's delay standard is highlighted by the fact that doing so would undermine the public interest in funding of grade separations for vehicle/rail crossings that have significantly greater delay than the crossings at issue here.

SEA has also provided no principled reason why, if its application of the FHWA guidelines is appropriate in this proceeding, those guidelines would not be equally applicable to other railroad crossings in Illinois and Indiana. Presumably, in accordance with the FHWA guidelines applied by SEA, the crossings with the highest exposure and greatest amount of delay would be the first candidates for grade separation, and states would start at the top of the list and work their way down as funding became available. But that is not the case, and that reality underscores the fact that SEA's proposed use of the FHWA guidelines as the basis for grade separation of the EJ&EW crossing delay impacts would be aberrational and blatantly arbitrary, unreasonable, contrary to the public interest, and discriminatory as to CN.

It appears that SEA made no investigation of or attempt to rank all crossings in Illinois or Indiana on the basis of the FHWA relative exposure index. Had it done so, it would have learned that there are approximately 122 crossings in Illinois and 4 crossings in Indiana with exposure above the proposed guideline of 1,000,000.[72] It has also made no examination of the relative rank of crossings based on the FHWA delay guideline. Yet there are an estimated 133 crossings in Illinois that currently exceed the 40 hours per day threshold for delay.[73] The following table shows the relative rank of the three crossings identified in the DEIS that would remain

[72] CN's environmental consultant compiled this list with data from the FRA database, which reports both ADT and train counts for each grade crossing in Illinois and Indiana.

[73] To calculate delay at each crossing, CN's environmental consultant used data reported in the FRA database, but had to make certain assumptions regarding train length and speed. In accordance with the Illinois Commerce Commission's methodology, it was assumed that main line trains were 7,000 feet in length and operated at 30 mph or timetable speed, whichever was lower.

candidates for mitigation under the FHWA guidelines after updated train counts and speeds are applied to 2007 ADTs:[74]

Relative Rank and Hours of Delay at Three Crossings that would Exceed FHWA Delay Threshold Even with Updated Train Counts, Updated Train Speeds, and IDOT Actual 2007 ADT[75]

	Ogden Ave		Chicago Road		Lincoln Hwy	
	Rank in Illinois	Hours of Delay	Rank in Illinois	Hours of Delay	Rank in Illinois	Hours of Delay
IDOT Actual 2007 ADT	73	53.6	49	66.3	108	44.0
CMAP-based projection of 2015 ADT[76]	70	54.4	45	68.8	106	44.5
DEIS projected 2015 ADT	34	72.5	21	87.9	45	68.6

SEA's analysis provides no defensible reason for the starkly different outcome from state rankings that result when FHWA standards are applied at locations off the EJ&E line. In effect, the Board would be requiring the funding of mitigation at crossings that would not rank as top priorities as compared to other crossings within the same state. This strongly suggests that SEA's use of FHWA conditions as a basis for ordering mitigation of vehicle/rail crossings is flawed. If SEA were to persist in using the FHWA guidelines as it has, it would place CN at an unfair competitive disadvantage relative to other railroads not facing these standards and wrongly pressure the state and federal governments to reorder their funding priorities in an arbitrary manner.

Another indicator of how flawed the FHWA standards are as an indicator of significant impacts and the need for mitigation is that there are a number of highway/highway crossings in

[74] The reasonableness of these assumptions is described in more detail in Section E.3 below.

[75] As CN argues below, if SEA were to calculate delay using the LOS criteria, correct data, and reasonable assumptions, all crossings except for two in Joliet that are already subject to a voluntary mitigation agreement would no longer qualify for mitigation.

[76] As CN argues in more detail below, SEA should rely on IDOT's actual 2007 ADTs rather than projecting any positive ADT growth, but CN nonetheless includes projected ADTs in this table for purposes of comparison.

the affected communities that presently exceed 40 hours of delay per day. These crossings show that the communities themselves do not see that crossing the FHWA 40 hour delay threshold as much cause for concern. For example, the intersection of the Northwest Highway and IL Route 59 in Barrington causes traffic delays of 172 hours a day. Yet, Barrington has made no attempt to solve this much larger delay problem. Indeed, for each other highway/rail at-grade crossing identified in the DEIS as being substantially affected by the Transaction, there is a nearby highway/highway intersection that experiences significantly more delay than would occur at the rail crossing based on post-Transaction conditions.

Thus, if SEA were to persist in resting its decisions on the FHWA guidelines it would be seeking to impose on CN a duty to separate grade crossings that communities do not impose on themselves, that no state imposes on any other railroad, and that SEA has never sought to impose on anyone but CN. This would not be balanced regulation, but an unsustainable reactionary response to political pressure that would indefensibly discriminate against CN and put it at a competitive disadvantage to all other railroads operating in the region.

E.2.e. There can be no basis for requiring grade separation as mitigation for crossings delays without a proper determination that the value of the mitigation is warranted by the cost of the separation and by the relative value of the mitigation at one crossing as opposed to the value of mitigating delay at other crossings. SEA has not conducted that analysis.

There is also no rational basis for SEA to suggest use of the FHWA guidelines without undertaking or conditioning use of such guidelines upon undertaking a cost-benefit analysis of proposed crossings. FHWA, and the Illinois Department of Transportation ("IDOT"), either

recommend or require a cost-benefit analysis prior to deciding when to separate a crossing.[77] Other reports on grade separations have recognized that economics play an important role in grade separations.[78] As SEA itself has stated:

> The cost to grade separate a crossing can be substantial . . . and the decision should not be based solely upon the outcome of the screening criteria . . . . The decision to grade separate a crossing should be based on a benefit/cost analysis that takes into consideration the aggregate benefits from many factors.

DM&E DEIS at G-7. Likewise, FHWA recognizes that "[t]he decision to grade separate a highway-rail crossing is primarily a matter of economics" that should "be based on long-term, fully-allocated life-cycle costs." FHWA Handbook at 77. There is no rational basis to require grade separations in this case without reference to such a benefit/cost analysis. In *DM&E*, SEA recommended using a benefit/cost analysis "to assist in making informed decisions about when to grade separate a crossing." *DM&E DEIS* at G-7. Unless it conducts or even considers a cost/benefit analysis, SEA risks imposing conditions that could require construction of a grade separation where the costs would greatly outweigh the benefits.

IDOT's approach is a good example of the benefit/cost analysis. IDOT uses a relatively simple benefit/cost analysis to determine whether existing or proposed grade crossings should be eliminated and/or replaced with a grade-separation. It uses two criteria both of which must be met for a grade crossing to be considered.[79]

First, IDOT calculates the annual Expected Crash Frequency ("ECF"), expressed in crashes per year, for the crossing. To calculate the annual ECF, IDOT multiplies (1) a factor

[77] FHWA Handbook at 155-65; Illinois Department of Transportation, Bureau of Local Roads and Streets Manual at 40-1(7) (Nov. 2006) ("IDOT BLR Manual"), *available at* http://www.dot.state.il.us/blr/manuals/Chapter%2040.pdf.

[78] TransTech Report at 27 ("Cost of grade separation improvements compared to the value of expected benefits is an important component of the technical analysis.").

[79] IDOT BLR Manual at 40-1(7).

based on the average 10-year ADT, (2) a factor based on the existing crossing protections, and (3) the number of trains per day. If the annual ECF exceeds 0.02 (that is, one additional crash every 50 years), the crossing meets the first threshold for separating.

Second, IDOT calculates the annual benefit-cost ratio for grade separating the crossing. If the benefit-cost ratio exceeds 1.0 (that is, the annual benefits exceed the annual costs), it meets the second threshold for consideration for separation. To calculate the benefit-cost ratio, IDOT uses a four step process.

First, IDOT calculates the Annual ECF savings by subtracting current ECF (that is, without the separation) from the future ECF (with the separation). Second, IDOT calculates the expected annual benefit of the grade separation. The annual benefit is the cost of a crash which is based on statistics provided by the National Safety Council ("NSC") and the Illinois Commerce Commission, multiplied by the Annual ECF savings. Third, IDOT calculates the annual cost of the grade separation, which is the total cost of the grade separation divided by the expected life of the structure, plus the additional cost of maintaining the grade separation as opposed to gates. Fourth, IDOT compares the annual benefits to the annual costs. If the annual benefits exceed the annual costs, the crossing meets IDOT's criteria for separating.

The following table shows the results of IDOT's cost benefit analysis as applied to the crossings identified by SEA as requiring mitigation, using the same assumptions regarding ADTs and train counts as in the DEIS:

Application of IDOT's Benefit/Cost Criteria[80] to Crossings[81] Identified by SEA as Requiring Mitigation					
Crossing	CN's Estimate of Construction Cost of Grade Separation	Total Annual Cost[82]	Total Annual Benefit[83]	Benefit/Cost Ratio (must be higher than 1.0 to be considered for separation)	Does crossing qualify for separation under IDOT benefit/cost analysis?
Allanson Road	$12,250,000	$434,933	$30,557	0.070	No
Diamond Lake Road	$10,000,000	$359,933	$12,784	0.036	No
IL 60&83	$7,500,000	$264,400	$38,856	0.147	No
Old McHenry Road	$17,800,000	$619,933	$46,093	0.074	No
Ela Road	$8,800,000	$319,933	$32,477	0.102	No
Hough St (IL 59&63)	$10,000,000	$359,933	$32,477	0.090	No
Liberty Street	$9,600,000	$346,600	$63,194	0.182	No
Ogden Ave (U.S.34)	$9,000,000	$314,400	$127,543	0.406	No
Montgomery Road	$9,000,000	$326,600	$75,606	0.231	No
135th Street	$10,000,000	$359,933	$32,655	0.091	No
Woodruff Road	$12,500,000	$443,267	$34,970	0.079	No
Washington Street	$6,000,000	$214,400	$23,396	0.109	No
Cicero Avenue	$13,000,000	$459,933	$64,257	0.140	No
Western Avenue	$6,500,000	$231,067	$50,555	0.219	No
Chicago Road	$17,000,000	$593,267	$60,485	0.102	No
Lincoln Hwy (U.S. 30)	$15,500,000	$531,067	$88,579	0.167	No

None of the crossings identified by SEA would be justified under IDOT's existing benefit/cost formula, further highlighting the minimal impacts of the transaction. All parties recognize that capital transportation budgets are stretched thin; to waste scarce resources without

[80] IDOT uses two criteria to determine whether existing or proposed grade crossings should be eliminated and/or replaced with a grade separation: when the expected crash frequency (ECF) for grade crossing gates exceeds 0.02 and the benefit-cost ratio exceeds 1.0.

[81] Broad Street in Griffith is not included because it is in Indiana.

[82] Assumptions: annual maintenance costs are $14,400 for a railroad overpass and $26,600 for a railroad underpass and grade separation has a 30 year life. The annual cost is the total construction cost divided by the 30 year expected life, plus maintenance costs.

[83] Assumptions: cost of a crash equals $688,379 (based on most recently published data on crash probabilities from the Illinois Commerce Commission and crash damages from the NSC); crash frequency is calculated using the formula Expected Crash Frequency ("ECF") = A * B * T, where A is a factor based on ADT, B is a factor based on existing crossing protections, and T is the number of trains. The annual benefit equals the ECF multiplied by the cost of a crash.

determining whether a separation is economically justified would violate the purposes of NEPA, as well as common sense.

E.3. SEA did not properly analyze impacts on vehicular traffic and therefore overstated the Transaction's impact on delay at grade crossings.

SEA's analysis of grade crossing delay mistakenly used data and assumptions that significantly overstated the likely impacts of the Transaction. Specifically, (1) SEA failed to use the most recent data regarding train counts, train speeds, and ADT; (2) SEA unreasonably used projected ADT data; and (3) even if it were reasonable to use projections of future ADTs, SEA's methodology for projecting ADT was unreasonable. The more reasonable assumptions set forth below indicate that, even under the flawed FHWA guidelines, only 4 crossings are potential candidates for mitigation.

E.3.a. SEA should use the train counts most recently reported by CN.

SEA should use updated train counts provided by CN. The train counts used in the DEIS included two trains that, at the time the Application was filed, CN believed would be rerouted over EJ&EW for interchange with CSXT at Kirk Yard. However (as CN advised SEA in April and May), CN has been unable to obtain CSXT's consent to an interchange of those trains at Kirk Yard, and they will therefore not be rerouted.[84] The DEIS notes the updated train counts (see the note preceding Appendix C to the SIP, which is included as Appendix B of the DEIS),

[84] Letter from Paul A. Cunningham, Counsel, CN, to Victoria J. Rutson, Chief, SEA, at 2 & n.1 (May 23, 2008), *available at* http://www.STBfinancedocket35087.com/html/inforequest.html; April 21, 2008 Letter, ("at least two of the trains that CN projected just six months ago would move over EJ&EW following the Transaction are unlikely to do so"),; *id.*, Attachment 1 ("The figures reflected in the Operating Plan include two trains that CN interchanges with CSX that CN expected to route over EJ&EW from Leithton to Kirk Yard. However, as a result of conversations with CSX, CN no longer expects those trains to be operated over EJ&EW.")

but fails to update the data used in its analyses accordingly. For the FEIS, SEA's analysis of delay should take this change in train counts into account.

E.3.b. SEA should use updated train speeds.

CN has redesigned the connection between the CN and EJ&E lines at Matteson to allow faster operating speeds on the main line though the connection than would the configuration originally planned by CN and submitted in its Application. CN submitted the revised design to SEA on August 21, 2008. CN has also modified its plans for improving the connection between the CN and EJ&E lines at Leithton so that southbound trains coming onto EJ&E from CN's Waukesha subdivision and northbound trains moving onto the Waukesha subdivision from EJ&E would be able to move at higher speeds than the design CN originally submitted for its planned improvement to this connection. CN submitted the revised design to SEA on September 18, 2008. For both connections, CN used its Train Performance Calculator ("TPC") to recalculate speeds of trains over grade crossings near the connections, and reported those speeds to SEA on September 26, 2008. (The updated train speeds reported on September 26 also corrected an error in CN's earlier calculation of the weighted average of the CN, EJ&E, and other train speeds on the EJ&E line, which gave excessive weight to the "other" (i.e., non-CN, non-EJ&E) trains. Additionally, to increase the accuracy of the results, CN calculated the train speed at each crossing as the average of the speeds as the head end, the midpoint, and the tail end of the train passed over the crossing, and reported the train speed as the average of those three speeds, instead of simply reporting the speed of the midpoint of the train at each grade crossing, as was done in the calculations reported previously.) For the FEIS, SEA should use these updated train speeds in its analysis of delay at grade crossings. Using updated train speeds would remove

Liberty Street, Montgomery Avenue, Broad Street, Cicero Avenue, Illinois Route 60/83, and Allanson Road as candidates for mitigation under the FHWA guidelines.

E.3.c. SEA should use the most recent reports of Average Daily Vehicular Traffic ("ADT") information.

CN agrees that SEA should obtain ADT data from a reliable, regional source and not rely on local source that could potentially be biased or use methodologies to collect and record ADTs that are inconsistent with those used by other jurisdictions. To the extent that traffic counts throughout the region are collected by a single agency using a reliable methodology, SEA should rely on those data. Fortunately, IDOT regularly collects traffic counts for roads throughout the region, and supplies its data to FRA for inclusion in FRA's grade crossing database.[85]

To ensure the most accurate analysis, SEA should use the most recent information on ADT available from IDOT and reported in the FRA's grade crossing database. In Illinois, traffic is counted on state-maintained routes every other year, while county highways and township roads are generally counted every five years.[86] According to the records maintained by FRA, IDOT updated the ADT information for several roads (both state- and county-maintained) with grade crossings over EJ&E, and that information has been available from FRA since March 31, 2008. Where this information is available, SEA should use it, because, as discussed below in section E.3.3, SEA's estimated 2007 ADT was off by over 60% compared to ADTs actually observed by IDOT.

[85] *See, e.g.*, Illinois Department of Transportation, Illinois Highway Information System: Railroad Information and Procedure Manual at ii (Jan. 2002), *available at* http://www.dot.il.gov/irrismanual.pdf. With the updated train speeds noted in the preceding section, the one Indiana crossing as to which the DEIS recommended mitigation would no longer trip the threshold criteria.

[86] Illinois Department of Transportation, Illinois Traffic Monitoring Program at 37 (2005), *available at* http://www.dot.state.il.us/itmp.pdf

The following chart shows those crossings where IDOT has recently updated the reported ADT, and compares the 2007 ADTs projected by SEA (based on growth rates it assigned to each county) with the ADTs currently observed and reported by IDOT and available in the FRA database. (As discussed below, Current Roadway LOS is included in order to indicate which highways are currently at or near capacity.)

Comparison of SEA's Estimated 2007 ADTs with 2007 ADTs Reported by IDOT

Crossing	SEA 2007 estimated ADT	IDOT 2007 reported ADT	Previously reported year	Previously reported ADT	Current Roadway LOS[87]
Diamond Lake Road	7,103	4,900	2004	6,500	C
IL 60&83	23,413	22,900	2005	23,300	F
Gilmer Road	14,729	12,600	2004	12,700	E
Old McHenry Road	25,596	21,400	2004	21,400	D
Oakwood Road	5,354	3,750	2004	4,900	B
Main Street (Lake Zurich)	13,792	5,900	2005	13,000	D
Old Rand Road	8,414	5,900	2004	7,700	B
Ela Road	16,892	15,000	2004	14,300	E
Cuba Road	10,249	7,600	2004	8,300	D
Northwest Hwy	26,573	26,800	2005	25,600	D
Hough Street/ IL 59&63	18,990	17,800	2005	17,800	E
Ogden Ave	36,177	36,400	2005	34,100	F
Main Street (Plainfield)	17,505	15,800	2005	16,500	E
Nelson Road	5,791	1,009	2004	5,300	C
Cicero Ave	28,257	21,500	2005	27,700	E
Chicago Road	24,788	21,600	2005	24,300	D
Lincoln Hwy	36,622	27,000	2005	35,900	F

The table shows that, in many instances, ADT has either stayed relatively constant (Gilmer Road, Old McHenry Road, Hough Street) or has declined substantially (Diamond Lake Road, Cicero Avenue, Chicago Road, Lincoln Highway). This is not surprising, because, as the table above demonstrates, many of the roadways currently operate at or above capacity, which

[87] The roadway LOS (which is different from a crossing LOS) is determined by calculating the volume to capacity ratio, which is the total daily volume divided by the total capacity. Capacity is determined based on the type of road and the number of lanes. For roadways with an LOS of F, the ratio is greater than 1.0, meaning that volume exceeds capacity. DEIS at 3.3-27.

limits the potential for growth in traffic. It is unclear why ADT at some crossings has fallen, but among the possible reasons for the decrease are higher gas prices, changes in demographic or traffic patterns, or construction of additional alternative routes.[88] In any event, the ADT observed in 2007 for several crossings is substantially lower than the ADT that SEA projected for 2007, strongly indicating that SEA's projections based on assumed annual growth percentages significantly overstate actual 2007 ADTs for all other crossings on the EJ&E arc.

E.3.d. There is no rational basis for using projected ADTs; SEA should use 2007 ADTs.

It is unprecedented and unreasonable to base mitigation requirements on ADT projected for eight years, to 2015. It is one thing to discuss impacts in terms of taking a "hard look" at the Transaction, but it is a different matter when an agency uses highly questionable projections as the sole basis for imposing mandatory mitigation. SEA has never before based mitigation on impacts that would not be projected to occur until many years in the future, and might not occur

[88] The FHWA, which measures vehicle miles traveled ("VMT") on a monthly basis, reports that, as of March 2008, cumulative VMT had fallen by 17.3 billion miles since November 2006. Press Release, Federal Highway Administration, Americans Driving At Historic Lows (May 23, 2008), *available at* http://www.dot.gov/affairs/fhwa1108.htm. That trend has continued through the summer of 2008, and since November of 2007 Americans have driven 53.2 billion fewer miles than they did over the same period a year earlier – topping the 1970s' total decline of 49.3 billion miles. Press Release, Federal Highway Administration, American Driving Reaches Eighth Month of Steady Decline (Aug. 13, 2008), *available at* http://www.dot.gov/affairs/fhwa1708.htm.

at all.[89] In all previous EISs, SEA relied on currently available ADTs without projecting them into the future.[90]

There are good reasons why SEA has historically declined to project future vehicular traffic as a basis for prescribing environmental mitigation, and there are good reasons to again decline to do so now. Predictions with the level of precision and reliability necessary to serve as the basis for very costly mandatory mitigation would, as a practical matter, be exceedingly difficult or impossible to make for the reasons discussed in the attached memorandum by Professor Jeffrey Dubin of the University of California Anderson School of Management (Exhibit 2). These include the difficulty of reasonably forecasting ADTs for such a long period, the uncertainty regarding their actual growth rates, the problems with assuming that a single county growth rate can be applied to a specific crossing, and the particularly large variances and uncertainties regarding underlying factors such as population growth rates and gasoline prices that can be expected to strongly influence ADTs. He explains that each of these sources of uncertainty makes any effort to forecast route specific vehicular traffic highly problematic and of limited utility. Prof. Dubin Memo, Exhibit 2 at 12-13.

[89] CN is aware of only one instance in which SEA used projected ADTs, and that was an Environmental Assessment where the issue was not imposition of expensive mitigation, but confirmation of the absence of significant impacts. *See Arizona E. Ry. – Construction & Operation – In Graham County, AZ*, STB Finance Docket No. 34836, Draft Environmental Assessment at 4-10 & Appendix F (STB served Feb. 25, 2008).

[90] See *Bayport Loop DEIS* at F-8 (ADT information was provided by TxDOT and was based on 2001 data, with the exception of three crossings for which 1996 or 1992 data were used because 2001 data were not available); *SW Gulf DEIS* (served Nov. 2004) at 4-15 (ADTs based on 2002 figures from TxDOT or 2003 figures from Medina County Commissioner); *DM&E DEIS* at G-1 (SEA obtained data from the FRA database and supplemented it with field observations and information supplied by DM&E and state officials); *Conrail FEIS* at 4-32 (SEA used ADTs contained in FRA database, updated for locations where state or local government agencies provided that information).

In addition, based on the information available, it appears as likely or more likely that future changes in ADT will be zero or negative rather than positive for the affected roads. Accordingly, Professor Dubin concludes that a growth rate no higher than zero should be assumed for purposes of SEA's ADT analysis. *Id.* This evidence is compelling.

For example, recently observed data by both IDOT and FHWA indicates that Americans and the citizens of Illinois are driving less, a trend that may continue as gas prices remain at historically high levels. The following chart shows the actually observed growth rates on some roads in northeastern Illinois:

Growth Rate at Selected Intersections Based on Last Two ADT Measurements by IDOT

Crossing	2007 reported ADT	Previously reported year	Previously reported ADT	Observed Growth Rate
Diamond Lake Road	4,900	2004	6,500	-8.99%
IL 60&83	22,900	2005	23,300	-0.86%
Gilmer Road	12,600	2004	12,700	-0.26%
Old McHenry Road	21,000	2004	21,400	-0.63%
Oakwood Road	3,750	2004	4,900	-8.53%
Main Street (Lake Zurich)	5,900	2005	13,000	-32.63%
Old Rand Road	5,900	2004	7,700	-8.49%
Ela Road	15,000	2004	14,300	1.61%
Cuba Road	7,600	2004	8,300	-2.89%
Northwest Hwy	26,800	2005	25,600	2.32%
Hough Street/ IL 59&63	17,800	2005	17,800	0.00%
Ogden Ave	36,400	2005	34,100	3.32%
Main Street (Plainfield)	15,800	2005	16,500	-2.14%
Nelson Road	1,009	2004	5,300	-42.47%
Cicero Ave	21,500	2005	27,700	-11.90%
Chicago Road	21,600	2005	24,300	-5.72%
Lincoln Hwy	27,000	2005	35,900	-13.28%

This trend of flat to decreasing ADT is consistent with national and state-wide trends. The FHWA has noted that Americans and the citizens of Illinois and Indiana have been driving

less. The following chart shows the month-to-month change in vehicle miles traveled on urban arterial roads both nationally and in Illinois and Indiana, as reported by FHWA.[91]

Month-over-Month Change in Vehicle Miles Traveled on Urban Arterials			
Month	Nationwide Change in VMT (Urban Arterials)	Illinois-wide Change in VMT (Urban Arterials)	Indiana-wide Change in VMT (Urban Arterials)
Nov-07	-0.40%	0.90%	-1.0%
Dec-07	-3.80%	-6.30%	-6.1%
Jan-08	-1.70%	-1.30%	-2.7%
Feb-08	-0.40%	-1.90%	0.9%
Mar-08	-3.70%	-6.00%	-7.9%
Apr-08	-1.00%	-1.40%	-3.5%
May-08	-3.20%	-4.10%	-6.8%
Jun-08	-4.20%	-4.50%	-4.9%

VMT is a measure of demand for automobile travel and is thus closely related to ADT. Based on the data in the chart above, it would not be surprising for ADTs at many crossings to exhibit zero or negative growth rates going forward.

One obviuous source of decreased demand for automobile travel is increased gasoline prices. Unsurprisingly, gasoline prices have risen substantially over the period of time for which FHWA has reported decreased VMT. In the face of high gasoline prices, consumers have short, intermediate, and long term responses; each would have a negative effect on ADT.

In the short term, drivers can make fewer trips,[92] make shorter trips, or make more combined trips or they can choose to take transit, bike, or walk.[93] In the medium term,

[91] Traffic Volume Trends, from which this data is compiled, is a monthly report based on hourly traffic count data reported by the States, and is available at http://www.fhwa.dot.gov/ohim/tvtw/tvtpage.cfm. These data are collected at approximately 4,000 continuous traffic counting locations nationwide.

[92] National gasoline consumption has been declining, indicating motorists are driving less. *See* Energy Information Administration, Short-Term Energy Outlook (Sept. 4, 2008) 4, *available at* http://www.eia.doe.gov/emeu/steo/pub/sep08.pdf ("Total U.S. petroleum and other liquids consumption is projected to decline by 610,000 bbl/d, or about 3 percent, in 2008"). Since February 2007, month over month consumption has declined in Illinois. *See* http://tonto.eia.doe.gov/dnav/pet/hist/a103620171m.htm.

consumers may choose to purchase more fuel-efficient vehicles, which could have a positive effect on ADT growth (or a neutral one, if the new vehicles are used to replace existing ones).[94] In the long term, drivers may take more significant measures, such as moving to be closer to their jobs or mass transit. All of these responses will tend to drive down ADT.

This underscores another reason it would be unreasonable for SEA to base mitigation on effects expected at some arbitrary time in the future. If it is true that ADT growth is either flat or negative (as recently observed data suggests), then current 2007 ADT is actually a conservative estimate of impacts from delay. There are simply too many unknowns regarding important inputs into SEA's model to support conditions that would impose upon CN a duty to pay now to mitigate effects that may never actually occur. SEA's use of only current ADT in taking a "hard look" at delay impacts has been judicially upheld, and there is no sound reason to change that methodology now.

In light of such evidence and broad trends against ADT growth, SEA's assumptions of uniform positive growth rates are unsupportable. The Board should instead use the latest available actual ADT data from IDOT or other like sources.

E.3.e. Even if SEA projects growth in vehicular traffic, any projections should be based on reasonable growth assumptions and not on the arbitrary assumptions contained in the DEIS.

Even if SEA concludes that it must project ADT for the purpose of conducting a "hard look" at the impacts of the Transaction, it should use more appropriate growth rates for vehicular

[93] Metra, for example, has seen a significant increase in ridership. *See* Jon Hilkevitch and Richard Wronski, Record ridership strains CTA, Metra, Pace – and it's likely to get worse, Chic. Trib., Sept. 2, 2008 (noting that, "fueled by high gas prices," Metra ridership increased 5% for the first half of 2008 and that Metra expects 2008 to be its third straight record-setting year).

[94] Although supply of fuel efficient vehicles has yet to catch up with demand, by the time current fuel inefficient vehicles are replaced on a large scale by fuel efficient ones, long-term impacts from high gasoline prices may begin to influence ADT.

traffic than those applied in the DEIS. As discussed by Professor Dubin (Exhibit 2 at 4-5), one way to assess the accuracy of SEA's forecasts is by examining its estimates of 2007 ADT versus the actual 2007 ADT counts that have now been completed. The following chart shows the crossings where IDOT updated its ADTs for 2007 (as reported to and available in the FRA database) and compares those figures with SEA's projected 2007 ADTs.

Comparison of SEA Projected 2007 ADT to Actual 2007 ADT Reported by IDOT			
Crossing	SEA's 2007 Estimated ADT	IDOT's Reported Actual ADT	Percent Difference
Diamond Lake Road	7,103	4,900	45.0%
Gilmer Road	14,729	12,600	16.9%
Old McHenry Road	25,596	21,000	21.9%
Oakwood Road	5,354	3,750	42.8%
Main Street (Lake Zurich)	13,792	5,900	133.8%
Old Rand Road	8,414	5,900	42.6%
Cuba Road	10,249	7,600	34.9%
Northwest Hwy	26,573	26,800	-0.8%
Hough Street/ IL 59&63	18,990	17,800	6.7%
Ogden Ave	36,177	36,400	-0.6%
Main Street (Plainfield)	17,505	15,800	10.8%
Nelson Road	5,791	1,009	473.9%
Cicero Ave	28,257	21,500	31.4%
Chicago Road	24,788	21,600	14.8%
Lincoln Hwy	36,622	27,000	35.6%
Average SEA Percentage Error			**60.6%**

Sources: DEIS at 3.3-7-14; FRA, Office of Safety Analysis, http://safetydata.fra.dot.gov/officeofsafety/publicsite/crossing/XingLocResults.aspx?state=17&countycity=&railroad=EJE&radionm=County&street=.

As the table illustrates, SEA's growth assumptions begin with an average over-estimation of 2007 ADT of 60.6%. This suggests strongly that SEA's chosen growth rates are too high. Moreover, as noted by Professor Dubin, the fact that SEA's forecasts are so far in error during

the earliest years of the forecast suggests that the degree of error could compound radically as the forecast horizon is extended to 2015 and beyond. *Id.* at 5.

These poor results are not surprising given the fatally flawed approach used by SEA for forecasting ADT growth. First, using a single growth rate for an entire county is unrealistically simplistic, because, among other factors, population growth is not uniform throughout the county. Developable areas that are closer to jobs and retail may be built up before outlying areas, and real-world growth in ADT would reflect this uneven growth in a way that county-wide projections do not. Also, as roads become congested, drivers begin to avoid them in favor of alternative routes.[95] Thus, ADT on a congested road might stay relatively constant (at a level that represents the capacity of the road), while traffic on alternative routes would grow, at least until those roads also reached their capacity. Professor Dubin explains that use of macro data such as county-wide growth rates on a micro basis at individual crossings substantially undermines SEA's forecasts due to resulting disaggregation uncertainty. Memorandum of Professor Dubin, Exhibit 2 at 5-6.

Second, the growth rates used by SEA are not supported by current demographic trends. SEA states that growth rates for Cook and Lake (IL) Counties were supplied by county engineering offices.[96] For other counties, SEA "estimated the percentage of growth for each year and each county using data from the late 1980s to 2006 to project ADT for the year 2007."[97] The

[95] TransTech Report at 35 ("[A]s capacity of a road is approached, the traffic will spread over time to form longer peak periods, or will divert to less congested roads. This can work in reverse; a road that is not currently at capacity can have an abnormal increase of traffic due to diversion from a more congested parallel route.").

[96] DEIS at 3.3-4.

[97] *Id.*

following table shows population growth in each of the counties that would be impacted by the EJ&E Transaction.

Comparison of SEA's Estimated County-wide ADT Growth Rates to Historic and CMAP's Projected Population Growth Rates

County	SEA Applied ADT Growth Rate	1980-1990 Growth Rate	1990-2000 Growth Rate	2000-2007 Growth Rate	2007-2030 Projected Growth Rate
Cook	1-2%	-0.26%	0.51%	-0.25%	0.52%
Lake (IL)	3%	1.51%	2.17%	1.40%	0.74%
Dupage	3%	1.74%	1.41%	0.39%	0.34%
Will	3%	1.01%	3.41%	4.27%	2.06%
Lake (IN)	3%	-0.90%	0.17%	0.22%	0.54%

Source: U.S. Census data, except future growth data, which is from CMAP, http://www.chicagoareaplanning.org/data/forecast/2030_revised/ENDORSED_2030_forecasts_9-27-06.pdf

As the table indicates, SEA's ADT growth rates are substantially higher than the historical growth rates in population that one would expect to correlate with SEA's projections. The table also indicates that 4 of the 5 counties are substantially developed and are unlikely to exhibit high levels of future growth. Cook and Lake (IN) counties have been substantially developed since before 1980, and have historical and projected future growth rates that are significantly below those figures used by SEA. While Lake (IL) and Dupage counties experienced significant growth in the periods 1980-1990 and 1990-2000, that growth has tapered off as the counties have now become fully developed. Moreover, even in those periods of relatively high growth, neither county saw the level of explosive growth that SEA has projected between the present and 2015. SEA's selected growth rate for Will County, which is the least inconsistent with population growth rate, is still a full percentage point higher than projections provided by CMAP.[98] See discussion of CMAP projections below.

[98] CMAP is an official Metropolitan Planning Organization, and is created by and operates under state law. CMAP was created to address regional transportation planning issues in northeastern Illinois.

As Professor Dubin shows in his memorandum, one of the most unsupportable aspects of SEA's forecast is in fact its unwarranted assumption that growth rates will be constant and positive. Memorandum of Professor Dubin, Exhibit 2 at 10-12. The table below powerfully illustrates that growth factors vary across crossings within individual counties, and that overall growth rates have in recent experience largely been negative instead of positive.

Comparison of Recent Annual ADT Growth Rates with SEA's Assumed Growth Rates

Street	County	Start Year	Start ADT	End Year	End-ADT	Growth Rate	SEA's Assumed Annual Percentage Growth Factor
Allanson Road	Lake	2004	15,300	2007	14,400	-2.00%	3
Old McHenry Rd.	Lake	2004	21,400	2007	21,000	-0.63%	3
Ela Road	Lake	2004	14,300	2007	15,000	1.61%	3
Hough St. Ill (59&63)	Lake	2005	17,900	2007	17,800	-0.28%	3
Liberty Street	DuPage	2004	15,200	2005	15,400	1.32%	3
Ogden Ave. (U.S.34)	DuPage	2005	34,100	2007	36,400	3.32%	3
Cicero Ave.	SE Cook	2005	27,700	2007	21,500	-11.90%	1
Chicago Rd.	SE Cook	2005	24,300	2007	21,600	-5.72%	1
Lincoln Hwy.	SE Cook	2005	35,900	2007	27,000	-13.28%	1
					Simple Average	**-3.06%**	

Source: Developed from data collected by FRA's Office of Safety Analysis, http:/safety data.fra.dot.gov/officeofsafety/publicsite/crossing/xingqryloc.aspx.

This shows that SEA's assumption of constant positive growth rates is untenable. It also reinforces the point that negative or zero near term and long term growth rates are just as likely at crossings of interest as positive growth rates.

For all of the above reasons, there are no grounds for SEA to depart from prior precedent and attempt to forecast ADTs with positive growth. Given the recent lack of growth in ADT, and the added fact that the impacts of the tremendous rise in gasoline prices are just beginning to be seen in changes in driving patterns and data reflecting those changes, the Board has ample

grounds for relying on current ADTs as a conservative (*i.e.*, likely high) estimate of future ADTs.

Alternatively, if the Board believes it can develop its own reasonably reliable forecasts of ADTs, it should use a more reliable and accurate methodology than that used for the DEIS, so that its projections properly reflect the anticipated zero or negative growth in ADT for most or all crossings.

As discussed above, however, making any projections regarding ADTs is not a simple matter. Therefore, as a final and least supportable option, if the Board believes it is compelled to forecast ADTs rather than rely on the latest available IDOT information, and the Board also believes it cannot reasonably do so itself, it might consider as a last resort utilizing CMAP information to develop projected ADTs. CMAP, an official government planning agency, maintains a list of projected ADTs for roads in northeastern Illinois. Nonetheless, as noted by Professor Dubin, CMAP's data will suffer from both model and data lag, and thus will likely project ADT that is too high. *See* Memorandum of Professor Dubin, Exhibit 2 at 13 For example, the future impacts of greatly increased gasoline prices will not be fully reflected in the CMAP data. This is one of the chief reasons it would be more accurate and defensible for the Board to utilize the most recent IDOT data.

Nonetheless, as compared to the DEIS projection methodology, CMAP's projections have the benefit of being well-studied and widely used, and of taking into account many of the considerations discussed above. CMAP's projections use a professionally recognized four-step transportation model that takes into account: trip generation; trip distribution; modal split; and

trip assignment.[99] CMAP's projections also take into account the fact that all roads are not equally attractive to drivers, who select the most efficient routes and avoid those that become congested if faster options are available. In other words, CMAP maintains a reasonably-robust transportation planning model for predicting, on a roadway by roadway basis, future ADTs.

While CMAP projects ADTs to 2030 and not to any years between then and the present, implied growth rates can be used to calculate projected ADTs for 2015, as set forth in the following table.

Comparison of SEA's 2015 Projected ADT to CMAP's 2015 Projected ADT

Crossing	SEA 2015 projection	CMAP 2030 projection	Implied CMAP growth rate	CMAP 2015 projection	Difference from SEA 2015 projection
IL 60 & 83	29,659	27,000	0.72%	24,250	-5,409
Diamond Lake Road	8,998	7,000	1.56%	5,547	-3,451
Old McHenry Road	32,424	27,000	1.10%	22,918	-9,506
Ela Road	21,398	17,000	0.55%	15,667	-5,731
Hough Street (IL 59 & 63)	24,056	18,000	0.05%	17,869	-6,187
Liberty Street	20,696	18,000	0.68%	16,259	-4,437
Ogden Avenue (US 34)	45,828	38,000	0.19%	36,949	-8,879
Montgomery Road/83rd Street	27,131	24,000	0.88%	21,030	-6,101
135th Street	11,766	15,000	2.50%	10,357	-1,409
Woodruff Road	10,659	16,000	3.23%	9,930	-729
Washington Street	11,714	9,000	0.91%	7,851	-3,863
Cicero Avenue	30,598	32,000	1.74%	24,689	-5,909
Western Avenue	24,717	32,000	1.52%	25,506	+789
Chicago Road	26,842	24,000	0.46%	22,406	-4,436
Lincoln Highway (US 30)	39,656	28,000	0.16%	27,344	-12,312
Broad Street (IN)[100]	19,572	21,681	0.81%	16,484	-3,088

[99] *See, e.g.*, Illinois Department of Transportation, Transportation Research Center, *Developing Long Range Traffic Projection Models for Illinois* at 11 (June 2004) *available at* http://www.dot.state.il.us/materials/research/iva_h1_fy03.exe. ("The most commonly accepted procedure for performing travel demand modeling is the 4-step process of trip generation, trip distribution, mode split, and trip assignment. . . . Common applications of travel demand models [include] predicting changes in travel patterns that result from changes in demographic characteristics and transportation supply.").

[100] Information from Northern Indiana Regional Planning Commission.

Certainly, if any use of projections is warranted, use of these CMAP 2015 ADTs would be more reasonable than using SEA's constant annual growth factors. *See* Exhibit 2 at 13 (despite CMAP's data and model lag, it provides a more accurate indicator of future growth than SEA's approach). They are based on projections by a professional, local planning agency that has the experience, expertise, and ability to make these kinds of projections. Further, they are based on a rigorous transportation model that is widely used for planning purposes in the Chicago area and is route specific. Use of projections for 2015 derived from CMAP's projections would eliminate Old McHenry Road as a candidate for mitigation.

E.4. Queue length is not a rational basis to require mitigation, and even if it were indicative of a need for mitigation, it would not require a grade separation.

SEA evaluated the operations of roadways that cross rail line segments expected to experience a change in rail traffic in order to assess the impact on regional mobility. Part of this assessment was an analysis of queue lengths, which SEA studied "to determine effects on local access and circulation due to the queued vehicles blocking crossing roadways." DEIS at 4.3-9. SEA determined that there would be a "serious" effect if the queue length at a crossing blocks a roadway that is not blocked under the No-Action Alternative. DEIS at 4.3-10. SEA calculated the queue length by estimating the number of vehicles in line at the end of the blocked crossing time of a single train event and multiplying that by an average vehicle length. If the queue length was longer than the storage length,[101] SEA determined the crossing could be substantially affected. SEA has never previously required mitigation based on this criterion, and it should not do so here.

[101] Storage length is the roadway distance from the at-grade crossing to the major thoroughfare, multiplied by the number of lanes.

E.4.a. Queue length is not a rational basis for requiring mitigation

There are a number of reasons why the queue length criterion, as used by SEA, is inappropriate for determining mitigation, and would be especially inappropriate for requiring a grade separation. First, the queue length criterion is based on the impact of a single train; because it is independent of changes in rail traffic volume, it can lead to anomalous results. For example, even if CN were proposing to add just one train to EJ&E, the crossings at Ela Road, Hough Street, 135th Street, and Lincoln Highway would still require mitigation under the queue length standard. Under SEA's logic, there could be substantial impacts where applicants propose increasing train traffic by fewer than three trains per day, below SEA's established thresholds, which only require analysis where train traffic would double (in tonnage) or increase by three or more trains a day. *See* DEIS at 4.3-1.

Second, it would be excessive for the Board to order mitigation on the basis of its queue length analysis because it is against the law in Illinois for a driver to enter an intersection "unless there is sufficient space on the other side of the intersection . . . to accommodate the vehicle he is operating without obstructing the passage of other vehicles . . . notwithstanding any traffic-control signal indication to proceed." 625 ILCS 5/11-1425(a). Thus, queue length from a grade crossing would only affect operation of an intersecting roadway where motorists were in violation of Illinois law. Where motorists follow the law, they will not enter the intersection if there is not sufficient space to clear it, and would therefore not interfere with operation of the intersecting road.[102]

[102] There are other potential problems with the queue length analysis. For example, CN is aware of only one previous environmental review where SEA calculated the actual length of the affected queue (rather than merely calculating the number of vehicles in the queue), and in that draft EA, served only seven months ago, SEA estimated queue length using a length of 17 feet 8 inches per vehicle, instead of the 25 feet assumed for this review. *See Ariz. E. Ry. – Constr. & Operation – in Graham County, Ariz.*, STB Finance Docket No. 34836, Draft Environmental

E.4.b. Even if it were reasonable for SEA to use queue length as a basis for finding a grade crossing to be "potentially substantially affected," the DEIS properly recognizes that solutions other than grade separations are appropriate.

Even if use of queue length were an appropriate criterion for imposing mitigation, the DEIS properly recognizes that there are effective solutions other than designating a crossing for grade separation. The most cost-effective solution is simply installing signs reminding motorists of their legal obligation not to enter an intersection where there is not enough space to clear it. Such "don't block the box" measures have been successfully implemented in jurisdictions, including Washington, D.C., facing intersection gridlock. Another possibility, recognized by the DEIS, are traffic signal revisions to manage queuing, or signalization interconnection. Such revisions would entail forwarding preemption/notification of an approaching train to the roadway traffic signal controller and railroad active warning devices at the same time. This information would cause the signal to alter its phasing to limit the queue buildup at the grade crossing.

There is more than one way to limit queue buildup using signalization interconnection, but the simplest would be limiting any movements that would conflict with the train. Alternatively, a traffic detection loop could be installed that would permit conflicting movements (i.e., allowing cars to be added to the queue) until the queue reaches a particular length, and then stop all conflicting movements. If uncontrolled left or right turns exist and contribute to queue length problems, signage could be installed to limit this problem. Therefore, as properly recognized in the DEIS, grade separations are neither justified nor required at those intersections where queue length is the sole ground for imposition of mitigation.

Assessment at 4-9 (STB served Feb. 25, 2008). The DEIS provides no explanation for the change in SEA's queue length assumptions.

E.5. Use of updated data, corrected assumptions, and proper analysis in keeping with past precedent, eliminates all crossings as candidates for mitigation other than Washington Street and Woodruff Road.

The preceding sections discuss (1) why it is unreasonable to abandon the LOS criteria for determining the applicability of mitigation, (2) various data that can and should be updated as part of SEA's FEIS, and (3) assumptions and analyses that should be corrected, in order to reasonably analyze whether there are potential impacts at vehicular grade crossings of the EJ&E line to determine if mitigation is warranted.

In sum, correcting the data – specifically the train counts and train speeds – underlying SEA's analysis would remove 6 crossings (Allanson Road, IL 60&83, Liberty Street, Montgomery Road, Cicero Avenue, and Broad Street) as candidates for mitigation even under the flawed FHWA guidelines. Using 2007 ADTs, which, as CN demonstrates above is a more reasonable basis for analysis than the county-wide growth rates applied by SEA, would remove a further 2 crossings (Old McHenry Road and Western Avenue) as candidates for mitigation under those guidelines. Recognizing that the queue length criterion is an inappropriate basis for mitigation would eliminate 4 further crossings (Diamond Lake Road, Ela Road, Hough Street, and 135th Street) as candidates for mitigation. Finally, recognizing that the FHWA guidelines are inappropriate for determining mitigation would eliminate the final 3 crossings (Ogden Avenue, Chicago Road, and Lincoln Highway). None of the crossings identified by SEA, with the exception of Washington Street and Woodruff Road (which are already the subject of a voluntary mitigation agreement) are therefore properly candidates for mitigation.

The following table summarizes the above paragraph, with each "NMR" signifying that at the given crossing No Mitigation is Required based on the assumption in the column heading.

Summary of How Reasonable Assumptions Regarding SEA's Grade Crossing Analysis Eliminates Certain Crossings as Candidates for Mitigation (NMR: No Mitigaiton Required)							
Crossing	Mitigation Agreement	Update Train Counts*	Update Train Speeds	Use 2015 ADTs based on CMAP growth rates	Use 2007 ADTs	Eliminate Queue Length Analysis	Use Only LOS criteria

* Would reduce findings of impacts, but would not by itself result in the removal of any of the listed crossings as candidates for mitigation.

This table demonstrates that under a proper analysis, the only two vehicular-rail at grade crossings warranting potential mitigation are the two grade crossings in Joliet (Woodruff Road and Washington Street), both of which are already subject to the mitigation agreement between the City of Joliet and CN.

E.6. Even if there were a rational basis for prescribing grade separations at crossings other than those in Joliet, the allocation of responsibility for any such crossing should be that traditionally applied under federal and state law.

One of the mitigation options that SEA is considering is for CN to pay up to 50% of the cost of a grade separation. For the reasons discussed below, such an allocation would violate the equitable principles inherent in the Transaction because CN is reducing delay and queue length at a number of grade crossings from levels that would meet SEA's criteria under the No Action Alternative but would not under the Proposed Action. Any mitigation imposed by the Board must recognize and take into account the substantial savings for those crossings. Additionally, SEA's proposed allocation would be contrary to decades of established federal policy. Absent exceptional circumstances, which, as the DEIS indicates are not present here, SEA should adhere to the traditional cost allocations for grade separations.

E.6.a. In considering responsibility for funding grade separations, SEA should take into account reductions in crossing delays.

The following tables list crossings on current CN lines into Chicago that currently meet the same standards for grade separation that SEA proposed be applied to crossings on the EJ&E line, but which would cease to be candidates for mitigation under those standards if the Transaction were approved:

Crossings on CN Lines that Exceed the 40 Hours of Vehicle Delay Threshold Under the No-Action Alternative but Not the Proposed Action[103]		
Crossing	No-Action Delay (hours)	Proposed Action Delay (hours)
Golf Road (IL 58)	48.3	1.5
Rand Road (US 12)	44.7	1.3
95th Street (US 12/US 20)	42.5	0.0
170th Street	57.2	8.5

Crossings on CN Lines that Exceed the Queue Length Threshold Under the No-Action Alternative but Not the Proposed Action Alternative[104]	
Crossing	Queue would block the following major thoroughfare
1st Avenue	North Avenue (IL 64)
Euclid Avenue	Wolf Road
Butterfield Road	Townline Road (IL 60)
26th Street	Harlem Ave (IL 43)
Des Plaines Ave	Cermak
Cermak	1st Ave/Golfview Ave (IL 171)
Wolf Road	Harrison St
79th Street	Columbus Ave
103rd Street	Kedzie Ave
111th Street	Kedzie Ave
Kedzie Ave	95th Street
95th Street	Kedzie Ave
99th Street	Kedzie Ave
119th Street	Kedzie Ave
127th Street	Kedzie Ave
Oakton Street	Rand Road (US 12)
Thacker Road	Graceland
Rand Road (US 12)	Golf Road (IL 58)

As SEA is well aware, many of CN's trains operate via trackage rights to navigate their way through the Chicago Terminal District. As a result of the Transaction, CN would

[103] All calculations regarding pre- and post-Transaction delay are taken from the DEIS. *See* DEIS at Table 4.3-6.

[104] All information regarding which crossings would have queue lengths that block major thoroughfares under the No Action Alternative but not the Proposed Action is taken from the DEIS. *See* DEIS at Attachment E1 pages 106-24.

substantially reduce operations on these shared lines – some of which cause considerable delay at grade crossings. For example, in a 2002 report, the Illinois Commerce Commission identified 30 crossings that delayed the most motorists per day, and 30 crossings that caused the most total delay per day.[105] The following table lists the crossings included in that report where CN would reduce or cease operations as a result of the EJ&E Transaction:

Grade Crossings Identified by the Illinois Commerce Commission as Experiencing Excessive Delay That Would Benefit From Reduced CN Traffic[106]					
Crossing	Community	No Action Trains	Proposed Action Trains	No Action Delay (hours)	Proposed Action Delay (hours)
Cumberland Ave. (Metra)	River Grove	3.6	0.0	11.5	0.0
Marquette Road (BRC)	Chicago	5.6	0.0	7.5	0.0
Archer Ave. (BRC)	Chicago	10.1	4.0	37.4	2.7
63rd Street (BRC)	Chicago	5.6	0.0	7.1	0.0
55th Street (BRC)	Chicago	5.6	0.0	13.2	0.0
47th Street	LaGrange	10.2	1.0	15.7	0.9

Some of the grade separations that are planned as part of CREATE are current at-grade crossings over rail lines on which CN train volumes would decrease as a result of the Transaction. Consequently, if the Transaction were approved, it is possible that these crossings would no longer require a separation, and the public money allocated for those projects could be reallocated to other crossings. The following table lists grade separations planned in connection with CREATE on which CN would reduce operations:

[105] *See* Illinois Commerce Commission, *Motorist Delay at Public Highway – Rail Grade Crossings In Northeastern Illinois* at 18-19 (July 2002), available at www.icc.illinois.gov/downloads/public/rr/021114rrdelay.pdf.

[106] All information regarding train counts and pre-and post-Transaction delay is from CN's analysis of grade crossings, which was submitted to SEA on September 26, 2008.

Grade Separations Planned as Part of CREATE[107] that Will Benefit From Reduced Rail CN Traffic			
Crossing	Community	No Action Trains	Proposed Action Trains
Archer Ave. (BRC)	Chicago	10.1	4.0
47th Street (IHB)	LaGrange	10.2	1.0
East Ave. (IHB)	LaGrange	10.2	1.0
31st Street (IHB)	LaGrange	10.2	1.0
71st Street (IHB)	Bridgeview	9.6	1.0
115th Street (IHB)	Alsip	9.6	1.0

In its 2030 Regional Transportation Plan, CMAP has designated several roads in the Chicago area as forming what CMAP calls the Strategic Regional Arterial ("SRA") System.[108] Many of the grade crossings on CN's lines that would experience reduced rail traffic as a result of the Transaction are on the SRA roads, as illustrated by the following table (SRA's identified by boldface):

Grade Crossings That Are Part of CMAP's Strategic Regional Arterial System That Would Benefit from Reduced CN Rail Traffic[109]						
Crossing	Community	No-Action Trains	Proposed Action Trains	No-Action Delay (hours)	Proposed Action Delay (hours)	Queue would block the following thoroughfare
Crossings that meet SEA's Thresholds						
Golf Road (IL 56)	Des Plaines	19.1	4.0	48.3	1.5	n/a
Rand Road	Des Plaines	19.1	4.0	44.7	1.3	n/a
95th Street (US 12 / US 20)	Evergreen Park	3.4	0.0	42.5	0.0	Kedzie

[107] *See* CREATE Final Feasibility at 53-54. All information regarding train counts and pre-and post-Transaction delay is from CN's analysis of grade crossings, which was submitted to SEA on September 26, 2008.

Any mitigation that SEA might recommend must take these crossings into account. The purpose of mitigation is not to create a public windfall. As the above tables indicate, the rerouting of trains now operating on CN lines in Chicago would have substantial environmental benefits – benefits that would offset the adverse environmental impacts experienced by communities along the EJ&E line.[110] In deciding on an appropriate allocation of mitigation expenses, SEA should be cognizant of the fact that CN is creating net environmental and public benefits and it therefore would not be appropriate to allocate mitigation funding to CN. In the absence of a railroad creating a net public harm, it would be unreasonable to allocate mitigation

[110] *See* Letter from Paul A. Cunningham to Victoria J. Rutson (Sept. 26, 2008) (transmitting CN's grade crossing delay analysis, showing a net reduction of 228 hours of delay region-wide).

costs on that entity. Such an approach has the potential of deterring transactions for which the cost of mitigating the all problems over whatever threshold is set would be prohibitive, even for a transaction which would benefit the public overall.

E.6.b. There is no rational basis for imposing on a railroad the cost and burden of mitigation of the impacts of a control Transaction differently from the delay impacts of any other railroad operation.

The impacts described in the DEIS, for which SEA is proposing mitigation, are almost entirely the result of anticipated increases in train traffic on the affected lines. But increases in traffic on rail lines are not regulated events; they are part of the normal operation of a railroad. Railroads are free to increase traffic on their lines without federal authorization (and may even be required to increase that traffic, if that is the only way they can discharge their common carrier obligations). In particular, railroads are free to rationalize use of their systems to increase efficiency and provide much needed augmentation of capacity by shifting traffic from heavily congested lines to underutilized lines. Doing so also can have positive environmental effects (as in this case) by removing rail traffic from locations where noise, delay at grade crossings, and similar impacts fall on relatively more residents than in the locations to which the traffic is shifted.

CN's competitors are free to increase traffic on their lines, and become more efficient by shifting traffic from one line to another, without federal licensing and thus without agency environmental review, and with no obligation to mitigate impacts of those traffic shifts.[111] The

[111] For example: UP has increased traffic on the former CNW line through West Chicago to 85 to 90 trains a day, up from 55 to 60 trains per day in the mid-1990s. Judy Newman, *Midwest Bottlenecks Mean More Train Traffic in State*, Wisc. State J., June 1, 2008, at C6. Similarly, NS increased traffic over its line between Front Royal and Manassas, Virginia, in the early 1990s, without any regulatory or environmental review, from two trains a day to 18 a day, in connection

market for rail transportation will be distorted if, in the context of a control transaction, an agency requires environmental mitigation that prevents or deters an acquiring railroad from using its property in ways that will enhance the efficiency of its rail operations, when other railroads are free to use their property to make similar enhancements without incurring any mitigation costs or other regulatory obligations.

The reason that Congress requires railroads to obtain STB approval for "minor" control transactions is not so that the STB will have a hook it may use to regulate the environmental effects that may follow such transactions. It is, as the statutory standards of section 11324(d) indicate, to prevent transactions from going forward that would substantially impair competition, and where the transactions' contributions to meeting significant transportation needs would not outweigh the anticompetitive effects. In other words, Congress meant for the agency to address the kinds of adverse impacts that are particularly characteristic of control transactions. There is nothing in the text or legislative history of the Staggers Act, which established the statutory standard under which this Transaction must be evaluated, to indicate that Congress meant the agency to address the kinds of adverse impacts that are typical of rail operations generally. To the extent that control transactions may, incidentally, have environmental effects caused by the ordinary operations of the new rail system, those effects are identical, from an environmental point of view, to similar effects caused by ordinary operations of other railroads. There is therefore no good reason, as a matter of environmental policy, to regulate those effects differently in the different contexts in which they arise.

with its plan to use its existing underused lines more efficiently to provide a new routing for its traffic to the Northeast. Ann O'Hanlon, *Angry Resident Suspicious of Rail Study*, Wash. Post, June 13, 1996, at V01; Don Phillips, *Freight Railroads' Recovery Appears to Be for Long Haul*, Wash. Post, July 11, 1994, at A1.

If it is considered desirable, as a matter of public policy, to protect the interests of communities along railroad lines by prohibiting those railroads from increasing traffic on their lines (and CN doubts that it would be desirable to prevent railroads from responding to increased demand for rail service), then that prohibition should apply equally to all rail lines and should not be dependent on a nexus with a corporate transaction such as a merger or acquisition. The increases in rail traffic that result from a rail acquisition are qualitatively and quantitatively identical to impacts from increases of the same magnitude resulting from a railroad's improved marketing, better service, internal re-routing, or other causes that do not require or flow from a control transaction, or result in agency-imposed conditions, as are the impacts on surrounding communities from such increases. There is no good reason why they should be regulated indirectly in a way that allows them to occur freely under one but not the other set of circumstances.

E.6.c. Federal and state grade separation policies would limit the railroad contribution here to no more than 5% of the cost of grade crossing upgrades, including separation.

The subject of who should pay for grade separations has been actively debated for some time. The current consensus is that, because the public derives most, if not all, of the benefit from a grade crossing improvement, the public should bear most, if not all, of the cost for that improvement. In recognition of the relatively minor benefits accruing to the railroad and the relatively larger benefits accruing to the public,federal and state policies regard the proper allocation for grade crossing improvement to come primarily from governmental authorities.

Beginning in the early 1960s, the federal government became concerned with the frequency of accidents at grade crossings and began to study ways to improve safety and properly allocate costs for upgrades to crossing safety devices. In 1962, the Interstate Commerce

Commission ("ICC") (the predecessor to the Board), after a thorough investigation of the problem of highway/rail at-grade crossing safety, found that "the consensus supports a conclusion that the major costs of grade separation and protection at rail-highway grade crossings should be borne by the public since the public is the principal recipient of the benefits derived from grade-crossing protection." *Prevention of Rail-Highway Grade Crossing Accidents Involving Railway Trains and Motor Vehicles*, 322 I.C.C. 1, 83 (1964).[112]

Building on the ICC's report, Congress, in the Federal Railroad Safety Act of 1970,[113] directed the Secretary of Transportation to undertake "a comprehensive study of the problem of eliminating and protecting railroad grade crossings" and to provide "recommendations for appropriate action, including, if relevant, a recommendation for equitable allocation of the economic costs of any such program proposed as a result of such study."[114] The same year, Congress also passed the Highway Safety Act of 1970,[115] which called for "a full and complete investigation and study of the problem of providing increased highway safety at public and private ground-level rail-highway crossings . . . including the estimate of the cost of such a program."[116]

The result of these two pieces of legislation was a two-part report, jointly prepared by the staffs of FHWA and FRA, and submitted by the Secretary of Transportation to Congress. Part

[112] *See also id.* at 87 (because "highway users are the principal recipients of benefits flowing from rail-highway grade separations . . . the cost of installing and maintaining such separations and protective devices is a public responsibility and should be financed with public funds that same as highway traffic devices.").

[114] *Id.*

[115] Pub. L. No. 91-605, 84 Stat. 1713.

[116] *Id.* § 205(a), 84 Stat. 1713, 1743 (enacting 23 U.S.C. § 322(e)).

I[117] discussed the crossing safety problem, and Part II[118] provided recommendations, including that Congress create a federal funding program for highway/rail at-grade crossings and allocate costs for crossing upgrades (including separations) according to relative benefits. Part II included a specific discussion of the relative benefits accruing to railroads and the public from grade crossing upgrades, and the equitable allocation of costs for those upgrades. The primary benefits to the railroad were found to be reduced maintenance costs for existing grade protection devices and the reduction in cost of claims for personal injuries resulting from accidents at grade crossings.[119] Benefits to motorists included reduced accidents, reduced delay, and reduced operating costs.[120] Based on the Report, the Secretary recommended that for separations "where benefits accrue to the railroad . . . the railroad contribution would be 5 percent of the railroad benefit related portion of the project cost" and for separations "where no benefits accrue to the railroad . . . there would be no railroad contribution to the project costs."[121]

Based on these two reports, Congress passed the Highway Safety Act of 1973,[122] which established a categorical safety program (section 203) for the elimination or reduction of hazards at rail/highway at-grade crossings and further stipulated that the federal share of improvement costs was to be 90%.[123]

[117] U.S. DOT, *Railroad-Highway Safety, Part I: A Comprehensive Statement of the Problem, A Report to Congress* (Nov. 1971).

[119] *DOT Recommendations* at 104.

[120] *Id.*

[121] *Id.* at 105.

[122] Pub. L. No. 93-87, 87 Stat. 250, 282.

[123] The Act also included funds for several demonstration projects that were intended to determine the feasibility of increasing safety at highway/rail at-grade crossings in urban areas. For these projects, federal funds covered 95% of the costs, while state or local governments paid

Under the current scheme, 23 U.S.C. § 130(b) authorizes DOT to:

> classify the various types of projects involved in the elimination of hazards of railway-highway crossings, and . . . set for each such classification a percentage of the costs of construction which shall be deemed to represent the net benefit to the railroad or railroads for the purpose of determining the railroad's share of the cost of construction. The percentage so determined shall in no case exceed 10 per centum. The Secretary shall determine the appropriate classification of each project.

Pursuant to that statute, DOT has adopted regulations that explicitly stated what the ICC had recognized in the early 1960s – railroads receive no ascertainable net benefit from grade crossing improvements, including grade separations:

> Projects for grade crossing improvements are deemed to be of no ascertainable net benefit to the railroads and there shall be no required railroad share of the costs.

23 C.F.R. § 646.210(b). Thus, under the current funding scheme, a railroad's contribution to a grade separation is capped at 5% when federal dollars are used (representing the slight benefit to the railroad from the elimination of its responsibility for maintenance of existing active warning devices, and from the reduction of its potential liability for crossing accidents).

It is therefore unclear whether the Board has the authority to impose on CN a requirement that it pay more for a grade separation than the statutory maximum, or the maximum imposed by regulation. In any event, simply because a crossing has been identified as a candidate for grade separation in an environmental review does not provide any basis for imposing a greater burden on the Transaction than the law imposes on railroads generally when crossing delay call for separation.

the remaining 5%. In subsequent highway funding bills, Congress made funds available for all crossings (regardless of whether they were on federal highways) and continued to appropriate money for the section 203 program. With the Surface Transportation and Uniform Relocation Assistance Act of 1987, Pub. L. No. 100-17, 101 Stat. 132, 160, the Grade Crossing Safety Program became a permanent law, *see id.* § 121(a), 101 Stat. 132, 159 (enacting 23 U.S.C. § 130(d)-(h)).

E.6.d. The longstanding federal policy concerning the allocation of the costs of grade improvements should be maintained in this case.

Basic principles. The allocation under the federal highway assistance programs of all or most of the costs of grade improvements away from the railroads – an allocation arrived at after numerous studies over many years - is the correct allocation from the viewpoint of social welfare – in particular, allocative efficiency – and fairness. Because there is "no ascertainable net benefit to the railroad," 23 C.F.R. § 646.210(b)(1)-(2), there would be a mismatch of costs and benefits were the allocation otherwise.

The proper allocation does not change in the present circumstance, where the environmental effects at issue are the result of a minor control transaction.[124] Congress has determined that minor transactions without anticompetitive effects are in the national interest. The Application here amply demonstrates the substantial transportation benefits of this Transaction. Those benefits would accrue to shippers both on CN and on other railroads with which CN interchanges traffic or that otherwise utilize the new routings, in addition to the private benefits to CN's shareholders, who are financing the Transaction. From the viewpoint of national transportation policy, this is socially desirable investment, bringing substantial public benefits.

[124] In this section, CN discusses the public policy considerations without waiving its positions, expressed elsewhere in these Comments, that the Board may lack authority to impose environmental conditions on a minor transaction; that, under NEPA, the environmental impacts of increased train traffic are not the result of the federal action at issue (*i.e.*, the approval by the Board of the Application), which the agency is required to take in the absence of anticompetitive effects – even if the environmental impacts are, as a practical matter, the result of the Transaction itself; that the increase in train movements along the EJ&E line, including in particular hazardous materials movements, may not even be a result of the Transaction itself; and that the DEIS overstates some of the negative environmental impacts. Even if none of these positions were correct, the longstanding federal policy of allocating the costs of grade improvements away from the railroad would be the correct policy here.

In addition to transportation benefits, which include public benefits, the Transaction would have environmental effects. They are both negative and positive, and those benefits and burdens fall on different communities. Those facts may, at least superficially, complicate the question of the best allocation, but they do not change the basic principles.

From the viewpoint of allocative efficiency, investors will not invest unless the benefits they will realize exceed the costs to them, and then they will choose the investments that allow them to realize the greatest amount of net benefits. From the viewpoint of fairness, the cost of benefits should be assigned to those who benefit. Thus, the federal policy embedded in the highway assistance program implicitly reflects an answer to two related questions: Which allocation best matches costs and benefits? And, what will be the effect on socially desirable investment of allocating a greater share to the railroad than is warranted by the benefits to it?

Mismatch of costs and benefits. The benefits of grade improvements, including grade crossings, at the 15 locations identified in the DEIS, like grade improvements generally, would not benefit the railroad or its customers. The improvements will not enable trains to proceed more quickly through the crossings, and any reduction in the number of accidents would have minuscule effects on the overall efficiency of the rail system. As the regulations governing federal highway aid confirm, the benefits of the grade improvements accrue to the communities involved.

If, nonetheless, and contrary to past practice, a large share of the costs of grade improvements is assigned to CN, the result would be a mismatch of costs and benefits. It is no response to say that the proper perspective is with respect to the Transaction as a whole that benefits CN's shareholders. It is true that CN's shareholders would benefit from the Transaction, but so would CN's shippers, other shippers, and the public, including the communities that will

benefit environmentally. Moreover, CN would have already paid a market rate for the Transaction, and CN has expressed a willingness to pay the costs of reasonable mitigation in line with past Board practice. Thus, assigning more costs to CN would not bring about a match of costs and benefits even from a Transactional perspective; a Transactional perspective does not allow or provide for a matching of costs and benefits.

Effects on socially desirable investment. Moreover, assigning a large share of the costs to the railroad could have adverse systemic effects. It would not increase and could reduce the extent of socially desirable railroad investment. The proposed Transaction would bring about public benefits in the form of transportation benefits and environmental benefits. Even without precise quantification, it is reasonably evident that these public benefits together would outweigh the adverse environmental effects. Indeed, CN believes that, if the DEIS eliminated faulty data and overly conservative assumptions, it would show that the Transaction's environmental benefits alone are greater than its environmental burdens.

If a generator of net benefits to society is required to pay the costs of generating benefits that do not accrue to it, there cannot be a positive impact on overall social welfare. Instead, investment decisions will skew toward investments that have minimal public costs or that generate benefits that accrue entirely to the railroad. The fact that shareholders of the railroad might nonetheless benefit from an investment, even if a greater share of costs that do not benefit the railroad are assigned to the railroad, does not change the point that the systemic effects of such an allocation could reduce socially desirable investment.

Effects on efficient negotiation. The DEIS encourages negotiated outcomes with respect to the 15 crossings and recognizes that "agencies with a regional perspective" are important in such negotiations. *See* DEIS at ES-41—ES-42. CN agrees that, because the

benefits and burdens fall on different communities, a regional perspective that embraces both types of communities can be important. CN also agrees that negotiated outcomes can be fairer and more efficient than Board-imposed outcomes, but only if the parties to the negotiations are prepared to bear costs commensurate with the benefits they will receive. If the Village of Barrington negotiates from the implicit position that drivers in that community value their time at $353 an hour, and that Barrington should not bear the costs of the grade improvements necessary to generate a significant portion of that amount, a successful negotiation is unlikely.

Thus, while a given outcome is or is not cost-effective and cost-beneficial without regard to how the costs are allocated, the likelihood of a negotiation actually achieving a cost-beneficial and cost-effective outcome depends greatly on the allocation as understood by the parties when they enter the negotiation. When one party, in accordance with longstanding federal policy, sees "no ascertainable benefit," and the other sees large benefits, impasse is likely if the allocation of costs is the opposite of the expected benefits.

Conclusion. Longstanding federal policy regarding the allocation of the costs of grade improvements is the proper policy in the context of this minor Transaction. Other than by allocating virtually all of the costs of grade improvements to the communities that will otherwise sustain adverse environmental impacts, there is no way to align the costs with the benefits of the grade improvements.

From the perspective of all of the environmental impacts of the Transaction, both positive and negative, the participation in negotiations of a regional agency whose responsibilities include both the communities that will be negatively affected and those that will be positively affected may bring about the fairest and most efficient result. Allocating a large share of the costs to CN would not align costs and benefits; would, if anything, reduce socially desirable investment; and

would reduce the chances that negotiations would achieve cost-beneficial and cost-effective outcomes.

E.6.e. The fact that CN is a profitable company incorporated and headquartered in Canada should be irrelevant to the issues before the Board under ICCTA and NEPA

Some comments from residents of Chicago suburbs who may be affected by increased freight train traffic over the EJ&E line have displayed an unfortunate bias against companies that are profitable or have "foreign" connections. They cite no authority for the Board to treat CN differently because it is a profitable Canadian railroad. Such biases have no place in the Board's proceeding. ICCTA, NEPA, and STB's rules do not impose any nationality or profitability test on an applicant. Nor does the application of these authorities differ based on where the acquiring company is incorporated or headquartered, or its level of profitability. Indeed, in the United States' economic system it is generally regarded as a good thing for a company to be efficient and profitable.

To the extent relevant, CN notes that (1) CN or predecessor companies have been operating in the U.S. since 1880; (2) its CEO, several other key officers, and most of its U.S. employees are Americans; and (3) the Board has not deemed CN's status as a Canadian company relevant in its three prior control proceedings in the past 10 years.

Canada and the United States are long-standing allies and partners in commerce and trade who share a 5500-mile border, about 4000 miles shared with 12 states on Canada's south, and over 1500 miles with Alaska on its west.[125] Their close economic relationship is reflected in the North American Free Trade Agreement (NAFTA), which encourages trade between the U.S. and Canada. Under applicable law and STB rules, the involvement of cross-border rail traffic has no

[125] CRS, Report for Congress: United States International Borders: Brief Facts at 2 (Nov. 9, 2006).

relevance to approval of control. Similarly, CN's status as a company incorporated in Canada also has no relevance under ICCTA or STB rules, nor under NEPA or CEQ rules.

Some opponents of the Transaction have disparagingly referred to the traffic likely to move over CN's lines as nothing more than "cheap goods from China." That should be irrelevant even if it were true, because in our economic and regulatory system it is not up to the residents of Barrington, Frankfort, or other Chicago suburbs to pass judgment on what imports or other traffic CN or other railroads should be allowed or encouraged to carry on their lines. As a freight railroad lawfully operating in the U.S., CN has a historic, federally-mandated common carrier duty to move the freight that is offered to it.[126]

The freight to and from Asia that CN will be carrying over the EJ&E line will be very much like the inbound and outbound freight that other railroads serving West Coast U.S. ports are carrying now, aided by substantial public investment in the infrastructure required to do so. As a result of the CN Transaction, U.S. shippers and receivers in Chicago and other commercial centers in the central, southern, and eastern parts of the country will be better situated to handle such trade.

F. Transportation Systems – Effects on Emergency Response

CN has been actively reaching out to potentially affected communities to address emergency response issues. While SEA relied on the same formulas for analysis as have been used (and upheld)[127] in previous EISs, CN has determined, based on its discussions with affected communities, that the emergency response analysis could be more useful if it was more rigorous.

[126] CN notes that no one is before the STB complaining about the same goods carried to, from, or within the U.S. by other railroads

[127] *See Mid-States Coalition for Progress v. STB*, 345 F.3d 520, 540 (8th Cir. 2003) (finding that SEA's analysis of emergency vehicle delay in DM&E EIS complied with NEPA).

CN is therefore offering to fund a quantitative analysis of the impact of the transaction on the provision of emergency services among the communities listed in Table 4.3-13 of the DEIS (DEIS at 4.3-75). CN has contracted with Innovative Emergency Management, Inc. ("IEM"), a leading national provider of homeland security and emergency management services to federal, state, and local government, to conduct a quantitative study of the impact of grade crossing delay on emergency response times for the 11 emergency response providers identified in the DEIS. CN initially undertook this expense in order to facilitate its negotiations with some of the affected communities, but believes it has application for the EIS more generally. IEM has completed an analysis of Mundelein, which CN uses as an example below.

Based on its consultation with IEM, CN offers the following comments on the analysis of emergency response providers included in the DEIS.

F.1 The emergency response analysis included in the DEIS failed to accurately quantify impacts to emergency response.

Instead of directly measuring impacts on emergency response time, the DEIS used two measures as proxies for emergency response delay: D_A (average delay for delayed vehicles) and T (total daily blockage time at the crossing). If an at-grade crossing was within an arbitrary 2-mile radius of an emergency response facility and would experience an increase of 30 seconds or more in average delay per delayed vehicle and 30 minutes or more of total daily blocked crossing time SEA considered that facility to be potentially significantly impacted. For the reasons discussed below, this screening process was over-inclusive and likely included many emergency response provides whose response times would only be minimally impacted by the increase in train traffic that would result from the Transaction. Therefore, before mitigation can be imposed, a more detailed analysis of actual impacts on response time must be performed.

F.1.a SEA's simplistic analysis overstates effects on emergency response.

Modern traffic simulation models (such as the one created by IEM) can capture the interactive effects among vehicles, infrastructure, and traffic control devices, and the delay at a crossing can be better estimated using more realistic models of arrival patterns, queuing effects, and acceleration/deceleration behavior. These models allow for the quantification of existing emergency response times, in order to form a baseline for comparison, and can be used to demonstrate the incremental effect of an increase in train traffic on emergency response times in a community. Such models can overcome the deficiencies with SEA's simplistic analysis, which are discussed below.

First, SEA's assumptions are limiting with respect to traffic behavior, particularly as related to the determination of their value for average delay for delayed vehicles (D_A). Response time is affected by more variables than simply delay at a crossing – variability in traffic volume, traffic queues, and driver behavior can all have a direct impact on response times. A more rigorous characterization of these and other variables is potentially important.

Second, average delay for delayed vehicles does not consider the interactive effects of regular traffic and emergency vehicles at the rail/highway at-grade crossings. SEA's estimation of average delay for delayed vehicles is based on a simple formula, with the assumption that vehicles arrive in uniform patterns and a 1.3 factor for deceleration and acceleration of vehicles. This simplistic formula is acceptable for measuring effects on normal traffic, but emergency vehicles operate under a different set of rules.

Third, SEA's use of the total time the crossing is blocked does not reflect coupling effects of the train traffic, automobile traffic, and emergency call patterns as related to intersection blockage. There is only a conditional probability (which can be estimated) that a response would

be ongoing and involving an emergency vehicle already taking the specific route to the blocked crossing when that crossing is blocked. There appears to have been no part of SEA's analysis that focused on this conditional probability and thus the probability of the specific set of events at issue – the frequency of responses that are delayed at blocked crossings. SEA's analysis in the DEIS is similar to simply saying "a train could block the path of an emergency response vehicle at some point in a 24 hour period" instead of saying "how likely is it that a train would block the path of an emergency response vehicle." For example, if a given station handles 12 calls in a day, but only one of them requires the use of an at-grade crossing, then the probability that the crossing will be blocked the one time during the day when the emergency response vehicle needs to use it is extremely low.

Thus, average delay per delayed vehicle and total time the crossing is blocked do not directly indicate impacts on emergency vehicles. Rather, they indicate the impacts on regular vehicles (which accounts for the vast majority of traffic), which may at best serve as a very rough surrogate for the impacts on the relatively infrequent and episodic emergency vehicles. Instead, the DEIS should consider the special characteristics of emergency vehicles, such as having the right of way during a response or the ability to turn all traffic lights to green in the direction of travel. The DEIS should also take into account the fact that emergency vehicles can and do move to the front of the queue of vehicles stopped at a crossing and would thus have a lower average delay per delayed vehicle value than other vehicles.

SEA's simplistic model did not take these realities into account. In contrast, the response time output provided by IEM comes from a simulation that specifically treats emergency vehicle behavior and the interaction of those vehicles with normal traffic and the driving environment

(intersections, crossings, signals, etc.). IEM's model is therefore a defensible basis for deciding on what levels of mitigation may be necessary in a given community.

F.1.b The DEIS failed to consider in any meaningful way the possibility of coordination between potentially impacted facilities during a response.

Although the DEIS alluded to mutual response agreements, DEIS at 4.3-52, the analysis gave no consideration to coordination between potentially impacted facilities, which appears to be the operational norm in at least some of these communities. Thus, there is no way to judge, based just on the analysis provided in the DEIS, whether an emergency response provider could potentially lower its response time to a level below the screening response time thresholds used in the DEIS by invoking mutual aid or their own dispatch policies that would involve nearby facility resources in a response.

For example, according to its fire chief (who was not interviewed for the DEIS analysis), the Village of Mundelein typically responds with equipment from multiple stations and with equipment from both the Village and one or more of the adjacent fire districts. Thus, a response, per dispatch rules, could come from more than one station to a point outside the arbitrary two-mile radius used to identify facilities in the DEIS. In such a scenario, which happens regularly, it is possible that responders from a second or even third station could arrive faster than the screening threshold delay would imply for the station in question. The DEIS analysis does not appear to account for such a real-world coordination, which would have a direct bearing on emergency response. Thus, the impacts projected by the DEIS are overly inclusive and incomplete, and likely overstate the actual impacts on emergency response time.

Again, sophisticated models, like the one developed by IEM, can simulate these coordinated responses and more accurate estimate response times that are likely to occur if the Transaction were to be implemented.

F.2 SEA should have used a more sophisticated model to estimate impacts on those emergency response providers identified in the DEIS

As discussed above, CN has hired an expert consultant, IEM, to quantitatively assess existing and expected emergency response impacts for each of the 11 emergency response providers identified in the DEIS as likely to be substantially affected. The IEM report for Mundelein is attached as Exhibit 3, but a brief summary of IEM's analysis and results is included here.

IEM created a traffic model that was able to simulate the movements of normal vehicles and emergency vehicles on the roadways, and that further simulates the effects of delays on vehicle travel due to the presence of freight or commuter trains.[128] ADT information was provided by IDOT and CMAP, and for morning peak hour queue counts, by Parsons Transportation Group. Freight train volume, length, and velocity were collected from the DEIS, and information on commuter trains was collected from Metra's website.

Emergency response calls were assumed to originate during the peak traffic hour (as a conservative estimate of expected response time) and geographically based on the population of a given area. To accurately simulate response times, IEM assumed emergency response vehicles moved at the same speed as surrounding traffic on uncongested roads, faster than surrounding

[128] The model roadway network includes all major roads, all major roads leading to the nearest fire stations, and the road network geography, including number of lanes, number of turn lanes, location and timing of traffic controls.

vehicles on congested roadways (but slower than if unobstructed), and are allowed to bypass queues at red lights (but at a lower speed than if the light were green).

IEM carefully and thoroughly calibrated and validated the model by (1) comparing simulated peak hour queues with queues actually collected in the field, (2) comparing simulated travel times for a handful of routes to travel times observed in the field, and (3) reviewing an animated version of the model to ensure that congestion and queuing occurred in the model at the same locations and to the same extent as observed in the field.

Once the model was built, calibrated, and verified, IEM ran 3,600 Monte Carlo simulations (i.e. random samplings) for each of 4 scenarios: 2008 ADTs with existing train data; 2008 ADTs with post-Transaction train data; 2015 ADTs with existing train data; and 2015 ADTs with post-Transaction train data. The simulations indicate that the average response time by emergency vehicles in Mundelein would change very little, if at all, as a result of the Transaction. The following table shows the results of IEM's analysis:

Average Travel Time by Fire Station and Scenario (in seconds)

Scenario	Countryside Fire Station #1	Countryside Fire Station #2	Mundelein Fire Station #2
2008 No Action	383	288	247
2008 Proposed Action	385	286	250
2015 No Action	390	287	257
2015 Proposed Action	390	287	255
Difference Between 2008 No Action and 2015 Proposed Action	7	-1	8

Thus, according to IEM's analysis, increasing rail and vehicle traffic as contemplated by the DEIS would increase average response times at two fire stations by less than 10 seconds, and

would decrease average response time at the third.[129] The portion of that increased response time attributable to increased rail traffic (*i.e.*, the difference between traffic under the 2015 No-Action Alternative and under the 2015 Proposed Action) is comparable. Statistically there is not a significant difference in response times between the respective scenarios compared. Further statistical analysis and charts and graphs are available in IEM's report.

F.3 Any mitigation should be based on actual degradation in response time as estimated by the model created by IEM

The DEIS does not attempt to quantify existing emergency response times, nor does it attempt to estimate emergency response times once the Transaction has been implemented. The former is important because it provides a baseline against which the actual effects of the Transaction can be measured, allowing SEA to measure the estimated incremental impacts fairly attributable to the increase in train traffic. To the extent that any commenters or the DEIS relies on anecdotal evidence or lay speculation about past problems or possible future scenarios, the evidence is irrelevant without substantial evidence and careful analysis of a causal relationship.

In contrast, the model developed by IEM provides a defensible quantitative means for analyzing the impacts to emergency response time and assessing the need for mitigation in a given community. If SEA is to conclude that mitigation for impacts on emergency response time is warranted, it should base that mitigation on the results of the analysis in IEM's model and not on speculation or anecdotal or potentially biased information provided by commenters. While CN was only able to complete its analysis for one community in time for this comment, it is ready, willing, and able to apply its model to other communities identified in the DEIS as being potentially substantially affected, either upon their request or at the request of SEA. CN is

[129] It is not surprising that response times would slightly decrease at Countryside Fire Station #2 in the post-Transaction scenario, as that station is proximate to a CN line that would experience a decrease in rail traffic.

confident that a rigorous, quantitative analytical process will demonstrate that impacts to emergency response providers may be overestimated by opponents and by SEA in the DEIS.

G. Land Use

CN agrees with the assessment of the DEIS that impacts on land use would be minimal.

H. Socioeconomics

Among the common suburban critiques of the Transaction is the claim that the "Transaction does nothing more than shift the problem from one town to another." Nothing, however, could be further from the truth. The problems the Transaction is designed to reduce are delay, inefficiency, and unreliability caused by slow moving trains through and across the intersecting lines in the Chicago terminal district. These are the problems CREATE was intended to resolve. The problem motivating CREATE, and motivating CN in entering this Transaction, is not vehicle delay at crossings on CN's existing lines, which is the primary problem that communities believe is being shifted to them.

Shifting trains to the EJ&E line would allow them to move more efficiently and relatively unimpeded, thus saving time throughout the regional transportation system and reducing delay at crossings overall. Moving CN's trains through Kirk Yard would allow CN to, for the most part, bypass the congested terminal district in downtown Chicago and would free up additional capacity in the yards, at the rail/rail crossings, and on the shared trackage of the terminal district. Changes in routing and the addition of $100 million in infrastructure improvements would result in positive improvements in CN's operations and the operations and fuel use of other railroads that have to move their trains through the Chicago terminal district. It is thus evident that the Transaction would have substantial, and positive, socioeconomic impacts.

CN's Application in this case did not describe those socioeconomic benefits in detail, but that was because it focused instead on the factors relevant to the statutory standard for approval and the applicable rules. While applicants for approval of "major" control transactions are required to "enumerate and, where possible, quantify the net public benefits their merger would generate," including "cost savings . . . and other merger-related public interest benefits," 49 C.F.R. § 1180.6(b)(11), no such requirement is imposed on applicants for approval of "minor" transactions. Requiring such socioeconomic information in connection with minor transactions would be contrary to Congress's purpose in enacting the Staggers Rail Act and ICCTA, which was to reduce regulatory burdens on railroads, in part by limiting the factors to be considered in reviewing non-major transactions, effectively deregulating those transactions except where they would substantially impair competition.

NEPA also does not require the Board to examine the economic or sociological consequences of its actions. *Ass'n of Pub. Agency Customers v. Bonneville Power Admin.*, 126 F.3d 1158, 1186 (9th Cir. 1997). Under CEQ regulations, "[e]conomic or social effects are not intended by themselves to require preparation of an environmental impact statement." 40 C.F.R. § 1508.14. Where economic and social effects are interrelated with natural and physical environmental effects, the EIS must "discuss" those effects, but neither NEPA nor CEQ regulations require government agencies to take economic effects into account in making their decisions. *Town of Stratford, Conn. v. FAA*, 285 F.3d 84, 89 (D.C. Cir. 2002).

It was not appropriate, however, for the DEIS to include SEA's analysis of purported impacts from elimination of redundant jobs, because the abolition of those positions (unlike, for example, Transaction-related changes in train traffic) was not interrelated with any impacts on the natural or physical environment. *Cf.* 40 C.F.R. § 1508.14. NEPA does not authorize an

agency to use its environmental review as a wedge to open up an examination of socioeconomic impacts generally; such an examination would transform the environmental review of a non-major rail control transaction into something close to a full-bore public interest analysis of the kind required for major transactions, and undo the deregulatory work of the Staggers Act.

But if the Board is to evaluate socioeconomic impacts, albeit limited to those interrelated with the natural or physical environment, in its NEPA review, then SEA should examine a much broader range of positive economic impacts than those mentioned in the DEIS here. A few of the beneficial economic impacts that the DEIS completely overlooked are described below, and a conservative valuation of their benefits is estimated. Also, if SEA is going to stand by its approach in quantifying the socioeconomic impacts that are mentioned in the DEIS, it should correct the flaws in that quantification that are described below.

The DEIS recognizes that the proposed transaction has the potential, if approved, to create powerful socioeconomic benefits for the Chicago area and the nation as a whole. For example, the DEIS states that, "[f]rom a broad societal perspective, the Proposed Action would improve the efficiency of rail operations and reduce the cost of shipping goods through the Chicago metropolitan area. Benefits include improved rail efficiency and construction employment generated while the double track and connections are being constructed." DEIS at 4.6-1. Moreover, "[t]he Proposed Action would improve the operational efficiency of the North American freight rail system by reducing transit time through Chicago." *Id.* at 4.6-23. Balanced against these gains, the DEIS claims to identify no more than "minor, negligible [adverse socioeconomic] effects." *Id.* at 6-23.

Nonetheless, the DEIS does not quantify fully, or even substantially, many of the socioeconomic benefits that would accrue if the Transaction were implemented. As explained

below, the DEIS does not account for, among other things, (1) the full measure of job gains attributable to the Transaction, (2) the value of the reduction of waiting times at at-grade crossings, and (3) the benefits to be derived from greatly improved operational efficiency of the North American freight rail system by reducing transit time and increasing the reliability of trains passing through Chicago. Even an incomplete sampling of the benefits for which the DEIS does not account demonstrates additional societal benefits on the order of $1.2 million per year from reduction in the time motorists are delayed at grade crossings, and $23.5 million each year from supply chain cost savings to CN customers as a result of greater efficiency of operations through Chicago. Together, over a 25-year period, these savings have a net present value of more than $170 million. In addition, the supply chain savings to CN customers would have downstream beneficial impacts on the national economy, so that the cost savings would result in a total gain of $54.6 million in U.S. economic output. Moreover, the Transaction would increase employment by approximately 1,025 jobs during its two-year implementation period, resulting in increased total output to the local (Illinois) economy of $155 million in each of the two years, and could potentially result in savings of approximately 1,400 jobs by relieving congestion exacerbated by future growth in rail traffic. The quantification of these benefits is explained below.

Moreover, as demonstrated below, the DEIS erroneously quantifies adverse labor impacts that it attributes to the Transaction. It exaggerates even the "minor, negligible" impacts it identifies as a result of job losses, and it fails to take account of the economic benefit to the national economy resulting from the railroad's ability, after the Transaction, to provide the same level of transportation services as it did before, but using fewer labor resources.

H.1 The DEIS does not properly assess the labor impacts of the Transaction in the Chicago area; the Transaction would actually have a significant positive impact on employment in both the Chicago region and the national economy.

When assessing labor impacts of the proposed Transaction, the DEIS examined only three effects. First, it considered the anticipated elimination of 114 redundant positions, as described in the Operating Plan, CN-2 at 226, and applied various multipliers provided by the IMPLAN input-output model to conclude that this job reduction would cause further job losses in the local economy, resulting in a total reduction of 280 jobs. DEIS at 4.6-4, H-4 & n.1. Second, the DEIS estimates that construction of new connections and double-track as part of implementation of the Transaction would create 396 new jobs during the two-year construction period, and it applied the same IMPLAN model to conclude that total employment would rise by 708 jobs, but that this job growth would be temporary, ending with the completion of construction after two years. *Id.* at 6.4-13—6.4-14. Third, the DEIS appears to conclude that the Transaction would make rail transportation more attractive to some shippers who presently move their freight by truck, leading to a decrease in truck traffic and the loss of 109 jobs in the trucking industry, with a corresponding increase in rail traffic and an increase of 53 jobs in the rail industry. The DEIS concludes, again on the basis of the IMPLAN model, that the total net impact of the shift from truck to rail transportation would be a loss of 86 jobs. DEIS at H-4; *id.* App. H, Attachment H1 at 14.[130]

The socioeconomic impacts caused by elimination of redundant positions were not an appropriate subject for analysis in an EIS prepared under NEPA, because those job reductions would result from operational efficiencies gained by combining two formerly separate

[130] While the DEIS states that "there would be no effect from the Proposed Action on local trucking firms," DEIS at 4.6-5, a calculation of such impacts is reported in Appendix H.

workforces; they would not arise from or be "interrelated" with "natural or physical environmental effects." *See* 40 C.F.R. § 1508.14.

But even if it were appropriate to examine those job eliminations, the DEIS misinterpreted their economic impact, as explained below. Further, the DEIS underestimated the total potential job growth attributable to the proposed Transaction, from both the creation of new jobs and the prevention of job losses.

H.1.a The DEIS miscalculates the employment impacts of the Transaction.

The DEIS correctly states that the proposed Transaction would create jobs in the Chicago region by providing a basis for CN to undertake construction projects involving rail connections, extension of sidings, and installation of double track. But its estimate that the Proposed Action would permanently reduce total Chicago-area employment by 280 jobs, while temporarily generating only 708 total jobs, which would disappear after completion of Transaction-related construction (DEIS at 4.6-2), greatly understates the job creation that should reasonably be anticipated as a result of the Transaction.

The DEIS's underestimation of total job growth is attributable to several errors.

First, the DEIS fundamentally misinterprets the economic significance of the reduction of positions resulting from the Transaction. These reductions, unlike job reductions resulting from reductions in output, represent cost savings whose effect on the economy as a whole is beneficial. The eliminations of positions in this case would occur because the railroad would be able to produce the *same* output as before, but with fewer resources (employees).[131] This is the

[131] SEA claims that the elimination of the 114 jobs would have negative economic impacts that "may appear high," but that this is "[b]ecause the rail transportation sector requires relatively little labor to produce a million dollars of output and each job produces a great deal of business output and value added to the region," so that "the loss of jobs would reduce the gross regional

very definition of economic efficiency. When this happens, as the Board and its predecessor agency have well understood, the public realizes an economic *gain*. In the words of the ICC, "[c]ost reductions, regardless of whether they are passed on to shippers, are public benefits because they permit a railroad to provide the same level of rail services with fewer resources or a greater level of rail services with the same resources." *Burlington N., Inc. – Control & Merger – Santa Fe Pac. Corp.*, 10 I.C.C.2d 661, 724 (1995) ("*BN/Santa Fe*"), *aff'd sub nom. W. Resources, Inc. v. STB*, 109 F.3d 782 (D.C. Cir. 1997).

Those cost savings may be passed on to shippers, and as a matter of fact "[t]hese efficiency gains, in varying degrees depending on competitive conditions, have generally been passed on to shippers as reduced rates and/or improved services."[132] In any event, the capital conserved by these efficiency gains is made available for more productive uses elsewhere in the economy, with resulting, positive, multiplier effects on output and on employment. The DEIS's failure even to mention (let alone attempt to quantify) those beneficial effects, while calculating supposed negative multiplier effects, unsupported by economic theory previously accepted by the Board, misrepresents the impacts of the Transaction.

Second, the DEIS erred by basing its estimate of job creation solely on the $100 million that CN plans to spend on capital improvements to implement the Transaction, leading to "construction employment generated while the double track and connections are being

product by $32.72 million in total." DEIS at 4.6-2, 4.6-5 n.2. But this misses the point that the proposed job reduction would make it possible for CN to produce every $1 million of output with even *less* labor, so that each railroad job would produce even *more* business output and value added to the region than before, and so that there would be no reduction in the gross regional product.

[132] *Canadian Nat'l Ry. – Control – Ill. Cent. Corp.*, 4 S.T.B. 122, 139-40 (1999); *accord, CSX Corp. – Control & Operating Leases/Agreements – Conrail Inc.*, 3 S.T.B. 196, 246 (1998) ("*Conrail*"), *aff'd sub nom. Erie-Niagara Rail Steering Committee v STB*, 247 F.3d 437 (2d Cir. 2001); *BN/Santa Fe*, 10 I.C.C.2d at 724.

constructed," DEIS at 4.6-1, while ignoring the jobs that would be created by the roughly $60 million that CN expects to spend on mitigation of the environmental impacts of the Transaction.

The DEIS estimates that construction of new connections and double-track to implement the Transaction would create 396 new jobs during the two-year construction period. SEA used the IMPLAN input model, applying various multipliers to calculate the direct, indirect, and induced labor and economic impacts of that job creation, and concluded that total jobs would rise by 708 during the construction period. But if impacts from expenditures on mitigation are taken into account, the positive economic impacts of the Transaction in the Chicago area are shown to be considerably greater than reported in the DEIS.

At CN's request, Global Insight, Inc., an economic consulting firm that is widely recognized for its expertise in modeling and forecasting, used its proprietary input-output model to conduct its own multiplier analysis of the effects of a CN expenditure of $150 million (including mitigation costs) to implement the Transaction over two years.[133] Global Insight's conclusions[134] were that that expenditure would bring about a total gain of 1,025 jobs in each of

[133] CN originally estimated that it would spend approximately $100 million in capital improvements in order to implement the Transaction. It later estimated that it would spend approximately $40 million to mitigate the environmental impacts of the Transaction. As noted above, CN now estimates that implementing its voluntary mitigation plan would cost roughly $60 million dollars. While not all of the mitigation spending would go into the construction sector, and while the applicable multipliers would differ to some degree to the extent that the expenditure went to non-construction industries, $50 million is a conservative estimate of the amount that would be spent on construction. The important point to remember here is that SEA did not examine *any* multiplier impacts from mitigation spending, which is clearly erroneous. For the sake of simplicity, Global Insight modeled the entire economic impact based on economic data for the State of Illinois, rather than attempting, as SEA did, to split the job impacts and resulting economic effects between the two states. There is no reason to believe that the multiplier effect of employment gains or reductions would be materially different in Indiana than in Illinois. (In any event, the majority of the impacts would be felt in Illinois.)

[134] *See* Global Insight, Inc., Economic Analysis for Canadian National Railway: Scenario Impact on the Illinois Economy (Sept. 2008) (attached hereto as Exhibit 4).

the two years. In addition, the expenditure would increase total employment by 1,025, labor income by $59 million, economic output by $155 million, economic value added by $73.6 million, and state tax receipts by $22 million for each year.

Third, the DEIS fails to note that CN does not plan to eliminate the 114 positions through workforce reductions or layoffs, but instead over time, primarily through attrition, as current job incumbents retire or move on to other positions (including ones that open up on CN itself). CN-2 at 226; see also *id.* App., Att. B, at 248. Thus, the personal and local dislocations that often accompany even efficient job reductions should be substantially mitigated in this case. Moreover, the Board is required by law to impose *New York Dock* labor conditions to protect the interests of employees adversely affected by control transactions such as this one.[135] These conditions would require CN to provide payments to displaced or dismissed employees for up to six years, depending on length of service, to protect those employees from loss of income from Transaction-related personnel actions. (This requirement is a powerful incentive for CN to implement job reductions in this case through attrition rather than through sudden layoffs.)

Fourth, even if SEA's use of the IMPLAN model to calculate multiplier effects from CN's planned job reductions were conceptually sound, its actual results would overstate the negative effects. Global Insight found, when it applied its input-output model to the reduction of 114 positions, that if the expected job losses had cascading negative effects through the economy (which they would not, for reasons stated above), they would lead to a total loss of 193 jobs (rather than the 280 calculated by SEA).[136]

[135] 49 U.S.C. § 11326(a); *New York Dock Ry. – Control – Brooklyn E. Dist. Terminal*, 360 I.C.C. 60, *aff'd sub nom. New York Dock Ry. v. United States*, 609 F.2d 83 (2d Cir. 1979).

[136] *See* Global Insight, Inc., Economic Analysis for Canadian National Railway: Scenario Impact on the Illinois Economy (Sept. 2008) (attached hereto as Exhibit 4). As explained above, the

Fifth, even if it were appropriate to assume that the Transaction would cause traffic to shift from truck to rail transportation,[137] it would not be appropriate to calculate the economic impact of that shift, as SEA appears to have done DEIS, App. H, Attachment H at 13, simply by looking at the immediate job losses in the trucking industry and applying multipliers to project a total job loss, offset only by corresponding job gains in the rail industry. That approach does not take into account the value of the cost savings or service improvements (which have similar economic effects to those of cost savings) that impel shippers to make such a shift. The benefits to shippers redound in turn to the shippers' customers or owners and so have beneficial multiplier effects through the local and national economy.

H.1.b The DEIS does not take into account potential positive labor impacts other than those caused by CN's planned construction activity.

The DEIS calculation of the impacts of the Transaction on employment is also incomplete because it does not reflect economic activities flowing from the Transaction other than construction activities. It thus overlooks many positive impacts on employment.

One way of estimating some of those positive impacts is by reference to the benefits that have been projected in connection with the CREATE Program, a portion of which would be achieved by the proposed Transaction. As the DEIS states, CREATE is a partnership dedicated to implementing "critically needed improvements to increase efficiency of the region's rail

assumption that 114 jobs would be abolished in the first year does not reflect CN's actual intentions; it thus leads to an exaggeration of the immediate impact of the job reductions.

[137] CN has not assumed that there would be any diversions of freight from truck to rail, and it is unclear (as noted above) whether SEA actually makes such an assumption, as the discussion of socioeconomic impacts in chapter 4 appears inconsistent with Appendix H. If in fact, however, SEA means to assume traffic diversions from freight to rail, the SEA needs also to describe fully the beneficial net environmental effects of the shift from truck to rail, including reductions in fuel consumption, highway congestion, and risk of accidents, none of which is discussed in the DEIS.

infrastructure and the quality of life of Chicago-area residents." DEIS at 2-65 (quoting www.createprogram.org/index.html). Included among the economic impacts that CREATE has studied are the impacts on employment levels expected as a result of congestion-reducing improvements to the Chicago Terminal District. CREATE estimates that it would, among other things, prevent the loss of 17,000 jobs that would be lost over the next 20 years if rail congestion problems are not addressed.[138]

The proposed Transaction would achieve part of the transportation improvement envisioned by CREATE in that it would reduce congestion by removing CN trains from rail lines in the CREATE District in central Chicago. It is therefore reasonable to expect that these improvements by CN to fluidity within Chicago would provide partial benefits comparable to those envisioned by CREATE.[139] That would include a portion of the 17,000 jobs expected to be preserved by CREATE within the CREATE District. Whatever methodology SEA may choose to calculate a proportion of the CREATE benefits that could be attributed to the Transaction, it

[138] CREATE Final Feasibility Plan at 37 (Aug. 2005).

This estimate was based on the assumption that there would be a 78.7% increase in rail freight, measured by the number of railcars, over a 20-year period. CN has maintained that any projections of rail traffic over more than a very short time horizon are likely to be inaccurate and unreliable. *See* letter of Paul A. Cunningham to Victoria J. Rutson (Apr. 21, 2008) (responding to SEA Information and Data Request #3). Nevertheless, to the extent that SEA finds any part of CREATE's projections of total growth in Chicago-area traffic to be reliable, then it may reasonably conclude that CREATE would prevent the job loss caused by the resulting increase in rail congestion. SEA may further reasonably conclude that to the extent that the Transaction would relieve some of that future congestion, it would prevent loss of a proportionate number of jobs.

[139] CN proposes to remove a total of 48.9 trains per day from its five subdivisions within the CREATE District, or approximately 8.2% of the 600 total daily trains operating in that District On those portions of its lines within the CREATE District, CN expects to reduce train traffic from 19.1 trains per day to 2.0 trains per day on the Waukesha Subdivision, from 3.0 to 1.7 trains per day on the Freeport Subdivision, from 12.6 to 2.0 trains per day on the Chicago Subdivision, and from 22.1 to 2.0 trains per day on the Elsdon Subdivision. CN also plans to increase train traffic from 1.8 to 2.0 trains per day on that portion of the Joliet Subdivision within the CREATE District, for a net decrease of 48.9 trains per day on all its lines in the District.

should at least acknowledge the likelihood that the Transaction would accomplish some widely desired transportation improvements, with positive economic and employment consequences.

H.2 The Transaction would have economic benefits, which the DEIS overlooked, from the net reduction in vehicular delays at at-grade highway crossings in the Chicago area.

Focusing on "increased traffic delays at highway/rail at-grade crossings" at locations "where the EJ&E tracks run directly through a community," the DEIS recognizes that "impacts to community cohesion are not expected to be more than moderate." DEIS at 4.6-10. It also recognizes that "[t]raffic delays would be reduced along the CN rail lines that experience decreased rail traffic" and that "this would reduce any existing, adverse effect to community cohesion along these rail lines." It makes no attempt, however, to quantify the economic benefit to the Chicago region from reduced delay at grade crossings.

CN has calculated that the Transaction would cause a net decrease of 228 hours each day to vehicles stopped at affected rail-highway grade crossings.[140] The monetary value of this time saving can be calculated by using time-value factors prescribed by the United States Department of Transportation ("DOT") in its "Departmental Guidance for the Valuation of Travel Time in Economic Analysis,"[141] which provides an objective, readily available estimate of value of time

[140] *See* Letter from Paul A. Cunningham to Victoria J. Rutson at 4 (Sept. 26, 2008); *id.*, Exhibit B.

[141] Memorandum from Frank E. Kruesi, Assistant Secretary for Transportation Policy, DOT, to Secretarial Officers and Modal Administrators, "Departmental Guidance for the Valuation of Travel Time in Economic Analysis" (Apr. 9, 1997) ("1997 Departmental Guidance"), *available at* http://ostpxweb.dot.gov/policy/Data/VOT97guid.pdf; Memorandum from Emil H. Frankel, Assistant Secretary for Transportation Policy, DOT, to Assistant Secretaries and Modal Administrators, "Revised Departmental Guidance, Valuation of Travel Time in Economic Analysis" (Feb. 11, 2003) ("2003 Revision to Departmental Guidance"), *available at* http://ostpxweb.dot.gov/policy/Data/VOTrevision1_2-11-03.pdf.

to persons delayed in transportation. DOT has instructed its modal agencies[142] to use the values and procedures set forth in this guidance document "for future DOT cost-benefit and cost-effectiveness analyses that employ measures of the value of travel time lost or saved."[143] The guidance document specifies, among other factors, the recommended percentage of hourly income, as well as the dollar value, to be used for estimating the value of time lost or saved for personal and business trips by car, as well as truck trips.

In 2003, DOT revised its Departmental Guidance to reflect updated information on hourly income. Following these revisions, DOT's estimated hourly value of travel time savings per person-hour for local travel by surface mode (measured in 2000 dollars) is:

For Personal Travel[144]	-	$10.60
For Business Travel	-	$21.20
Weighted Average (above two)	-	$11.20
Truck Drivers	-	$18.10

Because the values calculated by DOT are per person-hour, they cannot be applied until CN's calculations of vehicle-hours saved are converted into person-hours. The CMAP assumes that the number of persons per vehicle is 1.2 for work trips and 1.4 for non-work trips.[145] The 2000 U.S. Census, however, shows a larger number of persons (approximately 1.4) per vehicle

[142] *I.e.*, the Federal Highway Administration (highways), Federal Transit Administration (urban mass transit), Federal Aviation Administration (air), and Federal Railroad Administration (rail). (The omission of the Board from this listing reflects the Board's different status as an independent agency, not any view that the document is less relevant to the Board's activities.)

[143] 1997 DOT Guidance, transmittal memorandum at 1.

[144] Includes trips to work.

[145] Chicago Area Transportation Study, *Conformity Analysis Documentation: 2030 Regional Transportation Plan, FY 2004 - 2009 Transportation Improvement Program* (Oct. 2003).

for work trips in the Chicago Metropolitan Area.[146] It is therefore reasonable to assume that the average number of persons per vehicle for all trips in the Chicago area is 1.4.

Finally, it may be assumed that trucks constitute approximately 7.5% of the vehicles delayed at grade crossings. (This number is derived from the FRA's inventory of highway-rail grade crossings, which reports that trucks constitute 7.503113% of the total number of vehicles at the grade crossings on the EJ&E arc and on the lines within the arc used by CN.)

Applying these assumptions to the 228 net travel time savings calculated by CN yields these results:

1. **Local Travel Savings (excluding trucks)**
   - Number of passenger vehicle-hours saved per day
     = 228 x 0.925= 210.9
   - Number of person-hours saved per day
     = 1.4 x 210.9 = 295.26
   - Number of person-hours saved per year[147]
     = 325 x 295.26 = 95,959.5
   - Annual savings (dollar values as of 2000)
     = $11.20 x 95,959.5 = $1,074,746
2. **Local Travel Savings (trucks only)**
   - Number of truck vehicle-hours saved per day
     = 228 x 0.075 = 17.1
   - Number of person-hours saved per year
     = 1 x 325 x 17.1 = 5,557.5
   - Annual savings (dollar values as of 2000)
     = $18.10 x 5,557.5 = 100,591

[146] U.S. Bureau of the Census, Department of Commerce, U.S. 2000 Census of Population and Housing - Long Form, Table P-30 ("Means of Transportation to Work for Workers 16 and Over"). (The calculation of 1.4 persons per vehicle was made by taking the weighted average of the counts of number of persons per car for Cook, DuPage, Kane, Kendall, Lake, McHenry, and Will counties in Illinois and Lake County in Indiana.)

[147] The number of person-hours per day was multiplied by 325, rather than 365, as a conservative reflection of the lower vehicular traffic volumes on the affected roads on weekends.

3. **Total Annual Savings (dollar values as of 2000)**
   = $1,074,746 + $100,591 = $1,175,337

The present value of 25 years of these savings would amount to $15.0 million.

Thus, the quantification that the DEIS does not undertake demonstrates that the Transaction would annually contribute an additional $1,175,337 to the Chicago-area economy. (This estimate is a conservative one, because it is based on hourly income in 2000 and therefore does not reflect increases in income since that year.)

H.3 The Transaction would provide economic benefits to shippers as a result of reduced transit time and increased reliability of train service through Chicago.

CN's proposed acquisition of the EJ&E line around Chicago would allow CN to improve the fluidity and performance of the approximately 12,000 trains per year that it moves through the Chicago region. This fluidity translates into reduced transit times and improved system reliability, thereby lowering the overall supply chain costs for CN's customers whose freight must move through Chicago. SEA's analysis of the socioeconomic impacts of the Transaction does not acknowledge or account for any of these savings, even though they constitute clear socioeconomic benefits that would result from CN's re-routing of its trains over the EJ&E line in implementation of the Transaction.

Two of the most significant shipper savings made possible by improvement in CN's service and overlooked in the DEIS are reduced carrying cost of in-transit inventory and reduced safety stock costs. While goods are in transit, they are included on shippers' financial balance sheets, but they are not available for use in production or for sale. Time spent in transit thus imposes substantial carrying costs on shippers. If travel time is reduced, shipments arrive earlier at their destinations and are available for use or sale, and rail customers' inventory costs are

lowered. In addition, more reliable service enables customers to make further savings, because they are able to reduce their levels of safety stock levels (*i.e.*, additional inventory that is kept on hand as a hedge against fluctuations around mean transit time).

To develop estimates of these savings, CN retained Oliver Wyman, a global management consulting firm with extensive expertise in supply chain and logistics management and experience in advising the rail industry. Using CN data from 2006[148] and in consultation with CN personnel, Oliver Wyman determined pre-Transaction transit times, variability of transit times, and rail yard performance for each train type (*e.g.*, merchandise, intermodal, bulk) that CN now moves to, from, or through the Chicago terminal. CN personnel, using CN's Train Performance Calculator ("TPC"), statistics provided by EJ&E on actual operating performance on its line, and their own judgment based on their operating experience, provided their estimates of the post-Transaction speeds and variability of trains operating over the routes, including the EJ&EW line, that CN would use following implementation of the Transaction.

Using this information, Oliver Wyman was able to estimate the change that could be expected in mean transit time and variability for each train type on each applicable route. Reduction in transit time was a combination of reduced line-haul transit time and, where applicable, reduced dwell time in yards.[149] (Dwell time would not be applicable to unit trains, which do not require handling in yards.) Reduction in dwell time was an important factor in calculating reduction in transit time variability because longer time needed for car handling in a

[148] This year was chosen for the sake of consistency with the Operating Plan that was submitted as part of CN's Application, and which was constructed using data from 2006, the last full year for which data was available at the time the Plan was created.

[149] Because of time pressure, Oliver Wyman calculated the improvement in yard dwell time at CN's Markham Yard, and used Markham as a proxy for the other classification facilities used by the Chicago traffic under review. This approach gave a conservative estimate of the probability of making connections at non-CN yards.

yard means greater probability that a car will miss its connection with the outgoing train that is scheduled to take it to the next terminal. (Because at CN the connecting trains generally run once a day, if a car misses its departing train, even by as little as one or two hours, it will usually be delayed a full 24 additional hours. Long dwell times in a yard, by increasing the likelihood of missed train connections, can therefore multiply the variability of transit times over the length of a movement from origin to destination.

Oliver Wyman's calculations of improvements in transit time and reliability were conservative, because they omitted (a) reductions in time spent waiting by trains that have been made up and are awaiting a crew at locations outside the EJ&E arc for a route through Chicago (which often occurs today because the railroad is reluctant to pay for costs of a crew that is train that is only sitting on the track, so it waits until it knows the train can proceed before it calls a crew for a stopped train); (b) reduced transit time and variability of transit time for CN traffic within the Chicago terminal that would continue to use its current routes, but which would move more readily because of reduced traffic on the lines within Chicago; (c) downstream improvements in yard performance or transit time outside the EJ&E arc, resulting from improvements within the arc that make it more likely that a CN train will make its next connection on time at a downstream yard; and (d) improvements to traffic through Chicago that CN does not participate, but which would benefit from the reduction of CN's use of lines inside the arc.

An inventory carrying cost model was developed to estimate the savings to CN customers from reductions in transit times. This model applies the annual cost of capital and the reduced travel time to the total value of the goods in transit. Exhibit 5 ("Supply Chain Savings to CN Customers Resulting from acquisition of EJE: Model Results") presents Oliver Wyman's

calculations of the inventory carrying costs savings, both for all industries and for selected industries representing significant commodity groups (chemicals, metals, paper, and prepared food).[150]

In addition, Oliver Wyman developed a safety stock model, using transit time and transit time variability from origin to destination, and improvements to those factors, to estimate the pre- and post-Transaction safety stock levels. The post-Transaction reductions in safety stock were aggregated into commodity groups, and an average value per ton for each group was estimated. Oliver Wyman then calculated the annual dollars of savings to customers by multiplying the average value per ton by the safety stock reduction in tons multiplied by the cost of capital for the industry group multiplied by the average value per ton. Oliver Wyman's findings are reported in Exhibit 5, aggregated both for all industries and for the representative industries for which inventory carrying cost savings were reported.[151]

Thus, Oliver Wyman calculated the total savings that CN customers could expect from reductions in inventory carrying costs and safety stocks, as a result of the Transaction, is $23.5

[150] It was CN's judgment that a reasonable measure of pre-tax cost of capital for the affected industries would be 14% (8.7% after tax), and calculations based on that number are therefore reported in Exhibit 5. If, however, this number is regarded as too high, alternative calculations based on pre-tax costs of capital of 10 and 12% (6.2% and 7.4%, respectively, after tax) are also shown.

[151] If SEA wishes to inquire further into the methodology used by Oliver Wyman to arrive at these conclusions, CN is prepared to make members of the expert Oliver Wyman team that calculated them available to SEA.

million each year.[152] The present value of these savings over 25 years would be in excess of $160 million, at a 14% pre-tax cost of capital.[153]

These savings to CN's customers would have beneficial impacts throughout the national economy. In order to calculate the downstream impacts of these savings, CN asked Global Insight to calculate the multiplier effects that these savings could be expected to yield, if shippers used them to expand their manufacturing output by a corresponding level. Using its input-output model (described in section H.1.a, above), Global Insight calculated that an increase in manufacturing output of $100 million would lead to a total gain of 549 U.S. jobs, and $29.8 million in U.S. labor income. Moreover, it would lead to a total gain of $232.4 million in U.S. economic output, a total gain of $97.7 million in economic value added for the U.S. economy, and a total increase of $14.5 million in U.S. tax receipts.[154] For an increase in manufacturing output of only $23.5 million (the value of the yearly supply chain savings calculated by Oliver Wyman), the corresponding proportional results would be: a total gain of 129 U.S. jobs; increase in U.S. labor income of $7.0 million; a total gain of $54.6 million in U.S. economic output; a total gain of $23.0 million in economic value added for the U.S. economy; and a total increase of $3.4 million in U.S. tax receipts.

These savings are only a small portion of socioeconomic benefits that may be expected as a result of improved transit time and reliability caused by the Transaction. They exclude, for

[152] As noted above, this assumes a pre-tax cost of capital of 14%, but even at lower cost of capital assumptions, the savings are significant. A 10% pre-tax cost of capital would yield annual savings of $16.8 million, and a 12% pre-tax cost of capital would yield savings of $20.2 million.

[153] A pre-taxcost of capital of 10% or 12% would change the present value of the savings to approximately $160 million, or close to $160 million, respectively.

[154] These findings are reported in Exhibit 6 hereto ("Economic Analysis for Canadian National Railway: Manufacturing Scenario Impact on the U.S. Economy by Industry.")

example, the value that would be created for other railroads (both freight and passenger) operating in the Chicago area by increased fluidity of CN trains, greater line capacity, and improved on-time performance for interline connections. They also exclude the savings to CN from better crew and equipment utilization that would be made possible by improved transit times and reliability. They are, however, illustrative of the kinds of benefits that were overlooked in the DEIS's assessment of the socioeconomic impacts of the expected re-routing of CN trains, and that should be included if SEA intends its EIS to include such an analysis.

H.4 There is no basis for any determination that any negative effects of the transaction on property values would be other than minimal and offset by increases by positive impacts of property values where train operations are to be reduced

SEA apparently conducted a thorough literature search regarding the economic impact of increased rail traffic on property values. While the relevant data/literature supporting (or negating) adverse effects on property values from increased train traffic is sparse, DEIS at 4.6-6, in most respects SEA reasonably utilized existing literature to support its conclusions. The DEIS found that property values in the Chicago area overall will not be affected and there would be only "minor localized effects on property values," *id.* at 4.6-23 – which it did not quantify – while reduced traffic could bring beneficial effects to property values adjacent to the CN subdivisions, *id.* at 4.6-2. The DEIS does not, however, account for those beneficial effects in the various communities along CN's current lines. If that missing analysis were to be included, given that there are more properties adjacent to CN's existing lines, where traffic would be reduced, than adjacent to the EJ&E line, where traffic would be increased, there is every reason

to believe that the proposed Transaction's beneficial effects on property values equal or outweigh any adverse ones.[155]

The limited analysis contained in the DEIS is also subject to some significant problems and qualifications. The literature and data on "stigma" harm to property values due to nearby train traffic is too limited to form reliable quantitative conclusions – SEA found just one article addressing effects of train traffic levels on property values (Simons & El Jaouhari 2004 ("Simons article") – and several factors suggest that possible values SEA infers from the Simons article are on the high side.

First, in order to form any reliable conclusions, and in order to satisfy the minimum requirements of the Uniform Standards of Professional Appraisal Practice ("USPAP"), an opinion regarding property values must take into account local variables, including, where possible, relevant local market data. *See, e.g.,* USPAP Advisory Opinion No. 9, lines 179-81 (an analysis of environmental stigma "must be based on market data") (2006). SEA's purely mathematical extrapolation from the Simons article, DEIS Table 4.6-3, which addressed property values in entirely different communities in Ohio, does not do so. Local and individual data are likely to be highly significant here: for example, a plausible hypothesis is that residences and communities that are relatively upscale and that feature relatively modern construction may be well insulated by trees and modern windows from sound or other nuisances, and rail traffic may be less noticeable to potential buyers if rail lines are obscured by trees or other landscape

[155] It is also possible, although there is no evidence supporting such a conjecture, that because the communities along the EJ&E line are typically more affluent, with higher value residences, if – contrary to literature cited by SEA – additional train traffic has more effect on high-value residences than on low-value residences, the balance would go the other way. However, any suggestion that a possible decrease in value of a certain number of expensive residences outweighs a decrease in value of a larger number of less expensive residences would exacerbate the environmental justice concerns discussed below regarding SEA's analysis.

features. This hypothesis may explain Simons' finding of minimal or non-existent effects on property value for more upscale residences in the Ohio study.[156] It also suggests that negative property value effects reported in the Simons article, which involved a study of properties averaging 60 years old, *see id.* at 4.6-8, are likely to be greater than any effects that might be experienced in more recently built communities along the EJ&E line.

Second, in extrapolating from the Simons study, SEA assumed that each additional train would have the same property value effect, *i.e.,* 20 trains would have 20 times the property value effect of one new train. *See* DEIS 4.6-9 & Table 4.6-3. This assumption seems implausible on its face: at some point, it seems reasonable to expect the significance of additional trains to decline, as property owners either acclimatize to train noise or reach the threshold at which they opt to invest in improved sound insulation. Yet DEIS's analysis neither accounts for the likely reduced significance of the twentieth additional train as compared to the first, nor cites any

[156] Simons' finding profoundly undermines claims made by the Village Administrator of the Village of Lake Zurich at the August 26 Open House. As the DEIS notes, Simons found ***no*** statistically significant impact on property values for upscale properties (which Simons defined as those with more than 1,700 square feet) beyond 250 feet from the Ohio rail line, and only an average of 0.19% value decline per train for such properties within 250 feet of the rail line. *See* DEIS at 4.6-7, Table 4.6-3. Relying solely on the DEIS, the Lake Zurich Administrator asserted a 5-15% value decline in the value of all 364 Lake Zurich properties alleged to be within 500 feet of the EJ&E line. Statement of Bob Vitas, Village Administrator, Village of Lake Zurich, at 2, *available at* http://www.stb.dot.gov/Ect1/ecorrespondence.nsf/PublicIncomingByDocketNumber/D4B4A6DD0E13EE3E852574B40042F654/$File/10533.VITAS.PDF?OpenElement. He provided no basis whatsoever for that range, given that the range of value effects extrapolated in Table 4.6-3 of the DEIS is from no statistically significant impact to a maximum decline of 5.35% (for medium-sized properties within 250 feet of the rail line assuming an extra 20 trains a day). Moreover, while the Lake Zurich Administrator did not provide square footage data so that a direct comparison with the Simons study could be made, the value data he did provide strongly suggests that most of the 364 properties at issue (about 60% of which are alleged to be beyond 250 feet from the rail line, *see id.,* Ex. 2) would fall into the upscale category for which Simons found no significant impact. The mean value of the 340 residential properties for which the Lake Zurich Administrator provides fair market value data exceeds $324,700 ($110,408,403 / 340). (The remaining 24 properties either have no value assigned or have values assigned below $12,000.) *See id.*

literature nor makes any argument to justify treating all trains equally. Nor does it appear that DEIS's analysis takes any account of other factors likely to result in additional trains having different value effects, such as individual train noise, length, speed and timing (*e.g.,* night versus day).

Third, SEA's extrapolations from the Simons article should not be understood to predict any long-term effects. As SEA correctly notes, Simons "did not study whether property values would rebound over time." DEIS at 4.6-8. While the analogy is imperfect, the much richer appraisal literature that addresses "stigma" caused by environmental contamination suggests a likely answer to that question: that literature consistently finds that "stigma" declines – *i.e.,* property values recover – over time (often within a few months) as publicity dies down. *See, e.g.,* T. Jackson, "The Effects of Environmental Contamination on Real Estate: A literature Review," 9 *Jo. Real Est. Lit.* 93, 110 (2001) (reviewing 15 studies). This finding is unsurprising: property values reflect public perceptions which in turn reflect publicity, and the exaggerated claims of some property owners close to the EJ&E line who oppose the Transaction, and the adverse publicity they have generated, may be reflected in short-term stigma.

Thus, SEA's discussion of the Simons study from Ohio can generate nothing more than speculative suggestions about limited property value effects that are likely to be short-term, highly variable and individualized. Local property prices are no doubt affected by other factors extraneous to the proposed Transaction. For example, property prices in the region have declined recently, along with most of the rest of the United States. And, property prices along the EJ&E line may be negatively affected by the fact that those properties were built (almost invariably after the rail line) adjacent to a functioning rail line. But the pre-existing presence and type of use of the rail line – which the proposed Transaction would not change – should already

be built into property prices, and is anyway not attributable to the Transaction. Indeed, since no legal restriction currently limits traffic on the EJ&E line to its present levels, and since the level of freight traffic on the EJ&E line has fluctuated substantially over time, at least some risk of increased rail traffic should, if significant, already be built into local property values. Such pre-existing effects cannot be blamed on the proposed Transaction.

In summary, CN concurs with the finding of the DEIS indicates that, while there may be adverse effects on values of property adjacent to the EJ&E line, there would also be "a corresponding beneficial effect on property adjacent to the CN rail lines." DEIS at 4.6-9. Further, the DEIS finds that "the Proposed Action would not affect overall property values within the Study Area (the Chicago metropolitan area)." *Id.* Beyond those two conclusions, the analysis in the DEIS is speculative, and omits both the data necessary to reach any reliable affirmative finding of negative property value effects, and any examination of likely positive property value effects.

I. Environmental Justice

CN generally agrees with the conclusion in the DEIS that the Transaction would not cause significant environmental justice impacts. However, the DEIS appears to arbitrarily identify environmental justice communities falling only within 400-foot contours adjacent to CN lines inside the arc, but falling within 1,500-foot contours adjacent to the EJ&E arc. DEIS at 3.7-1. This different treatment is inexplicably discriminatory and potentially understates the impact of the No-Action alternative on environmental justice communities within the arc that are located more than 400 but fewer than 1,500 feet from existing CN lines. Additionally, the DEIS fails to analyze whether the No-Action alternative would have disproportionately high and adverse impacts on minority and low-income populations.

Even a cursory comparison of the demographics of the communities adjacent to the affected EJ&E lines, which would experience increased train traffic under the Proposed Action, with those of the communities adjacent to the existing CN lines, which would benefit from decreased train traffic, makes it extremely likely that SEA's analysis overlooked disproportionately high and adverse impacts of the No-Action alternative on the minority and low-income populations along the CN lines. Moreover, SEA should acknowledge the likelihood that imposition of costly environmental mitigation conditions itself could cause environmental injustice, by making the Transaction prohibitively expensive, and causing those disproportionately high and adverse impacts to fall upon the minority and low-income communities that would be deprived of the benefits of the Transaction.

After publication of the DEIS Christopher Berry and Ethan Bueno de Mesquita,[157] both of the University of Chicago, issued a report finding that the Transaction would benefit poorer areas with largely minority populations. Their report found that communities in Chicago that would experience a decrease in rail traffic have a population of about 1.25 million residents – 70 percent of them non-white, with a median household income of $46,000. In contrast, they report, the population of suburban communities along EJ&E is about 900,000 – 67% of whom are white, with a median income of $76,000.

With regard to mitigation, SEA's proposed additional item no. 20 (regarding "account[ing] for the special needs of minority and low-income populations adjacent to or in the immediate vicinity of the EJ&E rail line in the development of contingency or emergency plans such as the hazardous materials emergency response plan") is unreasonable. First of all, SEA

[157] C. Barry and E. Bueno de Mesquita, "Stalemate over Rail Plan Reflects Failure of Political Leadership," *available at* http://media1.dailysouthtown.com/multimedia/berrymesquitacn.pdf_20080911_13_16_26_47.imageContent.

does not explain how minority or low-income populations have "special needs" with regard to the railroad's emergency materials plans. CN would expect to respond in different ways depending on the nature of the emergency, but does not believe that its responses should differ materially with the demographics of the affected communities. But a more important point is that the DEIS identified no basis on which to impose mitigation for the sake of environmental justice. It found that "the potential for environmental justice communities to experience exposure due to a hazardous materials release would be slightly elevated, but not high and adverse," much less disproportionately high and adverse.[158] DEIS at 4.7-5. Exec. Order 12898 (1994), which provides the charter under which federal agencies evaluate environmental justice in conducting NEPA reviews, calls only for "identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of [agency] programs, policies, and activities on minority populations and low-income populations." Exec. Order No. 12898 § 1-101. The Executive Order is not a mandate for federal agencies to look for ways to benefit minority and low-income communities by imposition of conditions in licensing proceedings. In the absence of any disproportionately high and adverse impacts on minority or low-income populations from transportation of hazardous materials, there are no environmental justice effects regarding that transportation, and no basis for imposition of conditions to mitigate such effects. In any event, the greatest benefit the Board could confer on environmental justice communities is approval of CN's Application, which would allow CN to re-route trains that now run though those communities, and would lead to a reduction in the adverse noise, safety, and vehicular delay impacts now caused by those trains.

[158] In fact, the DEIS did not find that environmental justice communities would experience any disproportionately high and adverse impacts with respect to and of the effects it studied. DEIS at 4.7-3—4.7-5.

J. Noise & Vibration

When considering mitigation to noise impacts, SEA should, consistently with past practice, apply a "reasonableness" assessment to any mitigation measures proposed. SEA has historically proposed noise mitigation only where it was both feasible and reasonable. Feasibility issues considered by SEA include: technical practicability, site topography, the existing noise environment, and right-of-way and easement requirements. Reasonableness considerations include the extent of mitigation, the cost effectiveness, and the desires of local residents. 2 *Conrail FEIS* at 4-69.

SEA has also recognized that any noise increases on existing railroad rights-of-way from increased train operations that are unrelated to the proposed Transaction are not subject to any regulation or mitigation, as railroads have always been free to increase their operations and train traffic in the normal course of business without being constrained by the increased noise that might result.

SEA should apply the same reasonableness and feasibility determinations here. Feasible noise mitigation is that which can be implemented and provide a noise level reduction of at least 8 dBA to an impacted receiver. Additionally, to determine cost effectiveness, SEA should evaluate each impacted area where feasible noise mitigation could be provided and determine if the cost of such mitigation is $24,000 or less per benefiting receiver (residence). This is an IDOT standard[159] that is referenced in the Draft EIS. *See, e.g.*, DEIS at 4.10-14.

[159] *See* IDOT, Frequently Asked Questions – Noise Abatement, http://www.dot.state.il.us/desenv/noise/faqAbatement.html. While INDOT's standard is not referenced in the DEIS, it considers noise abatement to be feasible if a majority of first row receivers will experience at least a 7 dBA reduction in noise, and reasonable if it could be done for a cost of $25,000 or less per benefited receiver. *See* Indiana Department of Transportation, Traffic Noise Policy 7 (Jan. 2007), *available at* http://www.in.gov/indot/files/INDOTNoisePolicy(1).pdf

With regard to the analysis used in the DEIS, CN believes SEA used an unreasonably small sample size when conducting noise measurements, particularly given the wide range of results that were obtained. Only four EJ&E train passbys and eleven CN train passbys were measured. However, the range of the measured noise levels varied by 18 decibels for locomotives and 15 decibels for rail cars. This wide of a range indicates that there may be some outliers there that are skewing the results and suggests that averaging all of the measurements may not be appropriate. Alternatively, the CREATE Freight Noise Model (CREATE Model), available from FRA's website, could be used. This model was developed as part of the CREATE Program and includes reference source noise levels (SELs) developed for use in evaluating freight train operations. The CREATE Model is based on FTA's General Transit Noise Assessment spreadsheet, but incorporates a list of rail noise source categories that are more appropriate for the freight rail activity related to this proposed transaction. Additionally, it appears that SEA measured noise impacts based on EJ&E's existing operations. SEA's analysis does not take into account the fact the locomotives that CN would operate over EJ&E after the transaction is implemented are newer, better maintained, and much quieter than the locomotives that EJ&E currently operates.

CN cars are also better maintained, and use WILD detectors to eliminate flat spots on wheels, reducing wayside noise impacts. Thus, SEA's analysis of noise likely overstates that potential impact of the Transaction.

In addition to the proposals CN has made in items VM 77 through VM 83 of its VMP regarding noise and vibration, SEA has proposed additional measures nos. 23 through 27, many of which repeat the substance of CN's own proposals. However, SEA proposal no. 26 (regarding communication with Fermilab) is unreasonable as written, because it does not specify what kind

of "operational changes" could trigger a reporting requirement, and could even be construed to require notification every time CN modifies its train plan, regardless of any potential impact on the Fermilab. This requirement would be especially unreasonable because it has been proposed to mitigate vibration impacts that SEA has not even determined would take place. (The DEIS finds that "train-induced vibration would not affect current research activities at Fermilab (regardless of the number of trains per day on the EJ&E rail line), because current research activities are not located along the eastern property line near the EJ&E rail line." DEIS at 4.10-25. It then finds that train operations *could* affect future research activities, if Fermilab were to locate them within 500 feet of the EJ&E line. *Id.* It concedes, however, that "Fermilab has not selected specific locations for its future expansion projects." *Id.* It has not determined that expansion projects within 500 feet of the rail line are even likely, much less "reasonably foreseeable," let alone whether, if such projects were undertaken, "vibration from the Proposed Action would adversely affect Fermilab." In the absence of such a determination, there are no impacts to mitigate, and therefore no basis for the imposition of conditions on CN.

K. Biological Resources

While the DEIS discusses impacts of Transaction-related construction and changes in train operations on plant communities, wildlife, and conservation and natural areas, it generally concludes that those impacts would be "low" or "slight," or that they would lead to a "remote" probability of hazardous materials spills or wildfires. DEIS at 4.11-13, 4.11-26. To the extent that any of the impacts discussed rise above a minimal level, however, they would be adequately mitigated by the voluntary mitigation measures (VM 84 through VM 88) that CN would undertake if the Transaction were approved.

L. Water Resources

CN agrees with the conclusions of the DEIS indicating that impacts to water resources would be minimal. DEIS at 4.12-7, 4.12-48—4.12-49. In addition, CN has revised its Voluntary Mitigation Plan to incorporate much of the substance of SEA's proposed additional mitigation measures no. 63-68 into VM 89 through 100. CN, however, regards SEA's additional mitigation proposal no. 66 (regarding mitigation of impacts on isolated wetlands) as unreasonable to the extent that it imposes obligations in addition to CN's ordinary practice of consulting with the U.S. Army Corps of Engineers and following the Corps' guidance regarding obtaining all required wetlands permits from all levels of government. SEA proposal no. 66 should therefore be removed, or clarified to state that CN may follow that established practice, and that if the Corps advises it that any affected wetlands are subject to regulations of Kane and DuPage counties rather than to those of the Corps, then it will take such actions as may be required to conform to the local regulations.

M. Monitoring & Enforcement

SEA has proposed additional mitigation measure no. 72, requiring quarterly reports on the progress of, implementation of, and compliance with the mitigation conditions during the first three years of operational changes, or such other period as the Board may require. This requirement is considerably more burdensome than environmental monitoring and enforcement conditions imposed in other cases. For example, while the Board required applicants in the massive *Conrail* proceeding to certify their compliance with the environmental mitigation conditions imposed by the Board, *see generally CSX Corp. – Control & Operating Leases/Agreements – Conrail, Inc.*, 3 S.T.B. 196, 567-602 (1998), it only required periodic reporting with regard to one environmental condition, *id.* at 580 (Condition 8(A), requiring

quarterly reporting on quarterly reporting regarding grade crossing upgrades or improvements). In this case, if CN is to be required to report periodically on its progress in complying with all environmental mitigation conditions, it would be reasonable to require those reports no more frequently than semi-annually.

V. The Requirements of NEPA

A. NEPA does not require or authorize imposition of any mitigation.

It is axiomatic that NEPA is a procedural statute that does not require any particular outcome. *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989) ("NEPA itself does not mandate particular results, but simply prescribes the necessary process"). Where NEPA applies to a proposed action by a federal agency, its only requirement is that the "adverse environmental effects of the proposed action [be] adequately identified and evaluated," *id.*, and that the agency take a "hard look" at the environmental consequences of its action. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1979). NEPA's goal is to promote more informed agency decision-making, "by focusing the agency's attention on the environmental consequences of a proposed project." *Robertson*, 490 U.S. at 349. However, an agency is free to decide that other benefits of a proposed transaction, such as the substantive transportation benefits here, outweigh the adverse environmental impacts and call for approval. *Id.* at 350. In sum, NEPA requires only that an agency consider the potential environmental impacts of its actions. *Id.* at 352-53.

NEPA does not "require" that any action be taken "to mitigate the adverse effects of major federal actions." *Robertson*, 490 U.S. at 353 (citations and quotations omitted). NEPA requires nothing more than that the EIS "contain a detailed discussion of *possible* mitigation measures." *Id.* at 351 (emphasis added). There is no requirement that the agency have the

authority or ability to impose that mitigation, nor that it do so.[160] Indeed, it would be "inconsistent with NEPA's reliance on procedural mechanisms – as opposed to substantive, result-based standards" – to hold that NEPA authorizes an agency to develop and implement a plan to mitigate environmental harm before it can act. *Id.* at 353. And, "[b]ecause NEPA imposes no substantive requirement that mitigation measures actually be taken, it should not be read to require agencies to obtain an assurance that third parties will implement particular measures." *Id.* at 353. Thus, any authority the Board may have to mitigate the environmental impacts of a control transaction must be found in the Board's own governing statute.[161]

The obligations of an agency with regard to mitigation in the context of an EIS are thus fundamentally different from its mitigation obligations in the context of an Environmental Assessment ("EA"). Since passage of the Staggers Rail Act of 1980, neither the Board nor its predecessor has ever prepared an EIS for a rail control transaction, other than the massive *Conrail* acquisition proceeding. Even for large acquisitions with national implications, such as the *UP/SP* merger,[162] only an EA was prepared.[163] The purpose of an EA is to determine

[160] *Id.* at 352 ("There is a fundamental distinction . . . between a requirement that mitigation be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated . . . and a substantive requirement that a complete mitigation plan be actually formulated and adopted").

[161] And CN has consistently reserved the right to challenge conditions that exceed the Board's authority under that statute. *See* April 21, 2008 Letter at 6 n.2; *see also* CN-49 at 12 n.7.

[162] *Union Pac. Corp. – Control & Merger – S. Pac. Rail Corp.*, 1 S.T.B. 233 (1996) ("*UP/SP*"), *aff'd sub nom. W. Coal Traffic League v. STB*, 169 F.3d 775 (D.C. Cir. 1999).

[163] For many control transactions, neither an EA nor an EIS was found necessary. *E.g., Fortress Investment Group LLC – Control – Florida E. Coast Ry.*, STB Finance Docket No. 35031, slip op. at 5 (STB served Sept. 28, 2007); *Kansas City S. – Control – Kansas City S. Ry.*, STB Finance Docket No. 34342, Decision No. 12, slip op. at 21-23 (STB served Nov. 23, 2004); *Canadian Nat'l Ry. – Control – Bessemer & L.E. R.R.*, STB Finance Docket No. 34424, Decision No. 7, slip op. at 20-23 (STB served Apr. 9, 2004). Even a "major" control transaction was approved without either an EA or an EIS. *Union Pac. Corp. – Control – Chicago & N.W. Transp. Co.*, Finance Docket No. 32133, Decision No. 25, 1995 ICC LEXIS 37, at *149 (ICC served Mar. 7, 1995).

whether the proposed federal action would have significant environmental impacts warranting the preparation of an EIS. For this reason, any significant adverse environmental impacts identified by an EA must be mitigated below a level of significance, or the agency must proceed to prepare an EIS. *See* Forty Questions, 46 Fed. Reg. at 18,037 (agencies can include enforceable mitigation measures to conclude that an action does not require preparation of an EIS).

In contrast, when an EIS is prepared, there is no corresponding requirement that all identified adverse impacts be mitigated. There is only the procedural requirement that the EIS include a "reasonably complete discussion of possible mitigation measures." *Robertson*, 490 U.S. at 352. In fact, the DEIS prepared by SEA in this case (in five volumes, containing over 3,500 pages and standing nearly 8-1/2 inches high when stacked – the same size as the DEIS in *Conrail*) clearly identifies and describes potential mitigation, and thus fully satisfies NEPA's requirements.

B. It is unclear whether ICCTA, the Board's governing statute, provides any authority to impose environmental review or mitigation conditions on a "minor" transaction such as the CN/EJ&EW transaction.

The Transaction is governed by 49 U.S.C. § 11324(d), which requires the Board to approve it *unless* it finds that (1) the Transaction would be likely to cause "substantial lessening of competition, creation of a monopoly, or restraint of trade in freight surface transportation in any region of the United States," *and* (2) the anticompetitive impacts of the Transaction outweigh the public interest in meeting significant transportation needs. If the Board cannot find serious anticompetitive impacts, as described in section 11324(d)(1), then its substantive inquiry

"is at an end." *Illinois v. ICC*, 687 F.2d 1047, 1053 (7th Cir. 1982). It is clear from the record in this case that there is no basis for such a finding of anticompetitive harm.[164]

While it might appear that 49 U.S.C. § 11324(c) authorizes the Board to impose conditions on its approval of a transaction subject to section 11324, it has been held judicially and by the Board's predecessor agency that any authority the agency might have to impose conditions is limited to those matters which it may consider in granting or denying approval of the transaction under review. *Lamoille Valley R.R. v. ICC*, 711 F.2d 295, 301 n.3 (D.C. Cir. 1983) ("We therefore reject the suggestions . . . that the Commission has broader discretion in imposing conditions on a merger than in approving or rejecting the merger as a whole."); *Norfolk & W. Ry. – Purchase – Ill. Terminal R.R.*, 363 I.C.C. 882, 891 (1981) ("*Norfolk & Western/IT*") ("[W]e should not attempt to impose a condition on our approval of a transaction related to a matter which we could not lawfully consider as a basis for withholding our approval of that transaction. . . . To give effect to the congressional intent [in enacting the predecessor to section 11324(d)], we will exercise our conditioning power only where a condition bears on issues we may consider in deciding whether to approve a transaction.").

Thus, in this case, governing precedent would appear to preclude the imposition of involuntary conditions (other than the statutorily mandated labor protective conditions, *see* 49 U.S.C. § 11326; *Norfolk & Western/IT*, 363 I.C.C. at 892 n.10) aimed at mitigating non-competitive impacts of the Transaction.

[164] *See* CN-29; CN-31.

C. NEPA does not require analysis of impacts for which the agency action is not the legally relevant cause.

NEPA requires no more than an examination of the reasonably foreseeable environmental impacts that are caused by the agency action. The Supreme Court has rejected the "unyielding variation of 'but for' causation, where an agency's action is considered a cause of an environmental effect even when the agency has no authority to prevent the effect." *Pub. Citizen*, 541 U.S. at 767. Therefore, "where an agency has no ability to prevent a certain effect due to its limited statutory authority over the relevant actions, the agency cannot be considered a legally relevant 'cause' of the effect." *Id.* at 770. Accordingly, under NEPA, the agency's environmental review need not consider effects the agency approval would not cause. *Id.*

As CN has previously argued, the Board's authority over "minor" transactions is limited; under 49 U.S.C. § 11324(d), the Board "shall" approve the Transaction unless it finds both (a) likely and substantial anticompetitive effects, and (b) that those effects are not outweighed by "the public interest in meeting significant transportation needs." So a minor transaction may not be disapproved on environmental grounds, and *Lamoille Valley* seriously calls into question the Board's authority to impose environmental mitigation conditions on such a transaction. Thus, as it is unclear whether the Board's decision regarding to a minor transaction may be affected by the findings of an EA or EIS, it remains unclear that NEPA properly applies to such a transaction at all. However, accepting for purposes of this comment only that NEPA does apply, what is clear from *Public Citizen* is that it does not require analysis of impacts that could occur in the absence of the Transaction.

Therefore, the base for any study required under NEPA (as construed by the Supreme Court in *Public Citizen*) are those changes in traffic that would not happen "but for" the license sought here by the Applicants. For this reason, the impacts are unlikely to be as far reaching as

many parties to this proceeding seem to assume. CN and other railroads (and their respective customers) are presently free to re-route, and EJ&E is free to accept, additional traffic from the urban Chicago routes of CN and other railroads. Indeed, EJ&E is legally free to accept as much traffic as it finds in its interest to accept. (And it is free, without Board approval, to make improvements to the capacity of its line, such as new or extended sidings, double-tracking, improved signaling, that might be necessary or desirable for it to handle the increased traffic, so long as the improvements do not constitute construction of rail lines that invade new territorial markets.[165]) And if CN and EJ&E were to make such alternative arrangements for re-routing CN's traffic, in lieu of the proposed Transaction, there would be, absent the need for rail construction subject to the Board's jurisdiction, no environmental review and no related voluntary or imposed mitigation.[166]

As CN has previously explained, many of the trains that it currently runs through Chicago, and that it anticipates would be rerouted to the EJ&E line following the acquisition of EJ&EW, could be rerouted to EJ&E line without any regulatory action by the Board and thus without any environmental review.[167]

[165] *Missouri Pac. R.R. & So. Pac. Transp. Co. – Constr. & Operation Exemption – Avondale, LA*, STB Finance Docket No. 33123 slip op. at 4 (STB served July 11, 1997); *Texas & Pac. Ry. v. Gulf, Colo. & Santa Fe Ry. Co.*, 270 U.S. 266 (1926).

[166] *See, e.g., Conrail FEIS* at 1-5 (noting that "a railroad may upgrade a portion of its system or add service to shippers without seeking the Board's approval. Thus, if [applicants] had not proposed this Acquisition, they could have increased the number of trains on their existing lines to any level they deemed appropriate to meet demand and/or to achieve efficiency without the Board's review or regulation.").

[167] *See* Letter from Paul A. Cunningham to Victoria A. Rutson (April 21, 2008), available at http://www.stbfinancedocket35087.com/html/inforequest/request3/08apr21response/08apr21Response_Letter.pdf. The only exceptions are trains that CN plans to route to and from Kirk or Joliet yards, which CN cannot acquire without regulatory approval from the Board. Even for those exceptions, though, the obstacle to the movement of the trains over EJ&E is a practical one, not a legal one. CN could legally send those trains over the EJ&E line, and EJ&E could

Exhibit 1: List of Communities that will Experience a Change in Rail Traffic if the Transaction is Approved.

The following lists include communities that will experience a change in train traffic as a result of the CN/EJ&E Transaction. A community was included on a list only if a rail line (CN, EJ&E, or a rail line over which CN operates, such as the BRC or IHB) that would experience a change in traffic either ran through a part of the community or formed a portion of the community's boundary.

Except for the City of Chicago Community Areas, only incorporated communities were included. Chicago is divided into 77 community areas, which have been widely used ever since their inception in the 1920s as a means of summarizing social and physical features of spatial units smaller than the city as a whole, with historically stable boundaries for the compilation of census data. Community areas serve as the basis for a variety of urban planning initiatives on both the local and regional levels.

Population figures from 2000 were used only because it is the most recent data that is comparable across all communities. The population figures show that the Community Areas have equivalent populations to other communities inside and on the EJ&E arc.

The primary data source for the following lists was the Chicago & Vicinity 6-County StreetFinder, published by Rand McNally. If the boundaries were in question, zoning and other maps available on-line at individual community web sites were used. Such other maps were also used for all of the communities along the EJ&E. The relevant Chicago Community Areas were determined using GIS files, provided by the City of Chicago, that include the Community Area boundaries. A GIS file is a standard of encoding geographical information into an electronic file. They are created mainly by government mapping agencies, such as the USGS.

Inside-the-Arc Communities That Will See A Decrease In Train Traffic[1]

Communities Along the EJ&E That Will See An Increase in Train Traffic

Number	Community	2000 Population

Re: CN/EJ&E - SEA's ADT Growth Projections

BACKGROUND

You have asked me to review and comment on the use by the Section of Environmental Analysis of the Surface Transportation Board ("SEA") of annual percentage growth factors to forecast average daily traffic ("ADT") for highway/rail at-grade crossings in connection with SEA's Draft Environmental Impact Statement ("DEIS") for the proposed acquisition by Canadian National Railway Company and Grand Trunk Corporation (together, "CN") of the EJ&E West Company, a wholly owned subsidiary of Elgin Joliet & Eastern Railway Company ("EJ&E").

The DEIS indicates that SEA used fixed percentage growth factors to forecast ADTs to the common analysis years of 2007, 2015, and 2020. DEIS at 4.3-7, E-4. The DEIS explains that these growth percentages (3.0 for four of the counties, and 2.0 and 1.0 for the remaining two counties) were either (i) suggested by county officials, (ii) estimated from regional growth rates, adjacent roadway growth, and the rates for adjacent counties, or (iii) based on growth factors for adjacent crossing locations. *Id.*

SUMMARY OF CONCLUSIONS

For the reasons discussed below, I conclude that SEA's use of county-wide yearly percentage growth rates for ADT ranging from 1.0 to 3.0 was seriously flawed. If SEA must use any yearly percentage growth rate at all, use of a growth rate of zero would appear to provide a more accurate forecast. This would equate to SEA using the latest available actual ADT information (in most cases, apparently, IDOT information) for each crossing. As an alternative, and also preferable to SEA's use of 1-3 percent county-wide yearly percentage growth rates, SEA should consider developing ADT's for the years of interest by using CMAP's well-studied and more fundamentally sound projected ADTs.

DISCUSSION

I. BASIC PRINCIPLES OF FORECASTING

A prediction or forecast is a statement concerning unknown or future events. It is impossible to remove all uncertainty about the future. A forecast is useful when it reduces the uncertainty that prevailed before the forecast. A forecast that does not help reduce uncertainty is not helpful. It is not always the case that forecasts help reduce uncertainty. For instance, when the future to be forecast is inherently uncertain or when analysts attempt to forecast for long time horizons, forecasts become useless.

Most, but not all, forecasts have associated levels of certainty. For instance, statistical forecasts have so-called confidence bands. A statistician can make a statement that a given confidence band will contain the likely outcome being forecasted with a given degree of certainty. A 95 percent confidence interval is an interval that contains the true but unknown outcome with 95 percent certainty. In some cases the confidence band is simply too wide to be useful for decision making (*e.g.*, it includes a very large range of outcomes for a given

degree of certainty). In these situations, the forecast is not helpful. The mere existence of a forecast does not help determine whether it is helpful or not. The issue turns on the precision of the forecast.

All forecasts are subject to uncertainty. The components of this uncertainty include: (i) horizon uncertainty; (ii) model and parameter uncertainty; (iii) disaggregation uncertainty; and (iv) exogenous factor uncertainty. I discuss each of these forms of forecast uncertainty in turn.

(i) Horizon Uncertainty

There are well known statistical properties of so-called optimum forecasts. An optimum forecast uses all available information and has the greatest precision among all unbiased forecasts. While the mathematical development is not trivial the intuition is clear enough. The further ahead one forecasts, the less precise the forecast. An alternative way of saying this is that forecasts become less and less reliable the further they attempt to forecast into the future. At some point, forecasting become useless (or worse than useless, misleading) because currently available information ceases to contain anything of substantial relevance in performing the forecast.

The essential point is that the forecast variance increases dramatically with forecast length. This, in turn, means that as the forecast horizon increases the forecast itself must encompass a broader and broader range of values to maintain the same degree of confidence. Forecasts for longer horizons are simply less accurate than for short horizons.

(ii) Model and Parameter Uncertainty

The discussion above assumed that the model for the process that determines vehicular traffic is known, but in the real world it is not reasonable to presume that the model

parameters are known with certainty. The growth parameter is, in fact, unknown and requires estimation. Hence, in addition to the uncertainty that occurs due to horizon uncertainty, there is some uncertainty around the SEA's estimate of a percent growth rate (*e.g.*, 3 percent) assumed to be constant throughout an entire county and across time. This form of uncertainty compounds with the forecast horizon so that the confidence we can place on future traffic estimates diminishes with each additional year that is forecast.

While the SEA has not considered the accuracy of their forecasts, it is possible to assess this accuracy by examining the SEA estimates of 2007 vehicular traffic. The SEA estimated 2007 vehicular traffic based on their assumed constant growth rates and baseline levels previously reported typically two to three years prior (usually in 2004 or 2005). Now that 2007 data is available we may examine how well the SEA model did in determining the 2007 levels.

The following chart shows those crossings where IDOT has recently updated the reported ADT, and compares the 2007 ADT projected by SEA (based on growth rates it assigned to each county) with the ADT currently observed and reported by IDOT and available in the Federal Railway Administration ("FRA") database.

Comparison of SEA Projected 2007 ADT to Actual 2007 ADT Reported by FRA

Crossing	SEA's 2007 Estimated ADT	IDOT's Reported Actual ADT	Percent Difference
Diamond Lake Road	7,103	4,900	45.0%
Gilmer Road	14,729	12,600	16.9%
Old McHenry Road	25,596	21,000	21.9%
Oakwood Road	5,354	3,750	42.8%
Main Street (Lake Zurich)	13,792	5,900	133.8%
Old Rand Road	8,414	5,900	42.6%
Cuba Road	10,249	7,600	34.9%
Northwest Hwy	26,573	26,800	-0.8%
Hough Street/ IL 59&63	18,990	17,800	6.7%
Ogden Ave	36,177	36,400	-0.6%
Main Street (Plainfield)	17,505	15,800	10.8%
Nelson Road	5,791	1,009	473.9%
Cicero Ave	28,257	21,500	31.4%
Chicago Road	24,788	21,600	14.8%
Lincoln Hwy	36,622	27,000	35.6%
Average SEA Percentage Error			**60.6%**

Sources: DEIS at 3.3-7-14; FRA, Office of Safety Analysis, http://safetydata.fra.dot.gov/officeofsafety/publicsite/crossing/XingLocResults.aspx?state=17&countycity=&railroad=EJE&radionm=County&street=.

The chart shows that the SEA model overstates vehicular traffic on these road crossings (an average over-estimate) of 60.6 percent. Some segments such as Main Street (Lake Zurich) and Nelson Road are particularly poorly estimated by SEA assumptions even though the baseline for these estimates was not very long ago (2005 and 2004 respectively) and therefore relatively close in time to 2007. The degrees to which these segments have been over-estimated by the assumed SEA growth rate suggest that the latter is much too high at even 3 percent. Of equal importance, the forecast is off to a great degree at the very outset of the forecasting process, making it likely that this error will compound further as the forecast horizon is extended to 15 years and beyond. If the SEA assumed growth factors are

unworkable for year 2007, we cannot have any confidence that they will be of any use for longer horizons.

(iii) Disaggregation Uncertainty

SEA's use of a single growth factor across an entire county raises another significant issue. There is no basis in reality to assume, as SEA does, that a growth rate in Average Daily Trips (ADT) determined at the county level will be the same or even approximately the same across the many varied crossing points within a county. While uncertainty is generally reduced by aggregating smaller micro units to a larger aggregate, disaggregation generally works in the opposite direction – uncertainty is generally increased as one attempts to apply the aggregate (macro) to the individual (micro) level. Macro forecasting relies on the aggregation of many individual economic decisions. In that case, the law of large numbers comes into play to reduce the variability of the aggregate prediction and makes averages more precise as sample sizes are increased. The confidence band around the estimated average shrinks so that the range of uncertainty around the estimate is reduced. Conversely, the confidence band become wider (*i.e.*, the range of uncertainty becomes greater around a forecast) as one moves from the broader macro case dealing with more data and more observations to the more specific micro. Generally speaking, it is simply much more difficult to do useful and accurate individual level forecasting as compared to forecasting aggregates. The idiosyncratic variation from micro observation to micro observation makes the prediction effort difficult at best, and often unreliable.

In this case, SEA has simply assumed that crossing specific ADT volumes will be constant throughout a county, when one would clearly expect them to be subject to substantial variability. In counties experiencing new construction, for example, traffic growth can be

expected to be concentrated in adjacent roadways. Similarly, the construction of new roads or the completion of improvements on other roads can be expected to cause very specific traffic shifts as between roads. The failure of the SEA's methodology to account in any way for such differences substantially undermines its forecast.

(iv) Exogenous Factor Uncertainty

Even if a travel model were correctly specified and even if we could accurately determine the parameters of the model, there remains the issue of the degree of certainty with which we can forecast the underlying factors in the model. Many statistical and econometric models (as well as deterministic models, that is, models in which outcomes are precisely determined through known mathematical relationships among states and events) rely on underlying factors or drivers that are assumed to determine or somehow influence the variable of interest. These factors are called the model's exogenous factors. There are two polar assumptions that can be made about the exogenous factors: (1) one is that they are known with certainty and (2) the other is that the exogenous factors are as endogenous to the process being modeled as is the variable of interest. The reality lies somewhere between these two extremes, but exogenous factor uncertainty is as important as any other uncertainty in forecasting. It is another complexity ignored by the SEA's constant growth rate assumption.

Statisticians and econometricians attempt to use a model to substitute the uncertainties of the underlying factors that determine the particular variable of interest for the uncertainty in the variable of interest. By using a single growth rate, the SEA instead makes the untenable assumption that growth in vehicular traffic is constant across time and across all crossing points within a county. This assumption is clearly incorrect. As is well known, vehicular traffic depends on many factors including population, work and housing location decisions,

income levels, and the cost of gasoline. Modern approaches to vehicular traffic measurement, such as those used by the Chicago Metropolitan Agency for Planning ("CMAP"), include separate components for trip generation (how many trips will one take), destination choice (where is one going), mode choice (what transportation mode will one use), and route choice (which route will one use). Current empirical models are highly disaggregated and rely on separate exogenous factors at each level. It is unrealistic to assume, as the SEA has, that this highly complex process can be simplified into one constant growth number that (i) depends on no specifically expressed factors whatsoever and (ii) is constant for all routes within a large geographic area such as an entire county of the size of those at issue here.

Exogenous factor uncertainty makes long-term forecasting a difficult effort at best unless one assumes away the issue as has the SEA by assuming that growth rates are constant in the next year, the year after, fifteen years and even thirty years into the future. SEA growth rates are independent of gasoline prices or anything else that plausibly determines vehicular traffic. Moreover, by apparently basing these estimates on a long historical record, the SEA derives a growth factor for vehicular traffic that ignores the reality of the world in which people now drive where gasoline prices are higher than ever before and subject to significant volatility.

The factors that determine vehicular traffic growth are complex but fairly well understood. Certainly, exogenous factors such as population and gasoline prices affect vehicular trips. The trends respecting both, however, indicate strongly that the growth rates selected by SEA are far too high. As the following table illustrates, the reality is that population growth in Illinois Counties is not nearly as large as are the rates of growth presumed by the SEA for vehicular traffic.

Comparison of SEA's Estimated County-wide ADT Growth Rates to Historic and CMAP's Projected Population Growth Rates

County	SEA Applied ADT Growth Rate	1980-1990 Growth Rate	1990-2000 Growth Rate	2000-2007 Growth Rate	2007-2030 Projected Growth Rate
Cook	1-2%	-.26%	.51%	-.25%	.52%
Lake (IL)	3%	1.51%	2.17%	1.40%	.75%
Dupage	3%	1.74%	1.41%	.39%	.34%
Will	3%	1.01%	3.41%	4.27%	2.06%
Lake (IN)	3%	-.90%	.17%	.22%	.54%

Source: U.S. Census data, except future growth data, which is from CMAP, http://www.chicagoareaplanning.org/data/forecast/2030_revised/ENDORSED_2030_forecasts_9-27-06.pdf

Additionally, gasoline prices are at present increasing and have reached levels in real terms that have been previously unseen by consumers in Illinois and across the rest of the United States. These observations suggest that growth in vehicular trips is likely to arrest or perhaps reverse and turn negative.

Moreover, key factors such as prices for crude oil (and prices for their derivatives such as gasoline) are getting harder rather than easier to forecast. One measure of this is the volatility of the exogenous factor measured by the coefficient of variation in the factor. The coefficient of variation is the ratio of the factor's standard deviation to its mean. A large coefficient of variation means that the factor has occurred with large swings or volatility in its realized levels relative to its historical average. Factors, for which the volatility is increasing, reveal increasing levels of uncertainty, which then makes the *ex-ante* forecast even less precise.

Consider, for example, the present situation for crude oil. The energy market has become increasingly volatile. For instance, the coefficient of variation (standard deviation divided by average) for West Texas Intermediate crude real oil prices increased from 0.15 in the period 1986-1989 to 0.25 in the period 1990-1999, and to 0.36 in the period 2000-2006.

Clearly, the past two to three years have been particularly troublesome for worldwide petroleum consumers. The next decade is more likely to face increased price volatility.

As volatility has increased, the ability to do long-term forecasting of key factors has correspondingly diminished. The coefficient of variation for real oil prices has increased from 0.1 to 0.4 in the last 30 years alone. The backdrop of changing volatility does not portend well for stable forecasting, especially using overly simplistic simulations based on constant growth for long time frames. Neither have the sophisticated models of federal agencies shown any realized ability to forecast the future even for relatively short horizons.

Accordingly, there is no reason to suggest that a forecast of vehicular traffic which itself is driven by factors that are difficult to forecast will demonstrate any accuracy beyond even a few years into the future. Of course, this situation becomes even worse when a forecast is required for an individual street crossing, especially when the SEA has relied on an assumption that growth in such traffic is constant both over time and across all street crossings in a county.

II. ADDITIONAL ISSUES REGARDING THE USE OF CONSTANT GROWTH RATES

The application of constant growth rates to current baseline data is likely to produce an inaccurate forecast, particularly over a multi-year period. While the application of a constant growth rate is simple enough to understand, the situations in which this would be an optimal forecast are nearly nonexistent. In other words, a growth rate extrapolation is very unlikely to be correct unless the underlying process is extremely simplistic. In the case of vehicular traffic, it clearly is not.

The uncertainty in the forecast of future vehicular traffic that would result from application of a constant growth rate suggests that use of such a forecast for determining

environmental impact is subject to so much uncertainty that it should not be relied on. This is especially true because SEA's presumption of large and constant growth rates influences the preponderance of the resultant environmental impact.

By way of illustration I have assembled the exact growth rates in vehicular traffic at nine crossing points for which recent (post-2004) vehicular traffic data is available. I calculated the geometric mean growth rate using all available data after 2004. I do not include data prior to 2004 as such information is likely to produce a less reliable forecast than using the latest available actual ADTs. Unlike a mechanical general annual percentage increase, use of more recent ADTs will better reflect most recent growth rates as well as critical developments on the ground that may substantially impact traffic volumes at individual crossings, such as dwindling new development in largely built out communities, improvements and additions to road networks, the continued development and improvement of public transportation, and the rising cost of gasoline, to name just a few.

Comparison of Recent Annual ADT Growth Rates with SEA's Assumed Growth Rates

Street	County	Start Year	Start ADT	End Year	End-ADT	Growth Rate	SEA's Assumed Annual Percentage Growth Factor
Allanson Road	Lake	2004	15,300	2007	14,400	-2.00%	3
Old McHenry Rd.	Lake	2004	21,400	2007	21,000	-0.63%	3
Ela Road	Lake	2004	14,300	2007	15,000	1.61%	3
Hough St. Ill (59&63)	Lake	2005	17,900	2007	17,800	-0.28%	3
Liberty Street	DuPage	2004	15,200	2005	15,400	1.32%	3
Ogden Ave. (U.S.34)	DuPage	2005	34,100	2007	36,400	3.32%	3
Cicero Ave.	SE Cook	2005	27,700	2007	21,500	-11.90%	1
Chicago Rd.	SE Cook	2005	24,300	2007	21,600	-5.72%	1
Lincoln Hwy.	SE Cook	2005	35,900	2007	27,000	-13.28%	1
					Simple Average	**-3.06%**	

Source: Developed from data collected by FRA's Office of Safety Analysis, http:/safetydata.fra.dot.gov/officeofsafety/publicsite/crossing/xingqryloc.aspx.

While SEA determines that a historical growth rate of three percent is appropriate in all but Cook County, the table above clearly demonstrates that (i) vehicular traffic has growth factors that vary by crossing point within individual counties, and (ii) that the overall growth rate has been negative in recent experience rather than positive. The assumption of constant positive growth rates in this instance is not tenable. Moreover, it is as likely that for the routes of interest, the best estimate of the near term and long term growth rate is zero. The level of uncertainty in the likely future growth rate does not lead to any confidence that the presumed growth rate should be any positive number.

III. CONCLUSIONS

I see no value in extrapolating the vehicular traffic using an arbitrary constant growth rate. The uncertainty in the rate of growth in vehicular traffic is clear. Moreover, even if an accurate growth rate could be determined, there is no reason to believe that a county wide growth rate would have any applicability to specific routes within the county. There is no procedure available to the SEA that could give it any confidence in such a methodology. These problems are exacerbated as one moves from the macro to the micro level (*e.g.,* in the examination of specific crossing points).

Similarly, I have explained that forecasts are subject to various sources of uncertainty. These include model uncertainty, parameter uncertainty, horizon uncertainty, disaggregation uncertainty, and exogenous factor uncertainty. I have explained that each source of uncertainty in this instance makes efforts to forecast route specific vehicular traffic an exercise with very limited utility. Whether in the context of a statistical model or some other type of model, horizon uncertainty alone makes the reliability of forecasts problematic.

Additionally, we have seen that exogenous factor uncertainty has been increasing for many factors that plausibly affect vehicular traffic.

Given the route specific uncertainty in likely future vehicular traffic growth rates, and the strong indications that ADT growth may be zero or even negative, it is my opinion that at most a zero growth rate should be assumed in any environmental impact with respect to these key routes. This suggests that the SEA should simply rely on the most current available ADT information, such as that developed by IDOT, without assumed additional growth. Alternatively, I would argue that if SEA feels compelled to assume some growth rate higher than zero it should derive its growth rates from those projected by CMAP. Given the trends discussed above toward reduced growth and driving, CMAP's estimates are presumably high due to data and model lag. Nonetheless, CMAP's assignments of specific growth rates is a more likely indicator of future growth rates for route specific vehicular traffic, and CMAP's estimates are at least based on a rigorous transportation model that is route specific.

The Seasonal Demand for Electricity in the Pacific Northwest, with Steven E. Henson,

Bonneville Power Administration, DE-AI79-83BP13579, 1985.

The Role of Capital in Public Utility Industries: An Integration of Economic and Financial Effects, with Daniel L. McFadden (P.I.) and Tom C. Cowing, National Science Foundation Grant #SES-8205713, 1983.

Examples of Professor Dubin's work include:

INTELLECTUAL PROPERTY

- For a defendant law firm, Dr. Dubin developed a damage estimate for patent infringement litigation involving a computer upgrade chip patent.
- For a photographic equipment manufacturing company involved in patent infringement litigation, Dr. Dubin developed an econometric model to measure the relevant market, the product demand in that market and the damages resulting from the infringement.
- For a major computer company involved in patent litigation, Dr. Dubin reanalyzed a survey of computer purchase decisions offered by plaintiffs as evidence of historical damages. Dr. Dubin also designed and implemented a survey of computer users to measure potential damages.
- For a large U.S. food and beverage company, Dr. Dubin has developed econometric theory and models to assign values to several intangible assets. His approach is based on the comparison of the demand for branded and private label products.
- For a Japanese manufacturer of fractional horsepower micro-motors used in automobile power door locks and power mirrors allegedly infringed by a Hong Kong manufacturer, Dr. Dubin developed an econometric model of the world demand for micro-motors. This model was used in conjunction with an international pricing model to calculate lost profits from foregone sales and price erosion.
- For a large manufacturer of a top-50 chemical, Dr. Dubin developed a model of the world supply and demand for this chemical in order to calculate the damage resulting from a process patent infringement.
- In federal court litigation brought in New Orleans, Dr. Dubin assisted in developing a celebrity goodwill value assessment for appropriating a nationally known chef's likeness.
- For a developer of software, which provides credit card scoring, Dr. Dubin assisted counsel in developing alternative damage theories.
- For a manufacturer of a branded car wax, Dr. Dubin assisted counsel in damage calculations under alleged trade dress and trademark issues.
- For a manufacturer of artificial joint implants, Dr. Dubin developed an econometric model of

product selection by orthopedic surgeons in order to quantify potential lost profits.

ANTITRUST

- For generic manufacturers of several leading pharmaceuticals, Dr. Dubin analyzed higher prices paid by consumers that resulted from delaying the time when manufacturers branded patented drugs go off patent.
- For the generic manufacturers of a leading anti-cancer chemotherapy drug, Dr. Dubin considered the anti-competitive effects of patent extensions by these patent holders. He also analyzed the demand for chemotherapy agents and the extent of the market.
- For the Oakland Raiders, Dr. Dubin analyzed the demand for NFL football. He designed an econometric model to test audience effects on individual demand, as well as how aspects of team performance affect demand. This model established that opening season box office performance could have lingering effects for a football team in terms of demand for tickets.
- For the Department of Justice, Dr. Dubin was the lead economist and expert in a multinational merger analysis of major cardio ultrasound equipment manufacturers. Dr. Dubin utilized nested logit techniques to determine the patterns of substitution for purchasing ultrasound equipment. He then used these models to determine the price consequences for cardio ultrasound equipment that would likely occur as a result of the merger.
- For a manufacturer of agricultural silage bags, Dr. Dubin assessed geographic market definition and considered the joint market power of distribution of agricultural silage bags as evidenced by their boycott of specific manufacturers.
- For a group of corn-syrup manufacturers accused of price-fixing, Dr. Dubin provided econometric rebuttal testimony to demonstrate that the opposing expert did not demonstrate price-fixing.
- For a group of merging railroads, Dr. Dubin developed rebuttal testimony to demonstrate that the opposing expert had overstated the likely diversion from rail to truck.
- For architectural hinge manufacturers accused of price collusion, Dr. Dubin developed a model of hinge pricing based on hundreds of thousands of individual transactions.
- For the U.S. Department of Justice, using scanner data, Dr. Dubin developed econometric models of the demand for white bread. These models were used to demonstrate a proposed merger's likely price consequence.
- For a telecommunications company, Dr. Dubin developed an econometric model of the choice by individuals of market versus self-insurance and showed that the damages resulting from alleged unfair marketing were substantially mitigated.
- In an antitrust action filed in New York, Dr. Dubin assisted in preparing a report assessing

the divisional capital asset pricing model (CAPM) betas for an international copier and printer company.

STRATEGIC AND MANAGEMENT CONSULTING

- For a large refining company, Dr. Dubin developed an econometric model of gasoline demand.
- For Canada Post, Dr. Dubin developed an econometric model of the demand for various mail products and evaluated the simulation of a previously estimated econometric model.
- For a company doing credit card scoring analysis, Dr, Dubin evaluated the financial consequences that losing a sole-supply contract would have on market capitalization.
- For a major bank, Dr. Dubin analyzed the effects of automatic teller machines on the market for travelers checks.
- For the State of California, Dr. Dubin examined the effects of state income tax enforcement.
- For a gas pipeline restructuring under FERC Order 636a, Dr. Dubin developed a model analyzing the competitiveness of various market segments.
- For a gas pipeline, Dr. Dubin analyzed the competitive nature of the market for gas storage.
- For a top-five mail order company, Dr. Dubin analyzed historical purchase and promotion data at the individual level to model retail mail order demand, promotion effectiveness, and purchase behavior over time.
- For a large-scale manufacturer of architectural windows, Dr. Dubin has analyzed a new manufacturing process using structural econometric techniques and has designed an optimal production process.
- For the American Gaming Association, Dr. Dubin assisted in the development of economy-wide multiplier benefits from the gaming industry.
- For the Canadian Postal Service and Canadian Direct Marketing Association, Dr. Dubin prepared an econometric model of the demand for addressed admail and related complimentary products. This model was used to access the consequences of a proposed price increase in addressed admail.
- For a major oil-producer in Alaska, Dr. Dubin assisted in developing a model of crude oil pricing and determined the effects of natural gas liquids on crude prices.
- For a major energy company operating in Bolivia, Dr. Dubin analyzed the appropriate capital asset pricing model beta and quantified country risk and project risk.
- For a gas pipeline seeking market-based rates, Dr. Dubin conducted a discounting and

elasticity of demand study to demonstrate the workable competitive nature of the market.

NATURAL RESOURCE DAMAGE ASSESSMENT

- For a major mining corporation operating in the State of Montana, Dr. Dubin developed a discrete-choice model of river choice for recreational fishing and calculated the level of damages sustained from the diminished quality of a specific river.
- For the owner of a mining operation in Colorado, Dr. Dubin analyzed a residential pricing model offered as evidence by the plaintiffs in a class-action suit alleging loss of property values due to pollution of a river.
- For several potentially responsible parties in California, Dr. Dubin developed an econometric model of commercial fishing and determined the magnitude of potential damages from the effects of alleged ocean pollution.
- For a major oil company operating in the State of Texas, Dr. Dubin analyzed the level of damages sustained to property holders due to proximity to a toxic waste site.
- For several chemical companies operating in the state of Massachusetts, Dr. Dubin reanalyzed a property value-pricing model offered as evidence by the U.S. government in a superfund suit alleging damages from the pollution of a harbor near Boston.
- In litigation involving a superfund site in Los Angeles, Dr. Dubin assisted defense counsel in deposing plaintiff's expert economic witnesses regarding the design and findings of a CVM survey utilized to compute non-use damages. Dr. Dubin assisted in critiquing the CVM survey design methodology and in proposing and redesigning the survey.
- For a major electronic manufacturer operating in Phoenix, Arizona, Dr. Dubin assisted in the development of hedonic pricing regression models to measure the affect of ground water contamination on residential housing prices.

SURVEY RESEARCH

- For the City of Los Angeles, Dr. Dubin analyzed the LAPD's use of force reports. He accomplished this using stratified sampling methods across the various reporting districts in Los Angeles.
- Dr. Dubin assisted lawyers for merging railroads in determining whether a proposed merger would affect hazardous materials shipments. Dr. Dubin used sampling methods to determine the traffic volume that would have to be sampled in order to produce reliable hazardous material shipment estimates.
- For a major psychiatric hospital in the U.S., Dr. Dubin designed a survey of hospitals in the U.S. to measure patient overcharges.

- For a major food products manufacturer, Dr. Dubin designed a sample for the valuation of inventory and fixed assets.
- Dr. Dubin has analyzed survey results from several national surveys of individuals (NIECS, SIPP, BPA).
- For a major computer hardware company involved in litigation, Dr. Dubin designed a survey of computer software users regarding their purchase decisions.
- For counsel representing two merging railroads, Dr. Dubin critiqued a well known engineering model of railroad traffic.
- For counsel representing an intervening railroad, Dr. Dubin assisted in preparing discovery and deposition questions of an opposing statistical expert.
- For counsel representing two merging railroads, Dr. Dubin has performed a statistical sampling of traffic movements in order to measure potential divertible traffic.
- For the Los Angeles Police Department, Dr. Dubin developed statistical random samples of specific police activity in connection with the consent degree between LAPD and the Department of Justice.

UTILITY MERGERS

- In several proposed mergers of electric and gas utilities, Dr. Dubin explored and analyzed the projected synergies associated with the merger of two utilities. Dr. Dubin projected energy requirements for both stand-alone utilities and the combined utility over a period of ten years. Future capital requirements and savings resulting from the merger were calculated and projected over a ten-year period for both the merged and stand-alone scenarios.
- Dr. Dubin developed the BEARS and BULLS Merger model to analyze potential synergy savings and pro-forma balance sheets for proposed utility mergers. Dr. Dubin has applied this model in several utility merger cases.

CIVIL LITIGATION

- For the Internal Revenue Service, Dr. Dubin implemented measures of shareholder common control from voluminous monthly shareholder data covering a five-year period.
- Dr. Dubin assisted in determining the appropriate refund level due to the California Independent System Operator (CAISO) from their electricity purchases in the California wholesale energy market. Dr. Dubin developed models to calculate the natural gas spot price from published ranges and average prices.
- For several tobacco companies, Dr. Dubin addressed the issue of whether cigarette smoking and asbestos exposure were synergistic in causing lung cancer. Dr. Dubin has analyzed

several aspects of the tobacco-asbestos synergy issue to determine whether a combined exposure to smoking and asbestos raise the likelihood, above the individual risks, that an individual will contract lung cancer. Dr. Dubin reanalyzed the American Cancer Society database, and also conducted meta-analyses of early studies.

- For the City of San Francisco, Dr. Dubin developed a model that measured damages resulting from a major bank's failure to escheat municipal bond interest.
- For a major energy supplier in the Northwest, Dr. Dubin developed a model that measured damages resulting from a major bank's failure to escheat bond interest.
- For the City of San Francisco and the State of California, Dr. Dubin developed a model of fee overcharge and hidden interest collected by a large California title company.
- For the state of Alaska, Dr. Dubin developed a model that measured damages resulting from a major bank's failure to escheat bond interest.
- For a defendant bus company, Dr. Dubin calculated the present discounted value of future medical costs under various life scenarios.
- For the IRS, Dr. Dubin helped develop a shareholder value model that demonstrated that a packaging company's reorganization was a tax sham.
- For a grocery store chain, Dr. Dubin developed models of the demand for hamburgers to demonstrate the stigmatic effect on sales from bad publicity.
- For a gas company operating in the west, Dr. Dubin helped develop an econometric pricing model for carbon dioxide gas.

TESTIMONY

Before the Washington Utilities and Transportation Commission, Rebuttal Testimony on Behalf of Puget Sound Energy, Inc. Docket No. UE-072300, UG-072301, July 3, 2008. pdf (66kb)

Before the United States Court of Appeals, Ninth Circuit, Writ of Certiorari. Docket Nos. 06-1457, 06-1462, November, 2007. pdf (2.02mb)

Before the Public Utility Commission of Oregon, Affidavit on behalf of Pacificorp. Docket No. UM 1002, November 19, 2007. pdf (449kb)

Before the United States District Court, District of Maryland Southern Division, Deposition Testimony on behalf of Marriott International, Inc., a Delaware corporation, et al., Case No. 8:05-CV-00787-PJM, October 23, 2007. pdf (1140kb)

Before the Public Utility Commission of Oregon, Trial Testimony on behalf of Pacificorp. Docket No. UM 1002, August 8, 2007.

Before the Public Utility Commission of Oregon, Supplemental Reply Testimony on behalf of Pacificorp. Docket No. UM 1002, July 30, 2007. pdf (620kb)

Before the Eighth Judicial District Court, Clark County, Nevada, Trial Testimony on behalf of Advanced Medical Products, Inc. Case No. A449091, January 17, 2006.

Before the Eighth Judicial District Court, Clark County, Nevada, Deposition Testimony on behalf of Advanced Medical Products, Inc. Case No. A449091, January 15, 2006. pdf (254kb)

Before the United States District Court, Central District of California, Deposition Testimony on behalf of Castaic Lake Water Agency; Newhall County Water District, et al., Case No.CV00-12613 AHM RZx, December 12, 2006. pdf (4 mb)

Before the Eighth Judicial District Court, Clark County, Nevada, Deposition testimony on behalf of Advanced Medical Products, Inc. NRCP Rule 16.1(a)(2)(B) in Case No. A449091 Consolidated with Case Nos. A452332, A482194 & A49259, November 15, 2006. pdf (362 kb)

Before the Washington Utilities and Transportation Commission, Trial Testimony on behalf of Puget Sound Energy Inc., Docket No. UE-060266, Docket No. UG-060267, September 20, 2006. pdf (51.8kb)

Before the Washington Utilities and Transportation Commission, Prefiled Rebuttal Testimony on behalf of Puget Sound Energy Inc., Docket No. UE-060266, Docket No. UG-060267, August 26, 2006. pdf (95.1kb)

Before the United States District Court, District of Maryland Southern Division, Deposition Testimony on behalf of Marriott International, Inc., a Delaware corporation, et al., Case No. 8:05-CV-00787-PJM, February 24, 2006. pdf (1.11 mb)

Before the Superior Court of the State of California, County of Orange County - Central Justice Center, Deposition Testimony on behalf of Marilyn Miglin, an Individual, and Duke Miglin, an Individual, January 9, 2006. pdf (816kb)

Before the Washington Utilities and Transportation Commission, Trial Testimony on behalf of Puget Sound Energy, Inc., Docket No. UG-040640, Docket No. UE-040641, December 15, 2004. pdf (373kb)

Before the Washington Utilities and Transportation Commission, Trial Testimony on behalf of Puget Sound Energy, Inc., Docket No. UG-040640, Docket No. UE-040641, December 14, 2004. pdf (164kb)

Before the Washington Utilities and Transportation Commission, Prefiled Rebuttal Testimony on behalf of Puget Sound Energy, Inc., Docket No. UG-040640, Docket No. UE-040641, November 3, 2004. pdf (243kb)

INTRODUCTION

In 2007, Canadian National Railway Company and Grand Trunk Corporation (CN) filed an application with the Surface Transportation Board (STB) seeking approval to acquire control of the main rail line of Elgin, Joliet, and Eastern Railway Company (EJ&E) around Chicago, IL. CN plans to use EJ&E's main rail line to connect all five of CN's rail lines in the Chicago metropolitan area. Figure 1 shows the locations of the CN lines and EJ&E's main line.

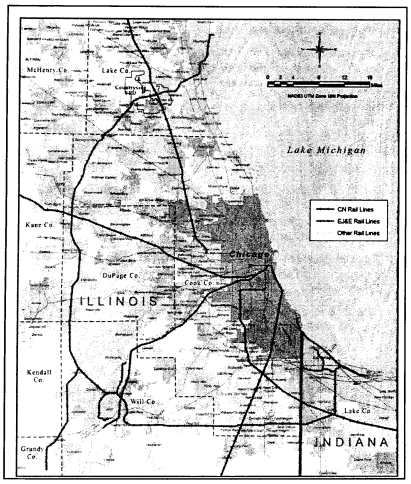

Figure 1: CN Lines and EJ&E's Main Line Locations

The acquisition, referred to hereafter as the proposed action, would result in an additional 13 to 22 trains per day traveling on the EJ&E line, as much of the train traffic currently traveling on CN's lines is diverted onto the EJ&E line. Traffic on the CN lines between

the EJ&E line and downtown Chicago would generally decrease. Because the increase in train traffic exceeds the STB's thresholds for environmental analysis, the STB's Section of Environmental Analysis (SEA) conducted a Draft Environmental Impact Statement (DEIS) describing the proposed action, alternatives (including a no-action alternative), the existing environment potentially affected by the proposed action, the potential environmental impacts associated with the proposed action and the alternatives, and potential mitigation measures.

The impacts examined by the DEIS included the estimated change in emergency response times of fire and police departments due to the change in the train traffic and resulting delays, at the at-grade road/rail crossings. The DEIS used two measures to evaluate the impacts at each affected intersection:

- The average delay for delayed vehicles (denoted D_A in the DEIS). This measure describes the anticipated impact on normal vehicles, which is used as a proxy for the impact on emergency vehicles.
- The total daily time the crossing is blocked by a train (denoted T in the DEIS).

Intersections found to have a D_A greater than 30 seconds or a T greater than 30 minutes were identified as potential problem areas in the DEIS. However, these impact measures have a number of limitations:

- D_A did not incorporate the interactive effects of peak and off-peak commuter traffic and emergency vehicles at the rail/highway at-grade crossings. For example, different amounts, and temporary distribution of, traffic volume at the crossings can result in different delays for emergency vehicles, with the same D_A values.
- The performance measures do not incorporate the probability that a given emergency response call will utilize an at-grade railroad crossing and therefore be at risk of delay due to a train.
- D_A and T are not direct indicators of impacts on emergency vehicles. Instead, they evaluate the impacts on regular traffic as a proxy for emergency vehicles. There is no explicit consideration of emergency services.

The present study represents a more comprehensive analysis of the impact of the proposed action on emergency response times through use of a model of train, emergency vehicle, and regular traffic to determine the change in emergency response times resulting from implementation of the proposed action.

STUDY AREA

Per discussions with the local stakeholders, the current study focuses on assessing the impact of CN's proposed action on fire emergency response times within the Countryside Fire Protection District (FPD) District 41C. Countryside FPD, shown in Figure 2, consists of five districts and is located just south and west of the Village of Mundelein in Lake County, Illinois.

District 41C comprises the south-central portion of the Countryside FPD, as shown in Figure 3. It is bordered to the east by a CN rail line, which handles both cargo and commuter trains. The district's northern boundary lies just south of the EJ&E railroad line, which is expected to experience increased train traffic as a result of the proposed action. Train traffic on CN line is expected to decrease as a result of the proposed action.[1]

The three nearest fire stations to District 41C are incorporated into the model. These include the two fire stations within the Countryside FPD, Station #1 and Station #2, as well as Mundelein Fire Station #2, which lies just outside the Countryside FPD.

Emergency response by these three fire stations to District 41C is expected to utilize six railroad crossings:[2]

- IL-60/83: This at-grade crossing of the EJ&E line is expected to see an increase in train traffic as a result of the proposed action.
- Diamond Lake Rd: This at-grade crossing of the EJ&E line is expected to see an increase in train traffic as a result of the proposed action.
- US-45 (North): This is a grade-separated crossing of the EJ&E line.
- IL-60: This at-grade crossing of the CN line is expected to see a decrease in freight train traffic as a result of the proposed action.
- Butterfield Rd: This at-grade crossing of the CN line is expected to see a decrease in freight train traffic as a result of the proposed action.
- US-45 (South): This at-grade crossing of the CN line is expected to see a decrease in freight train traffic as a result of the proposed action.

[1] The district boundaries were obtained from analysis of a hardcopy map rather than from an electronic source.
[2] Gilmer Rd and the EJ&E line, an additional at-grade rail crossing in the Countryside FPD that was noted in the DEIS, is not likely to be used by emergency vehicles traveling to District 41C.

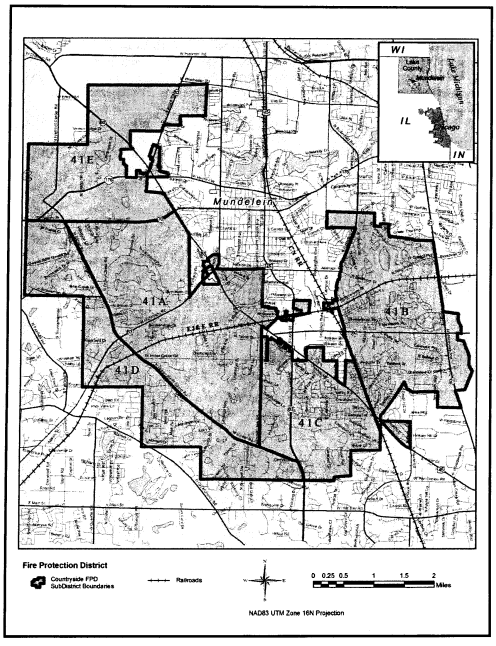

Figure 2: Countryside Fire Protection District

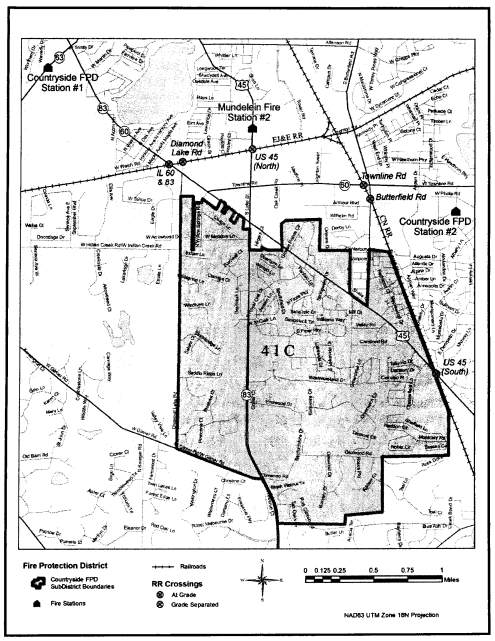

Figure 3: Project Study Area

METHODOLOGY

To assess the impact of the proposed action on emergency response times, IEM applied its QEM® methodology, which has been employed for more than 100 simulation-based studies. 39 of these studies specifically evaluated emergency response. The QEM® methodology was used to develop a model of the transportation network in the study area. The model was built in PTV Vision VISSIM, a widely-accepted stochastic, microscopic, and behavior-based transportation simulation software application with over 430 users in North America, including 18 State departments of transportation, 90 academic departments, and the Federal Highway Administration.

IEM's model of the study area simulates the movements of normal traffic, as well as emergency vehicles. In each simulated model run, the emergency vehicles from each of the three fire stations travel to a randomly selected emergency response destination in District 41C during typical morning peak-hour traffic. Trains were simulated on both the CN and EJ&E lines to measure their impact on the emergency vehicle travel times, under current conditions and under the proposed action, due to the possible blockage of the six railroad crossings described above. Normal vehicles, representing regular traffic, were incorporated into the model to represent their interactions with emergency vehicles.

Model simulations were run for four scenarios that were identified during discussions with the project stakeholders:

- **Scenario 1**–2008 No Action: Normal vehicle and train traffic reflected current conditions.
- **Scenario 2**–2008 Proposed Action: Normal vehicle traffic reflected current conditions. Train traffic was adjusted to reflect the CN/E&JE acquisition.
- **Scenario 3**–2015 No Action: Normal vehicle traffic was projected to reflect conditions expected in the year 2015. Train traffic reflected current (non-acquisition) conditions.
- **Scenario 4**–2015 Proposed Action: Normal vehicle traffic was projected to reflect conditions expected in year 2015. Train traffic was adjusted to reflect the CN/E&JE acquisition.

The following sections describe the development of various factors that were considered in the creation of the model.

Road Network

The road network incorporated in the model includes all major roads within the study area (Fire District 41C), as well as major roads leading to the three nearest fire stations, Countryside Fire Stations #1 and #2 and Mundelein Fire Station #2.

The road network was assembled from high-quality, regularly updated NAVTEQ street network data. NAVTEQ networks, which are also used by Google Maps and MapQuest,

are detailed and include neighborhood streets in every community in North America. These data are updated on a continuous basis, ensuring a high level of accuracy.[3]

The road network geography and attributes, such as the number of lanes, were validated and refined by analysis of aerial photographs of the area. Intersection attributes, such as the locations of turn lanes and traffic controls (signs and signals), were also identified using aerial photographs and during a site visit. These features and attributes were incorporated into the transportation model.

Normal Traffic

To accurately model traffic volumes for a typical morning peak hour, IEM collected data from a number of sources:

- An interactive mapping site[4] maintained by the Illinois Department of Transportation (IDOT) was used to collect Annual Average Daily Traffic (AADT) values on key roads throughout the study area.
- The Chicago Metropolitan Agency for Planning (CMAP), which oversees the model used for transportation planning around the Chicago area, provided current AADT values and projected traffic volumes for year 2020 for each leg of 10 key intersections in the study area.
- Parsons Transportation Group, an environmental consultant retained by CN, collected morning peak traffic volume and queue counts for several key roads and intersections around the boundary of the study area.

IEM used these data to estimate morning peak hour directional traffic volumes for two dozen sites across the transportation network. Hourly counts collected by Parsons were used for key intersections. In locations where hourly counts were not available, peak hour and directional percentages were estimated using values from nearby or similar road segments. This approach reflects IDOT's standard methodology for estimating peak hour and directional traffic volumes.[5] These directional traffic volumes were then used to determine the normal traffic volumes used in the model.

In order to capture the impact of turning vehicles, IEM estimated turning movements at the key intersections in the transportation network. To do this, IEM analyzed the directional volumes on each leg of the intersection using an internally-developed intersection analysis tool to determine the left, right, and through turning volumes that most closely matched the expected vehicular behavior at the intersection. These turning volumes were then used to program behavior in the transportation model.

[5] "State Procedures for Developing K-factors, D-factors, and Percent Trucks." Federal Highway Administration. May 2003. Retrieved from the Federal Highway Administration: http://knowledge.fhwa.dot.gov/cops/hcx.nsf/All+Documents/6E7B086CB3F97CBE85256D2E003DEF02/$FILE/KD and Pct Truck Report May 15 2003.doc

Finally, for each of the traffic volumes IEM used the growth rate information provided by CMAP to project the year 2015 estimates. The peak hour and directional factors, as well as the turning splits at each intersection, were assumed to be the same as the existing conditions.

Emergency Vehicles

Emergency vehicles were included in the model to estimate the change in their response times as a result of the proposed action. In order to accurately model all aspects of the emergency responses, IEM requested (from the Countryside Fire Protection District and the Mundelein Fire Department) the following data describing past emergency calls in the study area:

- Time of day
- Fire station dispatched in response
- Emergency response destination
- Emergency response time and travel time

The above information was provided to IEM too late in the project for inclusion in the modeling process. However, the information provided was used by IEM to compare the modeling results and benchmark the key measures of effectiveness (e.g., emergency vehicle response times to District 41C) by conducting some simplistic analysis. IEM can conduct a more thorough analysis, if additional time is made available.

In addition, IEM requested information on the dispatch policy or strategy used to allocate calls from within District 41C to the surrounding fire stations. This information has not been provided to IEM, so IEM used an alternative set of estimates to approximate the emergency vehicle travel used in the model.

Trip Origins and Destinations

Responses to emergency calls were modeled from each of the three study fire departments, which served as the origins of all emergency vehicle trips in the model. Each fire station was considered independently in the analysis of the model results.

The spatial distribution of the emergency response destinations was approximated with population data. District 41C was divided into 10 population subareas, based on a population distribution analysis of the area (Figure 4). It was then assumed that the number of calls in each zone would be proportional to the population.

To estimate the population subareas, IEM obtained second-quarter 2008 population data from Synergos Technologies.[6] Emergency response destinations were then randomly assigned to the fire stations proportionate to the population in each subarea.

[6] Synergos Technologies, Inc. Online: http://www.synergos-tech.com.

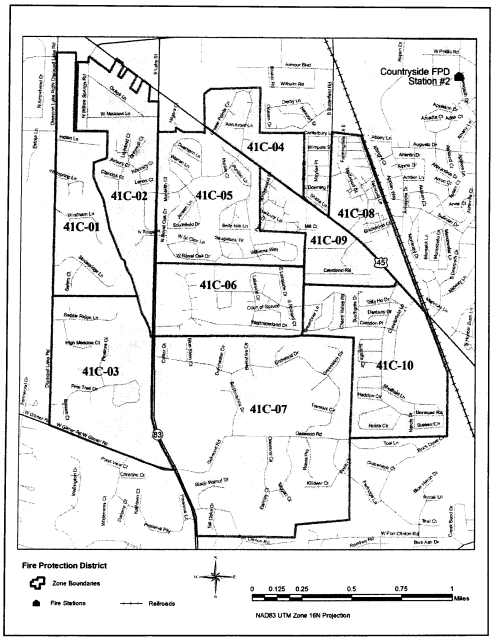

Figure 4: District 41C Population Subarea

Travel Speeds

Emergency vehicle speeds were simulated using the following principles:

- When unobstructed by congestion, emergency vehicles traveled at the same speed as the surrounding traffic.
- In areas where surrounding vehicles were stopped or traveling slowly due to congestion, emergency vehicles were allowed to pass them, but at a lower speed than if unobstructed.
- Many signalized intersections in the study area have preemption systems that ensure that approaching emergency vehicles will have a green light when they reach the light. To account for this in the model, emergency vehicles were allowed to bypass the traffic queue, but at a lower speed than if the intersection was unobstructed.

Trains

The daily volume, length, and average travel speed of the freight trains on CN[7] and EJ&E[8] lines were obtained from the DEIS. The hourly volumes of the trains were determined by assuming a uniform temporal distribution over 24 hours. Additionally, IEM simulated the commuter trains on CN lines during the morning peak hour, according to the schedule obtained from the Web site of Chicago Metra.[9]

The duration of blockages at the railroad crossings was determined by the train length and speed. The railroad/highway at-grade crossings were modeled to be blocked 30 seconds before the trains arrived and five seconds after the train left in accordance with the procedures used in the DEIS.

RESULTS

Model Calibration and Validation

To ensure the simulation accurately reflects actual traffic conditions, model calibration and validation are of paramount importance.

Traffic Volumes

An initial calibration compared the simulated peak hour volume to corresponding traffic count data collected by Parsons in the field. After inputting traffic demand data and configuring turn movements at each intersection, virtual loop detectors were placed at the links with count stations in the simulation model. The purpose of this was to simulate real-world conditions to ensure the model generated the observed volumes.

[7] Table 4.3-7 on page 4.3-28 of DEIS
[8] Table 4.3-5 on page 4.3-16 of DEIS
[9] http://metrarail.com/Sched/ncs/ncs.shtml

IEM collected the traffic volumes at 21 count stations from the field and compared the volumes with that generated in the simulation model. Table 1 lists the locations and count measurement methods for them. A "direct" measurement comes from an actual count in the field. "Calculated" measurements were estimated using the CMAP AADT count for the location and the peak-hour volume factor from the closest direct count station.

Table 1: Traffic Count Stations

Count Station	Location	Count Method
1	Midlothian SW of IL-60/83	Direct
2	IL-60/83 SE of Midlothian	Calculated
3	IL-60/83 NW of Midlothian	Direct
4	Midlothian NE of IL-60/83	Calculated
5	Diamond Lake Rd S of IL-60/83	Calculated
6	Diamond Lake Rd N of IL-60/83	Calculated
7	IL-60/83 SE of Diamond Lake Rd	Calculated
8	IL-60 between IL-83 & U.S. 45	Calculated

19	IL-83 N of Gilmer Rd	Direct
20	IL-83 S of Gilmer Rd	Calculated
21	Gilmer SE of Diamond Lake Rd	Calculated

Figure 5 compares the morning peak-hour traffic volume estimates at these locations with corresponding values from the model. Overall, the modeled volume was within one percent of the measured value. The highest individual station volume error was no more than 10 percent and most individual count errors were less than five percent.

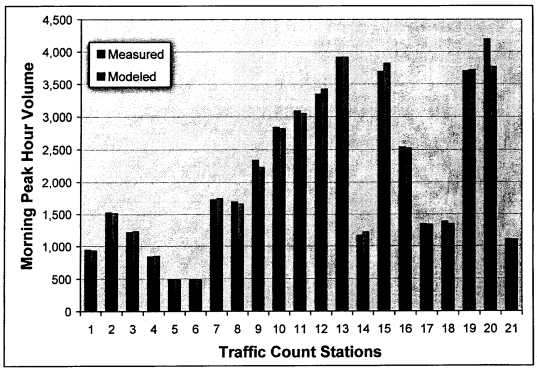

Figure 5: Model Traffic Volumes vs. Real-life Estimates

Travel Times

Modeled travel times for a handful of routes through the study area were also compared against corresponding field-observed values as another means of calibrating the model. The routes used in this comparison were identified as those to be most likely used by emergency vehicles from the three fire stations to respond to emergency calls in the study area.

Parsons collected the travel times along the selected routes by traveling in the selected direction during the morning peak hour. Three runs were performed for each travel time collection route and then averaged to minimize the impact of outliers. The adjusted travel times were recorded as average regular vehicular travel times along the corresponding roadway segments during the same peak morning hours.

IEM then adjusted road network and driver behavior parameters in the transportation software such that travel times in the model were similar to those collected in the field. Driver behavior parameters, including driver aggressiveness and awareness, mean target headway, and mean reaction time were modified to reflect local conditions and engineering judgment. The parameters were adjusted and the model was run in an

iterative process until the simulation model was considered to accurately reflect the observed travel times within one percent.

Little difference was observed between the observed and simulated queue lengths at bottleneck points (typically at signalized intersections). Table 2 presents the comparison between the measured and simulated travel times.

Table 2: Modeled and Measured Travel Times in Seconds

Route	Route Description	Measured Travel Time	Modeled Travel Time
1	From the intersection of IL-83/60 at Midlothian Rd, travel south via IL-83, to a point 100 yds north of Gilmer Road	578	627
2	From the intersection of S Lake St. (US-45) at W Hickory St., travel south via US-45 to a point 100 yards north of US-45 and CN/Wisconsin Central highway/railway at-grade crossing	486	508
3	From the intersection of Townline Rd (IL-60) at N Deerpath St, travel west via IL-60 to intersection of Townline Rd (IL-60) at S Lake St. (US-45), turn south to US-45, go straight at the intersection of US-45 and IL-83, continue on IL-83 to a point 100 yards north of Gilmer Rd.	431	414

Congestion and Queuing

Finally, IEM performed a review of animation features of the traffic model to ensure congestion and queuing in the model occurred in the same locations and to the same extent as was observed during field observations. This qualitative validation step was done as a final confirmation that the model accurately represented real-life conditions. Inspection of the modeled congestion patterns was conducted by an experienced traffic engineer using a 2-dimensional visualization and observed patterns were considered reasonable.

Emergency Call Generation

As described above, emergency calls were spatially distributed across 10 population subareas within District 41C in proportion to the population living in each population subarea. As shown in Figure 6 the modeled distribution for number of emergencies calls in each population subarea matches well against the populations for each of the subareas.

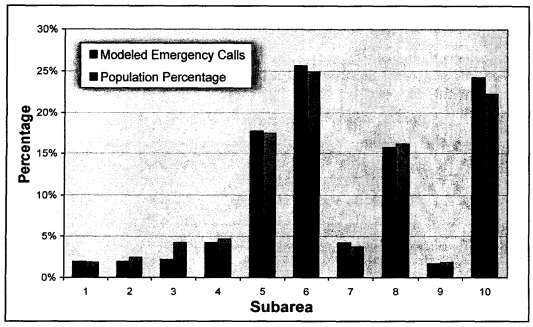

Figure 6: Modeled Emergency Call Percentage vs. Population Percentage by Subarea

Emergency Response Times

The transportation model simulated the travel of emergency vehicles, normal vehicles, and trains to determine the impact of the proposed action on emergency response times. Non-transportation-related aspects of emergency response, such as 911 dispatch times and fire station turnout times, are not expected to be impacted by the proposed action, so the impact from changing train traffic patterns on emergency vehicle travel times was assumed to be equivalent to the impact on overall response times.

The simulations indicated that the average emergency response times to District 41C will not be impacted in a meaningful way by the proposed action. For each fire station and year combination, the travel time for the proposed action scenario differed by no more than five seconds from the corresponding no action scenario. Table 3 shows the average emergency response time in seconds produced by the model for each of the four scenarios. The following section describes a more detailed statistical analysis of the results.

Table 3: Average Travel Time by Fire Station and Scenario (in seconds)

Scenario	Countryside Fire Station #1	Countryside Fire Station #2	Mundelein Fire Station #2
2008 No Action	383	288	247
2008 Proposed Action	385	286	250

Scenario	Countryside Fire Station #1	Countryside Fire Station #2	Mundelein Fire Station #2
2015 No Action	390	287	257
2015 Proposed Action	390	287	255

Statistical Analysis

A statistical analysis was conducted to describe and interpret differences in the modeled response times between scenarios. The analysis found no statistically significant changes in average response times between corresponding "no action" and "proposed action" scenarios.

However, the data was used to generate confidence intervals for the expected change in response times due to the proposed action. Table 4 presents the 95% confidence intervals for the change in average response time from the "no action" scenario to the corresponding "proposed action" scenario for each combination of year and fire station.

Table 4: 95% Confidence Interval for Changes in Average Response Times Due to Implementation of the Proposed Action

Fire Station #	Year	95% Confidence Interval for Change in Average Response Time between "no action" and "proposed action" Alternatives (seconds)
Countryside #1	2008	(-9.6, 6.4)
Countryside #1	2015	(-8.2, 8.0)
Countryside #2	2008	(-7.0, 10.4)
Countryside #2	2015	(-8.6, 8.9)
Mundelein #2	2008	(-9.2, 4.9)
Mundelein #2	2015	(-5.9, 8.3)

For each scenario, the model results indicate with 95% confidence that the average change in response time due to the proposed action will fall within the range of values shown. Positive values indicate an expected increase in travel times due to the proposed action. Negative values indicate an expected decrease in travel times due to the proposed action. For example, the model results indicate a 95% likelihood that the 2008 average response time for Countryside Fire Station #1 would be between 9.6 seconds longer and 6.4 seconds shorter if the proposed action was implemented than if no action had been taken.

The mean response time, confidence intervals, and other statistical characteristics of the simulated emergency responses are illustrated graphically using box plots. Figure 7,

Figure 8, and Figure 9 show the box plots of the response times for the four scenarios for Countryside Fire Station #1, Countryside Fire Station #2, and Mundelein Fire Station #2, respectively.

In these plots:

- The box represents the middle 50% of the data (the 25th through 75th percentiles).
- The line in the center of the box represents the median. Fifty percent of the response times were shorter than this value.
- The plus sign within the box represents the mean (average) response time.
- The vertical limits of the bar represents the minimum and maximum response times for the scenario.

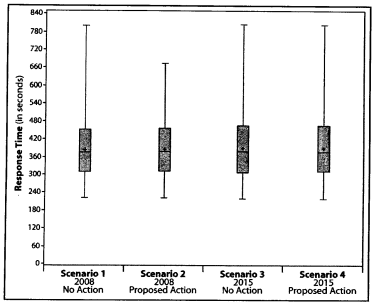

Figure 7: Emergency Response Times by Scenario, Countryside Fire Station #1

For example, the leftmost plot in Figure 7 represents the response time for the "2008 No Action" scenario for Countryside Fire Station #1. We can see that the range of the box (inter-quartile range) is from approximately 310 seconds to 450 seconds. This means that 25% of the simulated response times for this situation are shorter than 310 seconds and 75% of the simulated response times for this situation are shorter than 450 seconds. The median falls around 375 seconds and the mean is close to 380 seconds.. The actual data for this example are shown in Table 5.

Table 5: Model Emergency Response Time Statistics for Countryside Fire Station #1, 2008 No Action Scenario

Statistic	Response Time (seconds)
Maximum	801
75th percentile	452
Median	377
Mean	383
25th percentile	312
Minimum	221

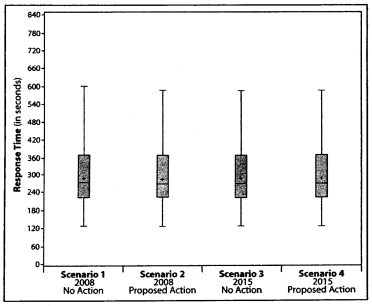

Figure 8: Emergency Response Times by Scenario, Countryside Fire Station #2

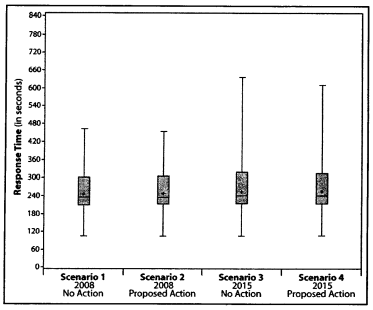

Figure 9: Emergency Response Times by Scenario, Mundelein Fire Station #2

Emergency Consequences

Response times for some emergency calls are critical. A few minutes may mean the difference between life and death. There are two major classes of emergency calls that are especially critical, those involving fires and those involving cardiac arrest.

Fire

A recent study using NFIRS data revealed that average damage claims of $27,000 were observed when responses occurred in less than 3 minutes; $34,000 at 5 minutes; $41,000 at 7 minutes; and $61,000 at longer than 9 minutes.[10] The key assumption of this analysis is that the most significant factor determining fire severity is the response time of the fire department. Some structure fires escape early detection, because no occupants are in the structure or the inhabitants are sleeping; for example, smoke alarms are present in 96% of homes and help speed the discovery of fires.[11] Operating under this assumption, IEM combined four sources of data to generate the expected consequence projections.

The first source of data is the distribution of fire severities on a standardized scale.[12] The scale describes the extent of the fire damage, such as confined to object, room, floor, or structure of origin and beyond. Since firemen begin working to extinguish a fire shortly

[10] B. Dedman, Slower arrival at fires is US is costing lives. Boston Globe. January 30, 2005. Retrieved from http://www.boston.com/news/specials/fires/fire_departments_struggle_as_towns_grow/ on 9/23/2008.
[11] M. Ahrens, Home Smoke Alarms - The Data as Context for Decision. Fire Technology, 2008 (January).
[12] M. Ahrens, Home Smoke Alarms - The Data as Context for Decision. Fire Technology, 2008 (January).

after arrival, the extent of fire damage is a good approximation of the size of most fires at the time the firemen arrived.

The second source of data is the distribution of fire response times.[13] When our key assumption holds true, using the first two sources of data it should be the case that when a fire department responds with one of its fastest times, a truck should arrive at one of the smallest fires. So, for a response time that is at the 25th percentile of the response time distribution, the fire severity should also be at the 25th percentile of the severity distribution.

The third and fourth sources of data are the rates of damage and the risks of death for each fire severity.[14] The larger the fire, the more damage it causes and the more dangerous it is, both for firefighters and for any building inhabitants. Therefore, by predicting the size of the fire for any particular response time, we can also predict the expected average damage claims and the expected loss of life.

The table below presents damages, expected economic loss, and fatality risk for fires, as a function of response time. Note that 81% of fires are confined to the floor, room, or object of origin within the building and correspond to a response time of 8 minutes or less.

Cardiac Arrest

Cardiac Arrest is a condition in which blood circulation is significantly reduced, usually due to an arrhythmia. Because no blood is circulating in the victim, a medical response to reinitiate cardiac rhythm must occur rapidly or brain damage will occur. The successful outcome of a cardiac arrest is usually described as eventual discharge from a hospital without neurological deficit.

In general, the rate of successful outcome for a cardiac arrest outside the hospital is about 3%[15,16] and the likelihood of successful revival from cardiac arrest decreases by 7-10% for every minute of delay.[17]

If cardiopulmonary resuscitation (CPR) is started within 4 minutes of cardiac arrest, the chances of successful revival can be increased by as much as 69%.[18] Because four minutes is less than the amount of time it usually takes EMS to arrive on scene,[19] initial CPR is often performed by a knowledgeable bystander. In one study, bystanders performed CPR 56% of the time and the average time between cardiac arrest and the application of advanced life support was around 10 minutes.[20]

The use of automated external defibrillators (AED) has been shown to greatly increase the chance of a successful outcome, but available data regarding AED use centers around 10 minutes after cardiac arrest and is not useful for minute-by-minute projection. If AEDs are employed properly, the chance of a successful outcome can be as high as 30%.[21]

9	0.19	0.3135
10	0.1	0.165
11	0.01	0.0165
12	0	0

As cardiac arrests represent approximately 1% of EMS calls,[22] changes in response time are not expected to have a large impact on the total number of lives saved due to delay in response times, notwithstanding the fact that for the small percent of responses involving cardiac arrests, every minute of delay does make a big difference in outcomes.

We also examined two additional types of medical emergencies in which time may be critical: strokes and trauma.

Strokes account for approximately 2% of EMS on-scene evaluations.[23] TPA is a therapy for ischemic stroke which, when administered within 3 hours of stroke onset, increases the absolute likelihood of independent survival by 16%.[24] Most stroke victims arrive at the hospital after the three hours have passed because they do not recognize the symptoms of stroke.[25] In a population of stroke patients, 54% were diagnosed with ischemic stroke. A delay in presentation of more than 3 hours excluded 73.1% from TPA, and 26.7% received TPA with the remainder being disqualified for various reasons.[15]

So although time can be critical in sparing ischemic stroke victims from adverse consequences, the relatively large time window (hours rather than minutes) for initiation

[22] E. Silverman, Cardiac Response Lags in D.C. retrieved from http://www.washingtonpost.com/wp-dyn/content/article/2008/05/28/AR2008052803312.html on 9/23/2008.

[25] C.R. Lacy, Delay in Presentation and Evaluation fro Acute Stroke. Stroke. 2001; 32:63-69.

of TPA therapy should in reality make emergency delays on the order minutes relatively unimportant with respect to eventual patient outcomes.

Trauma is a final class of medical conditions that were investigated. One would expect that due to the potential for blood loss that the outcomes for trauma victims are significantly influenced by the size of delays in emergency response. However, the most recent large population-based study examining this issue found that response time delays were not associated with increases in patient mortality.[26]

[26] Baez AA, et al. Predictive Effect of Out-of-Hospital Time in Outcomes of Severely Injured Young Adult and Elderly Patients. Prehospital and Disaster Medicine. 2006; 21: 427-430.

LIMITATIONS

Because of data or time restrictions associated with this study, it contains a number of assumptions and limitations. Many of these highlight ways in which this study could be enhanced or expanded upon in the future, especially if more data is provided by stakeholders.

- Due to lack of information describing the destinations of emergency calls, IEM assumed the number of emergency response calls in an area would be proportional to the population in that area. This assumption may not hold if certain areas have higher concentrations of people who make higher rates of emergency calls (e.g., elderly persons). Such demographic detail could be easily incorporated into our methodology, especially where stakeholders provide data regarding call distributions.
- IEM did not receive information on the operating procedure for dispatching or allocating emergency calls to the three fire stations (Countryside #1, Countryside #2, and Mundelein #2). Without this information:
  - IEM could not accurately estimate the response times in the model, as they would be implemented in practice by determining which fire station, or station combinations, would likely respond to each area. Instead, the response times for each of the fire stations were analyzed individually.
  - IEM was unable to calibrate the model to make the overall average response time match real-life calls. Instead, IEM reviewed the average response time for each of the three fire stations independently to determine that they were within reasonable range of the real-life figure.
- IEM did not receive information on how emergency calls distributed throughout the day. As a result, the model could not estimate how these fluctuations could affect response times.
- Due to time constraints, signal preemption for emergency vehicles has not yet been incorporated into the model.

Exhibit 4: Global Insight, Economic Analysis for Canadian National Railway: Manufacturing Scenario Impact on the Illinois Economy (September 2008).

ECONOMIC ANALYSIS FOR CANADIAN NATIONAL RAILWAY: SCENARIO IMPACT ON THE ILLINOIS ECONOMY

SEPTEMBER 2008

Conclusions

Global Insight, Inc. has estimated the direct, indirect, and induced impacts of two economic scenarios proposed by Canadian National Railway (CN) using its proprietary models. While CN has stated the impact would affect both the states of Illinois and Indiana, they also indicated that the vast majority of the impact will be in Illinois. Therefore, this analysis is done using Illinois data only as a reasonable representation of the overall outcome from the following two scenarios: (Scenario 1) a job reduction of 114 employees in the railroad industry and (Scenario 2) an increase in railroad construction spending of $150 million spread evenly between two years. Our analysis is done using 2008 economic data.

The analysis performed assumes both impacts take place starting in year 1 following the acquisition. However, CN has indicated that while that is true for the expected investment impact, the job losses are likely to occur through attrition over an undetermined period of time. This study's assumption that all jobs losses will occur in year 1 should be considered as the strongest possible impact. Still, our estimates for the 2008 perspective reveal that the combined effect of the job reduction and increase in spending is significantly positive from an economic perspective.

Methodology

The direct impacts gauge the initial effect of eliminating the 114 jobs in the railroad transportation industry (Scenario 1) as if those jobs were eliminated on day 1, and of yearly spending of $75 million (half of the proposed $150 million amount) on infrastructure construction for the railroad sector (Scenario 2). These are calculated using Global Insight's U.S. industry information on sector employment, economic output, and wages based on State of Illinois data.

The indirect impacts measure the effects of the job loss (Scenario 1) and the increase in infrastructure construction (Scenario 2) on the output of the state's 20 major industry sectors. These estimates are obtained by running Global Insight's U.S. Industry Input/Output Model, customized to configure the economic environment of Illinois.

The induced impacts capture the multiplier effect of changes in labor income on spending through the 20 major industry sectors. These are obtained by using income and spending sensitivity relationships supplied by Global Insight's U.S. Macro Service and our customized Input/Output Model.

Scenario Impacts

Based on the aforementioned methodology, Global Insight has estimated the following impacts of the two scenarios requested by Canadian National Railway:

Year 1 (Scenarios 1 and 2)

- Combining both scenarios leads to a **net gain of 833 jobs**. Scenario 1 leads to a total loss of 192 jobs, while Scenario 2 leads to a total gain of 1,025 jobs.
- Combining both scenarios leads to a **net gain of $45.360 million in labor income**. Job losses in Scenario 1 lead to a labor income decline of $13.312 million. Employment gains in Scenario 2 lead to a labor income increase of $58.672 million.
- Combined, both scenarios lead to a **net gain of $104.467 million in economic output**. The initial 114 job losses in railroad transportation in Scenario 1 lead to a total loss of $50.821 million in Illinois economic output. However, the initial $75.000 million yearly capital construction spending on railroad infrastructure in Scenario 2 leads to a total gain of $155.288 million in economic output.
- Combining the scenarios leads to a **net gain of $47.650 million in economic value added**. Output losses in Scenario 1 result in a $25.919-million decline in economic value added, while the increase in capital spending in Scenario 2 leads to a $73.569-million rise in economic value added.
- The combined scenarios lead to a **net gain of $16.091 million in state tax receipts**. The loss of jobs and economic activity in Scenario 1 reduces state tax receipts by $5.897 million. The expansion of capital spending in Scenario 2 leads to an increase in tax receipts of $21.988 million.

GLOBAL INSIGHT
(C) Copyright 2008. ALL RIGHTS RESERVED

Year 2 (Scenario 2)

In Scenario 2, the other half ($75 million) of the $150-million increase in railroad construction spending planned by CN occurs in year two. We estimate the impacts of that additional amount in year two to be similar in magnitude to year one. Specifically, the impacts in year two are:

- The number of jobs expands by 1,025.
- Labor income increases by $58.672 million.
- Economic output increases by $155.288 million.
- Economic value-added rises by $73.569 million.
- Tax receipts expand by $21.988 million.

Detailed Tables

For a detailed analysis of Scenarios 1 and 2 and their direct, indirect, and induced impacts on economic output, economic value added, employment, labor income, and tax receipts for the State of Illinois and its 20 major industry sectors, please refer to the tables that follow.

Economic Analysis for Canadian National Railway

Exhibit 6: Global Insight, Economic Analysis for Canadian National Railway: Manufacturing Scenario Impact on the U.S. Economy by Industry (September 2008).

ECONOMIC ANALYSIS FOR CANADIAN NATIONAL RAILWAY: MANUFACTURING SCENARIO IMPACT ON THE U.S. ECONOMY BY INDUSTRY

SEPTEMBER 2008

Conclusions

Global Insight, Inc. has estimated for Canadian National Railway (CN) the direct, indirect, and induced impacts of a one-time increase in U.S. manufacturing output on the U.S. economy by industry using its proprietary models. That estimate is intended to provide an order-of-magnitude impact on the economy that could result from improved efficiencies in the railway transportation business. For illustration purposes, we assumed an efficiency-led increase of $100 million in manufacturing output, which can then be scaled to the actual benefit estimated by CN. Similarly, one can use the multipliers provided to calculate the total impacts of any increase in manufacturing output estimated by CN.

The time basis for our analysis is 2008. Our estimates reveal that the multiplier effect of an increase in U.S. manufacturing output is significantly positive for the U.S. economy, from both a dollar and employment perspective.

Methodology

The direct impacts gauge the initial effect of expanding U.S. manufacturing output by $100 million. This is calculated using Global Insight's industry information on sector employment, economic output, and wages for the United States with a 2008 perspective.

The indirect impacts measure the effects of this manufacturing output increase on the country's 19 major industry sectors. These estimates are obtained by using Global Insight's U.S. Industry Input/Output Model, customized to a 2008 perspective.

The induced impacts capture the multiplier effect of changes in labor income on spending through the 19 major industry sectors. These are obtained by using income and spending sensitivity relationships supplied by the Global Insight's U.S. Macro Service and re-running our customized U.S. Input/Output Model.

Scenario Impacts

Based on the aforementioned methodology, Global Insight has estimated the impacts of this manufacturing scenario (labeled Scenario 3, as it follows two other scenarios previously estimated for Canadian National Railway by Global Insight) on the U.S. economy. Its estimated impacts are as follows:

Year 1 (Scenario 3)

- Increasing U.S. manufacturing output in a single year by $100 million leads to a **total gain of 549 U.S. jobs**. Of those, 358 jobs will be in manufacturing through direct, indirect, and induced impacts, and the remaining 191 will be in other sectors through indirect and induced impacts.
- The scenario leads to a **total gain of $29.899 million in U.S. labor income**.
- Starting with an initial increase of $100 million in manufacturing production, the scenario leads to a **total gain of $232.423 million in U.S. economic output**. This is a multiplier of 2.324.
- The scenario leads to a **net gain of $97.727 million in economic value added for the U.S. economy**. This represents a multiplier of 2.615.
- The scenario leads to a **total increase of $14.457 million in U.S. tax receipts**.

Detailed Tables

For a detailed analysis of Scenario 3 and its direct, indirect, and induced impact on U.S. economic output, economic value added, employment, and labor income for the country's 19 major industry sectors, along with the resulting effects on tax receipts, please refer to the tables that follow.
